Contact Information

NetWitness Community at https://community.netwitness.com contains a knowledge base that answers common questions and provides solutions to known problems, product documentation, community discussions, and case management.

Trademarks

RSA and other trademarks are trademarks of RSA Security LLC or its affiliates ("RSA"). For a list of RSA trademarks, go to https://www.rsa.com/en-us/company/rsa-trademarks. Other trademarks are trademarks of their respective owners.

License Agreement

This software and the associated documentation are proprietary and confidential to RSA Security LLC or its affiliates are furnished under license, and may be used and copied only in accordance with the terms of such license and with the inclusion of the copyright notice below. This software and the documentation, and any copies thereof, may not be provided or otherwise made available to any other person.

No title to or ownership of the software or documentation or any intellectual property rights thereto is hereby transferred. Any unauthorized use or reproduction of this software and the documentation may be subject to civil and/or criminal liability. This software is subject to change without notice and should not be construed as a commitment by RSA.

It is advised not to deploy third-party repos or perform any change to the underlying NetWitness Operating System that is not part of the supported NetWitness version. Any such change outside of the NetWitness approved image may result in a service or functionality conflict and require a reimage of the NetWitness system to bring NetWitness back to an optimized functional state. In the event a third-party repo is deployed, or other non-supported change is made by the customer without NetWitness approval, the customer takes full responsibility for any system malfunction until the issue can be remediated through troubleshooting efforts or a reimage of the service.

Third-Party Licenses

This product may include software developed by parties other than RSA. The text of the license agreements applicable to third-party software in this product may be viewed on the product documentation page on NetWitness Community. By using this product, a user of this product agrees to be fully bound by terms of the license agreements.

Note on Encryption Technologies

This product may contain encryption technology. Many countries prohibit or restrict the use, import, or export of encryption technologies, and current use, import, and export regulations should be followed when using, importing or exporting this product.

Distribution

Use, copying, and distribution of any RSA Security LLC or its affiliates ("RSA") software described in this publication requires an applicable software license.

RSA believes the information in this publication is accurate as of its publication date. The information is subject to change without notice.

THE INFORMATION IN THIS PUBLICATION IS PROVIDED "AS IS." RSA MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WITH RESPECT TO THE INFORMATION IN THIS PUBLICATION, AND SPECIFICALLY DISCLAIMS IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

Miscellaneous

This product, this software, the associated documentations as well as the contents are subject to NetWitness' standard Terms and Conditions in effect as of the issuance date of this documentation and which can be found at https://www.netwitness.com/standard-form-agreements/.

What's New in 12.4.1.0 Release

The NetWitness 12.4.1.0 Release Notes describe new features, enhancements, security fixes, upgrade paths, fixed issues, known issues, end-of-life functionality, build numbers, and self-help resources.

Enhancements

The following sections are a complete list and description of enhancements to specific capabilities:

- Event Stream Analysis
- User and Entity Behavior Analytics
- Insight
- Concentrator, Decoder, Log Collector, and Archiver Services
- Log Integrations
- Security

To locate the documents that are referred to in this section, see https://community.netwitness.com/t5/netwitness-platform-online/netwitness-platform-all-documents/ta-p/676246.

The Product Documentation section has links to the documentation for this release.

Event Stream Analysis

The following section describes the new enhancements for Event Stream Analysis (ESA) component:

Event Stream Analysis (ESA) Disaster Recovery Failover

The NetWitness Platform enables administrators to perform smooth failovers with minimal processes and tools involved in the entire design, making it easier for the clients to minimize downtime during service interruptions.

Administrators can set up an ESA Primary Standby node in the event of a disaster or unplanned outage of the original active ESA Primary node. Recovery involves switching from the active ESA Primary node to the ESA Primary Standby node by taking Mongo and configuration backups of the active ESA Primary system and restoring them to the ESA Primary Standby with the required configurations to ensure uninterrupted access to ESA correlation and context hub services.

The new ESA Primary Standby node should be configured with its unique IP and host details, ensuring a seamless setup process that is not hindered by prior configurations.

For more information on how to perform the ESA DR failover, see NetWitness Deployment Guide for 12.4.1.

User and Entity Behavior Analytics

The following section describes the new enhancements for UEBA component:

Deprecation of JA3 Entity from UEBA

NetWitness no longer supports JA3 as an entity for UEBA, starting from version 12.4.1. This change is implemented because JA3 is identified as an unreliable client identification method. The effectiveness of JA3 fingerprinting in determining the true identity of clients is no longer accurate due to the adoption of client TLS extension randomization. With randomization, a single client can have numerous JA3 fingerprints instead of just one. This makes it difficult for UEBA to accurately distinguish between normal and malicious activity.

For more information, see *NetWitness UEBA User Guide for 12.4.1*.

Insight

This section describes the functional improvements made to the Insight component:

Improved Network Assets Identification and Classification

This release introduces improvements to the NetWitness Analytics network asset identification process to ensure accurate classification and reduce misconfigurations.

- If users are running Port Scanners in their environment, it is important to remember that these Port Scanners can generate significant traffic. Such traffic could impact the NetWitness Analytics and result in misclassification of servers as clients, affecting enterprise network exposure, peer network exposure rankings, asset category, and detection accuracy for each asset. To prevent network asset misclassification, contact NetWitness Customer Support and provide them with the list of Port Scanner IPs. Your information will be used by NetWitness Analytics to improve asset identification and classification.

- If users do not follow the RFC 1918 standard and use a different standard to define their internal IP addresses, NetWitness Analytics may not recognize them correctly. As a result, some internal assets may be classified as external assets or vice versa. To avoid this issue, contact NetWitness Customer Support and provide them with your internal IP ranges. Your information will be used by NetWitness Analytics to improve asset identification and classification.

Concentrator, Decoder, Log Collector, and Archiver Services

The following enhancements are made for Concentrator, Decoder, Log Collector, and Archiver Services in 12.4.1.0 version:

Improved Packet Decoder Parsing with Maximum Parse Limit Per Protocol

NetWitness Platform optimizes the Packet Decoders for the most effective detection and investigation, balancing high performance with depth of visibility.

Administrators can now change the scanning depth limit depending on the detected protocol. Additionally, different `parse.bytes.max` for each protocol can be set to focus on parsing and generating metadata for more valuable sessions.

Improved Packet Decoder Parsing with Maximum Parse Limit Step Function

NetWitness Platform allows parsers to constantly step through a session as tokens are found on a protocol basis to optimize generating meta in appropriately valuable sessions. The Step Scan enables the scan engine to continue scanning from the position of the last token found for the specified number of bytes. This process repeats each time a token is found and continues until the scan reaches the end of the stream or there are no more tokens. Administrators can optimize specific parsing traffic further into a session to get better visibility for protocols more prone to extensive sessions with potential threats.

Introduction of Meta Keys to Track Bytes Scanned per Session

NetWitness Platform has introduced two new meta keys to track the number of bytes scanned per session. These meta keys are `scanned.client` and `scanned.server`, which keeps track of the scanned bytes for the client and server streams. Administrators can review the progress of a session scan and compare it to the set parse limit and session size. This setting is disabled by default, but it can be turned on by ensuring that the parser **ScannerAnalytics** is enabled. These meta are indexed as `UInt64` types with level `IndexKeys`, so all regular queries relating to integers are applicable.

Log Integrations

NetWitness Platform supports the integration of the following event sources to collect and parse logs. Unless specified, these services are supported on NetWitness Platform 12.2.0.0 or later.

- Crowdstrike Falcon
- Cisco FMC
- Nozomi Networks

For more information on integrating the parser services, see NetWitness Platform Integrations Guide.

Security

IMPORTANT: It is crucial to adhere to security best practices by avoiding the deployment of an Admin server node on a public IP address. This precaution is essential to mitigate the risk of potential directory traversal attacks, particularly through vulnerable endpoints such as `/nwrpmrepo` and `/service-mappings.json` files. These files contain sensitive information including private IPs, RPMs, and other executables, which must remain strictly restricted from exposure to the internet. Implementing this safeguard helps prevent unauthorized access to internal NetWitness environments.

For more information on Security Fixes, see https://community.netwitness.com/t5/netwitness-platform-advisories/ct-p/netwitness-advisories#security.

Upgrade Paths

The following upgrade paths are supported for NetWitness 12.4.1.0

- NetWitness 12.4.0.0 to 12.4.1.0
- NetWitness 12.3.1.0 to 12.4.1.0

- NetWitness 12.3.0.0 to 12.4.1.0
- NetWitness 12.2.0.1 to 12.4.1.0
- NetWitness 12.2.0.0 to 12.4.1.0

For more information on upgrading to 12.4.0.0, see Upgrade Guide for NetWitness 12.4.1.0

IMPORTANT: If you want to upgrade from 11.7.x or 11.7.x.x versions to 12.4.1.0 version, you must first upgrade to 12.2.0.0 or 12.3.0.0 version before upgrading to 12.4.1.

Product Version Life Cycle for NetWitness Platform

See for Product Version Life Cycle for NetWitness Platform a list of versions that reach End of Primary Support (EOPS).

What's New in Previous Releases (11.7 to 12.4.0.0)

The section provides new features and enhancements for all supported previous releases.

For more information, see https://community.netwitness.com/t5/netwitness-platform-online/what-s-new-in-previous-releases-11-7-to-12-1-1/ta-p/695650.

Fixed Issues in 12.4.1.0 Release

This section lists issues fixed in 12.4.1.0 version.

For additional information on fixed issues, see the Fixed Version column in the NetWitness® Platform Known Issues list (https://community.netwitness.com/t5/netwitness-platform-known-issues/netwitness-platform-known-issues/ta-p/571872) on NetWitness Community Portal.

UEBA Fixes

Tracking Number	Description
ASOC-145668	Red banner errors are displayed on the **Users** page after upgrading the UEBA server to version 12.4 from lower versions. This issue was caused by a connection failure between presidio-ui and presidio-output, which prevented the data from being displayed on the **Users** page.

Platform Fixes

Tracking Number	Description
ASOC-149880	The network interface fails to start after rebooting the 12.4.0.0 host due to the `NM_CONTROLLED` parameter set to `no` on the host.
ASOC-150789	Leapp upgrade fails due to Insufficient disk requirements.

Known Issues in 12.4.1.0 Release

Issues that remain unresolved in this release are documented in the NetWitness® Platform Known Issues list on the NetWitness community portal: https://community.netwitness.com/t5/netwitness-platform-known-issues/netwitness-platform-known-issues/ta-p/571872

Build Numbers for 12.4.1.0 Components

The following table lists the build numbers for various components of NetWitness 12.4.1.0

Component	Version Number
NetWitness Admin Server	rsa-nw-admin-server-12.4.1.0-240329015725.5.6589edfa.el8.alma.noarch.rpm
NetWitness Advanced Analytics Content	rsa-nw-advanced-analytics-content-12.4.1.0-240320123655.5.9bc2575.el8.alma.noarch.rpm

Self-Help Resources

There are several options that provide you with help as you need it for installing and using NetWitness:

- See the documentation for all aspects of NetWitness here: https://community.netwitness.com/t5/netwitness-platform/ct-p/netwitness-documentation
- Use the **Search** and **Create a Post** fields in NetWitness Community portal to find specific information here: https://community.netwitness.com/t5/netwitness-discussions/bd-p/netwitness-discussions
- See the NetWitness Knowledge Base: https://community.netwitness.com/t5/netwitness-knowledge-base/tkb-p/netwitness-knowledge-base
- See Troubleshooting section in the guides.
- See also NetWitness® Platform Blog Posts.
- If you need further assistance, contact NetWitness Support.

Contact NetWitness Support

If you contact NetWitness Support, you should be at your computer. Be prepared to provide the following information:

- The version number of the NetWitness Platform product or application you are using.
- The type of hardware you are using.

Use the following contact information if you have any questions or need assistance.

NetWitness Community Portal	https://community.netwitness.com In the main menu, click **Support > Case Portal > View My Cases**.
International Contacts (How to Contact NetWitness Support)	https://community.netwitness.com/t5/support/ct-p/support
Community	https://community.netwitness.com/t5/netwitness-discussions/bd-p/netwitness-discussions
NW Update	https://update.netwitness.com/
LiveUI	https://live.netwitness.com

NetWitness Educational Services

Sign up for access to NetWitness courses and additional resources on the NetWitness Educational Services and Training.

License Agreement

This software and the associated documentation are proprietary and confidential to RSA Security LLC or its affiliates are furnished under license, and may be used and copied only in accordance with the terms of such license and with the inclusion of the copyright notice below. This software and the documentation, and any copies thereof, may not be provided or otherwise made available to any other person.

No title to or ownership of the software or documentation or any intellectual property rights thereto is hereby transferred. Any unauthorized use or reproduction of this software and the documentation may be subject to civil and/or criminal liability. This software is subject to change without notice and should not be construed as a commitment by RSA.

It is advised not to deploy third-party repos or perform any change to the underlying NetWitness Operating System that is not part of the supported NetWitness version. Any such change outside of the NetWitness approved image may result in a service or functionality conflict and require a reimage of the NetWitness system to bring NetWitness back to an optimized functional state. In the event a third-party repo is deployed, or other non-supported change is made by the customer without NetWitness approval, the customer takes full responsibility for any system malfunction until the issue can be remediated through troubleshooting efforts or a reimage of the service.

Third-Party Licenses

This product may include software developed by parties other than RSA. The text of the license agreements applicable to third-party software in this product may be viewed on the product documentation page on NetWitness Community. By using this product, a user of this product agrees to be fully bound by terms of the license agreements.

Note on Encryption Technologies

This product may contain encryption technology. Many countries prohibit or restrict the use, import, or export of encryption technologies, and current use, import, and export regulations should be followed when using, importing or exporting this product.

Distribution

Use, copying, and distribution of any RSA Security LLC or its affiliates ("RSA") software described in this publication requires an applicable software license.

RSA believes the information in this publication is accurate as of its publication date. The information is subject to change without notice.

THE INFORMATION IN THIS PUBLICATION IS PROVIDED "AS IS." RSA MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WITH RESPECT TO THE INFORMATION IN THIS PUBLICATION, AND SPECIFICALLY DISCLAIMS IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

Miscellaneous

This product, this software, the associated documentations as well as the contents are subject to NetWitness' standard Terms and Conditions in effect as of the issuance date of this documentation and which can be found at https://www.netwitness.com/standard-form-agreements/.

Upgrade NetWitness Platform

This document provides information about the benefits and process of upgrading NetWitness Platform to 12.4.1.0. If you are using NetWitness Platform 12.2 or later versions, you can directly upgrade to NetWitness Platform 12.4.1 with AlmaLinux OS upgrade. Ensure you go through the pre-requisites and pre-upgrade tasks before you upgrade NetWitness Platform. You can upgrade NetWitness Platform using four different options depending upon your Internet connectivity. After upgrading, you should also perform certain post upgrade tasks and post upgrade sanity checks listed in this guide to complete the upgrade process successfully. The instructions in this document apply to both physical and virtual hosts (including AWS, Azure Public Cloud, and Google Cloud Platform) unless stated to the contrary.

IMPORTANT: The custom search patterns you created using the **search.ini** file in version 12.3.1 or earlier will not be migrated to the new **search.xml** file format used in version 12.4 and later. As a result, those custom search patterns will not be available from the **Content Library** > **More** > **Search Pattern Rule** tab after you upgrade to version 12.4 or later. For more information, see **Manage Search Pattern Rules** topic in the Centralized Content Management Guide for NetWitness.

Note: NetWitness Platform now supports installing multiple servers of UEBA in your environment. For more information, see **Configure Multiple UEBA Servers** topic in the *NetWitness UEBA Configuration Guide*.

There are many exciting new features that you can enable after you have upgraded to 12.4.1.0. For a detailed description of the new features in this release, see the *Release Notes for NetWitness Platform 12.4.1.0*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues. For more information on the new features released in the previous releases, see https://community.netwitness.com/t5/netwitness-platform-online/what-s-new-in-previous-releases-11-x-to-12-x/ta-p/695650.

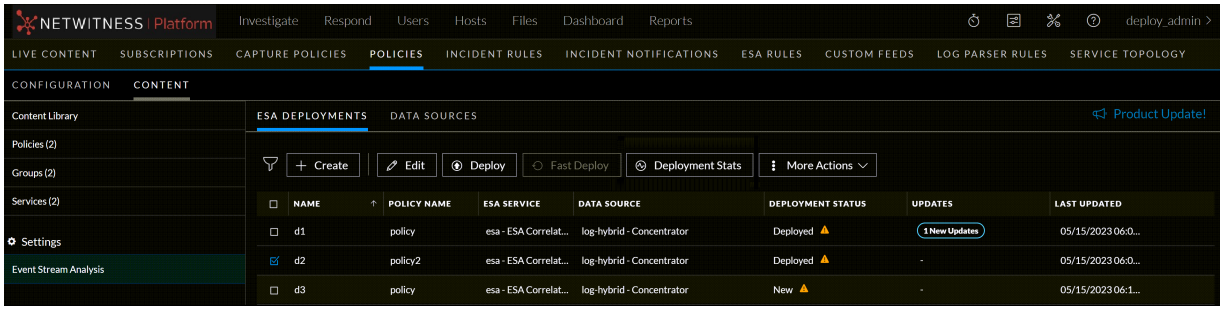
Upgrade Paths Supported for 12.4.1.0

The following upgrade paths are supported for NetWitness 12.4.1.0:

- NetWitness 12.4.0.0 to 12.4.1.0
- NetWitness 12.3.1.0 to 12.4.1.0
- NetWitness 12.3.0.0 to 12.4.1.0
- NetWitness 12.2.0.1 to 12.4.1.0
- NetWitness 12.2.0.0 to 12.4.1.0

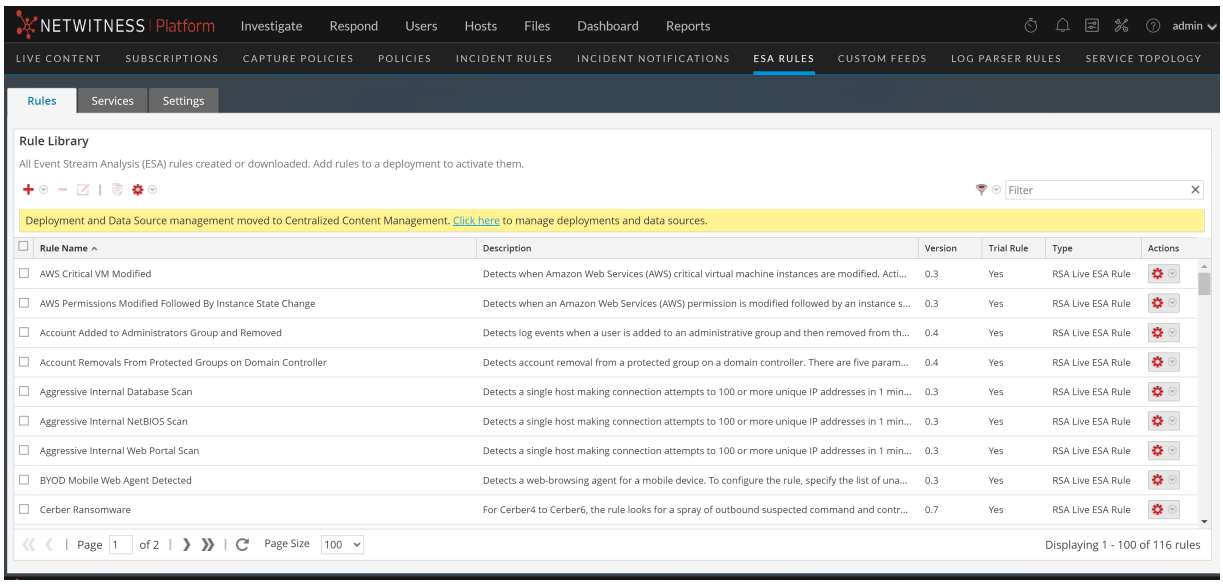
Running in Mixed Mode Environment

NetWitness Platform supports mixed mode during upgrade. Mixed mode occurs when some services are upgraded to the latest version and some services are still on the older versions.



For more information, see **Running in Mixed Mode** in the *NetWitness Hosts and Services Getting Started Guide*.

Note:
- If it takes a longer duration for upgrading all the hosts in your environment, contact NetWitness support to avoid encountering any issues.
- If you are running Endpoint Log Hybrid in mixed mode, make sure Endpoint Broker is on the same version as one of the Endpoint Servers.
- Mixed mode is not supported for ESA hosts in NetWitness Platform.



Upgrade Considerations for ESA Hosts

IMPORTANT: The NetWitness server, ESA primary host, and ESA secondary host must all be on the same NetWitness Platform version.

- You can only manage the ESA deployments and Data Sources through **Centralized Content Management**. Go to (**CONFIGURE**) > **Policies** > **Content** > **Event Stream Analysis** page to manage the ESA deployments and Data Sources. Refer the following figure.

- You can only manage the ESA Rules in the **ESA Rules** page. Refer the following figure.

- After upgrading to the 12.4.1.0 version, all the ESA deployments will be migrated to (**CONFIGURE**) > **Policies** page. Each deployment will be converted into a policy and group and will be available to manage only after the upgrade of the Correlation servers to the 12.4.1.0 version. Make sure that you plan the upgrade process so that Correlation servers are upgraded immediately after the Admin Server is done. The deployments will not be accessible until the corresponding Correlation servers are upgraded. However, the correlation servers will still continue to process the Alerts and Events.
- You must upgrade the ESA hosts immediately after upgrading the Admin Server.

  For more information on **Centralized Content Management** and managing the deployments, see Centralized Content Management Guide for NetWitness.

Upgrade or Install Windows Legacy Collection

Refer to Windows Legacy Collection Guide for NetWitness for NetWitness Legacy Windows Collection Upgrade & Installation Instructions.

Note: After you upgrade or install Windows Legacy Collection, reboot the system to ensure that Log Collection functions correctly.

Terminologies

Name	Description
AVX	Advanced Vector Extensions
VMX	Virtual Machine Extension
NFS	Network File System
BTRFS	B-Tree File System
DPDK	Data Plane Development Kit

Run Pre-Upgrade Checks

NetWitness strongly recommends that you run the pre-upgrade checks before you upgrade to NetWitness Platform 12.4.1.0 to identify any issues that may result in upgrade failure.

Note:
- Ensure that the deploy_admin password is valid and up to date. Do not change it from the UI. Use https://community.netwitness.com/t5/netwitness-platform-online/manage-the-deploy-admin-account/ta-p/669802 to change the password.
- If any probe fails when you run the pre-upgrade checks, refer https://community.netwitness.com/t5/netwitness-knowledge-base/netwitness-pre-upgrade-check-known-issues-master-list/ta-p/708695 to mitigate the issue associated with the failed probe.

Before you begin

You must first download the Standalone RPM using https://community.netwitness.com/t5/netwitness-platform-downloads/netwitness-platform-standalone-precheck-tool/ta-p/709096 and refer to the read me file for instructions on how to install the Standalone RPM and then run the pre-check.

To run the pre-upgrade checks:

1. SSH to Admin Server.
2. Using the Upgrade Precheck tool, run the following commands in sequence:
   a. `nw-precheck-tool-standalone os-migration-checklist`: This command allows the Upgrade Precheck tool to perform sanity checks for the list of probes in the OS Migration Checklist.
   b. `nw-precheck-tool-standalone upgrade-checklist`: This command allows the Upgrade Precheck tool to perform sanity checks for the list of probes in the Upgrade Checklist.
   c. `nw-precheck-tool-standalone network-checklist`: This command allows the Upgrade Precheck tool to perform sanity checks for the list of probes in the Network Checklist.
   d. `nw-precheck-tool-standalone cert-checklist`: This command allows the Upgrade Precheck tool to perform sanity checks for the list of probes in the Certificate Checklist.

OS Migration Checklist

The Upgrade Precheck tool performs the sanity checks for the following list of probes in the OS Migration checklist:

- **Version Check Probe**: Checks whether the NetWitness version of the system is the later version of 12.2.0.0 or not.
- **AVX / VMX Probe**: Checks if the AVX / VMX flags are enabled or not for the nodes that require them.
- **NFS Mount Probe**: Checks if NFS type mount point is active on any of the nodes.
- **Multiple kernel-devel Package Probe**: Checks if Decoder and PacketHybrid have multiple versions of kernel-devel package or not.

- **PF Ring Capture Device Probe**: Checks for PF_ring capture device on decoders and raises a warning to change PF_ring capture device to DPDK capture device.
- **BTRFS mount Probe**: Check if BTRFS partition is mounted.

  Note: LEAPP and Alma OS doesn't support BTRFS partition.
- **Disk space check**: Checks to ensure that enough disk is free in the / partition on each node.
- **Fips Mode Check**: Checks to ensure that the Fips mode is disabled (set to false) on all nodes.
- **Mountcheck probe**: Checks if all the partitions or file directories are mounted properly.
- **Salt Master Communication Check**: Verifies the salt communication from Node 0 to all the Nodes.
- **CIFS Check Probe**: Identifies any CIFS file systems on the hosts which are unsupported for in place upgrade.
- **XFS Ftype Check Probe**: Checks if there are any XFS file systems with ftype set to 0 on the host.
- **CCM Custom Content Check Probe**: Checks if **.envision** files are being extracted in their proper locations.
- **Optical Drive Check Probe**: Checks if any optical device is mounted on any hardware device. If any optical device is detected, the probe flags the user to unmount it.

Upgrade Checklist

The Upgrade Precheck tool performs the sanity checks for the following list of probes in the upgrade checklist:

- **Security Client File Check**: Ensures `security-client-amqp.yml` file is not present.
- **Node-0 NW Service-id Status Check**: Ensures all the service-id is intact with all the different services in Node 0.
- **Broker Service Trustpeer Symlink File Check**: Ensures Broker Service Trustpeer Symlink file `(/etc/netwitness/ng/broker/trustpeers/)` is not broken.
- **Node-0 NW Services Status Check**: Checks the status of all the services in Node 0.
- **Yum External Repo Check**: Ensures external repos are not available and not enabled.
- **Node-0 RPM DB Index Check**: Checks if the RPM DB is corrupted or not.
- **Salt Master Communication Check**: Verifies the salt communication from Node 0 to all the Nodes.
- **Node-0 Certificates Check**: Checks if any certificates are missing, expired, or invalid issuer type.

- **Mongo Authentication**: Validates the `deploy_admin` credentials fetched from `security-cli-client` using Mongo client.
- **Rabbitmq Authentication**: Validates the `deploy_admin` credentials fetched from `security-cli-client` using RabbitMQ.
- **(Component Hosts) Node X NW Service Status Check**: Verifies the status of services (Active or Inactive) on all the Node X.
- **(Component Hosts) Node X Certificates Check**: Checks the certificate expiry, missing, corrupted, and issuer mismatch in all the categories of Node X.
- **Provide Nodes CPU-Memory Info**: Provides CPU and Memory details of all the nodes along with the real-time available memory.
- **(Admin Server) Node 0 File System Utilization Check**: Verifies the disk partition utilization of `/var/netwitness/mongo`, `/var/netwitness`, and `root` on Node 0.
- **(Component Hosts) Node X File System Utilization Check**: Verifies the disk partition utilization of `/var/netwitness/mongo`, `/var/netwitness`, and `root` for ESA Primary and Endpoint Log Hybrid services on Node X.
- **Mongo File (ESAPrimary) Permission Mode Check**: Checks the ESA Primary node in the system or stack and verifies the permission mode of Mongo file.
- **Orchestration Server Normal Mode Check**: Checks if the orchestration service is running in normal or safe mode.
- **(Admin Server) Node 0 Init status Check**: Checks if there are any issues that might fail init process.
- **Fips Mode Check**: Checks to ensure that the Fips mode is disabled (set to false) before and after upgrade.
- **Node-X RPM DB Index Check**: Checks for the status of RPM DB on Node-X to make sure it is not corrupted.
- **Node-Z Yum Proxy Check**: Checks for the existence of yum.conf file and availability of proxy within the file on Node -Z.
- **Node-X Yum Proxy Check**: Checks for the existence of yum.conf file and availability of proxy within the file on Node -X.
- **Host Info Check Probe**: Checks if the required fields of information of all the hosts in the system (Host IP, Hostname, Installed Services, and Raw Version) are available.
- **Node-Z Cipher Check Probe**: Checks if the required ciphers are available in the location `/etc/rabbitmq/rabbitmq.config` on Node-0.
- **Node-X Cipher Check Probe**: Checks if the required ciphers are available in the location `/etc/rabbitmq/rabbitmq.config` on all Node-X.
- **Node-X Hardware Version Check Probe**: Checks for the hardware version of all reachable Node-X.
- **Node-Z Hardware Version Check Probe**: Checks for the hardware version of the Admin server.

- **PuppetCA Certificates Check Probe**: Checks if the stale puppet CA certificates are present in the location `/etc/pki/nw/trust/truststore.pem`.
- **AdminCertCheck Probe**: Verifies if the admin-certs across all the nodes are the same as the admin-certs on the Admin Server.
- **NTP Probe**: Checks all the nodes to ensure they are in sync with the NTP server.
- **StaleCerts Check Probe**: Checks the mongo and warns if there are any unused stale certificates in it.
- **NodeCertIDCheck Probe**: Checks the subject field of the node-cert and ensures that it is the same as the node-ID of the host.
- **Deploy Admin password expiry check Probe**: Verifies if the deploy_admin password is expired on Node-0.
- **File / Folder permission check**: This probe checks if the files / folders have the appropriate permissions.

Network Checklist

The Upgrade Precheck tool performs the sanity checks for the following list of probes in the network checklist:

- **(Admin Server) Node 0 closed ports Check**: Checks if the service ports required for NetWitness services are open and listening on Node 0.
- **(Component Hosts) Node X closed ports Check**: Checks if the service ports required for NetWitness services are open and listening on Node X.

Certificate Checklist

The Upgrade Precheck tool performs the sanity checks for the following list of probes in the Certificate checklist:

- **Node 0 Service Certificates Validity Check**: Checks the validity of service certificates in the location `/etc/pki/nw/service/` on Node-0.
- **Node X Service Certificates Validity Check**: Checks the validity of service certificates in the location `/etc/pki/nw/service/` on Node-X.
- **Node Certificates Validity Check on Node-0**: Checks the validity of node certificates in the location `/etc/pki/nw/service` on Node-0.
- **Node Certificates Validity Check on Node-X**: Checks the validity of node certificates in the location `/etc/pki/nw/service` on Node-X.
- **Root CA Certificates Validity Check**: Checks the validity of Root CA certificates in the location `/etc/pki/nw/ca`.

Prepare to Upgrade NetWitness Platform

Complete the following tasks to prepare for the upgrade to NetWitness Platform 12.4.1.0.

Task 1. (Important) Prepare to Upgrade AlmaLinux OS

Unsupported File System

Unmount and Remove BTRFS

BTRFS is a copy-on-write (CoW) filesystem for Linux that aims to implement advanced filesystem features while focusing on fault tolerance, repair, and easy administration. The BTRFS file system is deprecated from Red Hat Enterprise Linux 8, and AlmaLinux OS does not support the BTRFS file system. NetWitness does not use BTRFS by default, but in some categories like network decoder, network hybrid, etc., BTRFS module exists and is loaded. If BTRFS is mounted as a filesystem, perform the below steps to unmount the BTRFS partition manually (If BTRFS is not mounted, skip the below steps):

a. Relocate the data.

b. Unmount the BTRFS partition using the following command.

c. umount <btrfs partition path>. You can get the btrfs partition info from `/etc/fstab or df -hT` commands.

d. Remove the BTRFS partition from `/etc/fstab`.

e. Verify if the kernel moduleis still loaded using `lsmod | grep btrfs`. If the kernel module is still loaded , use `modprobe -r btrfs` to unload the btrfs kernel module.

f. Trigger/Retrigger the Upgrade.

For more information, refer the KB article “Upgrade to Alma OS when BTRFS file system is mounted.”

Unmount NFS

NFS type file systems active on the nodes cause the upgrade to fail for the nodes. You should manually unmount these mount points from the CLI of each node where it is found. Perform the below steps to unmount the NFS manually:

a. SSH to the nodes where NFS mount point is detected.

b. In each node, run `mount | grep 'type nfs'` and get the directory path of the NFS mount point.

> **Note:** Before unmounting NFS, you must stop the NetWitness services that rely upon NFS.
> For example: If Archiver and Warehouse Connector service is running on NFS, you must run the following commands to stop the services before unmounting NFS.
> `systemctl stop nwarchiver`
> `systemctl stop nwwarehouseconnector`

c. Execute umount <dir_path> from the terminal, where <dir_path> is the directory path from Step b.

d. Open `/etc/fstab` file in an editor of choice and comment out the line(s) that pertain to NFS mount point(s).

e. Run the NetWitness upgrade.

f. After upgrade has completed successfully, un-comment the respective entry from `/etc/fstab` and execute `mount -a` from the terminal to add the NFS mount point(s) back.

AVX/VMX CPU Instruction Set Check

AVX/VMX CPU flag needs to be enabled for NetWitness Platform 12.4.1.0. Run the command `salt '*' cmd.run "lscpu | grep -E 'avx|vmx'"` to check if AVX/VMX CPU instruction set is enabled. Refer the KB Article "Use AVX Instruction Set for MongoDB 5.0 Platform Support" for more information.

Note: For NetWitness hardware appliance, AVX/VMX CPU instruction set is enabled by default.

PF_RING to DPDK Migration Support

The decoder capture config will not be valid for customers using PF_RING capture (CentOS) and directly upgrading to 12.4.1.0 (AlmaLinux). First, they must migrate PF_RING devices to DPDK and then upgrade.

Refer to Migrate PF_RING Devices to DPDK for migration instructions.

Task 2. (Optional). Remove Legacy Package Repositories

You can free up the disk space by removing obsolete repositories from previous releases.

To remove the obsolete repositories:

1. Determine the version of the oldest NetWitness Platform host in your environment by using the NetWitness Repo tool. Do the following:

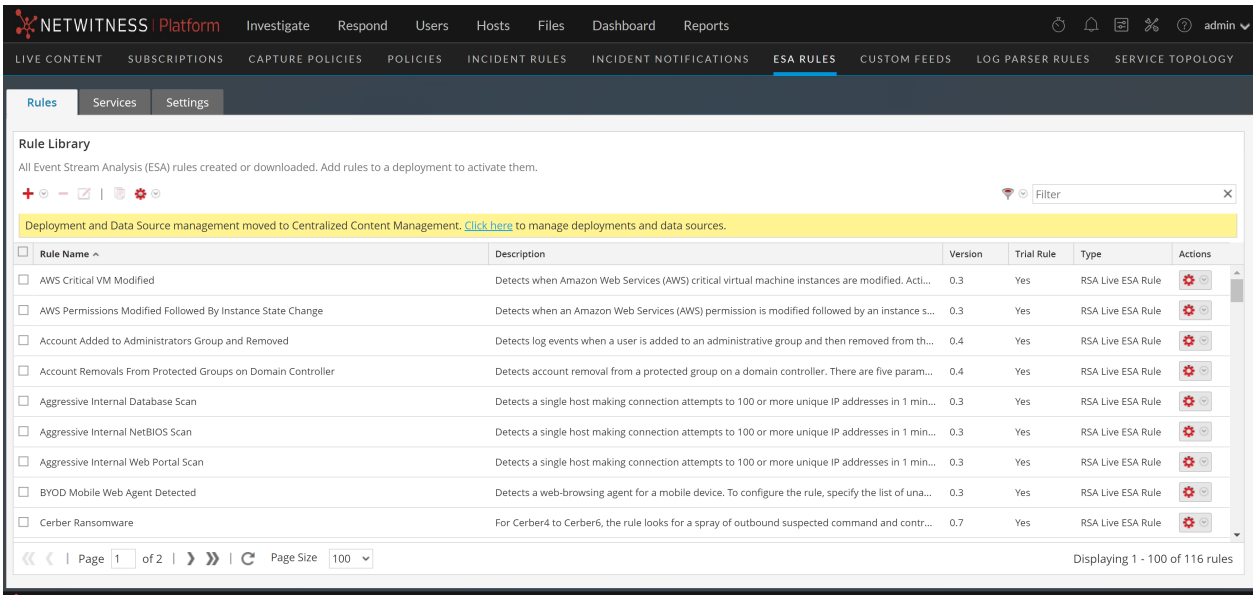
- SSH to the Admin Server as a `root` user.
- Run the following command.

  ```
  nw-repo-tool --list-obsolete
  ```

  After running this command, you will get a list of all the obsolete repositories.

2. Run the following command to remove all the obsolete repositories.

   ```
   nw-repo-tool --purge-obsolete
   ```



Task 3. Prepare ESA Deployments for Migration to 12.4.1.0

Before upgrading to 12.4.1.0, NetWitness recommends that all the ESA deployments maintain an error-free state. You must remove any unused ESA deployments, as ESA deployments will be migrated to policies and groups after upgrading to 12.4.1.0. Each deployment will be converted into a policy and group and will be available to manage only after the upgrade of the Correlation servers to the 12.4.1.0 version.

Manage ESA Deployments and Data Sources

You can only manage the ESA deployments and Data Sources through **Centralized Content Management**. Go to (**CONFIGURE**) > **Policies** > **Content** > **Event Stream Analysis** page to manage the ESA deployments and Data Sources. You can only manage the ESA Rules in the **ESA Rules** page. Refer the following figures.

Make sure that you plan the upgrade process so that Correlation servers are upgraded immediately after the Admin Server is done. The deployments will not be accessible until the corresponding Correlation servers are upgraded. However, the correlation servers will still continue to process the Alerts and Events. You must upgrade the ESA hosts immediately after upgrading the Admin Server.

For more information on **Centralized Content Management** and managing the deployments, see Centralized Content Management Guide for NetWitness.

IMPORTANT: If there is any need to import ESA Rules and enrichments, NetWitness recommends importing those missing rules and enrichments before the upgrade.

The pre-upgrade and post-upgrade states of deployments are represented in the following table.

SINo	Pre-upgrade Deployment State	Post-upgrade Deployment State		
		Creates Policy	Creates Group	The policy will be Published
1	Healthy deployment	Yes	Yes	Yes
2	Deployment with errors	Yes	Yes	Yes
3	Deployment with only rules	Yes	No	No
4	Deployment with no rules	No	No	No

Healthy deployment contains no errors, and the required resources such as ESA Server, Data source, and ESA rules are added.

Note: NetWitness recommends that all the deployments maintain an error-free state. You must remove any unnecessary or unused ESA deployments.

Task 4. Third-Party Package Removal

Any third-party packages installed on hosts out of the NetWitness repository are subjected to removal based on the Upgrade dependencies as part of OS migration.

Task 5. Single Sign-on (SSO): Enable SAML Response Signing in Microsoft Azure ADFS

The following configuration is only applicable to cases where the SAML response from Microsoft Azure ADFS was only encrypted by not signed. If your Microsoft Azure ADFS is already configured to sign and encrypt SAML responses, you can ignore this configuration and proceed with the upgrade process.

If you are not signing the SAML response, NetWitness recommends you to configure Microsoft Azure ADFS to encrypt and sign the SAML responses before upgrading your NetWitness Platform to version 12.4.1.0 for a successful Single Sign-on (SSO) login. To enable response signing in Active Directory Federation Service (AD FS), run the following command in ***powershell***:

```
Set-AdfsRelyingPartyTrust -TargetName <<relying-party-name>> -
SamlResponseSignature MessageAndAssertion
```

IMPORTANT: It is mandatory to configure Microsoft Azure ADFS to sign SAML responses before upgrading to version 12.4.1.0 of the NetWitness Platform. Without complying with these requirements, you may not be able to log in using SSO.

Task 6. (Optional). Disable STIG-based FIPS Kernel Controls

If you enabled STIG-based FIPS Kernel controls, you must disable them before initiating the NetWitness Platform upgrade process to avoid boot errors. To disable STIG-based FIPS Kernel controls, run the following commands:

```
manage-stig-controls --disable-control-groups 3 --host-all
grub2-mkconfig -o /boot/grub2/grub.cfg
```

After you upgrade NetWitness Platform, ensure that you enable STIG-based FIPS Kernel controls.

Note: STIG-based FIPS Kernel controls which require modifications to kernel boot options are not enabled by NetWitness out-of-the-box.

Task 7. (Optional). Verify Connection for Live Server

Note: This optional task is applicable to you only if you are upgrading NetWitness Platform through live.

Go to `admin/system/live services` and do a test connection to verify if you are able to connect to the live server as this is essential for the source-server from 12.x and above. This is an optional step and applicable only for customers who have configured live.

Task 8. Synchronize Time on Component Hosts with NW Server Host

Before you upgrade hosts, make sure that the time on each host is synchronized with the time on the NetWitness Server.

To synchronize the time, do one of the following:

1. Configure the NTP Server.

For more information, see **Configure NTP Servers** in the System Configuration Guide.

2. Perform the following steps:

a. SSH to the Admin Server host.

b. Run the following commands.

```
salt \* service.stop ntpd
salt \* cmd.run 'ntpdate nw-node-zero'
salt \* service.start ntpd
```

Perform Upgrade Tasks

IMPORTANT: NetWitness strongly recommends that you run the pre-upgrade checks before you upgrade to NetWitness Platform 12.4.1.0. For more information on how to run the pre-upgrade checks, see Run Pre-Upgrade Checks

Upgrade the systems in your environment in the following order:

1. NW Server hosts
2. Analyst UI hosts
3. ESA Primary hosts
4. ESA Secondary hosts
5. Standalone Broker hosts
6. Concentrator hosts
7. Archiver hosts
8. Packet Decoder hosts
9. Log Decoder hosts
10. Log Collector / VLC hosts
11. The rest of your component hosts

IMPORTANT: NW Server, Analyst UI, and ESA Primary and Secondary hosts must all be upgraded on the same day. The rest of your component hosts can be upgraded on the same day or later. Make sure that you plan the upgrade process so that Correlation servers are upgraded immediately after the Admin Server is done. For more information, see "**Task 3. Prepare ESA Deployments for Migration to 12.4.1.0**" in the topic Prepare to Upgrade NetWitness Platform. Mixed mode is not supported for ESA hosts in NetWitness Platform. The NetWitness server, ESA primary host, and ESA secondary host must all be on the same NetWitness Platform version.

For information about all the host types in NetWitness, see the *NetWitness Hosts and Services Getting Started Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

IMPORTANT: After upgrading the primary NW Server (including the Respond Server service), the Respond Server service is not automatically re-enabled until after the Primary ESA host is also upgraded to same version. The Respond post-upgrade tasks only apply after the Respond Server service is upgraded and is in the enabled state.

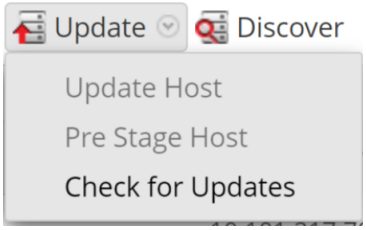
Note: For 12.4.1.0 version with Legacy Windows Log Collector, you should perform few additional post upgrade tasks. Refer to Legacy Windows Log Collection section in Perform Post Upgrade Tasks for these additional post upgrade tasks.

Select Upgrade Options

You can select one of the following upgrade options based on your Internet connectivity. They are listed in the order recommended by NetWitness Platform.

- Option 1: Upgrade NetWitness Platform using Live Services
- Option 2: Upgrade NetWitness Platform Offline
- Option 3: Upgrade NetWitness Platform using CLI (Offline)
- Option 4 (Optional): Pre-Stage Upgrade Repository by Downloading Packages

The following rules apply when you are upgrading hosts using any of the 4 upgrade methods:



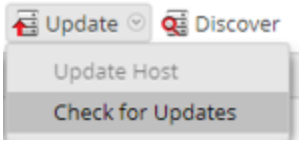
- You must upgrade the NW Server host first.
- You can only apply a version that is compatible with the existing host version.
- The NW Server, ESA primary, ESA secondary, and Analyst UI hosts must all be on the same NetWitness Platform version.

Option 1: Upgrade NetWitness Platform using Live Services

You can use this method if the NW Server host is connected to Live Services.

Caution: You must review your network policy before downloading the upgrade package which is around 11.7GB. If you have set up any policy that disallows file download beyond 10GB, the upgrade package download fails.

Note: You can pre-stage the upgrade repository using the **Pre Stage Host** feature. Refer the following figure. For more information, see Option 4 (Optional): Pre-Stage Upgrade Repository by Downloading Packages.



Prerequisites

1. The **Automatically download information about new upgrades every day** option is selected and is applied in **(Admin) > System > Updates**.
2. Updates are available. Go to **(Admin) > Hosts > Update > Check for Updates** to check for updates. The Host view displays the **Update Available** status.
3. 12.4.1.0 is available in the **Update Version** column.

To upgrade from 12.2.0.0, 12.2.0.1, 12.3.0.0, 12.3.1.0, and 12.4.0.0 to 12.4.1.0:

1. Go to **(Admin) > Hosts**.
2. Select the NW Server (`nw-server`) host.
3. Check for the latest updates.

Update Available is displayed in the **Status** column if you have a version update in your Local Update Repository for the selected host.

4. Select **12.4.1.0** from the **Update Version** column.

Note:
- If you want to view a dialog with the major features in the upgrade and information on the updates, click the information icon ( ) to the right of the upgrade version number.

- If you cannot find the version you want, select **Update > Check for Updates** to check the repository for any available updates. If an update is available, the message "New updates are available" is displayed and the **Status** column updates automatically to show Update Available. By default, only supported updates for the selected host are displayed.

5. Click **Update** > **Update Host** from the toolbar.
6. Click **Begin Update**.
7. Click **Reboot Host**.
8. Repeat steps 5 to 7 for other hosts.

Note: You can select multiple hosts to upgrade at the same time only after updating and rebooting the NW Server host. All ESA, Endpoint, and Malware Analysis hosts should be upgraded to the same version as that of the NW Server host.

Option 2: Upgrade NetWitness Platform Offline

You can manually upgrade NetWitness Platform by performing the following tasks.

Task 1. Populate Staging Folder (`/var/netwitness/common/update-stage/`) with Version Upgrade Files. Do the following.

1. Download the upgrade package `netwitness-12.4.1.0.zip` from NetWitness Community (https://community.netwitness.com/) > **Downloads** > **NetWitness Platform** > **Version 12.4.1.0** to a local directory:
   - If you are upgrading from 12.2.0.0, 12.2.0.1, 12.3.0.0, 12.3.1.0, and 12.4.0.0, download `netwitness-12.4.1.0.zip`.

2. SSH to the NW Server host.
3. Upload `netwitness-12.4.1.0.zip` to `/var/netwitness/common/update-stage/` on the NW Server Host.
   For example:

   ```
   mv /var/netwitness/tmp/netwitness-12.4.1.0.zip
   /var/netwitness/common/update-stage/
   ```

Note: NetWitness Platform unzips the file automatically.

Task 2. Apply Upgrades from the Staging Area to Each Host. Do the following.

Caution: You must upgrade the NW Server host before upgrading any non-NW Server host.

1. Log in to NetWitness.
2. Go to  **(Admin) > Hosts**.

   Note: If you are already on the  **(Admin) > Hosts** page and the **Check for Updates** option (**Update** > **Check for Updates**) is grayed out, refresh the page from the browser to check for the updates.
3. Check for updates and wait for the upgrade packages to be copied, validated, and ready to be initialized.

   "Ready to initialize packages" is displayed if:

   - NetWitness Platform can access the upgrade package.
   - The package is complete and has no errors.

   Refer to Troubleshooting Version Installations and Updates for instructions on how to troubleshoot errors (for example, "Error deploying version <version-number>" and "Missing the following update package(s)," are displayed in the **Initiate Update Package for RSA NetWitness Platform** dialog.)
4. Click **Initialize Update**.

   It takes some time to initialize the packages because the files are large and need to be unzipped. The time varies depending on how the host is configured.
   After the initialization is successful, the **Status** column displays Update Available.
5. Click **Update** > **Update Hosts** from the toolbar.

6. Click **Begin Update** from the **Update Available** dialog.
   After the host is upgraded, it prompts you to reboot the host.
7. Click **Reboot Host** from the toolbar.

Option 3: Upgrade NetWitness Platform using CLI (Offline)

You can use this option if the NW Server host is not connected to Live Services.

Before you begin

Make sure that you have downloaded the following file from NetWitness Community (https://community.netwitness.com/) > **Products > NetWitness Platform** > **Downloads** to a local directory:

- If you are upgrading from 12.2.0.0, 12.2.0.1, 12.3.0.0, 12.3.1.0, and 12.4.0.0 to 12.4.1.0, download:

  `netwitness-12.4.1.0.zip`

- If you are using external repository, you can update the external repository with the latest upgrade content. For more information, see External Repo Instructions for CLI upgrade.

To upgrade NW Server Hosts and component servers:

Note: If you copy and paste the commands from PDF to Linux SSH terminal, the characters do not work. However, you can copy the commands from the HTML page https://community.netwitness.com/t5/netwitness-platform-online/upgrade-tasks-for-12-1-1/ta-p/695018#Option3 and paste them to Linux SSH terminal.

1. Stage the 12.4.1.0 files to prepare them for the upgrade. Consider the following scenarios.
   - **Option 1 (Manual)** : Log into the NetWitness Server and create the following directory:

     `/var/netwitness/tmp/upgrade/12.4.1.0/`
     Then copy the package zip file to the `/var/netwitness/tmp/` directory of the NW Server and extract the package files from `/var/netwitness/tmp/` to the appropriate directory using the following command:

     `unzip netwitness-12.4.1.0.zip -d /var/netwitness/tmp/upgrade/12.4.1.0`
     Make sure you remove the update zip file from the staging directory after it is extracted.

   - **Option 2 (Automated)** : Log into the NetWitness Server and create the following directory:
     `/var/netwitness/tmp/upgrade/`
     Then copy the NetWitness 12.4.1.0 package zip files to the `/var/netwitness/tmp/` directory on the NetWitness Server.
     After this, run the below command to extract, validate, and initialize the 12.4.1.0 zip files:
     `[root@SA ~]# upgrade-cli-client --init --stage-dir /var/netwitness /tmp/upgrade --download-path /var/netwitness/tmp/ --version 12.4.1.0`
     Once the message **(INFO) Download and extraction of all the necessary NetWitness zips are completed** is displayed in the console of the admin server, only then the initialization process will begin.

   Note: If you do not receive the message **(INFO) Download and extraction of all the necessary NetWitness zips are completed**, run the previous command again.

   IMPORTANT: After staging 12.4.1.0 (using the Option 2), if the initialization fails, run the command `upgrade-cli-client --init --version 12.4.1.0 --stage-dir /var/netwitness/tmp/upgrade`. If the initialization succeeds, ignore the step 2 Initialize the upgrade below and proceed with the further steps 3-6.

2. Initialize the upgrade using the following command:
   `upgrade-cli-client --init --version 12.4.1.0 --stage-dir /var/netwitness/tmp/upgrade`
3. Upgrade the NW Server host, using the following command:
   `upgrade-cli-client --upgrade --version 12.4.1.0 --host-key <ID / display name / (hostname/ IP address)>`

   Note: Once the upgrade is triggered, NW Server will reboot automatically ~10 mins into the upgrade process. It will boot into the new kernel (4.18 for Alma Linux 8.9).

   Caution: Users are advised to wait until the UI is up and running, which may take up to an hour to complete. After 20 to 30 minutes of the migration, you can SSH and check if the OS is migrated. Once the OS migration is complete, it may take at least 30 minutes for the UI to appear as the NW Upgrade runs in the background.

   The above upgrade process can be tracked through a virtual console for VMs or remote console for servers with iDRACs.

   For more information on how to connect to the virtual console, see https://www.dell.com/support/kbdoc/en-in/000179797/dell-poweredge-idrac-virtual-console.

   Once the OS is migrated and able to SSH to Admin Node, run the following command on the host to confirm successful OS migration:

   - `cat /etc/redhat-release`
   - `AlmaLinux release 8.9 (Midnight Oncilla)`

   Caution: After the OS migration, reinstall any third-party RPMs you have previously installed.
4. Once the orchestration-server is up, it will automatically trigger the NW Upgrade through chef to the desired NW Version. To check the progress of this, please SSH to the Admin Server and run the following command:

   - `orchestration-cli-client --check-admin-upgrade-status`

   Note: Run the above command only for NW Admin Server.
5. When the NW Server host upgrade is successful, reboot the host from NetWitness Platform user interface in the Hosts view.
6. (Conditional) If Warm Standby Server is deployed, repeat steps 1 to 5 on the Warm Standby Server host.
7. Repeat steps 3 and 5 for each component host, changing the IP address to the component host which is being upgraded.

Note: You can check versions of all the hosts, using the command `upgrade-cli-client --list` on the NW Server host. If you want to view the help content of `upgrade-cli-client`, use the command `upgrade-cli-client --help`.

External Repo Instructions for CLI upgrade

For information about setting up an external repository, see **Appendix A. Set Up External Repo** in the *12.4.1.0Upgrade Guide for NetWitness Platform*. The following instructions assume that you already have an external repository set up. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

1. Stage the 12.4.1.0 files to prepare them for the upgrade. Consider the following scenarios.
   - **If you are upgrading from 12.2.0.0, 12.2.0.1, 12.3.0.0, 12.3.1.0, and 12.4.0.0**, you only need to stage 12.4.1.0.
     - **Option 1 (Manual)** : Log into the NetWitness Server and create the following directory:

       `/var/netwitness/tmp/upgrade/12.4.1.0/`
       Then copy the package zip file to the `/var/netwitness/tmp/` directory of the NW Server and extract the package files from `/var/netwitness/tmp/` to the appropriate directory using the following command:

       `unzip netwitness-12.4.1.0.zip -d /var/netwitness/tmp/upgrade/12.4.1.0`
       Make sure you remove the update zip file from the staging directory after it is extracted.
     - **Option 2 (Automated)** : Log into the NetWitness Server and create the following directory:
       `/var/netwitness/tmp/upgrade/`
       Then copy the NetWitness 12.4.1.0 package zip files to the `/var/netwitness/tmp/` directory on the NetWitness Server.
       After this, run the below command to extract, validate, and initialize the 12.4.1.0 zip files:
       `[root@SA ~]# upgrade-cli-client --init --stage-dir /var/netwitness /tmp/upgrade --download-path /var/netwitness/tmp/ --version 12.4.1.0`
       Once the message **(INFO) Download and extraction of all the necessary NetWitness zips are completed** is displayed in the console of the admin server, only then the initialization process will begin.

   Note: If you do not receive the message **(INFO) Download and extraction of all the necessary NetWitness zips are completed**, run the previous command again.

   IMPORTANT: After staging 12.4.1.0 (using the Option 2), if the initialization fails, run the command `upgrade-cli-client --init --version 12.4.1.0 --stage-dir /var/netwitness/tmp/upgrade`. If the initialization succeeds, ignore the step 2 Initialize the upgrade below and proceed with the further steps 3-6.

2. Initialize the upgrade using the following command:
   `upgrade-cli-client --init --version 12.4.1.0 --stage-dir /var/netwitness/tmp/upgrade`

3. Upgrade the NW Server host, using the following command:
   `upgrade-cli-client --upgrade --version 12.4.1.0 --host-key <ID / display name / (hostname/ IP address)>`

   Note: Once the upgrade is triggered, NW Server will reboot automatically ~10 mins into the upgrade process. It will boot into the new kernel (4.18 for Alma Linux 8.9).

Caution: Users are advised to wait until the UI is up and running, which may take up to an hour to complete. After 20 to 30 minutes of the migration, you can SSH and check if the OS is migrated. Once the OS migration is complete, it may take at least 30 minutes for the UI to appear as the NW Upgrade runs in the background.

The above upgrade process can be tracked through a virtual console for VMs or remote console for servers with iDRACs.

For more information on how to connect to the virtual console, see https://www.dell.com/support/kbdoc/en-in/000179797/dell-poweredge-idrac-virtual-console.

Once the OS is migrated and able to SSH to Admin Node, run the following command on the host to confirm successful OS migration:

- `cat /etc/redhat-release`
- `AlmaLinux release 8.9 (Midnight Oncilla)`

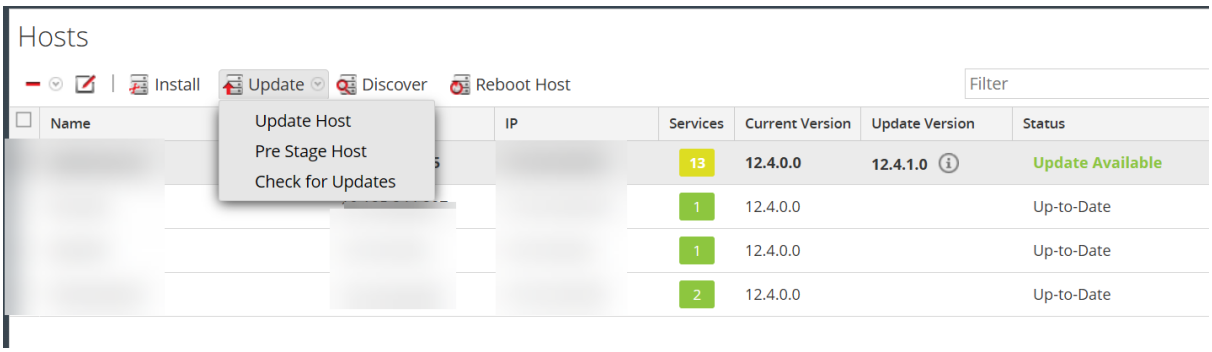
Caution: After the OS migration, reinstall any third-party RPMs you have previously installed.

4. Once the orchestration-server is up, it will automatically trigger the NW Upgrade through chef to the desired NW Version. To check the progress of this, please SSH to the Admin Server and run the following command:
   - `orchestration-cli-client --check-admin-upgrade-status`

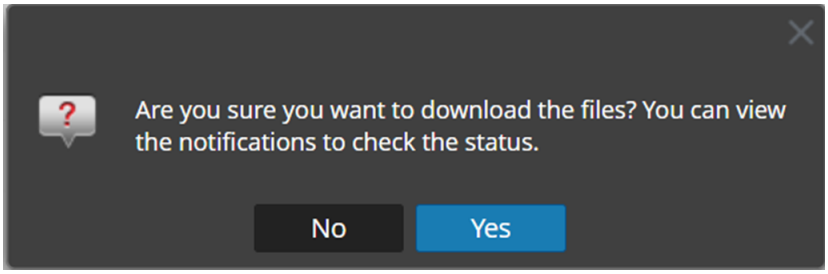
   Note: Run the above command only for NW Admin Server.
5. When the NW Server host upgrade is successful, reboot the host from NetWitness Platform user interface in the Hosts view.
6. (Conditional) If Warm Standby Server is deployed, repeat steps 1 to 5 on the Warm Standby Server host.
7. Repeat steps 3 and 5 for each component host, changing the IP address to the component host which is being upgraded.

Note: You can check versions of all the hosts, using the command `upgrade-cli-client --list` on the NW Server host. If you want to view the help content of `upgrade-cli-client`, use the command `upgrade-cli-client --help`.

Option 4 (Optional): Pre-Stage Upgrade Repository by Downloading Packages



You can pre-stage the upgrade repository by downloading the required packages (.zip) without affecting the system. This minimizes the upgrade downtime and ensures the upgrade is completed within the planned time.



To pre-stage the upgrade repository and update the hosts:

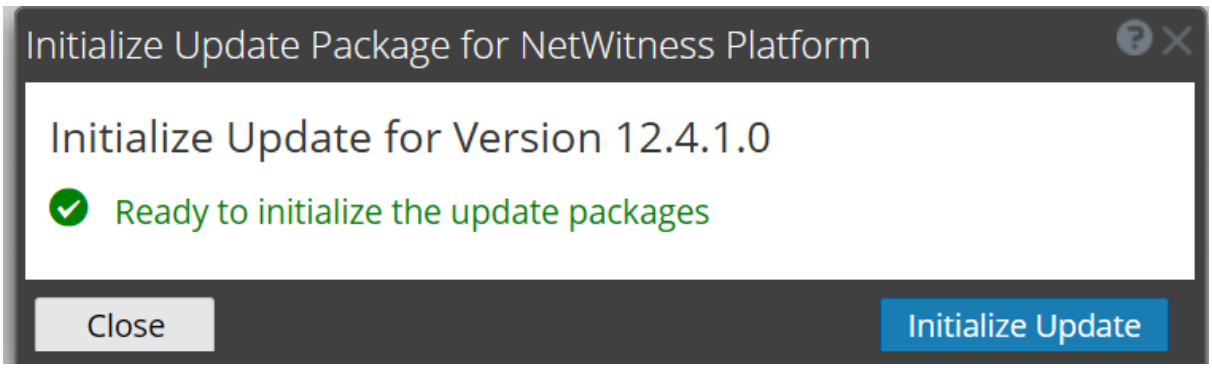
1. Go to **(Admin) > Hosts**.
2. Click **Update > Check for Updates** from the toolbar.

   All possible update versions will be displayed in the Versions drop-down list.
3. Click **Update** > **Pre Stage Host** and select the version in the update version column.

   A confirmation message for downloading the files is displayed.

4. Click **Yes** to download the upgrade packages to the repo.
5. Verify the status of the download in the notifications tray as shown below.

   The **Pre Stage Host** and **Upgrade Host** will be disabled until pre stage is completed.



Note: The current version and the update version in the UI will be the same during the pre stage as it is not the actual update. This is because only the repo files are downloaded and no actual upgrade is done. The version will change only after upgrade.

6. If the download is successful, **Check for Updates** again to start the initialization.

7. Click **Initialize Update**.

   The initialization of the package will take some time as the files are large and will need to be unzipped.

IMPORTANT: Pre Stage Repo preparation steps from 1 to 4 can be performed at any time. However, from steps 5 to 8 the upgrade process begins and you must NOT reboot the host or restart the jetty server during this time as it will corrupt the .ZIP files.

8. Check the status of initialization in the notifications tray.
9. After the initialization is completed successfully, click **Update** > **Update Host**.

   After the host is updated, you will be prompted to reboot the host.
10. Set up the host and reboot the host.

Perform Post Upgrade Tasks

This topic lists the tasks you must perform after upgrading NetWitness Platform. Complete the tasks that apply to the hosts in your environment.

- General
- Event Stream Analysis (ESA)
- Respond
- User and Entity Behavior Analytics
- Legacy Windows Log Collector
- Setting Recovery Password for Lockbox

General

You must configure Jetty, restore the core services contents, and also start Network capture, Log capture, and aggregation after upgrading NetWitness Platform.

Configure Jetty

For Jetty Configuration and related information, see **Manage Custom Jetty Configuration** section in **Manage Custom Host Entries** topic in the System Maintenance Guide.

Make Sure Services Have Restarted and Are Capturing and Aggregating Data

Make sure that services have restarted and are capturing data (this depends on whether or not you have auto-start enabled).

If required, restart data capture and aggregation for the following services:

- Decoder
- Log Decoder
- Broker
- Concentrator
- Archiver

To Start Network Capture:

1. In the NetWitness Platform menu, go to  (Admin) > **Services**.
   The **Services** view is displayed.
2. Select each **Decoder** service.

3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 

To Start Log Capture:

1. In the NetWitness Platform menu, go to  (Admin) > **Services**.
   The **Services** view is displayed.
2. Select each **Log Decoder** service.
3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 

To Start Aggregation:

1. In the NetWitness Platform menu, go to  (Admin) > **Services**.
   The **Services** view is displayed.
2. For each **Concentrator**, **Broker**, and **Archiver** service:
   a. Select the service.
   b. Under  (actions), select **View** > **Config**.
   c. In the toolbar, click 

3. For Event Stream Analysis (ESA):

   Note: Mixed mode is not supported for ESA hosts in NetWitness Platform version 11.6 and later. The NetWitness server, ESA primary host, and ESA secondary host must all be on the same NetWitness Platform version.

   There are no required post-upgrade tasks for ESA. For ESA troubleshooting, see ESA Troubleshooting Information.

   If you want to add support for Endpoint, UEBA, and Live content rules, you must update the `multi-valued` and `single-valued` parameter meta keys on the ESA Correlation service to include all the required meta keys. It is not necessary to make these adjustments during the upgrade; you can make the adjustments later at a convenient time. For detailed information and instructions, see **Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys** in the ESA Configuration Guide.

Restore the Core Services Contents

Once you upgrade to 12.4.1.0, the Core services Contents such as Configuration files (.cfg), Feeds, Parsers, and Log Devices are copied to the **.tar** location of the respective components such as Decoder, Log Hybrid, Network Hybrid, and Log Decoder.

The following table lists the Core Services Contents paths and the **.tar** location of the respective components where the Core Services Contents are copied.

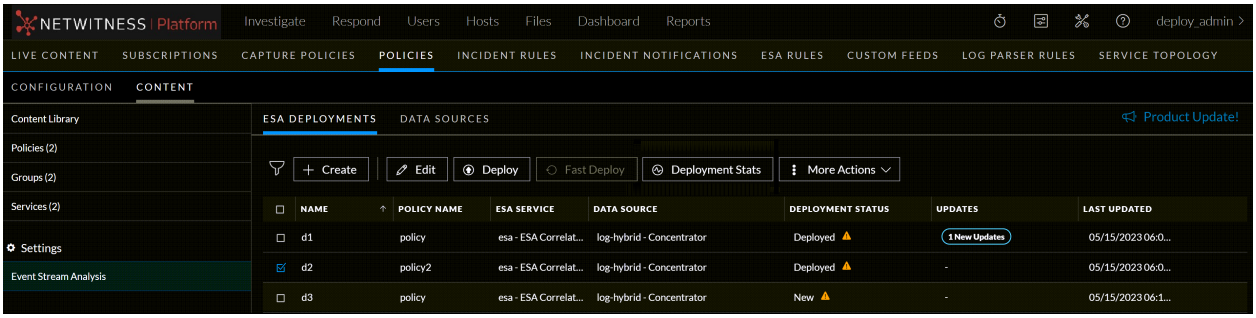
Core Services Contents Paths	Components	.tar location of the Components
/etc/netwitness/ng/feeds (Feeds)	Decoder	/var/netwitness/decoder/decoder_backupcontent_ccm.tar
/etc/netwitness/ng/parsers (Parsers)	Log Hybrid	/var/netwitness/logdecoder/logdecoder_backupcontent_ccm.tar
/etc/netwitness/ng/envision/etc/devices (Log Devices)	Network Hybrid	/var/netwitness/decoder/decoder_backupcontent_ccm.tar
/etc/netwitness/ng/NwDecoder.cfg (Configuration files (.cfg))	Log Decoder	/var/netwitness/logdecoder/logdecoder_backupcontent_ccm.tar

By default, CCM option is disabled. After upgrading to 12.4.1.0, if you enable CCM and encounter the loss of the Core Services Contents, you can use the backup tar files to recover the lost data. For more information, see https://community.netwitness.com/t5/netwitness-knowledge-base/automatic-backup-of-core-service-content-after-upgrading-core/ta-p/694527.

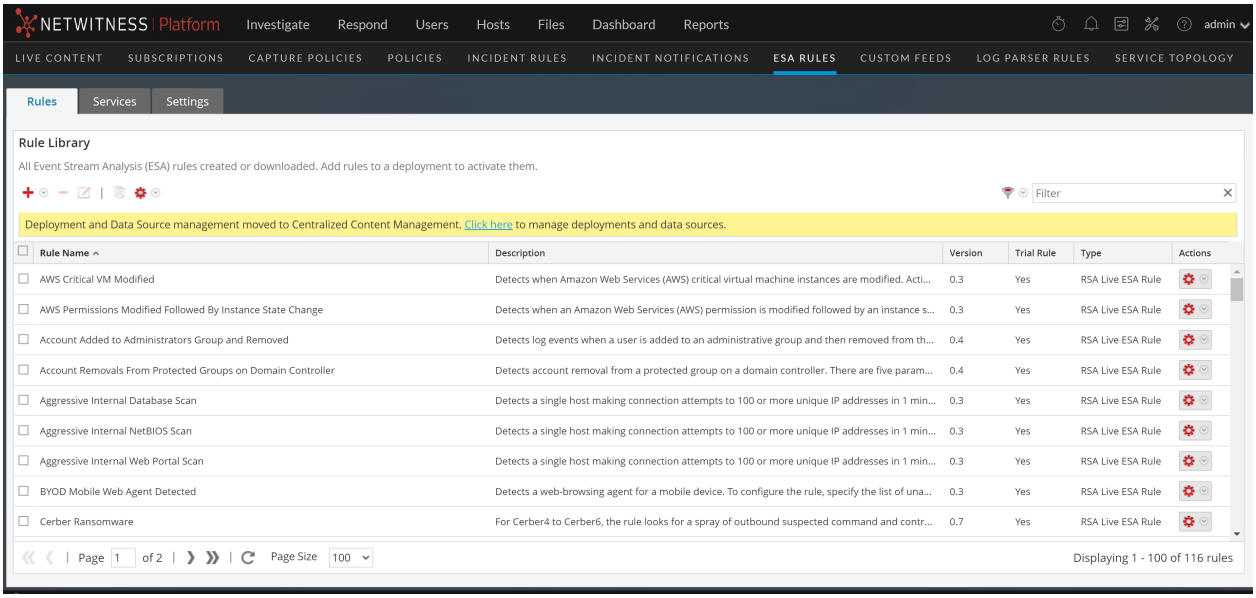
Event Stream Analysis (ESA)

After upgrading to the 12.4.1.0 version, all the ESA deployments will be migrated to (**CONFIGURE**) > **Policies** page. Each deployment will be converted into a policy and group and will be available to manage only after the upgrade of the Correlation servers to the 12.4.1.0 version. Make sure that you plan the upgrade process so that Correlation servers are upgraded immediately after the Admin Server is done. The deployments will not be accessible until the corresponding Correlation servers are upgraded. However, the correlation servers will still continue to process the Alerts and Events. Verify if all the ESA deployments are in a healthy state. For more information, see **View a Deployment** topic in the *Live Services Management Guide*.

Note: Analysts must have appropriate permissions to view the ESA rules under (**CONFIGURE**) > **ESA Rules** and (**CONFIGURE**) > **Policies** pages. For more information, see the **Source-server** section in the **Role Permissions** topic in the *System Security and User Management Guide*.



The pre-upgrade and post-upgrade states of deployments are represented in the following table.



SINo	Pre-upgrade Deployment State	Post-upgrade Deployment State		
		Creates Policy	Creates Group	The policy will be Published
1	Healthy deployment	Yes	Yes	Yes
2	Deployment with errors	Yes	Yes	Yes
3	Deployment with only rules	Yes	No	No
4	Deployment with no rules	No	No	No

(Optional) Using the **Merge Policy** button, you can merge a policy having ESA content with a policy with no ESA content. For more information, see **Merge Policy with ESA Content** topic in the *Live Services Management Guide*.

Manage ESA Deployments and Data Sources

You can only manage the ESA deployments and Data Sources through **Centralized Content Management**. Go to (**CONFIGURE**) > **Policies** > **Content** > **Event Stream Analysis** page to manage the ESA deployments and Data Sources. You can only manage the ESA Rules in the **ESA Rules** page. Refer the following figures.

You must upgrade the ESA hosts immediately after upgrading the Admin Server.

Migrate custom scripts for notifications

- Since there are a wide range of changes regarding the file permissions and ownership attributes of custom script files of the **Script Notifications** feature (**ADMIN** > **System** > **Global Notifications** > **Script**), Netwitness suggests having a backup of the custom scripts before the system is upgraded to 12.4
- Once the upgrade is completed, each script needs to be revisited for syntactic/semantic changes that have to be done.

- Even if the custom script in NetWitness versions prior to 12.4 is accessing any file resources in the /tmp or /var/tmp folder, they cannot be accessed further since the ownership with which the custom script executes has been changed. The suggestion for this scenario is to tweak/modify the custom script to create/read from a new file in **/tmp** or **/var/tmp** directory.

For more information on **Centralized Content Management** and managing the deployments, see Centralized Content Management Guide for NetWitness.

Respond

The Primary ESA server must be upgraded to 12.4.1.0 before you can complete the following task.

Note: After upgrading the primary NW Server (including the Respond Server service), the Respond Server service is not automatically re-enabled until after the Primary ESA host is also upgraded to 12.4.1.0. The Respond post-upgrade tasks only apply after the Respond Server service is upgraded and is in the enabled state.

(Conditional) Restore Any Respond Service Custom Keys in the custom_normalize_alerts.js and support new datasource

Note: If you did not manually customize the custom_normalize_alerts.js, you can skip this task. We attempt to automatically migrate the custom keys. However in case of failures, use this step to verify the custom data's integrity.

If you added custom keys in the `/var/netwitness/respond-server/scripts/custom_normalize_alerts.js` file for use in custom normailization, modify the `/var/netwitness/respond-server/scripts/custom_normalize_alerts.js` file and add the custom normalized keys from the automatic backup file. The backup file is located in `/var/netwitness/respond-server/scripts` and it is in the following format:

`custom_normalize_alerts.js.bak-<time of the backup>`

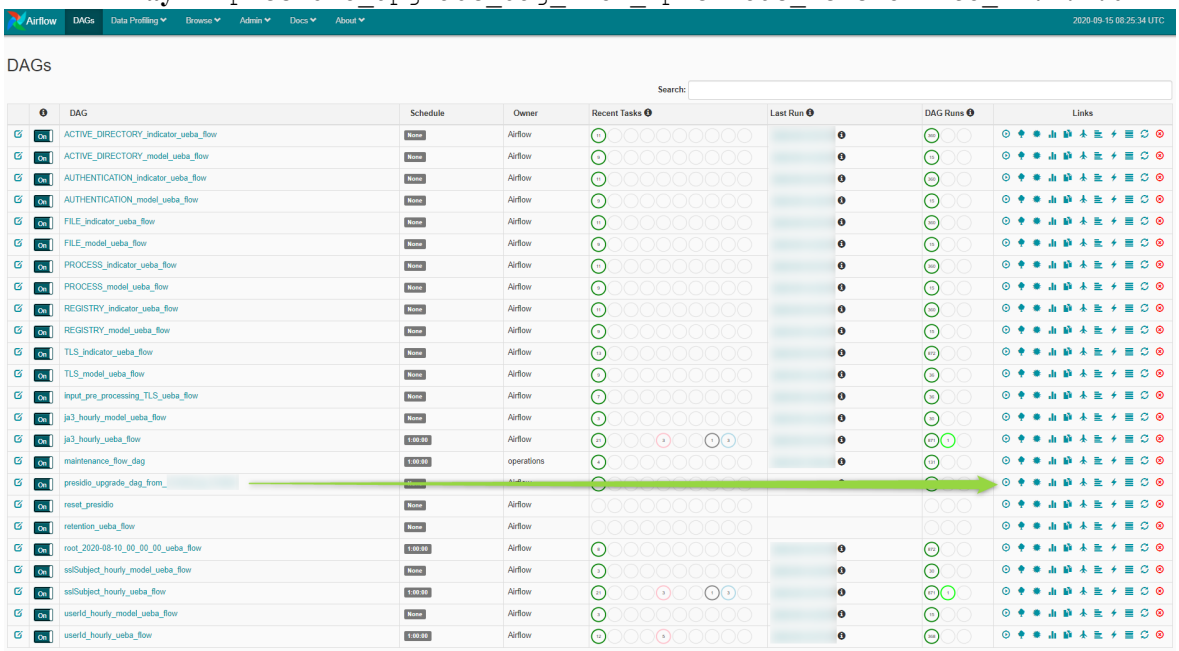
In case of automatic update of the script fails, add support for Netwitness Core and NetWitness Insight by updating the `custom_normalize_alerts.js` file manually to support these new sources in respond.

User and Entity Behavior Analytics

Complete the following tasks after upgrading UEBA to 12.4.1.0.

IMPORTANT: Before the upgrade, if you encountered and resolved the task failure issues, then after the upgrade, you must replace the `authentication.json` file before you run the post-upgrade tasks. The task failure issues in Airflow and their solutions are described in the 'Troubleshooting' topic of the *UEBA Configuration Guide*.

1. Update the UEBA configuration using the following command from the UEBA machine.
   - `source /etc/sysconfig/airflow`
   - `source $AIRFLOW_VENV/bin/activate`



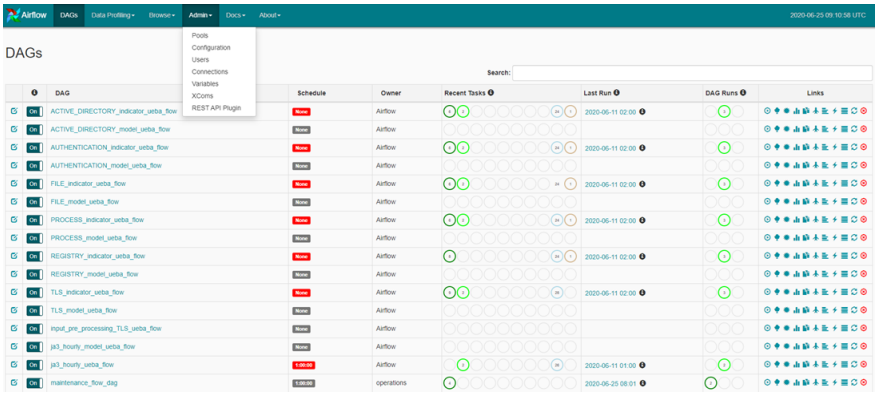
- `python /var/netwitness/presidio/airflow/venv39/lib/python3.9/site-packages/presidio_workflows-1.0-py3.9.egg/presidio/resources/rerun_ueba_server_config.py`
- `deactivate`

2. (Optional) Update the UEBA processing schema, if needed.

   NetWitness recommends that the UEBA start date is set to 28 days earlier than the current date. For UEBA systems that intend to process TLS data, you must make sure that the start date is set to no later than 14 days earlier than the current date.

   For more information, see the "reset-presidio script" section in the *UEBA Configuration Guide*.

3. Run the airflow upgrade DAG.
   - Go to Airflow main page `https://<UEBA-host-name>/admin`
   - Enter the admin username and password.
   - Click the **Play** in `presidio_upgrade_dag_from_<previous_version> to_12.4.1.0`.



> **Note:** A light green circle will appear next to the upgrade DAG row during the upgrade. If the upgrade process is completed successfully the light green circle changes to green. If the upgrade process fails, the light green circle changes to red.

4. Set the appropriate "Boot Jar Pools" slots:
   - **Physical Appliance**: Update the `spring_boot_jar_pool` slot value be 18.
   - **Virtual Appliance**: Update the `spring_boot_jar_pool` slot value to 22.
     To update the **Spring Boot Jar Pools** slots, go to the Airflow main page, tap the **Admin** tab at the top bar and tap **Pools**.

   a. To access the Airflow UI, go to `https://<UEBA_host>/admin` and enter the credentials.
      User: admin

Password: The environment deploy admin password.

b. Click on the pencil mark of the Pools to update the slot values.

5. Edit the `spring_boot_jar_pool` and update the slots amount to 22.

Legacy Windows Log Collector

Refresh Legacy Windows Log Collector Certificates with Updated SA Certificates

Post Upgrade Steps:

1. Execute the following command in SA:

   a. `wlc-cli-client --host-display-name` **`hostDisplayName`** `--service-display-name` **`serviceDisplayName`** `--host` **`WLChostIPAddress`** `--port 50101 --use-ssl false`

   Enter following information:

   i. **Legacy Windows Log Collector REST Username and Legacy Windows Log Collector REST Password**: Enter the admin credentials for the Legacy Windows Log Collector.

   ii. **Security Server Username and Security Server Password**: Enter admin credentials for NetWitness.

2. Restart the system.

Setting Recovery Password for Lockbox

After upgrading all the Log Collectors and WLC in the NW deployment to 12.4.0.0, administrator should execute the **Recovery Password Utility** using SATools. This tool sets the Lockbox recovery password for all the log collector services (version 12.4 or above) within the deployment. Administrators are advised to keep a note of the Lockbox recovery password as required during disaster recover scenarios.

To set the recovery password, the administrator should SSH into **Admin Server(Node 0)** and execute the utility **set-lockbox-password** from the path `/opt/rsa/saTools/bin/set-lockbox-password`. Administrators should enter the new password to be set as recovery password for the Lockbox available in all the Log Collectors.

Note: On re-executing the utility and setting an updated Lockbox, the recovery password will reset the password for all the applicable log collector services (version 12.4 and above).

```
[root@adminserver ~]# cd /opt/rsa/saTools/bin
[root@adminserver bin]# ll
total 68
-rwx------. 1 root root  3224 Dec 10 11:38 category-toggle
-rwx------. 1 root root   699 Dec 10 11:38 dkms-recompile
-rwx------. 1 root root  4719 Dec 10 11:38 external-repo-creator

-rwx------. 1 root root  5037 Dec 10 11:38 set-deploy-admin-password
-rwxrwxrwx. 1 root root  3071 Dec 21 13:28 set-lockbox-password
-rwx------. 1 root root 18074 Dec 10 11:38 sosreport-select-plugins
-rwx------. 1 root root  4762 Dec 10 11:38 ueba-server-config
[root@adminserver bin]# ./set-lockbox-password
Enter the Lockbox password to be set:
Please re-enter the password
Lockbox operation in progress...
Setting lockbox password for 10.125.245.116 : Success
Setting lockbox password for 10.125.245.105 : Success
Setting lockbox password for 10.125.245.114 : Success
Lockbox password is already set for log-collector :
'"logcollector":10.125.245.116'
'"logdecoder":10.125.245.105'
'"endpointloghybrid1":10.125.245.114'
[root@adminserver bin]#
```

Perform Sanity Checks After Upgrade

You must perform the following sanity checks after upgrading to NetWitness 12.4.1.0.

1. Go to  (Admin) > **Services** view to verify that all the services are active (appearing in green) after upgrade.

2. Verify that the services are upgraded to match the host version. The service version in  (Admin) > **Services** view must match the host version in  (Admin) > **Hosts** view after upgrade.

3. In the  (Admin) > **Services** view, do the following.

   - Select a Log Collector service and go to  (actions) > **View** > **System** view to verify if the required logs collection is started. You should click the  drop-down option and go to the right collection protocol to check if the logs collection is started. If the required collection is not started, select  next to the required collection protocol from the list to start the collection.

   - Select a Log Decoder service and go to  (actions) > **View** > **System** view to verify if the Log Decoder is capturing the logs properly.

   - Select a Packet Decoder service and go to  (actions) > **View** > **Config** view to check if the capture interface is configured under **Decoder Configuration** section. If the capture interface is not configured, you must select the required capture interface from the drop-down list to configure it. If the capture interface is already configured, go to the  (actions) > **View** > **System** view of the Packet Decoder and check if the capture is started. If the capture is not started, click  to start the packet capture.

4. Go to  (Admin) > **Services** > Select a Log Decoder or Packet Decoder service >  (actions) > **View** > **Stats** > **General** view to analyze the current capture rate.

5. Verify that the Concentrators, Archivers, and Brokers are aggregating the data. Make sure that you can investigate from each Concentrator, Archiver, and Broker to validate that it is operational.

6. Go to **Respond** > **Alerts** view to verify if the alerts are triggering from different sources.

7. Go to  (Admin) > **Health & Wellness** > **Alarms** view and verify if the SMS server is up and running.

8. Go to  (Admin) > **Event Sources** > **Monitoring Policies** view and verify if the policies configured before upgrade are appearing.

9. Go to  (Admin) > **Health & Wellness** > **New Health & Wellness** > **Pivot to Dashboard** > **Elastic** > **Dashboard** view and ensure the following.

   - The visualizations you created before upgrade still exist.

- The metric server is up and running.
- Alerts are generated properly for the monitors you have configured before upgrade.

Install the 12.4.1.0 Relay Server

IMPORTANT: Post upgrading EPLH from 12.2.x.x and 12.3.x.x versions to 12.4.1.0, you must re-install the relay server on EL 8 (Alma Linux) box since relay server is a standalone server.

Before you begin

- Make sure you have the EL 8 box.
- Perform the following tasks before installing the 12.4.1.0 Relay server:
  1. Upgrade NetWitness Platform XDR.
  2. Once the EPLH is upgraded, download the relay packager.
  3. Copy the packager to EL 8 box.
  4. Turn off the existing Relay server.
  5. Configure the IP address of EL 8 by re-using the IP address of the existing Relay server.

     Once you configure the IP address of EL 8, install the Relay server. For more information, see **(Optional) Installing and Configuring Relay Server** section in the Endpoint Configuration Guide. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Note: You must keep the security patches up to date on the Relay Server.

Upgrade Endpoint Agents

See **Upgrade Agents** in the Endpoint Agent Installation Guide for NetWitness Platform for instructions on how to upgrade the agents.

Troubleshoot Upgrade Issues

This section describes the error messages displayed in the Hosts view when it encounters problems updating host versions and installing services on hosts in the Hosts view. If you cannot resolve an upgrade or installation issue using the following troubleshooting solutions, contact Customer Support.

Troubleshooting instructions for the following errors that may occur during the upgrade are described in this section.

- AlmaLinux OS Troubleshooting Information
- deploy_admin Password Expired Error
- Downloading Error
- Error Deploying Version <version-number> Missing Update Packages
- Upgrade Failed Error
- External Repo Update Error
- Host Update Failed Error
- Missing Update Packages Error
- Patch Update to Non-NW Server Error
- Reboot Host After Update from Command Line Error
- Reporting Engine Restarts After Upgrade

Troubleshooting instructions are also provided for errors for the following hosts and services that may occur during or after an upgrade.

- Log Collector Service
- NW Server
- Orchestration
- Reporting Engine
- Event Stream Analysis
- Legacy Windows Log Collector

Problem	Unable to boot the appliance after upgrading
Wokaround	1. Manually modify the GRUB boot line to `FIPS=0` to get it to boot. 2. From here, disable FIPS using the following command: `manage-stig-controls --disable-control-groups 3 --host-all` 3. Verify the line `FIPS=1` is removed from `/boot/grub2/grub.cfg` • If not, run the following command:

```
grub2-mkconfig -o /boot/grub2/grub.cfg
```

4. Reboot.
5. Run the following command to enable FIPS:

   ```
   manage-stig-controls --enable-control-groups 3 --host-all
   ```

6. Reboot again.

AlmaLinux OS Troubleshooting Information

For better understanding, AlmaLinux OS Upgrade can be divided into 4 parts:

1. Running the precheck utility to ensure the health of the system and detect any upgrade issues. This can be done any time before the upgrade using the standalone precheck-tool rpm. (required only on NW Server)

   Logs are recorded here - `/var/log/netwitness/precheck-tool/checklist.log`

2. Initialization or init phase (happens only on NW Server)

   For any issues during init phase, check these logs.

   - salt minion logs - `/var/log/salt/minion`
   - deployment-upgrade logs - `/var/log/netwitness/deployment-upgrade/chef-solo.log`

   Note: Please perform the init only when you plan to do the actual upgrade. It is not recommended to perform an init without upgrading the system in the same change window.

3. OS Upgrade from CentOS to AlmaLinux

   As the first step of OS Upgrade, salt gets upgraded. You can execute the below command to see that salt is upgraded to version 3006:

   ```
   cat /var/log/yum.log | grep salt
   ```

   You can view similar to the below update where xxx represents the current datetime stamp:

   ```
   xxx Updated: salt-master-3006.2-0.x86_64
   xxx Updated: salt-api-3006.2-0.x86_64
   xxx Updated: salt-minion-3006.2-0.x86_64
   ```

   For any issues, with salt-upgrade, please check:

   - /var/log/netwitness/node-infra-server/node-infra-server.log
   - /var/log/salt/master
   - /var/log/salt/minion

   Once salt has been upgraded, the leapp process will begin.

   The logs can be viewed in `/var/log/salt/minion`:

   ```
   xxx [salt.loaded.ext.module.nw_platform:445 ][INFO ][139407] [1/5]
   Searching for leapp config for version: 12.4.1.0
   ```

```
xxx [salt.loaded.ext.module.nw_platform:453 ][INFO ][139407] [2/5]
Retrieving leapp config for version: 12.4.1.0

xxx [salt.fileclient :1333][INFO ][139407] Fetching file from saltenv
'base', ** done ** 'config/12.4.1.0-pre-upgrade.repo'

xxx [salt.loaded.ext.module.nw_platform:467 ][INFO ][139407] [3/5] Running
pre-requisites required to perform leapp upgrade

xxx [salt.fileclient :1333][INFO ][139407] Fetching file from saltenv
'base', ** done ** 'leapp/netwitnessmigrate/actor.py'

xxx [salt.fileclient :1333][INFO ][139407] Fetching file from saltenv
'base', ** done ** 'leapp/netwitnessmigrate/libraries/netwitnessmigrate.py'

xxx [salt.fileclient :1333][INFO ][139407] Fetching file from saltenv
'base', ** done ** 'leapp/netwitnessmigrate.py'

xxx [salt.fileclient :1333][INFO ][139407] Fetching file from saltenv
'base', ** done ** 'leapp/addupgradebootentry.py'

xxx [salt.loaded.ext.module.nw_platform:500 ][INFO ][139407] [4/5] Running
leapp pre-upgrade

xxx [salt.loaded.ext.module.nw_platform:503 ][INFO ][139407] [5/5] Running
leapp upgrade
```

For any issues encountered during OS Upgrade, the logs below will be helpful in troubleshooting.

- `/var/log/salt/minion`
- If Preupgrade fails - `/var/log/leapp/leapp-preupgrade.log`
- If Leapp upgrade fails - `/var/log/leapp/leapp-upgrade.log`

If leapp fails, then `/var/log/leapp/leapp-report.txt` will provide you with details about inhibitors.

A few minutes after this log “Running leapp upgrade” in /var/log/salt/minion, the system will reboot and may take 20 to 30 minutes to return.

Once it is up, you can confirm the OS using the command cat `/etc/almalinux-release`. If it does not show Alma Linux release, please call Customer Support before taking any action.

Also, if you have triggered the upgrade through UI and see the status "`Performing OS Migration`" on any NodeX for more than an hour, please check the leapp logs and reach out to Customer Support.

4. NW Software upgrade to 12.4.1.0

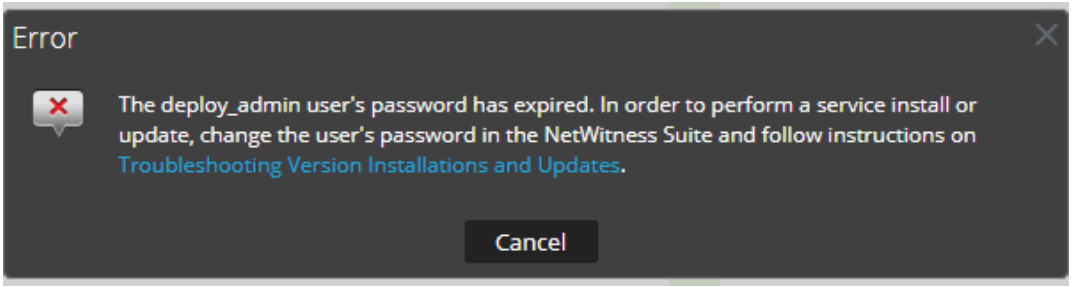
   Once the OS Migration has completed, The NW software upgrade begins and takes up to 30 min before the UI is functional.

   You can see these logs in `/var/log/salt/minion` when NW software upgrade starts:

```
xxx [salt.loaded.ext.module.nw_platform:276 ][INFO ][14035] Preparing node
for upgrade to 12.4.1.0

xxx [salt.loaded.ext.module.nw_platform:280 ][INFO ][14035] [1/2] Searching
for yum config for version: 12.4.1.0

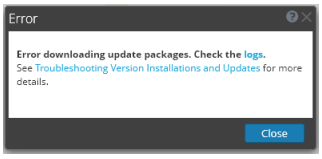
xxx [salt.loaded.ext.module.nw_platform:287 ][INFO ][14035] [2/2]
Retrieving yum config for version: 12.4.1.0
```



```
xxx [salt.fileclient :1333][INFO ][14035] Fetching file from saltenv
'base', ** done ** 'config/12.4.1.0-pre-upgrade.repo'

xxx [salt.loaded.ext.module.nw_platform:300][INFO ][14035] Upgrading chef
package

xxx [salt.loaded.ext.module.nw_platform:300][INFO ][14035] Upgrading rsa-
nw-config-management package
```

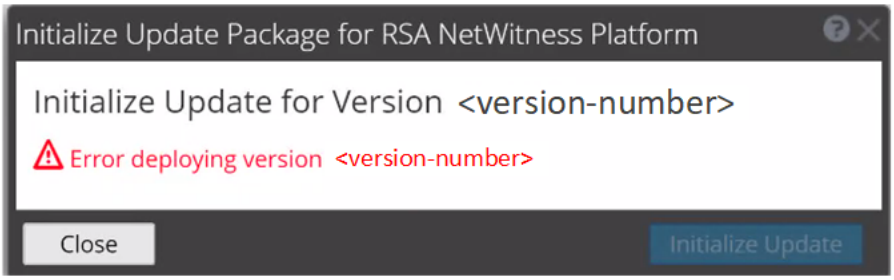


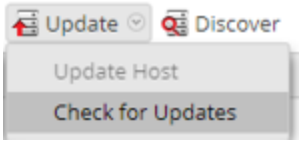
You can also refer to config management logs at `/var/log/netwitness/config-management/chef-solo.log` or UI logs `/var/netwitness/uax/logs/sa.log`

deploy_admin User Password Has Expired Error

Error Message	
Cause	The `deploy_admin` user password has expired.

Solution	Reset your `deploy_admin` password password. Do the following.
	1. On the NW Server host only, run the following command.
	`nw-manage --update-deploy-admin-pw`
	`Please enter the new deploy_admin account password: <new-deploy-admin-password>`
	`Please confirm the new deploy_admin account password: <new-deploy-admin-password>`
	2. Review the output of the `nw-manage --update-deploy-admin-pw` command to verify the `deploy_admin` password was successfully updated on all hosts. If an NW host is down or fails for any reason as displayed by the output of the `nw-manage --update-deploy-admin-pw` command, run `nw-manage --sync-deploy-admin-pw --host-key <host-identifier>` to synchronize the password between the NW Server and the host that failed once the communication failure is resolved.
	3. On the host that failed installation or orchestration, run the `nwsetup-tui` command and use the new **deploy_admin** password in response to the **Deployment Password** prompt.





Downloading Error

Error Message	
Problem	When you select an update version and click **Update** >**Update Host**, the download starts but fails to complete.
Cause	Version download files can be large and take a long time to download. If there are communication issues during the download it will fail.
Solution	1. Try to update again. 2. If it fails again with the same error, try to update using the offline methods as described in "Offline Method from Hosts View" or "Offline Method Using Command Line Interface" in the *Upgrade Guide for NetWitness Platform*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues. 3. If you are still not able to update, contact Customer Support.

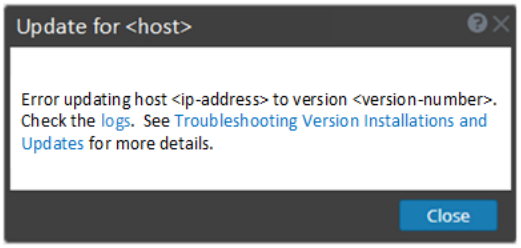
Error Message	If you are upgrading from NetWitness Platform 11.x.x.x to 11.6.x.x or later, offline UI upgrade fails with the Download error message.

Solution	1. In the Command Line Interface (CLI), do the following:
	a. SSH to NW Server.
	b. Run the following command:
	`upgrade-cli-client --upgrade --host-key <ID, IP address, hostname or display name of host> --version <version number>`
	`For example:`
	`upgrade-cli-client --upgrade --host-key <ID, IP address, hostname or display name of host> --version 11.6.0.0`
	2. After the NW Server is successfully updated, log in to the NW Server user interface and go to  **(Admin) > Hosts**, where you are prompted to reboot the host.
	3. Click **Reboot Host** from the toolbar.
	To upgrade all the other hosts directly from the user interface:
	1. Click **Begin Update** from the **Update Available** dialog.
	After the host is upgraded, it prompts you to reboot the host.
	2. Click **Reboot Host** from the toolbar.

Error Deploying Version <version-number> Missing Update Packages

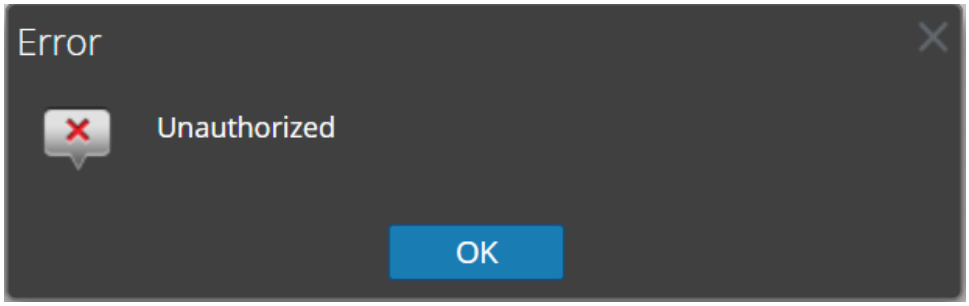
Error Message	
Problem	Error deploying version <version-number> is displayed in the **Initialize Update Package for NetWitness Platform** dialog after you click on **Initialize Update** if the update package is corrupted.
Solution	1. Click **Close** to close the dialog. 2. Remove the version folder from staging folder. 3. Make sure that the salt-master service is running. 4. Recopy the update package zip file to the staging folder. 5. In the **Hosts** view toolbar, select **Check for Updates** again.  6. Click **Initialize Update**. 7. Click **Update** > **Update Hosts** from the toolbar. 8. Click **Begin Update** from the **Update Available** dialog. After the host is updated, it prompts you to reboot the host. 9. Click **Reboot** from the toolbar.

Upgrade Failed Error



Error Message	You will receive an error in the error log similar to the following while trying to update to version 11.6 or later: `FATAL: Chef::Exceptions::Package: yum_package[rsa-protobufs-rt] (rsa-audit::packages line 11) had an error: Chef::Exceptions::Package: No version specified, and no candidate version available for rsa-protobufs-rt`
Cause	Custom builds/rpms installed for certain components installed on hosts, such as in the case of installing Hotfixes.

Solution	**To resolve the issue:**
	1. SSH to Admin Server.
	2. Locate the component descriptor file by running the following command.
	`cd /etc/netwitness/component-descriptor/`
	3. Open the component descriptor file by running the following command.
	`vi nw-component-descriptor. json`
	4. Search for "packages" section for the component you have custom build/rpm. For example, below shown is the package details for "concentrator" host that has custom build/rpm.
	`"concentrator": {`
	`"cookbook_name": "rsa-concentrator",`
	`"service_names": ["rsa-nw-concentrator"],`
	`"family": "launch",`
	`"default_port": xxxx, "description": "Concentrator",`
	`"packages":[{ "name": "rsa-nw-concentrator",`
	`"version" : "11.6.0.0-2003001075220.5.cecf24b.e.17.centos"`
	`},`
	5. Delete the complete version details including (,) character in the packages section. For example, it should look like as shown below after you delete the version details.
	`"packages": [{`
	`"name": "rsa-nw-concentrator"`
	`},`
	Note: You must delete the version details for all the host that has custom builds/rpms in the component descriptor of the admin server.
	6. Run the upgrade process again.



External Repo Update Error

Error Message	You will receive an error similar to the following error while trying to update to a new version from the : `.Repository 'nw-rsa-base': Error parsing config: Error parsing "baseurl = 'https://nw-node-zero/nwrpmrepo /<version-number>/RSA'": URL must be http, ftp, file or https not ""`
Cause	Incorrect path specified.
Solution	Make sure that: • the URL does exist on the NW Server host. • you used the correct path and remove any spaces from it.

Host Update Failed Error

Error Message	
Problem	When you select an update version and click **Update** > **Update Host**, the download process is successful, but the update process fails.

Solution	1. Try to apply the version update to the host again.
	Often this is all you need to do.
	2. If you still cannot apply the new version update:
	Monitor the following logs on NW Server as it progresses (for example, run the `tail -f` command from the command line):
	`/var/netwitness/uax/logs/sa.log`
	`/var/log/netwitness/orchestration-server/orchestration-server.log`
	`/var/log/netwitness/deployment-upgrade/chef-solo.log`
	`/var/log/netwitness/config-management/chef-solo.log`
	`/var/lib/netwitness/config-management/cache/chef-stacktrace.out`
	The error appears in one or more of these logs.
	3. If you still cannot apply the update, gather the logs from **step 2** above and contact Customer Support.

Error Message	
Problem	When you select an update version and click **Update** > **Check for Updates**, the **Unauthorized** error message is displayed. As a result, the connection to the live service fails.
Solution	1. Make sure the Live test connection passes. 2. Update https://update.netwitness.com/RSA-netwitness in **(Admin)** > **System** > **Updates**.

	3. SSH to the Admin Server and backup `/etc/default/jetty`.
	4. Update the following entry at the end of the JAVA_OPTIONS in the `/etc/default/jetty`.
	`JAVA_OPTIONS="${JAVA_OPTIONS} -Drsa.nw.legacy.web.server.system.update.repo.url=https://update.netwitness.com/RSA-netwitness/ -Drsa.nw.legacy.system.update.auth.url=https://update.netwitness.com/authenticate "`
	5. Restart the jetty service. Run the following command.
	`service jetty restart`

Missing Update Packages Error

Error Message	**Initialize Update for Version xx.x.x.x** Missing the following update package(s) Download Packages from NetWitness Link
Problem	Missing the following update package(s) is displayed in the **Initialize Update Package for NetWitness Platform** dialog when you are updating a host from the **Hosts** view offline and there are packages missing in the staging folder.
Solution	1. Click Download Packages from NetWitness Community in the **Initialize Update Package for NetWitness Platform** dialog. The NetWitness Community page that contains the update files for the selected version is displayed. 2. Select the missing packages from the staging folder. The **Initialize Update Package for NetWitness Platform** dialog is displayed telling you that it is ready to initialize the update packages.

Patch Update to Non-NW Server Error

Error Message	The `/var/log/netwitness/orchestration-server/orchestration-server.log` has an error similar to the following error: **`API|Failure /rsa/orchestration/task/update-config-management [counter=10 reason=IllegalArgumentException::Version '12.x.x.n' is not supported`**
Problem	After you update the NW Server host to a version, you must update all non-NW Server hosts to the same version. For example, if you update the NW Server from 12.2.0.0 to 12.4.1.0 or later, the only update path for the non-NW Server hosts is the same version (that is, 12.4.1.0). If you try to update any non-NW Server host to a different version (for example, from 12.2.0.0 to an 12.3.x.x) you will get this error.
Solution	Do any of the following: • Update the non-NW Server host to 12.4.1.0 or later, or

	• Do not update the non-NW Server host (keep it at its current version)

Reboot Host After Update from Command Line Error

Error Message	You will receive a message in the User Interface to reboot the host after you update and reboot the host offline. 
Cause	The above error occurs when you use CLI to reboot the host. You must use the User Interface to reboot the host.
Solution	Reboot the host in the **Host** View in the User Interface.

Reporting Engine Restarts After Upgrade

Problem	In some cases, after you upgrade to 11.6 or later from versions of 11.x, such as 11.4, the Reporting Engine service attempts to restart continuously without success.
Cause	The database files for live charts, alert status, or report status may not be loaded successfully as the files may be corrupted.
Solution	**To resolve the issue:** 1. Check which database files are corrupted: Navigate to the file located at `/var/netwitness/reserver/rsa/soc/reporting-engine/logs/reporting-engine.log` and check the following blocks: • If the live charts db file is corrupted, the following logs are displayed: Attempt Failed!!! Clearing pending acquires. While trying to acquire a needed new resource, we failed to succeed more than the maximum number of allowed acquisition attempts (30). Last acquisition attempt exception: org.h2.jdbc.JdbcSQLException: File corrupted while reading record: null. Possible solution: use the recovery tool [90030-196] at org.h2.message.DbException.getJdbcSQLException(DbException.java:345) at org.h2.message.DbException.get(DbException.java:168) org.springframework.beans.factory.BeanCreationException: Error creating bean with name 'chartSummaryDAOImpl': Invocation of init method failed; nested exception is com.rsa.soc.re.exception.ReportingException: java.sql.SQLException: Connections could not be acquired from the underlying database! • If the alert status db file is corrupted, the following logs are displayed:

Attempt Failed!!! Clearing pending acquires. While trying to acquire a needed new resource, we failed to succeed more than the maximum number of allowed acquisition attempts (30). Last acquisition attempt exception:

org.h2.jdbc.JdbcSQLException: File corrupted while reading record: null. Possible solution: use the recovery tool [90030-196]

at org.h2.message.DbException.getJdbcSQLException(DbException.java:345)

at org.h2.message.DbException.get(DbException.java:168)

org.springframework.beans.factory.UnsatisfiedDependencyException: Error creating bean with name 'alertStatusHandler': Unsatisfied dependency expressed through field 'alertExecutionStatsDAO'; nested exception is org.springframework.beans.factory.UnsatisfiedDependencyException: Error creating bean with name 'alertExecutionStatsDAOImpl': Unsatisfied dependency expressed through field 'persistedAlertExecutionStatsDAO'; nested exception is org.springframework.beans.factory.BeanCreationException: Error creating bean with name 'persistedAlertExecutionStatsDAOImpl'

- If the report status db file is corrupted, the following logs are displayed:

```
org.h2.jdbc.JdbcSQLException: File corrupted while reading
record: null. Possible solution: use the recovery tool
[90030-196]
```

2. To resolve the live charts database file corruption, do the following:
   a. Stop the Reporting Engine service.
   b. Move the `livechart.mv.db` file from `/var/netwitness/reserver/rsa/soc/reporting-engine/livecharts` folder to a temporary location.
   c. Restart the Reporting Engine service.

   Note: Some live charts data may be lost on performing the above steps.

3. To resolve the alert status or report status database file corruption, perform the following steps:
   a. Stop the Reporting Engine service.
   b. Replace the corrupted db file with the latest `alertstatusmanager.mv.db` or `reportstatusmanager.mv.db` file from `/var/netwitness/reserver/rsa/soc/reporting-engine/archives` folder.
   c. Restart the Reporting Engine service.

For more information, see the Knowledge Base article Reporting Engine restarts After upgrade to NetWitness Platform 11.4.

Problem	After you upgrade to version 11.6 or later, the Reporting Engine service does not restart.
Cause	The Reporting Engine service may not start due to any of the following reasons. - workspace.xml not updated. - Time is not converted properly in livechart h2 database. - JCR (Jackrabbit repository) is corrupted with primary key violation.
Solution	To resolve the issue, run the Reporting Engine Migration Recovery tool (`rsa-nw-re-migration-recovery.sh`) on the Admin Server where the Reporting Engine service

	is installed.
	
	Note: You can find the Reporting Engine Migration Recovery tool in the below location.
	`/opt/rsa/soc/reporting-engine-<version number>-<Tag>/nwtools`
	For example:
	`/opt/rsa/soc/reporting-engine-11.6.0.0-<Tag>/nwtools`
	
	1. SSH to Admin Server.
	
	2. Untar the RE (Reporting Engine) tool, run the following command.
	`tar -xvf rsa-nw-re-recovery-tool-bundle.tar`
	
	3. (Optional) If you want to untar the RE tool file in some other directory, you can create a directory and untar the RE tool. Run the following commands.
	`mkdir <NAME OF THE DIRECTORY>`
	`tar -xvf rsa-nw-re-recovery-tool-bundle.tar --directory <PATH OF THE DIRECTORY>`
	
	4. Run the script, run the following command.
	`./<PATH OF THE DIRECTORY>/rsa-nw-re-recovery-tool.sh`
	
	For more information, see the Knowledge Base article **Reporting Engine Migration Recovery Tool**.

Log Collector Service (`nwlogcollector`)

Log Collector installation logs posted to `/var/log/install/nwlogcollector_install.log` on the host running the `nwlogcollector` service.

Error Message	`<timestamp>.NwLogCollector_PostInstall: Lockbox Status : Failed to open lockbox: The lockbox stable value threshold was not met because the system fingerprint has changed. To reset the system fingerprint, open the lockbox using the passphrase.`
Cause	The Log Collector Lockbox failed to open after the update.
Solution	Log in to NetWitness and reset the system fingerprint by resetting the stable system value password for the Lockbox as described in the **Reset the Stable System Value** topic under **Configure Lockbox Security Settings** topic in the *Log Collection Configuration Guide*.

Error Message	`<timestamp> NwLogCollector_PostInstall: Lockbox Status : Not Found`
Cause	The Log Collector Lockbox is not configured after the update.
Solution	If you use a Log Collector Lockbox, log in to NetWitness and configure the Lockbox as described in the **Configure Lockbox Security Settings** topic in the *Log Collection Configuration Guide*.

Error Message	`<timestamp>: NwLogCollector_PostInstall: Lockbox Status : Lockbox maintenance required: The lockbox stable value threshold requires resetting. To reset the system fingerprint, select Reset Stable System Value on the settings page of the Log Collector.`
Cause	You need to reset the stable value threshold field for the Log Collector Lockbox.
Solution	Log in to NetWitness and reset the stable system value password for the Lockbox as described in the **Reset the Stable System Value** topic under **Configure Lockbox Security Settings** topic in the *Log Collection Configuration Guide*.

Error Message	Decoder tries to start capture events but fails. `Aug 27 01:44:41 nwdecoder NwDecoder[8052]: [Decoder] [failure] The PF_RING driver is not installed.`
Cause	The decoder capture config will not be valid for customers using PF_RING capture (CentOS) and directly upgrading to 12.4.1.0 (AlmaLinux). First, they must migrate PF_RING devices to DPDK and then upgrade.
Solution	**To resolve the issue:** Refer to Migrate PF_RING Devices to DPDK for migration instructions.

NW Server

These logs are posted to `/var/netwitness/uax/logs/sa.log` on the NW Server Host.

Problem	After upgrade, you will notice one of the following: • Audit logs are not getting forwarded to the configured Global Audit Setup. • The following message seen in the `sa.log`. `Syslog Configuration migration failed. Restart jetty service to fix this issue`
Cause	NW Server Global Audit setup migration failed to migrate from 12.2.x.x or 12.3.x.x. to 12.4.1.0 or later.
Solution	1. SSH to the NW Server. 2. Submit the following command. `orchestration-cli-client --update-admin-node`

Orchestration

The orchestration server logs are posted to `/var/log/netwitness/orchestration-server/orchestration-server.log` on the NW Server Host.

Problem	1. Tried to upgrade a non-NW Server host and it failed. 2. Retried the upgrade for this host and it failed again. You will see the following message in the `orchestration-server.log`. `"'file' _virtual_ returned False: cannot import name HASHES""`
Cause	Salt minion may have been upgraded and never restarted on failed non-NW Server host

Solution	1. SSH to the non-NW Server host that failed to upgrade.
	2. Submit the following commands.
	`systemctl unmask salt-minion`
	`systemctl restart salt-minion`
	3. Retry the upgrade of the non-NW Server host.

Problem	When you install and orchestrate a fresh 12.4.1.0 core Node-X to the Admin server (Node-0) upgraded from 12.0 or older versions to 12.4.1.0, the core services such as Concentrator, Log Decoder, Log Collector, Archiver, Decoder, Appliance, Workbench, Warehouse Connector, and Broker appear inactive under the **Services** column in the **Admin** > **Hosts** view. As a result, you cannot access the core services in the UI. This is not applicable if you are orchestrating a fresh 12.4.1.0 core Node-X to the fresh-Installed 12.4.1.0 Admin Server (not upgraded from 12.0 or older versions to 12.4.1.0).
Cause	The 12.4.1.0 core Node-X uses a dedicated SA-server certificate instead of the common Node-0 node certificate under its trustpeers if it is orchestrated directly to an upgraded 12.4.1.0 Admin Server host.

Solution	1. Before you bootstrap and orchestrate the 12.4.1.0 core Node-X host, run the following commands.
	`mkdir -p /etc/netwitness/platform`
	`touch /etc/netwitness/platform/nw-upgrade-mode`
	2. Perform this workaround only if you skip the above workaround (Workaround 1). Run the following commands after you bootstrap and orchestrate the 12.4.1.0 core Node-X host.
	`touch /etc/netwitness/platform/nw-upgrade-mode`
	`nw-manage --refresh-host --host-key <core-node-x-salt-minion-uuid>`
	`systemctl restart <core-service-name>`
	Note:
	- Refer the file `/etc/salt/minion` to find `<core-node-x-salt-minion-uuid>`.

	- You must enter the core service name such as **nwarchiver** (Archiver), **nwdecoder** (Decoder), **nwlogcollector** (Log Collector), **nwappliance** (Appliance), **nwconcentrator** (Concentrator), **nwlogdecoder** (Log Decoder), **nwbroker** (Broker), **nwworkbench** (Workbench), and **nwwarehouseconnector** (Warehouse Connector) in `<core-service-name>`.

Reporting Engine Service

Reporting Engine Update logs are posted to to`/var/log/re_install.log` file on the host running the Reporting Engine service.

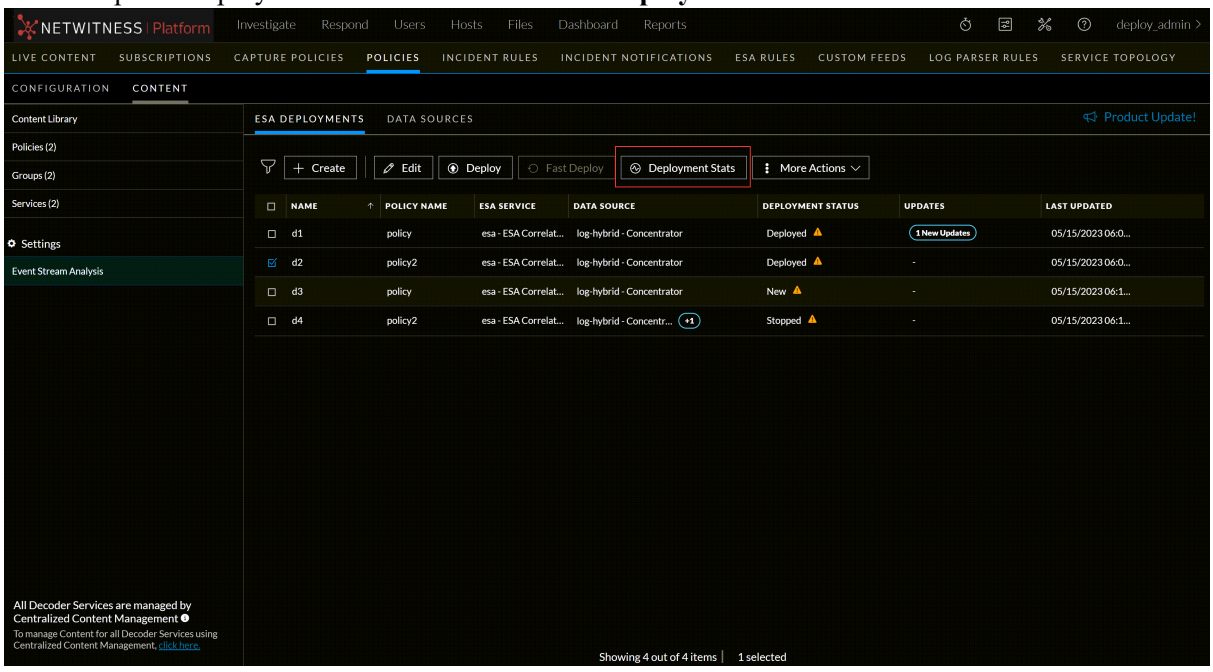
Error Message	`<timestamp> : Available free space in /var/netwitness/re-server/rsa/soc/reporting-engine [ ><existing-GB ] is less than the required space [ <required-GB> ]`
Cause	Update of the Reporting Engine failed because you do not have enough disk space.
Solution	Free up the disk space to accommodate the required space shown in the log message. See the **Add Additional Space for Large Reports** topic in the *Reporting Engine Configuration Guide* for instructions on how to free up disk space.

Event Stream Analysis

Problem	After upgrading to version 12.4.1.0 or later, the ESA correlation server does not aggregate events from the configured data sources.
Error Message	`Invalid username or password at com.rsa.netwitness.streams.base.RecordSourceSubscription.run (RecordSourceSubscription.java:173)`
Solution	**To resolve the issue:** In the NetWitness user interface, 1. Go to (**CONFIGURE**) > **Policies** > **Content** > **Event Stream Analysis** > **Data Sources**. The **Data Sources** panel is displayed. 2. Select the data source and click **Edit Datasource** in the toolbar. The **Edit Datasource** dialog is displayed. 3. In the **Edit Datasource** dialog, do one of the following: • Select **Trusted Authentication**. • Select **Use Credentials** and enter the Username and Password. 4. Click **Test Connection** to make sure that it can communicate with the ESA service and then click **OK**. **Note:** Do the above procedure for all the configured data sources.

	5. Deploy all the deployments associated with the edited data sources in the **Data Sources** panel after you finish making changes to the data sources.

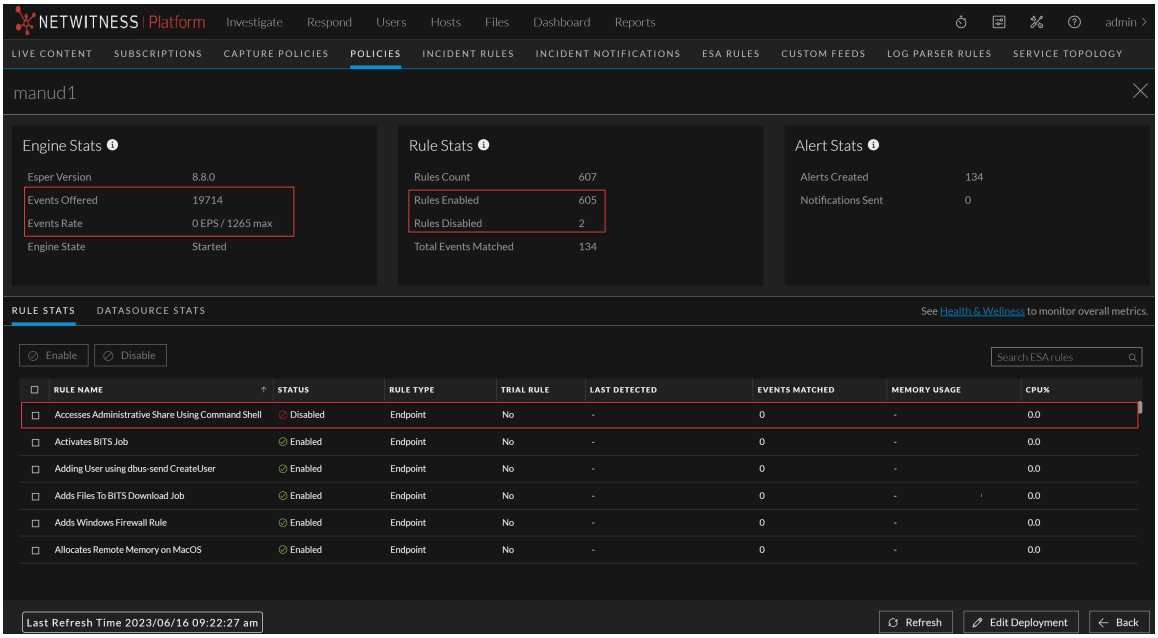
Legacy Windows Log Collector



Problem	Legacy Windows Log Collector appears as inactive when the stack is upgraded to 12.4.1.0.
Cause	Certificate update in the SA node.
Solution	Refer Legacy Windows Log Collector section in the Perform Post Upgrade Tasks.

ESA Troubleshooting Information

ESA Rules are Not Creating Alerts



If you are not seeing any alerts, check the status of the ESA rule deployments.

1. Go to (**CONFIGURE**) > **Policies** > **Content** > **Event Stream Analysis** > **ESA Deployments**. The **ESA Deployment** panel is displayed.
2. Select required deployment from the list and click **Deployment Stats** tab.

3. Deployment Stats page is displayed, which shows the status of your ESA services and deployments.

4. For each ESA rule deployment:
   a. In the **Engine Stats** section, look at the **Events Offered** and the **Offered Rate**. They confirm that the data is being aggregated and analyzed properly. If you see 0 for Events Offered, nothing is coming in for the deployment.
   b. In the **Rule Stats** section, look at the **Rules Enabled** and **Rules Disabled**. If there are any disabled rules, look in the **Deployed Rule Stats** section below to view the details of the disabled rules. Disabled rules show a white circle. Enabled rules show a green circle.

5. If you notice any disabled rules that should be enabled:
   a. Go to  **(Configure) > ESA Rules > Rules** tab and redeploy the ESA rule deployments that contain disabled rules.
   b. Go back to the **Services** tab and check to see if the rules are still disabled. If the rules are still disabled, check the ESA Correlation service log files, which are located at `/var/log/netwitness/correlation-server/correlation-server.log`.

Note: To avoid unnecessary processing overhead, the Ignore Case option has been removed from the ESA Rule Builder - Build a Statement dialog for meta keys that do not contain text data values. During the upgrade to 11.4 or later, NetWitness Platform does not modify existing rules for the Ignore Case option. If an existing Rule Builder rule has the Ignore Case option selected for a meta key that no longer has the option available, an error occurs if you try to edit the statement and try to save it again without clearing the checkbox.

Example ESA Correlation Server Warning Message for Missing Meta Keys

If you see a warning message in the ESA Correlation server error logs that means there is a difference between the `default-multi-valued` parameter and `multi-valued parameter` meta key values, the new Endpoint, UEBA, and Live content rules will not work. Completing the **Update the Multi-Valued and Single-Valued Parameter Meta Keys for the latest Endpoint, UEBA, and RSA Live Content Rules** procedure in the *ESA Configuration Guide* should fix the issue.

Multi-Valued Warning Message Example

```
2019-08-23 08:55:07,602 [ deployment-0] WARN Stream|[alert, alert_id,
browserprint, cert_thumbprint, checksum, checksum_all, checksum_dst, checksum_
src, client_all, content, context, context_all, context_dst, context_src, dir_
path, dir_path_dst, dir_path_src, directory, directory_all, directory_dst,
directory_src, email_dst, email_src, feed_category, feed_desc, feed_name,
file_cat, file_cat_dst, file_cat_src, filename_dst, filename_src, filter,
function, host_all, host_dst, host_orig, host_src, host_state, ip_orig, ipv6_
orig, OS, param, param_dst, param_src, registry_key, registry_value, risk,
risk_info, risk_suspicious, risk_warning, threat_category, threat_desc,
threat_source, user_agent] are still MISSING from multi-valued
```

Single Value Warning Message Example

```
2019-08-23 08:55:07,602 [ deployment-0] WARN Stream|[accesses, context_target,
file_attributes, logon_type_desc, packets] are still MISSING from single-
valued
```

Use NetWitness Community Portal for Assistance

You can use NetWitness Community Portal to search for specific documents, find information related to End of Life of appliances, and read blogs.

Self-Help Resources

There are several options that provide you with help as you need it for installing and using NetWitness:

- See the documentation for all aspects of NetWitness here: https://community.netwitness.com/t5/netwitness-platform/ct-p/netwitness-documentation
- Use the **Search** and **Create a Post** fields in NetWitness Community portal to find specific information here: https://community.netwitness.com/t5/netwitness-discussions/bd-p/netwitness-discussions
- See the NetWitness Knowledge Base: https://community.netwitness.com/t5/netwitness-knowledge-base/tkb-p/netwitness-knowledge-base
- See Troubleshooting section in the guides.
- See also NetWitness® Platform Blog Posts.
- If you need further assistance, contact NetWitness Support.

Contact NetWitness Support

If you contact NetWitness Support, you should be at your computer. Be prepared to provide the following information:

- The version number of the NetWitness Platform product or application you are using.
- The type of hardware you are using.

Use the following contact information if you have any questions or need assistance.

NetWitness Community Portal	https://community.netwitness.com In the main menu, click **Support > Case Portal > View My Cases**.
International Contacts (How to Contact NetWitness Support)	https://community.netwitness.com/t5/support/ct-p/support
Community	https://community.netwitness.com/t5/netwitness-discussions/bd-p/netwitness-discussions
NW Update	https://update.netwitness.com
LiveUI	https://live.netwitness.com

Feedback on Product Documentation

You can send an email to nwdocsfeedback@netwitness.com to provide feedback on NetWitness Platform documentation.

NetWitness Community at https://community.netwitness.com contains a knowledge base that answers common questions and provides solutions to known problems, product documentation, community discussions, and case management.

Trademarks

RSA and other trademarks are trademarks of RSA Security LLC or its affiliates ("RSA"). For a list of RSA trademarks, go to https://www.rsa.com/en-us/company/rsa-trademarks. Other trademarks are trademarks of their respective owners.

License Agreement

This software and the associated documentation are proprietary and confidential to RSA Security LLC or its affiliates are furnished under license, and may be used and copied only in accordance with the terms of such license and with the inclusion of the copyright notice below. This software and the documentation, and any copies thereof, may not be provided or otherwise made available to any other person.

No title to or ownership of the software or documentation or any intellectual property rights thereto is hereby transferred. Any unauthorized use or reproduction of this software and the documentation may be subject to civil and/or criminal liability. This software is subject to change without notice and should not be construed as a commitment by RSA.

It is advised not to deploy third-party repos or perform any change to the underlying NetWitness Operating System that is not part of the supported NetWitness version. Any such change outside of the NetWitness approved image may result in a service or functionality conflict and require a reimage of the NetWitness system to bring NetWitness back to an optimized functional state. In the event a third-party repo is deployed, or other non-supported change is made by the customer without NetWitness approval, the customer takes full responsibility for any system malfunction until the issue can be remediated through troubleshooting efforts or a reimage of the service.

Third-Party Licenses

This product may include software developed by parties other than RSA. The text of the license agreements applicable to third-party software in this product may be viewed on the product documentation page on NetWitness Community. By using this product, a user of this product agrees to be fully bound by terms of the license agreements.

Note on Encryption Technologies

This product may contain encryption technology. Many countries prohibit or restrict the use, import, or export of encryption technologies, and current use, import, and export regulations should be followed when using, importing or exporting this product.

Distribution

Use, copying, and distribution of any RSA Security LLC or its affiliates ("RSA") software described in this publication requires an applicable software license.

Introduction

The instructions in this guide apply to physical hosts exclusively. See the *Virtual Host Installation Guide for NetWitness Platform 12.1* for instructions on how to set up virtual hosts in 12.1.

Note: Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Supported Hardware

Series 6.

Refer to the *NetWitness* Hardware Setup Guides for detailed information on each series type (https://community.netwitness.com/t5/netwitness-platform-hardware/tkb-p/netwitness-hardware-documentation).

Endpoint Log Hybrid Host Hardware Specifications

Series 6 (Dell R740 hardware. See "(Optional) Task 2 - Install Endpoint Log Hybrid" in Post Installation Tasks for instructions on how to install the Endpoint Log Hybrid.

Note: If you have RSA NetWitness Endpoint 4.x hardware, you can re-purpose it for NetWitness Endpoint Log Hybrid 12.0.

NetWitness UEBA Host Hardware Specifications

S6 (Dell R640) hardware. See "(Optional) Task 3 - Install NetWitness UEBA" in Post Installation Tasks for instructions on how to install NetWitness UEBA.

SERIES 6 (DELL R640) SPECIFICATIONS

Specification	Capacity
Model	Dell PowerEdge R630xl
Processor Type	Intel Xeon E5 -2680v3
Processor Speed	2.5 GHz
Cache	30MB
Number of Cores	12
Number of Processors	2
Number of Threads	24
Total Memory	256GB
Internal Disk Controller	Dell PERC H730
External Disk Controller	Dell PERC H830

Specification	Capacity
SAN Connectivity (HBA) - Optional	N/A
Remote Management Card	iDRAC8 Enterprise
Drives	Total - 6 Drives 2 x 1TB, 2.5" HDD 4 x 2TB, 2.5" HDD
Chassis	1U
Weight	18.4 kg (40.5 lbs)
NIC Card*	On Board 2 x 10 Gb Copper 2 x 10 Gb & 2 x 1Gb Copper (Other options are available)
Dimensions	H: 4.28 cm (1.68 in.) x W: 48.23 cm (18.98 in.) x D: 75.51 cm (29.72 in.)
Power	1100W Redundant
BTU/hr	4100 BTU/hr (max)
Amps (Spec)	1100W / 220VAC = 5A
Actual Amp Draw (Post Startup)	2.1 Amps
Events Per Second (EPS)	100K EPS
Throughput	N/A

Note: Network Interface Controller (NIC) card options are available for swap with on-board daughter cards or add ons.

External Attached Storage

If you have external storage devices (for example, DACs or PowerVaults) attached to physical hosts, refer to the Hardware Setup Guides on NetWitness Community (https://community.netwitness.com/t5/netwitness-platform-hardware/tkb-p/netwitness-hardware-documentation) for information on how to configure this storage.

Physical Host Installation Workflow

The following diagram illustrates the NetWitness 12.1 Physical Host Installation workflow.

Self-Help Resources

There are several options that provide you with help as you need it for installing and using NetWitness:

- See the documentation for all aspects of NetWitness here: https://community.netwitness.com/t5/netwitness-platform/ct-p/netwitness-documentation
- Use the **Search** and **Ask it** fields in NetWitness Community to find specific information here: https://community.netwitness.com/
- See the NetWitness Knowledge Base: https://community.netwitness.com/t5/netwitness-knowledge-base/tkb-p/netwitness-knowledge-base
- See Troubleshooting section in the Guides.
- See also NetWitness® Platform Blog Posts.
- If you need further assistance, contact NetWitness Support.

Contact NetWitness Support

If you contact NetWitness Support, you should be at your computer. Be prepared to provide the following information:

- The version number of the NetWitness Platform product or application you are using.
- The type of hardware you are using.

Use the following contact information if you have any questions or need assistance.

NetWitness Community	https://community.netwitness.com/ In the main menu, click **Support** > **Case Portal** > **View My Cases**.
International Contacts (How to Contact NetWitness Support)	https://community.netwitness.com/t5/support-information/how-to-contact-netwitness-support/ta-p/563897
Community	https://community.netwitness.com/t5/support/ct-p/support

Installation Tasks

This topic contains the tasks you must complete to install NetWitness 12.1 on physical hosts.

Checklist

Complete the installation tasks in the following order.

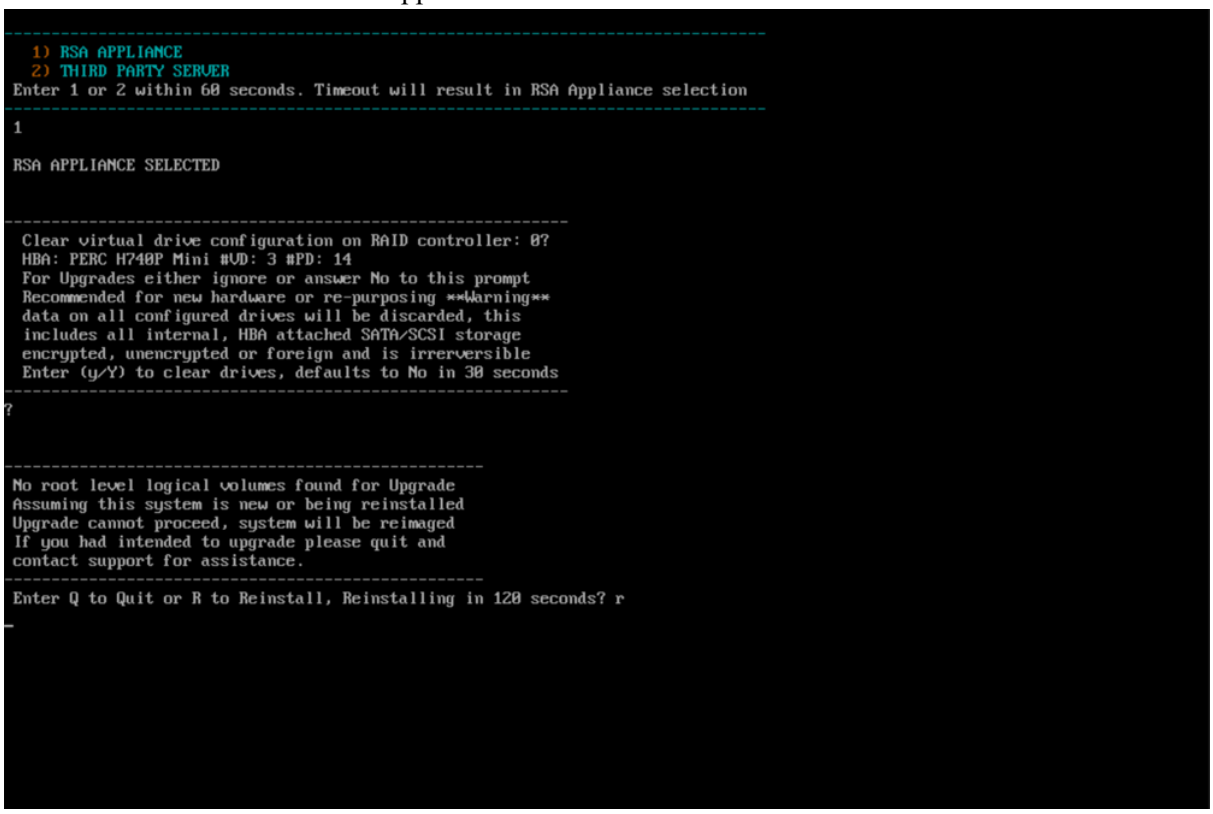
Step	Description	Instructions
1	Install 12.1 on NetWitness hosts.	Install 12.1 on the NetWitness Server (NW Server) Host and Other Component Host
2	Set up ESA hosts.	Set Up ESA Hosts
3	Install component services on your hosts.	Install Component Services on Hosts
4	Complete licensing requirements for services.	Complete Licensing Requirements
5	(Optional) Install warm standby NW Server host.	(Optional) Install Warm Standby NW Server

Caution: Before you begin the installation process, open all your firewall ports. The"Network Architecture and Ports" topic in the *Deployment Guide for NetWitness Platform 12.1* lists all the ports in a deployment. Do not proceed with the installation until the ports on your firewall are configured.

Install 12.1 on the NetWitness Server (NW Server) Host and Other Component Host

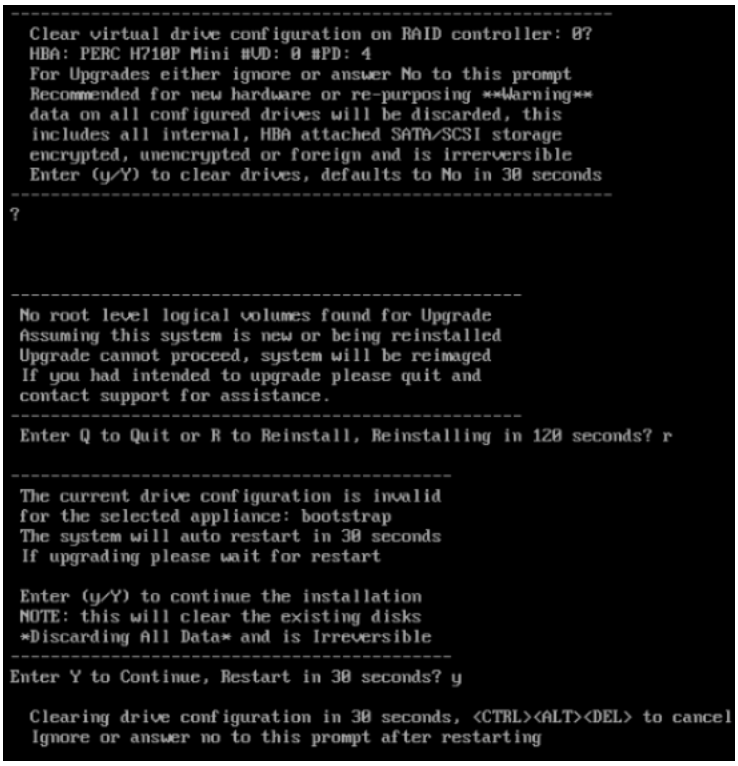
Complete the following steps to install 12.1 on NW Server host and other component hosts. Steps that are specific to the NW Server host or to component hosts are noted.

Create a Base Image on the RSA Appliance



1. Attach media (ISO) to the host.
   See the *USB Build Stick Instructions for NetWitness* for more information. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.
   - Hypervisor installations - see the *Virtual Host Installation Guide for NetWitness Platform 12.1*
   - Physical media - use the ISO image to create bootable flash drive media. You can use Rufus or another suitable imaging tool to create a Linux file system on the USB drive. Rufus is available at https://rufus.ie

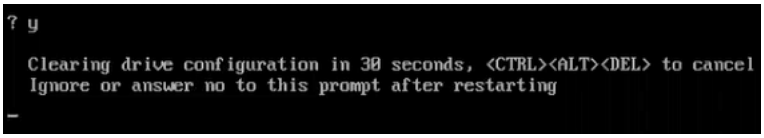
- iDRAC installations - the virtual media type is:
  - **Virtual Floppy** for mapped flash drives
  - **Virtual CD** for mapped optical media devices or ISO file.



2. Log in to the host and reboot it.

```
login: root
Password:
Last login: Tue Sep 19 13:27:15 on tty1
[root@saserver ~]# reboot
```

3. Select **F11** (boot menu) during reboot to select a boot device and boot to the connected media. After system checks, the **Welcome to NetWitness Platform 12.1** installation menu is displayed.
4. Select **Install NetWitness Platform 12.1** (default selection) and press **Enter**. The Appliance Type selection menu is displayed.
5. You must enter **1** to select RSA appliance.



6. The Installation program runs and stops at the Enter (**y**/**Y**) to clear drives prompt that asks you to format the drives.

Caution: You must respond **y** or **Y** to this prompt even if the host does not have an internal RAID configuration or the installation will fail.

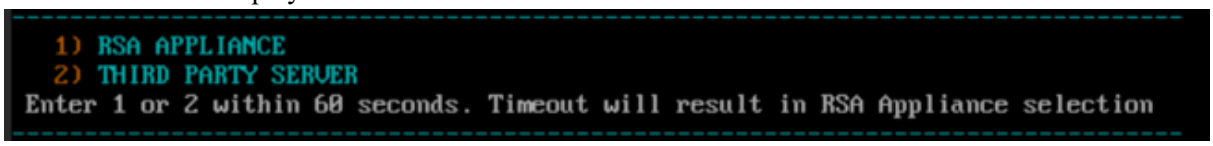
7. Type **y** to continue. The default action is No, so if you ignore the prompt, it will select No in 30 seconds, and will not clear the drives.

The system displays all the installation tasks it is performing. This can take a minute or so. After it completes the tasks, the installation program reboots the host.

Caution: Do not reboot with the attached media attached (media that contains the ISO file, for example a build stick).

Create a Base Image on the Third Party Server Hardware

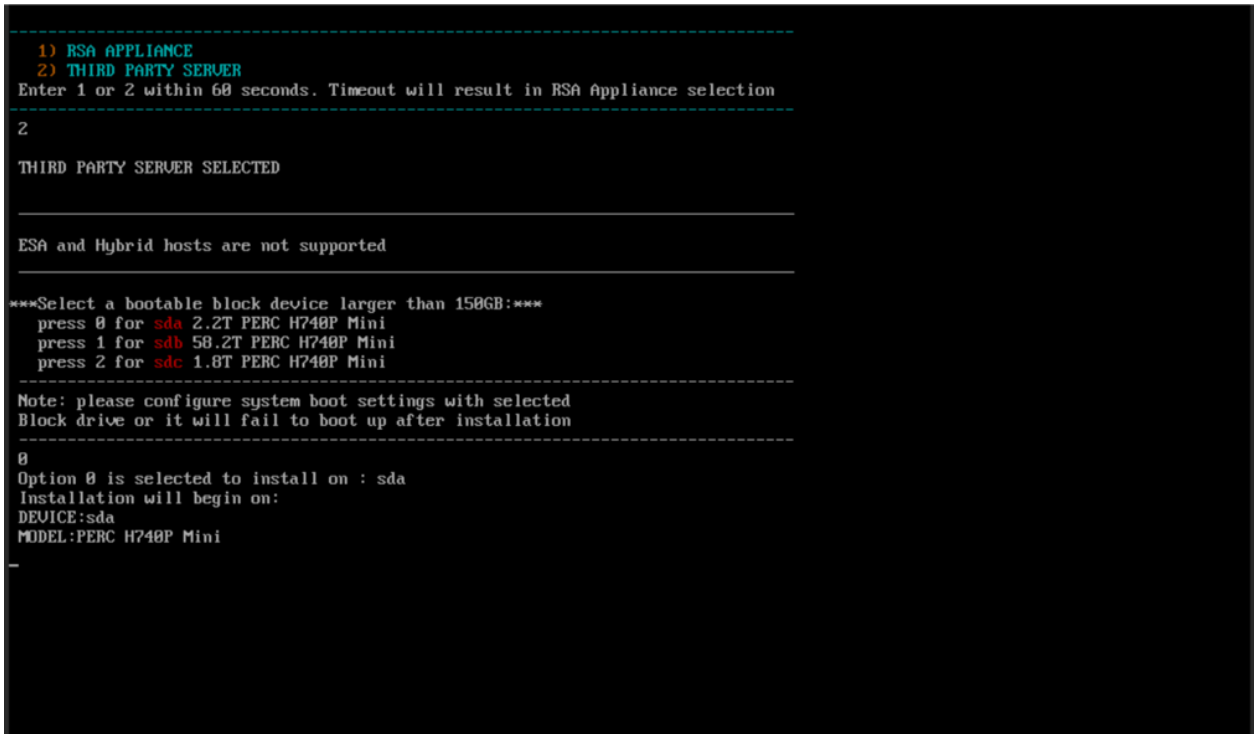
Prerequisites



NetWitness recommends that the Third party Server Hardware meets the criteria defined in Appendix D. Third Party Server System Requirement.

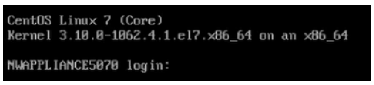
1. Attach media (ISO) to the host.
   See the *USB Build Stick Instructions for NetWitness* for more information. Go to the NetWitness All

Versions Documents page and find NetWitness Platform guides to troubleshoot issues.



- Physical media - use the ISO image to create bootable flash drive media. You can use Rufus or another suitable imaging tool to create a Linux file system on the USB drive. Rufus is available at https://rufus.ie.

2. Log in to the host and reboot it.
3. Select **F11** (boot menu) during reboot to select a boot device and boot to the connected media. After system checks, the **Welcome to NetWitness Platform 12.1** installation menu is displayed.
4. Select **Install Netwitness Platform 12.1** (default selection) and press **Enter**. The Appliance Type selection menu is displayed.



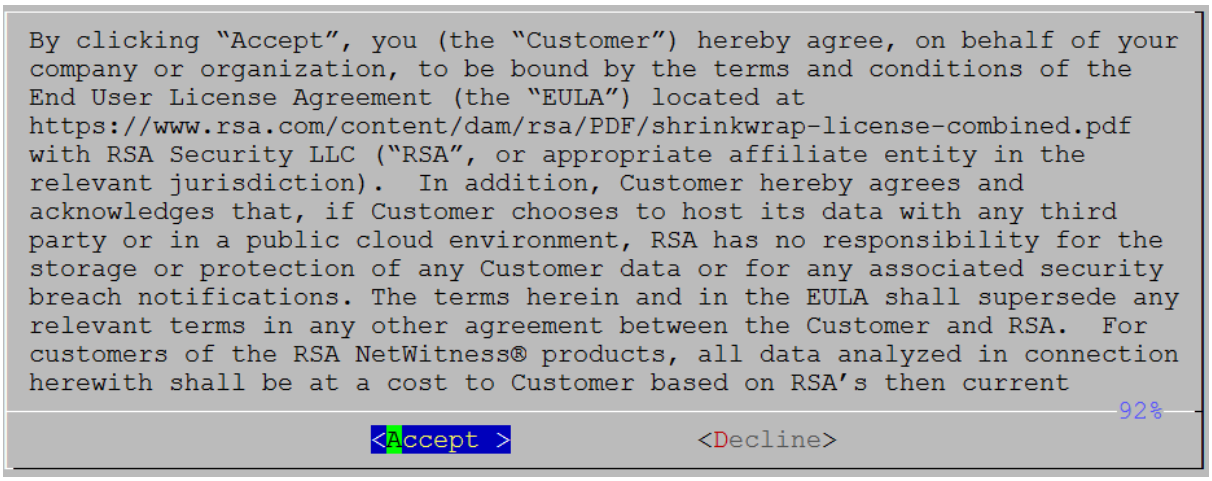
5. Enter **2** to select the Third Party Server.
6. All the available block devices are displayed. Select a block device larger than 150 GB to install the Netwitness Platform.

Note: You must configure the system boot settings with selected block device else the system will not boot after imaging.

7. The system displays all the installation tasks running, and it may take few minutes to complete the installation. Once the installation is complete, the installation program reboots the host.

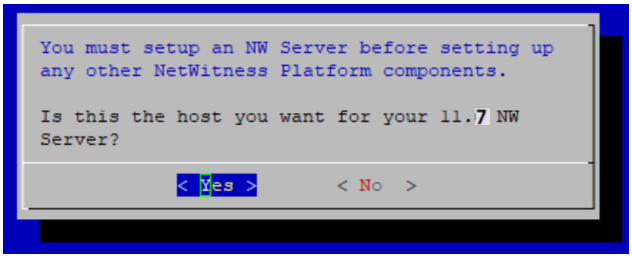
Caution: Do not reboot with the attached media that contains the ISO file, for example, build stick.

Install NetWitness Platform



Caution: If you want to install the Endpoint Relay Server, do not run the `nwsetup-tui` script. Follow the instructions in "(Optional) Installing and Configuring Relay Server" in the *NetWitness Endpoint Configuration Guide*.

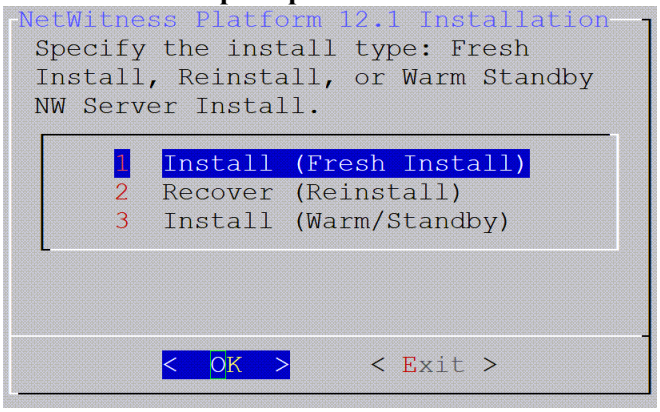
IMPORTANT: In NetWitness Platform version 11.6 or Later, deployment account password must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ .) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`.
If `deploy_admin` password is changed on Primary NW Server, It must be changed on the Warm Standby Server if it exists.



1. Log in to the host with the `root` credentials and run the `nwsetup-tui` command to set up the host.

   This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.

   Note: Use the following options to navigate the Setup prompts.
   1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, and use the Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**). Press **Enter** to register your command response and move to the next prompt.
   2.) The Setup program adopts the color scheme of the desktop or console you use to access the host.
   3.) If you specify DNS servers during the Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` script to proceed. Any misconfigured DNS servers cause the Setup program to fail. If you need to reach a DNS server after setup that is unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see "Change Host Network Configuration" topic in the System Maintenance Guide.
   If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).



2. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 12.1 NW Server** prompt is displayed.

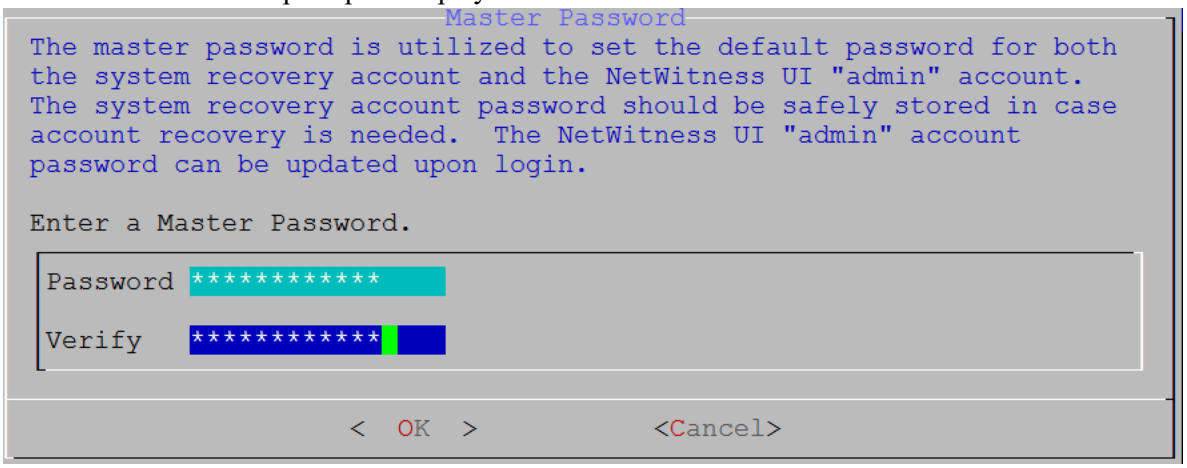
3. Tab to **Yes** and press **Enter** to install 12.1 on the NW Server.
   Tab to **No** and press **Enter** to install 12.1 on other component hosts.

   Caution: If you choose the wrong host for the NW Server and complete the Setup, you must restart the Setup Program (step 2) and complete steps all the subsequent steps to correct this error.

4. The **Install** prompt is displayed (**Recover** does not apply to the installation.).
   NW Server Host prompt:

   Other Component Hosts, the prompt is the same, but does not include option 3 Install (Warm/Standby)

5. Press **Enter**. **Install (Fresh Install)** is selected by default.
   The **System Host Name** prompt is displayed.
   NW Server prompt:



Other Component Hosts prompt says <non-nwserver-host-name>

Caution: If you include "." in a host name, the host name must also include a valid domain name.

Press **Enter** if want to keep this name. If not, edit the host name, tab to **OK**, and press **Enter** to change it.

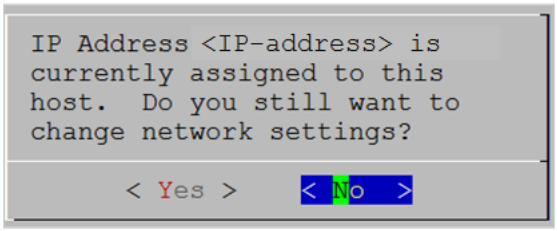
6. **This step applies only to NW Server hosts**.
   The **Master Password** prompt is displayed.

   The following list of characters are supported for Master Password and Deployment Password:

   - Symbols: **! @ # % ^ +**
   - Numbers: **0-9**
   - Lowercase Characters: **a-z**
   - Uppercase Characters: **A-Z**

   No ambiguous characters are supported for Master Password and Deployment Password. For example:
   space { } [ ] ( ) / \ ' " ` ~ ; : . < > -

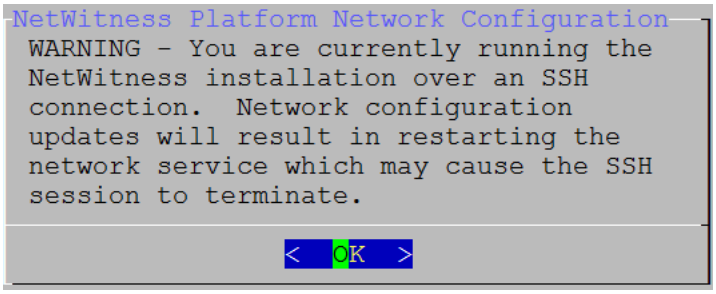
   Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.



7. **This step applies to both NW Server hosts and component hosts.**
   The **Deployment Password** prompt is displayed.

Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

8. One of the following conditional prompts is displayed.



- If the Setup program finds a valid IP address for this host, the following prompt is displayed.

  Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** if you want to change the IP configuration on the host.

- If you are using an SSH connection, the following warning is displayed.

  Note: If you connect directly from the host console, the following warning is not displayed.

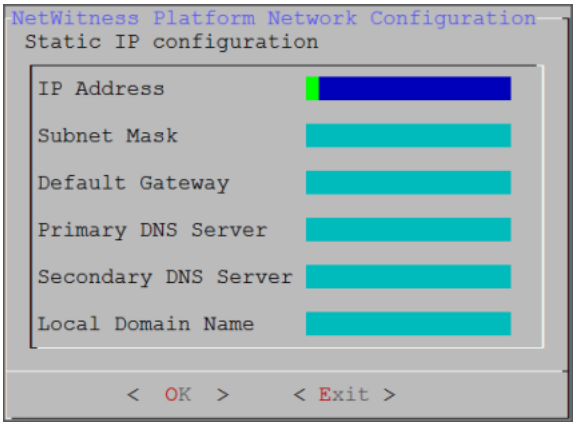
  Press **Enter** to close warning prompt.

- If the Setup Program finds an IP configuration and you choose to use it, the **Update Repository** prompt is displayed. Go to step 12 and complete the installation.

- If the Setup Program did not find an IP configuration or if you choose to change the existing IP configuration, the **Network Configuration** prompt is displayed.

  Caution: Only select "**Use DHCP**" as an IP address configuration for the NW Server if DHCP issues static IP addresses.

Tab to **OK** and press **Enter** to use **Static IP**.



If you want to use DHCP, down arrow to **2 Use DHCP** and press **Enter**.

The **Network Configuration** prompt is displayed.

9. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit.**

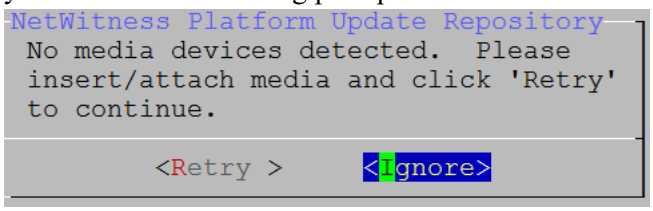
   The following **Static IP Configuration** prompt is displayed.

10. Type the configuration values, tab to **OK**, and press **Enter**. If you do not complete all the required fields, an `All fields are required` error message is displayed (**Secondary DNS Server** and **Local Domain Name** fields are not required). If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

    Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

11. The Use Network Address Translation (NAT) prompt is displayed.

    For the NW Server, tab to **No** and press **Enter**.
    For component hosts, if this host requires the use of NAT-based addresses to communicate with the NW Server, tab to **Yes**. Otherwise, tab to **No** and press **Enter**.

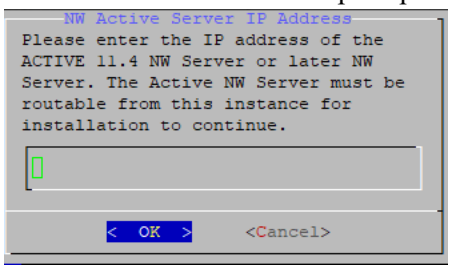


12. The **Update Repository** prompt is displayed.

    For the NW Server:

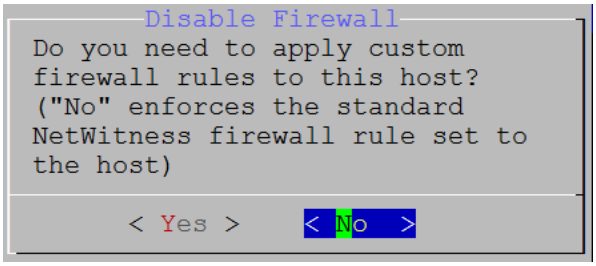
    - Press **Enter** to choose the **Local Repo**.
    - If you want to use an external repo, down arrow to **External Repo**, tab to **OK**, and press **Enter**. If you select **1 The Local Repo (on the NW Server)** in the Setup program, make sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can install NetWitness 12.1. If the program cannot find the attached media,

you receive the following prompt.



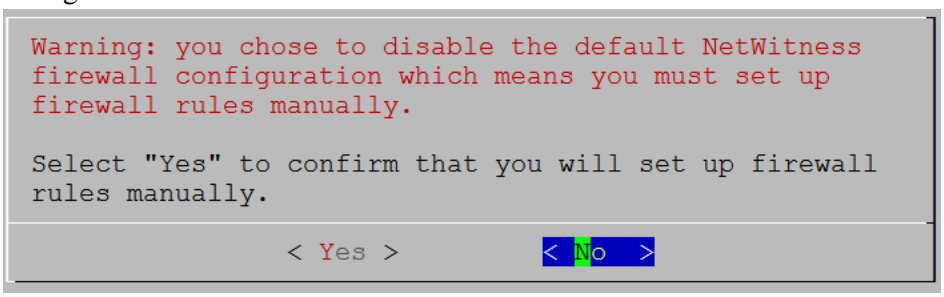
- If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access to NetWitness updates and CentOS updates. Refer to "Appendix B. Create an External Repo" in this guide for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.

Enter the base URL of the NetWitness external repo and click **OK.** The **Start Install** prompt is displayed.



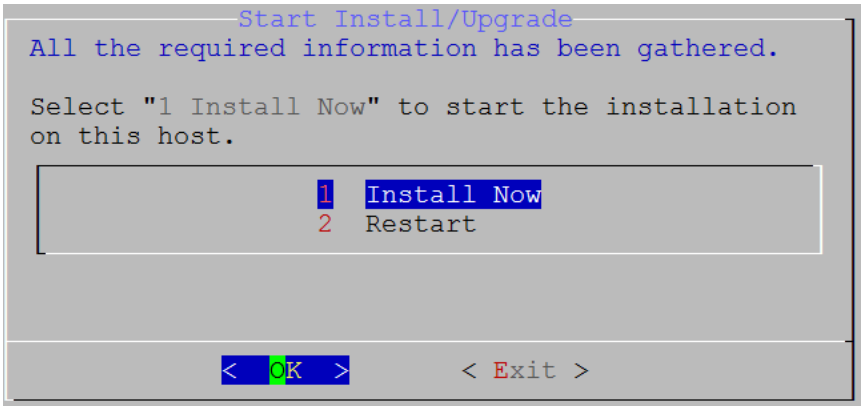
For component hosts:

- Select the same repo that you selected when you installed the NW Server host and follow the steps above.
- The NW Server IP Address prompt is displayed.



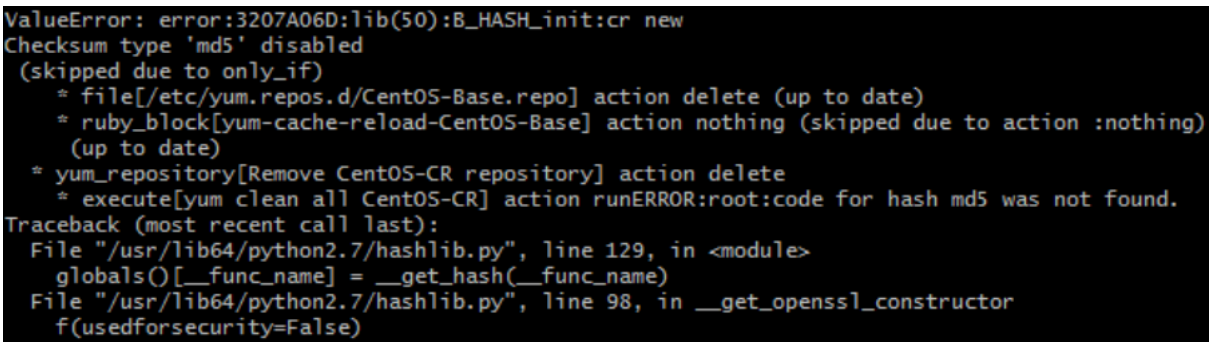
Type the NW Server IP address. Tab to **OK** and press **Enter**.

13. The Disable firewall prompt is displayed.



Tab to **No** (default), and press **Enter** to use the standard firewall configuration.
To disable the standard firewall configuration, tab to **Yes**, and press **Enter**.
If you select **Yes**, confirm your selection(select **Yes** again) or select **No** to use the standard firewall

configuration.



14. The **Start Install** prompt is displayed.

15. Press **Enter** to install 12.1.
When **Installation complete** is displayed, you have installed 12.1 on this host.

Note: Ignore the hash code errors similar to the errors shown in the following figure that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.

16. (Optional) If your system configuration requires that a component host must use a NAT IP address to reach the NW Server host, you must configure the NAT IP address of the NW Server by running the following command:
`nw-manage --update-host --host-id <NW Server Host UUID> --ipv4-public <NAT IP address>`

Set Up ESA Hosts

After you install your NW Server and component hosts, follow these steps to set up your ESA hosts.

- Install your primary ESA host following the instructions in "Install 12.1 on the NetWitness Server (NW Server) Host and Other Component Hosts" in this guide, and install the **ESA Primary** service on it after you finish the Set Up program in the UI in  (Admin) > **Hosts** > :
- (Conditional) If you have a secondary ESA host, install it and install the **ESA Secondary** service on it after you finish the Set Up program in the UI in  (Admin) > **Hosts** > :

Install Component Services on Hosts

After you have installed NW Server and component hosts, and set up your ESA hosts, follow these steps to install component services, such as Decoders and Concentrators, on your host systems.

1. Install a component service on the host.
   a. Log into NetWitness and go to (missing or bad snippet)> **Hosts**.
   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the host in the **New Hosts** dialog and click **Enable**.
   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

   c. Select that host in the **Hosts** view and click .
   The **Install Services** dialog is displayed.

   d. Select the appropriate host type (for example, **Concentrator**) in **Category** and click **Install**.

Complete Licensing Requirements

Complete licensing requirements for installed services. See the *NetWitness Platform 12.1 Licensing Management Guide* for more information. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

(Optional) Install Warm Standby NW Server

Refer to "Warm Standby NW Server Host" under "Deployment Option Setup Procedures" in the *Deployment Guide for NetWitness Platform 12.1* for instructions on how to set up a Warm Standby NW Server.

Update or Install Windows Legacy Collection

Refer to Windows Legacy Collection Guide for NetWitness for NetWitness Legacy Windows Collection Upgrade & Installation Instructions.

Note: After you upgrade or install Windows Legacy Collection, reboot the system to ensure that Log Collection functions correctly.

Post Installation Tasks

This topic contains the tasks you complete after you install 12.1.

- Event Stream Analysis (ESA)
- NetWitness Endpoint
- NetWitness UEBA

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Event Stream Analysis (ESA)

Configure Meta Keys on New ESA Hosts to Match Upgraded ESA Hosts in the Same NetWitness Platform Network

If you have one or more ESA hosts in a NetWitness Platform network, which were upgraded from a version before 11.3.0.2 to 11.7, and you add a new ESA host, you must configure the meta keys on the new ESA host to match the other ESA hosts. All ESA Correlation services on the same NetWitness Platform network must have the same Meta Key configurations.

1. For each ESA Correlation service on an upgraded ESA host and for the ESA Correlation service on the newly installed ESA host:
   a. Open a new tab, go to  (Admin) > **Services**, and in the Services view, select the ESA Correlation service and then select  > **View** > **Explore**.
   b. In the Explore view node list for the ESA Correlation service, select **correlation** > **stream**.
2. Ensure that the **`multi-valued`** and **`single-valued`** meta key values are the same on each of the upgraded ESA Correlation services.
3. Ensure that the **`multi-valued`** and **`single-valued`** meta key values on the newly installed ESA host are the same as those on the upgraded services.
4. To apply any changes on the ESA Correlation services, go to  **(Configure)** > **ESA Rules** and click the **Settings** tab. In the Meta Key References, click the **Meta Re-Sync (Refresh)** icon ().
5. If you updated the ESA Correlation services, redeploy the ESA rule deployments.

For more information, see "Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys" in the *ESA Configuration Guide*.

NetWitness Endpoint

The tasks in this section only apply to customers that use the NetWitness Endpoint component of NetWitness Platform.

Install Endpoint Log Hybrid

Depending on the number of agents and the location of the agents, you can choose to deploy a single Endpoint Log Hybrid host or multiple Endpoint Log Hybrid hosts. To deploy a host, you provision it and install a category on it.

- **Single Endpoint Log Hybrid host** - Deploy NetWitness Server host, Endpoint Log Hybrid host, and ESA host or hosts.
- **Multiple Endpoint Log Hybrid hosts** - Deploy NetWitness Server host, ESA host or hosts, Endpoint Log Hybrid hosts. You can deploy up to 6 Endpoint Log Hybrid hosts. For a consolidated view of all endpoint data from multiple Endpoint Log Hybrid hosts, install the Endpoint Broker. You can add only one broker in a NetWitness platform deployment which serves upto 6 Endpoint Log Hybrid hosts.

  Note: NetWitness recommends that you co-locate the Endpoint Broker on the NetWitness Broker host. However, you can deploy the Endpoint Broker on a separate host or co-locate it on the Endpoint Log Hybrid.

  Note: You must plan to scale your ESA deployment to support multiple Endpoint Log Hybrid hosts.

Follow these steps to deploy an Endpoint Log Hybrid host.

Complete the following steps first:

- For a physical host, complete steps 1 - 16 in "Install NetWitness Platform" under Installation Tasks in the *Physical Host Installation Guide for NetWitness Platform*
- For a virtual host, complete steps 1 - 16 in "Step 4. Install NetWitness Platform" under Install NetWitness Platform Virtual Host in Virtual Environment in the *Virtual Host Installation Guide for NetWitness Platform 12.1*

Configuring Multiple Endpoint Log Hybrids

Follow these steps to install another Endpoint Log Hybrid.

Step 1: Install additional Endpoint Log Hybrid

- To install a physical host, complete steps 1 - 16 in "Install NetWitness Platform" under Installation Tasks in the *Physical Host Installation Guide for NetWitness Platform 12.1*

- To install a virtual host, complete steps 1 - 16 in "Step 4. Install NetWitness Platform" under Install NetWitness Platform Virtual Host in Virtual Environment in the *Virtual Host Installation Guide for NetWitness Platform 12.1*

Step 2: Setup the Endpoint Log Hybrid

1. Create a directory `mkdir -p /etc/pki/nw/nwe-ca`.
2. Copy the following certificates from the first Endpoint Log Hybrid to the secondary Endpoint Log Hybrid:

   `/etc/pki/nw/nwe-ca/nwerootca-cert.pem`

   `/etc/pki/nw/nwe-ca/nwerootca-key.pem`

   Note: NetWitness recommends that you copy certificates from Endpoint Log Hybrid to secondary Endpoint Log Hybrid CentOS to Windows using the `SCP` command to avoid any corruption caused by Antivirus or third-party tools.

Step 3: Switch to the NetWitness UI and add Hosts

- See Add Hosts to the Endpoint Log Hybrid: for more information.

Add Hosts to the Endpoint Log Hybrid:

1. Log into NetWitness Platform and click  **(Admin) > Hosts**.

   The New Hosts dialog is displayed with the Hosts view grayed out in the background.

   Note: If the New Hosts dialog is not displayed, click **Discover** in the **Hosts** view toolbar.

2. Select the host in the **New Hosts** dialog and click **Enable**.

   The New Hosts dialog closes and the host is displayed in the Hosts view.

3. Select that host in the **Hosts** view (for example, **Endpoint**) and click 

.

   The Install Services dialog is displayed.

4. Select the **Endpoint Log Hybrid** category and click **Install**.
5. Make sure that the Endpoint Log Hybrid service is running.
6. Configure Endpoint Meta forwarding.

   See the *Endpoint Configuration Guide* for instructions on how to configure Endpoint Meta forwarding.

7. Deploy the ESA Rules from the Endpoint Rule Bundle. For more information, see "Deploy Endpoint Risk Scoring Rules on ESA" section in the ESA Configuration Guide.

   Note: The Endpoint IIOCs are available as OOTB Endpoint Application rules.

8. Review the default policies and create groups to manage your agents. See *Endpoint Configuration Guide*.

   Note: In 11.3 or later, agents can operate in Insights or Advanced mode depending on the policy configuration. The default policy enables the agent in an advanced mode. If you want to continue to use the Insights agent, before updating, review the policy, and make sure that the Agent mode is set to Insights.

9. Install the Endpoint Agent. You can install an Insights (free version) or an Advanced agent (licensed). See *Endpoint Agent Installation Guide* for detailed instructions on how to install the agent.

   Note: You can migrate the Endpoint Agent from 4.4.0.x to 11.7. For more information, see the *NetWitness Endpoint 4.4.0.x to NetWitness Platform 12.1 Migration Guide*.

(Optional) Configure an Endpoint Service on an Existing Log Decoder Host

You can install an Endpoint service category on an existing Log Decoder host. For an overview of installing service categories on hosts, see "Hosts and Services Set Up Procedures" in the *Host and Services Getting Started Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

- If you have an existing Endpoint Log Hybrid, you must copy certificates from that Endpoint Hybrid host to the Log Decoder before you install the Endpoint service category on the Log Decoder.
- If you do not have an Endpoint Log Hybrid host, you do not need to copy over the certificates before you install the Endpoint service category on the Log Decoder.

Do You Need to Install an Endpoint Service onto Separate Hardware

If you are only using NW Platform for collecting and analyzing logs, you can co-locate your Endpoint Server on the same physical hardware as your Log Decoder. For more information, see the Prepare Virtual or Cloud Storage topic in the *Storage Guide for NetWitness Platform*.

If you exceed these guidelines, the amount of disk space usage and CPU might become so high as to create alarms for your Endpoint Server in Health and Wellness. If you notice this, and are running both log collection and EDR scans, you can use Throttling to control the amount of data coming into the Log Decoder.

If that doesn't help, NetWitness recommends that you move your Endpoint Server onto separate hardware from that used by your Log Decoder.

Install an Endpoint Service Category on an Existing Log Decoder

To install an Endpoint service category on an existing Log Decoder if you have an existing Endpoint Log Hybrid:

1. Create a directory `mkdir -p /etc/pki/nw/nwe-ca`.
2. Copy the following certificates from the first Endpoint Log Hybrid to the Log Decoder on which you are going to install the additional **Endpoint** service category.

   Note: NetWitness recommends that you copy certificates from Endpoint Log Hybrid to secondary Endpoint Log Hybrid using the `SCP` command to avoid any corruption caused by Antivirus or third-party tools.

   `/etc/pki/nw/nwe-ca/nwerootca-cert.pem`

   `/etc/pki/nw/nwe-ca/nwerootca-key.pem`
3. Log into NetWitness Platform and click  **(Admin) > Hosts**.
4. Select the Log Decoder host in the **Hosts** view and click .

   The Install Services dialog is displayed.
5. Select the **Endpoint** category and click **Install**.

To install an Endpoint service category on an existing Log Decoder if you do not have an existing Endpoint Log Hybrid:

1. Log into NetWitness Platform and click  **(Admin) > Hosts**.
2. Select the Log Decoder host in the **Hosts** view and click .

   The Install Services dialog is displayed.
3. Select the **Endpoint** category and click **Install**.

NetWitness UEBA

The tasks in this section only apply to customers that use the UEBA component of NetWitness Platform.

Install UEBA

To set up NetWitness UEBA in NetWitness Platform 11.7, you must install and configure the NetWitness UEBA service.

The following procedure shows you how to install the NetWitness UEBA service on a NetWitness UEBA Host Type and configure the service.

1. For:
   - A physical host, complete steps 1 - 16 in "Install NetWitness Platform" under "Installation Tasks" in the *Physical Host Installation Guide for NetWitness Platform 11.7*.
   - A virtual host, complete steps 1 - 16 in "Step 4. Install NetWitness Platform" in the *Virtual Host Installation Guide for NetWitness Platform 11.7*.

   Note: The Kibana and Airflow webserver User Interface password is the same as the deploy admin password. Make sure that you record this password and store it in a safe location.

2. Log into NetWitness Platform and go to  **(Admin) > Hosts**.
   The New Hosts dialog is displayed with the Hosts view grayed out in the background.

   Note: If the New Hosts dialog is not displayed, click **Discover** in the **Hosts** view toolbar.

3. Select the host in the **New Hosts** dialog and click **Enable**.
   The New Hosts dialog closes and the host is displayed in the Hosts view.

4. Select that host in the **Hosts** view (for example, **UEBA**) and click .
   The Install Services dialog is displayed.

5. Select the **UEBA** Host Type and click **Install**.

6. Make sure that the UEBA service is running.

7. Complete licensing requirements for NetWitness UEBA.
   See the *Licensing Management Guide* for more information.

   Note: NetWitness Platform supports the User and Entity Behavior Analytics License (UEBA). This license is used based on the number of users. The Out-of-the-Box Trial License is a 90-day trial license. In case of UEBA licenses, the 90-day trial period begins from the time the UEBA service deployed on the NetWitness Platform product.

Configure NetWitness UEBA

To start running UEBA:

1. Define the following parameters: data schemas, data source (NetWitness Broker or Concentrator) and start date.

   a. Define UEBA schemas:
      Choose schemas from the following list:

      AUTHENTICATION, FILE, ACTIVE_DIRECTORY, PROCESS, REGISTRY and TLS.

      Note: The TLS packet requires adding the hunting package and enabling the JA3 feature. For more information regarding events that each schema contains, see the *NetWitness UEBA Configuration Guide*.

   b. Define the data source:
      If your deployment has multiple Concentrators, we recommend that you assign a Broker at the top of your deployment hierarchy for the NetWitness UEBA data source.

   c. Define the UEBA start-date:

      Note: The selected start date must contain events from all configured schemas.

      NetWitness recommends that the UEBA start date is set to 28 days earlier than the current date. For UEBA systems that intend to process TLS data, you must make sure that the start date is set to no later than 14 days earlier than the current date.

2. . Create a user account for the data source (Broker or Concentrator) to authenticate to the data.
   a. Log into NetWitness Platform.
   b. Go to (Admin) **> Services**.
   c. Locate the data source service (Broker or Concentrator).
      Select that service, and select (Actions) > **View** > **Security**.
   d. Create a new user and assign the "Analysts" role to that user.
      The following example shows a user account created for a Broker.

3. SSH to the NetWitness UEBA server host.
4. Submit the following commands with the above parameters that you already defined.
   `/opt/rsa/saTools/bin/ueba-server-config -u <user> -p <password> -h <host> -o <type> -t <startTime> -s <schemas> -v -e <argument>`
   Where:

Argument	Variable	Description
-u	<user>	User name of the credentials for the Broker or Concentrator instance that you are using as a data source.
-p	<password>	Password of the credentials for the Broker or Concentrator instance that you are using as a data source. The following special characters are supported in a password. !"#$%&()*+,-:;<=>?@[\]^_`\{\|} If you want to include a special character or special characters, you must delimit the password with an apostrophe sign, for example: sh /opt/rsa/saTools/bin/ueba-server-config -u brokeruser -p **'!"UHfz?@ExMn#$'** -h 10.64.153.104 -t 2018-08-01T00:00:00Z -s 'AUTHENTICATION FILE ACTIVE_DIRECTORY TLS PROCESS REGISTRY' -o broker -v
-h	<host>	IP address of the Broker or Concentrator used as the data source. Currently, only one data source is supported.
-o	<type>	Data source host type (broker or concentrator).
-t	<startTime>	Historical start time as of which you start collecting data from the data source in YYYY-MM-DDTHH-MM-SSZ format (for example, 2018-08-15T00:00:00Z). **Note:** The script interprets the time you enter as UTC (Coordinated Universal Time) and it does not adjust the time to your local time zone.
-s	<schemas>	Array of data schemas. If you want to specify multiple schemas, use a space to separate each schema (for example, AUTHENTICATION FILE ACTIVE_ DIRECTORY PROCESS REGISTRY TLS).
-v		**verbose mode**.
-e	<argument>	Boolean Argument. This enables the UEBA indicator forwarder to Respond. **Note:** If your NetWitness deployment includes an active Respond server, you can transfer NetWitness UEBA indicators to the Respond server and create incidents by enabling the indicator forwarder, from this data. For more information on how to enable the NetWitness UEBA incidents aggregation, see Enable User Entity Behavior Analytics Incident Rule.

5. If you are deploying a hot fix on 11.x.x.x version, you must do the following:
   a. Run the presidio-upgrade DAG.
   b. Press the play sign next to the DAG and then click the trigger button.

Enable Access Permission for the NetWitness UEBA User Interface

After you install NetWitness UEBA 11.7, you need to assign the UEBA_Analysts and Analysts roles to the UEBA users. For more information, see 'Assign User Access to UEBA' topic in the *NetWitness UEBA Configuration Guide*. After this configuration, UEBA users can access the **Investigate** > **Users** view.

Note: To complete NetWitness UEBA configuration according to the needs of your organization, See the *NetWitness UEBA Configuration Guide*.

Deployment Options

NetWitness Platform has the following deployment options. See the *NetWitness Deployment Guide* for detailed instructions on how to deploy these options.

- **Analyst User Interface** - gives you access to a subset of features in the NetWitness Platform UI that you can set up in individual locations when you deploy NetWitness Platform in multiple locations. It is designed to reduce latency and improve the performance that can occur when accessing all functionality from the Primary User Interface on the NW Server Host (Primary UI).
- **Group Aggregation** - configures multiple Archiver or Concentrator services as a group and share the aggregation tasks between them.
- **New Health and Wellness Search** - New Health and Wellness is an advanced monitoring and alerting system that provides insights on the operational state of the host and services in your deployment, and helps identify potential issues.
- **Hybrid Categories on Series 6 (R640) Hardware** - installs Hybrid Categories such as Log Hybrid and Network (Packet) Hybrid service categories on a Series 6 (R640) Physical host. This gives you the ability to attach multiple PowerVault external storage devices to the Series 6 (R640) Physical host.
- **NW Server Deployment on ESA Hardware** - installs the NW Server host on NetWitness Series 6 Analytics hardware. The Series 6 Analytics Hardware has more memory and storage capacity than the standard Core appliance on which NW Server has typically been deployed. This results in better overall responsiveness and larger retention capacity for Report Engine.
- **Second Endpoint Server** - deploys a second Endpoint Server.
- **Warm Standby NW Server** - duplicates the critical components and configurations of your active NW Server Host to increase reliability.

Appendix A. Troubleshooting

This section describes solutions to problems that you may encounter during installations and upgrades. In most cases, NetWitness creates log messages when it encounters these problems.

Note: If you cannot resolve an upgrade issue using the following troubleshooting solutions, contact Customer Support (https://community.netwitness.com/t5/support-information/how-to-contact-netwitness-support/ta-p/563897).

This section has troubleshooting documentation for the following services, features, and processes.

- Command Line Interface (CLI)
- Event Stream Analysis

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Command Line Interface (CLI)

Error Message	Command Line Interface (CLI) displays: "Orchestration failed." `Mixlib::ShellOut::ShellCommandFailed: Command execution failed. STDOUT/STDERR suppressed for sensitive resource in/var/log/netwitness/config-management/chef-solo.log`
Cause	Entered the wrong `deploy_admin` password in `nwsetup-tui`.
Solution	Retrieve your `deploy_admin` password. 1. SSH to the NW Server host. `security-cli-client --get-config-prop --prop-hierarchy nw.security-client --prop-name deployment.password` SSH to the host that failed. 2. Run the `nwsetup-tui` again using correct `deploy_admin` password.

Error Message	`ERROR com.rsa.smc.sa.admin.web.controller.ajax.health. AlarmsController - Cannot connect to System Management Service`
Cause	NetWitness sees the Service Management Service (SMS) as down after successful upgrade even though the service is running.
Solution	Restart SMS service. `systemctl restart rsa-sms`

Error Message	You receive a message in the User Interface to reboot the host after you update and reboot the host offline. 
Cause	You cannot use CLI to reboot the host. You must use the User Interface.
Solution	Reboot the host in the Host View in the User Interface.

Event Stream Analysis

For ESA Correlation troubleshooting information, see the *Alerting with ESA Correlation Rules User Guide*.

Appendix B. Create an External Repository

Complete the following procedure to set up an external repository (Repo).

Note: 1.) You need an unzip utility installed on the host to complete this procedure. 2.) You must know how to create a web server before you complete the following procedure.

1. (Conditional) Complete this step if you have an external repo and you want to override it.
   - Case 1: You bootstrapped the host from an external repo and you want to upgrade using a local repo on the Admin Server.
     a. Create the `/etc/netwitness/platform/repobase` file.
        `vi /etc/netwitness/platform/repobase`
     b. Edit the `repobase` file so that the only information in the file is the following URL.
        `https://nw-node-zero/nwrpmrepo`
     c. Complete the instructions on how to run the upgrade using the `upgrade-cli-client` tool.
   - Case 2: You bootstrapped the host from local repo on the Admin server (NW Server host) and you want to use an external repo for the upgrade.
     a. Create the `/etc/netwitness/platform/repobase` file.
        `vi /etc/netwitness/platform/repobase`
     b. Edit the `repobase` file so that the only information in the file is the following URL.
        `https://<webserver-ip>/<alias-for-repo>`
     c. Complete the instructions on how to run the upgrade using the `upgrade-cli-client` tool. The instructions are in "Appendix A. Offline Method (No Connectivity to Live Services) - Command Line Interface" in the *Upgrade Guide for NetWitness Platform*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.
2. Set up the external repo.
   a. Log in to the web server host.
   b. Create directory to host the NW repository (`netwitness-11.7.0.0.zip`), for example `ziprepo` under `web-root` of the web server. For example, /var/netwitness is the web-root, run the following command string.
      `mkdir -p /var/netwitness/<your-zip-file-repo>`
   c. Create the 11.7.0.0 directory under `/var/netwitness/<your-zip-file-repo>`.
      `mkdir -p /var/netwitness/<your-zip-file-repo>/11.7.0.0`
   d. Create the `OS` and `RSA` directories under `/var/netwitness/<your-zip-file-repo>/11.7.0.0`.
      `mkdir -p /var/netwitness/<your-zip-file-repo>/11.7.0.0/OS`
      `mkdir -p /var/netwitness/<your-zip-file-repo>/11.7.0.0/RSA`

e. Unzip the `netwitness-11.7.0.0.zip` file into the `/var/netwitness/<your-zip-file-repo>/11.7.0.0` directory.
`unzip netwitness-11.7.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.7.0.0`
Unzipping `netwitness-11.7.0.0.zip` results in two zip files (`OS-11.7.0.0.zip` and `RSA-11.7.0.0.zip`) and some other files.

f. Unzip the:
`OS-11.7.0.0.zip` into the `/var/netwitness/<your-zip-file-repo>/11.7.0.0/OS` directory.
`unzip /var/netwitness/<your-zip-file-repo>/11.7.0.0/OS-11.7.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.7.0.0/OS`

The external url for the repo is `http://<web server IP address>/<your-zip-file-repo>`.

g. Unzip the:
`RSA-11.7.0.0.zip` into the `/var/netwitness/<your-zip-file-repo>/11.7.0.0/RSA` directory.
`unzip /var/netwitness/<your-zip-file-repo>/11.7.0.0/RSA-11.7.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.7.0.0/RSA`

h. (Conditional - For Azure) Follow these steps for Azure update.

   i. `mkdir -p /var/netwitness/<your-zip-file-repo>/11.7.0.0/OS/other`

   ii. `unzip nw-azure-11.3-extras.zip -d /var/netwitness/<your-zip-file-repo>/11.7.0.0/OS/other`

   iii. `cd /var/netwitness/<your-zip-file-repo>/11.7.0.0/OS`

   iv. `createrepo`

i. Use the `http://<web server IP address>/<your-zip-file-repo>` in response to **Enter the base URL of the external update repositories** prompt from NW 11.7.0.0 Setup program (`nwsetup-tui`) prompt.

Appendix C. Silent Installation Using CLI

You can use the following Command Line Interface commands to run the installation script (`nwsetup-tui`) without getting prompted for inputs. This enables you to automate the installation of a host by supplying response to the scripts prompts through the command line.

1. After you have created a base image on the host, log in to the host with the `root` credentials.
2. Submit the `nwsetup-tui` script with the `--silent` command and the arguments that you want to apply.

   The following command string is an example of how you would install a basic NW Server host.

   ```
   nwsetup-tui --silent --is-head=true --host-name=new-host --master-
   pass=netwitness --deploy-pass=netwitness --repo-type=1 --custom-
   firewall=false --ip-override=false --eula=true
   ```

Note: In NetWitness Platform version 11.6 or later, deployment account password must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ .) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`.
If `deploy_admin` password is changed on Primary NW Server, It must be changed on the Warm Standby Server if it exists.

3. (Conditional - For Component Hosts Only) Install the appropriate service **Category** on the newly provisioned host in the NetWitness Platform Hosts view.

   a. Log into NetWitness and go to  **(Admin)** > **Hosts**.

   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the host in the **New Hosts** dialog and click **Enable**.

   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

   c. Select that host in the **Hosts** view (for example, **Event Stream Analysis**) and click 

.

   The **Install Services** dialog is displayed.

   d. Select the appropriate host type in **Category** and click **Install**.

Arguments

Argument	Description
`--help-install-opts`	Display all the arguments in this table.

Argument	Description
`--eula`	Accept or decline the End User License Agreement (EULA). Specify: • `true` (default) to accept the agreement • `false` to decline it and cancel the installation. For example: `--eula=true`
`--is-head`	Designate the host as the NW Server host or a component host. Specify: • `true` for NW Server host. • `false` for Component host. For example: `--is-head=true`
`--host-name`	Specify new hostname. If you do not specify this argument, NetWitness Platform retains the existing hostname. For example: `--host-name=<hostname>`
`--master-pass`	Enter master password. For example: `--master-pass=<password>`
`--deploy-pass`	Enter deployment password. For example: `--deploy-pass=<password>`
`--iface-name`	Specify network interface. For example: `--iface-name=eth0`
`--ip-override`	Accept or override IP address found for this host or change the IP configuration found on the host. Specify: • `true` provide IP address. • `false` use IP address found on the host. For example: `--ip-override=false`
`--ip-type`	Select ip address configuration type. Specify: • `1` Static IP Configuration) • `2` DCHP For example: `--ip-type=1`
`--ip-addr`	For Static IP configuration, enter IP Address for static address. For example: `--ip-addr=<ip-address>`
`--ip-netmask`	For Static IP configuration, enter Subnet Mask for static address. For example: `--ip-gateway=<subnet-mask>`

Argument	Description
`--ip-gateway`	For Static IP configuration, enter default gateway for static address. For example: `--ip-gateway=<default-gateway>`
`--ip-nameserver`	IP address assigned to DNS server. `--ip-nameserver=<ip-address>`
`--ip-nameserver-secondary`	Optional - IP address assigned to a secondary DNS server. For example: `--ip-nameserver-secondary=<ip-address>`
`--ip-domain`	For Static IP configuration, enter Local Domain Name for static address. For example: `--ip-domain=<default-gateway>`
`--repo-type`	Select type of update repository. Specify: • `1` Local repository • `2` External repository For example: `--repo-type=1`
`--repo-url`	For an external update repository, specify the url of the repository. For example: `--repo-url=<url>`
`--head-ip`	For a component host, specify IP Address of the NW Server. For example: `--head-ip=<ip-address>`
`--custom-firewall`	Disable default firewall configuration and use your custom configuration. Specify: • `true` use custom firewall configuration. • `false` use default firewall configuration. For example: `--custom-firewall=true`
`--use-nat`	Configure the host to use Network Address Translation (NAT) based IP addresses: • `true` use NAT IPs to connect to other hosts • `false` do not use NAT IPs to connect to other hosts (default) For example: `--use-nat=false`

Appendix D. Third Party Server System Requirement

This section contains all the hardware requirements and configuration needed to successfully deploy NetWitness Platform on Third Party Server Hardware. It contains the required compute, memory, drive types and recommendations.

Third Party Server Deployments only support the following NetWitness Platform components:

- Core Services (Broker , Decoder, Log Decoder, Archiver , Concentrator)
- Analyst UI
- New Health & Wellness
- Log Collector
- Malware Analysis
- Warehouse connector

Hardware Requirements

Administrators must configure single bootable block device (RAID volume/group) and ensure it is bootable. After installation is complete, See core service storage configuration the NetWitness Storage Guide.

Item	Core
Host Type	• NW Server • Warm standby • Analyst UI • Health & Wellness • Core Services • Log Collector • Malware Analytics • Warehouse Connector
Memory	128 GB
Processor	
Processor Speed	3.2 Ghz
# of Processors	2
# of Cores	8 Cores Per Processor
# of Threads	16 Threads Per Processor
Storage Configuration	

Item	Core
Volume	Single block device. 150 GB or greater.
Drive Types	10K SAS or SSD
RAID Configuration	1, 5 or 6
Network	
NIC	Supported by Centos 7.9 (1G, 10G or 40G)
Capture Speed	3G

NetWitness Community at https://community.netwitness.com contains a knowledge base that answers common questions and provides solutions to known problems, product documentation, community discussions, and case management.

Trademarks

RSA and other trademarks are trademarks of RSA Security LLC or its affiliates ("RSA"). For a list of RSA trademarks, go to https://www.rsa.com/en-us/company/rsa-trademarks. Other trademarks are trademarks of their respective owners.

License Agreement

This software and the associated documentation are proprietary and confidential to RSA Security LLC or its affiliates are furnished under license, and may be used and copied only in accordance with the terms of such license and with the inclusion of the copyright notice below. This software and the documentation, and any copies thereof, may not be provided or otherwise made available to any other person.

No title to or ownership of the software or documentation or any intellectual property rights thereto is hereby transferred. Any unauthorized use or reproduction of this software and the documentation may be subject to civil and/or criminal liability. This software is subject to change without notice and should not be construed as a commitment by RSA.

It is advised not to deploy third-party repos or perform any change to the underlying NetWitness Operating System that is not part of the supported NetWitness version. Any such change outside of the NetWitness approved image may result in a service or functionality conflict and require a reimage of the NetWitness system to bring NetWitness back to an optimized functional state. In the event a third-party repo is deployed, or other non-supported change is made by the customer without NetWitness approval, the customer takes full responsibility for any system malfunction until the issue can be remediated through troubleshooting efforts or a reimage of the service.

Third-Party Licenses

This product may include software developed by parties other than RSA. The text of the license agreements applicable to third-party software in this product may be viewed on the product documentation page on NetWitness Community. By using this product, a user of this product agrees to be fully bound by terms of the license agreements.

Note on Encryption Technologies

This product may contain encryption technology. Many countries prohibit or restrict the use, import, or export of encryption technologies, and current use, import, and export regulations should be followed when using, importing or exporting this product.

Distribution

Use, copying, and distribution of any RSA Security LLC or its affiliates ("RSA") software described in this publication requires an applicable software license.

RSA believes the information in this publication is accurate as of its publication date. The information is subject to change without notice.

The Basics

This guide describes the basic requirements of a NetWitness deployment and outlines optional scenarios to address the needs of your enterprise. Even in small networks, planning can ensure that all goes smoothly when you are ready to bring the hosts online.

Note: This document refers to several additional documents available on NetWitness Community Link. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

There are many factors you must consider before you deploy NetWitness. The following items are just some of these factors. You need to estimate growth and storage requirements when you consider these factors:

- The size of your enterprise (that is, the number of locations and people that will use NetWitness)
- The volume of network data and logs you need to process
- The performance each NetWitness user role needs to do their jobs effectively.
- The prevention of downtime (that is, how to avoid a single point of failure).
- The environment in which you plan to run NetWitness
  - RSA Physical Hosts (software running on hardware supplied by RSA)
  - Software Only provided by NetWitness:
    - On-Premises (On-Prem) Virtual Hosts
      See the *NetWitness Virtual Host Installation Guide* for detailed instructions on how to deploy on-prem virtual hosts.
    - VCloud:
      - Amazon Web Services (AWS)
        See the *NetWitness AWS Installation Guide* for detailed instructions on how to deploy virtual hosts in AWS.
      - Azure
        See the *NetWitness Azure Installation Guide* for detailed instructions on how to deploy virtual hosts in Azure.
      - Google Cloud Platform (GCP)
        See the *NetWitness Google Cloud Platform Installation Guide* for detailed instructions on how to deploy virtual hosts in Google Cloud.

Basic Deployment

Before you can deploy NetWitness you need to:

- Consider the requirements of your enterprise and understand the deployment process.
- Have a high-level picture of the complexity and scope of a NetWitness deployment.

IMPORTANT: It is crucial to adhere to security best practices by avoiding the deployment of an Admin server node on a public IP address. This precaution is essential to mitigate the risk of potential directory traversal attacks, particularly through vulnerable endpoints such as `/nwrpmrepo` and `/service-mappings.json` files. These files contain sensitive information including private IPs, RPMs, and other executables, which must remain strictly restricted from exposure to the internet. Implementing this safeguard helps prevent unauthorized access to internal NetWitness environments.

Process

The components and topology of a NetWitness network can vary greatly between installations, and should be carefully planned before the process begins. Initial planning includes:

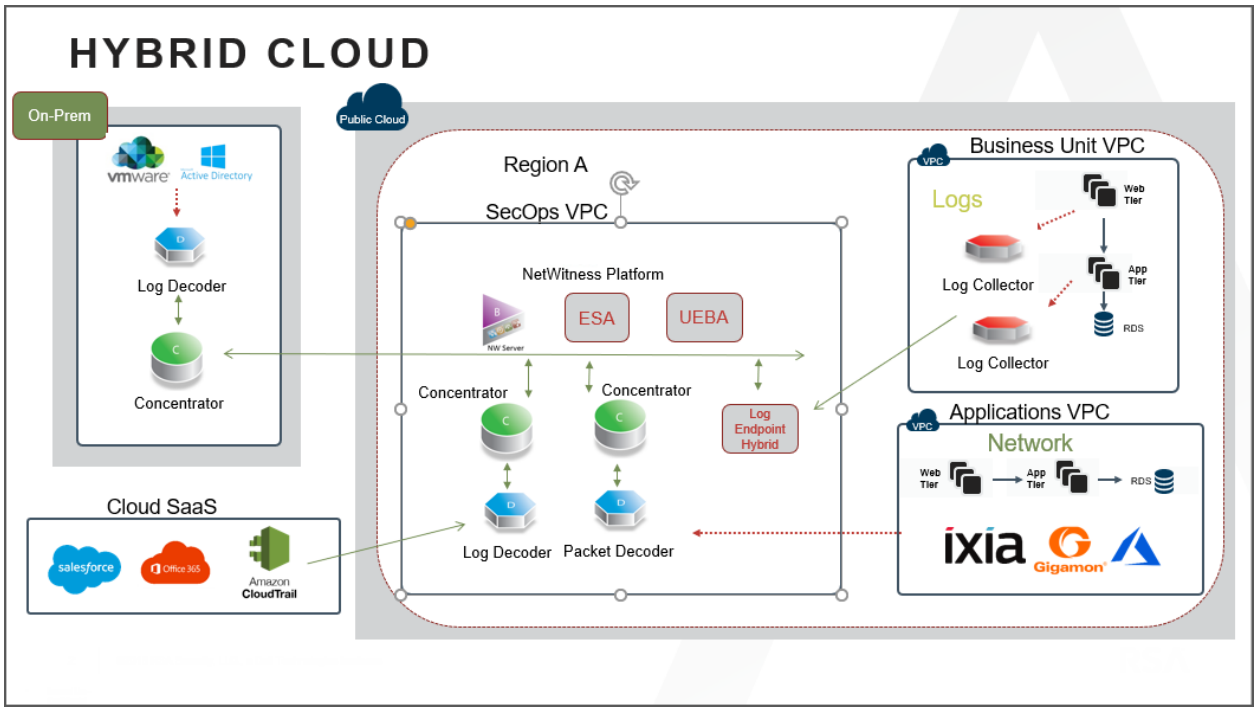
- Consideration of site requirements and safety requirements.
- Review of the network architecture and port usage.
- Support of group aggregation on Archivers and Concentrators, and virtual hosts.

When ready to begin deployment, the general sequence is:

- For RSA Physical Hosts:
  1. Install physical hosts and connect to the network as described in the NetWitness Hardware Setup Guides and the *NetWitness Physical Host Installation Guide*.
  2. Set up licensing for NetWitness as described in the *NetWitness Licensing Guide*.
  3. Configure individual physical hosts and services as described in *NetWitness Host and Services Getting Started Guide*. This guide also describes the procedures for applying updates and preparing for version upgrades.
- For On-Prem virtual hosts, follow the instructions in the *NetWitness Virtual Host Setup Guide*.
- For AWS, follow the instructions in the *NetWitness AWS Installation Guide*.
- For Azure, follow the instructions in the *NetWitness Azure Installation Guide*.
- For Google Cloud, follow the instructions in the *NetWitness Google Cloud Platform Installation Guide*.

When updating hosts and services, follow recommended guidelines under the "Running in Mixed Mode" topic in the *NetWitness Host and Services Getting Started Guide*.

You should also become familiar with Hosts, Host Types, and Services as they are used in the context of NetWitness also described in the *NetWitness Host and Services Getting Started Guide*.



NetWitness High-Level Deployment Diagrams

NetWitness is inherently modular. Whether organizations are looking to deploy on-premise or in the cloud, the NetWitness components are decoupled in a way which allows flexible deployment architectures to satisfy a variety of use cases.

The following figure is an example of a hybrid cloud deployment, where the base of the components are residing within the SecOps VPC. Centralizing these components make management easier while keeping network latency to a minimum.

Network, log, and endpoint traffic could then be aggregated up to the SecOps VPC. The on-premise location would function just like a normal physical deployment and would be accessible for investigations and analytics.

Cloud SaaS visibility could be captured from a Log Decoder residing in either the cloud or on-premise locations.

Deployment Optional Setup Procedures

You can deploy NetWitness with the following options.

Analyst User Interface
Group Aggregation
New Health and Wellness Search
Hybrid Categories on Series 6 (R640) Hardware
NW Server Deployment on ESA Hardware
Second Endpoint Server
Warm Standby NW Server

Analyst User Interface

The Analyst User Interface (UI) gives you access to a subset of features in the NetWitness Platform UI that you can set up in individual locations when you deploy NetWitness Platform in multiple locations. It is designed to reduce latency and improve the performance that can occur when accessing all functionality from the Primary User Interface on the NW Server Host (Primary UI).

You can have can have multiple Analyst UI instances provisioned in the same manner as the other NW component hosts.

Features and Limitations

Each Analyst UI host:

- Can be deployed to specific organizational groups. For example: the Americas, EMEA, APAC, Tier 1 Analysts, Tier 3 Analysts.
- If Analyst UI hosts are deployed regionally, you have the capability of querying those regional brokers directly (less latency), instead of than having to route through the Primary UI.
- Helps distribute load off the Primary UI.
- Has its own Reporting Engine (RE).
- If it becomes unavailable for any planned or unplanned reason, it will not affect the Primary UI or any other Analyst UI instances.
- Provides the same pre-query filter verification, Data Privacy protection, and RBAC functionality as the Primary UI.
- Points back to the primary NW Server for authentication and configuration.
- Does not have access to any administrative functions. All administration functions take place on the Primary UI.
- Does not allow you to create or manage Content (that is, ESA rules, app rules, feeds). All Content creation and management takes place on the Primary UI.

Use Case

Large environments that include Geo distribution with a single data center and multiple NW Servers require Analyst UI instances in all their NetWitness locations or managed entities.

For example, if an Analyst UI is deployed for the EMEA SOC team, analysts can query their EMEA NetWitness Platform hosts directly. If the EMEA team has Broker hosts and Concentrator hosts within the region, the Analyst UI can connect and query them instead of connecting back to Primary user Interface (Primary UI).

Deployment

You must install the **Analyst UI** service category on a dedicated host and you install it in the same manner as any component service category on a host.

See the "Task 2 - Install 12.4.1 on Other Component Hosts" in the NetWitness Platform Installation Guides for instructions on how to install any component service. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

After you provision the Analyst UI host (that is after you run the nwsetup-tui for the component host designated for the Analyst UI), complete the following steps to install the Analyst UI service category on the provisioned host.

1. Log in to **NetWitness** and go to  (Admin) > **Hosts**.
   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

2. Select the host in the **New Hosts** dialog and click **Enable**.
   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

3. Select that host in the **Hosts** view (for example, **Analyst UI**) and click 

   .
   The **Install Services** dialog is displayed.

4. Select **Analyst UI** in **Category** and click **Install**.

5. Configure NetWitness Platform for each Analyst UI instance.Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

   a. Make sure that each Analyst UI instance is connected to the correct local Reporting Engine and has the appropriate Investigation parameters set. The *Getting Started Guide for NetWitness Platform* describes the default Analyst UI Dashboard and how you manage dashboards.

   Note: You must add data sources to each Reporting Engine instance to execute Reports and Charts on an Analyst UI. See "Configure the Data Sources" in the*Reporting Engine Configuration Guide for NetWitness Platform* for instructions.

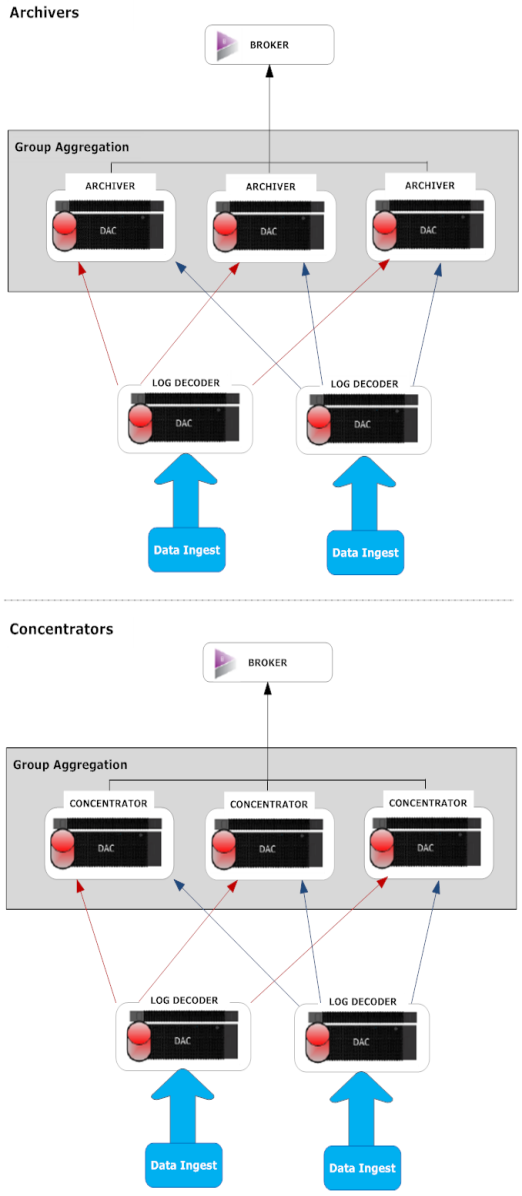
b. Configure whether to normalize alerts for any Respond Server (NW Server or Analyst UI) by enabling or disabling alert normalization. "Configure Analyst UI for Respond Server Alert Normalization" in the *NetWitness Respond Configuration Guide for NetWitness Platform* tells you how to configure Respond Server alert normalization for the Analyst UI.

Group Aggregation

You use Group Aggregation to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them. You can configure multiple Archiver services or Concentrator services to efficiently aggregate from multiple Log Decoder services to improve query performance on the data:

- Stored in the Archiver.
- Processed through the Concentrator.

NetWitness Group Aggregation Deployment Recommendations



NetWitness recommends the following deployment for Group Aggregation:

- 1 - 2 Log Decoders
- 3 - 5 Archivers or Concentrators

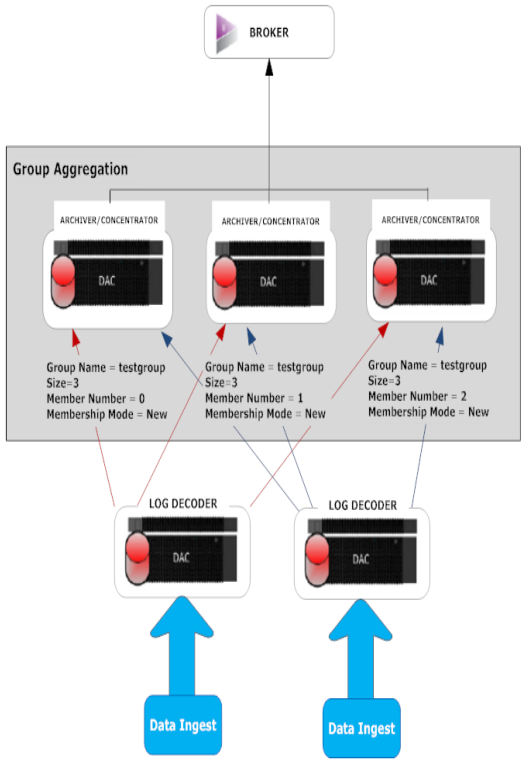
Advantages of Using Group Aggregation

- Increases the speed of NetWitness queries.
- Improves the performance of aggregate queries (Count and Sum) on the environment.
- Enhances investigation service performance.
- Gives you the option of storing data for a longer duration for investigation purposes.

The following diagram illustrates Group Aggregation.

You can have any number of Archivers or Concentrators grouped together and form an aggregation group. The Archiver or Concentrator services in the group divide all the aggregated sessions between them based on the number of sessions defined in the Aggregate Max Sessions parameter.

For example, in an aggregation group containing two Archiver services or two Concentrator services with the Aggregate Max Sessions parameter set to 10,000, the services would divide the session between themselves as illustrated in the following table.



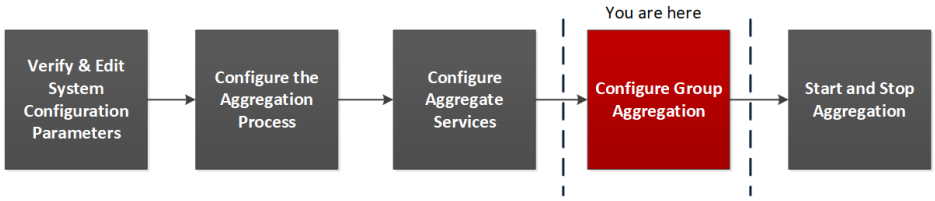
Archiver 0 or Concentrator 0	Archiver 1 or Concentrator 1
1 - 9,999	10,000 - 19,999
20,000 - 29,999	30,000 - 39,999
40,000 - 49,999	50,000 - 59,999

Configure Group Aggregation

Complete this procedure to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them.

Prerequisites

Plan the network design for group aggregation. The following figure is an example of a group aggregation setup.



Ensure that you understand the Group aggregation parameters in the following table, and create a group aggregation plan.

Parameter	Description
Group Name	It determines the group to which the Archiver or Concentrator belongs. You can add any number of groups aggregating data from a Log Decoder. The Group Name parameter is used by the Log Decoder to identify which Archiver or Concentrator services are working together. All Archiver or Concentrator services in the group should have the same group name.
Size	It determines the number of Archiver or Concentrator services in the aggregation group.
Member Number	It determines the position of the Archiver or Concentrator in the aggregation group. For a group of size N, member number from 0 to N-1 must be set on each of the Archiver or Concentrators services in the aggregation group. For example: If the size of the aggregation group is 2, the member number of one of the Archiver or Concentrator service should be set to 0 and the member number of the other Archiver or Concentrator should be set to 1.
Membership Mode	There are two membership modes: • **New**: Adding a new Archiver or Concentrator service as a member to the existing aggregation group or creating an aggregation group. The Archiver or Concentrator service does not aggregate any existing sessions from the service as other members of the group would have already aggregated all the sessions on the service. This Archiver or Concentrator service will only aggregate new sessions as they appear on the service. • **Replace**: Replacing an existing aggregation group member. The Archiver or Concentrator will begin aggregation from the oldest session available on the service it is aggregating from.

Note: The Membership Mode parameter has an effect only when no sessions have been aggregated from the service. After some sessions are aggregated, this parameter has no effect.

Set up Group Aggregation

This workflow shows the procedures you complete to configure group aggregation.

Complete the following steps to set up group aggregation.

1. Configure multiple Archiver or Concentrator services in your environment. Make sure that you add the same Log Decoder as data source to all the services.

2. Perform the following on all the Archiver or Concentrator services that you want to be part of aggregation group:

   a. Go to **(Admin) > Services**.

   b. Select the Archiver or Concentrator service, and select > **View** > **Config**.

   The Service Config view of the Archiver or Concentrator is displayed.

   c. In the **Aggregate Services** section, select **Log Decoder**.

   d. Click Toggle Service to change the status of the Log Decoder to offline if it is online.

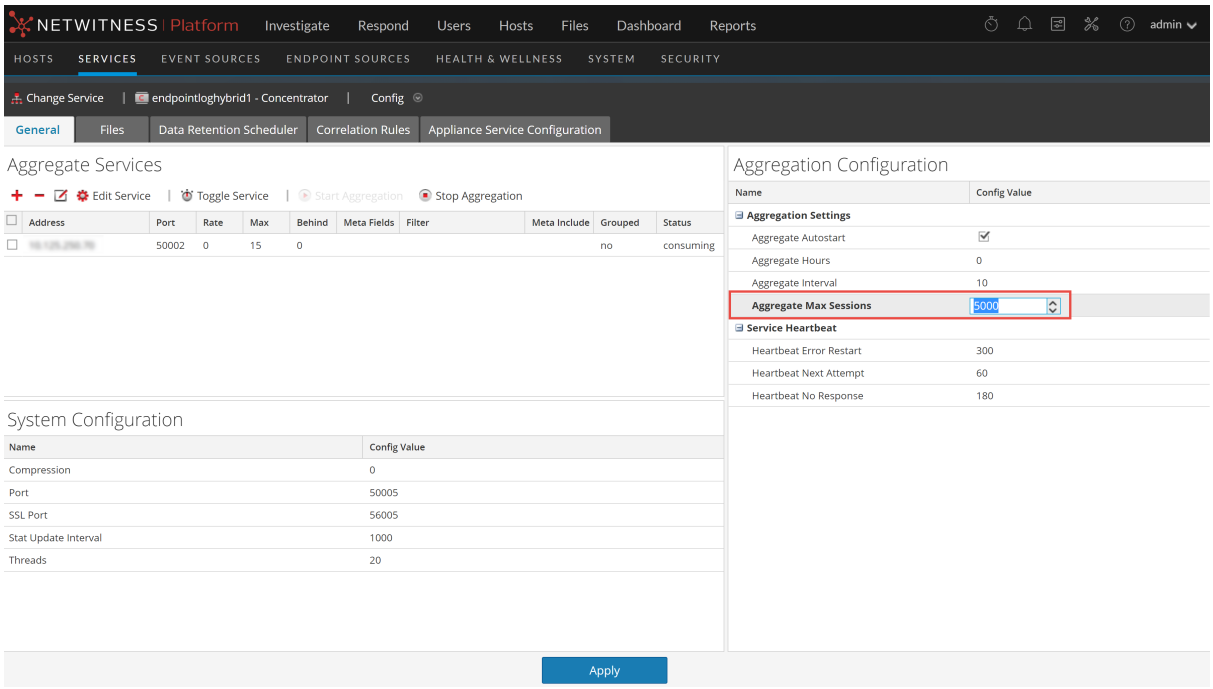
   e. Click .

   The **Edit Aggregate Service** dialog is displayed.

   f. Click Group Aggregation.

   The **Edit Group Aggregation** dialog is displayed.

   g. Select the **Enabled** checkbox and set the following parameters:



- In the **Group Name** field, type the group name.
- In the **Size** field, select the number of Archiver or Concentrator services in the aggregation group.
- In the **Member Number** field, select the position of the Archiver or Concentrator in the aggregation group.
- In the **Membership Mode** drop-down menu, select the mode.

h. Click **Save**.

i. In the Service Config view, click **Apply**.

j. Perform **Step b** to **Step i** on all other Archiver or Concentrator services that need to be part of group aggregation.

3. In the **Aggregation Configuration** section, set the **Aggregate Max Sessions** parameter set to **10000**.

New Health and Wellness

New Health and Wellness is an advanced monitoring and alerting system that provides insights on the operational state of the host and services in your deployment, and helps identify potential issues.

System Requirements

The following tables list the memory, disk, and CPU recommended for the New Health and Wellness based on the size of the deployment.

Note: The recommended values might differ when you install and try the new features and enhancements.

Caution: If the New Health and Wellness node is on a different subnet, you must open the respective NetWitness Platform hosts port. For more information, see "New Health and Wellness on Different Subnet" section in the Network Architecture and Ports.

Standalone Virtual Host

Minimum memory for a standalone virtual host is 16 GB.

Each NetWitness platform host writes 150 MB of New Health and Wellness metrics data into Elasticsearch data per day. For example, if you have 45 NetWitness Platform hosts then 6.6 GB of metrics data is written to Elasticsearch per day.

CPU	Memory
4 cores	16 GB

Physical Host

Deployment Size	Memory	CPU	DISK per day
Small (~5-10 hosts / 20-40 services)	16 GB	15%	1.5 GB
Medium (~150-200 hosts / 300- 400 services)	18 GB	15%	29 GB
Large (~250-300 hosts / 500-600 services)	22 GB	15%	44 GB

Based on the resources available, you can deploy the 12.4.1 New Health and Wellness feature on any one of the following, listed in the order of preferred deployment method with most preferred first:

- Standalone virtual host (Most preferred recommendation to ensure no performance impact on any other functionality of deployed nodes)

- Physical host:
  - Broker
  - Admin Server
  - ESA

Installing New Health and Wellness enables all hosts in your deployment to start sending metrics to monitor New Health and Wellness. After you deploy New Health and Wellness , see the "Monitor New Health and Wellness " topic in the *System Maintenance Guide* for instructions on how to configure and use this feature.

Please direct any New Health and Wellness feedback to nw.health.wellness.feedback@netwitness.com.

After you provision the New Health and Wellness host, complete the following steps to install the **New Health and Wellness** service category on the provisioned host.

1. Log in to NetWitness and go to  (Admin) > **Hosts**.
   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   Note: If you are not installing New Health and Wellness on a standalone virtual host ignore step 2.

2. Select the host in the **New Hosts** dialog and click **Enable**.
   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.
3. Select that host on which New Health and Wellness should be installed in the **Hosts** view (for example, **New Health and Wellness**) and click 

.

The **Install Services** dialog is displayed.

4. Select **New Health and Wellness** in **Category** and click **Install**.
5. Refresh all hosts to write to elastic search.
   a. SSH to the NW Server host.
   b. Run the following commands.
      `nw-manage --refresh-host --host-all`
      This may take few minutes for the changes to take effect based on the number of hosts in your deployment.

Note: (For Standalone Virtual host only) After you review your initial datastore configuration, you may determine that you need to add a new volume. For information on adding a new volume see “Add New Volume and Extend Existing File Systems” topic in the *Virtual Host Installation Guide*.

Note: After you have installed New Health and Wellness, for some reason, if you want to uninstall New Health and Wellness, you must refer to "Uninstall New Health and Wellness" in the *Upgrade guide*.

Hybrid Categories on Series 6 (R640) and Series 7 (R660) Hardware

You can install Hybrid Categories such as Log Hybrid and Network (Packet) Hybrid service categories on a Series 6 (R640) or a Series 7 (R660) Physical host. This gives you the ability to attach multiple PowerVault external storage devices (MD1400 or MD2412) to the Series 6 (R640) and MD2412 PowerVaults to the Series 7 (R660) Physical host.

NW Server Deployment on ESA Hardware

You now have the option to deploy the NW Server host on Series 6 or Series 7 Analytics hardware. The Series 6 or Series 7 Analytics Hardware has more memory and storage capacity than the standard Core appliance on which NW Server has typically been deployed. This results in better overall responsiveness and larger retention capacity for Report Engine.

Note: You can install the NW Server on ESA hardware, but you cannot co-locate any ESA services (categories) with the NW Server on this hardware.

Second Endpoint Server

Complete the following procedure to deploy a second Endpoint Server.

1. Set up a new host in NetWitness Platform.
   - For a physical host, complete steps 1 to 16 in "Install NetWitness Platform" under "Installation Tasks" in the *Physical Host Installation Guide for NetWitness Platform 12.4.1*.
   - For a virtual host, complete steps 1 to 6 in "Step 4. Install NetWitness Platform" in the *Virtual Host Installation Guide for NetWitness Platform 12.4.1*.

     Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.
2. SSH to the host that you set up in step 1.
3. Submit the following command string.
   ```
   mkdir -p /etc/pki/nw/nwe-ca
   ```

   Note: You do not need to modify permissions.
4. Copy the following two files from the previously deployed endpoint server to the new/second endpoint server:
   ```
   /etc/pki/nw/nwe-ca/nwerootca-cert.pem
   /etc/pki/nw/nwe-ca/nwerootca-key.pem
   ```
5. nstall Endpoint on the host.
   a. Log in to NetWitness Platform and go to  (Admin) > **Hosts**.
   The **New Hosts** dialog is displayed with the Hosts view grayed out in the background.

      Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the new host in the **New Hosts** dialog and click **Enable**.
   The New Hosts dialog closes and the host is displayed in the **Hosts** view.

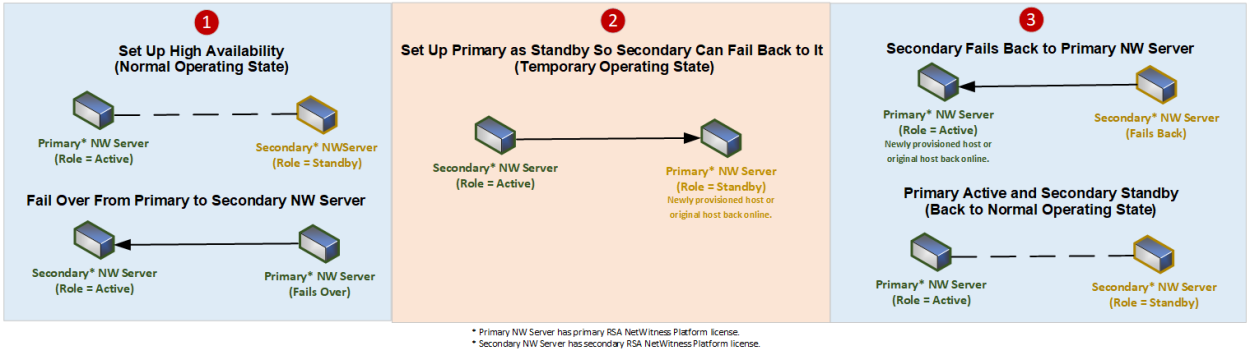
   c. Select that host in the Hosts view (for example, Endpoint Server II) and click 

.
   The **Install Services** dialog is displayed.

   d. Select **Endpoint** in **Host Type** and click **Install**.

Warm Standby NW Server Host

The Warm Standby NW Server duplicates the critical components and configurations of your active NW Server host to increase reliability.



A secondary NW Server remains in the standby role and, when configured, receives backups of the primary NW Server in the active role at regular intervals. If the primary NW Server fails (goes offline), the fail-over procedure must be executed allowing the secondary NW Server to assume the active role.

The secondary NW Server and Primary NW Server can have different IP addresses. Having the same IP address for both the primary NW Server and secondary NW Server is no longer necessary.

When you set up a secondary NW Server as a Warm Standby, a failure or scheduled switch from the primary NW Server to the secondary NW Server is referred to as a fail-over. You fail back to return to the normal operating state (that is, primary NW Server in the active role and the secondary NW Server in the standby role).

The following diagram illustrates the fail-over and fail-back process.

1. Set up secondary NW Server as standby (initial setup). This is the normal operating state.
2. The primary NW Server fails over to the secondary NW Server. After the fail-over, get the primary NW Server back online and set it up in the standby role. This is a temporary operating state.
3. Fail the secondary NW Server back to the primary. The primary NW Server is back to the active role and secondary is back to the standby role. This is the normal operating state.

Note: When you set up the secondary NW Server, follow the same administrative procedures, for example, for upgrade and maintenance, as the procedures for the primary active NW Server.

Procedures

Complete the following task to set up a secondary NW Server in the standby role for fail-over:

- Set up a secondary NW Server in the standby role.

Complete the following tasks when required to maintain high availability:

- Fail over the primary NW Server to secondary NW Server.
- Fail back the secondary NW Server to primary NW Server.

Planned Fail-Over Scenario

This scenario occurs when you schedule a fail over (see **Planned Fail-Over** under step 3 in the Fail Over primary NW Server to Secondary NW Server procedure). You should not need do anything after the fail-over completes.

Required Fail-Over Scenario without Hardware Replacement

This scenario occurs when the primary NW Server fails (see *Required Fail-Over* under step 3 in the Fail Over Primary NW Server to Secondary NW Server topic), but you are able to recover it easily without re-imaging (for example, the active NW Server has corrupt or insufficient RAM). You do not need to run the `nwsetup-tui` and you do not need to contact NetWitness Customer Support to reestablish correct licensing when:

1. The active (primary NW Server) fails over to the Standby (secondary NW Server) and that secondary host temporarily assumes the role of the active NW Server.
2. You fix the problem with the primary NW Server (for example, install new RAM) and fail back to it from the secondary host.

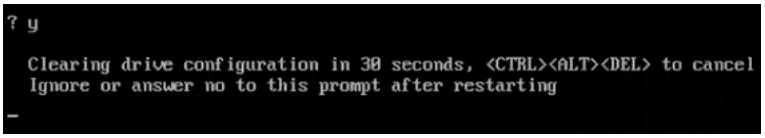
Required Fail-Over Scenario with Hardware Replacement

This scenario occurs when the active NW Server completely fails and the hardware requires replacement, for example you receive a Return Merchandise Authorization (RMA). You need to run reconfigure the host with the `nwsetup-tui` and contact NetWitness Customer Support to reestablish licensing. If you choose to rebuild the replacement host as a temporary standby (for example, until your scheduled fail-back occurs), you must answer "**Yes**" to the **Standby Host Recovery Mode** `nw-setup-tui` prompt when configuring this temporary standby for failing back (see step 4 in the Set Up Secondary NW Server in Standby Role procedure for the context of this prompt).

Set Up Secondary NW Server in Standby Role

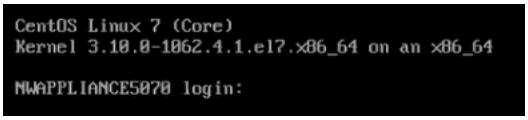
3. Before you install a secondary NW Server host for the standby role, make sure that:
   a. The primary NW Server is running 12.4.1.
   b. All component hosts are running 12.4.1
      If you are:
      - Installing NetWitness Platform 12.4.1, follow the instructions in the *NetWitness Platform Physical Host Installation Guide for Version 12.4.1*.
4. Create a base image on the secondary NW Server:
   a. Attach media (ISO) to the host.
      See the *NetWitness Platform Build Stick Instructions* for more information.
      - Physical media - use the ISO to create bootable flash drive media the **Etcher®** or another suitable imaging tool etch an Linux file system on the USB drive. See the *NetWitnessBuild Stick Instructions* for information on how to create a build stick from the ISO. Etcher is available at: https://etcher.io.
      - iDRAC installations - the virtual media type is:
        - **Virtual Floppy** for mapped flash drives.
        - **Virtual CD** for mapped optical media devices or ISO file.
   b. Log in to the host and reboot it.

```
login: root
Password:
Last login: Tue Sep 19 13:27:15 on tty1
[root@saserver ~]# reboot
```



c. Select **F11** (boot menu) during reboot to select a boot device and boot to the connected media. After some system checks during booting, the following **Welcome to NetWitness Platform 12.4.1** installation menu is displayed. The menu graphics will render differently if you use a physical USB flash media.

d. Select **Install NetWitness Platform 12.4.1** (default selection) and press **Enter**.
The Installation program runs and stops at the **Enter (y/Y) to clear drives** prompt that asks you to format the drives.

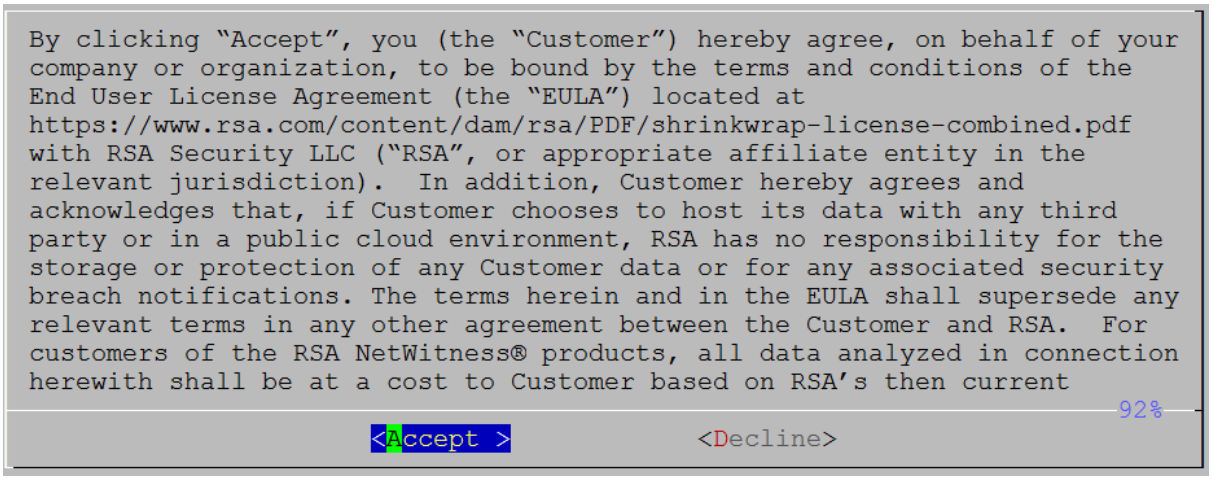


Caution: You must respond y or Y to this prompt even if the host does not have an internal RAID configuration or the installation will fail.

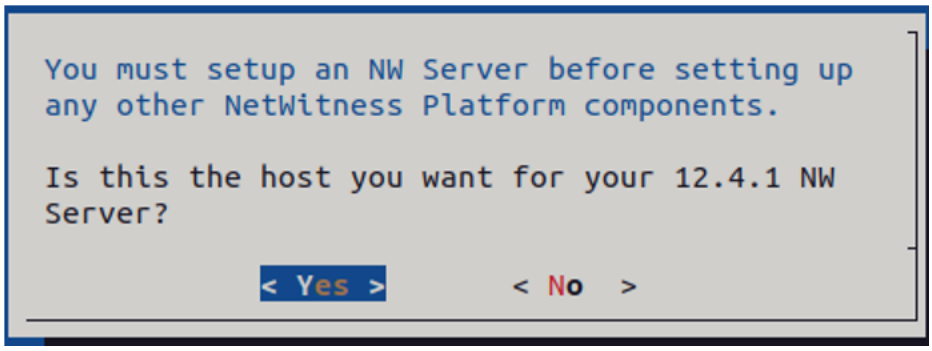
e. Type **Y** to continue.
The default action is No, so if you ignore the prompt and it will select No in 30 seconds and will not clear the drives. The **Press enter to reboot** prompt is displayed.

The system displays the all installation tasks it is performing. This can take a minute or so.After it completes the tasks, the installation program reboots the host.

Caution: Do not reboot the attached media (media that contains the ISO file, for example a build stick).



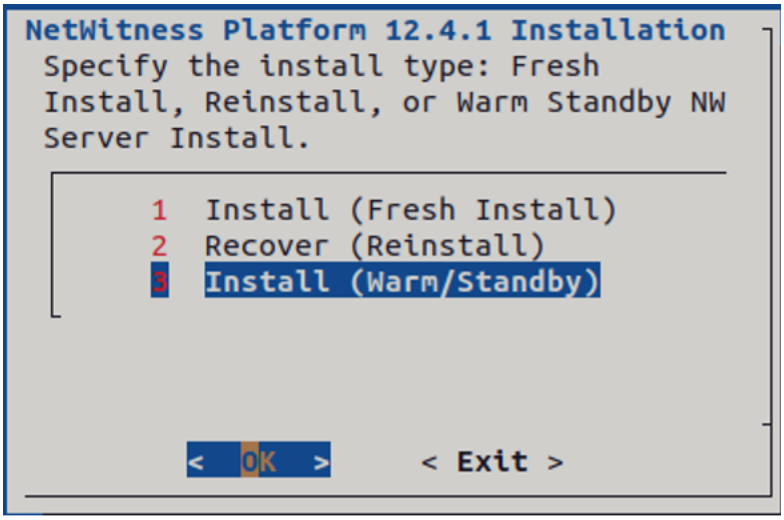
f. Log in to the host with the `root` credentials.



2. Run the `nwsetup-tui` command.

Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use the Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press **Enter** to register your command response and move to the next prompt.
2.) The Setup program adopts the color scheme of the desktop or console you use access the host.
3.) During the Setup program, when you are prompted for the network configuration of the host, be sure to specify the same network configuration that was used for the original installation of 11.x on this host (it must be exactly the same).

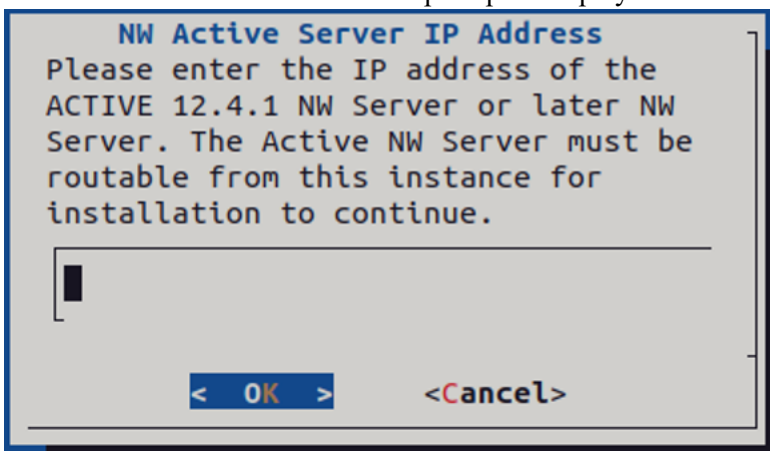
This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.



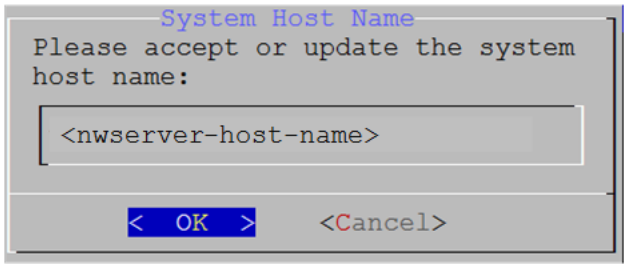
3. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 12.4.1 NW Server** prompt is displayed.

   Your response to this prompt identifies a host as either the primary or secondary during a fresh install (and the selected response stays constant regardless of the current or future role, that is active or standby of the host).

4. Tab to **Yes** and press **Enter**.
   The **Install or Recover** prompt is displayed.



5. Tab to **3 Install (Warm Standby)** and press **Enter**.
   The Standby Host Recovery Mode prompt is displayed.



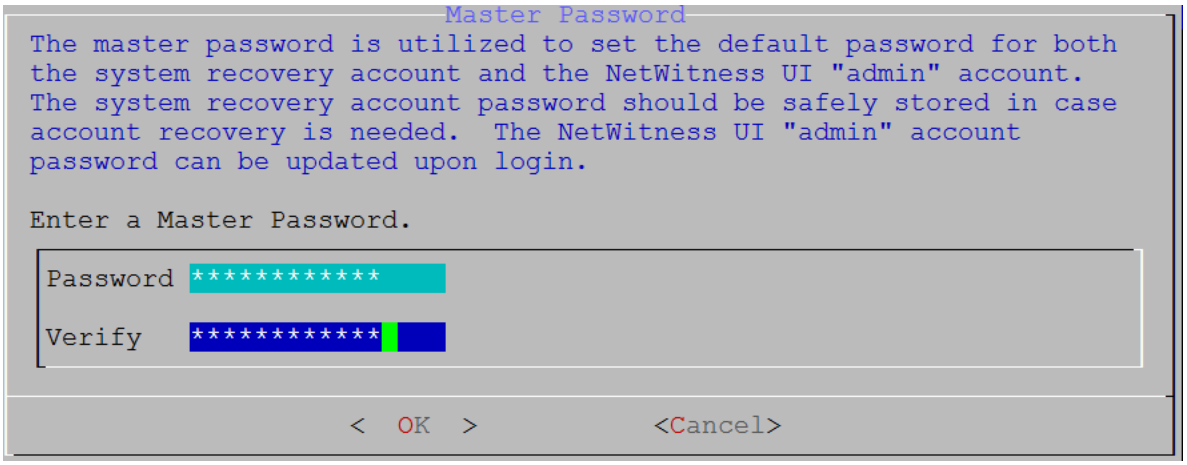
6. Tab to:

   - **No** and press **Enter** to set up a secondary NW Server with the standby role (most common scenario).
   - **Yes** and press **Enter** to set up a host that was previously used as a primary NW Server with the standby role so you can execute a fail-over and fail-back (less common scenario).

The NW Active Server IP Address prompt is displayed.

7. Type the IP Address of the NW Server in the active role, tab to **OK**, and press **Enter**.
   The **Host Name** prompt is displayed

Caution: If you include "." in a host name, the host name must also include a valid domain name.



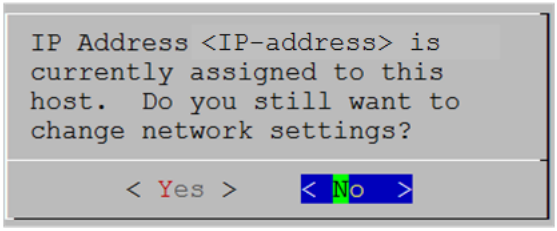
8. Press **Enter** if want to keep this name. If not edit the host name, tab to **OK**, and press **Enter** to change it.
   The **Master Password** prompt is displayed.

   Note: You must use the same Master and Deploy Admin credentials fot the Warm Standby NW Server Host that you used for the Active NW Server Host.

   The following list of characters are supported for Master Password and Deployment Password:

   - Symbols: **! @ # % ^ +**
   - Lowercase Characters: **a-z**
   - Uppercase Characters: **A-Z**

   No ambiguous characters are supported for Master Password and Deployment Password. For example: space { } [ ] ( ) / \ ' " ` ~ ; : .< > -



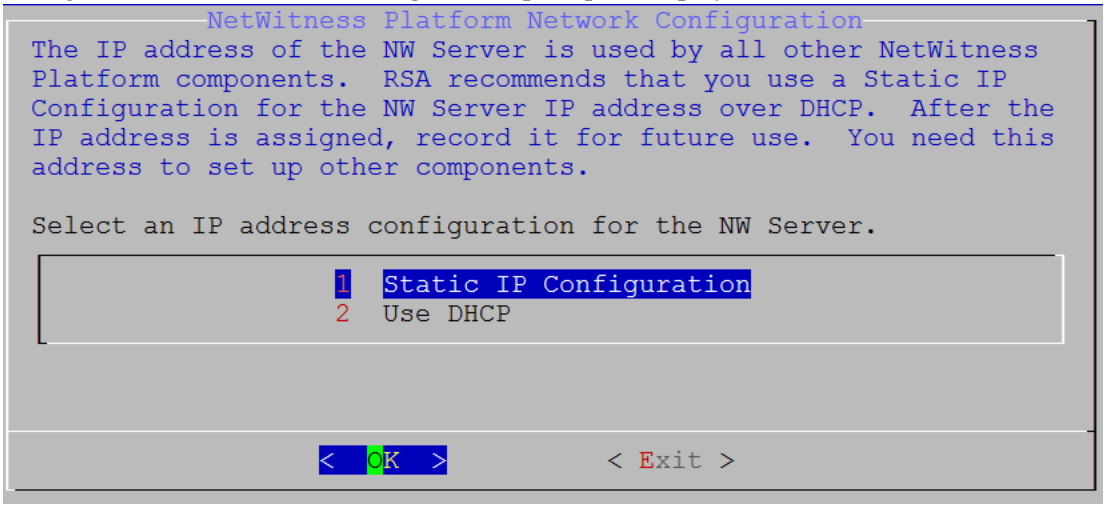
9. Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.
   The **Deployment Password** prompt is displayed.

10. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**. One of the following conditional prompts is displayed.

    - If the Setup program finds a valid IP Address for this host, the following prompt is displayed.

      Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** if you want to change the IP configuration found on the host.

    - If you are using an SSH connection, the following warning is displayed.



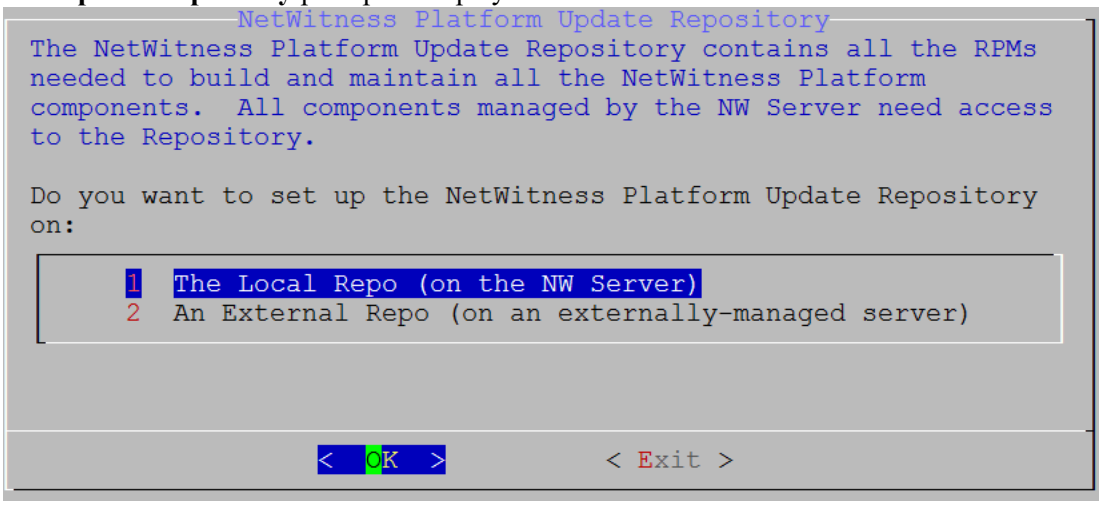
> **Note:** If you connect directly from the host console, the following warning will not be displayed.

      Press **Enter** to close warning prompt.

    - If the Setup Program found an IP configuration and you chose to use it, the **Update Repository** prompt is displayed. Go to step 12 to and complete the installation.

    - If the Setup Program did not find an IP configuration or if you chose to change the existing IP configuration, the **Network Configuration** prompt is displayed.

11. Tab to **OK** and press **Enter** to use **Static IP**.
    If you want to use DHCP, down arrow to **2 Use DHCP** and press **Enter**.
    The **Network Configuration** prompt is displayed.

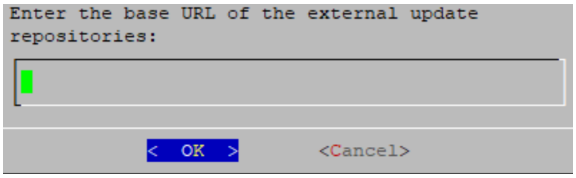


12. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit.**
    The following **Static IP Configuration** prompt is displayed.

13. Type the configuration values (using the down arrow to move from field to field), tab to **OK**, and press **Enter**. If you do not complete all the required fields, an `All fields are required` error message is displayed (**secondary DNS Server** and **Local Domain Name** fields are not required). If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

    Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

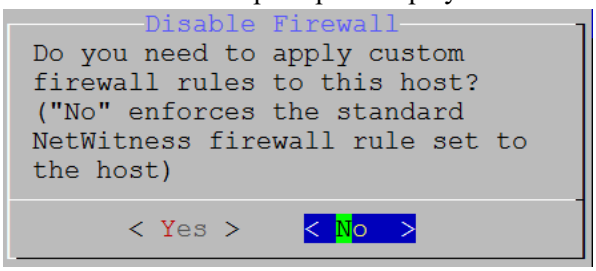
    The **Update Repository** prompt is displayed.



14. Press **Enter** to choose the **Local Repo** on the NW Server.
    If you want to use an external repo, down arrow to **External Repo**, tab to **OK**, and press **Enter**.

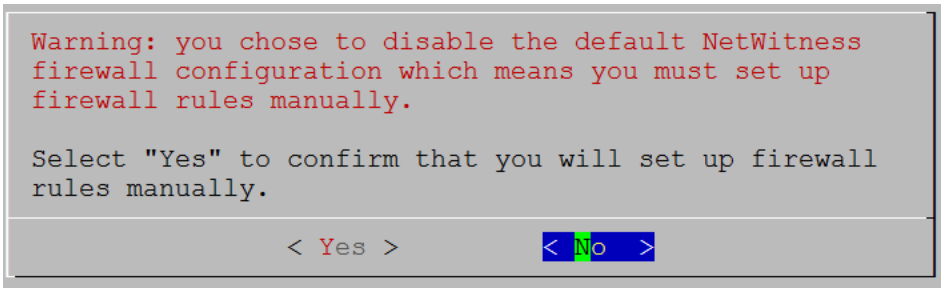
    - If you select **1 The Local Repo (on the NW Server)** in the Setup program, make sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can install NetWitness 12.4.1.
    - .0.0. If the program cannot find the attached media, you receive the following prompt.

- If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access to NetWitness updates and CentOS updates. Refer to "Appendix B. Create an External Repo" in the *Physical Host Installation Guide* for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.



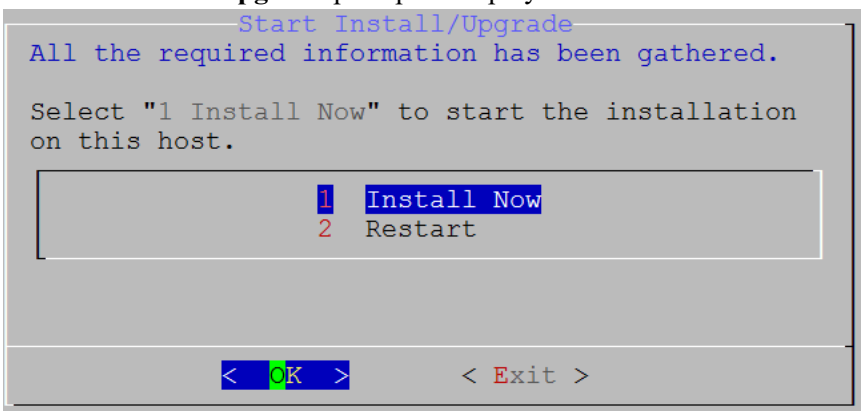
Enter the base URL of the NetWitness external repo and click **OK.** The **Start Install** prompt is displayed.

See "Set Up an External Repository with NetWitness and OS Updates" under "Hosts and Services Procedures" in the *NetWitness Platform Hosts and Services Getting Started Guide* for instructions.



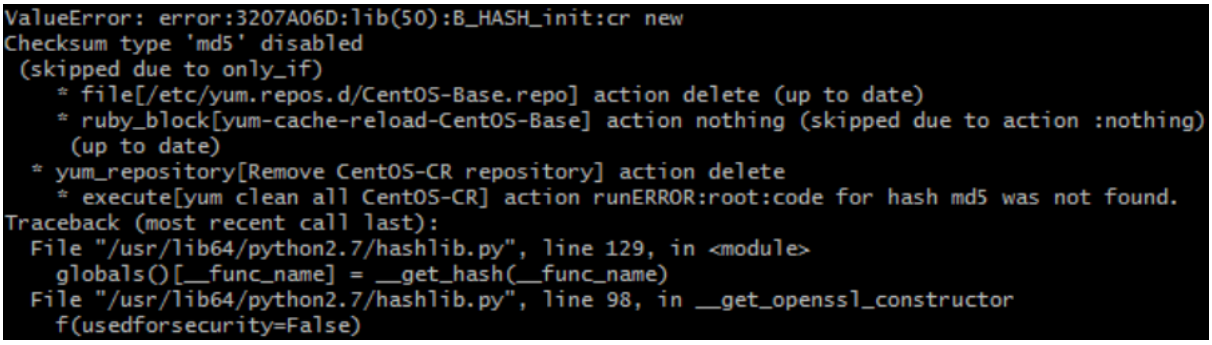
Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

The Disable firewall prompt is displayed.



15. Tab to **No** (default), and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.

If you select **Yes**, confirm your selection(select **Yes** again) or select **No** to use the standard firewall configuration.



The **Start Install/Upgrade** prompt is displayed.

16. Press **Enter** to install 12.4.1 on the NW Server.
    When **Installation complete** is displayed, you have installed the 12.4.1 NW Server on this host.

> **Note:** Ignore the hash code errors similar to the errors shown in the following figure that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.

17. License the secondary NW Server.

    a. Log in to the secondary NW Server User Interface, click  (Admin) > **System** > **Info**, and note the **License Server ID** under **Version Information**.

    b. SSH to the primary NW Server.

    c. Edit the `/opt/netwitness/flexnetls/local-configuration.yaml` file and add the `back up hostid` (that is, the **License Server ID**).
    This is an example of the section of the `local-configuration.yaml` file before you add the **License Server ID**.

```
# Hostid of the backup server, if in fail over configuration.
#backup-hostid:
```

    This is an example of the section of the `local-configuration.yaml` file after you add the MAC address (for example, `000c2918c80d`) of the Warm Standby NW Server Host.

```
# Hostid of the backup server, if in fail over configuration.
backup-hostid: "000c2918c80d"
```

d. Restart the fneserver service.
```
systemctl restart flexnetls-RSALM
```

e. (Conditional) If your NetWitness Platform deployment is prohibited from accessing the Internet (Air Gap), you must:

i. Download the capability request from NetWitness Platform User Interface.

ii. Upload the request to FNO.

iii. Upload the response from FNO to the NetWitness Platform User Interface.

18. Schedule the backup of the primary NW Server and the copying of this backed-up data to the secondary NW Server.

a. SSH to the primary NW Server.

b. Submit the following commands.
```
/opt/rsa/saTools/bin/schedule-standby-admin-data-sync -d -i <warm-standby-admin-server-ip>
```

Note: If the Warm Standby server becomes active, and if it will be accessed by any NW host with a NAT IP address, the NAT IP address must be added to the command:
```
/opt/rsa/saTools/bin/schedule-standby-admin-data-sync -d -i <warm-standby-admin-server-ip>-p<warm-standby-NAT-admin-server-ip>
```

This backs up the primary NW Server data and copies the backup archive file to the secondary NW Server daily for future fail-over use. It also schedules the backup and copy to execute on a daily basis. You can display help for the `schedule-standby-admin-data-sync` script with the following command string.
```
/opt/rsa/saTools/bin/schedule-standby-admin-data-sync --help
```
This returns the following help to which you can refer to customize the host data backup (such as backup frequency).
```
Schedule Data Synch between AdminServer and Standby AdminServer
Script also executes a synchronization each time.
Usage:
schedule-standby-admin-data-sync command [options]
```

```
Commands:

-h, --help                  Display Help
-d, --daily                 Schedule daily data
                            synchronization
-w, --weekly                Schedule weekly data
                            synchronization
-c, --custom <crontab       Schedule custom data
formatted>                  synchronization
                            i.e. to schedule for
                            midnight on 1st and
                            10th of the month:
                            '0 0 1,10 * *'
-i, --standby-ip <IP        (required) IP
address>                    address of standby
                            NW Server
-p, --standy-ip-public <NAT (optional) NAT-based
IP address>                 IP address of
                            standby NW Server
-v, --verbose               Enable verbose
                            output
```

Fail Over Primary NW Server to Secondary NW Server with Same IP Address

Initially, the primary NW Server fails over to the secondary NW Server. When the primary NW Server is back up, the secondary NW Server fails over to the primary NW Server, and that is referred to as a fail-back. When it is possible for the secondary NW Server to have the same IP address as the primary NW Server after failover, complete the following procedure to fail over from the primary NW Server to the secondary NW Server.

1. SSH to the secondary NW Server.

IMPORTANT: If you have installed New Health & Wellness on Admin Server, perform the following:
- Install New Health & Wellness on Standby NW server.
- Back up the Search category (New Health and Wellness) from Primary NW server to standby NW server using the NRT:

```
nw-recovery-tool --export --dump-directory <Backup_directory_path> --category Search
```

You must manually copy files from Primary NW server to Standby NW server after running the above command.

2. Run the `nw-failover` script with the `--make-active` argument:
   ```
   nw-failover --make-active
   ```
3. Complete the following steps for planned and required fail-over.
   a. SSH to the primary NW Server.
   b. Run the fail-over script with the `--make-standby` argument to assign the standby role to the primary NW Server:
      ```
      nw-failover --make-standby
      ```
   c. Shut down the primary NW Server.

   Note: If you have a catastrophic failure, you may need to provision a new host or re-image the primary NW Server and complete the Set Up secondary NW Server in Standby Role procedure for this host to create a new primary NW Server, so that you can fail back to it.
4. Validate that the component hosts have connected to the new active NW Server by running the following command on the new active NW Server:
   ```
   nw-manage --check-hosts-status
   ```

   Note: Do not continue to the next step until all component hosts have successfully connected to the new active NW Server. Rerun `nw-manage --check-hosts-status` as needed to continue verification.
5. Restart the Respond-server service once the failover operation has been successfully completed.
6. Follow the IP address change procedures for the now-active NW Server in "Change Host Network Configuration" in the *System Maintenance Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Note: If the primary NW Server is going to remain online, you must update its IP address so that it no longer conflicts with the Warm Standby NW Server IP address when it is changed. Follow the IP address change procedures for the now-active NW Server in "Change Host Network Configuration" in the *System Maintenance Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

7. Shut down the primary NW Server, or reboot the primary NW Server and set it up as the new secondary NW Server by completing the steps in Set Up Secondary NW Server in Standby Role for this host to create a new primary NW Server, so that you can fail back to this host.

IMPORTANT: After successful fail over to Standby NW server, restore the Search category (New Health & Wellness) using NRT:
`nw-recovery-tool --import --dump-directory <Backup_directory_path> --category Search`

Fail Over Primary NW Server to Secondary NW Server with Different IP Address

If your secondary NW Server will maintain a different IP address from your primary NW Server after a fail-over event, for example, if the secondary NW Server is located in a different data center from the primary NW Server, follow these steps to fail over from the primary NW Server to the secondary NW Server.

1. SSH to the secondary NW Server.

IMPORTANT: If you have installed New Health & Wellness on Admin Server, perform the following:
- Install New Health & Wellness on Standby NW server.
- Back up the Search category (New Health and Wellness) from Primary NW server to standby NW server using the NRT:
`nw-recovery-tool --export --dump-directory <Backup_directory_path> --category Search`
You must manually copy files from Primary NW server to Standby NW server after running the above command.

2. Run the failover script:
   `nw-failover --make-active`
3. Complete the following steps for planned and required fail-over.
   a. SSH to the primary NW Server.
   b. Run the fail-over script with the `--make-standby` argument to assign the standby role to the primary NW Server:
      `nw-failover --make-standby`
   c. Shut down the primary NW Server.

      Note: If you have a catastrophic failure, you may need to provision a new host or re-image the primary NW Server and complete the Set Up secondary NW Server in Standby Role procedure for this host to create a new primary NW Server, so that you can fail back to it.

4. If you are running in a mixed-version environment, log in to each component host that is still on a version prior to 12.4.1 and execute the following:
   - `netconfig --update-dns --dns <active-nw-server-ip-address>`
   - `sed -Ei 's/^master:.*/master: <active-nw-server-ip-address>/g' /etc/salt/minion`
   - `systemctl restart salt-minion`

   Note: If you have a component host that uses a NAT IP address to reach the NW Server, substitute the `<NAT-IP-address>` for the `<active-nw-server-ip-address>` in both bullet items above.
5. Restart the Respond-server service once the failover operation has been successfully completed.
6. Shut down the primary NW Server, or reboot the primary NW Server and set it up as the new secondary NW Server by completing the steps in Set Up Secondary NW Server in Standby Role for this host to create a new primary NW Server, so that you can fail back to this host.

IMPORTANT: After successful fail over to Standby NW server, restore the Search category (New Health & Wellness) using NRT:
`nw-recovery-tool --import --dump-directory <Backup_directory_path> --category Search`

Note: If the secondary NW Server had any custom certificates, you must re-apply them after failover. For information about how to re-apply custom certificates, see "(Optional) Use a Custom Server Certificate" in the *System Security and User Management Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Note: After upgrading the NW Server host or a component host to 12.4.1, review the contents of the `/etc/hosts.user` file for any obsolete host entries. The `/etc/hosts.user` file contains system and user-generated entries that are not managed by NetWitness Platform. However, entries from `/etc/hosts.user` are merged with NetWitness Platform-generated host mappings to create and update `/etc/hosts`. To avoid conflicts with NetWitness Platform-generated mappings, and to avoid generating connectivity errors resulting from an IP address change, NetWitness recommends that you remove any entries in `/etc/hosts.user` that include a non-loopback IP address of a NetWitness Platform host. After updating `/etc/hosts.user`, you must refresh the system by running the following command:
`nw-manage --refresh-host --host-key <ID, IP, hostname or display name of host>`

Note: While changing a host's IP address or during failover, component hosts can become disconnected from NW Server hosts. Follow these steps to reconnect a host system to its NW Server system.
1. Log in to the component host using SSH or the console.
2. Run the command `nw-manage --override-nws-ip --ipv4 <current IP address of the NW Server.`
When this command completes, the component host is reconnected to the NW Server at the specified IP address.

Follow the steps in the sections that apply to your environment.

- SSO
- Reporting Engine
- UCF
- PAM
- ECAT
- RSA NetWitness Orchestrator (By Demisto)
- Audit Logging
- Health and Wellness
- Malware Analysis
- Windows Legacy Collection

SSO

Update Configuration for Single Sign-On

Note: You must disable SSO configurations ONLY when NW Server IP is changed.

When the host network is configured with a new IP address, the SSO configurations also must be updated.

To do this:

1. Disable the SSO configuration using `nw-shell` after failover from new IP.
   To resolve this issue you must disable SSO manually, using the following commands:
   a. SSH to `admin server node`.
   b. Connect to `nw-shell`.
   c. Connect to admin server service using the `connect --service admin-server` command.
   d. Log in to admin server using the `login` command.
   e. Enter the admin username and password.
   f. Execute the following commands:
      - `cd /rsa/security/authentication/web/saml/sso-enabled`
      - `set false`
      - `logout`
      - `exit`

- `systemctl restart rsa-nw-admin-server`

2. Change the host IP address to the new IP.
3. Generate the new metadata and reupload it in ADFS. For more information, see the "Configure SAML 2.0 provider settings for portals" topic in the Microsoft documentation.

For more information, see the "Troubleshooting" topic in the *System Security and User Management Guide.*

Reporting Engine

Update Configuration for Reporting Engine

Note: You must update the Reporting Engine configurations ONLY when NW Server IP is changed.

When the host network is configured with a new IP address, you must update and verify the Reporting Engin configurations. The hostname for NetWitness configurations under the Output Actions must be updated with the new IP.

To manually configure the new IP, perform the following steps:

1. Log in to NetWitness Platform.
2. Navigate to  (Admin) > **Services > Reporting Engine > View > Config**.
3. Click the **Output Actions** tab.

4. Add the new IP address in the **Hostname** field.
5. Click **Apply**.

UCF

To enable UCF to communicate with NetWitness Platform:

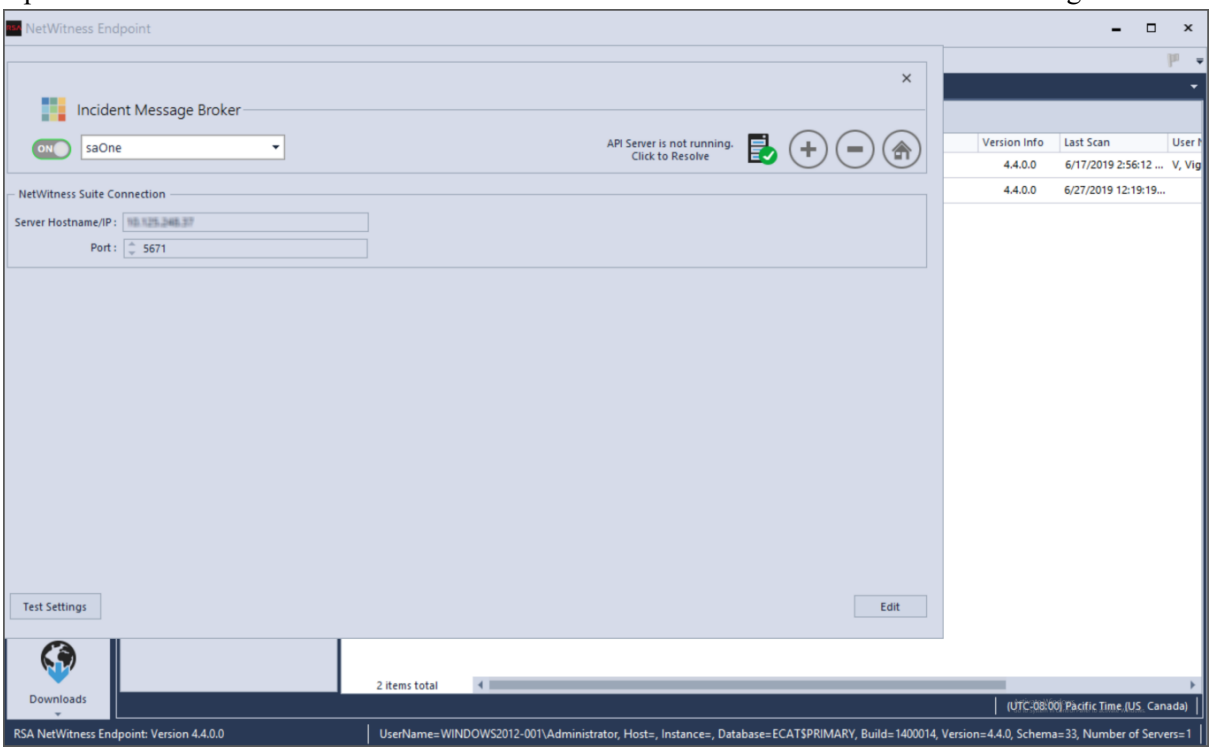
1. On the UCF server, execute the `runConnectionManager.bat` file (the same file that is used for adding connection details).
2. Select **Option #2, Edit endpoints**.
3. Select the NW Server connection from the options that are displayed.
4. When you are prompted for Host Address (the old IP address is shown in parentheses) enter the new IP address.

   Note: Do not change any other setting.

PAM

If you have PAM configured, after the failover, you must configure the system again using the instructions in the "Configure PAM Login Capability" topic in the *System Security and User Management Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

ECAT

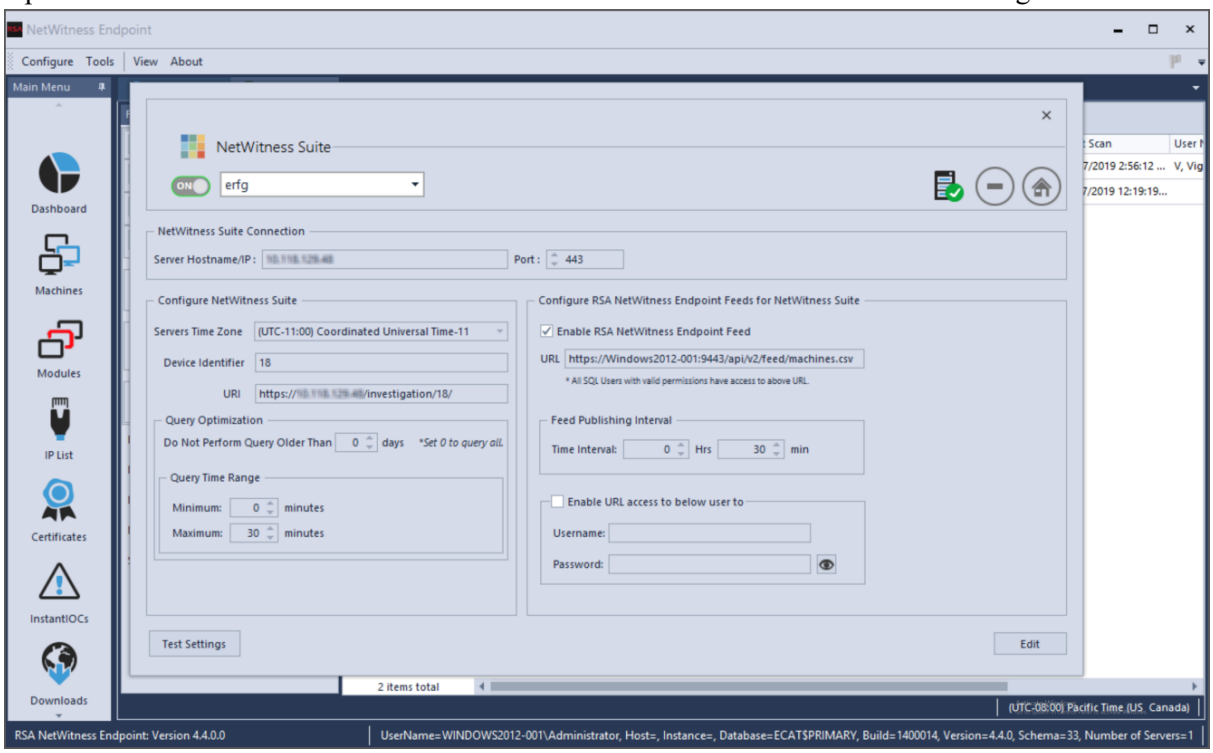


Update the following services:

- Incident Message Broker
- NetWitness Suite
- Syslog Server Settings

Incident Message Broker

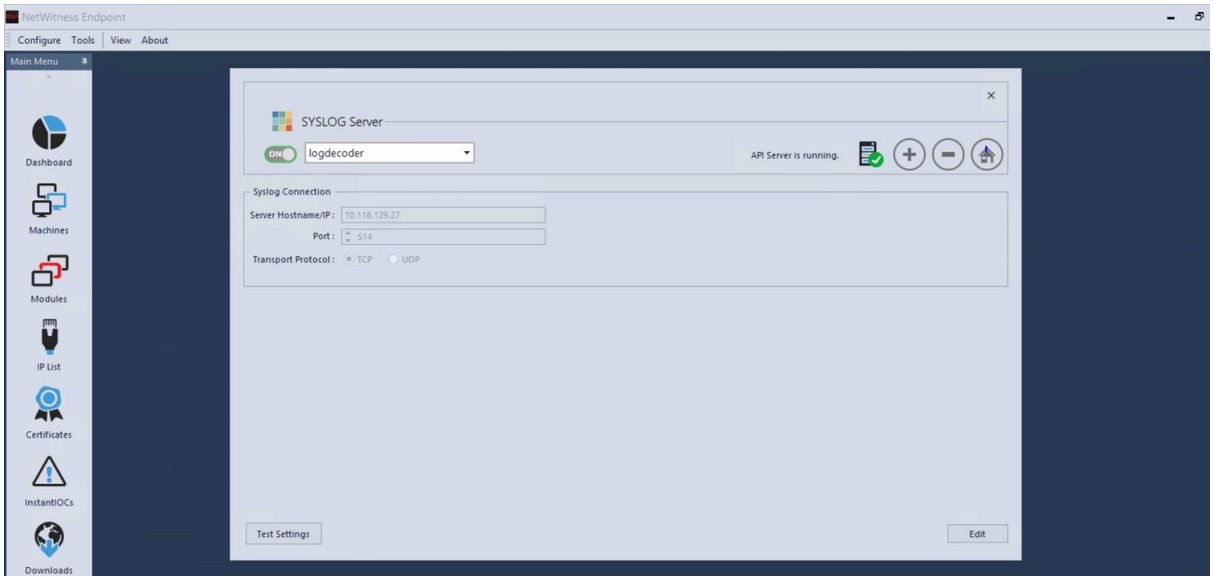
1. Log in to the NetWitness Endpoint user interface and go to **Configure** > **Monitoring and External Components Configuration** > **Incident Message Broker**.



2. Update the server Hostname and IP Address to the current active server and test the settings.

NetWitness Suite

1. Log in to the NetWitness Endpoint user interface and go to **Configure** > **Monitoring and External Components Configuration** > **Netwitness Suite**.

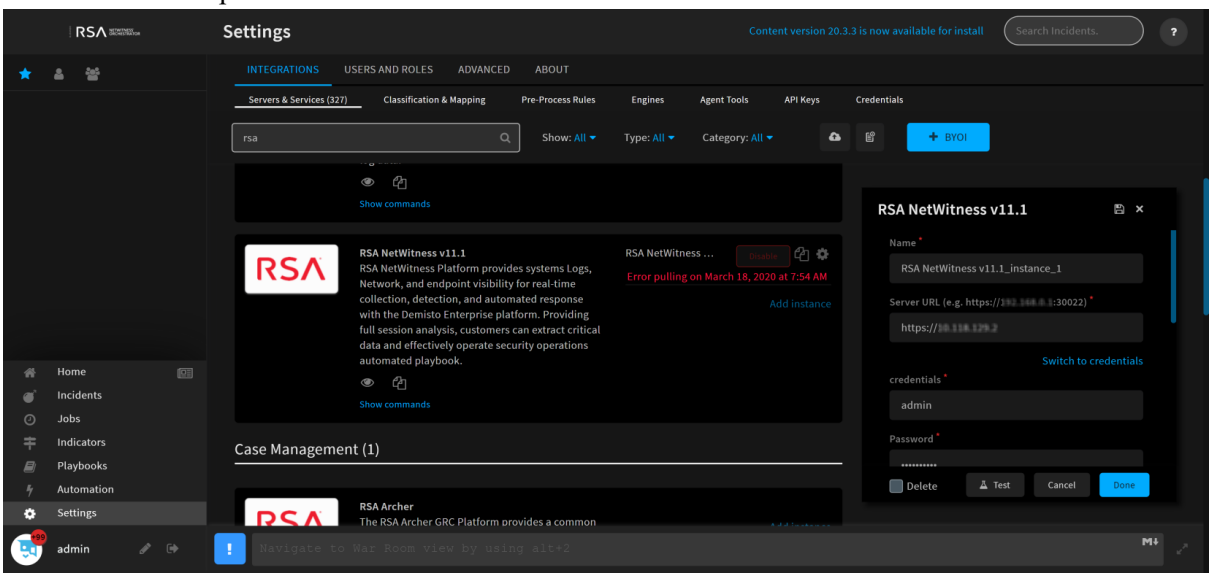


2. Update the server Hostname and IP address to the current active server and test settings.

Syslog Server Settings

If you are forwarding syslog messages to a NetWitness Platform Log Decoder, update the syslog server settings to point to the new IP address of the Log Decoder host.

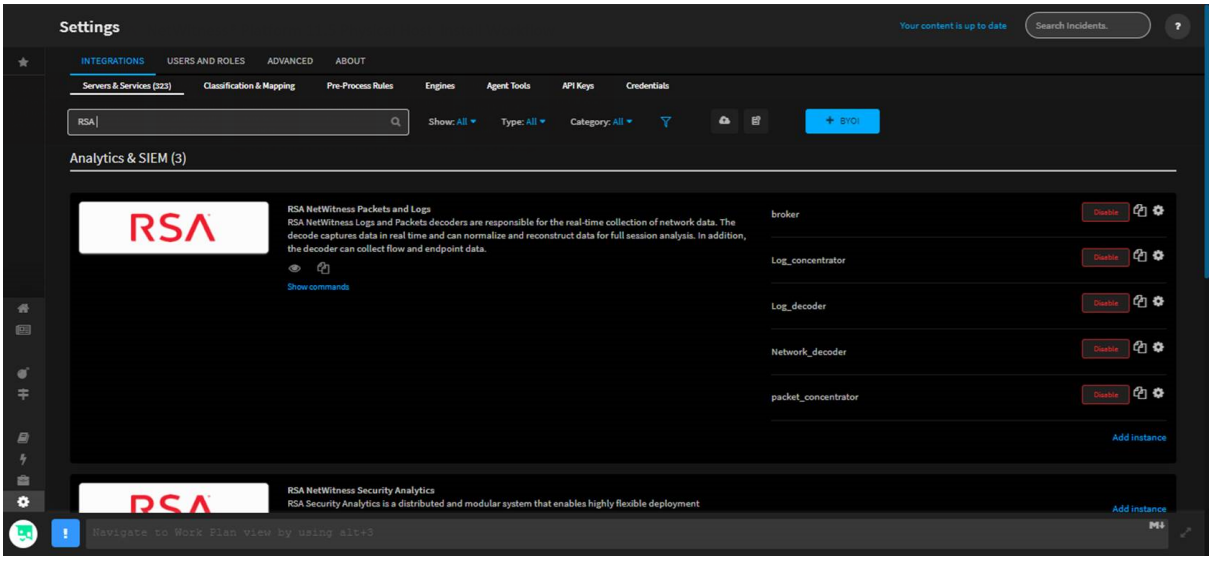
1. Log in to the NetWitness Endpoint user interface and go to **Configure** > **Syslog Server**.



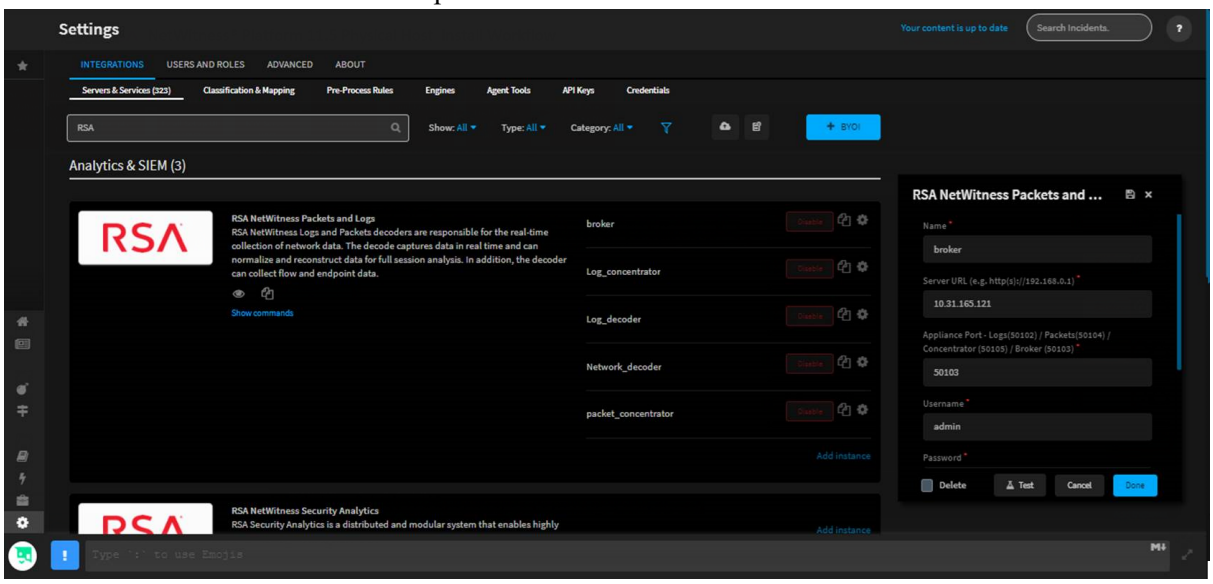
2. Select **logdecoder**, and in **Server Hostname/IP**, enter the new IP address of the Log Decoder host.

RSA NetWitness Orchestrator (By Demisto)

Update the Current Active NW Server to Fetch Respond Incidents and Alerts



1. Log in to Orchestrator and go to **Settings** > **server&services**.
2. Edit the RSA NetWitness V11.1 instance by updating the server URL to the current active NW Server to fetch respond incidents and alerts.



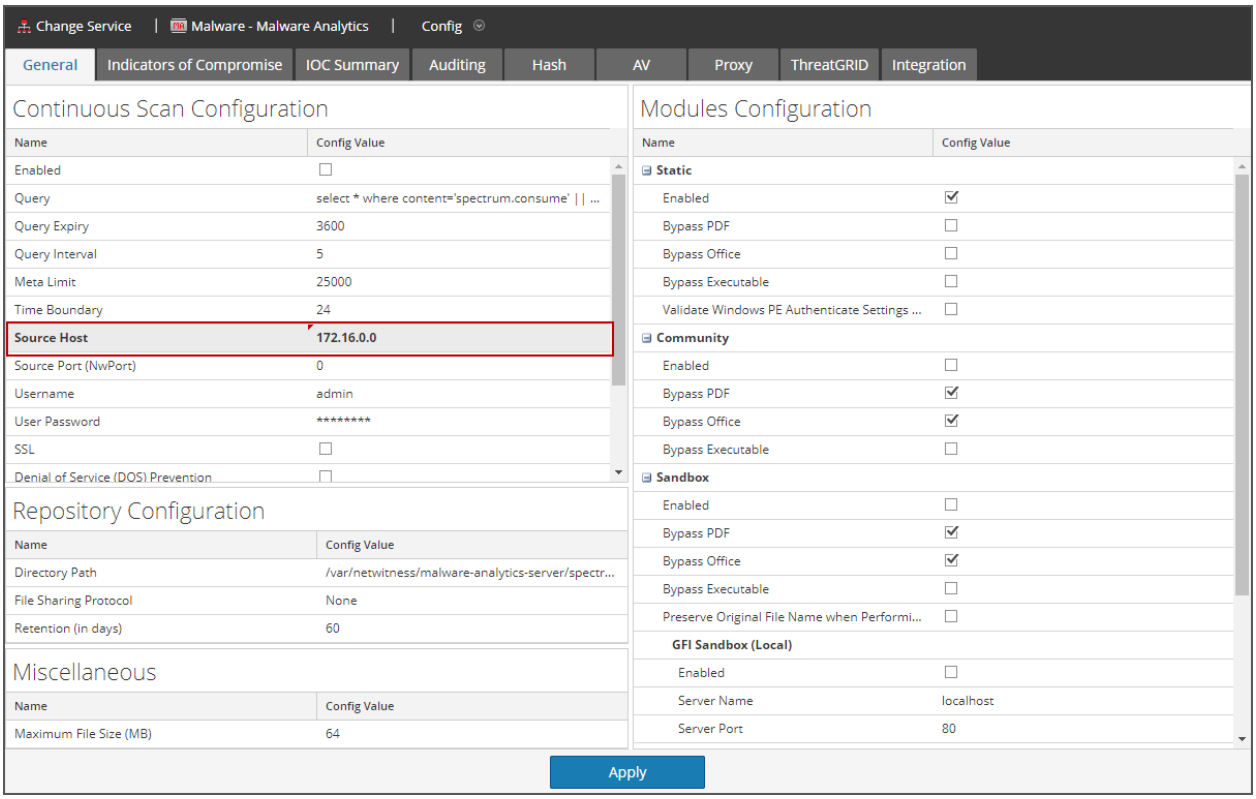
Update Component Hosts Acting as Data Sources

If you change the IP address of a component host, for example, a Concentrator, Network or Log Decoder, or Broker, that is acting as data source to the Orchestrator, update the following settings to point to the new IP address of the host.

1. Log in to Orchestrator and go to **Settings** > **server&services** and select the component host.

2. Enter the new IP address of the component host in **Server URL** and click **Done**.

Audit Logging



If you have changed the IP address of the NW Server, you must reconfigure audit logging. For instructions, see "Configure Global Audit Logging" in the *System Configuration Guide*.

Health and Wellness

If you have any Health and Wellness rules that contain IP addresses that have been changed, you must update those rules with the new IP addresses. For information about managing Health and Wellness rules, see "Monitor Health and Wellness using NetWitness Platform UI" in the *System Maintenance Guide*.

Malware Analysis

Source host IP address changes are not updated in the NetWitness user interface for Malware Analysis continuous scan configurations. You must manually update this configuration in the Malware Analysis Config view > **General** > **Continuous Scan Configuration** and update the source host IP address to the new host IP address.

Windows Legacy Collection

On occasion, you may need to change the IP address of your Windows Legacy Collector. You may also need to edit any Destination Groups that you have configured.

Change WLC IP Address

The following procedure describes how to change the IP address for your system.

1. Log onto the Windows Legacy Collector system and manually change the IP address on the system.
2. In the UI, confirm that the Log Collector service corresponding to the WLC system shows up in error (Red). It might take some time for it to reflect the changed status.
3. On the NetWitness Server, use the **nw-manage** utility to view the host information for the WLC using the following command:

   ```
   nw-manage --list-hosts
   ```

   Sample output from running the command is shown here:

   ```
   {
   "id" : "fdb8150c-e040-459e-8cc5-3c60ec2c65ae",
   "displayName" : "WLC-HOST-104",
   "hostname" : "10.101.216.102",
   "ipv4" : "10.101.216.102",
   "ipv4Public" : null
   } ]
   ```

   You use the value of **"id"** from your output in the following step.

4. Use the **nw-manage** utility to change the IP address of the WLC. For the **host-id** argument, use the value for the **"id"** that you noted from step 3. For the **ipv4** value, use the new IP Address to which you are changing.

   ```
   nw-manage --update-host --host-id "fdb8150c-e040-459e-8cc5-3c60ec2c65ae" --ipv4 10.101.216.105
   ```

5. After you see the message that the previous command ran successfully, go to the NetWitness Server UI and verify that the WLC service is running without any errors.

Edit Destination Groups For Log Collectors and VLCs

The Windows Legacy Collector is often configured with Destination Groups to forward events to Log Collectors or Virtual Log Collectors. If the IP address of any such Destination LC or VLC is changed, the Windows Legacy Collector can no longer forward events. To remediate this, you must edit the Destination groups for the WLC, making sure to select the new LC or VLC IP Address.

Note: If you added any content to the `/etc/hosts` file on the primary server, the contents of that file are available under `/var/netwitness/standby-data/unmanaged/etc` on the failover server. You can manually copy those files to the `/etc/hosts` file on the failover server after the failover is complete.

Fail Back Secondary NW Server to Primary NW Server

After a fail-over from the primary NW Server to the secondary NW Server, you need to fail back to your original setup of the primary NW Server in the active role and the secondary NW Server in the standby role.

Essentially, you follow the same steps described under Fail Over Primary NW Server to Secondary NW Server to fail back to your original setup (that is primary NW Server-active and secondary NW Server-standby). The difference is that you now need to fail over from the secondary NW Server to the primary NW Server.

Note: The secondary SA becomes active in case of a fail over. You should re-run the `schedule-standby-admin-data-sync` from the secondary SA before failing back to the primary SA.

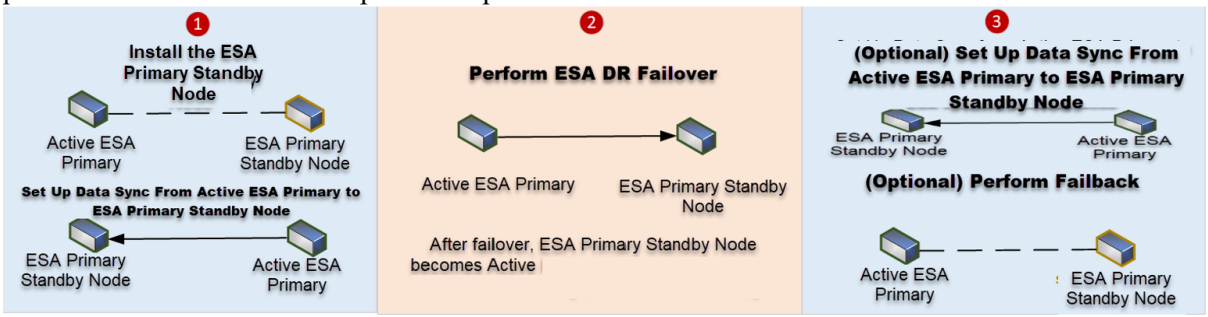
Introduction to ESA Primary Disaster Recovery Failover

NetWitness platform enables administrators to perform smooth failovers with minimal processes and tools involved in the entire design, making it easier for the clients to minimize downtime during service interruptions.

Administrators can set up an ESA Primary StandBy Node in the event of a disaster or unplanned outage of the original active ESA Primary node. Recovery involves switching from the active ESA Primary node to ESA Primary Standby node by taking Mongo and configuration backups of the active ESA Primary system and restoring them to the ESA Primary Standby with the required configurations to ensure uninterrupted access to ESA correlation and context hub services.

The new ESA Primary Standby node should be configured with its unique IP and host details, ensuring a seamless setup process not hindered by prior configurations.

Note: More than 1 ESA Primary Standby is not supported.



Prerequisites

- Active ESA Primary System
- ESA Primary Standby System
- The system configuration of the ESA Primary Standby System must be the same as the system configuration of the active ESA Primary System.

Workflow

The following figure is a high-level workflow illustrating the step-by-step tasks you can perform to complete ESA Primary Disaster Recovery Failover and Failback process.

1. Install the ESA Primary Standby Node (initial setup) and set up the data sync from Active ESA Primary to ESA Primary Standby Node.
2. Perform ESA Primary Disaster Recovery Failover to make ESA Primary Standby node as the active node.
3. If the older Active ESA Primary is recovered after a disaster, set up the data sync from the current Active ESA Primary to the older Active ESA Primary (ESA Primary Standby Node) and then perform Failback. This is an optional step.

For more information on the workflow, see ESA Primary Disaster Recovery Failover Use Case Example.

Install ESA Primary Standby

You must install a new VM / HW appliance on a dedicated host in the same manner as you install any component service category on a host.

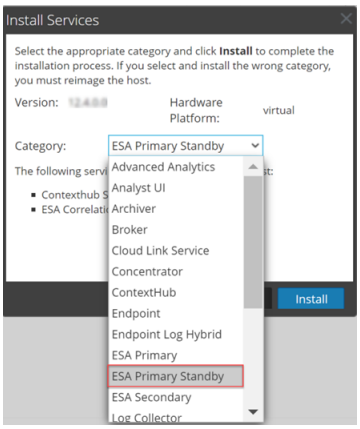
See the "Install NetWitness Platform" in the NetWitness Platform Documentation for instructions on how to install any component service. Follow the steps to deploy for ESA Primary Standby component.

After you provision the VM / HW appliance (that is after you run **nwsetup-tui** for the component host designated for the ESA Primary Standby UI), complete the following steps to setup the ESA Primary Standby service category on the provisioned host.

1. Log in to NetWitness and go to (**Admin**) > **Hosts**.

   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.



2. Select the host in the **New Hosts** dialog and click **Enable**.

   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

3. Select that host in the **Hosts** view (for example, **ESA Primary Standby**) and click Install .

   The **Install Services** dialog is displayed.

4. Select **ESA Primary Standby** in **Category** and click **Install**.

5. During the installation, the ESA Primary Standby services are enabled. Proceed with the installation once the ESA Primary Standby services are disabled.

Note: - The ESA Primary Standby services can be activated only after the failover. At any point of time, only one ESA Primary node should be active and running.

Note: At any point of time if you want to know which ESA Primary node is active, you must run the following command.

```
nw-failover-esa -- show-state
```

Caution: In CCM, the Correlation servers from both active ESA Primary node and ESA Primary Standby node will be available. However, you must only configure your deployments, policies, and groups with the Correlation server service running on the current active ESA primary node.

Set up Data-Sync

Data-Sync is a process which involves exporting, transferring, and importing of the new, deleted, and modified data such as Incidents and Alerts from the active ESA Primary to ESA Primary Standby periodically. The Data-sync script is designed to operate on active ESA Primary for synchronizing data between an active and ESA Primary Standby server in the NetWitness environment. It handles the export of the new, deleted, and modified data from the active ESA Primary, transfer to ESA Primary Standby, and import on the Standby side. The periodic data-sync process ensures that the Mongo DBs of both active ESA Primary and ESA Primary Standby are in sync with each other.

To trigger data-sync, run the following script on the active ESA Primary:

```
/opt/rsa/saTools/bin/schedule-standby-esa-primary-data-sync -n -d 23 -f
23 -i "<standby-ip>"
```

The following table provides details on the syntax of the script.

Syntax	Description
-n	Checks the date and frequency input that you provide.
-d	Indicates the number of days of Respond DB data you want to carry over from active ESA Primary to ESA Primary Standby. The minimum range is 1 day and the maximum range is 30 days.
-f	Indicates the frequency of the data-sync process (minimum of once every hour, maximum of once every 23 hours).
-i	Indicates the IP of ESA Primary Standby host.

Perform ESA Primary Disaster Recovery Failover (Make Active)

In case of a disaster or catastrophic failure of active ESA Primary, you can perform ESA Primary Disaster Recovery failover to make ESA Primary Standby active.

To perform ESA Primary Disaster Recovery Failover

1. SSH to the Admin Server.
2. Run the following failover script with the **--make-active** argument:

   ```
   nw-failover-esa --make-active
   ```

3. (Optional) Complete the following steps for planned and required fail-over.
   a. SSH to the NW Server.
   b. Run the fail-over script with the --make-standby argument:

      ```
      nw-failover-esa --make-standby
      ```

This step can be performed only under the following scenarios:

1. After installing a new ESA Primary Standby node and setting up the data sync from the active ESA Primary to the newly installed ESA Primary Standby node.
2. After recovering the older (previous) active ESA Primary.

Note: After you run the `nw-failover-esa --make-active` command, the ESA Primary Standby node becomes active, and if you reboot the original (previous) active node, the original (last) active node becomes Standby.

nw-failover-esa Script Arguments

The following table lists all the arguments used while running the **nw-failover-esa** script for ESA Primary Disaster Recovery failover.

Arguments	Description
-ma, --make-active	The argument is used to make Standby node to active node.
-ms, --make-standby	The argument is used to make active node to Standby node.
--local	The argument is used to perform make standby operation locally on the active node.
-ss, --show-state	The argument is used to know the status of ESA Primary nodes.

RBAC Permissions

For more information on the RBAC permissions for ESA Primary Disaster Recovery Failover, see System Security and User Management Guide for 12.4.1.

ESA Primary Disaster Recovery Failover Use Case Example

The following use case provides the example of an administrator using NetWitness Platform to perform ESA Primary Disaster Recovery failover.

After logging in to NetWitness Platform, John, an administrator, observes that the active ESA Primary node contains a lot of data associated with Respond DB, Context Hub DB, and Correlation server DB. The administrator decides to install an ESA Primary Standby system and perform periodic data-sync to avoid any sort of data loss in case of the catastrophic failure of the active ESA Primary system. As the first step, John installs the ESA Primary Standby system by referring to Install ESA Primary Standby section. After installing the Standby system, John runs the following script on the active ESA Primary node and triggers the data-sync process.

```
/opt/rsa/saTools/bin/schedule-standby-esa-primary-data-sync -n -d 23 -f 23 -i
"<standby-ip>"
```

Initially, the administrator sets the frequency of the data-sync process to once in **23** hours. Later, John decides to set the frequency of the data-sync process to **1** hour as the administrator thinks that the time period of **23** hours is too long and if the disaster happens at say 12th hour or 15th hour, the data loss will be significant. Therefore, he runs the following script on the active ESA Primary node.

```
/opt/rsa/saTools/bin/schedule-standby-esa-primary-data-sync -n -d 1 -f 1 -i
"<standby-ip>"
```

Soon after setting up the data-sync process, John observes that the ESA Primary node which was active, up, and running previously has failed. The administrator immediately takes further steps of action and performs ESA Primary Disaster Recovery failover after referring to Perform ESA Primary Disaster Recovery Failover (Make Active) section to make the ESA Primary Standby node as the active node.

After performing a successful failover, John notices that the configurations associated with the ESA data are now reflecting in ESA Primary Standby.

Note: Data backed up or synced up till the last periodic data-sync will be available in the ESA Primary Standby. Post that, any incoming data will not be a part of ESA Primary Standby.

After 2-3 months, the previous active ESA Primary node (say ESAP1) recovers after going through a catastrophic failure. This time, John decides to make the recovered ESA Primary node a standby node. Therefore, the administrator performs the Step 3 mentioned in Perform ESA Primary Disaster Recovery Failover (Make Active) section to make the recovered ESA Primary node a standby node.

Caution: To perform the failback process (making ESAP1 as the active ESA Primary node and the current active ESA Primary node (say ESAP2) as the ESA Primary Standby node again) once ESAP1 is recovered, atleast one data-sync job must be run on ESAP2 (current active ESA Primary node). Otherwise, the failback process fails.

Troubleshoot ESA Primary Disaster Recovery Failover Issues

This section lists certain issues that you may encounter during or after setting up the periodic data-sync and while performing ESA Primary Disaster Recovery failover.

Periodic Data-Sync Failure Issue

Problem	Periodic data-sync fails which can be seen in `/var/log/netwitness/standby-esa-primary-sync/standby-esa-primary-data-sync.log` file.
Workaround	If periodic data-sync is failing, do the following. • Make sure that the ESA Primary Standby node is running and it is reachable from the active ESA Primary node. • Make sure that the Mongo DB associated with the ESA Primary Standby node is running.

Make-Active Failure Issue

Problem	When you run the make-active command, failover fails which can be seen on the console logs or in `/var/log/netwitness/recovery-tool/recovery.log` file.
Workaround	If make-active is failing, do the following. • Make sure that the ESA Primary Standby node is running and it is reachable from the active ESA Primary node. • Make sure that the Mongo DB associated with the ESA Primary Standby node is running. • Make sure that atleast one data-sync job is completed and atleast one backup file is present on ESA Primary Standby at `/var/netwitness/standby-esa-primary-data/`. • Make sure that the Correlation and Context Hub services are running only on the active ESA Primary node and are not running on ESA Primary Standby node.

Note: In CCM (Centralized Content Management), Admin, Appliance and other pages, the Context Hub and Correlation services on the ESA Primary Standby node appear down not because of any real failures but because of the fact they are purposely made down.

Appendix

This section contains few additional information on ESA Primary Disaster Recovery Failover.

Data-Sync Responsibilities

The data-sync performs the following actions:

- Sets a cron with the specified frequency to run the NRT backup.

  Frequency:

  Number of days of Mongo backup: 1 to 30 days

  Frequency of triggering the script: Every hour or once in 23 hours.
- Takes NRT backup of Configuration of Correlation-server, Context Hub server, and ESA Mongo data.
- Verifies the integrity of the transferred data through checksums. Updates metadata related to the last successful backup time and recovery flag.
- Transfers the exported active ESA Primary data using the NetWitness Recovery Tool securely through zipped folder to ESA Primary Standby using SSH and SCP keys.
- Imports the configuration and ESA data on ESA Primary Standby.
- Sets a cron on the active ESA primary for clean-up after failover (make-active). Cron is set during the execution but the cleanup runs only when the actual standby becomes active.

IMPORTANT: When you set up periodic data-sync to sync the data from active ESA Primary node to ESA Primary Standby node, do the following.
-Run the command `crontab -l` on the active ESA Primary node and make sure that the following output is displayed.

```
1 */1 * * * /opt/rsa/saTools/bin/schedule-standby-esa-primary-data-sync -d 23 -f 1 -i <IP of Standby ESA>
@reboot /etc/netwitness/recovery-tool/nw-recovery-helper/nw-failover-esa.py -ms -local]
```

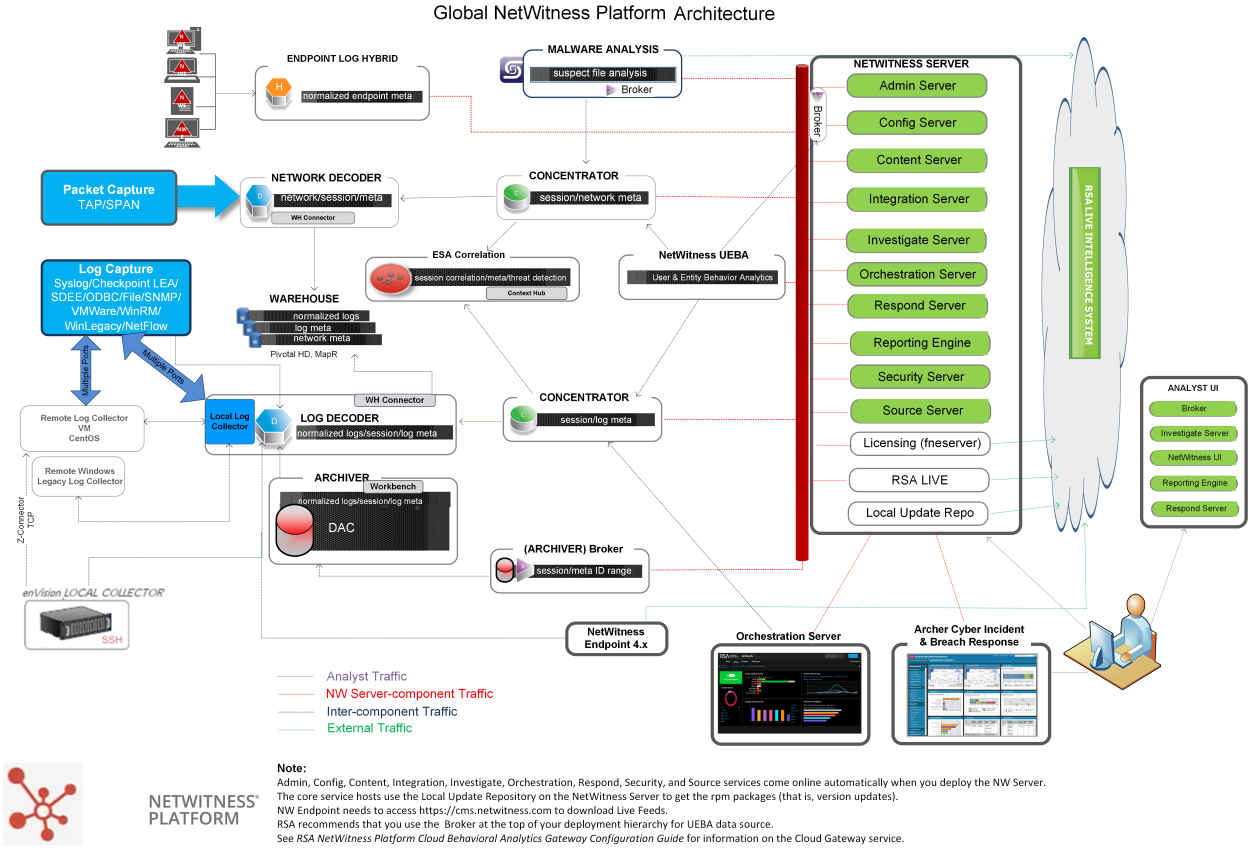
- Run the command `crontab -l` on the ESA Primary Standby node and make sure that the following output is displayed.

```
@reboot /etc/netwitness/recovery-tool/nw-recovery-helper/nw-failover-esa.py -ms -local]
```

If the respective outputs are not displayed when you run the `crontab -l` command on the active ESA Primary node and ESA Primary Standby node, run the data-sync script on the active ESA Primary node.

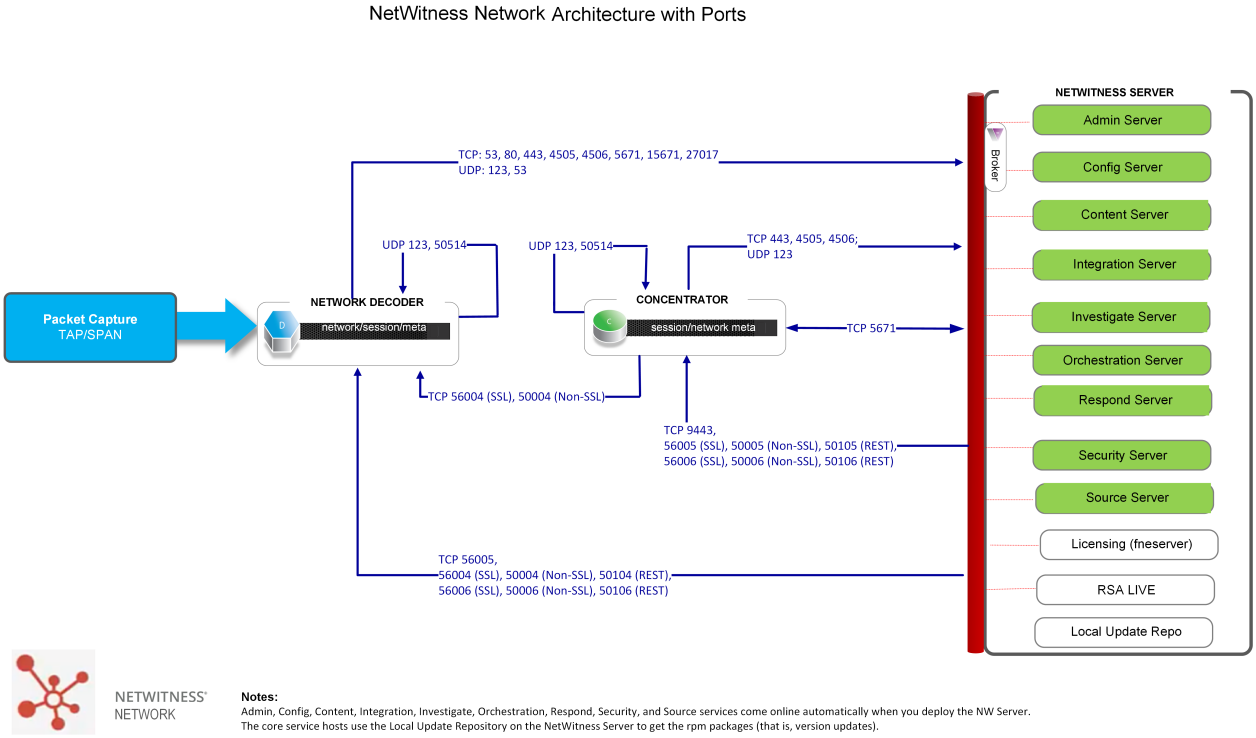
Note: Context Hub Database collections are only exported and transferred to ESA Primary Standby during data-sync. They are imported on ESA Primary Standby only during failover. In case of Respond Database, the collections such as Alerts and Incidents are not only exported and transferred to ESA Primary Standby, but they are also imported on ESA Primary Standby during data-sync.

Network Architecture and Ports



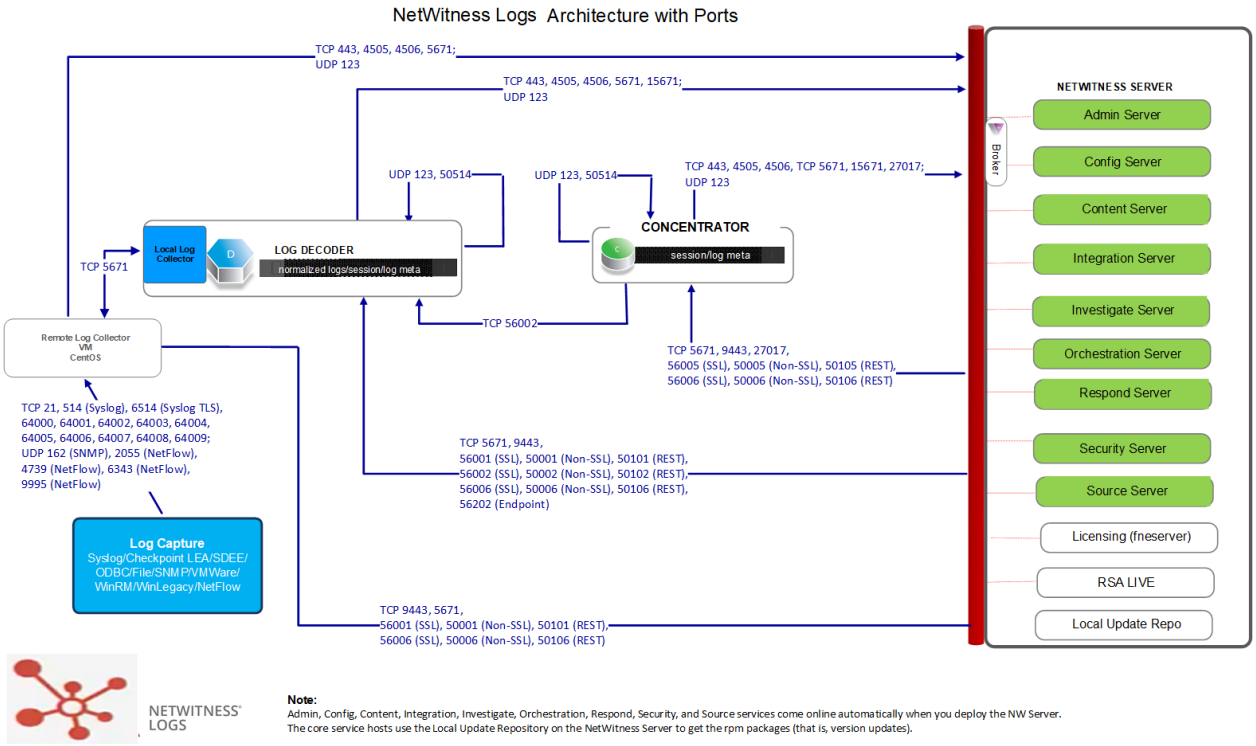
Refer to the following diagrams and port tables to ensure that all the relevant ports are opened for components in your NetWitness deployment to communicate with each other.

See NetWitness Endpoint Architecture at the end of this topic for individual Endpoint Architectural diagrams.



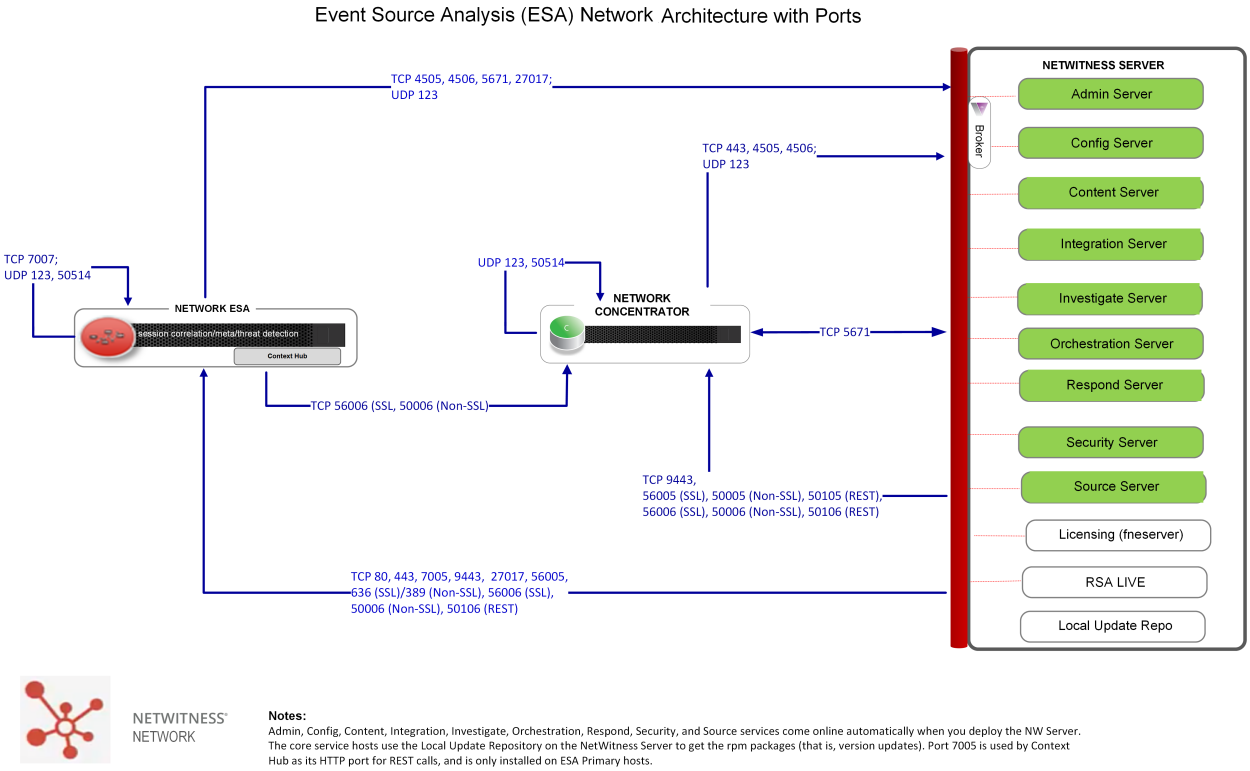
NetWitness Network Architecture Diagram

The following diagram illustrates the NetWitness network architecture including all of its component products.



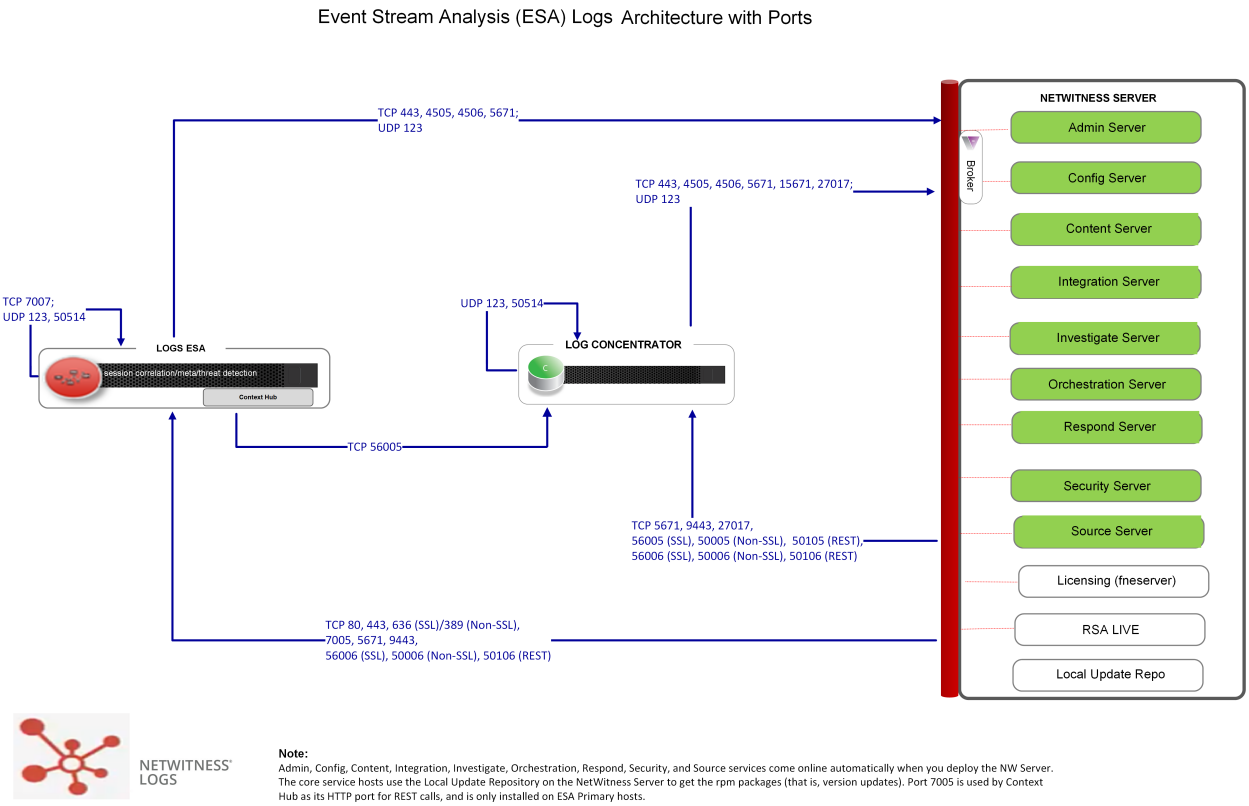
Note: NetWitness core hosts must be able to communicate with the NetWitness Server (Primary Server in a multiple server deployment) through UDP port 123 for Network Time Protocol (NTP) time synchronization.

NetWitness Network (Packets) Architecture Diagram with Ports



NetWitness Logs Architecture Diagram with Ports

Note:
Admin, Config, Content, Integration, Investigate, Orchestration, Respond, Security, and Source services come online automatically when you deploy the NW Server.
The core service hosts use the Local Update Repository on the NetWitness Server to get the rpm packages (that is, version updates).



Event Stream Analysis Network (Packets) Architecture Diagram with Ports

The following diagram illustrates the Event Stream Analysis network architecture with packet capture.

Event Stream Analysis (Logs) Architecture Diagram with Ports

The following diagram illustrates the Event Stream Analysis network architecture with log collection.

NetWitness Firewall Requirements Summary

The following table lists all the ports that need to be open in your firewall by host.

Note: The "NW Server" host ports apply to both the Primary and Warm Standby NW Server. Synchronization between the Primary and Warm Stanby is done through TCP Port 22.

Source Host	Destination Host	Ports
NW Server	ESA Primary	**TCP:** 22, 5671, 7005 **UDP:**123
NW Server	ESA	**TCP:** 22, 5671 **UDP**: 123
NW Server	Network Decoder	**TCP:** 22, 5671, 50004 (Non-SSL), 50006 (Non-SSL), 50104 (REST), 50106 (REST), 56004 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Broker	**TCP:** 5671, 50003 (Non-SSL), 50006 (Non-SSL), 50103 (REST), 50106 (REST) 56003 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Concentrator (Network & Logs)	**TCP:** 22, 5671, 50005 (Non-SSL), 50006 (Non-SSL), 50105 (REST), 50106 (REST), 56005 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Network Hybrid	**TCP:** 22, 5671, 50004 (Non-SSL), 50005 (Non-SSL), 50006 (Non-SSL), 50104 (REST), 50105 (REST), 50106 (REST), 56004 (SSL), 56005 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Log Decoder	**TCP:** 22, 5671, 50001 (Non-SSL), 50002 (Non-SSL), 50006 (Non-SSL), 50101 (REST), 50102 (REST), 50106 (REST), 56001 (SSL), 56002 (SSL), 56006 (SSL) **UDP:** 123
NW Server	Log Hybrid	**TCP:** 22, 5671, 50001 (Non-SSL), 50002 (Non-SSL), 50005 (Non-SSL), 50006 (Non-SSL), 50101 (REST), 50102 (REST), 50105 (REST), 50106 (REST), 56001 (SSL), 56002 (SSL), 56005 (SSL), 56006 (SSL) **UDP:** 123

Source Host	Destination Host	Ports

Source Host	Destination Host	Destination Ports	Comments
Endpoint Log Hybrid	NW Server	TCP 15671	RabbitMQ Management UI
Endpoint Log Hybrid	NW Server	TCP 444	nw-node-infra service failover check

Endpoint Relay Server

Source Host	Destination Host	Destination Ports	Comments
Endpoint Agent	Relay Server	TCP 443	To forward host data to the Relay Server
Endpoint Log Hybrid	Relay Server	TCP 443	Pull host data from the Relay Server

Event Stream Analysis (ESA) Host

Note: The ports in this table are for the ESA Primary an ESA Secondary hosts. The Content Hub, Correlation and ESA Analytics services are co-located on the ESA Primary host. The Correlation and ESA Analytics services are co-located on the ESA Secondary host.

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	ESA	TCP 15671	RabbitMQ Management UI
ESA Primary and Secondary	NW Server	TCP 15671	RabbitMQ Management UI
ESA Primary and Secondary	NW Server	TCP 443	RSA Update Repository
Admin Workstation	ESA	TCP 22	SSH
NW Server, ESA Secondary	ESA Primary	TCP 27017	MongoDB
NW Server	ESA Primary	TCP 7005	Context Hub Launch Port - (ESA Primary)
NW Server	ESA	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
ESA Primary and Secondary	cms.netwitness.com	TCP 443	Live
ESA Primary and Secondary	NFS Server	TCP 111 2049 UDP 111 2049	iDRAC Installations
ESA Primary and Secondary	Active Directory	636 (SSL)/389 (Non-SSL)	
NW Server	ESA	80 (HTTP)/ 443 (HTTPS)(REST)	
ESA Primary	Archer	443 (SSL)/80 (Non-SSL)	
ESA Primary	ESA Primary	TCP 7007	Launch Port
ESA Primary and Secondary	NW Server	TCP 444	nw-node-infra service failover check

New Health and Wellness

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	New Health and Wellness	TCP 22	SSH
Admin Workstation	New Health and Wellness	TCP 5601	Kibana UI
NW Hosts	New Health and Wellness	TCP 9200	Elasticsearch REST API Port
NW Server	New Health and Wellness	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
NW Server	New Health and Wellness	TCP 15671	RabbitMQ Management UI
NW Server	New Health and Wellness	TCP 7018	Metrics Server Launch Port
NW Server	New Health and Wellness	TCP 7020	Node Infra Server Launch Port

New Health and Wellness on Different Subnet

If the New Health and Wellness is on a different subnet, you must open the respective NetWitness Platform hosts port.

Example:
New Health and Wellness is on subnet A: 10.10.1.0/24 and LogHybrid host is on subnet B: 10.10.2.0/24. In this case, you must open ports for Log Decoder, Log Collector, Concentrator on Metrics Server (New Health and Wellness host) to allow ports in the firewall for communication.

Source Host	Destination Host	Destination Ports	Comments
New Health and Wellness	Log Decoder	50002(Non-SSL),56002 (SSL)	Log Decoder Application Ports
New Health and Wellness	Log Collector	50001(Non-SSL),56001 (SSL)	Log Collector Application Ports
New Health and Wellness	Concentrator	50005(Non-SSL)/56005 (SSL)	Concentrator Application Ports

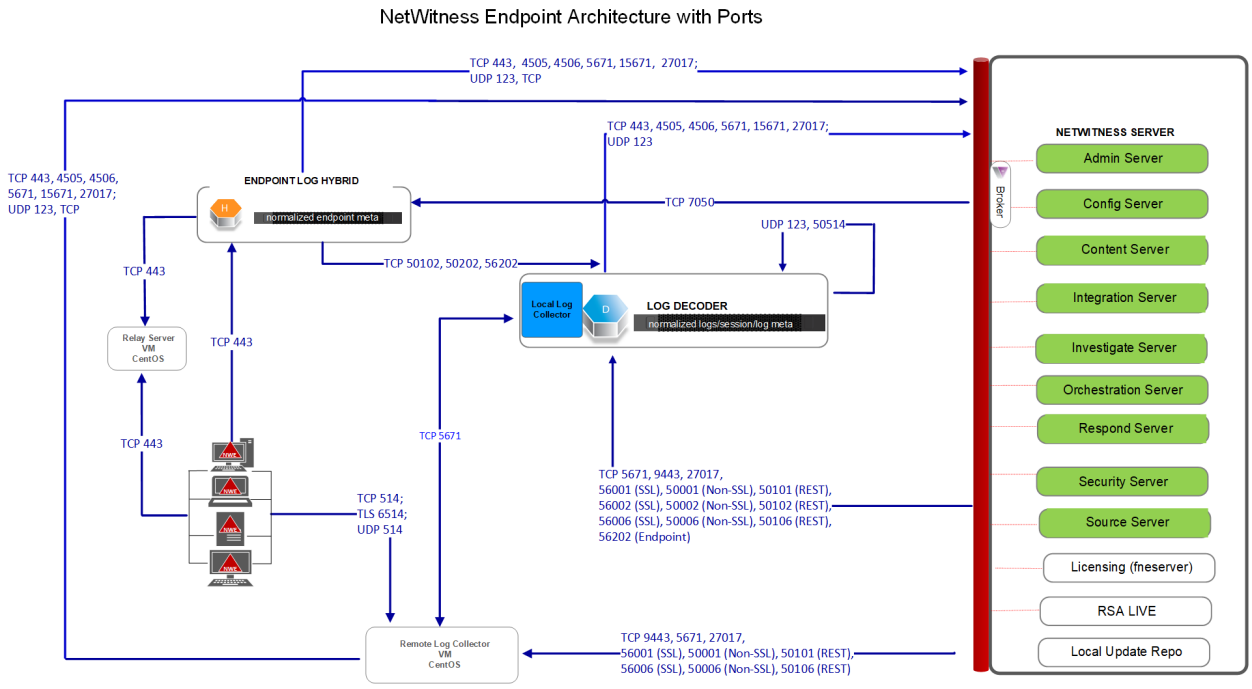
NetWitness Endpoint Architecture



NetWitness Endpoint Architecture

NetWitness Endpoint 4.4 Integration with NetWitness Platform

NetWitness Endpoint Architecture with Ports

For more information on the services running on Endpoint Log Hybrid, see *NetWitness Endpoint Configuration Guide*.

How to Change UDP Port for Endpoint Log Hybrid

The following steps tell you how to change the Endpoint Log Hybrid default UDP port 444 if it is not acceptable in your environment. 555 is the example this procedures uses as a replacement for 444 UDP port.
There are two tasks you need to o change the Endpoint Log Hybrid default UDP port 444:

Task 1 - Tell All Agents to Use a New UDP Port

Task 2 - Update the Port on All Endpoint Log Hybrid Hosts in Your Environment

Note: If you did not select the custom firewall rules option when you ran the nwsetup-tui, NetWitness platform overwrites the firewall rules are overwritten after a period of time. Please refer to the following Knowledge Base Article 00036446 (https://community.netwitness.com/t5/netwitness-knowledge-base/how-to-add-custom-firewall-rules-after-nwsetup-tui-has-completed/ta-p/5900) if this is the case.

Task 1 - Tell All Agents to Use a New UDP Port

Complete the following steps to update the UDP port in the default Enterprise Data Replication (EDR) policy, and all other policies you have, to tell all agents to use a new UDP port.

1. In the **NetWitness** menu, select  (Admin) > **Endpoint Sources** > **Policies**.
   The **Policies** view is displayed.
2. Select the **Default EDR Policy** and click **Edit** from the toolbar.
3. roll down to find the **UDP PORT** and change the value (for example, change from **444** to **555**).
4. Click **Publish Policy** at the bottom of the view.

Task 2 - Update the Port on All Endpoint Log Hybrid Hosts in Your Environment

SSH to each Endpoint Log Hybrid host in your environment with `admin` credentials and make the following updates.

1. Update the `iptables` rules to allow `555` in place of `444`.
   a. Replace `444` with `555` in the following file.
   ```
   vi /etc/sysconfig/iptables
   ```
   b. Restart `iptables` with the following command string.
   ```
   systemctl restart iptables
   ```
   c. Verify the change with the following command string.
   ```
   iptables -L -n
   ```
   The following is an example of what is displayed for a correct change.
   ```
   ACCEPT udp -- 0.0.0.0/0 0.0.0.0/0 udp multiport dports 555 /*
   EndpointNginxPort */ ctstate NEW
   ```
2. Update the SELinux policy. 555 is a privileged port, so you must update SELinux policy to allow this port.
   a. Run the following command string.
   ```
   semanage port -a -t http_port_t -p udp 555
   ```
   If you received any python errors or warnings, ignored them.
   b. Verify the change with the following command string.
   ```
   semanage port -l | grep http_port_t
   ```
   The following is an example of what is displayed for a correct change.
   ```
   http_port_t udp 555, 444
   ```
   c. (Optional) Remove `444`.
3. Update nginx config.
   a. Edit the following file.
   ```
   vi /etc/nginx/nginx.conf
   ```
   b. Search for the following string.
   ```
   listen 444 udp;
   ```
   c. Replace `444` with `555`.

d. Restart nginx with the following command string.
```
systemctl restart nginx
```

4. Verify that agents are communicating over the new port.

a. Run the following command string.
```
tcpdump -i eth0 port 555
```

b. Wait for 30 seconds because the port sends out a beacon every 30 seconds. If t everything is working correctly, information similar to the following will be displayed.
```
09:20:12.571316 IP 10.40.15.103.60807 > EPS1.rsa.lab.emc.com.dsf: UDP,
length 20
09:20:12.572433 IP EPS1.rsa.lab.emc.com.dsf > 10.40.15.103.60807: UDP,
length 1
```
Both lines must be returned. One is the size request (`20` bytes) and the other is the response size (`1` byte).

Site Requirements and Safety

Make sure that you read this topic thoroughly and observe all warnings and precautions prior to installing or maintaining your NetWitness devices.

Intended Application Uses

This product was evaluated as Information Technology Equipment (ITE) that may be installed in offices, schools, computer rooms, and similar indoor commercial type locations. This device is not intended for any connection to an outdoor type cable.

Service

There are no user-serviceable components inside of this device. Please contact Customer Care in the event of a malfunction. In a fault condition, high temperatures may arise inside the system causing an alarm signal. In the event of the alarm signal, immediately disconnect the device from the power source and contact Customer Care. Further operation of the device will be unsafe and may cause personal injury or property damage.

Safety Information

Site Selection

The system is designed to operate in a typical office environment. Choose a site that is:

- Clean, dry, and free of airborne particles (other than normal room dust).
- Well-ventilated and away from sources of heat, including direct sunlight and radiators.
- Away from sources of vibration or physical shock.
- Isolated from strong electromagnetic fields produced by electrical devices.
- In regions that are susceptible to electrical storms, we recommend you plug your system into a surge suppressor.
- Provided with a properly grounded wall outlet.
- Provided with sufficient space to access the power supply cords, because they serve as the product′s main power disconnect.

Equipment Handling Practices

Reduce the risk of personal injury or equipment damage by:

- Conforming to local occupational health and safety requirements when moving and lifting equipment.
- Using mechanical assistance or other suitable assistance when moving and lifting equipment.

- Reducing the weight for easier handling by removing any easily detachable components.

Power and Electrical Warnings

Caution: The power button, indicated by the standby power marking, DOES NOT completely turn off the system AC power; 5V standby power is active whenever the system is plugged in. To remove power from system, you must unplug the AC power cord(s) from the wall outlet.

- Do not attempt to modify or use an AC power cord if it is not the exact type required. A separate AC cord is required for each system power supply.
- This product contains no user-serviceable parts. Do not open the system.
- When replacing a hot-plug power supply, unplug the power cord to the power supply being replaced before removing it from the server.

Rack Mount Warnings

- The equipment rack must be anchored to an unmovable support to prevent it from tipping when a server or piece of equipment is extended from it. The equipment rack must be installed according to the rack manufacturer's instructions.
- Mounting of the equipment in the rack should be such that a hazardous condition is not achieved due to uneven mechanical loading.
- Extend only one piece of equipment from the rack at a time.
- To avoid risk of potential electric shock, a proper safety ground must be implemented for the rack and each piece of equipment installed in it.

Cooling and Air Flow

Installation of the equipment should be such that the amount of air flow required for safe operation of the equipment is not compromised.

NetWitness Community at https://community.netwitness.com contains a knowledge base that answers common questions and provides solutions to known problems, product documentation, community discussions, and case management.

Trademarks

RSA and other trademarks are trademarks of RSA Security LLC or its affiliates ("RSA"). For a list of RSA trademarks, go to https://www.rsa.com/en-us/company/rsa-trademarks. Other trademarks are trademarks of their respective owners.

License Agreement

This software and the associated documentation are proprietary and confidential to RSA Security LLC or its affiliates are furnished under license, and may be used and copied only in accordance with the terms of such license and with the inclusion of the copyright notice below. This software and the documentation, and any copies thereof, may not be provided or otherwise made available to any other person.

No title to or ownership of the software or documentation or any intellectual property rights thereto is hereby transferred. Any unauthorized use or reproduction of this software and the documentation may be subject to civil and/or criminal liability. This software is subject to change without notice and should not be construed as a commitment by RSA.

It is advised not to deploy third-party repos or perform any change to the underlying NetWitness Operating System that is not part of the supported NetWitness version. Any such change outside of the NetWitness approved image may result in a service or functionality conflict and require a reimage of the NetWitness system to bring NetWitness back to an optimized functional state. In the event a third-party repo is deployed, or other non-supported change is made by the customer without NetWitness approval, the customer takes full responsibility for any system malfunction until the issue can be remediated through troubleshooting efforts or a reimage of the service.

Third-Party Licenses

This product may include software developed by parties other than RSA. The text of the license agreements applicable to third-party software in this product may be viewed on the product documentation page on NetWitness Community. By using this product, a user of this product agrees to be fully bound by terms of the license agreements.

Note on Encryption Technologies

This product may contain encryption technology. Many countries prohibit or restrict the use, import, or export of encryption technologies, and current use, import, and export regulations should be followed when using, importing or exporting this product.

Distribution

Use, copying, and distribution of any RSA Security LLC or its affiliates ("RSA") software described in this publication requires an applicable software license.

Getting Started with ESA

This topic covers quick start topics for NetWitness Event Stream Analysis (ESA) to help you get started in using ESA. The following topics are designed to assist you in working with ESA Correlation Rules.

- Best Practices helps you to understand how to best set up, deploy, and create rules.
- Troubleshoot ESA helps you to troubleshoot different aspects of ESA, including rule writing and deployment.
- View Memory Metrics for Rules helps you to work with memory metrics to understand memory usage for ESA services.

In NetWitness version 11.5 and later, There are only two services that can run on an ESA host:

- **ESA Correlation (ESA Correlation rules):** Creates alerts from ESA rules.
- **Contexthub Server (Context Hub):** Runs only on an ESA primary host. Contexthub Server provides enrichment lookup capability in the Respond and Investigate views. For information, see the *Context Hub Configuration Guide*.

Note: The Event Stream Analytics Server (ESA Analytics) service is not supported in NetWitness Platform version 11.5 and later.

The first service is the ESA Correlation service that creates alerts from ESA rules, also known as ESA Correlation Rules, which you create manually or download from Live.

In NetWitness 11.3 and later, the ESA Correlation service replaces the Event Stream Analysis service and is also known as ESA Correlation Server. The ESA Correlation service provides the same services as the Event Stream Analysis service with the added benefit of enabling you to specify different data sources for your ESA correlation rules. Like the Event Stream Analysis service, the ESA Correlation service installs on the ESA Primary and ESA Secondary host types.

The second service is the Contexthub Server service, which provides enrichment lookup capabilities in the Respond and Investigate views. It runs only on an ESA Primary host. For information, see the *Context Hub Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

IMPORTANT: The NetWitness server (Admin server), ESA primary host, and ESA secondary host must all be on the same NetWitness Platform version.

How ESA Generates Alerts

The ESA Correlation service runs rules that specify criteria for problem behavior or threatening events in your network. When ESA detects a threat that matches rule criteria, it generates an alert.

To generate alerts, ESA performs the following functions:

1. Gathers data
2. Runs ESA rules against the data
3. Captures events that meet rule criteria
4. Generates alerts for those captured events

Data Source Configuration Changes

In NetWitness version 11.3 and later, the ESA Correlation service enables you to specify different data sources for different sets of rules. Instead of adding data sources, such as Concentrators, to the entire ESA Correlation service, you can specify different data sources for each ESA rule deployment. An ESA rule deployment includes an ESA Correlation service with its associated data sources and a set of ESA rules. For example, you may want to use Concentrators with HTTP packet data in one deployment and Concentrators with HTTP log data in another deployment. For more detailed information, see Deploy Rules to Run on ESA.

An Endpoint Risk Scoring Rules Bundle is available in NetWitness Platform

An Endpoint Risk Scoring Rules Bundle, which contains approximately 400 rules, comes with NetWitness 11.3 and later. Endpoint risk scoring rules only apply to NetWitness Endpoint. You can add the Endpoint Risk Scoring Rules Bundle to an ESA rule deployment in the same way that you would add any ESA rule. However, you must specify endpoint data sources (Concentrators) in the ESA Rule Deployment.

The ESA Correlation service can process endpoint risk scoring rules, which generate alerts that are used in risk scoring calculations to identify suspicious files and hosts. To turn on risk scoring for NetWitness Endpoint, you must deploy endpoint risk scoring rules on ESA. For instructions, see "Deploy Endpoint Risk Scoring Rules on ESA" in the *ESA Configuration Guide*. For complete information on configuring NetWitness Endpoint, see the *NetWitness Endpoint Configuration Guide*.

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Best Practices

Best practices provide guidelines to help you write and manage rules, deploy rules, and maintain system health for your ESA services.

Understand Event Stream Analysis Rule Types

The ESA Correlation service provides advanced stream analytics such as correlation and complex event processing at high throughputs and low latency. It is capable of processing large volumes of disparate event data from Concentrators. However, when working with Event Stream Analysis, you should be aware of the factors that affect resource usage in order to create effective rules.

Each event that is received by ESA is evaluated to determine if it may trigger a rule. There are three types of rules that can be deployed in order to determine what the ESA engine should do with the incoming event. Each of these rule types have different impacts on system resource utilization. All three rule types may be created via the Rule Builder, Advanced Event Processing Language (EPL) rules, or downloaded via RSA Live. The table below lists the rule type and the impact this rule may have on system resources.

Rule Type	Description
Simple Filter Rule	This rule has no correlation to other events. At ingestion time, this rule is evaluated against a set of conditions, and if those conditions are met an alert is generated. If no conditions match, the event is quickly released by the engine to free up memory usage. These rules do not take up memory since the events are not retained beyond the initial evaluation. The memory resource usage does not increase as more simple filter rules are deployed. However, if the filter condition is too generic, it is possible that this rule can generate too many alerts, which will strain the system resources for the storage and retrieval of these alerts. For example, you might write a rule to generate an alert when HTTP network activity arrives over a non-standard HTTP port.
Event Window Rule	This rule evaluates a set of events over a time period for specific conditions. At ingestion time, the rule is evaluated against a set of conditions. If those conditions are met, the event is retained in memory for a specific amount of time. After the specified time passes, the events are removed from the time window if the number of events collected does not meet the threshold to trigger an alert. The memory consumption of such rules is highly dependent on the incoming event rate (traffic), the amount of data per event, and the time length specified in the event window. Each matching event is retained in memory until the time window has passed, so the longer the time window, the greater the potential volume. For example, you might write a rule that generates an alert if a user has five failed login attempts within a ten minute time frame.

Rule Type	Description
Followed By Rule	This rule evaluates a chain of incoming events to determine if the sequence of events matches a particular condition. At ingestion time, the rule is evaluated against a set of conditions. If the conditions are met, one of two actions occurs: • If this is the first event of the sequence, a new event thread is started, and the event is retained as the head of the sequence. • If the event belongs to an existing event thread, it is added to that sequence. In both cases, the event is retained in memory. The amount of resource usage is particularly sensitive to the customer environment for this type of rule. If the filter condition generates many event threads, resources are consumed for each new thread (in addition to the event). Additionally, if the end of the event thread is never met (that is, an alert is never generated), then the entire event is saved in memory indefinitely. For example, you might write a rule to generate an alert when a user fails to log in to a server, then performs a successful login, and then creates a new account.

Note: ESA sends alerts to NetWitness Respond for processing and the alerts are eventually stored in a database. If your rule creates too many alerts, it can slow down another part of the system.

When writing and deploying rules, you should be aware that rule memory usage and alert generation consume system resources. The sections below are designed to help you keep your usage at a healthy level and monitor for problems if systems are becoming overloaded.

Best Practices for Writing Rules

These are general guidelines for writing rules.

- **Create alerts for actionable events**. The purpose of an alert should be to notify you of an event that requires immediate and specific action. For events that do not require action, or only require you to have awareness of the event, you can create a report.
- **Validate your ESA rules within the Rule Builder or Advanced EPL Rule Builder before you deploy them**. To prevent errors in your rules and confirm that they generate the expected alerts, you can test the rule logic with JSON data within the rule builders. This capability is available in NetWitness Platform version 11.5 and later. For more information, see Validate an ESA Rule and Validate an Advanced EPL Rule .
- **Configure new rules as trial rules so you can observe how they react in your environment**. If you deploy new rules as trial rules, they will be disabled if the configured memory threshold is exceeded.
- **Configure Alert notifications only after your rule testing and tuning is complete**. This can help ensure you do not get flooded with notifications if a rule behaves differently than you expect.

- **Rules need to be specific so that you limit resource usage**. Use the following guidelines to limit usage:
  - Make the filters on the rule exclude all but the necessary events for the rule to fire accurately.
  - Make the size of your windows (window time for correlation) as small as possible.
  - Limit the events that you include in the window: For example, if you only want to see IDS events, ensure that you only include those events in your time window.
- **Add Memory Thresholds to ESA rules that use memory**. For example, if a rule contains windows or pattern matching, configure a memory threshold for that rule. If the rule goes over the allotted memory threshold, it gets disabled individually and an error is displayed for that rule on the  **(Configure) > ESA Rules > Services** tab. This capability is available in NetWitness Platform version 11.5 and later.
- **Rules need to be tuned to an alert level that is manageable**. If you are flooded with alerts, then the purpose and of an alert is lost. For example, maybe you want to know about encrypted traffic to other countries. But, you could limit the list to countries that are known risks. This limits the volume of alerts to a level you can manage.

For more best practice information for writing ESA rules, see ESA Rule Writing Best Practices.

Best Practices for Working with RSA Live Rules

These are guidelines for RSA Live Rules.

- **Deploy RSA Live rules in small batches**. Not every rule is suited to every environment. The best way to ensure your RSA Live rules are successful is to deploy them in small batches so you can test them in your environment. If you deploy small batches, it's much easier to tell if a particular rule has an issue.
- **Read the rule descriptions provided with RSA Live rules**. ESA rules are not “one size fits all.” Not all rules will work in your environment. The rule descriptions tell you which parameters you will need to modify to successfully deploy a rule in your environment.
- **Set your parameters**. RSA Live rules have parameters that need to be modified. If you do not modify your parameters, the rule may not work or it may exhaust your memory.
- **Deploy new rules as trial rules so you can observe how they react in your environment.** If you deploy new rules as trial rules, they will be disabled if the configured memory threshold is exceeded. For more details, see Working with Trial Rules.

Best Practices for Deploying Rules

These are general guidelines for deploying rules.

- **Deploy rules in small batches so you can observe how they react in your environment.** Not all environments are the same, and a rule will need to be tuned for memory usage, alert volume, and

effective detection of events.

- **Test rules before you configure alert notifications**. Configure Alert notifications only after your rule testing and tuning is complete. This can help ensure you do not get flooded with alerts if a rule behaves differently than you expect.
- **Monitor system health as a part of your deployment process**. When you deploy rules, monitor your system's health as a part of your deployment process. You can view total memory usage for your ESA in the Health and Wellness tab. For more information, see "View Detailed Statistics in Health and Wellness" in Troubleshoot ESA.

Best Practices for System Health

These are general guidelines for system health.

- **Set up new rules as trial rules**. A common issue is that new rules may cause memory issues. To prevent this, you can set up new rules as trial rules. If the configured memory threshold is met, all trial rules are disabled to prevent the system from running out of memory. For more information about trial rules, see Working with Trial Rules.
- **Set up thresholds in Health & Wellness to alert you if memory usage is too high**. There are metrics in NetWitness Health & Wellness that track memory usage. You can set up alerts and notifications to send you an email if those thresholds are crossed. For more information about the memory statistics you can view, see View Memory Metrics for Rules.
- **Monitor memory metrics for each rule in Health & Wellness**. For each rule, you can view the estimated memory usage in Health & Wellness. You can use this information to ensure that rules do not use too much memory. For more information about the memory statistics you can view, see View Memory Metrics for Rules.

Troubleshoot ESA

This section describes common issues that may occur while using ESA, and it suggests common solutions to these problems.

Troubleshoot ESA Correlation Services

Problem	Possible Causes	Solutions
On the NetWitness Platform Dashboard, the ESA service appears in red to indicate it is offline. In the  **(Configure) > ESA Rules** view, the following message appears: "The Service is either offline or not reachable."	Several	When an ESA Correlation service is offline, there are many possible causes. However, a common issue is that you have created a rule that uses excessive memory and causes the ESA service to fail. To troubleshoot this problem, see Steps to Troubleshoot Memory Issues with an ESA Service Offline. Other common causes might be that your firewall is blocking the connection between the ESA and NetWitness Platform, or the ESA Correlation service machine may be down. To bring up ESA Services: Go to  **(Admin) > Services**, select your ESA service, and then select  **> Start**. If your ESA service is stopping and restarting in a loop, you may need to call Customer Support to get the services to start.

Problem	Possible Causes	Solutions
On the NetWitness Platform Dashboard, the ESA service appears in red to indicate it is offline. In the **(Configure) > ESA Rules** view, the following message appears: "The Service is either offline or not reachable.	Configuration issues	If your system has been recently upgraded, you may have made a configuration error. Go to **(Admin) > Services**, select your ESA service and then select **> Edit**. In the Edit Service dialog, click **Test Connection**. If the connection fails, you likely have a configuration error. Attempt to fix your configuration error and try again.
Suddenly, an ESA Correlation service is completely unresponsive and appears to have crashed. The ESA Correlation Log file shows a Too Many Open Files error.	Connectivity issues	The most likely cause for this error is a connectivity issue between the ESA Correlation service and a data source used in an ESA rule deployment, such as a Concentrator or Decoder. 1. Restart the ESA Correlation service. 2. Go to **(Admin) > Services**, select your ESA service and then select **> Restart**. 3. Check the connectivity from ESA to the data source. Look for connection errors in the ESA Correlation logs. You can use SSH to get in the system and go to: `/var/log/netwitness/correlation-server/correlation-server.log`. For example: `Error: com.rsa.netwitness.streams. RecordStreamException: admin@<ip address>:56005:: com.rsa.netwitness.streams.RecordStreamException: connect::com.rsa.asoc.transport.nw.session. NextgenException: Failed to connect to <ip address>:56005` If there are network connectivity issues, fix the issues and then restart the ESA Correlation service again to see if it fixes the problem. If you have a data source with intermittent connectivity, you should remove it from the ESA rule deployment.

Troubleshoot RSA Live Rules for ESA

Problem	Possible Causes	Solutions
I imported a group of rules from RSA Live, and now my ESA service is crashing. Why?	You may not have configured the parameters for the RSA Live rule to tune it for your environment.	Each rule in RSA Live has a description that includes the parameters you must configure and prerequisites for your environment. Review this description to see if the rule is appropriate for your environment. To ensure that you deploy rules safely in your environment, configure new rules as trial rules to test them in your environment. Trial rules add a safeguard for testing new rules. For details on this, see Deploy Rules as Trial Rules.

I imported a group of rules from RSA Live, and while the rules deployed without errors, they were later disabled.	Not all RSA Live rules are meant for every environment. You may not have the correct meta in your ESA for the rule to run.	You can verify that a rule was disabled by going to  **(Configure) > ESA Rules > Services > Deployed Rule Stats**. If the rule is disabled, the green icon does not display next to the rule.
		If a rule deployed correctly but was disabled, check the logs for exceptions related to the rule. Specifically, check to see if the rules were disabled due to missing meta. To do this, go to the ESA Correlation logs. You can use SSH to get in the system and go to: `/var/log/netwitness/correlation-server/correlation-server.log`.
		Then, search for a message similar to the following:
		`"Property named '<meta_name>' is not valid in any stream"`
		For example, you might see:
		`Failed to validate filter expression '(medium=1 and streams=2 or medium=3...(238 chars)': Property named 'tcp_flags_seen' is not valid in any stream`
		If a similar message displays, you may need to add a custom meta key to the Log Decoder or Concentrator. To do this, follow these instructions: "Create Custom Meta Keys Using Custom Feed" in the *Decoder and Log Decoder Configuration Guide*.

Troubleshoot ESA Rules

Problem	Possible Causes	Solutions
I have an ESA rule that is not getting deployed and is not creating alerts.	A meta key that the rule uses is a string array type, but it shows as a string type on ESA.	Check to see if any string array meta keys that the rule uses are configured as string array types on ESA. Go to  **(Configure) > ESA Rules > Settings** tab (Meta Key References). • If it shows `string[]`, it is configured as a string array type on ESA. This is fine. • If it shows `string` without the brackets, it is configured as a string type and you need to fix it on ESA. In the ESA Correlation service Explore view, go to `correlation/stream`. Add string array meta keys to the **multi-valued** list to allow them to be used as an array in ESA rules. Go back to the Meta Key References and click the refresh icon (). Verify that the meta keys with a string array type show a value of `.string[]`. For additional details, see "Configure Meta Keys as Arrays in ESA Correlation Rules" in the *ESA Configuration Guide*.
I set up notifications for a rule, but we are not receiving them. The `correlation-server.log` file does not show any errors. Why?	Correlation-server successfully sent the notification messages to integration-server, but when integration-server tried to send the notifications to their destination, it failed.	When troubleshooting notifications, check both the ESA Correlation service log files (`/var/log/netwitness/correlation-server/correlation-server.log`) AND the Integration-Server log files on the NetWitness Server (`/var/log/netwitness/integration-server/integration-server.log`). For an example, see Integration-Server SMTP Notification Error Example. **Note:** For any notification-related troubleshooting, check the `integration-server log` file in addition to the log file of the service creating the notification.

Problem	Possible Causes	Solutions
I created a rule with an enrichment, added an SMTP notification, and deployed my rule. We are not receiving SMTP notifications. Why?	You do not have a template that met the criteria to parse the events.	Check the ESA Correlation service log files to see if the SMTP notification failed: `/var/log/netwitness/correlation-server/correlation-server.log`. For more details on the notification error, check the Integration-Server log file on the NetWitness Server (also known as Node 0, Admin server, or NWServer): `/var/log/netwitness/integration-server/integration-server.log`. If you use an ESA rule that has an enrichment, such as a Context Hub list, you must create a custom template. You can duplicate a default template and adjust it for your enrichment. See SMTP Notification Error Example below for a notification error example. For information on creating a custom ESA template, see "Define a Template for ESA Alert Notifications" in the *System Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.
I created a custom rule (via the Rule Builder or Advanced EPL), and my rule is not firing. Why?	You may have connectivity issues.	Check the Offered Rate statistic on the **(Configure) > ESA Rules > Services** tab. Select the ESA service and then look at the statistics on the tab for the Deployment. If the Offered Rate is zero, then the ESA service is not receiving data from Concentrators. Check the ESA Correlation log files for connectivity issues: `/var/log/netwitness/correlation-server/correlation-server.log`. If the offered rate is not zero, the meta key name and type used in the rule likely doesn't match the meta key present in events. Check to see if the meta key name and type used in the rule is valid by searching for the meta key name in **(Configure) > ESA Rules > Settings** tab (Meta Key References).

Problem	Possible Causes	Solutions
I created a custom rule (via the Rule Builder or Advanced EPL), and my rule is not firing. Why?	There may be a problem with the rule.	**If a specific rule is not firing**, go to **(Configure) > ESA Rules > Services** to see if the rule was disabled. In the **Deployed Rule Stats** section, a rule that is disabled displays a clear enabled button (instead of the green enabled button). You can also check Events Matched field. Go to **(Configure) > ESA Rules > Services**. From there, you can see the number of events that were matched in the **Events Matched** column. If no events matched, check the logic of your rule for errors. For example, check the syntax for uppercase and lowercase errors, and check the time window. If the rule still doesn't fire, consider simplifying the logic of the rule to see if it fires when there is less complexity.
After a recent upgrade, I am not seeing alerts and I am seeing disabled rules.	There may be a problem with the ESA rule deployment.	Deploy the ESA rule deployments again. Create a Deployment steps in the Live Services Management Guide provides more information on deploying rules using the ESA Correlation service. If this does not resolve the issue, check the ESA Correlation log files for more information: `/var/log/netwitness/correlation-server/correlation-server.log`.
After an update or upgrade to 11.3.0.2 or later, if I try to make an adjustment to some rules, I get an error when trying to save them.	The Ignore Case option may be selected for a meta key that does not contain alphabetic values, such as IP address.	In NetWitness Platform 11.3.0.2 and later, the Ignore Case option has been removed from the ESA Rule Builder - Build a Statement dialog for meta keys that do not contain text values. Adding Ignore Case on meta keys which do not contain alphabetic values causes additional processing to occur for no added benefit. In the ESA Rule Builder - Build a Statement dialog, check to see if you have any meta keys that do not contain alphabetic characters, for example, ip_src and ip_dst. If you do, clear the **Ignore Case** checkbox for those meta keys and try to save the rule again.

Problem	Possible Causes	Solutions
After an upgrade to 11.3.0.2 or later, I see a warning message in the ESA Correlation service log file showing a difference between the multi-valued and default-multi-valued parameter meta key values. Why?	You do not have the required meta keys on ESA Correlation that the Endpoint, UEBA, and Live content rules need to work.	If you want to use the latest Endpoint, UEBA, and Live content rules, add the necessary meta keys to the `multi-valued` and `single-valued` parameter fields. For detailed information and instructions, see "Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys" in the *ESA Configuration Guide*. For example warning messages, see Example ESA Correlation Server Warning Message for Missing Meta Keys.
Meta keys marked as sensitive for data privacy are still included in notifications and alerts for some rules.	In ESA rules that do not select every piece of meta from the session (that is, using **`select *`**), you may see that data privacy (if enabled) and the **Pivot to Investigate > Navigate** link accessed from a context tooltip in the Respond Incident Details view does not work.	The following steps apply to all released versions of NetWitness 11.3 and later. In 11.4 and later, you do not need to follow these steps for data privacy. However, you need to follow these steps if you want to enable the **Pivot to Investigate > Navigate** link accessed from a context tooltip in the Respond Incident Details view. 1. Add the ESA generated `event_source_id` meta key to the `index-concentrator-custom.xml` file. 2. Add the `event_source_id` meta key to the SELECT statement within any ESA rule that does not select every piece of metadata from the session. 3. After the Concentrator changes take effect, redeploy the ESA rule deployment that contains the ESA rule. To do this, see Update any ESA Rule that Selects Only Certain Meta Keys from the Session to Include event_source_id. For NetWitness 11.4 and later, to resolve the data privacy issue, see How to Remove Sensitive Meta Keys Globally from All Alerts.

Problem	Possible Causes	Solutions
The **Pivot to Investigate > Navigate** link does not work in a context tooltip accessed from Respond.	In ESA rules that do not select every piece of meta from the session (that is, using `select *`), you may see that data privacy (if enabled) and the **Pivot to Investigate > Navigate** link accessed from a context tooltip in the Respond Incident Details view does not work.	For NetWitness 11.3 and later (including 11.4), see Update any ESA Rule that Selects Only Certain Meta Keys from the Session to Include event_source_id.
I added a data source filter to the data sources in my ESA rule deployment. It was working fine and then all of a sudden, I stopped receiving alerts.	If there are any adjustments to an application rule on the Decoders that are mapped to the data sources used in your data source filter, the filter does not work for that rule since the application rule used in the filter no longer exists.	The optional data source filter is available in NetWitness 11.5 and later. If an application rule linked to a data source filter is modified on a Decoder, the filter must be removed, added again, and redeployed. The changes take effect on ESA after the deployment is redeployed.
I added a data source filter to the data sources in my ESA rule deployment and I see an "Invalid header size" error while communicating with Core services in the ESA Correlation log file.	You are filtering out a large portion of the traffic and less sessions match the aggregation criteria.	In the Explore view node list for an ESA Correlation service, select **correlation > stream**. Decrease the `max-sessions` parameter from 10,000 to a lower session count and restart the ESA Correlation service. For step-by-step instructions, see .
I created a rule using a Context Hub list and it was working properly, but suddenly, the rule stopped firing and ESA is not processing any rules.	If a Context Hub list that is used by ESA Correlation is renamed or deleted, ESA will not be able to access the list and may halt processing for all rules.	Do not rename or delete a Context Hub list that is used in a deployed ESA rule. ESA Correlation will also not be able to access a Context Hub list if you delete it and then add it again with the same name while the rule is deployed. If you rename a Context Hub list or recreate the Context Hub list with the same name, update the ESA rules that use that Context Hub list, and then redeploy the ESA rule deployments that contain those rules.

SMTP Notification Error Example

The following SMTP notification error example is an excerpt from a `correlation-server.log` file, which shows an error message for sending notifications with unsupported templates. In this example, there is a rule that is configured with the GeoIP enrichment, which has a hash table as one of its fields (the GeoIPLookup meta). Because the default SMTP template is only designed to deal with metas that are either singular values or arrays that contain only singular values, such as `"ip.src":"1.1.1.1"` and `"action":["fw:inbound-network-traffic"]`, sending the email notification fails due to the array containing a hash table.

```
FTL stack trace ("~" means nesting-related):

- Failed at: ${value!""} [in template "smtp.ftl" in macro "value_of" at line
1, column 152]

- Reached through: @value_of metadata[key] [in template "smtp.ftl" at line 85,
column 141]

----

...

For "${...}" content: Expected a string or something automatically convertible
to string (number, date or boolean), or "template output" , but this has
evaluated to an extended_hash (LinkedHashMap wrapped into
f.t.DefaultMapAdapter):

==> value!"" [in template "smtp.ftl" at line 1, column 154]
```

Integration-Server SMTP Notification Error Example

The following SMTP notification error example is an excerpt from an `integration-server.log` file, which shows a failure when the Integration-server attempts to send an email notification to the email notification server. In this case, you should check the email notification server configuration in the Global Notifications settings (**(Admin) > System > Global Notifications > Servers** tab).

```
2019-10-09 18:53:42,015 [-SMTP-5c45c867e4b03b89a49b78ba] WARN
Notification|SMTP dispatch failed (Reason: Sending the email to the following
server failed : email.server.com:25)

java.lang.IllegalArgumentException: org.apache.commons.mail.EmailException:
Sending the email to the following server failed : email.server.com:25
```

Example ESA Correlation Server Warning Message for Missing Meta Keys

If you see a warning message in the ESA Correlation server error logs for missing multi-valued meta keys, there is a difference between the `default-multi-valued` parameter and `multi-valued parameter` meta key values, and the new Endpoint, UEBA, and Live content rules will not work. The same is true for missing single-valued meta keys. Completing the "Update the Multi-Valued and Single-Valued Parameter Meta Keys for the latest Endpoint, UEBA, and RSA Live Content Rules" procedure in the *ESA Configuration Guide* should fix the issue.

