Release Notes

This document lists the fixes in NetWitness Platform 11.3.0.1. Read this document before deploying or updating NetWitness Platform 11.3.0.1

Fixed Issues

This document lists issues fixed in NetWitness Platform 11.3.0.1.

Upgrade Fixes

Tracking Number	Description
SACE-11250	In cases where systems have gone through multiple kernel updates, the `/boot` directory contained multiple kernel images, which consumed the `/boot` partition.

Health and Wellness Fixes

Tracking Number	Description
SACE-10840	The following NetWitness Database (NW DB) retention statistics are now available in 11.3.0.1 • Overall Meta Oldest File Time Retention • Overall Session Oldest File Time Retention • Overall Packet Oldest File Time Retention

Respond Fixes

Tracking Number	Description
ASOC-75674	When you update to 11.3, Respond's primary host property (`/rsa/primary/host`) was set to `false` by default, which had an adverse effect on some of the critical functionality. This is now set as `true`.

UEBA Fixes

Tracking Number	Description
ASOC-75673	The cache size for MongoDB is set to 20 GB for better performance.
ASOC-73271	The OOTB UEBA Incident Rule was missing UEBA values in the `Source` and `GroupBy` fields.

Endpoint Fixes

Tracking Number	Description
ASOC-74735	Owner information is now available on the Hosts > Details > Process tab.
ASOC-73742	A complete list of Loaded Libraries was not displayed when investigating the process.
ASOC-74199	On Windows, the agent driver stopped when the agent mode was changed multiple times from `Advanced` to `Insights`.
ASOC-74025	The Endpoint agent was not able to communicate to the server using UDP when it went back to HTTP mode.
ASOC-72823	The default scan schedule is now set to 1 week for improved performance of the Endpoint Server.

Archiver Fixes

Tracking Number	Description
ASOC-74691	When you included a meta value in the Archiver configuration, the metakey `word` was also added.

Build Numbers

The following table lists the build numbers for various components of NetWitness Platform 11.3.0.1.

Component	Version Number
NetWitness Platform Decoder	11.3.0.1-9760.5
NetWitness Platform Concentrator	11.3.0.1-9760.5
NetWitness Platform Broker	11.3.0.1-9760.5
NetWitness Platform Log Decoder	11.3.0.1-9760.5
NetWitness Platform Archiver (Workbench)	11.3.0.1-9760.5
NetWitness Platform Appliance	11.3.0.1-9760.5
NetWitness Platform Console	11.3.0.1-9760.5
NetWitness Platform Endpoint Agents	11.3.0.1-1904041524.5
NetWitness Platform Endpoint Server	11.3.0.1-190410132138.5
NetWitness Platform Legacy Web Server	11.3.0.1-190429134525.5
NetWitness Platform Log Player	11.3.0.1-9760.5
NetWitness Platform Respond Server	11.3.0.1-190429095829.5
NetWitness Platform SDK	11.3.0.1-9760.5

Update Instructions

You need to read the information and follow these procedures for updating NetWitness Platform version 11.3.0.1.

The following update paths are supported for NetWitness Platform 11.3.0.1:

- NetWitness Platform 11.1.x.x to 11.3.0.1
- NetWitness Platform 11.2.x.x to 11.3.0.1
- NetWitness Platform 11.3.0.0 to 11.3.0.1

To update NetWitness Platform from 11.1.x.x or 11.2.x.x, you must download files for the 11.3.0.0 base release and the 11.3.0.1 patch release. To update from 11.3.0.0 to 11.3.0.1, you only need to download files for the 11.3.0.1 patch release.

For update paths supported for 11.3.0.0, see the *Update Guide for Version 11.x.x.x to 11.3*.

You can update 11.3.0.1 patch using one of the following options:

- If the NetWitness Server has internet connectivity to Live Services, the NetWitness Platform User Interface can be used to apply the patch.
- If the NetWitness Server does not have internet connectivity to Live Services, the Command Line Interface (CLI) can be used to apply the patch.

Update Tasks

Task 1: Disable Decoder Services

Before updatng to 11.3.0.1, you must disable Capture AutoStart on Network Decoder and Network Hybrid Services.

To disable the Capture Autostart field:

1. Go to **ADMIN** > **Services**.
   The Administration Services view is displayed.
2. Select a Network Decoder or Network Hybrid service and select > **View** > **Config**.
   The services config view for the selected Network Decoder or Network Hybrid is displayed.
3. In the **Decoder Configuration** panel, deselect the **Capture Autostart** field and click **Apply**.