Multi-Valued Warning Message Example

```
2019-08-23 08:55:07,602 [ deployment-0] WARN Stream|[alert, alert_id,

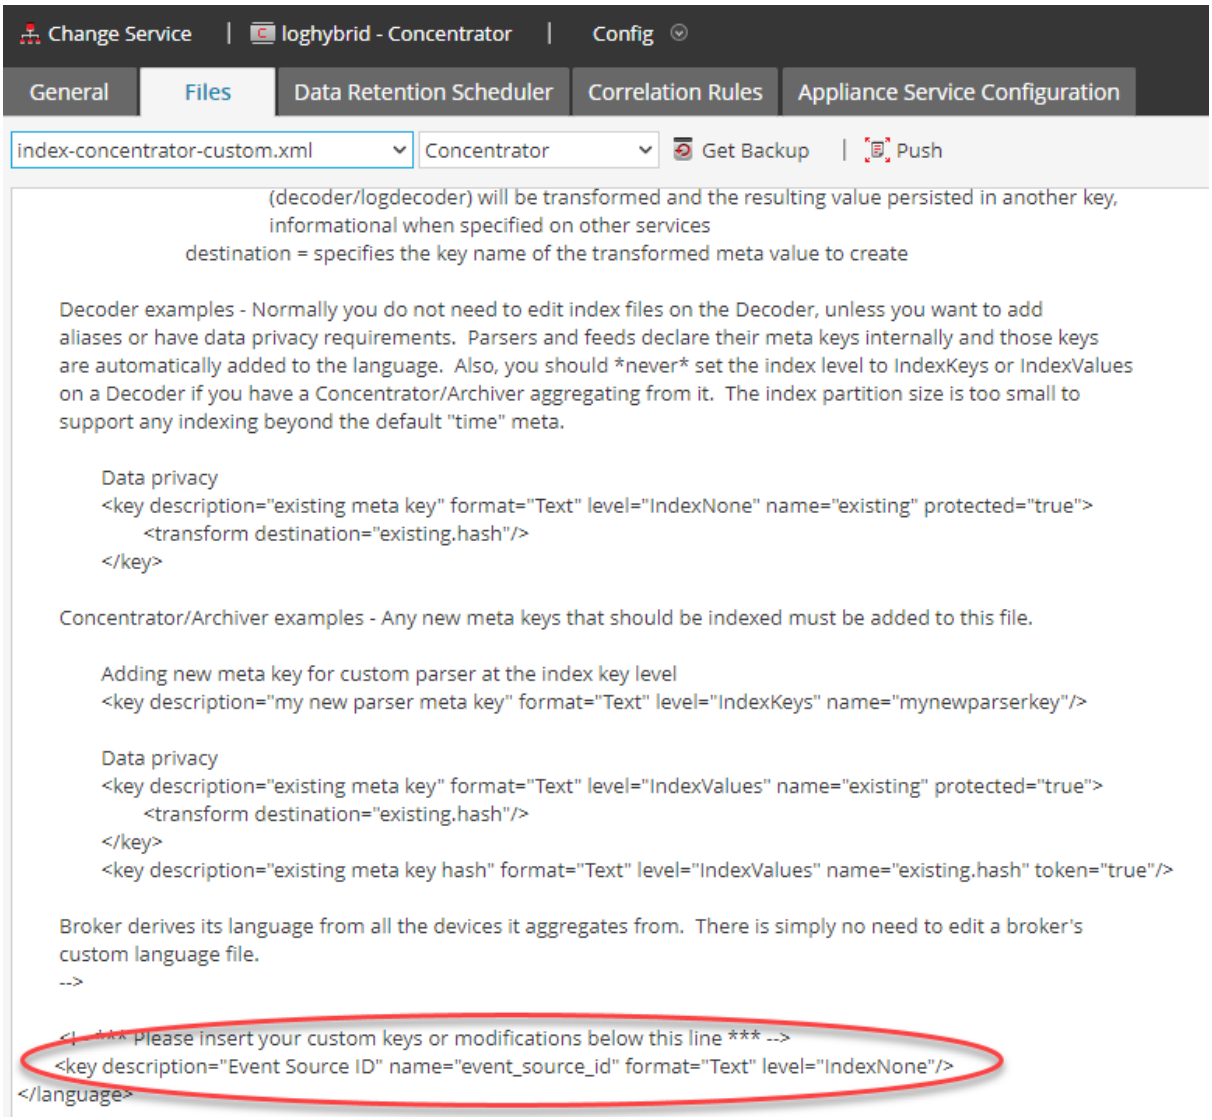
Single Value Warning Message Example

```
2019-08-23 08:55:07,602 [ deployment-0] WARN Stream|[accesses, context_
target, file_attributes, logon_type_desc, packets] are still MISSING
from single-valued
```

Update any ESA Rule that Selects Only Certain Meta Keys from the Session to Include event_source_id



In ESA rules that do not select every piece of meta from the session (that is, using **`select *`**), you may see that data privacy (if enabled) and the **Pivot to Investigate > Navigate** link accessed from a context tooltip in the Respond Incident Details view does not work.

The following steps apply to all released versions of NetWitness 11.3 and later. In 11.4 and later, you do not need to follow these steps for data privacy, instead, see How to Remove Sensitive Meta Keys Globally from All Alerts. However, you need to follow these steps if you want to enable the **Pivot to Investigate > Navigate** link accessed from a context tooltip in the Respond Incident Details view.

Note: Do not use any Esper keyword as custom meta keys since this causes an error while creating an ESA Rule. For Esper keywords, see Reserved keywords.

1. Update the **`index-concentrator-custom.xml`** file to include the ESA generated **`event_source_id`** meta key. If you do not add the meta key, ESA cannot recognize it and the rule will fail to deploy.
   The following figure shows the file configured for the custom meta key "**`Event Source ID`**" with index settings of "**`IndexNone`**" with a format of "**`Text`**".

   <key description="Event Source ID" name="event_source_id" format="Text" level="IndexNone"/>

To save and deploy the new setting on the NetWitness host, select the **Apply** button. To force the change, restart the Concentrator service or you can wait until the next polling interval for the change to be recognized.

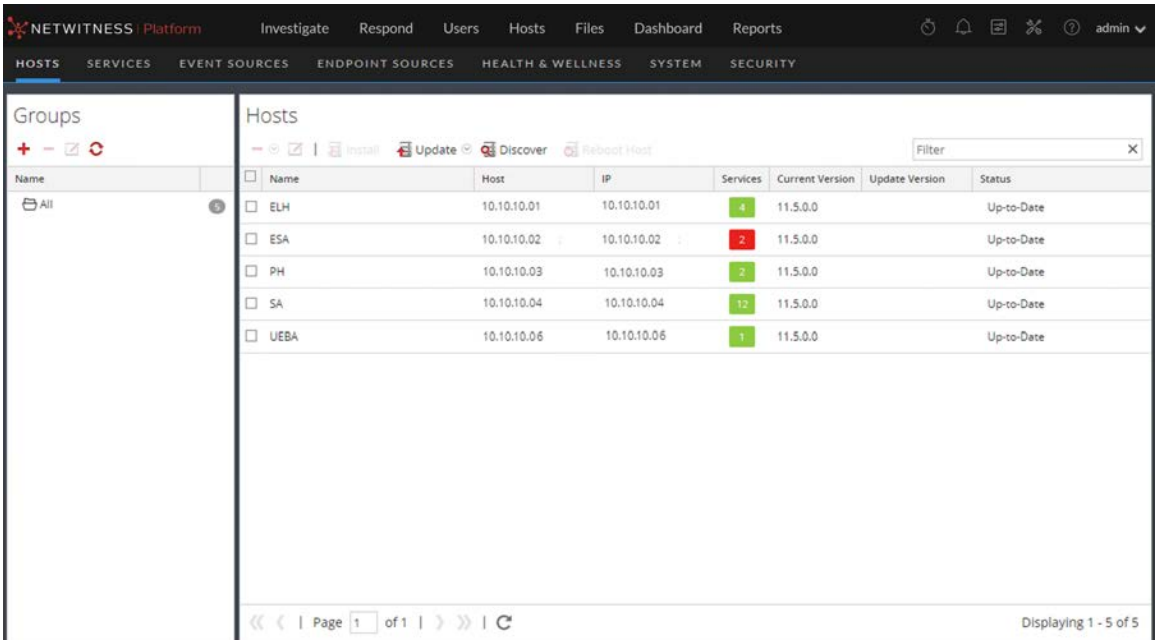
The XML file can also be deployed to other NetWitness hosts by clicking the **Push** button and selecting the destination NetWitness host. Only deploy the XML file to a NetWitness host that runs that service (that is, other Concentrators).

2. Update any ESA rule that selects only certain meta from the session to include the ESA generated **`event_source_id`** meta key. Add the **`event_source_id`** meta key to the **`SELECT`** statement. See the following example rule.

Example Rule with event_source_id

```
@RSAAlert
SELECT user_dst, reference_id, hostname, event_source_id FROM
Event(
```

```
device_class='Windows Hosts',
reference_id IN ('4624' , '4625'),
user_dst IS NOT NULL,
user_dst NOT LIKE '%$',
user_dst NOT IN ('ANONYMOUS LOGON','SYSTEM')
)
.win:time_batch(10 Minutes)
GROUP BY user_dst
HAVING COUNT(distinct hostname) >= 15;
```



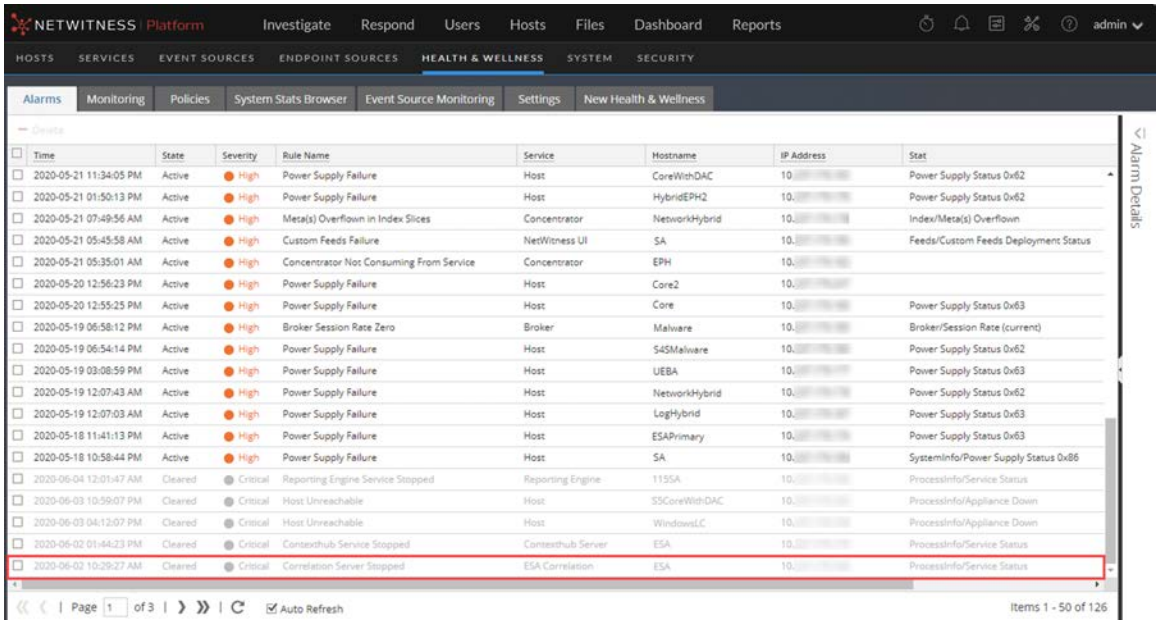
3. After the Concentrator changes takes effect, redeploy the ESA rule deployment that contains the ESA rule.

For additional information, see How ESA Handles Sensitive Data. For information on the stragegy and benefits of obfuscating data, see the *Data Privacy Management Guide*.

Steps to Troubleshoot Memory Issues with an ESA Service Offline

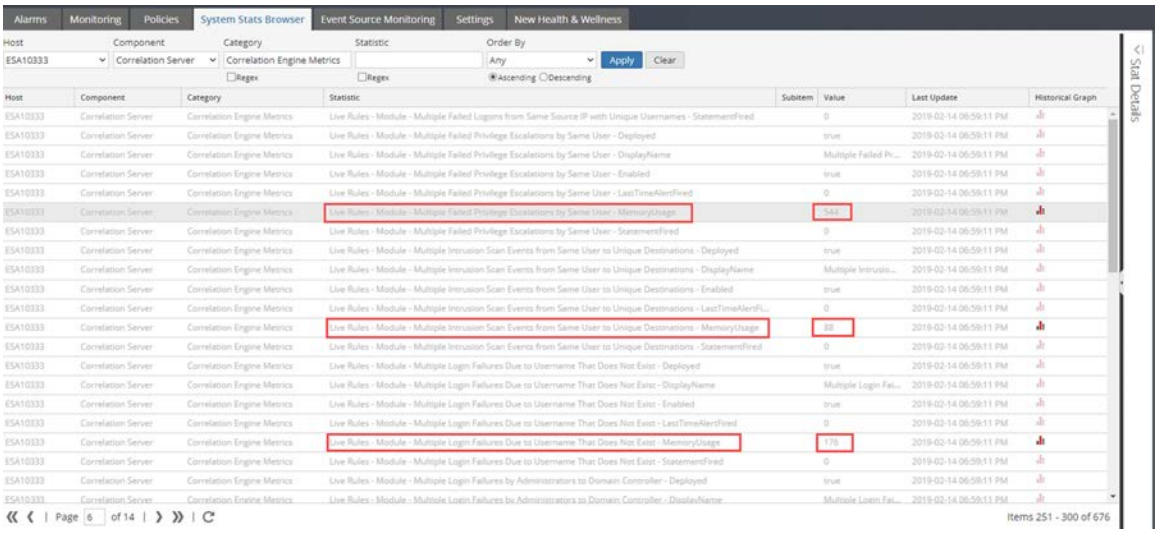
Step 1: Verify that your Host Is Running

The first step to troubleshooting is to ensure that your host is running. To do this, go to  **(Admin) > Hosts**. If the host is down, the system parameters will not display (updating host information can sometimes be delayed), the **Services** display in red, and you may see an error message.



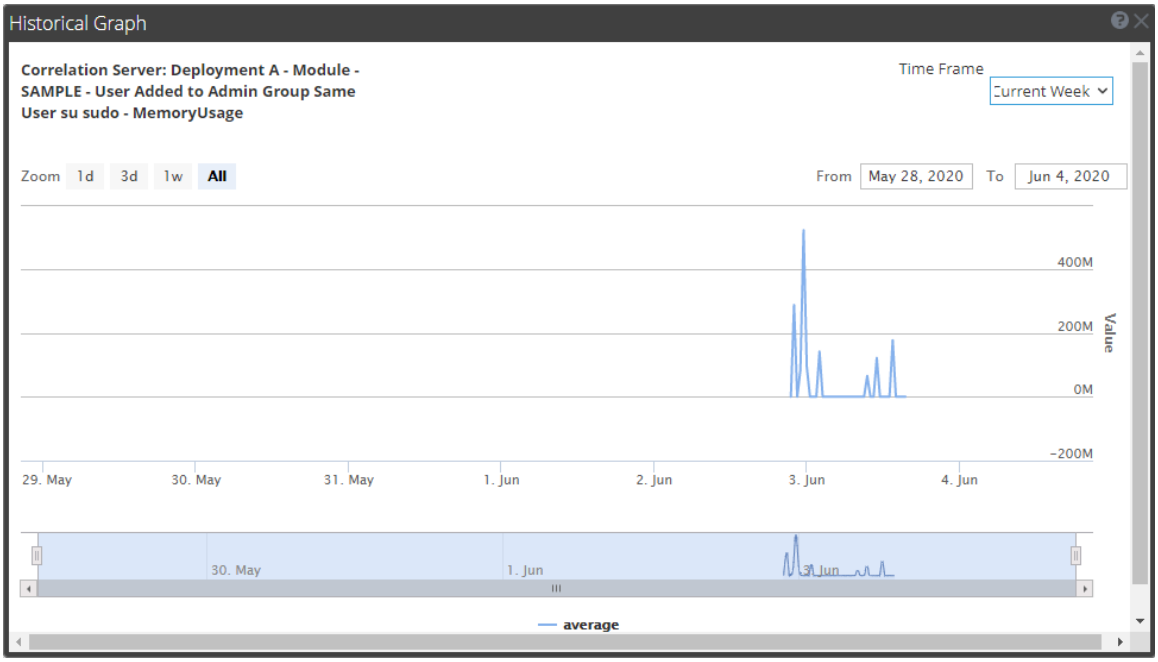
If your host is down, contact your NetWitness Administrator to restart it. Otherwise, go to Step 2.

Step 2: View Detailed Statistics in Health & Wellness



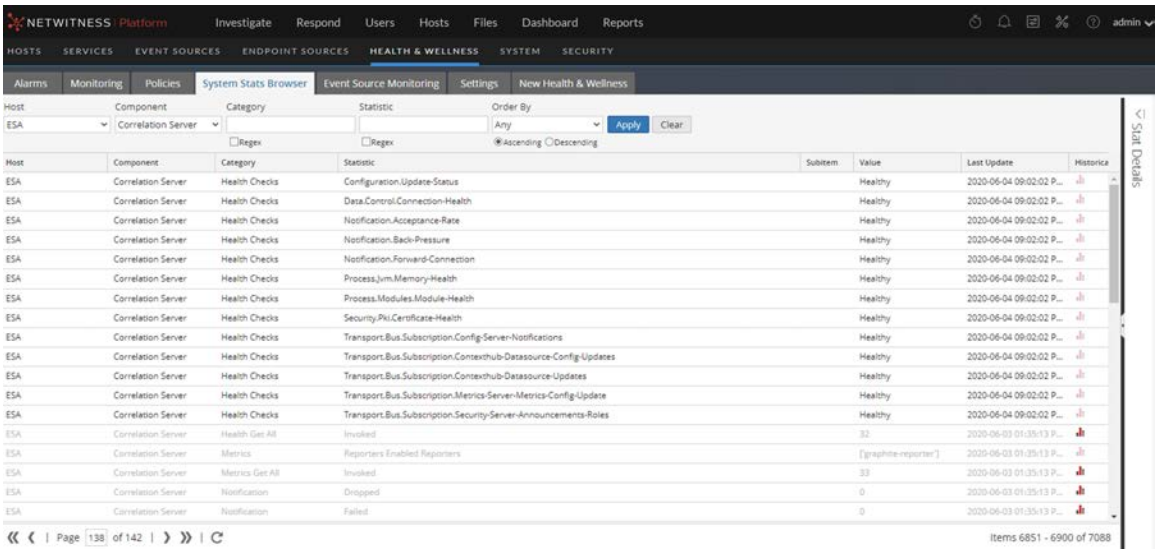
If your ESA service is down, you can go to Health & Wellness and view the **last known metrics** to see where potential issues are occurring. The most common problem is that your ESA service is exceeding memory thresholds, which causes it to stop or fail. In NetWitness 11.5 and later, see also View Health Statistics and Trends for ESA Correlation in New Health & Wellness.

1. Go to **(Admin) > Health & Wellness > Alarms** to see if the ESA triggered any alarms. Look for the following alarms for ESA Correlation:
   - Correlation Server in Critical State
   - Correlation Server in Unhealthy State
   - Correlation Server Stopped



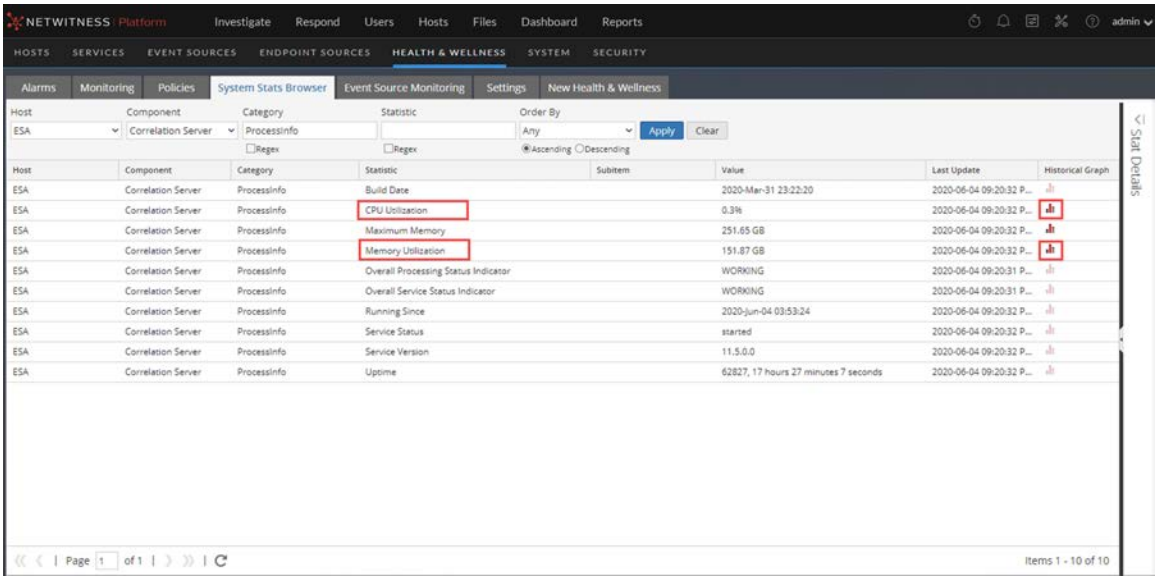
2. Go to **(Admin) > Health & Wellness > System Stats Browser** to see the memory metrics for each rule's performance. To view the metrics, enter the following and click **Apply**:

Host	Component	Category
<your host>	Correlation Server	Correlation Engine Metrics



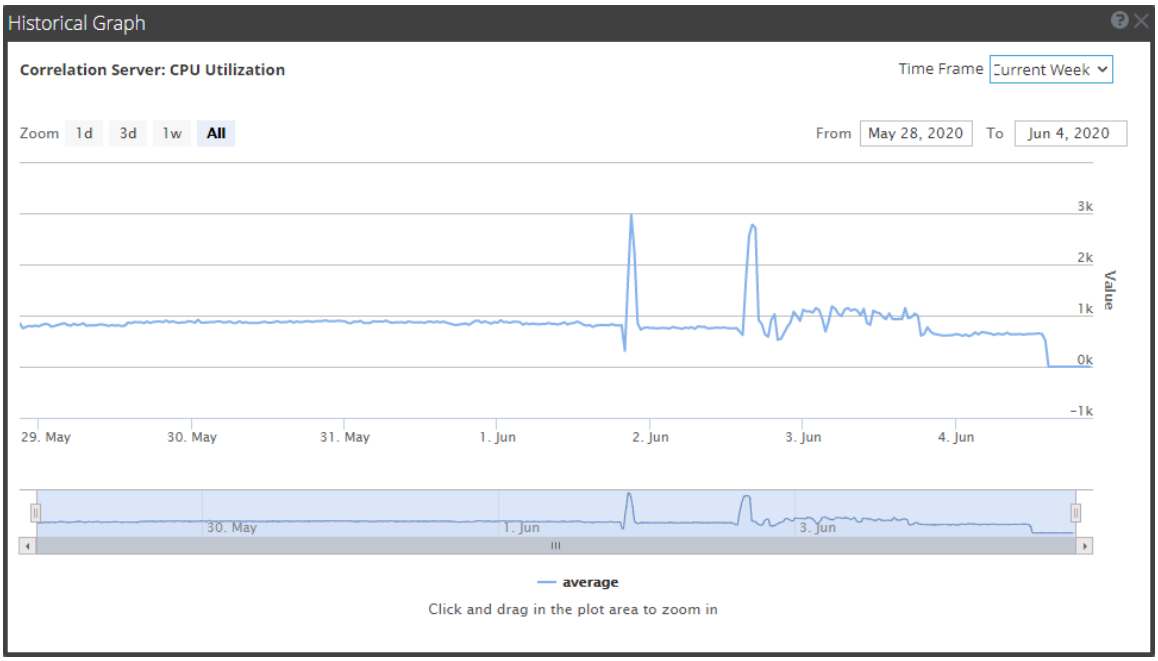
The name of the rule is in the **Statistic** column and the memory usage in bytes is in the **Value** column.

3. Click  to view a historical view of memory usage for the rule in the **Historical Graph** column.



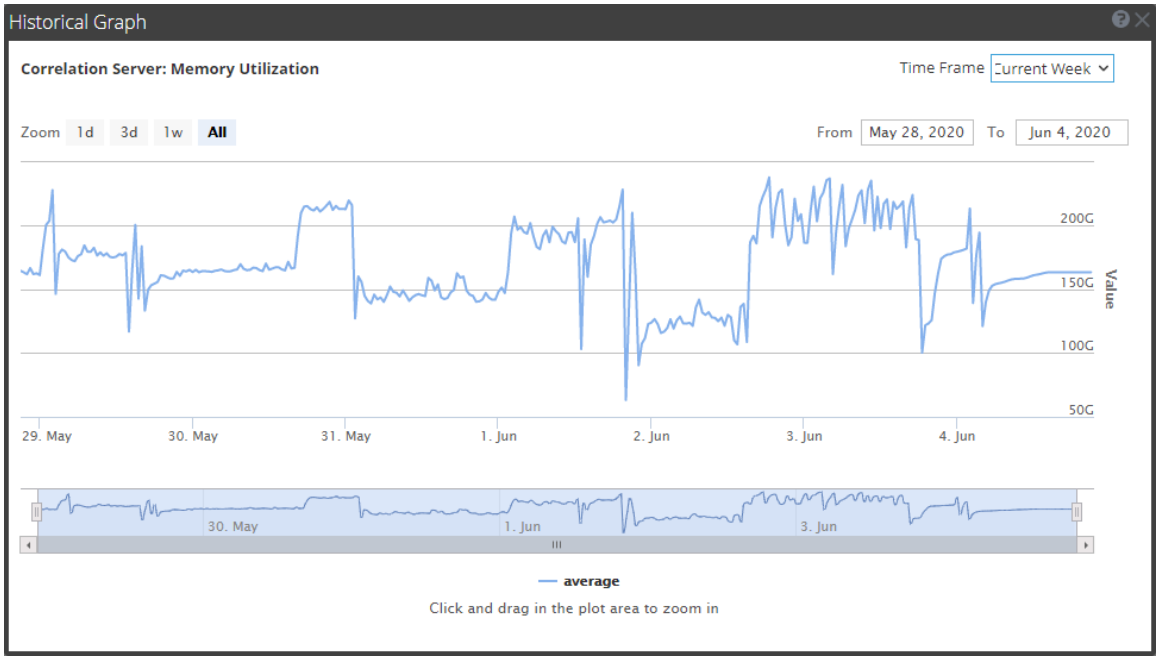
4. In the **System Stats Browser**, you can also see details of your ESA Correlation service performance.

Select your host, and use the following filters to view the following statistics:



Host	Component	Category	Statistic	Example
<your host>	Host	SystemInfo	CPU Utilization	49.74%
<your host>	Host	SystemInfo	Memory Utilization	72.87%
<your host>	Host	SystemInfo	Used Memory	183.14 GB
<your host>	Host	SystemInfo	Total Memory	251.65 GB
<your host>	Host	SystemInfo	Uptime	289546, 3 days 8 hours 25 minutes 46 seconds
<your host>	Correlation Server	Process jvm	Memory Total Max	163 GB
<your host>	Correlation Server	Process jvm	Memory Total Used	13.50 GB
<your host>	Correlation Server	ProcessInfo	CPU Utilization	0.3%
<your host>	Correlation Server	ProcessInfo	Maximum Memory	251.65 GB
<your host>	Correlation Server	ProcessInfo	Memory Utilization	151.87 GB

The following figure shows the location of the ESA Correlation service CPU and Memory Utilization statistics.



5. Click  to view a historical view of CPU and memory utilization.

   The following figure shows the historical graph of **CPU utilization**.

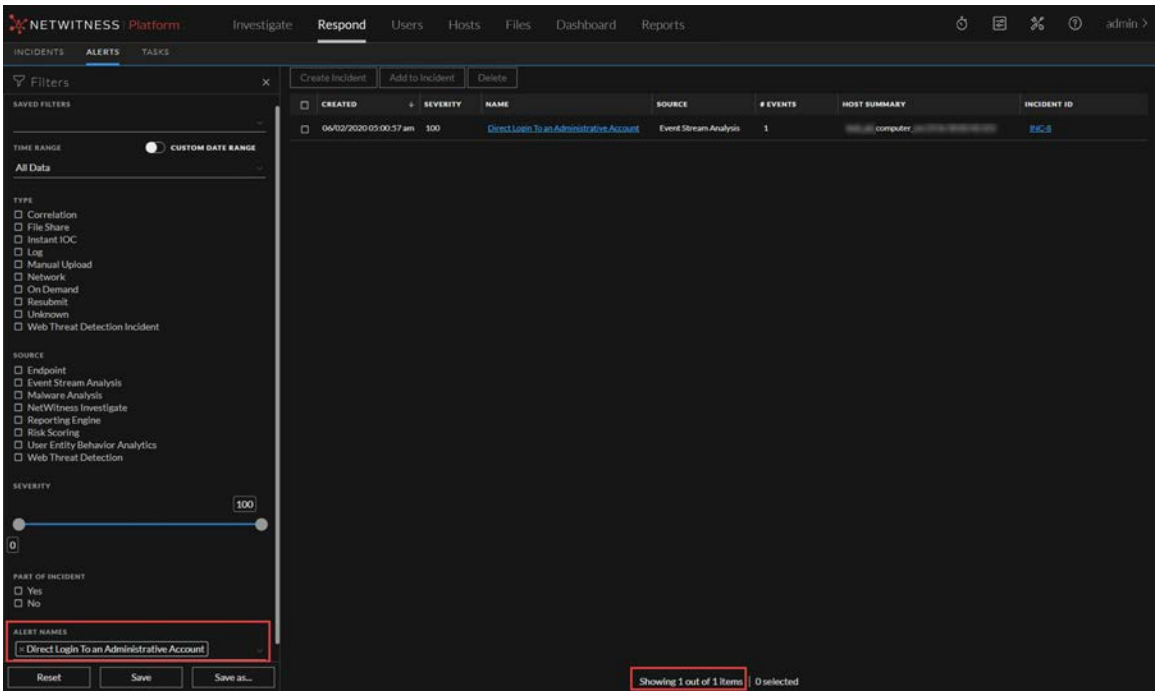
The following figure shows the historical graph of **Memory Utilization**.

If you are having a problem with memory or CPU utilization, continue to step 3.

Step 3: Bring up your ESA Services

1. Go to **(Admin) > Services**, select your ESA service, and then select **> Start**.
2. Return to the ESA Service to troubleshoot which rules have created memory issues.

If your ESA service is stopping and restarting in a loop, you may need to call Customer Support to get the services to start.

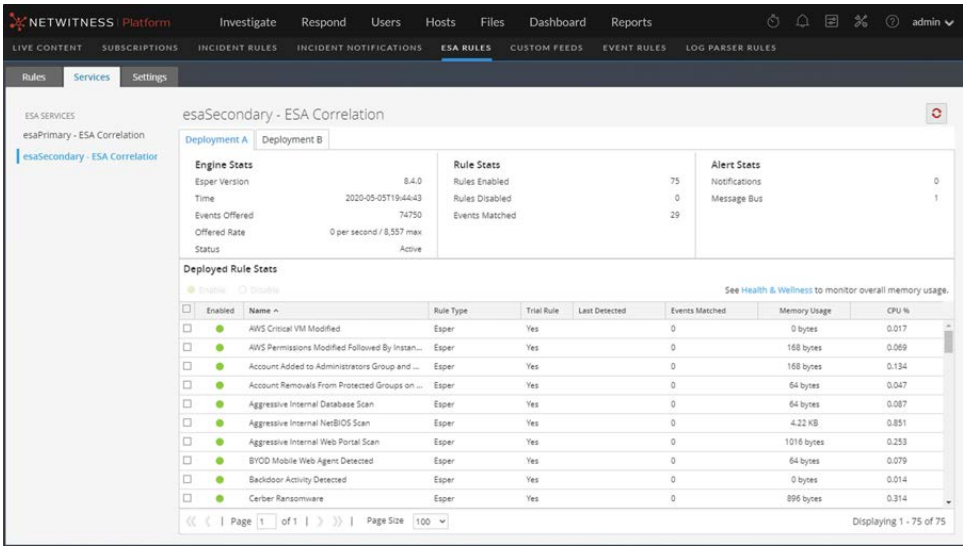


If you are able to start your ESA service without a shutdown, continue to step 4.

Step 4: Check the Alerts and Events Volume

After you are able to restart your ESA service without an immediate shutdown, you can review the stats for your rules to see which rules are consuming too many resources. Sometimes, ESA services fail because a rule is generating too many alerts or a rule is matching too many events. Check for both of these issues if you have determined that memory usage is causing your ESA service to shut down.

View Alert Summaries



Rules that generate a high volume of alerts can overwhelm the system and cause it to fail or restart. To view the alert summaries, go to **Respond > Alerts**. In the **Filters** panel on the left, in the **Alert Names** section, select the alert name for the rule. The number of alerts with that name appears at the bottom of the Alerts list results. If the number is significantly high for a particular rule, you need to disable the rule and rewrite it to be more efficient.

To clear your filter, click **Reset**.

View Events Matched

Sometimes a rule matches too many events, which can use up excessive memory. This typically occurs if you create a large event window where a great number of events accumulate without triggering an alert. This is a problem because each event is stored in memory while the rule waits for the alert to trigger. To check for this issue, go to **(Configure) > ESA Rules > Services**. From there, you can see the number of events that were matched in the **Events Matched** column for the deployment. If a high number of events were matched for a given rule, you can investigate the rule further to see if you can make it more efficient.

Step 5: Disable and Repair the Rule that Caused Issues

Once you have determined the rules that need to be rewritten, disable them and rewrite rules so that they don't generate such a high volume of alerts or events. For pointers on how to write more efficient rules, see Best Practices.

Disable Rules

1. To disable rules, go to **(Configure) > ESA Rules > Services**, and select the rules you want to disable in the **Deployed Rules Stats** field.
2. Select **Disable** to disable the rules.

Edit Rules

1. To repair the rules, go to **(Configure) > ESA Rules > Rules tab > Rule Library**.
2. For each rule that you repair, do the following:
   a. Select the rule to edit and then select **> Edit**.
   b. Edit the rule to be more efficient. For instructions on creating rules, see Add Rules to the Rule Library
   c. When you are satisfied with your rule, you can save the rule as a trial rule to ensure that any memory issues do not affect ESA services performance. To do this, follow the steps listed in Working with Trial Rules.

Deploy Rules

To deploy rules, see topic Create a Deployment in the *Live Services Management Guide*.

Verify that the Rules are Enabled

After you deploy the ESA rules, they should automatically show as enabled. If not, you can enable the rules.

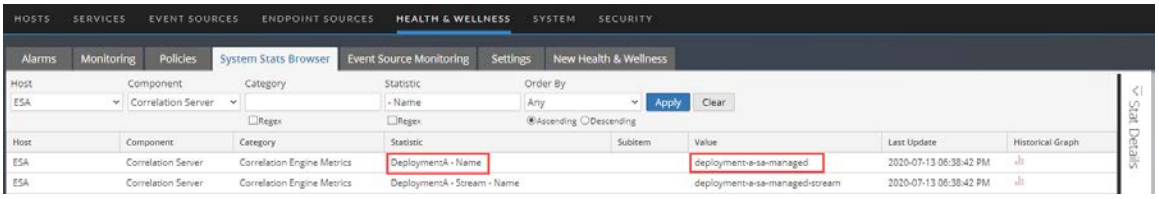
1. Go to **(Configure) > ESA Rules > Services** tab, and select the ESA service in the options panel.
2. On the deployment tab for the deployment that contains the rules, in the Deployed Rule Stats section, look at the status of the rules in the Enable column. Enabled rules show a green circle. If the rules show a white circle, you can enable the rules.
3. To enable rules, select the rules you want to enable and select **Enable** above the table.

(Optional) Check the ESA Correlation Log Files for More Information

Once you verify that your services are down and some potential causes for the system going down, check to see if the service is stopping and restarting in a loop. To do this, go to the ESA Correlation logs. You can use SSH to get in the system and go to: `/var/log/netwitness/correlation-server/correlation-server.log`.

ESA Rule Troubleshooting with Nw-Shell

Note: This procedure applies to NetWitness Platform 11.3 and later versions.



The ESA Correlation service replaces the Event Stream Analysis service in NetWitness version 11.3 and later. As a result of this change, some settings are no longer available in the user interface. In addition to the standard troubleshooting methods available, you can use the **nw-shell** utility to perform advanced troubleshooting of the ESA Correlation service and rules. For detailed information on the nw-shell utility, see the *NetWitness Shell User Guide*.

- Find Your Engine Name for Nw-Shell
- Connect to an ESA Correlation Server
- View the Contents of a Named Window
- See the Method Input and Output

Find Your Engine Name for Nw-Shell

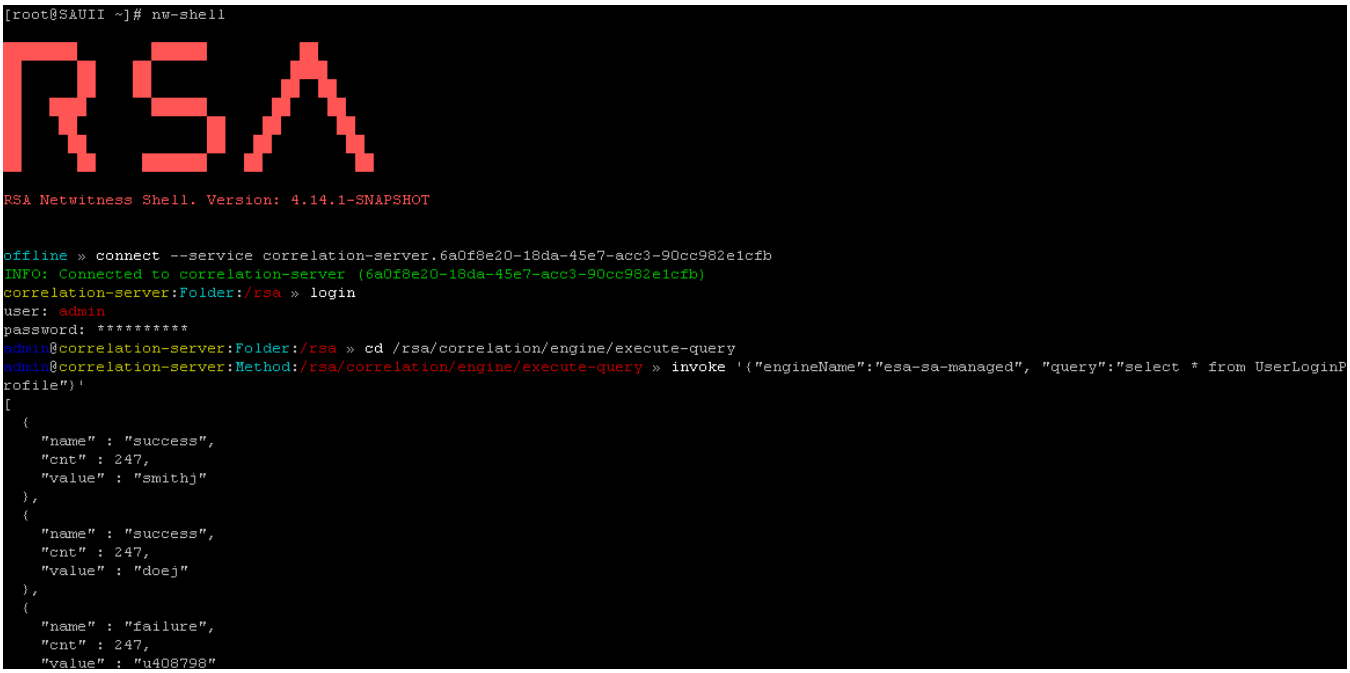
Follow these steps to find your engine name using your ESA rule deployment name. Your engine name is required for ESA Nw-Shell troubleshooting. Locate the names of each deployment that you plan to troubleshoot.

1. In the NetWitness UI, go to  **(Admin) > Health & Wellness > System Stats Browser**.
2. In the System Stats Browser, use the following filters and then click **Apply**.
   a. **Host**: Select your ESA host.
   b. **Component**: Select **Correlation Server**.
   c. **Statistic**: Type **- Name** (put a space between the dash and name).
3. In the **Statistic** column, locate your deployment followed by **- Name**. The name in the **Value** field is `YOUR ENGINE NAME`.

In the above example, the deployment name is DeploymentA and the engine name is `deployment-a-sa-managed`.

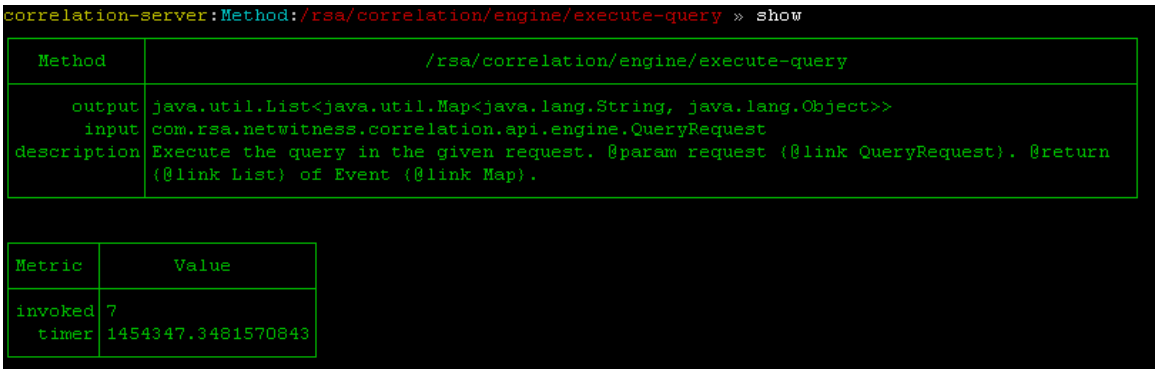
Connect to an ESA Correlation Server

1. Log in to nw-shell:
   a. Connect via SSH to the NW server (head unit).
   b. After logging in and getting the command prompt, type `nw-shell`.
2. Connect to ESA:
   a. Go to your ESA physical host and type the command:
   `cat /etc/netwitness/correlation-server/service-id`
   b. Go back to the NW server and nw-shell and connect to the correlation server:
   `connect --service correlation-server.ID`
3. Log in to ESA with the admin user credentials.
   a. Type `login`.
   b. Enter the username and password of the admin user.



View the Contents of a Named Window

Use the execute-query method to view the contents of a named window.



1. After you are connected to the ESA correlation service and authenticated, type:
   `cd /rsa/correlation/engine/execute-query`
2. Type `invoke '{"engineName":"<YOUR ENGINE NAME>", "query":"<YOUR QUERY>"}`
   - Where `<YOUR ENGINE NAME>` = the engine name that you located in Find Your Engine Name for Nw-Shell.
   - Where `<YOUR QUERY>` = the select statement into the named window.

Example: `invoke '{"engineName":"esa-sa-managed", "query":"select * from UserLoginProfile"}'`

See the Method Input and Output

Type `show` at the command line to see the input and output expected. All method invocation must be prefaced by `invoke`.

Obtain Correlation Server Metrics for ESA Rule Deployment Troubleshooting Using Nw-Shell

Note: This procedure is available in NetWitness Platform version 11.4.1 and later.

You can use Nw-Shell to view ESA Correlation Server metrics for each of your ESA rule deployments. These metrics show the number of sessions behind for the deployment data sources as well as the memory usage for the rules in the deployment.

1. Find the engine name to use for Nw-Shell. See Find Your Engine Name for Nw-Shell.
2. Connect to an ESA Correlation Server. See Connect to an ESA Correlation Server.
3. After you are connected to the ESA correlation service and authenticated, type:
   `cd /rsa/correlation/service/stats/get-condensed-metrics`
4. Type `invoke '<YOUR ENGINE NAME>'`
   Where `<YOUR ENGINE NAME>` is the engine name that you located in Find Your Engine Name for Nw-Shell.

Here is an example of the metrics output that you can obtain for your ESA rule deployment:

```
{
  "engineName" : "esa",
  "eventsOffered" : 1650,
  "maxEventsRate" : 2.337019271237945,
  "eventsRate" : {
    "count" : 1650,
    "oneSecRate" : 0.02129597415982235,

      "cpuLockedTimeNanos" : 28249,
      "statementFired" : 0,
      "alertsFired" : 0
    }
  ]
}
```

View Memory Metrics for Rules

This topic tells ESA rule writers how to view memory metrics for an ESA Correlation service and its associated ESA rules. You can see estimated memory usage for each rule running on a server, and you can use this information to modify your rule statements and conditions if they use too much memory.

Rules can sometimes consume more memory than you expect, causing ESA to slow down or stop. To see approximately how much memory a rule is using, you can view estimated memory usage for each rule in the Health & Wellness System Stats browser (you need permissions to access this module). You can use this information to modify your rules to be more efficient.

At a high level, you need to complete the following steps to use memory metrics to troubleshoot memory usage for rules:

1. Ensure you have the correct permissions to view the Health & Wellness module. For information on roles and permissions, see ESA Permissions.
2. View the memory statistics in Health & Wellness.
3. (Recommended) Configure Health & Wellness ESA policies to send an email if memory thresholds are exceeded. See "Manage Policies" in the *System Maintenance Guide* for instructions on sending email notifications.
4. Use the memory metrics data to modify rules to be more efficient, if necessary.

Note: You can also view memory metrics for ESA rules in the  **(Configure) > ESA Rules > Services** tab. See View Stats for an ESA Service.

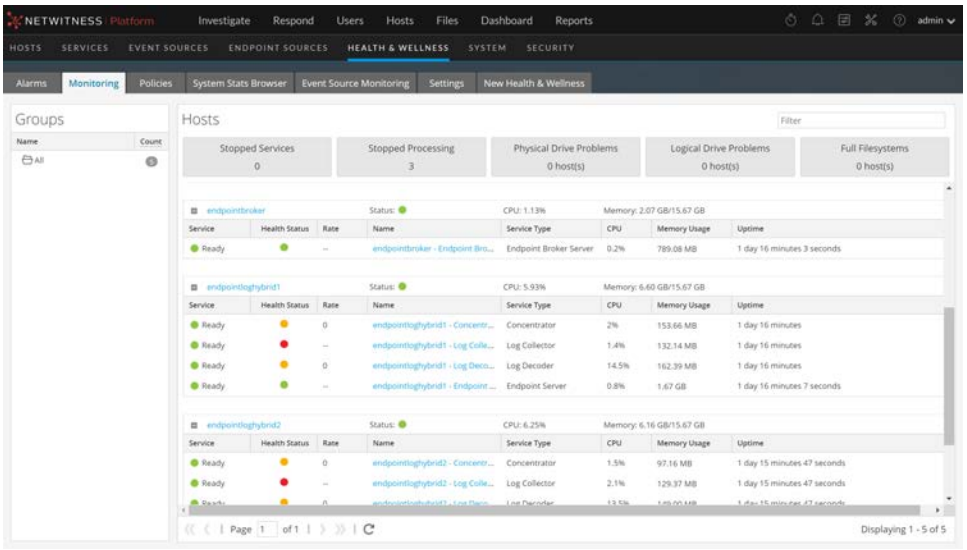
Prerequisites

The following are requirements for using memory metrics:

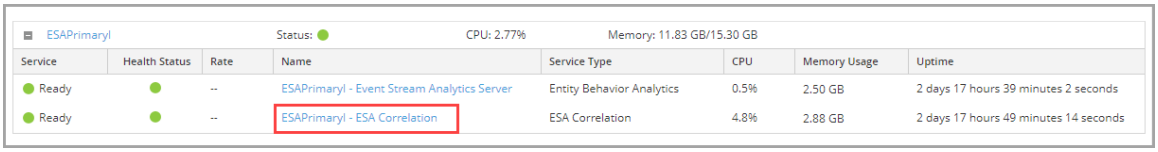
- You must have the appropriate permissions to view Health & Wellness statistics.
- (Recommended) Configure the ESA Health & Wellness policy to send an email when memory thresholds are exceeded.

Note: Memory Metrics is always on for the ESA Correlation service; you do not have to enable it.

View Health Statistics and Trends for ESA Correlation in New Health & Wellness

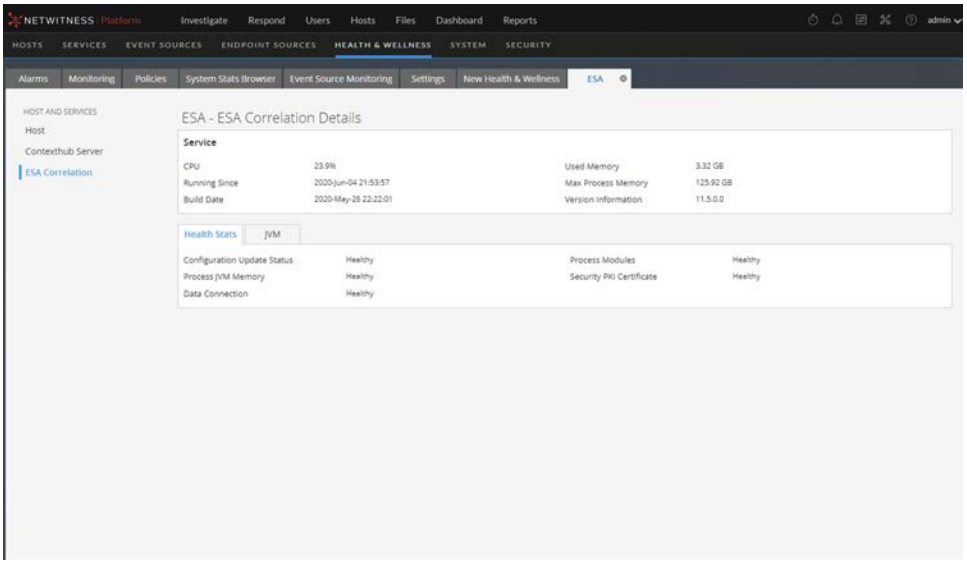


In NetWitness version 11.5 and later, New Health & Wellness provides improved and intuitive dashboards, monitors, and visualizations. The ESA Correlation Overview dashboard provides health statistics and trends on ESA rule deployments.

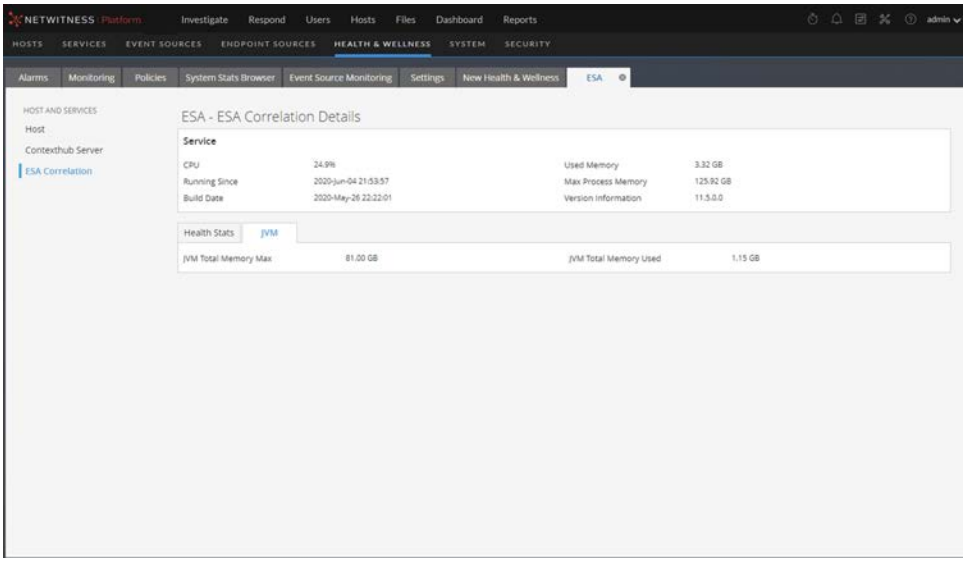


For more information, see "Monitor New Health and Wellness" and "Appendix A: New Health and Wellness Dashboards / ESA Correlation Overview Dashboard" in the *System Maintenance Guide*.

View Memory Metrics for an ESA Correlation Service in Health & Wellness



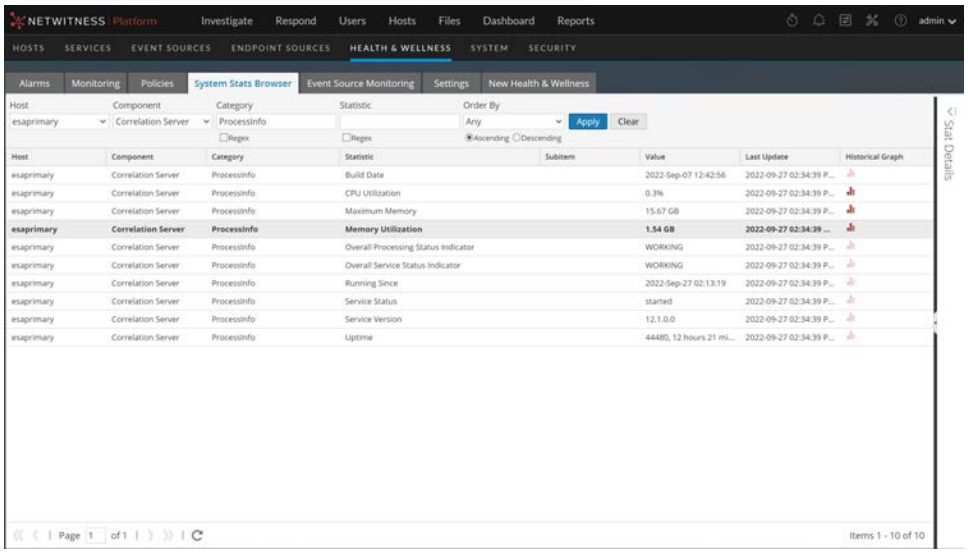
1. Go to **(Admin) > Health & Wellness > Monitoring** tab.



2. Locate your host and click the link in the **Name** field for your ESA Correlation service, for example, ESA- ESA Correlation.

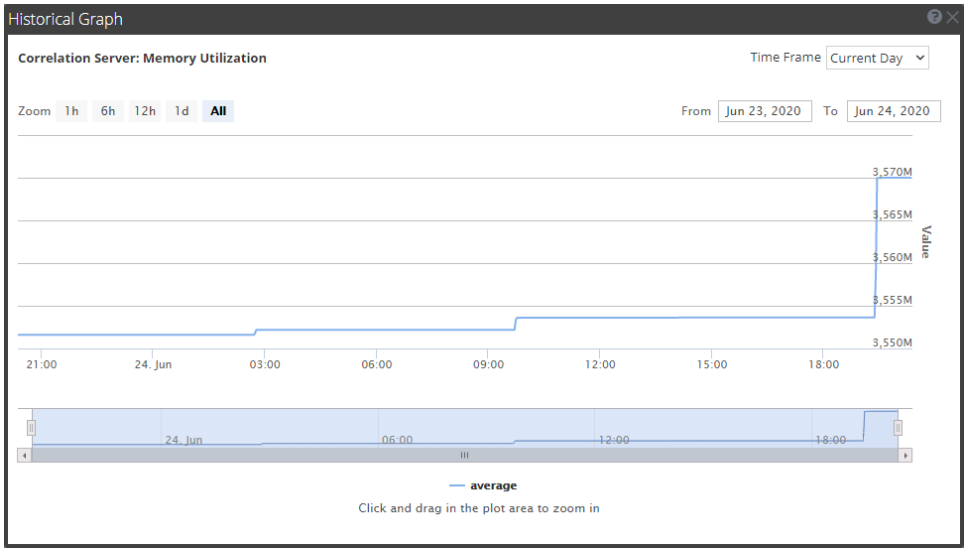
3. On the tab for your ESA host, click the **Health Stats** tab.
   You can view the health status of the ESA Correlation service.

4. Click the **JVM** tab.
   You can view the JVM total memory used by the selected ESA Correlation service.



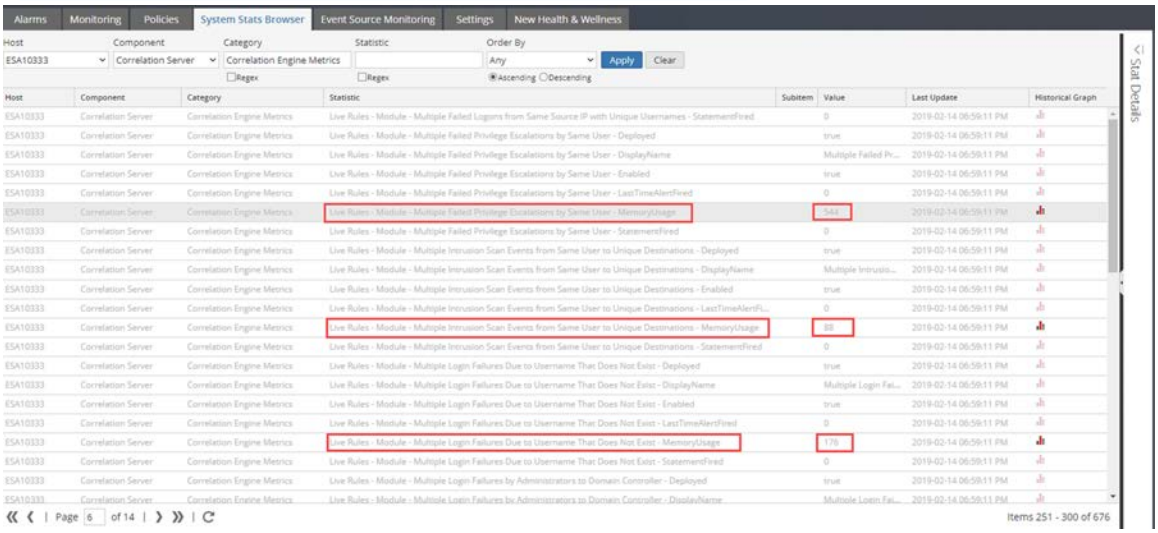
Note: You can also view memory metrics for the ESA Correlation service in the **(Configure) > ESA Rules > Services** tab. See View Stats for an ESA Service.

View Memory Metrics for an ESA Correlation Service and its ESA Rules



1. Go to  **(Admin) > Health & Wellness > System Stats Browser**.
2. To view memory metrics for an ESA Correlation service, in the **Host** field, select your ESA host. Select **Correlation Server** for **Component**, enter **ProcessInfo** for **Category**, and then click **Apply**.

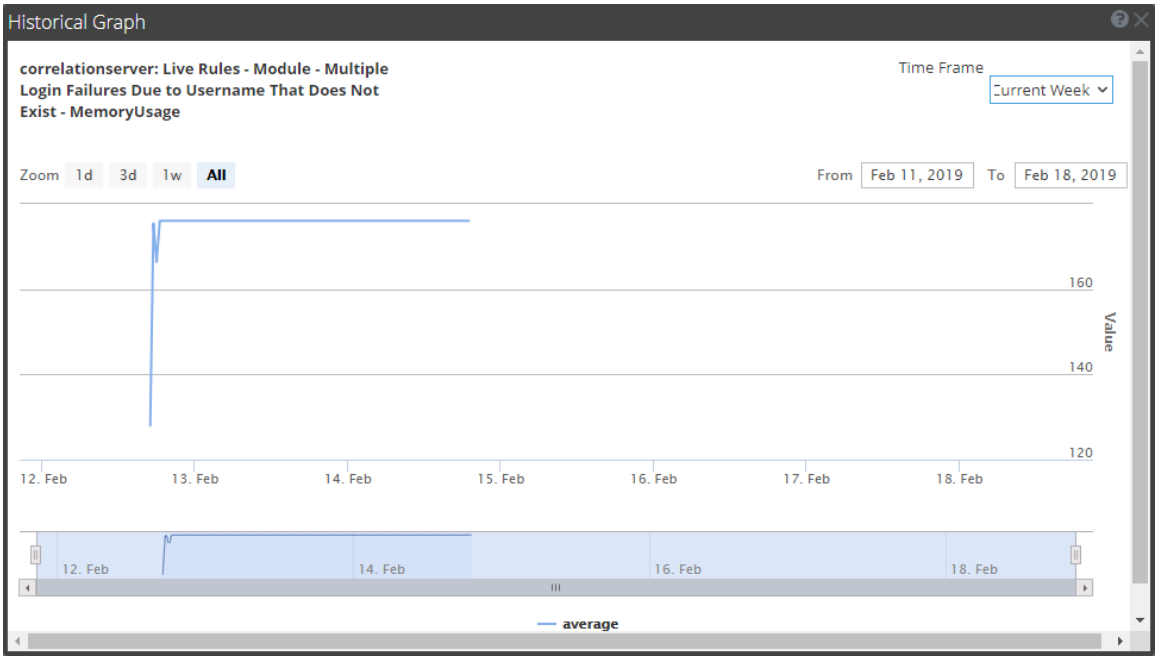
Host	Component	Category
<your host>	Correlation Server	ProcessInfo



The **Memory Utilization** statistic shows the total memory in use by the ESA Correlation service.

3. To view the historical memory usage for the ESA Correlation service, click the **Historical Graph** icon.

4. To view the memory metrics for individual rules, in the **Category** field, enter **Correlation Engine Metrics** and click **Apply**.



Host	Component	Category
<your host>	Correlation Server	Correlation Engine Metrics

The name of the rule is in the **Statistic** column appended with **MemoryUsage** and the memory usage in bytes is in the **Value** column.

Note: The **Last Update** field reflects when Health & Wellness polls ESA. However, the Memory Metrics is not synchronized with the Health & Wellness polling. For example, if the memory threshold is exceeded on 2/10/19 at 12 p.m., but Health & Wellness polls at 2/10/19 at 12:10 p.m., the **Last Update** field will display a timestamp of 2/10/19 12:10 p.m.

5. Click  to view a historical view of memory usage for the rule in the **Historical Graph** column.

Note: You can also view memory metrics for ESA rules in the  **(Configure) > ESA Rules > Services** tab. See View Stats for an ESA Service.

How ESA Handles Sensitive Data

This topic explains how ESA treats sensitive data, such as usernames or IP address, that it receives from Core services. The Data Privacy Officer (DPO) role can identify meta keys that contain sensitive data and should display obfuscated data. ESA does not display or store sensitive meta. Consequently, ESA will not pass sensitive data to NetWitness Respond.

Optionally, ESA can add an obfuscated version of the sensitive data to an event. For example, the DPO identifies `user_dst` as sensitive. ESA can add an obfuscated version, such as `user_dst_hash`, to an event. The obfuscated meta is not sensitive, so ESA will display and store it the same way as any other non-sensitive meta.

For more information on the strategy and benefits of obfuscating data, see the *Data Privacy Management Guide*.

This topic explains the following:

- How ESA treats sensitive data it receives from Core services
- How to prevent sensitive data leaks in an Advanced EPL rule
- How to remove sensitive meta keys from global alerts

How ESA Treats Sensitive Data from Core Services

When ESA receives sensitive data from Core services, ESA passes on only the obfuscated version of the data. ESA does not store or show sensitive data.

The following features are impacted:

- Outputs – ESA does not forward sensitive data to outputs, which include alerts, notifications, and MongoDB storage.
- Advanced EPL rules – If an EPL statement creates an alias for a sensitive meta key, sensitive data will leak. This topic illustrates how this happens so you can avoid it.
- Enrichments – If a sensitive meta key is used in the join condition, sensitive data will leak. This topic illustrates how this happens so you can avoid it.

Advanced EPL Rule

If an EPL query statement renames a sensitive meta key, the data will not be protected.

ESA identifies a sensitive meta key by the name:

- `ip_src` is the sensitive meta key.
- `ip_src_hash` is the non-sensitive, obfuscated version.

To support data privacy, the sensitive meta key must not be renamed in an EPL query. If a sensitive meta key is renamed, the data will no longer be protected.

For example, in a rule such as select `ip_src as ip_alias...`, `ip_alias` contains the sensitive data but it is not protected because ESA only knows about `ip_src`, not `ip_alias`. In this case, IP addresses would not be obfuscated. Real values would be displayed.

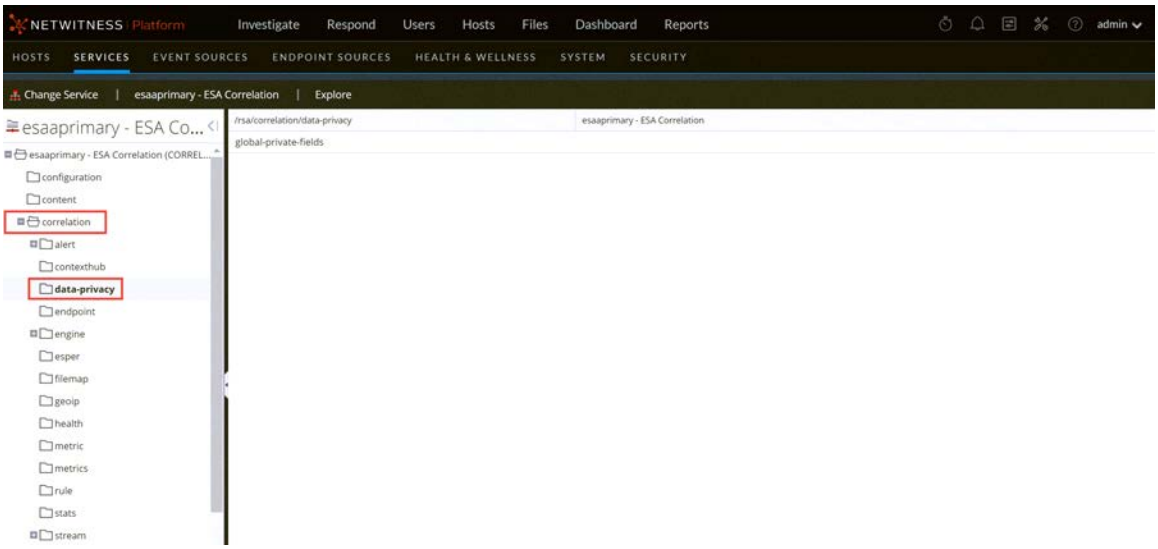
Enrichment Source

When a sensitive meta key is used in a join condition, sensitive data can be displayed.

The enrichment database, which is the other part of the join condition, has one column that matches the sensitive meta key. This cross reference is to actual values not obscured values. Consequently, actual values are displayed.

In the following example, both parts of the join condition are highlighted.

- `ip_src` contains sensitive data.
- `ipv4` will be added to the alert and exposed as non-sensitive data.



Because the `ipv4` value is the same as the `ip_src` value, `ipv4` contains and displays sensitive data.

How to Remove Sensitive Meta Keys Globally from All Alerts

Note: This procedure applies only to ESA Correlation Rules in NetWitness Platform 11.4 and later versions.

For data privacy reasons, it may be necessary to remove some sensitive meta keys from the alert output globally, regardless of the data source. In the ESA Correlation service, you can set the **`global-private-fields`** parameter to remove the meta keys from all alert output.

1. Go to **(Admin) > Services**, and in the Services view, select an ESA Correlation service and then select **> View > Explore**.
2. In the Explore view node list for the ESA Correlation service, select **correlation > data-privacy**.
3. In the **`global-private-fields`** parameter, add the sensitive meta keys that you want removed from all alerts.

The changes are effective immediately.

For more information on the strategy and benefits of obfuscating data, see the *Data Privacy Management Guide*.

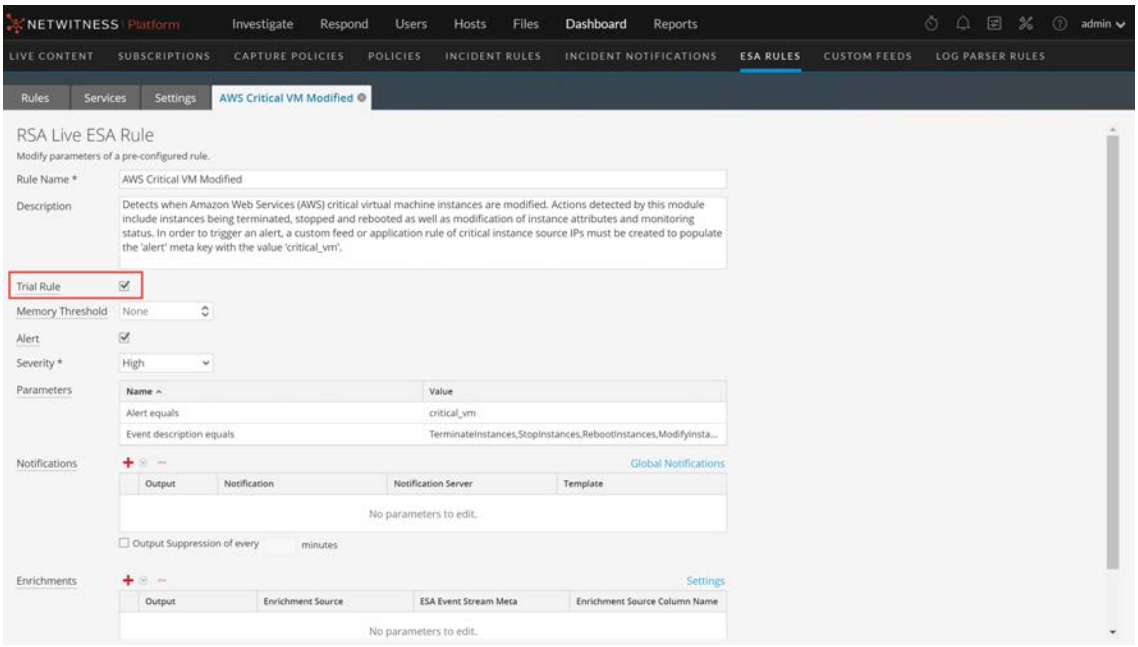
ESA Rule Types

This topic describes each type of ESA rule, when to use them and the permissions each role has with them. The following table lists each type, describes it, and explains when to use it.

Rule Type	Description	When to Use
RSA Live ESA	RSA Live has a catalog of ESA rules that are available to modify to run in your network.	RSA Live ESA rules are available to leverage rules that are already built. Modify the configurable parameters to customize to meet your requirements.
Rule Builder	In the rule builder, you define rule criteria in an easy-to-use interface.	Use the rule builder to create your first rules. You choose many of the rule conditions from lists.
Advanced EPL	With the Event Processing Language (EPL), you define rule criteria by writing a query.	Use advanced EPL rules to define rule criteria in the EPL syntax.
Endpoint Rule Bundle	An Endpoint Risk Scoring Rules Bundle, which contains approximately 400 rules, comes with NetWitness 11.3 and later. The rules in this bundle only apply to NetWitness Endpoint.	If you have NetWitness Endpoint, you can configure risk scoring to identify suspicious files and hosts. To turn on risk scoring for NetWitness Endpoint, you must deploy endpoint risk scoring rules on ESA. For instructions, see "Deploy Endpoint Risk Scoring Rules on ESA" in the *ESA Configuration Guide*. For complete information on configuring NetWitness Endpoint, see the *NetWitness Endpoint Configuration Guide*.

Sample Rules

Sample Rule Builder rules come with NetWitness and appear in the Rule Library. Use sample rules to get comfortable working with rules before creating your own. You can safely edit and deploy these sample rules.



Endpoint Risk Scoring Rules Bundle

An Endpoint Risk Scoring Rules Bundle, which contains approximately 400 rules, comes with NetWitness 11.3 and later. These rules appear in the Rule Library with the sample rules. Endpoint risk scoring rules only apply to NetWitness Endpoint. You can add the Endpoint Risk Scoring Rules Bundle to an ESA rule deployment in the same way that you would add any ESA rule. However, you must specify endpoint data sources (Concentrators) in the ESA Rule Deployment.

Trial Rules Mode

For any type of rule, you can select the Trial Rule setting as an additional safeguard. Trial rules get disabled if they exceed a memory threshold set by the administrator. Run a rule in trial mode to monitor memory usage and to disable the rule automatically if it uses more memory than the threshold allows.

The following figure shows the Trial Rule setting in the Rule Builder.

ESA Permissions

This topic lists all ESA permissions and shows which permissions are assigned to each pre-configured NetWitness role. User access is restricted based on roles and permissions assigned to roles.

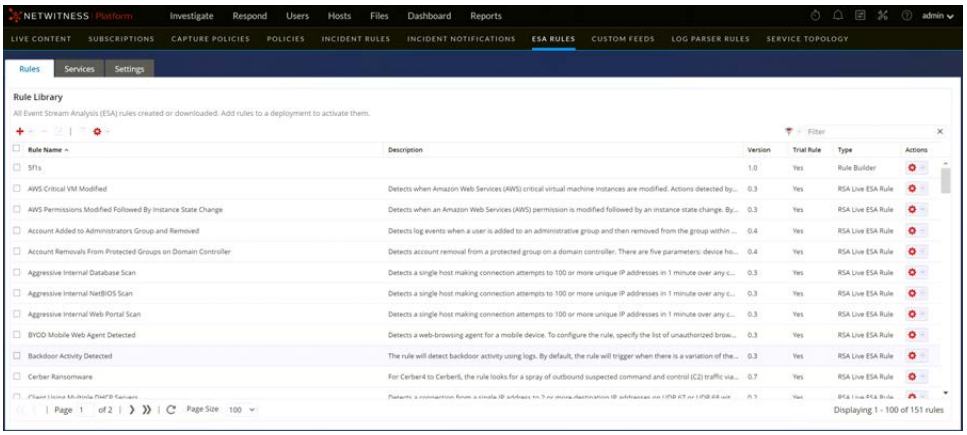
- Administrators
- Operators
- Analyst
- Security Operations Center (SOC) Managers
- Malware Analysts (MA)
- Data Privacy Officer

There are four permissions for ESA:

- **Access Alerting Module**: Is required for any permission
- **View Rules**: Allows view-only permission for rules in the Rule Library

- **View Alerts**: Allows view-only permission for alerts ESA generates
- **Manage Rules**:Allows you to view, create, edit, and delete rules

The following table lists permissions for ESA and the roles to which they are assigned. Use this table to see how each role can work with rules and alerts.



Permission	Administrators	Operators	Analysts	SOC Mgrs	MAs	DPOs
Access Alerting Module	Yes	Yes	Yes	Yes		Yes
View Rules	Yes	Yes		Yes		Yes

For more information on roles and permissions, see the *System Security and User Management Guide*.

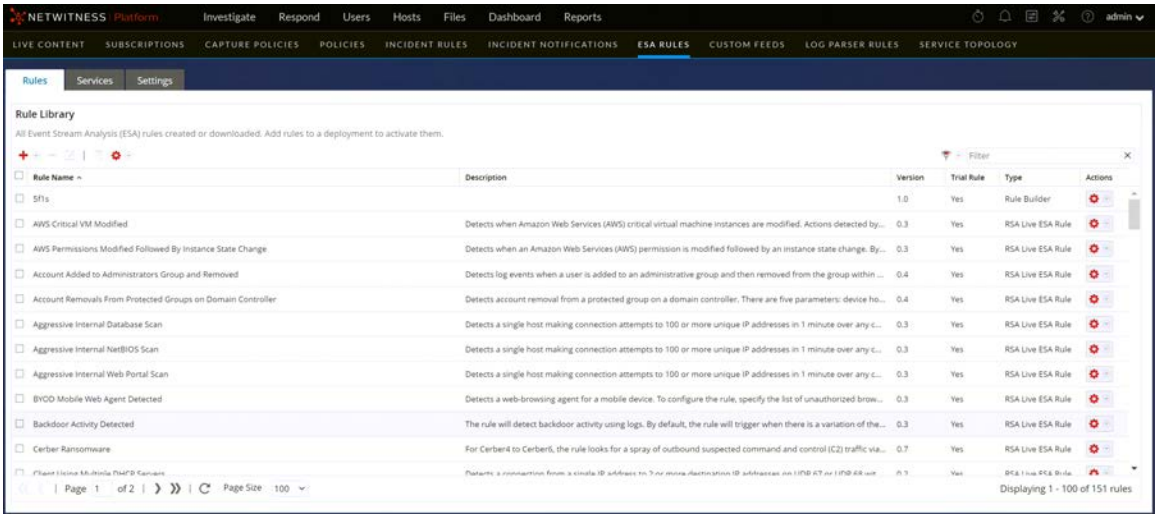
Practice with Sample Rules

NetWitness comes with sample rules so analysts can become familiar with how rules look before they create their own rules. Use the sample rules to become familiar with the Rule Builder and to practice editing and deploying a rule.

Sample rules are installed in the Rule Library, which contains every rule you download or create. The following figure shows sample rules in the Rule Library.

These are the available sample rules:

- SAMPLE - Blacklist - From inside countries that are not the US, Non SMTP Traffic on TCP Port 25 Containing Executable
- SAMPLE - Non SMTP Traffic on TCP Port 25 Containing Executable
- SAMPLE - P2P Software as Detected by an Intrusion Detection Device

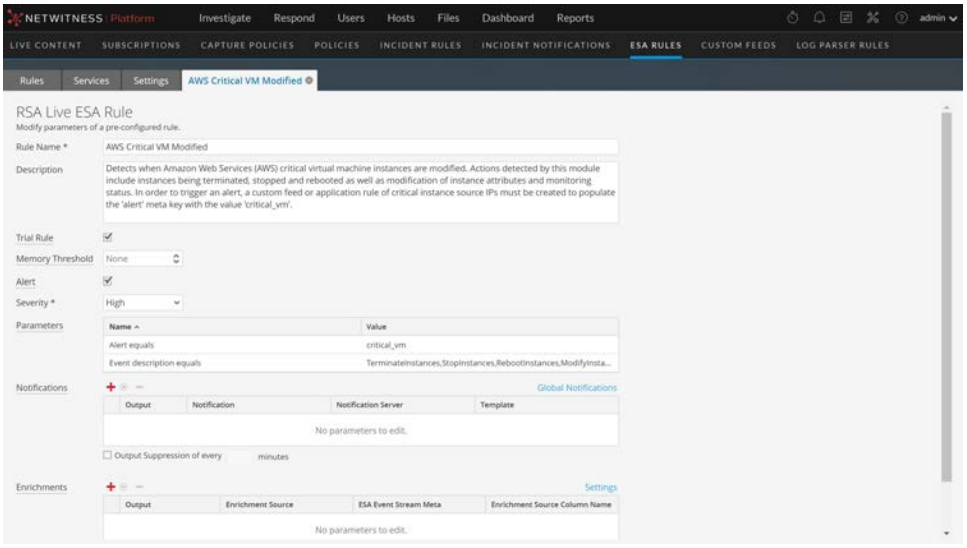


- SAMPLE - User Added to Admin Group Same User su Sudo
- SAMPLE - Whitelist - From outside of Germany, P2P Software as Detected by an Intrusion Detection Device.

Each name begins with SAMPLE to distinguish the rules that are installed with NetWitness from the rules you download and create.

Rule Library

The Rule Library shows the following information for a rule:



- **Name** summarizes the data or events the rule collects.
- **Description** explains the rule in more detail, although only the beginning shows in the Rule Library.
- **Trial Rule** indicates if trial mode is enabled or disabled for the rule.
- **Type** shows the origin of the rule, built in Rule Builder or Advanced EPL, downloaded from RSA Live, or Endpoint Rule Bundle.

Practice with Sample Rules

1. Go to **(Configure) > ESA Rules**.
   The ESA Rules view is displayed with the Rules tab open.

2. In the **Rule Library**, double-click a sample rule or select a sample rule and click . The rule is opened in Rule Builder.

3. To practice with a sample rule, refer to the following topics for detailed descriptions and procedures:
   - To familiarize yourself with the Rule Builder user interface, see Rule Builder Tab for a description of each field.
   - To learn how to edit a rule, see Add a Rule Builder Rule for a step-by-step procedure.
   - To deploy sample rule, see Deploy Rules to Run on ESA to learn how to associate the rule with an ESA service.

After you practice with sample rules, you will be able to download, create, and deploy your own rules.

Working with Trial Rules

The ESA Correlation service is capable of processing large volumes of disparate event data from Concentrators. However, when working with ESA Correlation rules, it is possible to create rules that use excessive memory. This can slow your ESA service or even cause it to shut down unexpectedly. To ensure that rules do not use excessive memory, you can enable them as trial rules. You should disable the trial rule setting only after testing the new rule in your environment during times of both normal and peak network traffic.

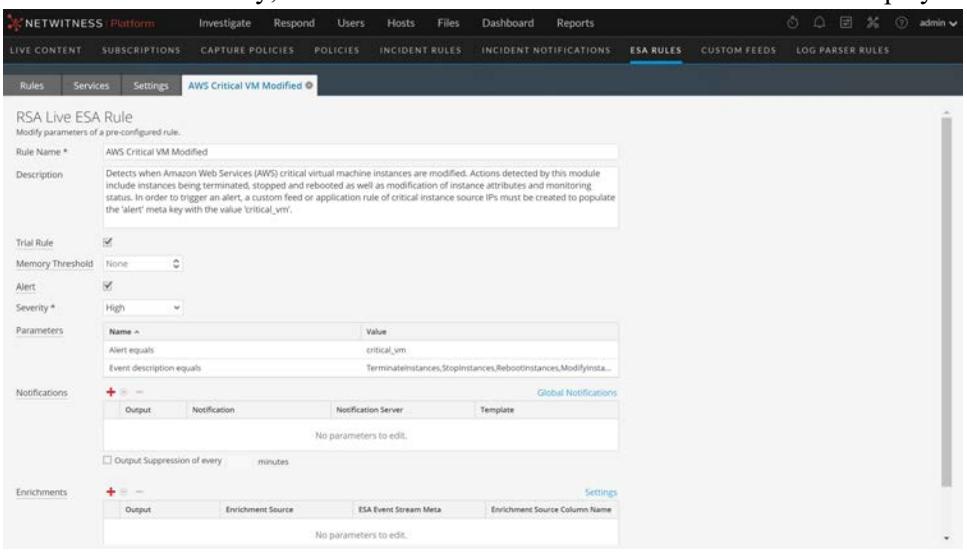
You can set a global threshold of the percentage of memory that trial rules may use. If that configured memory threshold is exceeded, all trial rules are disabled automatically. To configure the memory threshold, see "Change Memory Threshold for All Trial Rules" in the *ESA Configuration Guide*.

For suggestions on creating more efficient rules, see "Best Practices for Writing Rules" in Best Practices.

By default, new rules and RSA Live rules that you import are configured as trial rules. As a best practice, when you edit an existing rule, select the Trial Rule option, which allows you to deploy the rule with an added safeguard.

Note: Run a rule as a trial rule long enough to assess the performance during normal and peak network traffic.

Deploy Rules as Trial Rules



This topic explains to administrators how to enable trial rules when creating new rules or editing rules. Trial rules are automatically disabled if a specified total JVM memory utilization threshold is exceeded.

In NetWitness 11.4 and later, ESA trial rules no longer change status after an upgrade or deployment.

For example, if you change the status of a trial rule to disabled ((Configure) > ESA Rules > Services tab) and redeploy the ESA rule deployment ((Configure) > **ESA Rules** > **Rules** tab), the trial rule remains disabled.

1. Go to **(Configure) > ESA Rules**.
   The Configure ESA Rules view is displayed with the Rules tab open.

2. From the Rule Library, choose to add or edit a rule. The rule builder is displayed in a new tab.

3. To make a new or existing rule a trial rule, select the **Trial Rule** checkbox.
4. Add the rule conditions or modify the rule as needed. For instructions on editing rules, see Add Rules to the Rule Library.
5. Click **Save**.
6. Ensure that trial rules are enabled for your ESA and that you are satisfied with the thresholds configured for trial rules.
   The memory threshold is set in the configuration file. To configure it, see "Change Memory Threshold for All Trial Rules" in the *ESA Configuration Guide*.
   - The threshold is configured per ESA and is a percentage of Java Virtual Memory.
   - The configuration parameter, `fatal-percentage`, has a default value of 90.
7. Optionally, you can set up the policies in Health and Wellness to send you an email notification if the total JVM memory utilization threshold is exceeded.

The next time you deploy the rule, it runs in trial rule mode.

Note: If a trial rule is disabled, you will need to go to the **(Configure) > ESA Rules > Services** tab to re-enable the trial rules. For more instructions on re-enabling trial rules on a service, see View ESA Stats and Alerts.

Add Rules to the Rule Library

This topic explains how to add each type of rule to the rule library. You must add a rule to the Rule Library before you can deploy it. Permission to manage rules is required for all tasks in this section. To add rules, you can download them from ESA Live, create a rule via the Rule Builder, or write advanced EPL rules.

For more details on each of these procedures, see:

- Working with Live ESA Rules
- Add a Rule Builder Rule
- Add an Advanced EPL Rule

In addition to deploying a rule, you can edit, duplicate, import, export, and remove a rule in the Rule Library. For details on these procedures, see Working with RulesWorking with Rules

Note: Analysts must have appropriate permissions to view the ESA rules under (**CONFIGURE**) > **ESA Rules** and (**CONFIGURE**) > **Policies** pages. For more information, see the **Source-server** section in the "Role Permissions" topic in the *System Security and User Management Guide*.

Working with Live ESA Rules

This topic explains working with configurable ESA rules from the NetWitness Live Content Management System so you can customize them to meet your needs. Live contains a catalog of rules. Each rule has configurable parameters so you can customize the rule for your environment. If Live has a rule to detect events that you want to detect in your network, download the rule to save time. You can edit the configurable parameters and save the rule in your Rule Library. For detailed information about each rule, including whether the rule is for logs, packets, or both, see "ESA Rules" at the following link: https://community.netwitness.com/t5/netwitness-platform-threat/rules/ta-p/677884

This is an example of how each Live ESA rule is described on Live:

Rule Name	Description
Logins across Multiple Servers	Detects logins from the same user across 3 or more separate servers within 5 minutes. The time window and number of unique destinations are configurable.

As the name shows, the rule looks for logins across multiple servers. The description explains the rule criteria in more detail and specifies which parameters you modify.

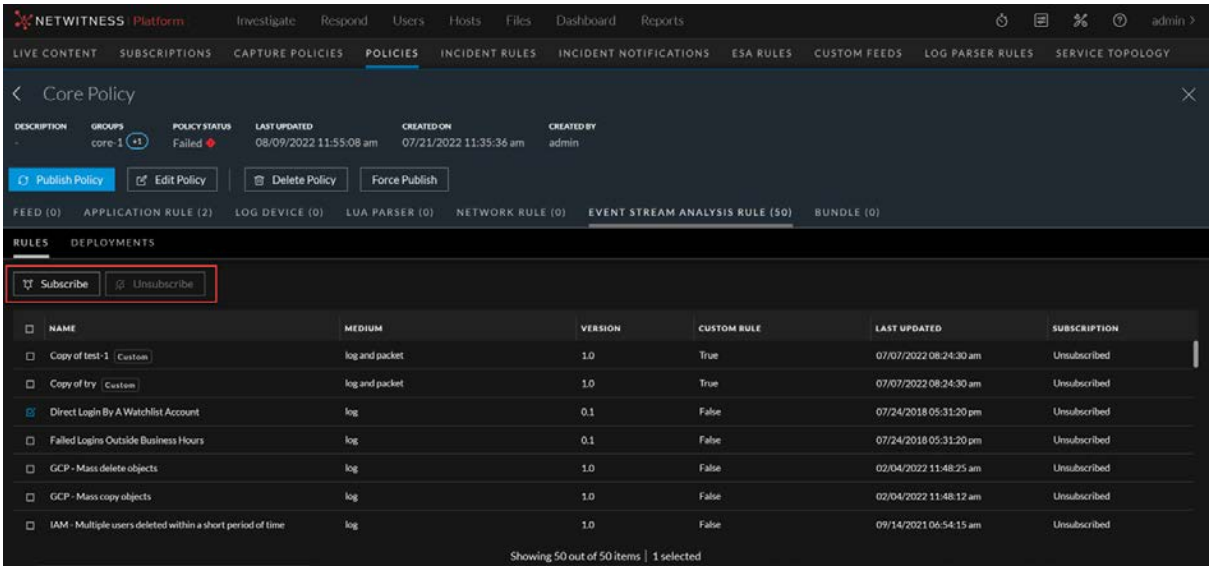
Note: When a rule description includes a configurable parameter, the default setting for the parameter is used. In the example rule, the description states 5 minutes. However, the time window is configurable so 5 is the default number of minutes.

Prerequisites

These are the prerequisites for working with configurable Live ESA rules;

- Have permission to manage rules.
- Create a Live Account. See the *Live Services Management Guide* for details.
- Set up Live on NetWitness. See the *Live Services Management Guide* for details.
- Update your meta keys. See "Update Your ESA Rules for the Required Multi-Value and Single-Value Meta Keys" in the *ESA Configuration Guide*

Subscribe and Unsubscribe Live ESA Rules



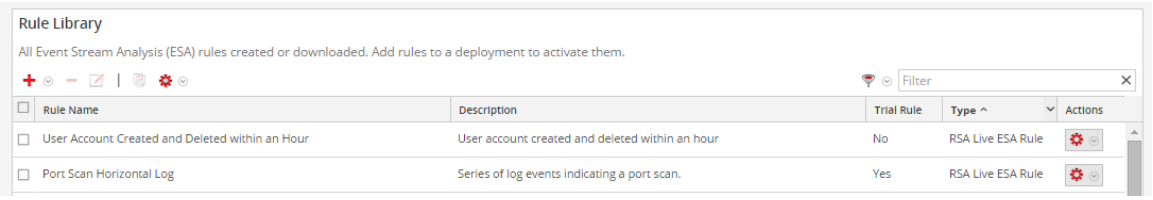
You can subscribe and unsubscribe live ESA rules from the **Configure** > **Policies** page.

To Subscribe the Live ESA rules

1. Go to  **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
   The available policies are displayed.
3. Click a Policy.

The selected policy view is displayed and by default **Application Rule** is selected.

4. Click **Event Stream Analysis Rule** > **Rules**.
5. Click one or more Live ESA rules and click **Subscribe**.



Note: ESA Rules cannot be manually deployed via Live Services. By default, all the ESA rules from Live are available in the ESA Rule library, if live is configured.

Customize an RSA Live ESA Rule

This topic explains how to configure parameters in an RSA Live ESA rule. When you download an RSA Live ESA rule, the rule appears in the Rule Library which includes the following columns:

- Rule Name
- Description
- Trial Rule
- Type
- Actions

The type is RSA Live ESA Rule.

Prerequisites

- Administrator, Operator, SOC Manager, or DPO role permissions are required.
- Rules must be downloaded to the Rule Library.

Configure Parameters for an RSA Live ESA Rule

1. Go to  **(Configure) > ESA Rules > Rules** tab.
2. In the **Rule Library**, double-click an RSA Live ESA Rule or select the rule and click .
   The RSA Live ESA Rule tab is displayed.
3. (Optional) Change the following fields:
   - Rule Name
   - Description
   - Trial Rule (Enabled by default. NetWitness recommends you run a rule as a trial rule long enough to assess the performance during normal and peak network traffic.)
   - Alert (This option applies to 11.3 and later.) Select Alert to send an alert to Respond. Clear the checkbox if you do not want to send an alert to Respond. To turn alerts on or off for ALL rules, see the *ESA Configuration Guide*.
   - Severity
   - Notifications
   - Enrichments
4. To configure the rule for your environment, in the **Parameters** section replace the default in the **Value** Column.

5. Click **Save**.

Add a Rule Builder Rule

Each ESA rule is designed to detect something in your network and to generate an alert for it:

- User activity that is not allowed, such as attempting to download software that is not sanctioned
- Suspicious behavior, such as mass audit clearing
- Known malicious threats, such as worm propagation or a password-cracking tool

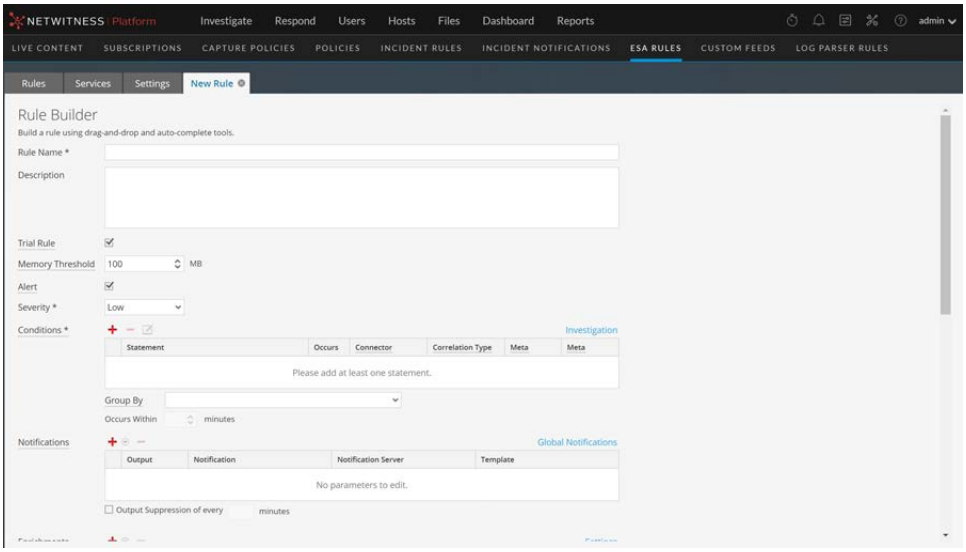
There are two methods to design a rule in ESA:

- **Rule Builder** is an easy-to-use interface. You provide a meta key and value, then select choices from lists to complete the criteria.
- **Advanced EPL** allows you to write queries in the Event Processing Language. You must know EPL syntax.

If you know EPL, you can use either method. If you do not know EPL, you should use Rule Builder. These topics explain the Rule Builder.

Step 1. Name and Describe the Rule

This topic provides instructions to identify a rule, indicate if it is a trial rule and assign a severity level. When you add a new rule, the first information to provide is a unique name and description of what the rule detects. After you save the rule, this information is displayed in the Rule Library.



Prerequisites

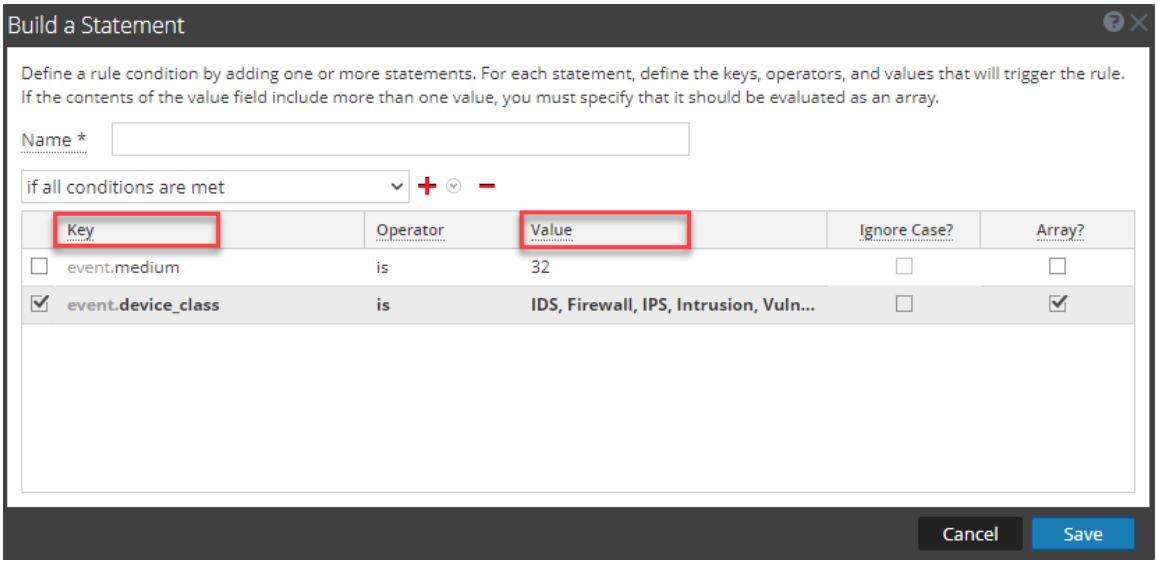
You must have permission to manage rules. See ESA Permissions.

Name and Describe a Rule

1. Go to  **(Configure) > ESA Rules > Rules** tab.

2. In the **Rule Library**, select  **> Rule Builder**.
   The New Rule tab is displayed.

3. Type a unique, descriptive name in the **Rule Name** field.
   This name will appear in the Rule Library so be specific enough to distinguish the rule from others.
4. In the **Description** field, explain which events the rule detects.
   The beginning of this description will appear in the Rule Library.
5. By default, new rules are configured as a Trial Rule. A trial rule automatically disables the rule if all trial rules collectively exceed the memory threshold. If you are editing an existing rule, you can select **Trial Rule** to safely test the rule edits.
   Use trial rule mode as a safeguard to see if a rule runs efficiently and to prevent downtime caused by running out of memory. For more information, see Working with Trial Rules.
6. (This option applies to 11.5 and later.) Enter a **Memory Threshold** for a rule that uses memory, such as a rule that contains windows or pattern matching. If the configured memory threshold is exceeded, the rule gets disabled individually and an error is displayed for that rule on the  (Configure) > ESA Rules > Services tab. The Memory Threshold option works for trial rules and non-trial rules. New rules default to a 100 MB memory threshold. Rules that existed before version 11.5 do not have a default value and a memory threshold is not set.
7. (This option applies to 11.3 and later.) Select **Alert** to send an alert to Respond. Clear the checkbox if you do not want to send an alert to Respond. To turn alerts on or off for ALL rules, see the *ESA Configuration Guide*.
8. For **Severity**, classify the rule as Low, Medium, High or Critical.



Step 2. Build a Rule Statement

This topic provides instructions to define rule criteria in Rule Builder by adding statements. A statement is a logical grouping of rule criteria in the Rule Builder. You add statements to define what a rule detects.

Example

The following graphic shows an example of a Rule Builder statement.

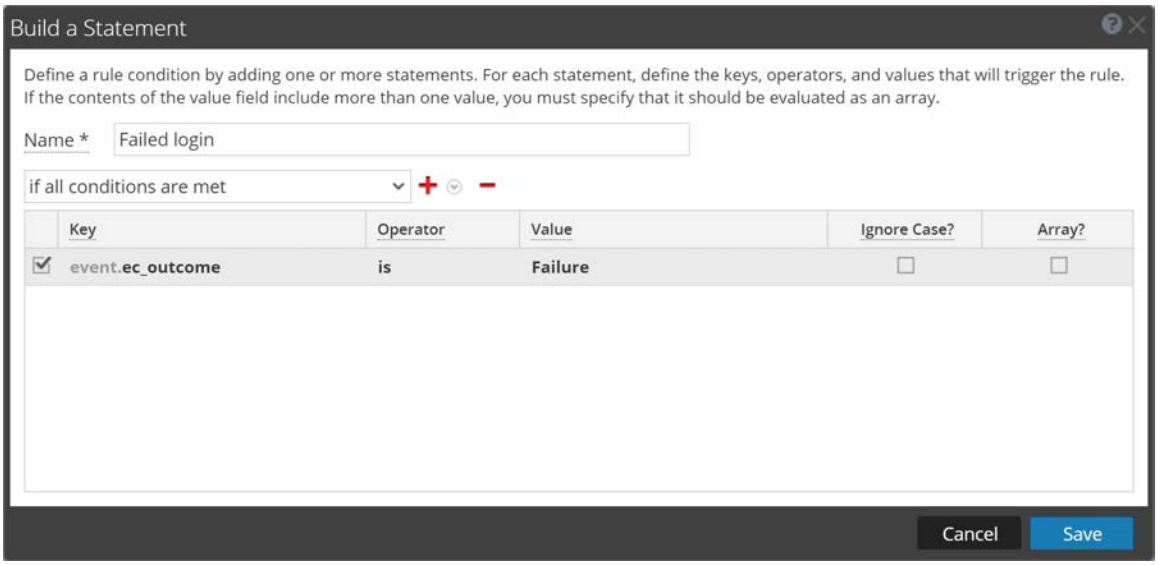
Every statement contains a key and value. Then, you build logic around the pair by selecting an option in each other field.

Prerequisites

To build a rule statement, you must know the meta key and the meta value.

For a complete list of meta keys, go to **(Configure) > ESA Rules > Settings > Meta Key References**.

Meta entities are not currently supported, such as:



```
fullname.all
eth.all
ip.all
ipv6.all
port.src.all
port.dst.all
dir.path.all
org.all
geoip.all
port.all
```

```
domain.all
email.all
filename.all
directory.all
checksum.all
param.all
context.all
attack.all
analysis.all
compromise.all
inv.all
outcome.all
ec.all
user.all
host.all
client.all
```

Caution: If you add meta entities to your rule, they cannot get data from the data sources, so they do not trigger alerts.

Build a Rule Statement

1. Go to  **(Configure) > ESA Rules**.
   The Rules tab is displayed by default.
2. In the **Rule Library**, click  **> Rule Builder** or edit an existing Rule Builder rule.
   The Rule Builder view is displayed.
3. In the **Conditions** section, click .
   The Build Statement dialog is displayed.

4. **Name** the statement. Be clear and specific. The statement name will appear in the Rule Builder.
5. From the drop-down list, select which circumstances the rule requires:
   - if **all conditions** are met
   - if **one of these conditions** are met
6. Specify the criteria for the statement:
   a. For **Key,** type the name of the **Meta Key**.
   b. For **Operator** specify the relationship between the meta key and the value you will provide for it. The operator that you use depends on the metadata type.
   The choices are: is, is not, is not null, is greater than (>), is greater than or equal to (>=), is less than (<), is less than or equal to (<=), is one of (For array type meta), is not one of (For array type meta), contains, not contains, begins with, ends with
   c. Type the **Value** for the meta key.
   Do not add quotes around a value. Separate multiple values with a comma.
   d. The **Ignore Case?** field is designed for use with string and string array values. By choosing the **Ignore Case** field, the query will treat all string text as a lowercase value. This ensures that a rule that searches for the user named Johnson would trigger if the event contains "johnson," "JOHNSON," or "JoHnSoN." (For best rule performance, only use the **Ignore Case** option when necessary.)
   e. The **Array?** field indicates if the contents of the Value field represent one or more than one value.
   Select the Array checkbox if you entered multiple, comma-separated values in the **Value** field. For example, "ec_activity is Logon, Logoff" requires you to select the Array checkbox.
7. To use another meta key in the statement, click , select **Add Meta Condition** and repeat step 6.
8. To add a whitelist, click  and select **Add Whitelist Condition**.

9. To add a blacklist, click  and select **Add a Blacklist Condition**.
10. To save the statement, click **Save**.

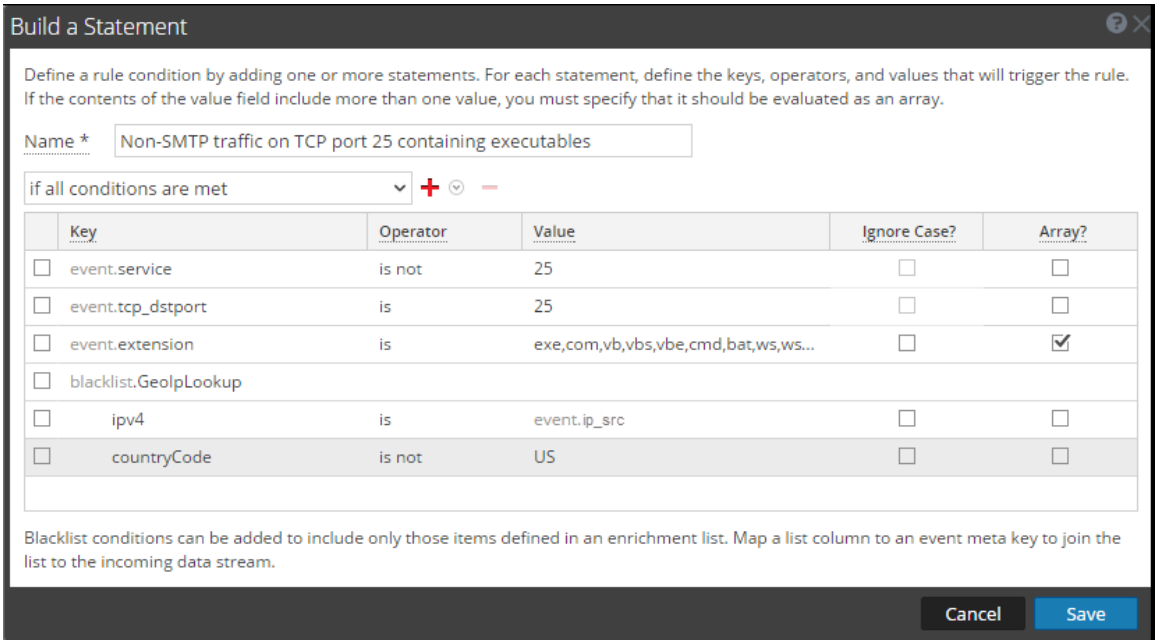
To Add a Whitelist

You use a whitelist to ensure that specified entities are excluded from triggering the rule. Whitelists can be based on geographic location, in-memory enrichment, or Context Hub list sources. For example, if you want to create a rule that only triggers for IP addresses outside of the US, you can create a whitelist of US IP addresses.

1. After you add a meta condition, click  and select **Add Whitelist Condition**.
2. In the **EnterWhitelist Name** field, select an enrichment source. Any in-memory enrichment, Context Hub list, or a named window in Esper can be used as the source for a whitelist.
3. For the subcondition:
   a. If you used a GeoIP source for the whitelist, ipv4 is automatically entered for the subcondition. Enter the meta value for the corresponding value field. For example, enter *ipv4 is ip_src* to ensure the GeoIP records are selected based upon the ip_src being found in the GeoIP lookup database. In addition, if you used a GeoIP source for the whitelist, you might want to add a subcondition to specify the geographic region to exclude from the rule results. For example, to specify that the country code must be USA, enter "*CountryCode is US*".
   b. If you used a Context Hub list for the whitelist, select a column name from the list, then select an operator and enter the meta value for the corresponding value field.

Note: An *Entity* is a specified piece of meta, such as IP address, MAC address, user, host, domain, file name, or file hash.

To Add a Blacklist

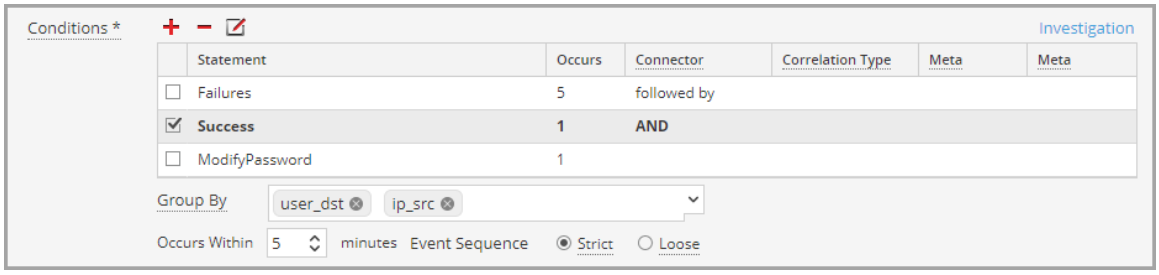


You use a blacklist to ensure that specified entities trigger the rule. Blacklists can be based on geographic location, in-memory enrichment, or Context Hub list sources. For example, you can specify that the rule only includes results from Germany.

1. After you add a meta condition, click  and select **Add Blacklist Condition**.
2. In the **Enter Blacklist Name** field, select an enrichment source. Any in-memory enrichment, Context Hub list, or a named window in Esper can be used as the source for a blacklist.
3. For the subcondition:
   a. If you used a GeoIP source for the blacklist, ipv4 is automatically entered for the subcondition. Enter the meta value for the corresponding value field. For example, enter ipv4 is ip_src to ensure the GeoIP records are selected based upon the ip_src being found in the GeoIP lookup database. In addition, if you used a GeoIP source for the blacklist, you might want to add a subcondition to specify the geographic region to include in the rule results. For example, to specify that the rule only includes results for Germany, enter "*CountryCode is DE*".

b. If you used a Context Hub list for the blacklist, select a column name from the list, then select an operator and enter the meta value for the corresponding value field.

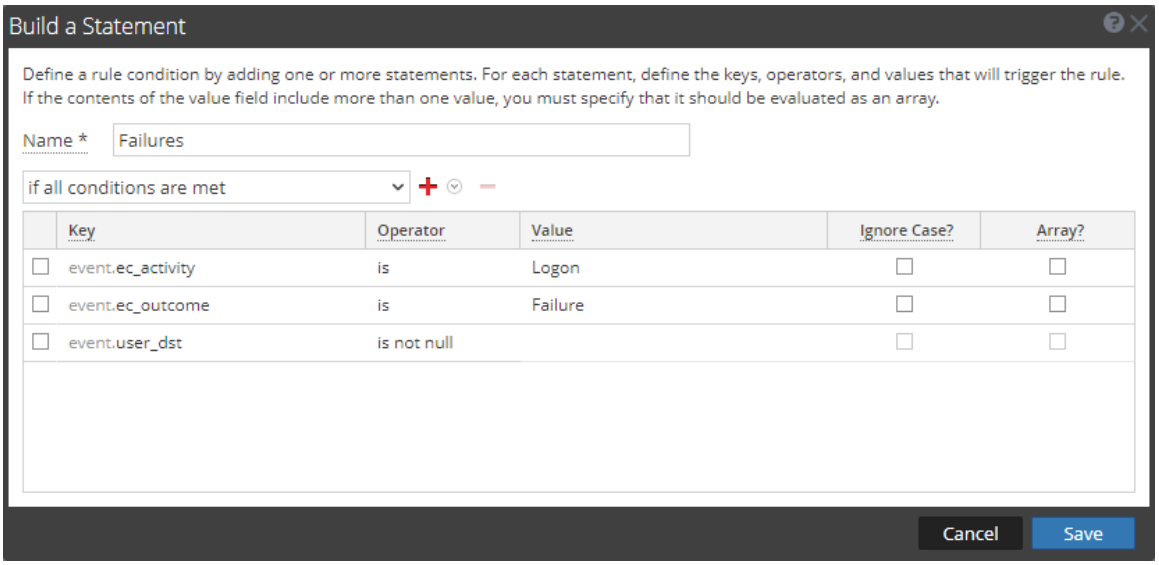
Example: Blacklist



The following statement shows a blacklist statement for a rule that monitors for non-SMTP traffic on TCP destination port 25 containing an executable from countries that are outside of the United States.

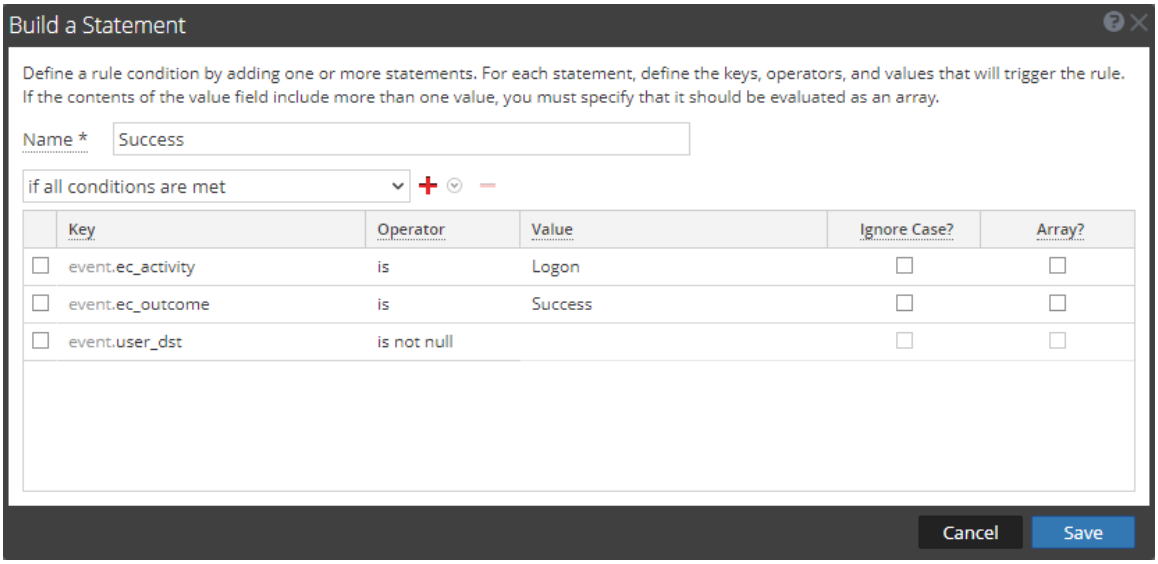
Statement	Description
service is not 25	The traffic is not SMTP traffic.
tcp_dstport is 25	The traffic is running on TCP port 25.
extension is exe, com,vb,vbs,vbe,cmd,bat,ws,wsf,src,sh	The file extension is an executable.
GeoIpLookup	The blacklist is based on a GeoIPLookup source.
ipv4 is ip_src	The GeoIP records are selected based upon the ip_src being found in the GeoIP lookup database.
countryCode is not US	When looking up the IP address Event.ip_src in the GeoIP database, the record it returns does not contain "US" in the countryCode field.

Example: Strict Pattern Matching and Using the *Is Not Null* Operator



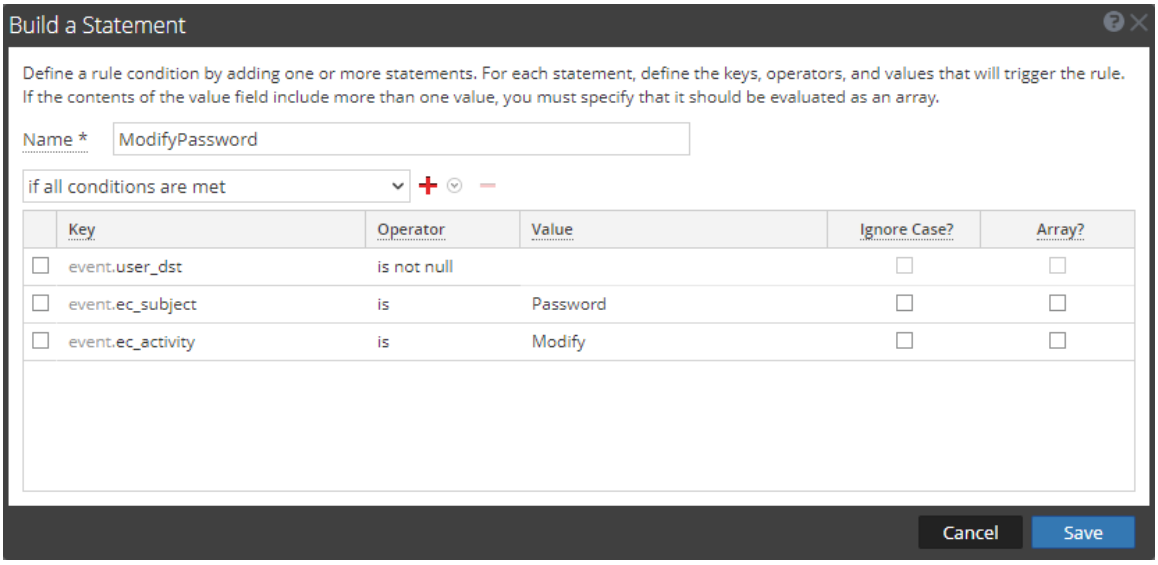
The following example uses the ability to exclude null values and create a strict pattern match to ensure that it returns the expected rule results. The following conditions make up the rule:

Rule Condition	Description
Failures	This condition searches for five failed logins with a "followed by" connector, meaning that the condition (Failures) must be followed by the next condition (Success).
Success	This condition searches for one successful login.
ModifyPassword	This condition searches for an instance where the password is modified.
GroupBy: user_dst, ip_src	The GroupBy field ensures that all the previous conditions are grouped by the user_dst meta (the user destination account) and ip_src. This is important to the construction of the rule because the rule attempts to find a case where a user has attempted to log into the same destination account multiple times, finally logged in successfully, and then changed the password. Grouping by ip_src ensures that the user logged in from the same machine attempted to log into an account multiple times. The rule may give unexpected results if you do not group the results.
Occurs within 5 minutes	The time window for the events to occur is five minutes. If the events occur outside of this time window, the rule does not trigger.
Event Sequence: Strict	The event sequence is configured for a strict pattern match. This means that the pattern must match exactly as it is specified with no intervening events. Strict pattern matching allows you to ensure that the Esper engine only generates alerts for rules that exactly match the pattern you want to find. For example, a common rule might be to search for five failed logins followed by a successful login. If you select a loose pattern match, this rule will trigger if there are any number of successful logins between the failed logins. Since the point of the rule is to find frequent *and* sequential login attempts, a strict match is required to ensure that you get the results you expect.



Note: Each of these conditions is explained in further detail in the sections below.

For each condition, a statement is built in the Rule Builder. The following statement makes up the Failures condition:



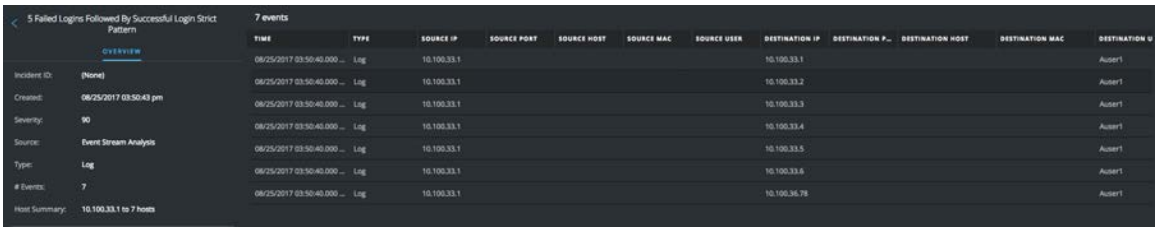
Rule Statement	Description
ec-activity is Logon	Identifies activity that attempts to log on to a system. The **Ignore Case** field is designed for use with string and string array values. By choosing the **Ignore Case** field, the query will treat all string text as a lowercase value. You may want to use this field if you are unsure what case may be used when logging a particular event. For best rule performance, only use the **Ignore Case** option when necessary.
ec_outcome is Failure	Identifies activity outcome logged as "failure."
user_dst is not null	Ensures that the condition is only true if user_dst is populated. The **is not null** operator allows you to ensure that a field returns a value. You may want to use this field when a rule depends on a particular field returning a value. For example, you want to create a rule that identifies the same user attempting to log into the same destination account multiple times (potentially a password-guessing attack). If the field that represents the user destination account is empty, you don't want the rule to trigger. To ensure the field contains a value, you use the **is not null** operator.

The following statement makes up the Success condition:

Rule Statement	Description
ec_activity is Logon	Identifies logon activity.
ec_outcome is Success	Identifies a logon that is successful.
user_dst is not null	Ensures that user destination account field must be populated for the condition to be true.

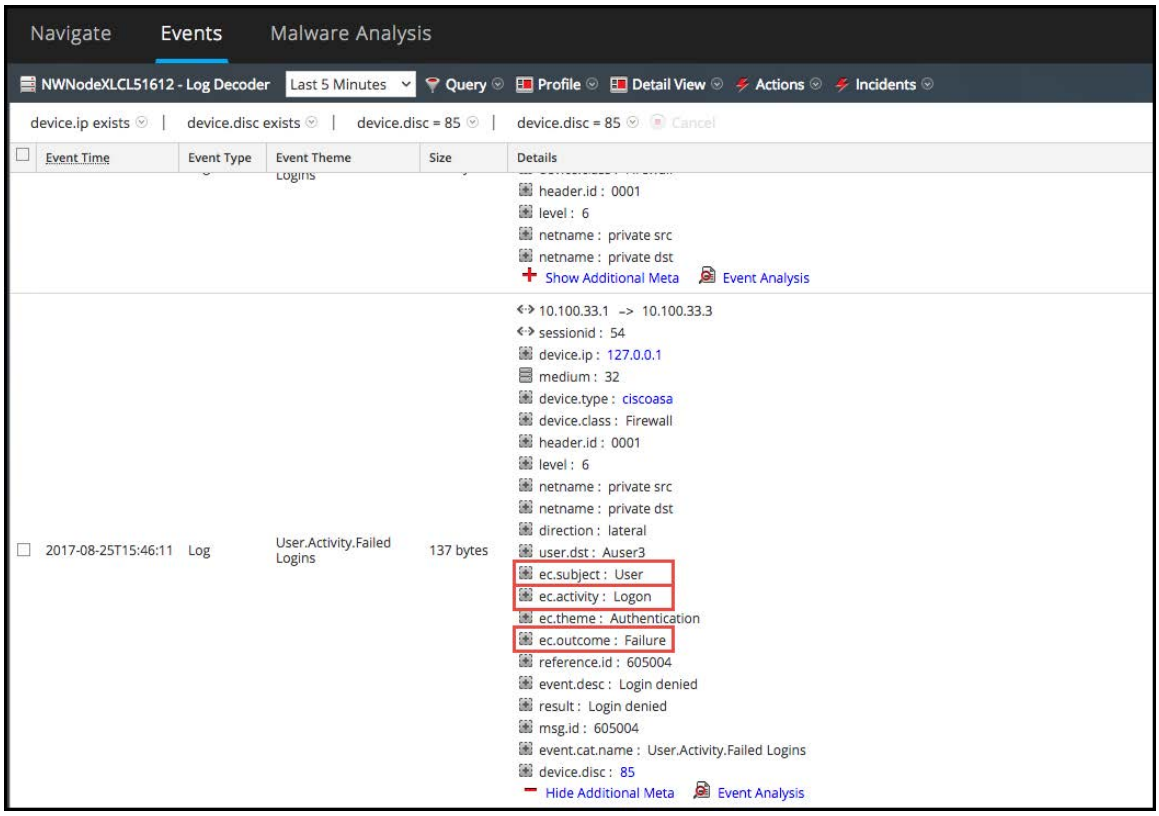
The following statement makes up the ModifyPassword condition:

Rule Statement	Description
user_dst is not null	Ensures the user destination account field must be populated for the condition to be true.
ec_subject is Password	Identifies a subject of Password.
ec_activity is Modify	Identifies activity where the password was modified.



Example Results

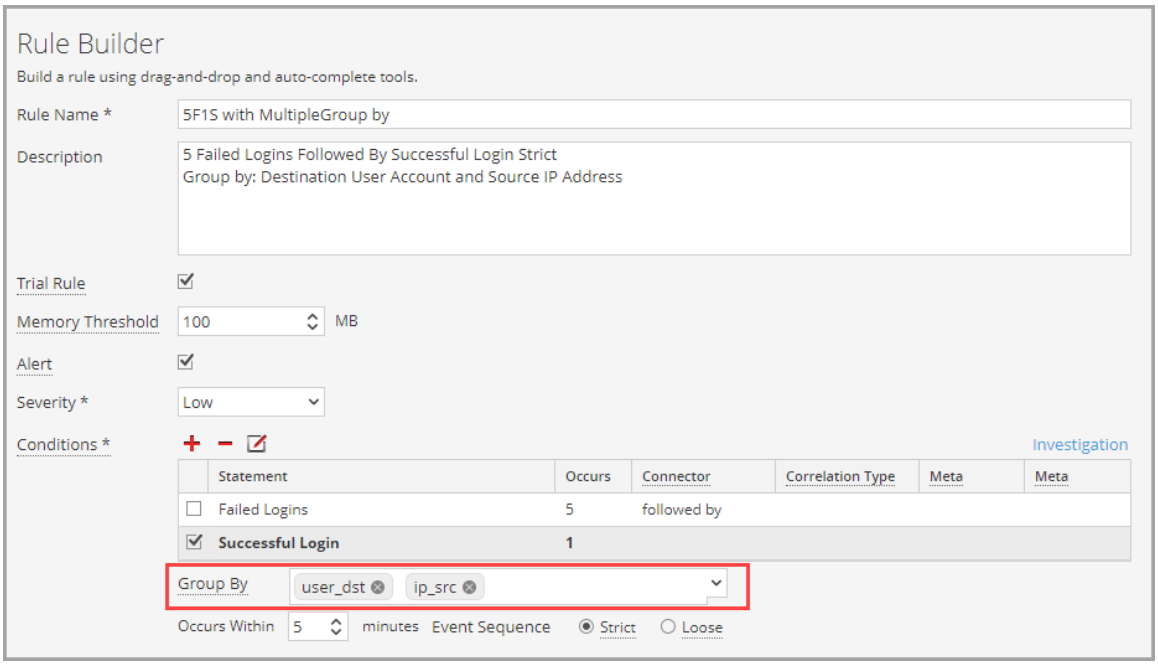
When the alert fires for the above example rule, you can see that the rule triggered for seven events, and that each event contains a user. You can also see that the events follow a strict pattern: five failed login events, followed by a successful login event, followed by a modification to the account.



The following figure shows the alert in the Respond Alerts List view.

The next figure shows the events in the alert in the Respond Alert Details view.

Drilling down into the Investigation view by clicking on the source for one of the events, you can see the case for each of the string values.

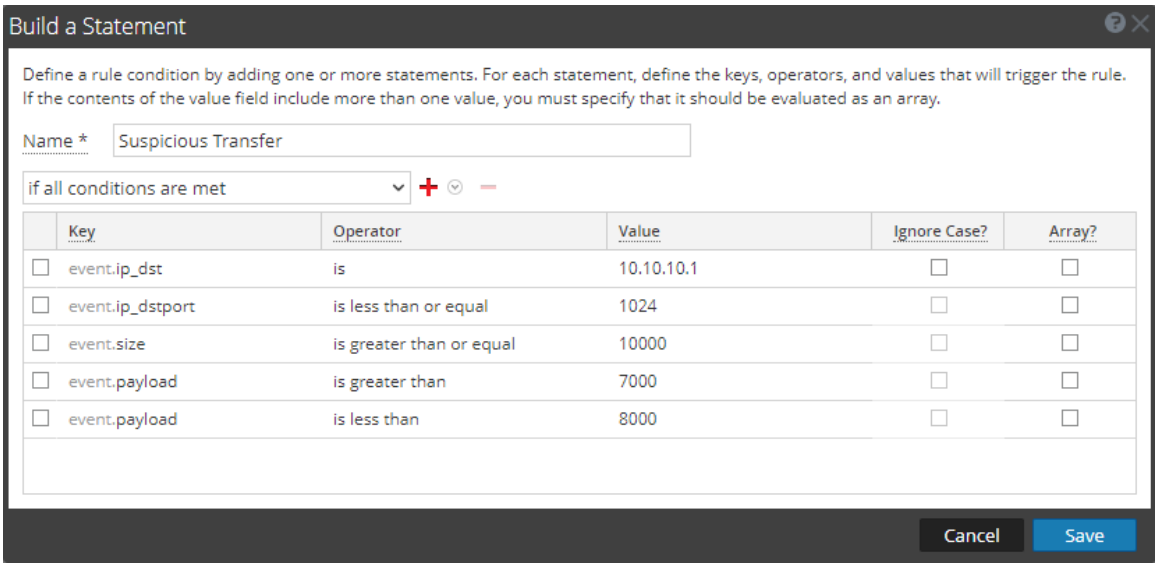


Example: Grouping the Rule Results

The **Group By** field allows you to group and filter rule results. For example, suppose that there are three user accounts; Joe, Jane, and John and you use the **Group By** meta, user_dst. The result will show events grouped under the accounts for Joe, Jane, and John.

You can also group by multiple keys, which can further filter rule results. For example, you might want to group by user destination account and machine to see if a user logged into the same destination account from the same machine attempts to log into an account multiple times. To do this, you might group by user_dst and ip_src.

The following example shows a rule grouped by user_dst and ip_src.

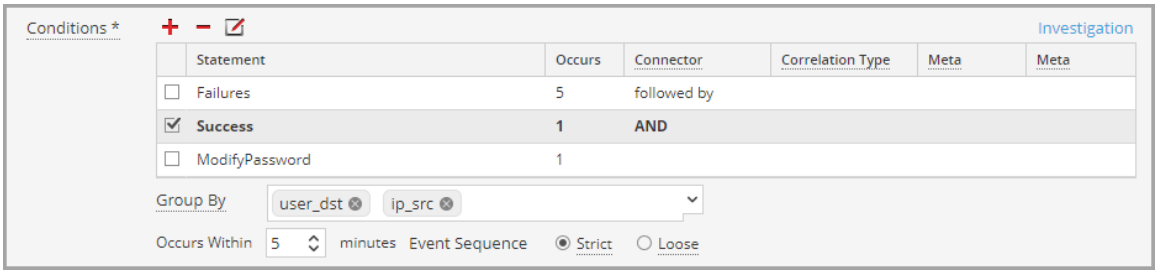


Rule Condition	Description
Failed Logins	Identifies five failed login attempts (must be followed by the next condition; that is, the five failed logins must be followed by a successful login).
Successful Login	Identifies one successful login.
Group By: user_dst and ip_src	Groups the rule results by user_dst (user destination account) and ip_src (IP address of the machine that the user is logging in from). This allows the rule to look for a user logged in from the same machine to the same destination account, resulting in a much more targeted rule result.
Occurs within 5 minutes with a strict pattern match	The events must occur within five minutes, and the pattern matching is strict, meaning it must follow the pattern exactly for the rule to trigger.

Example: Working with Numeric Operators

Numeric operators allow you to write rules against numeric values, such as specifying that a value is greater than, less than, or equal to a specific value. This is useful particularly for cases where you might want to specify a numeric threshold, that is, *payload is greater than 7000*.

The following example attempts to identify a data transfer to a particular destination through the common ports where the transfer size is high and the payload is in a suspicious range.



Rule Statement	Description
ip_dst is 10.10.10.1	The destination port is 10.10.10.1.
ip_dstport is greater than or equal to 1024	The destination port is in a commonly used port range, 1024 or greater.
size is greater than or equal to 10000	The size of the transfer is 10000 or greater, which is a suspiciously large transfer.
payload is greater than 7000	The payload is between 7000 and 8000, which is a suspiciously large payload.
payload is less than 8000	The payload is between 7000 and 8000, which is a suspiciously large payload.

Step 3. Add Conditions to a Rule Statement

This topic provides instructions to add conditions, such as specifying a certain time frame, to a rule statement. When you build a statement, you specify what a rule detects. You add conditions to make further stipulations, such as how many times or when the criteria must occur.

Example

The following graphic shows an example of the conditions for Rule Builder statements. Combined, the statements and conditions comprise the rule criteria.

This rule detects 5 failed logon attempts followed by one successful logon, which could be the sign that someone has hacked into user account. This is the criteria for the rule:

A. 5 failed logons are required.

B. 1 successful logon must follow the failures

C. A password was changed.

D. All events must occur within 5 minutes.

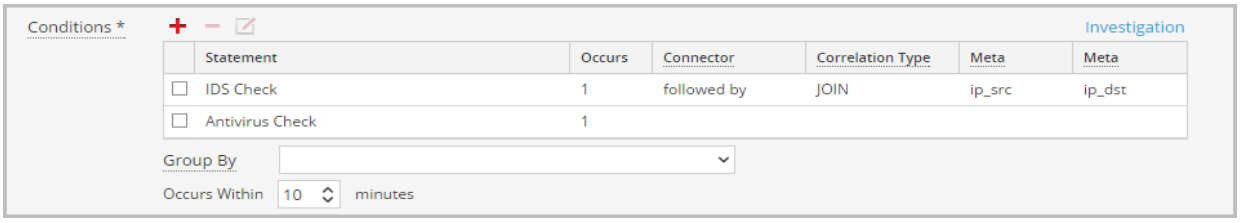
E. Group alerts by user (user_dst), because steps A and B must be performed on the same user destination account. Also, group by machine (ip_src) to ensure that the user logged in from the same machine attempts to log into an account multiple times.

F. The match is a strict pattern, meaning that the pattern must match exactly with no intervening events.

Add Conditions to a Rule Statement

1. In the **Conditions** section, select a statement and click .
2. For **Occurs**, enter a value to specify how many occurrences are required to meet the rule criteria.
3. If you have multiple statements, in the **Connector** field select a logical operator to join one statement to another:
   - followed by
   - not followed by

- AND
- OR



4. **Correlation Type** applies only to **followed by** and **not followed by**. If you choose a correlation type of SAME, select one meta to correlate on, and if you choose a correlation type of JOIN, select two meta to correlate on. You may want to use JOIN if you are trying to correlate on meta from two different data sources. For example, say you want to correlate an AV alert with an IDS alert. See the examples below for a use case where two meta from different sources are joined.
5. If events must happen within a specific timeframe, enter a number of minutes in the **Occurs Within** field.
6. Choose whether the pattern must follow a **Strict** match or a **Loose** match. If you specify a strict match, this means that the pattern must occur in the exact sequence you specified with no additional events occurring in between.

   For example, if the sequence specifies five failed logins (F) followed by a successful login (S), this pattern will only match if the user executes the following sequence: F,F,F,F,F,S. If you specify a loose match, this means that other events may occur within the sequence, but the rule will still trigger if all of the specified events also occur. For example, five failed login attempts (F), followed by any number of intervening successful login attempts (S), followed by a successful login attempt might create the following pattern: F,S,F,S,F,S,F,S,F,S which would trigger the rule despite the intervening successful logins.
7. Choose the fields to group by from the dropdown list. The **Group by** field allows you to group and evaluate the incoming events.
   For example, in the rule that detects 5 failed logon attempts followed by 1 successful attempt, the user must be the same, so user_dst is the **Group By** meta key. You can also group by multiple keys. Using the previous example, you might want to group by user and machine to ensure that the same user logged in from the same machine attempts to log in to an account multiple times. To do this, you might group by user_dst and ip_src.

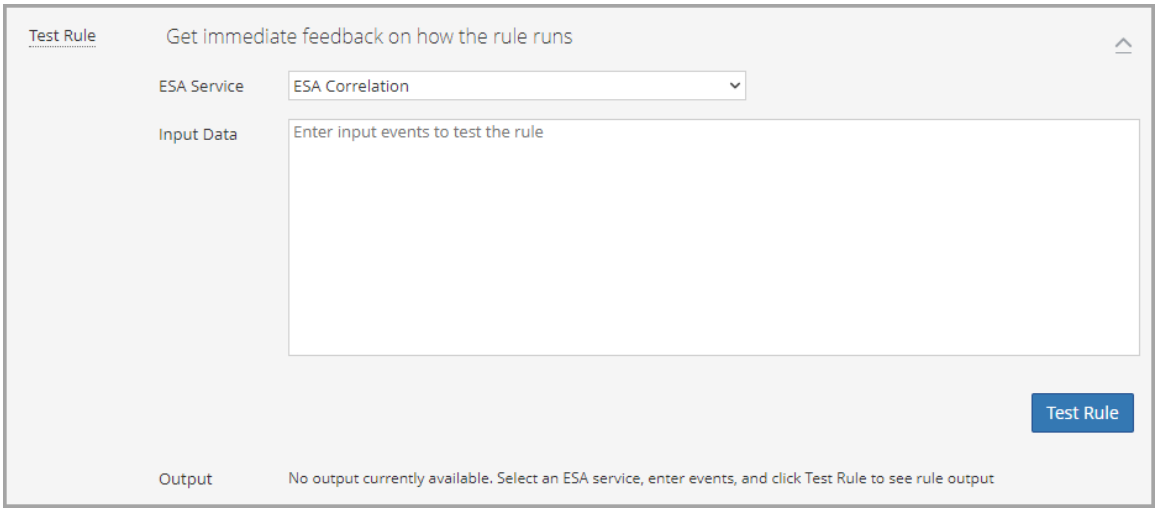
Example

The following graphic shows an example of the conditions for a rule that allow you to evaluate the same entities across multiple devices so you can accomplish complex use cases. For example, you can create a rule that triggers if an IDS (Intrusion Detection System) alert is followed by an AV(Anti-virus) alert for the same workstation. The work station key is not the same between the two (IDS & AV) sources, so you can perform a JOIN in order to evaluate the different entities.

In the IDS alert, the workstation is identified by the source IP address from the IDS alert, and would be compared to the destination IP address from the AV alert.

This is the criteria for the rule:

A. An IDS alert occurs.



B. The destination IP address from the AV alert and source IP address for the workstation from the IDS alert are joined to allow you to view the same entities across different sources.

C. An Antivirus alert follows the IDS alert.

Validate an ESA Rule

You can confirm that an ESA rule generates the expected alerts by testing the rule logic using JSON input data. You can view the alerts in the output, but this test does not send any alert notifications.

1. If you are not already in the rule, go to **(Configure) > ESA Rules > Rules** tab and in the **Rule Library**, open the ESA rule that you want to test.
2. Scroll down to the **Test Rule** section.

3. In the **ESA Service** field, select the ESA Correlation service to process the rule. Use the same ESA Correlation service that you plan to use in the ESA rule deployment that contains the rule.
4. In the **Input Data** field, enter the input events to test the rule. Download the events from the Investigate view in JSON format, copy the events, and paste them in this field. You can do this from the Investigate > Navigate view or the Investigate > Events view.

   To download the events from the Investigate > Navigate view:

   a. In the main menu, go to **Investigate > Navigate** in a new tab, select a data source, and click **Navigate**.

   b. In the Navigate view, click **Load Values** and click a meta value to filter the events.

c. Save the events as meta in the JSON file format [Save Events > Meta > (name the file) > Export Meta Format: choose JSON].

d. In the toolbar click the **(Jobs)** icon and then click **View Your Jobs**.

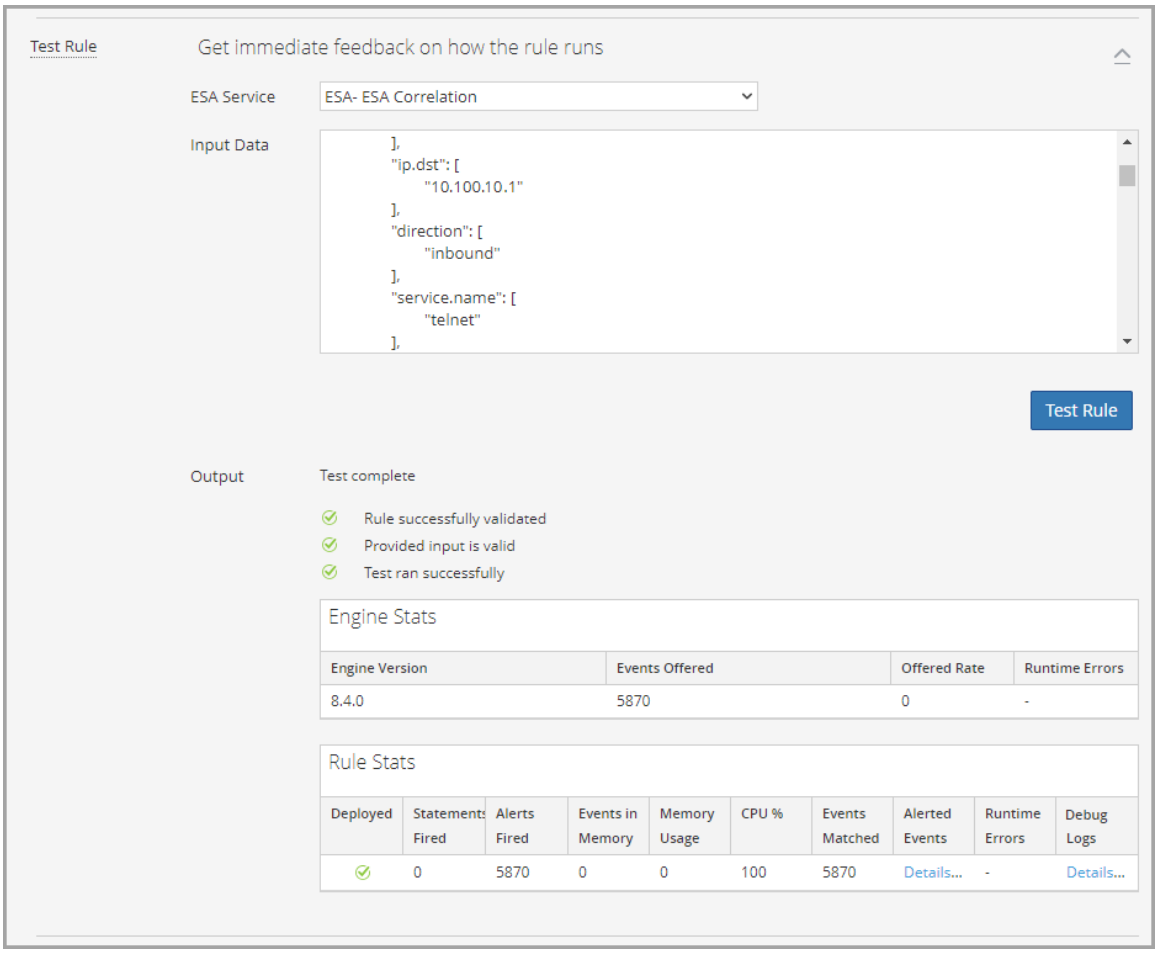
e. In the Jobs panel, download your extracted meta, for example: **`investigation-2020-May-19-08-30-20.json`**.

f. Go to back to the **(Configure) > ESA Rules** tab opened previously and copy the contents of the JSON file into the **Input Data** field in your ESA rule.

To download the events from the Investigate > Events view:

a. In the main menu, go to **Investigate > Events** in a new tab.

b. In the Events view, enter a query for the ESA rule test.



c. Select the events to use and in the **Download** or **Download All** menu, select **Visible Meta as JSON** or **All Meta as JSON**, depending on the size of your selection.

d. In the main menu, go to **Dashboards** and in the toolbar click the **(Jobs)** icon and then click **View Your Jobs**.

e. In the Jobs panel, download your extracted meta, for example: **Concentrator_ALL_EVENTS_ALL_META.json**.

f. Go to back to the **(Configure) > ESA Rules** tab opened previously and copy the contents of the JSON file into the **Input Data** field in your ESA rule.

5. Click **Test Rule**. The **Output** field shows the output of your rule and you can determine if the results meet your requirements.

The following table describes the test rule output **Engine Stats**.

Field	Description
Engine Version	Esper version running on the ESA service
Events Offered	Number of events processed by the ESA service since the last service start
Offered Rate	The rate that the ESA service processes current events / The maximum rate that the ESA service processed events
Runtime Errors	If applicable, this field can contain a link to runtime error messages related to the ESA rule deployment.

The following table describes the test rule output **Rule Stats**.

Field	Description
Deployed	A green checkmark indicates that the rule is deployed on the selected ESA service.

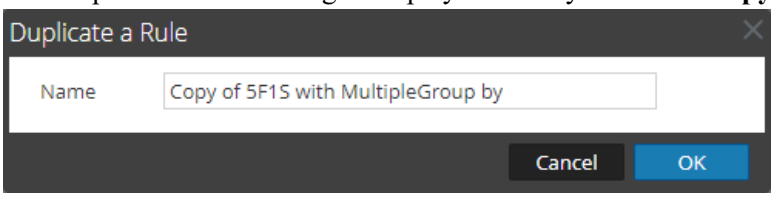
Field	Description
Statements Fired	The number of statements that fired the alerts
Alerts Fired	The number of alerts generated from the test data
Events in Memory	The number of events placed in memory by the rule
Memory Usage	The total amount of memory used by the rule
CPU %	The percentage of the deployment CPU used by the rule. For example, a deployment with 1 rule shows 100% CPU usage for that rule and a deployment with two equally CPU heavy rules show 50% each.
Events Matched	The number of events that matched the rule
Alerted Events	If applicable, this field can contain a link to events that caused an alert.
Runtime Errors	If applicable, this field can contain a link to runtime error messages related to the rule.
Debug Logs	This field contains a link to Esper debug (audit) logs.

Working with Rules

This topic discusses additional procedures you can perform on rules. You may want to perform any of the following procedures:

- Edit, Duplicate or Delete a Rule
- Filter or Search for Rules
- Import or Export Rules

Edit, Duplicate or Delete a Rule



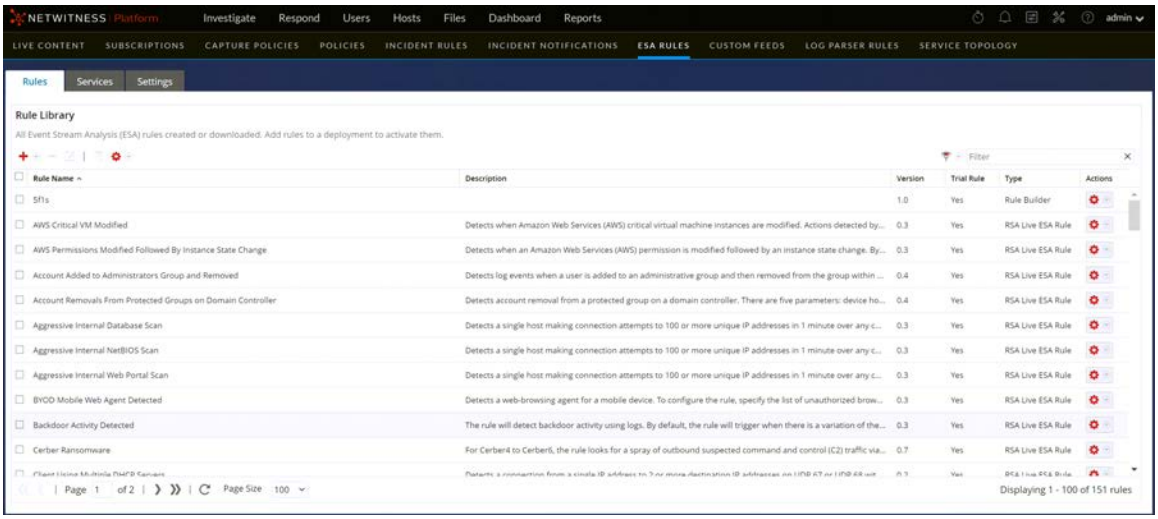
This topic provides instructions to edit, duplicate, or delete an Event Stream Analysis (ESA) rule. When you edit a rule, ESA applies the updated criteria going forward. No changes are made to previously generated alerts.

Edit a Rule

1. Go to **(Configure) > ESA Rules > Rules** tab.
   The Rules tab is displayed.
2. In the **Rule Library**, select the rule you want to edit and click .
   Depending on the rule type, the respective rule tab is displayed.
3. Modify the required parameters.
4. Click **Save**.

Duplicate a Rule

1. In the **Rule Library**, select the rule you want to duplicate and click .
2. The Duplicate a Rule dialog is displayed. The system adds **Copy of** in front of the rule name.



3. In the **Name** field, type a unique name for the duplicate rule and click **OK**.

A duplicate rule with the new name is added to the Rule Library.

Delete a Rule

1. Go to **(Configure) > ESA Rules > Rules**.
   The Rules tab is displayed.

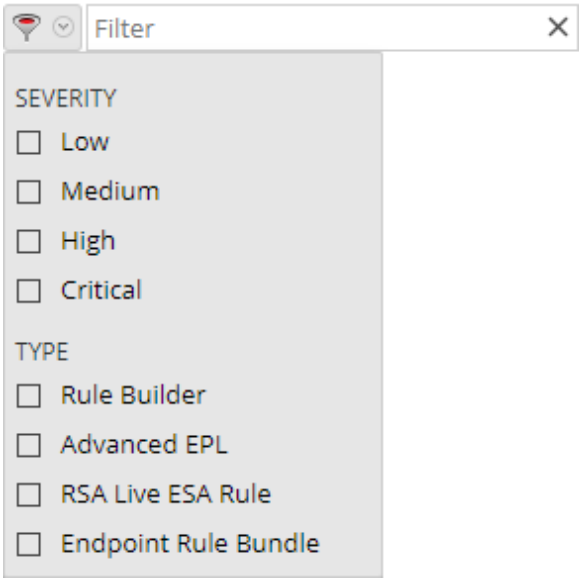
2. In the Rule Library, select one or more rules and click .

   A warning dialog is displayed.

3. Click **Yes**.
   A confirmation message that the rule is deleted successfully is displayed and the selected rule is deleted from the Rule Library.

Filter or Search for Rules

This topic shows analysts how to specify the type of rules that display in the Rule Library.



Prerequisites

Make sure that you understand the Rule Library view components. For more information, see Rule Library Panel.

Filter Rules

1. Go to **(Configure) > ESA Rules**.
   The Rules tab is displayed by default.

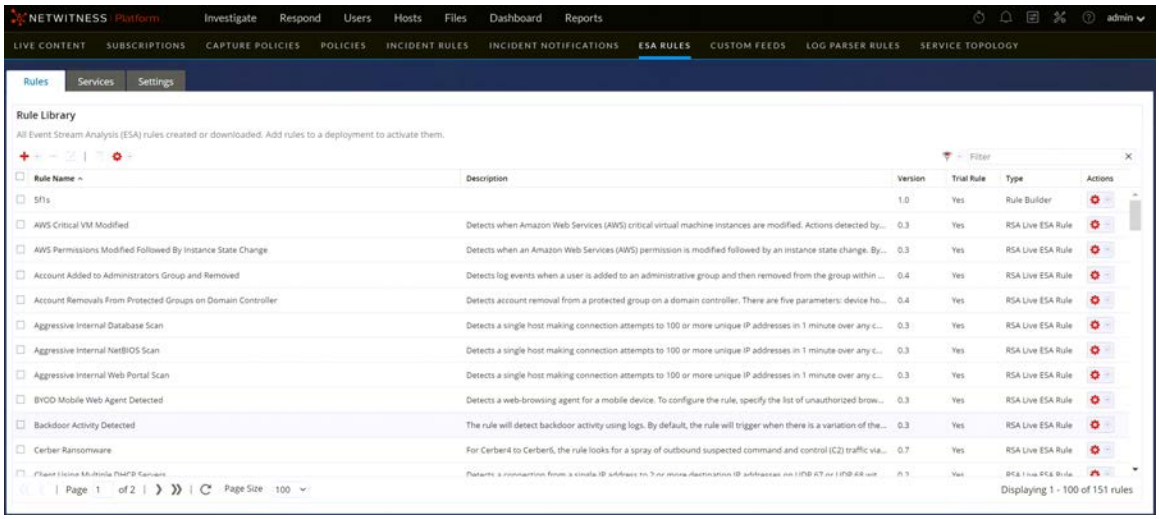
2. In the **Rule Library** panel toolbar, click and select the severity and type of rules that you would like to appear in the Rule Library list. The following figure shows the Filter drop-down list.

The selected rule types appear in the list.

Search for Rules

1. Go to **(Configure) > ESA Rules**.
   The Rules tab is displayed by default.
2. In the **Rule Library** panel toolbar, type a rule name in the Filter field.
   The Rule Library panel lists the rules that match the names entered in the Filter field.

Import or Export Rules



The topic provides instructions to import ESA rules from a NetWitness instance and to export ESA rules to your hard drive so you can keep a local copy.

If you exported a rule in an earlier version of NetWitness, the following conditions apply when you import the rule in version 10.5 or later:

- Exported in version 10.3 – You cannot import rules to version 10.5 or later.
- Exported in version 10.4 – You can import rules to version 10.5 or later.

Import ESA Rules

1. Go to **(Configure) > ESA Rules > Rules** tab.
   The Rules tab is displayed.

2. In the **Rules Library** toolbar, select  **> Import**.
   The Import ESA Rules dialog is displayed.

3. Click **Browse** to browse and select the file containing the ESA rules.
4. Click **Import**.

Export ESA Rules

1. Select an ESA rule or multiple rules and select  **> Export** in the Rule Library toolbar.
   A warning dialog is displayed.
2. Click **Yes**.
   The Export Rules dialog is displayed.
3. In the **Enter File Name** field, type a filename for the file with the ESA rules and click **Export**.
   The file is exported as a binary file to your machine.

Note: The binary file cannot be edited.

Choose How to be Notified of Alerts

This topic explains the different notification methods and how to add a notification method to a rule. Administrator, SOC Manager or DPO role permissions are required for all tasks in this section.

When a rule triggers an alert, ESA can send a notification in the following ways:

- Email
- Syslog
- Script

To configure a notification, you configure these components:

- **Notification Server**: The notification server is the source of the notifications. After you configure a notification server, you can add it to a rule. When the rule triggers an alert, the rule will use that server to send alert notifications.
- **Notifications**: These are the outputs (destinations) of the notifications, which can be email, script, and Syslog. When you design a rule, you can specify the notification for an alert.
- **Templates**: The message format of an alert notification is defined in a template.

If you use an ESA rule that has an enrichment, such as a Context Hub list, you must create a custom template. You can duplicate a default template and adjust it for your enrichment. For more information, see Troubleshoot ESA Rules. For information on creating a custom template, see see "Configure Meta Keys as Arrays in ESA Correlation Rules" in the *System Configuration Guide*.

Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Note: ESA SNMP notifications are not supported for NetWitness 11.3 and later.

Alert suppression and alert rate regulation are two features that Event Stream Analysis provides. Alert suppression ensures that multiple emails are not sent out for the same alert. For example, consider a rule to detect failed user logins. If you set the alert suppression to three minutes, you will see only the alerts generated in that time frame. This is fewer than the number of alerts you would see without alert suppression. Some alerts can be duplicates. With alert suppression, emails are not sent for duplicate alerts. This ensures the inbox is not flooded with redundant alert notifications.

Alert rate regulation is a preventive measure to ensure that alerts from misconstrued rules do not flood the system. This ensures that ESA does not send more than the configured limit of emails within one minute.

Notification servers, notifications, and templates are configured in the Administration System view. For more information, see "Configure Notification Servers", "Configure Notification Outputs", and "Configure Templates for Notifications" in the *System Configuration Guide.*

Notification Methods

When a rule triggers an alert, ESA can send a notification in the following ways:

- Email
- Syslog
- Script

Note: ESA SNMP notifications are not supported for NetWitness 11.3 and later.

Email Notifications

ESA Correlation can send notifications to users through email about various system events.

To configure these email notifications, you need to:

- Configure the SMTP email server as an output provider. For instructions, see "Configure the Email Settings as Notification Server" in the *System Configuration Guide*.
- Set up an email account to receive notifications. For instructions, see "Configure Email as a Notification" in the *System Configuration Guide*.
- Configure a template for email notification. For instructions, see "Configure Global Notifications Templates" in the *System Configuration Guide*.

Syslog

Event Stream Analysis can send events and consolidate logs in Syslog format to a Syslog server.

To configure these Syslog notifications, you need to:

- Configure Syslog server settings as an output provider. For instructions, see "Configure a Syslog Notification Server" in the *System Configuration Guide*.
- Configure Syslog message format as an output action. For instructions, see "Configure Syslog as a Notification" in the *System Configuration Guide.*
- Configure a template for Syslog. For instructions, see "Configure Global Notifications Templates" in the *System Configuration Guide*.

Script Alerter

Apart from the alert notifications ESA allows users to run scripts in response to ESA alerts.

Scripts enable you to do custom integration with applications that exist in your environment. For example, if you want to open an incident ticket from an application when a specific alert is triggered, Script Alerter lets you write a script that calls the application API and has ESA invoke it when the specific ESA rule is triggered. You can configure a FreeMarker template to define what details you want to extract from the output of the ESA rule and pass it as command line arguments to the script.

To use the Script Alert, you need to:

- Configure the user identity and other details that are required to execute the script. For instructions, see "Configure Script as a Notification Server" in the *System Configuration Guide*.

- Define the Script. For instructions, see "Configure Script as a Notification" in the *System Configuration Guide*.
- Configure a template for the script. For instructions, see "Configure Global Notifications Templates" in the *System Configuration Guide*.

Migrate custom scripts for notifications

- If a custom script needs file(s) to be accessed for read/write/execute operation, then file(s) must be in **/tmp** or **/var/tmp** directories.
- If the custom script or any nested script accessed by the custom script tries to use a file resource, then the absolute path of the file resource must be specified.
- For custom scripts using nested scripts/file resources of the other folder in read mode, default Linux File System permissions are applied.
- As Python 2 is EOL, NetWitness recommends migrating the scripts to Python 3.9 or higher version supported on this platform.
- The major change is that post 12.4, custom scripts will be executed by a privileged user in a sandbox-like environment.

Add Notification Method to a Rule

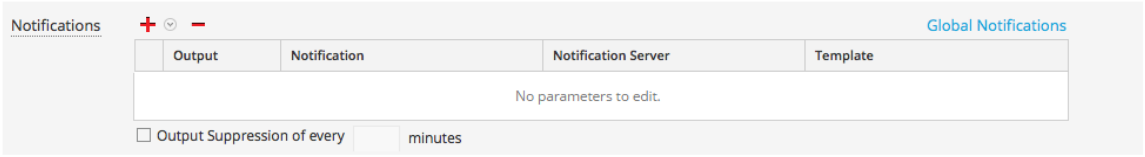
This topic tells administrators how to add a notification, such as email, to a rule. ESA uses the notification method when it generates an alert for an event that meets rule criteria.

You add a notification to a rule so ESA can let you know when a rule triggers an alert. Although the notification fields are not required, it is a best practice to add a notification to a rule.

When you add a notification method to a rule, you select the following information:

- Output
- Notification
- Notification Server
- Template

Prerequisites



- Your role must have permission to manage rules.
- The rule must exist.
- The notification method must be configured with a supported server and template:

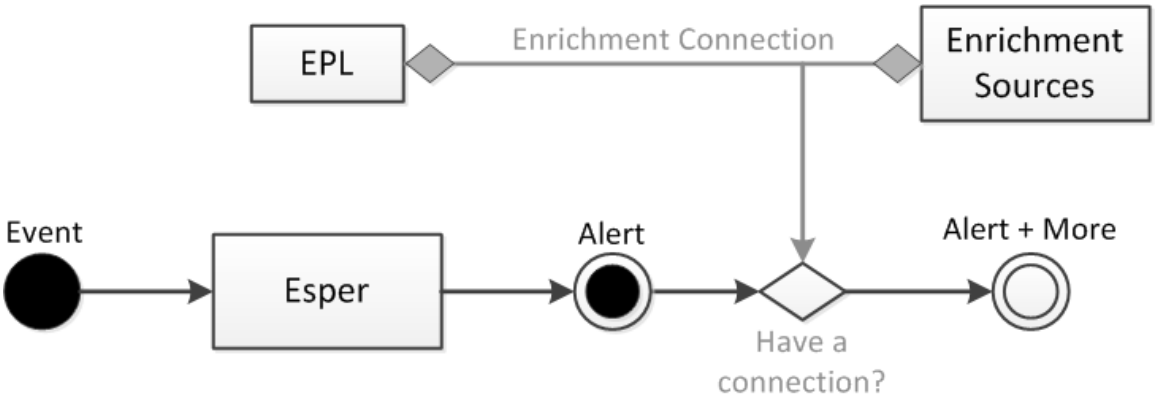
  Go to  **(Admin) > System > Global Notifications**.

  For detailed procedures, see the *System Configuration Guide.*

Add a Notification Method to a Rule

1. Go to **(Configure) > ESA Rules > Rules** tab.
2. In the **Rule Library**, click to add a new rule or select an existing rule and click .
   Depending on the rule type, the Rule Builder or Advanced EPL tab is displayed.
   The Notifications section is the same for both tabs.

3. Click and select the **Output** for the alert:
   - Email
   - SNMP (This option is not supported in NetWitness 11.3 and later.)
   - Syslog
   - Script
4. Double-click the **Notification** field and select the name of a previously configured output.
   For example, Level 1 Analyst could be the name of an email notification that goes to the L1-Analysts email distribution group.
5. Double-click the **Notification Server** field and select the server that sends the notification.
6. Double-click the **Template** field and select a format for the alert.
   The following figure shows the settings for a Syslog notification.



7. If you want to specify frequency, select **Output Suppression**, then enter the number of **minutes**.
8. If you want to add another notification, repeat steps 3-7.
9. Click **Save**.
   When ESA generates an alert for an event that matches the rule criteria, you will be notified of the alert via each notification method added to the rule.

Add a Data Enrichment Source

This topic tells how to add a previously configured enrichment source to a rule. When ESA creates an alert, information from the source gets included in it.

Enrichments provide the ability to include contextual information into correlation logic and alert output. Without enrichments, all information included in an ESA alert is from a Core service. With enrichments, you can request for look ups into a variety of sources and include the results into the outgoing alerts. The following figure illustrates the enrichment feature.

Enrichment configuration is made up of two logical units:

- Enrichment Sources – These are data stores of contextual information.
- Enrichment Connections – These act as connectors between alert meta and source columns.

ESA allows you to make connections between Event Processing Language (EPL) statements and enrichment sources. Once the connections are established, the system joins the selected fields from the alert output with the information in the sources and uses the matching data to enrich the alert that is sent out. ESA can connect with the following sources:

- Esper Named Windows
- MaxMindGeoIP Database

Note: The geoIP enrichment source can neither be created nor deleted. It is provided out of the box to the user.

Example Rule with Enrichments

The following example rule illustrates how ESA enrichments can enhance alerts.

```
@RSAAlert @Name("simple") SELECT * FROM Event(ec_theme='Login Failure')
```

This rule generates an alert for every logon failure and thus if the following (simplified) event stream is received at ESA:

sessionid	ec_ theme	username	ip_src	ip_dst	host_dst
1	Login Success	dshrute	23.xx.23x.16		
2	Login Failure	jhalpert	23.xx.23x.16	31.1x.x9.1x8	www.facebook.com

An alert without an enrichment with the following constituent `events` might be generated in response to the second session:

```
{
     "events": [
          {
               "username": "jhalpert",
               "host_dst": "www.facebook.com",
               "ip_dst": "31.1x.x9.1x8",
               "sessionid": 2,
               "ec_theme": "Login Failure",
               "esa_time": 1406148964130,
               "ip_src": "23.xx.23x.16"
          }
     ]
 }
```

The JSON output shows all the information available for inclusion into an ESA notification using an appropriate FreeMarker template. For instance, the template expression `${events[0].username}` would evalute to `jhalpert`.

With enrichments, the same deployment, with the same event stream, can generate the alert shown below.

```
{"events": [
     {
          "username": "jhalpert",
          "host_dst": "www.facebook.com",
          "GeoIpLookup": [
          {
               "city": "Cambridge",
               "longitude": -71,
               "countryCode": "US",
               "areaCode": 617,
               "metroCode": 506,
               "region": "MA",
               "dmaCode": 506,
               "ipv4Obj": "/23.xx.23x.16",
               "countryName": "United States",
               "postalCode": "02142",
               "ipv4": "23.xx.23x.16",
               "latitude": 42,
               "organization": "Verizon Business"
          }
     ],
     "orgchart": [
          {
               "supervisor": "mscott",
               "name": "James Halpert",
               "extension": 3692,
               "location": "Scranton",
```

```
            "department": "Sales",
            "id": "jhalpert"
        }
    ],
    "ip_dst": "31.1x.x9.1x8",
    "sessionid": 2,
    "LoginRegister": [
        {
            "username": "dshrute",
            "ip_src": "23.xx.23x.16"
        }
    ],
    "ec_theme": "Login Failure",
    "esa_time": 1406155218912,
    "ip_src": "23.xx.23x.16"
    }
]}
```

The system pulls contextual data to make the alert more meaningful.

To include the name of the supervisor and the name of the user with the last successful login in the ESA notification, this example includes the following template expressions: `${events[0]["orgchart"][0].supervisor}` gives the name of the supervisor of the employee in the alert and `${events[0]["LoginRegister"][0].username}` gives the name of the user with the last successful logon from the same `ip_src` (using a stream based Named Window).

Enrichment Sources

This topic explains options for adding an external data source to provide additional information in alerts. Enrichment sources provide additional information in alerts. For example, an in-memory table can provide a full name, title, office location, and employee number if a user matches rule criteria. The following types of enrichment sources are available:

- Context Hub List (Preferred)
- In-Memory Table (Ad hoc only)
- GeoIP

Note: Database, Database Connection, Warehouse Analytics, and Recurring In-Memory Tables as enrichment sources are not supported for the ESA Correlation service in NetWitness 11.3 and later.

It is preferable to use Context Hub List enrichment sources instead of In-Memory Table enrichment sources. You can share Context Hub List enrichment sources across the NetWitness. You can only use the In-Memory Table with ESA. Recurring In-Memory Tables are no longer supported; use Content Hub Lists as enrichment sources.

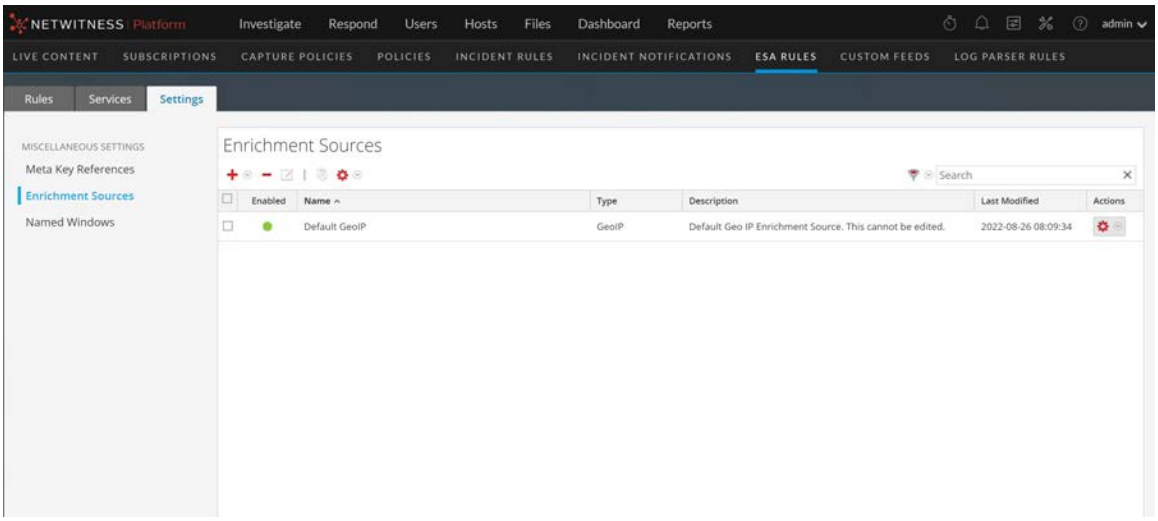
Note: The geoIP enrichment source can neither be created nor deleted. It is provided out of the box to the user.

Configure a Context Hub List as an Enrichment Source

This topic provides instructions on how to configure a Context Hub list as an enrichment source for ESA. Once a Context Hub list is added as an enrichment source, analysts can use the configured list as a statement condition when creating an ESA rule. Any changes made to the list from within Context Hub are automatically reflected in the enrichment source in real-time. For example, you could create a list of IP addresses in Context Hub and then use that list as either a blacklist or whitelist as part of a correlation rule condition. Any subsequent changes made to the IP list in Context Hub will be reflected in the enrichment source in real-time, to ensure the correlation rule operates with a constantly updating set of information.

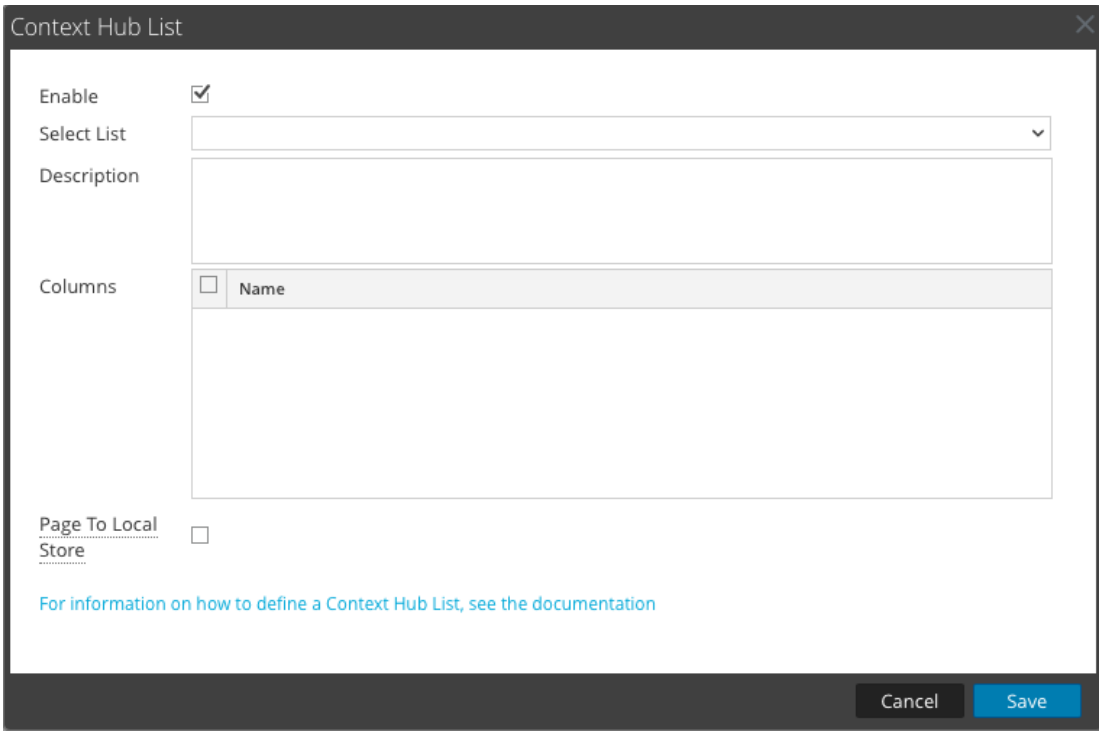
Prerequisites

Before configuring a Context Hub list as an enrichment source, the list must first be created as a data source in Context Hub. Any list created in Context Hub is supported and the lists may contain string or numeric values, including IP addresses. For information on creating a list as a data source in Context Hub, see the *NetWitness Context Hub Configuration Guide*.



Caution: When creating a Context Hub list for use as an enrichment source, the list name and its field names cannot include any spaces or special characters, or start with a number. If you do not follow this naming convention, when you attempt to add the list as an enrichment source in ESA, an error message will be displayed and you will not be allowed to add the list.

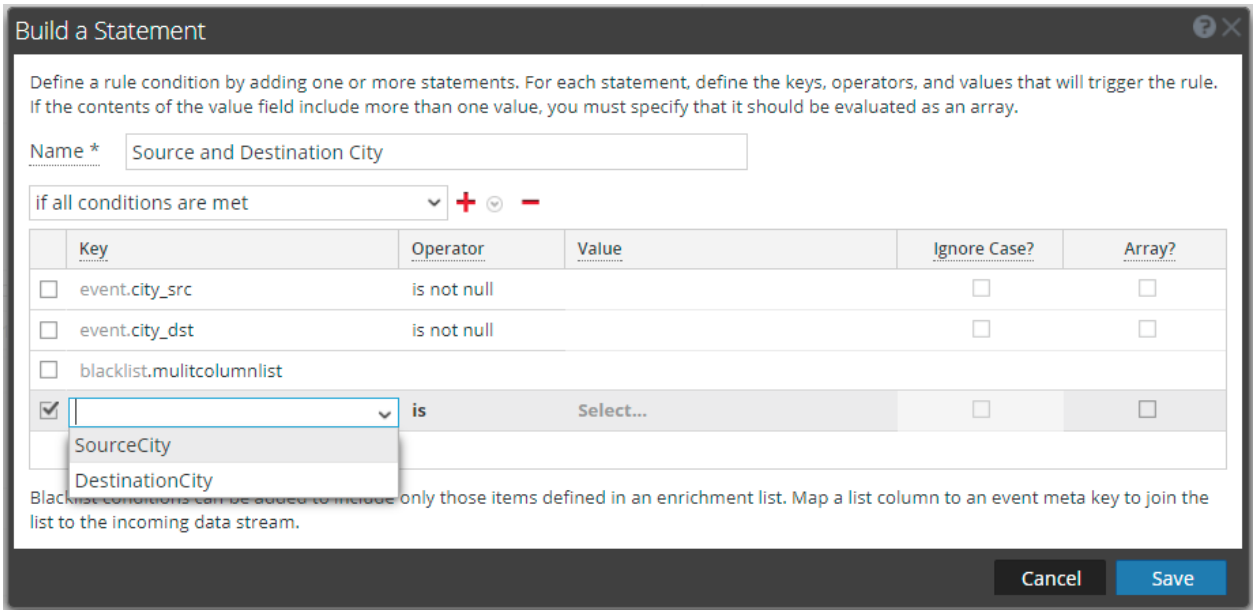
IMPORTANT: If you rename a Context Hub list or recreate the Context Hub list with the same name, update the ESA rules that use that Context Hub list, and then redeploy the ESA rule deployments that contain those rules.



Configure a Context Hub List as an Enrichment Source

1. Go to  **(Configure) > ESA Rules > Settings** tab.
2. In the options panel, select **Enrichment Sources**.

   The Enrichment Sources panel is displayed.



3. From the  drop-down menu, select **Context Hub**.

4. Select **Enable** to enrich alerts with a Context Hub list. This is selected by default. If disabled, the alerts will not be enriched with the configured Context Hub list.
5. Select the desired Context Hub list from the **Select List** drop-down menu of pre-configured lists.
6. (Optional) In the **Description** field, type a brief description about the selected Context Hub list. The text entered here is displayed on the Enrichment Sources panel.
7. In the **Columns** field, all columns included in the selected Context Hub list are listed. Click to enable or disable the columns in the list that you wish to include when using this list as an enrichment source in an alert.

8. (Optional) Click to enable the **Page To Local Store** option. This option is useful if you have a very large list and performance is affected. If this is the case, enabling this option will write a copy of the Context Hub list to the local disk to improve performance.
9. Click **Save**.
   The Context Hub list is configured. You can now add it to an ESA rule as part of a condition statement as either a blacklist or a whitelist condition.

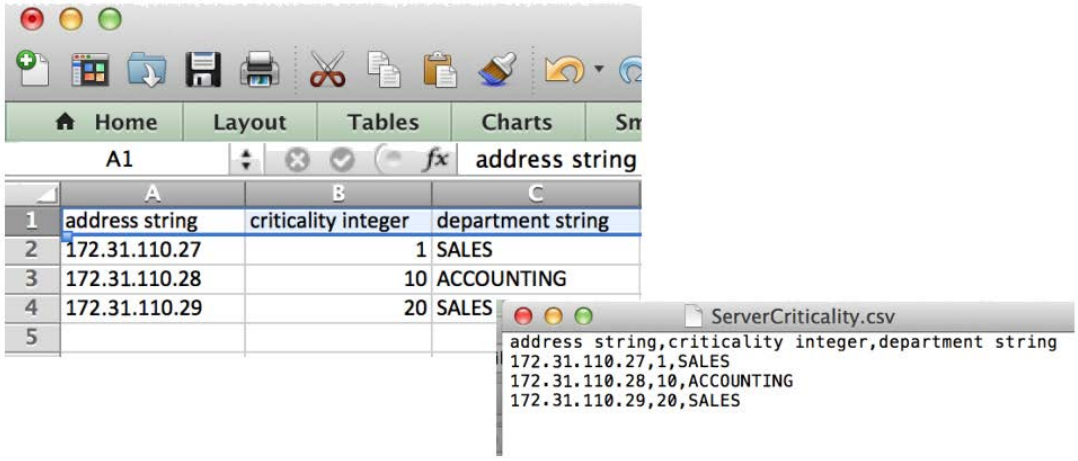
The following figure illustrates adding a Context Hub list as part of a condition statement. In this example, a context Hub list named "multicolumnlist" was added as a blacklist condition. The list contains two columns, SourceCity and DestinationCity. The next step would be to select one of the column names as the subcondition and then specify the operator and enter the meta value for the corresponding value field.

For complete details for adding a whitelist or blacklist to a condition statement, see Step 2. Build a Rule Statement.

To add a Context Hub list as a condition to an existing rule, select to edit the desired rule in the Rule Library, then add a condition in the Conditions section and select to add a whitelist or blacklist condition to the new condition statement.

Configure an In-Memory Table as an Enrichment Source

This topic provides instructions on how to configure an in-memory table. When you configure an in-memory table, you upload a .CSV file as an input to the table. You can associate this table with a rule as an enrichment source. When the associated rule generates an alert, ESA will enrich the alert with relevant information from the in-memory table.



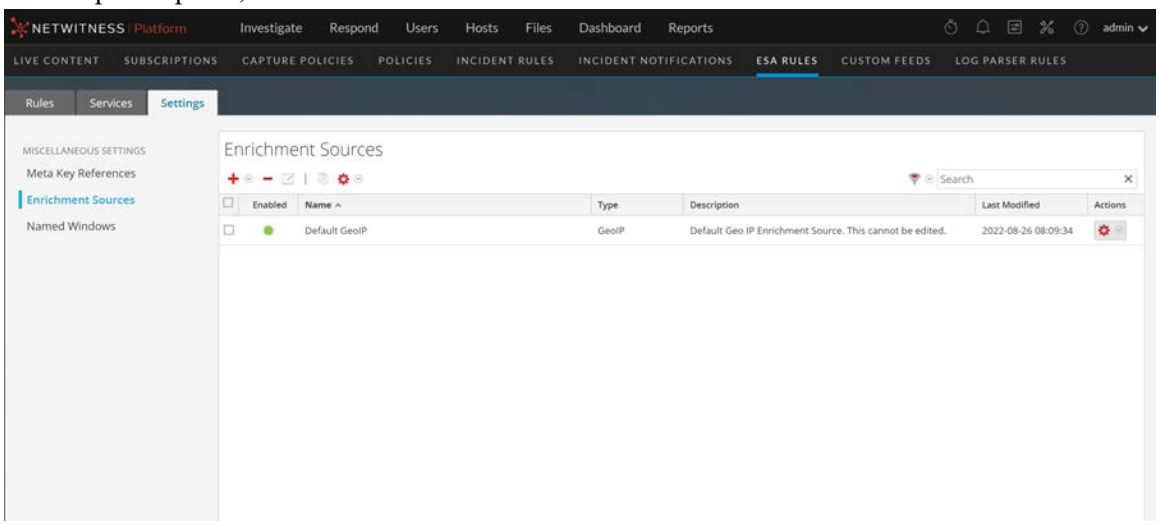
For example, a rule could be configured to detect when a user tries to download freeware and to identify the person by user ID in the alert. The alert could be enriched with additional information from an in-memory table that contains details such as full name, title, office location and employee number.

Note: It is preferable to use Context Hub List enrichment sources instead of In-Memory Table enrichment sources for rules. Recurring In-Memory Tables are no longer supported; use Content Hub Lists as enrichment sources. For more information, see Configure a Context Hub List as an Enrichment Source.

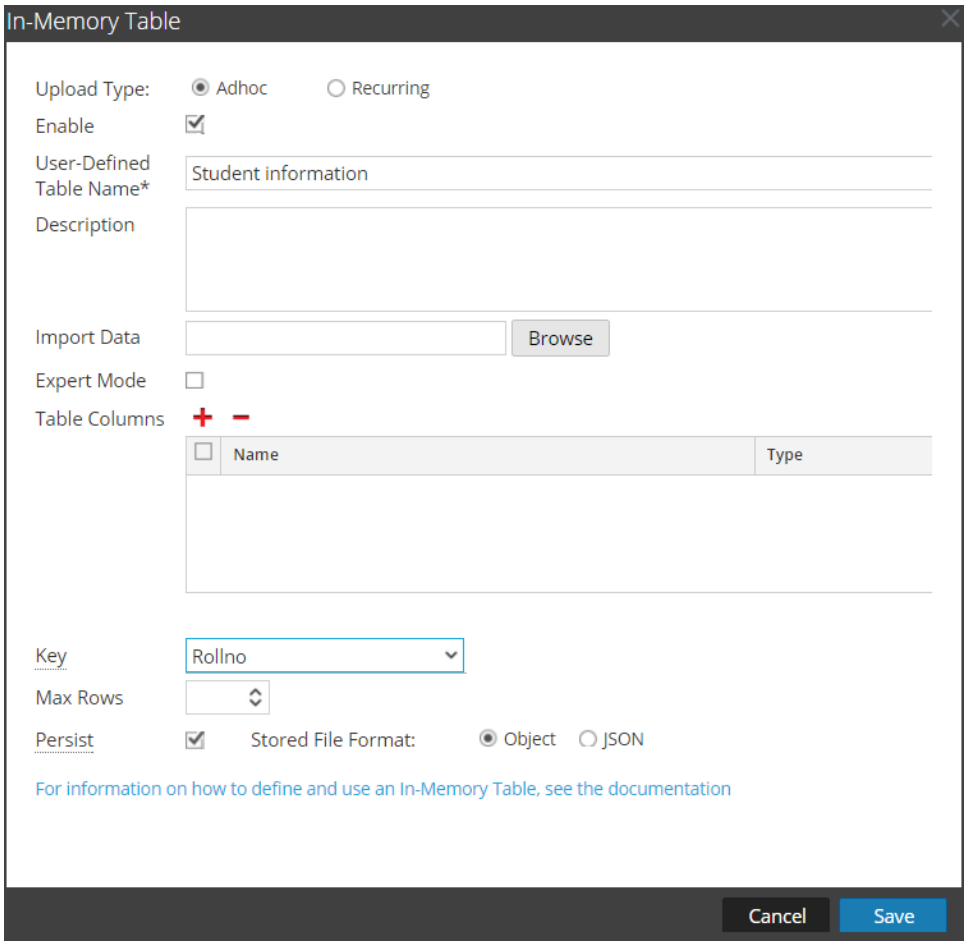
Prerequisites

- The column name in the .CSV file cannot have whitespace characters.
  For example *Last_Name* is correct, and *Last Name* is incorrect.
- The .CSV file must begin with a header line that defines fields and types.
  For example, *address string* would define the header field as *address*, and the type as *string*.

The following shows a valid .CSV file represented as a .CSV and as a table.



Configure an Ad hoc In-Memory Table



Note: It is preferable to use Context Hub List enrichment sources instead of In-Memory Table enrichment sources for rules. Recurring In-Memory Tables are no longer supported; use Content Hub Lists as enrichment sources. For more information, see Configure a Context Hub List as an Enrichment Source.

1. Go to **(Configure) > ESA Rules**.
   The Configure view is displayed with the ESA Rules tab open.
2. Click the **Settings** tab.

3. In the options panel, select **Enrichment Sources**.

4. In the **Enrichment Sources** section, click  > **In-Memory Table**.

5. Describe the in-memory table:
   a. Select **Ad hoc**.
   b. By default, **Enable** is selected. When you add the in-memory table to a rule, alerts will be enriched with data from it.
      If you add an in-memory table to a rule but do not want alerts to be enriched, deselect the checkbox.
   c. In the **User-Defined Table Name** field, type a name, such as Student Information, for the in-memory table configuration.

   Note: Do not use any Esper keyword as **User-Defined Table Name** since this causes an error while using this enrichment in the ESA Rule. For Esper keywords, see Reserved keywords.

   d. If you want to explain what the enrichment adds to an alert, type a **Description** such as:
      When an alert is grouped by Rollno, this enrichment adds student information, such as name and marks.
6. In the **Import Data** field, select the .CSV file that will feed data to the in-memory table.
7. If you want to write an EPL query to define an advanced in-memory table configuration, select **Expert Mode**.
   The Table Columns are replaced by a **Query** field.
8. In the **Table Columns** section, click + to add columns to the in-memory table.
9. If a valid file is selected in the Import Data field, the columns populate automatically.

Note: If you selected Expert mode, a Query field is displayed instead of Table Columns.

10. In the **Key** drop-down menu, select the field to use as the default key to join incoming events with the in-memory table when using a CSV-based in-memory table as an enrichment. By default, the first column is selected. You can also later modify the key when you open the in-memory table in enrichment sources.
11. In **Max Rows** drop-down menu, select the number of maximum number of rows that can reside in the in-memory table at a particular instance.
12. Select **Persist** to preserve the in-memory table on disk when the ESA service stops and to re-populate the table when the service restarts.
13. In **Stored File Format** field, do one of the following:
    - Select **Object**, if you want to store the file in a binary format.
    - Select **JSON**, if you want to store the file in a text format.
      By default, **Object** is selected.
14. Click **Save**.
    The adhoc in-memory table is configured. You can add it to a rule as an enrichment or part of the rule condition. See Add an Enrichment to a Rule.

When you add an in-memory table, you can add it to a rule as an enrichment or as a part of the rule condition. For example, the following rule uses an in-memory table as a part of the rule condition to create a whitelist, and it also uses an in-memory table of details in the user_dst file to enrich the alert that is displayed.

The rule shows the in-memory table as a whitelist rule condition:

Next, the alert is enriched with the User_list in-memory table:

Therefore, the user_dst in-memory table is used to create a whitelist, and it is also used to enrich the data in the alert if the alert is triggered.

Add a Recurring In-Memory Table

Recurring In-Memory Tables are no longer supported; use Content Hub Lists as enrichment sources. For more information, see Configure a Context Hub List as an Enrichment Source.

It is preferable to use Context Hub List enrichment sources for ESA rules instead of In-Memory Table enrichment sources. You can share Context Hub List enrichment sources across the NetWitness Platform. You can only use the In-Memory Table with ESA.

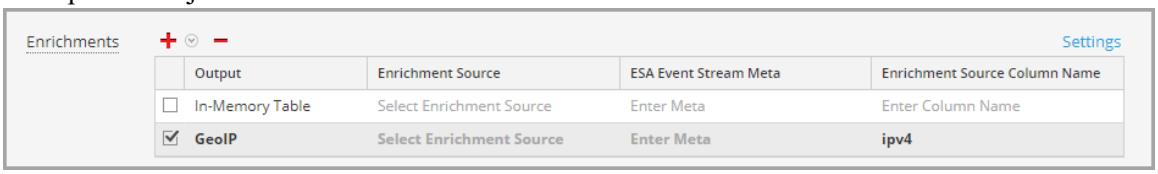
Note: Database, Database Connection, Warehouse Analytics, and Recurring In-Memory Tables as enrichment sources are not supported for the ESA Correlation service in NetWitness 11.3 and later.

Add an Enrichment to a Rule

This topic tells how to add a previously configured enrichment source to a rule. When ESA creates an alert, information from the source gets included in it.

Adding an enrichment to a rule allows you to request for look ups into a variety of sources and include the results in the outgoing alerts, giving you a more detailed alert. This procedure requires role permissions for Administrator, DPO, and SOC Manager.

Note: This procedure does not apply to adding a Context Hub list as an enrichment to a condition statement in an existing rule. For information see Configure a Context Hub List as an Enrichment Source.



To add an enrichment to a rule:

1. Go to **(Configure) > ESA Rules**.
2. In the **Rule Library** view, do one of the following:
   - Double-click a rule.
   - Select a rule and click in the **Rule Library** toolbar.

   The Rule Builder panel is displayed in a new NetWitness tab.
3. In the **Enrichments** section, click and select any of the following enrichment types:
   - In-Memory Table
   - GeoIP

   Note: If you use a GeoIP source, ipv4 is automatically populated, and is not editable.

   The enrichment types that you have selected are displayed in the table.
4. For the added enrichment type, perform the following:
   - In the **Output** column, select the type that you have configured.
   - In the **Enrichment Source** drop-down list, select the enrichment source defined.
   - In the **ESA Event Stream Meta** field, type the event stream meta key whose value will be used as one operand of join condition.

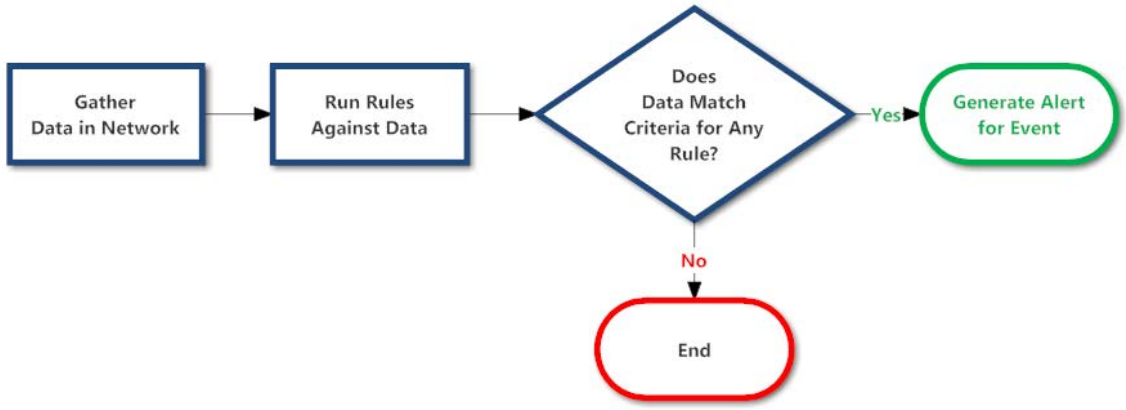
   - In the **Enrichment Source Column Name** field, type the enrichment source column name whose value will be used as another operand of the join condition.
5. Select **Debug**. This adds an @Audit('stream') annotation to the rule. This is useful when debugging the Esper rules.
6. Click **Show Syntax** to test if the defined ESA rule is valid.
7. Click **Save**.

For details on parameters and their descriptions, see Rule Builder Tab.

Deploy Rules to Run on ESA

This section explains how an ESA Rule Deployment works and how to set up a deployment to run a group of ESA rules. Administrator, SOC Manager, or Data Privacy Officer role permissions are required for all procedures in this section.

To create an ESA rule deployment, you need to perform the steps described in Managing ESA Rules, Data Sources and Deployments



How an ESA Rule Deployment Works

An ESA rule deployment consists of an ESA service, one or more data sources, and a set of ESA rules. When you deploy rules, the ESA service runs them to detect suspicious or undesirable activity in your network. Each ESA rule detects a different event, such as when a user account is created and deleted within one hour.

The ESA service performs the following functions:

1. Gathers **data** in your network
2. Runs ESA **rules** against the data
3. Applies rule **criteria** to data
4. Generates an **alert** for the captured event

The following graphic shows this workflow:

In addition, you may want to perform other steps on your deployment, such as replacing an ESA service, changing a data source, editing or deleting a rule from the deployment, renaming or deleting the deployment, or showing updates to the deployment. For descriptions of these procedures, Managing ESA Rules, Data Sources and Deployments.

Managing ESA Rules, Data Sources and Deployments

From 12.1 and later versions, the ESA deployments are managed by policies and groups on the **(Configure)** > **Policies** page.

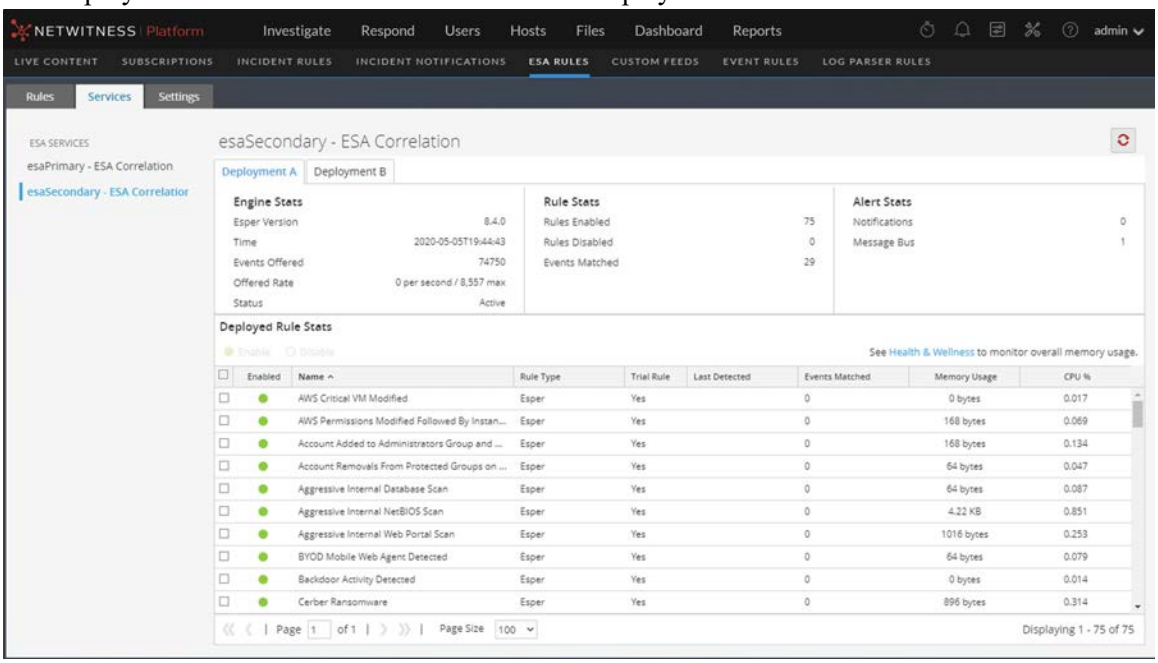
If you want to create any new ESA rules, add new data sources or perform any new ESA deployments, see the following sections in the Live Services Management guide:

- To view, add, edit, or delete data sources, see section "Manage ESA Datasources".
- To add, edit or delete an ESA rule, see the following topics, "Create an ESA Rule", "Edit, Duplicate or Delete a Rule", and "Delete an ESA Rule".
- To view, create, edit, remove, deploy or stop a deployment, see section "Manage Deployments".

View ESA Stats and Alerts

When ESA generates alerts, you can view details about how the rules performed, such as statistics on the engine, rule, and alert, and you can also view information on which rules are enabled or disabled. For instructions on viewing ESA stats, see View Stats for an ESA Service

When your ESA generates alerts, you can view the results in the Respond Alerts List view. This enables you to see trends and understand both the volume and frequency of alerts. For instructions on viewing alerts, see View a Summary of Alerts



View Stats for an ESA Service

This topic describes how to view the deployment statistics (stats) for an ESA Correlation service. This procedure is useful when you are attempting to determine the effectiveness of a rule or troubleshoot an ESA rule deployment.

Caution: When you modify and re-deploy an ESA rule deployment, all of the stats are removed from that deployment. The generated alerts are not removed from NetWitness Respond.

View ESA Stats

1. Go to **(Configure) > ESA Rules > Services** tab.
2. From the **ESA Services** list on the left, select a service.
   The deployment stats for the selected service are displayed.

3. (This option applies to NetWitness version 11.3 and later.) In the Deployment view under the ESA Correlation service name, select the tab of the deployment you would like to view. For example,

select the Deployment A tab to view the stats for deployment A. Select the Deployment B tab to view the status for deployment B.

4. Review the following sections of ESA stats.
   For a complete description of each statistic in each section, see Services Tab.
   - **Engine Stats**
   - **Rule Stats**
   - **Alert Stats**
5. In the **Deployed Rule Stats**, review details about the rules deployed on the ESA.
   For a complete description of each column in each section, see Services Tab.
   - If the rule is enabled or disabled
   - What the rule name is
   - The type of rule
   - If the rule is running in Trial Rule mode
   - Last detected
   - Events matched
   - The amount of memory used by the rule
   - The percentage of the deployment CPU used by the rule (available in NetWitness version 11.5 and later)
6. To monitor overall memory usage and health of your ESA Correlation service, click **Health & Wellness**.

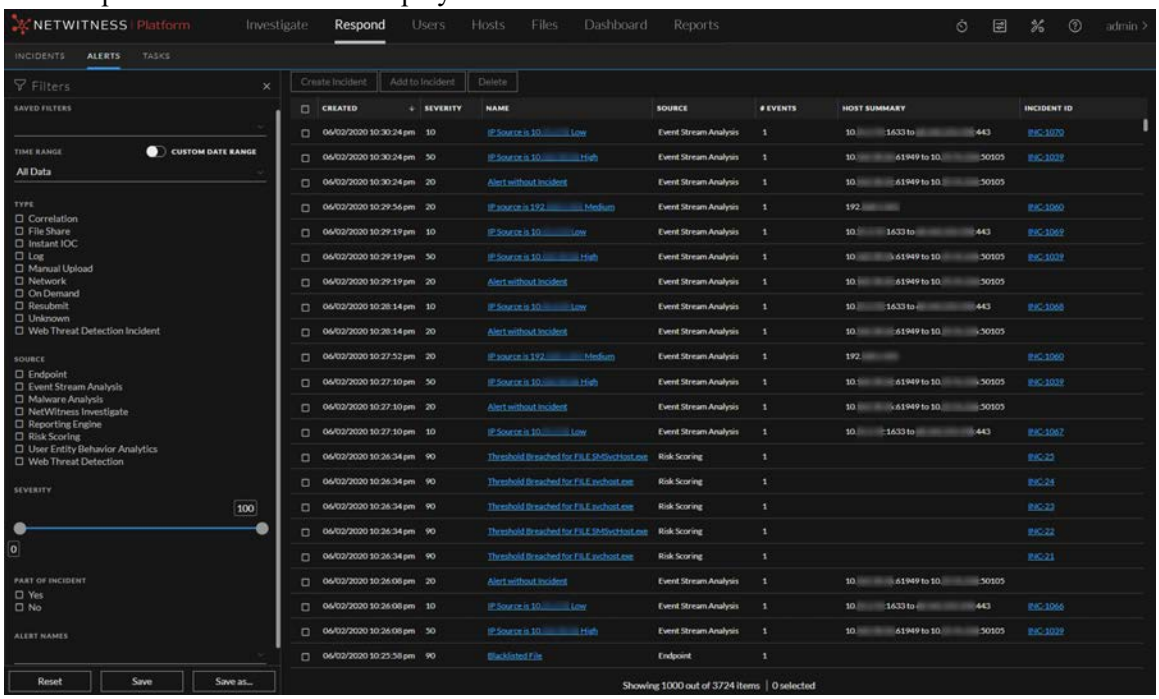
Enable or Disable Rules

1. In the **Deployed Rule Stats** panel, select a rule from the grid.
2. Click Enable to enable the rule, or click Disable to disable the rule.
   The Services tab is refreshed to show the changes, which take effect immediately.

Refresh the Statistics

The Services tab does not update statistics automatically unless you enable or disable a rule. To ensure you view current statistics:

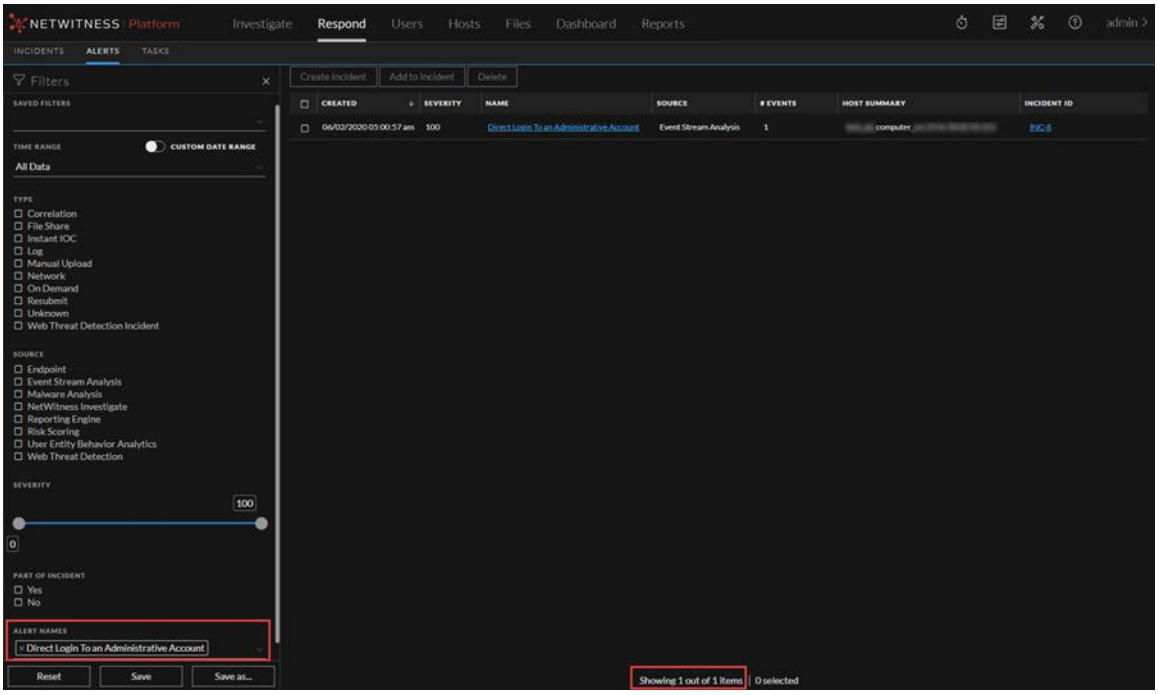
1. Click  in the upper right corner to refresh the information.
2. View the updated information.



View a Summary of Alerts

In the Repond view, you can browse through various alerts from multiple sources. You can filter the alerts list to show only alerts of interest, such as by Alert Name, alert source, and a specific time range from the following sources:

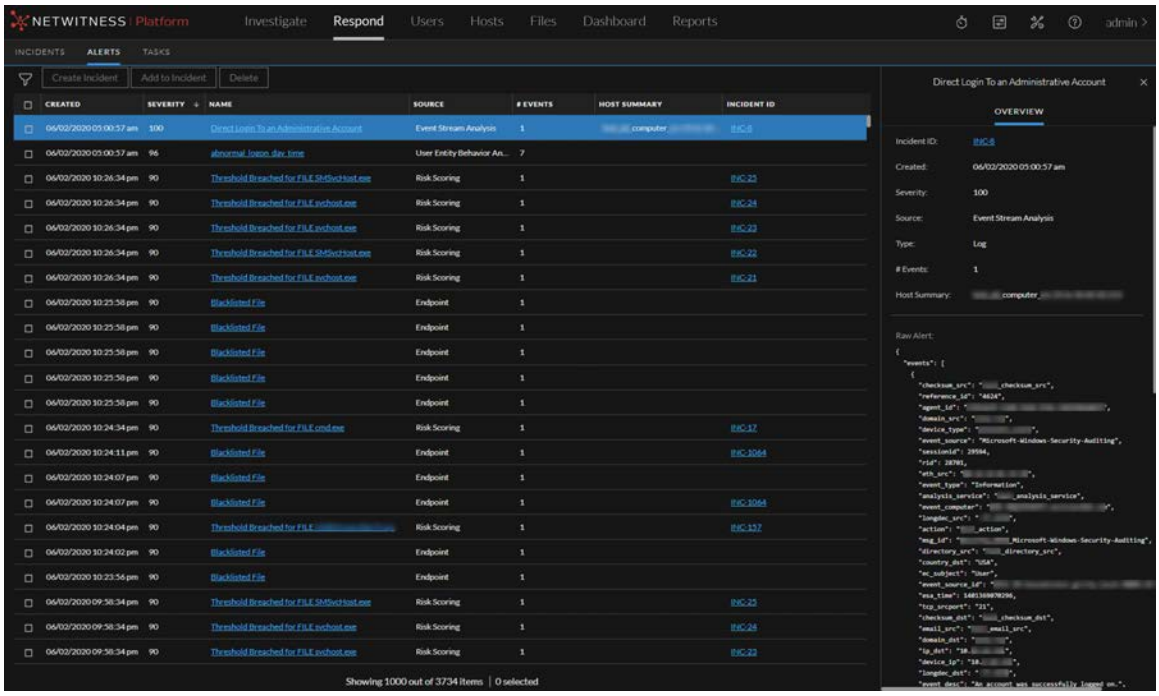
1. Detect AI
2. Endpoint
3. Event Stream Analysis
4. Malware Analysis
5. NetWitness Investigate
6. Reporting Engine
7. Risk Scoring
8. User Entity Behavior Analysis
9. Web Threat Detection



Perform the following steps to use the functionalities provided in the Respond view.

1. Go to **Respond > Alerts**.
   The Respond Alerts List view displays a list of all NetWitness alerts.

2. In the **Filters** panel on the left, you can filter the alerts list to view specific alerts for a specific time frame. For example, in the Alert Names section, you can select an alert for an ESA rule, such as



Direct Login to an Administrative Account, and leave the Time Frame set to Last Hour.
The alerts list to the right shows a list of alerts that match your filter selection along with a count of the alerts at the bottom of the alerts list.

The alerts list shows information about each of the alerts.

- **Created**: Displays the date and time when the alert was created in the source system.
- **Severity**: Displays the level of severity of the alert. The values are from 1 to 100.
- **Name**: Displays a basic description of the alert.
- **Source**: Displays the original source of the alert.
- **# of Events**: Indicates the number of events contained within an alert.
- **Host Summary**: Displays details of the host, like the host name from where the alert was triggered.
- **Incident ID**: Shows the incident ID of the alert. If there is no incident ID, the alert does not belong to an incident.

3. You can click an alert in the list to open an **Overview** panel on the right where you can view raw alert metadata.

For more information about filtering alerts and viewing alert details, see the *NetWitness Respond User Guide*.

Add an Advanced EPL Rule

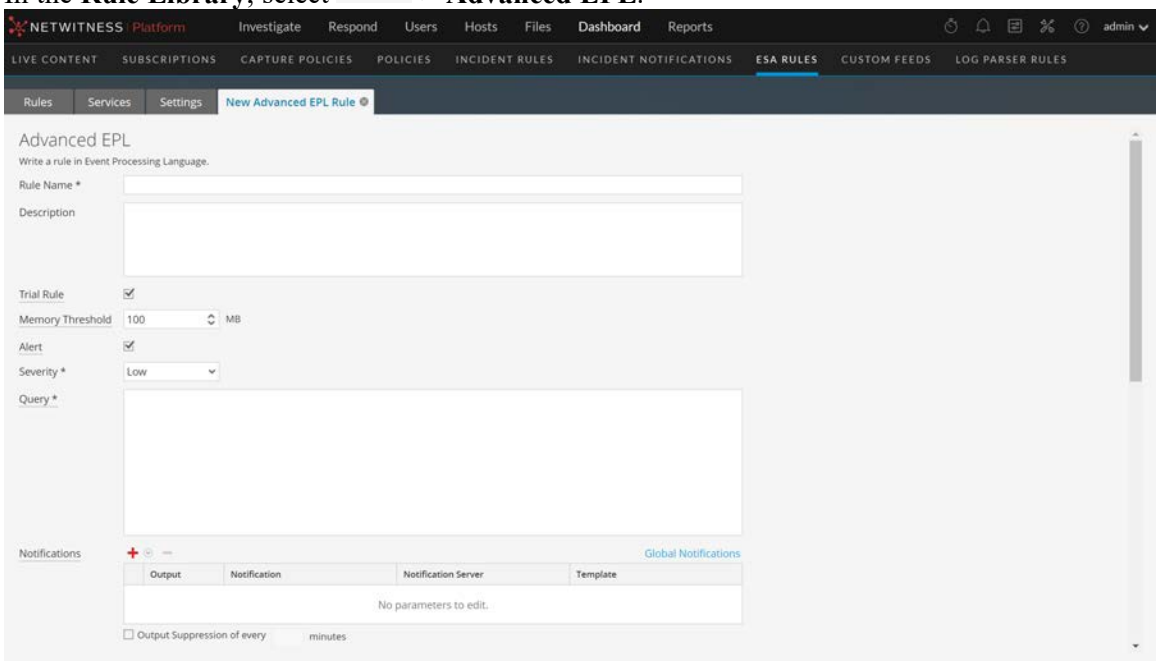
This topic provides instructions to define rule criteria by writing an EPL query. EPL is a declarative language for handling high-frequency time-based event data. It is used to express filtering, aggregation, and joins over possibly sliding windows of multiple event streams. EPL also includes pattern semantics to express complex temporal causality among events.

Write an advanced EPL rule when rule criteria is more complex than what you can specify in Rule Builder.

It is outside the scope of this guide to explain EPL syntax.

- For EPL Documentation, see http://www.espertech.com/esper/esper-documentation/
- For the EPL Online Tool, see http://esper-epl-tryout.appspot.com/epltryout/mainform.html

For best practices on writing advanced EPL rules, see ESA Rule Writing Best Practices.



Prerequisites

The following are prerequisites for adding an advanced rule:

- You must know Event Processing Language (EPL).
- You must understand ESA Annotations to mark which EPL statements are linked to generating alerts.

Add an Advanced EPL Rule

1. Go to **(Configure) > ESA Rules**.
2. In the **Rule Library**, select **> Advanced EPL**.

3. Type a unique, descriptive name in the **Rule Name** field.

   This name will appear in the Rule Library so be specific enough to distinguish the rule from others.

4. In the **Description** field, explain which events the rule detects.

   The beginning of this description will appear in the Rule Library

5. Select **Trial Rule** to automatically disable the rule if all trial rules collectively exceed the memory threshold.

   Use trial rule mode as a safeguard to see if a rule runs efficiently and to prevent downtime caused by running out of memory. For more information, see Working with Trial Rules.

6. (This option applies to 11.5 and later.) Enter a **Memory Threshold** for a rule that uses memory, such as a rule that contains windows or pattern matching. If the configured memory threshold is exceeded, the rule gets disabled individually and an error is displayed for that rule on the (Configure) > ESA Rules > Services tab. The Memory Threshold option works for trial rules and non-trial rules. New rules default to a 100 MB memory threshold. Rules that existed before version 11.5 do not have a default value and a memory threshold is not set.

7. (This option applies to 11.3 and later.) Select **Alert** to send an alert to Respond. Clear the checkbox if you do not want to send an alert to Respond. To turn alerts on or off for ALL rules, see the *ESA Configuration Guide*.

8. For **Severity**, classify the rule as Low, Medium, High or Critical.

9. To define rule criteria, write a **Query** in EPL.

   Note: For all meta key names, use an underscore not a period. For example, `ec_outcome` is correct but `ec.outcome` is not.

   Supported meta entities:

S. No	Supported Meta Entities	Description
1	fullname_all	
2	eth_all	
3	ip_all	Combines all the IPv4 meta keys.
4	ipv6_all	Combines all the IPv6 meta keys.
5	port_src_all	
6	port_dst_all	
7	dir_path_all	
8	org_all	
9	geoip_all	
10	port_all	
11	domain_all	
12	email_all	
13	filename_all	
14	directory_all	
15	checksum_all	
16	param_all	
17	context_all	
18	attack_all	
19	analysis_all	
20	compromise_all	
21	inv_all	
22	outcome_all	
23	ec_all	
24	user_all	
25	host_all	

26	client_all

10. For dynamic statement name generation in ESA, you must enclose the meta keys in curly brackets and include this annotation in the syntax:

    ```
    @Name("RIG {ip_src} {alias_host} {ec_activity}")
    ```

    where,

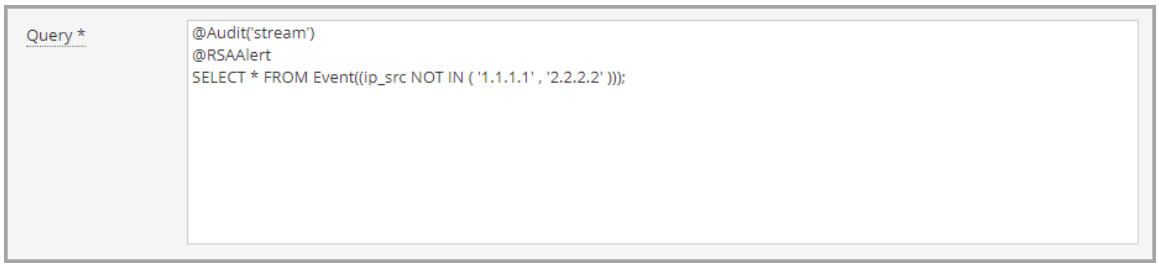
    - RIG is the static part of the statement name
    - {ip_src}, {alias_host}, {ec_activity} is the dynamic part of the statement name

    Note: If any of the metas in the dynamic part of the statement name has a null value, it is displayed as a static text.

    If a rule should generate an alert, include this ESA annotation in the syntax:

    ```
    @RSAAlert
    ```

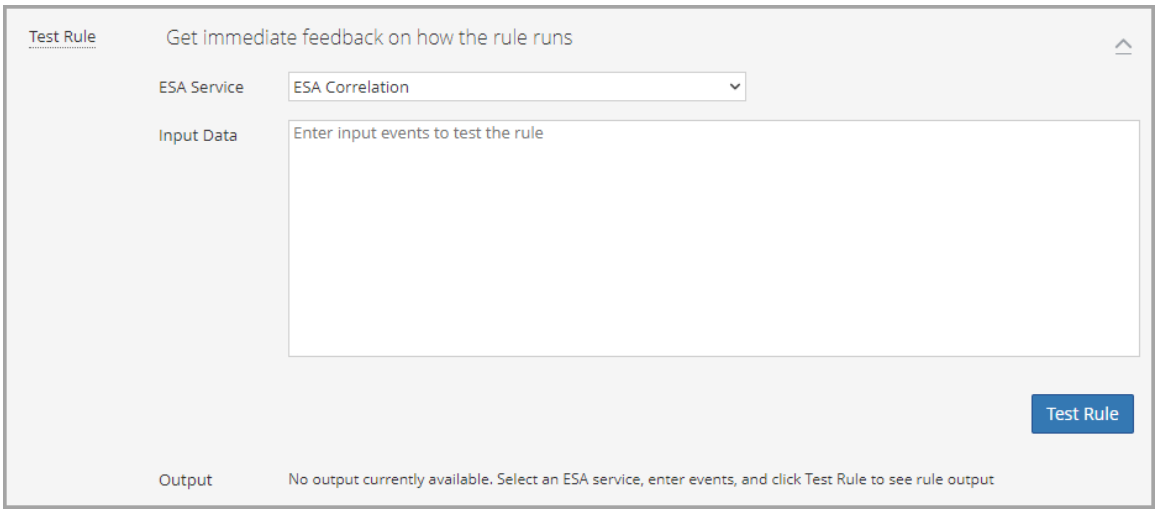
    For more information on ESA Annotations, see ESA Annotations.



Validate an Advanced EPL Rule

You can confirm that an ESA rule generates the expected alerts by testing the rule logic using JSON input data. You can view the alerts in the output, but this test does not send any alert notifications.

If you want to view all of the debug information, include an `@Audit('stream')` annotation to your rule query and view the Debug Log in the test output. To enable auditing you require to add `@Audit` to the rule and set the logging level for the Esper audit package to INFO. This can be done by creating `correlation-server.yml` file under `/etc/netwitness/correlation-server` with this content and restarting the correlation-server service with systemctl restart rsa-nw-correlation-server:



```
logging:
   level:
     com.espertech.esper.audit: INFO
```

The following basic example query contains the `@Audit('stream')` annotation and queries for events that do not have a source IP of 1.1.1.1 or 2.2.2.2.

1. If you are not already in the rule, go to **(Configure) > ESA Rules > Rules** tab and in the **Rule Library**, open the ESA rule that you want to test.

2. Scroll down to the **Test Rule** section.

3. In the **ESA Service** field, select the ESA Correlation service to process the rule. Use the same ESA Correlation service that you plan to use in the ESA rule deployment that contains the rule.
4. In the **Input Data** field, enter the input events to test the rule. Download the events from the Investigate view in JSON format, copy the events, and paste them in this field. You can do this from the Investigate > Navigate view or the Investigate > Events view.

   To download the events from the Investigate > Navigate view:

   a. In the main menu, go to **Investigate > Navigate** in a new tab, select a data source, and click **Navigate**.
   b. In the Navigate view, click **Load Values** and click a meta value to filter the events.
   c. Save the events as meta in the JSON file format [Save Events > Meta > (name the file) > Export Meta Format: choose JSON].
   d. In the toolbar click the **(Jobs)** icon and then click **View Your Jobs**.
   e. In the Jobs panel, download your extracted meta, for example: **`investigation-2020-May-19-08-30-20.json`**.
   f. Go to back to the **(Configure) > ESA Rules** tab opened previously and copy the contents of the JSON file into the **Input Data** field in your ESA rule.

   To download the events from the Investigate > Events view:

   a. In the main menu, go to **Investigate > Events** in a new tab.
   b. In the Events view, enter a query for the ESA rule test.
   c. Select the events to use and in the **Download** or **Download All** menu, select **Visible Meta as JSON** or **All Meta as JSON**, depending on the size of your selection.

d. In the main menu, go to **Dashboards** and in the toolbar click the **(Jobs)** icon and then click **View Your Jobs**.

e. In the Jobs panel, download your extracted meta, for example: **Concentrator_ALL_EVENTS_ALL_META.json**.

f. Go to back to the **(Configure) > ESA Rules** tab opened previously and copy the contents of the JSON file into the **Input Data** field in your ESA rule.

5. Click **Test Rule**. The **Output** field shows the output of your rule and you can determine if the results meet your requirements.

Note: If you are testing any Rule that has meta key defined as type 'short', the Test Rule will not generate alert for the event.

The following table describes the test rule output **Engine Stats**.

Field	Description
Engine Version	Esper version running on the ESA service

Field	Description
Events Offered	Number of events processed by the ESA service since the last service start
Offered Rate	The rate that the ESA service processes current events / The maximum rate that the ESA service processed events
Runtime Errors	If applicable, this field can contain a link to runtime error messages related to the ESA rule deployment.

The following table describes the test rule output **Rule Stats**.

Field	Description
Deployed	A green checkmark indicates that the rule is deployed on the selected ESA service.
Statements Fired	The number of statements that fired the alerts
Alerts Fired	The number of alerts generated from the test data
Events in Memory	The number of events placed in memory by the rule
Memory Usage	The total amount of memory used by the rule
CPU %	The percentage of the deployment CPU used by the rule. For example, a deployment with 1 rule shows 100% CPU usage for that rule and a deployment with two equally CPU heavy rules show 50% each.
Events Matched	The number of events that matched the rule
Alerted Events	If applicable, this field can contain a link to events that caused an alert.
Runtime Errors	If applicable, this field can contain a link to runtime error messages related to the rule.
Debug Logs	This field contains a link to Esper debug (audit) logs.

Event Processing Language (EPL)

This topic describes Event Processing Language (EPL), a declarative language for dealing with high frequency time-based event data. ESA uses Event Processing Language (EPL), a declarative language for dealing with high frequency time-based event data. It is used for express filtering, aggregation, and joins over possibly sliding windows of multiple event streams. EPL also includes pattern semantics to express complex temporal causality among events. It can perform, but is not limited to, the following functions:

- Filter Event
- Alert Suppression
- Compute percentages or rations
- Average, count, min and max for a given time window
- Correlate events arriving in multiple stream
- Correlate events that arrive out of order
- On-Off Windows
- Followed-by and Not Followed-by support
- Regex filter support

Databases require explicit querying to return meaningful data and are not suited to push data as it changes. The developer must implement the temporal and aggregation logic himself. By contrast, the EPL engine provides a higher abstraction and intelligence and can be thought of as a database turned upside-down. Instead of storing the data and running queries against stored data, EPL allows applications to store queries and continuously run the data through. Response from the EPL engine is real-time when conditions occur that match user defined queries.

For best practices on writing advanced EPL rules, see ESA Rule Writing Best Practices.

Advanced ESA rules require correct character case, but in the Investigate Navigate view all characters are converted to lowercase. However, the meta may not be lowercase despite appearances in the Investigate Navigate view. To ensure you are using the correct case, you can make a strict pattern match for better performance.

Strict Pattern Match Example

```
@RSAAlert(oneInSeconds=0)
SELECT * FROM Event(
     (medium IN ( 1 ) AND
     filetype IN ( 'pdf' , 'windows_executable' , 'x86 pe' , 'windows
executable' ))
     ).win:time(5 Minutes)
MATCH_RECOGNIZE (
     MEASURES E1 as e1_data , E2 as e2_data
     PATTERN (E1 E2)
     DEFINE
          E1 as (E1.filetype IN ('pdf')),
          E2 as (E2.filetype IN ( 'pdf' , 'windows_executable' , 'x86 pe' ,
'windows executable' ))
```

```
);
```

Caution: Care should be taken to only add the case-insensitive *toLowerCase()* function on meta keys as needed. The *toLowerCase()* function can cause significant performance decreases. Consider checking the Investigate Events view or the Event Analysis view to see the real character case for meta fields and avoid unnecessary usage of the function.

For the purposes of online help, basic statements are used to illustrate how to set up ESA; however, for more information about writing EPL statements, the http://www.espertech.com site provides tutorials and examples.

Note: In NetWitness version 11.5, ESA Correlation supports Esper version 8.4.0. In version 11.4, ESA Correlation supports Esper version 8.2.0 and in version 11.3, ESA Correlation supports Esper version 7.1.0.

ESA Annotations

This topic describes annotations that NetWitness provides to use in advanced EPL rules.

For best practices on writing advanced EPL rules, see ESA Rule Writing Best Practices.

@RSAContext Annotation (11.5 and later)

The @RSAContext annotation can be used in advanced rules to dynamically add or remove data from a Context Hub list after the rule fires. For example, you can create a rule that automatically adds an IP address to a blacklist and removes it from a whitelist.

You can update a single-column or a multi-column Context Hub list. The @RSAContext annotation also performs error handling when the Context Hub list cannot be reached.

Prerequisites

Before deploying a rule using the @RSAContext annotation, the list must exist in Context Hub. For information on creating a Context Hub list, see the *Context Hub Configuration Guide*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

IMPORTANT: If you rename a Context Hub list or recreate the Context Hub list with the same name, update the ESA rules that use that Context Hub list, and then redeploy the ESA rule deployments that contain those rules.

Single-Column Context Hub Lists

The @RSAContext annotation uses the following format for a single column Context Hub list:

```
@RSAContext (list="<single_column_list>", action=<DELETE_ENTRY or ADD_ENTRY>,
onError = <STOP_ALL_RULE_PROCESSING_AND_WAIT or IGNORE_ERROR_AND_CONTINUE>,
fields={"LIST=<meta_key>"})
```

The @RSA Context parameters for a **single-column** Context Hub List are described in the following table.

Parameter	Description
`list`	Where `<single_column_list>` is the name of the single-column Context Hub list (whitelist or blacklist).
`action`	You can add an entry to or remove an entry from the list: • `DELETE_ENTRY` - Removes an entry from the list. • `ADD_ENTRY` - Adds an entry to the list. You can only have one action per `@RSAContext` entry.

Parameter	Description
onError	Identifies how to handle errors, for example, when the Context Hub list is not available or is full. You can choose one of the following options: • STOP_ALL_RULE_PROCESSING_AND_WAIT: If any error occurs with the selected actions on the Context Hub list, stop all rule processing including data aggregation and retry indefinitely until the actions are successfully executed. Halting processing for one Context Hub list results in halting processing for all Context Hub lists. Select this option if it is important to update a Context Hub list before processing any more rules. For example, you may have a blacklist that must be updated before continuing rule processing. • IGNORE_ERROR_AND_CONTINUE: If any error occurs with the selected actions on the Context Hub list, ignore the error and the @RSAContext entry, and continue processing. If it is not a Context Hub error, assume that the error occurs before reaching Context Hub, and retry until the actions are successfully executed. Select this option if continuing rule processing is more important than updating the Context Hub list.
fields	Maps a meta key value to the column in the Context Hub list. Single-column lists always show LIST= in capital letters.

The first example deletes a source IP address from an IP whitelist. However, if the list is not available, the source IP address is not removed from the list and processing is continued.

```
@RSAContext (list="ip_whitelist", action=DELETE_ENTRY, onError = IGNORE_ERROR_
AND_CONTINUE, fields={"LIST=ip_src"})
```

The second example adds a source IP address to an IP blacklist. However, if the list is not available, all rule processing stops including data aggregation, and the ESA Correlation service retries indefinitely until the entry is added to the specified Context Hub list.

```
@RSAContext (list="ip_blacklist", action=ADD_ENTRY, onError = STOP_ALL_RULE_
PROCESSING_AND_WAIT, fields={"LIST=ip_src"})
```

Multi-Column Context Hub Lists

The @RSAContext annotation uses the following format for a multi-column Context Hub list:

```
@RSAContext (list="<multi_column_list>", action=<DELETE_ENTRY or ADD_ENTRY>,
onError = <STOP_ALL_RULE_PROCESSING_AND_WAIT or IGNORE_ERROR_AND_CONTINUE>,
fields={"<column1>=<meta_key1 or constant value1>",<column2>=<meta_key2 or
constant value2>",<column n>=<meta_key n or constant value n>",})
```

The @RSA Context parameters for a **multi-column** Context Hub List are described in the following table.

Parameter	Description
`list`	Where `<multi_column_list>` is the name of the multi-column Context Hub list.
`action`	You can add an entry to or remove an entry from the list: • `DELETE_ENTRY` - Removes an entry from the list. • `ADD_ENTRY` - Adds an entry to the list. You can only have one action per `@RSAContext` entry.
`onError`	Identifies how to handle errors, for example, when the Context Hub list is not available or is full. You can choose one of the following options: • `STOP_ALL_RULE_PROCESSING_AND_WAIT`: If any error occurs with the selected actions on the Context Hub list, stop all rule processing including data aggregation and retry indefinitely until the actions are successfully executed. Halting processing for one Context Hub list results in halting processing for all Context Hub lists. Select this option if it is important to update a Context Hub list before processing any more rules. For example, you may have a blacklist that must be updated before continuing rule processing. • `IGNORE_ERROR_AND_CONTINUE`: If any error occurs with the selected actions on the Context Hub list, ignore the error and the `@RSAContext` entry, and continue processing. If it is not a Context Hub error, assume that the error occurs before reaching Context Hub, and retry until the actions are successfully executed. Select this option if continuing rule processing is more important than updating the Context Hub list.
`fields`	Maps a meta key values or constant values to the columns in the Context Hub list. Multi-column lists show the names of each column in the `fields` parameter.*

The first example deletes a user and the associated source and destination IP addresses from a multi-column IP whitelist. However, if the list is not available, the specified fields are not removed from the list and processing is continued.

```
@RSAContext (list="MultColumn_whitelist", action=DELETE_ENTRY, onError =
IGNORE_ERROR_AND_CONTINUE, fields={"source=ip_src","destination=ip_
dst","user='smith'"})
```

The second example adds a user and the associated source and destination IP addresses to a multi-column IP blacklist. However, if the list is not available, all rule processing stops including data aggregation, and the ESA Correlation service retries indefinitely until the entry is added to the specified Context Hub list.

```
@RSAContext (list="MultColumn_blacklist", action=ADD_ENTRY, onError = STOP_
ALL_RULE_PROCESSING_AND_WAIT, fields={"source=ip_src","destination=ip_
dst","user='smith'"})
```

Automatic Context Hub List Updates

When using the @RSAContext annotation in your rules, string array meta keys (shown as `string[]` in the Meta Key References on the ESA Rules > Settings tab) are inserted and removed as separate lines in the Context Hub list. This enables lookups in the Investigate and Respond views.

Single Column Context Hub List Update Example

A single column Context Hub list has one column with the string array meta key `alias_host`. If the rule using that list fires and `alias_host` has three values (Google, Yahoo, and Dell), ESA Correlation adds three rows to the Context Hub list:

Google
Yahoo
Dell

Multi-Column Context Hub List Update Example

A multi-column Context Hub list has three columns. If the rule using that list fires and the meta keys have the following values:

- `username` (string array) with values Aimee and Chris
- `ip_dst` (string) with value 10.10.10.10
- `alias_host` (string array) with values Dell, Google, and Yahoo

ESA Correlation adds six rows to the Context Hub list:

Aimee, 10.10.10.10, Dell
Aimee, 10.10.10.10, Google
Aimee, 10.10.10.10, Yahoo
Chris, 10.10.10.10, Dell
Chris, 10.10.10.10, Google
Chris, 10.10.10.10, Yahoo

@RSAAlert Annotation

The @RSAAlert annotation is used to mark which EPL statements are linked to generating alert notifications. It is designed to work with the alert notification suppression feature in the Rule Builder user interface.

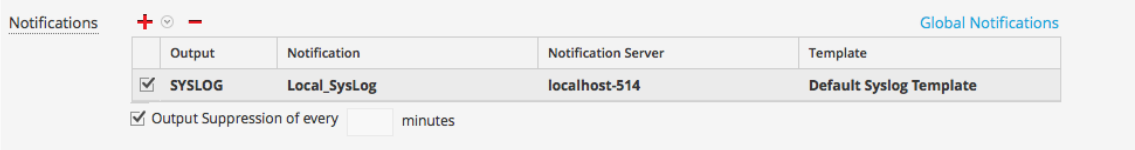
The @RSAAlert annotation can be useful when working with alert notifications, especially if you want to filter notifications, such as sending one notification for each user that triggers an alert.

For example, suppose you want to generate alert notifications for login failures. You could add the following statement:

*@RSAAlert select * from event(msg_id="login_fail")*

Event number	Message ID	username	src_IP	Time
1	login_fail	alice	1.2.3.4	10:00
2	login_fail	alice	1.2.3.4	10:01
3	login_fail	alice	6.7.8.9	10:01
4	login_fail	bob	1.2.3.4	10:01
5	login_fail	alice	1.2.3.4	10:03

For the above statement, five alert notifications are generated.



However, suppose you wanted to modify the statement to generate one alert for each separate username. You can use the *identifier* attribute. For example, the statement *@RSAAlert(identifier={"username"}) SELECT* FROM Event(msg_id="login_fail")* generates one notification for the first alert for "bob" and one for the first alert for "alice." Subsequent alerts for "bob" and "alice" are ignored.

You can further distinguish the users by adding details via the identifier variable. For example, you can distinguish by user and IP address using the following statement: *@RSAAlert(identifier={"username", "src_ip"}) SELECT* FROM Event(msg_id="login_fail")*. Then, you would see notifications generated by user name and IP address (one alert for "alice" at 1.2.3.4, another alert for "alice" at 6.7.8.9, and an alert for "bob" at 1.2.3.4).

To use identifiers with Alert Notification Suppression:

The @RSAAlert annotation is designed to work with the alert notification suppression feature in the Rule Builder user interface. To do this:

1. Create a rule in the Rule Builder user interface, and select the alert suppression feature when configuring notifications.

2. Copy the code from the Rule Builder rule into a new advanced rule.
3. Configure the advanced rule to include identifiers (as described above) and save the advanced rule.
4. Delete the original rule builder rule.

@RSAPersist Annotation

The @RSAPersist annotation is used to mark a named window as an ESA managed window for persistence. By marking the named window as an ESA managed window, ESA periodically writes the contents of the window to disk and restores them back if the window is undeployed and redeployed. The systems take a snapshot just before the ESA rule deployment is undeployed and the window is removed. Conversely, it restores the window contents from the snapshot just after the deployment is redeployed. This ensures that the contents of the window are not lost if the deployment state is altered or if the ESA service goes down.

For example, consider a named window, `DHCPTracker` that holds a mapping from IP addresses to each assigned hostname.You can annotate the statement with the @RSAPersist annotation as:

```
@RSAPersist
 create window DHCPTracker.std:unique(ip_src) as (ip_src string, alias_
host string);
 insert into DHCPTracker select IP as ip_src, HostName as alias_host from
DHCPAssignment(ID=32);
```

Note: All windows definitions are not suitable for persistence. `@RSAPersist` annotation must be used with care. If the window has timed-records or if it depends on time based constraints it is very likely that the reverted snapshots will not restore it to the correct state. Also, any changes to the window definition will invalidate the snapshots and reset the window to a blank state. The system does not do any semantic analysis to determine if the changes to the window definition are conflicting or not. Note that other parts of a deployment (that is, other than the particular CREATE WINDOW call that defines the window) may change, without invalidating the snapshots.

Caution: (This caution applies only to NetWitness Platform versions 11.3.x, 11.4.x, and 11.5.0.0.) To avoid data being overwritten, if you have a rule with a named window, do not disable and re-enable it. Instead, undeploy and redeploy the ESA rule deployment that contains the rule.

IMPORTANT: The @RSAPersist annotation suggests avoiding the use of 'Event' as a data type when keeping all windows, as 'Event' is already declared as the schema. Please refer to examples of valid and invalid syntax scenarios.

Invalid Examples:

1. `@RSAAlert`
2. `@RSAPersist`
3. `create window datas#keepall(evt Event);`
4.
5. `Insert into datas SELECT * FROM Event;`

1. `@RSAAlert`
2. `@RSAPersist`
3. `CREATE WINDOW demo_keepall.win:keepall (evt1 Event);`

4. `INSERT INTO demo_keepall`
5. `SELECT * FROM Event`
6. `WHERE user_dst = ANY('User35','User31');`
7. `SELECT * FROM demo_keepall;`

Valid Examples:

1. `@RSAAlert`
2. `@RSAPersist`
3. `create window datatest#keepall(evt String);`
4. `Insert into datatest SELECT * FROM Event;`

1. `@RSAAlert`
2. `@RSAPersist`
3. `CREATE WINDOW demo_keepall.win:keepall (evt1 java.util.Collection);`
4. `INSERT INTO demo_keepall`
5. `SELECT * FROM Event`
6. `WHERE user_dst = ANY('User35','User31');`
7. `SELECT * FROM demo_keepall;`

Note: When using rules with named windows and enrichment windows, it is essential to ensure no differing or missing column types in the window definition. It is also advisable to avoid using keywords like 'Event' and 'Schema' as column names in the window definition. Additionally, if a rule attempts to define the same window twice, it is expected that runtime exceptions will occur.

@UsesEnrichment (10.6.1.1 and later)

The @UsesEnrichment can be used in advanced EPL rules to reference enrichments. In order to synchronize enrichments with ESA, all enrichment dependencies in EPL rules must be referenced with the @UsesEnrichment annotation.

The @UsesEnrichment annotation uses the following format:

```
@UsesEnrichment(name= '<enrichment_name>')
```

For example, the following EPL references a whitelist enrichment:

```
@UsesEnrichment(name = 'Whitelist')
@RSAAlert
SELECT * FROM Event(ip_src NOT IN (SELECT ip_address FROM Whitelist))
```

@Name

The @Name is the statement name defined in ESA advanced rules. It is used to dynamically generate statement names in ESA alerts. The statement name of only an alert triggering statement is displayed. This annotation has meta keys enclosed in curly brackets.

Note: Dynamic-name-enabled option allows you to disable dynamic alert name generation.

The @Name annotation uses the following format:

```
@Name("<static_part_of_statement_name> {meta_key1} {meta_key2}…")
```

For example, the following EPL references meta keys *ip_src* and *user_name* whose values will be dynamically generated.

@Name(“Login Event to {ip_src} by {user_name}”)

Note: You can specify any number of meta keys in the statement for dynamic statement name generation.
The length of individual meta key is limited to 64, after which the value is truncated and appended with “…”.
The length of the dynamic generation of statement name is limited to 128, after which the value is truncated to 128 and appended with “…”. All the remaining values post truncation will be treated as static values.

@Audit Annotation

Add the `@Audit('stream')` annotation to your ESA rules to print alerts to the ESA logs for troubleshooting. This is useful when debugging the Esper rules. The @Audit('stream') annotation provides debug information for the next statement in the rule. For example:

```
@Audit('stream')
@RSAAlert
SELECT * FROM Event((ip_src NOT IN ( '1.1.1.1' , '2.2.2.2' )));
```

In the above example, `@RSAAlert` is only necessary if the statement needs to send an alert to the Respond view.

In NetWitness Platform 11.5 and later, you can test rules in the rule builders. If you add the `@Audit ('stream')` annotation to an advanced EPL rule, you can view the Debug Log in the test output. For more information, see Validate an Advanced EPL Rule .

Example Advanced EPL Rules

Following are the examples of Advanced ESA rules. Each example has multiple ways of implementing the same use-case.

For best practices on writing advanced EPL rules, see ESA Rule Writing Best Practices.

Example #1:

Create a user account and delete the same user account in 300s. User information is stored in user_src meta.

EPL #1:

Rule Name	CreateAndDelete Useraccount1
Rule Description	Create a user account followed by an action to delete the same user account in 300 seconds.

Rule Code	`@RSAAlert(oneInSeconds=0)`
	`SELECT * FROM Event(ec_subject='User'`
	`  AND ec_outcome='Success'`
	`  AND user_src is NOT NULL`
	`  AND ec_activity IN ('Create', 'Delete')`
	`  ).win:time(300 seconds)`
	`match_recognize (partition by user_src`
	`   measures C as c, D as d`
	`   pattern (C D)`
	`  define`
	`   C as C.ec_activity='Create' ,`
	`   D as D.ec_activity='Delete');`

Note	• Filter events needed for pattern in given time frame. Filter conditions should be such that only required events are passed to match recognize function. In this case, they are create and delete user account Events. That is, Event(ec_subject='User' AND ec_outcome='Success' AND user_src is NOT NULL AND ec_activity IN ('Create', 'Delete') • Partition by creates buckets. In this case, Esper creates buckets per value of user_src. And hence value of user_src is common between both events. • Define the pattern you want. Right now it is set to Create Followed by Delete. You can do multiple creates followed by delete (C+ D). Pattern is very similar to regular expression. • Most efficient use case. • The ‘loose’ pattern match of (C+ D) will result in decreased performance. Unless you need to include all C events within the generated alert, keep the strict pattern match of (C D). See the Esper documentation for more details.

EPL #2:

Rule Name	CreateAndDeleteUseraccount2
Rule Description	Create a user account followed by an action to delete the same user account in 300 seconds.

Rule Code	`@RSAAlert(oneInSeconds=0)`
	`SELECT * from pattern[every (a= Event(ec_subject='User' AND ec_outcome='Success' AND user_dst is NOT NULL AND ec_activity IN ('Create'))`
	`->`
	`( Event(ec_subject='User' AND ec_outcome='Success' AND user_dst is NOT NULL AND ec_activity IN ('Create') AND user_src = a.user_src)`
	`) )where timer:within(300 Sec) ];`

Note	• Lets say same user is created twice and deleted once in that order. Then the above pattern will fire 2 alerts. • A thread is created for every User creation. • There is no way to control threads. It is important to have time bounds and preferably small intervals. • If you do not need every first event to start a new thread and match with the subsequent second event, then add suppression syntax of @SuppressOverlappingMatches after the pattern keyword. See the Esper documentation for more details.

Example #2:

Detect pattern where user created followed by login by same user and user is deleted in end. In case of windows logs user info is stored in either user_dst or user_src depending on event.

user_src(create) = user_dst(Login) = user_src(Delete)

EPL #3:

Rule Name	CreateUserLoginandDeleteUser
Rule Description	Detect a pattern where a user creates a User account followed by login by the same user followed by deletion of the User account.

Rule Code	`@RSAAlert(oneInSeconds=0)`
	`SELECT * FROM Event(ec_subject='User'`
	`and ec_activity in ('Create','Logon','Delete')`
	`and ec_theme in ('UserGroup', 'Authentication')`
	`and ec_outcome='Success'`
	`).win:time(300 seconds)`
	`match_recognize (measures C as c, L as l, D as d`
	`pattern (C L D)`
	`define`
	`C as C.ec_activity = 'Create',`

	L as L.ec_activity = 'Logon' AND L.user_dst = C.user_src, D as D.ec_activity = 'Delete' AND D.user_src = C.user_src);
Note	• Since user_src/user_dst is not common across all events we can't use partition. It will be 1 single bucket running 1 pattern at a time. For example, for user 1 and 2 if the stream of events are C1C2L1D1, C1L1C2D1, there will be no alert because C1 thread got reset by C2. Alert will be fired only if C1L1D1 are in order and no other event either from same user or other user falls in between. • Another solution would be to use Named Window and merge user_dst and user_src into single column and then run match recognize. (EPL #3). • Pattern can also be used. You might get more alerts than expected. (EPL #4).

EPL #4: Using NamedWindows and match recognize

Rule Name	CreateUserLoginandDeleteUser
Rule Description	Detect a pattern where a user creates a User account followed by login by the same user followed by deletion of the User account.
Rule Code	@Name('NormalizedWindow') create window FilteredEvents.win:time (300 sec) (user String, ecactivity string, sessionid Long); @Name('UsersrcEvents') Insert into FilteredEvents select user_src as user, ec_activity as ecactivity, sessionid from Event(ec_subject='User' and ec_activity in ('Create','Delete') and ec_theme in ('UserGroup', 'Authentication') and ec_outcome='Success' and user_src is not null); @Name('UsrdstEvents') Insert into FilteredEvents select user_dst as user, ec_activity as ecactivity, sessionid from Event(ec_subject='User' and ec_activity in (Logon') and ec_theme in ('UserGroup', 'Authentication') and ec_outcome='Success' and user_dst is not null); @Name('Pattern') @RSAAlert(oneInSeconds=0, identifiers={"user"}) select * from FilteredEvents match_recognize (partition by user measures C as c, L as l, D as d pattern (C L+D) define C as C.ecactivity= 'Create', L as L.ecactivity= 'Logon', D as D.ecactivity='Delete');

EPL #5: Using Every @RSAAlert(identifiers={"user_src"})

Rule Name	CreateUserLoginandDeleteUser

Rule Description	Detect a pattern where a user creates a User account followed by login by the same user followed by deletion of the User account.
Rule Code	`SELECT a.time as time,a.ip_src as ip_src,a.user_dst as user_dst,a.ip_dst as ip_dst,a.alias_host as alias_host from pattern [every (a=Event (ec_subject='User' and ec_activity='Create' and ec_theme='UserGroup' and ec_outcome='Success') -> (Event(ec_subject='User' and ec_activity='Logon' and ec_theme='Authentication' and user_src=a.user_dst) -> b=Event(ec_subject='User' and ec_activity='Delete' and ec_theme='UserGroup' and user_dst=a.user_dst))) where timer:within(300 sec)];`

Example #3:

Excessive login failures from same sourceIP.

EPL #6: @RSAAlert(identifiers={"ip_src"})

Rule Name	ExcessLoginFailure
Rule Description	The same user tried logging in from the same Source IP and faced login failures.

Rule Code	`@RSAAlert(oneInSeconds=0)`
	`SELECT * FROM Event ( ip_src IS NOT NULL AND ec_activity ='Logon'`
	`AND ec_outcome = 'Failure').win:time_batch(300 seconds) GROUP BY`
	`ip_src HAVING COUNT(*) = 10;`

Note	• Uses time _batch: Looks at events in batches(tumbling window). Every event matching the filter criteria will be kept for the specified time window. • "GROUP BY" clause aggregates events within the data window by ip_src and HAVING clause instructs a count of 10 events with the same ip_src must occur within the time window. • One of the issues with tumbling windows is that events occurring towards the end of the batch might not lead to an alert. In the below sequence of events at t=301 even though 10 login failures occurred for the same login in the last 300 secs, there will be no alert because the batch of events was dropped at t=300.

Time t	Login Failures for Specific Users	Alert	Time Batch
0	0	0	1
295	6	0	1
299	3	0	1
301	1	0	2
420	6	0	2
550	3	0	2
600	0	0	3

	720 6 0 3 850 3 0 3 900 1 1 3 ends and 4 begins • Above problem can be resolved using win:time windows (EPL#7)instead of win:time_length_batch windows. • Outer group by is to control events when time elapses. Say you have 9 events at end of 60 secs, Esper engine will push those 9 events to listener. Group by and count will restrict it since count is not equal to 10. • Time and count can be modified as needed.

EPL #7: @RSAAlert(identifiers={"ip_src"})

Rule Name	ExcessLoginFailure
Rule Description	The same user tried logging in from the same Source IP and faced login failures.

Rule Code	`@RSAAlert(oneInSeconds=0)`
	`SELECT * FROM Event ( ip_src IS NOT NULL AND ec_activity ='Logon'`
	`AND ec_outcome = 'Failure').win:time(300 seconds) GROUP BY ip_src HAVING COUNT(*) = 10;`

Note	• This is a sliding window and hence after an alert is fired for a set of events they can be used for another alert as well until time has passed. • If 10 events were involved in causing the alert only the last event will appear. • Events are not removed from the time window. You could use output rate limiting. See the Esper documentation for more details.

Example #4:

Multiple failed logins from multiple different users from same source to same destination, a single user from multiple different sources to same destination.

EPL #8: using time_batch

Rule Name	MultiplefailedLogins
Rule Description	There are multiple failed logins for the following cases: - From multiple users from same source to same destination. - Single user from multiple sources to the same destination.

Rule Code	`@RSAAlert(oneInSeconds=0)`
	`SELECT * FROM Event (`
	`ec_activity='Logon'`
	`AND ec_outcome='Failure'`

	AND ip_src IS NOT NULL AND ip_dst IS NOT NULL AND user_dst IS NOT NULL) .win:time_batch(300 seconds) group by ip_src,ip_dst having count(distinct user_dst) >= 5;
Note	• ip.dst and ip.src are common across all events. • user_dst is unique for all events. • Alert is fired when there are at least 5 different users try to login from same ip.src and ip.dst combination.

Example #5:

No Log traffic from a device in a given timeframe.

EPL #9: using timer:interval

Rule Name	NoLogTraffic
Rule Description	There is no log traffic observed from a device in a given time frame.
Rule Code	SELECT * FROM pattern [every a = Event(device_ip IN ('10.0.0.0','10.0.0.1') AND medium = 32) -> (timer:interval (3600 seconds) AND NOT Event(device_ip = a.device_ip AND device_type = a.device_type AND medium = 32))];
Note	• Rule only detects sudden loss of traffic. It won't alert if there is no traffic to begin with. You need at least 1 event for rule to alert. • List of device ip address or device hostnames as input. Only these systems will be tracked. • Time input is required. Alert is fired when time interval between events exceeds input time.

Example #6:

Multiple Failed Logins NOT followed by a Lockout event by the same user.

EPL #10: using timer and Lockout

Rule Name	FailedloginswoLockout
Rule	There are multiple failed logins that are not followed by Lockout event by the same

Description	user.

Rule Code	`SELECT * FROM pattern [every-distinct(a.user_dst, a.device_ip, 1 msec) (a= Event(ec_activity='Logon' and ec_outcome='Failure' and user_dst IS NOT NULL) -> [2]( Event ( device_ip =a.device_ip and ec_activity='Logon' and ec_outcome='Failure' and user_dst=a.user_dst)`
	`AND NOT Event( ( ec_activity='Logon' and ec_outcome='Success' and device_ip = a.device_ip and user_dst=a.user_dst) or (ec_activity='Lockout' and device_ip = a.device_ip and user_dst=a.user_dst))))`
	`where timer:within(60 seconds) -> (timer:interval(30 seconds) and not Event(device_ip=a.device_ip and user_dst=a.user_dst and ec_activity='Lockout')) ];`

Note	• Above query detects the absence of a Lockout Event after the occurrence of 2 failed logins from same user. • The occurrence of the multiple failed logins are timed and are assumed to occur within a certain period of time. Also, in-practice the Lockout event is assumed to occur within a short time after the occurrence of the last failed login event because the threshold value of Failed logins per user is set in a given domain. • In current query, every distinct will suppress new thread for combination of user and device for 1 millisec. • Time allowed for 3 failed logins is 60 secs since 1st failed attempt. Wait period for lockout event to occur is 30 secs

Example #7:

Custom functions to perform LIKE and REGEX operations for ARRAY elements.

EPL #11: @RSAAlert(oneInSeconds=0)

Rule Name	MatchLikeRegex
Rule Description	There are custom functions to perform LIKE and REGEX comparisons of array meta keys.

Rule Code	`SELECT * FROM pattern[`
	`e1=Event(matchLike(alias_host, "10.0.0.%")) AND`
	`e2=Event(matchRegex(alias_host, "10\.0\.0\.1[0-9][0-9]"))`
	`where timer:within(5 Minutes)];`

Note:
1. "**.**" in meta keys should be replaced with ("_").
2. All patterns should be time bound.
3. Use appropriate tags in front of statements, for example:

```
@RSAPersist:
@RSAAlert:
```

For additional details you can refer to:

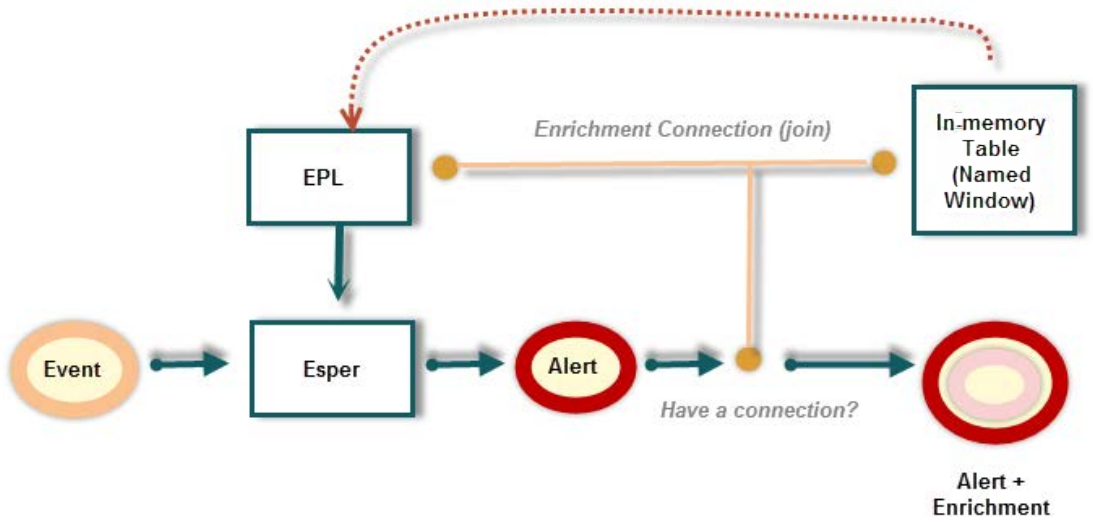
- EPL Online Tool: http://esper-epl-tryout.appspot.com/epltryout/mainform.html

Configure an In-Memory Table Using an EPL Query



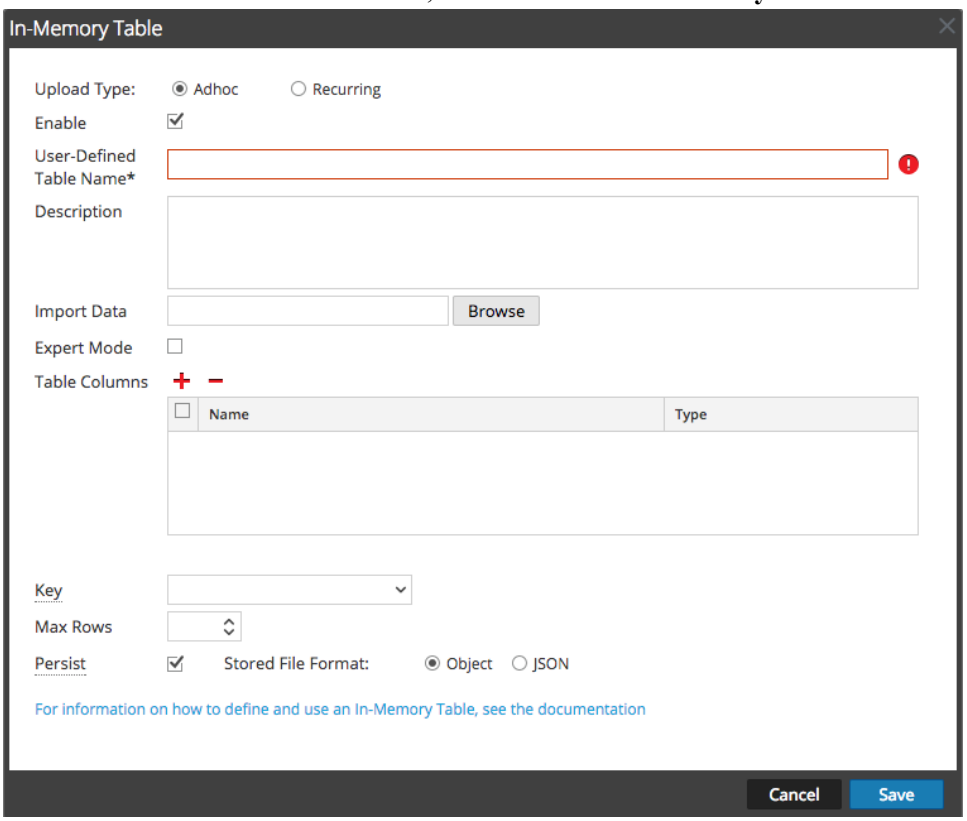
Note: It is preferable to use Context Hub List enrichment sources instead of In-Memory Table enrichment sources for rules. Recurring In-Memory Tables are no longer supported; use Content Hub Lists as enrichment sources. For more information, see Configure a Context Hub List as an Enrichment Source.

When you use an In-Memory Table configuration in expert mode, you can create an enrichment source or named window based on an Esper query. This allows you to have more control over the content and create more dynamic content. When you do this, an EPL query constructs the named window to capture interesting states from the event stream.

Workflow

The following shows the workflow for creating a query using a named window:

1. The event is sent to the Esper Engine.
2. An EPL query is generated.
3. An alert is triggered.
4. The query checks to see if there is a connection between the event and the Named Window.
5. If there is a connection, the query that populates the Named Window is run and populated.
6. The content from the Named Window is added to the alert content and sent or displayed (depending on your settings).



Prerequisites

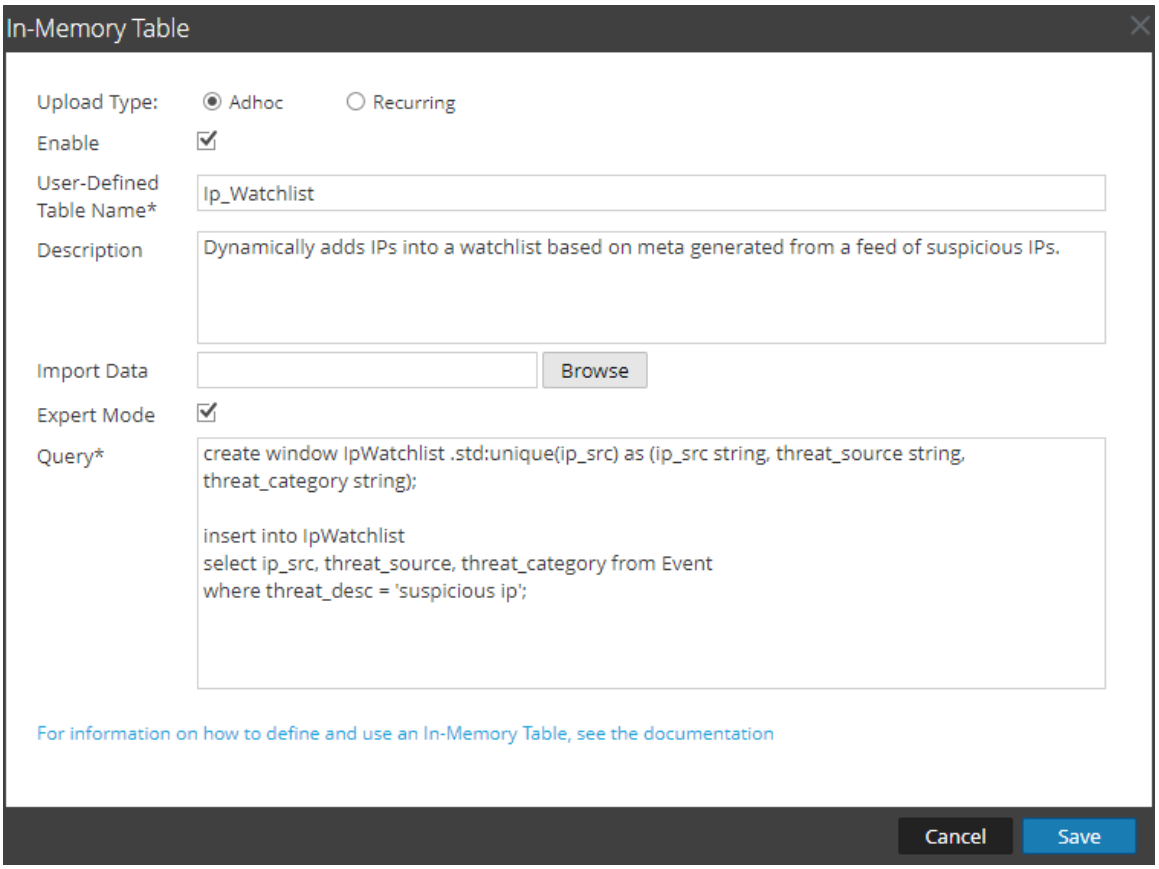
- The meta used in the EPL statement must exist in the data.
- You must create well-formed EPL statements.

Procedure

Note: It is preferable to use Context Hub List enrichment sources instead of In-Memory Table enrichment sources for rules.

1. Go to **(Configure) > ESA Rules**.
   The Configure view is displayed with the Rules tab open.
2. Click the **Settings** tab.
3. In the options panel, select **Enrichment Sources**.
4. In the **Enrichment Sources** section, click > **In-Memory Table**.

5. Select **Adhoc**.
   By default, Enable is selected. When you add the in-memory table to a rule, alerts will be enriched with data from it.
6. In the **User-Defined Table Name** field, type a descriptive name to describe the in-memory table.
7. If you want to explain what the enrichment adds to an alert, enter information in the **Description** field.
   This description displays when you view the list of enrichments from the Enrichment Sources view, so it's a good idea to enter a thorough description as a best practice. Doing this allows other users to understand the content of the enrichment without opening it to examine its contents.
8. Select **Expert Mode** to define an advanced in-memory table configuration by writing an EPL query. The Table Columns are replaced by a **Query** field.
9. Select **Persist** to preserve the in-memory table on disk when the ESA service stops and to re-populate the table when the service restarts.
10. Enter the EPL query in the **Query** field. The query should be well-formed, and it's a good idea to test it before entering it in the field.
11. Click **Save**.



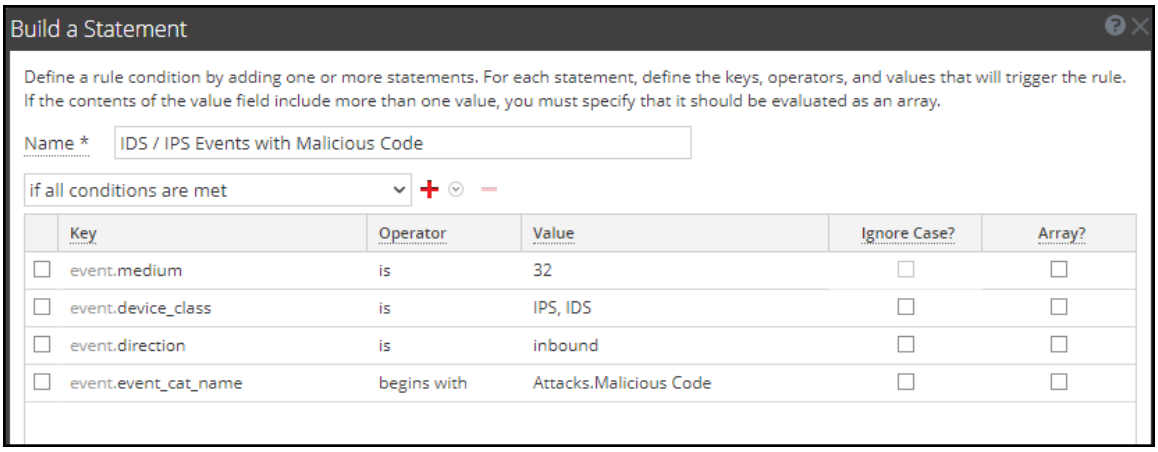
Example

For example, you want to know when an IPS or IDS is giving five or more inbound events with an event identified with malicious code. Additionally, you would like to know when the source IP of those events has been identified as suspicious by other sources. This information helps to more quickly triage the event and determine whether the alert is a true positive.

Step 1: Create the Enrichment

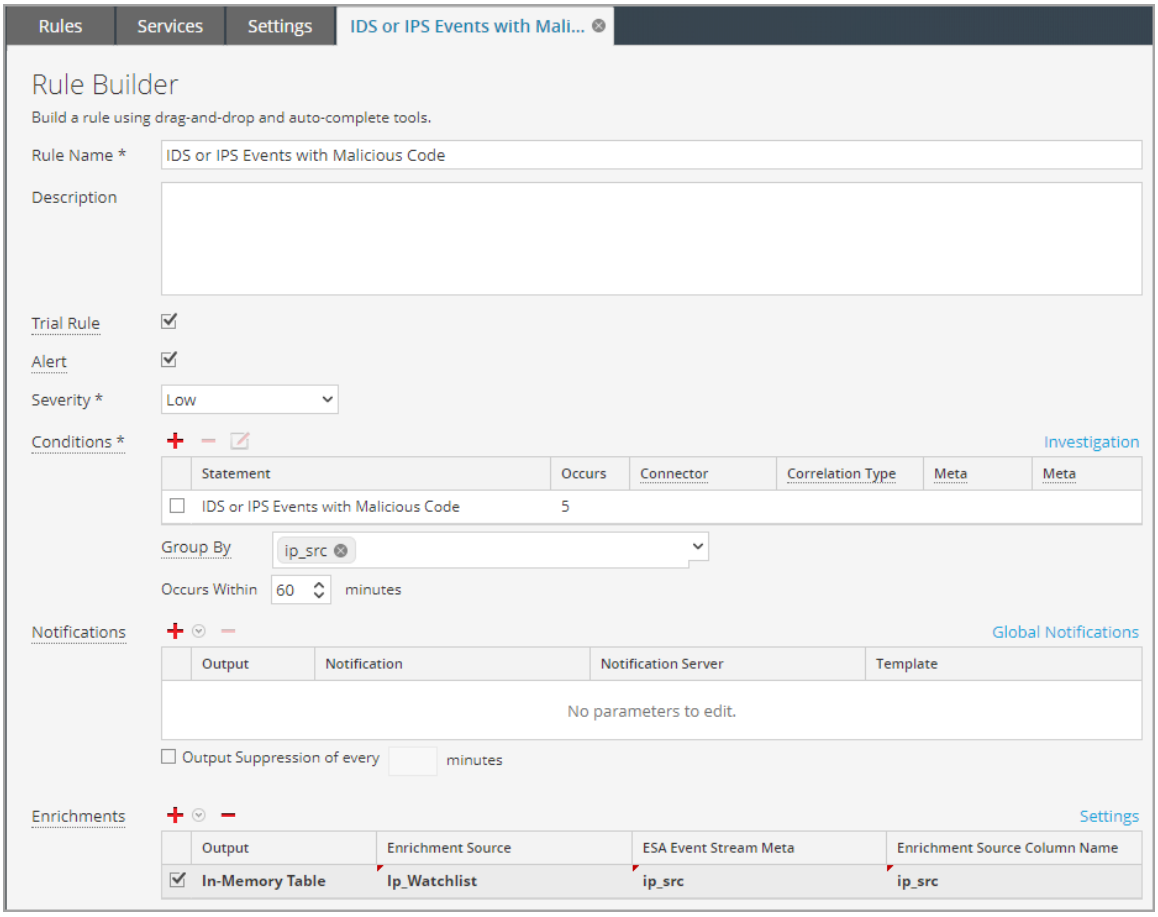
In this example, this enrichment is a watchlist of IPs that have been identified as suspicious by third party sources or by internal staff. The meta of `threat_desc equal to 'suspicious ip'` is generated when a match to a feed occurs. This meta can be matched and output based on a log, packet, or endpoint event.

The enrichment should look like the following:



Parameters	Description
Upload Type	Adhoc
IP_Watchlist	IP_Watchlist
Description	Dynamically populated whitelist based on a feed of IPs that are considered suspicious.
Expert Mode	Selected

Query	`create window IpWatchlist .std:unique(ip_src) as (ip_src string, threat_source string, threat_category string);`
	`insert into IpWatchlist`
	`select ip_src, threat_source, threat_category from Event`
	`where threat_desc = 'suspicious ip';`



Step 2: Create Your Rule

First, you need to create your ESA Correlation rule. This example rule looks for inbound IPS or IDS log events with the `event_cat_name` beginning with `Attacks.Malicious Code`. If five or more events for the same `ip_src` occur within 60 minutes, then an alert will be triggered. If an `ip_src` from the Enrichment equals the `ip_src` from the alert, then that alert will be enriched with additional meta. In this case, the analyst would see the values for `threat_source` and `threat_category` in the raw alert. `Threat_category` would indicate the type of malware and `threat_source` would indicate the entity that has reported the ip as suspicious. The analyst could use this information to do additional research or escalate to the next tier for creation of a possible incident.

Rule Statement

Rule Logic with Enrichment Added

ESA Alert References

In Event Stream Analysis (ESA), you configure and deploy ESA rules to get alerted about potential network threats.

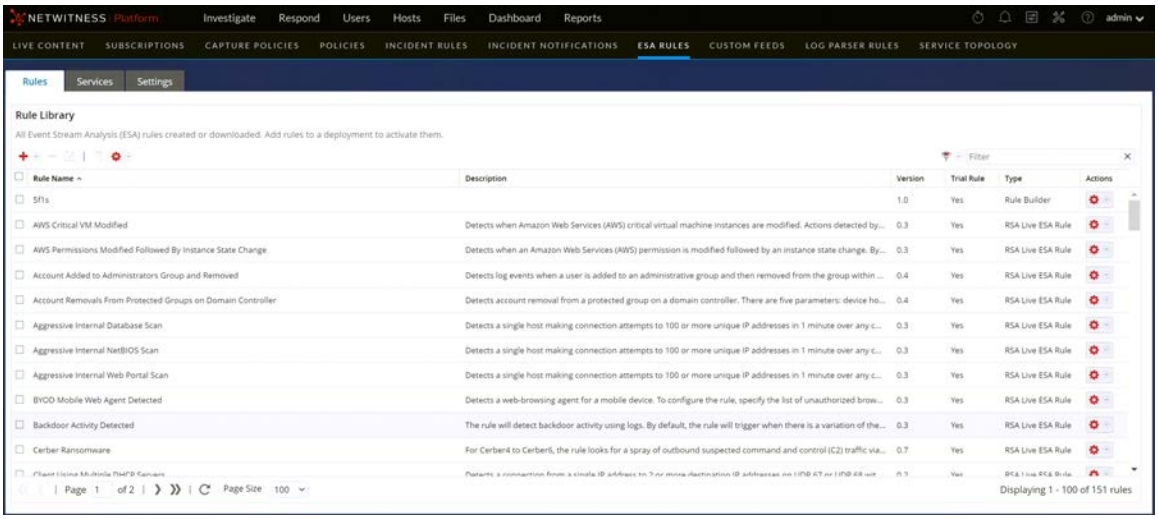
These topics explain the user interface for ESA Correlation rules.

- Rules Tab
- Rule Library Panel
- Rule Builder Tab
- Build a Statement Dialog
- Advanced EPL Rule Tab
- Rule Syntax Dialog
- Services Tab
- Settings Tab

Rules Tab

The Rules tab enables you to view and configure ESA rules.

What do you want to do?



Role	I want to ...	Show me how
Content Expert	View types of rules	ESA Rule Types
Content Expert	Deploy Trial Rules	Working with Trial Rules
Content Expert	Create a rule	Add Rules to the Rule Library

Related Topics

Getting Started with ESA

Quick Look

The Rules tab is displayed when you go to **(Configure) > ESA Rules**.
The following figure shows the Rules tab.

The Rules tab is divided into two sections:

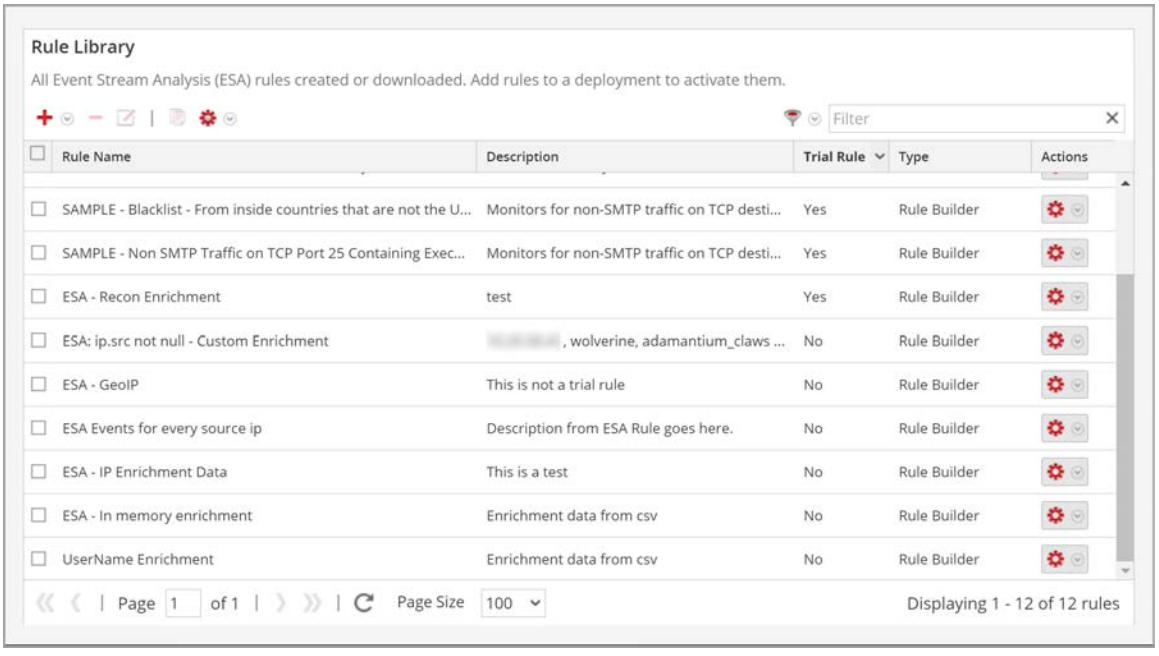
- Rules Tab Options Panel
- Rule Library Panel

Rule Library Panel

The Rule Library panel allows you to manage rules.

What do you want to do?

Role	I want to ...	Show me how
Content Expert	Add an ESA rule.	Add a Rule Builder Rule
Content Expert	Edit, duplicate, or delete an ESA rule.	Edit, Duplicate or Delete a Rule
Content Expert	Import or export ESA rules.	Import or Export Rules
Content Expert	Filter the ESA rules list.	Filter or Search for Rules



Related Topics

- Add an Advanced EPL Rule

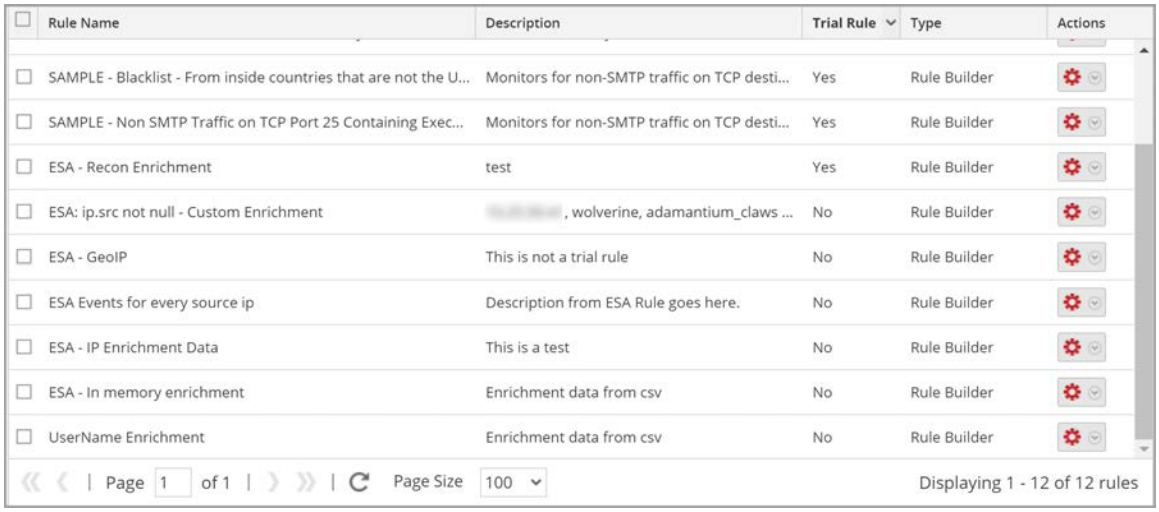
Quick Look

To access this view, go to **(Configure) > ESA Rules**. The Rules tab is displayed and the Rule Library panel is on the right.

The following figure shows the Rule Library panel.

The Rule Library panel includes the following components:

- Rule Library toolbar
- Rule Library list

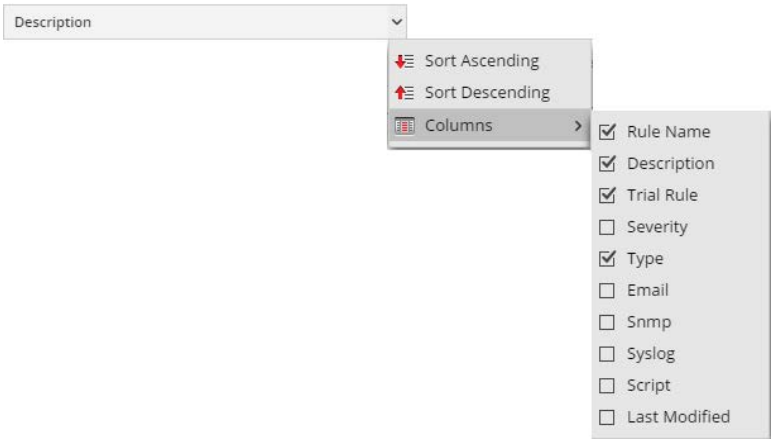


Rule Library Toolbar

The Rule Library toolbar allows you to add, delete, edit, duplicate, filter, export, and import ESA rules. The following figure shows the icons for these actions.

Rule Library List

The following figure shows the Rule Library list.



The Rule Library list shows all of the ESA rules. The following table lists the columns in the Rule Library list and their description.

Column	Description
Rule Name	Purpose of the ESA rule.
Description	Summary of what the ESA rule detects.
Trial Rule	Deployment mode to see if the rule runs efficiently.
Type	The type of rule. For more information, see ESA Rule Types.
Actions ( )	Menu to delete, edit, duplicate, or export the selected rule.
Severity	Threat level of alert triggered by the rule.
Email	Indicates whether an alert notification for the rule is sent by email. This column is not visible by default.

Column	Description
SNMP	Indicates whether an alert notification for the rule is sent using SNMP. This column is not visible by default. (ESA SNMP notifications are not supported in NetWitness version 11.3 and later.)
Syslog	Indicates whether an alert notification for the rule is sent using Syslog. This column is not visible by default.
Script	Indicates whether an alert notification for the rule executes a script. This column is not visible by default.
Last Modified	The date and time when the ESA rule was last modified. This column is not visible by default.

To display columns which aren't visible by default, hover over the title of a column and click the **v** on the right. This opens a drop-down menu in which you can sort the contents of the column or choose which columns you want to see in the Rule Library list.

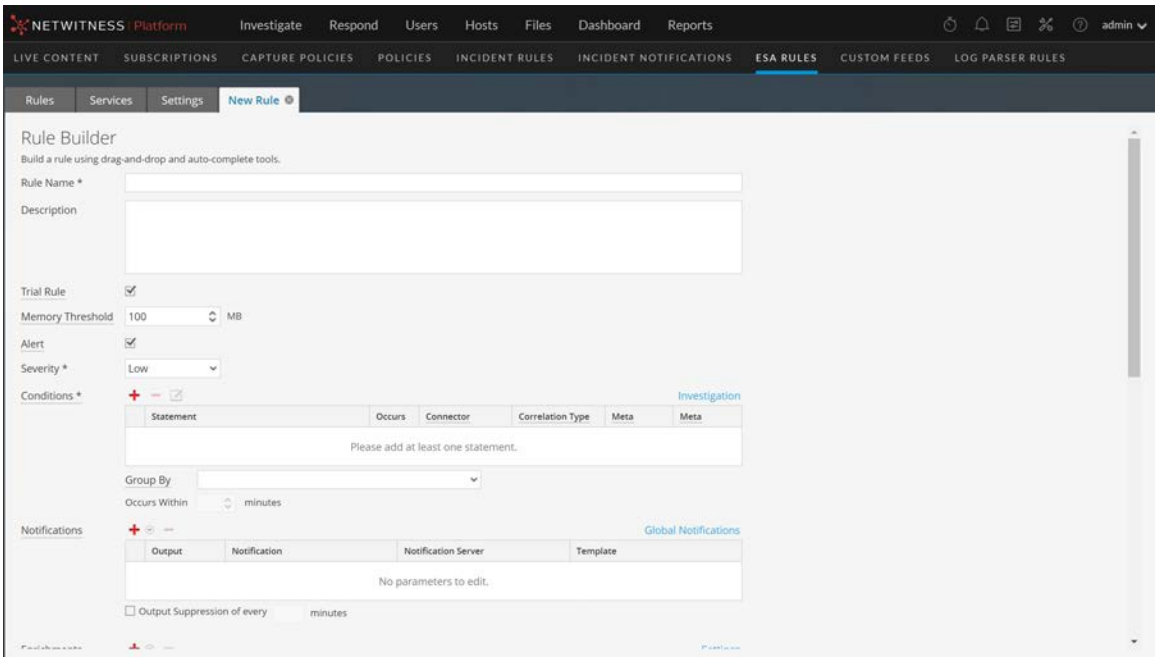
Rule Builder Tab

The Rule Builder tab enables you to define a Rule Builder rule.

What do you want to do?

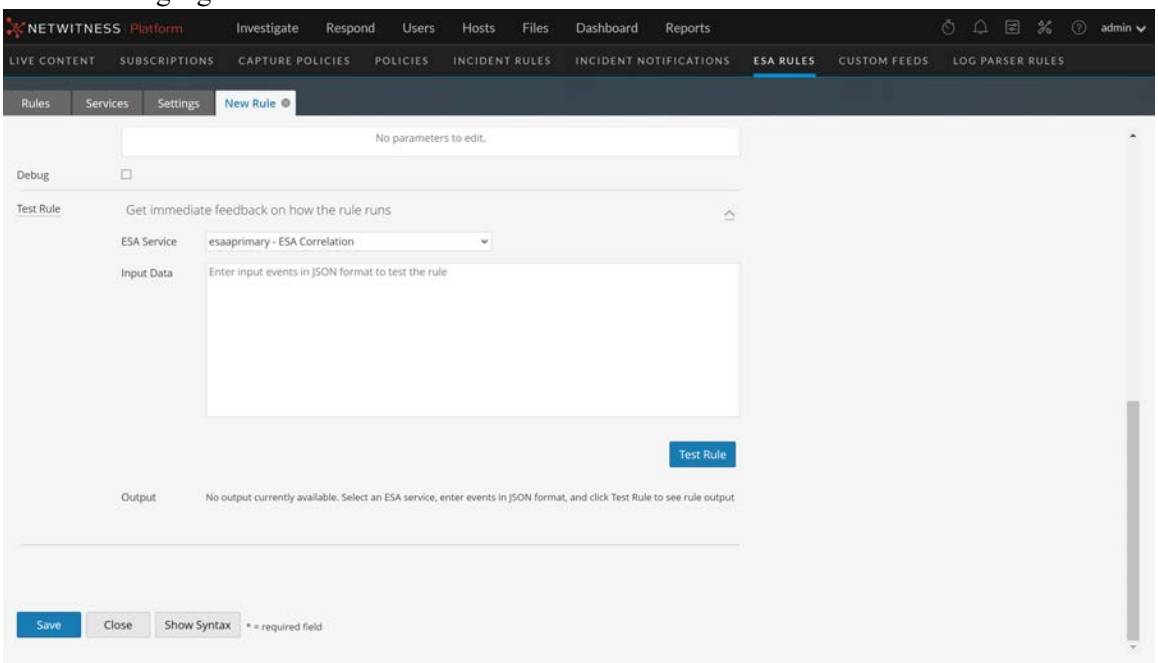
Role	I want to ...	Show me how
Content Expert	Define a Rule Builder rule.	Add a Rule Builder RuleStep 1. Name and Describe the Rule
Content Expert	Define rule criteria.	Step 2. Build a Rule Statement
Content Expert	Add conditions to the rule.	Step 3. Add Conditions to a Rule Statement
Content Expert	Test the ESA rule logic.	Validate an ESA Rule

Related Topics



- Add an Advanced EPL Rule

Quick Look



To access the Rule Builder tab:

1. Go to  **(Configure) > ESA Rules**.
   The Rules tab opens by default.
2. In the **Rule Library** toolbar, select  **> Rule Builder**.
   The Rule Builder tab is displayed.

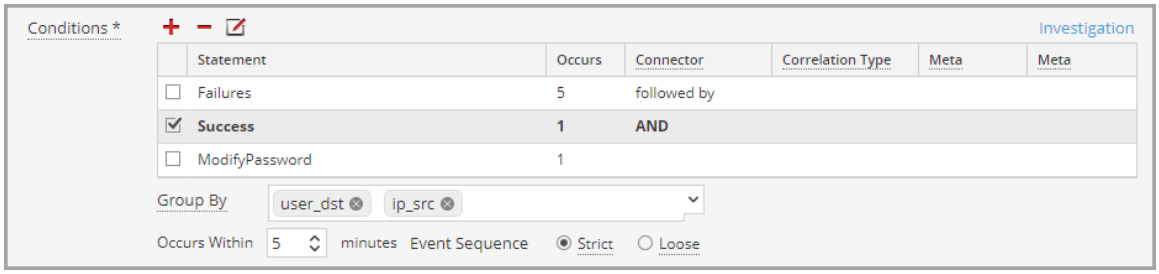
The following figure shows the Rule Builder tab.

The following figure shows the Rule Builder tab scrolled down with the Test Rule section in view.

The following table lists the parameters in the Rule Builder tab.

Field	Description
Rule Name	Purpose of the ESA rule.
Description	Summary of what the ESA rule detects.
Trial Rule	Deployment mode to see if the rule runs efficiently.

Field	Description
Memory Threshold	(This option applies to version 11.5 and later.) The maximum memory usage allowed for this rule in MB. Add Memory Thresholds to ESA rules that use memory. For example, if a rule contains windows or pattern matching, configure a memory threshold for that rule. If the configured memory threshold is exceeded, it gets disabled individually and an error is displayed for that rule on the (Configure) > ESA Rules > Services tab. New rules default to a 100 MB memory threshold. Rules that existed before version 11.5 do not have a default value and a memory threshold is not set.
Alert	(This option applies to version 11.3 and later.) When selected, the alert is sent to Respond. If the checkbox is cleared, an alert will not be sent to Respond. To turn alerts on or off for ALL rules, see the *ESA Configuration Guide*.
Severity	Threat level of alert triggered by the rule.



The Rule Builder includes the following components:

- Conditions Section
- Notifications Section
- Enrichments Section
- Debug Option
- Test Rule Section

Conditions Section

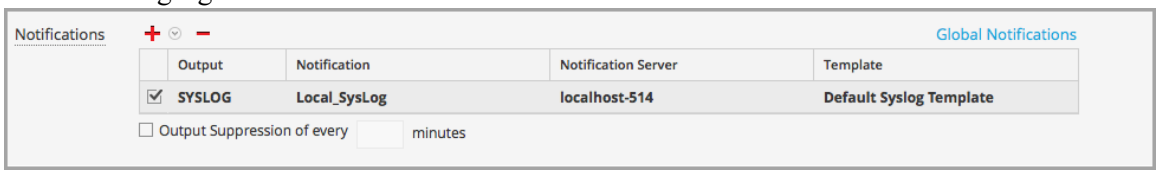
In the Conditions section of the Rule Builder tab, you define what the rule detects.

The following figure shows the Conditions section.

The following table lists the parameters of the Conditions section.

Parameter	Description
+	Add a statement.
−	Remove selected statement.
	Edit selected statement.

Parameter	Description
Statement	Logical group of conditions for one operation.
Occurs	Alert frequency if the condition is met. This specifies that there must be at least that many events that satisfy the criteria in order to trigger an alert. The time window in minutes binds the Occurs count.
Connector	Options to specify relationship among the statements: • followed by • not followed by • AND • OR The Connector joins two statements with AND, OR, followed by, or not followed by. When followed by is used, it specifies that there is a sequencing of those events. AND and OR build one large criteria. The followed by creates distinct criteria that occurs in sequence.
Correlation Type	**Correlation Type** applies only to **followed by** and **not followed by**. If you choose a correlation type of SAME, select one meta to correlate on, and if you choose a correlation type of JOIN, select two meta to correlate on. You may want to use JOIN if you are trying to correlate on meta from two different data sources. For example, say you want to correlate an AV alert with an IDS alert.
Meta	Enter the meta condition if choosing a correlation type of SAME or JOIN (as described above).
Meta	Enter the second meta condition if choosing a correlation type of JOIN (as described above). For example, The destination IP address from the AV alert and source IP address for the workstation from the IDS alert are joined to allow you to view the same entities across different sources.
occurs within minutes	Time window within which the conditions must occur.
Event Sequence	Choose whether the pattern must follow a *strict* match or a *loose* match. If you specify a strict match, this means that the pattern must occur in the *exact* sequence you specified with no additional events occurring in between. For example, if the sequence specifies five failed logins (F) followed by a successful login (S), this pattern will only match if the user executes the following sequence: F,F,F,F,F,S. If you specify a loose match, this means that other events may occur within the sequence, but the rule will still trigger if all of the specified events also occur. For example, five failed login attempts (F), followed by any number of intervening successful login attempts (S), followed by a successful login attempt might create the following pattern: F,S,F,S,F,S,F,S,F,S which would trigger the rule despite the intervening successful logins.



Parameter	Description
Group By	Select the meta key by which to group results from the dropdown list. For example, suppose that there are three users; Joe, Jane, and John and you use the Group By meta, **user_dst** (user_dst is the meta field for the user destination account). The result will show events grouped under the user destination accounts, Joe, Jane, and John. You can also group by multiple keys. For example, you might want to group by user and machine to see if a user logged in from the same machine attempts to log into an account multiple times. To do this, you might group by user_dst and ip_src.

Notifications Section

In the Notifications section, you can choose how to be notified when ESA generates an alert for the rule.

For more information on the alert notifications, see Add Notification Method to a Rule.

The following figure shows the Notifications section.

Parameter	Description
	To add an alert notification type.
	To delete the selected alert notification.
Output	Alert notification type. Options are: • Email • SNMP (This option is not supported in NetWitness version 11.3 and later.) • Syslog • Script
Notification	Name of previously configured output, such as an email distribution list.
Notification Server	Name of server that sends the output.
Template	Name of template for the alert notification.
Output Suppression of every	Option to specify alert frequency.
Minutes	Alert frequency in minutes.

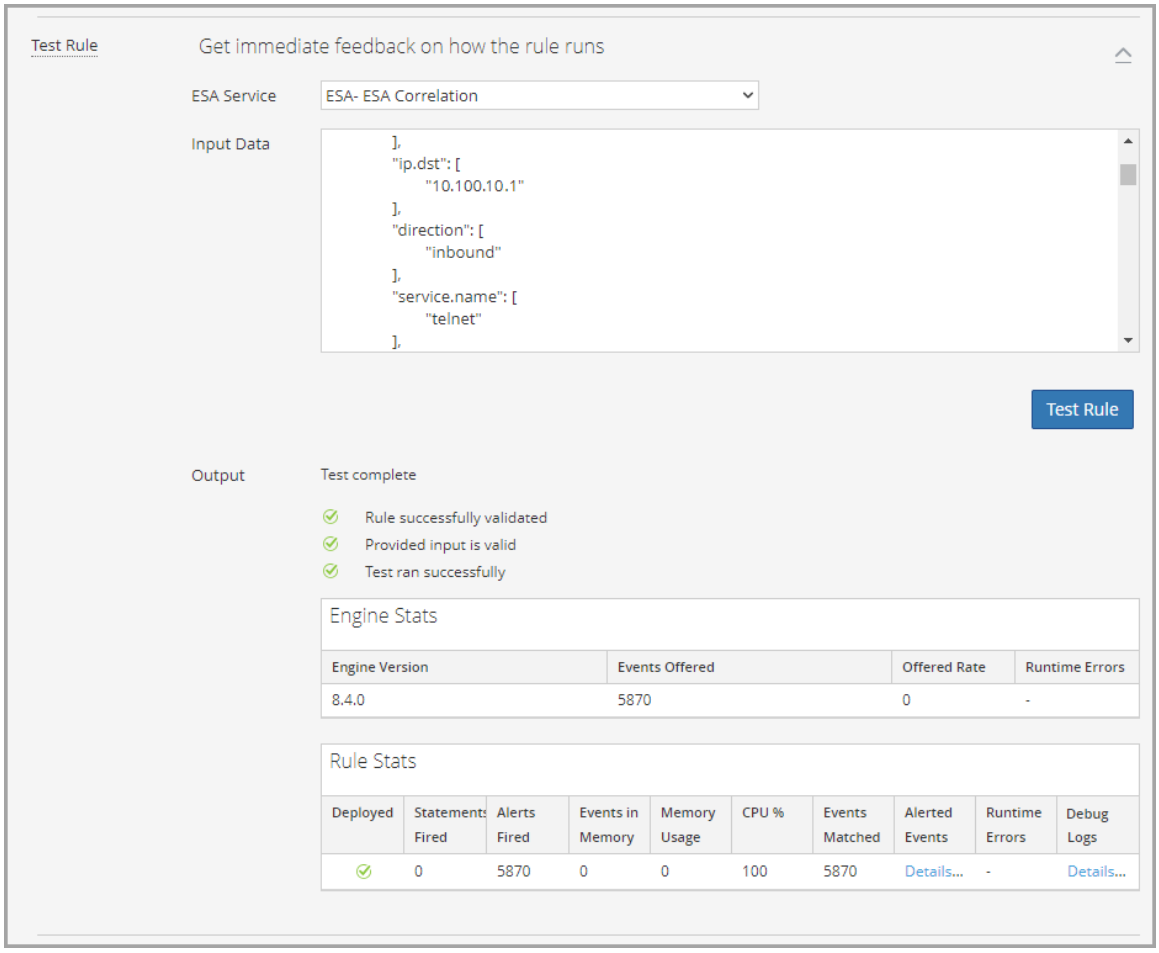
Enrichments Section

In the Enrichments section, you can add a data enrichment source to a rule.

For more information on the enrichments, see Add an Enrichment to a Rule.

The following figure shows the Enrichments section.

Parameter	Description
+	To add an enrichment.
−	To delete the selected enrichment.
Output	Enrichment source type. Options are: • In-Memory Table (Ad hoc only - Recurring In-Memory Tables are no longer supported in version 11.3 and later.) • GeoIP
Enrichment Source	Name of previously configured enrichment source, such as a .CSV filename for an In-Memory Table.
ESA Event Stream Meta	ESA meta key whose value will be used as one operand of join condition.
Enrichment Source Column Name	Enrichment source column name whose value will be used as the other operand of the join condition. For an in-memory table, If you configured a key when creating a .CSV-based enrichment, this column automatically populates with the selected key. However, you can change it if you like. For a GeoIP enrichment source, ipv4 is automatically selected.



Debug Option

Select the Debug option to print alerts to the ESA logs for troubleshooting. This adds an @Audit ('stream') annotation to the rule. This is useful when debugging the Esper rules.

Test Rule Section

Note: The Test Rule section is available in NetWitness Platform 11.5 and later.

In the Test Rule section, you can validate your ESA rule to determine if the rule logic is working as expected before deploying the rule.

Field	Description
ESA Service	Select the ESA Correlation service to process the rule.
Input Data	Enter the input events to test the rule. Download the events from the Investigate view in JSON format, copy the events, and paste them in this field.
Output Data	After you select an ESA Correlation service, input data, and click the Test Rule button, you can view the output of the rule here and verify that the rule is working according to your requirements. You can view the alerts in the output, but this test does not send any alert notifications.

The following table describes the test rule output **Engine Stats**.

Field	Description
Engine Version	Esper version running on the ESA service
Events Offered	Number of events processed by the ESA service since the last service start
Offered Rate	The rate that the ESA service processes current events / The maximum rate that the ESA service processed events
Runtime Errors	If applicable, this field can contain a link to runtime error messages related to the ESA rule deployment.

The following table describes the test rule output **Rule Stats**.

Field	Description
Deployed	A green checkmark indicates that the rule is deployed on the selected ESA service.
Statements Fired	The number of statements that fired the alerts
Alerts Fired	The number of alerts generated from the test data
Events in Memory	The number of events placed in memory by the rule
Memory Usage	The total amount of memory used by the rule
CPU %	The percentage of the deployment CPU used by the rule. For example, a deployment with 1 rule shows 100% CPU usage for that rule and a deployment with two equally CPU heavy rules show 50% each.
Events Matched	The number of events that matched the rule
Alerted Events	If applicable, this field can contain a link to events that caused an alert.
Runtime Errors	If applicable, this field can contain a link to runtime error messages related to the rule.
Debug Logs	This field contains a link to Esper debug (audit) logs.

Syntax

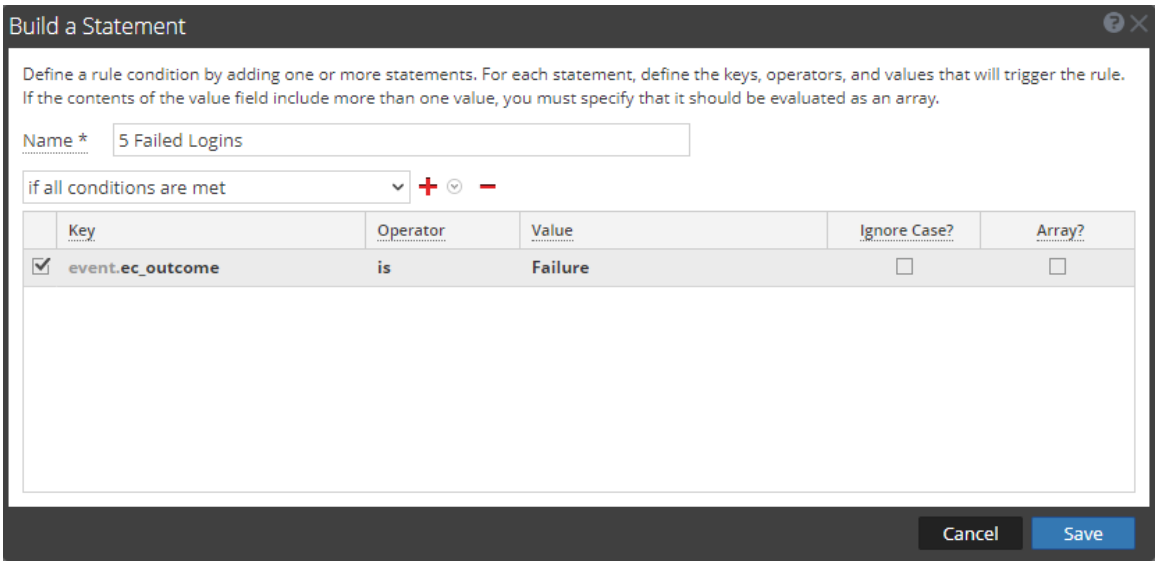
Click **Show Syntax** to view the EPL syntax of conditions, statements, and debugging parameters. It also provides a warning when the syntax is invalid. For more information, see Rule Syntax Dialog.

Build a Statement Dialog

The Build a Statement dialog allows you to construct a condition statement when creating a new Rule Builder rule.

What do you want to do?

Role	I want to ...	Show me how
Content Expert	Configure a rule statement.	Step 2. Build a Rule Statement
Content Expert	Add conditions to the rule.	Step 3. Add Conditions to a Rule Statement



Related Topics

- Add a Rule Builder Rule

Quick Look

To access the Build a Statement dialog:

1. Go to  **(Configure) > ESA Rules**.
   The Configure ESA Rules view is displayed with the Rules tab open.
2. In the **Rule Library** toolbar, select  **> Rule Builder**.
   A New Rule tab is displayed..
3. In the **Conditions** section, click .
   The Build a Statement dialog is displayed.

The following table describes the parameters in the Build a Statement dialog.

Parameter	Description
Name	Purpose of the statement.
Select	Conditions the rule requires. There are two options: • If all conditions are met • If any of these conditions are met
Key	Key for ESA to check in the rule statement.

Parameter	Description
Operator	Relationship between the meta key and value for the key: • is • is not • is not null • is greater than (>) • is greater than or equal to (>=) • is less than (<) • is less than or equal to (<=) • is one of (For array type meta) • is not one of (For array type meta) • contains • not contains • begins with • ends with
Value	Value for ESA to look for in the key.
Ignore Case?	This field is designed for use with string and array of string values. By choosing the **Ignore Case** field, the query will treat all string text as a lowercase value. This ensures that a rule that searches for the user named Johnson would trigger if the event contains "johnson," "JOHNSON," or "JoHnSoN."
Array?	Choice to indicate if contents of Value field represent one value or multiple values: • Select the box to indicate multiple values. • Clear the box to indicate one value.
+	Add a statement. You can add a meta condition, whitelist condition, or blacklist condition.
−	Delete selected statement.
Save	Add statement to the Conditions section of the Rule Builder tab.

The following table shows the operators you can use in the Rule Builder:

Operator	Required Value	Usage	Example	Meaning
is	Singular string value	The meta key is equal to the *value* field.	***user_dst*** is John Doe.	***user_dst*** is equal to the string *"John Doe"*.

Operator	Required Value	Usage	Example	Meaning
is	Array string value	The meta key is equal to one of the elements of the *value* field.	***user_dst*** is John, Doe, Smith.	***user_dst*** is equal either to the string *"John"* or to the string *"Doe"* or to the string *"Smith"* (Note, the spaces are stripped.).
is not	Singular string value	The meta key is not equal to the *value* field.	***size*** is not 200.	***size*** is not equal to the number 200 (size is a numeric value).
is not	Array string value	The meta key is not equal to any of the elements of the *value* field.	***size*** is not 200, 300, 400.	***size*** is equal neither to *200* nor to *300* nor to *400*.
is not null	N/A (looks for any value)	The meta key value is not null.	***user_dst*** is not null.	***user_dst*** is a meta that contains a value.
is greater than (>)	Number	The numeric value of the meta key is greater than the number in the *value* field.	***payload*** is greater than 7000.	***payload*** is a numeric value that is greater than 7000.
is greater than or equal to (>=)	Number	The numeric value of the meta key is greater than or equal to the number in the *value* field.	***payload*** is greater than or equal to 7000.	***payload*** is a numeric value that is greater than or equal to 7000.
is less than (<)	Number	The numeric value of the meta key is less than the number in the *value* field.	***ip_dstport*** is less than 1024.	***ip_dstport*** is a numeric value that is less than the numeric value 1024.
is less than or equal to (<=)	Number	The numeric value of the meta key is less than or equal to the number in the *value* field.	***ip_dstport*** is less than or equal to 1024.	***ip_dstport*** is a numeric value that is less than or equal to numeric value 1024.
is one of	Array string value	The meta key is one of the array string values in the *value* field.	***alias_host*** is one of Facebook, UTube, Instagram.	***alias_host*** is one of the array string values *Facebook, UTube, Instagram*.
is not one of	Array string value	The meta key is not one of the array string values in the *value* field.	***alias_host*** is not one of Facebook, UTube, Instagram.	***alias_host*** is not one of the array string values *Facebook, UTube, Instagram*.

Operator	Required Value	Usage	Example	Meaning
contains	String	The *value* field is a substring of the meta key. (This operator is only available for a string-valued meta key).	***ec_outcome*** contains failure.	***ec_outcome*** is a string that contains the substring *"failure"*.
not contains	String	The *value* field is not a substring of the meta key (This operator is only available for a string-valued meta key).	***ec_outcome*** not contains failure.	***ec_outcome*** is a string that does not contain the substring*"failure"*.
begins with	String	The *value* field is the beginning of the meta key (This operator is only available for a string-valued meta key).	***ip_dst*** begins with 127.0.	***ip_dst*** is a string that starts with *"127.0"*.
ends with	String	The *value* field is the end of the meta key (This operator is only available for a string-valued meta key).	***user_dst*** ends with son.	***user_dst*** is a string that ends in*"son"*.

Note: Terms in ***bold italics*** are Meta that may not exist in all customer environments.

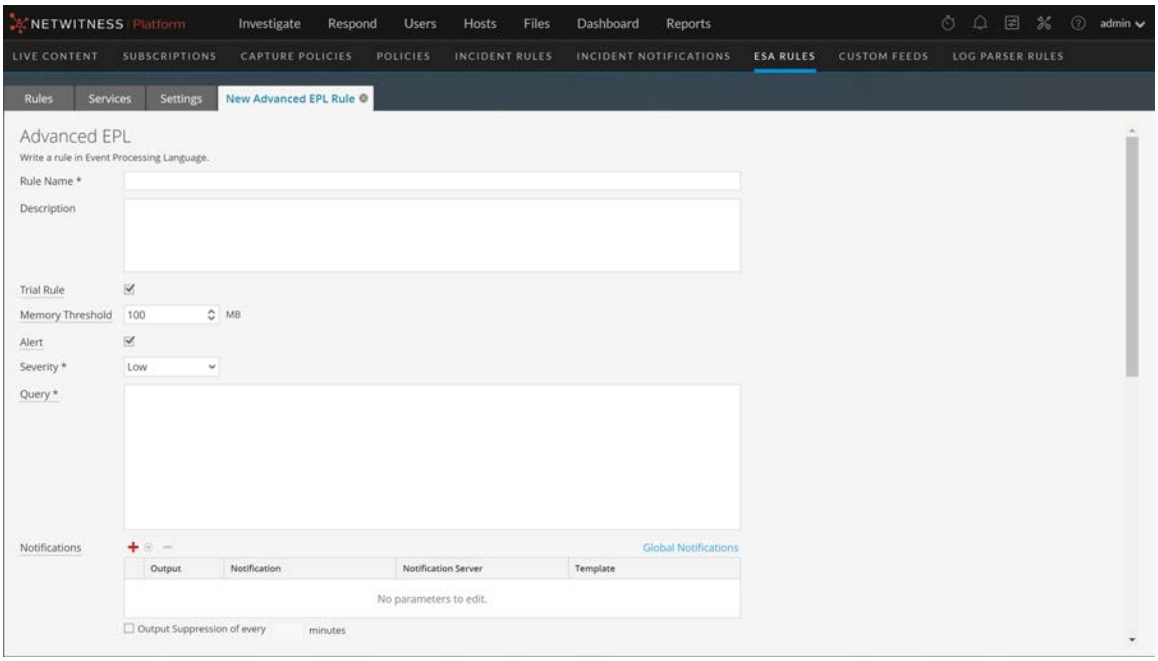
Advanced EPL Rule Tab

The Advanced EPL Rule tab enables you to define rule criteria with an Event Processing Language (EPL) query.

What do you want to do?

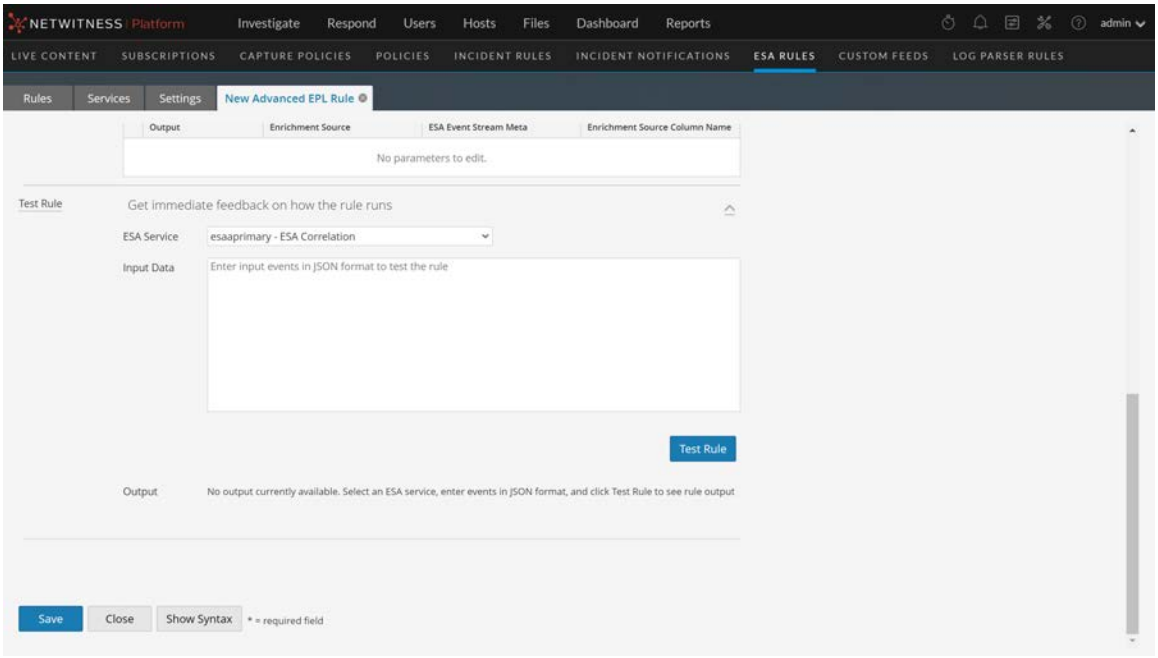
Role	I want to ...	Show me how
Content Expert	Define an Advanced EPL rule.	Add an Advanced EPL Rule
Content Expert	Test the Advanced EPL rule logic.	Validate an Advanced EPL Rule
Content Expert	See examples of an Advanced EPL Rule.	Example Advanced EPL Rules
Content Expert	See best practices for writing Advanced EPL Rules.	ESA Rule Writing Best Practices

Related Topics



- Add a Rule Builder Rule
- Enrichment Sources

Quick Look



To access the Advanced EPL Rule tab:

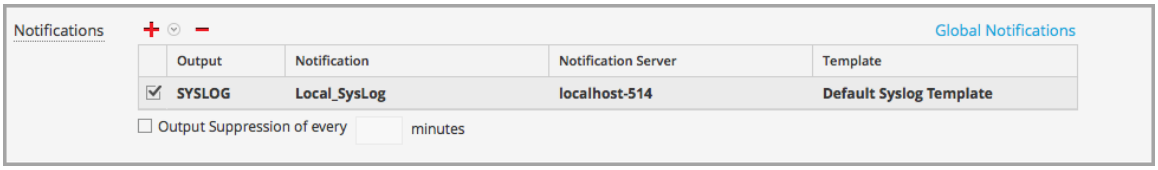
1. Go to **(Configure) > ESA Rules**.
   The Configure view is displayed with the Rules tab open by default.
2. In the **Rule Library** toolbar, select **> Advanced EPL**.
   The Advanced EPL Rule tab is displayed.

The following figure shows the Advanced EPL Rule tab.

The following figure shows the Advanced EPL Rule tab scrolled down with the Test Rule section in view.

The following table lists the parameters in the Advanced EPL Rule tab.

Parameters	Description
Rule Name	Purpose of the ESA rule.
Description	Summary of what the ESA rule detects.



Parameters	Description
Trial Rule	Deployment mode to see if the rule runs efficiently.
Memory Threshold	(This option applies to version 11.5 and later.) The maximum memory usage allowed for this rule in MB. Add Memory Thresholds to ESA rules that use memory. For example, if a rule contains windows or pattern matching, configure a memory threshold for that rule. If the configured memory threshold is exceeded, it gets disabled individually and an error is displayed for that rule on the (Configure) > ESA Rules > Services tab. New rules default to a 100 MB memory threshold. Rules that existed before version 11.5 do not have a default value and a memory threshold is not set.
Alert	(This option applies to version 11.3 and Later.) When selected, the alert is sent to Respond. If the checkbox is cleared, an alert will not be sent to Respond. To turn alerts on or off for ALL rules, see the *ESA Configuration Guide*.
Severity	Threat level of alert triggered by the rule.
Query	EPL query that defines rule criteria.

Notifications Section

In the Notifications section, you can choose how to be notified when ESA generates an alert for the rule.

For more information on the alert notifications, see Add Notification Method to a Rule.

The following figure shows the Notifications section.

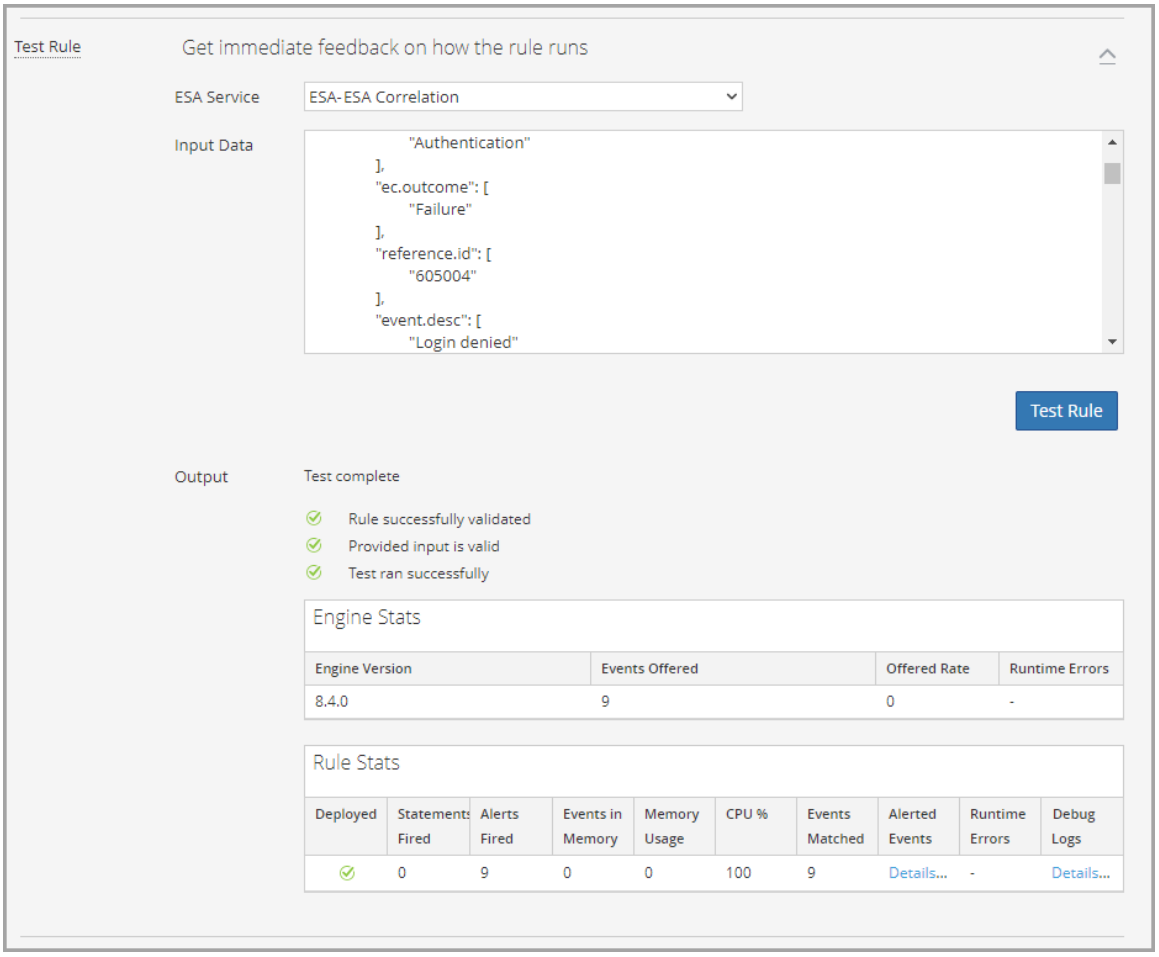
Parameter	Description
+	To add an alert notification type.
−	To delete the selected alert notification type.
Output	Alert notification type. Options are: • Email • SNMP (This option is not supported in NetWitness version 11.3 and later.) • Syslog • Script
Notification	Name of previously configured output, such as an email distribution list.

Parameter	Description
Notification Server	Name of server that sends the output.
Template	Name of template for the alert notification.
Output Suppression of every	Option to specify alert frequency.
Minutes	Alert frequency in minutes.

Enrichments Section

In the Enrichments section, you can add a data enrichment source to a rule.

For more information on the enrichments, see Add an Enrichment to a Rule.
The following figure shows the Enrichments section.



Parameter	Description
+	To add an enrichment.
−	To delete the selected enrichment.
Output	Enrichment source type. Options are: • In-Memory Table (Ad hoc only - Recurring In-Memory Tables are no longer supported in version 11.3 and later.) • GeoIP
Enrichment Source	Name of previously configured enrichment source, such as a .CSV filename for an In-Memory Table.
ESA Event Stream Meta	ESA meta key whose value will be used as one operand of join condition.
Enrichment Source Column Name	Enrichment source column name whose value will be used as the other operand of the join condition.

Test Rule Section

Note: The Test Rule section is available in NetWitness Platform 11.5 and later.

In the Test Rule section, you can validate your ESA rule to determine if the rule logic is working as expected before deploying the rule.

Field	Description
ESA Service	Select the ESA Correlation service to process the rule.
Input Data	Enter the input events to test the rule. You can download the events from the Investigate view in JSON format, copy the events, and paste them in this field.
Output Data	After you select an ESA Correlation service, input data, and click the Test Rule button, you can view the output of the rule here and verify that the rule is working according to your requirements. You can view the alerts in the output, but this test does not send any alert notifications. If you want to view all of the debug information for the test, include an `@Audit('stream')` annotation to your rule query.

The following table describes the test rule output **Engine Stats**.

Field	Description
Engine Version	Esper version running on the ESA service
Events Offered	Number of events processed by the ESA service since the last service start
Offered Rate	The rate that the ESA service processes current events / The maximum rate that the ESA service processed events
Runtime Errors	If applicable, this field can contain a link to runtime error messages related to the ESA rule deployment.

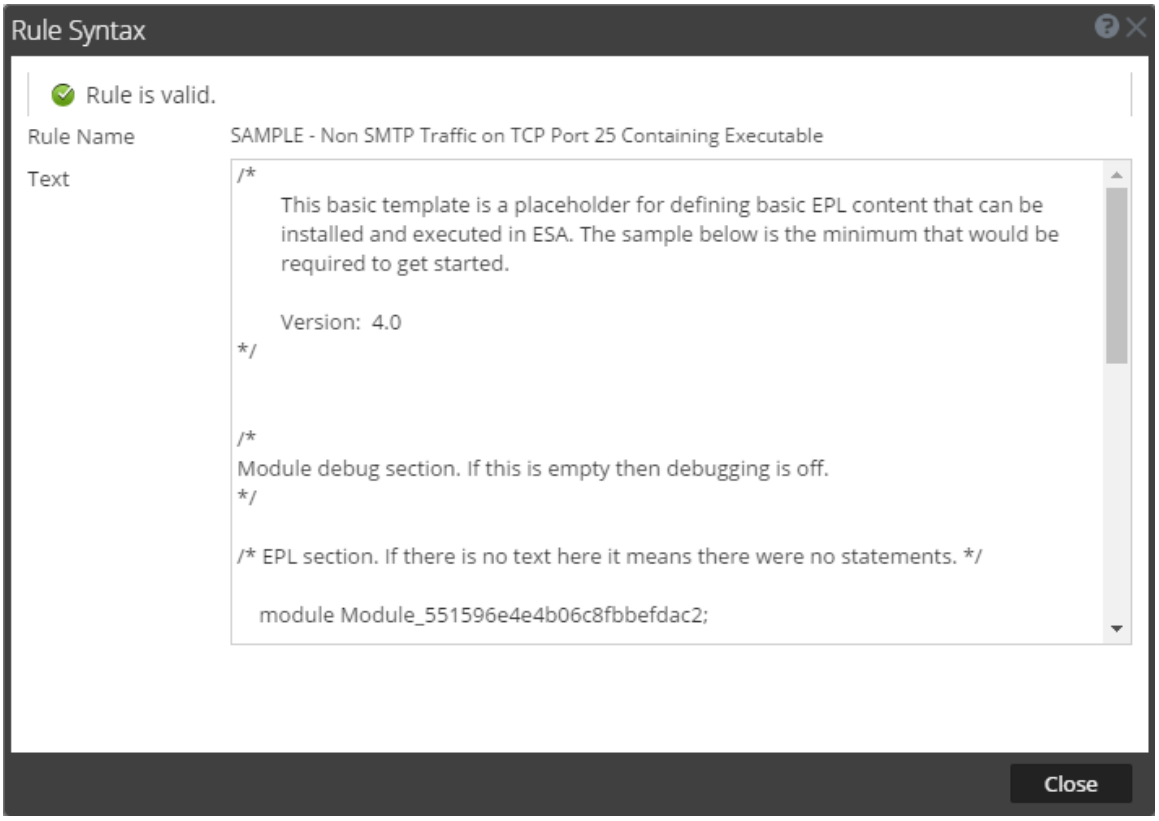
The following table describes the test rule output **Rule Stats**.

Field	Description
Deployed	A green checkmark indicates that the rule is deployed on the selected ESA service.
Statements Fired	The number of statements that fired the alerts
Alerts Fired	The number of alerts generated from the test data
Events in Memory	The number of events placed in memory by the rule
Memory Usage	The total amount of memory used by the rule
CPU %	The percentage of the deployment CPU used by the rule. For example, a deployment with 1 rule shows 100% CPU usage for that rule and a deployment with two equally CPU heavy rules show 50% each.
Events Matched	The number of events that matched the rule
Alerted Events	If applicable, this field can contain a link to events that caused an alert.
Runtime Errors	If applicable, this field can contain a link to runtime error messages related to the rule.
Debug Logs	This field contains a link to Esper debug (audit) logs.

Syntax

Click **Show Syntax** to view the EPL syntax of conditions, statements, and debugging parameters. It also provides a warning when the syntax is invalid. For more information, see Rule Syntax Dialog.

Rule Syntax Dialog



This topic describes the features of the Rule Syntax dialog. The Rule Syntax dialog displays the EPL syntax of conditions, statements, and debugging parameters, and provides a warning when the syntax is invalid.

Quick Look

To access this dialog:

1. Go to **(Configure) > ESA Rules**.
2. In the **Rule Library** view, do one of the following:
   a. Click and select **Advanced EPL** or **Rule Builder**.
   b. Double-click an existing rule.
   c. Select an existing rule and click in the **Rule Library** toolbar.
   d. In the row of an existing rule, select **> Edit**.
   The new or existing rule is displayed in a new tab, available to edit.
3. Click **Show Syntax** at the bottom of the tab.

The following figure shows an example of the Rule Syntax dialog showing a valid rule.

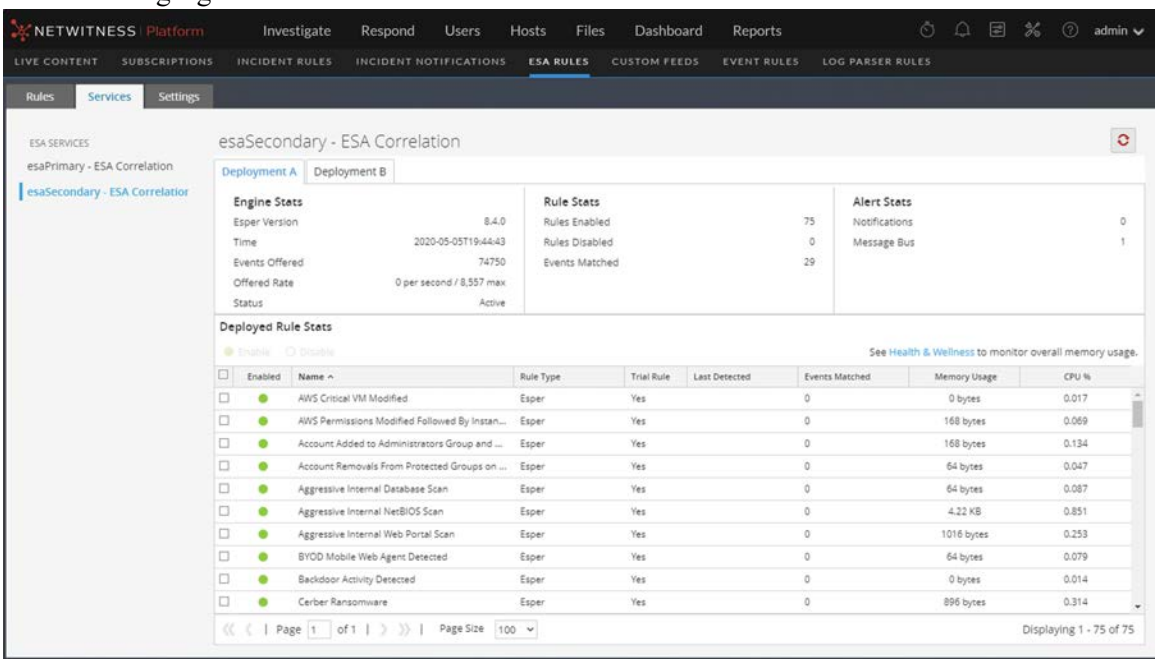
The following table describes the Rule Syntax dialog parameters.

Parameters	Description
Rule is valid or **Validation error in rule**	Indicates whether the rule syntax is valid or needs to be changed.
Rule Name	Displays the name of the rule.
Text	Displays the EPL syntax of conditions, statements, and debugging parameters if the rule is valid.

Services Tab

This topic provides an overview of the **(Configure) > ESA Rules > Services** tab. The Services tab shows the status of the deployments on each ESA service.

What do you want to do?



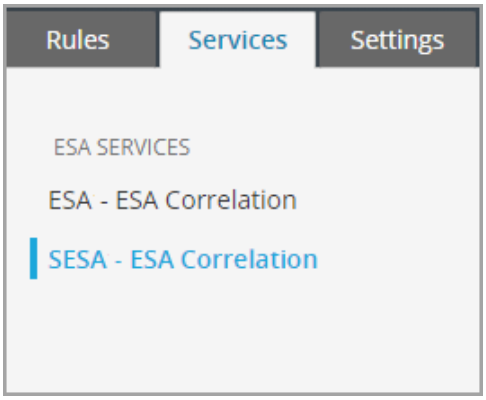
Role	I want to ...	Show me how
Content Expert	Troubleshoot Services Tab.	Troubleshoot ESA
Content Expert	View deployment Stats for an ESA Service.	View Stats for an ESA Service

Related Topics

- View a Summary of Alerts

Quick Look

The following figure shows the Services tab:



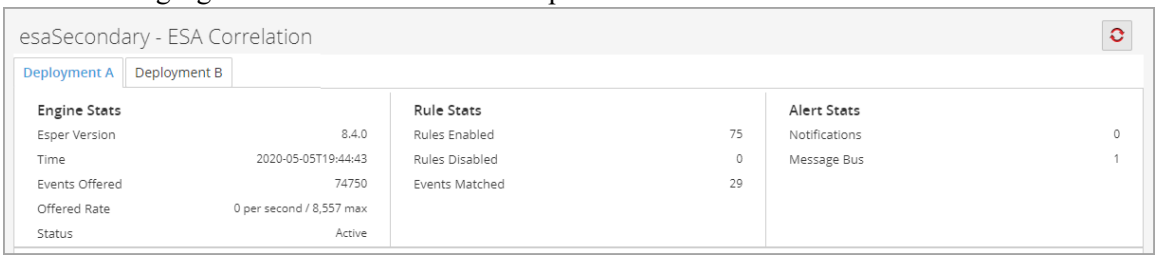
(This option is available in NetWitness version 11.3 and later.) If an ESA Correlation service has multiple deployments, under the service name, you will see a tab for each deployment. In the above example, there are two deployment tabs, Deployment A and Deployment B. Each tab displays information specific to that deployment.

The Services tab has the following sections:

- ESA Services panel (on the left)
- General Stats panel (top right)
- Deployed Rule Stats panel (bottom right)

ESA Services Panel

The ESA Services panel lists the name of each ESA service added to NetWitness.



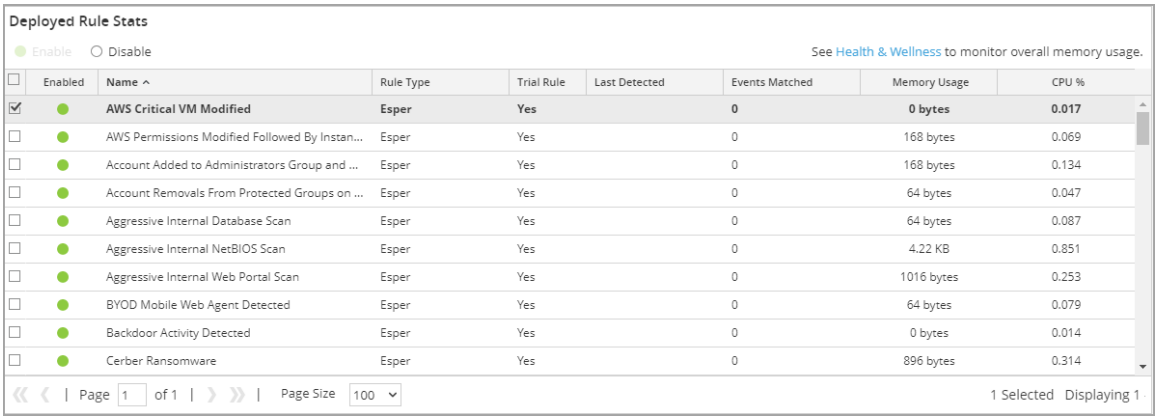
General Stats Panel

The General Stats panel provides information on the Esper engine, rules, and alerts.

The General Stats panel contains the following sections:

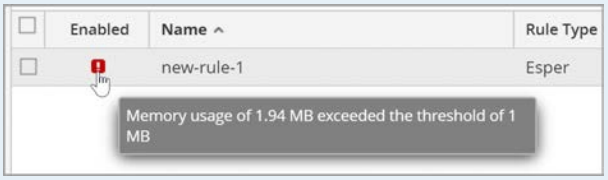
- Engine Stats
- Rule Stats
- Alert Stats

The following figure shows the General Stats panel.



The following table lists and describes the parameters in each section.

Sections	Parameter	Description
Engine Stats	Esper Version	Esper version running on the ESA service
	Time	Time when the last event was sent to Esper Engine
	Events Offered	Number of events processed by the ESA service since the last service start
	Offered Rate	The rate that the ESA service processes current events / The maximum rate that the ESA service processed events.
	Status	Shows the status of the deployment. A status of **Active** means that the deployment is active. A status of **Inactive** means that there was probably an error starting the deployment. Check the error log file for more information: `/var/log/netwitness/correlation-server/correlation-server.log`.
Rule Stats	Rules Enabled	Number of rules enabled
	Rules Disabled	Number of rules disabled
	Events Matched	Total number of events matched to all rules on the ESA service
Alert Stats	Notifications	The total number of notifications sent by email, SNMP, syslog, or script for the deployment. (ESA SNMP notifications are not supported in NetWitness Platform version 11.3 and later.)
	Message Bus	The total number of alerts sent to Respond for the deployment



Deployed Rule Stats Panel

The Deployed Rule Stats panel provides details on the rules that are deployed on the ESA service.

The following figure shows the Deployed Rule Stats panel.

The table lists the various parameters in the view and their description.

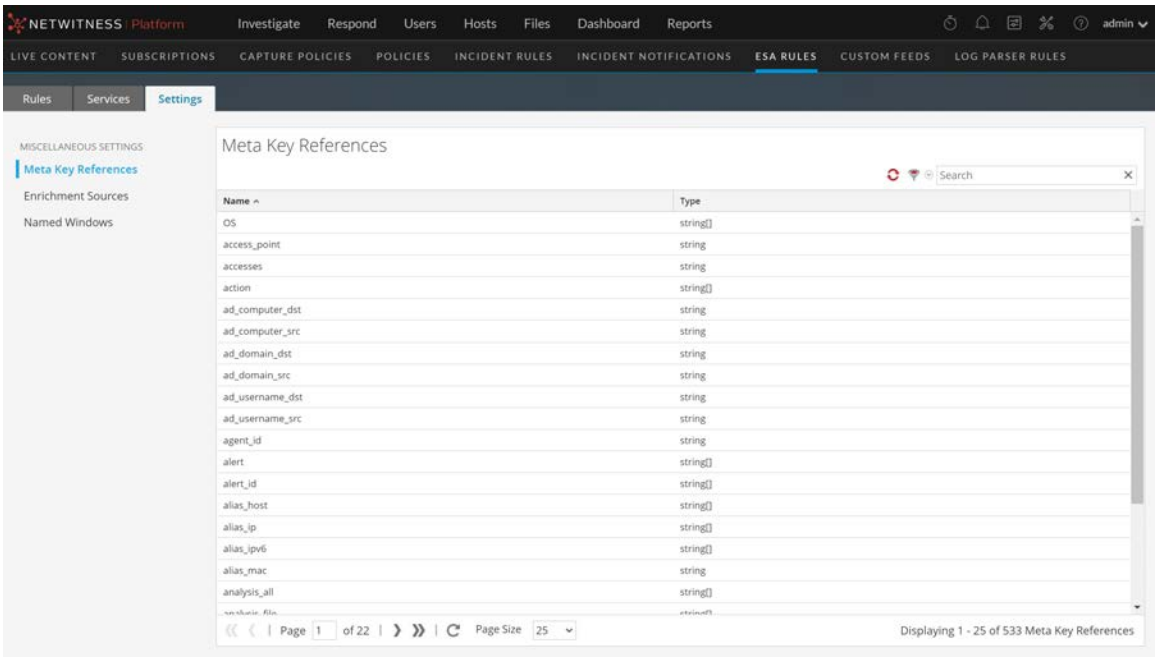
Parameters	Description
Enable	Enables a rule that was disabled.
Disable	Disables a rule that was enabled.
Health & Wellness link	Enables you to monitor overall memory usage and health of your ESA Correlation service.
Enabled	Indicates whether the rule is enabled or disabled. A green circle icon indicates that the rule is enabled. A white circle icon indicates that the rule is disabled. If a disabled rule has an error message, it shows in the Enabled field. Hover over the icon to view the error message tooltip. The following example shows that the rule was disabled because it exceeded the configured memory threshold for that rule. 
Name	Name of the ESA rule.
Rule Type	(This field applies to version 11.3 and later.) **Endpoint** indicates a rule from the Endpoint Risk Scoring Bundle and **Esper** indicates Esper-specific rules, such as Rule Builder and Advanced EPL rules.
Trial Rule	Indicates if the rule is running in trial rule mode.
Last Detected	The last time alert was triggered for the rule.
Events Matched	The total number of events that matched the rule.
Memory Usage	The total amount of memory used by the rule. **Note:** The Endpoint Risk Scoring Rules Bundle rules do not show memory usage.
CPU %	The percentage of the deployment CPU used by the rule. For example, a deployment with 1 rule shows 100% CPU usage for that rule and a deployment with two equally CPU heavy rules show 50% each. (This field is available in version 11.5 and later.) **Note:** The Endpoint Risk Scoring Rules Bundle rules do not show CPU usage.

Settings Tab

This topic describes the components of the **(Configure) > ESA Rules > Settings** tab. In the Settings tab, you can perform the following tasks:

- MetaKey References
- Viewing the List of Meta Entities
- Enabling Meta Entity in the ESA Correlation Server
- Building Rules with Custom Meta Entities
- Configure a data enrichment source
- View Named Windows

What do you want to do?



Role	I want to ...	Show me how
Content Expert	Configure an in-memory table as an enrichment source. (Recurring In-Memory Tables are no longer supported in version 11.3 and later.)	Configure an In-Memory Table as an Enrichment Source
Content Expert	Configure a Context Hub list as an enrichment source.	Configure a Context Hub List as an Enrichment Source

Related Topics

- Add a Data Enrichment Source
- Rule Builder Tab

Quick Look

The following figure shows the Meta Key References section in the Settings tab.

Meta Key References

The Meta Key References section lists each Meta key used by the ESA Correlation server and the type of value the key requires.

Meta key entities are configured to be a part of Event Schema. After you upgrade from NetWitness® Platform 11.5, or previous releases to NetWitness® Platform 11.6, you can enable the string [] meta keys entities. You can create rules and configure alerts based on the meta key entities that you select. You can also add meta entities to create rules. The meta entities retrieves data from the data sources to trigger alerts.

Note: Only the meta keys comprising of string [] are supported.

Viewing the List of Meta Entities

Perform the following steps to view the list of meta entities that are available in the system:

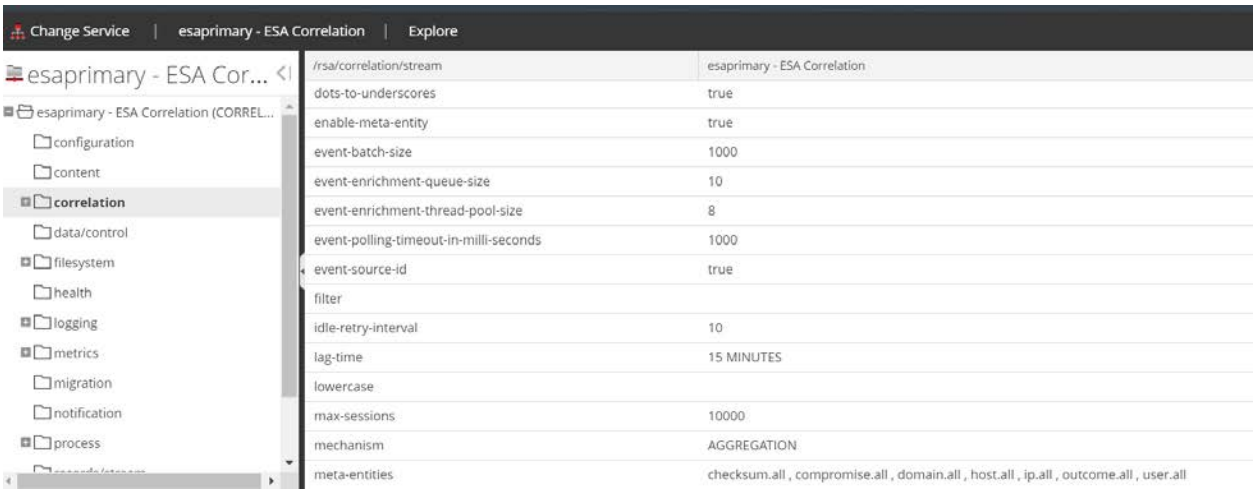
1. Go to (Configure) > **ESA RULES** > **Settings** > **Meta Key References**.

The Meta Key References page displays all the meta keys that are enabled.

2. Enter the name of the meta key in the Search text box to view specific meta entities.

Enabling Meta Entity in the ESA Correlation Server

After an upgrade to NetWitness 11.6 or later, you need to enable the meta entities in the ESA Correlation server to create rules and configure alerts based on the meta key entities.



To enable meta entities in the ESA Correlation server:

1. Click (Admin) **Admin** > **Services**.

2. In the Services view, select the ESA Correlation service.

3. Click the settings icon and go to **View** > **Explore**.

The ESA Correlation Configuration page lists all the services.

4. Click **enable-meta-entity** and set it to **true**.

Note: By default, **enable-meta-entity** is set to **false**. Ensure that you enable only the specific meta entitiy using which you want to build a rule. Enabling multiple meta entities affects the system performance.

5. Add custom meta entities by appending or editing the meta-entities field values under explore view.

In the Explore view node list for the ESA Correlation service, select **Correlation** > **Stream**.All the stream settings are listed. You can add custom meta entities to the list as per the requirement. Once you enable custom meta entities, you can view them under Meta Key References. Once you enable the custom meta key entities, the rules will start evaluating the meta key entities and start to evaluate and trigger alerts as per the configured conditions. For more information, see Viewing the List of Meta Entities

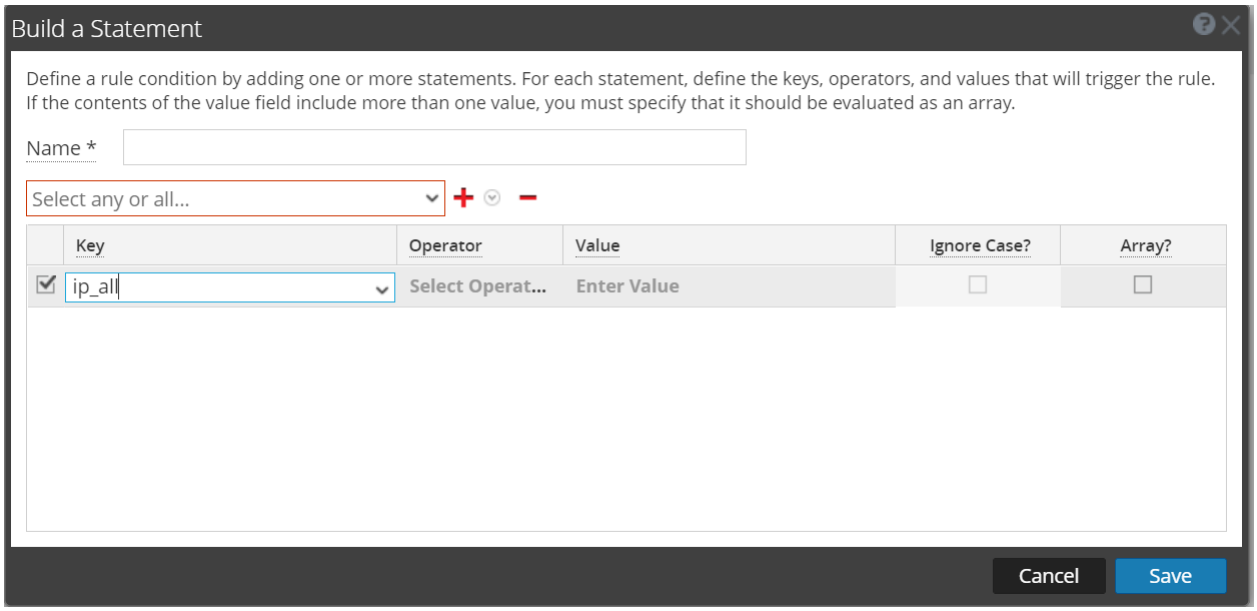
The following meta entities are listed in the ESA Correlation Configuration page:

- checksum.all
- compromise.all
- domain.all
- host.all
- ip.all
- outcome.all
- user.all

Meta Entity Usage Example

ip_all, and *host_all* are some of the examples of meta entities.

For example, the *ip_all* meta entity can be used to check for any malicious IPs. It combines all the IPv4 meta keys (*ip_src*,*alias_ip*, *ip_dst*, and *forward_ip*) and creates a string array to retrieve information and trigger alerts.



Note: You can add and enable custom meta entities (string arrays) to the list.

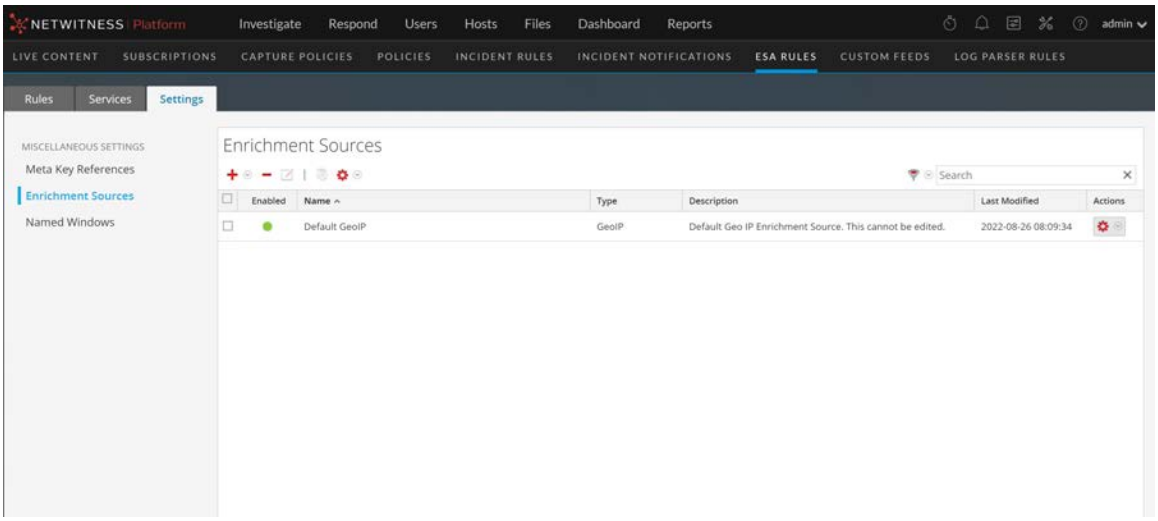
Building Rules with Custom Meta Entities

This topic provides instructions to define rule criteria in Rule Builder by adding statements. A statement is a logical grouping of rule criteria in the Rule Builder. You add statements to define what a rule detects.

The following graphic shows an example of a Rule Builder statement using meta entities.

Every statement contains a key and value. Then, you build logic around the pair by selecting an option in each other field.

Prerequisites



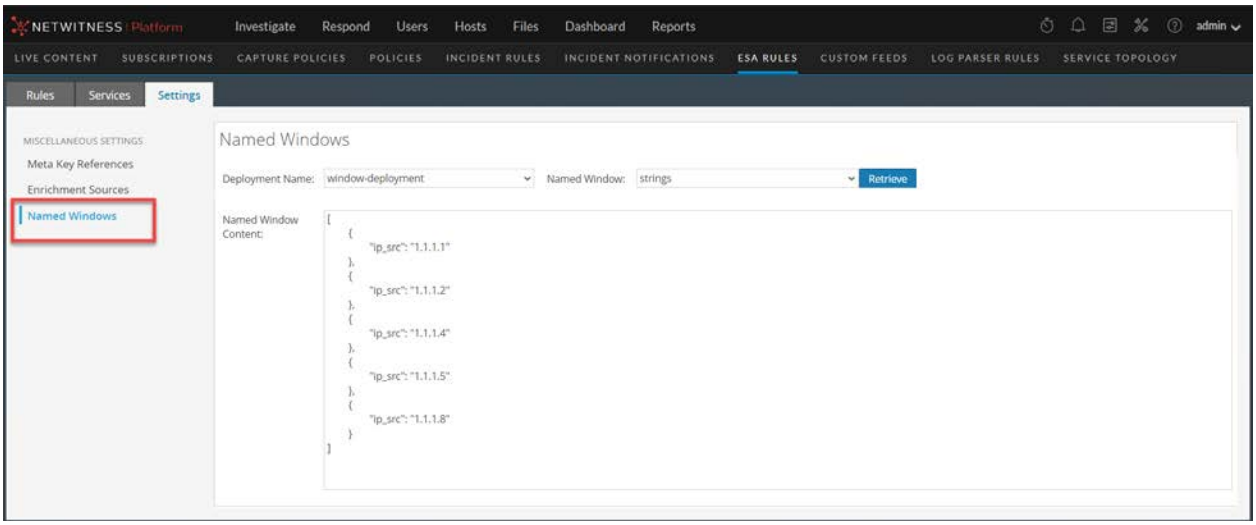
To build a rule statement, you must know the meta key and the meta value. For a complete list of meta keys, go to (Configure) > **ESA Rules** > **Settings** > **Meta Key References**.For more information about building rules with meta entities, see Rule Builder Tab.

Enrichment Sources

In the Enrichment Sources section, you can use the following external data sources:

- GeoIP
- In-Memory Table (Add hoc only - Recurring In-Memory Tables are no longer supported in version 11.3 and later.)
- Context Hub

The following figure shows the Enrichment Sources section in the Settings tab.



View Named Windows

The ESA Esper processing model is continuous, helps in storing the data from the consumed sessions in the form of named windows based on the deployed ESA rule.

From 12.0 and later, you can view the contents of the windows of a particular named window using the named window settings tab.

The following figure shows the Named Windows section in the Settings tab.

Perform the following steps to view the list of named windows that are available in the system:

1. Go to **Configure** > **ESA RULES** > **Settings** > **Named Windows**.
2. Select a deployment name from the **Deployment Name** drop-down list.
3. Select a named window from the **Named Window** drop-down list.
4. Click **Retrieve**.

Introduction to Endpoint Agent Installation

Note: The information in this guide applies to Version 11.1 and later.

Hosts can be laptops, workstations, servers, physical or virtual, where a supported operating system is installed. An Endpoint Agent can be deployed on a host with either a Windows, Mac, or Linux operating system. The installation process involves:

1. (Optional) Configuring the Relay Server

Note: You must set up the default relay server before generating the Agent packager. Whenever the Relay server configuration is modified, agent policy is updated automatically. For more information on configuring the relay server, see *Endpoint Configuration Guide*.

2. Generating an agent packager
3. Generating the agent installer

You can run the agent installer specific to your operating system to deploy agents on the hosts. The agents collect endpoint data and tracking events from these hosts. It monitors key behaviors related to process, file, registry, console, and network, and forwards them as events to the Endpoint Server over HTTPs.

Note: The Endpoint agent can operate either in Insights or Advanced mode depending on the policy configuration. For more information, see the *NetWitness Endpoint Configuration Guide*.

Supported Operating Systems

Note: From version 12.0 and higher, NetWitness Endpoint agents run on ARM devices running on Windows 10 and 11.

Windows	Linux *(The agent software runs only on x86_64 architecture)*	macOS
Windows 11 (up to version 22H2)	CentOS 7.x and 8.x	macOS Sonoma (14) **Note:** For more information on how to enable Process Events tracking on macOS 14, see Enable Process Events Tracking on macOS 14.
Windows 10 Kiosk Mode (64-bit)	Red Hat Enterprise Linux 7.x, 8.x, and 9.x	macOS Ventura (13)
Windows 10 (32 and 64-bit) (up to version 22H2)	SUSE Linux Enterprise Server 12 SP1, 12 SP3, 12 SP4, 12 SP5, 15 SP1, and 15 SP4	macOS Monterey (12)
Windows 8.1 (32 and 64-bit)	Ubuntu 16.04 LTS, 18.04 LTS, and 20.04 LTS	macOS Big Sur (11)
Windows 8 (32 and 64-bit)	Oracle Linux 8.8	macOS Catalina (10.15)
Windows 7 (32 and 64-bit)	Alma Linux 9.0	macOS Mojave (10.14)
Windows Server 2022 Windows Server 2022 Core		macOS High Sierra (10.13)
Windows Server 2019 Windows Server 2019 Core		macOS Sierra (10.12)
Windows Server 2016		OS X El Capitan (10.11)
Windows Server 2012 R2		OS X Yosemite (10.10)
Windows Server 2012		OS X Mavericks (10.9)
Windows Server 2008 R2 (32 and 64-bit)		

Hardware Requirements

The minimum requirements for installing, uninstalling, and upgrading the agent comply with the specific operating system requirements.

Enable Process Events Tracking on macOS 14

You can track Process events on macOS 14 after enabling audit control in your machine.

To enable Process events tracking on macOS 14

Note: The steps 1 and 4 are applicable to you only if the agent is installed and running on your machine. If the agent is not installed on your machine, skip the steps 1 and 4 and perform only the steps 2, 3, and 5.

1. Stop NetWitness agent by running the following command.

   ```
   sudo launchctl unload /Library/LaunchDaemons/com.rsa.nwe.agent.daemon.plist
   ```

2. Copy the audit service template config file to create a new config by running the following command.

   ```
   sudo cp /etc/security/audit_control.example /etc/security/audit_control
   ```

3. Enable auditd service by running the following command.

   ```
   sudo launchctl enable system/com.apple.auditd
   ```

4. Enable NetWitness agent by running the following command.

   ```
   sudo launchctl load /Library/LaunchDaemons/com.rsa.nwe.agent.daemon.plist
   ```

5. Reboot the system.

Disable Process Events Tracking on macOS 14

You can disable Process events tracking in your macOS 14 by disabling the already enabled audit control.

To disable Process events tracking on macOS 14

1. Stop NetWitness agent by running the following command.

   ```
   sudo launchctl unload /Library/LaunchDaemons/com.rsa.nwe.agent.daemon.plist
   ```

2. Disable auditd service by running the following command.

   ```
   sudo launchctl disable system/com.apple.auditd
   ```

3. Remove the audit service config file by running the following command.

   ```
   sudo rm /etc/security/audit_control
   ```

4. Enable NetWitness agent by running the following command.

   ```
   sudo launchctl load /Library/LaunchDaemons/com.rsa.nwe.agent.daemon.plist
   ```

5. Reboot the system.

Installation Flowchart

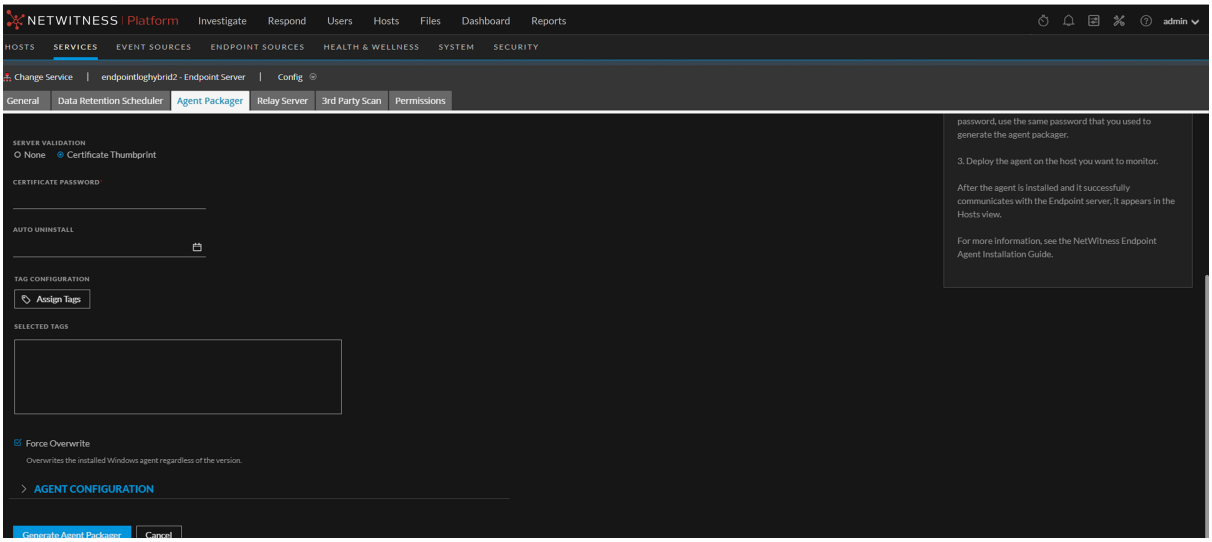
The following flowchart illustrates the Endpoint agent installation process:

Prerequisites

- Install NetWitness. For more information, see the *Physical Host Installation Guide* or *Virtual Host Installation Guide*.
- Install NetWitness Endpoint Log Hybrid. For more information, see the *Physical Host Installation Guide* or *Virtual Host Installation Guide*.
- Deploy ESA Rules from the Endpoint Rule Bundle. For more information, see *ESA Configuration Guide*.
- Configure Endpoint Metadata forwarding. For more information, see *NetWitness Endpoint Configuration Guide*.
- Review the default policies and create groups to manage your agents. For more information, see *NetWitness Endpoint Configuration Guide*.
- Configure your RSA Live account and make sure the File Reputation service is enabled. For more information, see *Live Services Management Guide*.
- To migrate an existing NetWitness Endpoint 4.4.0.x to NetWitness Platform 11.5 and later, see https://community.netwitness.com/t5/netwitness-platform-online/migrating-netwitness-endpoint-4-4-0-x-to-netwitness-platform/ta-p/669090 to import the NetWitness Endpoint 4.4.0.x configurations (file status, certificate status and blocked hashes).

Note: If you are upgrading, make sure that you deploy the latest Endpoint application rules from RSA Live. For more information, see *Live Services Management Guide*.

Generate an Endpoint Agent Packager



To generate an agent packager to collect endpoint data from hosts:

1. Log in to NetWitness.

   Type `https://<NW-Server-IP-Address>/login` in your browser to get to the NetWitness Login screen.

2. Click  **(Admin) > Services**.

3. Select the **Endpoint Server** service and click  **> View > Config > Agent Packager** tab.
   The Agent Packager tab is displayed.

4. Enter the values in the following fields:

Field	Description
Endpoint Server	Displays all the available Endpoint servers in the deployed.
Endpoint Server Forwarder (Optional)	The optional Endpoint Server Forwarder allows you to enter an alternative Fully Qualified Domain Name (FQDN) or IP address on which the sever can be reached in the case that agents need to go through a NAT or similar in order to reach the Endpoint Server. If specified forwarder is not available, agent will eventually fall back to the packaged address.
HTTPS Port	Port number. For example, 443.
Server Validation	Determines how the agent validates the Endpoint Server certificate: • None – The agent will not validate the server certificate. • Certificate Thumbprint – default selection. The agent identifies the server by validating the thumbprint of the Root CA of the server certificate.
Certificate Password	Password used to download the packager. The same password is used while generating the agent installer. **Note:** The password must be minimum seven characters long and a combination of uppercase and lowercase letters, numbers, and special characters. For example, **Admin@123**.
Auto Uninstall	Date and time the agent automatically uninstalls. You can leave it blank if not required.
Tag Configuration	When you click **Assign Tags** under Tag Configuration, you can do any of the following: • Create new tags and assign them to the hosts. • Select already existing tags and assign them to the hosts. For more information, see Investigate Hosts.
Force Overwrite	Overwrites the installed Windows agent regardless of the version. If this option is not selected, the same installer can be run multiple times on a system, but installs the agent only once. If you enable this option, make sure that you provide the same service name and driver service name as the previously installed agent, while creating a new agent. **Note:** If you want to force overwrite with MSI, run the following command: `msiexec /fvam <msifilename.msi>` After you move an agent from one deployment to another, using Force Overwrite to change the agent incurs an 8-hour delay in communication between the agent and its Endpoint Server on the new deployment. To eliminate the delay, uninstall the agent from the old deployment, and reinstall the agent on the new deployment.

Field	Description
Agent Configuration	
Note: The following Service and Driver fields are applicable only for Windows.	
Service	
Service Name	Name of the agent service. For example, NWEAgent.
Display Name	Display name of the agent service. For example, NWE Agent.
Description	Description of the agent service. For example, NetWitness Endpoint.
Driver	
Driver Service Name	Name of the driver service. For example, NWEDriver.
Driver Display Name	Display name of the driver service. For example, NWE Driver.
Driver Description	Description of the driver service. For example, NetWitness Endpoint Driver.
Generate Agent	Generates an agent packager.

5. Click **Generate Agent**.

   This downloads an agent packager (**AgentPackager.zip**) on the host where you are accessing the NetWitness user interface.

Generate Endpoint Agent Installers

To generate endpoint agent installers to deploy on hosts:

Note: Use a Windows machine to execute the agent packager file.

1. Unzip the **AgentPackager.zip** file. It includes the following:
   - **agents** folder – Contains executables for Linux, Mac, and Windows.
   - **config** folder – Contains configuration file and the certificates required to communicate between the Endpoint Server and the agent.
   - **AgentPackager.exe** file.
2. Run the **AgentPackager.exe** file as administrator by right-clicking the file and selecting **Run as administrator**.
3. Enter the same password used while generating the agent packager and press **Enter**.
   This creates the following installers in the root folder:
   - nwe-agent-package.exe (for Windows)
   - NWE000032.msi (for Windows 32-bit)
   - NWE000064.msi (for Windows 64-bit)
   - NWE00Aa64.msi (for ARM based Windows 64-bit)
   - nwe-agent.pkg (for Mac)
   - nwe-agent.x86_64.rpm (for RPM based Linux 64-bit)
   - nwe-agent.x86_64.deb (for Debian based Linux 64-bit)

   Note: The MSI files should not be renamed.

Deploy and Verify Endpoint Agents

This section provides instruction on how to deploy and verify agents.

Note: By default, the agent is installed in the Insights mode. Depending on the policy assigned, the agent can operate in Insights or Advanced mode. Make sure you review the policy before deploying the agent. For more information, see *NetWitness Endpoint Configuration Guide*.

Deploying Agents (Windows)

To deploy the agent, run the **nwe-agent-package.exe** file on the hosts you want to monitor.

Verifying Windows Agents

After deploying the Windows agents, you can verify if a Windows agent is running by using any of the following methods:

- Using the NetWitness UI

  The Hosts view contains the list of all hosts with an agent. You can look for the host name on which the agent is installed.

  Note: Click **Hosts** or press F5 to refresh the list for latest data.

- Using Task Manager

  Open Task Manager and look for service name that you configured while generating the agent packager on the host machine.

- Using Services.msc

  Open `Services.msc` in run and look for the service name that you configured while generating the agent packager on the host machine.

Deploying Agent (Linux)

To deploy the agent on the hosts you want to monitor:

RPM based Linux

Run the **nwe-agent.x86_64.rpm** (for 64-bit) file. To run the command, open Terminal on the Linux machine and run the following command as `root`:

```
rpm -iv <installer file name>.rpm
```

For example, using the default installer file name, you can enter the following command:

`rpm -iv nwe-agent.x86_64.rpm` (for x86_64 architecture)

Note: To upgrade RPM based Linux agents, run **rpm -Uvh nwe-agent.x86_64.rpm**.

Debian based Linux

Run the **nwe-agent.x86_64.deb** (for 64-bit) file. To run the command, open Terminal on the Linux machine and run the following command as `root`:

```
dpkg -i <installer file name>.deb
```

For example, using the default installer file name, you can enter the following command:

`dpkg -i nwe-agent.x86_64.deb` (for x86_64 architecture)

(Enter the administrator password when prompted.)

Note: To upgrade Debian based Linux agents, run **dpkg -i nwe-agent.x86_64.deb**.

Verifying Linux Agents

After deploying the Linux agents, you can verify if a Linux agent is running by using any of the following methods:

- Using the NetWitness UI

  The Hosts view contains the list of all hosts with an agent.

  Note: Click **Hosts** or press F5 to refresh the list for latest data.

- Using Command Line

  Run the following command to get the PID:

  ```
  pgrep nwe-agent
  ```

- To check the NetWitness Endpoint version, run the following command:

  ```
  cat /opt/rsa/nwe-agent/config/nwe-agent.config | grep version
  ```

Deploying Agent (Mac)

To deploy the agent, run the `nwe-agent.pkg` file on the hosts you want to monitor. On macOS version Catalina (10.15) and higher, you need to move the `nwe-agent.pkg` file to a folder with sufficient access privileges (e.g., `/tmp`) and install the agent from there.

Verifying Mac Agents

After deploying the Mac agents, you can verify if a Mac agent is running by using any of the following methods:

- Using the NetWitness UI

  The Hosts view contains the list of all hosts with an agent.

  Note: Click **Hosts** or press F5 to refresh the list for the latest data.

- Using Activity Monitor

  Open Activity Monitor (/Applications/Utilities/Activity Monitor.app) and look for NWEAgent.
- Using Command Line

  Run the following command to get the PID

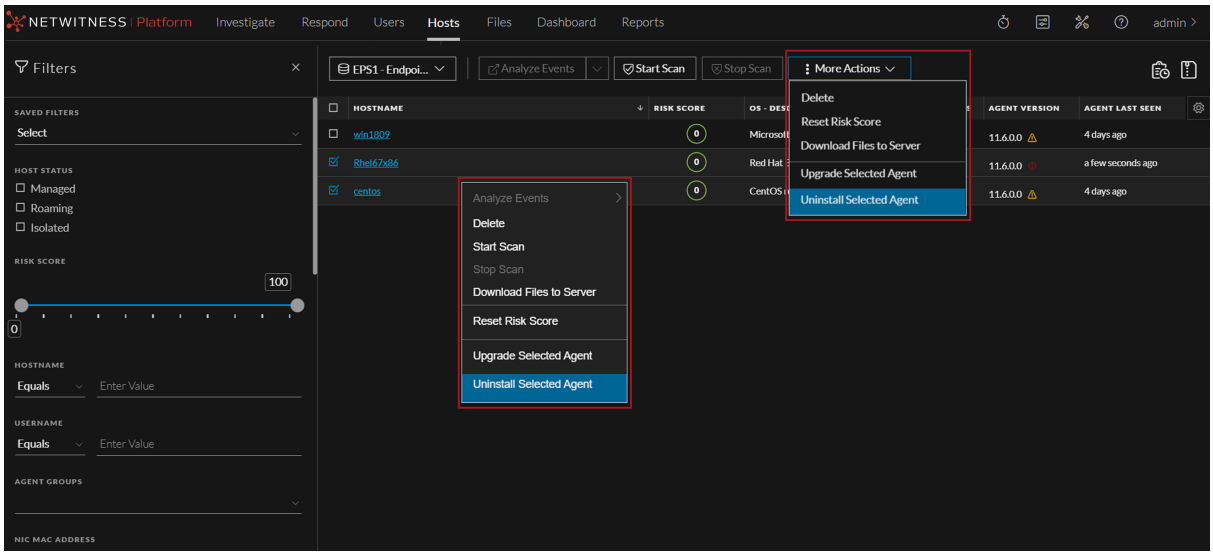
  ```
  pgrep NWEAgent
  ```
- To check the NetWitness Endpoint version, run the command:

  ```
  grep a /var/log/NWEAgent.log | grep NWEAgent | grep Version
  ```

Uninstall Agents

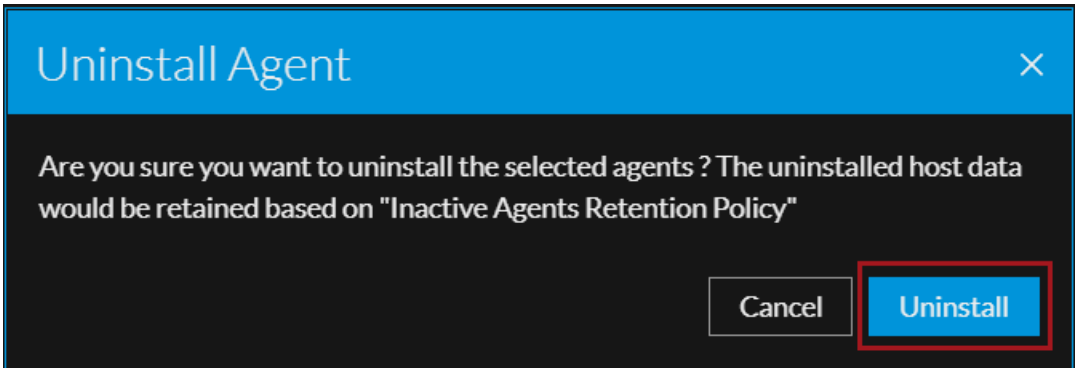
You can use one of the following methods to uninstall Endpoint agents. Select a method based on your current Endpoint agent version.

- Uninstalling Agent using UI (Supported from agent version 11.5.1 and later)
- Uninstalling Agent Manually



Uninstalling Agent using UI (Supported from agent version 11.5.1 and later)

Note: To uninstall an agent using UI, the agent must be a managed agent with version 11.5.1 or later.

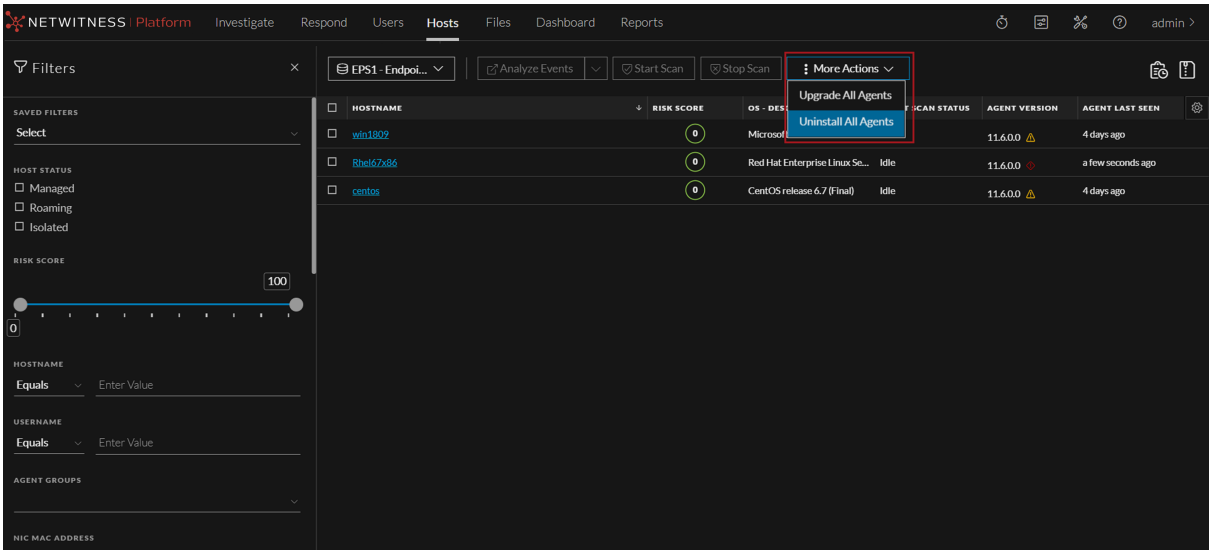


You can uninstall agent using UI by going to **Hosts** and performing one of the following options.

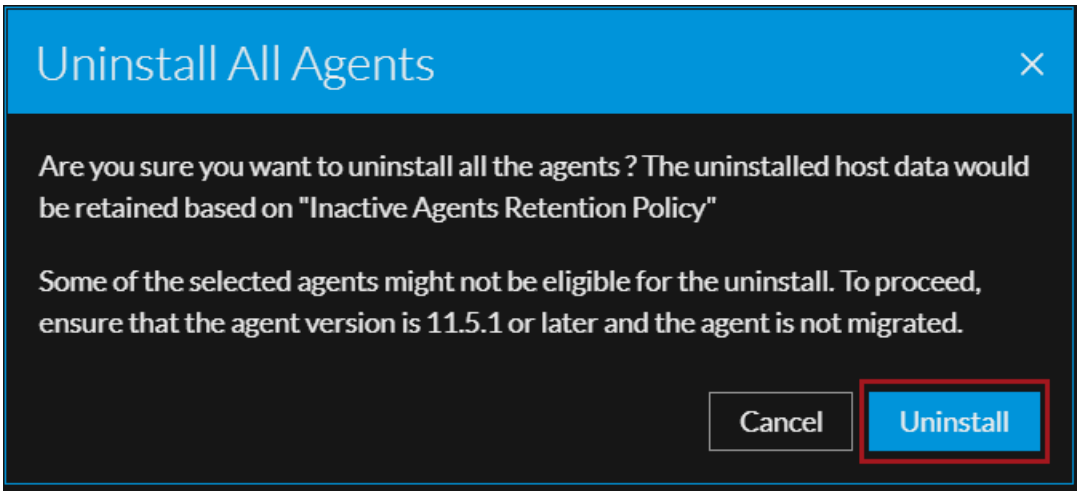
Uninstall one or more agents from Hosts view

1. Select one or more hosts from which you want to uninstall the agents.
2. Selected **More Actions > Uninstall Selected Agent** from the toolbar.

3. In the **Uninstall Agent** dialog, click **Uninstall.**



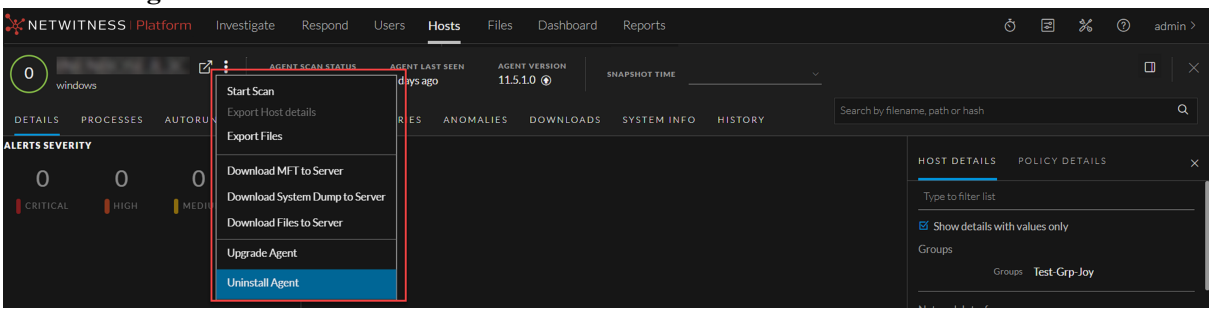
Uninstall all the agents from Hosts view



Note: Uninstall All Agents via UI is also supported for Broker service.

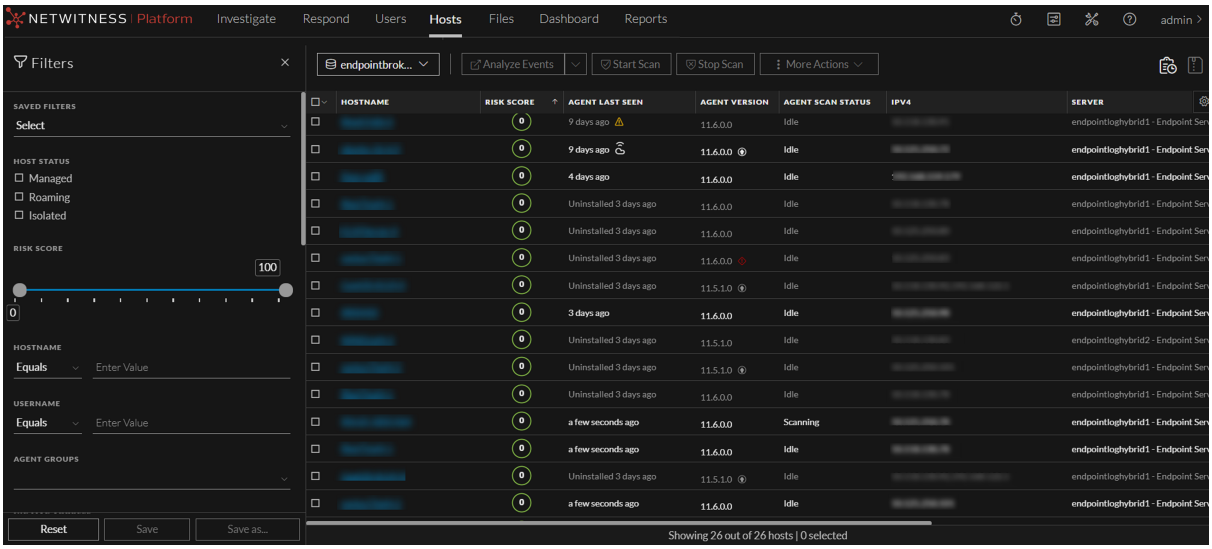
1. Select **More Actions > Uninstall All Agents** from the toolbar.

Note: For the uninstall all agents option, you do not need to select the hosts. **Upgrade All Agents** / **Uninstall All Agents** are the default options on the More Actions drop-down. If you select one or more hosts, the More Actions drop-down shows Upgrade Selected Agent / Uninstall Selected Agent as the available options.



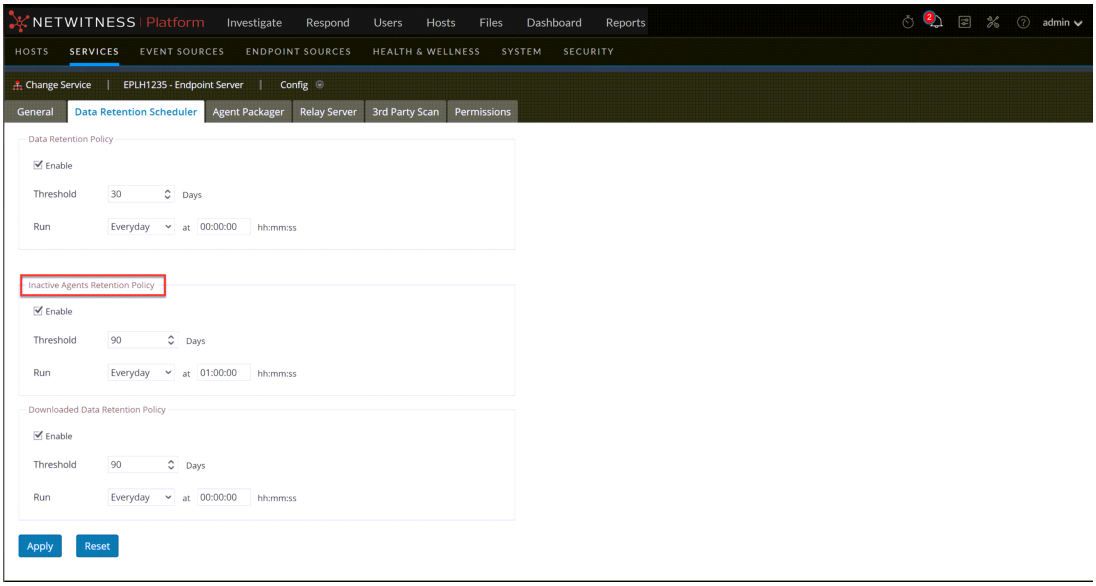
2. In the **Uninstall All Agents** dialog, click **Uninstall.**

Note: Uninstall All Agents process will require more time to complete depending upon the number of agents selected based on the filters applied.



Uninstall an agent from Host details view

1. Select the hostname to open the host details, click ⋮ (**More Actions**) beside the hostname, and select **Uninstall Agent**.



2. In the **Uninstall Agent** dialog, click **Uninstall.**

3. After the agent is uninstalled, **Agent Last Seen** is updated and the host is grayed out in the **Hosts** view.

Note: Once an agent is uninstalled, only **Delete** and **Analyze Events** actions can be performed on it.

IMPORTANT: If you are uninstalling agent using UI, the uninstalled host data would be retained based on **Inactive Agents Retention Policy.**

Uninstalling Agent Manually

Uninstalling Windows Agent

Run the following command as administrator:

```
msiexec /x{63AC4523-5F19-42F0-BC43-97C8B5373589}
```

Uninstalling Linux Agent

For RPM based Linux, run the following command as root:

```
rpm –ev nwe-agent
```

For Debian based Linux, run the following command as root:

```
dpkg -r nwe-agent
```

Uninstalling Mac Agent

Run the following commands:

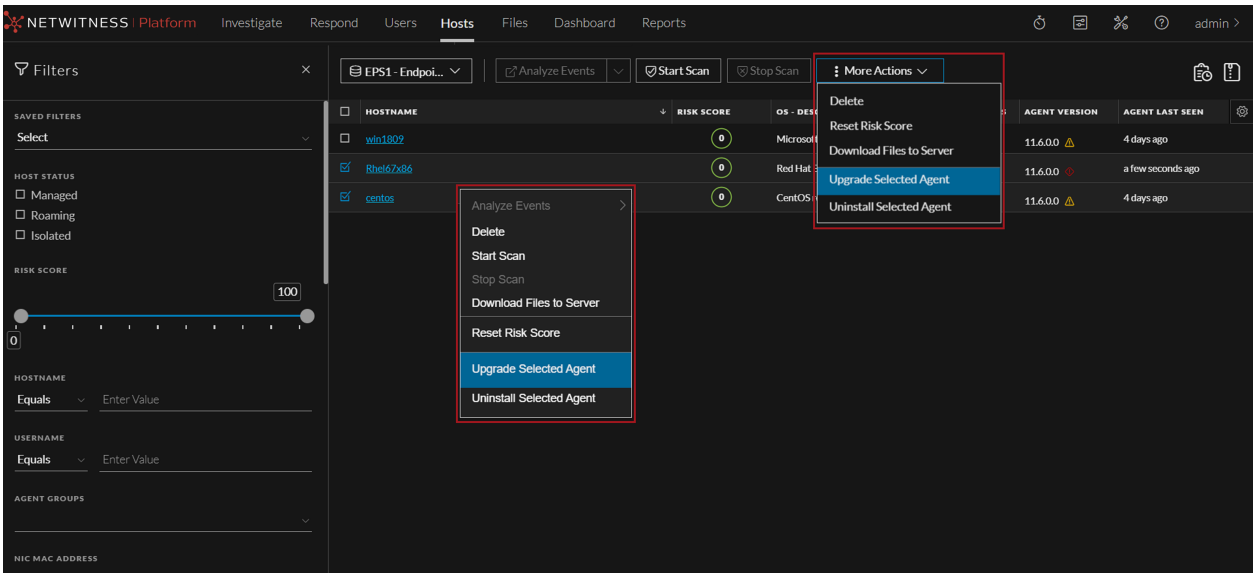
1. `sudo launchctl unload /Library/LaunchDaemons/com.rsa.nwe.agent.daemon.plist`
2. `sudo rm -Rf /usr/local/nwe`
3. `sudo rm -Rf '/Library/Application Support/NWE'`
4. `sudo rm –Rf /Library/LaunchDaemons/com.rsa.nwe.agent.daemon.plist`
5. `sudo pkgutil --forget com.rsa.pkg.nwe`

Upgrade Agents

You can use one of the following methods to upgrade Endpoint agents. Select a method based on your current Endpoint agent version. If you have upgraded the endpoint server recently, you must restart it to see **Upgrade Selected Agent** and **Upgrade All Agents** options on the UI.

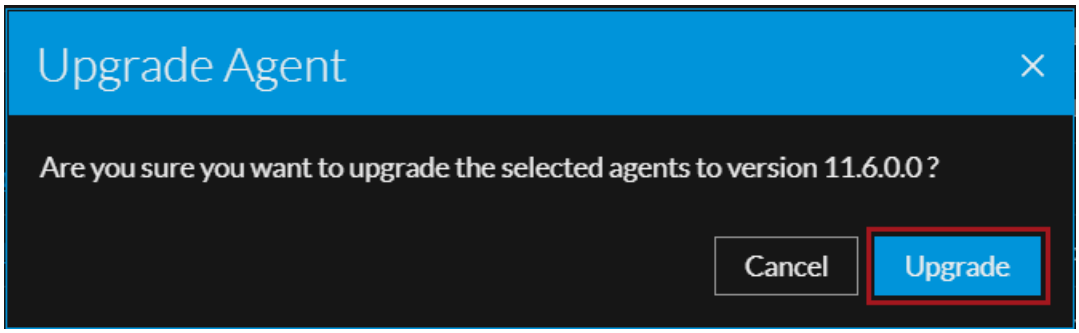
- Upgrading 11.5.1 or Later Agents Versions Using UI
- Upgrading 11.3.x or Later Agents Versions

Upgrading 11.5.1 or Later Agents Versions Using UI



Note: To upgrade agent from UI, ensure the service user account has both `endpoint-server.agentupdate.manage` and `endpoint-server.ca.manage` permissions. For more information on how to assign roles and permissions, see "Add a Role and Assign Permissions" in the *System Security and User Management Guide*.

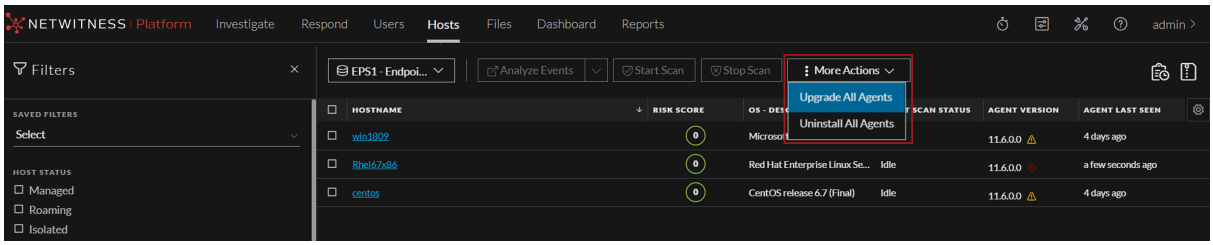
From 11.6, you can upgrade the Endpoint agents using the UI. Agent version must be 11.5.1 or later to upgrade using the UI.



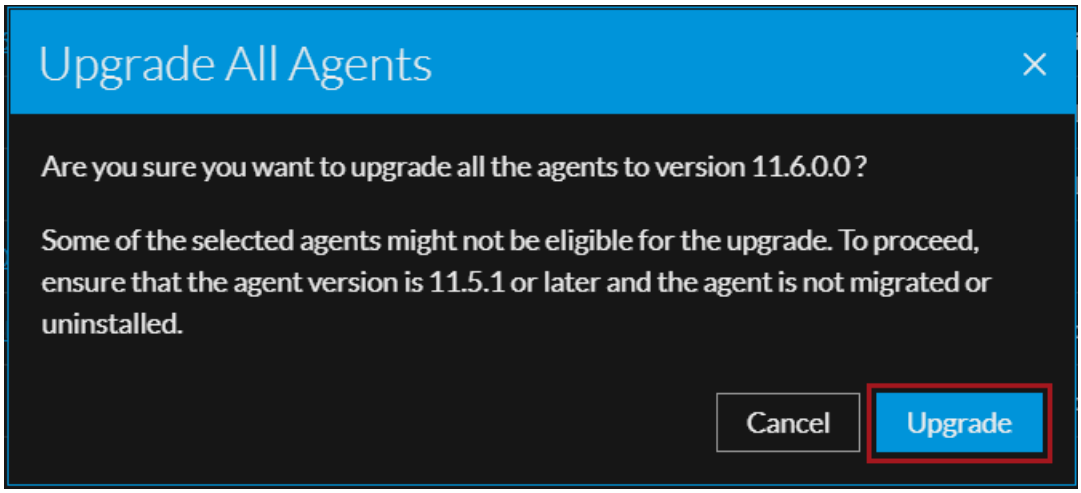
You can upgrade agents using UI by going to **Hosts** and performing one of the following options.

Upgrade one or more agents from Hosts view

1. Select one or more hosts and select **More Actions > Upgrade Selected Agent**



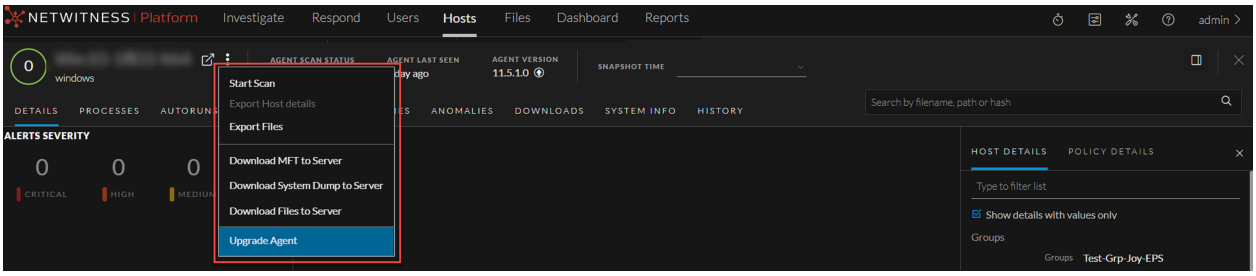
2. In the **Upgrade Agent** dialog, click **Upgrade**.



Upgrade all agents from Hosts view

1. Select **More Actions > Upgrade All Agents** from the toolbar, to perform bulk agent upgrade.

Note: For the upgrade all agents option, you do not need to select the hosts. **Upgrade All Agents** / **Uninstall All Agents** are the default options on the More Actions drop-down. When you select one or more hosts, the More Actions drop-down shows Upgrade Selected Agent / Uninstall Selected Agent as the available options.



2. In the **Upgrade All Agents** dialog, click **Upgrade**.

Note: Upgrade All Agents process will require more time to complete, depending upon the number of agents selected based on the filters applied.

Upgrade an agent from Hosts details page

Select the hostname to open the host details, click ⋮ (**More Actions**) beside the hostname, and select **Upgrade Agent**.

1. In the **Upgrade Agent** dialog, click **Upgrade**.

Note: To upgrade an agent using UI, the agent must be a managed agent with version 11.5.1 or later.

The following upgrade status icons are displayed in the **Agent Version** column.

Icons	Upgrade Status	Description
	Upgrade Available	An agent upgrade is available.
	Agent Upgrade Pending	The agent has not yet received the upgrade command.
	In Progress	The agent is being upgraded.
	Failed	Agent upgrade failed. View details in the agent history page.
No Icon	No Upgrade Available	No upgrade available for the agent. Refer to agent eligibility.

You can view the list of commands issued to the agents (by the server or actions performed by any analyst) in the Host view and Host details. By default, commands are sorted based on the command time.

To view the commands:

1. Go to **Hosts**.
2. Do any one of the following,

   - To view all commands, click . You can also filter commands.
     The Agent History view is displayed.
   - To view commands specific to a particular host:
     - Click the host for which you want to view the commands.
     - In the Host details view, click **History** tab. You can also filter commands.
       The History view is displayed.

For more information on Agent History, see the "Investigating Hosts" topic in the *NetWitness Endpoint User Guide*.

Upgrading 11.3.x or Later Agents Versions

You can upgrade the 11.3.x and later versions of Endpoint agent to 11.6 or later.

Note: In a multi-server Endpoint deployment, during an agent upgrade, make sure that the correct Endpoint server is mentioned in the respective agent policy. In case the agent uses the default policy, ensure to use the agent packager downloaded from the respective Endpoint server to which it is communicating. Using Agent packager from different Endpoint server for agent upgrade will result in migrating the agents to another Endpoint server.

Note: For a subsequent installation or upgrade, use the same service and driver service name.

To upgrade from 11.3.x and later, download the 11.6 agent packager, deploy and verify agents. For more information, see Generate an Endpoint Agent Packager and Deploy and Verify Endpoint Agents.

Upgrade from 4.4.0.9 and 4.4.1.x is supported only for version 11.3. For more information, see *NetWitness Endpoint 4.4.1.x to NetWitness Platform 11.3 Migration Guide*.

To upgrade an agent from 4.4.0.x to 11.6, uninstall the agent and perform a fresh installation.

Recommendations for Installing Agents in Virtual Desktop Infrastructure (VDI) Environment

Agent ID is generated based on various parameters, such as security identifier (SID) and SMBIOS Universal Unique Identifier (UUID). A SMBIOS UUID is a 128-bit number used to uniquely identify a host.

Note: While cloning the VDI image where an agent is already installed, the agent ID automatically changes for Windows and Mac agents if `uuid.action = keep` is not set in the .vmx file. For more information, see Configure a Virtual Machine to change the UUID.
For Linux agents, the agent ID does not change automatically on VDI clone.

When you clone a VDI image:

- If you do not change the agent ID for each VDI clone, make sure that the SMBIOS UUID remains the same.
- If you change the agent ID for each VDI clone, make sure that the SMBIOS UUID is also changed.

To avoid duplication of agent IDs, make sure that the SMBIOS UUID changes on the following VDIs:

- Citrix XenServer
- VMWare Workstation
- VMware vCloud Director

  For more information, see VMware Knowledge Base.
- vCenter hosted ESXi Server

To get the SMBIOS UUID on a Windows virtual host, execute the following command:

```
wmic csproduct get UUID
```

Troubleshooting

This section provides information about possible issues when using the NetWitness Endpoint.

Packager Issue

Issue	Failed to generate the agent installers.
Explanation	Some encryption software may create additional files that fails to generate the agent installers.
Resolution	Copy the packager to a machine that does not have antivirus or encryption software and then generate the agent installers.

Issue	Failed to generate agent installers for MAC.
Explanation	Agent packager `AgentPackager.exe` fails to generate MAC agent installer (`nwe-agent.pkg`) with the error message "Failed to generate table of content for package" or "Failed to create config file C:\AgentPackager (4)\agents\mac\Plugins\NWEInstallerPlugin.bundle\Contents\Resources\config.cfg".
Resolution	Run the `AgentPackager.exe` as administrator by right-clicking the file and selecting **Run as Administrator**.

Issue	Agent packager generates temporary agent installers for MAC.
Explanation	Agent packager `AgentPackager.exe` generates MAC agent installer as `nwe-agent_tmp.pkg` instead of `nwe-agent.pkg`.
Resolution	Run the `AgentPackager.exe` as administrator by right-clicking the file and selecting **Run as Administrator**. The MAC agent package `nwe-agent.pkg` will be generated as expected

Agent Upgrade via UI Issues

Issue	Agent upgrade not available.
Explanation	1. The agent version might not be supported for upgrade from UI. Agent version has to be 11.5.1 or later for upgrade via UI. 2. Logged in user may not have appropriate permission for upgrade from UI. 3. Agent version is up-to date.
Resolution	1. Use the manual upgrade method for upgrading the version.

	2. Use admin user which have following permissions, endpoint-server.agentupdate.manage and endpoint-server.ca.manage. 3. No upgrade required. Agent version is already up-to date and no further upgrade is available.

Issue	Agent upgrade is in Pending state.
Explanation	The hosts for which the command is shown in pending could be in offline or inactive state.
Resolution	Ensure Hosts/agents are communicating with Endpoint server directly or via Relay server for it to receive the upgrade command from server. Verify "Agent Last seen" time in Host listing page.

Issue	Agent upgrade failed.
Explanation	1. Agent upgrade fail with any of the following reasons: • Service Name or Driver name mismatch • Checksum mismatch • Installer size mismatch 2. Agent installer could not be created.
Resolution	1. Retry upgrading the agent. If it continues to fail, use the manual upgrade method. 2. Check the permissions for the user initiated the upgrade command. User can be viewed in **Host** > **Agent History** page. User should have following permissions, `endpoint-server.agentupdate.manage` and `endpoint-server.ca.manage`.

Issue	Linux agent upgrade fails with an error, sudo not found.
Resolution	Make sure that the sudo package is installed on the agent machine.

Agent Uninstall via UI Issues

Issue	Agent uninstalled failed.
Explanation	Agent uninstall fails due to several unknown reasons.
Resolution	1. Retry uninstalling the agent. 2. Use the manual uninstall method. For more information, see Uninstalling Agent Manually.

Events Tracking Issues

Issue	Process events cannot be tracked on macOS 14 agent machine.
Explanation	The audit() framework used to track process events is deprecated in macOS 11 and disabled by default in macOS 14. As a result, the process events cannot be tracked on macOS 14 agent machine.
Resolution	For workaround, see **Enable Process Events Tracking on macOS 14** section in Introduction to Endpoint Agent Installation.

NetWitness Endpoint

Note: The information in this topic applies to NetWitness Version 11.1 and later.

About NetWitness Endpoint

NetWitness Platform provides an endpoint detection and response solution that continuously monitors the behavior of all endpoints in and outside the network to provide deep visibility and analysis of executables and processes. It helps to detect new, unknown, and targeted attacks, highlights suspicious activity for investigation, exposes anomalous behaviors, and determines the scope of compromise to help analysts respond to advanced threats faster. During investigation, the analyst can use the visual indication of threat level to assess the risk of endpoints.

As part of this solution, NetWitness introduces **Endpoint Log Hybrid** that:

- Collects and manages endpoint (host) data from Windows, Mac, and Linux hosts.
- Collect log files and Windows logs from Windows hosts.
- Generates metadata to correlate endpoint data with sessions from other events sources, such as logs and network.

Analysts can:

- Perform instant scans for detailed insights of the host behavior at any point in time.
- Analyze the scope of the attack across hosts and network through integrated metadata.
- Quickly triage and focus their investigation by managing suspect and legitimate files.
- Perform multiple checks of file legitimacy to determine if a file is malicious, including checking file certificates and hashes.
- Blacklist malicious files and then block them across all hosts in the network to prevent future execution of this file on any host.
- Download Files, Master File Table (MFT), system dump, and process dump for forensic investigation.
- Isolate host from the network to safely investigate possible threats within the host.

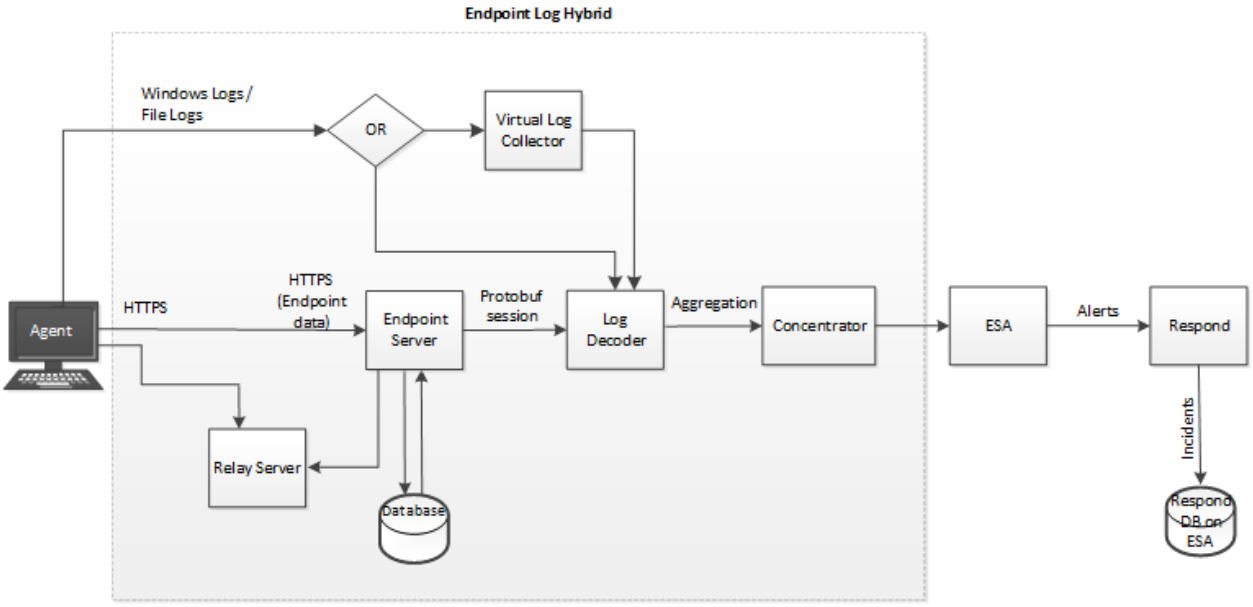
Endpoint Log Hybrid receives data from the Endpoint Agents. The following services run on the Endpoint Log Hybrid:

- **Endpoint Server**: Manages data received and stores it in a database. It parses the events, generates metadata, and forwards it to the Log Decoder through protobuf. You can deploy up to 6 Endpoint Log Hybrid hosts. For a consolidated view of all endpoint data from multiple Endpoint Log Hybrid hosts, install the Endpoint Broker. You can add only one broker in a NetWitness platform deployment which serves up to 6 Endpoint Log Hybrid hosts. Multiple Endpoint Log Hybrids are required to share certificates by copying them from the primary Endpoint Log Hybrid to the secondary Endpoint Log Hybrid using the `SCP` command.

  Note: You may need to install your Endpoint Server on separate hardware from your Log Decoder. If you are only using NW Platform for collecting and analysing logs, you can co-locate your Endpoint Server on the same physical hardware as your Log Decoder. For more information, see the Prepare Virtual or Cloud Storage topic in the *Storage Guide for NetWitness Platform*.

  If you exceed these guidelines, the amount of disk space usage and CPU might become so high as to create alarms for your Endpoint Server in Health and Wellness. If you notice this, and are running both log collection and EDR scans, you can use Throttling to control the amount of data coming into the Log Decoder.

  If that doesn't help, NetWitness recommends that you move your Endpoint Server onto separate hardware from that used by your Log Decoder.



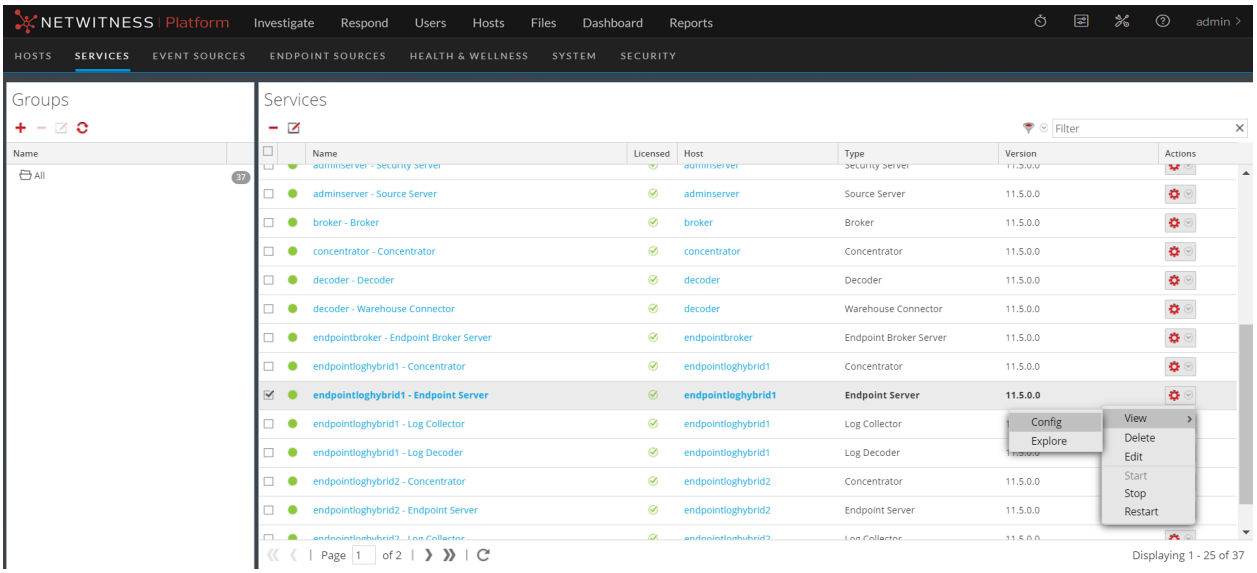
- **Log Decoder**: Captures data from the Endpoint Server and processes the metadata.
- **Concentrator**: Aggregates metadata from the Log Decoder and makes it available for all upstream components like Investigate, Reporting Engine, Respond, and Event Stream Analysis similar to NetWitness Decoder and Concentrator.
- **Log Collector**: Collects logs from all event sources that are supported for the log collection in the NetWitness Platform.

In addition to the above services, the Endpoint Log Hybrid leverages the following services:

- **Event Stream Analysis (ESA)**: Creates alerts from ESA rules for Endpoint data.
- **Endpoint Broker**: Provides a consolidated view of all Endpoint servers in a multiple Endpoint Log Hybrid deployment.

Endpoint Agent Data Flow

The following figure shows the endpoint data flow from the agent to the NetWitness:



The *Hosts and Services Getting Started Guide* provides the information you need to understand and install all the NetWitness services.

Basic configuration involves:

- Installing agents on hosts
- Deploying the ESA rules from the Endpoint Rule Bundle
- Creating groups and policies
- Configuring Endpoint metadata forwarding and retention policies
- Defining health and wellness policies to monitor Endpoint Server
- Installing and configuring Relay Server

You can configure the required settings in the NetWitness user interface under Administration Services Config view (**(Admin) > Services > Endpoint Server > Config**).

Agent Modes

Note: The information in this topic applies to NetWitness Version 11.3 and later.

In NetWitness 11.3 and later, the Endpoint agent can operate either in Insights or Advanced mode depending on the policy configuration. For more information on policy configuration, see the *NetWitness Endpoint Configuration Guide*. You can have both Insights and Advanced agents in a single deployment.

There is no license required for the Insights agent. However, you must procure a license for an Advanced agent. For more information on licensing, see the *Licensing Management Guide*.

The following table list the features supported for Insights and Advanced agents:

Feature	Insights Agent	Advanced Agent
Full System Scan	No	Yes (agent version 11.6.1 or higher)
Scan data - Processes, Autoruns, Files, Drivers, Libraries, and System Information	Yes - Windows, Mac, and Linux	Yes - Windows, Mac, and Linux
Tracking data - Process, File, Registry, Network, and Console	No	Yes - Windows and Mac Registry and Console events are applicable only for Windows.
Expanded network visibility	Yes - Windows	Yes - Windows
Anomaly detection - Image Hooks, Kernel Hooks, Registry Discrepancies, and Suspicious Threads	No	Yes - Windows
Windows log collection	Yes	Yes
File log collection	Yes - Windows	Yes - Windows
Threat detection content - ESA, Application Rules	Yes	Yes
Analysis of downloaded file	Yes	Yes
File status - Whitelist, Blacklist, Graylist, and Neutral	Yes	Yes
File remediate (Block)	No	Yes - Windows
Process visualization	No	Yes
Live connect	Yes	Yes

Feature	Insights Agent	Advanced Agent
File reputation service (Third-party lookup)	Yes	Yes
Risk score for hosts	No	Yes
MFT, process dump, and system dump download	No	Yes - Windows
Automatic file download	Yes	Yes
Automatic Memory DLL Download	No	Yes
Manual file download	No	Yes
Network isolation	No	Yes - Windows
Relay server	Yes	Yes

Endpoint Log Hybrid Configuration

This topic provides the high-level tasks required to configure the Endpoint Log Hybrid.

Tasks	Description
Install the Endpoint Log Hybrid	For a physical host: See *Install Endpoint Log Hybrid* topic under Post Installation Tasks on *Physical Host Installation Guide* For a virtual host: See *Install Endpoint Log Hybrid* topic under Step 5. Post Installation Tasks on *Virtual Host Setup Guide*.
Configure one or more Endpoint Log Hybrids	For a physical host: See *Configuring Multiple Endpoint Log Hybrids* topic under Post Installation Tasks on *Physical Host Installation Guide* For a virtual host: See *Configuring Multiple Endpoint Log Hybrids* topic under Step 5. Post Installation Tasks on *Virtual Host Setup Guide*.
Add hosts to the Endpoint Log Hybrid	For a physical host: See *Add Hosts to the Endpoint Log Hybrid* topic under Post Installation Tasks on *Physical Host Installation Guide* For a virtual host: See *Add Hosts to the Endpoint Log Hybrid* topic under Step 5. Post Installation Tasks on *Virtual Host Setup Guide*.
Deploy Application and ESA Rules	See Deploying Endpoint Application Rules and ESA Correlation Rules.

Tasks	Description
Configuring Metadata Forwarding	Similar to logs and packets, you can view Endpoint metadata in the Navigate and Events view. You can also generate reports and alerts for the Endpoint data. By default, the Endpoint Meta option is disabled. The agent must be installed with the Endpoint Meta option enabled to forward metadata.
Install Agents on Hosts	The Endpoint agent installer is generated using the Packager tab under **(Admin) > Services > Config > Endpoint Server** from the NetWitness user interface. The Packager is a zip file that contains executables and configuration files for generating agent installer for Linux, Mac, and Windows operating systems. You can install only one version of the agent on a host. If you have a previous version of an agent installed (for example, 4.4), uninstall this agent to install the 12.4.1.0 agent. After the agent is installed, it appears on the **Hosts** view. By default, the Endpoint data is posted for the first time. To collect subsequent Endpoint data, you have to either schedule a scan or perform ad hoc scan. It retrieves data, such as drivers, processes, DLLs, files (executables), services, autoruns, security information, anomalies, system configurations, and scripts found on the host. **Note:** If a Windows host has proxy setup enabled and configured, the Endpoint agent communicates to the Endpoint server through proxy. If a host has both Automatic (Auto detect and Setup Script) and Manual proxy settings enabled and configured, the order of precedence is as follows: 1. Manual proxy setup 2. Automatic proxy setup - Use setup script 3. Automatic proxy setup - Automatically detect settings

Tasks	Description
Install and Configure the Relay Server	See (Optional) Installing and Configuring Relay Server.
3rd Party Scan	Configure 3rd party scans like YARA and OPSWAT. See Configure YARA and Configure OPSWAT
Permissions	Grant or Revoke role permissions for the selected Endpoint Server. See Manage Role Permissions at Endpoint Server Level
Manage Groups and Policies	To efficiently manage and update endpoint agent configurations, you can group the agents, and manage their behavior using policies.
Enable Reputation Status	Reputation Status is enabled by default in an NetWitness Platform 11.3 and later deployment and displays information about the file. For troubleshooting, see the *Live Services Guide*.
Risk Score	Risk Score is calculated and obtained from NetWitness Respond for hosts and files. For more information, see the *NetWitness Respond Configuration Guide*.
Configuring Data Retention Policy	Define data retention policies to optimally store and manage the Endpoint data based on the age of the Endpoint data or the storage size. By default, 30 days of agent data is retained.
Managing Inactive Agents	By default, agents (including all the collected Endpoint data) that have not communicated with the Endpoint Server for 90 days will be automatically deleted.
Configure Retention Policy for Downloaded Files	Define retention policy to optimally store and manage the downloaded data such as system dump, process dump, files, and MFT. By default, 90 days of data is retained.
Investigate Endpoint data	You can investigate the Endpoint data in the **Hosts** and **Files** views. For more information, see the *NetWitness Endpoint User Guide*.

Deploying Endpoint Application Rules and ESA Correlation Rules

Note: The information in this topic applies to NetWitness Version 11.3 and later.

The existing IIOCs from NetWitness Endpoint 4.4.0.x are now available as OOTB Endpoint Application rules tagged as Indicators of Compromise, Behaviors of Compromise, Enablers of Compromise, and Analysis.File. Application rules for Endpoint are automatically available on installation of NetWitness 11.3 and later.

For Endpoint risk score, every Application rule must have an ESA rule that generates alerts used for the risk score calculation. A set of OOTB ESA rules are available as Endpoint Rule Bundle. You must specify the Endpoint data sources (Concentrators) and deploy the ESA Rules from the Endpoint Rule Bundle. For more information, see "Deploy Endpoint Risk Scoring Rules on ESA" section in the *ESA Configuration Guide*.

If the Application rule key value matches with ESA rule then an alert is triggered which is used to compute the risk score and an incident is raised when risk score exceeds the defined threshold limit.

Note: If you are upgrading from an existing Endpoint Log Hybrid to 11.3 or later, you must deploy the Application rules from RSA Live. During deployment, you must specify Endpoint Log Hybrid Log Decoder service. In case of multiple Endpoint servers, select all the Endpoint Log Hybrid Log Decoder services. For more information, see the *Live Services Management Guide*.

You can view the application rules that are deployed in  **(Admin) >Services > Endpoint Log Hybrid - Log Decoder** > **Config** > **App Rules** and application rules that were triggered in **Investigate** > **Navigate**> **Endpoint Log Hybrid - Concentrator** > **App rules**.

The Endpoint ESA rules generate alerts with the severity; Critical, High, and Medium. You can view the alerts on:

- Risk Details tab - You can view Critical, High and Medium alerts for a host or file on **Hosts** > **Risk Details** or **Files** > **Risk Details**.
- Respond view : You can view only critical and high severity alerts on **NetWitness Respond** > **Alerts**.

Custom Endpoint Rule for Risk Scoring

If you have custom IIOCs in NetWitness Endpoint 4.4.0.x, you need to create these custom Endpoint rules. Once you have created your custom Application rule, you must create the custom ESA Rule for risk score calculation and update the RiskConfig file in MongoDB.

To create a custom Endpoint rule, perform the following tasks:

1. Add a custom Application Rule: For more information on creating a custom Application Rule, see *Create an Application Rule* topic in the **Live Services Management Guide**.
2. Add a custom ESA Rule: For more information on creating a custom ESA Rule, see *Create an ESA Rule* topic in the **Live Services Management Guide**.
3. Add the rule to RiskConfig

ESA Rule Parameters

The following table describes the fields that define an ESA rule.

Fields	Description
id	The name of the ESA Rule. For example, In Encrypted Directory.
key	The metakey on which an alert would be generated. For example, alert is generated on analysis.file metakey for In Encrypted Directory rule.
value	Specify the value. The value must exactly match with the App rule name. For example, in encrypted directory.
title	The name of the alert. For example, In Encrypted Directory.
type	Specify the type of rule. For custom endpoint rule, the type must be ENDPOINT.
enabled	The status of the rule. Specify true, if the rule should be considered for risk scoring.
description	The description of the rule.
severity	The severity of the rule; critical, high or medium.

Add the rule to RiskConfig

After you create the custom Application rule and the ESA rule, you must update the RiskConfig in mongoDB.

To update the riskconfig file, perform the following:

1. SSH to Admin Server.
2. Create a JavaScript file (For example, `in-encrypteddirectory- rule.js)` with the custom ESA rule definition in the below format.

```
db.risk_rule.insertMany(
[ {
"name" : "In Encrypted Directory",
"enabled" : true,
"handler" : "Default",
"entities" : {

},
"metas" : {
"File" : [
```

```
{
"meta" : "checksum_src",
"name" : "filename_src",
"weight" : NumberInt(100)
}
],
"Host" : [
{
"meta" : "agent_id",
"name" : "alias_host",
"weight" : NumberInt(100)
}
]
},
"_class" : "com.rsa.asoc.respond.pipeline.risk.rules.AlertScoringRule"
} ]
)
```

The following table describes the fields that define a rule.

Field	Description
name	The name of the ESA rule.
enabled	The flag to enable or disable risk scoring. Specify true to enable risk scoring.
handler	The value of this should be Default.
entities	The value of this should be empty.
metas > Files > meta	The metakey for a file for which score should be calculated.
metas > Files > name	The name of the metakey of the file identity.
metas > Files > weight	By default the weight value is 100.
metas > Host > meta	The metakey for a host for which score should be calculated.
metas > Host > name >	The name of the metakey of the host identity.
metas > Host > weight	By default the weight value is 100.
_class	This is used for internal purpose, do not change.

3. Insert the new rule into the riskconfig file on mongoDB using following command:

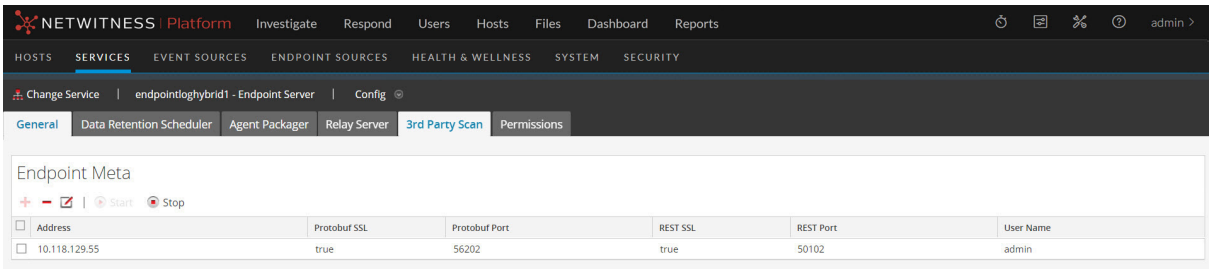
```
mongo respond-server --authenticationDatabase admin -u deploy_admin -p
<deploy_admin-user-password> in-encrypted-directory-rule.js
```

4. Confirm if ESA rule is updated successfully in the riskconfig, using following command

```
mongo respond-server --authenticationDatabase admin -u deploy_admin -p
<deploy_admin-user-password> --eval "db.risk_rule.find({ "name": /.*In
Encrypted Directory.*/i })"
```

5. Restart the Respond server for the changes to take effect.

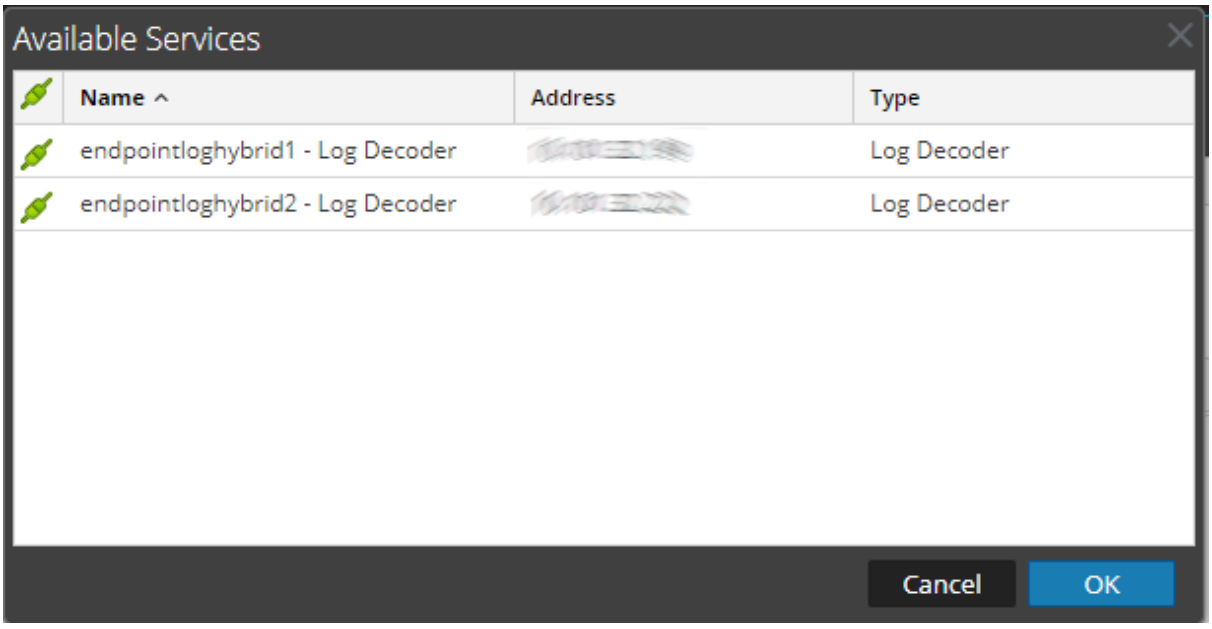
```
service rsa-nw-respond-server restart
```



After you create a custom Endpoint rule and update the risk configuration file, whenever an event is generated for the new rule (For example, In Encrypted Directory) an alert will be generated and the risk score is calculated for the host and file.

Configuring Metadata Forwarding

To view the metadata, you must enable the metadata forwarding while installing the Endpoint Log Hybrid. The Endpoint metadata is displayed in the NetWitness Investigate (**Navigate** and **Events** views) similar to Logs and Packets. For information on metadata mappings, see Endpoint Metadata Mappings.



To configure metadata forwarding:

1. Go to **(Admin) > Services**.
2. In the Services view, select the **Endpoint Server** service.
3. Click and select > **View** > **Config**.
4. Click the **General** tab.

5. Click in the toolbar.

   The Available Services dialog is displayed.

6. Select a Log Decoder service and click **OK**.

   The Add Service dialog is displayed.

Note: You can add only one Log Decoder service.

7. Enter the administrator credentials for authentication.
8. (Optional) If you enable Raw Data, a brief summary of the session is forwarded along with the metadata.
9. (Optional) If you have enabled SSL on the REST port in the Log Decoder, select the **REST SSL** option. By default, the REST port for non-SSL is 50102.
10. Select the **Protobuf SSL** option to enable SSL on Protobuf. By default, the Protobuf port is 50202.
11. Click **Save**.

After configuring the metadata forwarding, make sure to:

- Start the capture on the Log Decoder
- Start the aggregation on the Concentrator
- Add the Log Decoder as a service in the **Concentrator**

Start Metadata Forwarding to the Log Decoder

1. In the Endpoint Meta config > General view, select the service.
2. Click Start
   The Endpoint Server starts forwarding the metadata to the Log Decoder.

Stop Metadata Forwarding to the Log Decoder

1. In the Endpoint Meta config > General view, select the service.
2. Click Stop.
   The Endpoint Server stops forwarding the metadata to the Log Decoder.

Remove Metadata Forwarding

Note: Make sure you stop the service, before removing the metadata forwarding.

1. In the Endpoint Meta config view, select the service.
2. Click −.
3. Click **Apply**.

Endpoint Metadata Mappings

You can view the default metadata mappings or modify the metadata mappings for endpoints.

JSON Schema for Metadata Mappings

All metadata mappings is configured using the JSON schema. The following is a sample JSON schema:

```
{
"metaKeyPairs" : [
     {
     "metaKeyPairsCategory" : "",
     "keyPairs" : [
          {
          "endpointJpath" : "",
          "metaName" : "",
          "type" : "",
          "enabled" : true
          },
          {
          "endpointJpath" : "",
          "metaName" : "",
          "type" : "",
          "enabled" : true
```

```
            }
        ]
        }
]
}
```

The following APIs are used to view or modify the metadata mappings:

- `get-default` - Returns the default configurations for the endpoint metadata mappings.
- `get-custom` - Returns the custom configurations for the endpoint metadata mappings.
- `set-custom` – Helps customize the endpoint metadata mappings.

View the Metadata Mappings

To view the endpoint metadata mappings:

1. On the NW server, run the `nw-shell` command from the command line.
2. Run the `login` command and enter the credentials.
3. Connect to the Endpoint Server using the following command:
   `connect --host <IP address> --port <number>`

Note: The default port is 7050.

4. Run the following commands:

```
cd endpoint/meta
cd get-default
invoke
```

The following screen shows the default metadata mappings:

```
    {
      "endpointJpath" : "users/sessionType",
      "metaName" : "logon_type",
      "type" : "text",
      "enabled" : true
    },
    {
      "endpointJpath" : "hostFileEntries/hosts",
      "metaName" : "dhost",
      "type" : "text",
      "enabled" : true
    },
    {
      "endpointJpath" : "securityConfigurations",
      "metaName" : "event_state",
      "type" : "text",
      "enabled" : true
    }
  ]
},
{
  "metaKeyPairsCategory" : "MACHINE_IDENTITY",
  "keyPairs" : [
    {
      "endpointJpath" : "_id",
      "metaName" : "agent.id",
      "type" : "text",
      "enabled" : true
    },
```

To disable a default metadata mapping:

Enter the same endpointJpath value and set the enabled parameter to `false`.

For example, if the endpointJpath is `Category` and enabled parameter is `true`, enter the same endpointJpath and set the enable parameter to `false`.

```
{
  "metaKeyPairsCategory" : "COMMON",
  "keyPairs" : [
    {
      "endpointJpath" : "Category",
      "metaName" : "category",
      "type" : "text",
      "enabled" : true
    },
```

Note: Do not modify the metaKeyPairsCategory in the schema; “COMMON”, “COMMON_MACHINE”, “COMMON_MACHINE_FOR_EVENTS”.

To change the metadata name or metadata type:

Enter the same endpointJpath value and specify values for the metaName and type.

Note: The metaName must exist in the table-map.xml of the Log Decoder, index-concentrator.xml or index-concentrator-custom.xml file of the Concentrator, for the metaName to appear on the Investigate view.

Add or Modify Metadata Mappings

To add or modify the metadata mappings, run the `set-custom` API. The metaKeyPairs configuration provided in the JSON file should match the JSON schema of the default configuration received through the `get-default` API.

1. On the NW server, run the `nw-shell` command from the command line.
2. Run the `login` command and enter the credentials.
3. Connect to the Endpoint Server using the following commands:

   ```
   connect --service endpoint-server
   ```

   Note: The default port number is 7050.

4. Run the following commands:

   ```
   cd endpoint/meta
   cd set-custom
   invoke --file <json file>
   ```

You can add new metaKeys by adding entries to the file that will be uploaded using the `set-custom` API. The following example shows how to add a new metadata mapping:

View the Custom Metadata Mappings

To view the custom metadata mappings, run the `get-custom` API, and then invoke commands.

Note: The `get-custom` API will return values only if the metadata mappings are modified using the `set-custom` API.

Endpoint Sources

Note: The information in this topic applies to NetWitness Version 11.3 and later.

The Endpoint agents deployed in your environment may be large in number and geographically distributed. To efficiently manage and update configurations automatically, agents can be organized into smaller subsets called **Groups**.

Groups

Groups can be created based on Machine OU, IP address (IPv4 and IPv6), host names, operating system type, and operating system description. You can create groups based on your requirements. For example, you can group all agents running on Windows 2016 Server and IP ranging from 10.40.10.1 to 10.40.10.200. For more information on creating groups, see Creating Groups and Policies.

Note: All agents that are not part of any group use the default policy settings.

Policies

To manage the behavior of agents in a group, you can apply a set of rules called **Policies**. The NetWitness supports three types of policies for endpoints: **Agent Endpoint**, **Agent File Logs**, and **Agent Windows Logs** policies. The following default policies are available on installation.

Note: NetWitness recommends that you review these default policies before deploying agents.

- Default Agent Endpoint (EDR) Policy
- Default Windows Log Policy
- Default File Log Policy

You can either assign the default policies to a group, modify the default policy, or create custom policies based on your organizational requirements.

Note: You cannot edit the default policy for Windows Logs nor for File Logs.

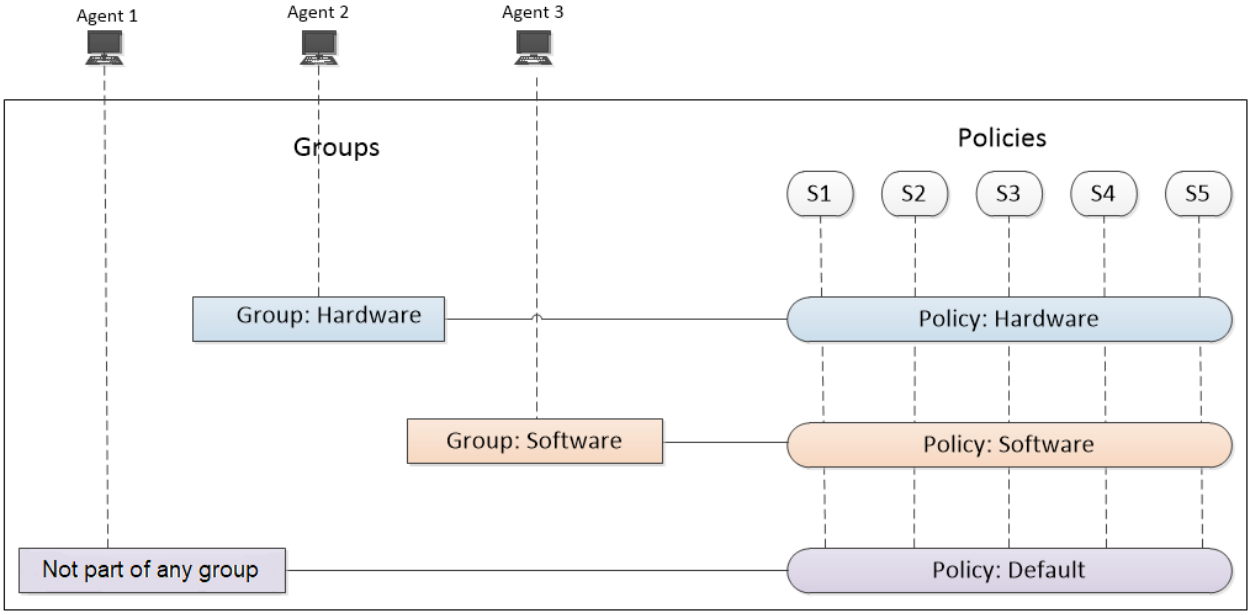
You can do the following through a policy:

- Define the agent mode - Insights or Advanced
- Configure scan schedule and settings
- Configure automatic file download
- Configure endpoint settings, such as which Endpoint server the agents should communicate, port details, and beacon intervals
- Configure response actions such as blocking
- Configure Windows and File Log collection

For example, you can create a policy to schedule scan and enable blocking. For more information on creating policies, see Create an EDR Policy, Create a File Log Policy, or Create a Windows Log Policy.

Group Ranking

When a group is created, a rank is associated with every group based on the creation order. If an agent belongs to multiple groups, to handle conflicting configurations, you can reorder the groups to change the ranking, and the policy associated with the highest ranked group takes precedence.

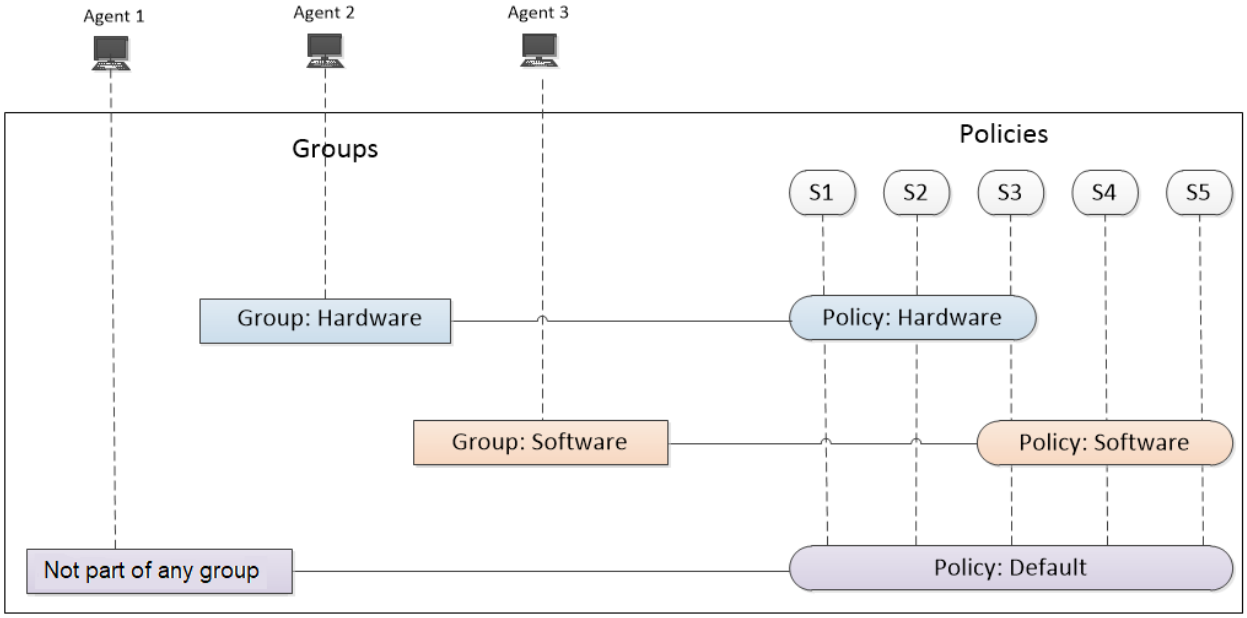


Example 1

A **Server** group contains 100 hosts with a default Agent Endpoint policy. Amongst these, if 20 hosts require further investigations, analyst can:

1. Create a temporary group with a static list of these 20 hosts.
2. Create or apply any policy to this group that will not impact any other hosts.
3. Edit the ranking for the new group, moving to the top of the Ranking list (making sure it is above the existing Server group).
4. After investigation is done, delete this group. The hosts are revalidated and assigned to the appropriate group based on the ranking.

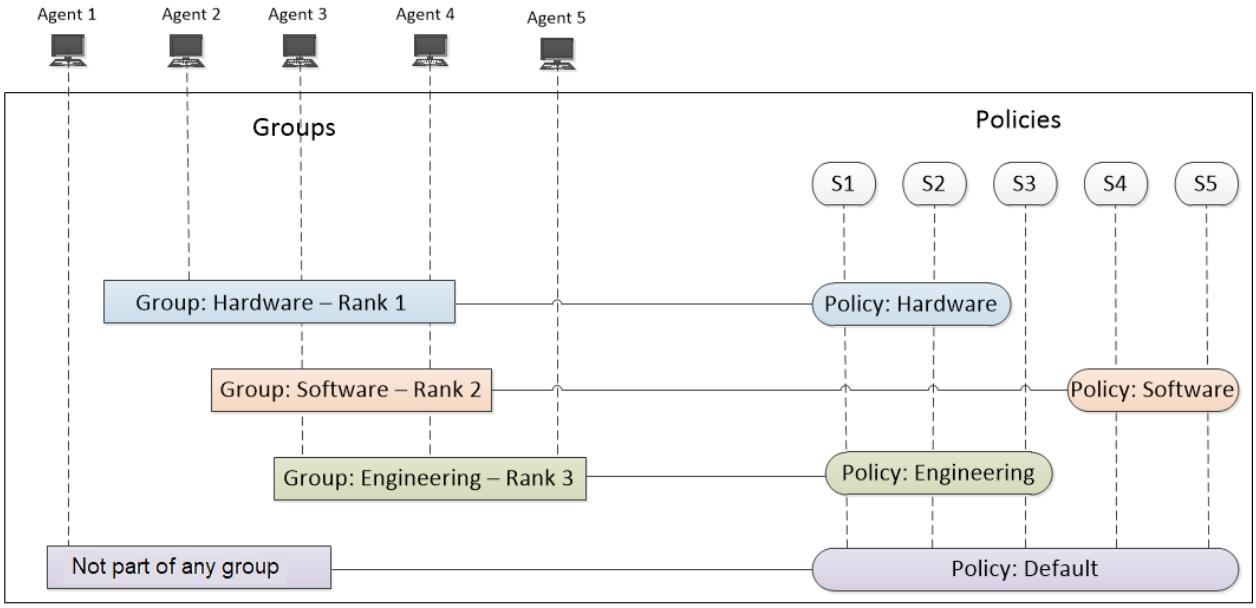
Example 2



Case 1:

* S1, S2, S3, S4, and S5 represents policy settings, such as run scheduled scan, agent mode, scan settings, response actions, and so on.

Each agent is a part of a unique group that is associated with a policy, where each policy has all settings S1, S2, S3, S4, and S5 defined. For example, Agent 2 is a part of the group Hardware, where all settings in the policy Hardware are applicable.



Case 2:

* S1, S2, S3, S4, and S5 represents policy settings, such as run scheduled scan, agent mode, scan settings, response actions, and so on.

In the policy Hardware, S4 and S5 settings are not defined, and hence the agent 2 inherits settings S4 and S5 from the default policy.

Case 3:

* S1, S2, S3, S4, and S5 represents policy settings, such as run scheduled scan, agent mode, scan settings, response actions, and so on.

- Agent 2 is a part of the highest ranked group Hardware, and with the policy Hardware. The agent 2 inherits settings S3, S4, and S5 from the default policy as they are not defined in the policy Hardware.

- Agent 3 is a part of Hardware, Software, and Engineering groups, and with the policy Software. The agent considers the settings S4 and S5 from the policy Software, and the remaining undefined settings are inherited as follows:
  - S1 and S2 from the policy Hardware, which is associated with the highest ranked group.
  - S3 from the policy Engineering, which is the next ranked group.
- Agent 4 is a part of Hardware, Software, and Engineering groups, and with the policy Engineering.
  - Though settings S1 and S2 are defined in policy Engineering, the agent 4 considers the settings S1 and S2 from the policy Hardware as it is associated with the highest ranked group.
  - S4 and S5 from the policy Software, which is the associated with the next highest ranked group.
  - S3 from the policy Engineering.

The following are some of the key points:

- If an agent is not assigned to any group, default policies are applied.
- A policy can be assigned to multiple groups. However, a group can only have one policy of each type (Agent Endpoint and Agent Windows Logs).
- An agent can belong to multiple groups. The policy is derived based on the ranking of the group as shown in the above example (case 3).
- If all settings are defined in a single policy, and it is the highest ranked policy for an agent, no policy settings from other ranked groups are inherited (case 1).
- If there are any undefined settings in the policy, the settings from the default policy is considered as shown in the example above (case 2 and 3).
- If an agent falls into more than one group, its complete set of policy attributes is determined as follows:
  - It takes all settings from the highest ranked policy that applies.
  - Any settings that are not set in the highest ranked policy are taken from the next highest ranked policy that applies.
  - If there are still unset attributes, they are taken from the default policy.
  - If there are any conflicts, the higher ranked policy wins.

Example 3

Assume the following:

- Agent A belongs to below two groups, **Production Servers** and **All Windows Hosts**.
- The Production Servers group has the **Schedule scan set and no blocking** policy assigned, and it has the following settings:
  - Schedule Scan : Enabled
  - Effective Date: 2019-03-08

  - Start Time: 09:00
  - Scan Frequency: Every 1 week
  - CPU Maximum: 45 %
  - Virtual Machine Maximum: 20 %
  - Blocking: Disabled
- The All Windows Hosts group has the **EDR for All Windows** policy applied, which has the following settings:
  - Scan Master Boot Record: Disabled
  - Blocking: Enabled
- The **Production Servers** group is ranked higher than the **All Windows Hosts** group for EDR policies. Keep in mind that ranking only applies to policies of the same source type: that is, all EDR policies are ranked, and all Windows Logs policies are ranked separately.

Agent A gets its final policy configuration as per the ranking of the groups (and associated policies) to which it belongs:

- The agent uses the schedule set in the **Schedule scan set and no blocking** policy.
- Scan Master Boot Record is disabled, because that is set in the **EDR for All Windows** policy.
- Blocking is disabled: since there is a conflict, the value in the higher ranked policy is used.
- All other attributes are set based on values in the Default EDR policy.
- Note that if you wanted Blocking to be enabled, you could change the group ranking so that All Windows Hosts is higher than Production Servers: in this case, Production Servers would win the conflict, and Blocking would be enabled for Agent A.

Default Agent Endpoint (EDR) Policy

When an agent is installed, it operates in an Insights mode until a policy is assigned. The following are the default EDR policy settings:

Settings	Fields	Default Value
Scan Schedule	Run Scheduled Scan	Disabled
	Effective Date	Current date
	Scan Frequency	Every week
	Start Time	09:00 (this is 9 AM)
	CPU Maximum	25%
	Virtual Machine Maximum	10%

Settings	Fields	Default Value
Agent Mode	Monitoring mode	Advanced
Scan Settings	Scan Master Boot Record	Disabled
	Auto Scan New Systems When Added	Disabled
File Download Settings	Automatic File Download	Enabled
	Automatic Memory DLL Download	Enabled
	Signature	Exclude All Signed
	File Size Limit	1 MB
Response Action Settings	Blocking	Disabled
	Network Isolation	Disabled
Endpoint Server Settings	Endpoint Server	The agent considers the default Endpoint Server that is configured during packager generation.
	Server Alias (Optional)	
	HTTPS Port	443
	HTTPS Beacon Interval	15 Minutes
	UDP Port	444
	UDP Beacon Interval	30 Seconds

Default Windows Log Policy

The following are the default Windows Log policy settings:

Settings	Fields	Default Value
Windows Log Settings	Status	Disabled
	Protocol	TLS
	Send Test Log	Disabled

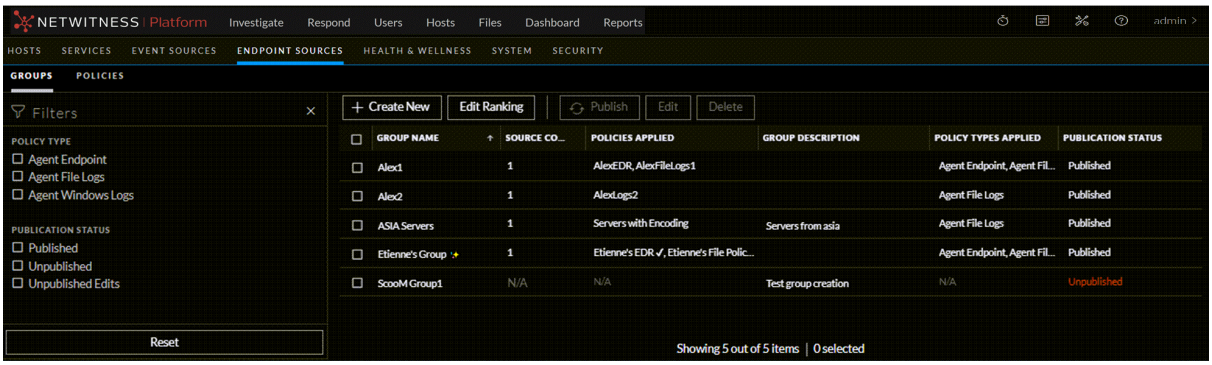
Default File Log Policy

The following are the default File Log policy settings:

Settings	Fields	Default Value
File Log Settings	Status	Disabled
	Protocol	TLS
	Send Test Log	Disabled

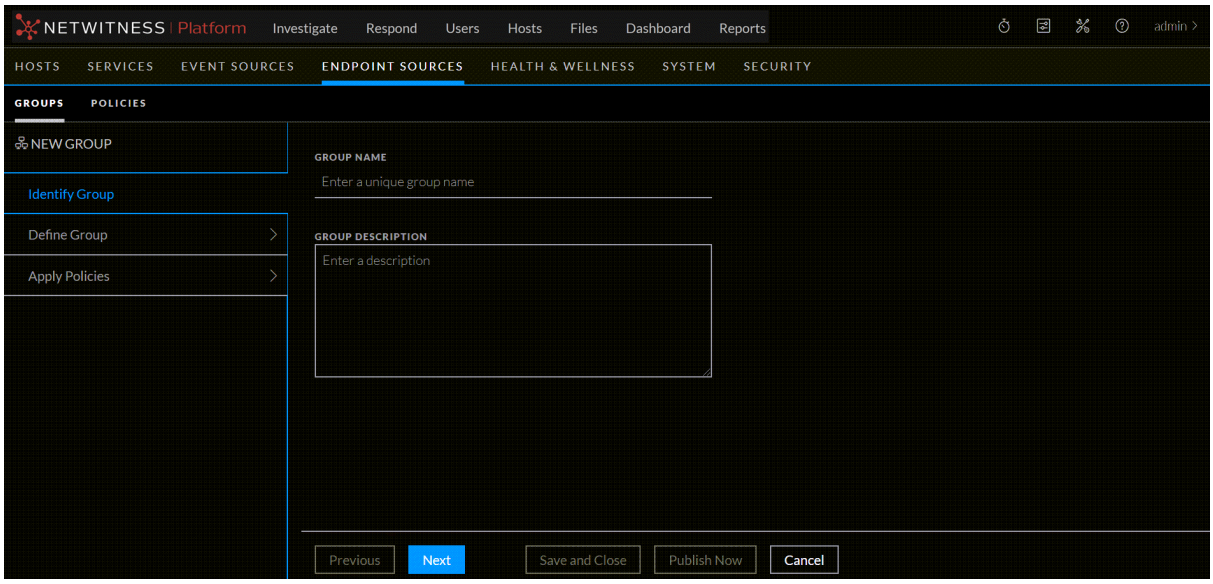
Creating Groups and Policies

Note: The information in this topic applies to NetWitness Version 11.3 and later.



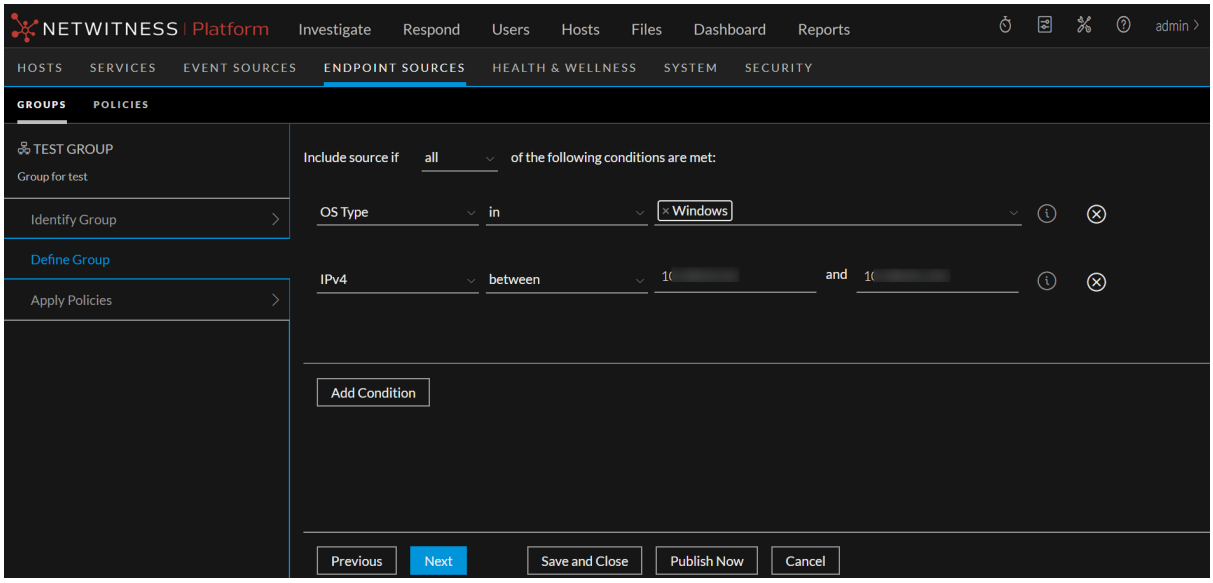
The following sections provide instructions on how to create groups and policies.

- Groups: Create a Group
- Policies:
  - Construct a Policy
  - Create an EDR Policy
  - Create a Windows Log Policy
  - Create a File Log Policy
  - Replace Windows SFTP Agents



Create a Group

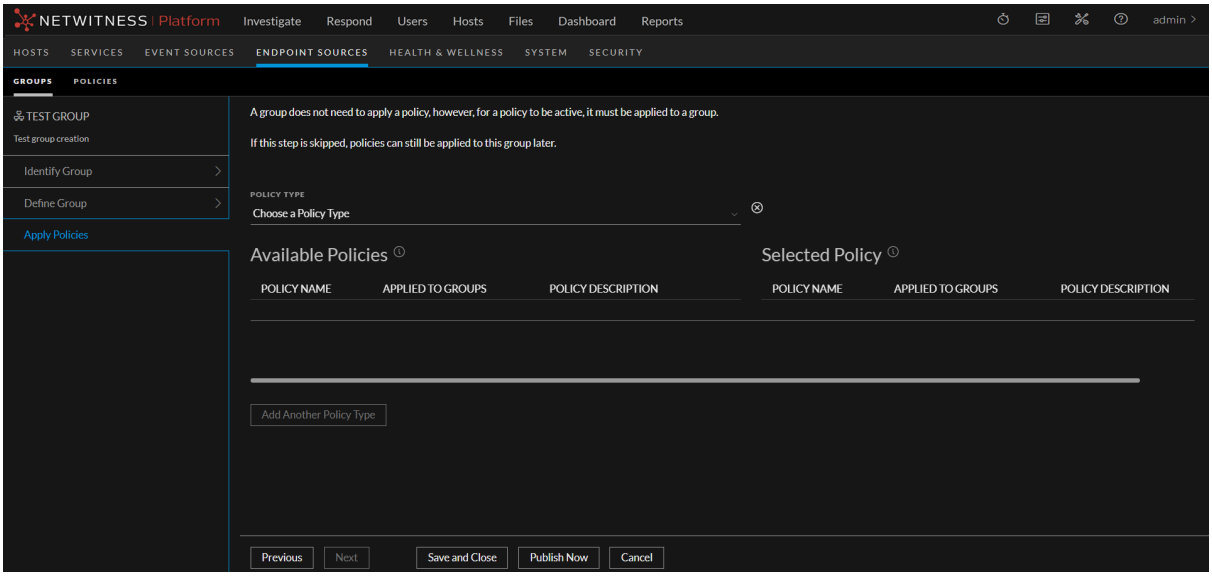
To create a group:



1. Go to **(Admin) > Endpoint Sources** view.
2. In the left panel, select the **Groups** tab.

3. In the toolbar, click **Create New**.
4. In the **New Group** panel, enter a group name and group description, and click **Next**.

5. Specify the logical statements that define the condition for an agent to be included in the group. Each logical statement consists of: parameter, operator, and values to match.



- In the **Include source if ___ of the conditions are met** field, select either **all** or **any**.
- For each logical statement, select the required options:

Item	Description
Parameter	The parameter can be OS Type, OS Description, Host Name, IPv4, IPv6, Machine OU, Tag, and Subnet. • OS Type, OS Description, Host Name: The value you enter should reference hardware or virtual machines that are running endpoint agents. • IPv4 or IPv6: Enter valid IP addresses as either ranges or as a set of IP addresses to include or exclude. • Machine OU: Enter a valid Machine OU(Organizational Unit) name. • Tag: Enter a valid tag that already exists. • Subnet: Enter a valid Subnet mask. **Note:** If you do not want to include certain IP addresses, use the **Not in** operator, and enter the IP addresses separated by a space or a comma.
Operator	The choice of values is dependent upon the parameter you chose. For example, if your parameter is OS Type, the only operator available is **in**.
Value or values to match	The value or values to match. For the OS Type parameter, you can choose one or more values from the drop-down list. For all other parameters, you can enter free-form text. **Note:** Although you can enter any text for values, the system validates your entries when you attempt to proceed to another screen, and will not allow you to proceed until values are valid.

6. Continue adding conditions until you have completely specified the new group. After you have added all conditions, click **Next** to proceed.
7. (Optional) Click **Apply Policies** and select the source type from the drop-down list.

   Policies with the selected source type are displayed below **Available Policies**.

   Select a policy by clicking . Skip this step if you want to apply a policy to the group at a later time.

Note: You can attach only one policy per source type to a group. That is, you cannot attach more than one Agent Endpoint policy to a single group, nor more than one Agent Windows Logs policy.

For more information on creating policies, see Create an EDR Policy, Create a Windows Log Policy, or Create a File Log Policy.

8. Do one of the following:
   - Click **Save and Close** to save the settings and return to the Groups view. The publication status is displayed as **Unpublished** in the Groups view.

     Note: You can select an unpublished group and click **Publish** to publish a group.
   - Click **Publish Now** to publish the group.

Construct a Policy

When you create a policy, you should keep in mind the way groups and Agents can inherit values from other policies. The simplest way to construct a policy is to set values for all of the available settings for that policy type. If you do this, you can assign the policy to one or more groups, and all of the agents in those groups can receive the settings defined in the policy itself.

However, you do not need to set all possible available settings within a single policy. In the Group Ranking section, there are examples that show where values can come from, based on the ranking order.

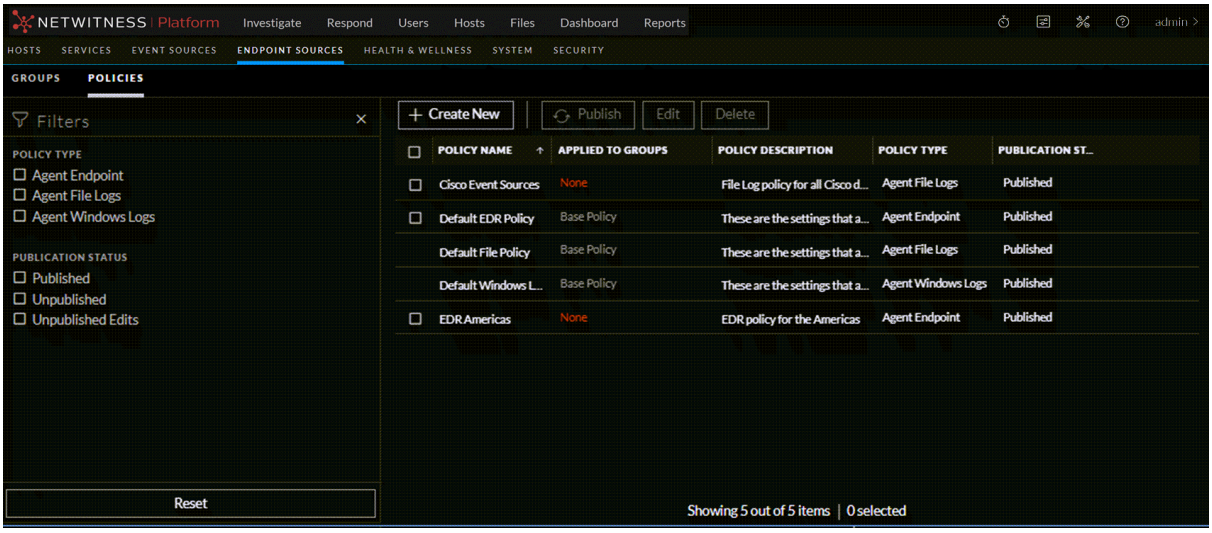
Note: Remember that a group can have no more than one of each policy type assigned to it: it can be assigned 0 or 1 Agent Endpoint, Agent File Logs, and Agent Windows Logs policies.

If an agent is only a member of one group, that agent's settings are as follows:

- If a value is set in the policy assigned to the group, that value is used.
- If a value is not set in the policy assigned to the group, the value set in the default policy is used.

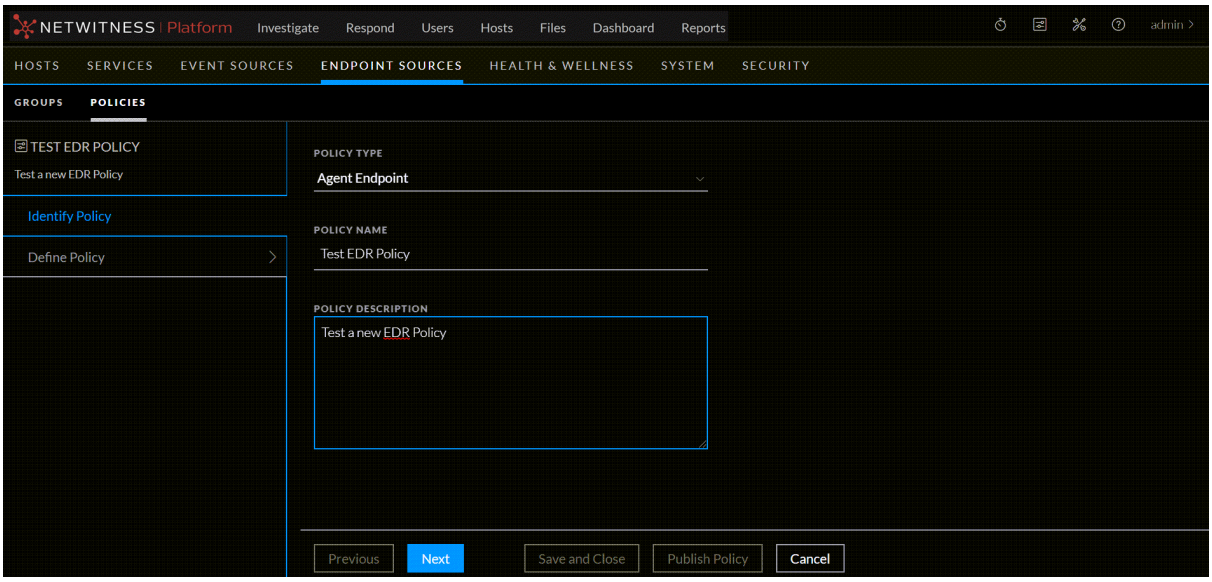
For agents that are members of multiple groups, it is a bit more complicated. For these agents, the settings are evaluated from highest priority member group (as set on the Edit Rankings page) to the lowest priority member group. If a parameter is set in a higher group, it is not overwritten, event if the same parameter is also set in a lower group. For example, assume an Agent is part of three groups:

- If a value is set in the highest ranked policy, the agent uses that value.
- If a value is not set in the highest ranked policy, but is set in the second-highest-ranked policy, the agent uses the value from the second-highest-ranked policy.
- If a value is not set in either the first- or second-highest ranked policy, but is set in the third-highest-ranked policy, the agent uses the value from the third-highest-ranked policy.
- If a value is set in the highest-ranked policy and either or both of the other policies, the value is taken from the highest-ranked policy.
- If a value is not set in any of the three policies assigned to the agent, the agent uses the value set in the default policy.



Create an EDR Policy

While creating a policy, note the following:

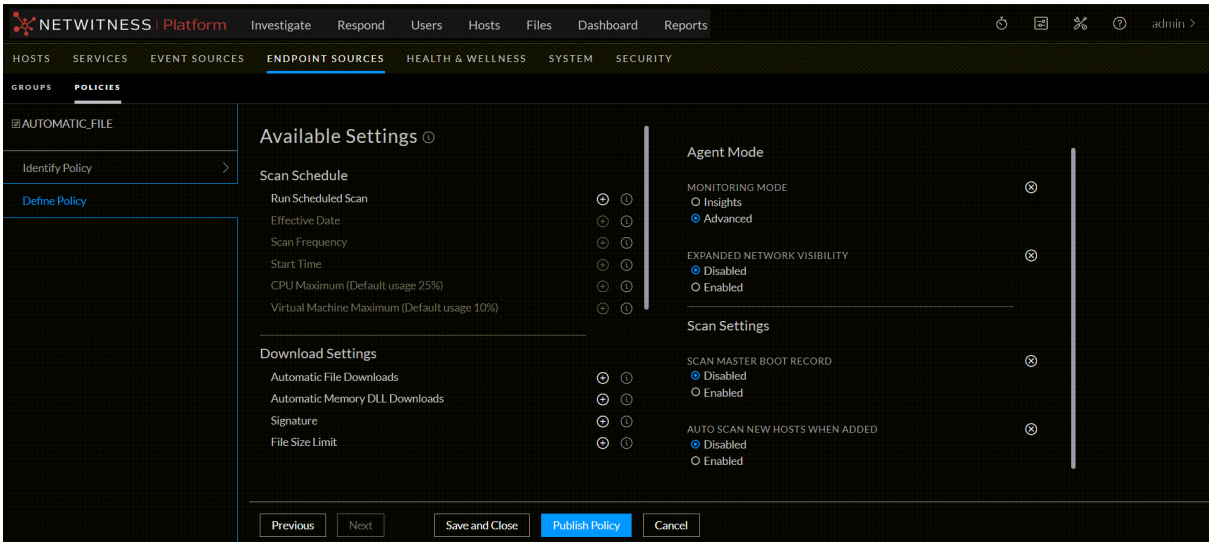


- Whenever you choose a setting, it is added to the **Selected Settings** panel.
- To clear any of your selected settings, click  to remove that setting.
- At any point in the wizard, you can choose **Save and Close**, so that you can return to complete the policy at a later time.

To create an EDR policy:

1. Go to  **(Admin) > Endpoint Sources**.
2. Click **Policies**. The available policies are displayed.

3. Click **Create New** to add a new policy.
4. In the New Policy panel, do the following:



- Select **Agent Endpoint** as the source type from the drop-down list.
- Enter the policy name.
- Enter a description for the policy.

5. Click **Next**.

6. Click  to select a setting from list of **Available Settings**. After you click, the specific setting is moved under the **Selected Settings** panel. You need to enter the required values for the selected settings. For details, see Define Policy Panel for Agent Endpoint Policy.

Note: You do not need to set all possible available settings within a single policy. The complete list of settings for an agent is derived from one or more groups to which that agent belongs. This is described in more detail in Construct a Policy.

- In the Scan Schedule category, enable **Run Scheduled Scan** to configure the scan, and set any of the available parameters based on your needs. For more details, see Define Policy Panel for Agent Endpoint Policy.
- In the **Agent Mode** category, you can set the following:
  - Select the monitoring mode of the agent - Insights or Advanced.
  - Select **Expanded Network Visibility**:

    ### Prerequisite

    Note: For Expanded Network Visibility to work, ensure the service user account used for aggregating Endpoint Log Decoder data to Endpoint Concentrator is assigned with the `decoder.manage` permission. For more information on how to assign roles and permissions, see "Services Security View - Aggregation Role" in the *Hosts and Services Getting Started Guide for NetWitness Platform*.

    - To enable network tracking and monitoring on Windows hosts in Insights mode.

    Note: Reports UDP connections for Windows 10 version 1803 in Insights mode.

    - To optimize the frequency of agents sending network events for both Insights and Advanced modes.
    - The endpoint agents should have the **Expanded Network Visibility** option enabled for enriched network events from NetWitness Platform packet deployment with endpoint data. In the **Events** View > **Hosts** tab, the endpoint data related to the network event selected will be automatically displayed if it exists. For more information, see "Host Information" in the *Investigate User Guide*.

    Note: For network tracking in Insights mode, verify that the Windows Management Instrumentation (WMI) service is enabled.
- In the Scan Settings category, you can enable either or both of the following actions:
  - Enable **Scan Master Boot Record** to include Master Boot Record (MBR) details in scheduled scans.
  - Enable **Auto Scan New Systems When Added** to automatically queue a scan for any host that does not have any snapshot data
- In the Download Settings category, you can set the following:
  - Enable **Automatic File Downloads** to automatically download files based on the Signature and file size. By default this option is enabled.
  - Enable **Automatic Memory DLL Downloads** to automatically download all the memory DLLs that are detected during a scan. By default this option is enabled.
  - Select the **Signature** type to limit the download of files based on the signature (not available for Linux systems).

- Specify the **File Size Limit** to limit the download of files based on the file size. The file size limit should be between 1 KB - 10 MB.

- In the Response Action Settings category you can enable or disable the following actions:
  - Enable **Blocking** to prevent the execution of a malicious file on any host.
  - Enable **Network Isolation** to provide an option to isolate a compromised host during investigation.
- In the Endpoint Server Settings, configure your server:
  - Add the Endpoint server that the agent will communicate from the drop-down list.

    Note: If you do not select an Endpoint Server, the agent uses the default Endpoint Server that is configured during packager generation.
  - (Optional) Enter an alternative hostname or IP address.
  - Enter the HTTPS port used for communication.
  - Specify the HTTPS beacon interval.
  - Enter the UDP port used for communication.
  - Specify the UDP beacon interval.
  - **Advanced Setting** - For NetWitness Support staff only.

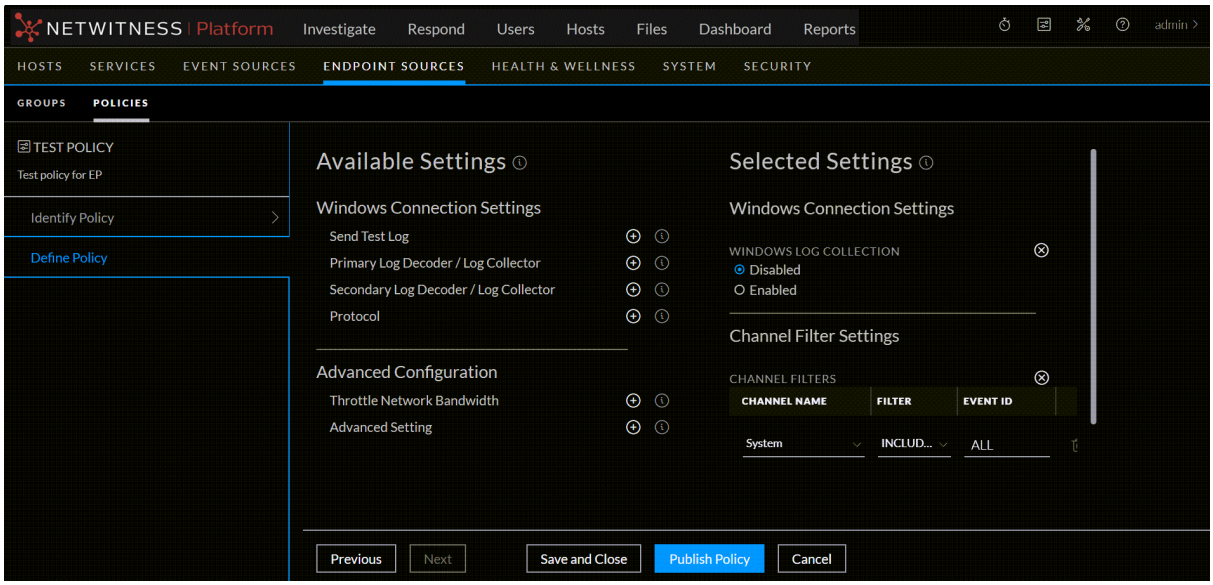
    IMPORTANT: It is strongly recommended not to use the Advanced Configuration unless advised to do so by NetWitness.

7. Do one of the following:
   - Click **Save and Close** to save the settings and return to the Policies view. The policy will be listed under the **Unpublished** category.
   - Click **Publish Policy** to publish the policy.

Create a Windows Log Policy

To create a Windows Log policy:

1. Go to  **(Admin) > Endpoint Sources**.
2. Click **Policies**. The available policies are displayed.
3. Click **Create New** to add a new policy.
4. In the New Policy panel, do the following:



- Select **Agent Windows Logs** as the source type from the drop-down list.
- Enter the policy name.
- Enter a description for the policy.

5. Click **Next**.

6. Click  to select a setting from list of **Available Settings**. After you click a setting it is moved under the **Selected Settings** panel. You need to enter the required values for the selected settings.

Note: You do not need to set all possible available settings within a single policy. The complete list of settings for an agent is derived from one or more groups to which that agent belongs. This is described in more detail in Construct a Policy.

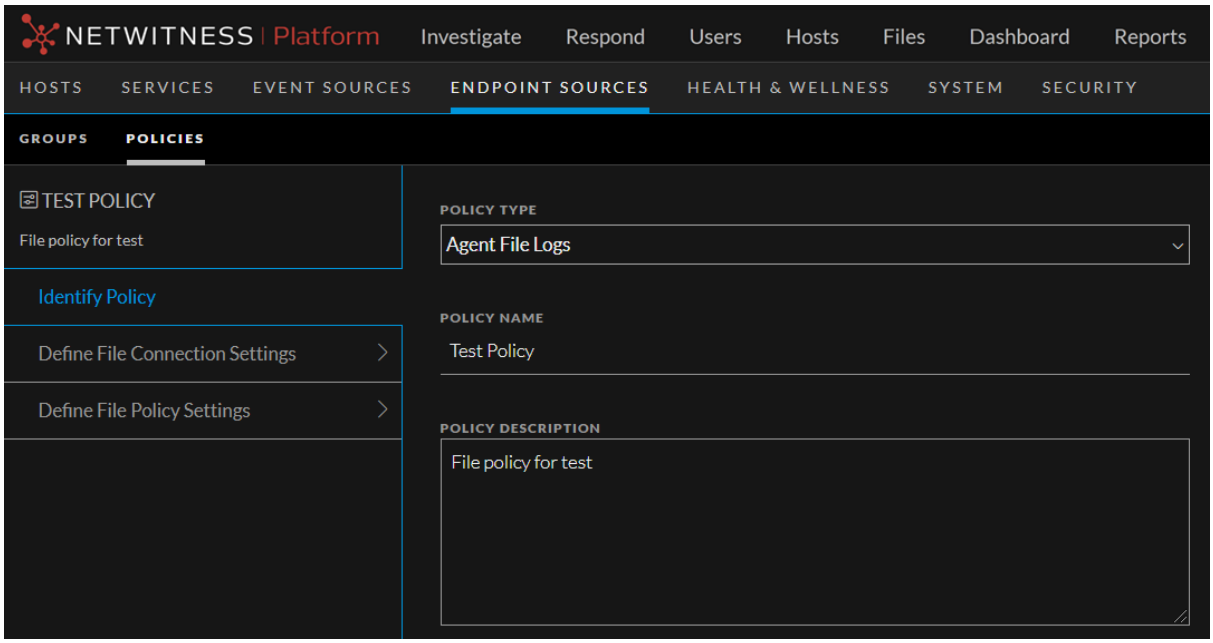
- Select **Windows Log Collection** to enable Windows Log collection. By default, this option is disabled.
- Enable **Send Test Log** to send a test log. By default, this option is disabled.
- Select **Primary Log Decoder / Log collector** to forward logs from the drop-down list.
- (Optional) Select **Secondary Log Decoder / Log collector** to forward logs from the drop-down list.

  Note: When the Endpoint Agent is configured to use the UDP protocol and the Primary Log Decoder/ Remote Log Collector is not reachable, the secondary Log Decoder or Log Collector is not functional. The logs are not forwarded to the secondary Log Decoder or Log Collector when the primary is down, thus resulting in the event loss.

- Select **Protocol** from the drop-down list. The available options are UDP, TCP, and TLS. By default, the protocol is TLS.
- Add **Channel Filters** and select the channels from which the logs are collected from the drop-down list. You can add or remove a channel filter and specify individual Event IDs.

- **Advanced Configuration**
  - **Throttle Network Bandwidth:** use this setting to limit network bandwidth that the Agent uses to connect to NetWitness. This setting is disabled by default: click **Enabled** to turn it on, and then enter a value in kilobits per second.
    - If not set, Agent does not do any network throttling.
    - If set to a positive value ***x***, agent limits network bandwidth to ***x*** kbps.
  - **Advanced Setting** - For NetWitness Support staff only.

    IMPORTANT: It is strongly recommended not to use the Advanced Configuration unless advised to do so by NetWitness.



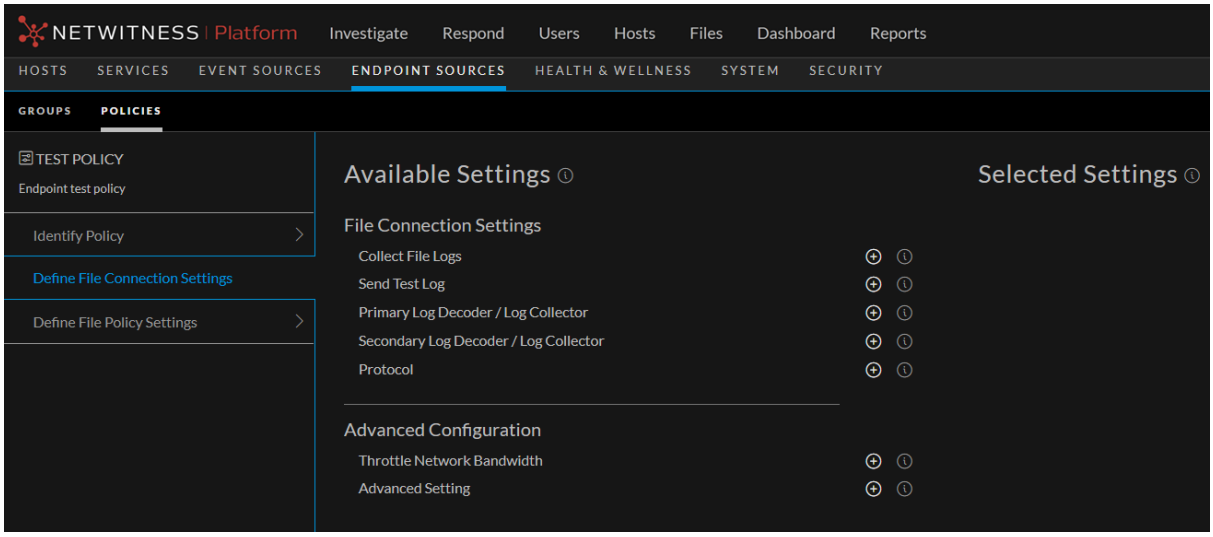
7. Do one of the following:
   - Click **Save and Close** to save the settings and return to the Policies view. The policy will be listed under the **Unpublished** category.
   - Click **Publish Policy** to publish the policy.

Create a File Log Policy

Note: You cannot create File Log policies while the system is in mixed mode. Until all Endpoint servers are updated to 11.4, the Agent File Logs options on the policy create, assign policy, and edit ranking pages are disabled.

To create a File Log policy:

1. Go to  **(Admin) > Endpoint Sources**.
2. Click **Policies**. The available policies are displayed.
3. Click **Create New** to add a new policy.
4. In the New Policy panel, do the following:

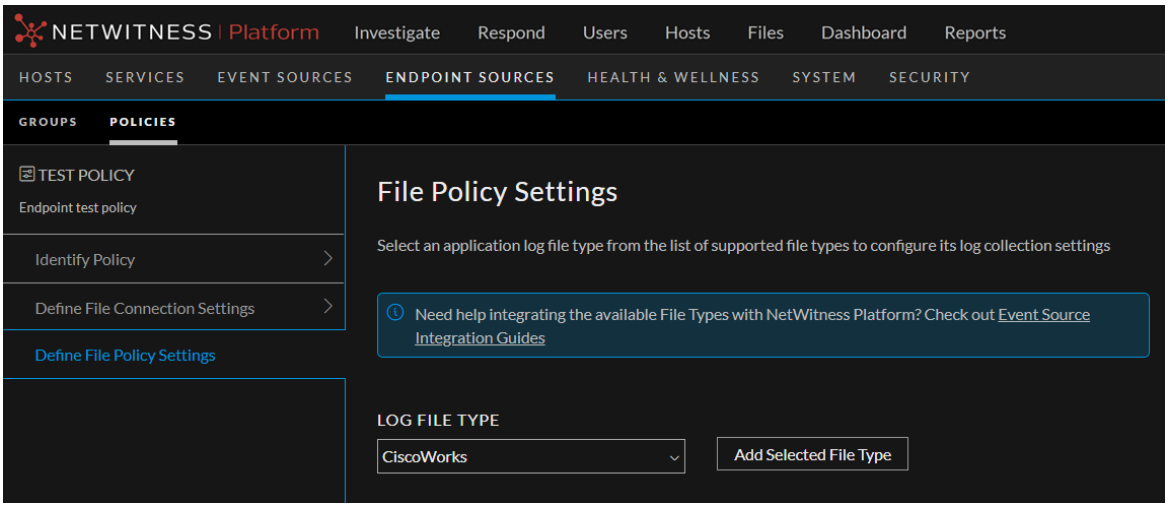


- Select **Agent File Logs** as the source type from the drop-down list.
- Enter the policy name.
- Enter a description for the policy.

5. Click **Next**.

6. Click  to select a setting from list of **Available Settings**. After you click a setting, the specific setting is moved under the **Selected Settings** panel. You need to enter the required values for the selected settings.

Note: You do not need to set all possible available settings within a single policy. The complete list of settings for an agent is derived from one or more groups to which that agent belongs. This is described in more detail in Construct a Policy.



- Enable **Collect File Logs** to collect file logs on endpoints assigned to this policy. By default, this option is disabled.
- Enable **Send Test Log** to send a test log. By default, this option is disabled.
- Select **Primary Log Decoder / Log collector** to forward file logs from the drop-down list.
- (Optional) Select **Secondary Log Decoder / Log collector** to forward file logs from the drop-down list.

  Note: When the Endpoint Agent is configured to use the UDP protocol and the Primary Log Decoder/Remote Log Collector is not reachable, the secondary Log Decoder or Log Collector is not functional. The logs are not forwarded to the secondary Log Decoder or Log Collector when the primary is down, thus resulting in the event loss.

- Select **Protocol** from the drop-down list. The available options are UDP, TCP, and TLS. By default, the protocol is TCP.
- **Advanced Configuration**
  - **Throttle Network Bandwidth:** use this setting to limit network bandwidth that the Agent uses to connect to NetWitness. This setting is disabled by default: click **Enabled** to turn it on, and then enter a value in kilobits per second.
    - If not set, Agent does not do any network throttling.
    - If set to a positive value ***x***, agent limits network bandwidth to ***x*** kbps.
  - **Advanced Setting** - For NetWitness Support staff only.

    IMPORTANT: It is strongly recommended not to use the Advanced Configuration unless advised to do so by NetWitness.

7. Click **Next**, and add the file type or types for the policy.
   a. Select a log file type from the list, then click **Add Selected File Type** to configure its log collection settings.

   For a list of currently supported event source types, see Endpoint Sources - Policies.

   b. Choose values for the available parameters.

- **Collect Logs**: Select **Enable** or **Disable**.
- **On First Connect**: Choose whether or not to collect older, historical data, or just new data. The default setting is to collect new data only.

  Note: New data is data that is collected starting from when you configure log collection for the specified event source.

- (Optional) **Log File Path**: Add a path for where the log files are stored. This is only necessary if the log files are not stored in the standard directory for the selected event source type. To add a path, click **Add Path** and enter a pathname.

  Note: This can be a Universal Naming Convention (UNC) pathname. (`\\host-name\share-name\file-path`).

  Click **Add Path** again to add another path. You can add as many paths as you like.

- **Exclusion Filters**: You can enter a newline-separated list of exclusion filters, which specify log files from which NetWitness should not be collecting data.

  Note: The filter needs to be entered as a valid regex string, or the system will not allow you to save it.

- Advanced Settings: note that most users do not need to set these parameters.
  - **Source Alias**: For most installations, this value is not needed. Use this to specify a unique event source name, in the case you have multiple event sources of the same type, for example two IBM WebSphere MQ event sources in the same NetWitness installation.
  - **File Encoding**: Select a type of file encoding. You can choose from a wide variety of encodings. The default value is **UTF-8/ASCII**.

For more details on the available parameters, see Panels for Log File Policy.

c. You can add more file types to the policy. After you have added all your file types, proceed to the next step.

8. Do one of the following:

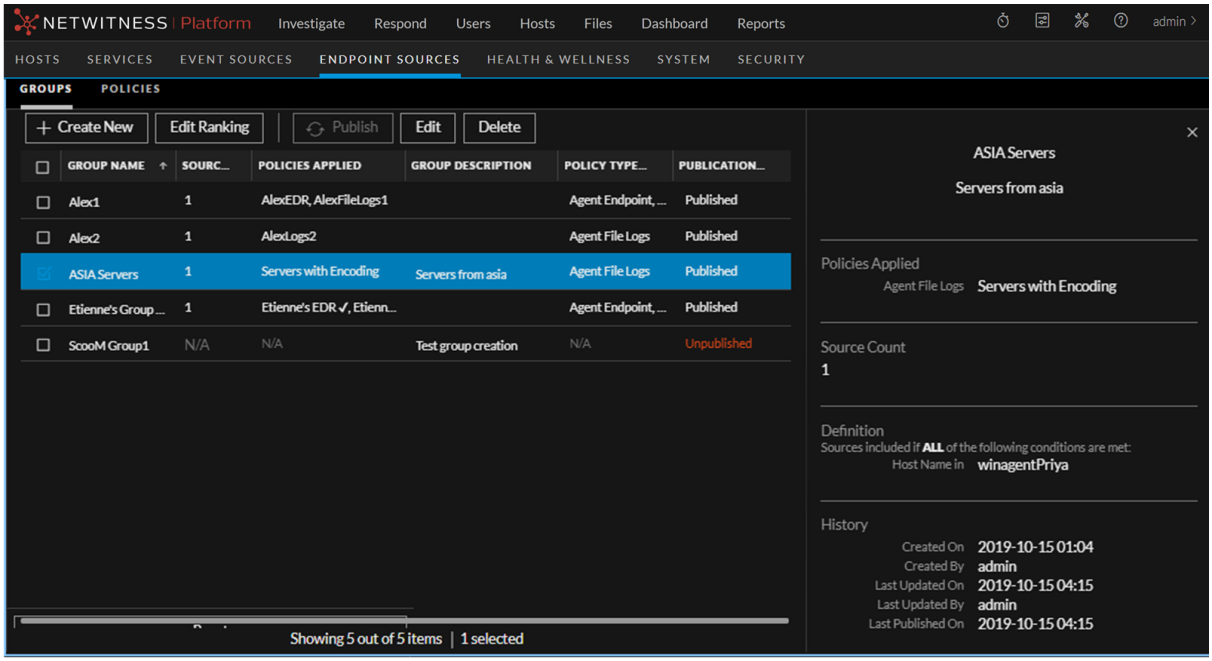
- Click **Save and Close** to save the settings and return to the Policies view. The policy will be listed under the **Unpublished** category.
- Click **Publish Policy** to publish the policy.

Replace Windows SFTP Agents

Note that you might want to replace the SFTP Agent for Windows with the NetWitness Endpoint Agent for collection from file event sources. If so, perform the following procedure:

1. Using the File Collection Policy wizard (as described below), configure file collection for your event sources.
2. Verify that collection is working.
3. On each of your event sources, stop the SFTP service.

Managing Groups



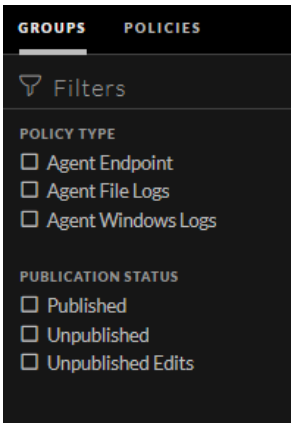
Note: The information in this topic applies to NetWitness Version 11.3 and later.

You can view group details, edit group details, filter endpoint groups, delete groups, and edit group ranking. For details on how to create groups, see Create a Group.

View Group Details

To view properties of the selected group:

1. Go to **(Admin) > Endpoint Sources**.
2. In the left panel, select the **Groups** tab. The details, such as group name, source count, policies applied, group descriptions, source type applied, and publication status are displayed. For more details on these columns, see Endpoint Sources - Groups.
3. Click the row to view the properties in the right-panel.



Filter Endpoint Groups

The Filters Panel allows you to filter the list of displayed groups, based on the one of the following source type:

- Agent Endpoint
- Agent Windows Logs

Additionally, you can sort based on publication status:

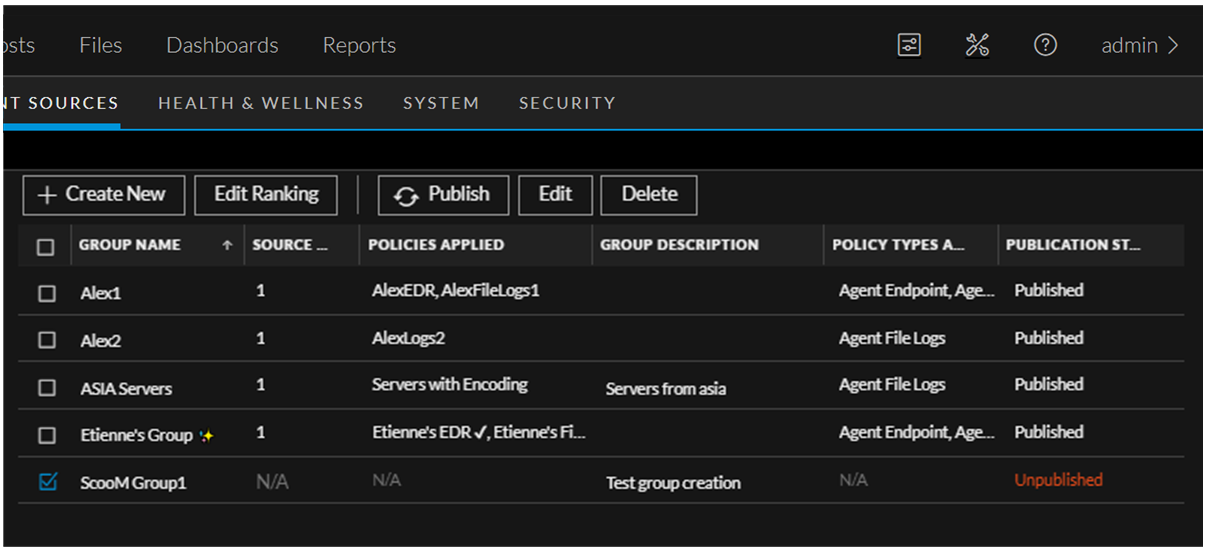
- Published - Groups that are published to use.
- Unpublished - Groups that are saved but not published.
- Unpublished Edits - Groups that are previously published and edited later and saved, but not published.

The Filters panel can be hidden or displayed:

- To hide, click the icon at the top-right of the panel.
- To display if hidden, click the icon in the toolbar.

Click **Reset Filters** to remove the currently applied filter criteria.

Edit a Group



You can edit the properties of the group at any point in time. To edit properties of a group:

1. Go to **(Admin) > Endpoint Sources**.
2. Select a group and click **Edit**.
3. Edit the group details as required.
4. Do one of the following:
   - Click **Save and Close** to save the changes and return to the Groups view. The group will be listed under the **Unpublished Edits** category.
   - Click **Publish Now** to publish the changes.

Delete a Group

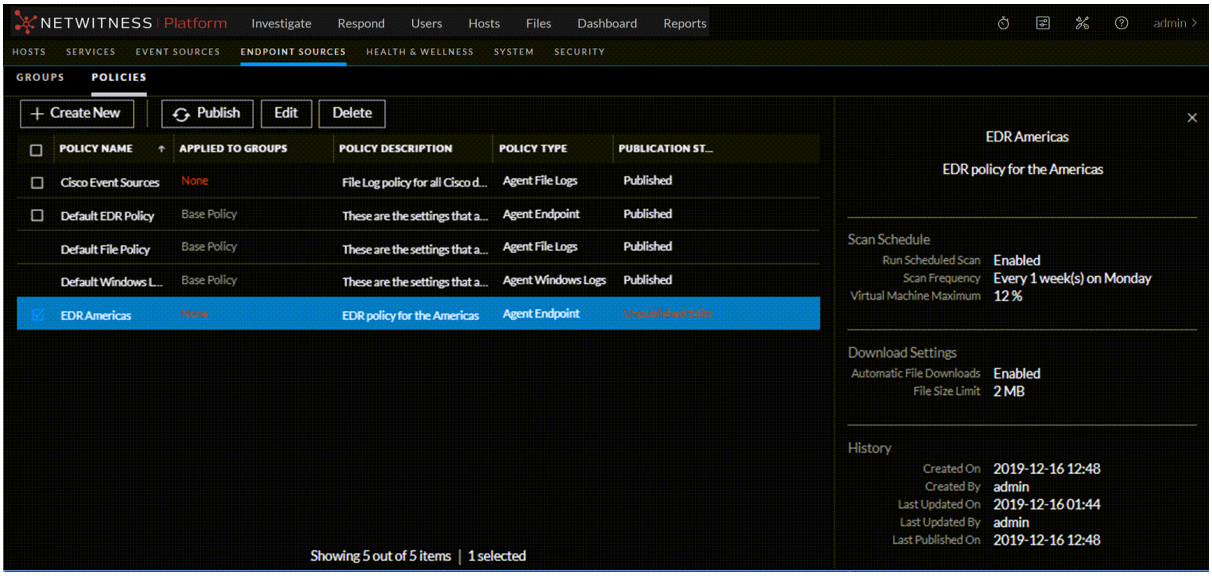
To delete a group:

1. Go to **(Admin) > Endpoint Sources**.
2. The **Groups** tab and available groups are displayed.

3. Select one or more groups and click **Delete**.
4. Click **Delete**. The confirmation message is displayed.
5. In the Delete Groups dialog, click **Delete Group(s)** to permanently delete the selected groups.

Managing Policies

Note: The information in this topic applies to NetWitness version 11.3 and later. Policies are not applicable on standalone agents.



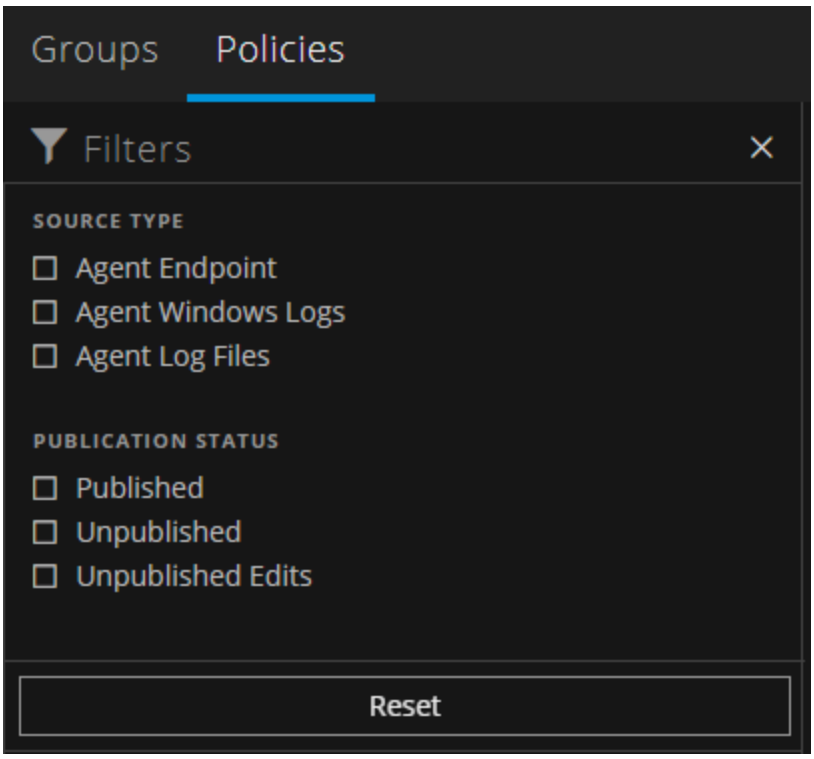
You can view, edit, filter, and delete policies, as detailed in the following sections:

- View Policy Details
- Filter Policies
- Edit a Policy
- Delete a Policy
- Conflict Resolution

View Policy Details

To view properties of the selected policy:

1. Go to **(Admin) > Endpoint Sources**.
2. In the left panel, select the **Policies** tab. The details, such as policy name, applied to groups, policy description, source type, and publication status are displayed. For more details on these columns, see Endpoint Sources - Policies.
3. Click the row to view details about selected policy in right pane.



Filter Policies

The Filters Panel allows you to filter the list of displayed policies, based on the source type. You can filter on any combination of the following:

- Agent Endpoint
- Agent File Logs
- Agent Windows Logs

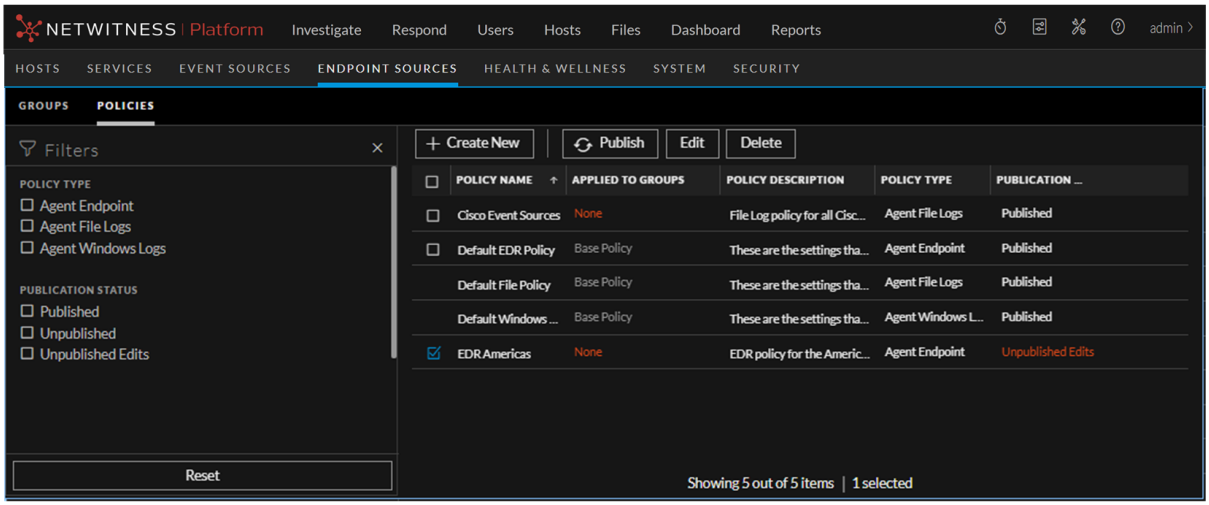
Additionally, you can filter based on publication status:

- Published: Policies that are published to use.
- Unpublished: Policies that are saved but not published.
- Unpublished Edits: Policies that are previously published and edited later and saved, but not published.

The Filters panel can be hidden or displayed:

- To hide, click the icon at the top-right of the panel.
- To display if hidden, click the icon in the toolbar.

Click **Reset Filters** to remove the currently applied filtering criteria.



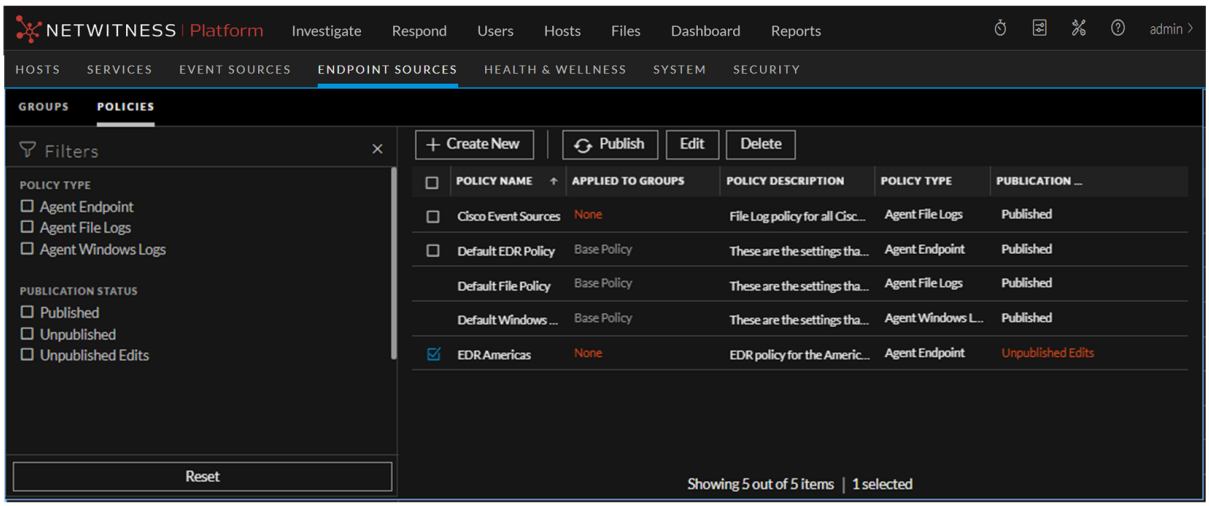
Edit a Policy

You can edit the settings of the default Agent Endpoint and custom policies. The default Agent Windows Log policy cannot be edited.

Note: For the default EDR policy, you cannot edit the source type, policy name, and policy description. However, you can edit the details in the Define Policy panel.

To edit a policy:

1. Go to **(Admin) > Endpoint Sources**, and select the **Policies** tab.
2. Select a policy and click **Edit**.



3. Edit the policy details as required.
4. Do one of the following:
   - Click **Save and Close** to save the changes and return to the Policies view. The policy will be listed under the **Unpublished Edits** category.
   - Click **Publish Policy** to publish the changes.

Delete a Policy

To delete a policy:

1. Go to **(Admin) > Endpoint Sources**.
2. Click the **Policy** tab. The available policies are displayed.

3. Select one or more policies and click **Delete**.

   The confirmation message is displayed.

4. In the Delete Policies dialog, click **Delete Policy(ies)** to permanently delete the selected policies.

Conflict Resolution

An endpoint can be in more than one group, and can thus have more than one Agent Endpoint, Agent File Logs, or Windows Logs policy applied to it. In this case, there may be conflicting settings that could be applied to the endpoint.

For example, an endpoint that is in two Groups could have two, different File Log policies applied to it. In this case, some of the settings could have conflicting values. The value that is actually applied to the endpoint is determined by the highest-ranked policy that contains a value for that setting.

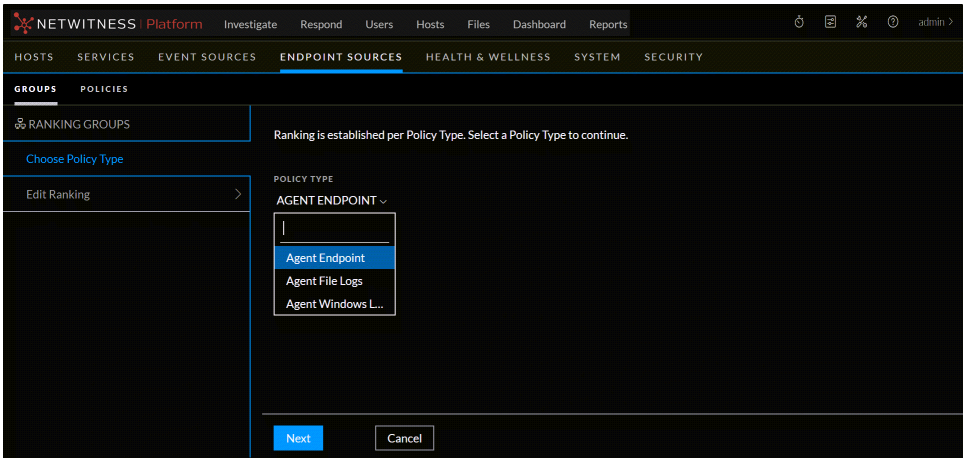
For example, assume there is an endpoint that has 2 Agent File Log policies applied to it:

- LF Policy One: Log File Type is webgateway, and **File Encoding** is set to UTF-8
- LF Policy Two: Log File Type is webgateway, and **File Encoding** is set to Local Encoding

How NetWitness assumes the webgateway logs are encoded is dependent upon which policy is ranked higher:

- If Policy One is ranked higher than Policy Two, NetWitness treats the logs as having UTF-8 encoding.
- If Policy Two is ranked higher than Policy One, NetWitness treats the logs as having Local Encoding.

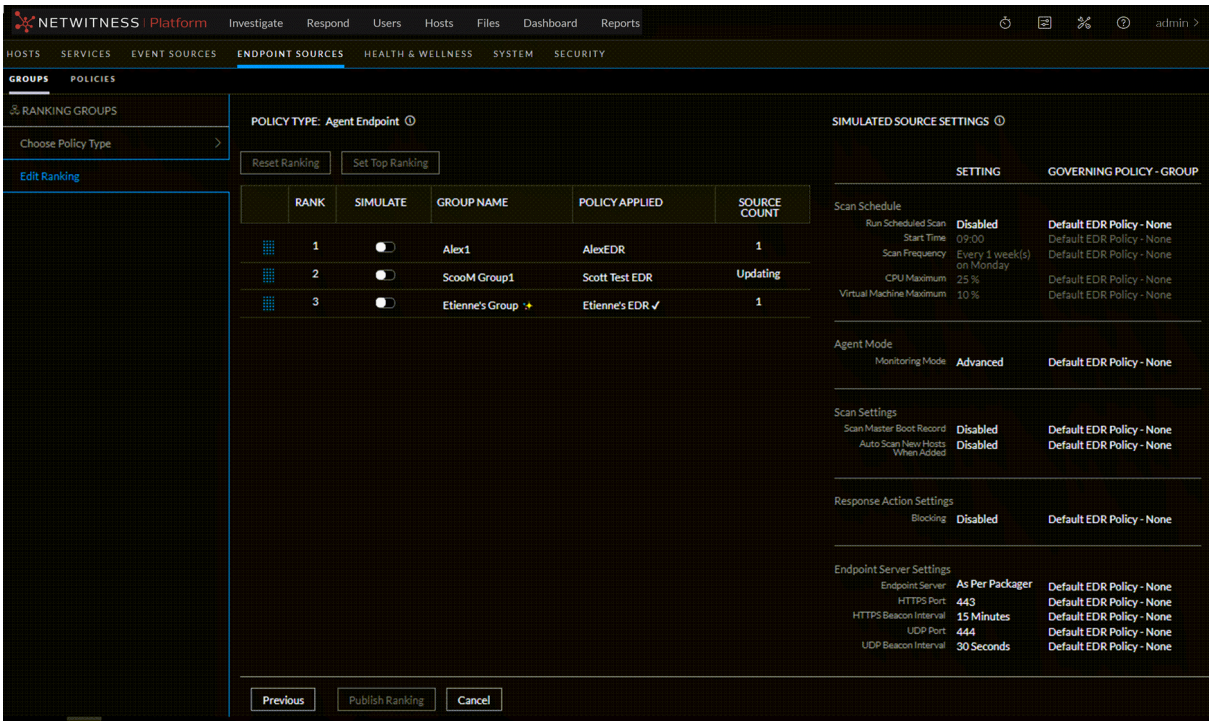
For an example using EDR policies, see Simulation Examples, which shows how you can preview the settings that would be applied before actually changing any policy rankings.



Change Policy Ordering for Groups

An endpoint agent can be included in multiple groups. And these groups can have different policies applied to them. In this case, you can edit the ordering or ranking of policies, to specify a hierarchy for your policies.

Edit Ranking



To edit the ordering or ranking of a group:

1. Go to  **(Admin) > Endpoint Sources**.
2. Select the Groups tab and click **Edit Ranking**.
3. Select one of the following source type for the drop-down list:
   - **Agent Endpoint** to rank the groups associated with Agent Endpoint type policies.
   - **Agent Windows Logs** to rank the groups associated with Agent Windows Log type policies
   - **Agent Log Files** to rank the groups associated with agents that are using File Collection.

4. Click **Next**.

   The Ranking view is displayed:

You can simulate your policy settings and how they affect the endpoints within their groups. This gives you the ability to preview how your changes to the ranking will affect the policy settings applied to each hypothetical agent.

5. You can manipulate the sliders to simulate different options. You can select the slider in the **Simulate** column for each group into which a hypothetical agent would fall, and drag it to the right to simulate turning on that policy.

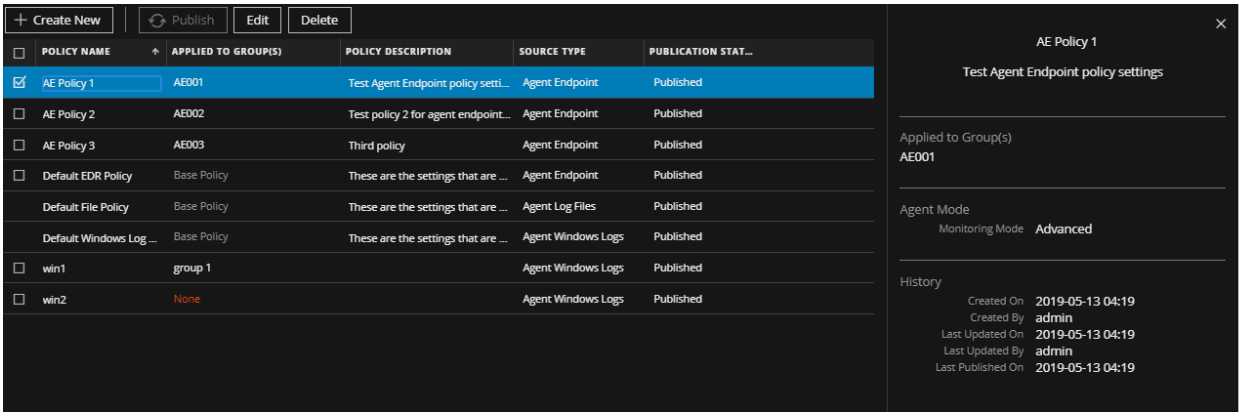
   This image shows all policies being simulated:

6. Reorder your groups as necessary.
   a. Select anywhere within a group's row.
   b. Drag the group up or down to change the priority. Priority decreases from top to bottom.
   c. Repeat moving groups until they are ordered as you prefer.

   Note: To move any group to the top, select the group and click **Set Top Ranking**.

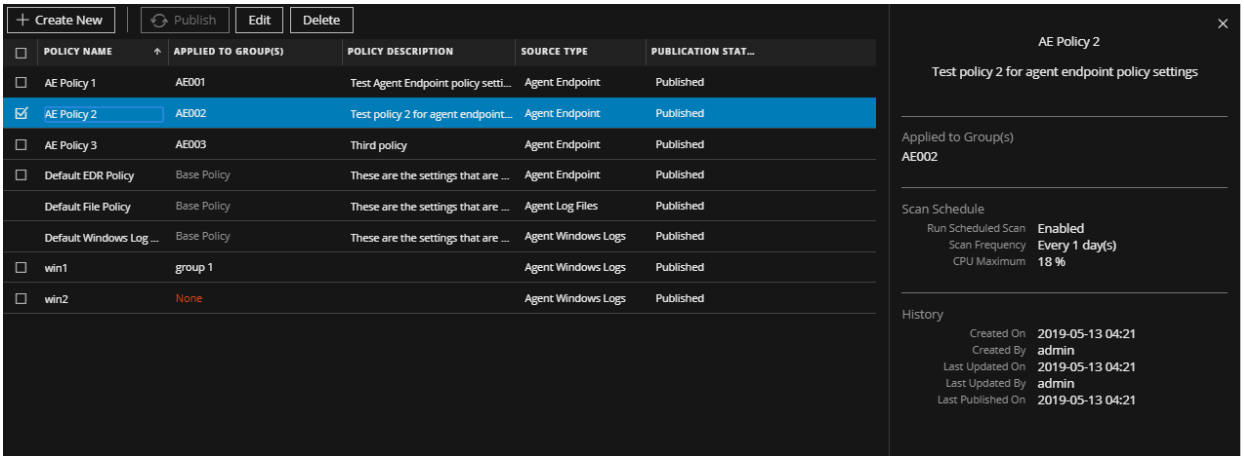
7. As you change the rankings for your groups, you can preview how the policy settings would change based on your new rankings. For example, assume each of the following scenarios:
   - If you have a hypothetical agent that belongs in group 1, simulate only group 1 to see which policies would affect that agent.
   - If you have a hypothetical agent that belongs in group 1 and group 2, simulate both group 1 and group 2 to see how policies would be applied for that agent.
8. After you have specified the optimal ranking order, you can publish the new ranking.

Simulation Examples



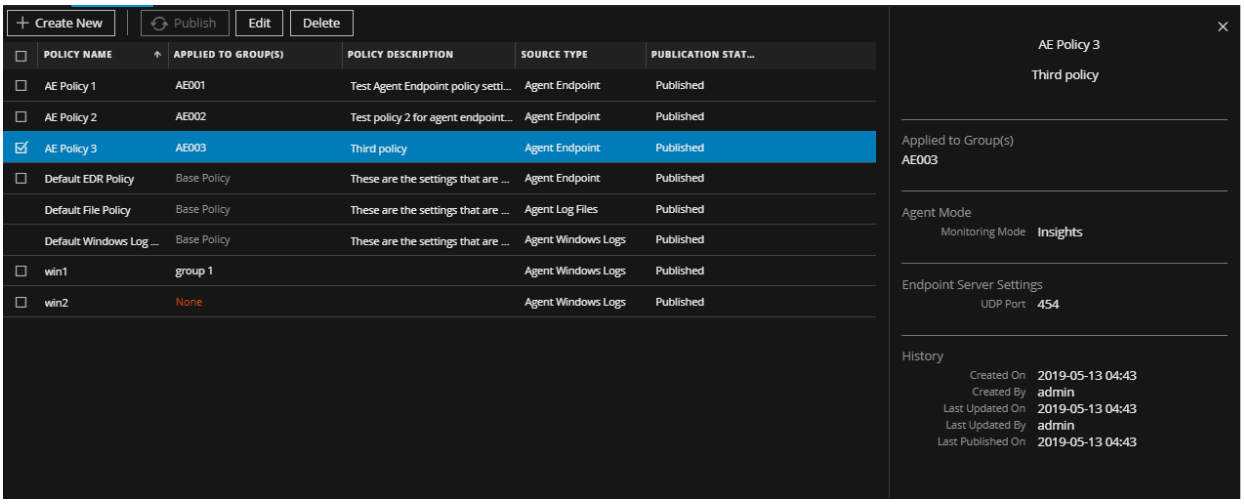
This section contains simulation examples for Agent Endpoint policies and Agent Log policies. Note that Windows policies have the same behavior as Agent Endpoint policies.

Agent Endpoint Policies Examples



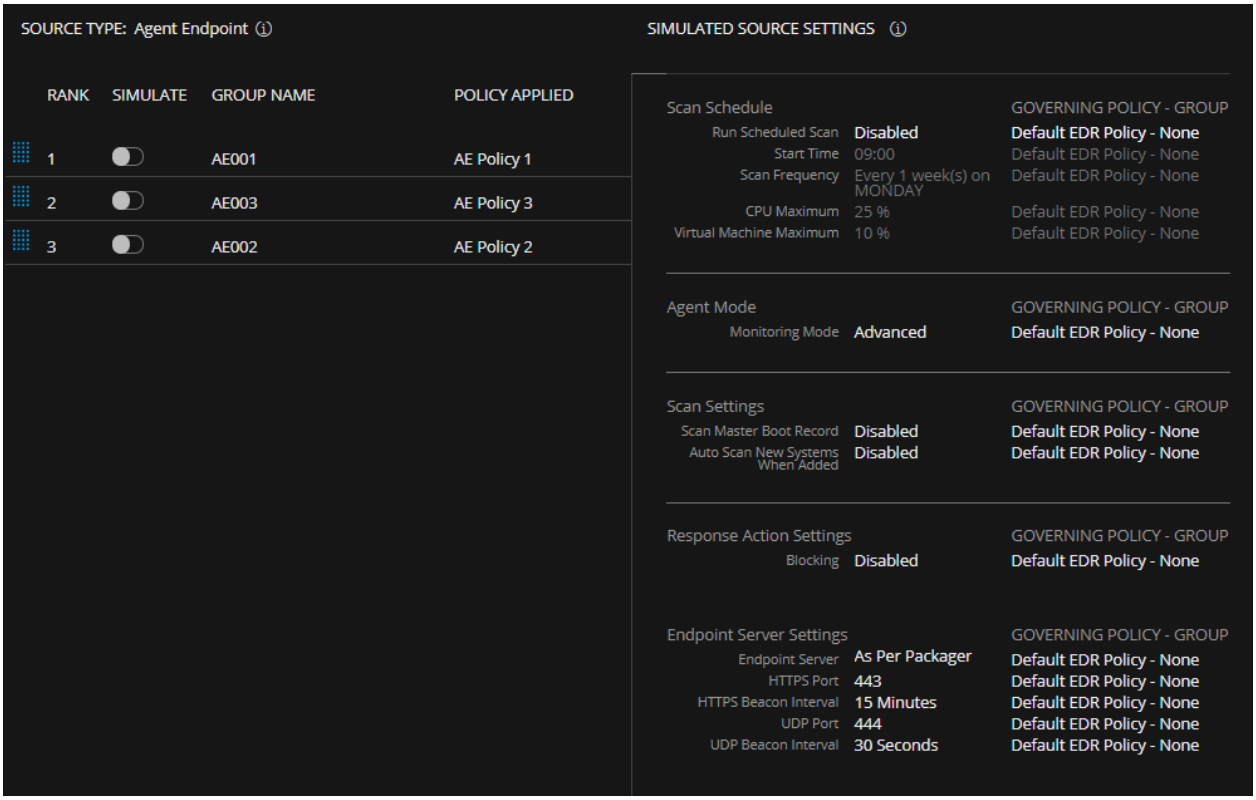
The **Simulated Source Settings** panel shows each individual policy setting, along with the governing policy for each setting.

Examine **AE Policy 1**, **AE Policy 2** and **AE Policy 3** to see which values are set in those policies.

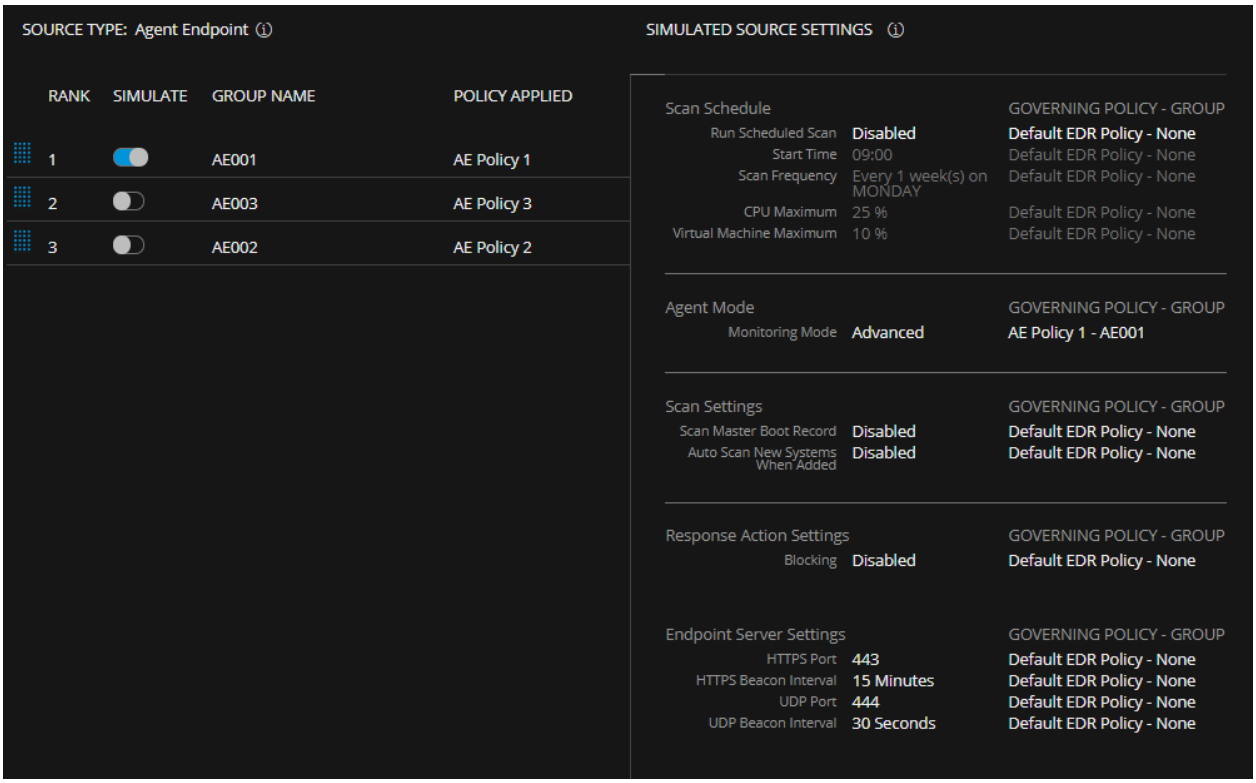


AE Policy 1 has Agent Mode set:

AE Policy 2 has a scan schedule set, as well as limiting the CPU maximum to 18%:



AE Policy 3 has Agent Mode set (to **Insights**), and sets the UDP Port to **454**:



No Settings Applied

When none of the policies are simulated, you can see that the Default EDR Policy governs all behavior.

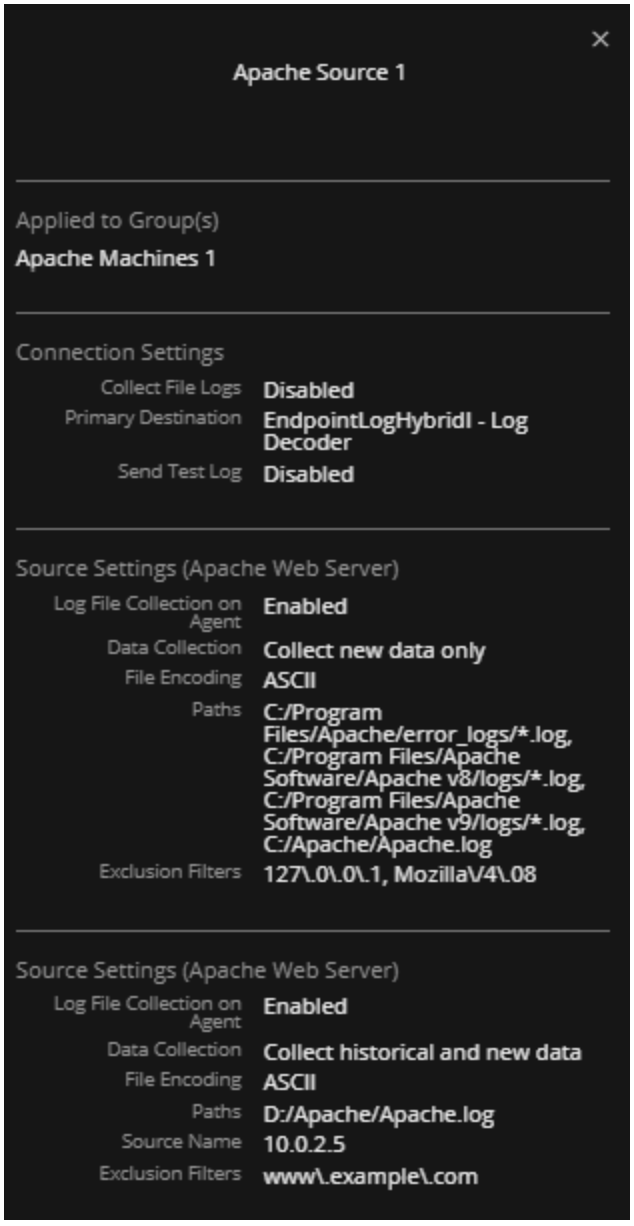
Simulate a Single Policy

When you select the AE001 Group, you can see that the values set in AE Policy 1 govern the behavior Agent Mode, as well as the Default EDR Policy being used for all unset parameters.

Simulate Multiple Policies

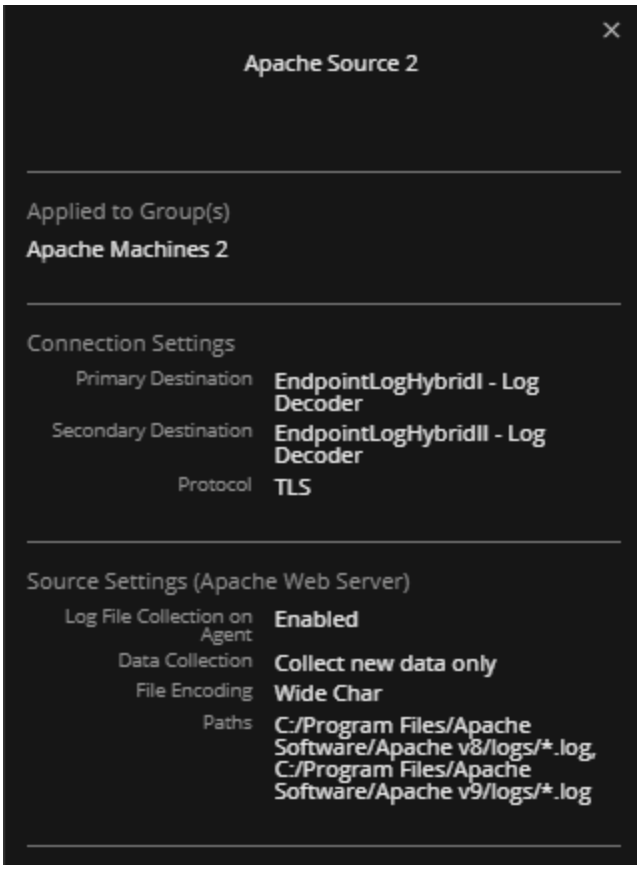
When you select multiple groups and policies, you can see the effects of each policy, based on the current ranking.

You can see that Agent Mode is set to **Insights**: this is because **AE Policy 3** is ranked above **AE Policy 1**, so the higher ranked policy's setting is used. None of the other parameters are set in more than a single policy, so for those, each policy's setting is used. Since **AE Policy 1** only has Agent Mode set—and **AE Policy 3** ranks higher and sets a different value—**AE Policy 1** does not govern any of the EDR settings. And finally, for parameters not set in any of the simulated policies, the Default EDR Policy settings are used.



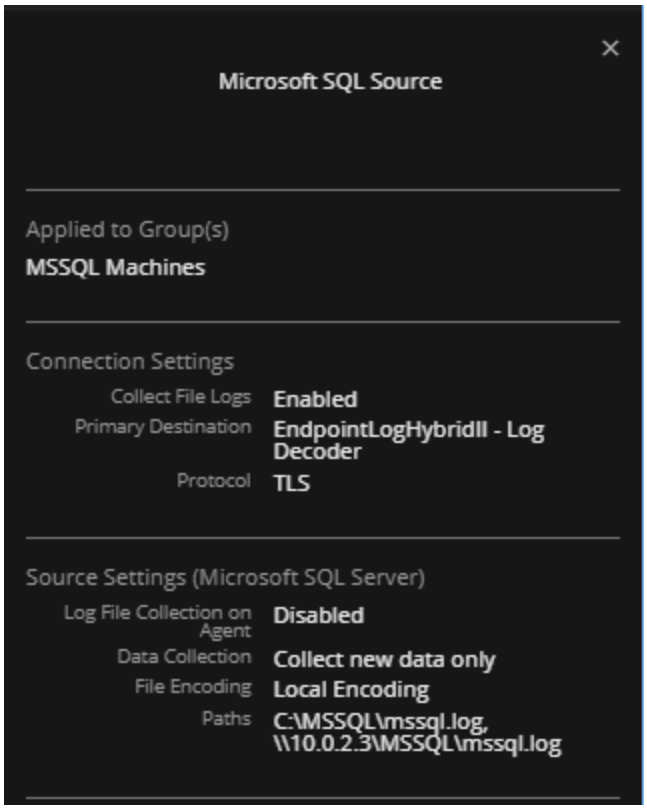
File Log Policies Simulation Example

The collection of parameter values into a complete policy works a bit differently for File Log policies than for EDR or Windows policies. To determine which values are applied from which policies, note the following:



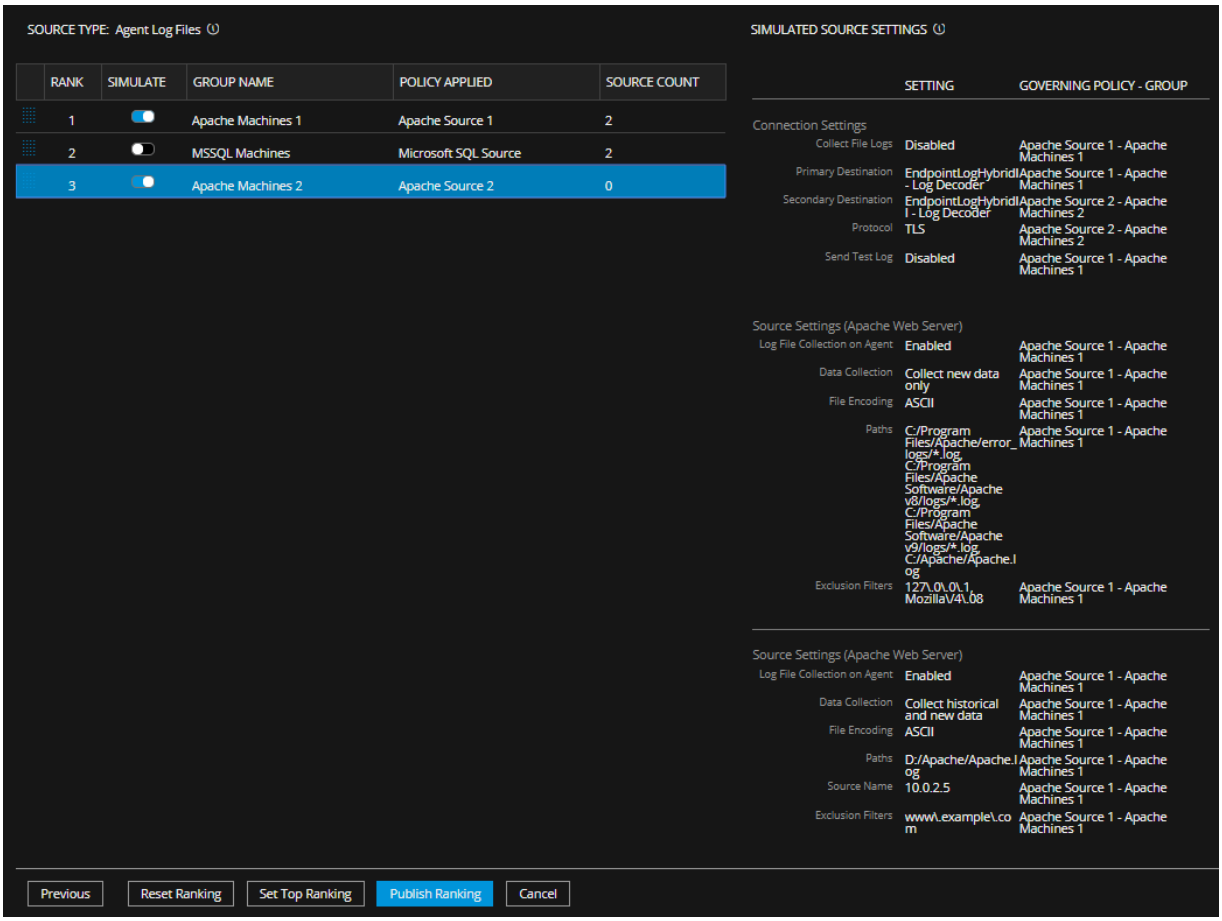
- Each event source type acts as a separate setting. That is, if a policy has values for both Apache and Access Manager, for example, each of those event source types is treated as a separate set of values.
- When an endpoint inherits values, it might not only get values from the highest ranked policy that has a value set. It might, for example, inherit Apache values from one policy, and Access Manager settings from another.
- If you consider a set of File Log policies that all include settings for the same event sources, then they behave the same as EDR and Windows policies.

Consider the following example, where there are three log file policies—two with Apache source types and one with MS SQL event source type.

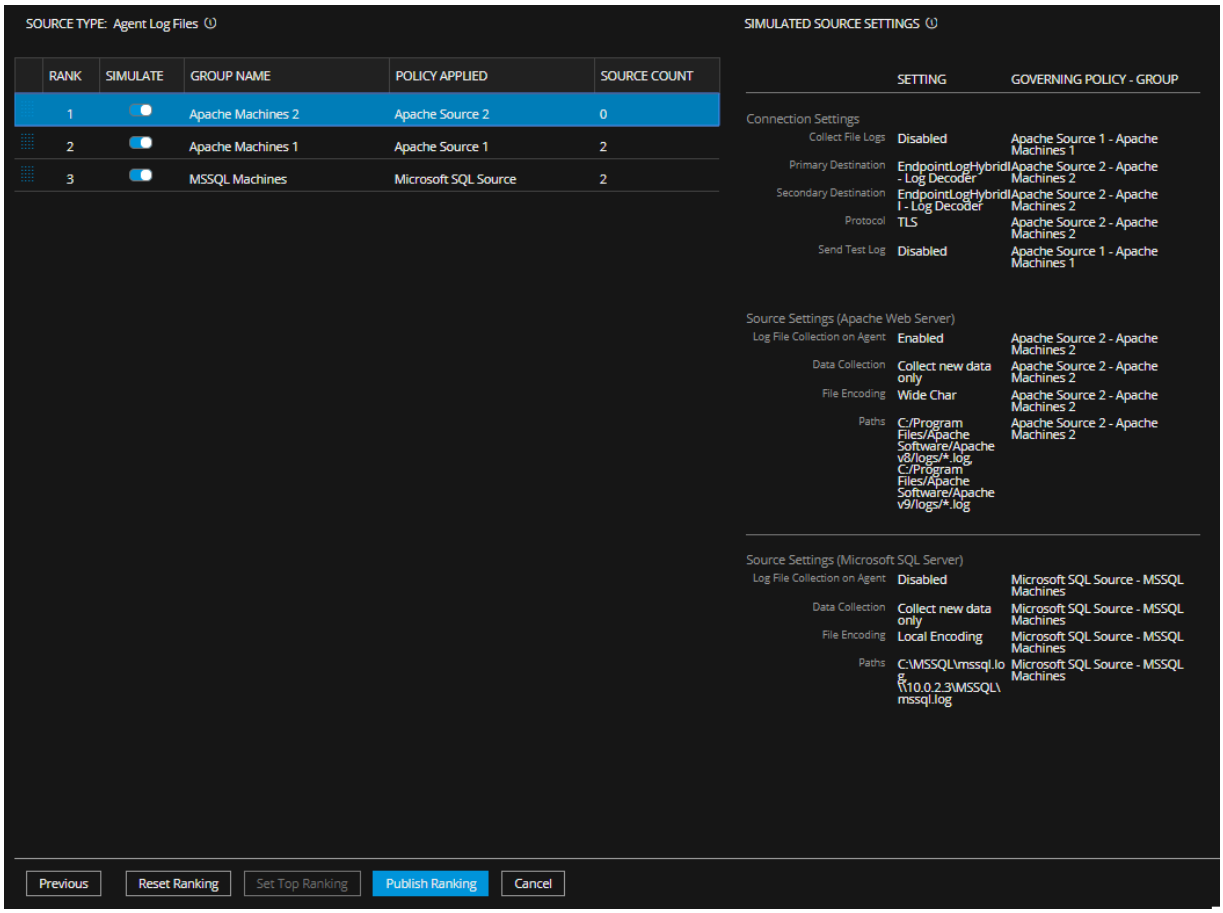


- File policy **Apache Source 1**:

- File policy **Apache Source 2**:



- File policy **Microsoft SQL Source**:



Examine two of the possible ranking orders:

- Simulate policies 1: **Apache Source 1**, 2: **Apache Source 2**. Note that in this case, the MS SQL policy is not simulated.

In this case, all Apache settings for the group are inherited from the **Apache Source 1** policy.

- Move the **Apache Source 2** policy higher than **Apache Source 1** policy, and add the **Microsoft SQL Source** policy. Simulate policies 1: **Apache Source 2**, 2: **Microsoft SQL Source**, 3: **Apache Source 1**.

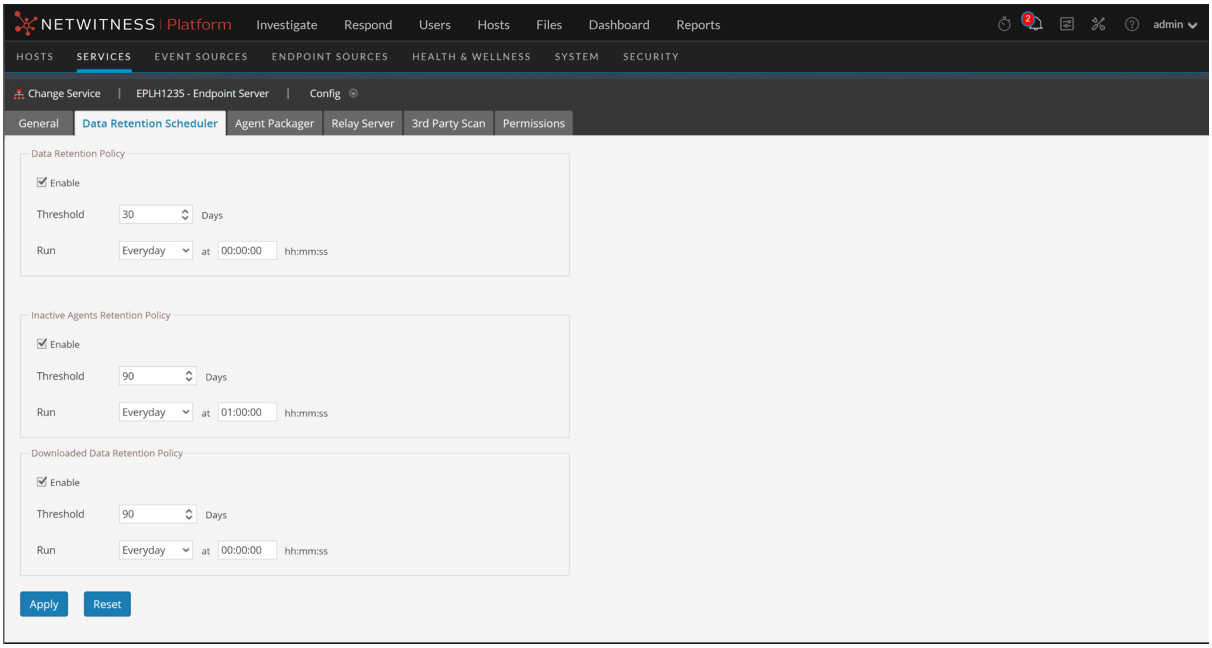
In this case, all Apache settings for the group are inherited from the **Apache Source 2** policy, and groups also get the MS SQL settings.

So, the Apache settings are inherited from the highest ranked Apache policy **only**, but the source settings as a whole are **combined** to include settings from each event source type.

The SIMULATE Slider

The slider has two positions:

- On: 
- Off: 



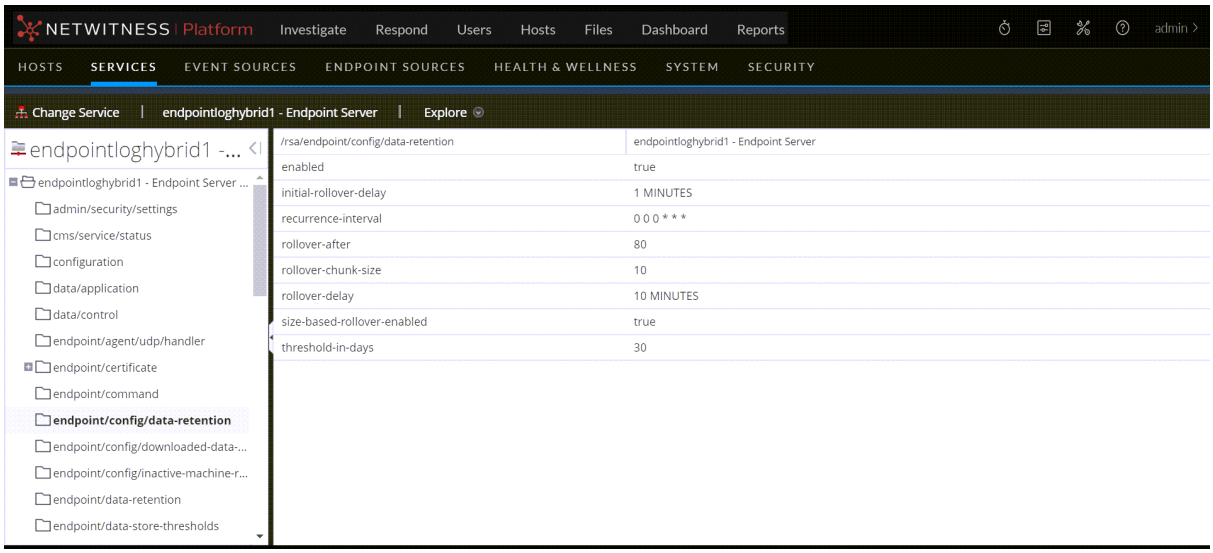
If the simulate slider is ON for a policy, that policy's values are factored into the complete set of governing settings. If the slider is OFF for a policy, the setting for that policy have no effect on the list of the governing settings.

Configuring Data Retention Policy

An administrator can configure the retention policies to retain the Endpoint data based on the age or the storage size. By default, days and size-based retention policies are enabled.

To change the configuration for age-based retention:

1. Go to **(Admin) > Services**.
2. In the Services view, select the **Endpoint Server** service.
3. Click and select > **View** > **Config**.
4. Click the **Data Retention Scheduler** tab.

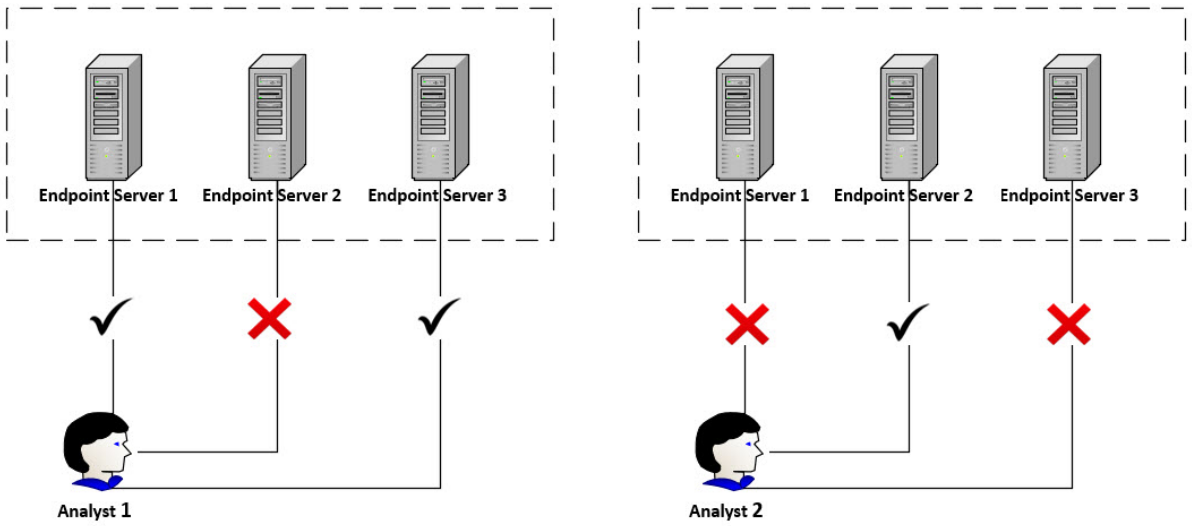


5. In the **Data Retention Policy** panel, by default, the **Threshold** is set to 30 days, and **Run** to Everyday. This means only 30 days of Endpoint data is retained and the older data is deleted from the database.
6. Click **Apply**.

To change the configuration for size-based retention:

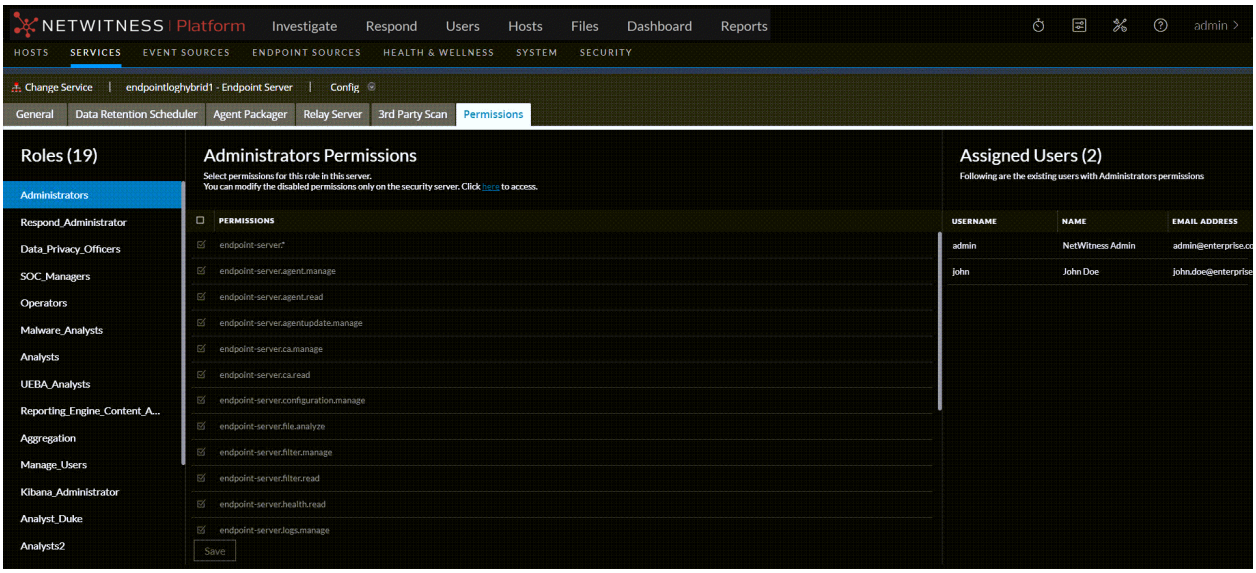
By default, for the size-based retention, the `rollover-after` value is set to 80 and `rollover-chunk-size` is set to 10. This means that when the storage size exceeds 80 percent of the space allocated for the disk partition, 10 percent of the older Endpoint data is deleted from the database. However, you can change these values as follows:

1. Go to **(Admin) > Services**.
2. In the Services view, select the **Endpoint Server** service.
3. Click and select > **View > Explore**. The Explore view is displayed:



4. In the left panel, select **endpoint/config/data-retention**.
5. Edit the configurations based on your requirements.

Manage Role Permissions at Endpoint Server Level

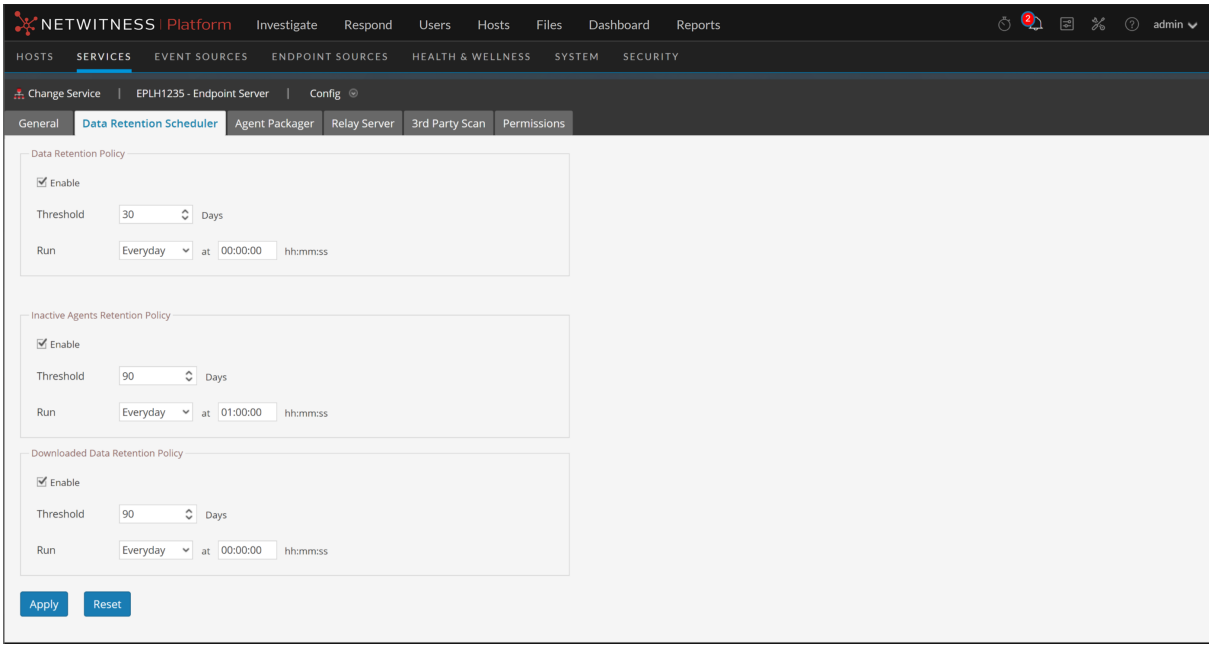


NetWitness Platform version 11.7 and later provides more flexibility for managing RBAC (Role-Based Access Control). This enhancement enables you to grant/revoke access for any role at individual endpoint server levels in an environment rather than all. On the **admin > Config** view for any endpoint server, you can navigate to the **Permissions** tab and manage a significant number of permissions for the selected endpoint server. A new permission called **endpoint-server.file.analyze** lets the user perform file analysis activities(Analyze Files, Save a Local Copy and Initiate OPSWAT Scans), allowing more flexible options to manage user permissions. Refer to Manage Users with Roles and Permissions on the *System Security and User Management Guide* for more information.

The following illustrations show how you can set permissions at the endpoint server level for an analyst.

To configure permissions at the endpoint server level:

1. Go to **(Admin) > Services**.
2. In the Services view, select the Endpoint Server service.
3. Click  and select **View > Config**.
4. Navigate to **Permissions** tab.
5. Select a role from the **Roles** pane on the left. (For more information on managing roles, refer (Optional) Add a Role and Assign Permissions in *System Security and User Management Guide*.)
6. Select the permissions from the **PERMISSIONS** section (Center pane).
7. Click **Save**. The **Assigned Users** pane on the right shows the list of users assigned with the selected role and permissions.
8. Repeat steps **5 – 7** if you want to modify permissions to any role. Make sure you save the changes before navigating out of the current role.



Note: Some of the permissions on the Permissions tab are disabled, and you can modify them only on the Security server (Admin > Security). All other permissions listed here are editable on both the Security server and the Permissions tab. For more information on managing permissions and on the NetWitness Platform, see *System Security and User Management Guide*.

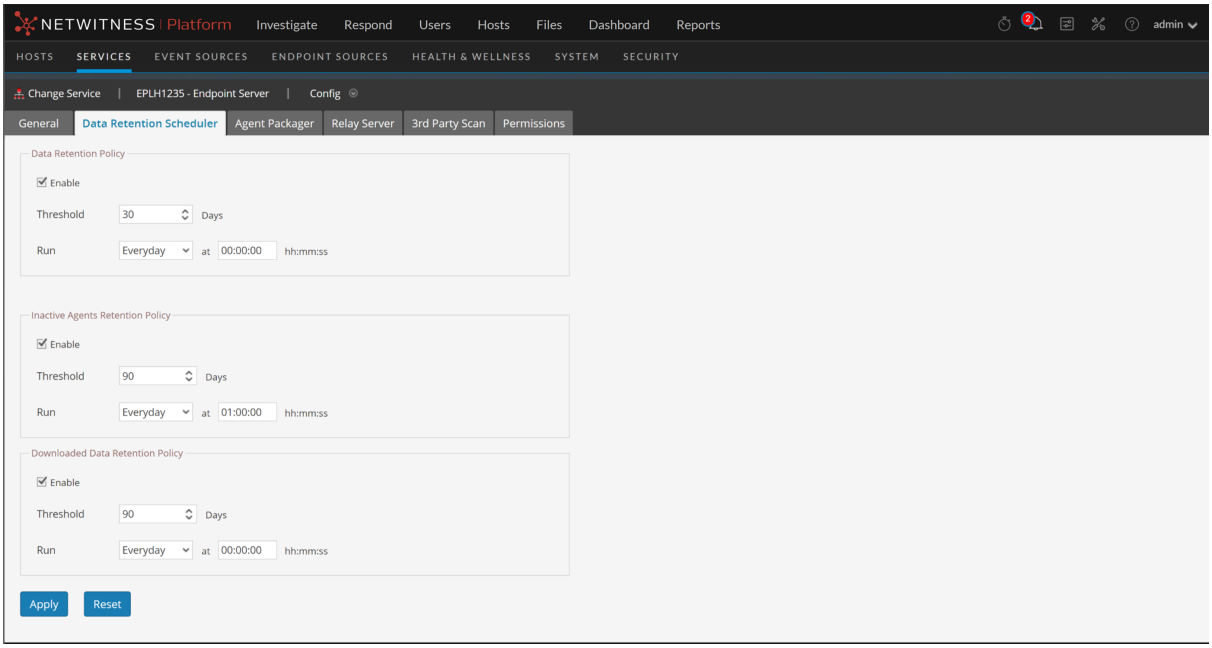
Managing Inactive Agents

An administrator can configure the inactive agent retention policy to delete data of agents that are inactive, from the Endpoint Server. On deletion, the Endpoint Server stops collecting data from these agents. By default, this option is enabled.

To configure the inactive agent retention policy:

1. Go to  **(Admin) > Services**.
2. In the Services view, select **Endpoint Server**.
3. Click  and select > **View** > **Config**.
4. Click the **Data Retention Scheduler** tab.

5. In the **Inactive Agents Retention Policy** panel, by default, the **Threshold** is set to 90 days and **Run** to Everyday. This means that the data of agents that have not communicated with the Endpoint server for 90 days is deleted from the database.
6. Click **Apply**.



Note: The Inactive Agents Retention Policy is not applicable for NetWitness Endpoint 4.4.0.2 or later agents.

Configure Retention Policy for Downloaded Files

An administrator can configure the retention policy to delete the downloaded files from the Endpoint server based on the number of days. By default, this option is enabled.

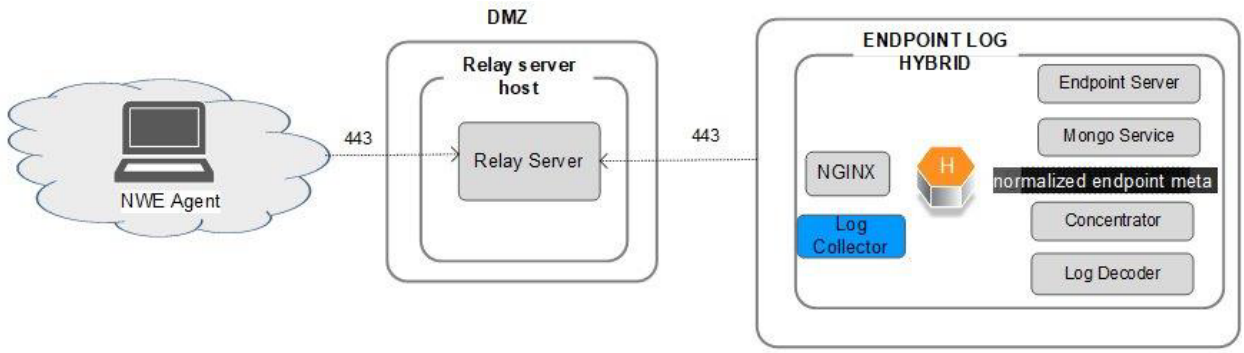
To configure the retention policy:

1. Go to  **(Admin) > Services**.
2. In the Services view, select **Endpoint Server**.
3. Click  and select > **View** > **Config**.
4. Click the **Data Retention Scheduler** tab.

5. In the **Downloaded Data Retention Policy** panel, by default, the **Threshold** is set to 90 days and **Run** to every day. This means only 90 days of data is retained and the older data is deleted from the Endpoint server.
6. Click **Apply**.

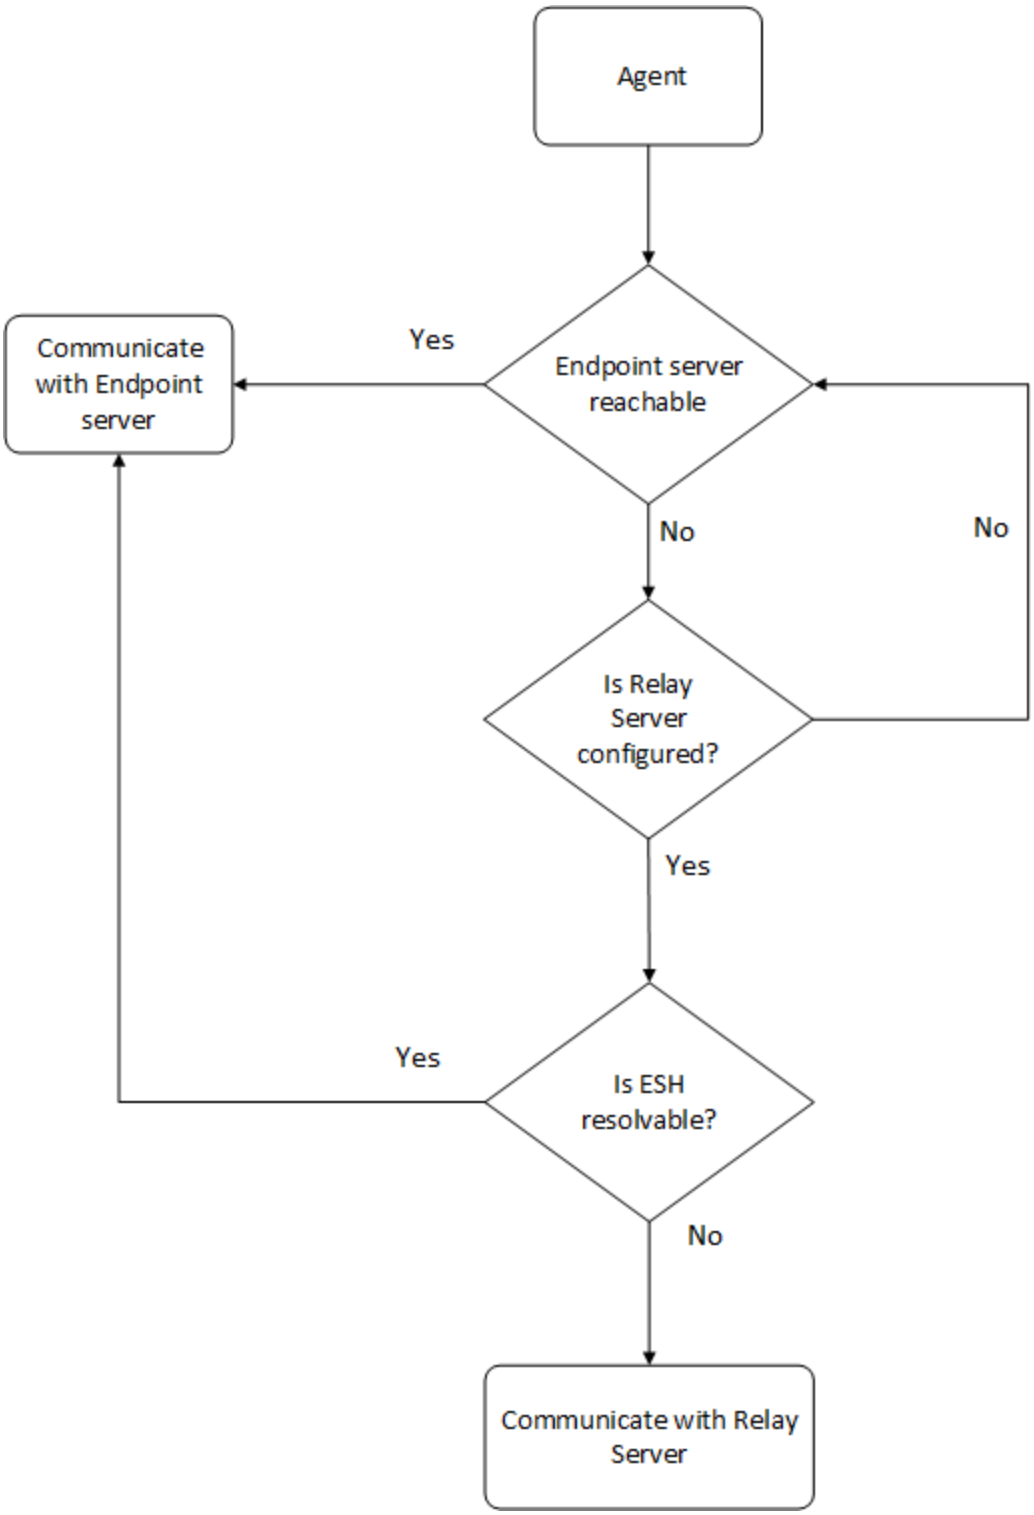
(Optional) Installing and Configuring Relay Server

Note: The information in this topic applies to NetWitness Version 11.3.1 and later.



Relay Server (referred to as RAR in NetWitness Endpoints) extends NetWitness Platform's visibility into endpoints when they are outside the corporate network. The Relay Server deployed in a cloud or DMZ relays the endpoint data between the hosts and the Endpoint Server. The hosts that are outside the corporate network send the endpoint data to the configured Relay Server and the corresponding Endpoint server pulls the data.

Note: If you have Windows hosts that are outside the corporate network, the log data is not sent to the Relay Server.



You can configure a Relay Server on the Endpoint Server Config view. Once the Relay Server is configured, the policy for the host is automatically updated and you can view the Relay Server settings on the **Host Details** view > **Policy Details** panel.

You can configure a single Relay Server with one or more Endpoint servers. In this case, the Relay Server ensures that the endpoint data reaches the Endpoint Server configured in the policy.

The following describes the architecture of the Relay Server.

The following flowchart explains how the host switches to the Relay Server.

Agent
Endpoint server reachable
Yes
Communicate with Endpoint server
No
No
Is Relay Server configured?
Yes
Yes
Is ESH resolvable?
No
Communicate with Relay Server

Installing the Relay Server

The Relay Server installer contains binaries, certificates, configuration files, and the installation script required to install the Relay Server.

IMPORTANT:
- The Relay Server version must match with the corresponding NetWitness Endpoint Server version. If you plan to upgrade a Relay Server to a newer version, first upgrade the Endpoint Server, then download the Relay Server installer, and run the installer script.
- Operating System updates and general system hardening on the Relay Server must be managed by the customer according to standard best practices. The Relay server package does not contain OS updates and the operating system will not be updated as part of the standard NetWitness update process.
- Do NOT run the nwsetup-tui script to install the Relay Server. Follow the instructions in this document only as Relay Server is an independent server and not part of NetWitness UI (Admin > Hosts).

Installation Media

The Relay Server can be installed only on EL 8 or NetWitness Platform 12.4.0.0 base image which is available for download from Downloads page (https://community.netwitness.com/t5/netwitness-platform-downloads/tkb-p/netwitness-downloads). Also, make sure that the Relay server host is connected to internet to download the required dependencies.
For more information on deploying Relay Server host on a:

- DMZ - see "Step 1a. Deploy the Virtual Host to create VM" in the *Virtual Host Installation Guide*.
- Cloud
  - see "Step 1. Deploy NW Server Host" in the *Azure Installation Guide*.
  - see "AWS Deployment" in the *AWS Installation Guide*.

Relay Server Host System Requirements

Agents	RAM	CPU Cores	Disk	Ideal Beacon Interval
20000	32 GB	4 cores	200GB	5 min

To install the Relay Server:

1. Log in to NetWitness Platform.
2. Click  **(Admin) > Services**.
3. Select the **Endpoint Server** service and click  > **View** > **Config** > **Relay Server** tab.
4. In the **Download Installer** section, enter the installer password and click **Download** to download the Relay Server installer file (**RelayInstaller.zip**).

5. Copy the Relay Server installer file (**RelayInstaller.zip**) to the Relay Server host.
6. Unzip the **RelayInstaller.zip** file on the Relay Server host. For example:

   ```
   /home/RelayInstaller.zip
   unzip <installer path>
   ```

7. Set up the execution permission using the following command:

   ```
   chmod +x install.sh
   ```

8. Run the installer script using the following command:

   ```
   ./install.sh
   ```

   The **All necessary RPMs will be installed without further** prompts is displayed.
9. Enter **Y** to continue the installation.

   The password prompt is displayed.
10. Enter the password.

    Note: Make sure you enter the same password you set while downloading the Relay Server installer.

    Note: In case if you are re-installing the Relay Server host. **Do you wish to update the list** prompt is displayed.
    - Enter **Y** to update the Endpoint server IPs.

    Enter the Endpoint Server IPs prompt is displayed.
11. Enter all the Endpoint server IPs you plan to configure with the Relay server with comma separated.

If the Relay Server installation is successful, you can check the status of the services:

- Check if the Relay Server is up and running:

  ```
  systemctl status rsa-nw-relay-server
  ```

- Check if Ngnix is running:

  ```
  systemctl status ngnix
  ```

You can also update Endpoint Server IPs without installing the Relay Server.

To update Endpoint Server IPs without installing the Relay Server:

1. Run the following command:

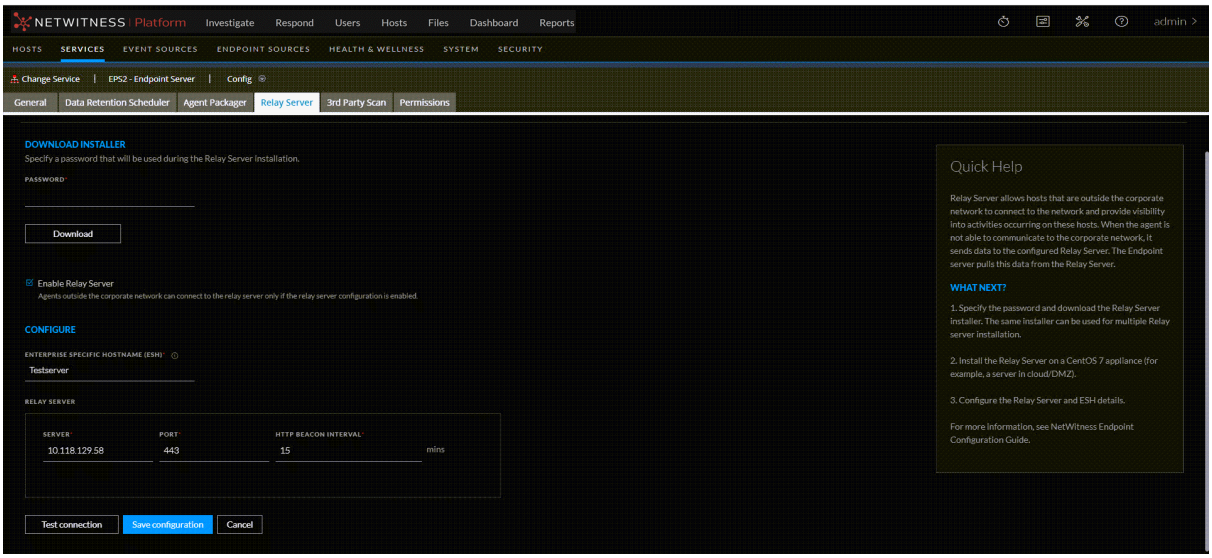
   ```
   bash /var/netwitness/relay-configure-allowed-hosts.sh
   ```

   The list of all the configured Endpoint server IPs is displayed and **Do you wish to update the list** prompt is displayed.
2. Enter **Y** to update the list of Endpoint server IPs.

   Enter the Endpoint Server IPs prompt is displayed.
3. Enter a comma-separated list of all the Endpoint Server IPs to update.

   The list of updated IPs is displayed.

Configuring the Relay Server



Make sure you have installed the Relay Server.

Note: During Relay Server host installation, firewalld is configured to allow incoming connections only on TCP ports 443 and 22.

To configure the Relay Server:

1. Log in to NetWitness Platform.
2. Click **(Admin) > Services**.
3. Select the **Endpoint Server** service and click > **View** > **Config** > **Relay Server** tab.

   The Relay Server tab is displayed.

4. Select the **Enable Relay Server** check box to enable the Relay Server configuration.

   Note: To disable the Relay Server, clear the **Enable Relay Server** check box.

   Caution: Before you disable the Relay Server configuration, if the hosts will be always roaming make sure to migrate these hosts to an alternate Endpoint server configured with a different Relay server. Else these hosts will not be able to connect back to the corporate network. When you disable the configuration, the Relay Server settings are removed from the EDR policy.

5. In the **Configure** section:

a. Enter the ESH.

IMPORTANT: This should a hostname that can only be resolved on the corporate internal DNS and not on public internet DNS (ex: 1.1.1.1 or 8.8.8.8). It is used to determine if the host running the Endpoint agent client is connected to the internal network (physically on premise or through VPN).

b. Specify the Relay **Server**, **Port** and **HTTP Beacon Interval**.

IMPORTANT: The Relay Server needs to be a hostname that can be resolved correctly on both internal DNS (with the internal IP) and public DNS (with the public IP)

6. Click **Test Connection** to check if the Relay Server is reachable.
7. Click **Save Configuration** to save the configuration.

Note: Before you modify the Relay Server configuration, perform any one of the following:
- Make sure that the hosts are inside the corporate network so that the policy with the Relay Server configuration is applied.
- If hosts will always be roaming, then migrate these hosts to an alternate Endpoint server configured with a different Relay Server.

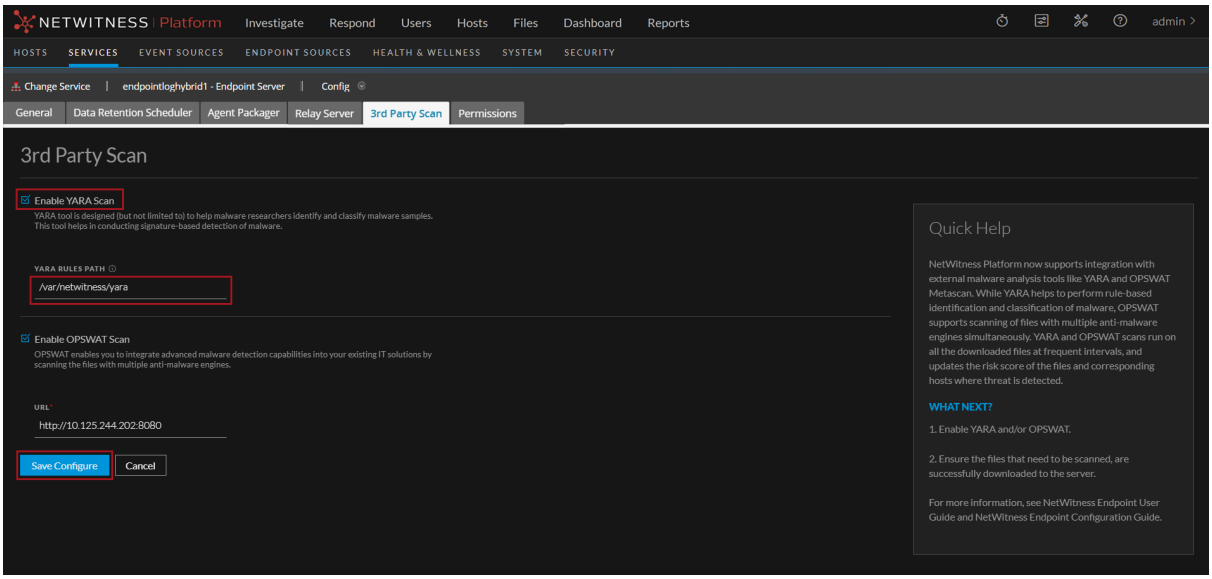
IMPORTANT: You must change the root password after you deploy the Relay Server host.

Note: If you encounter test connection failure between Endpoint server and relay server, see **Relay Server Issues** section in the Troubleshooting topic.

Configure YARA

YARA helps analysts in identifying and classifying malware in a simple and effective manner. By default YARA is disabled, administrators can configure and enable YARA. You are required to provide YARA rule files and specify the path where these rule files are stored. Ensure that the Endpoint server and YARA rules directory are in the same appliance.

Note: The YARA rules directory should have the permission as 'netwitness'.



Note: For new installations, YARA will be included as part of the orchestration. If you are upgrading to NetWitness Platform 11.6 or later, YARA is included automatically. In case of an upgrade, deploy the following Yara App rules from Live-

- Yara Rule Matched
- Process with Matched Yara Rule

IMPORTANT: Ensure that YARA is configured and YARA RULES PATH is same across all the Endpoint servers.

To change the configuration for YARA:

1. Go to  **(Admin) > Services**.
2. In the Services view, select the **Endpoint Server** service.
3. Click  and select **View** > **Config**.
4. Click the **3rd Party Scan** tab.

5. Select **Enable YARA Scan.**

6. In **YARA RULES PATH**, specify the directory path where the YARA rule files are stored.

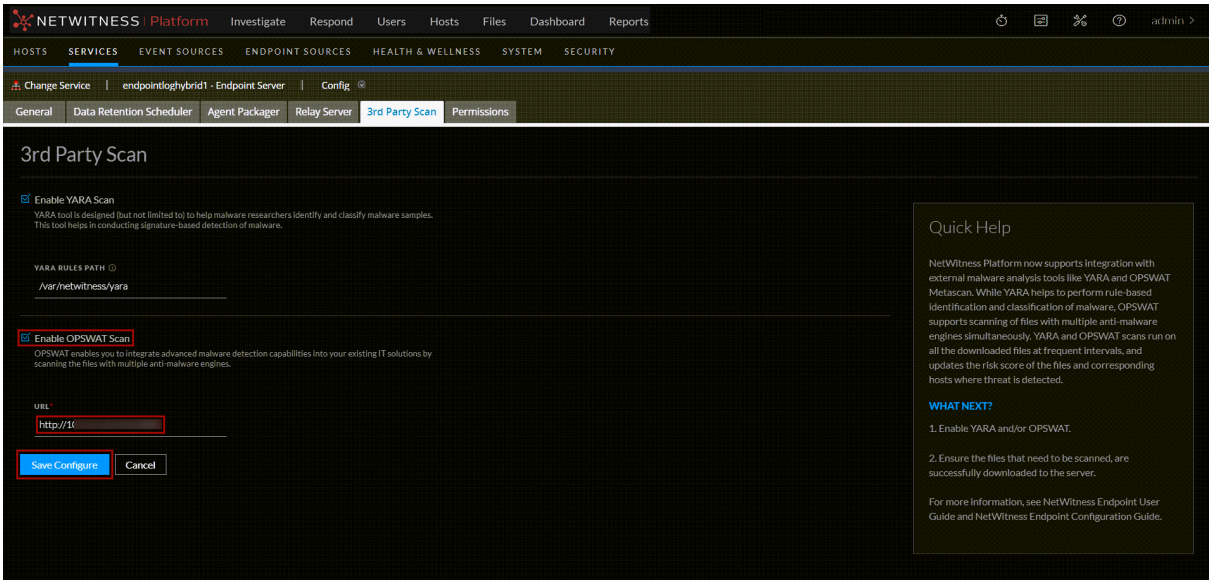
   Note: You can add any number of YARA rule files in this directory. Each rule file can have more than one rule. All downloaded files are scanned by all the YARA rule files.

7. Click **Save Configure**.

Configure OPSWAT

OPSWAT (MetaDefender Core) provides advanced malware detection capabilities by scanning files with multiple anti-malware engines simultaneously. OPSWAT is disabled by default. As an administrator, you can enable and configure OPSWAT on the endpoint servers.

Note: You need to deploy the following OPSWAT app rules from Live services to log decoder for successful configuration of OPSWAT on endpoint servers:



- opswat reported infected
- opswat reported suspicious
- process with opswat reported suspicious
- process with opswat reported infected

IMPORTANT: Ensure that OPSWAT is configured in all endpoint servers and the configuration parameters are consistent across all endpoint servers.

To enable and configure OPSWAT:

1. Go to **(Admin) > Services**.
2. In the Services view, select the Endpoint Server service.
3. Click  and select **View > Config**.
4. Click the **3rd Party Scan** tab.
5. Select **Enable OPSWAT Scan**.
6. Enter the URL.

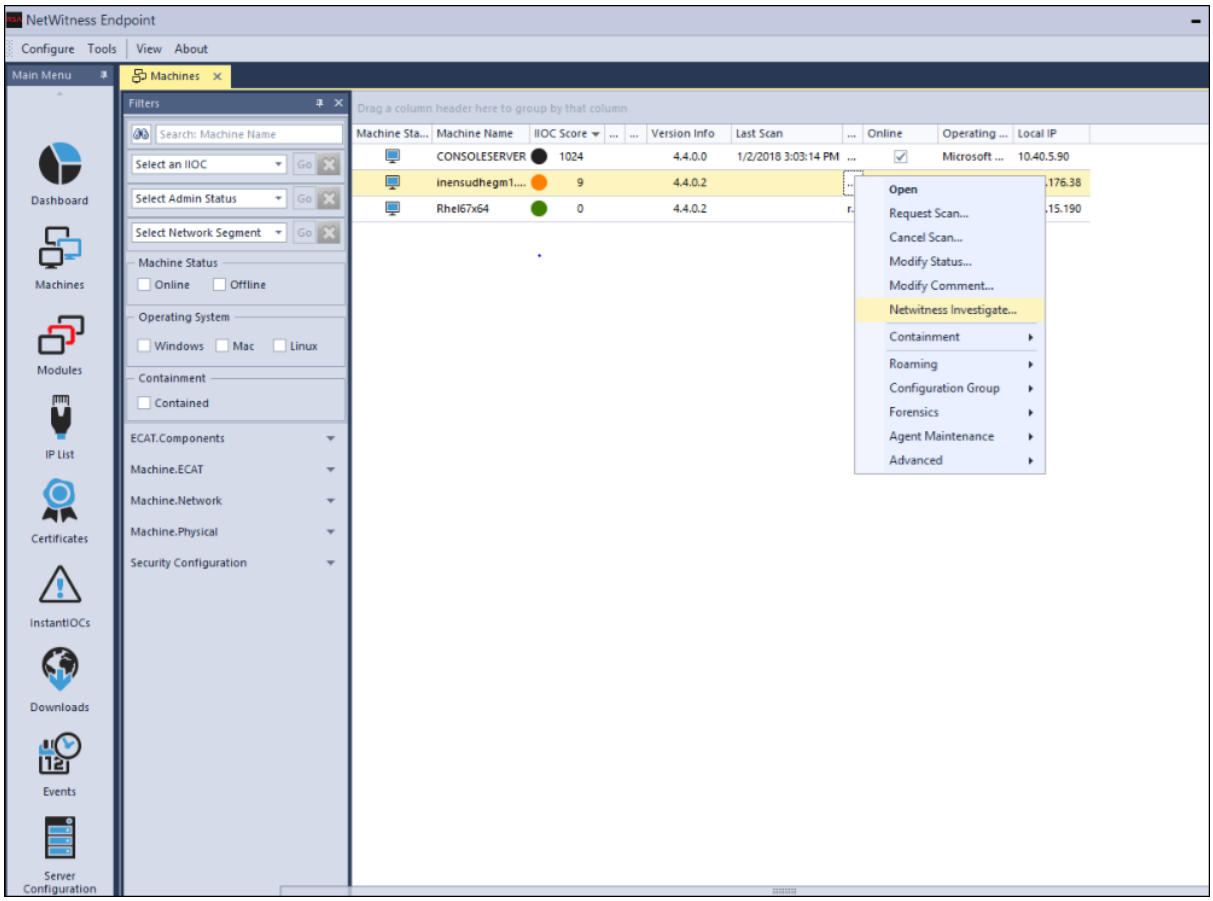
7. Click **Save Configure.**

Integrating NW Endpoint 4.4.0.2 or Later with NW Platform

You can configure the Endpoint Metadata for the NetWitness Endpoint 4.4.0.2 by integrating the Meta Integrator service in the NetWitness Endpoint 4.4.0.2 directly to a Log Decoder. You can view the Endpoint metadata in the **Investigate > Navigate** and **Events** views. This integration includes the following steps:

- Enable Metadata Forwarding
- Enable Machines to Forward Metadata

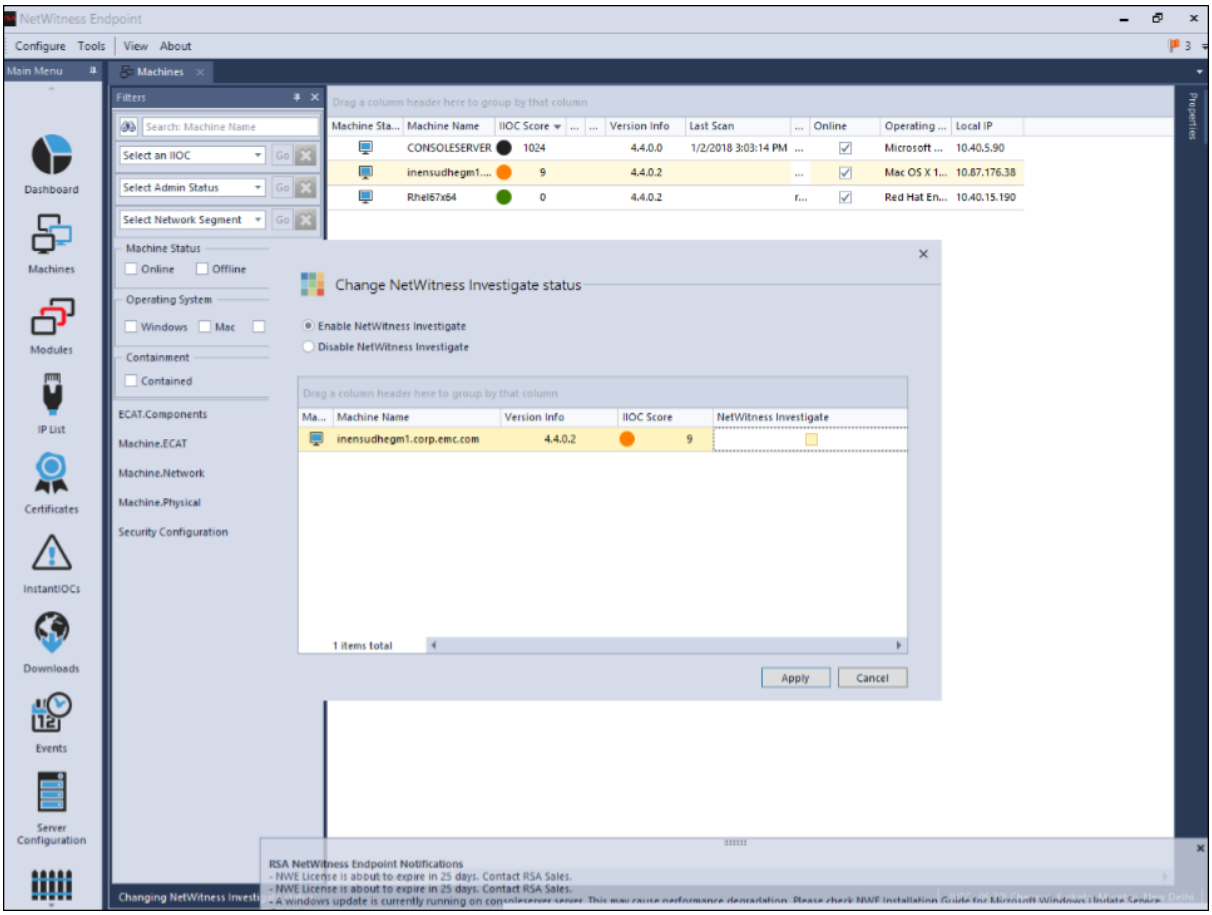
Enable Metadata Forwarding



To enable the Metadata Integrator service for the selected NetWitness Endpoint 4.4.0.2 agents, run the following command:

```
ConsoleServer.exe /nw-investigate enable
```

Enable Machines to Forward Metadata



After you enable the Metadata Forwarding using any one of the above options, perform the following to enable the machines to forward metadata to the Log Decoder.

1. Open the NetWitness Endpoint 4.4.0.2 user interface.
2. Click **Machines** from the left panel. The list of available machines are displayed.

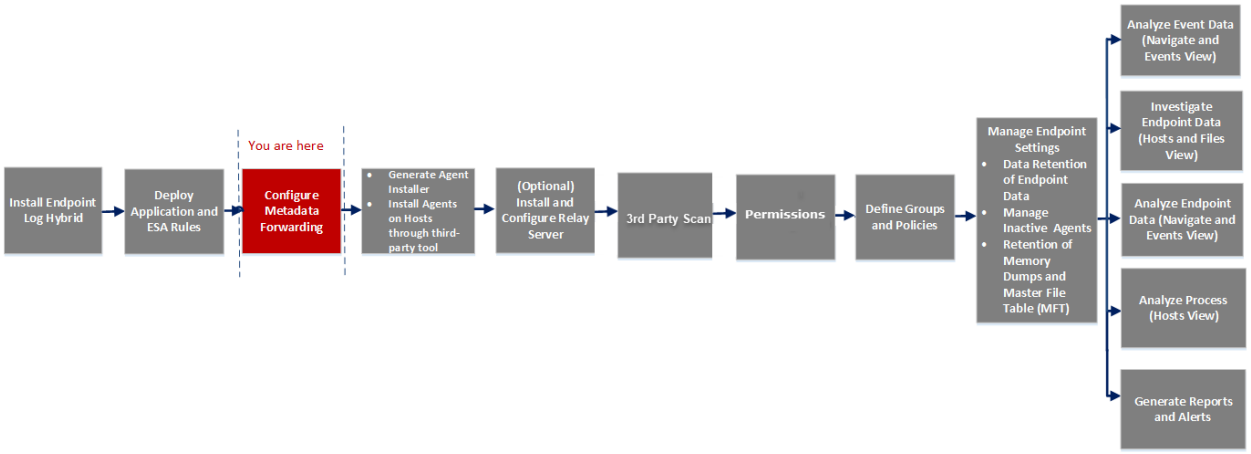
3. Select machines for which you want to forward metadata to the NetWitness Endpoint Server.
4. Right-click and select the **NetWitness Investigate** option.

   The Change NetWitness Investigate Status dialog is displayed.

5. Select the **Enable NetWitness Investigate** option.
6. Click **Apply**.
7. To verify if the **Enable NetWitness Investigate** option is enabled, repeat step 4.

Endpoint References

This section is intended to help you understand the purpose of the Services Config View for the Endpoint Server. For each configuration, there is a brief introduction and a What Do You Want To Do table with links to related procedures. In addition, it includes workflow and Quick Look sections to highlight important features in the user interface.



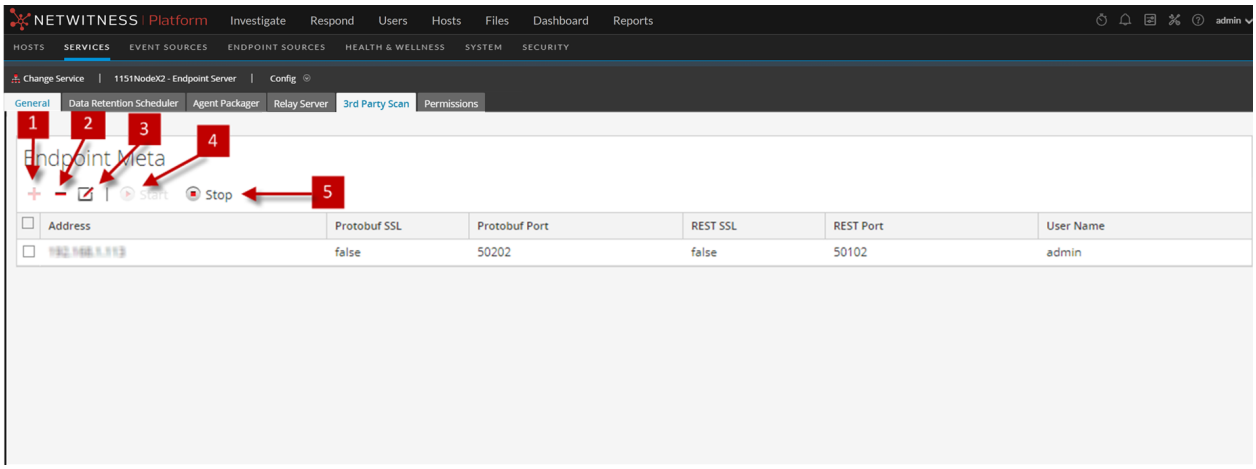
You can view the complete service nodes in tree form in the Services Explore view. For more information, see the "Services Explore View" topic in the *Hosts and Services Getting Started Guide*.

General Tab

In the **General** tab, you can configure the Endpoint metadata forwarding for multiple endpoint servers. To access this view:

1. Go to **(Admin) > Services**.
2. In the Services view, select **Endpoint Server** for which you want to configure the metadata forwarding.
3. Click and select > **View** > **Config**.
4. Click the **General** tab.

Workflow



What do you want to do?

User Role	I want to ...	Show me how
Administrator	Configure Endpoint Metadata Forwarding for the NetWitness Endpoint Agents*	Configuring Metadata Forwarding
Administrator	Configure Endpoint Metadata Forwarding for the NetWitness Endpoint 4.4.0.2 or later Agents*	Integrating NW Endpoint 4.4.0.2 or Later with NW Platform

*You can perform this task in the current view

Quick Look

The following figure is an example of the General tab.

1 Click + to view the Available Services dialog.

2 Click − to delete the added service.

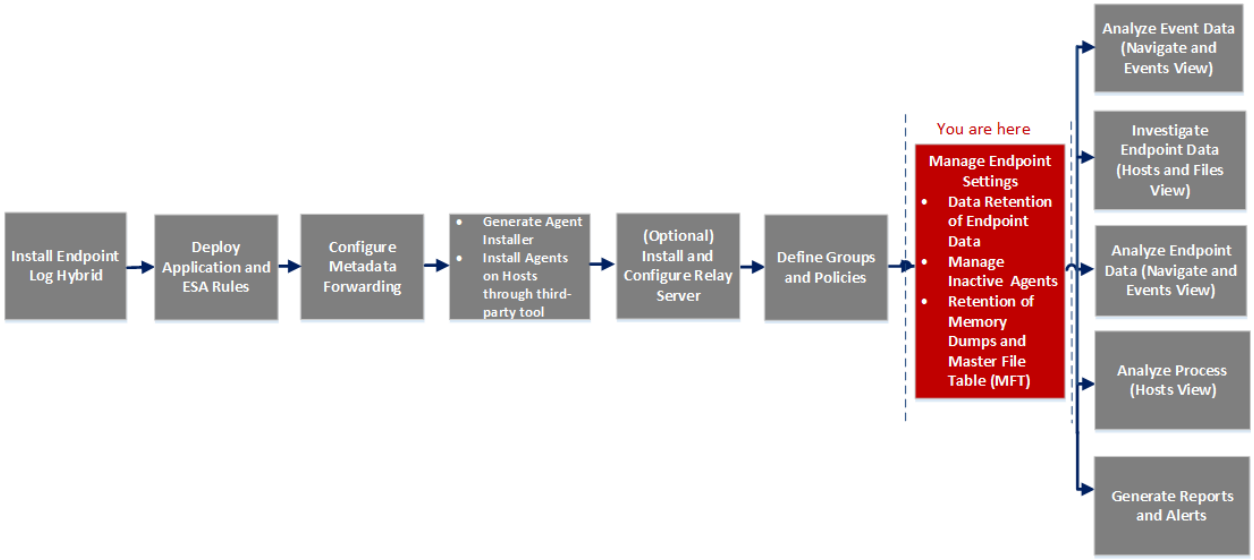
3 Click to edit the information for the added service.

4 Click Start to start the Endpoint metadata forwarding.

5 Click Stop to stop the Endpoint metadata forwarding.

The following table describes the fields in the General tab.

Field	Description
Address	Displays the IP address of the Log Decoder.
Protobuf SSL	Indicates if SSL is enabled on Protobuf. By default, this option is disabled.
Protobuf Port	Displays the port used for Protobuf. By default, the port is 50202.
REST SSL	Indicates if SSL is enabled on the REST port in the Log Decoder. By default, this option is disabled.
REST Port	Displays the port used for REST communication. The default value is 50102 (for non-SSL) and value 56102 (for SSL).
User Name	Displays the user name.
Raw Data	Sends a brief summary of the session along with the metadata if enabled. By default, this option is disabled.



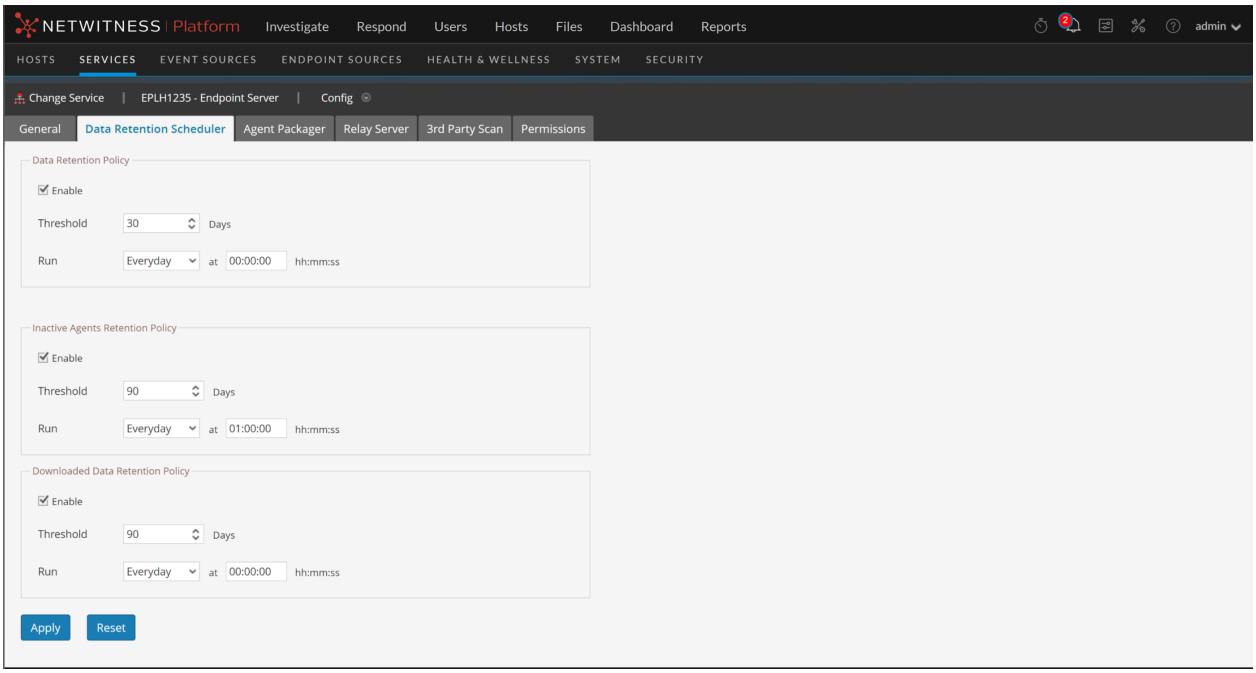
Data Retention Scheduler Tab

In the **Data Retention Scheduler** tab, you can configure data retention, inactive agents, and downloaded data retention policies for multiple endpoint servers. To access this view:

1. Go to  **(Admin) > Services**.
2. In the Services view, select **Endpoint Server**.
3. Click  and select > **View** > **Config**.
4. Click the **Data Retention Scheduler** tab.

Repeat the above steps to configure data retention settings for multiple endpoint servers.

Workflow



What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure Data Retention Policy*	Configuring Data Retention Policy
Administrator	Configure Inactive Agents Policy*	Managing Inactive Agents
Administrator	Configure Downloaded Data Retention Policy*	Configure Retention Policy for Downloaded Files

*You can perform this task in the current view

Quick Look

The following figure is an example of the Data Retention Scheduler tab.

Features

The following table lists the fields for **Data Retention Policy**.

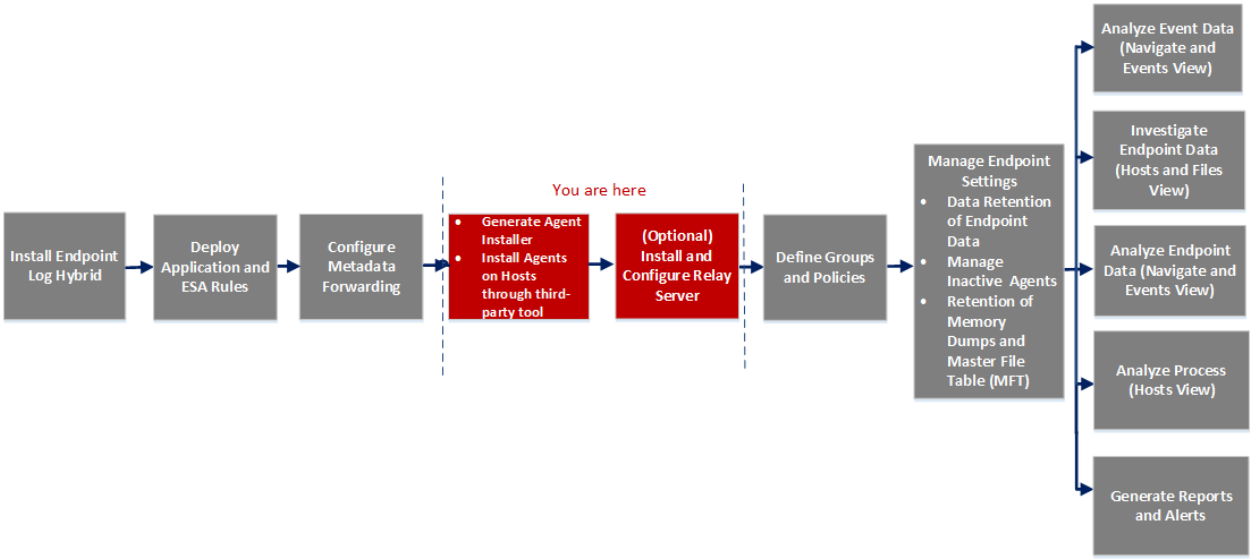
Field	Description
Enable	Enables the configuration for the Data Retention Policy. By default, this option is enabled.
Threshold	Displays the number of days the Endpoint data is retained in the database. By default, the Threshold is set to 30 days. The data older than 30 days is deleted from the database.
Run	Displays the schedule for running the data retention job. By default, the database check occurs everyday at 00:00:00 AM. You can select the frequency from the drop-down list (Everyday, Weekdays, Weekends, or Custom, where Custom allows you to select one or more specific days of the week) and time to run the job.
Apply	Overwrites any previous schedule for the data retention policy and applies the new schedule immediately.
Reset	Resets the schedule to the default settings.

The following table lists the fields for **Inactive Agents Retention Policy**.

Fields	Description
Enable	Enables the configuration for the Inactive Agents Retention Policy. By default, this option is enabled.

Fields	Description
Threshold	Displays the number of days the inactive agents are retained in the Endpoint Server. By default, the threshold value is 90 days.
Run	Displays the schedule for running the inactive agents retention job. By default, the database check occurs everyday at 00:00:00 AM. You can select the frequency from the drop-down list (Everyday, Weekdays, Weekends, or Custom, where Custom allows you to select one or more specific days of the week) and time to run the job.
Apply	Overwrites any previous schedule for the inactive agents retention policy and applies the new settings immediately.
Reset	Resets the schedule to the default settings.

The following table lists the fields for **Downloaded Data Retention Policy**.



Fields	Description
Enable	Enables the configuration for the Downloaded Data Retention Policy. By default, this option is enabled. **Note:** The downloaded data can be Files, Process Dump, System Dump, and MFT.
Threshold	Displays the number of days the downloaded data is retained in the Endpoint Server. By default, the Threshold is set to 90 days. The data older than 90 days is deleted from the Endpoint Server.
Run	Displays the schedule for running the retention job. By default, the database check occurs everyday at 00:00:00 AM. You can select the frequency from the drop-down list (Everyday, Weekdays, Weekends, or Custom, where Custom allows you to select one or more specific days of the week) and time to run the job.
Apply	Overwrites any previous schedule for the retention policy and applies the new schedule immediately.
Reset	Resets the schedule to the default settings.

Agent Packager Tab

In the **Agent Packager** tab, you can generate an agent packager and agent installer. To access this view:

1. Go to **(Admin) > Services**.
2. In the Services view, select **Endpoint Server**.
3. Click and select > **View** > **Config**.
4. Click the **Packager** tab.

Workflow

Administrator	Configure Relay Server*	(Optional) Installing and Configuring Relay Server

* You can perform this task in the current view.

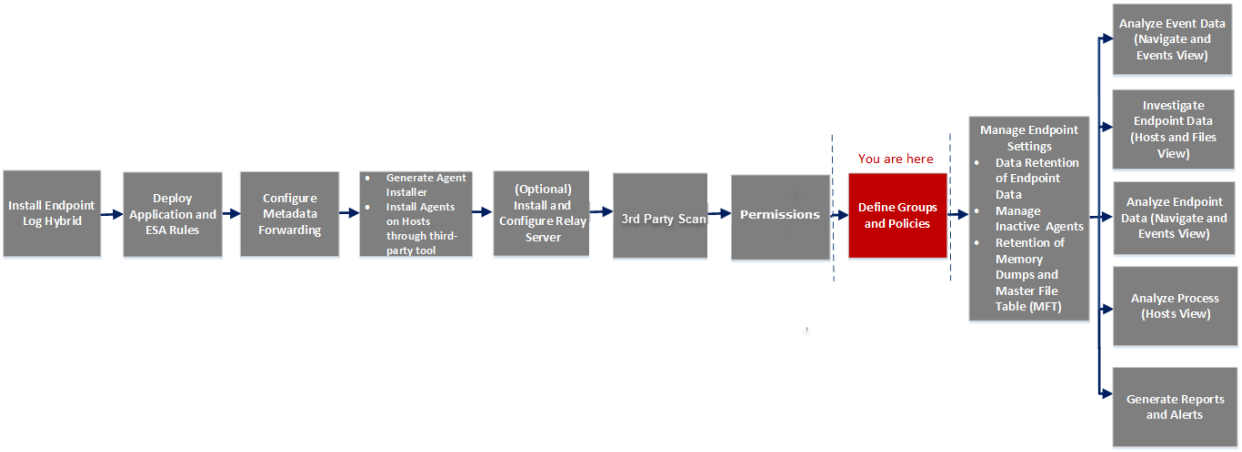
Quick Look

The following figure is an example of the Relay Server tab.

Features

The following table lists the fields for Relay Server tab.

Field	Description
Download Installer	
Password	Enter the relay server installation password. For example, netwitness. Password must be minimum of 3 characters and can contain alphanumeric and special characters. **Note:** You must provide the same password when prompted during Relay Server installation.
Download	Click to download the Relay Server installer.
Enterprise Specific Hostname (ESH)	Enter the hostname which can be resolved only within the corporate network.
Enable Relay Server	Check Enable Relay Server for Agents outside the corporate network to connect to the configured relay server. By default, this option is disabled.
Configure	
Server	Hostname or IP of the Relay Server.
Port	Port number. For example, 443.
HTTP Beacon Interval	Enter the Interval value ranges from 60 – 1440 minutes.
Test Connection	Click test connection to check if the relay server is reachable by the agents.



Field	Description
Save Configuration	Saves the relay server configuration.
Cancel	Cancel the unsaved changes.

Endpoint Sources - Groups

Note: The information in this topic applies to NetWitness Version 11.3 and later.

The **(Admin) > Endpoint Sources** view contains two tabs: **Groups** and **Policies**.

Workflow

What do you want to do?

User Role	I want to ...	Show me how
Administrator	create new groups*	Create a Group
Administrator	edit groups*	Edit a Group
Administrator	edit ranking*	Managing Groups

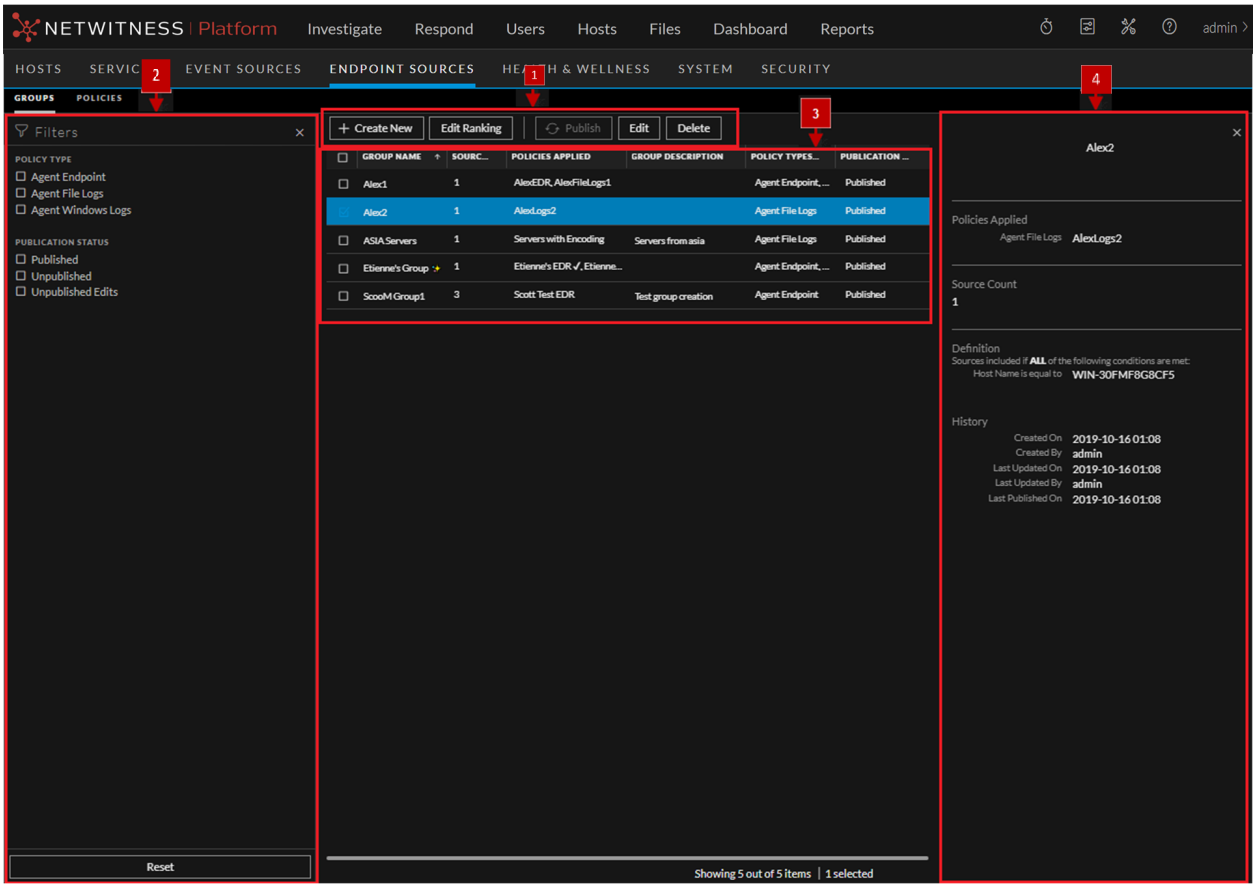
Administrator	create an EDR policy	Create an EDR Policy
Administrator	create a Windows Log policy	Create a Windows Log Policy
Administrator	edit policies	Edit a Policy
Administrator	delete policies	Delete a Policy



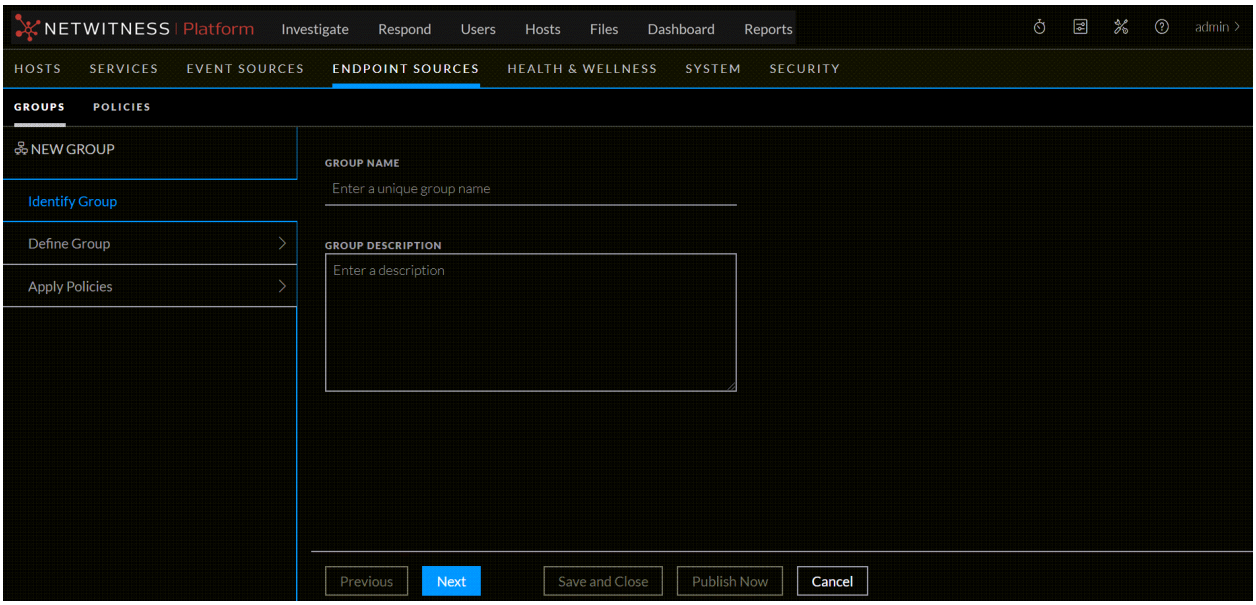
*You can perform this task in the current view.

Related Topics

- Endpoint Sources
- Managing Policies

Quick Look

Below is an example of the Groups tab:

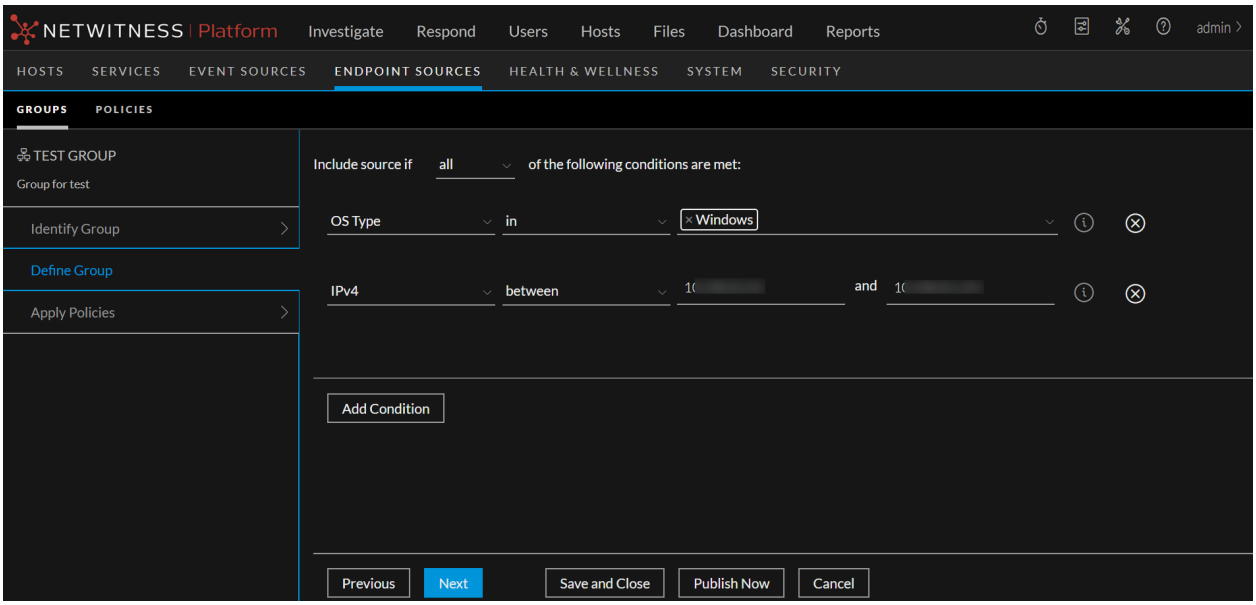


1 **Toolbar**

- **Create New**: Lets you create a new group. For more information, see Create a Group
- **Edit Ranking**: Lets you edit the ranking of groups. For more information, see Managing Groups
- **Publish**: Publishes the selected group or groups.
- **Edit**: Lets you edit the details of an existing group. For more information, see Edit a Group.
- **Delete**: Deletes the selected group or groups permanently. For more information, see Delete a Group.

2	**Filter Pane** • **Filters**: You can filter groups based on Policy Type and Publication Status. To hide, click the  icon at the top-right of the panel. To display if hidden, click the  icon in the toolbar. • **Reset**: Removes the currently applied filter criteria. For more information, see Filter Endpoint Groups.
3	**Groups List Pane** • **Group name**: Name of the group. • **Source Count**: Number of hosts that are currently members of the group. • **Policies applied**: Lists the policies applied to this group. • **Group description**: Description of the group. • **Policy Types Applied:** Type of policies applied to the group: Agent Endpoint, Agent File Logs, Agent Windows Logs, or any combination of these. • **Publication Status**: Status of the group - Published or Unpublished. You can also sort on any column. If you mouse over a column header, a sort icon is displayed: . Click the icon to sort by the selected column.
4	**Group Details Pane** Displays the properties of the selected group. **Note:** Click the row to view the Properties panel for a group.

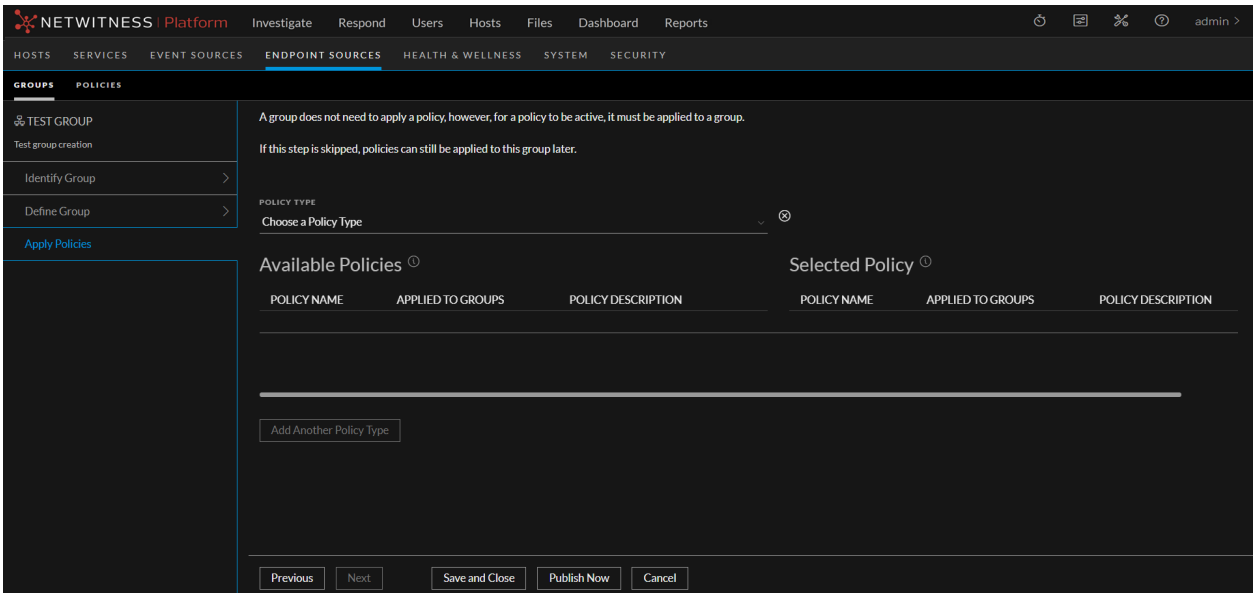
Create Group



Below is an example of the Create Group dialog. The table describes the information and options in the Create Group dialog.

Field	Description
Group Name	Name of the group. The name should be unique.
Group Description	Description of the group and should not exceed 8000 characters.

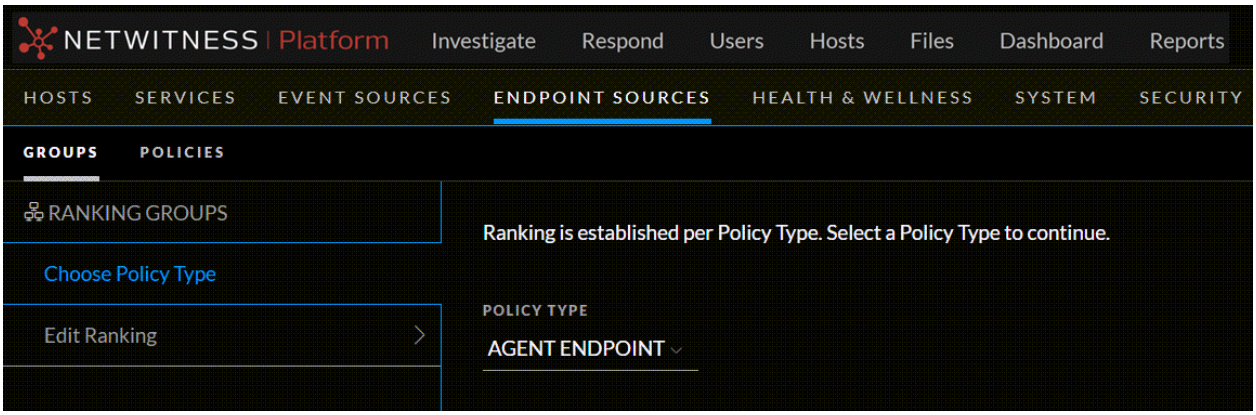
Define Group



Below is an example of Define Group panel. The table describes the information and options in the Define Group panel:

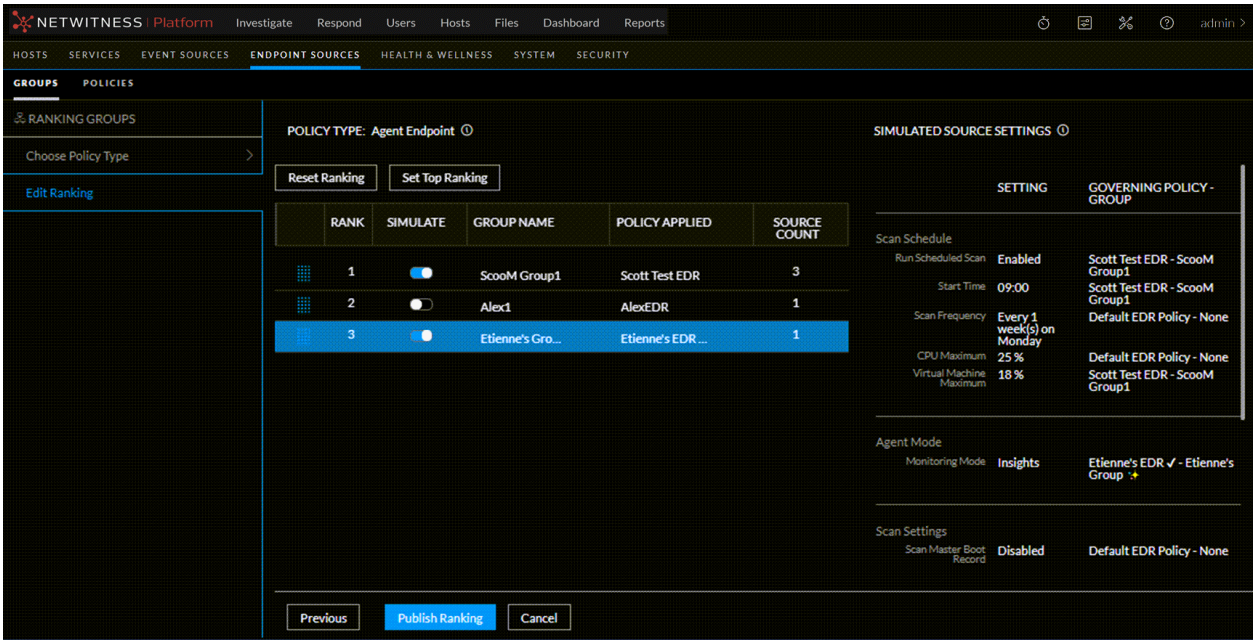
Field	Description
Include source if ...of the conditions are met	Defines the conditions for an agent to be included in the group. Available options are all or any.
Parameter	The parameter can be OS Type, OS Description, Host Name, IPv4, IPv6, Machine OU, Tag, and Subnet. • OS Type - Type of operating system. Available options are: Windows, Linux, and MacOS. • OS Description - Description of the operating system. The description should not exceed 256 characters. Available operators are: is equal to, contains, start with, and ends with. For example, Microsoft Windows 10 Enterprise. • Host name - Name of the host. The host name can contain only alphanumeric characters. Available operators are: is equal to, contains, start with, ends with, and in. For example, DESKTOP-QQPDNG3. • IPv4 and IPv6 - IP address. Available operators are: between, in, not in, and between. For example, 10.40.15.220. • Machine OU - Name of the Machine OU. Available operators are: **is equal to**, **contains**. For example, OU=Win10, OU=Contractors, DC=corp, DC=com • Tag - Name of the tag that already exists. Available operators are: **is equal to**, **contains**, and **in**. • Subnet - The value of the Subnet Mask. Available operator is: **in**. **Note:** If you do not want to include certain IP addresses, use the **Not in** operator, and enter the IP address separated by a space or a comma.
Operator	The choice of values is dependent upon the parameter you chose. For example, if your parameter is OS Type, the only operator available is **in**.
Value or values to match	The value or values to match. For the OS Type parameter, you can choose one or more values from the drop-down list. For all other parameters, you can enter free-form text. **Note:** Although you can enter any text for values, the system validates your entries when you attempt to proceed to another screen, and will not allow you to proceed until values are valid.
Add condition	Lets you add another condition.

Apply Policies



Below is an example of Apply Policies panel. The table describes the information and options in the Apply Policies panel:

Field	Description
Source Type	Defines the source type for the group. Available options are Agent Endpoint and Agent Windows Logs.
Available Policies	List the available policies associated with the source type.
Selected Policies	List the policies selected.
Add Another Source Type	Lets you add another source type.
Save and Close	Saves the settings and closes the Create Group dialog.
Publish Now	Publishes the created group.



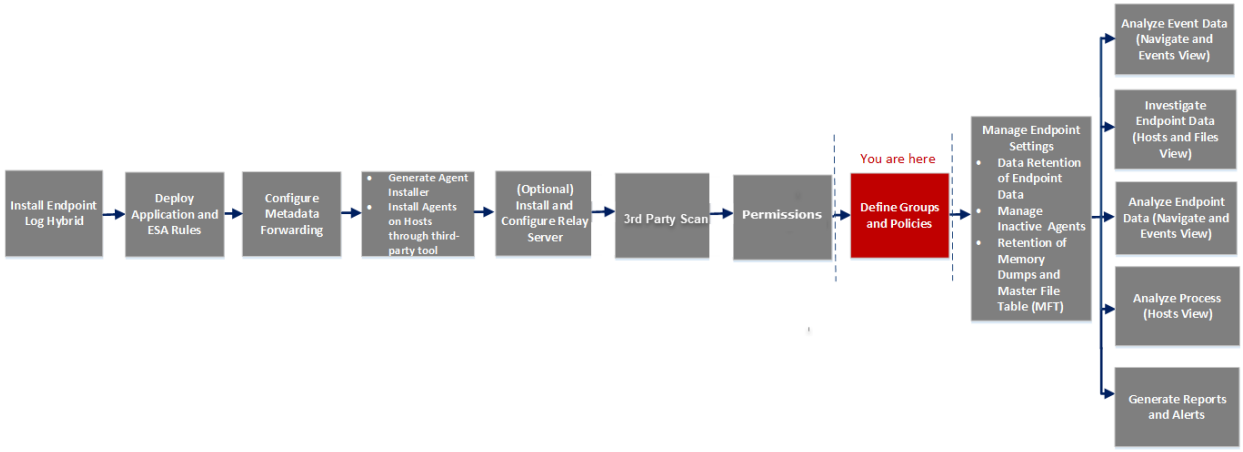
Ranking Groups

Below is an example of the Ranking Groups dialog. The table describes the information and options in the Ranking Groups dialog.

Field	Description
Source Type	Establishes ranking for the source type. Available options are Agent Endpoint and Agent Windows Logs.

Below is an example of the Edit Ranking panel.

From this panel, you can do the following:



- Drag the group up or down to change the priority. Priority decreases from top to bottom.
- Turn the Simulate slider on or off, to simulate your policy settings and how they affect the endpoints within their groups. For more details, see Simulation Examples.
- Use the available buttons to perform actions:
  - **Reset Ranking**: Resets the ranking to the original order.
  - **Set Top Ranking**: Moves the selected group to the top.
  - **Previous**: Navigates to the Choose Source Type panel.
  - **Publish Ranking**: Lets you edit the details of an existing group. For more information, see Edit a Group.
  - **Cancel**: Discards the changes and returns to the Groups tab.

Endpoint Sources - Policies

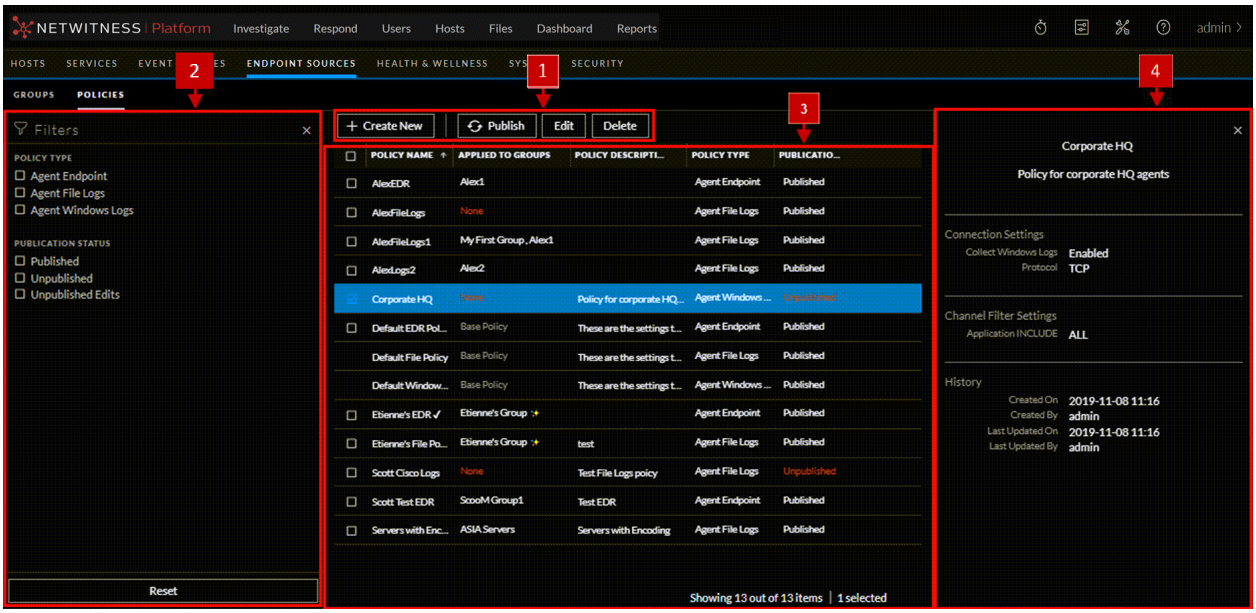
Note: The information in this topic applies to NetWitness Version 11.3 and later.

The **(Admin) > Endpoint Sources** view contains two tabs: **Groups** and **Policies**.

Workflow

What do you want to do?

User Role	I want to ...	Show me how
Administrator	create new groups	Create a Group
Administrator	edit groups	Edit a Group
Administrator	edit ranking	Managing Groups
Administrator	delete groups	Delete a Group
Administrator	view default policies*	Default Agent Endpoint (EDR) Policy
Administrator	create an EDR policy*	Create an EDR Policy
Administrator	create a Windows Log policy*	Create a Windows Log Policy
Administrator	create a File Log policy*	Create a File Log Policy
Administrator	edit policies*	Edit a Policy
Administrator	delete policies*	Delete a Policy



*You can perform this task in the current view

Related Topics

- Endpoint Sources
- Managing Groups

Quick Look

Below is an example of the Policies tab:

1 **Toolbar**

- **Create New**: Lets you create a new policy. For more information, see Managing Policies.
- **Publish**: Publishes the selected policy.
- **Edit**: Lets you edit the details of an existing policy. For more information, see Edit a Policy.
- **Delete**: Deletes the selected policies permanently. For more information, see Delete a Policy.

2 **Filter Panel**

- **Filters**: You can filter policies based on Policy Type and Publication Status.

  To hide, click the icon at the top-right of the panel. To display if hidden, click the icon in the toolbar.

- **Reset**: Removes the currently applied filter criteria.

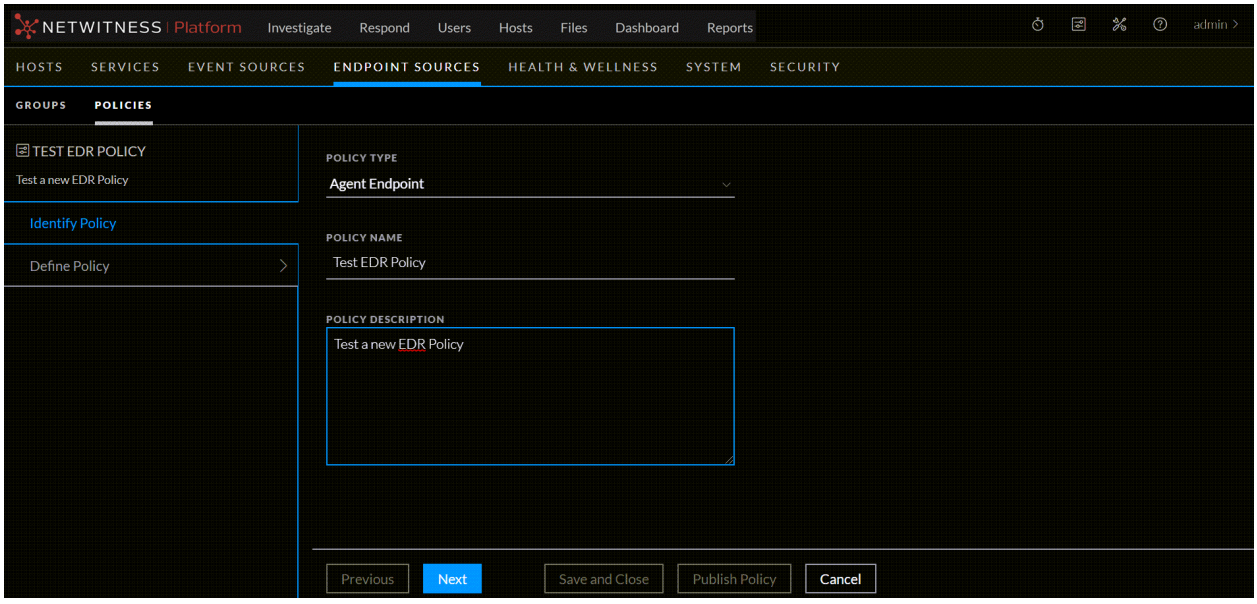
For more information, see Filter Policies.

3 **Policies List Panel**

Policy View. Displays the policy details:

- **Policy name**: Name of the policy.
- **Applied to groups**: Lists the group to which this policy is applied.
- **Policy description**: Displays the first portion of the description.
- **Policy type**: Displays the policy type: Agent Endpoint, Agent File Logs, or Agent Windows Logs.
- **Publication Status**: Status of the policy: Published or Unpublished.

You can also sort on any column. If you mouse over a column header, a sort icon is displayed: . Click the icon to sort by the selected column.



4 **Policy Details Panel**

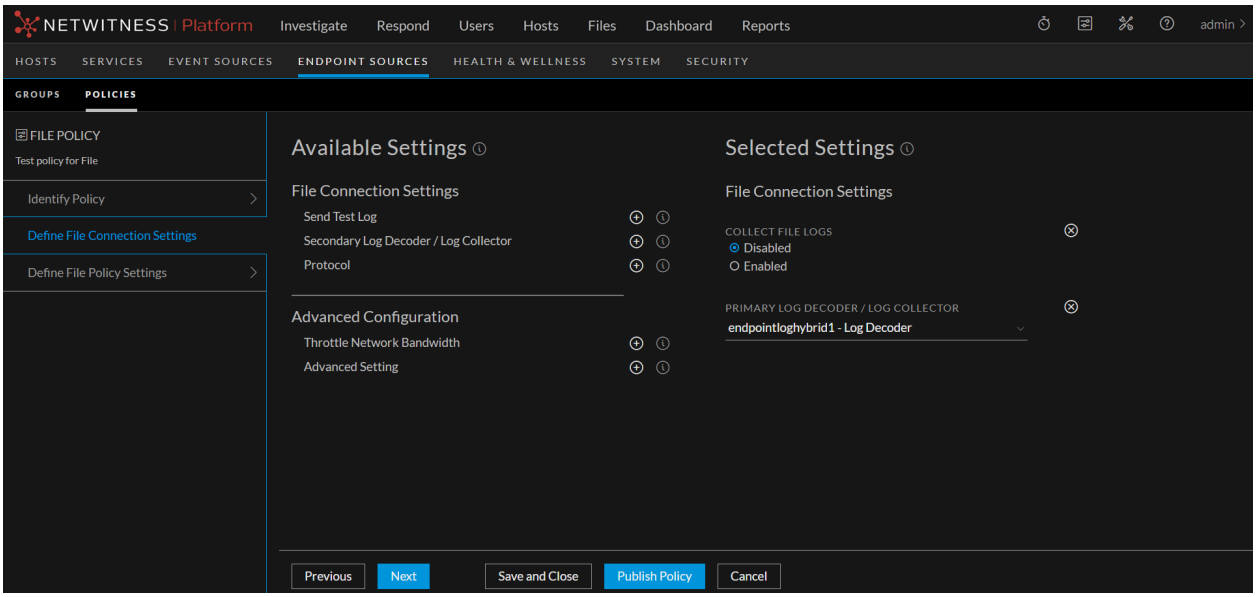
Displays the properties of the selected policy.

Note: To view the Properties panel for a policy, click the Policy Name.

Create Policy

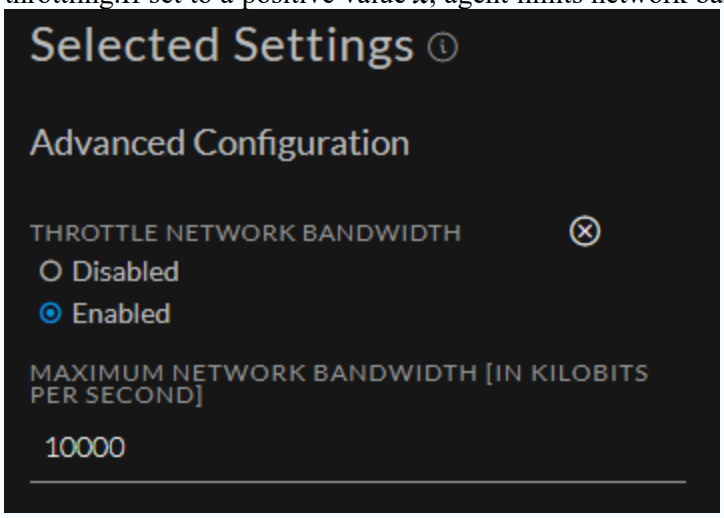
Below is an example of the Create Policy dialog. The table describes the information and options in the Create Policy dialog.

Field	Description
Policy Type	Displays the type for the policy. Available options are Agent Endpoint, Agent File Logs, and Agent Windows Logs.



Field	Description
Policy Name	Name of the policy. The name should be unique.
Policy Description	Description of the policy. Description should not exceed 8000 characters.

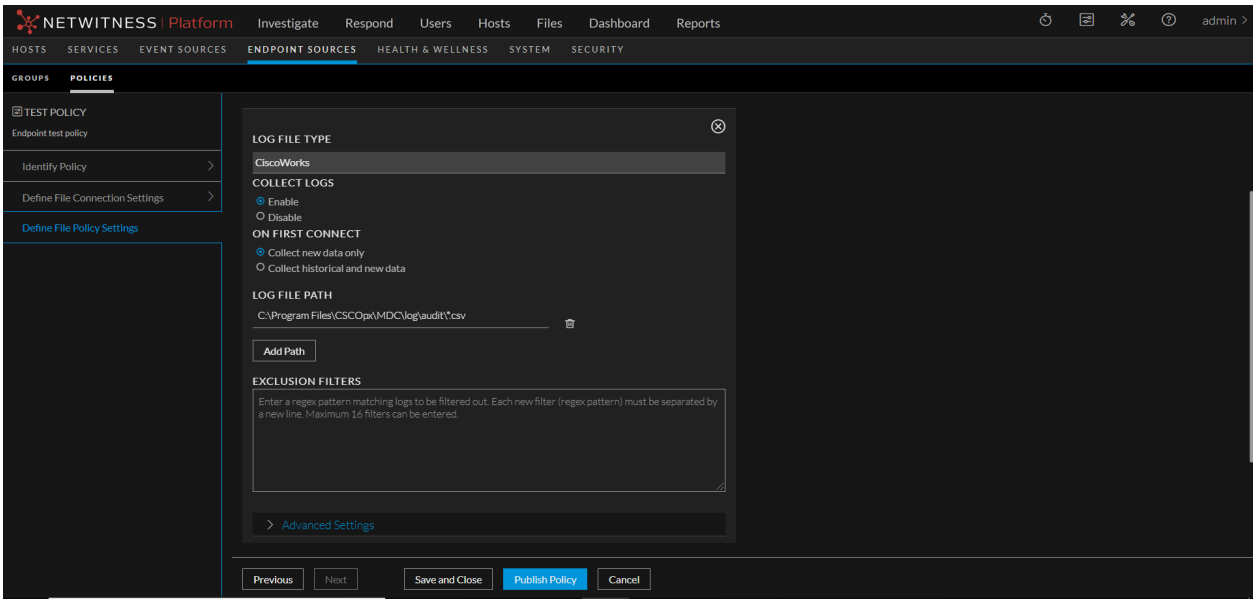
Panels for Log File Policy



There are two panels for defining the parameters for an Agent Log File Policy: **Define Connection Settings** and **Define File Policy Settings**.

Define Connection Settings

Below is an example of Define Connection Settings panel. The table describes the information and available options.



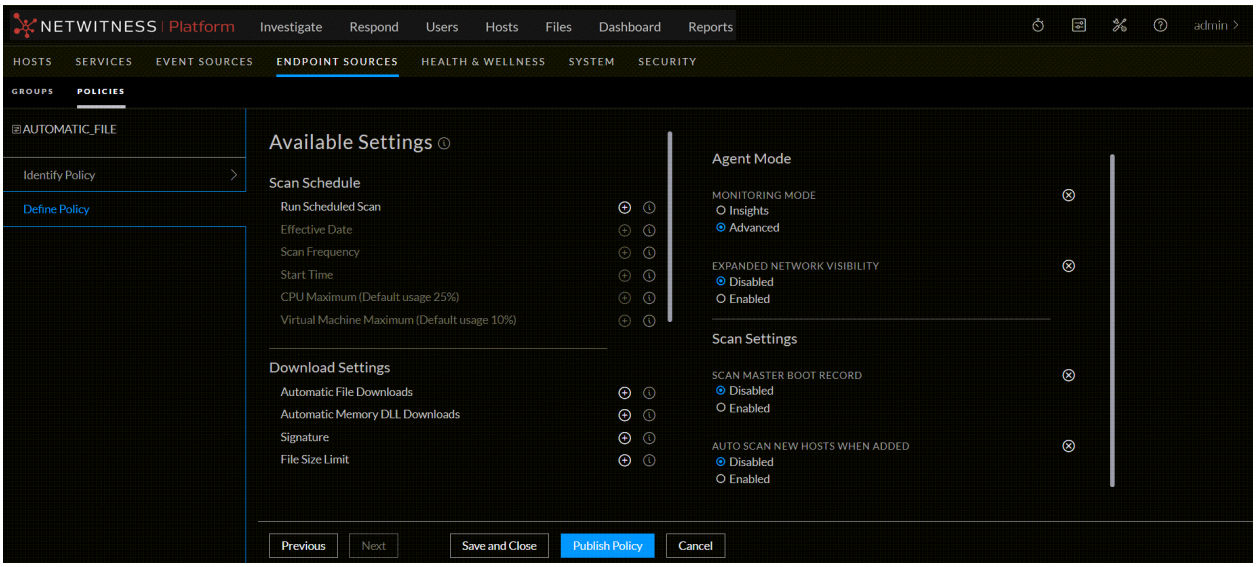
Field	Description
Collect File Logs	If enabled, the log file collection capability of the agent is activated. Logs are collected and forwarded to the NetWitness as they are generated. If disabled, no defined event source logs are collected. **Note:** This option must be enabled for any file event sources to be collected.
Send Test Log	If enabled, a sample log is sent to the configured server when the policy is loaded to test connectivity. This allows to test the configuration before standard logs are available. By default, this option is disabled.

Field	Description
Primary Log Decoder / Log Collector	The primary Log Decoder or Log Collector to which the collected file logs will be forwarded.
Secondary Log Decoder / Log Collector	If the primary Log Decoder or Log Collector is not reachable, collected file logs are forwarded to the secondary Log Decoder or Log Collector. **Note:** The NetWitness cannot detect failures when UDP protocol is used.
Protocol	Select the transport protocol that is used to forward the collected file logs to the NetWitness servers. The following options are available: • SSL: Recommended, but also the most resource-intensive option. • TCP: Sends the logs in clear text over a reliable TCP connection. May be acceptable within a corporate network. • UDP: Sends the log in clear text over a non-guaranteed UDP connection. This is the least resource intensive option. **Note:** Resource intensity is dependent upon the Log Decoder, since there is only a single connection per agent.
Advanced Configuration	
Throttle Network Bandwidth	Use this setting to limit network bandwidth that the Agent uses to connect to NetWitness. This setting is disabled by default: click **Enabled** to turn it on, and then enter a value in kilobits per second.If not set, Agent does not do any network throttling.If set to a positive value ***x***, agent limits network bandwidth to ***x*** kbps. 

Field	Description
Advanced Setting	**Caution:** It is strongly recommended not to use this setting unless advised to do so by NetWitness.

Define File Policy Settings

Field	Description
Log File Type	From the drop-down menu, select the type of event source to be monitored. The list of available event source is based on all the event source types defined on your NetWitness. You can add event source types using the Live Services module. For details, see "Find and Deploy Live Resources" in the *Live Services Management Guide*.
Collect Logs	If enabled, log files for this file type instance are collected and forwarded to the NetWitness. File collection must be enabled on each source applying this policy for these specific logs to be collected.
On First Connect	Determines whether the NetWitness Agent collects all logs or only newly created logs located in the specified paths upon initial collection. In both cases, new logs are collected. **Note:** Historical logs cannot be collected after an agent has begun collecting logs.



Field	Description
Log File Path	One or more paths to be used by the agent to locate the log files. Represents the location of the log files to be read. **Note:** The Path value cannot end at a directory—the final portion of the path must represent a file name or set of files (using wildcard characters). You can use wildcards for both files and directories. Each source is limited to entry of 16 paths. This setting must include a path and a file spec. For example: `C:\Program Files\apache-tomcat-*\logs\*.log`. In this case, the file spec is all files with a ".log" extension in the specified path. If you cannot use wildcards to specify multiple files, you can add additional paths to accommodate the differences in path locations on a specific endpoint agent. This might be due to installation locations or version information. Only the paths with valid locations and files on the specific endpoint agent are used, and the others are ignored. For many event source types, there is a default path. If so, you only need to enter a path if the log files are not stored in the standard directory for that event source type. **Note:** This can be a standard Windows pathname (such as `C:\Program Files\Apache\error_logs\logfile.log`) or a UNC (Universal Naming Convention) pathname (`\\host-name\share-name\file-path`). For more details about UNC paths, see Endpoint Sources - Policies below.
Exclusion Filters	An optional list of regex patterns which can be used to filter out any logs that match the patterns. Each separate filter should be entered on a new line. Each source is limited to 16 exclusion filters. **Note:** Each filter needs to be entered as a valid regex string, or the system does not allow you to save it.
Advanced Settings	

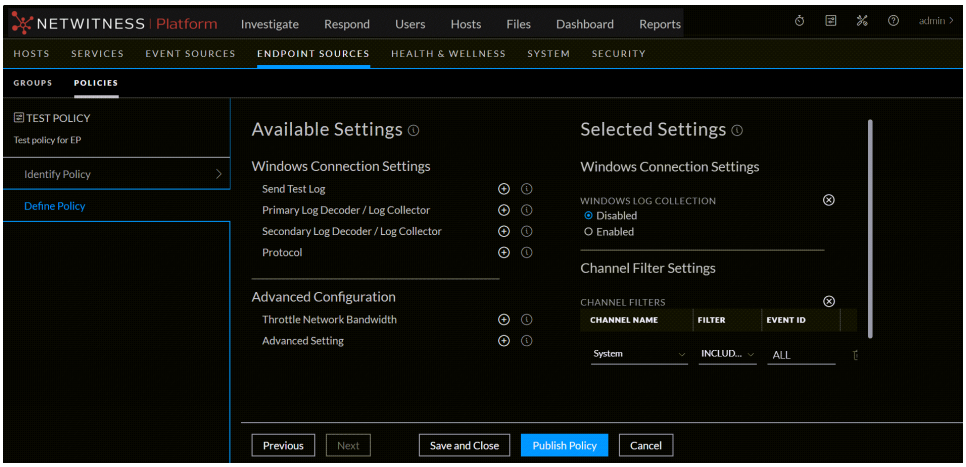
Field	Description
Source Alias	Optionally, enter a hostname, IPv4 or IPv6 address to identify individual sources. This is recommended when there are two or more sources of the same type on the same server: For example, a server that runs two instances of Apache web server. **Note:** This value only rarely needs to be entered. One example is if you have more than one Web Server, and they are running different Apache servers. Note the following: • If you enter a value for this parameter, the event source is applicable to a single Endpoint server. • This optional address or hostname is included in the meta for any logs originating from this source. This can be used by analysts to assist in identifying the source. • Set a value for this parameter if two sources of the same event source type are configured in the same policy. • This setting is not commonly needed: it is only useful if the policy is only applied to a single endpoint.
File Encoding	Specifies the type of character encoding of the log files. If **Local Encoding** is selected, the NetWitness Agent uses the default encoding of the Windows machine upon which it is running. This setting must match the encoding of the log files, or they will not be processed correctly. **Note:** UTF-8/ASCII is recommended (and the default). UTF-8 is a super-set of ASCII Note that all logs are re-encoded to UTF-8 before being sent to the NetWitness.

For a list of the currently supported types, see Currently Supported File Log Event Source Types.

Define Policy Panel for Agent Endpoint Policy

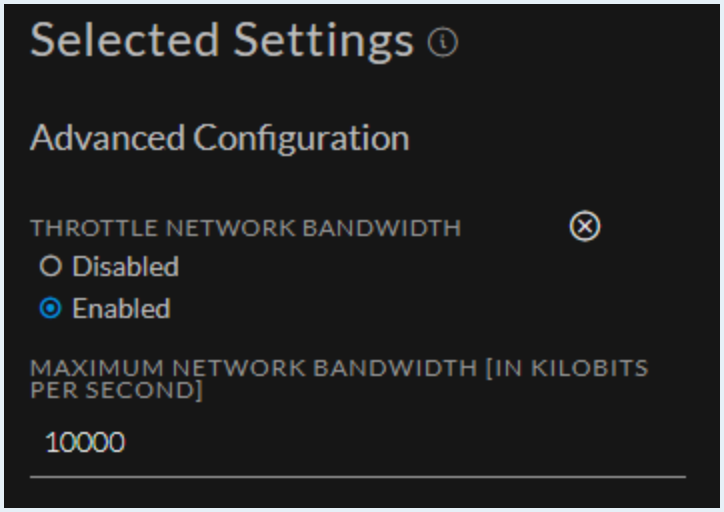
Below is an example of Define policy panel. The table describes the information and options for Agent Endpoint policy:

Settings	Description
	Scan Schedule
Run Scheduled Scan	Run a scheduled scan if you want to receive regular snapshots from a host. Scan snapshots provide detailed information about processes and files loaded on the memory. By default, this option is disabled. You can also run a manual scan from the **Hosts** view. **Note:** The following scan schedule options are available only when the scan schedule is enabled. The values entered are specific to the agent time zone.
Effective Date	Date when the policy takes effect. If you do not want this policy to take effect as soon as it is applied to a group and published, set an effective date that is in the future. By default, this is set to the current date.
Scan Frequency	Determines how often the scheduled scan runs on a host. By default, this is set to every week. Every network is different and the frequency should balance the needs of the analysts for current data, availability to review the data, and how systems deal with the load of the generated data. Select Days or Weeks: • Days: Select the number of days of the scan frequency. You can set a schedule to scan every n days, where n is 1, 2, 3, 4, 5, 6, 10, 15, or 20. For example, to scan every third day, select 3. • Weeks: Select after how many weeks the policy scan should be initiated and on which day of the week the policy scan should initiate. For example, to scan every other Wednesday, choose 2 and W.
Start Time	Time when the scheduled scan starts to run on a host. By default, this is set to 9:00. This is the local host time, meaning that scans across a global network will not run all at once. Note that the time is in 24 hour format. To set a time of 7:30 PM, select 19:30.



Settings	Description
CPU Maximum	Amount of CPU the agent can use to run scheduled scans on physical hosts. By default, the value is set at 25%. Increasing the CPU maximum increases the speed of scan snapshot retrieval. Drag the slider to specify the maximum CPU usage by the created policy. Minimum value is 5%. Use the slider to select the maximum CPU processing power to use for the scan. Note that the higher the percentage, the less CPU is available for other tasks on the host.
Virtual Machine Maximum	Amount of CPU the agent can use to run scheduled scans on virtual machines. By default, the value is set at 10%. Increasing the virtual machine maximum value increases the speed of scan snapshot retrieval. Drag the slider to specify the maximum Virtual Machine usage by the policy. Minimum value is 5%. Use the slider to select the maximum CPU processing power to use for the scan. Keep in mind that the higher the percentage, the less CPU is available for other tasks running on the virtual machine.
Agent Mode	
Monitoring mode	Allows you to specify whether an agent should operate in Insights (free) or Advanced mode (license). By default, it is set to Advanced.
(Version 11.5 and Later) Expanded Network Visibility	Enables network tracking and monitoring on Windows hosts in Insights mode. **Note:** For network tracking in Insights mode, verify that the Windows Management Instrumentation (WMI) service should be enabled. It also optimizes the frequency of agents sending network events for network packet correlation for both Insights and Advanced modes. By default, this option is disabled.
Scan Settings	
Scan Master Boot Record	Includes Master Boot Record (MBR) details in scheduled scans. By default, this option is disabled. This can help to identify when an operating system boot sequence is compromised. However, not all modifications to the MBR are malicious, as they could be made to provide encryption or enforce licensing of certain legitimate software.
Auto Scan New Systems When Added	Automatically scans when a new host is added. By default, this option is disabled. If this option is disabled, no snapshot data is displayed in the **Hosts** view until a manual or scheduled scan is run on these hosts. Existing hosts will not be affected. **Note:** Enabling this option on a new deployment when this policy is applied to a large number of hosts may result in a large number of simultaneous scans that cause performance degradation.
Download Settings	
Automatic File Download	Automatically download the files to the NetWitness Endpoint Server based on the file size and signature. If a file is present on multiple hosts or multiple Endpoint Servers, only one instance of the file is downloaded. By default this option is enabled.

Settings	Description
Automatic Memory DLL Downloads	From version 11.6.1 and higher, all memory DLLs that are detected during a scan, will be automatically downloaded regardless of the file size. This option is enabled by default.
Signature	Limits the download of files based on the signature. The options are : • Exclude All Signed - Downloads all the unsigned files to the NetWitness Endpoint Server and exclude all the signed files. • Exclude only Microsoft and Apple signed - Downloads all the unsigned files and exclude the files signed by Microsoft and Apple. • Include All- Downloads all the signed and unsigned files. **Note:** . In case of Linux, **Exclude all signed** and Exclude **Microsoft and Apple** signed options will download the files that are not part of any installed RPMs or files which are part of RPM but the hashes does not match with RPM.
File Size Limit	Limits the download of files based on the file size. The File size should be between 1 KB and 10 MB. By default, file size lesser than or equal to 1 MB are downloaded automatically.
Response Action Settings	
Blocking	Allows an analyst to prevent the execution of a malicious file on any host running an Advanced mode agent. By default, this option is disabled. File blocking will not be enforced if it is disabled by policy, which might be desirable to ensure that there are no performance side effects on systems where CPU or IO performance is critical. **Note:** Blocking is only supported on Windows agent (in Advanced mode) with NetWitness version 11.3 and later.
Network Isolation	Allows an analyst to block hosts that are compromised from connecting to the network. This controls the spread of an attack and help analyze the malware behavior after the network isolation. All attempted network connections are monitored and reported to the Endpoint Server. By default, this option is disabled. **Note:** Network isolation is only supported on Windows agent (in Advanced mode) with NetWitness version 11.4 and later.
Endpoint Server Setting	
Endpoint Server	Displays all available Endpoint servers in the deployed. **Note:** If you do not select an Endpoint Server, the agent uses the default Endpoint Server that is configured during packager generation.
Server Alias (Optional)	The optional server alias allows you to enter an alternative hostname or IP address on which the server can be reached in the case that agents need to go through a NAT or similar in order to reach the Endpoint Server.



Settings	Description
HTTPS Port	Port number used for HTTPS communication. By default, the port is set to 443. If you want to change this port, make sure that it matches the server configuration. If you enter the wrong port, the agents can no longer communicate with the Endpoint server and the system will be non-functional.
HTTPS Beacon Interval	Determines how often an agent can communicate with the Endpoint server over HTTPS. By default, the value is set to 15 minutes. The default method of beaconing is UDP. Beaconing is used as a method of keep-alive to know if a host is online and to allow hosts to respond faster than the fallback HTTPS beacon time.
UDP Port	Port number used for UDP communication. By default, the port is set to 444. If you want to change this port, make sure that it matches the server configuration. Entering the wrong port results in loss of functionality and effects performance.
UDP Beacon Interval	Determines how often an agent can communicate with the Endpoint server over UDP. By default, the value is set to 30 seconds.

Define Policy Panel for Windows Logs Policy

The table describes the information and options for Agent Windows Logs policy:

Settings	Description
Windows Log Collection	If enabled, logs from the Windows hosts are collected and forwarded to the NetWitness Platform. By default, this option is disabled.
Send Test Log	If enabled, a sample log is sent to the configured server when the policy is loaded to test connectivity. This allows to test the configuration before standard logs are available. By default, this option is disabled.

Settings	Description
Primary Log Decoder / Log collector	Primary NetWitness Log Decoder or Log Collector to which the collected Windows logs are forwarded.
(Optional) Secondary Log Decoder / Log collector	If the primary Log Decoder or Log Collector is not reachable, the collected Windows logs are forwarded to the secondary Log Decoder or Log Collector. **Note:** NetWitness cannot detect failures when UDP protocol is used.
Protocol	Select whether TLS, TCP, or UDP transport protocol is used to forward the collected Windows logs to the NetWitness Platform servers. By default, the protocol is TCP.
Channel Filters	Configure which Windows Log events to collect by selecting a channel, filter condition, and the relevant event IDs. You can either select common channels, such as Security or System from the drop-down list, or create custom channels by entering the channel name. By default, all events are collected from a selected channel. To collect a subset of events from that channel replace 'ALL' with the relevant Event IDs. Select **INCLUDE** if only events with the listed Event IDs should be collected or select **EXCLUDE** to collect all events except for these events.
Advanced Configuration	
Throttle Network Bandwidth	Use this setting to limit network bandwidth that the Agent uses to connect to NetWitness. This setting is disabled by default: click **Enabled** to turn it on, and then enter a value in kilobits per second. • If not set, Agent does not do any network throttling. • If set to a positive value ***x***, agent limits network bandwidth to ***x*** kbps. 

Settings	Description
Advanced Setting	**Caution:** It is strongly recommended not to use this setting unless advised to do so by NetWitness.

Troubleshooting

This section provides information about possible issues when using NetWitness Endpoint.

Agent Communication Issues

Issue	Agent **Last Seen Time** column is not updated in the UI.
Explanation	The issue could be due to any one of the following: • Agent is inactive • Agent data is not processed if the **Endpoint.Health.Overall-Health** statistic shows **Unhealthy** due to which all the agent data including agent last seen time is not updated.
Resolution	See the resolution for these statistics in the Health and Wellness Issues section.

Issue	Agent is unable to communicate with the Endpoint Server.
Explanation	This could be due to one of the following reasons: • Agent is inactive. • Endpoint Server settings is incorrect in the agent packager or policy configuration, or not available for communication. • Endpoint Server or Nginx Server is not running . • Firewall or IP table rules are blocking the connection between the host and Endpoint Server.
Resolution	• Check if the Endpoint Server and Nginx Server are reachable. • If the Endpoint Server settings are incorrect, uninstall the agent, download the agent packager, and reinstall the agent. • Update firewall or IP table rules, if required.

Issue	Agent takes a long time to scan.
Explanation	Sometimes, the NetWitness Endpoint scan takes a long time to complete. This is because of the CPU usage by other antivirus programs (such as Windows Defender, McAfee, Norton, and so on) that may be installed on the agent machines.
Resolution	It is recommended to whitelist the `<service.exe>` (name provided in the packager, by default, the service name is `NWEAgent.exe`) file in the antivirus suite.

Issue	You want to change the responsiveness of the Agent.

Explanation	Depending on your installation, you can adjust Beaconing intervals to change how responsive your agents are.
Resolution	If resources are not a concern, you can lower the HTTPS Beacon Interval and UDP Beacon Intervals. If resources are a concern and responsiveness of the agent is not, you can increase these intervals.

Issue	Agent is unable to generate network tracking events in Insights mode.
Explanation	Verify that Windows Management Instrumentation (WMI) service is running.
Resolution	• Run `Services.msc` and look for Windows Management Instrumentation (WMI) service. • Go to properties and change the **Startup type** to Automatic.

Packager Issues

Message	`Failed to load the client certificate.`
Issue	Incorrect certificate password.
Explanation	While generating the agent installer, the certificate password does not match with the one provided while downloading the agent packager from the UI.
Resolution	Specify the correct certificate password.

Health and Wellness Issues

Endpoint Issues

Behavior	The health check of the **Endpoint.Health.Overall-Health** statistic shows **Unhealthy**.
Issue	Endpoint Server service or required resources are not available or not in a usable state. This could be due to one of the following reasons: • Unable to forward Endpoint meta data to the Log Decoder. • Endpoint Log Hybrid disk usage reaches the specified limit. • Mongo DB is down or excessive read and write errors during processing.
Resolution	• For Log Decoder issue, see Log Decoder Issues section. • For disk usage and Mongo DB issues, see Disk Usage and Mongo Issues section.

Disk Usage and Mongo Issues

Behavior	The health check of the **Data.Application.Connection-Health Application**, **Data Store Disk Usage** or **Data Persistence** for Endpoint Server shows Unhealthy.
Issue	• **Data.Application.Connection-Health Application** or **Data Persistence** shows Unhealthy, if Mongo service is down or fails due to authentication. • **Data Store Disk Usage** shows **Unhealthy**, if Endpoint Server Mongo storage size has exceeded the threshold. By default, the server automatically delete the old data when it reaches 80% of the disk space.
Resolution	• For **Data.Application.Connection-Health Application** or **Data Persistence** issue, you must check the Endpoint server logs (`/var/log/netwitness/endpoint-server/endpoint-server.log`) and Mongo logs (`/var/log/mongodb/mongod.log`), and: ◦ If the issue is due to authentication, you must reissue the certificate. For more information, see "Service Certificate Reissue" section in the *System Maintenance Guide*. ◦ If the issue is due to Mongo service is down, you must restart the Mongo. • For **Data Store Disk Usage** issue, you must increase the storage or configure data retention settings to clear the old data. For more information, see Configuring Data Retention Policy.

Log Decoder Issues

Behavior	Endpoint metadata is not available in the **Investigate > Navigate** or **Events** view.
Issue	The health check of the **Log Decoder Buffer** and **Meta Forward** shows **Unhealthy** in the Health and Wellness.
Explanation	The issue could be due to any of the following reasons: • Log Decoder capture is not started. • Concentrator aggregation is not started. • Log Decoder connection issue. • Log Decoder buffer usage is beyond the specified limit.
Resolution	Make sure that: • Capture is enabled on the Log Decoder. • Aggregation is enabled on the Concentrator. • Meta forwarding is configured properly.

	Note: Make sure **Capture Autostart** is enabled in the Service Config view for Log Decoder and **Aggregate Autostart** is enabled in the Service Config view for Concentrator.

File Log Policy Issues

Invalid Policy or Bad Connection Issues

Issue	Policies can be invalid for a variety of reasons. Some examples: • No sources found if the policy is enabled. • Invalid or missing typespec file • No destination is reachable for a file log policy event source type Additionally, if capture is stopped on the destination Log Decoder, Endpoint Agents will send an error to the Endpoint Server saying that they failed to connect. Also, if there is a lot of data to be processed for Agents collecting File data (when File Policy is enabled) , there is a possibility that Log Decoder buffer becomes full. If this happens, the Log Decoder cannot process any requests from the Agents communicating via EPS.
Explanation	The system is dynamic in nature, which means its state can change: event sources can lose their connection, typespec files can be altered or deleted, and other changes can occur that can invalidate a previously valid policy.
Resolution	To help identify the specific issue, check the log file on the Endpoint Server that reports the error: `/var/log/netwitness/endpoint-server/endpoint-server.audit.log` Relevant errors will be listed as **FileLogError** in the log file. If you experience this issue, you can do the following: 1. Try to identify and target higher-value data, thus limiting the total amount of data being processed. 2. Enable throttling in the File policy to smooth out the peaks in usage. 3. If you really do need to process more data on a regular basis, consider server-side hardware upgrades.

Reset File Collection Bookmarks

Issue	If the system is not configured correctly, NetWitness might collect logs and not be able to parse them. Or, files might get sent, but for some reason, not make it to the Log Decoder (for example if communication is via UDP and there is a network connectivity issue).

	In these and other cases, you can reprocess these "missing" log files.
Explanation	For whatever reason, you may need to reprocess logs from the beginning of the file.
Resolution	Reset bookmarks for an event source type using the procedure described here: Reset File Collection Bookmarks.

Missing Log Collectors and Event Sources in the User Interface

Issue	Some log collectors or event sources seem to be missing from the list of available items.
Explanation	The Filter drop-down menus (types, log collectors, and log decoders) only show values that are in the event sources database, rather than all possible values. For example, if you have a log collector that has not yet collected any logs, then it is missing from the list.
Resolution	Collect logs from a specific log collector and event source, and then they should appear as items in the appropriate menu.

Relay Server Issues

Test Connection Issues

Issue	Relay Server test connection failed.

Resolution	1. Check if the hostname or IP and port of the Relay Server are correct.
	2. Make sure that the hostname or IP of the Relay Server is resolvable from the Endpoint Server. Perform the following:
	a. In the Endpoint Log Hybrid console, verify if the Relay Server is reachable using the following command:
	`nc -zvw3 <relayhost> <relayport>`
	If the Relay Server is not reachable contact your Administrator.
	b. If the Relay Server is reachable, verify if the correct Relay Server installer is used by getting the Endpoint Server revision ID from the Relay Server host (`/var/log/relay-install.log`) and check the Endpoint Server RPM on Endpoint Log Hybrid using the following command:
	`rpm -qa | grep <Endpoint Server Revision ID>`
	c. Make sure if the Relay Server is installed and running.
	• Verify the Relay Server installation logs using the following command:
	`/var/log/relay-install.log`
	• Verify the status of Relay Server using the following command:
	`systemctl status rsa-nw-relay-server`

Issue	Test fails when installing relay server in cloud, using CentOS 7 configuration

Resolution	1. Check if you have entered the suggested port numbers.
	2. If you have entered any other port number than the suggested one
	3. Make sure that the hostname or IP of the Relay Server is resolvable from the Endpoint Server. Perform the following:
	a. In the Endpoint Log Hybrid console, verify if the Relay Server is reachable using the following command:
	`nc -zvw3 <relayhost> <relayport>`
	If the Relay Server is not reachable contact your Administrator.
	b. If the Relay Server is reachable, verify if the correct Relay Server installer is used by getting the Endpoint Server revision ID from the Relay Server host (`/var/log/relay-install.log`) and check the Endpoint Server RPM on Endpoint Log Hybrid using the following command:
	`rpm -qa | grep <Endpoint Server Revision ID>`
	c. Make sure if the Relay Server is installed and running.
	• Verify the Relay Server installation logs using the following command: `/var/log/relay-install.log`
	• Verify the status of Relay Server using the following command: `systemctl status rsa-nw-relay-server`

Issue	Relay Server installer generation fails with an error message ‘Unable to download the installer. Retry after sometime’.
Explanation	Dependencies of the Relay Server are not resolved or downloaded completely.
Resolution	You must retry the download after 5-10 minutes. If the download still fails even after all dependencies are downloaded in the Endpoint Server, contact the NetWitness Customer Support. **Note:** You can check ‘Finished downloading all Relay Server dependencies’ message in the Endpoint Server logs at `/var/log/netwitness/endpoint-server/endpoint-server.log`, to see if the dependencies are downloaded. If the download fails due to yum related issues, then you must clean yum repo using the command `yum clean all` and restart the Endpoint Server.

Issue	After the removal of DNSMasq in 12.1 and later versions, test connection fails between the Endpoint server and relay server.
Resolution	For the test connection to succeed, perform the following.

	1. SSH to Endpoint server. 2. Edit the `/etc/nginx/conf.d/relay.conf` file and go to `resolver nw-node-zero ipv6=off;` line. 3. Replace `nw-node-zero` with the nameserver IP or hostname. 4. Run the following command to restart nginx service. `systemctl restart nginx` 5. Try **Test Connection** again.

Installation Issues

Issue	Relay Server installation fails due to missing or corrupted dependencies.
Resolution	Re-download the installer dependencies, perform the following: 1. Go to **(Admin) > Endpoint Server** service > select > **View** > **Explore**. 2. In the Endpoint server configuration, make sure **endpoint.relay.installer.download-on-restart** boolean is set to true (by default it is true). 3. Restart the Endpoint server using the following command: `systemctl restart rsa-nw-endpoint-server` Fresh dependencies will be downloaded to the local directory in the Endpoint Server. This may take few minutes. 4. Download the Relay Installer. 5. Run the Relay Server Installation Script. For more information, see (Optional) Installing and Configuring Relay Server.

YARA Issues

Issue	Failure in saving YARA configuration.
Explanation	The rule-folder path is under some Linux user home-directory such as /root or /home/user1.
Resolution	Choose other paths such as /var or /tmp etc. or change the owner of the directory to 'netwitness' user.

OPSWAT Issues

Files can not be scheduled for scan

Issue	Some files cannot be scheduled for the scan. See Endpoint Configuration Guide > Troubleshooting
Explanation	The issue could be due to any one of the following: 1. One of the endpoint servers is either down or not responsive. 2. OPSWAT is not configured in one or more of the endpoint servers.
Resolution	1. Ensure all the endpoint servers are up and running. 2. Ensure OPSWAT is configured in all the endpoint servers.

OPSWAT not configured on all endpoint servers

Issue	OPSWAT is not configured on appropriate Endpoint servers.
Explanation	The issue could be due to any one of the following: 1. OPSWAT is not configured in any of the endpoint servers. 2. One or more endpoint servers are down.
Resolution	1. Ensure OPSWAT is configured in all the endpoint servers. 2. Ensure all the endpoint servers are functioning.

OPSWAT scan results not getting updated

Issue	OPSWAT scan is scheduled successfully, but no results are getting updated.
Explanation	The issue could be due to any one of the following: 1. Either you have selected unsupported file extensions, or some files are larger than the configured file size limit. 2. OPSWAT server is either down or not responsive.
Resolution	1. Ensure only the files with supported extensions are selected, and file size has not exceeded the configured maximum file size. 2. Contact OPSWAT support for additional information.

Appendices

Reset File Collection Bookmarks

In cases where issues have caused logs to be lost, or not correctly sent to the Log Decoder, you can resend messages in log files by resetting the bookmarks for those log files.

Note: For security reasons, NetWitness does not allow resetting bookmarks from the agents. Rather, you must do so from an Endpoint Server.

The following procedure describes how to reset bookmarks for file collection logs.

Note: Currently, you can reset bookmarks for all sources or just one specific source, by providing a list in a JSON file.

Construct a JSON File to Identify Agents and Event Source Types for Reset

First, you need to construct a JSON file using the following structure:

```
{

     "agentIds": [],
     "sourceType" : ""

}
```

where:

- `agentIds`: a list of the IDs for one or more Endpoint Agents: these are the individual agents on which the source log files reside.
- `sourceType`: this is a list of the file event source type or types for which you want the log file bookmarks to be reset.

For details on finding agent IDs and source types, see How to Find Agent IDs and Source Types below.

For example, the following source code snippet could be used to delete bookmarks for **all** sources on 3 agents:

```
{

     "agentIds": ["43F27B6E-A02D-955A-9607-2DFC5D17B6E7",
        88AD4B2C-192B-B50E-A125-C05B801301AA"
        "3899038D-8F42-BC93-5BA7-ECBFC309D6A3"],
     "sourceType": "ALL"

}
```

Similarly, the following source code snippet could be used to delete bookmarks for **apache** sources on 3 agents:

```
{
```

```
    "agentIds": ["43F27B6E-A02D-955A-9607-2DFC5D17B6E7",
       88AD4B2C-192B-B50E-A125-C05B801301AA"
       "3899038D-8F42-BC93-5BA7-ECBFC309D6A3"],
    "sourceType": "apache"

}
```

Reset Bookmarks

Perform the following steps to reset the bookmarks that you specified in a JSON-formatted file:

1. SSH to the NetWitness Admin Server.
2. Run `nw-shell` command. for details about using the NetWitness shell, see the *Shell User Guide*, available in NetWitness Link.
3. After nw-shell starts, connect to an Endpoint Server service, using the following command:

   `connect --service endpoint-server.`*`serviceID`*

   where *serviceID* is identifier for the Endpoint Server that hosts the agents you are changing. See How to Find Endpoint Service IDs for details on how to retrieve the service ID.
4. Change to the directory where the reset command resides:

   `cd endpoint/command/reset-bookmark`
5. Login with an administrator account.
   a. Type the login command:

      `login`

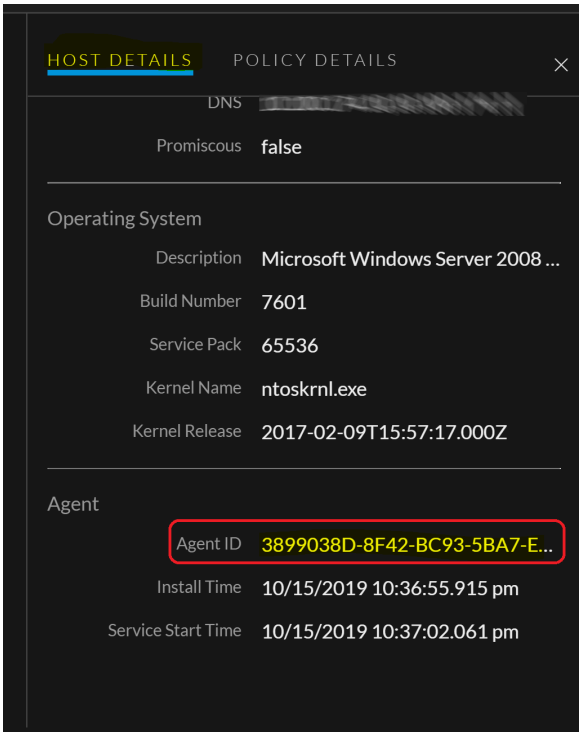
   b. Enter the user name for your admin account.

   c. Enter the password for your admin account.
6. Run the reset command: you need to provide the JSON path and filename that you created earlier.

   `invoke --file <path and filename for JSON>`

   For example:

   `invoke --file /tmp/test.json`



The bookmarks for each log file identified in your JSON file are reset. The following image shows an example NetWitness Shell session:

```
[root@SA ~]# nw-shell
RSA Netwitness Shell. Version: 5.15.0-SNAPSHOT

How to Find Agent IDs and Source Types

To find the Agent IDs for agents, go to **Hosts** > ***<select an Agent>***, then click the **Host Details** panel, and scroll down to the **Agent** section, where the Agent ID is shown:

To find the source types, go to **Hosts** > ***<select an Agent>***, then click the **Policy Details** panel, expand Agent File Logs, view the Source Settings for the source type name to use:

How to Find Endpoint Service IDs

You can retrieve the service ID for an Endpoint Server by using SSH to connect to it.

To retrieve the service ID for an Endpoint Server:

1. SSH to the NetWitness Endpoint Server for which you need to retrieve the ID. The IP address is available under  **(Admin) > Hosts**. The IP address for each host is listed in the **Host** column of the table.
2. View the file that contains the ID by running the following command:

   ```
   cat /etc/netwitness/endpoint-server/service-id
   ```

   It returns the Endpoint Server ID, for example:

   ```
   38909c2f-7a9b-415a-b567-f49a19cf250e
   ```

Currently Supported File Log Event Source Types

The following event source types are currently supported:

Apache Tomcat	Apache Web Server	CA Siteminder
CiscoWorks	CiscoWorks	Citrix XenMobile Device Manager
Courion Password Courier	EMC NetWorker	EMC Symmetrix
GlobalSCAPE EFT Server	IBM TAM WebSEAL	IBM WebSphere
IBM WebSphere MQ	JBoss Application Server	Kaspersky Anti-Virus
McAfee Endpoint	Microsoft DHCP	Microsoft Exchange
Microsoft Exchange 2007	Microsoft Exchange 2010	Microsoft Exchange 2013
Microsoft Exchange 2016	Microsoft Exchange SMTP	Microsoft Forefront Threat Management Gateway
Microsoft IAS (TVM)	Microsoft ISA	Microsoft ISA 2006
Microsoft ISA PF	Microsoft SQL Server	MSIAS
Oracle Access Management	Oracle iPlanet Web Server	Oracle WebLogic
Oracle WebLogic Audit Recorder	Perforce	Perforce AL
Perforce P4D	Rapid7 NeXpose	RIM Blackberry Enterprise Server
RSA Access Manager	RSA ACE Server	RSA ACE Server
RSA ACE Server AM	RSA ACE Server AMX	RSA Adaptive Auth (Hosted)
RSA Certificate Manager	RSA Federated Identity Manager	SAP ERP Central Component
Steel-Belted Radius Accounting	Steel-Belted Radius Authentication	SunOne LDAP Directory Server
Trend Micro IMSS	Trend Micro IWSS	Trend Micro IWSS Audit
VMware View	Windows DNS Debug Logs	MicrosoftIIS (W3C Format)

Specify UNC (Universal Naming Convention) Paths

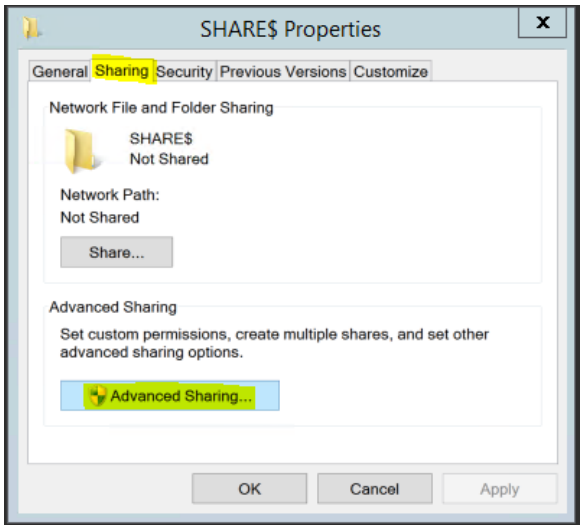
During configuration of a Log File Policy, you can specify the log file path. You can set one or more paths to be used by the agent to locate the log files. The path can be a standard Windows pathname (such as `C:\Program Files\Apache\error_logs\logfile.log`) or a UNC (Universal Naming Convention) pathname (`\\host-name\share-name\file-path`). This topic describes how to specify a UNC path.

Secure the UNC Path Location

When you use a UNC path to collect log data on a remote system, make sure that you secure the UNC path location. One solution that works with minimal risk in a Windows domain environment is to do the following:

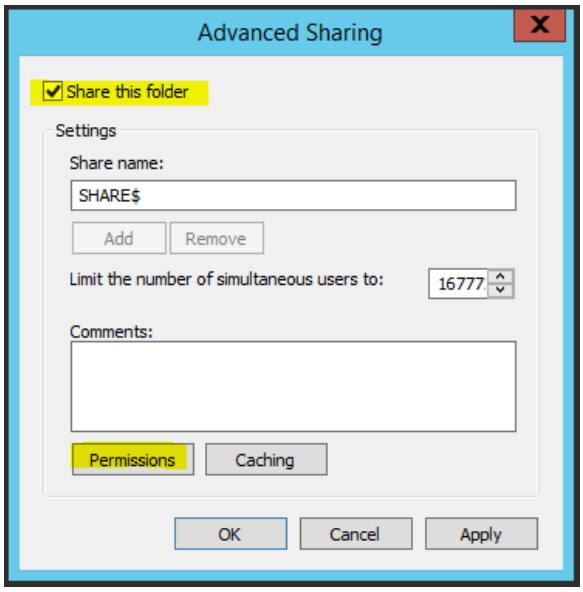
1. Create a share on the directory on the computer where the log data exists in isolation.
2. Name the share to something like **LOGDATA$** for example. (Shares can be hidden from curious browsers by adding a "$" to the end of the share name).
3. Remove all the default share permissions except local admin so it can be changed.
4. Add a share permission for the agent computer system. This allows any user on the agent system to access the shared location. On the agent system collecting the remote log data, nothing else should be required to properly collect the log data from the UNC path.

Note: You may not be able to view the UNC directory contents from file explorer. Seek advice from your IT or security group for additional guidence to setting up and securing a UNC directory share.



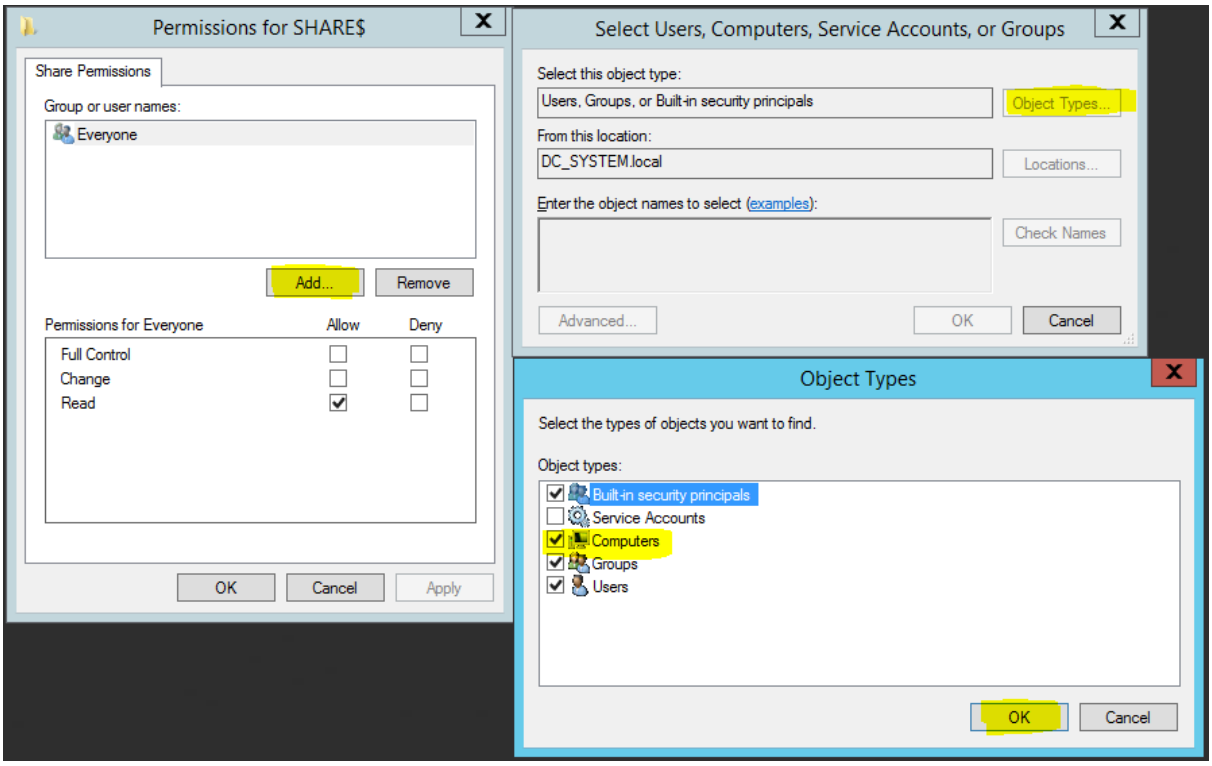
The following procedures describe how to:

- Share a folder between machines in a domain, and
- Share a folder between machines in a Workgroup

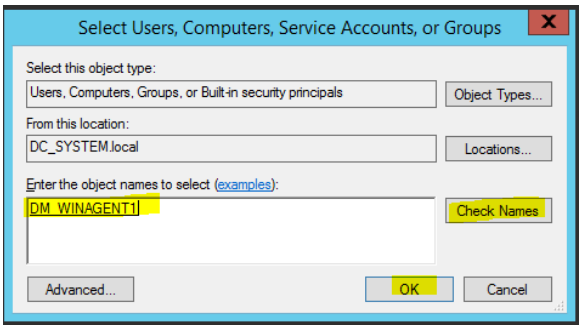


Share a folder between machines in a domain

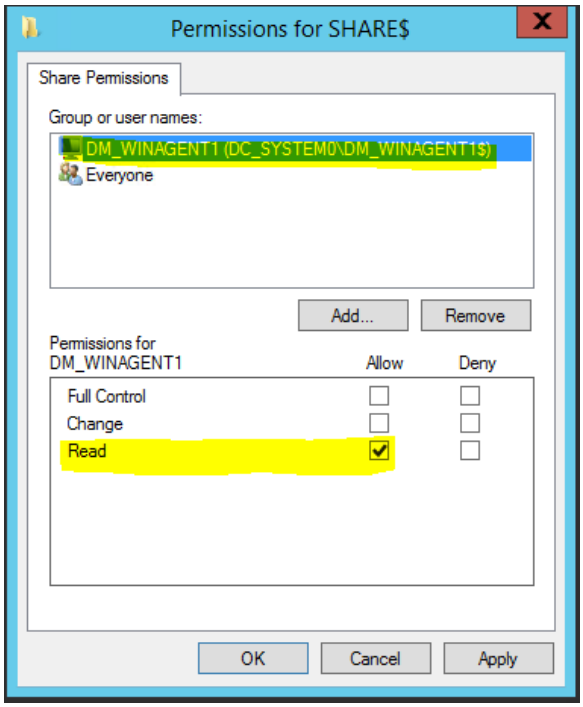
This procedure describes how to share a folder between Windows machines that are both in the same domain.



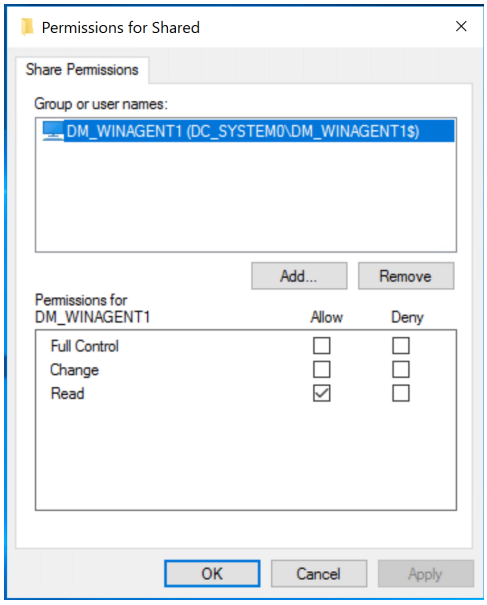
1. Log on to a Domain member machine that contains the logs folder you want to collect using an agent.
2. Right click on the folder you want to share with the agent to collect logs from, and click **Properties**: **SHARE$** in this example.



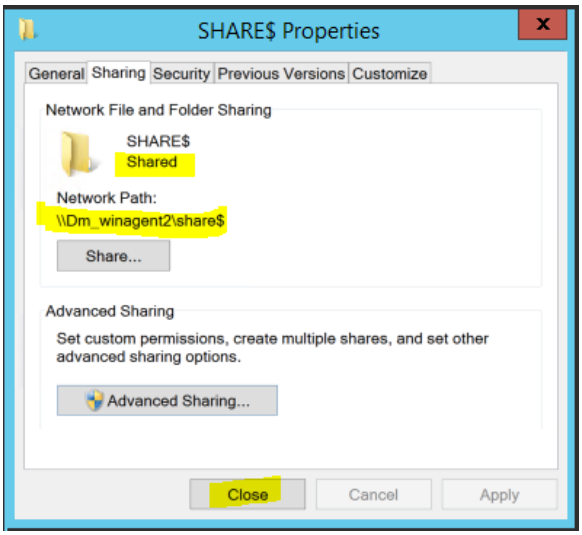
3. Click Advanced Sharing, select Share this folder, and then click Permissions.



4. Click **Add**, and then on the next window click **Object Types**, check **Computers**, hit **OK**.

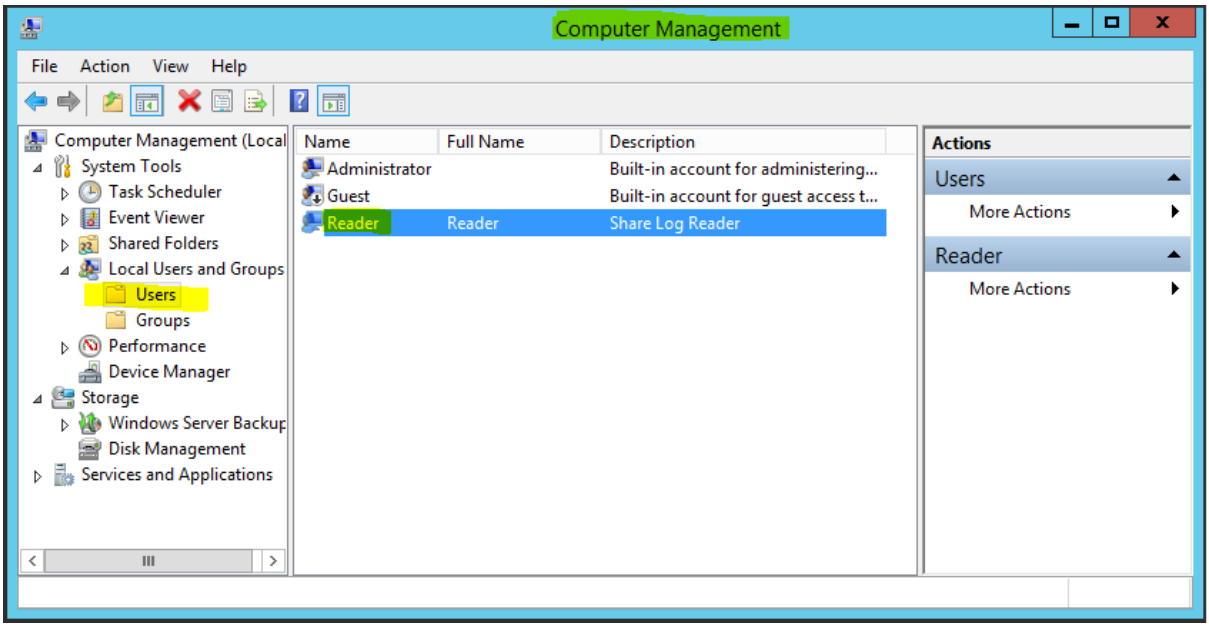


5. Search for the Agent computer name as shown below and click **OK**.

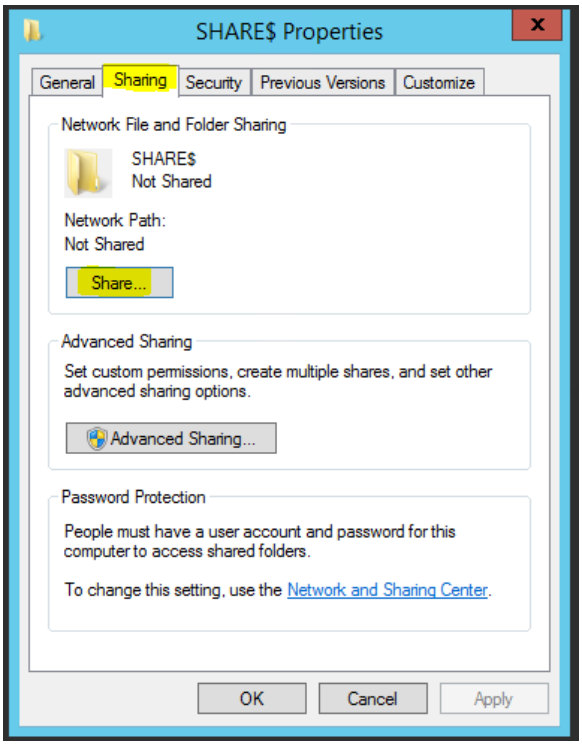


6. In the Permissions screen, provide **Read** permission to the agent, click **Apply**, and then click **OK**.

7. Remove **Everyone** from the Share Permissions list.

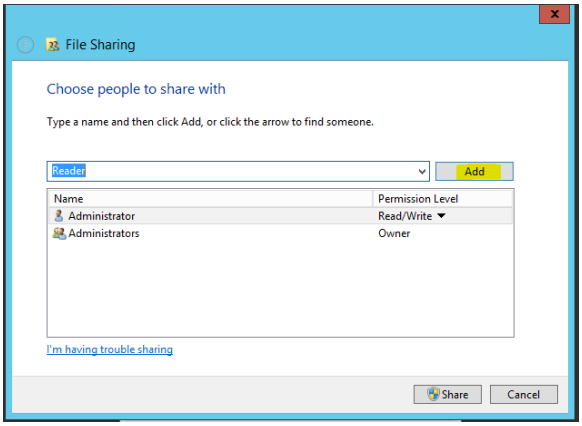


8. Verify that now the **SHARE$** folder status is correct, and note the network path so that you can enter it later, when you configure the policy that will use this shared folder.

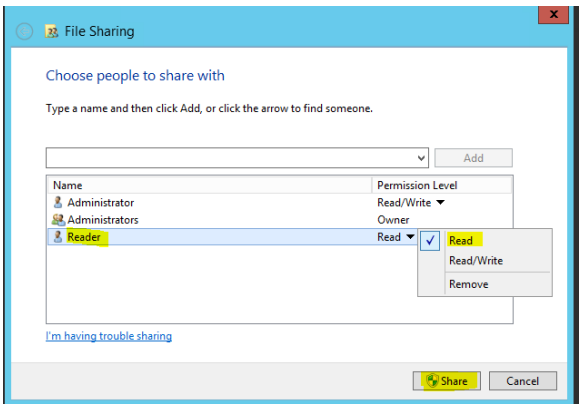


Share a folder between machines in a Workgroup

This procedure describes how to share a folder between Windows machines that are both in the same Workgroup.



1. Log on to a workgroup machine that contains the logs folder you want to collect using an agent.
2. Create a non-admin user for log collection: **Reader** in this example.



3. Right click on the folder you want to share with the agent to collect logs from, and click **Properties**: **SHARE$** in this example.
4. Click the **Sharing** tab, then click **Share**.

5. Choose the newly-created user and click **Add**.

6. Select the **Read** permission and click **Share**.

7. Log onto the Agent to add credentials, so that the system can read logs from the shared folder.
   a. Download the `psexec` tool from the Microsoft web site.
   b. Run the following command:

      ```
      psexec -i -s cmd.exe
      ```

      A new command window opens, running as **system**.
   c. In the command window, run the following command to cache credentials for the newly-created user to access logs on shared folder from a workgroup machine:

      ```
      net use \\hostname of machine with logs\Share$
      ```

      For example:

      ```
      net use \\WGWINAGENT2\Share$
      ```
   d. Provide the username and password for the non-admin user created earlier (in step 2).

This command adds credentials to read logs from the shared folder on the workgroup machine.

License Agreement

This software and the associated documentation are proprietary and confidential to RSA Security LLC or its affiliates are furnished under license, and may be used and copied only in accordance with the terms of such license and with the inclusion of the copyright notice below. This software and the documentation, and any copies thereof, may not be provided or otherwise made available to any other person.

No title to or ownership of the software or documentation or any intellectual property rights thereto is hereby transferred. Any unauthorized use or reproduction of this software and the documentation may be subject to civil and/or criminal liability. This software is subject to change without notice and should not be construed as a commitment by RSA.

It is advised not to deploy third-party repos or perform any change to the underlying NetWitness Operating System that is not part of the supported NetWitness version. Any such change outside of the NetWitness approved image may result in a service or functionality conflict and require a reimage of the NetWitness system to bring NetWitness back to an optimized functional state. In the event a third-party repo is deployed, or other non-supported change is made by the customer without NetWitness approval, the customer takes full responsibility for any system malfunction until the issue can be remediated through troubleshooting efforts or a reimage of the service.

Third-Party Licenses

This product may include software developed by parties other than RSA. The text of the license agreements applicable to third-party software in this product may be viewed on the product documentation page on NetWitness Community. By using this product, a user of this product agrees to be fully bound by terms of the license agreements.

Note on Encryption Technologies

This product may contain encryption technology. Many countries prohibit or restrict the use, import, or export of encryption technologies, and current use, import, and export regulations should be followed when using, importing or exporting this product.

Distribution

Use, copying, and distribution of any RSA Security LLC or its affiliates ("RSA") software described in this publication requires an applicable software license.

NetWitness Endpoint Integration

NetWitness customers who are using NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later can integrate into NetWitness 11.x in several different ways.

Note: In Version 11.2 and later, the following components are rebranded:
- NetWitness Suite to NetWitness Platform
- Packet Decoder to Network Decoder

Integration Options

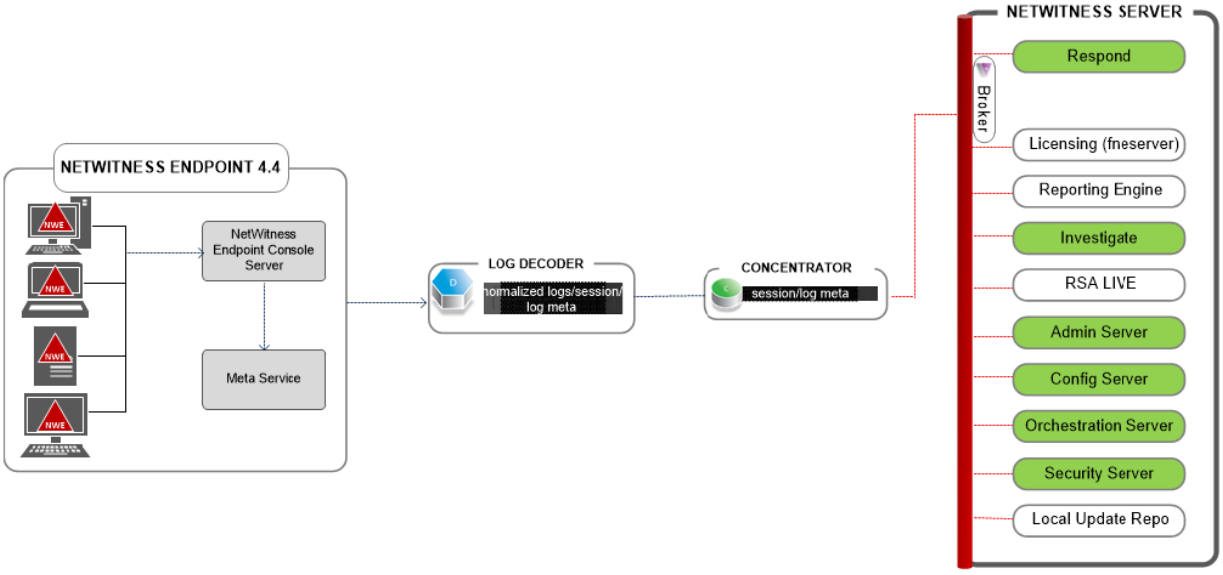
Integration Methods

The following are the NetWitness Endpoint integration methods:

- Configure Endpoint Alerts through Respond
- Configure Contextual Data from Endpoint through Recurring Feed
- Configure Endpoint Alerts through Syslog into a Log Decoder
- Configuring Meta Integrator service in the NetWitness Endpoint 4.4.0.2 or later directly to a Log Decoder

Endpoint alerts into NetWitness Respond. This integration provides the capability for forwarding Endpoint alerts to Respond.

Contextual data from Endpoint through a NetWitness Live recurring feed. This integration can enrich the session displayed in NetWitness Investigation with contextual information; some examples include the host operating system, MAC address, IIOC score, and other data that may not be present in the log or packet data.



NetWitness Endpoint alerts through Syslog (CEF) into NetWitness Log Decoders. This integration provides the capability to forward Endpoint events through Syslog and to correlate the events with other log or packet metadata in the NetWitness ecosystem.

(For Version 11.1 and later) **NetWitness Endpoint directly to a Log Decoder.** This integration lets you view the Endpoint metadata in the **Investigate > Navigate** and **Event Analysis** view similar to Logs and Packets.

Note: For information on NetWitness Endpoint 4.4.0.x integration with NetWitness, see *NetWitness Endpoint Configuration Guide*.

NetWitness Endpoint Metadata Integration

The NetWitness Platform provides seamless integration allowing Endpoint metadata to be included into the NetWitness work flow. This lets analyst to investigate an incident and respond using packet, log, and endpoint metadata. The endpoint metadata provides further indicators and context related to a host, user, process, or file. It also provides tracking data that provide data of what has transpired with a host, user, process, or file.

Built-in NetWitness Endpoint Lookup

With the NetWitness Endpoint user interface (UI) installed on the same machine where the analyst is using a browser to access NetWitness, the built-in NetWitness Endpoint Lookup from NetWitness Investigation and NetWitness Respond provides right-click access to the NetWitness Endpoint console server for the following meta keys: IP address (ip-src, ip-dst, ipv6-src, ipv6-dst, orig_ip), host (alias-host, domain.dst), client, and file-hash. These are described in the "Launch an External Lookup of a Meta Key" topic in *Investigation and Malware Analysis User Guide* and the "View Alerts" topic in *NetWitness Respond User Guide*.

NetWitness configuration is not required for endpoint lookup when you are using one of the built-in parsers, NetWitness Endpoint or CEF, and you have not customized the default meta keys used when loading metadata in Investigation. For more information, see "Manage and Apply Default Meta Keys in an Investigation" topic in the *Investigation and Malware Analysis User Guide*.

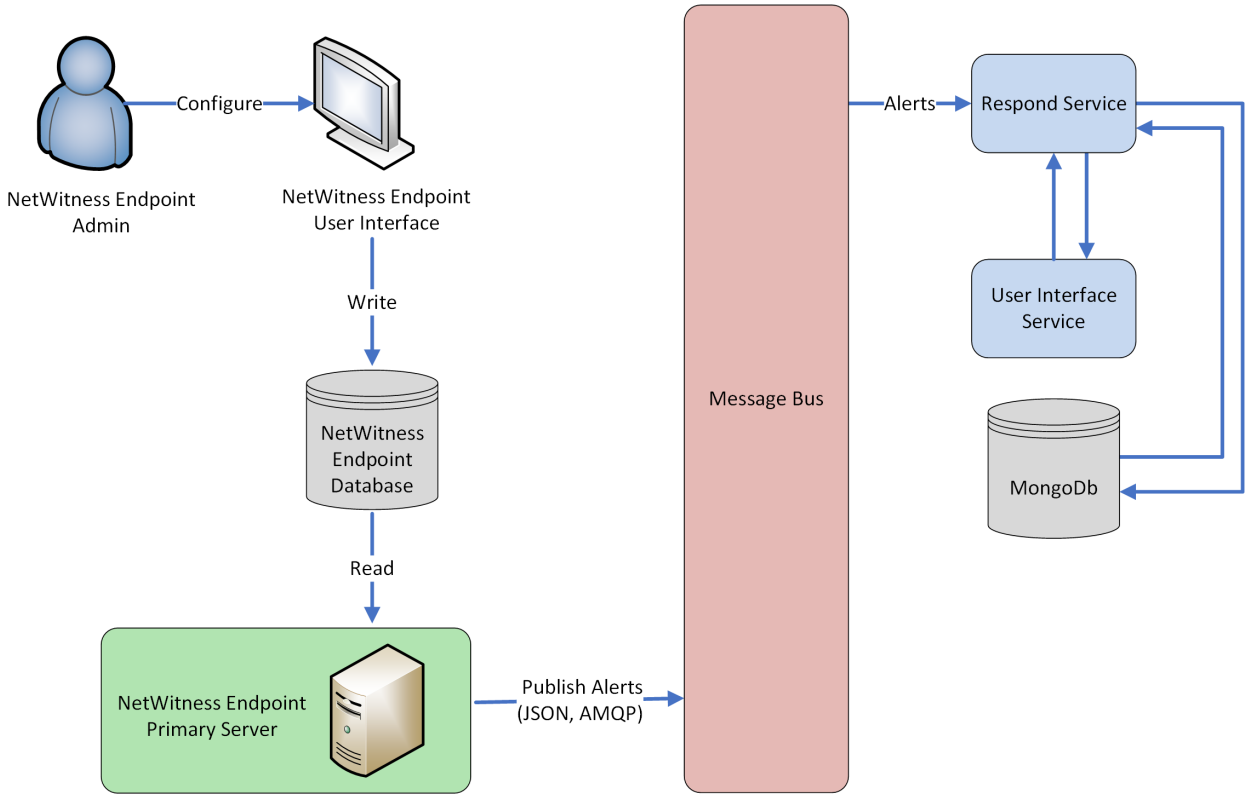
Note: The exception occurs if you customize NetWitness by editing the display setting for the default meta keys in Investigation, add meta keys to the table-map-custom.xml file, or customize NetWitness Endpoint feeds. Some configuration is required to add the custom meta keys to the context menu NetWitness Endpoint Lookup in the  **(Admin)** > System view as described in the "Add Custom Context Menu Actions" topic in the *System Configuration Guide*.

NetWitness Endpoint Alerts and Indicators of Compromise

NetWitness Endpoint IIOC (Instant Indicator of Compromise) is a database query that NetWitness Endpoint runs on collected NetWitness Endpoint scan data to determine the presence of potential malware on scanned hosts. NetWitness Endpoint 4.1.2 or later ships with IOCs that users can enable and mark as alertable. NetWitness Endpoint runs IOC queries regularly on new scan data, which is collected and stored in the database. If the IOC query is satisfied, this indicates a potential indicator of compromise, and the event can be reported to a user or sent to an external system as an alert.

Possible types of alerts are:

- Machine alert: This alert indicates that the machine in question is suspicious.
- Module alert: This alert indicates that a module, such as a file, a DLL, or an executable, is suspicious. It contains details about the module in question.
- Event alert: This alert represents any other suspicious activity detected by NetWitness Endpoint that does not fall into the above categories.



Each of these alert types can be sent to NetWitness.

Configure NetWitness Endpoint Alerts to Respond

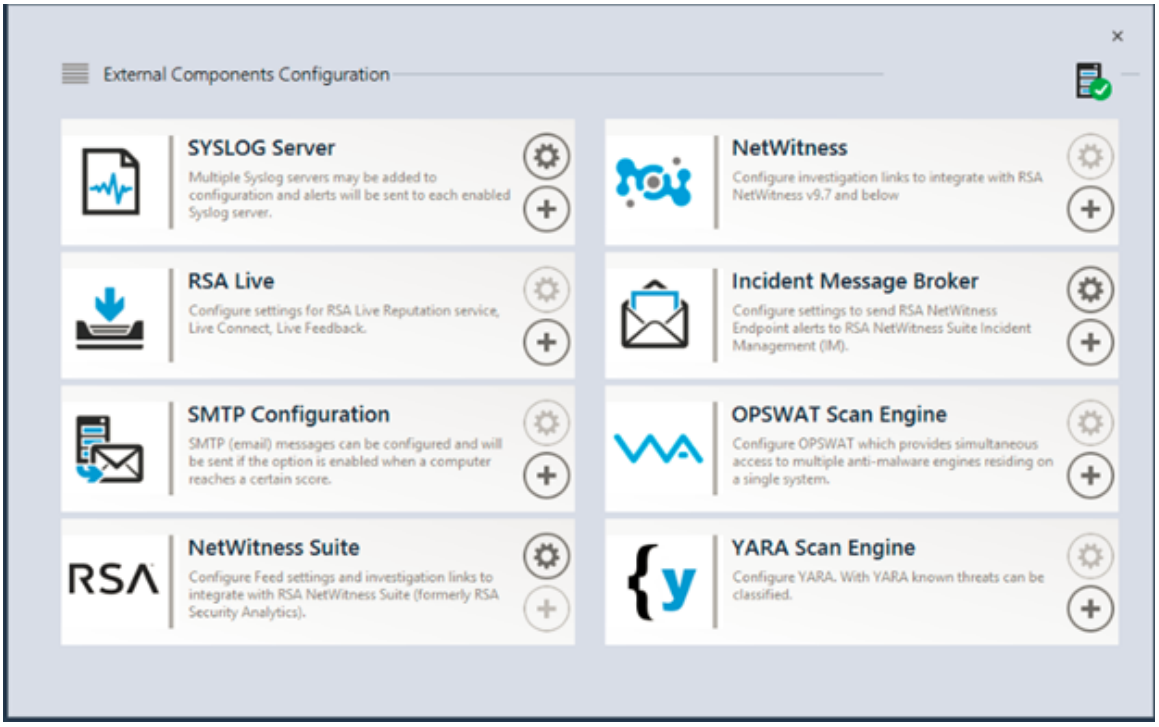
This procedure is required to integrate NetWitness Endpoint with NetWitness so that the NetWitness Endpoint alerts are picked up by the Respond component of NetWitness and displayed in the **Respond > Alerts** view.

Note: NetWitness supports NetWitness Endpoint versions 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later for NetWitness Respond integration. For more information, see the "NetWitness Suite Integration" topic in the *NetWitness Endpoint User Guide*.

The diagram below represents the flow of NetWitness Endpoint alerts to the Respond Incident List view of NetWitness and its display in the **Respond > Alerts** view.

Prerequisites

Ensure that you have the following:



- The Respond service is installed and running on NetWitness.
- NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later is installed and running.

Configure NetWitness Endpoint to Forward NetWitness Endpoint Alerts

To configure NetWitness Endpoint to send alerts to Respond to the NetWitness user interface:

1. In the NetWitness Endpoint user interface, click **(Configure) > Monitoring and External Components**.

   The External Components Configuration dialog is displayed.

2. From the components listed, select **Incident Message Broker** and click + to add a new IM broker.
3. Enter the following fields:
   a. **Instance Name**: Enter a unique name to identify the IM broker.
   b. **Server Hostname/IP address**: Enter the Host DNS or IP address of the IM broker (NetWitness Server).
   c. **Port number**: The default port is 5671.
4. Click **Save**.
5. Navigate to the **ConsoleServer.exe.config** file in **C:\Program Files\RSA\ECAT\Server**.
6. Modify the virtual host configurations in the file as follows:
   `<add key="IMVirtualHost" value="/rsa/system" />`

Note: In NetWitness 11.0 and 11.1, the virtual host is "/rsa/system". For version 10.6.x and below, the virtual host is "/rsa/sa".

7. Restart the API Server and Console Server.
8. To set up SSL for Respond Alerts, perform the following steps on the NetWitness Endpoint primary console server to set the SSL communications:
   a. Export the NetWitness Endpoint CA certificate to .CER format (Base-64 encoded X.509) from the personal certificate store of the local computer (without selecting the private key).
   b. Generate a client certificate for NetWitness Endpoint using the NetWitness Endpoint CA certificate. (You MUST set the CN name to ecat. Run cmd.exe console with Administrator rights.)

      ```
      makecert -pe -n "CN=ecat" -len 2048 -ss my -sr LocalMachine -a sha1 -sky
      exchange -eku 1.3.6.1.5.5.7.3.2 -in "NweCA" -is MY -ir LocalMachine -sp
      "Microsoft RSA SChannel Cryptographic Provider" -cy end -sy 12
      c:\client.cer
      ```

      Note: In the previous code sample, if you upgraded to version 4.3 (or later) from a previous version and did not generate new certificates, you should substitute `"EcatCA"` for `"NweCA"`. Or, if your current operating system has PowerShell version 5.1 or later, you can use the following code sample:

      ```
      PS C:\> New-SelfSignedCertificate -KeyExportPolicy Exportable -Subject
      "CN=ecat" -KeyAlgorithm RSA -KeyLength 2048 -CertStoreLocation
      "cert:\LocalMachine\My" -HashAlgorithm SHA256 -KeySpec KeyExchange -
      TextExtension @("2.5.29.37={text}1.3.6.1.5.5.7.3.2,1.3.6.1.5.5.7.3.1") -
      Provider "Microsoft RSA SChannel Cryptographic Provider" -KeyUsage
      DigitalSignature, KeyEncipherment, KeyAgreement -Signer (Get-ChildItem -
      Path Cert:\LocalMachine\My\ -DnsName NweCA)-NotAfter (Get-Date).AddYears
      (5); Export-Certificate –Cert (Get-ChildItem –Path
      Cert:\LocalMachine\My\ -DnsName ecat) –FilePath C:\Client.cer
      ```

   c. Make a note of the thumbprint of the client certificate generated in step b. Enter the thumbprint value of the client certificate in the IMBrokerClientCertificateThumbprint section of the ConsoleServer.Exe.Config file as shown.

      ```
      <add key="IMBrokerClientCertificateThumbprint"
      value="896df0efacf0c976d955d5300ba0073383c83abc"/>
      ```

9. On the NetWitness Server, copy the NetWitness Endpoint CA certificate file in .CER format into the import folder:

   `/etc/pki/nw/trust/import`

10. Issue the following command to initiate the necessary Chef run:
    `orchestration-cli-client --update-admin-node`
    This appends all of those certificates into the truststore.
11. Restart the RabbitMQ server:
    `systemctl restart rabbitmq-server`
    The NetWitness Endpoint account should automatically be available on RabbitMQ.
12. Import the `/etc/pki/nw/ca/nwca-cert.pem` and `/etc/pki/nw/ca/ssca-cert.pem` files from the NetWitness Server and add them to the Trusted Root Certification stores in the Endpoint Server.

Troubleshooting

This section suggests how to resolve problems you may encounter when you configure NetWitness Endpoint alerts to Respond.

Known Issues	Solutions
Orchestration fails on admin node.	You must copy and paste the content of NweCA or EcatCA certificate in `/etc/rabbitmq/ssl/truststore.pem` and restart the Rabbitmq service.

Configure Contextual Data from NetWitness Endpoint Through Recurring Feed

You can configure NetWitness Endpoint data in NetWitness to provide contextual data from NetWitness Endpoint to Decoder and Log Decoder sessions. This configuration adds contextual meta values in addition to the instant IOC alerts that can be used to build correlations to other metadata in the NetWitness ecosystem.

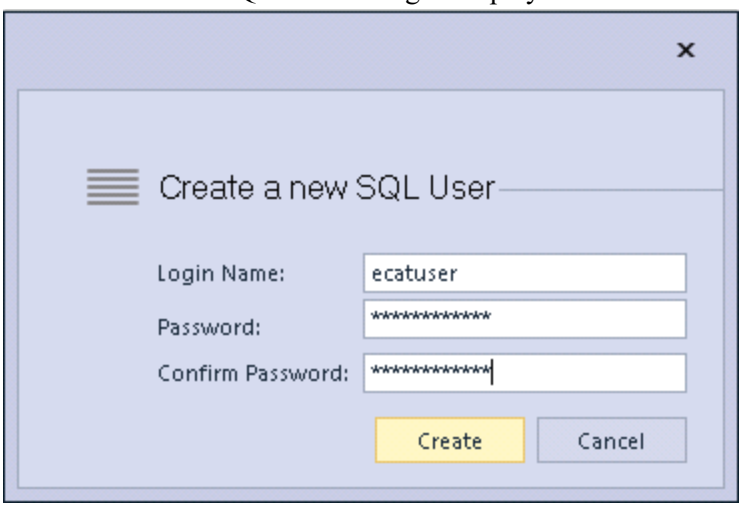
Administrators can configure NetWitness to consume system scan contextual data from NetWitness Endpoint through a NetWitness Live recurring feed. This integration can enrich the session from a Decoder or Log Decoder with contextual information displayed in NetWitness Investigation; some examples include the host operating system, MAC address, IIOC score, and other data that may not be present in the log or packet data into sessions from a Decoder or Log Decoder.

Note: Although this feature is targeted for customers with a Network Decoder, a recurring feed can also be implemented in Log Decoders.

Caution: In an environment with many NetWitness Endpoint hosts, using recurring feed may result in decreased performance on the NetWitness ingest devices (Decoder and Log Decoder).

Prerequisites

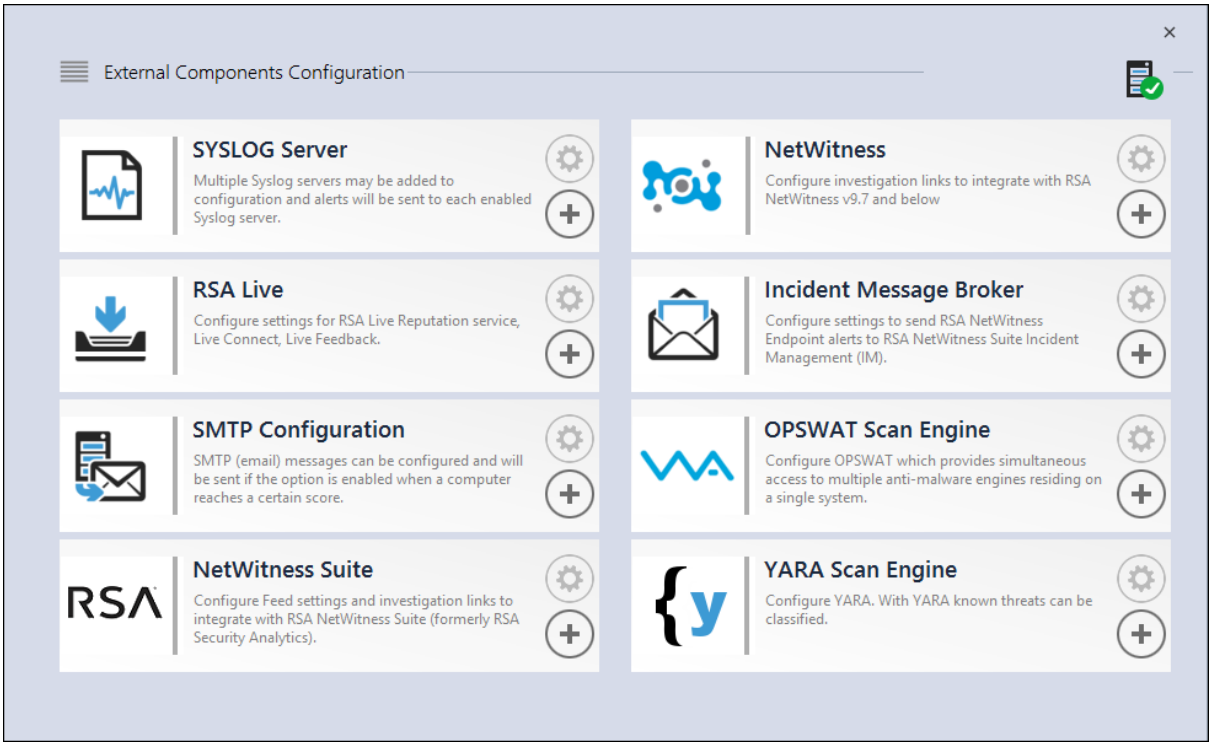
- Version 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later NetWitness Endpoint Console server and NetWitness Server Version 10.4 and above installed.
- Version 11.0 or 11.1 NetWitness Decoder and Concentrator connected to the NetWitness Server in the network.



To Configure Contextual Data from NetWitness Endpoint Through Recurring Feed, perform the following:

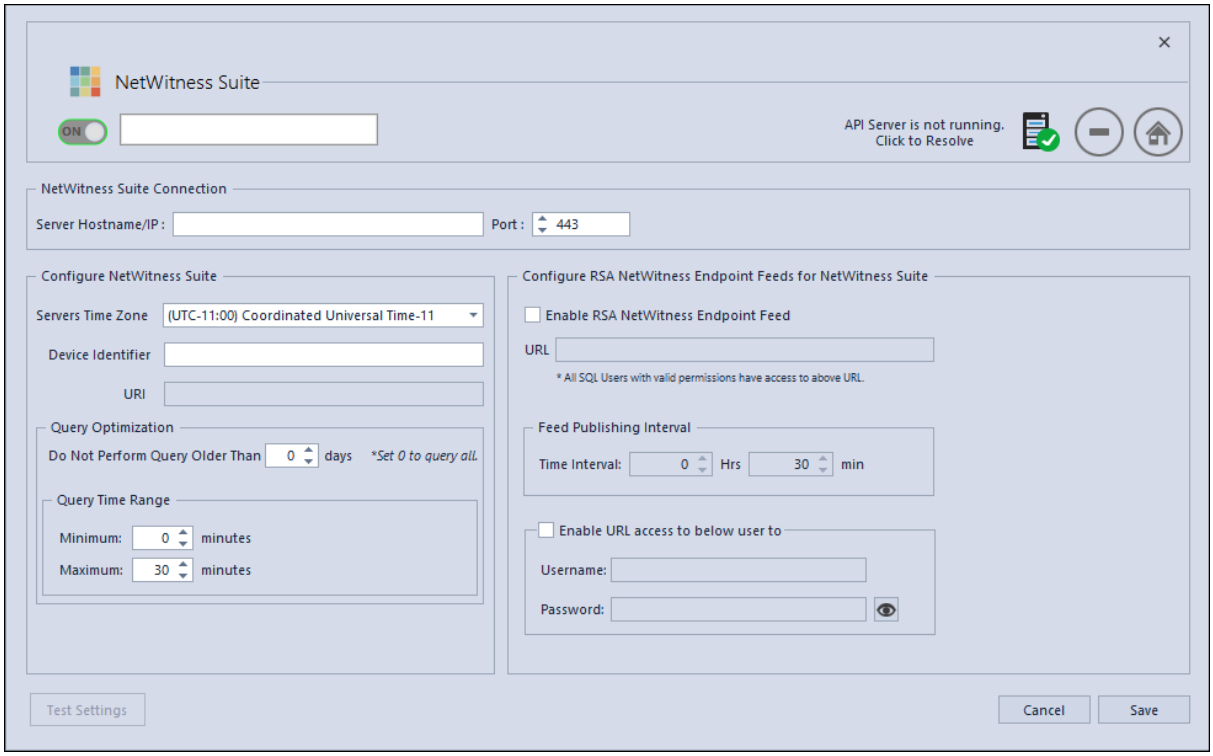
1. Enable the NetWitness Endpoint Feed for NetWitness in the NetWitness Endpoint User Interface.
2. Export the NetWitness Endpoint CA Certificate from the NetWitness Endpoint Console server and Import it into NetWitness trust store.
3. Configure the NetWitness Concentrator service to define which meta keys are indexed.
4. Create a recurring feed in NetWitness Live.

Enable the NetWitness Endpoint Feed for NetWitness



1. In the NetWitness Endpoint user interface, create SQL user in NetWitness Endpoint:
   a. Open the NetWitness Endpoint user interface and log on using the proper credentials.
   b. From the menu bar, select  **(Configure) > Manage Users and Roles**, right-click in the pane, and select **create sql user**.

The Create a new SQL User dialog is displayed.



c. Enter the **Login Name** and **Password** and click **Create**.

2. From the menu bar, select **(Configure) > Monitoring and External Components**.
   The External Components Configuration dialog is displayed.

3. In NetWitness, click +.
   The NetWitness dialog is displayed.

4. In the **NetWitness** panel, in **On**, enter the name to identify the NetWitness component.
5. In the **NetWitness Connection** panel, perform the following.
   a. In the **Server Hostname/IP** field, enter the host name or IP address of the NetWitness Server.
   b. In the **Port** field, enter the port number. By default port number is 443.
6. In the **Configure NetWitness** panel, perform the following:
   a. In the **Servers Time Zone** field, select the time zone for the component from the drop-down list.
   b. In the **Device Identifier** field, enter the NetWitness concentrator device ID.

   Note: You can find the Device Identifier in NetWitness when you look up a Concentrator or Broker in **Investigation > Navigate > <*Concentrator or Broker Name*>**. The Device Identifier is the number in the URL after "investigation." For example, in the URL `https://<IP address>investigation/319/navigate/values`, the Device Identifier is **319**.

   The **URI** field is populated when you click **Save**.
7. In the **Query Optimization** panel, in the **Do Not Perform Query Older Than** field, enter the number of days to limit the query period. Enter **0** if you want to discard this feature.

8. In the **Query Time Range** panel, perform the following:
   a. In the **Minimum** field, enter the number of minutes for the minimum query time range. This value is used to automatically increase the time range submitted to NetWitness. This ensures that a query returns a positive response if the NetWitness Endpoint Agent's reported time is slightly different than NetWitness Endpoint's time.
   b. In the **Maximum** field, enter the number of minutes to limit the time range. This value is used to automatically limit the time range submitted to NetWitness, so that a query does not overload the NetWitness Server.
9. In the **Configure NetWitness Endpoint Feeds for NetWitness** panel, perform the following:
   a. Select **Enable NetWitness Endpoint Feed**.
   b. In the **URL** field, enter the SQL **Username** and **Password** (configured in step 1) to access the location of the feed.
   The **URL** field is populated when you click **Save**.
   c. Enter the time interval for the frequency at which feeds are published.
10. In the **Feed Publishing Interval** panel, in the **Time Interval** field, select the time interval in **hrs** and **mins** for the frequency at which feeds are published.
11. In the **Enable URL access to below user to** panel, enter the **Username** and **Password** of the NetWitness Endpoint user.
12. Click **Save**.
    A feed is created.

Export the NetWitness Endpoint SSL Certificate

Note: This procedure works only for NetWitness 10.5 and above because Java 8 support was added for 10.5. If you are using an earlier version of NetWitness, refer to the applicable version of this guide.

To export the NetWitness Endpoint CA certificate from the NetWitness Endpoint Console server and copy it to the NetWitness host:

1. Log on to the NetWitness Endpoint Console.
2. Open **MMC**.
3. Add a certificate snap-in for **Computer account**.
4. Export the certificate named **`NweCA`** (in NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later fresh install) or **`EcatCA`** (in NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5).
   a. Export without a private key.
   b. Export in DER encoded binary X.509 (`.CER`) format.
   c. Name it **`NweCA.cer`** (in NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later fresh install) or **`EcatCA.cer`** (in NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5).

5. Copy the NetWitness Endpoint CA certificate to the NetWitness host:
   - For NetWitness Endpoint 4.3.0.4, 4.3.0.5 or 4.4 fresh installation:
     `scp NweCA.cer root@<sa-machine>:.`
   - For NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5:
     `scp EcatCA.cer root@<sa-machine>:.`
6. To import the NetWitness Endpoint Endpoint CA certificate into the NetWitness Trusted store, navigate to java directory. Enter the following commands:
   - For NetWitness Endpoint fresh installation:
     `keytool -import -v -trustcacerts -alias nweca -file ~/NweCA.cer -keystore /etc/pki/java/cacerts -storepass changeit`
   - For NetWitness Endpoint upgraded from previous version:
     `keytool -import -v -trustcacerts -alias ecatca -file ~/EcatCA.cer -keystore /etc/pki/java/cacerts -storepass changeit`

   When prompted for certificate update confirmation, enter **Yes**.
7. Create a file `jetty.user` in the `/etc/default` directory and add the following text.
   `JAVA_OPTIONS="${JAVA_OPTIONS} -Djdk.security.allowNonCaAnchor=true"`
8. On the NetWitness host, do one of the following:
   - For NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later fresh installation, edit**`/etc/hosts.user`** to map the IP address of the NetWitness Endpoint Console server to the name **NweServerCertificate** by adding the following line to the file:

     `<ip-address-ecat-cs> NweServerCertificate`
   - For NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5, edit **`/etc/hosts.user`** to map the IP address of the upgraded NetWitness Endpoint Console server to the name **`ecatserverexported`** by adding the following line to the file:

     `<ip-address-ecat-cs> ecatserverexported`
9. SSH to ADMIN Server and run the following command.
   `nw-manage --refresh-host --host-all`
10. To restart NetWitness, enter the following command:
    service jetty restart

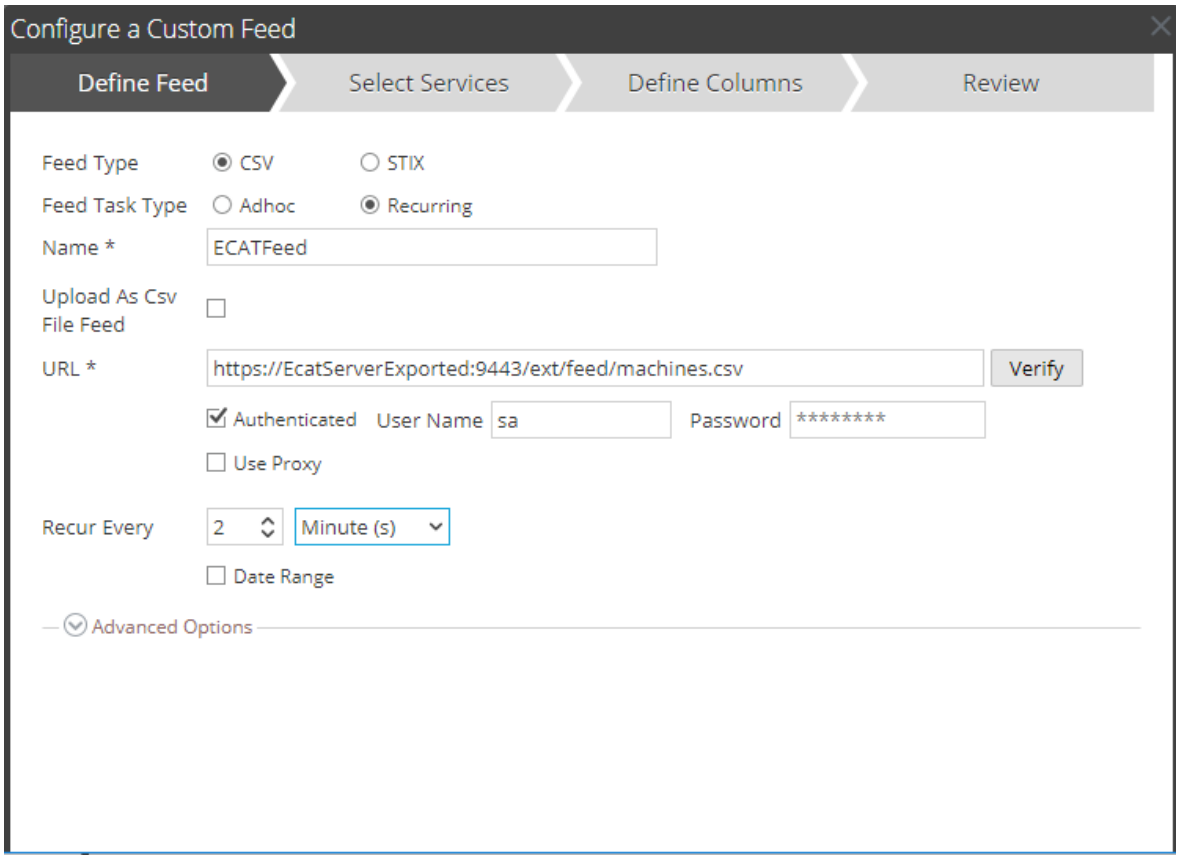
Configure the NetWitness Concentrator Service

1. Log on to NetWitness and go to  **(Admin) > Services**.
2. Select a **Concentrator** from the list and select **View > Config.**
3. Select the **Files** tab, and from the **Files to Edit** drop-down menu, select **index-concentrator-custom.xml**.
4. Add the following NetWitness Endpoint meta keys to the file and click **Apply**. Make sure that this file contains the XML sections already; if the lines are not included, add them. The following lines are examples; make sure the values match your configuration and the column names you included in

the feed definition, where:
description is the name of the meta key you want to display in NetWitness Investigation.
level is "IndexValues"
name matches the column name of the CSV file that NetWitness uses while defining the recurring feed (see the table in *Configure the Recuring Custom Feed Task in NetWitness* below).

```
<key description="Gateway" format="Text" level="IndexValues" name="gateway"
valueMax="250000" defaultAction="Open"/>
<key description="Risk Number" format="Float64" level="IndexValues"
name="risk.num" valueMax="250000" defaultAction="Open"/>
<key description="Strans Addr" format="Text" level="IndexValues"
name="stransaddr" valueMax="250000" defaultAction="Open"/>
<key description="Domain" format="Text" level="IndexValues" name="domain"
valueMax="250000" defaultAction="Open"/>
<key description="User Account" format="Text" level="IndexValues"
name="username" valueMax="250000" defaultAction="Open"/>
<key description="Ecat Connectiontime" format="Text" level="IndexValues"
name="ecat.ctime" valueMax="250000" defaultAction="Open"/>
<key description="Ecat Scantime" format="Text" level="IndexValues"
name="ecat.stime" valueMax="250000" defaultAction="Open"/>
```

5. Restart the Concentrator to activate the custom key updates.

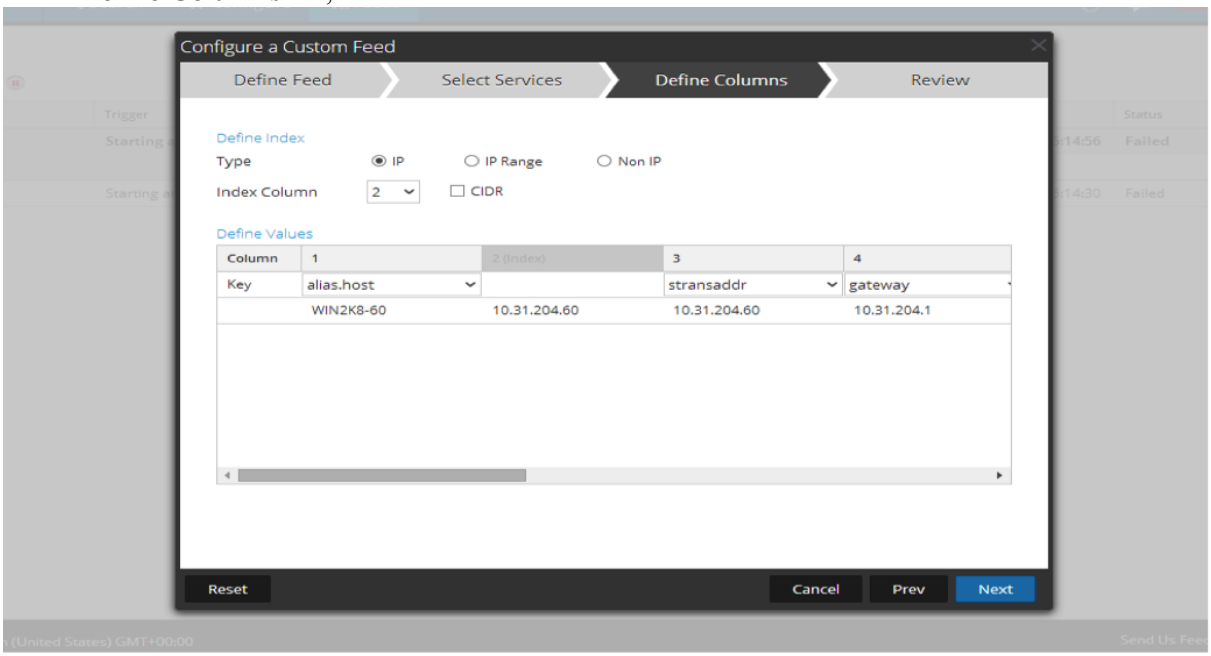


Configure the Recurring Custom Feed Task in NetWitness

1. Log on to NetWitness and go to  **(Configure) > Custom Feeds**.
   The Feeds view is displayed.
2. In the toolbar, click .
   The Setup Feed dialog is displayed.
3. In the Setup Feed dialog, select **Custom Feed** and click **Next**.
   The Configure a Custom Feed wizard is displayed, with the Define Feed form open.
4. In the **Define Feed**, perform the following:
   a. In the **Feed Type** field, select **CSV**.
   b. In the **Feed Task Type** field, select **Recurring**.
   c. In the **Name** field, enter the name of the feed. For example, EndpointFeed.
   d. Enable the **Upload As Csv File Feed** checkbox to upload the feed as a CSV file.
   e. In the **URL** field, enter the URL with the hostname of the Windows server on which NetWitness Endpoint is installed:
      - For NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later fresh installation, use the URL **`https://NweServerCertificate:9443/api/v2/feed/machines.csv`**.
      - For NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5, use the URL **`https://ecatserverexported:9443/api/v2/feed/machines.csv`**.

f. Enable the **Authenticated**checkbox and enter the username and password as noted in *Enable the ECAT Feed* above.

g. Click **Verify** to check if NetWitness can reach the web resource.

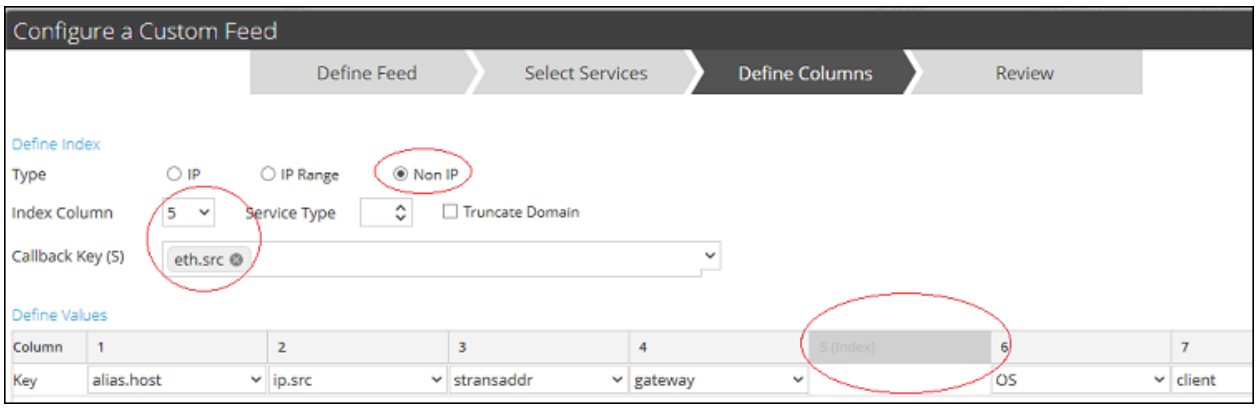


.

h. Define the schedule and click **Next**

5. In the **Select Services** tab, select the Decoder or groups to consume the feed. Click **Next**.

6. In the **Define Columns** tab, enter the column names as shown in the table below and save the feed.



The following table shows the columns in the CSV file for the NetWitness Endpoint feed.

Column	Name	Description	Column Name in NetWitness (Meta Key Name)
1	MachineName	Host name of the Windows agent	alias.host
2	LocalIp	IPv4 address	IP type (indexed column)
3	RemoteIp	Far end IP as seen by the router	stransaddr
4	GatewayIp	IP of the gateway	gateway
5	MacAddress	MAC address	eth.src
6	OperatingSystem	Operating system used by the Windows Agent	OS
7	AgentID	Agent ID of the host (unique ID assigned to the agent)	client
8	ConnectionUTCTime	Last time when the agent connected to NetWitness Endpoint server	ecat.ctime
9	Source Domain	Domain	domain.src
10	ScanUTC time	Last time when the agent was scanned	ecat.stime

Column	Name	Description	Column Name in NetWitness (Meta Key Name)
11	UserName	Username of the client machine	username
12	Machine Score	Score of the agent indicating the suspicious level	risk.num

Note: In the table, the recommended index setting is LocalIp. However, if the LocalIp for NetWitness Endpoint Agent PC is allocated by a DHCP Server and the DHCP lease has expired, and if the IP is then re-allocated to another PC, the metadata created by the feed will be incorrect. To avoid this risk, use the machine name or the Mac address instead of the localIP address as the Feed's index. For example, to use a Mac address, you could enter the values as shown in the following figure.

Result

When viewing feed data in NetWitness, upon a match of the indexed value (ip.src), meta data is populated in Investigation, Reporting, and Alerting Interfaces.

Configure Endpoint Alerts Through Syslog into a Log Decoder

You can configure the use of NetWitness Endpoint data in NetWitness to provide NetWitness Endpoint alerts through Syslog into Log Decoder sessions. This generates metadata that is used by NetWitness Investigation, Alerts, and Reporting Engine.

For NetWitness networks that are consuming logs, this integration of NetWitness Endpoint with NetWitness pushes NetWitness Endpoint events to the Log Decoder through common event format (CEF) syslog messages and generates metadata that is used by NetWitness Investigation, Alerts, and Reporting Engine. The use case for this integration is SIEM Integration to allow centralized event management, correlation of NetWitness Endpoint events with other Log Decoder data, NetWitness reporting on NetWitness Endpoint events, and NetWitness alerting of NetWitness Endpoint events.

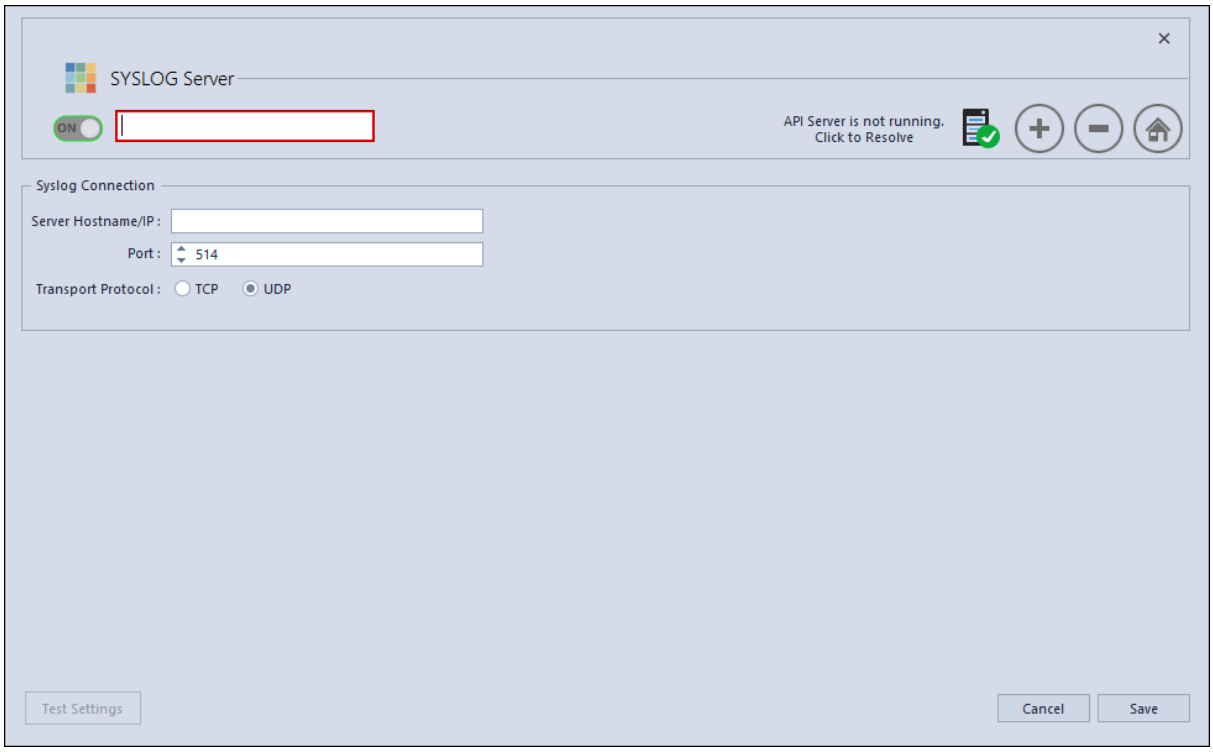
Prerequisites

The following are required for this integration:

- Version 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later NetWitness Endpoint UI.
- NetWitness Server Version 11.1 is installed.
- Version 10.4 or later NetWitness Log Decoder and Concentrator connected to the NetWitness Server in the network.
- Port UDP- 514 or TCP - 1514 open from NetWitness Endpoint server to Log Decoder in the firewall.

Procedure

1. Deploy the required parser (CEF or rsaecat) to the Log Decoder as described in the "Manage Live Resources" topic in *Live Services Management*. After you deploy the parser, make sure the parser is enabled. For more information, see "Services Config View - General Tab" in the *Malware Analysis Configuration Guide*.

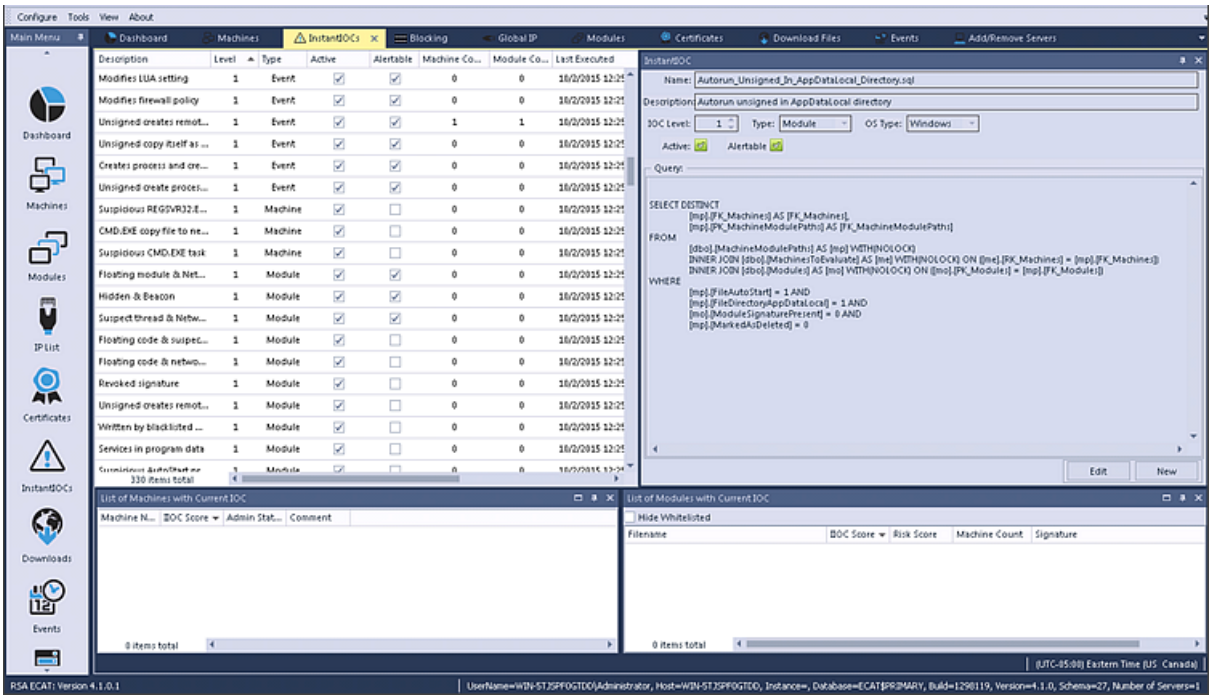


Note: Use only one of these parsers. When the CEF parser is deployed, it supersedes the NetWitness Endpoint parser, and all CEF messages into NetWitness are processed by the CEF parser. Enabling both parsers is an unnecessary burden on performance.

2. Configure NetWitness Endpoint to send syslog output to NetWitness and generate NetWitness Endpoint alerts to the Log Decoder.
3. (Optional) Edit the table mapping in `table-map-custom.xml` and the `index-concentrator-custom.xml` to add fields based on user preferences for metadata to be mapped to NetWitness.

Configure NetWitness Endpoint to Send Syslog Output to NetWitness

To add the Log Decoder as a Syslog external component and generate NetWitness Endpoint alerts to the Log Decoder:



1. Open the NetWitness Endpoint user interface and log on using the proper credentials.
2. From the menu bar, select **(Configure) > Monitoring and External Components**.
   The External Components Configuration dialog is displayed.
3. In **SYSLOG Server**, click .
   The SYSLOG Server dialog is displayed.

4. In the **NetWitness** panel, in **On**, enter the descriptive name for the Log Decoder.
5. In the **Syslog Connection** panel, perform the following to enable Syslog messaging:

   Server Hostname/IP = The hostname DNS or IP address of the NetWitness Log Decoder
   Port = 514
   Transport Protocol = Select **UDP** or **TCP** as appropriate for your Syslog server for the transport protocol.

6. Click **Save**.
7. Open the **InstantIOCs** window in the NetWitness Endpoint UI and, in the **Alertable** column, click to enable each IIOC for which you want alerts sent to the Log Decoder.

When the instant IOCs are triggered, Syslog alerts from the NetWitness Endpoint server are sent to the Log Decoder. Log Decoder alerts are then aggregated to the Concentrator. These events are injected into the Concentrator as metadata.

Edit the Table Mapping in table-map-custom.xml

In the default NetWitness table-map.xml provided by NetWitness, the meta keys in the `table-map.xml` file are set to `Transient`. In order to view the meta keys in Investigation, the keys must be set to `None`. To make changes to the mapping, you must add the entries to the `table-map-custom.xml` on the Log Decoder.

This is the list of meta keys in `table-map.xml`.

NetWitness Endpoint Fields	NetWitness Mapping	Transient in NetWitness
agentid	client	No
CEF Header Hostname Field	alias.host	No
CEF Header Product Version	version	No
CEF Header Product Name	Product	Yes
CEF Header Severity	severity	Yes

NetWitness Endpoint Fields	NetWitness Mapping	Transient in NetWitness
CEF Header Signature ID	event.type	No
CEF Header Signature Name	event.desc	No
destinationDnsDomain	ddomain	Yes
deviceDnsDomain	domain	Yes
dhost	host.dst	No
dst	ip.dst	No
end	endtime	Yes
fileHash	checksum	No
fname	filename	No
fsize	filename.size	No
gatewayip	gateway	Yes
instantIOCLevel	threat.desc	No
instantIOCName	threat.category	No
machineOU	dn	No
machineScore	risk.num	No
md5sum	checksum	No
os	OS	No
port	ip.dstport	No
protocol	protocol	Yes
Raw Message	msg	Yes
remoteip	stransaddr	Yes
rt	alias.host	No
sha256sum	checksum	No
shost	host.src	No
smac	eth.src	No
src	ip.src	No
start	starttime	No
suser	user.dst	No
timezone	timezone	No

NetWitness Endpoint Fields	NetWitness Mapping	Transient in NetWitness
totalreceived	rbytes	Yes
totalsent	bytes.src	No
useragent	user.agent	No
userOU	org	Yes

The following seven keys are not in `table-map.xml`; to use these keys in NetWitness you need to add them to `table-map-custom.xml`, and set the flags to `None`.

NetWitness Endpoint Fields	NetWitness Mapping	Transient in NetWitness
moduleScore	cs.modulescore	Yes
moduleSignature	cs.modulesign	Yes
Target module	cs.targetmodule	Yes
YARA result	cs.yararesult	Yes
Source module	cs.sourcemodule	Yes
OPSWATResult	cs.opswatresult	Yes
ReputationResult	cs.represult	Yes

Here are the entries to be added to the `table-map-custom.xml` if required.

```
<mapping envisionName="cs_represult" nwName="cs.represult" flags="None"
envisionDisplayName="ReputationResult"/>
 <mapping envisionName="cs_modulescore" nwName="cs.modulescore" format="Int32"
flags="None" envisionDisplayName="ModuleScore"/>
 <mapping envisionName="cs_modulesign" nwName="cs.modulesign" flags="None"
envisionDisplayName="ModuleSignature"/>
 <mapping envisionName="cs_opswatresult" nwName="cs.opswatresult" flags="None"
envisionDisplayName="OpswatResult"/>
 <mapping envisionName="cs_sourcemodule" nwName="cs.sourcemodule" flags="None"
envisionDisplayName="SourceModule"/>
 <mapping envisionName="cs_targetmodule" nwName="cs.targetmodule" flags="None"
envisionDisplayName="TargetModule"/>
 <mapping envisionName="cs_yararesult" nwName="cs.yararesult" flags="None"
envisionDisplayName="YaraResult"/>
```

Note: Restart the Log Decoder or reload the log parsers for the changes to take effect.

Configure the NetWitness Suite Concentrator Service

1. Log on to NetWitness and go to  **(Admin) > Services**.
    1. Select a **Concentrator** from the list and select **View > Config.**
2. Select the **Files** tab, and from the **Files to Edit** drop-down list, select **index-concentrator-custom.xml**.

3. Add the NetWitness Endpoint meta keys to the file and click **Apply**. Make sure that this file contains the XML sections already; if the lines are not included, add them.
4. Restart the Concentrator.
5. To add the Concentrator as a data source in the Reporting Engine, in the  **(Admin) > Services** view, select the **Reporting Engine** and Select **View> Config > Sources.**
   NetWitness Endpoint meta is populated in Reporting Engine, and you can run reports by selecting the appropriate meta keys.

Example

Note: The following lines are examples; make sure the values match your configuration and the column names you included in the feed definition, where:
description is the name of the meta key you want to display in NetWitness Investigation.
level is "IndexValues"
name is the NetWitness Endpoint meta key name from the table below

```
<language>
<key description="Product" format="Text" level="IndexValues" name="product"
valueMax="250000" defaultAction="Open"/>

 <key description="Strans Address" format="Text" level="IndexValues" name="stransaddr"
valueMax="250000" defaultAction="Open"/>
 </language>
```

Result

Analysts can:

- Create NetWitness alerts based on NetWitness Endpoint events by configuring NetWitness Endpoint events as an enrichment source.
- Create ESA rules using NetWitness Endpoint meta as described in the "Add Rules to the Rules Library" topic in the *Alerting Using ESA Guide*.
- Report on NetWitness Endpoint events using NetWitness Endpoint meta as described in the "Configure a Rule" topic in the *Reporting Guide*.
- View NetWitness Endpoint alerts in NetWitness Respond as described in the "View Alerts" topic in *NetWitness Respond User Guide*.
- View NetWitness Endpoint meta keys in Investigation along with standard NetWitness core meta keys as described in the "Conduct an Investigation" topic in *Investigation and Malware Analysis User Guide*.

Introduction to Endpoint Investigation

NetWitness Investigate provides data analysis capabilities in NetWitness, so that analysts can analyze packet, log, endpoint, and UEBA data, and identify possible internal or external threats to security and the IP infrastructure. This guide helps analysts perform investigations of endpoint data using NetWitness Investigate.

Note: In Version 11.1 and later, the Hosts and Files views provide a view into endpoint data. Earlier versions offer access to endpoint data using a standalone NetWitness Endpoint server.

For more information, see the *NetWitness Endpoint Quick Start Guide*, the *NetWitness Investigate Quick Start Guide*, and the *NetWitness Investigate User Guide*.

Endpoint Metadata

Endpoint metadata is generated when hosts are scanned and when there are real-time activities on the hosts. You can view the following categories of sessions when metadata forwarding is enabled:

Operating System	Scan Categories & Real-time events	Tracking Categories

Windows	file, service, dll, process, task, autorun, machine, kernel hook, image hook, registry discrepancies, suspicious threads and removable device(USB) detection	• Process event - Reports any process related activities, such as `openprocess`, `openosprocess`, `createprocess`, `createremotethread`, `openbrowserprocess`.
		• File event - Reports any file related activities by an executable, such as `readdocument`, `writetoexecutable`, `renameexecutable`, `selfdeleteexecutable`, `openphysicaldrive`.
		• Registry event - Reports activities that result in registry creation or modification, such as `modifyservicesimagepath`, `modifyfirewallpolicy`, `createservicesimagepath`, `createsecuritycenterconfiguration`, `modifybadcertificatewarningsetting`, `Modifies Startup Folder Location`, `Modifies Winlogon Registry Settings`, `Registers Time Provider Dll`, `Registers Port Monitor Dll`, `Registers Netsh helper Dll`, `Registers AppInit Dll`, `Registers AppCert Dll`,
		• System event - Reports connection of removable devices(USB devices), IP change and boot events such as, `removableDeviceConnected`, `removableDeviceDisconnected`
		• Network event - TCP/UDP and incoming/outgoing.
		  • Reports outbound and inbound network connections on all supported Windows platforms.
		  • Reports IPv4 and IPv6 connections.
		• Console event (for Windows 8 and later) - User input that is entered into a console application, such as `cmd.exe`, `powershell.exe`, is captured and reported with the context `console.local`.
		Commands executed by `cmd.exe`, `powershell.exe` as a result of inter-process communication through anonymous pipes are captured and reported with the context `console.remote`.

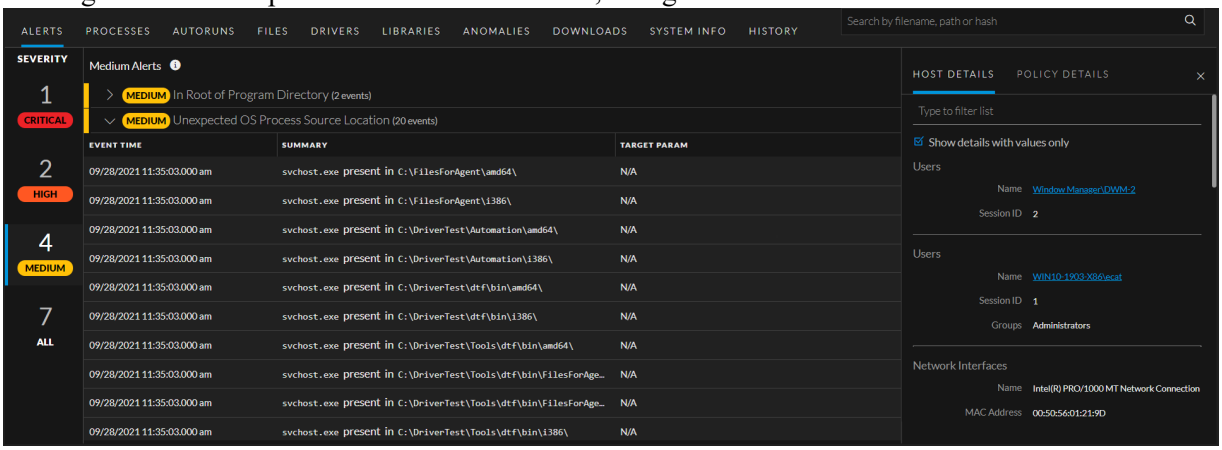
Operating System	Scan Categories & Real-time events	Tracking Categories
		For example, `Get-Item -Path Registry::HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion`.
Linux	file, autrorun, loaded library, systemd, process, cron, initd, and machine	• Process event - Reports process related activities such as `createprocess`. • File event - Reports any file related activities by an executable, such as `writetoexecutable`.

Mac	file, daemon, process, task, dylib, autorun, and machine	• Process event - Reports any process related activities, such as `openprocess`, `createprocess`, `openosprocess`, `openbrowserprocess`, `allocateremotememory`, `createremotethread`.
		• File event - Reports any file related activities by an executable, such as `writetoexecutable`, `renameexecutable`, `createautorun`, `deleteexecutable`, `selfdeleteexecutable`, `writetoplist`, `writetosudoers`, `createbrowserextension`.
		• Network event - TCP/UDP and incoming/outgoing.
		  • Reports outbound and inbound network connections on all supported Mac operating systems.
		  • Reports IPv4 and IPv6 connections.

For more information on metadata, meta keys, meta values, and meta entities, see the *NetWitness Investigate User Guide*.

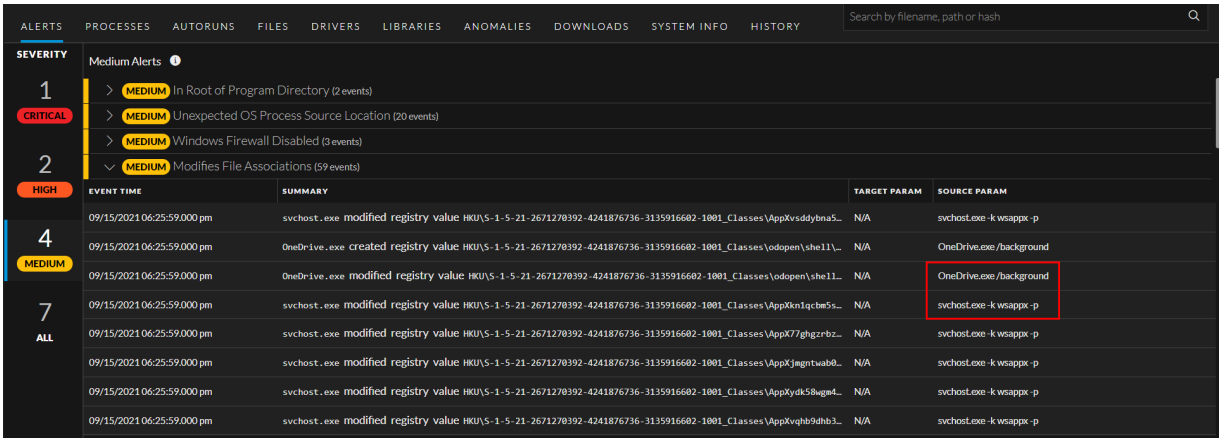
You can track Process events on Mac OS 14 after enabling audit control in your machine. For more information, see Introduction to Endpoint Agent Installation topic in *NetWitness Endpoint Agent Installation Guide for 12.3.1*.

Risk Score



Analysts can use the risk score to begin an investigation on hosts and files. NetWitness uses a proprietary algorithm to calculate the risk scores ranging from 0 to 100. A subset of alerts associated with hosts and files contribute to the risk score calculation. Analysts can review critical and high alerts associated with a risk score to identify strong evidence of malicious activity and take required action.

Note: If you have an Insights agent, you can view the risk score for files but not for hosts. To view the risk score for hosts, upgrade to the Advanced agent. For more information, see the *NetWitness Endpoint Configuration Guide*.



The following factors contribute to the risk score:

- **Distinct Alerts.** Any host or file activities that are suspicious or malicious generate alerts. Only the distinct alerts are used for risk score calculation.
- **Severity of Alerts.** Severity of alerts, such as critical, high, and medium.

  This figure is an example of a host with 1 Critical, 2 High and 4 Medium distinct alerts.

  All the distinct alert shown in the above example can be for the same file or different files. For example, Modifies File Associations alert is triggered for files, such as `svchost.exe` and `OneDrive.exe`.

  This figure is an example of a file with the Critical alert. The file can have a same alert name being triggered by two different hosts as shown below.

The risk score is reset when you perform any of the following actions:

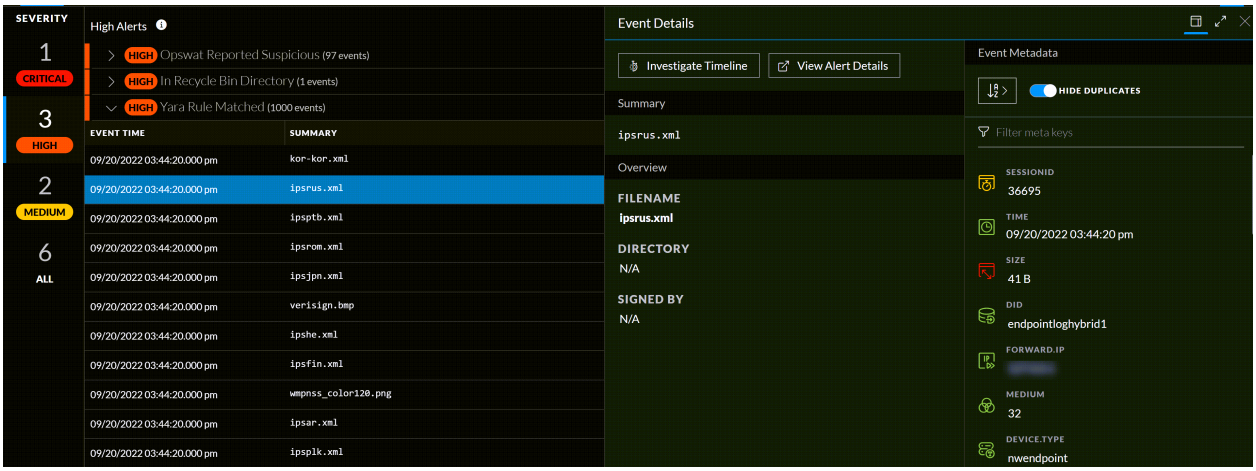
- Whitelist or blacklist a file after investigation. The risk score of a file is set to 0 on whitelisting and set to 100 on blacklisting.
- If the alerts or events triggered by the host or files on the host are false positive, you make changes to the Endpoint Application rules or ESA rules and reset the risk score.

Besides the above factors, the risk score is reset when a file no longer matches Yara rules in the subsequent scans

Note: When you whitelist a file or reset the risk score, the alerts that contributed to the risk score are not shown in the Host Details tab.

The host risk score depends on the risk score of all the files on the host. When you change the file status or reset the file risk score, the host risk score is recalculated. For example, the score for all the hosts on which a blacklisted file is present is recalculated and becomes 100. If the host is not found to be infected, you can reset the host risk score. This deletes the alerts contributed to the risk score and does not impact the global file score. For more information on changing the file status, see Changing File Status or Remediate.

Note: For the risk score calculation, the ESA Correlation server must be configured with an Endpoint Concentrator. The application rules are automatically deployed on installation. For an upgrade, you must deploy the application rules from RSA Live. For more information, see the *NetWitness Endpoint Configuration Guide*.



Note: For the accurate risk score calculation, the default multi-valued meta keys are required on the ESA Correlation service. For more information, see "Configure Meta Keys as Arrays in ESA Correlation Rule Values" section in the *ESA Configuration Guide*.

Severity of Alerts

The following table depicts the risk score range based on the associated alert severity:

Severity	Color	Risk Score Range
Critical	Red	100
High	Orange	70-99
Medium	Yellow	31-69
Low	Green	0-30

The following is an example of alerts contributing to the risk score:

In the above example, there are three distinct High alerts. For each alert type, associated events are displayed. The details of the events are displayed with the metadata information. For more information on severity alerts and metadata information, see Analyze Hosts Using the Risk Score and Analyze Files Using the Risk Score.

Global and Local Risk Score

Analysts can get better context on file activities on hosts using the global risk score and the local risk score of a file.

Global Risk Score - The global risk score is an aggregate of all suspicious and malicious activities performed by the file across all hosts. This score indicates the potential threat posed by the file across the NetWitness Platform.

Local Risk Score - The local risk score is calculated on suspicious or malicious activities performed by the file on a specific host. The local risk score is used for the host risk score calculation.

For more information on the global and local risk score, see Investigating Files and Investigating Hosts.

Automated Incident Creation Based on Risk Score

By default, a threshold is set for the risk score to control the generation of incidents and alerts in NetWitness Respond. For more information on configuring the threshold limit, see the *NetWitness Respond Configuration Guide*.

File Reputation

The File Reputation service available on RSA Live checks the reputation of every file hash against an extensive database of known file hashes updated in real-time. The file reputation is displayed on the Investigate and Respond views.

The reputations for a file hash are:

Reputation	Description
Malicious	File hash is labeled as malicious.
Suspicious	File hash is suspected to be malicious.
Unknown	File hash is not known.
Known	File hash information is known to the file reputation service and does not have any previous bad record.
Known Good	File hash information is known good, such as files signed by Microsoft or RSA.
Invalid	File hash format is invalid.

The suspicious or malicious files are available for further analysis in the **Investigate > Navigate** view and **Investigate > Events** view. For more information on the file reputation service, see the *Live Services Management Guide*.

Note: The File Reputation service supports maximum of 10 million files for a reputation of file hash.

File Status

To help analysts triage and focus on their investigation, NetWitness provides capabilities to manage suspect and legitimate files. For example, you can whitelist files that are legitimate (such as security products), or blacklist files based on known threats and investigation.

A file can be classified as follows:

- Blacklist: File that is marked suspicious, such as when ransomware is found by scan.
- Graylist: File that is marked for a later review.

- Whitelist: File that is legitimate and is not to be considered for risk scoring.
- Neutral: Default status.

For more information, see Changing File Status or Remediate.

Remediation

If a file is malicious or infected, you can block the file to prevent future execution on any host. Remediation helps to:

- Stop or reduce the spread of identified malware, such as viruses, trojans, rootkits, worms, spyware, and adware.
- Identify attempted breach points to aid in deeper analysis; all events are time-stamped allowing analysts to trace backward to identify the entry point.
- Remove unwanted software, such as adware, which can potentially mask real malware.
- Stop all actions possible by the loader.

You can block files with the following file extension: EXE, COM, SYS, DLL, SCR, OCX, BAT, PS1, VBS, VBE, and VB. For more information, see Changing File Status or Remediate.

Network Isolation

If you suspect that a host is potentially compromised with the threat still being active, you can isolate the host from the network and safely investigate possible threats within the host. By isolating the host, you can control the spread of an attack and analyze the malware behavior. When a host is isolated, the connection to the following IP addresses are allowed:

- Endpoint Server, Relay Server, DNS, DHCP, Gateways, 0.0.0.0, 255.255.255.255, and any other IP addresses that the agent connects with.
- Other IP addresses that you include in the exclusion list.