Task 2: Update the Patch

You can choose one of the following update methods based on your internet connectivity.

Online Method (Connectivity to Live Services): Update Using NetWitness User Interface

You can use this method if the NetWitness Server is connected to Live Services and can obtain the package.

Note: If the NetWitness Server does not have access to Live Services, use Offline Method (No connectivity to Live Services): Update using the Command Line Interface .

Prerequisites

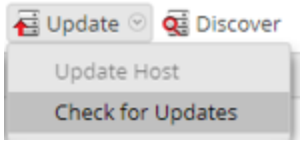
Make sure that:

1. The “Automatically download information about new updates every day” option is checked and is applied in **ADMIN** > **System** > **Updates** .
2. Go to **ADMIN** > **Hosts** > **Update** > **Check for Updates** to check for updates. The Host page displays the **Update Available** status.
3. 11.3.0.1 is available under “Update Version” column.

Note: If you have custom certs, move any custom certs from `/etc/pki/nw/trust/import/` directory to `/root/cert`. Follow these steps to move the certs:
1.) `mkdir /root/cert.`
2.) `mv /etc/pki/nw/trust/import/* /root/cert.`

Procedure

1. Go to **ADMIN** > **Hosts**.
2. Select the NetWitness Server (nw-server) host.
3. Check for the latest updates.



4. Update Available is displayed in the **Status** column if you have a version update in your Local Update Repository for the selected host.
5. Select **11.3.0.1** from the **Update Version** column.
   If you:
   - Want to view a dialog with the major features in the update and information on the updates click the information icon ( ) to the right of the update version number.
   - Cannot find the version you want, select **Update > Check for Updates** to check the repository for any available updates. If an update is available, the message "New updates are available" is displayed and the **Status** column updates automatically to show Update Available. By default, only supported updates for the selected host are displayed.
6. Click **Update** > **Update Host** from the toolbar.
7. Click **Begin Update**.
8. Click the **Reboot Host**.
9. Repeat steps 6 to 8 for other hosts.

Note: You can select multiple hosts to update at the same time only after updating and rebooting the NetWitness Admin server. All ESA, Endpoint, and Malware Analysis hosts should be updated to the same version as that of NW Admin Server or NetWitness Admin Server.

Note: Not all components have been changed for 11.3.0.1, so after you perform the update steps, it is normal to see some components with different version numbers. For a list of the components that were updated for this release, see Build Numbers.

Offline Method (No connectivity to Live Services): Update using the Command Line Interface

You can use this method if the NetWitness Server is not connected to Live Services.

Prerequisites

Make sure that you have downloaded the following files, which contain all the NetWitness Platform 11.3.0.1 update files, from RSA Link (https://community.rsa.com/) > NetWitness Platform > RSA NetWitness Logs and Network > Downloads > RSA Downloads to a local directory:

- If you are updating from an 11.1.x.x or an 11.2.x.x release, download `netwitness-11.3.0.0.zip` and `netwitness-11.3.0.1.zip`.
- If you are updating from 11.3.0.0, download `netwitness-11.3.0.1.zip`.

Procedure

You need to perform the update steps for NW Admin servers and for component servers.

Note: If you copy paste the commands from PDF to Linux SSH terminal, the characters do not work. It is recommended to type the commands.

1. **If you are updating from 11.1.x.x or 11.2.x.x**, you must stage 11.3.0.0 and 11.3.0.1. Log into the `/root` directory of the Admin NetWitness Server and create the following directories:

   `/tmp/upgrade/11.3.0.0`

   `/tmp/upgrade/11.3.0.1`

   and then copy the package zip files to the `/root` directory of the Admin server and extract the package files from `/root` to the appropriate directories:

   ```
   unzip netwitness-11.3.0.0.zip -d /tmp/upgrade/11.3.0.0
   unzip netwitness-11.3.0.1.zip -d /tmp/upgrade/11.3.0.1
   ```

2. **If you are updating from 11.3.0.0 to 11.3.0.1**, you only need to stage 11.3.0.1. Log into the `/root` directory of the Admin NetWitness Server and create the following directory:

   `/tmp/upgrade/11.3.0.1`

   and then copy the package zip files to the `/root` directory of the Admin server and extract the package

files from `/root` to the `/tmp/upgrade/11.3.0.1` directory:

```
unzip netwitness-11.3.0.1.zip -d /tmp/upgrade/11.3.0.1
```

Note: If you copied the .zip file to the created staging directory to unzip, make sure that you delete the initial .zip file that you copied to the staging location after you extract it.