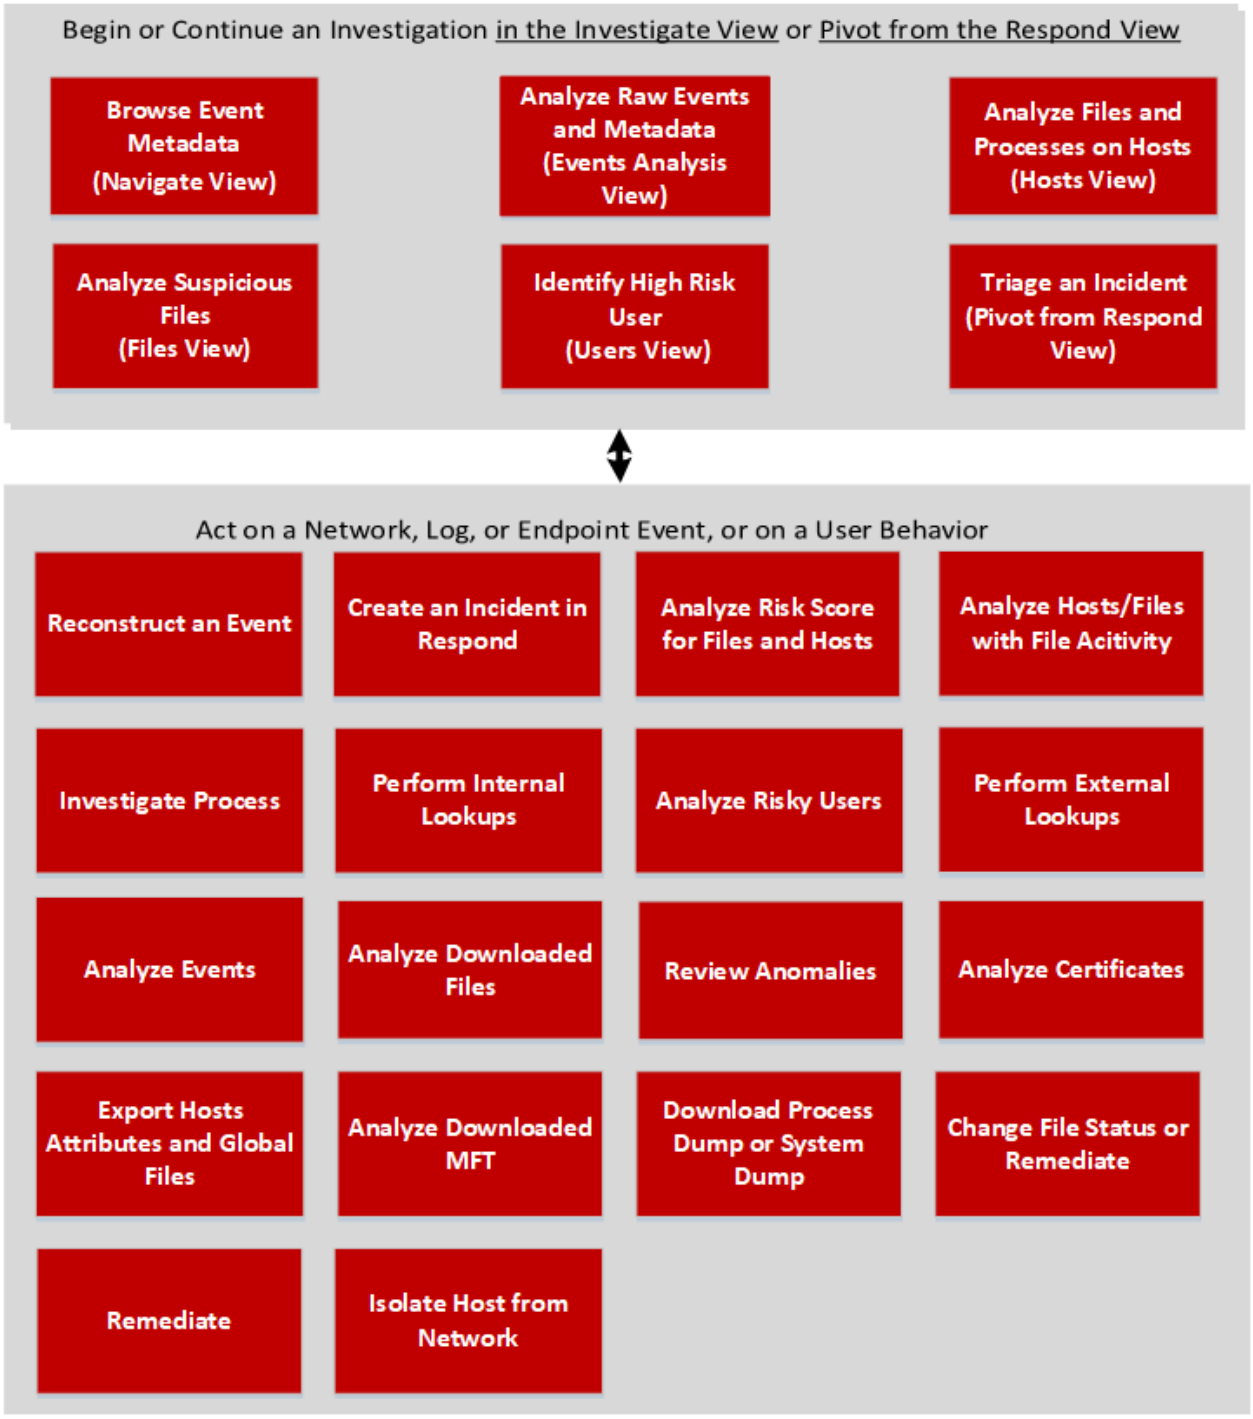
In the isolated state, all events are reported to the Endpoint Server retaining full visibility into activities on the host. You can continue investigation by requesting scans, downloading MFT, files, and so on. The following metadata is added to the network events:

- network.isolated - indicates that the host is isolated.
- network.connectallowed - indicates that the network connection is allowed as the IP address is included in the exclusion list.
- network.connectblocked - indicates that the network connection is blocked.

Note: If the agent is enabled for log or file collection, make sure that you add the Log Decoder IP addresses in the exclusion list while you isolate the host.

For more information, see Isolating Hosts from Network.

Focusing on Endpoint Analysis



This guide provides the information needed to conduct an investigation that is focused on endpoint data from configured hosts. Analysts who conduct analysis using Investigate need to have the appropriate system roles and permissions set up for their user accounts. An administrator must configure roles and permissions as described in Roles and Permissions for Endpoint Analysts. For more information on roles and permissions, see the *System Security and User Management Guide*.

To hunt for information on hosts that have the agent running, begin the investigation in the Hosts view (**Hosts**). For every host, you can see processes, drivers, DLLs, files (executables), services, anomalies, and autoruns that are running, and information related to logged-in users. (See Investigating Hosts.)

You can begin the investigation on files in your deployment in the Files view (**Files**). (See Investigating Files.)

Note: To access the Hosts and Files views, you must have the `endpoint-server.filter.manage` permission.

Analysts use the Hosts and Files views to investigate or perform analysis on hosts or files using attributes such as IP address, host name, Mac address, risk score, and so on. This figure shows the high-level capabilities of an endpoint investigation. The top box are all the possible starting points, and the lower box shows the tasks that you can accomplish from different starting points.

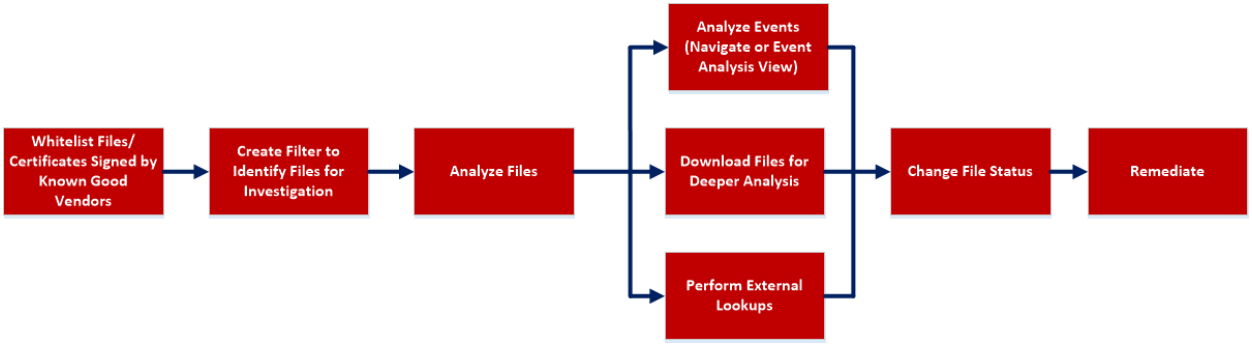
Isolate Host from Network



Investigating Files

Note: The information in this topic applies to NetWitness Version 11.3 and later.

The Files view provides a holistic view of all files in your NetWitness platform. You can apply various filters, sort, and categorize files into different status to reduce the number of files for analysis and identify suspicious or malicious files.

Best Practices

The following are some best practices and tips that may help you investigate efficiently to identify and isolate threats or attacks:

- Whitelist all files signed by RSA, Microsoft, and any other known good vendors. Use the filters to list the files and change the status of all these files to whitelist. For more information, see Filter Files and Changing File Status or Remediate.

  Note: Some Microsoft signed files are restricted from whitelisting as there is a potential risk of them being used for malicious purposes. To view the list, see Files Restricted from Whitelisting.

- Change the status of certificate and the associated files automatically. For more information, see Analyze Certificates.
- Filter to exclude whitelisted, files with valid signature, known good files based on reputation status. For more information, see Filter Files.
- Lookup Google or VirusTotal with the filename or hash to get more information about a suspected file. For more information, see Launch an External Lookup for a File.
- Analyze the files using one or more of these indicators:

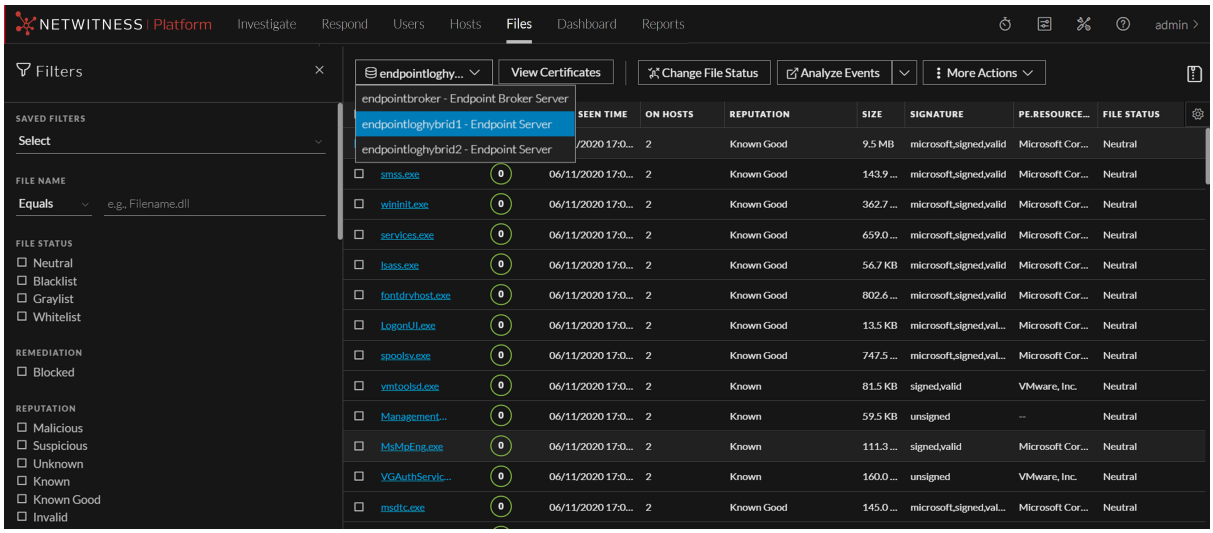
  a. Risk score - Displays the risk score for a file. Analysts can view the associated alerts and events for further investigation. For more information, see Analyze Files Using the Risk Score.

  b. On Hosts - Indicates the number of hosts on which a file exist. If a file is present on fewer hosts with a high risk score, it may require further investigation. You can also sort or filter using On Hosts column to narrow down the search during investigation. For more information, see Analyze Hosts with File Activity.

c. File status - To manage suspected and legitimate files, analysts can use the file status to manage. For more information on the various file status, see Changing File Status or Remediate.

d. Reputation status - Indicates the reputation of a file hash for analyst to narrow-down the files to investigate. For more information, see File Reputation.

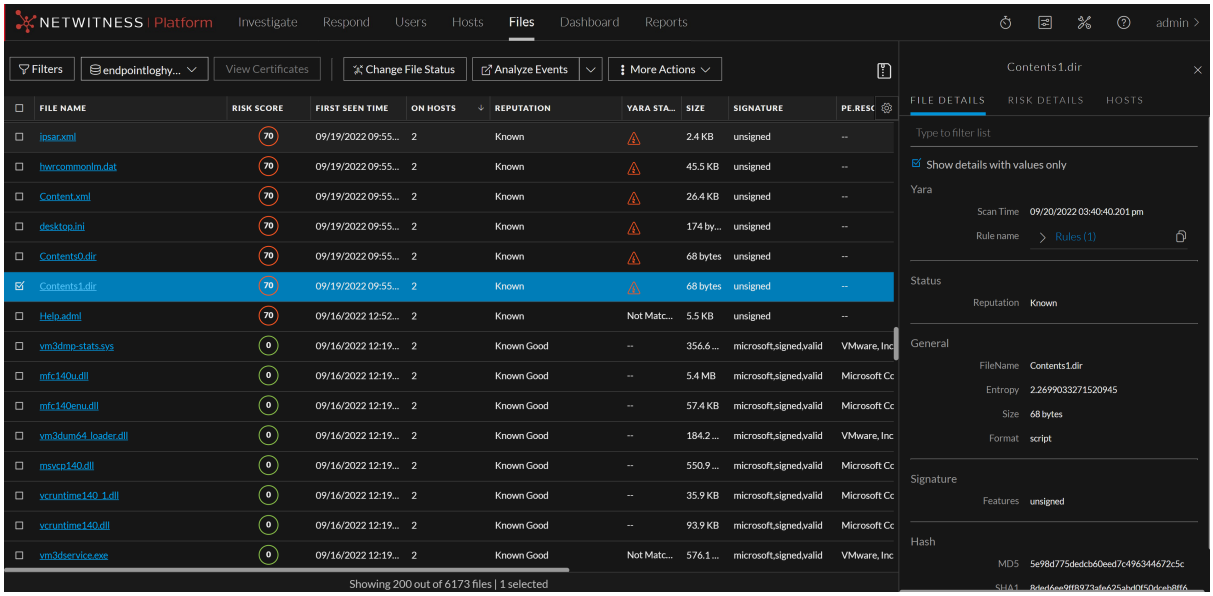
e. Signature - A valid signature on a file signed by a trusted vendor, such as Microsoft and Apple indicates that the file is not a risk. If a file is unsigned, it may be malicious, and needs investigation.



f. File name - Many trojans write random file names when dropping their payloads to prevent an easy search across the hosts in the network based on the filename. For example, if a file is named `svch0st.exe`, `scvhost.exe`, or `svchosts.exe`, it indicates that the legitimate Windows file named `svchost.exe` is being mimicked.

- Investigate a particular file name or hash by pivoting to Navigate or Events view to view context, file activity on different hosts, and any file transfers across the network through packet data. For more information, see Analyzing Events.
- Investigate files using a rule-based detection technique. YARA helps to identify threats effectively using easy-to-create malware descriptions called YARA rules. For more information, see Analyze Files Using YARA.
- Download suspicious files to the server for deeper analysis. For more information, see Analyzing Downloaded Files.
- Change the status of the file (blacklist or graylist), and block an infected or malicious file. For more information, see Changing File Status or Remediate.

View Files



You can view all files present on a specific Endpoint server or consolidated list of all files on multiple Endpoint servers using the Endpoint Broker for analysis. To view files:

1. Go to **Files**.
2. Select one of the following:

- **Endpoint Broker Server** to view all files across all Endpoint servers.
- **Endpoint Server** to view files on a specific Endpoint server.

3. Select the file that you want to analyze.
4. Click a row to view the following details:

- **File Details** displays the file information. For more information, see Launch an External Lookup for a File.
- **Risk Details** displays the distinct alerts associated with the risk score. For more information, see Analyze Files Using the Risk Score.
- **Hosts** displays the number of hosts on which file activities are present. For more information, see Analyze Hosts with File Activity.

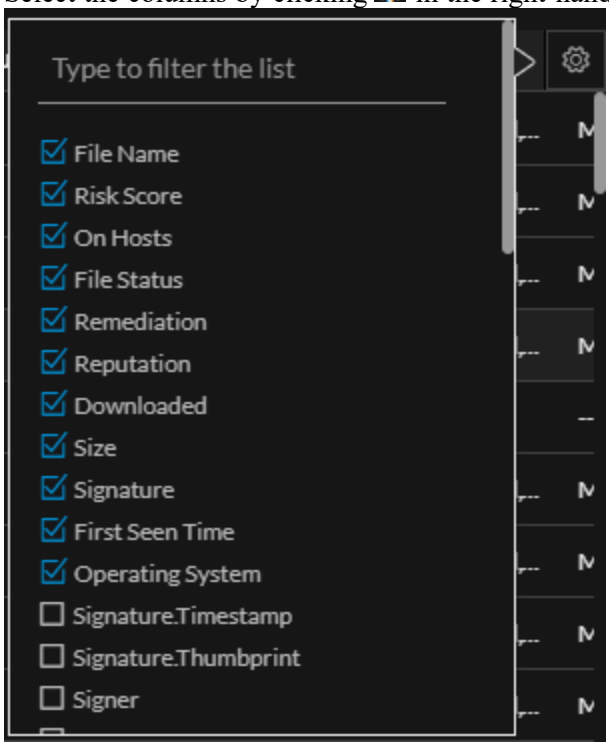
Filter Files

You can narrow down the investigation by filtering files using file name, on hosts, file status, risk score, remediation, reputation status, operating system, size, entropy, format, signature, company name, checksum (MD5 and SHA256), downloaded status, and YARA rules.

Note: While filtering on a large data set, use at least one indexed field with the `Equals` operator for better performance. The following fields are indexed in the database - Filename, MD5, SHA256, Operating System, First Seen Time, Format, File Status, On Host, and Reputation Status.

Select the parameters in the Filters tab. Click **Save** to save the search and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters list. To delete a filter, hover over the name and click .

Note: Special characters are not allowed in the filter name except underscore (_) and hyphen (-) while saving the filter.



For example, to filter the files based on file reputation, select the reputation status in the Filter panel.

Note: For the file size, 1 KB is calculated as 1024 bytes. For example, if the actual size of the file is 8421 bytes, the UI will display it as 8.2 KB instead of 8.22 KB. It is recommended to search using the bytes format when using the `Equals` operator.

Add and Sort Columns in the Table

By default, the Files view displays a few columns, and files are sorted based on the risk score. To add or remove columns:

1. Go to **Files**.
2. Select the columns by clicking in the right-hand corner.

3. Scroll down or enter the keyword to search and select the required columns.
4. To sort the column in ascending or descending order, click the arrow on the column header.

Analyze Files Using the Risk Score

Based on the Alert severity, the files can be analyzed using the following options:

- **View Alert Details**: This option allows you to analyze the files associated with **Critical** and **High** alerts. For more information, see Investigating a Process.
- **Analyze Process Tree**: This option allows you to analyze the files associated with **Medium** alerts. For more information, see Investigating a Process.

To analyze files associated with Critical and High alerts using the risk score:

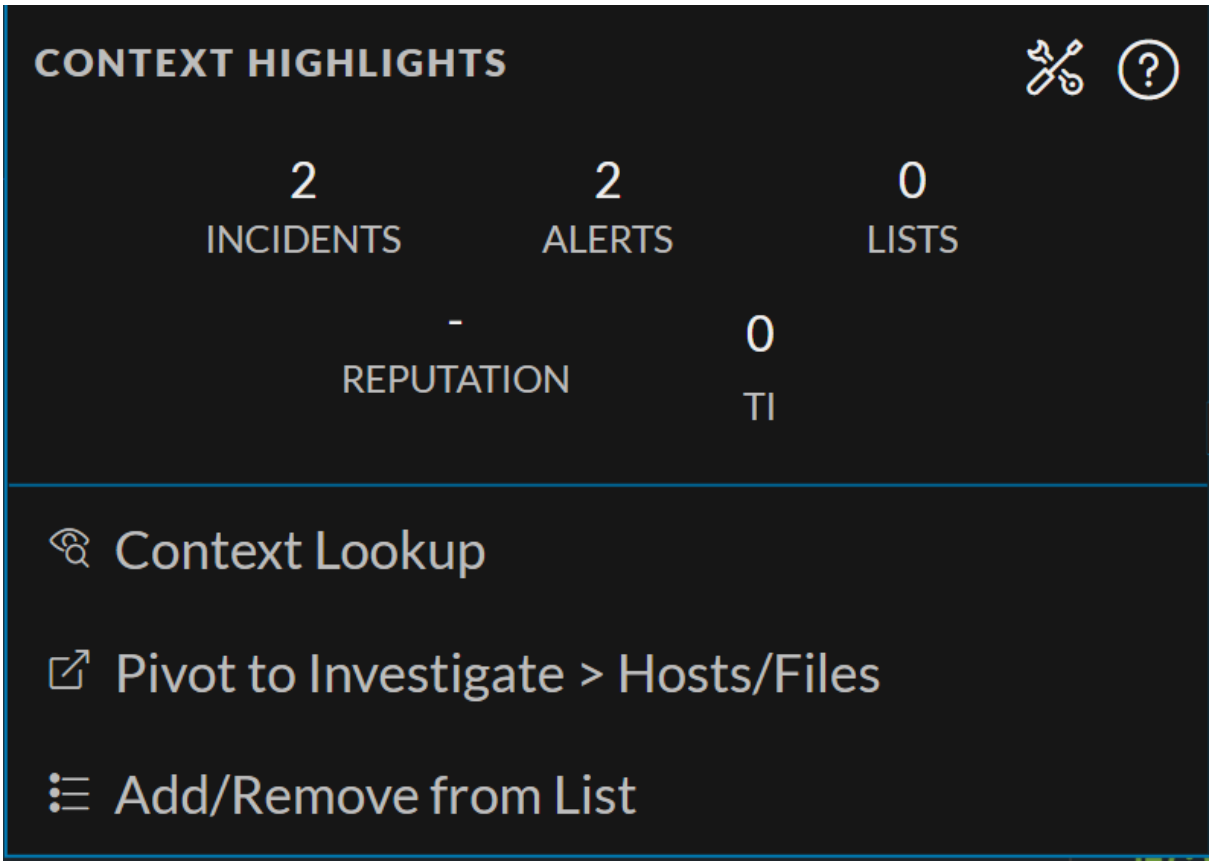
1. Go to **Files**.

   The **Files** view is displayed.
2. In the Server drop-down list, select the Endpoint server or Endpoint Broker server to view the files.
3. Select the file and do any of the following.
   - Click a row to view the risk associated with the file in the **Risk Details** panel.
   - Click the filename to view the associated alerts and events.

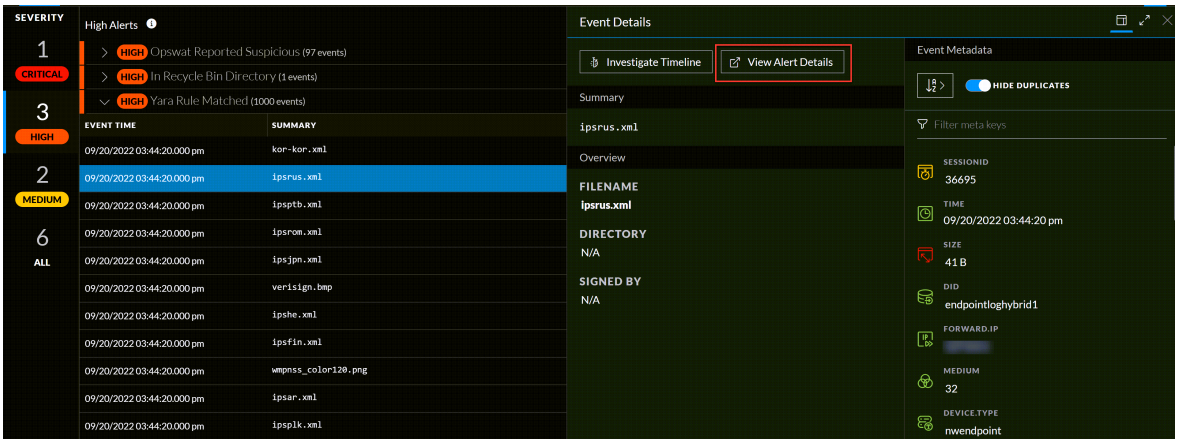
The **Alerts** tab is displayed.

4. In the **Alerts** > **Severity** panel, click the alert severity, such as **Critical** or **High**.
   The list of distinct alerts is displayed along with the total number of events associated with the alert.
5. Click an alert to view the associated events.

   Note: For each alert, only the latest 1000 events are displayed.



6. To view all the details associated with a specific event, click on an event. The **Event Details** panel is displayed with the summary and overview information associated with the event.



7. You can also view the Event Metadata such as IP, Filename, File hash, and Category in the **Event Details** panel.

   Note: The **contexthub-server.contextlookup.read** permission is enabled only for Administrators, Analysts, Malware Analysts, SOC Managers and Respond Administrators. Administrators can enable this permission for other roles in the **Files** view to view context lookup for meta values and perform the Add/Remove from List actions. For more information, see the "Role Permissions" topic in the *System Security and User Management Guide*.

8. Click the drop-down option besides the metadata value to view additional information about the specific metadata. The **Context Highlights** dialog displays a list of the data sources that have context data available for meta value. These are the possible data sources: NetWitness Endpoint, Incidents, Alerts, Hosts, Files, and Feeds.

9. To investigate the original event and destination domain of the event, do any of the following:
   - To investigate the events in a specific time frame, click **Investigate Timeline** on the **Event Details** panel. For more information, see the *NetWitness Investigate User Guide*.
   - To investigate a particular process, click **View Alert Details** on the **Event Details** panel. For more information on process analysis, see Investigating a Process.

To analyze files associated with Medium alerts using the risk score:

1. Go to **Files**.

   The **Files** view is displayed.

2. In the Server drop-down list, select the Endpoint server or Endpoint Broker server to view the files.

3. Select the file and do any of the following.

   - Click a row to view the risk associated with the file in the **Risk Details** panel.
   - Click the filename to view the associated alerts and events.

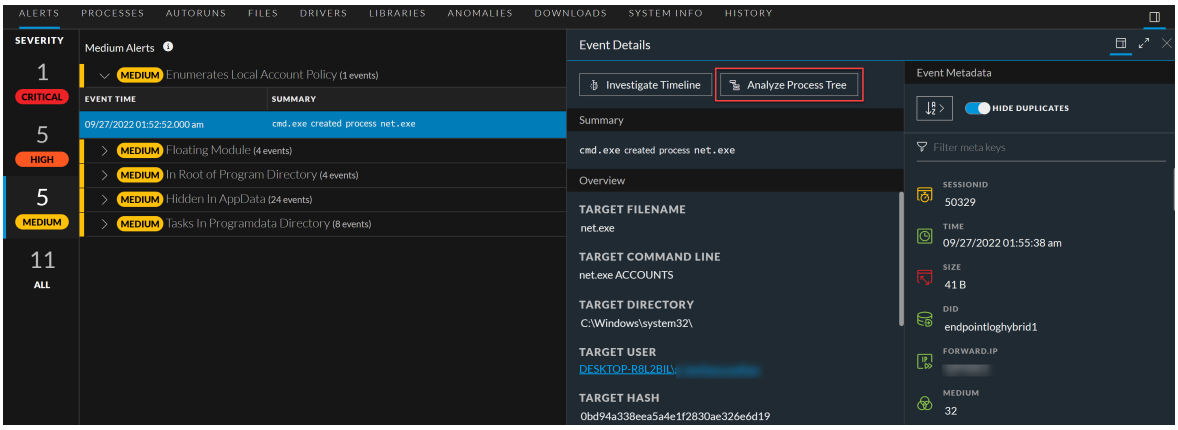
     The **Alerts** tab is displayed.

4. In the **Alerts** > **Severity** panel, click the **Medium** alert severity.
   The list of distinct alerts is displayed along with the total number of events associated with the alert.

5. Click an alert to view the associated events.

   Note: For each alert, only the latest 1000 events are displayed.

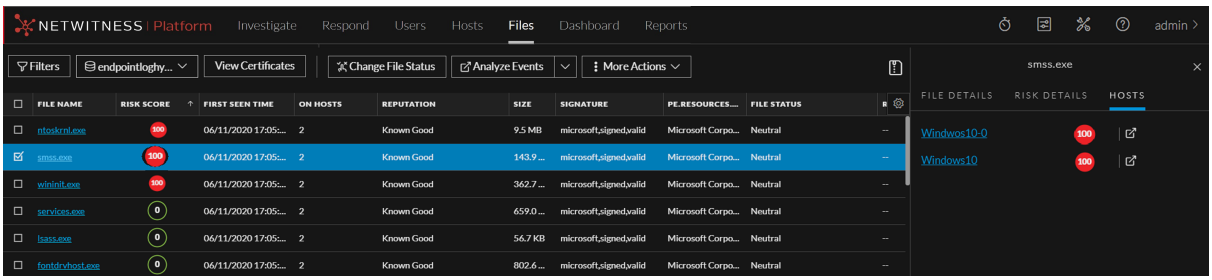
6. To view all the details associated with a specific event, click on an event. The **Event Details** panel is displayed with the summary and overview information associated with the event.



7. You can also view the Event Metadata such as IP, Filename, File hash, and Category in the **Event Details** panel.

8. Click the drop-down option besides the metadata value to view additional information about the specific metadata. The **Context Highlights** dialog displays a list of the data sources that have context data available for meta value. These are the possible data sources: NetWitness Endpoint, Incidents, Alerts, Hosts, Files, and Feeds.

9. To investigate the original event and destination domain of the event, do any of the following:
   - To investigate the events in a specific time frame, click **Investigate Timeline** on the **Event Details** panel. For more information, see the *NetWitness Investigate User Guide*.
   - To investigate a particular process, click **Analyze Process Tree** on the **Event Details** panel. For more information on process analysis, see Investigating a Process.



Analyze Hosts with File Activity

To view the list of hosts on which a file exist, do the following:

Note: By default, the system detects the best data source for the On Hosts aggregation. To change the data source, in the Explore view, modify the investigate service ID under `endpoint/investigate`.

1. In the **Files** tab, click the row for the file you want to analyze.
2. In the right panel, click the **Hosts** tab. The list of hosts along with the risk score are displayed.

3. Click the host name to open the host details.
4. Click  to analyze events on the host in the Events view. For more information, see Analyzing Events.

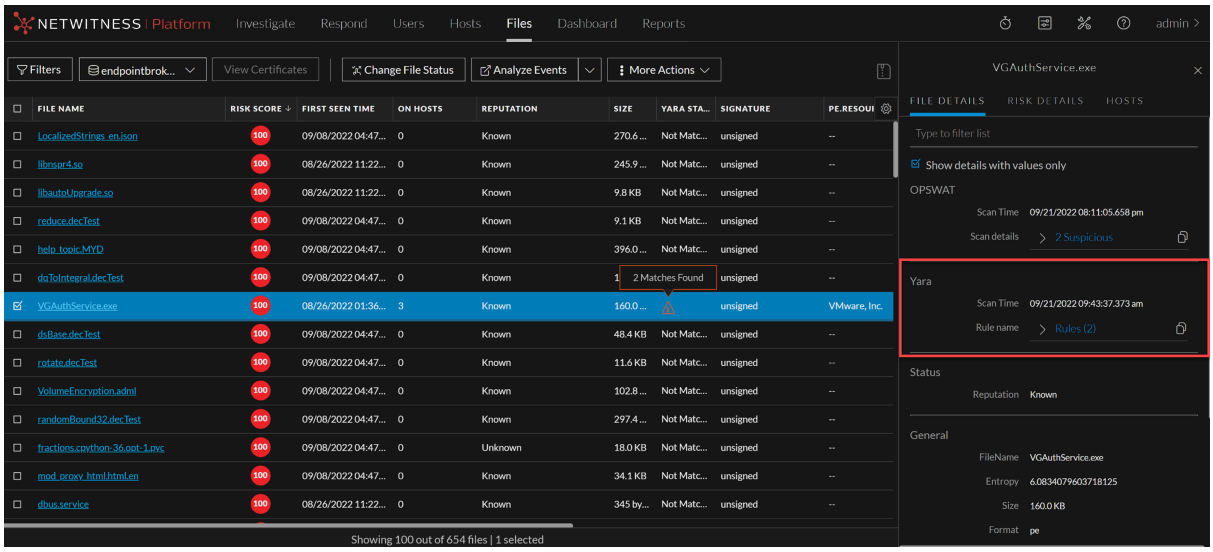
Analyze Files Using YARA

YARA helps analysts with rule-based detection capabilities in identifying and classifying malware. You can easily create malware descriptions using YARA rules. YARA scans can be performed at the Endpoint server level and Endpoint agent level.

Analyze Files at the Endpoint Server Level

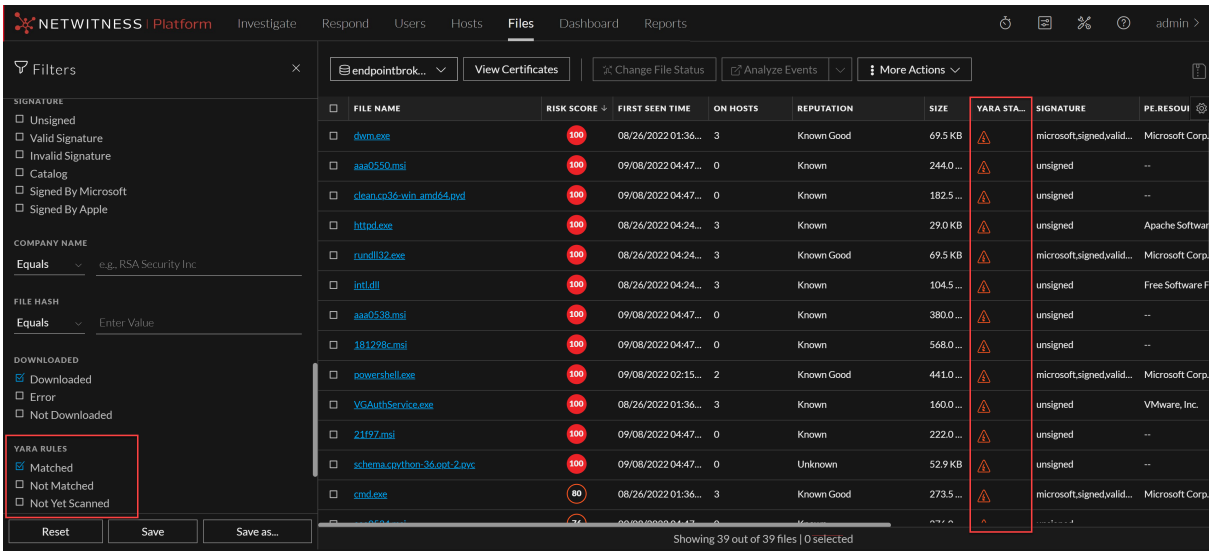
Administrators must enable and configure YARA on the Endpoint server. To learn more about enabling and configuring YARA, refer to NetWitness Endpoint Configuration Guide.

Files must be downloaded to the Endpoint server and YARA scans the downloaded files automatically. The scan results are displayed under **YARA STATUS** on the **Files** tab.



To analyze the scanned files,

1. Go to **Files**.
2. Select the Endpoint server from the server drop-down , to view files.
3. Select a file that is downloaded to the Endpoint server and do any of the following:
   - Click a row to view the YARA scan details associated with the file in the **File Details** panel.
   - If any file matches one or more YARA rules, the **File Details** panel displays the matching rule names besides scan time.
   - **YARA STATUS** field displays the status of the YARA scan. Following are the available statuses and their definitions



- **Matched** - The file matches with one or more YARA rules
- **Not Matched** - The file does not match with any of the YARA rules
- **Not Yet Scanned** - There is no scan performed for this file. Files will be scanned automatically once they have been downloaded. After the scan YARA status will be updated to either Matched or Not Matched

Note: When a file matches with a YARA rule, high severity alerts are triggered and, the file's risk score is updated. In the subsequent scans, If the same file doesn't match with a YARA rule, the risk score will be reset.

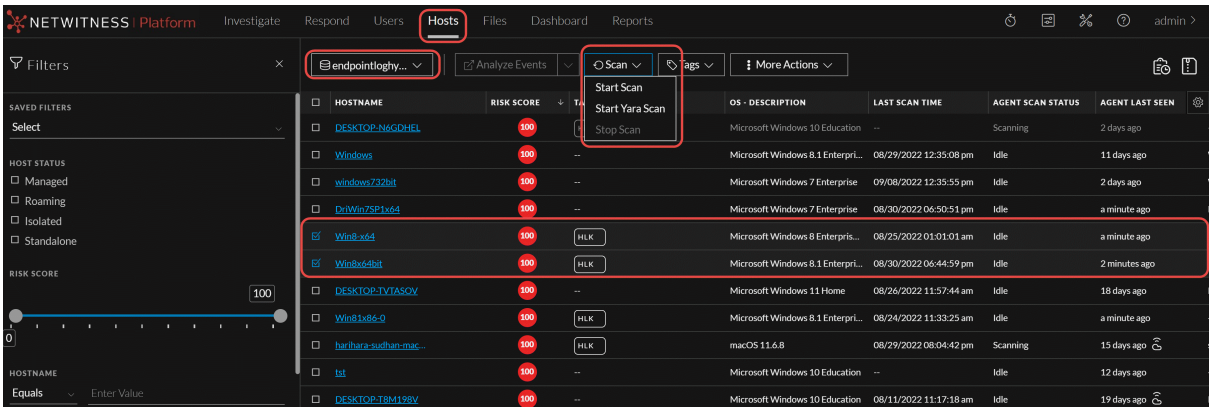
Note: If a downloaded file has an error, it will not be scanned by YARA and, the **Downloaded** column will display the file download status as **Error**.

4. On the **Filters** pane, scroll to the **YARA RULES** section. This section provides options to filter the files based on YARA scan status:
   - Select **Matched** to view the files that match YARA rules.
   - You can also view the files that do not match YARA rules or not yet scanned against YARA rules, by selecting **Not Matched** or **Not Yet Scanned** from the **YARA RULES** section.

For more information on investigating with YARA, see *NetWitness Investigate User Guide.*

Yara Scan at the Endpoint Agent Level

NetWitness Platform allows you to quickly perform YARA scan at the Endpoint Agent level. A snapshot of the YARA scan shall be available on the Endpoint server with the details such as:



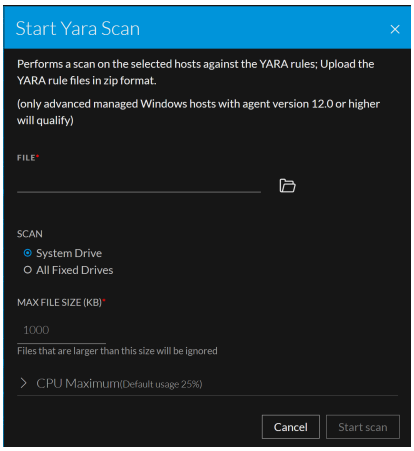
- List of files matching the YARA rules.
- List of YARA rules ran during the scan and the YARA rules status such as Loaded or Failed to load.

  Note: To perform Yara scan at the Endpoint agent level, the agent version must be higher than or equal to 12.1. This is applicable for the Advanced mode Windows Agents.

- YARA version associated with the agent.

To initiate YARA scan on the Endpoint Agent,

1. Click **Hosts**.
2. Select the Endpoint server from the server drop-down, to view hosts.
3. Select one or multiple hosts and click **Scan** > **Start Yara Scan**.



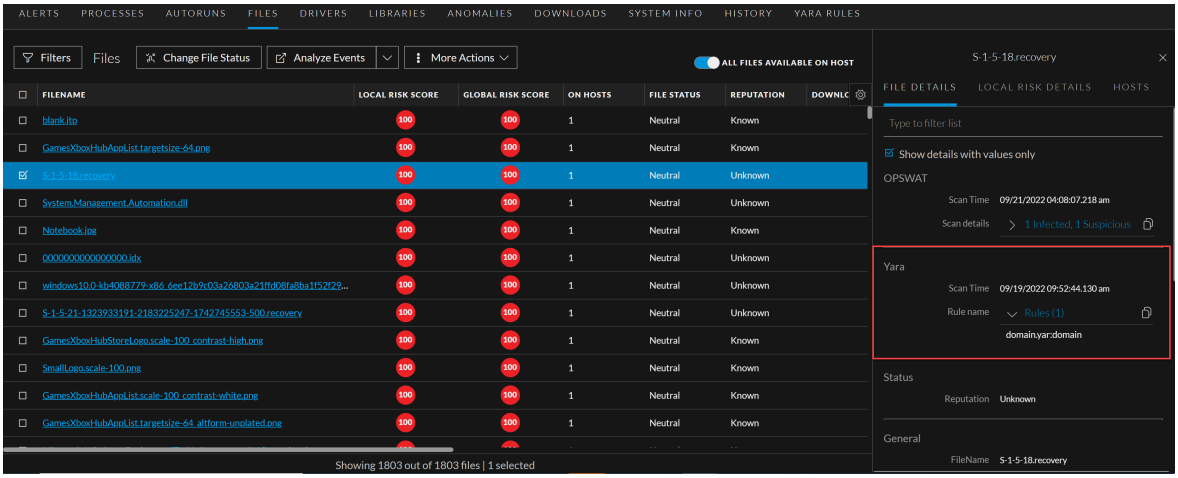
4. On **Start Yara Scan** pop-up,

   a. Click and upload the YARA rule zip file.

   b. Select **System Drive** (Default selection) or **All Fixed Drives**.

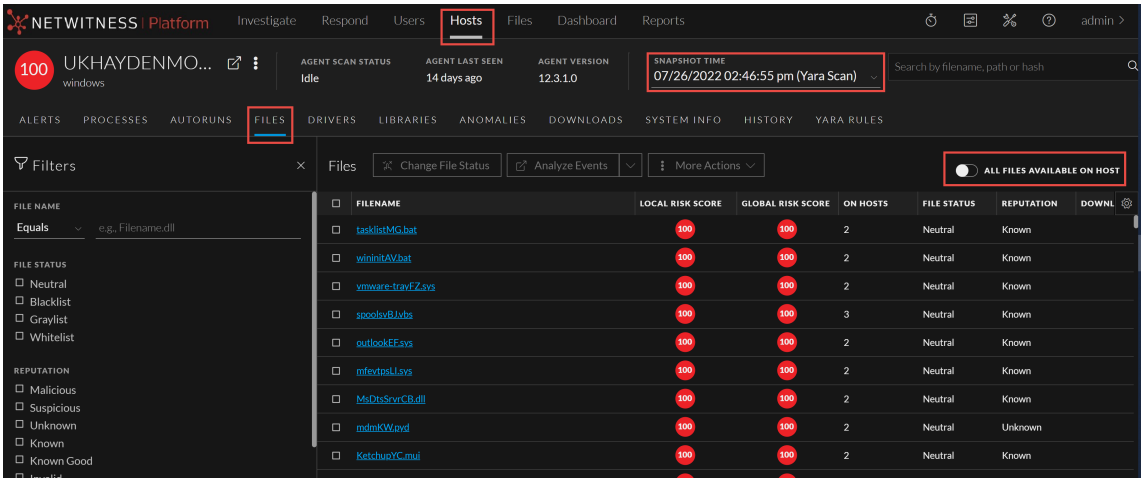
   c. Enter the Max File Size in Kilo Bites (KB).

   d. Select CPU Maximum.



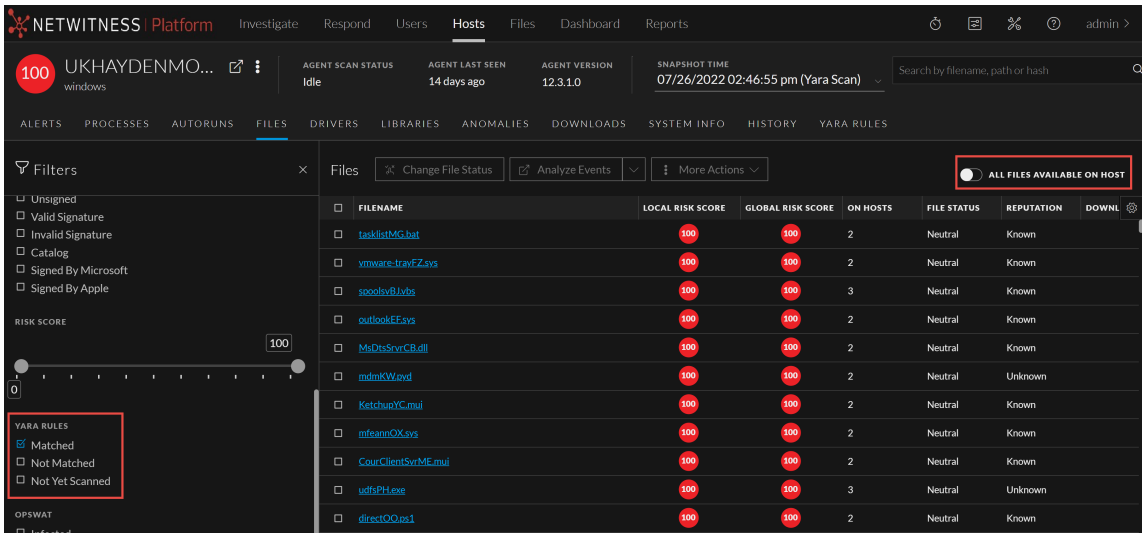
5. Click **Start scan**. See the command status In the **Host** > **History** tab.

To analyze the scanned hosts and files:

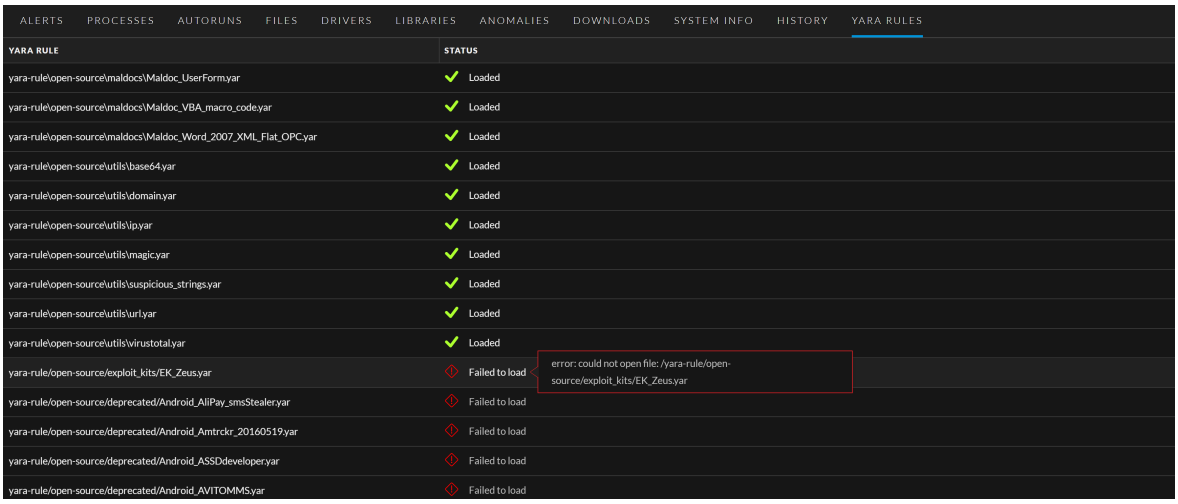


1. Log in to the NetWitness Platform.
2. Click **Hosts**.
3. Select the Endpoint server from the server drop-down to view hosts.
4. Select the **Host** and **YARA Snapshot Time**, and do any of the following:
   - In the Host details view, click **Files** and select a row to view the YARA scan details associated with the file in the **Details** panel.

If any file matches with one or more YARA rules, the **Details** panel displays the matching rule names besides scan time.



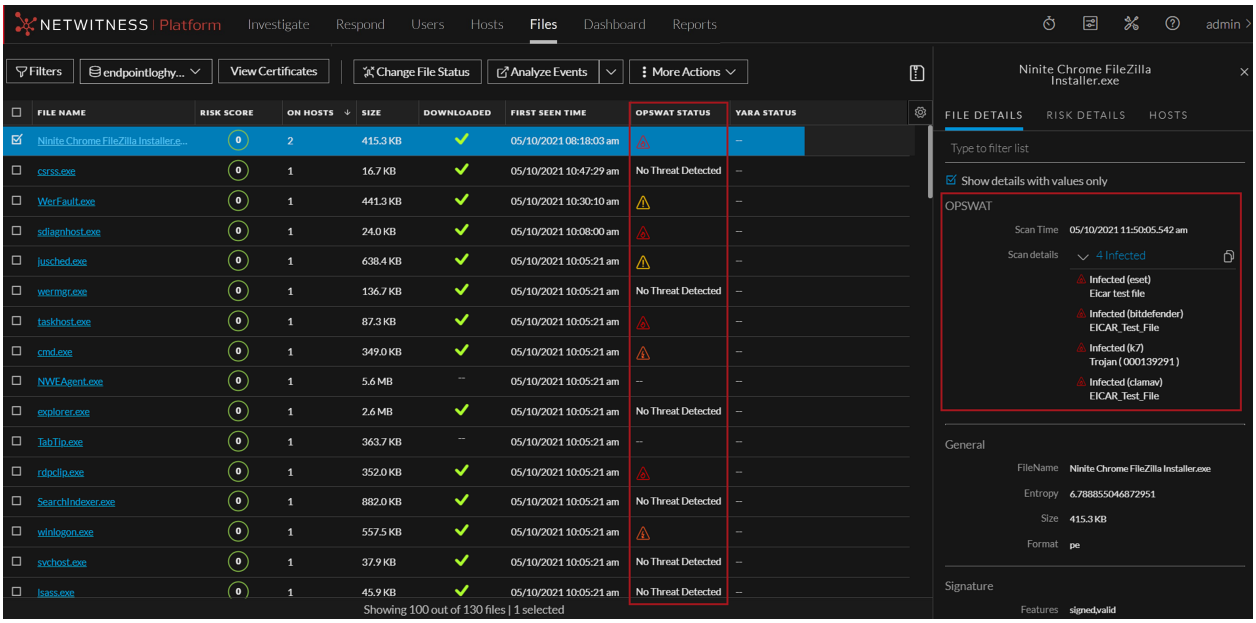
- Toggle the **All Files Available on Host** to view all the files irrespective of the snapshot selected.



Note: When a file matches with a YARA rule, high severity alerts are triggered and the file's risk score is updated.

- On the **Filters** pane, scroll to the **YARA Rules** section. This section provides options to filter the files based on YARA scan status: Select **Matched** to view the files that match YARA rules.
  - You can also view the files that do not match YARA rules or not yet scanned against YARA rules, by selecting **Not Matched** or **Not Yet Scanned** from the YARA rules section.

- In the Host details view, click the **YARA Rules** tab to know if the YARA rules used for the scan are successfully loaded or failed to load. If any of the YARA rules are failed to load, hover over  icon (Failed to load) to know the reason for failure.



- In the Host details view, click the **History** tab to view the command history.

Analyze Files Using OPSWAT

OPSWAT (MetaDefender Core) provides advanced malware detection capabilities by scanning files with multiple anti-malware engines simultaneously. Administrators need to enable and configure OPSWAT on the Endpoint server. To learn more about enabling and configuring OPSWAT, see *NetWitness Endpoint Configuration Guide*.

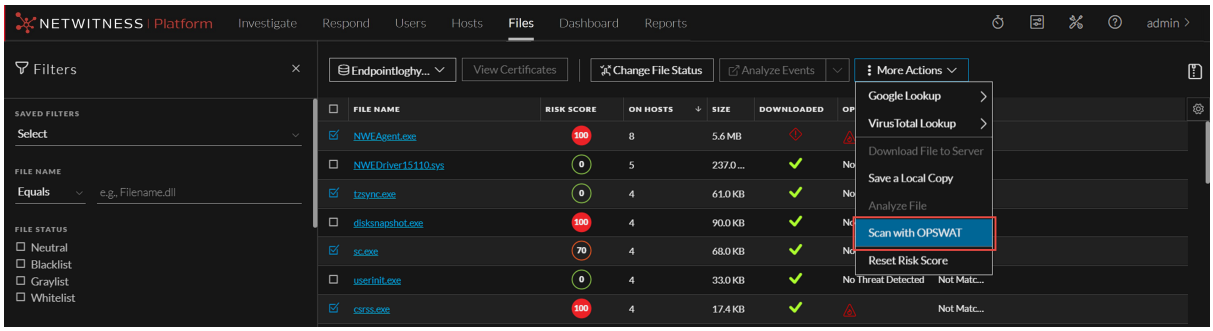
All downloaded files (executable) will automatically be sent to OPSWAT server for scanning once OPSWAT is enabled and configured on the endpoint servers.

Scan files with OPSWAT

Downloaded files are automatically sent to the OPSWAT server for scanning. However, you can also initiate the scan manually using options under the**More Actions** menu. Executable files with the following file extensions, ***pe***, ***script***, ***macro***, and ***elf*** are supported by this feature. The maximum file size limit is set to 10MB by default. You can increase or decrease it if required.

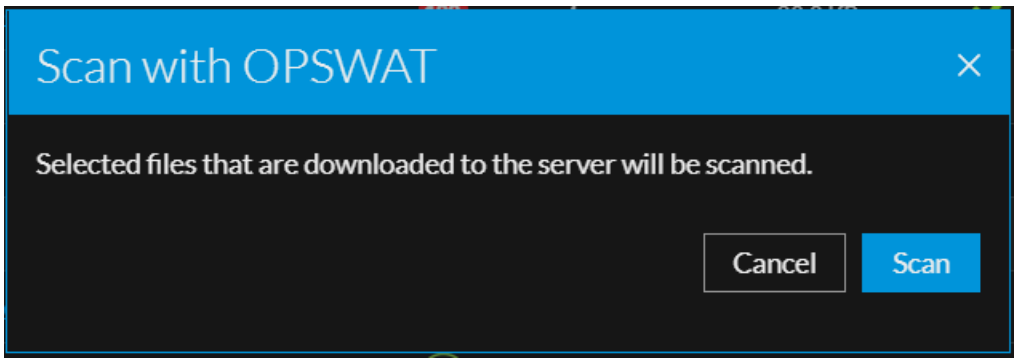
Automatic scan:

The endpoint server will automatically send all (executable) downloaded files to the OPSWAT server. The scan results will be displayed under the**OPSWAT STATUS** column on the**Files** tab.



Manual Scan:

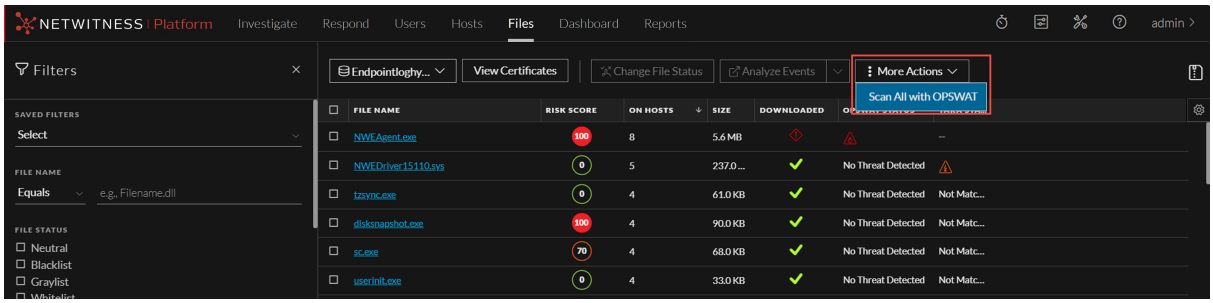
You can also manually initiate an OPSWAT scan using the options under the**More Actions** menu on the **Files** tab.



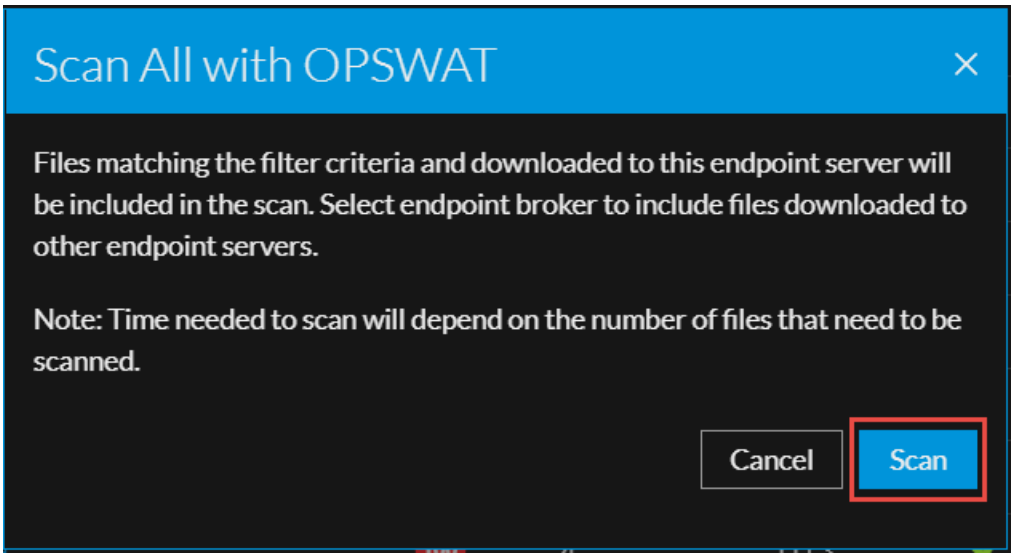
The **More Actions** menu provides the following options:

Manual Scan - Scan selected files

1. Select the files that need to be sent to the OPSWAT server for scanning.
2. Select **More Actions > Scan with OPSWAT**.



3. Click **Scan** on the confirmation pop-up.



Manual Scan - Scan all files

1. Select **More Actions > Scan All with OPSWAT**.

2. Click **Scan** on the confirmation pop-up.

View OPSWAT Scan Results

The scan results will be displayed under the**OPSWAT STATUS** column on the**Files** tab as follows:

 - File is infected

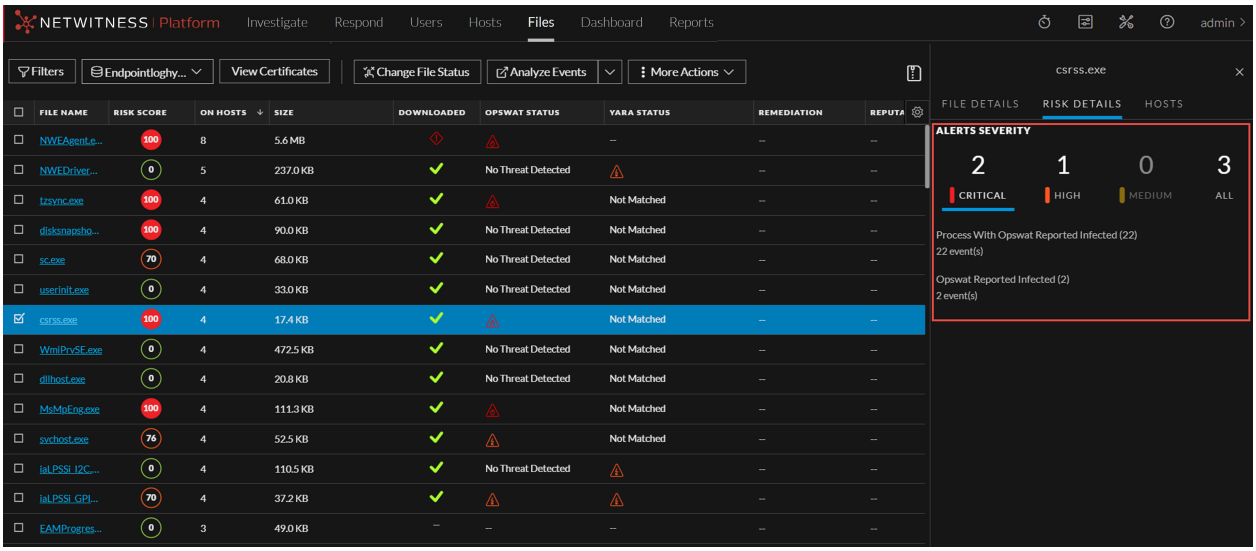
 - Suspicious file

 - Scan failed; see troubleshooting section for more information.

 - The file is clean as of the last scanned time.

 - Not yet scanned.

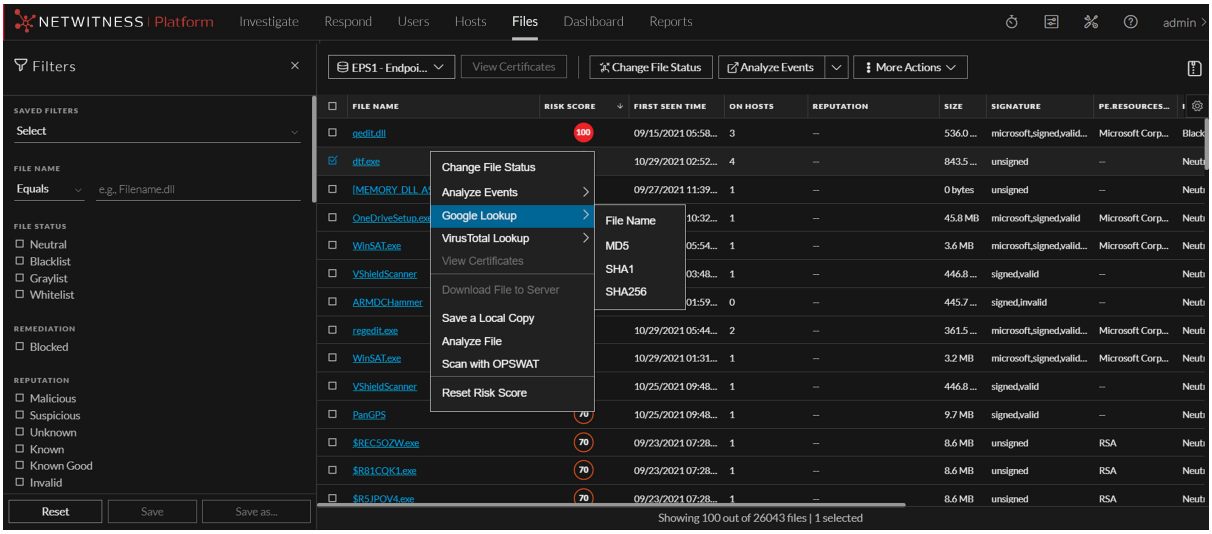
Click on a file to view scan results under the**FILE DETAILS** panel.



- **Scan Time**: States the last scanned time.
- **Scan details**: States whether a file is infected or suspicious or no threat detected, names of anti-malware engines that identified the threat.

Alerts and Impact on Risk scores

Alerts: Critical alerts will be triggered when OPSWAT finds a file as infected, and High severity alerts when a file is found suspicious.



Risk score: If a file is found infected or suspicious by OPSWAT, the risk score of that file and the corresponding host will be increased.

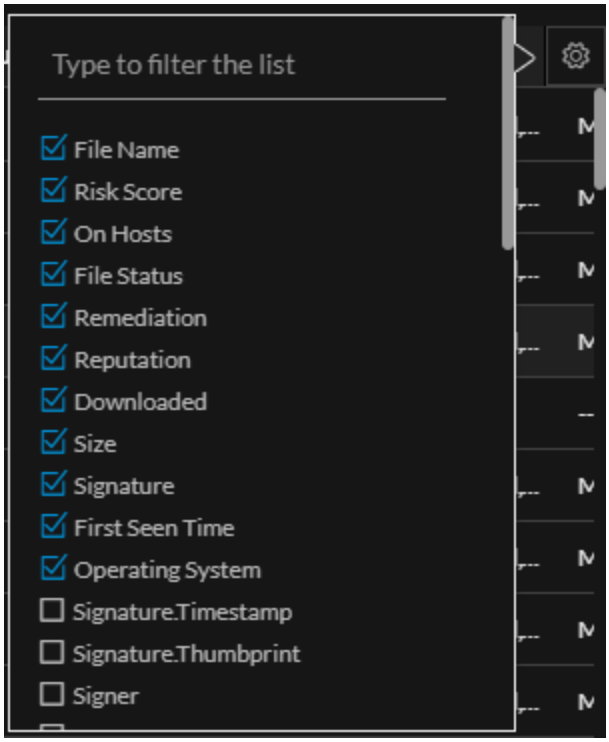
Launch an External Lookup for a File

While analyzing a file, you can search Google or VirusTotal with the filename or hash to get more information about the file. To launch the search:

1. Go to **Files**.
2. View the details of the file name and hash from the table MD5, SHA1, and SHA256 columns, or view the details in the File Details tab on the right panel.
3. Select one or more files, and right-click or in the **More Actions** drop-down list in the toolbar, do the following:

   a. Select **Google Lookup** and perform a search on the filename, MD5, SHA1, or SHA256.

   b. Select **VirusTotal Lookup** and perform a search on MD5, SHA1, or SHA256.



Note: To open files in multiple tabs, make sure you enable the pops-up in the browser.

Set Files Preference

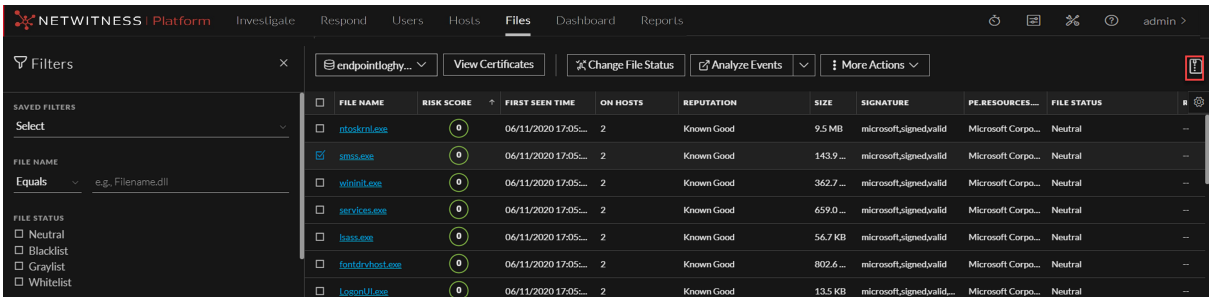
By default, the Files view displays a few columns and the files are sorted based on the risk score. If you want to view specific columns and sort data on a specific field:

1. Go to **Files**.

2. Select the columns by clicking in the right-hand corner. The following example shows the drop-down list displayed while adding columns:

3. Sort the data on the required column.

Note: The selections you make here become your default view every time you log in to the Files view.



Export Global Files

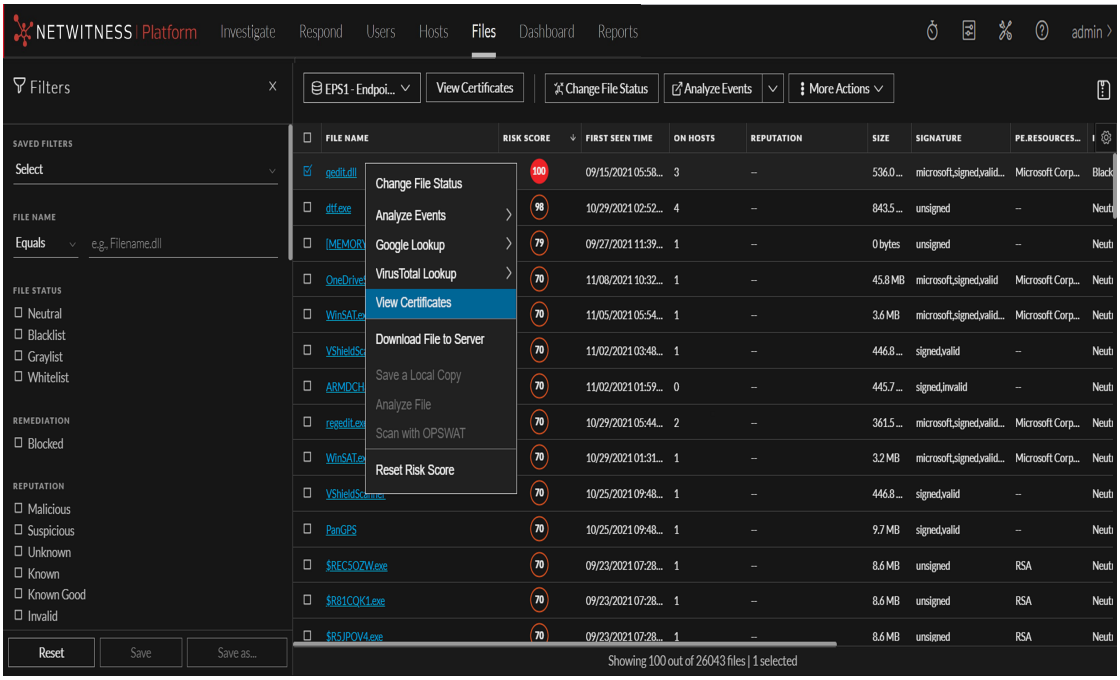
To extract the list of global files to a comma-separated values (csv) file:

Note: While filtering on a large data set, use at least one indexed field with the `Equals` operator for better performance. You can export up to 100k files at a time.

1. Go to **Files**.
2. Filter the files by selecting the required filter option.
3. Add columns by clicking in the right-hand corner.

4. Click  to export the files to a csv file.

You can either save or open the CSV file.



Analyze Certificates

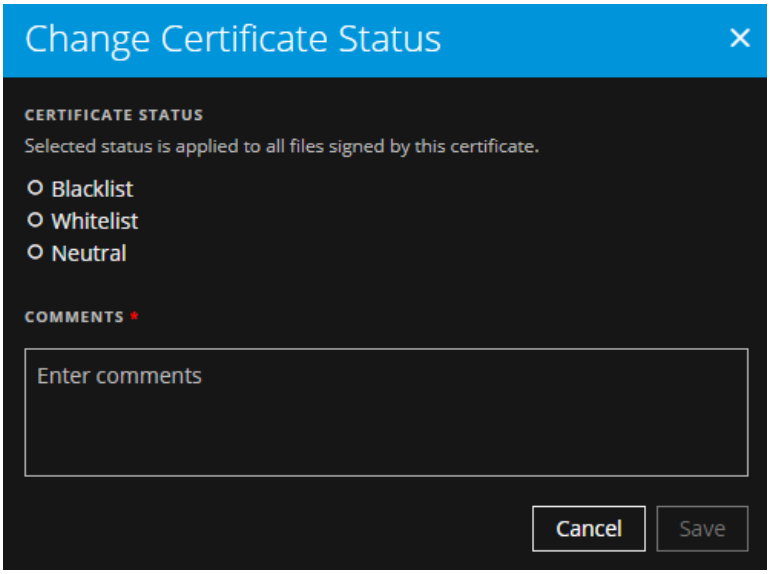
Note: The information in this topic applies to NetWitness Version 11.3 and later.

The Certificates view provides a list of code-signing certificates reported by hosts found in your deployment and their associated properties. You can select the certificates under a specific Endpoint server.

To view the certificates in an Endpoint server:

1. Go to **Files**.
2. From the drop-down menu, select the Endpoint server to view certificates present on that server. To view a consolidated list of certificates, select the Endpoint Broker server.
3. Select a file and do one of the following:

- Right-click and select **View Certificates** from the context menu.
- Click **View Certificates** in the toolbar.



Change the Certificate Status

You can assign a Whitelist status to the certificate signed by certain trusted vendors and this status can be automatically applied to all files that is signed by this certificate. If you consider abc a trusted vendor, you can set the status for the certificates signed by abc as Whitelist.

Similarly, you can also set the certificate status as Blacklist or Neutral. If a company's certificate is stolen or compromised, you can blacklist this certificate and remediate.

To change the certificate status:

1. Select a certificate, and click **Change Certificate Status**.

2. In the Change Certificate Status dialog, select a status - Blacklist, Whitelist, or Neutral.

   Note: If you have manually updated a file status in the Files or Hosts view, changing the status in the Certificate view does not impact the file status as the manual update takes precedence. For example, if you have whitelisted the file vmci.sys that is signed by VMware, Inc. in the Files or Hosts view, and you have blacklisted VMware, Inc. in the Certificate view, the file vmci.sys remains Whitelisted though the certificate is blacklisted.

3. Add a comment and click **Save**.
4. Click **< Files** to go to the Files view.

Note: In a multi-server environment, changing the status of a certificate in one endpoint server updates the respective files in other endpoint servers. For example, if a certificate status is set to Blacklist on one endpoint server, all files signed by this certificate are set to Blacklisted on all endpoint servers.

Filter Certificates

You can filter certificates on status, signature, friendly name, and thumb print.

Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters list. To delete a filter, hover over the name, and click .

Note: Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.

Manage Blocked File Hashes

Blocked File Hashes view **Files** > **Manage** > **Blocked File Hashes** allows administrators and analysts to perform the following actions.

- View already blocked File Hashes in the deployment.
- Add new File Hash and block it.
- Delete and unblock the Blocked File Hashes.
- Import and block multiple File Hashes using the CSV file.

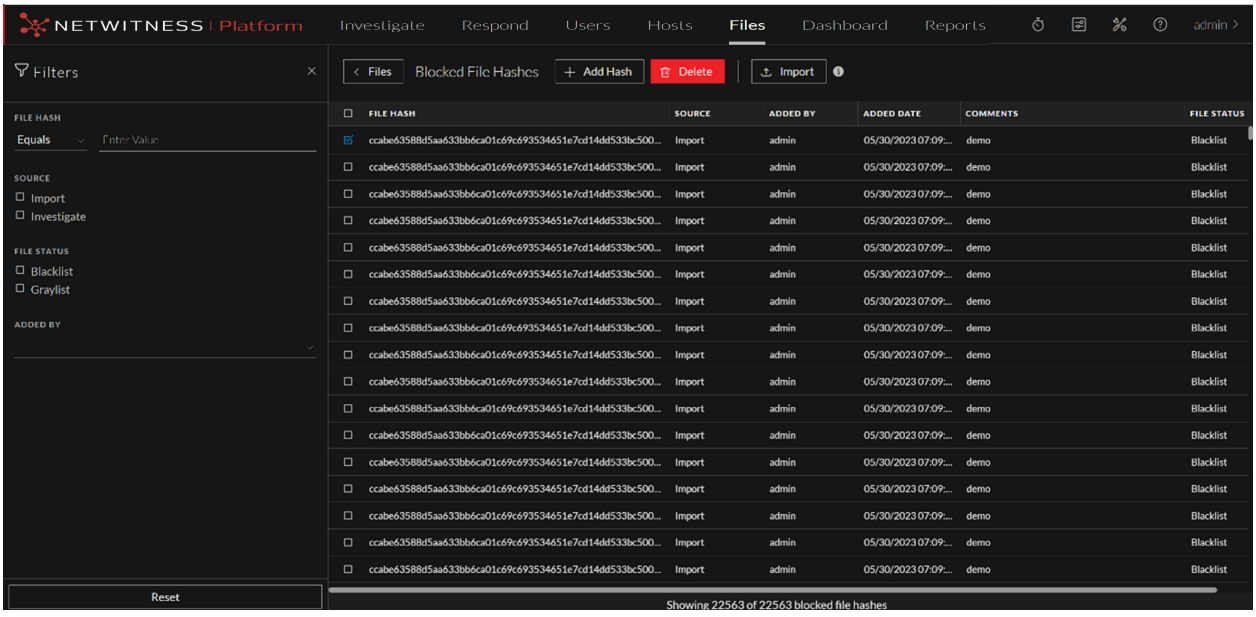
You can block up to a maximum of 50,000 file hashes.

IMPORTANT:
- Enter only valid SHA256 hashes; otherwise, the blocking functionality might break.
- Do not block any file hashes signed by RSA, Microsoft, and Apple. It might make your Endpoints unresponsive.
- If the number of already blocked File Hashes is 0, and you import more than 50K File Hashes, only the first 50K File Hashes are blocked.

Note: Analysts must have the **contexthub-server.datasource.read** permission to access the **Blocked File Hashes** view.

Toolbar Actions

The table below lists the toolbar actions available in the **Blocked File Hashes** view.



Option	Description
+ Add Hash	Select this option to block a single File Hash.
Delete	Select this option to delete the blocked File Hashes.
Import	Select this option to import and block multiple File Hashes.
< Files	Select this option to return to the **Files** view.

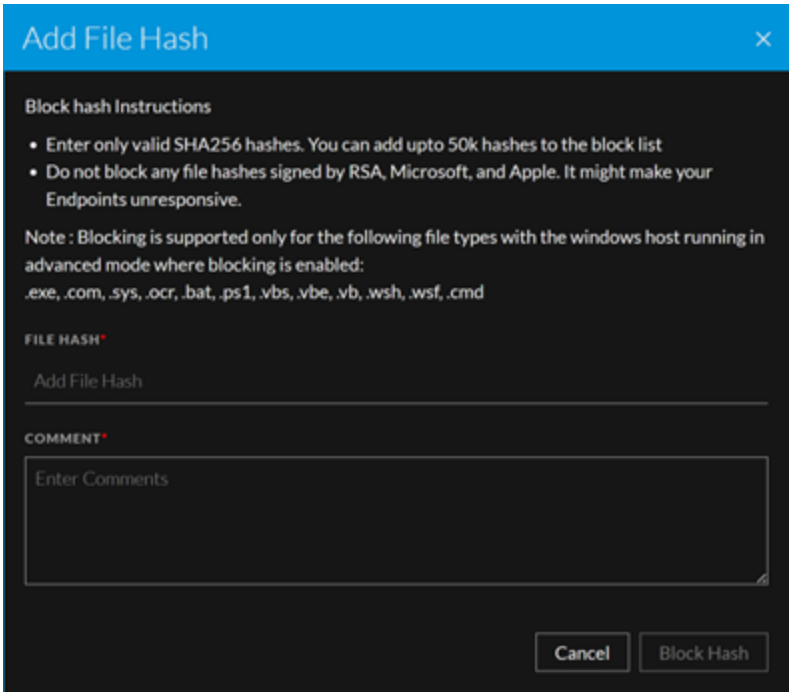
View Blocked File Hashes

You can view the File Hashes already blocked as part of NetWitness deployment in the **Blocked File Hashes** view.

To view the Blocked File Hashes:

1. Go to **Files** > **Manage** > **Blocked File Hashes**.
   The **Blocked File Hashes** view is displayed.

2. View the list of Blocked File Hashes in the **File Hash** column.



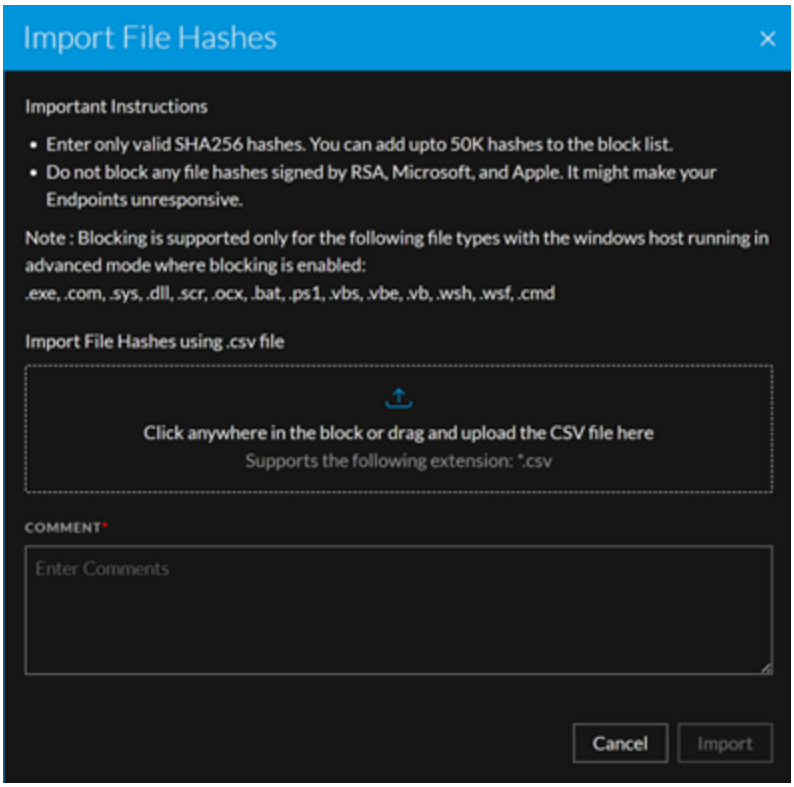
Add File Hash

You can add a new File Hash to the list of blocked hashes using the **Add Hash** option in the **Blocked File Hashes** view.

To block a new File Hash:

1. Go to **Files** > **Manage** > **Blocked File Hashes** > **Add Hash**.

   The **Add File Hash** dialog is displayed.



2. Enter the **File Hash**.
3. Specify the reason for blocking the new File Hash in the **Comment** section.
4. Click **Block Hash**.

Import File Hashes

You can import and block the File Hashes in bulk using the **Import** option in the **Blocked File Hashes** view.

To import the File Hashes:

1. Go to **Files** > **Manage** > **Blocked File Hashes** > **Import**.
   The **Import File Hashes** dialog is displayed.

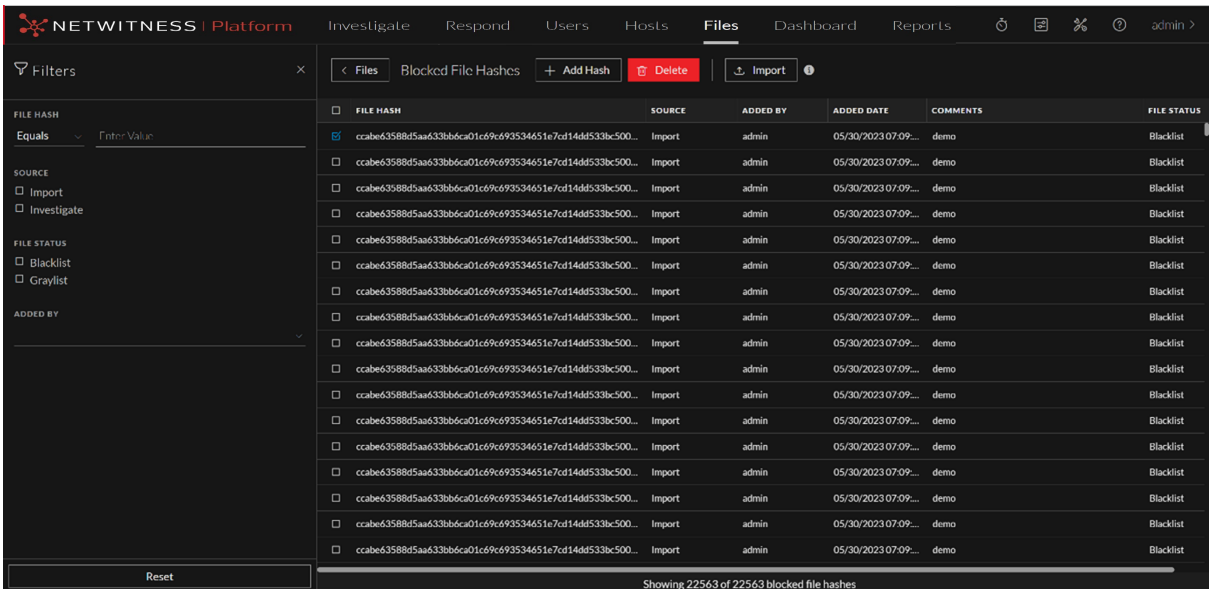
2. Under **Import File Hashes using .csv file**, do one of the following.
   - Click the block to upload the CSV file.
   - Drag and upload the CSV file in the block.
3. Specify the reason for blocking the File Hashes in the **Comment** section.
4. Click **Import**.

Note: Only the unique file hashes are imported during the Import process. If you import the .csv file with few existing blocked file hashes, the Blocked File Hashes List view is updated to reflect the corresponding changes. The duplicate file hashes are not accounted for the change in the total count of blocked file hashes.

Note: While updating the CSV file, make sure you enter each file hash value in separate rows under a single column and then upload the CSV file to block the file hashes. Refer the following figure.

	A	B	C	D	E	F	G
1	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2116						
2	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2117						
3	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2118						
4	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2116						
5	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2117						
6	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2118						
7	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2119						
8	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2120						
9	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2121						
10	ccabe63588d5aa633bb6ca01c69c693534651e7cd14dd533bc5008f9a80f2122						

Note: Analysts must have the **contexthub-server.datasource.manage** permission to import the file hashes.



Delete File Hash

You can delete and unblock a blocked File Hash using the **Delete** option in the **Blocked File Hashes** view.

To delete a blocked File Hash:

1. Go to **Files** > **Manage** > **Blocked File Hashes**.

   The **Blocked File Hashes** view is displayed.

2. Select the blocked File Hash and click **Delete**.

The **Delete Hash** confirmation dialog is displayed.

3. Click **Delete**.

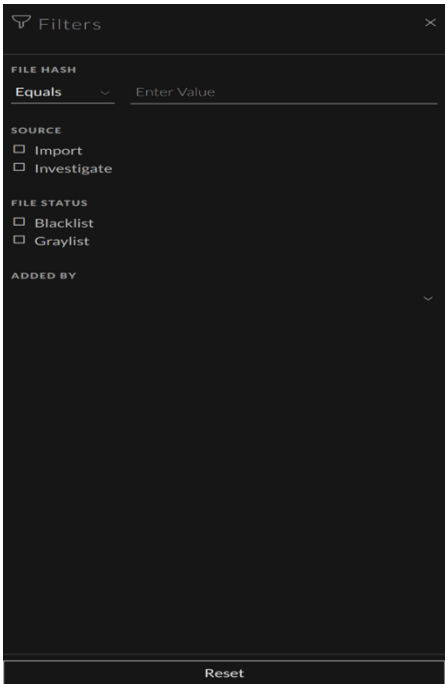
Blocked File Hashes List View

The Blocked File Hashes List view consists of a Filters panel and the Blocked File Hashes List.

Blocked File Hashes List

The Blocked File Hashes List displays all the Blocked File Hashes in the NetWitness Platform.

The following table describes the columns in the Blocked File Hashes List.



Columns	Description
	Allows you to select the required Blocked File Hash.
File Hash	Displays the list of Blocked File Hashes
Source	Displays the Source used for blocking the File Hashes. For Example: **Import** **Note:** When you upgrade to 12.3 or later versions from the versions older than 12.0, the **Source** column displays **Investigate** for all the File Hashes blocked in the previous deployment using the **Import** option. The **Source** column displays **Import** only for the File Hashes you block using the **Import** option in NetWitness Platform 12.3 or later versions. If you upgrade to 12.3 or later versions from 12.0 or later versions, the **Source** column displays **Import** for the File Hashes blocked in the previous deployment and the current deployment using the **Import** option.
Added By	Displays the name of the administrator or the analyst who blocked the File Hashes.
Added Date	Displays the date on which the File Hashes are blocked. For Example: 03/20/2023 10:00:00AM
Comment	Displays the comment provided by the administrator or the analyst while blocking the File Hashes.
File Status	Displays the file status of the Blocked File Hashes. For Example: **Blacklisted**.

Filter Blocked File Hashes

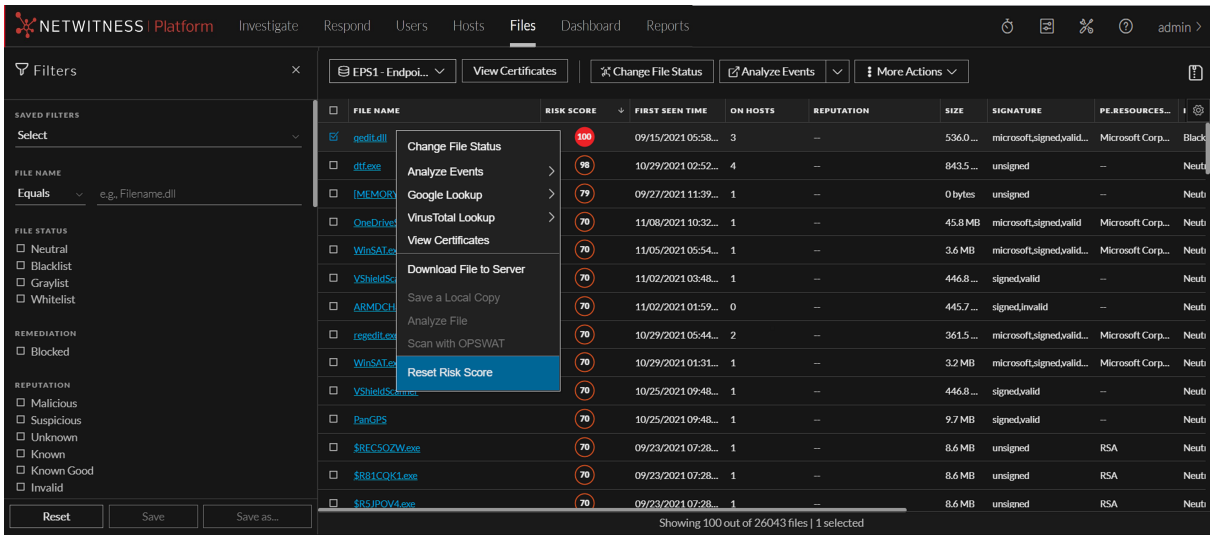
You can filter the Blocked File Hashes based on the following parameters.

- Value of the File Hash
- Source used for blocking the File Hashes

- File status of the Blocked File Hashes
- User who blocked the File Hashes

Click **Reset** to remove the filters applied.

Resetting Risk Score of Files



You can reset the risk score for a file in these situations:

- If the alerts or events triggered by the host or a file are considered to be false positive, you can make required changes to the Endpoint Application rules or ESA rules.
- After you take required action on a malicious file.

When you reset the risk score, the risk calculation for the file is deleted and score is set to 0. The risk score on all the hosts on which this file exists is recalculated. You can reset the risk score for a single file or multiple files.

To reset the risk score of a file:

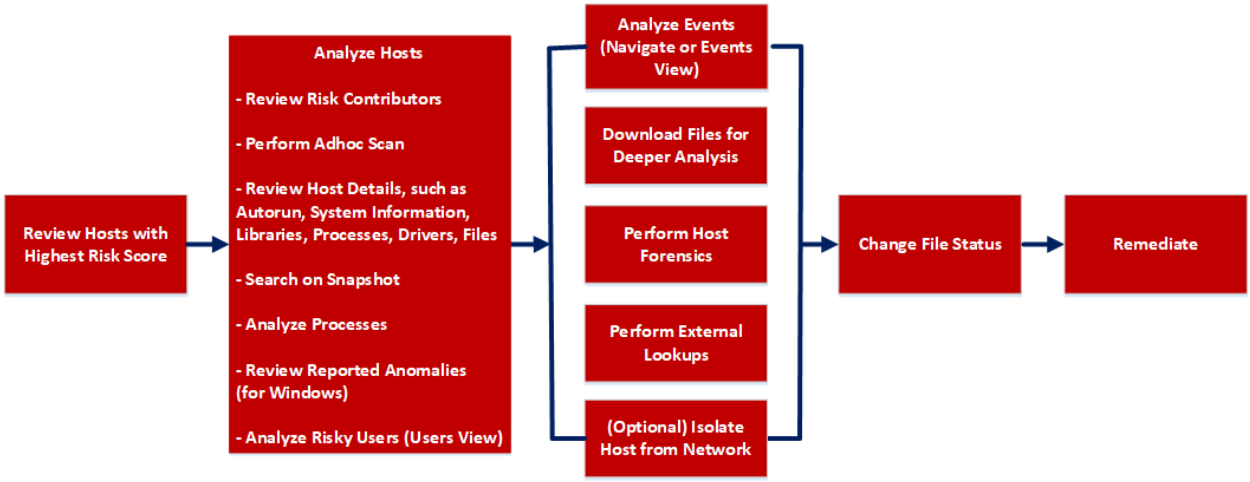
1. Go to **Files**.
2. Select the Endpoint Server or Endpoint Broker.
3. Select one or more files and do one of the following:

- Right-click and select **Reset Risk Score** from the context menu.
- Click **More Actions** > **Reset Risk Score** in the toolbar.

All the alerts associated with the score are deleted.

Note: You can select a maximum of 100 files to reset the score.

4. Refresh the page to view and confirm if the file's score is reset. This may take sometime for changes to take effect.



Investigating Hosts

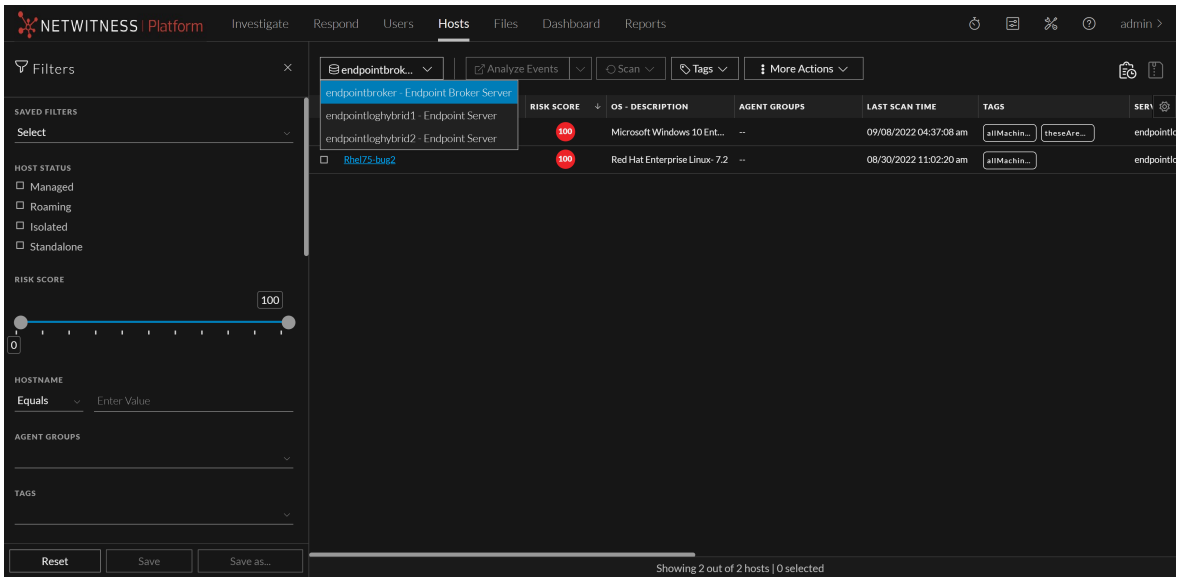
Note: The information in this topic applies to NetWitness Version 11.3 and later.

The Hosts view allows you to investigate on a host, which includes scan details, tracking events related to alerts, anomalies, and process details.

Best Practices

The following are some best practices and tips that may help you investigate efficiently to identify and isolate threats or attacks:

- Review hosts with highest risk score and analyze the alerts contributing to the risk. Review the entities, such as file name, processes involved in the alerts. For more information, see Analyze Hosts Using the Risk Score.
- Review files or processes that created this suspected file, and check if any other files are accessed or created in the Events view. For more information, see Analyzing Events.
- Review hosts for rare files in the **On Hosts** column. If a file is present on 100 hosts, it can be legitimate. If a file is present on fewer hosts with a high risk score, it may be malicious and needs further investigation.
- Filter to exclude hosts on host status, risk score, hostname, and so on. For more information, see Filter Hosts.
- Search Google or VirusTotal with the file hash and review any reported activities. For more information, see Launch an External Lookup for a File.



- Review the processes, autoruns, files, libraries, drivers, and system information. For example,
  - Search for files in known malware locations. For example,
    - C:\Windows\.
    - C:\Users\<name>\AppData\<uncommon folder>.
    - C:\Users\<name>\AppData\Local\Temp.
    - C:\Windows\Temp\.
  - Search for a particular file name or hash and review the snapshot to check when the file was first seen.
  - Review any network connections established by the process, such as:
    - Domain or IP address.
    - Ports used (common (80 and 443) versus uncommon ports (8080 , 8888, and 3465)) and check if the ports are listening actively.
  - Check the file compile time. If the date is recent, it could be malicious.
  - Check the file creation time on the host.
- Review reported anomalies, such as suspicious threads, kernel hooks, image hooks, and registry discrepancies. For more information, see Analyze Anomalies.
- Launch Process Analysis to view the sequence of activities performed on the host by the file or process. For more information, see Analyze Processes.
- Download suspicious files to the server for deeper analysis. For more information, see Analyzing Downloaded Files.
- Download MFT, process, or system dump to the server for forensic investigation. For more information, see Performing Host Forensics.
- After investigation if a file is found to be malicious you change the status of the file (blacklist or graylist) and block infected or malicious file. For more information, see Changing File Status or Remediate.
- (Optional) If you suspect that a host is potentially compromised with the threat still being active, you can isolate the host from the network and safely investigate possible threats within the host. For more information, see Isolating Hosts from Network.

View Hosts

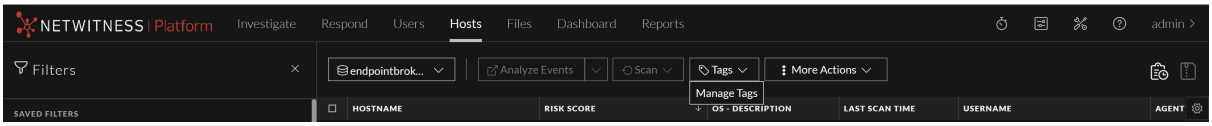
You can view all hosts present on a specific Endpoint server or consolidated list of all hosts on multiple Endpoint servers using the Endpoint Broker for analysis. By default, hosts are sorted based on the risk score. To view the hosts:

1. Go to **Hosts**.
2. Select from the following:

- **Endpoint Broker Server** to view all hosts across all Endpoint servers. When querying, the Endpoint Broker ignores Endpoint servers that are offline. If the Endpoint server is online but is not responding, the Endpoint Broker waits for 10 seconds, and ignores if it does not respond.
- **Endpoint Server** to view hosts on a specific Endpoint server.

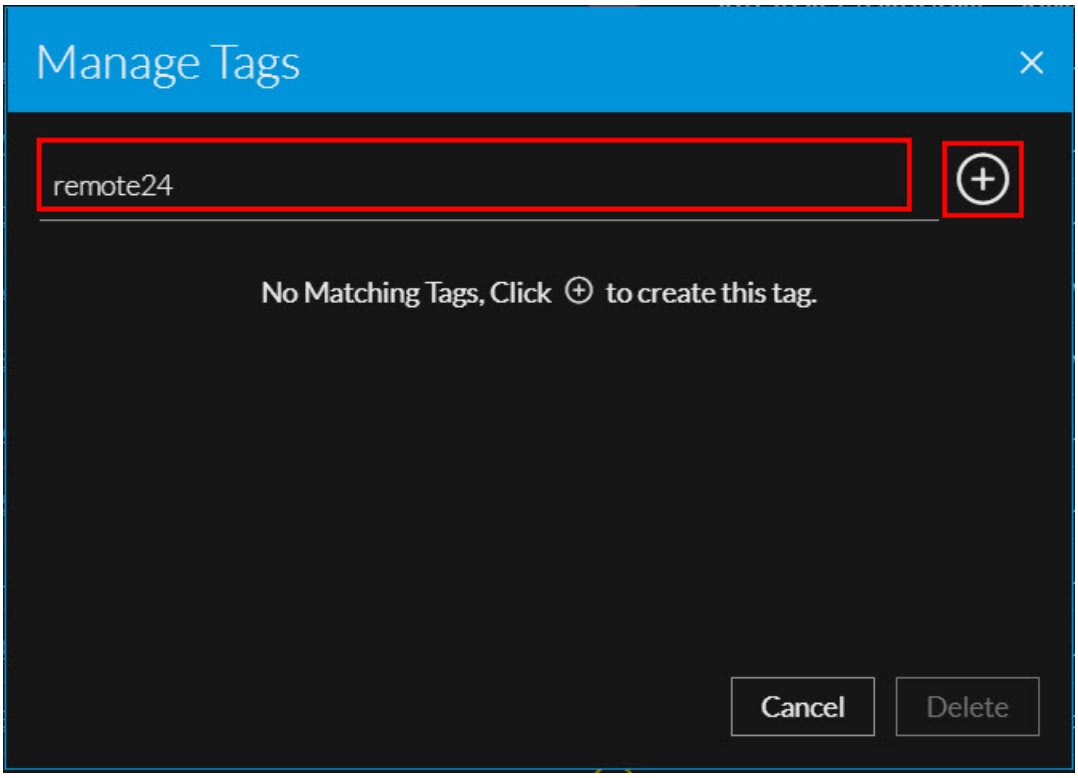
3. Select a host that you want to analyze.
4. Click a row to view the following details:
   - **Host Details** displays the host information such as Network Interfaces, operating system, hardware and others.
   - **Risk Details** displays the distinct alerts associated to the risk score and the alerts severity. Click **Critical**, **High**, **Medium**, or **All** to display all the alerts. For more information, see Analyzing Risky Users.
5. Click **Show next 100 hosts** to view other hosts.
6. Click the host name to investigate the scan results. For more information, see Analyze Host Details.

Manage Hosts Using Tags



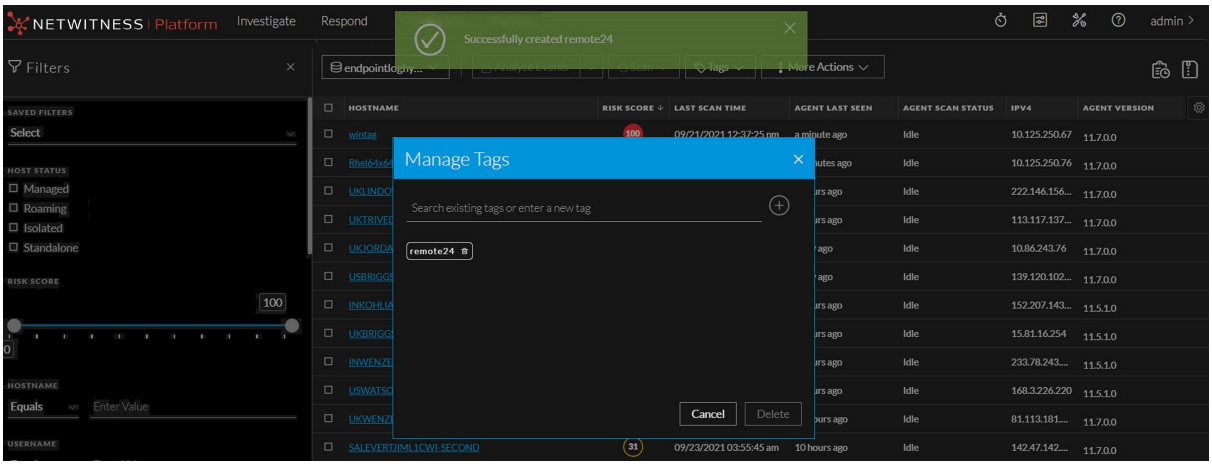
From version 11.7 and later, NetWitness Platform allows you to create Tags to manage the hosts effectively. Tags are custom texts that you can create and assign to hosts for identifying them. A tag can contain alphabets, numbers and special characters(Except \ **' , [ ] "** and **space**). You can use these tags to create host groups. You can also filter hosts by tags using the filters pane on the Hosts screen.

Manage Tags



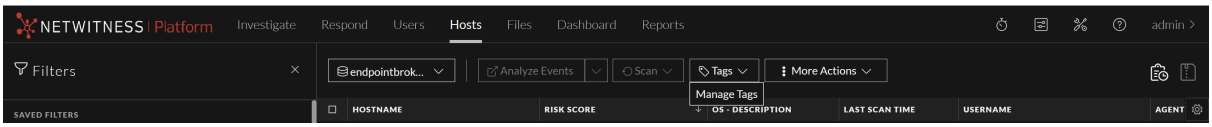
The Manage Tags option allows you to create and delete tags without selecting any hosts.

To Create Tags:

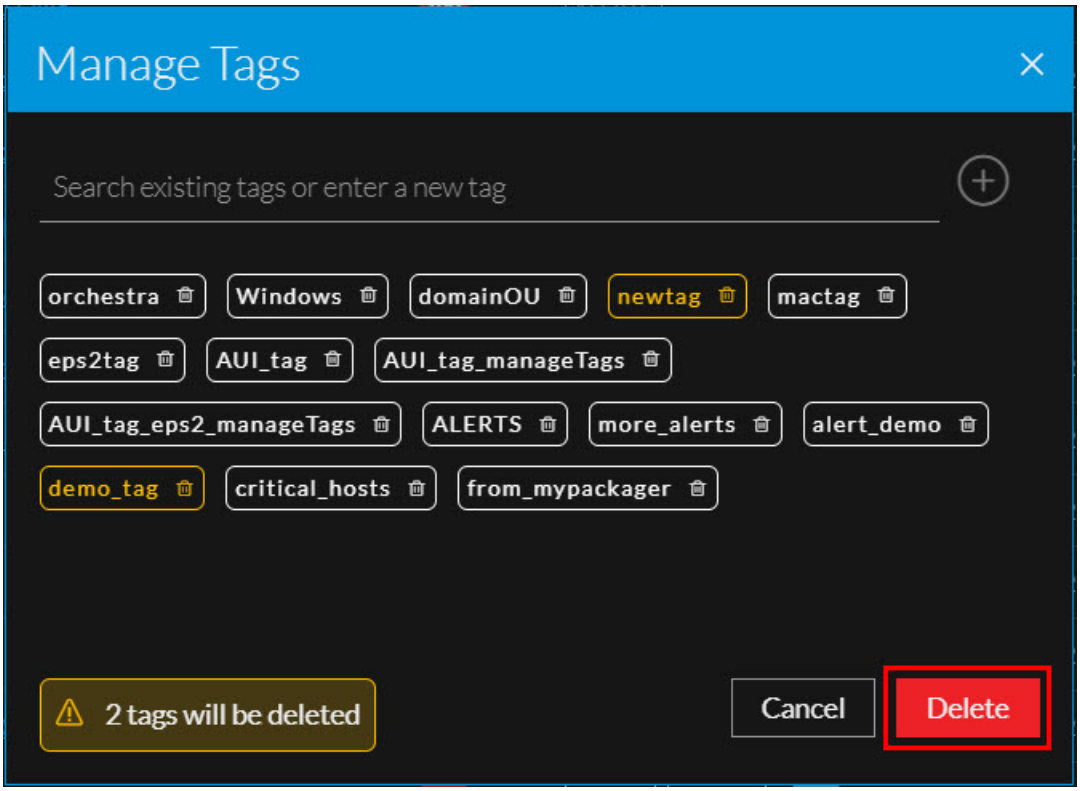


1. Click **Tags > Manage Tags** on the Hosts tab.

2. Enter a valid tag in the text field on the **Manage Tags** pop-up and click ⊕.

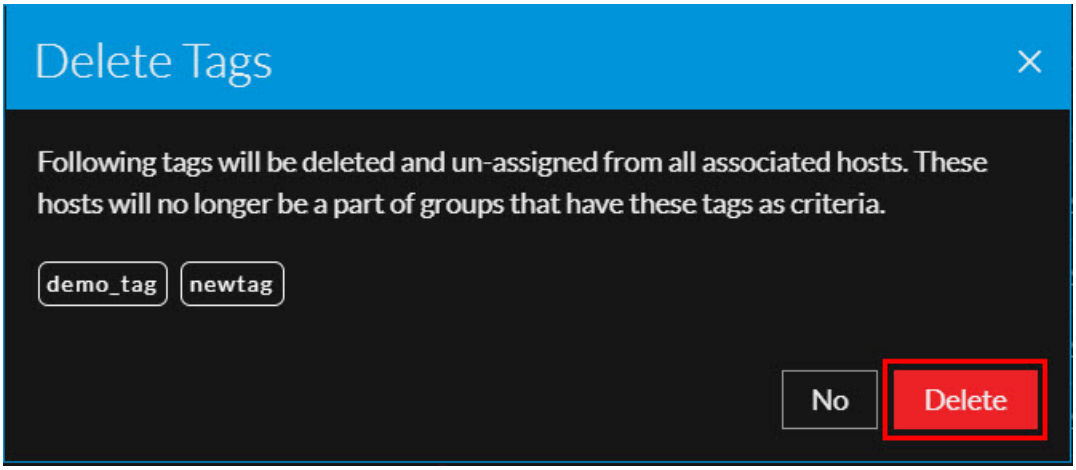


- The tag is created, and a success message will appear.



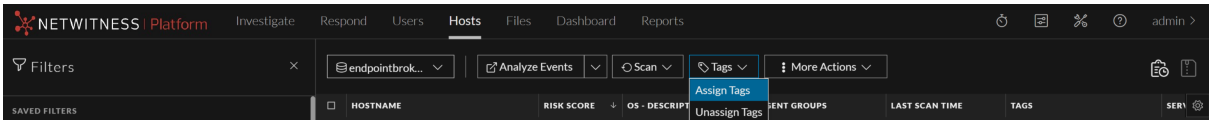
3. Repeat step 2 to create more tags.

To Delete Tags:



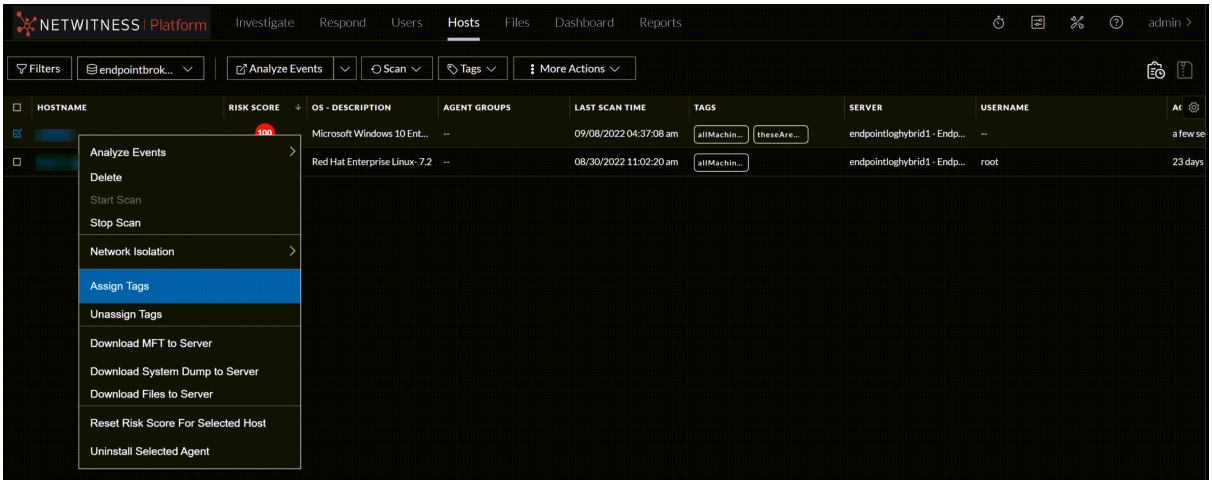
1. Click **Tags > Manage Tags** on the Hosts tab.

2. Select the tags that you want to delete and click **Delete** on the **Manage Tags** pop-up.



3. Click **Delete** on the **Delete Tags** confirmation pop-up.

Note: The tags you deleted will also be unassigned from all associated hosts. If the associated hosts are a part of groups created using these tags as one of the criteria, then the hosts will no longer be a part of those groups. Refer What happens next after unassigning or deleting tags from hosts? for more information.

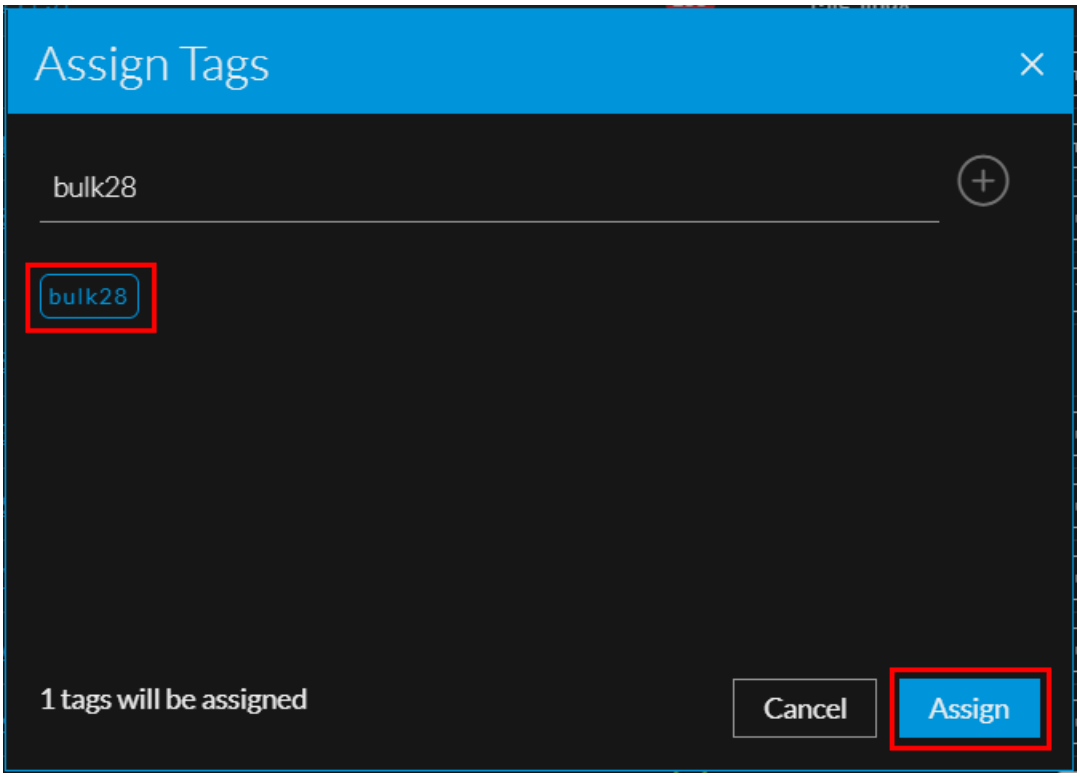


Assign tags

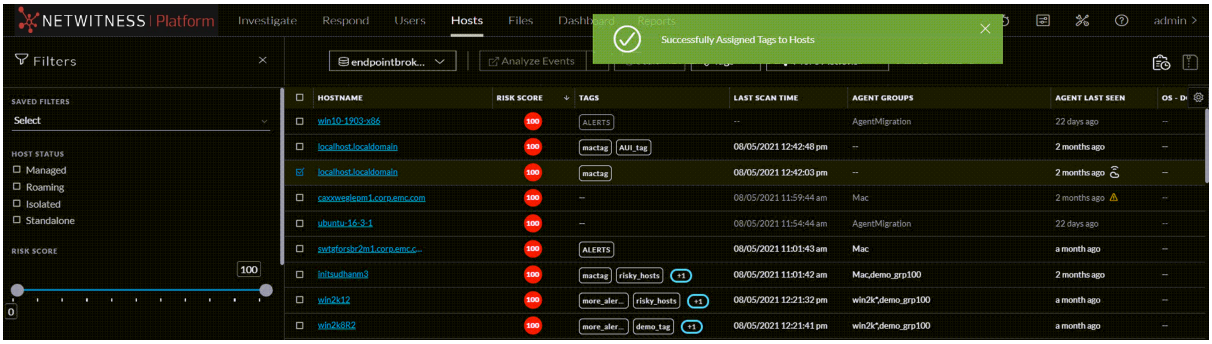
1. Select one or more hosts on the Hosts tab.
2. Do one of the following.
   - Select **Tags > Assign Tags** from the menu.

   - Select a host, right click and select **Assign Tags**.

     The **Assign Tags** pop-up will appear and shows all the existing tags.

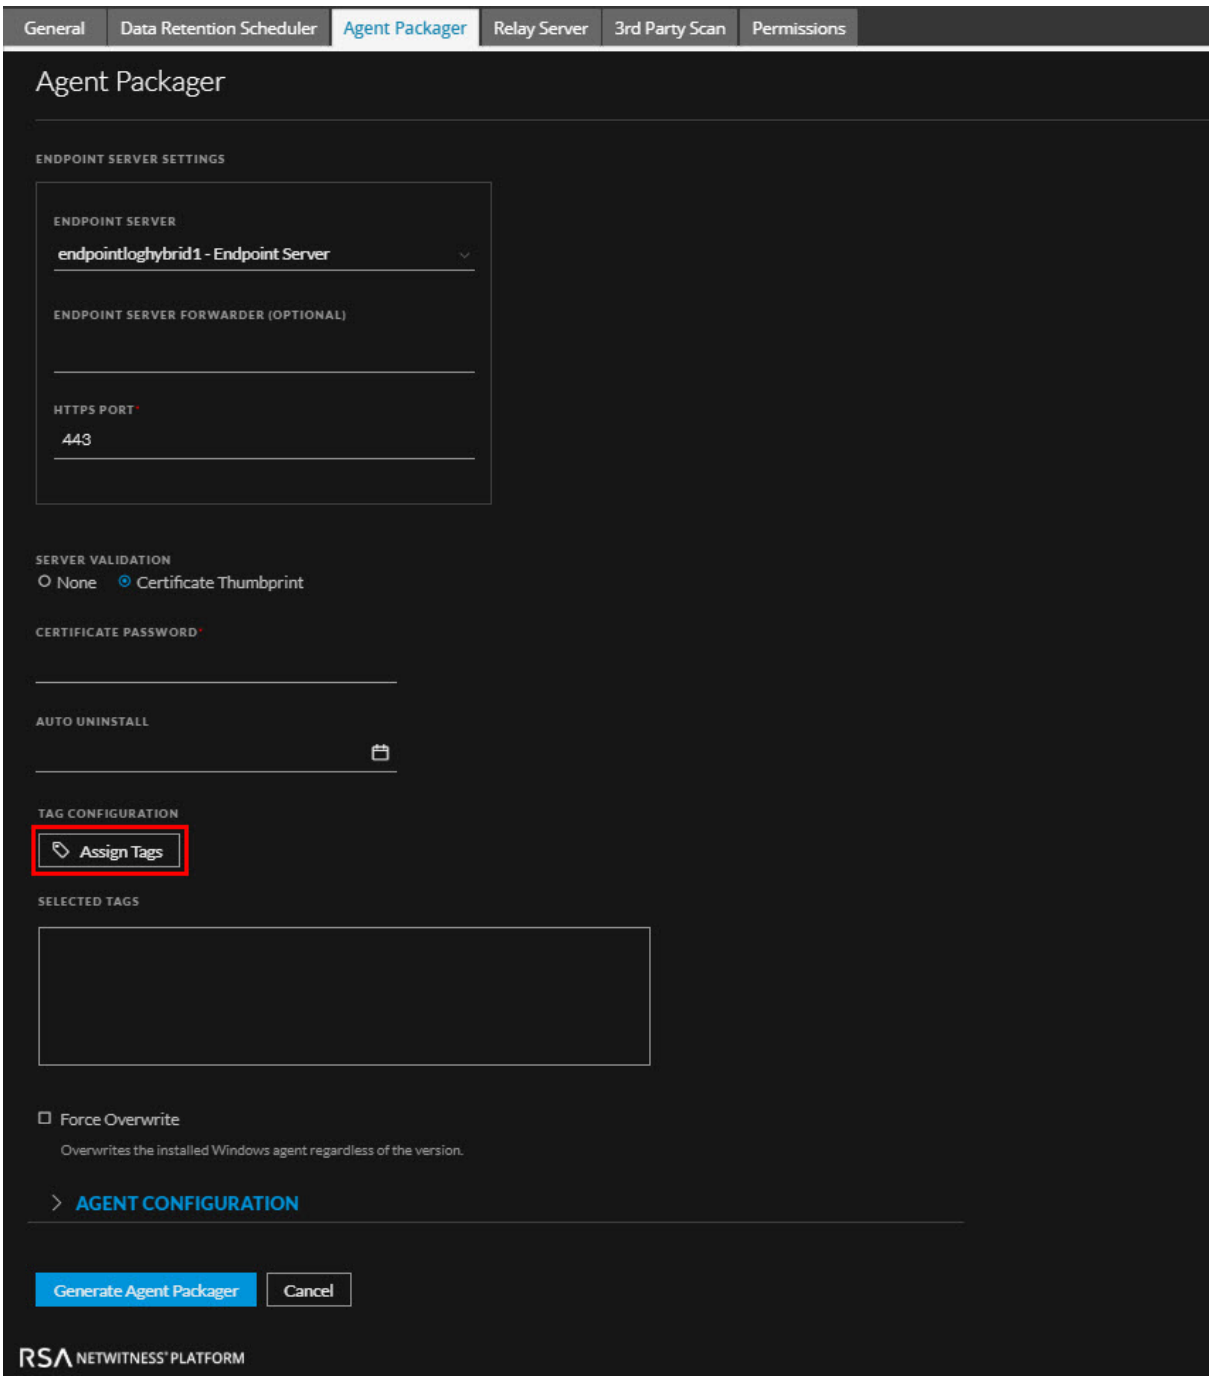


3. Do one of the following.

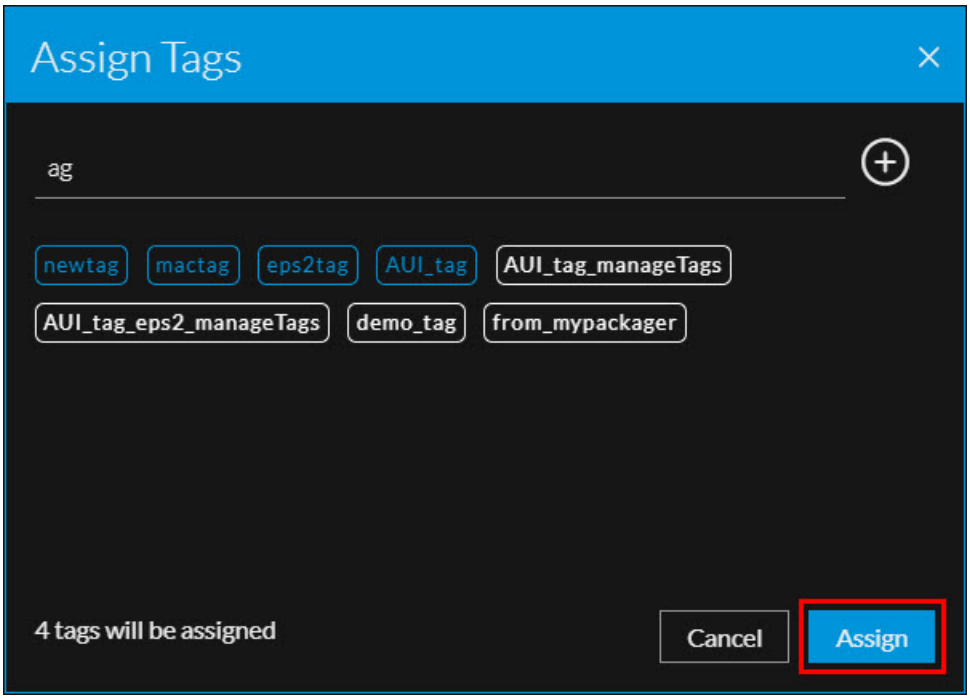


- Enter a valid tag and click  to create it. The newly created tag is selected by default.

- Search for an existing tag using the text field and select it if required.



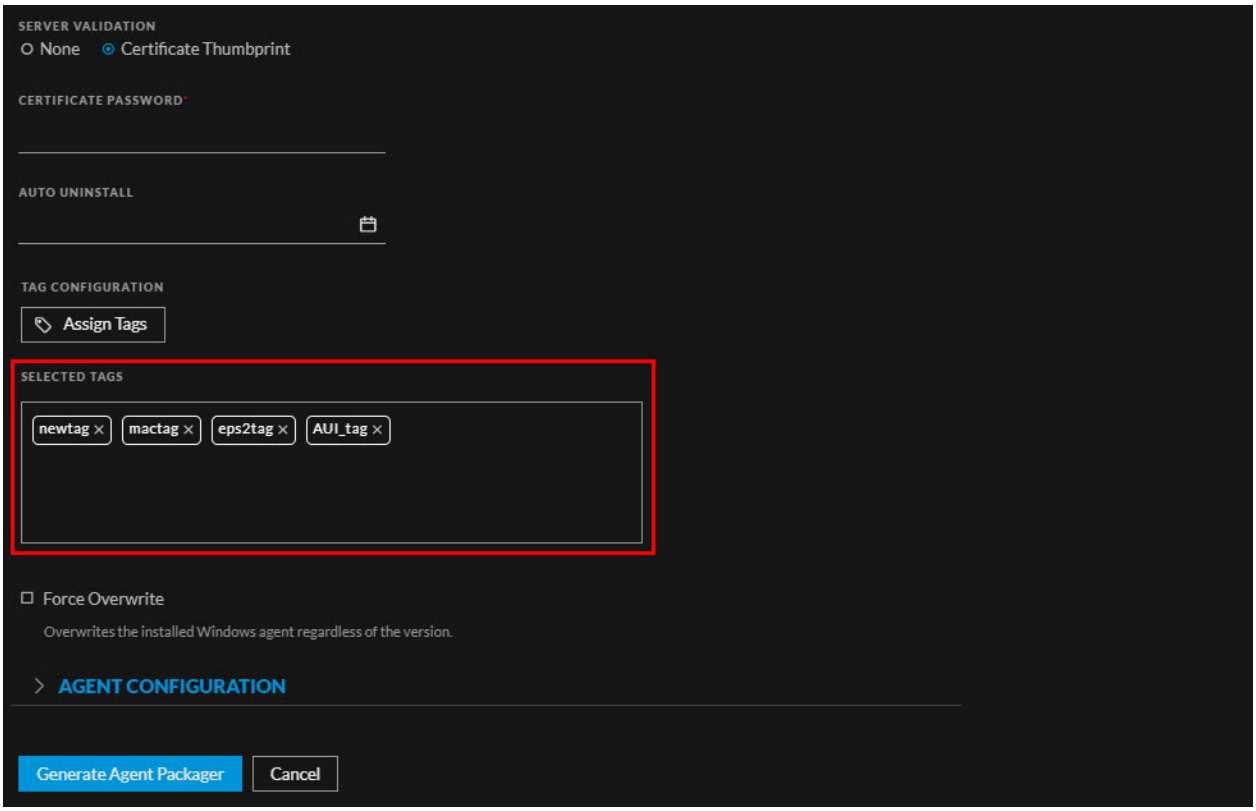
4. Click **Assign**. These tags will be assigned to the selected hosts.



Create and Assign Tags When Generating the Agent Packager

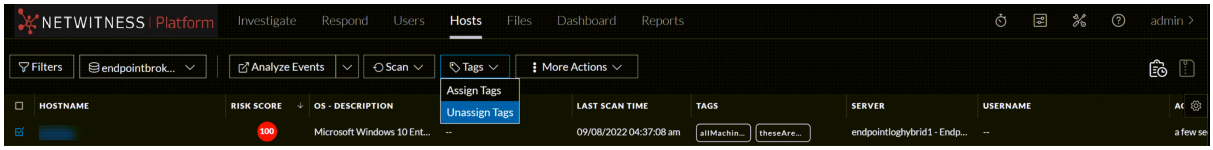
You can add tags to the hosts while installing the Endpoint agents. When generating the agent packager on the Agent Packager tab, you can either create new tags or select already existing tags. These tags will automatically be assigned to the host in which the agent will be installed.

1. Click **Assign Tags** under **TAG CONFIGURATION** on the **Agent Packager** tab.

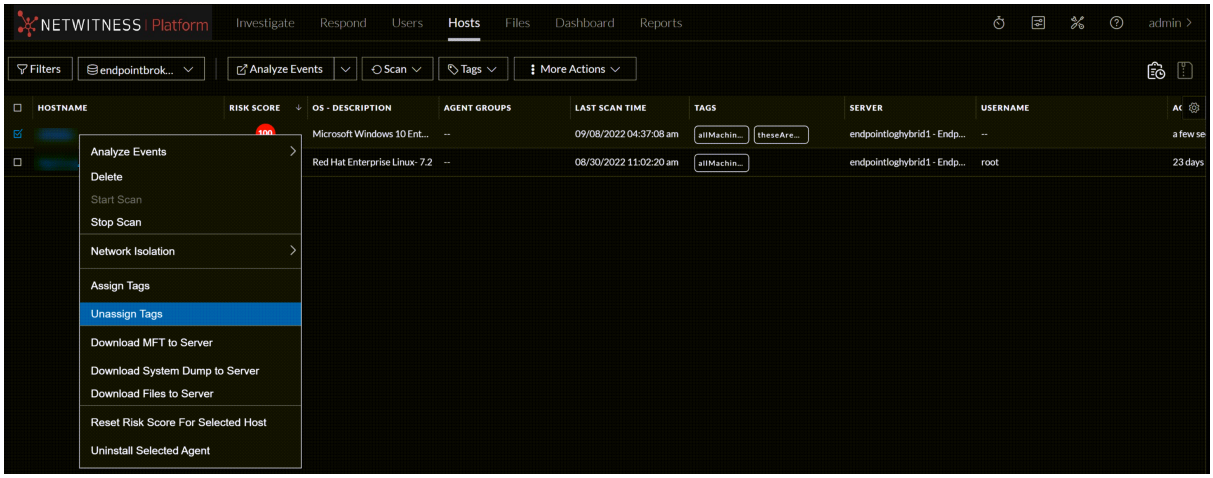


2. On the **Assign Tags** pop-up, do one of the following.
   - Search for an existing tag using the text field and click **Assign**.

- Enter a new tag in the text field and click  to add it to the selection. Click **Assign**.

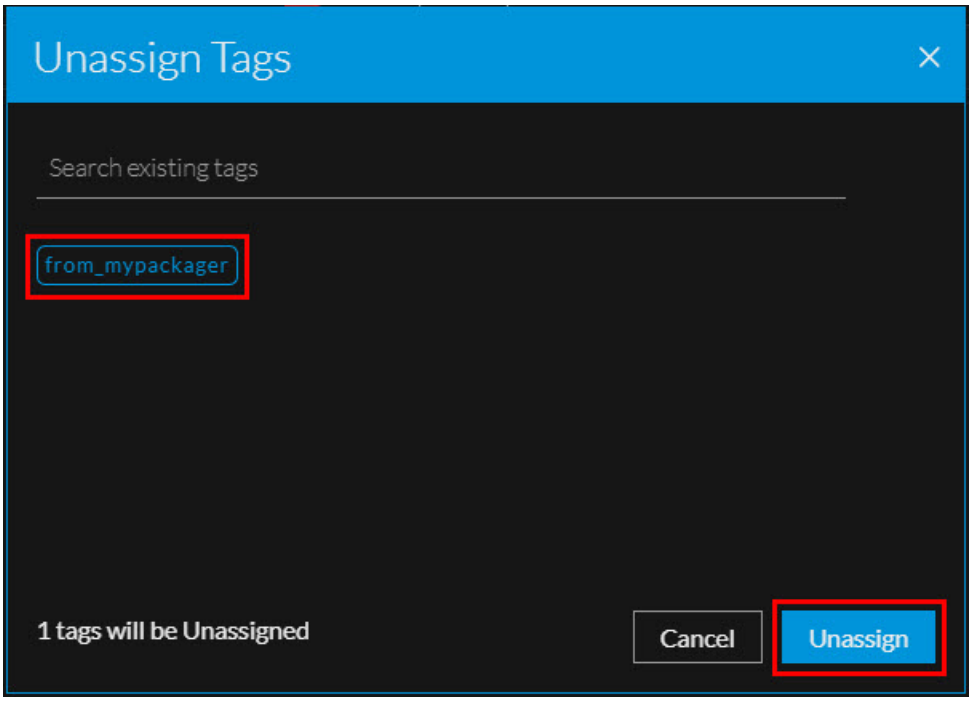


3. Assigned tags will appear under **SELECTED TAGS**.



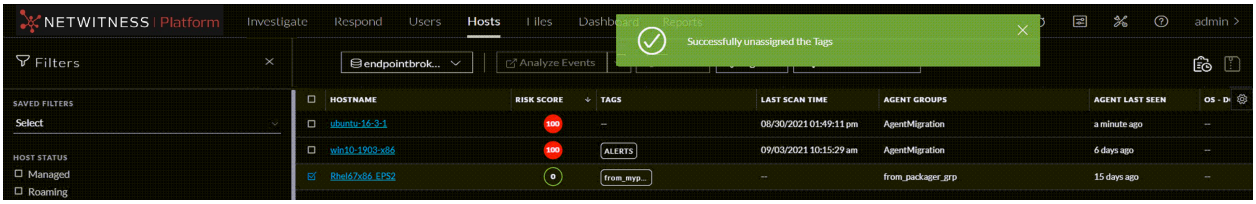
Note: The tags added while generating the Agent Packager are applicable only to the newly installed agents and not to the manually upgraded agents.

Unassign tags



1. Select one or more hosts on the **Hosts** tab.
2. Do one of the following.
   - Select **Tags > Unassign Tags** from the menu.

   - Right click a host and select **Unassign Tags**. The **Unassign Tags** pop-up will appear and show all the tag assigned to the selected hosts.



3. Search for the tags you want to unassign, select them and click **Unassign**.

4. Click **Unassign** on the confirmation pop-up.

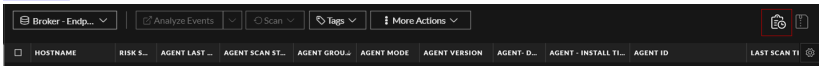
5. These tags will be Unassigned from the selected hosts.

What happens next after unassigning or deleting tags from hosts?

Unassigning/deleting tags from hosts will immediately initiate group & policy evaluation. For example, if a host is a part of the group created using only the unassigned/deleted tag as criteria, the host will no longer be a part of that group. Refer to the following scenarios to understand more.

Example Scenario 1: Assume you create a group with a couple of tags as grouping criteria, all the hosts with these tags assigned will be a part of the group. And, if you delete these two tags(or unassigning from the hosts), the hosts may no longer be a part of this group.

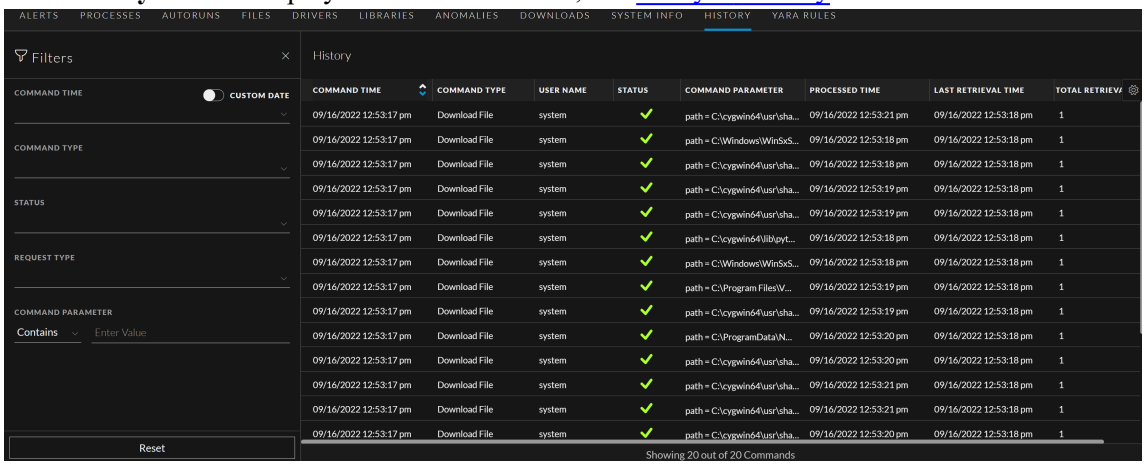
Example Scenario 2: Assume you create a group with a couple of tags and IP addresses as grouping criteria; all the hosts assigned with these tags and IP addresses will be a part of the group. And, if you delete(or unassigning from the hosts) the tags alone, the hosts may still be a part of this group as they are still grouped using the IP addresses.



View Agent History

You can view the list of commands issued to the agents (by the server or actions performed by any analyst) in the Host view and Host details. By default, commands are sorted based on the command time.

To view the commands:

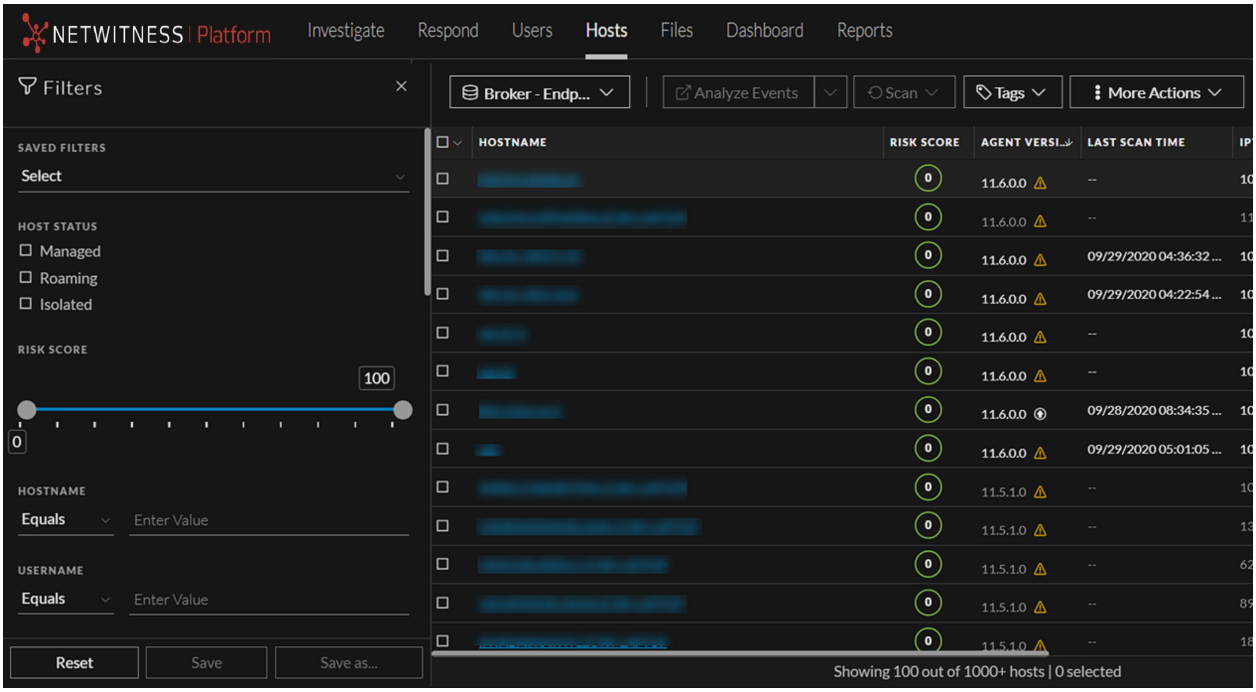


1. Go to **Hosts**.
2. Do any one of the following,

- To view all commands, click . You can also filter commands, for more information see Filter Hosts.

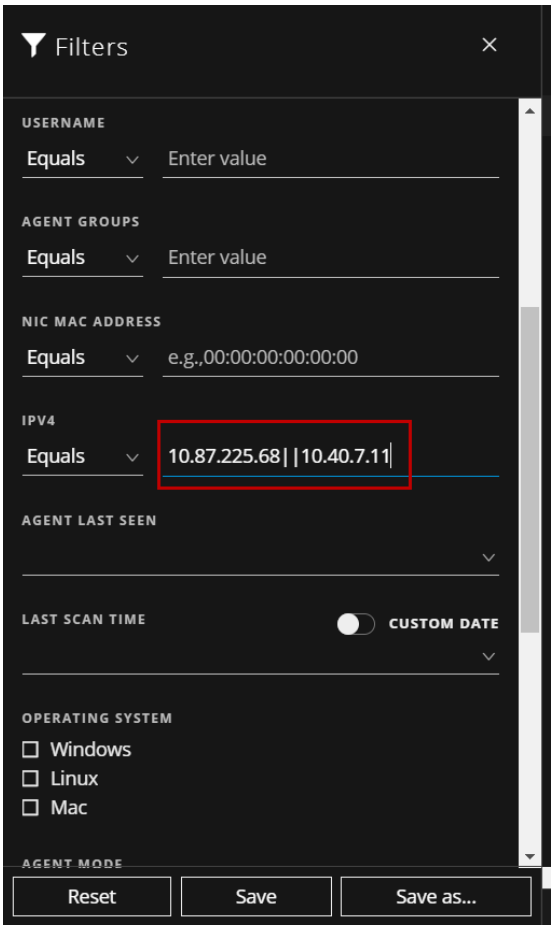
The Agent History view is displayed. For more details, see Analyze History.

- To view commands specific to a particular host:
  - Click the host for which you want to view the commands.
  - In the Host details view, click **History** tab. You can also filter commands, for more information see Filter Host Details.
    The **History** view is displayed. For more details, see Analyze History.



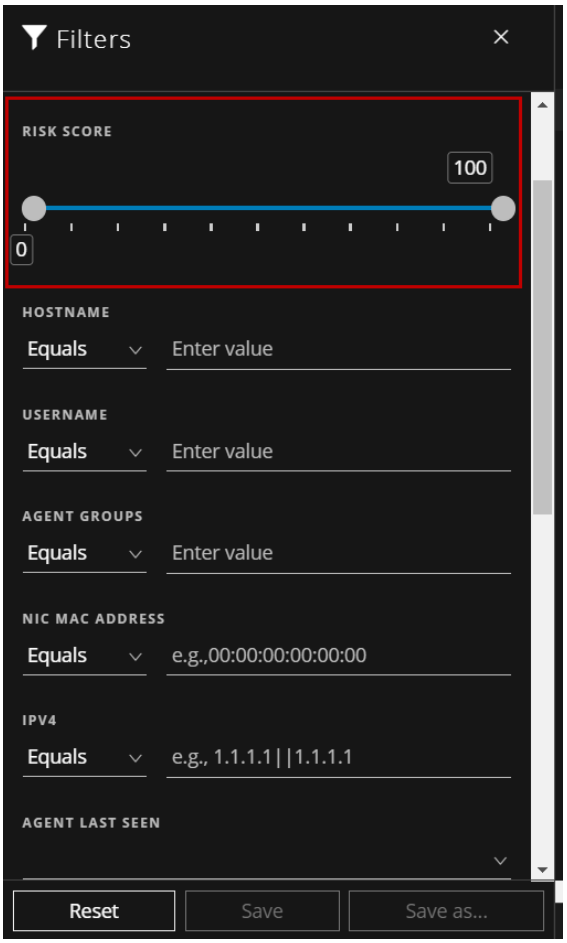
Filter Hosts

You can filter hosts on agent version, agent ID, agent mode, agent upgrade, agent last seen, last scan time, operating system, hostname, username, Mac address, risk score, IPV4, driver error code, security configurations, agent groups, and host status - managed, roaming, and isolated.



In the **Host** view > click , to filter the commands on command type, status, host name, request type, command parameter and command time. In the Command Time field, you can filter by custom date range.

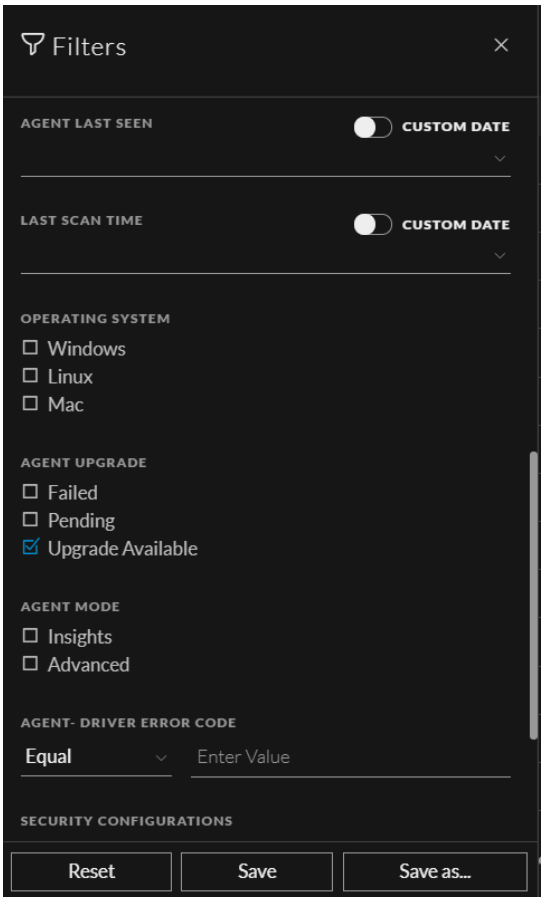
Note: While filtering on a large amount of data, use at least one indexed field with the `Equals` operator for better performance. The following fields are indexed in the database - Hostname, IPv4, Operating System, Last Scan Time, and Risk Score.



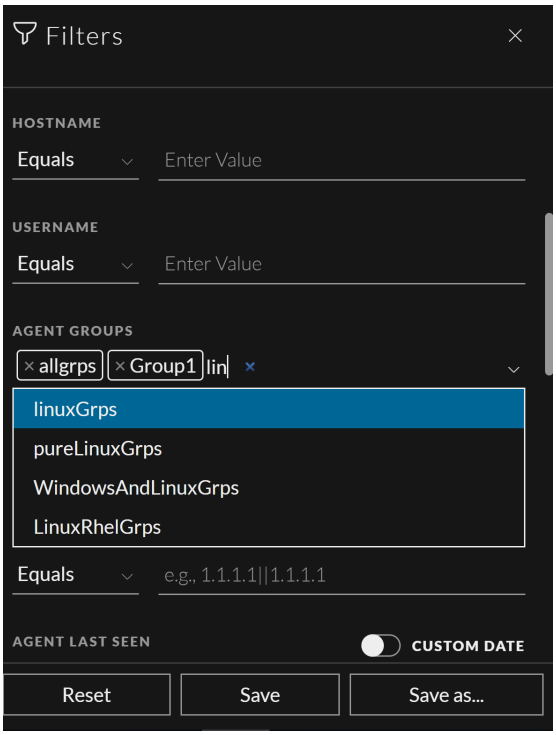
To search multiple values within a field, set the filter option to `Equals`, and use `||` as a separator.

For example, using `Equals` operator for multiple IPV4 values with a separator `||`.

To filter on the agent last seen or last scan time, select the option from the drop-down list. If you select 3 Hours ago for the Last Scan Time, the result displays hosts that were last scanned 3 hours ago or earlier.

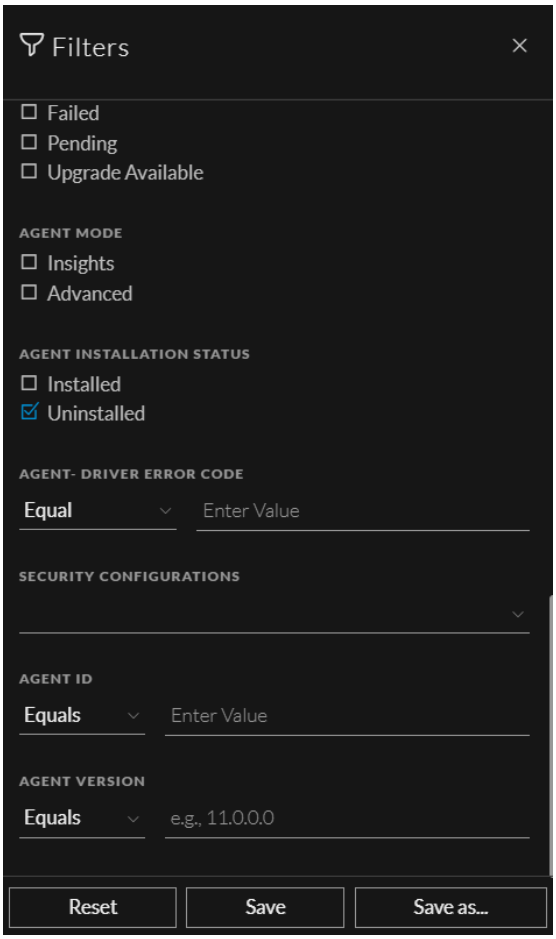


To filter on the risk score, use the slider to increase or decrease the values between 0 to 100.



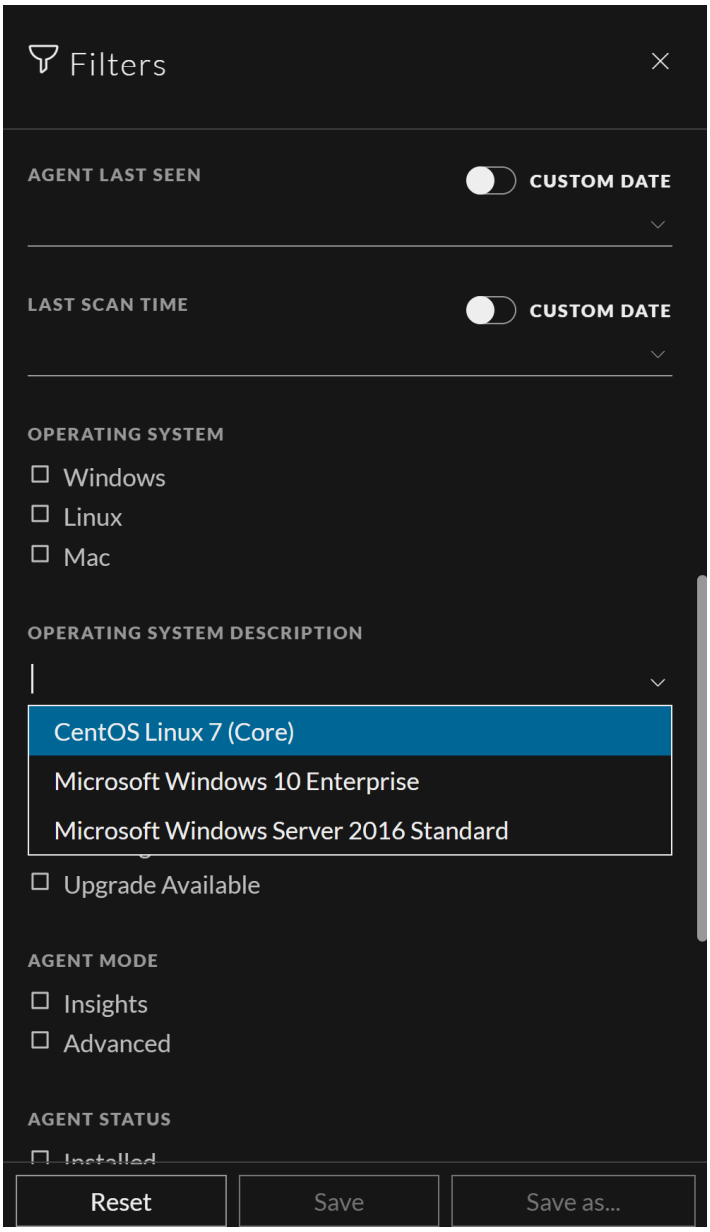
Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters panel on the left. To delete a filter, hover over the filter name and click 🗑.

Note: Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.



To filter the agents based on the upgrade status, select one of the upgrade statuses. For example, select the **Upgrade Available** checkbox to get the list of agents available for an upgrade.

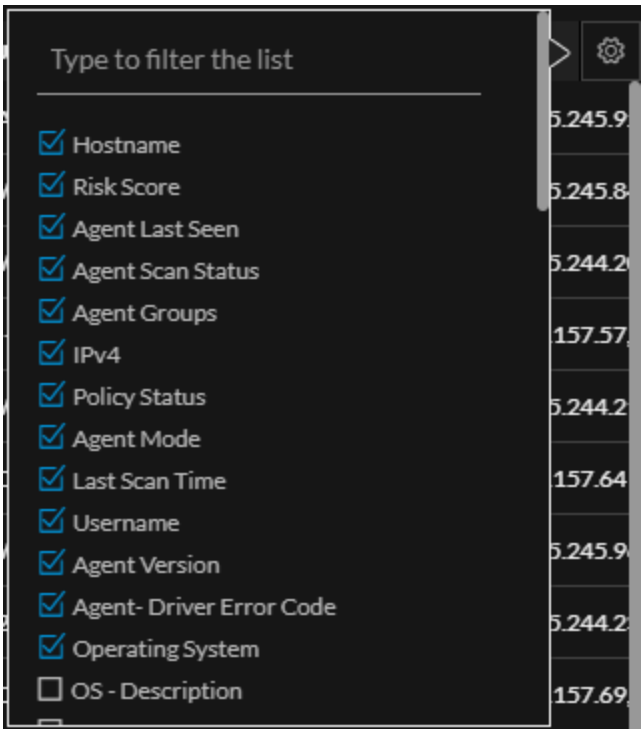
To filter the agents based on single or multiple agent groups, select a group from the drop-down list. You can also search the name of the groups from this list.



To filter the agents based on the installation status, select one of the installation statuses. For example, select the **Uninstalled** checkbox to get the list of agents for which the uninstall is initiated or successfully completed.

You can also filter the commands on command type, status, host name, request type, command parameter and command time (In which you can filter by custom date range), by clicking .

In 12.3 and later versions, you can filter the hosts on specific versions of Windows, Mac, and Linux using the **Operating System Description** field.



For Example: **CentOS Linux 7 (Core)**, **Microsoft Windows 10 Enterprise**, and **Microsoft Windows Server 2016 Standard**. Refer the following figure.

Adding and Sorting Columns in the Table

By default, the Hosts view displays a few columns and the hosts are sorted based on the risk score. To add or remove columns:

1. Go to **Hosts**.
2. Select the columns by clicking in the right-hand corner.

3. Scroll down or enter the keyword to search for the column.
4. Click the arrow on the column header to sort the column in ascending or descending order.

Scan Hosts

You may want to perform an on-demand scan if you want to get the latest snapshot of the host.

You can either choose to perform a quick scan or a full system scan.

Quick scan - Scans all executable files that are loaded in memory. Both Insights and Advanced agents support quick scan.

Full System Scan - Scans all fixed drives or the system drive You can perform a full system scan only on advanced agents that are in version 11.6 or later. Native executables are included in the full system scan, by default

When hosts are scanned, the Endpoint Agent retrieves the following data that can be used for investigation:

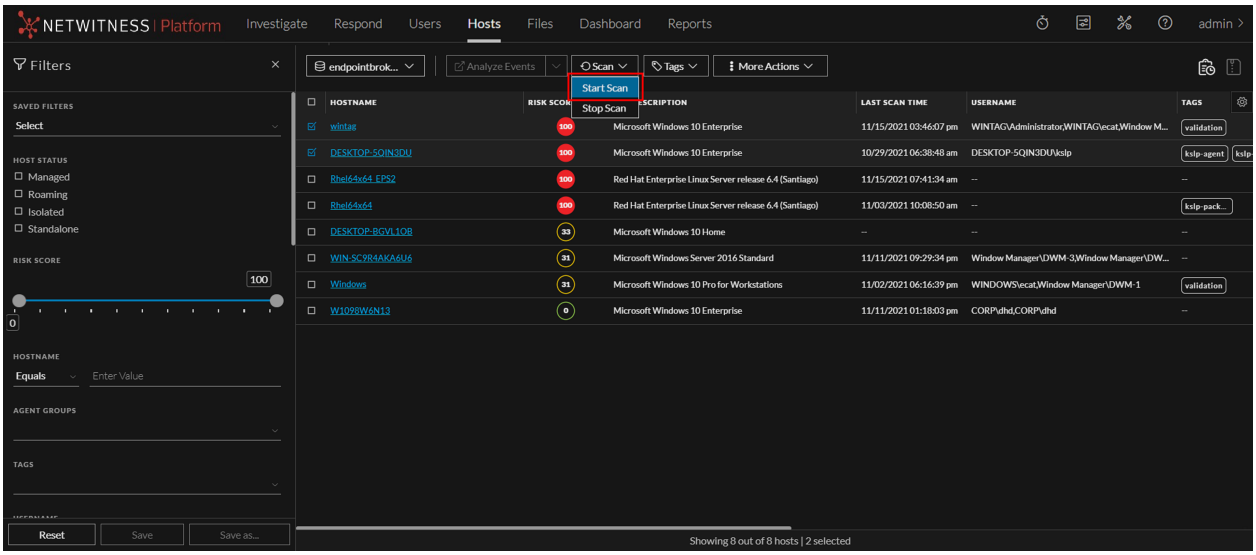
- Drivers, processes, DLLs, files (executables), services, autoruns, anomalies, host file entries, and scheduled tasks running on the host.
- System information such as network share, installed Windows patches, Windows tasks, logged-in users, bash history, and security products installed.

To perform a Quick Scan:

1. Go to **Hosts**.
2. Select one or more hosts (up to 100) at a time, and do one of the following:

- Click **Scan > Start Scan** from the menu (Or)
- Right-click and select **Start Scan** from the context menu

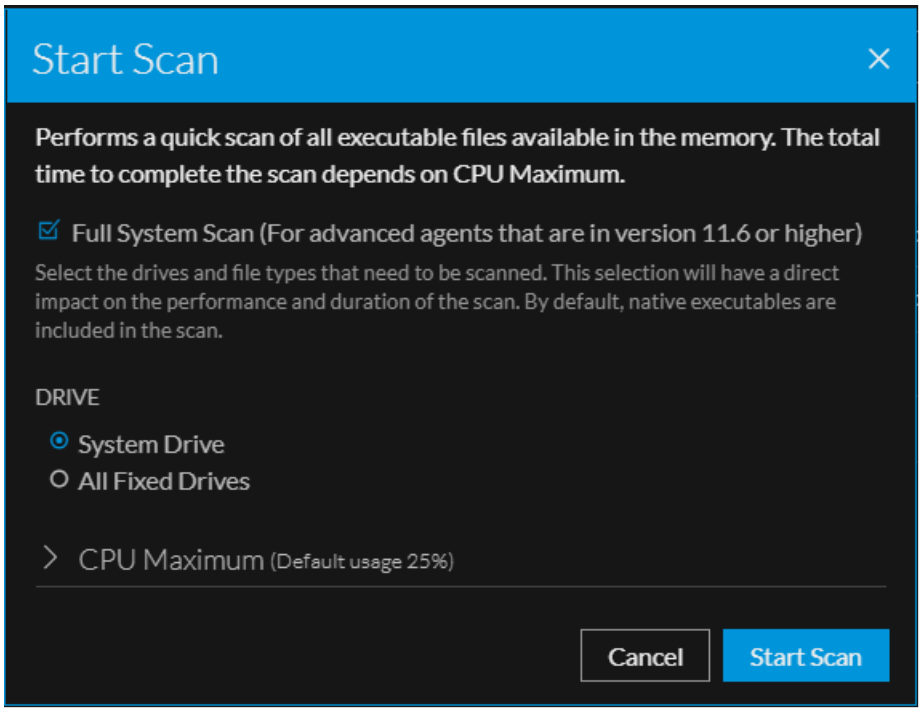
3. Click **Start Scan** on the pop-up. Quick scan is initiated for executable modules loaded in memory.



The following are the scan statuses:

Status	Description
Idle	No scan is in progress.
Scanning	Scan is in progress.
Pending	Scan request is sent to the server, and the agent will receive the request the next time it communicates with the server.
Cancel	Stop request is sent to the server, and the agent will receive the request the next time it communicates with the server.

Note: By default, the scan utilizes 25% of the CPU. You can click CPU Maximum and select a value from 5% to 100%. Increasing the CPU Maximum limit reduces the scan time but could lead to more CPU usage.



To perform a Full System Scan:

1. Go to **Hosts**.
2. Select one or more hosts (up to 100) at a time for an on-demand scan, and do one of the following:
   - Click **Scan > Start Scan** from the menu bar (Or)
   - Right-click and select **Start Scan** from the context menu

1. From the **Start Scan** pop-up, select **Full System Scan (Only on advanced agents that are 11.6 or higher.)**

2. Select **System Drive**(Default selection) or **All Fixed Drives**
3. Click **Start Scan** on the pop-up.

Note: An Endpoint server supports up to 10k Full System Scans in a rollover period.

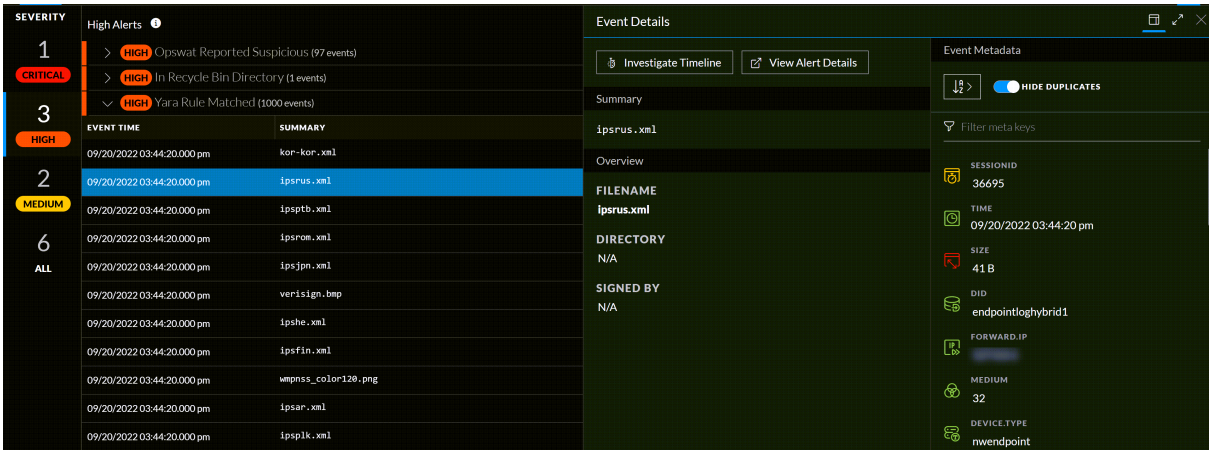
Analyze Hosts Using the Risk Score

You can investigate a host by analyzing the risk contributors such as alerts and events to look for suspicious or malicious activity.

Based on the severity of the alert triggered by the host, you can analyze the host using the following options:

- **View Alert Details**: This option allows you to analyze the host when Critical and High alerts are triggered. For more information, see Investigating a Process.
- **Analyze Process Tree**: This option allows you to analyze the host when Medium alerts are triggered. For more information, see Investigating a Process.

To analyze the hosts (which trigger Critical or High alerts) using the risk score:



1. Go to **Hosts**.

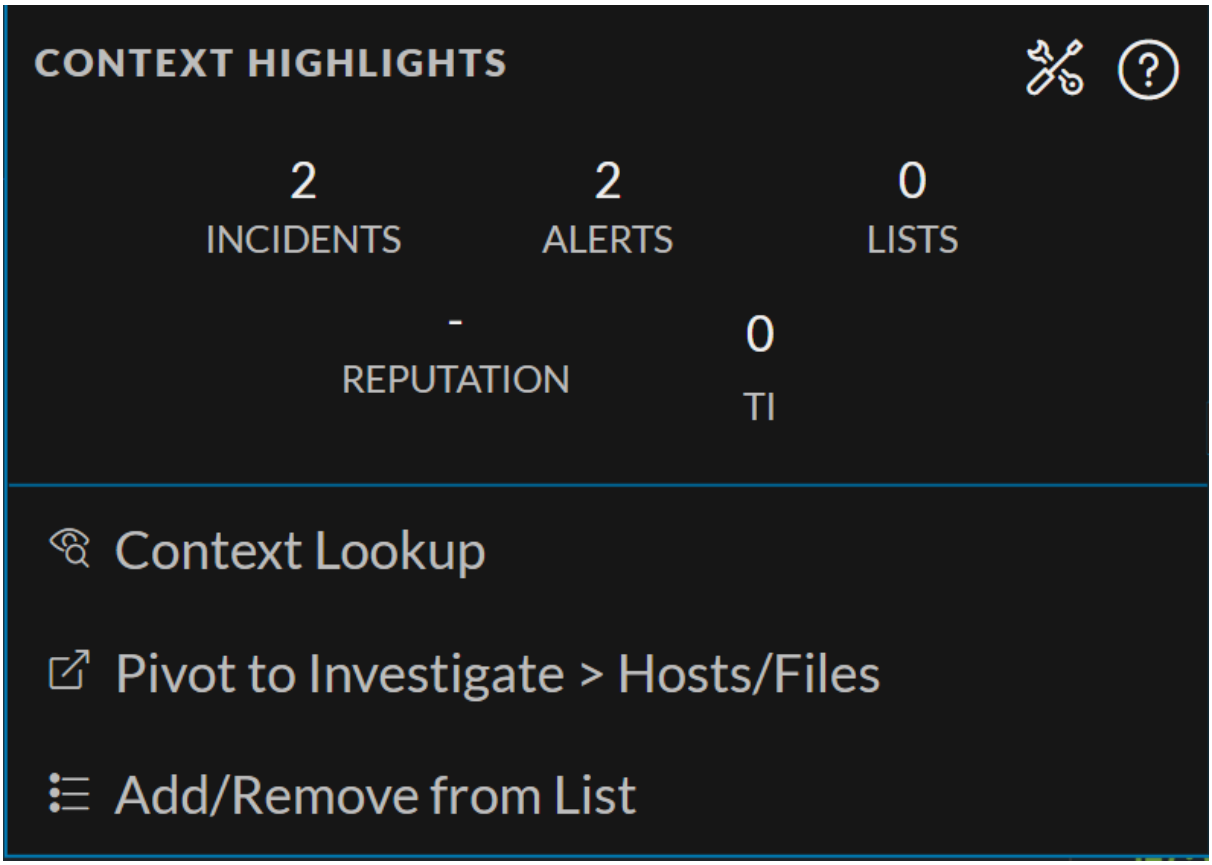
   The **Hosts** view is displayed.
2. In the Server drop-down list, select the Endpoint server or Endpoint Broker server to view the hosts.

3. Select the host and do any of the following.
   - Click a row to view the risk associated with the host in the **Risk Details** panel.
   - Click the hostname to investigate the host.

     The **Alerts** tab is displayed.
4. In the **Alerts** > **Severity** panel, click the alert severity such as **Critical** or **High**.

   The list of distinct alerts is displayed along with the total number of events associated with the alert.
5. Click an alert to view the associated events.

Note: For each alert, only the latest 1000 events are displayed.



6. To view all the details associated with a specific event, click on an event. The **Event Details** panel is displayed with the summary and overview information associated with the event.

7. You can also view the Event Metadata such as IP, Filename, File hash, and Category in the **Event Details** panel.

Note: The **contexthub-server.contextlookup.read** permission is enabled only for Administrators, Analysts, Malware Analysts, SOC Managers and Respond Administrators. Administrators can enable this permission for other roles in the **Hosts** view to view context lookups for meta values and perform the Add/Remove from List actions. For more information, see the "Role Permissions" topic in the *System Security and User Management Guide*.

8. Click the drop-down option besides the metadata value to view additional information about the specific metadata. The **Context Highlights** dialog displays a list of the data sources that have context data available for meta value. These are the possible data sources: NetWitness Endpoint, Incidents, Alerts, Hosts, Files, and Feeds.

9. To investigate the original event and destination domain of the event, do any of the following:
   - To investigate the events in a specific time frame, click **Investigate Timeline** on the **Event Details** panel. For more information, see the *NetWitness Investigate User Guide*.
   - To investigate a particular process, click **View Alert Details** on the **Event Details** panel. For more information on process analysis, see Investigating a Process.

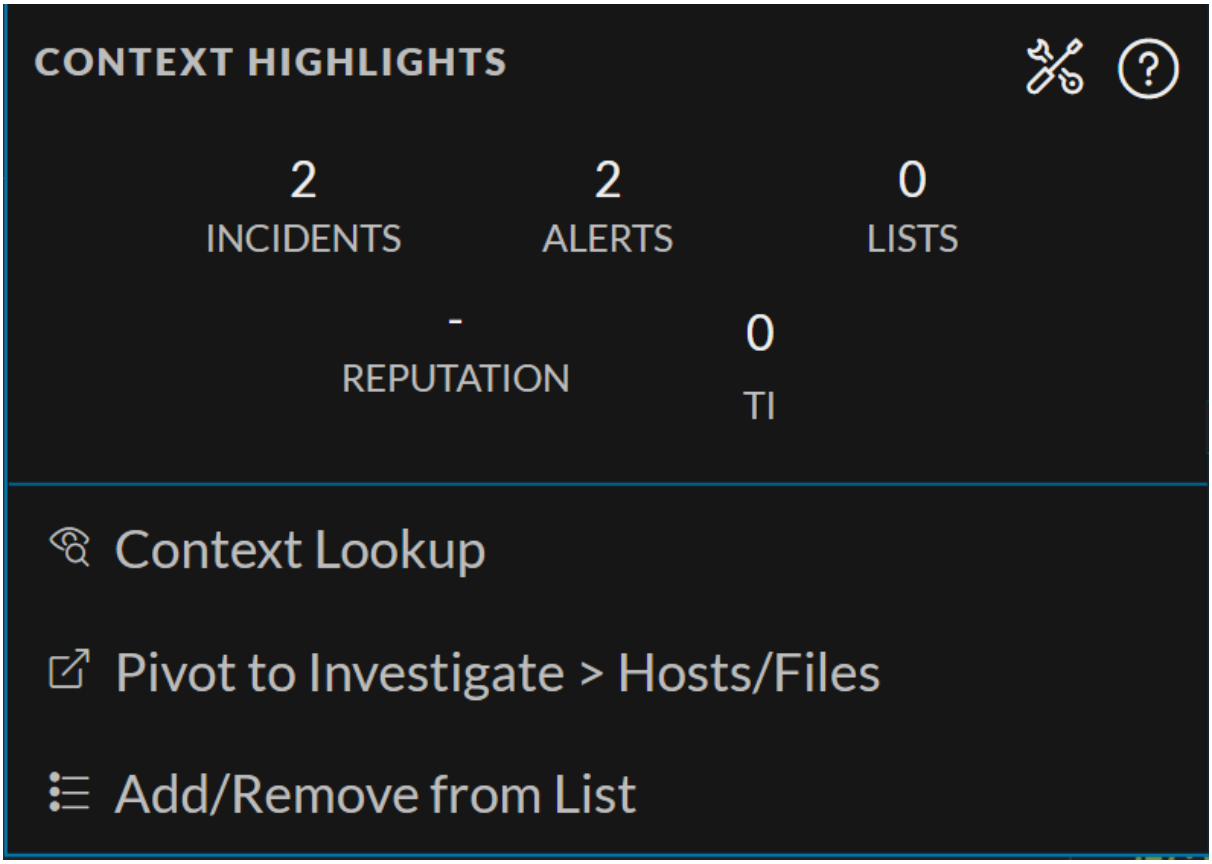
To analyze the hosts (which trigger Medium alerts) using the risk score:

1. Go to **Hosts**.

   The **Hosts** view is displayed.
2. In the Server drop-down list, select the Endpoint server or Endpoint Broker server to view the hosts.
3. Select the host and do any of the following.
   - Click a row to view the risk associated with the host in the **Risk Details** panel.
   - Click the hostname to investigate the host.

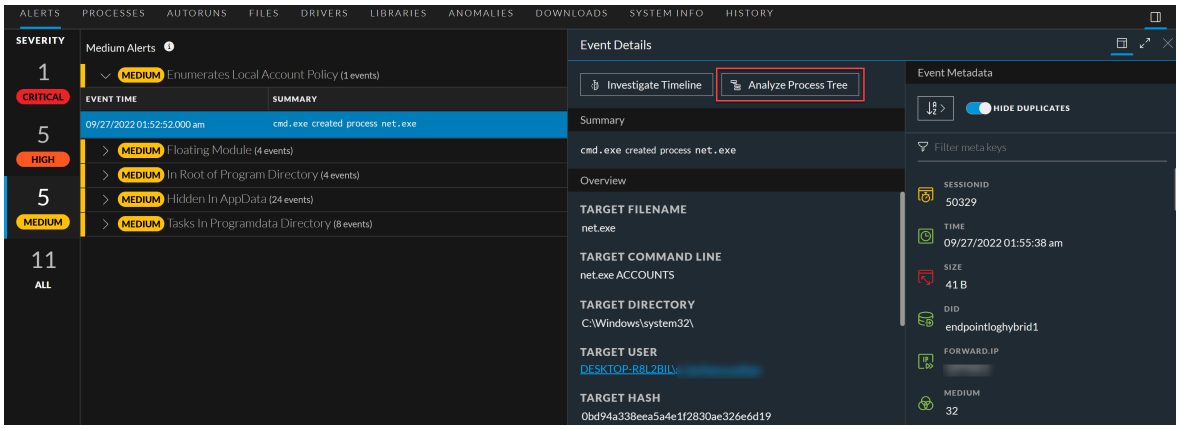
     The **Alerts** tab is displayed.
4. In the **Alerts** > **Severity** panel, click the **Medium** alert severity.

   The list of distinct alerts is displayed along with the total number of events associated with the alert.
5. Click an alert to view the associated events.



Note: For each alert, only the latest 1000 events are displayed.

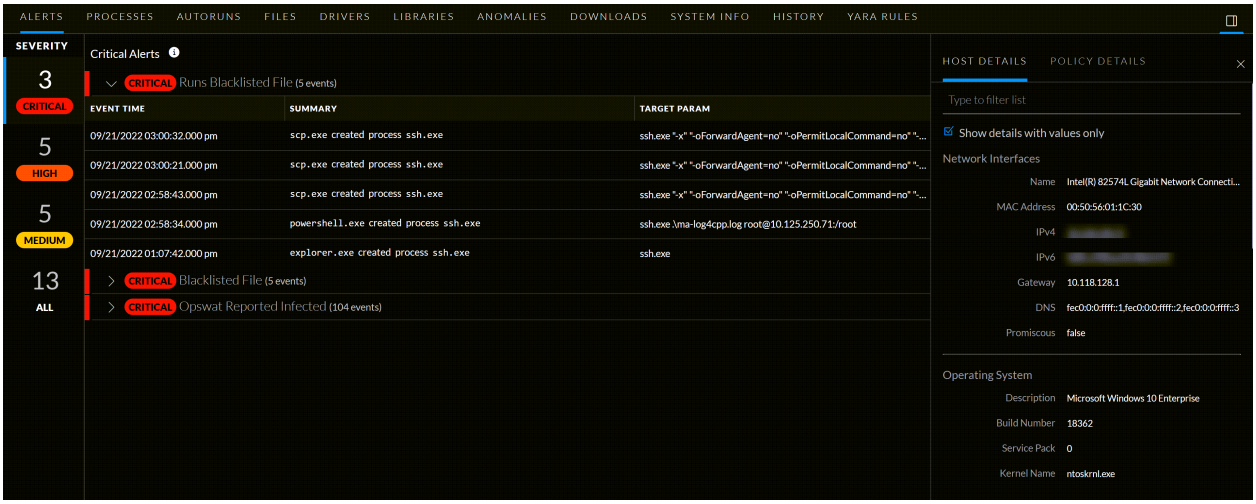
6. To view all the details associated with a specific event, click on an event. The **Event Details** panel is displayed with the summary and overview information associated with the event.



7. You can also view the Event Metadata such as IP, Filename, File hash, and Category in the **Event Details** panel.

8. Click the drop-down option besides the metadata value to view additional information about the specific metadata. The **Context Highlights** dialog displays a list of the data sources that have context data available for meta value. These are the possible data sources: NetWitness Endpoint, Incidents, Alerts, Hosts, Files, and Feeds.

9. To investigate the original event and destination domain of the event, do any of the following:
    - To investigate the events in a specific time frame, click **Investigate Timeline** on the **Event Details** panel. For more information, see the *NetWitness Investigate User Guide*.
    - To investigate a particular process, click **Analyze Process Tree** on the **Event Details** panel. For more information on process analysis, see Investigating a Process.



Analyze Host Details

To look for suspicious files on a host, click the host name and view the details of the host, or start an on-demand scan to get the most recent information. On the right-hand panel, you can view the following:

- **Host Details** displays the host information, such as Network interface, operating system, hardware and others.
- **Policy Details** displays the complete resolved policy settings.

For more details, see Hosts View - Details Tab.

Filter Host Details

In the Processes, Autoruns, Files, Drivers, Libraries, and Anomalies tabs, you can filter the processes or files on file status, reputation, file or process name, signature, and risk score. Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters panel on the left. To delete a filter, hover over the filter name and click 🗑.

In the **Host** view > **Files** tab, you can filter the files available on host, and files deleted from host. The result of files deleted from host depends on the data retention policy configured in the **Endpoint Config** view > **Data Retention Scheduler** tab. By default, data retention policy is configured for 30 days, this means only 30 days of deleted files are stored in the Endpoint server. These filter options are disabled if **All Files Available on Host** toggle is disabled.

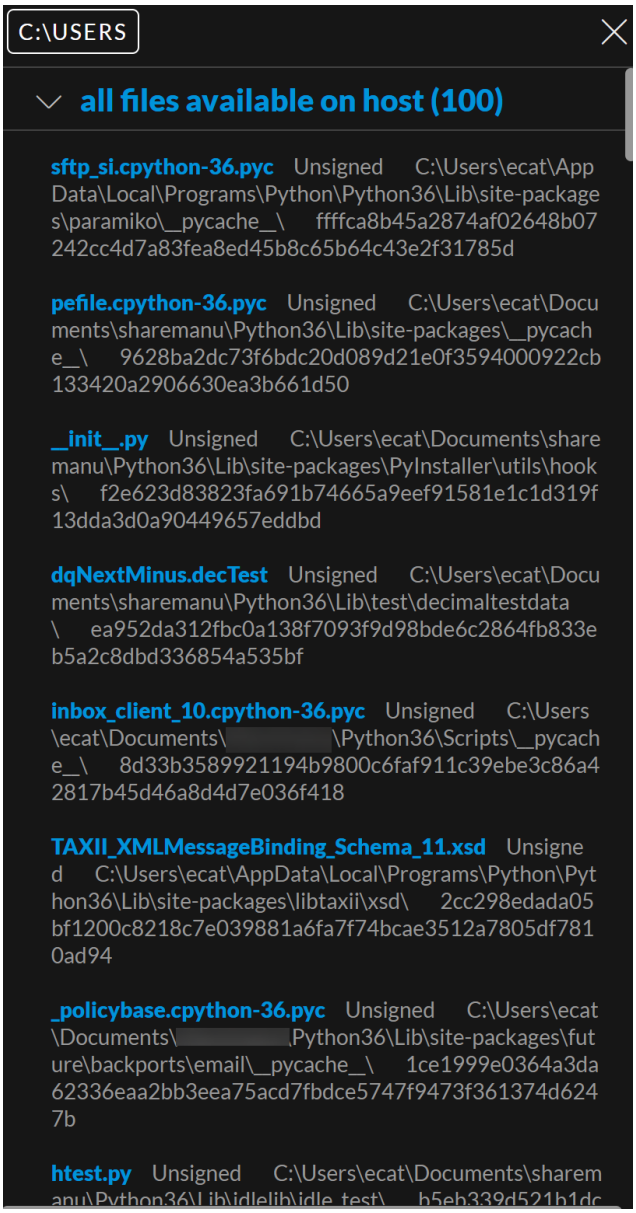
In the **Host** view > **History** tab, you can filter the commands on command type, status, host name, request type, command parameter and command time. In the Command Time field, you can filter by custom date range.

Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters).The filter is added to the **Saved Filters** panel on the left. To delete a filter, hover over the filter name and click 🗑.

Note: Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.

Search Files on Host

To investigate a host or to check if it is infected with a known malware, you can search for occurrences of the file name, file path, or SHA-256 checksum.



Note: To search for a SHA-256 checksum, provide the entire hash string in the search box.

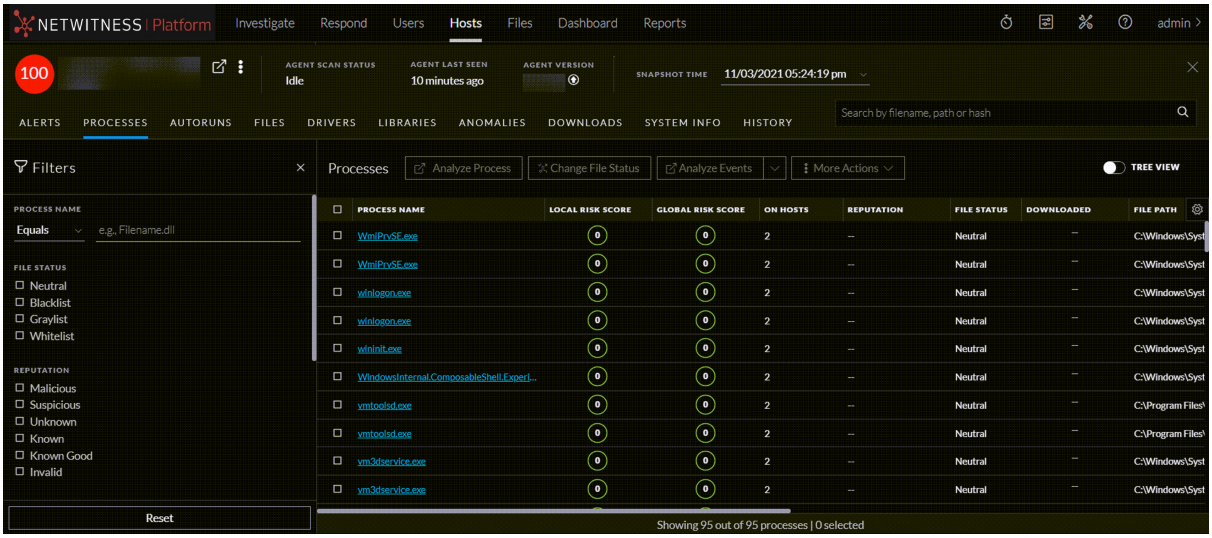
The result displays the matching files present on the host in **All Files Available on Host** category and in the respective **snapshot** category with the details, such as file name, signature information,and checksum. In addition, the **snapshot** category displays the system interaction, for example, ran as process, library, autorun, service, task, or driver. To view more details, click the **filename** or **system interaction** link.

Example, a user has clicked and executed a malicious attachment through a phishing email, and downloaded it to `C:\Users`. To investigate this file:

1. Go to **Hosts**.
2. Select the host that you want to investigate or select the Endpoint Broker server to investigate all the hosts.
3. In the **Alerts** tab, enter the file path `C:\Users` in the search box.

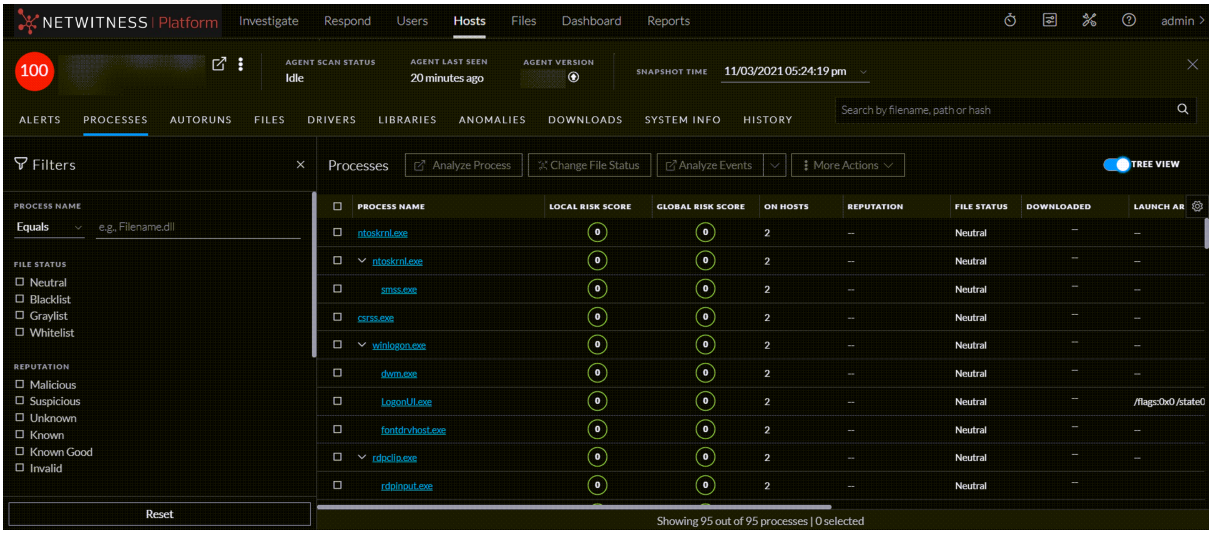
   The search displays a maximum of 100 results of the executables in this folder. In this example, there are some unsigned file that might be malicious. If the search is executed on an Endpoint Broker server, it queries all the Endpoint servers.

This file is run as a Process.



4. To view details of this file, click **Process** in the result.

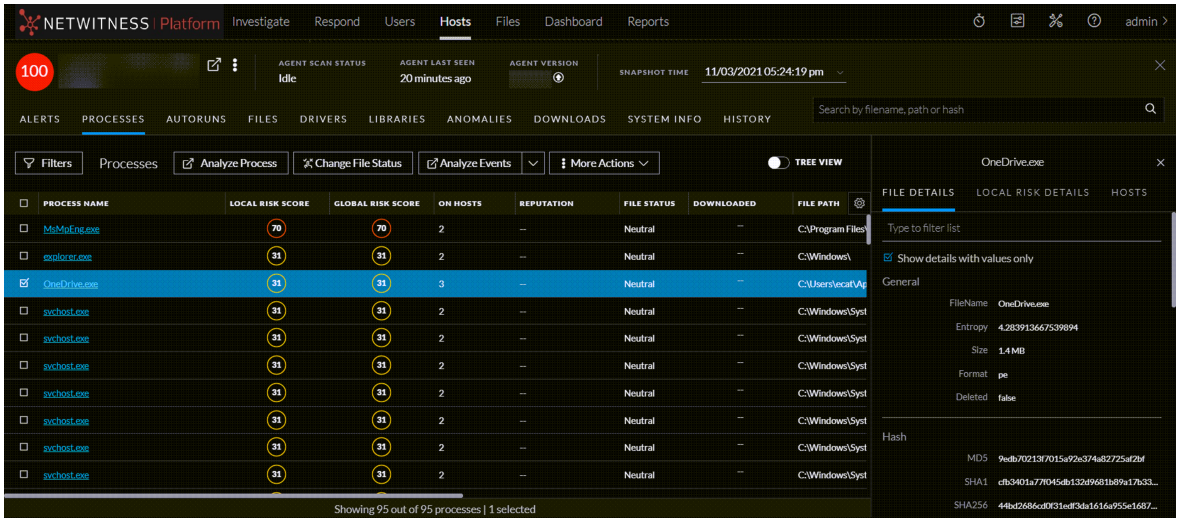
   This opens the **Process** tab where you can view the process details.



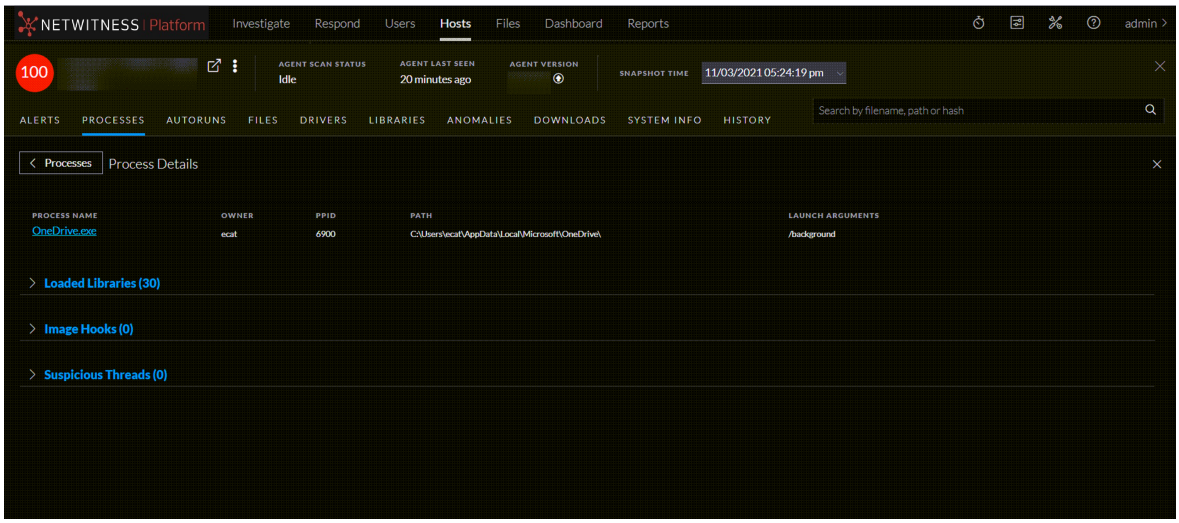
Analyze Processes

To analyze the process:

1. In the **Hosts** details, select the **Processes** tab.



To view the process tree, click the toggle switch. The following is an example of the tree view:



2. In the **Processes** Tab, do one of the following:

- Click a row to view the properties of a process in the right panel.

- Click the process name to view the process details of a specific process.

When reviewing processes, it is important to see the launch arguments. Even legitimate files can be used for malicious purposes, so it is important to view all of them to determine if there is any malicious activity.

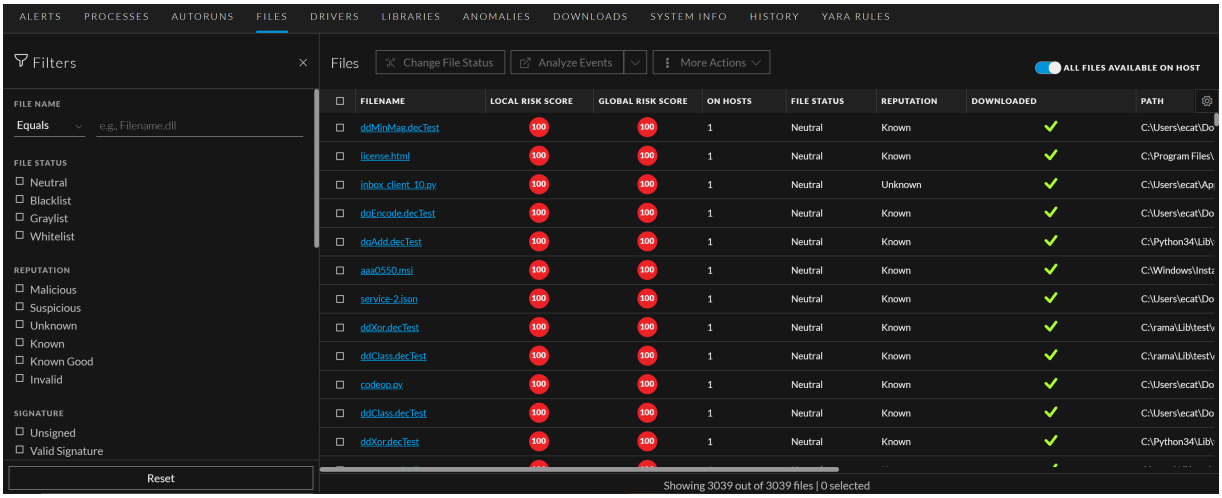
For example,

- `rundll32.exe` is a legitimate Windows executable that is categorized as a good file. However, an adversary may use this executable to load a malicious DLL. Therefore, when viewing processes, you must view the arguments of the `rundll32.exe` file.
- `LSASS.EXE` is a child to `WININIT.EXE`. It should not have child processes. Often malware use this executable to dump passwords or mimic to hide on a system (`lass.exe`, `lssass.exe`, `lsasss.exe`, and so on).
- Most legitimate user applications like Adobe and Web browsers do not spawn child processes like `cmd.exe`. If you encounter this, investigate the processes.

You can view the sequence of activities performed on the host by the file or process using the process analysis. For more information, see Investigating a Process.

Analyze Autoruns

In the Hosts details, select the **Autoruns** tab. You can view the autoruns, services, tasks, and cron jobs that are running for the selected host.



For example, in the Services tab, you can look for the file creation time. The compile time is found within each portable executable (PE) file in the PE header. The time stamp is rarely tampered with, even though an adversary can easily change it before deploying to a victim's endpoint. This time stamp can indicate if a new file is introduced. You can compare the time stamp of the file against the created time on the system to find the difference. If a file was compiled a few days ago, but the time stamp of this file on the system shows that it was created a few years ago, it indicates that the file is tampered.

Note: The Endpoint Broker queries the Hosts present across multiple Endpoint Servers for each Autorun and displays the total count of the hosts for the respective Autoruns in the **On Hosts** column in the **Hosts** > **Autoruns** Broker view.
For Example:
If an Autorun is running on 2 different hosts present across multiple Endpoint Servers, the **On Hosts** count of the Autorun is displayed as 2 in the **Hosts** > **Autoruns** Broker view.

Analyze Files

To analyze the files, you can do either one of the following based on your requirement.

- In the **Hosts** view, select the **Files** tab.
  You can view the list of all files (reported as part of scan and tracking) on the host including the deleted files.

- To view the files reported as part of scan snapshot, you must disable **All Files Available On Host** toggle and select the scan time from the **Snapshot** drop-down list.

Example for analyze files, many trojans write random filenames when dropping their payloads to prevent an easy search across the endpoints in the network based on the filename. If a file is named `svch0st.exe`, `scvhost.exe`, or `svchosts.exe`, it indicates that the legitimate Windows file named `svchost.exe` is being mimicked.

Analyze Libraries

In the Hosts details, select the **Libraries** tab. You can view the list of libraries loaded at the time of scan.

For example, a file with high entropy gets flagged as packed. A packed file means that it is compressed to reduce its size (or to obfuscate malicious strings and configuration information).

Analyze Drivers

In the Hosts details, select the **Drivers** tab. You can view the list of drivers running on the host at the time of scan.

For example, using this panel, you can check if the file is signed or unsigned. A file that is signed by a trusted vendor such as Microsoft and Apple, with the term `valid`, indicates that it is a good file.

Analyze Anomalies

Note: This tab is available only for advanced agent.

In the Hosts details, select the **Anomalies** tab. You can view the following details for the selected host:

- Image hooks - Hooks found in executable images (user-mode or kernel-mode) - IAT, EAT, Inline, exceptionHandler.
- Kernel hooks - Hooks found on kernel objects (such as Driver Object [Pointers, IRP_MJ, SSDT, IDT, and so on]). This also includes filter devices.
- Suspicious threads - Threads whose starting address points to memory DLLs or floating code. The threads could be running with either user-mode or kernel-mode privileges. These threads could run malicious code inside a trusted application to execute their own code.
- Registry discrepancies - The Windows registry is a hierarchical database that stores configuration settings and options on Microsoft Windows operating systems. It contains settings for low-level operating system components and for applications running on the platform: the kernel, device drivers, services, SAM, user interface, and third party applications all use the registry. The discrepancies between low-level parsing with Win32 registry API are reported.

Note: Anomalies is applicable only for Windows hosts.

For example, hooking is used to intercept calls in a running application and to capture information related to the API invocations. Malicious programs can implant hooks in various system applications for different purposes, such as hiding files, directories, registry entries, intercepting users keystrokes to establish a stealthy communication channel with the attacker.

Analyze System Information

In the Hosts details, select the **System Information** tab. This panel lists the agent system information. For Windows operating system, the panel displays the host file entries and network shares of that host.

For example, malware might use host file entries to block antivirus updates.

Analyze History

In the Host details, select the **History** tab. This tab lists the commands along with the respective status and additional details.

When you review the history, look for the command status and retrieval count to check if the agent retrieved the commands.

Below are some examples:

- A file download command is issued, but the file is deleted on the host. In this case status of the command is failed as the file is not downloaded.
- The retrieval count increases, but the command is not processed. This happens when an analyst requests a large number of files (For example, MFT, system dump, or process dump), and the connection breaks when the agent uploads these files.
- If the agent command is not retrieved, the agent is either offline or busy processing other commands (For example, uploading a system dump). In this case, the status of the command shows pending.

To view more details, click the **Hostname** link highlighted in blue. The Hosts details view is displayed. In the case of MFT, download file, system dump, and process dump command types, **Downloads** tab is displayed with details such as file name, type, status, size, downloaded time and SHA256 of the file, when you click on the **Hostname** link.

Export Host Details or Files to JSON File

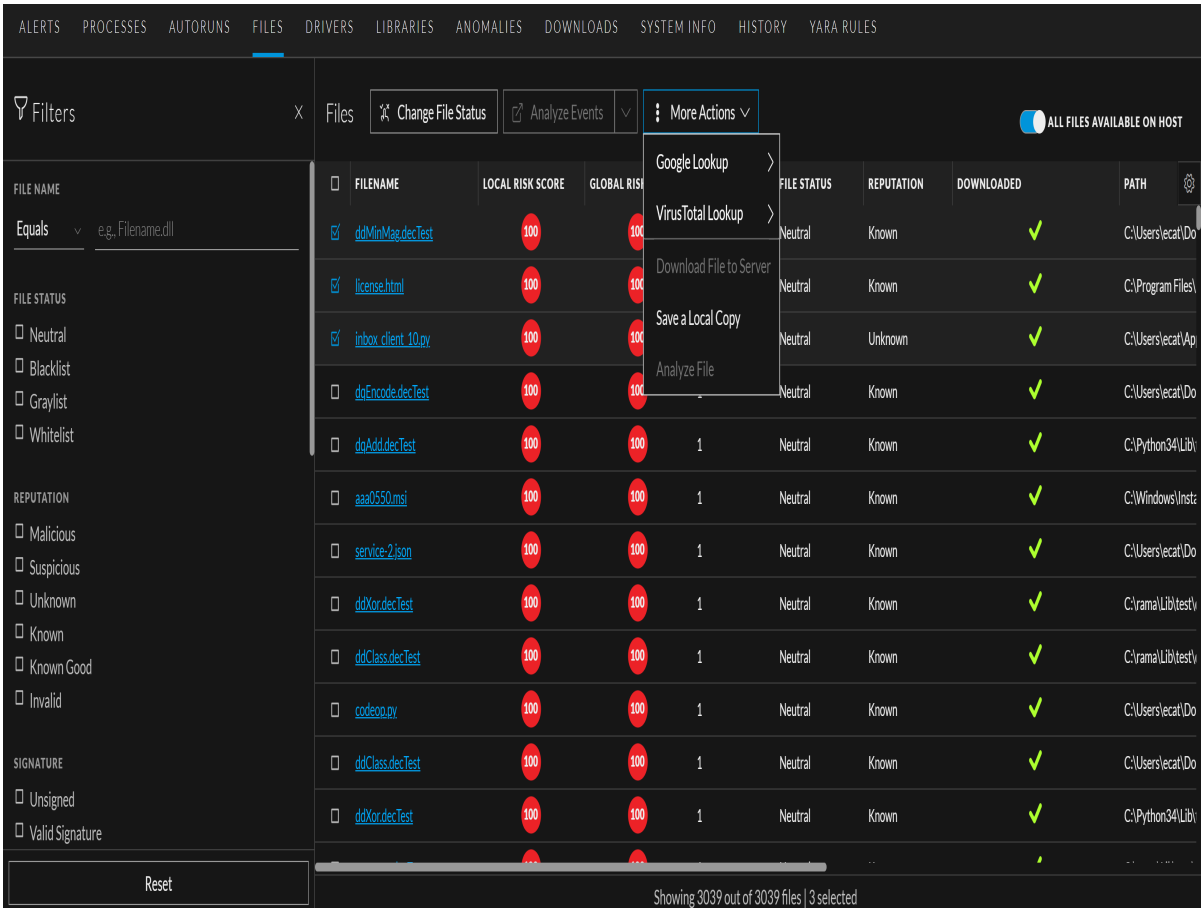
Note: Export Host details option is disabled if there is no snapshot time.

To export host details or files to JSON file:

1. Go to **Hosts**.
2. Select the hostname to open the host details.
3. Click  (**More**) beside the hostname and do any of the following:
   - To export the scan data categories for the host, select **Export Host Details**. This exports files such as:
     - allfiles.json - This file consists of the file name, file path, signature, file checksum, and so on that is reported as part of scan and tracking.
     - fileContext.json - This file consists of the file name, file path, signature, file checksum, and so on that is reported during the host scan.

- machinedetails.json - This file consists of the machine details, including hardware, operating system, interfaces, and so on, along with the agent details like version, policy details.

Note: If Endpoint Broker is selected and a host is communicated with multiple Endpoint servers, during the host details export, all files and details of the host are exported from the Endpoint server where the selected snapshot is stored.



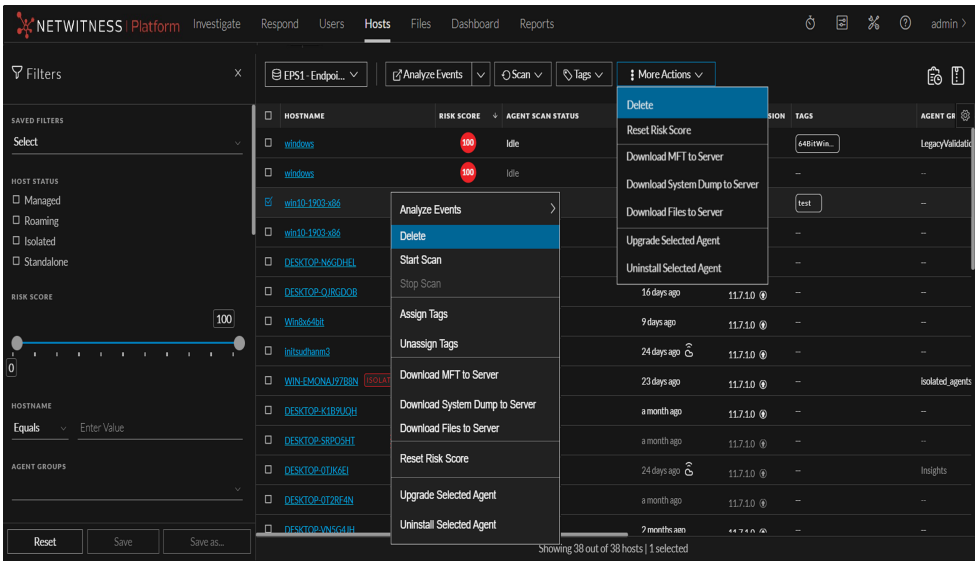
Note: allfiles.json file is exported irrespective of the selected snapshot.

- To export all the files available on the host, select **Export Files**. This exports:
  - allfiles.json - This file consists of the file name, file path, signature, file checksum, and so on that is reported as part of scan and tracking.

Launch an External Lookup for a File

While analyzing a file, you can search Google or VirusTotal with the filename or hash to get more information about the file. To launch the search:

1. Go to **Hosts** > **Host Details** (Autorun, Files, Drivers, Libraries, or Anomalies tab).
2. Right-click one or more files, or in the **More Actions** drop-down list in the toolbar, do the following:



- Select **Google Lookup** to perform a search on the filename, MD5, SHA1, or SHA256.
- Select **VirusTotal Lookup** to perform a search on MD5, SHA1, or SHA256.

Note: To open files in multiple tabs, make sure you enable the pops-up in the browser.

Delete a Host

If the agent is uninstalled on a host or if you no longer require the host scan data, you can manually delete this host from the Hosts view. Deleting a host deletes all scan data associated with the host. To delete hosts:

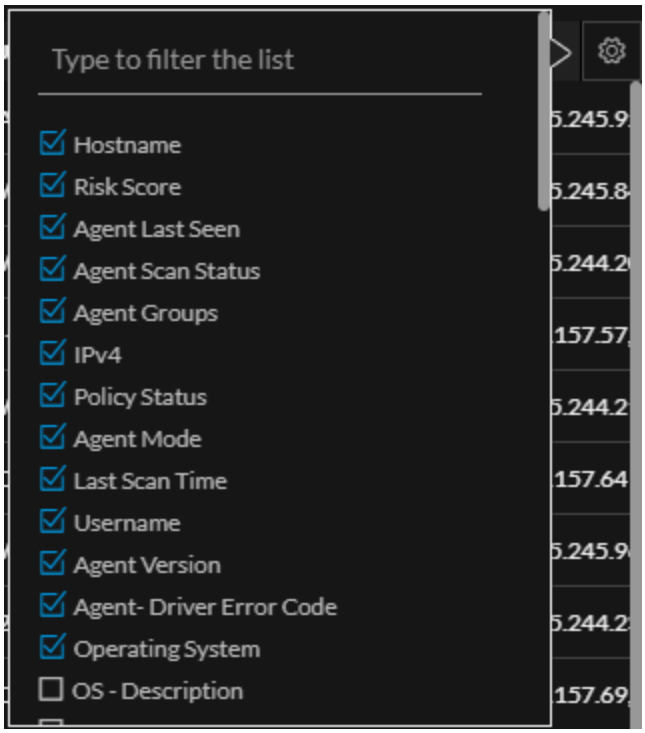
1. Go to **Hosts**.
2. Select the hosts that you want to delete from the Hosts view and do one of the following:

- Right-click and select **Delete** from the context menu.
- Click **More** drop-down list in the toolbar and select **Delete**.

Note: If you accidentally delete a host from the Hosts view, the Endpoint Server forbids all requests from this agent. The agent must be uninstalled manually from the host and reinstalled for it to appear on the Hosts view.

Deleting Hosts with Older Agent Versions

After upgrading the 11.1.x and 11.2.x agents to 11.3 or later, if you want to delete the hosts with older versions:



1. Go to **Hosts** view.
2. Filter the hosts based on the Agent version, and delete these hosts.

If you do not delete, the hosts are deleted based on the Data Retention Policy settings.

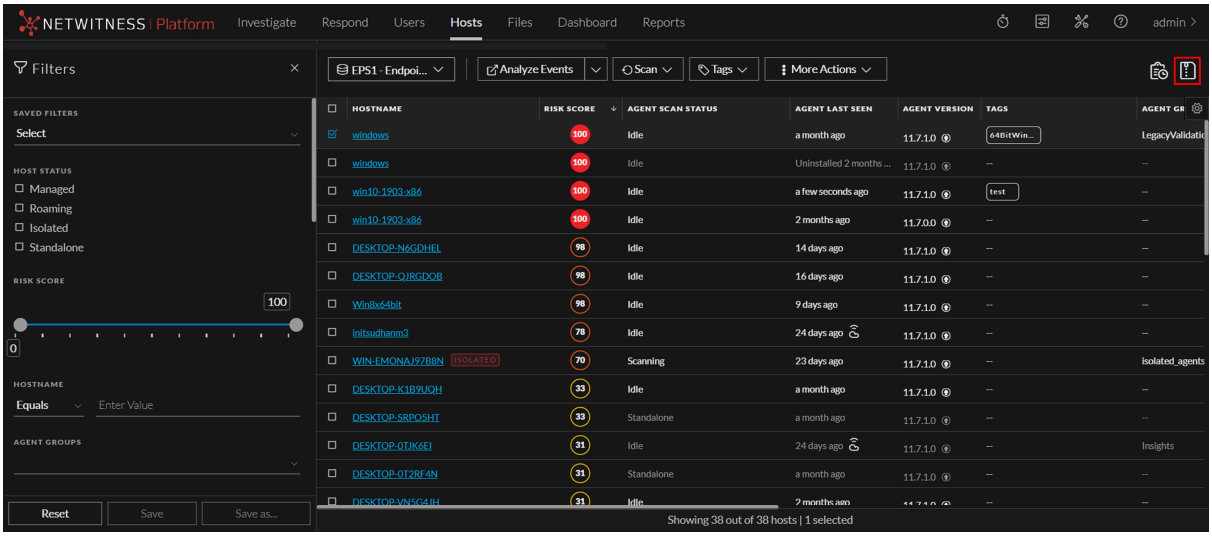
Set Hosts Preference

By default, the Hosts view displays a few columns and the hosts are sorted based on the risk score. If you want to view specific columns and sort data on a specific field:

1. Go to **Hosts**.
2. Select the columns by clicking in the right-hand corner. The following example shows the drop-down list displayed while adding columns:

3. Scroll down or enter the keyword to search for the column in the displayed list.
4. Sort the data on the required column.

Note: The selections you make here become your default view every time you log in to the Hosts view.



Export Host Attributes

You can export up to 100,000 host attributes at a time. To extract the host attributes to a csv file:

1. Go to **Hosts**.
2. Filter the hosts by selecting the required filter options.

3. Add columns by clicking in the right-hand corner.

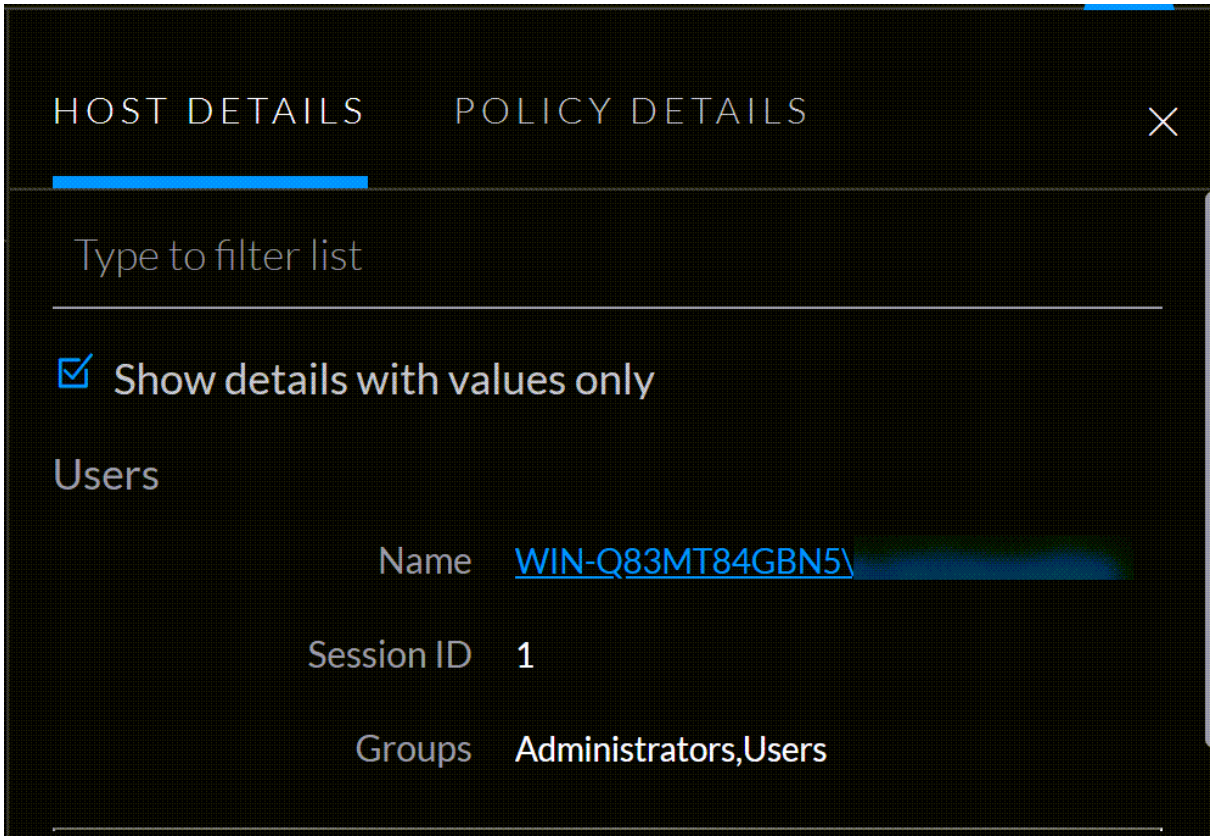
4. Click to export the host attributes to a csv file.

You can either save or open the csv file.

Migrate Hosts

Hosts can be migrated from one Endpoint server to another using groups and policy associated with the host. If a host is migrated, the Server column shows as **Migrated**. On all the tabs within the Hosts view, the message Host is migrated to <Server-name> is displayed. You view the host details by clicking the <Server-name>. The risk score of a migrated host is displayed on all Endpoint servers where it is present.

Note: Some of the actions are disabled for the migrated host on the selected server, such as start scan, start stop, analyze events, and others. If you want to perform the required action, select the Endpoint server to which the host is migrated.



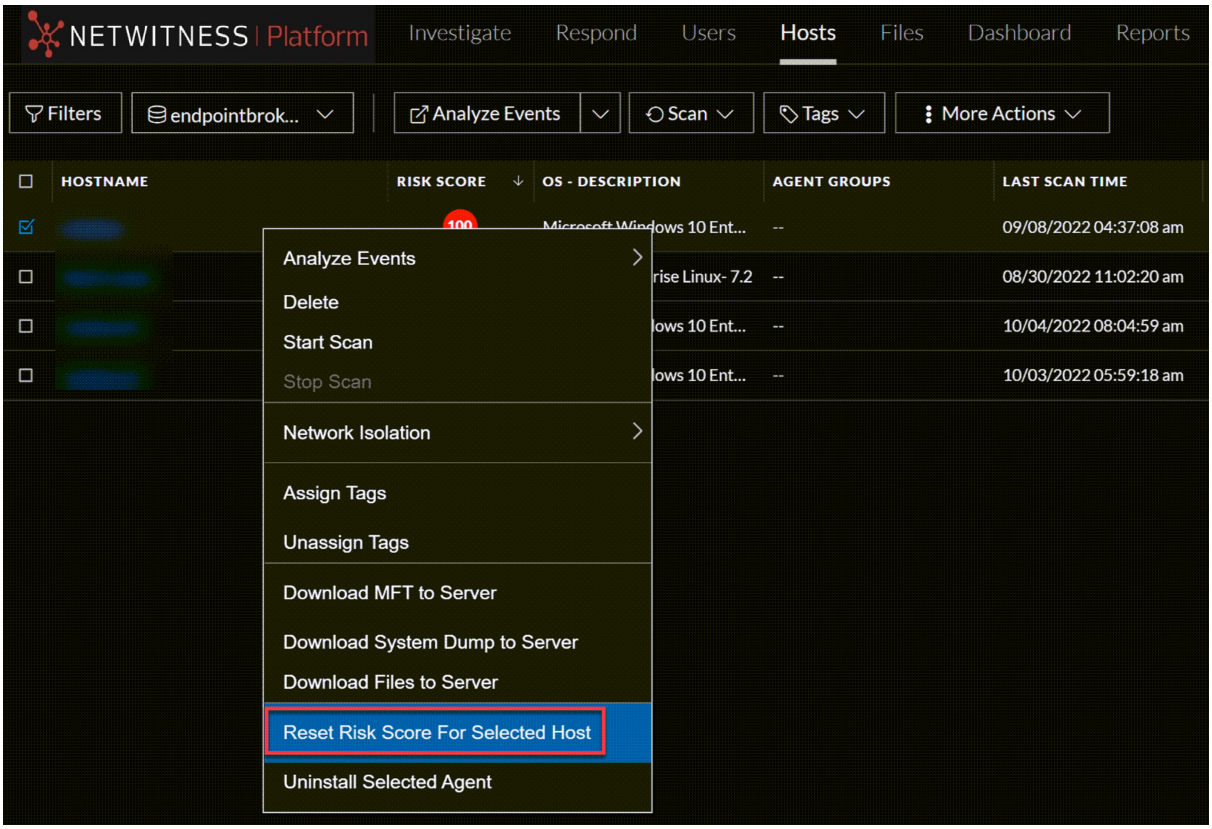
Note: To view only managed hosts, select the **Show Only Managed Agents** option in the Filters panel.

Analyzing Risky Users

If you have NetWitness UEBA installed, you can view the alerts associated with users logged in on the host. To analyze risky users:

1. Go to **Hosts**.
2. Click the host name you want to analyze.
3. In the **Host Details** panel, under the **Users** category, click the name.

This opens the **Entities** tab for investigation in a new tab.



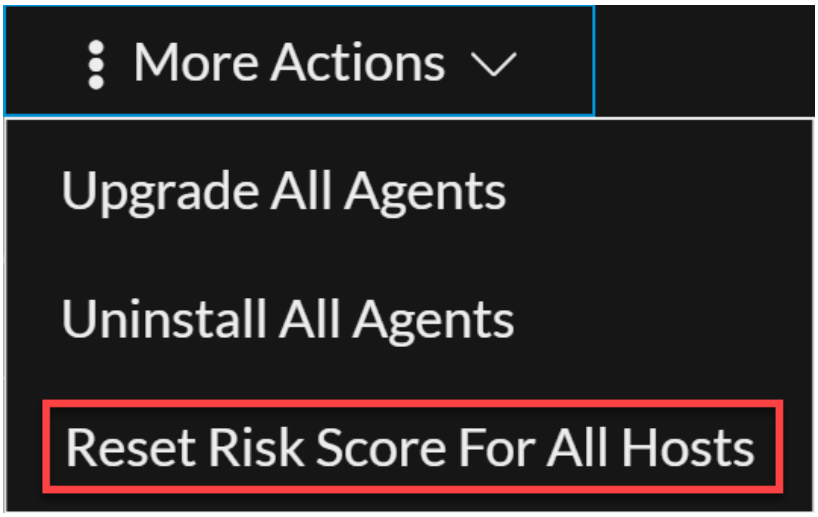
Resetting Risk Score of Hosts

You can reset the risk score for a host in these situations:

- If the alerts or events triggered by the host or files on the host are false positive, you can make changes to the Endpoint Application rules or ESA rules.
- After you take required action on the host for malicious file activities contributing to the risk score. When you reset the risk score, all the risk calculation for the host is deleted. When you reset the host's risk score, it does not change the file's risk score. You can reset the score for a single host or multiple hosts.

To reset the risk score of the selected host:

1. Go to **Hosts**.
2. Select the Endpoint Server or Endpoint Broker.
3. Select one or more hosts and do one of the following:



- Right-click and select **Reset Risk Score For Selected Host** from the context menu.
- Click **More Actions** > **Reset Risk Score For Selected Host** in the toolbar.

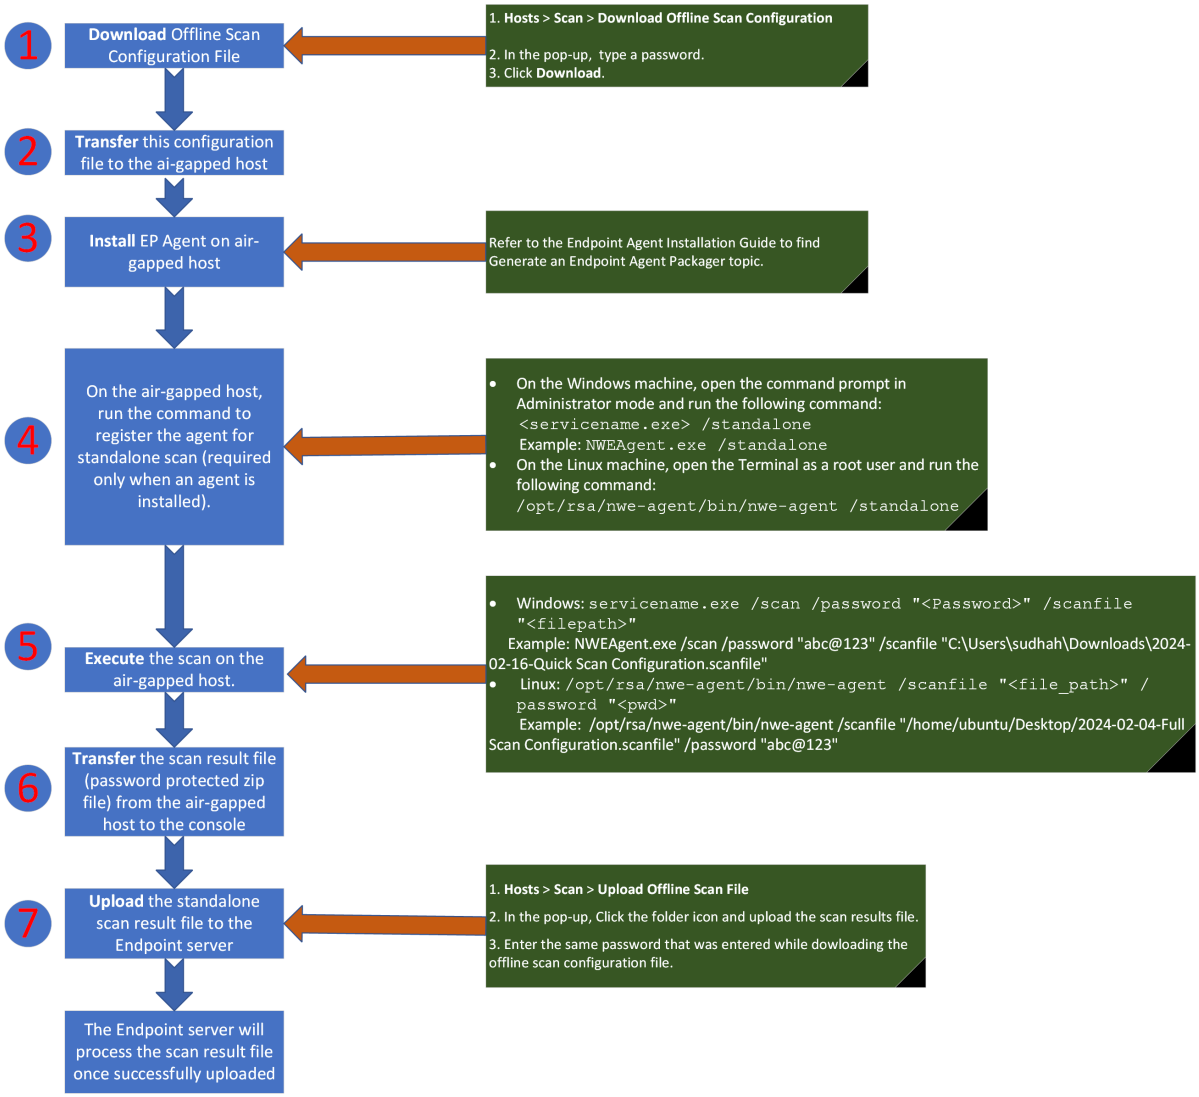
All the alerts associated with the score are deleted.

4. Refresh the page to view and confirm if the host's score is reset. This may take sometime for changes to take effect.

To reset the risk score of all the available hosts simultaneously:

1. Go to **Hosts**.
2. Click **More Actions** > **Reset Risk Score For All Hosts** in the toolbar.

All the alerts associated with the score are deleted.

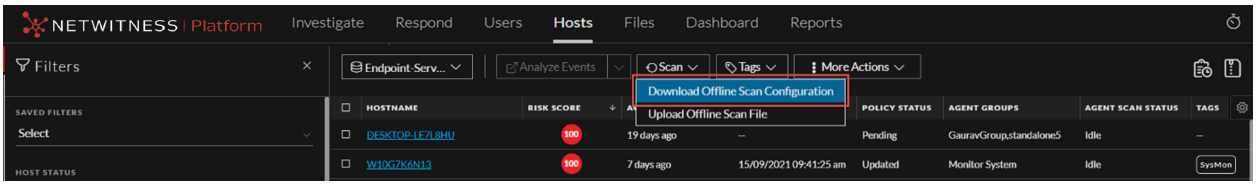


Standalone Scan on Air-gapped Windows and Linux Hosts

The Standalone scan feature allows administrators to run scans on the air-gapped Windows and Linux hosts that are disconnected from the network. Administrators can download the scan command once from UI and execute it on multiple hosts. For the best utilization of resources, NetWitness recommends running standalone scan every two weeks. Policies do not apply on air-gapped hosts, and features such as downloading MFT to the server, upgrading agents through UI, downloading a file to the server are not available for standalone agents.

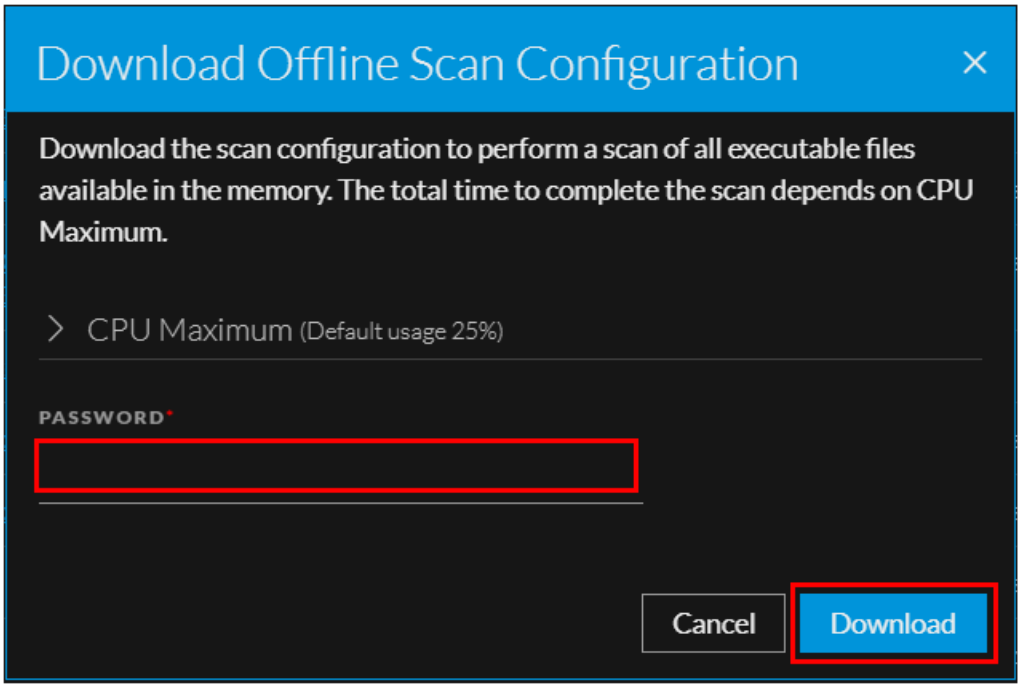
The scan process involves two files:

- **Offline Scan Configuration** - Contains the configuration information needed to run the scan.
- **Scan Results File** - This contains the results of the Scan, which you can upload using the **Scan > Upload Offline Scan File** option on the **Hosts** view. This file will be imported and processed by NetWitness.



Standalone scan workflow:

Note: Both Download Offline Scan Configuration and Upload Offline Scan File options are available only on the Endpoint server view. These options can't be accessed from Broker view.



Generate the scan configuration file

1. Click **Scan > Download Offline Scan Configuration** on the Hosts screen.

On the Download Offline Scan Configuration pop-up,

2. (Optional) **Select CPU Maximum**.
3. Enter a Password. (not more than 31 characters long)
4. Click **Download**.

5. Transfer the Offline Scan Configuration file to the air-gapped host.

Install Endpoint Agent and Register for Standalone Scan

1. Install the Endpoint Agent on the air-gapped host. Refer to *Endpoint Agent Installation Guide* for more information.
2. Register the agent for standalone scan (required only when an agent is installed).
   - If you are using a Windows machine, open command prompt in administrator mode and execute the following command:

     `ServiceName.exe /standalone`

     Example: `NWEAgent.exe /standalone`
   - If you are using a Linux machine, open the terminal as a root user and execute the following

command:

```
/opt/rsa/nwe-agent/bin/nwe-agent /standalone
```

Start a Standalone scan on Windows

1. Open the command prompt in Administrator mode, on the air-gapped host.
2. Execute the scan using the following command (syntax):

```
ServiceName.exe /scan /password ”<password>” /scanfile "<filepath>”
```

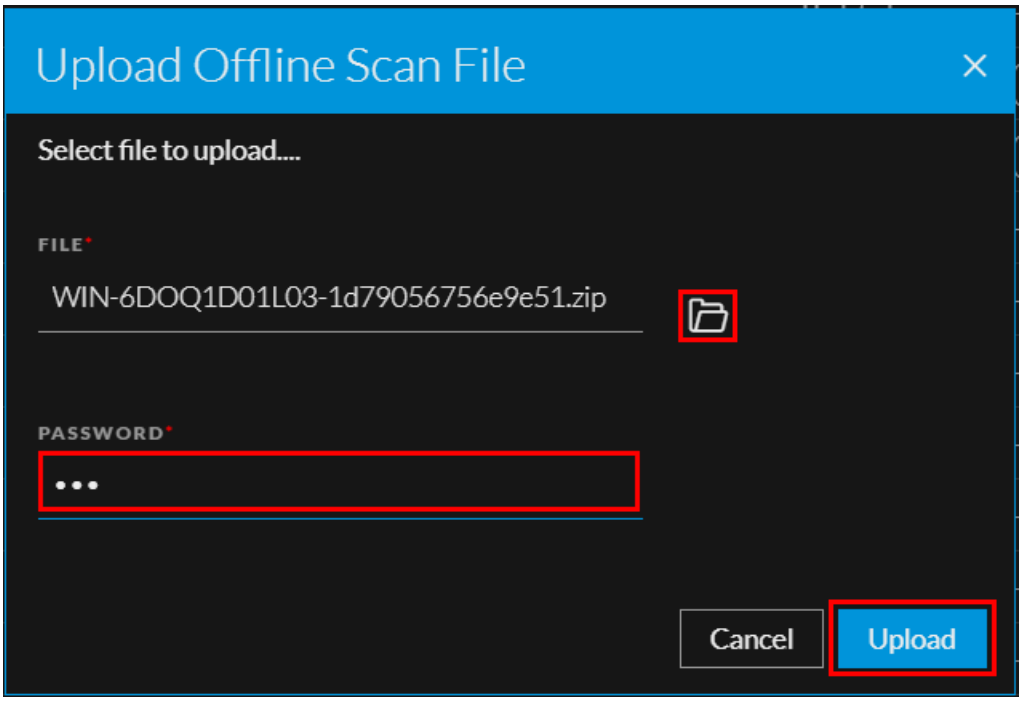
Example: `NWEAgent.exe /scan /password "Abc123$" /scanfile "C:\Users\johndoe\Downloads\2021-12-06-Full Scan Configuration.scanfile"`

- `<password>` is the password entered while generating the Offline Scan Configuration File.
- `<filepath>` is name of the scan configuration file with full path.

3. Wait until the scan is completed.
4. Transfer the scan result file (password protected .zip file) to upload to the UI.

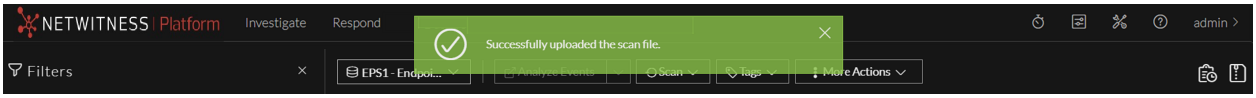
Start a Standalone scan on Linux

1. Open the terminal as a root user, on the air-gapped host.
2. Execute the scan using the following command (syntax):



```
/opt/rsa/nwe-agent/bin/nwe-agent /scanfile "<file_path>" /password "<pwd>"
```

Example: `/opt/rsa/nwe-agent/bin/nwe-agent /scanfile "/home/ubuntu/Desktop/2024-02-04-Full Scan Configuration.scanfile" /password "abc@123"`



3. Wait until the scan is completed.
4. Transfer the scan result file (password protected .zip file) to upload to the UI.

Upload the Standalone scan result file

1. Click **Scan > Upload Offline Scan File** on the Hosts screen.

2. Click  and upload the scan result file.
3. Enter the same password that was entered while downloading the offline scan configuration file.
4. The Endpoint server will process the scan result file once successfully uploaded.

Note: Standalone agents can only be upgraded manually using the Endpoint agent packager. Refer to *Generate an Endpoint Agent Packager* on *Endpoint Agent Installation Guide* for more information.

Investigating a Process

Note: The information in this topic applies to NetWitness Version 11.3 and later.

Analysts can perform process analysis to investigate a particular process behavior to:

- Understand the entire process event chain, process parent-child relationships, and all associated events in a timeline view.
- Analyze important process attributes, such as username, launch arguments, reputation, file status, signer, signature, risk score, and file path.

The Analyze Process view provides a list of processes captured on hosts in a parent-child hierarchical format over a time range. The process tree is created from the tracking event type "Process event" where the action meta key is `createProcess`. The agent reports new events for the same createProcess if the following parameters change:

- Parent process filename
- Child process filename
- Launch arguments
- User name

If the above parameters do not change, the event is reported only once every eight hours.

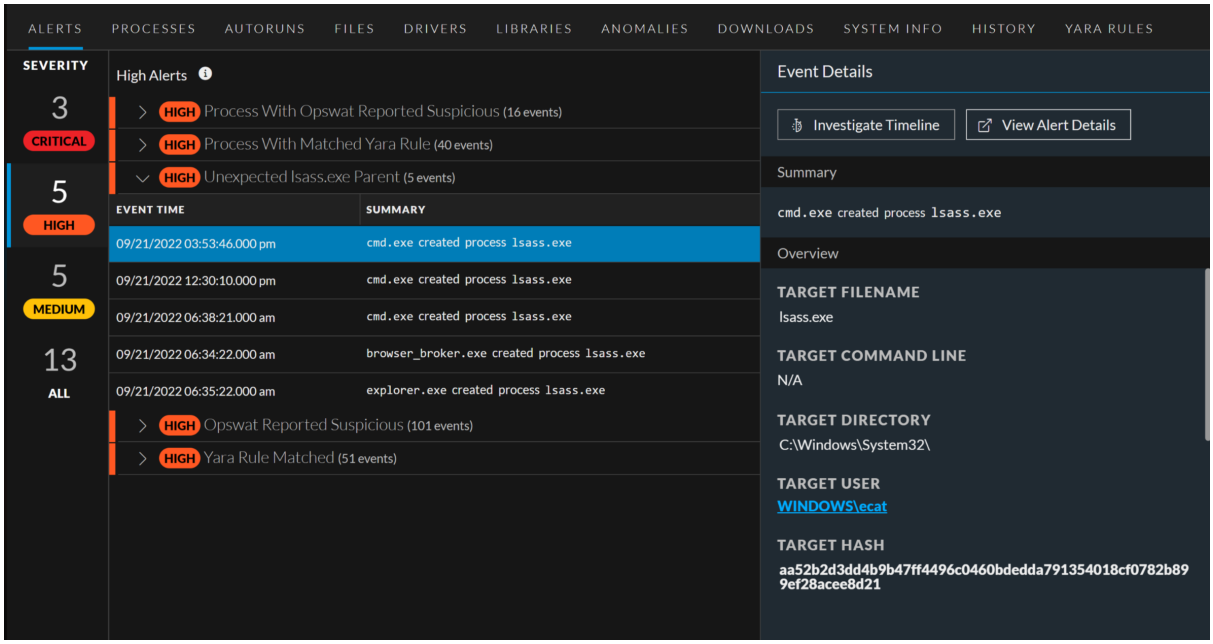
Best Practices

When reviewing a host for malicious activity, there are a few key things to review while looking for malicious processes.

- Process Name - When reviewing running processes on a host, check for the name of the program that looks suspicious. Sometimes malware uses random names, such as `wzuduje.exe`. In some cases, the names might be misleading such as `adob3.exe`, `scvhost.exe`, or `Microsoft.exe`. Being familiar with Windows processes and any type of internal tool that might be used throughout the environment, also helps you to identify potentially malicious or suspicious files.
- File Path - Similar to knowing normal and key Windows processes, knowing what path the processes originate from is a key to detect certain processes that imitate the legitimate process. For instance, if you see `svchost.exe` running on a system from `C:\Users\<username>\AppData\Roaming\adobe\` (which is a valid file path), and knowing that the legitimate Windows process originates from `C:\Windows\System32\`, you can determine that the `svchost.exe` file starting from the `C:\Users\<username>\AppData\Roaming\adobe\` directory is the suspicious one. To help determine further identification of a suspicious process, review the Autoruns tab to see if this process is running as an autorun, service, or task.
- File Signature - When a software package is created, it has a valid digital signature. The following are a few exceptions:
  - If a process that is running is not digitally signed, it does not automatically confirm that the file is malicious.

  - While files may have a valid signature, it does not mean that they are legitimate. There are instances of software identified as a Potentially Unwanted Program (PUP) or Adware, which can have a valid signing certificate.
- On Hosts - Indicates the number of hosts on which a file exist. If a file is present on fewer hosts with a high risk score, it may be malicious and needs further investigation.
- Reputation - Leveraging the reputation service is a way to find malicious processes.
- Analyze events - For further insight to a process, you can analyze console events, network events, file events, process events, and registry events.
  - Network events - Look for any suspicious domains to which the process is connecting. Sometimes malware creates legitimate connections to a known site, such as google.com, bing.com to hide its activity on the network. Look for connections to Dynamic DNS domains where a lot of known malicious activity resides. During analysis, consider uncommon processes making direct connections to an IP address or to a uncommon port number.
  - File and process events - Review process interactions that have occurred on the system with the suspected file. You can look for key events such as `writeToExecutable`, `renameExecutable`, and `createRemoteThread`, which indicate suspicious behavior.
- Leverage other methods
  - Look up with Google - You can search the file name or hash value against Google to determine if the file is malicious.
  - Look up with VirusTotal – You can search the hash value against the VirusTotal to determine if the file is malicious between multiple AV vendors.
  - Download file – Download and analyze a file to find indicators such as compile time, imported DLLs, section names, and performing string searches. Look for TLD values (.com, .net, .biz) or debug information of a compiled binary (.pdb), which can be easily changed or forged.
  - Time stamp values – Review modified, accessed, and created dates associated with the binary. Review how long a file has been residing on a host. While this value is correct most of the time, attackers can change the time stamp values of a file.

Analyze a Process

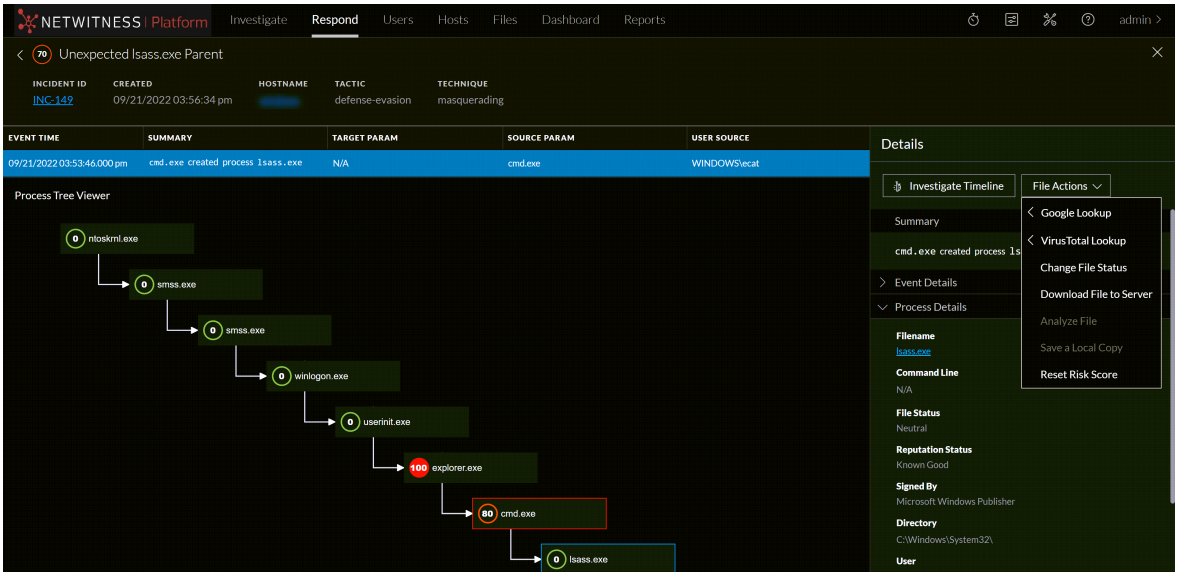


Based on the Alert severity, you can analyze the processes using two different options:

- **View Alert Details**: This option allows you to analyze the processes associated with **Critical** and **High** Alerts.
- **Analyze Process Tree**: This option allows you to analyze the processes associated with **Medium** Alerts.

To analyze the process associated with Critical and High Alerts:

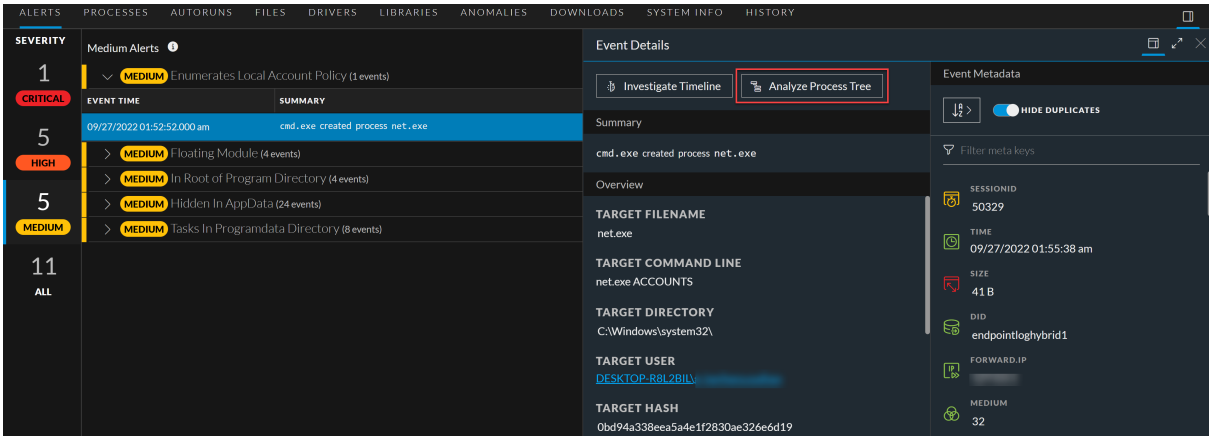
1. Go to **Hosts** and click on a host.
2. Click on an event associated with the **Critical** or **High** alert on the Host Details view. The **Event Details** panel appears.



3. Click **View Alert Details** to analyze the process activities of a file associated with the **Critical** or **High** Alerts.

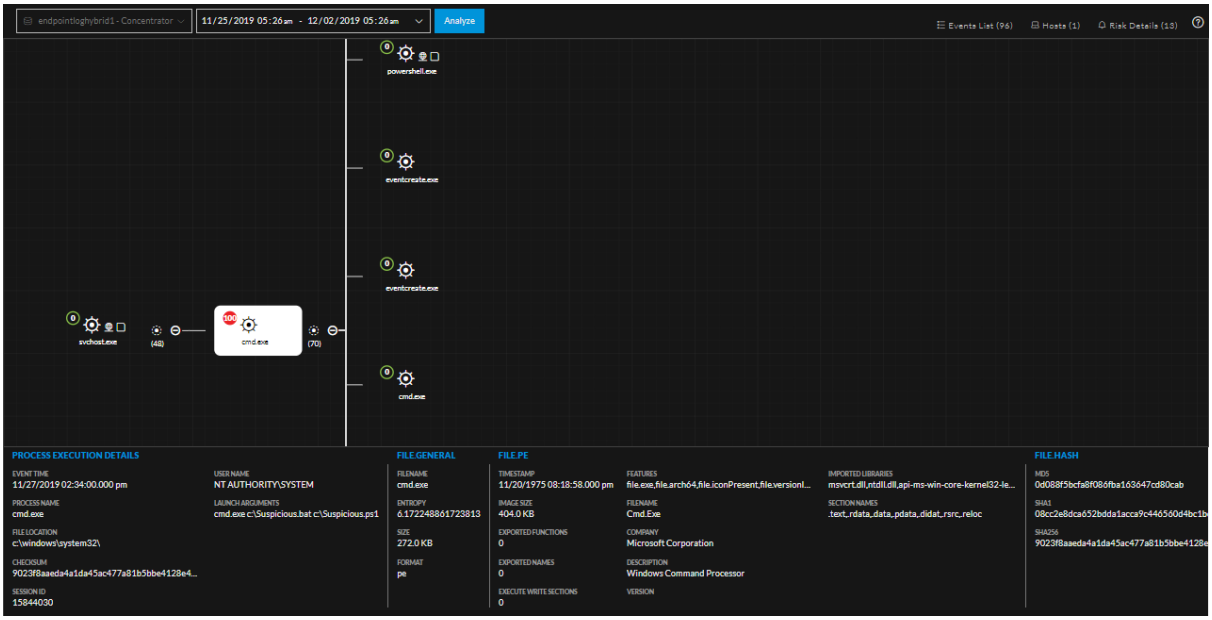
The **Process Tree Viewer** is displayed in the **Respond** service.

4. Select the process in the **Process Tree Viewer** and click **File Actions** in the **Details** panel to perform the following actions:
   - **Google Lookup**
   - **VirusTotal Lookup**
   - **Change File Status**
   - **Download File to Server**
   - **Analyze File**
   - **Save a Local Copy**



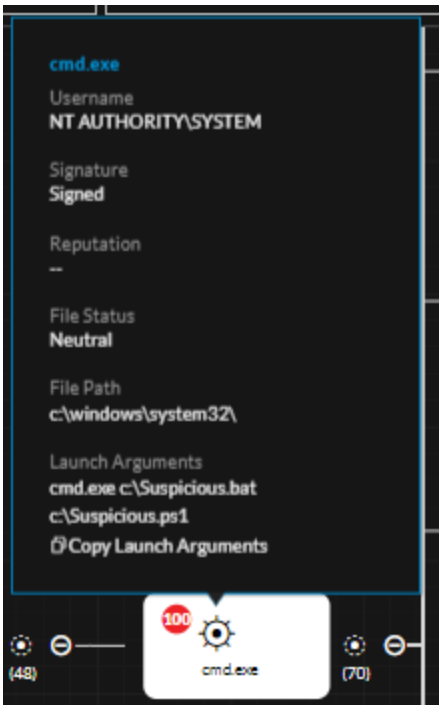
- **Reset Risk Score**

To analyze the process associated with Medium Alerts:



1. Go to **Hosts** and click on a host.
2. Click on an event associated with the **Medium** alert on the Host Details view. The **Event Details** panel appears.
3. To analyze the process activities of a file associated with the **Medium** Alerts, do one of the following:
   - In the **Event Details** panel, click **Analyze Process Tree**.
   - Select the **Processes** tab and do one of the following:
     - Right-click a process and select **Analyze Process** from the context menu.
     - Click **Analyze Process** in the toolbar.

   In the following example, the file `cmd.exe` has created process `net.exe`.

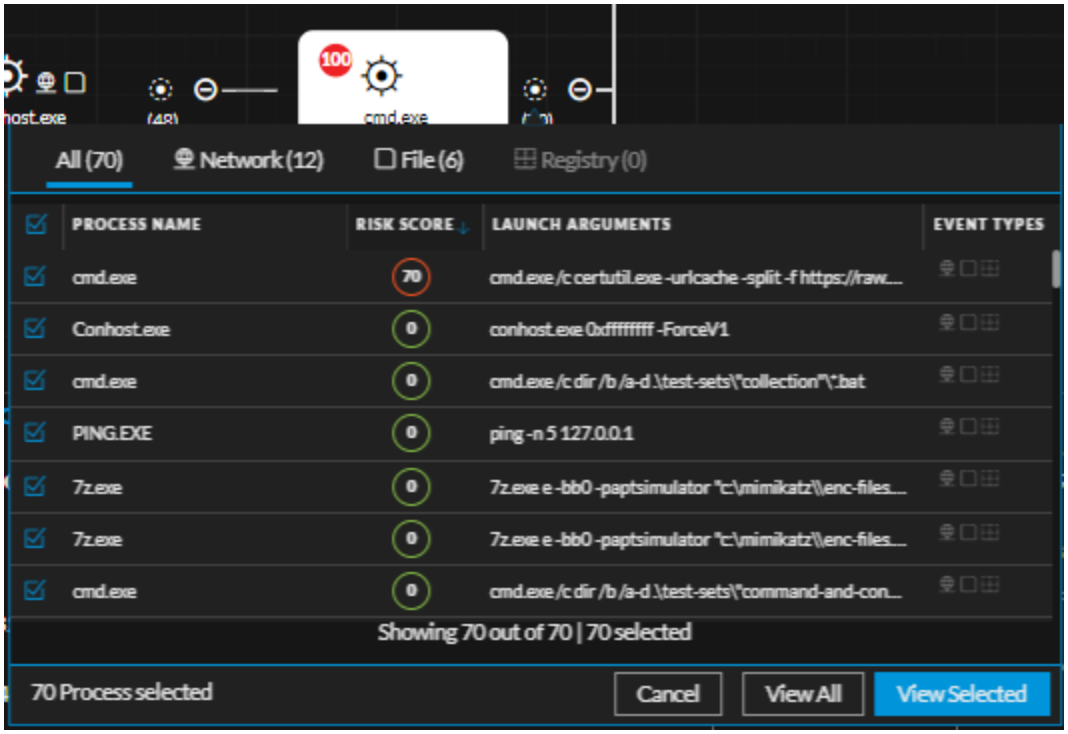


Clicking **Analyze Process** displays the process visualization. For each node, the process name, risk score, and type of activity the selected process has performed (network, file, or registry) are displayed. Optionally, you can change the time range to view data.

You can view the properties, such as process execution details, file properties of the selected process in the bottom of the view.

Note: No result is displayed in the process visualization view if there is no data for last seven days or if there is no `createprocess` event.

4. On the right side of the process visualization view:
   - Click **Events List** to view the associated events. You can also filter events based on the events category. For more information on filtering, see Analyze Events for a Process.
   - Click **Hosts** to view the hosts on which this file is present and the associated risk score. For more information, Analyze Hosts with File Activity.
   - Click **Risk Details** to view the list of distinct alerts, such as Critical, High, Medium, and All. For more information, see Analyze Hosts Using the Risk Score.
5. Hover over the process name to analyze important process attributes, such as username, launch arguments, reputation, file status, signer, signature, and file path.

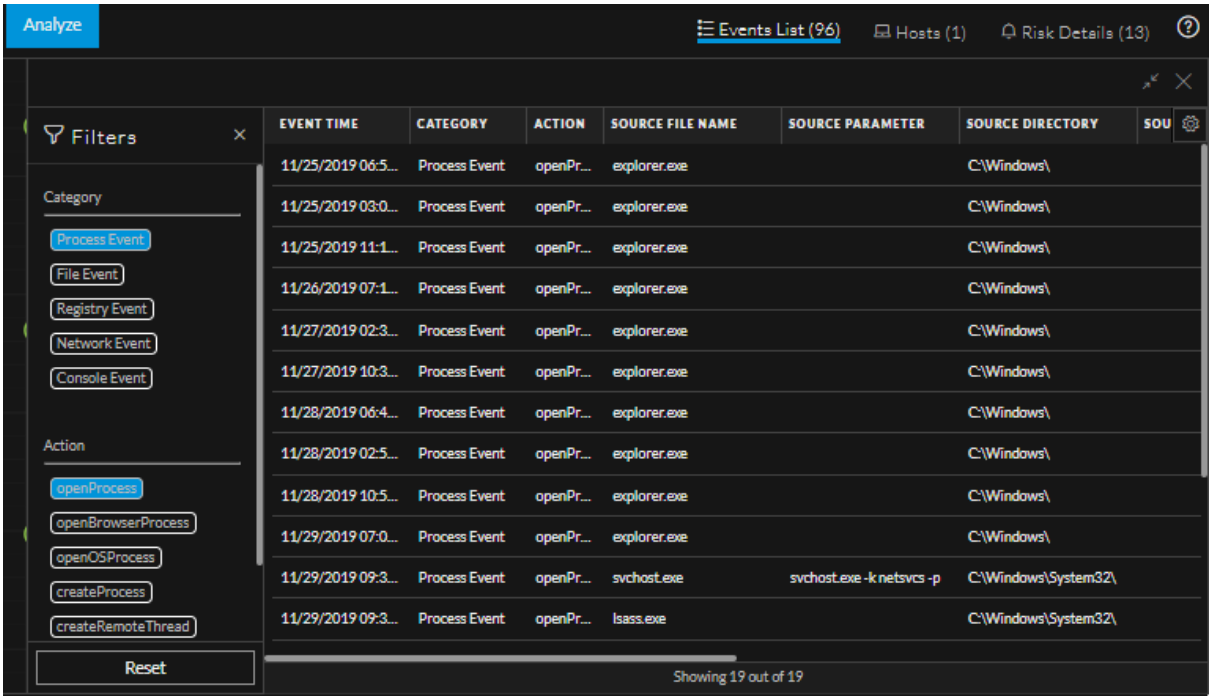


6. Click  to view the child processes. The Process selection dialog is displayed with the child processes associated with the process based on the risk score. You can filter the result on the event type by clicking icons on the top panel. When no matching event types are available, these filter options are disabled.

   Depending on the type of event, the icons are highlights in the Event Types column.

   a. Click **View All** to view all child processes or select the required processes and click **View selected**. The associated events and properties are displayed in the right panel.

b. Click  to change the process selection and click  to collapse the view.



Analyze Events for a Process

To analyze events for the selected process:

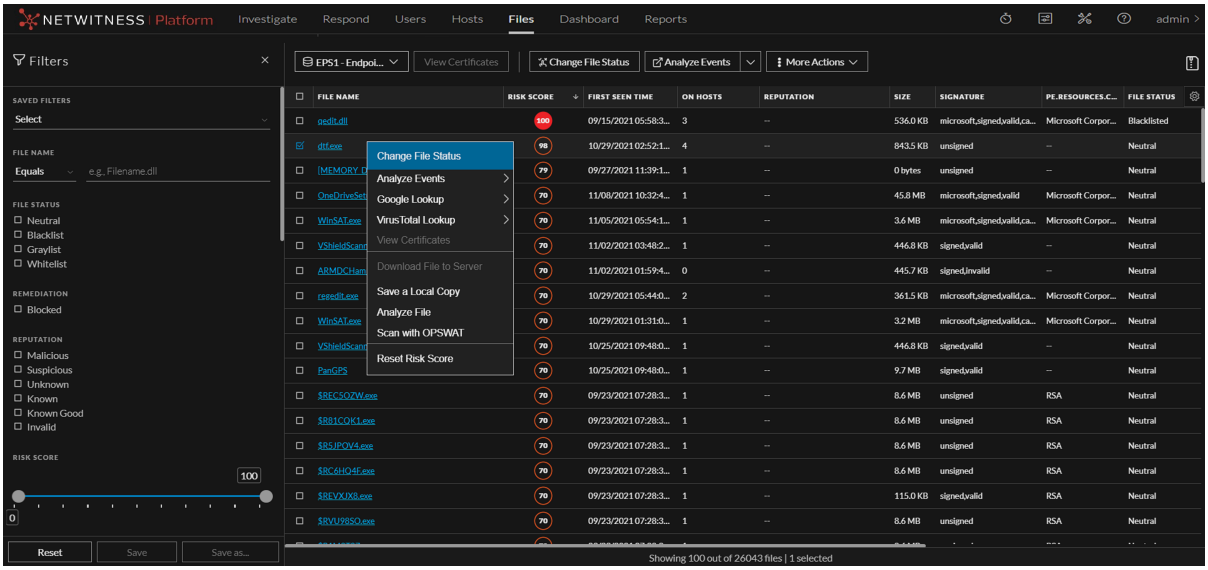
1. Perform steps 1 to 3 in To analyze the process associated with Medium Alerts:.
2. In the process visualization, click the **Events** tab.
3. To narrow down the search to find any suspicious indicators, behaviors, or specific type of event, filter on a set of matched events based on a category - Process, File, Registry, Network Event, or Console Event (for Windows).

For example, to view only process events, select the **Process Event** category, and filter on action.

The result displays the sequence of activities involving this process for the selected filters.

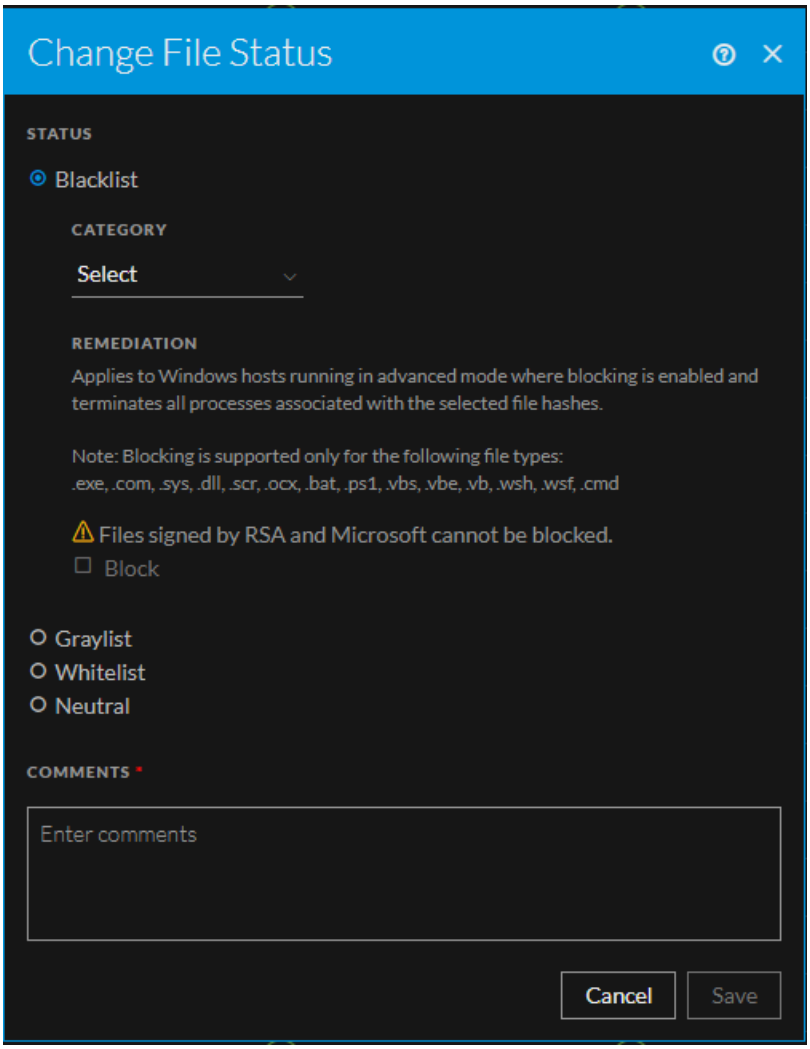
Note: For the console events, the context for local and remote are available only if the data is sent from 11.4 or later agents.

Note: At any given time, if the number of process events created from a single source VPID in Linux exceeds the count of **100**, only the first **100** events are displayed in the Process Visualization > **Events** view for a time interval of **8** hours. Only after the time interval of **8** hours, the new set of events created from the same source VPID (maximum **100** process events) will be displayed along with the existing set of events.



For Example: At **12PM** IST, if **1000** process events are created from a single source VPID, only the first **100** events are displayed in the Process Visualization > **Events** view until **8PM** IST. After **8PM** IST on the same day, the new set of **100** events created after **8PM** IST from the same source VPID will be displayed along with the existing set of events.

Changing File Status or Remediate



Note: By default, the blocking option is disabled in the policy. To enable blocking, in the policy configuration, change the **Blocking** option to **Enabled** under Response Action Settings. For more information, see the *NetWitness Endpoint Configuration Guide*.

To change the status of a file:

1. Do one of the following:
   - Go to **Hosts** (Processes, Autoruns, Files, Drivers, Libraries, or Anomalies tab).
   - Go to **Files**.
2. Select one or more files and do one of the following:

   - Right-click and select **Change File Status** from the context menu.
   - Click **Change File Status** in the toolbar.
3. In the Change File Status dialog, select a status - **Blacklist**, **Whitelist**, **Graylist**, or **Neutral**.

Note: You cannot whitelist certain Microsoft files, such as `cscript.exe`, `wscript.exe`, `cmd.exe`, `bash.exe`, as there is a potential risk of them being used for malicious purposes. For more information, see Files Restricted from Whitelisting.

If you select Blacklist or Graylist, the following options are displayed:

a. **Category:** Select the appropriate category type: **Generic Malware**, **APT: Advanced Persistent Threats**, **Attacker Tool**, **Unidentified**, **Ransomware**.

Caution: Before blocking, make sure that you review the file because this may cause the system or software to be unusable.

b. **Remediate:** Select **Block** to block the file.

Note: Blocking is supported only for Windows hosts that are running in advanced mode. All PE files along with the following file extensions can be blocked.
.exe, *.com*, *.sys*, *.dll*, *.scr*, *.ocx*, *.bat*, *.ps1*, *.vbs*, *.vbe*, *.vb*, *.wsh*, *.wsf*, *.cmd*
You cannot block the following:.
- Memory DLL and floating code
- Files that are signed by Microsoft or RSA.
To delete a blocked file, users can log in to the host and execute the delete command using the elevated command prompt.

4. Add a comment and click **Save**.

You can change the status of only 100 files at a time. When the status is changed, it impacts the file status on all hosts on which the file is present. The status is sent as a session under the **File** category, and available for investigation. If the file is seen in subsequent scan or tracking, the corresponding sessions contain a meta value with the file status (except Neutral).

Import File Hashes using the Block Hash tool

The Block Hash tool allows you to import a set of file hashes which can be set to block state and change the file bias status (whitelist, blacklist, and graylist). The tool allows you to block the imported file hashes (suspicious, invalid, and malicious) and prevent them from opening or executing on the hosts. You can block up to a maximum of **50,000** file hashes using this tool.

Note: For more information on changing the file status or blocking the file, see Changing File Status or Remediate.

IMPORTANT:
- Enter only valid SHA256 hashes; otherwise, the blocking functionality might break.
- Do not block any file hashes signed by RSA, Microsoft, and Apple. It might make your Endpoints unresponsive.
- Make sure the number of hashes entered in the JSON file is less than the number of the available limit of hashes that can be blocked (the maximum limit is **50,000**).
For example: If 100 file hashes are already blocked as part of NetWitness deployment, you can only block 49,900 more file hashes using this tool.

JSON File Format

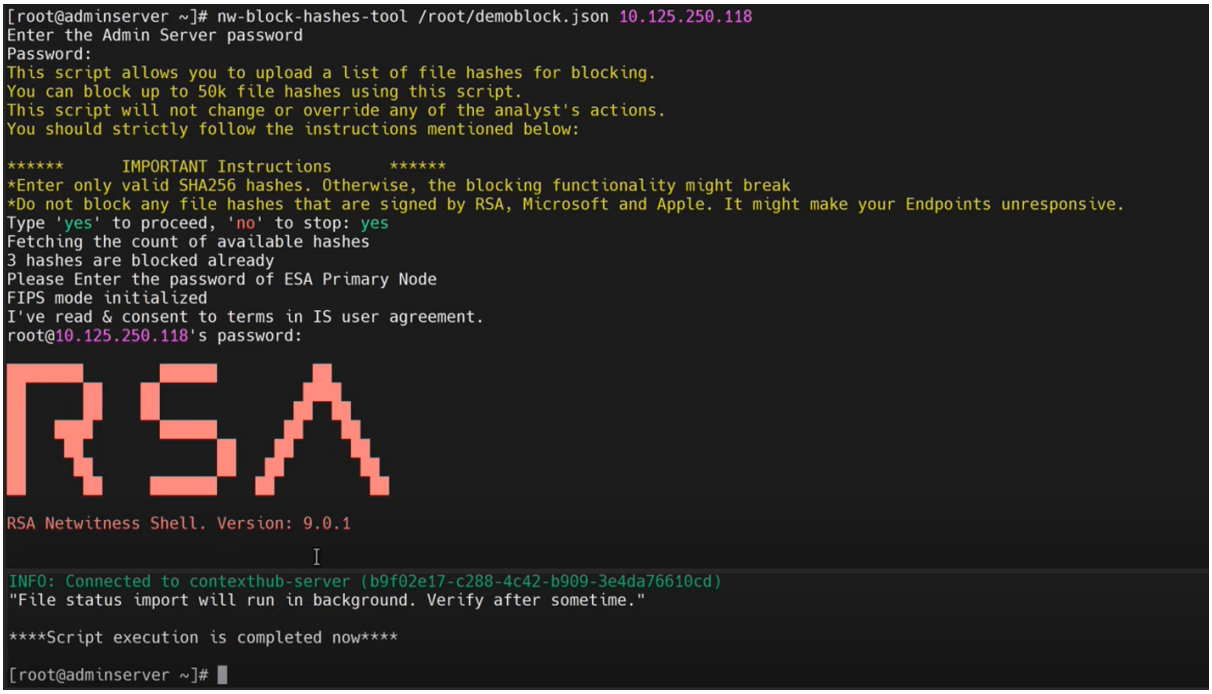
The example below describes the JSON file format for blocking and blacklisting the file hashes.

Sample demoblock.JSON:

```
[{
"checksums":
["1b30e463ebe0131db66fce7d4aa43f3e149064d85c4c0dc5218b077886da2804","67fa30e4
63ebe0131db66fce7d4aa43f3e149064d85c4c0dc5218b077dsbhb561","78vbba909e463ebe0
131dsdsdb66fce7d4aa43f3e1dsdsd49064d85dsdsman61n"],
"fileStatus": "Blacklist",
"comment”: "File blocking set through new tool",
"remediationAction": "Block"
}]
```

The example below describes the JSON file format only for blacklisting the file hashes.

Sample demoblock.JSON:



```
[{
"checksums":
["2b30e463ebe0131db66fce7d4aa43f3e149064d85c4c0dc5218b077886da2800","97fa30e4
63ebe0131db66fce7d4aa43f3e149064d85c4c0dc5218b077dsbhb500","38vbba909e463ebe0
131dsdsdb66fce7d4aa43f3e1dsdsd49064d85dsdsman68c"],
"fileStatus": "Blacklist",
"comment": "File status change set through new tool",
}]
```

To block the file hashes using the Block Hash tool:

1. SSH to node 0 and copy the JSON file (containing the file hashes to be blocked) stored in it.
2. Run the tool.

   ```
   nw-block-hashes-tool <absolute path of json residing on node 0> <ESA node
   IP/hostname>
   ```

   Note: Enter the JSON file path in `<absolute path of json residing on node 0>` and enter the ESA node IP in `<ESA node IP/hostname>`.
   For Example: `nw-block-hashes-tool /root/demoblock.json 10.125.250.118`.

3. Enter the Admin Server password.
4. Follow the instructions displayed on the screen. Enter any one of the following options when prompted.

- **yes**: Enter **yes** to proceed with the execution of the script.
- **no**: Enter **no** to stop the execution of the script.

> **Note:** At this stage, the tool validates the number of incoming file hashes through the JSON file and the number of existing file hashes already blocked in the deployment. If the total of the file hashes (incoming through JSON file and existing as blocked in the deployment) exceeds the maximum limit of **50,000**, the tool stops the execution, and it will not proceed further.

Files Restricted from Whitelisting

To view or update the files that are restricted from whitelisting, do the following:

1. On the NW server, run the `nw-shell` command from the command line.
2. Run the `login` command and enter your credentials.
3. Connect to the Endpoint Server using the following command:

   ```
   connect endpoint-server
   ```
4. Run the following commands to view the list of files:
   - `cd endpoint/file/status/restricted/get`
   - `invoke Whitelist`
5. Run the following commands to add files to the list:
   - `cd endpoint/file/status/restricted/get`
   - `invoke '{"id":"<filename>","restrictedStatus":["Whitelist"], "enable":true}`
6. Run the following commands to delete files from the list:
   - `cd endpoint/file/status/restricted/update`
   - `invoke '{"id":"<filename>","restrictedStatus":["Whitelist"], "enable":false}`

Analyzing Downloaded Files

To perform a deep analysis of suspicious files, you can manually or automatically download the file to the server.

Note: Saving or analyzing downloaded file works the same way irrespective of whether the file is downloaded manually or automatically.

Note: Downloaded files are stored in the Endpoint Server which may fill up the disk space. To utilize the storage efficiently without impacting the health of Endpoint Server, NetWitness recommends you to configure an external storage mount, so all the Endpoint Server can use the configured location to store the downloaded data.
By default, all files are downloaded to `/var/netwitness/endpoint-server/<files>/`. If you want to change the location, make sure that you have **endpoint-server.configuration.manage** permissions and do the following:
1. In the Explore view, go to **endpoint/download**,
2. In the base-path, provide the location of the directory.

Caution: By default, the status **File Download Disk Usage** stats in the **Health and Wellness** view shows unhealthy if the disk usage reaches 60% and the file download stops automatically when the disk usage is 70%. You can customize the warning or fatal thresholds in the  **> Services > Endpoint Server > view > Explore > rsa.endpoint.file-download-disk-thresholds.warning-percent** and **rsa.endpoint.file-download-disk-thresholds.fatal-percent** parameters respectively.

For the downloaded file, you can:

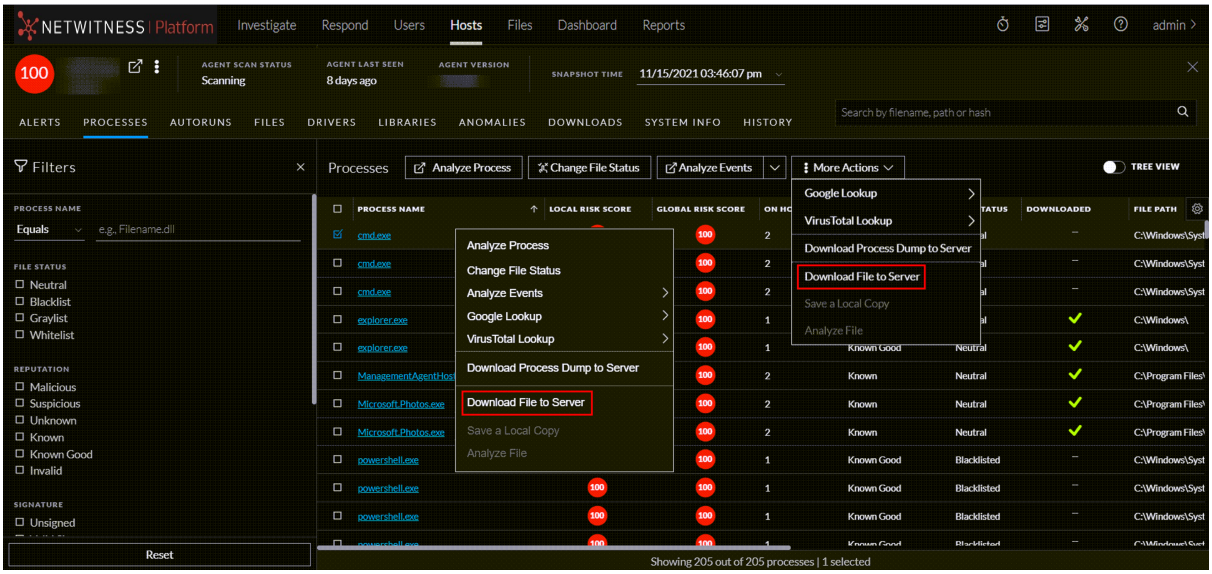
- Search for strings in the executable
- View text content for scripts
- View imported libraries and functions
- Save a local copy for further analysis

Download Files to Server

Downloading file to server is not supported for memory DLL and floating code.

Note: Downloading files may take significant time. Additional requests to the agent during download are queued and processed when the download is complete.

Automatic File Download

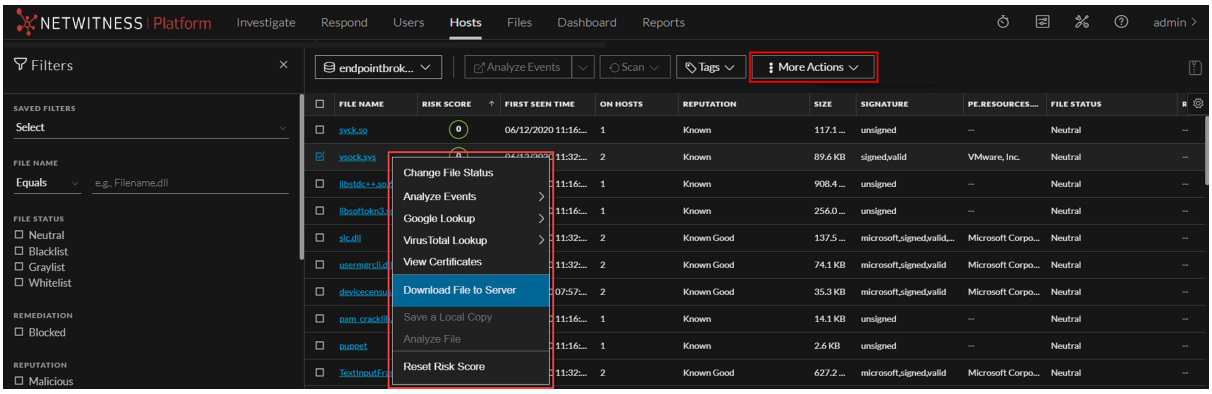


By default, the files that are unsigned and size lesser than or equal to 1 MB are downloaded automatically to the NetWitness Endpoint server. And, only single copy of each file is downloaded automatically. You can limit the volume of files to be downloaded in the  **> Endpoint Sources > Policies** tab, so the files matching certain criteria are only downloaded automatically. For more information on automatic file download settings, see "Create an EDR Policy" section in the *NetWitness Endpoint Configuration Guide*.

The status of the download is displayed in the **Files** tab > **Downloaded** column.

Manual File Download

To manually download files to the server from the Hosts view:



1. Go to **Hosts**.
2. Select the hostname to open the Host Details view.
3. In any of the Processes, Autoruns, Files, Drivers, Libraries, or Anomalies tabs, select the file, and do one of the following:

- Right-click and select **Download File to Server** from the context menu.
- Select **Download File to Server** from the **More Actions** drop-down list in the toolbar.

To download files to the server from the Files view:

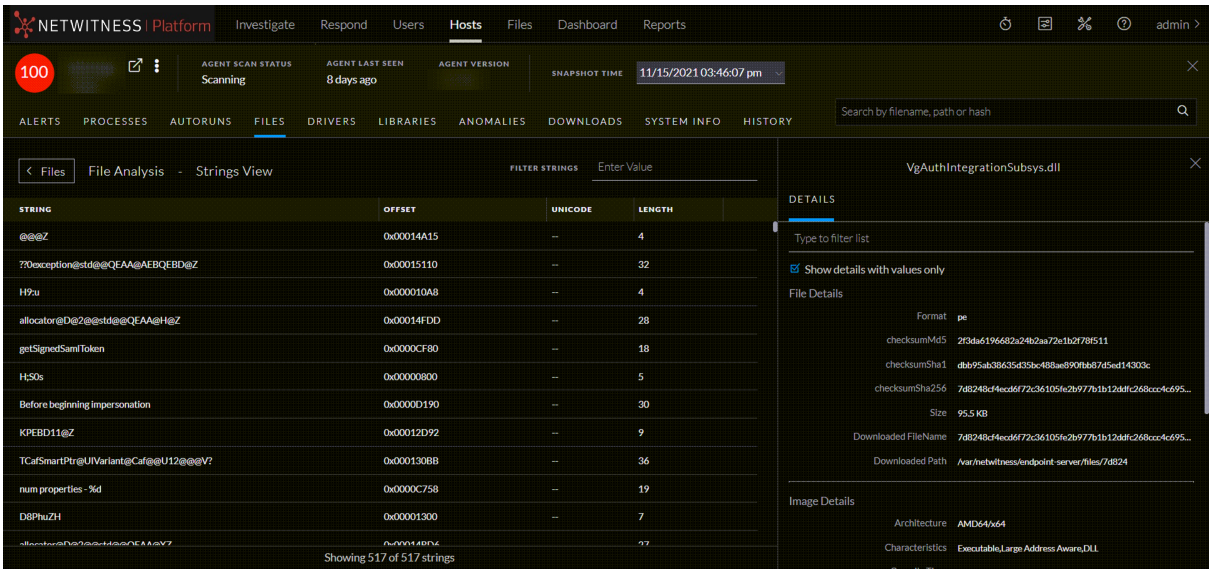
1. Go to **Files**.
2. Select the file and do one of the following:

- Right-click and select **Download File to Server** from the context menu.
- Select **Download File to Server** from the **More Actions** drop-down list in the toolbar.

The status of the download is displayed in the Downloaded column. The download statuses are Downloaded, Not downloaded, and Error.

Save Downloaded Files

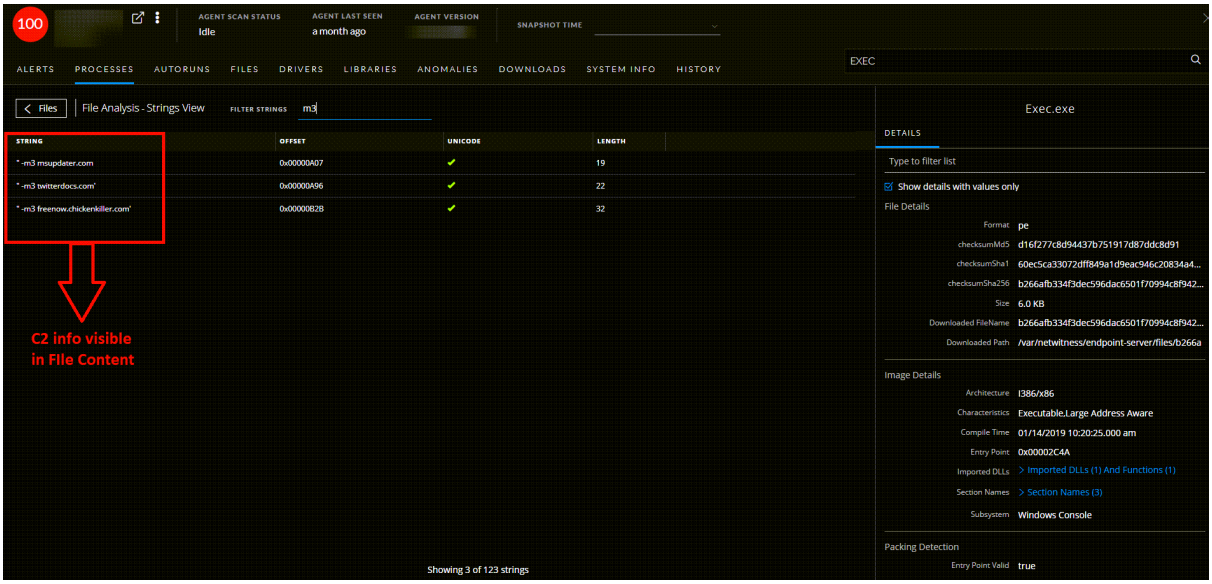
You can retrieve a downloaded file and save it to your local file system for further analysis. Downloaded files are stored in the server in the configured location. This option is enabled only if the file is downloaded to the server.



To save a file:

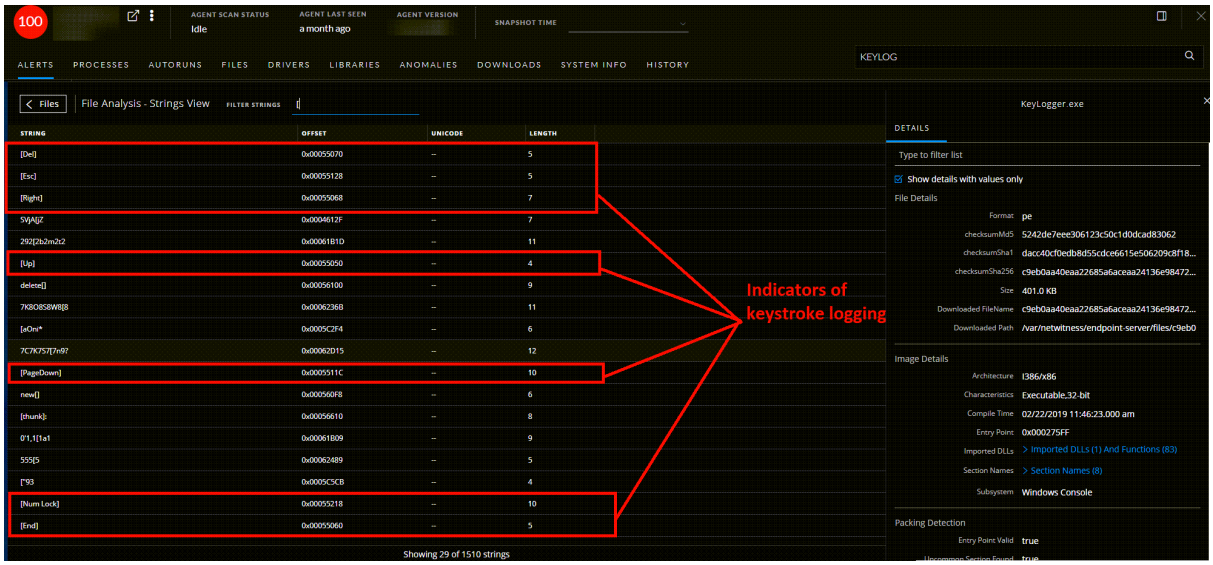
1. Go to **Hosts** or **Files** .
2. Right-click the file you want to save and select **Save a Local Copy**.
3. Browse the location and click **Save**.

Analyze Downloaded Files



You can use the **Analyze File** option to view detailed information about a downloaded file. This option is enabled only if the file is downloaded to the server. To analyze a file:

1. Go to **Hosts** or **Files**.
2. Right-click the downloaded file and select **Analyze File**. The File Analysis view opens and properties of the are is displayed in the right panel.



3. View strings in the file in the Strings view while analyzing an executable (such as `macho`, `pe`, `elf`). This view contains the string, offset in the binary, unicode, and the length of the string. You can search for or filter on a specific string value in the **Filter String** field.
4. View the text content of the file and look for any suspicious behavior in the script file.

   For example, if the file contains C2 information in the form of domain names or IP addresses, it is highly suspicious.

If you see unprintable keyboard keys listed within the file, such as: [F1], [F2]…[Page Up], [Enter], [ESC], and so on, that may be indicative of a keystroke logger.

Performing Host Forensics

Note: The information in this topic applies to NetWitness Version 11.4 and later.

You can perform the following forensic investigation on a host:

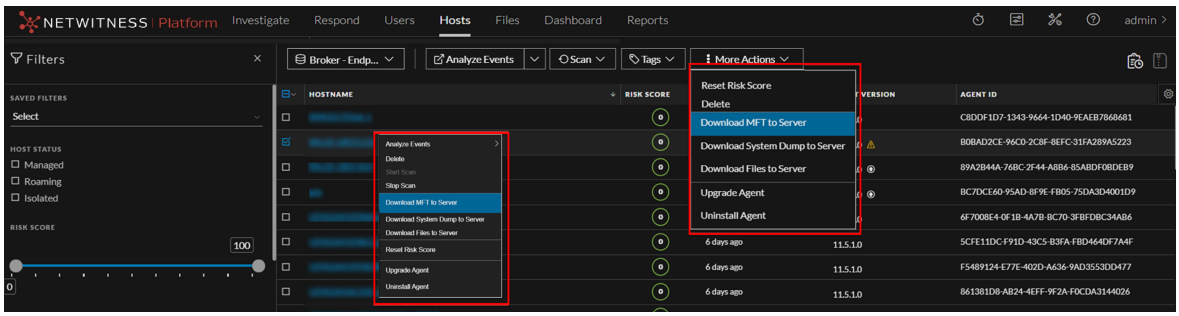
- Master File Table (MFT)
- System Dump
- Process Dump

Note: This is applicable only for Windows agent (in Advanced mode) with NetWitness Platform version 11.4. Downloading system dump files may take significant time. Additional requests to the agent during system dump download are queued and processed when the download is complete. MFT, system dump, and process dump downloads are not supported for agents communicating through Relay server.

Note: MFT, system dump, and process dump are stored in the Endpoint Server which may fill up the disk space. For large deployments, to utilize the storage efficiently without impacting the health of Endpoint Server, NetWitness recommends you to configure an external storage mount, so all the Endpoint Server can use the configured location to store the downloaded data.
By default, all files are downloaded to `/var/netwitness/endpoint-server/<file type>/`, where `<file type>` is MFT, system dump, or process dump. If you want to change the location, make sure that you have endpoint-server.configuration.manage permissions and do the following:
1. In the Explore view, go to **endpoint/download**.
2. In the base-path, provide the location of the directory.

Download Master File Table

Master File Table contains metadata of every file on the host. It keeps track of information, such as filename, size, timestamps, permissions, and location of the file on the host. It consists of two sets of timestamps - Standard Information ($SI) and File Name ($FN). Each set has the following timestamps - creation, access, update, and modification.

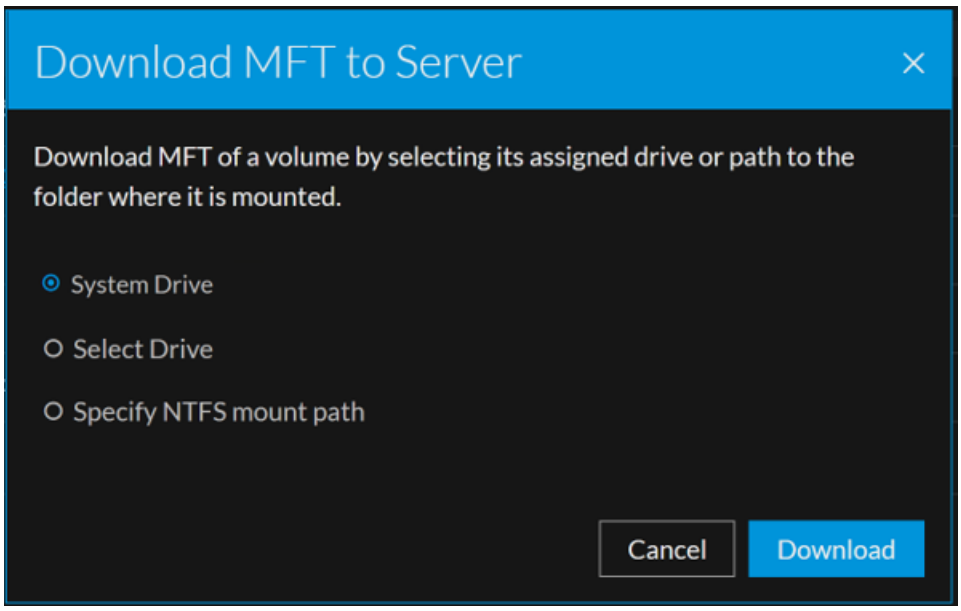


Time stomping is a technique that modifies the timestamps for a file (creation, access, update, and modification time) to mimic files that are in the same folder, making it difficult to identify suspicious files on a host. To perform forensic investigation of a suspicious file, you can download and analyze the MFT, and focus on files that are time stomped. For more information, see Analyze Downloaded MFT.

During MFT analysis, you can also search for suspicious filenames, and also files that were created before or after a known malicious event. You can also download files from the MFT viewer for further analysis.

Download MFT to Server

To download MFT to the server from the Hosts view:



1. Go to **Hosts** and do one the following:
   - Select one or more hosts and select **Download MFT to Server** from the right-click context menu, or from the **More Actions** drop-down list in the toolbar.

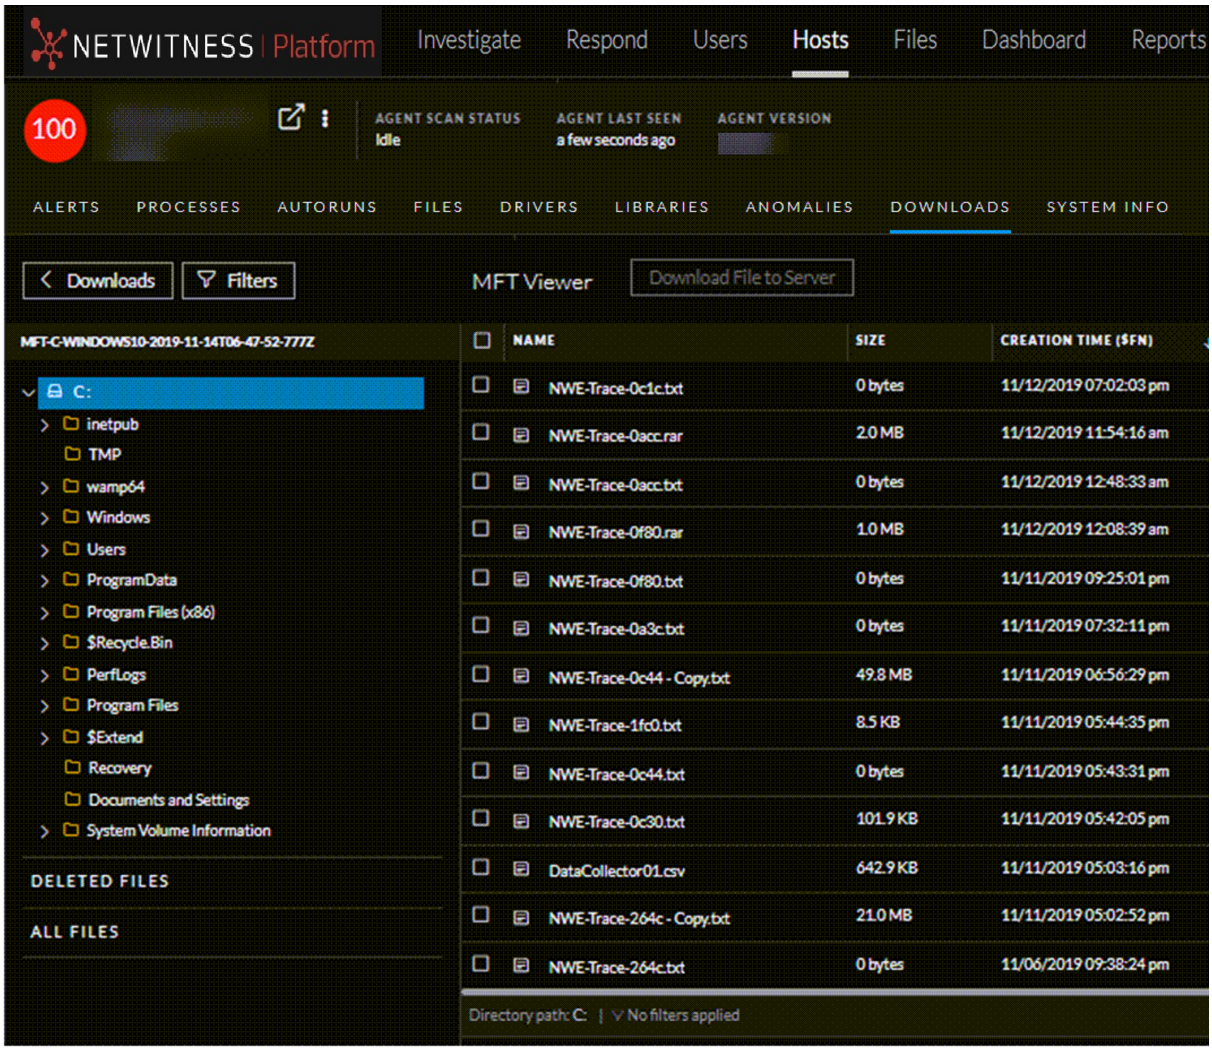
   - Select the hostname to open the host details, click ⋮ (**More**) beside the hostname, and select **Download MFT to Server**.

2. In the **Download MFT to Server** dialog, select one of the following:
   - **System Drive** - to download MFT to the system drive.
   - **Select Drive** - to download MFT on assigned drive.
     You can select any drive from the **Drive** drop-down list. By default the selected drive is C.
   - **Specify NTFS mount path** - to download MFT on the path to the folder where it is mounted

   Click **Download**.

3. View details of the downloaded MFT in the **Downloads** tab within the host details. For more information, see Hosts View - Downloads Tab.

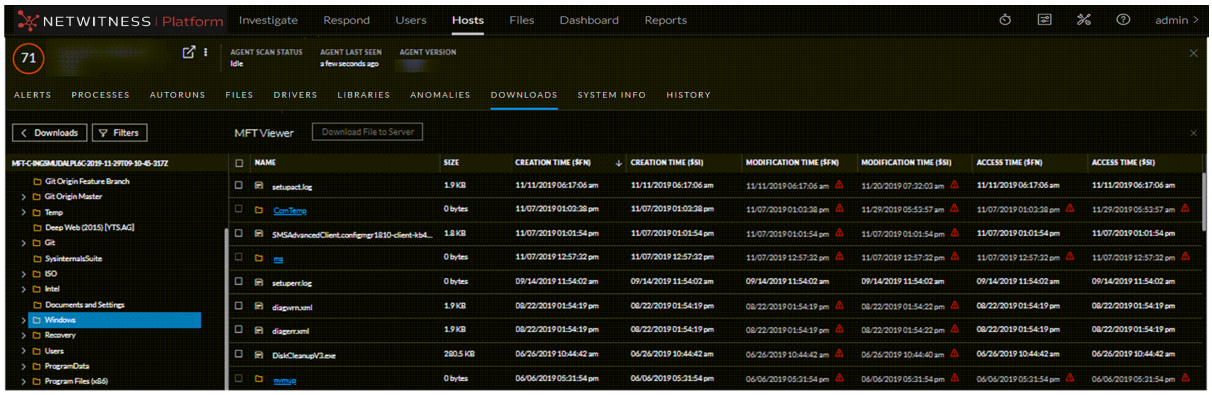
Analyze Downloaded MFT



You can use the MFT viewer to begin analysis where you can search for files based on file name, time stamps, and identify files that are timestomped.

View MFT

To view the content of the downloaded MFT:

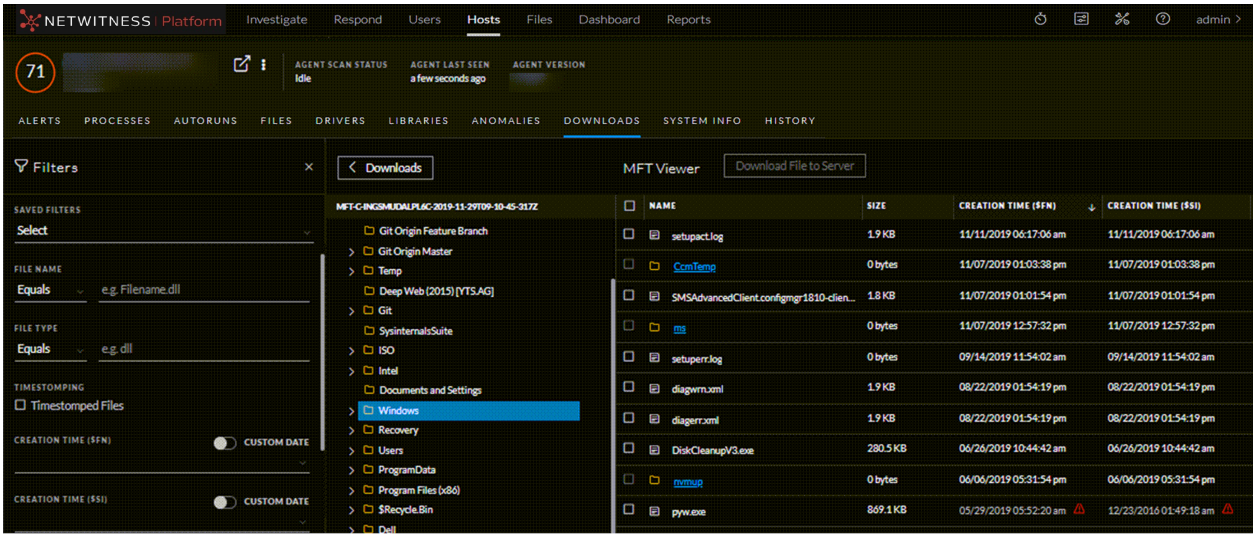


1. Go to **Hosts**.
2. Select the hostname to open the host details and select the **Downloads** tab.
3. Click the file name. The MFT viewer is displayed.

   All available files are displayed in a tree view similar to the Windows Explorer in the All Files folder. The Deleted Files folder contains a sequential list of all deleted files.

4. Click ▶ to view the folder structure. Click the row to view the folder content.

   The details of the MFT is displayed in the table. By default, the table is sorted on the creation time ($FN). If the $SI and $FN timestamps are different, the columns are highlighted in red (⚠) indicating that it is time stomped.



5. Select one or more files and click **Download File to Server** on the toolbar to download files to the server.

> **Note:** Downloading a folder is not supported and hence the option is grayed out for folders.

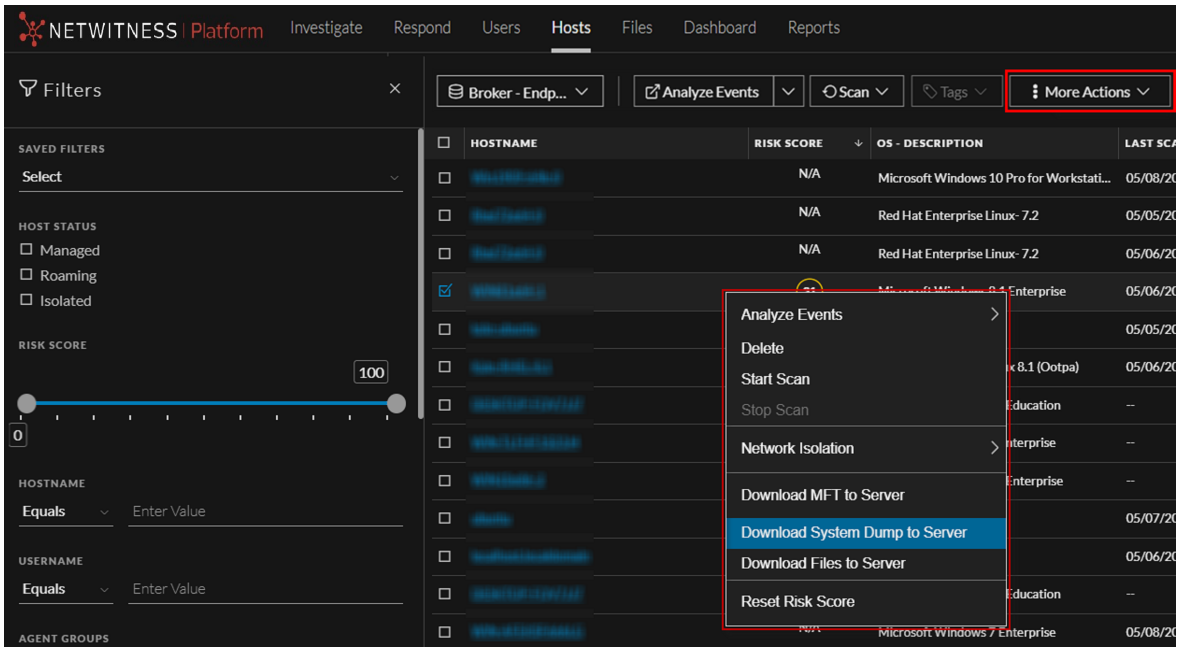
Filter MFT

You can filter files on file name, creation time ($FN), creation time ($SI), access time ($FN), access time ($SI), update time ($FN), update time ($SI), modified time ($FN), and modified time ($SI).

Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters panel on the left. To delete a filter, hover over the filter name and click .

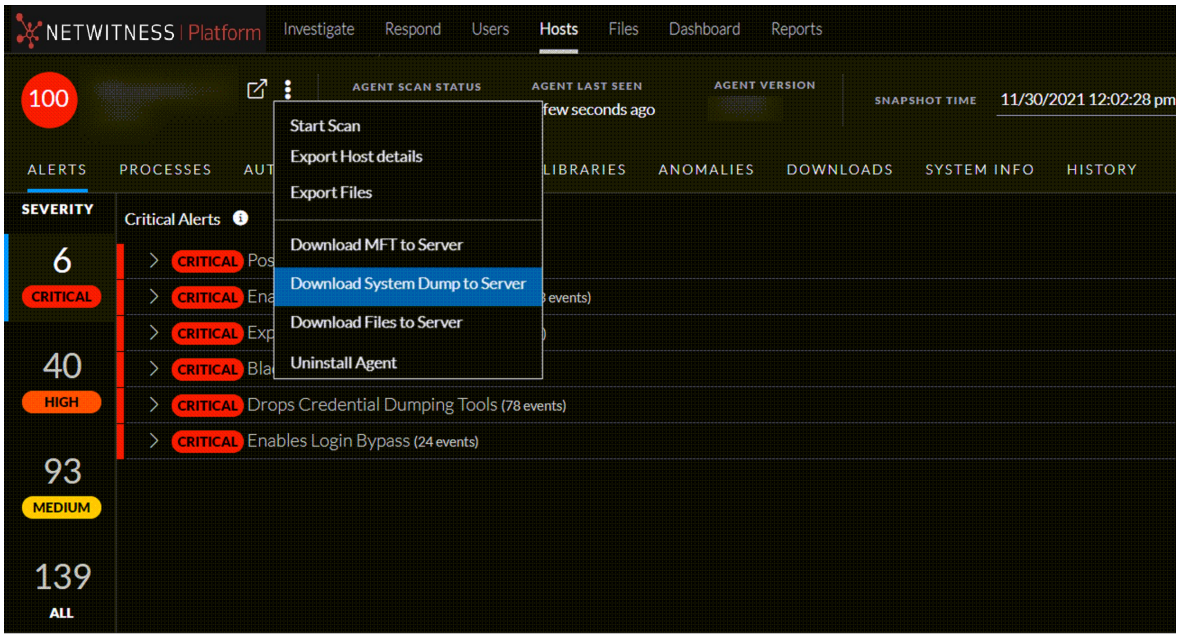
> **Note:** Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.

To filter, save, and delete MFT, see Filter Downloaded Files, Save Downloaded File, and Delete Downloaded Files.



System and Process Memory Dump

To perform forensic investigation during an incident response, you can request a memory dump of a host or a process running on the host. You can analyze these dumps using third-party tools, such as Volatility, Rekall.



Download System Dump to Server

To download system dump to the server from the Hosts view:

1. Go to **Hosts** and do one the following:
   - Select a host and select **Download System Dump to Server** from the right-click context menu, or from the **More** drop-down list in the toolbar.

- Select the hostname to open the host details and select **Download System Dump to Server** from the **More** option besides the hostname.

2. View the details of the downloaded system dump in the **Downloads** tab within the host details. For more information, see Hosts View - Downloads Tab.

Remote Shell

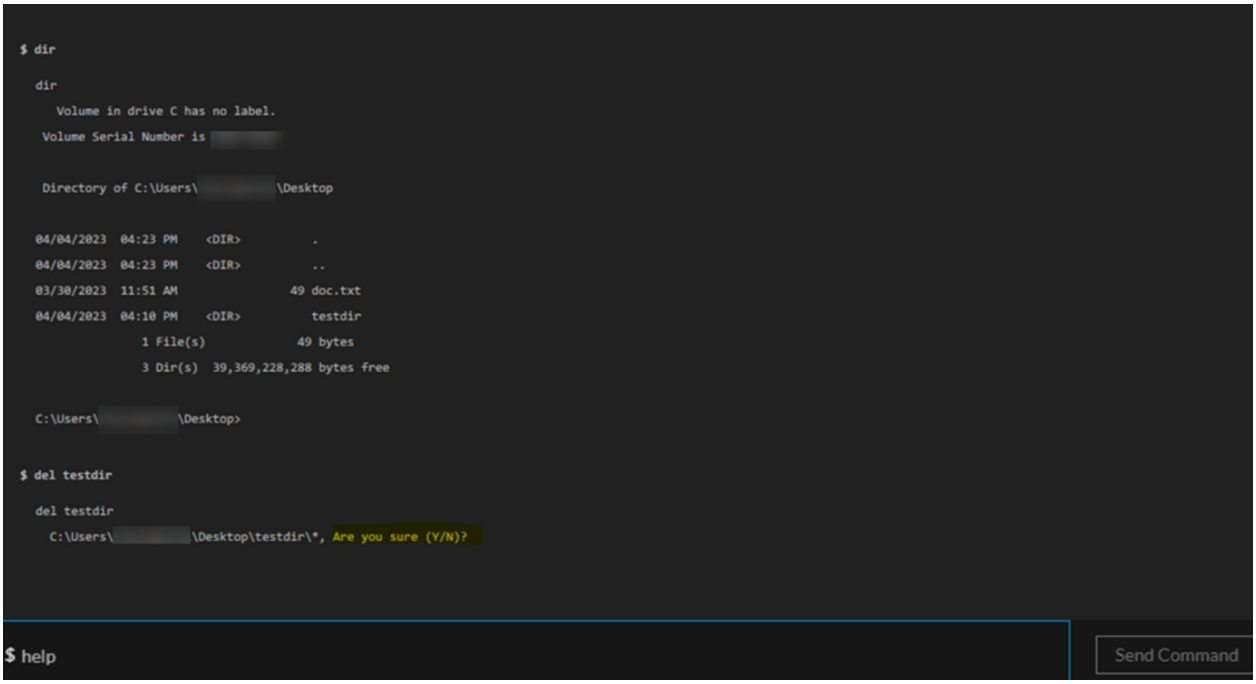
From version 12.3 or later, **NetWitness Remote Shell** feature (**Hosts** > Select the hostname > click  **(More)** beside the hostname > **Remote Shell**) allows you to access the agents installed on your Windows machine remotely and execute a list of commands to perform certain actions such as deleting the files, changing the directories, terminating specific processes, and executing the processes on the remote host.

Warning:
- Use **NetWitness Remote Shell** feature with utmost caution to avoid the potential for negative impact on the system. NetWitness Platform is not responsible for any damages, loss of data, or other consequences that may arise after using **NetWitness Remote Shell** feature.

- If you are an administrator, NetWitness recommends you to add roles and assign the role permissions only for the selected users in the **Security** > **Roles** view to avoid any damages to the system.

Note:
- **NetWitness Remote Shell** feature can be used only if Windows Advanced mode Agents are installed on the machine. The agent version must be 12.3 or higher to access the **NetWitness Remote Shell** feature.

- **NetWitness Remote Shell** feature supports connection with the agents that communicate through the relay servers (RAR). To access the **NetWitness Remote Shell** feature for the agent that communicates through the relay servers (RAR), you must download the latest relay packager from the Endpoint Server (EPS) and install it on the existing relay server.
For more information, see https://community.netwitness.com/t5/netwitness-platform-online/optional-installing-and-configuring-relay-server/ta-p/669551.



List of Supported Commands

The following table provides information about the list of supported commands displayed in the **NetWitness Remote Shell** console.

Supported Commands	Description
help	View the list of available commands
cd	Change the current working directory
del	Delete a file
rmdir	Delete a folder
dir	List the contents of a directory
mkdir	Create a new directory
tasklist	List all the active processes on the computer
taskkill	Terminate a process
call	Execute a process on the remote computer

Supported Commands	Description
reg	View or modify Windows registry settings

Note:
- You must use only the silent commands to perform the required actions.
- You must end the session and re-connect if you run any command that requires user inputs. Refer the following figure.

Example Scenarios

Example 1: If you want to delete a specific file that exists in different subfolders, you must run the following command.

```
del /s /q <full_file_path>
```

Here,

- **del** refers to delete.

- **/s** refers to the deletion of the file from all the subfolders.

- **/q** refers to quiet or silent mode execution.

- **<full_file_path>** refers to the location where the file exists.

Example 2: If you want to terminate a specific process running on your Windows machine, you must run the following commands.

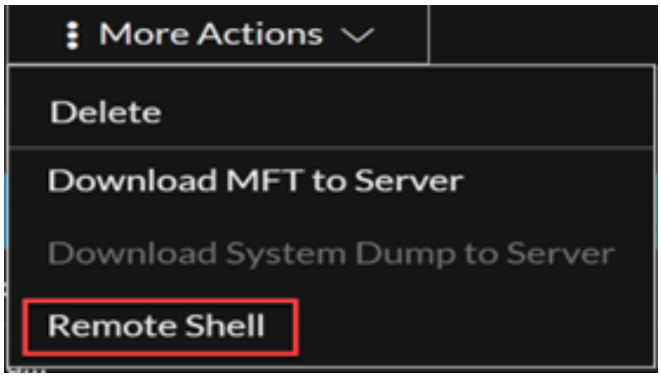
```
taskkill /f /im <process-name>
taskkill /f /pid <process-id>
```

Here,

- **taskkill** refers to terminate.

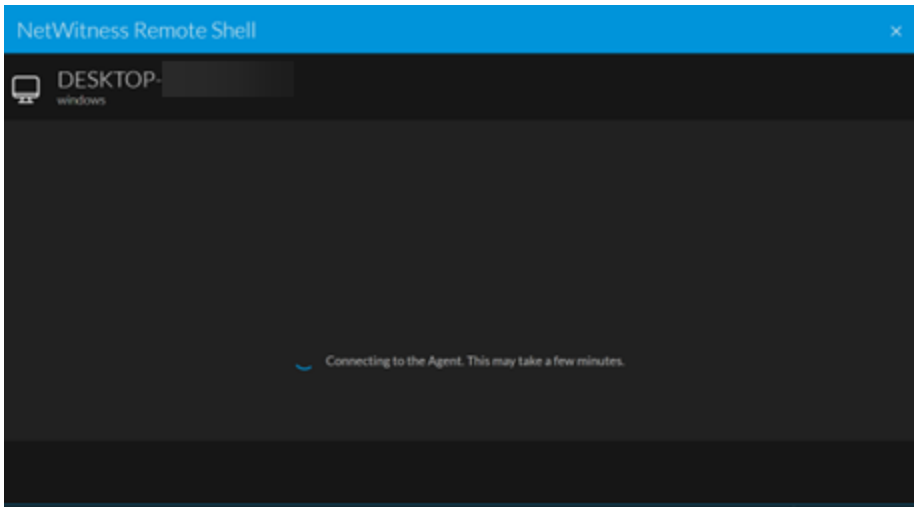
- **/f** refers to force shutdown.
- **/im** refers to image name.
- **<process-name>** refers to the specific process.
- **<process-id>** refers to the specific process ID.
- **/pid** refers to process ID.

Example 3: If you want to delete a specific registry, you must run the following command.



```
reg delete /f <keyname> [/v ]
```

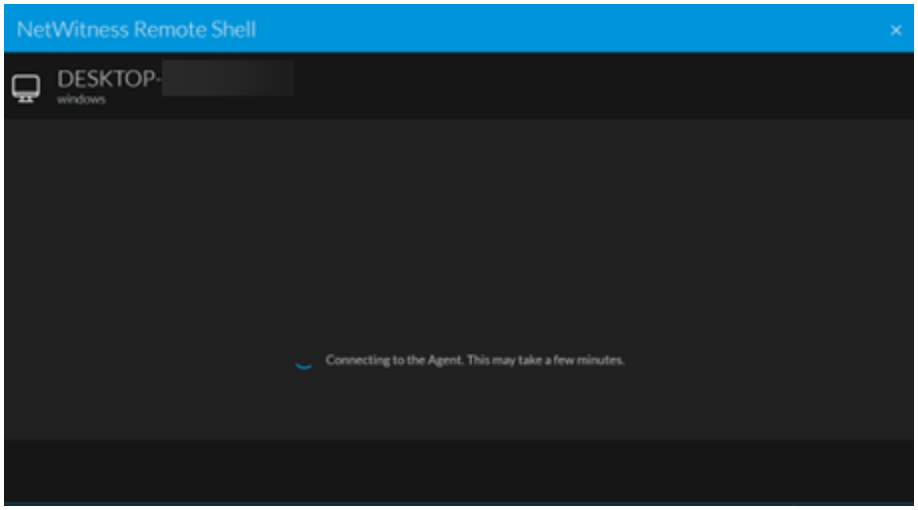
Here,



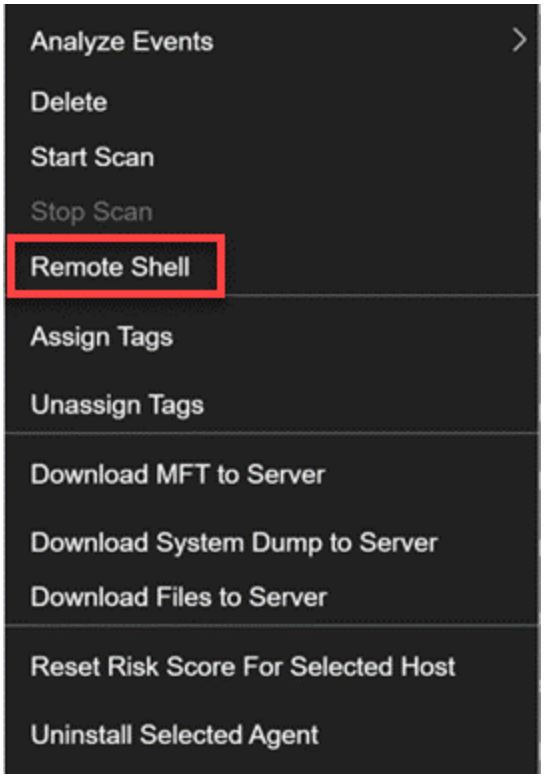
- **reg delete** refers to deleting a registry key.
- **/f** refers to deleting the existing registry subkey or entry without asking for the confirmation.
- **<keyname>** refers to the registry key name.
- **[/v]** refers to deleting a specific entry under the subkey.

To execute commands using NetWitness Remote Shell:

1. Go to **Hosts**. Do one of the following.
   - Click a row in the **Hosts** list view and go to **More Actions** > **Remote Shell**.

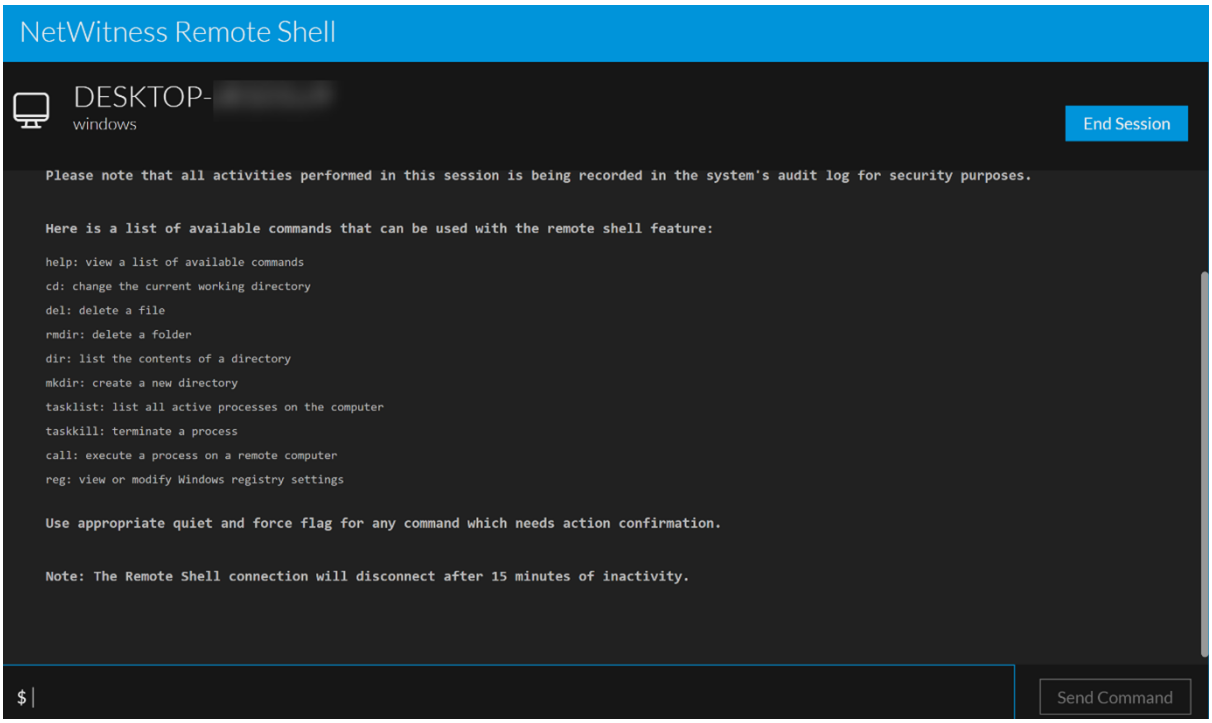


The **NetWitness Remote Shell** window is displayed.



- Click the Hostname and click (More) beside the hostname in the Host Details view to select **Remote Shell**.

  The **NetWitness Remote Shell** window is displayed.



- Right-click a row in the **Hosts** list view and select **Remote Shell**.

  The **NetWitness Remote Shell** window is displayed.

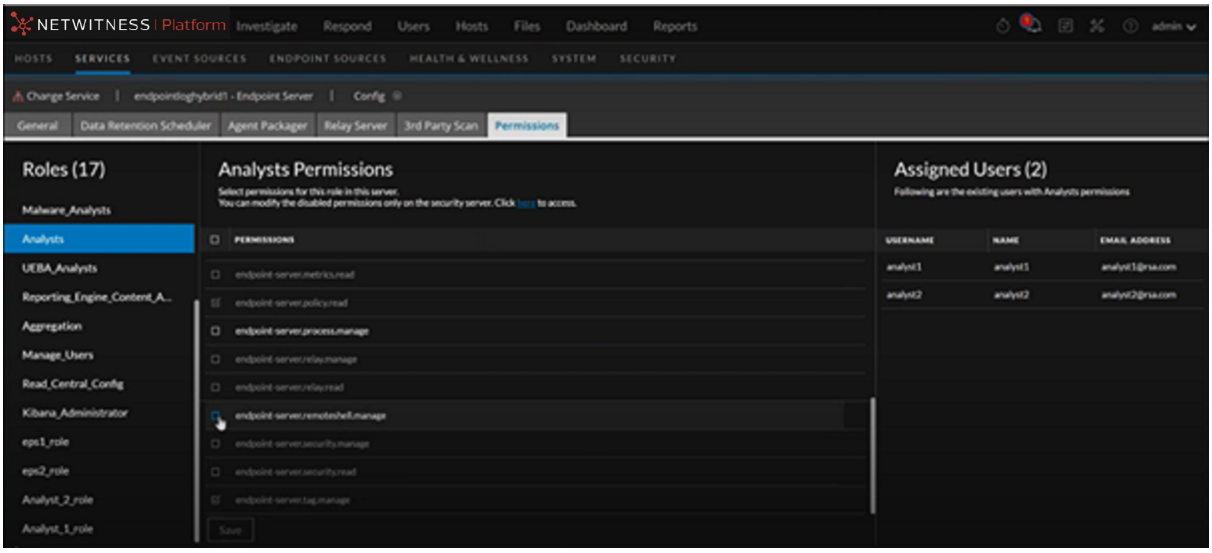
2. Enter the commands once the Agent is connected.

3. Click **Send Command** or press the **Enter** key.
4. Click **End Session** in the **NetWitness Remote Shell** window once the required action is performed.

   The confirmation window is displayed.
5. Click **End Session** to close the **NetWitness Remote Shell** window.

RBAC Permissions for Remote Shell

Users with Analysts and other roles must have the **endpoint-server.remoteshell.manage** permission to view and access **the NetWitness Remote Shell** feature. Administrators can assign the **endpoint-server.remoteshell.manage** role permission to a specific user or to a specific role. The existing roles must be duplicated in the **Security** > **Roles** view and the new users must be assigned to the duplicated roles to assign the **endpoint-server.remoteshell.manage** role permission only to the specific new users.



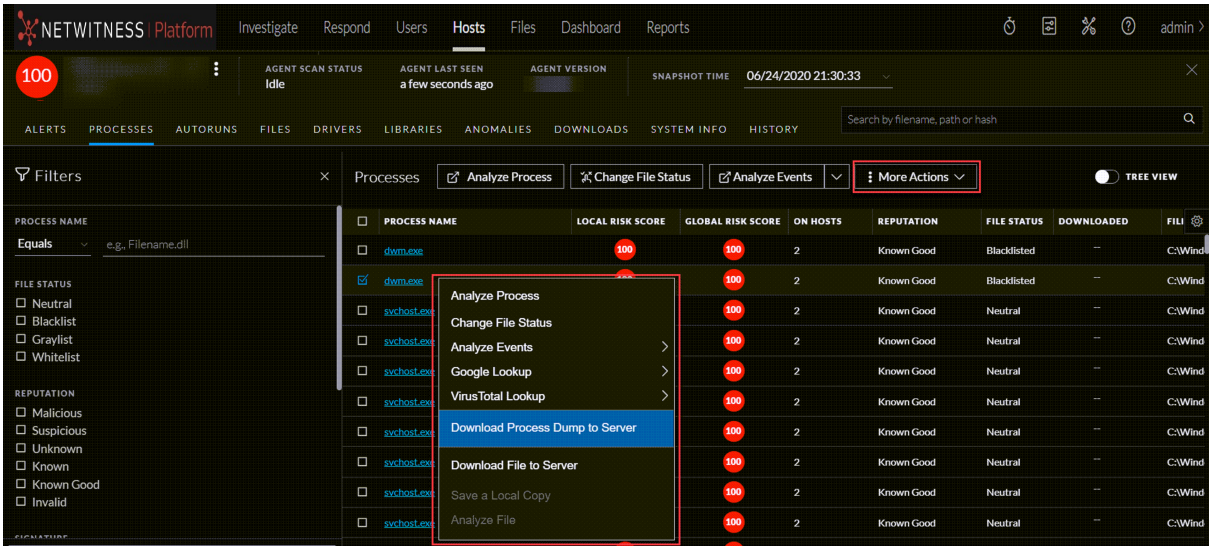
You must go to **(Admin)** > **Services** > select the Endpoint Server Service > **View** > **Config** > **Permissions** view to assign the **endpoint-server.remoteshell.manage** permission to the specific users. For more information on duplicating a role, adding a role and assigning permissions, and editing the role permissions, see **System Security and User Management Guide for 12.3**.

Administrators can configure the RBAC Permission at Endpoint Server level. You can allow the users assigned to a specific role to view and access the **NetWitness Remote Shell** feature on any specific Endpoint Server. When you allow the user to view and access the **NetWitness Remote Shell** feature only on a specific Endpoint Server such as EPS1, the user cannot view or access the **NetWitness Remote Shell** feature on any other Endpoint Servers such as EPS2 and EPS3. If the user has the access to the **NetWitness Remote Shell** feature on one of the Endpoint Servers such as EPS1, the user can view the **NetWitness Remote Shell** feature enabled in the **Endpoint Broker Server** view for all the agents. In this case, the user can access the feature and connect with the remote agent from the **Broker** view, if the selected remote agent is present only in EPS 1 and not in any other Endpoint Servers such as EPS2 and EPS3. If the user attempts to connect with the remote agent which is present only in EPS2, the **NetWitness Remote Shell** console screen keeps loading. This happens since the user can access the feature only on EPS1 and not on EPS 2.

Note: If you configure the **endpoint-server.remoteshell.manage** permission at the role level in the **Security** > **Roles** view, the users assigned to the role can access the **NetWitness Remote Shell** feature on any Endpoint Servers such as EPS 1, EPS 2, and EPS 3.
For more information on Configuring the RBAC permissions at the role level, see **(Optional) Add a Role and Assign Permissions** section in the **System Security and User Management Guide for 12.3**.

To configure Remote Shell RBAC permission to the specific users at the endpoint server level:

1. Go to  (Admin) > **Services**.
2. In the **Services** view, select the required Endpoint Server service.
3. Click  and select **View** > **Config**.
4. Go to **Permissions** tab.
5. Select the role you duplicated in the **Security** > **Roles** view from the **Roles** panel on the left.
6. Select the permission **endpoint-server.remoteshell.manage** from the **Permissions** section.



7. Click **Save**.

For more information on configuring the permissions at the Endpoint Server level, see Manage Role Permissions at Endpoint Server Level.

Download Process Dump to Server

To download process dump to the server:

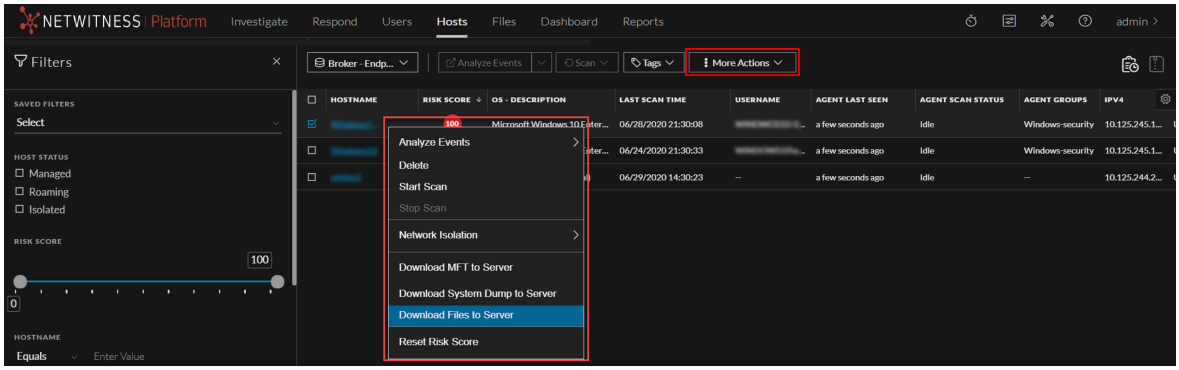
1. Go to **Hosts**.
2. Select the hostname to open the host details.
3. In the Processes, Libraries, or Anomalies tab, select **Download Process Dump to Server** from the right-click context menu, or from the **More Actions** drop-down list in the toolbar.

4. View the details of the download process dump in the **Downloads** tab within the host details. For more information, see Hosts View - Downloads Tab.

To filter, save, and delete system dump or process dump, see Filter Downloaded Files, Save Downloaded File, and Delete Downloaded Files.

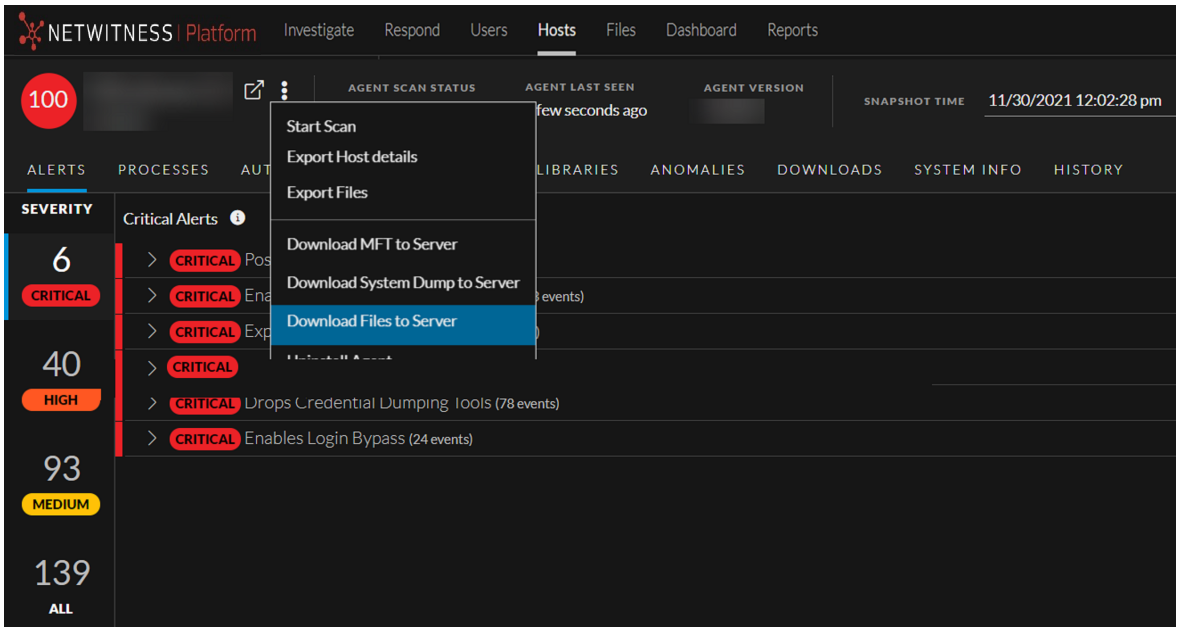
The following are some errors you might encounter during system and process dump download:

Issue	Explanation
Parameter is incorrect.	The process for which the dump is requested might be running with a different process ID.
Element not found	The process for which the dump is requested is no longer active.
java.io.IOException:Unable to unwrap data, invalid status [CLOSED]	Connection to the agent is interrupted.
java.net.SocketTimeoutException	The network is slow or the system is down.
One or more arguments are not correct	Agent might be in the Insight mode or driver is not running.



Download Files Using Full Path or Wildcard

You can manually download files that help in investigations by either providing full path of the file or using wildcard.



Note: This is applicable only for agents in Advanced mode with NetWitness Platform version 11.5 and later.

To download files to the server:

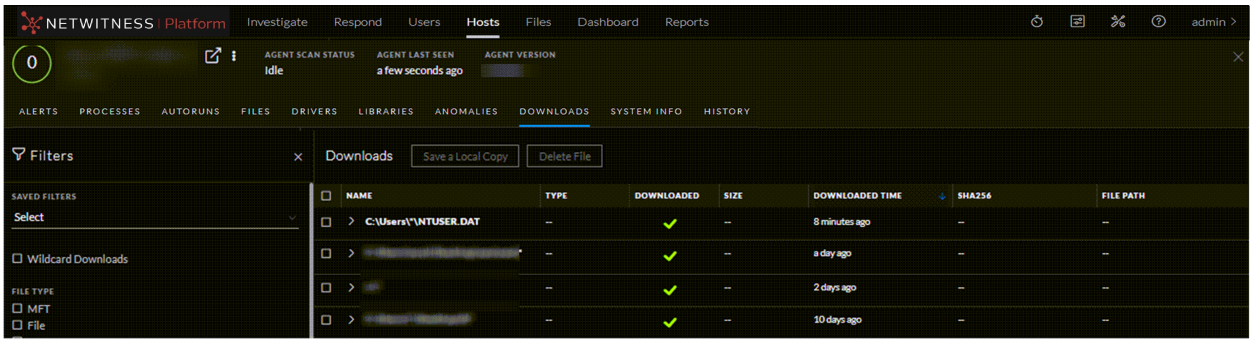
1. Go to **Hosts** and do one of the following:
   - Select one or more hosts from the same operating system, and select **Download Files to Server** from the right-click context menu, or from the **More Actions** drop-down list in the toolbar. You can download files from only top 100 selected hosts at a time.

   - Select the hostname to open the host details, click ⋮ (**More**) beside the hostname, and select **Download Files to Server**.

2. In the **Download Files to Server** dialog, enter the full path where the files may be present or search using wildcard. For wild card search, you can use a maximum of two `*`, one at a folder level and the other at a file level.

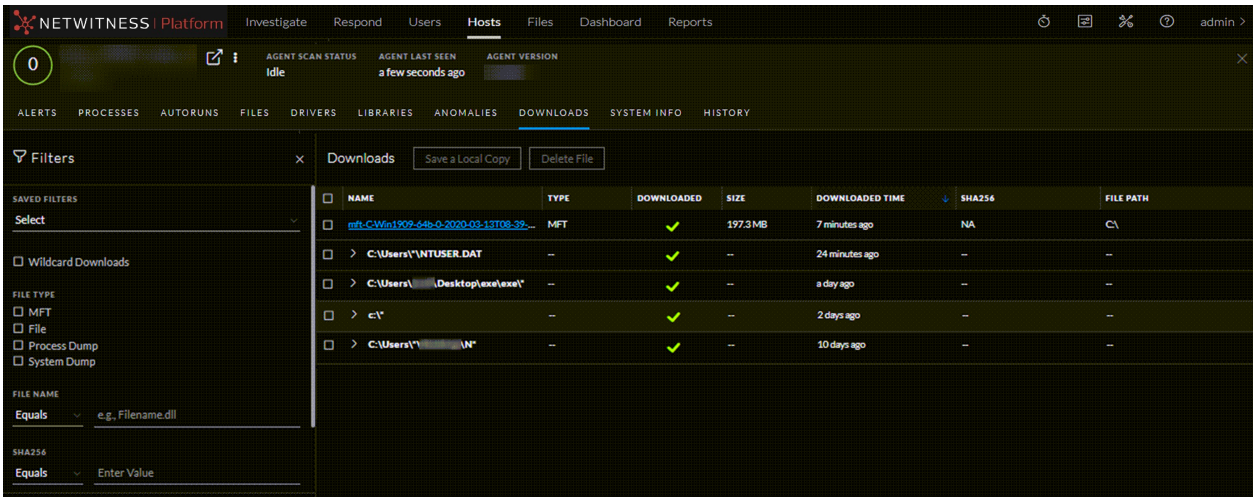
   For example, to retrieve the registry hive, you can enter the full path, `C:\Windows\System32\config\SYSTEM`.

   If you want to retrieve user settings and configuration preferences for all users, download all files using the wildcard `C:\Users\*\NTUSER.DAT`.



3. For wildcard search, enter the number of files to download and size of the file. By default, the number of files is set to 10 and file size is set to 100 MB. For example, if the maximum number of files is set to 10 and file size is set to 10 MB, first 10 files within 10 MB are downloaded.

   Note: You can set a limit to the Maximum Number of Files field on the explore page of the Endpoint server (> **[Endpoint server] > explore > endpoint/command > max-file-count**). By default, the limit is set to 100, and you can change it to any value between 100 - 1000 in each Endpoint server. In broker view, if the Endpoint servers have different max-file-count, the lesser value will be taken as the limit.

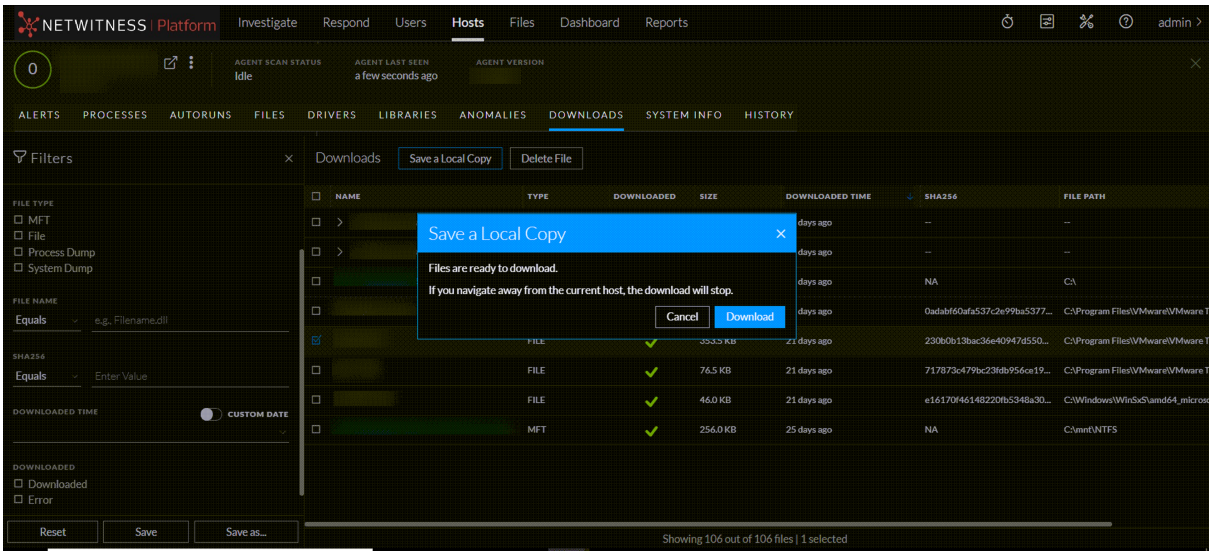


4. Click **Download**.

All files downloaded as a part of wildcard search are grouped together based on the search criteria. For example, all files downloaded using `C:\Users\*\NTUSER.DAT` are grouped, and you can click to expand and view all files under this group. You can sort the groups on the downloaded time and view the status of the download in the **Downloaded** column.

Filter Downloaded Files

You can filter the downloaded files on wildcard downloads, file type, file name, SHA256 (for files), and downloaded time. In the Downloaded Time field, you can also filter by custom date.



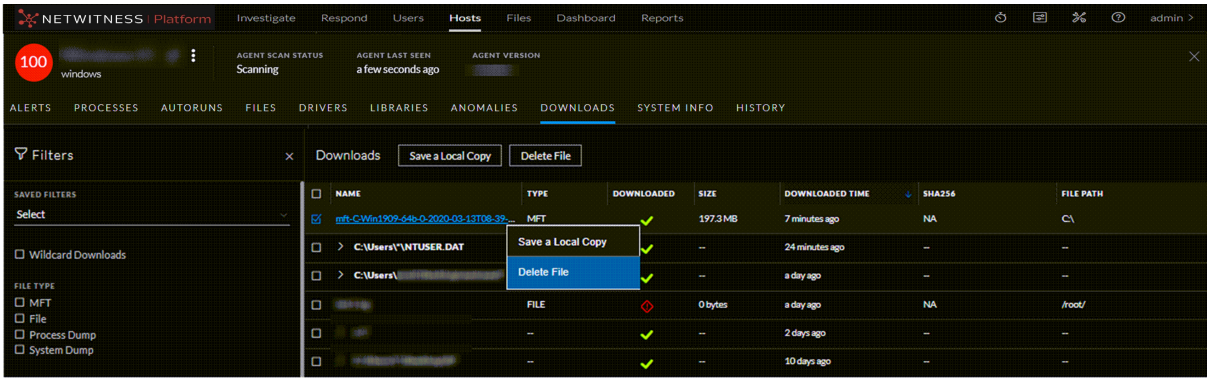
Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters panel on the left. To delete a filter, hover over the filter name and click .

Note: Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.

Save Downloaded File

You can retrieve the downloaded file and save it to your local file system for further analysis. To save the file:

1. Go to **Hosts**.
2. Select the hostname to open the host details and select the **Downloads** tab.
3. Right-click the file you want to save and select **Save a Local Copy** from the context menu or from the toolbar.



4. In the **Save a Local Copy** dialog, click **Download**.

Note: For wildcard downloads, select a file from the group that are downloaded successfully to save a local copy. You cannot save multiple files in the group at a time or save files with errors.

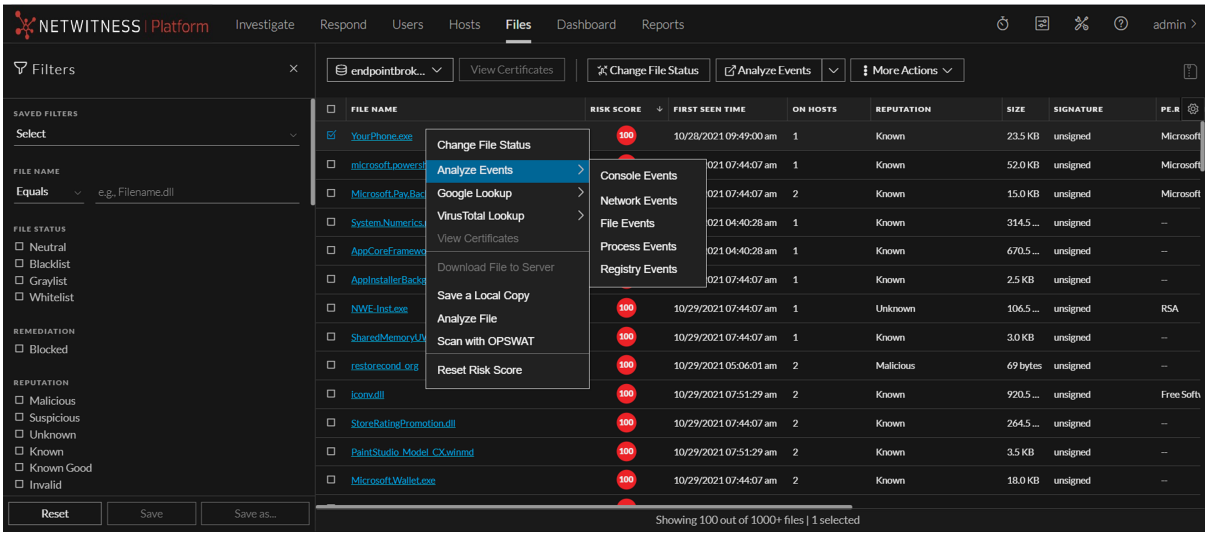
Delete Downloaded Files

If you want to delete the downloaded file from the server:

1. Go to **Hosts**.
2. Select the hostname to open the host details and select the **Downloads** tab.
3. Right-click one or more files you want to delete, and select **Delete File** from the context menu or from the toolbar.

Note: For wildcard downloads, you can select the group to delete all files that are downloaded.

Analyzing Events



If you need to investigate a particular host, IP address, username, filename, or hash to look for related activity across a time range, you can pivot to Navigate view to get the entire context of the activity. By default, the time range is set to 7 days. You can change the time range.

Note: By default, the system detects the best data source to pivot to Navigate view. To change the data source, modify the investigate service ID under endpoint or investigate in the Explore view.

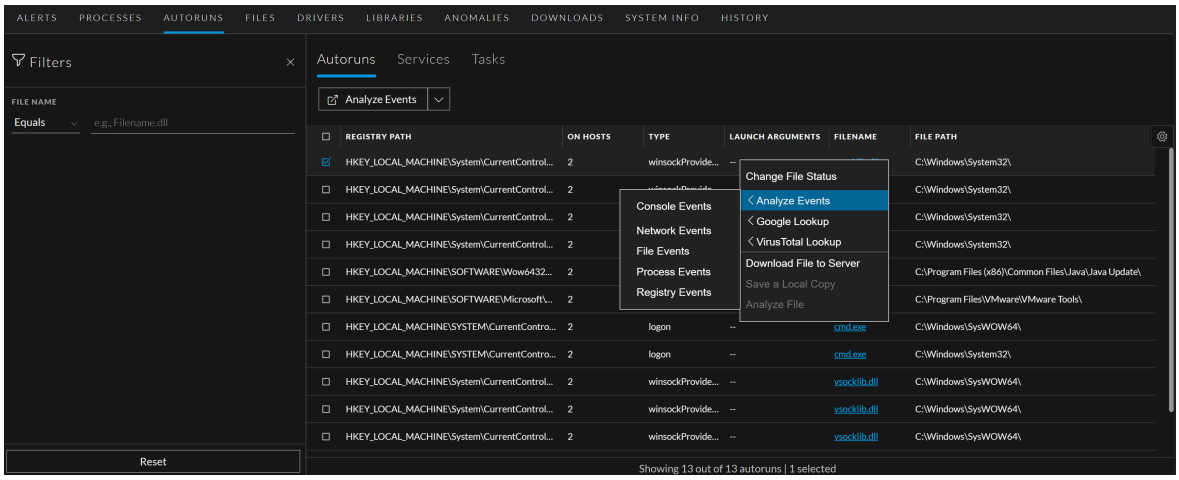
Analyze Events from Files View

To investigate a particular filename or hash (SHA256 and MD5):

1. Go to **Files**.
2. Select the file you want to analyze and do one of the following:
   - Right-click and select **Analyze Events** from the context menu.
   - Click **Analyze Events** in the toolbar.

This opens the Navigate view with data related to the file. For more information on analyzing events in the Navigate and Events views, see the *NetWitness Investigate User Guide*.

Note: If the values are not indexed, the results take time to load. For more information, see Troubleshooting NetWitness Endpoint.



Analyze Events from Hosts View

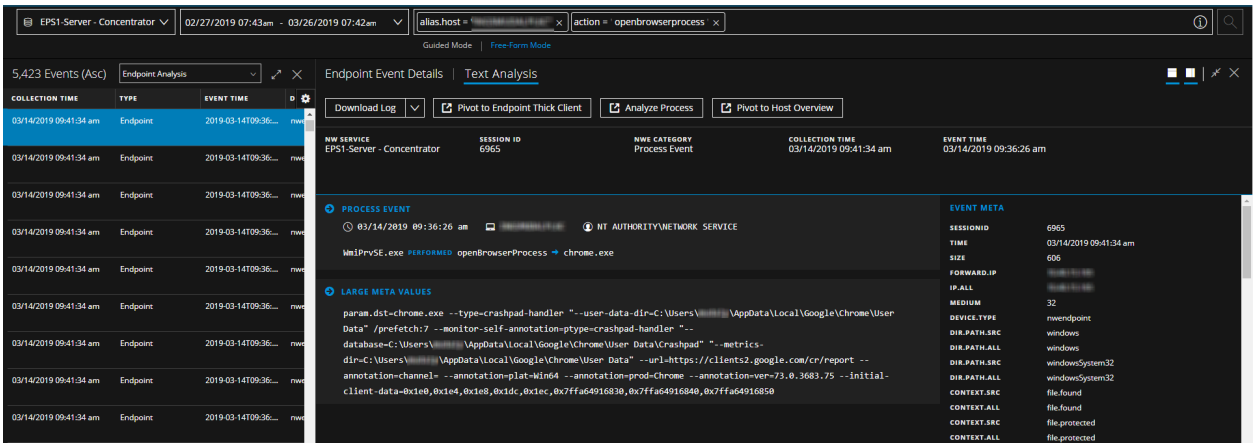
To investigate a particular host, IP address (IPV4), or username:

1. Go to **Hosts**.
2. Do one of the following:

- Right-click a host, select **Analyze Events** from the right-click context menu or in the toolbar, and select a specific event type (such as network events, file events) that you want to view.
- Select the hostname to open the host details. Right-click a file or in the toolbar, select **Analyze Events**, and select a specific event type that you want to view.

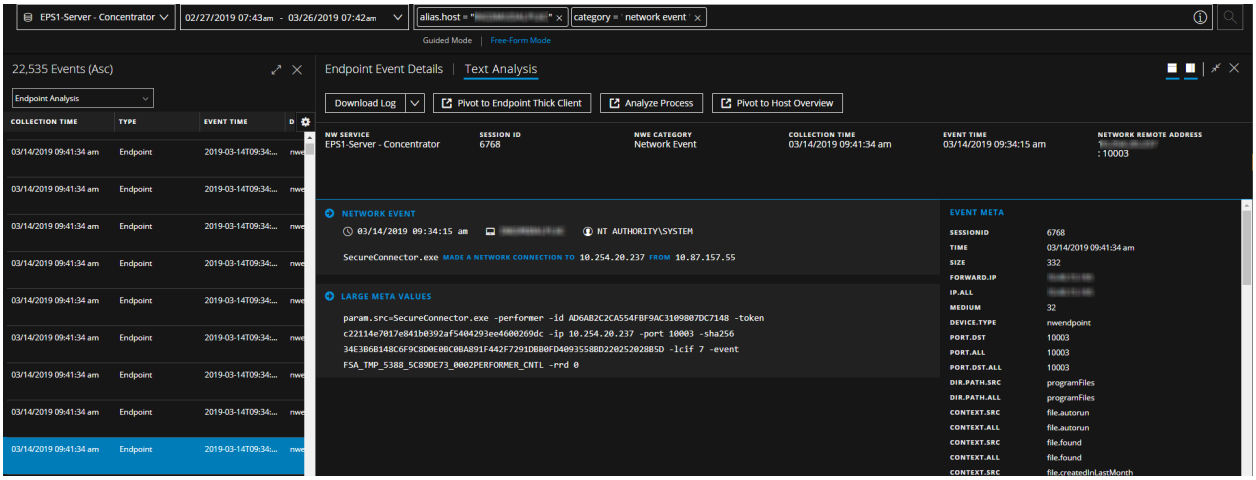
  The following figure is an example of the **Autoruns** tab.

  This opens the Navigate view with data related to the file.



For more information on analyzing events in the Navigate and Events views, see the *NetWitness Investigate User Guide*.

Text Analysis for an Endpoint Event

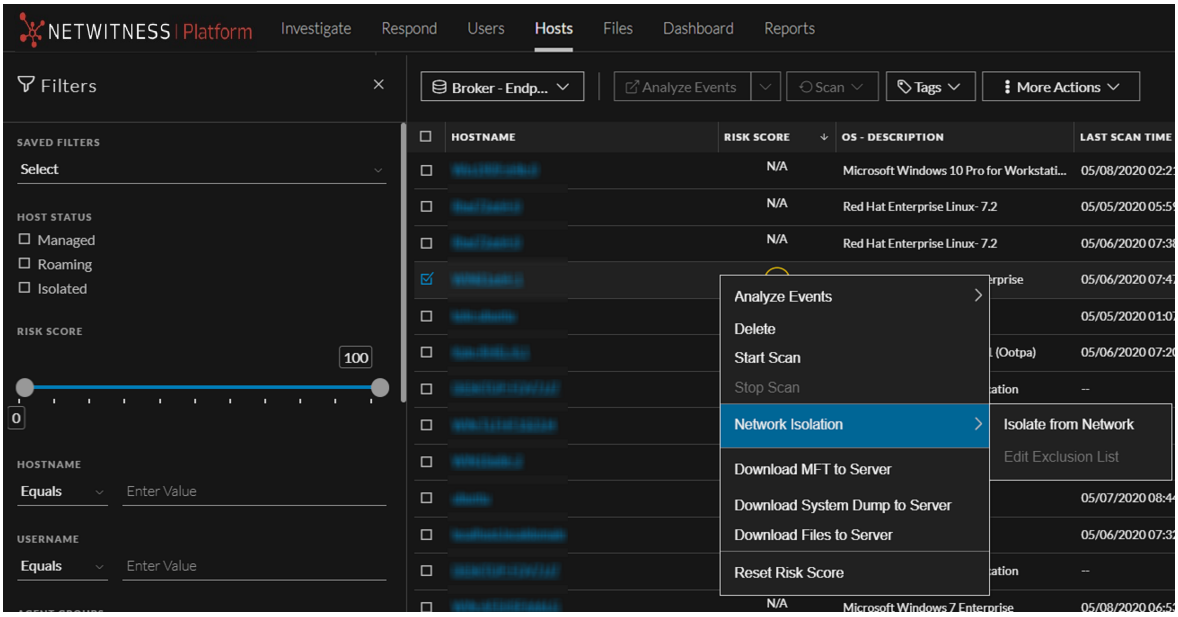


You can view all Endpoint events in their original text format in the Events view Event List panel. When you click an event in the Event list panel, the adjacent panel shows the Text Analysis. Pagination controls add flexibility when paging through the reconstructed text of an event. The Text Analysis displays the following:

- Event Header, which provides summary information about the event. (Version 11.5 and Later) The event header includes host name, process, and user name details in addition to other event details if the selected Endpoint event contains these metadata.
- Options for exporting - log, csv, xml, and json formats.
- Option to pivot to the Endpoint Thick Client to analyze the meta value.
- Option to analyze process details associated with the event.
- Option to view the host details for further analysis.

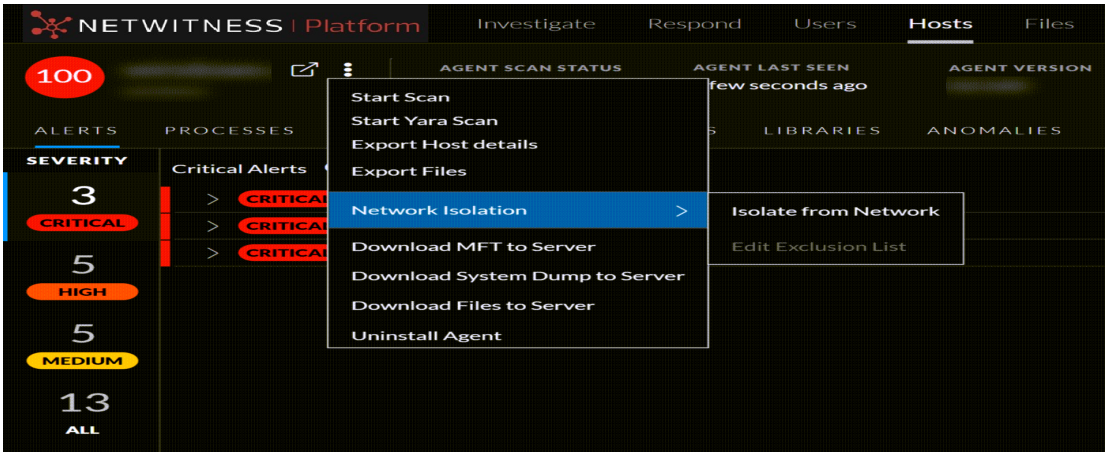
Below is an example of the Process event for Endpoint. The text in the Text Analysis panel explains that a source process `WmiPrvSE.exe` opened a browser process named `chrome.exe`. In the events, if there is a meta value that exceeds 255 characters, the value is displayed in the Large Meta Values panel.

Below is an example of the Network event:



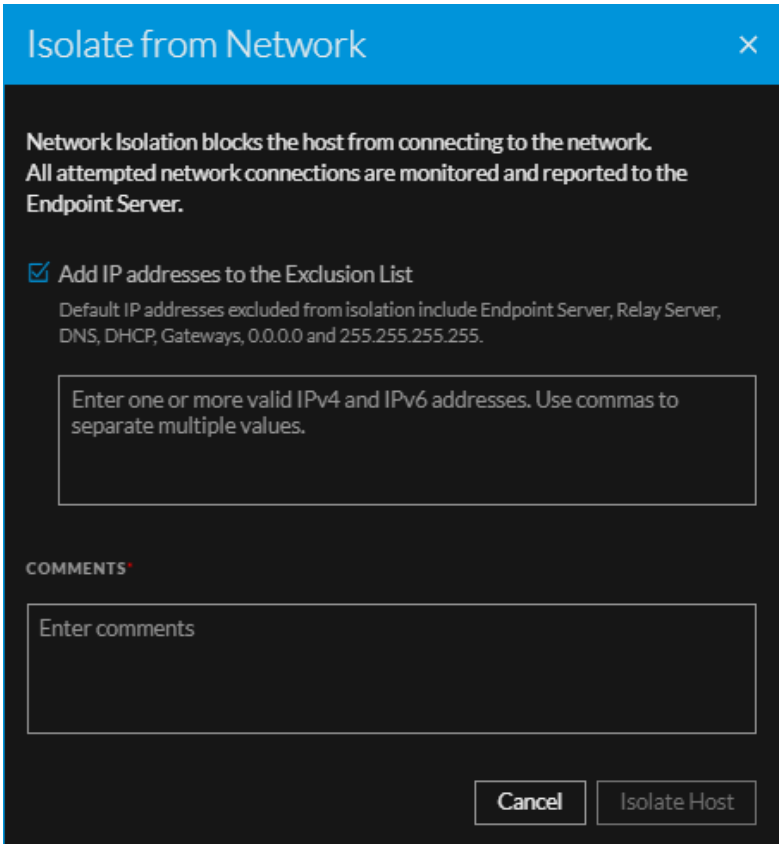
For more information on Events view, see the *NetWitness Investigate User Guide*.

Isolating Hosts from Network



Note: By default, the network isolation option is disabled in the policy, and you cannot view options mentioned in this section. To enable network isolation, in the policy configuration, select **Enabled** in the **Network Isolation** option under Response Action Settings. For more information, see the *NetWitness Endpoint Configuration Guide*.

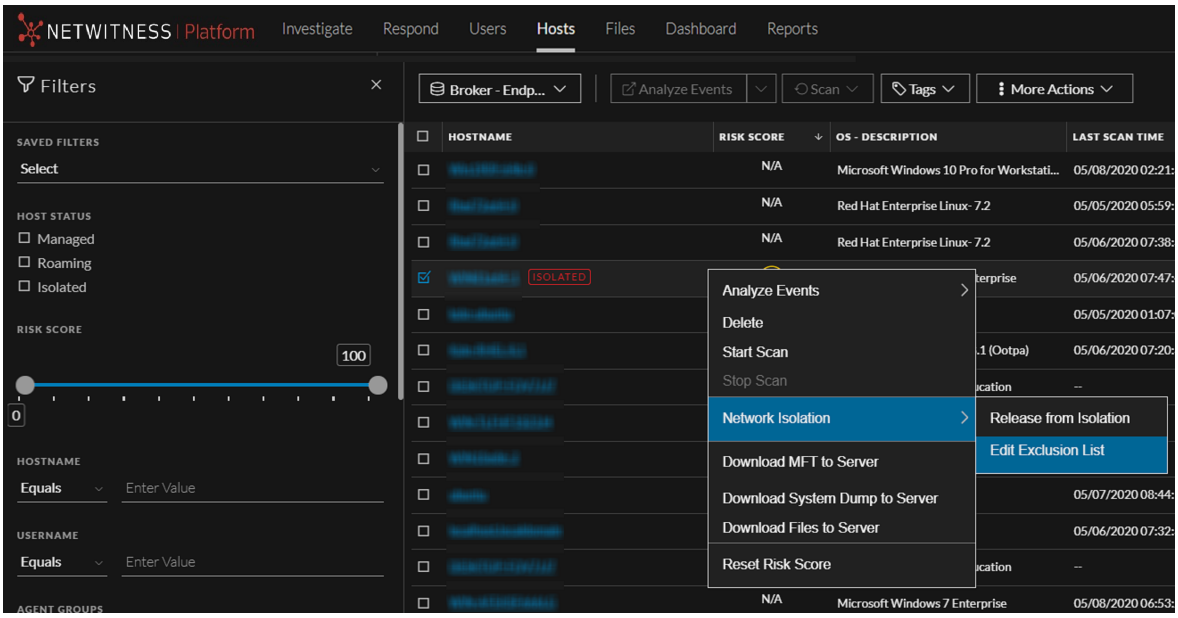
To isolate a host from the network:



1. Go to **Hosts** and do one of the following:
   - Select a host and select **Network Isolation > Isolate from Network** from the right-click context menu, or from the **More** drop-down list in the toolbar.

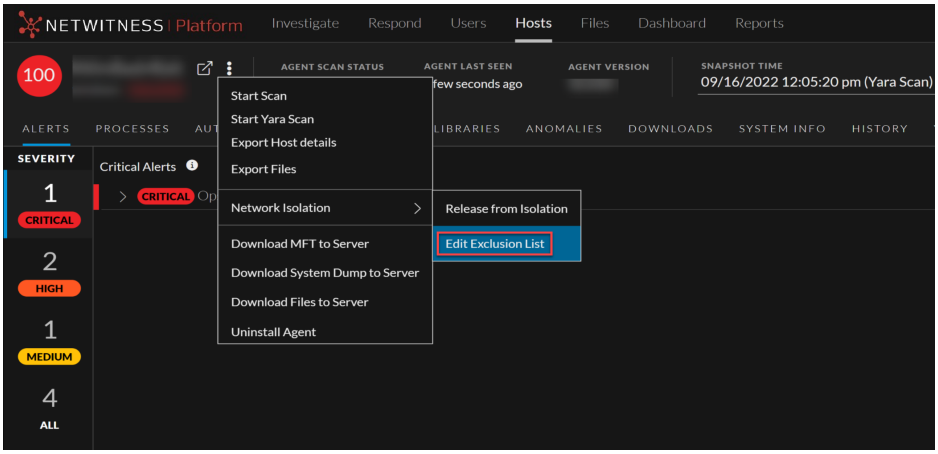
   - Select the hostname to open the host details, click ⋮ (**More**) beside the hostname, and select **Network Isolation > Isolate from Network**.

2. In the Isolate from Network dialog, by default, a set of IP addresses are excluded from isolation. For more information, see Network Isolation. To add IP addresses to the list, select the **Add your IPs to Exclusion List** checkbox. You can enter up to 100 IP addresses separated by comma.



3. Enter comments.
4. Click **Isolate Host**.

Note: When a host is isolated, the connection to the following IP addresses are allowed:
- Endpoint Server, Relay Server, DNS, DHCP, Gateways, 0.0.0.0, 255.255.255.255, and any other IP addresses that the agent connects with.
- Other IP addresses that you include in the exclusion list.

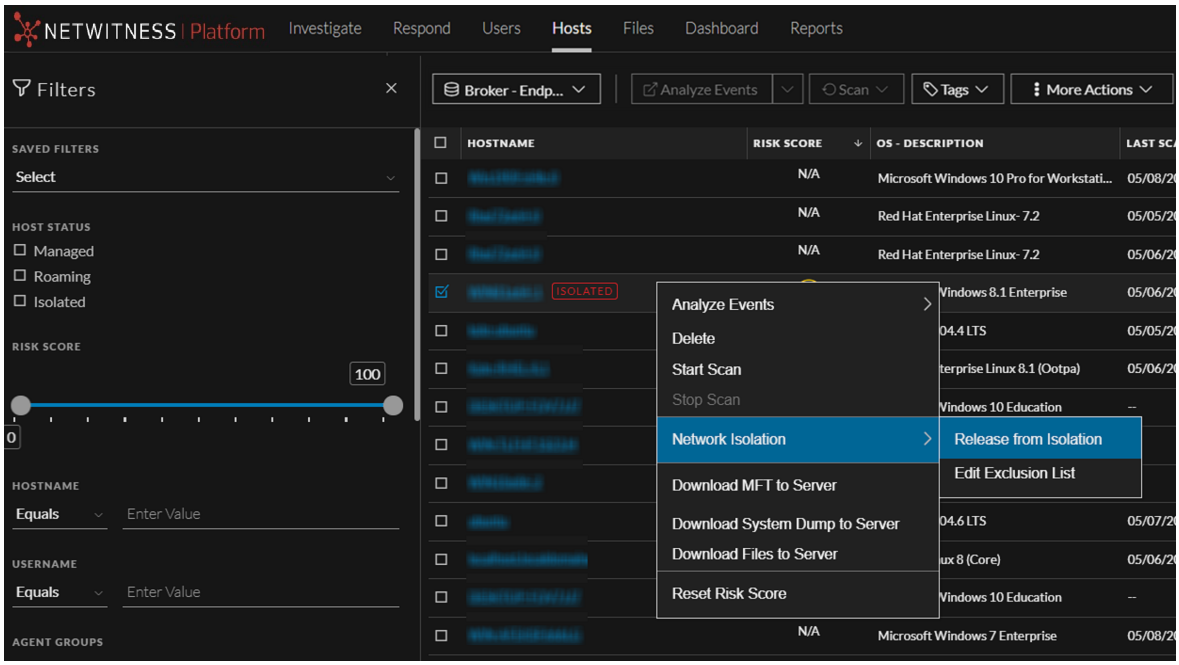


Edit Exclusion List

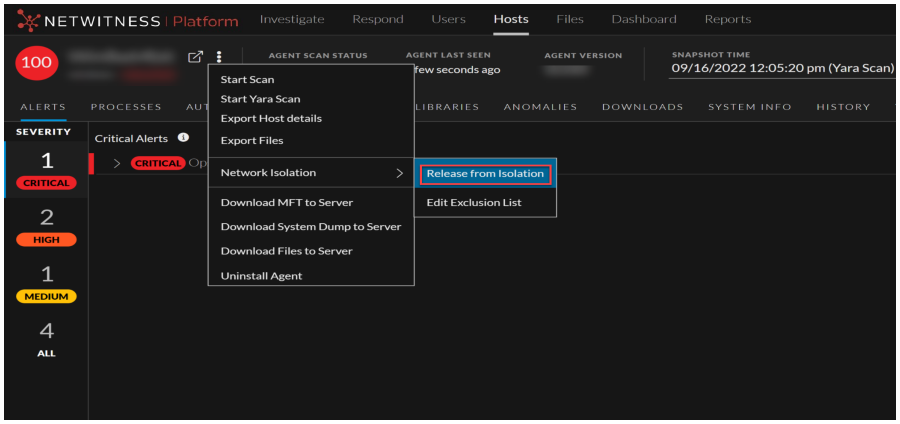
To edit the exclusion list:

1. Go to **Hosts** and do one of the following:
   - Select a host and select **Network Isolation > Edit Exclusion List** from the right-click context menu, or from the **More** drop-down list in the toolbar.

- Select the hostname to open the host details, click ⋮ (**More**) beside the hostname, and select **Network Isolation > Edit Exclusion List**.



2. Add or modify the IP addresses in the list.
3. Enter comments and click **Save**.



Release Isolated Hosts

Releasing the isolated host restores the network connection and removes IP addresses added to the Exclusion list. To release the host from isolation:

1. Go to **Hosts** and do one of the following:
   - Select a host and select **Network Isolation > Release from Isolation** from the right-click context menu, or from the **More** drop-down list in the toolbar.

- Select the hostname to open the host details, click ⋮ (**More**) beside the hostname, and select **Network Isolation > Release from Isolation**.

2. Enter comments and click **Release Host**.

High Availability (Endpoint Recovery)

The High Availability or Endpoint recovery configuration feature in the **Admin Server - Source Server Explore** view (**Admin** > **Services** > select the Source Server > **View** > **Explore** > **endpoint/recovery**) allows administrators to map the service ID of an Endpoint server with the recovery Endpoint service ID as part of recovery configuration.

Note: Map the service IDs of multiple Endpoint servers in the form of comma separated Key Value pairs. You must enter ':' in between the Key Value pairs. The Key refers to the service ID of the unavailable Endpoint server and the Value refers to the service ID of the recovery Endpoint server. For Example: <Unresponsive EPS ServiceId-1>: <Recovery EPS ServiceId-2>, < Unresponsive EPS ServiceId-3>: < Recovery EPS ServiceId-4>

To configure the Endpoint Recovery

1. Go to **Admin** > **Services**.

   The **Services** view is displayed.

2. Select the Source Server. Go to **View** > **Explore**.

   The **Explore** view is displayed.

3. Click **endpoint/recovery**.

4. Enter the service IDs of the Endpoint servers in **failover-service-id-mapping** field.

Endpoint Recovery Use Case Example

The following use case provides an example of an Endpoint administrator using the High Availability feature in the NetWitness Platform to configure the Endpoint recovery.

Use Case: Endpoint Server EPS 1 turns unresponsive

Administrator Steven finds that an Endpoint server EPS 1 in the environment is not responding from a long time and the communication between the agents and the Endpoint server EPS 1 is failing. Steven navigates to the **Admin Server - Source Server Explore** view and selects **endpoint/recovery** configuration. As part of the Endpoint recovery configuration, Steven maps the service ID of EPS1 with the service ID of an active Endpoint server EPS 2.

Pre-requisites for Endpoint Recovery Configuration

Make sure the following pre-requisites are met before you perform Endpoint Recovery Configuration.

- Before you install the recovery Endpoint server EPS 2 and perform Endpoint recovery configuration, make sure you copy the **nwerootca-key.pem** and **nwerootca-cert.pem** certificate files from EPS 1 (unresponsive Endpoint server) to EPS 2 (recovery Endpoint server). If the certificate files in EPS 1 and EPS 2 do not match, the agent fails to communicate with EPS 2 in case of EPS 1 failure.

IMPORTANT: Once you install EPS 1 on your machine, backup the **nwerootca-key.pem** and **nwerootca-cert.pem** certificate files. If you fail to do so and the EPS 1 fails due to some disaster, you cannot copy the **nwerootca-key.pem** and **nwerootca-cert.pem** certificate files in EPS 1 to EPS 2.

For more information on how to backup and copy the certificate files, see **Configuring Multiple Endpoint Log Hybrids** section in **Install NetWitness Platform Virtual Host in Virtual Environment** topic in the *Virtual Host Installation Guide for 12.3.1*.

- When you replace an unresponsive relay server configured on an Endpoint server with the new relay server, make sure you re-use the same Fully Qualified Domain Name (FQDN) or IP address of the unresponsive relay as part of the relay recovery configuration.
- You must enter the Forwarder address of the recovery Endpoint server in **Endpoint Sources** > **Policies** view immediately after mapping the service IDs of the Endpoint servers in the **Admin Server - Source Server Explore** view. During the failure of an Endpoint server EPS 1, if the IP address of the recovery Endpoint server EPS 2 changes, and you do not provide the Forwarder address of the recovery Endpoint in **Endpoint Sources** > **Policies** view, the agent fails to communicate with the recovery Endpoint server EPS 2.
- The HTTPS ports of the Primary Endpoint server and the recovery Endpoint server must match during the Endpoint recovery configuration.

DNS Recovery Configuration

Note: The agent cannot establish communication through RAR mode as part of DNS Recovery. If Endpoint server is not directly reachable, the DNS recovery fails.

When all the Endpoint servers in the deployment are unresponsive, the agent searches for the recovery Endpoint server through the DNS entry. You must configure the new recovery Endpoint server in the deployment and include it in the DNS record to allow the agent to communicate with the newly added recovery Endpoint server.

To add the recovery Endpoint server to the DNS entry

1. Enter the following in DNS server.
   - **Domain Name**: Enter the domain name of the recovery Endpoint server in the form of **<service ID>.nwrecovery.local**.

     For example: Domain Name must be entered in the form of 5bdv7ado-69a0-41f2- 8574-d3ffc78b9.nwrecovery.local.

     Here, **<service ID>** is the service ID of the unresponsive Endpoint server which is variable and **nwrecovery.local** is a static element in all the domain names.
   - IP Address: Enter the IP address of the recovery Endpoint server as the IP address for the domain name.
2. Perform Endpoint recovery configuration in **Admin Server - Source Server Explore** view. For more information, see To configure the Endpoint Recovery.

   The agent establishes communication with the newly added recovery Endpoint server.

NetWitness Endpoint with Third-Party Antivirus Products

If you want the NetWitness Endpoint agent to coexist with any of the security products, make sure to whitelist the agent. For more information, see the respective third-party product documentation.

Troubleshooting NetWitness Endpoint

This section provides information about possible issues when using NetWitness Endpoint.

General Issues

Issue	Some of the hosts or files data are not displayed when Endpoint Broker is selected for querying.
Solution	The Endpoint Broker aggregates data from all Endpoint Servers, which responds within 10 seconds. You must increase the query timeout value to see the result of Endpoint server that is online. Perform the following: 1. Go to  **(Admin) > Endpoint Broker** service. 2. Click  > **View** > **Explore**. 3. Click **endpoint/broker** node. 4. In the **query-timeout** field increase the value, for example, 30 seconds.

Issue	The Endpoint Agent is unable to communicate with the Endpoint Server. The connection may not be established due to any of the following issues: • UDP • HTTPS • Firewall

Solution	• To verify the UDP or HTTPS connection, you must verify the connection between Windows Endpoint Agent and Endpoint Server:
	1. Go to System32 folder using the following command:
	`cd C:\Windows\System32`
	2. Execute the following command:
	`<Agent Service name>.exe /testnet`
	For example, `NWEAgent.exe /testnet`
	• If the issue is with the firewall, check the incoming and outgoing firewall rules.

Issue	The Endpoint Agent is unable to communicate with the Log Decoder. The connection may not be established due to any of the following issues: • UDP • TCP • TLS

Solution	• Firewall

	• To verify the UDP, TCP, and TLS connection, you must verify the connection between Windows Endpoint Agent and the Log Decoder:
	1. Go to System32 folder using the following command:
	`cd C:\Windows\System32`
	2. Execute the following command:
	`<Agent Service name>.exe /testlognet`
	For example, `NWEAgent.exe /testlognet`
	• If the issue is with the firewall, check the incoming and outgoing firewall rules.

Multi-server Issue

Issue	Agent is not communicating with the Endpoint Server after migration.
Solution	Check the Nginx logs of the Endpoint Server to which the agent has migrated, and if the agent is communicating with error code 403, that means the certificate of the first Endpoint Server and second Endpoint Server are different. This is because during the installation of second Endpoint Server, the certificate of first Endpoint Server is not copied to the second Endpoint Server. Reinstall the second Endpoint Server by copying the certificate of first Endpoint Server, and reinstall the agent. For more information, see the *Physical Host Installation Guide*.

Hosts View Issues

Message	`An error has occurred. The Endpoint Server may be offline or inaccessible.`
Issue	When attempting to access the Hosts or Files view, the view opens with the message.
Explanation	Endpoint Server or Nginx Server is not running. Check the status of the Endpoint Server under  **(Admin) > Services** or check if the Endpoint Server host IP address is registered with the Admin Server. For more information, see the *Physical Host Installation Guide* or *Virtual Host Installation Guide*. If the service is not running, start the Endpoint Server.

Issue	Hosts view shows 'No Results Found.' error in the following scenario: • Host A belongs to Endpoint server A and does not exist in Endpoint server B. • Endpoint server B is selected in Hosts view. • In a new window/tab, open the Host details page (of Host A) • Navigate to Hosts view using **[*Host Name*] > Actions > Pivot to Investigate**

	> Hosts/Files `Endpoint server B is selected by default, and the page shows 'No results found.' error.`
Explanation	This is expected behavior. The Endpoint server that is selected first is considered to be current /active throughout the session.
Workaround	Ensure the correct Endpoint server is selected, and `Pivot to Investigate > Hosts/Files` will behave normally.

Issue	For MFT download: 1. The request fails with file not found error for drives/mount paths created on the machine after agent is installed. 2. Incorrect MFT is downloaded for the provided NTFS mount path.
Solution	Make sure that the agent version is 11.6 or later.

Files View Issues

Issue	Unable to analyze events from **Hosts** and **Files** view.
Explanation	Other than Broker or Concentrator, if any aggregation service, such as Archiver, is aggregating data from the Log Decoder that is configured for metadata forwarding from any Endpoint server, clicking **Analyze Events** from **Hosts** and **Files** view for this Endpoint server may not work. To resolve this issue: **Note:** To get the investigate-service-id: 1) Go to **(Admin) > Services > Concentrator** service. 2) Click > **View** > **Explore** tab. 3) Expand the **sys/stats** node list. 4) In the UUID filed, copy the value. 1. Go to **(Admin) > Services > Endpoint Server** service. 2. Click > **View** > **Explore** tab. 3. In the **endpoint/investigate** field, specify the **investigate-service-id**.

Policy Issue

Issue	Policy status in the Policy Details panel is not updated or shows Policy Unavailable/Permission Required.
Explanation	**Policy Unavailable** - Hosts belong to previous versions, such as NetWitness Platform 11.1 or 11.2, where a policy is not applied.

	Permission Required - If you do not have permissions, see the "Role Permissions" topic in the *System Security and User Management Guide*.

Issue	Policy Status shows error.
Explanation	Policy may have wrong configurations. Check the error description, logs in Endpoint server, and audit logs for details. Contact your system administrator with the error details.

Driver Issue

Issue	While loading the driver on the host, an error is encountered.
Explanation	Check the driver error code in the **Agent-Driver Error Code** column under **Hosts** view. Contact your system administrator with the error code.

Download Issue

Issue	Downloads (Files, MFT, System/Process dumps, etc.) fail at times.
Explanation	Downloads fail when there is not sufficient disk space on the Endpoint Server.
Workaround	Clean up some disk space and try downloading again. We recommend you keep sufficient disk space before initiating any download.

File Reputation Service Issue

Issue	When you configure RSA Live for the first time and the File Reputation service is not connected.
Solution	You must manually enable the File Reputation service. To enable the File Reputation service: 1. Go to  **(Admin) > System > Live Services**. 2. In the **Additional Live Services** section, select the enable File Reputation check box. 3. Click **Apply**.

Risk Scoring for Hosts or Files Issue

Issue	NetWitness Endpoint takes a long time to process risk scoring for Hosts or Files.

Solution	Check the backlog of alerts for risk scoring. 1. SSH to the ESA Primary appliance. 2. Execute the following command: `mongo respond-server --authenticationDatabase admin -u deploy_admin -p <deploy_admin_password> --eval 'db.staging.find({"$or":[{state:"STAGED"},{state :"WORKING"}]}).count()' --quiet` The backlog count is displayed. If the backlog count is 1 million or greater, you must disable the risk scoring and Endpoint ESA alerts. 3. To disable risk scoring: a. Go to **(Admin) > Services > Respond** service. b. Click > **View** > **Explore**. c. Expand the **respond/scheduled/jobs** node list. d. In the **risk-scoring-enabled** field, set the value to **false**. 4. To disable Endpoint ESA alerts: a. To disable NetWitness Endpoint ESA alerts generation for severity; Critical, High and Medium. i. Go to **(Configure) > ESA Rules**. The Configure view is displayed with the Rules tab open. ii. In the **Options** panel, under Deployments, select the Endpoint deployment to delete. A confirmation dialog is displayed. iii. Click **Yes**. b. To disable only Medium severity NetWitness Endpoint ESA alerts: i. Go to **(Admin) > ESA Correlation** service (on which Endpoint deployment is added). ii. Click > **View** > **Explore**. iii. Expand the **correction/alert** node list. iv. In the **transient-enabled** field, set the value to **false**.

Endpoint Broker/Server Issue

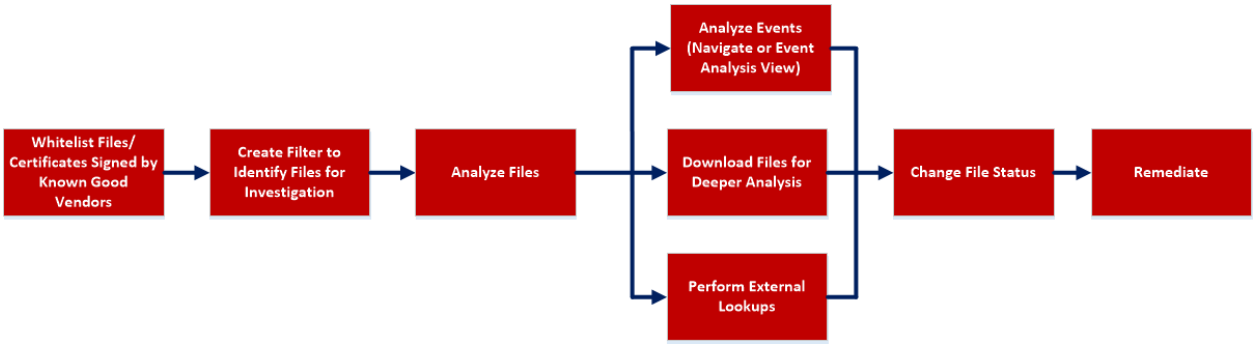
Issue	User have access to one Endpoint server and unable to access the other.
Explanation	Reach out to the administrator and check if you have access to that endpoint servers. Request for access if required.

Issue	In the Endpoint Server Broker view, the user can scan hosts that belong to a particular Endpoint server but cannot scan hosts that belong to another Endpoint server.
Explanation	User may not have access to that endpoint server. Check with the Administrator to see if the user has access.

NetWitness Endpoint Reference Materials

This section is intended to help you understand the purpose and application of NetWitness **Investigate** > **Hosts** view and **Files** view. For each view, there is a brief introduction and a What Do You Want To Do table with links to related procedures. In addition some of the reference materials include workflows and Quick Looks to highlight important features in the user interface.

- Files View
- Hosts View
- Hosts View - Details Tab
- Hosts View - Process Tab
- Hosts View - Autoruns Tab
- Hosts View - Files Tab
- Hosts View - Drivers Tab
- Hosts View - Libraries Tab
- Hosts View - Anomalies Tab
- Hosts View - Downloads Tab
- Hosts View - System Information Tab
- Hosts View - Agent History Tab
- Hosts View - YARA Rules Tab



Files View

Note: The information in this topic applies to NetWitness Version 11.1 and later.

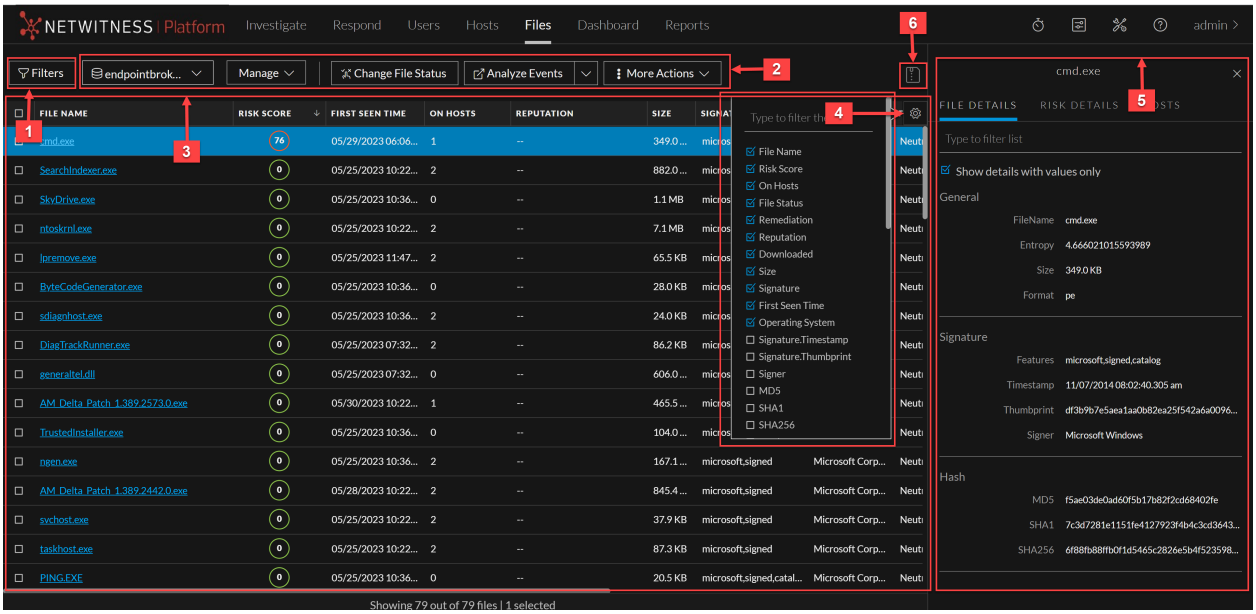
The Files view provides a holistic view of all files in your deployment. To access this view, go to **Files**. By default, the Files view displays 100 files. To display more files, click **Load More** at the bottom of the page.

You can either view files specific to an Endpoint server or view all files from multiple Endpoint servers by selecting the Endpoint Broker.

Workflow

What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	whitelist files and certificates signed by known good vendors*	Analyze Certificates
Threat Hunter	create filter to identify files for investigation*	Filter Files
Threat Hunter	analyze files*	Investigating Files
Threat Hunter	analyze events*	Analyzing Events
Threat Hunter	download files for deeper analysis*	Analyzing Downloaded Files
Threat Hunter	perform external lookups*	Launch an External Lookup for a File
Threat Hunter	change file status or remediate*	Changing File Status or Remediate



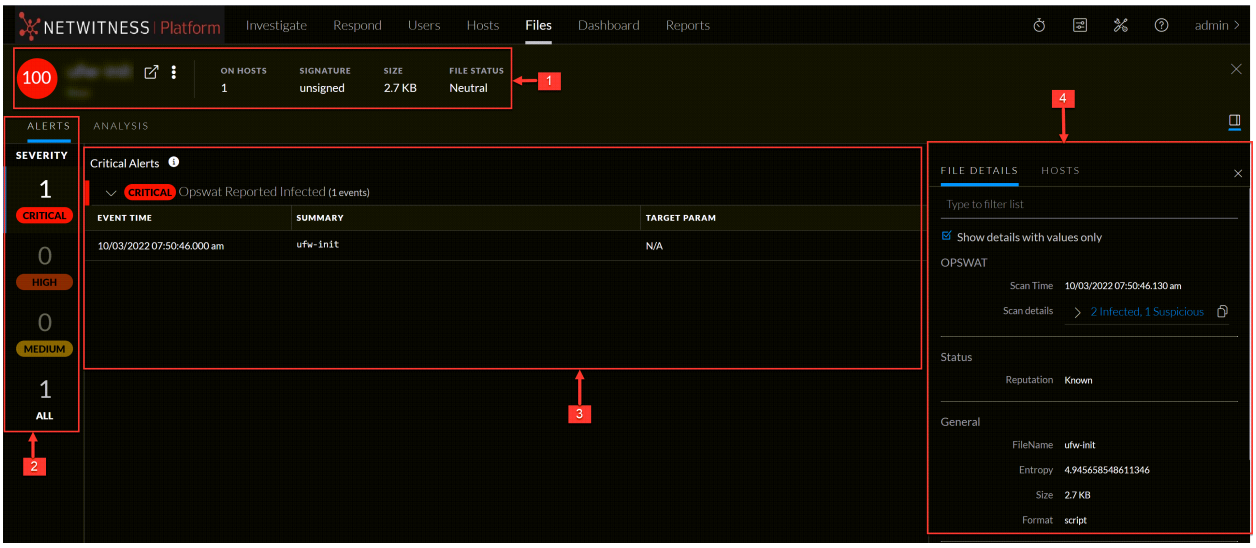
*You can perform this task in the current view

Related Topics

- Focusing on Endpoint Analysis
- Investigating Hosts
- Analyzing Downloaded Files
- Analyzing Events
- Analyze Certificates
- Manage Blocked File Hashes
- Changing File Status or Remediate

Quick Look

Below is an example of the Files view:

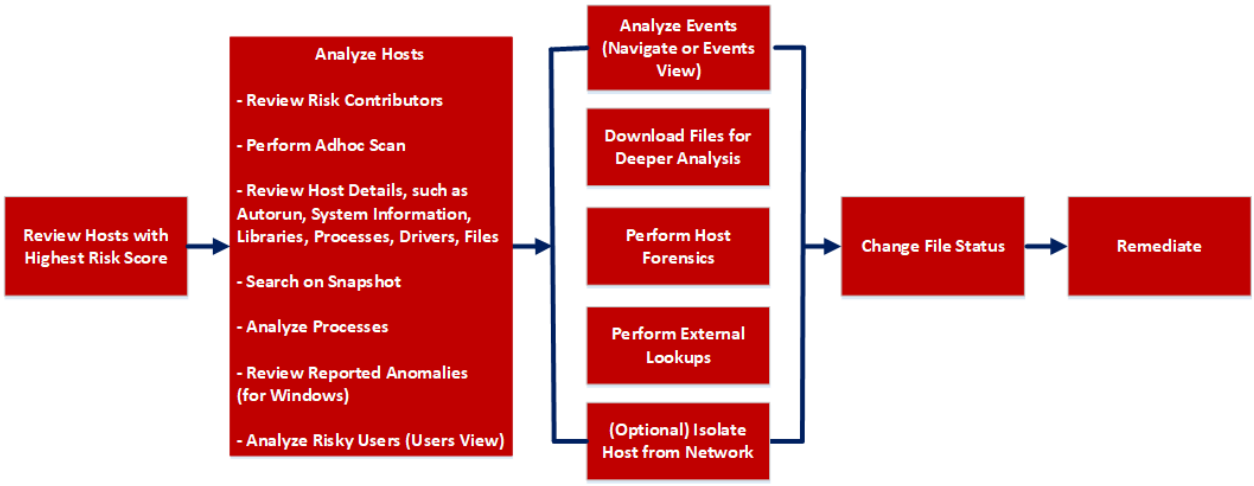


1 **Filter Files**. You can filter the files by selecting the options in the Filters panel and create filters. For more information, see Filter Files.

2	**Actions in the toolbar:** **Server drop-down list** - You can select the Endpoint server or Endpoint Broker server to view the hosts. **Manage** - You can select any of the following drop-down options in the Manage drop-down list. • **Certificates** - Allows you to view a list of code-signing certificates reported by hosts found in your deployment and their associated properties. For more information, see Analyze Certificates. • **Blocked File Hashes** - Allows you to add or import new file hashes and manage the existing blocked file hashes. **Change File Status** - Provides capabilities to manage suspect and legitimate files and block malicious or infected files to prevent future execution of the file on any host. For more information, see Changing File Status or Remediate. **Analyze Events** - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events. **More Actions** - Provides options to: • Perform external lookups. • Download files to server, save a local copy, and analyze files for deeper analysis. • Reset risk score. **Note:** You can perform the above actions from the right-click context menu.
3	**Sort Columns.** Lets you sort on column titles.
4	**Settings Menu.** You can set Files view preferences by selecting columns from the Settings menu. For more information, see Set Files Preference.
5	**Show/Hide File Properties Panel.** Click a row to show or hide the File Properties panel. It displays the following tabs: **File Details** - Displays the file information. **Risk details** - Displays the distinct alerts associated with the risk score. **Hosts** - Displays the top 100 hosts based on the risk score on which the file is present. For more information, see Analyze Hosts with File Activity.
6	**Export to CSV** - Extracts global files to a CSV file. For more information, see Export Global Files.

File Details View

To access this view, go to **Files**, and select a file. Below is an example of the File Details view:



1	**Agent and Scan Details**. You can view the following agent and scan details of the selected host: **Host name** - Name of the host. For example, `WIN-ABC`. **Risk score** - Risk score of the host. **Operating System** - Operating system on which the agent is running (Linux, Windows, or Mac). **Analyze Events** - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events. **More** - Provides options to perform external lookups. **On Hosts** - Indicates the number of hosts on which a file exist. **Signature** - Provides signatory information. **Size** - Size of the file. **File Status** - Status of the file. For example, `Neutral`.
2	**Alerts Severity** tab - Displays list of distinct alerts, such as Critical, High, Medium and All, along with the total number of events associated with the alert. **Analysis** tab - Provides detailed information about a downloaded file. For more information, see Analyzing Downloaded Files.
3	Displays events for an alert and metadata associated with a specific event.
4	**Show/Hide File Properties Panel.** Click a row to show or hide the File Properties panel. It displays the following tabs: **File Details** - Displays the file information. **Hosts** - Displays the hosts on which file activities are present. For more information, see Analyze Hosts with File Activity.

Hosts View

Note: The information in this topic applies to NetWitness Version 11.1 and later.

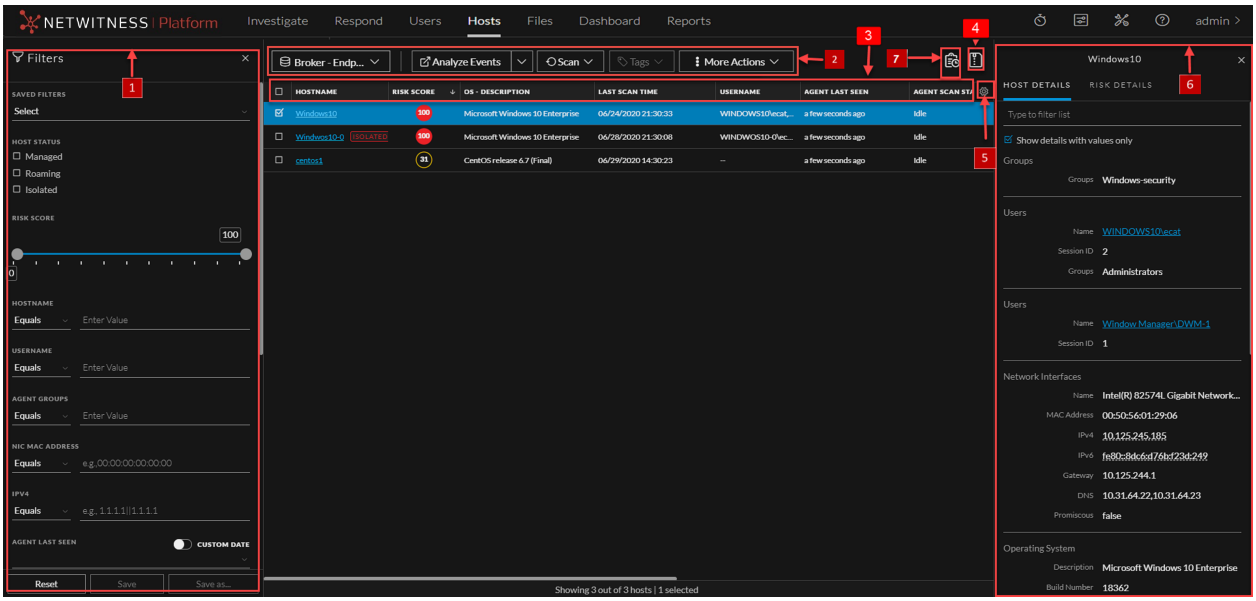
The Hosts view provides a list of all hosts with an Endpoint agent installed. To access this view, go to **Hosts**. By default, hosts are sorted based on the risk score.

Workflow

What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	review hosts with highest risk score*	Analyze Hosts Using the Risk Score
Threat Hunter	analyze hosts*	Investigating Hosts
Threat Hunter	perform adhoc scan*	Scan Hosts
Threat Hunter	review host details*	Analyze Host Details
Threat Hunter	search on snapshot*	Search Files on Host
Threat Hunter	analyze processes*	Investigating a Process
Threat Hunter	review reported anomalies*	Analyze Anomalies

User Role	I want to ...	Show me how
Threat Hunter	analyze risky users*	Analyzing Risky Users
Threat Hunter	analyze events*	Analyzing Events
Threat Hunter	download files for deeper analysis*	Analyzing Downloaded Files
Threat Hunter	perform external lookups*	Launch an External Lookup for a File
Threat Hunter	change file status or remediate*	Changing File Status or Remediate
Threat Hunter	filter files*	Filter Host Details
Threat Hunter	isolate host from network*	Isolating Hosts from Network
Threat Hunter	download MFT*, system dump*, or process dump	Performing Host Forensics



*You can perform this task in the current view.

Quick Look

Below is an example of the Hosts view:

1 **Filter Hosts**.You can filter the hosts by selecting the options in the Filters panel and create filters. For more information, see Filter Hosts.

2 **Actions in the toolbar:**

Server drop-down list - You can select the Endpoint server or Endpoint Broker server to view the hosts.

Analyze Events - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events.

Start Scan - Starts a scan for the selected hosts.

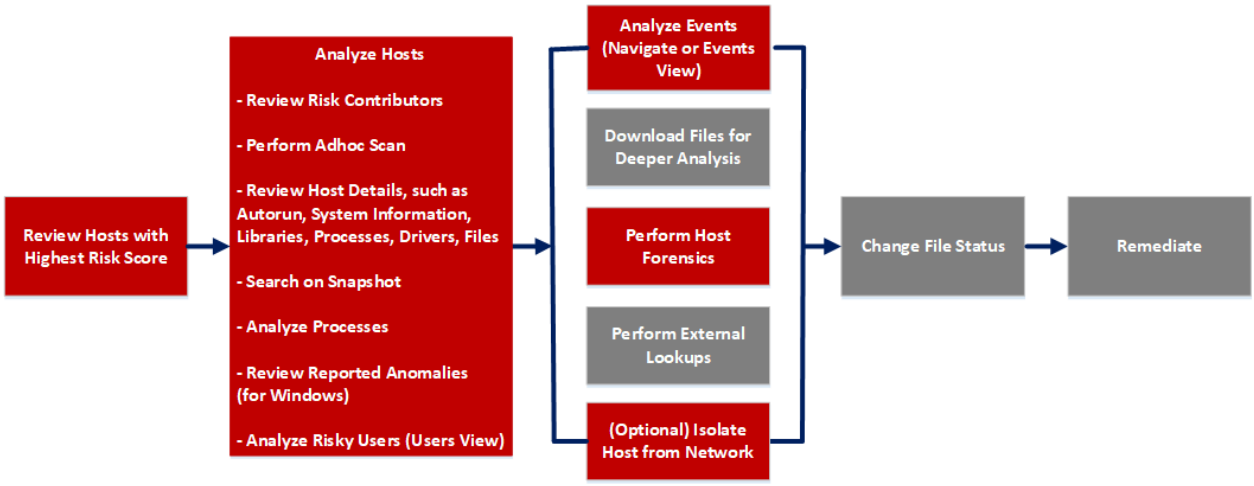
Stop Scan - Stops a scan for the selected hosts.

More Actions - Provides options to:

- Reset risk score.
- Delete - Lets you delete hosts manually from the user interface. After deletion, the Endpoint server does not process any request from this host. For more information, see Delete a Host.
- Download MFT to the server. For more information, see Performing Host Forensics.
- Download System Dump to the server. For more information, see System and Process Memory Dump.
- Isolation host from the network. For more information, see Isolating Hosts from Network.
- Perform remediation actions using the Remote Shell option. For more information, see Performing Host Forensics.

Note: You can perform the above actions from the right-click context menu.

3 **Sort Columns**. Lets you sort on column titles.



4	**Export to CSV** - Extracts host attributes to a CSV file. For more information, see Export Host Attributes.
5	**Settings Menu.** You can set Hosts view preferences by selecting columns from the Settings menu. For more information, see Set Hosts Preference.
6	**Show/Hide Host Properties Panel.** Click a row to show or hide the Host Properties panel. It displays the following tabs: **Host details** - Displays the host information such as Network Interfaces, operating system, hardware and others. **Risk details** - Displays the distinct alerts associated with the risk score.
7	**View Agent History** - Displays the list of commands issued to the agent. For more information, see View Agent History.

Hosts View - Details Tab

Note: The information in this topic applies to NetWitness Version 11.1 and later.

The Details tab provides details of the selected host. To access this view, go to **Hosts** view, and select a host.

Workflow

What do you want to do?

- Isolating Hosts from Network

Quick Look

Below is an example of the Details tab:

1 **Agent and Scan Details**. You can view the following agent and scan details of the selected host:

Host name - Name of the host. For example, `WIN-ABC`.

Risk score - Risk score of the host.

Operating System - Operating system on which the agent is running (Linux, Windows, or Mac).

Agent Scan Status - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts.

Agent Last Seen - Time when the agent last communicated with the Endpoint server.

Agent Version - Version of the agent. For example, `11.3.0.0`.

Analyze Events - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events.

More - Provides options to:

- Start a scan for the selected hosts. For more information, see Scan Hosts.
- Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes.
- Isolation host from the network. For more information, see Isolating Hosts from Network.
- Download MFT to the server. For more information, see Performing Host Forensics.
- Download System Dump to the server. For more information, see System and Process Memory Dump.
- Perform remediation actions using the Remote Shell option. For more information, see Performing Host Forensics.

Snapshot Time - Lists scanned time stamps. To view the scan history, you can select the snapshot time from the drop-down menu.

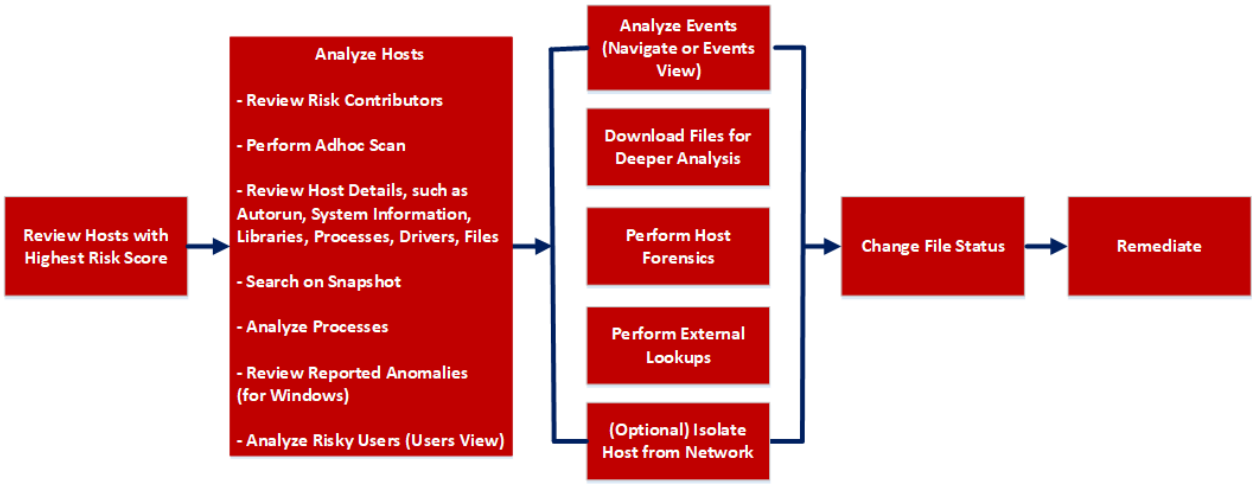
2	Search files on host. Lets you search the files on the host (file name, file path, and SHA-256 checksum). For more information, see Search Files on Host.
3	**Show/Hide Right Panel** - Displays host and policy details panel.
4	**Host Details Panel** - Displays all properties of the selected host. It is grouped as follows: **Groups** - Groups on which the host is added on. **User** - Information related to the user. **Network Interfaces** - Network adapter information, such as Mac Address, Gateway. **Operating System** - Operating system version and build information. **Agent** - Agent-related information, such as agent ID, driver error code, install time, and agent mode. **Hardware** - Information related to the architecture. **Locale** - Time zone and language that is local to the host.

5 **Policy Details Panel** - Displays the following:

- Policy Status -
  - Updated - Host has the latest policy.
  - Pending - Policy is resolved but the latest policy is not updated on the host. When the host communicates with the Endpoint server next time, the latest policy is applied if there are no errors.
  - Unavailable - Hosts that belong to previous versions, such as NetWitness Platform 11.1 or 11.2, or the source server is not installed.
  - Error - Problem applying the latest policy along with the error description.
- Blocked Hashes Status -
  - Updated - Host has the latest blocked hashes.
  - Pending - Hashes are blocked but the latest hashes are not updated on the host. When the host communicates with the Endpoint server next time, the latest hashes are applied if there are no errors.
- Evaluated Time - Time when the Endpoint server evaluated the policy.
- Relay Server. Displays the Relay Server details.
  - Server - Host name or IP address of the Relay Server.
  - Port - Port number.
  - HTTP Beacon Interval - HTTP beacon interval value in minutes.
- Complete resolved policy settings. For more information, see "Managing Policies" in the *NetWitness Endpoint Configuration Guide*.

Note: The values that are not set in the policy are not displayed.

6 **Alerts Severity** - Displays list of distinct alerts, such as Critical, High, Medium and All, along with the total number of events associated with the alert.



7 Displays events for an alert and metadata associated with a specific event. For more information, see Analyze Hosts Using the Risk Score.

Hosts View - Process Tab

Note: The information in this topic applies to NetWitness Version 11.1 and later.

The Process panel provides a list of processes running on the host. To access this tab, select a host from the **Hosts** view and click the **Process** tab.

Workflow

What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	review hosts with highest risk score*	Analyze Hosts Using the Risk Score

- Perform remediation actions using the Remote Shell option. For more information, see Performing Host Forensics.

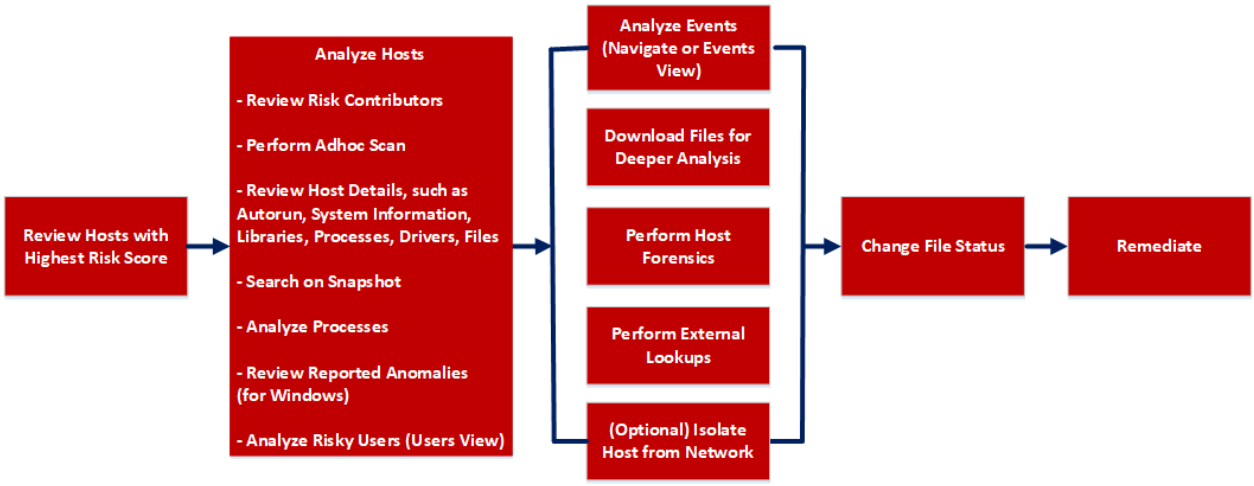
Snapshot Time - Lists scanned time stamps. To view the scan history, you select the snapshot time from the drop-down menu.

2	**Actions in the toolbar:** **Analyze Process** - Lets you perform process analysis to investigate a particular process behavior, and understand the entire process event chain, process parent-child relationships, and all associated events. For more information, see Investigating a Process. **Change File Status** - Provides capabilities to manage suspect and legitimate files and block malicious or infected file to prevent future execution of the file on any host. For more information, see Changing File Status or Remediate. **Analyze Events** - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events. **More** - Provides options to: • Perform external lookups. • Download files to server, save a local copy, and analyze files for deeper analysis. • Download process dump to server. **Note:** You can perform some of the above actions from the right-click context menu.
3	**Search on Snapshots**. Lets you search on all snapshots (file name, file path, and SHA-256 checksum). For more information, see Search Files on Host.
4	**Toggle.** Lets you toggle between List view and Tree view.
5	**Process panel** - Displays process information, such as process name, local risk score, global risk score, On Hosts, reputation status, file status, and others.
6	**Show/Hide Right Panel** - Displays the following properties of a process in the right panel: • **Details** - Displays all properties of the selected process. It is grouped as follows: **General** - General information about the file, such as file name, entropy, size, and format. **Signature** - Provides signatory information. **Hash** - Hash type of the file (MD5, SHA1, and SHA256). **Time** - Time when the file was created, modified, or accessed. **Location** - Location of the file. **Process** - Details of the process, such as image size and PID. **Image** - Image details loaded by the process. • **Local Risk Details** - Displays the alerts associated with the local risk score, such as Critical, High, Medium and All. • **Hosts** - Displays the top 100 hosts based on the risk score on which the file is present.
7	**Filter Files**. You can filter processes by selecting the options in the Filters panel and create filters. For more information, see Filter Host Details.
8	**Settings Menu.** You can set Hosts view preferences by selecting columns from the Settings menu. For more information, see Set Hosts Preference.

Process Details

Clicking the process name displays the process details of a specific process as shown in the following figure:

Field	Description
Process Name	Name of the process. For example, `server.exe`.
PID	ID of the process. For example, `492`.
Path	Path of the file associated with the process on the disk. For example, `C:\Windows\System32`.
Launch Arguments	Command line arguments passed to the process when it is launched. For example, `-k LocalServiceNoNetwork`.



- List of loaded libraries for the selected process, such as DLLs (for Windows), Dylibs (for Mac), or .SO (for Linux).
- List of autoruns (if configured).
- List of image hooks and suspicious threads (for Windows).

Hosts View - Autoruns Tab

Note: The information in this topic applies to NetWitness Version 11.1 and later.

The Autoruns panel provides a list of autoruns, services, tasks, and cron jobs running on the host. To access this tab, select a host from the **Hosts** view and click the **Autoruns** tab.

Workflow

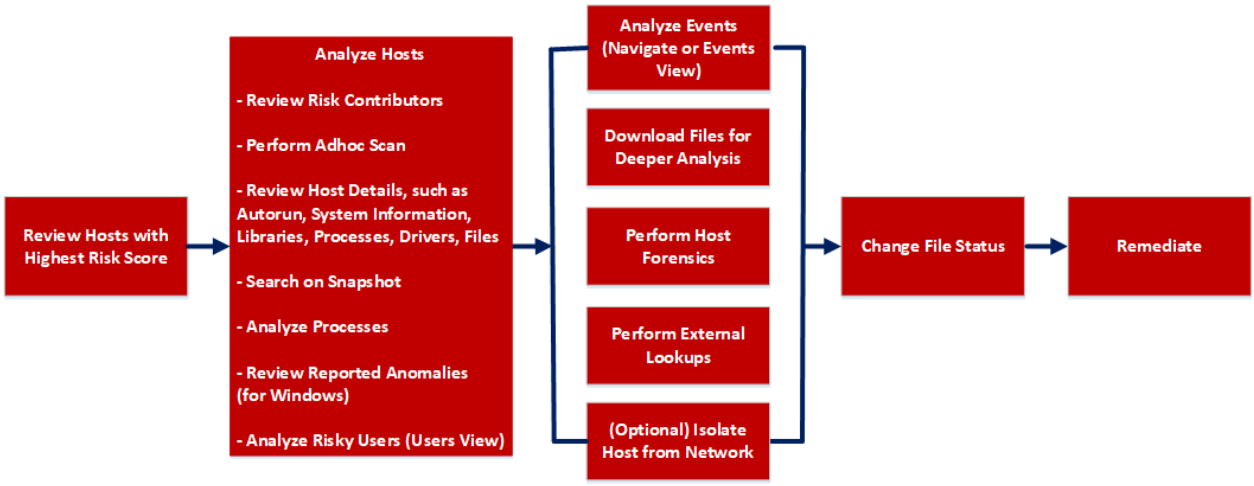
- Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes.
- Isolation host from the network. For more information, see Isolating Hosts from Network.
- Download MFT to the server. For more information, see Performing Host Forensics.
- Download System Dump to the server. For more information, see System and Process Memory Dump.
- Perform remediation actions using the Remote Shell option. For more information, see Performing Host Forensics.

Snapshot Time - Lists scanned time stamps. To view the scan history, you can select the snapshot time from the drop-down menu.



2	**Actions in the toolbar:** **Change File Status** - Provides capabilities to manage suspect and legitimate files and block malicious or infected file to prevent future execution of the file on any host. For more information, see Changing File Status or Remediate. **Analyze Events** - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events. **More Actions** - Provides options to: • Perform external lookups. • Download process dump to server. • Download files to server, save a local copy, and analyze files for deeper analysis. **Note:** You can perform some of the above actions from the right-click context menu.
3	**Search on Snapshots**. Lets you search on all snapshots (file name, file path, and SHA-256 checksum). For more information, see Search Files on Host.
4	**Details Panel** - Displays the following tabs: • **Autoruns** - Files that are executed at start-up. • **Services** - Files that are running as a service for the selected host. • **Tasks/Cron jobs** - Files that are configured to run as scheduled tasks along with the trigger.
5	**Show/Hide Right Panel** - Displays the following properties in the right panel: • **Details** - Displays all properties of the selected process. It is grouped as follows: **General** - General information about the file, such as file name, entropy, size, and format. **Signature** - Provides signatory information. **Hash** - Hash type of the file (MD5, SHA1, and SHA256). **Time** - Time when the file was created, modified, or accessed. **Location** - Location of the file. **Autoruns/Services/Tasks** - Details related to autrouns, services, or tasks. • **Local Risk Details** - Displays the alerts associated with the local risk score, such as Critical, High, Medium and All. • **Hosts** -Displays the top 100 hosts based on the risk score on which the file is present.
6	Clicking a filename lets you navigate to the Files view for further analysis.
7	**Filter Files**. You can filter files by selecting the options in the Filters panel and create filters. For more information, see Filter Host Details.
8	**Settings Menu.** You can set Hosts view preferences by selecting columns from the Settings menu. For more information, see Set Hosts Preference.

Hosts View - Files Tab

Note: The information in this topic applies to NetWitness Version 11.1 and later.

The Files tab displays all files on the host including the files deleted within last 30 days. To access this tab, select a host from the **Hosts** view and click the **Files** tab. By default, it displays 100 files. To display more files, click **Load More** at the bottom of the page.

Workflow

What do you want to do?

Quick Look

Below is an example of the Files tab:

1 **Agent and Scan Details**. You can view the following agent and scan details of the selected host:

Host name - Name of the host. For example, `WIN-ABC`.

Risk score - Risk score of the host.

Operating System - Operating system on which the agent is running (Linux, Windows, or Mac).

Agent Scan Status - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts.

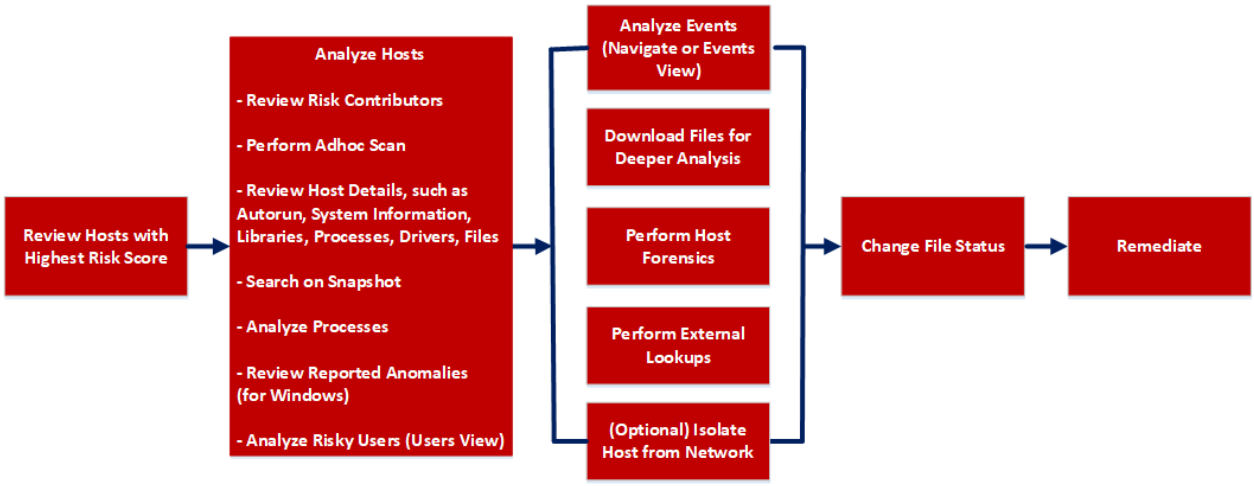
Agent Last Seen - Time when the agent last communicated with the Endpoint server.

Agent Version - Version of the agent. For example, `11.3.0.0`.

More - Provides options to:

- Start a scan for the selected hosts. For more information, see Scan Hosts.
- Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes.
- Isolation host from the network. For more information, see Isolating Hosts from Network.
- Download MFT to the server. For more information, see Performing Host Forensics.
- Download System Dump to the server. For more information, see System and Process Memory Dump.
- Perform remediation actions using the Remote Shell option. For more information, see Performing Host Forensics.

Snapshot Time - Lists scanned time stamps. To view the scan history, you can select the snapshot time from the drop-down menu.



2	**Actions in the toolbar:** **Change File Status** - Provides capabilities to manage suspect and legitimate files and block malicious or infected file to prevent future execution of the file on any host. For more information, see Changing File Status or Remediate. **Analyze Events** - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events. **More Actions** - Provides options to: • Perform external lookups. • Download files to server, save a local copy, and analyze files for deeper analysis. **Note:** You can perform some of the above actions from the right-click context menu.
3	Search files on host. Lets you search the files on the host (file name, file path, and SHA-256 checksum). For more information, see Search Files on Host.
4	**All Files Available on Host** - Lists all files (reported as part of scan and tracking) on the host. By default, **All Files Available on Host** toggle is enabled for Windows and Mac.
5	**Details Panel** - Displays information, such as filename, local risk score, global risk score, on hosts, reputation status, file status, package details and others.
6	**Show/Hide Right Panel** - Displays the following properties in the right panel: • Details - Displays all properties of the selected process. It is grouped as follows: **General** - General information about the file, such as file name, entropy, size, and format. **Signature** - Provides signatory information. **Hash** - Hash type of the file (MD5, SHA1, and SHA256). **Time** - Time when the file was created, modified, or accessed. **Location** - Location of the file. • Local Risk Details - Displays the alerts associated with the local risk score, such as Critical, High, Medium and All. • Hosts - Displays the top 100 hosts based on the risk score on which the file is present.
7	Clicking a filename lets you navigate to the Files view for further analysis.
8	**Filter Files**. You can filter files by selecting the options in the Filters panel and create filters. **Note:** In the **Deleted** column, a trash icon appears next to the deleted file. The **Deleted** column is not displayed if you disable **All Files Available On Host**. For more information, see Filter Host Details.
9	**Settings Menu.** You can set Hosts view preferences by selecting columns from the Settings menu. For more information, see Set Hosts Preference.

Hosts View - Drivers Tab

Note: The information in this topic applies to NetWitness Version 11.1 and later.

The Drivers tab lists the drivers running on the hosts at the time of scan. To access this tab, select a host from the **Hosts** view and click the **Drivers** tab.

Image Hooks

Image hooks found in executable image are displayed in the following columns.

Columns	Description
Type	Type of the hook . Possible values are - inline, iat, eat, or exception Handler.
Local Risk Score	Risk score of suspicious or malicious activities performed by the file on a specific host.
Global Risk Score	Aggregated score of all suspicious and malicious activities performed by the file across all hosts.
Reputation	Reputation of a file hash. The statuses are - Malicious, Suspicious, Unknown, Known, Known Good, and Invalid.
Signature	Provides signatory information.
Downloaded	Indicates the status of the downloaded file - Downloaded, Not Downloaded, and Error.
Hooked Process	Process in which hooks are placed.
Hooked Filename	Name of the file that was modified by the hook.
Hooked Symbol	Symbol in which the hook is performed.

Kernel Hooks

Hooks found on kernel objects are displayed in the following columns.

Category	Description
Type	Type of kernel object which was modified. Possible values are: objectInitializer,basicObjectPointer, majorFunction, invalidObject, fastIO, notifyRoutine, attachedDevice, device, miniPort, sdt, sysEnter, or type.idt.
Driver name	Name of the driver which placed the hooks.
Local Risk Score	Risk score of suspicious or malicious activities performed by the file on a specific host.
Global Risk Score	Aggregated score of all suspicious and malicious activities performed by the file across all hosts.

Category	Description
Reputation	Reputation of a file hash. The statuses are - Malicious, Suspicious, Unknown, Known, Known Good, and Invalid.
Signature	Provides signatory information.
Downloaded	Indicates the status of the downloaded file - Downloaded, Not Downloaded, and Error.
Object Function	Name of the object function hooked into.
Hooked File Name	Name of the file that was modified by the hook.

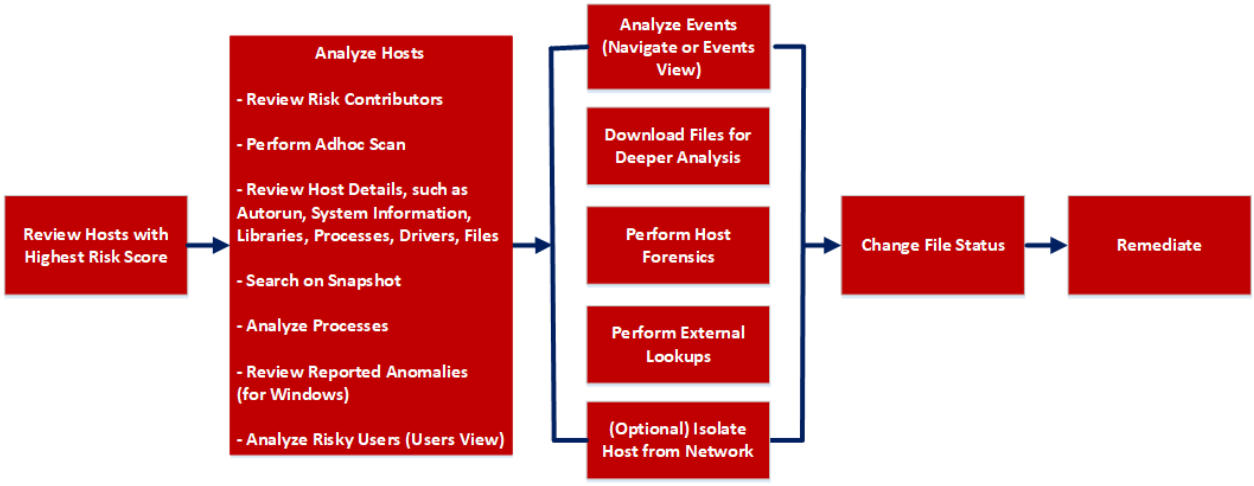
Suspicious Threads

Threads whose service table was hooked are displayed in the following columns.

Category	Description
Start Address	Start Address - Start address of the thread.
DLL Name	Name of the DLL.
Local Risk Score	Risk score of suspicious or malicious activities performed by the file on a specific host.
Global Risk Score	Aggregated score of all suspicious and malicious activities performed by the file across all hosts.
Reputation	Reputation of a file hash. The statuses are - Malicious, Suspicious, Unknown, Known, Known Good, and Invalid.
Process	File name and PID of the process in which thread is running.
Downloaded	Indicates the status of the downloaded file - Downloaded, Not Downloaded, and Error.
Signature	Provides signatory information.
Thread ID	ID of the running thread.
Thread Environment Block	Address of the thread environment block.

Registry Discrepancies

Configuration settings and options on Microsoft Windows operating systems that are stored are displayed in the following columns.



Category	Description
Hive	Name of the registry hive when possible, otherwise it displays the hive ID. Possible values are: `hkeyClassesRoot`, `hkeyCurrentUser`, `hkeyLocalMachine`, `hkeyUsers`, or `hkeyPerformanceData`.
Reason	Type of registry discrepancy. Possible values are: notFound, embeddedNull, accessDenied, parentIsHidden, or dataMismatch.
Registry Path	Registry path that is affected. The value is separated by a @ character.
Raw Type	Value type found in the low-level parsing.
Raw Data	Value data extracted from the low-level parsing.
API Type	Value type from the Win32 registry API.
API Data	Value data from the Win32 registry API.

Hosts View - Downloads Tab

Note: The information in this topic applies to NetWitness Version 11.4 and later.

The Downloads tab provides information about all downloads (MFT, files, system dump, and process dump) performed on the host. To access this tab, select a host from the **Hosts** view and click the **Downloads** tab.

Workflow

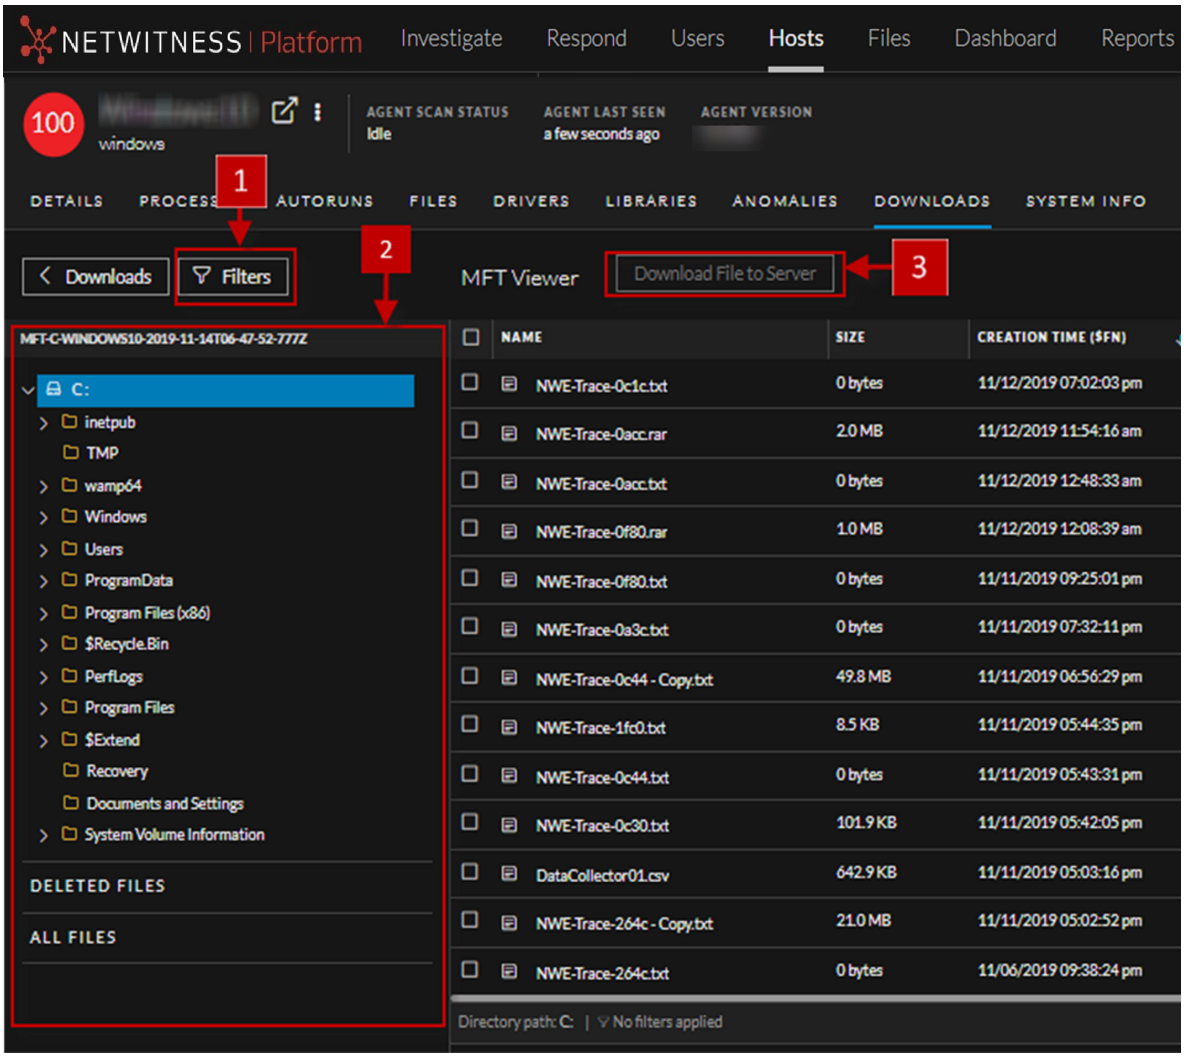
Quick Look

Below is an example of the Downloads tab:

1	**Agent and Scan Details**. You can view the following agent and scan details of the selected host: **Host name** - Name of the host. For example, `WIN-ABC`. **Risk score** - Risk score of the host. **Operating System** - Operating system on which the agent is running (Linux, Windows, or Mac). **Agent Scan Status** - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts. **Agent Last Seen** - Time when the agent last communicated with the Endpoint server. **Agent Version** - Version of the agent. For example, `11.3.0.0`. **More** - Provides options to: • Start a scan for the selected hosts. For more information, see Scan Hosts. • Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes. • Isolation host from the network. For more information, see Isolating Hosts from Network. • Download MFT to the server. For more information, see Performing Host Forensics. • Download files to the server. For more information, see Download Files Using Full Path or Wildcard. • Download System Dump to the server. For more information, see System and Process Memory Dump. • Perform remediation actions using the Remote Shell option. For more information, see Performing Host Forensics.
2	**Filter Files**. You can filter downloaded files by selecting the options in the Filters panel and create filters. For more information, see Performing Host Forensics.
3	**Actions in the toolbar:** **Save a Local Copy** - Lets you retrieve the downloaded MFT and save it to your local file system for further analysis. **Delete File** - Deletes the downloaded MFT from the server. For more information, see Performing Host Forensics.
4	**View MFT Details**. Click the filename to view the MFT details. For more information, see MFT Viewer.

The table displays the following information:



Column	Description
File Name	Name of the file that is downloaded. For example, `VGAuthService.exe`.
Type	Type of file downloaded - MFT, file, memory dump.

Column	Description
Downloaded	Status of the download:  - Download successful  - Processing the downloaded file  - Errors including download failed  - Errors downloading one or more files in the group.
Size	Size of the downloaded file.
Downloaded Time	Time when the MFT was downloaded.
SHA256	SHA256 of the file. **Note:** This is applicable only for files.

MFT Viewer

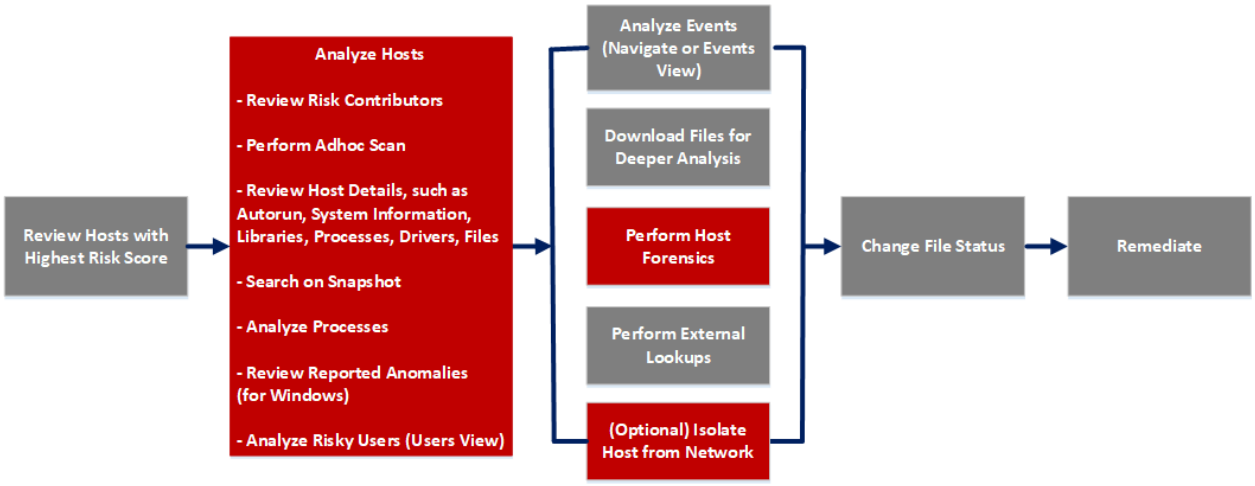
You can analyze the downloaded MFT using the MFT Viewer. For more information, see Analyze Downloaded MFT.

Below is an example of the MFT Viewer:

1. **Filter Files**. You can filter files by selecting the options in the Filters panel and create filters. For more information, see Filter MFT.
2. **Folder Details**. Lets you view the content of the MFT.
3. **Download File to Server**. Downloads files to the server.

The table displays the following information:

Column	Description
Name	Name of the file. For example, `dtf.exe`.
Size	Size of the file.
Creation Time ($FN)	File Name ($FN) creation time.
Creation Time ($SI)	Standard Information ($SI) creation time.



Column	Description
Modification time ($FN)	$FN modified time.
Modification time ($SI)	$SI modified time.
Access time ($FN)	$FN access time.
Access time ($SI)	$SI access time.
Update time ($FN)	$FN updated time.
Update time ($SI)	$SI updated time.
Full Path	Path of the file.
Allocated Size	File size on the disk.
Archive	Indicates if a file is archived.
Compressed	Indicates if a file is compressed.
Encrypted	Indicates if a file is encrypted.
Hidden	Indicates if a file is hidden.
Directory	Indicates if it is a directory.
Extension	Type of the file. For example, exe, pdf, txt.

Hosts View - System Information Tab

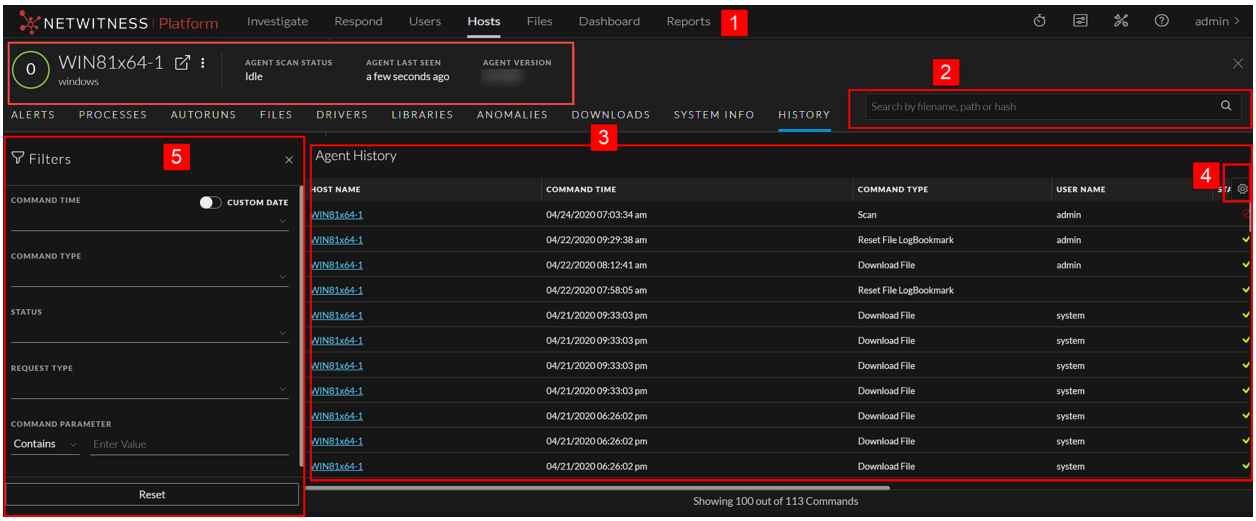
Below is an example of the System Information tab:

1	**Agent and Scan Details**. You can view the following agent and scan details of the selected host: **Host name** - Name of the host. For example, `WIN-ABC`. **Risk score** - Risk score of the host. **Operating System** - Operating system on which the agent is running (Linux, Windows, or Mac). **Agent Scan Status** - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts. **Agent Last Seen** - Time when the agent last communicated with the Endpoint server. **Agent Version** - Version of the agent. For example, `11.3.0.0`. **More** - Provides options to: • Start a scan for the selected hosts. For more information, see Scan Hosts. • Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes. • Isolation host from the network. For more information, see Isolating Hosts from Network. • Download MFT to the server. For more information, see Performing Host Forensics. • Download System Dump to the server. For more information, see System and Process Memory Dump. • Perform remediation actions using the Remote Shell option. For more information, see Performing Host Forensics. **Snapshot Time** - Lists scanned time stamps. To view the scan history, you can select the snapshot time from the drop-down menu.
2	**Search on Snapshots**. Lets you search on all snapshots (file name, file path, and SHA-256 checksum). For more information, see Search Files on Host.
3	**System Information Panel** - See System Information Panel.

System Information Panel

The System Information panel displays the following tabs:

Tabs	Description
Host File Entries	All network redirections written in the host file. For example, IP Address - `10.10.10.3` and DNS Name - `localhost,localhost.localdomain,localhost4,localhost4.localdomain4`
Network Shares	Network name of the shared resource (for Windows only). For example, Name - `Admin$`, Description - `Remote Admin`, Path - `C:\`, Permissions - `None`, Type - `disk, special`, Max Users - `4294967295`, Current Users - `0`.



Tabs	Description
Security Products	Installed security products (for Windows only). For example, Display Name - `Windows Defender`, Instance - `D68DDC3A-831F-4FAE-9E44-DA132C1ACF46`, Features - `Enabled`, Type - `antiVirus`.
Windows Patches	List of patches applied by Windows update (for Windows only). For example, `KB2959936`.
Security Configuration	Security configuration details on the host. For example, firewall disabled or enabled, smart screen filter disabled or enabled. This field is only applicable for Windows and Mac.
Installed Applications	Displays the information about the various applications installed on a Windows machine.

Hosts View - Agent History Tab

The Agent History tab lists the commands along with the respective status and additional details.

Quick Look

Below is an example of the Agent History tab:

1 **Agent and Scan Details**. You can view the following agent and scan details of the selected host:

Host name - Name of the host. For example, `WIN-ABC`.

Risk score - Risk score of the host.

Operating System - Operating system on which the agent is running (Linux, Windows, or Mac).

Agent Scan Status - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts.

Agent Last Seen - Time when the agent last communicated with the Endpoint server.

Agent Version - Version of the agent. For example, `11.3.0.0`.

More - Provides options to:

- Start a scan for the selected hosts. For more information, see Scan Hosts.
- Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes.
- Isolation host from the network. For more information, see Isolating Hosts from Network.
- Download MFT to the server. For more information, see Performing Host Forensics.
- Download System Dump to the server. For more information, see System and Process Memory Dump.
- Perform remediation actions using the Remote Shell option. For more information, see Performing Host Forensics.

2 **Search files on host**. Lets you search the files on the host (file name, file path, and SHA-256 checksum).

3 **Details Panel**- Displays information, such as:

- **Command Time** - Command issued time.
- **Command Type** - Type of the command (Identity, scan, stop scan, download file, MFT, process dump, system dump, start isolation, update isolation exclusion list, stop isolation, reset file logbookmark, and download multiple files, agent upgrade, and uninstall agent) issued.
- **User Name** - User who issued the command. For example, Analyst, System.
- **Status** - Status (success, pending, expired, failed, or cancelled) of the command issued.

Note: If the command's status is expired, it means that the agent is unable to process the command even after five retries.

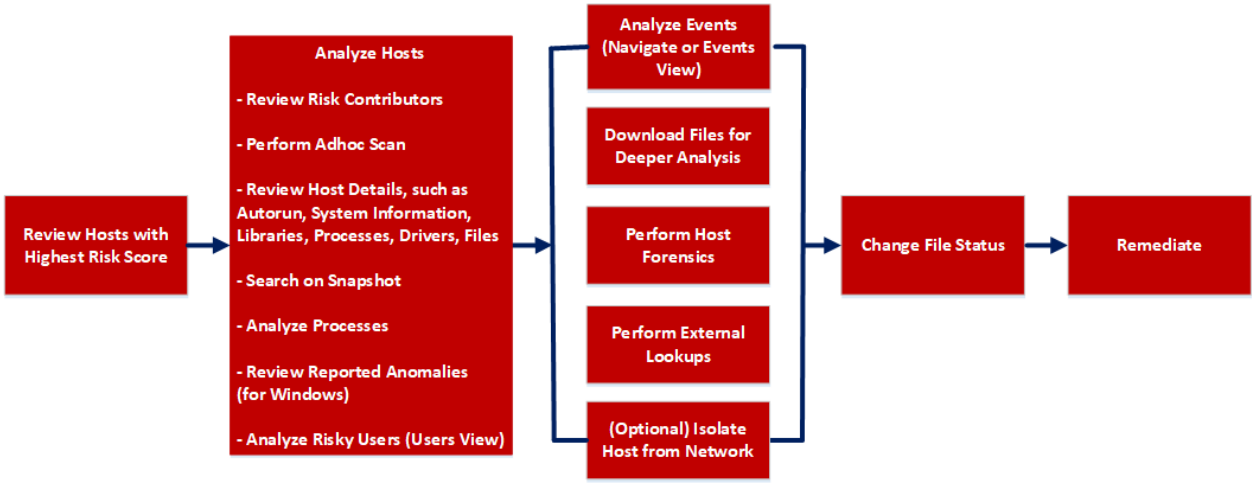
- **Command Parameter** - Parameters associated with the command. For example, Command parameter for command type Download File is `path = C:\Windows\System32\ | filename = cmd.exe | hash = 6f88fb88ffb0f1d5465c2826e5b4f523598b1b8378377c8378ffebc171bad18b`

Note: Command types such as identity, scan, stop scan, stop isolation, system dump do not contain any associated command parameters.

- **Processed Time** - Time at which the command is completed, pending, expired, failed, or cancelled.
- **Last Retrieval time** - Last time when the command is issued to the agent.
- **Total Retrieval** - The number of times the command is issued to the agent.

Note: After you upgrade to NetWitness version 11.5, the commands executed in the previous versions are displayed automatically. The fields such as last retrieval time, total retrieval, and user do not contain any values. For system generated commands, the user field value shows as system.

4 **Filter Files**. You can filter commands by selecting the options in the Filters panel. For more information, see Filter Host Details.



5 **Settings Menu.** You can set History view preferences by selecting columns from the Settings menu.

Hosts View - YARA Rules Tab

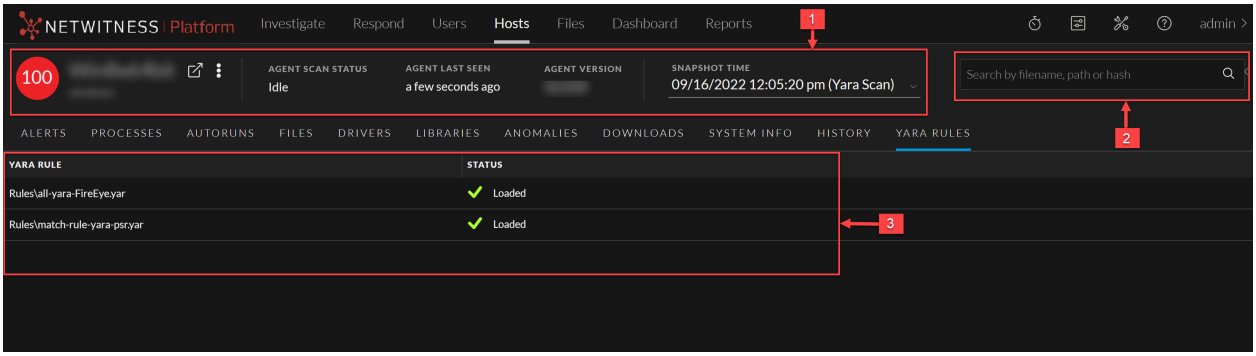
Note: The information in this topic applies to NetWitness Version 12.0 and later.

The **YARA Rules** tab lists the various YARA rules used for the scan and their status. To access this tab, select a host from the **Hosts** view and click the **YARA Rules** tab.

Workflow

What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	review hosts with highest risk score	Analyze Hosts Using the Risk Score
Threat Hunter	analyze hosts*	Investigating Hosts
Threat Hunter	perform adhoc scan*	Scan Hosts
Threat Hunter	review host details	Analyze Host Details
Threat Hunter	search on snapshot*	Search Files on Host
Threat Hunter	analyze processes	Investigating a Process
Threat Hunter	review reported anomalies	Analyze Anomalies
Threat Hunter	analyze risky users	Analyzing Risky Users
Threat Hunter	analyze events	Analyzing Events
Threat Hunter	download files for deeper analysis	Analyzing Downloaded Files
Threat Hunter	perform external lookups	Launch an External Lookup for a File
Threat Hunter	change file status or remediate	Changing File Status or Remediate
Threat Hunter	isolate host from network*	Isolating Hosts from Network
Threat Hunter	download MFT, system dump, or process dump*	Performing Host Forensics



*You can perform this task in the current view.

System Configuration Overview

In the Administration System view, administrators can configure system settings to receive optimal performance from NetWitness. This diagram show the available configuration options.

In this guide, the standard procedures provide instructions for administrators who want to customize settings that apply across the system in NetWitness. Although some of these settings have default values, the administrator needs to view and evaluate all default values.

Additional procedures are not essential for the set up of NetWitness, they include certain customization options that are beyond the usual setup; for example, adding custom context menus or setting up a proxy.

In addition, reference topics and troubleshooting topics supply detailed information about the user interface and suggestions for resolving possible issues.

The following sections describe system configuration:

- Standard Procedures provide instructions for administrators who want to customize settings that apply across the system in NetWitness.
- Additional Procedures provide instructions for setting up customization options that are beyond the usual system configuration.

Standard Procedures

The topics in this section provide instructions for administrators who want to customize settings that apply across the system in NetWitness. Although some of these settings have default values, the administrator needs to view and evaluate all default values. The procedures can be performed in any sequence and are listed alphabetically.

Access System Settings

Configure Notification Servers

Configure Notification Outputs

Configure Templates for Notifications

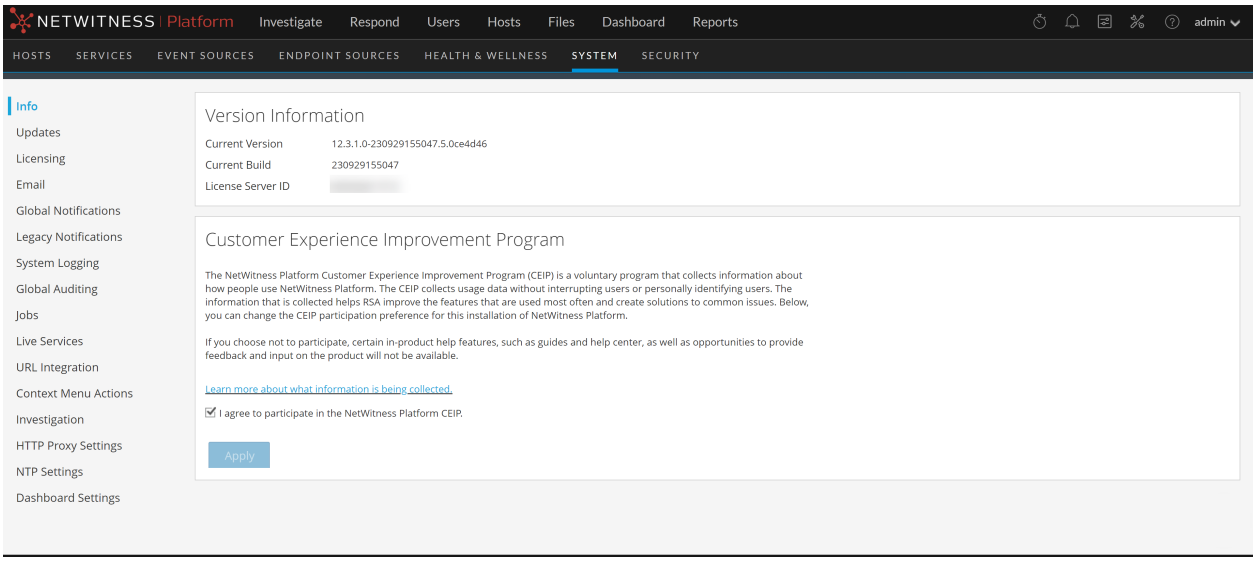
Configure the Email Settings as Notification Server

Configure Email Servers and Notification Accounts

Configure Global Audit Logging

Configure Investigation Settings

Configure Live Services Settings



Configure Log File Settings

Access System Settings

This topic introduces the system configuration capabilities of NetWitness in the Administration System view. Administrators can configure notifications, email notifications, global audit logging, logging settings, connection to Live Services, and URL integration in NetWitness.

To access the system settings:

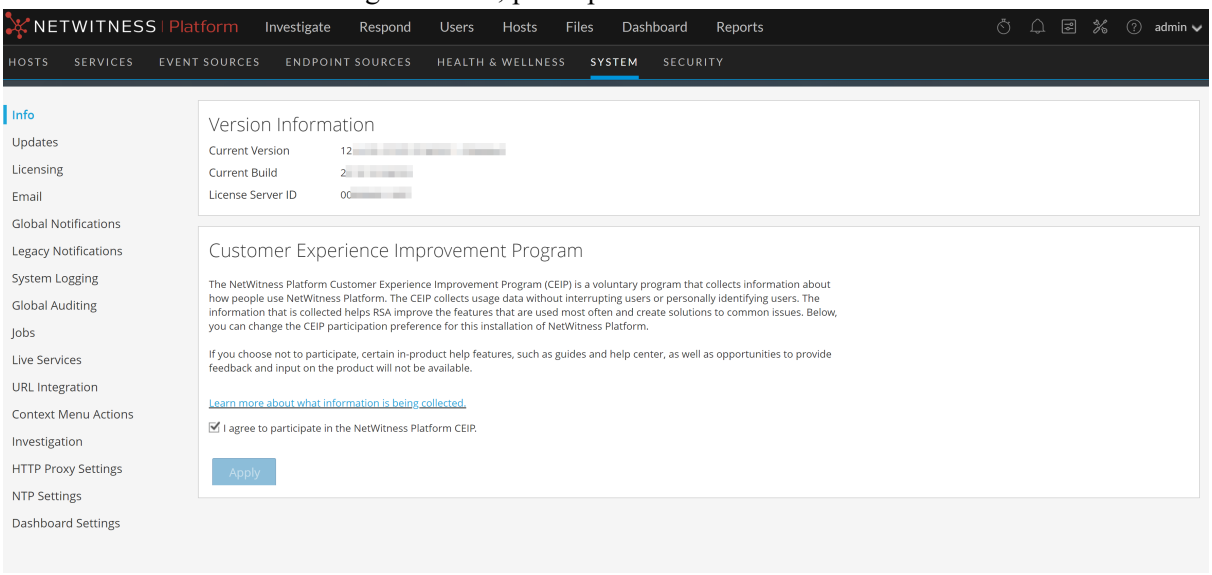
Go to  **(Admin)** > **System**.
The Administration System view is displayed.

On the left panel of the Administration System view is an options panel listing all system nodes available for configuration. When you select a node, the associated content is displayed in the right panel.

Configure the Customer Experience Improvement Program

The NetWitness Platform Customer Experience Improvement Program (CEIP) is an initiative to improve NetWitness Platform continuously. When a customer enables this program, the CEIP performs analytics about how individual users work in NetWitness Platform without interrupting their workflow or personally identifying users. As part of this program, NetWitness gains insights on your deployment and license usage and analytics on pages viewed and actions taken. NetWitness uses these analytics when making decisions about new features and enhancements to prioritize in upcoming releases. For more information, see Customer Experience Improvement Program and Live Feedback: Learn More.

By default, a dialog box is shown to enable or disable the CEIP program if users have not already subscribed to the program. When a user with ***config-server.configuration.manage***, ***Access Live Module***, ***Manage Live System Settings***, and ***Access Administration Module*** permissions login to NetWitness Platform for the first time on a server that did not have NetWitness Live Feedback enabled, a popup dialog presents the option to enable the feature. Users who log in later do not see the dialog, but any Administrator or users with required permissions can disable or enable the feature anytime.



In Version 12.3.1.0 or later, the CEIP program dialog is displayed to all the users who previously did not enable the CEIP program and are upgrading to a major or minor NetWitness Platform version. For example, in NetWitness Platform version 12.3.1.0, the major version is represented by 12 while the minor version is represented by 3.

Disable or Enable Participation in the CEIP

All user roles with permission to view the (Admin) > **System** > **Info** panel can see if the program is enabled or not, but only users with ***config-server.configuration.manage***, ***Access Live Module***, ***Manage Live System Settings***, and ***Access Administration Module*** permissions assigned to their user role can change the setting. The built-in Administrators role has these permissions assigned by default. To view or change permissions assigned to a role, see "Change Permissions Assigned to a Role" in the *System Security and User Configuration Guide*.

To enable or disable participation in the program:

1. As a user with the required permissions, log in to the NetWitness Platform.
2. Go to **(Admin)** > **System** > **Info**.
   The checkbox next to **I agree to participate in the NetWitness Platform CEIP** indicates whether the feature is enabled. In the figure below, participation is enabled.

3. Do one of the following:
   a. To enable participation, under Customer Experience Improvement Program, set the checkbox next to **I agree to participate in the NetWitness Platform CEIP**. A check mark indicates that you are agreeing to participate in the program. Click **Apply.**
      NetWitness Platform begins to collect telemetry on page views and click and focus events.
   b. To disable participation after it has been enabled, under Customer Experience Improvement Program, clear the checkbox next to **I agree to participate in the NetWitness Platform CEIP**. An empty checkbox indicates that you do not wish to participate in the program. The check mark is removed and a message advises that some information may be collected on open user sessions

until those users log out of their sessions. Click **Apply.**
The feature is turned off, and collection ends when all open user sessions are closed.

Configure Notification Servers

This topic provides instructions on how to configure notification servers. For ESA, notification servers are required to define an ESA rule. A notification server is also required to configure global audit logging.

Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, New Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond. Notification Servers define the servers from which you want to receive notifications from the system. For Global Audit Logging, define Log Decoders as Syslog Notification Servers.

You can define, delete, edit, import, and export a notification server in NetWitness. Individual topics describe the relevant procedures. For more information on ESA alert configuration, see "Notification Methods" in the *Alerting with ESA Correlation Rules User Guide*. You delete, edit, import, and export notification outputs and notification servers in the same way as templates. You cannot disable or delete notification servers associated with global audit logging configurations.

Notification Servers Overview

This topic provides an overview of notification servers. You configure notification servers in the Administration System view ( (Admin) > **System** > **Global Notifications** > **Servers** tab).

Global Notifications are used by a variety of components in NetWitness, such as Event Stream Analysis (ESA), Respond, Health and Wellness, New Health and Wellness, Event Source Management (ESM), and Global Audit Logging. Notification settings are called **Notification Servers**.

Event Stream Analysis sends notifications to users through email, SNMP, or Syslog about various system events. In ESA, these alert notification settings are called Notification Servers. You can configure multiple notification servers and use them while defining an ESA rule, for example, you can configure multiple mail servers or Syslog servers and use the settings while defining an ESA rule.

Note: New Health and Wellness supports only Email and Syslog notifications.

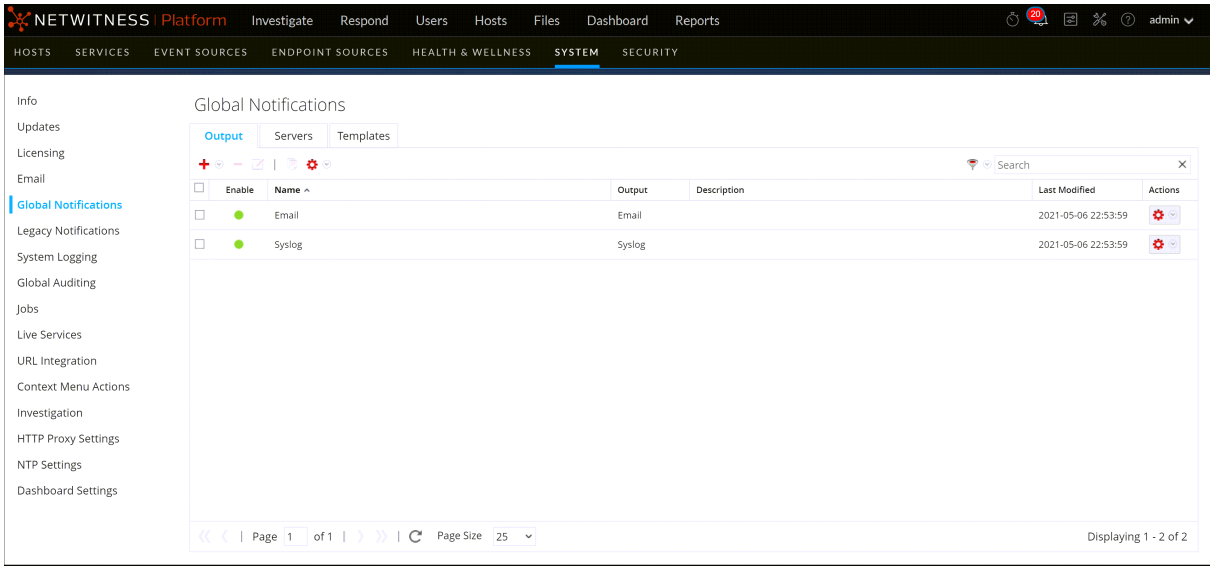
Note: ESA SNMP notifications are not supported for NetWitness 11.3 and later.

You can configure the following notification servers:

- Email
- SNMP
- Syslog
- Script

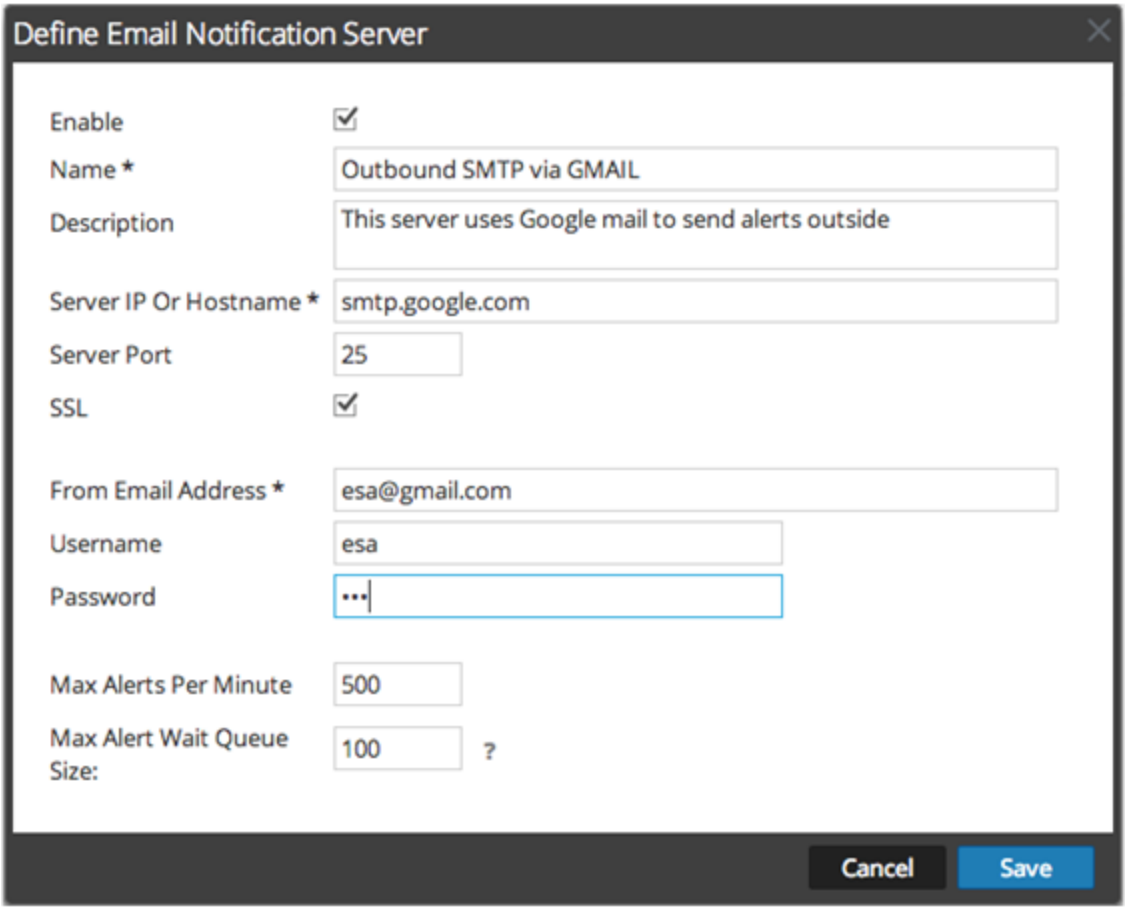
Email notification servers enable you to configure email server settings to send alert notifications. SNMP notification servers enable you to configure SNMP trap host settings as a notification server to send alert notifications.

Syslog notification servers enable you to configure Syslog settings as a notification server to send notifications. When enabled, Syslog provides auditing through the use of the RFC 5424 Syslog protocol. Syslog has proven to be an effective format to consolidate logs, as there are many open source and proprietary tools for reporting and analysis. For Global Audit Logging, you can only use Syslog Notification Servers.



Script notification servers enable you to configure Script as a notification server.

For detailed information on the different notification server configurations, including parameters and descriptions, see Define Notification Server Dialogs.



Configure the Email Settings as Notification Server

To configure email server settings as a notification server to send alert notifications:

1. Go to **(Admin)** > **System**.
2. In the options panel, select **Global Notifications**.
   The **Notifications** configuration panel is displayed with the **Output** tab open.
3. Click the **Servers** tab.

4. From the  drop-down menu, select **Email**.

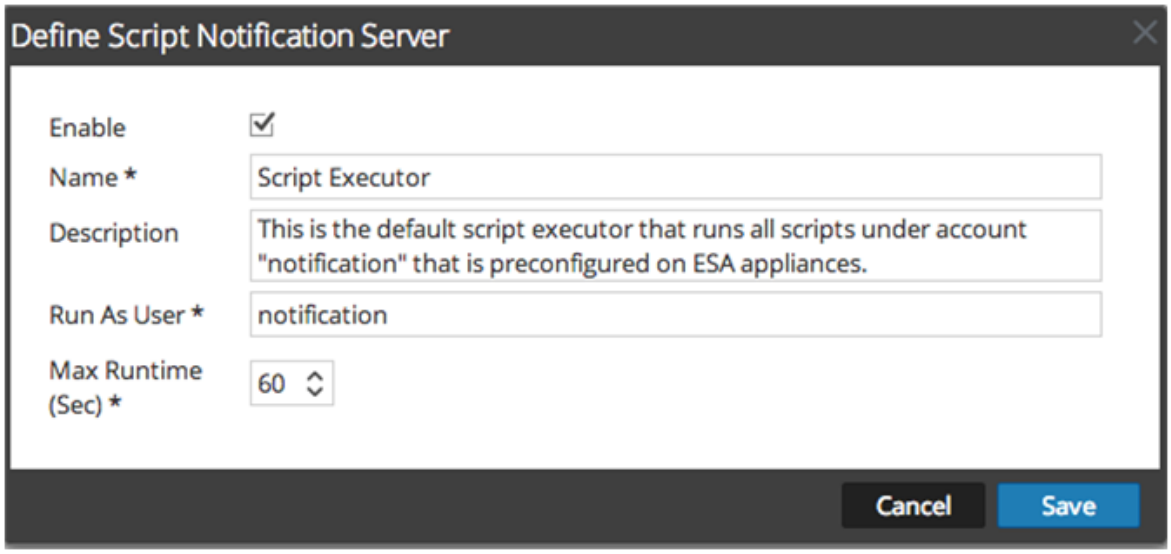
5. In the **Define Email Notification Server** dialog, provide the required information and click **Save**.

Note: For ESM/SMS and ESA notifications, you must specify only the hostname/FQDN in the Server IP or Hostname field.

Note:
- If you enable SSL in **Define Email Notification Server** dialog, you must obtain the servers certificate in **.pem** format from the server and then run the following command to install the certificate in the Integration server truststore.

```
security-cli-client --add-trusts -s integration-server -x <mail-server-certificate-filename>.pem -u <username> -k <password>
```

- The preferred Server Port is **587**.



For details of the parameters and descriptions, see Define Notification Server Dialogs

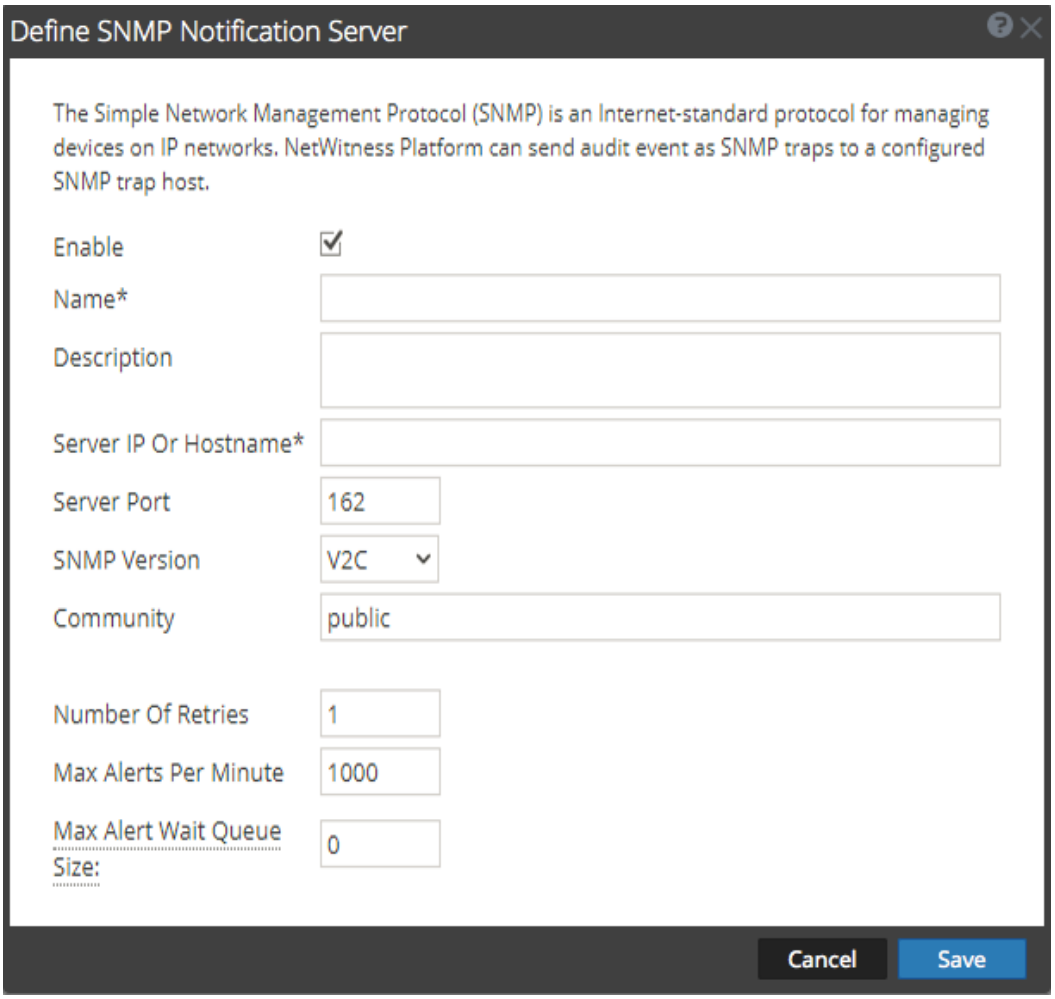
Configure Script as a Notification Server

ESA allows you to run scripts in response to ESA alerts. However, you must first configure the user identity and other details that are required to run the scripts.

To configure Script as a notification server:

1. Go to **(Admin)** > **System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Servers** tab.
4. From the drop-down menu, select **Script**.

5. In the **Define Script Notification Server** dialog, provide the required information and click **Save**.



For details of the parameters and descriptions, see Define Notification Server Dialogs.

Configure the SNMP Settings as Notification Server

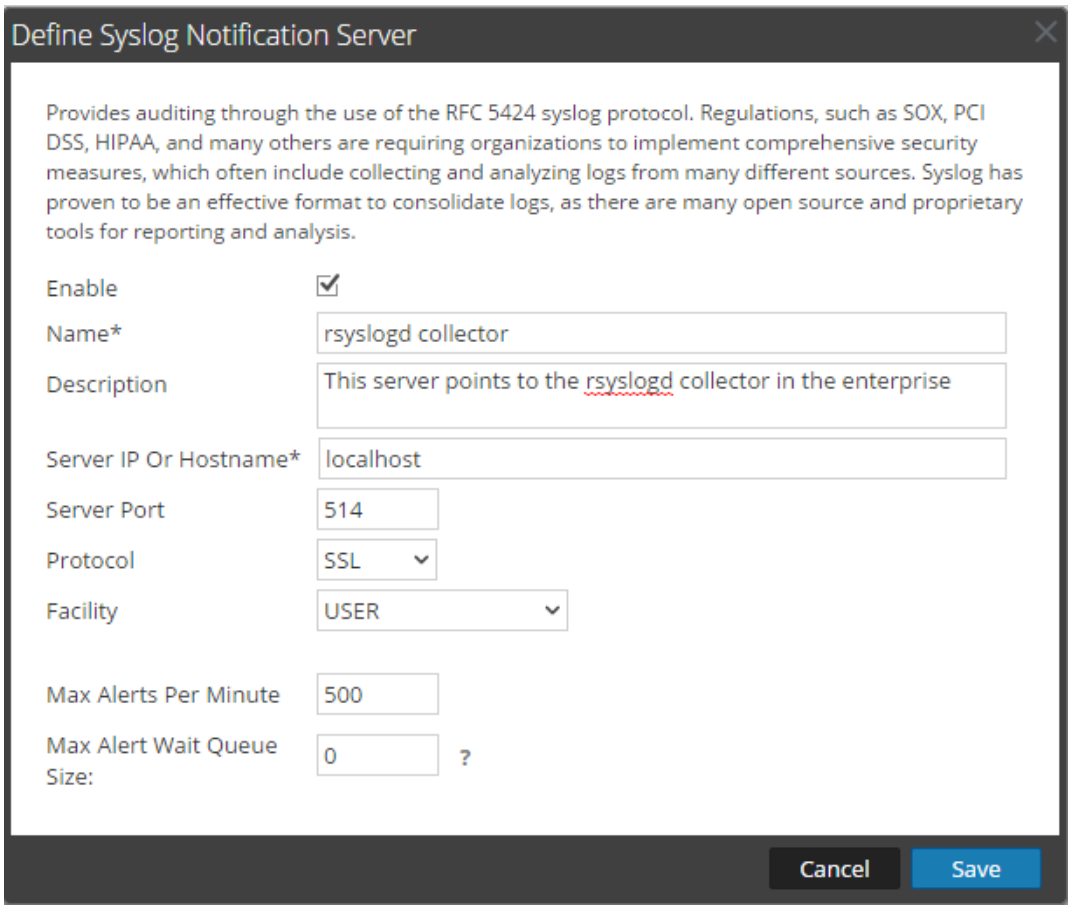
To configure the SNMP trap host settings as a notification server to send alert notifications:

1. Go to **(Admin)** > **System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Servers** tab.

4. From the  drop-down menu, select **SNMP**.

5. In the **Define SNMP Notification Server** dialog, provide the required information and click **Save**.

For details of the parameters and descriptions, see Define Notification Server Dialogs.



Configure a Syslog Notification Server

This topic provides instructions on how to configure a Syslog notification server. When enabled, Syslog provides auditing through the use of the RFC 5424 Syslog protocol. Syslog has proven to be an effective format to consolidate logs, as there are many open source and proprietary tools for reporting and analysis.

To configure Syslog as a notification server:

1. Go to  **(Admin)** > **System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Servers** tab.

4. From the  drop-down menu, select **Syslog**.

5. In the **Define Syslog Notification Server** dialog, provide the required information and click **Save**.

For details of the parameters and descriptions, see Define Notification Server Dialogs.

Note: If you select **TCP SSL** as the protocol, you must set the Server Port to **6514** unless any other custom port forwarding mechanism is in place.

Configure Notification Outputs

This topic provides instructions on how configure notification outputs. These notification outputs are required to define an ESA rule.

Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, New Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond.

Note: You do not need to configure the Output tab for Global Audit Logging.

Notification Output configurations define email addresses and subject lines, SNMP trap OID settings, syslog output settings, and script code.

You can define, delete, edit, import, and export notification outputs in NetWitness. Individual topics describe the relevant procedures. For more information on ESA alert configuration, see "Notification Methods." in the *Alerting with ESA Correlation Rules User Guide*. You delete, edit, import, and export notification outputs and notification servers in the same way as templates. If you attempt to delete a notification output being used by alerts, you will receive a warning confirmation message that the alerts using the notification will not function properly. The message shows the number of alerts in use.

Notification Outputs Overview

This topic provides an overview of notification outputs. notification outputs are required when defining an ESA rule. You can configure notification outputs in the Administration System view ((Admin) > **System** > **Global Notifications** > **Output** tab).

Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, New Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond.

Note: You do not need to configure notification outputs (the Output tab) for Global Audit Logging.

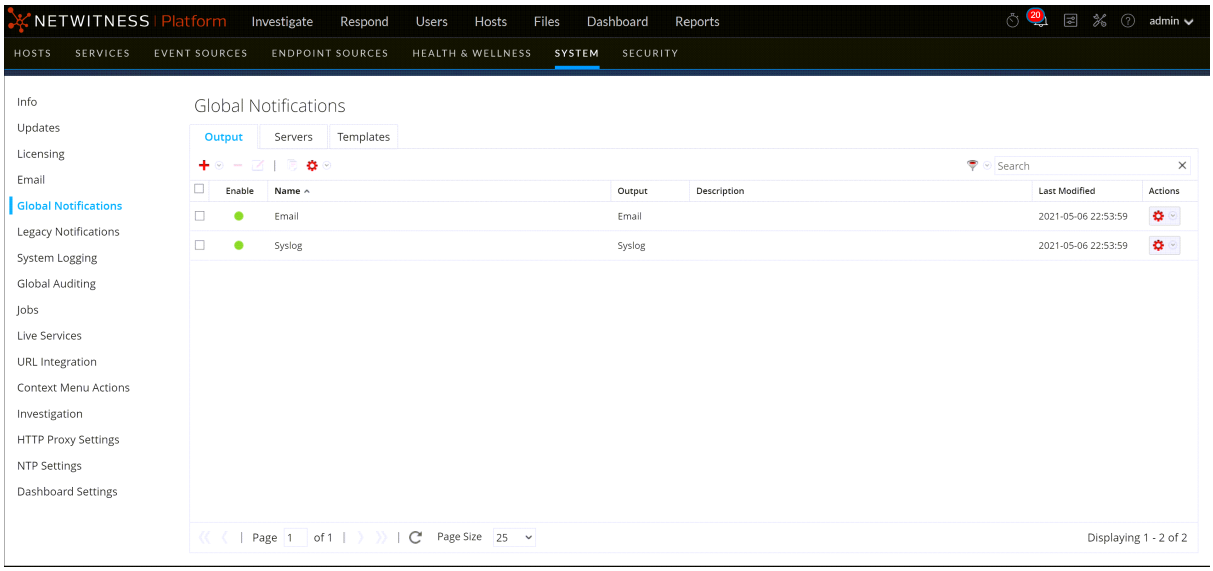
Notification outputs are the destinations used for sending notifications. For ESA, notification outputs enable you to define how you want to receive the ESA alerts. The following are the different notification outputs supported by NetWitness:

- Email
- SNMP
- Syslog
- Script

Note: New Health and Wellness supports only Email and Syslog notification outputs.

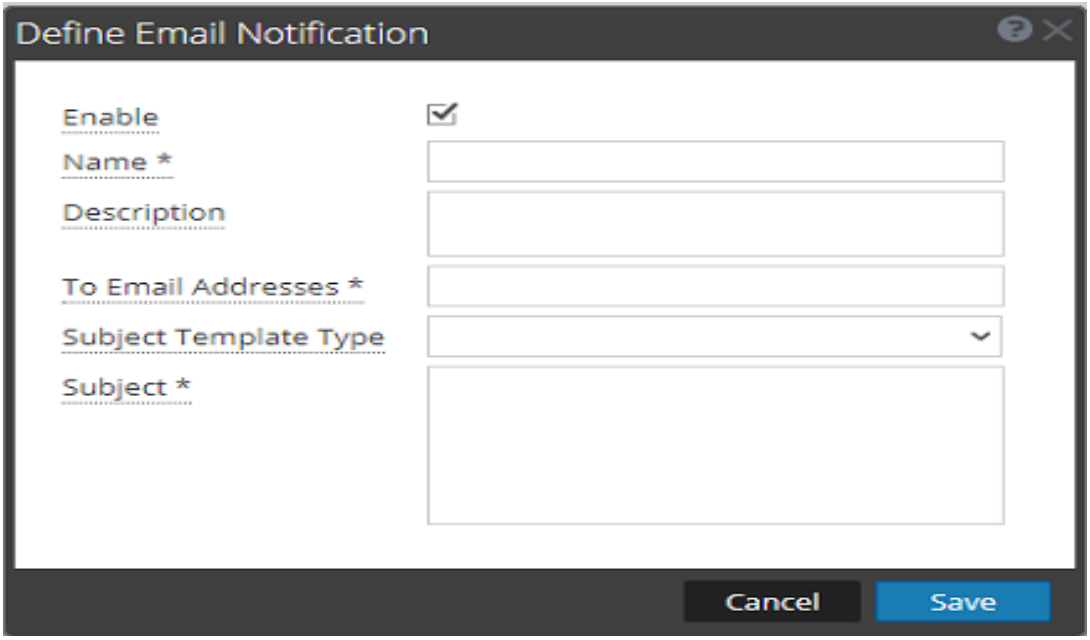
Note: ESA SNMP notifications are not supported for NetWitness 11.3 and later.

Email notification settings define the destination email address to which you can send the alerts. You can also add a custom description in the subject of the email and define multiple destination email addresses.



SNMP notification settings enable you to define the SNMP settings to send alert notifications. Syslog notifications enable you to define the Syslog settings used to send alert notifications. Script notifications enable you to define the Script that executes in response to the alert.

For detailed information on the notification configurations, including parameters and descriptions, see Define Notification Server Dialogs.



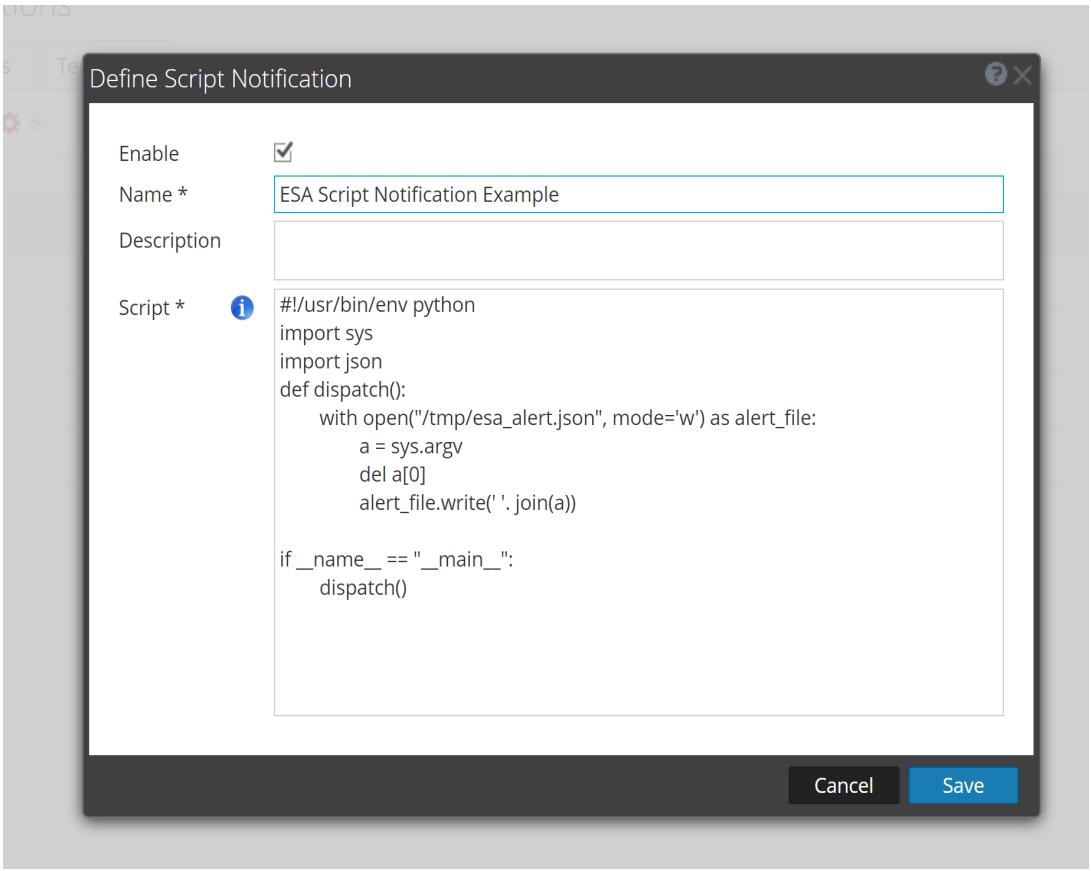
Configure Email as a Notification

To configure Email as a notification:

1. Go to  **(Admin)** > **System**.
2. In the options panel, select **Global Notifications**.

3. On the **Output** tab, from the  drop-down menu, select **Email**.

4. In the **Define Email Notification** dialog, provide the required information and click **Save**.



For details of the parameters and descriptions, see Define Notification Server Dialogs.

Configure Script as a Notification

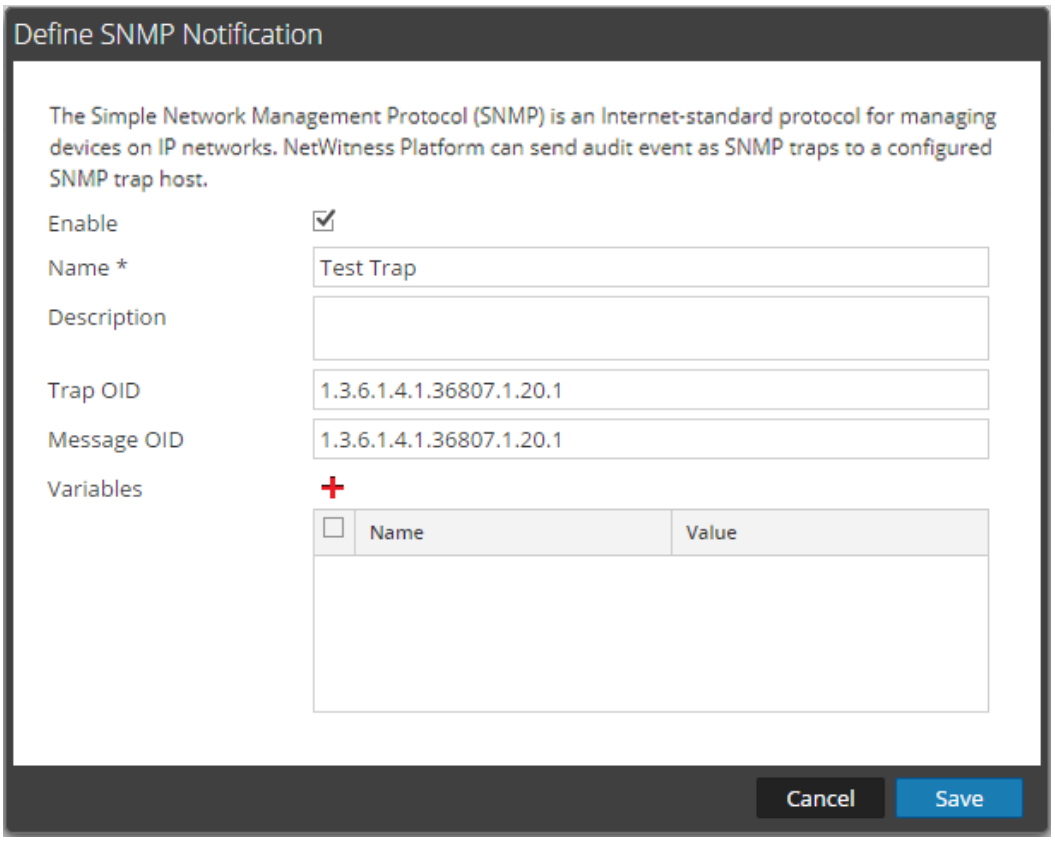
This topic provides instructions to define and configure a Script as a notification output. ESA allows you to run scripts in response to ESA alerts. You need to define the script using the  (Admin) > **System** > **Notifications** > **Output** tab. You can use any script for ESA notifications.

To configure the script as a notification:

1. Go to  **(Admin)** > **System**.
2. In the options panel, select **Global Notifications**.
3. On the Output tab, from the  drop-down menu, select **Script**.

4. In the **Define Script Notification** dialog, provide the required information and click **Save**.

> **Note:** To retrieve alerts information in the scripts, use command line arguments based on the scripting language. For Example:
> - If you are using Python as the scripting language, use sys.argv (command line arguments) to retrieve alerts information.
> - If you are using Bash as the scripting language, use $*, $1, $2, and $@ (command line arguments) to retrieve alerts information.



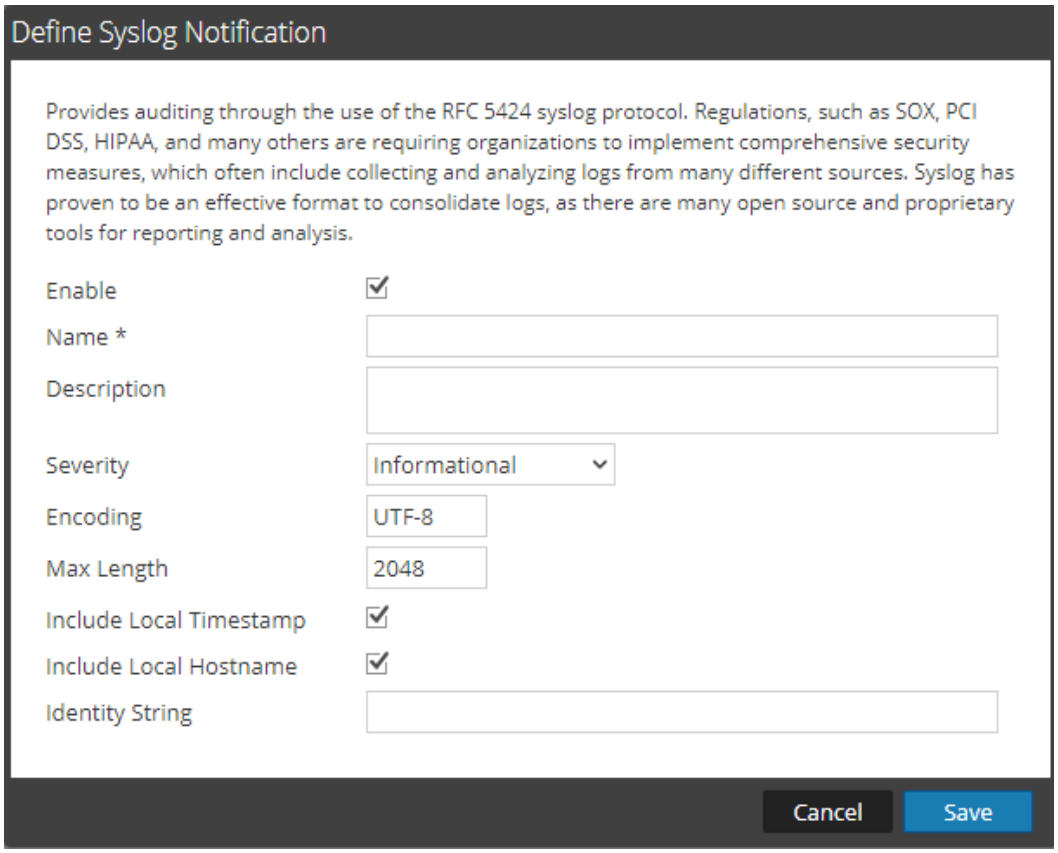
> **Note:** Use **Temp** folder to create files or folders as a part of the script.

For details of the parameters and descriptions, see Define Notification Server Dialogs.

Configure SNMP as a Notification

To configure SNMP as a notification output to send alert notifications:

1. Go to **(Admin)** > **System**.
2. In the options panel, select **Global Notifications**.
3. On the Output tab, from the drop-down menu, select **SNMP**.



4. In the SNMP Notification dialog, provide the required information and click **Save**.
   For details of the parameters and descriptions, see Define Notification Server Dialogs.

Configure Syslog as a Notification

To configure Syslog as a notification output when sending alert notifications:

1. Go to **(Admin)** > **System**.
2. In the options panel, select **Global Notifications**.

3. On the Output tab, from the  drop-down menu, select **Syslog**.

4. In the **Define Syslog Notification** dialog, provide the required information and click **Save**. For details of the parameters and descriptions, see Define Notification Server Dialogs.

Configure Templates for Notifications

You configure notification templates in the Administration System view ((Admin) > **System** > **Global Notifications** > **Templates** tab). A notification template defines the format and message fields of the notifications. There are different template types for the notifications that you can configure:

- Audit Logging
- Event Stream Analysis
- Event Source Monitoring
- Health Alarms
- New Health & Wellness Alarms.

You can use the available default templates or you can configure your own templates for Email (SMTP), SNMP, Syslog, and Script, depending on the template type. To learn how to modify or configure your own template, see Define Notification Template Dialog.

Global audit logging sends audit logs in the format specified in the Audit Logging template. You can use the default audit logging templates or you can define your own audit logging template. For more information on how to define an Audit Logging template, see Define a Template for Global Audit Logging.

Event Stream Analysis (ESA) sends notifications in the format specified in the Event Stream Analysis templates. The default Event Stream Analysis templates for email, SNMP, Syslog, and Script are available on installation. You can customize these templates as well as create new templates which you can use for the notifications. For more information on how to define ESA templates, see Define a Template for ESA Alert Notifications.

For more information on ESA alert configuration, see "Notification Methods" in the *Alerting with ESA Correlation Rules User Guide*. You cannot delete templates associated with global audit log configurations.

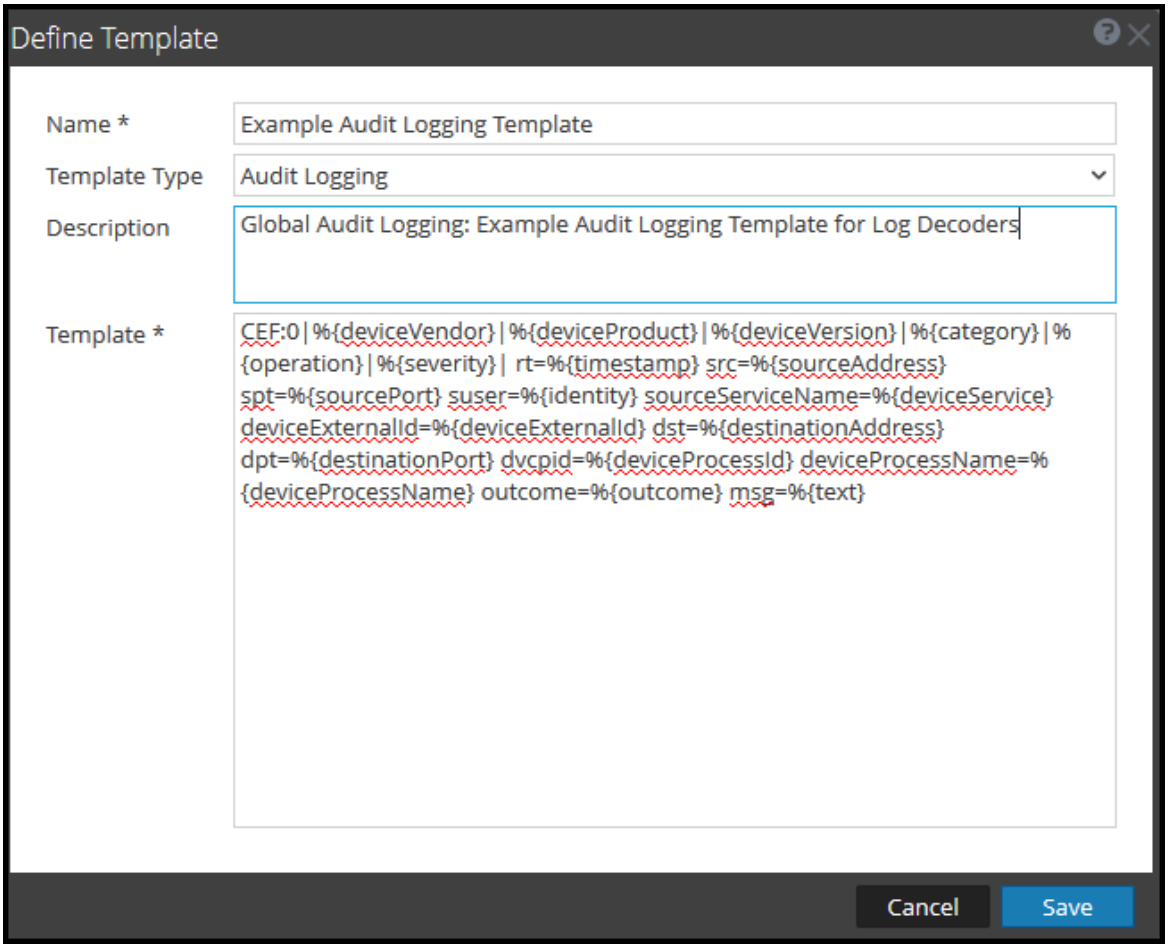
To learn how to define, delete, edit, duplicate, import, and export a notification template in NetWitness, see:

- Configure Global Notifications Templates
- Define a Template for ESA Alert Notifications
- Import and Export a Global Notifications Template

Configure Global Notifications Templates

This topic provides instructions for adding, editing, duplicating, and deleting global notifications templates.

Note: New Health and Wellness supports only Email and Syslog notification outputs.

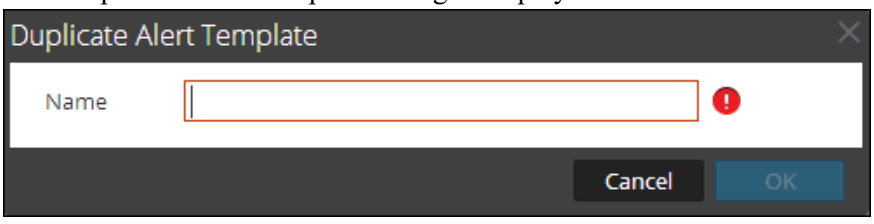


Note: ESA SNMP notifications are not supported for NetWitness 11.3 and later.

Add a Template

You can use the default templates provided or you can configure your own templates. To configure your own template:

1. Go to  **(Admin)** > **System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Click  to configure a template.
5. In the **Define Template** dialog, provide the following information:
   a. In the **Name** field, type the name for the template.
   b. In the **Template Type** field, select the type of template you want to create. For example, if you are creating a template for global audit logging, select the Audit Logging template type. For New Health and Wellness, select New Health & Wellness Alarms template type.
   c. In the **Description** field, type a brief description for the template.
   d. In the **Template** field, specify the format for the template, see Define Notification Template Dialog.



e. Click **Save** to save the template.
The following is an example of a template for Audit Logging.

Duplicate a Template

You can make a copy of an existing default or user-defined template. To duplicate a template:

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Select the template that you want to duplicate and click .
The Duplicate Alert Template dialog is displayed.

5. Type the name for the duplicate template.
6. Click **OK**.

You can modify a default or user-defined template. When you edit a template, the changes are reflected only when the alert is triggered.

Edit a Template

1. Go to **(Admin)** > **System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Select a template and click .
5. In the **Define Template** dialog, modify the **Name**, **Template Type**, **Description**, and **Template** fields as required.
6. Click **Save** to save the template.

Delete a Template

You can delete a user-defined template. When you delete a template that is used in an ESA rule, the Event Stream Analysis default template is used for alerts. You cannot delete templates associated with global audit logging configurations.

1. Go to **(Admin)** > **System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Select one or more templates and click .
   A confirmation dialog is displayed.
5. Click **Yes**.
   The selected template is deleted.

Define a Template for ESA Alert Notifications

This topic describes how you can define a template for alert notifications. Event Stream Analysis (ESA) allows you to define useful templates for alerts. You need to have a good understanding of FreeMarker and the ESA data model to define a template. For more information on FreeMarker, see FreeMarker Template Author's Guide.

ESA Data Model

Consider an ESA alert rule as shown below:

```
@Name('module_144d43f5_f0b4_4cd0_8c6c_5ce65c37e624_Alert')
@Description('Brute Force Login To Same Destination')
@RSAAlert(oneInSeconds=0, identifiers={"ip_dst"})
SELECT* FROMEvent (ec_activity = 'Logon',ec_theme = 'Authentication',ec
outcome = 'Failure',ip_dst IS NOT NULL)
.std:groupwin(ip_dst)
.win:time_length_batch(60 seconds, 2)
GROUPBYip_dst HAVING COUNT(*) = 2;
```

When a rule like the above is fired, the alert generated has two constituent events, each resembling a NextGen session with multiple meta values. The alert data-object passed to the FreeMarker template evaluator are as follows:

```
(root)
  |
  +- id = "4e67012f-9c53-4f0b-ac44-753e2c982b79"                    // Unique identifier for each alert
  |
  +- severity = 1                                                    // The severity of the alert
  +- time = 2018-12-31T11:02Z                                        // The alert time (needs a ?datetime for
proper rendering)
  |  +- moduleType = "ootb"                                          // The module type
  |
  +- moduleName = "Brute Force Login To Same Destination"            // A description of the module
  |
  +- statement = "module_144d43f5_f0b4_4cd0_8c6c_5ce65c37e624_Alert" // The name of the EPL statement
  |  +- events                                                       // The constituent events - as a sequence
of event maps
       |   +- [0]                                                    // offset 0 (i.e. the first constituent
event)
       |   |       |   |
       |   +- event_cat_name = "User.Activity.Failed Logins"
       |   +- device_class = "Firewall"                             // event meta (accessible as ${events
[0].device_class}$)
       |   |       |   +- event_source_id = "uttam:50002:1703395"    // Investigation URI to the individual
session (used by SA)
       |   |
       |   +- ...                                                   // Other meta
       |   |
       |   +- sessionid = 1703395                                   // NextGen sessionid
       |   |
       |   +- time = 1388487764                                     // event/session time at NextGen source
(as a long Unix timestamp)
       |   |
       |   +- user_dst = "user5"
       |
       +- [1]                                                       // offset 1 (i.e. the second consituent
event)
           |
           +- device_class = "Firewall"
           |
           +- event_cat_name = "User.Activity.Failed Logins"
           |
           +- event_source_id = "uttam:50002:1703405"
           |
           +- ...
           |
           +- sessionid = 1703405
           |
           +- time = 1388487766
           |
           +- user_dst = "user5"
```

There are two types of template variables available in the data model:

- **Alert Meta Data**: These hold alert level details like statement name, module name, alert id, alert time, severity, and others. In FreeMarker terminology, these are top level variables associated with the alert instance itself and can be referenced simply by their names like `${moduleName}`. The `time` meta

is special because it is of type `Date` and it needs to be suffixed with a `?datetime` to be properly rendered.

- **Constituent Event Meta Data**: These include the session meta fields from individual events that constitute the alert. An alert can have multiple constituent events, so there can be more than one such map in the same alert. These show up as a sequence of hashes to the FreeMarker template evaluator and must be referenced. For instance, the alert has two constituent events the event_source_id for the first is available as `${events[0].event_source_id}` and the same for the second is accessible as ${`events[1].event_source_id`.} You also need to be aware of which meta fields are multi-valued because those need be treated as sequences, for example ${`events[0].alias_host`} will not work because it is a sequence.

Note: The metadata available in the constituent events for a given alert is determined by the EPL SELECT clause. For example, alerts from `SELECT sessionid, time FROM ...` have only two meta values available (sessionid, time). Constituent events in `SELECT * FROM Event ...` will carry all meta fields from the `Event` type with **non-null** values.

If your template uses meta keys that are not present in all alert output, you should consider using the FreeMarker provisions for default values.

For example, if a template with text Id=${id},ec_outcome=${ec_outcome} is evaluated for an alert which does not include the meta key `ec_outcome` then the template evaluation fails. In such cases, you can use the missing value placeholder `${ec_outcome!"default"}`.

Import and Export a Global Notifications Template

This topic provides instructions on how to import and export a template for notifications.

- You can export default or user-defined templates.
- You can import a template that has been exported from the NetWitness instance. If you import a template with the same name as an existing template, then the existing template will be overwritten.

Import a Template

1. Go to  **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. In the toolbar, select  **> Import**.
   The **Import** dialog is displayed.
5. In the **Select File**field, type the filename or click **Browse** and select the file to be imported.
6. Click **Import**.

Export a Template

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Select the template you want to export.

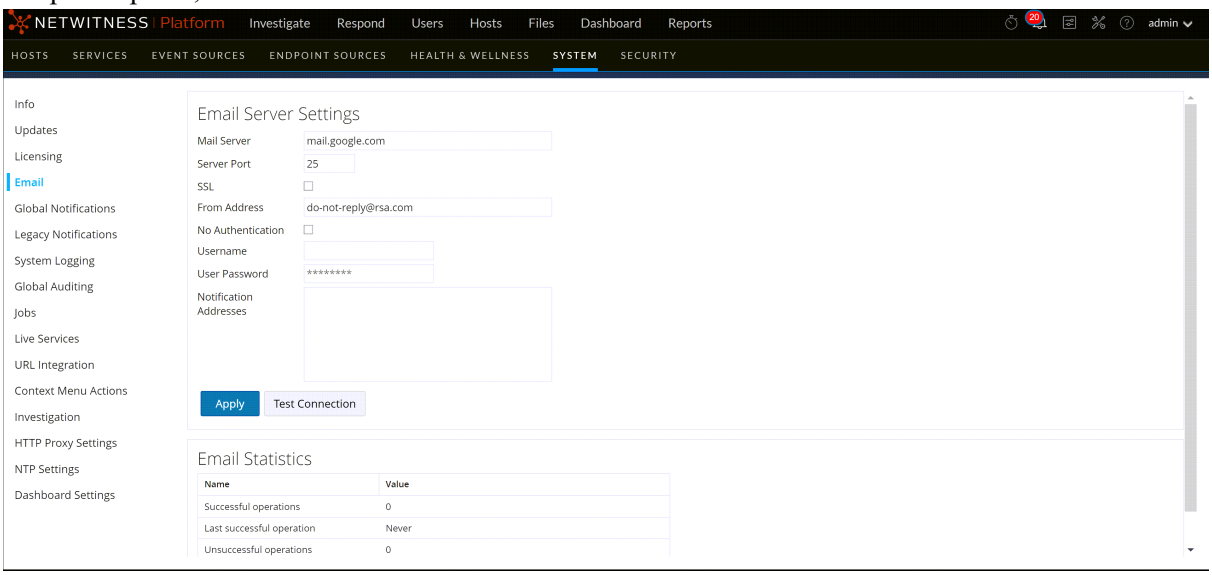
   Note: You can export all the templates using the > **Export All** option.

5. In the **Actions** column, select > **Export**.
   The **Export** dialog is displayed.
6. In the **Enter File Name** field, type the filename.
7. Click **Save**.

Configure Email Servers and Notification Accounts

This topic provides instructions for configuring email so that users can receive notifications in NetWitness. NetWitness Platform can send notifications to users through email about various system events. To be able to configure these email notifications, you must first configure the SMTP email server. The Email Configuration panel provides a way to:

- Configure the email server.
- Set up an email account to receive notifications.
- View statistics on email operations.



NetWitness requires access to an SMTP mail server in order to send reports to users. Each user account can be configured to receive emailed reports. These reports can be generated manually, through the user interface, or automatically, through the auditing system. The following guidelines apply:

- Any SMTP mail host can be used to deliver emails, and each host requires a different configuration. The SMTP provider provides the settings for configuration.
- Some SMTP servers require user authentication in order to relay emails successfully. Typically, this is the login and password for the email account.
- Best practice is to create a new, dedicated email account on the SMTP email server for NetWitness reports.

To configure NetWitness email notifications:

1. Go to **(Admin) > System**.
   The Administration System view is displayed.

2. In options panel, select **Email**.

3. If you want to change the default mail server, specify the **Mail server** name and **Server port**.
4. If the email server communicates with NetWitness using SSL, set the box next to **Use SSL**.
5. In the **From address** field, type the name of the email account sending NetWitness email notifications.
6. If the SMTP server requires user authentication to relay emails successfully, type the **Username** and **User Password** for logging in to the email account.
7. To activate the settings, click **Apply**.
   You can now configure NetWitness modules to receive various notifications by email.

Configure Global Audit Logging

Global Audit Logging provides NetWitness Auditors with consolidated visibility into user activities within NetWitness in real-time from one centralized location. This visibility includes audit logs gathered from the NetWitness system and the different services throughout the NetWitness infrastructure.

NetWitness audit logs collect in a centralized system that converts them into the required format and forwards them to an external syslog system. The external syslog system can be a third-party syslog server or a Log Decoder.

You configure global audit logging in the Global Audit Logging Configurations panel. An audit logging template defines the format and message fields of the audit log entries. A Syslog Notification Server configuration defines the destination to send the audit logs. If you want to forward audit logs to a Log Decoder, configure a Syslog type of Notification Server for the Log Decoder.

The following are some of the user actions logged from NetWitness:

- User logouts
- All UI pages accessed
- Committed configuration changes
- Queries performed by the user
- Data export operations

Note: For examples of some of the user actions logged, see Add New Configuration Dialog

After you create a global audit logging configuration, audit logs containing these user actions automatically go to the external syslog system in the format specified in the selected Audit Logging template. You can create multiple global audit logging configurations for different destinations that use different templates. For example, you can create a global audit logging configuration for an external Syslog server with a template that contains all of the available meta keys and another configuration for a Log Decoder with a template that contains selected meta keys.

For Log Decoders, you use the Default Audit CEF Template. You can add or remove fields from the Common Event Format (CEF) template if you have specific requirements. Define a Template for Global Audit Logging provides instructions and Supported CEF Meta Keys describes the CEF meta keys available to use in the audit logging templates.

For third-party syslog servers, you can use a default audit logging template or define your own format (CEF or non-CEF). Define a Template for Global Audit Logging provides instructions and Supported Global Audit Logging Meta Key Variables describes the available variables.

Auditors can view the audit logs on the selected Log Decoder or third-party syslog server. If using a Log Decoder, auditors can view the audit logs using NetWitness Investigations or Reports.

The following figure shows global audit logs in Investigation (**Investigate** > **Events**).

For examples of some of the user actions logged, see Add New Configuration Dialog. For a list of message types being logged by the various NetWitness components, see Global Audit Logging Operation Reference.

Global Audit Logging - High-Level Procedure

Global Audit Logging is configured in the Global Audit Logging Configurations panel, which is accessed from  (Admin) > System view > Global Auditing. Before you can configure Global Audit Logging, you need to configure a Syslog Notification Server and an Audit Logging template. A Syslog Notification Server defines the destination to send the audit logs. An Audit Logging template defines the format and message fields of the audit log entry.

The Global Audit Logging Configuration panel provides a **view settings** link that takes you to the Global Notifications panel ( (Admin) > System view > Global Notifications) where you can configure the Syslog Notification Server and Audit Logging template.

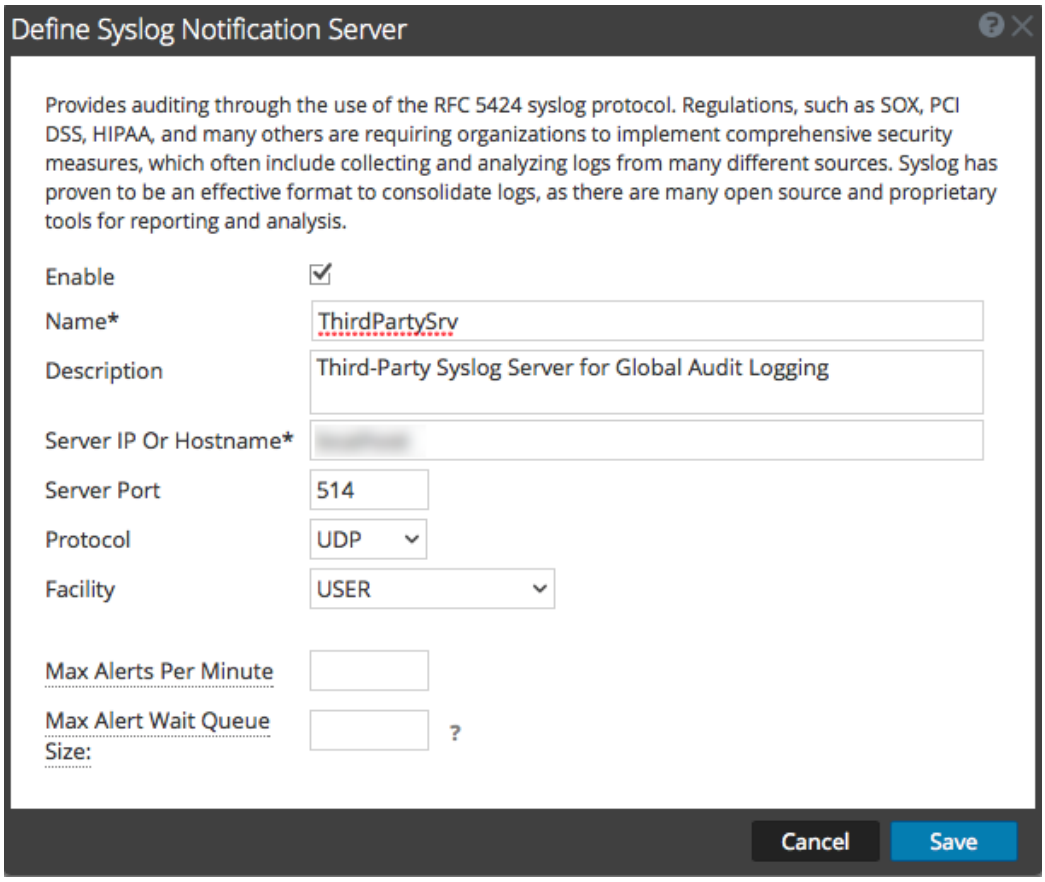
Perform the following procedures in the order shown to configure Global Audit Logging.

Procedures	Reference / Instructions
1. Configure a Syslog Notification Server.	Configure a Syslog Notification Server to use for Global Audit Logging. You can define a third-party syslog server or Log Decoder as a destination to receive the audit logs. Configure a Destination to Receive Global Audit Logs. Global Audit Logging configurations use the Syslog notification server type. If you want to forward audit logs to a Log Decoder, create a Notification Server of the Syslog type.
2. Select or configure an Audit Logging template to use.	Select an Audit Logging template for the Syslog notification server. You can use a default Audit Logging template or define your own audit logging template. Global Audit Logging configurations use the Audit Logging template type and a Syslog notification server. Configure Templates for Notifications provides additional information. For Log Decoders, use the **Default Audit CEF Template**. You can add or remove fields from the Common Event Format (CEF) template if you have specific requirements. Define a Template for Global Audit Logging provides instructions. For third-party syslog servers, you can use a default audit logging template or define your own format (CEF or non-CEF). Define a Template for Global Audit Logging provides instructions and Supported Global Audit Logging Meta Key Variables describes the available variables.
3. (Optional - Only if consuming with a Log Decoder) Deploy the Common Event Format parser to your Log Decoder from Live.	Ensure that you have deployed and enabled the latest Common Event Format parser from Live. Find and Deploy Live Resources and Enable and Disable Log Parsers provide instructions.

Procedures	Reference / Instructions
4. Define a global audit logging configuration, which defines how the global audit logs are forwarded to external Syslog systems.	Define a Global Audit Logging Configuration provides instructions. After you add a Global Audit Logging configuration, audit logs are forwarded to the selected Notification Server in the configuration.
5. Verify that the global audit logs show the audit events.	Test your audit logs to ensure that they show the audit events as defined in your audit logging template. Verify Global Audit Logs provides instructions.

Configure a Destination to Receive Global Audit Logs

In Global Audit Logging, Syslog Notification Servers are the configurations that define the destinations to receive global audit logs. You need to configure a Syslog Notification Server to use Global Audit Logging. You can define a third-party syslog server or a Log Decoder as the destination to receive the audit logs.



Configure a Syslog Notification Server for a Third-Party Syslog Server

1. Go to  **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Servers** tab.

   Note: You do not need to configure the Output tab for Global Audit Logging.

4. From the  drop-down menu, select **Syslog**.

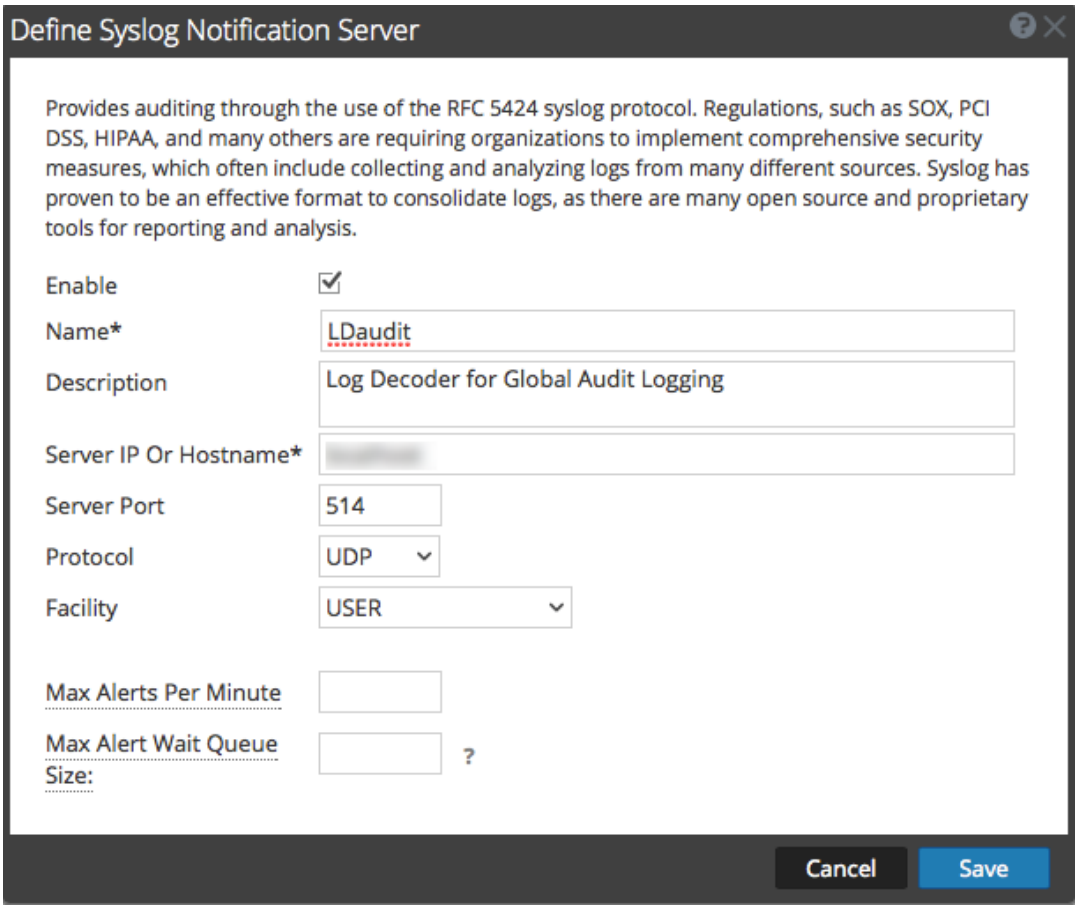
   The **Define Syslog Notification Server** dialog is displayed.

5. Configure the Syslog notification server as described in the following table.

Field	Description
Enable	Select to enable the notification server.
Name	A name to identify or label the third-party syslog server.
Description	(Optional) A brief description of the notification server.
Server IP or Hostname	The third-party syslog server hostname or IP address.
Server Port	The port number where the target syslog process is listening.
Protocol	The protocol to be used for transferring formatted audit logs to the third-party syslog server.
Facility	The syslog facility to be used for writing formatted audit logs to the third-party syslog server.

The **Max Alerts Per Minute** and **Max Alert Wait Queue Size** fields are not used for Global Audit Logging.

6. Click **Save**.



Configure a Syslog Notification Server for a Log Decoder

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Servers** tab.

   Note: You do not need to configure the Output tab for Global Audit Logging.

4. From the + drop-down menu, select **Syslog**.

   The **Define Syslog Notification Server** dialog is displayed.

5. Configure the Syslog notification server as described in the following table.

Field	Description
Enable	Select to enable the notification server.
Name	A name to identify or label the Log Decoder syslog notification server.

Field	Description
Description	(Optional) A brief description of the notification server.
Server IP or Hostname	The Log Decoder hostname or IP address.
Server Port	The port number where the target syslog process is listening.
Protocol	The protocol to be used for transferring formatted audit logs to the Log Decoder.
Facility	The Syslog facility to be used for writing formatted audit logs to the Log Decoder.

The **Max Alerts Per Minute** and **Max Alert Wait Queue Size** fields are not used for Global Audit Logging.

6. Click **Save**.

Next Steps

Select a default Audit Logging template to use for Global Audit Logging. If necessary, you can define your own custom template. Define a Template for Global Audit Logging provides additional information.

Define a Template for Global Audit Logging

This topic provides instructions on how to define an audit logging template to use for Global Audit Logging. Before you configure Global Audit Logging, configure a Syslog notification server and select an Audit Logging template. You can choose to use a default audit logging template or you can define your own template.

NetWitness includes two default audit logging templates:

- **Default Audit CEF Template**: You can use this template for Log Decoders and third-party syslog servers.
- **Default Audit Human-Readable Format**: You can use this template only for third-party syslog servers. Do not forward messages from this template to a Log Decoder.

The first procedure provides instructions on how to define an audit logging template for a Log Decoder. The audit logging template defines the format and message fields of the audit logs sent to the Log Decoder or third-party syslog server.

Global audit logging templates that you define for a Log Decoder use Common Event Format (CEF) and must meet the following specific standard requirements:

- Include the CEF headers in the template.
- Use only the extensions (Key=Value) listed in the Supported CEF Meta Keys table.
- Ensure that the extensions are in the `key=%{string}<space>key=%{string}` format.

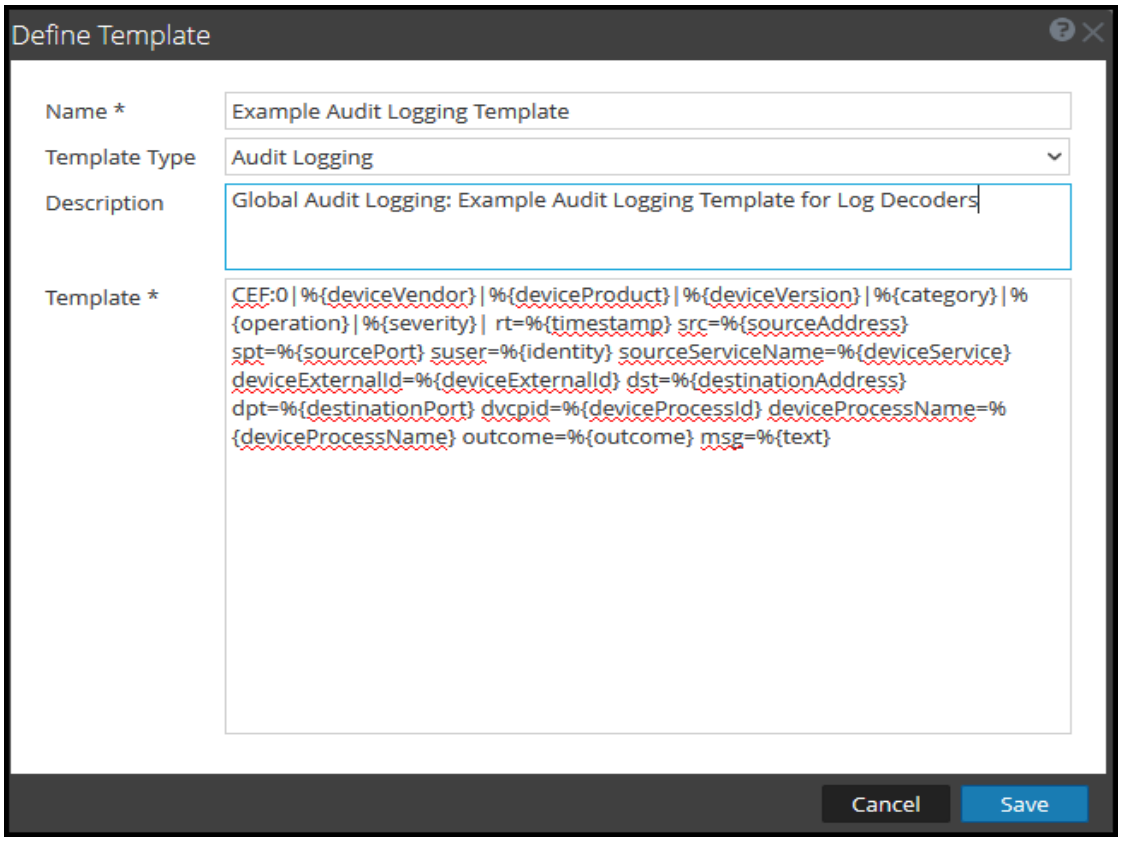
The second procedure provides instructions on how to define a custom global audit logging template in human-readable format for a third-party syslog server. For third-party syslog servers, you can define your own format (CEF or non-CEF).

Define a Global Audit Logging Template for a Log Decoder

You can use the **Default Audit CEF Template** to send global audit logs to a Log Decoder. To define your own template:

1. Go to  **(Admin) > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Click  to configure a template.
5. In the **Define Template** dialog, provide the following information:
   a. In the **Name** field, type the name for the template.
   b. In the **Template Type** field, select the **Audit Logging** template type.
   c. In the **Description** field, type a brief description for the template.
   d. In the **Template** field, enter the format for the audit logging template.
   The following format is a customized template provided as an example. It differs from the default CEF template.

```
CEF:0|%{deviceVendor}|%{deviceProduct}|%{deviceVersion}|%{category}|
%{operation}|%{severity}|
rt=%{timestamp} src=%{sourceAddress} spt=%{sourcePort} dpt=
%{destinationPort} dst=%{destinationAddress} dvcpid=%{deviceProcessId}
tpt=%{transportProtocol} sessionId=%{sessionId} scope=%{scope} suser=
%{identity} sourceServiceName=%{deviceService} deviceExternalId=
%{deviceExternalId} deviceProcessName=%{deviceProcessName} device
Facility=%{deviceFacility} outcome=%{outcome} msg=%{text} remoteAddress
=%{remoteAddress} reasonForFailure=%{reasonForFailure} reason=%{reason}
arguments=%{Arguments} user=%{User} referrerURL=%{referrer} role=%{Role}
id=%{id} account=%{Account} deviceIDs=%{deviceIDs} file=%{file} account
Provider=%{AccountProvider} uri=%{uri} addRole=%{Add.Role} addPermission
=%{Add.Permission} userAgent=%{userAgent} userGroup=%{userGroup}
userRole=%{userRole} key=%{key} value=%{value} paramKey=%{Key}
paramValue=%{Value} alert=%{alert} incident=%{incident} action=%{action}
notification Binding=%{NotificationBinding} name=%{name} enabled=
%{enabled} disabled=%{disabled} params=%{parameters}
```



The highlighted CEF syslog header is required to conform to the CEF standard and is a requirement for the CEF parser in the Log Decoder. The other keys are optional and you can configure them. See all the supported meta keys that are supported by the CEF parser in the Log

Decoder in the Supported CEF Meta Keys table.

Note: Use all of the extensions in the following format:
`deviceProcessName=%{deviceProcessName} outcome=%{outcome}`
Include a `<space>` between each key=%{string} pair in the extension keys section.

Note: After you upgrade to 11.x from earlier versions, then '$' is replaced with '%' automatically

6. Click **Save**.

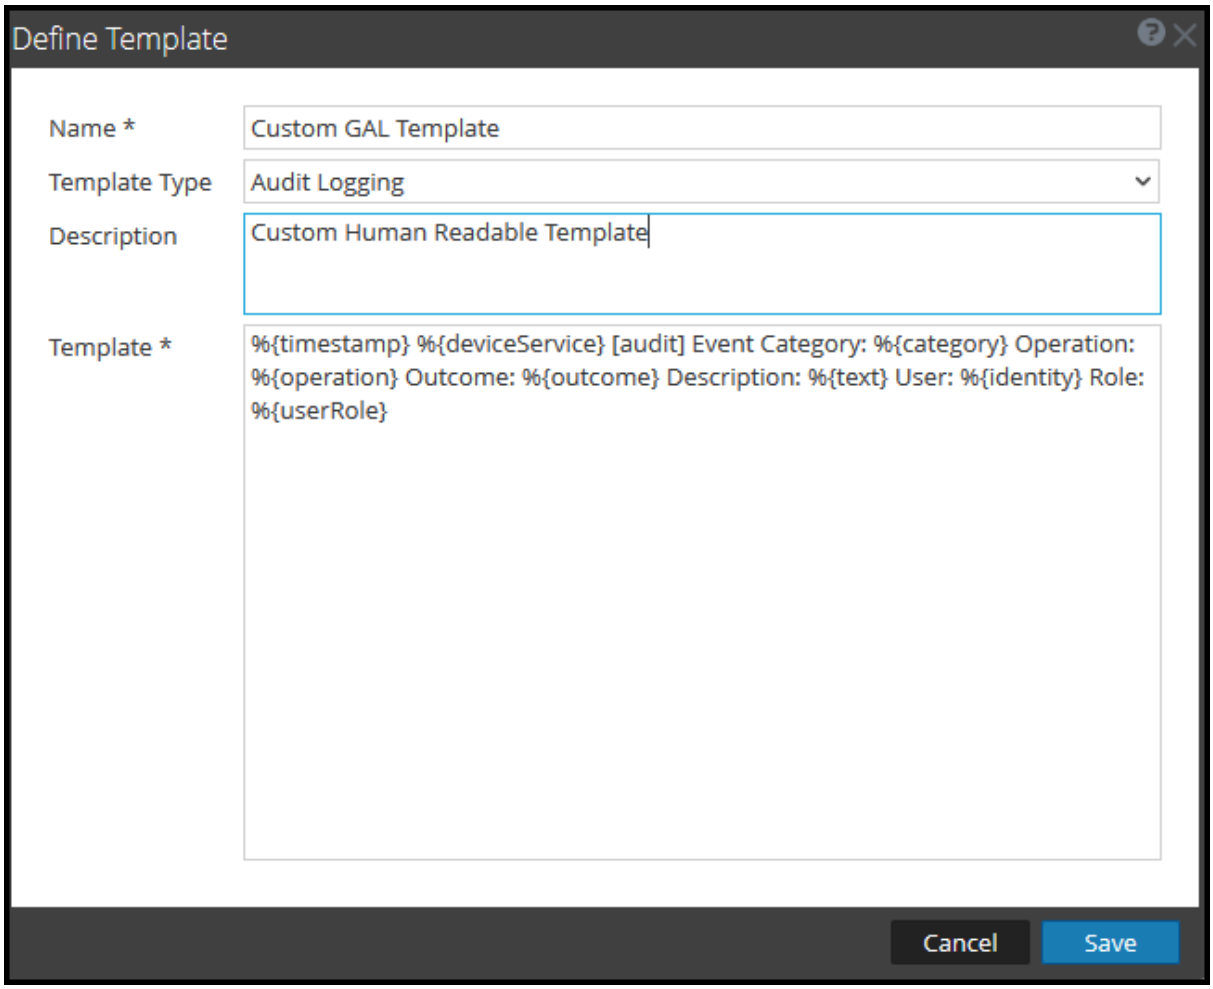
After you define the CEF audit logging template, ensure that you have deployed and enabled the latest Common Event Format (CEF) parser from Live. "Find and Deploy Live Resources" in the *Live Services Management Guide* provides instructions.

Note: If you need to use a specific meta key for Investigations and Reporting, ensure that the meta keys that you select are indexed in the **table-map-custom.xml** file on the Log Decoder. If they are not indexed, follow the instructions in the "Maintain the Table Map Files" topic in the *Host and Services Configuration Guide* procedure to update the table mappings. Ensure that the meta keys are also indexed in the **index-concentrator-custom.xml** on the Concentrator. See the "Edit a Service Index File" topic in the *Host and Services Configuration Guide* for additional information.

Define a Custom Global Audit Logging Template

For third-party syslog servers, you can define your own template format (CEF or non-CEF). You can use the **Default Audit Human-Readable Format** template to send global audit logs to a third-party syslog server in a format that is easier to read than the CEF format. If you want to define your own template in human-readable format, follow this procedure.

For Log Decoders, you must use a CEF template with some specific requirements. The *Define an Audit Logging Template for a Log Decoder* procedure above provides instructions for creating a template in CEF format.



To define a custom global audit logging template in human-readable format:

1. Go to  **(Admin) > System**.
2. In the left navigation panel, select **Notifications**.
3. Click the **Templates** tab.
4. Click  to configure a template.
5. In the **Define Template** dialog, provide the following information:
   a. In the **Name** field, type the name for the template.
   b. In the **Template Type** field, select the **Audit Logging** template type.
   c. In the **Description** field, type a brief description for the template.
   d. In the **Template** field, enter the format for the audit logging template. The following example is in human-readable format with selected meta key variables.

```
%{timestamp} %{deviceService} [audit] Event Category: %{category}
Operation: %{operation} Outcome: %{outcome} Description: %{text}
User: %{identity} Role: %{userRole} Parameters: %{parameters}
```

You can use any of the meta key variables that are supported by global audit logging shown in the Supported Global Audit Logging Meta Key Variables table.

6. Click **Save**.

The following example shows global audit logs in human-readable format for this template:

```
Jun 11 2019 04:53:54 UpdateStackConcentrator Jun 11 2019 04:53:54 CONCENTRATOR
[audit] Event Category: DATA_ACCESS Operation: sdk.info Outcome: pending
Description: has requested the SDK summary info User: admin Role: null
params=flags\=1
```

```
Jun 11 2019 04:53:55 updatestackadminserver Jun 11 2019 04:53:55 source-server
[audit] Event Category: API Operation: /rsa/process/ready Outcome: success
Description: null User: Netwitness Web(nw-web) Role: null params=
{"Arguments":"[]"}
```

```
Jun 11 2019 05:15:46 UpdateStackeplh Jun 11 2019 05:15:46 LOG_DECODER [audit]
Event Category: MANAGEMENT Operation: upload Outcome: pending Description: has
started uploading file User: escalateduser Role: null params=file\=esmFeed.zip
```

Next Step

Define a Global Audit Logging Configuration provides instructions for defining a global audit logging configuration for NetWitness.

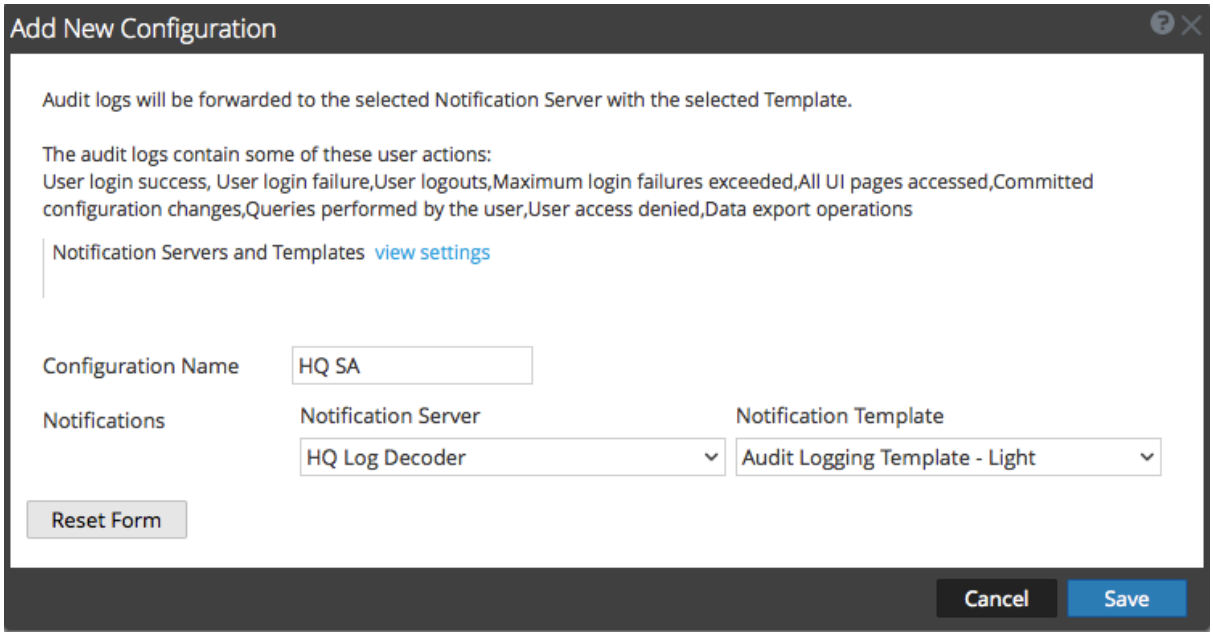
Define a Global Audit Logging Configuration

This topic tells administrators how to define a global audit logging configuration. This procedure is required only if you choose to set up centralized audit logging in your environment. These global audit logging configurations define how the global audit logs are forwarded to external syslog systems or Log Decoders. Audit logs are forwarded to the selected Notification Servers.

Prerequisites

Before starting this procedure, configure the following to use for global audit logging:

- Syslog Notification Server
- Audit Logging Template



You configure the notification server and template on the Global Notifications panel. You can access the Global Notifications panel by going to (Admin) > System and select Global Notifications. You can only define a Syslog type of Notification Server for global audit logging. For Log Decoders, use a Syslog type of Notification Server and a Common Event Format (CEF) audit logging template. You can use a default audit logging template or define your own template. You can create multiple audit logging templates and Syslog Notification Servers to use for your global audit logging configurations.

If you are forwarding global audit logs to a Log Decoder, deploy the Common Event Format parser to your Log Decoder from Live.

Add a Global Audit Logging Configuration

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Auditing**.
   The **Global Audit Logging Configurations** panel is displayed.

3. Click + to add a global audit logging configuration.
   The **Add New Configuration** dialog is displayed.

4. In the **Configuration Name** field, type a unique name for the global audit logging configuration. For example, you can create a configuration for a specific type of global audit logging configuration, such as HQ NW for a NetWitness headquarters configuration.
5. In the **Notifications** section, select the syslog **Notification Server** to use for this configuration. The notification server is the destination to send the global audit logs.
6. Select the audit logging **Notification Template** to use for this configuration. The Audit Logging template defines the format and audit log message fields to be sent.
7. Click **Save**.

Add New Configuration Dialog provides additional information and examples of the user actions logged. For a list of message types being logged by the various NetWitness components, see Global Audit Logging Operation Reference.

Edit a Global Audit Logging Configuration

This topic provides instructions on how to edit a global audit logging configuration. You can edit a global audit logging configuration to change the destination of the global audit logs for your user audits by selecting a different Notification Server. You can also change the format and message fields of the global audit log entries by selecting a different Notification Template. You make changes to the Notification Server or Template on the Global Notifications panel. You can access the Global Notifications panel by clicking the **view settings** link on the Global Audit Logging Configurations panel.

You cannot change which NetWitness user actions are logged and sent in the global audit logs.

1. Go to **(Admin) > System**.
2. In the options panel, select **Global Auditing**.

3. In the **Global Audit Logging Configurations** panel, select a configuration to edit and click .
4. In the **Add New Configuration** dialog, modify the global audit logging configuration as required. You can modify the **Configuration Name** and select a different **NotificationServer** or **Template**.
5. Click **Save.**

Delete a Global Audit Logging Configuration

Deleting a global audit configuration does not delete the associated notification server and template. After you delete a global audit logging configuration, the forwarding of global audit logs specified in that configuration is discontinued.

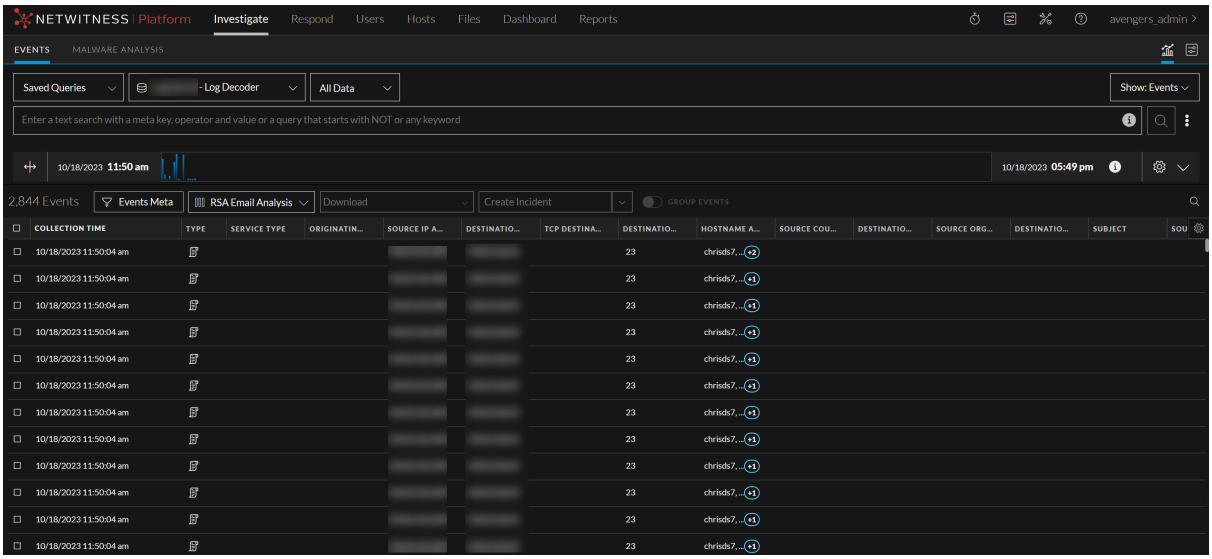
1. Go to  **(Admin) > System**.
2. In the options panel, select **Global Auditing**.
3. In the **Global Audit Logging Configurations** panel, select a configuration to delete and click .
   A confirmation dialog is displayed.
4. Click **Yes**.
   The selected configuration is deleted.

Verify Global Audit Logs

This topic provides instructions on how to verify global audit logs. After you have configured global audit logging, you need to test your global audit logs to ensure that they show the audit events as defined in your global audit logging template.

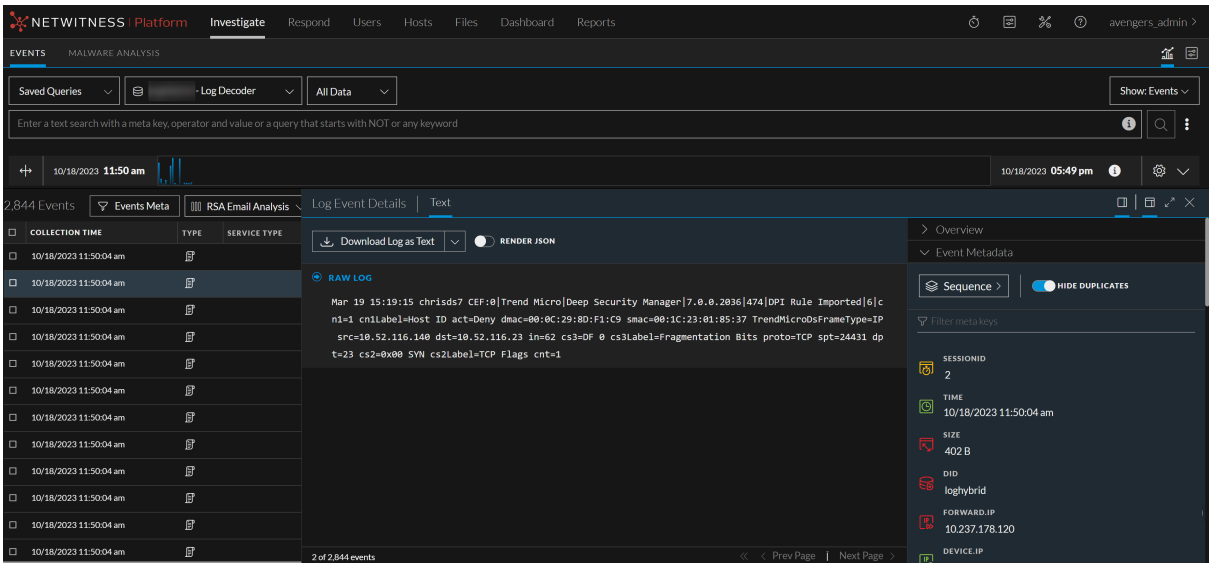
In version 11.5 and later, audit logging provides information about the aggregation account and the actual user who submitted the query. For example, the information is displayed as follows in the audit log:

```
User aggAccount (session 478, [::1]:1133, on behalf of <username of submitter>) has requested the SDK transforms.
```



This information is available through multiple levels of Brokers and Concentrators.

Note: If you are running a mixed-version environment, any version earlier than 11.5 will not provide the real user information.



Before starting this task, complete the steps detailed in Configure Global Audit Logging.

To view and verify the global audit logs if you are using a Log Decoder:

1. Go to **Investigate** > **Events**, select the Log Decoder service and click the submit query icon () to the right of the query bar.

2. Compare the fields in the global audit logs with the fields defined in the global audit logging template that you used in your global audit logging configuration.
3. Double-click a log to open the reconstruction and click  to open the Event Meta panel.
4. Verify that the meta that you want to audit is correct.

Example CEF Output

The following example shows global audit logs for an audit logging Common Event Format (CEF) template.

Template:

```
CEF:0|%{deviceVendor}|%{deviceProduct}|%{deviceVersion}|%{category}|%{operation}|%{severity}|
```

```
t=%{timestamp} src=%{sourceAddress} spt=%{sourcePort} tpt=%{transport
Protocol} scope=%{scope} suser=%{identity} sourceServiceName=%{device Service}
deviceExternalId=%{deviceExternalId} deviceProcessName=%{device ProcessName}
outcome=%{outcome} msg=%{text} remoteAddress=%{remoteAddress}
reasonForFailure=%{reasonForFailure} reason=%{reason} arguments= %{Arguments}
user=%{User} referrerURL=%{referrer} role=%{Role} id=%{id} account=%{Account}
deviceIDs=%{deviceIDs} file=%{file} accountProvider= %{AccountProvider} uri=%
{uri} addRole=%{Add.Role} addPermission= %{Add.Permission} userAgent=%
{userAgent} userGroup=%{userGroup} userRole= %{userRole} key=%{Key} value=%
{Value} alert=%{alert} incident=%{incident} action=%{action}
notificationBinding=%{NotificationBinding} name=%{name} enabled=%{enabled}
disabled=%{disabled} params=%{parameters}
```

Example logs:

```
Jun 07 2019 09:06:05 UpdateStackConcentrator CEF:0|RSA|NetWitness Audit|
11.3.1.0|AUTHENTICATION|logoff|6|rt=Jun 07 2019 09:06:05 src=101.101.101.

index.manage,logs.manage,rules.manage,sdk.content,sdk.manage,sdk.meta,
sdk.packets,services.manage,storedproc.execute,storedproc.manage,sys.manage,
users.manage \r\n
```

Configure Centralized Audit Logging

NetWitness Platform collects audit logs from all the NetWitness services and aggregates it into a single file in a centralized location on the NetWitness Admin Server. This aggregated log file provides the advantage for faster access and easy analysis of the audit logs.

The aggregated logs from all services are sent to the following centralized location:

- `/var/netwitness/logstash/logs/rsa-netwitness-audit.log` (JSON format)
- Syslog running on the local host (human-readable format)

Centralized audit logging is enabled by default. To forward the aggregated logs to the external syslog system (a third-party Syslog server or Log Decoder), you must configure the Global Audit logging in  **(Admin) > System > Global Auditing**. The aggregated logs are sent in the format specified in the selected Audit Logging template. A Syslog Notification Server configuration defines the destination to send the audit logs. To forward the audit logs to a Log Decoder, configure a Syslog type of Notification Server for the Log Decoder.

- For instructions on how to define a template, see Define a Template for Global Audit Logging
- For instructions on how to configure a syslog notification server, see Configure a Destination to Receive Global Audit Logs
- For instructions on how to configure global Audit logging, see Define a Global Audit Logging Configuration

Filtering the Aggregated Logs

Before the logs are aggregated, standard filters are applied to the logs to reduce redundancy and filter out logs that are not useful. The filters contain entries that control the content written to the aggregated log file. The following default filters are available in `/etc/logstash/` location.

- `json-filter-action.yaml`
- `json-filter-category.yaml`

`json-filter-action.yaml` - This filter blacklists the log messages based on the `operation` meta key and stops the log message being written to aggregated log file. For example, if `"/rsa/process/ready":"true"` is entered in `json-filter-action.yaml`, any raw log that contains `"/rsa/process/ready"` in the `operation` meta key is blacklisted and not written to aggregated log file.

Note: If you do not want to apply filters, then delete all the default entries and replace with `{}` character. Note that this increases the log size and the logs may be redundant.

`json-filter-category.yaml` - This filter whitelists the log messages based on the `category` meta key and writes the log message to the aggregated log file. For example, if `'\b(?i)SECURITY\b':"true"` is entered in `json-filter-category.yaml`, any raw log that contains `'SECURITY'` in the `category` meta key is whitelisted and written to the aggregated log file.

Log Retention Policy

The aggregated log file is retained as per the following default settings:

- If the file size reaches 250 MB, the file is compressed as a single zip file.
- If the number of zip files exceed 90, the oldest zip file in the directory is automatically deleted.

You can modify the log retention policy in the file `logstash` available in `/etc/logrotate.d/` location.

Note: The size of the aggregated log file depends on the filters applied, so make sure to set up filters correctly for optimal directory space.

Disable Centralized Audit Logging

If you do not want the logs to be aggregated, in the `json-filter-category.yaml` filter, delete all the default entries and replace with the `{}` character.

Configure Investigation Settings

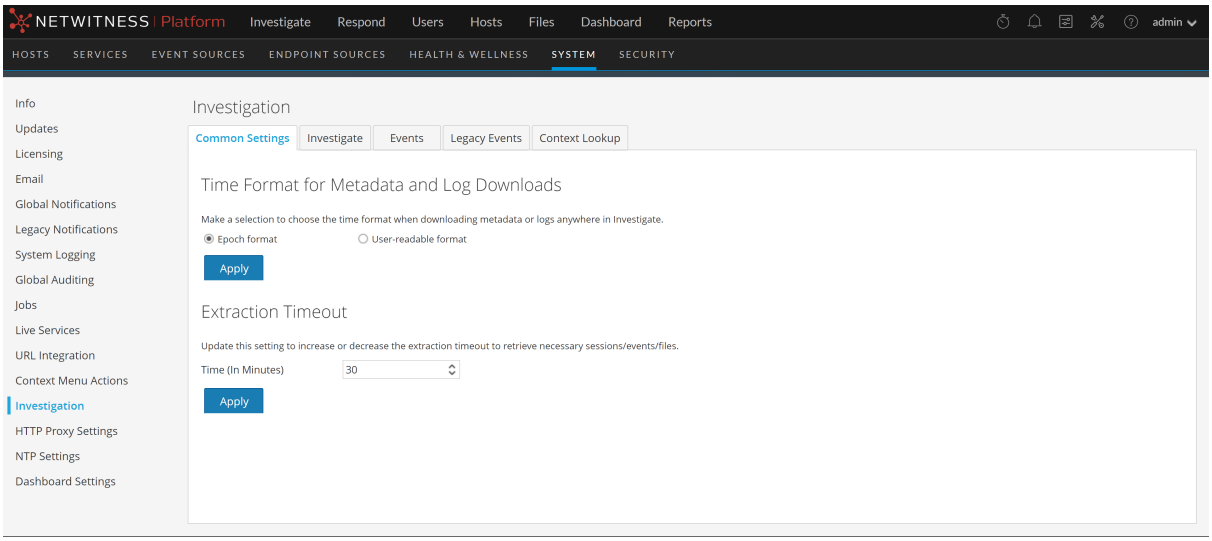
This topic provides instructions for administrators who are configuring the settings that apply to all investigations on the NetWitness instance being configured. The settings for configuring and tuning behavior of NetWitness Investigate are available in the  (Admin) > **System** > **Investigation** panel. These settings apply to all investigations and reconstructions on the current instance of NetWitness.

Map Context Hub Meta Types

The Context Hub is preconfigured with meta fields mapped to entities. NetWitness Respond and Investigate use these default mappings for context lookup. For information about adding meta keys, see "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*.

Caution: For the Context Lookup to work correctly in the Respond and Investigate views, when mapping meta keys in the  (Admin) > System > Investigation > Context Lookup tab, it is best practice to add only meta keys to the Meta Key Mappings. Do not add fields in the MongoDB to the Meta Key Mappings. Here is a sample meta key and Mongo DB field; `ip.address` is a meta key and `ip_address` is a field in the MongoDB.

In the **Context Lookup** tab, you can manage mapping of Context Hub meta types with meta keys in Investigate. You can add or remove meta keys in the list of meta types supported in Investigate by Context Hub. Procedures associated with this tab are provided in "Manage Context Hub Lists and List Values in the Navigate and Events Views" in the *NetWitness Investigate User Guide*.



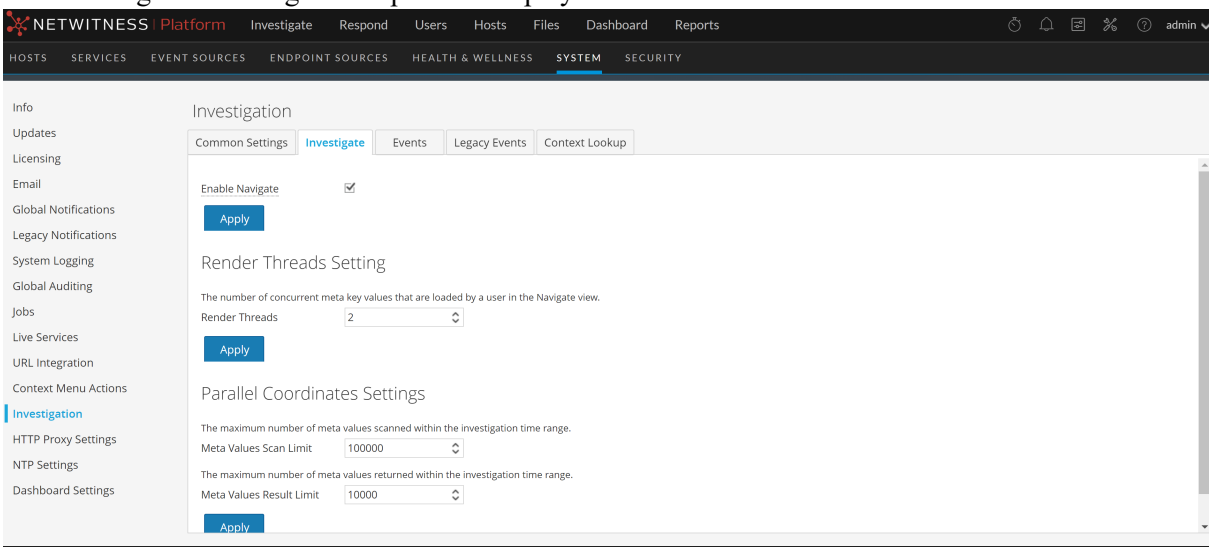
Configure Common Settings

In version 11.5 and later, the Common Settings tab allows you to configure settings that apply to the Navigate view, the Events view, and the Legacy Events view. Initially, the only setting that you can set for all views is the time format used when downloading metadata and logs, and other settings may be added in future versions.

By default, the time format for downloads is Epoch format, which shows the time as a numerical value representing the number of seconds from the Unix epoch, January 1, 1970. The resulting number requires a conversion to be understood. You can change the setting to get a more understandable format that combines the user preference time zone, date format, and time format into an easily understood representation, which follows the industry standard ISO 8601 representation when possible.

This setting applies to all 11.7 Investigate views.

1. Go to **(Admin) > System**, and in the options panel, select **Investigation**.
   The Investigation Configuration panel is displayed.



2. In the **Common Settings** tab, do the following:
   a. Select the time format to be used in metadata and log downloads in Investigate.
   b. Edit the time in minutes to set the extraction timeout when the logs are downloaded before the session expires.
      By default, it is set to 30 minutes and can be set to a maximum of 60 minutes.
3. Click **Apply**.
   The setting goes into effect immediately.

Configure Navigate and Legacy Events View Settings

The name of the Version 11.3 and earlier Events tab was changed to Legacy Events tab in Version 11.4.

1. Go to **(Admin) > System.**
2. In the options panel, select **Investigation.**

The Investigation Configuration panel is displayed.

3. In the **Investigate** tab, in the **Render Threads Settings** field, select the maximum number of concurrent meta key values that are loaded by a single user in the Navigate view. Click **Apply**.
4. In the **Investigate** tab, in the **Parallel Coordinates Settings** section, set the maximum limits for meta values scanned and meta value results that can be included in a parallel coordinates visualization. For better performance, these are the recommended settings: Meta Values Scan Limit - 100000 and Meta Values Result Limit to 1,000-10,000
   Click **Apply**.
5. In the **Legacy Events** tab, in the **Enable Legacy Events** section, select the check box to view the legacy sub menus and legacy events in classic view. Click **Apply**.
6. In the **Legacy Events** tab, in the **Event Search Settings** section, set the maximum numbers of events scanned and event results displayed when an analyst is conducting an event search in the Legacy Events view. The actual number of events scanned and displayed may be slightly greater than the limit set here. Click **Apply**.
7. In the **Legacy Events** tab, in the **Reconstruction Settings** section, set the limits for the amount of data processed in the reconstruction of a single event. The default values are 500 maximum packets and 2097152 bytes. If analysts are seeing slow performance when reconstructing sessions in Investigate, the reconstruction settings may need adjustment. Click **Apply**.

   Caution: Setting a higher value affects the performance of the NetWitness Server by increasing the time and memory taken to create a reconstruction of an event. Setting the value to zero disables any limit and may lead to a NetWitness Server crash.

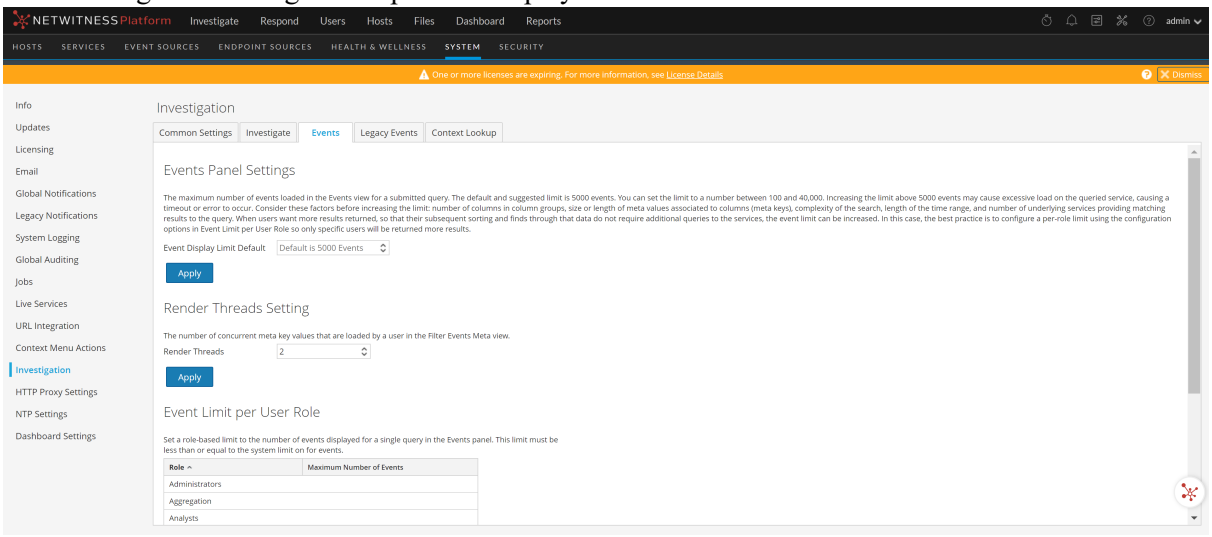
7. (Optional) In the **Legacy Events** tab, in the **Web View Reconstruction Settings** section, enable the use of supporting files in a web view reconstruction, and configure the additional settings to calibrate web view reconstructions. These include the time range (in seconds) to scan for related events, the maximum number of related events to scan, and overrides to Reconstruction Settings for use with web view reconstructions. Click **Apply**.

Clear Reconstruction Cache for Services

Under Reconstruction Cache Settings, administrators can clear the cache for one or more services. For example, the administrator can clear the cache for a single Broker, a Broker and Decoder, or all connected services. These are a few examples of causes for stale cache being used in a reconstruction.

- The downstream services may have their sessions invalidated or data reset. As an example, if Investigate is browsing a Broker and a downstream Concentrator or Decoder has a data reset, the metadata and session data for the investigating service (Broker) does not match the content if the downstream service has reset and repopulated. The reconstruction in Investigate shows content from cache, which does not match the real content. Even if the Decoder is offline, content is still displayed in the Broker reconstruction. Clearing cache on the Broker causes the NetWitness to reach out to the Decoder and an error is returned because the Decoder is offline.
- Another case where cache may be stale is when a service ID for a downstream service changes. This can happen when exporting, importing, deleting, and adding services to NetWitness because NetWitness can reuse service IDs. In this case, clearing the cache on the Broker causes NetWitness to request data from the services.

To clear reconstruction cache, do one of the following:



1. To clear cache for one or more services, select the services and click **Clear Cache for the Selected Services**.
2. To clear the cache for all listed services, click **Clear Cache for All Services.**
   The reconstruction cache for the selected services is cleared. NetWitness sends a request for data to the services.

Configure Events View Settings

These settings apply to the 11.3 and earlier Event Analysis view and the 11.4 and later Events view.

1. Go to **(Admin) > System**, and in the options panel, click **Investigation**.

   The Investigation Configuration panel is displayed.

2. In the **Events** tab, in the **Event Display Limit Default** field under **Events Panel Settings**, select the maximum number of events loaded in the Events panel when a query is submitted.
   The default and suggested value is 10,000 events, and you can select a value between 100 and 40,000 events. Increasing the limit above 10,000 events may cause excessive load on the queried service, causing a timeout or error to occur. Consider these factors before increasing the limit: number of columns in column groups, size or length of meta values associated to columns (meta keys), complexity of the search, length of the time range, and number of underlying services providing matching results to the query.
   When users want more results returned, so that their subsequent sorting and finds through that data do not require additional queries to the services, the event limit can be increased. In this case, the best practice is to configure a per-role limit using the configuration options in Event Limit per User Role so only specific users are returned more results. For example, set the global Event Limit Default to 5,000, and then create different Analyst roles that can be set to higher limits, up to the maximum 40,000 events.
3. If a query returns more events than the configured Event Limit Default, the Events panel title shows the analyst that more results are available but are not listed due to the limit. Increasing the limit may place additional load on the queried service; the ideal limit is determined by your environment.
4. Click **Apply**.

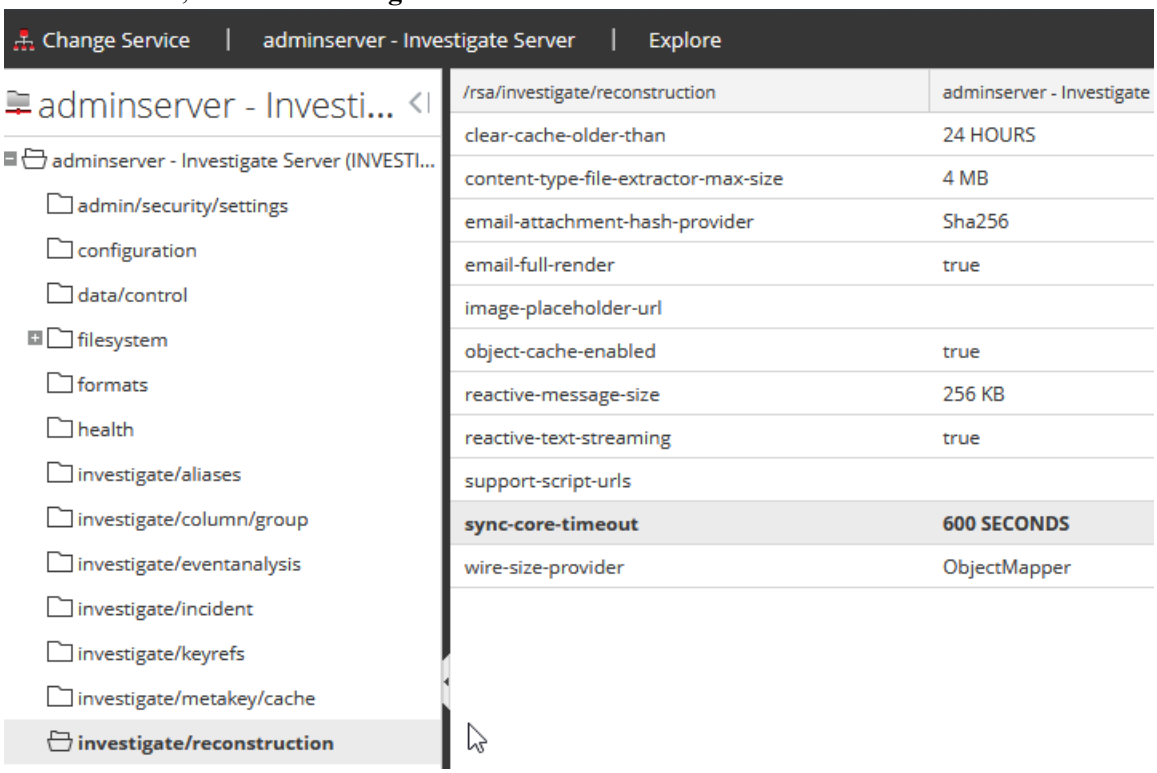
   The change becomes effective immediately, and applies to any new queries submitted by analysts.
5. Under **Render Threads Settings** in the **Render Threads** field, select the maximum number of concurrent meta key values that are loaded by a single user in the Events Meta view. The Render Threads value should be between **1-8**. The default value is **2**.

   Note: By increasing the number of render threads, the meta values within the Events Meta panel are loaded simultaneously.
6. Click **Apply**.

The change becomes effective immediately, and applies to any new queries submitted by analysts.

7. Under **Event Limit Per User Role**, select the maximum number of events loaded for a single query for individual user roles. This limit must be less than or equal to the system events limit of 40,000 events; it can be larger than the default or configured limit set under Event Limit Default.
8. Click **Apply**.

   The change becomes effective immediately, and applies to any new queries submitted by users assigned to the user role.



Configure the Sync Core Timeout to Remedy Deadlocks in Events View Reconstructions

The `sync-core-timeout` is a setting in the `/investigate/reconstruction` node that determines the maximum time to wait for operations for caching core content to complete to prevent deadlocks. The default value is 600 seconds (10 minutes) and needs no adjustment under most circumstances. If analysts are seeing a spinner for a very long time (>10 minutes) when loading a reconstruction in the Events view, for example from events on a 10G Decoder, increasing the length of this timeout may improve the ability to reconstruct events.

Caution: Changing the timeout setting to more than 600 seconds may lead to stability issues.

To adjust the sync-core-timeout:

1. Go to  **(Admin) > Services > Investigate-server** and **View > Explorer**.
2. In the node list, click the **investigate-reconstruction** node.

3. In the **sync-core-timeout** field, type a new value for the number of seconds before timeout and press **RETURN**.
   The setting is applied and goes into effect immediately.

Configure Live Services Settings

Options for configuring Live Services are in the System view > Live Services Configuration panel. The Live Configuration panel allows you to configure:

- The Live account.
- The Live Content update schedule and preferences for notification of updates.
- Participation in Live Services Feedback (Version 11.4.0 and earlier).
- Sharing Live Content Usage
- RSA Live Connect (Version 11.5.0 and earlier).

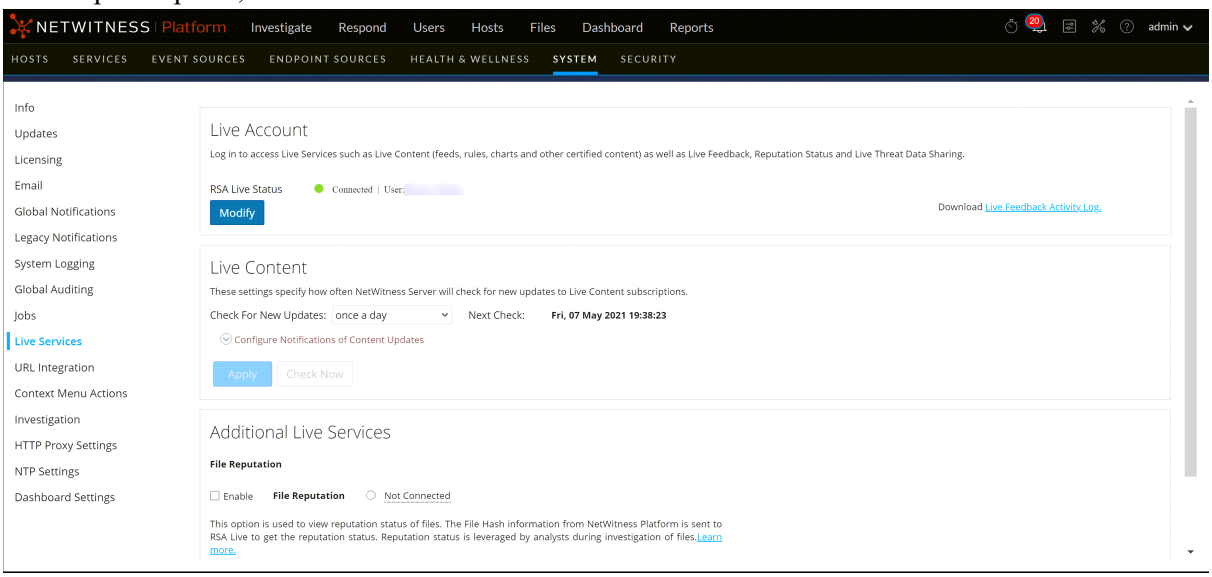
Prerequisites

To activate your Live account for NetWitness, please contact NetWitness Customer Support. When you have a confirmation that your Live account has been set up, you can configure and test the CMS server connection.

For information on Analyst Behaviors and Data Sharing, see "NetWitness Feedback and Data Sharing" topic in the *Live Services Management Guide*.

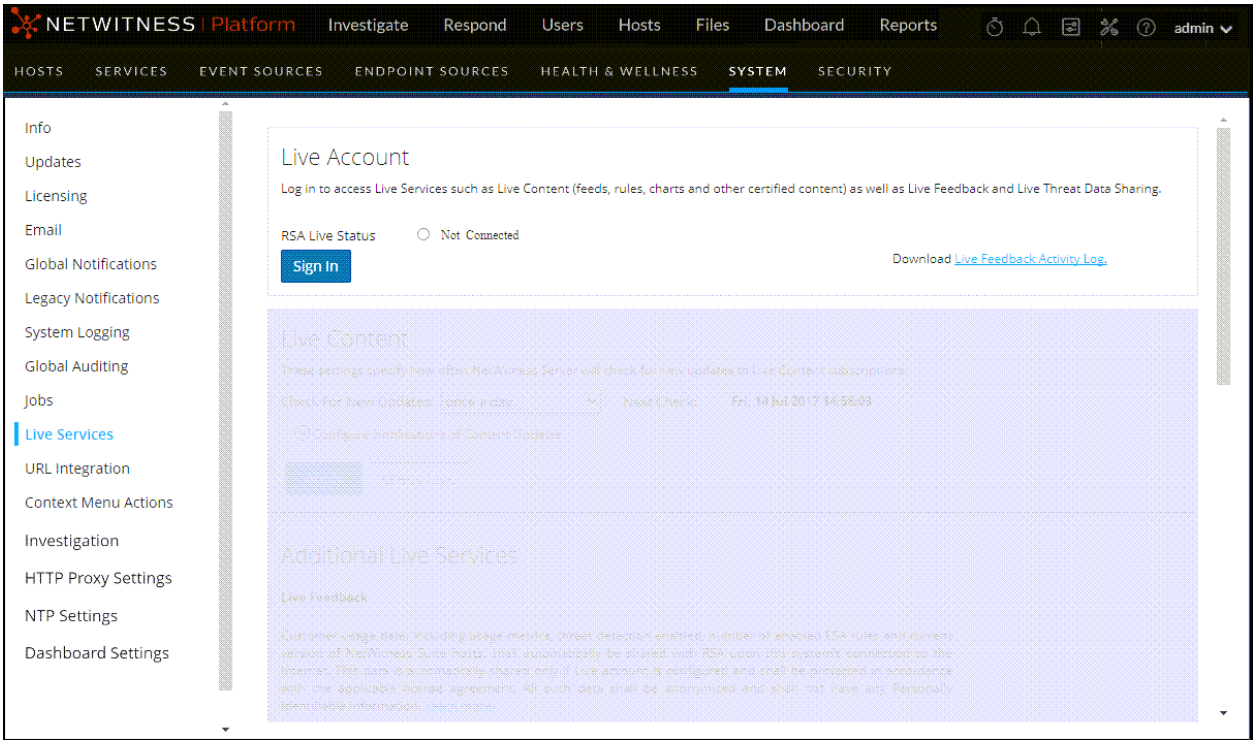
About Live Feedback Participation

Once you sign up for a Live account, Live Feedback automatically collects relevant information for further improvement and anonymously sends it to NetWitness. The shared data is protected in accordance with the applicable license agreement. For information on Live Feedback, see Live Feedback Overview. For information, see Configure Live Services Settings



If needed, you can manually download historical usage data and share it with NetWitness. For information on how to download historical usage data and share it with NetWitness, see Upload Data to NetWitness for Live Feedback.

This topic contains the following procedures:



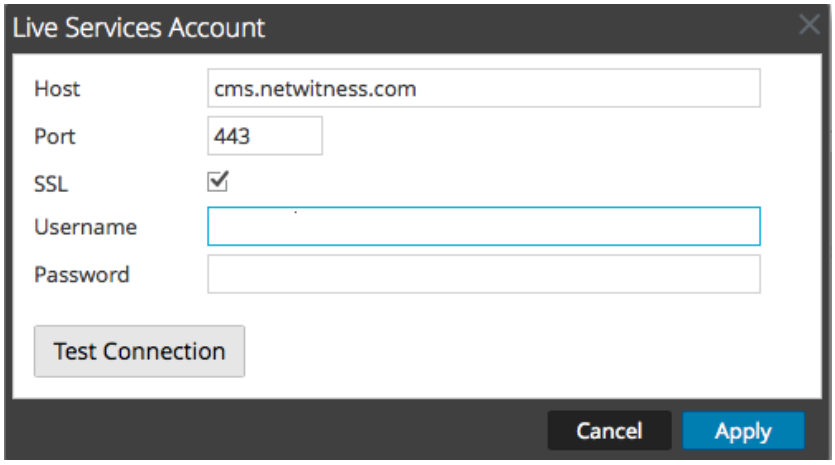
- Access the Live Services Configuration Panel
- Configure Live Account
- Configure the Live Content Synchronization Interval and Notification
- Force Immediate Synchronization

Access the Live Services Configuration Panel

1. Go to  **(Admin) > System**.
2. In the options panel, select **Live Services**.

Note: If you are not signed in with your Live Account credentials, a masked screen is displayed.

Configure Live Account



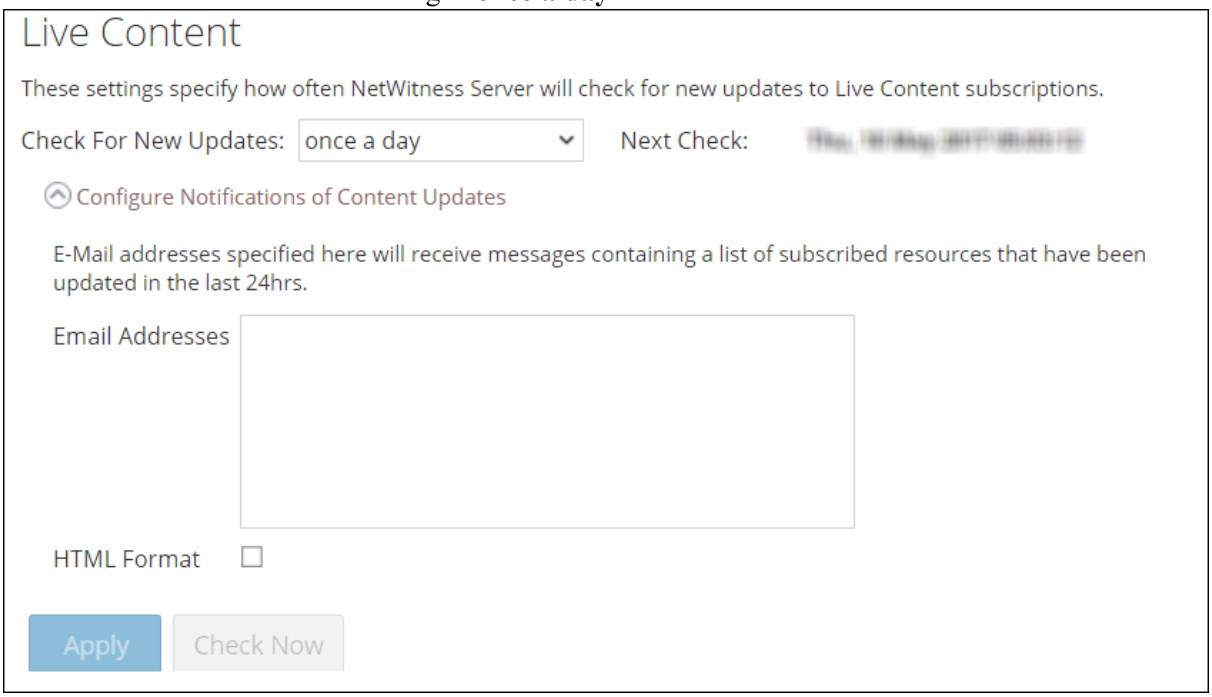
In the **Live Account** section, you must set up the user's Live account. The information needed to set up the user's Live account consists of the Username, Password, and Live URL for the Content Management System. This information is provided by Customer Care.

To configure a Live account:

1. In the **Live Account** section, click **Sign In**.

   Note: The **Modify** button shows that the live account is configured. Click **Modify** to change the user that is accessing Live Services.

2. In the Live Services Account dialog box, enter the Host (typically **cms.netwitness.com**) and type your username and password.



3. (Optional) If you are using a different CMS, type the host URL for the Content Management System. The default points to the CMS at **cms.netwitness.com**.
4. (Optional) If you are using a different CMS, type the communications port for Live to send requests to the Content Management System. The default for this field is **443**, which is the communications port on the Content Management System.
5. (Optional) If you do not want to use SSL, uncheck the **SSL** option. (SSL is enabled by default.)
6. Click **Test connection** to test the connection to CMS.
7. To save and apply the configuration, click **Apply**.

Configure the Live Content Synchronization Interval and Notification

You can change the interval at which NetWitness checks for new updates to Live Content:

1. Use the **Check for New Updates** field to change the interval. Select an interval from the drop-down list. The default value for this setting is **once a day**.

2. To configure Live Services to send update reports to one or more people, in the **Email Addresses** field, type the email addresses as a comma-separated list, for example, **john@company.com,ted@company.com,brian@company.com**
3. (Optional) To receive messages in HTML format rather than plain text, select **HTML Format**.
4. To save and apply, click **Apply**.

   The time and date of the next scheduled Live synchronization based on the configured interval for checking is displayed.

Force Immediate Synchronization

Instead of waiting for the next scheduled resource cycle, this option forces Live to begin immediate synchronization of the subscribed resources in this instance of NetWitness. One use for this is to see the immediate impact of a configuration change. For example, a new service has been added, or new resources have been toggled for automatic deployment. The scheduled synchronization could take place hours later if Live Services is set to synchronize a few times a day.

Caution: Synchronization can cause a parser reload if a FlexParser is deployed in the update cycle. This is acceptable once or twice a day, but a number of back-to-back parser reloads can cause packet loss at the Decoder. If this is the initial setup and you haven't configured Live resource subscriptions, do not Synchronize Now. Wait until you have configured subscriptions.

To force immediate synchronization, click **Check Now**. NetWitness checks for updates in subscribed resources.

File Reputation

File Reputation provides analysts the opportunity to view reputation status of files.

By default, **File Reputation** is enabled in **Additional Live Services** section.

Live Feedback Overview

This topic provides an introduction to Live Feedback. Live Feedback collects relevant information such as the Licensing usage data for Network Decoder, Log Decoder and Malware Analysis, Threat Detection Enabled or Disabled status, Number of enabled ESA rules,and version number details of all the services of NetWitness. For more information about the licensing usage data for Packer Decoder, Log Decoder and Malware Analysis, see the **License Details** tab topic in the *Licensing Guide*. The information is collected to improve future releases of NetWitness. You will automatically be signed on to live feedback and you cannot disable this option.

In addition to this, information on the Live Content Usage can also be shared with NetWitness. Live Content usage metrics for resource types from  **(Configure) > Live Content > Search Criteria** such as total count of NetWitness Application Rule, NetWitness Correlation Rule etc. can be shared with NetWitness. The information collected is used to improve the use of Live Content. For more information about sharing live content configuration, see Live Services Configuration Panel.

About Live Feedback Participation

Once you sign up for a Live account, Live Feedback automatically collects relevant information for further improvement and anonymously sends it to NetWitness. The shared data is protected in accordance with the applicable license agreement. For information on Live Feedback, see Live Feedback Overview. For information, see Configure Live Services Settings

If needed, you can manually download historical usage data and share it with NetWitness. For information on how to download historical usage data and share it with NetWitness, see Upload Data to NetWitness for Live Feedback.

Note: Live Feedback is activated only if you have configured your Live account.

The Live Feedback data is in JSON format as mentioned below. When you sign up with your Live Account credentials, a single encrypted JSON file is automatically uploaded to the NetWitness servers everyday.

JSON File

The JSON file consists of usage data information for a component or a set of components. In case of a set of components with the same license id, the usage data for all the components is aggregated and represented as a component called Entitlement. However, even if there is a single component such as a log decoder or decoder, an Entitlement component will be generated and will display the usage data for a single component. This aggregation is for components namely log decoders, decoders or malware analysis.

Note: The version of Entitlement is always null as it is the aggregate for a license data.

For example, if there are three Decoders with the same license id "xxx" with the following usage data:
Decoder1 = 150 MB
Decoder2 = 250 MB
Decoder3 = 100 MB
The aggregated usage data of 500 MB is displayed.

This JSON file is described in the following sections:

- Components
- Metrics
- Other Product Details
- Sample

Components

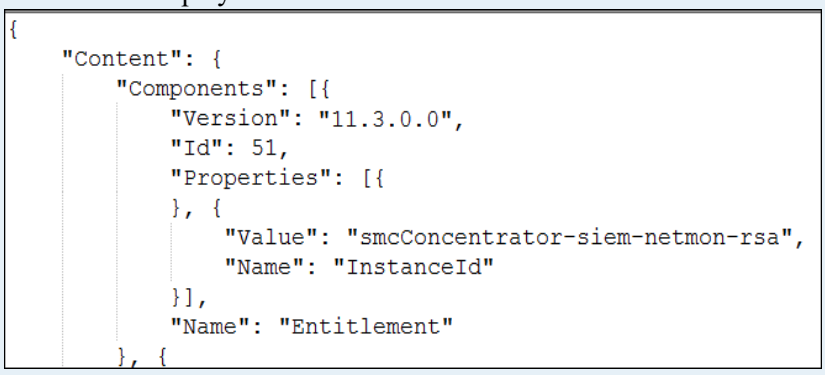
Details of each service in your NetWitness deployment. This is represented as Component. For each component the following details are displayed.

Component	Description
Version	Version number of the component in the NetWitness deployment. For example, 11.1.0.0.x.x.x.x.
ID	This is the unique Component ID that represents the host and is used to link to the metrics generated.
Properties	• **Name** - This is the name of the property for that component. For example, malware analysis, ESA, log decoder, etc. • **Value** - This is the unique value to identify the component.

Metrics

Metrics of the components (hosts) such as Log Decoder, Decoder and Malware Analysis. The license usage data for each host is shared. For Live Content usage metrics, resource types from  **(Configure) > Live Content > Search Criteria** such as total count of NetWitness Application Rule, NetWitness Correlation Rule and so on are shared.

Component	Description
Usage	• **Value** - This is the value generated for the specific component ID for each component. • **Name** - This is the name of the statistics for which the metrics is collected. For example, Capture Total Bytes.
StartTimeUTC	This is the time from when the metrics is collected. (in EPOCH format).
EndTimeUTC	This is the time when the metrics collection is complete (in EPOCH format).
Component ID	This is the ID of the component for which the value is recorded.



Other Product Details

- **End Time** - This is the time when the metrics collection is complete (in EPOCH format).
- **Product Name** - This is the name of the product. In this example, the Product Type is **NetWitness**.
- **Version** - This is the version of the JSON file which tracks the changes made to the file format.

- **Start Time** - This is the time from when the metrics is collected. (in EPOCH format).
- **Product Type** - This is the name of the product. In this example, the Product Type is **NetWitness**.
- **Product Version** - This is the version of the product from which the metrics is collected. In this example, the Product Version is **11.3.0.0-SNAPSHOT**.
- **Product Instance** - This is the License Server ID.
- **Checksum** - This is the information which is used for integrity checks.

The following table describes details of the JSON file with examples.

Metrics	Description
Content	Displays the content that contains all the Components, Metrics, Product Type and Product Instance data except Checksum.

Metrics	Description
Components	The details of all the services in NetWitness are represented as a Component. The details of the component such as the version number of the component, the name, and the value is displayed.  **Version**: Displays the version of NetWitness service. For example, 11.3.0.0. **ID**: Displays an unique id which is generated for the NetWitness service and is used to link to the metrics for that particular component. In this example, the ID for Malware Analysis is 5 and the metrics is displayed for ComponentId 5 in bytes:  **Properties**: Displays the properties for the component such as name and value as shown in the above figure. **Value**: Displays the value of the property which is an internal UUID for a component as shown in the above figure This is generated by NetWitness. For example, For malware analysis the value displayed as "55f7a0b30e502231c42d063f" **Name: "InstanceId"**: Displays the name of the property as shown in the above figure.

Metrics	Description
	Name": "malwareanalysis": Displays the name of component which is a service name such as LogDecoder, Decoder, or MalwareAnalysis.

Metrics	Displays the list of the metrics with the usage data for components namely MacHosts, LinuHosts and WinHosts.
	In this example, the metrics is displayed for ComponentId 1 in bytes.
	
	}],
	"Metrics": [{
	"Usage": [{
	"Value": "0.0",
	"Name": "MacHosts"
	}, {
	"Value": "0.0",
	"Name": "LinuxHosts"
	}, {
	"Value": "0.0",
	"Name": "WinHosts"
	}, {
	"Value": "0.0",
	"Name": "TotalHosts"
	}],
	"StartTimeUTC": 1539043200000,
	"EndTimeUTC": 1539129599000,
	"ComponentId": 1
	}, {

	StartTimeUTC: Displays the time when the metrics is collected, in the EPOCH format.
	Usage: Displays the usage value and usage type statistics of the component.
	Value: Displays the value of the statistics. For example, "Value": "1582940012678" as shown in the above figure.
	Name: Displays the name of the statistics. For example, Capture Total Bytes or Total File bytes.
	EndTimeUTC: Displays the time when the metrics collection is complete, in the EPOCH format.
	ComponentId: Displays the component id for which the metric values are collected. This is the same as the "ID" in the Components section.
Content	Displays the content that contains all the Components, Metrics, Product Type and Product Instance data except Checksum.
ProductType	Displays the product type that generates the file. For example, `"ProductType": "NetWitness Platform"`
ProductInstance	Displays the License server Id and is unique per NetWitness. For example, `"ProductInstance": "00-0C-29-6C-66-E3"`

Metrics	Description
Checksum	Displays the Checksum for the "Content" section in the file. Used by NetWitness for integrity check. For example, `"Checksum": "883DACF97E4BCD9F590A1461A4DD0A312B5883A6CF82E0518E77AAB6A6DDB654"`

Example

Here is a sample JSON file.

```
{
    "Content": {
        "Components": [{
            "Version": "11.3.0.0",
            "Id": 7,
            "Properties": [{
                "Value": "57470c96e4b0cf62c7bfbd53",
                "Name": "InstanceId"
            }],
            "Name": "esa"
        },
        {
            "Version": "11.3.0.0",
            "Id": 4,
            "Properties": [{
                "Value": "5714c78be4b0ea5bd2b96e69",
                "Name": "InstanceId"
            }],
            "Name": "incidentmanagement"
        },
        {
            "Version": "11.3.0.0",
            "Id": 2,
            "Properties": [{
                "Value": "5714c78be4b0ea5bd2b96e65",
                "Name": "InstanceId"
            }],
            "Name": "sa"
        },
        {
            "Version": "11.3.0.0",
            "Id": 1,
            "Properties": [{
                "Value": "5714c78be4b0ea5bd2b96e63",
                "Name": "InstanceId"
            }],
            "Name": "malwareanalysis"
        },
        {
            "Version": "11.3.0.0",

    }, {
```

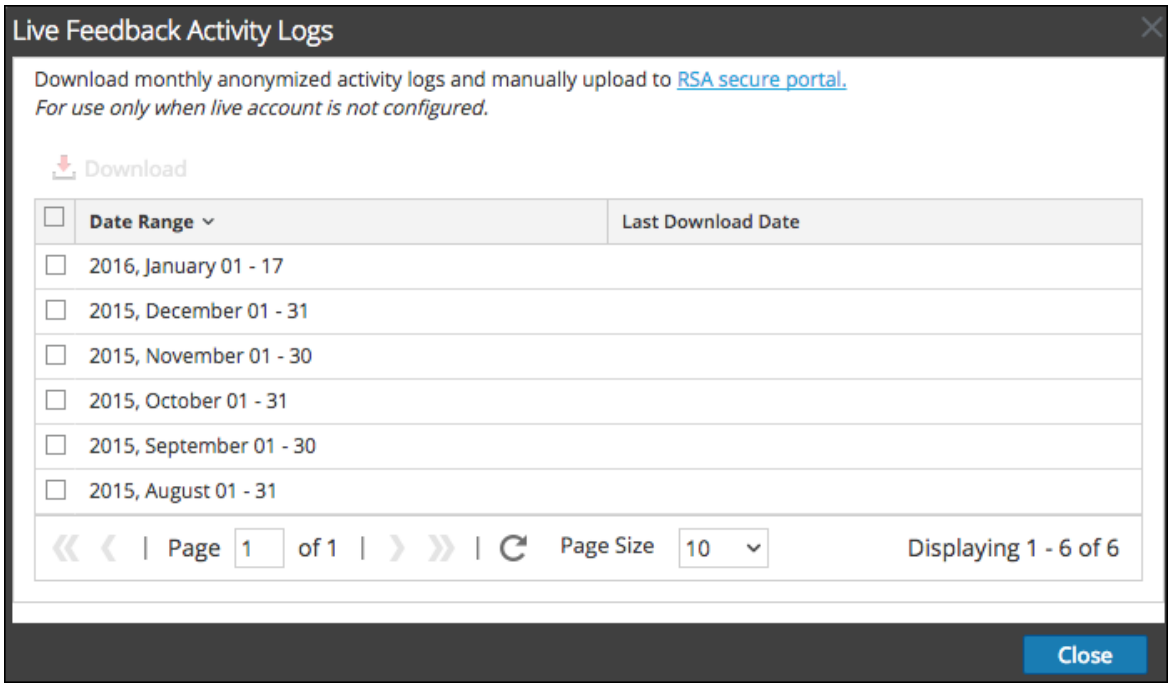
Upload Data to NetWitness for Live Feedback

This topic provides instructions for a NetWitness administrator to export the metrics in NetWitness for Live Feedback.

If the Live Account is not configured, you can manually upload the usage data to NetWitness. For more information, see Live Services Configuration Panel.

The Live Account section has a Live Feedback Activity Log which enables you to download the usage data required for Live Feedback. This is active regardless of the Live Account configuration.

You can first download the Live Feedback historical data, and then upload it to share with NetWitness.



Download Live Feedback Historical Data

To download the Live Feedback historical data:

1. Go to **(Admin)** > **System**.
2. In the options panel, select **Live Services**.

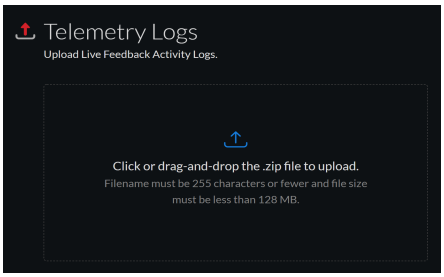
   The **Live Account** screen is displayed which consists of the **RSA Live Status** and Download **Live Feedback Activity Log**.
3. Click the **Live Feedback Activity Log**.

   The **Live Feedback Activity Log** window opens which allows the NetWitness user to download the required Live Feedback historical data.

4. Select one or multiple entries by setting the checkboxes and click **Download**.

   Note: If you select multiple entries in the history table, the downloaded zip file consists of an individual JSON file for each month.

The downloaded Live Feedback data is in JSON format, and is bundled as a .zip file. For more information, see Live Feedback Overview.



Share Data with NetWitness

After you download the Live Feedback data, you can then upload it using the following procedure.

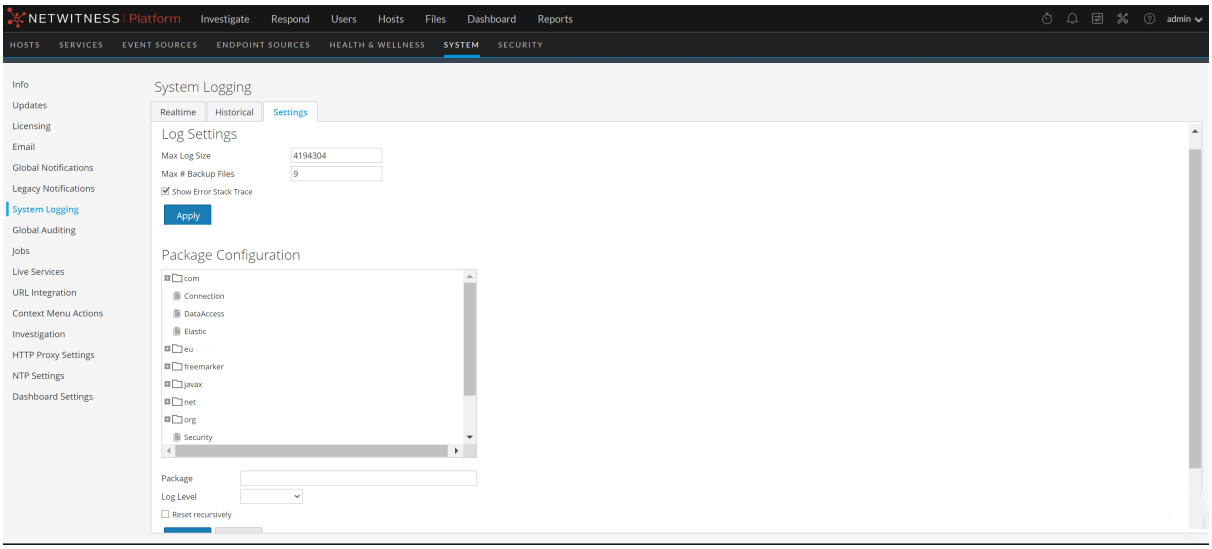
Note:
- To download the Live Feedback data, see topic Download Live Feedback Historical Data.
- You can share data using the new live registration portal. For more information, Create Live Account.

To share the data to NetWitness

1. Log in to the NetWitness Cloud Services using your credentials.
2. Click  on the left panel.
   The **Telemetry Logs** dialog is displayed.

Note:
- You can upload only .zip files.
- Filename must be 255 characters or less and file size must be less than 128 MB.

3. Click or drag-and-drop a file onto this area to upload.



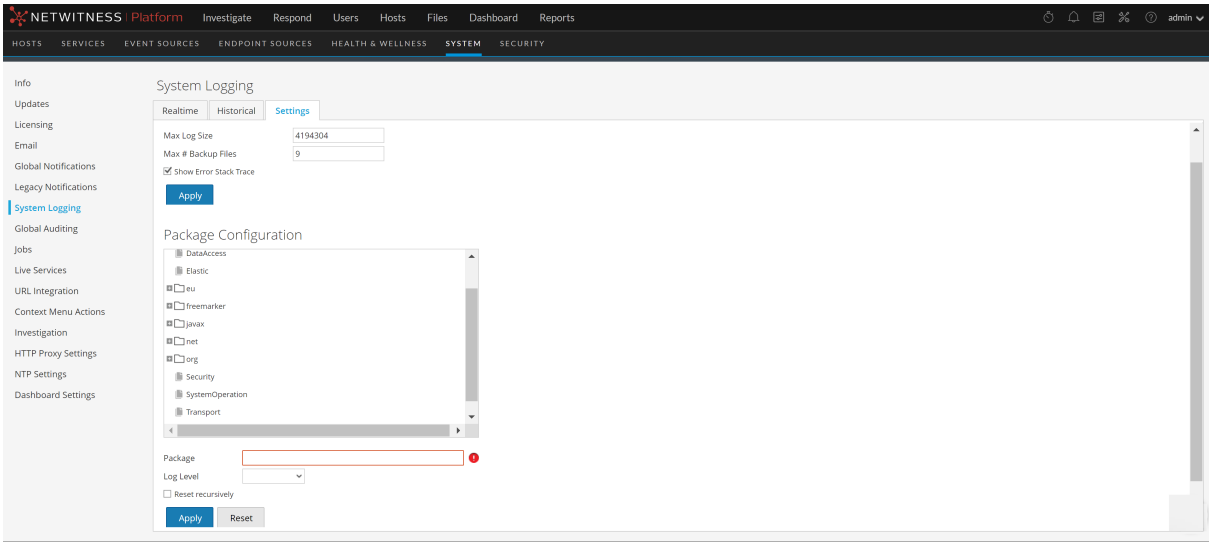
Configure Log File Settings

In NetWitness Platform, you can configure the size of the log files, the number of backup log files maintained, as well as the default logging levels for the packages within NetWitness.

Configure System Log File Size and Backup Count

The log file size and backup count are configured with default values. If you want to change the default values for the log file size and number of backups:

1. Go to  **(Admin) > System.**
2. In options panel, select **System Logging**.
   The System Logging Configuration panel opens to the Realtime tab by default.



3. Click the **Settings** tab.
4. In the **Max Log Size** field, type the maximum size in bytes. The minimum value for this setting is **4096**.
5. In the **Max # Backup Files** field, type the maximum number of backup logs to maintain. The minimum value for this setting is **0**. When the maximum number of log files is attained, and a new backup file is made, the oldest backup is discarded.
6. Click **Apply**.
   The changes go into effect immediately.

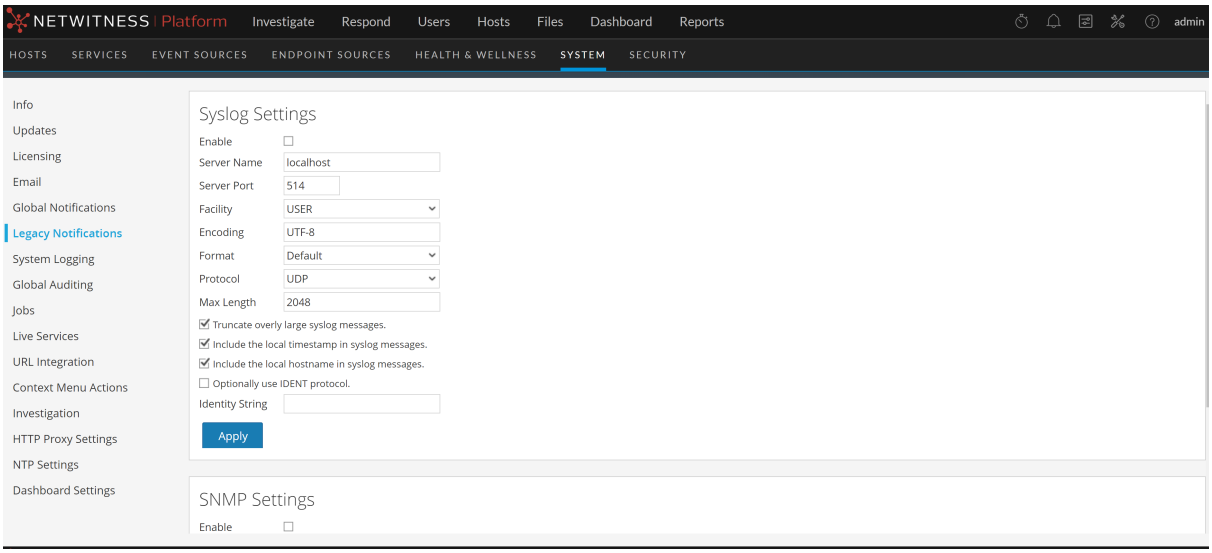
Set the Log Level for an Individual Package

The Package Configuration section shows the NetWitness Network in a tree structure. The tree contains all the packages used within NetWitness. You can drill down into the tree to view the log levels of each package. The log level for all packages that are not explicitly set is the same as the **root** log level. To set the log level for a package:

1. Select the package in the **Package** tree.
   The name of the package is displayed in the **Package** field. If a log level is already set for the

package, that level is shown.

2. Select the **Log Level** in the drop-down list.
3. Click **Apply**.
   The new log level becomes effective immediately.
4. (Optional) If you want to revert to the default log level specified for **root**, click **Reset**.



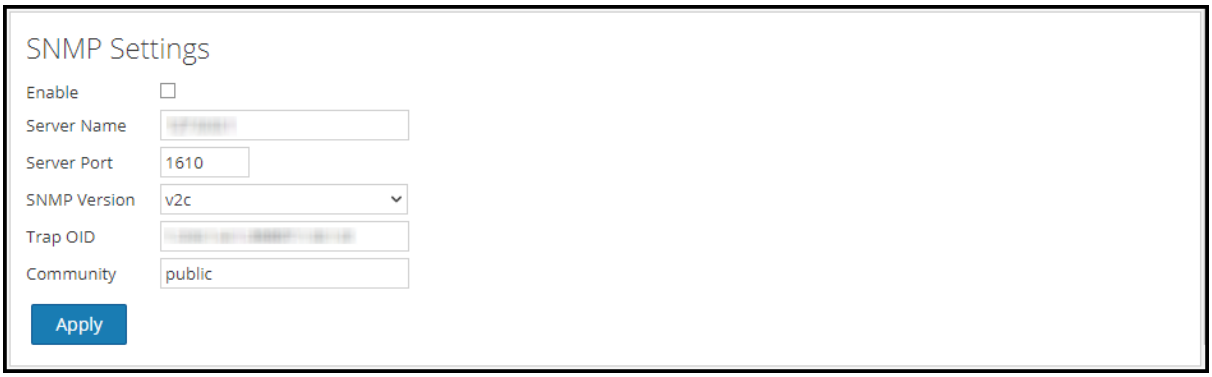
Configure Syslog and SNMP Settings

On the Legacy Notifications panel, you can configure syslog and SNMP notification settings. These configurations are used for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.

Configure and Enable Syslog Settings

1. Go to  **(Admin) > System**.
2. In the options panel, select **Legacy Notifications**.

   The Legacy Notifications Configuration panel is displayed.



3. In the **Server Name** and **Server Port** fields under **Syslog Settings**, type the host name where the target syslog process is running and the port where the target syslog process is listening.
4. In the **Facility**, **Encoding**, **Format**, and **Max length** fields, specify the syslog facility, message text encoding, message format, and maximum message length.
5. In the **Protocol** field, select either UDP or TCP.
6. (Optional) Select the options for what to include in messages: **Truncate overly large syslog messages**, **Include the local timestamp in syslog messages**, and **Include the local hostname in syslog messages**.
7. (Optional) Configure syslog to prepend an Identity String before each syslog alert.
8. Set the **Enable** checkbox.
9. Click **Apply**.

Syslog notifications are immediately enabled. Legacy Notifications Configuration Panel provides detailed information about these settings.

Configure and Enable SNMP Settings

1. Go to **(Admin) > System**.
2. In the options panel, select **Legacy Notifications**.

   The Legacy Notifications Configuration panel is displayed, with SNMP Settings at the bottom of the panel.

3. In the **Server Name** and **Server Port** fields under **SNMP Settings**, type the host name and listening port of the SNMP trap host.
4. Select the **SNMP version** in the drop-down menu, **v1** or **v2c**.
5. In the **Trap OID** field. specify the object ID for the SNMP trap on the trap host that receives the audit event. The default value is **0.0.0.0.0.1**.
6. In the **Community** field, specify the community string used to authenticate on the SNMP trap host, the default value is **public**.
7. Set the **Enable** checkbox.
8. Click **Apply**.

SNMP notifications are immediately enabled. Legacy Notifications Configuration Panel provides detailed information about these settings.

Disable Syslog or SNMP Settings

To disable syslog or SNMP settings on this NetWitness instance:

1. Clear the appropriate **Enable** checkbox.
2. Click **Apply**.
   The selected settings are immediately disabled.

Additional Procedures

Additional procedures are not essential for the set up of NetWitness, they include certain customization options that are beyond the usual setup; for example, adding custom context menus or setting up a proxy.

Add Custom Context Menu Actions

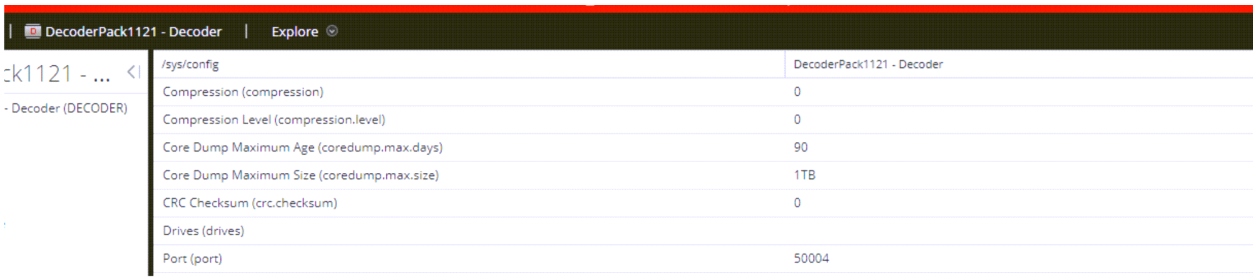
Configure NTP Servers

Configure Proxy for NetWitness Platform

Add New Configuration Dialog

Supported CEF Meta Keys

Supported Global Audit Logging Meta Key Variables



Global Audit Logging Operation Reference

Local Audit Log Locations

Configure Core Dump Retention

When a NetWitness service starts, it checks the cores directory for core files. If any are older than 90 days, they are deleted. Then, if the core files take up more than 500 GB, the service will delete them from the oldest until the core files are under this limit.

From 12.3 and later, a new feature is added to all NetWitness services allowing the user to customize the time and size limits using new configuration parameters under the `/sys/config` node in the Explore view.

This picture shows the new parameters in the explore screen on a decoder. To update, simply click the value and enter a new value as you would with any other configuration parameter. The new values will take effect the next time the service starts.

Parameters

- Core Dump Maximum Age
- Core Dump Maximum Size

Core Dump Maximum Age

This parameter controls the maximum number of days that the service will keep core files. Any core file older than the number shown here (in days) will be deleted when the service starts. The default is 90. The values range from 10 to 1825 (5 years)

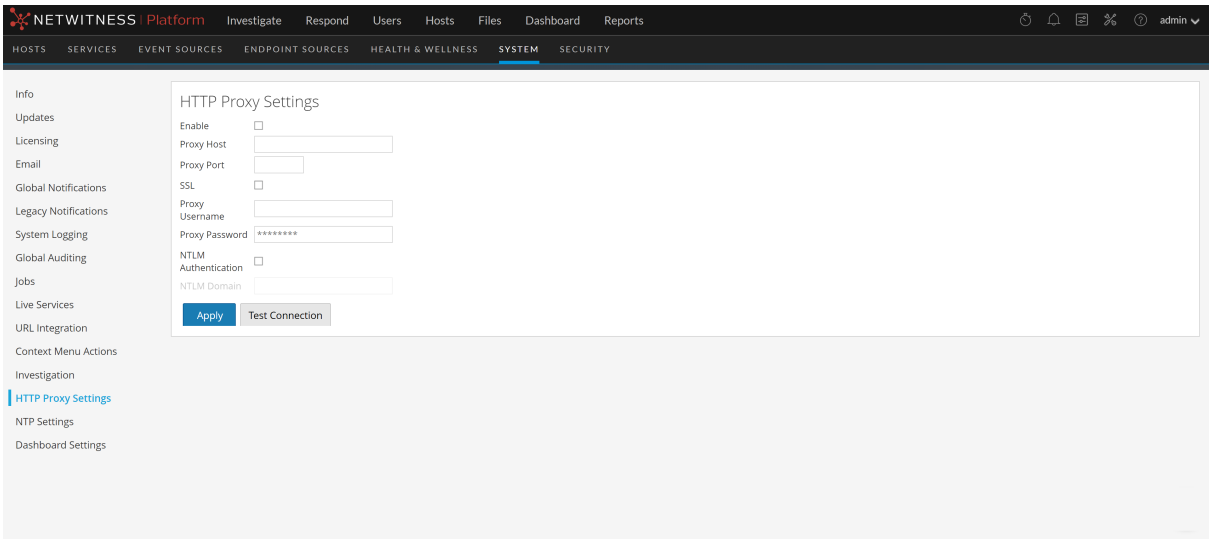
Core Dump Maximum Size

This parameter controls the maximum number of bytes that core files can take on the disk. When the service starts, if the total of all core files is over this limit, the service will start deleting files starting with the oldest until the total amount of disk space used is under this limit. The default is 500 GB, and the range is 10 GB -1000000000 GB. "0" is allowed and means unlimited.

Caution: As the core files are kept on the same drive as the meta DB. As such, the value for Core Dump Max Size should be coordinated with the meta DB space limitations and the physical storage size.

Configure Proxy for NetWitness Platform

This topic provides a procedure for setting up a proxy that is used across NetWitness modules and services.



Note: Proxy support is only for HTTP and HTTPS proxies and not SOCKS5.

You can configure a proxy that is used across NetWitness modules and services in the System View > Advance Configuration panel. The Proxy Settings in the Advanced Configuration panel set up a proxy to be used wherever a proxy is needed in NetWitness. These settings override any proxy settings configured for an individual service or module, such as Malware Analysis or Live.

To configure a proxy for use across NetWitness modules:

1. Go to  **(Admin) > System**.
2. In the options panel, select **HTTP Proxy Settings**.

   The HTTP Proxy Settings panel is displayed.

3. Click the **Enable** checkbox.

   The fields where you configure the proxy settings are activated.

4. Type the hostname for the proxy server and the port used for communications on the proxy server.
5. (Optional) Type the username and password that serve as credentials to access the proxy server if authentication is required.
6. (Optional) Enable **Use NTLM Authentication** and type the NTLM domain name.
7. (Optional) Enable **Use SSL** if communications use Secure Socket Layer. If you enable **Use SSL**, ensure that you import the required certificates for the services to retrieve information.

   You need to import certificates and add the certificate in the head node for all the specific services that communicate externally over a proxy. If there are any other service that communicates with external resources over the internet, ensure that you add the certificates. For more on how to add the certificates, see Import Certificates for HTTPS Service
8. The proxy is immediately available for use throughout NetWitness modules and services, for example, Live and Malware Analysis.
9. To save and apply the configuration, click **Apply**.

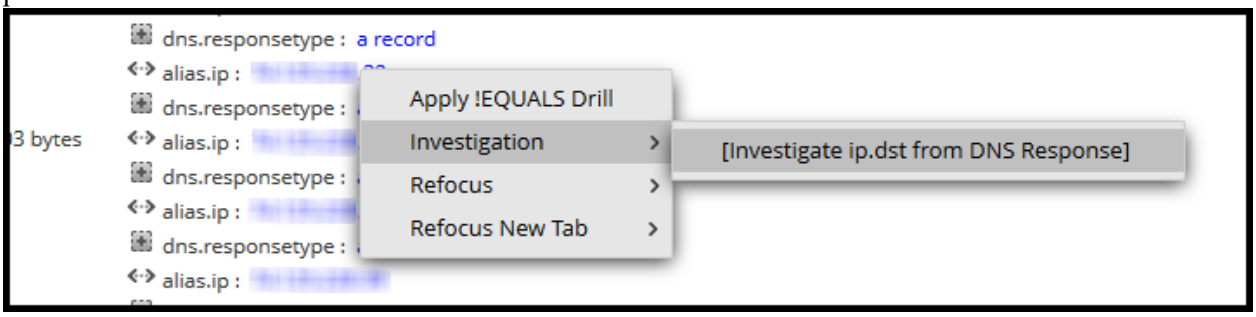
Import Certificates for HTTPS Service

Import certificates to communicate with the HTTPS services:

1. SSH to the NW node and copy the CA certificate located in the following directory:
   /etc/pki/ca-trust/source/
2. Execute the following command to update the certificates:
   `update-ca-trust`
3. Execute the following command to add the certificate to the java keystore:
   `keytool -list -keystore /etc/pki/java/cacerts -storepass changeit |& head`
4. Restart the service on the NW node.

Note: Perform the procedure for all the HTTPS servers.
Example: HTTPS proxy server and HTTPS feed server.

Add Custom Context Menu Actions

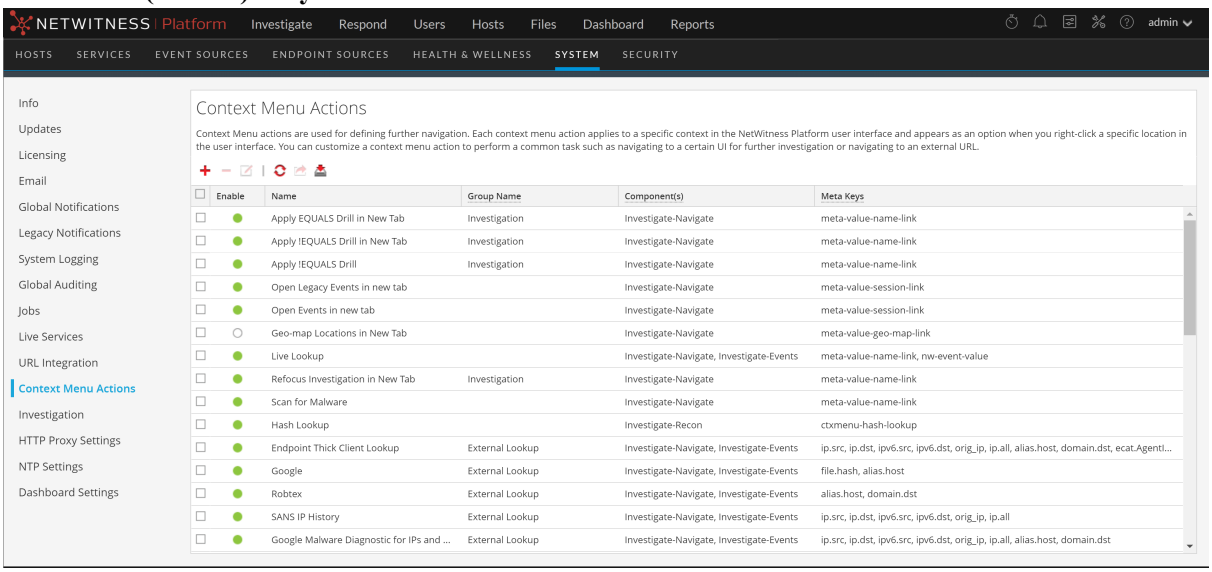


In the Context Menu Actions panel, Data Privacy Officer, Administrator, Analyst, and SOC Manager can view, add, edit, delete, import, and export context menu actions for the current instance of NetWitness. Each context menu action applies to a specific context in the NetWitness user interface, and appears as an option when you right-click a specific location in the user interface.

If you want to create a custom variation of a built-in context menu action, you can copy the configuration to a new context menu action and modify the custom context menu action. To copy, switch to the Advanced view, open the action and copy the JSON configuration file, create a new action/edit an existing action and paste. A context menu action is defined by:

- Action: The title of the action in the context menu.
- Component: The NetWitness module in which the context menu is available.
- Meta key: The content to which the action applies.
- Definition: The definition of the action.

Note: All context menu actions created before you upgrade to 11.3, functions as configured.

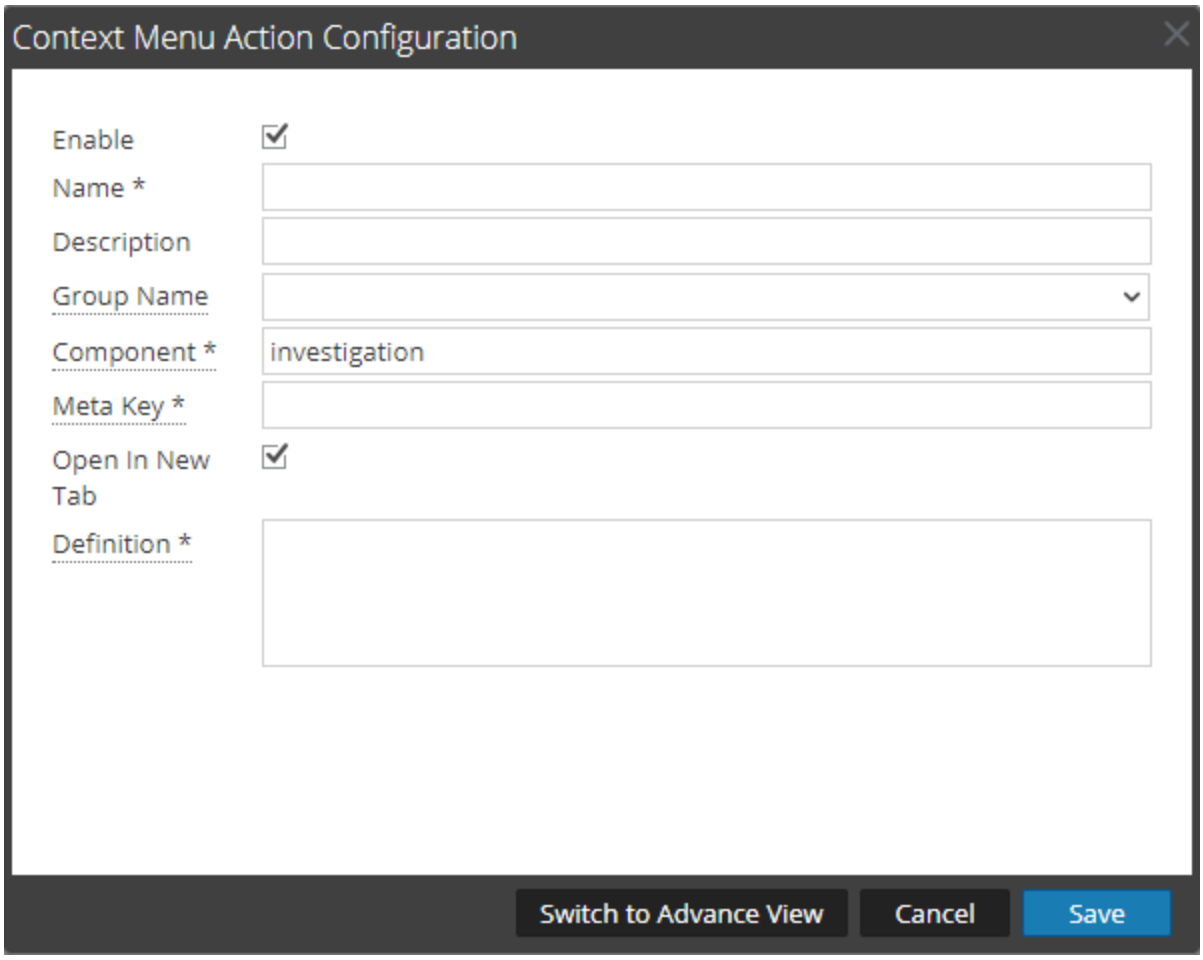


This is an example of a custom context menu action; the steps to create this example are provided as a procedure below.

View Context Menu Actions in NetWitness

To view existing context actions in NetWitness both default and custom:

1. Go to  **(Admin) > System.**



2. In the options panel, select **Context Menu Actions**.
   All the new actions which were available in NetWitness Suite 11.1 in the Investigate > Events tab can now be configured using the context menu actions. Details of the information in the Context Menu Action panel are provided in Context Menu Actions Panel.

Add a Context Menu Action

To add a context menu action in NetWitness:

1. In the toolbar, click .
   The Context Menu Action Configuration dialog is displayed.

Fill the required fields:

a. Enable: Select Enable to enable this context menu action.

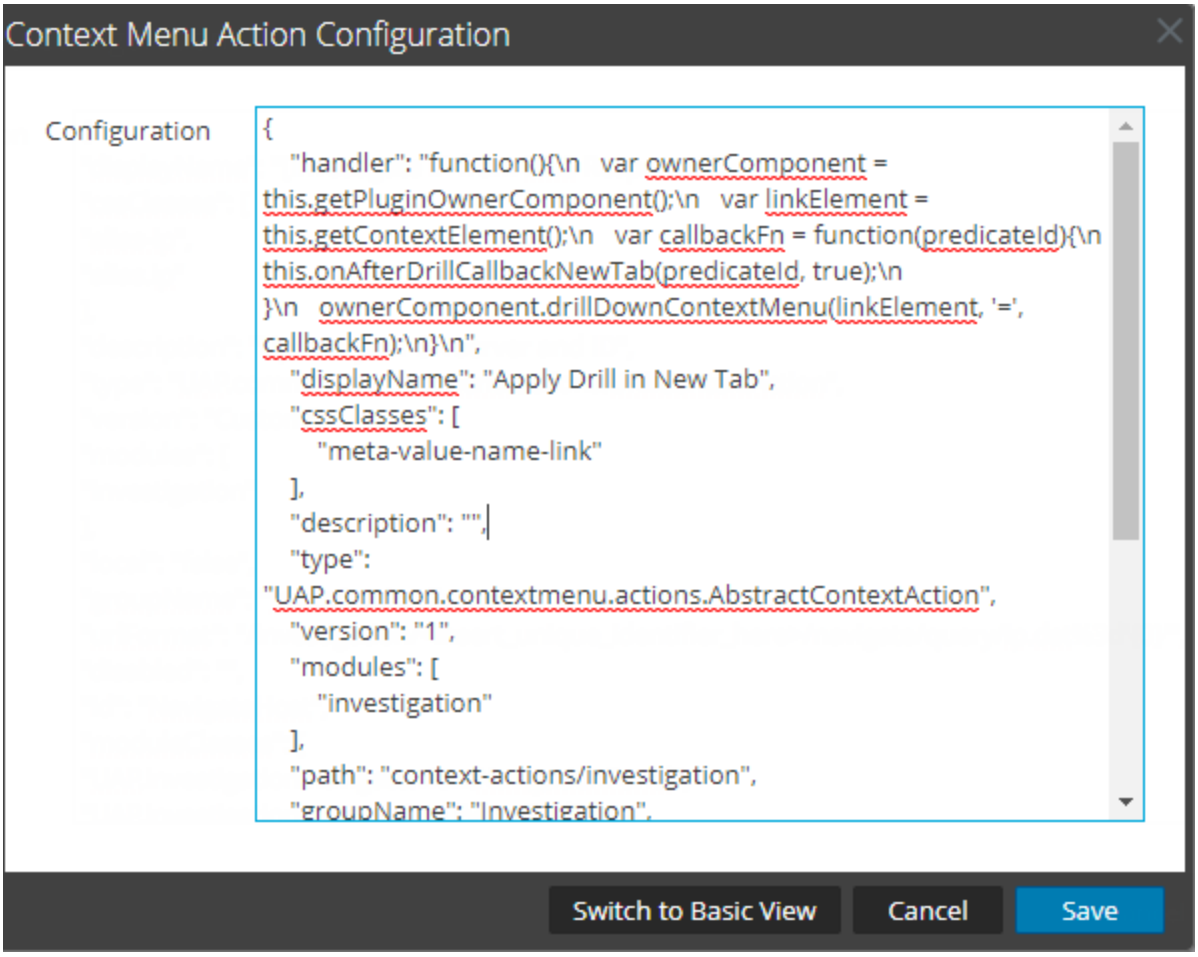
b. Name: Enter the name of the context menu action.

c. Description: Enter a description of the context menu action.

d. Group Name: Select the group name from the drop-down menu. The action appears under this group in Context menu.

e. Component: The name of the component under which action will appear in the user interface. For example. under Investigate, the Context menu action can appear under Investigate-Navigate, Investigate-Legacy Events, Investigate-Event Recon and Investigate-Events.

Note: The Investigate-Legacy Events option and related data is displayed only if the Enable Legacy Events checkbox is enabled under **(Admin)** > **System** > **Investigation** > **Legacy Events**.



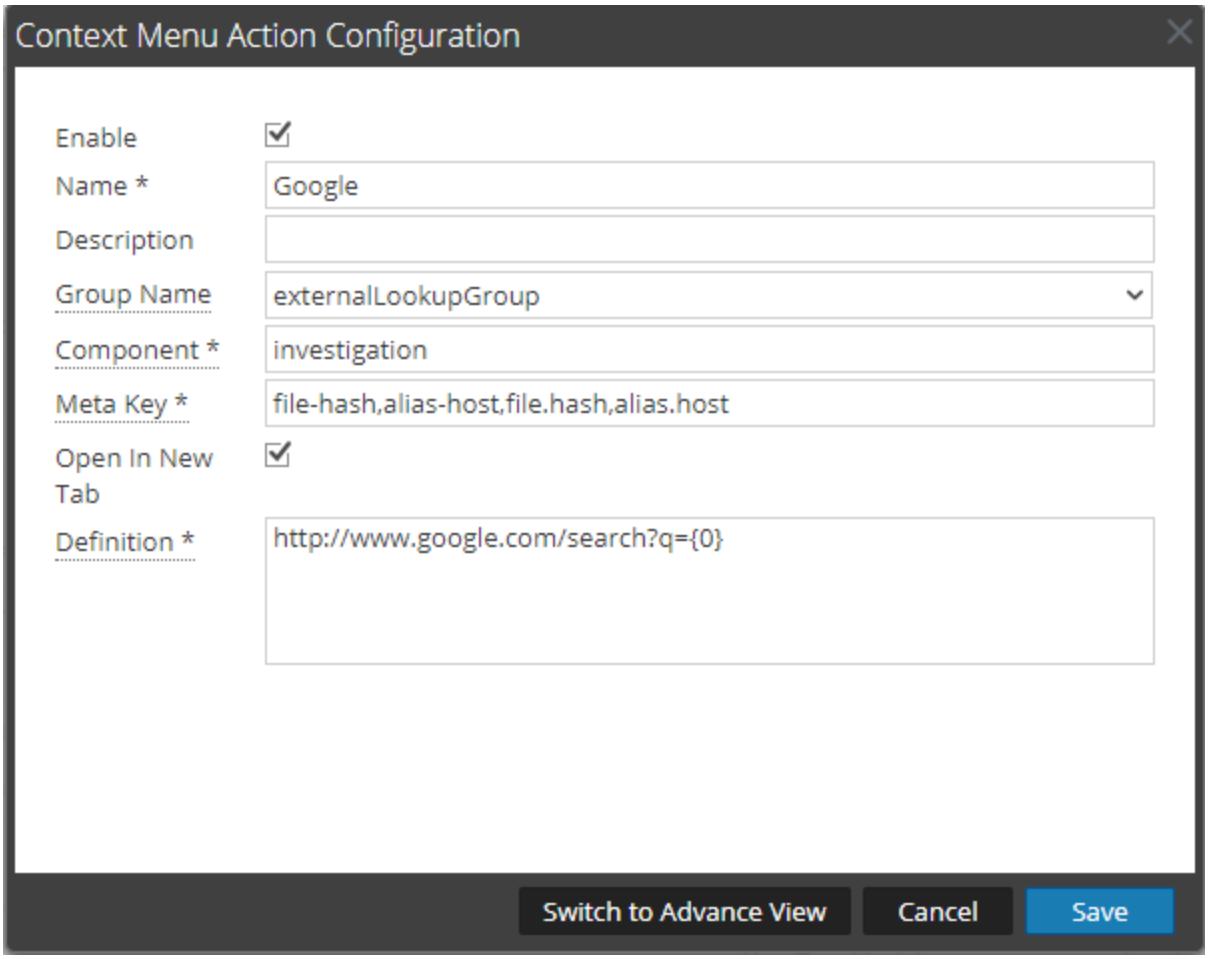
f. Meta Key: Enter the meta key separated by commas to further narrow-down scope for the context menu action. The action will appear on these meta key. Context menu actions have to be defined specifically for each meta key, the key references in a meta key do not inherit a context menu actions. For example, a context menu action created for ip.all are not created for ip.src as well. A

separate action has to be created for the sub-category or key reference of a meta.

g. Open in New Tab: Select this option to open the context menu action in a new tab.

h. Definition: Enter further action performed for this context menu action. For example, open a certain user interface or navigate to an external URL.

2. You can also type the CSS code to define the context menu action. The example procedure at the end of this topic provides step-by-step instructions that you can use to create a useful context menu action. Click **Switch to Advance View** to add the context menu action.



3. Click **OK.**
The new context menu action is created and added at the end of the list of context menu actions.

4. The context menu action becomes available in the configured location.

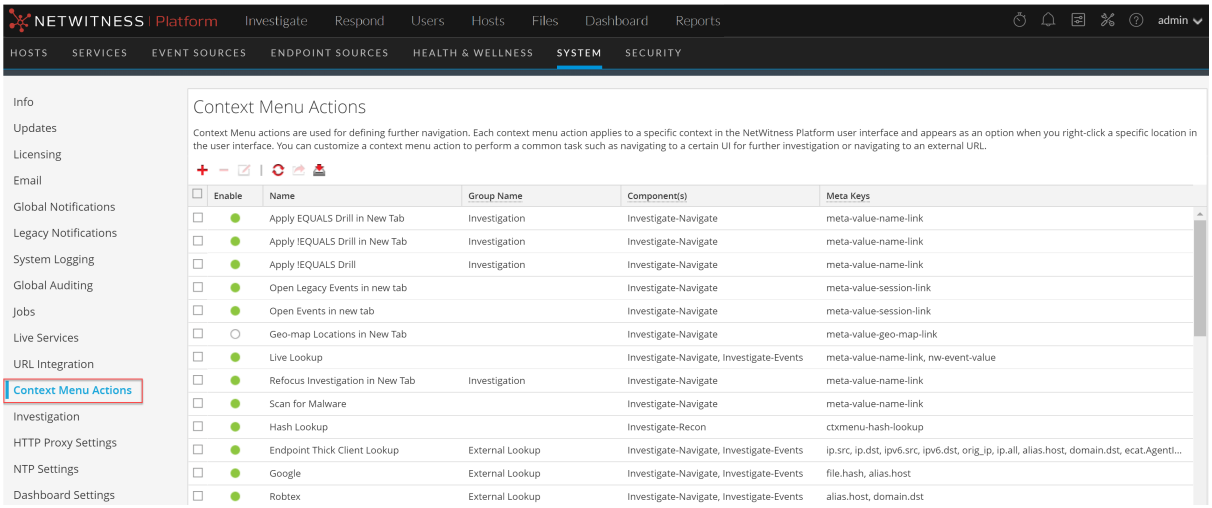
Edit a Context Action

To edit a context action:

1. Select the row in the grid and either **double-click** the row or click .
The **Context Menu Action Configuration Dialog** is displayed.

2. Edit the **Configuration**.
3. To save the changes, click **OK**.

Delete a Context Action

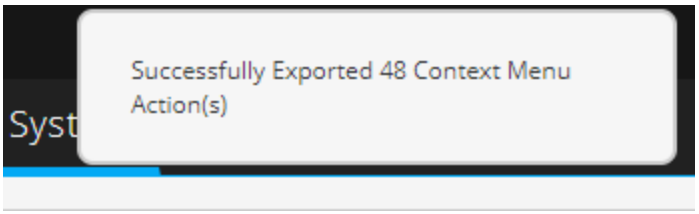


To remove a context menu action from NetWitness entirely:

1. Select the action.
2. Click .
   A dialog requests confirmation that you want to delete the context menu action.
3. Click **Yes**.
   The option is removed from the Context Menu Actions panel.

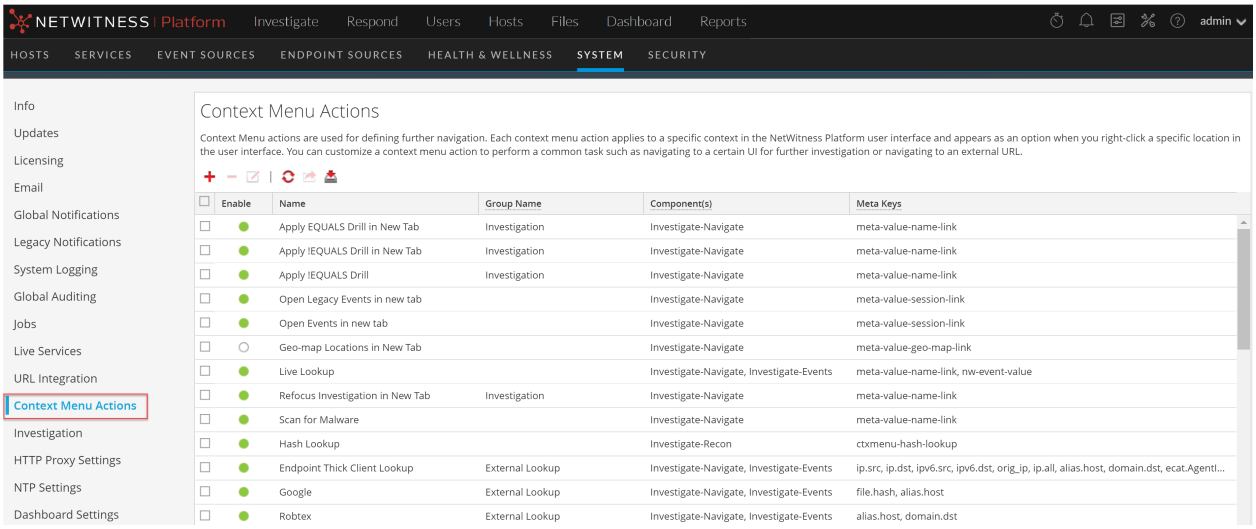
Export Context Menu Actions

You can export context menu action to a zip file. The zip file contains the JSON files with each each JSON file mapping to a context menu action. To export the context menu action, follow these steps:



1. Go to **(Admin) > System**.
2. Click **Context Menu Actions**.

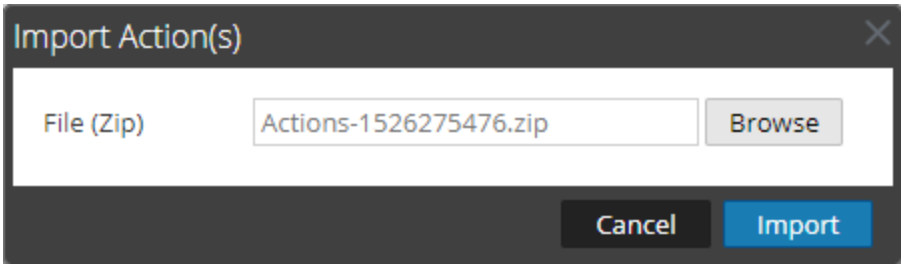
3. Click to select a context menu action to import. Click the header to select ALL the context menu actions.



4. Click Export Action(s) under Context Menu Actions.
5. The success message confirming the actions uploaded successfully is displayed.

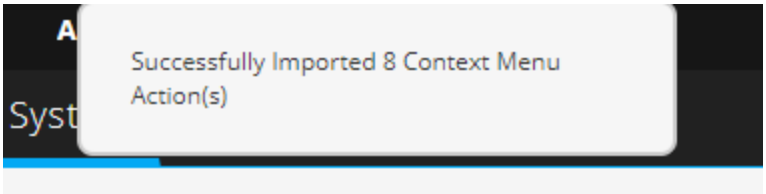
Import Context Menu Actions

You can import context actions in Context Menu Actions tab. These actions can then be edited or used as is for investigating context where applicable. Follow these steps to import a context menu action(s):



1. Go to **(Admin) > System**.
2. Click **Context Menu Actions**.

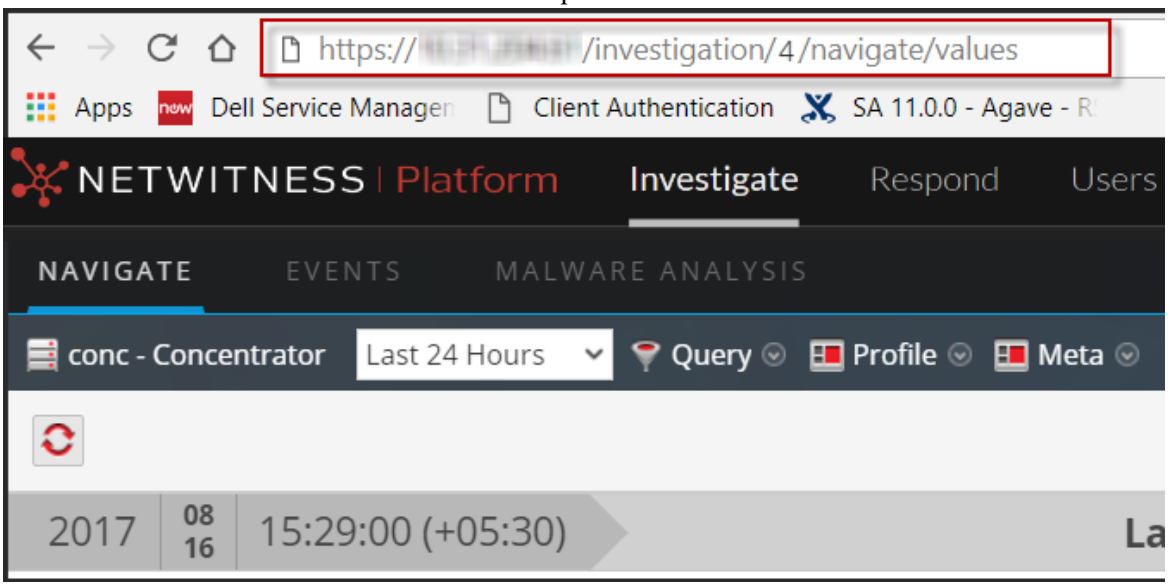
3. Click Import Action under Context Menu Actions.
4. In Import Action click **Browse** to locate and select the file. The zip file typically contains the json files containing context menu actions exported previously.



5. Select the Zip file and click **Open**.
6. Click **Import**

Note: There is no validation for an action for Events with a Javascript function.

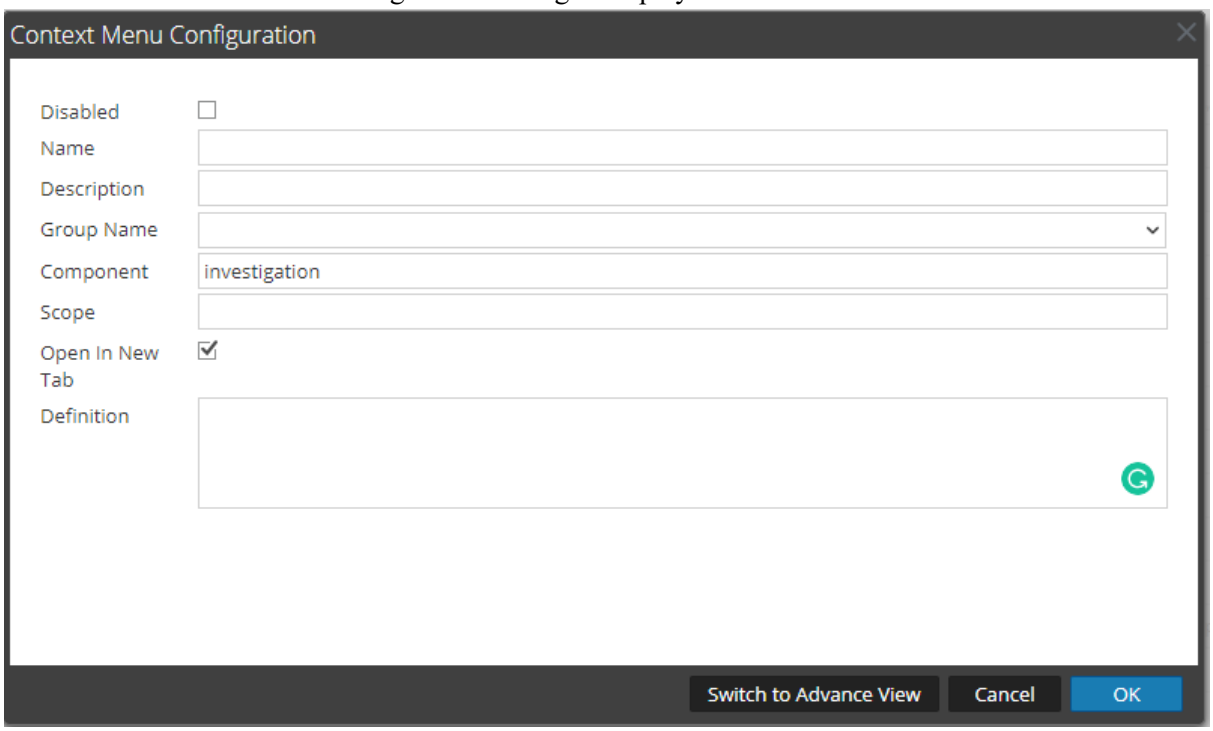
7. The success message confirming the actions uploaded successfully are displayed.



Note: If an error message is displayed, check the log files and try importing the context menu actions file again.

Example Procedure: Context Menu Action to Investigate ip.dst from alias.ip

This example adds a context menu action that allows analysts to pivot from the `alias.ip` values (the IP addresses returned from a DNS request) to the `ip.dst` meta key. It helps analysts to locate any detected traffic to the IP address that was returned for a DNS query.

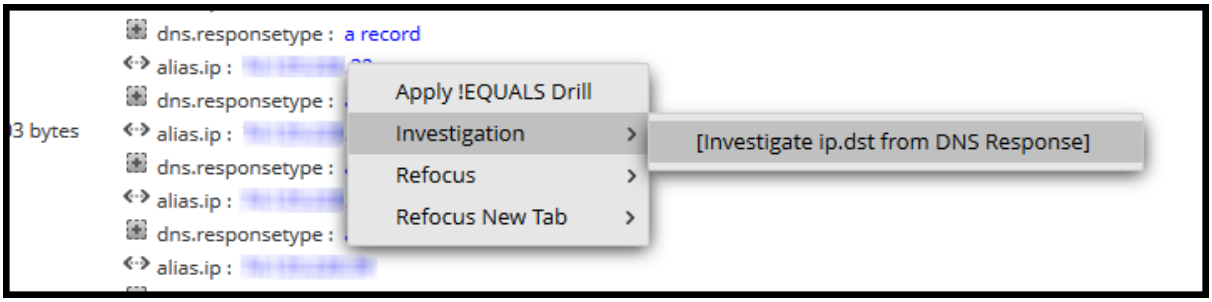


To implement the context menu action:

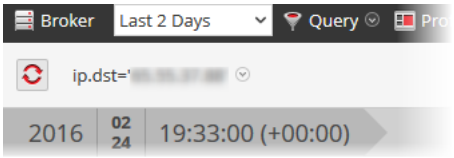
1. Determine the unique identifier for your NetWitness Server as follows:
   a. Log onto NetWitness , go to **Investigate > Navigate**, choose a service (for example, a Concentrator) to investigate, and wait for the values to load.
   b. Look for the URL and locate the number after `investigation`. In this example, the unique identifier for the action is 4. You need this unique identifier to add to the context menu action.

2. Go to  **(Admin) > System > Context Menu Actions**
   In the toolbar, click .

The Context Menu Action Configuration dialog is displayed.



3. Copy the entire sample code block below and paste it in the window.



```
{
    "displayName": "[Investigate IP from DNS Response]",
    "cssClasses": [
        "alias-ip",
        "alias.ip"
    ],
    "description": "Update your NW server and ID",
    "type": "UAP.common.contextmenu.actions.URLContextAction",
    "version": "Custom",
    "modules": [
        "investigation"
    ],
    "local": "false",
    "groupName": "investigationGroup",
    "urlFormat": "/investigation/<insert_unique_identifier_
here>/navigate/query/ip.dst%3d'{0}'",
    "disabled": "",
    "id": "NavigateHost",
    "moduleClasses": [
        "UAP.investigation.navigate.view.NavigationPanel",
        "UAP.investigation.events.view.EventGrid"
    ],
```

```
    "openInNewTab": "true"
}
```

4. In the **urlFormat** line replace **<insert-unique_identifier_here>** with your unique identifier. The URL should look like this:
   `"/investigation/4/navigate/query/ip.dst%3d'{0}'"`
5. Click **OK**, and restart your browser.
6. To test the action, open an investigation in the Navigate view and right-click on the meta key `alias.ip`.
   The context menu with the Investigation option should look like the following figure.

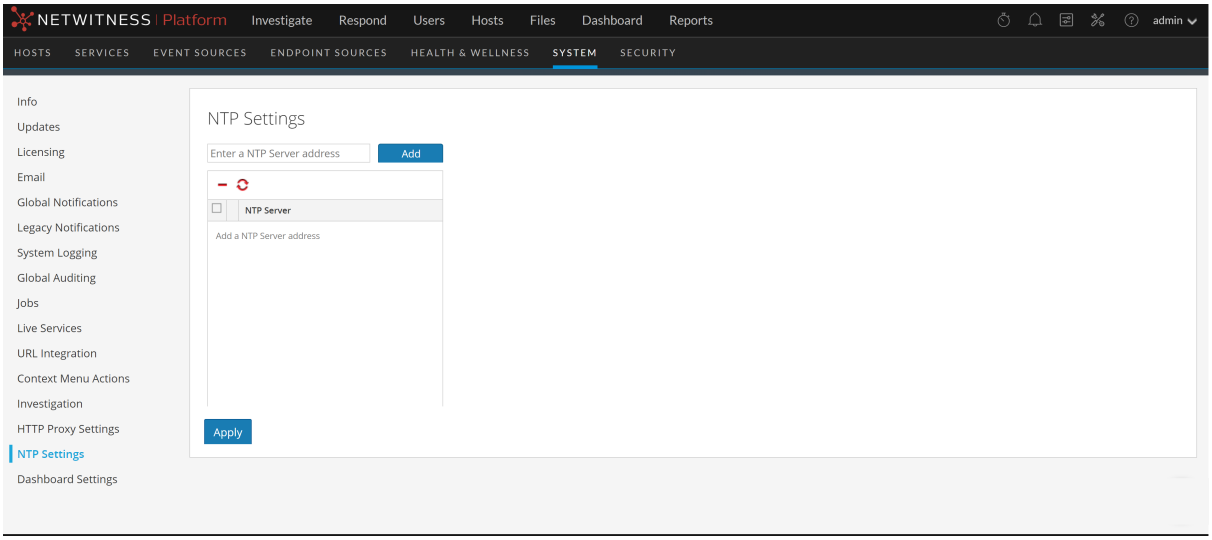
7. Should produce a pivot like this.

8. If you are using this example for DNS traffic investigation, you may want to consider creating a meta group specific to DNS traffic as described in "Manage User-Defined Meta Groups" in the *NetWitness Investigate Guide*.

Configure NTP Servers

This topic provides instructions on how to configure Network Time Protocol (NTP) servers. NTP is a protocol designed to synchronize host machine clocks over a network. For more information on NTP go to their home page (http://www.ntp.org/).

Note: NetWitness Server Core hosts must be able to communicate with the NetWitness Server host with UDP port 123 for NTP time synchronization.



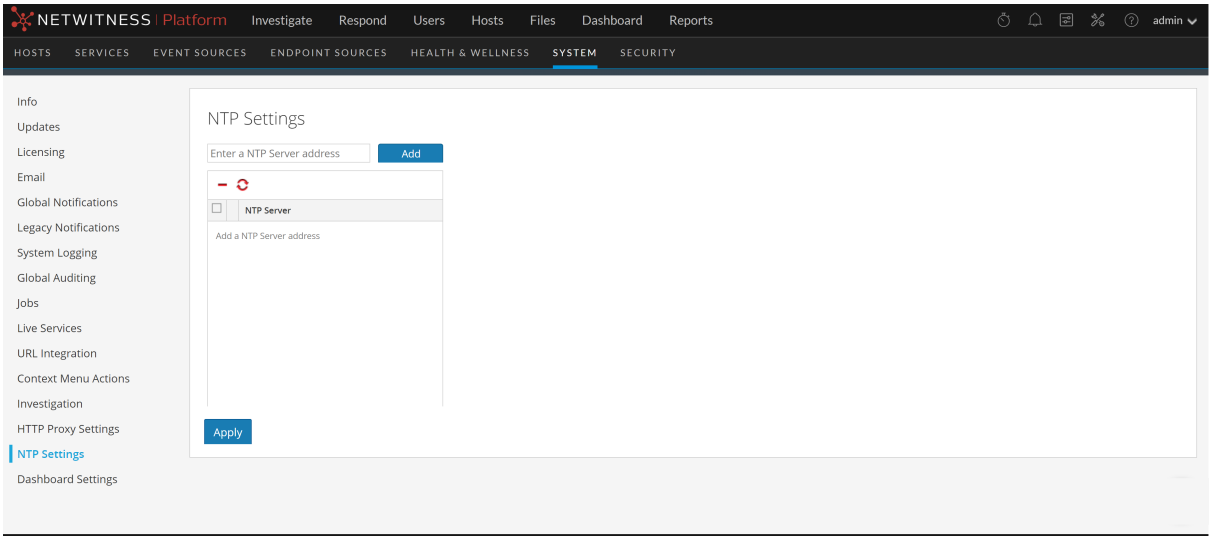
You use the **(Admin)** > **System** > **NTP Settings** view to configure one or more NTP servers. After you configure an NTP server, NetWitness uses NTP to synchronize the host machine clocks. You configure multiple NTP servers for Fail Over purposes. This topic contains the following procedures:

- Add an NTP Server
- Modify an NTP Server

Add an NTP Server

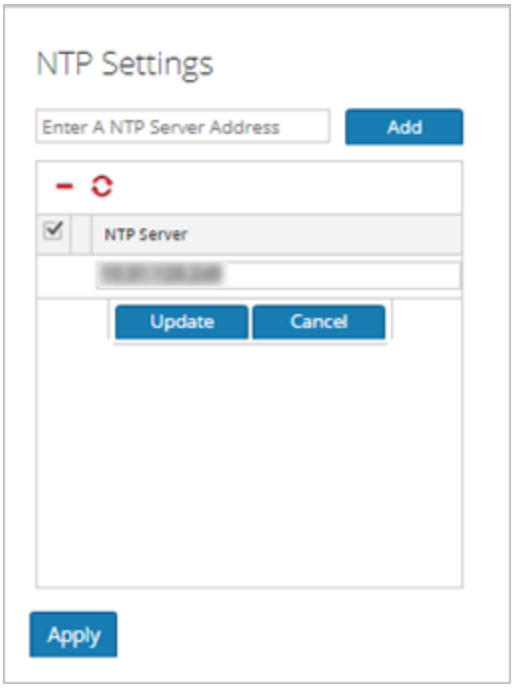
To add an NTP server:

1. Go to (Admin) > **System**.
2. In the options panel, select **NTP Settings**.
   The NTP Settings panel is displayed prompting you to enter the hostname (that is, the IP Address or FQDN) of an NTP server.



3. Enter the IP address or FQDN for an NTP server.
   If the hostname syntax is invalid, NetWitness disables the **Add** and **Apply** buttons and displays **Entered an invalid hostname**.
4. Click **Add**.
   - If the hostname syntax is valid and NetWitness can reach the server, it displays **Validating**.
   - If the hostname syntax is valid and NetWitness cannot reach a server, the following is displayed, where ***hostname*** is the hostname that you attempted to add: **The NTP server *hostname* is unreachable. Please verify the address or check your firewall settings.**
5. Click **Apply**.
   A dialog displays notification that the settings have been saved and requests confirmation that you want to apply the settings now.
6. Click **Yes**.
   The NTP server specified now ensures that your host machine clocks are synchronized. If you decide to configure multiple NTP servers and a server is down, NetWitness will fail over to next server configured.

For details of the parameters and descriptions, see NTP Settings Panel.



Modify an NTP Server

To modify an existing NTP server:

1. Go to **(Admin) > System**.
2. In the options panel, select **NTP Settings**.
   The NTP Setting panel is displayed.

3. Double-click the **NTP Server** hostname that you want to modify.
   The NTP Server textbox becomes editable and the Update and Cancel buttons are displayed.

4. Edit the hostname, click **Update**, and click **Apply.** (click **Cancel** before you click **Apply** to cancel the edit.)
   NetWitness changes the hostname according to your edits.

Troubleshoot System Configuration

The topics in this section provide troubleshooting information for administrators who are configuring settings that apply across the system in NetWitness.

- Troubleshoot Global Audit Logging
- Troubleshoot Issues identified in the NTP Settings Panel or Log Files Messages
- Troubleshoot Global Notifications

Troubleshoot Global Audit Logging

This topic provides information about possible issues that NetWitness users may encounter when implementing Global Audit Logging in NetWitness. Look for explanations and solutions in this topic.

After you configure Global Audit Logging, you should test your audit logs to ensure that they show the audit events as defined in your audit logging template. If you cannot view the audit logs on your third-party syslog server or Log Decoder, or the audit logs do not appear as expected, look at the basic troubleshooting suggestions below. If you are still having issues, you can look at the advanced troubleshooting suggestions.

Basic Troubleshooting

If you cannot view audit logs on a third-party syslog server or Log Decoder:

- Verify that RabbitMQ is up and running.
- Verify the syslog notification server configuration and make sure it is enabled.

  (This configuration is located at  (Admin) > System > Global Notifications. Do not select Legacy Notifications.)
- Check the Global Audit Logging configuration.

Configure Global Audit Logging and Verify Global Audit Logs provide instructions. If you are sending audit logs to a Log Decoder:

- Ensure that the Log Decoder is aggregating on the Concentrator on the same host:
   (Admin) > Services > (Select Concentrator) >  > View > Config.
- Verify that the latest CEF parser is deployed and enabled.
- Check the audit logging notification template. You must use a CEF template and all logs feeding into the Log Decoder must use a CEF template.

If you are sending audit logs to a third-party syslog server, Ensure that the destination port configured for the third-party syslog server is not blocked by a firewall.

Advanced Troubleshooting

In order to use Global Audit Logging on your network, RabbitMQ must be functioning.

For centralized audit logging, each of the NetWitness services writes audit logs to rsyslog listening on port 50514 using UDP on the local host. The rsyslog plugin provided in the audit logging package adds additional information and uploads these logs to RabbitMQ. Logstash running on the NetWitness Server host aggregates audit logs from all of the NetWitness services, coverts them to the required format, and sends them to a third-party syslog server or Log Decoder for investigation. You configure the format of the global audit logs and the destination used by Logstash through the NetWitness user interface.

Define a Global Audit Logging Configuration provides instructions.

Verify the Packages and Services on the Hosts

NetWitness Host

The following packages or services must be present on the NetWitness Server host:

- rsyslog-8.4.1
- rsa-audit-rt
- logstash-5.6.4
- rsa-audit-plugins
- rabbitmq server

Services on a Host other than the NetWitness Host

The following packages or services must be present on each of the NetWitness hosts other than the NetWitness Server host:

- rsyslog-8.4.1
- rsa-audit-rt
- rabbitmq server

Log Decoder

If you forward global audit logs to a Log Decoder, the following parser should be present and enabled:

- CEF

Possible Issues

What if I perform an action on a service but audit logs do not reach the configured third-party syslog server or Log Decoder?

The possible causes could be one or all of the following:

- A service is not logging to the local syslog server.
- Audit logs are not getting uploaded to RabbitMQ from the local syslog.
- Audit logs are not aggregated on the NetWitness Server host.
- Aggregated logs on the NetWitness Server host are not being forwarded to the configured third-party syslog server or Log Decoder.

- The Log Decoder is not configured to receive global audit logs in CEF format:
  - Log Decoder capture is not turned on
  - CEF Parser is not present
  - CEF Parser is not enabled

Possible Solutions

The following table provides possible solutions for the issues.

Issue	Possible Solutions

A service is not logging to the local syslog server.	• Ensure that rsyslog is up and running. You could use the following command:
	`service rsyslog status`
	• Ensure that rsyslog is listening on port 50514 using UDP.
	You could use the following command:
	`netstat -tulnp|grep rsyslog`
	• Ensure the application or component is sending audit logs to port 50514. Run the tcpdump utility on the local interface for port 50514.
	You could use the following command:
	`sudo tcpdump -i lo -A udp and port 50514`
	See "Solution Examples" below to view the command outputs.

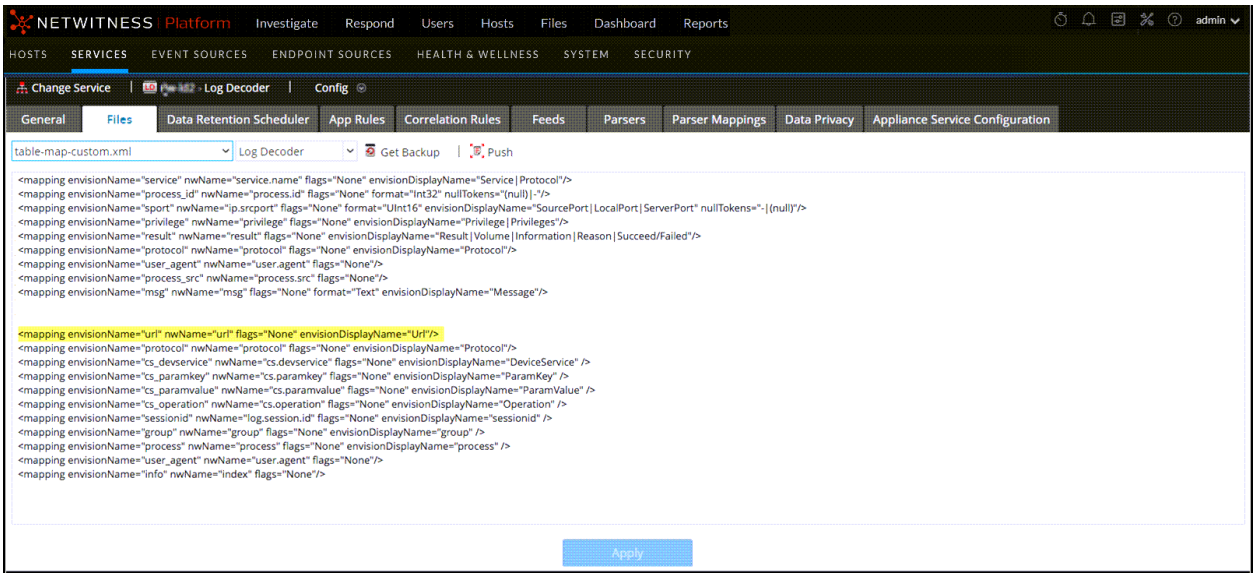
Audit logs are not getting uploaded to RabbitMQ from the local syslog.	• Ensure that the rsyslog plugin is up and running. You could use the following command:
	`ps -ef|grep rsa_audit_onramp`
	• Ensure the RabbitMQ server is up and running.
	You could use the following command:
	`service rabbitmq-server status`
	See "Solution Examples" to view the command outputs.

Audit logs are not aggregated on the NetWitness Server host.	• Ensure Logstash is up and running. You could use the following commands:
	`ps -ef|grep logstash`
	`service logstash status`
	• Ensure the RabbitMQ server is up and running.
	You could use the following command:
	`service rabbitmq-server status`
	• Ensure the RabbitMQ server is listening on port 5672.

Issue	Possible Solutions

	You could use the following command:
	`netstat -tulnp|grep 5672`
	• Check for any errors generated at the Logstash level.
	You could use the following command for the location of the log files:
	`ls -l /var/log/logstash/logstash.*`
	See "Solution Examples" to view the command outputs.

Aggregated logs on the NetWitness Server host are not being forwarded to the configured third-party syslog server or Log Decoder.	• Ensure Logstash is up and running.
	You could use the following commands:
	`ps -ef|grep logstash`
	`service logstash status`
	• Check for any errors generated at the Logstash level.
	You could type the following command for the location of the log files:
	`ls -l /var/log/logstash/logstash*`
	See "Solution Examples" below to view the command outputs.
	• Ensure that the destination service is up and running.
	• Ensure that the destination service is listening on the correct port using the correct protocol.
	• Ensure that the configured port on the destination host is not blocked.



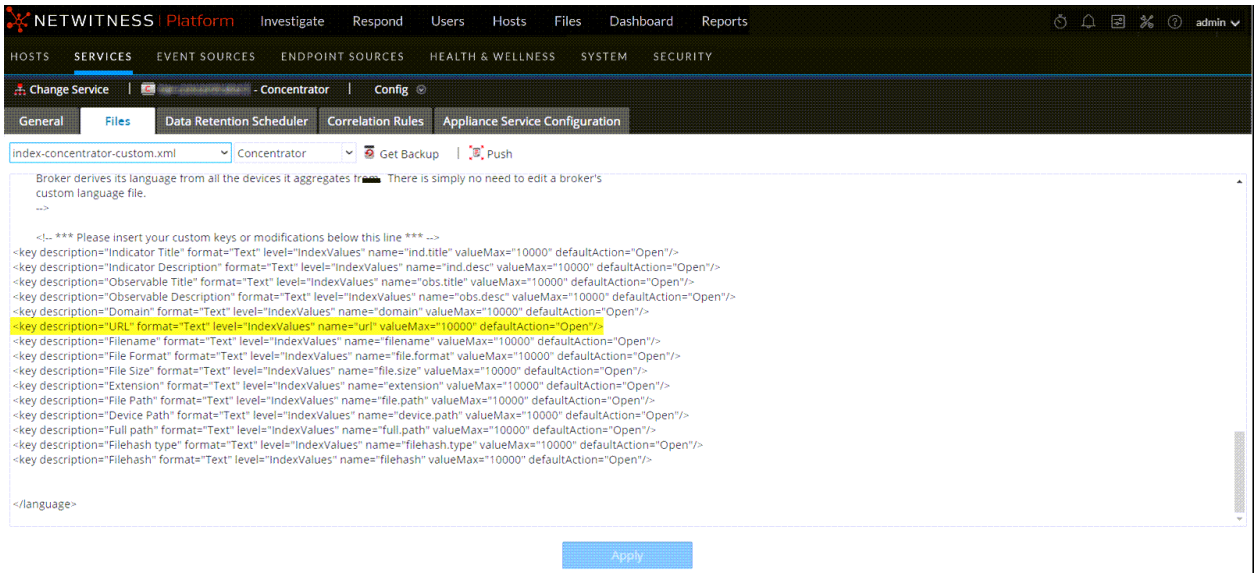
Audit logs forwarded from the Logstash lead to parse failure at the Log Decoder.	• Ensure that you are using an appropriate notification template. Audit Logs parsed by a Log Decoder must be in CEF format. The destination from which audit logs directly or indirectly make their way to the Log Decoder must also use a CEF Template. • The Notification Template must follow the CEF standard. Follow the steps in this guide to either use the default CEF template or create a custom CEF template following strict guidelines. Define a Template for Global Audit Logging provides additional information. • Verify the Logstash configuration.

Why can't we see the custom metadata in Investigation?

Usually, if a meta key is not visible in Investigation, it is not being indexed. If you need to use custom meta keys for Investigations and Reporting, ensure that the meta keys that you select are indexed in the **table-map-custom.xml** file on the Log Decoder. Follow the "Maintain the Table Map Files" procedure to modify the **table-map-custom.xml** file on the Log Decoder.

Ensure that the custom meta keys are also indexed in the **index-concentrator-custom.xml** on the Concentrator. "Edit a Service Index File" provides additional information.

The following figure shows an example **table-map-custom.xml** file in NetWitness Server ((Admin) > Services > (select the Log Decoder) > >View > Config) with a custom meta `url` example highlighted.



The `url` custom meta example is highlighted in the following code sample from the **table-map-custom.xml** file above:

```
<mapping envisionName="url" nwName="url" flags="None"
envisionDisplayName="Url"/>
<mapping envisionName="protocol" nwName="protocol" flags="None"
envisionDisplayName="Protocol"/><mapping envisionName="cs_devservice"
nwName="cs.devservice" flags="None" envisionDisplayName="DeviceService"
/><mapping envisionName="cs_paramkey" nwName="cs.paramkey" flags="None"
envisionDisplayName="ParamKey" /><mapping envisionName="cs_paramvalue"
nwName="cs.paramvalue" flags="None" envisionDisplayName="ParamValue"
/><mapping envisionName="cs_operation" nwName="cs.operation" flags="None"
envisionDisplayName="Operation" /><mapping envisionName="sessionid"
nwName="log.session.id" flags="None" envisionDisplayName="sessionid"
/><mapping envisionName="group" nwName="group" flags="None"
```

```
envisionDisplayName="group" /><mapping envisionName="process" nwName="process"
flags="None" envisionDisplayName="process" /><mapping envisionName="user_
agent" nwName="user.agent" flags="None"/><mapping envisionName="info"
nwName="index" flags="None"/>
```

The following figure shows an example **index-concentrator-custom.xml** file in NetWitness Server ((Admin) > Services > (select the Concentrator) > > View > Config) with a custom meta `url` example highlighted.

The `url` custom meta example is highlighted in the following code sample from the **index-concentrator-custom.xml** file above:

```
<key description="Severity" level="IndexValues" name="severity"
valueMax="10000" format="Text"/><key description="Result" level="IndexValues"
name="result" format="Text"/><key level="IndexValues"  name="ip.srcport"
format="UInt16" description="SourcePort"/><key description="Process"
level="IndexValues" name="process" format="Text"/><key description="Process
ID" level="IndexValues" name="process_id" format="Text"/><key
description="Protocol" level="IndexValues" name="protocol" format="Text"/><key
description="UserAgent" level="IndexValues" name="user_agent"
format="Text"/><key description="DestinationAddress" level="IndexValues"
name="ip.dst" format="IPv4"/><key description="SourceProcessName"
level="IndexValues" name="process.src" format="Text"/><key
description="Username" level="IndexValues" name="username"
format="Text"/><key description="Info" level="IndexValues" name="index"
```

```
format="Text"/><key description="customdevservice" level="IndexValues"
name="cs.devservice"  format="Text"/>
<key description="url" level="IndexValues" name="url"  format="Text"/>
<key description="Custom Key" level="IndexValues" name="cs.paramkey"
format="Text"/><key description="Custom Value" level="IndexValues"
name="cs.paramvalue"  format="Text"/><key description="Operation"
level="IndexValues" name="cs.operation"  format="Text"/><key description="CS
Device Service" level="IndexValues" name="cs.device" format="Text"
valueMax="10000" defaultAction="Closed"/>
```

Solution Examples

The following possible solution examples show the outputs of the example commands. See the above table for the complete listing of possible solutions.

Ensure that rsyslog is up and running

You can use the following command:

```
service rsyslog status
```

```
[root@NWAPPLIANCE22574 ~]# service rsyslog status
rsyslogd (pid  1293) is running...
[root@NWAPPLIANCE22574 ~]#
```

Ensure that rsyslog is listening on port 50514 using UDP

You can use the following command:

```
netstat -tulnp|grep rsyslog
```

```
[root@NWAPPLIANCE22574 ~]# netstat -tulnp|grep rsyslog
udp        0      0 127.0.0.1:50514           0.0.0.0:*                           1293/rsyslogd
[root@NWAPPLIANCE22574 ~]#
```

Ensure that the application or component is sending audit logs to port 50514

The following figure shows the output of running the tcpdump utility on the local interface for port 50514.

You can use the following command:

```
sudo tcpdump -i lo -A udp and port 50514
```

```
[root@NWAPPLIANCE22574 ~]# sudo tcpdump -i lo -A udp and port 50514
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on lo, link-type EN10MB (Ethernet), capture size 65535 bytes

```

Ensure that the rsyslog plugin is up and running

You can use the following command:

```
ps -ef|grep rsa_audit_onramp
```

```
[root@NWAPPLIANCE22574 ~]# ps -ef|grep rsa_audit_onramp
root      1636  1293  0 06:05 ?        00:00:03 /usr/sbin/rsa_audit_onramp --node_id=96b08193-a9d0-4a79-b362-87b56851f411
root     22248  6921  0 09:09 pts/0    00:00:00 grep rsa_audit_onramp
[root@NWAPPLIANCE22574 ~]#
```

Ensure the RabbitMQ server is up and running

You can use the following command:

```
service rabbitmq-server status
```

```
[root@NWAPPLIANCE22574 ~]# service rabbitmq-server status
Status of node sa@localhost ...
[{pid,1862},
 {running_applications,
     [{rabbitmq_federation_management,"RabbitMQ Federation Management",
         "3.4.2"},
      {rabbitmq_management,"RabbitMQ Management Console","3.4.2"},
      {rabbitmq_web_dispatch,"RabbitMQ Web Dispatcher","3.4.2"},
      {webmachine,"webmachine","1.10.3-rmq3.4.2-gite9359c7"},
      {mochiweb,"MochiMedia Web Server","2.7.0-rmq3.4.2-git680dba8"},
      {rabbitmq_federation,"RabbitMQ Federation","3.4.2"},
      {rabbitmq_stomp,"Embedded Rabbit Stomp Adapter","3.4.2"},
      {rabbitmq_management_agent,"RabbitMQ Management Agent","3.4.2"},
      {rabbit,"RabbitMQ","3.4.2"},
      {ssl,"Erlang/OTP SSL application","5.3.2"},
      {public_key,"Public key infrastructure","0.21"},
      {crypto,"CRYPTO version 2","3.2"},
      {asn1,"The Erlang ASN1 compiler version 2.0.4","2.0.4"},
      {os_mon,"CPO  CXC 138 46","2.2.14"},
      {inets,"INETS  CXC 138 49","5.9.7"},
      {mnesia,"MNESIA  CXC 138 12","4.11"},
      {amqp_client,"RabbitMQ AMQP Client","3.4.2"},
      {rabbitmq_auth_mechanism_ssl,
          "RabbitMQ SSL authentication (SASL EXTERNAL)","3.4.2"},
      {xmerl,"XML parser","1.3.5"},
      {sasl,"SASL  CXC 138 11","2.3.4"},
      {stdlib,"ERTS  CXC 138 10","1.19.4"},
      {kernel,"ERTS  CXC 138 10","2.16.4"}]},
 {os,{unix,linux}},
 {erlang_version,
     "Erlang R16B03 (erts-5.10.4) [source] [64-bit] [smp:2:2] [async-threads:30] [kernel-poll:true]\n"},
 {memory,
```

Ensure logstash is up and running

You can use the following commands:

```
ps -ef | grep logstash
service logstash status
```

```
[root@NWAPPLIANCE22574 ~]# ps -ef|grep logstash
logstash  1583     1  0 06:05 ?        00:01:09 /usr/bin/java -Djava.io.tmpdir=/var/lib/logstash -Xmx500m -XX:+UseParNewGC -XX:+UseConcMarkSweepGC -Djava.awt.headless=true -XX:C
MSInitiatingOccupancyFraction=75 -XX:+UseCMSInitiatingOccupancyOnly -jar /opt/logstash/vendor/jar/jruby-complete-1.7.11.jar -I/opt/logstash/lib /opt/logstash/lib/logstash/runner
.rb agent --pluginpath /opt/logstash -f /etc/logstash/conf.d -l /var/log/logstash/logstash.log
root      8509  6921  0 09:31 pts/0    00:00:00 grep logstash
[root@NWAPPLIANCE22574 ~]# service logstash status
logstash is running
[root@NWAPPLIANCE22574 ~]#
```

Ensure the RabbitMQ server is listening on port 5672

For example, type the following command:

```
netstat -tulnp | grep 5672
```

```
[root@NWAPPLIANCE22574 ~]# netstat -tulnp|grep 5672
tcp        0      0 127.0.0.1:5672              0.0.0.0:*                   LISTEN      1862/beam.smp
tcp        0      0 0.0.0.0:25672               0.0.0.0:*                   LISTEN      1862/beam.smp
[root@NWAPPLIANCE22574 ~]#
```

Check for any errors generated at the Logstash level

You can type the following command for the location of the log files:

```
ls -l /var/log/logstash/logstash.*
```

```
[root@NWAPPLIANCE22574 ~]# ls -l /var/log/logstash/logstash.*
-rw-r--r--. 1 root     root        0 Apr 24 06:05 /var/log/logstash/logstash.err
-rw-r--r--. 1 logstash logstash 1043 Apr 24 06:04 /var/log/logstash/logstash.log
-rw-r--r--. 1 root     root       57 Apr 24 06:12 /var/log/logstash/logstash.stdout
[root@NWAPPLIANCE22574 ~]#
```

See the Possible Solutions table above for the complete listing of issues and possible solutions.

Troubleshoot Issues identified in the NTP Settings Panel or Log Files Messages

This section provides troubleshooting information for issues identified by messages NetWitness displays in the NTP Settings panel and log files.

Issue	Possible Solutions
Message	User Interface: **Unexpected error occurred. First check the logs then contact Customer Care to resolve error.** **System Log:** **Timestamp Level Message** *yyyy-dd-mmThh:mm:ss:ms* ERROR com.rsa.smc.sa.adm.exception.MCOAgent Exception: No request sent, we did not discover any nodes
Possible Cause	Low level NetWitness configuration is in error or supporting service is not running.
Solution	Contact Customer Care.
Message	User Interface: **Specified an invalid Hostname syntax**.
Possible Cause	Tried to enter NTP server hostname that does not confirm to IP address or FQDN syntax.
Solution	Reenter hostname in using correct syntax.
Message	User Interface: **Specified NTP server that already exists.**
Possible Cause	Tried to enter NTP server hostname that is already defined in NetWitness.
Solution	Enter hostname for an NTP server not configured in NetWitness.
Message	User Interface: **Cannot reach NTP server *hostname***. Please verify the server address and your firewall settings.
Possible	The server address or firewall settings may be in error.

Issue	Possible Solutions
Cause	
Solution	Verify the server address and your firewall settings and correct them if required.

Troubleshoot Global Notifications

This topic provides information about possible issues that NetWitness users may encounter when implementing Global Notifications in NetWitness.

Issue	Possible Solution
We are not receiving notifications that were configured for a service, but the service log file does not show any errors.	For any notification-related troubleshooting, check the `integration-server log` file in addition to the log file of the service creating the notification. For example, when troubleshooting ESA rule notifications, check both the ESA Correlation service log files (`/var/log/netwitness/correlation-server/correlation-server.log`) AND the Integration-Server log files on the NetWitness Server (`/var/log/netwitness/integration-server/integration-server.log`). If the `integration-server.log` file shows a failure when the Integration-Server attempts to send a notification to the notification server, you should check the notification server configuration in the Global Notifications settings (**(Admin) > System > Global Notifications > Servers** tab).

References

This topic provides reference materials that describe the user interface for configuring system settings in NetWitness and define parameters. Administrators use options in the Administration System view to configure system settings. Each panel is described in a separate topic.

- Legacy Notifications Configuration Panel

Global Audit Logging Configurations Panel

In the **Global Audit Logging Configurations** panel ((Admin) > **System** > **Global Auditing**), you configure global audit logging by adding configurations that define how global audit logs are forwarded to external syslog systems. Global audit logs are forwarded to the selected Notification Server in your global audit logging configuration using the selected Notification Template.

Global Audit Logging provides auditors with consolidated visibility into user activities within NetWitness in real-time from one centralized location.

Workflow

This workflow shows the necessary procedures to configure and verify Global Audit Logging.

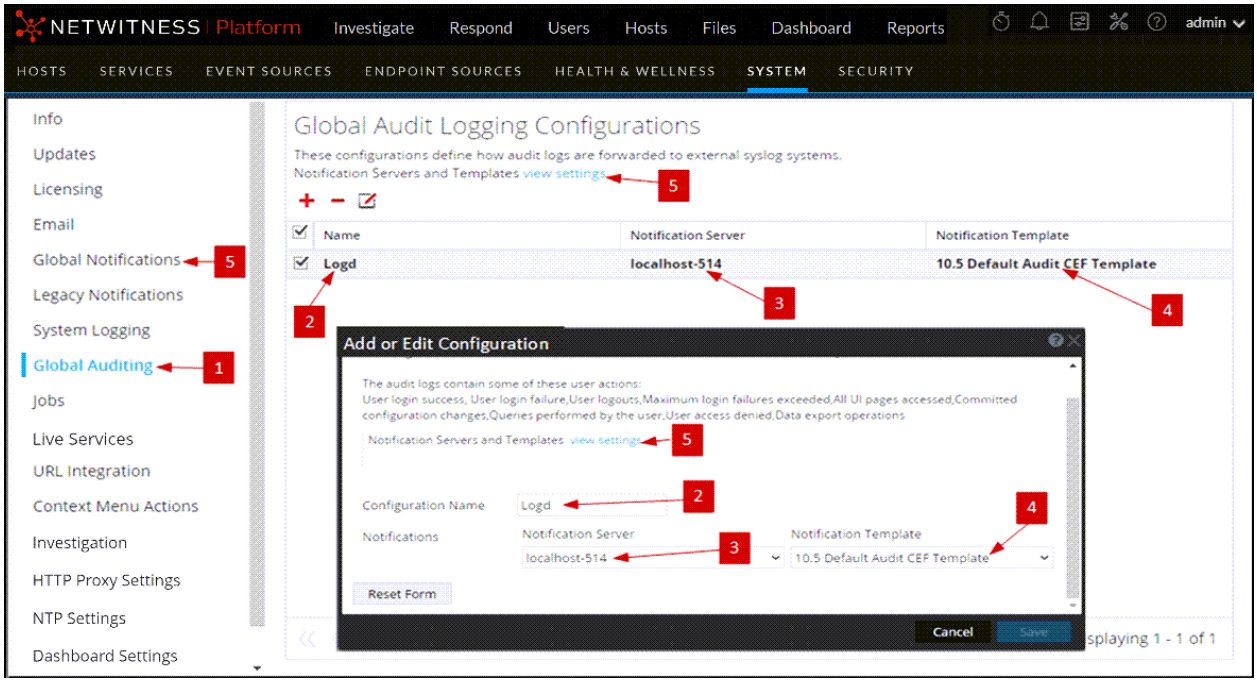
Before you can define a Global Audit Logging configuration, you need to create a Syslog Notification Server on the **Global Notifications** > **Server** tab. The Syslog Notification Server is the destination that receives the global audit logs. Next, you need to select or define an Audit Logging template on the **Global Notifications** > **Templates** tab. The Audit Logging template defines the format and message fields of the audit logs sent to the Log Decoder or third-party syslog server. If you are consuming with a Log Decoder, deploy the Common Event Format parser to your Log Decoder from Live.

Note: You do not need to configure the Global Notifications > Output tab for Global Audit Logging.

After you add a Global Audit Logging configuration here, audit logs are forwarded to the selected Notification Server in the configuration. Verify your audit logs to ensure that they show the audit events as defined in your audit logging template.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Create a Syslog Notification Server.	Configure a Destination to Receive Global Audit Logs
Administrator	Choose an Audit Logging template.	Define a Template for Global Audit Logging



Role	I want to ...	Show me how
Administrator	Configure Global Audit Logging	Define a Global Audit Logging Configuration For the complete procedure, see "Global Audit Logging - High-Level Procedure" in Configure Global Audit Logging.
Administrator	Verify Global Audit logs	Verify Global Audit Logs

Quick Look

The following example illustrates a Global Audit Logging configuration. The configuration defines how NetWitness forwards global audit logs to external syslog systems.

1 Displays the Global Audit Logging Configurations panel.
2 Name that identifies the Global Audit Logging configuration.
3 Notification Server assigned to the Global Audit Logging configuration.
4 Notification Template assigned to the Global Audit Logging configuration.

5 Displays the Global Notifications panel where you set up Servers and Templates required to configure a Global Audit Logging configuration.

Toolbar

The following table describes the toolbar actions

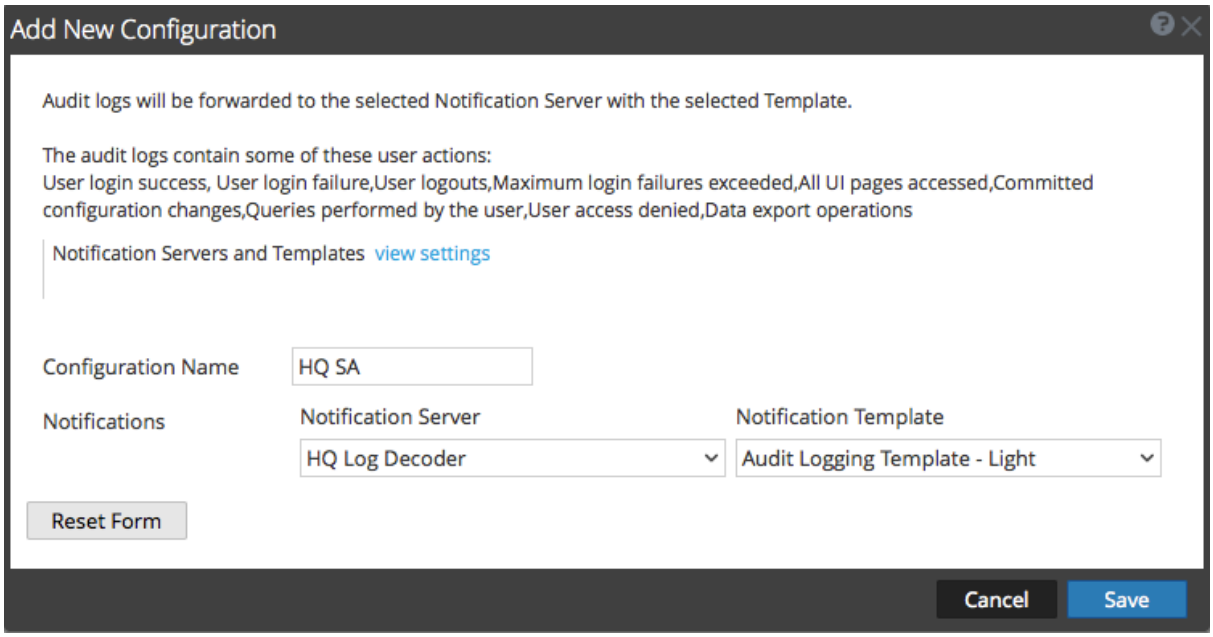
Icon	Description
	Adds a global audit logging configuration.
	Deletes a global audit logging configuration. Deleting a global audit configuration does not delete the associated notification server and template. After you delete a global audit logging configuration, the forwarding of global audit logs specified in that configuration is discontinued.
	Edits a global audit logging configuration. You can change the destination of the global audit logs for your user audits by selecting a different Notification Server. You can also change the format and message fields of the global audit log entries by selecting a different Notification Template. You cannot change which NetWitness user actions are logged and sent in the global audit logs.

Configurations

The following table describes the listed configurations.

Title	Description
	To select an individual configuration, select the checkbox next to the configuration. To select all configurations, select the checkbox in the title bar of the table.
Name	Displays the name of the global auditing configuration. For example, you can name the configurations based on the destination of the global audit logs, such as HQ SA and My Syslog Server.
Notification Server	Displays the Syslog Notification Server selected as the destination for the global audit logs. If you want to forward global audit logs to a Log Decoder, create a Syslog type of Notification Server. Configure a Destination to Receive Global Audit Logs provides instructions on how to create a Syslog Notification Server for global audit logging.
Notification Template	Displays the Audit Logging Notification Template selected for the configuration. It defines the format and message fields of the audit log entries. For Log Decoders, use the **Default Audit CEF Template**. You can add or remove fields from the Common Event Format (CEF) template if you have specific requirements. Define a Template for Global Audit Logging provides instructions and Supported CEF Meta Keys describes the available CEF meta keys. For, third-party syslog servers, you can use a default audit logging template or define your own format (CEF or non-CEF). Define a Template for Global Audit Logging provides instructions and Supported Global Audit Logging Meta Key Variables describes the available meta key variables.

Add New Configuration Dialog



In the NetWitness Platform, Administration System view Global Audit Logging Configurations panel, you can create multiple global audit logging configurations. These configurations are used to forward global audit logs to a central location to perform user audits.

Procedures related to global audit logging are described in Configure Global Audit Logging.

To access the **Add New Configuration** dialog:

1. Go to select **(Admin)** > **System**.
2. In the options panel, select **Global Auditing**.
3. In the **Global Audit Logging Configurations** panel, click .

   The **Add New Configuration** dialog is displayed.

   The Notifications section enables you to select a syslog notification server for the global audit logging configuration and a template to use for the global audit logs. The template defines the details of the global audit log entries.

Features

The following table describes the features in the Add New Configuration and Edit Configuration dialogs.

Feature	Description
Notifications Servers and Templates **view settings** link	Takes you to the Global Notifications panel where you can view or configure the notification server and template settings. A syslog notification server and an audit logging template are required before you can create a global audit configuration.
Configuration Name	Specifies the unique name used to identify the global audit logging configuration.
Notification Server	Specifies the syslog notification server to send the selected audit log information. Configure a Destination to Receive Global Audit Logs provides instructions on how to create a Syslog Notification Server for global audit logging.
Notification Template	Specifies the template to use for the global audit logging configuration. The template should be an Audit Logging template. For Log Decoders, use the **Default Audit CEF Template**. You can add or remove fields from the Common Event Format (CEF) template if you have specific requirements. Define a Template for Global Audit Logging provides instructions. For third-party syslog servers, you can use a default audit logging template or define your own format (CEF or non-CEF). Define a Template for Global Audit Logging provides instructions and Supported Global Audit Logging Meta Key Variables describes the available variables.
Reset Form button	Clears the configuration settings in the dialog.

User Actions Logged

The following table provides examples of some of the user actions logged from NetWitness. These actions are the minimum user actions logged when applicable.

User Action	Example
User login success	A user logs on with valid credentials.
User login failure	A user tries to log on using invalid credentials.
User logouts	A user logs out from NetWitness (Administration > Sign Out) or a user logs out due to a session timeout.
Max login failures exceeded	A user tries to log on using invalid credentials five times. Five (5) is the number of Max Login Failures defined in Administration Security view > Settings tab (Administration > Security > Settings tab).
All UI pages accessed	When a user accesses the Reporting module (Administration > Reports), it logs as `[REP] Reports`. When a user accesses the Administration System view (Administration > System), it logs as `[ADM] System`.

User Action	Example
Committed configuration changes	A user changes his or her password and or any security setting (Administration > Security > Settings tab).
Queries performed by the user	A user performs an investigation query.
User access denied	A user tries to access a module and does not have permissions to access it.
Data export operations	A user exports data from the Events view (Investigation > Events > Actions > Export).

The following table shows examples of internal audit logs logged from NetWitness

User Actions	Audit Log Examples

For lists of message type being logged by the various NetWitness components, see Global Audit Logging Operation Reference.

Supported CEF Meta Keys

This topic describes the Common Event Format (CEF) meta keys that NetWitness global audit logging supports.

Global audit logging templates that you define for a Log Decoder use Common Event Format (CEF) and must meet the following specific standard requirements:

- Include the CEF headers in the template.
- Use only the extensions and custom extensions in a (Key=Value) format from the meta key table below.
- Ensure that the extensions and custom extensions are in the `key=%{string}<space>key=%{string}` format.

For third-party syslog servers, you can define your own format (CEF or non-CEF).

Procedures related to this table are described in Define a Template for Global Audit Logging and Configure Global Audit Logging.

Supported Common Event Format (CEF) Meta Keys

The following table describes the CEF Syslog meta keys that NetWitness global audit logging supports. The Datetime and Hostname fields in the Syslog Prefix are not configurable and not included in the template, but they are prepended to every log message by default. The CEF Header is required to conform to the CEF standard and for any CEF parser. The Extensions and Custom Extensions are optional. The Default Audit CEF Template contains many of the fields in this table. You can add any of the Extensions and Custom Extensions listed to the global audit logging template that you define.

CEF Field	String	Description	NW Meta Keys	Index in Log Decoder
Syslog Prefix				
Datetime	Not Configurable	Syslog Header date time	event.time.str	Transient
Hostname	Not Configurable	Syslog Header hostname	alias.host	None
CEF Header		The CEF Header fields are required to conform to the CEF standard and for any CEF parser.		
CEF:Version	CEF:0	CEF Header	--STATIC--	N/A
DeviceVendor	%{deviceVendor}	The product vendor, NetWitness	-	N/A
DeviceProduct	%{deviceProduct}	The product family. This is always NetWitness Audit.	product	Transient
DeviceVersion	%{deviceVersion}	Host/Service version	version	Transient

CEF Field	String	Description	NW Meta Keys	Index in Log Decoder
Signature ID	%{category}	Identifier of the audit event. It specifies the the category of the audit event.	event.type	None
Name	%{operation}	Description of the event	event.desc	None
Severity	%{severity}	Severity of the audit event	severity	Transient
Extensions				
deviceExternalId	%{deviceExternalId}	Unique ID of the host or service generating the audit event	hardware.id	Transient
deviceFacility	%{deviceFacility}	Syslog facility used when writing the event to syslog daemon. For example, authpriv.	cs.devfacility	Custom
deviceProcessName	%{deviceProcessName}	Name of the executable corresponding to dvcpid	process	None
dpt	%{destinationPort}	Destination Port	ip.dstport	None
dst	%{destinationAddress}	Destination IP Address	ip.dst	None
dvcpid	%{deviceProcessId}	ID of the process generating the event, which is the process ID of the NetWitness service	process.id	Transient
msg	%{text}	Free text, extra information, or actual description for the event	msg	Transient
outcome	%{outcome}	Outcome of the operation performed corresponding to the audit event	result	Transient
tpt	%{transportProtocol}	Network protocol used	protocol	Transient
userAgent	%{userAgent}	Browser detail of the user accessing the page	user.agent	Transient
rt	%{timestamp}	Time at which the event is reported	event.time	None
sourceServiceName	%{deviceService}	The service that is responsible for generating this event	service.name	Transient

CEF Field	String	Description	NW Meta Keys	Index in Log Decoder
spt	%{sourcePort}	Source Port	ip.srcport	Transient
userRole	%{userRole}	User role permissions assignment. For example: admin.owner, appliance.manage, connections.manage, everyone, logs.manage, services.manage, storedproc.execute, storedproc.manage, sys.manage, users.manage	user.role	Transient
src	%{sourceAddress}	Source IP Address	ip.src	None
suser	%{identity}	Identity of the logged on user responsible for generating the audit event	user.dst	None
Custom Extensions				
params	%{parameters}	API and Operation parameters, which capture specific parameters about a query	index	Transient
paramKey	%{key}	A configuration item key. It is the config param for which the audit event is captured. For example: /sys/config/stat.interval	obj.name	None
paramValue	%{value}	A configuration value. It is the value captured during the update.	no meta key	Custom
userGroup	%{userGroup}	Role assignment. For example: Administrators, Analysts, MalwareAnalysts, Malware_Analysts, Operators, PRIVILEGED_CONNECTION_AUTHORITY, SOC_Managers	group	None

CEF Field	String	Description	NW Meta Keys	Index in Log Decoder
referrerURL	%{referrer}	The parent URL that refers to the current URL	referer	None
sessionId	%{sessionId}	Session or connection identifier	log.session.id	Transient
remoteAddress	%{remoteAddress}	Ip address of the destination	ip.src	None
reasonForFailure	%{reasonForFailure}	reason for failure for the certain action performed	result	None
reason	%{reason}	Reason for certain action performed	result	None
addRole	%{Add.Role}	User role Assignment	user.role	Transient
id	%{id}	Incident id or host id	no meta key	Transient
arguments	%{arguments}	Value passes between programs or functions	index	Transient
uri	%{uri}	Directory	directory	None
user	%{User}	Name of the user from the source or destination	user.dst	None
accountProvider	%{AccountProvider}	Authentication account for the user. For example, PAM, and PKI.	index	Transient
file	%{file}	Name of the content file used for deployment	filename	File
deviceIDs	%{deviceIDs}	Device id for the particular service	hardware.id	Transient
role	%{Role}	User role assignment	user.role	Transient
account	%{Account}	user account	user.dst	None
addPermission	%{Add.Permission}	User role permission assignment	permissions	Transient
key	%{Key}	Name of a configuration/rule	obj.name	None
value	%{Value}	Value of a configuration change. For example, "Value":"HR12". In this example, hours format is changed to 12 hours.	no meta key	Custom

CEF Field	String	Description	NW Meta Keys	Index in Log Decoder
alert	%(alert}	Id of the alert, For example, id:5ce457afec6c0f02ffb85ace	alert	Transient
moduleSettings	%{ModuleSettings}	Message or name of a setting	index	Transient
incident	%{incident}	Id of the incident. For example, INC-313	context	None
action	%{action}	Action performed by the user. For example, service.stop	action	None
notificationBinding	%{NotificationBinding}	Type of notification. For example, incident created, alert, incident removed	index	Transient
name	%{name}	name of a configuration or rule	alert	Transient
enabled	%{enabled}	Enable the rule	no meta key	Custom
disabled	%{disabled}	Disable the rule	no meta key	Custom

Note: Use all of the extensions in the following format:
`deviceProcessName=%{deviceProcessName} outcome=%{outcome}`
Include a `<space>` between a value and a tagname.

By default, all meta keys are not indexed. In the above table, the **Index in Log Decoder** column shows the state of the `flags` keyword (Transient, None, and Custom). If a key is set to `Transient`, it is parsed but not stored in the database. If it is set to `None`, it is indexed and stored in the database. A key listed as "Custom" does not exist in the table-map.xml file and, therefore, it is not stored or parsed at all.

For more information, see the following documentation:

- The "Maintain the Table Map Files" section in the "Hosts and Services Procedures" topic in the *Hosts and Services Getting Started Guide* provides instructions for verifying and updating the table mappings.
- The "Edit a Service Index File" section in the "Hosts and Services Procedures" topic in the *Hosts and Services Getting Started Guide* provides information on updating the custom index file on the Concentrator.

Supported Global Audit Logging Meta Key Variables

This topic describes the meta key variables that NetWitness global audit logging supports.

NetWitness provides predefined global audit logging templates that you can use for your global audit logging configurations. For third-party syslog servers, you can define your own template format (CEF or non-CEF) using supported meta key variables.

Procedures related to this table are described in Define a Template for Global Audit Logging and Configure Global Audit Logging.

Supported Global Audit Logging Meta Key Variables

The following table describes the meta key variables that NetWitness global audit logging supports. Use these values to create a custom audit logging template for a third-party syslog server.

Variable	Description
%{category}	Identifier of the audit event. It specifies the the category of the audit event.
%{destinationAddress}	Destination IP Address
%{destinationPort}	Destination Port
%{deviceExternalId}	Unique ID of the service generating the audit event
%{deviceFacility}	Syslog facility used when writing the event to syslog daemon. For example, authpriv.
%{deviceProcessId}	ID of the process generating the event, which is the process ID of the NetWitness service
%{deviceProcessName}	Name of the executable corresponding to dvcpid
%{deviceProduct}	The product family. This is always NetWitness Audit.
%{deviceService}	Service responsible for generating the event
%{deviceVendor}	The product vendor, RSA
%{deviceVersion}	Host/Service version
%{identity}	Identity of the logged on user responsible for generating the audit event
%{key}	A configuration item key. It is the config param for which the audit event is captured.
%{operation}	Description of the event

Variable	Description
%{outcome}	Outcome of the operation performed corresponding to the audit event
%{parameters}	API and Operation parameters, which capture specific parameters about a query
%{referrerUrl}	The parent URL that refers to the current URL
%{sessionId}	Session or connection identifier
%{severity}	Severity of the audit event
%{sourceAddress}	Source IP Address
%{sourcePort}	Source Port
%{sourceService}	The service that is responsible for generating this event
%{text}	Free text, extra information, or actual description for the event
%{timestamp}	Time at which the event is reported
%{transportProtocol}	Network protocol used
%{userAgent}	Browser detail of the user accessing the page
%{userGroup}	Role assignment
%{userRole}	User role permissions assignment
%{value}	A configuration value. It is the value captured during the update

Global Audit Logging Operation Reference

This topic lists message types being logged by the various NetWitness components. Most messages plainly state the operation being logged; when necessary the meaning of the message is explained.

After you create a global audit logging configuration, audit logs automatically go to the external syslog system in the format specified in the selected audit logging template. The message types being logged by the various NetWitness components are shown in the following tables.

CARLOS

The following table lists the operations logged by CARLOS.

Serial #	Operation Name	Meaning
1	SetProviderConfiguration	A new notification server (for example, SMTP server) was added or updated
2	SetInstanceConfiguration	A new notification type (for example, email destination) was added or updated
3	SetTemplateDefinition	A new template was added or updated
4	RemoveProviderConfiguration	A notification server was removed
5	RemoveInstanceConfiguration	A notification type was removed
6	RemoveTemplateDefinition	A template definition was removed
7	Commit	A configuration bean change was committed
8	Set	A JMX property value was set via NetWitness Explore view

ESA

The following table lists the operations logged by the Event Stream Analysis (ESA).

Serial #	Operation Name	Meaning
9	SetSourceRequest	A concentrator was added or updated to ESA as source
10	RemoveSourceRequest	A concentrator was removed from ESA as source
11	SetEplModule	An EPL module was deployed or updated to ESA
12	RemoveEplModule	An EPL module was removed from ESA

Serial #	Operation Name	Meaning
13	SetEnrichmentSourceRequest	An ESA enrichment source was added/updated
14	RemoveEnrichmentSourceRequest	An ESA enrichment source was removed
15	SetDatabaseReference	An enrichment database reference was made to ESA
16	UpdateEnrichmentData	Data rows added to an ESA enrichment source
17	SetEnrichmentConnection	A connection was made between an EPL module and an enrichment source
18	RemoveEnrichmentConnection	A connection between an EPL module and an enrichment source was removed
19	DisableTrialModule	ESA Trial rules were disabled

Investigation

The following table lists the operations logged by Investigations.

Serial #	Operation Name	Meaning
1	VisualizePreferences	Operations related to Informer Visualization Request.
2	ParallelCoordinates	Operations related to Loading of Co-Ordinate View Navigation.
3	TimeLine	Operations related to Loading of Timeline View Navigation.
4	ExteralQuery	Operation when a Direct Query is fired via URL.
5	PrintView	Operations to open Investigation in Print View.
6	submitExtractFiles	Operation to submit a Request to Extract files from Sessions.
7	submitExtractLogs	Operation to submit a Request to Extract Logs from Sessions.
8	submitExtractPcap	Operation to submit a Request to Extract Sessions from Sessions.
9	DataScienceDrill	Operation to investigate from Data Science Report.
10	breadCrumbs	Operation to access the Query Breadcumbs.
11	Create	Operation when a new Investigation Query is being saved as a predicate to be used for URL Integration.
12	userPredicates	Operation to access Recent Queries of a user.

Serial #	Operation Name	Meaning
13	chartDefaultMetas	Operation to access last used Meta for generating Coordinate Chart.
14	defaultDevice	Operation to access the Default Investigation Device.
15	deleteDefaultDevice	Operation to delete the Default Investigation Device.
16	chartPreferences	Operation to edit an Investigation Navigation Chart Parameters such as Height.
17	devicePreferences	Operation to save the preferences about the Investigation Device such asTime Range, Profile, Meta Groups etc.
18	topValues	Operation to get the Top Values for Metas. Normally called from Top Values Dashlet.
19	MetaLanguages	Operation to read the Meta Languages from a Device.
20	MetaGroups	Operations related to Investigation Meta Groups.
21	DefaultMetaKeys	Operations related to Investigation Default Meta Keys.
22	UpdateDefaultMetaKeys	Operations to update Investigation Default Meta Keys.
23	UpdateMetaGroup	Operations to update Investigation Meta Groups.
24	ApplyMetaGroup	Operations to use Investigation Meta Groups.
25	DeactivateMetaGroup	Operations to reset Investigation Meta Groups in UI.
26	DeleteMetaGroup	Operations to remove Investigation Meta Group.
27	DeleteMetaGroups	Operations to remove multiple Investigation Meta Groups.
28	ImportMetaGroups	Operations to import Investigation Meta Groups.
29	ExportMetaGroup	Operations to export multiple Investigation Meta Groups.
30	GeoMap	Operation to access the Geo Map View of Investigation.
31	deleteEndpointCache	Operation to clear Reconstruction Cache of a Device.
32	delete	Operation to delete Alert Templates.
33	CustomColumnGroup	Operation to apply or read Custom Column Group.
34	Import	Operations related to Import of Column Group or Profiles.
35	Export	Operations related to Export of Column Group or Profiles.
36	SaveProfile	Operation to save an Investigation Profile.
37	ApplyProfile	Operation to apply an Investigation Profile.

Serial #	Operation Name	Meaning
38	DeactivateProfile	Operation to deactivate an Investigation Profile.
39	DeleteProfile	Operation to delete an Investigation Profile.
40	DeleteProfiles	Operation to delete multiple Investigation Profiles.

Reporting Engine

The following table lists the operations logged by the Reporting Engine.

Serial #	Operation Name	Meaning
1	TEMPLATE	For all operations related to template
2	CHART	For all operations related to chart
3	REPORT	For all operations related to report
4	RULE	For all operations related to rule
5	IMAGE	For all operations related to Logo Images used in Reports.
6	LIST	For all operations related to list
7	ALERT	For all operations related to alert
8	CONFIG	For all operations related to configuration change
9	SCHEDULE	For all operations related to schedule
10	ROLE	For all operations related to role/authorization
11	BATCH_JOB	For all operations related to batch jobs
12	SCHEDULER	For all operations related to scheduler
13	QUERYPROCESSOR	For all operations related to queryprocessor
14	FORMATTER	For all operations related to formatter
15	OUTPUTACTION	For all operations related to outputaction
16	STATUSMANAGER	For all operations related to statusmanager
17	BATCH_RUNDEF	For all operations related to batch rundef
18	CHARTGROUP	For all operations related to chart group
19	REPORTGROUP	For all operations related to report group
20	RULEGROUP	For all operations related to rule group

Serial #	Operation Name	Meaning
21	LISTGROUP	For all operations related to list group
22	DISKSPACE	For all operations related to disk space

Warehouse Connector

The following table lists the operations logged by the Warehouse Connector.

Serial #	Operation Name	Meaning
1	LockBox Password Create	Operation to create LockBox Password.
2	LockBox Password Update	Operation to update LockBox Password.
3	LockBox Password Refresh	Operation to refresh LockBox Password.
4	Adding Stream	Operation to add a Stream.
5	Adding Source	Operation to add a Source.
6	Adding Destination	Operation to add a Destination.
7	Removing	Operation to remove a Source, Stream, or Destination.
8	Changing Password	Operation to change the Password.
9	Updating Source	Operation to update a Source.
10	Adding Source to Stream	Operation to add a Source to a Stream.
11	Deleting Source from Stream	Operation to delete a Source from a Stream.
12	Setting Destination to Stream	Operation to set a Destination to a Stream.
13	Finalizing Stream	Operation to finalize a Stream and initiate the aggregation.
14	Stopping Stream	Operation to stop a Stream.
15	Starting Stream	Operation to start a Stream.
16	Reloading Stream	Operation to reload a Stream.

Health & Wellness

The following table lists the operations logged by Health & Wellness.

Serial #	Operation Name	Meaning
1	SavePolicyRequest	Operation while adding or modifying a Policy.
2	RemovePolicyRequest	Operation while removing a Policy.

NetWitness Core Services

The following table lists the operations logged by NetWitness Core Services.

Serial #	Operation Name	Meaning
1	FILE-Command	Operation to list, retrieve and delete files from approved directories on this device.
2	SERVICE-Start	Service started
3	SERVICE-Stop	Service stopped
4	REDIRECT-Syslog	Operation for syslog forwarding.
5	ADD-Monitor	Issuing a filesystem monitor operation
6	DELETE-Monitor	Issuing a filesystem monitor deletion operation
7	SHUTDOWN-Service/shutdown.service	Shutting down appliance service
8	REBOOT-Service	Restarting appliance service
9	CONFIGURE-Network	Issuing Network Configuration change
10	SET-NTP	Issuing NTP set operation
11	STOP-NTP	Issuing NTP stop operation
12	NTP-Timesync	Issuing NTP time sync operation
13	SET-SNMP	Issuing SNMP set
14	UPGRADE/upgrade	Issuing upgrade operation
15	create.collection	Operation to create an empty collection.
16	restore	Issuing restore
17	session.aggregation	Issuing aggregation start/stop
18	add.device	Adding a device for aggregation
19	edit.device	Editing a device used for aggregation
20	delete.device	Deleting a device used for aggregation
21	capture.start	Starting capture operation
22	capture.stop	Stopping capture operation
23	select.interface	Selecting capture interface
24	export	Operation to export packets or sessions.

Serial #	Operation Name	Meaning
25	reload	Issuing a parser reload
26	schema	Issuing a schema request for loaded parsers
27	upload/file.upload	Issuing file upload
28	notify	Issuing feed notify
29	delete	Issuing file deletion
30	edit.config	Configuration change operation
31	parsers.transforms	Perform a language key transformation
32	data.reset	Data reset operation
33	timeout	REST request timeout
34	cancel	Cancel a running query
35	timeroll	Operation to delete the database files that exceed a given limit.
36	dump	Operation to dump information out of the database in nwd formatted files.
37	session.wipe	Issuing a session wipe operation
38	REPLACE-Rule	Issuing a rule replace operation
39	MERGE-Rule	Issuing a rule merge operation
40	ERASE-Rule	Issuing deletion of a set of all rules
41	ADD-Rule	Issuing a rule addition operation
42	DELETE-Rule	Issuing deletion of a set of rules
43	sdk.info	Issuing SDK summary info.
44	sdk.session	Issuing SDK session info.
45	sdk.language	Issuing SDK language
46	sdk.aliases	Issuing SDK alias request
47	sdk.transform	Issuing SDK transformation request
48	sdk.search	Issuing session content search request
49	sdk.cache	Operation related to session content cache
50	sdk.content	Issuing session content request

Serial #	Operation Name	Meaning
51	check.authorization	Operation to check user roles for permissions to execute an operation.
52	close.connection	Issuing a connection close operation
53	handshake	Issuing an SSL handshake
54	logon/login	Operation to login from NW to the other services, mostly to privileged users.
55	STOREDPROCOP	Issuing file upload cancel/start
56	ADD-Task	Added scheduled task
57	DELETE-Task	Deleted scheduled task
58	logoff	Issuing logout operation
59	list.cacerts	Issuing list trusted CA certificate operation
60	delete.cacerts	Issuing delete trusted CA certificate operation
61	add.cacerts	Issuing addition of trusted CA certificate operation
62	restart.command	Issuing restart command line option
63	delete.file/file.delete	Operation to delete system configuration files.
64	update.file/file.update	Operation to update system configuration file.
65	create.file	Issuing file creation operation
66	query	Issue a database query
67	unlock	Issuing unlock user account operation
68	user.add	Operation to create user accounts on individual devices.
69	user.delete	Operation to delete a user on individual devices.
70	group.create	Operation to add a new group to the system.
71	user.remove	Remove a user account from a group
72	group.delete	Delete a group from the /users/groups tree
73	add.user	Issuing add user command to collection
74	delete.user	Issuing delete user command to collection
75	remove.user	Removing an user from collection
76	collection.open	Issuing an open command for a collection

Serial #	Operation Name	Meaning
77	collection.close	Issuing a close command for a collection
78	collection.delete	Issuing collection deletion command
79	reingest.start	Operation to start reingesting of packet data in collection.
80	feed.notify	Issuing a feed notify command
81	collect	Issuing a collect command
82	collect.start	Issuing a data collection start
83	collection.global	Issuing import parser command
84	parser.reload	Issuing parser reload command
85	reingest	Operation to reingest packet data in collection.
86	collection.create	Issuing a create collection command
87	collection.restore	Issuing a restore collection command
88	collection.clone	Issuing a clone collection command
89	parser.reload	Issuing parser reload command
90	sdk.query	Performs a query against the meta database
91	sdk.msearch	Search for pattern matches in many sessions or packets
92	sdk.values	Performs a value count query and returns the matching values for a report
93	sdk.timeline	Returns the count of sessions/size/packets in discrete time intervals

Malware Analysis

The following table lists the operations logged by the Malware Analysis (MA) component.

Serial #	Operation Name	Meaning
1	GetDashBoardSummaryRequest	Get dashboard analysis statistics
2	GetFileScoreSummaryRequest	Get aggregated file scores by score type and risk level
3	CountEventsAndFilesRequest	Get count of events and files over a time frame
4	GetAvVendorDetectionRequest	Get AV vendor analysis results

Serial #	Operation Name	Meaning
5	GetAVVendorsRequest	Get list of AV Vendors supported
6	SetInstalledAVVendors	Request Update list of installed AV Vendors in config
7	CountEventByCriteriaRequest	Count events by criteria
8	FindEventByIdRequest	Get event by id
9	FindEventByCriteriaRequest	Get event by criteria
10	DeleteEventRequest	Delete event
11	CommentOnEventRequest	Add comment to event
12	ReSubmitEventRequest	Resubmit event for analysis
13	FindEventScoreByIdRequest	Get event score by event id
14	FindEventScoreByCriteriaRequest	Get event score by criteria
15	FindMetaByIdRequest	Get meta by id
16	FindMetaByCriteriaRequest	Get meta by criteria
17	FindMetaValueByCriteriaRequest	Get meta value by criteria
18	CountByDistinctMetaValueRequest	Count distinct meta values
19	CountByMetaNameAndValueWithDate RangeIntervalRequest	Count meta and values with interval for charting
20	CountByValueAndAverageOverallScore Request	Count meta and map to overall scores for events
21	CountByValueAndAverageGroupScore Request	Count meta and map to group scores for events
22	CountFileEntryByCriteriaRequest	Count files by criteria
23	FindFileEntryByIdRequest	Get file by id
24	FindFileEntryByCriteriaRequest	Get file by criteria
25	ReSubmitFileEntryRequest	Resubmit file for analysis
26	FileDownloadRequest	Download file from repository
27	FileUploadRequest	Upload file for analysis
28	FindFileScoreByIdRequest	Get file score by id
29	FindFileScoreByCriteriaRequest	Get file score by criteria

Serial #	Operation Name	Meaning
30	FindHashValueByIdRequest	Get whitelist/blacklist Hash value by id
31	FindHashValueByCriteriaRequest	Get whitelist/blacklist Hash value by criteria
32	AddHashValueRequest	Add whitelist/blacklist Hash value
33	UpdateHashValueRequest	Update whitelist/blacklist Hash value
34	DeleteHashValueRequest	Delete whitelist/blacklist Hash value
35	FindHashValueByMd5Request	Find whitelist/blacklist Hash value by md5
36	AddHashValueInFileRequest	Add File to repository as well as hash value
37	GetDefaultRulesRequest	Get default IOC Rules configuration
38	ResetToDefaultRulesRequest	Reset IOC Rules configuration to default
39	GetAllOverrideRulesRequest	Get IOC Rules user created override configuration
40	FindOverrideRuleByIdRequest	Find IOC override rule by id
41	AddOverrideRuleRequest	Add IOC override rule
42	UpdateOverrideRuleRequest	Update IOC override rule
43	DeleteOverrideRuleRequest	Delete IOC override rule
44	SubmitOnDemandNextGenRequest	Submit new ondemand nextgen scan
45	FindOnDemandJobEntryByIdRequest	Get ondemand job entity by id
46	FindOnDemandJobEntryByCriteria Request	Get ondemand job entity by criteria
47	GetOnDemandJobInfoRequest	Get ondemand job reference entity by id
48	GetOnDemandDefaultConfiguration	Request Get ondemand default configuration
49	CancelOnDemandJobRequest	Cancel ondemand job in progress
50	DeleteOnDemandJobRequest	Delete ondemand job
51	ReSubmitOnDemandJobRequest	Resubmit ondemand job
52	SubscriptionRequest	Subscribe to MA Cloud communication
53	UnSubscribeRequest	Unsubscribe from MA Cloud communication
54	GetTopEventInfluencesRequest	Get Top N event influences

Serial #	Operation Name	Meaning
55	GetServerInfoRequest	Get server info, such as server time
56	DataResetRequest	Reset database
57	OnDemandJobStatusNotification	Report ondemandjob progress to subscribers
58	LicenseStatusNotification	Report license status - num samples analyzed
59	DataResetNotification	Report that data was reset
60	GetIocSummaryRequest	Get IOC rules aggregated by event/file scores
61	FindAlertTemplatesByCriteriaRequest	Get rabbitmq alert templates by criteria
62	SaveAlertTemplateRequest	Update alert template
63	DeleteAlertTemplateRequest	Delete alert template
64	GetJobStatusRequest	Get in progress job analysis thread status
65	GetEventTypeCountSummaryRequest	Get event analysis counts by date chart
66	Logon	Logon to the MA Service
67	Modified	Modifying config changes
68	GetNextGenSummaryRequest	Get nextgen dashboard summary statistics

NetWitness User Interface

The following table lists the operations logged by the NetWitness User Interface component.

Serial #	Operation Name	Meaning
1	uploadTrialLicense	Upload Trial License
2	LicenseEntitle	Entitle License
3	LicenseDeactivation	Deactivate License
4	ExpiredLicense	License Expired
5	LicenseOutOfComplianceAcknowledgement	EULA Acknowledgement
6	resetLicense	Reset License
7	usageDateExport	License data usage - csv/pdf

Serial #	Operation Name	Meaning
8	refreshLicense	Refresh LLS license
9	LicenseOutOfCompliance	Out of Compliance
10	OOTBEntitlementOutOfCompliance	OOTB Trial license Out of Compliance
11	OOTBEntitlementFirstLoginTimeModified	OOTB time modified
12	OOTBEntitlementFileDeleted	OOTB File deleted
13	OOTBEntitlementDataTampering	OOTB data tampering
14	uploadOfflineResponse	Upload offline response
15	offlineDownloadCapRequest	Download offline request
16	movePerpetualToThroughput	Move Appliance license to Throughput
17	moveThroughputToPerpetual	Mover Throughput to Appliance license
18	mapApplianceLicense	Map Service to Real license
19	delete	Operation to delete Alert Templates.
20	HttpRequest	Operation for Audit Logging of the accessed URL.
21	Page Accessed	Operation for Audit Logging of the accessed page.
22	Navigate	Operation to navigate to the accessed page.
23	Events	Operation to view the accessed event page.
24	Recon	Operation for Event Reconstruction requested.
25	Services	Operation while reading the list of available devices for investigation.
26	Service	Operation for a List of devices requested to be investigated.
27	Collections	Operation to view the list of collections requested.
28	Profiles	Operation to apply a Profile.
29	ColumnGroups	Operation to apply or read Column Group.

Serial #	Operation Name	Meaning
30	ParallelCoordinates	Operations related to Loading of co-ordinate view navigation.
31	Timeline	Operations related to loading of timeline view navigation.
32	PrintView	Operations to open investigation in print view.
33	Preferences	Operations related to Informer Request.
34	import	Operations related to Import of Column Group or Profiles.
35	export	Operations related to Export of Column Group or Profiles.
36	Predicate	Operations related to Queries (Predicates) used for Investigation.
37	Languages	Operation for Language requested from a Device.
38	CancelLanguageLoad	Operation for Language Load Canceled from Navigate Page.
39	summary	Operation for a summary requested from a Device.
40	languages	Operation for a language requested from a device.
41	aliases	Operation for meta aliases requested from a device.
42	query	Operation for SDK Query requested from a device.
43	msearch	Operation for a meta search requested from a device.
44	nodeListing	Node Listing for a node requested from a Device.
45	content	SDK Content call requested from a Device for downloading a PCAP or Log.
46	Export Files	File Listing Requested for a Session in File View or Extraction jobs.
47	packets	Packets requested for sessions in Packet View or Extraction Jobs.

Serial #	Operation Name	Meaning
48	deleteEndpointCache	Operation to clear reconstruction cache of a device.
49	Logon	Operation for user to sign in to NetWitness User Interface.
50	Logoff	Operation for user to sign out of NetWitness User Interface.
51	defaultDevice	Operation to access the Default SA UI Device.
52	deleteDefaultDevice	Operation to delete the Default investigation device.
53	submitExtractFiles	Operation to submit a request to Extract files from Sessions.
54	submitExtractLogs	Operation to submit a Request to Extract Logs from Sessions.
55	submitExtractPcap	Operation to submit a Request to Extract Sessions from Sessions.
56	MetaGroup	Operations related to SA UI Meta Groups.
57	ExternalQuery	Operation when a Direct Query is fired via URL.
58	GeoMap	Operation to access the Geo Map View of Investigation.
59	SaveProfile	Operation to save an Investigation Profile.
60	ApplyProfile	Operation to apply an Investigation Profile.
61	DeleteProfile	Operation to apply an Investigation Profile.
62	DeactivateProfile	Operation to apply an Investigation Profile.
63	VisualizePreferences	Operations related to Informer Visualization Request.
64	ExportMetaGroup	Operations to export multiple SA UI Meta Groups.
65	userPredicates	Operations to export multiple SA UI Meta Groups.

Serial #	Operation Name	Meaning
66	FileView	Operation for reconstruction request for File View.
67	resource.update	Operation when Live Subscription State changes.

Respond

The following table lists the operations logged by the Respond component.

Serial #	Operation Name	Meaning
1	update	Update notification setting
2	update	Update integration settings configuration
3	delete	Delete Alerts
4	create	Create new incident
5	update	Update incident details
6	read	Read incident details
7	delete	Delete incidents
8	read	Read remediation tasks
9	delete	Delete Remediation tasks
10	update	Update remediation tasks
11	create	Create new rule
12	update	Update existing alert rule
13	reorder	Reorder priority of alert rules

Investigate Server

Serial #	Operation name	Meaning
1	Aliases	Fetch aliases
2	BackgroundJob	Category for all background job
3	ColumnGroup	Category for all column group operation

Serial #	Operation name	Meaning
4	Count-query	Default Investigate
5	Countdistict-query	Default Investigate
6	Content	Default Session Content
7	Create	User entity
8	Create	User preferences
9	Create	Predicate
10	Delete	User preferences
11	Delete	Predicate
12	Extract-content	Extract Content from Session
13	Folders	Category for all folder operation
14	Files	SDK content request
15	InvestigateExport	Category for extraction invocation
16	Key-refs	Fetch meta keys
17	Languages	SDK language call
18	MetaGroup	Category for all meta group operation
19	Metakey	Category for all metakey operation
20	MailReconstruction	Category for all mail reconstruction operation
21	ParsingRequest	Category for all request parsing operation
22	PacketReconstruction	Category for all packet reconstruction operation
23	Predicate InvestigateIncidents	Category for all predicate operation
24	Query	SDK query
25	Reconstruction	Category for common shared reconstruction operation
26	ReconstructionCache	Category for reconstruction caching operation
27	ReconstructionStreaming	Category for reconstruction streaming operation
28	ReconstructDataSecurity	Category for reconstruction security operations (data-scrubbing)
29	Session-Meta	SDK query to get session meta

Serial #	Operation name	Meaning
30	Summary	SDK summary
31	Search-meta-value	Search meta-value based on field name
32	TextReconstruction	Category for all text reconstruction operation
33	Timeline	Timeline request
34	UserPreferences	Category for all user preferences operation
35	Update	User entity
36	Update	User preferences
37	Update	Profile group
38	Update	Predicate
39	Values	SDK values
40	Validate-query	Validate SDK query

Security Server

The following table lists the events logged by the Security Server.

Log Category	Description
Create:	Add record for a role with new ID.
Create:	Add user record with new ID.
Update:	Update the user account with a new ID.
Authentication:	Logs events pertaining to user logins and logouts.
Authorization:	Logs events pertaining to user access checks and RBAC management.
UserAccount	Logs events pertaining to NetWitness domain account management.
ExternalProvider:	Tracks events pertaining with external account providers (for example, Active Directory).

The following example shows an event logged by the Security Server:

```
2018-03-13 16:25:02,938 UserAccount{action=ExpirePassword, success=true,
identity=admin, parameters={id=Justin}}
```

Admin Server

The following table lists the events logged by the Admin Server.

Log Category	Description
Restore:	System operation to restore a data springboard.

Config Server

The following table lists the events logged by the Admin Server.

Log Category	Description
newregistration:	Record the registration to config server that manages the collection storage.

Context Hub Server

The following table lists the events logged by the Admin Server.

Log Category	Description
verifyconnection:	System operation to check if the connection is live.
addconnection	Create new connection to access data.

Local Audit Log Locations

NetWitness has global audit logging capabilities. When you configure global audit logging, audit logs from all NetWitness components collect in a centralized system, which converts them into the required format and forwards them to a third-party syslog server or a Log Decoder.

To view audit logs from the individual services, you can look at the local audit log locations.The following table shows the local directory paths of the audit logs for the NetWitness user interface and the various NetWitness services.

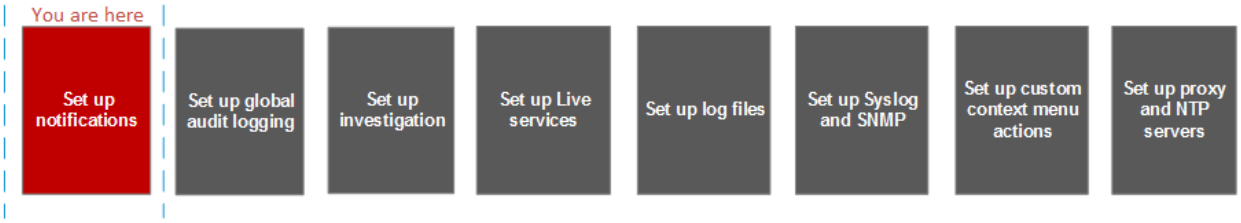
Service/Module	Audit Log Location
NetWitness User Interface (NetWitness Web Server)	The NetWitness user interface sends audit logs to the following locations: • `/var/lib/netwitness/uax/logs/audit/audit.log` (human-readable format) • Syslog running on the local host (JSON format) The NetWitness user interface uses the AUTH facility of syslog to write audit logs to syslog. You can only see audit logs in the first location (`/var/lib/netwitness/uax/logs/audit/audit.log`).
Core Services (Decoder, Log Decoder, Concentrator, Broker, and Archiver), Log Collector, Warehouse Connector, and Workbench	The Core services and similar services send audit logs to Syslog running on the local host. Path: `/var/log/secure` (JSON format) The Core services use the AUTHPRIV facility of syslog to write audit logs to syslog.

Service/Module	Audit Log Location

Reporting Engine,
Malware Analysis,
Respond,
ESA Correlation (11.3 and later),
and Event Stream Analysis
(11.2 and earlier)
	These services send audit logs to the following locations:
	• `<application-home-directory>/logs/audit/audit.log` (human-readable format)
	• Syslog running on the local host (JSON format)
	
	The following are the audit log locations of these services:
	Reporting Engine:
	`/var/netwitness/re-server/rsa/soc/reporting-engine/logs/audit/audit.log`
	Respond Server:
	`/var/log/netwitness/respond-server/respond-server.audit.log`
	Malware Analysis:
	`/var/lib/netwitness/malware-analytics-server/spectrum/logs/audit/audit.log`
	ESA Correlation (11.3 and later):
	`/var/log/netwitness/correlation-server/correlation-server.audit.log`
	Event Stream Analysis (11.2 and earlier):
	`/opt/rsa/esa/logs/audit/audit.log`
	These services use the AUTH facility of syslog to write audit logs to syslog. You can only see audit logs in the first location (`<application-home-directory>/logs/audit/audit.log`).

Health & Wellness, Event Source Management (ESM), and Appliance and Service Grouping (ASG)	These Services send audit logs to the following locations: • `/opt/rsa/sms/logs/audit/audit.log` (human-readable format) • Syslog running on the local host (JSON format) These services use the AUTH facility of syslog to write audit logs to syslog. You can only see audit logs in the first location (`/opt/rsa/sms/logs/audit/audit.log`).
Aggregated Audit Logs	The aggregated audit logs from all the services are sent to the following locations: • `/var/netwitness/logstash/logs/rsa-netwitness-audit.log` (JSON format) • Syslog running on the local host (human-readable format)

Global Notifications Panel



Global Notifications panel introduces the features for configuring notification settings. Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond.

In the Global Notifications panel, you can configure the following global notification settings:

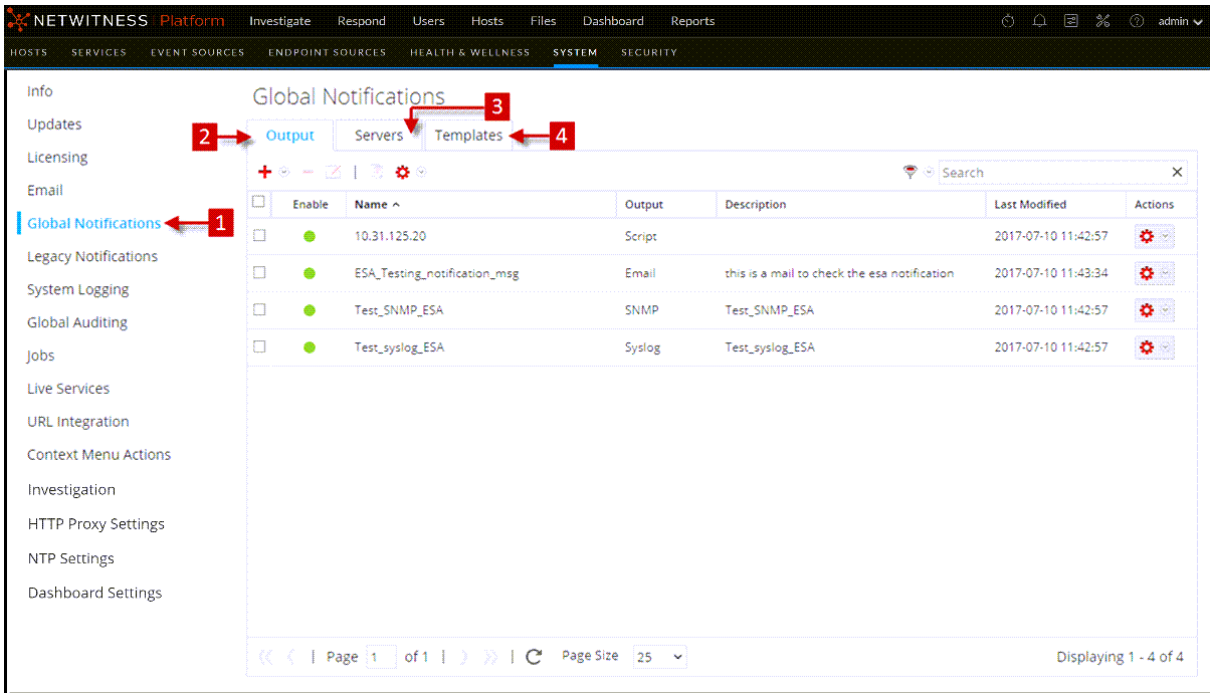
- Notification Outputs
- Notification Servers
- Templates

Note: ESA SNMP notifications are not supported for NetWitness 11.3 and later.

WorkFlow

What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure Notification Servers	Servers Tab
Administrator	Configure Notification Outputs	Output Tab
Administrator	Configure Notification Templates	Templates Tab



Related Topics

- Configure a Syslog Notification Server
- Configure Script as a Notification Server

Quick Look

To access the Notifications configuration panel:

1. In the main menu, select (Admin) > **System**.
2. In the options panel, select **Global Notifications.**

1 Displays the Global Notification Panel.
2 Displays the Output Tab
3 Displays the Servers Tab
4 Displays the Templates Tab

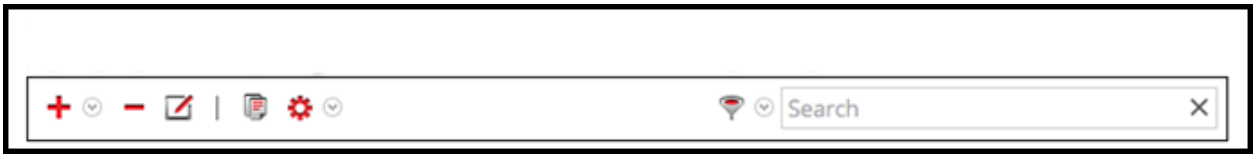
Toolbar and Features

The Global Notifications panel has three tabs: Output, Servers, and Templates.

Feature	Description
Output tab	This tab enables you to configure notification outputs. See Output Tab for more information.
Servers tab	This tab enables you to configure notification servers. See Servers Tab for more information.
Templates tab	This tab enables you to configure notification templates. See Templates Tab for more information.

This table describes the columns in the grid for Notification Outputs and Notification Servers.

Column	Description
	Selects a row for an action in the toolbar. Clicking the checkbox in the column title selects or deselects all rows in the grid.
Enable	Indicates whether the configuration is enabled. A solid colored green circle indicates that a configuration is enabled. A blank white circle indicates that a configuration is not enabled.
Name	A name that identifies or labels the configuration.
Output	The configuration output. The outputs are Email, SNMP, Syslog, and Script.
Description	A brief description about the configuration.
Last Modified	Shows the date and time of the last configuration change.
Actions	Provides an Actions menu for the selected configuration with actions that can be taken on the configuration. The Actions menu enables you to delete, edit, duplicate, and export the configuration.

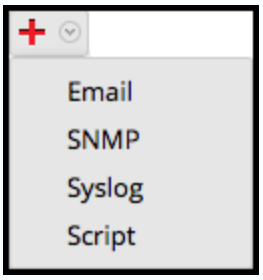


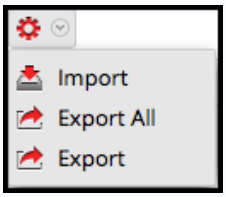
This table describes the columns in the grid for Notification Templates.

Column	Description
	Selects a row for an action in the toolbar. Clicking the checkbox in the column title selects or deselects all rows in the grid.
Name	A name that identifies or labels the template.
Template Type	The type of template. The types are Audit Logging, Event Stream Analysis, Event Source Monitoring, and Health Alarms.
Description	A brief description about the template.
Actions	Provides an Actions menu for the selected configuration with actions that can be taken on the template. The Actions menu enables you to delete, edit, duplicate, and export the template.

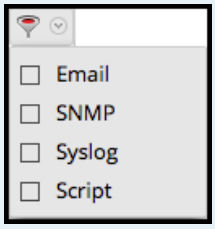
Global Notifications Panel Toolbar

The Global Notifications panel toolbar is at the top of the Output, Servers, and Templates tabs.





The following figure shows the toolbar on the Output and Servers tabs.



The following figure shows the toolbar on the Templates tab.

The following table describes the features of the Global Notifications panel toolbar.

Feature	Description
 	Adds a notification server on the Servers tab, adds a notification output (notification) on the Output tab, and adds a notification template on the Templates tab. On the Servers and Output tabs, you can select to configure Email, SNMP, Syslog, and Script notification settings.
	Removes a selected notification configuration. You cannot delete notification servers and notification types that are associated with global audit log configurations. If you attempt to delete a notification output (notification) being used by alerts, you will receive a warning confirmation message that the alerts using the notification will not function properly. The message shows the number of alerts in use. You can also delete a configuration by selecting a configuration and then in the Actions column, selecting  > Delete.
	Edits a selected notification configuration. You can also edit a configuration by selecting a configuration and then in the Actions column, selecting  > Edit.
	Duplicates a selected notification configuration. You can also duplicate a configuration by selecting a configuration and then in the Actions column, selecting  > Duplicate.
	Displays the following options: • **Import**: Imports a notification server, type, or template. For example, on the Servers tab, you can import a notification server configuration. • **Export All**: Exports all of the configurations. For example, if you are on the Servers tab, you can export all of the notification server configurations. • **Export**: Exports a selected configuration. You can also export a configuration by selecting a configuration and then in the Actions column, selecting  > Export.

Feature	Description
	Filters by Email, SNMP, Syslog, or Script.
	Searches configurations in the grid.

Define Notification Server Dialogs

This topic describes the Define Notification Server dialogs used to configure the settings of the various types of notification servers. You configure notification servers in the (Admin) > **System** > **Global Notifications** > **Servers** tab.

Notifications are used by a variety of components in NetWitness, such as Event Stream Analysis (ESA), Respond, and Global Audit Logging. Notification settings are called Notification Servers. In the Servers tab of the Administration System view Notifications panel, you can create multiple Notification Server configurations.

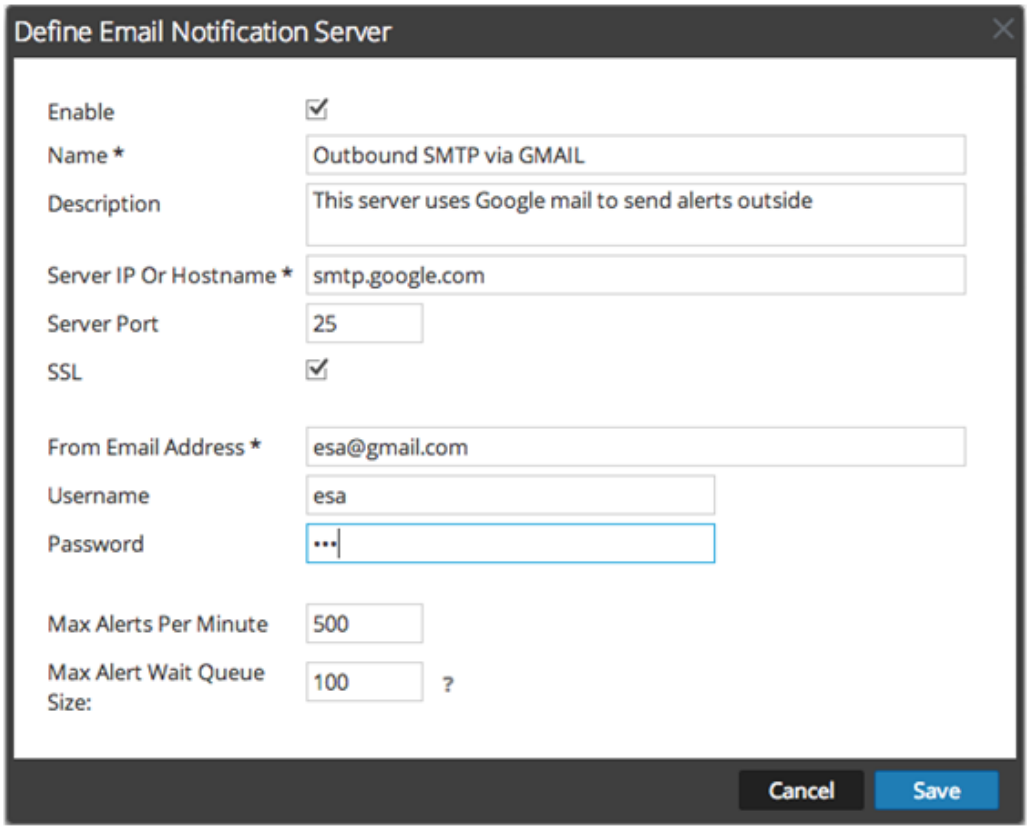
You can configure the following types of notification server settings in NetWitness:

- Email
- SNMP
- Syslog
- Script

For Global Audit Logging, you can only use Syslog Notification Servers.

Procedures related to notification servers are described in Configure Notification Servers.

To access the Define Notification Server dialogs



1. Go to **(Admin) > System**.
2. In the left navigation panel, select **Global Notifications**.
3. In the **Notifications Servers** panel, click and then select a type of notification server (Email, SNMP, Syslog, or Script)
   The Define Notification Server dialog is displayed for your selection.

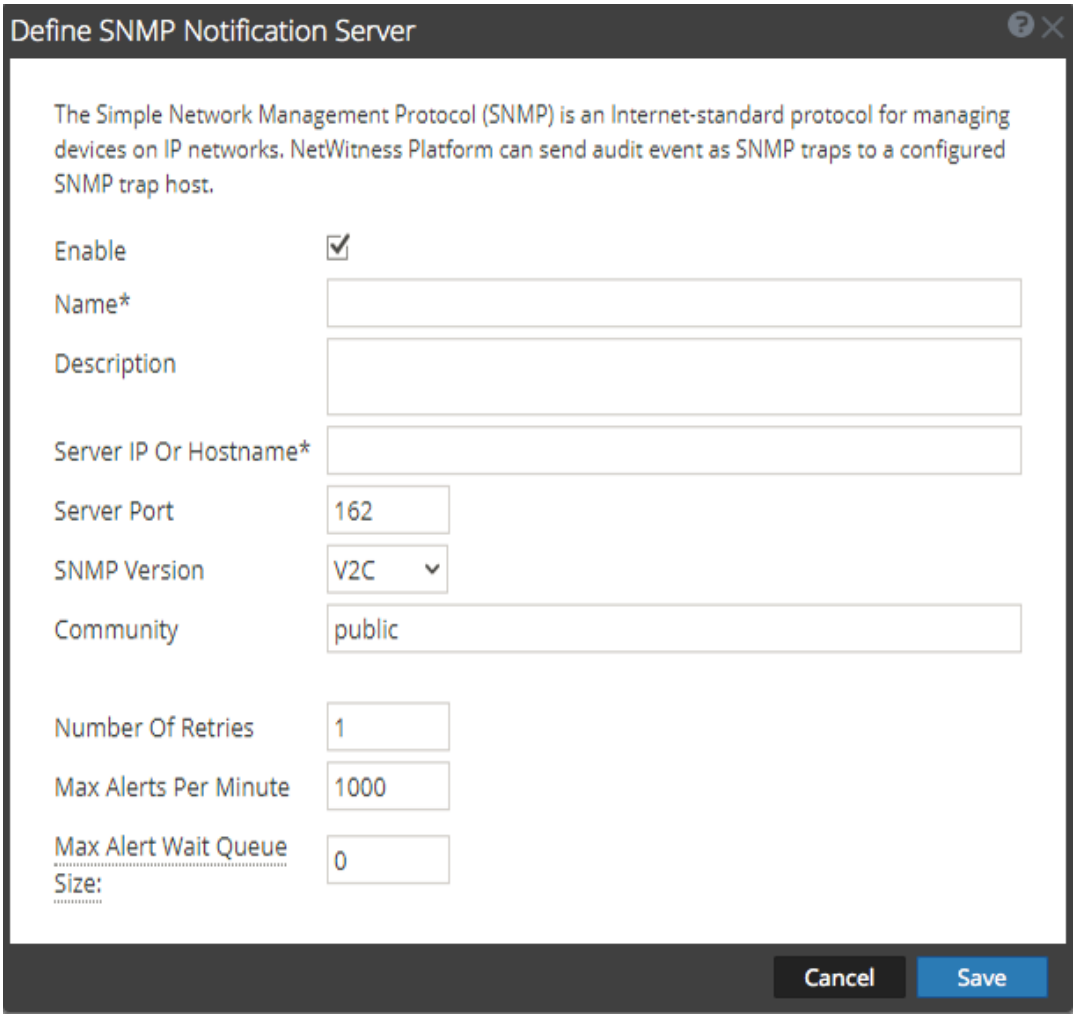
There are four notification server dialogs, which allow you to configure notification servers.

Email

Email notification servers enable you to configure email server settings to send alert notifications.

The following figure shows the Define Email Notification Server dialog.

The following table lists the various parameters that you need to define for the email notification servers.



Parameters	Description
Enable	Select to enable the notification server.
Name	A name to identify or label the notification server.
Description	A brief description about the notification server.
Server IP Or Hostname	Hostname of the email server. For ESM/SMS and ESA notifications, you must specify only the hostname/FQDN.
Server Port	The server port.
SSL	Select the option if you want the communication to happen through SSL.
From EMail Address	Email account from which you want to send email notifications.
Username	Username for logging into the email account if the SMTP server requires user authentication to relay emails successfully.

Parameters	Description
Password	User password for logging into the email account if the SMTP server requires user authentication to relay emails successfully.
Max Alerts Per Minute	Describes the maximum number of alerts per minute.
Max Alert Wait Queue Size	Describes the maximum number of alerts to be queued before they are dropped.

SNMP

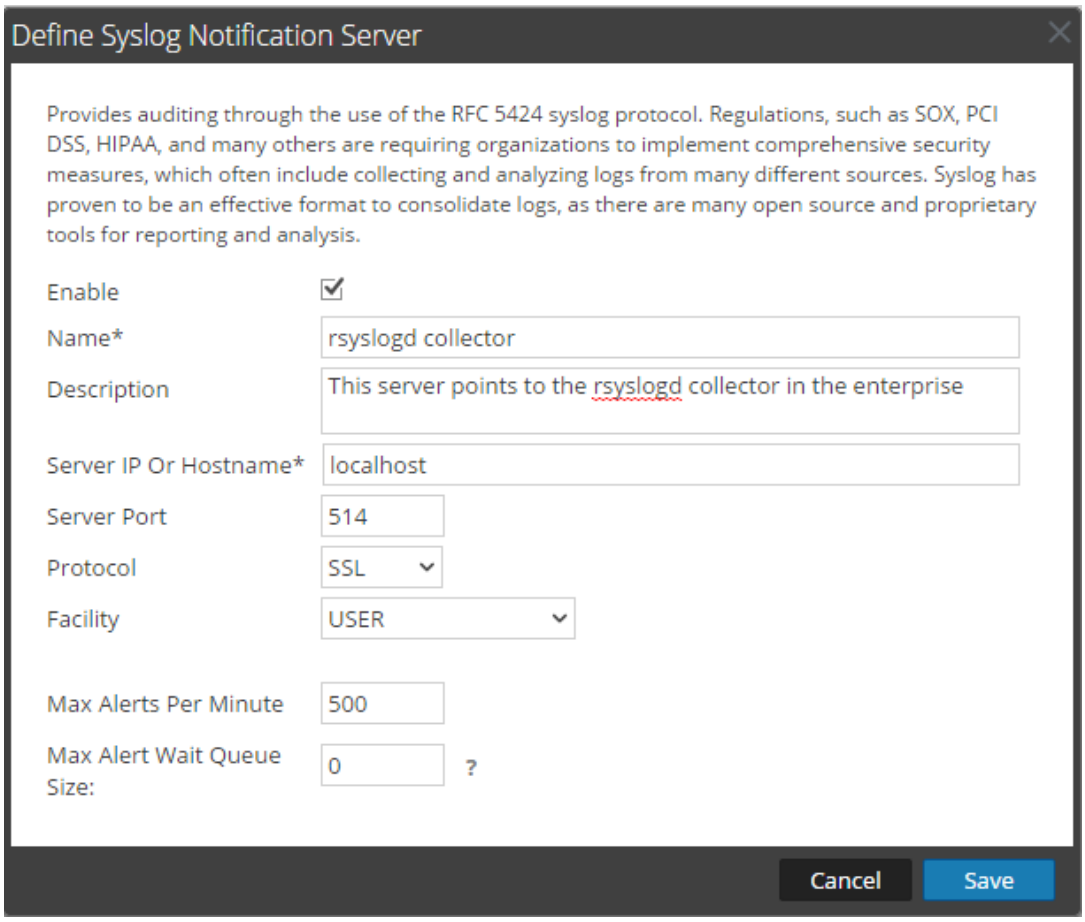
SNMP notification servers enable you to configure SNMP trap host settings as a notification server to send alert notifications.

The following figure shows the Define SNMP Notification Server dialog.

The following table lists the various parameters that you need to define for the SNMP notification servers.

Parameters	Description
Enable	Select to enable the notification server.
Name	A name to identify or label the notification server.
Description	A brief description about the notification server.
Server IP Or Hostname	SNMP trap host IP address or hostname.
Server Port	Listening port number on the SNMP trap host.

<table>
<tr><th>Parameters</th><th>Description</th></tr>
<tr><td>SNMP Version</td><td>SNMP version. The following are the options:
V1
V2C
V3
If you select SNMP Version 3 (v3), the following parameters are displayed:
<table>
<tr><th>Parameters</th><th>Description</th></tr>
<tr><td>Notification Type</td><td>Based on the notification type a SNMP messages are sent each time an alert is generated.
The following notification types are supported:
Inform - Inform is acknowledged trap. The sender gets an acknowledgement from the receiver.
Trap - Trap is unacknowledged notification</td></tr>
<tr><td>Authoritative Engine ID (This optioin is availabe only for notification type TRAP)</td><td>An identifier which is used to identify the agents. Authoritative engine ID along with the username is used to uniquely identify the agent.</td></tr>
<tr><td>Security Level</td><td>Define the security level. The following are the options:
Unauthenticated and Unencrypted
Authenticated and Unencrypted
Authenticated and Encrypted</td></tr>
<tr><td>Auth Protocol (This option is available only for security level Authenticated and Unencrypted and Authenticated and Encrypted)</td><td>Authentication protocol which is used to validate a user before providing an access to the server. The options are:
SHA
MD5</td></tr>
<tr><td>Auth Key (This option is available only for security level Authenticated and</td><td>A password that you want to use for authentication.</td></tr>
</table></td></tr>
</table>



Parameters	Description
	Unencrypted and Authenticated and Encrypted) Privacy Protocol (This option is available only for security level Authenticated and Encrypted) — Privacy protocol is an encryption technique for data communication. Private Key (This option is avaliable only for security level Authenticated and Encrypted) — A password that you want to use for encryption.
Community	Community string used to authenticate on the SNMP trap host. The default value is **public**.
Number of Retries	Number of retries for the trap.
Max Alerts Per Minute	Maximum number of alerts per minute.
Max Alert Wait Queue Size	Maximum number of alerts to be queued before they are dropped.

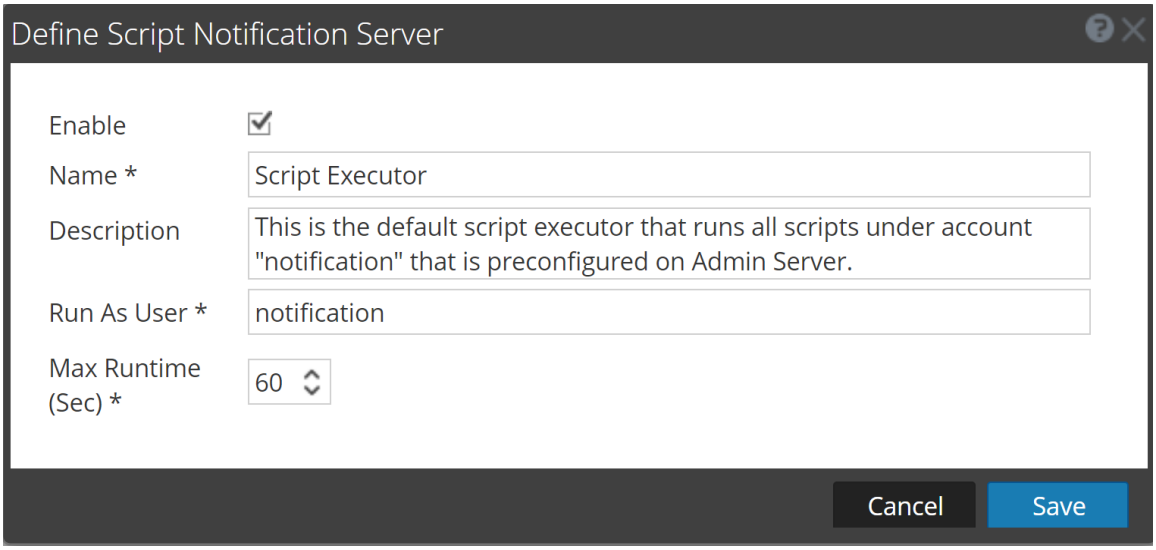
Syslog

Syslog notification servers allow you to configure Syslog settings as a notification server to send notifications. When enabled, Syslog provides auditing through the use of the RFC 5424 Syslog protocol. Syslog has proven to be an effective format to consolidate logs, as there are many open source and proprietary tools for reporting and analysis.

You cannot disable notification servers associated with global audit logging configurations.

The following figure shows the Define Syslog Notification Server dialog.

The following table lists the various parameters that you need to define for the Syslog notification servers.



Parameters	Description
Enable	Select to enable the notification server.
Name	A name to identify or label the notification server.
Description	A brief description about the notification server.
Server IP Or Hostname	The hostname of the host where the target Syslog process is running.
Server Port	The port number where the target Syslog process is listening.
Protocol	The protocol to be used to transfer the Syslog files.
Facility	The designated Syslog facility to use for all outgoing messages. It is used to specify what type of program is logging the message. Some possible values are KERN, USER, MAIL, and DAEMON. This lets the configuration file specify that messages from different facilities will be handled differently.

Parameters	Description
Max Alerts Per Minute	Maximum number of alerts per minute. This field is not used for Global Audit Logging.
Max Alert Wait Queue Size	Maximum number of alerts to be queued before they are dropped. This field is not used for Global Audit Logging.

Script

Script notification servers enable you to configure Script as a Notification Server.

The following figure shows the Define Script Notification Server dialog.

The following table lists the various parameters that you need to define for the Script notification servers.

Parameters	Description
Enable	Select to enable the notification server.
Name	A name to identify or label the notification server.
Description	A brief description about the notification server.
Run As User	Name of the user identity under which the script is executed. The default user identity is **notification**. For ESA, you cannot set this to anything else unless you have created the account on the Admin Server.
Max Runtime (Sec)	The maximum time (in seconds) the script is allowed to run.

Define Notification Output Dialogs

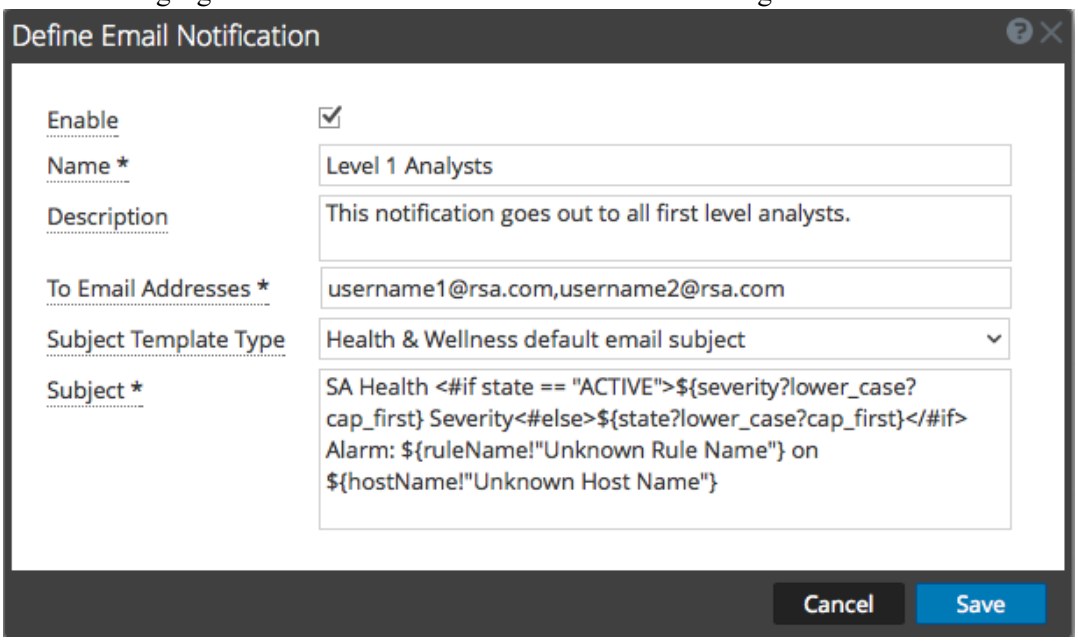
This topic provides descriptions of the various notification output dialogs. You configure notification outputs in the (Admin) > System > Global Notifications > Output tab. Notifications are basically the destinations used for sending notifications. For ESA, notifications enable you to define how you want to receive the ESA alerts. The following are the different notifications supported by NetWitness:

- Email
- SNMP
- Syslog
- Script

Procedures related to notifications are described in Configure Notification Outputs.

To access the Define Notification dialogs

1. Go to **(Admin)** > **System**.
2. In the options panel, select **Global Notifications**.
3. On the **Output** tab, click and then select a notification output (Email, SNMP, Syslog, or Script) The Define Notification dialog is displayed for your selection.



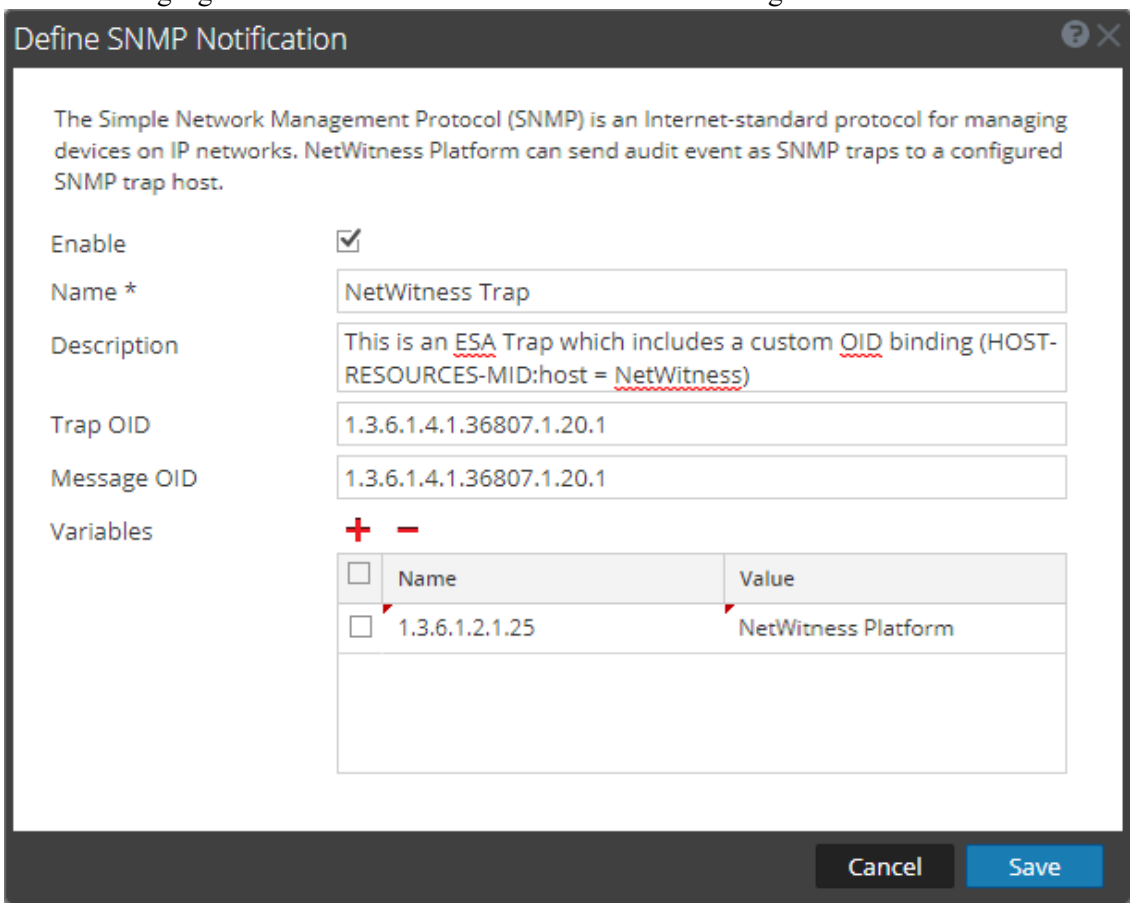
Features

There are four notification dialogs, which allow you to configure notification outputs.

Email

Email notifications enable you to define the destination email address to which you can send the alerts. It also enables you to add a custom description in the subject of the email and also to define multiple destination email addresses.

The following figure shows the Define Email Notification dialog.



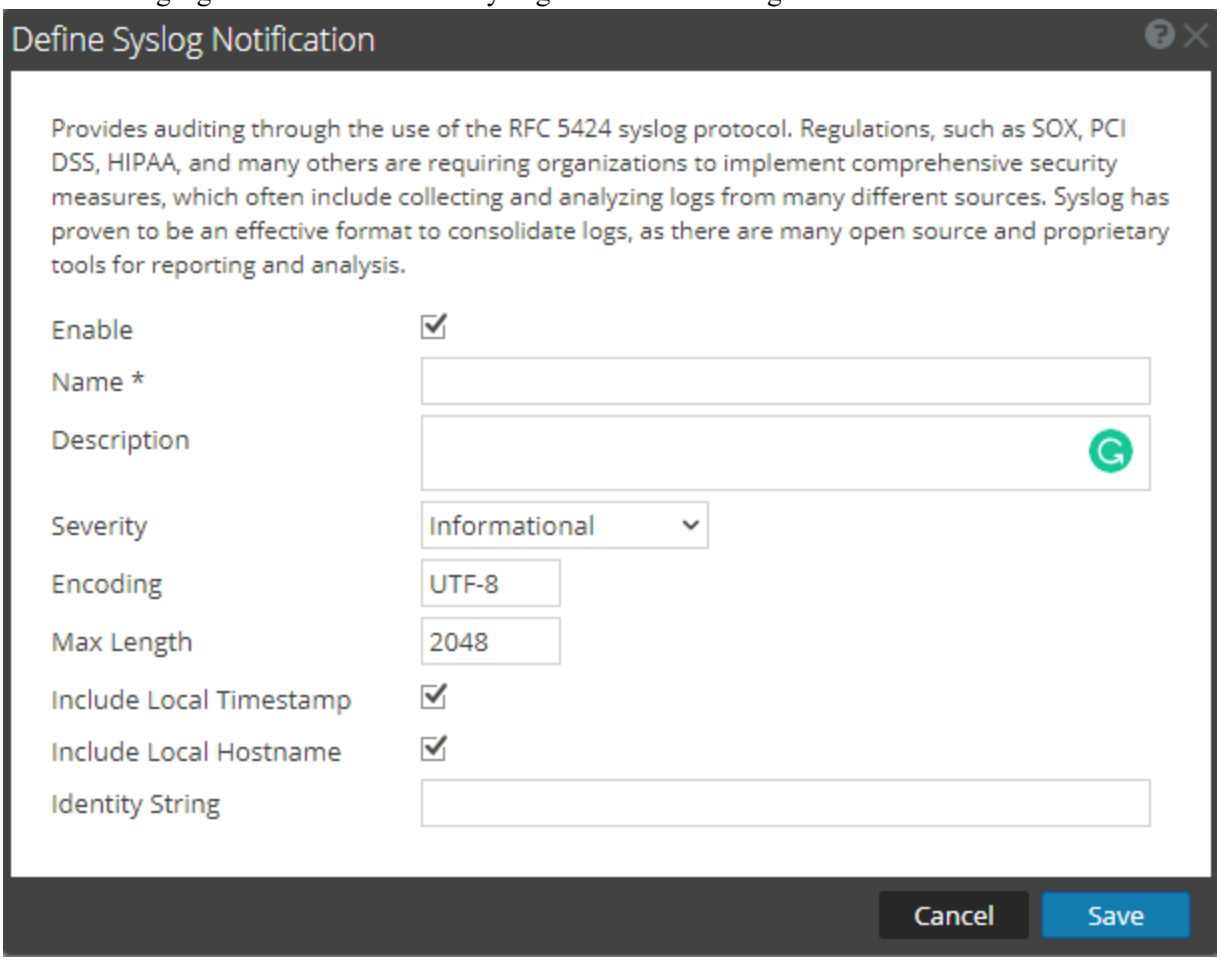
The following table lists the various parameters that you need to define for the email notifications.

Parameter	Description
Enable	Select to enable the notification.
Name	A name to identify or label the notification.
Description	A brief description about the notification.
To Email Addresses	Describes the destination email address to which the alert needs to be sent. **Note:** You can define multiple email addresses.
Subject Template Type	Lists available templates for creating a subject. When you choose a template, the Subject field is automatically filled in with the code for your chosen template. Example, for New Health and Wellness, you must select **New Health & Wellness default email subject**.
Subject	Custom description about the triggered alert. This information is automatically filled in if you choose one of the predefined templates from the Subject Template Type drop-down menu. **Note:** To provide a custom subject, please refer to "Include the Default Email Subject Line" topic in the *System Maintenance Guide*.

SNMP

SNMP notifications enable you to define the SNMP settings to send alert notifications.

The following figure shows the Define SNMP Notification dialog.



The following table lists the various parameters that you need to define for the SNMP notifications.

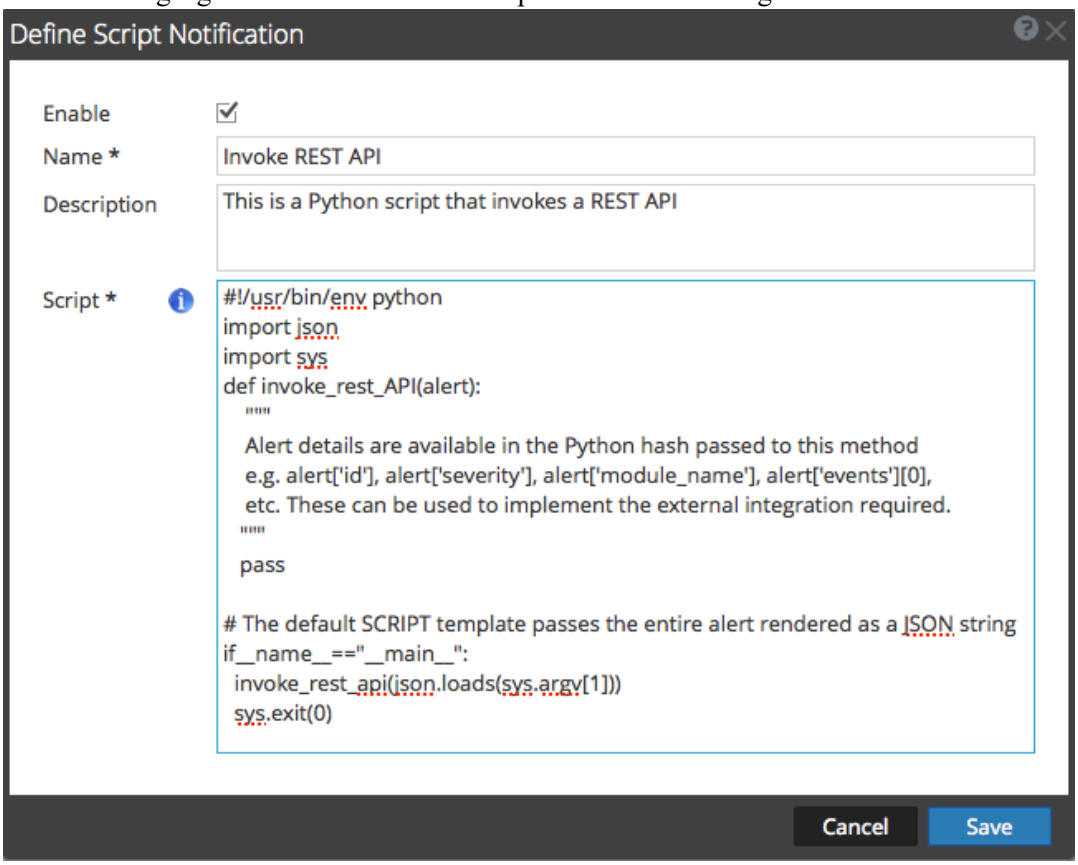
Parameter	Description
Enable	Select to enable the notification.
Name	A name to identify or label the notification.
Description	A brief description about the notification.
Trap OID	The object ID for the SNMP trap on the trap host that receives the event. The default value is **1.3.6.1.4.1.36807.1.20.1**. This value is a hierarchical name that represents the system that generates the trap. 1.3.6.1.4.1 is the common prefix for all enterprises and 36807.1.20.1 identifies NetWitness.
Message OID	The message object identifier for the SNMP trap.
Variables	Additional information that should be included within the trap. It is a variable that is a name value pair.

Syslog

Syslog notifications enable you to define the Syslog settings to send alert notifications.

The following figure shows the Define Syslog Notification dialog.

The following table lists the various parameters that you need to define for the Syslog notifications.



Parameter	Description
Enable	Select to enable the notification.
Name	A name to identify or label the notification.
Description	A brief description about the notification.
Severity	Defines the severity of the alert.
Encoding	Defines the encoding format. In some environments where no regular character sets are used (for example, Japanese characters), this field will help selecting the right encoding of the characters.
Max Length	The maximum length of a Syslog message in bytes. The default value is **2048**. Messages that exceed the maximum length are truncated when the **Truncate overly large syslog messages** checkbox is selected, which is found in Administration > System > Legacy Notifications. Legacy Notifications Configuration Panel provides additional information.

Parameter	Description
Include Local Timestamp	Select to include the local timestamp in messages.
Include Local Hostname	Select to include the local hostname in Syslog messages.
Identity String	An identity string to be prefixed to each Syslog alert. If the string is blank, no identity string is prefixed to the outgoing Syslog alerts. You can use this to identify the alerts from ESA.

Script

Script notifications enable you to define the Script that executes in response to the alert. You can use any script for ESA notifications.

The following figure shows the Define Script Notification dialog.

The following table lists the various parameters that you need to define for the Script notifications.

Parameter	Description
Enable	Select to enable the notification.
Name	A name to identify or label the notification.

Parameter	Description
Description	A brief description about the notification.
Script	Defines the script.

Define Notification Template Dialog

In the Global Notifications panel, you can configure global notification settings for Notification Servers, Notification Outputs, and Notification Templates. On the Templates tab, you configure the templates for various notifications. The notification template defines the format and message fields of the notifications. You can select a default template or you can use the Define Template dialog to configure and edit templates.

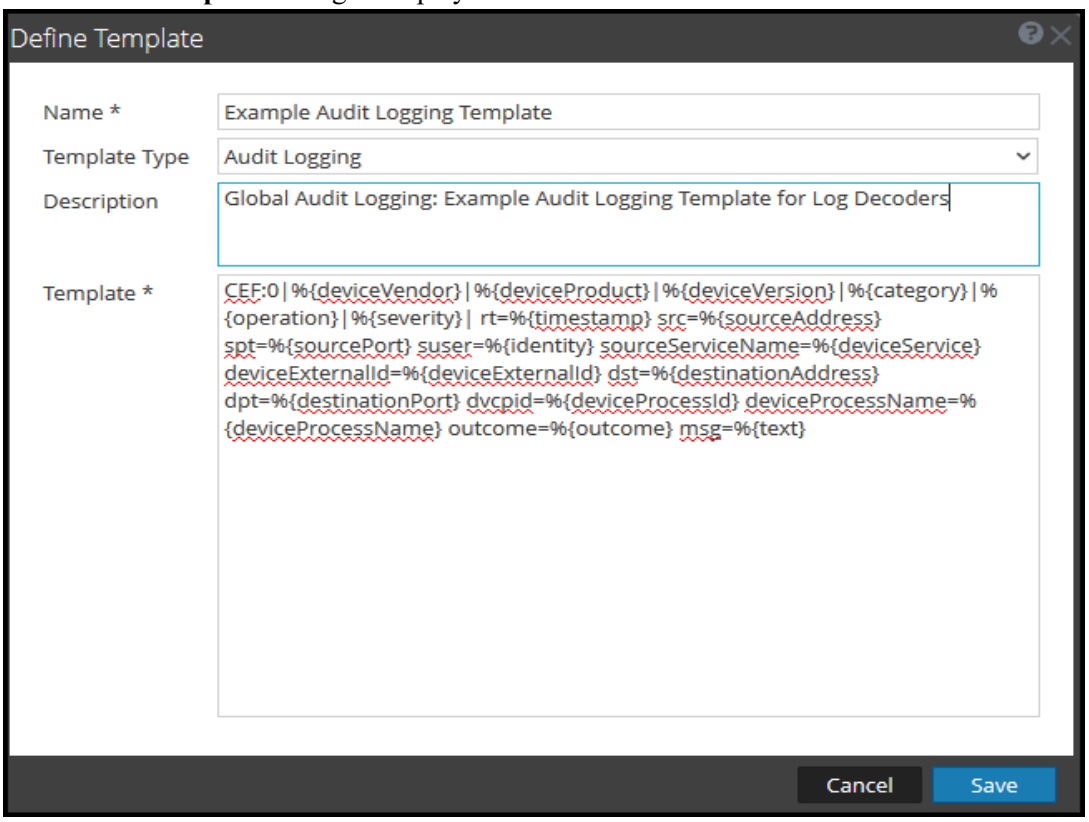
You can select a default template and use it or modify a default template based on your requirement. You can also use one of the following template types and create a template:

- Audit Logging
- Event Stream Analysis
- Event Source Monitoring
- Health Alarms
- New Health & Wellness Alarms.

These notification templates are created in an HTML, FreeMarker (FTL) format, a combination of both HTML and FTL, or Common Event Format (CEF) format:

- Email (SMTP) notification output type is created in both HTML and FTL formats.
- SNMP and Script notification output types are created in FTL format.
- Syslog notification output type is created in CEF format.

You need to have a good understanding of HTML, FTL, and CEF formats to successfully configure your own notification template. Click on the respective links to understand the specific formats.



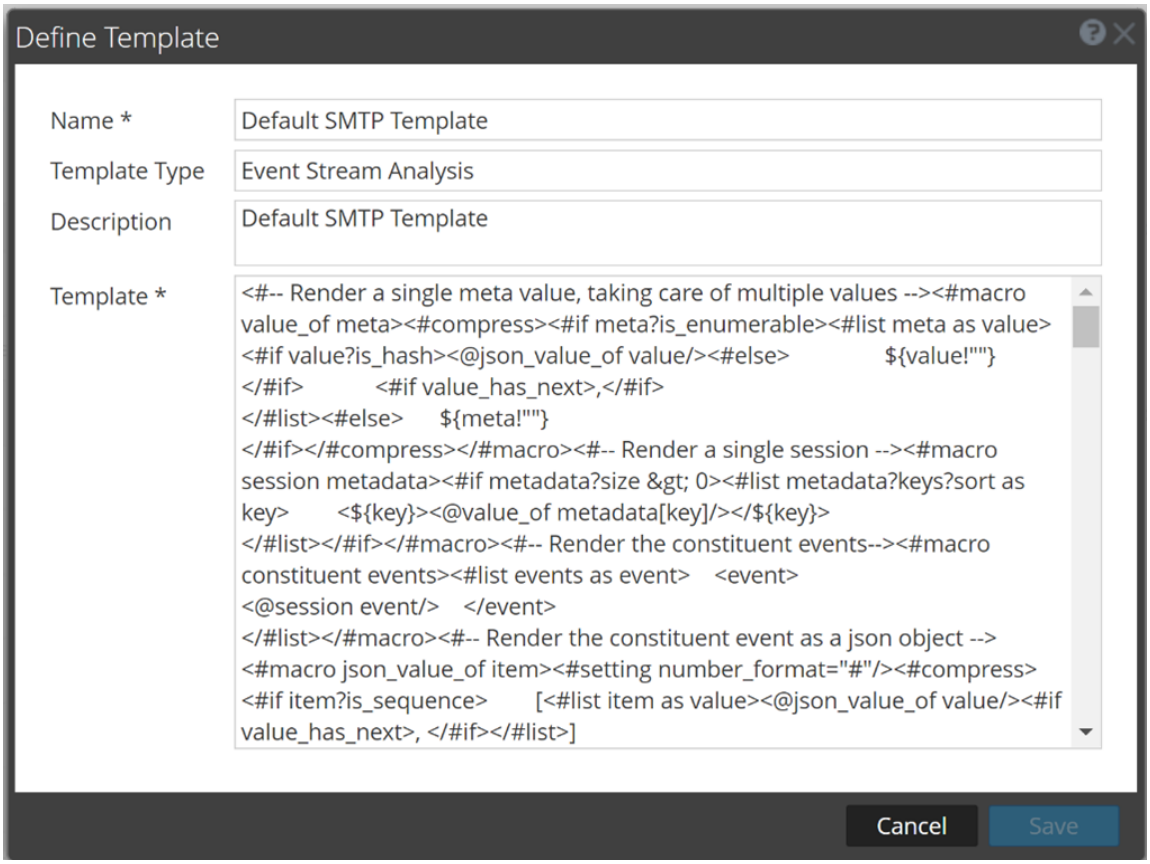
- HTML format, Introduction to HTML.
- FTL format, Overall structure - Apache FreeMarker Manual.
- CEF format, Freemarker Tips & Tricks in NetWitness.

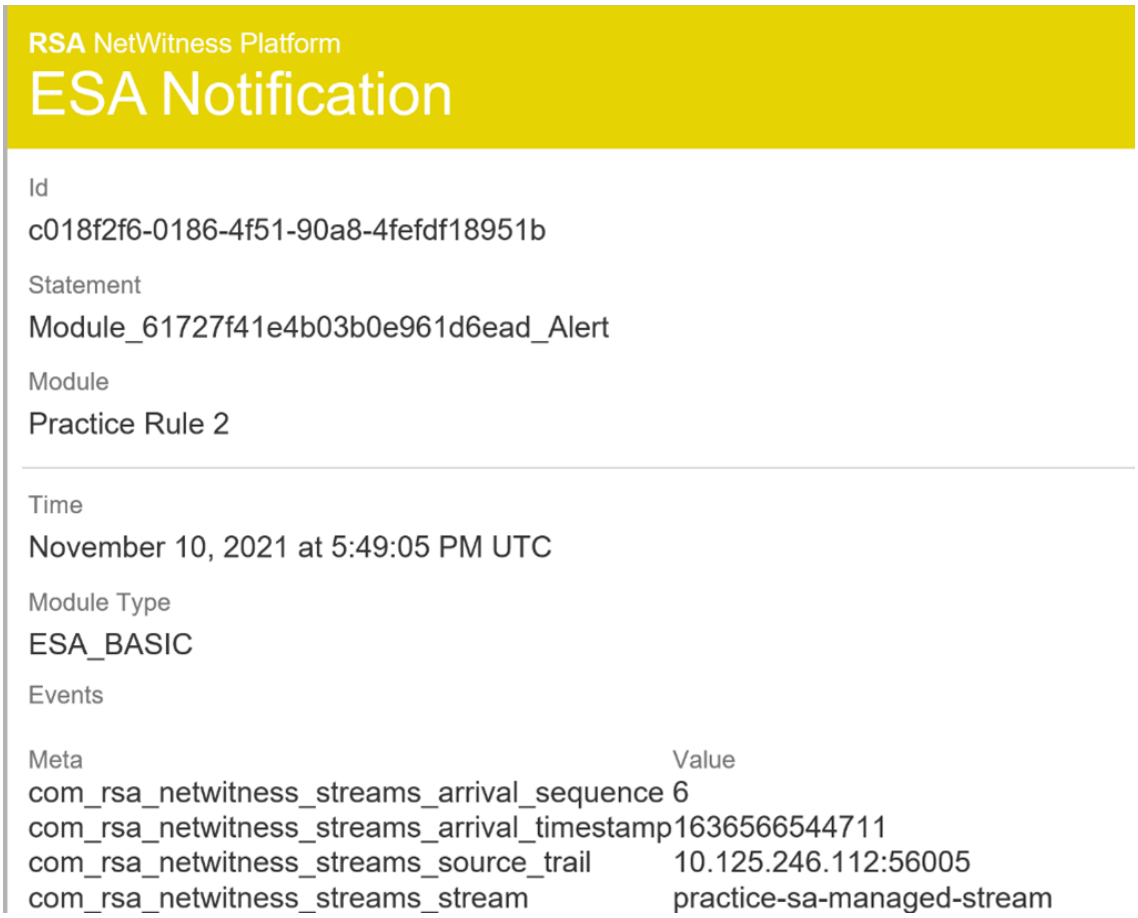
Procedures related to notification templates are described in Configure Templates for Notifications.

To access the Define Template dialog

1. Go to  **(Admin) > System**.
2. In the left navigation panel, select **Global Notifications > Template Tab**.
3. In the **Notifications Configurations** panel, click , or select a configuration and click  to modify.

The **Define Template** dialog is displayed.





The following table describes the features in the Define Template dialog.

Field	Description
Name	Type a unique name for the notification template.
Template Type	Select the type of template that you want to create: • **Audit Logging**: Use this template for Global Audit Logging. • **Event Stream Analysis**: Use this template type for ESA alert notifications. • **Event Source Monitoring**: Use this template type for ESM notifications. • **Health Alarms**: Use this template type for Health and Wellness notifications. • **New Health and Wellness Alarms**: Use this template type for New Health and Wellness notifications.
Description	Add a description for the template. For example, if you create a notification template for Log Decoders to use for Global Audit Logging, you could mention that information in the description.

Field	Description
Template	Specify mandatory **CEF:** prefix when you create a template in CEF format. Define a Template for Global Audit Logging provides instructions on how to define an audit logging template to use for Global Audit Logging. To define a template for Event Stream Analysis (ESA), see Define a Template for ESA Alert Notifications. **Note:** Use Key references available in default notification templates.

Below is an example of a defined SMTP (email) template and output.

Output Tab

In the **Global Notifications** panel, in the **Output** tab ((Admin) > **System** > **Global Notifications** > **Output**), you configure notification outputs. Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, New Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond.

Notification Output configurations define email addresses and subject lines, SNMP trap OID settings, syslog output settings, and script code.

Notifications are the destinations configured for the alert notifications that are sent by ESA service. You can configure the following as destinations using the Output tab:

- Email
- SNMP
- Syslog
- Script

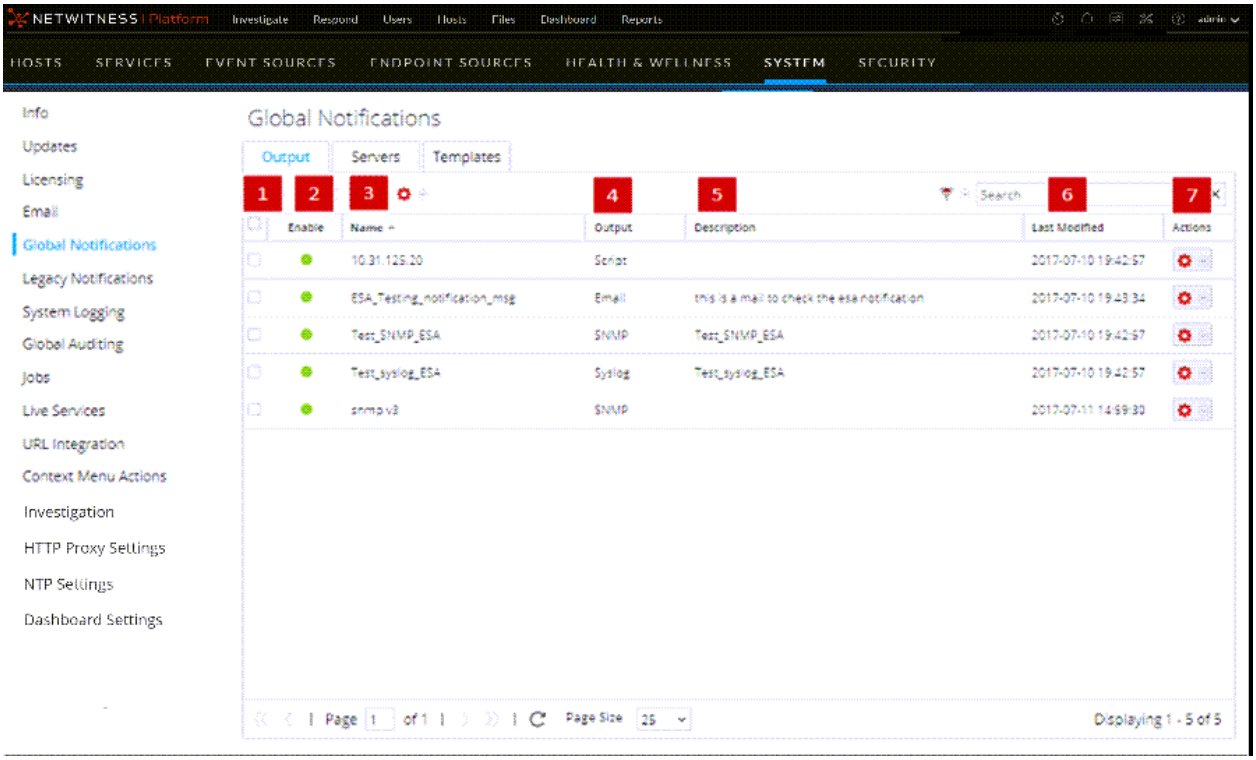
Note: You do not need to configure the Output tab for Global Audit Logging. For detailed steps, see Configure Global Audit Logging.

Workflow

This workflow shows the necessary procedures to configure and verify the output for Global Notifications. You can perform the following:

- Configure the Email settings as notification.
- Configure SNMP settings as notification.
- Configure Syslog settings as notification.
- Configure a Script as notification.

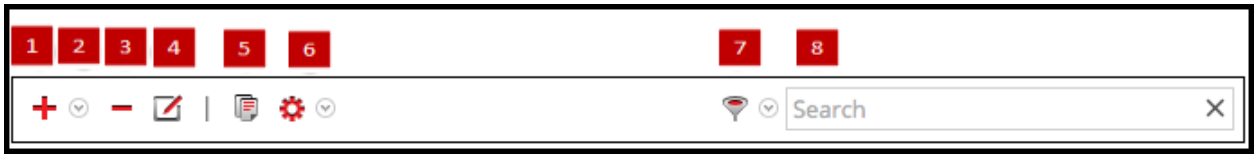
What do you want to do?



Role	I want to ...	Show me how
Administrator	Define notification outputs.	Configure Notification Outputs

Related Topics

- Notification Outputs Overview
- Configure Email as a Notification
- Configure Script as a Notification
- Configure SNMP as a Notification
- Configure Syslog as a Notification



Quick Look

The following example illustrates Global Notification Outputs configuration.

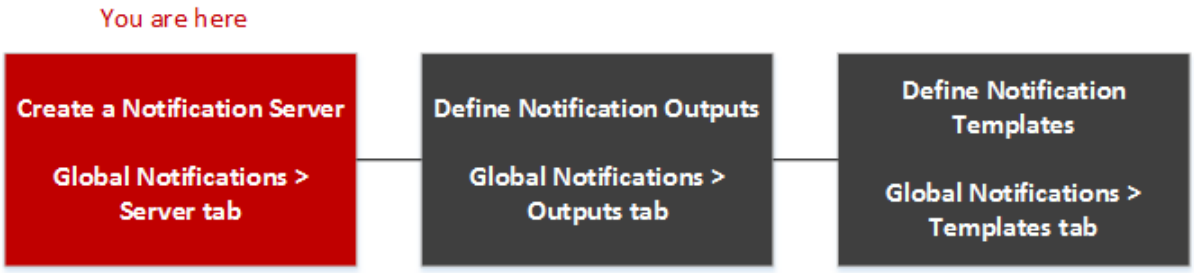
1	Selects a row for an action in the toolbar. Selecting the check box in the column title selects or deselects all rows in the grid.
2	Indicates whether the configuration is enabled. A solid colored green circle indicates that a configuration is enabled. A blank white circle indicates that a configuration is not enabled.
3	Identifies or labels the configuration.
4	Identifies the configuration output. The outputs are Email, SNMP, Syslog, and Script.
5	Describes the configuration.
6	Shows the date and time of the last configuration change.
7	Provides an Actions menu for the selected configuration with actions that can be taken on the configuration. The Actions menu enables you to delete, edit, duplicate, and export the configuration.

The Global Notifications panel toolbar is at the top of the Output tag and provides the following options:

1. Adds a notification output
2. Configures Email, SNMP, Syslog, and Script notification settings.
3. Removes a selected notification configuration. You cannot delete notification servers and notification types that are associated with global audit log configurations. If you attempt to delete a notification output (notification) being used by alerts, you will receive a warning confirmation message that the alerts using the notification will not function properly. The message shows the number of alerts in use. You can also delete a configuration by selecting a configuration and then in the Actions column, selecting > Delete.
4. Edits a selected notification configuration. You can also edit a configuration by selecting a configuration and then in the Actions column, selecting > **Edit**.
5. Duplicates a selected notification configuration. You can also duplicate a configuration by selecting a configuration and then in the Actions column, selecting > **Duplicate**.
6. Displays the following options:
   - **Import**: Imports a notification server, type, or template. For example, on the Servers tab, you can import a notification server configuration.
   - **Export All**: Exports all of the configurations. For example, if you are on the Servers tab, you can export all of the notification server configurations.
   - **Export**: Exports a selected configuration. You can also export a configuration by selecting a configuration and then in the Actions column, selecting > **Export**.
7. Filters by Email, SNMP, Syslog, or Script.
8. Searches configurations in the grid.

Servers Tab

Servers Tab describes the components of the **Global Notifications** > **Servers** tab. This tab enables you to configure notification servers. Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond.



Configure **Notification Servers** in the Servers tab. On the Servers tab, add the servers from which you want to receive notifications from the system. For Global Audit Logging, define Log Decoders as Syslog Notification Servers.

Event Stream Analysis can send notifications to users through email, SNMP, or Syslog when an alert is triggered on the ESA service. These alert notification senders are called Notification Servers. You can configure multiple notification settings and use them while defining an ESA rule, for example, you can configure multiple mail servers or Syslog servers and use the settings while defining an ESA rule.

Workflow

The workflow shows the necessary procedures to configure and verify the Servers for Global Notifications. You can perform the following:

- Configure the Email settings as a notification server.
- Configure SNMP settings as a notification server.
- Configure Syslog settings as a notification server.
- Configure a Script as a notification server.

What do you want to do?

Role	I want to ...	Show me how

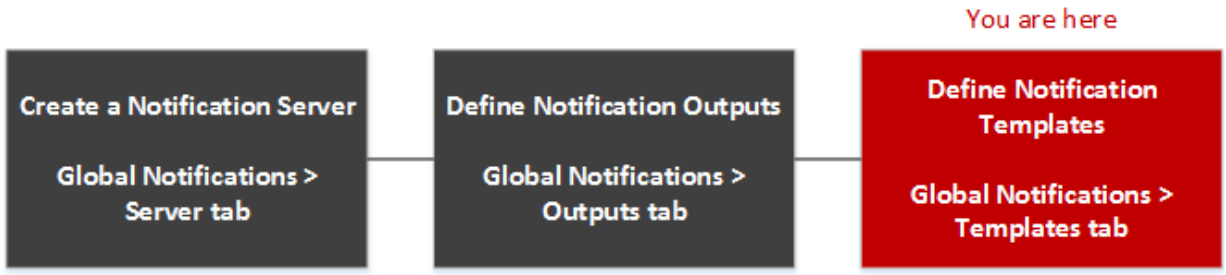
The following example illustrates Global Notification Servers configuration.

1	Displays the Server Tab Panel.
2	Selects a row for an action in the toolbar. Selecting the checkbox in the column title selects or deselects all rows in the grid.
3	Indicates whether the configuration is enabled. A solid colored green circle indicates that a configuration is enabled. A blank white circle indicates that a configuration is not enabled.
4	Identifies or labels the configuration.
5	Identifies the configuration output. The outputs are Email, SNMP, Syslog, and Script.
6	Describes the configuration.
7	Shows the date and time of the last configuration change.
8	Provides an Actions menu for the selected configuration with actions that can be taken on the configuration. The Actions menu enables you to delete, edit, duplicate, and export the configuration.

The Global Notifications panel toolbar is at the top of the Output tag and provides the following options:

1	Adds a notification output
2	Configures Email, SNMP, Syslog, and Script notification settings.
3	Removes a selected notification configuration. You cannot delete notification servers and notification types that are associated with global audit log configurations. If you attempt to delete a notification output (notification) being used by alerts, you will receive a warning confirmation message that the alerts using the notification will not function properly. The message shows the number of alerts in use. You can also delete a configuration by selecting a configuration and then in the Actions column, selecting  > Delete.
4	Edits a selected notification configuration. You can also edit a configuration by selecting a configuration and then in the Actions column, selecting  > **Edit**.
5	Duplicates a selected notification configuration. You can also duplicate a configuration by selecting a configuration and then in the Actions column, selecting  > **Duplicate**.
6	Displays the following options: • **Import**: Imports a notification server, type, or template. For example, on the Servers tab, you can import a notification server configuration. • **Export All**: Exports all of the configurations. For example, if you are on the Servers tab, you can export all of the notification server configurations. • **Export**: Exports a selected configuration. You can also export a configuration by selecting a configuration and then in the Actions column, selecting  > **Export**.
7	Filters by Email, SNMP, Syslog, or Script.
8	Searches configurations in the grid.



Templates Tab

The Notification Templates tab enables to configure notification templates. Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, New Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond. Notification templates define the format and message fields of the notifications.

Select a default template or configure templates for Email, SNMP, Syslog, and Script, depending on the template type. For Event Stream Analysis (ESA) templates, configure Email, SNMP, Syslog, and Script. For Audit Logging templates, configure Syslog.

Event Stream Analysis templates are not specific to any type of alert notifications, that is, the same template can be used for all types of notifications.

Import and Export a Global Notifications Template

Quick look

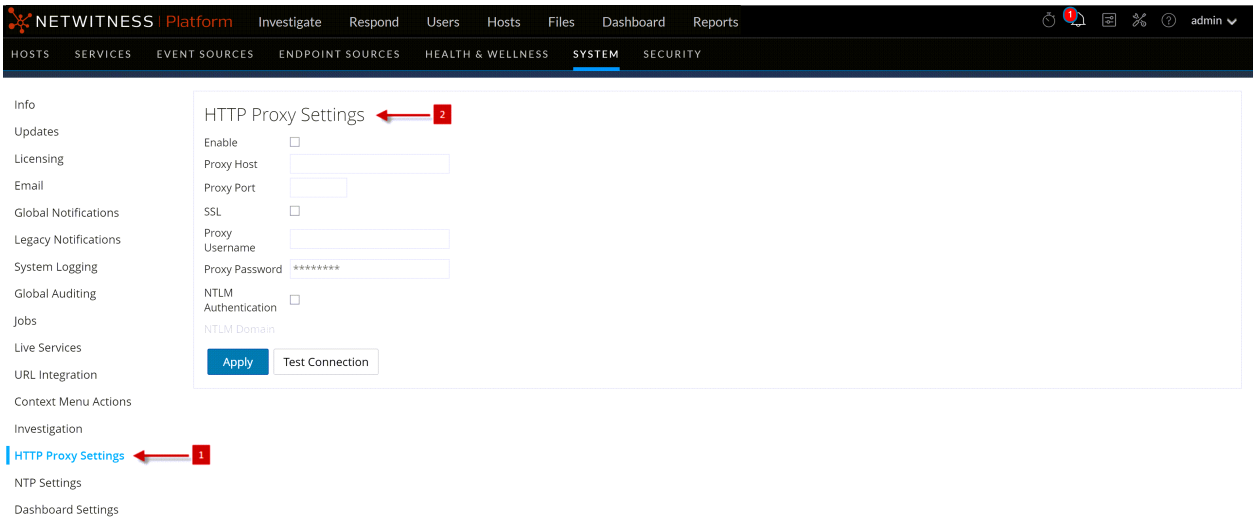
The following example illustrates Global Notification Templates Tab.

1. Selects a row for an action in the toolbar. Selecting the check box in the column title selects or deselects all rows in the grid.
2. Identifies or labels the templates
3. Choose a Template Type
4. Describes the templates
5. Provides an Actions menu for the selected templates with actions that can be taken on the Templates. The Actions menu enables you to delete, edit, duplicate, and export the configuration.

HTTP Proxy Settings Panel

HTTP Proxy Settings Panel introduces the proxy support features of the (Admin) > **System** > **HTTP Proxy Settings** panel.

Note: Proxy support is only for HTTP and HTTPS proxies and not SOCKS5.



The HTTP Proxy Settings panel provides a user interface for configuring a proxy for use across NetWitness modules and services. The Proxy Settings set up a proxy to be used wherever a proxy is needed in NetWitness. The settings in this panel override any proxy settings configured for an individual service such as Malware Analysis or Live.

Related topics

"Configure Proxy for NetWitness Platform" in Additional Procedures

Quick Look

The following example illustrates an HTTP Proxy Settings Panel.

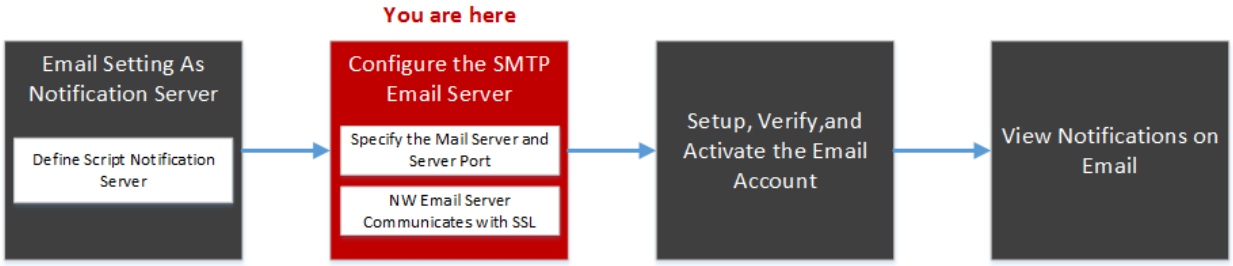
1 Displays the HTTP Proxy Settings Panel.
2 Allows the user to configure HTTP Proxy Sittings.

This table describes the features in the HTTP Proxy Settings section.

Feature	Description
Enable	Enable the system proxy configuration for use in NetWitness.
Proxy Host	The hostname for the proxy host.

Feature	Description
Proxy Port	The port used for communication on the proxy host.
SSL	(Optional) Enable communication using SSL.
Proxy Username	(Optional) The user name used to log on to the proxy host if the proxy requires authentication.
Proxy Password	(Optional) The user password used to log on to the proxy host if the proxy requires authentication.
NTLM Authentication	Use NT LAN Manager authentication and session security protocols.
NTLM Domain	The name of NTLM domain.
Apply	Applies any changes made, and they become effective immediately.

Email Configuration Panel



The Email Configuration Panel provides information about email configuration settings in the (Admin) > **System** > **Email Configuration** panel. NetWitness Platform sends notifications to users with email about various system events. To be able to configure these email notifications, first configure the SMTP email server (See Configure Email Servers and Notification Accounts).

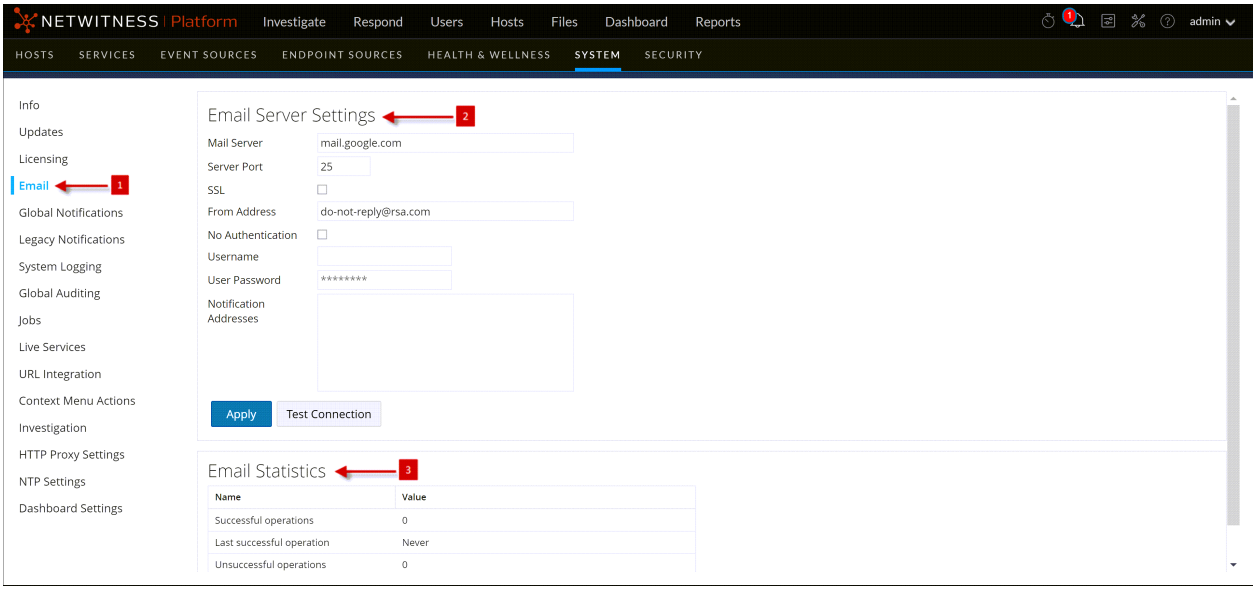
The Email Configuration panel provides a way to:

- Configure the email server.
- Set up an email account to receive notifications.
- View statistics on email operations.

Workflow

This workflow shows the necessary procedures to configure and verify Email Panel.

What do you want to do?



Role	I want to ...	Show me how
Administrator	Configure the SMTP Email Server	Configure Email Servers and Notification Accounts
Administrator	Email Setting as Notification Server	Configure the Email Settings as Notification Server
Administrator	Setup, Verify and Activate the Email Account	Receive Notification on Email

Related Topics

- Configure the Email Settings as Notification Server
- Configure Email as a Notification
- Configure Email Servers and Notification Accounts

Quick Look

The following example illustrates an Email configuration. The configuration defines how events are notified on Email.

1 Displays the Email Configuration Panel.
2 Allows the user to configure Email Server sittings.
3 Provides feedback on Email operations.

The **Email Configuration** panel has two sections: **Email Server Settings** and **Email Statistics**.

Email Server Settings

In the **Email Server Settings** section, you configure the following parameters.

Feature	Description
Mail server	The email server name. The default value is **mail.google.com**.
Server port	The server port used to send and receive emails. The default value is **25**.
Use SSL	The preference for SSL use in communications between the email server and NetWitness. The default value is to not use SSL (unchecked).
From address	The address that appears in all emails from NetWitness. The default from address for emails is **do-not-reply@netwitness.com**.
Username	The username to access the email server. The default value is **blank**.
User password	The user password to access the email server. The default value is **blank**.

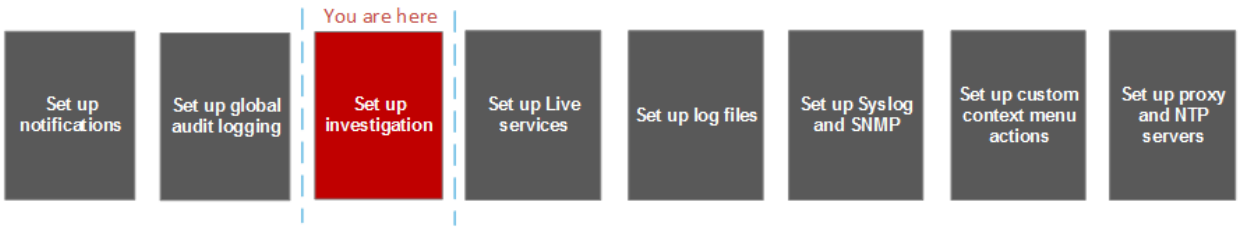
Feature	Description
Test connection	Tests the connection to the email server.
Apply	Applies the email configuration to this instance of NetWitness.

Email Statistics

The Email Statistics section provides feedback on the number of successful and failed email operations as well as the time of the last successful and unsuccessful email operation. For each statistic the name of the statistic and the value is displayed.

Investigation Configuration Panel

The (Admin) > **System** > Investigation Configuration panel provides the user interface for administrators to configure the system-wide settings that NetWitness Investigate uses when analyzing data and reconstructing an event.



The settings allow an administrator to manage application performance for Investigate. As analysts analyze and reconstruct sessions that they are investigating, performance can be affected by operations that involve loading, searching, visualizing, and reconstructing large amounts of data.

Note: Analysts can also set individual preferences for Investigate in the Profiles view and in the Navigate, Legacy Events, and Events views.

To access the Investigation Configuration panel:

1. Go to **(Admin)** > **System.**
2. In the options panel, select **Investigation**.

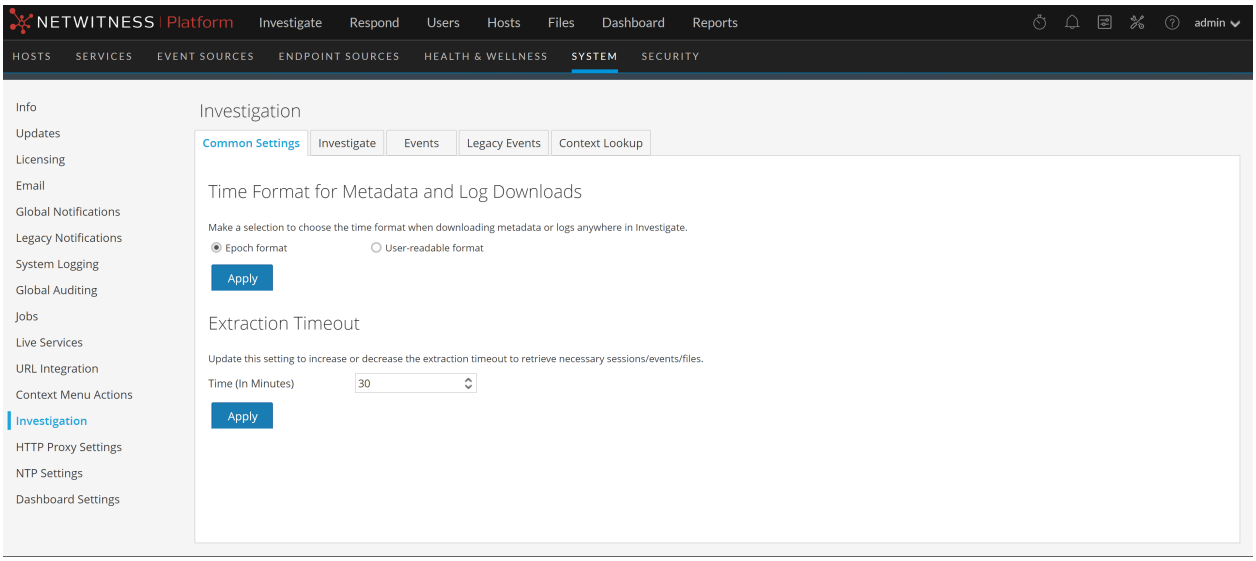
Workflow

What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure Navigate, Legacy Events, and Events view settings	Configure Investigation Settings
Administrator	Map Context Hub Meta Types	Configure Investigation Settings
Administrator	Clear reconstruction cache for services	Configure Investigation Settings

Related Topics

- Standard Procedures



Quick Look

The Investigation Configuration panel has four tabs: Common Settings (Version 11.5 and later), Navigate, Events, Legacy Events, and Context Lookup.

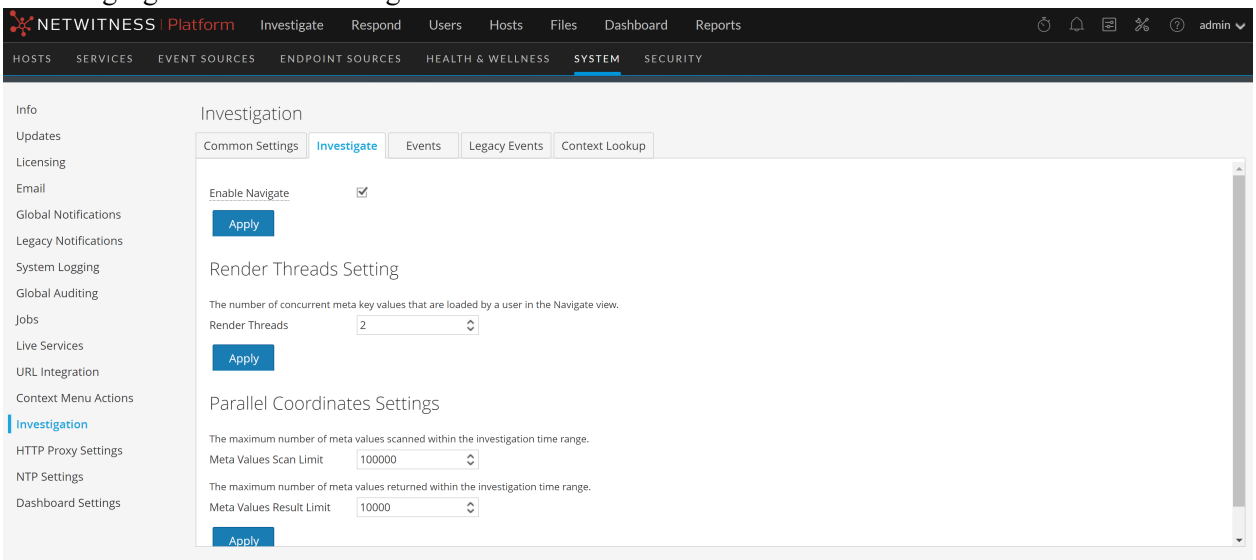
Though most fields in the tabs have a selection list with specific increments through the range of possible values, you can enter a value within the allowed range manually. An invalid entry is signaled by the field highlighted in red. When valid values are selected, clicking Apply in a given section puts the changes into effect immediately.

Common Settings Tab

The Common Settings tab applies to all Investigate views.

The following table describes the options in this tab.

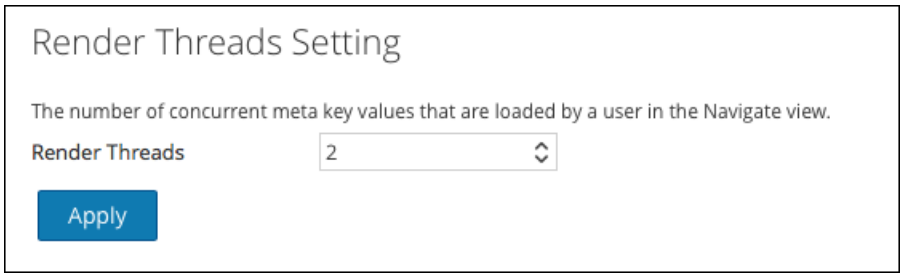
Parameter	Description
Time Format for Metadata and Log Downloads	
Epoch format	Use the Epoch format in downloads from Investigate (default value). These are Epoch representations of `2020-04-13 09:34AM`: • 12-hour representation = `61547519856000` • 24-hour representation = `61547519976000`



Parameter	Description

User-readable format	Use a user-readable time in downloads from Investigate. The downloads use a more understandable format that combines the user preference time zone, date format, and time format into an easily understood representation, which follows the industry standard ISO 8601 representation when possible.
	Examples of 12-Hour Format
	`04-13-2020T09:17:36AM-07:00`
	`13-04-2020T09:17:36AM-07:00`
	`2020-13-13T09:17:36AM-07:00`
	Examples of 24-Hour Format
	`04-13-2020T09:19:14-07:00`
	`13-04-2020T09:19:14-07:00`
	`2020-04-13T09:19:14-07:00`

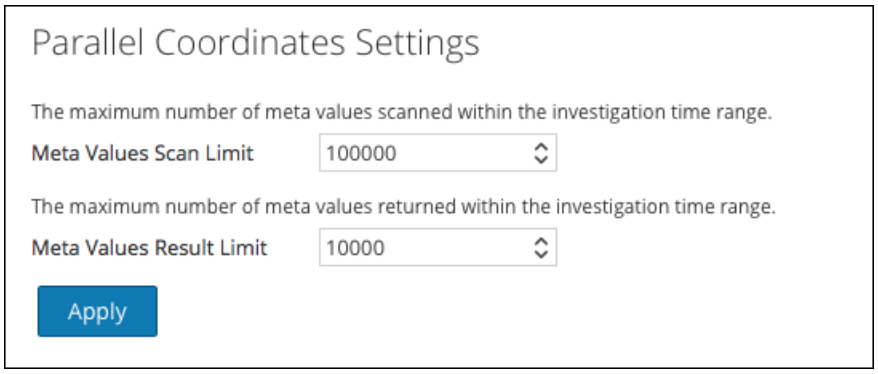
Extraction Timeout	
Time (In Minutes)	Use this to set the time limit before the session expires when downloading the logs from the service.



Investigate Tab

The Investigate tab has two sections: Render Threads Setting and Parallel Coordinates Settings. The following figure shows the Navigate tab.

Render Threads Setting

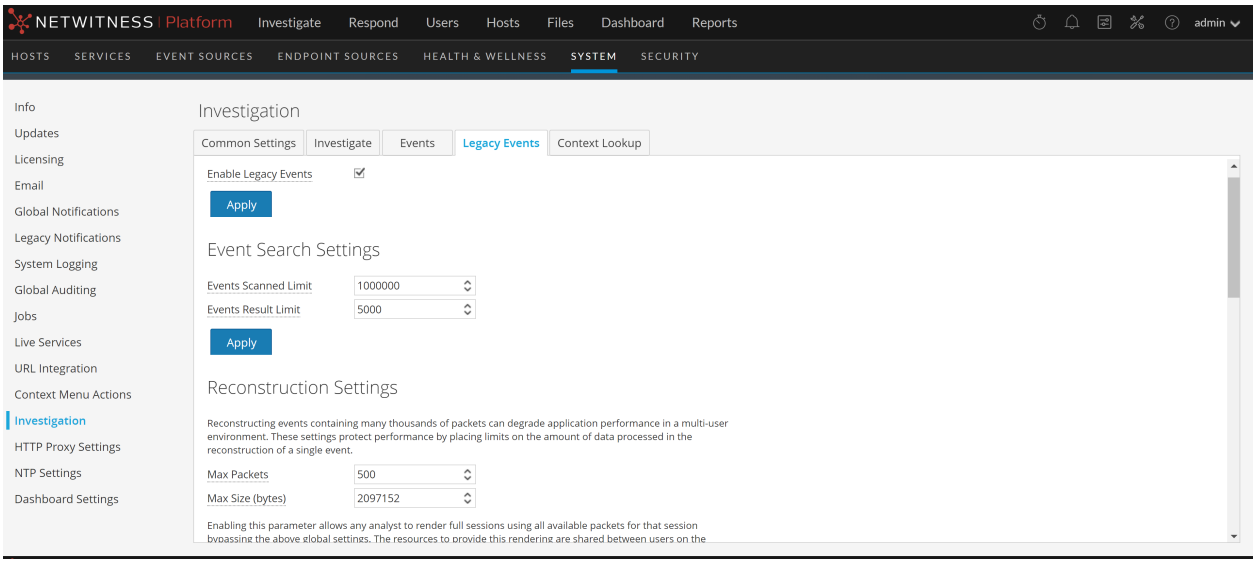


The Render Threads Setting is a selectable value between 1 and 20, which defines the number of concurrent (Values) loads in the Navigate view. The default value is 1.

Parallel Coordinates Settings

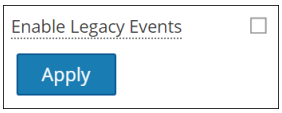
The Parallel Coordinates Settings apply to the Parallel Coordinates visualization in the Navigate view. There is a fixed limit on the amount of data that can be rendered as a parallel coordinates chart. In NetWitness the administrator can configure parallel coordinates limits here.

Note: For better performance, recommended settings are **Meta Values Scan Limit: 100000** and **Meta Values Result Limit: 1000-10000**.



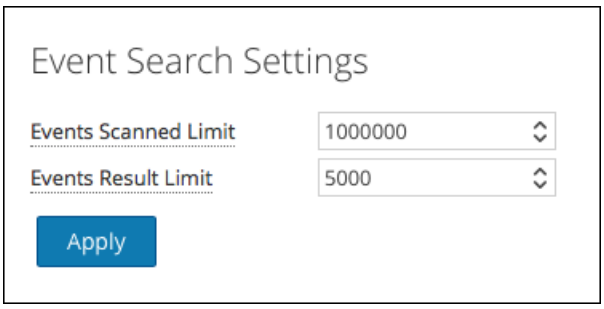
The following table describes the Parallel Coordinates Settings.

Parameter	Description
Meta Values Scan Limit	The maximum number of meta values scanned within the time range the analyst has selected in the Navigate view. Possible values are in the range of 1,000 to 10,000,000. The default value is 100,000.
Meta Values Result Limit	The maximum number of meta values returned within the time range the analyst has selected in the Navigate view. Possible values are in the range of 100 to 1,000,000,000. The default value is 10,000.



Legacy Events Tab

The Events tab provides configurable settings that affect the investigation of events. This tab has five sections: Enable Legacy Events, Event Search Settings, Reconstruction Settings, Web View Reconstruction Settings, and Reconstruction Cache Settings. The following figure shows the Events tab.

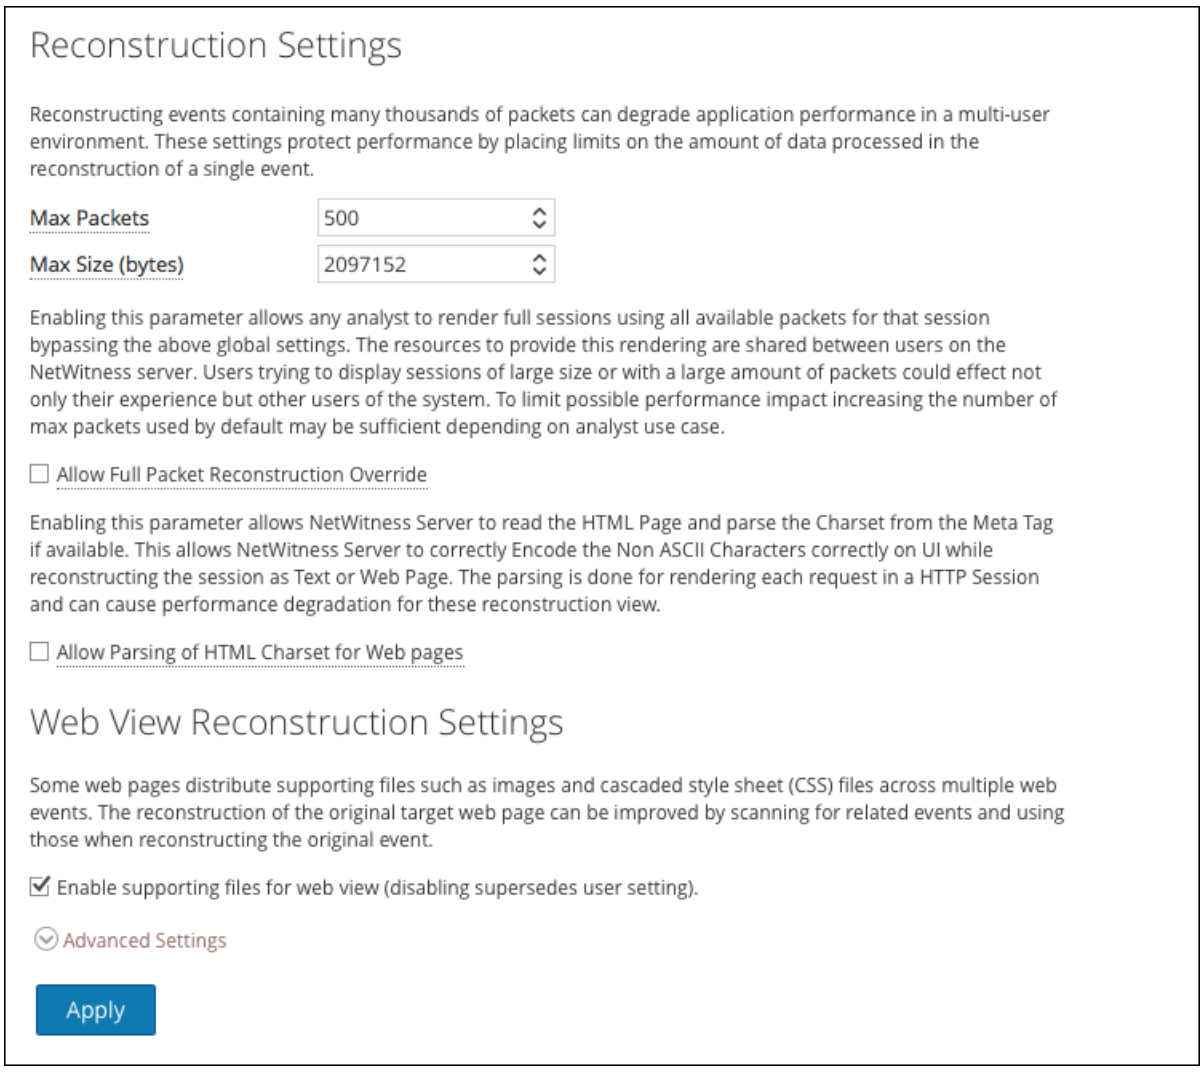


Enable Legacy Events

The Enable Legacy Events checkbox helps to enable and view the legacy events tab and view the classic events page on the UI. By default, this option is disabled.

Event Search Settings

The Event Search Settings help to limit the number of events scanned when searching in the Events view.



The following table describes the Event Search Settings.

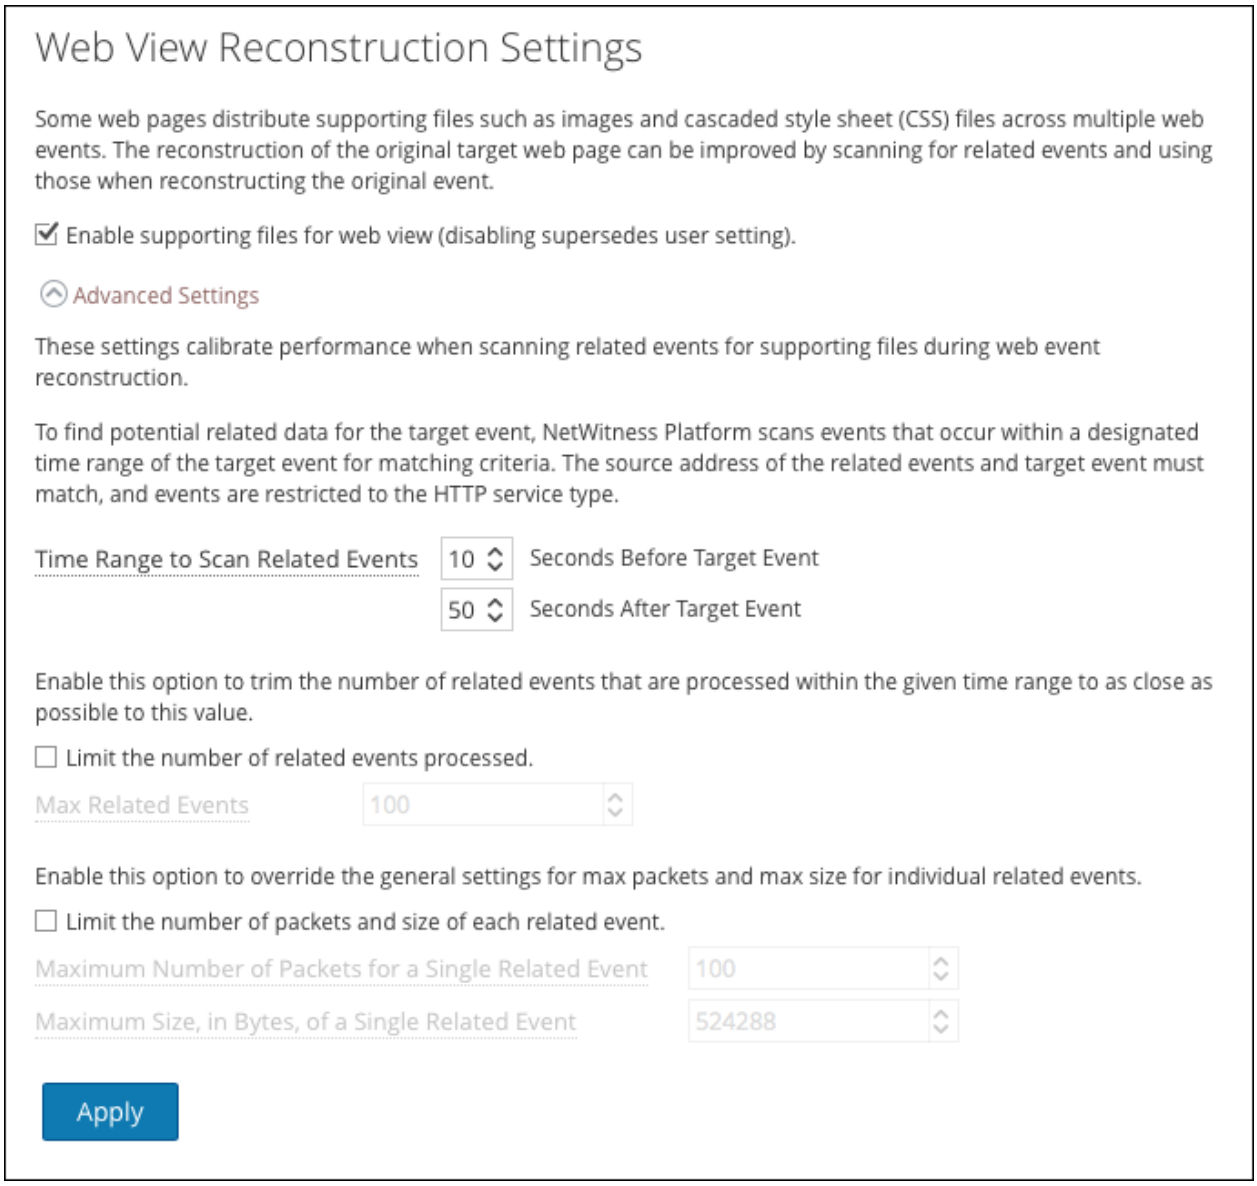
Parameter	Description
Events Scanned Limit	The maximum number of events to scan when searching in the Events view. The actual number of events scanned may be slightly greater than the limit set here.
Events Result Limit	The maximum number of results to return when searching in the Events view. The actual number of results returned may be slightly greater than the limit here.

Reconstruction Settings

As analysts reconstruct sessions that they are investigating, some events can be very large and contain many thousands of source packets. Reconstructing these sessions, especially in a multi-user environment, can degrade application performance. The Reconstruction Settings allow an administrator to limit the number of packets and the size of a single event during reconstruction.

Note: An override to the Reconstruction Settings section is configurable for web views (under Web View Reconstruction Settings).

The following table describes the Reconstruction Settings features.



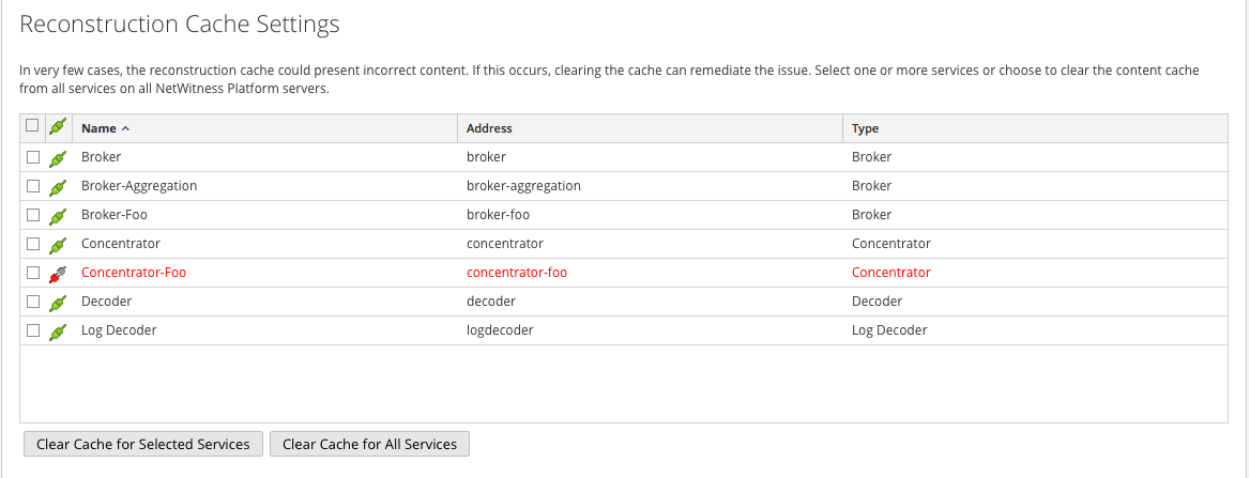
Parameter	Description
Maximum number of packets for a single event	This setting protects performance by placing a limit on the number of packets processed for a single event reconstruction. Possible values are in the range from 100 to 10,000 packets, using manual entry or increments of 100 from the selection list. The default value is 100 packets.
Maximum size, in bytes of a single event	This setting protects performance by placing a limit on the maximum size, in bytes, of a single event reconstruction. Possible values are in the range from 102,400 to 104,857,600 bytes, using manual entry or increments of 10,240 from the selection list. The default value is 2,097,152 bytes.
Allow Full Packet Reconstruction Override	When this checkbox is selected, the analysts is provided with a Use More Packets button in the Reconstruction Panel. This enables the NW Server to regenerate events using all the packets available in the Event.
Allow Parsing of HTML Charset for Web pages	This option allows the NetWitness Server to identify the web page encoding defined in the HTML meta tag instead of the HTTP header. The default setting is disabled.

Web View Reconstruction Settings

The Web View Reconstruction Settings allow an administrator to configure settings that improve the reconstruction of a web view by scanning and reconstructing related events that contain the same supporting files. When NetWitness is reconstructing a web view that spans multiple events, it is possible to improve the reconstruction of the target event by scanning and reconstructing related events that contain the same supporting files, such as images and cascaded style sheet (CSS) files.

- The only related events scanned are HTTP service type events with the same source address as the target event, and a time stamp within a specified time range before and after the target event.
- The maximum number of related events to scan is configurable.

Clicking on the Advanced Settings option displays all configurable settings in this section.



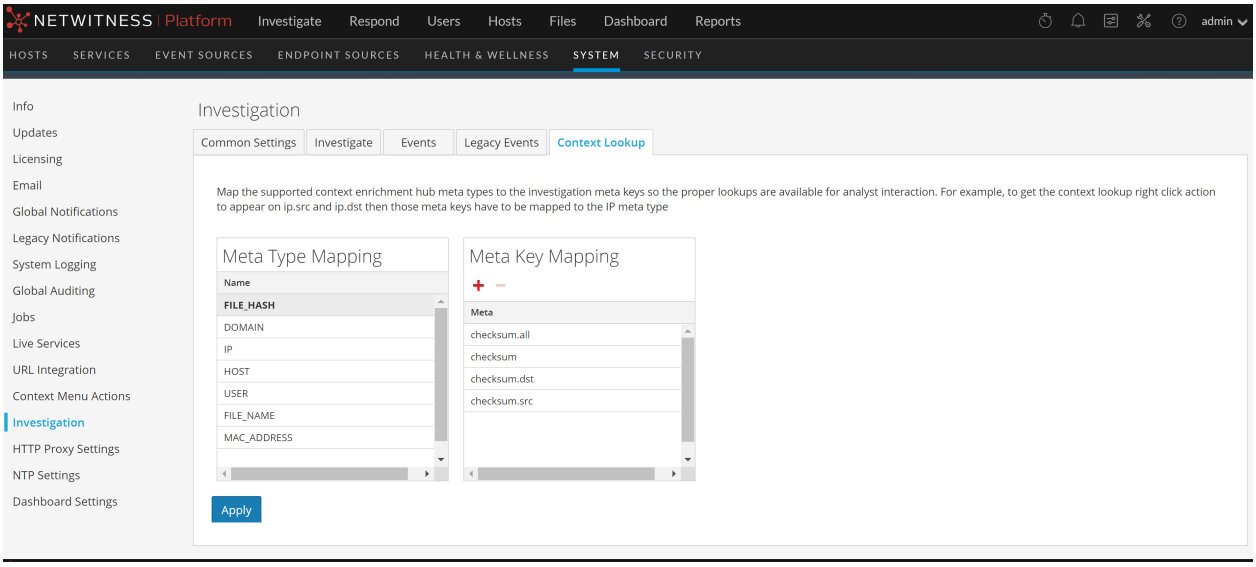
The following table describes the Web View Reconstruction Settings.

Parameter	Description
Enable supporting files for web view	This option determines how web views that have related data in other sessions are reconstructed. The default setting is enabled. When enabled, supporting files from related events can be used in the reconstruction of web views. Additional settings for calibrating the performance are enabled in this section, and Analysts have the option to enable CSS use in reconstructions. When disabled, supporting files from related events are not used and the setting for analysts to enable CSS use in reconstructions is disabled.

Parameter	Description
Time Range to Scan Related Events	Available when **Enable supporting files for web view** is checked. Configures the time range within which NetWitness scans related events that are of the service type HTTP and have the same source address as the target event. This is a value between 0 and 60. • Seconds Before Target Event • Seconds After Target Event
Limit the number of related events processed	Allows configuration of the maximum number of related events that NetWitness scans within the specified time range to discover supporting files for the target event. By default, this is disabled. When enabled, the Maximum Related Events field becomes active.
Max Related Events	When **Limit the number of events processed** is enabled, this field specifies the maximum number of related events that NetWitness scans within the specified time range to discover supporting files for the target event. This is a selectable value between 10 and 1,000, using an increment of 100. The default value is 100.
Limit the number of packets and size of each related event	Overrides the general settings for the maximum number of packets and maximum size (in bytes) for individual related events.
Maximum Number of Packets for a Single Related Event	Possible values are in the range from 100 to 10,000 packets, using increments of 100 from the selection list. The default value is 100 packets.
Maximum Size, in Bytes, of a Single Related Event	Possible values are in the range from 102,400 to 104,857,600 bytes, using increments of 10,240 from the selection list. The default value is 524,288 bytes.

Reconstruction Cache Settings

In some cases, the reconstruction cache can present incorrect content; for this reason NetWitness removes reconstructions that are older than a day from the cache. The cache is cleaned every day at midnight. Between the daily cache cleanings, certain actions may result in stale cache being used for a reconstruction, and if the need arises, administrators can manually clear cache for one or more services that are connected to the current NetWitness Server.



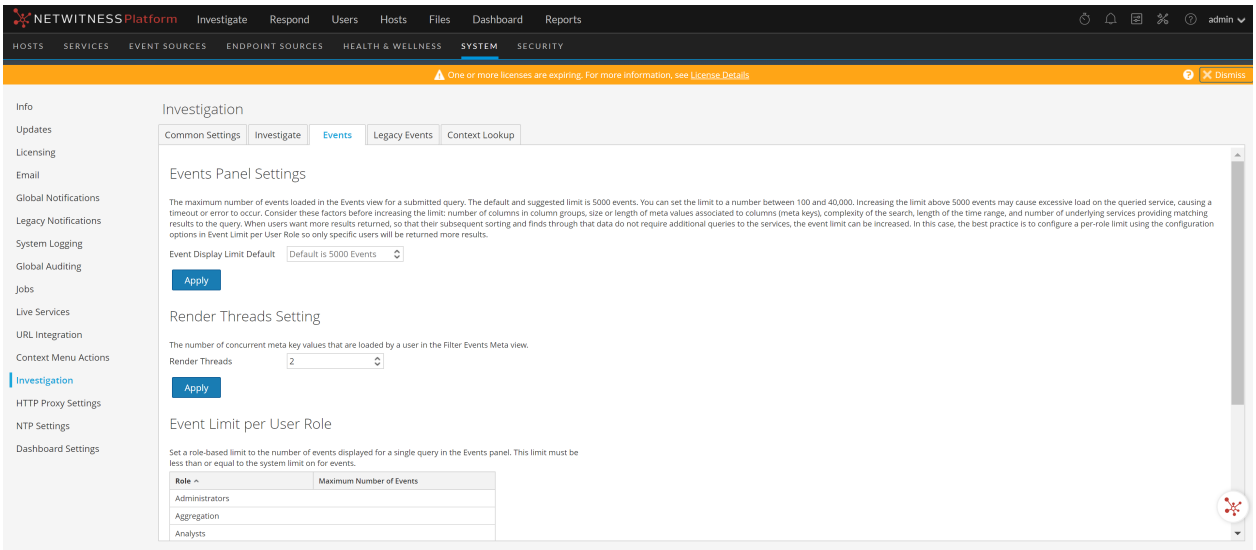
The following table describes the Reconstruction Cache Settings features.

Feature	Description
Selection box	Selection box in individual rows and in the title bar allow selection of one or more, or all services that need to have cache cleared manually.
Clear Cache for Selected Services	Clears the reconstruction cache for each selected service.
Clear Cache for All Services	Clears the reconstruction cache for all services.

Context Lookup Tab

Procedures associated with this panel are provided in "Manage Meta Type and Meta Key Mapping" in the *Context Hub Configuration Guide*. The following figure shows the Context Lookup tab.

The Context Lookup tab enables the administrator to configure the Investigate meta keys and meta type mapping. The administrator can add or remove meta keys found in Investigate to the list of meta types supported by Context Hub service. NetWitness Respond and Investigate use these default mappings for context lookup. For information about adding meta keys, see "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*.



Caution: For the Context Lookup to work correctly in the Respond and Investigate views, this is the best practice: When mapping meta keys in the (Admin) > SYSTEM > Investigation > Context Lookup tab, add only meta keys to the Meta Key Mappings. Do not add fields in the MongoDB. For example, `ip.address` is a meta key and `ip_address` is not a meta key (it is a field in the MongoDB).

The following table describes the features of the Context Lookup tab.

Feature	Description
	Adds a meta key to the selected meta type supported by Context Hub.
	Deletes the meta key from the selected meta type.
Apply	Saves the changes made to the Context Lookup tab.

Events Tab

The following figure shows the Event tab.

The Events tab provides configurable settings that affect the number of events displayed in the Events panel. This tab has three sections: Events Panel Settings, Render Threads Setting, and Event Limit per User Role.

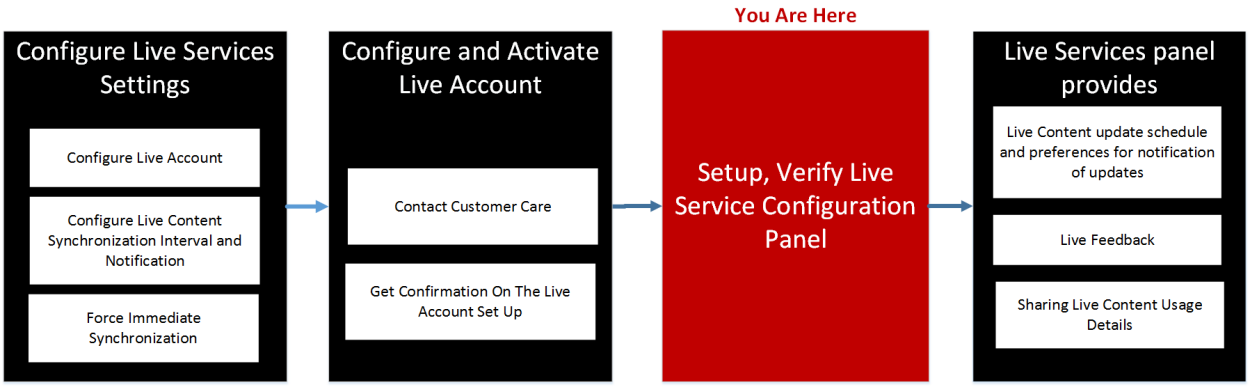
Feature	Description

Feature	Description
Event Display Limit Default	Specifies the maximum number of events loaded in the Events panel when a query is submitted. Possible values are integers between 100 and 40,000, and the default value is 5,000 events. If a query returns more events than the configured Event Limit Default, the Events panel title shows the analyst that more results are available but are not listed due to the limit. Increasing the limit may place additional load on the queried service; the ideal limit is determined by your environment.
Render Threads Setting	Specifies the maximum number of concurrent meta key values that are loaded by a single user in the Events Meta view. The default value is 1.
Event Limit Per User Role	Specifies the maximum number of events loaded for a single query for individual user roles. This limit must be less than or equal to the system events limit of 40,000, but it can be greater than the Event Display Limit Default.
Apply	Each setting has an Apply button, which saves the change. The change becomes effective immediately, and applies to any new queries submitted by users.

Live Services Configuration Panel

Live Services Configuration Panel introduces the features for setting up your Live account and the CMS server connection.

Live Account consists of two sections, namely RSA Live Status and Download Live Feedback Activity Log. **Sign In** by entering your Live Account credentials to access the Live Services. To activate your Live account for NetWitness, contact NetWitness Customer Support. When you have confirmation that your Live account has been set up, you can configure the CMS server connection as described in Configure Live Services Settings



The Live Services panel provides the user interface for:

- The Live account
- The Live Content update schedule and preferences for notification of updates
- Participation in Live Feedback
- Sharing Live Content Usage Details

For information on Live Feedback, see Live Feedback Overview

For information on Analyst Behaviors and Data Sharing, see the "NetWitness Feedback and Data Sharing topic in the *Live Services Management Guide*.

Workflow

What do you want to do?

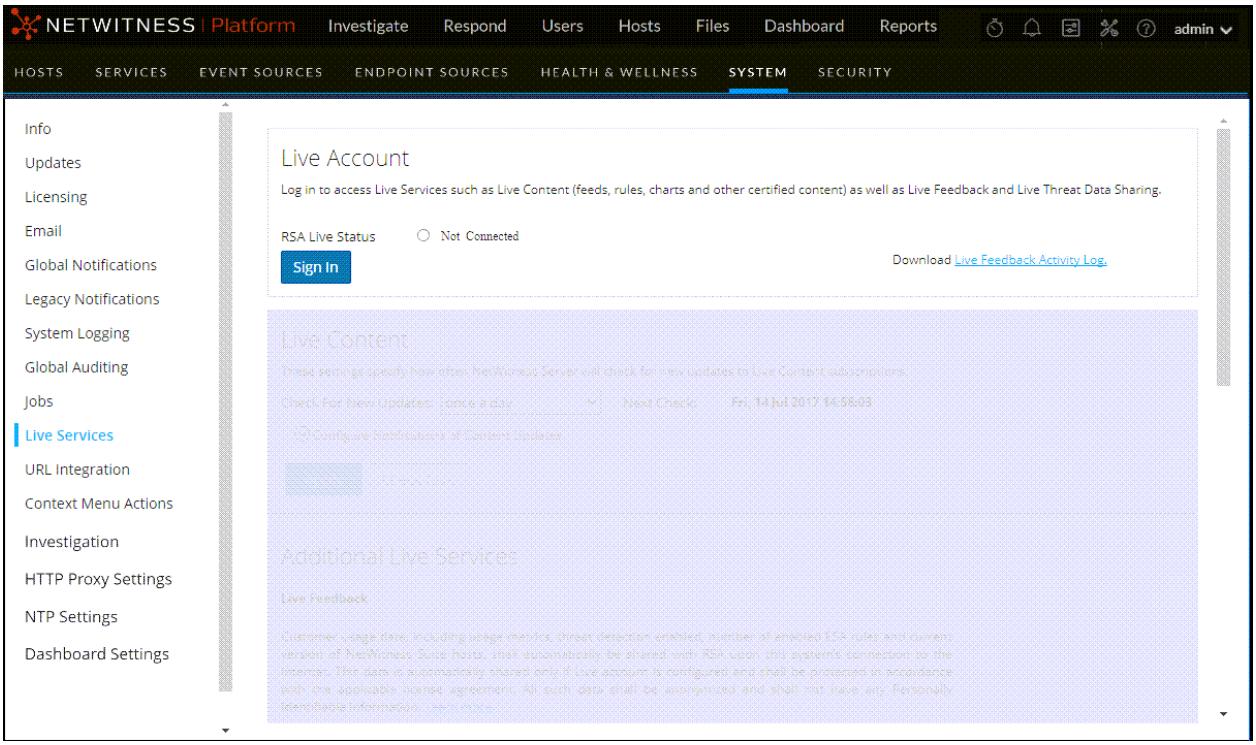
- *Live Services Management Guide*



Live Services Quick Look

You access this view in the **(Admin)** > **System** > **Live Services**.

1 Displays the Live Services Configuration Panel.
2 Enter Live Account Credentials with the help of Customer Care.
3 Provides updates on Live Content.
4 Additional Live Services provide Live feedback.

Note: If you are not signed in with your Live Account credentials, a masked screen is displayed as shown here.

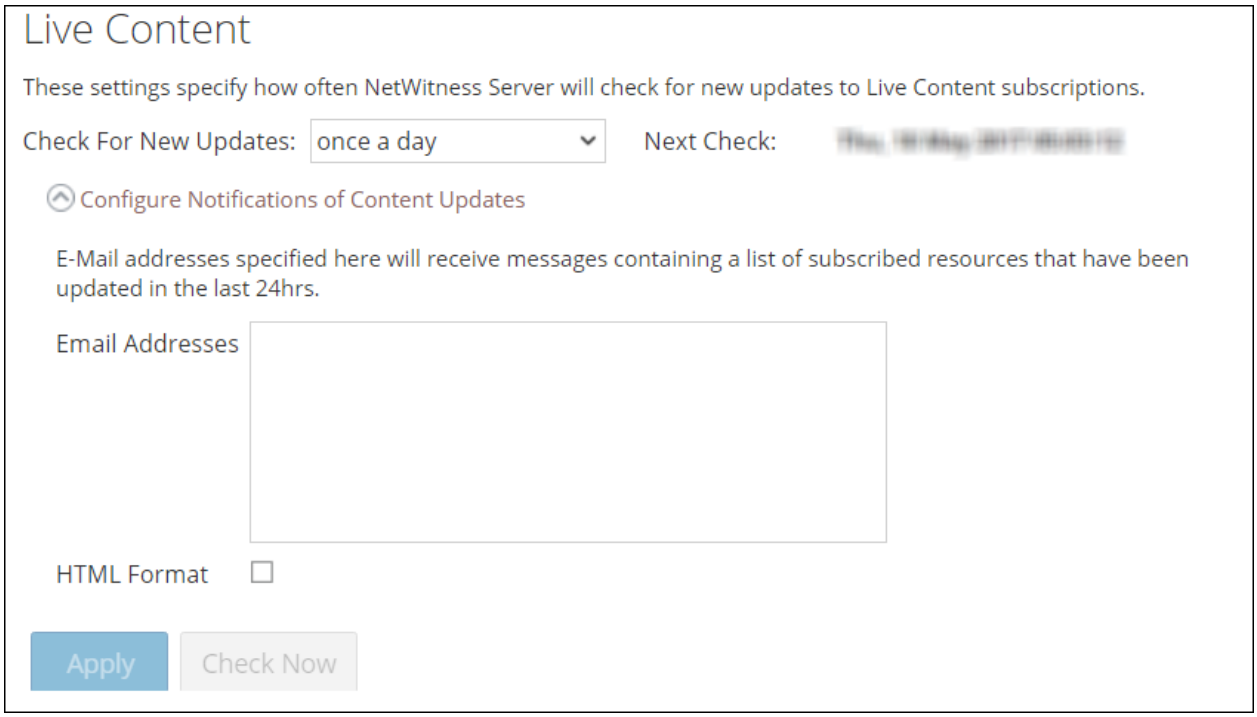
The Live Configuration panel has three sections: Live Account, Live Content, and Additional Live Services.

Live Account Section

In the **Live Account** section, you must enter the Live credentials. The information needed to set up the user's Live account consists of the Username, Password, and Live URL for the NetWitness Content Management System. This information is provided by Customer Care.

The following table describes the Live Account section features.

Feature	Description
Host	The Live URL for the Content Management System. The default value points to the NetWitness CMS at **cms.netwitness.com**.
Port	The communications port for Live to send requests to the Content Management System. The default value for this field is **443**, which is the communications port on the Content Management System.
SSL	Allows the user to communicate via SSL.
Username	The Live account user name as provided by NetWitness Customer Support.
Password	The Live account user password as provided by NetWitness Customer Support.
Test connection	Tests if the connection is successful or not.
Apply	Saves and applies the configuration.



The Live Account section provides an option to download and share the Live Feedback historical data by clicking Live Feedback Activity Log.

For more information about how to download historical data, see Upload Data to NetWitness for Live Feedback

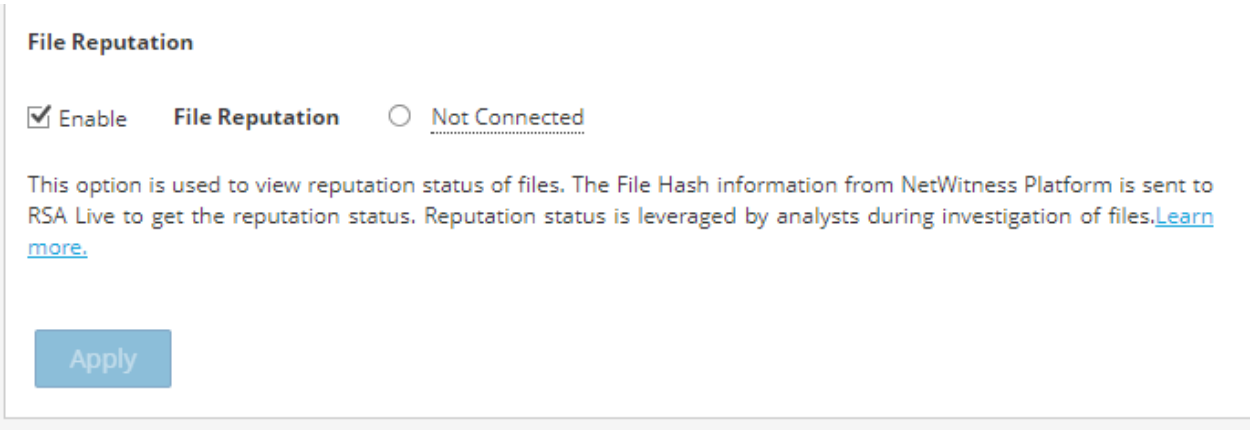
Live Content Section

You can configure the Live Content Synchronization interval and notification at which NetWitness checks for new updates to Live Content:

Use the **Check for New Updates** field to change the interval. Select an interval from the drop-down list. The default value for this setting is **once a day**.

The following table describes the Live Content features.

Feature	Description
Check for new updates	This setting dictates how often NetWitness checks for new updates to Live Subscriptions and synchronizes subscribed resources and tags: • once a day • twice a day • four times a day • every hour • every other hour • every half hour The default value for this setting is once a day.
Next Check	Displays the time and date of the next scheduled Live synchronization based on the configured interval for checking.
Email Addresses	Email addresses specified here receive messages containing a list of subscribed resources that have been updated in the last 24 hours.
HTML format	Specifies the format of email messages. • Set = HTML • Cleared = text
Check Now	Instead of waiting for the next scheduled resource cycle, this option forces Live to begin immediate synchronization of the subscribed resources in this instance of NetWitness. **Caution:** Use this feature with caution because synchronization can cause a parser reload if a Lua Parser or Flex Parser is deployed in the update cycle. This is acceptable once or twice a day, but a number of back-to-back parser reloads can cause packet loss at the Decoder. If this is the initial setup and you haven't configured Live resource subscriptions, do not Synchronize Now. Wait until you have configured subscriptions.
Apply	Applies the changed configuration to the subscription synchronization behavior. The changes become effective immediately. The **Next Live synchronization is scheduled for** field is updated if the time changed.



Force Immediate Synchronization

To force immediate synchronization, click **Check Now**. NetWitness checks for updates in subscribed resources.

Instead of waiting for the next scheduled resource cycle, this option forces Live to begin immediate synchronization of the subscribed resources in this instance of NetWitness. One use for this is to see the immediate impact of a configuration change. For example, a new service has been added, or new resources have been toggled for automatic deployment. The scheduled synchronization could take place hours later if Live Services is set to synchronize a few times a day.

Caution: Synchronization can cause a parser reload if a Flex Parser is deployed in the update cycle. This is acceptable once or twice a day, but a number of back-to-back parser reloads can cause packet loss at the Decoder. If this is the initial setup and you haven't configured Live resource subscriptions, do not Synchronize Now. Wait until you have configured subscriptions.

Additional Live Services

Note: Click on Learn more to know more about the data NetWitness is collecting. For more information, see Live Feedback Overview

The following tables describes the Additional Live Services features.

Feature	Description

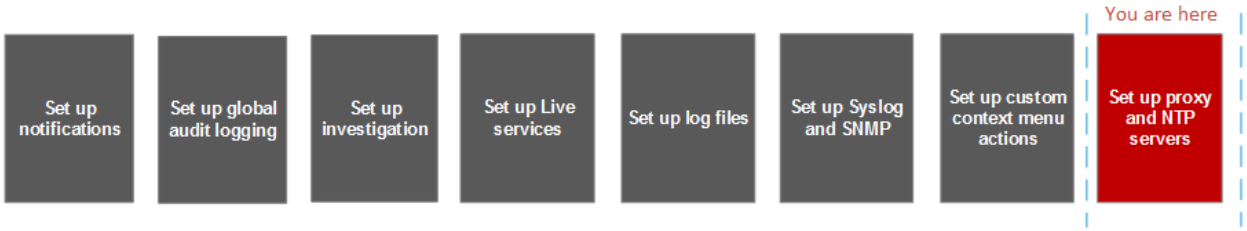
Live Feedback	Lists the types of data NetWitness is collecting:
	• Product Name
	• Product Version
	• Product Instance
	• Activation Key
	• Details of each Component such as:
	  • ID
	  • Name
	  • Version
	  • Instance ID
	• Metrics for each component

Additional Feedback Insights	Enables NetWitness to send anonymous, technical data about the content usage metrics to NetWitness. This option is enabled by default.

About Live Feedback Participation

Once you sign up for a Live account, Live Feedback automatically collects relevant information for further improvement and anonymously sends it to NetWitness. The shared data is protected in accordance with the applicable license agreement. For information on Live Feedback, see Live Feedback Overview. For information, see Configure Live Services Settings

If needed, you can manually download historical usage data and share it with NetWitness. For information on how to download historical usage data and share it with NetWitness, see Upload Data to NetWitness for Live Feedback.



NTP Settings Panel

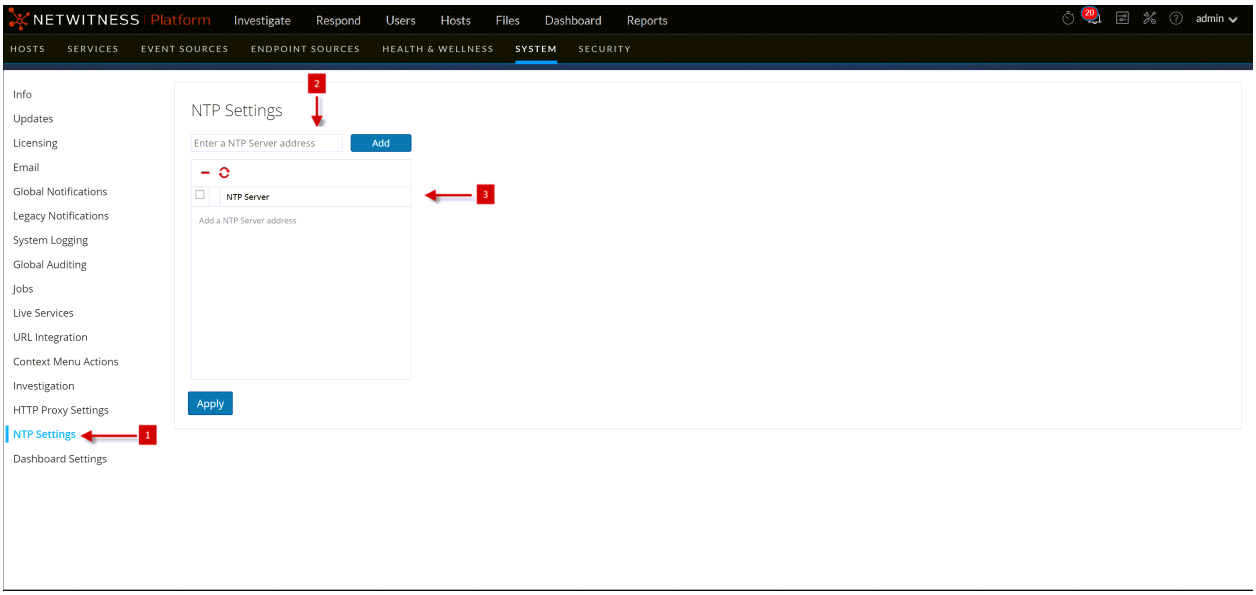
NTP setting panel is a protocol designed to synchronize the host machine clocks over a network. For more information on NTP see the home page (http://www.ntp.org/).

Note: NetWitness core hosts must be able to communicate with the NetWitness Server host with UDP port 123 for NTP time synchronization.

You use the **(Admin)** > **System** > **NTP Settings** view to configure one or more NTP servers. After you configure an NTP server, NetWitness uses NTP to synchronize the host machine clocks. You configure multiple NTP servers for Fail Over purposes.

Workflow

What you need to do?



Role	I want to ...	Show me how
Administrator	Add or Modify an NTP Server	Configure NTP Servers

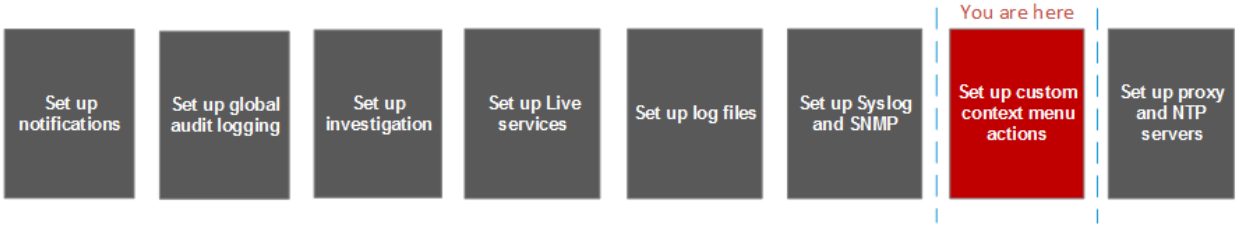
Related Topics

- Configure NTP Servers
- Troubleshoot Issues identified in the NTP Settings Panel or Log Files Messages

Quick Look

The following example illustrates an NTP setting panel. The panel defines how to add NTP server to NTP setting panel.

1 Displays the NTP setting panel.
2 Enter the NTP Server IP Address or hostname.
3 Click on an existing hostname.



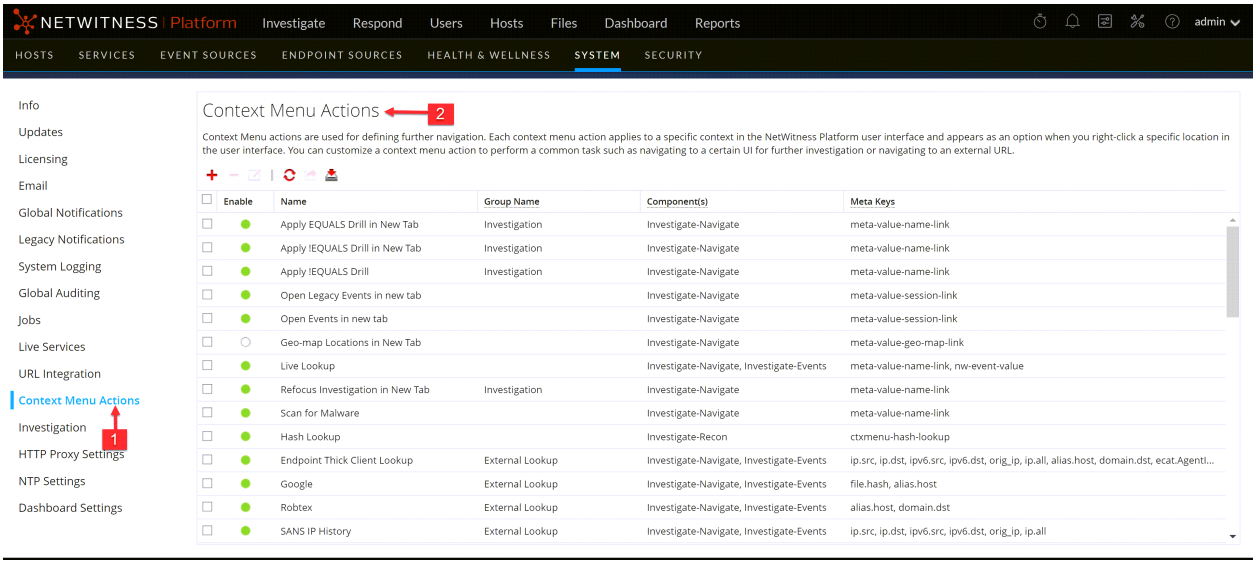
The following table describes the settings in the NTP Settings panel.

Setting	Description
Add	Enter the NTP Server IP Address or hostname to add the NTP server to NetWitness.
	Delete the selected NTP server.
	Synchronizes the selected NTP server.
	Selects the NTP server that you want to delete or synchronize.
NTP Server	NTP Server IP Address or hostname. If you click on an existing hostname, NetWitness makes the hostname editable and displays the following command buttons: • **Update** - Applies your edits. • **Cancel** - Cancels your edits.
Apply	Applies the NTP server settings and synchronizes host machine clocks to NTP.

Context Menu Actions Panel

In the Context Menu Actions panel, Administrators can view built-in context menu actions, and add, edit, or delete custom context menu actions that appear as options in a context menu.

Workflow



What do you want to do?

Role	I want to ...	Show me how
Administrator	Custom Context Menu Actions panel	Add Custom Context Menu Actions.

Quick Look

The following figure is an example of the Context Menu Actions panel.

1 Displays the Context Menu Actions Panel.
2 Toolbar allows you to Add, Edit, Delete Context Menu Actions.

The Context Menu Actions panel has a list and a toolbar. The following table describes the toolbar options and grid features.

Features	Description
	Displays the Context Menu Configuration dialog, in which you can create a new context action.
	Refreshes the list.
	Deletes the selected context actions. NetWitness does not request confirmation that you want to delete the action. The selected actions are immediately deleted with no opportunity to cancel.
	Displays the Edit Context Action dialog, in which you can edit an existing context action.
Visibility	Displays whether the context menu action is enabled or disabled.
Action Name	The name of the context menu action as it appears on the meta when a user right-clicks to initiate action.
Action Group	The action group under which this context menu action is grouped.
Component	The UI component to which the Action Name and Action Group belong.

Meta Keys	The names of the modules in which the context action is available. Currently all built-in context menu actions are for the Investigation module.
	When creating a context menu action, the parameter is `modules`.
	Here is a line of sample code:
	`"modules": [`
	`"investigation"`
	`],`

CSS Classes and Examples

CSS classes can be meta keys and non-meta keys.

Meta Key CSS Classes

One type of CSS class that you can add is meta keys. For meta keys that have a period, change the period to a dash when defining a CSS class. For example, the meta key `alias.host` becomes the CSS class `alias-host`. The meta key `ip.src` becomes the CSS class `ip-src`.

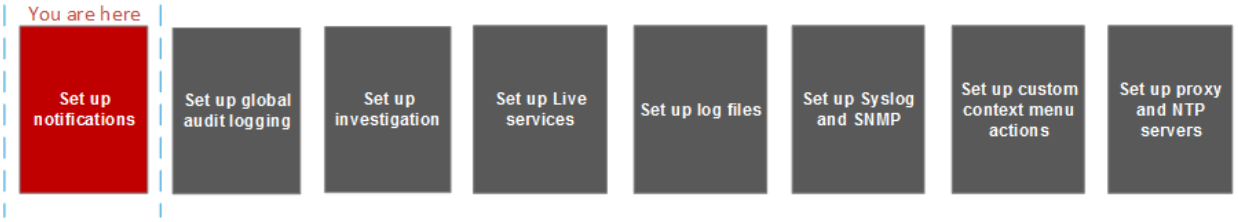
Non-Meta Key CSS Classes

Built-in non-meta key CSS Classes are also available. The classes in the following table define actions and the part of the user interface where the action is available.

CSS Class	Type	Description
meta-value-session-link	Action	Open on meta session count number
meta-value-name-link	Action	Open on meta value name
nw-event-value	Action	Use for reconstruction context actions on meta value
UAP.investigation.navigate.view. NavigationPanel	User interface	Applies to Navigate view
UAP.investigation.events.view. EventGrid	User interface	Applies to Event View
UAP.investigation.reconstruction.view. content.ReconstructedEventDataGrid	User interface	Applies to Event Reconstruction View

Example

This is a commented example of a context menu action to validate the user agent from the Client Application (client) meta key. The comments are removed automatically once applied in the Administration System view. The new menu item is displayed after restarting the browser.



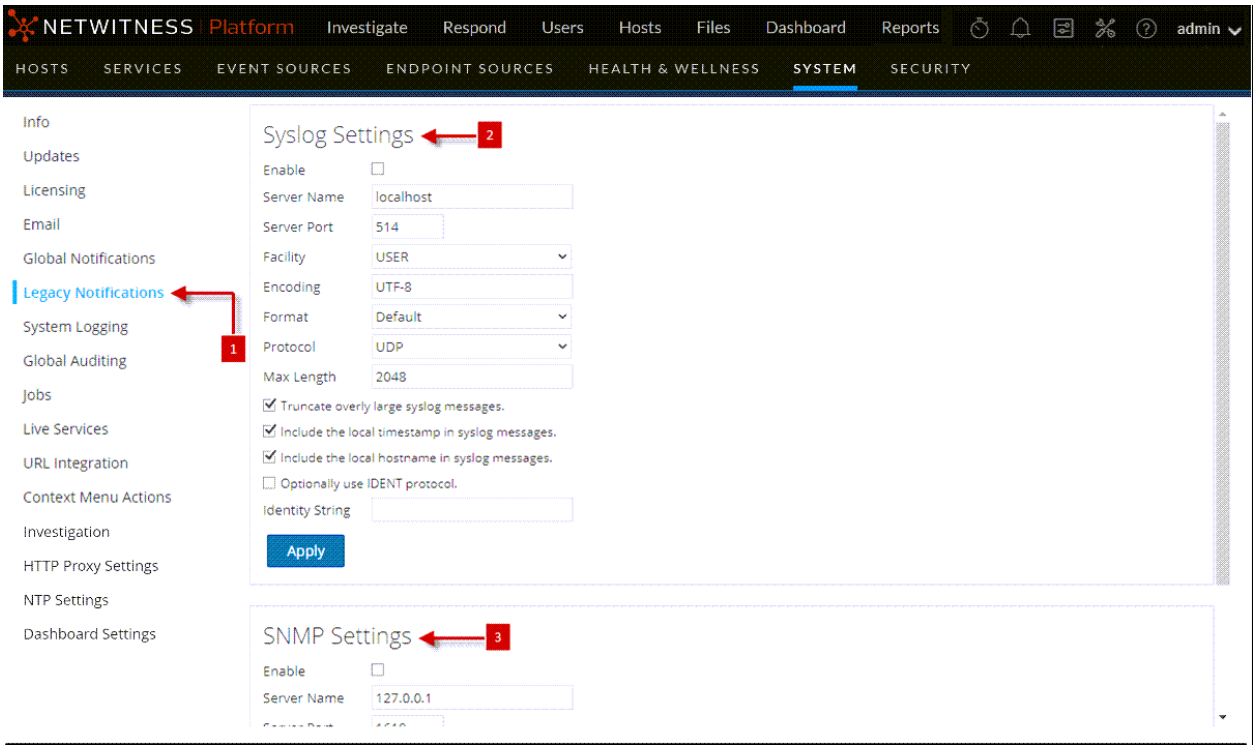
```
{
     "displayName": "User Agent String Lookup”, <!-- What name shows up in NW
UI -->
     "cssClasses": [
         “client”  <!-- What meta key to launch from -->
     ],
     "description": "",
     "type": "UAP.common.contextmenu.actions.URLContextAction",
     "version": "1",
     "modules": [
         "investigation"
     ],
     "local": "false",
     "groupName": "externalLookupGroup”, <!-- What group to show link in.
Remove line to show in main list -->
     "urlFormat": "http://www.useragentstring.com/?uas={0}&getText=all”, <!-- The {0}
gets replaced with whatever was right clicked on -->
     "disabled": "",
     "id": "UserAgentStringAction",
    "moduleClasses": [
         "UAP.investigation.navigate.view.NavigationPanel”, <-- Enabled in
Navigate pane-->
        “UAP.investigation.events.view.EventGrid” <-- Enabled in Event View
pane -->
     ],
     "openInNewTab": "true",
     "order": "15"
 }
```

Legacy Notifications Configuration Panel

The Legacy Notifications Configuration panel provides the ability to configure syslog and SNMP notification settings. These configurations are used for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.

Procedures related to these settings are described in Configure Syslog and SNMP Settings.

Workflow



What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure Syslog Settings	Configure Syslog and SNMP Settings
Administrator	Configure SNMP Settings	Configure Syslog and SNMP Settings

Related Topics

- Configure Syslog and SNMP Settings

Quick Look

1. Displays the Legacy Notification Configuration Panel.
2. Allows the user to configure syslog notifications for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.
3. Allows the user to configure SNMP notifications for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.

The Legacy Notifications Configuration Panel consists of two sections: Syslog Settings and SNMP Settings.

Syslog Settings

The following table describes the available options for configuring syslog notifications for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.

Feature	Description
Enable	Enables the syslog settings configured here.
Server Name	Specifies the host where the target syslog process is running.
Server port	Specifies the port where the target syslog process is listening.

Feature	Description
Facility	Specifies the designated syslog facility to use for all outgoing messages. Possible values are KERN, USER, MAIL, DAEMON, AUTH, SYSLOG, LPR, NEWS, UUCP, CRON, AUTHPRIV, FTP, LOCAL1 through LOCAL7.
Encoding	Specifies the encoding to use for text in syslog messages, for example, UTF-8.
Format	Specifies the message format. Possible values are: Default, PCI DSS, or SEC.
Protocol	Specifies the communications protocol used when sending syslogs: UDP or TCP. By default, the UDP protocol is selected.
Max length	Specifies the maximum length in bytes of any syslog message. The default value is **2048**. Messages that exceed the maximum length are truncated when the **Truncate overly large syslog messages** checkbox is selected.
Truncate overly large syslog messages	When checked, any messages exceeding the maximum length are truncated.
Include the local timestamp in syslog messages	When checked, NetWitness includes the local timestamp in messages.
Include the local hostname in syslog messages	When checked, NetWitness includes the local hostname in syslog messages.
Optionally use IDENT protocol	When checked, NetWitness prepends the identity string to outgoing syslog alerts.
Identity string	This is an identity string to be prepended to each syslog alert. If the string is blank, no identity string is prepended to the outgoing syslog alerts. You can use this to identify the source of the alert. Users conventionally set it to the name of the program that sends the syslog message.
Apply	Applies the syslog configuration settings.

SNMP Settings

The following table describes the available options for configuring SNMP notifications for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.

Feature	Description
Enable	Enables the SNMP settings configured here.
Server Name	Specifies the SNMP trap host.
Server port	Specifies the listening port on the SNMP trap host
SNMP version	Specifies the SNMP version, **v1** or **v2c**.

Feature	Description
Trap OID	Specifies the object ID for the SNMP trap on the trap host that receives the audit event. The default value is **0.0.0.0.0.1**.
Community	Specifies the community string used to authenticate on the SNMP trap host, the default value is **public**.
Enable	Enables SNMP notifications as configured here.
Apply	Applies the SNMP configuration settings.

What Is NetWitness® Investigate?

NetWitness audits and monitors all traffic on a network. One type of service--a Decoder--ingests, parses, and stores the packets, logs, and endpoint data traversing the network. The configured parsers and feeds on the Decoder create *metadata* that analysts can use to investigate the ingested logs and packets. Another type of service, called a Concentrator, indexes and stores the metadata. NetWitness Investigate provides the data analysis capabilities in NetWitness, so that analysts can analyze packet, log, and endpoint data, and identify possible internal or external threats to security and the IP infrastructure.

About This Guide

This guide provides end-to-end guidelines for all members of the SOC team to configure NetWitness Investigate and to investigate log and network events. End-to-end guidelines for investigating endpoints and user entity behavior using NetWitness Investigate are provided in separate documents:

- *NetWitness Endpoint Quick Start Guide*
- *NetWitness UEBA Quick Start Guide*

Getting Help with NetWitness Platform

There are several options that provide you with help as you need it for installing and using NetWitness:

- See the documentation for all aspects of NetWitness here: https://community.netwitness.com/t5/netwitness-platform/ct-p/netwitness-documentation
- Use the **Search** and **Create a Post** fields in NetWitness Community portal to find specific information here: https://community.netwitness.com/t5/netwitness-discussions/bd-p/netwitness-discussions
- See the NetWitness Knowledge Base: https://community.netwitness.com/t5/netwitness-knowledge-base/tkb-p/netwitness-knowledge-base
- See Troubleshooting section in the guides.
- See also NetWitness® Platform Blog Posts.
- If you need further assistance, contact NetWitness Support.

Use these links to access documentation that is not related to a particular version of the software:

- Hardware setup guides: https://community.netwitness.com/t5/netwitness-platform-hardware/tkb-p/netwitness-hardware-documentation
- Documentation for Content such as feeds, parsers, application rules, and reports: https://community.netwitness.com/t5/netwitness-platform-threat/tkb-p/netwitness-threat-intelligence.

Getting Started

The following tasks can be performed in any sequence and are for the entire SOC team.

Description	References
	
View information about product updates, improvements, and known issues	*Release Notes*
Understand how NetWitness Investigate works	"How NetWitness Investigate Works" in the *NetWitness Investigate User Guide*

Setup, Installation, or Upgrade

No special setup, installation, or upgrade tasks are required for Investigate; it is part of NetWitness Platform for Logs and Network. However, setup is required for several components with which NetWitness Investigate works if you plan to do this type of analysis. These tasks are for the Administrator, and the SOC Manager may want to understand the setup.

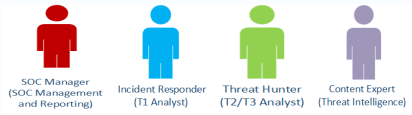
Description	References
	
Install and set up the Malware Analysis (standalone or service)	Malware Analysis Configuration Guide
Install and set up NetWitness Endpoint (standalone or service)	NetWitness Endpoint Quick Start Guide
Install and set up NetWitness UEBA (standalone or service)	NetWitness UEBA Quick Start Guide

System-Level Configuration

Administrators configure system-level preferences for NetWitness Investigate.The below-mentioned tasks are for the administrator, and the tasks can be performed in any sequence. SOC Managers should understand the possible configuration options.

Description	References
	
Configure role-based access control (RBAC) for analysts who will be using Investigate. These components have permissions related to investigate: investigate (Navigate view and Legacy Events view), investigate-server (Events view), Malware (Malware Analysis view), Endpoint-broker-server, and Endpoint-server.	"Role Permissions" in the System Security and User Management Guide
Configure Investigate to limit content available for different user roles (preQueries).	"Verify Query and Session Attributes per Role" in the System Security and User Management Guide
Configure default settings and limits for NetWitness Investigate on a system level.	"Configure Investigation Settings" in the System Configuration Guide

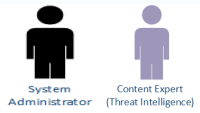
User Preference Configuration



The following tasks are for Threat Hunters, Content Experts, and Incident Responders, and SOC Managers. The tasks can be performed in any sequence.

Description	References
	
Configure Navigate view and Events view preferences.	"Configure the Navigate and Legacy Events View" in the *NetWitness Investigate User Guide*
Configure Event Analysis view preferences.	"Configure the Events View" in the *NetWitness Investigate User Guide*
Configure the Malware Analysis view preferences.	"Configure Malware Analysis" in the *Malware Analysis User Guide*

Investigation



Different types of investigation may be handled by analysts with different skill levels and goals.

- Incident Responders (T1 Analysts) typically pivot to Investigate from NetWitness Respond to find detailed information about an incident so that they can respond to and remediate incidents.
- Threat Hunters (T2/T3 Analysts) typically peruse events, metadata, and raw content so that they can recommend issues for remediation and remediate issues.
- Content Experts (Threat Intelligence) typically peruse events, metadata, raw content, user and host data, and UEBA data so that they can investigate new threat intelligence, evaluate and create new feeds, and create correlation rules to flag indicators of compromise.
- SOC Managers need to understand the use cases.

Description	References
	
Learn about practical use cases	"Sample Use Cases for NetWitness Investigate" in the *NetWitness Investigate User Guide*
Investigate metadata and raw events in logs and network traffic	"Beginning an Investigation" in the *NetWitness Investigate User Guide*
Investigate possible malware	Malware Analysis User Guide
Investigate endpoints	NetWitness Endpoint User Guide
Perform user and entity behavior analysis	NetWitness UEBA User Guide

Maintenance

The administrator can perform the following tasks in any sequence.

Description	References
	
Maintain the list of queries and analyze the query patterns of other users of the NetWitness Platform system.	"Maintaining Queries Using URL Integration" in the System Maintenance Guide

Description	References
Fine tune system-level configuration settings to improve performance or limit access to data.	"Verify Query and Session Attributes per Role" in the System Security and User Management Guide "Configure Investigation Settings" in the System Configuration Guide

Task 1. Install 12.4.1 on the NetWitness Server Host 14

Task 2. Install 12.4.1 Log Hybrid Host 15

Task 3. Install and Configure NetWitness® UEBA 15

Post Installation Task **16**

Set a user with privileges to access the UEBA Pages 16

Introduction

NetWitness® UEBA standalone installation is designed to support other security tools such as Security Information and Event Management (SIEM). It allows users of a third-party SIEM solutions to leverage NetWitness for UEBA.

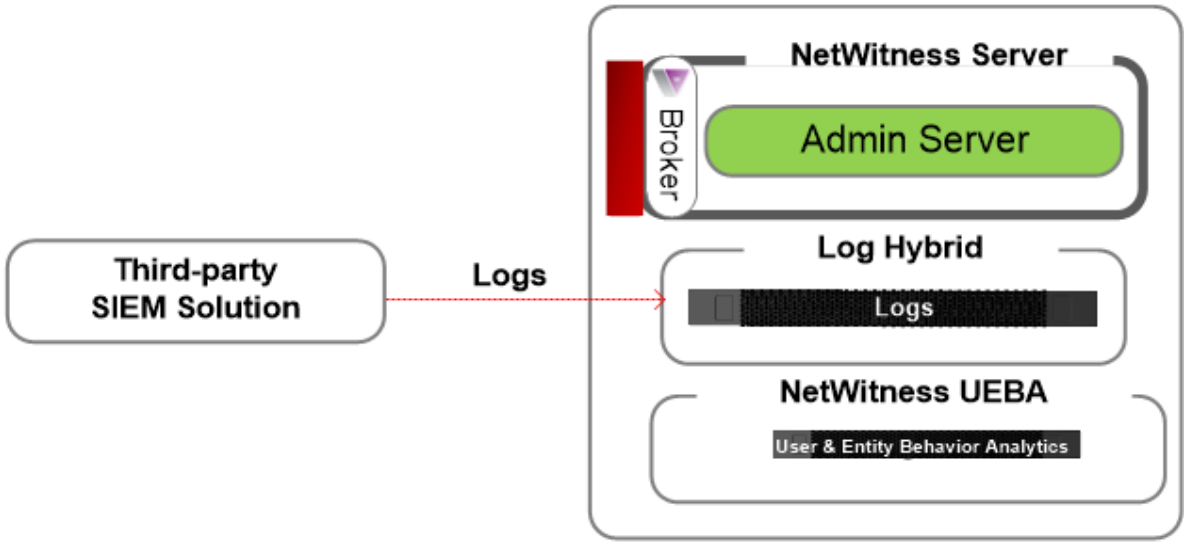
NetWitness® UEBA standalone installation includes:

1. NetWitness Admin Server
2. NetWitness Log Hybrid
3. NetWitness UEBA

Note: NetWitness® UEBA standalone installation supports up to 100,000 users on a single running instance. If you have more than 100,000 users, contact Customer Support.

Windows Log Sources

NetWitness UEBA standalone installation natively supports the following Windows log sources:



- Windows Active Directory
- Windows Logon and Authentication Activity
- Windows File Servers
- Windows Remote Management

For more information, see the "NetWitness UEBA Use Cases for Windows Logs" topic in the *NetWitness UEBA User Guide*.

NetWitness UEBA Standalone Installation

This section contains a high-level UEBA standalone installation diagram and a list of NetWitness UEBA ports.

The following diagram illustrates the NetWitness UEBA standalone installation.

Note:

- UEBA connects to the Broker or Log Hybrid host.
- To configure the Log Hybrid for logs from a third-party SIEM, contact your RSA Account Manager.

UEBA Host and Service Ports

Source Host	Destination Host	Destination Ports	Comments
UEBA Server	NW Server	TCP 443	NetWitness Update Repository
UEBA Server	NW Server	TCP 56003 (SSL), 50003 (Non-SSL), 50103 (REST)	Broker Application Ports
UEBA Server	NW Server	TCP 56005 (SSL), 50005 (Non-SSL), 50105 (REST)	Log Hybrid, Concentrator Application Ports
Admin Workstation	UEBA Server	443	UEBA Monitoring
Admin Workstation	UEBA Server	22	SSH
Admin Workstation	UEBA Server	8100	Airflow UI

System Requirements

You can run the NetWitness® UEBA standalone installation as follows:

- NetWitness Physical Hosts (software running on hardware supplied by NetWitness)
  - Install physical hosts and connect to the network as described in the NetWitness® Platform Hardware Setup Guides and the *NetWitness® Platform Physical Host Installation Guide 12.4.1 version*.
  - Set up licensing for NetWitness Platform as described in the *NetWitness® Platform Licensing Guide*.
- On-Premises (On-Prem) Virtual Hosts (Software Only provided by Netwitness)

Physical Host Hardware Specifications

You must install the NetWitness UEBA host on the S6 (Dell R640 hardware).

Series 6 (DELL R640) SPECIFICATIONS

Specification	Capacity
Host Type	UEBA
Model	Dell PowerEdge R640
Processor Type	Intel Xeon Gold 6126
Processor Speed	2.6Ghz
Cache	19.25M Cache
# of Processors	2
# of Cores	12 Cores per Processor
# of Threads	24 Threads per Processor
Series 6 Hard Drives Field replaceable Hot swappable	2 X 1TB NL-SAS 7.2K 4 X 2.4TB SAS 10K Total - 6 Drives Slots 0-1: 1TB Slots 2-5: 2.4TB
Memory	256GB 8 * 32GB RDIMM 2133MT/s
Storage Controllers	External PERC H840, Internal PERC H740P
Network Interface Card	Intel X710 DP 10Gb DA/SFP+, + 1350 DP 1Gb Ethernet, Network Daughter Card

Specification	Capacity
Power	
PSU	Dual, Hot-plug, Redundant Power Supply (1+1), 1100 W AC
BTU/hr	4100 BTU/hr (Maximum)
Voltage	100-240 V AC, autoaranging
Current	12 A - 6.5 A
Form Factor	1U, full depth
Weight (approximate)	21.9 kg (48.28 lbs)
Dimensions (approximate)	With bezel: 482.0 mm (18.97 in) [w] x 808.51 mm (31.83 in) [d] x 42.8 mm (1.68 in) [h]Without bezel: 482.0 mm (18.97 in) [w] x 794.67 mm (31.29 in) [d] x 42.8 mm (1.68 in) [h]
Shipping Dimensions	Server boxed for shipping (includes rail kit) Height: 30.48 cm (12 inch) Width: 104.14 cm (41 inch) Depth: 64.14 cm (25.25 inch) Weight: 25.85 kg (57 lb)
Throughput / EPS	N/A

* NIC Card options are available for swap with on-board daughter card or add on.

Virtual Host Specifications

Following is the recommended system requirements for a UEBA virtual host.

The recommended vCPU specification for UEBA is Intel Xeon CPU @2.59 Ghz.

CPU	Memory	Reserved Memory Allocation	Disk Requirements for /var/netwitness Partition	Read IOPS	Write IOPS
32 cores	256GB	192GB	• Storage: 1.5 TB • Provisioning: Thick	500	500

IMPORTANT:
- You must reserve all the resources allocated to UEBA on the VM server. For example, if a user has a 2.1GHz CPU, then 32CPUs * 2.1GHz = 67.2GHz or 67200MHz must be reserved.
- The **/var/netwitness** partition must be mounted on a **1.5 TB** Thick-provisoned disk for storage usage.

Note: NetWitness recommends that you only deploy UEBA on a virtual host if your log collection volume is low. If you have a moderate to high log collection volume, NetWitness recommends that you deploy UEBA on the physical host.

Installation Media

Installation media are in the form of OVA packages, which are available for download and installation from Download Central. As part of your order fulfillment, NetWitness gives you access to the OVA.

Installation Tasks

This topic contains the tasks you must complete to install NetWitness UEBA standalone installation.

Note: Download or make sure you have access to the *Physical Host Installation Guide* for Version 12.4.1 before beginning the tasks. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

For Physical Hosts:

You need to complete the following tasks in the order shown below.

Task 1. Install 12.4.1 on the NetWitness Server Host

Task 2. Install 12.4.1 Log Hybrid Host

Task 3. Install and Configure NetWitness® UEBA

Task 1. Install 12.4.1 on the NetWitness Server Host

For the NetWitness Server (NW Server), this task:

- Creates a base image.
- Sets up the 12.4.1 NW Server host.

For more information on how to install the NetWitness Server host, see "Install 12.4.1 on the NetWitness Server (NW Server) Host" section in the *Physical Host Installation Guide for Version 12.4.1*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Task 2. Install 12.4.1 Log Hybrid Host

For a non-NW Server host, this task:

- Creates a base image.
- Sets up the 12.4.1 non-NW Server host or Log Hybrid.

For more information on how to install the Log Hybrid host, see "Task 2 - Install 12.4.1 on Other Component Hosts" section in the *Physical Host Installation Guide for Version 12.4.1*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Task 3. Install and Configure NetWitness® UEBA

To set up NetWitness UEBA, you must install and configure the NetWitness UEBA service.

The following procedure shows you how to install the NetWitness UEBA service on a NetWitness UEBA Host Type and configure the service.

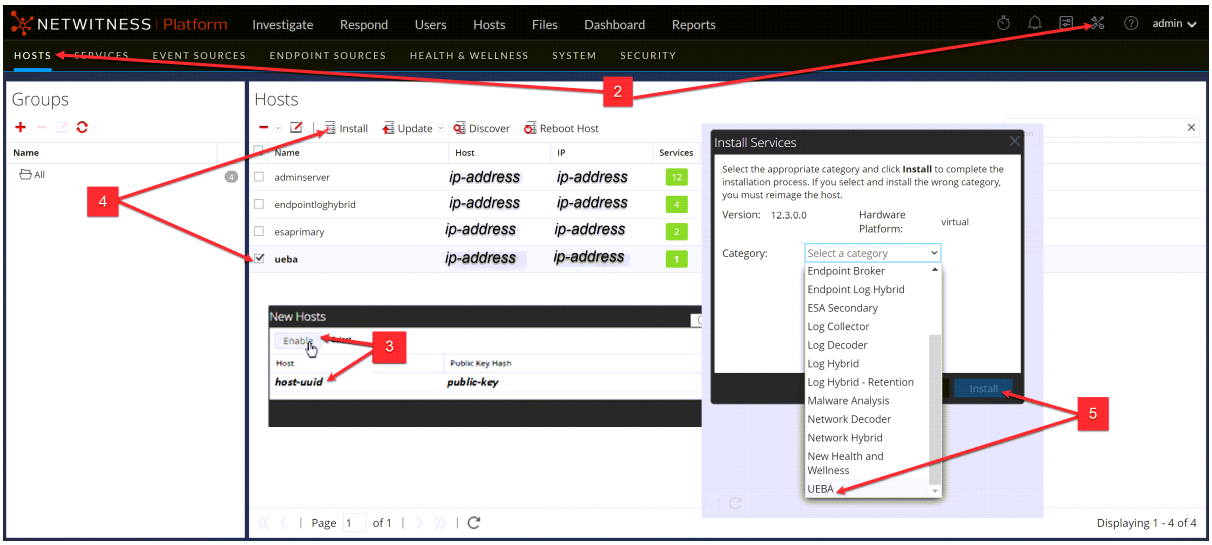
1. Complete steps 1 - 14 under "Task 2 - Install 12.4.1 on Other Component Hosts" in "Installation Tasks" of the *NetWitness Platform Physical Host Installation Guide for Version 12.4.1*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

   Note: The Kibana and Airflow webserver User Interface password is the same as the deploy_admin password. Make sure that you record this password and store it in a safe location.

2. Log in to the NetWitness Platform and go to **(Admin) > Hosts**.

   The New Hosts dialog is displayed with the Hosts view grayed out in the background.

   Note: If the New Hosts dialog is not displayed, click **Discover** in the **Hosts** view toolbar.



3. Select the host in the **New Hosts** dialog and click **Enable**.

   The New Hosts dialog closes and the host is displayed in the Hosts view.

4. Select that host in the **Hosts** view (for example, **UEBA**) and click Install.

   The Install Services dialog is displayed.

5. Select the **UEBA** Host Type and click **Install**.

6. Make sure that the UEBA service is running.
7. Complete licensing requirements for NetWitness UEBA.

   See the *NetWitness Platform 12.4.1 Licensing Management Guide* for more information. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

   Note: NetWitness Platform supports the User and Entity Behavior Analytics License (UEBA). This license is used based on the number of users. The Out-of-the-Box Trial License is a 90-day trial license. In case of UEBA licenses, the 90-day trial period begins from the time the UEBA service deployed on the NetWitness Platform product.

Configure NetWitness UEBA

To start running UEBA:

1. Define the following parameters: data schemas, data source (NetWitness Broker or Concentrator) and start date.

   a. Define UEBA schemas:
   Choose schemas from the following list:

   AUTHENTICATION, FILE, ACTIVE_DIRECTORY, PROCESS, REGISTRY and TLS.

   Note: The TLS packet requires adding the hunting package. For more information regarding events that each schema contains, see the *NetWitness UEBA Configuration Guide*.

   b. Define the data source:
   If your deployment has multiple Concentrators, we recommend that you assign a Broker at the top of your deployment hierarchy for the NetWitness UEBA data source.

   c. Define the UEBA start-date:

   Note: The selected start date must contain events from all configured schemas.

   NetWitness recommends that the UEBA start date is set to 28 days earlier than the current date. For UEBA systems that intend to process TLS data, you must make sure that the start date is set to no later than 14 days earlier than the current date.

2. . Create a user account for the data source (Broker or Concentrator) to authenticate to the data.

   a. Log in to the NetWitness Platform.

   b. Go to  (Admin) > **Services**.

   c. Locate the data source service (Broker or Concentrator).
   Select that service, and select  **(Actions)** > **View** > **Security**.

   d. Create a new user and assign the “Analysts” role to that user.

The following example shows a user account created for a Broker.

3. SSH to the NetWitness UEBA server host.
4. (For Virtual Machines Only) Set the appropriate parallelism value:
   If the UEBA system runs on VM, update the airflow parallelism value to be 64 by running the following command:
   ```
   sed -i "s|parallelism = 256|parallelism = 64|g"
   /var/netwitness/presidio/airflow/airflow.cfg
   ```
5. Submit the following commands with the above parameters that you already defined.
   ```
   /opt/rsa/saTools/bin/ueba-server-config -u <user> -p <password> -h <host> -
   o <type> -t <startTime> -s <schemas> -v -e <argument>
   ```
   Where:

Argument	Variable	Description
`-u`	`<user>`	User name of the credentials for the Broker or Concentrator instance that you are using as a data source.

Argument	Variable	Description
-p	<password>	Password of the credentials for the Broker or Concentrator instance that you are using as a data source. The following special characters are supported in a password. !"#$%&()*+,-:;<=>?@[\]^_`\{\|} If you want to include a special character or special characters, you must delimit the password with an apostrophe sign, for example: sh /opt/rsa/saTools/bin/ueba-server-config -u brokeruser -p **'!"UHfz?@ExMn#$'** -h 10.64.153.104 -t 2018-08-01T00:00:00Z -s 'AUTHENTICATION FILE ACTIVE_DIRECTORY TLS PROCESS REGISTRY' -o broker -v
-h	<host>	IP address of the Broker or Concentrator used as the data source. Currently, only one data source is supported.
-o	<type>	Data source host type (broker or concentrator).
-t	<startTime>	Historical start time as of which you start collecting data from the data source in YYYY-MM-DDTHH-MM-SSZ format (for example, 2018-08-15T00:00:00Z). **Note:** The script interprets the time you enter as UTC (Coordinated Universal Time) and it does not adjust the time to your local time zone.
-s	<schemas>	Array of data schemas. If you want to specify multiple schemas, use a space to separate each schema (for example, AUTHENTICATION FILE ACTIVE_ DIRECTORY PROCESS REGISTRY TLS).
-v		**verbose mode**.
-e	<argument>	Boolean Argument. This enables the UEBA indicator forwarder to Respond. **Note:** If your NetWitness deployment includes an active Respond server, you can transfer NetWitness UEBA indicators to the Respond server and create incidents by enabling the indicator forwarder, from this data. For more information on how to enable the NetWitness UEBA incidents aggregation, see Installation Tasks.

6. Set the appropriate "Boot Jar Pools" slots:

   - **Physical Appliance**: Update the `spring_boot_jar_pool`" slots to be 18.
   - **Virtual Appliance**: If the UEBA system is running on VM, update the `spring_boot_jar_pool` and the `retention_spring_boot_jar_pool` slots values to 5.
     To update the “Spring Boot Jar Pools” slots, Go to the Airflow main page, tap the “Admin” tab at the top bar and tap “Pools”.

   a. To access the Airflow UI, go to `https://<UEBA_host>/admin` and enter the credentials.

   • User: admin

   • Password: The environment deploy admin password.

   b. Click on the pencil mark of the polls to update the slot values.

Enable Access Permission for the NetWitness UEBA User Interface

After you install NetWitness UEBA standalone 12.4.1, you need to assign the UEBA_Analysts and Analysts roles to the UEBA users. For more information, see 'Assign User Access to UEBA' topic in the *NetWitness UEBA Configuration Guide*. After this configuration, UEBA users can access the **Investigate** > **Users** view.

Note: To complete NetWitness UEBA configuration according to the needs of your organization, See the *NetWitness UEBA Configuration Guide*.

For Virtual Hosts

You must complete the following tasks in the order shown below.

Task 1. Install 12.4.1 on the NetWitness Server Host

Task 2. Install 12.4.1 Log Hybrid Host

Task 3. Install and Configure NetWitness® UEBA

Task 1. Install 12.4.1 on the NetWitness Server Host

On the host you have deployed for the NetWitness Server (NW Server), this task installs:

- The 12.4.1 NW Server environmental platform.
- The NW Admin Server.
- A repository with the RPM files required to install the other functional components or services.

For more information on how to install the NetWitness Server host, see "Task 1- Install 12.4.1 on the NW Server Host" section in the *Virtual Host Installation Guide for Version 12.4.1*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Task 2. Install 12.4.1 Log Hybrid Host

Complete the following tasks on a non-NW Server host:

- Install the 12.4.1 environmental platform.
- Apply the 12.4.1 RPM files to the service from the NW Server Update Repository.

Note: You must install the Log Hybrid host.

For more information on how to install the non-NetWitness Server host, see "Task 3 - Install 12.4.1 on Other Component Hosts" section in the *Virtual Host Installation Guide for Version 12.4.1*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues..

Task 3. Install and Configure NetWitness® UEBA

Prerequisite: Increase Memory for Virtual Deployment

Virtual Machines are deployed with approximately 104 GB in the storage mount by default. To install NetWitness UEBA, you must increase the storage space in your virtual environment to at least 800 GB.

To set up NetWitness UEBA, you must install and configure the NetWitness UEBA service.

The following procedure shows you how to install the NetWitness UEBA service on a NetWitness UEBA Host Type and configure the service.

1. Complete steps 1 - 15 for Virtual Hosts under "Task 3 - Install 12.4.1 on Other Component Hosts" in "Installation Tasks" of the *NetWitness Platform Virtual Host Installation Guide for Version 12.4.1*. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

   Note: The Kibana and Airflow webserver User Interface password is the same as the deploy admin password. Make sure that you record this password and store it in a safe location.

2. Complete steps 2 - 9 under Task 3. Install and Configure NetWitness® UEBA.

Post Installation Task

Set a user with privileges to access the UEBA Pages

After you install NetWitness UEBA standalone 12.4.1, you need to assign the **UEBA_Analysts** and **Analysts** roles to the UEBA users. For more information, see *NetWitness UEBA Configuration Guide*.

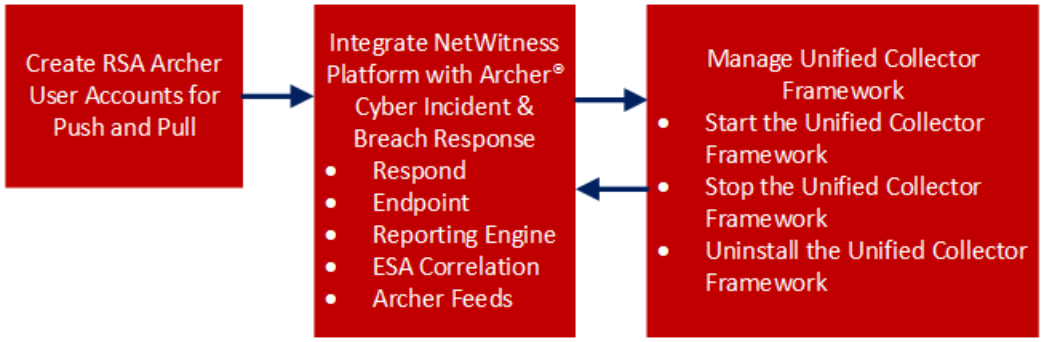
Archer Integration

Administrators can integrate NetWitness with Archer Cyber Incident & Breach Response to send alerts and incidents from NetWitness to Archer for incident management and remediation. This guide provides a high-level workflow for configuring this integration.

Note: When you upgrade from Security Analytics 10.6.5 to NetWitness 11.x, the Archer Cyber Incident & Breach Response integration is no valid, and must be re-configured.

The following table list the NetWitness 11.x integration options with Archer Cyber Incident & Breach Response Version 1.3.1.2.

Archer Cyber Incident & Breach Response Version	NetWitness 11.x Integration	Reference
1.3.1.2	ESA Correlation	See "Configure ESA Correlation for Integration with Archer Cyber Incident & Breach Response" section.
1.3.1.2	Reporting Engine (RE)	See "Configure Reporting Engine for Integration with Archer Cyber Incident & Breach Response" section.
1.3.1.2	Respond	See "Configure Respond for Integration with Archer Cyber Incident & Breach Response 1.3.1.2" section.
1.3.1.2	Archer Feeds	See "Archer Feeds" section.



Configure NetWitness to Work With Archer

The Archer Cyber Incident & Breach Response solution enables you to aggregate all actionable security alerts, allowing you to become more effective, proactive, and targeted in your incident response and SOC management. For more information on Archer Cyber Incident & Breach Response capabilities, see Archer documentation on the Archer Community or on the Archer Exchange Community.

This version of Archer determines how NetWitness will be integrated. For supported Archer platforms, see the *SecOps Installation Guide*.

Archer Cyber Incident & Breach Response1.3.1.2 integrates with NetWitness using the UCF (Unified Collector Framework), which comprises of NetWitness Respond integration service and Archer Cyber Incident & Breach Response Watchdog service.

This figure represents the flow of NetWitness 11.x integration with Archer Cyber Incident & Breach Response 1.3.1.2.

Create Archer User Accounts for Push and Pull

You must create a user account for the web service client to transfer data to the Archer GRC Platform.

You require two Archer user accounts to avoid conflicts while sending and receiving data from NetWitness.

To create a user account for push and pull:

1. On the Archer UI, click **Administration** > **Access Control** > **Users** > **Add New**.
2. In the **First Name** and **Last Name** fields, enter a name that indicates that the Unified Collector Framework (UCF) uses this account to push data into Archer GRC. For example, UCF User, Push.

   Note: When configuring the Pull account, enter a name that indicates that the UCF uses this account to pull data from Archer GRC. For example, UCF User, Pull.

3. (Optional) Enter a user name for the new user account.

   Note: If you do not specify a user name, the Archer GRC Platform creates the user name from the first and last name entered when you save the new user account.

4. In the **Contact Information** panel, in the **Email** field, enter an email address to associate with the new user account.

5. In the **Localization** section, change the time zone to (UTC) Coordinated Universal Time.

   Note: The UCF uses UTC time to baseline all the time-related calculations.

6. In the **Account Maintenance** section, enter and confirm a new password for the new user account.

   Note: Make a note of the user name and password for the new user account that you created. You need to enter these credentials when you set up the UCF to communicate with the Archer GRC Platform through the web service client.

7. Clear the Force Password Change On **Next Sign-In** option.
8. In the **Security Parameter** field, select the security parameter that you want to use for this user.

   Note: If you assign a default security parameter with a password change interval of 90 days, you also must update the user account password stored in the SA IM integration service every 90 days. To avoid this, you can optionally create a new security parameter for the SA IM integration service user account, and set the password change interval to the maximum value allowed by your corporate standards.

9. Click the **Groups** tab, and perform the following:
   a. In the **Groups** panel, click **Lookup**.
   b. In the **Available Groups** window, expand Groups.
   c. Scroll down and select **SOC: Solution Administrator and EM: Read Only**.
   d. Click **OK**.
10. Click **Apply** and click **Save**.
11. If the machine language and regional settings of your Archer GRC system are set to anything other than English-US, perform the following:
    a. Open the user account you just created, and in the **Localization** section, in the **Locale** field, select **English (United States)**, and click **Save**.
    b. On the Windows system hosting your Archer GRC Platform, open **Internet Information Services (IIS) Manager**.
    c. Expand your Archer GRC site, click **.Net Globalization**, in both the **Culture** and **UI Culture** fields, select **English (United States)**, and click **Apply**.
    d. Restart your Archer GRC site.
12. Repeat steps 1 – 11 to create a second user account for the UCF to pull data from Archer GRC.

Integrate NetWitness Platform With Archer Cyber Incident & Breach Response

You have to configure the system integration settings to manage incident workflow in Archer Cyber Incident & Breach Response.

For information on how to configure system integration settings, see the "Manage Incidents in Archer Cyber Incident & Breach Response" in the *NetWitness Respond Configuration Guide*.

Unified Collector Framework

NetWitness integrates with Archer Cyber Incident & Breach Response 1.3.1.2 using the UCF. The UCF integrates with all supported SIEM tools and the Archer Cyber Incident & Breach Response solution. After you configure the system integration settings, all incidents are managed in Archer Cyber Incident & Breach Response instead of NetWitness Respond. Incidents created before the integration will not be managed in Archer Cyber Incident & Breach Response.

Note:
• You must configure the same option in both NetWitness and the Unified Collector Framework.
• Integration of the NetWitness Respond module with Reporting Engine or ESA Correlation can result in duplicate events, alerts, and incidents created in Archer Cyber Incident & Breach Response.

UCF supports multiple SIEM tools connections at the same time, such as supporting NetWitness Reporting Engine, HP ArcSight, and NetWitness Respond. However, different instances of the same SIEM tool are not supported, such as two NetWitness servers connected to the same UCF.

Prerequisites

- Install the Archer Cyber Incident & Breach Response package on Archer. See Archer documentation Archer Community or on the Content Tab at https://www.archerirm.community/t5/exchange-overviews/archer-exchange-offering-list/ta-p/672315.
- Install Archer Cyber Incident & Breach Response 1.3.1.2.
- Ensure you have NetWitness 11.1 as it is compatible with Archer Cyber Incident & Breach Response 1.3.1.2.
- Ensure that Respond is configured inNetWitness.

The UCF allows you to integrate your Archer Cyber Incident & Breach Response system with the following:

- NetWitness Respond
- NetWitness Reporting Engine
- NetWitness ESA Correlation.
- Archer Feeds

Configure Respond for Integration with Archer Cyber Incident & Breach Response

Step 1: Select the Mode for NetWitness Respond

1. Go to  **(Admin) > Services**, select the **Respond Server** service, and select  > **View** > **Explore**.

2. Navigate to `respond/integration/export`.
3. Set the `archer-sec-ops-integration-enabled` field to **true**.
4. Restart the Respond service by running the following command:
   `systemctl restart rsa-nw-respond-server`

Step 2: Configure NetWitness Respond to Forward Alerts to UCF

1. Navigate to `C:\Program Files\RSA\SA IM integration service\cert-tool\certs` in the SecOps Middleware box.
2. Copy both `keystore.crt.pem` and `rootcastore.crt.pem` from the certs folder (to the import folder of NetWitess server):
   ```
   cp rootcastore.crt.pem /etc/pki/nw/trust/import
   cp keystore.crt.pem /etc/pki/nw/trust/import
   ```

   Note: Before you copy the files from UCF to NetWitness Admin server, examine the files to remove any blank lines and save them.

3. SSH to NW-server box
   a. Run the update-admin-node command:
      `orchestration-cli-client --update-admin-node`
   b. Restart the RabbitMQ service:
      `systemctl restart rabbitmq-server`
   c. Restart the SMS service:
      `systemctl restart rsa-sms.service`

      Note: This step is mandatory to avoid receiving the "message bus down" error message which indicates that the EventSourceMessagePublisher has failed to reconnect to RabbitMQ on restart. This can cause some features such as deleting event sources to function improperly.

   d. Create user archer and set permissions for the virtual host '`/rsa/system`'
      ```
      rabbitmqctl add_user archer archer
      rabbitmqctl clear_password archer
      rabbitmqctl set_permissions -p /rsa/system archer ".*" ".*" ".*"
      ```

Step 3: Forward Alerts to the NetWitness Respond

- To forward NetWitness ESA Correlation alerts to the NetWitness Respond:
  a. Go to  **(Admin) > Services > ESA** service.
  b. Select an **ESA Correlation** service and select  **> View > Explore**.
  c. Navigate to the Correlation option in the left panel and select the Alert option.
  d. Edit the respond-enabled option to TRUE.
  e. Restart the Correlation server.

- To forward NetWitness Reporting Engine alerts to NetWitness Respond:
  a. Go to **(Admin) > Services > Reporting Engine** service.
  b. Select the **Reporting Engine** service, and then select **> View > Config**.
  c. Click the **General** tab.
  d. In the **System Configuration section**, select the **Forward Alerts to Respond** checkbox and click **Apply**.
- To forward NetWitness Malware Analysis alerts to NetWitness Respond:
  a. Go to **(Admin) > Services > Malware Analysis** service
  b. Select the **Malware Analysis** service, and select > **View** > **Config**.
  c. Click the **Auditing** tab.
  d. In the **Respond Alerting** panel, verify that the **Enabled Config Value** checkbox is selected. If the checkbox is not selected, select the checkbox, and click **Apply**.

Step 4: Forward Endpoint Alerts to the NetWitness Respond

You can forward Endpoint alerts to the Archer GRC through NetWitness Respond. For more information on how to Configure NetWitness Endpoint Alerts via Message Bus, see "Configure NetWitness Endpoint Alerts via Message Bus" in the *NetWitness Endpoint Integration Guide*.

Step 5: Aggregate Alerts into Incidents

The Respond Server service consumes alerts from the message bus and normalizes the data to a common format (while retaining the original data) to enable simpler rule processing. It periodically runs rules to aggregate multiple alerts into an incident and set some attributes of the Incident (for example, severity, category, and so on). For more information on aggregating alerts, see the "Configure Alert Sources to Display Alerts in Respond View" topic in the *NetWitness Respond Configuration Guide*.

To configure alert aggregation:

1. Go to **(Configure) > Incident Rules**.
2. To enable the rules provided out-of- the-box:
   a. Double-click the rule.
   b. Select **Enabled**.
   c. Click **Save**.
   d. Repeat steps a-c for each rule.
3. To add a new rule:
   a. Click **Create Rule**.
   b. Select **Enabled**.
   c. Enter the values in the following fields:

- Rule Name
- Action
- Match Conditions
- Grouping Options
- Incident Options
- Priority
- Notifications

4. Click **Save**.

Configure Endpoints in Unified Collector Framework

Endpoints provide the connection details required for the UCF to reach both your NetWitness and Archer GRC systems.

Note: Some endpoints are necessary to use different integrations. The following list shows the mandatory endpoints.

Mandatory Endpoint Integration

- Archer Push endpoint
- Archer Pull endpoint
- Mode selection: SecOps or Non SecOps mode.

Note:
• If Non SecOps mode is selected, incidents are managed in NetWitness Respond instead of Archer Cyber Incident & Breach Response.
• You must configure the port depending on the protocol (TCP, UDP, or secure TCP).
• Make sure the certificate subject name for your Archer GRC server matches the hostname.

Procedure

1. On the UCF system, open the Connection Manager, as follows:
   a. Open a command prompt.
   b. Change directories to `<install_dir>\SA IM integration service\data-collector`.
   c. Enter `runConnectionManager.bat`.
2. In the **Connection Manager**, enter **1** for Add Endpoint.
3. Add an endpoint for pushing data to Archer Cyber Incident & Breach Response, as follows:
   a. Enter the number for Archer.

      Note: Enable SSL to add the Archer endpoints.

   b. For the endpoint name, enter **push**.

c. Enter the URL of your Archer GRC system.

d. Enter the instance name of your Archer GRC system.

e. Enter the user name of the user account you created to push data into your Archer GRC system.

f. Enter the password for the user account you created to push data into your Archer GRC system, and confirm the password.

g. When prompted if this account is used for pulling data, enter **False**.

4. Add an endpoint for pulling data from Archer Cyber Incident & Breach Response, as follows:

a. Enter the number for Archer.

> **Note:** SSL must be enabled to add the Archer endpoints.

b. For the endpoint name, enter **pull**.

c. Enter the URL of your Archer GRC system.

d. Enter the instance name of your Archer GRC system.

e. Enter the user name of the user account you created to pull data from your Archer GRC system.

f. Enter the password for the user account you created to pull data from your Archer system, and confirm the password.

g. When prompted if this account is used for pulling data, enter **True**.

5. Add an endpoint for NetWitness:

- For Respond

a. Enter the number for NetWitness IM.

b. Enter a name for the endpoint.

c. Enter the SA Host IP address.

d. For SA Messaging Port, enter **5671**.

e. Enter the target queue for remediation tasks. Selecting All processes both the Archer Integration (GRC) and IT Helpdesk (Operations).

f. When prompted to automatically add certificates to the SA trust store, enter **No**.
The certificates are added manually in previous steps.

> **Note:** If the auto upload of certificates is preferred, then user account credentials cannot be guest/guest. Instead, deploy_admin credentials can be used.

g. In UCF connection manager, select the mode, as follows:

i. Enter the number for Mode Selection.

ii. Select Manage incident workflow exclusively in Archer Cyber Incident & Breach Response from the drop-down.

> **Note:** Make sure you select the second option as the first option is not supported in NetWitness Platform 11.x release.

- For Reporting Engine and ESA Correlation
  a. To use third-party integrations, add the Syslog Server Endpoint, as follows:
     i. Enter the number for Syslog Server Endpoint.
     ii. Enter the following:
     - User defined name
     - SSL Configured TCP port number

       Note: Defaults to 1515. If you do not want to host the Syslog server in this mode, enter **0**.
     - TCP port number - Enter the TCP port if the Syslog client sends the Syslog message in TCP mode.

       Note: Defaults to 1514. If you do not want to host the Syslog server in this mode, enter **0**.
     - UDP port number - Enter the UDP port if the Syslog client sends the Syslog message in UDP mode.

       Note: Defaults to 514. If you do not want to host the Syslog server in this mode, enter **0**.

     By default, the Syslog server runs in the above three modes, unless it is disabled by entering **0**.
  b. To test the Syslog client, enter the number for Test Syslog Client. Use the Test Syslog client with the files from `<install_dir>\SA IM integration service\config\mapping\test-files\`.

6. In the Connection Manager, enter **5** to test each endpoint.

Configure Reporting Engine for Integration with Archer Cyber Incident & Breach Response

To configure Syslog Output Action for the Reporting Engine:

1. Go to  **(Admin) > Services**.
2. Select the **Reporting Engine** service, and click  **View** > **Config**.
3. Click the **Output Actions** tab.
4. In the **NetWitness Platform Configuration** panel, in the **Host Name** field, enter the host name or IP address of the Reporting Engine server.
5. In the **Syslog Configuration** section, add the Syslog Configuration as follows:

a. In the **Server Name** field, enter the host name of the UCF.

b. In the **Server Port** field, enter the port that you selected in the UCF Syslog configuration.

c. In the **Protocol** field, select the transport protocol.

> **Note:** Configure SSL if you select Secure TCP.

6. Click **Save**.

To configure NetWitness Reporting Engine SSL for Secure Syslog Server:

1. Copy the certificate `keystore.crt.der` from the UCF machine to NetWitness server box at `/usr/lib/jvm/java-1.8.0-openjdk-1.8.0.161-0.b14.el7_4.x86_64/jre/lib/security`.
2. Run the following command:

```
keytool -import -file keystore.crt.der -alias ucf-syslog -keystore /etc/pki/nw/trust/truststore.jks -storepass changeit
```

> **Note:** Do not copy and paste the above command. Type the command to avoid errors.

3. Enable **ServerCertificateValidationEnabled** to **true:**
   - Go to  **(Admin) > Services**.
   - Select  **> View > Explore** of the **Reporting Engine** service .
   - Expand **com.rsa.soc.re** > **Configuration** > **SSLContextConfiguration**.
   - Expand **SSLContextConfiguration** and set **ServerCertificateValidationEnabled** to **true**.
4. Restart the Reporting Engine service by running the following command:
   `service rsasoc_re restart`

To configure rules in NetWitness Platform:

1. Go to **Reports > Manage**.
   The Manage tab is displayed.
2. In the **Rules > Groups** panel, click **+**.
3. Enter a name for the new group.
4. Select the group you created, and in the Rule toolbar, click **+**.
   1. In the **Rule Type** field, select **NetWitness Platform DB**.
5. Enter a name for the rule.
6. Enter values in the **Select** and **Where** fields based on the rule that you want to create.

> **Note:** Add the Syslog configuration with the Syslog name set above.

7. Click **Save**.

Note: To see the same number of alerts in the Reporting Engine and Archer GRC, make sure that you have selected **Once** for execute in both the Syslog and Record tabs.

To add Alert Templates for the Reporting Engine in NetWitness Platform:

The UCF syslog configuration contains out-of-the-box alert templates that you can use to create an alert with a syslog output action. These templates define the criteria used to aggregate alerts into incidents in your Archer GRC Platform.

The sample templates are located in the following location on the UCF system:

`<install_dir>\SA IM integration service\config\mapping\templates\SecOps_SA_Templates`

1. Go to **Reports > Manage > Alerts**.
2. Select the **Template** tab and click +.

Note: After you copy the template in the Create/Modify Template window, make sure to replace `cs25=${sa.host} cs25Label=sahost` to `cs25=${nw.host} cs25Label=nwhost`.

3. In the **Name** field, enter a name for the alert template.
4. In the **Message** field, enter the alert message.
5. Click **Create**.
6. Repeat steps 3 to 6 for each alert template that you want to add.

To Configure Alerts in NetWitness Platform:

In NetWitness Reporting Engine, an alert is a rule that you can schedule to run on a continuous basis and log its findings to several different alerting outputs.

1. Go to **Reports > Manage > Alerts**.
2. Click +, select **Enable**, then Select the rule you created.
3. Select **Push to Decoders**.

   Note: If you do not enter a value in this field, the link in the Archer Security Alerts application to NetWitness does not work.

4. From the Data Sources list, select your data source.
5. In the **Notification** section, select **Syslog**.
6. Click + and complete the Syslog configuration fields.
7. In the **Body Template** field, select the template that you want to use for this Syslog alert.
8. Click **Save**.

Configure ESA Correlation for Integration with Archer Cyber Incident & Breach Response

To configure ESA Correlation Syslog Notification Settings in NetWitness:

1. Go to  **(Admin) > System > Global Notifications**.
2. Click the **Output** tab.
3. Define and enable an ESA Correlation Syslog notification.
4. Click the **Servers** tab.
5. Define and enable a Syslog notification server.
6. In the Syslog Server Configuration section, enter the following:

   Field Description:

   - Name - Specify the custom name.
   - Server IP (Hostname) - Specify the hostname or IP Address of the system on which you installed the UCF.
   - Port - Specify the port number on which you want the UCF to listen.
   - Facility - Specify the Syslog facility.
   - Protocol - Select the protocol.
7. Click **Save**.

To configure NetWitness Platform ESA Correlation SSL for Secure Syslog Server:

If the Syslog server is configured with Secure TCP, configure the SSL.

1. Copy the `keystore.cert.pem` from UCF machine to NetWitness server.
2. Run the following command:

   ```
   security-cli-client --add-trusts --service integration-server --superuser-id admin --superuser-pwd netwitness --chain-file <path to keystore.cert.pem file>
   ```
3. Restart the integration server by running the following command:

   ```
   service rsa-nw-integration-server restart
   ```

To Add ESA Correlation Alert Templates

The UCF syslog configuration contains out-of-the-box alert templates that you can use to create an alert with a syslog output action. These templates define the criteria used to aggregate alerts into incidents in your Archer GRC Platform.

The sample templates are located in the following location on the UCF system:

`<install_dir>\SA IM integration service\config\mapping\templates\SecOps_SA_Templates\SecOps_SA_ESA_templates.txt`

1. Select  **(Admin) > System > Global Notifications**.
2. Click the **Templates** tab and click .
3. In the **Template Type** field, select ESA Correlation.
4. In the **Name** field, enter the name for the template.
5. 6. (Optional) In the **Description** field, enter a brief description for the template.

6. 7. In the **Template** field, enter the alert message.
7. 8. Click **Save**.
8. 9. Repeat steps 3 – 8 for each alert template that you want to add.

To Create ESA Correlation Rules

1. Click  **(Configure) > ESA Rules**.
2. In the **Rule Library**, click ✚.
3. Select **Rule Builder**.
4. In the **Rule Name** field, enter a name for the rule.
5. In the **Description** field, enter a description for the rule.
6. Select the **Severity**.
7. In the **Condition** panel:
   a. Click ✚ to build a statement.
   b. Enter a name, select a condition type, and add meta data/value pairs for the statement.
   c. Click **Save**.
   d. Repeat steps a – c until you have built all the statements for the rule.
8. In the **Notifications** section, select **Syslog**.
9. Select the notification, Syslog server, and template that were created previously.
10. Click **Save** and click **Close**.
11. In the Deployments section, click .
12. Click ✚ and enter a deployment name.
13. Click ✚ for ESA Correlation services section.
14. Select the ESA Correlation Service.
15. In the Data Source section, click ✚ and select a data source.
16. Click **Save**.
17. In the **ESA Correlation Rules** section, click ✚ to select the ESA Correlation Rule that you created.
18. Click **Save**.
19. Click **Deploy Now**.

Archer Feeds

By default, only the IP address and Criticality Rating fields in the Archer Devices application are fed into NetWitness by the SA IM Integration Service. You can customize the Enterprise Management plug-in to include the Business Unit and Facility fields that are cross-referenced in the Devices application in the feed. For more details, see Archer documentation at https://www.archerirm.community/t5/exchange-overviews/archer-exchange-offering-list/ta-p/672315.

Note: If you want to feed Business Unit and Facility information from your Archer GRC Platform into Live, you must also add keys for these fields in the index-concentrator-custom.xml file.

Update the Concentrator and Decoder Services

The SA IM Integration Service in Archer Cyber Incident & Breach Response manages the files for a custom feed and deposits these files in a local folder that you specify when you configure the Enterprise Management Endpoint. The Live module of NetWitness retrieves the feed files from this folder. Live then pushes the feed to the Decoders, which start creating metadata based on the captured network traffic and the feed definition. To enable the Concentrator to detect a new metadata created by the Decoders, make sure to edit the `index-concentrator-custom.xml`, `index-logdecoder-custom.xml`, and `index-decoder-custom.xml` files.

1. Select  **(Admin) > Services**.
2. Select the **Concentrator** and select  > **View > Config**.
3. Click the **Files** tab.
4. From the drop-down list, select the `index-concentrator-custom.xml` file. Do one of the following:
   - If content already exists in the file, add a key for the new metadata element:

     ```
     <key description="Criticality" format="Text" level="IndexValues"
     name="criticality" defaultAction="Open"/>
     ```

     Note: Do not copy and paste above command . Type the command to avoid errors.
   - If the file is blank, add the following content:

     ```
     <?xml version="1.0" encoding="utf-8"?>
     <language level="IndexNone" defaultAction="Auto">
     <key description="Criticality" format="Text" level="IndexValues"
     name="criticality" defaultAction="Open"/>
     </language>
     ```
5. Click **Apply**.
6. To add multiple devices:
   a. Click **Push**.
   b. Select the devices to which you want to push this file.
   c. Click **OK**.

7. Repeat steps 1 to 6 for the Log Decoders and Index Decoders, using index-logdecoder-custom.xml and index-decoder-custom.xml.
8. Restart the Concentrator and Decoder services by running the following commands:
```
service nwdecoder restart
service nwconcentrator restart
```

Add the Archer Enterprise Management Endpoint in UCF

1. In the UCF connection manager, select the mode:
   a. Enter the number for Mode Selection.
   b. Select one of the following options:
      - Manage incident workflow in NetWitness.
      - Manage incident workflow exclusively in Archer Cyber Incident & Breach Response.
2. Add the Archer Enterprise Management Endpoint:
   a. Enter the number for Enterprise Management.
   b. Enter the values in the fields as described in the table below.

Field	Description
Endpoint Name	Optional endpoint name.
Web Server Port	Defaults to 9090. You can configure this to host the web server url by providing the URL with the port number as in the NetWitness live feed: http://hostname:port/archer/sa/feed.
Criticality	Criticality of the assets to be pulled from Archer GRC. If **false**, pull assets with any criticality. If **true**, pull assets with only high criticality. To configure this manually, edit the em.criticality property in the collector-config properties file to provide a comma-separated list of criticalities: LOW, MEDIUM, HIGH.
Feed Directory	Directory where the assets CSV file from Archer GRC are saved. **Note:** The directory path provided must exist.
Web Server Username	Username for authenticating to the EM web server.
Web Server Password	Password for authenticating to the EM web server.

Field	Description
SSL Mode	Defaults to No. If **No**, the URL uses `http mode: http://hostname:port/archer/sa/feed` If you have not updated the host file, see "Update the NetWitness Host File" section. **Note:** NetWitness currently does not support Archer recurring feeds in SSL mode.

Update the NetWitness Platform Host File

1. Edit the host file on the NetWitness server at the following location: `vi /etc/hosts`.
2. Enter the following for the UCF host IP address:

   `<ucf-host-ip> <ucf-host-name>`
3. Restart NetWitness server by running the following command:

   `service jetty restart`
4. While configuring the NetWitness live feed, enter the host name for the URL instead of the IP address and the port number configured for Enterprise Management endpoint in the UCF:

   `http: //<ucf-host-name> : <EM_Port>/archer/sa/feed.`
5. Verify that the connection works.

Create a Recurring Feed Task

For NetWitness to download feed files from the NetWitness Respond Integration Service and push the feeds to Decoders, you must create a recurring feed task and define the feed settings.

Note: For Archer Cyber Incident & Breach Response 1.2: For NetWitness to download feed files from the UCF machine and push the feeds to Decoders, you must create a recurring feed task and define the feed settings. The procedure is similar to Archer Cyber Incident & Breach Response 1.3, with a few exceptions. See documentation on the Archer Exchange Community for details.

1. Select  **(Configure) > Custom Feeds**.
2. In the **Feeds** view, Click **+**.
3. Select **Custom Feed**, and click **Next**.
4. Select **Recurring**.
5. Enter a name for the feed.
6. In the URL field, enter the following:

   `http://ucf_hostname/archer/sa/feed`

   where, *`http :ucf_hostname_or_ip:port`* is the address of the NetWitness Respond Integration Service system. For example: `http://<ucf-host-name>` .
7. Select **Authenticated**.

8. In the **User Name** and **Password** fields, enter the credentials of the user account you created in the Add the Archer Enterprise Management Endpoint in UCF procedure.
9. Define the recurrence interval for the feed.
10. In the **Date Range** panel, define a start and end date for the feed, and click **Next.**
11. Select each Decoder to which you want to push this feed, and click **Next**.
12. In the **Type** field, amke sure that IP is selected.
13. In the **Index Column** field, select 1.
14. In the second column, set the Key value to criticality, and click **Next**.
15. Review your feed configuration details and click **Finish**.

Manage Unified Collector Framework

This section provides additional tasks for configuring and managing the UCF for Archer Cyber Incident & Breach Response 11.3.1.2 Integration.

Start the Unified Collector Framework

1. Click **Control Panel > Administrative Tools > Services**.
2. Select **RSA Unified Collector Framework**.
3. Click **Start**.

Stop the Unified Collector Framework

1. Click **Control Panel > Administrative Tools > Services**.
2. Stop the Archer Cyber Incident & Breach Response WatchDog Service.

   Note: If you do not stop the Watchdog service, the Watchdog service starts the NetWitness Respond Service.

3. Select **RSA Unified Collector Framework**.
4. Click **Stop**.

Note: If the service takes too long to shutdown, use the Task Manager to end the RSASAIMDCService.

Uninstall the Unified Collector Framework

1. Click **Control Panel** > **Programs and Features**.
2. Select **RSA Unified Collector Framework**.
3. Click **Uninstall**.

Troubleshoot Archer Integration

This section provides resolutions to common problems that you may encounter while configuring Archer Cyber Incident & Breach Response 1.3.1.2 with NetWitness Respond.

Problem	After adding the endpoint for IM: NetWitness Respond the Certificate Authority truststore fails to set.
Solution	1. Make sure that the SSH credentials for the NetWitness host are valid. 2. If the credentials are correct, but the error still occurs, manually copy certificates.

Problem	Remediation Tasks being pushed to the operations queue through the UCF are not appearing in Archer Cyber Incident & Breach Response as Findings.
Solution	1. Open the Connection Manager using the command prompt: • `Change directories to <install_dir>\SA IM integration service\data-collector.` • `Type: runConnectionManager.bat` 1. Enter **2** to edit endpoint. 2. Enter **3** to NetWitness Respond. 3. Make sure the Target Queue is set to **All** or **Operations**.

Problem	In the `<install_dir>\SA IM integration service\logs\collector.log`, there are SSL errors between NetWitness and RSA Unified Collector Framework.
Solution	Verify that the SSL certificates are valid. **Note:** NetWitness Respond certificates are valid for two years. If your certificates are expired, regenerate and copy the expired certificates. **To regenerate and copy the certificates:** 1. In the Command Prompt, go to `<install_dir>\SA IM integration service\data-collector`. 2. Enter `runConnectionManager.bat` 3. Enter the number for Regenerate NetWitnessRespondIntegration Service Certificate. 4. In the NetWitness Respond endpoint, in Connection Manager, enter the number for Edit Endpoint. 5. Enter **Yes** to copy the certificates automatically to the NetWitness trust store. **Note:** If certificates fail to copy, manually copy the certificates.

Problem	NetWitness unable to forward incidents to UCF.

Solution	1. In the collector config (`C:\PROGRAM FILES\RSA\SA IM INTEGRATION SERVICE\CONFIG\collector-config`), change the following:
	`im.virtualhost=/rsa/im/integration`
	to
	`im.virtualhost=/rsa/system`
	2. Restart UCF. For more information on restarting UCF, see Start the Unified Collector Framework.
	3. In the data collector (`C:\PROGRAM FILES\RSA\SA IM INTEGRATION SERVICE\data-collector`), double click on the following file to run it.
	`runConnectionmanager.bat`

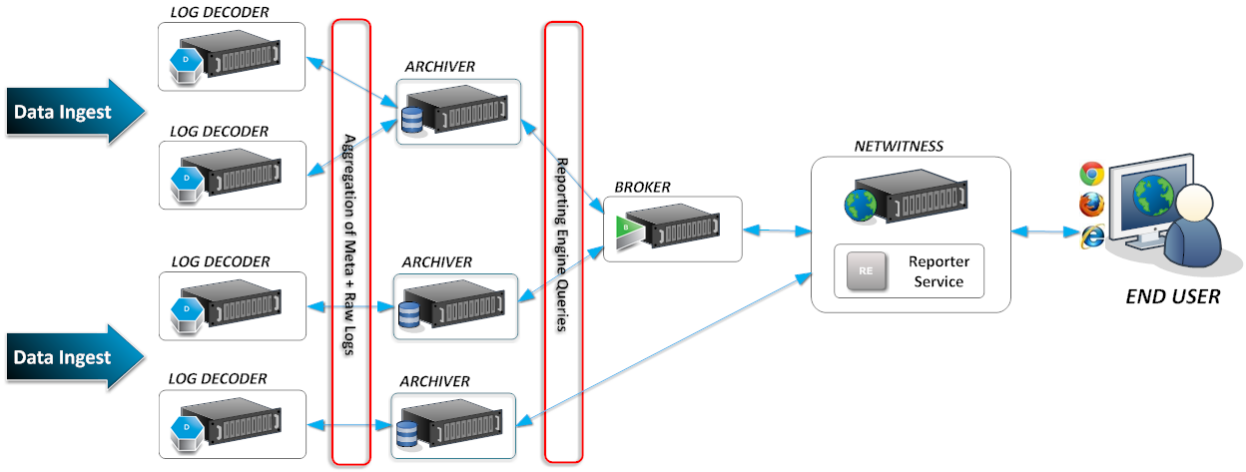
Archiver Overview



This guide provides detailed instructions on how to configure Archiver in your network, additional procedures that are used at other times, and reference materials that describe the user interface for configuring Archiver in your network.

The NetWitness Archiver is an appliance that enables long-term log archiving by indexing and compressing log data and sending it to Archiving storage. The Archiving storage is then optimized for long-term data retention and compliance reporting.

Archiver stores raw logs and log meta from Log Decoders for long-term retention and it uses Direct-Attached Capacity (DAC) for storage.

Note: Raw packet and packet meta are not stored in the Archiver.

The following figure depicts the architecture of a NetWitness network that implements the Archiver.

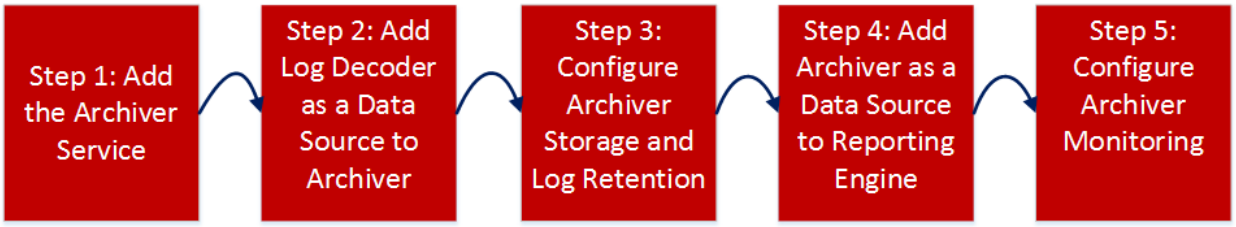
Configuring an Archiver

The NetWitness Archiver is an appliance that enables long-term log archiving by indexing and compressing log data and sending it to Archiving storage. The Archiving storage is then optimized for long-term data retention and compliance reporting.

Archiver stores raw logs and log meta from Log Decoders for long-term retention and it uses Direct-Attached Capacity (DAC) for storage.

Note: Raw packet and packet meta are not stored in the Archiver.

Prerequisites



Ensure that you have:

- Installed the Archiver host in your network environment.
- Installed and configured Log Decoder in your network environment.

If you want to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them, refer to **Group Aggregation** in the *Deployment Guide*.

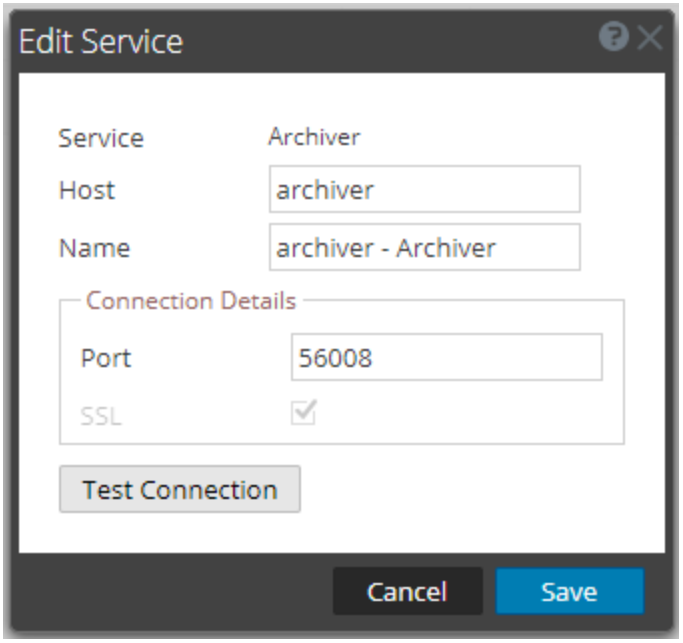
Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver.

The following table describes the basic steps for configuring an Archiver.The tasks must be completed in the sequence they are given.

Configuration Step	Description
Edit the Archiver Service	Provides information on how to add an Archiver service to the Archiver host and apply a license to it.
Add Log Decoder as a Data Source to Archiver	Provides instructions on how to add a Log Decoder to an Archiver.

Configuration Step	Description
Configure Archiver Storage and Log Retention	Provides instructions on how to configure storage and log retention on an Archiver.
Add Archiver as a Data Source to Reporting Engine	Provides instructions on how to add an Archiver as a data source to Reporting Engine to generate reports for the data collected by an Archiver.
Configure Archiver Monitoring	Provides instructions on how to configure the alert mechanism related to Archiver storage.



Edit the Archiver Service

To add an Archiver service, ensure that you have installed an Archiver host on which you want to run the Archiver service. See "Step 1: Add or Update Host" topic in the *Host and Services Getting Started Guide* for the procedure that explains how to add a host.

Perform the following steps to edit the Archiver service:

1. Go to **(Admin) > Services**.
   The Services panel is displayed.

2. Select an Archiver service and click in the **Services** panel toolbar.
   The Edit Service dialog is displayed.

3. Provide the following details.

Field	Description
Host	Select a host from the drop-down menu.
Name	Type a name for the service.
Port	Default port is 50008.
SSL	Select **SSL** if you want NetWitness to communicate with the service using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates. **Note:** If you select SSL, ensure SSL is enabled in the System Configuration panel.

Field	Description
Username	(Optional) Type the username for the service.
Password	(Optional) Type the password for the service.
Entitle Service	Select if you want to apply the entitlements currently configured to this service. For more information, see "Entitlement Capability Implementation" topic in the *Licensing Guide*.

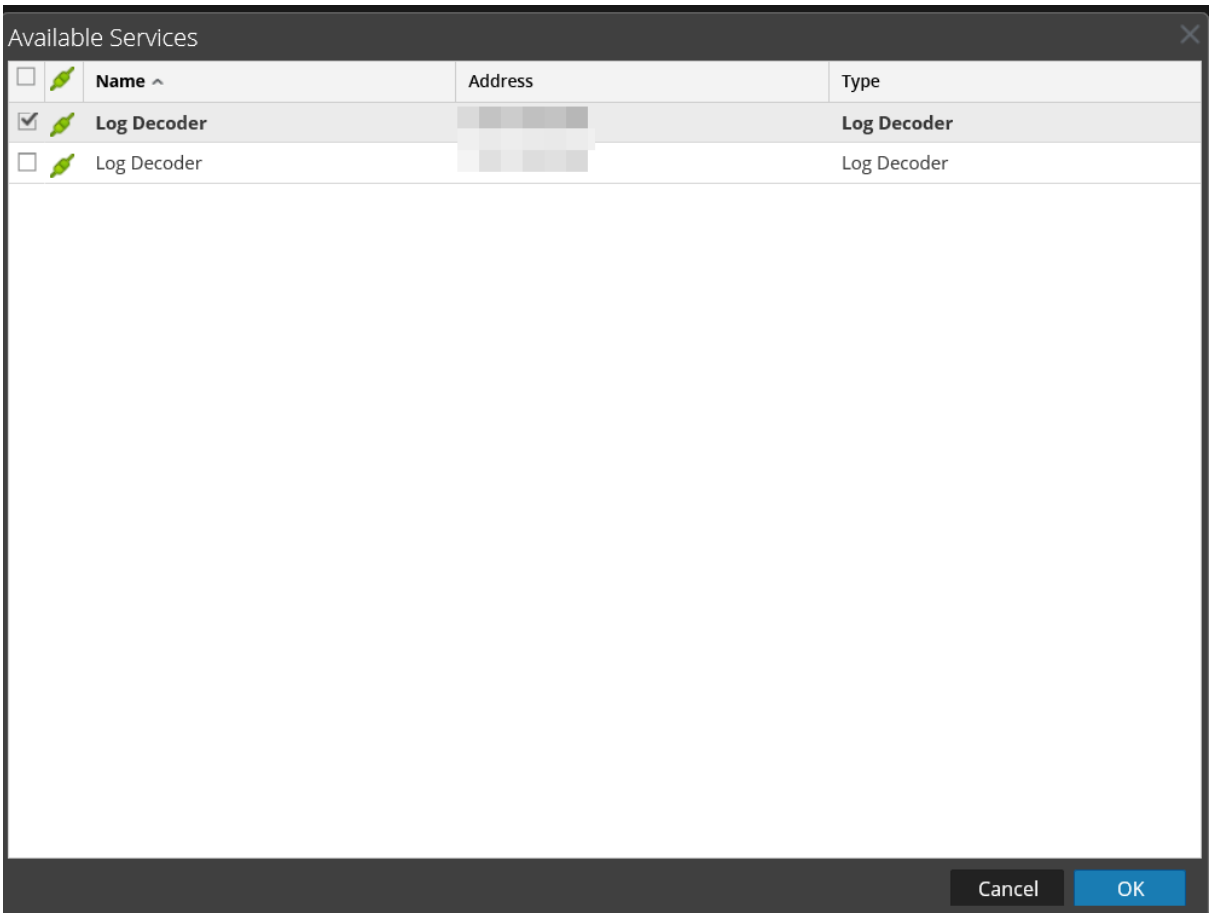
4. Click **Test Connection** to determine if NetWitness connects to the service.
5. When the result is successful, click **Save**.

   The edited service is now displayed in the services panel.

   Note: If the test is unsuccessful, edit the service information and retry.

6. Apply license to the Archiver service.

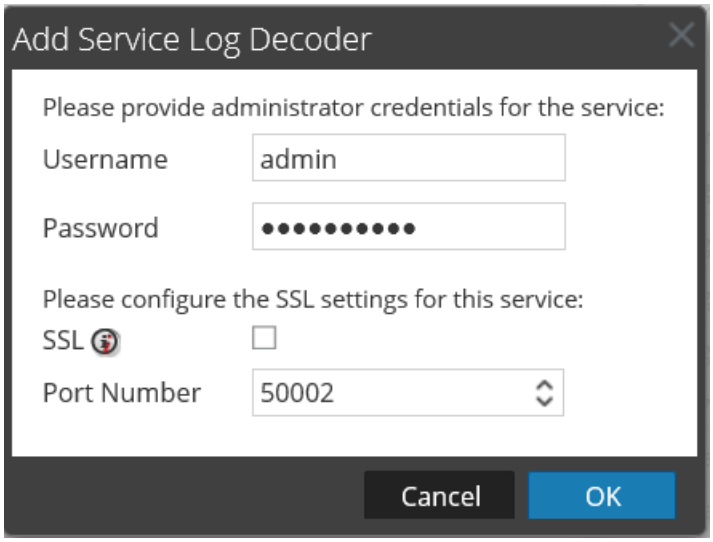
   Refer to the "Synchronize NetWitness Server**"** topic in the *Licensing Guide* for details on the procedure to activate (apply a license to) the Archiver service.



Add Log Decoder as a Data Source to Archiver

To add a Log Decoder as a data source to Archiver, you need to have installed the Archiver host in your network environment, installed and configured a Log Decoder in your network environment, and added the Archiver host to NetWitness and make sure the Archiver service shows as active and licensed.

Add Log Decoder as a Data Source to Archiver



To add a Log Decoder as a data source to an Archiver:

1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click **> View > Config**.
   The Services Config view of Archiver is displayed.
3. On the **General** tab, in the **Aggregate Services** panel, click .
   The Available Services dialog is displayed.

4. Select the Log Decoder service to add as a data source to the Archiver and click **OK**.

5. If the Log Decoder is using the trust model, an Add Service dialog is displayed.

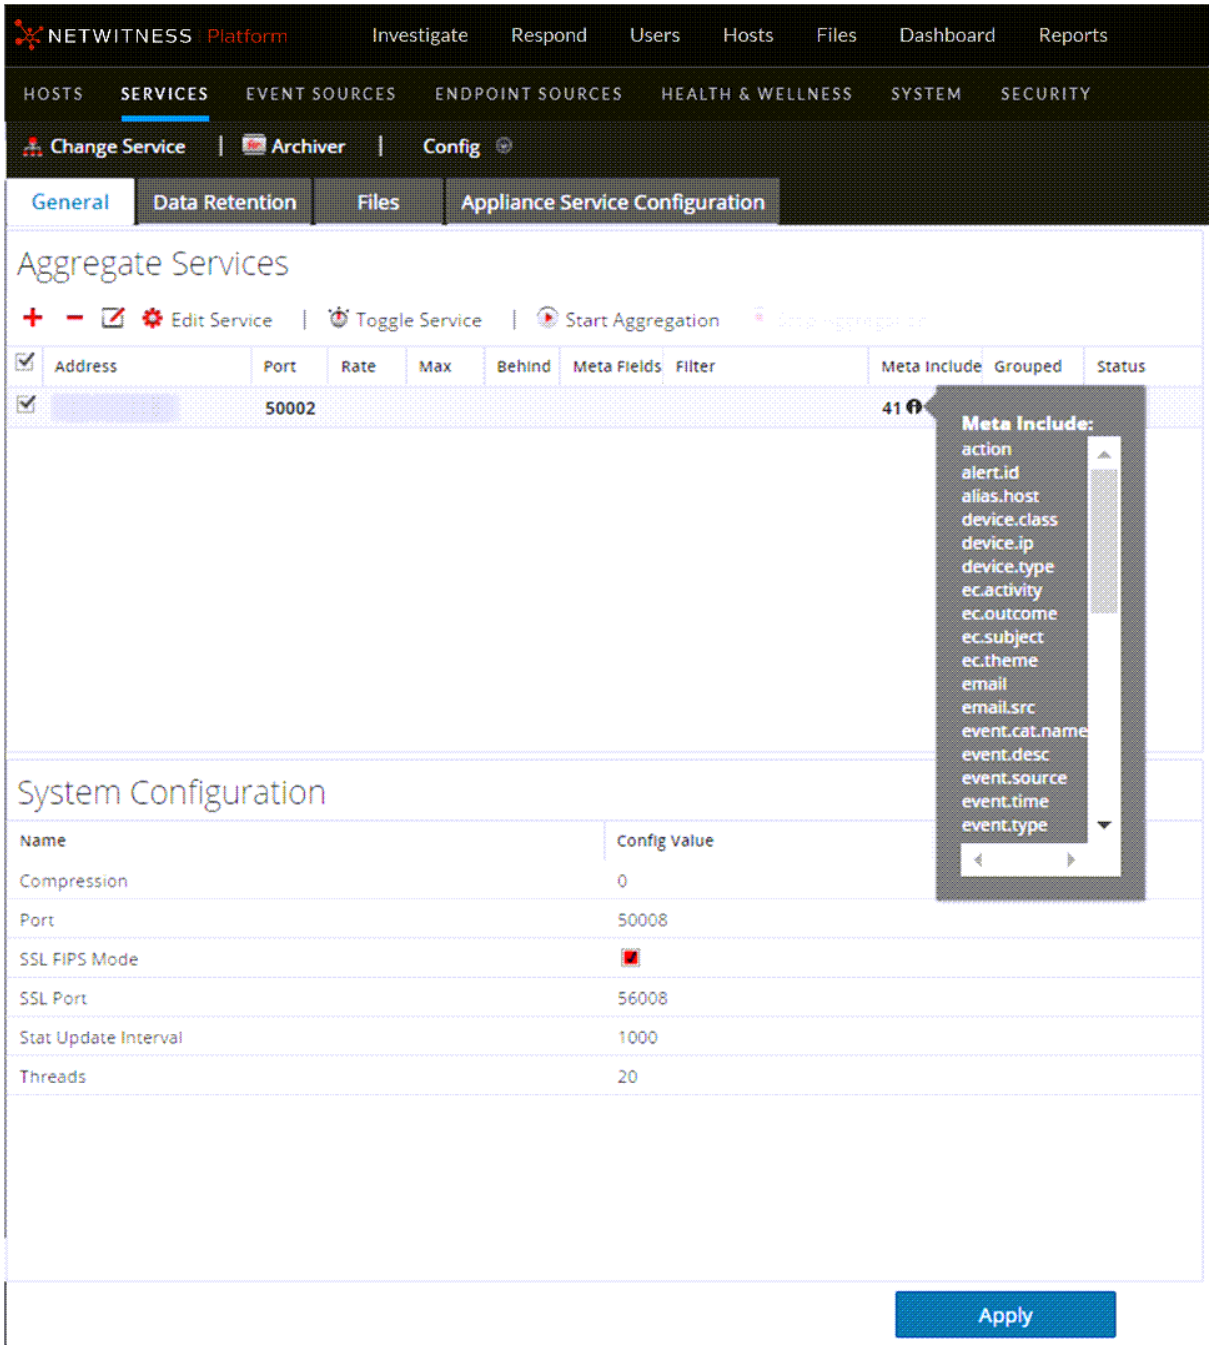
6. Type the username and password for the Log Decoder, and configure the SSL settings.
7. Click **OK**.
   The selected Log Decoder service is listed in the **Aggregate Services** panel.

Archiver Meta Settings Considerations

To maximize retention time, the meta items and index of the Archiver have been reduced (when compared to the Concentrator) to support common reporting needs. This means that, by default, you may not be able to run all of the reports you run on the Concentrator on the Archiver. You can view a list of the current meta and index items used by the Archiver in the following locations:

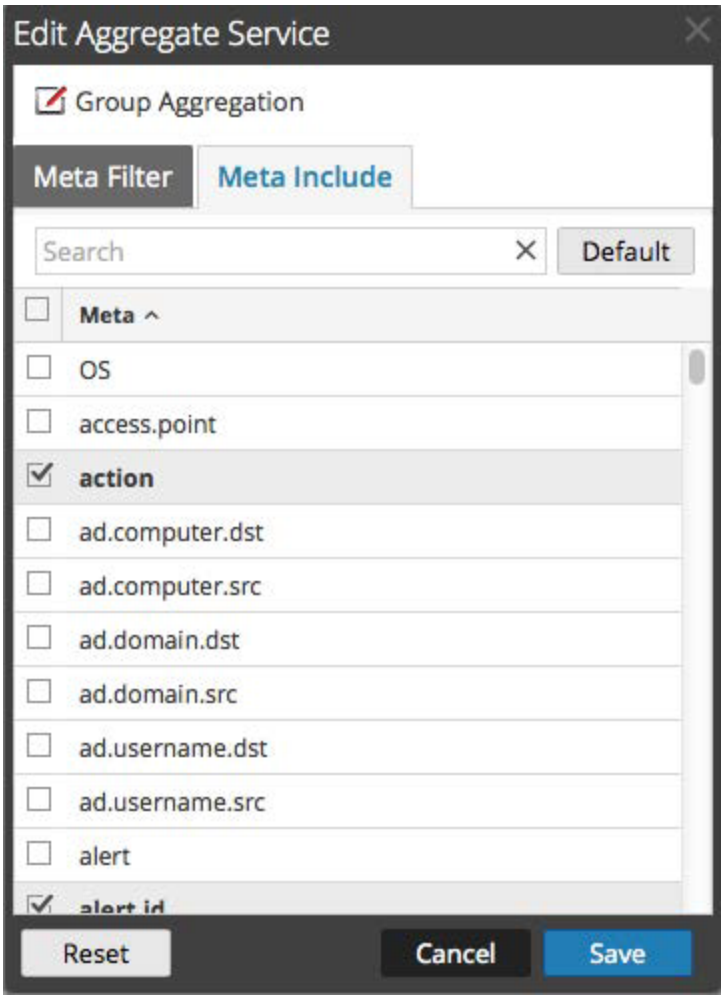
- **Explorer view**: The **/archiver/devices/<logdecoder>/config/options** path in the **metaInclude** field shows the current list of meta items.
- **Config view > Files tab**: The **index-archiver.xml** shows the default index configuration. The **index-archiver-custom.xml** shows any modifications.

The meta items and index of the Archiver can be customized to support customer specific reporting needs, however this will require additional storage, CPU resources, and Memory resources to support, and may impact retention time. As more meta items are added to the Archiver, the maximum aggregation rate will decrease, and the time to execute reports will increase.



See (Optional) Configure Meta Filters for Aggregation and (Optional) Add Index Entries for Archiver Reporting for additional details.

(Optional) Configure Meta Filters for Aggregation



Follow this procedure to view and add additional meta items to the Archiver.

Caution: Adding meta or indexes will require additional storage, CPU resources, and Memory resources to support, and may impact retention time. As more meta items are added to the Archiver, the maximum aggregation rate will decrease, and the time to execute reports will increase.

1. To view the current meta items, in the **Aggregate Services** panel, select the Log Decoder service and click ⓘ in the **Meta Include** field.

2. To add additional meta items, select the Log Decoder service and click ✎.

3. In the Edit Aggregate Service dialog, select the meta items to include in the Meta Include list. For example, you may want to consider including ip.srcport, tcp.srcport, udp.srcport, msg, url, query, bytes, alias.host, ip.dst, ip.dstport, ip.src, tcp.dstport, megabytes, time, event.desc, and word.
4. Click **Save** and then click **Apply**.
5. See (Optional) Add Index Entries for Archiver Reporting below for information on how to index the additional meta keys.

(Optional) Add Index Entries for Archiver Reporting

Caution: Adding meta or indexes will require additional storage, CPU resources, and Memory resources to support, and may impact retention time. As more meta items are added to the Archiver, the maximum aggregation rate will decrease, and the time to execute reports will increase.

The Archiver's default index configuration only includes value indexes for these keys:

- time
- decoder source (did)

- destination user account (user.dst),
- alert ID (alert.id)
- device IP (device.ip)
- source IP address (ip.src)
- destination IP address (ip.dst)
- event description (event.desc)
- device class (device.class)
- medium
- object name (obj.name)
- word

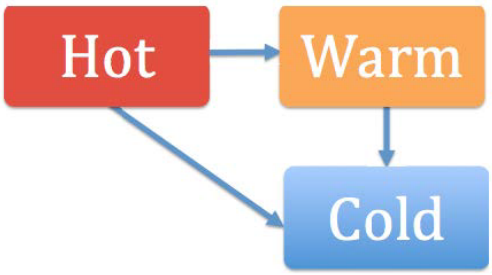
For information on customizing this list, see "Index Customization" in the *Core Database Tuning Guide*.

Configure Archiver Storage and Log Retention

This topic provides instructions for Administrators to configure storage and log retention on an Archiver.

For compliance reasons, it is often necessary to retain some logs longer than other logs. Some logs are legally sensitive and cannot be retained for a long period of time. Other logs have a requirement to be retained for years. In addition to compliance, some logs are useful for historic forensics and other logs have little to no security or operationally relevant value and can be deleted after a short time.

Because business requirements vary, NetWitness enables you to configure Collections, which are log retention sets for storing log data. For each collection, you can specify how much of the total storage space to use and how many days to retain the logs in the collection. To specify the type of logs to put in the collection, you define retention rules to associate with the collections. Retention rules for all of your collections execute sequentially in an order that you define.



To do this, you must first define the total physical storage space for your collections. NetWitness enables you to define three types of storage:

- **Hot Tier Storage**: This storage contains log data that is in active use as part of the business process. Users can access these logs faster than other types of storage and they can use these logs for reporting and other tasks. Hot storage is usually Direct-Access Capacity (DAC) or SAN storage.
- **Warm Tier Storage**: (Optional) This storage contains older log data aggregated by Archiver. Log data access is slower than hot storage. Users can also use these logs for reporting and other tasks. Warm storage is usually Network Attached Storage (NAS).
- **Cold Tier Storage**: (Optional) This storage contains the oldest log data that is either required for the operation of the business or mandated by regulatory requirements. The logs are offline and Archiver cannot access these logs for reporting or other tasks. However, if you want to access this log data, you can restore it to the collections created on the Archiver service and then use it for reporting. Cold storage is usually offline storage, such as NAS, or temporary storage before archiving to tape. Once data moves to the Cold Tier, that data is no longer managed by Archiver. Once moved, it is incumbent on external processes to back it up or manage that Cold Tier space such that it does not reach 100% capacity. If capacity is reached, this will cause the Archiver to stop aggregation until the problem is fixed.

Archivers are preconfigured to use available hot storage and a default log collection, so you do not have to configure Archiver storage and log retention if you do not have complex log retention requirements.

Logs can move from one type of storage to another in the following ways:

- Hot Storage > Cold Storage
- Hot Storage > Warm Storage > Cold Storage

When a collection reaches its retention limits for hot and warm storage, NetWitness deletes the log data from hot or warm storage. With cold storage configured, a copy goes into cold storage before the logs are deleted from hot or warm storage. For example, if you have a collection with Hot Storage of 1 TB, Warm Storage of 1 TB, and Cold Storage enabled, when the log data reaches 1 TB of hot storage, the oldest log data moves to warm storage. When the log data in warm storage reaches 1 TB, the oldest log data from warm storage is copied to cold storage before it is removed from warm storage.

For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first. For example, if you have a collection with Hot Storage of 1 TB, no Warm or Cold Storage, and a Retention period of 20 days, if the Log data exceeds 1 TB after 11 days, the oldest logs over 1 TB are deleted even though the collection has a 20 day retention period.

After you create hot, warm, and cold storage, you configure your log retention storage collections. You can specify the maximum size of the Hot and Warm Storage for the collection, whether to use Cold Storage, the number of days to retain the logs in the collection, the data compression, and whether to use a hash algorithm to be able to verify the data integrity of the files being saved.

After configuring your collections, you define retention rules for your collection. These rules specify the type of logs to be stored in the collection. Each collection must have at least one retention rule associated with it in order to store log data.

Procedure

Perform the following tasks in the order shown to configure storage and log retention.

Task	Reference
1. Configure total hot, warm, and cold storage.	Refer to Configure Hot, Warm, and Cold Storage.
2. Configure log retention storage collections.	Refer to Configure Log Storage Collections.
3. Define retention rules for the collections and determine the order of execution of the overall list of retention rules.	Refer to Define Retention Rules.

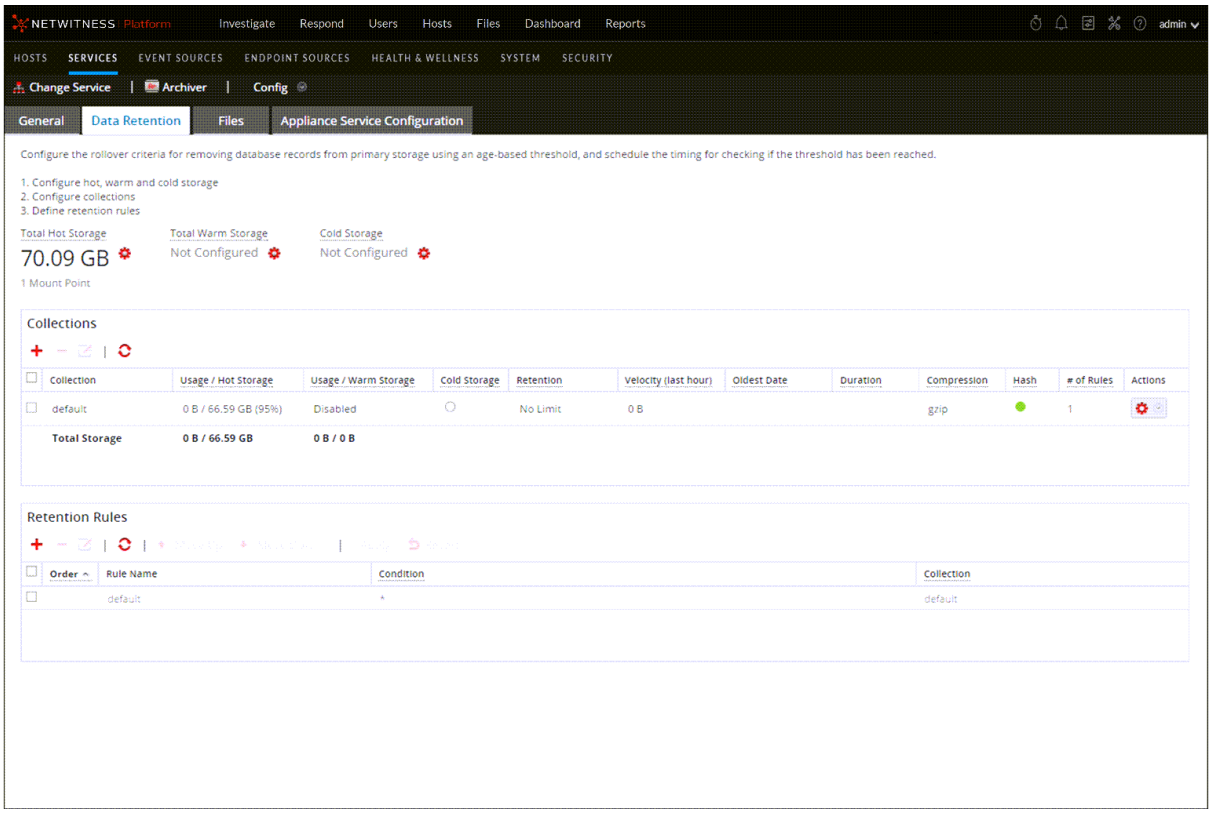
Configure Hot, Warm, and Cold Storage

This topic provides instructions for Administrators on how to configure total hot, warm, and cold storage on an Archiver.

An Archiver host has hot storage pre-configured to the defaults. Administrators can configure total hot, warm, and cold storage to meet their specific business requirements. An Archiver must have total hot storage configured, but warm and cold storage configurations are optional. NetWitness does not manage cold storage.

Prerequisites

Ensure that you have:



1. Installed the Archiver host in your network environment.
2. Installed and configured Log Decoder in your network environment.
3. Added Archiver as a Core service to your NetWitness deployment.
4. Added Log Decoder services as a data source for Archiver.
5. Installed and configured a DAC or other physical storage in your network environment.
6. Determined your log retention and storage requirements.

Procedures

Configure Total Hot Storage for an Archiver

1. Go to  **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click  **> View > Config**.

   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Data Retention** tab, in the **Total Hot Storage** section, click  to configure total hot storage.

4. In the **Hot Storage Mount Points** dialog, add the mount points attached to the Archiver host that you want to include in Total Hot Storage.

   These are the paths to high performance storage, such as DAC storage and SAN. Do not add collections or subdirectories to the mount points.

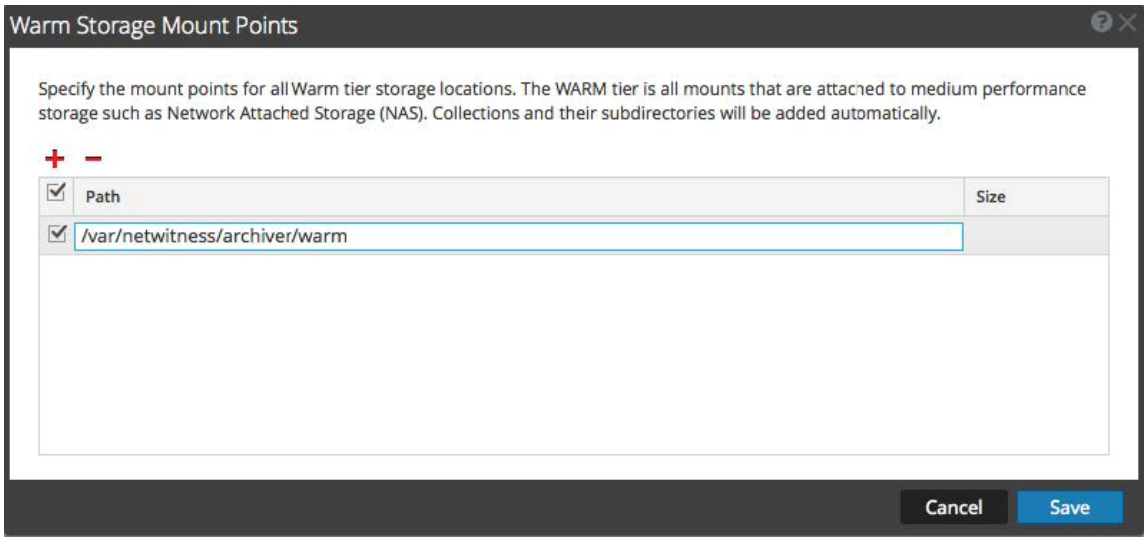
   To add a mount point, click + and type the path to the mount point.

5. Verify that your mount point paths are correct and click **Save**.

NetWitnesswill automatically create metadb, packetdb, sessiondb, and index directories for each collection defined on the Archiver:

```
<storageLocation>/<CollectionName>/metadb
<storageLocation>/<CollectionName>/packetdb
<storageLocation>/<CollectionName>/sessiondb
<storageLocation>/<CollectionName>/index
```

For example, if your mount point is /var/netwitness/archiver, then the following directories will be created for each of your collections:

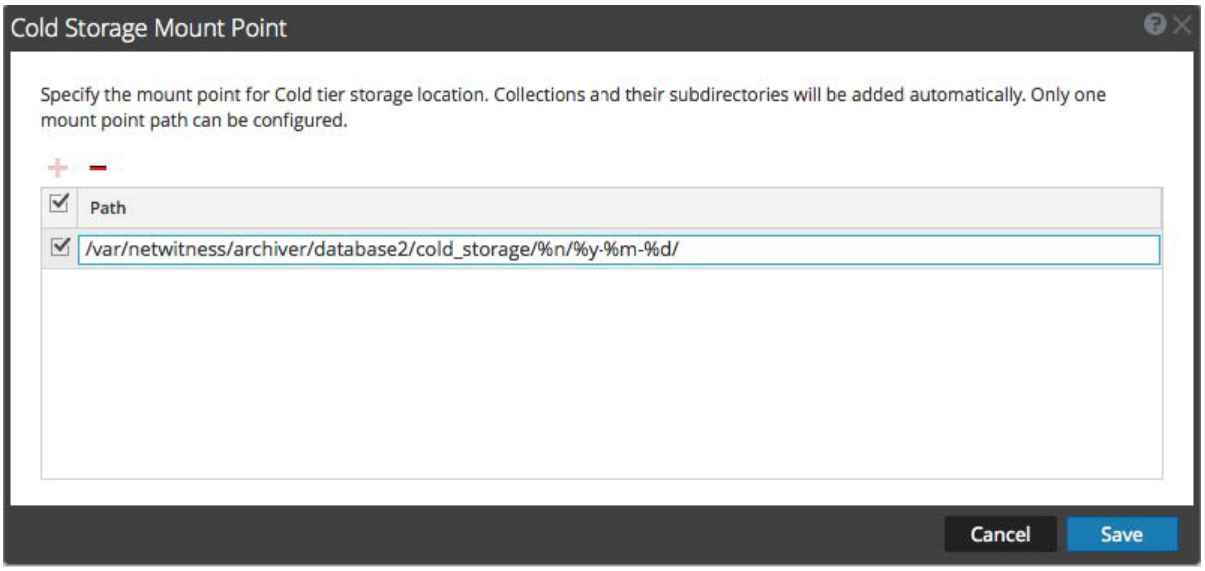


```
/var/netwitness/archiver/<CollectionName>/metadb
/var/netwitness/archiver/<CollectionName>/packetdb
/var/netwitness/archiver/<CollectionName>/sessiondb
/var/netwitness/archiver/<CollectionName>/index
```

After the Archiver service is restarted, data will start being saved to your defined collections. Ensure that your log retention collections are correct before restarting the Archiver service.

Caution: After data has been saved to a mount point, it cannot be removed from the user interface.

Configure Total Warm Storage for an Archiver



(Optional) The procedure to configure Total Warm Storage for an Archiver is the same as for Total Hot Storage, except that you click in the Total Warm Storage section and add the mount points that you want to use for warm storage, which are the physical paths to warm storage, such as Network Attached Storage (NAS).

Configure Total Cold Storage for an Archiver

(Optional) The procedure to configure Total Cold Storage for an Archiver is the same as for Total Hot Storage, except that you click in the Total Cold Storage section and you add only one mount point for cold storage. NetWitness does not manage cold storage.

You must include the collection name format specifier `%n` somewhere in the cold storage mount point path name to avoid filename collisions between collections.

The following format specifiers are allowed in the path:

Format Specifier	Description
%n	collection name (required)
%y	year the data moved to cold storage
%m	month
%d	day
%h	hour
%##r	block of hours for the current day. For example, if you want three 8 hour blocks, you can set it to %8r. The first 8 hours of the day returns 0, the second 8 hours returns 1, and last 8 hours of the day returns 2.

Changes take effect immediately.

For example, if you have a collection named **compliance** and you create the following cold storage path:

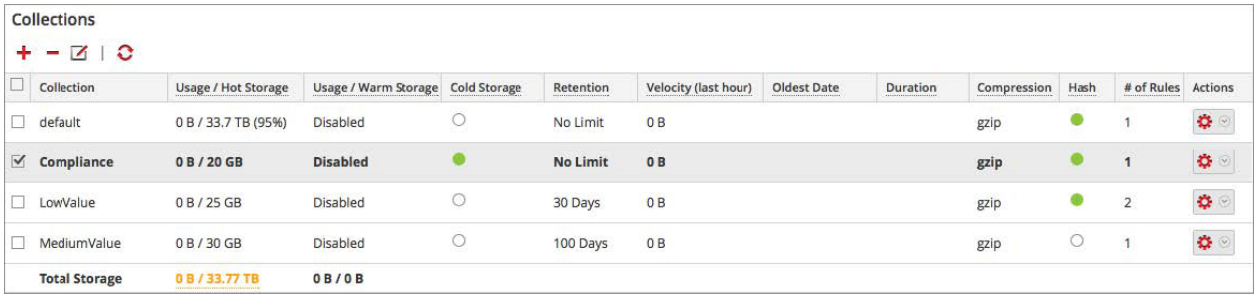
`/sa-cold-storage/%n/%y-%m-%d/`

NetWitness creates a directory each day with the following format:

/sa-cold-storage/compliance/2015-11-20/

Hot, Warm, and Cold Tier Storage Features

The following table describes features of the Hot, Warm, and Cold Tier Storage dialogs.



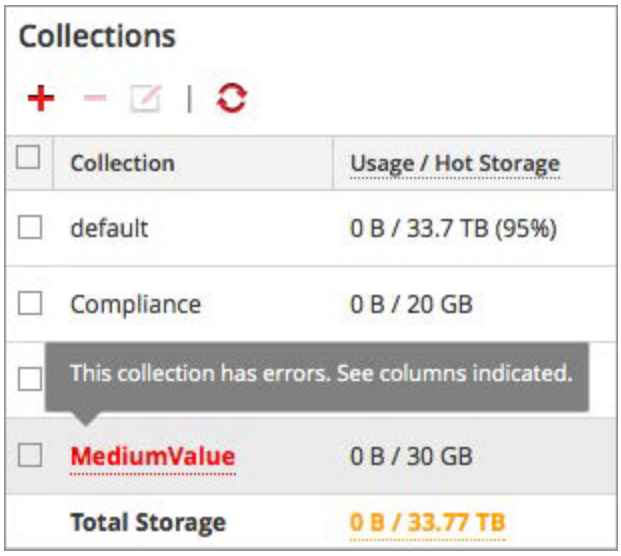
Feature	Description
+	Adds a mount point.
−	Removes a mount point. You cannot delete a mount point that is in use unless you delete the associated collections.
☐	Select the mount points that you want to include for the Total Hot, Warm, and Cold Storage. You can only select one mount point for Total Cold Storage.

Mount Point	Shows the path to the attached physical storage. For example: **/var/netwitness/archiver/database0**, which is the location of the hot storage DAC.
	Do not add collections or subdirectories to the mount points. NetWitness will automatically create metadb, packetdb, sessiondb, and index directories for each collection defined on the Archiver:
	`<storageLocation>/<CollectionName>/metadb`
	`<storageLocation>/<CollectionName>/packetdb`
	`<storageLocation>/<CollectionName>/sessiondb`
	`<storageLocation>/<CollectionName>/index`
	For example, if your hot storage mount point is /var/netwitness/archiver, then the following directories will be created for each of your collections:
	`/var/netwitness/archiver/<CollectionName>/metadb`
	`/var/netwitness/archiver/<CollectionName>/packetdb`
	`/var/netwitness/archiver/<CollectionName>/sessiondb`
	`/var/netwitness/archiver/<CollectionName>/index`
	For Cold Storage, you must include the collection name format specifier `%n` somewhere in the cold storage mount point path name to avoid filename collisions between collections.

Storage Size	Shows the size of the attached storage. The Data Retention tab shows the total amount of storage for your reference.

Collections

The Collections section lists all of your storage collections along with Total Storage for Hot and Warm Storage.



Collections Features

The following table describes the icons and columns of the Collections section. You can hide some of the columns based on your requirements.

Feature	Description
	Opens the Collections dialog, in which you can add a storage collection.
	Removes the selected collection. Deleting the collection permanently removes all stored data from the collection, but the empty data directories remain.
	Opens the Collections dialog, in which you can edit the selected collection.
	Refreshes collection information.
	Selects a collection. For example, you can select a collection for editing or removal.
Collection	Shows the name of your collection, such as Default, Compliance, MediumValue, and LowValue. You can create multiple collections with different criteria for retaining logs. If you do not create any collections, the Default collection is used. If a collection has errors, the collection name and the columns with errors appear in red text.
Usage / Hot Storage	Shows the current hot storage usage and the maximum hot storage for the collection. When the size of the logs reach the maximum hot storage amount, the logs are removed or they roll to the next available storage tier (warm or cold).
Usage / Warm Storage	Shows the current warm storage usage and the maximum warm storage for the collection. When the size of the logs reach the maximum warm storage amount, the logs are removed or they roll to available cold storage.
Cold Storage	Indicates whether cold storage is enabled or disabled. A solid colored green circle indicates that cold storage is enabled ( ). An blank white circle indicates that cold storage is disabled.
Retention	Shows the number of days that logs are retained before being removed or optionally moved to cold storage. No Limit indicates that log retention is not restricted by a specified number of days. For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first.
Velocity (last hour)	Shows the number of logs captured over the last hour.
Oldest Date	Shows the date and time of the last log capture.
Duration	Shows how may days ago that the last log was captured. For example: 20 days.
Compression	Shows the compression type used for the meta and raw data in the collection.
Hash	Shows whether hash is enabled or disabled. When enabled, the hash algorithm is used to ensure the data integrity of the files being saved. By default, the only data being hashed is raw logs and the hash files are saved in the same directory as data.

Feature	Description
# of Rules	Shows the number of rules applied to the collection. Define at least one rule for each collection. A collection without any associated rules shows a zero in red text as a warning: The collection name also appears in red text, which indicates an error in the collection. **Caution:** If a collection does not have a rule, no logs will ever go into that collection.
Actions	Enables you to see the rules associated with a collection in the Retention Rule section when you select <actions button> **> Select Rules**. In the Retention Rule section, you can change the overall priority of the collection rules.
Total Storage	Shows the current total hot storage usage and the maximum total hot storage at the bottom of the **Usage / Hot Storage** column. It also shows the current total warm storage usage and the maximum total warm storage at the bottom of the **Usage / Warm Storage** column.

Any errors in the collection appear in red text. A dotted underline indicates that a tooltip is available with information about the error.

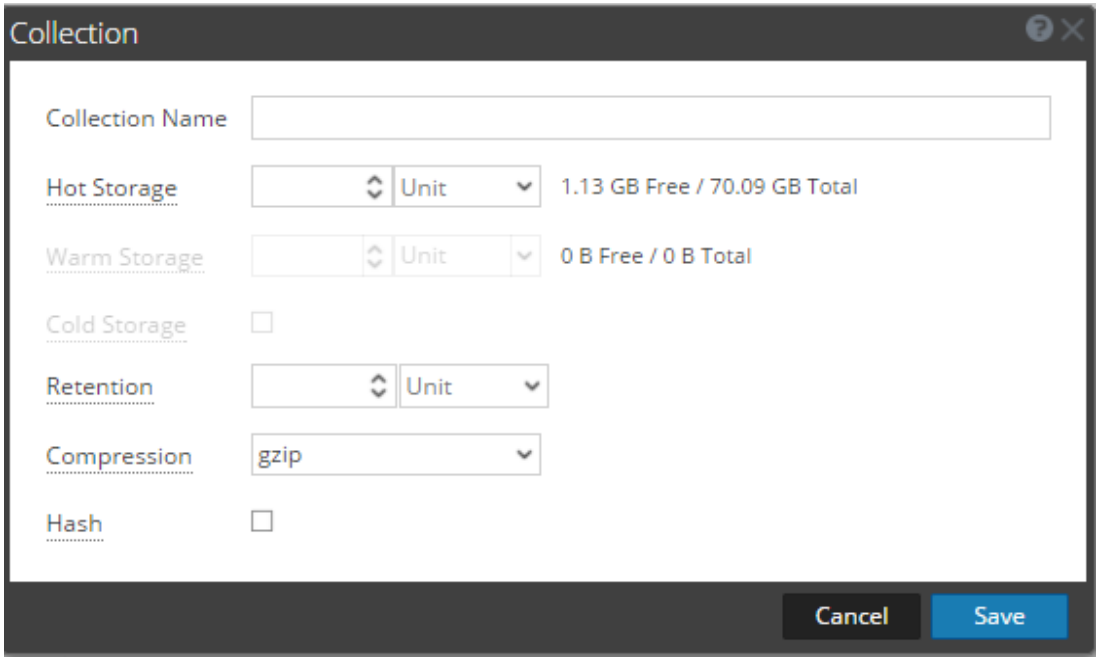
Collections that have editing disabled (grayed out) also have tooltips that provide information on the problem.

Retention Rules

The Retention Rules section lists all of the retention rules used for your storage collections listed in the order of rule execution.

The following table describes the features of the Retention Rule section.

Feature	Description
	Opens the Rule Definition dialog, in which you can add a retention rule to use in a storage collection.
	Removes the selected retention rule. In order for your log collections to gather and store log data, you must associate them with at least one retention rule.
	Opens the Rule Definition dialog, in which you can edit the selected retention rule.
	Refreshes retention rule information.
Move Up	Moves the selected retention rule up in the Retention Rule priority list. Retention Rule order is very important. NetWitness evaluates the the retention rules for all of the collections in numerical order by the number listed in the Order column in the Retention Rule section. You can also use drag and drop to reorder retention rules.
Move Down	Moves the selected retention rule down in the Retention Rule priority list. Retention Rule order is very important. NetWitness executes the retention rules for all of the collections in numerical order by the number listed in the Order column in the Retention Rule section.
Apply	Saves the rule order change.
Revert	Reverts the rule order change.
	Selects or shows a selected retention rule.
Order	Shows the order of a rule in the overall list of retention rules.
Rule Name	Shows the name of rule, such as ComplianceDevices and GeneralWindowsLogs.
Condition	Shows the conditions for the rule. These conditions specify the type of logs to include in the collection. Define Retention Rules presents the guidelines for all queries and rule conditions in Core services.
Collection	Shows Collection name and how many days that the collection is retained. For example: MediumValue (30 Days)



Collection Dialog

On the (Admin) > **Services** > **Config** view > **Data Retention** tab of an Archiver, administrators can define the criteria for log retention and storage. In the Collection dialog, which is accessible from the Collections section, you can define individual storage collections to use for different log types. For example, you may want to create collections for compliance reasons or to selectively retain critical logs.

Procedures related to this dialog box are described in Configure Archiver Storage and Log Retention and Configure Log Storage Collections.

To access the Collection dialog:

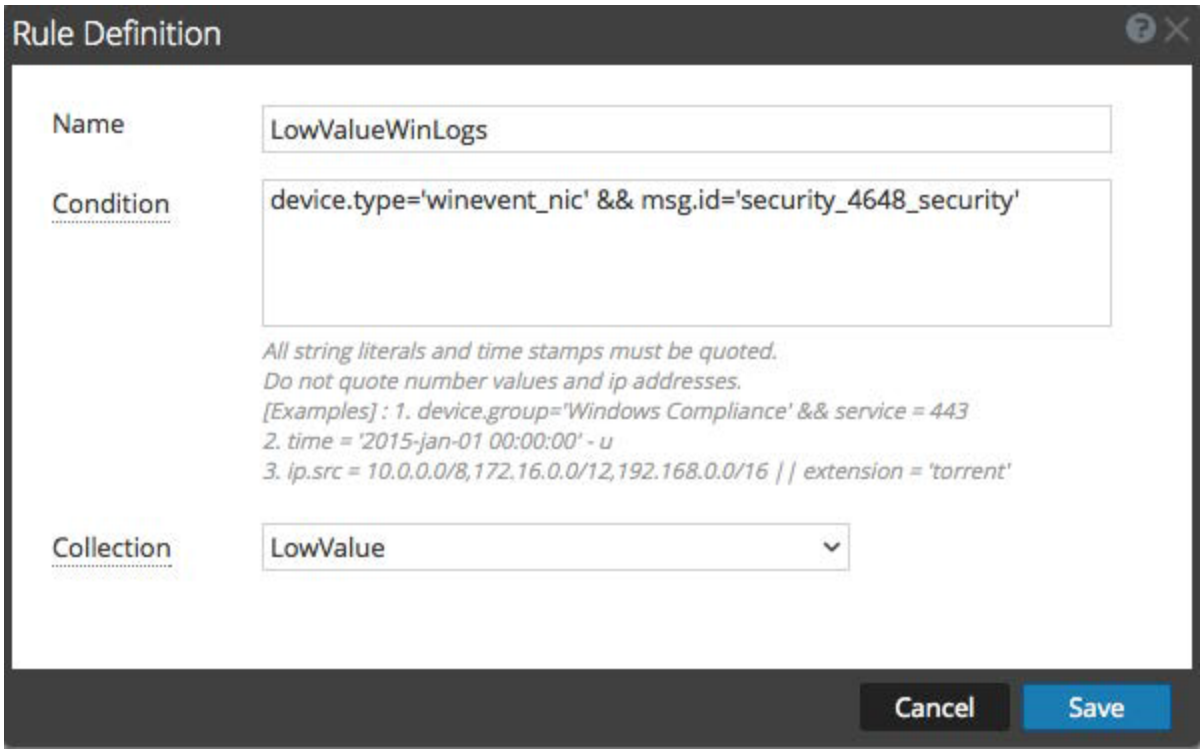
1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click **> View > Config**.
   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Data Retention** tab.
4. In the **Collections** section, click to add or edit the rule.
   The Collection dialog is displayed.

The following table describes the fields in the Collection dialog.

Field	Description
Collection Name	Specify a name for your collection, such as Compliance, MediumValue, or LowValue.

Field	Description
Hot Storage	Specify the maximum size or percentage of hot storage to use for this collection. The free space available to use for hot storage and the total hot storage are shown next to this field. When the size of the logs reach the maximum hot storage size, the logs are removed or they roll to the next available storage tier (warm or cold).
Warm Storage	(Optional) Specify the maximum size or percentage of warm storage to use for this collection. The free space available to use for warm storage and the total warm storage are shown next to this field. When the size of the logs reach the maximum warm storage size, the logs are removed or they roll to available cold storage.
Cold Storage	(Optional) Specify whether to use cold storage for this collection. If you use cold storage for the collection, logs outside of the specified size and retention limits roll over to cold storage. If you do not use cold storage, logs outside of the specified size and retention limits are removed.
Retention	(Optional) Specify the number of days that logs are retained before they are removed or rolled over to cold storage. For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first.
Compression	Specify the type of compression to use for meta and raw logs in the collection. You can compress the meta and raw logs using GZIP or LZMA to save space. GZIP is very fast at compressing and decompressing, but it does not compress as well as LZMA. LZMA offers better compression at a cost of decompression speed (roughly three times slower than GZIP). Compression ratios are highly dependent on your data. The default compression is GZIP.
Hash	Specify whether to enable or disable hash. When enabled, the hash algorithm is used to verify the data integrity of the files being saved. By default, the only data being hashed is raw logs and the hash files are saved in the same directory as data.

Note: When decreasing collection storage allocations or lowering retention time, it may take several minutes to hours for the data to move and space to become available depending on the amount of moving (rolling) data. The default times are every 20 minutes for a size roll and every six hours for a time roll.



Rule Definition Dialog

In the  (Admin) > Services > Config view > Data Retention tab of an Archiver, administrators can define the criteria for log retention and storage. In the Rule Definition dialog, which is accessible from the Retention Rules section, you can define retention rules to use for your storage collections.

Procedures related to this dialog box are described in Configure Archiver Storage and Log Retention and .Define Retention Rules

To access the Rule Definition dialog:

1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click **> View > Config**.
   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Data Retention** tab.
4. In the **Retention Rule** section, click or .
   The Rule Definition dialog is displayed.

The following table describes fields in the Rule Definition dialog.

Field	Description
Name	Specify a unique name for your retention rule. For example: ComplianceDevices
Condition	Specify the conditions for the type of logs that you want to include in the collection. All sting literals and time stamps must be quoted. Do not quote number values and IP addresses. For example: `device.group='PCI Devices' || device.group='HIPPA Devices'`
Collection	Select the collection on which you want to apply this rule. For example: Compliance

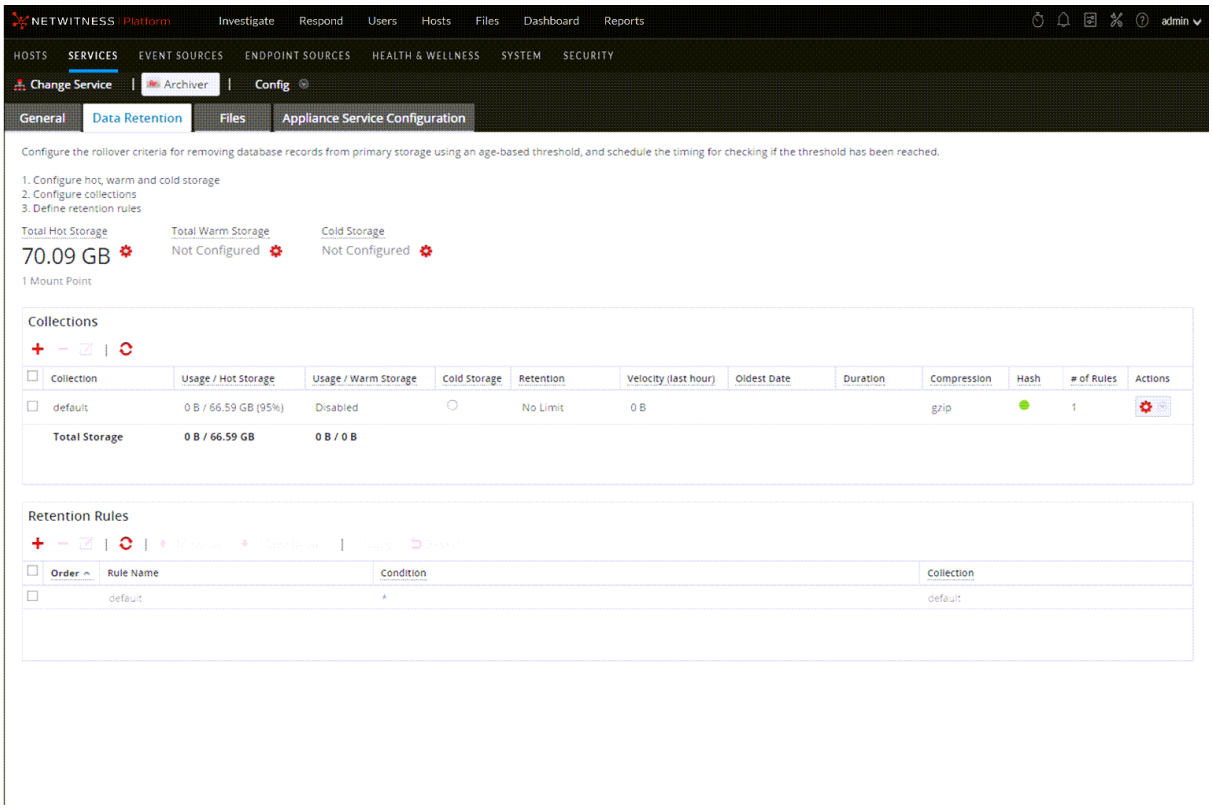
Configure Log Storage Collections

This topic provides instructions for Administrators on how to configure log storage collections on an Archiver.

NetWitness enables you to define individual storage collections for different log types. You can specify the maximum size of the Hot and Warm Storage space used by the collection, whether to use offline storage (Cold Storage), the number of days to retain the logs in the collection, the data compression, and whether to use a hash algorithm to be able to verify the data integrity of the files being saved. You should create collections based on your log retention storage requirements. Each collection that you create must be associated with at least one retention rule.

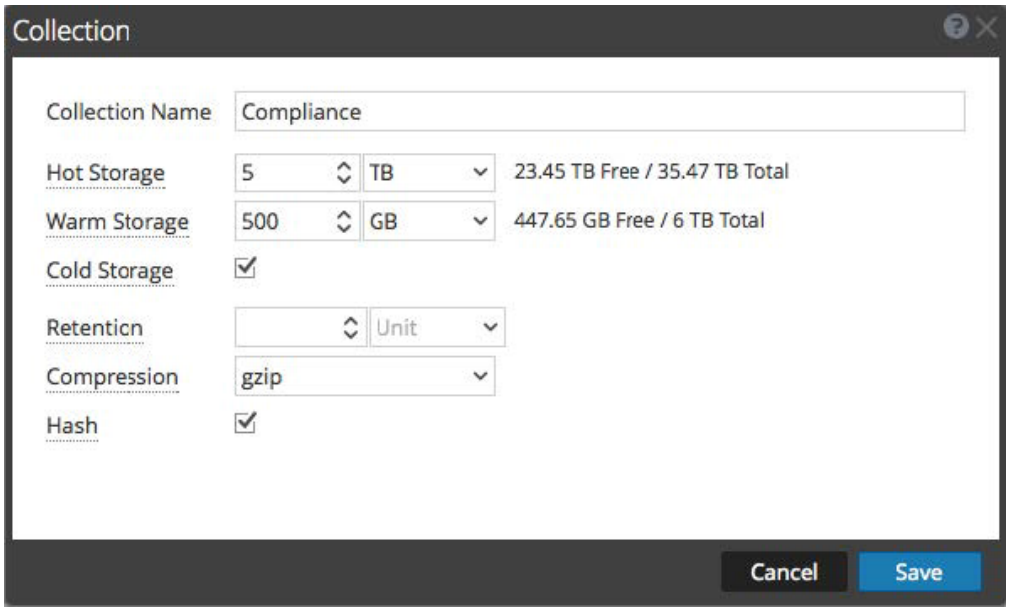
Prerequisites

Before you configure your log retention storage collections, configure total hot, warm, and cold storage.



Configure a Log Storage Collection

To configure a log retention storage collection on an Archiver:



1. Go to  **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click  **> View > Config**.

   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Data Retention** tab, in the **Collections** section, click  to add a collection.

   (If you decide to make changes to an existing collection, you can select the collection and click  to change the settings.)

The **Collection** dialog is displayed.

4. Configure the collection as described in the following table.

Field	Description
Collection Name	Specify a unique name for your collection, such as Compliance, MediumValue, or LowValue.

Field	Description
Hot Storage	Specify the maximum size or percentage of hot storage to use for this collection. The free space available to use for hot storage and the total hot storage is shown next to this field.
Warm Storage	(Optional) Specify the maximum size or percentage of warm storage to use for this collection. The free space available to use for warm storage and the total warm storage is shown next to this field.
Cold Storage	(Optional) Specify whether to use cold storage for this collection. If you use cold storage for the collection, logs outside the storage limits are copied to cold storage before they are deleted from hot or warm storage.
Retention	(Optional) Specify the number of days that logs are retained before they are removed or rolled over to cold storage. For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first.
Compression	Specify the type of compression to use for meta and raw logs in the collection. You can compress the meta and raw logs using GZIP or LZMA to save space. GZIP is very fast at compressing and decompressing, but it does not compress as well as LZMA. LZMA offers better compression at a cost of decompression speed (roughly three times slower than GZIP). Compression ratios are highly dependent on your data. The default compression is GZIP.
Hash	Specify whether to enable or disable hash. When enabled, the hash algorithm is used to verify the data integrity of the files being saved. By default, the only data being hashed is raw logs and the hash files are saved in the same directory as data.

5. Click **Save**.

   Any errors in the collection appear in red text. A dotted underline indicates that a tooltip is available with information about the error. Your collection name appears in red text until at least one retention rule is defined for your collection.
   If you have a collection with editing disabled (grayed out), look at the associated tooltip for more information.

Note: When decreasing collection storage allocations or lowering retention time, it may take several minutes to hours for the data to move and space to become available depending on the amount of moving (rolling) data. The default times are every 20 minutes for a size roll and every six hours for a time roll.

Define Retention Rules

Administrators can define and order retention rules for log storage collections on an Archiver. Retention rules specify the type of logs to be stored in the collection. For your log collections to gather and store log data, you must associate them with at least one retention rule. When you configure a retention rule, you specify a condition and a collection for that rule. The condition (rule definition) determines the type of logs stored in that collection.

For the condition, you can use anything that works in a regular query `where` clause.

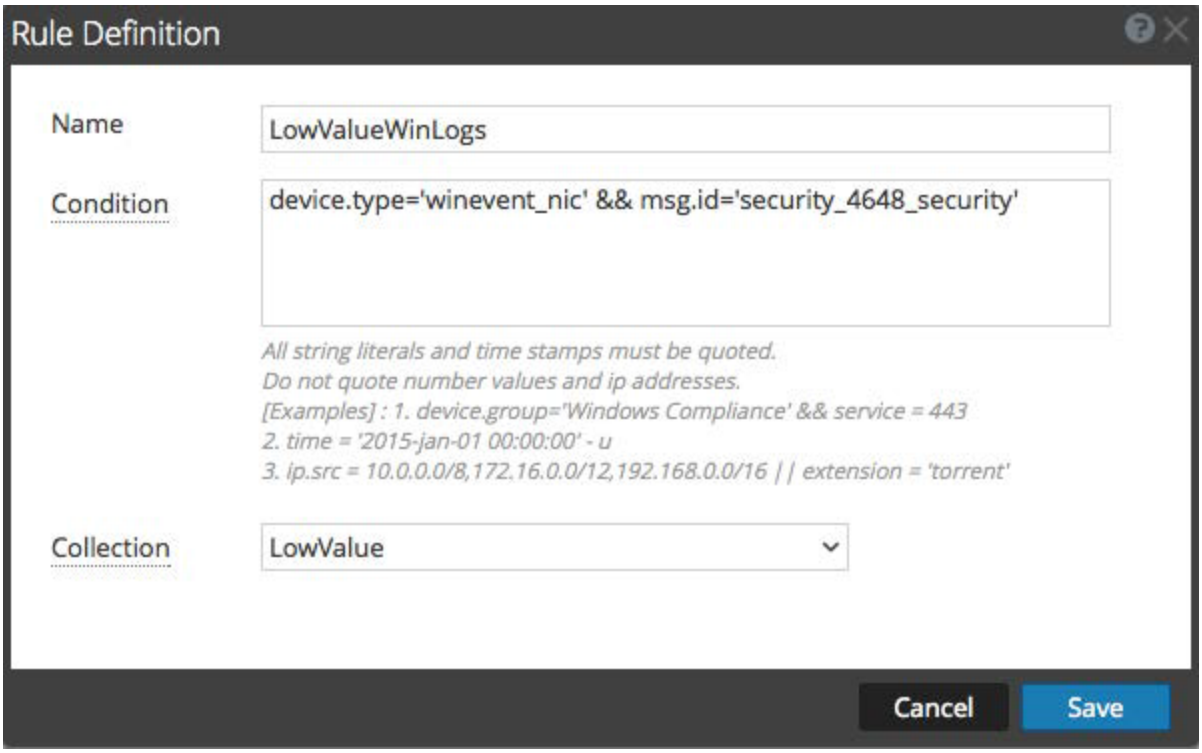
For example, to get logs from compliance services, you can use the following condition:

```
device.group='PCI Devices' || device.group='HIPPA Devices'
```

After you define the retention rules for your collections, it is important that you specify the order of your retention rules. NetWitness evaluates the retention rules for all of the collections in numerical order by the number listed in the Order column in the Retention Rule section of the Data Retention tab of the Archiver ((Admin) > Services Config view).

Caution: Rule order is very important. It determines the priority for evaluating the log data for storage retention.

Prerequisites



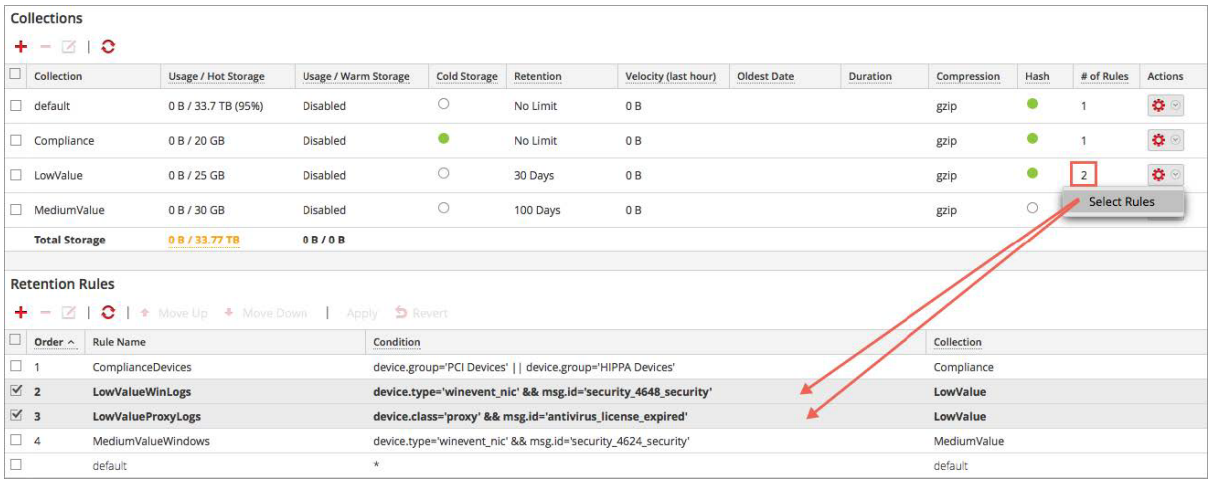
Before you configure your retention rules:

- Configure total hot, warm, and cold storage
- Configure log storage collections

Procedures

Define a Retention Rule for a Collection

1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click **> View > Config**.
   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Data Retention** tab, in the **Retention Rules** section, click .
   The **Rule Definition** dialog is displayed.



4. Configure the fields in the Rule Definition dialog as described in the following table:

Field	Description
Rule Name	Specify a unique name for your retention rule. It cannot include spaces. For example: LowValueWinLogs
Condition	Specify the conditions for the type of logs that you want to include in the collection. All string literals and time stamps must be quoted. Do not quote number values and IP addresses. For example: `device.type='winevent_nic' && msg.id='security_4648_security'`
Collection	Select the collection on which you want to apply this rule. For example: LowValue.

5. Click **Save**.

   The retention rule that you define becomes associated with the collection you selected. On the **Data Retention** tab, in the **Collections** section, you can click  **> Select Rules** in the **Actions** column for the selected collection to view the retention rules associated with the collection in the **Retention Rule** section.

Specify the Order of your Retention Rules

To prioritize the complete list of all of your retention rules:

1. In the **Retention Rules** section of the **Data Retention** tab, select a retention rule and use drag and drop (or select **Move Up** and **Move Down**) to change its order in the priority list.

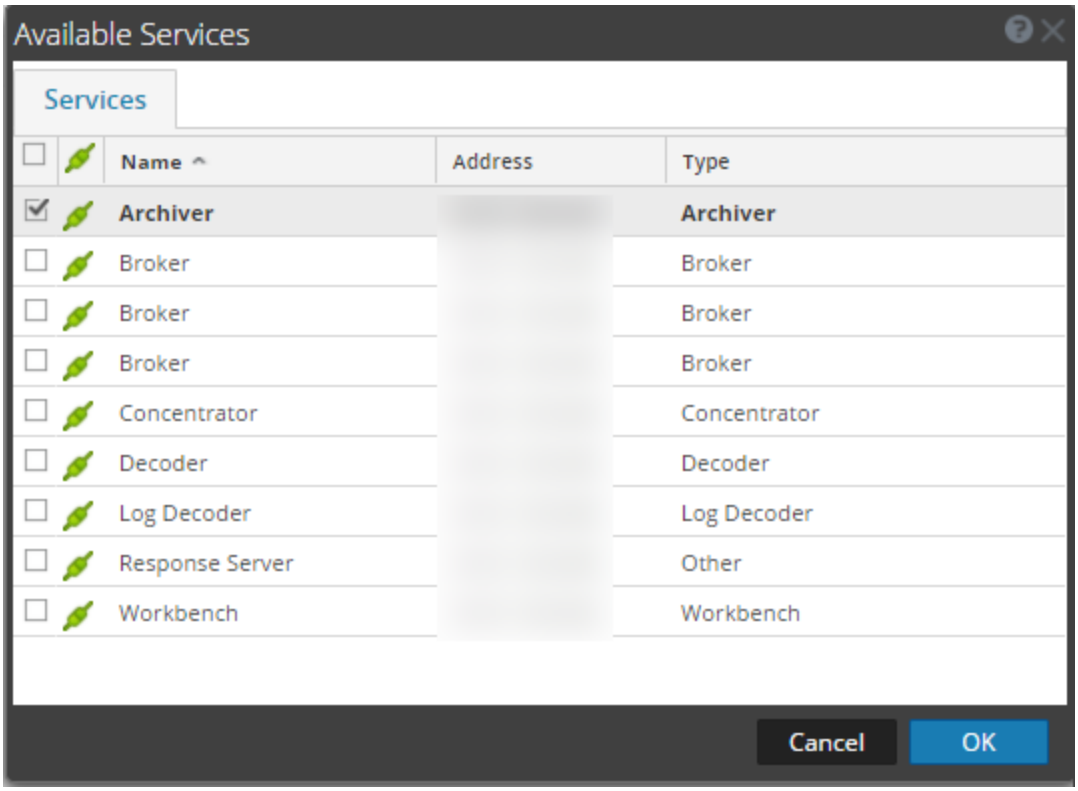
2. Click **Apply** to save the order of the retention rules.

Caution: Rule order is very important. It determines the priority for evaluating the log data for storage retention.

Add Archiver as a Data Source to Reporting Engine

This topic provides instructions on how to add Archiver as a data source to Reporting Engine to generate reports for the data collected by Archiver.

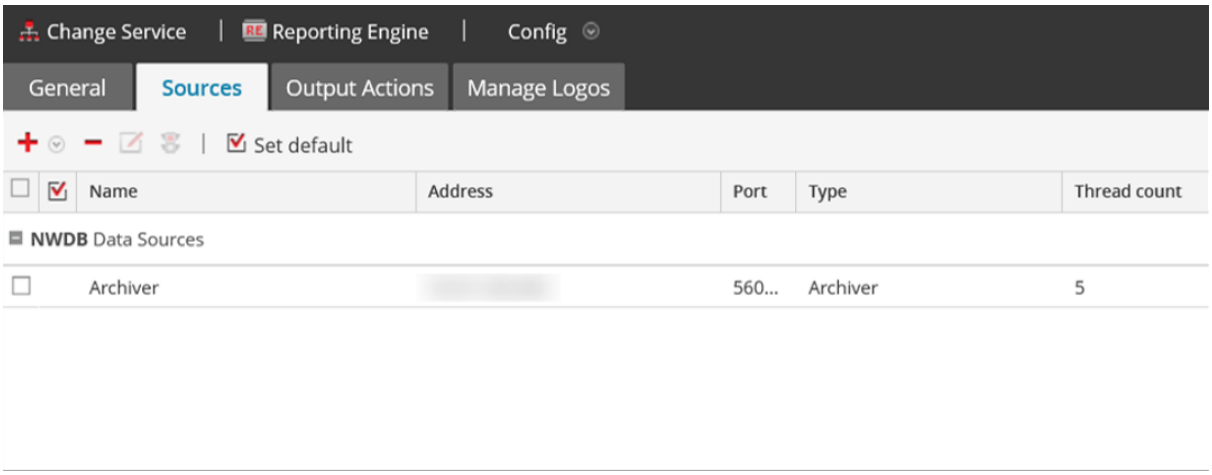
Prerequisites



Ensure that you have:

1. Installed the Archiver host in your network environment.
2. Installed and configured a Log Decoder in your network environment.
3. Verified that Reporting Engine and Archiver services are active.

Procedure

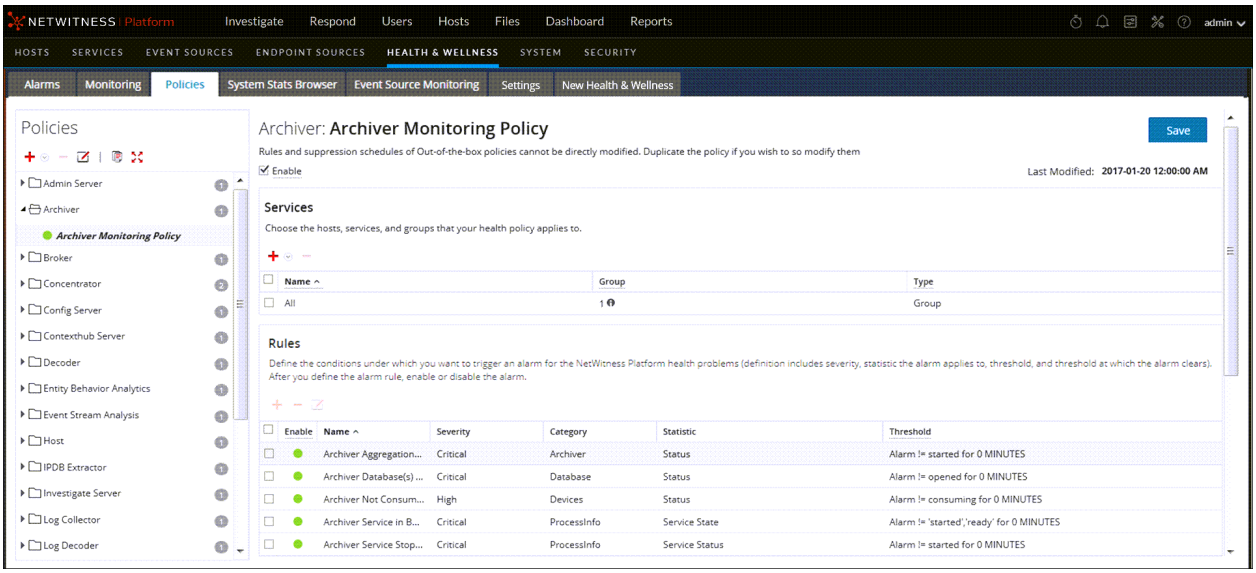


To associate an Archiver data source with Reporting Engine:

1. Go to  **(Admin)** > **Services**, click , and select **Reporting Engine**.
2. In the **Actions** column, select **View** > **Config**.
   The Services Config view of Reporting Engine is displayed with General tab open.
3. Select the **Sources** tab.
4. Click  and select **Available Services**.
   The Available Services dialog is displayed.

5. Select the Archiver that you want to add as data source to the Reporting Engine and click **OK**. The Service Information dialog is displayed.
6. Type the username and password for the Archiver.
7. Click **OK**.

   The selected Archiver is listed in the NWDB Data Sources category.



You can now create reports on the data collected by Archiver.

Configure Archiver Monitoring

Health & Wellness enables you to automatically generate notifications when critical thresholds are met.

Review the Health & Wellness policies for Archiver and Host in the Health & Wellness Policies section. Make updates as required.

For detailed information, see "Manage Policies" in the *System Maintenance Guide.*

Additional Archiver Configuration

This topic is a collection of individual procedures, which an administrator may perform at any time and they are not required to complete the initial setup of the Archiver. These procedures are presented in alphabetical order.

Use this section when you are looking for instructions to perform a specific task after the initial setup of an Archiver.

Configuring Data Backup and Restore

This topic provides information on the data backup and restore feature for an Archiver. You can use this feature to back up Archiver data and retrieve the backed up data.

You can back up the data in the following ways:

- Use scripts to copy files from cold storage backup folders onto an offline storage.
- Use backup software to copy files from cold storage backup folders onto an offline storage.
- Run EMC Networker or other backup software on Archiver and have it do daily incremental backup of the database files.

Note: For details on the procedure to back up data using Networker, see the *Administration Guide for Networker*.

Once you have the data backup, you have to perform the following tasks to restore the backed up data that is installed on the Archiver.

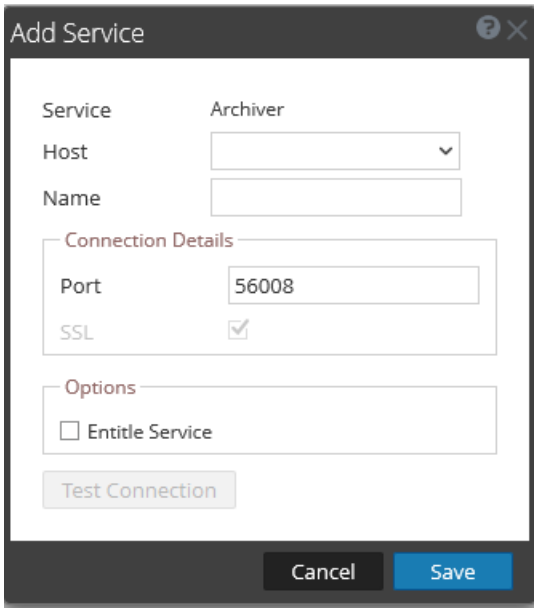
Action	Description
1. Restore your data to a location accessible by the Archiver.	Refer to Create Collection
2. Create a collection in Archiver that uses that location.	Refer to "Manage Collections" topic in the *Workbench Configuration Guide*.
3. Add the Archiver service as a data source on Reporting Engine to generate reports for the data restored on the Archiver service.	Refer to Add Archiver as a Data Source to Reporting Engine

Add Archiver Service

The NetWitness Archiver service enables you to create collections with restored data from Archiver offline (cold) storage. This procedure is only required if you do not have the Archiver service installed.

Prerequisites

Make sure you have added an Archiver host and applied a license to it.



Procedure

Note: This procedure is only required if you do not have Archiver service installed.

Perform the following steps to add the Archiver service:

1. Go to **(Admin) > Services**.
2. In the **Services** panel, select **+>Archiver**.

   The Add Service dialog is displayed, as shown below.

3. Provide the following details.

Field	Description
Host	Select an Archiver host from the drop-down menu.
Name	Type a name for the service.
Port	Default port is 50007.
SSL	Select **SSL** if you want NetWitness to communicate with the service using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates. **Note:** If you select SSL, ensure SSL is enabled in the System Configuration panel.
Username	(Optional) Type the username for the service.
Password	(Optional) Type the password for the service.

4. Click **Test Connection** to determine if NetWitness connects to the service.
5. When the result is successful, click **Save**.

   The added service is now displayed in the Services panel.

Note: If the test is unsuccessful, edit the service information and retry.

Create Collection

You can create a collection on an Archiver service using data restored from the backed-up data or an existing subset of data. When you recover the backed-up data, you have to place it in the collection folder created on the Archiver service to enable you to generate the required reports for the retrieved data. For example, if you have backed up the data using EMC Networker at <*location*>, you can use the restore options in Networker to restore the backed-up data to the collection folder created on the Archiver service. For restore procedure using EMC Networker, see the *Administration Guide for Networker*.

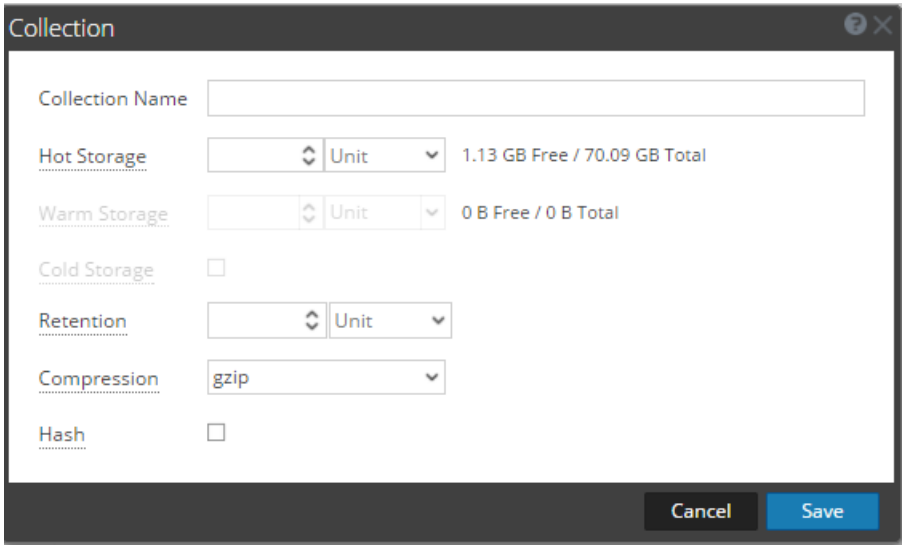
Prerequisites

Ensure that you have the following:

- Archiver service installed on an Archiver host.
- The Archiverservice has enough space to hold the collection.
- The backed-up data placed in a known location on your local host, if you are creating a collection using the data restored from the backed-up data.

Procedure

The Data Retentions tab enables Administrators to restore and save data that is restored from a backup or from an existing set of data.



Note: The Administrator can point the source path to the location of the database files and the restore command copies them to the Archiver. The Administrator needs to mount those directories to the Archiver before a restoration collection can be created.

To create a collection using data restored from the backed-up data or existing subset of data:

1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, click **> View > Config**.

   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Data Retentions** tab and click in the **Collections** panel to add a collection.

   The **Collection** dialog is displayed.

4. Provide the following information:
   - **Collection Name:** Name of the Archiver collection that you want to restore.
   - **Hot Storage:**Enter the number of Archiver database files and unit size (either Gigabytes or Terabytes) that have been moved from cold storage.
   - **Retention:** Select the number of days or hours that you want to store the collection.
   - **Compression:** Select the compression type for the collection.
5. Click **Save** to restore the collection.

   Note the following:
   - Target is the location where the collection is created.
   - If the source path provided to create the restoration collection does not exist, the following error message is displayed:

     "The source path does not exist '/xxx/xxx/'."

If there is insufficient storage to restore your collection, the following error is displayed:

"Error during disk space checking. Insufficient disk space in location '/xxx/xxx'."

6. The Schedule Job dialog is displayed with the following message:

   "Restoring data into a new collection. Check the jobs page for progress."

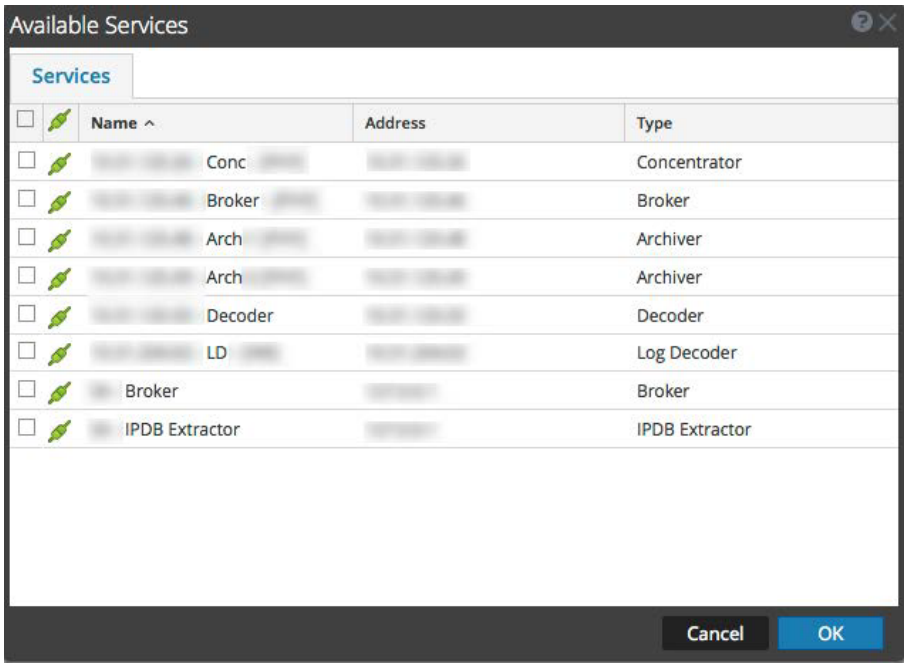
7. Click **Jobs**  icon in the top right area of the main menu to expand the list of restoration collection jobs with their current status.

Note: When restoring a collection, the larger the dataset that you have to restore, the longer the restoration will take. If you are restoring a collection containing hundreds of gigabytes or more, restoration may take several hours.

Add Archiver Service as a Data Source to Reporting Engine

This topic provides instructions on how to add the Archiver service as a data source to Reporting Engine to generate reports for the data restored onto the Archiver.

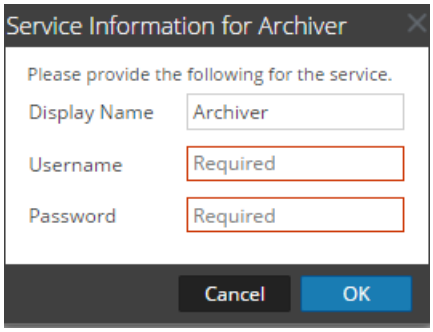
Prerequisites



Ensure that you have:

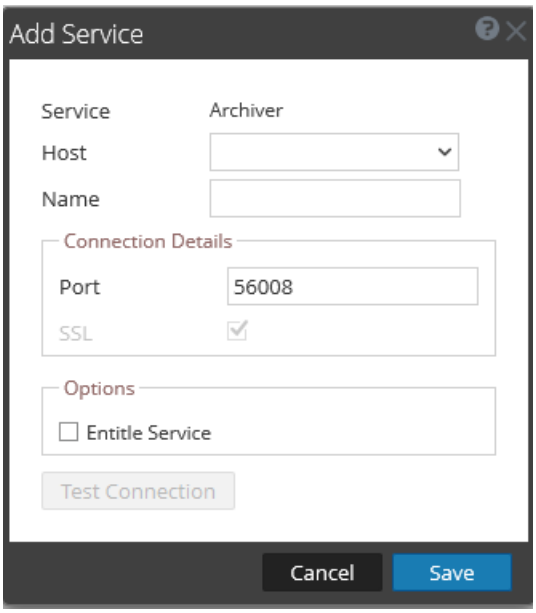
- Installed the Archiver service on the Archiver host.
- Added a collection on the Archiver service.

Procedure



Perform the following steps to add the Archiver service as a data source to Reporting Engine:

1. Go to  **(Admin) > Services**, click  , and select **Reporting Engine** service.
2. In the **Actions** column, click  **> View > Config**.
   The Services Config view of Archiver is displayed with General tab open.
3. Click the **Sources** tab.
4. Click  and select **Available Services**.
   The Available Services dialog is displayed.



5. Select the Archiver service and click **OK**.

   If the Archiver service is using a Trust Model, the Service Information dialog for the selected service is displayed with the username and password fields required. If the service is not using a Trust Model, these fields will be optional.

6. Type the username and password for admin credentials for the service.
7. Click **OK**.

   The Add Service dialog is displayed.

8. Select a host from the drop-down list and click **Save**.

   The Archiver service is now added as a data source to the Reporting Engine and is listed in the NWDB Data Sources list.

Note: This procedure has to be performed for each collection.

An Administrator can create and delete Workbench collections. and view Workbench statistics and logs. This topic provides all of these procedures and an example procedure for restoring a collection for Reporting and Investigation.

- Mount Archiver Directories
- Create a Collection
- Delete a Collection
- Investigate a Collection
- View Workbench Collection Statistics
- View Workbench Logs

Mount Archiver Directories

If data is in offline storage or cold-tier storage, you need to mount the Archiver directories in order to restore the data for reporting and investigation purposes:

1. Go to  **(Admin) > Services**.
2. Select an **Archiver** from the **Services** panel and select  **> View > Explore**.

   The Explorer view for the Archiver is displayed

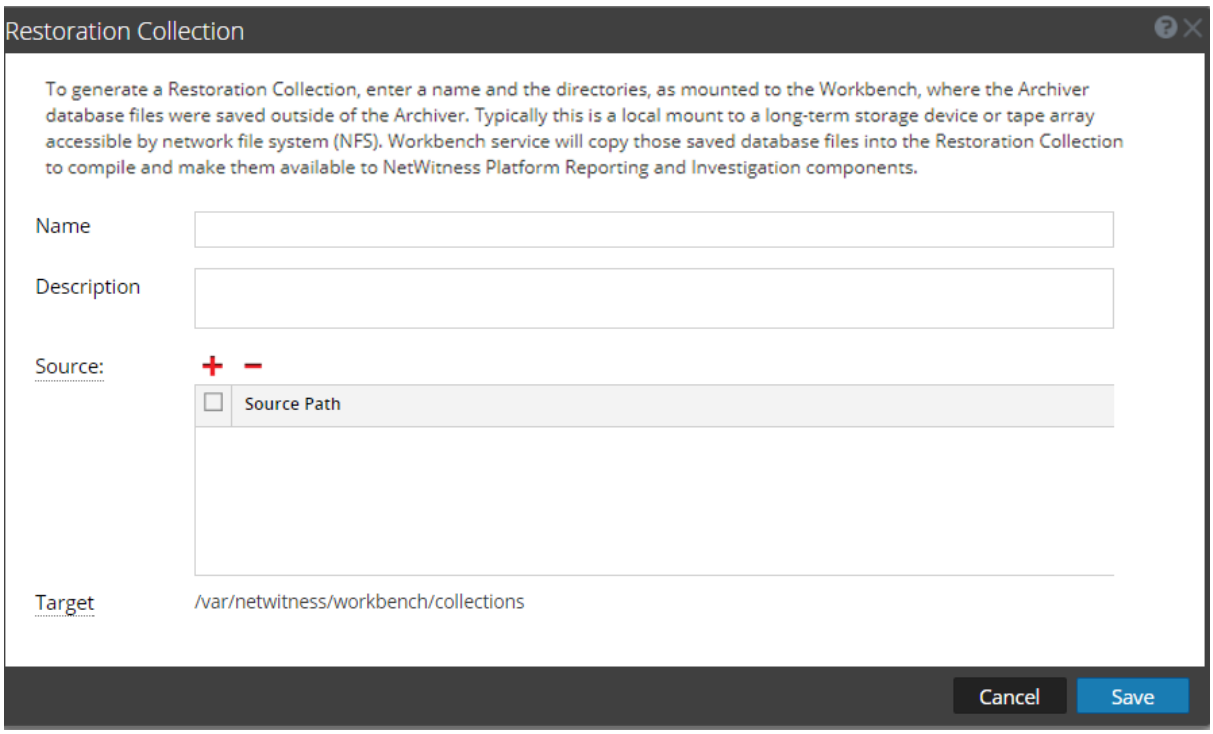
3. Right-click on the **Database** node in left-hand tree and select **Database** properties to open them in the right-hand panel.
4. Run the **manifest** command for a time range, for example, 2015-April-01 to 2015-April-10.

   The search returns all files that need to be restored for the selected query.

Create a Collection

Administrators can create collections of restored data from a backup or from an existing set of data.

Note: You can point the source path to the location of the database files and the restore command copies them to the Archiver. You need to mount those directories to the Archiver (where the Workbench is installed) before a restoration collection can be created.



To create a collection using data restored from the backed up data or existing subset of data:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a **Workbench**, then select **> View > Config**.

   The Services Config view is displayed with the General tab open.
3. Click the **Collections** tab.

   The Collections panel is displayed.
4. Click in the toolbar.

   The Restoration Collection dialog is displayed.

5. Provide the following information:
   - **Name:** Name of the Workbench collection that you want to restore.
   - **Source:** Location where the Archiver database files have been moved from cold storage.

   Note: Target is the location where the collection is created.

6. Click **Save** to restore the collection.

   Note: If the source path provided to create the restoration collection does not exist, the following error message is displayed:
   `The source path does not exist '/xxx/xxx/'.`

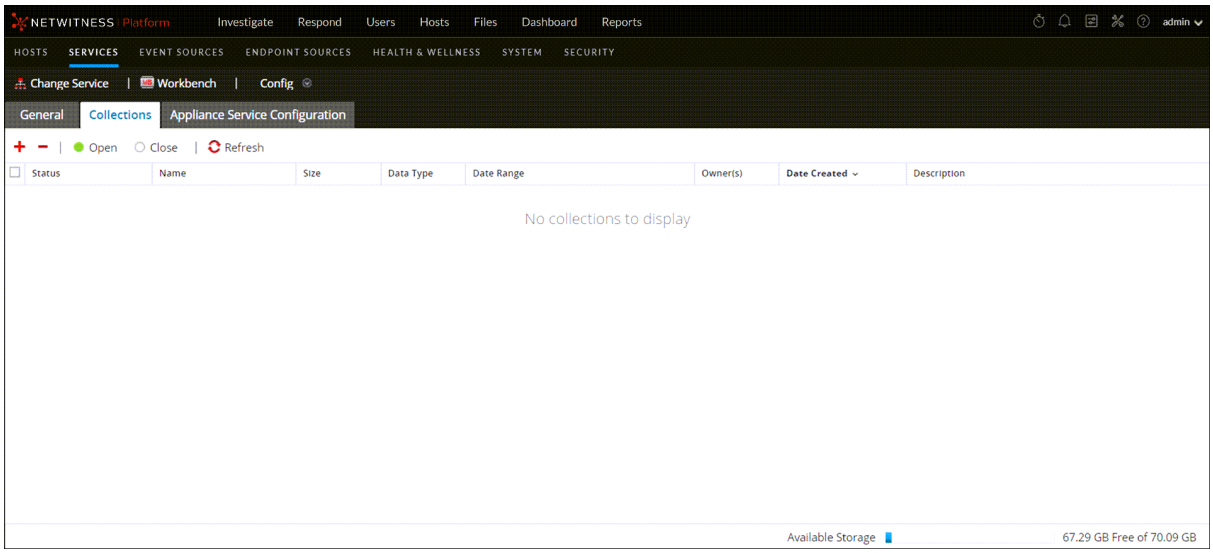
   If there is insufficient storage to restore your collection, the following error is displayed:
   `Error during disk space checking. Insufficient disk space in location '/xxx/xxx'.`

   The Schedule Job dialog is displayed with the following message:
   `Restoring data into a new collection. Check the jobs page for progress.`

7. Click the **Jobs** icon  in the NetWitness toolbar to expand the list of restoration collection jobs with their current status.

Note: Restoring a collection that is larger than 550 GB may take several hours to process.

Delete a Collection



Administrators can delete collections from the Workbench service.

Perform the following steps to delete a collection:

1. Go to  **(Admin) > Services**.
2. In the **Services** view, select a **Workbench**, and click  **> View > Config**.

   The Services Config view opens with the General tab displayed.
3. Select the **Collections** tab.

   The Collections panel is displayed.

4. In the Collections panel, select the collection that you want to delete.
5. Click − from the toolbar.

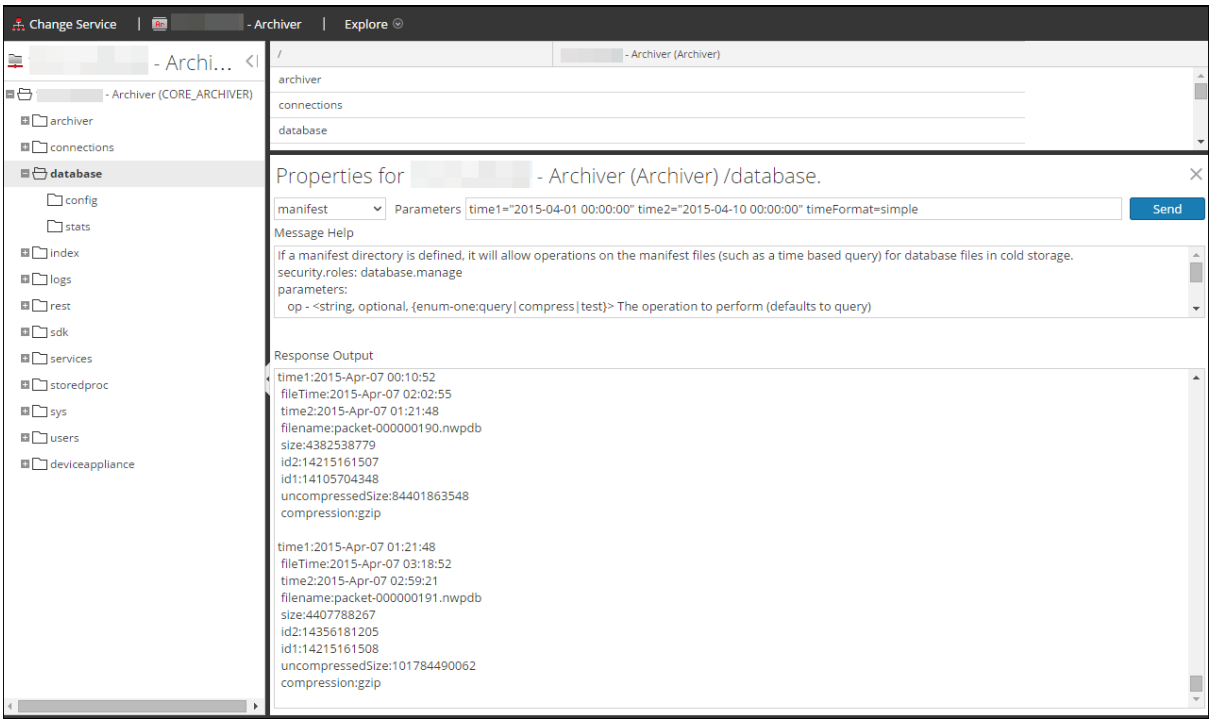
   A warning dialog requests confirmation.
6. If you want to delete the collection, click **Yes**.

   The collection is removed from the Workbench service.

Example Procedure: How to Restore a Collection for Reporting and Investigation

The following steps illustrate how to restore data for reporting and investigation purposes that is in offline storage or cold-tier storage. In the following example, data is restored for the time range beginning on 2015-April-01 through 2015-April-10.

To restore data for reporting and investigation purposes:



1. Go to **(Admin) > Services**, select the **Archiver**, and click **> View > Explore**.

   The Explorer view for Archiver is displayed.
2. Right-click on **Database** node in left-hand tree and select **Database** properties to open them in the right-hand panel.
3. Run the **manifest** command for the selected time range 2015-April-01 to 2015-April-10.

   The search returns all files that need to be restored for your selected query.

   Example Search:

   ```
   time1="2015-04-01 00:00:00" time2="2015-04-10 00:00:00" timeFormat=simple
   ```

4. Go to **(Admin) > Services**, select an **Archiver**, then select **> View > Config**.
   The Services Config view is displayed with the General tab open
5. Select the **Collections** tab.
6. Create a restoration collection with the source path pointing to files listed in the manifest command output.
7. Save the collection.
   After successfully creating a collection, you can use this collection for reporting and investigation purposes.

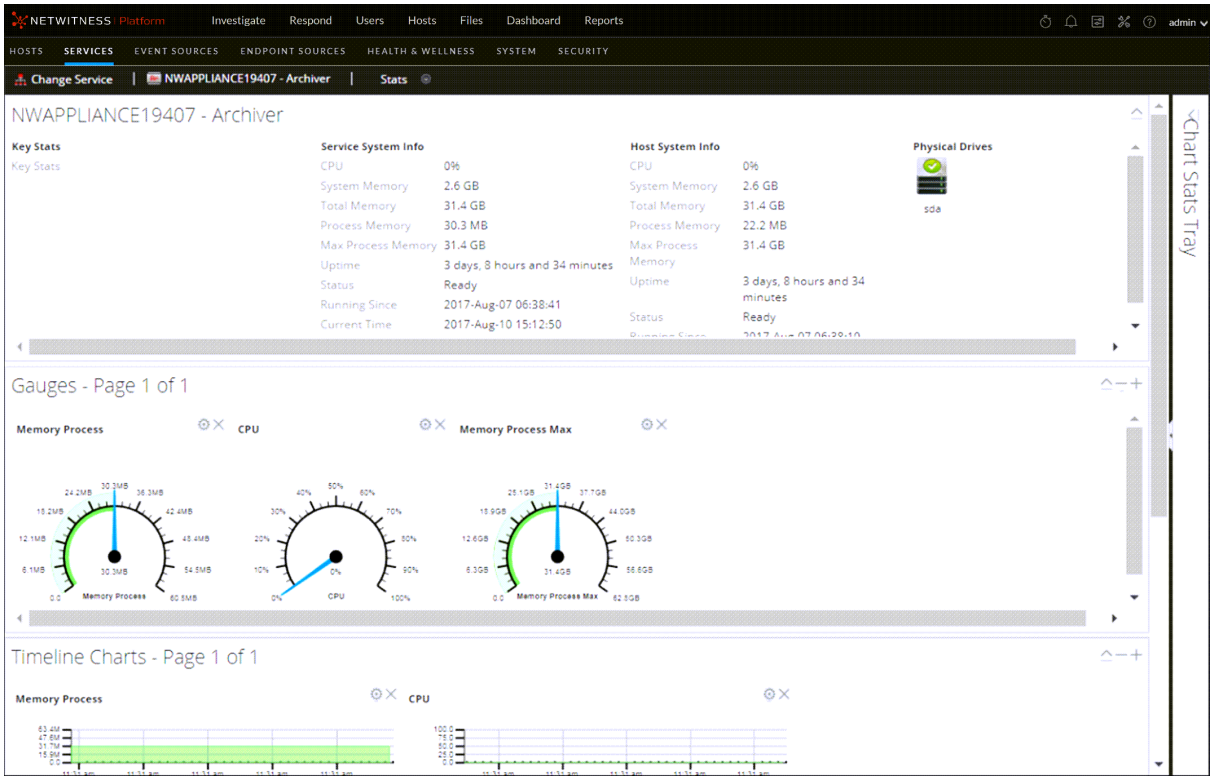
Investigate a Collection

To perform an investigation on an Archiver collection:

1. Go to **Investigate**.
   The Investigate dialog is displayed.
2. Click the **Collections** tab in the Investigate dialog.
3. Select an Archiver service in the left panel.
4. Select the collection you want to investigate in the right panel.
5. Click **Navigate**.

The Navigate view is displayed showing data pertaining to the Archiver collection that you selected.

Note: For detailed information about using Investigate, see the *Investigate User Guide.*.



View Archiver Collection Statistics

The same statistics available for other services are provided for the Archiver service. The Services Stats view displays key statistics and system information that pertain to your selected Archiver service. The information is displayed in several different sections within the Stats view: Archiver, Gauges, Timeline Charts and Chart Stats Tray. The Chart Stats Tray lists all available statistics for the Archiver. Any statistic in the Chart Stats Tray can be displayed in a timeline chart.

Perform the following steps to view Archiver statistics:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select an **Archiver**, then select **View > Stats**

   The Services Stats view is displayed.

Note: For more information about Archiver statistics, see the *Host and Services Getting Started Guide*.

View Archiver Logs

Perform the following steps to view logs on an Archiver service:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a **Archiver**, then select **> View > Logs**

The Services Logs panel is displayed.

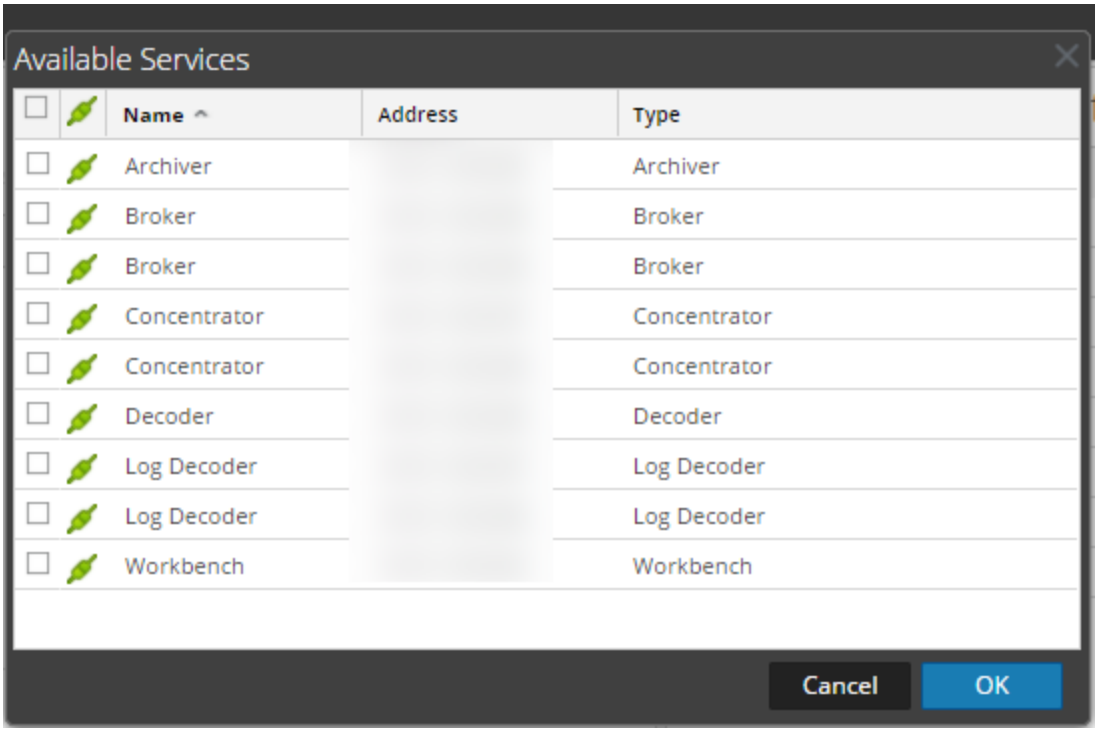
Note: For information about viewing and configuring audit logs, see "Configure Global Audit Logging" topic in the *System Configuration Guide.*

Add Archiver Service as a Data Source to Broker

Adding the Archiver service as a data source to Broker is useful when you have more than one collection and you want a report on the archived data. To do this, you can add more than one collection as a downstream service to a Broker and then generate a report on it.

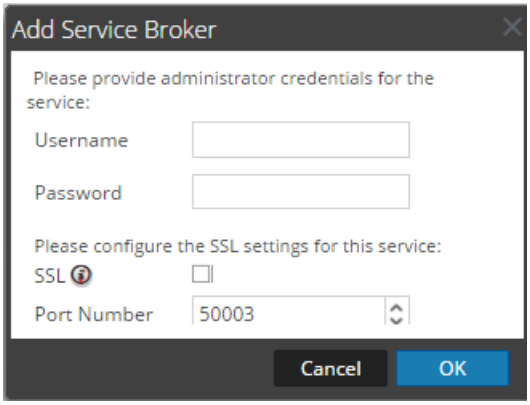
Prerequisites

Ensure that you have:



- Installed the Archiver service on the Archiver host.
- Added a collection on the Archiver service.

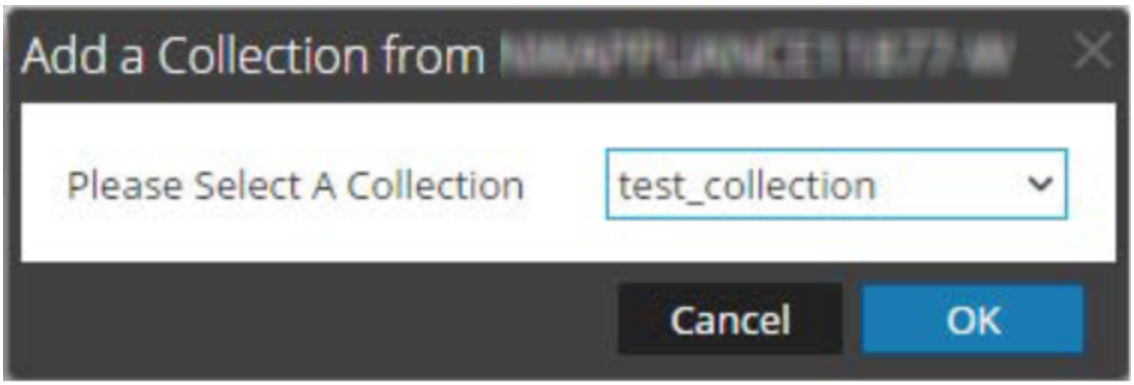
Procedure



To add an Archiver service as a data source on the Broker:

1. Go to  **(Admin) > Services** and select a **Broker** service.
2. In the **Actions** column, select  **> View > Config**.
   The Config view is displayed with the General tab open.
3. In the **Aggregate Services** section, click .

The Available Services dialog is displayed.



6. Select the Broker service and click **OK**.
7. If the Archiver service is using a Trust Model, a Service Information dialog for the selected service is displayed.

8. Type the username and password for admin credentials for the service.
9. Click **OK**.

   The Add Collection dialog is displayed.

10. Select a collection from the drop-down list and click **OK**.

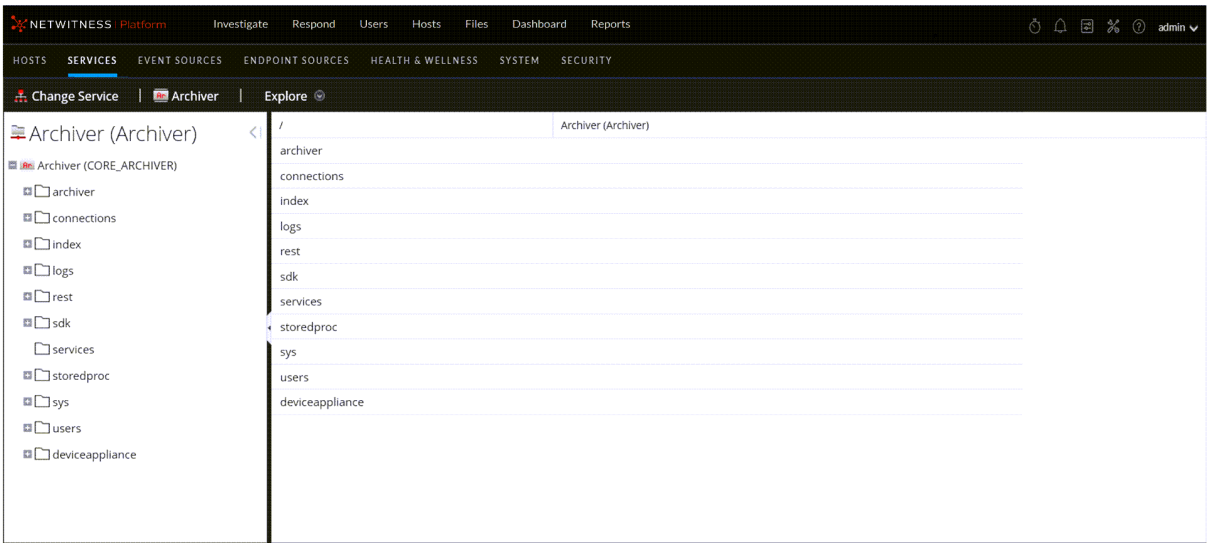
    The Archiver service is now added as a data source to the Broker.

Note: This procedure has to be performed for each collection.

Retrieve Hash Information

Archiver provides a command, **hashInfo**, which you can use to retrieve the hash information for each session, meta, and packet database that meets the session list or date range criteria. The hash information retrieved is in the form of a list of string parameters, each string parameter corresponding to the hash information for a single database file. You can retrieve the hash information of the database files using the Archiver Service Explore view or REST interface of the Archiver service. The hash information thus retrieved is used to compare the database files in the original location and the exported location to validate data integrity.

The following table lists the criteria that you can use to retrieve the hash files from the database.



Criteria	Description
sessions	You can retrieve the hash information of the database files by specifying the sessions that exist or read from the session database to determine the associated meta and packet id required to determine which meta and packet database files are needed to retrieve the hash information. **For example:** sessions=100 - Retrieves the hash information of all database files that contain the constituent components(session, meta, content) of session 100. sessions=100,500000 - Retrieves the hash information of all database files that contain the constituent components(session, meta, content) of session 100 and 500000
beginDate	You can specify a begin date as a filter against the database files. This finds the hash information for the files created after the specified date. The begin date specified has to be in the format YYYY-MM-DD HH:MM:SS.
endDate	You can specify an end date as a filter against the database files. This finds the hash information for the files created before the specified date. The end date specified has to be in the format YYYY-MM-DD HH:MM:SS **For example:** beginDate: “2014-Mar-25 05:52:00” endDate=”2014-Mar-27 05:52:00” – Retrieves the hash information of all the database files in between March 25, 2014 and March 27, 2014 in the specified time range on those days.
directories	By default, the hash information files are stored with the database files they were created for. You can also store the hash information file in different location by defining multiple locations in the hash.dir configuration parameter. You can define the location as a filter and retrieve the hash information files for the configured location. **For example:** directories="/home/hash" – Retrieves the hash information of the database files from the location /home/hash

Procedure

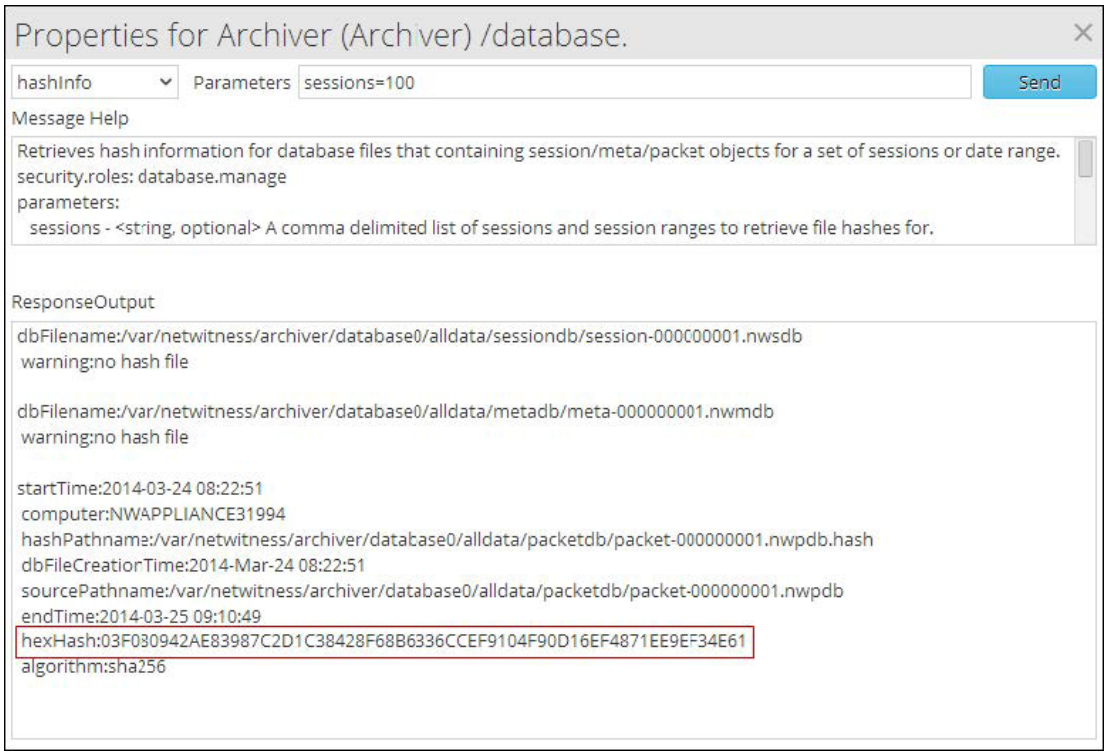
To retrieve hash information of the database files:

1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the **Actions** column, select **View > Explore**.

   The Explore view of the Archiver service is displayed.

3. In the node tree, right-click on **archiver** and select **Properties**.

   The Properties dialog is displayed.



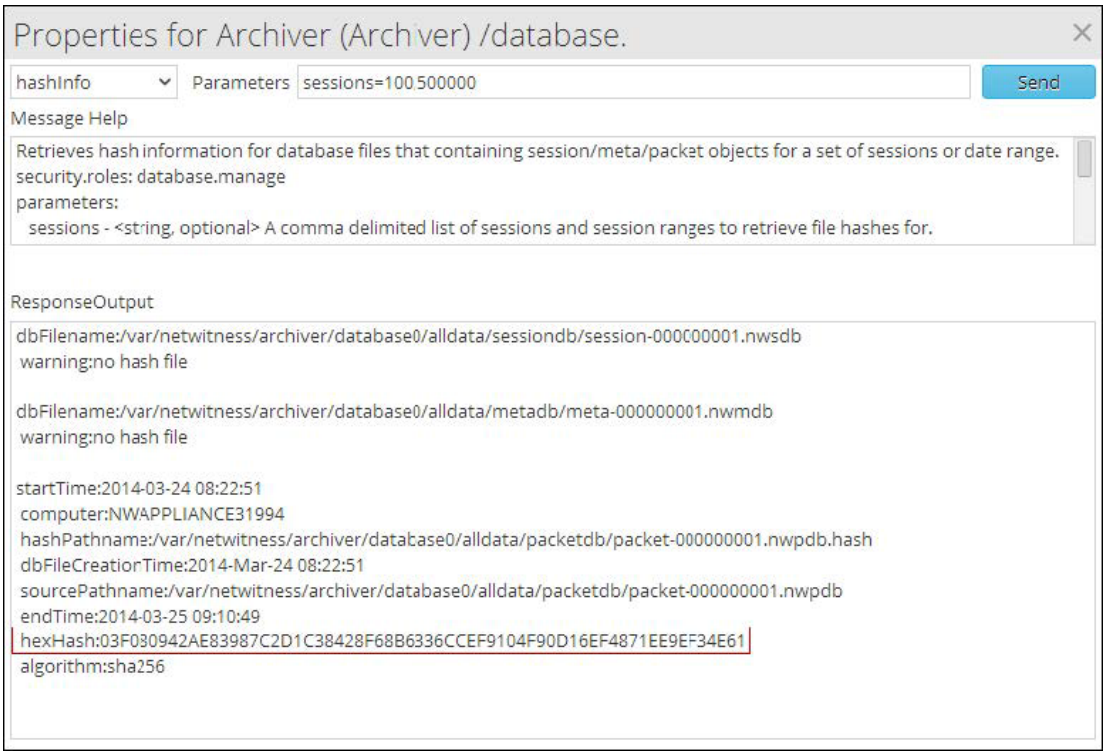
4. In the drop-down menu, select **hashInfo**.
5. In the **Parameters** field, type the criteria that you want to use to retrieve the hash information from the database.
6. Click **Send**.

   The output of the command is displayed in the ReponseOutput textbox. In the output, the hash information is shown in the hexHash parameter. You can use this hash information to verify data integrity manually.

Examples

Retrieve the hash information of the database files for the sessions that exist.
Criteria: sessions=100

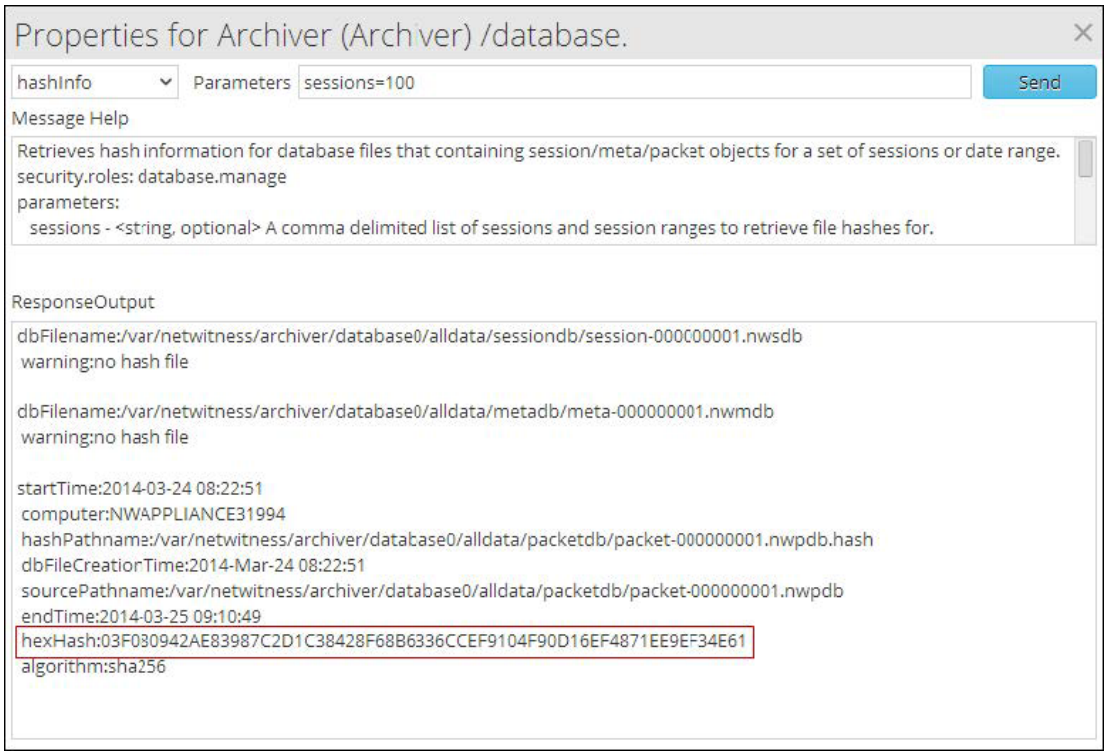
Output



The hash information shown in the hexHash parameter is retrieved and you can use this to verify data integrity manually for session 100.

Retrieve the hash information of the database files for the session ranges that exist.

Criteria: sessions=100,500000



Output

The hash information shown in the hexHash parameter is retrieved and you can use this to verify data integrity manually for session range 100 - 500000

Retrieve the hash information of the database files created in the specified date range
Criteria: beginDate="2017-Mar-25 05:52:15" endDate="2017-Mar-27 05:52:15"

Output

The hash information shown in the hexHash parameter is retrieved and you can use this to verify data integrity manually for the date range specified.

Archiver Collection Dialog

On the (Admin) > Services > Config view > Data Retention tab of an Archiver, administrators can define the criteria for log retention and storage. In the Collection dialog, which is accessible from the Collections section, you can define individual storage collections to use for different log types. For example, you may want to create collections for compliance reasons or to selectively retain critical logs.

Workflow

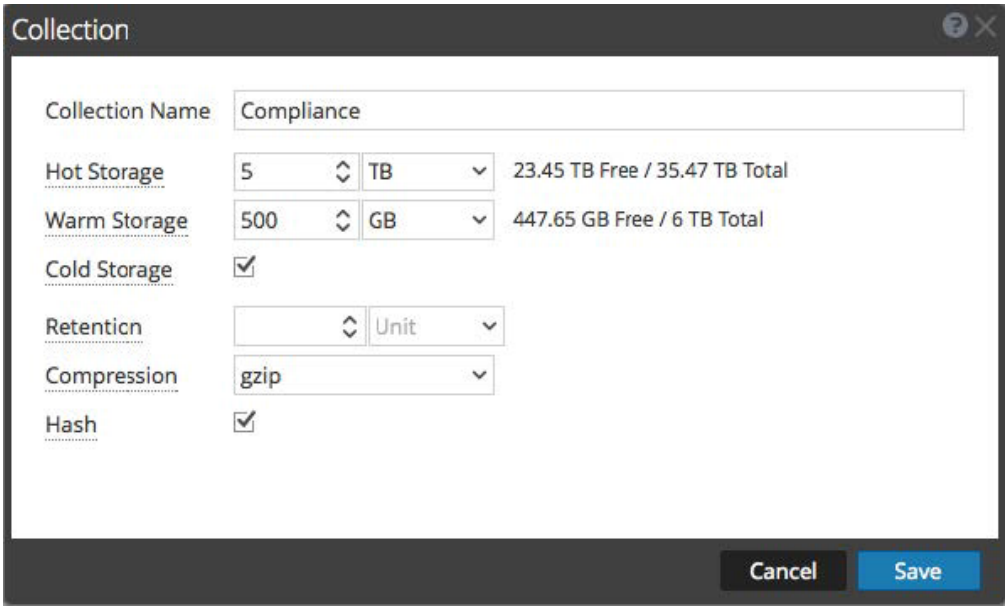
This workflow illustrates the end-to-end installation and configuration process for an Archiver.

What do you want to do?

Role	I want to...	Show me how...
Administrator	Add an Archiver service	Edit the Archiver Service
Administrator	Add a Log Decoder as a source to the Archiver	Add Log Decoder as a Data Source to Archiver
Administrator	*Configure Archiver Storage and Log Retention	Configure Archiver Storage and Log Retention
Administrator	Add an Archiver as a Data Source to the Reporting Engine	Add Archiver as a Data Source to Reporting Engine
Administrator	Configure Archiver Monitoring	Configure Archiver Monitoring

*You can perform this task here.

Related Topics



Configuring an Archiver

Quick Look

To access the Collection dialog:

1. Go to **(Admin) > Services**, click , and select **Archiver**.
2. In the Actions column, click **> View > Config**.
   The Services Config view of Archiver is displayed with General tab open.

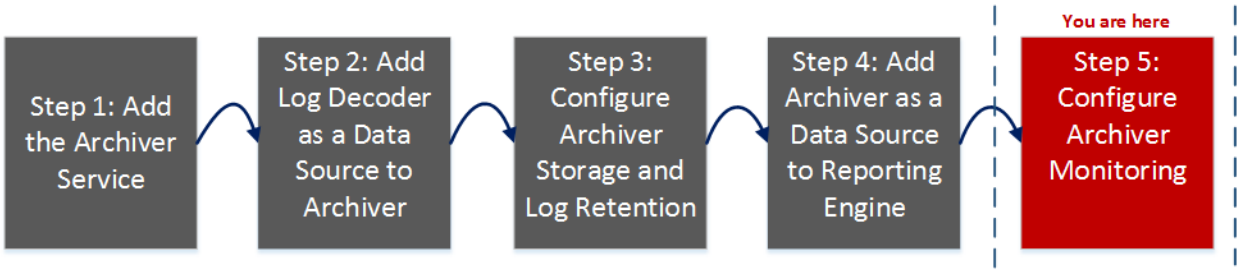
3. Click the **Data Retention tab**.
4. In the Collections section, click .
   The Collection dialog is displayed.

Note: When decreasing collection storage allocations or lowering retention time, it may take several minutes to hours for the data to move and space to become available depending on the amount of moving (rolling) data. The default times are every 20 minutes for a size roll and every six hours for a time roll.

The following table describes the fields in the Collection Dialog.

Field	Description
Collection Name	Specify a name for your collection, such as Compliance, MediumValue, or LowValue.
Hot Storage	Specify the maximum size or percentage of hot storage to use for this collection. The free space available to use for hot storage and the total hot storage are shown next to this field. When the size of the logs reach the maximum hot storage size, the logs are removed or they roll to the next available storage tier (warm or cold).
Warm Storage	(Optional) Specify the maximum size or percentage of warm storage to use for this collection. The free space available to use for warm storage and the total warm storage are shown next to this field. When the size of the logs reach the maximum warm storage size, the logs are removed or they roll to available cold storage.
Cold Storage	(Optional) Specify whether to use cold storage for this collection. If you use cold storage for the collection, logs outside of the specified size and retention limits roll over to cold storage. If you do not use cold storage, logs outside of the specified size and retention limits are removed.

Field	Description
Retention	(Optional) Specify the number of days that logs are retained before they are removed or rolled over to cold storage. For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first.
Compression	Specify the type of compression to use for meta and raw logs in the collection. You can compress the meta and raw logs using GZIP or LZMA to save space. GZIP is very fast at compressing and decompressing, but it does not compress as well as LZMA. LZMA offers better compression at a cost of decompression speed (roughly three times slower than GZIP). Compression ratios are highly dependent on your data. The default compression is GZIP.
Hash	Specify whether to enable or disable hash. When enabled, the hash algorithm is used to verify the data integrity of the files being saved.



Archiver Services Config View - General Tab

The General tab for an Archiver in the Services Config view helps manage basic service configuration, configure the aggregate service, and configure the aggregation process between an Archiver and the aggregate service.

To access the General tab, go to **(Admin) > Services**, select an **Archiver** service, then select **View > Config**.

Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver.

Configuring the aggregate service (whose data is consumed and aggregated) includes:

- Adding, editing, and deleting Archivers as aggregate services
- Toggling an aggregate service online and offline
- Monitoring statistics for aggregate services
- Starting and stopping aggregation

Configuring the aggregation process includes setting:

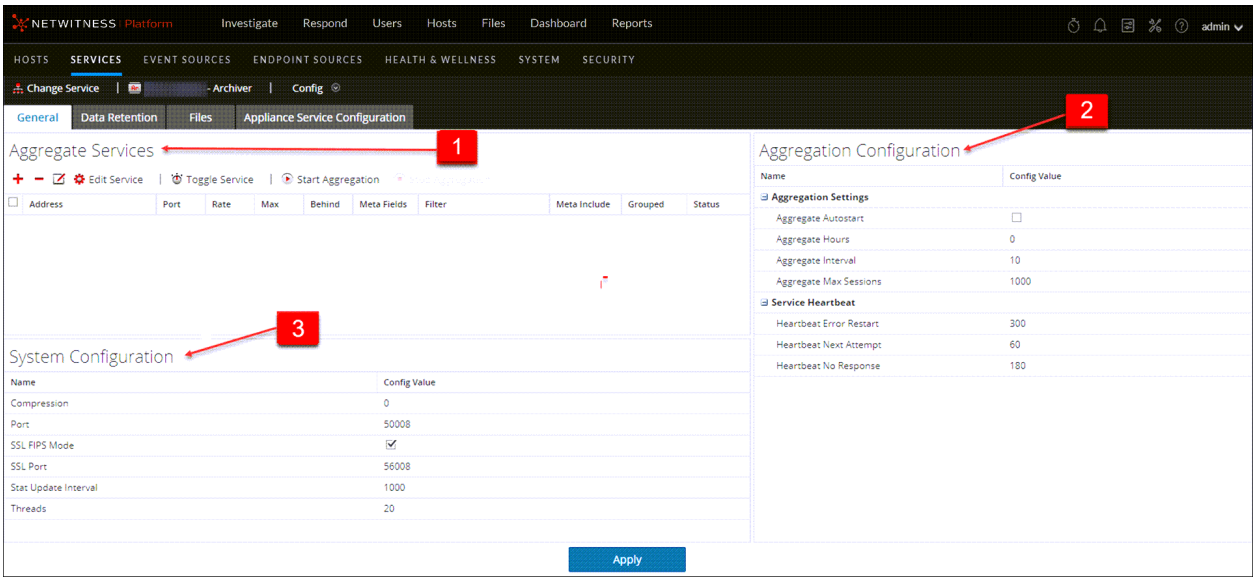
- Aggregation autostart
- Timing and performance parameters, such as the number of sessions per round of aggregation and time between rounds
- The timing of attempts to restart, reconnect, or take offline a non-responsive aggregate service

Note: Archiver can aggregate from Log Decoder r and Archiver (Archiver-Archiver aggregation). Archiver can be aggregated by Archiver and Broker. A Broker can aggregate from either set of concentrators or set of Archivers

What do you want to do?

Role	I want to...	Show me how...
Administrator	Add an Archiver service	Edit the Archiver Service
Administrator	Add a Log Decoder as a Data Source to an Archiver	Add Log Decoder as a Data Source to Archiver

Role	I want to...	Show me how...
Administrator	Configure Archiver Storage and Log Retention	Configure Archiver Storage and Log Retention
Administrator	Add an Archiver as a Data Source to a Reporting Engine	Add Archiver as a Data Source to Reporting Engine
Administrator	*Configure Archiver Monitoring	Configure Archiver Monitoring
Administrator	Start and Stop aggregation Add, edit, delete, and toggle an aggregate service	Aggregate Services Section
Administrator	Manage System Configuration	System Configuration Section



*You can perform this task here.

Related Topics

Configure Log Storage Collections

Quick Look

This is an example of the General tab.

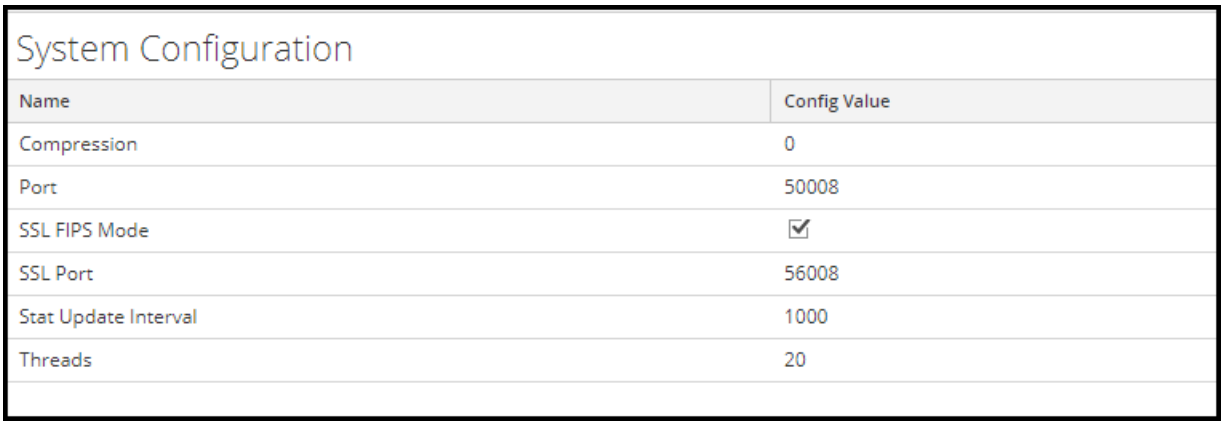
These are the three major sections in the General tab for Archivers:

1. Aggregate Services section provides a way to start and stop aggregation, as well as add, edit, delete, and toggle an aggregate service.
2. System Configuration section manages service configuration for a service.
3. Aggregation Configuration section provides configuration settings that affect various aspects of the aggregation process.

Aggregate Services Section

This is an example of the Aggregate Services section for a Concentrator. The Aggregate Services section toolbar offers these options.

Option	Description
	Opens a dialog in which you can add a Archiver or a Log Decoder.
	Removes the selected aggregate service.
	Opens a dialog to edit **Meta Fields** and **Filter** values.
	When aggregation has been stopped or has not started, starts aggregating data from the online service in the list using the rules defined for the service.
	When aggregation is in progress, stops aggregation on the Broker or Concentrator. This stops all services and flushes the index, which may take several minutes to complete. It is necessary to stop aggregate services in order to perform various administrative procedures.
	Toggles the state of a service between offline and online. Only data from online service is consumed during aggregation.



The Aggregate Services section list has these columns.

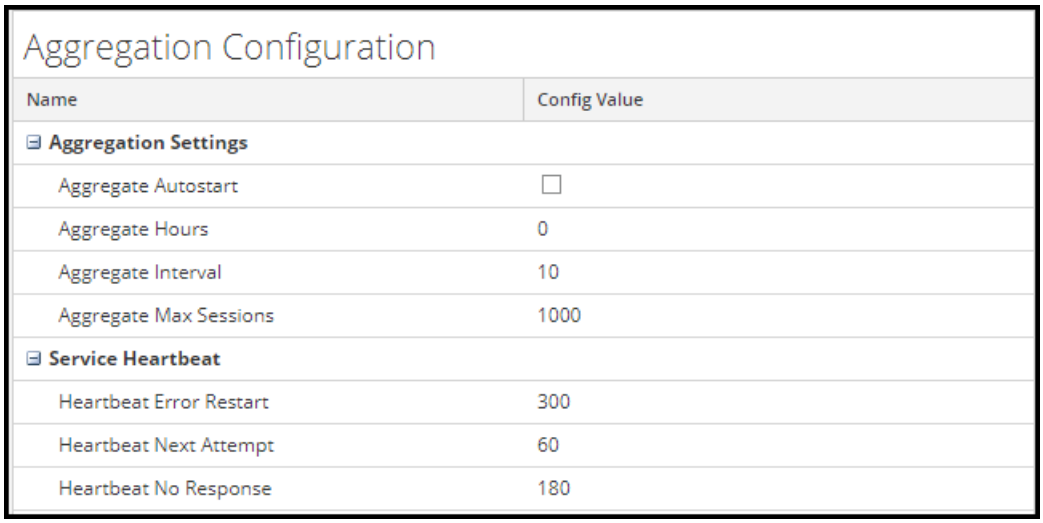
Column	Description
Address	Lists the address of the service.
Port	Lists the port on which the service listens. The default ports are: • 50001 for Log Collectors • 50002 for Log Decoders • 50003 for Brokers • 50004 for Decoders • 50005 for Concentrators • 50007 for other services
Rate	Lists the number of metadata objects being written to the database per second. Values are rolling average samples over a short time period (10 seconds). After capture stops, the rate is reset to **0**.
Max	Lists the maximum number of metadata objects written to the database per second since capture started. Values are rolling average samples over a short time period (10 seconds). After capture stops, **Max** continues to show the maximum value during capture.
Behind	Lists the number of sessions on the service that need to be aggregated.

Column	Description
Collection	For Brokers only, indicates the collection that was selected when the Analyst Workbench service was added to the Aggregate Services section.
Meta Fields	For Concentrators only, lists the types of metadata being consumed by the aggregate service.
Filter	For Concentrators only, lists any filter being applied to the metadata being consumed by the aggregate service.
Meta Include	For Concentrators only, lists the number of types of meta included in the aggregate service.
Grouped	Whether or not the aggregate service is part of a group.
Status	Lists the current status of the service: • online = available to provide data for consumption by the Broker or Concentrator • offline = not available to provide data for consumption by the Broker or Concentrator • consuming = providing data for consumption by the Broker or Concentrator

System Configuration Section

When a service is first added, default values are in effect. You can edit these values to tune performance.

The System Configuration section has these parameters.



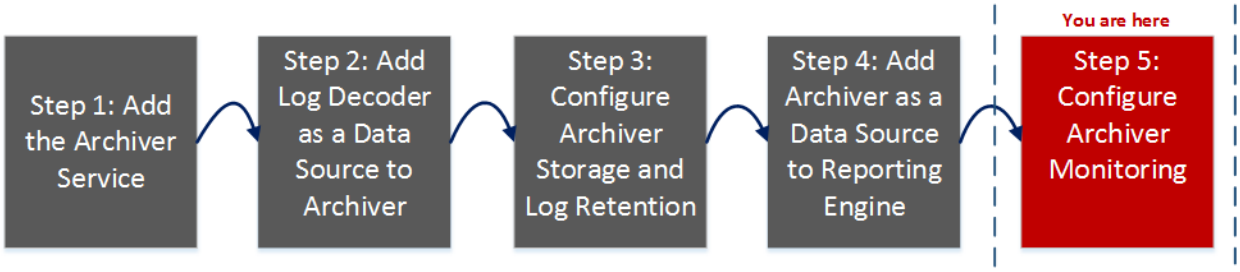
Parameter	Description
Compression	The minimum number of bytes that must be transmitted per response before compression. A setting of **0** disables compression. The default value is **0**. A change in value is effective immediately for all subsequent connections.

Parameter	Description
Port	The port on which the service listens. The default ports are: • 50001 for Log Collectors • 50002 for Log Decoders • 50003 for Brokers • 50004 for Decoders • 50005 for Concentrators • 50007 for other services
SSL FIPS Mode	When enabled (**on**), the security of data transmission is managed by encrypting information and providing authentication with SSL certificates. The default value is **off**.
SSL Port	Indicates the SSL port.
Stat Update Interval	The number of milliseconds between statistic updates on the system. Lower numbers cause more frequent updates and can slow down other processes. The default value is **1000**. A change in value is effective immediately.
Threads	The number of threads in the thread pool to handle incoming requests. A setting of **0** lets the system decide. The default value is **15**. Changes takes effect on service restart.

Aggregation Configuration Section

The Aggregation Configuration Section provides configuration settings for aggregation. When you click **Apply**, the changes are saved; however, not all settings take effect immediately. The tables for Aggregation Settings and Service Heartbeat provide details.

Caution: Do not edit any of these settings without guidance from Customer Support.



Archiver Service Configuration

This topic lists and describes the available configuration settings for NetWitness Archivers.

Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver

What do you want to do?

Role	I want to...	Show me how...

Data Retention Tab - Archiver

From the (Admin) > Services > Config view > Data Retention tab of an Archiver, administrators can define the criteria for log retention and storage.

Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver. From the Data Retention Tab you can configure hot, warm, and cold storage along with configuring multiple storage collections for data retention.

What do you want to do?

Role	I want to...	Show me how...
Administrator	Add the Archiver service.	Edit the Archiver Service
Administrator	Add Log Decoder as a Data Source to an Archiver.	Add Log Decoder as a Data Source to Archiver
Administrator	*Configure Archiver Storage and Log Retention.	Configure Archiver Storage and Log Retention
Administrator	Add an Archiver as a Data Source to Reporting Engine.	Add Archiver as a Data Source to Reporting Engine
Administrator	Configure Archiver Monitoring.	Configure Archiver Monitoring

*You can perform these tasks here.

Configuring an Archiver

Configure Hot, Warm, and Cold Storage

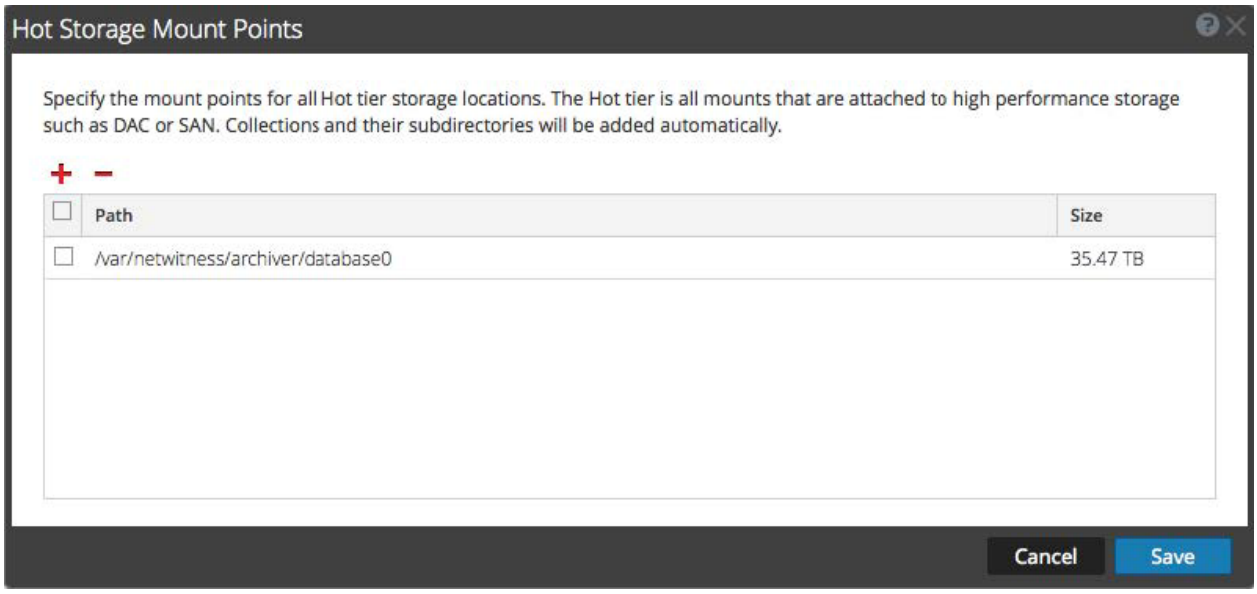
Quick Look

As an administrator, you can configure hot, warm, and cold storage as well as multiple storage collections with different locations and criteria for retaining logs. For example, you can create a Compliance collection that stores logs for a specific time period as required by government regulations. You can create another collection that stores low value logs in hot storage with a much shorter retention period. The flexibility of these collections enables you to have significantly less overall storage requirements.

1	Displays the Collections panel with the Data Retention tab open.
2	Allows you to sort the collections in ascending or descending order.
3	Displays the allocated hot storage space for the collection, as well as the approximate current usage.
4	Displays the allocated warm storage space for the collection, as well as the approximate current usage.
5	Displays whether the collection uses cold storage for long-term backup.
6	Displays the time range used to determine when data is moved to cold storage or discarded.
7	Displays the amount of data written to the collection during the past hour.
8	Displays the date of the oldest data stored in the collection.
9	Displays the approximate age of the oldest data stored in the collection.
10	Displays the compression type used in collection storage.
11	Displays whether or not hashes are used when storing data in the collection.
12	Displays the number of retention rules that use this collection for storing data.
13	Displays the Actions drop-down menu.

14 Displays the Retention Rules panel.
15 Displays the order in which Retention Rules are evaluated in the execution chain.
16 Displays the name of the Retention Rule.
17 Data that satisfies this condition is stored in the corresponding collection.
18 Displays the collection used to store the data that satisfies this particular rule condition.

Total Hot, Warm, and Cold Storage

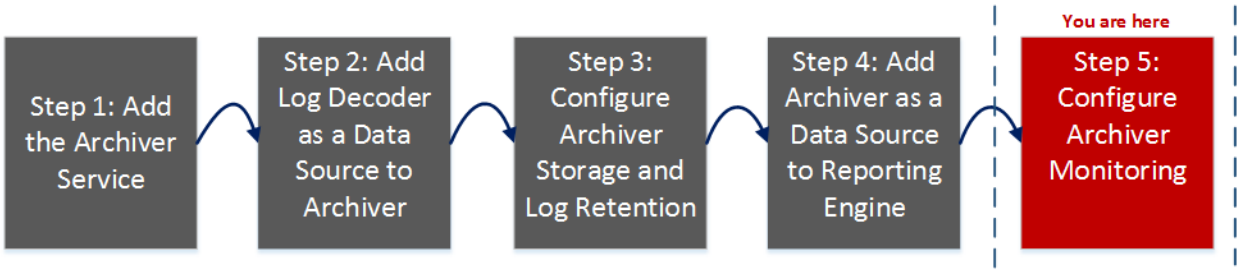


The Total Hot Storage section shows the total amount of Hot storage available and the number of hot storage mount points. The Total Hot Storage section shows the total amount of Warm storage available and the number of warm storage mount points. The Total Cold Storage section shows the total amount of Cold storage and the remaining free space available in Cold storage.

Hot, Warm, and Cold Storage Mount Points Dialogs

In the Hot, Warm, and Cold Storage Mount Points dialogs, you can specify the mount points for your storage locations. You can specify portions of this storage to use for your log storage collections.

To access the Hot, Warm, and Cold Storage Mount Points dialogs, click the icon near the respective section.



Services Config View - Archiver

The Services Config view ((Admin) > Services > select Archiver service and select >View > Config) provides a way to manage basic service configurations, configure aggregate services, configure log retention and storage, edit service configuration files, and configure the appliance service for an Archiver.

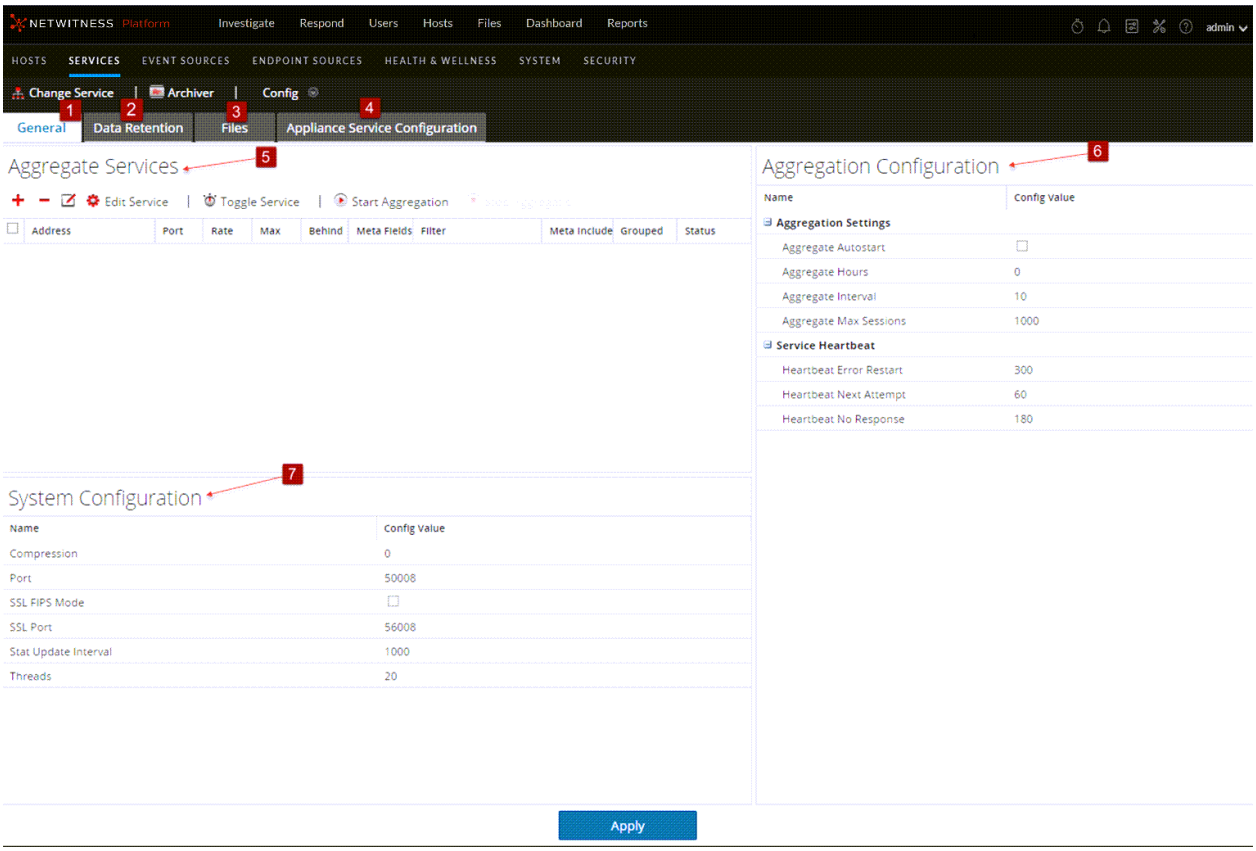
Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver.

What do you want to do?

Role	I want to...	Show me how...
Administrator	Add the Archiver service.	Edit the Archiver Service
Administrator	Add a Log Decoder as a Data Source to an Archiver.	Add Log Decoder as a Data Source to Archiver
Administrator	Configure Archiver Storage and Log Retention.	Configure Archiver Storage and Log Retention
Administrator	Add an Archiver as a Data Source to Reporting Engine..	Add Archiver as a Data Source to Reporting Engine
Administrator	Configure Archiver Monitoring.	Configure Archiver Monitoring
Administrator	*Add a Log Decoder as an aggregate service.	Click in the Aggregate Services section.
Administrator	*Remove the selected aggregate service.	Click in the Aggregate Services section.

Role	I want to...	Show me how...
Administrator	*Edit Meta Fields and Filter values of the aggregate service.	Click  in the Aggregate Services section. You can specify the type of metadata that the Archiver consumes from this service. You can also specify a rule to filter data that the Archiver consumes from this service.
Administrator	*Communicate with the Archiver.	Click  in the Aggregate Services section. This enables you to enter the administrator credentials of the selected aggregate service so that it can communicate with the Archiver.
Administrator	*Toggle the state of a service between offline and online.	Click  in the Aggregate Services section.
Administrator	*Aggregate data using the rules defined for the service.	Click  in the Aggregate Services section. Note that it is necessary to start aggregate service after aggregation has been stopped.
Administrator	*Stop aggregation on the Archiver.	Click  in the Aggregate Services section. This stops all services and flushes the index, which may take several minutes to complete. It is necessary to stop aggregate services in order to perform various administrative procedures.



*You can perform this task in the current view.

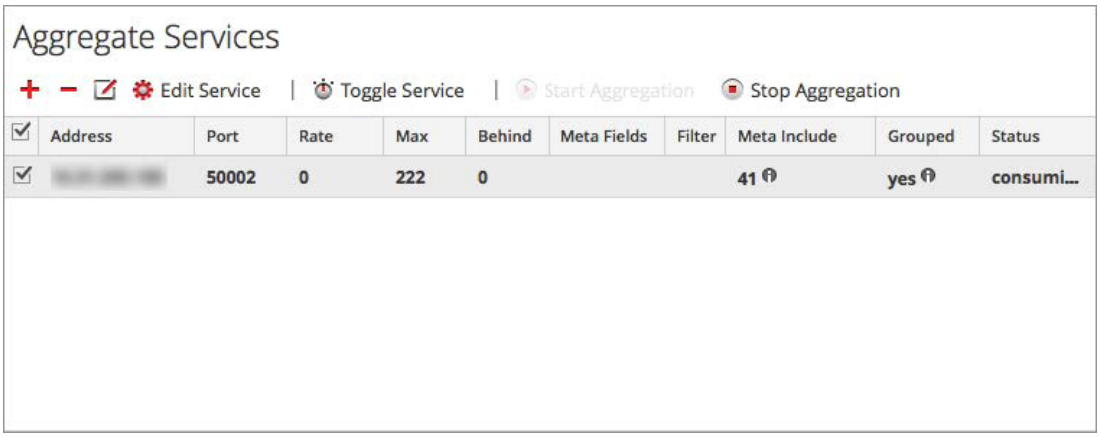
Related Topics

Configure Log Storage Collections

Quick Look

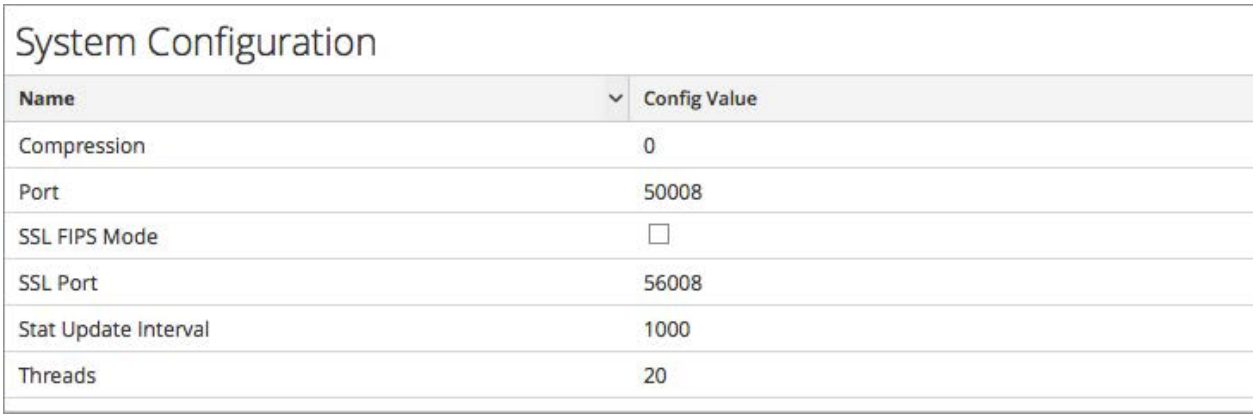
The Services Config view has four tabs and three panels.

1	General tab provides a way to manage basic Archiver service configuration.
2	Data Retention tab provides a way to view and edit collections and retention rules.
3	Files tab allows you to edit enables you to edit the service configuration files for the Archiver as text files
4	Appliance Service Configuration tab provides a way to configure an Archiver service.
5	Aggregate Services panel provides a way to start and stop aggregation, as well as add, edit, delete, and toggle an aggregate service.
6	Aggregation Configuration panel provides configuration settings that affect various aspects of the aggregation process.
7	System Configuration panel provides a way to manage service configuration for an Archiver service.



General

The General tab contains the following sections:

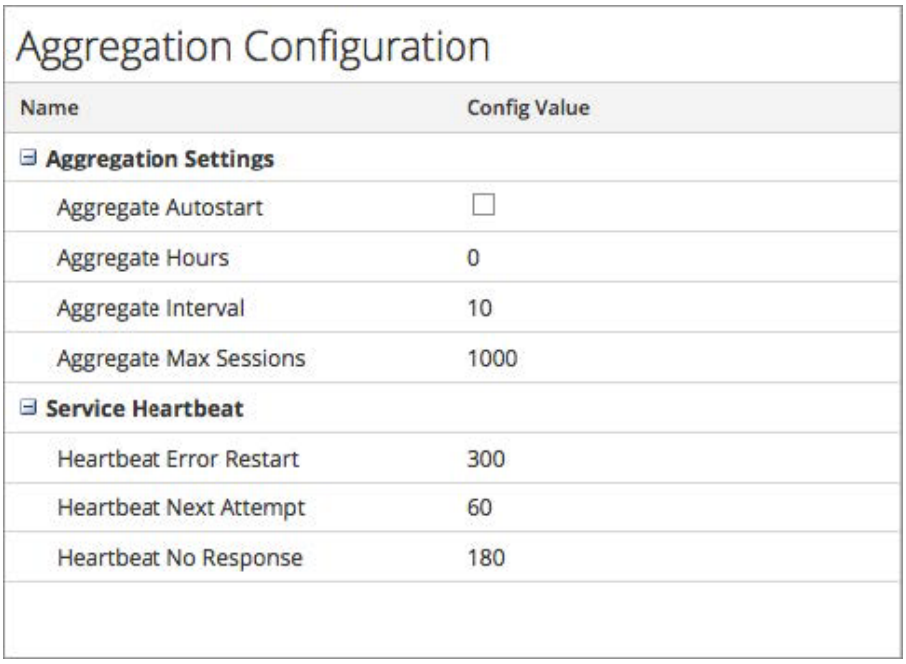


- Aggregate Services
- System Configuration
- Aggregation Configuration

Aggregate Services

The Aggregate Services section provides a way to start and stop aggregation, as well as add, edit, delete, and toggle an aggregate service.

System Configuration



When you add an Archiver service, default values are in effect. NetWitness designed the default values to accommodate most environments and recommends that you do not edit these values because it may adversely affect performance. The following table describes the System Configuration parameters.

Task	Description
Compression	Determines the minimum amount of bytes before a message is compressed. If set to zero, messages are not compressed.
Port	Determines the port used by the service. **Note:** If you change the port number, ensure that you restart the service.
SSL FIPS mode	If enabled, all the data transferred in the network will be encrypted using SSL.
SSL Port	Indicates the port used for encrypting using SSL.

Task	Description
Stat Update Interval	Determines how often (in milliseconds) statistic nodes are updated in the system.
Threads	Determines the number of threads in the thread pool to handle incoming requests.

Aggregation Configuration

The Aggregation Configuration section contains the following sections:

- Aggregation Settings
- Service Heartbeat

Aggregation Settings

The Aggregations Settings section has the following parameters.

Parameter	Description
Aggregate Autostart	If enabled, data aggregation will automatically restart after a service restart.
Aggregate Hours	Determines the maximum number of hours a service is allowed to start aggregation.
Aggregate Interval	Determines the minimum number of milliseconds before another round of aggregation is requested.

Parameter	Description
Aggregate Max Sessions	Determines the number of sessions to aggregate on each round.

Service Heartbeat

The Service Heartbeat section has the following parameters.

Parameters	Description
Heartbeat Error Restart	Determines the number of seconds to wait after a service error before attempting a service reconnect.
Heartbeat Next Attempt	Determines the number of seconds to wait before attempting a service reconnect.
Heartbeat No Response	Determines the number of seconds to wait before taking unresponsive service to offline.

Files

The **Files** tab in the Service Config view enables you to edit the service configuration files for the Archiver as text files. The files available to edit vary depending upon the type of service being configured.

The following files are common to all core services:

- Service index file
- NetWitness file
- Crash reporter file
- Scheduler file
- Feed definitions file

For more information on the **Files** tab, see "Files Tab" in the *Host and Services Getting Started Guide*.

AWS Installation Overview

Before you can deploy NetWitness in the Amazon Web Services (AWS) you need to:

- Review the recommended compute and memory specifications needed for each NetWitness instance.
- Get familiar with the NetWitness Storage Guide to understand the types of drives and volumes needed to support NetWitness instances. For more information, see the Storage Guide for NetWitness® Platform 12.4.1.
- Make sure that you have a NetWitness Throughput license.

When you are ready to begin deployment, you can purchase any of the following Third-Party solutions for packet capture in AWS. If you engage one of these third-parties, they will assign an account representative and a professional services engineer to you who will work closely with NetWitness Support.

- Gigamon® GigaVUE
- Ixia CloudLens™
- f5® BIG-IP

AWS Environment Recommendations

AWS instances have the same functionality as the NetWitness Azure, virtual, and hardware hosts. NetWitness recommends that you perform the following tasks when you set up your AWS environment.

- Based on the resource requirements of the different components, follow the best practices to use the system and the dedicated storage Elastic Block Store (EBS) Volumes appropriately.
- Make sure that the compute capacity provides a write speed of 10% greater than the required sustained capture and ingest rate for the deployment.
- Build a Concentrator directory for the index database on the Provisioned IOPS SSD.

AWS Deployment Scenarios

Before you can deploy NetWitness you need to:

- Consider the requirements of your enterprise and understand the deployment process.
- Have a high-level picture of the complexity and scope of a NetWitness deployment.

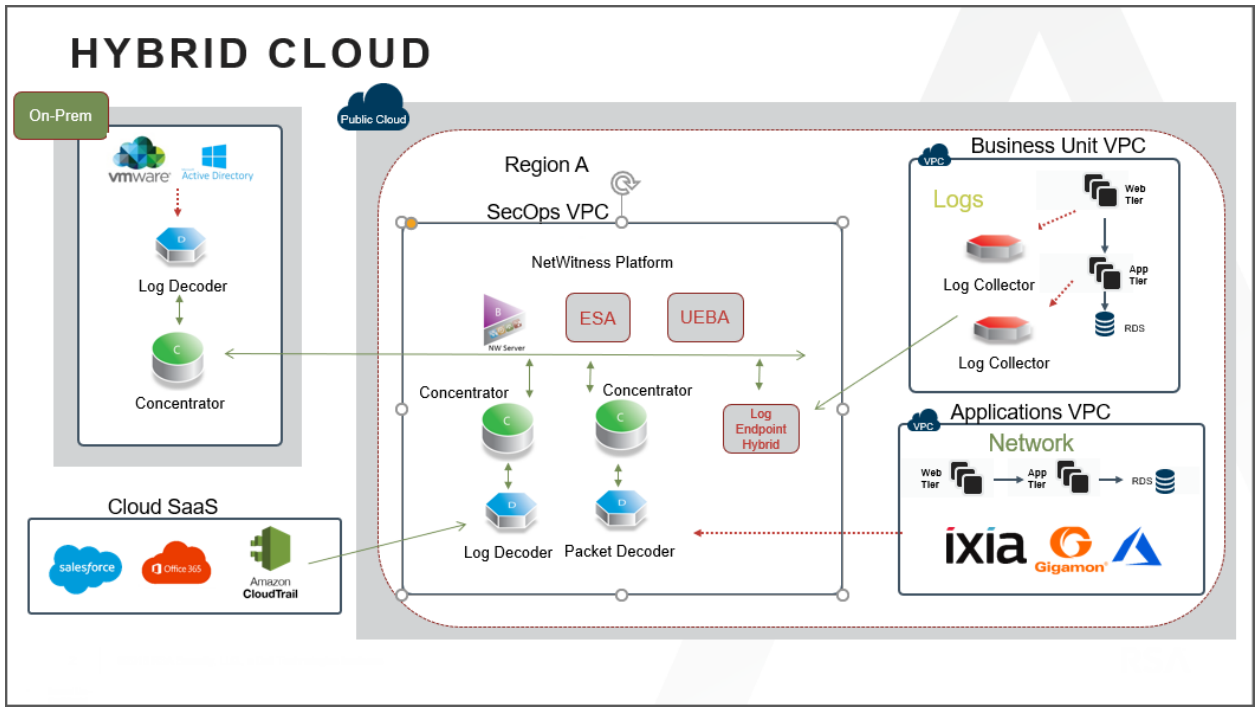
Process

The components and topology of a NetWitness network can vary greatly between installations, and should be carefully planned before the process begins. Initial planning includes:

- Consideration of site requirements and safety requirements.
- Review of the network architecture and port usage.
- Support of group aggregation on Archivers and Concentrators, and virtual hosts.

When updating hosts and services, follow recommended guidelines under the "Running in Mixed Mode" topic in the *NetWitness Host and Services Getting Started Guide*.

You should also become familiar with Hosts, Host Types, and Services as they are used in the context of NetWitness also described in the *NetWitness Host and Services Getting Started Guide*.



NetWitness High-Level Deployment Diagram

NetWitness is inherently modular. Whether organizations are looking to deploy on-premise or in the cloud, the NetWitness components are decoupled in a way which allows flexible deployment architectures to satisfy a variety of use cases.

The following figure is an example of a hybrid cloud deployment, where the base of the components are residing within the SecOps VPC. Centralizing these components make management easier while keeping network latency to a minimum.

Network, log and endpoint traffic could then be aggregated up to the SecOps VPC. The on-premise location would function just like a normal physical deployment and would be accessible for investigations and analytics.

Cloud SaaS visibility could be captured from a Log Decoder residing in either the cloud or on-premise locations.

Prerequisites

You need the following items before you begin the installation process:

- Ixia account (https://login.ixiacom.com/)
- Access to AWS console
- Network rout-able (and proper AWS Security Groups) for the containers to transfer data to the NetWitness Decoder.

AWS Deployment

This topic contains the rules and high-level tasks that you must follow to deploy NetWitness components in the AWS.

Rules

You must adhere to the following rules when deploying NetWitness in AWS.

- If you reboot the Network Decoder instance, the tunnel is not retained. Create the tunnel on Network Decoder again and restart the Decoder service.
- It is recommended to use private IP addresses when you provision AWS NetWitness instances.

Note: If you assign a public IP to the NW Server Host, update the /etc/nginx/conf.d/nginx.conf configuration file as follows:

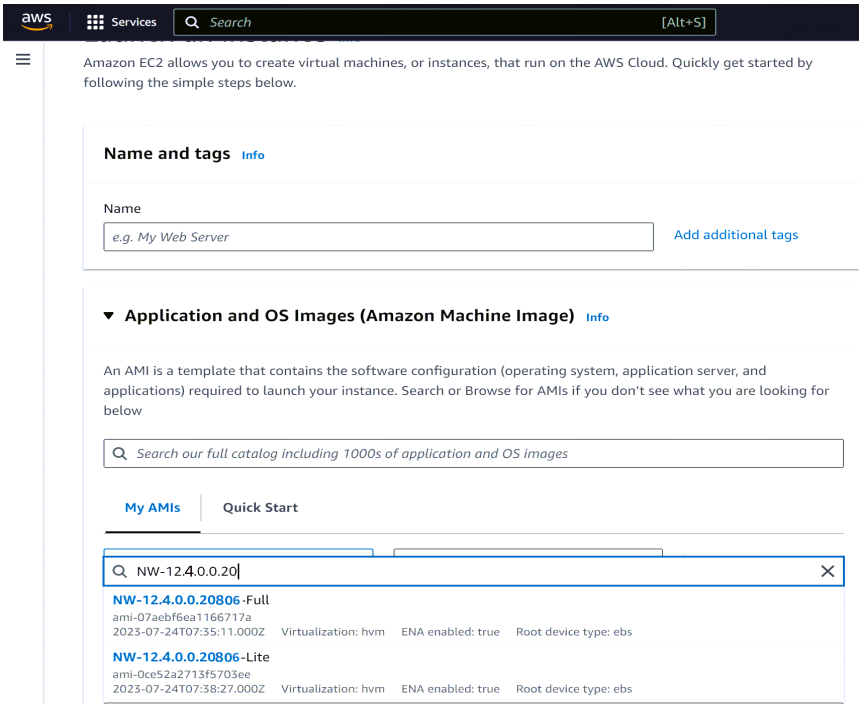
```
location /nwrpmrepo
{
alias /var/lib/netwitness/common/repo;
index index.html index.htm;
allow <Subnet-Gateway>/Subnet mask ;
#example
# allow 10.0.0.1/25;
deny all;
autoindex on;
}
```

Checklist

Step	Description	√
1	Establish AWS Environment	
2	Find NetWitness Platform AMIs	
3	Launch an Instance and Configure a Host	
4	Configure Hosts (Instances) in NetWitness Platform	
5	Configure Packet Capture	

Establish AWS Environment

1. Make sure that you have an AWS environment with the capacity to meet or exceed the NetWitness performance guidelines described in AWS Instance Configuration Recommendations.
2. Go to Find NetWitness Platform AMIs.



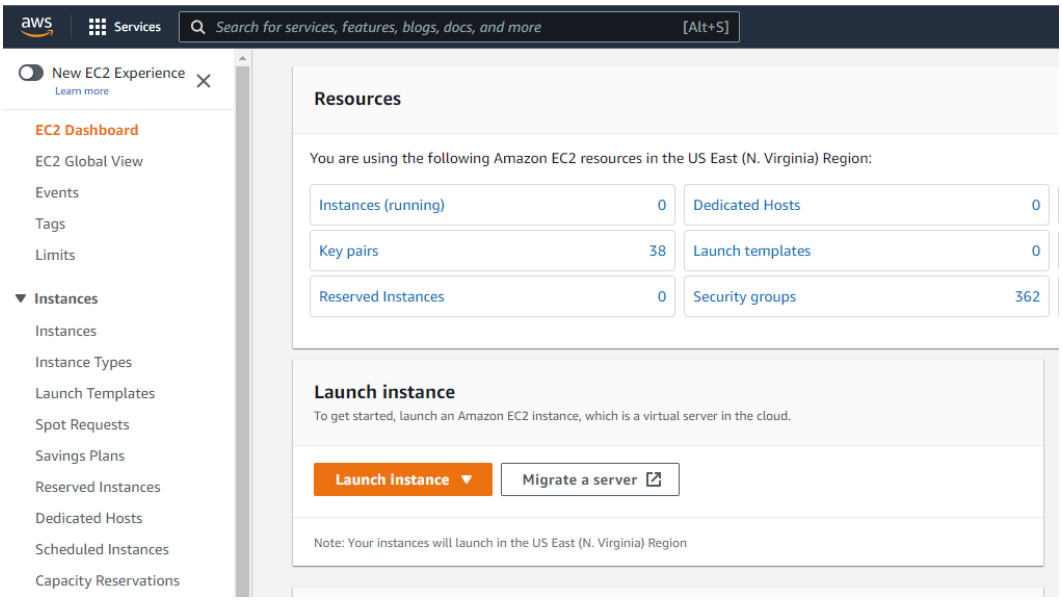
Find NetWitness Platform AMIs

You can search for NW- AMI files within the Public/Shared/Community repository, using the keyword "NW".

Note: NetWitness AMIs are available by default in the US East (N. Virginia) region (us-east-1). If you need AMIs for other regions, contact NetWitness Customer Support.

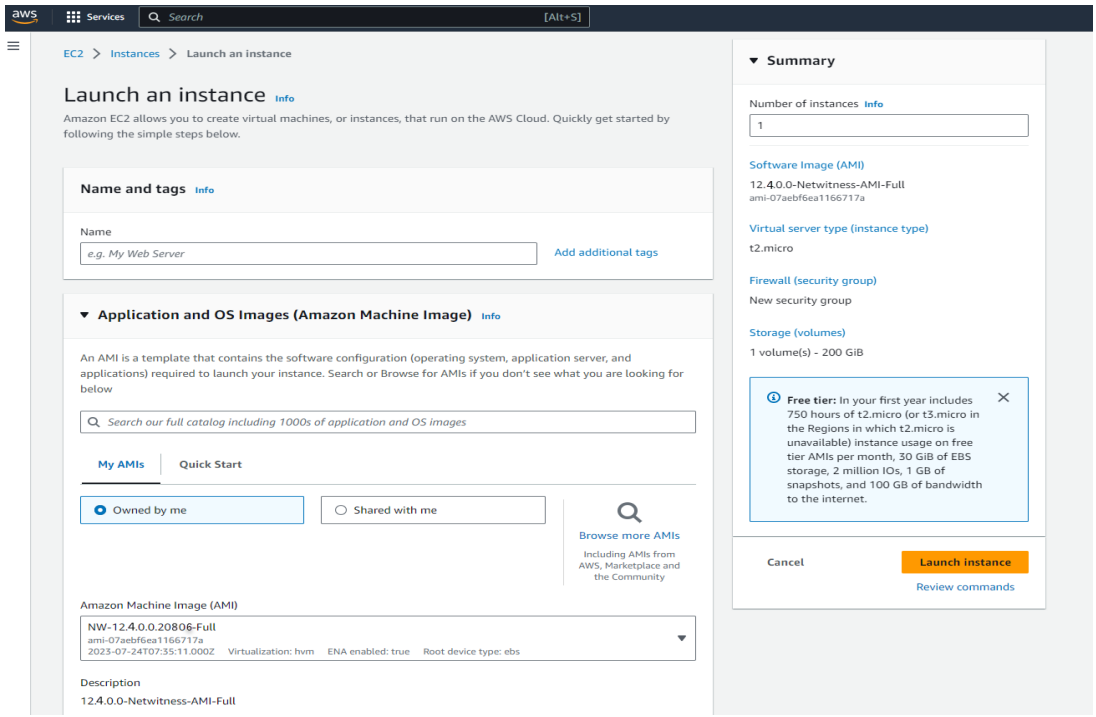
Note: For more information, see AWS **Finding Shared AMIs** documentation (http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/usingsharedamis-finding.html).

1. Open the new Amazon EC2 console (New Subscriber Account) at https://console.aws.amazon.com/ec2/.
2. Go to **EC2 Dashboard** and click **Launch Instance**.
   Launch an Instance page is displayed.
3. Under **Application and OS Images (Amazon Machine Image)**, click **My AMIs** and select either **Owned by me** or **Shared with me** option.
4. Search for **NW-12.4** from the **Amazon Machine Image (AMI)** drop-down menu to find the NetWitness AMIs.



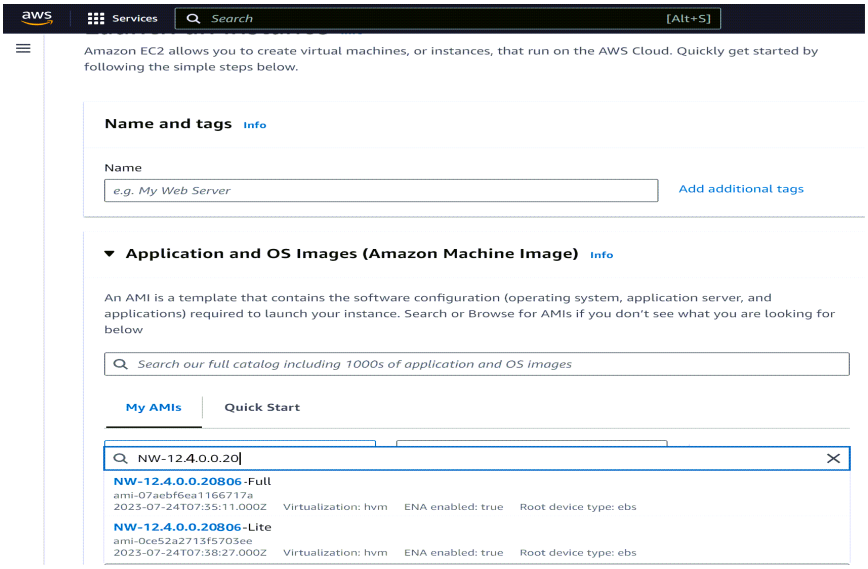
Note: Contact NetWitness Customer Support (https://community.netwitness.com/t5/support-information/how-to-contact-netwitness-support/ta-p/563897) to obtain access to the **NW-12.4.0.0.20806-Full**.

5. Go to Launch an Instance and Configure a Host.



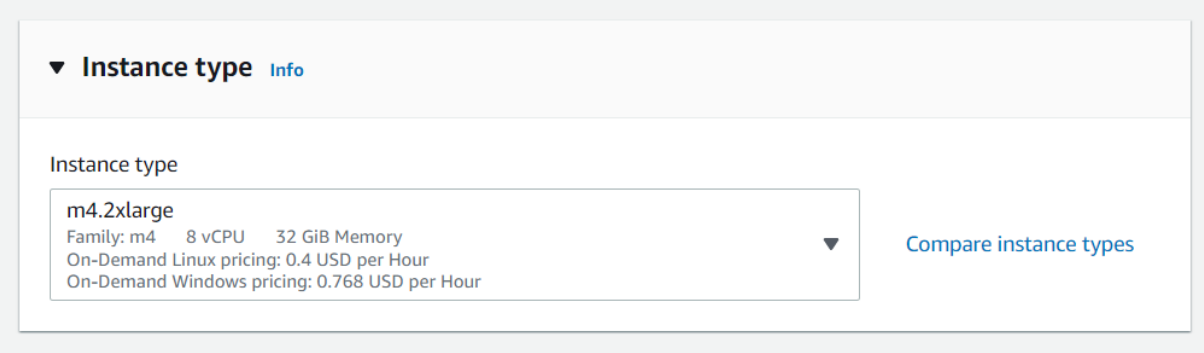
Launch an Instance and Configure a Host

Note: Fore more information, see AWS "Launch an instance using the new launch instance wizard" documentation (https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ec2-launch-instance-wizard.html).

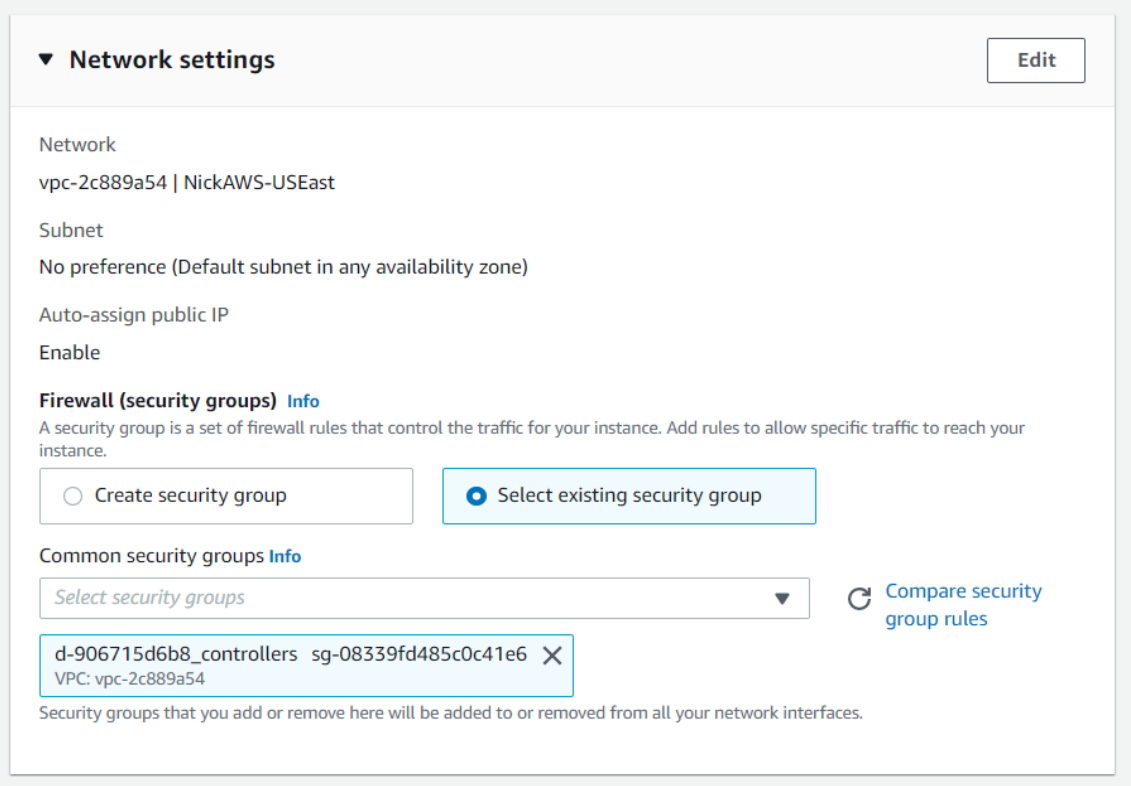


1. Log in to the Amazon EC2 console.
2. Go to **EC2 Dashboard** and click **Launch Instance**.

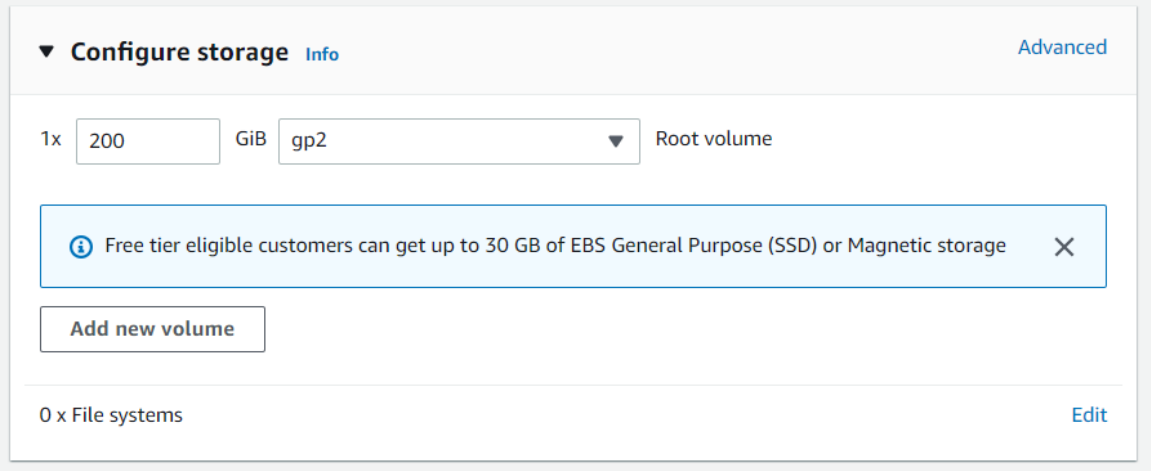
Launch an Instance page is displayed.



3. (Optional) Under **Name and tags**, enter a name for your instance.
4. Under **Application and OS Images (Amazon Machine Image)**, click **My AMIs** and select either **Owned by me** or **Shared with me** option.
5. Search for **NW-12** and select the **NW-12.4.0.0.20806-Full** image from the **Amazon Machine Image (AMI)** drop-down menu.

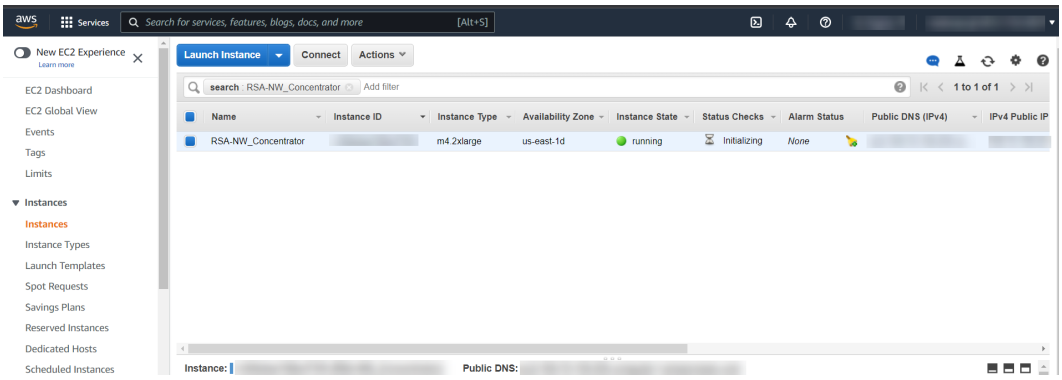


6. Under **Instance type**, Choose the RAM and CPUs by selecting the instance type.
   For more information, see Storage Guide for NetWitness® Platform 12.4.1 for guidelines on how to configure the EC2 Instance based on the requirements of the NetWitness component (that is, service) for which you are launching an instance. The following example has the **m4.2xlarge** instance type

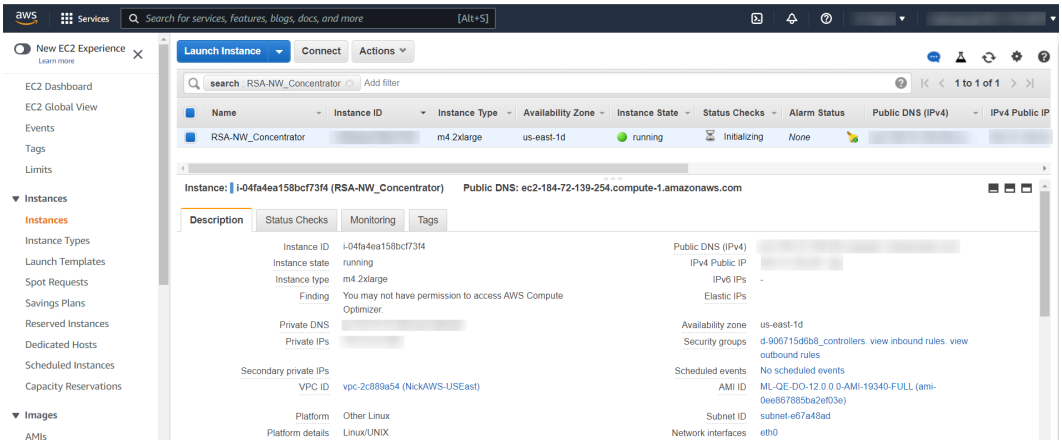


selected with **8** CPUs and **32** GB of RAM.

7. Under **Network settings**, select **Select existing security grop** option and select your security group from **Common security groups** drop-down menu.



8. Under **Configure Storage** specify the size and type of the volume.



For more information, see the Storage Guide for NetWitness® Platform 12.4.1 for guidelines on how to configure storage based on based on the requirements of the NetWitness component (that is, service) for which you are launching an instance.

9. Under **Summary**, you can specify the number of instances required and to review your instance configuration.
10. Click **Launch Instance**.
11. Click **Instances**.
12. Select **Instances** from the left navigation panel to review all instances that AWS is initializing (for example, the **RSA-NW_Concentrator**) .

The IP Address for the new **RSA-NW-Concentrator** host is ***sample-ip-address***.

13. SSH to the newly-created instance using the default NetWitness credentials.
14. Go to Configure Hosts (Instances) in NetWitness Platform.

Storage Configurations

For storage allocations of all host types, see the Prepare Virtual or Cloud Storage topic in the *Storage Guide for NetWitness® Platform 12.4*.

Installation Tasks

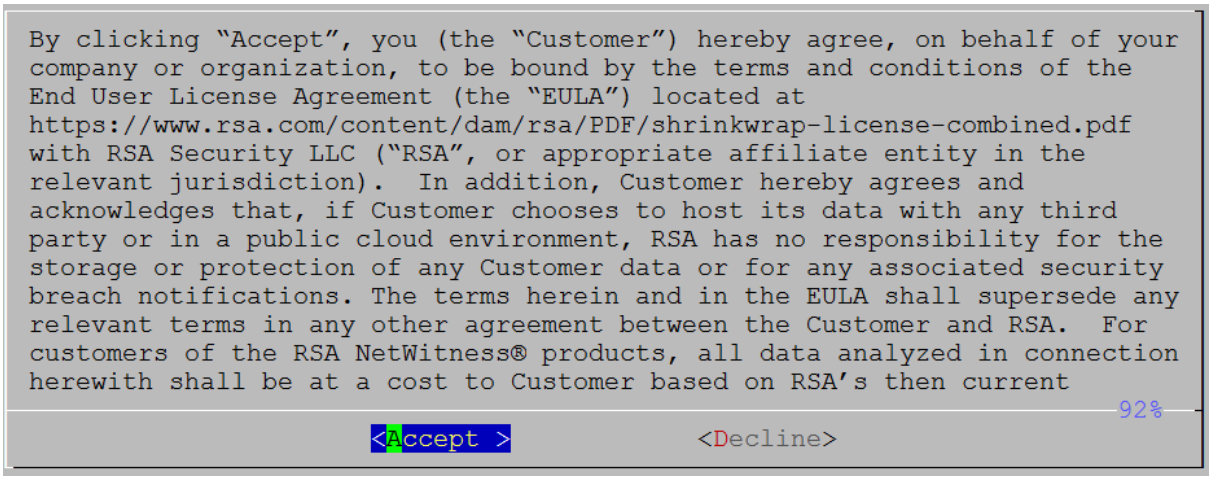
Before you begin the installation tasks make sure you open the firewall ports. For more information on the lists of all the ports in a deployment, see the"Network Architecture and Ports" topic in the *Deployment Guide for NetWitness Platform 12.4*.

Caution: Do not proceed with the installation until the ports on your firewall are configured.

Task 1 - Install 12.4.1 on the NW Server Host and Component Hosts

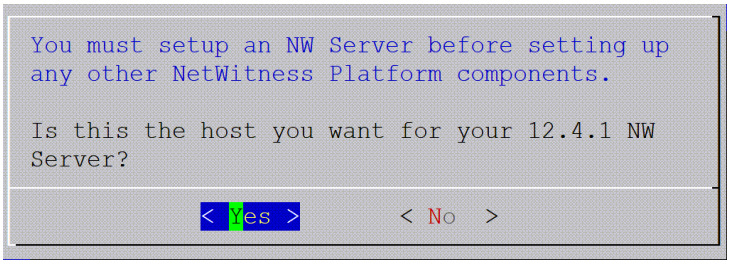
Complete the following steps to install 12.4.1 on NW Server host and other component hosts. Steps that are specific to the NW Server host or to component hosts are noted.

Note: You can perform this task for **NW-12.4.0.0.20806-Full** instance.



Caution: If you want to install the Endpoint Relay Server, do not run the `nwsetup-tui` script. Follow the instructions in "(Optional) Installing and Configuring Relay Server" in the *NetWitness Endpoint Configuration Guide*.

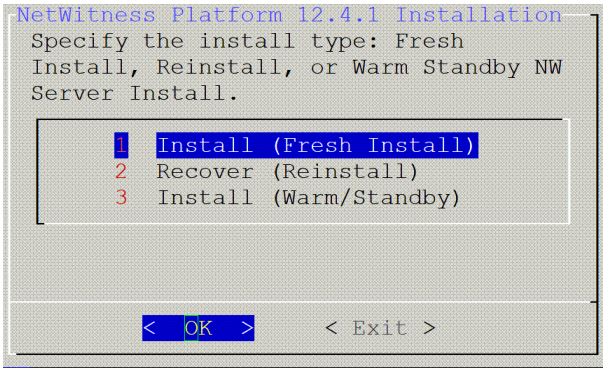
IMPORTANT: In NetWitness Platform version 11.6 or later, deployment account password must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ .) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`. If `deploy_admin` password is changed on Primary NW Server, It must be changed on the Warm Standby Server if it exists.



1. Log in to the host with the `root` credentials and run the `nwsetup-tui` command to set up the host.

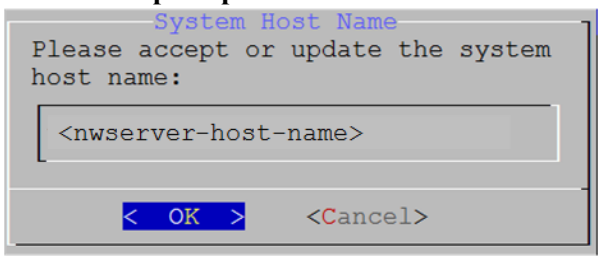
   This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.

> **Note:** Use the following options to navigate the Setup prompts.
> 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, and use the Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**). Press **Enter** to register your command response and move to the next prompt.
> 2.) The Setup program adopts the color scheme of the desktop or console you use to access the host.
> 3.) If you specify DNS servers during the Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` script to proceed. Any misconfigured DNS servers cause the Setup program to fail. If you need to reach a DNS server after setup that is unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see "Change Host Network Configuration" topic in the System Maintenance Guide.
> If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).



2. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 12.4.1 NW Server** prompt is displayed.

3. Tab to **Yes** and press **Enter** to install 12.4.1 on the NW Server.
   Tab to **No** and press **Enter** to install 12.4.1 on other component hosts.



Caution: If you choose the wrong host for the NW Server and complete the Setup, you must restart the Setup Program (step 2) and complete steps all the subsequent steps to correct this error.

4. The **Install** prompt is displayed (**Recover** does not apply to the installation. It is for 12.4.1 Disaster Recovery.).
   NW Server Host prompt:

   Other Component Hosts, the prompt is the same, but does not include option 3 Install (Warm/Standby)

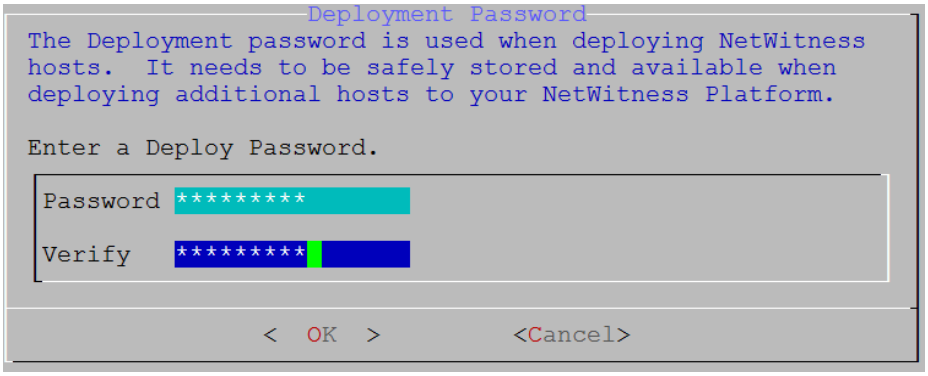
5. Press **Enter**. **Install (Fresh Install)** is selected by default.
   The **System Host Name** prompt is displayed.
   NW Server prompt:

   Other Component Hosts prompt says <non-nwserver-host-name>

   Caution: If you include "." in a host name, the host name must also include a valid domain name.

   Press **Enter** if want to keep this name. If not, edit the host name, tab to **OK**, and press **Enter** to change it.

6. **This step applies only to NW Server hosts**.
   The **Master Password** prompt is displayed.

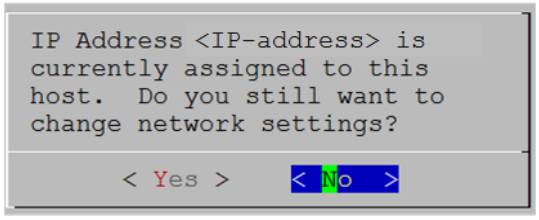


The following list of characters are supported for Master Password and Deployment Password:

- Symbols: **! @ # % ^ +**
- Numbers: **0-9**
- Lowercase Characters: **a-z**
- Uppercase Characters: **A-Z**

No ambiguous characters are supported for Master Password and Deployment Password. For example:
space { } [ ] ( ) / \ ' " ` ~ ; : . < > -

Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.



7. **This step applies to both NW Server hosts and component hosts.**
   The **Deployment Password** prompt is displayed.

   Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

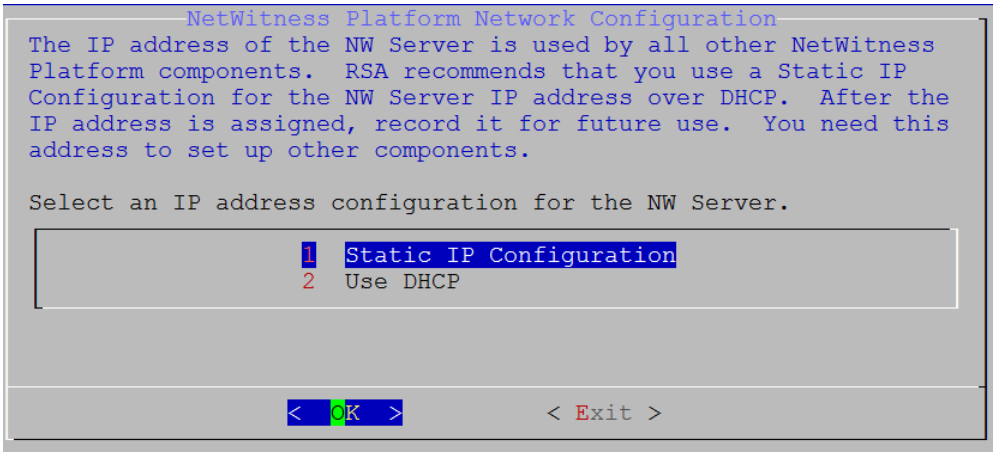
8. One of the following conditional prompts is displayed.

   - If the Setup program finds a valid IP address for this host, the following prompt is displayed.

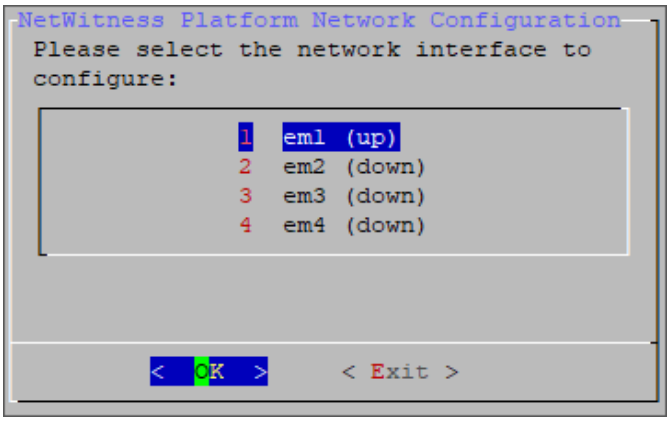
     Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and

press **Enter** if you want to change the IP configuration on the host.

- If you are using an SSH connection, the following warning is displayed.

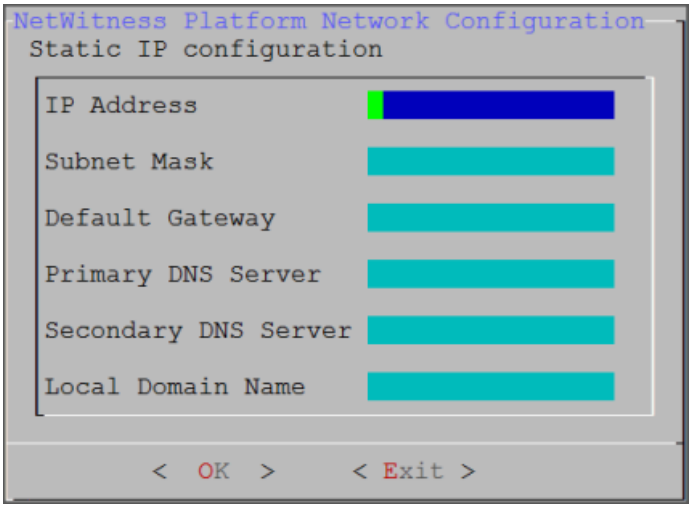


Note: If you connect directly from the host console, the following warning is not displayed.



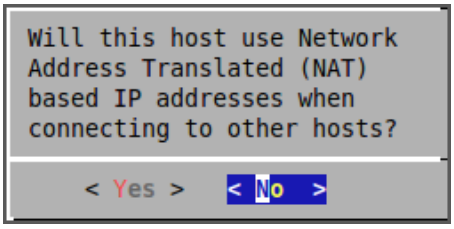
Press **Enter** to close warning prompt.

- If the Setup Program finds an IP configuration and you choose to use it, the **Update Repository** prompt is displayed. Go to step 12 and complete the installation.
- If the Setup Program did not find an IP configuration or if you choose to change the existing IP configuration, the **Network Configuration** prompt is displayed.



Caution: Only select "**Use DHCP**" as an IP address configuration for the NW Server if DHCP issues static IP addresses.

Tab to **OK** and press **Enter** to use **Static IP**.
If you want to use DHCP, down arrow to **2 Use DHCP** and press **Enter**.
The **Network Configuration** prompt is displayed.



9. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit.**
   The following **Static IP Configuration** prompt is displayed.

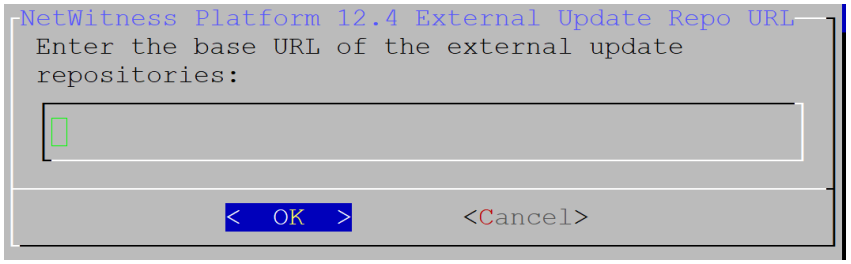
10. Type the configuration values, tab to **OK**, and press **Enter**. If you do not complete all the required fields, an `All fields are required` error message is displayed (**Secondary DNS Server** and **Local Domain Name** fields are not required). If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

    Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

11. The Use Network Address Translation (NAT) prompt is displayed.

    For the NW Server, tab to **No** and press **Enter**.
    For component hosts, if this host requires the use of NAT-based addresses to communicate with the NW Server, tab to **Yes**. Otherwise, tab to **No** and press **Enter**.

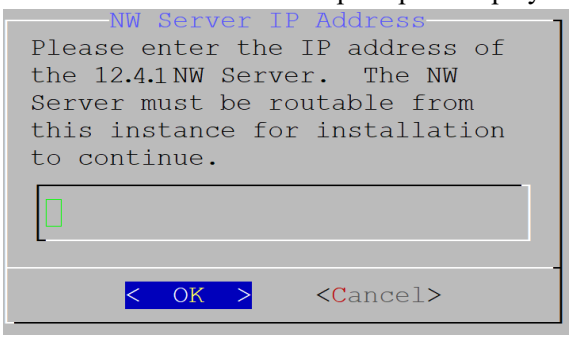
12. The **Update Repository** prompt is displayed.



For the NW Server:

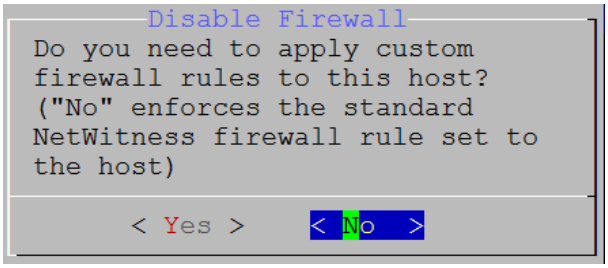
- Press **Enter** to choose the **Local Repo**.
- If you want to use an external repo, down arrow to **External Repo**, tab to **OK**, and press **Enter**. If you select **1 The Local Repo (on the NW Server)** in the Setup program, make sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can install NetWitness 12.4.1. If the program cannot find the attached media, you receive the following prompt.

- If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access to RSA updates and CentOS updates. Refer to "Appendix B. Create an External Repo" in this guide for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.



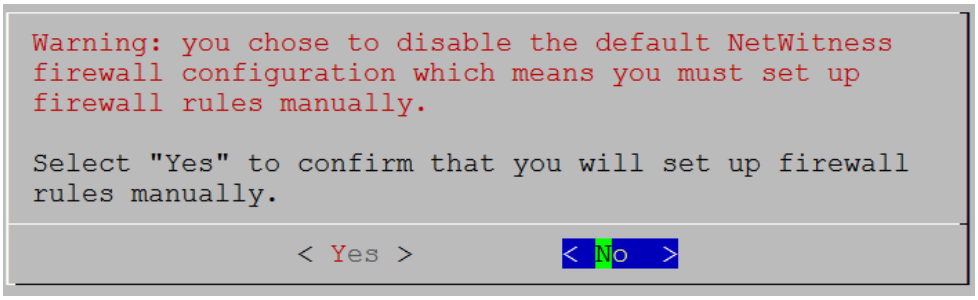
Enter the base URL of the NetWitness external repo and click **OK.** The **Start Install** prompt is displayed.

For component hosts:

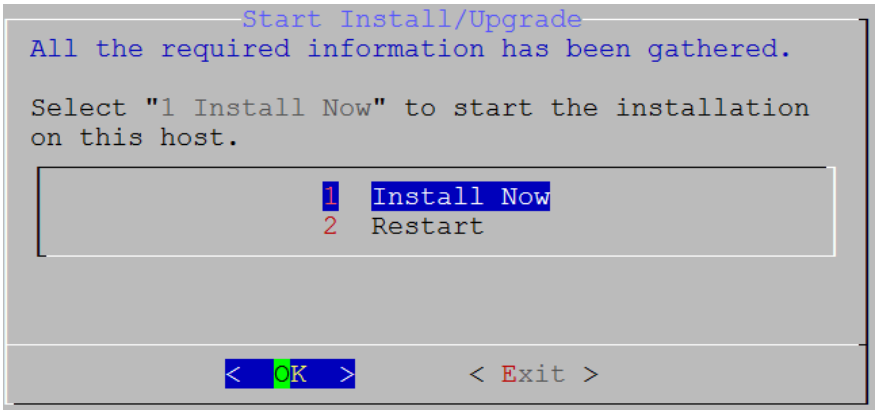


- Select the same repo that you selected when you installed the NW Server host and follow the steps above.

- The NW Server IP Address prompt is displayed.



Type the NW Server IP address. Tab to **OK** and press **Enter**.



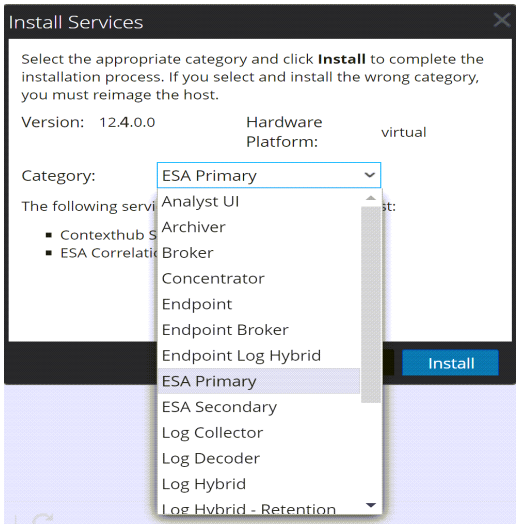
13. The Disable firewall prompt is displayed.

Tab to **No** (default), and press **Enter** to use the standard firewall configuration.
To disable the standard firewall configuration, tab to **Yes**, and press **Enter**.
If you select **Yes**, confirm your selection(select **Yes** again) or select **No** to use the standard firewall configuration.

14. The **Start Install** prompt is displayed.

15. Press **Enter** to install 12.4.1.
    When **Installation complete** is displayed, you have installed 12.4.1 on this host.

    Note: Ignore the hash code errors similar to the errors shown in the following figure that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



```
ValueError: error:3207A06D:lib(50):B_HASH_init:cr new
Checksum type 'md5' disabled
 (skipped due to only_if)
    * file[/etc/yum.repos.d/CentOS-Base.repo] action delete (up to date)

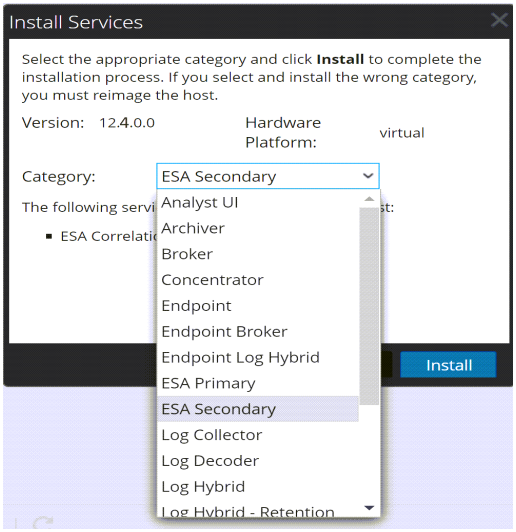
    f(usedforsecurity=False)
```

16. (Optional) If your system configuration requires that a component host must use a NAT IP address to reach the NW Server host, you must configure the NAT IP address of the NW Server by running the following command:
    `nw-manage --update-host --host-id <NW Server Host UUID> --ipv4-public <NAT IP address>`



Set Up ESA Hosts

After you install your NW Server and component hosts, follow these steps to set up your ESA hosts.

- Install your primary ESA host following the instructions in "Install 12.4.1 on the NetWitness Server (NW Server) Host and Other Component Hosts" in this guide, and install the **ESA Primary** service on it after you finish the Set Up program in the UI in  (Admin) > **Hosts** > :

- (Conditional) If you have a secondary ESA host, install it and install the **ESA Secondary** service on it after you finish the Set Up program in the UI in (Admin) > **Hosts** > Install:

Install Component Services on Hosts

After you have installed NW Server and component hosts, and set up your ESA hosts, follow these steps to install component services, such as Decoders and Concentrators, on your host systems.

1. Install a component service on the host:

   a. Log into NetWitness and go to (Admin) > **Hosts**.
   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the host in the **New Hosts** dialog and click **Enable**.
   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

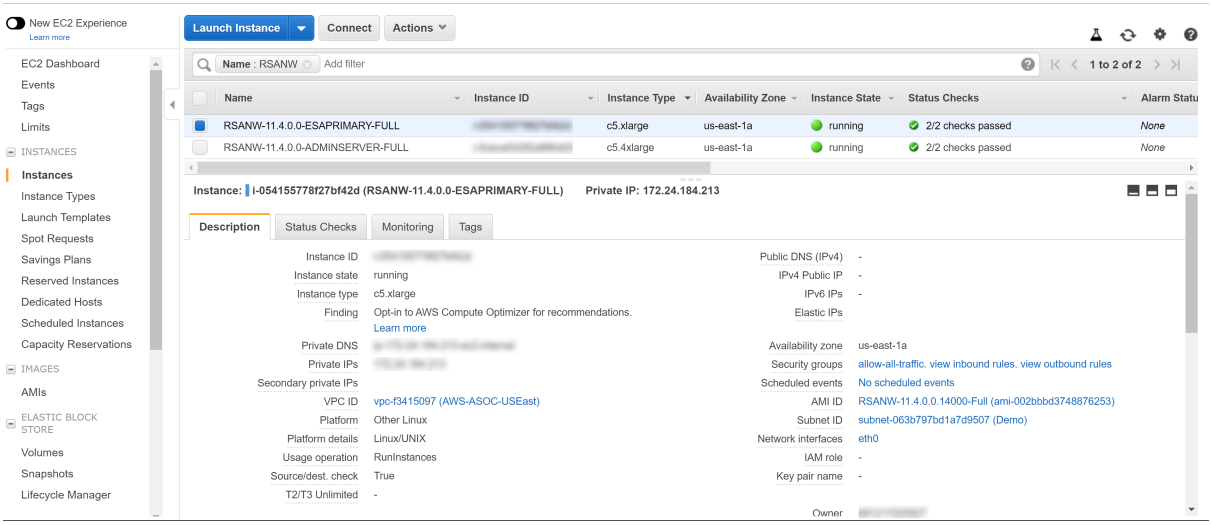
   c. Select that host in the **Hosts** view and click Install.
   The **Install Services** dialog is displayed.

d. Select the appropriate host type (for example, **Concentrator**) in **Category** and click **Install**.

Complete Licensing Requirements

Complete licensing requirements for installed services. See the *NetWitness Platform 12.4.1 Licensing Management Guide* for more information. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

(Optional) Install Warm Standby NW Server



Refer to "Warm Standby NW Server Host" under "Deployment Option Setup Procedures" in the *Deployment Guide for NetWitness Platform 12.4.1* for instructions on how to set up a Warm Standby NW Server.

(Optional) Boot NetWitness 11.4 EC2 Instance using c5 Instance Types

Following are the steps:

1. Deploy an EC2 instance using NW 11.4 Lite/Full AMI (RSANW-11.4.0.0.14000-Full, ami-002bbbd3748876253).
2. Select a non-nitro based instance type. For example, "_m4.large_" and boot the instance.
3. Install the package "_dracut-config-generic_" and rebuild the initramfs image.
4. For environment without internet connection, copy the provided RPM package to target 11.4 EC2 instance and install it.
5. Shutdown or stop the EC2 instance. Ensure that the instance shutdown behavior is set to "Stop" and not "_Terminate._".

6. Change the instance type of existing EC2 instance to nitro-based c5 types (For example, c5.4xlarge) and start the EC2 instance.
7. The EC2 instance boots successfully now, passing the system and instance status health checks.

Note: Once the instance is moved to c5 instance types and booted successfully, the system will remain fixed in c5 instance state and cannot be reverted back to m4 instance types.

Configure Hosts (Instances) in NetWitness Platform

Configure individual hosts and services as described in NetWitness *Host and Services Getting Started Guide*. This guide also describes the procedures for applying updates and preparing for version upgrades.

Note: After you successfully launch an instance, AWS assigns a default hostname to it. For more information, see "Change Host Network Configuration" in the *System Maintenance Guide* for instructions on changing a hostname.Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Configure Packet Capture

You can integrate any of the following Third-Party solutions with the Network Decoder to capture packets in the AWS cloud:

- Gigamon® GigaVUE
- Ixia CloudLens™
- f5® BIG-IP
- VPC Traffic Mirroring

Integrate Gigamon GigaVUE with the Network Decoder

There are two main tasks to configure the Gigamon® third-party Tap vendor packet capture solution:

Task 1. Integrate the Gigamon® solution.

Task 2. Configure a tunnel on Network Decoder

Task 1. Integrate the Gigamon Solution

Gigamon® Visibility Platform on AWS will be available through the AWS Marketplace and activated by a BYOL license. A thirty-day free trial is also available.

For more information on the Gigamon® solution, see "Gigamon® Visibility Platform for AWS Data Sheet"https://www.gigamon.com/sites/default/files/resources/datasheet/ds-gigamon-visibility-platform-for-aws-4095.pdf.

For more information on the deployment details, see "Gigamon® Visibility Platform for AWS Getting Started Guide" https://www.gigamon.com/sites/default/files/resources/deployment-guide/dg-visibility-platform-for-aws-getting-started-guide-4111.pdf.

After the “Monitoring Session” is deployed within the Gigamon GigaVUE-FM, you can configure the Network Decoder Tunnel.

Task 2. Configure Tunnel on the Network Decoder

1. SSH to the Decoder.
2. Submit the following command strings.

```
$ sudo ip link add tun0 type gretap local any remote <ip_address_of_
VSERIES_NODE_TUNNEL_INTERFACE> ttl 255 key 0

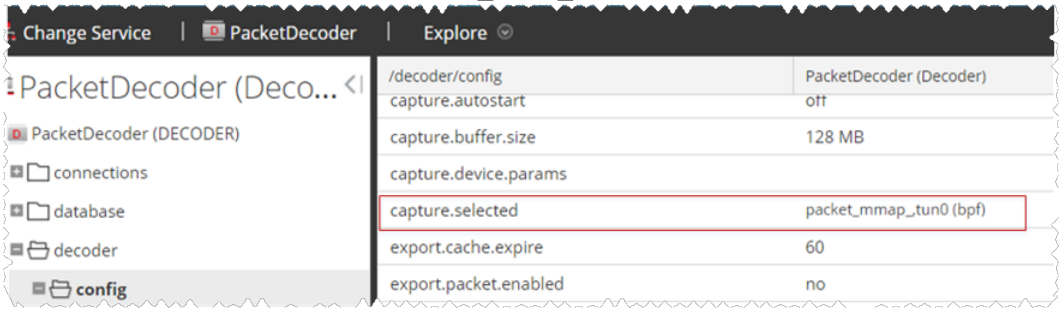
$ sudo ip link set tun0 up mtu <MTU-SIZE>

$ sudo ifconfig (to verify if the tunnel tun0 is being listed in the list
of interfaces)

$ sudo lsmod | grep gre ( to make sure if the below kernel modules are
running:

ip_gre 18245 0

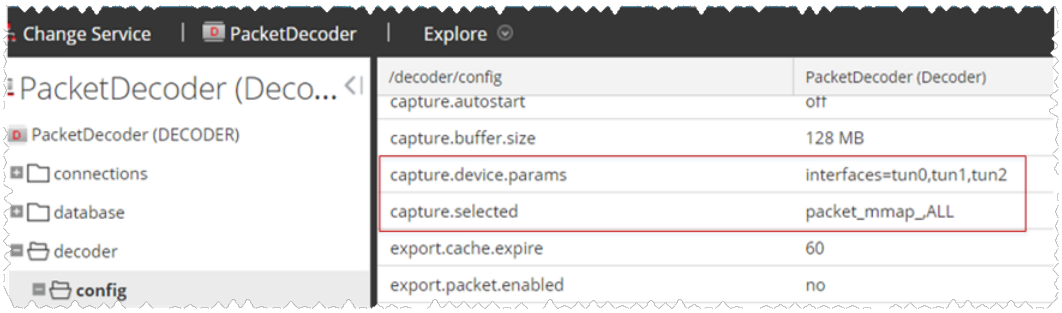
ip_tunnel 25216 1)



If they are not running then execute the below commands to enable the
modules

$ sudo modprobe act_mirred

$ sudo modprobe ip_gre
```



3. Create a firewall rule in the Network Decoder to allow traffic through the tunnel.
   a. Open the `iptables` file.
      `vi /etc/sysconfig/iptables`
   b. Append the line `-A INPUT -p gre -j ACCEPT` before the `commit` statement
   c. Restart `iptables` by executing the following commands.
      `service iptables restart`
      `service ip6tables restart`

4. Set the interface in the Network Decoder.
   a. Log in NetWitness, select the `decoder/config` node in Explorer view for the Network Decoder service.
   b. Set the `capture.selected = packet_mmap_,tun0`.

5. (Conditional) - If you have multiple tunnels on the Network Decoder.
   a. Restart Decoder service after you create the tunnel in Network Decoder.
   b. Log in to NetWitness, select the `decoder/config` node in Explorer view for the Network Decoder service, and set the following parameters.

```
capture.device.params = interfaces=tun0,tun1,tun2
capture.selected = packet_mmap_,All
```

6. Restart decoder service.

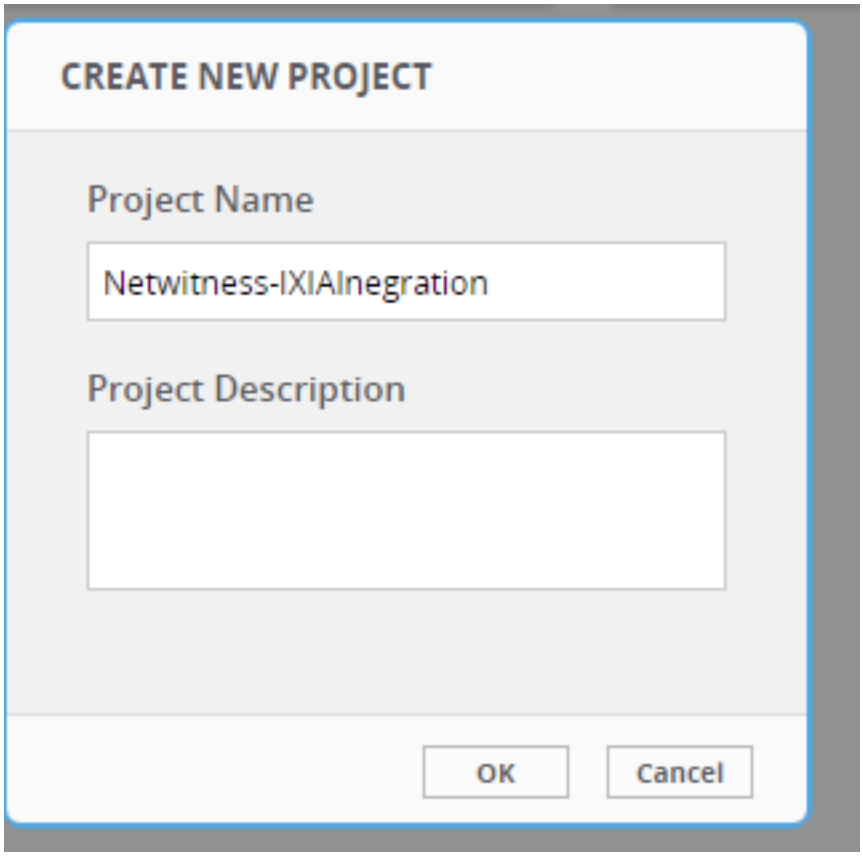
```
$ sudo restart nwdecoder
```

   The user should be all set to capture the network traffic in Decoder.

Integrate Ixia with the Network Decoder

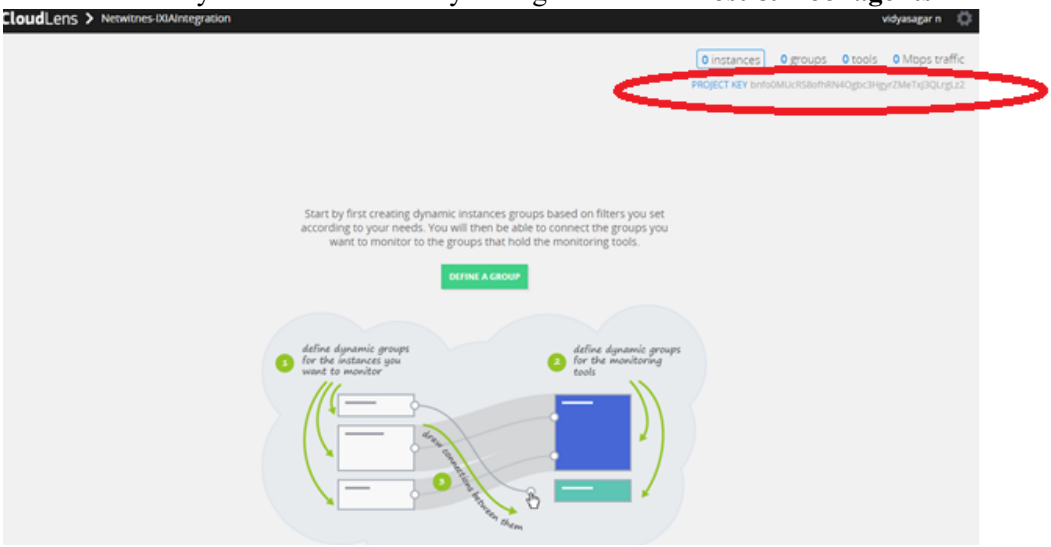
You must complete the following tasks to integrate the Network Decoder with Ixia CloudLens.

Task 1. Deploy Client Machines
Task 2. Create CloudLens Project
Task 3. Install Docker Container on Decoder
Task 4. Install Docker Container on Clients
Task 5. Map Network Decoder to Ixia Clients
Task 6. Validate CloudLens Packets Arriving at Decoder
Task 7. Set Interface in Network Decoder



Task 1. Deploy Client Machines

- Deploy client machines onto which you want to route the traffic to the Network Decoder. See the Ixia CloudLens documentation (https://www.ixia.cloud/help/Default.htm) for specifications needed for supported client machines.
- For Client Machines (as well as Decoder machine) the following ports must be opened on AWS Security Group Inbound Rules; UDP 19993 from all, TCP 22 from Admin IP.



Task 2. Create CloudLens Project

Complete the following steps to create a new project and get your project key.

1. Get Cloudlens login credentials and access to a free trial.
   a. Create an Ixia login account at https://www.ixiacom.com/products/cloudlens-trial-a.
2. Go to the Cloudlens public site (https://www.ixia.cloud).
3. Click + (add) to create a new project with a name of your choosing (for example, **NetWitness-IxiaIntegration**).

4. Click on your newly created project and make note of your Project Key.
   You need the key later for the API key configured on the **Host & Tool agents**.

Task 3. Install Docker Container on Decoder

Complete the following steps to install the Docker container onto the Network Decoder.

1. SSH to the Network Decoder.
2. Enter the following commands to complete the install the Docker service on the Decoder.

```
#yum clean all
# yum -y install docker
```

3. Enter the following command string to start the Docker service.

```
# service docker start
```

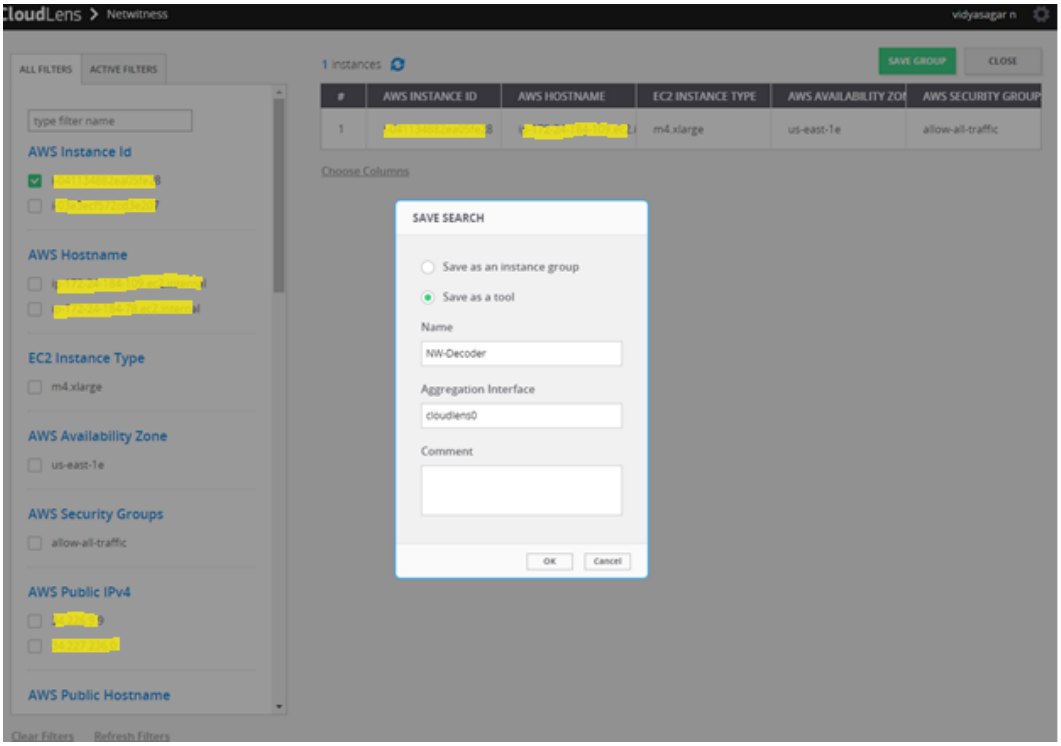
4. Enter the following commands to:
   - Access the Ixia repository and obtain the cloudlens-agent container.
   - Replace the **ProjectKeyFromIxiaProjectPortal** variable, which identifies your project key in Ixia portal, with the Project Key you created in Task 2. Create CloudLens Project.

```
sudo docker run \
--name cloudlens \
 -v /:/host \
-v /var/run/docker.sock:/var/run/docker.sock \
-d --restart=always \
--net=host \
--privileged \
ixiacom/cloudlens-agent:latest \
--server agent.ixia.cloud \
--accept_eula y \
--apikey ProjectKeyFromIxiaProjectPortal \
```

Task 4. Install Docker Container on Clients

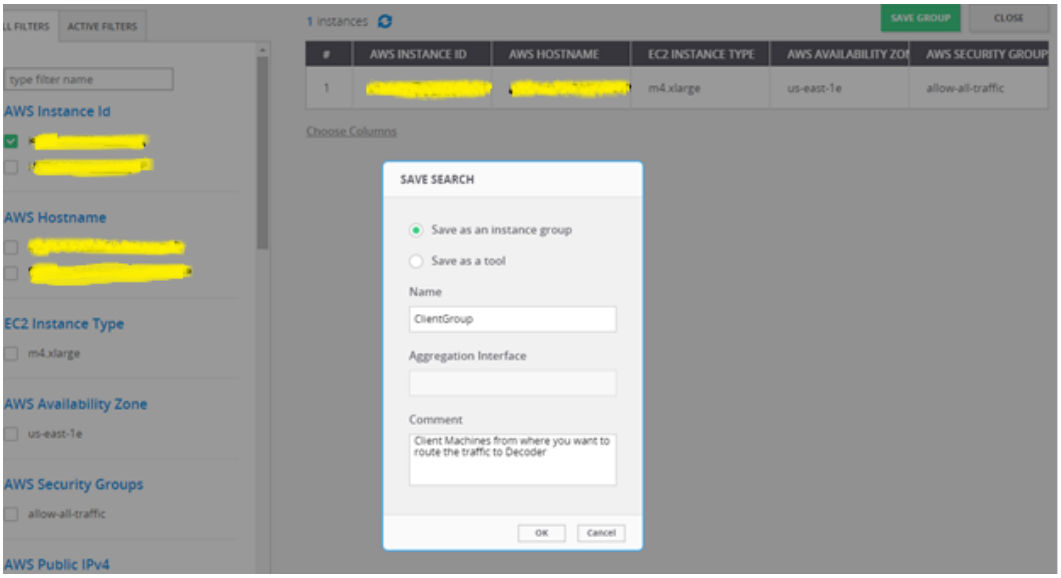
Complete the follow steps to Y install the Docker Container onto the client machines for which you want to route the traffic to the Network Decoder.

1. SSH to the AWS Client instance.
2. Enable root access to OS CLI (for example `sudo su -`).
3. Enter the following commands to install Docker.
   ```
   # yum -y install docker
   ```
   Caution: The above example of the installed docker engine is for CentOS7. The instructions may vary slightly for different Linux Distributions. For more information, see the Docker docs at https://docs.docker/install.
4. Enter the following commands to start the Docker service.
   ```
   # service docker start
   ```
5. Enter the following commands to:
   - Access the Ixia repository and obtain the **cloudlens-agent** container.
   - Replace the variable **ProjectKeyFromIxiaProjectPortal**, which identifies your project key in Ixia portal, with the Project Key you created in the previous section.
     ```
     sudo docker run \
     --name cloudlens \
      -v /:/host \
     -v /var/run/docker.sock:/var/run/docker.sock \
     -d --restart=always \
     --net=host \
     --privileged \
     ixiacom/cloudlens-agent:latest \
     --server agent.ixia.cloud \
     --accept_eula y \
     --apikey ProjectKeyFromIxiaProjectPortal \
     ```



Warning: If you cut and paste commands from a PDF, first paste them into a test editor such as Notepad to confirm the syntax before pasting into the OS CLI. Direct cut and paste between PDF and CLI can contain dashes or other special characters that should not be part of the commands.

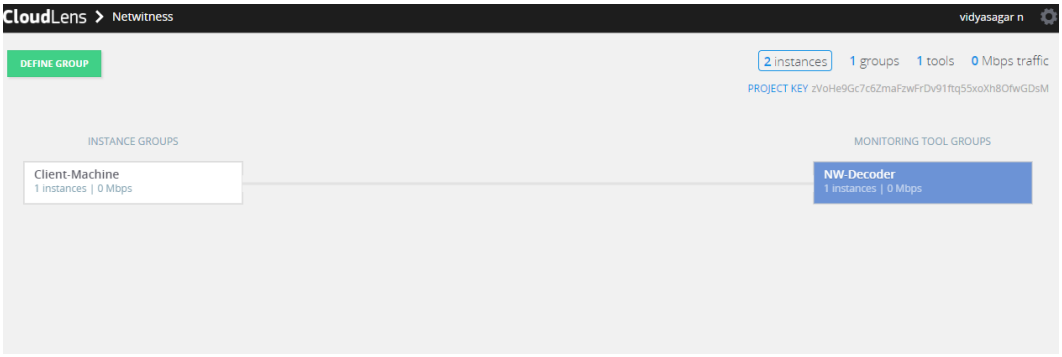
Task 5. Map the Network Decoder to Ixia Clients



Complete the following steps to map the Network Decoder to the client machines to route the traffic to the Network Decoder.

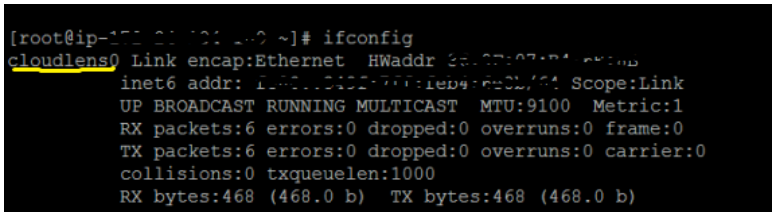
1. Go to the Cloudlens public site (https://www.ixia.cloud).
2. Double-click on your project to open it.
3. Click the **Define Group** button or the Instances count.
   You should see two instances listed, one for your decoder and the other for the client machines.
4. Filter for the decoder instance and click **Save Search**.
5. Choose **Save as a tool**.
6. Specify a name for the tool, and the **Aggregation Interface**.
   Use a meaningful name for the Aggregation Interface (for example **cloudlens0**. This is a virtual

interface that appears in the OS where your Tool is installed. You need to instruct your tool to 'listen' to that interface in a subsequent step.

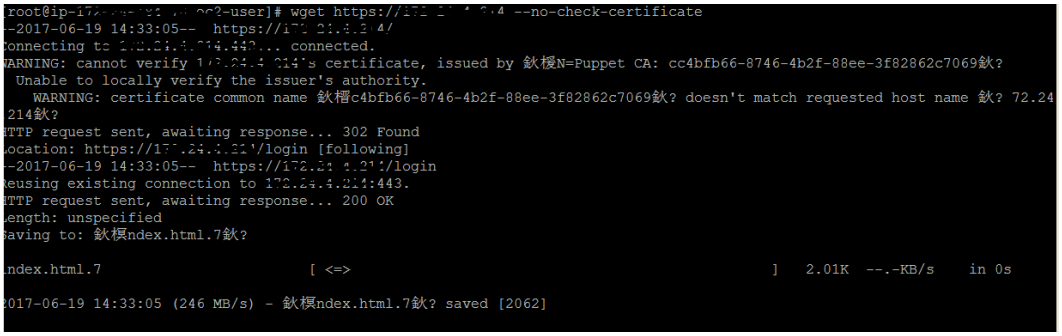


7. Filter the client host instance from the list, and click **Save Search**.

8. Navigate back to the top-level view of the project.
   Your client machine instance and Decoder instance are now displayed.



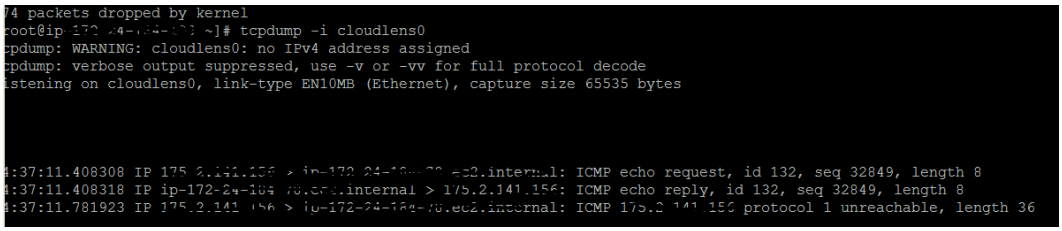
9. Drag a connection between the your client machine instance and Decoder instance to allow the flow of packets.



Task 6. Validate CloudLens Packets Arriving at Decoder

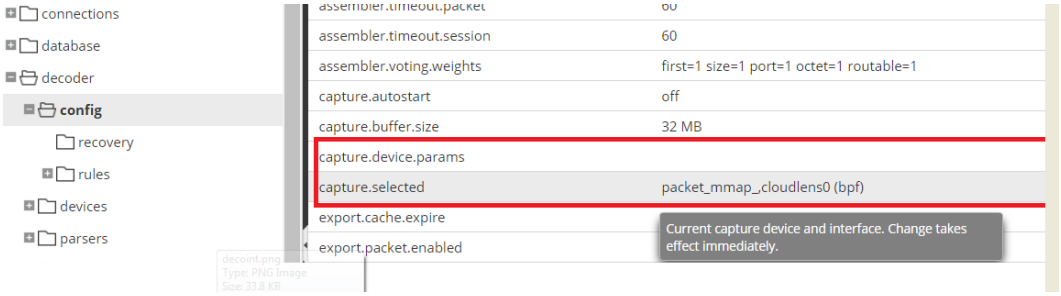
Complete the following steps to validate that packets are actually arriving at the Network Decoder.

1. SSH to the Network Decoder.
2. Enter the following command.
   `ifconfig`
   The new aggregation interface you created is displayed.



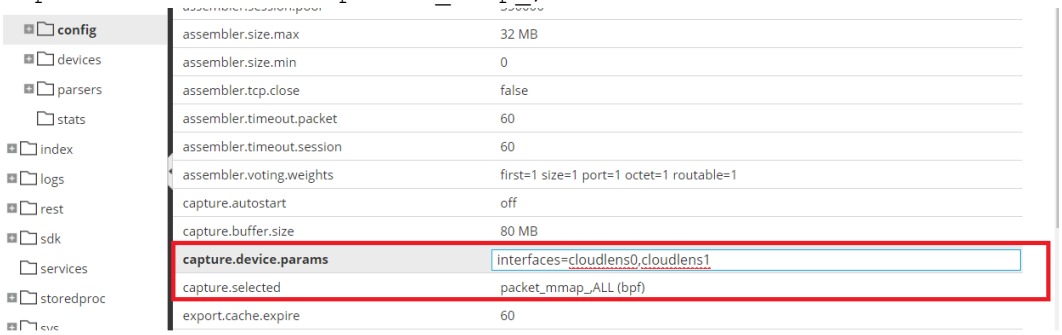
3. Generate traffic from the client OS instance CLI (for example, `wget http://www.google.com/`).

4. SSH to Network Decoder to go to your Network Decoder instance CLI.



5. Enter the following commands to look for suitable results in the tcpdump.
   `tcpdump -I Cloudlens0`

Task 7. Set the Interface in the Network Decoder



Complete the following steps in the Network Decoder to set the interface to use for the Ixia integration.

1. SSH to the Network Decoder.
2. Enter the following commands to restart decoder service.
   `$ sudo restart nwdecoder`
   The Network Decoder is now set to capture network traffic.
3. Log in to NetWitness and click  **(Admin) > Services**.
4. Select a Decoder service and click  > **View > Explore**.
5. Expand the **decoder** node and click **config** to view the configuration settings.
6. Set the **capture.selected** parameter to the following value.
   packet_mmap_,cloudlens0(bpf)

7. (Conditional) - If you have multiple capture interfaces on the Network Decoder, set the parameters with the following values.
   `capture.device.params --> interfaces=cloudlens0,cloudlens1`

```
capture.selected --> packet_mmap_,All
```

8. Restart the Decoder service after you set the **capture.selected** parameter.

Integrate f5® BIG-IP with the Network Decoder

IG-IP Virtual Edition (VE) is an inline virtual server and load balancer. A common use case would be for the f5® box to be a virtual web server that presents a single IP address / host name that manages requests to a pool of web servers in the cloud.

All traffic to NetWitness flows through the f5® BIG-IP VE virtual server.

The virtual server functions of the BIG-IP clone all traffic to a designated computer by re-writing mac addresses and loading them into a subnet shared with the destination sniffer. This guide describes how to set up the Decoder as the sniffer.

f5® BIG-IP VE Deployment Information

f5® BIG-IP VE on AWS will be available through the AWS Marketplace and activated by a BYOL license. A thirty-day free trial is also available.

For more information on this solution refer to the f5® BIG-IP DNS Data Sheet (https://www.f5.com/pdf/products/big-ip-dns-datasheet.pdf).

Task 1: Set Up a BIG-IP VE Virtual Server Instance

Set up a BIG-IP VE Virtual Server Instance according to the instructions in the "BIG-IP Virtual Edition 12.1.0 and Amazon Web Services: Multi-NIC Manual" (https://support.f5.com/kb/en-us/products/big-ip_ltm/manuals/product/bigip-ve-multi-nic-setup-amazon-ec2-12-1-0.html). Complete all the steps through the last steps, "Creating a virtual server."

This virtual server performs packet capture. You may need to create multiple virtual servers to depending on your volume.

As part of creating the virtual server, you must have at least one server in your NetWitness domain to handle the traffic routed by the virtual server (for example, you can create another instance in AWS to host the internal server).

Task 2: Create a Clone Pool

1. Make sure that your Decoder has a network interface on the same subnet as one of the network interfaces on the BIG-IP VE instance.
   The clone pool sends packets to the Decoder by rewriting MAC addresses and sending them out a

network interface. MAC address rewriting can be used to route packets to another subnet.

2. Set up the clone pool within the BIG-IP VE virtual server according to the instructions in "K13392: Configuring the BIG-IP system to send traffic to an intrusion detection system (11.x - 13.x)" article (https://support.f5.com/kb/en-us/solutions/public/13000/300/sol13392.html).
   This document explains how to create the clone pool, and how to make an existing virtual server copy traffic to the clone pool. In this case, we will place the Decoder instance in the clone pool.

Guidelines

The following guidelines will help you to configure packet capture correctly using BIG-IP VE.

- The Decoder instance must have its own IP address on one of the same subnets as BIG-IP VE. BIG-IP uses that IP address to identify the Decoder as being part of the clone pool.
- When adding the Decoder instance to the clone pool, BIG-IP asks for a port number in addition to the IP address. This port number does not matter for the cloned traffic. The Decoder will receive all the cloned traffic, regardless of what port number was used here.
- By default, the AWS subnet shared by the Decoder and BIG-IP VE will not allow the cloned traffic to travel from the BIG-IP VE interface to the Decoder interface. You must disable the **`source/dest. check`** on both the Decoder and BIG-IP VE network interfaces in AWS.
- The Decoder instance must have a single network interface, eth0, by default. The Decoder captures traffic on this interface, but it may also receive administrative traffic on this interface. NetWitness recommends using network rules to filter out ssh and nwdecoder traffic from the capture stream. These are ports 22 (ssh) and 50004/56004 (nwdecoder).

Troubleshooting Tips

There are areas to troubleshoot if packets are not being accepted by the Decoder.

- Make sure that the BIG-IP VE is sending the packets out of the correct interface.
  The BIG-IP VE instance contains tcpdump. Use it to verify the cloned packets are being sent out the expected interface. If they are not, there is a problem in the setup of the clone pool or the virtual server.
- Make sure that the Decoder is receiving packets.
  The Decoder has `tcpdump` installed on it. Use it to verify that the Decoder is receiving packets. If the Decoder is not capturing packets, make sure that
  - The AWS **`source/dest. check`** is turned off.
  - The Decoder is on the same subnet as the interface the BIG-IP VE is using to clone packets.

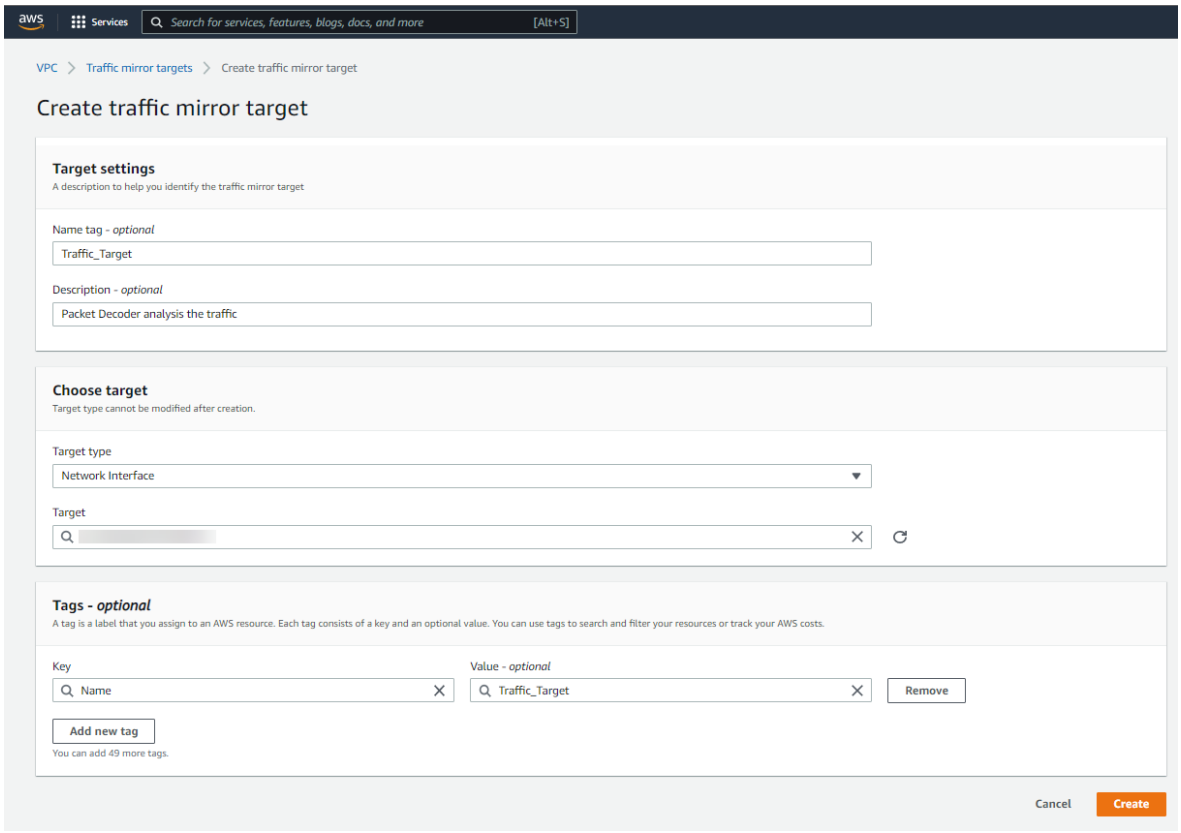
Integrate VPC Traffic Mirroring with the Network Decoder

VPC Traffic Mirroring allows users to capture and inspect network traffic to analyze packets without using any third-party packet forwarding agents. The solution provides insight and access to network traffic across VPC infrastructure. Users can copy network traffic at any ENI (Elastic Network Interfaces) in VPC, and send it to NetWitness to analyze, monitor, and troubleshoot performance issues.

You must complete the following tasks to integrate the Network Decoder with VPC Traffic Mirroring:

Task 1. Configure the Network Decoder as a VPC Traffic Mirroring Destination

Task 2. Configure a VPC Traffic Mirroring Filter



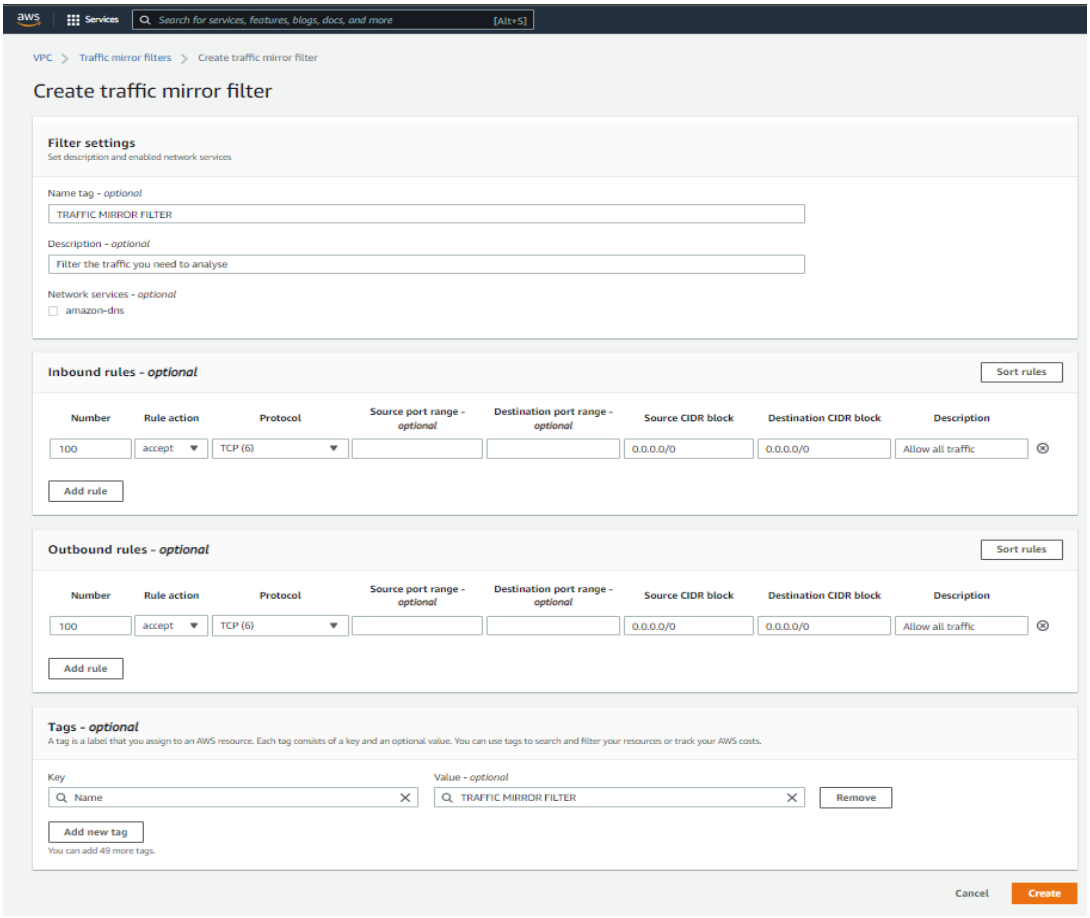
Task 3. Configure a VPC Traffic Mirroring Session

Task 4. Setup a new VXLAN interface on the Network Decoder

Task 5. Validate VPC Traffic Mirroring Packets Arriving at Network Decoder

Task 1. Configure the Network Decoder as a VPC Traffic Mirroring Destination.

1. Open the VPC service console view at https://console.aws.amazon.com/vpc/home.
2. In the navigation panel, select **Traffic mirror targets**.
3. Click **Create traffic mirror target**.



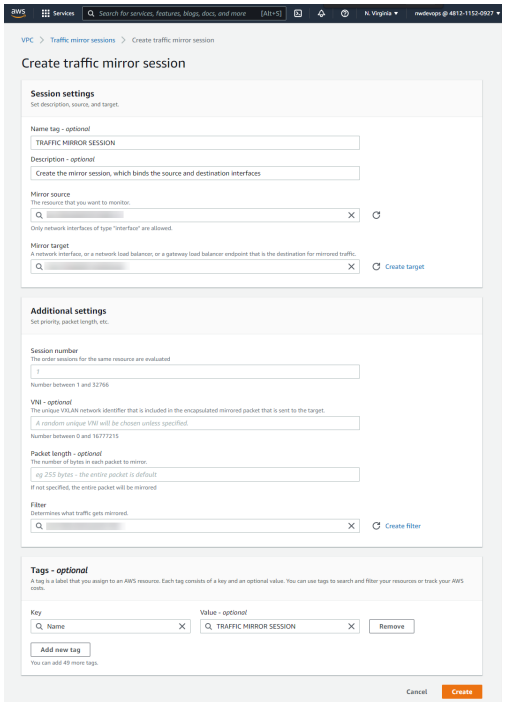
4. In the **Create traffic mirror target** dialog, provide all the required information and click **Create**.

Task 2. Configure a VPC Traffic Mirror Filter

Configure the VPC traffic mirror filter to send only the required packets to the Network Decoder. You can determine if the inbound or outbound traffic needs to be captured or not.

Note: Make sure the UDP port 4789 is open on the AWS instance of Network Decoder.

1. In the navigation panel, select **Traffic mirror filters**.
2. Click **Create traffic mirror filter**.



3. In the **Create traffic mirror filter** dialog, provide all the required information and click **Create**.

Task 3. Configure a VPC Traffic Mirror Session

You must configure a VPC Traffic Mirror Session to mirror the traffic by a communication channel between source ENI and destination ENI.

1. In the navigation panel, select **Traffic mirror sessions**.
2. Click **Create traffic mirror session**.

3. In the **Create traffic mirror session** dialog, provide all the required information and click **Create**.

Task 4. Set Up a new VXLAN Interface on the Network Decoder

To capture the UDP enabled traffic you must create an interface and tunnel it to Network Decoder by performing the following steps.

1. SSH to the Decoder.
2. Enter the following commands.

```
sudo ip link add tun0 type vxlan id <VXNLAN ID> local any dev <primary
interface ex: eth0> dstport 4789

sudo ip link set tun0 up

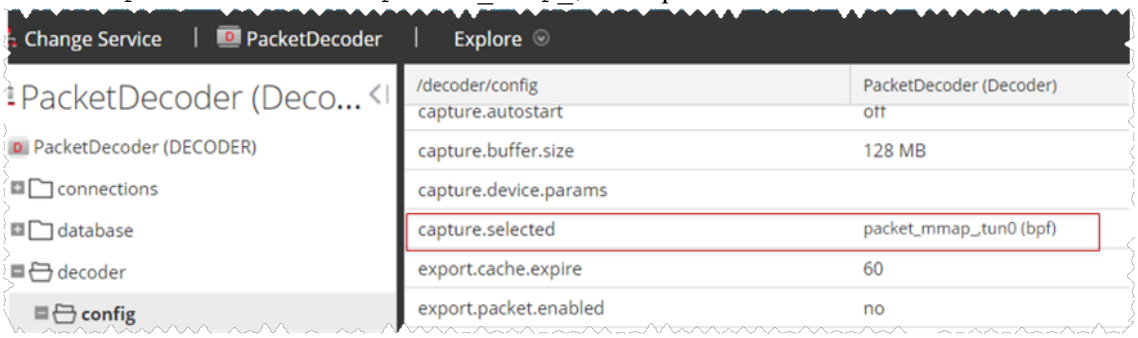
ifconfig
```

```
tun0: flags=4163<UP,BROADCAST,RUNNING,MULTICAST>  mtu 8951
        inet6 fe80::bc58:afff:fe06:ec29  prefixlen 64  scopeid 0x20<link>
        ether be:58:af:06:ec:29  txqueuelen 1000  (Ethernet)
        RX packets 989  bytes 74140 (72.4 KiB)
        RX errors 0  dropped 0  overruns 0  frame 0
        TX packets 0  bytes 0 (0.0 B)
        TX errors 0  dropped 8 overruns 0  carrier 0  collisions 0
```

3. To create a firewall rule in the Network Decoder to allow traffic through the tunnel.

a. Open the IP tables file using the command `vi /etc/sysconfig/iptables`.

b. Append the line `-I INPUT -p udp -m udp --dport 4789 -j ACCEPT`.



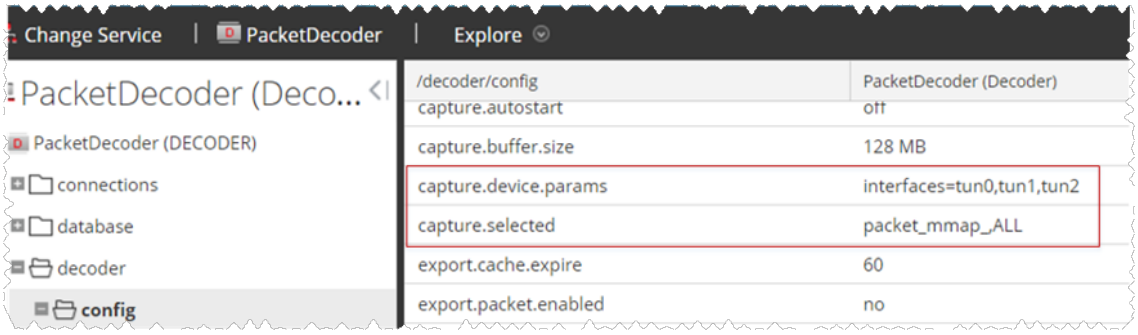
c. Restart IP tables by using the following commands.

```
service iptables restart
service iptables status
```

4. To set the interface in the Network Decoder.

   a. Log in to NetWitness, select the `decoder/config` node in Explorer view of the Network Decoder service.

   b. Set the `capture.selected = packet_mmap_,tun0` parameter.



5. (Conditional) If you have multiple tunnels on the Network Decoder.

   a. Restart the Decoder service after you create the tunnel in Network Decoder.

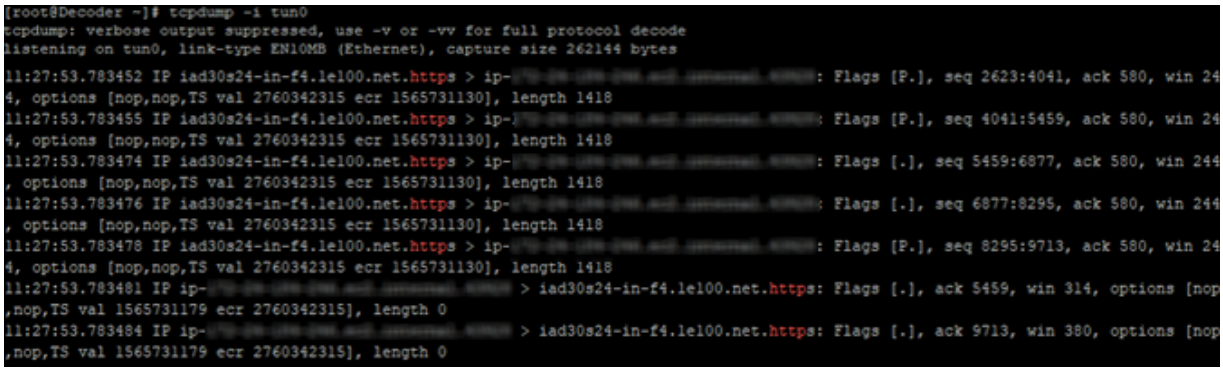
   b. Log in to NetWitness, select the `decoder/config` node in Explorer view of the Network Decoder service, and set the following parameters.

```
capture.device.params = interfaces=tun0,tun1,tun2
capture.selected = packet_mmap_,All
```

6. Restart the Decoder service.

```
$ sudo restart nwdecoder
```

   The user should be all set to capture the network traffic in the Network Decoder.



Task 5. Validate VPC Traffic Mirroring Packets Arriving at the Network Decoder

Perform the following steps to validate if the Network Decoder is receiving the network data (packets) successfully.

1. Generate traffic from the client OS instance CLI (for example, `wget http://www.google.com/`).

2. Enter the `tcpdump -i tun0` command to look for suitable results in the tcpdump.

3. The NetWitness reflects meta values as shown below.

Note: You can mirror traffic from an EC2 instance that is supported by the AWS Nitro system (A1, C5, C5d, C5n, I3en, M5, M5a, M5ad, M5d, p3dn.24xlarge, R5, R5a, R5ad, R5d, T3, T3a, and z1d).

Note: For more information, see "New – VPC Traffic Mirroring" documentation at https://aws.amazon.com/blogs/aws/new-vpc-traffic-mirroring/.

AWS Instance Configuration Recommendations

Note: These recommendations can be used as a baseline for 12.4.1.0 and adjusted as needed.

This topic contains the minimum AWS instance configuration settings recommended for the NetWitness virtual stack components.

- EC2 Instance:
  - Instance type adjustments -you must adjust instance types according to your ingestion rate, content and parsers, dashboard reports, scheduled reports, investigations, and active users.
  - Recommended settings - the recommended settings in the NW component instance tables below were calculated under the following conditions.
    - Ingestion rates of 15,000 EPS and 1.5 Gbps were used.
    - All the components were integrated.
    - The Log stream includes a Log Decoder, Concentrator, and Archiver.
    - The Packet stream includes a Network Decoder and Concentrator.
    - The Endpoint Hybrid stream includes a Endpoint Server, Concentrator and Log Decoder.
    - Respond is receiving alerts from the Reporting Engine and Event Stream Analysis.
    - The background load includes reports, charts, alerts, investigation, and respond.
- Block Storage

  For more information on the required volumes and the storage allocations, see the Storage Guide for NetWitness® Platform 12.4.

Archiver

EC2 Instance			
EPS	**Instance Type**	**Enhanced Networking Enabled**	**Tenancy Type - Dedicated - Run a Dedicated Instance**
5,000	m4.xlarge No of CPU: 4 Memory: 16 GB	No	Yes
10,000	m4.2xlarge No of CPU: 8 Memory: 32 GB	No	Yes
15,000	m4.4xlarge No of CPU: 16 Memory: 64 GB	No	Yes

Cloud Provider Block Storage			
Volumes	**Device**	**Volume Type**	**IOPS/Baseline Throughput**
/ (root)	/dev/sda1	General Purpose SSD	N/A
usr,var,opt,home,tmp	/dev/sdf	General Purpose SSD	N/A

Appendix A. Silent Installation Using CLI

You can use the following Command Line Interface commands to run the installation script (`nwsetup-tui`) without getting prompted for inputs. This enables you to automate the installation of a host by supplying response to the scripts prompts through the command line.

1. After you have created a base image on the host, log in to the host with the `root` credentials.
2. Submit the `nwsetup-tui` script with the `--silent` command and the arguments that you want to apply.

   The following command string is an example of how you would install a basic NW Server host.

   ```
   nwsetup-tui --silent --is-head=true --host-name=new-host --master-
   pass=netwitness --deploy-pass=netwitness --repo-type=1 --custom-
   firewall=false --ip-override=false --eula=true
   ```

Note: Deployment account password must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ .) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`.
If `deploy_admin` password is changed on Primary NW Server, it must be changed on the Warm Standby Server if it exists.

3. (Conditional - For Component Hosts Only) Install the appropriate service **Category** on the newly provisioned host in the NetWitness Platform Hosts view.

   a. Log into NetWitness and go to  **(Admin)** > **Hosts**.

   The **New Hosts** dialog is displayed with the **Hosts** view greyed out in the background

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the host in the **New Hosts** dialog and click **Enable**.

   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

   c. Select that host in the **Hosts** view (for example, **Event Stream Analysis**) and click 

.

   The **Install Services** dialog is displayed.

   d. Select the appropriate host type in **Category** and click **Install**.

Arguments

Argument	Description
`--help-install-opts`	Display all the arguments in this table.

Argument	Description
`--eula`	Accept or decline the End User License Agreement (EULA). Specify: • `true` (default) to accept the agreement • `false` to decline it and cancel the installation. For example: `--eula=true`
`--is-head`	Designate the host as the NW Server host or a component host. Specify: • `true` for NW Server host. • `false` for Component host. For example: `--is-head=true`
`--host-name`	Specify new hostname. If you do not specify this argument, NetWitness Platform retains the existing hostname. For example: `--host-name=<hostname>`
`--master-pass`	Enter master password. For example: `--master-pass=<password>`
`--deploy-pass`	Enter deployment password. For example: `--deploy-pass=<password>`
`--iface-name`	Specify network interface. For example: `--iface-name=eth0`
`--ip-override`	Accept or override IP address found for this host or change the IP configuration found on the host. Specify: • `true` provide IP address. • `false` use IP address found on the host. For example: `--ip-override=false`
`--ip-type`	Select ip address configuration type. Specify: • `1` Static IP Configuration) • `2` DCHP For example: `--ip-type=1`
`--ip-addr`	For Static IP configuration, enter IP Address for static address. For example: `--ip-addr=<ip-address>`
`--ip-netmask`	For Static IP configuration, enter Subnet Mask for static address. For example: `--ip-gateway=<subnet-mask>`

Argument	Description
`--ip-gateway`	For Static IP configuration, enter default gateway for static address. For example: `--ip-gateway=<default-gateway>`
`--ip-nameserver`	IP address assigned to DNS server. `--ip-nameserver=<ip-address>`
`--ip-nameserver-secondary`	Optional - IP address assigned to a secondary DNS server. For example: `--ip-nameserver-secondary=<ip-address>`
`--ip-domain`	For Static IP configuration, enter Local Domain Name for static address. For example: `--ip-domain=<default-gateway>`
`--repo-type`	Select type of update repository. Specify: • `1` Local repository • `2` External repository For example: `--repo-type=1`
`--repo-url`	For an external update repository, specify the url of the repository. For example: `--repo-url=<url>`
`--head-ip`	For a component host, specify IP Address of the NW Server. For example: `--head-ip=<ip-address>`
`--custom-firewall`	Disable default firewall configuration and use your custom configuration. Specify: • `true` use custom firewall configuration. • `false` use default firewall configuration. For example: `--custom-firewall=true`
`--use-nat`	Configure the host to use Network Address Translation (NAT) based IP addresses: • `true` use NAT IPs to connect to other hosts • `false` do not use NAT IPs to connect to other hosts (default) For example: `--use-nat=false`

License Agreement

This software and the associated documentation are proprietary and confidential to RSA Security LLC or its affiliates are furnished under license, and may be used and copied only in accordance with the terms of such license and with the inclusion of the copyright notice below. This software and the documentation, and any copies thereof, may not be provided or otherwise made available to any other person.

No title to or ownership of the software or documentation or any intellectual property rights thereto is hereby transferred. Any unauthorized use or reproduction of this software and the documentation may be subject to civil and/or criminal liability. This software is subject to change without notice and should not be construed as a commitment by RSA.

It is advised not to deploy third-party repos or perform any change to the underlying NetWitness Operating System that is not part of the supported NetWitness version. Any such change outside of the NetWitness approved image may result in a service or functionality conflict and require a reimage of the NetWitness system to bring NetWitness back to an optimized functional state. In the event a third-party repo is deployed, or other non-supported change is made by the customer without NetWitness approval, the customer takes full responsibility for any system malfunction until the issue can be remediated through troubleshooting efforts or a reimage of the service.

Third-Party Licenses

This product may include software developed by parties other than RSA. The text of the license agreements applicable to third-party software in this product may be viewed on the product documentation page on NetWitness Community. By using this product, a user of this product agrees to be fully bound by terms of the license agreements.

Note on Encryption Technologies

This product may contain encryption technology. Many countries prohibit or restrict the use, import, or export of encryption technologies, and current use, import, and export regulations should be followed when using, importing or exporting this product.

Distribution

Use, copying, and distribution of any RSA Security LLC or its affiliates ("RSA") software described in this publication requires an applicable software license.

Azure Installation Overview

Azure instances have the same functionality as the NetWitness hardware and virtual hosts. NetWitness recommends that you perform the following tasks when you set up your Azure environment.

Before you can deploy NetWitness in Azure, you need to:

- Review the recommended compute and memory specifications needed for each NetWitness instance.
- Get familiar with the NetWitness Storage Guide to understand the types of drives and volumes needed to support NetWitness instances. For more information, see Storage Guide for NetWitness® Platform 12.4.1.
- Make sure that you have a NetWitness Throughput license.
- Use Chrome for your browser (Internet Explorer is not supported).

Azure Environment Recommendations

Azure instances have the same functionality as the NetWitness hardware hosts. NetWitness recommends that you perform the following tasks when you set up your Azure environment.

- Based on the resource requirements of the different components, follow best practices to use the system and dedicated storage appropriately.
- Build Concentrator directory for index database and Decoder directory for Packet database on SSD Disks with high IOPS / write throughput.

Azure Deployment Scenarios

Before you can deploy NetWitness you need to:

- Consider the requirements of your enterprise and understand the deployment process.
- Have a high-level picture of the complexity and scope of a NetWitness deployment.

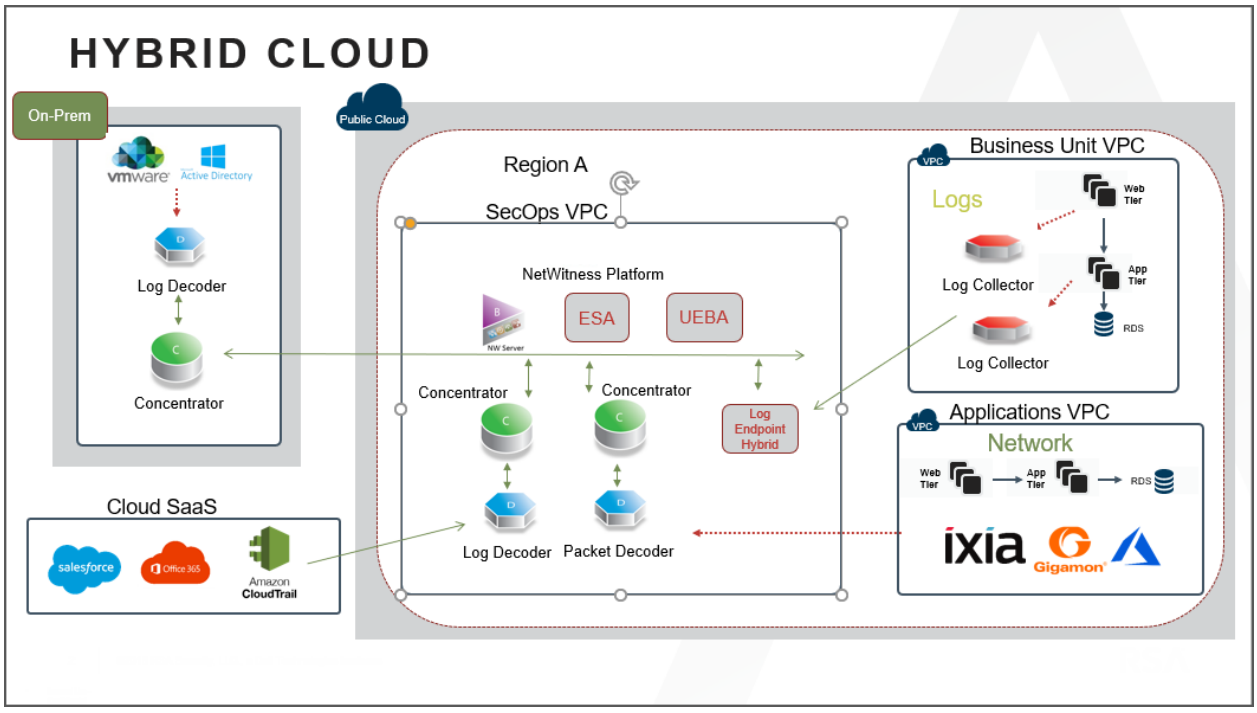
Process

The components and topology of a NetWitness network can vary greatly between installations, and should be carefully planned before the process begins. Initial planning includes:

- Consideration of site requirements and safety requirements.
- Review of the network architecture and port usage.
- Support of group aggregation on Archivers and Concentrators, and virtual hosts.

When updating hosts and services, follow recommended guidelines under the "Running in Mixed Mode" topic in the *NetWitness Host and Services Getting Started Guide*.

You should also become familiar with Hosts, Host Types, and Services as they are used in the context of NetWitness also described in the *NetWitness Host and Services Getting Started Guide*.



NetWitness High-Level Deployment Diagram

NetWitness is inherently modular. Whether organizations are looking to deploy on-premise or in the cloud, the NetWitness components are decoupled in a way which allows flexible deployment architectures to satisfy a variety of use cases.

The following figure is an example of a hybrid cloud deployment, where the base of the components are residing within the SecOps VPC. Centralizing these components make management easier while keeping network latency to a minimum.

Network, log and endpoint traffic could then be aggregated up to the SecOps VPC. The on-premise location would function just like a normal physical deployment and would be accessible for investigations and analytics.

Cloud SaaS visibility could be captured from a Log Decoder residing in either the cloud or on-premise locations.

Azure Configuration Recommendations

This topic contains the minimum Azure VM configuration settings recommended for the NetWitness (NW) virtual stack components.

- VM:
  - The recommended settings in the NetWitness component VM tables below were calculated under the following conditions.
    - Ingestion rates of 15,000 EPS and 1.5GBps were used.
    - All the components were integrated.
    - The Log stream included a Log Decoder, Concentrator, and Archiver.
    - The Packet stream included a Network Decoder and Concentrator.
    - Incident Management was receiving alerts from the Reporting Engine and Event Stream Analysis.
    - The background load included reports, charts, alerts, investigation, and respond.
    - The default partition size of Azure VM hosts for `/root` is 8GB and for `/var/netwitness` is 15GB. These partitions can be increased to a minimum of 40GB. For more information see, Updating Partition Size.
- VHD (Storage)
  For more information, see Storage Guide for NetWitness® Platform 12.4.1 on how to increase the number of volumes based on your storage requirements using the NetWitness Sizing & Scoping Calculator.

Azure Instance Recommendations

The following table shows the storage recommendations for NetWitness Azure VMs.

Azure Image Type	Rate (EPS)	CPU (Cores)	RAM (GB)	Instance Type (Azure Name)
NW Server	Does not apply	16	112	Standard D14_v2
Log Decoder	15,000	32	128	Standard D32s_v3
Log Concentrator	15,000	16	112	Standard DS14_v2
Archiver	15,000	16	112	Standard D14_v2
Log Collector	15,000	8	32	Standard D8s_v3
UEBA*	Does not apply	16	112	Standard D14_v2

Note: *If your log collection volume is low, NetWitness recommends you to deploy UEBA only on a virtual host. If you have a moderate to high log collection volume, NetWitness recommends you to deploy UEBA on the physical host as described under "NetWitness UEBA Host Hardware Specifications" in the *Physical Host Installation Guide*.

Refer to the *Storage Guide for NetWitness Platform* for additional storage information.

Packet Stream Solutions

The following tables show Instance recommendations for Different EPS rates for Packet stream.

Note: NetWitness Decoder is supported with Gigamon Packet broker from version 11.7.x or higher on Azure Cloud environment.

Decoder - Gigamon Solution

Azure Image Type	Rate (Mbps)	CPU (Cores)	RAM (GB)	Instance Type (Azure Name)	Accelerated Networking Enabled
Decoder	500	16	64	Standard D16ds_v4	Yes
Decoder	1000	16	64	Standard D16ds_v4	Yes
Decoder	1500	32	128	Standard D32ds_v4	Yes

Rate (Mbps)	Volumes	Volume Type	IOPS / Baseline Throughput
500	index, session, meta	RAID5 of minimum 3 P15 Premium SSD Disks	80MB/s
500	packet	RAID5 of minimum 3 P15 Premium SSD Disks	80MB/s
1000	index, session, meta	RAID5 of minimum 3 P20 Premium SSD Disks	170MB/s
1000	packet	RAID5 of minimum 3 P30 Premium SSD Disks	170MB/s
1500	index, session, meta	RAID5 of minimum 3 P40 Premium SSD Disks	300MB/s
1500	packet	RAID5 of minimum 3 P40 Premium SSD Disks	300MB/s

Concentrator - Gigamon Solution

Azure Image Type	Rate (Mbps)	CPU (Cores)	RAM (GB)	Instance Type (Azure Name)	Accelerated Networking Enabled
Packet Concentrator	500	16	64	Standard D16ds_v4	No
Packet Concentrator	1000	16	114	Standard DS14_v2	No
Packet Concentrator	1500	16	114	Standard DS14_v2	No

Note: For Packet Concentrator with **500**Mbps rate, if the query load on the environment is on the higher side (max concurrent queries > **5**), it is recommended to use **Standard DS14_v2** Instance.

Rate (Mbps)	Volumes	Volume Type	IOPS / Baseline Throughput
500	index	RAID5 of minimum 3 P30 Premium SSD Disks	10000
500	session, meta	RAID5 of minimum 3 P15 Premium SSD Disks	80MB/s
1000	index	RAID5 of minimum 3 P40 Premium SSD Disks	12000
1000	session, meta	RAID5 of minimum 3 P20 Standard SSD Disks	170MB/s
1500	index	RAID5 of minimum 3 P40 Premium SSD Disks	15000
1500	session, meta	RAID5 of minimum 3 P40 Premium SSD Disks	300MB/s

ESA and Context Hub

The following table shows Instance recommendations for Different EPS rates for ESA.

Rate (EPS)	CPU (Cores)	RAM (GB)	Instance Type	Accelerated Networking Enabled
15,000	16	112	Standard DS14_ v2	No
50,000	20	140	Standard DS15_ v2	Yes
100,000	32	256	Standard E32s_ v3	Yes

Updating Partition Size

You can increase the partition size to a minimum of 40GB each.

After adding additional required disk size to the Azure VM, you can extend the partition sizes using the following commands:

1. SSH to the VM, login as a root user and execute the following command to view the existing partitions along with the new partition added.
   `lsblk`
2. Check the name of the new partition. Eg: `sdc`

```
pvcreate /dev/sdc -y
vgextend netwitness_vg00 /dev/sdc -y
lvextend -L 40G /dev/netwitness_vg00/root -y
xfs_growfs /dev/netwitness_vg00/root
lvextend -L 40G /dev/netwitness_vg00/nwhome -y
xfs_growfs /dev/netwitness_vg00/nwhome
```

These commands are provided assuming that `sdc` is the new disk added and 40GB is the extended partition size for each of the partitions.

Azure Deployment

This topic contains the rules and high-level tasks you must perform to deploy NetWitness components in Azure.

Rules

You must adhere to the following rules:

It is recommended to use private IP addresses when you provision Azure NetWitness VMs.

Checklist

Step	Description	√
1.	Deploy NW Server Host	
2.	Deploy NW Component Hosts in Azure	
3.	Installation Tasks	

Storage Configurations

This topic contains the recommended Azure storage configurations.

For storage allocations of all host types, see the Prepare Virtual or Cloud Storage topic in the *Storage Guide for NetWitness® Platform 12.4.1*.

Enabling Swap Partition in Azure Deployments

After completing the Azure deployment, you must enable the swap in your deployment.

To do this, perform the following steps:

1. Modify the default parameters at `/etc/waagent.conf` to

```
ResourceDisk.Format=y
ResourceDisk.Filesystem=ext4
ResourceDisk.MountPoint=/mnt/resource
ResourceDisk.EnableSwap=y
ResourceDisk.SwapSizeMB=4096
```

The following screenshot displays the default parameters.

```
# Format if unformatted. If 'n', resource disk will not be mounted.
ResourceDisk.Format=y

# File system on the resource disk
# Typically ext3 or ext4. FreeBSD images should use 'ufs2' here.
ResourceDisk.Filesystem=ext4

# Mount point for the resource disk
ResourceDisk.MountPoint=/mnt/resource

# Create and use swapfile on resource disk.
ResourceDisk.EnableSwap=n

# Size of the swapfile.
ResourceDisk.SwapSizeMB=0
```

The following screenshot displays the modified parameters.

```
# Format if unformatted. If 'n', resource disk will not be mounted.
ResourceDisk.Format=y

# File system on the resource disk
# Typically ext3 or ext4. FreeBSD images should use 'ufs2' here.
ResourceDisk.Filesystem=ext4

# Mount point for the resource disk
ResourceDisk.MountPoint=/mnt/resource

# Create and use swapfile on resource disk.
ResourceDisk.EnableSwap=y

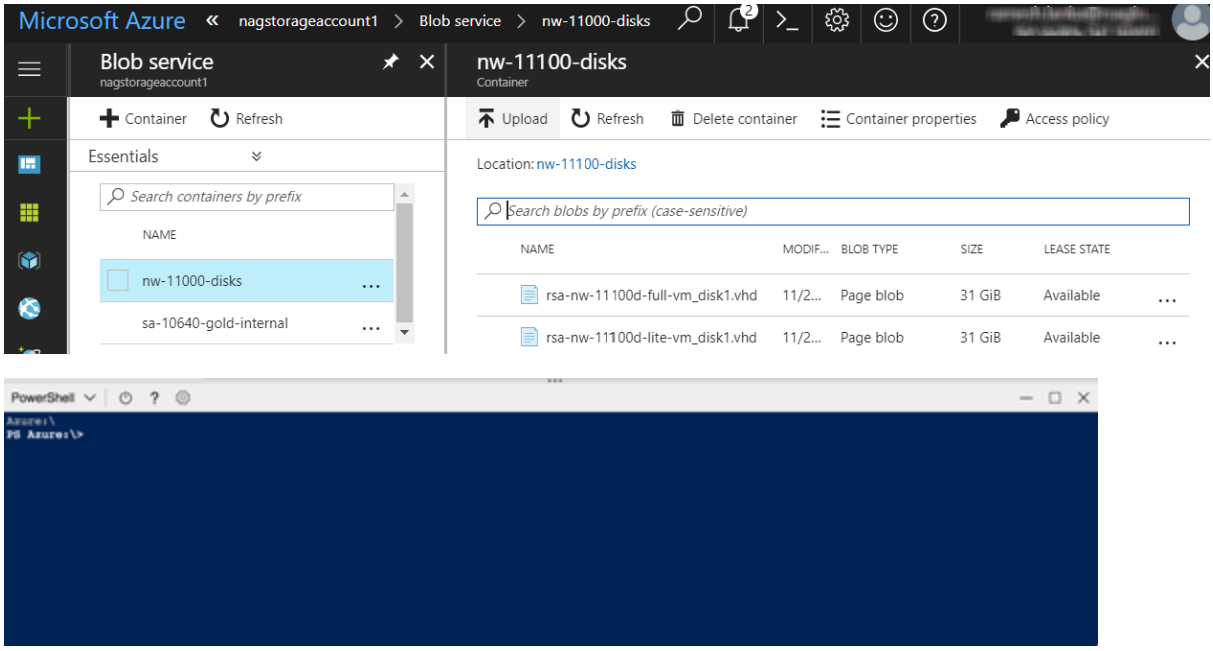
# Size of the swapfile.
ResourceDisk.SwapSizeMB=4096
```

Note: You can set the `ResourceDisk.SwapSizeMB` parameter based on your requirement.

2. Restart the `waagent.service` using the command: `systemctl restart waagent.service`

Note: To check the status of the swap use the command `swapon --show`.

Deploy NW Server Host



The following tasks must be performed to deploy a NetWitness Server (NW Server) on a virtual machine (VM) in the Azure Cloud environment.

Note: It is not mandatory to deploy the NW Server in the Azure Cloud environment . For more information on how to deploy other components, see Azure Deployment Scenarios.

Task 1. - Upload NW Server VHDs

To upload NW Server VHDs to Azure.

1. Contact Customer Support (https://community.netwitness.com/t5/support/ct-p/support) to open a support case requesting the NW Server VHDs. A valid throughput license is required.
2. Customer Support will update the case with VHD URI's.
3. In the Azure Portal, open the Powershell CLI.

You will need a storage account, blob service and container setup. This is where the VHD's are copied. After these are in place, you can execute the following command within the Azure Portal Powershell CLI. Alternatively, you can also run these commands from the Powershell on your workstation:

a. Run this command from Powershell to install AzureRM: `Install-Module -Name AzureRM -AllowClobber`

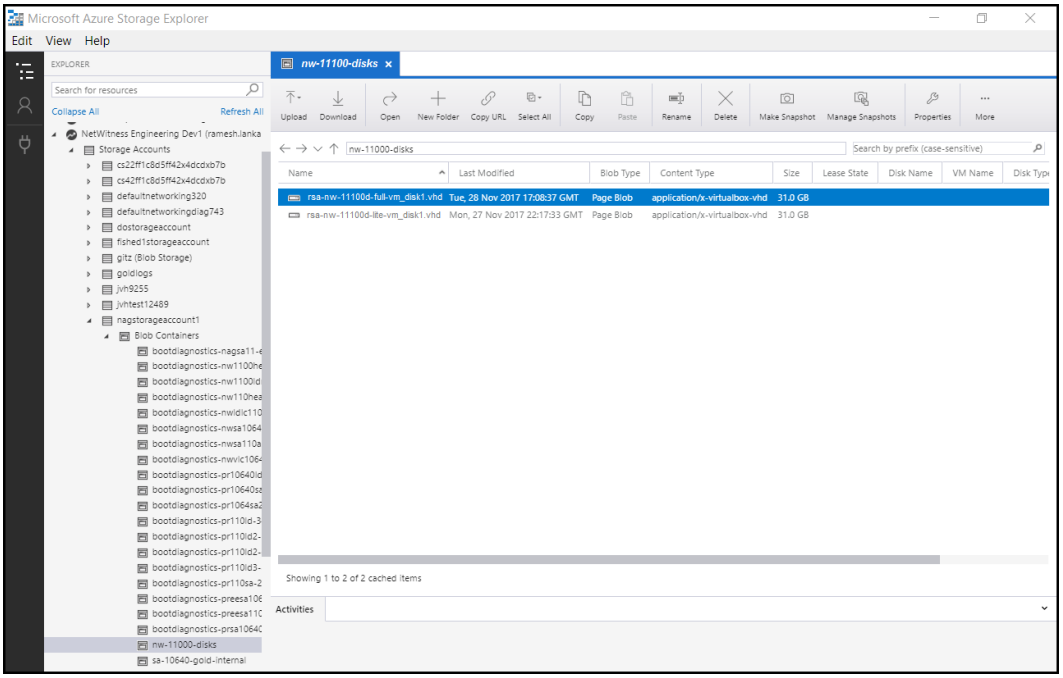
b. Execute this command to verify the installation process has been successfully done: `Import-Module -Name AzureRM`

c. If you find any error regarding execution policy, execute this command: - `Set-ExecutionPolicy -ExecutionPolicy RemoteSigned` (then repeat step b)

d. (Optional) If you are running the commands from the Powershell on your workstation, log in to your Azure account using this command: `Login-AzureRmAccount`

e. Select the Subscription: `Select-AzureRmSubscription -SubscriptionId <subscriptionid>`

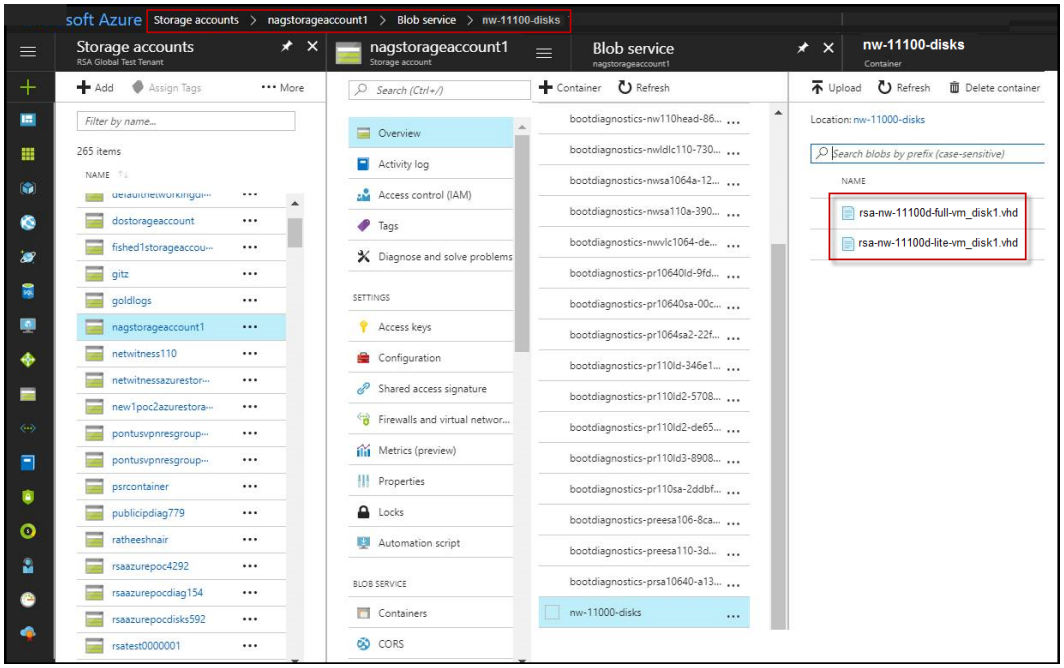
f. Create a target context: `$targetStorageContext = (Get-AzureRmStorageAccount -ResourceGroupName <resource-group-name> -Name <storage-account-name>).Context`



g. Start the copy: `Start-AzureStorageBlobCopy -AbsoluteUri "<SAS-URL>" -DestContainer <container-name> -DestBlob <destination-blob-name> -DestContext $targetStorageContext`

h. Obtain the Blob copy status by using the command: `Get-AzureStorageBlobCopyState -Blob "< destination-blob-name>" -Container "<container-name> " -Context $targetStorageContext`

4. Once the VHD's are successfully copied. You'll must create an image and a VM.

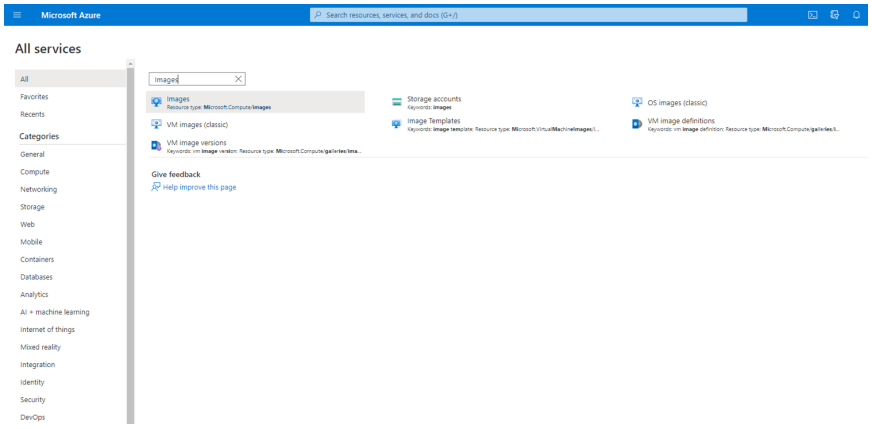


5. Verify if all the NW Server VHDs are uploaded into the Azure Cloud.

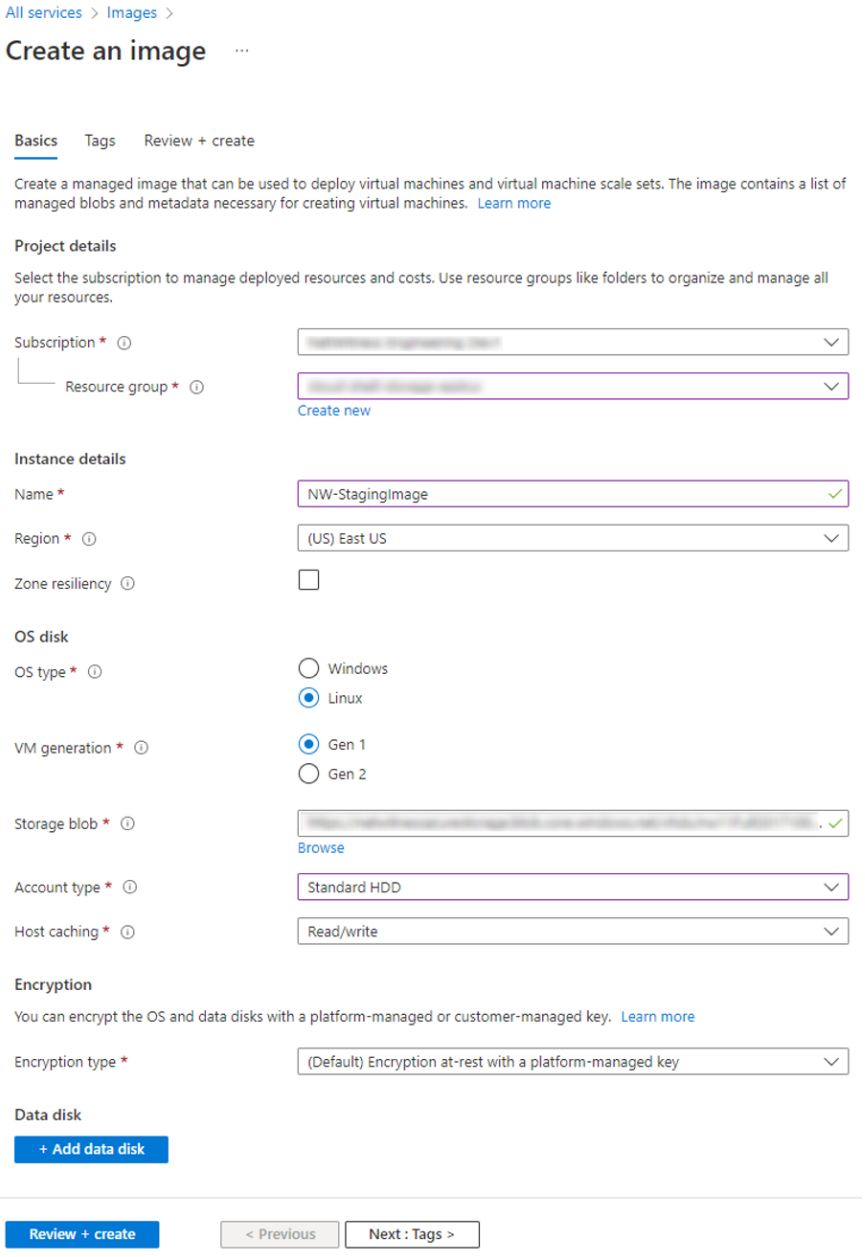
Note: Alternatively, you can use the Microsoft Azure Storage Explorer windows utility (http://storageexplorer.com/) to verify that all the VHDs from the following location subscription exist. This utility helps you manage the contents of your storage.

a. Log in to the Azure portal (https://portal.azure.com).

b. From the right panel, click **Storage accounts** > **netwitnessazurestorage1** > **Blob service** > **nwazurevhdstore**.



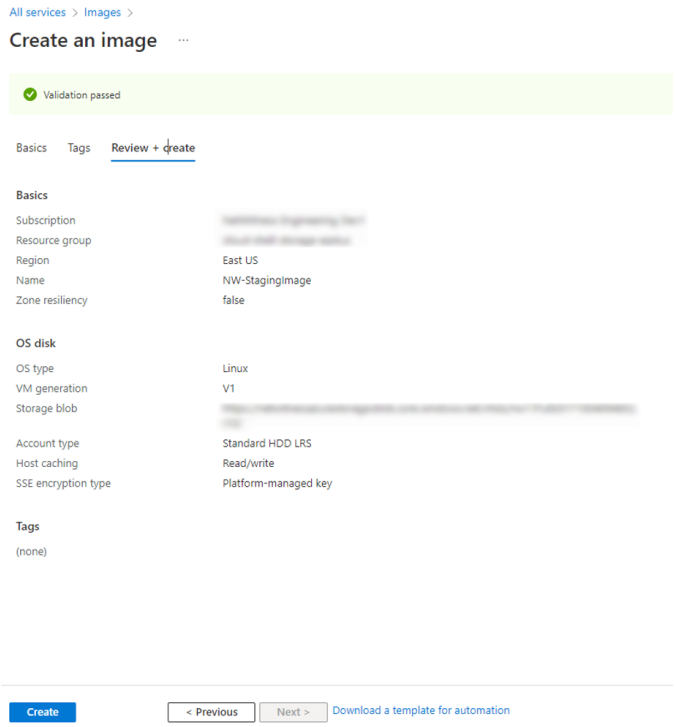
6. (Optional) In the Azure Explorer, go to the **NetWitness** group > **Storage Accounts** > **netwitnessazurestorage1**) > **Blob Containers** > **nwazurevhdstore**).



Task 2. - Create NW Server Image

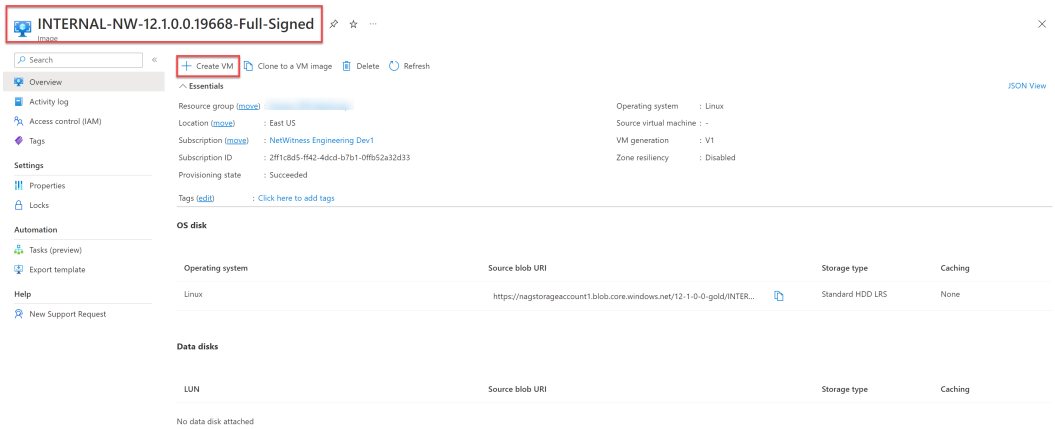
To create a NW Server image in Azure from upload VHDs, perform the following steps:

1. Log in to https://portal.azure.com.
2. From the left panel, click **All Services** and filter by Images.
3. Click **Images**.

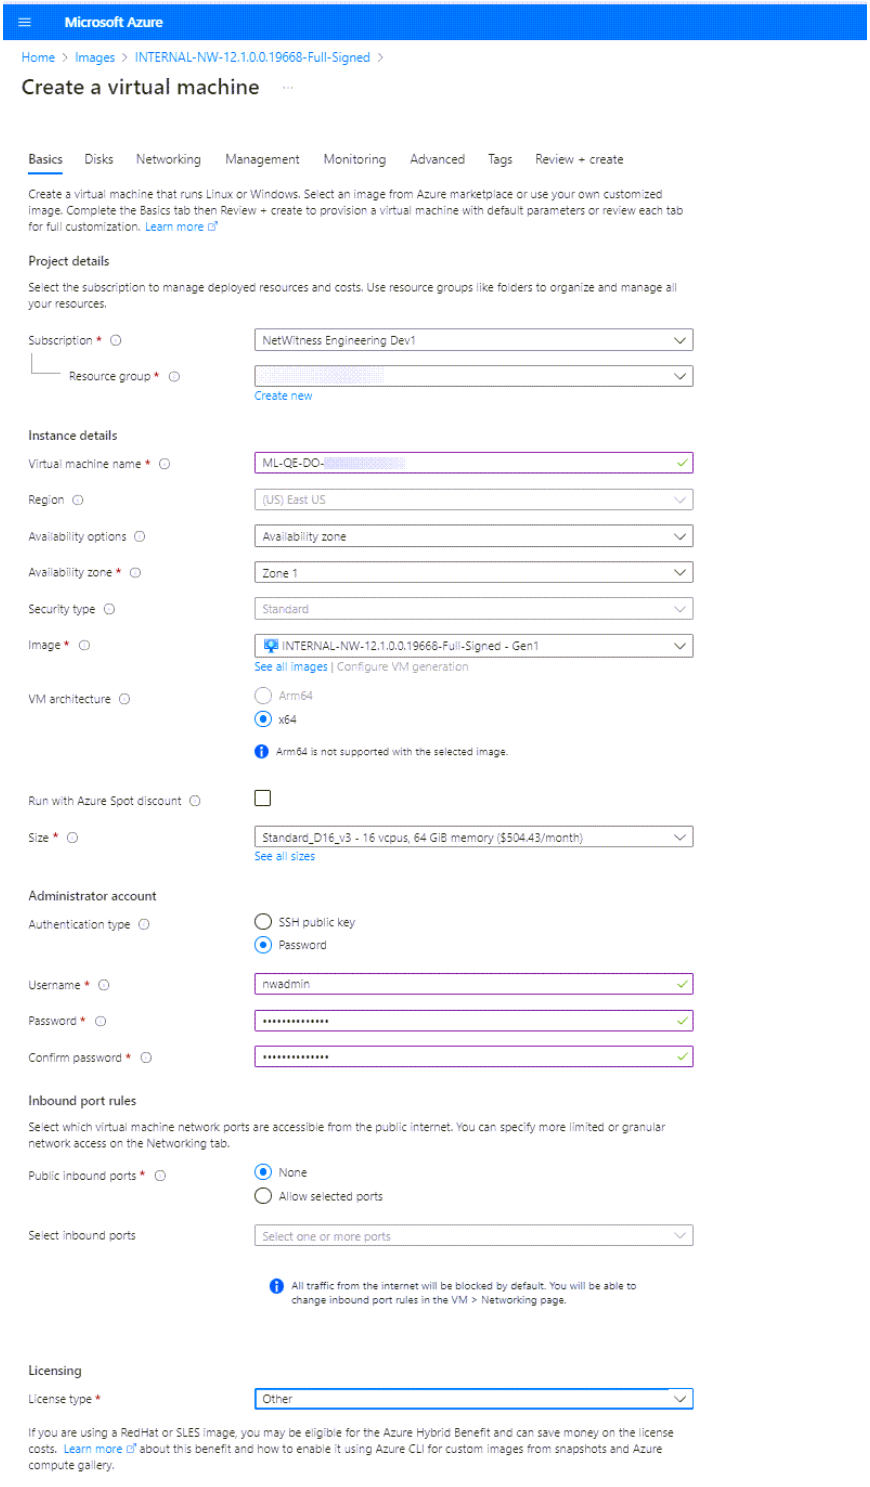


4. To create and configure the Image.
   a. Click **Create**.
   b. Enter an image **Name**, select the correct **Resource Group**, select a valid **Region**, and set the **OS Disk** to Linux.
   In the **Storage blob**, browse to the uploaded location of the VHDs .
   c. Make sure that **Standard (HDD)** is selected for **Account Type**.
   The following screen shot illustrates a completed **Create Image** view.

   d. Click **Next : Tags >** to add the tags for the Image (optional) and then Click **Review + create**.
   Azure does a validation check.



e. Click **Create** to create the image.
Check notifications on top right for the confirmation.

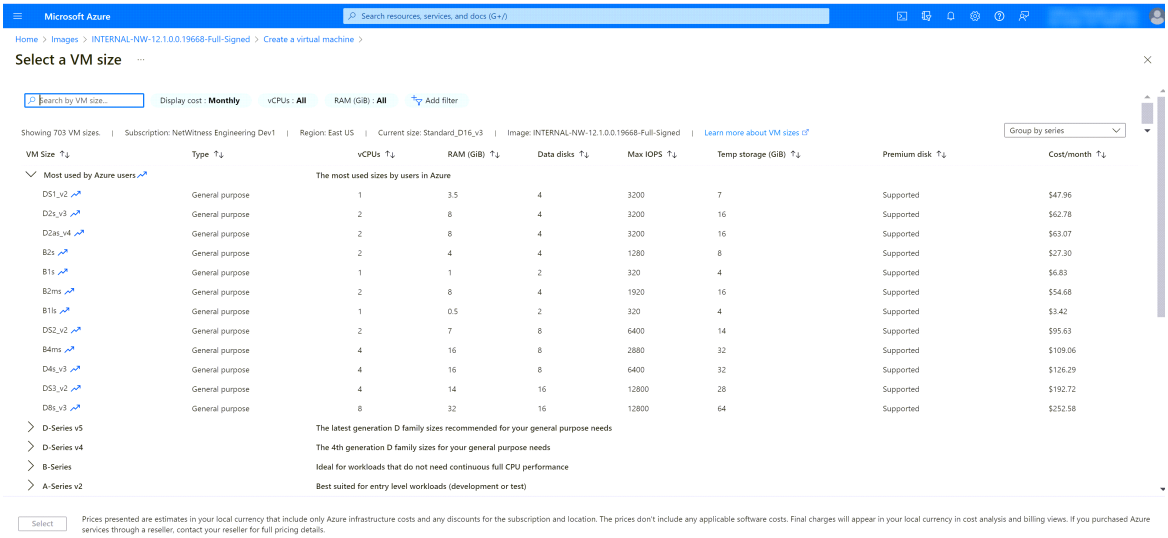


Task 3. Create Virtual Machine (VM)

To create a VM in Azure using the NW Server image:

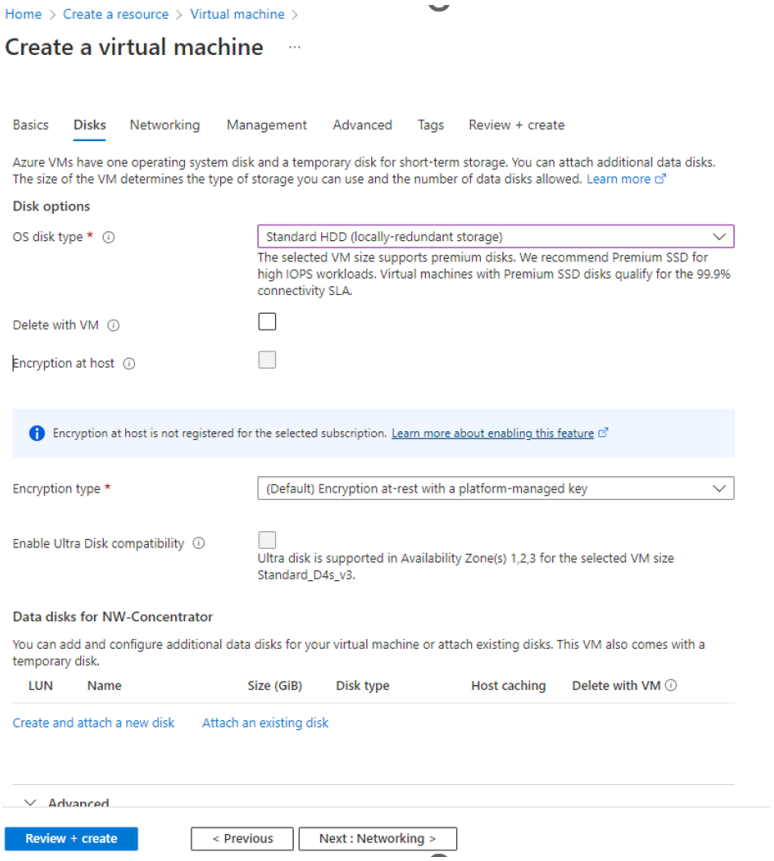
1. Go to **Images** and click **Create VM**.

The **Basics** tab is displayed.



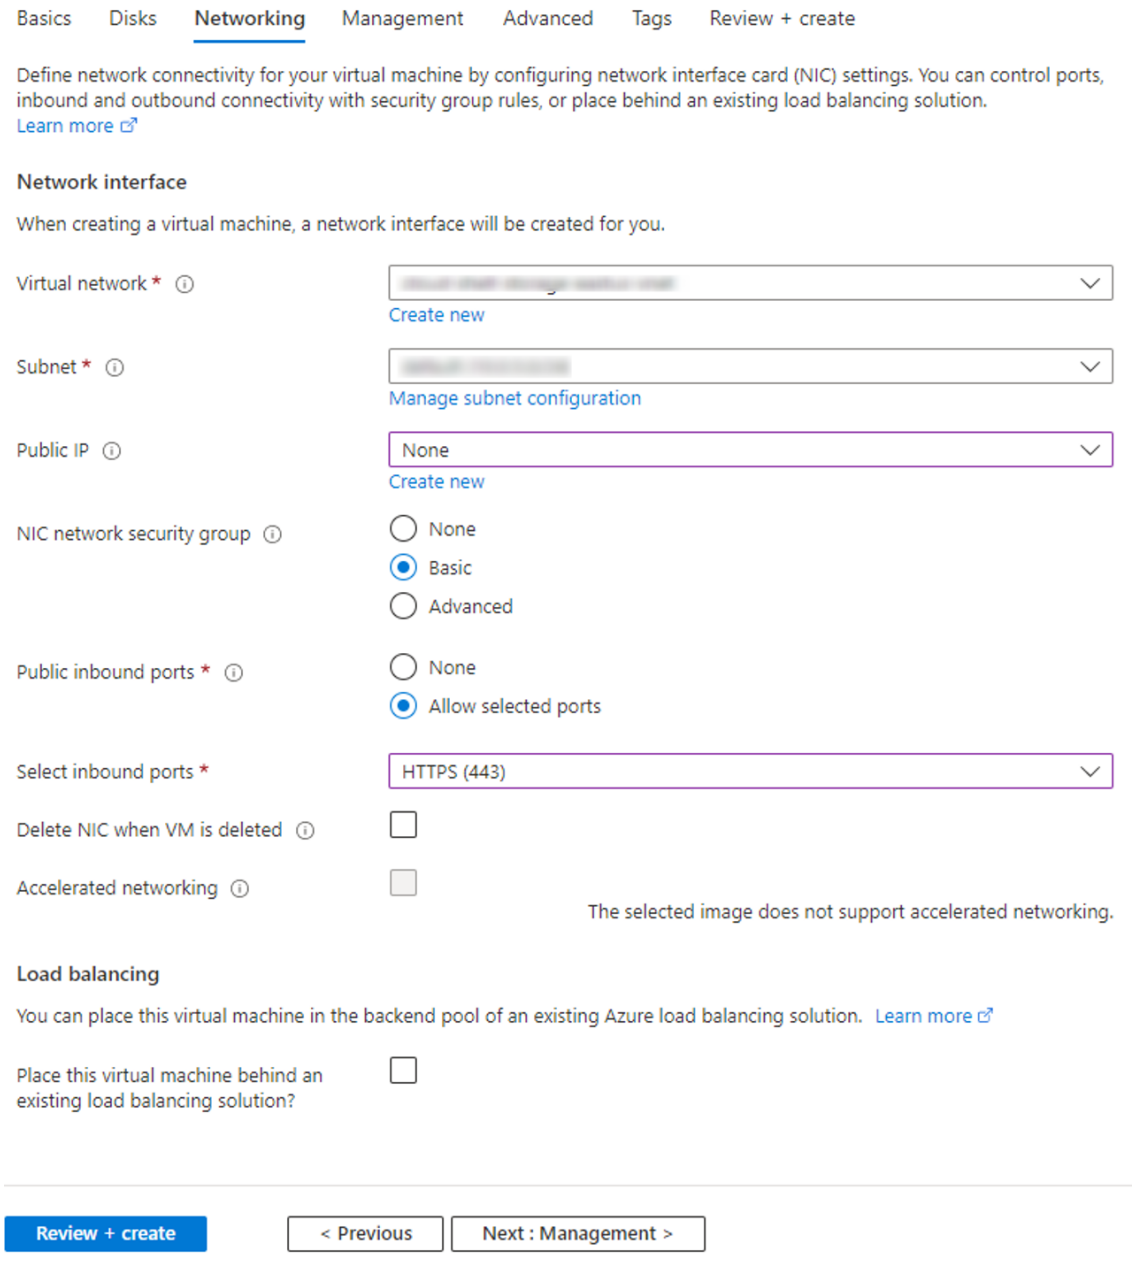
2. Enter the values in following fields.
   a. In the **Name** field, enter a user-defined name (for example, **ML-QE-DO**.

> **Caution:** The username and password that you define is used to login to the system as a non-administrator user. Do not use the root user (the login does not have superuser permissions). You must change the root password the first time that you log in to the VM by executing the `su passwd root` command. This is a critical step and should not be missed. You cannot use `root` for a username (Azure-specific).



> **Note:** Make sure the values selected in the **Subscription**, **Resource group**, and **Region** fields are correct.

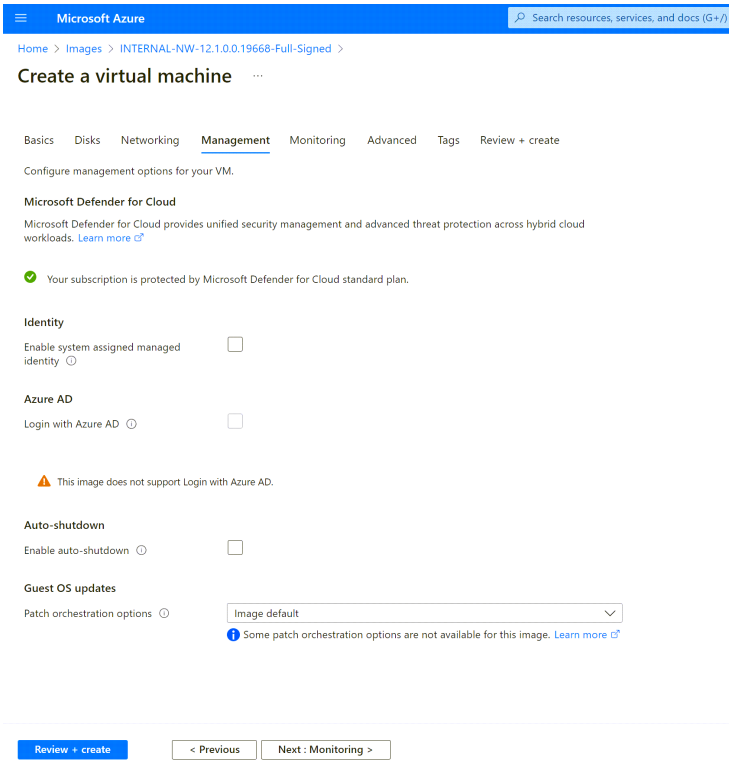
   b. Click **See all sizes** and select appropriate Size and Instance. The recommended instance for Concentrator is **Standard F8**.



> **Note:** The sizing is based upon the capacity requirements of your enterprise. For more information on NetWitness VM size recommendations based on log capture rates, see Azure Configuration Recommendations. The minimum size NetWitness recommends for the NW Server is **F8 Standard**.

   c. In the **User name** field, enter a valid username.
   d. In the **Authentication type** field, click **Password** and enter a strong password that is a combination of lowercase, uppercase, numeral and a symbol (for example, **Password@123**).
   e. Click **Next** : **Disks >**.
   The **Disks** tab is displayed.
3. In the OS Disk type, select **Standard HDD** from the drop-down list and click **Next : Networking >**.

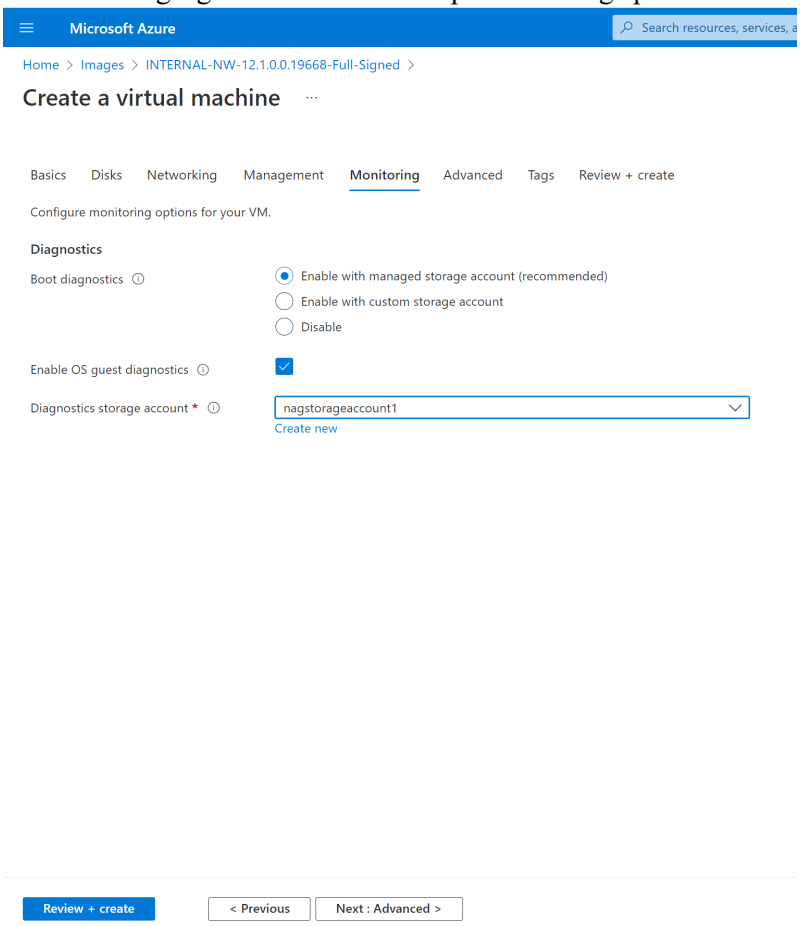
The **Networking** tab is displayed.



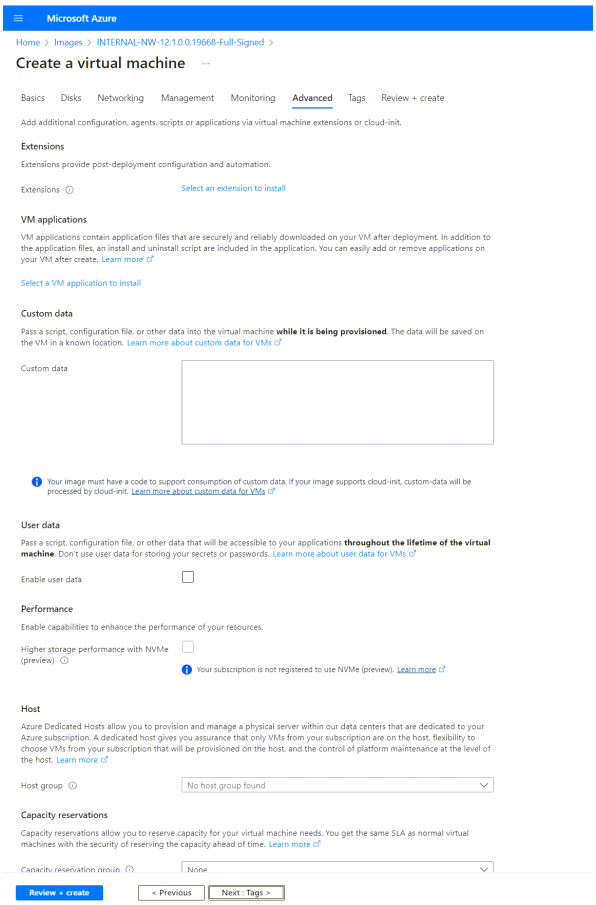
4. Click and define the fields.
   a. In the **Networking** tab, select:
      - A valid **Virtual network** and **Subnet**.

      - **None** for the **Public IP address**.
        NetWitness recommends **None** for the **Public IP address** (this is not mandatory). You can assign a public IP address, but it countermands Best Practices to assign a public IP to something that is based in the Azure Cloud.

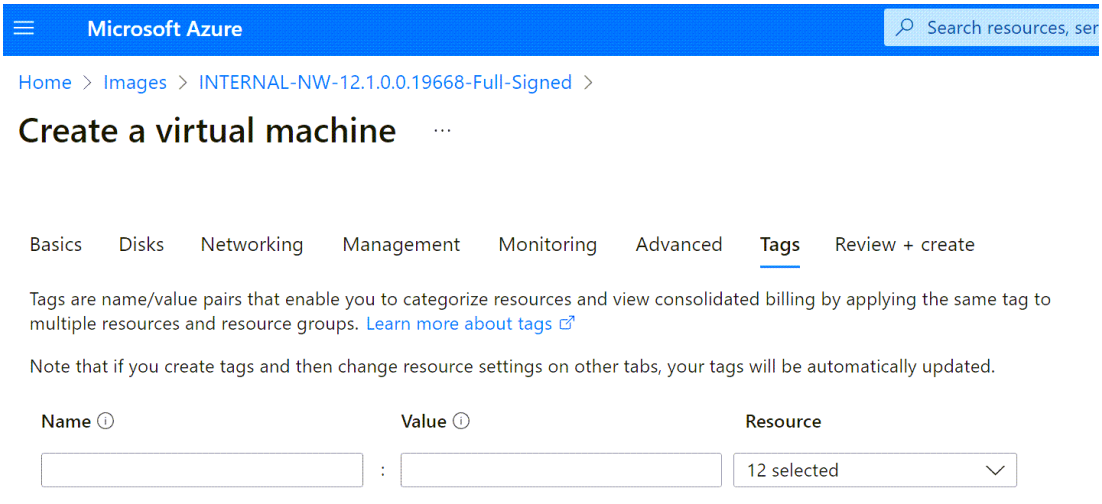
- A valid **Network security group**.
  For information on Network security groups, see the Microsoft Azure documentation (https://docs.microsoft.com/en-us/azure/virtual-network/virtual-networks-nsg).



b. (Optional) In the **Management** tab, configure the details if required and click **Review + create**.



c. In the **Monitoring** tab, under Diagnostics, select:



- **On** for **Boot Diagnostics**
- **On** for **OS guest diagnostics**
- a valid **Diagnostics storage account**

The following figure illustrates a completed Settings panel.

Note: By default, the settings remain unchanged in the **Advanced** and **Tags** tab. Add any name and value pairs for tags based on requirement.

Microsoft Azure

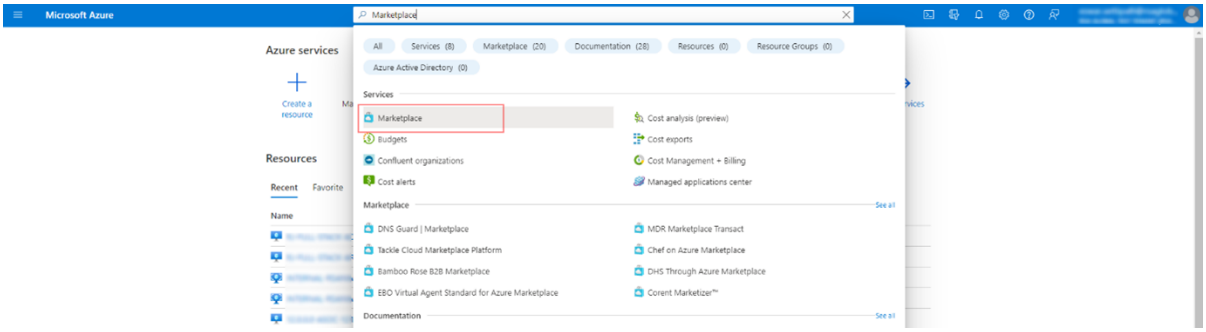
The NW Server VM Deployment is successful when you see the VM status as **Running**.

6. Click **Overview** on the Virtual Machine to view all the required details such as VM status and IP Address.

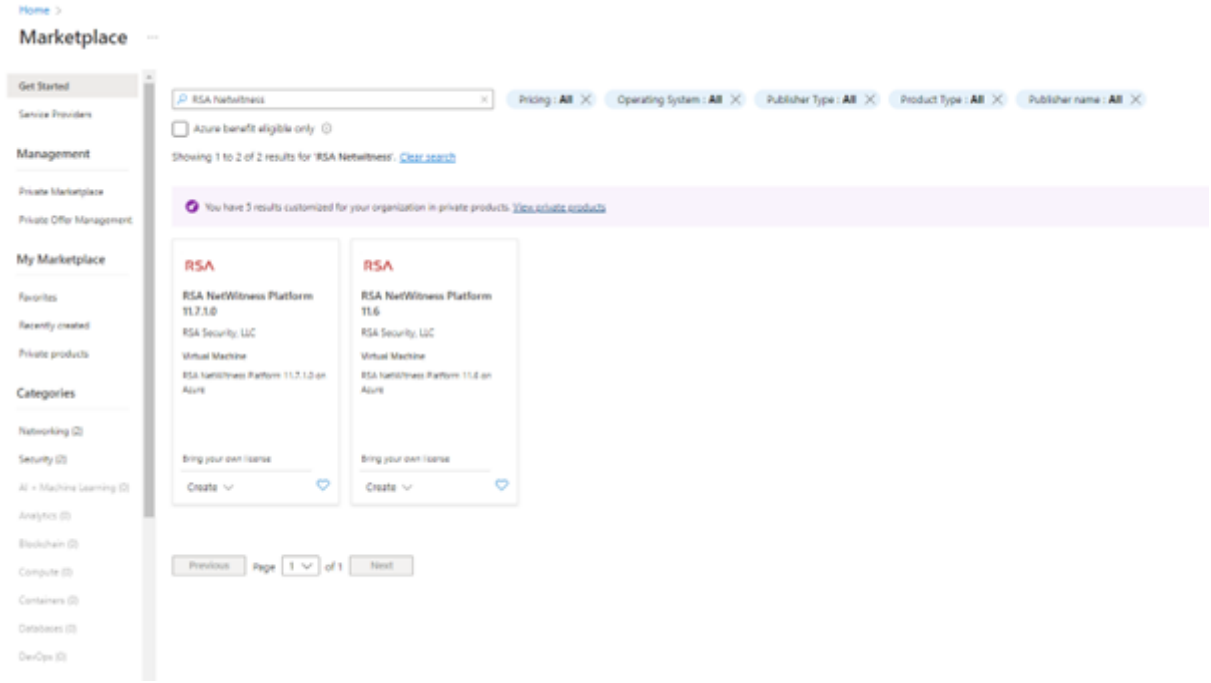
7. SSH to the VM using the username that you specified in Step 2d of Task 3 and reset the **root** password. Use the `su passwd root` command string to reset the root password.

```
[psradmin@12 ~]$ sudo passwd root
[sudo] password for psradmin:
Changing password for user root.
New password:
BAD PASSWORD: The password contains more than 4 characters of the same class consecutively
Retype new password:
passwd: all authentication tokens updated successfully.
```



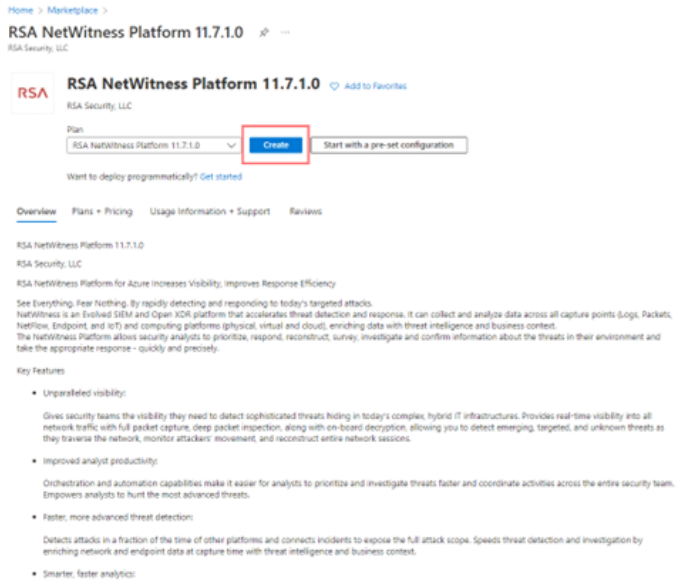
8. Close the current SSH session and open a new SSH session with **root** using the username and the password created in the previous step.

> **Note:** Step 8 is a critical, one-time step for a new deployment. If you do not complete this step, the NetWitness User Interface will not load.



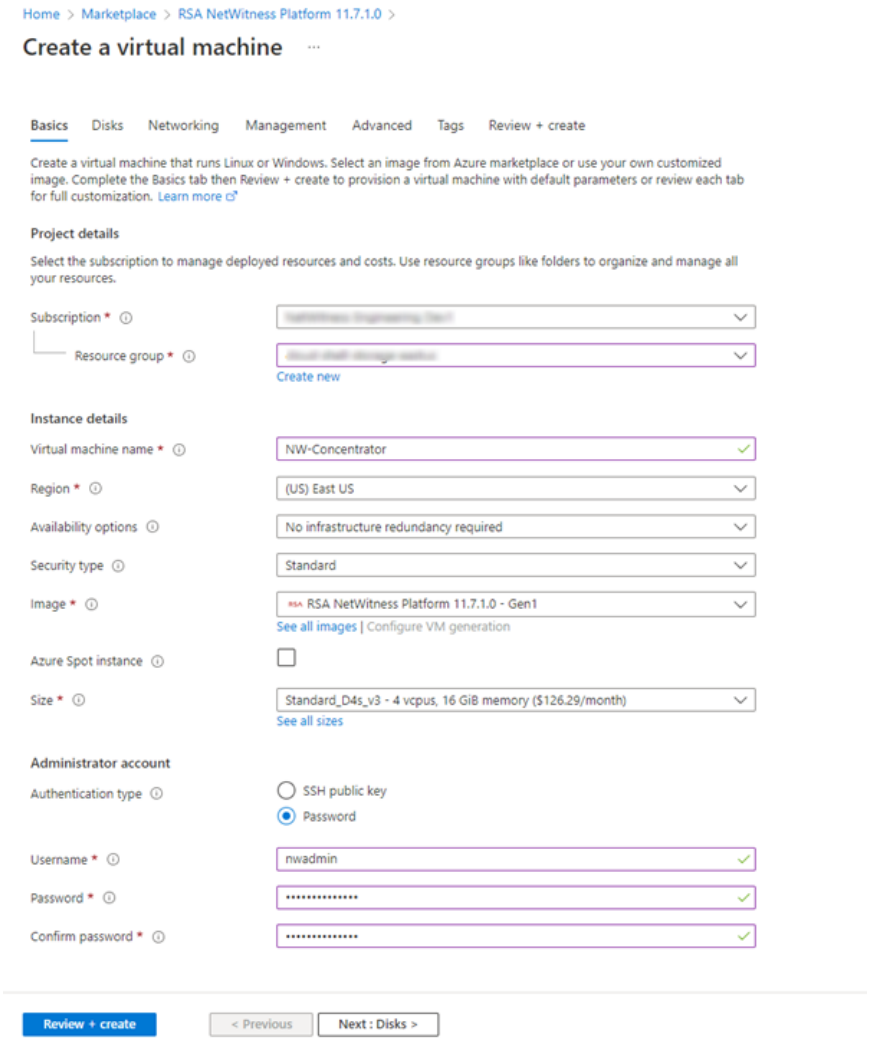
Deploy NW Component Hosts in Azure

You must perform the following tasks to configure a NW Component Host on a Virtual Machine (VMs) in the Azure Cloud environment.



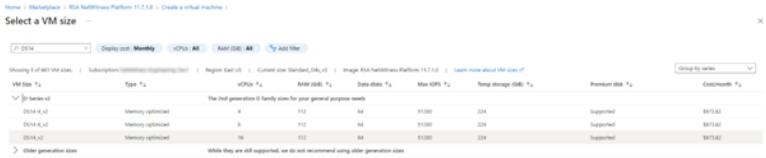
1. Search for Marketplace in Azure portal.

2. Search for **RSA NetWitness**.



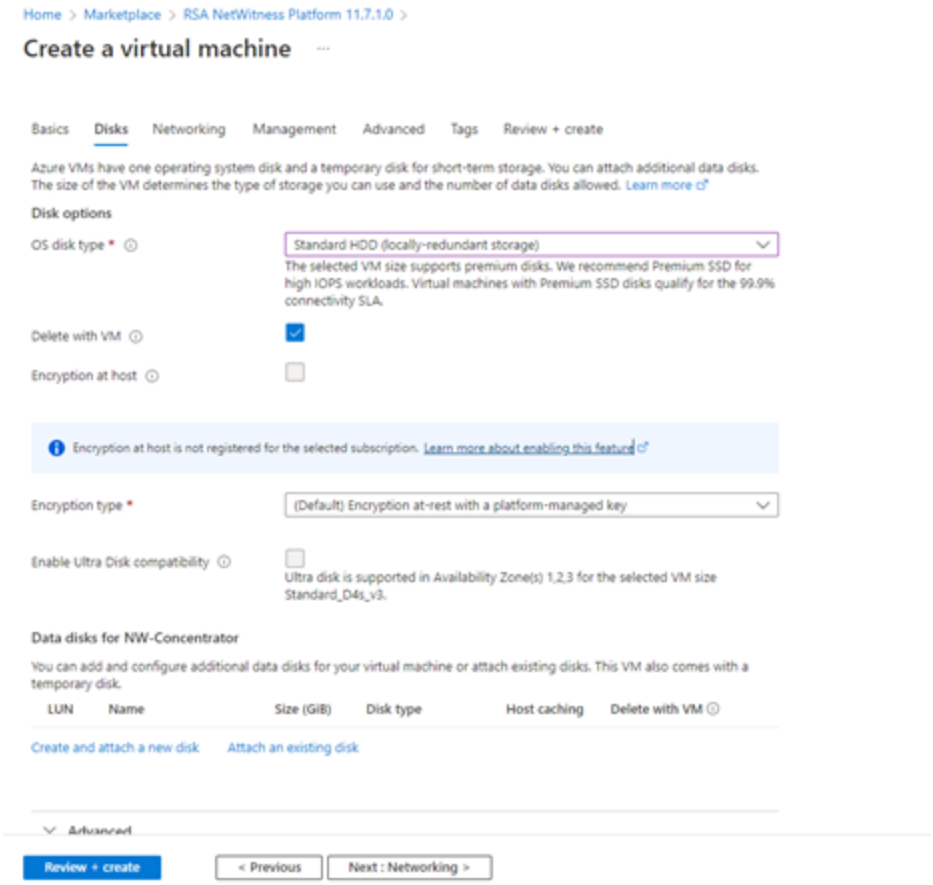
3. Select RSA NetWitness Platform 12.4.1.0 and click **Create**.

The **Create virtual machine** wizard opens and displays the **Basics** tab.



4. Enter the values in the following fields:
   a. Specify a VM **Name** (for example, **NW-Concentrator**).
   b. Select **Password** for **Authentication type**.
   c. Enter your credentials (**User name** and **Password**) and **Confirm Password**.
   d. Click **OK**.

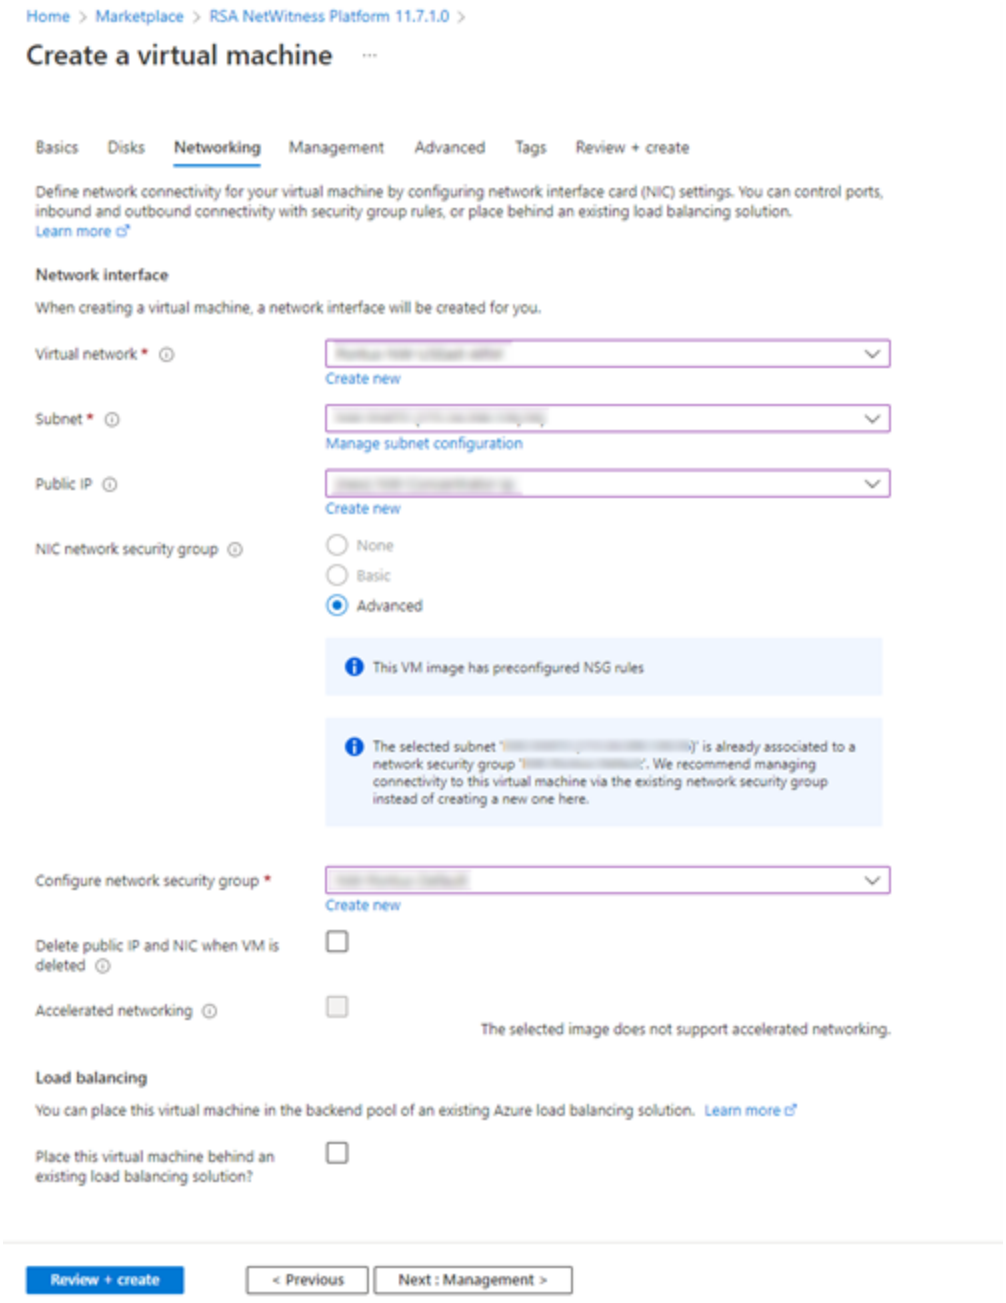
Azure validates the **Basic** specifications and the **2 Size** page is displayed.



5. Click on the appropriate VM size (for example, **Standard DS14 v2** for the Concentrator) for the service and click **Select** for a VM **Size**.

   For more information on NetWitness recommendations of the VM sizes for each service, see Azure Configuration Recommendations.

   Azure validates the **Size** specifications. Click **Next : Disks >**.

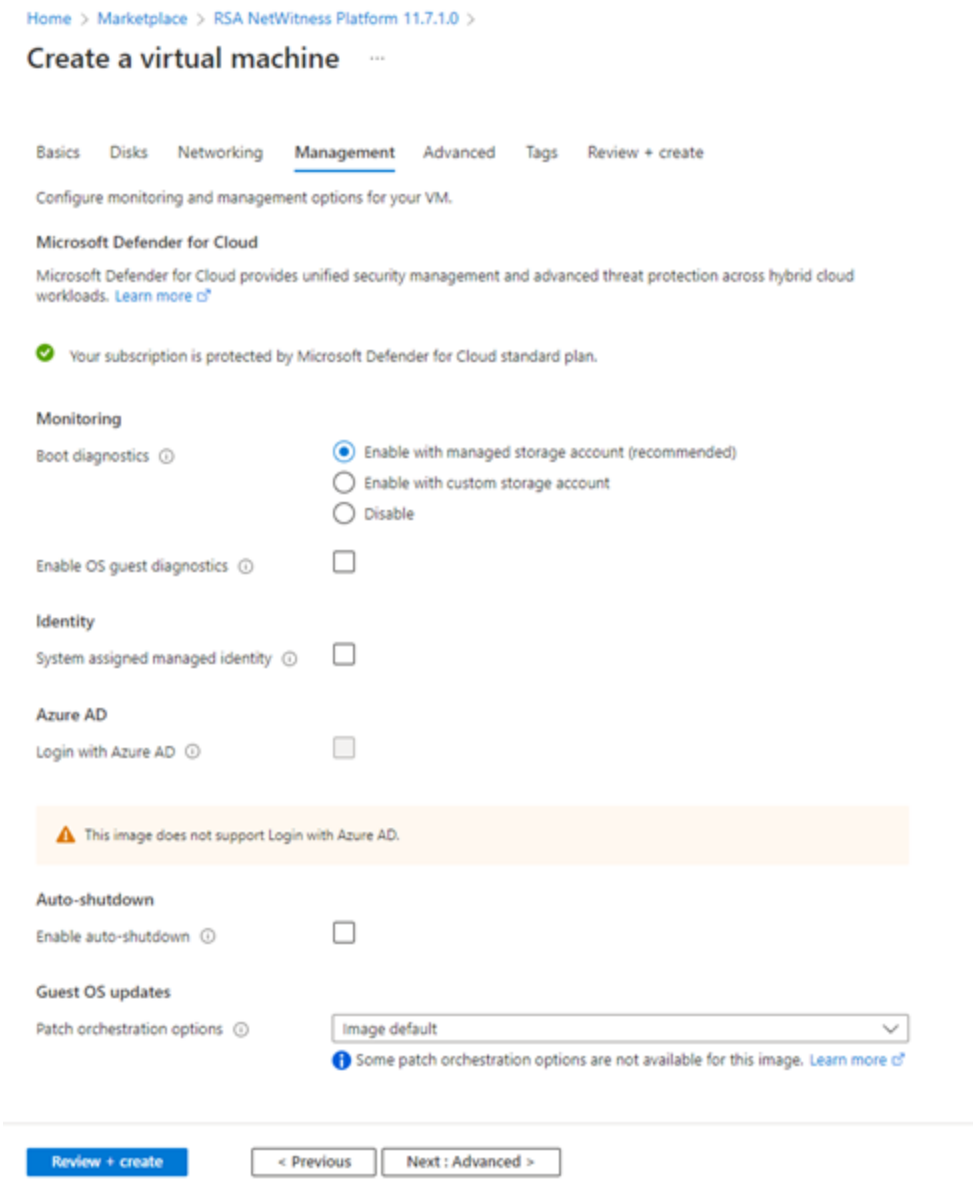


6. Under **Disks** tab, Select **SSD** for the **VM disk type** of the Concentrator or **HDD** for all other components. Solid State Disk (SSD) performs better than a Hard Drive (HDD).

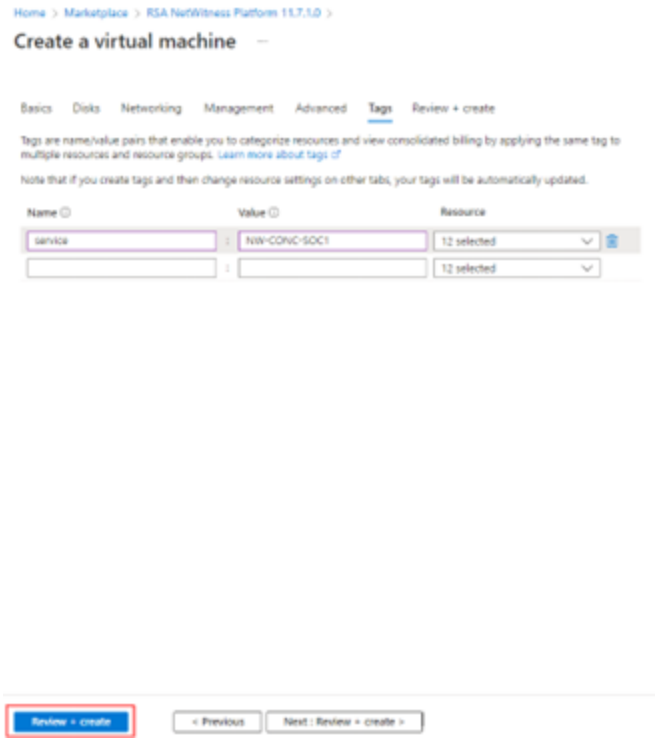
Click **Next : Networking >**.

7. In the **Networking** tab:
   a. Adjust **Virtual network**, **Subnet**, and **Public IP address** according to the requirements of your network.
   b. Enabling **Accelerated Networking** is recommended for Decoder hosts with higher line rates (> **800**Mbps).
   c. Specify a valid **Network Security group**.

> **Note:** For information on Network security groups, see the Microsoft Azure documentation (https://docs.microsoft.com/en-us/azure/virtual-network/virtual-networks-nsg). Refer to *Deployment: Network Architecture and Ports* (https://community.netwitness.com/t5/netwitness-platform-online/network-architecture-and-ports/ta-p/668996) for a comprehensive list of the ports you must set up for all NetWitness components.



d. After completing the configurations, click **Next : Management >**.



8. In the **Management** Tab:

   a. Enable Boot diagnostics and OS guest diagnostics.

   b. Configure Identity based on your requirements.

9. Click **Next : Advanced >** to enter **Advanced** settings tab. Make the required changes if any and click **Next : Tags >**.
10. In the **Tags** menu, add **Name**, **Value** pairs if any and click **Review + create**.

Azure validates the VM and displays the status check.

11. Click **Create** to deploy the NW-Concentrator VM in Azure.
12. Configure the host VM in NetWitness 12.4.1.0.
13. Repeat steps 1 through 12 inclusive for the rest of the core NetWitness component services.

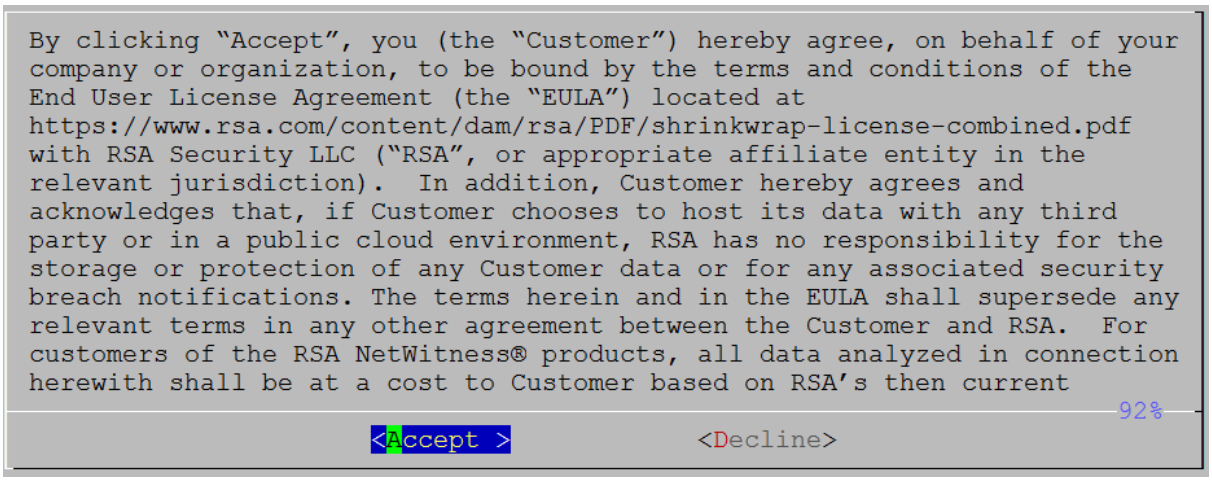
Installation Tasks

Before you begin the installation tasks make sure you open the firewall ports. For more information on the lists of all the ports in a deployment, see the"Network Architecture and Ports" topic in the *Deployment Guide for NetWitness Platform 12.4.1*.

Caution: Do not proceed with the installation until the ports on your firewall are configured.

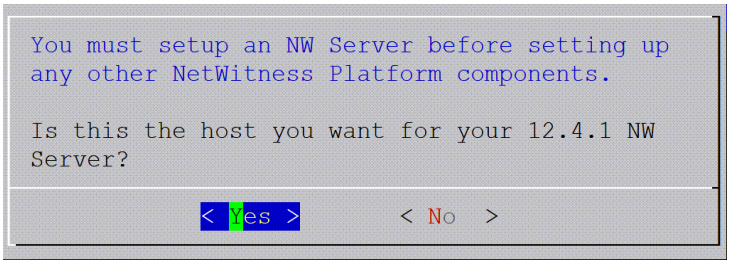
Install 12.4.1 on the NetWitness Server (NW Server) and Component Hosts

Note: You can perform this task for **INTERNAL-NW-12.4.0.0.20806-Full-Signed** instance.



Caution: If you want to install the Endpoint Relay Server, do not run the `nwsetup-tui` script. Follow the instructions in "(Optional) Installing and Configuring Relay Server" in the *NetWitness Endpoint Configuration Guide*.

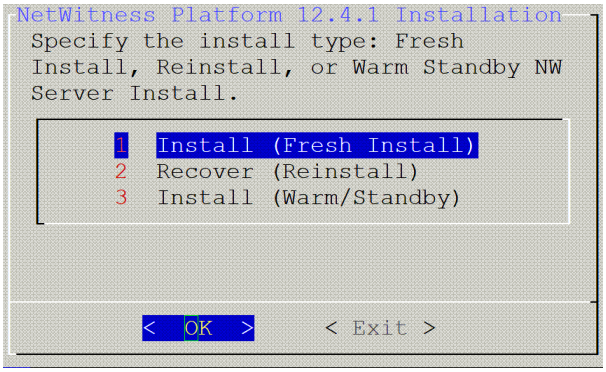
IMPORTANT: In NetWitness Platform version 11.6 or later, deployment account password must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ .) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`. If `deploy_admin` password is changed on Primary NW Server, It must be changed on the Warm Standby Server if it exists.



1. Log in to the host with the `root` credentials and run the `nwsetup-tui` command to set up the host.

   This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.

   Note: Use the following options to navigate the Setup prompts.
   1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, and use the Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**). Press **Enter** to register your command response and move to the next prompt.
   2.) The Setup program adopts the color scheme of the desktop or console you use to access the host.
   3.) If you specify DNS servers during the Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` script to proceed. Any misconfigured DNS servers cause the Setup program to fail. If you need to reach a DNS server after setup that is unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see "Change Host Network Configuration" topic in the System Maintenance Guide.
   If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).



2. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 12.4.1 NW Server** prompt is displayed.

3. Tab to **Yes** and press **Enter** to install 12.4.1 on the NW Server.
   Tab to **No** and press **Enter** to install 12.4.1 on other component hosts.

   Caution: If you choose the wrong host for the NW Server and complete the Setup, you must restart the Setup Program (step 2) and complete steps all the subsequent steps to correct this error.

4. The **Install** prompt is displayed (**Recover** does not apply to the installation. It is for 12.4.1 Disaster Recovery.).
   NW Server Host prompt:

Other Component Hosts, the prompt is the same, but does not include option 3 Install (Warm/Standby)

5. Press **Enter**. **Install (Fresh Install)** is selected by default.
   The **System Host Name** prompt is displayed.
   NW Server prompt:

   Other Component Hosts prompt says <non-nwserver-host-name>

   Caution: If you include "." in a host name, the host name must also include a valid domain name.

   Press **Enter** if want to keep this name. If not, edit the host name, tab to **OK**, and press **Enter** to change it.

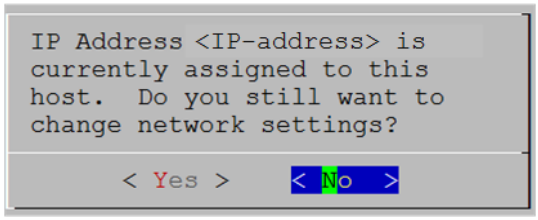
6. **This step applies only to NW Server hosts**.
   The **Master Password** prompt is displayed.

   The following list of characters are supported for Master Password and Deployment Password:

   - Symbols: **! @ # % ^ +**
   - Numbers: **0-9**
   - Lowercase Characters: **a-z**
   - Uppercase Characters: **A-Z**

   No ambiguous characters are supported for Master Password and Deployment Password. For example:
   space { } [ ] ( ) / \ ' " ` ~ ; : . < > -

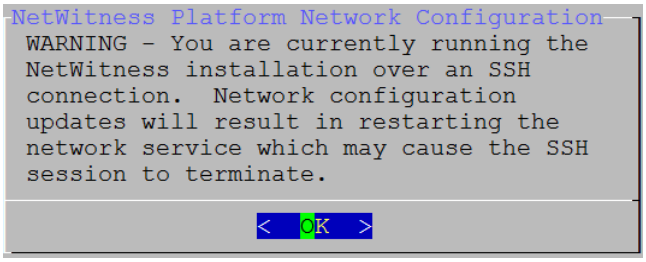
   Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.



7. **This step applies to both NW Server hosts and component hosts.**
   The **Deployment Password** prompt is displayed.

Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

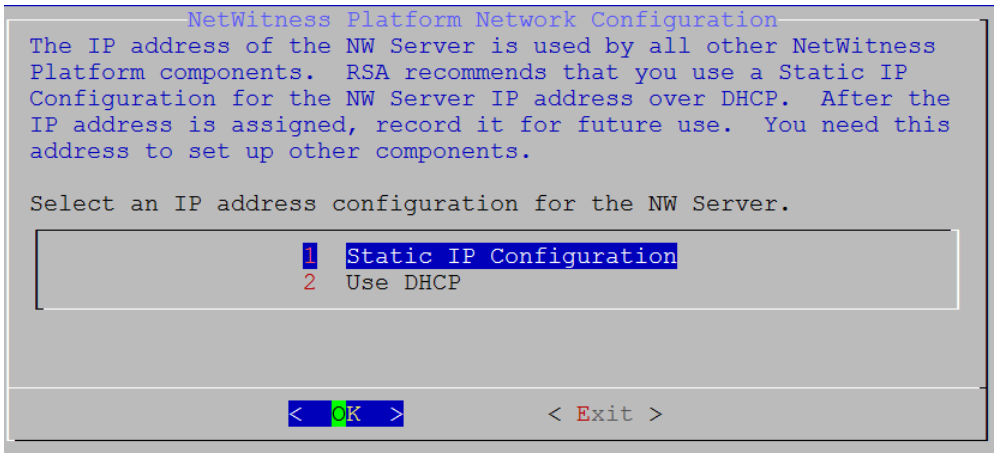
8. One of the following conditional prompts is displayed.



- If the Setup program finds a valid IP address for this host, the following prompt is displayed.

Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** if you want to change the IP configuration on the host.

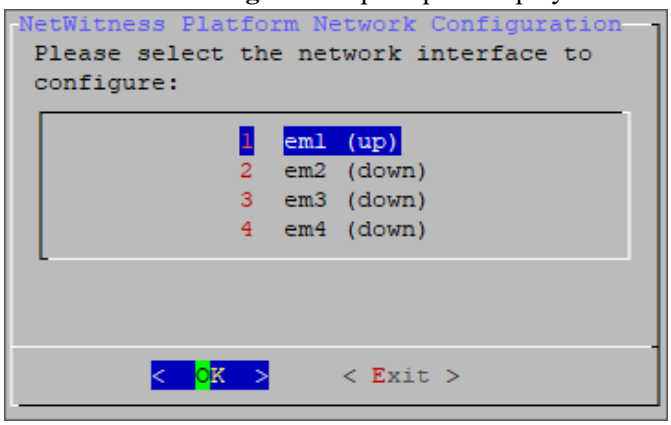
- If you are using an SSH connection, the following warning is displayed.



Note: If you connect directly from the host console, the following warning is not displayed.

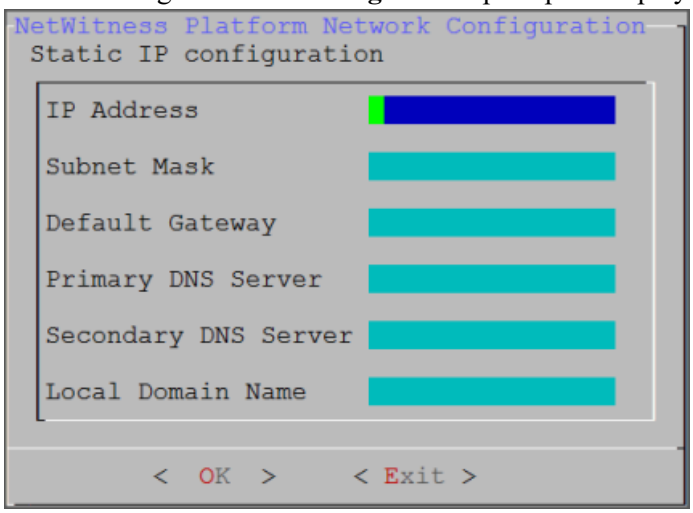
Press **Enter** to close warning prompt.

- If the Setup Program finds an IP configuration and you choose to use it, the **Update Repository** prompt is displayed. Go to step 12 and complete the installation.
- If the Setup Program did not find an IP configuration or if you choose to change the existing IP configuration, the **Network Configuration** prompt is displayed.



Caution: Only select "**Use DHCP**" as an IP address configuration for the NW Server if DHCP issues static IP addresses.

Tab to **OK** and press **Enter** to use **Static IP**.



If you want to use DHCP, down arrow to **2 Use DHCP** and press **Enter**.

The **Network Configuration** prompt is displayed.

9. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit.**

   The following **Static IP Configuration** prompt is displayed.

10. Type the configuration values, tab to **OK**, and press **Enter**. If you do not complete all the required fields, an `All fields are required` error message is displayed (**Secondary DNS Server** and **Local Domain Name** fields are not required). If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

    Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

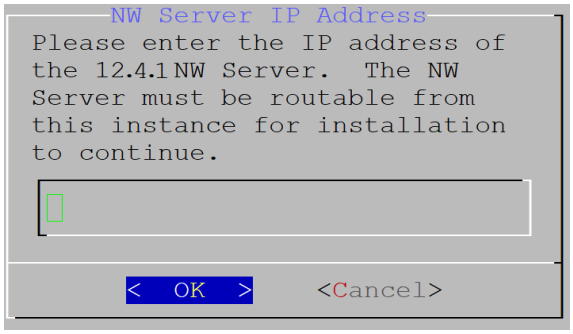
11. The Use Network Address Translation (NAT) prompt is displayed.

    For the NW Server, tab to **No** and press **Enter**.
    For component hosts, if this host requires the use of NAT-based addresses to communicate with the NW Server, tab to **Yes**. Otherwise, tab to **No** and press **Enter**.

12. The **Update Repository** prompt is displayed.

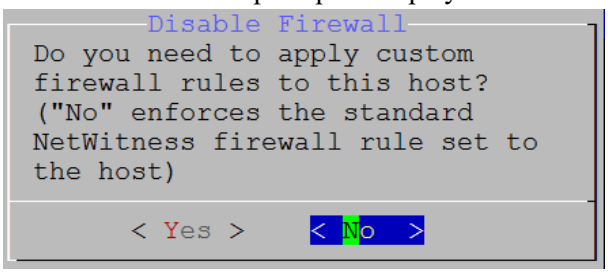
    For the NW Server:

    - Press **Enter** to choose the **Local Repo**.
    - If you want to use an external repo, down arrow to **External Repo**, tab to **OK**, and press **Enter**. If you select **1 The Local Repo (on the NW Server)** in the Setup program, make sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can install NetWitness 12.4.1. If the program cannot find the attached media, you receive the following prompt.



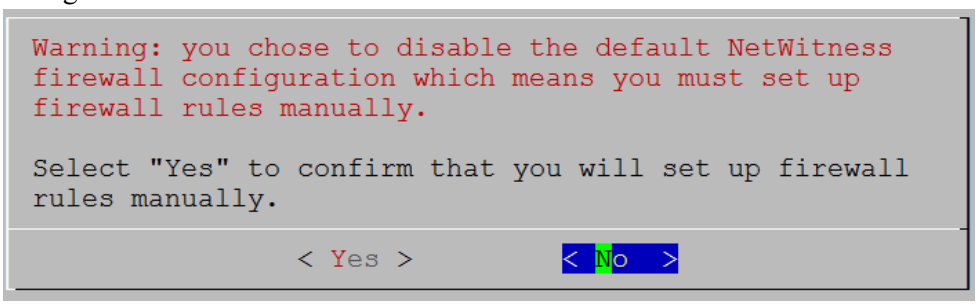
- If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access to RSA updates and CentOS updates. Refer to "Appendix B. Create an External Repo" in this guide for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.

Enter the base URL of the NetWitness external repo and click **OK.** The **Start Install** prompt is displayed.



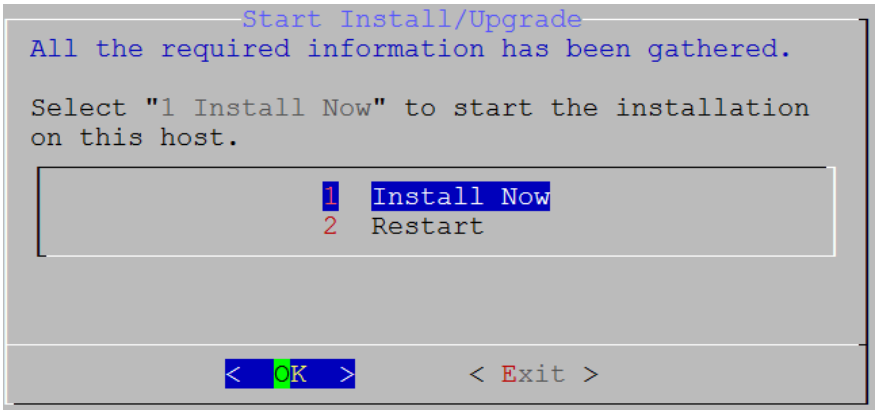
For component hosts:

- Select the same repo that you selected when you installed the NW Server host and follow the steps above.
- The NW Server IP Address prompt is displayed.



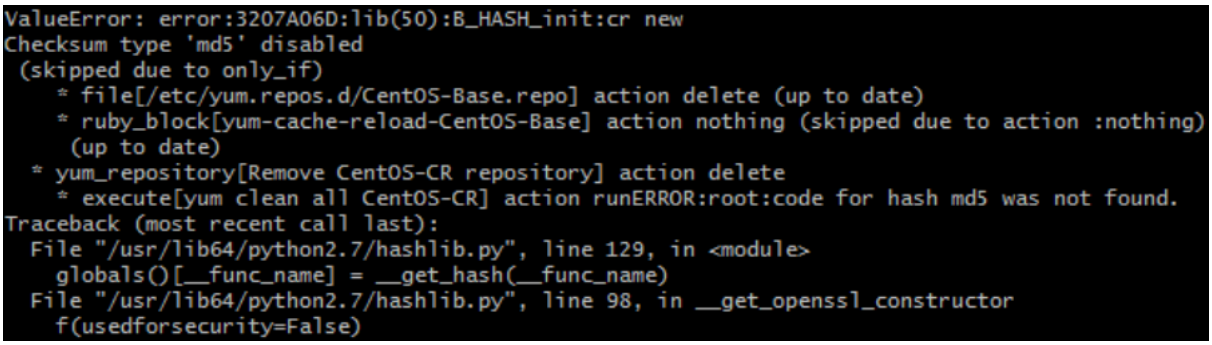
Type the NW Server IP address. Tab to **OK** and press **Enter**.

13. The Disable firewall prompt is displayed.



Tab to **No** (default), and press **Enter** to use the standard firewall configuration.
To disable the standard firewall configuration, tab to **Yes**, and press **Enter**.
If you select **Yes**, confirm your selection(select **Yes** again) or select **No** to use the standard firewall

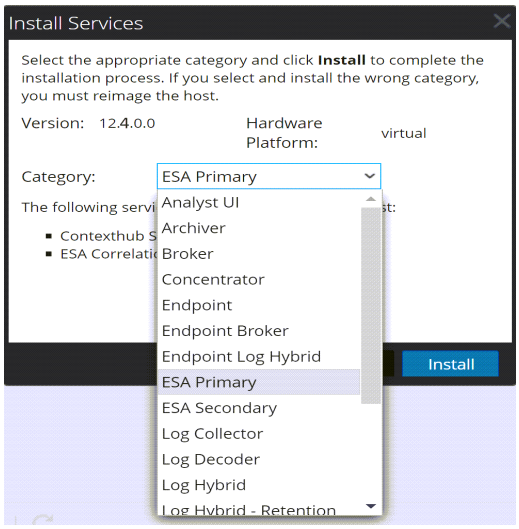
configuration.



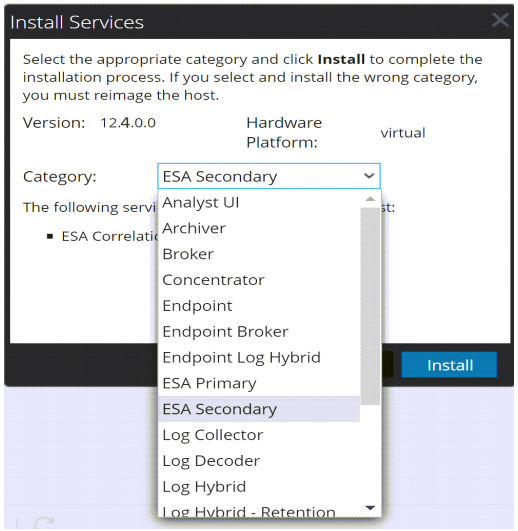
14. The **Start Install** prompt is displayed.

15. Press **Enter** to install 12.4.1.
When **Installation complete** is displayed, you have installed 12.4.1 on this host.

Note: Ignore the hash code errors similar to the errors shown in the following figure that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



16. (Optional) If your system configuration requires that a component host must use a NAT IP address to reach the NW Server host, you must configure the NAT IP address of the NW Server by running the following command:
`nw-manage --update-host --host-id <NW Server Host UUID> --ipv4-public <NAT IP address>`



Set Up ESA Hosts

After you install your NW Server and component hosts, follow these steps to set up your ESA hosts.

- Install your primary ESA host following the instructions in "Install 12.4.1 on the NetWitness Server (NW Server) Host and Other Component Hosts" in this guide, and install the **ESA Primary** service on it after you finish the Set Up program in the UI in (Admin) > **Hosts** > Install:

- (Conditional) If you have a secondary ESA host, install it and install the **ESA Secondary** service on it after you finish the Set Up program in the UI in (Admin) > **Hosts** > Install:

Install Component Services on Hosts

After you have installed NW Server and component hosts, and set up your ESA hosts, follow these steps to install component services, such as Decoders and Concentrators, on your host systems.

1. Install a component service on the host:

   a. Log into NetWitness and go to (Admin) > **Hosts**.
   The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

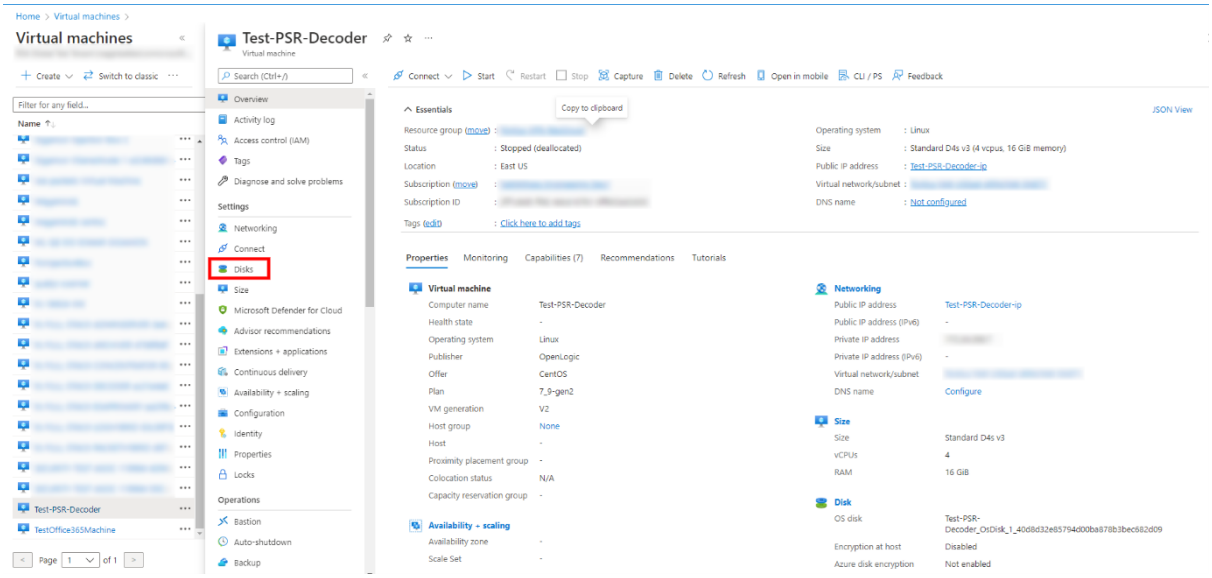
   b. Select the host in the **New Hosts** dialog and click **Enable**.
   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

   c. Select that host in the **Hosts** view and click Install.
   The **Install Services** dialog is displayed.

   d. Select the appropriate host type (for example, **Concentrator**) in **Category** and click **Install**.

Complete Licensing Requirements

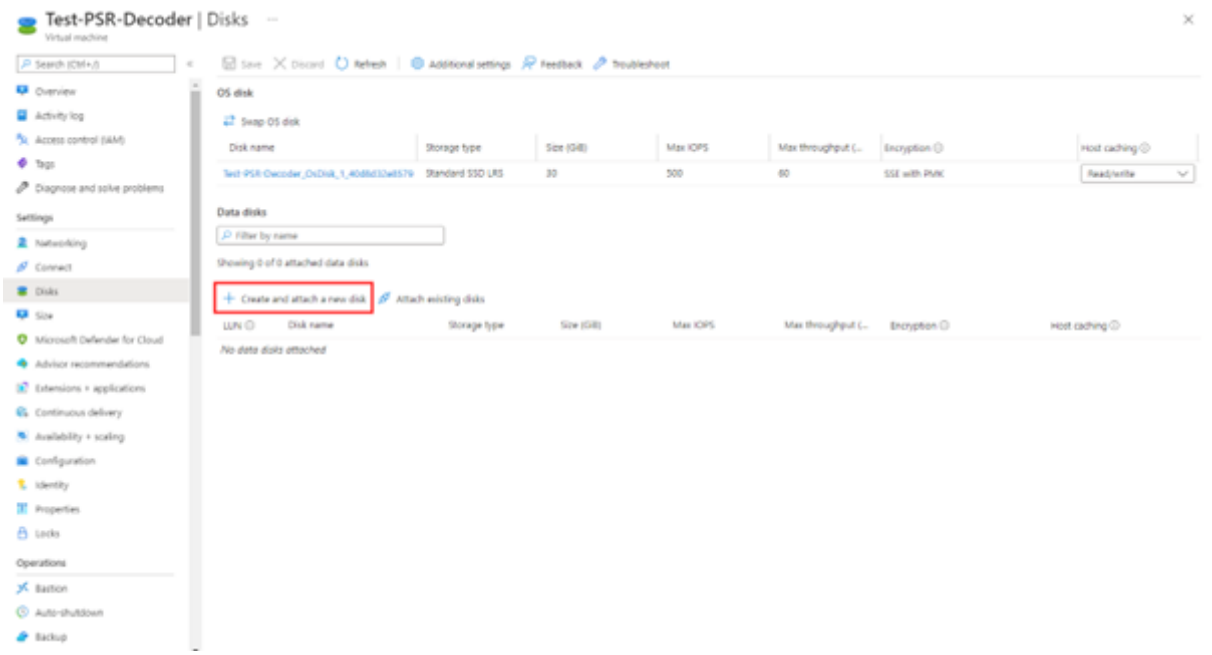
Complete licensing requirements for installed services. See the *NetWitness Platform 12.4.1 Licensing Management Guide* for more information. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.



(Optional) Install Warm Standby NW Server

Refer to "Warm Standby NW Server Host" under "Deployment Option Setup Procedures" in the *Deployment Guide for NetWitness Platform 12.4.1* for instructions on how to set up a Warm Standby NW Server.

NetWitness Azure Storage Allocation Procedure

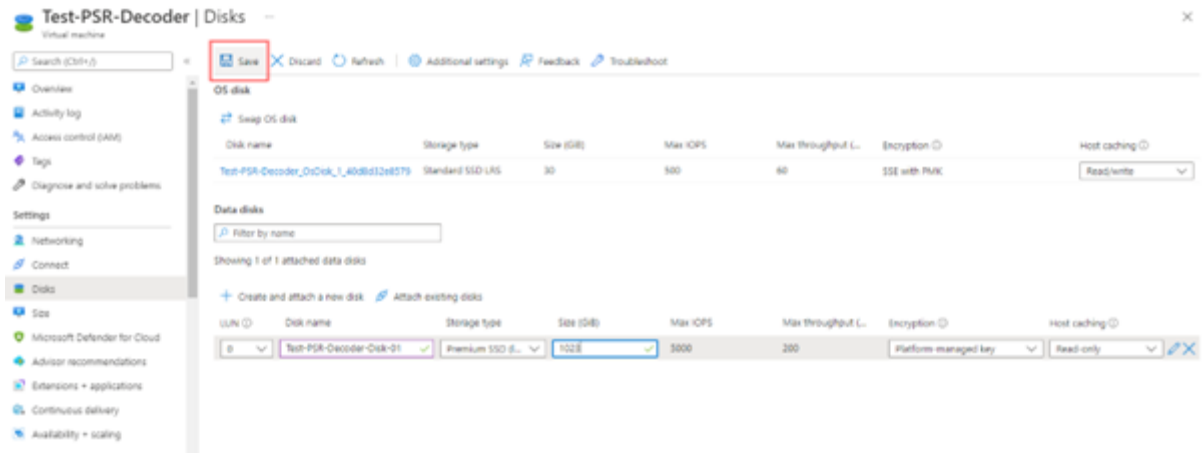


To allocate storage in NetWitness Platform 12.4.1.0, perform the following steps:

1. In Microsoft Azure portal (https://portal.azure.com/), go to **Virtual Machines**.
2. Click the required VM > **Disks**.

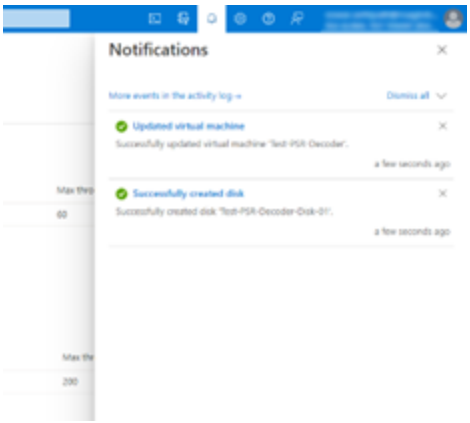
3. Click **Create and attach a new disk**.

> **Note:** You need to add the appropriate amount of disks / IOPS to meet the retention requirements. If you need to add more than a single disk, a RAID configuration is needed.



4. In the Disks view,
   a. Enter the Disk name.
   b. Select the storage type of disk.

Note: Premium SSD with high throughput / IOPS is recommended for Concentrator-IndexDB, Decoder-PacketDB.



c. Select appropriate disk tier and size based on IOPS / Required retention. For more information, refer Azure Managed Disks documentation (https://docs.microsoft.com/en-us/azure/virtual-machines/disks-types).

d. Enable **Read/write** caching.

5. Click **Save** to finish adding the disk.

6. Once the disk is saved, the success notification messages are displayed in the **Notifications** view.

RAID Creation

NetWitness recommends striping the disks to get better performance / IOPS with added disks for deployments that require high IOPS/ throughput (for example: a packet decoder with 1.5Gbps). **Mdadm** Utility is used to create a raid array.

Parameters related to Raid Array Creation

- `--create`: Name of the managed disk you want to create. Usually, the name begins with /dev/md0, /dev/md1, and /dev/md2.
- `--level`: Raid level for creating an array. It can be 0, 1, 5, 6, or 10.
- `--raid-devices`: Total count of the disks to be configured in an array along with device names separated by space.

  For Example: `--raid-devices`=5 /dev/sdc /dev/sdd /dev/sde /dev/sdf /dev/sdg

Steps to create a Raid Array

Follow the steps below after the required disks are added to the Host VM

1. Identify the name of the newly added disks. Run the command `lsblk`.

   For Example: **/dev/sde** and **/dev/sdf**

2. Select the set of disks as part of your RAID-5 configuration.

   For example: Select the disks **/dev/sde**, **/dev/sdf**, **/dev/sdg**, **/dev/sdh** as part of your PacketDB for Decoder.

3. Run the command `mdadm --create /dev/md0 --assume-clean --level 5 --raid-devices=4 /dev/sde /dev/sdf /dev/sdg /dev/sdh`.

4. Check the status of the disks once the RAID configuration is created. Run the following command

   `mdadm--detail`

5. Run the command `vgcreate -s 32 decodersmall1 /dev/md0` to create a volume group **decodersmall1** which will span across the entire RAID configuration.

6. Run the command `lvcreate -L 4T -n packetdb decodersmall1` to create a logical volume **PacketDB** on **decodersmall1**.

7. Run the command `mkfs.xfs /dev/mapper/decodersmall1-packetdb` to format the newly created logical volume to an xfs partition required by the NetWitness services.

8. Make entries in the `/etc/fstab` configuration file to mount the logical volume (created) and retain the logical volumes even after a system reboot.

9. Run the command `mdadm --detail --scan > /etc/mdadm.conf` to create and store the information about the RAID configurations in the file. On system reboot, the RAID configuration is retained.

10. Run `reconfig api` on the core-service database node to update the database directory settings.

Example Scenario

The below commands describe the steps to configure a RAID-5 for PacketDB with 4 disks.

```
mdadm --create /dev/md0 --assume-clean --level 5 --raid-devices=4 /dev/sdc /dev/sdd /dev/sde /dev/sdf

vgcreate -s 32 decoder /dev/md0

lvcreate -L 3.9T -n packetdb decoder

mkfs.xfs /dev/mapper/decoder-packetdb
```

```
echo "/dev/decoder/packetdb /var/netwitness/decoder/packetdb xfs
noatime,nosuid 1 2" >> /etc/fstab
mount -a
mdadm --detail --scan > /etc/mdadm.conf
```

Note: For more information regarding Azure Disks, see Azure managed disk types, Configure software RAID, Performance tiers for managed disks, and Change the performance of Azure managed disks using the Azure portal.

Configure Hosts (Instances) in NetWitness Platform

Configure individual hosts and services as described in NetWitness *Host and Services Getting Started Guide*. This guide also describes the procedures for applying updates and preparing for version upgrades.

Note: After you successfully launch an instance, Azure assigns a default hostname to it. For more information, see "Change Host Network Configuration" in the *System Maintenance Guide* for instructions on changing a hostname. Go to the NetWitness All Versions Documents page and find NetWitness Platform guides to troubleshoot issues.

Configure Packet Capture

You can integrate one of the following third-party solutions with the Network Decoder to capture packets in the Azure cloud environment.

- Gigamon GigaVUE
- Ixia CloudLens

Integrate Gigamon GigaVUE with the Network Decoder

You can access Gigamon Visibility Platform through the Azure Marketplace on the Azure portal. It is activated by a BYOL license. A thirty-day free trial is also available. For more information on the Gigamon solution, see GigaVUE Cloud Suite for Azure.

For more information regarding GigaVUE Deployment, see https://docs.gigamon.com/doclib515/Content/GV-Cloud-Azure/preface-Azure.html?tocpath=GigaVUE%20Cloud%20Suites%7CAzure%7C_____0.

You will see the traffic incoming on NW Decoder Host once the **Monitoring Session** is deployed within the **Gigamon GigaVUE-FM** with Decoder receiver NIC as tunnel.

Integrate Ixia with the Network Decoder

Keysight Ixia CloudLens SaaS is a Network Visibility platform. For more information on the CloudLens solution, see https://www.keysight.com/in/en/products/network-visibility/cloud-visibility/cloudlens/cloudlens-saas.html.

You must complete the following tasks to integrate the Network Decoder with Ixia CloudLens.

Task 1. Deploy Client Machines

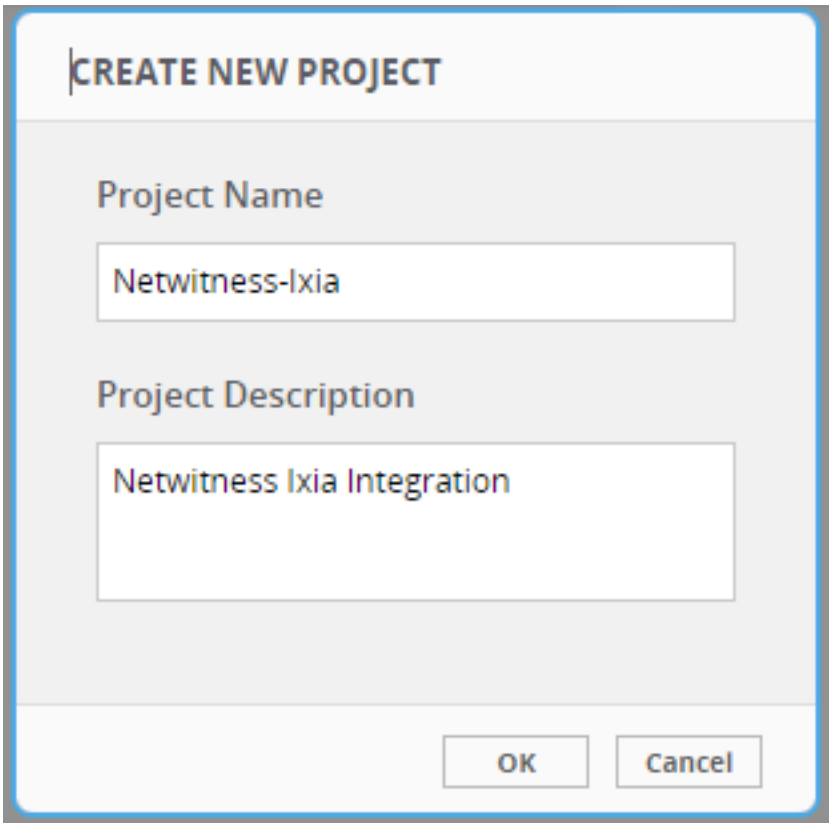
Task 2. Create CloudLens Project
Task 3. Install Docker Container on Decoder
Task 4. Install Docker Container on Clients
Task 5. Map Network Decoder to Ixia Clients
Task 6. Validate CloudLens Packets Arriving at Decoder
Task 7. Set the Interface in the Network Decoder

Task 1. Deploy Client Machines

- Deploy client machines from which you want to route the traffic to the Network Decoder. See the Ixia CloudLens documentation (**https:<CloudLensManager_IP>/cloudlens/docs/Default.htm**) for specifications needed for supported client machines.

Note: <CloudLensManager_IP> is the respective CloudLens Manager instance.

Note: Modify the VM's network security group to allow incoming traffic on following ports:
- **TCP: 22 (SSH)**: Connection to the instance / VM.
- **IP Protocol: 47 (GRE)**: Required by CloudLens Sensor Tap to send the tapped traffic to the Sensor Tool.
- **UDP Protocol: 19993 (Encrypted Tunnel)** – Required by CloudLens Sensor Tap to send the tapped traffic to the Sensor Tool.



For more information, see https://docs.microsoft.com/en-us/azure/virtual-network/virtual-networks-nsg.

Task 2. Create CloudLens Project

1. Login to **Ixia Cloudlens Manager** and go to the **Configure** Page.
2. Click + (add) to create a new project.
3. In the **CREATE NEW PROJECT** view,
   - Enter the Project Name

     For Example: **Netwitness-Ixia**.
   - Enter the Project Description

     For Example: **Netwitness Ixia Integration**.

4. Click **OK**.
5. Click **SHOW PROJECT KEY** to get the API Key for the project.

   The key is required to configure the **Host and Tool agents**.

Task 3. Install Docker Container on Decoder

1. SSH to Network Decoder.
2. Setup the docker. For more information on how to setup the docker, see https://docs.docker.com/engine/install/centos/.
3. Run the following commands to setup Docker insecure-registry parameter and pull the sensor image from CloudLens:

```
echo "{\"insecure-registries\":[\"<CloudLens_IP_here>\"]}" | sudo tee /etc/docker/daemon.json

sudo systemctl enable docker.service

sudo service docker restart
```

4. Pull the CloudLens agent docker image. Run the following command:

```
sudo docker pull <CloudLens_IP_here>/sensor
```

5. Start the CloudLens agent with **ProjectKeyFromIxiaProjectPortal** retrieved from Task 2. Create CloudLens Project and CloudLens Manager IP. Run the following command:

```
sudo docker run -v /lib/modules:/lib/modules -v /var/log:/var/log/cloudlens -v /:/host -v /var/run/docker.sock:/var/run/docker.sock --cap-add SYS_MODULE --cap-add SYS_RESOURCE --cap-add NET_RAW --cap-add NET_ADMIN --name cloudlens-agent -d --restart=on-failure --net=host --log-opt max-size=50m --log-opt max-file=3 <CloudLens_IP_here>/sensor --accept_eula yes --project_key ProjectKeyFromIxiaProjectPortal --server <CloudLens_IP_here> --ssl_verify no
```

Task 4. Install Docker Container on Clients

1. SSH to Azure VM with root privileges.
2. Setup the docker for the OS / Distributions. For more information, see https://docs.docker.com/engine/install/.
3. Run the following commands to setup Docker insecure-registry parameter and pull the sensor image from CloudLens:

```
echo "{\"insecure-registries\":[\"<CloudLens_IP_here>\"]}" | sudo tee /etc/docker/daemon.json

sudo systemctl enable docker.service

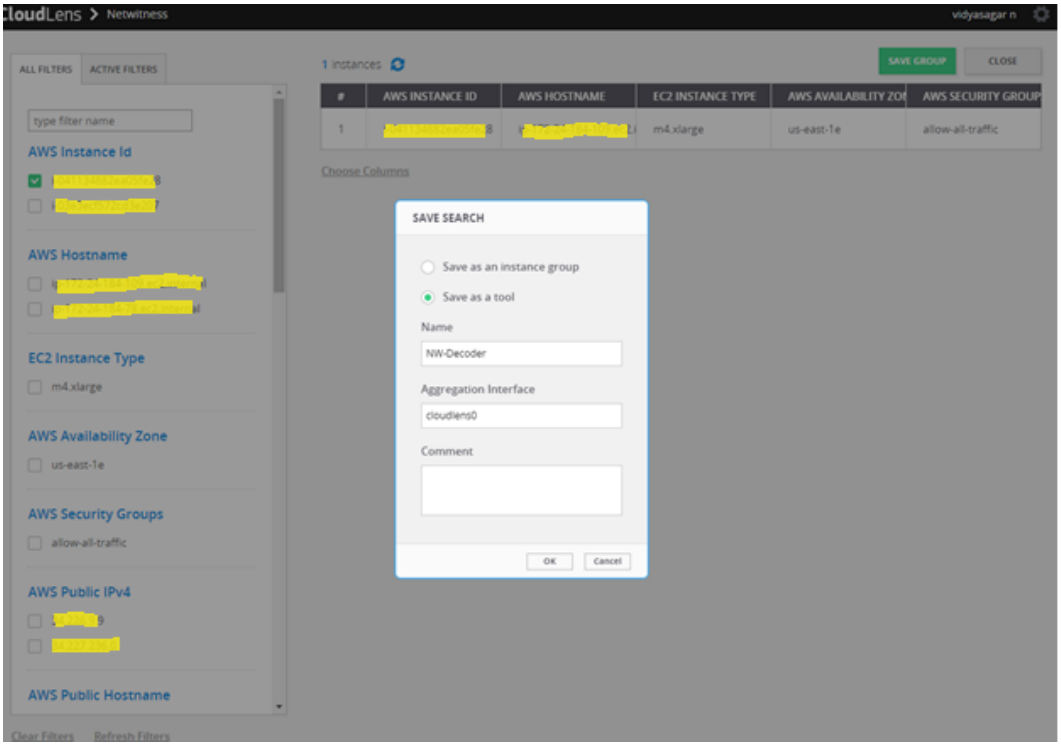
sudo service docker restart
```

4. Pull the CloudLens agent docker image. Run the following command.

```
sudo docker pull <CloudLens_IP_here>/sensor
```

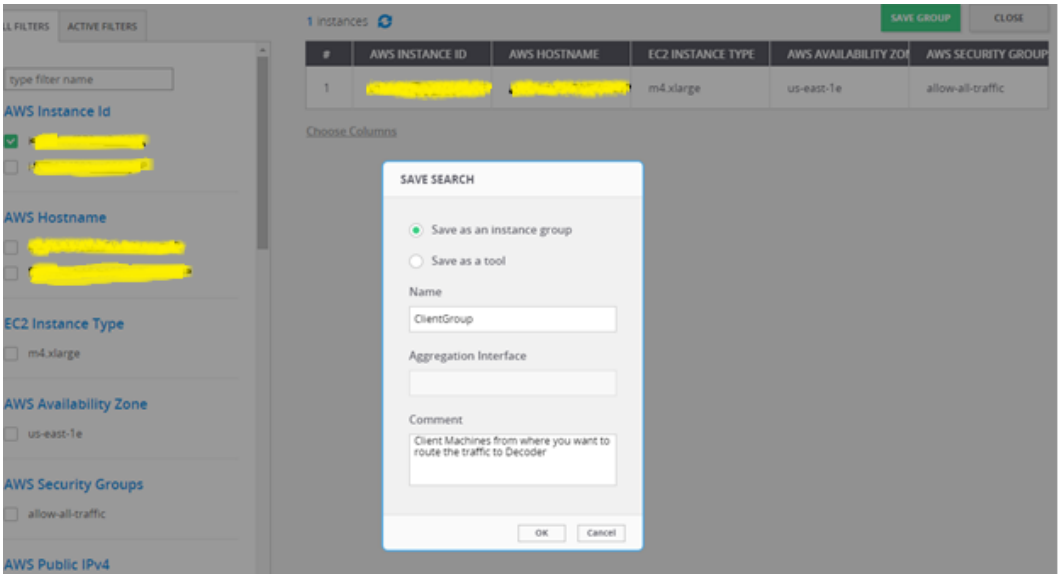
5. Start the CloudLens agent with **ProjectKeyFromIxiaProjectPortal** retrieved from Task 2. Create CloudLens Project and CloudLens Manager IP. Run the following command.

```
sudo docker run -v /lib/modules:/lib/modules -v /var/log:/var/log/cloudlens
-v /:/host -v /var/run/docker.sock:/var/run/docker.sock --cap-add SYS_
MODULE --cap-add SYS_RESOURCE --cap-add NET_RAW --cap-add NET_ADMIN --name
cloudlens-agent -d --restart=on-failure --net=host --log-opt max-size=50m -
-log-opt max-file=3 <CloudLens_IP_here>/sensor --accept_eula yes --project_
key ProjectKeyFromIxiaProjectPortal --server <CloudLens_IP_here> --ssl_
verify no
```



Task 5. Map Network Decoder to Ixia Clients

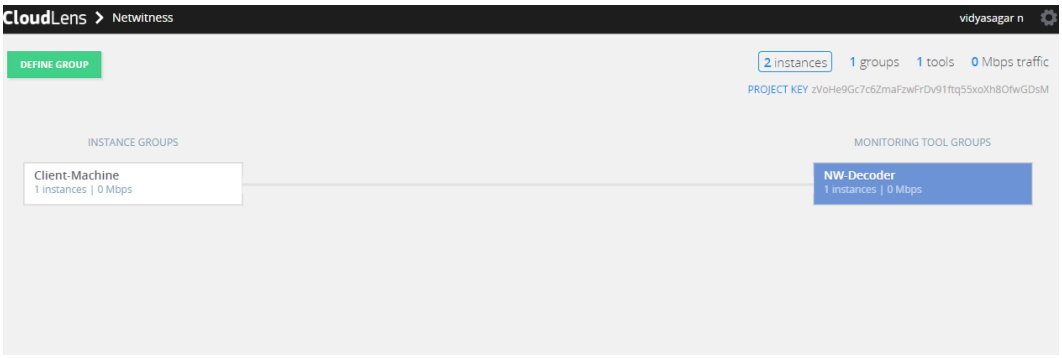
Map the Network Decoder to the client machines to route the traffic to the Network Decoder. Do the following:



1. Go to the **CloudLens Manager** UI.
2. Click on your project and open it.
3. Click **Define Group** or the Instances count.

   You should see two instances listed, one for your decoder and the other for the client machines.
4. Apply filter for the decoder instance and click **Save Search**.
5. Select **Save as a tool**.
6. Specify a name for the tool and the **Aggregation Interface**.

> **Note:** Use a meaningful name for the Aggregation Interface (for example **cloudlens0**. This is a virtual interface that appears in the OS where your Tool is installed. You need to instruct your tool to 'listen' to that interface in a subsequent step.

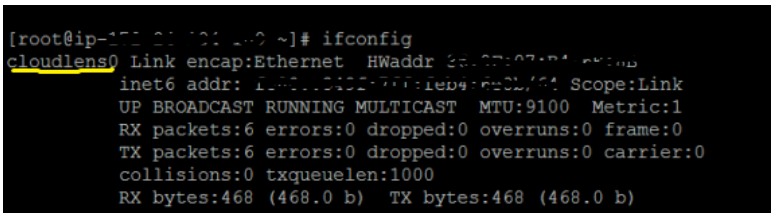


7. Apply filter for the client host instance from the list and click **Save Search**.

8. Navigate back to the top-level view of the project.

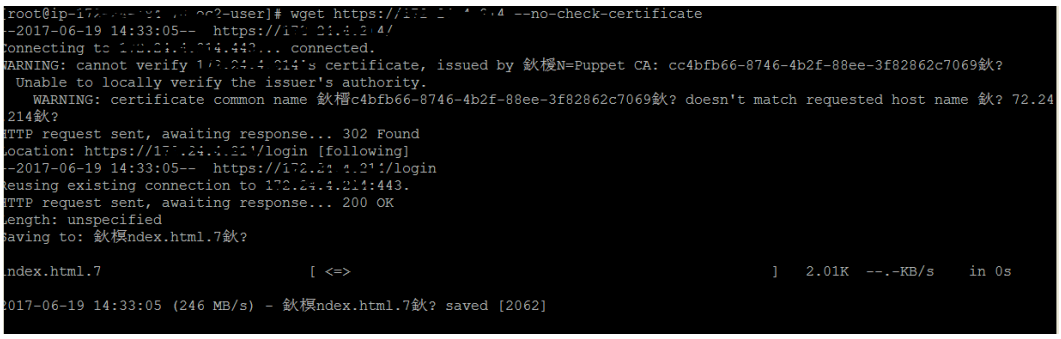
   Your client machine instance and Decoder instance are now displayed.

9. Drag a connection between the client machine instance and Decoder instance to allow the flow of packets.



Task 6. Validate CloudLens Packets Arriving at Decoder

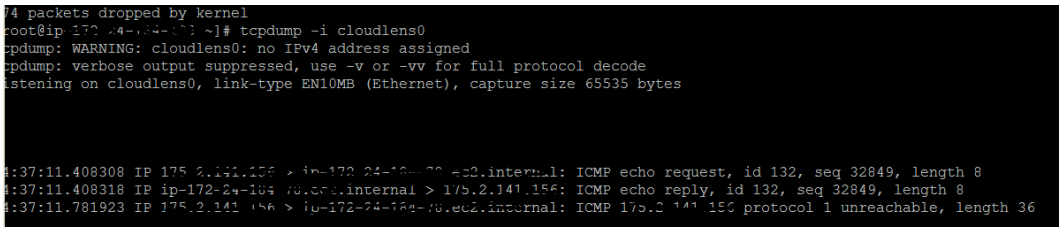
Complete the following steps to validate that the packets are actually arriving at the Network Decoder.



1. SSH to the Network Decoder.
2. Run the following command.

   ```
   ifconfig
   ```

   The new aggregation interface you created is displayed.

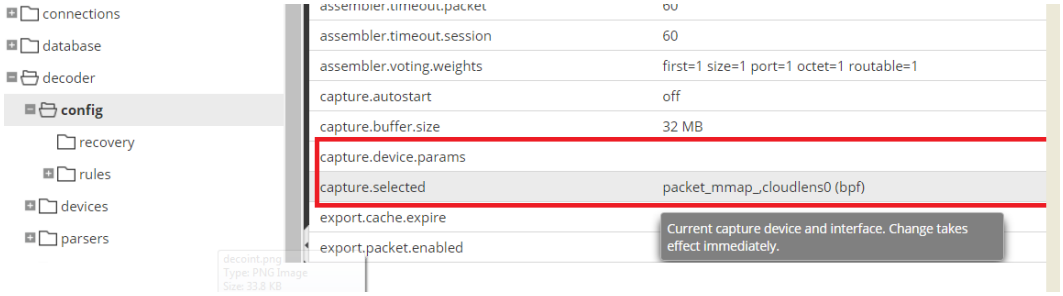


3. Generate traffic from the client OS instance CLI (for example: `wget http://www.google.com/`).

4. SSH to the Network Decoder and go to your Network Decoder instance CLI.
5. Run the following command to look for suitable results in the tcpdump.

   `tcpdump -I Cloudlens0`

Task 7. Set the Interface in the Network Decoder



Complete the following steps in the Network Decoder to set the interface for the Ixia integration.

1. SSH to the Network Decoder.
2. Run the following command to restart the decoder service:

   `$ sudo restart nwdecoder`

   The Network Decoder is now set to capture the network traffic.
3. Log in to NetWitness and click  **(Admin) > Services**.
4. Select a Decoder service and click  > **View > Explore**.
5. Expand the **decoder** node and click **config** to view the configuration settings.

6. Set the **capture.selected** parameter to the following value.
   packet_mmap_,cloudlens0(bpf)

7. Restart the Decoder service after you set the **capture.selected** parameter.

Appendix A. Silent Installation Using CLI

You can use the following Command Line Interface commands to run the installation script (`nwsetup-tui`) without getting prompted for inputs. This enables you to automate the installation of a host by supplying response to the scripts prompts through the command line.

1. After you have created a base image on the host, log in to the host with the `root` credentials.
2. Submit the `nwsetup-tui` script with the `--silent` command and the arguments that you want to apply.

   The following command string is an example of how you would install a basic NW Server host.

   ```
   nwsetup-tui --silent --is-head=true --host-name=new-host --master-
   pass=netwitness --deploy-pass=netwitness --repo-type=1 --custom-
   firewall=false --ip-override=false --eula=true
   ```

Note: Deployment account password must contain at least one number, one upper and lower case letter, and one special characters (!@#%^,+ .) along with the existing policy. The same password policy applies while updating deploy_admin password using `nw-manage script`.
If `deploy_admin` password is changed on Primary NW Server, it must be changed on the Warm Standby Server if it exists.

3. (Conditional - For Component Hosts Only) Install the appropriate service **Category** on the newly provisioned host in the NetWitness Platform Hosts view.

   a. Log into NetWitness and go to  **(Admin)** > **Hosts**.

   The **New Hosts** dialog is displayed with the **Hosts** view greyed out in the background

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the host in the **New Hosts** dialog and click **Enable**.

   The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

   c. Select that host in the **Hosts** view (for example, **Event Stream Analysis**) and click 

.

   The **Install Services** dialog is displayed.

   d. Select the appropriate host type in **Category** and click **Install**.

Arguments

Argument	Description
`--help-install-opts`	Display all the arguments in this table.

Argument	Description
`--eula`	Accept or decline the End User License Agreement (EULA). Specify: • `true` (default) to accept the agreement • `false` to decline it and cancel the installation. For example: `--eula=true`
`--is-head`	Designate the host as the NW Server host or a component host. Specify: • `true` for NW Server host. • `false` for Component host. For example: `--is-head=true`
`--host-name`	Specify new hostname. If you do not specify this argument, NetWitness Platform retains the existing hostname. For example: `--host-name=<hostname>`
`--master-pass`	Enter master password. For example: `--master-pass=<password>`
`--deploy-pass`	Enter deployment password. For example: `--deploy-pass=<password>`
`--iface-name`	Specify network interface. For example: `--iface-name=eth0`
`--ip-override`	Accept or override IP address found for this host or change the IP configuration found on the host. Specify: • `true` provide IP address. • `false` use IP address found on the host. For example: `--ip-override=false`
`--ip-type`	Select ip address configuration type. Specify: • `1` Static IP Configuration) • `2` DCHP For example: `--ip-type=1`
`--ip-addr`	For Static IP configuration, enter IP Address for static address. For example: `--ip-addr=<ip-address>`
`--ip-netmask`	For Static IP configuration, enter Subnet Mask for static address. For example: `--ip-gateway=<subnet-mask>`

Argument	Description
`--ip-gateway`	For Static IP configuration, enter default gateway for static address. For example: `--ip-gateway=<default-gateway>`
`--ip-nameserver`	IP address assigned to DNS server. `--ip-nameserver=<ip-address>`
`--ip-nameserver-secondary`	Optional - IP address assigned to a secondary DNS server. For example: `--ip-nameserver-secondary=<ip-address>`
`--ip-domain`	For Static IP configuration, enter Local Domain Name for static address. For example: `--ip-domain=<default-gateway>`
`--repo-type`	Select type of update repository. Specify: • `1` Local repository • `2` External repository For example: `--repo-type=1`
`--repo-url`	For an external update repository, specify the url of the repository. For example: `--repo-url=<url>`
`--head-ip`	For a component host, specify IP Address of the NW Server. For example: `--head-ip=<ip-address>`
`--custom-firewall`	Disable default firewall configuration and use your custom configuration. Specify: • `true` use custom firewall configuration. • `false` use default firewall configuration. For example: `--custom-firewall=true`
`--use-nat`	Configure the host to use Network Address Translation (NAT) based IP addresses: • `true` use NAT IPs to connect to other hosts • `false` do not use NAT IPs to connect to other hosts (default) For example: `--use-nat=false`

Broker and Concentrator Basics

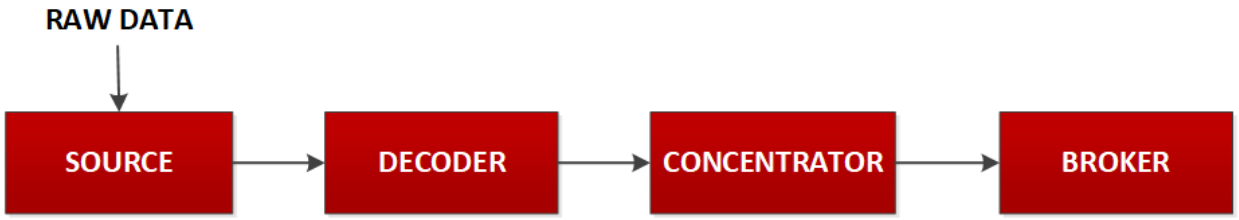
Concentrators and Brokers aggregate data captured or aggregated by other services unlike Decoders, which capture data.

NetWitness supports the following Broker and Concentrator services:

- Brokers - aggregate data across entire infrastructure from configured Concentrators. You can have multiple concentrators aggregating into one broker. You can also have multiple brokers aggregating into a single broker.
- Concentrators - aggregates and analyzes data across multiple capture locations from decoders, indexes and directs queries.

You can configure various Brokers and Concentrators together under a Broker. Brokers are able to pull in data quickly from the Concentrators because they acquire index information only. This configuration is done using the NetWitness user interface. Most of the configuration is performed in the Administration Services view (**(Admin) > Services**).

You can also configure the aggregate services and perform the whole aggregation process using the Services view. This helps setup aggregation autostart, timing and performance parameters, maximum number of open meta and session files. In addition to this, you can also time the attempts to restart, reconnect, or take a non-responsive aggregate service offline. Configuring Aggregate services includes managing Concentrators and Decoders as aggregate services. You can also limit the data being consumed from an aggregate service using meta fields and filters. The aggregation tasks are performed in the General tab of Administration Services view (**(Admin) > Services**).



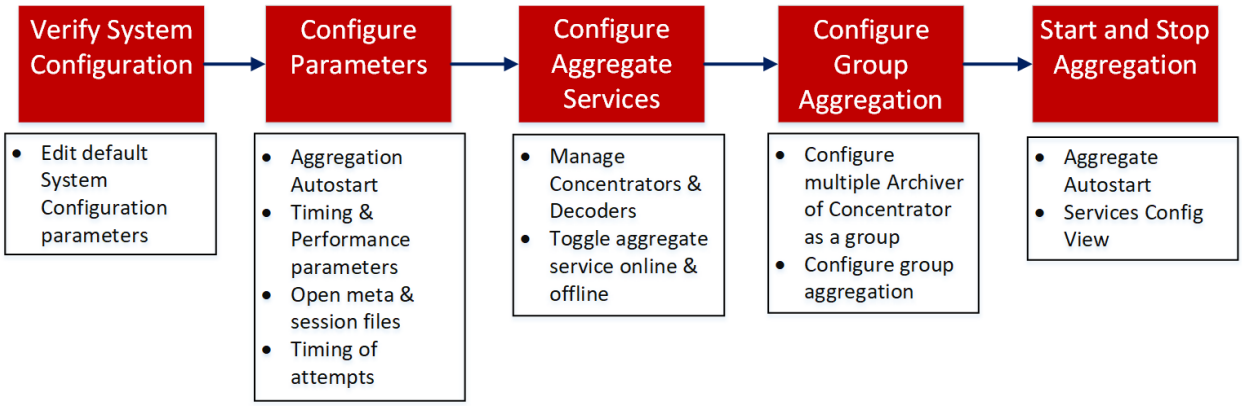
Overview of Broker and Concentrator

Brokers and Concentrators work in conjunction with Decoders and Log Decoders in the NetWitness Platform network. Unlike the two types of Decoders, which capture packets and logs, Concentrators and Brokers aggregate the data captured or aggregated by other services. Brokers aggregate data from configured Concentrators; Concentrators aggregate data from Decoders. A complete overview of the NetWitness Platform is provided in the *NetWitness Platform Getting Started Guide*.

Note: Go to the Master Table of Contents in NetWitness community portal to find and view referenced documents.

As raw data is entered in the system from the source for analysis, it has to be collected and parsed. This raw data is collected, parsed, and stored using a Decoder. The packet data is then indexed, stored, and parsed by the Concentrator. Parsed packet data is also provided as an endpoint for queries. Eventually, the Broker routes queries across multiple Decoder and Concentrator appliances. Here is how information flows to a Concentrator and Broker.

In most cases, the default values for compression, statistics update interval, and number of threads in the thread pool are set at a good point for optimal system performance.

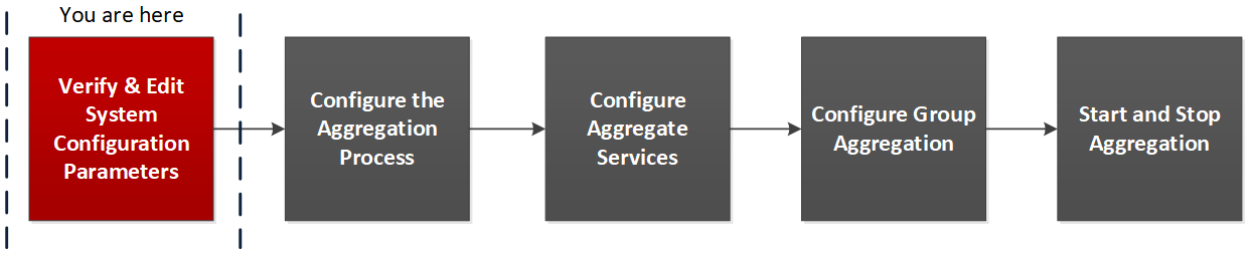


- Concentrator: is required for any large environment to store the Meta data that is generated by the parsers and feeds being triggered by packets and logs ingested into the decoders.
- Broker: The Broker service is similar to the Concentrator service except that it indexes the collected information. It performs virtual mapping of indices on all connected concentrators. Due to the less internal processing performed, the response time is fast. To allow investigation, multiple brokers and/or concentrators report data into a broker.

Broker and Concentrator Configuration

Setting up a Broker or Concentrator involves configuring the basic system parameters, the aggregate services, and the aggregation process between a Broker or Concentrator and the aggregate services.

These are the required configuration steps for a new Broker or Concentrator, and also for changing the configuration of an existing Broker. Perform the steps in the section in the sequence they are given.



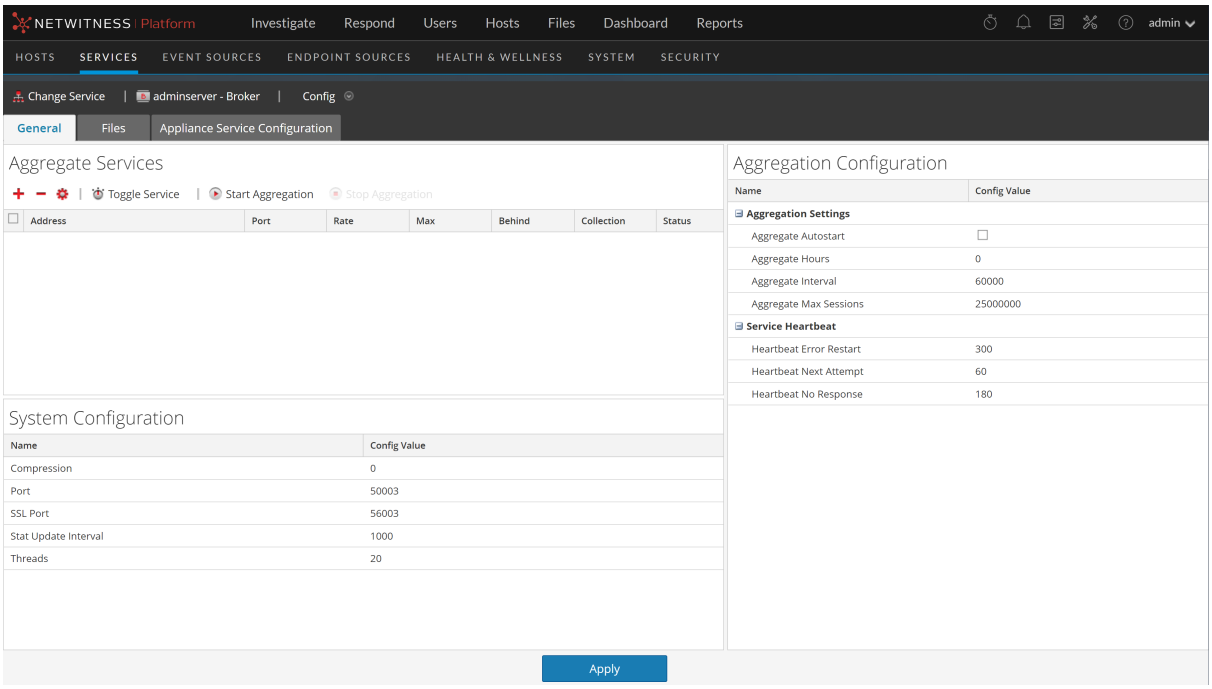
Basic Configuration Checklist

The following checklist provides the sequence for tasks that are required to configure a Broker or Concentrator that has been added to NetWitness in accordance with the *Hosts and Services Guide*.

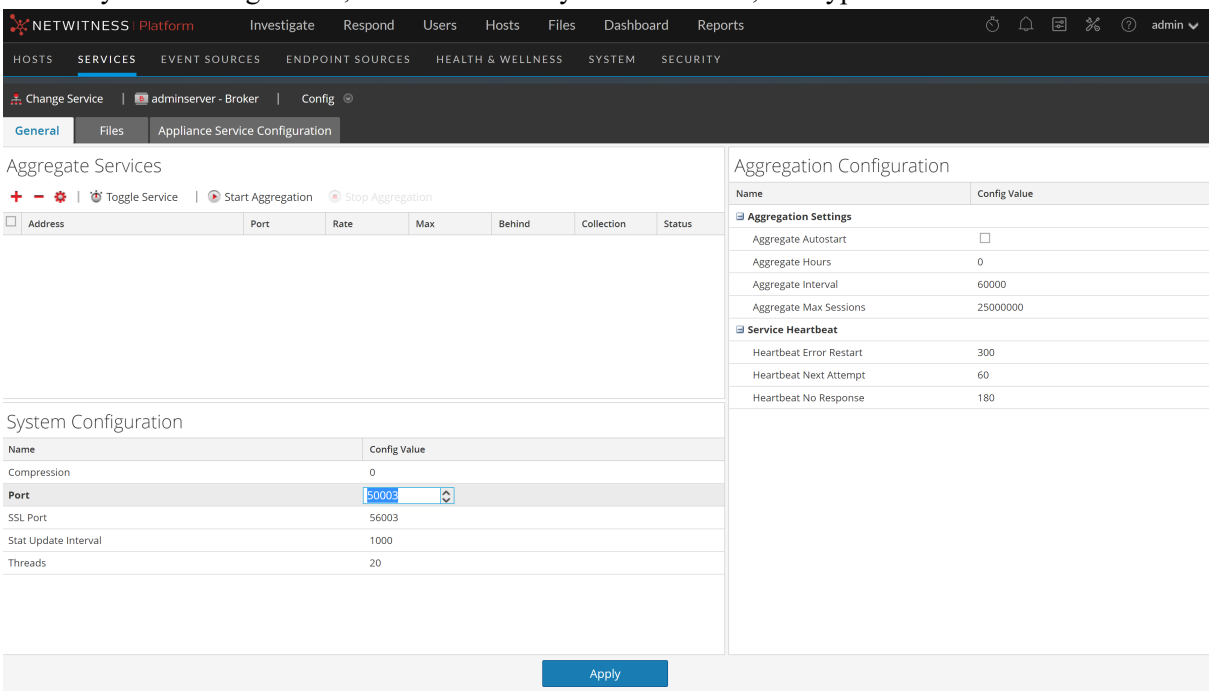
Configuration Step	Description
Step 1 - Verify System Configuration	Verify system configuration default values for the host and service are appropriate as described in Step 1. Verify Service System Configuration
Step 2 - Configure Parameters	Configure parameters that govern the overall aggregation process as described in Step 2. Configure the Aggregation Process
Step 3 - Configure Aggregate Services	Configure aggregate services as described in Step 3. Configure Aggregate Services
Step 4 - Configure Group Aggregation	(Optional) Configure group aggregation as described in Step 4. (Optional) Configuring Group Aggregation
Step 5 - Start and Stop Aggregation	Start and stop aggregation as described in Step 5. Start and Stop Aggregation

Step 1. Verify Service System Configuration

When a service is first added to NetWitness, default values for the system configuration parameters are in effect. You can edit these values to tune performance.



In most cases, the default values for compression, statistics update interval, and number of threads in the thread pool are set at a good point for optimal system performance.

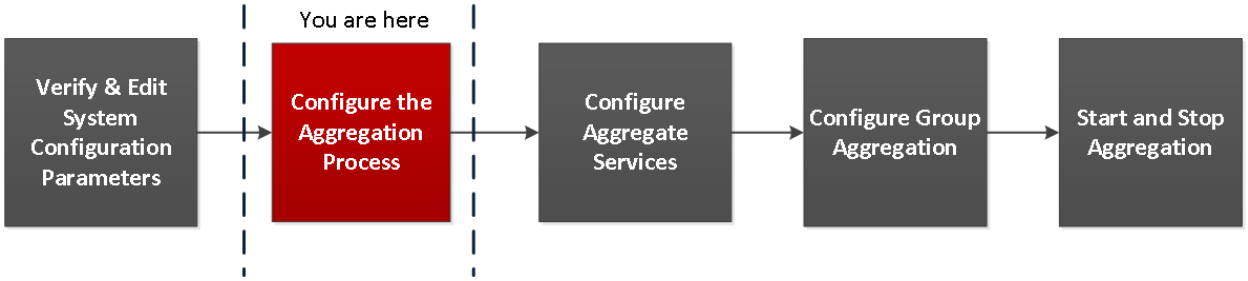


To edit system configuration parameters for a Broker or Concentrator:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Broker or Concentrator, and select **> View > Config**.

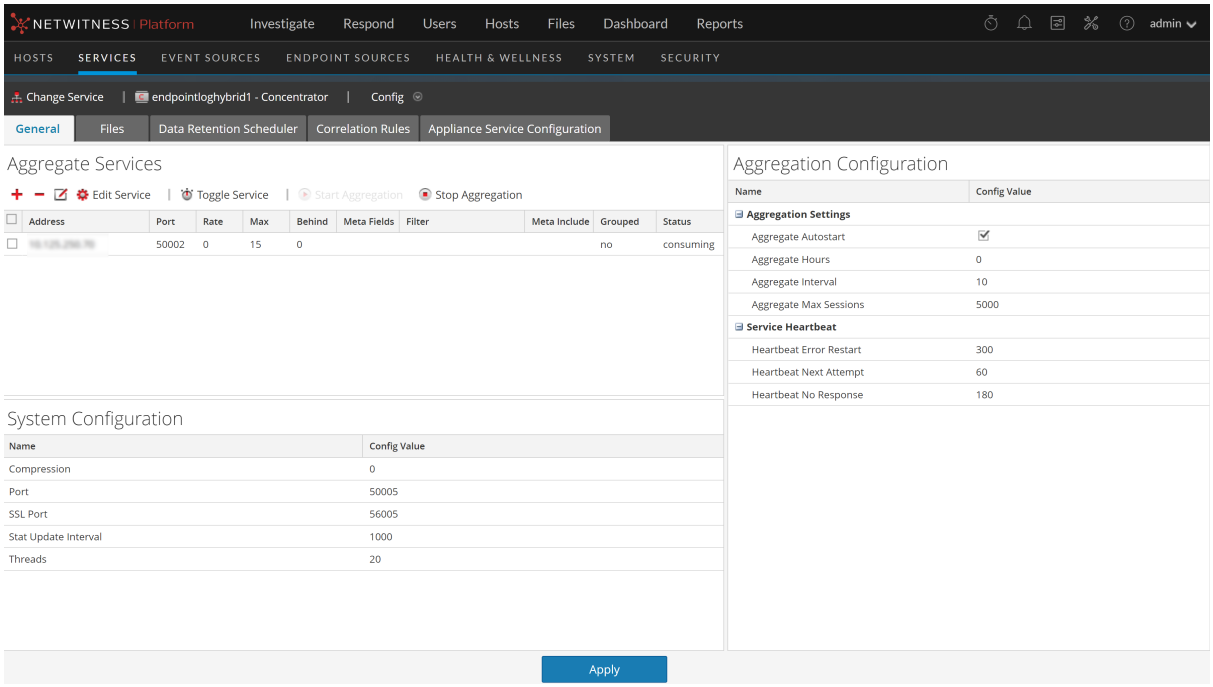
   The Services Config view for the selected service is displayed.

3. Under System Configuration, click a field that you want to edit, and type a new value.



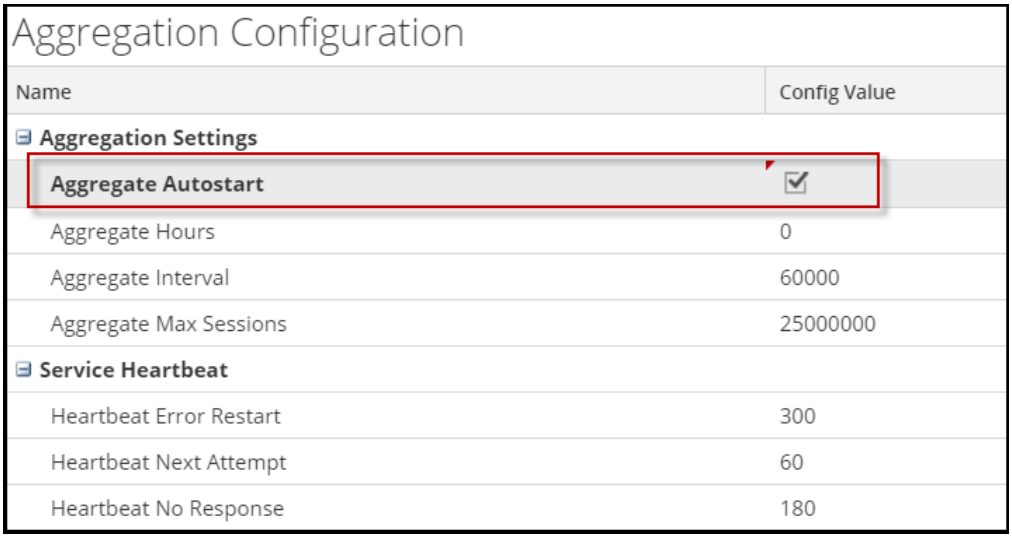
4. When finished editing, click **Apply**.

Step 2. Configure the Aggregation Process



Configuring the aggregation process for a Broker or Concentrator includes setting:

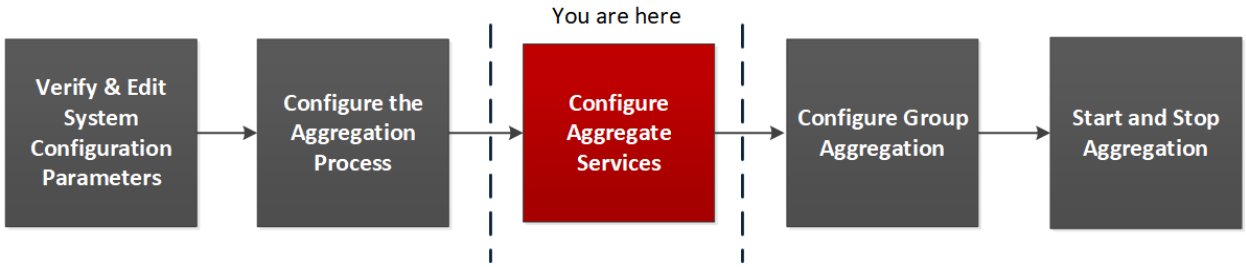
- Aggregation autostart
- Timing and performance parameters, such as the number of sessions per round of aggregation and time between rounds
- Maximum number of open meta and session files
- The timing of attempts to restart, reconnect, or take offline a non-responsive aggregate service



To configure the aggregation process on a Broker or Concentrator:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Broker or Concentrator, and select **> View > Config**.
   The Services Config view, which includes the Aggregation Configuration section, is displayed.

3. (Optional) Select **Aggregate Autostart** to enable automatic start of aggregation when a service is online.

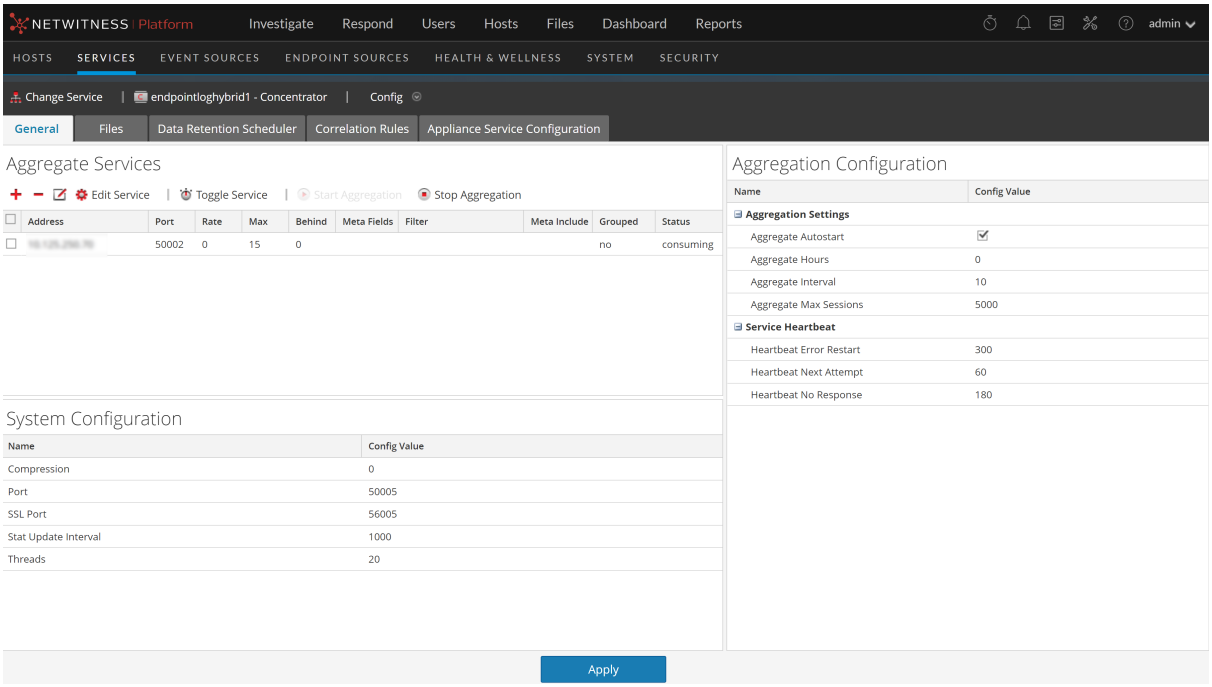


4. (Optional) Edit any of the aggregation settings: the hours back to begin aggregation, the milliseconds between rounds of aggregation, and maximum number of sessions per aggregation round.
5. (Optional) Edit any of the Service Heartbeat settings, which specify the timing of the first attempt to reconnect to a service after an error, the next attempt to reconnect, and taking the service offline after failure to reconnect.
6. When finished editing the settings, click **Apply**.
   The settings become effective immediately.

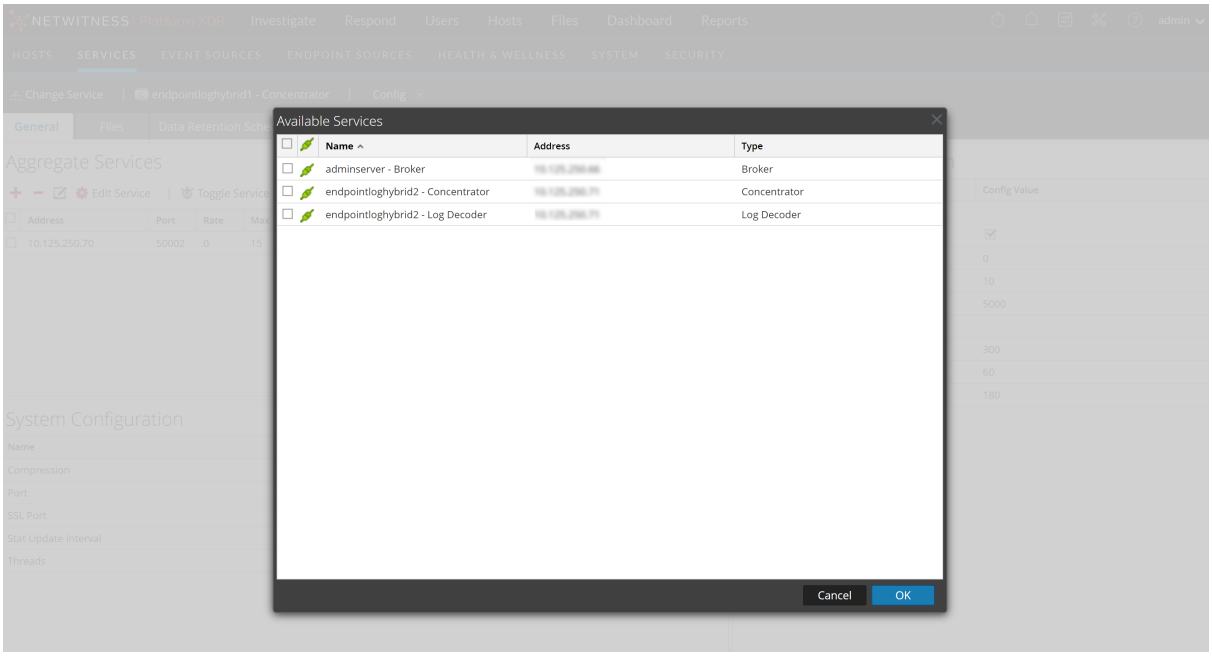
Step 3. Configure Aggregate Services

This topic introduces basic tasks related to data aggregation on Brokers and Concentrators. For information on the optional setup of group aggregation, see Step 4. (Optional) Configuring Group Aggregation.

Configuring the aggregate services (whose data is consumed and aggregated) includes:



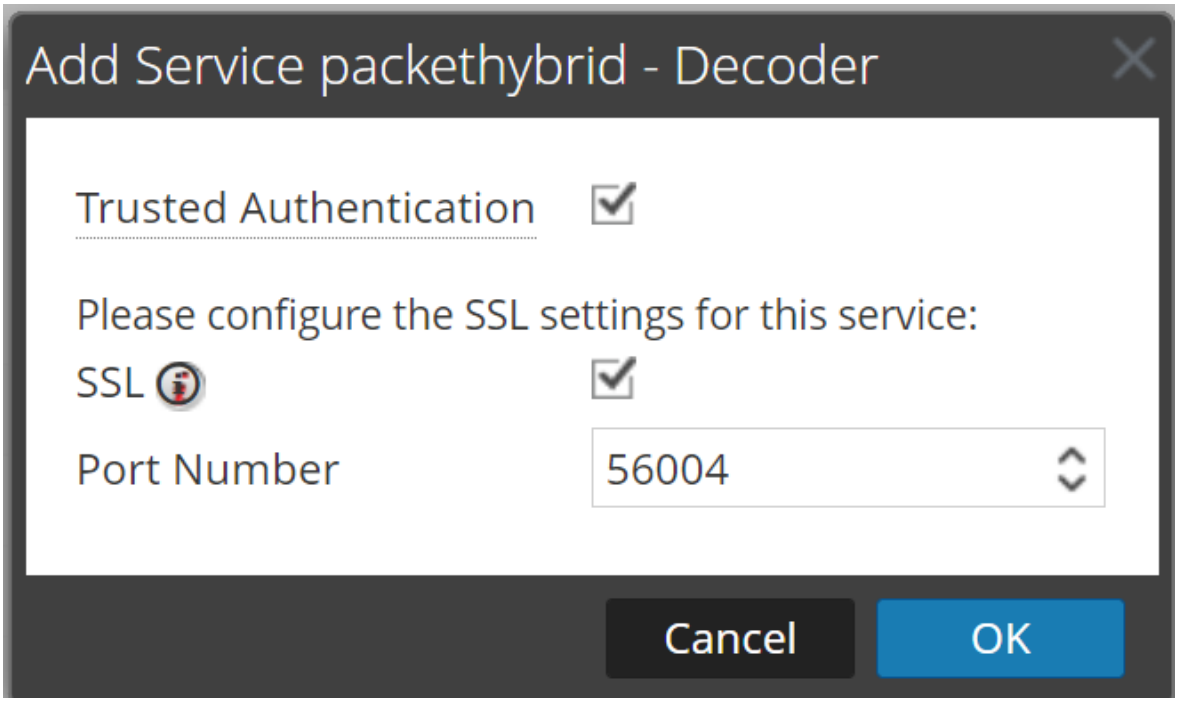
- Adding, editing, and deleting Concentrators and Decoders as aggregate services
- Toggling an aggregate service online and offline



To configure aggregate services to a Broker or Concentrator:

1. Go to  **(Admin) > Services**.
2. In the **Services** view, select a Broker or Concentrator, and select  **> View > Config**.

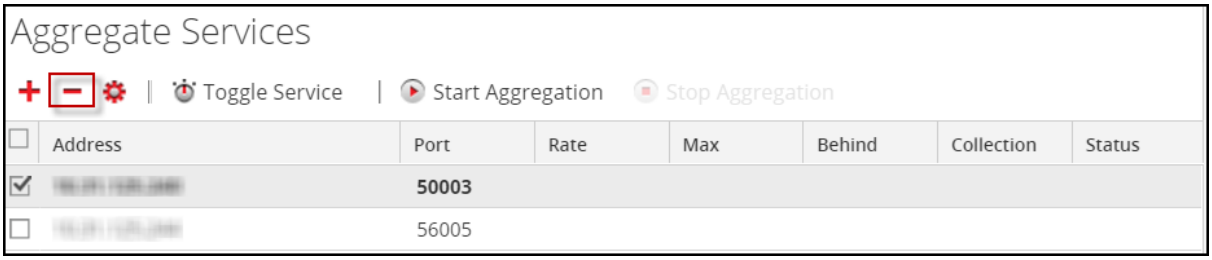
   The Services Config view for the selected service is displayed.



3. Click  in the **Aggregate Services** toolbar.
   The Available Services dialog is displayed.

4. Select one or more services to be added and click **OK**.
5. Use one of the following ways to add a service for aggregation:
   - Use Password-Based Authentication. Enter the Administrator username and password. Click **OK**.

- Select **Trusted Authentication**. Click **OK**.



The added services are listed in the Aggregate Services list.

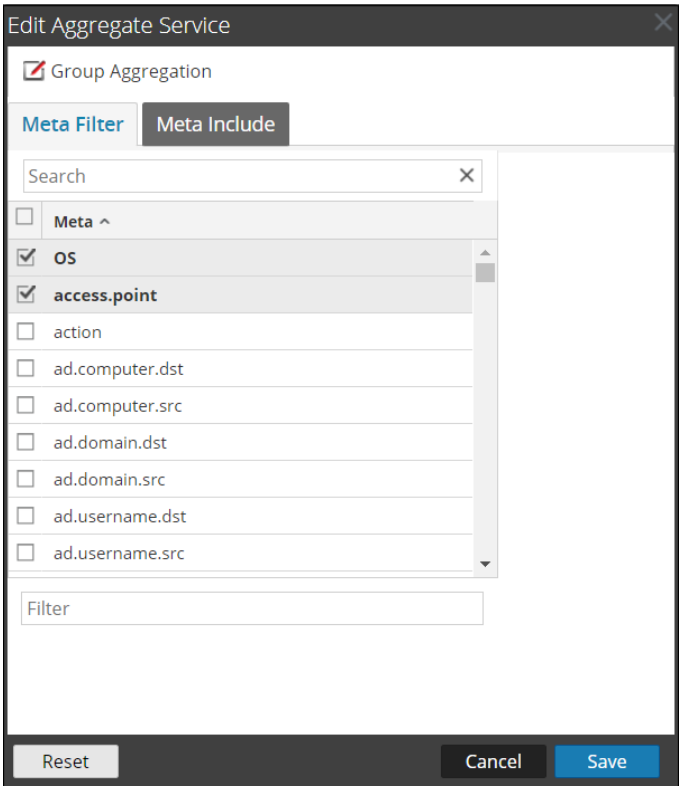
6. To save the changes, click **Apply**.

To remove aggregate services from a Broker or Concentrator:

Note: This option applies only to offline services. If the aggregate service is online, you must first toggle the service offline.

1. In the **Aggregate Services** list, select one or more services.
2. Click − in the toolbar.

The service is removed from Aggregate Services list.



3. To save the change, click **Apply**.

To edit aggregate services on a Concentrator:

Note: This option applies only to offline services. If the aggregate service is online, you must first toggle the service offline. You can edit only one service at a time.

You can limit the data being consumed from an aggregate service using meta fields and filters.

1. Click **Change Service** to change the service to Concentrator.
2. In the **Aggregate Services** list, select one or more services.
3. Click in the toolbar. Enter the authentication information in the pop up dialog box.
   - If the service was added on a different instance of NetWitness, you must add it to this instance of NetWitness in order to edit. A warning dialog allows you to add the service. If you click **Yes**, the Add Service dialog is displayed.
   - If the service is online, a dialog notifies that the service must be offline and requests confirmation that you want to continue. If you click **Yes**, NetWitness takes the service offline and the Edit Aggregate Service dialog is displayed.
   - If the service is offline, the Edit Aggregate Service dialog is displayed with the editable properties for an aggregate service on a Concentrator.
4. Click a type of metadata in the **Meta Include** tab to select the type of metadata for the Concentrator to consume from this service. Click **Save**.

5. To specify a rule to filter data that the Concentrator consumes from this service, compose a rule in the **Meta Filter** tab. Click **Save**.
6. Click **Close**.

   The Edit Aggregate Service dialog closes and the changes are shown in the Aggregate Services list. In this example, two meta were selected on the Meta Include tab. When you click the information icon in the Meta Include field, it shows the selections.
7. To save the changes, click **Apply**.

Toggle a Service

When data aggregation starts, Brokers and Concentrators consume data from aggregate services that are online. When first added to a Broker or Concentrator, aggregate services are offline.

To toggle a service between online and offline:

1. Select a service in the **Aggregate Services** list.
2. Click 

.

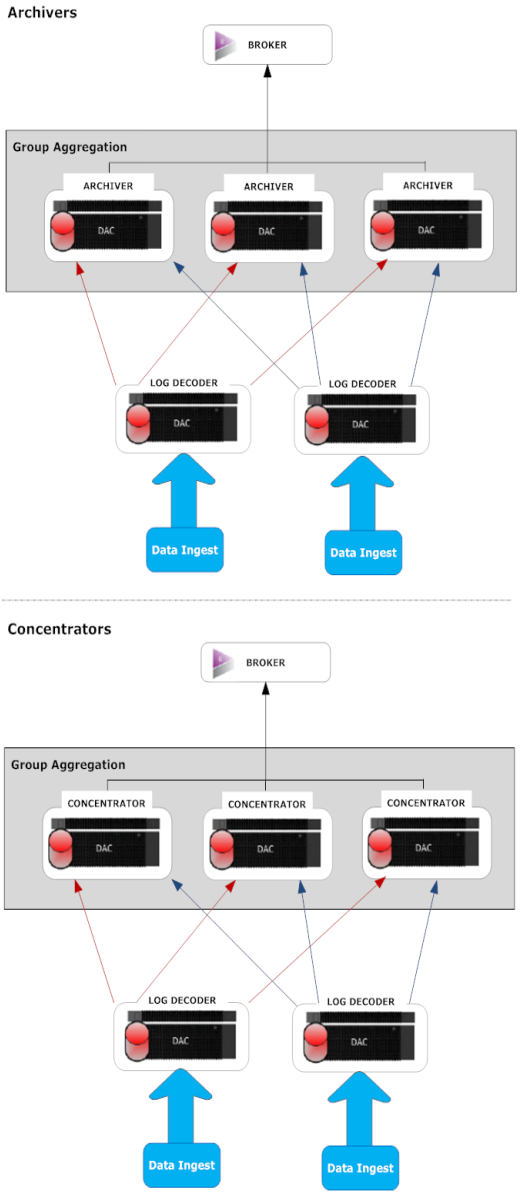
   The status is changed.

Step 4. (Optional) Configuring Group Aggregation

You use Group Aggregation to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them. You can configure multiple Archiver services or Concentrator services to efficiently aggregate from multiple Log Decoder services to improve query performance on the data:

- Stored in the Archiver.
- Processed through the Concentrator.

NetWitness Group Aggregation Deployment Recommendations



NetWitness recommends the following deployment for Group Aggregation:

- 1 - 2 Log Decoders
- 3 - 5 Archivers or Concentrators

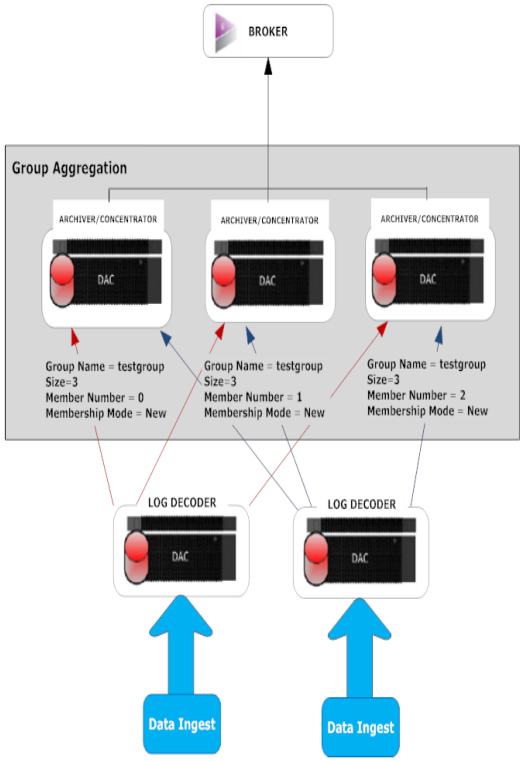
Advantages of Using Group Aggregation

- Increases the speed of NetWitness queries.
- Improves the performance of aggregate queries (Count and Sum) on the environment.
- Enhances investigation service performance.
- Gives you the option of storing data for a longer duration for investigation purposes.

The following diagram illustrates Group Aggregation.

You can have any number of Archivers or Concentrators grouped together and form an aggregation group. The Archiver or Concentrator services in the group divide all the aggregated sessions between them based on the number of sessions defined in the Aggregate Max Sessions parameter.

For example, in an aggregation group containing two Archiver services or two Concentrator services with the Aggregate Max Sessions parameter set to 10,000, the services would divide the session between themselves as illustrated in the following table.



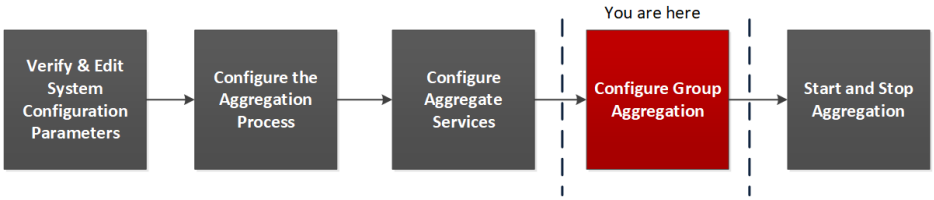
Archiver 0 or Concentrator 0	Archiver 1 or Concentrator 1
1 - 9,999	10,000 - 19,999
20,000 - 29,999	30,000 - 39,999
40,000 - 49,999	50,000 - 59,999

Configure Group Aggregation

Complete this procedure to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them.

Prerequisites

Plan the network design for group aggregation. The following figure is an example of a group aggregation setup.



Ensure that you understand the Group aggregation parameters in the following table, and create a group aggregation plan.

Parameter	Description
Group Name	It determines the group to which the Archiver or Concentrator belongs. You can add any number of groups aggregating data from a Log Decoder. The Group Name parameter is used by the Log Decoder to identify which Archiver or Concentrator services are working together. All Archiver or Concentrator services in the group should have the same group name.
Size	It determines the number of Archiver or Concentrator services in the aggregation group.
Member Number	It determines the position of the Archiver or Concentrator in the aggregation group. For a group of size N, member number from 0 to N-1 must be set on each of the Archiver or Concentrators services in the aggregation group. For example: If the size of the aggregation group is 2, the member number of one of the Archiver or Concentrator service should be set to 0 and the member number of the other Archiver or Concentrator should be set to 1.
Membership Mode	There are two membership modes: • **New**: Adding a new Archiver or Concentrator service as a member to the existing aggregation group or creating an aggregation group. The Archiver or Concentrator service does not aggregate any existing sessions from the service as other members of the group would have already aggregated all the sessions on the service. This Archiver or Concentrator service will only aggregate new sessions as they appear on the service. • **Replace**: Replacing an existing aggregation group member. The Archiver or Concentrator will begin aggregation from the oldest session available on the service it is aggregating from.

Note: The Membership Mode parameter has an effect only when no sessions have been aggregated from the service. After some sessions are aggregated, this parameter has no effect.

Set up Group Aggregation

This workflow shows the procedures you complete to configure group aggregation.

Complete the following steps to set up group aggregation.

1. Configure multiple Archiver or Concentrator services in your environment. Make sure that you add the same Log Decoder as data source to all the services.

2. Perform the following on all the Archiver or Concentrator services that you want to be part of aggregation group:

   a. Go to **(Admin) > Services**.

   b. Select the Archiver or Concentrator service, and select > **View** > **Config**.

   The Service Config view of the Archiver or Concentrator is displayed.

   c. In the **Aggregate Services** section, select **Log Decoder**.

   d. Click Toggle Service to change the status of the Log Decoder to offline if it is online.

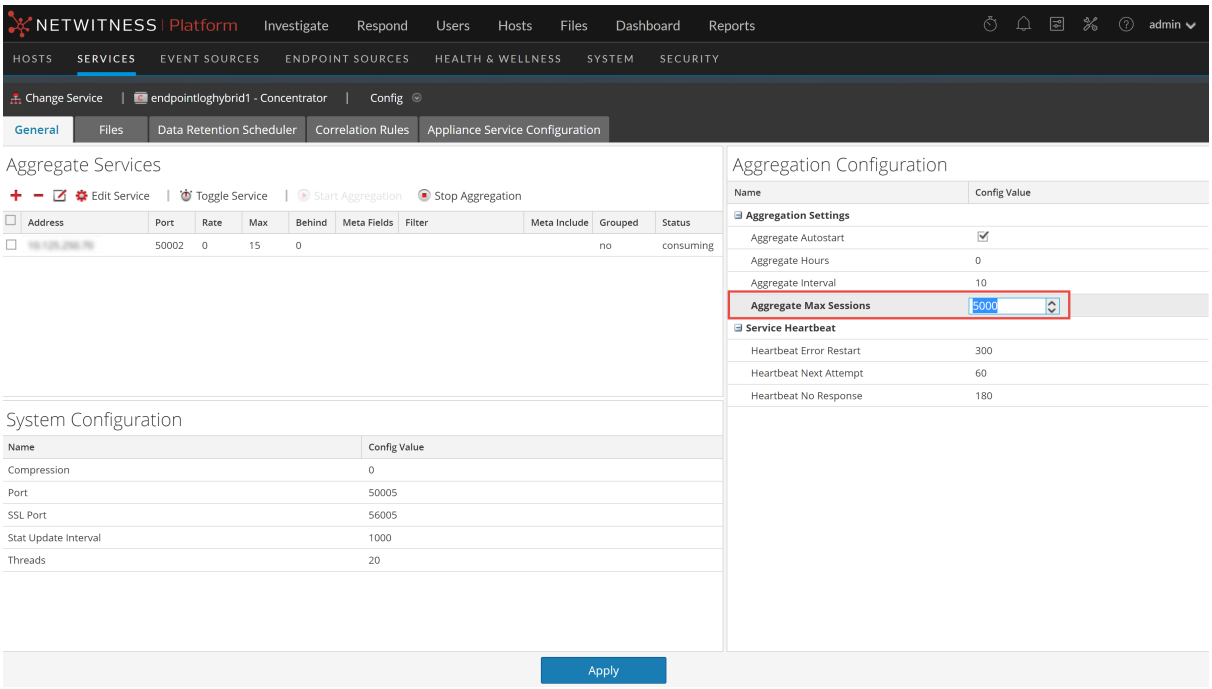
   e. Click .

   The **Edit Aggregate Service** dialog is displayed.

   f. Click Group Aggregation.

   The **Edit Group Aggregation** dialog is displayed.

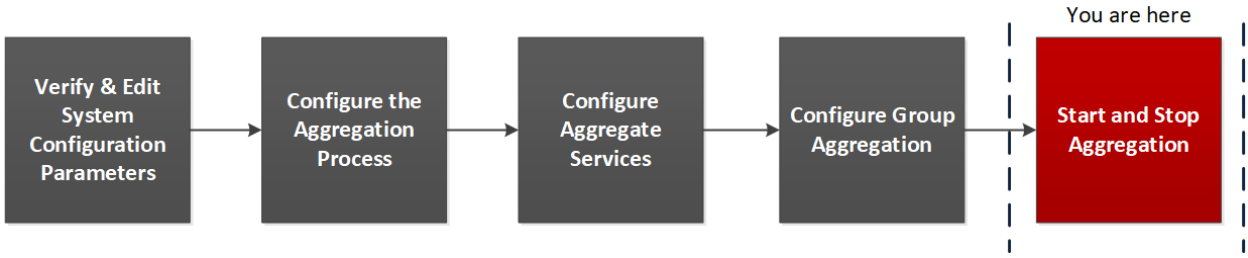
   g. Select the **Enabled** checkbox and set the following parameters:



- In the **Group Name** field, type the group name.
- In the **Size** field, select the number of Archiver or Concentrator services in the aggregation group.
- In the **Member Number** field, select the position of the Archiver or Concentrator in the aggregation group.
- In the **Membership Mode** drop-down menu, select the mode.

h. Click **Save**.

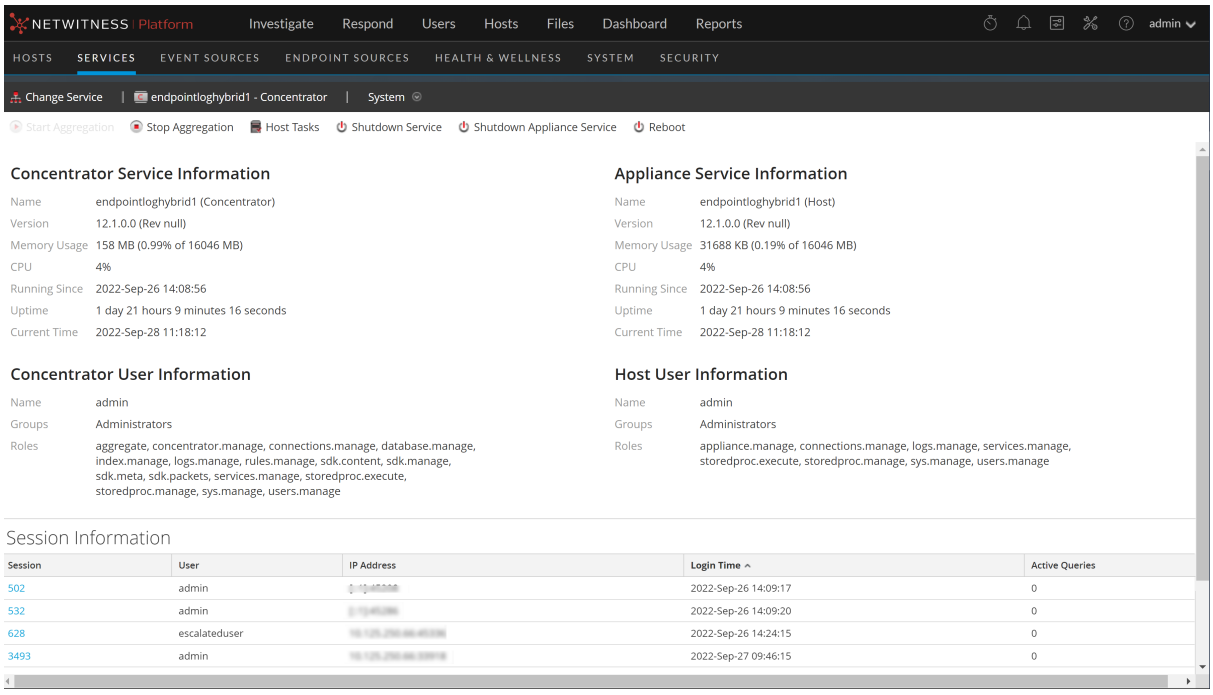
i. In the Service Config view, click **Apply**.



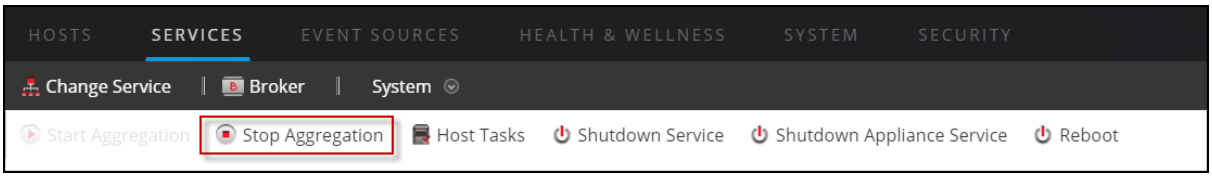
j. Perform **Step b** to **Step i** on all other Archiver or Concentrator services that need to be part of group aggregation.

3. In the **Aggregation Configuration** section, set the **Aggregate Max Sessions** parameter set to **10000**.

Step 5. Start and Stop Aggregation



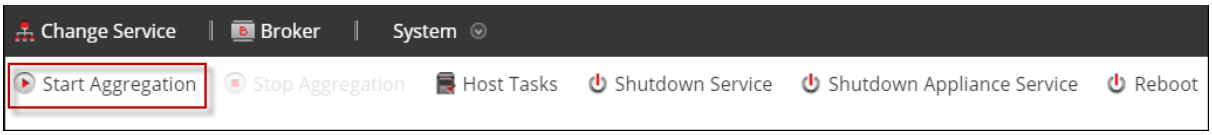
When a Broker or Concentrator starts up, it automatically begins aggregating data if Aggregate Autostart is enabled. When autostart is not enabled, you can start and stop data aggregation manually.



Note: The Aggregate Configuration Settings (in the Services Config View - Broker or Concentrator General Tab) determine whether Aggregate autostart is enabled, as well as the size of a round of aggregation and time between rounds.

To start and stop data aggregation in the services system view:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Broker or Concentrator, and select > **View** > **System.**



3. To stop a Broker or Concentrator that is capturing data, click **Stop Aggregation** in the toolbar. The service stops aggregating data and the **Stop Aggregation** option in the toolbar is unavailable. The **Start Aggregation** option becomes active.

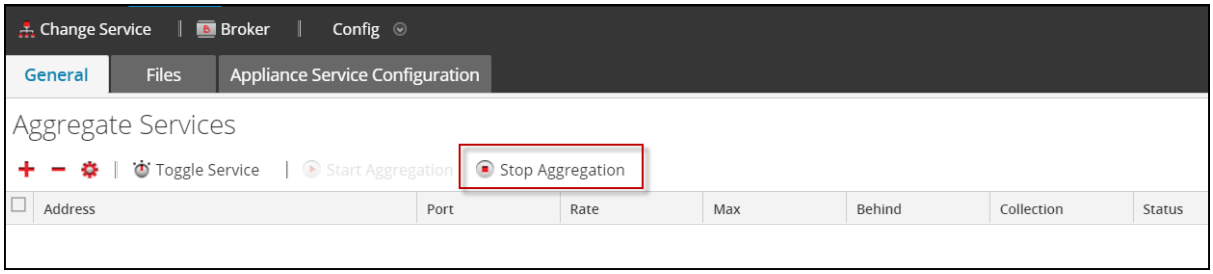
4. If you want the service to start aggregating data again, click **Start Aggregation**.

   You can now investigate the captured data in the Investigation module.

To start and stop aggregation in the services config view:

1. Go to **(Admin) > Services**.
2. In the **Services** view, select a Broker or Concentrator, and select > **View** > **Config**.

   The Services Config view, which includes the Aggregate Services section, is displayed.



3. To start aggregation on the selected Broker or Concentrator, click Start Aggregation in the **Aggregate Services** toolbar.

   When aggregation starts, the status of all online aggregate services changes to **consuming**. The Start Aggregation button is disabled and the Stop Aggregation button is enabled.

4. To stop aggregation, click  in the **Aggregate Services** toolbar.

   When aggregation stops, the status of all consuming aggregate services changes to **online**. The Stop Aggregation button is unavailable and the Start Aggregation button is available.

Broker and Concentrator Configuration References

You can configure Brokers and Concentrators using the NetWitness user interface.

In addition to the views described here, you can view the complete service nodes in a tree form in the Services Explore view, see the "Services Explore View" topic in the *Hosts and Services Getting Started Guide*.

Services Config View - Broker or Concentrator General Tab

The General tab for a Broker or Concentrator in the Services Config helps manage basic service configuration, configure the aggregate service, and configure the aggregation process between a Broker or Concentrator and the aggregate service.

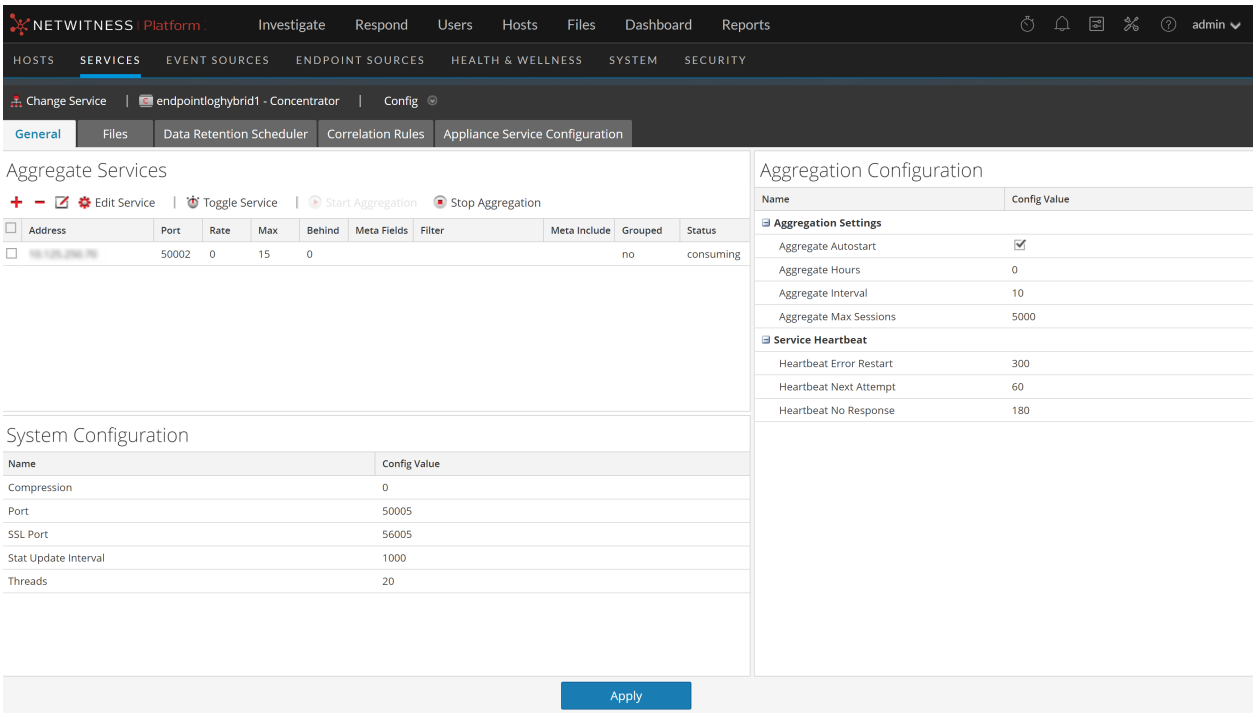
Configuring the aggregate service (whose data is consumed and aggregated) includes:

- Adding, editing, and deleting Concentrators and Brokers as aggregate services
- Toggling an aggregate service online and offline
- Monitoring statistics for aggregate services
- Starting and stopping aggregation

Configuring the aggregation process includes setting:

- Aggregation autostart
- Timing and performance parameters, such as the number of sessions per round of aggregation and time between rounds
- The timing of attempts to restart, reconnect, or take offline a non-responsive aggregate service

What do you want to do?



Role	I want to...	Refer to...
Administrator	Start and Stop aggregation Add, edit, delete, and toggle an aggregate service	Aggregate Services Section

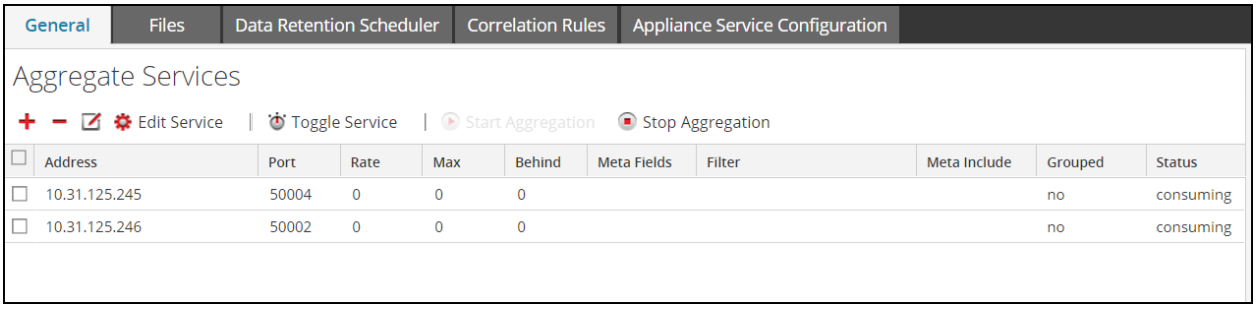
General tab

This is an example of the General tab for a Concentrator.

This is an example of the General tab for a Broker.



These are the three major sections in the General tab for Brokers and Concentrators:

- Aggregate Services
- System Configuration

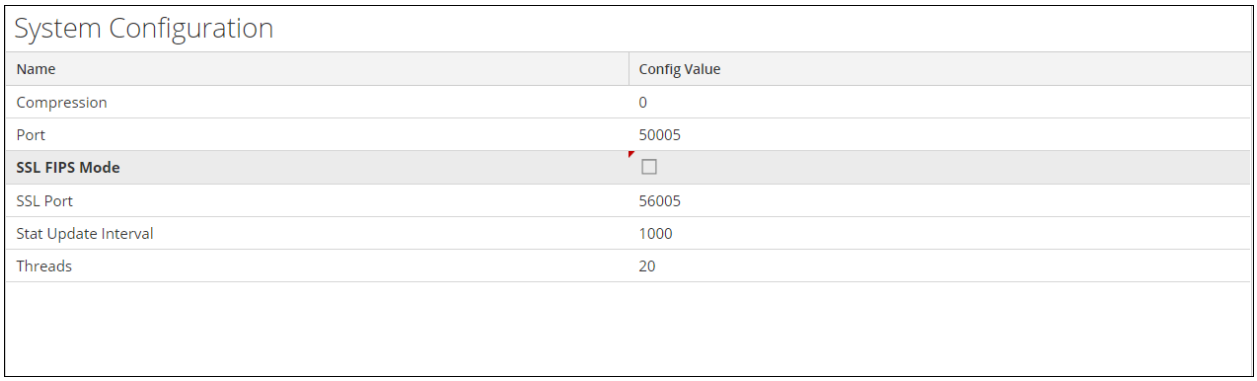
- Aggregation Configuration

Aggregate Services Section

The Aggregate Services section provides a way to start and stop aggregation, as well as add, edit, delete, and toggle an aggregate service. This is an example of the Aggregate Services section for a Concentrator.

The Aggregate Services section toolbar offers these options.

Option	Description
	Opens a dialog in which you can add a Concentrator, Decoder, or Log Decoder as an aggregate service.
	Removes the selected aggregate service.
	For Concentrators only, opens a dialog to edit **Meta Fields** and **Filter** values for the Concentrator.
	Enables you to enter the administrator credentials of the selected aggregate service so that it can communicate with the Broker or Concentrator.
	When aggregation has been stopped or has not started, starts aggregating data from the online service in the list using the rules defined for the service.
	When aggregation is in progress, stops aggregation on the Broker or Concentrator. This stops all services and flushes the index, which may take several minutes to complete. It is necessary to stop aggregate services in order to perform various administrative procedures.
	Toggles the state of a service between offline and online. Only data from online service is consumed during aggregation.



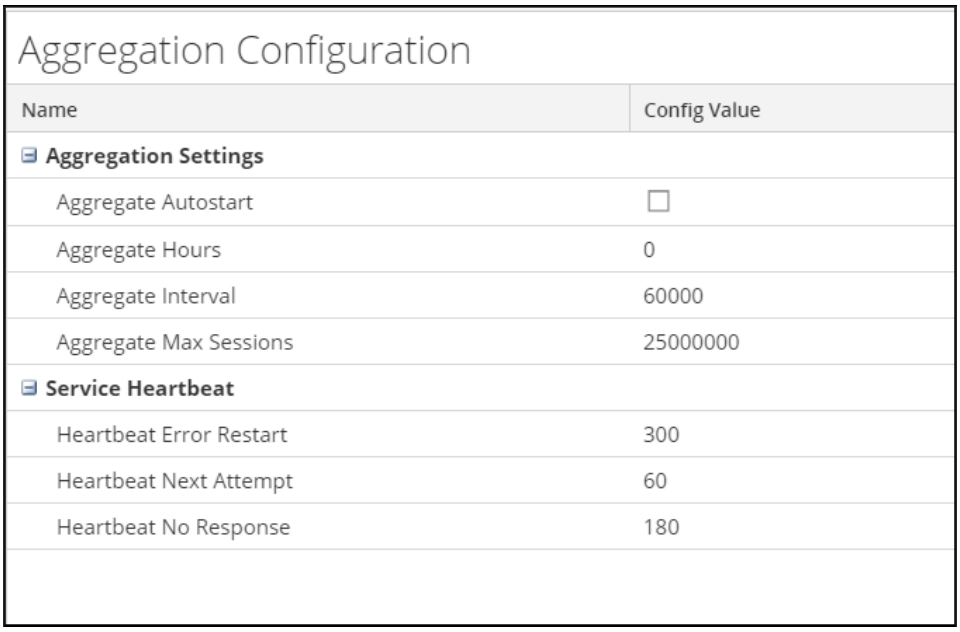
The Aggregate Services section list has these columns.

Column	Description
Address	Lists the address of the service.

Column	Description
Port	Lists the port on which the service listens. The default ports are: • 50001 for Log Collectors • 50002 for Log Decoders • 50003 for Brokers • 50004 for Decoders • 50005 for Concentrators • 50007 for other services
Rate	Lists the number of metadata objects being written to the database per second. Values are rolling average samples over a short time period (10 seconds). After capture stops, the rate is reset to **0**.
Max	Lists the maximum number of metadata objects written to the database per second since capture started. Values are rolling average samples over a short time period (10 seconds). After capture stops, **Max** continues to show the maximum value during capture.
Behind	Lists the number of sessions on the service that need to be aggregated.
Collection	For Brokers only, indicates the collection that was selected when the Analyst Workbench service was added to the Aggregate Services section.
Meta Fields	For Concentrators only, lists the types of metadata being consumed by the aggregate service.
Filter	For Concentrators only, a rule expression (as used in a 'where' clause) can be used to filter the results. You must add a meta key along with an operator and a value, for example `ip.src !=127.0.0.1 && word exists`
Meta Include	For Concentrators only, lists the number of types of meta included in the aggregate service.
Grouped	Whether or not the aggregate service is part of a group.
Status	Lists the current status of the service: • online = available to provide data for consumption by the Broker or Concentrator • offline = not available to provide data for consumption by the Broker or Concentrator • consuming = providing data for consumption by the Broker or Concentrator

System Configuration Section

The System Configuration section manages service configuration for a service. When a service is first added, default values are in effect. You can edit these values to tune performance.



The System Configuration section has these parameters.

Parameter	Description
Compression	The minimum number of bytes that must be transmitted per response before compression. A setting of **0** disables compression. The default value is **0**. A change in value is effective immediately for all subsequent connections.
Port	The port on which the service listens. The default ports are: • 50001 for Log Collectors • 50002 for Log Decoders • 50003 for Brokers • 50004 for Decoders • 50005 for Concentrators • 50007 for other services
SSL FIPS Mode	When enabled (**on**), the security of data transmission is managed by encrypting information and providing authentication with SSL certificates. The default value is **off**.
SSL Port	Indicates the SSL port.
Stat Update Interval	The number of milliseconds between statistic updates on the system. Lower numbers cause more frequent updates and can slow down other processes. The default value is **1000**. A change in value is effective immediately.
Threads	The number of threads in the thread pool to handle incoming requests. A setting of **0** lets the system decide. The default value is **15**. A change takes effect on service restart.

Aggregation Configuration Section

The Aggregation Configuration section provides configuration settings that affect various aspects of the aggregation process. When you click **Apply**, the changes are saved; however, not all settings take effect immediately. The tables for Aggregation Settings and Service Heartbeat provide details.

Caution: Do not change any of these settings unless guided by the Developers or the Customer Support team. Contact the Customer Support for any questions before editing any of these settings.

The following table describes the aggregation settings

Setting	Description
Aggregate Autostart	Option to start aggregation automatically each time the Broker or Concentrator is started. Checked means yes, unchecked means no. This change takes effect immediately.
Aggregate Hours	The number of hours back for each service that the Concentrator or Broker attempts to recover at the beginning of aggregation. This change takes effect immediately. • If the value is set to 0, aggregation for each service starts where it last left off, no matter the number of hours behind. • If the value is any positive integer, the Concentrator or Broker only consumes sessions less than that number of hours back. For example, if a service's most current session is +10 hours from the last session, this is what happens with two different Aggregate Hours values: • With a value of 12, the Concentrator or Broker starts consuming where it left off. • With a value of 4, all sessions between 5 and 10 hours back are skipped and the Concentrator or Broker starts consuming the session that started 4 hours back.
Aggregate Interval	The number of milliseconds between rounds of service aggregation. All services managed by the Broker or Concentrator request additional rounds of session and metadata to be aggregated. If a Broker or Concentrator is still consuming the previous round of data, it cannot request more until it finishes. Change takes effect immediately.
Aggregate Max Sessions	The maximum number of sessions that the Broker or Concentrator requests in a given round of data aggregation. Change takes effect after restart.

Service Heartbeat

In communicating with each aggregate service, Brokers and Concentrators monitor the heartbeat of the service. These parameters specify the timing of the first attempt to reconnect to a service after an error, the next attempt to reconnect, and taking the service offline after failure to reconnect.

Setting	Description
Heartbeat Error Restart	After a heartbeat error is detected on an aggregate service, specifies the number of seconds for a Broker or Concentrator to wait before attempting a service reconnect.
Heartbeat Next Attempt	After a failed attempt to reconnect to an aggregate service, specifies the number of seconds for a Broker or Concentrator to wait before attempting another service reconnect. Change takes effect immediately.
Heartbeat No Response	After failing to reconnect to an unresponsive service, specifies the number of seconds for the Broker or Concentrator to wait before taking the unresponsive service offline. Change takes effect immediately.

When editing parameters in the General tab, you must click **Apply** to save changes.

Services System View - Broker or Concentrator

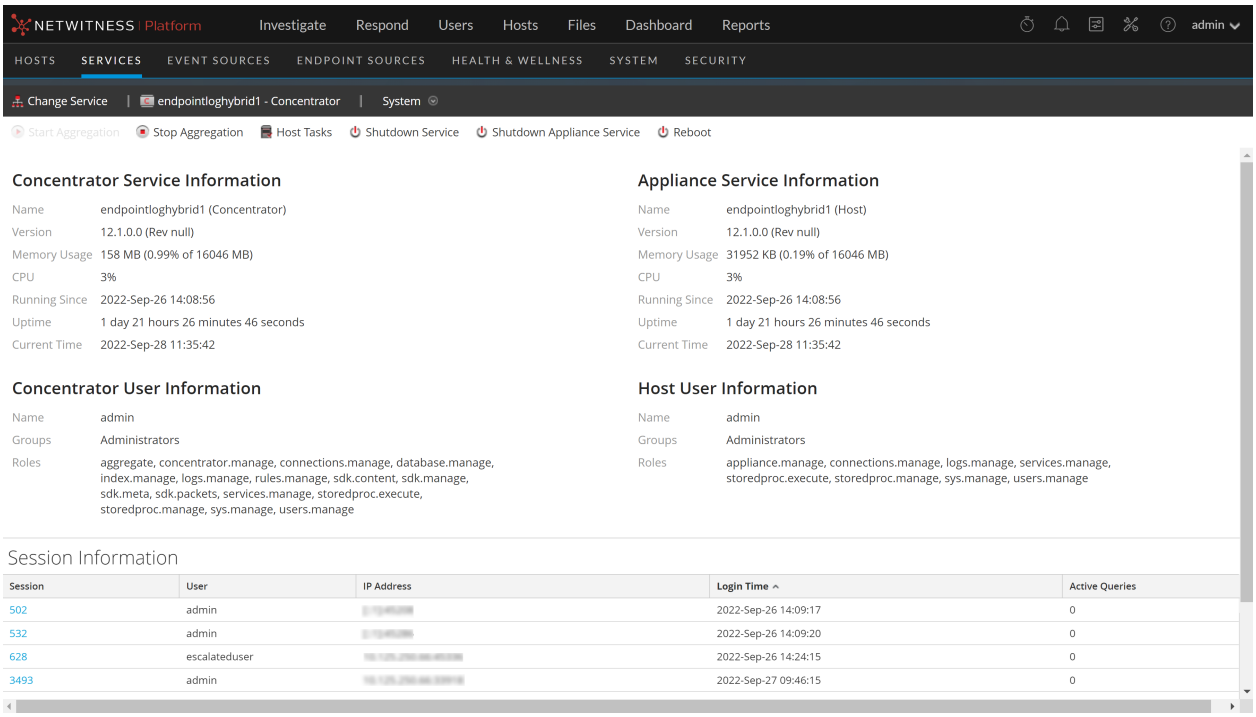
The Services System view displays information specific to specific to Brokers and Concentrators.

While information displayed in this view is the same for all types of Core services, several options in the toolbar are relevant only for Brokers and Concentrators.

What do you want to do?

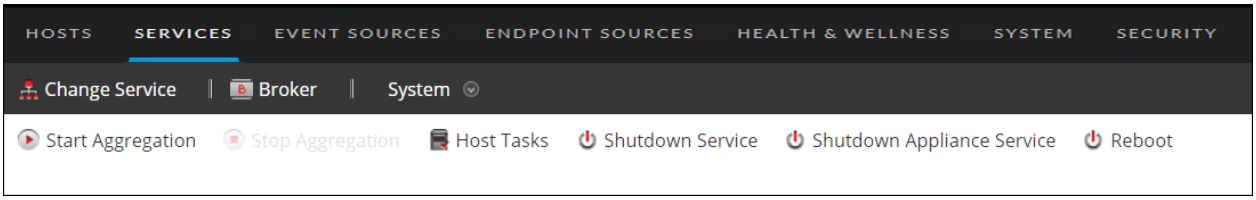
Role	I want to...	Refer to...
Administrator	Start and Stop aggregation Add, edit, delete, and toggle an aggregate service	Services System View - Broker or Concentrator
Administrator	Manage System Configuration	Services System View - Broker or Concentrator

Related Topics



- Broker and Concentrator Basics
- Broker and Concentrator Configuration

Services System View



You can access this view by doing the following:

1. Go to  **(Admin)** > **Services.**
2. Select a Concentrator or Broker, and select  > **View** > **System**.

   The System view for the selected Concentrator or Broker is displayed.

The following figure is an example of the toolbar for a Broker or Concentrator.

Host Tasks, Shutdown Service, Shutdown Appliance Service or (Shutdown Appliance), and Reboot are common to all services and are described in the "Services System view" topic in the *Host and Services Getting Started Guide*.

This table describes toolbar options that apply only to a Concentrator or Broker. Both buttons are unavailable until aggregator services are configured and consuming data.

Action	Description
Start Aggregation	Starts aggregation of data being consumed on a Concentrator or Decoder configured as an aggregation service for the selected Broker or Concentrator. The Start Aggregation button is available only when aggregator services are configured and consuming data.
Stop Aggregation	Stops aggregation of data being consumed on a Concentrator or Decoder configured as an aggregation service for the selected Broker or Concentrator. The Stop Aggregation button is available only when aggregation is occurring.

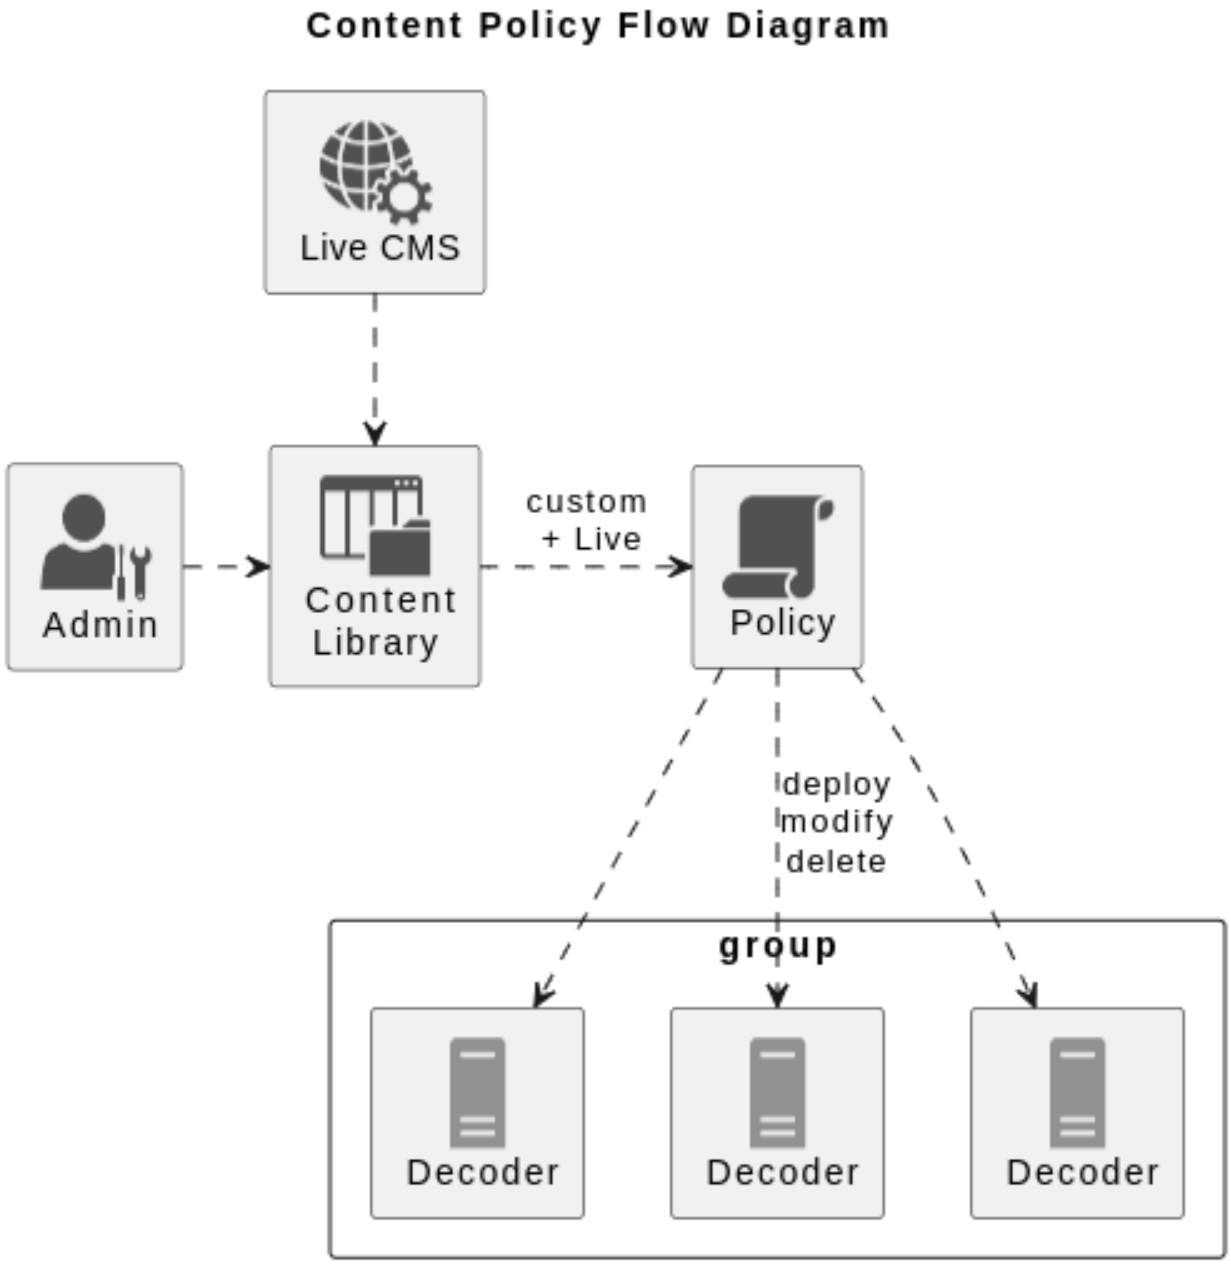
About Policy-based Centralized Content Management (CCM)

Legacy content management involves deploying and managing content in multiple places in the UI.

- **Live Content UI**: Located under the Configuration interface, this allows a “push” deployment of Live content to one or more services, but does not provide any management of content once it is deployed
- **Service Config UI**: Located under **Admin > Services > View Config**, this UI enables you to view, edit or delete content on individual services.



Policy-based Centralized Content Management (CCM) is a unified approach to find, deploy, and manage content through the entire life cycle based on policies that can be assigned to groups of devices. It is a single location to view, modify and manage the content deployed across all services in the environment.

This approach consists of three elements:

- Groups: A collection of NetWitness services (such as Decoders, Log Decoders, and Correlation Servers etc.) to assign and manage content.
- Content Policies: A container of content and subscription settings used to assign and manage content within a Group.
- Content Library: A local repository of content which resides on the Admin Server and is used to assign content to policies. This includes both Live and Custom content.

The Content Library contains Live content (synchronized with the Live CMS) and any custom content you create or import. To deploy, remove or manage content on your services, content is assigned from the Content Library to a Content Policy. Once that content policy is assigned to a group and Published, the content changes are put into effect on the services within the group.

Workflow

Benefits

Benefits of Policy-based Centralized Content Management:

- Add or remove content without repeating the process on each service.
- Add content from RSA Live or add your custom content into a single content repository. You can add content from this repository to a policy.
- Add a new service to an existing group to automatically deploy all necessary content.
- One-click management of subscriptions and automatic updates
- Provides highly responsive and updated UI for browsing RSA Live content that can help you with the following:
  - View Live content along with your content policies and click  to add content from Live.
  - Seamlessly view Live content along with your custom content.
- Create and upload content to the Content Library easily by:
  - Importing log parsers as a zip file instead of converting to ".envision" format.
  - Cloning existing Application Rules and Network Rules.
- Switch services between legacy Content Management UI and the new Centralized Content Management via Groups and Policies using the "toggle" feature. This can prevent content being mistakenly added or modified outside of a Policy, causing an out-of-sync issue.
- Create, modify and publish policies and manage custom content in the Content Library even without an internet connection.
- Find content, policies or groups of interest easily by using the **Filtering** capability of the UI.
- Receives meta key and operator suggestions while creating Application Rule and Network Rule conditions. This eases the creation of error-free rules.
- Manage ESA content and handle multiple deployments seamlessly using Policy.
- Seamlessly view ESA Live content along with your own custom content.
- Add and manage ESA Correlation servers as part of groups.
- Manage all the data sources for the ESA Correlation servers from the **Settings** > **Event Stream Analysis** > **Data Sources** page seamlessly.

IMPORTANT: It is recommended not to use the Centralized Content Management and Service Config page or Live Content page simultaneously for managing the content. Using the Service Config UI to add or modify content can cause the content to become out-of-sync with the Content Policy.

Note: If Policy-based Centralized Content Management is enabled for a service, then the Policy-based Centralized Content Management enabled services will be disabled in Live content UI and user will not be able to manage content of these services from Service Config page as Service Config page becomes read only and no actions except 'export' can be performed from Service Config page.

Enable or Disable CCM for All or Individual Decoder Services

You can choose to use CCM to manage content for selected services or for all services.

When CCM is Enabled:

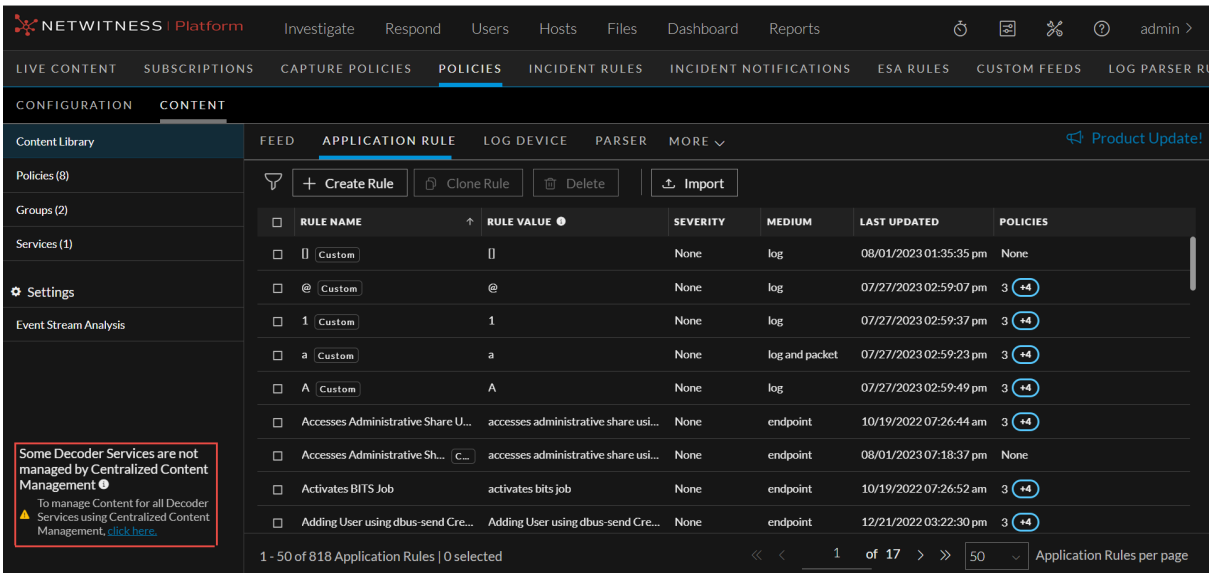
- The service config page is read-only. Only **Export** button is enabled in service config page to export content.
- Content cannot be deployed to CCM enabled services through the Live Content UI.
- Content for all CCM enabled services can be managed through the Content Policies and the Content Library.
- Content subscription from CCM overrides content subscription from **(CONFIGURE) > Subscriptions** page.

When CCM is Disabled:

- Content can be deployed from Live Content UI.
- The content of the service can be managed from service config page. Any changes made through the Service Config page does not reflect in the content policy.
- The service is disabled in the Policy or Group page of CCM and the policy status changes to **Partial**. The policy can be published with a disabled service. However, the policy state always remains **Partial**. Publishing a policy will affect only the services that are enabled for CCM.

  Note: When a service, which is part of a group, is added back to CCM, the policy status changes to "Unpublished".

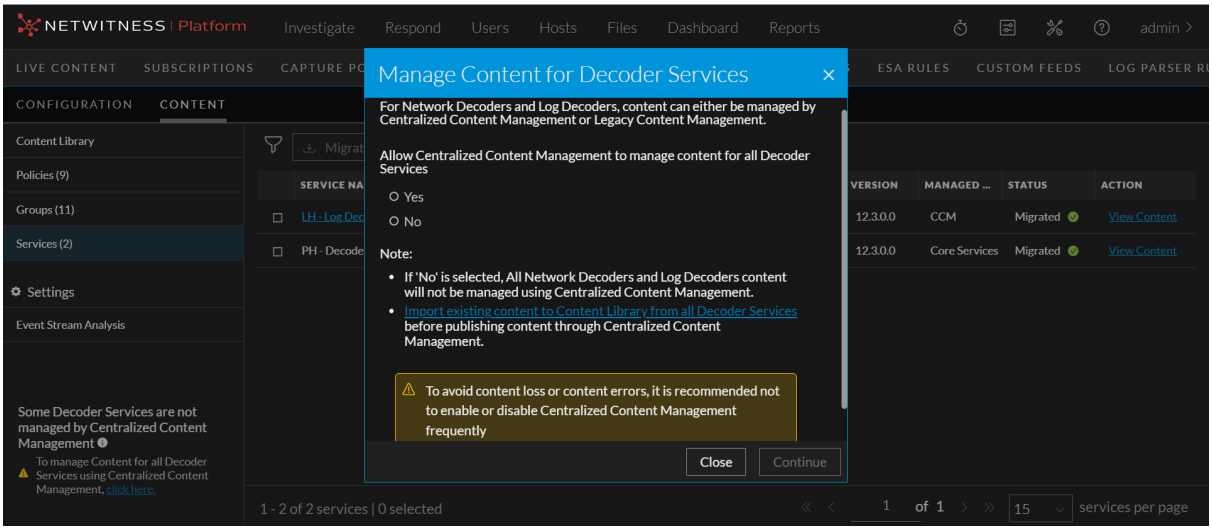
Enable or Disable CCM for All Decoder Services



From 12.2 version onwards, a CCM toggle is introduced to enable or disable CCM for all 12.0+ Decoder Services. The toggle is available on the UI.

To enable or disable CCM for all Decoder Services on the UI

Scenario 1: Some Decoder Services are Managed by CCM



1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click either **Content Library**, **Policies**, **Groups** or **Services**.

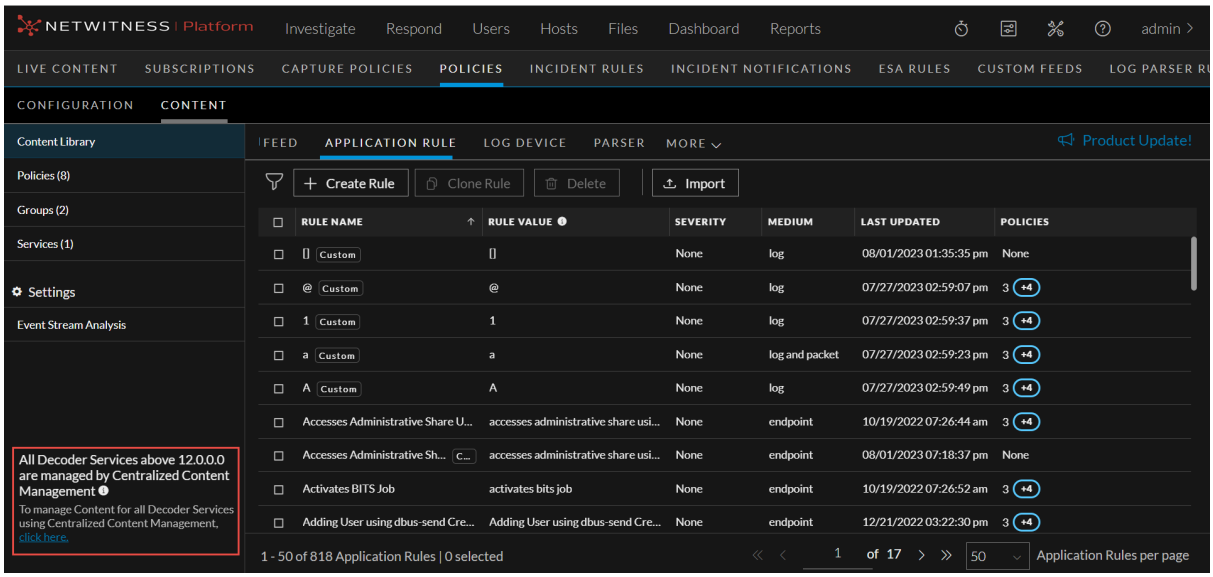
   The respective screens are displayed. On these screens, on the left bottom corner, the message on managing the content is displayed.

4. If the NetWitness platform consists of only few Decoders managed by CCM, then the message "Some Decoder Services are managed by Centralized Content Management" is diplayed. In such a case, you can choose to either manage all the Decoder Services by CCM or not to manage any Decoder Services by CCM by clicking **click here**.

   The **Manage Content for Decoder Services** pop-up window is displayed.

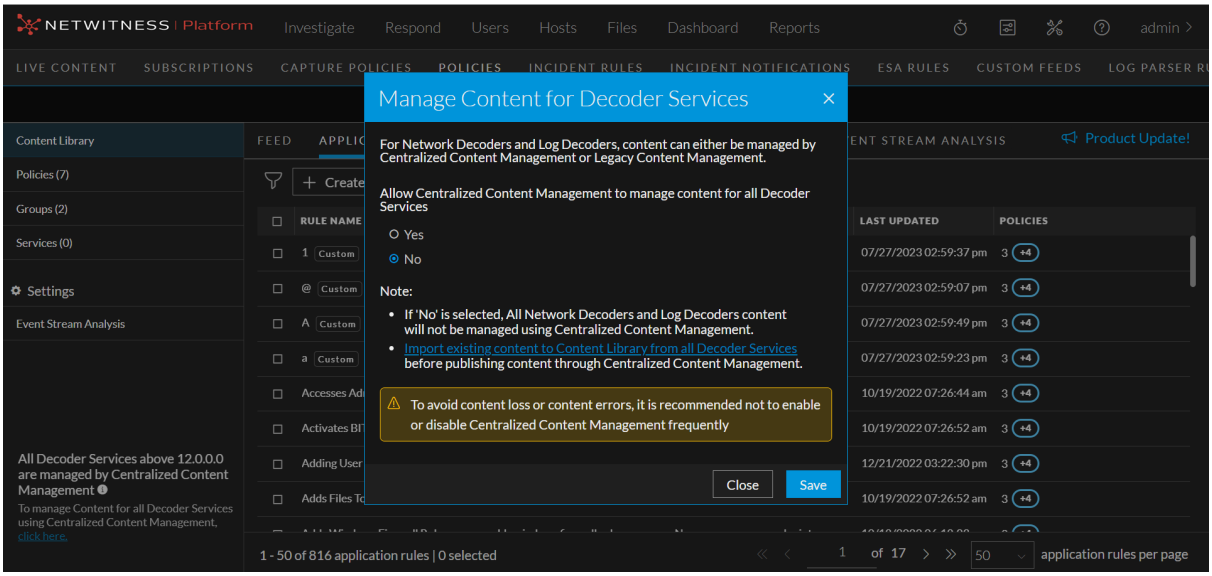
5. On the **Manage Content for Decoder Services** pop-up window, click **Yes** for **Allow Centralized Content Management to manage content for all Decoder Services** to enable CCM for all Decoder Services. Click **No** to disable CCM for all Decoder Services.

   Note: Read the notes on the pop-up window before clicking on **Continue**.



6. Click **Continue**. The **Manage Content for Decoder Services - Review and Confirm** screen is displayed.

7. Click **Confirm** to review and confirm the services which will be enabled or disabled based on the selected option. Else, click **Back** to go back to the previous screen.
8. The success message is displayed on the screen.

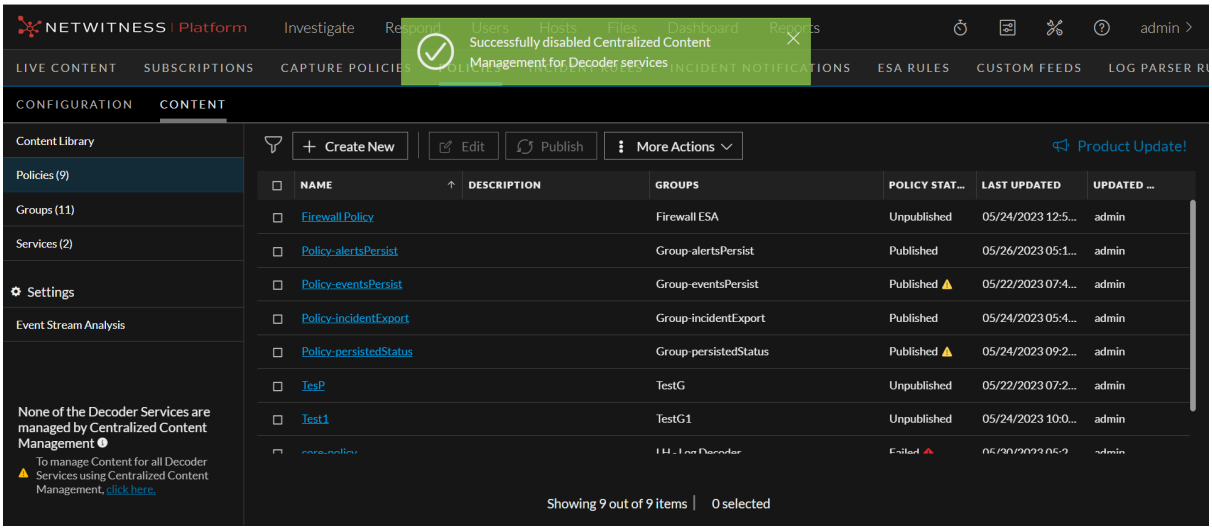


Scenario 2: All Decoder Services are Managed by CCM

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click either **Content Library**, **Policies**, **Groups** or **Services**.
4. The respective screens are displayed. On these screens, on the left bottom corner, the message on managing the content is displayed.

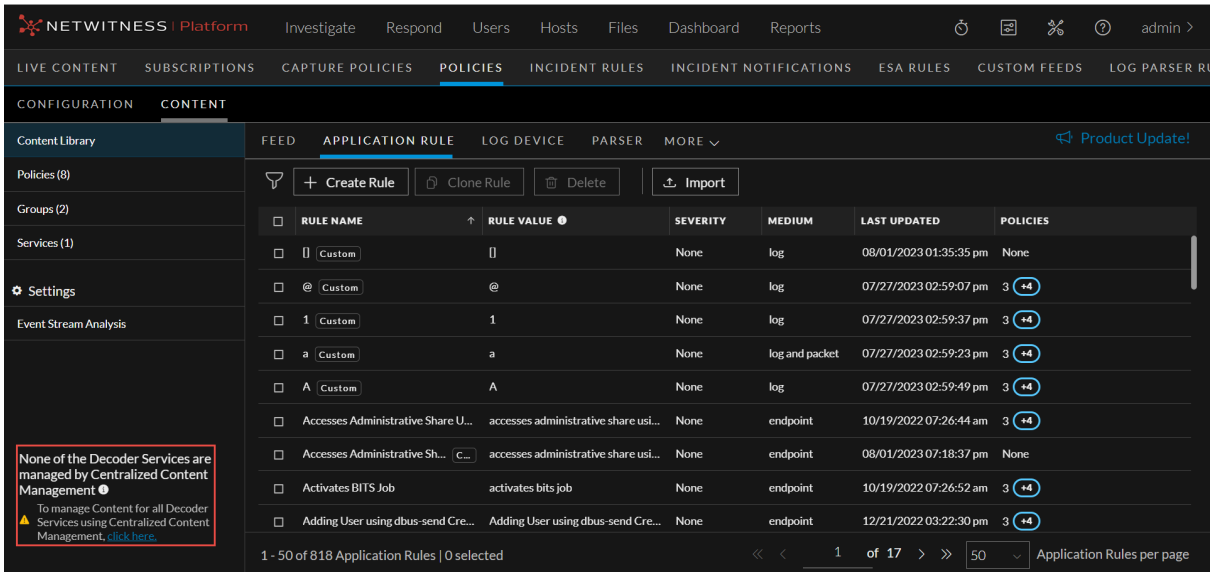
5. 5. If the NetWitness platform consists of all Decoders managed by CCM, then the message "All Decoder Services above 12.0.0.0 are managed by Centralized Content Management" is displayed. In such a case, you can choose to not manage any Decoder Services by CCM by clicking **click here**.

6. The **Manage Content for Decoder Services** pop-up window is displayed.



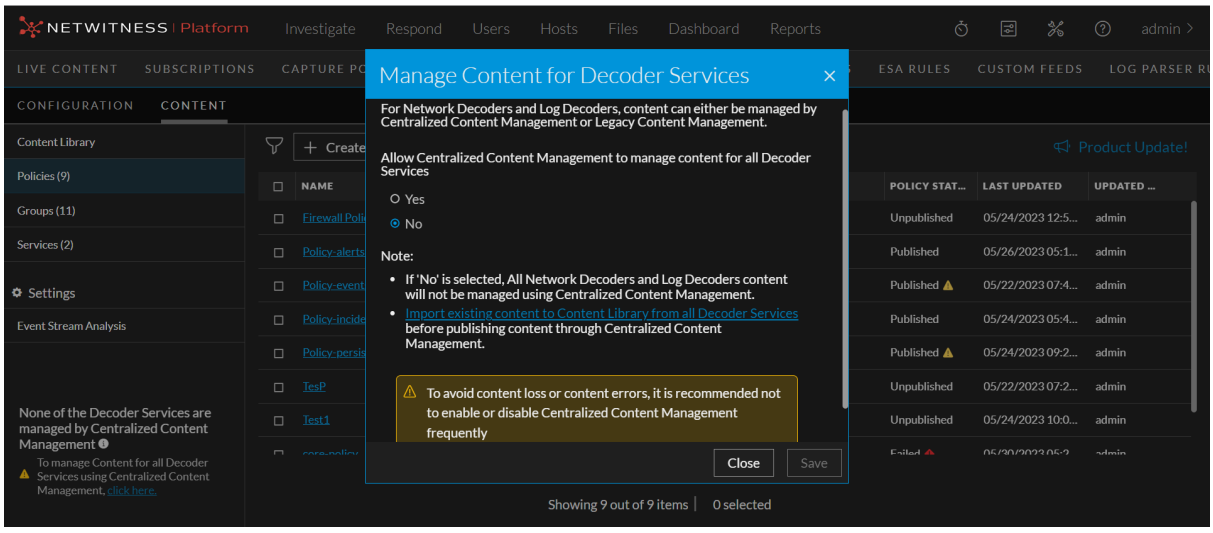
7. On the **Manage Content for Decoder Services** pop-up window, click **No** for **Allow Centralized Content Management to manage content for all Decoder Services** to disable CCM for all Decoder Services.

> **Note:**
> - The **Yes** option is selected by default.
> - Read the notes on the pop-up window before clicking on **Save**.



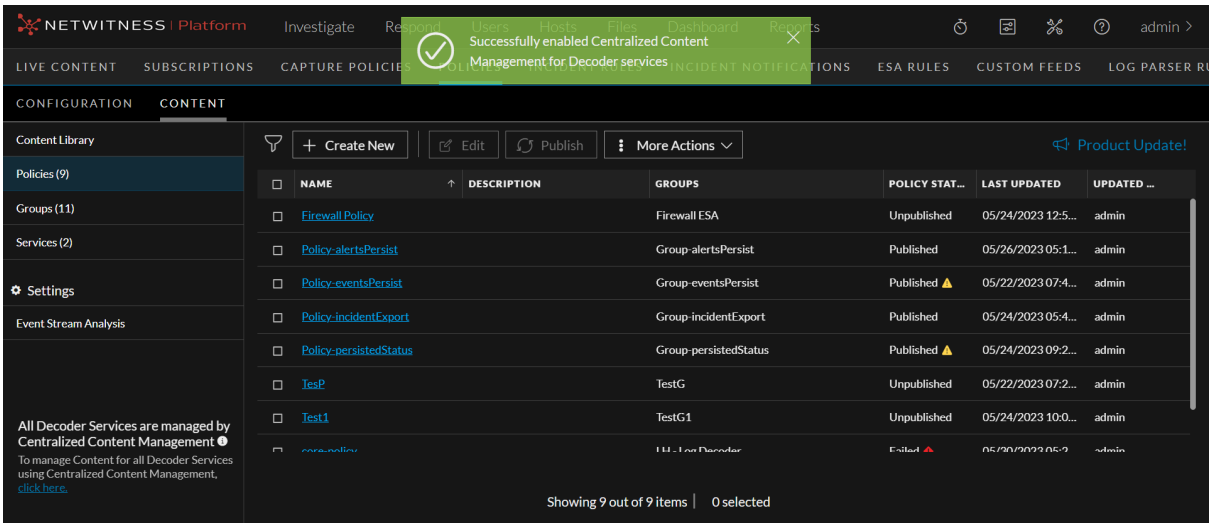
8. Click **Save**. The success message is displayed on the screen.

> **Note:** The **Save** option is enabled only when you select **No**.



Scenario 3: None of the Decoder Services are Managed by CCM

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click either **Content Library**, **Policies**, **Groups** or **Services**.
4. The respective screens are displayed. On these screens, on the left bottom corner, the message on managing the content is displayed.



5. If the NetWitness platform does not consist of any Decoders managed by CCM, then the message "None of the Decoder Services are managed by Centralized Content Management" is displayed. In such a case, you can choose to manage all Decoder Services by CCM by clicking **click here**.
6. The **Manage Content for Decoder Services** pop-up window is displayed.

7. On the **Manage Content for Decoder Services** pop-up window, click **Yes** for **Allow Centralized Content Management to manage content for all Decoder Services** to enable CCM for all Decoder Services.

Note:
- The **No** option is selected by default.
- Read the notes on the pop-up window before clicking on **Save**.

8. Click **Save**. The success message is displayed on the screen.
9. **Note:** The **Save** option is enabled only when you select **Yes**.

Enable or Disable CCM for Individual Decoder Services

To enable or disable CCM for individual Decoder services, see Enable or Disable CCM for Individual Decoder Services *topic under* Manage Services.

Manage Content Library

This section contains:

- Migrate Content from Core Services to Content Library
- Import Content to Content Library
- Create an Application Rule
- Clone Application Rule
- Edit Application Rule
- Delete Application Rule
- View Application Rule Details
- Create a Network Rule
- Edit Network Rule

- Create an ESA Rule
- Edit an ESA Rule
- Delete an ESA Rule
- About SASE Integration Plugins
- Manage Search Pattern Rules
- Filter Content Rules

Migrate Content from Core Services to Content Library

The customers who want to use Centralized Content Management, and if their content is already deployed, a migration process is required.

The following types of content can be migrated from Core Services:

- Application Rule
- Network Rule
- Log Device
- Live Feeds
- LUA Parser

Note:
- When the user upgrades a Decoder or Log Decoder from 11.x, 12.0 or 12.1 version to 12.1.1 or later version, a back up of all the content is created automatically. Backup file will be available on Core Services' host under the following path:
For Log Decoder - `/var/netwitness/logdecoder/logdecoder_backupcontent_ccm.tar`
For Network Decoder - `/var/netwitness/decoder/decoder_backupcontent_ccm.tar`
- When migrating content from two Decoders that have two different types of Custom or Live Base Parser associated with same Custom or Live Base Parser, both the Custom Parsers are added to Content Library. Th association inside the Policy will be with the most recently migrated Custom Parser.
- Within a migrated Policy, a Custom Parser will have only one Custom or Live Base Parser associated with it.
- Migrated content version will be in the Policy, if as part of migration, the Policy is auto created. If you remove this content, you cannot add the old version of the content back.

For steps on how to migrate content from Core Services to Content Library, see Migrate Content from Service under Manage Services.

Import Content to Content Library

Before the custom content can be used in policies, it must be imported to the Content Library.

To export Application Rules or Network Rules from Legacy UI

1. Go to  **(Admin) > Services**.
2. Go to Config view of the service where application rule or network rule is deployed.
3. Click either the **Application Rule** or the **Network Rule** tab.

   Note: The **Network Rule** tab is only available for **Network Decoder** services.
4. Select the content to migrate.
5. Click **Export** to export the selected content or click **All** to export all the content.

   The following table lists the supported file types and file extensions for Application Rules and Network Rules:

Content	Supported File Types	Supported File Extensions
Application Rules	**.NWR**	NA
Network Rules	**.NWR**	NA

To export Feeds, LUA Parsers, or Log Devices

The content file locations are as given below:

- Feeds content file location: /etc/netwitness/ng/feeds
- Lua Parsers content file location: /etc/netwitness/ng/parsers
- Log Devices content file location: /etc/netwitness/ng/envision/etc/devices

You can upload the files which are copied locally from these locations and import these files to Content Library.

The following table lists the supported file types and file extensions for Log Devices, LUA Parsers and Feeds:

Content	Supported File Types	Supported File Extensions
Feeds	**.zip**	**.feed** and **.token**
Log Devices	**.envision**, **.zip**, **.xml** **Note:** - The zip file should have a root folder. The root folder should contain the 'N' folders for 'N' number of content. The 'N' folder names should be the content names. The 'N' folders, will contain the respective xml files. - You can upload a maximum of 10 xml files at once. - You can upload base parsers as well as custom parser at once. - If you are importing a file which has both base and custom content, the base and custom content files are separated after importing them. - - The custom log parser naming convention should be '<base>msg-custom.xml'. - The base content name in Content Library will be the display name mentioned in the xml file. - The custom content name in Content Library will be the 'displayname-custom'. - While importing extension of a Base Parser, when multiple flavours of a Base Parser are present in Content Library, the extension is associated to the first Base Parser that is found.	NA
LUA Parsers	**.zip**	**.luax**, **.lua** and **.flextoken**

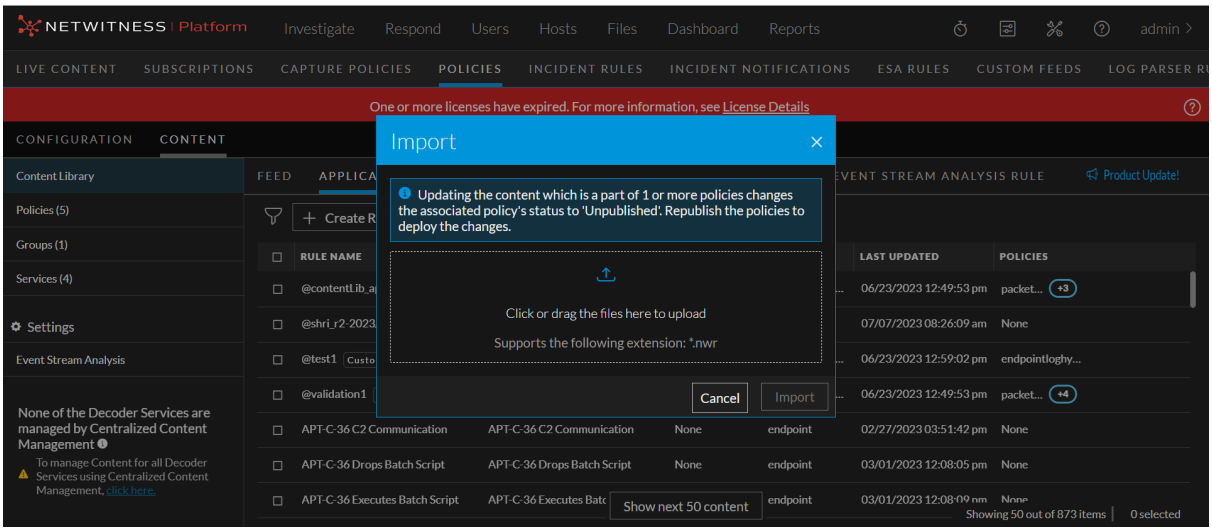
Note: Any imported content will be treated as custom content. If imported content has the same name as existing Live content, then it must be renamed upon import. Custom content with the same name can be overwritten.

To create .envision files

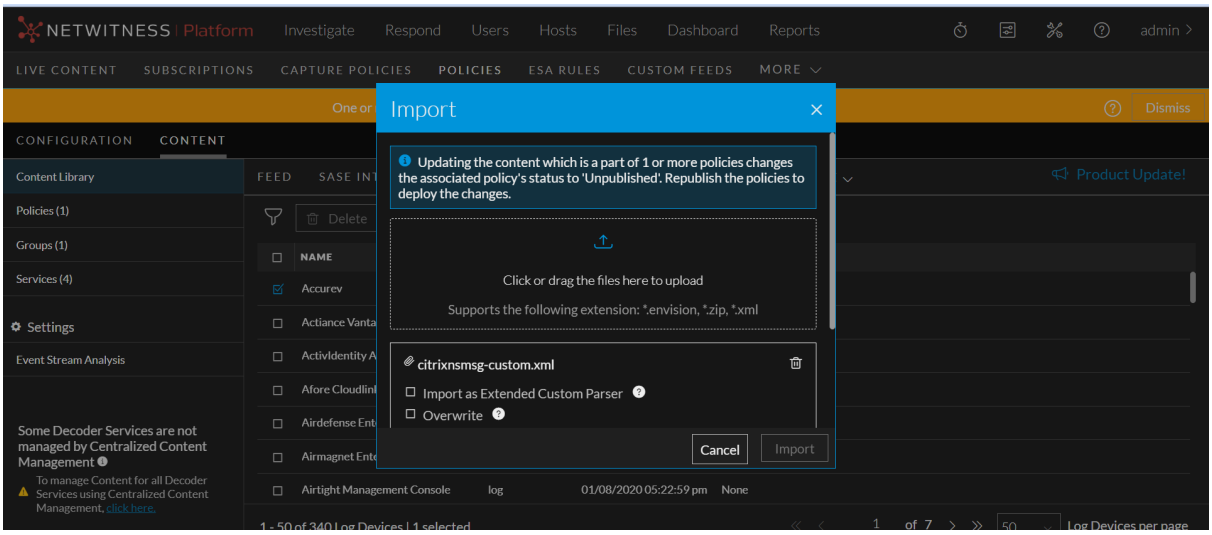
1. Keep all the Log Devices in a root folder in your local drive. For example, "logDevices".
2. From the command prompt, run the python script specified in the NetWitness Community portal with input argument as the path of the above folder.

   Note: The command to run the python script is "python3 pythonscriptname.py inputArg".
3. Once you run the script, a new zip named "nw_content_logDevices.zip" is created. This zip file will contain all the envision files.

IMPORTANT: All actions except 'Export' are disabled for Application Rules, Network Rules, Feeds, LUA Parsers and Log Devices from Service Config page for all core services if the service is managed by Policy-based Centralized Content Management.



To import content to Content Library



1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Depending upon the type of content to be imported, click the following tabs:
   - **Application Rule**
   - **Network Rule**
   - **Parser**
   - **Feeds**
   - **Log Devices**

Note: The name of the application rule or network rule to be imported should not be same as existing rule name.

5. In the respective content panel, click **Import**.

6. In the **Import** panel, click or drag the file to upload.
7. While importing a Log Device parser, if you want to import a standalone XML as an extended parser, select **Import as Extended Custom Parser**. If this option is not selected, then the XML will be imported as a standalone parser.
8. Click **Overwrite** to overwrite content. This is applicable only in case of overriding an already imported content.

   Note: You cannot overwrite the content if the content name is same as the rule name of the existing content of the same type from live server. However, you can overwrite the content if the content name is same as the custom content rule name.

9. Select the medium types.
10. Click **Import** to complete the import process.

Create an Application Rule

This topic describes the steps to create an application rule. When you create a custom application rule, NetWitness allows you to tag MITRE ATT&CK Tactics and Techniques and for each rule.

IMPORTANT: Both MITRE ATT&CK® and ATT&CK® are registered trademarks of the MITRE Corporation. © 2024 The MITRE Corporation. This work is reproduced and distributed with the permission of The MITRE Corporation.

To create a new Application Rule

1. Go to  **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.

   The available rules are displayed.
4. In the application rule panel, click **+ Create Rule** to add an application rule.
5. In the **CreateNew Rule** panel, do the following:
   - Enter a unique rule name. If the name of that application rule is the same as an existing rule, an error message is displayed.
   - Enter the rule value. This is the value written to the alert meta. While creating a new rule, the rule value is defaulted with the rule name. However, you can modify the same.
   - Enter the condition for the rule. You can apply two types of conditions for the rule.
     - Normal mode:
       - It gives suggestions for supported metas (ip, host and so on) and operators (“=”, “Not Equal To”, “Contains”, “Exists” and so on).
       - The entered condition will be enclosed in a ‘Pill’. When you enter multiple conditions, the conditions are automatically joined by an ‘AND’ operator. On clicking the ‘AND’ operator, you can toggle between ‘AND’ and ‘OR’ operators.
     - Advanced: You can customize the conditions as a free form text.
   - Select the medium to be applied for the rule.
   - Enter the description for the rule.
   - Select the session data to be applied for the rule.
   - Select the session options to be applied for the rule. The options are listed below:
     - **Flag Session with rule name in meta key**: Select the meta value for the alert from the drop-down menu. This is mandatory.
     - **Forward**: This option enables the performance of syslog forwarding when the log matches the rule.
     - **Transient**: This option prevents the created alert metadata from being written to the disk.

- **Notify**: This option enables you to choose the **Severity** levels for the application rule and utilize the option to trigger alert generation.
  - Low
  - Medium
  - High
  - Critical

Note: Severity is selected by default as Low.

- **MITRE ATT&CK TACTICS**: Lets you select MITRE ATT&CK TACTICS from the list.

Note: Ensure that you apply at least one MITRE ATT&CK TACTIC for the rule.

- **MITRE ATT&CK TECHNIQUES**: Lets you select MITRE ATT&CK TECHNIQUES from the list.
- **DESCRIPTION**: Provide a description for the rule.

- Click **Save** to save the new application rule.
- Click **Reset** to reset the fields.
- Click **Cancel** to cancel the operation.

Clone Application Rule

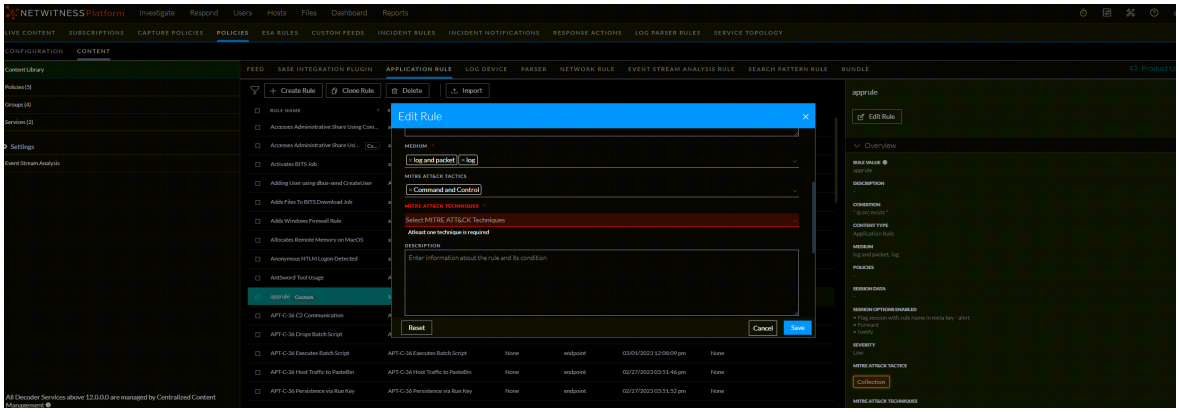
This topic describes the steps to clone an application rule.

To clone an Application Rule

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.

3. In the left panel, click **Content Library**.
4. The list of application rules is displayed. From the available list of rules, select the rule to be cloned.
5. Click **Clone Rule**.
6. In the **Clone Rule** panel, do the following:
   - Enter a unique rule name. If the name of that application rule is same as an existing rule, an error message is displayed.
   - Enter the rule value.

     Note: You can clone existing rules to generate cloned rules with different rule names but with same rule value.
   - Enter the condition for the rule.
   - Select the medium to be applied for the rule.
   - Select the MITRE ATT&CK TACTICS for the rule.
   - Select the MITRE ATT&CK TECHNIQUES for the rule.
   - Enter the description for the rule.
   - Select the session data to be applied for the rule.
   - Select the session options to be applied for the rule.
   - Select a meta value from the Flag session with rule name in meta key drop-down menu. This is a mandatory field.
   - Click **Clone** to clone the rule.
   - Click **Cancel** to cancel the operation.



Edit Application Rule

When you edit the application rule, follow these guidelines:

- You can only edit the custom rules.
- The rule name and rule value cannot be edited if the custom rule is assigned to a policy.
- If the custom rule assigned to a policy is edited, then the customer must republish the policy for the changes to take effect in the service.
- The rule value cannot be edited. The rule value can be same for different rule names.
- While editing the rule name, if the name of that application rule is same as an existing rule, an error message is displayed.
- Let’s you to tag MITRE ATT&CK Tactics for each rule.
- Let’s you select the MITRE ATT&CK Techniques for the rule.

To edit an Application Rule

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Select an application rule to edit.
5. Click **Edit Rule** to edit the application rule.
6. In the **Edit Rule** panel, do the following:
   - Enter a unique rule name. If the name of that application rule is the same as an existing rule, an error message is displayed.
   - Enter the rule value. This is the value written to the alert meta.
   - Enter the condition for the rule. You can apply two types of conditions for the rule.
     - Normal mode:
       - It gives suggestions for supported metas (ip, host and so on) and operators ("=", "Not Equal To", "Contains", "Exists" and so on).
       - The entered condition will be enclosed in a 'Pill'. When you enter multiple conditions, the conditions are automatically joined by an 'AND' operator. On clicking the 'AND' operator, you can toggle between 'AND' and 'OR' operators.
     - Advanced: You can customize the conditions as a free form text.
   - Select the medium to be applied for the rule.
   - Select the MITRE ATT&CK TACTICS for the rule. The MITRE ATT&CK Tactics are listed. You can select an appropriate MITRE ATT&CK Tactic.

   - Select the MITRE ATT&CK TECHNIQUES for the rule. The MITRE ATT&CK Techniques are listed. You can select an appropriate MITRE ATT&CK Technique.
   - Enter the description for the rule.
   - Select the session data to be applied for the rule.

- Select the session options to be applied for the rule.The options are listed below:
  - **Flag Session with rule name in meta key**: Select the meta value for the alert from the drop-down menu. This is mandatory.
  - **Forward**: This option enables the performance of syslog forwarding when the log matches the rule.
  - **Transient**: This option prevents the created alert metadata from being written to the disk.
  - **Notify**: This option enables you to choose the **Severity** levels for the application rule and utilize the option to trigger alert generation.
    - Low
    - Medium
    - High
    - Critical

  Note: Severity is selected by default as Low.
- Click **Save** to save the application rule details.
- Click **Reset** to reset the fields.
- Click **Cancel** to cancel the operation.

Delete Application Rule

When you delete the application rule, follow these guidelines:

- You can delete only the custom application rules.
- You cannot delete the application rule if it is associated to a policy. You should first disassociate the application rule from the policy and then delete it.

To delete an Application Rule

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Select an application rule to delete.
5. Click **Delete** to permanently delete the selected application rule.

View Application Rule Details

This topic describes the steps to view the application rule details.

To view Application Rule details

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
   The list of application rules is displayed.
4. Click a row to view details about the selected application rule in the right panel.
   The various details of the application rule are displayed.

Create a Network Rule

This topic describes the steps to create a network rule.

To create a Network Rule

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Click the **Network Rule** tab.
5. In the network rule panel, click **+ Create Rule** to add a network rule.
6. In the **New Create Rule** panel, do the following:
   - Enter a unique rule name. If the name of that network rule is the same as an existing rule, an error message is displayed.
   - Enter the rule value. This is the value written to the alert meta. While creating a new rule, the rule value is defaulted with the rule name. However, you can modify the same.
   - Enter the condition for the rule. You can apply two types of conditions for the rule.
     - Normal mode:
       - It gives suggestions for supported metas (ip, host and so on) and operators (“=”, “Not Equal To”, “Contains”, “Exists” and so on).
       - The entered condition will be enclosed in a ‘Pill’. When you enter multiple conditions, the conditions are automatically joined by an ‘AND’ operator. On clicking the ‘AND’ operator, you can toggle between ‘AND’ and ‘OR’ operators.
     - Advanced: You can customize the conditions as a free form text.

     Note: The medium is selected as **Packet** by default, and it cannot be modified.
   - Enter the description for the rule.
   - Select the session data to be applied for the rule.
   - Select the session options to be applied for the rule.

- Click **Cancel** to cancel the operation.
- Click **Reset** to reset the data.
- Click **Save** to save the new network rule.

Clone Network Rule

This topic describes the steps to clone an application rule.

To clone an Application Rule

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Click **Network Rule** tab.
5. The list of application rules is displayed. From the available list of rules, select the rule to be cloned.
6. Click **Clone Rule**.
7. In the **Clone Rule** panel, do the following:
   - Enter a unique rule name. If the name of that network rule is same as an existing rule, an error message is displayed.
   - Enter the rule value.

     Note: You can clone existing rules to generate cloned rules with different rule names but with same rule value.
   - Enter the condition for the rule.

     Note: The medium is selected as **Packet** by default, and it cannot be modified.
   - Enter the description for the rule.
   - Select the session data to be applied for the rule.
   - Select the session options to be applied for the rule.
   - Click **Clone** to clone the rule.
   - Click **Cancel** to cancel the operation.

Edit Network Rule

When you edit the network rule, follow these guidelines:

- You can only edit the custom rules.
- The rule name and rule value cannot be edited if the custom rule is assigned to a policy.

- If the custom rule assigned to a policy is edited, then you must republish the policy for the changes to take effect in the service.
- The rule value cannot be edited. The rule value can be same for different rule names.
- While editing the rule name, if the name of that network rule is same as an existing rule, an error message is displayed.

To edit a Network Rule

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Click the **Network Rule** tab.
5. Select the network rule to edit.
6. Click **Edit Rule** to edit the network rule.
7. In the **Edit Rule** panel, do the following:
   - Enter a unique rule name. If the name of that network rule is the same as an existing rule, an error message is displayed.
   - Enter the rule value. This is the value written to the alert meta.
   - Enter the condition for the rule. You can apply two types of conditions for the rule.
     - Normal mode:
       - It gives suggestions for supported metas (ip, host and so on) and operators (“=”, “Not Equal To”, “Contains”, “Exists” and so on).
       - The entered condition will be enclosed in a ‘Pill’. When you enter multiple conditions, the conditions are automatically joined by an ‘AND’ operator. On clicking the ‘AND’ operator, you can toggle between ‘AND’ and ‘OR’ operators.
     - Advanced: You can customize the conditions as a free form text.

     Note: The medium is selected as **Packet** by default, and it cannot be modified.
   - Enter the description for the rule.
   - Select the session data to be applied for the rule.
   - Select the session options to be applied for the rule.
   - Click **Cancel** to cancel the operation.
   - Click **Reset** to reset the data.
   - Click **Save** to save the new network rule.

Delete Network Rule

When you delete the network rule, follow these guidelines:

- You can delete only the custom network rules.
- You cannot delete the network rule if it is associated to a policy. You should first disassociate the network rule from the policy and then delete it.

To delete a Network Rule

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Click **Network Rule** tab.
5. Select a network rule to delete.
6. Click **Delete** to permanently delete the selected network rule.

View Network Rule Details

This topic describes the steps to view the network rule details.

To view Network Rule details

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Click the **Network Rule** tab.
5. The list of network rules is displayed.
6. Click a row to view details about the selected network rule in the right panel.
   The various details of the network rule are displayed.

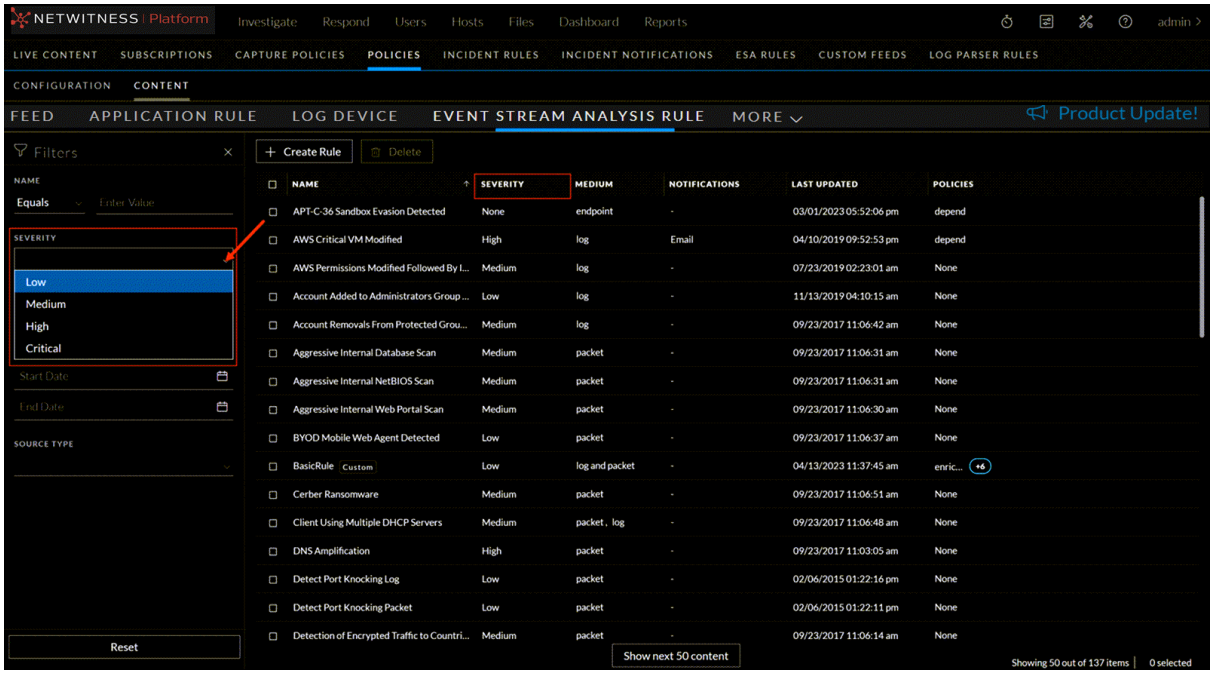
Create an ESA Rule

This topic describes the steps to create an ESA rule.

To create an ESA Rule

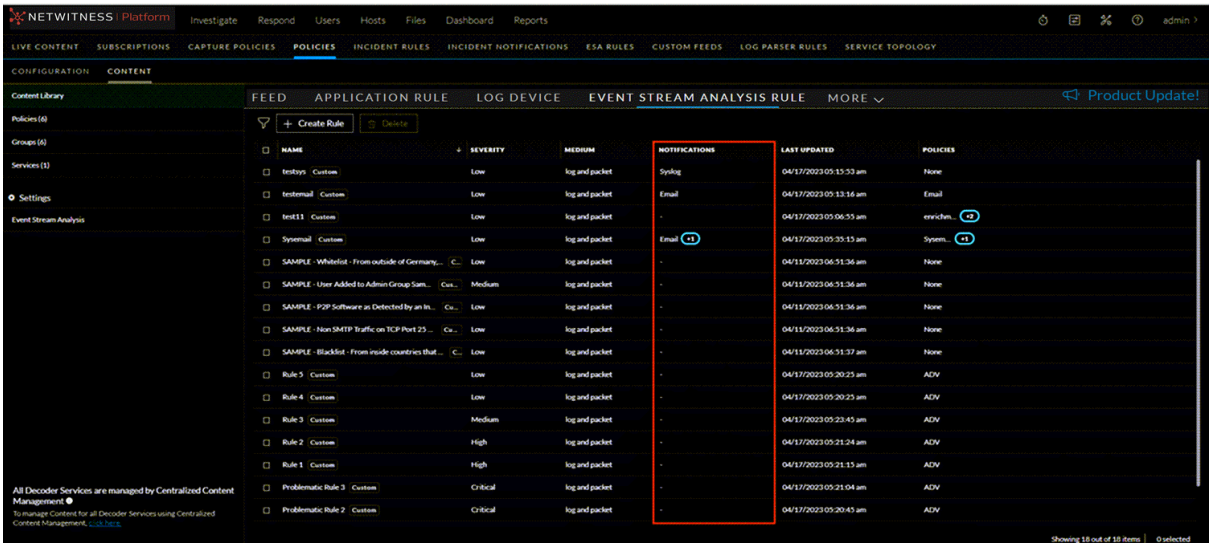
1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
   The available rules are displayed.
4. Click **Event Stream Analysis Rule**.
5. In the ESA rule panel, click **+ Create Rule** to add an ESA rule.

You can select the **Advanced EPL** option or **Rule Builder** option from the dropdown as per your requirement. It navigates to **ESA Rules** > **Rules** view.



See the section Add a Rule Builder Rule for more information on creating rules in Rule Builder.

See the section Add an Advanced EPL for more information on creating Advanced EPL.



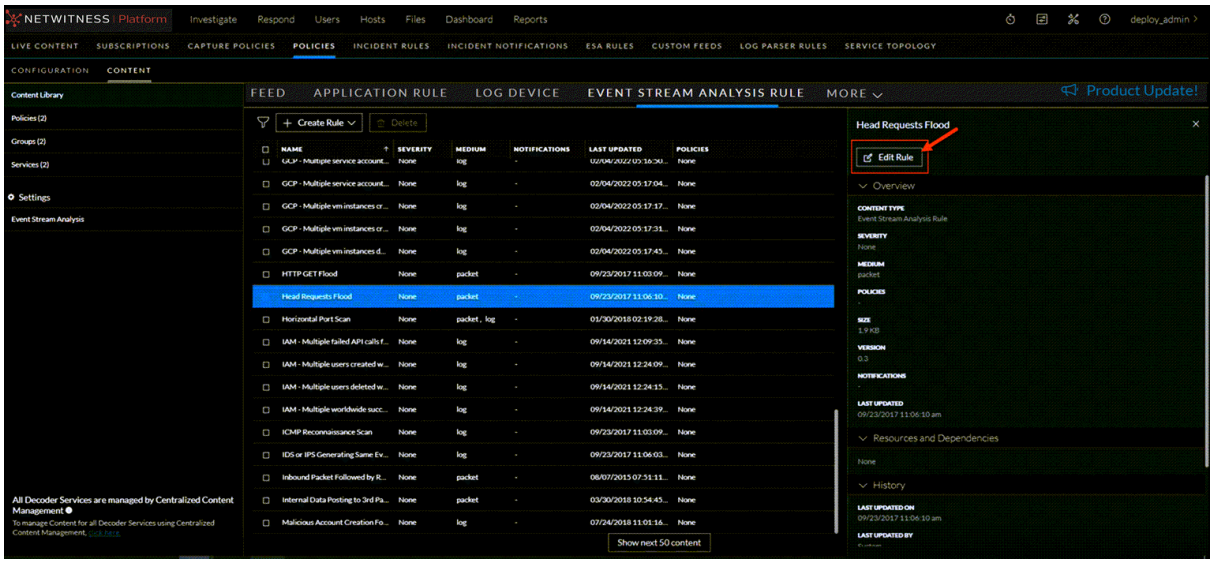
Note: Analysts must have appropriate permissions to view the ESA rules under (**CONFIGURE**) > **ESA Rules** and (**CONFIGURE**) > **Policies** pages. For more information, see the **Source-server** section in the "Role Permissions" topic in the *System Security and User Management Guide*.

From 12.3 and later, **Severity** and **Notifications** list views are added to the **Event Stream Analysis Rule** section.

The Severity list consists of None, Low, Medium, High, and Critical. You can also view rules filtering these options except for None. For more information on filtering these options, see Filter Content Rules.

Rules with syslog and email notifications can be viewed on the **Notifications** list of the **Event Stream Analysis Rule** section.

Edit an ESA Rule



This topic provides instructions to edit an Event Stream Analysis (ESA) rule. When you edit a rule, ESA applies the updated criteria going forward. No changes are made to previously generated alerts.

To edit an ESA Rule

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.

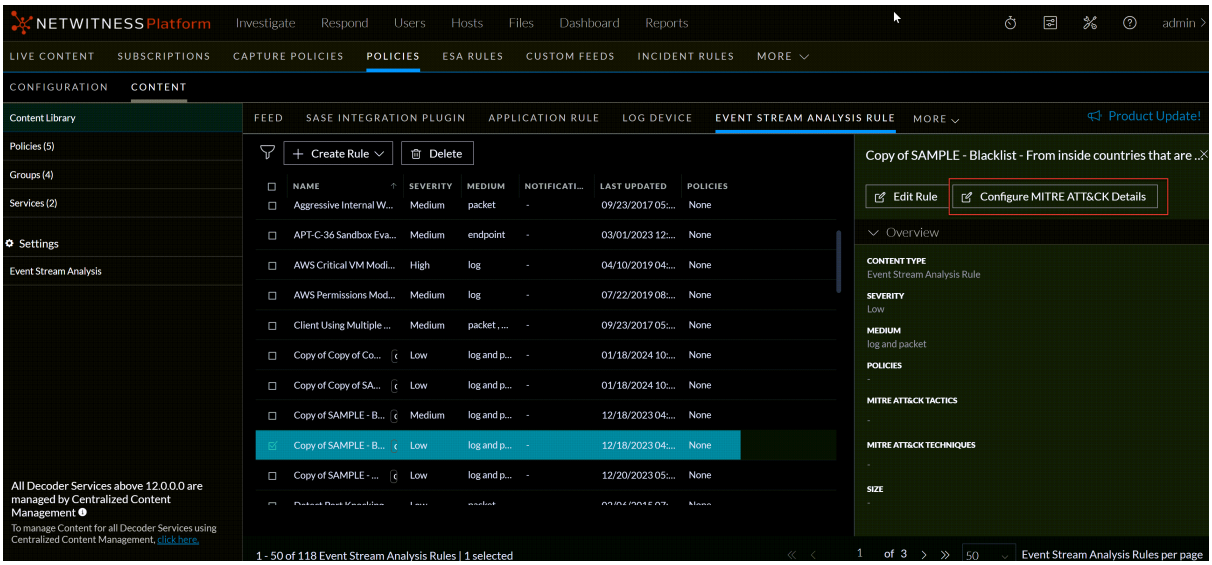
   The available rules are displayed.
4. Click **Event Stream Analysis Rule**.
5. In the ESA rule panel, select the rule that needs to be edited.

   The overview panel opens, showing the Edit Rule tab on top.
6. Click the **Edit Rule** tab.

It navigates to **ESA Rules** > **Rules** view.

For more information on editing an ESA rule, see Edit, Duplicate or Delete a Rule.

Configure MITRE ATT&CK Details for an ESA Rule



You can tag MITRE ATT&CK Tactics and Techniques for an ESA rule. MITRE framework provides insight into tactics, techniques, or sub-techniques used by advanced attackers or advanced persistent threats (APTs). When you tag an ESA rule with MITRE ATT&CK Tactics and Techniques, analysts can easily identify incidents, alerts, and events that are associated with MITRE techniques and tactics.

To configure MITRE ATT&CK details for an ESA Rule

1. Go to **(CONFIGURE)** > **Policies**.
2. In the **policies** panel, click **Content**.
3. In the left panel, click **Content Library**.

   The available rules are displayed.
4. Click **Event Stream Analysis Rule**.
5. In the ESA rule panel, select the rule that needs to be edited.

   The overview panel opens, showing the Edit Rule tab on top.
6. Click the **Configure MITRE ATT&CK Details** option.

7. In the **Configure MITRE ATT&CK Details** window, select the **MITRE ATT&CK Tactics**. You can apply multiple MITRE Tactics for an ESA rule.
8. Select the **MITRE ATT&CK Techniques**. You can apply multiple MITRE Techniques for an ESA rule.

   For more information on MITRE ATT&CK framework, see About MITRE ATT&CK Tactics and Techniques .

Delete an ESA Rule

You can delete one or more ESA rules. Once the ESA rule is deleted, the ESA rule will be removed from the available list.

To delete an ESA Rule

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.

   The available rules are displayed.
4. Click **Event Stream Analysis Rule**.

   The available ESA rules are displayed.

   Note: Only Custom ESA rules that are not assigned to a policy will be available for deletion.
5. Select one or more custom ESA rules and click **Delete**.

   A confirmation pop-up is displayed.
6. Click **Delete**.

About MITRE ATT&CK Tactics and Techniques

NetWitness allows you to tag an application rule with MITRE ATT&CK Tactics and Techniques. MITRE framework provides insight into tactics, techniques, or sub-techniques used by advanced attackers or advanced persistent threats (APTs). NetWitness uses the MITRE ATT&CK framework to detect and analyze different types of threats.

When you tag an application rule with MITRE ATT&CK Tactics and Techniques, analysts can look into the various techniques and tactics associated with the Incidents, alerts, and events.

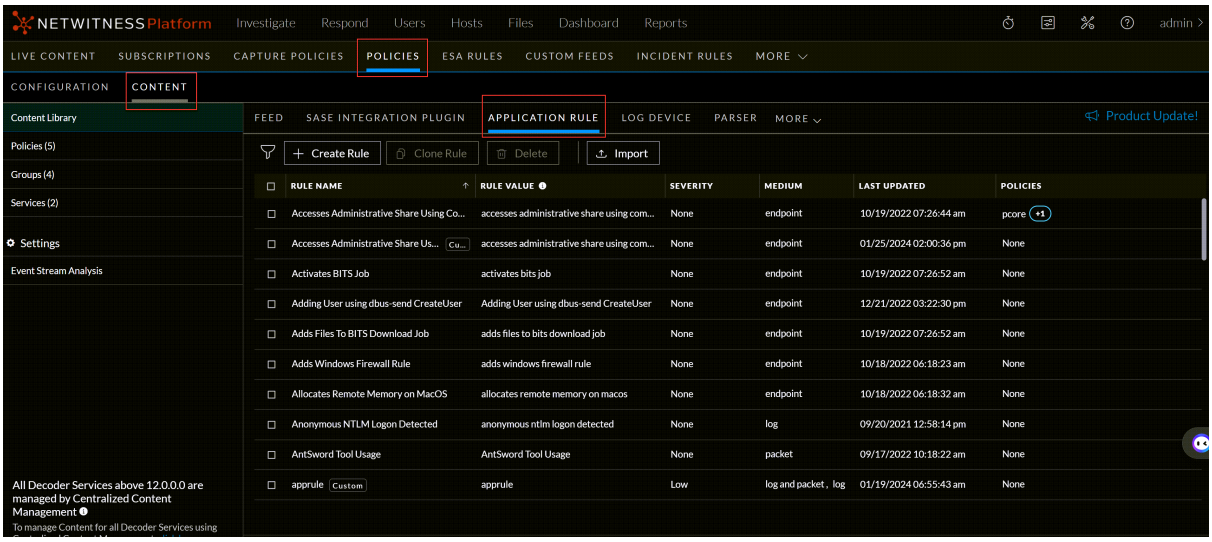
You do not have to search the MITRE pages to understand techniques or tactics and learn about their implications. You can view all the MITRE details in the **ATT&CK Explorer**. The additional details about MITRE ATT&CK Tactics and Techniques help you to understand how an attack or event is detected in their NetWitness system and then make informed decisions.

NetWitness Platform enables analysts to conduct further analysis with levels of granularity in techniques.

The MITRE ATT&CK framework is a curated knowledge base and model for cyber adversary behavior. It reflects the various phases of an adversary's attack lifecycle and the platforms they are known to target.

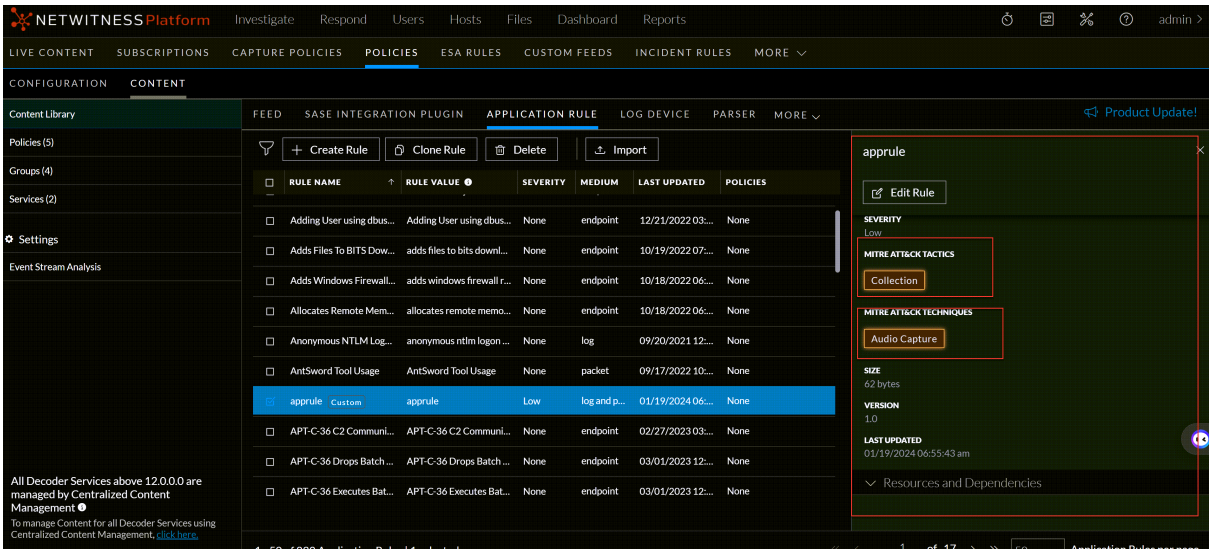
For more information on the MITRE ATT&CK framework, go tohttps://attack.mitre.org/resources/faq/

For more information, see “Use MITRE ATT&CK Framework” chapter in the NetWitness Respond User Guide for 12.4 .



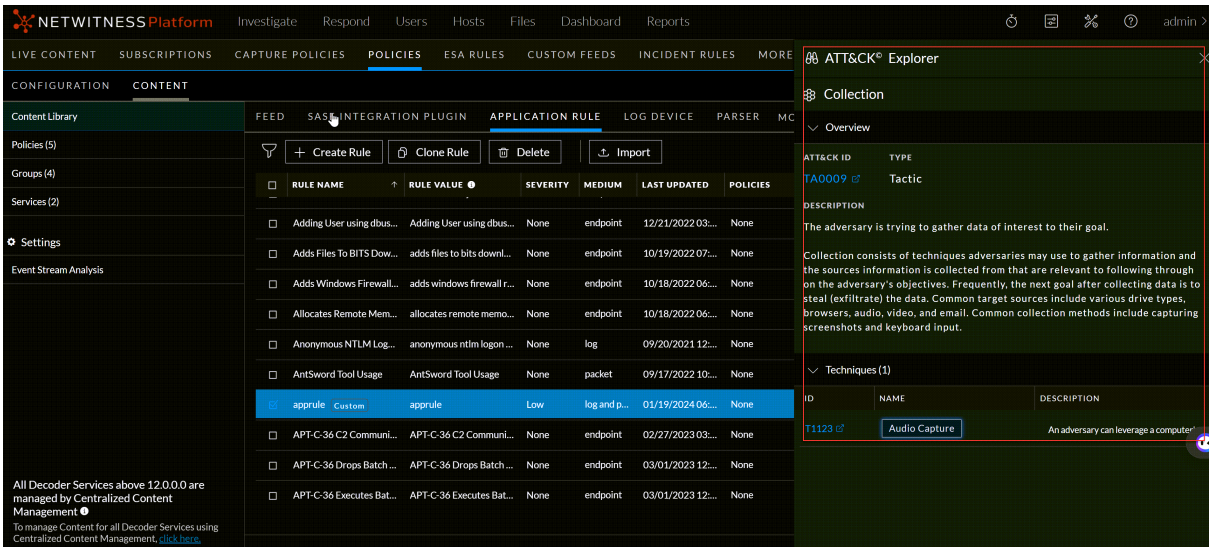
View MITRE ATT&CK Tactics and Techniques in Application and ESA rules

NetWitness allows you to tag application rules and ESA rules with MITRE ATT&CK Tactics and Techniques. When you tag MITRE ATT&CK Tactics and Techniques, you can view the details of the tactics and techniques used by advanced attackers or advanced persistent threats (APTs). You do not have to search the MITRE pages to understand techniques or tactics and learn about their implications. You can view all the MITRE details in the ATT&CK explorer. The additional details about MITRE ATT&CK Tactics and Techniques help you to understand how an attack or event is detected in their NetWitness system and then make informed decisions.



IMPORTANT: Both MITRE ATT&CK® and ATT&CK® are registered trademarks of the MITRE Corporation. © 2024 The MITRE Corporation. This work is reproduced and distributed with the permission of The MITRE Corporation.

To view MITRE ATT&CK Tactics and Techniques in application and ESA rules



1. Go to **(CONFIGURE)** > **Policies**.
2. In the **Policies** panel, click **Content** tab.
3. Click **APPLICATION RULE**. The Application Rules are listed.

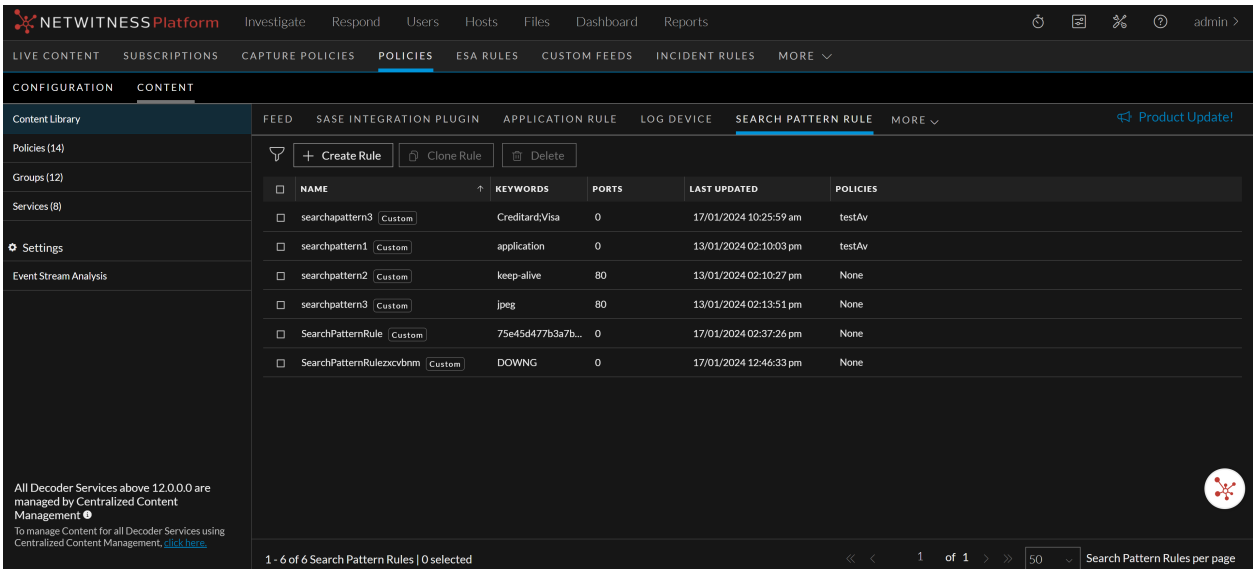
4. Click a rule that you want to view the MITRE ATT&CK Tactics and Techniques. The rule panel appears on the left side.

5. In the left panel, scroll down and view the MITRE ATT&CK TACTICS and TECHNIQUES categories.
6. Click a MITRE ATT&CK TACTICS or TECHNIQUES. The ATT&CK Explorer panel appears with details on tactics and techniques.

You can view the following details:

Fields	Description
MITRE ATT&CK Tactics	Displays the type of tactics associated with the Incident. For example, **Credential Access**. The tactic **Credential Access** tries to steal account names and passwords. For more information, see https://attack.mitre.org/tactics/enterprise/.
ATT&CK ID	Displays the ATT&CK ID associated with the Tactics. You can click the ATT&CK ID and go to the MITRE page and view the details. Analysts can benefit by visiting the MITRE page directly to get additional details about the Tactics. For example: **TA0006**. The Tactics ID **TA0006** is associated with the Tactic **Credential Access**.
TYPE	Displays the Technique associated with the Tactics.
TACTIC	Displays the Tactics that you tagged. You can tag multiple Tactics with a rule.
DESCRIPTION	Displays the detailed information about the Tactic associated with the particular incident.
Techniques	Displays the ID, Name, and the Description of the various Techniques and Sub – Techniques associated with the Tactics. **Note:** Techniques are how the adversary tries to achieve a tactical goal by performing an action. Sub – Techniques describe the adversarial behavior at a lower level than a technique. For more information, see • https://attack.mitre.org/resources/faq/#faq-0-0-header. • https://attack.mitre.org/techniques/enterprise/.

Fields	Description
Mitigations	Displays the ID, Name, and Description of the Mitigations used to prevent a technique or sub-technique from successfully executing. For example, The Mitigation name Account Use Policies associated with the ID M1036 helps configure features related to account use, like login attempt lockouts and specific login times. For more information, see https://attack.mitre.org/mitigations/enterprise/.
Procedure Examples	Displays the ID, Name, and Description of the procedures that the adversary uses for techniques or sub-techniques. For example, Lazarus Group with the ID G0032 is a North Korean state-sponsored cyber threat group that was responsible for the November 2014 destructive wiper attack against Sony Pictures Entertainment as part of a campaign named Operation Blockbuster by Novetta. For more information, see https://attack.mitre.org/resources/faq/#faq-0-2-header and https://attack.mitre.org/groups/G0032/.



For more information, see “Use MITRE ATT&CK Framework” chapter in the NetWitness Respond User Guide for 12.4 .

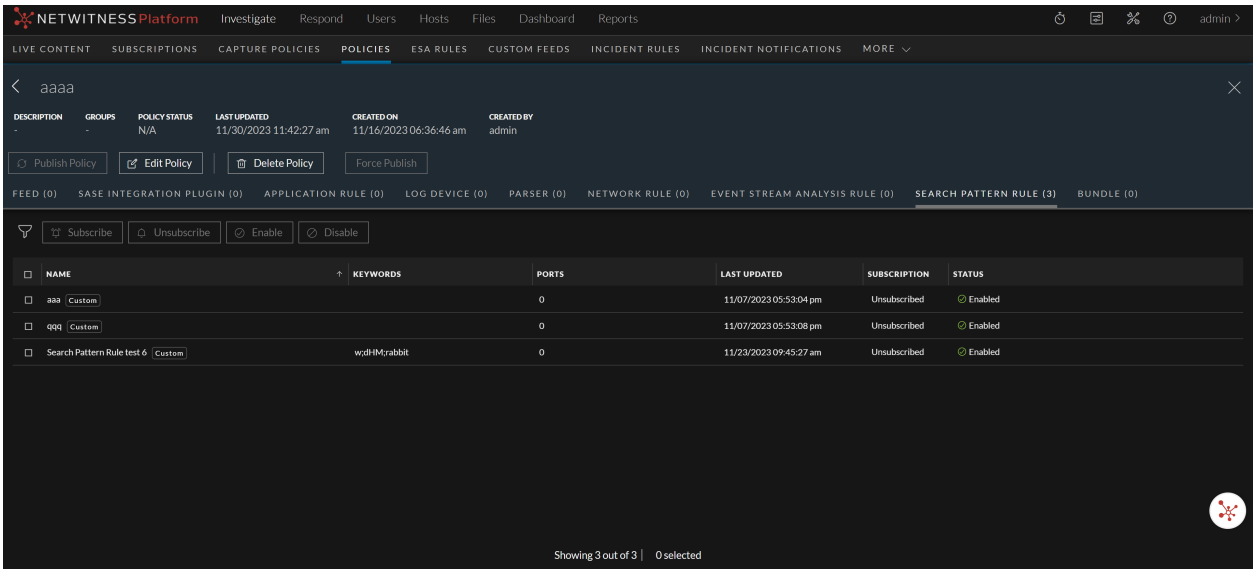
Manage Search Pattern Rules

From NetWitness Platform version 12.4 or later, administrators and analysts can create search pattern rules from the **Configure** > **Policies** > **Content Library** page to find sensitive data on their networks. These rules use keywords to identify patterns and they are matched based on an exact keyword string. Once a pattern is applied to a matched policy with services (Decoders), it searches for that pattern in the network traffic. Upon successful detection of a match, two important metadata will be generated (**found** and **match**).

- **found**: If a match (a keyword) is identified in a stream, the name of the search pattern rule will be added as the found metadata.
- **match**: If a keyword is detected as a match, the specific keyword that is identified will be added as a match meta.

Analysts can use this metadata to investigate further and determine if the sensitive data is being used maliciously. Additionally, analysts can gain real-time visibility into their network traffic, proactively monitoring it for potential threats.

Here is an example of search pattern that can be used to find sensitive data in networks:



Keywords: Keywords are words or phrases that are often associated with sensitive data. For example, the keyword **credit card** could be used to find network traffic that contains credit card numbers.

IMPORTANT: The custom search patterns you created using the **search.ini** file in version 12.3.1 or earlier will not be migrated to the new **search.xml** file format used in version 12.4 and later. As a result, those custom search patterns will not be available from the **Content Library** > **More** > **Search Pattern Rule** tab after you upgrade to version 12.4 or later.

For example, in an environment, if you have four Decoders with CCM enabled and published to the policy. However, only three of these decoders have the search parser enabled, while one decoder doesn't have it enabled. As a result, only the three decoders with enabled search parser will generate **found** and **match** meta keys.

In addition, administrators can perform other operations on the search pattern rule, such as editing, cloning, deleting, and filtering a rule.

Note: You can also view the search pattern rules inside a **Policy Details** view and allows you to enable or disable those rules. For more information, see Manage Policies.

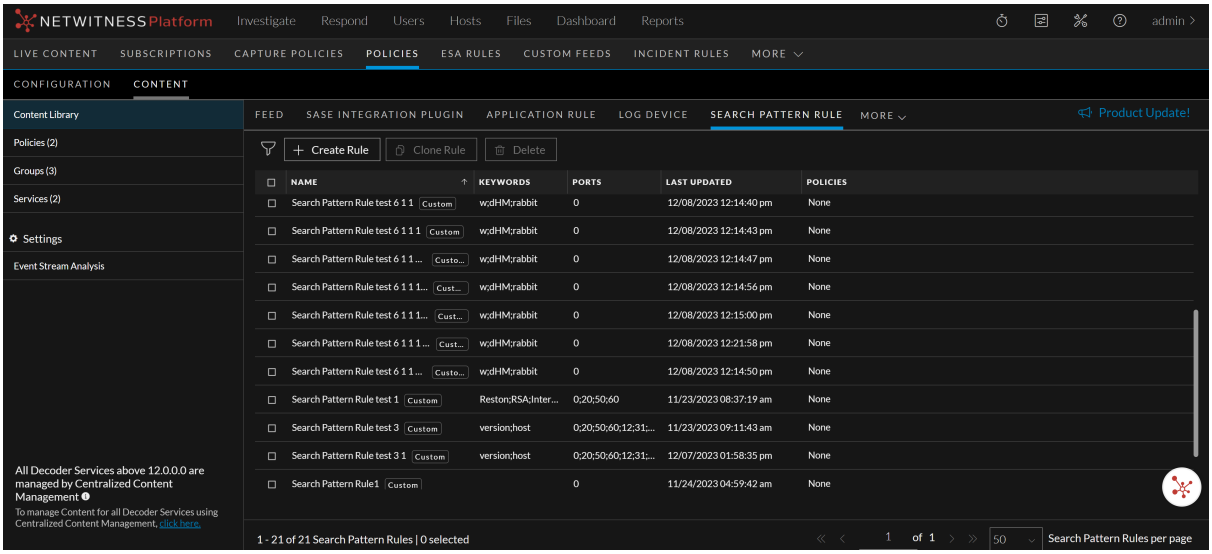
You must create a policy with the **Search Pattern Rule** type and associate the policy with the group having a Decoder service, and then publish the policy.

For more information on adding the search pattern rule content to a policy, see Create and Publish Policies.

For more information on groups, see Manage Groups.

You can perform following operations for Search Pattern Rule:

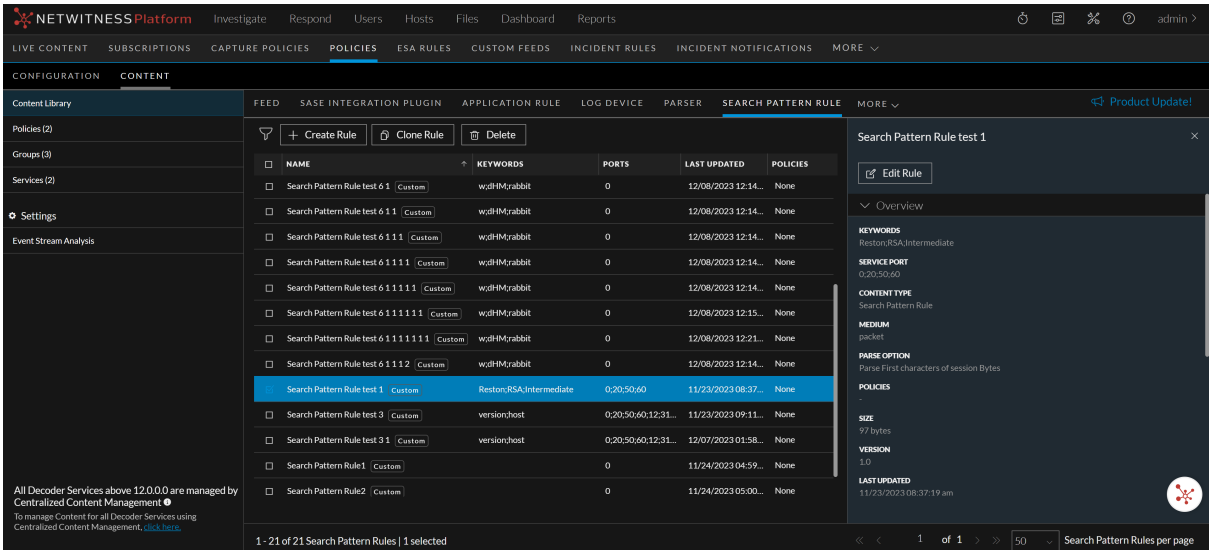
- View Search Pattern Rule Details
- Create a Search Pattern Rule
- Edit a Search Pattern Rule
- Clone a Search Pattern Rule
- Delete a Search Pattern Rule
- Filter Search Pattern Rules
- Filter Search Pattern Rules from Policy Details View



View Search Pattern Rule Details

This topic describes the steps to view the search pattern rule details.

To view the Search Pattern Rule details



1. Go to **(CONFIGURE)** > **Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Click **More** > **Search Pattern Rule**.

The Search Pattern Rule tab is displayed.

5. Click a row to view details about the selected search pattern rule in the right panel.

   The various details of the search pattern rule are displayed.

Create a Search Pattern Rule

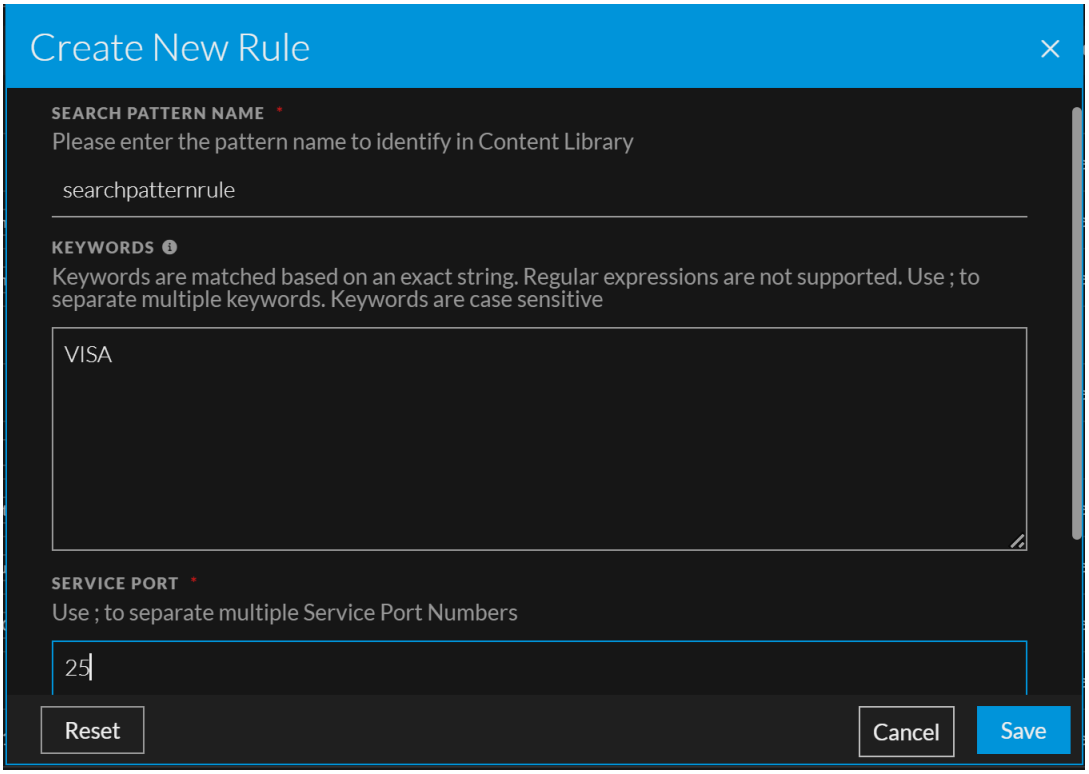
This topic describes the steps to create the search pattern rules.

Prerequisites

- By default, only administrators are allowed to create search patterns. To enable access for analysts, they must contact their administrators.

- To generate the meta keys **found** and **match**, you need to enable the **Search Parser** (found and match), which is disabled by default. To do this, navigate to **(Admin)**> **Services** > select **Decoder** service > > **Config** > **General** > under **Parser Configuration** section, enable the **Search Parser**.

Note: Creating a generic search pattern rule will cause performance issues.



Note: An administrator must enable **source-server.centralpolicy.manage** permission on the source server and **rules.manage** permission on the core devices to allow analysts to create the search pattern rules. For more information, see the "Role Permissions" topic in the *System Security and User Management Guide*.

To create a Search Pattern Rule

1. Go to **(CONFIGURE)** > **Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Click **More** > **Search Pattern Rule**.

   The Search Pattern Rule tab is displayed.
5. Click + **Create Rule**.

   The Create New Rule dialog is displayed.

6. Enter the pattern name to identify them. The name must be unique and can contain a maximum of 256 characters. Use only letters, and numbers.

   Note: Search Pattern names cannot contain spaces.

7. Enter one or more keywords in the **Keywords** text box. Keywords are matched based on an exact string only. Regular expressions (Regex) are not supported.

   Use semicolons (;) to separate multiple keywords. For example, **CreditCard**;**VISA**;**US**. Keywords are case-sensitive. You can enter one or more keywords to improve the chances of detecting an exact string match.

   Note: Non-ASCII characters (for example, é, €, ★ , etc.) are not supported. Enter only ASCII characters when creating a search pattern.

8. Enter one or more port numbers in the **Service Port** field. Use semicolons (;) to separate multiple port numbers. For example, **20**;**21**;**23**.

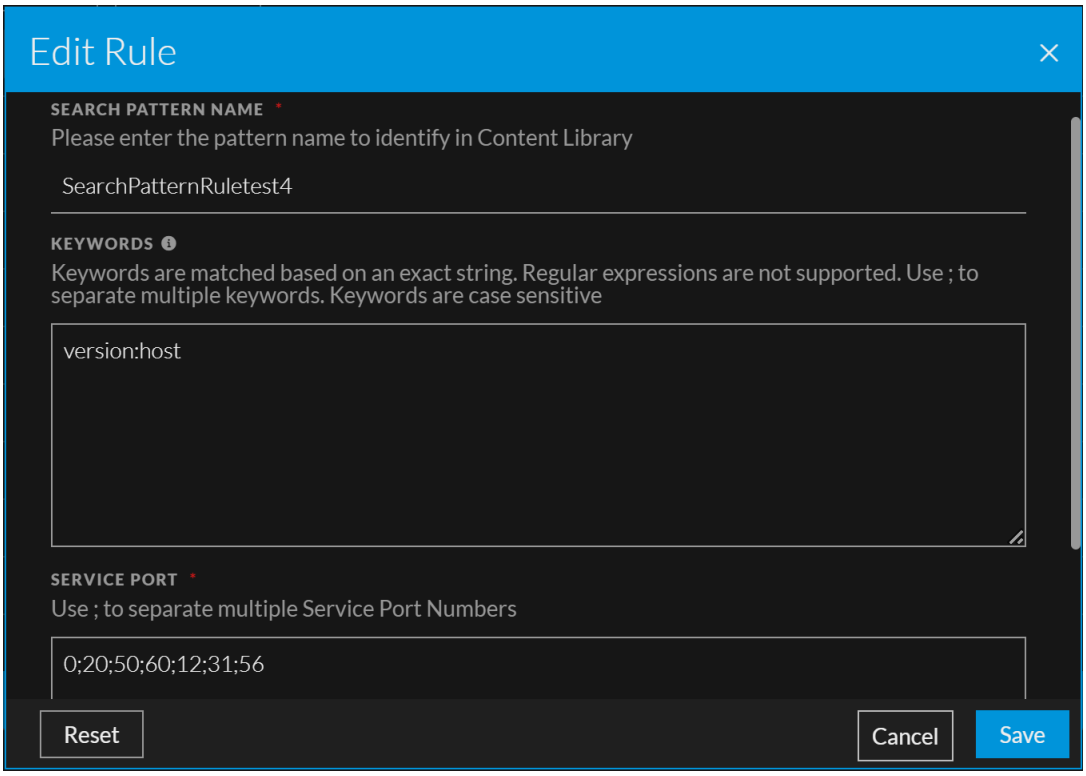
   Note: The port numbers must be between **1** and **65535**.

9. Click **Save** to create the search pattern rule.
10. Click **Reset** to reset the fields.

Edit a Search Pattern Rule

When you edit the search pattern rule, follow these guidelines:

- The search pattern rule name cannot be edited if the rule is assigned to a policy.
- If the rule assigned to a policy is edited, then the administrator must republish the policy for the changes to take effect in the service.
- While editing the rule name, if the name of that search pattern rule is the same as an existing rule, an error message is displayed.



To edit a Search Pattern Rule

1. Go to  **(CONFIGURE)** > **Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Click **More** > **Search Pattern Rule**.

   The Search Pattern Rule tab is displayed.

5. Click a row of the search pattern rule to be modified.
6. Click **Edit Rule** to modify the search pattern rule.

   The Edit Rule dialog is displayed.

7. In the **Edit Rule** panel, do the following:
   a. Enter a unique rule name. The name must be unique and can contain a maximum of 256 characters. Use only letters, and numbers.

      Note: Search Pattern names cannot contain spaces. If the name of that search pattern rule is the same as an existing rule, an error message is displayed.

   b. Enter one or more keywords in the **Keywords** field. Keywords are matched based on an exact string only. Regular expressions (Regex) are not supported.

      Use semicolons (;) to separate multiple keywords. For example, **CreditCard**;**VISA**;**US**. Keywords are case-sensitive. You can enter one or more keywords to improve the chances of detecting an exact string match.

   c. Enter one or more port numbers in the **Service Port** field. Use semicolons (;) to separate multiple port numbers. For example, **20**;**21**;**23**,

      Note: The port numbers must be between **1** and **65535**.

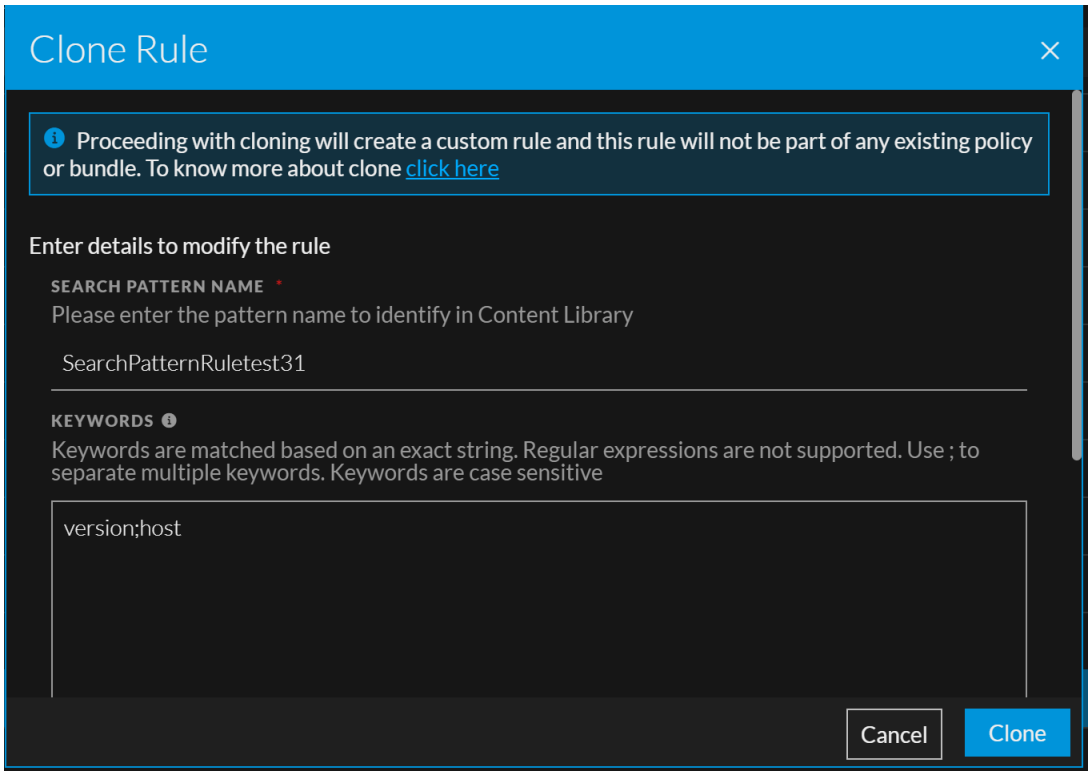
   d. Click **Save** to save the search pattern rule details.

   e. Click **Reset** to reset the fields.

   f. Click **Cancel** to cancel the operation.

Clone a Search Pattern Rule

This topic describes the steps to clone a Search Pattern rule.



Note:
• Cloning will create a search pattern rule and will not be associated with any existing policy.
• You can clone existing search pattern rules to generate new ones with different rule names but with the same parameters.
• You can clone only one search pattern rule at a time.

To Clone a Search Pattern Rule

1. Go to **(CONFIGURE)** > **Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Click **More** > **Search Pattern Rule**.

   The Search Pattern Rule tab is displayed.
5. Select a search pattern rule and click **Clone Rule**.

   The Clone Rule dialog is displayed.

6. In the **Clone Rule** panel, do the following:
   a. Enter a unique name for the search pattern rule clone. The name can contain a maximum of 256 characters. Use only letters, and numbers.

      Note: Rule names are always appended with a number. For example, if the rule has the name **SearchPatternRuletest3**, its name will be changed to **SearchPatternRuletest31** after the cloning.

b. Enter one or more keywords in the **Keywords** text box. Keywords are matched based on an exact string only. Regular expressions (Regex) are not supported.

   Use semicolons (;) to separate multiple keywords. For example, **CreditCard**;**VISA**;**US**. Keywords are case-sensitive. You can enter one or more keywords to improve the chances of detecting an exact string match.

c. Enter one or more port numbers in the **Service Port** field. Use semicolons (;) to separate multiple port numbers. For example, **20**;**21**;**23**,

   Note: The port numbers must be between **1** and **65535**.

d. Click **Clone** to clone the search pattern rule details.

e. Click **Cancel** to cancel the operation.

Delete a Search Pattern Rule

When you delete the search pattern rule, follow these guidelines:

- You cannot delete the search pattern rule if it is associated with a policy. You should first disassociate the search pattern rule from the policy and then delete it.
- If you select a search pattern rule that is associated with a policy and another that is not associated with a policy, the delete button will be disabled.

To delete a Search Pattern Rule

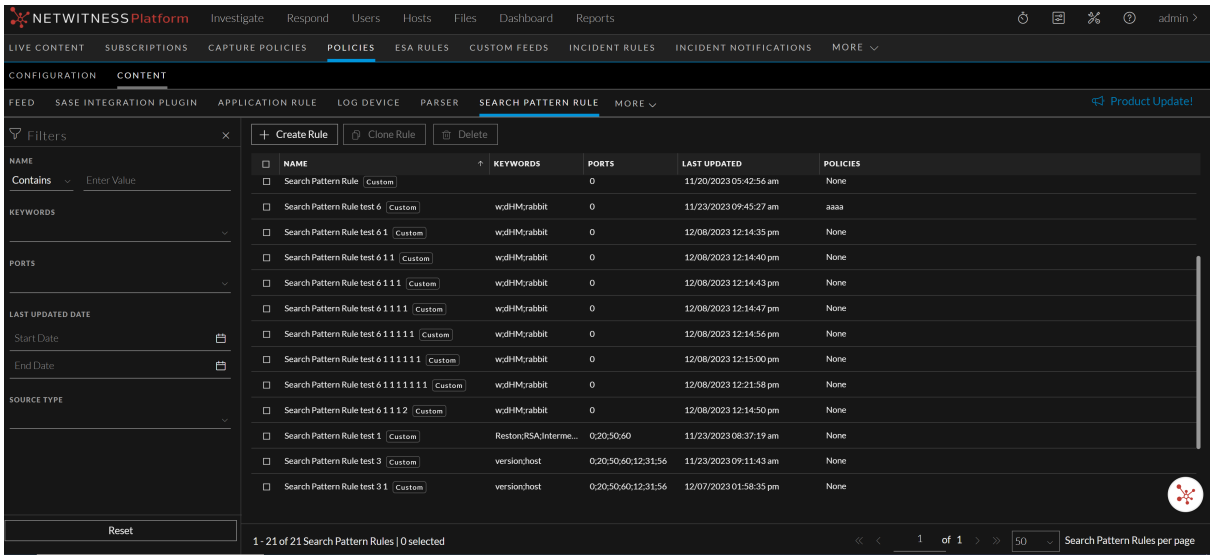
1. Go to **(CONFIGURE)** > **Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.
4. Click **More** > **Search Pattern Rule**.

   The Search Pattern Rule tab is displayed.
5. Select one or more search pattern rules and click **Delete**.

   A confirmation pop-up is displayed.
6. Click **Delete** to permanently delete the selected search pattern rules.

Filter Search Pattern Rules

The Filters panel allows you to filter the list of search pattern rules under the content library based on the name, keywords, ports, last updated date, and source type.



To filter the search pattern rules

1. Go to **(CONFIGURE)** > **Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Content Library**.

4. Click **More** > **Search Pattern Rule**.

   The Search Pattern Rule tab is displayed.

5. By default, the filters panel is hidden. Click the (Filters) icon in the toolbar to expand the filters panel.

6. To search by name:

   - Set the filter option to **Contains** operator from the drop-down list and start typing the name of the search pattern rule. Type one character, and a list of search pattern rules that contain that character is displayed, as you continue to type, the list is filtered to match.
   - Set the filter option to **Equals** operator from the drop-down list and enter the full name. The particular rule will be displayed.

7. To search by keywords, select one or more keywords that are listed in the **Keywords** drop-down list. The filter is an AND operator when searching for multiple keywords, such as **Visa** and **MasterCard**. In this case, the filter results will display all matches that contain both Visa and MasterCard.

8. To search by ports, select one or more port numbers that are listed in the **Ports** drop-down list. The filter is an AND operator when searching for multiple port numbers, such as **25** and **34**. In this case, the filter results will display all matches that contain both 25 and 34.

9. To filter by date range, under the **Last Update Date**, select the start date and end date from the date fields.

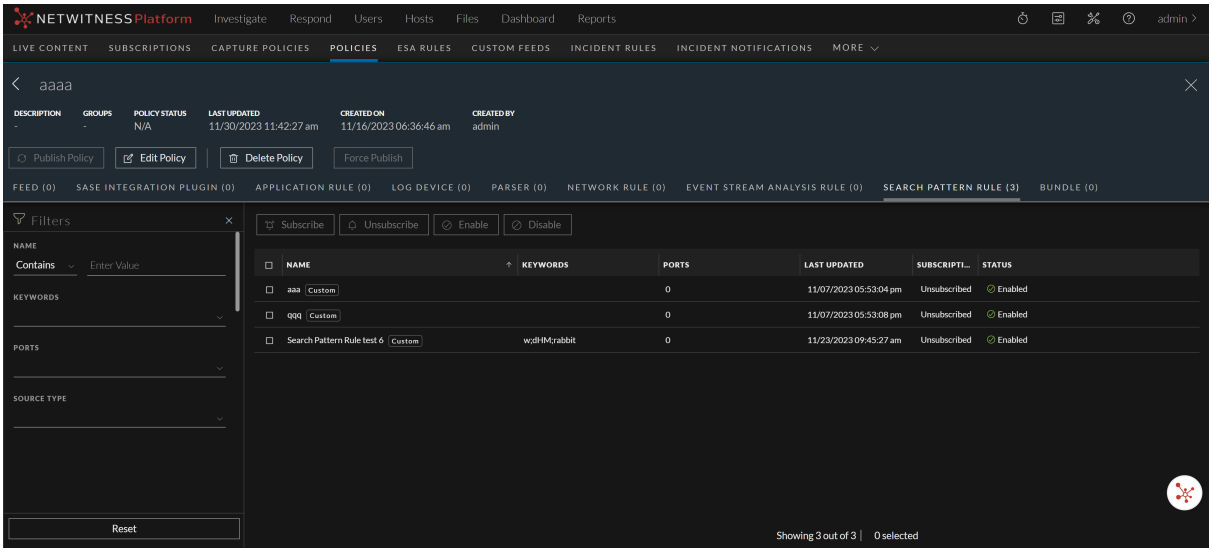
   For example, to filter search pattern rules that were updated between May 1 and May 31, you select May 1 as the start date and May 31 as the end date. You must enter dates in mm/dd/yyyy format, or you can click and pick dates from a calendar.

10. To filter by source type, select one or more sources from the **Source Type** drop-down list. The options are listed below:

    - **Custom**
    - **Live**

11. To hide, click the icon at the top-right of the panel.

The search pattern rules are displayed in the right panel according to the filter you selected. Click **Reset** to clear the existing filter results.



Filter Search Pattern Rules from Policy Details View

The Filters panel allows you to filter the list of displayed search pattern rules in the policy details view based on the name, keywords, ports, source type, enabled/disabled status, subscription status, resource-created date, and last updated date.

To filter the search pattern rules

1. Go to **(CONFIGURE)** > **Policies**.
2. In the policies panel, click **Content**.
3. Click **Policies**. The available policies are displayed.
4. Do one of the following:
   - Click a policy name.
   - Click a row to view details about the selected policy and click **View Details**.

   The policy details view is displayed.
5. Click the **Search Pattern Rule** tab.
6. By default, the filters panel is hidden. Click the (Filters) icon in the toolbar to expand the filters panel.

7. To search by name:
   - Set the filter option to **Contains** operator from the drop-down list and start typing the name of the search pattern rule. Type one character, and a list of search pattern rules that contain that character is displayed, as you continue to type, the list is filtered to match.
   - Set the filter option to **Equals** operator from the drop-down list and enter the full name. The particular rule will be displayed.

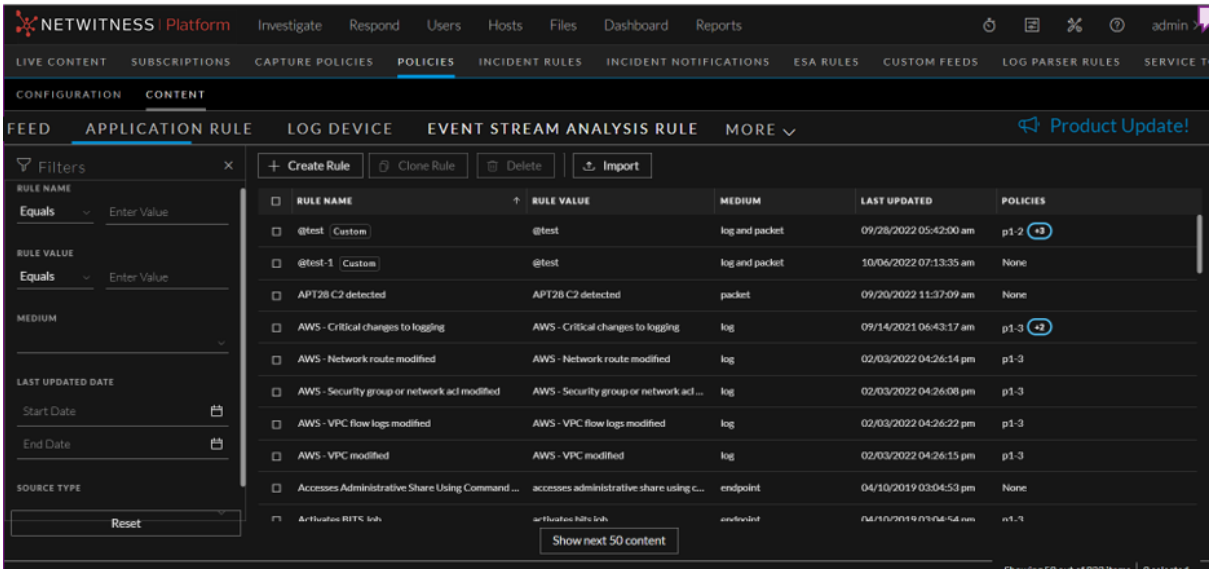
8. To search by keywords, select one or more keywords that are listed in the **Keywords** drop-down list. The filter is an AND operator when searching for multiple keywords, such as **Visa** and **MasterCard**. In this case, the filter results will display all matches that contain both Visa and MasterCard.
9. To search by ports, select one or more port numbers that are listed in the **Ports** drop-down list. The filter is an AND operator when searching for multiple port numbers, such as **25** and **34**. In this case, the filter results will display all matches that contain both 25 and 34.
10. To filter by source type, select one or more sources from the **Source Type** drop-down list. The options are listed below:
    - **Custom**
    - **Live**
11. To filter by enabled/disabled status, select one or more statuses from the **Enabled/Disabled Status** drop-down list. The options are listed below:
    - **Enabled**
    - **Disabled**
12. To filter by subscription status, select one or more statuses from the **Subscription** drop-down list. The options are listed below:
    - **Subscribed**
    - **Unsubscribed**
13. To filter by a resource created date range, under the **Resource Created Date**, select the start date and end date from the date fields.

    For example, to filter contents that were created between July 1 and July 30, you select July 1 as the start date and July 30 as the end date. You must enter dates in **mm/dd/yyyy** format or you click and pick dates from a calendar.
14. To filter by date range, under the **Last Update Date**, select the start date and end date from the date fields.

    For example, to filter search pattern rules that were updated between May 1 and May 31, you select May 1 as the start date and May 31 as the end date. You must enter dates in mm/dd/yyyy format, or you can click and pick dates from a calendar.
15. To hide, click the  icon at the top-right of the panel.

    The search pattern rules are displayed in the right panel according to the filter you selected. Click **Reset** to clear the existing filter results.

Filter Content Rules



The Filters panel allows you to filter the list of displayed contents under the content library based on the name, medium, date range, and source type.

This applies to the following content rule types:

- Feed
- Application Rule
- Log Device
- Lua Parser
- Network Rule
- Event Steam Analysis Rule
- SASE Integration Plugin
- Search Pattern Rule
- Bundle

To filter the content rules

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Content Library**.
4. By default, the filters panel is hidden, click the (Filters) icon in the toolbar to expand the filters panel.

5. To search by rule name:
   - Set the filter option to **Contains** operator from the drop-down list and start typing the name of the rule. Type one character and a list of rules that contain that character is displayed, as you continue to type the list is filtered to match.

- Set the filter option to **Equals** operator from the drop-down list and enter the full name. The particular content type will be displayed.

6. To filter by rule value:
   - Set the filter option to **Contains** operator from the drop-down list and start typing the rule value. Type one character and a list of rules that contain the rule value with that character is displayed, as you continue to type the list is filtered to match.
   - Set the filter option to **Equals** operator from the drop-down list and enter the full rule value. The particular content type will be displayed.
7. To filter by medium, select one or more mediums from the **Medium** drop-down list. The options are listed below:
   - **endpoint**
   - **log**
   - **log and packet**
   - **packet**
8. To filter by date range, under the **Last Update date**, select the start date and end date from the date fields.

   For example, to filter policies that were updated between July 1 and July 30, you select July 1 as the start date and July 30 as the end date. You must enter dates in **mm/dd/yyyy** format or you click and pick dates from a calendar.
9. To filter by source type, select one or more sources from the **Source Type** drop-down list. The options are listed below:
   - **Custom**
   - **Live**
10. To hide, click the  icon at the top-right of the panel.

    The contents are displayed in the right panel according to the filter you selected. Click **Reset** to clear the existing filter results.

Manage Groups

This section contains:

- Create a Group
- View a Group
- Delete a Group
- Edit a Group
- Filter Groups

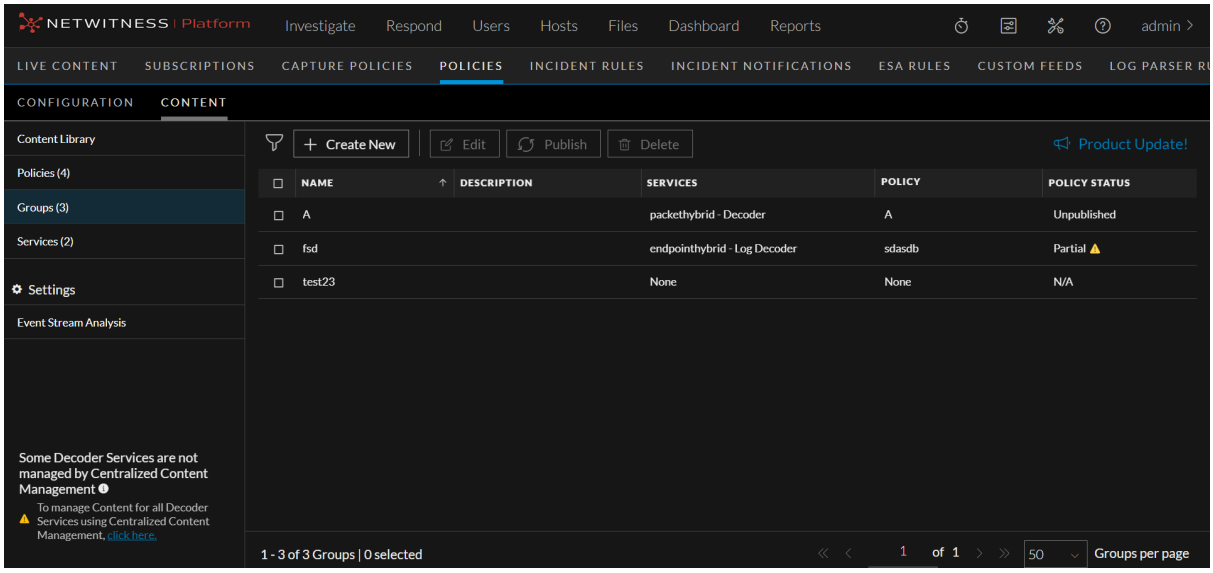
Create a Group

You can create a group with one or more services and assign one policy to it. Groups may be created without any assigned policy; however, a policy must be assigned to a group and Published in order for any content changes to take effect.

To create a Group

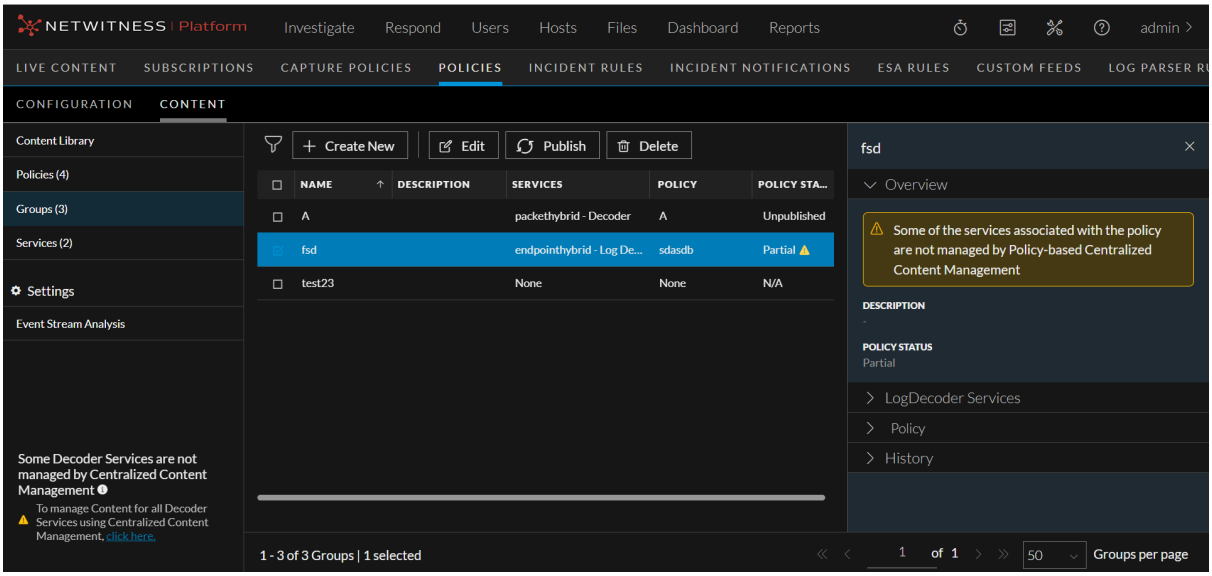
1. Go to  **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Groups**.
4. In the tool bar, click **+ Create New**.
5. In the **New Group** panel, do the following:
   - Enter the name of the group.
   - Enter the description for the group.
6. Click **Next**.
7. In the **Define Group**, click + to assign services to the group.

   Note:
   - A service is disabled if it is assigned to another group.
   - A service is disabled if it is not managed by Policy-based Centralized Content Management.
   - ESA Services are not disabled when assigned to a group, as the ESA services can be assigned to more than one group.
8. Click **Next**.
9. In the **Assign Policies**, click + to assign policies to a group. You can assign only one policy to any particular group.



10. Do any one of the following:
    - Click **Save and Publish** to save and publish the settings.
    - Click **Save and Close** to save the settings.

View a Group



This topic describes the steps to view the properties of Group.

To view the properties of the selected Group

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Groups**. The available groups are displayed. By default, 50 groups are displayed per page. To go to the next page, click . To go to the last page, click .

4. Click a row to view details about the selected group in the right panel.

Caution:

- An icon is displayed in the Groups View indicating policy status unpublished, if any services are part of the selected group and do not have any deployment then some of the associated correlation services require ESA deployments.
- An icon is displayed in the Groups View, indicating that the policy status failed for multiple reasons. Please see the groups overview section in the UI to find the failure reason and the workaround.

Delete a Group

You can delete one or more groups. Once the group is deleted, all services will be removed from the group and all the policy content will be deleted from the services.

To delete a Group

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Groups**. The available groups are displayed.
4. Select one or more Groups and click **Delete**.

   The Delete Groups dialog is displayed.
5. To delete the deployed content from the services upon deleting the group, select the option **Delete deployed content from the services on group removal**. For ESA service, the content will be deleted upon deleting the group.
6. Click **Delete** to permanently delete the selected group.

   The confirmation message is displayed.

Note:
- For a group with multiple services, even if we fail to delete a particular service under the group, the other services will get deleted. The service which is not deleted will be in **Failed** state.
- The group status changes to **Failed** if group deletion fails for any particular reason.

Edit a Group

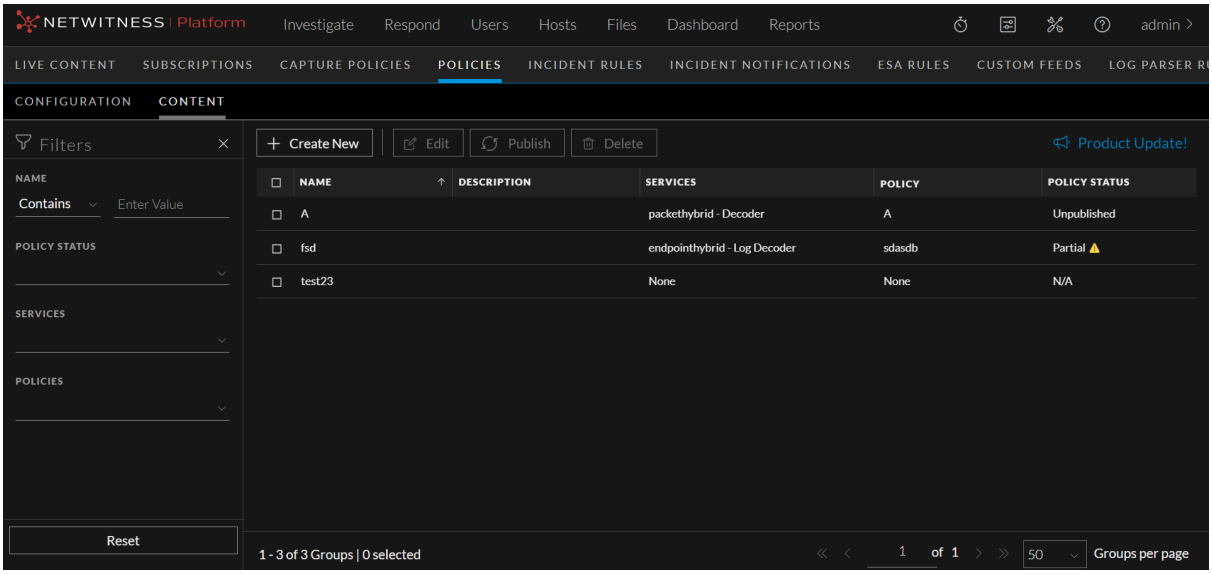
You can edit the properties of the group at any point in time. The status of the updated group is unpublished if you change the service or policies in a group. If you just change the group name and description, then the status remains published (if it is already published).

To edit the selected Group

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Group**. The available groups are displayed.
4. Select a group to edit and click **Edit**.
5. Make the required changes in the group.
6. Do any one of the following:
   - Click **Save and Publish** to save and publish the policy.

     Note:
     - While removing a service from the group, you can opt to either delete the content of the service and remove the service or just remove the service from the group. While removing a service that has Log Device content, you can delete the Custom Parser and disable the Base Log Device Parser from the service.
     - While removing the group from the policy, the ESA content will be deleted by default.
   - The policy will be listed under the Unpublished category.
   - Click **Save and Close** to save the settings and return to the Policies view.

Filter Groups



The Filters Panel for content group allows you to filter the list of displayed groups, based on the group name, policy status, services and policies.

To filter the Groups

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Groups**. The available groups are displayed.

4. To filter the groups, click . The filter panel is displayed.

5. On the filter panel, do the following:

   a. Select the **Name** drop-down value as either **Equals** or **Contains**. To search the group name using the **Contains** operator, set the filter option to **Contains** operator from the drop-down list and start typing the name of the group. Type one character and a list of group that contain that character is displayed, as you continue to type, the list is filtered to match. To search the group name using the **Equals** operator, set the filter option to **Equals** operator from the drop-down list and enter the full name. The particular group name will be displayed.

   b. Select the **Policy Status** from the drop-down list. The various drop-down values are:

      i. **Published**: Groups that are published to use.

      ii. **Unpublished**: Groups that are saved but not published.

      iii. **Failed**: Groups that are failed to publish.

iv. **N/A**: Groups for which publication status is not applicable.

v. **Partial**: Groups that are partially published.

c. Select the **Services** from the drop-down list.

d. Select the **Policies** from the drop-down list.

e. To reset the fields, click **Reset**.

Manage Policies

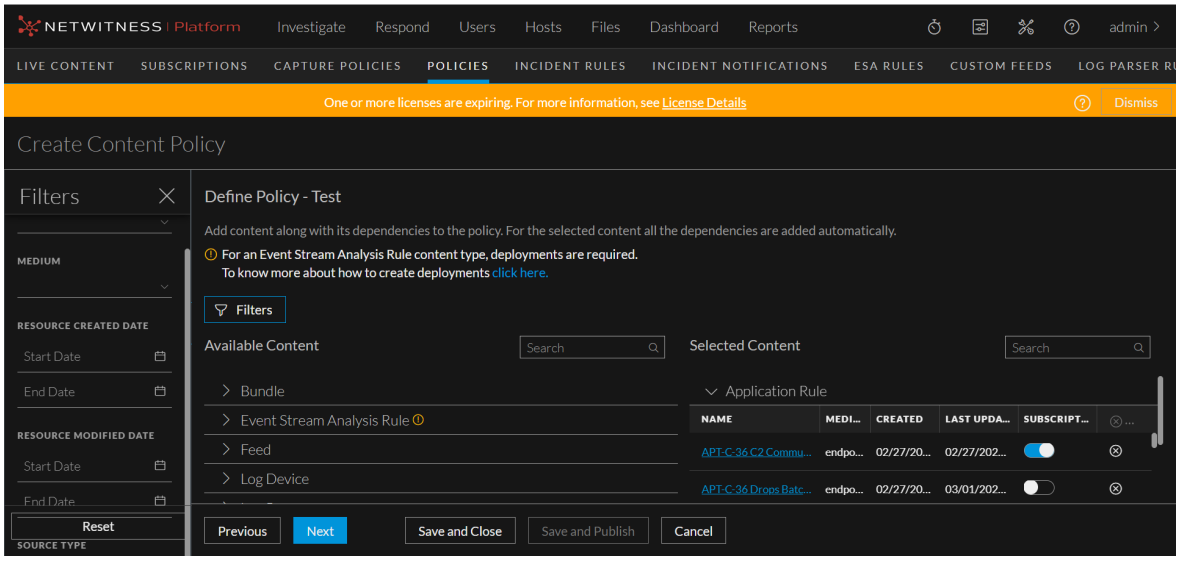
This section contains:

- Create and Publish Policies
- Clone a Policy
- Delete a Policy
- Edit a Policy
- View a Policy
- Enable Content for a Policy
- Disable Content for a Policy
- Subscribe Content for a Policy
- Unsubscribe Content for a Policy
- Filter Policies
- Filter Policy Content Details
- Merge Policy with ESA Content

Create and Publish Policies

You can create a policy and assign it to one or more groups.

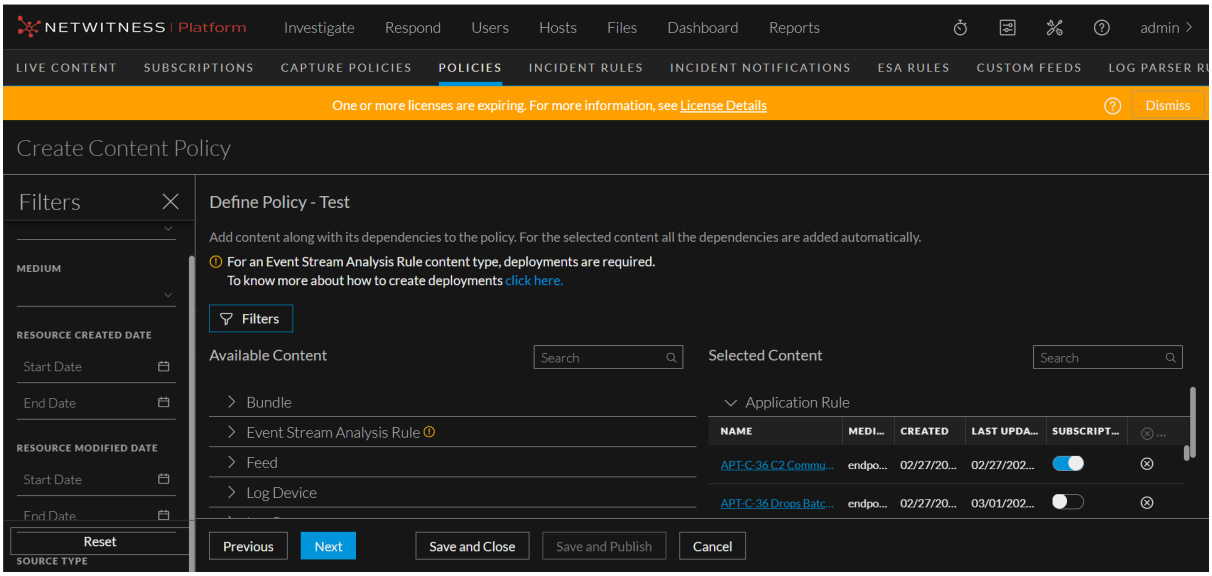
To create a Policy



1. Go to  **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Policies**.

   The available policies are displayed.
4. Click **+ Create New** to add a new policy.
5. In the **New Policy** panel, do the following:
   - Enter a unique policy name.
   - Enter a description for the policy.
6. Click **Next**.
7. In the **Available Content**, select the content type and click + to add the content to the policy. To add all content based on the resource type, click . After you add the content, you can enable subscription (if required) by clicking subscribed toggle. Once the content is subscribed the updates are pushed automatically. To conveniently search the available content, type the initial content text in

the **Search** box available under the **Available Content** .To conveniently search the selected content, type the initial content text in the **Search** box available under the **Selected Content** .

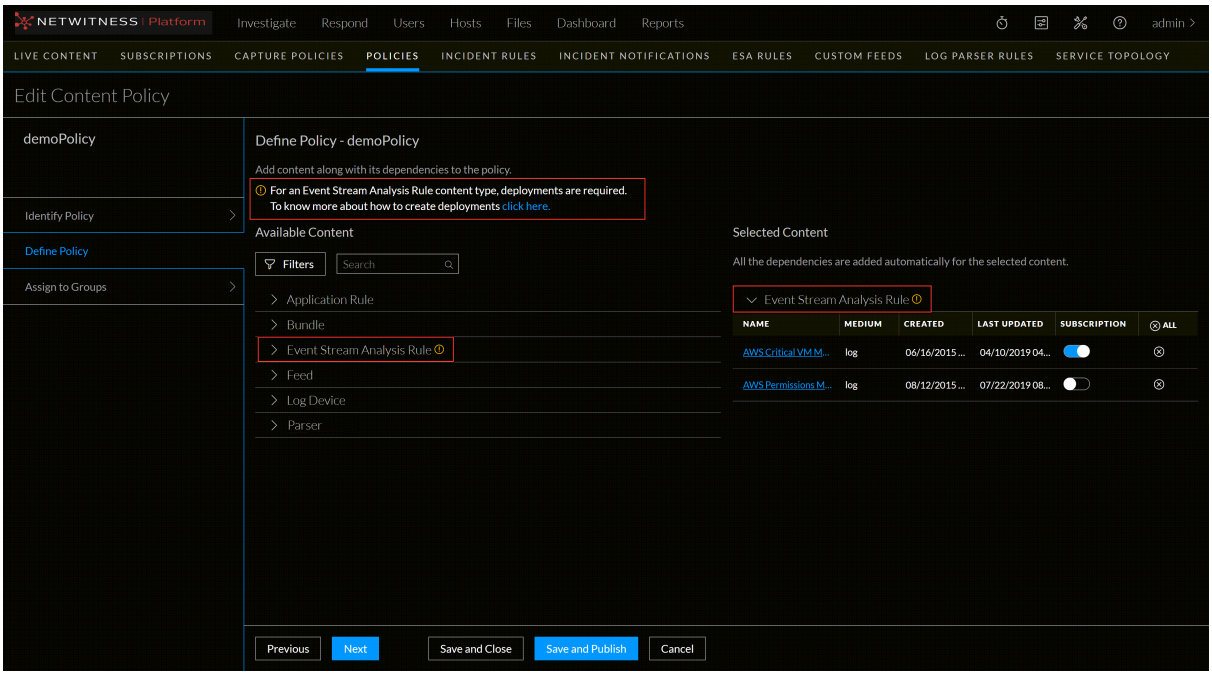


8. To filter both available and selected content, do the following:

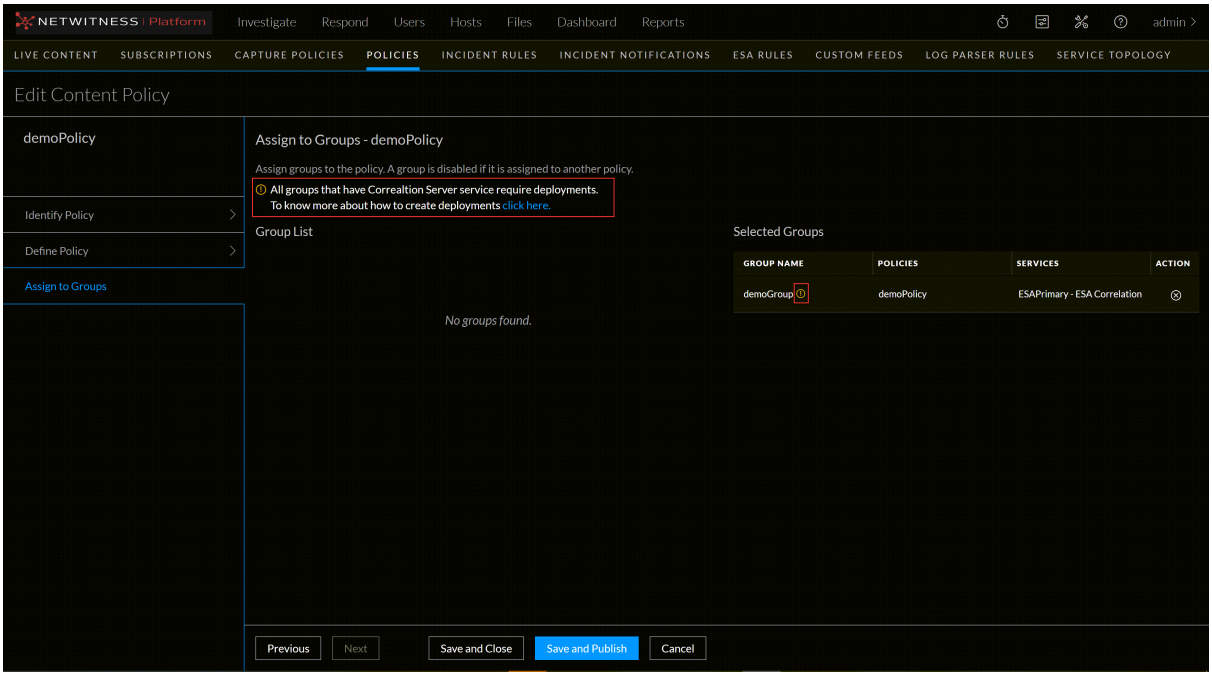
   - Click the  icon. The filter panel window is displayed.

   - Select the **Resource Types** from the available drop-down values.
   - Select the **Medium** from the available drop-down values.
   - Select the **Resource Created Date** and **Resource Modified Date**.
   - To reset the fields, click **Reset**.

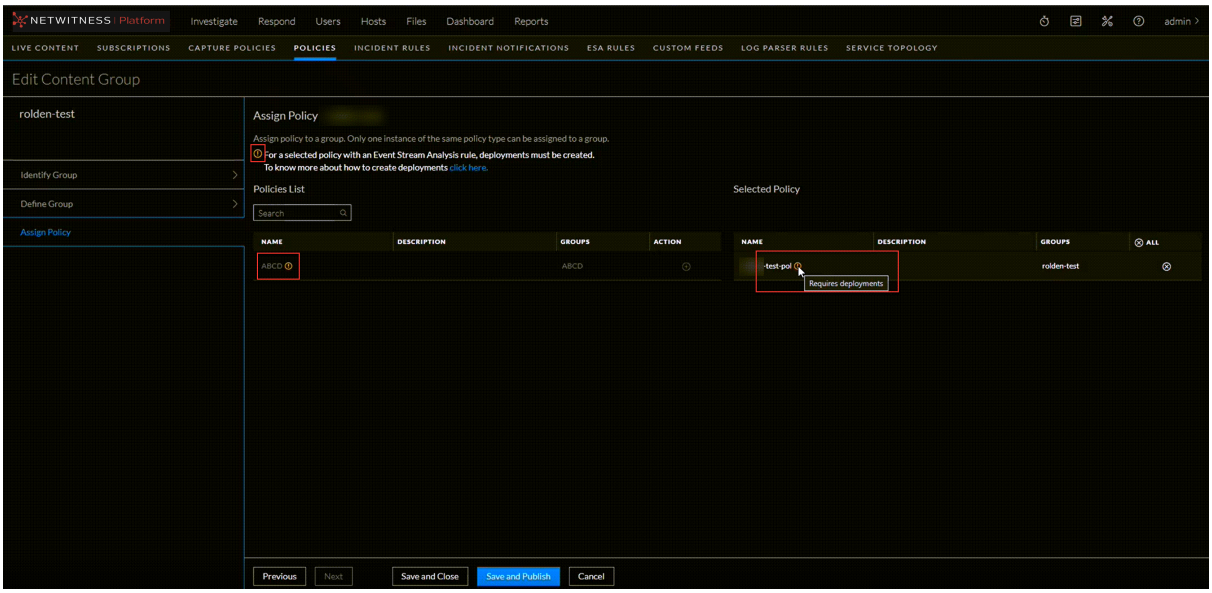
Note: Subscription is not allowed for custom content.



9. **Note:**
- All the dependencies are added automatically for the selected content. You can click on the content name highlighted in blue and look for details such as content description, content type, resources and dependencies and so on. You can also add and subscribe the resource from the details view.

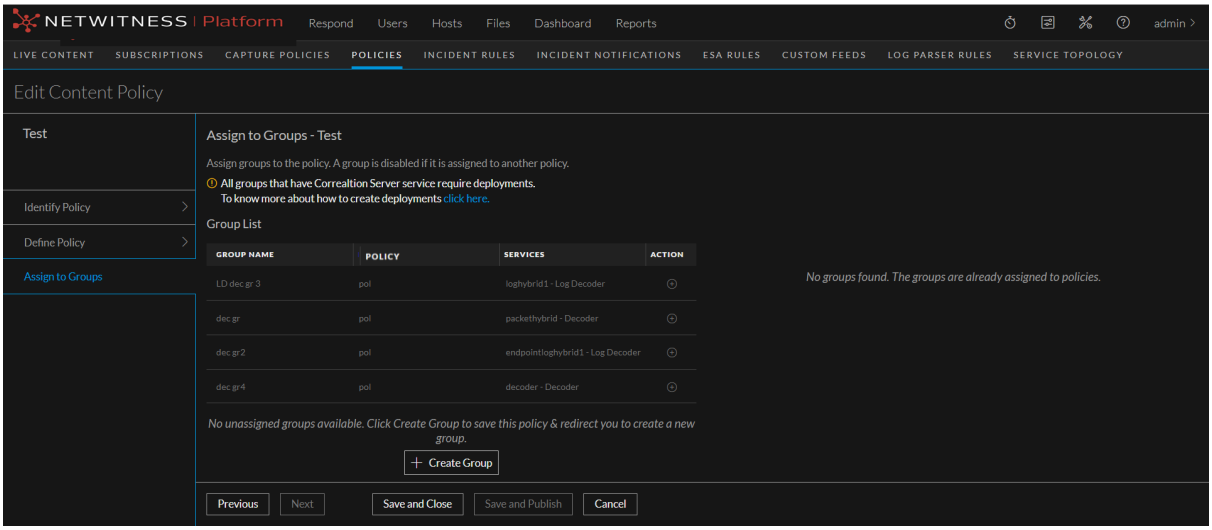


A caution icon is displayed to create a deployment on three scenarios.



- To implement the **Event Stream Analysis Rule** content type, you must have a deployment.

- All groups that have correlation server service must have a deployment.



- For any selected policy with an ESA rule, deployment are must be created.

To create and manage deployments, refer to Manage Deployments feature.

10. In the Group List, click + to assign groups to the policy.

Note: A group is disabled if another policy of the same type is already assigned to this group.

11. If there are no unassigned groups available, click 

to save the policy and redirect you to **Create New Group** screen. For more information on creating a new group, see Create a Group feature.

12. Click **Save and Publish** to save and publish the settings.

Note: You can also publish a policy from **Policy Details** screen. For more information on publishing a policy from **Policy Details** screen, refer View a Policy feature.

13. Click **Cancel** to cancel the publish content dialog.

14. Click **Save and Close** to save the settings.

IMPORTANT:
- From 12.3 version onwards, contents of services are not wiped out while publishing the first policy.
- The endpoint risk scoring requires certain application rules. Refer Endpoint Risk Scoring Rules to view the list of these application rules.

Clone a Policy

When you clone a policy, all the content from the old policy is copied to the new policy. The cloned policy can be assigned to a new group. You can clone only one policy at a time.

To clone a Policy

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Policies**. The available policies are displayed.
4. Select a policy to clone and in the More actions drop-down list in the tool bar, click **Clone**.

   The policy is cloned successfully.

Delete a Policy

Deleting a policy removes all content from the associated group.

To delete a Policy

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Policies**. The available policies are displayed.
4. Select one or more policies and in the More actions drop-down list in the tool bar, click **Delete**.

   The **Delete Policies** dialog is displayed.
5. To delete the deployed content from the group's services upon deleting the policy, select the option **Delete deployed content from the group's services on policy removal**. For ESA service, the content will be deleted upon deleting the policy.
6. Click **Delete** to permanently delete the selected policy.

   Deletion will take immediate effect and the policy will no longer be available in any group.

Note:
- While deleting a policy that has Log Device content, you can delete the Custom Parser and disable the Base Log Device Parser from the service.
- The services associated with this policy still require a restart if the restart is pending.
- You can also delete a policy from **Policy Details** screen. For more information on deleting a policy from **Policy Details** screen, refer View a Policy feature.
- The policy status changes to **Failed** if policy deletion fails for any particular reason.

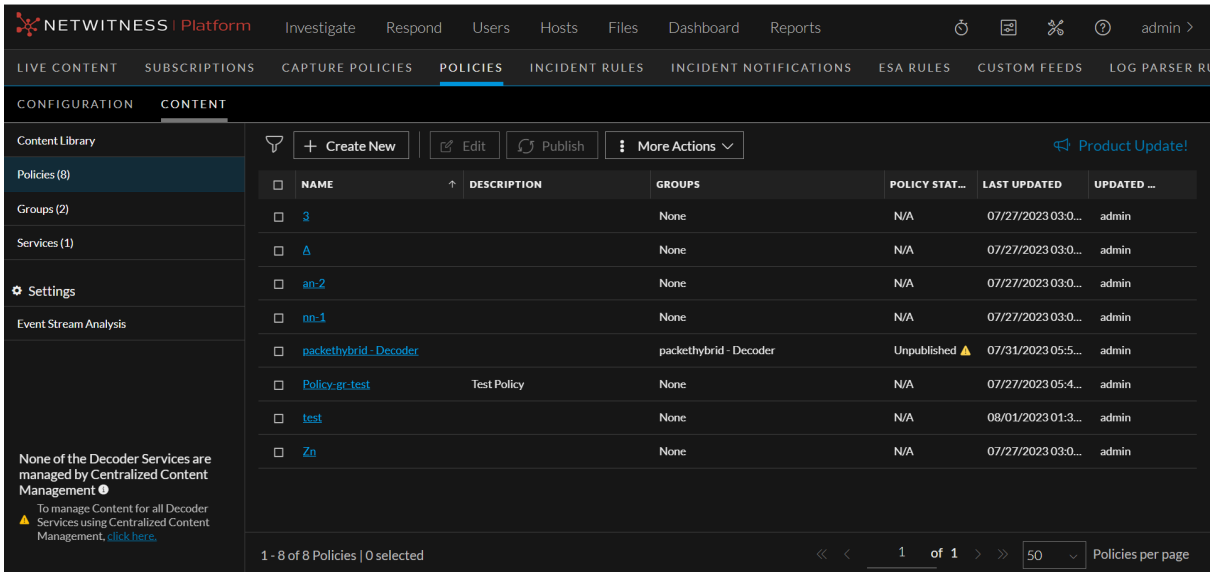
Edit a Policy

You can edit the content and settings of the policies. Once the policy is edited, the changes in the policy are reflected upon saving the policy. The changes are applied to the service once published. After saving and before publishing, the publication status of the changed policy is set to **Unpublished** if any settings are changed.

To edit a Policy

1. Go to  **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Policies**. The available policies are displayed.
4. Select a policy to edit and click **Edit**.
5. Make the required changes in policy.
6. Do any one of the following:
   - Click **Save and Publish** to save and publish the policy. The policy will be listed under the Unpublished category.

     Note:
     - While removing a service from the group, you can opt to either delete the content of the service and remove the service or just remove the service from the group. While removing a service that has Log Device content, you can delete the Custom Parser and disable the Base Log Device Parser from the service.
     - While removing the group from the policy, the ESA content will be deleted by default.
   - Click **Save and Close** to save the settings and return to the Policies view.

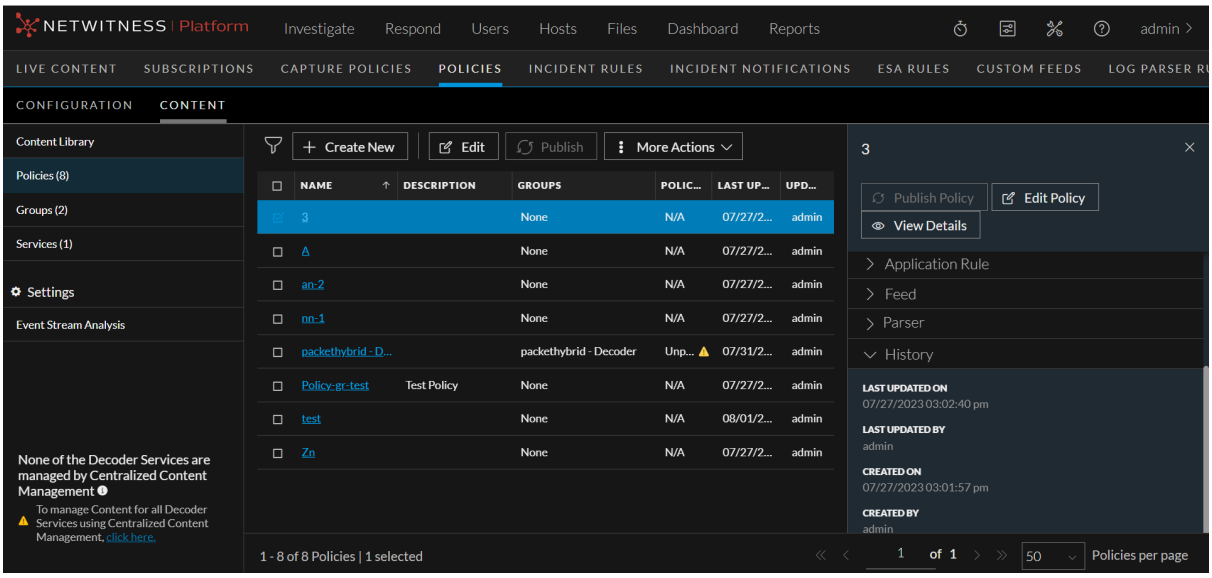


Note: You can also edit a policy from **Policy Details** screen. For more information on editing a policy from **Policy Details** screen, see View a Policy feature.

View a Policy

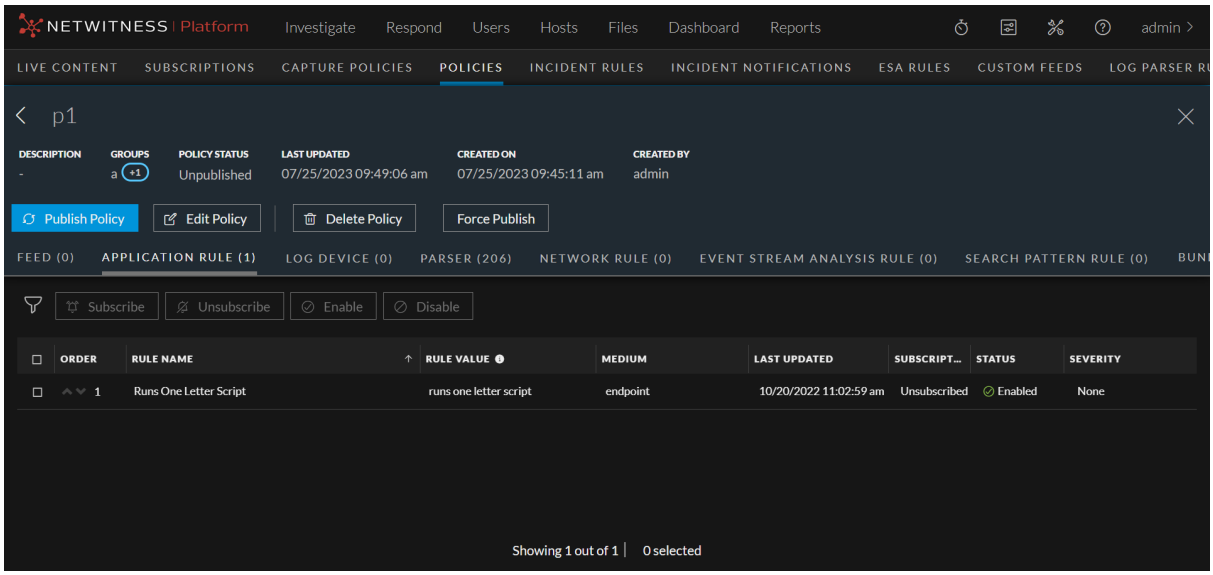
This topic describes the steps to view the properties of a Policy.

To view properties of the selected Policy



1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Policies**. The available policies are displayed. By default, 50 policies are displayed per page. To go to the next page, click . To go to the last page, click .

Caution:



- An icon is displayed in the Policy View indicating policy status unpublished, if any services are part of the selected policy and do not have any deployment then some of the associated correlation services require ESA deployments.
- An icon is displayed in the Policy View, indicating that the policy status failed for multiple reasons. Please see the policy overview section in the UI to find the failure reason and the workaround.

4. From the policy listing page, you can perform the following actions:
   - Select a policy and click **Edit** to edit the policy. For more information on editing a policy, seeEdit a Policy feature.
   - Select the policy and click **Publish** to publish the policy if the policy is unpublished.
   - Select the policy and click **More Actions > Assign to Groups** to assign policy to available group.
   - Select the policy and click **More Actions > Clone** to clone the policy. For more information on cloning a policy, seeEdit a PolicyClone a Policy feature.
   - Select the policy and click **More Actions > Delete** to delete the policy. For more information on deleting a policy, see Delete a Policy feature.
   - Select the policy and click **More Actions > Force Publish** to force publish the policy. This action allows you republish all the content irrespective of the policy status.
5. Click a row to view details about the selected policy on the side panel.

6. To change the order of application rule assigned to the policy, do the following:
   1. To move the application rule or network down the order, click in the **Order** column.
   2. To move the application rule up the order, click in the **Order** column.
   3. You can also manually enter the order number in the **Order** column.
7. To change the order of network rule assigned to the policy, do the following:
   1. Click **Network Rules** tab.
   2. To move the network rule or network down the order, click in the **Order** column.
   3. To move the network rule up the order, click in the **Order** column.
   4. You can also manually enter the order number in the **Order** column.

   IMPORTANT: It is recommended not to order application rules or network rules deployed on the service from Service Config page if the service is part of Centralized Content Management.
8. Click the policy to view the details on the policy in a new page.

9. From the policy details page, you can perform the following actions:
   - To edit the policy, click **Edit Policy**. For more information on editing a policy, see Edit a Policy feature.
   - To delete the policy, click **Delete Policy**. For more information on deleting a policy, see Delete a Policy feature.
   - To publish the policy, click **Publish Policy**. For more information on creating and publishing a policy, see Create and Publish Policies feature.
   - To force publish a policy, click **Force Publish**. This action allows you republish all the content irrespective of the policy status.
   - To filter the content, click . For more information on filtering policy content details, see Filter Policy Content Details feature.
   - To enable or disable subscription, click **Subscribe** or **Unsubscribe** respectively.

     Note:
     - Subscription is not allowed for custom content.
     - The **Subscribe** and **Unsubscribe** button is disabled if any one of the content selected is custom.

Enable Content for a Policy

This topic describes the steps to enable the content for a Policy.

To enable content

1. Go to  **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Policies**.

4. Click the policy name to view the policy details.
5. In the **Application Rule**, **Network Rule**, **Feed**, **Log Device**, **SASE Integration Plugin**, **Search Pattern Rule** or **LUA Parser** panel, click the row to select the content to be enabled. You can either select all content or select any specific content to be enabled.
6. Click **Enable**.

If a Custom Log Device has a Base Parser as its dependency, then:

- The enable or disable status of the Custom Log Device will be same as that of the enable or disable status of Base Parser.
- You will not be able to enable or disable the Custom Parser.

Disable Content for a Policy

This topic describes the steps to disable the content for a Policy.

To disable content

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Policies**.
4. Click the policy name to view the policy details.
5. In the **Application Rule**, **Network Rule**, **Feed**, **Log Device**, **SASE Integration Plugin**, **Search Pattern Rule** or **LUA Parser** panel, click the row to select the content to be disabled. You can either select all content or select any specific content to be disabled.
6. Click **Disable**.

If a Custom Log Device has a Base Parser as its dependency, then:

- The enable or disable status of the Custom Log Device will be same as that of the enable or disable status of Base Parser.
- You will not be able to enable or disable the Custom Parser.

Subscribe Content for a Policy

This topic describes the steps to subscribe content for a Policy.

To subscribe content

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Policies**.
4. Click the policy name to view the policy details.

5. In the **Application Rule**, **Network Rule**, **Feed**, **Log Device**, **LUA Parser**, **Event Stream Analysis Rule**, **SASE Integration Plugin** or **Bundles** panel, click the row to select the content to be subscribed. You can either select all content or select any specific content to be subscribed.
6. Click **Subscribe**.

Unsubscribe Content for a Policy

This topic describes the steps to unsubscribe the content for a Policy.

To unsubscribe content

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Policies**.
4. Click the policy name to view the policy details.
5. In the **Application Rule**, **Network Rule**, **Feed**, **Log Device**, **LUA Parser**, **Event Stream Analysis Rule, SASE Integration Plugin** or **Bundles** panel, click the row to select the content to be unsubscribed. You can either select all content or select any specific content to be unsubscribed.
6. Click **Unsubscribe**.

Filter Policies

The Filters Panel allows you to filter the list of displayed policies, based on the policy status and service type:

- **Decoder**
- **Log Decoder**
- **Concentrator**

Additionally, you can filter based on publication status or service status:

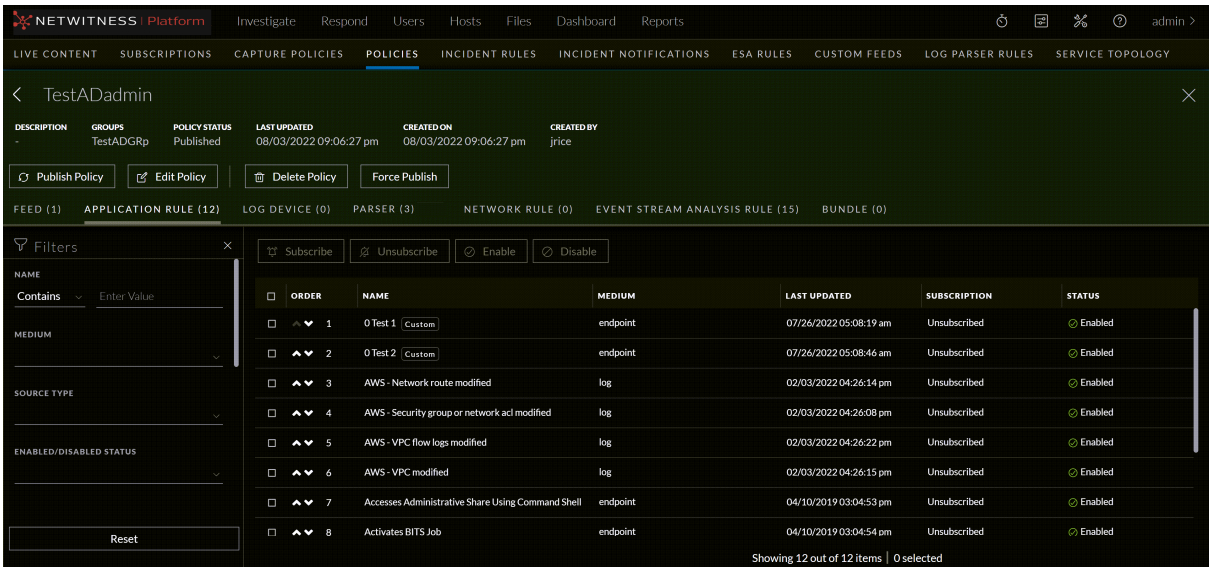
- **Published**: Policies that are published to use.
- **Unpublished**: Policies that are saved but not published.
- **Failed**: Policies that are failed to publish.
- **N/A**: Policies for which publication status is not applicable.

The **Filters** panel can be hidden or displayed:

- To display if hidden, click the icon in the toolbar.
- To hide, click the icon at the top-right of the panel.

Filter Policy Content Details

The Filters panel allows you to filter the list of displayed content in the policy details view based on the name, medium, source type, enabled/disabled status, subscription status, severity, resource created date, and last updated date.



This applies to the following content types:

- Feed
- Application Rule
- Log Device
- Lua Parser
- Network Rule
- Event Steam Analysis Rule
- SASE Integration Plugin
- Search Pattern Rule
- Bundle

To filter policy content details

1. Go to  **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Policies**. The available policies are displayed.
4. Do one of the following:
   - Click a policy name.
   - Click a row to view details about the selected policy and click **View Details**.

   The policy details view is displayed.

5. By default, the filters panel is hidden, click the (Filters) icon in the toolbar to expand the filters panel.
6. To search by name:
   - Set the filter option to **Contains** operator from the drop-down list and start typing the name of the content rules. Type one character and a list of content rules that contain that character is displayed, as you continue to type the list is filtered to match.
   - Set the filter option to **Equals** operator from the drop-down list and enter the full name. The particular content type will be displayed.
7. To filter by medium, select one or more mediums from the **Medium** drop-down list. The options are listed below:
   - **endpoint**
   - **log**
   - **log and packet**
   - **packet**
8. To filter by source type, select one or more sources from the **Source Type** drop-down list. The options are listed below:
   - **Custom**
   - **Live**
9. To filter by enabled/disabled status, select one or more statuses from the **Enabled/Disabled Status** drop-down list. The options are listed below:
   - **Enabled**
   - **Disabled**

   Note: Enabled/Disabled Status filtering is not applicable to Event Stream Analysis Rule content.

10. To filter by subscription status, select one or more statuses from the **Subscription** drop-down list. The options are listed below:
    - **Subscribed**
    - **Unsubscribed**
11. To filter by severity of the content, under the **Severity** field, select the drop-down values as either **Low**, **Medium**, **High** or **Critical**.

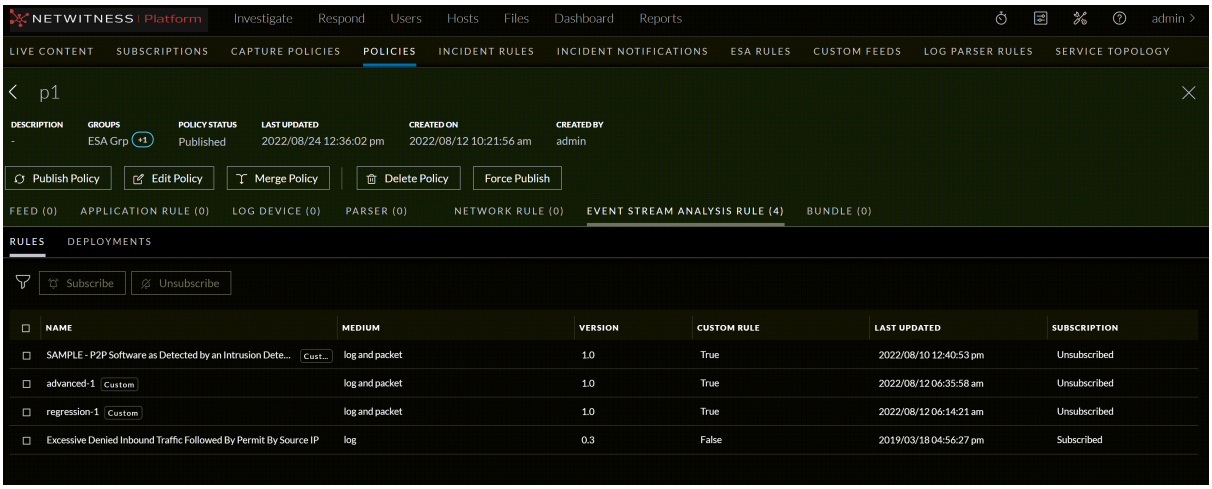
    Note: This field is applicable only for the content type 'Application Rule'.
12. To filter by a resource created date range, under the **Resource Created Date**, select the start date and end date from the date fields.

    For example, to filter contents that were created between July 1 and July 30, you select July 1 as the start date and July 30 as the end date. You must enter dates in **mm/dd/yyyy** format or you click and pick dates from a calendar.
13. To filter by date range, under the **Last Update date**, select the start date and end date from the date fields.

    For example, to filter contents that were updated between July 1 and July 30, you select July 1 as the start date and July 30 as the end date. You must enter dates in **mm/dd/yyyy** format or you click and pick dates from a calendar.
14. To hide, click the icon at the top-right of the panel.

    The contents are displayed in the right panel according to the filter you selected. Click **Reset** to clear the existing filter results.

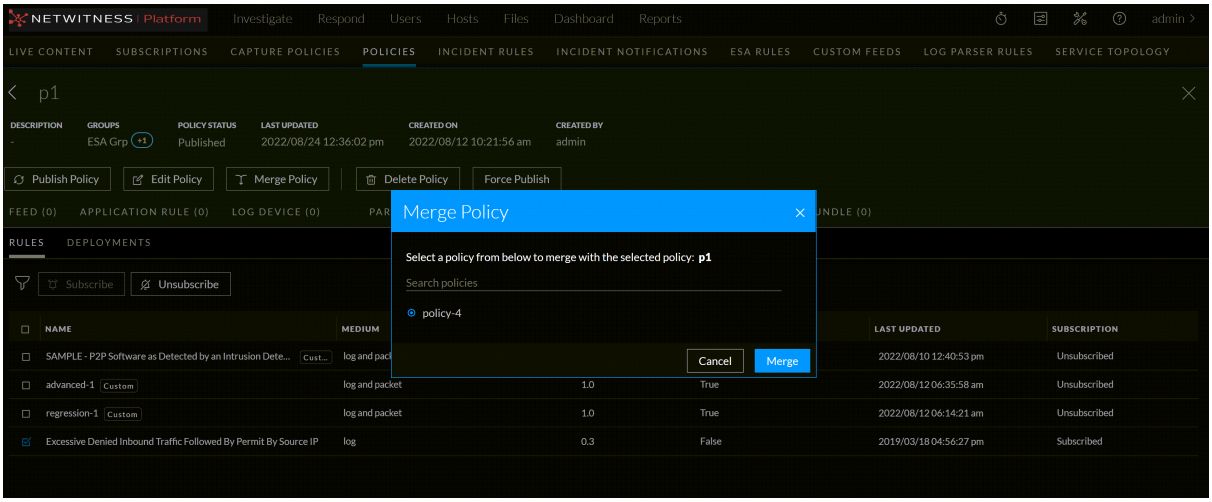
Merge Policy with ESA Content



From the 12.1 version, the ESA content is managed through the **(CONFIGURE)** > **Policies** page. After you upgrade to the 12.1 version, all the existing ESA deployments will be migrated to the policies and groups view. The **Merge Policy** button will be available only for the policy having ESA content and can only be merged with a policy with no ESA content.

Note: On merging a policy with another policy, the original policy gets deleted, and the other policy gets updated with the original policy content.

To merge Policy with an ESA Content



1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Select a policy having ESA content to merge with another policy.

   The selected policy with ESA content view is displayed.

4. Click **Merge Policy**.

   The Merge Policy dialog is displayed.

5. Select a policy from the list or search for the name and Click **Merge**.

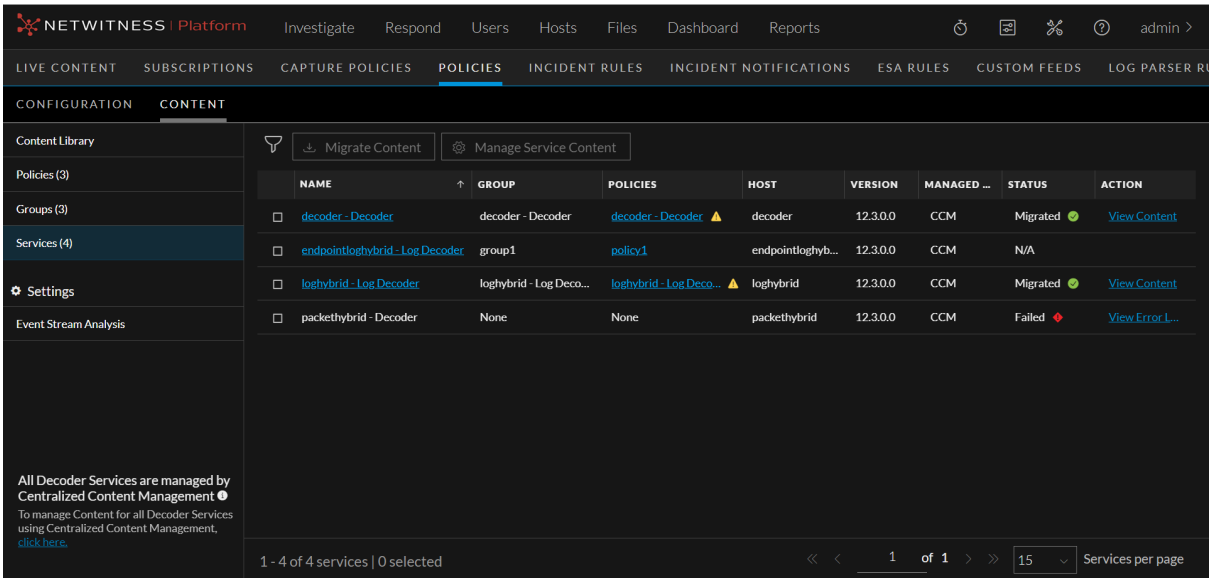
   A confirmation pop-up is displayed.

6. Click **Confirm**.

Manage Services

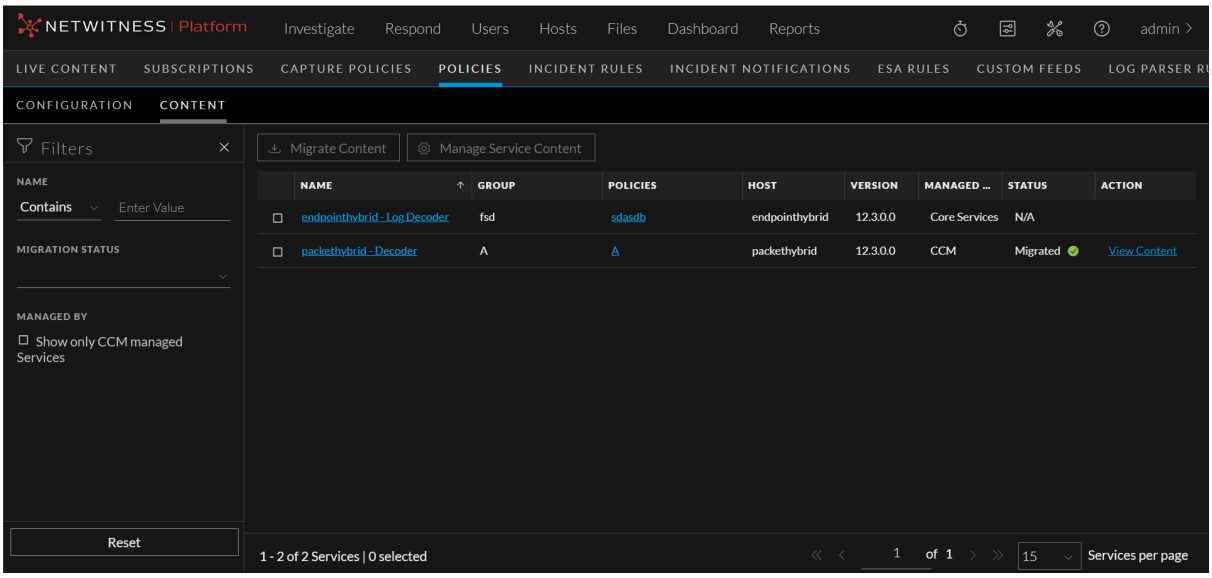
A service performs a unique function, such as collecting logs or archiving data. Each service runs on a dedicated port and is modeled as a plug-in to enable or disable, according to the function of the host.

This sections contains:



- Migrate Content from Service
- View a Service
- Enable or Disable CCM for Individual Decoder Services

View a Service



This topic describes the steps to view the details of a service.

To view details of the selected Service

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Click **Services**. The list of services are displayed. By default, 15 services are displayed per page. To go to the next page, click . To go to the last page, click .

4. To filter the services, click . The **Filters** panel is displayed.

5. On the **Filters** panel, do the following:

   i. Select the **Name** drop-down value as either **Equals** or **Contains**. To search the service name using the **Contains** operator, set the filter option to **Contains** operator from the drop-down list and start typing the name of the service. Type one character and a list of service that contain that character is displayed, as you continue to type, the list is filtered to match. To search the service name using the **Equals** operator, set the filter option to **Equals** operator from the drop-down list and enter the full name. The particular service name will be displayed.

   ii. Select the **Migration Status** drop-down value.

   iii. Select **Show only CCM Managed Services** check-box under the **Managed By** field to display only the CCM managed services.

   iv. To reset the fields, click **Reset**.

6. Click the service to view the details of the service. The different details of the service are displayed. These details include the contents which will be deployed to the services from CCM policies.

7. To filter the content based on various parameters, click .
8. Click the content to view the details of the content on the right side panel. The complete content details such as **Overview**, **Resources and Dependencies**, and **History** are displayed.

9. To view the details of the policy for the migrated service, click the policy name present under the **Policies** column in the **Service List** page.

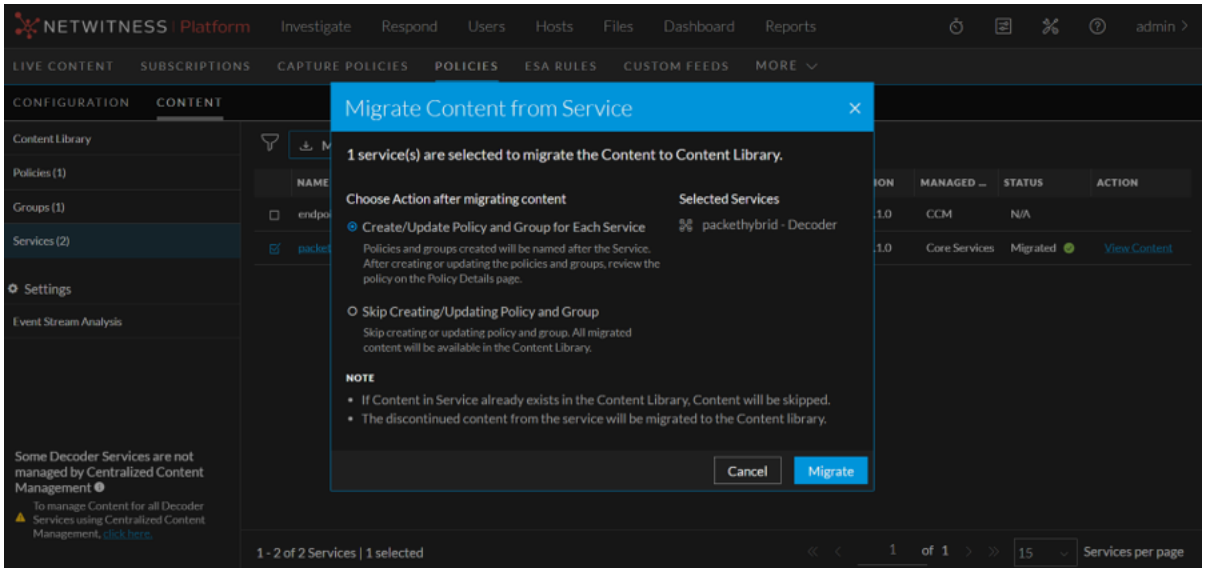
   For more details on the policy details, see View a Policy feature.

10. To view the details of the migrated content for the service, click the **View Content** hyperlink present under the **Action** column in the **Service List** page.
11. To view the details of the logs for failed migration, click the **View Error Log** hyperlink present under the **Action** column in the **Service List** page.

For more details on the migrating content from service, viewing migrated content and viewing error logs, see Migrate Content from Service feature.

Migrate Content from Service

This option allows you to migrate the contents of 12.3 and above version services.



To migrate Content from Service

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Services**. The list of services are displayed.
4. Select the services from which you want to migrate the content.

   Note: By default, you can select up to 5 services for migration. This also includes the services which are under migration. However, you can modify this number from **Admin -> Source Server -> Explore -> Central/Content -> Migration**.

5. Click **Migrate Content**.

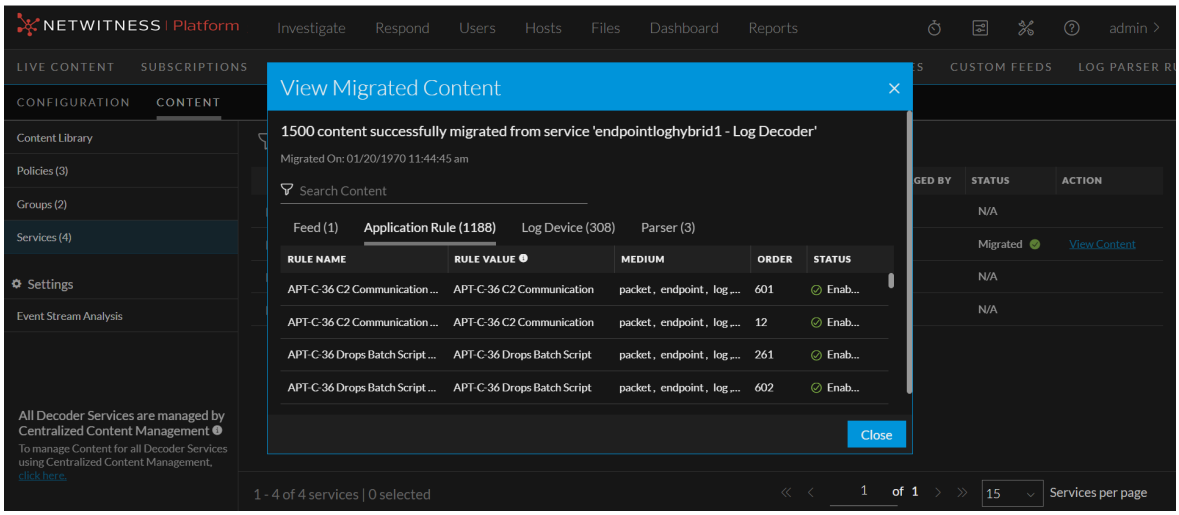
   The **Migrate Content from Service** pop-up window is displayed.

6. On the **Migrate Content from Service** pop-up window, choose action and click **Migrate**.
   - If you select **Create/Update Policy and Group for Each Service**, policy and group will be created or updated for each service selected for migration. Once the migration process is complete, the policy and group will be listed under the respective listing pages. The policy and group which is created or updated for the service will be in 'Unpublished' state and it can be published only after it is reviewed. In the **Policy Listing** page, the **Publish** button for such a policy will be disabled until the policy is reviewed. The policy can be published only after reviewing it either from **Policy Details** page or **Edit Policy** Page. When the policy or group gets updated with the

new content, the order of the new content will be given priority.

- If you select **Skip Creating/Updating a Policy and Group**, only the content will be migrated. All the migrated content will be available in Content Library.

Note:
- If the service is assigned to a group which is not attached to any policy, then the **Create/Update Policy and Group for Each Service** is disabled.
- When migrating content from two Decoders that have two different types of Custom or Live Base Parser associated with same Custom or Live Base Parser, both the Custom Parsers are added to Content Library. The association inside the Policy will be with the most recently migrated Custom Parser.
- Within a migrated Policy, a Custom Parser will have only one Custom or Live Base Parser associated with it.
- Migrated content version will be in the Policy, if as part of migration, the Policy is auto created. If you remove this content, you cannot add the old version of the content back.



Note: If a service migration fails to update a policy:
- You can edit the existing policy and add only the required content.
- Remove the service that is part of a group and remigrate the content. This will only create a policy if the content number is less than 8000.

7. The migration initiation message is displayed on the screen. The **Status** column displays the following values based on the status of migration:
   - Queued
   - Initializing
   - Analyzing Content
   - Migrating Content
   - Migrated
   - Failed

Note:
- The service can also be remigrated if it is already migrated and assigned to groups and policies.
- During parallel migration, if the selected services are updating common policies or using policies that are already being updated, you will receive a warning message on the screen. In such a scenario, it is recommended to update the policies through migration one service at a time to ensure that the last migrated service influences the policy in terms of order and version.

8. To view the migrated content details, do the following:
   - Click the **View Content** hyperlink present under the **Action** column. The hyperlink is available only after the migration process is complete.

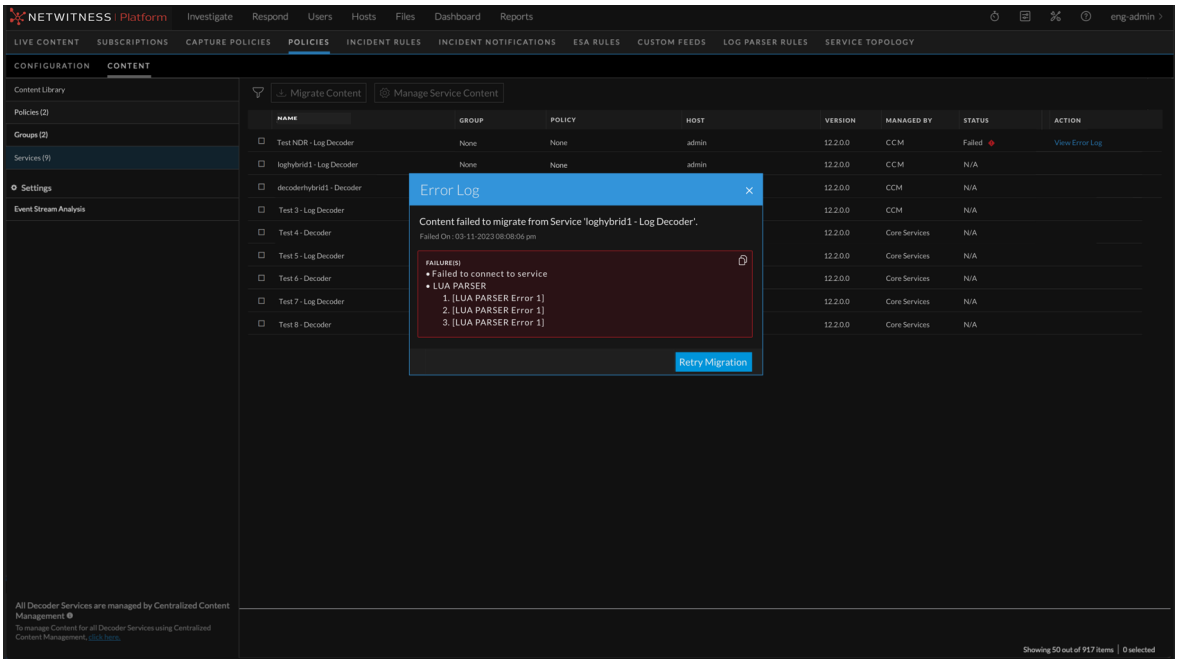
     The **View Migrated Content** pop-up window is displayed with the different tabs such as **Feed**, **Application Rule**, **Network Rule**, **Log Device** and **LUA Parser**.

Note:
- **Network Rules** tab is not applicable for Log Decoders.
- **Log Device** tab is not applicable for Decoders.

IMPORTANT: During the process of migration, if a Decoder that is being migrated contains multiple application rules and/or network rules with the exact same rule name and rule condition, only one of those rules will be retained in the service. The remaining rules will be considered duplicates and removed. Therefore, post migration, none of the migrated services will have multiple rules with the same rule name and the same rule value.

- Click  to search the migrated content based on various parameters.

  Note:
  - For Application Rule and Network Rule, the search is based on **Rule Name** and **Rule Value**.
  - For Feeds, Log Device and LUA Parser, the search is based on the **Name**.



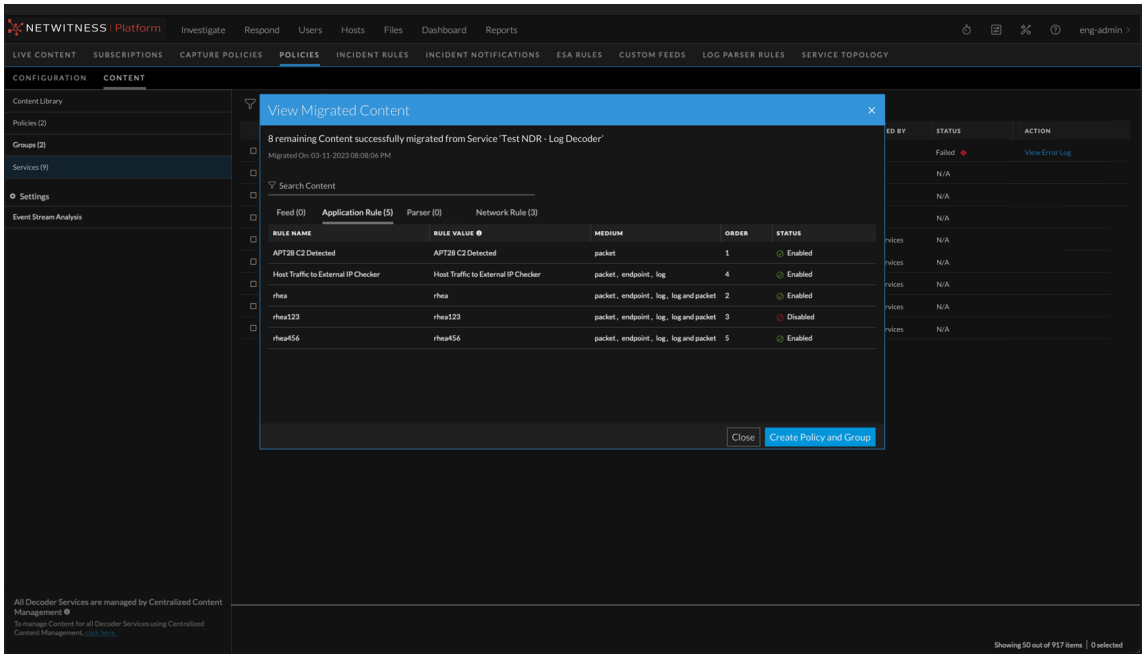
- Click each tab to view the content details. The **Application Rule** and **Network Rule** tabs will have details such as **Rule Name**, **Rule Value**, **Medium**, **Order** and **Status**. The **Log Device**, **Feeds** and **LUA Parser** tabs will have details such as **Name**, **Medium** and **Status**.

9. To view the error log details in case of failed migration, do the following:

   - Click the **View Error Log** hyperlink present under the **Action** column. The hyperlink is available only if the migration process has failed due to some reason.

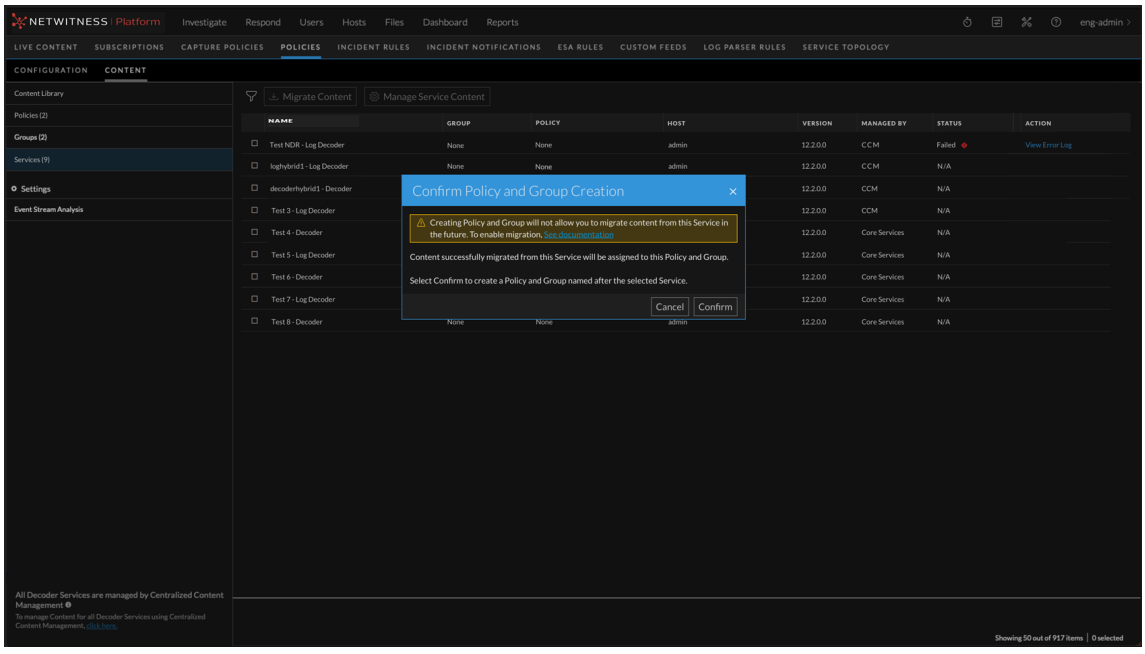
     The **Error Log** pop-up window is displayed with the details of error.

     The following screen is displayed if no content is migrated to Content Library.



Note: You should manually migrate the content in case of failed automated migration.

The following screen is displayed if some content is migrated is Content Library.



- To copy the error logs, click .
- To retry migration, click **Retry Migration**.
- In case of partial migration, to view the content that have been migrated successfully, do the following:

- Click **View Migrated Content**. The **View Migrated Content** pop-up window is displayed with the details of migrated content.

- To create policy and group for the service which is partially migrated, click **Create Policy and Group**.

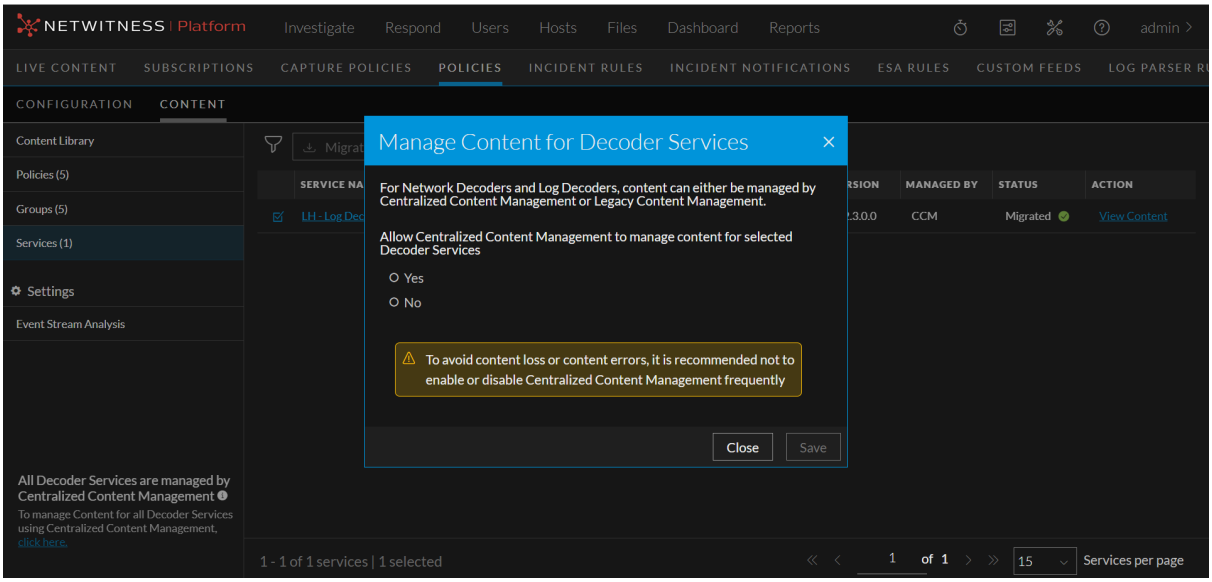
  The **Confirm Policy and Group Creation** pop-up window is displayed.

Best Practice Recommendation: Before creating policy and group for partially migrated service, it is recommended to retry migration.

- To confirm creation of policy and group, click **Confirm**. The policy and group will be listed under the **Policy Listing** and **Group Listing** pages.
- To go back to the **Service List** page, click **Cancel**.
- If you do not want to create policy and group for partially migrated service, click **Close in View Migrated Content** pop-up window.

10. To cancel the migration, click **Cancel** in the **Migrate Content from Service** pop-up window.

Note: Migrated Live contents will be categorized as Custom contents, if:
- You have modified the Live content manually before migrating it.
- The migrated Live content is an older version of the content.



Enable or Disable CCM for Individual Decoder Services

This topic describes the steps to enable or disable CCM for individual Decoder Services.

To enable or disable CCM for individual Decoder Service

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. In the left panel, click **Services**. The list of services are displayed.
4. Select the service(s) for which you want to enable or disable CCM and click **Manage Service Content**.

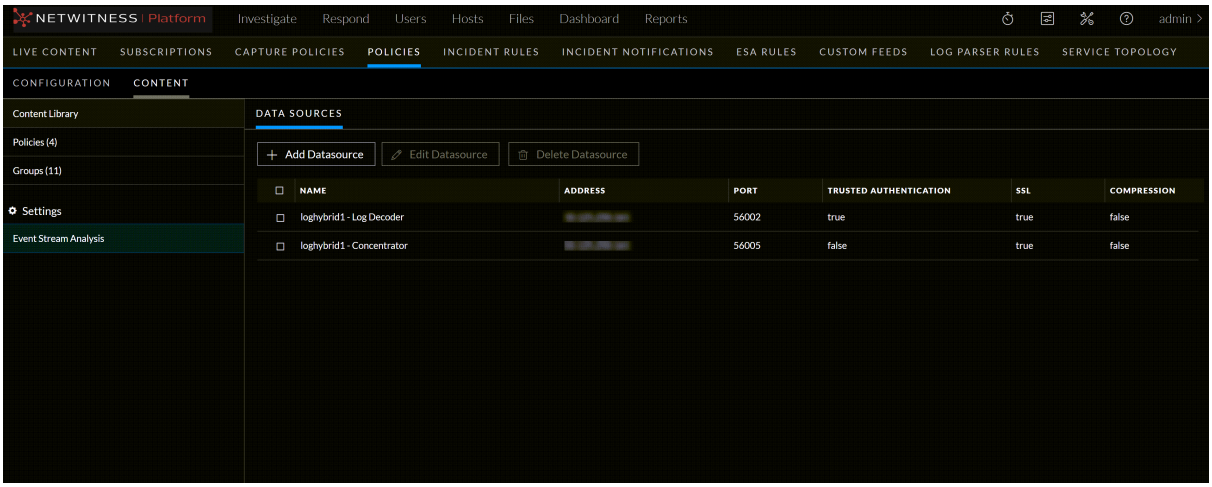
   The **Manage Content for Decoder Services** pop-up window is displayed.

5. In the pop-up window, select **Yes** for **Allow Centralized Content Management to Manage Content for Selected Decoder Services** to enable CCM for the selected service. Select **No** to disable CCM for the selected service.
6. Click **Save** to save the changes.

Manage ESA Datasources

This section contains:

- View an ESA Datasource
- Add an ESA Datasource
- Edit an ESA Datasource
- Delete an ESA Datasource



View an ESA Datasource

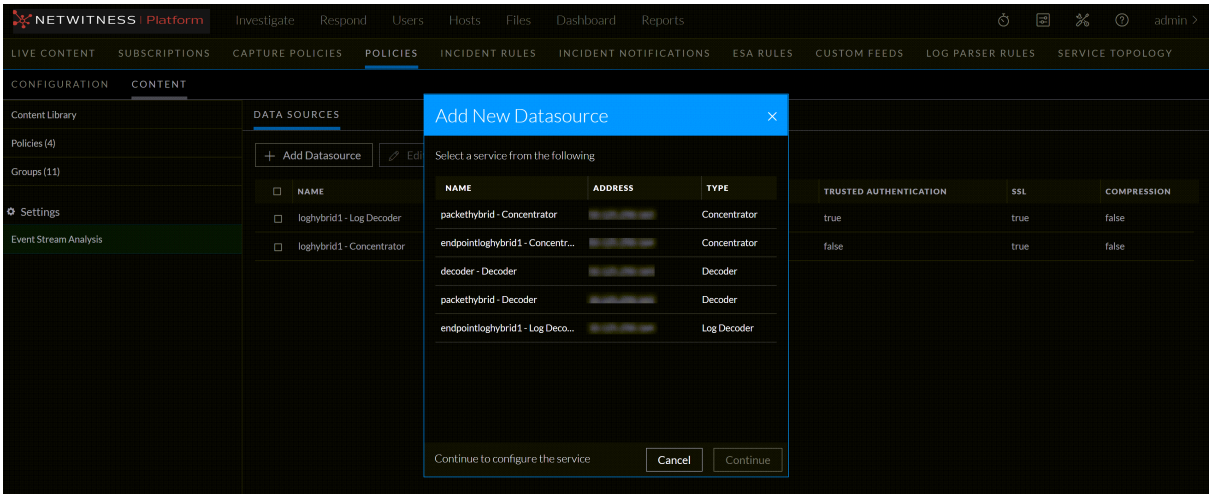
This topic describes the steps to view the ESA datsources available.

To view an ESA Datasource

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Under **Settings**, click **Event Stream Analysis** > **Data Sources**.

   The available datasources are displayed.

Add an ESA Datasource



You can add one or more ESA data sources, such as Concentrators, to use for your selected ESA Service. This enables you to specify different data sources for each deployment.

To add an ESA Datasource

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.

3. Under **Settings**, click **Event Stream Analysis** > **Data Sources**.
4. Click + **Add Datasource**.

   The Add New Datasource dialog is displayed.

Note: You can add a Log Decoder as a data source for ESA. But, it is better to add a Concentrator to take advantage of undivided aggregation as the Decoder may have other processes aggregating from it.

5. Select a service and click **Continue**.

Note: You can add only one service at a time.

6. Do one of the following:
   - Select the **Trusted Authentication** checkbox.
   - Enter your credentials (username and password) for the datasource.

Note:
- If you select **Trusted Authentication** instead of username and password. This option will enable the use of SSL by default. However, you can still configure the compression settings.
- If you choose to enter your username and password. You can configure both SSL and compression settings.

7. To enable the SSL settings, select the **SSL** checkbox. You can set your desired port number.

IMPORTANT: Ensure that you turn on SSL only if necessary, in order to avoid performance impact on the SSL protocol.

8. (Optional) You have the option to adjust the Compression Level for Concentrators on ESA. To enable compression, select the **Compression** checkbox. You can set the **Compression Level** for a Concentrator from 0-9:

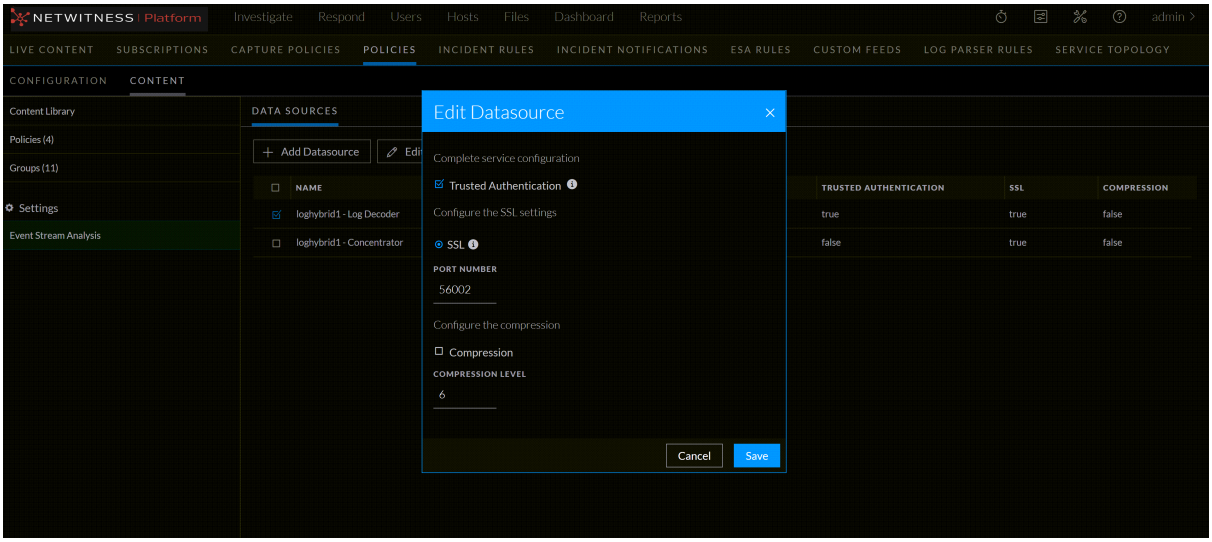
   - Compression Level = **0** (If compression is enabled, it allows Core Services to control the amount of compression.)
   - Compression Level = **1** (It uses the lowest amount of compression and has the highest performance.)
   - Compression Level = **9** (It uses the highest amount of compression and has the worst performance.)

   Somewhere in the middle between 1 and 9 is usually the best setting, which is what you get when you select a compression level of 0. For more detailed information, see the *Core Database Tuning Guide*.

Note: When you set the compression level for a Concentrator on ESA, it sets the same compression level for that Concentrator for ESA Correlation Rules.

9. Click **Test Configuration** to make sure that it can communicate with the ESA service.
10. Click **Save**.

    After you configure your data sources and they appear in the Available Configured Data Sources dialog, you can use them for your deployment.



Edit an ESA Datasource

You can edit the properties of the datasource at any point in time. You can edit the user credentials, SSL, port, and compression value of the datasource. When a data source password changes, it is important to change the password on the data source so that ESA can continue to communicate with the data source.

To edit an ESA Datasource

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Under **Settings**, click **Event Stream Analysis** > **Data Sources**.
4. Select a datasource and click **Edit Datasource**.

The Edit Datasource dialog is displayed.

5. Make the required changes in the datasource.
6. Click **Save**.

Delete an ESA Datasource

You can delete one or more ESA datasources. Once the datasource is deleted, the service will be removed from the available configured list.

To delete an ESA Datasource

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
3. Under **Settings**, click **Event Stream Analysis** > **Data Sources**.
4. Select a datasource and click **Delete Datasource**.

   A confirmation pop-up is displayed.
5. Click **Delete Datasource**.

Manage Deployments

The ESA deployment consists of a policy with ESA rules, ESA services, and data sources. The ESA service scans your network for suspicious activity whenever you deploy policies. An ESA rule detects a different event every time, such as when a user account is created and deleted within 24 hours.

In addition, you can perform other steps on your deployment, such as changing a data source, editing or deleting a rule from the deployment through policy, renaming or deleting the deployment, or showing updates to the deployment, see Additional ESA Correlation Rules Procedures

In 12.1 and later versions, you must create a policy with the ESA rule content type and associate the policy with the group having a correlation service to create a deployment.

For more information on policies, see Policies

For more information about groups, see Groups

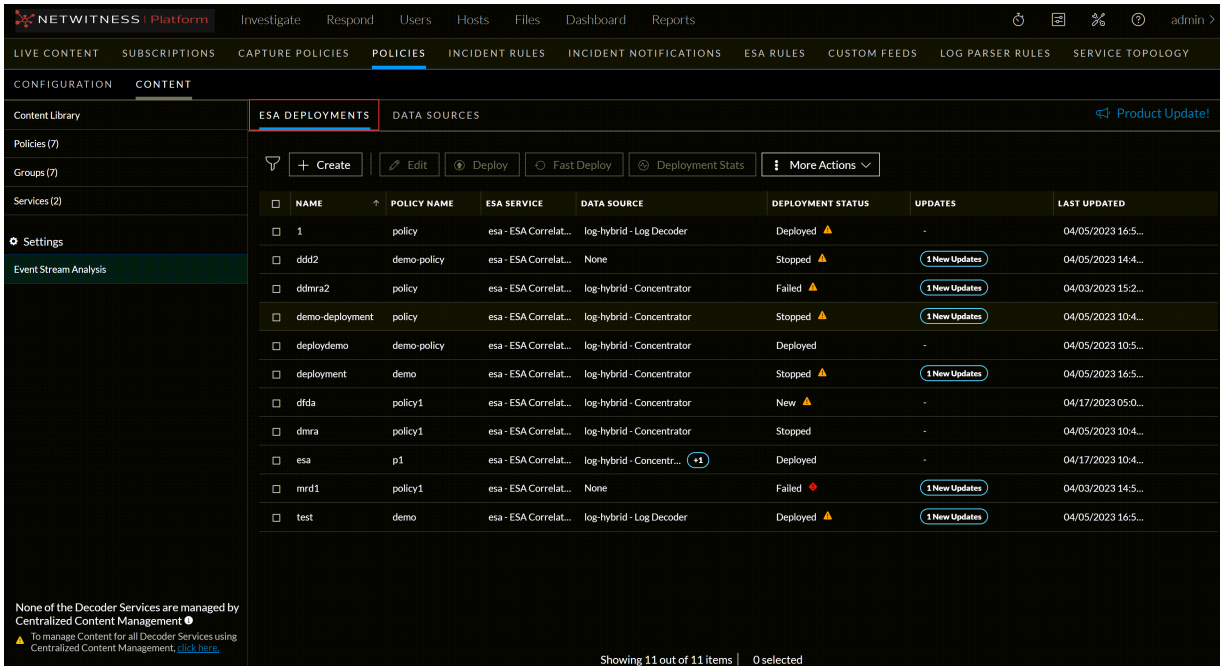
Note: With the unified ESA Deployments tab, you can manage deployments from a single view across all policies within Policy-based Centralized Content Management (CCM).

You can do the following:

- View a Deployment
- Create a Deployment
- Edit a Deployment
- Start a Deployment
- Fast Deployment
- Deployment Stats
- Remove a Deployment
- Stop a Deployment
- Migrate ESA Deployments to Policies and Groups

View a Deployment

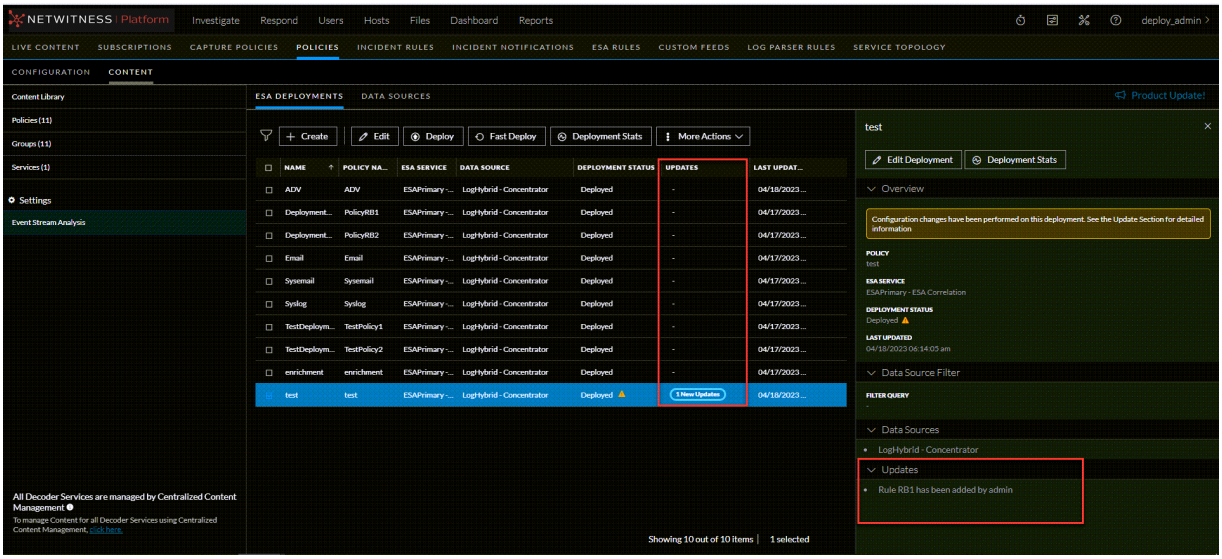
In the ESA deployment view, you can view a list of all the deployments associated with the policies and the actions you can perform with them. It helps you manage and set-up deployments within CCM to create, edit, deploy, remove, and stop deployments. NetWitness Platform provides two methods to manage deployments.



You can view deployments in the following ways:

- Using the **ESA Deployments** tab. The ESA Deployments tab provides a consolidated view of all the available deployments within CCM. You can create, edit, remove, and pause deployments.
- Using a specific policy. In this method, you cannot view other deployments. You need to go to each policy and create, edit, remove and pause a deployment.

To view all deployments using the ESA Deployments tab



1. Go to **(CONFIGURE)** > **Policies** > **Content**.
2. Under **Settings**, click **Event Stream Analysis** > **ESA Deployments**.

The available deployments are displayed.

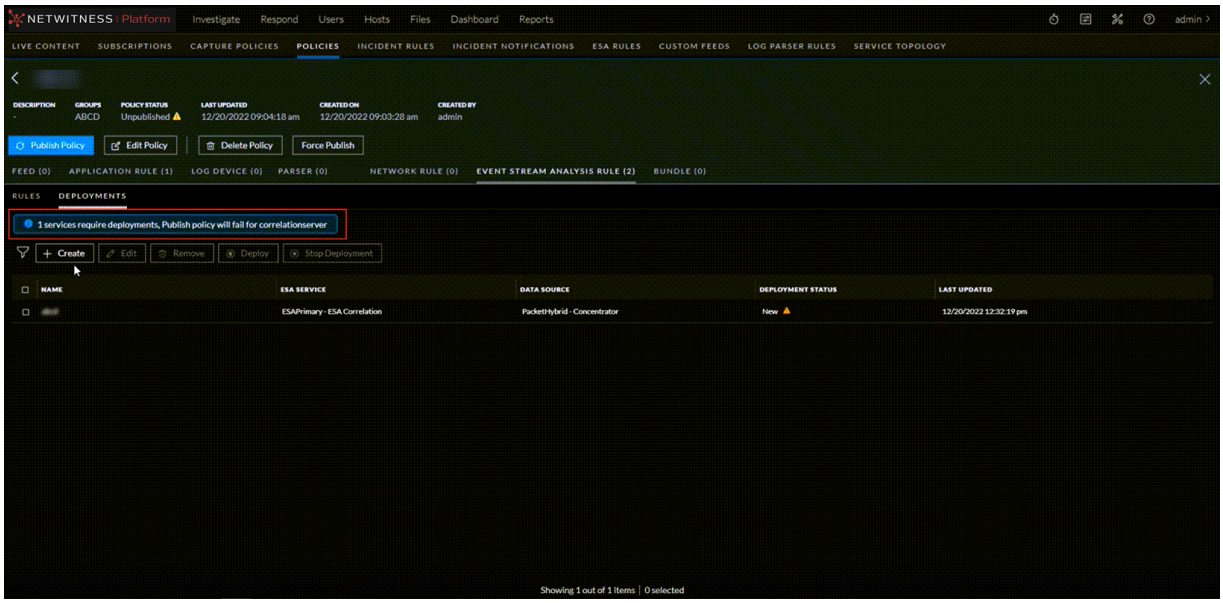
Note: Any changes made, like add / edit / delete to **rules**, **notifications**, and **enrichments** on the **ESA Rules** page for deployments, are displayed in the **Updates** section of the **ESA Deployments** view.

IMPORTANT: Any changes required for rule configurations must be made on the **ESA Rules** page only.

To view a deployment from a selected policy

1. Go to **(CONFIGURE)** > **Policies**.
2. In the policies panel, click **Content**.

The available policies are displayed.



3. Click a Policy.

The selected policy view is displayed, and the Application Rule is default selected.

4. Click **Event Stream Analysis Rule** > **Deployments**.

The available deployments for the selected policy are displayed.

Caution: An icon is displayed in the deployments view indicating services require deployments, publish policy will fail for correlation servers. You may need to create deployments for such services if required.

Create a Deployment

When you create a deployment, you need to select a policy, ESA service, and data sources. An ESA rule deployment consists of an ESA service, one or more data sources, and a set of ESA rules. When you deploy rules, the ESA service runs them to detect suspicious or undesirable activity in your network. Each ESA rule detects a different event, such as when a user account is created and deleted within one hour.

For more information on data sources, see Data Source

In 12.1 and later versions, you must create a policy with the ESA rule content type and associate the policy with the group having a correlation service to create a deployment.

For more information on policies, see Policies

You can create deployments in the following ways:

- Using the ESA Deployments tab. The ESA Deployments tab provides a consolidated view of all the available deployments within CCM. You can create deployments.
- Using a specific policy. In this method, you cannot view other deployments. You need to go to each policy and create a deployment.

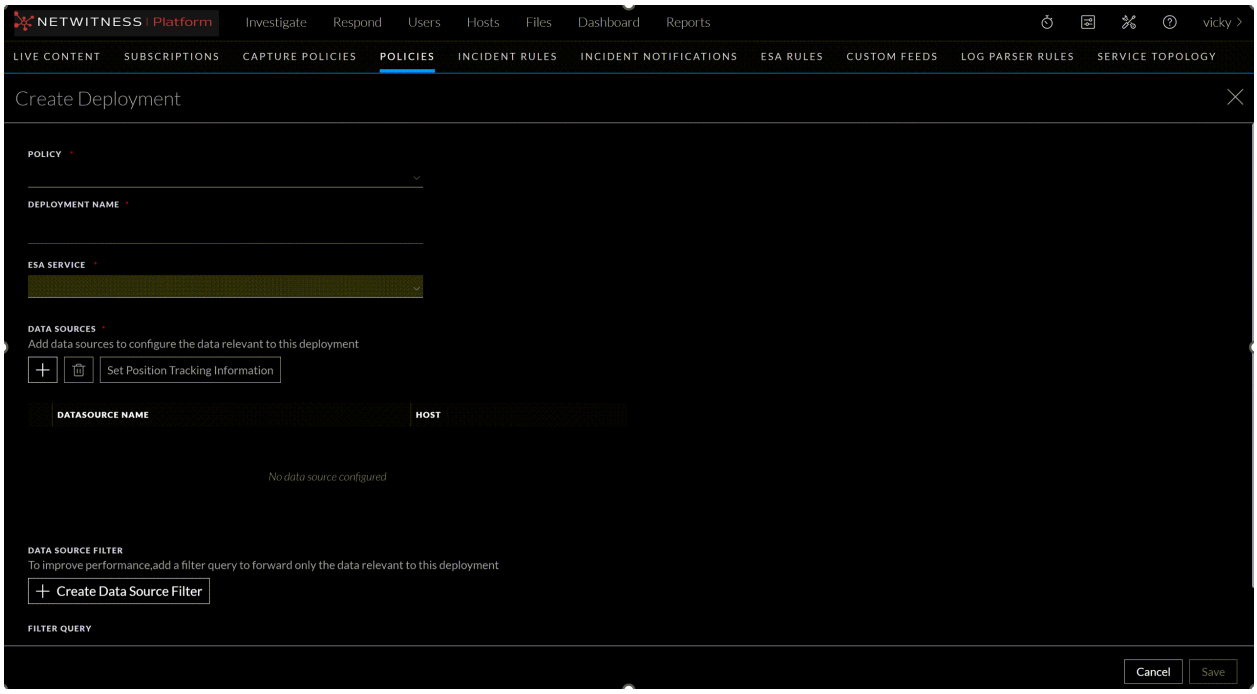
Prerequisites

- The group is assigned to a policy
- The Correlation server service is available in the groups assigned.

- A minimum of one ESA rule is added to the policy.
- ESA data source must be configured.

  For more information about groups, see Groups

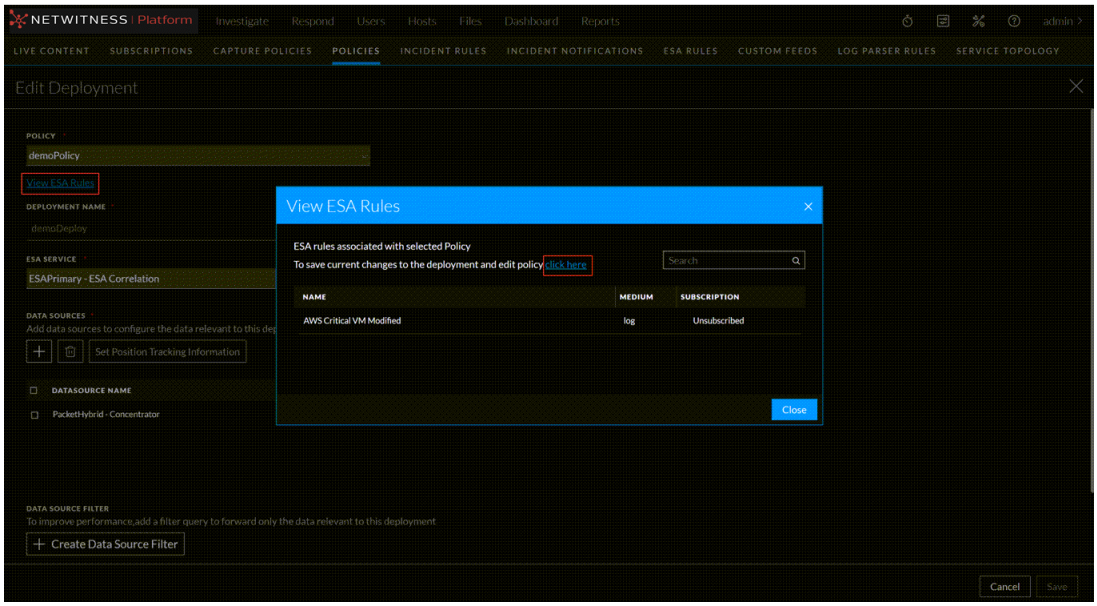
To create a deployment using the ESA Deployments tab



1. Go to **(CONFIGURE)** > **Policies** > **Content**.
2. Under **Settings**, click **Event Stream Analysis** > **ESA Deployments**.

The available deployments are displayed.

3. Click + **Create**

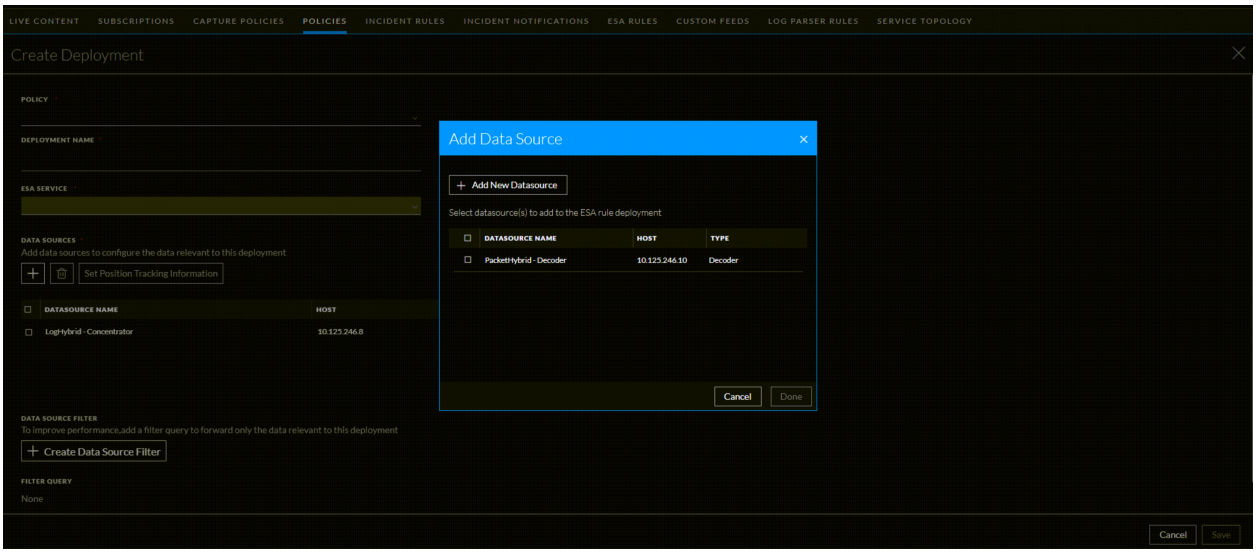


The Create Deployment dialog is displayed.

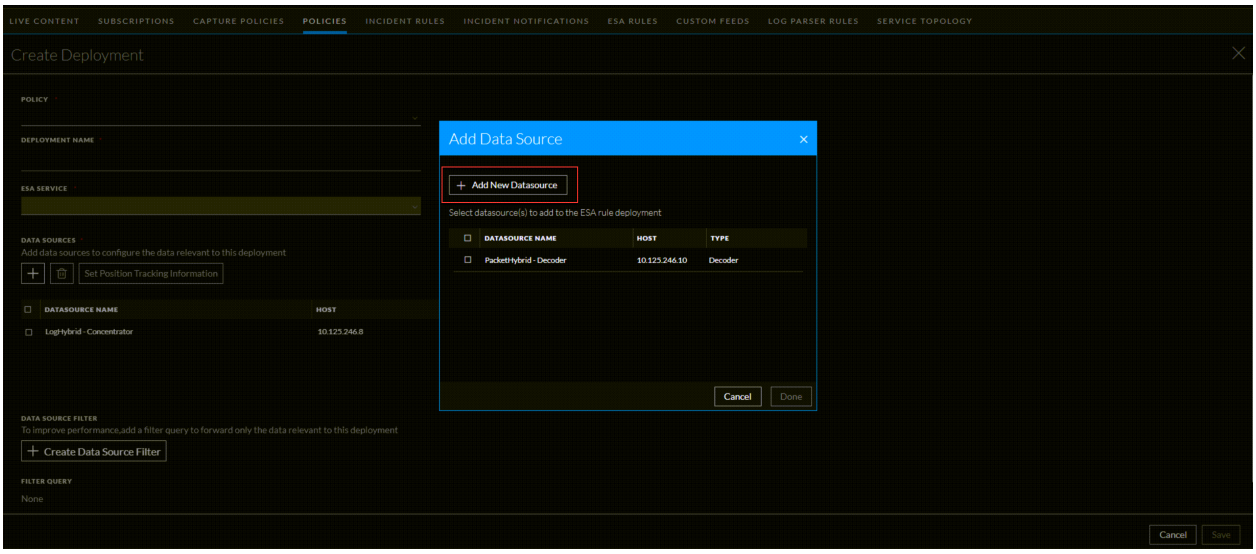
4. Select an eligible policy from the policy list.

Note: All the policies that meet the criteria mentioned above are listed in the policy drop-down. It is required to select a policy to proceed further.

If required, you can click on View ESA Rules to search for rules associated with selected policy.



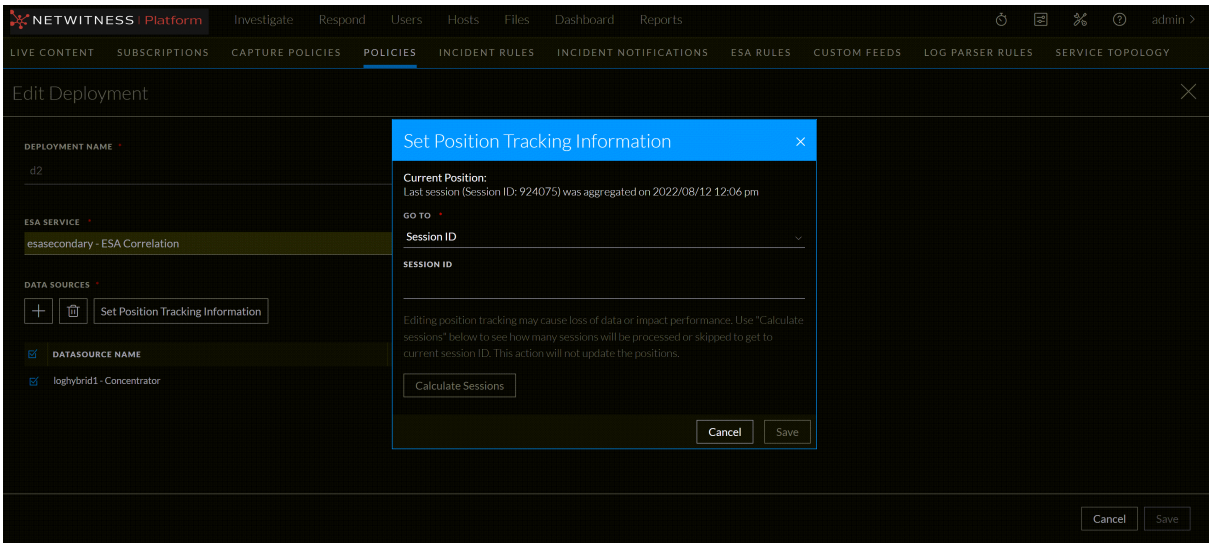
5. Enter a name for the deployment.
6. Select a service from the **ESA Service** drop-down list.



Note: Once the deployment is saved, the selected policy, name and ESA service cannot be modified.

7. Under **Data Sources**, click + to add a data source.

   The **Add Data Source** dialog is displayed.



If required, you can add a new data source by selecting + **Add New Datasource** tab in the dialog-box.

IMPORTANT: If the data sources are not listed, you can add the required datasource. For more information, see the topic Add an ESA Datasource.

8. Select one or more data sources and click Done.
9. To delete the data source, select the data source and click .
10. (Optional) Select the required data source and click **Set Position Tracking Information** to process specific or ignore certain sessions.

    The Set Position Tracking Information dialog is displayed.

a. In the Position Tracking Information dialog, perform the following:

   i. If you want to set the position tracking information based on date and time stamp:

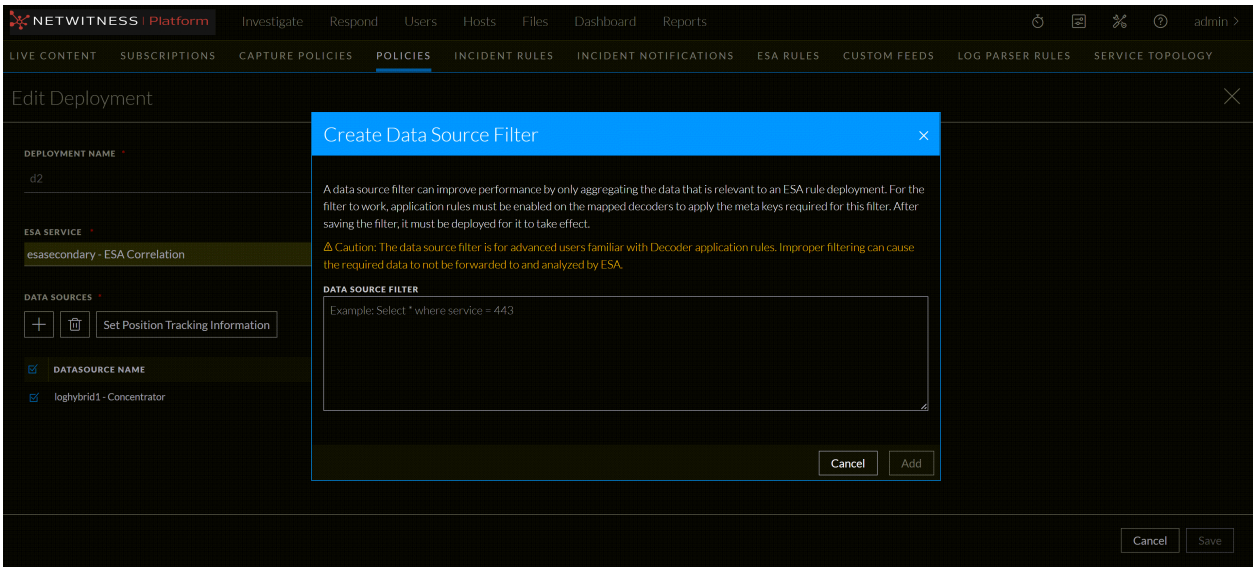
      In the **Go To** drop-down menu, select **Date and Time** and enter the date and time.

   ii. If you want to set the position tracking information, based on the session ID:

      In the **Go To** drop-down menu, select **Session ID** and enter the session ID in the **Session ID** field.

      The ESA Correlation service starts processing the events from the session ID that you entered.

b. Click **Calculate Sessions** to calculate the number of sessions that will be processed to the existing position of the data source, if any.



c. To save the edited position tracking data source, click **Save**.

   For more information on Position Tracking Information, see Position Tracking Information.

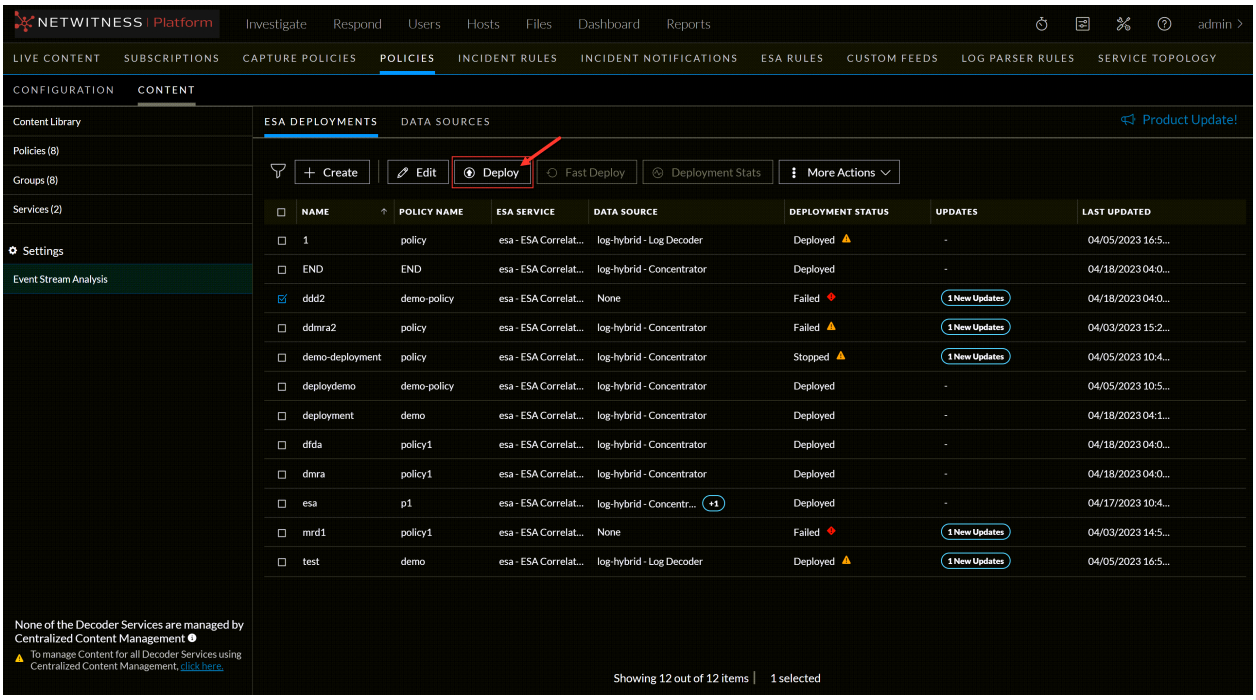
11. (Optional) To filter out specific session data coming into ESA, under Data Source Filter, click + **Create Data Source Filter**.

Caution: The data source filter is for advanced users familiar with Decoder application rules. Improper filtering can cause the required data not to be forwarded to and analyzed by ESA.

The **Create Data Source Filter** dialog is displayed.

a. Specify the filter query in the below format as shown in the following example:

Select *where service = 443



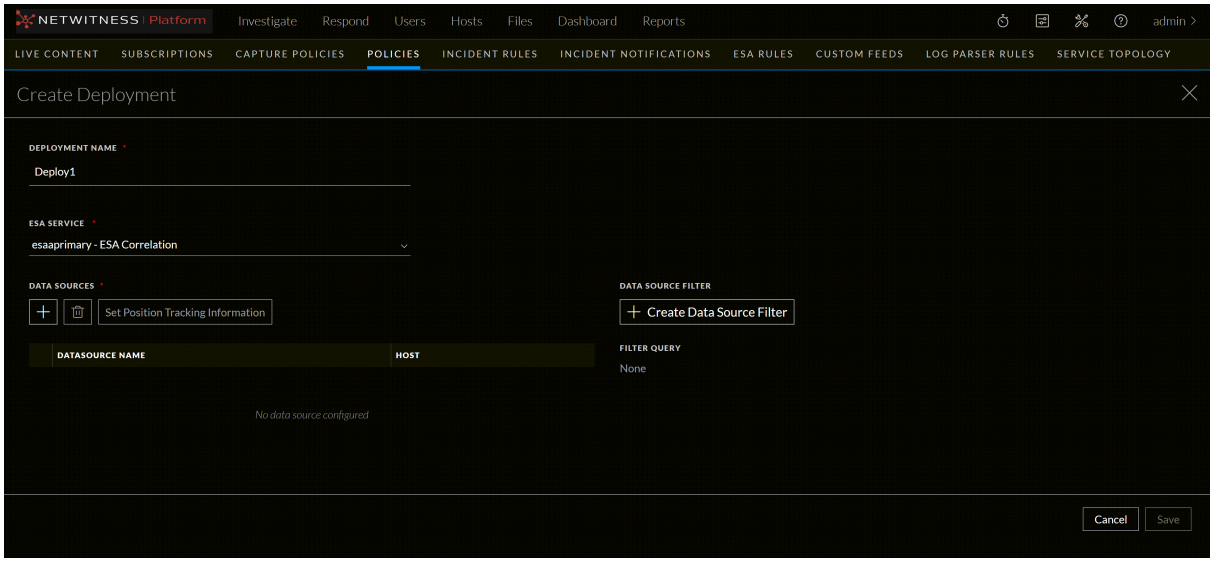
Based on the query processed, it will filter out only HTTPS logs-related sessions and will be forwarded to the ESA.

b. Click **Add**.

c. If you want to delete the existing data sources filter, click **Clear Data Source Filter**, and **Save** to remove it permanently.

12. To save the deployment, click **Save**.

13. Select the created deployment and click **Deploy**.



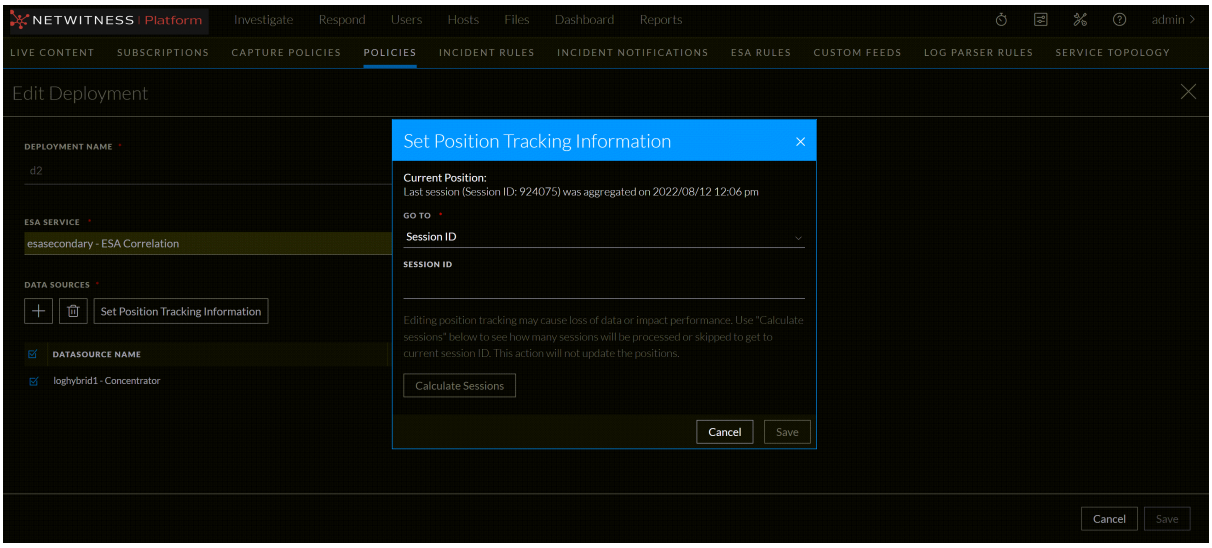
To create a deployment from a selected policy

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
   The available policies are displayed.
3. Click a Policy.

   The selected policy view is displayed and by default **Application Rule** is selected.
4. Click **Event Stream Analysis Rule** > **Deployments**.

   The available deployments for the selected policy are displayed.
5. Click + **Create Deployment**.

   The Create Deployment dialog is displayed.



6. Enter a name for the deployment.

   Note: The policy is preselected as the user creates the deployment from the policy details view.
7. Select a service from the **ESA Service** drop-down list.
8. Under **Data Sources**, click + to add a data source.

   The Add Data Source dialog is displayed.
9. Select one or more data sources and click **Done**.

   IMPORTANT: If the data sources are not listed, you can add the required datasource. For more information, see the topic Add an ESA Datasource.
10. To delete the data source, select the data source and click .
11. (Optional) the required data source and click **Set Position Tracking Information** to reprocess specific sessions or ignore certain sessions.

    The Set Position Tracking Information dialog is displayed.

a. In the Position Tracking Information dialog, perform the following:

   i. If you want to set the position tracking information based on date and time stamp:

      In the **Go To** drop-down menu, select **Date and Time** and enter the date and time.

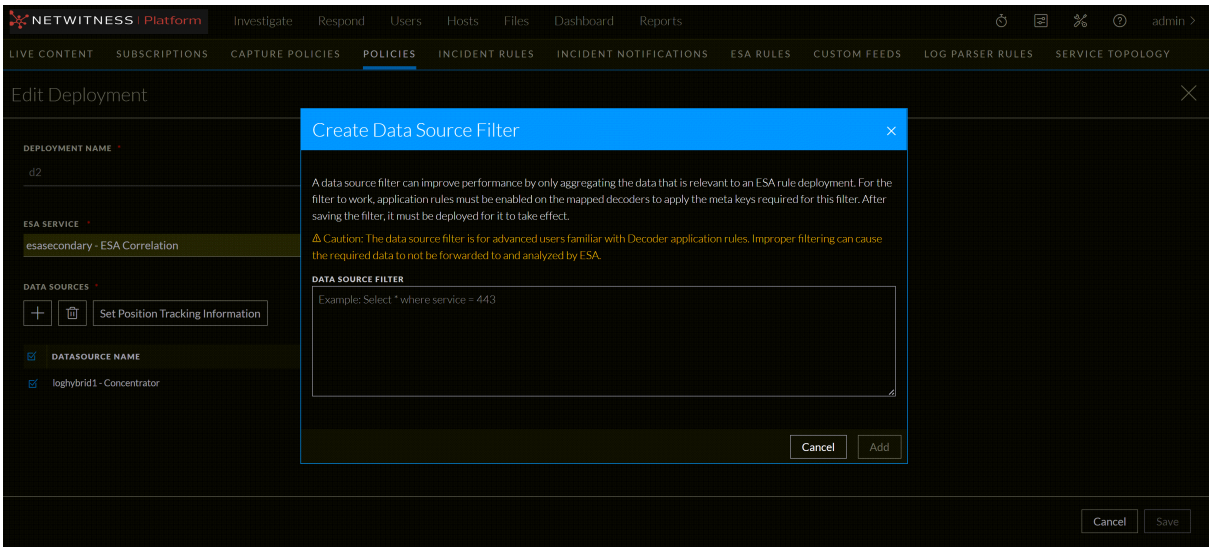
   ii. If you want to set the position tracking information, based on the session ID:

      In the **Go To** drop-down menu, select **Session ID** and enter the session ID in the **Session ID** field.

      The ESA Correlation service starts processing the events from the session ID that you entered.

b. Click **Calculate Sessions** to calculate the number of sessions that will be processed with respect to the existing position of the data source, if any.

c. To save the edited position tracking data source, click **Save**.



d. The tracking position information will be deployed to the ESA Correlation service, only when the deployment is successfully completed.

   For more information on Position Tracking Information, see Position Tracking Information.

12. (Optional) To filter out certain session data coming into ESA, under Data Source Filter, click + **Create Data Source Filter**.

Caution: The data source filter is for advanced users familiar with Decoder application rules. Improper filtering can cause the required data to not be forwarded to and analyzed by ESA.

The Create Data Source Filter dialog is displayed.

a. Specify the filter query in the below format as shown in the following example:

Select *where service = 443

Based on the query processed, it will filter out only HTTPS logs related sessions and will be forwarded to the ESA.

b. Click **Add**.

c. If you want to delete the existing data sources filter, click **Clear Data Source Filter** and click **Save** to remove it permanently.

13. To save deployment, click **Save**.

14. Select the created deployment and click **Deploy**.

Edit a Deployment

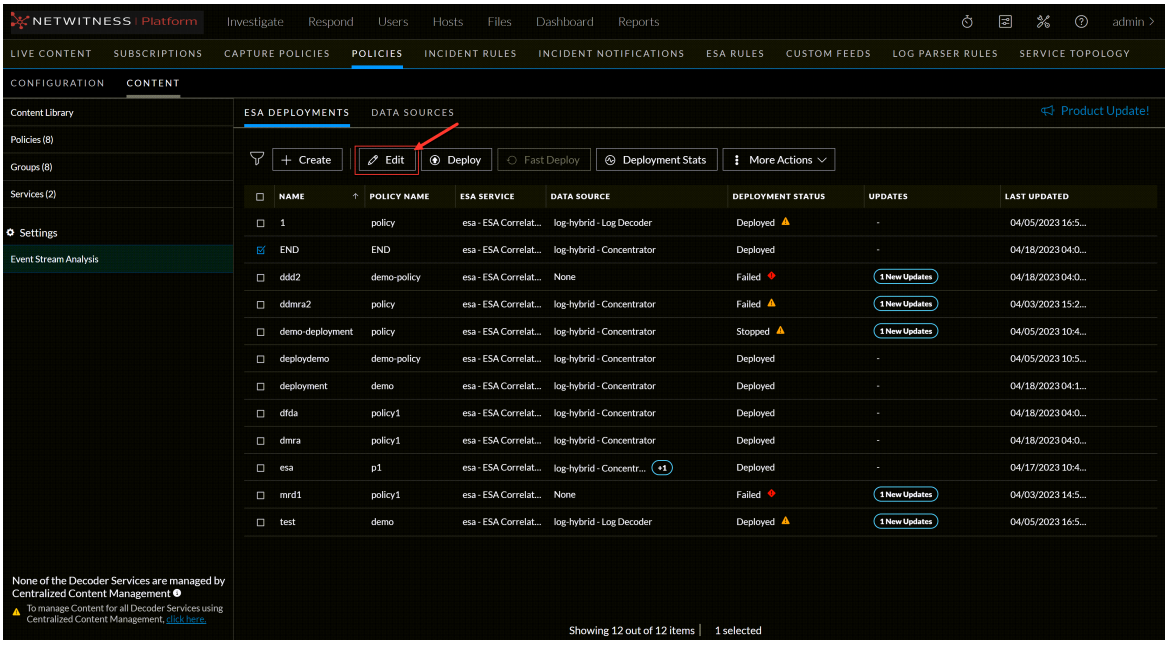
You can edit a deployment to change the data source, create a data source filter, and view ESA rules that are associated with this deployment. A data source filter can improve performance by only aggregating the data that is relevant to an ESA rule deployment. For the filter to work, application rules must be enabled on the mapped decoders to apply the meta keys required for this filter. After saving the filter, it must be deployed for it to take effect.

However, you cannot change the deployment name, or ESA service that are associated with the deployment.

You can edit deployments in the following ways:

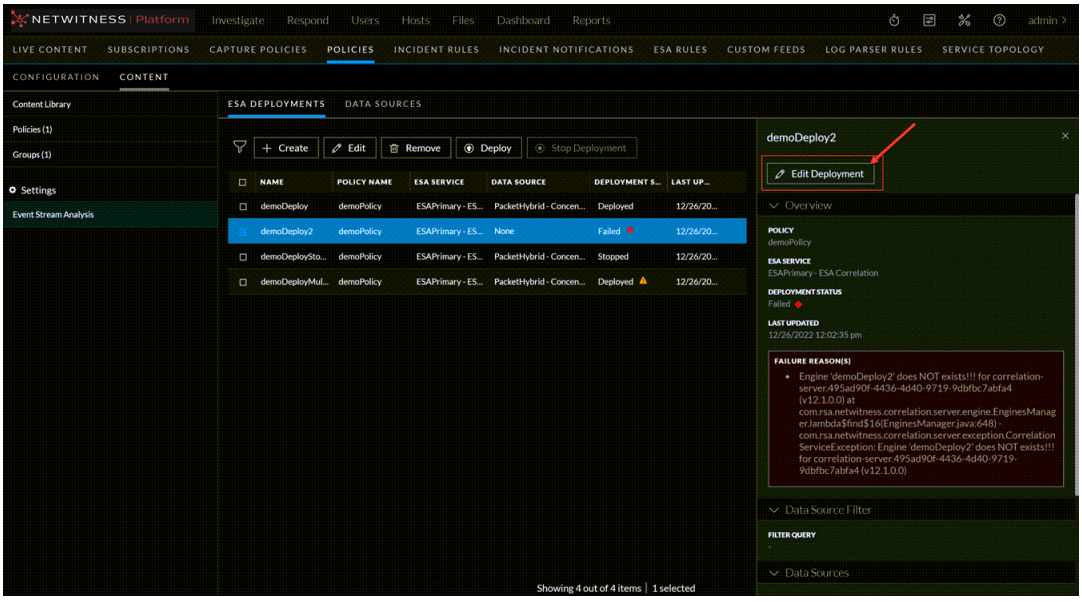
- Using the ESA Deployments tab. The **ESA Deployments** tab provides a consolidated view of all the available deployments within CCM. You can edit deployments.
- Using a specific policy. In this method, you cannot view other deployments. You need to go to each policy and edit a deployment.

To edit a deployment from the ESA Deployments tab



1. Go to **(CONFIGURE)** > **Policies** > **Content**.

2. Under **Settings**, click **Event Stream Analysis** > **ESA Deployments**.



The available deployments are displayed.

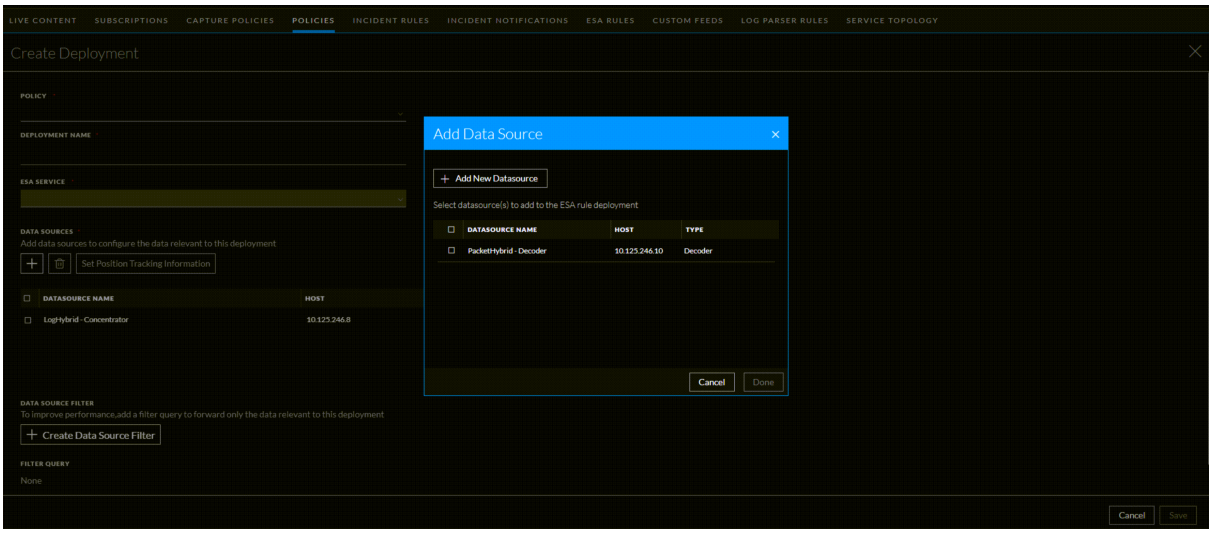
3. Select a deployment and click **Edit** or **Edit Deployment**.

   a. When you select the checkbox and click **Edit**.

   b. When you select or click a row of the deployment, a right panel is displayed to click **Edit Deployment**.

The **Edit Deployment** dialog is displayed.

4. (Optional) you can click on **View ESA Rules** to search for rules associated with selected policy. To save current changes to the deployment and modify the policy, select **click here** and navigate to the **Edit Content Policy** page.



5. Make the required changes in the deployment.

   Policy, deployment name, and ESA service are pre-populated and cannot be modified.

6. Under **Data Sources**, click + to add a data source.

   The **Add Data Source** dialog is displayed.

7. If required, you can add a new data source by selecting + **Add New Datasource** tab in the dialog-box.

IMPORTANT: If the data sources are not listed, you can add the required datasource. For more information, see the topic Add an ESA Datasource.

8. Click **Save**.
9. Select the deployment and click **Deploy**.

To edit a deployment from a selected policy

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
   The available policies are displayed.
3. Click a Policy.

   The selected policy view is displayed and by default **Application Rule** is selected.

4. Click **Event Stream Analysis Rule** > **Deployments**.

   The available deployments for the selected policy are displayed.

5. Select a deployment to edit and click **Edit Deployment**.

   The **Edit Deployment** dialog is displayed.

6. Make the required changes in the deployment.
7. Click **Save**.
8. Select the deployment and click **Deploy**.

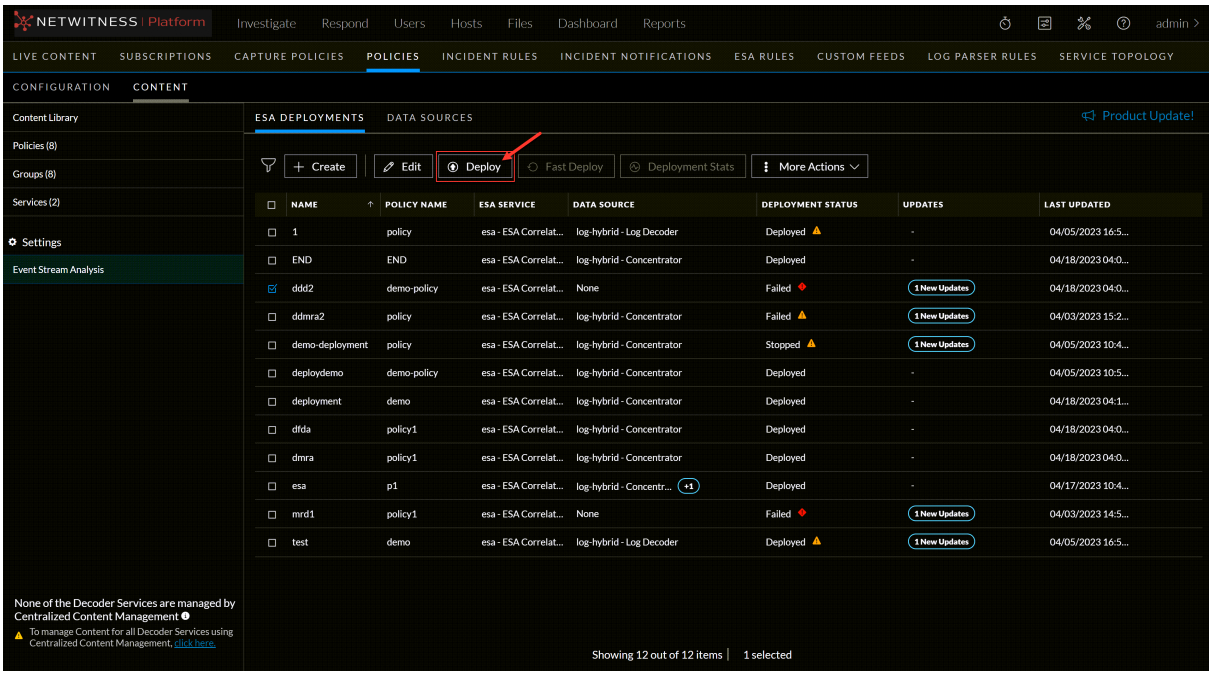
> **Note:** You can deploy the changes either by performing a **Deploy** action on selected deployment or by publishing the policy. Publishing a policy with deployment in stopped state, will not deploy the deployment.

Start a Deployment

The deployment includes ESA services with policy and associated ESA rules. When you initiate deployment, the correlation services start processing sessions from the configured data sources for matching events for the selected ESA rules in the policy.

For more information about ESA services and rules, see Alerting with ESA Correlation Rules

You can start deployments in the following ways:



- Using the ESA Deployments tab. The ESA Deployments tab provides a consolidated view of all the available deployments within CCM. You can initiate deployments.
- Using a specific policy. In this method, you cannot view other deployments. You need to go to each policy and initiate a deployment.

To initiate a deployment, with the ESA Deployments tab

1. Go to (CONFIGURE) > **Policies** > **Content**.
2. Under **Settings**, click **Event Stream Analysis** > **ESA Deployments**.

The available deployments are displayed.

3. Select a deployment and click **Deploy**.

To start a deployment with selected policy

1. Go to (CONFIGURE) > **Policies**.
2. In the policies panel, click **Content**.
   The available policies are displayed.
3. Click a Policy.

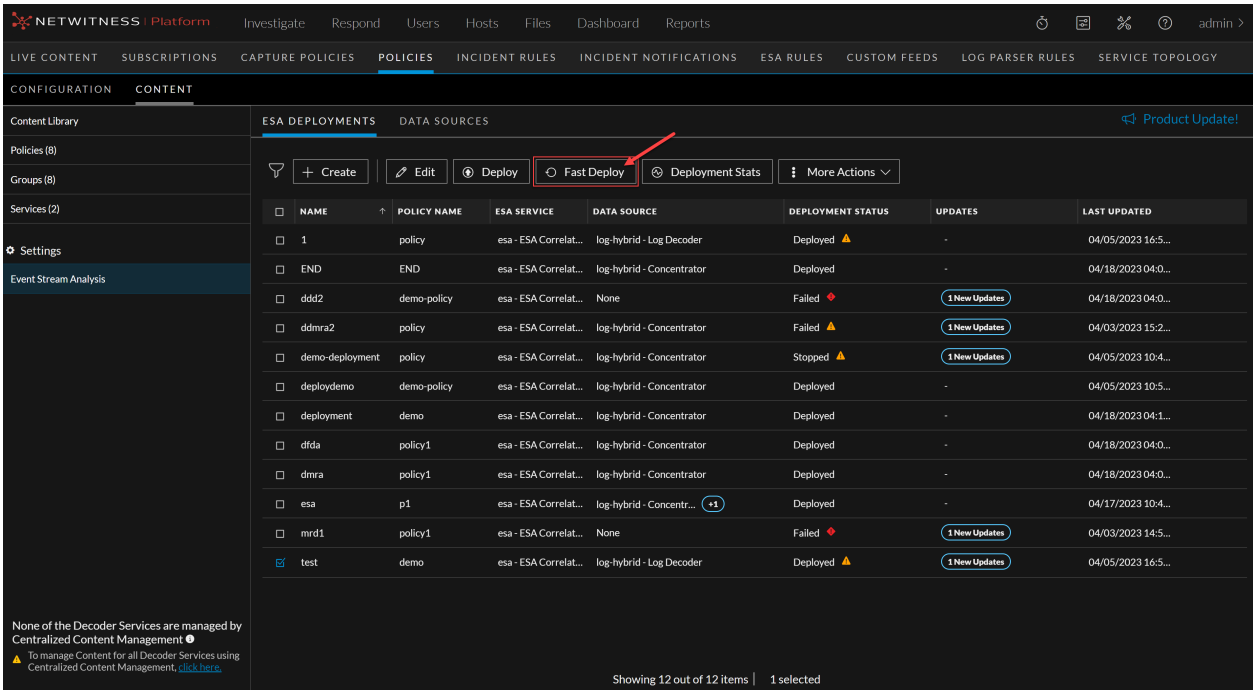
   The selected policy view is displayed and by default **Application Rule** is selected.
4. Click **Event Stream Analysis Rule** > **Deployments**.

   The available deployments for the selected policy are displayed.
5. Select the deployment to deploy and click **Deploy**.

> **Note:** You can deploy the changes either by performing a Deploy action on selected deployment or by publishing the policy. Publishing a policy with deployment in stopped state, will not deploy the deployment.

Fast Deployment

The **Fast Deploy** option is a feature that allows a user to quickly load the latest rule that runs entirely on the Esper Engine without redeploying the entire engine.



To do fast deployment

1. Go to **(CONFIGURE)** > **Policies** > **Content**.
2. Under **Settings**, click **Event Stream Analysis** > **ESA Deployments**.

The available deployments are displayed.

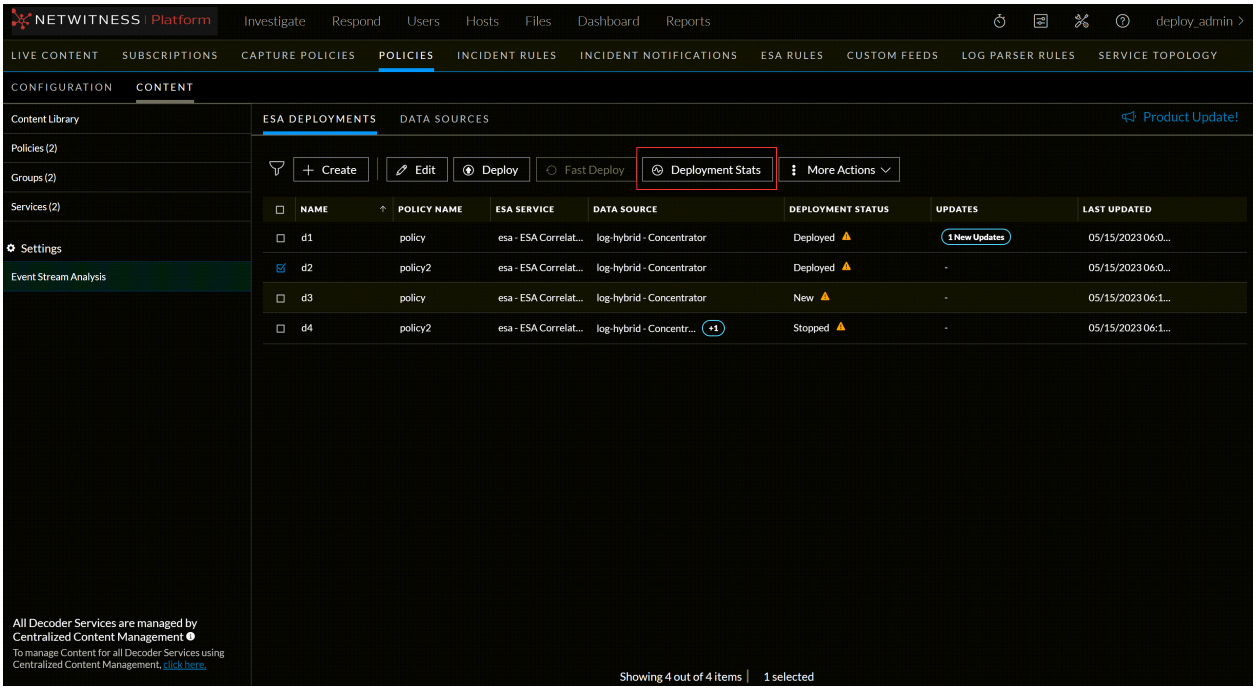
You can use the **Fast Deploy** option when there has been a change to an ESA rule, i.e., a rule has been added, modified, or deleted. If any other changes have been made, such as adding a data source, then the **Fast Deploy** option will not be available.

3. Select the deployments that are updated and need to be deployed.
4. Click **Fast Deploy**.

Deployment Stats

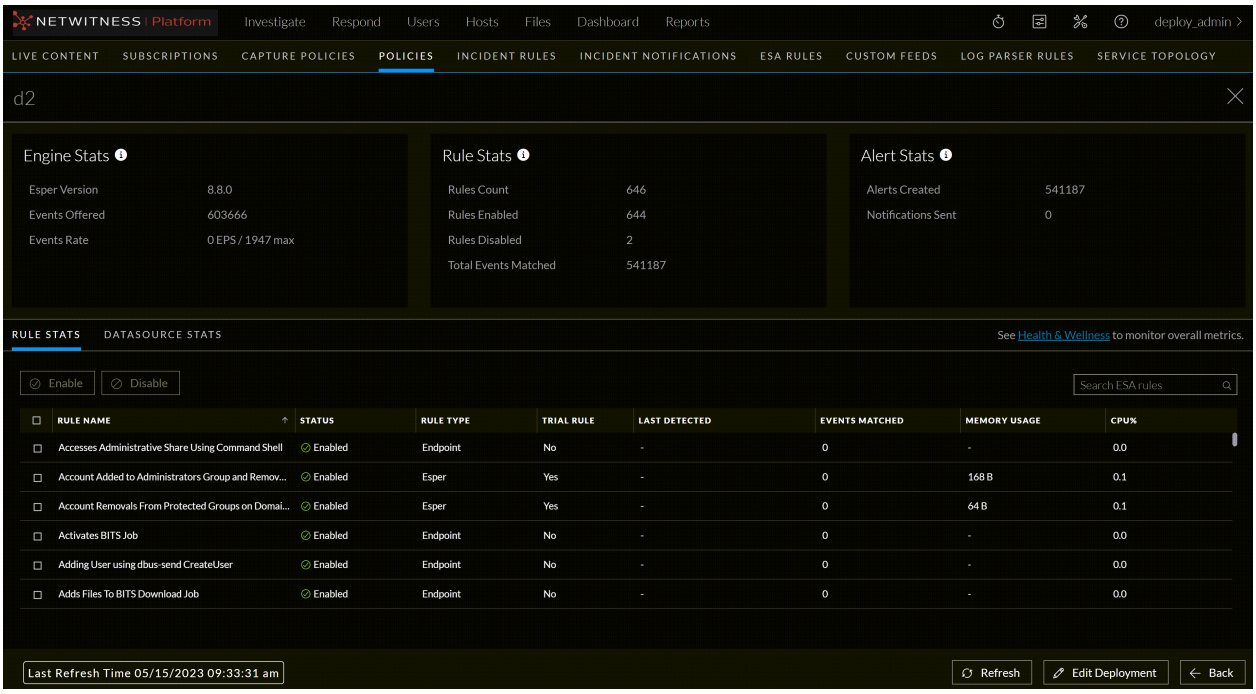
When an ESA deployment is deployed, you can view details about how the deployment is performing, such as statistics on the engine, rule, and alert. You can also view information on which rules are enabled or disabled and change their status.

This topic describes how to view an ESA Correlation service's deployment statistics (stats). This procedure is useful when determining a rule's effectiveness or troubleshooting an ESA rule deployment.



Caution: When you modify and re-deploy an ESA rule deployment, all the stats are removed from that deployment. The generated alerts are not removed from NetWitness.

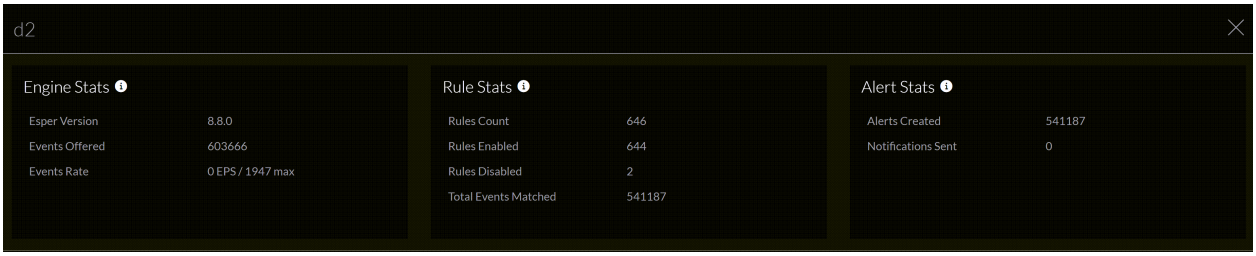
To view a Deployment Stats



1. Go to **(CONFIGURE)** > **Policies** > **Content**.
2. Under **Settings**, click **Event Stream Analysis** > **ESA Deployments**.

The available deployments are displayed.

3. Select a deployment you want to see the stats.
4. Click on the **Deployment Stats** tab.



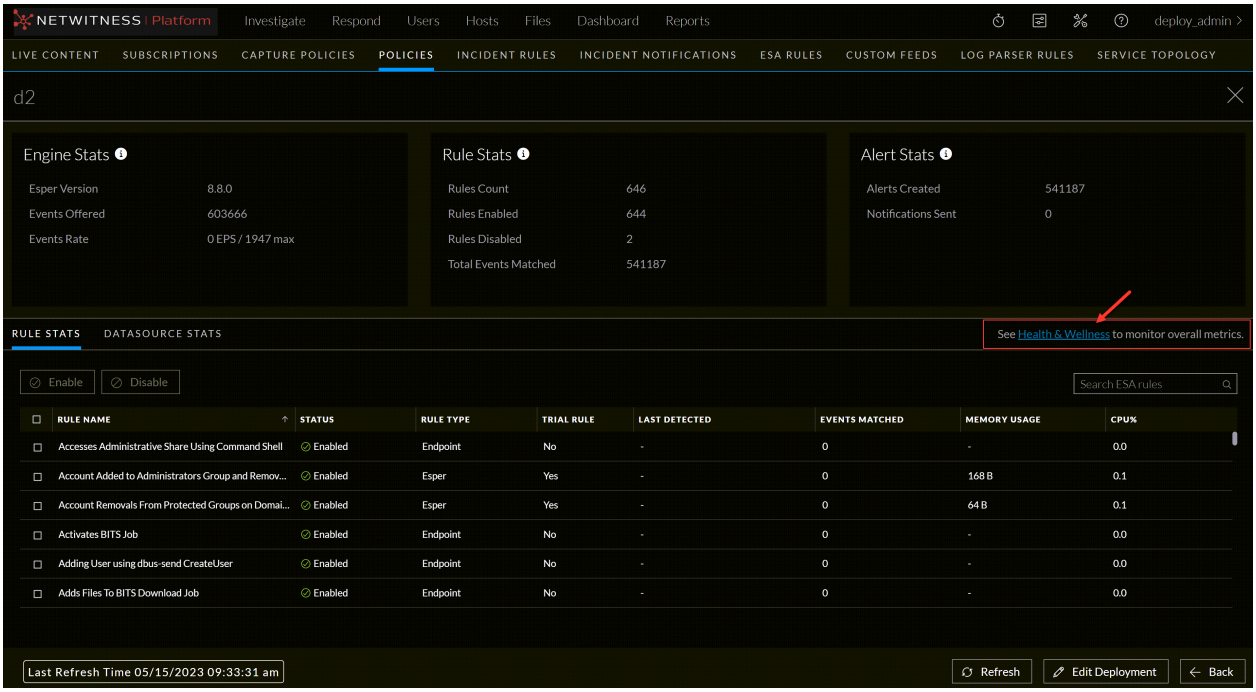
The deployment stats for the selected service are displayed.

Review the following sections of selected Deployment Stats. For a complete description of each statistic in each section, see the Deployment Stats Information.

- **Engine Stats**
- **Rule Stats**
- **Alert Stats**

The following figure shows the Deployment Stats panel.

5. Review the list of details about the rules deployed on the ESA.



- If the rule is enabled or disabled
- Rule name
- Rule type
- Rule trial mode
- Last detected
- Events matched
- Rule memory usage

- Deployment CPU percentage used by the rule.

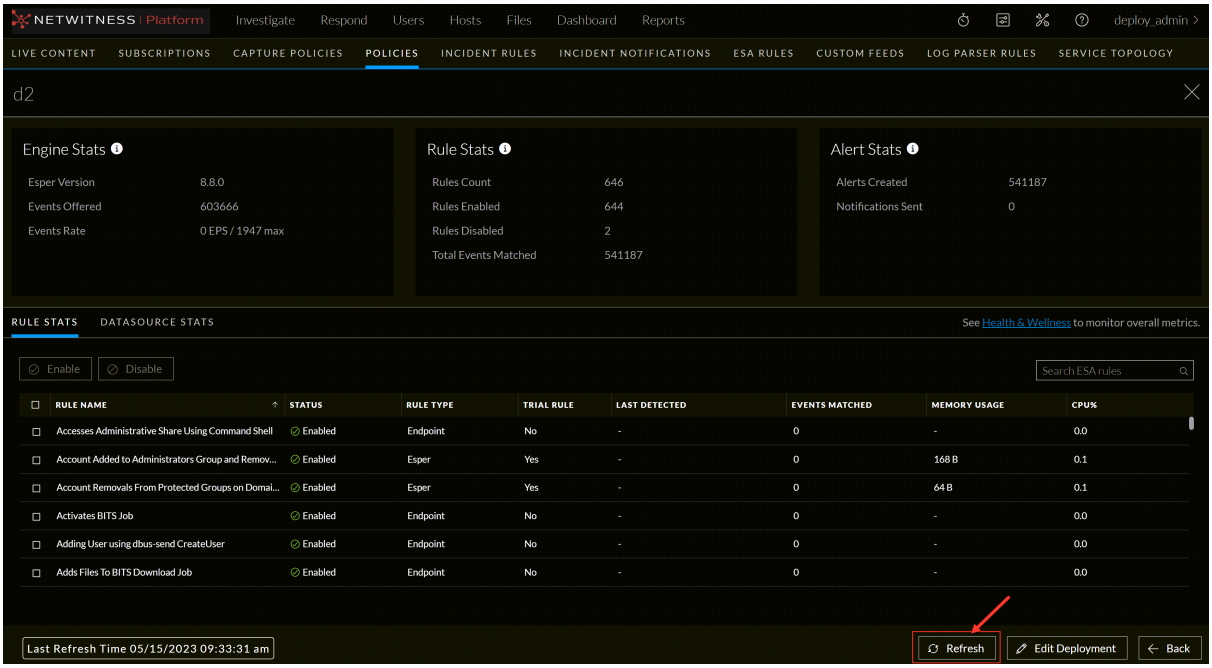
  For a complete description of each column in each section, see Deployment Stats Information.

Check Health and Wellness

To monitor your ESA Correlation service's overall memory usage and health, click **Health & Wellness**.

To Enable or Disable Rules

1. Select a rule from the **Rule Stats** panel grid.
2. Click **Enable** to enable the rule or click **Disable** to disable the rule.



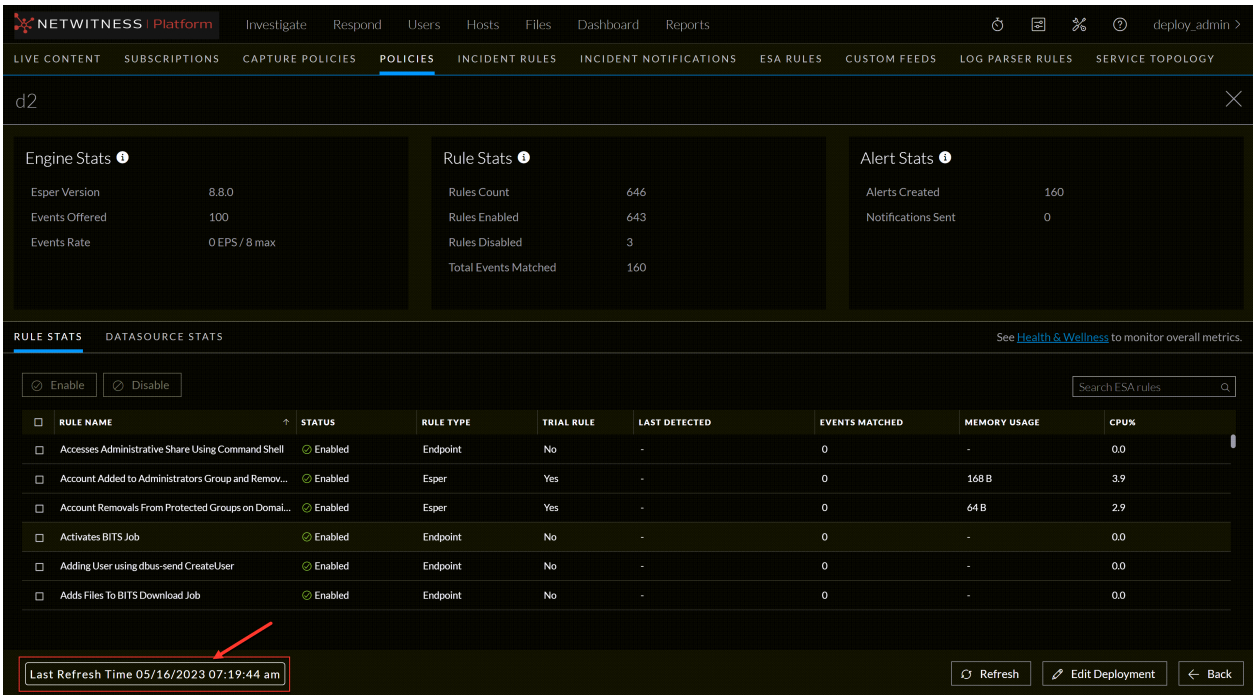
To Refresh the Statistics

The Services tab does not update statistics automatically unless you enable or disable a rule.

1. Click the **Refresh** tab in the bottom right corner to refresh the information.

   The Services tab is refreshed to show the changes which take effect immediately.

2. View the updated information.

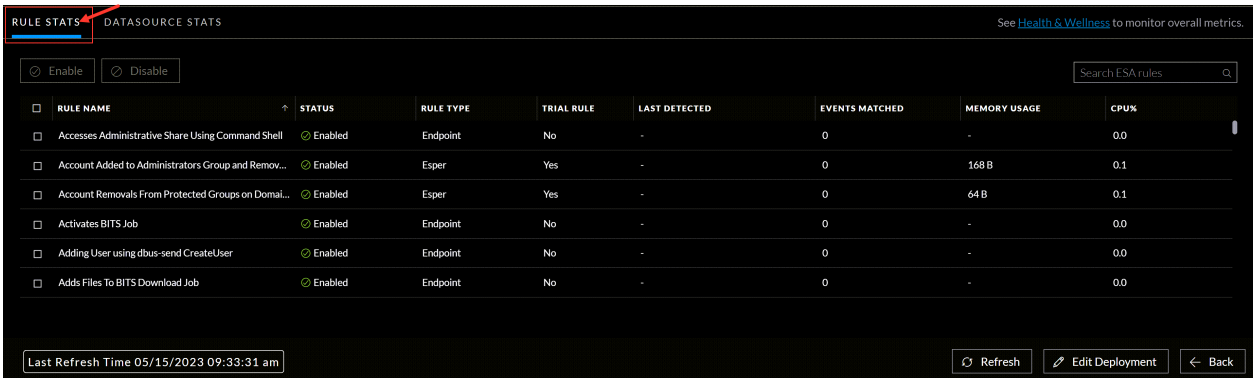


Edit the Deployment

To edit the deployment, Click the **Edit Deployment** tab in the bottom right corner of the page.

Last Refresh Time

This information indicates the last time when the deployment stats page was refreshed.

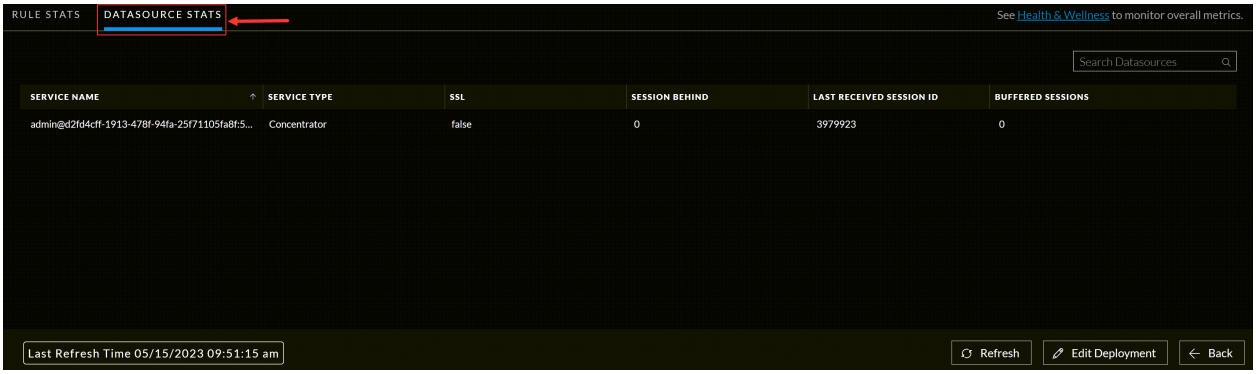


Sections	Parameter	Description
Engine Stats	Esper Version	Esper version running on the ESA service
	Events Offered	Number of events processed by the ESA service since the last service started.
	Events Rate	The rate that the ESA service processes current events / The maximum rate that the ESA service processed events.

Sections	Parameter	Description
Rule Stats	Rules Enabled	The number of rules enabled.
	Rules Disabled	The number of rules disabled.
	Rules Count	The number of rules inside a deployment.
	Total Events Matched	Total number of events matched to all rules on the ESA service.
Alert Stats	Notifications	The total number of notifications sent by email, SNMP, syslog, or script for the deployment. (ESA SNMP notifications are not supported in NetWitness Platform version 11.3 and later.)
	Alerts Created	The total number of alerts sent to Respond for the deployment.

The Rule Stats panel details:

The Rules Stats provides details on the rules that are deployed on the ESA service. The following figure shows the **Rule Stats** panel.



The table below lists the various parameters in the Rules Stats view and their description.

Parameters	Description
	Enables a rule that was disabled.
	Disables a rule that was enabled.
Health & Wellness link	Enables you to monitor overall memory usage and health of your ESA Correlation service.
Status	Indicates whether the rule is enabled or disabled. A green circle icon  indicates that the rule is enabled. A white circle icon  indicates that the rule is disabled. **Note:** If a rule has an error on deployment, it shows up as **'Failed'**. Hover over the Failed icon to view the error message in the tooltip.
Rule Name	Name of the ESA rule.

Parameters	Description
Rule Type	**Endpoint** indicates a rule from the Endpoint Risk Scoring Bundle and **Esper** indicates Esper-specific rules, such as Rule Builder and Advanced EPL rules.
Trial Rule	Indicates if the rule is running in trial rule mode.
Last Detected	The last time alert was triggered for the rule.
Events Matched	The total number of events that matched the rule.
Memory Usage	The total amount of memory used by the rule. **Note:** The Endpoint Risk Scoring Rules Bundle rules do not show memory usage.

Parameters	Description
CPU %	The percentage of the deployment CPU used by the rule. For example, a deployment with 1 rule shows 100% CPU usage for that rule and a deployment with two equally CPU heavy rules show 50% each. **Note:** The Endpoint Risk Scoring Rules Bundle rules do not show CPU usage.

The Data Source Stats panel details:

Parameters	Description
Service Name	Identity of the service.
Service Type	Type of the service.

Parameters	Description
SSL	Data Source connected to ESA deployment over an SSL connection using SSL port (For example, for the concentrator, it is 56005).
Session Behind	Difference between the last latest session id on the concentrator and the currently processed session id on ESA.
Last Received Session ID	The latest session id received by the deployment from the data source.
Buffered Sessions	Number of sessions in the ESA buffer to be consumed by the Esper engine.

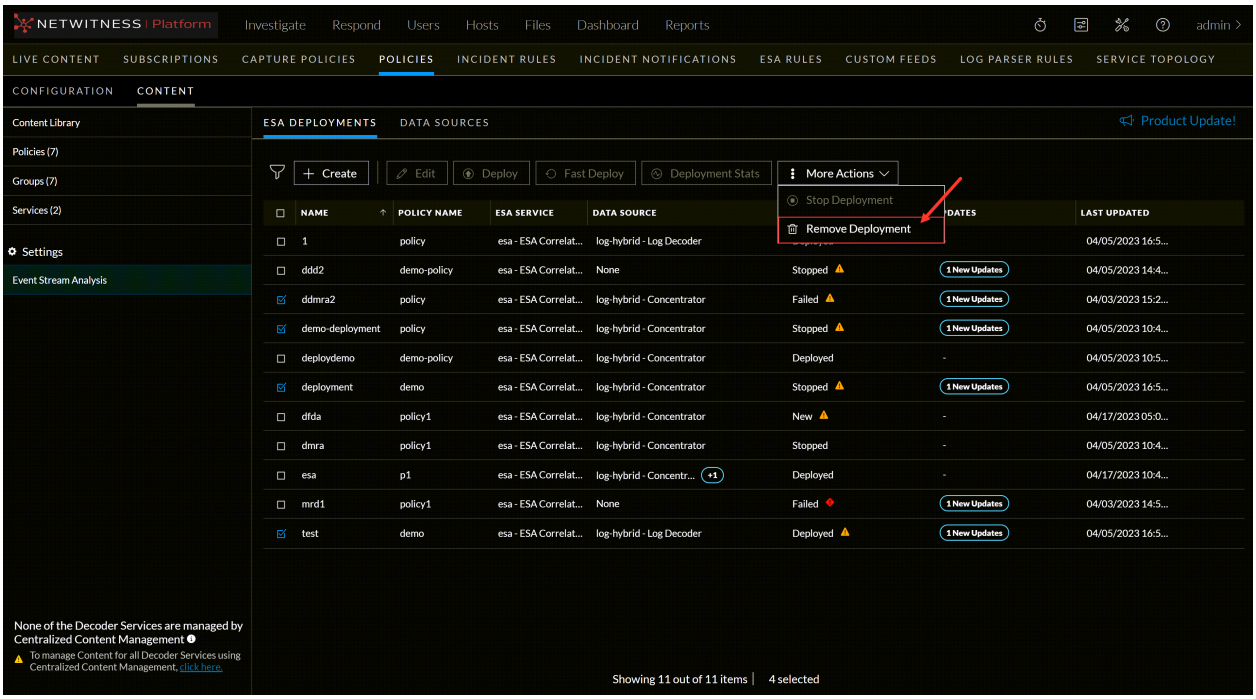
Remove a Deployment

You can delete one or more deployments when those deployments are not required. Once the deployment is deleted, all the configurations associated with the deployment will be permanently deleted from the correlation server. The alert process will be stopped for the deleted deployment.

You can remove deployments in the following ways:

- Using the **ESA Deployments** tab. The ESA Deployments tab provides a consolidated view of all the available deployments within CCM. You can remove deployments.
- Using a specific policy. In this method, you cannot view other deployments. You need to go to each policy and remove a deployment.

To remove a deployment from the ESA Deployments tab



1. Go to **(CONFIGURE)** > **Policies** > **Content**.
2. Under **Settings**, click **Event Stream Analysis** > **ESA Deployments**.

The available deployments are displayed.

3. Select the deployment that needs to be removed and click **Remove**.

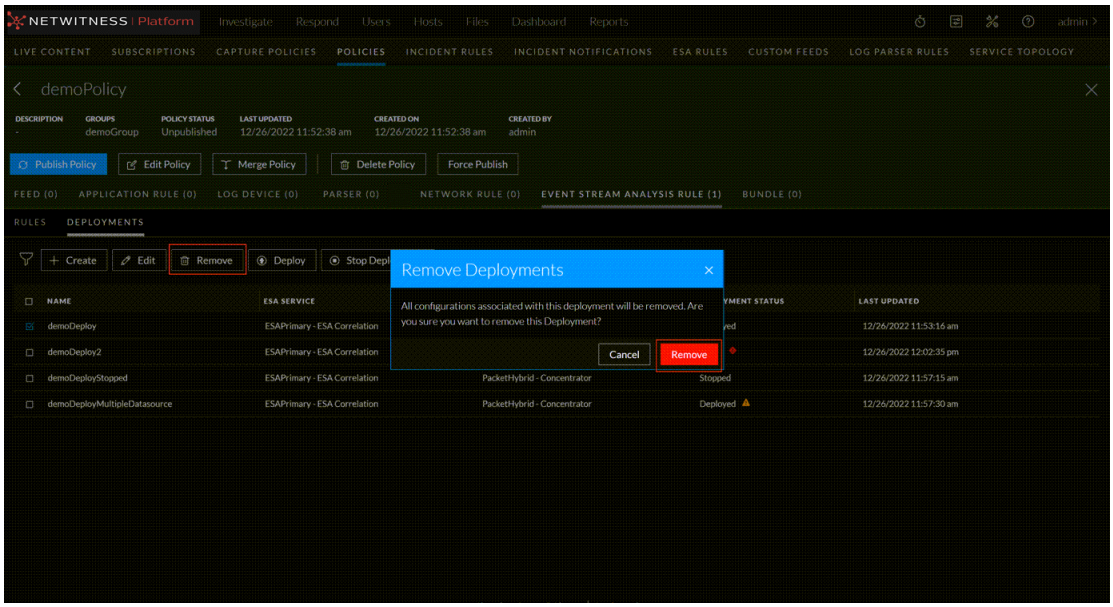
   A confirmation pop-up is displayed to confirm.

4. Click **Remove**.

To remove a deployment from a selected policy

1. Go to **(CONFIGURE)** > **Policies**.
2. In the policies panel, click **Content**.
   The available policies are displayed.
3. Click a Policy.

   The selected policy view is displayed and by default **Application Rule** is selected.



4. Click **Event Stream Analysis Rule** > **Deployments**.

   The available deployments for the selected policy are displayed.

5. Select the deployment that needs to be removed and click **Remove Deployment**.

   A confirmation pop-up is displayed to confirm if you want to remove it.

6. Click **Remove**.

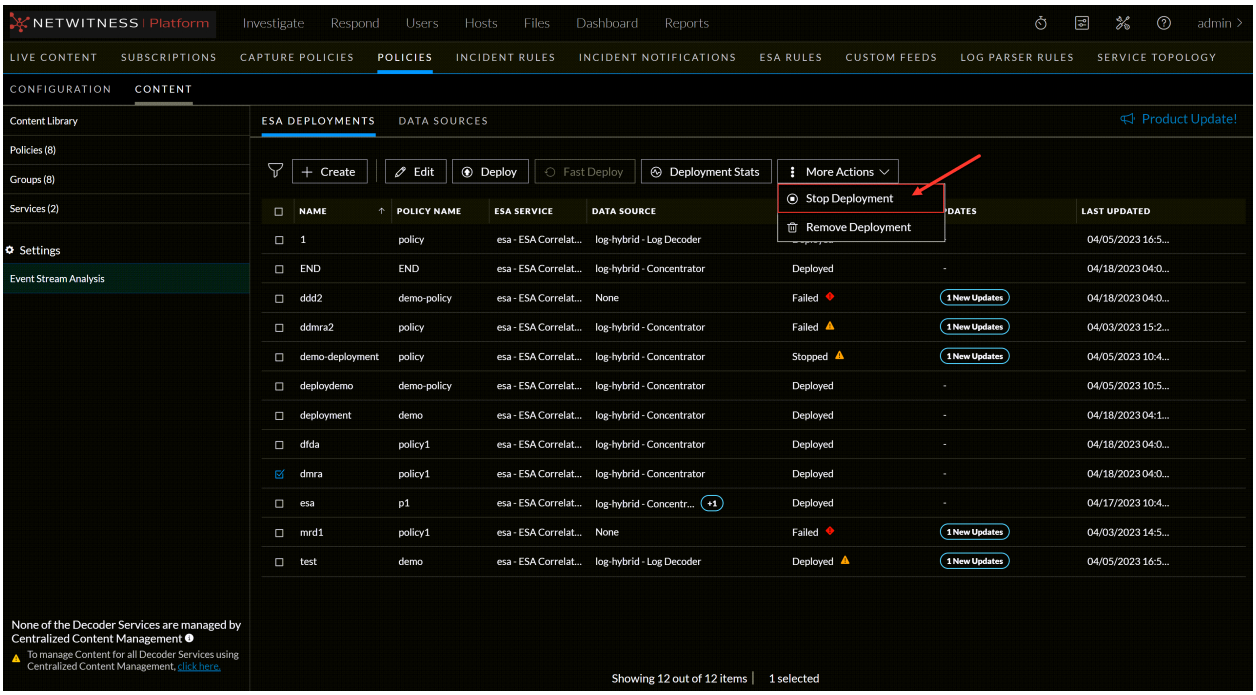
Note: It is required to have at least one deployment associated with the correlation service present in the group associated with the policy.

Stop a Deployment

You can stop a deployment to temporarily pause an ESA deployment. This will stop processing the event stream analysis alerts corresponding to the deployed policy.

To delete a deployment completely, see Remove a Deployment

To initiate a deployment again, see Start a Deployment



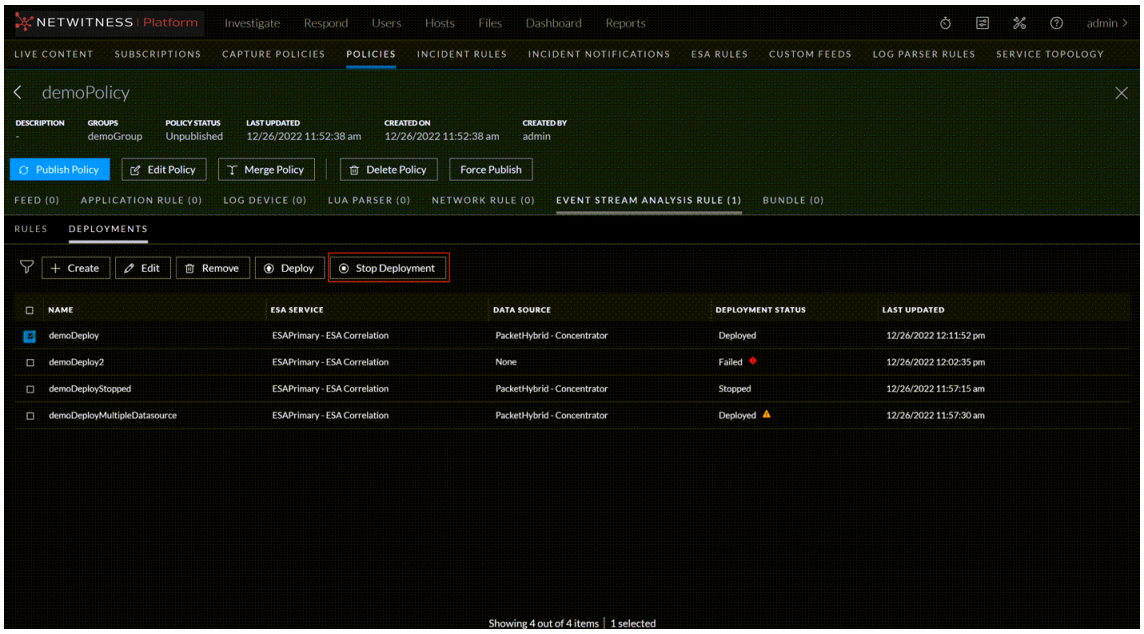
You can stop deployments in the following ways:

- Using the ESA Deployments tab. The ESA Deployments tab provides a consolidated view of all the available deployments within CCM. You can stop deployments.
- Using a specific policy. In this method, you cannot view other deployments. You need to go to each policy and stop a deployment.

To stop a deployment from the ESA Deployments tab

1. Go to **(CONFIGURE)** > **Policies** > **Content**.
2. Under **Settings**, click **Event Stream Analysis** > **ESA Deployments**.

   The available deployments are displayed.
3. Select the deployment that must be stopped temporarily and click **Stop Deployment**.



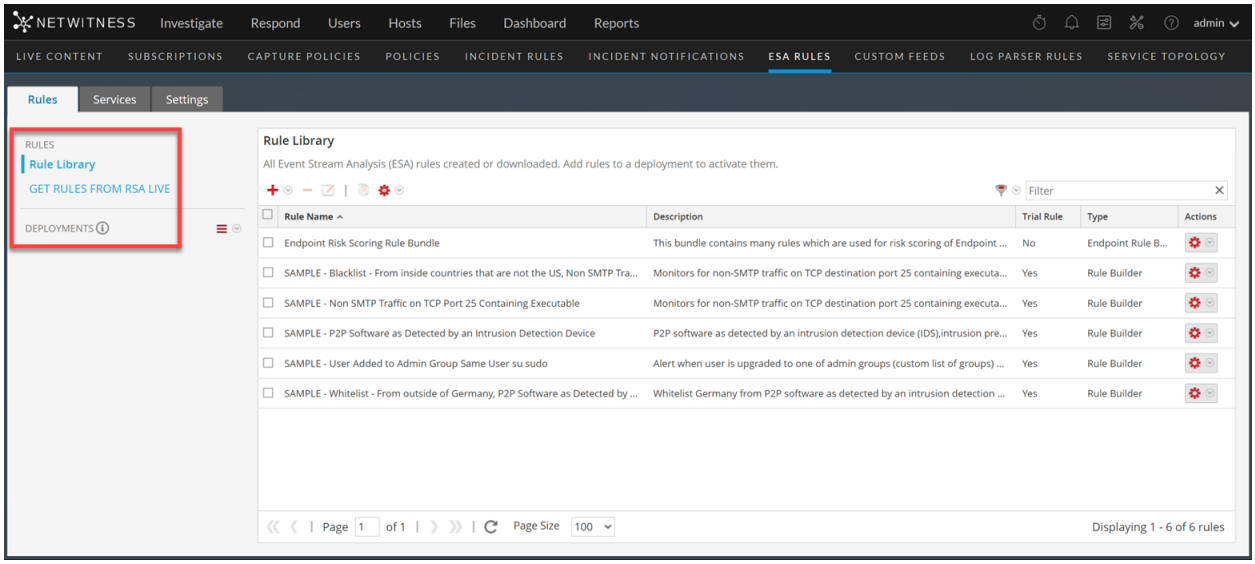
To stop a deployment from a selected policy

1. Go to **(CONFIGURE) > Policies**.
2. In the policies panel, click **Content**.
   The available policies are displayed
3. Click a Policy.

   The selected policy view is displayed and by default **Application Rule** is selected.
4. Click **Event Stream Analysis Rule** > **Deployments**.

   The available deployments for the selected policy are displayed.
5. Select the deployment that needs to be stopped temporally and click **Stop Deployment**.

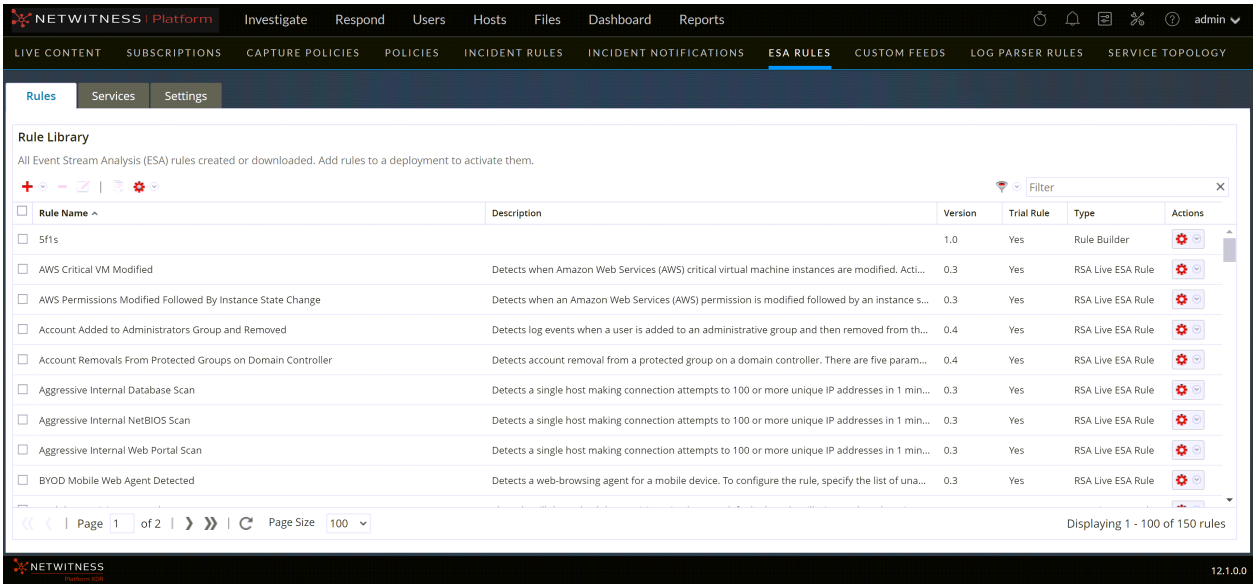
Note: Publishing the policy will not deploy the stopped deployments.



Migrate ESA Deployments to Policies and Groups

From version 12.1 and later, on successful upgrade of the Admin Server, the ESA deployments are managed by the policies and groups page. The deployments are not available on **(CONFIGURE)** > **ESA Rules** page.

12.0 and Earlier version



ESA Rules page in the 12.0 version.

12.1 version

Updated ESA Rules page in 12.1 version, where only rule libraries are available.

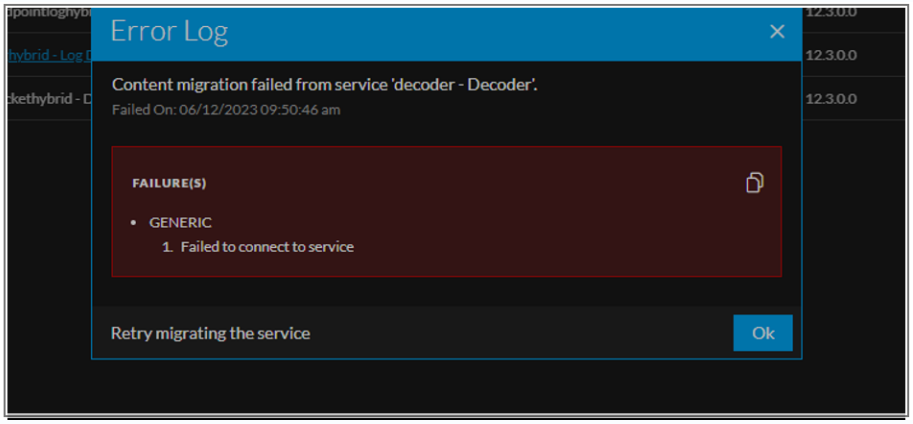
Note: The ESA deployments, after upgrading the Admin Server to 12.1 are not available to view or modify until the Correlation servers are also upgraded to the 12.1 version. However, the events are consumed, and ESA alerts are processed by the Correlation server.

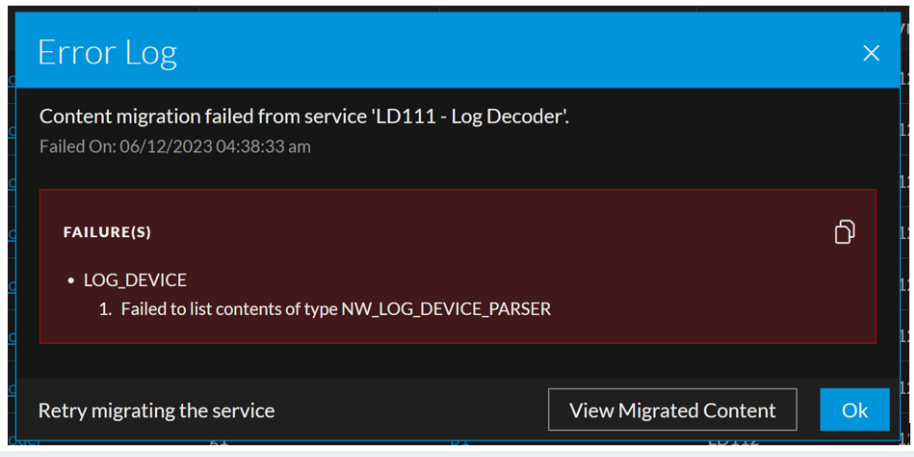
All the deployments are automatically migrated to policies and groups:

- Each deployment is converted into a policy and a group.
- Once the ESA Correlation server is upgraded to the 12.1 version, you can access these deployments as groups and policies.

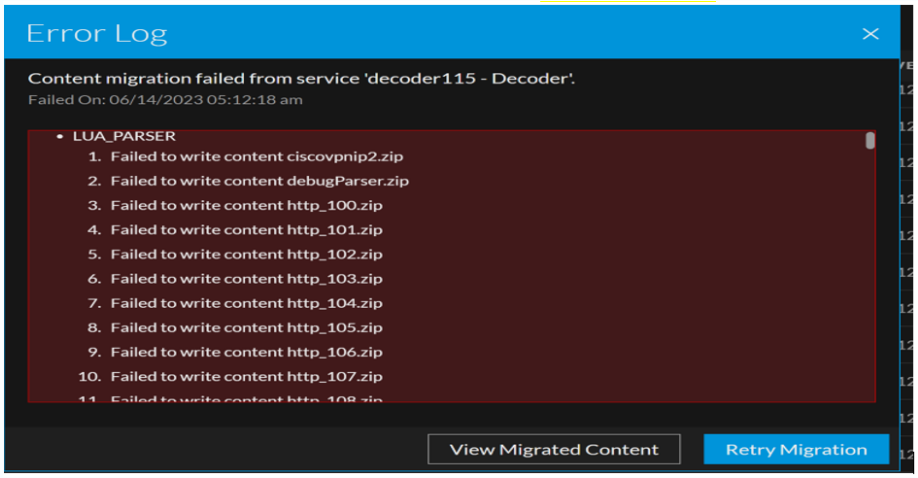
IMPORTANT: If there is any need to import ESA Rules and Enrichments. NetWitness recommends importing those missing rules and enrichments before the upgrade.

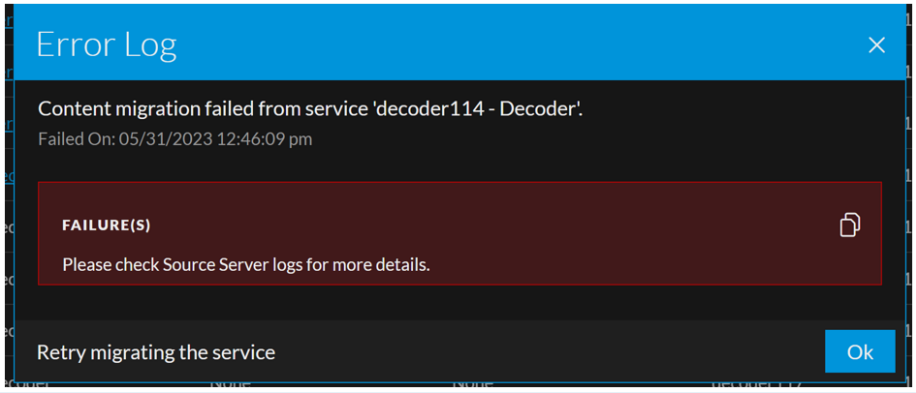
The following table provides the information on different deployment states for Policy and Groups:



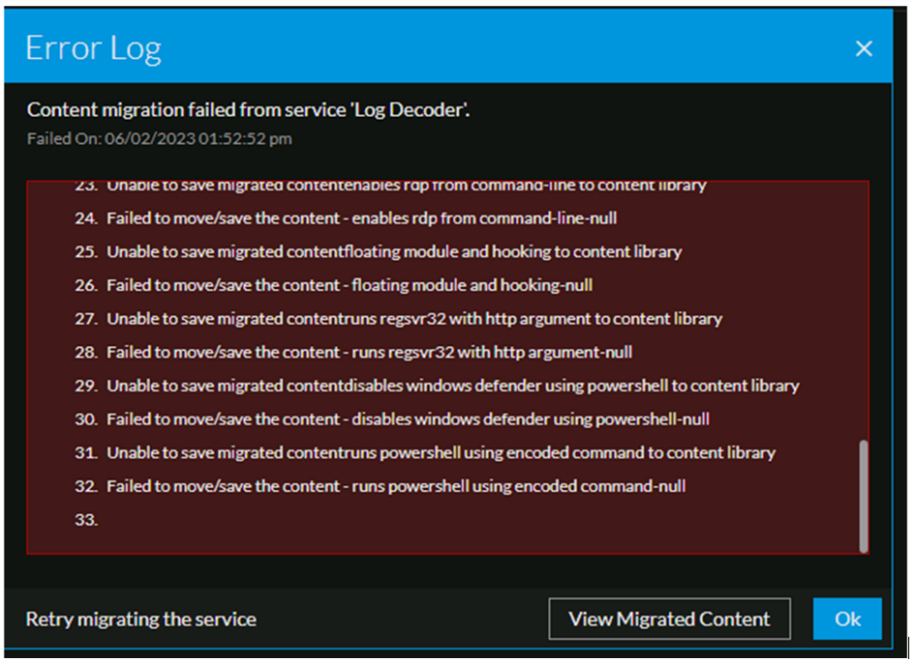


SlNo	Pre-upgrade Deployment State	Post-upgrade Deployment State		
		Creates Policy	Creates Group	The policy will be Published
1	Healthy deployment	Yes	Yes	Yes
2	Deployment with errors	Yes	Yes	Yes
3	Deployment with only rules	Yes	No	No
4	Deployment with no rules	No	No	No





Healthy deployment contains no errors, and the required resources such as ESA Server, Data source, and ESA rule are added.



Note: NetWitness recommends that all the deployments maintain an error-free state and also remove any unnecessary or unused ESA deployments.

Troubleshooting

This topic provides information about possible issues that NetWitness users may encounter when using Centralized Content Management (CCM) in NetWitness. You can look up explanations of issues and their solutions.

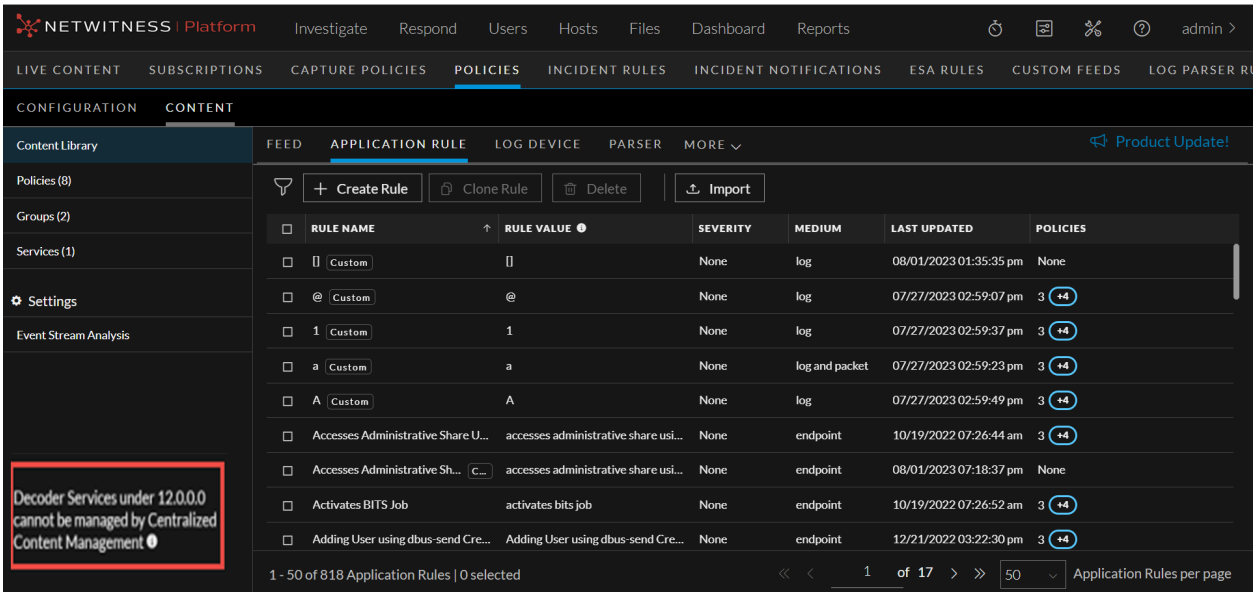
Problem	Solution
Failed to connect to service	Generally this error occurs when service is offline. If the service status is offline, then restart service and retry migration. If the service status is online, then retry migration. 
Failed to list content of type LOG_DEVICE_ PARSER	This is a temporary failure. Retrying migration resolves this issue. 

Problem	Solution
Failed to write content	This is a temporary failure. Retrying migration resolves this issue. 
Please check source server logs for more details.	This error occurs when source server goes offline during migration. Hence, restart source server and retry migration. 

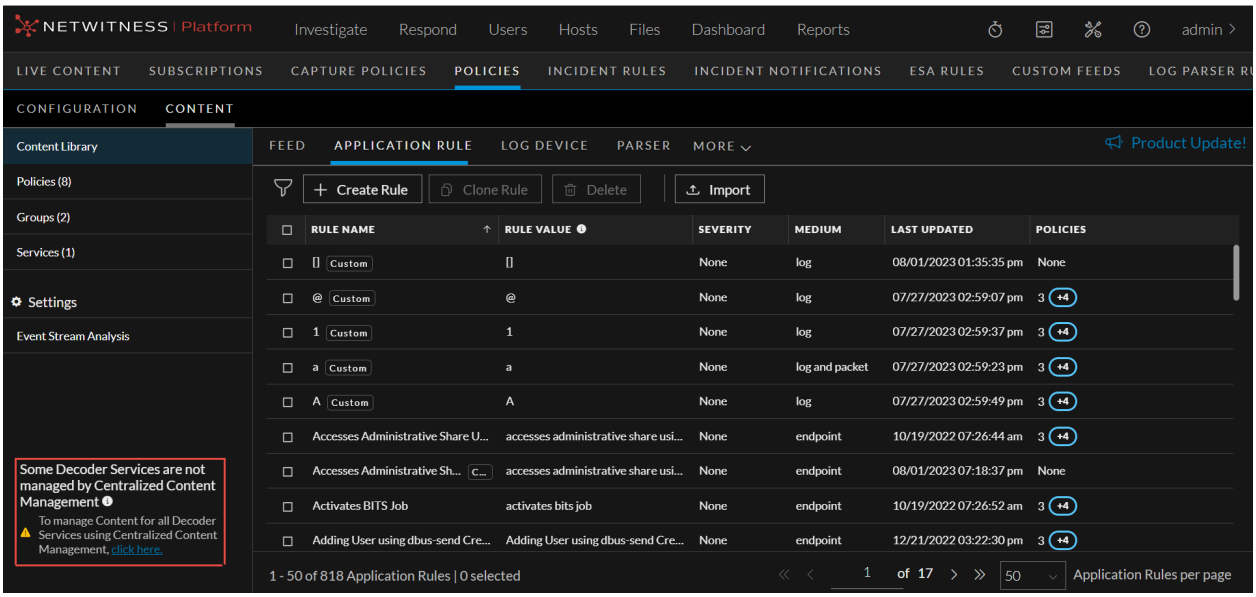
Problem	Solution
Failed to move/save the content	This error may occur for various reasons and needs more investigation. Hence, please raise a CE ticket and share mongo dump and source server log with ticket. 

References

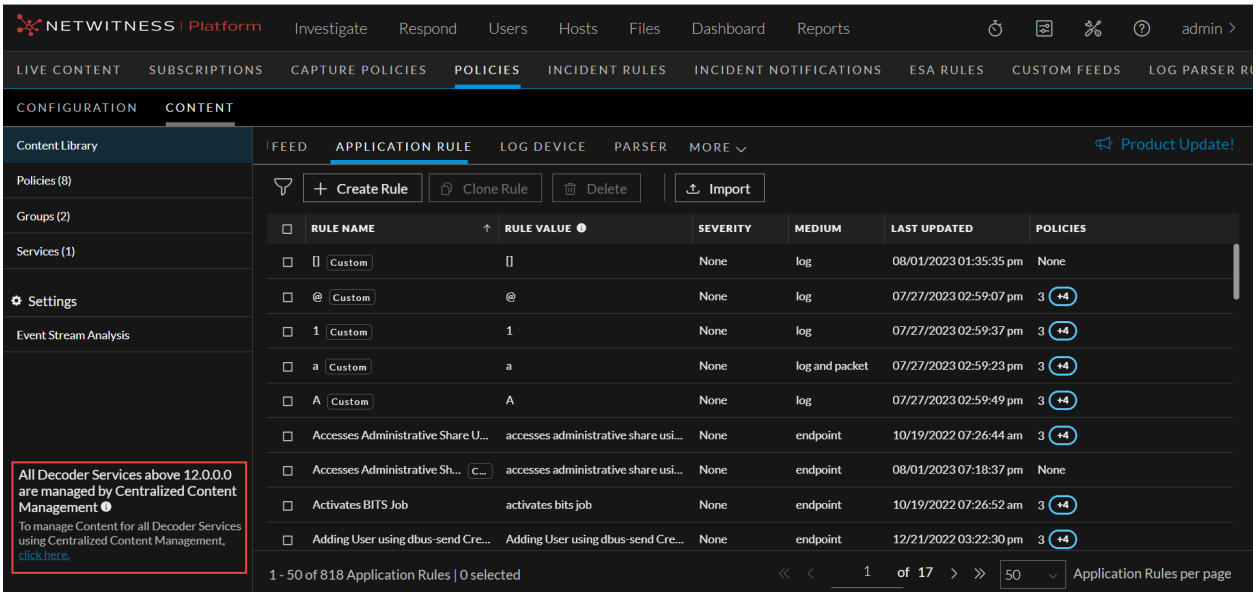
This section is a collection of references, which describe the user interface and more detailed information about how Policy-based Centralized Content Management works in NetWitness. The topics are presented in alphabetical order.



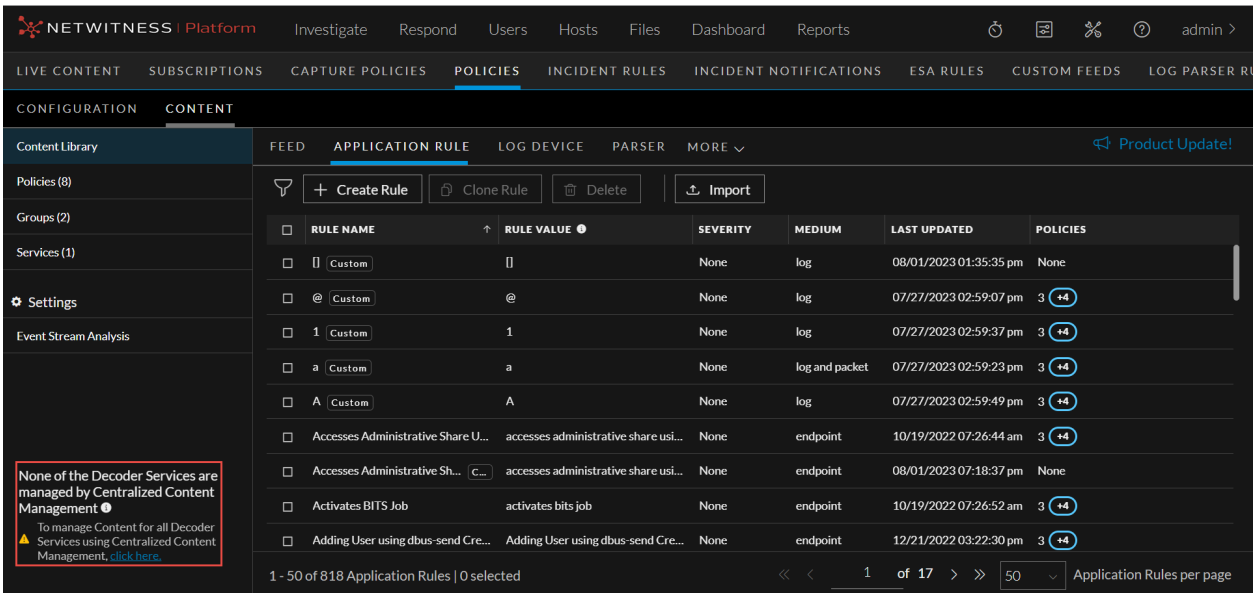
- Content Library Tab
- Data Sources Tab
- Deployments Tab
- Groups Tab
- Policies Tab
- Services Tab



Content Library Tab



The **(CONFIGURE)** > **Policies** view contains two tabs: **Configuration** and **Content**.



The **CONTENT** tab has **Content Library**, **Policies**, **Groups** and **Services** on the left panel.

Below is an example of the Content > Content Library tab:

Application Rules per page

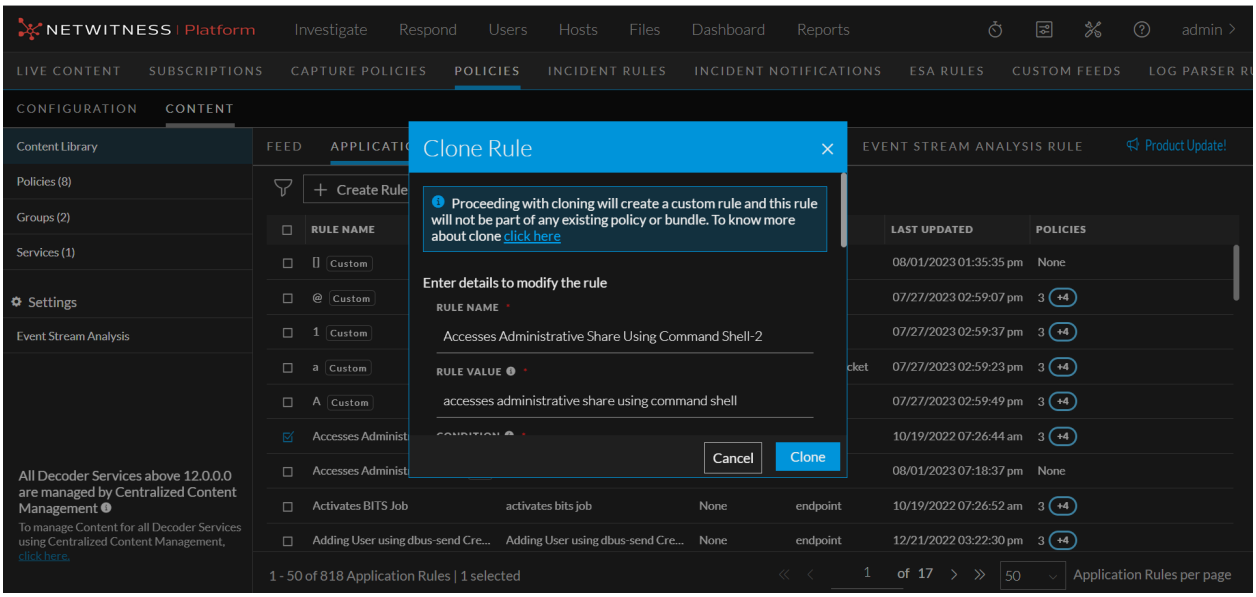
The following table describes the Content Library tab.

1	By default, 50 contents are displayed per page. To go to the next page, click ›. To go to the last page, click ».
2	Toolbar • Create Rule - Lets you create a rule. • Clone Rule - Lets you clone an application rule or network rule. For more information, see Clone Application Rule or Clone Network Rule. • Delete - Lets you delete an application rule or network rule. For more information, see Delete Application Rule or Delete Network Rule. • Import - Lets you import an application rule or network rule. For more information, see Import Content to Content Library.
3	Rule List Pane • Rule Name - Name of the rule. • Rule Value - The rule value. • Medium - Medium through which the rule is created. • Last Updated - Displays the time when the rule is updated. • Policies - Policies to which the rule is applied. You can also sort on any column. If you mouse over a column header, a sort icon is displayed: . Click the ↑ icon to sort by the selected column.

Create New Rule dialog:

Below is an example of the Create New Rule dialog:



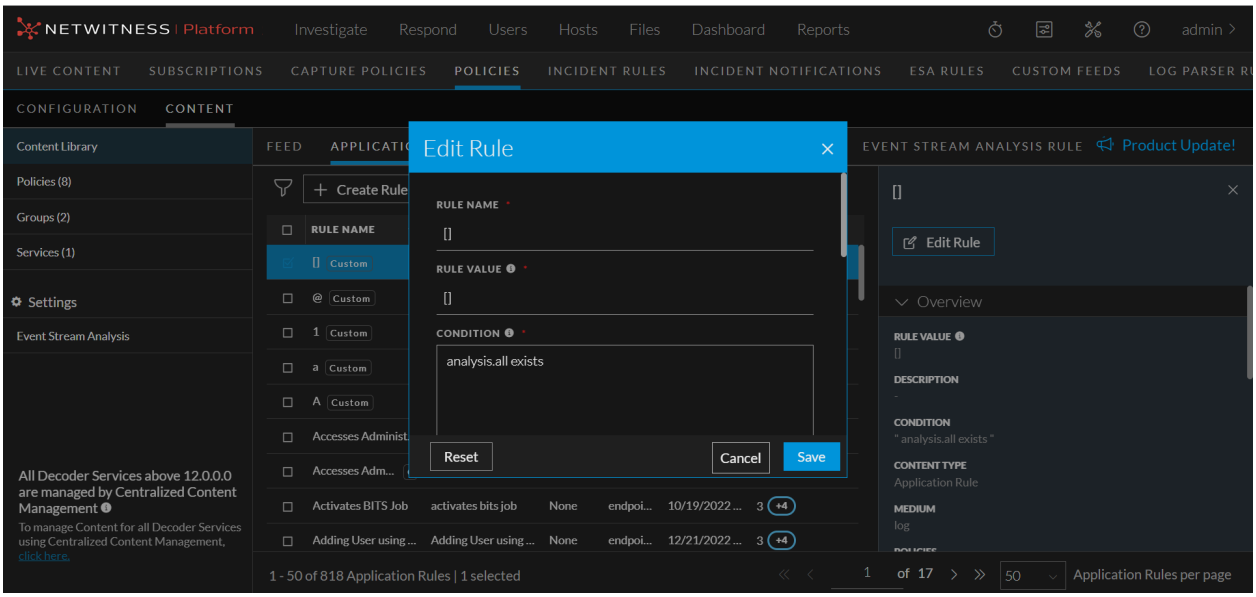
The table describes the information and options in the Create New Rule dialog:

Field	Description
Rule Name	Name of the new rule. The name should be unique.
Rule Value	The rule value. While creating a new rule, the rule value is defaulted with the rule name. However, you can modify the same.
Condition	Condition for the new rule. You can apply two types of conditions for the rule. **Normal mode:** It gives suggestions for supported metas (ip, host and so on) and operators (“=”, “Not Equal To”, “Contains”, “Exists” and so on). The entered condition will be enclosed in a ‘Pill’. When you enter multiple conditions, the conditions are automatically joined by an ‘AND’ operator. On clicking the ‘AND’ operator, you can toggle between ‘AND’ and ‘OR’ operators. **Advanced:** You can customize the conditions as a free form text.
Medium	Medium through which the rule is created. For a network rule, the value of medium is selected as **Packet** as default and you cannot edit it.
MITRE ATT&CK Tactics	Tactics associated with the rule. For example: **Credential Access**. For more information on MITRE ATT&CK Tactics, see **Use MITRE ATT&CK Framework** topic in the NetWitness Respond User Guide for 12.4
MITRE ATT&CK Techniques	Techniques associated with the rule. For example: **OS Credential Dumping**. For more information on MITRE ATT&CK Techniques, see **Use MITRE ATT&CK Framework** topic in the NetWitness Respond User Guide for 12.4

Description	The description of the new rule.
Session Data	Session data for the new rule. Indicates if the rule processing should stop, keep, filter or truncate when the session data is running.
Session Options	Session options for the new rule. Indicates if the session options should be alert, forward or transient.
Flag session with rule name in meta key	Conditions for which the alert should be turned on.
Save	Saves the settings and closes the Create New Rule dialog.
Cancel	Cancels the operations.

Clone Rule dialog:

Below is an example of the Clone Rule dialog.



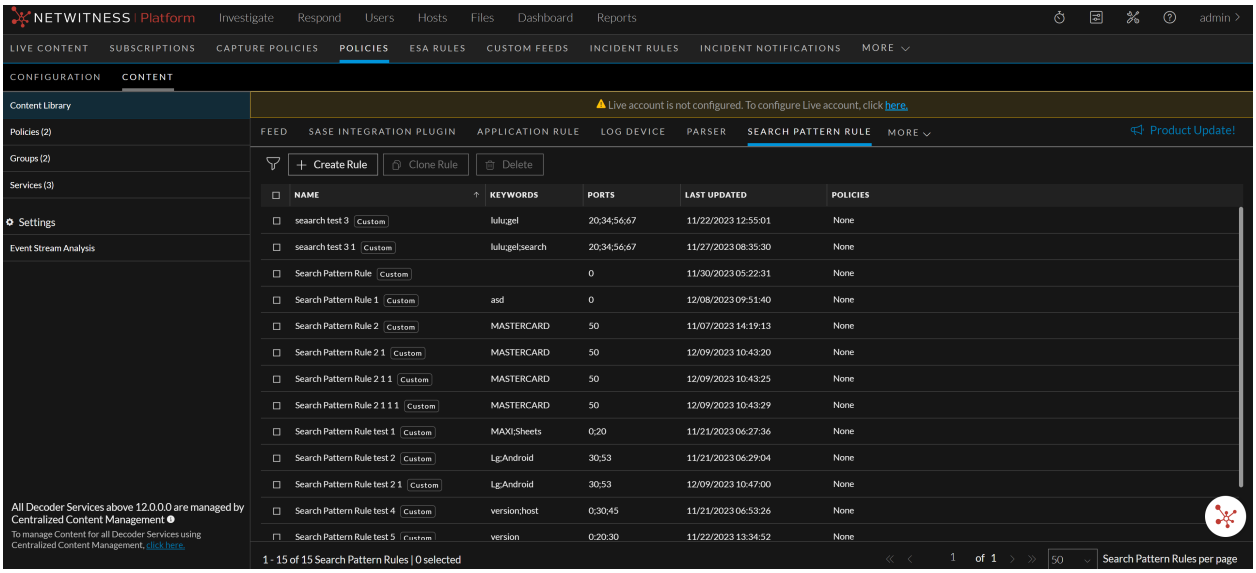
The table describes the information and options in the Clone Rule dialog:

Field	Description
Rule Name	Name of the cloned rule. The name should be unique.
Rule Value	The rule value written to the alert meta.

Condition	Condition for the new rule. You can apply two types of conditions for the rule. **Normal mode:** It gives suggestions for supported metas (ip, host and so on) and operators (“=”, “Not Equal To”, “Contains”, “Exists” and so on). The entered condition will be enclosed in a ‘Pill’. When you enter multiple conditions, the conditions are automatically joined by an ‘AND’ operator. On clicking the ‘AND’ operator, you can toggle between ‘AND’ and ‘OR’ operators. **Advanced:** You can customize the conditions as a free form text.
Medium	Medium through which the rule is created. For a network rule, the value of medium is selected as **Packet** as default and you cannot edit it.
MITRE ATT&CK Tactics	Tactics associated with the rule. For example: **Credential Access**. For more information on MITRE ATT&CK Tactics, see **Use MITRE ATT&CK Framework** topic in the NetWitness Respond User Guide for 12.4
MITRE ATT&CK Techniques	Techniques associated with the rule. For example: **OS Credential Dumping**. For more information on MITRE ATT&CK Techniques, see **Use MITRE ATT&CK Framework** topic in the NetWitness Respond User Guide for 12.4
Description	The description of the new rule.
Session Data	Session data for the new rule. Indicates if the rule processing should stop, keep, filter or truncate when the session data is running.
Session Options	Session options for the new rule. Indicates if the session options should be alert, forward or transient.
Flag session with rule name in meta key	Conditions for which the alert should be turned on.
Clone	Clones the rule and closes the Cone Rule dialog.
Cancel	Cancels the operation.

Edit Rule dialog:

Below is an example of the Edit Rule dialog:



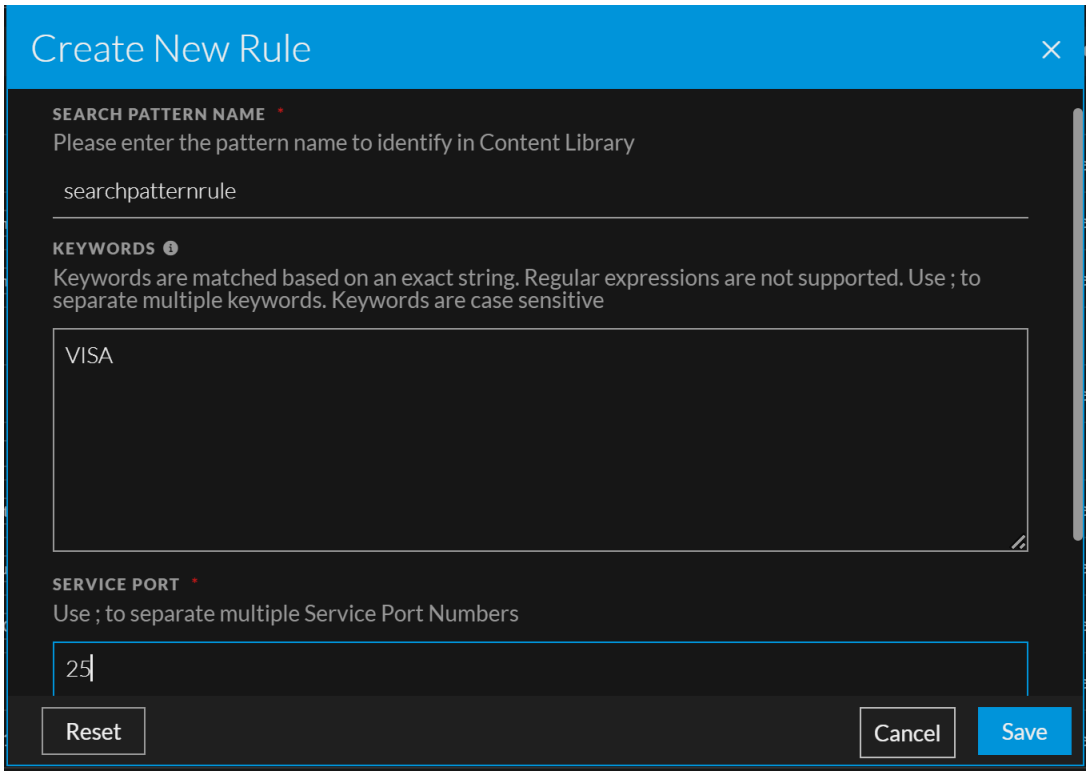
The table describes the information and options in the Edit Rule dialog:

Field	Description
Rule Name	Name of the new rule. The name should be unique.
Rule Value	The rule value.
Condition	Condition for the new rule. You can apply two types of conditions for the rule. **Normal mode:** It gives suggestions for supported metas (ip, host and so on) and operators (“=”, “Not Equal To”, “Contains”, “Exists” and so on). The entered condition will be enclosed in a ‘Pill’. When you enter multiple conditions, the conditions are automatically joined by an ‘AND’ operator. On clicking the ‘AND’ operator, you can toggle between ‘AND’ and ‘OR’ operators. **Advanced:** You can customize the conditions as a free form text.
Medium	Medium through which the rule is created. For a network rule, the value of medium is selected as **Packet** as default and you cannot edit it.
MITRE ATT&CK Tactics	Tactics associated with the rule. For example: **Credential Access**. For more information on MITRE ATT&CK Tactics, see **Use MITRE ATT&CK Framework** topic in the NetWitness Respond User Guide for 12.4
MITRE ATT&CK Techniques	Techniques associated with the rule. For example: **OS Credential Dumping**. For more information on MITRE ATT&CK Techniques, see **Use MITRE ATT&CK Framework** topic in the NetWitness Respond User Guide for 12.4

Description	The description of the new rule.
Session Data	Session data for the new rule. Indicates if the rule processing should stop, keep, filter or truncate when the session data is running.
Session Options	Session options for the new rule. Indicates if the session options should be alert, forward or transient.
Flag session with rule name in meta key	Conditions for which the alert should be turned on.
Save	Saves the settings and closes the Edit Rule dialog.
Reset	Reset the fields.
Cancel	Cancels the operation.

Search Pattern Rule tab

Following is an example of the **Content** > **Content Library** > **More** > **Search Pattern Rule** tab:



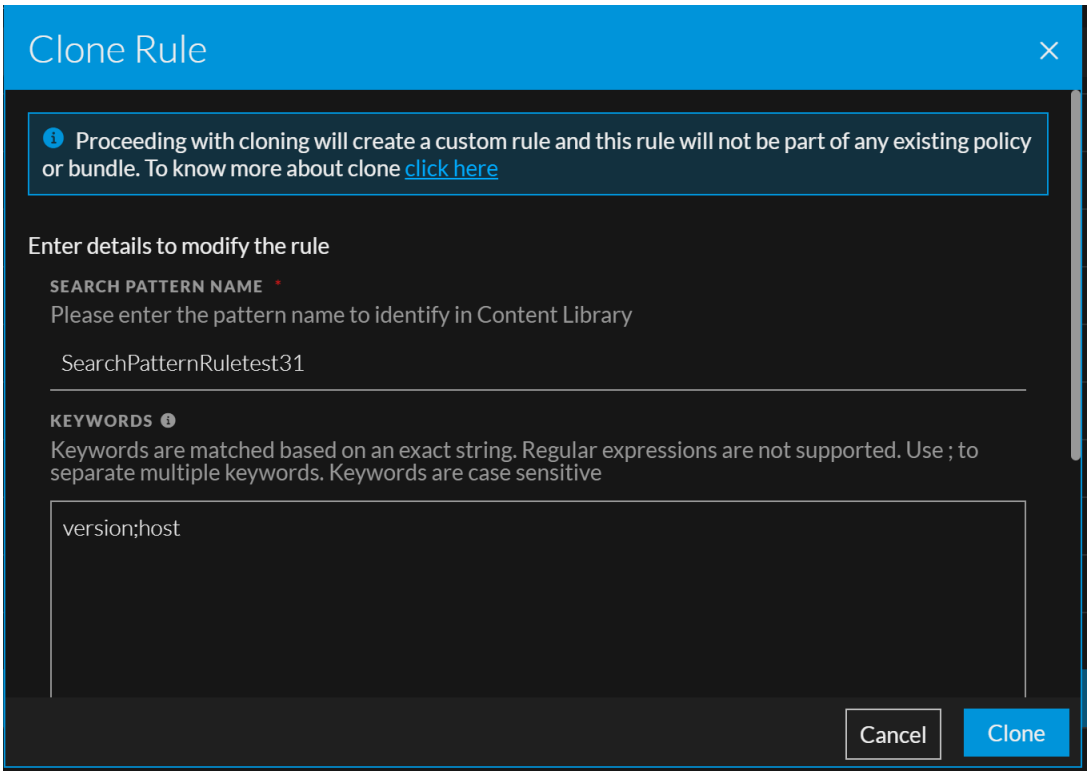
1 Toolbar

- **Create Rule** - Allows you to create a search pattern rule.
- **Clone Rule** - Allows you to clone a search pattern rule. For more information, see Manage Search Pattern Rules
- **Delete** - Allows you to delete a search pattern rule. For more information, see Manage Search Pattern Rules

2	Rule List Pane • **Name** - Name of the search pattern rule. • **Keywords** - Displays the keywords associated for each search pattern rule. • **Ports** - Displays the ports associated for each search pattern rule. • **Last Updated** - Displays the time when the rule is updated. • **Policies** - Policies to which the rule is applied. You can also sort on any column. If you mouse over a column header, a sort icon is displayed: . Click the  icon to sort by the selected column.

Create New Rule dialog for Search Pattern Rule:

Below is an example of the Create New Rule dialog for Search Pattern Rule:

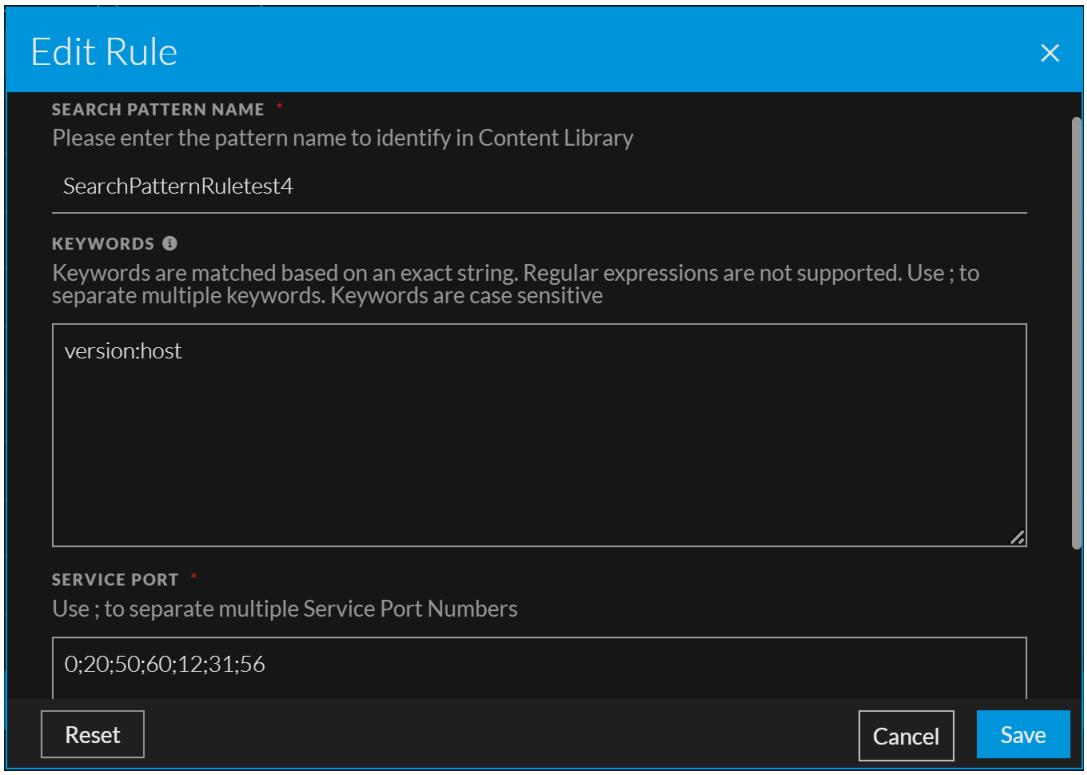


Field	Description
Search Pattern Name	Name of the new rule. The name should be unique.
Keywords	Allows you to add one or more keywords. Keywords are matched based on an exact string only. Regular expressions (Regex) are not supported. Use semicolons (;) to separate multiple keywords. For example, **CreditCard**;**VISA**;**US**.

Field	Description
Service Port	Allows you to add one or more ports. Use semicolons (;) to separate multiple port numbers.For example, **20**;**21**;**23**. The port numbers must be between **1** and 65535.
Save	Saves the settings and closes the Create New Rule dialog.
Cancel	Cancels the operations.
Reset	Reset the fields.

Clone Rule dialog for Search Pattern Rule:

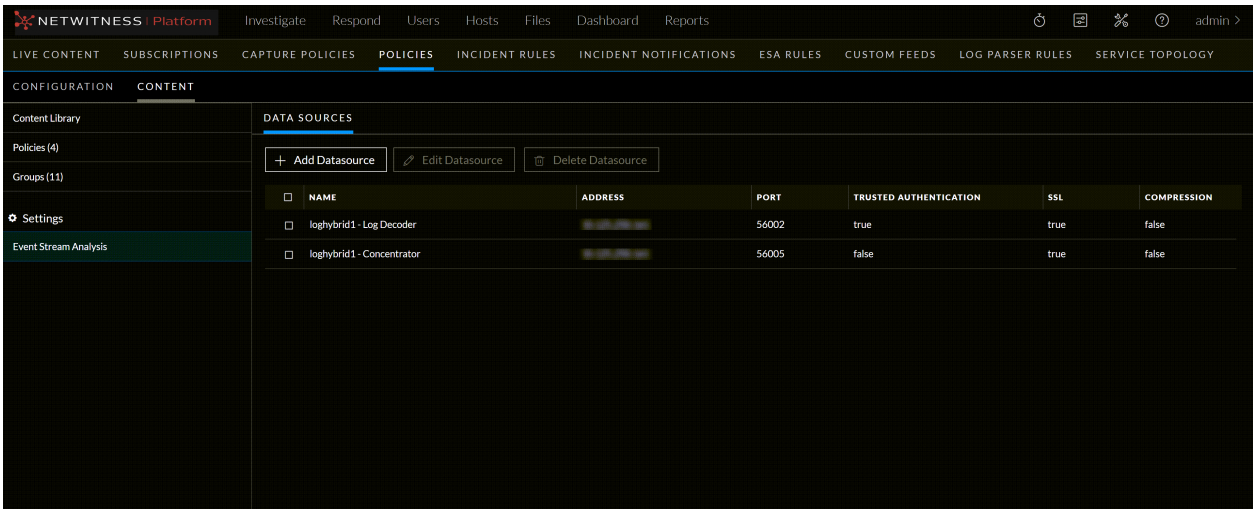
Below is an example of the Clone Rule dialog.



Field	Description
Search Pattern Name	Name of the new rule. The name should be unique.
Keywords	Allows you to add one or more keywords. Keywords are matched based on an exact string only. Regular expressions (Regex) are not supported. Use semicolons (;) to separate multiple keywords. For example, **CreditCard**;**VISA**;**US**.
Service Port	Allows you to add one or more ports. Use semicolons (;) to separate multiple port numbers.For example, **20**;**21**;**23**. The port numbers must be between **1** and **65535**.

Field	Description
Clone	Clones the rule and closes the Cone Rule dialog.
Cancel	Cancels the operations.

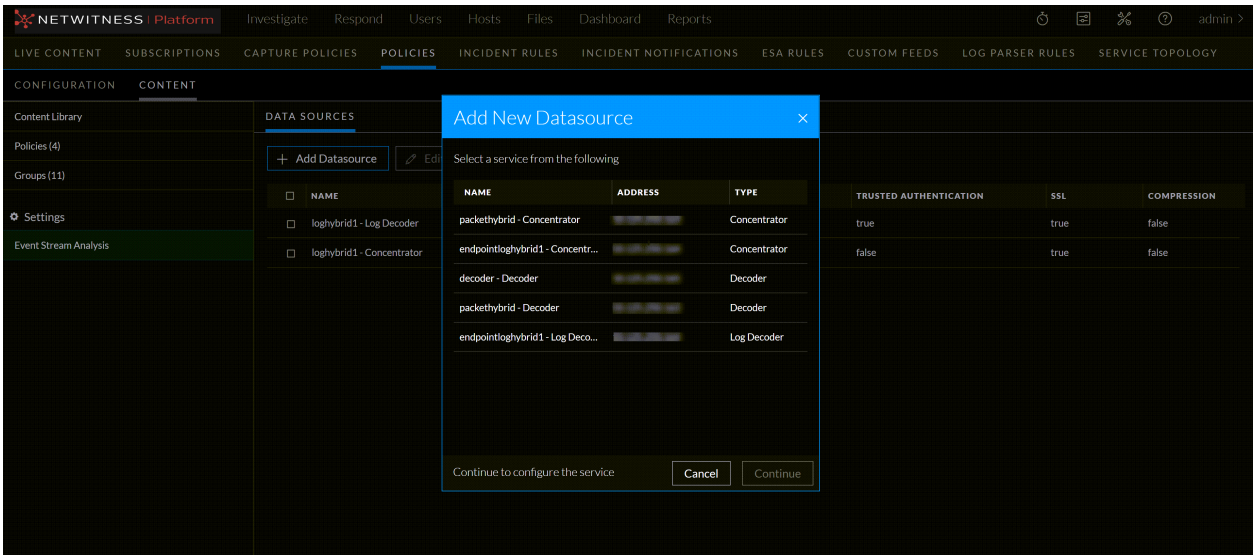
Edit Rule dialog for Search Pattern Rule:



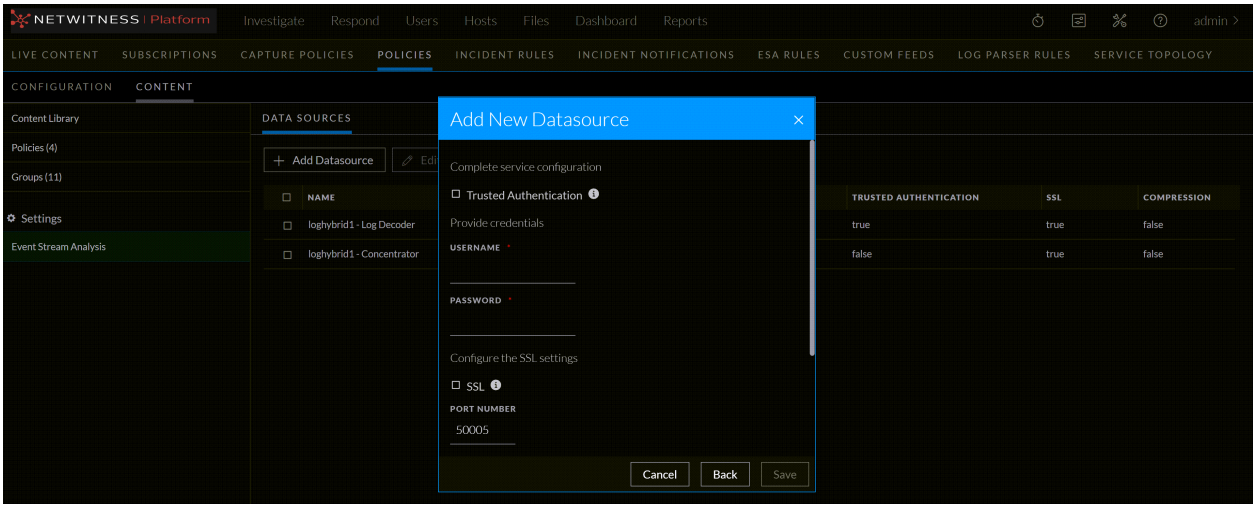
Below is an example of the Edit Rule dialog.

Field	Description
Search Pattern Name	Name of the new rule. The name should be unique.
Keywords	Allows you to add one or more keywords. Keywords are matched based on an exact string only. Regular expressions (Regex) are not supported. Use semicolons (;) to separate multiple keywords. For example, **CreditCard**;**VISA**;**US**.
Service Port	Allows you to add one or more ports. Use semicolons (;) to separate multiple port numbers.For example, **20**;**21**;**23**. The port numbers must be between **1** and **65535**.
Save	Saves the settings and closes the Edit Rule dialog.
Cancel	Cancels the operations.
Reset	Reset the fields.

Data Sources Tab



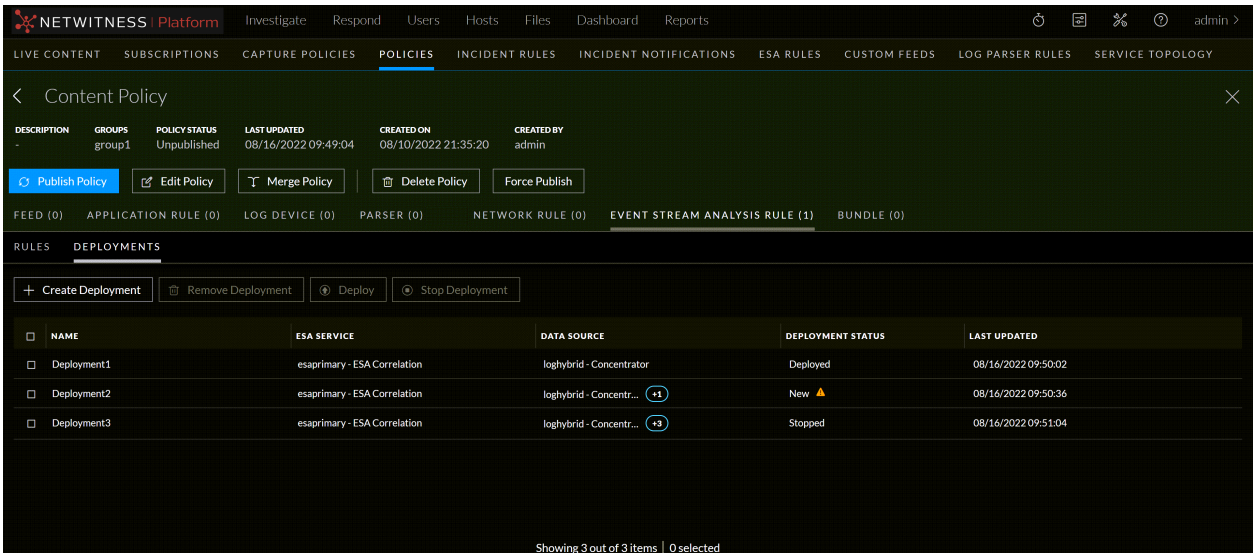
Below is an example of the **Content** > **Settings** > **Event Stream Analysis** > **Data Sources** tab:



The following table describes the Data Sources tab.

1	Toolbar • Add Datasource- Lets you to add a new Datasource. For more information, see Add an ESA Datasource. • Edit - Datasource - Lets you edit the Datasource. For more information, see Edit an ESA Datasource. • Delete Datasource - Deletes the selected Datasource.
2	Data Sources List Pane • Name - Shows the name of the data sources used by the selected ESA service. Data sources can be Concentrators or Decoders. • Address - IP address of the datasource where the ESA service is installed. • Port - Shows the port number used for authentication. • Trusted Authentication - Indicates that it uses Trusted Authentication for communication with ESA Service. • SSL - Indicates that it uses SSL for Authentication. • Compression - Enables you to adjust the Compression Level on different datasources for ESA.

Below is an example of the **Add New Datasource** dialog:



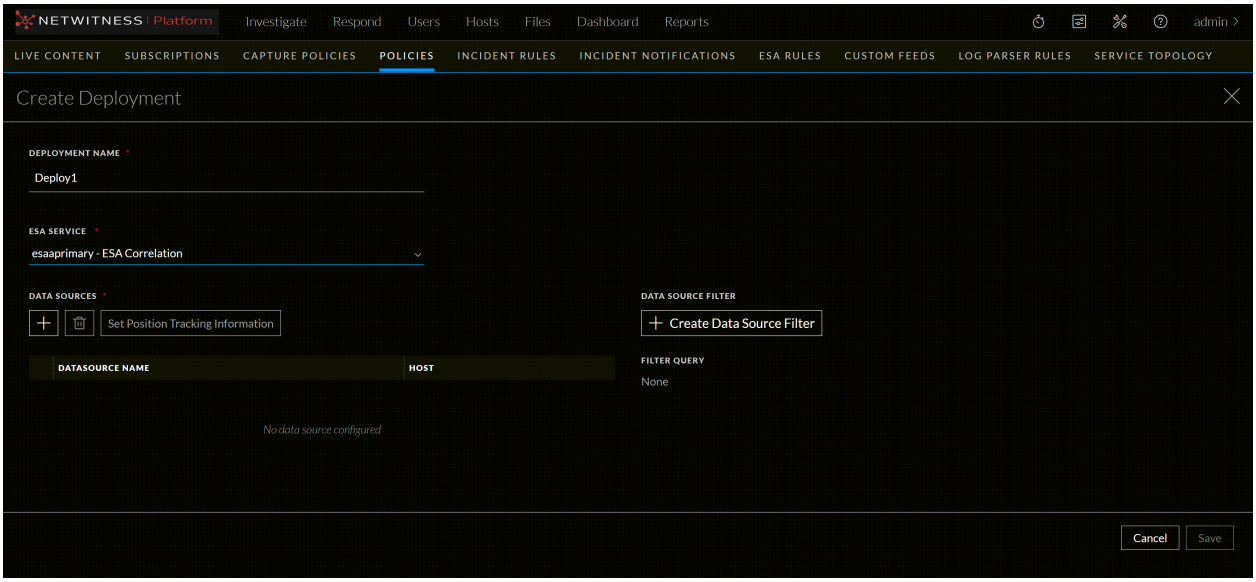
The table describes the information and options in the **Add New Datasource** dialog.

Field	Description
Trusted Authentication	This option will enable the use of SSL by default for authentication.
Username	The username used to sign in to your account for authenticating the datasource.
Password	The password for authenticating the datasource.
SSL	This will enable the use of SSL for authentication.
Port Number	This will enable the use of the port number for authentication.
Compression	This option enables you to adjust the Compression Level on different datasources for ESA.
Compression Level	Enables you to set different compression level. Compression Level: **0**, **1**, and **9**. For more information, see Add an ESA Datasource.

Field	Description
Test Configuration	Validates the provided configuration.
Save	Saves the settings and closes the Add New Datasource dialog.
Cancel	Cancels the operations.

Deployments Tab

Below is an example of the **Content** > **Policies** > select a policy > **Event Stream Analysis Rule** > **Deployments** tab:



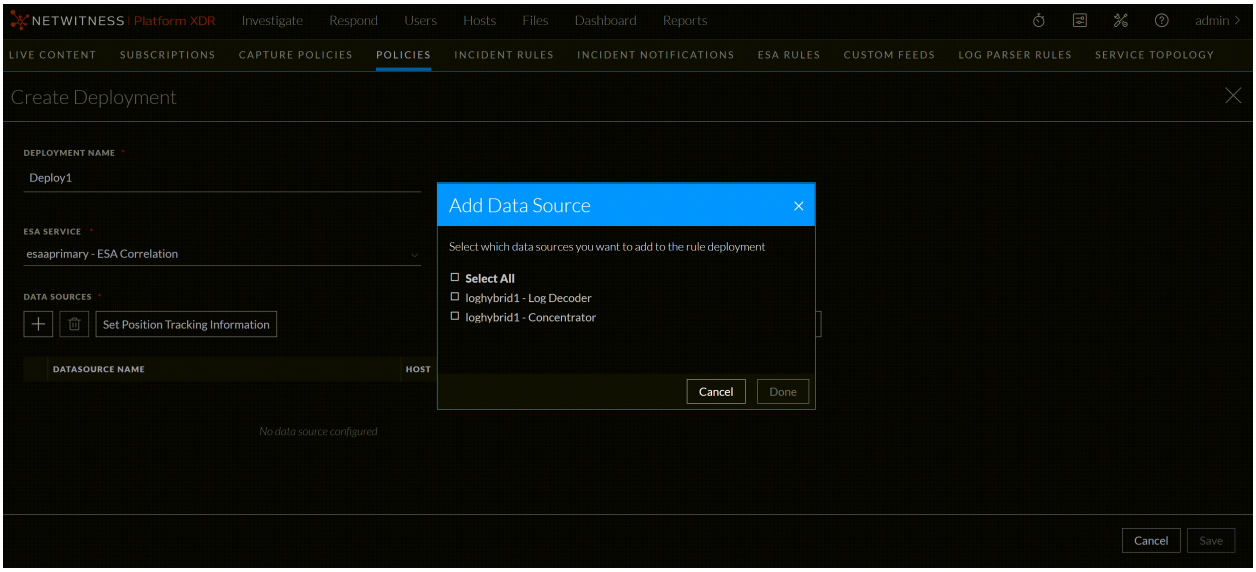
The following table describes the Deployments tab.

1	Toolbar • Create Deployment - Lets you to Add a new Deployment. For more information, see Create a Deployment. • Remove Deployment - Lets you to remove the Deployment.For more information, see Remove a Deployment. • Deploy - Lets you to deploy the Deployment. • Stop Deployment - Lets you to stop the selected Deployment.

2	Deployment List Pane • Name - Name of the content. • ESA Service - Displays the ESA service selected. • Data Source - Displays the Datasource added for ESA deployment. • Deployment Status - Status of the deployment. The values are: Deploying, Deployed, New, Stopping, Stopped, and Failed. • Last Updated - Displays the time when the deployment is updated.

Create Deployment dialog:

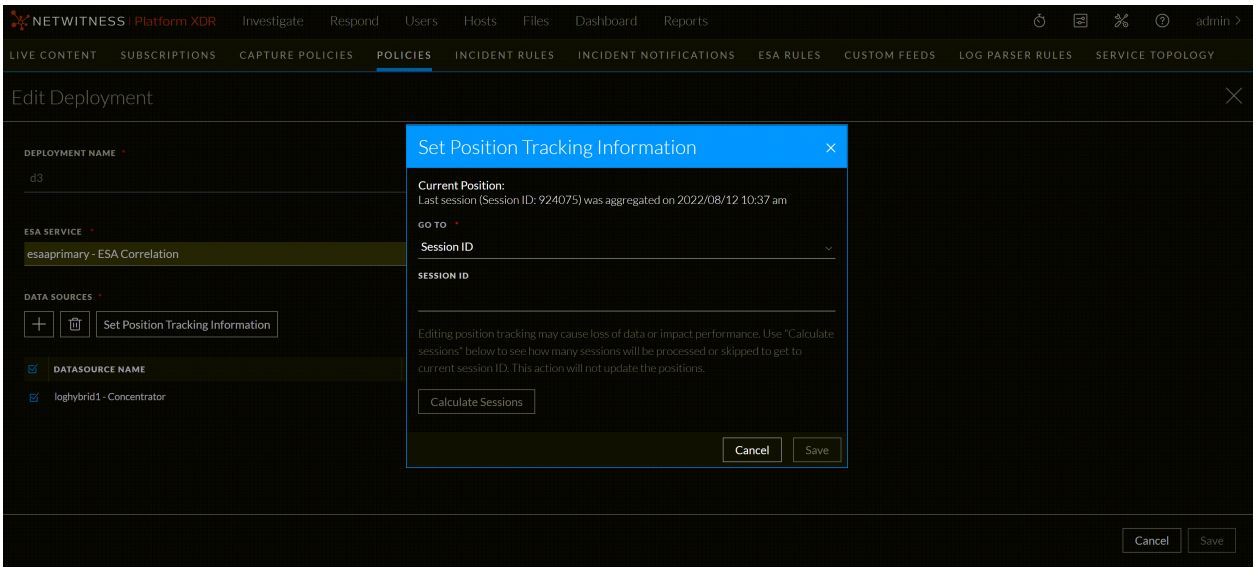
Below is an example of the Create Deployment dialog:



The table describes the information and options in the **Create Deployment** dialog.

Field	Description
Deployment Name	Name of the deployment. The name must be unique.
ESA Service	Displays the list of ESA services from the drop-down list. • esaprimary – ESA Correlation • esasecondary – ESA Correlation
	Adds a Datasource from the available list. At least one Datasource is required to set the position tracking information for ESA.
	Deletes the datasource that you are currently editing.

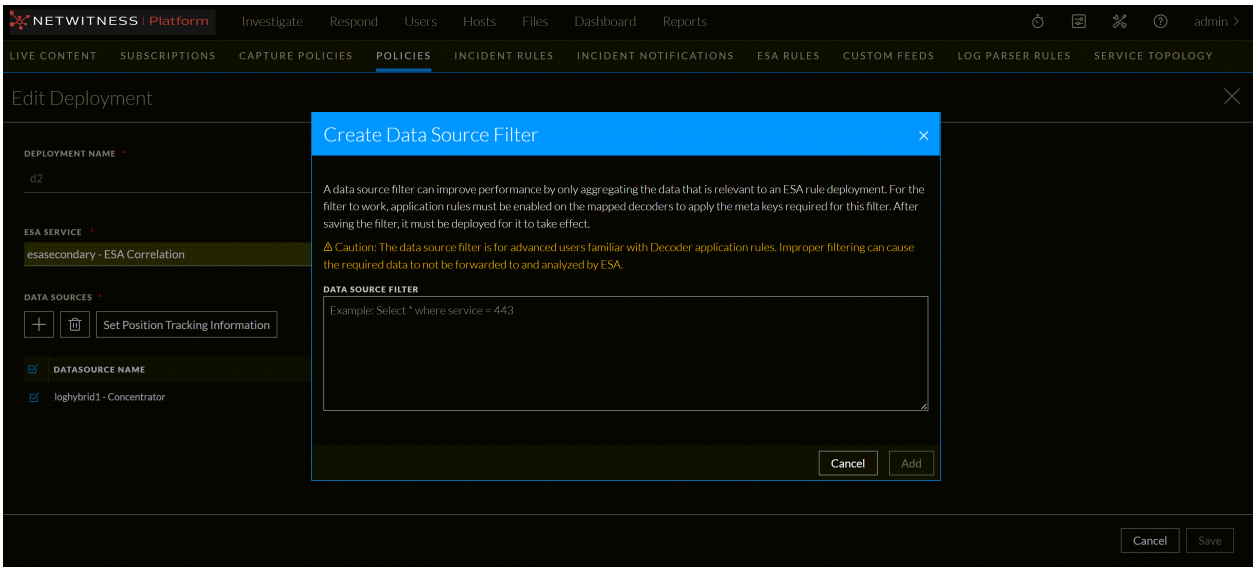
Field	Description
Set Position Tracking Information	Adds a position tracking information on different datasources for ESA. Position Tracking Information enables you to visualize the progress of the sessions that ESA has processed, and provides information on the session IDs and the time/date when the events were processed. For more information, see Position Tracking Information.
Create Data Source Filter	Enables you to create the datasource filter to get the required results.
Save	Saves the settings and closes the Create Deployment dialog.
Cancel	Cancels the operations.



Below is an example of **Add Data Source** Dialog.

The table describes the information and options in the **Add Data Source** dialog.

Field	Description
Select Datasource / Select All	Allows you to select one or more datasources.
Done	Adds the datasource and closes the Add Data Source dialog.
Cancel	Cancels the operations.

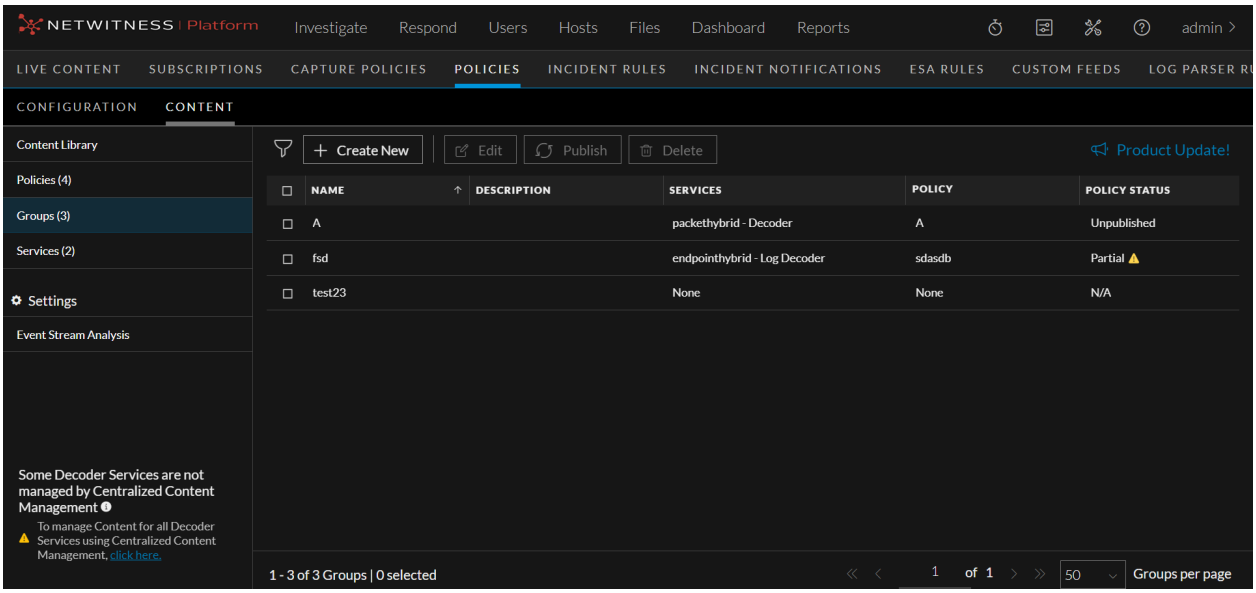


Below is an example of **Set Position Tracking Information** dialog.

The table describes the information and options in the **Set Position Tracking Information** dialog.

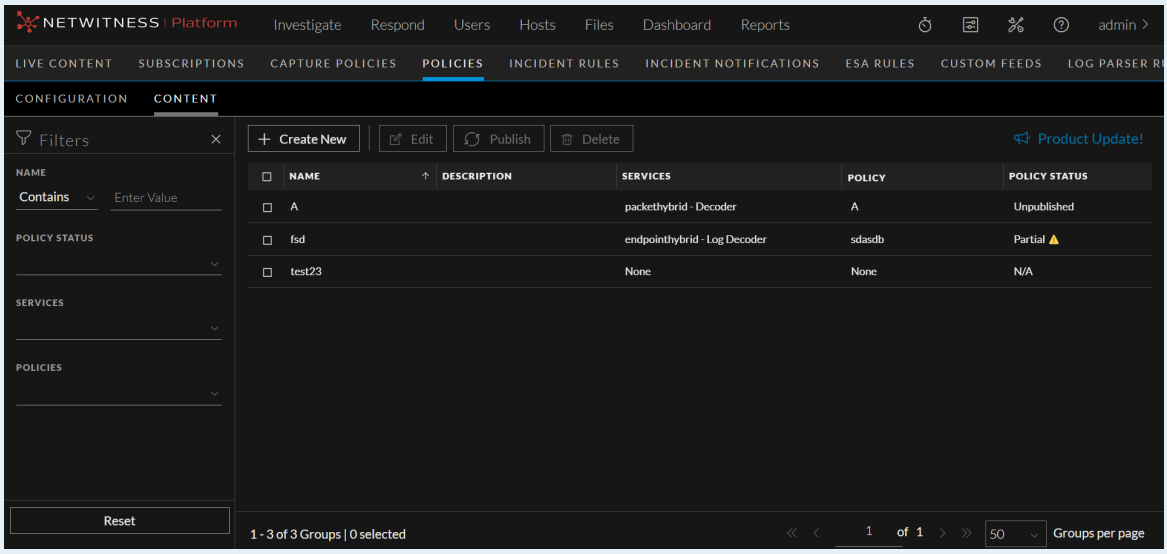
Field	Description
Go To	This option will enable the use of Session ID and data and time for ESA Correlation Service for the events.
Session ID	The ESA Correlation service starts processing the events from the session ID that you entered.
Date and Time	The ESA Correlation service starts processing the events from the date and time that you entered.
Calculate Sessions	This will calculate the number of sessions that will be processed with respect to the existing position of the data source.
Save	Saves the settings and closes the Set Position Tracking Information dialog.
Cancel	Cancels the operations.

Below is an example of **Create Data Source Filter** Dialog



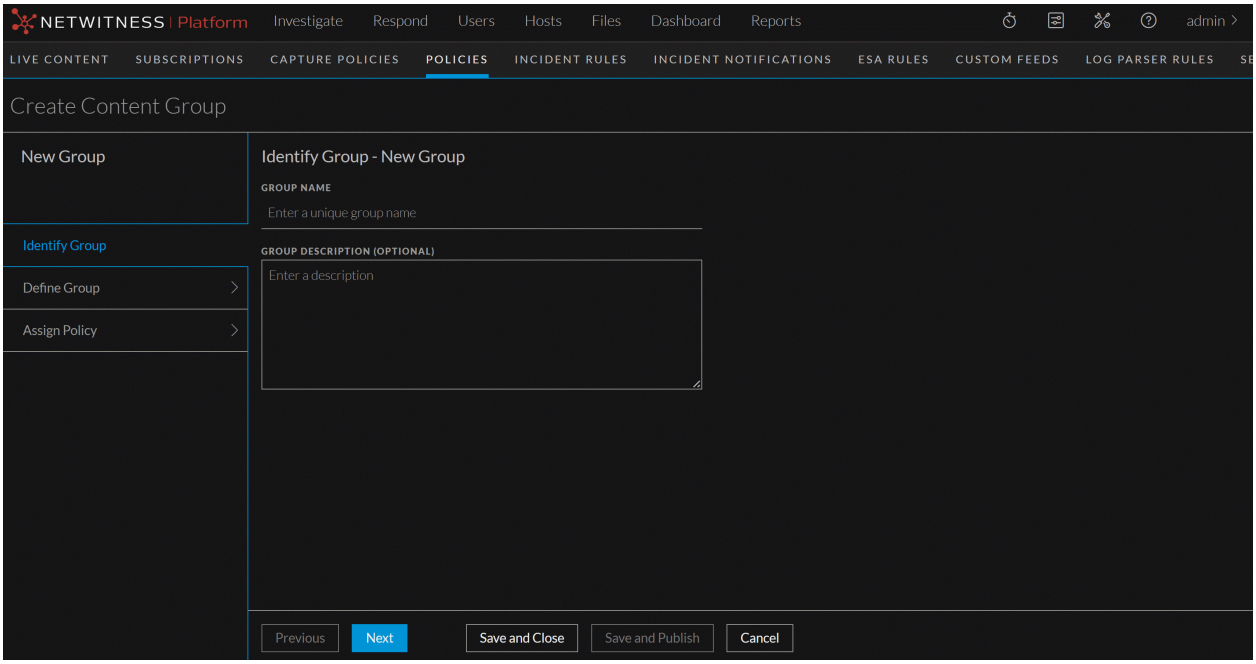
The table describes the information and options in the **Create Data Source Filter** dialog.

Field	Description
Data Source Filter	Enables you to enter the data source filter. For example, you can type **Select *where service = 443** to filter based on the query processed, it will filter out only HTTPS logs related sessions and will be forwarded to the ESA.
Add	Adds the configurations and closes the Create Data Source Filter dialog.
Cancel	Cancels the operations.



Groups Tab

Below is an example of the Content > Groups tab:

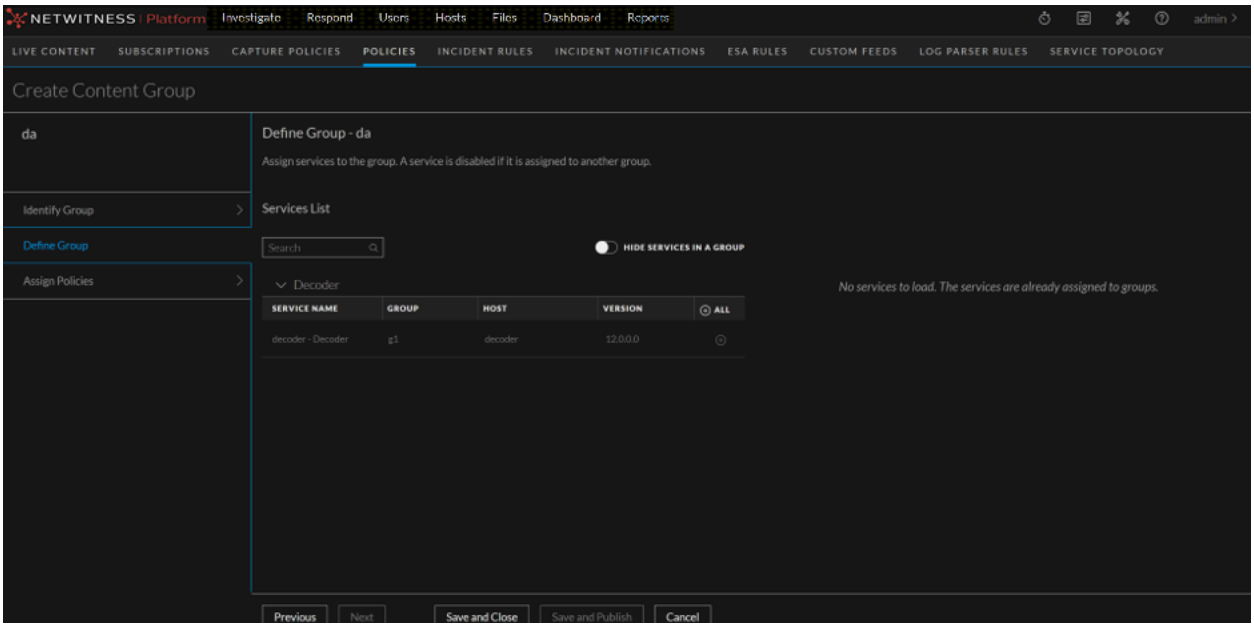


The following table describes the Groups tab.

1	By default, 50 groups are displayed per page. To go to the next page, click ›. To go to the last page, click ».

2	- Filter the groups based on various parameters.  Filter Panel: • Name - Select the **Name** drop-down value as either **Equals** or **Contains**. To search the group name using the **Contains** operator, set the filter option to **Contains** operator from the drop-down list and start typing the name of the group. Type one character and a list of group that contain that character is displayed, as you continue to type, the list is filtered to match. To search the group name using the **Equals** operator, set the filter option to **Equals** operator from the drop-down list and enter the full name. The particular group name will be displayed. • Policy Status - Select the **Policy Status** from the drop-down list. The various drop-down values are: ◦ **Published**: Groups that are published to use. ◦ **Unpublished**: Groups that are saved but not published. ◦ **Failed**: Groups that are failed to publish. ◦ **N/A**: Groups for which publication status is not applicable. ◦ **Partial**: Groups that are partially published. • Services - The service type to which the group is attached. • Policies – The policies to which the group is attached.
3	Toolbar • Create New - Lets you create a new group. For more information, see Create a group. • Edit - Lets you edit the group. For more information, see Managing Groups. • Publish - Publishes selected groups. • Delete - Deletes the selected group.

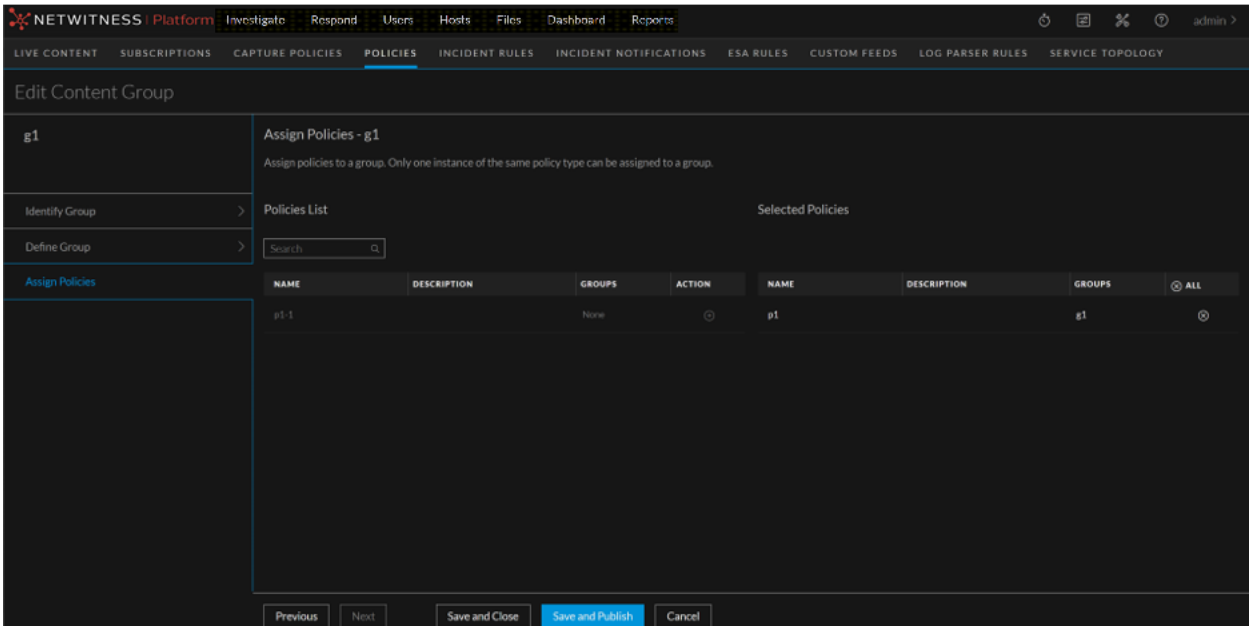
4	Group List Pane • Name - Name of the group. • Description - Description of the group. • Services - Displays the service to the which the group is applied. • Policies - Displays the policy to which the group is applied. • Policy Status - Status of the policy. The values are: Published, Unpublished, Failed, N/A. You can also sort on any column. If you mouse over a column header, a sort icon is displayed:  . Click  to sort by the selected column.
5	Groups Details Panel Displays the properties of the selected group.



Below is an example of the Create group dialog:

The table describes the information and options in the Create Group dialog:

Field	Description
Group Name	Name of the group. The name should be unique.
Group Description (Optional)	Description of the group. Description should not exceed 8000 characters.
Save and Close	Saves the settings and closes the Create Group dialog.

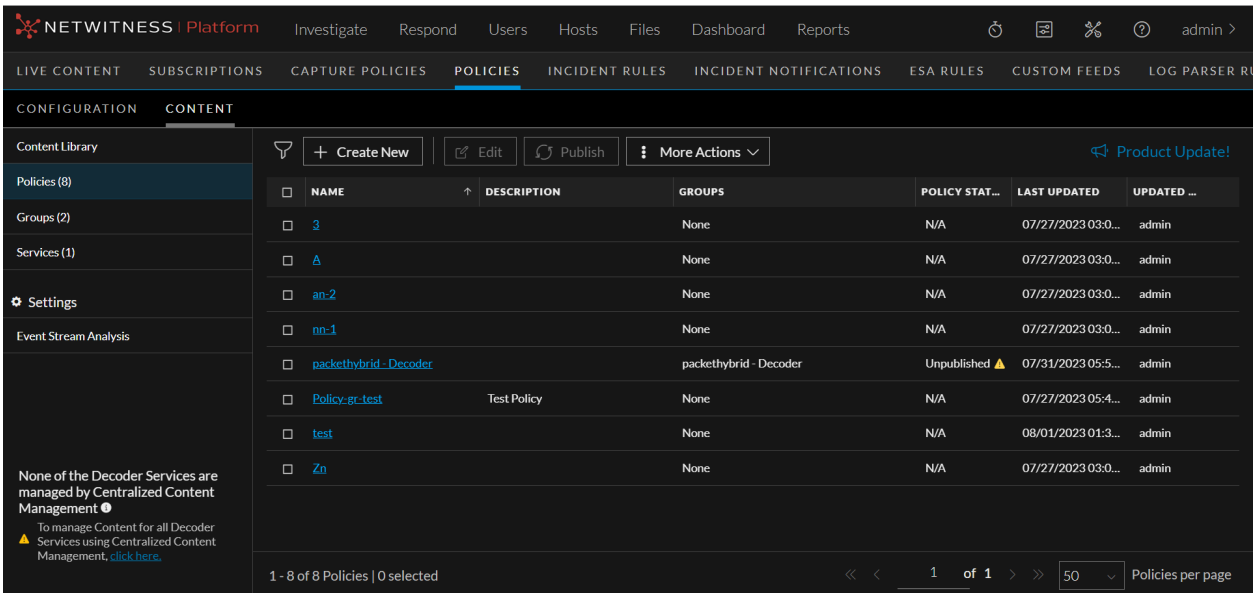


Below is an example of the define group dialog:

The table describes the information and options in the Define Group dialog:

Field	Description
Services List	Displays the list of services. The following describes services list: Service name – Name of the service. • Group - Name of the group. • Host - Host name of the service. • Version - Service version. • All - Lets you to add services to the group. You can either click to add all services or click ⊙ to add specific service.
Hide Services in a Group	Displays the services that is not assigned to any group. By default, this option is disabled.
Selected Services	Displays the list of selected services for the group.
Save and Close	Saves the setting and closed the create group dialog.
Save and Publish	Saves and publishes the created group. **Note:** This option is disabled if you have not: - Assigned services. - Assigned policies.

Below is an example of Assign policy dialog:



The following table describes assign policy dialog:

Field	Description
Policies List	Displays the list of policies associated with the group. The following describes policies list: • Name - Name of the policy. • Description - Description of the policy. • Groups - Groups associated with the policy. • Action - Click to add policies to the group.
Selected Policies	Displays the list of selected policies for the group.
Save and Close	Saves the setting and closed the create group dialog.
Save and Publish	Saves and publishes the created group. **Note:** This option is disabled if you have not: - Assigned services. - Assigned policies.

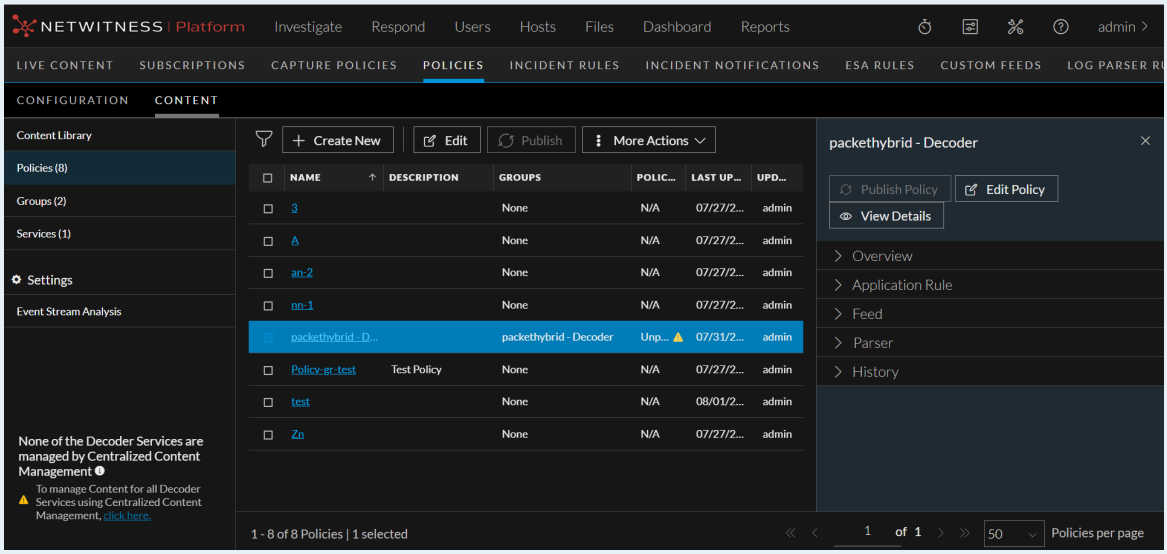
Policies Tab

The **(CONFIGURE) > Policies** view contains two tabs: **Configuration** and **Content**.
Below is an example of the **Content > Policies** tab:

The following table describes the Policies tab.

1	By default, 50 policies are displayed per page. To go to the next page, click ›. To go to the last page, click ».

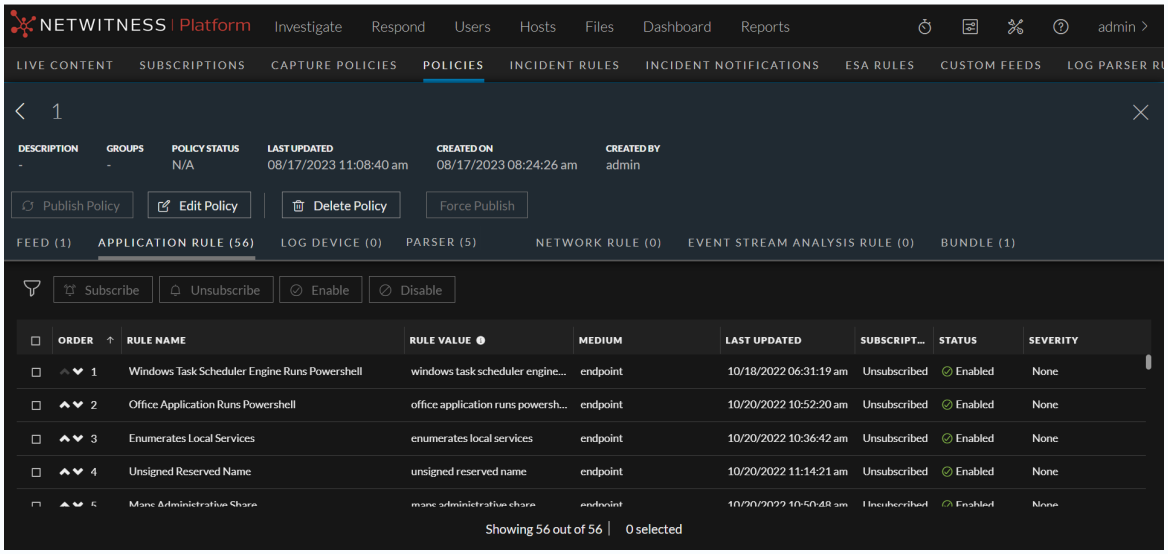
2 Toolbar:



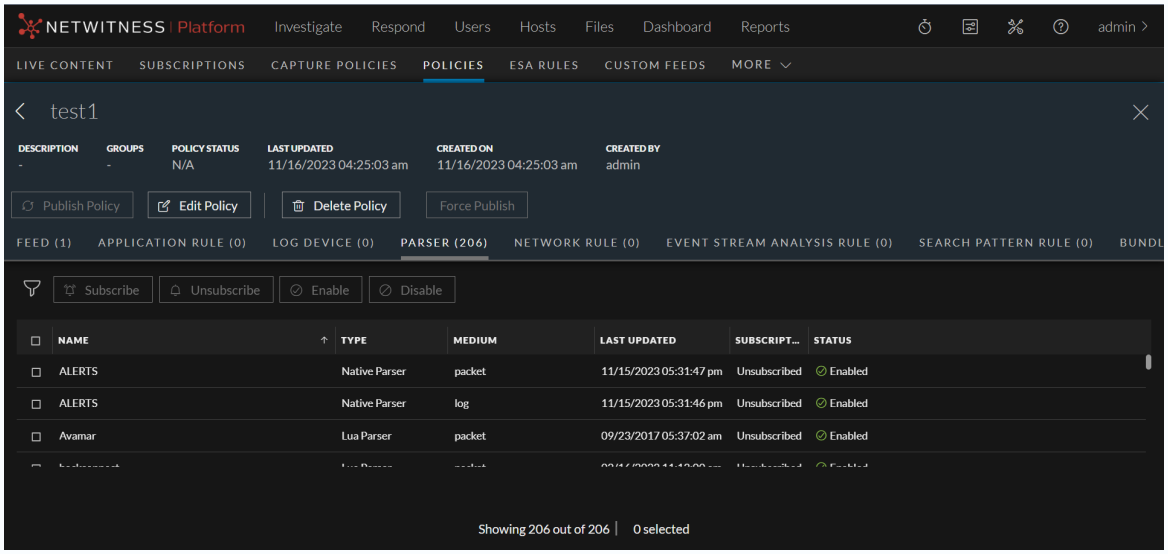
- Create New - Lets you create a new policy. For more information, see Create a policy.
- Edit - Lets you edit the policy. For more information, see Edit a Policy.
- Publish - Publishes selected policy or policies.
- More Actions:
  - Assign to Group --Lets you assign policy to a group.
  - Clone - Lets you clone a policy.
  - Revert to - Lets you view the previous policy versions and revert policy to any previous version.

    Note:
    - The current version of the policy is disabled.
    - This option is disabled either if no policy is selected or multiple policies are selected.
  -  - Lets you name a policy version when you revert the policy.
  - Delete - Deletes the selected group or groups permanently.
  - Force Publish - Lets you republish all the content irrespective of the policy status. This option allows you to re-push all content or configurations to all services in the group. Some of the scenarios where you might want to force publish the policy are:
    - There was a service that was down or did not successfully receive content when it was first pushed out.
    - Some content may have been modified or removed locally on a service (outside of CCM control) and you want to re-apply the content from the policy.

3 Policy List Pane:



- Name - Name of the policy.
- Description - Description of the policy.
- Groups - Lists the group to which this policy is applied.
- Policy Status - Status of the policy. The values are: Published, Unpublished, Failed, N/A.
- Last Updated - Displays the time when the policy is updated.
- Updated By - The user who updated the policy. You can also sort on any column. If you mouse over a column header, a sort icon is displayed: . Click the  icon to sort by the selected column.



4 Policy List - Side Pane:

- Publish Policy - Lets you publish all the unpublished and/or failed content. For more information, see Create a policy.
- Edit Policy - Lets you edit the policy. For more information, see Edit a Policy.
- View Details - Lets you view the complete policy details.
- Expand the sections **Overview**, **Application Rule**, **Bundle**, **Feed**, **Lua Parse**r and **History** to view the details of the policy.
- The table contains details such as **Policy Version**, **Version Name** and **Published By**.

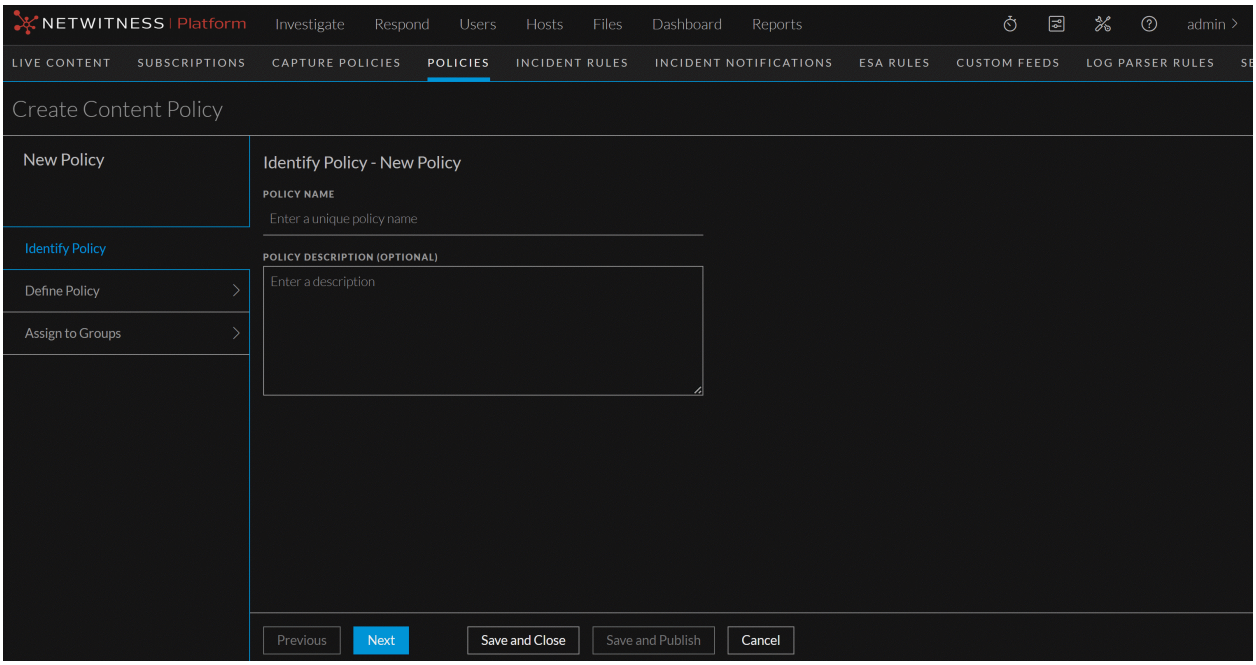
5 Policy Details Panel:

Displays the properties of the selected policy.

Toolbar:

- Publish Policy - Lets you publish all the unpublished and/or failed content. For more information, see Create a policy.
- Edit Policy - Lets you edit the policy. For more information, see Edit a Policy.
- Delete Policy - Deletes the selected policy or policies permanently.
- Force Publish - Lets you republish all the content irrespective of the policy status.

Policy Details Pane:

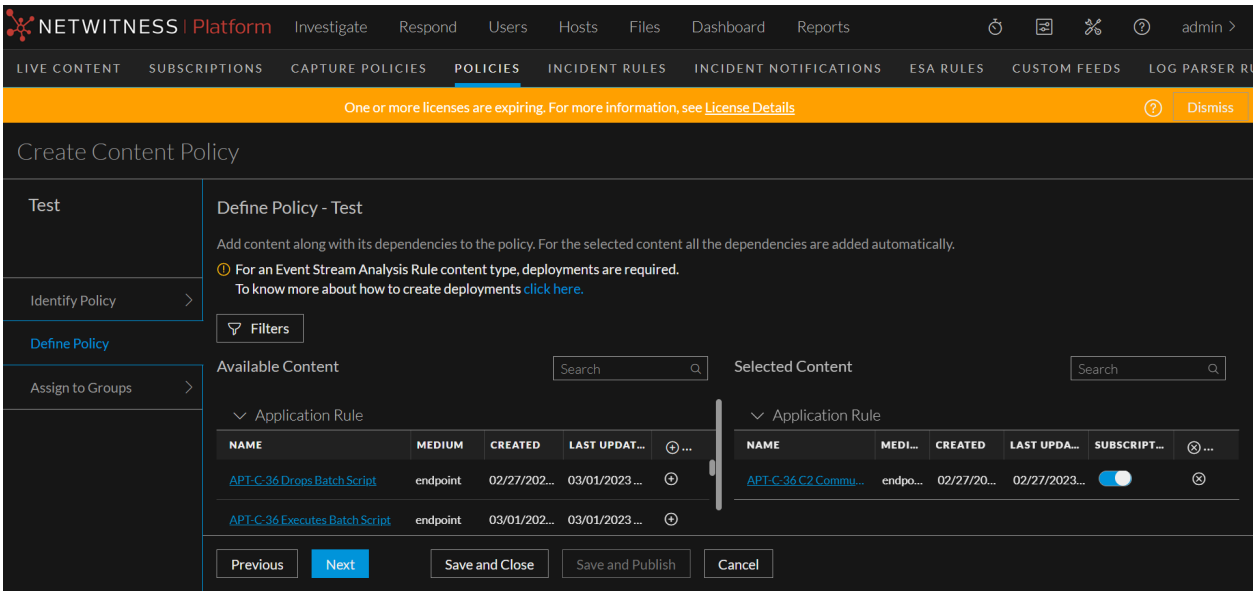


- Order - Order of the content. Click  to sort and display the content in the ascending order.

Click  to sort and display the content in descending order. This field is applicable only for **Application Rule** and **Network Rule** tabs.

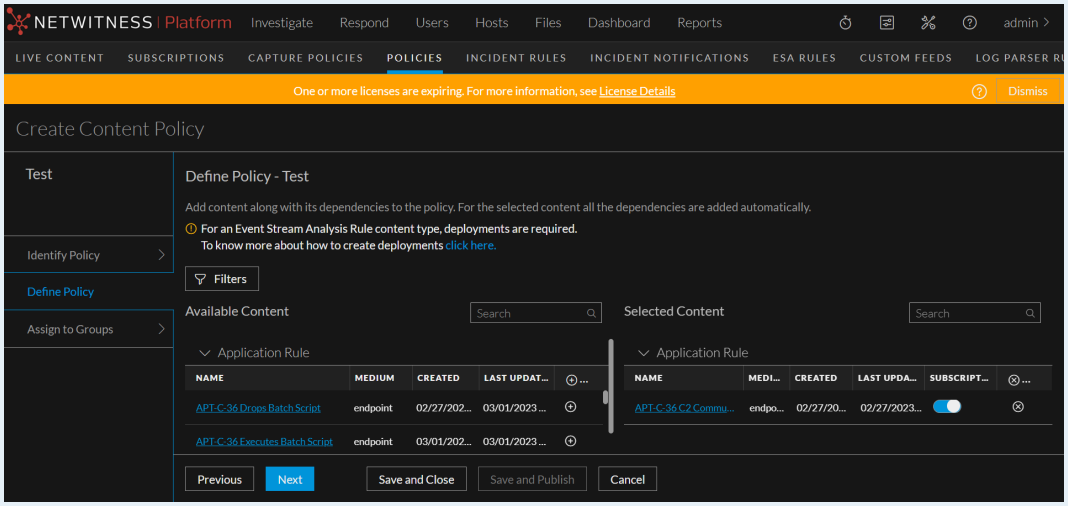
- Rule Name - Name of the rule. The rule name will be unique. This field is applicable only for **Application Rule** and **Network Rule** tabs.
- Rule Value - The rule value. It is the value written to the alert meta. The rule value can be duplicate. You can clone existing rules with different rule names, but with same rule value. This field is applicable only for **Application Rule** and **Network Rule** tabs.
- Name - The content name. This field is applicable only for **Feed**, **Log Device** and **Parser** tabs.
- Type - The type of parser. For example, **Lua Parser** or **Native Parser**. This field is applicable only for **Parser** tab.
- Medium - Meta data source medium.
- Severity - The severity of content. For example, **Low**, **Medium**, **High** or **Critical**. This field is applicable only for **Application Rule** and **Event Stream Analysis Rule** tabs.
- Last Updated - Displays the time when the content is last updated.
- Subscription - Indicates if the content is subscribed or unsubscribed.
- Status - The status of resource.
-  - Filter the list of displayed content in the policy details view based on the name, medium, source type, enabled/disabled status, subscription status, severity, resource created date, and last updated date. Following are the fields available in the filter panel:
  - Name - If you set the filter option to **Contains** operator from the drop-down list and start typing the name of the content rules, a list of content rules that contain that character is displayed, as you continue to type the list is filtered to match. If you set the filter option to **Equals** operator from the drop-down list and enter the full name, the particular content type will be displayed.
  - Medium - Select one or more mediums from the drop-down list. The available options are 'endpoint', 'log', 'log and packet' and 'packet'.
  - Source Type - Select one or more sources from the drop-down list. The available options are 'Custom' and 'Live'.
  - Enabled/Disabled Status - Select one or more statuses from the drop-down list. The available options are 'Enabled' and 'Disabled'. This field is not applicable for Event Stream Analysis Rule content type.
  - Subscription - Select one or more statuses from the drop-down list. The available options are 'Subscribed' and 'Unsubscribed'.
  - Severity - Select the severity from the drop-down list. The available options are 'Low', 'Medium', 'High' and 'Critical'. This field is applicable only for Application Rule and ESA content type.
  - Resource Created Date - Select the resource created date range.
  - Last Update Date - Select the last update date range.
- Subscribe - Lets you subscribe for the content if it is unsubscribed.

- Unsubscribe - Lets you unsubscribe for the content if it is subscribed.
- Enable - Lets you enable the content for the policy.
- Disable - Lets you disable the content from the policy.
-  - Move the content down the order.
-  - Move the content up the order.



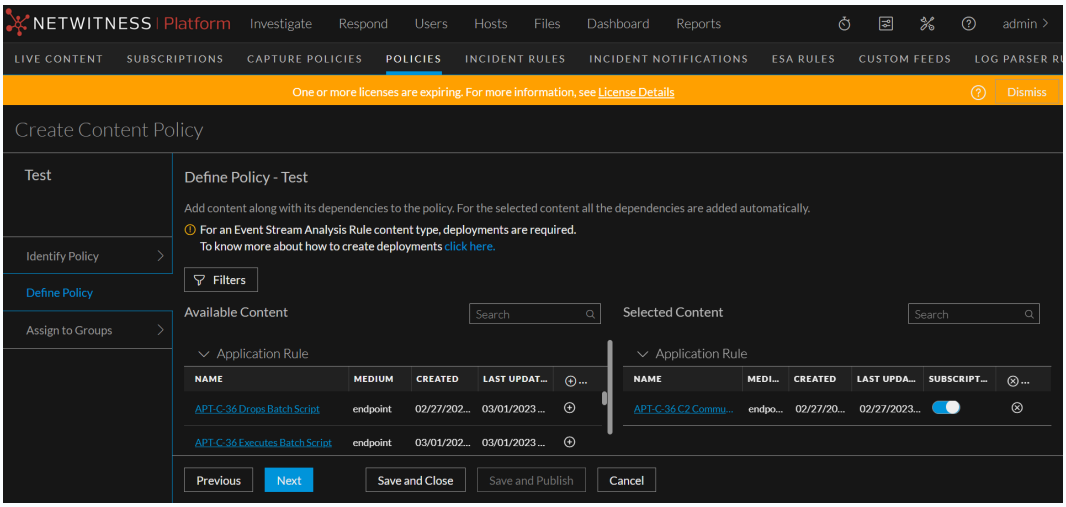
Below is an example of the Create Content Policy dialog.

The table describes the information and options in the Create Policy dialog:



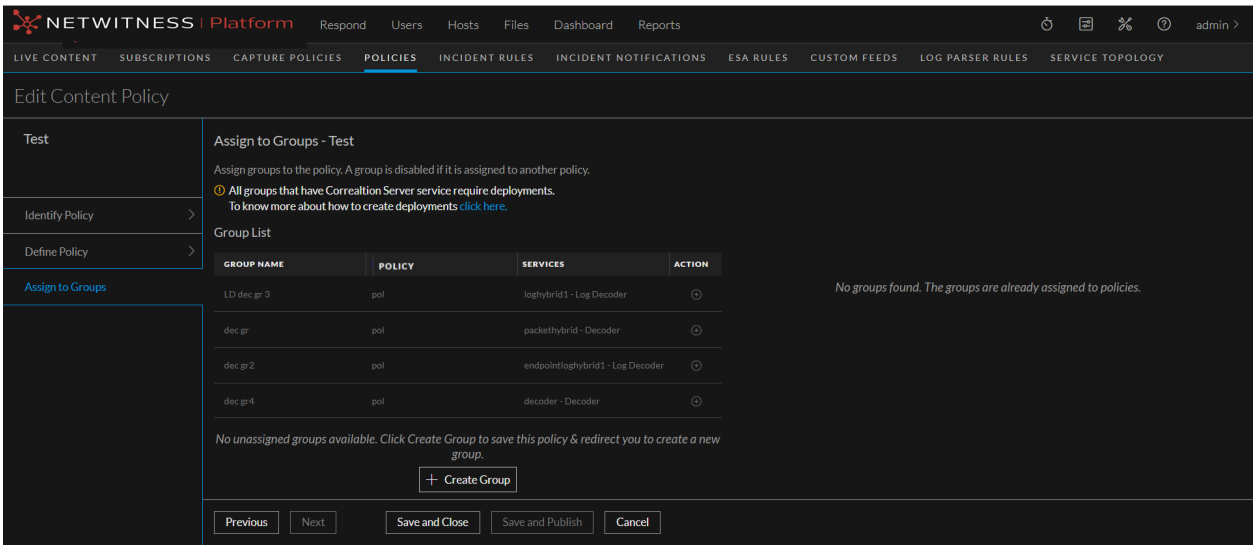
Field	Description
Policy Name	Name of the policy. The name should be unique.
Policy Description (Optional)	Description of the policy. Description should not exceed 8000 characters.

Define Policy Settings:



Field	Description

Available Content	Displays the available content resources in your deployment. Click  expand the resource type.

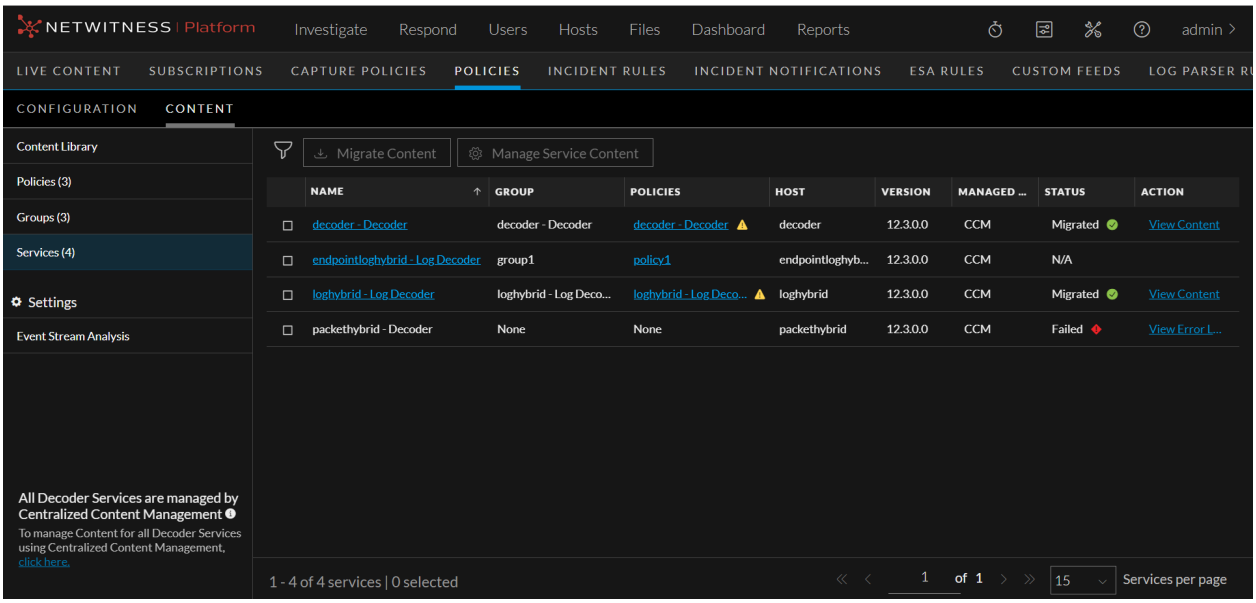


The following describes resource type:

- Name - Name of the resource.
- Medium - Meta data source medium. Available values for medium are as follows:
  - **Endpoint**: applied to content that uses meta derived from endpoint agent and endpoint server data
  - **Log**: applied to content that uses meta derived from log data
  - **Packet**: applied to content that uses meta derived from network packets
  - **Log and packet**: applied to content that correlates meta derived across log and packet data
- Created - Displays the time when the resource is created
- Last Updated - Displays the time when the resource is updated last.
- Action- Click + to add the resource and its dependencies to your deployment.
-  - Click to add all content based on the resource type.
-  - Filter the available content based on the following parameters:
  - **Resource Types** - The resource or the content type.
  - **Medium** - Meta data source medium. Available values for medium are as follows:
    - **Endpoint**: Applied to content that uses meta derived from endpoint agent and endpoint server data
    - **Log**: Applied to content that uses meta derived from log data
    - **Packet**: Applied to content that uses meta derived from network packets
    - **Log and packet**: Applied to content that correlates meta derived across log and packet data

	◦ **Resource Created Date** - The date on which the content was created. ◦ **Resource Modified Date** - The date on which the content was modified. ◦ **Reset** - Reset the fields. • **Search** - Conveniently search the available content.
Selected Content	Lists the selected resource. Additionally, you can subscribe the content. Once the content is subscribed, the content resources are updated automatically in case of any changes.  •  - Filter the selected content based on the following parameters: ◦ **Resource Types** - The resource or the content type. ◦ **Medium** - Meta data source medium. Available values for medium are as follows: ◦ **Endpoint**: Applied to content that uses meta derived from endpoint agent and endpoint server data ◦ **Log**: Applied to content that uses meta derived from log data ◦ **Packet**: Applied to content that uses meta derived from network packets ◦ **Log and packet**: Applied to content that correlates meta derived across log and packet data ◦ **Resource Created Date** - The date on which the content was created. ◦ **Resource Modified Date** - The date on which the content was modified. ◦ **Reset** - Reset the fields. • **Search** - Conveniently search the selected content.

Assign to Group:



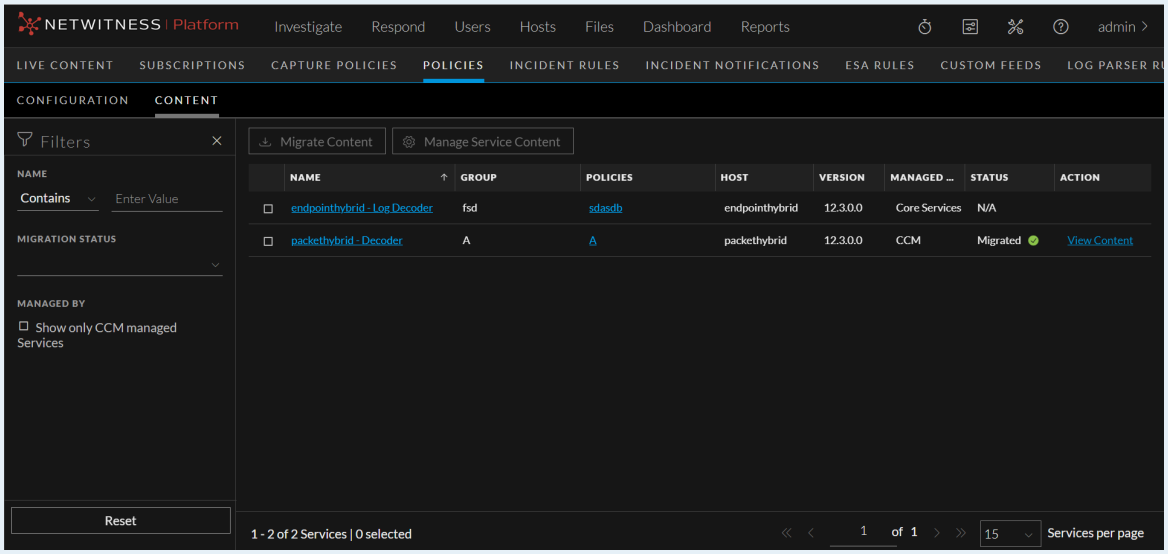
Group List	Displays the list of groups associated with the policy. A group is disabled if it is already assigned to another policy. • Group Name • Policies • Services • Action
	Click to create new group.
Selected Group	Lists the selected groups. Click  to add groups.
Save and Close	Saves the settings and closes the Create Policy dialog.
Save and Publish	Saves and publishes the created policy. **Note:** This option is disabled if: - Policy settings are not customized. - Policy is not assigned to groups.

Services Tab

The  **(CONFIGURE)** > **Policies** view contains two tabs: **Configuration** and **Content**.

The **CONTENT** tab has **Content Library**, **Policies**, **Groups** and **Services** on the left panel.

Below is an example of the Content > Services tab:

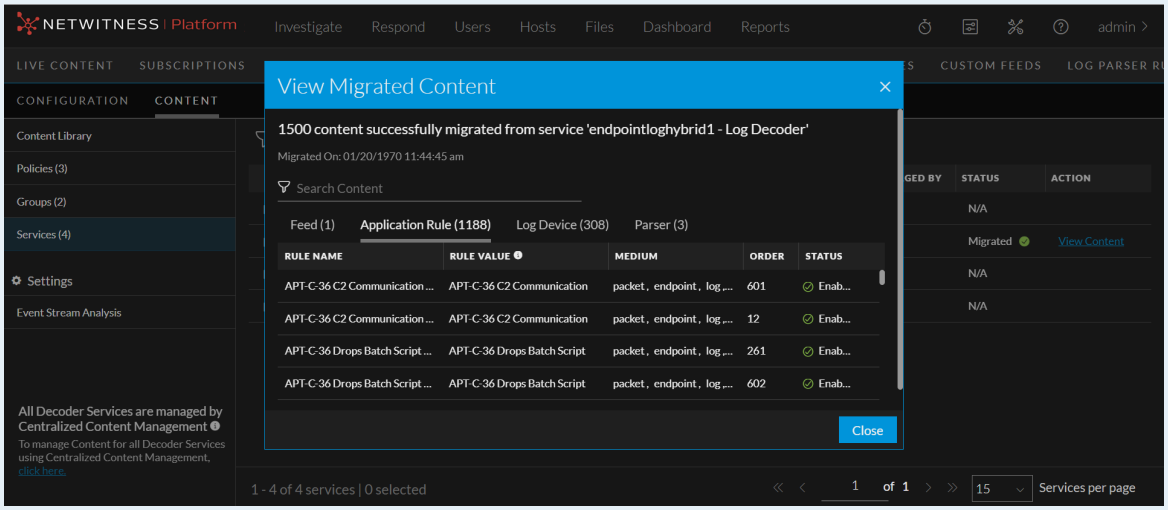


By default, 15 services are displayed per page. To go to the next page, click . To go to the last page, click .

1 Toolbar

- Migrate Content - Lets you migrate content from service. For more information, see Migrate Content from Service.
- Manage Service Content - Lets you enable or disable CCM for individual service(s). For more information, see Enable or Disable CCM for Individual Decoder Services.

2 - Filter services based on various parameters.



Filter Panel:

- Name - Select the **Name** drop-down value as either **Equals** or **Contains**. To search the service name using the **Contains** operator, set the filter option to **Contains** operator from the drop-down list and start typing the name of the service. Type one character and a list of service that contain that character is displayed, as you continue to type, the list is filtered to match. To search the service name using the **Equals** operator, set the filter option to **Equals** operator from the drop-down list and enter the full name. The particular service name will be displayed.
- Migration Status - The **Migration Status** drop-down value. The drop-down values are 'Migrated', 'Migrating', 'Failed' and 'NA'.
- Managed By - Select the **Show only CCM Managed Services** to display only the CCM managed services.
- Reset - Reset the fields.

3 Services List Pane:

- Name - Name of the service.
- Group - The group to which service belongs.
- Policies - The policy to which the service is assigned. Click the policy name to view the details of the policy.
- Host - The service host name .
- Version - The service version number.
- Managed By - Indicates if the service is managed by CCM or Core Services.
- Status - Displays the migration status of the service. The column displays the following values based on the status of migration:
  - Queued
  - Initializing
  - Analyzing Content
  - Migrating Content
  - Migrated
  - Failed
- Action - Displays the action on the migrated content. The following actions are available:
  - View Content - If the **Status** is 'Migrated'.
  - View Error Log - If the **Status** is 'Failed'.

4 View Content - Click the hyperlink under the **Action** column to view the migrated content details in the **View Migrated Content** Pop-up window.

Available Tabs in the **View Migrated Content** Pop-up Window:

- Feed
- Application Rule
- Network Rule
- Log Device
- LUA Parser

Note:
- **Network Rules** tab is not applicable or Log Decoders.
- **Log Device** tab is not applicable for Decoders.

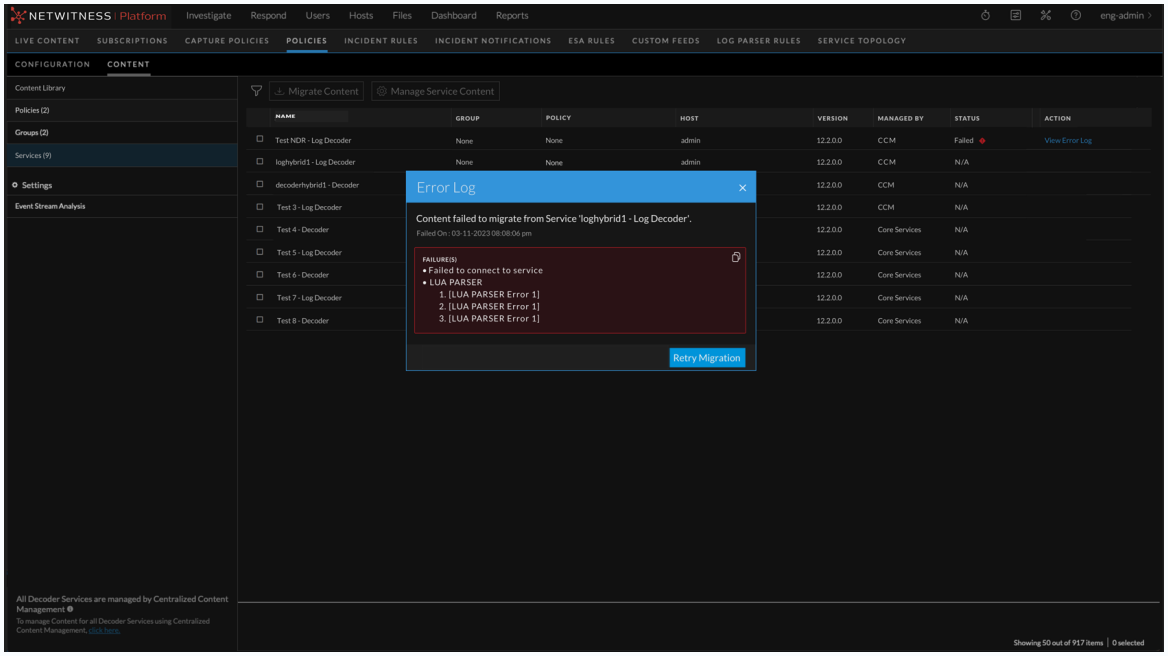
IMPORTANT: During the process of migration, if a Decoder that is being migrated contains multiple application rules and/or network rules with the exact same rule name and rule condition, only one of those rules will be retained in the service. The remaining rules will be considered duplicates and removed. Therefore, post migration, none of the migrated services will have multiple rules with the same rule name and the same rule value.

 - Search the migrated content based on various parameters.

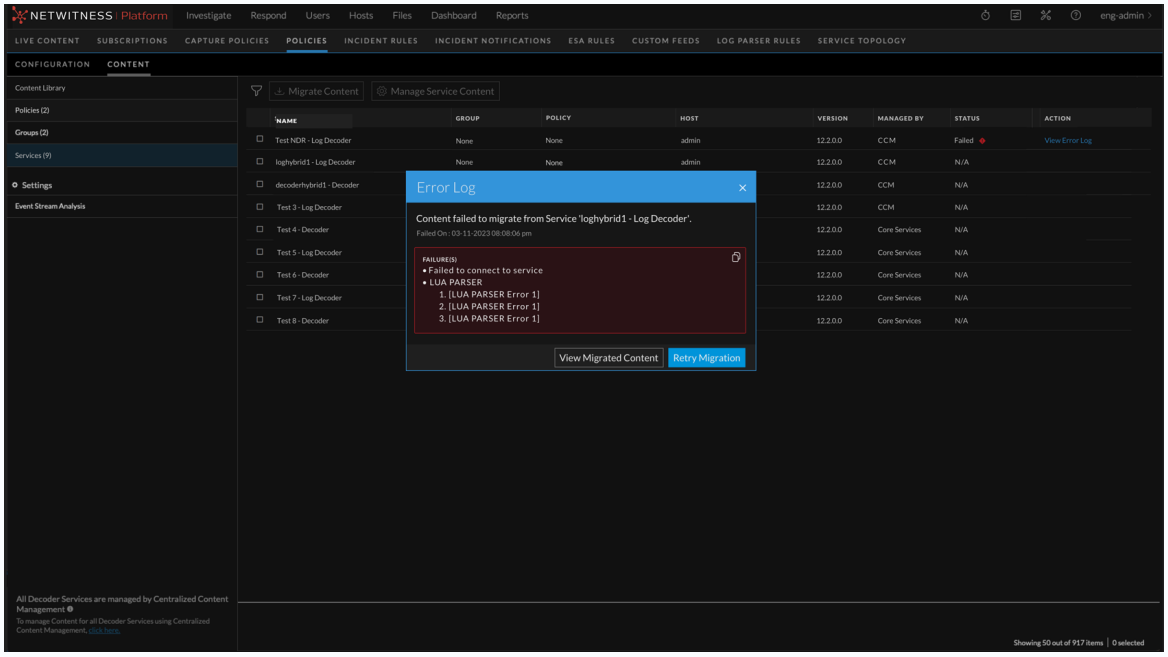
Note:
- For Application Rule and Network Rule, the search is based on **Rule Name** and **Rule Value**.
- For Feeds, Log Device and LUA Parser, the search is based on the **Name**.

Content Details for Feeds, Log Device and LUA Parser:

- Name - The content name.
- Medium - Meta data source medium.
- Status - The status of resource. For example, Enabled or Disabled.



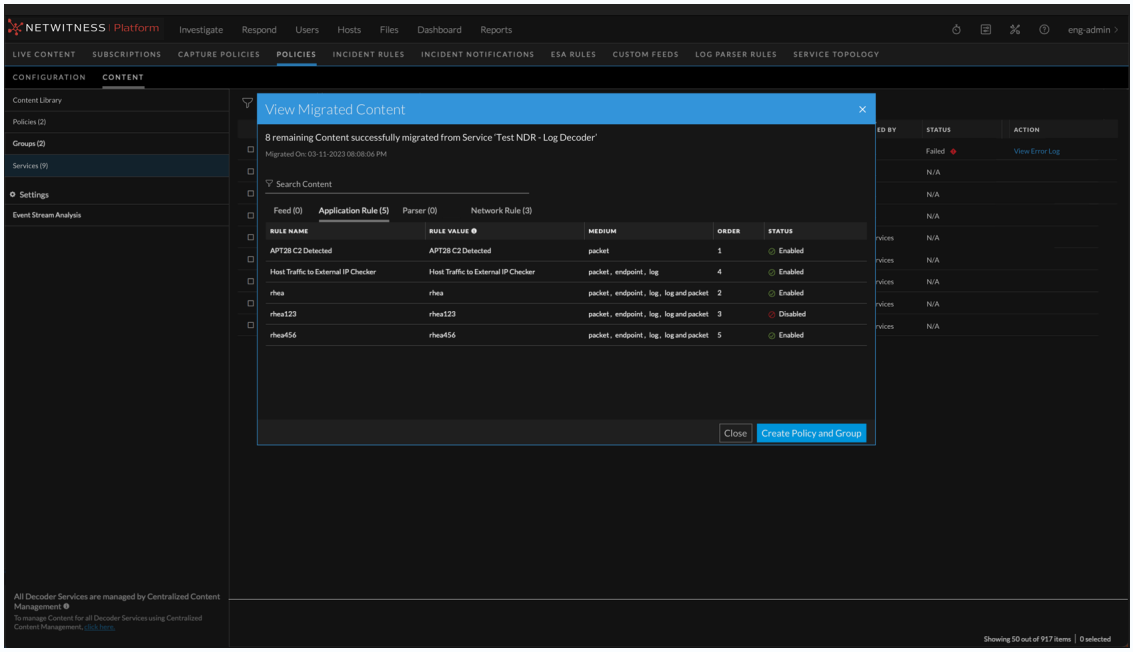
Content Details for Application Rule and Network Rule:



- Rule Name - Name of the rule. The rule name will be unique.
- Rule Value - The rule value. It is the value written to the alert meta. The rule value can be duplicate. You can clone existing rules with different rule names, but with same rule value.
- Medium - Meta data source medium.
- Order - The order of rule.
- Status - The status of resource. The status of resource. For example, Enabled or Disabled.

Available button in the **View Migrated Content** Pop-up Window:

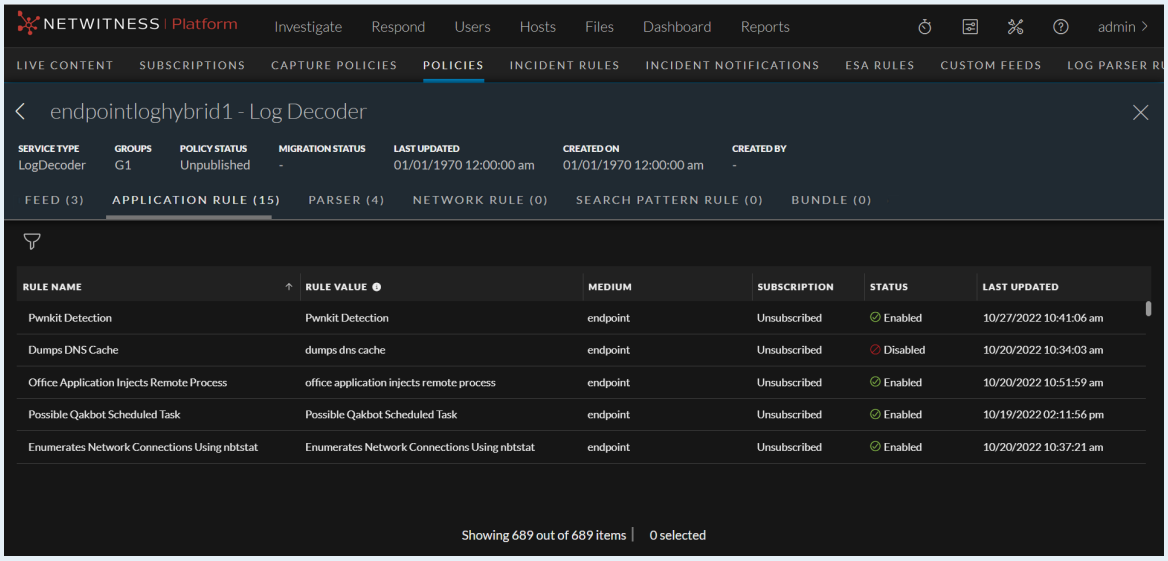
- Close - Close the pop-up window and return to **Service List** page.



5 View Error Log - Click the hyperlink under the **Action** column to view the log details in case the migration is failed.

Available buttons and Icons in the **Error Log** Pop-up Window:

-  - Copy the error logs.
- View Migrated Content - Click to View the content that have been migrated successfully. This button is present only in case of partial migration.



Available buttons and Icons in the **View Migrated Content** Pop-up Window:

- Close - Closes the pop-up window.
- Create Policy and Group - Creates policy and group for the partially migrated service.

- Retry migration - Retry migration.

6 Service Details Panel:

Displays the properties of the selected service.

Toolbar:

- Service Type - The type of service. For example, LogDecoder.
- Groups - The groups associated with the service.
- Policy Status -Indicates if the policy associated with the service is published or unpublished.
- Migration Status - The migration status of the service content.
- Last Updated - The date and time stamp on which the service was last updated.
- Created On - The date and time stamp on which the service was created.
- Created By - The user ID of the user who has created the service.

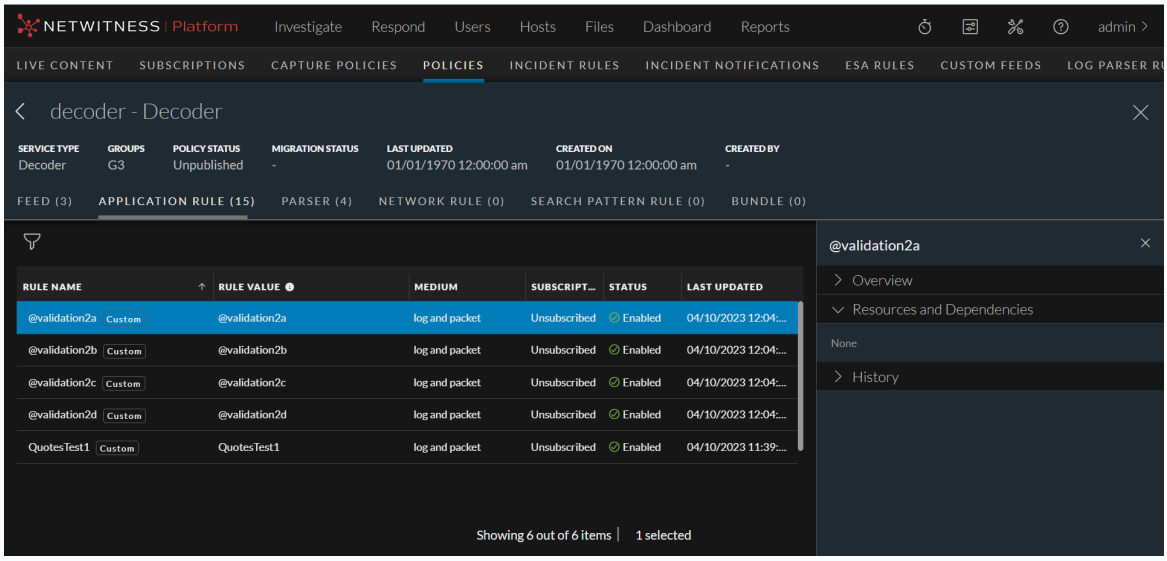
Available Content Tabs:

- Feed
- Application Rule
- Log Device. This tab is not applicable for service type 'Packet Decoder'.
- LUA Parser
- Network Rule. This tab is not applicable for service type 'LogDecoder'.
- Bundle

Service Details Pane for Feeds, Log Device, LUA Parser and Bundle:

- Name - The content name.
- Medium - Meta data source medium.
- Last Updated - Displays the time when the content is last updated.

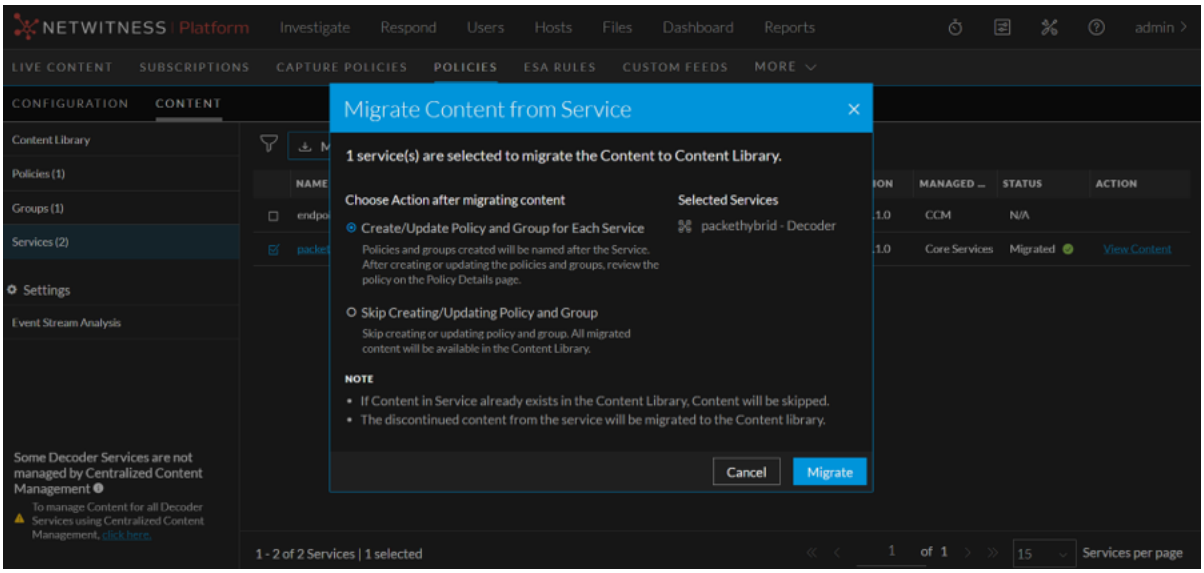
- Subscription - Indicates if the content is subscribed or unsubscribed.
- Status - The status of resource.



Service Details Pane for Application Rule and Network Rule:

- Rule Name - Name of the rule. The rule name will be unique.
- Rule Value - The rule value. It is the value written to the alert meta. The rule value can be duplicate. You can clone existing rules with different rule names, but with same rule value.
- Medium - Meta data source medium.
- Last Updated - Displays the time when the content is last updated.
- Subscription - Indicates if the content is subscribed or unsubscribed.
- Status - The status of resource.

- Filter the content based on various parameters.



7 Service Details Right Panel:

Displays the complete content details such as **Overview**, **Resources and Dependencies** and **History**.

Migrate Content from Service dialog:

Below is an example of the Migrate Content from Service dialog:

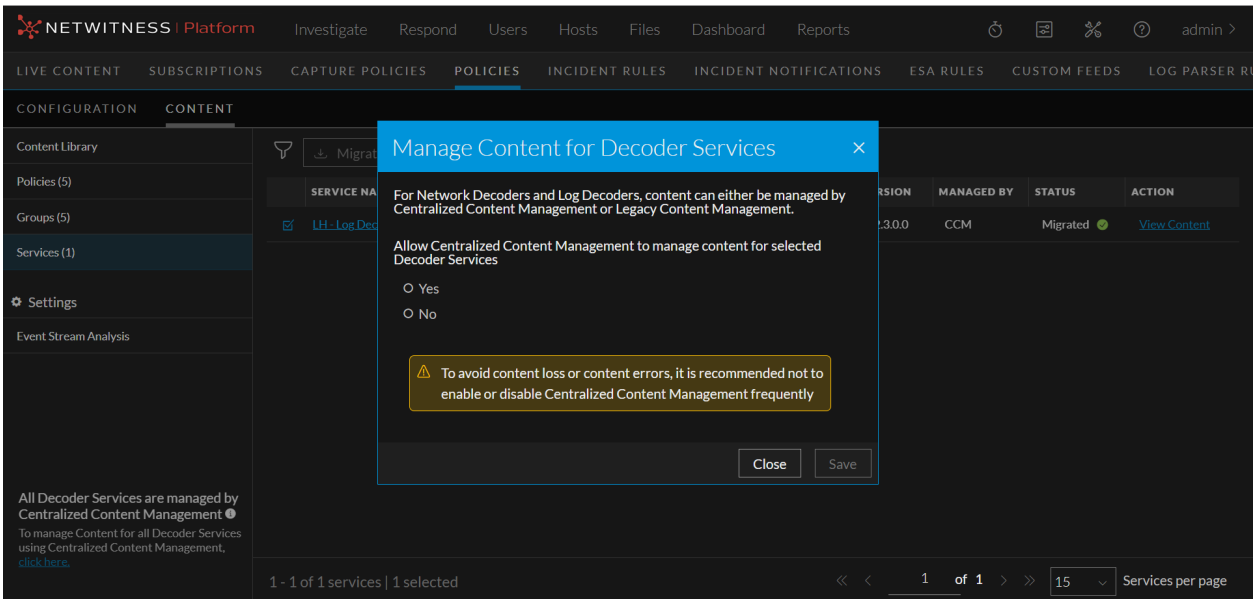
Note:
- If you select **Create/Update Policy and Group for Each Service**, policy and group will be the created or updated for each service selected for migration. Once the migration process is complete, the policy and group will be listed under the respective pages.
- The policy and group which is created or updated for the service will be in 'Unpublished' state and it can be published only after it is reviewed. In the **Policy Listing** page, the **Publish** button for such a policy will be disabled. The policy can be published only after reviewing it either from **Policy Details** page or **Edit Policy** Page. When the policy or group gets updated with the new content, the order of the new content will be given priority.
- If you select **Skip Creating/Updating Policy and Group**, only the content will be migrated. All the migrated content will be available in Content Library.

For more details on publishing a policy, refer Create and Publish Policies feature.

For more details on editing a policy, refer Edit a Policy feature.

For more details on policy details, refer View a Policy feature.

For more details on editing a group, refer Edit a Group feature.



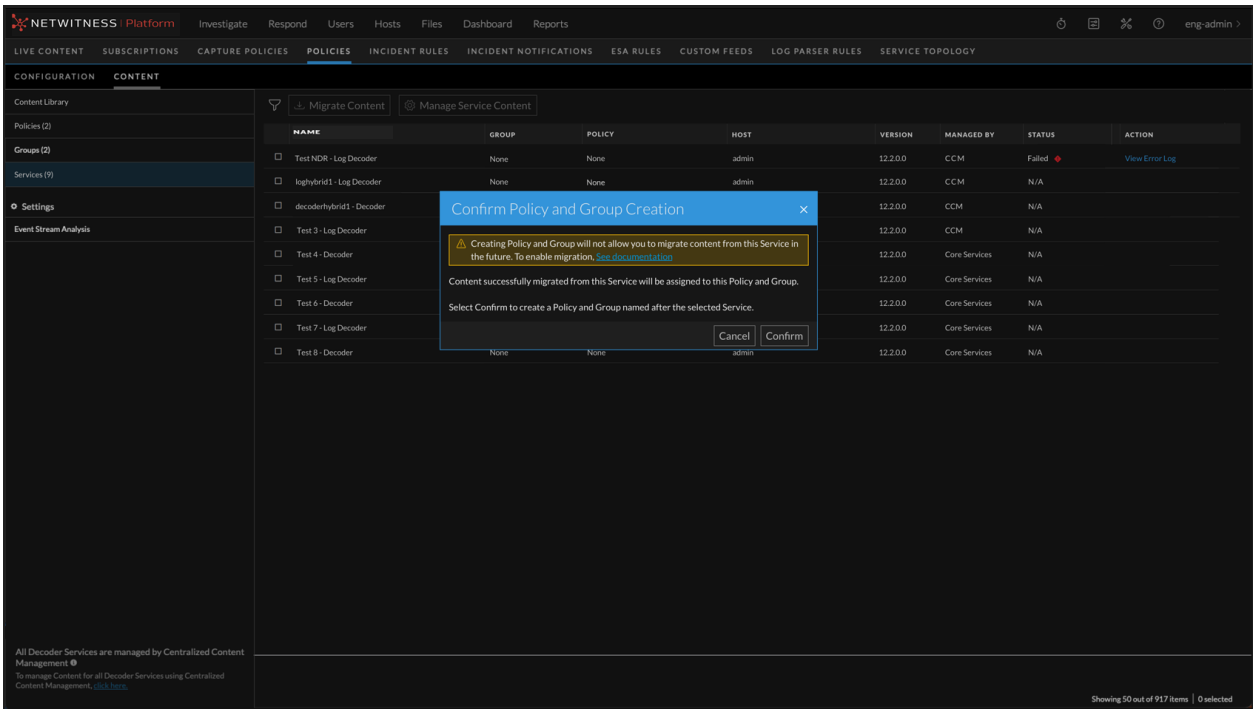
For more details on group details, refer View a Group feature.

The table describes the information and options in the Migrate Content from Service dialog:

Field	Description
Migrate	Initiate the migration of content for the selected service.
Cancel	Cancels the operation.

Manage Content for Decoder Services dialog:

Below is an example of the Manage Content for Decoder Services dialog:



The table describes the information and options in the Manage Content for Decoder Services dialog:

Field	Description
Allow Centralized Content Management to Manage Content for Selected Decoder Services	Select **Yes** to enable CCM for selected service(s). Select **No** to disable CCM for selected service(s).
Save	Save the changes.
Close	Close the **Manage Content for Decoder Services** pop-up window.

Confirm Policy and Group Creation dialog:

Below is an example of the Confirm Policy and Group Creation dialog:

The table describes the information and options in the Confirm Policy and Group Creation dialog dialog:

Field	Description
Cancel	Close the pop-up window and cancel the policy and group creation for the partially migrated service.
Confirm	Creates the policy and group for the partially migrated service. The policy and group will be listed under the Policy Listing and Group Listing pages.

Appendix A: Endpoint Risk Scoring Rules

Endpoint risk scoring requires the following content:

- "accesses administrative share using command shell"
- "activates bits job"
- "adds files to bits download job"
- "adds firewall rule"
- "allocates remote memory"
- "antivirus disabled"
- "archiving software reads multiple documents"
- "autorun debian package mismatch"
- "autorun file path not part of debian package"
- "autorun file path not part of rpm"
- "autorun key contains non-printable characters"
- "autorun"
- "autorun rpm mismatch"
- "autorun unsigned active setup"
- "autorun unsigned appinit_dlls"
- "autorun unsigned bho"
- "autorun unsigned bootexecute registry startup method"
- "autorun unsigned explorer registry startup method"
- "autorun unsigned hidden"
- "autorun unsigned hidden only executable in directory"
- "autorun unsigned ie toolbar"
- "autorun unsigned in appdatalocal directory"
- "autorun unsigned in appdataroaming directory"
- "autorun unsigned in programdata directory"
- "autorun unsigned in temp directory"
- "autorun unsigned logontype registry startup method"

- "autorun unsigned lsa provider"
- "autorun unsigned servicedll"
- "autorun unsigned winlogon helper dll"
- "autorun unsigned winsock lsp"
- "bad certificate warning disabled"
- "blacklisted file"
- "browser runs command prompt"
- "browser runs mshta"
- "browser runs powershell"
- "builds script incrementally"
- "clears application event log"
- "clears event logs using powershell"
- "clears security event log"
- "clears setup event log"
- "clears system event log"
- "combines binaries using command prompt"
- "command line usage of archiving software"
- "command line writes script files"
- "command prompt obfuscation"
- "command prompt obfuscation using value extraction"
- "command shell runs rundll32"
- "completes bits download job"
- "configures image hijacking"
- "configures port redirection"
- "copies binary over administrative share"
- "created in last month"
- "creates browser extension"
- "creates domain user account"
- "creates executable in startup directory"
- "creates local driver service"

- "creates local service"
- "creates local task"
- "creates local user account"
- "creates password-protected archive"
- "creates recursive archive"
- "creates remote process using wmi command-line tool"
- "creates remote service"
- "creates remote task"
- "creates run key"
- "creates shadow volume for logical drive"
- "creates suspicious service running command prompt"
- "debian package hash mismatch in important system directory"
- "debian package hash mismatch"
- "deletes backup catalog"
- "deletes firewall rule"
- "deletes shadow volume copies"
- "deletes shadow volume copies using powershell"
- "deletes usn change journal"
- "disables event logging service"
- "disables firewall"
- "disables safe mode"
- "disables security service"
- "disables startup repair"
- "disables uac"
- "disables uac remote restrictions"
- "disables windows audit policy"
- "disables windows defender using powershell"
- "downloads binary using certutil"
- "drops credential dumping tools"
- "dumps dns cache"

- "dyld inserted"
- "enables cleartext credential storage"
- "enables login bypass"
- "enables rdp from command-line"
- "enables safe mode"
- "enumerates arp table"
- "enumerates available systems on network"
- "enumerates domain account policy"
- "enumerates domain administrators"
- "enumerates domain computers"
- "enumerates domain controllers"
- "enumerates domain groups"
- "enumerates domain users"
- "enumerates enterprise administrators"
- "enumerates exchange domain servers"
- "enumerates exchange servers"
- "enumerates ip configuration"
- "enumerates local account policy"
- "enumerates local administrators"
- "enumerates local administrators on domain controller"
- "enumerates local groups"
- "enumerates local services"
- "enumerates local users"
- "enumerates logical disk"
- "enumerates mapped resources"
- "enumerates network connections"
- "enumerates primary domain controller"
- "enumerates processes on local system"
- "enumerates processes on remote system"
- "enumerates remote netbios name table"

- "enumerates remote resources"
- "enumerates route table"
- "enumerates services hosted in processes"
- "enumerates system info"
- "enumerates trusted domains"
- "evades scanning within windows defender"
- "evasive powershell used over network"
- "event viewer executes uncommon binary"
- "execute dll through rundll32"
- "exports sensitive registry hive"
- "extracts password-protected archive"
- "file encrypted"
- "file hidden"
- "file path not part of debian package in important system directory"
- "file path not part of debian package"
- "file path not part of rpm in important system directory"
- "file path not part of rpm"
- "file vault disabled"
- "floating module and hooking"
- "floating module in browser process"
- "floating module in os process"
- "floating module"
- "gatekeeper disabled"
- "gets current user as system"
- "gets current username and group information"
- "gets current username"
- "gets hostname"
- "gets remote time"
- "gina replacement"
- "graylisted file"

- "hidden and hooking"
- "hidden in appdata"
- "hidden plist and autorun"
- "hidden running as root"
- "hooks audio output function"
- "hooks authentication function"
- "hooks crypto function"
- "hooks dnsquery function"
- "hooks gui function"
- "hooks network http function"
- "hooks network io function"
- "hooks ntldr function"
- "hooks registry access function"
- "hooks registry enumeration function"
- "http daemon runs command prompt"
- "http daemon runs powershell"
- "http daemon runs reconnaissance tool"
- "http daemon writes executable"
- "ie dep disabled"
- "ie enhanced security disabled"
- "in appdata directory"
- "in hidden directory"
- "in recycle bin directory"

Position Tracking Information

The ESA Correlation service continuously streams data from the data sources like decoders (log and network), and concentrators. ESA retrieves events from the data sources, and applies rules to generate alerts to detect malicious activities. When you deploy a data source, ESA starts processing information from the latest available session, by default. Position Tracking Information enables you to visualize the progress of the sessions that ESA has processed, and provides information on the session IDs and the date and time when the events were processed.

Set Position Tracking Information enables you to:

- Visualize the number of sessions that a particular ESA data source has already analyzed, review the number of sessions ESA would process after you edit the position tracking, and plan your work.
- Set the tracking position information based on:
  - Session ID
  - Date and Time (Collection Time)
- Set position tracking for multiple data sources before you deploy them.
- Calculate the number of sessions that the ESA Correlation Service is scheduled to process for a particular data source to either process, reprocess, or skip sessions with respect to the current position of the data source.

Note: The Position tracking feature with the Date and Time option works based on the profile time settings in the NetWitness Platform UI. This time-zone based time from the UI is converted to UTC, and is sent to the core, to retrieve the corresponding session ID for that time stamp.
Example: If the UI follows IST, the UI converts it to UTC and sends it to the core. The session ID is fetched for the specific UTC time stamp, and set to position tracking at deployment.

Use Case Scenario

This section provides information about how you can use position tracking information in a real-world scenario.

Case 1: If you have deployed a data source with a total of 400 sessions that ESA has already processed, and if you want to start processing the events from the beginning, perform the following steps to reprocess the sessions.

Edit the position Tracking Information

1. Select the deployment and click **Edit Deployment**.
2. Select the datasource and click **Set Position Tracking Information**.

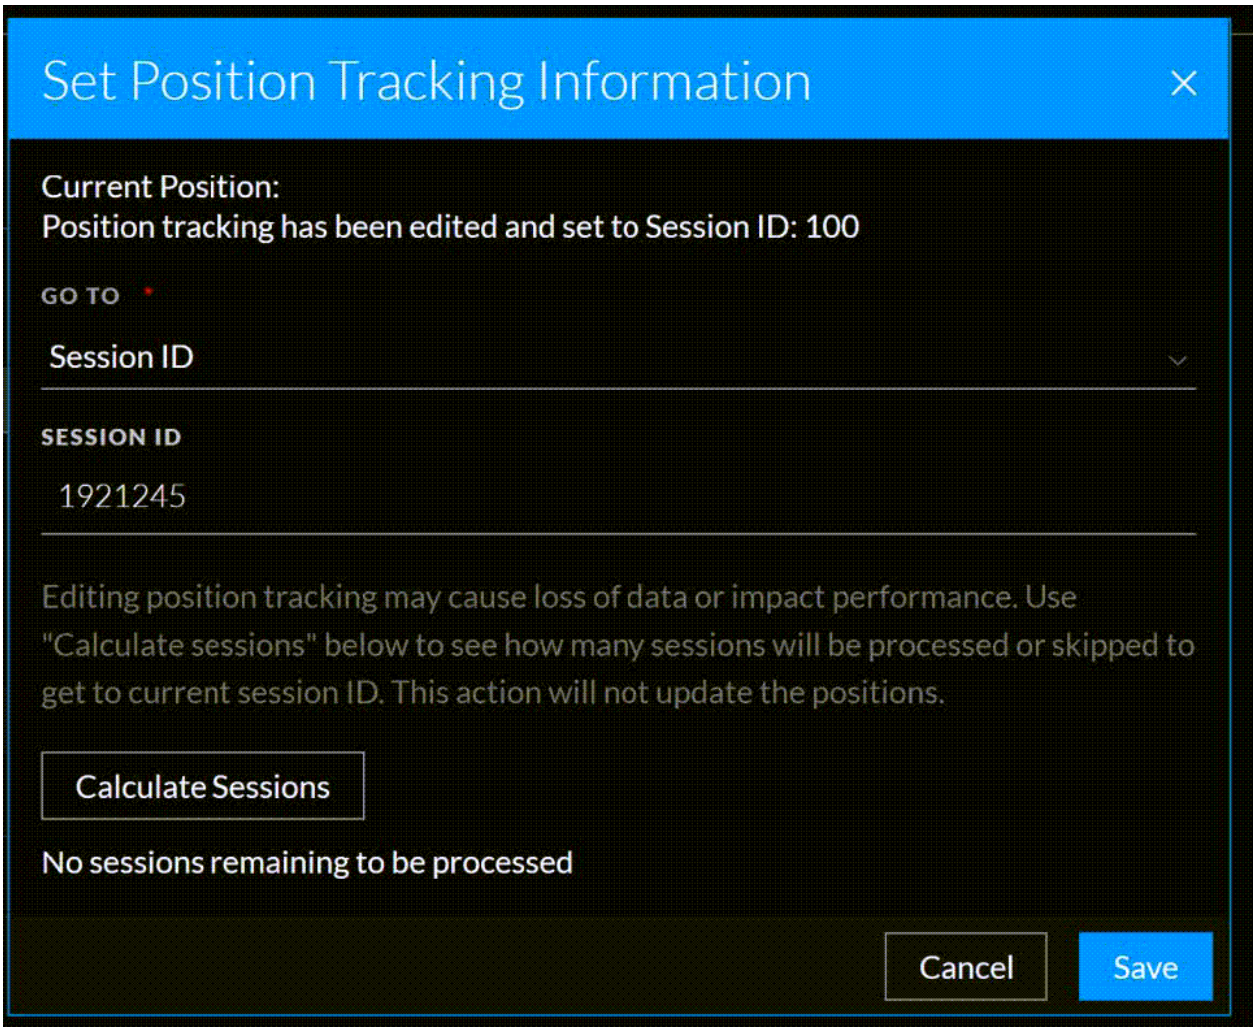
   The Set Position Tracking Information dialog is displayed.
3. In the **Go To** drop-down menu, select the **Session ID** and enter the session number as 1 in the **Session ID** text field.

You can also set the position tracking information based on date and time and the sessions will be calculated using data and time.

4. Click **Calculate Sessions**.
5. Click **Save** twice.
6. Select the Deployment and click **Deploy**.

   All the 400 sessions will be reprocessed.

   The following image shows the use case scenario.



Case 2: If you have deployed a data source with a total of 700 sessions available and the current position of the data source is at 100 and if you set the sessions ID to 250. In this case, 150 sessions will be skipped. You can also set the sessions based on the date and time.

The following image shows the use case scenario.

Case 3: If you have deployed a data source that has a total of 1921237 sessions available and if you set the session ID higher than the available sessions for the data source. In this case, no remaining sessions will be processed. You can also set the sessions based on date and time.

The following image shows the use case scenario.

Note: Editing the tracking information is optional. If you add a new data source to an existing ESA deployment, and you do not edit the tracking information, ESA follows the default behavior to process events.

Contact Information

NetWitness Community at https://community.netwitness.com contains a knowledge base that answers common questions and provides solutions to known problems, product documentation, community discussions, and case management.

Trademarks

RSA and other trademarks are trademarks of RSA Security LLC or its affiliates ("RSA"). For a list of RSA trademarks, go to https://www.rsa.com/en-us/company/rsa-trademarks. Other trademarks are trademarks of their respective owners.

License Agreement

This software and the associated documentation are proprietary and confidential to RSA Security LLC or its affiliates are furnished under license, and may be used and copied only in accordance with the terms of such license and with the inclusion of the copyright notice below. This software and the documentation, and any copies thereof, may not be provided or otherwise made available to any other person.

No title to or ownership of the software or documentation or any intellectual property rights thereto is hereby transferred. Any unauthorized use or reproduction of this software and the documentation may be subject to civil and/or criminal liability. This software is subject to change without notice and should not be construed as a commitment by RSA.

It is advised not to deploy third-party repos or perform any change to the underlying NetWitness Operating System that is not part of the supported NetWitness version. Any such change outside of the NetWitness approved image may result in a service or functionality conflict and require a reimage of the NetWitness system to bring NetWitness back to an optimized functional state. In the event a third-party repo is deployed, or other non-supported change is made by the customer without NetWitness approval, the customer takes full responsibility for any system malfunction until the issue can be remediated through troubleshooting efforts or a reimage of the service.

Third-Party Licenses

This product may include software developed by parties other than RSA. The text of the license agreements applicable to third-party software in this product may be viewed on the product documentation page on NetWitness Community. By using this product, a user of this product agrees to be fully bound by terms of the license agreements.

Note on Encryption Technologies

This product may contain encryption technology. Many countries prohibit or restrict the use, import, or export of encryption technologies, and current use, import, and export regulations should be followed when using, importing or exporting this product.

Distribution

Use, copying, and distribution of any RSA Security LLC or its affiliates ("RSA") software described in this publication requires an applicable software license.

How Context Hub Works

Context Hub service provides enrichment lookup capability in the Respond and Investigate views. An Administrator can configure the Context Hub service and the data sources to enable an Analyst to perform the context lookup for the required data sources.

By default, the Context Hub service supports enrichment lookups for meta types such as IP address, User, Domain, MAC address, File Name, File Hash, and Host.

The following data sources are supported by NetWitness and provide enriched data when configured.

Lists- Provides contextual information from a list of blacklists, whitelists, or watchlists.

Archer- Provides Criticality information of a device or specific asset based on the IP or Host which needs constant monitoring.

Active Directory - Provides contextual information of a user to help determine if the user is suspicious or not.

NetWitness Endpoint - Provides context information for endpoint module and machine indicators and to help determine if any of the Endpoint devices are compromised.

Respond- Provides contextual information of a specific meta available in respond and enables analyst to respond faster based on context data.

File Reputation Server - Provides contextual information for reputation status of files.