3. Initialize the update, using the following command:

```
upgrade-cli-client --init --version 11.3.0.1 --stage-dir /tmp/upgrade
```

4. Update Netwitness Server, using the following command:

```
upgrade-cli-client --upgrade --host-addr <IP of Netwitness Server> --version 11.3.0.1
```

5. When the component host update is successful, reboot the host from NetWitness UI.
6. Repeat steps 4 and 5 for each component host, changing the IP address to the component host which is being updated.

Note: You can check versions of all the hosts, using the command `upgrade-cli-client --list` on the NetWitness Server. If you want to view the help content of `upgrade-cli-client`, use the command `upgrade-cli-client --help`.

Note: If the following error displays during the update process:

```
2017-11-02 20:13:26.580 ERROR 7994 — [ 127.0.0.1:5671]
o.s.a.r.c.CachingConnectionFactory : Channel shutdown: connection error;
protocol method: #method<connection.close>(reply-code=320, reply-
text=CONNECTION_FORCED - broker forced connection closure with reason
'shutdown', class-id=0, method-id=0)
```

the patch will install correctly. No action is required. If you encounter additional errors when updating a host to a new version, contact Customer Support (Contacting Customer Care).

External Repo Instructions for CLI Update

Note: The external repo should have separate directories for 11.3.0.0 and 11.3.0.1, as described in Offline Method (No connectivity to Live Services): Update using the Command Line Interface .

1. Stage 11.3.0.1 by creating a directory on the NetWitness Server at `/tmp/upgrade/11.3.0.1` and extract the zip package.

```
unzip netwitness-11.3.0.1.zip -d /tmp/upgrade/11.3.0.1
```

Note: If you copied the .zip file to the created staging directory to unzip, make sure that you delete the initial .zip file that you copied to the staging location after you extract it.

2. Initialize the update, using the following command:

```
upgrade-cli-client --init --version 11.3.0.1 --stage-dir /tmp/upgrade
```

3. Update Netwitness Server, using the following command:
   `upgrade-cli-client --upgrade --host-addr <IP of Netwitness Server> --version 11.3.0.1`
4. When the component host update is successful, reboot the host from NetWitness UI.
5. Repeat steps 3 and 4 for each component host, changing the IP address to the component host which is being updated.

Note: You can check versions of all the hosts, using the command `upgrade-cli-client --list` on NetWitness Server. If you want to view the help content of `upgrade-cli-client`, use the command `upgrade-cli-client --help`.

Note: If the following error displays during the update process:
```
2017-11-02 20:13:26.580 ERROR 7994 — [ 127.0.0.1:5671]
o.s.a.r.c.CachingConnectionFactory : Channel shutdown: connection error;
protocol method: #method<connection.close>(reply-code=320, reply-
text=CONNECTION_FORCED - broker forced connection closure with reason
'shutdown', class-id=0, method-id=0)
```
the patch will install correctly. No action is required. If you encounter additional errors when updating a host to a new version, contact Customer Support (Contacting Customer Care).

Post-Update Tasks

Task 1 - Update HIVE version

After you update to 11.3.0.1, you need to update the HIVE version that is compatible with Warehouse. To install the latest HIVE version, run the following commands on the NetWitness admin server and restart the Reporting Engine service.

1. To install HIVE 0.12 version, run the following command:
   `rpm -ivh rsa-nw-hive-jdbc-0.12.0-1.x86_64.rpm`
2. To Install HIVE 1.0 version, run the following command:
   `rpm -ivh rsa-nw-hive-jdbc-1.0.0-1.x86_64`

Task 2 (Optional) - Move the custom certs

Move the custom certs from external directory to `/etc/pki/nw/trust/import` directory.

Task 3 (Conditional) - Reconfigure PAM Radius Authentication

If you configured PAM Radius authentication in 11.3x.x using the `pam_radius` package, you must reconfigure it in 11.3.0.1 using the `pam_radius_auth` package.

You need to execute the below commands on NW Server on which the Admin server resides.

Note: If you have configured `pam_radius` in 11.x.x.x, perform the below steps to uninstall the existing version, or you can proceed with Step 2.

Step 1: Verify the existing page and uninstall the existing `pam_radius` package.

```
rpm -qa |grep pam_radius
yum erase pam_radius
```

Step 2: To install the `pam_radius_auth` package, run the following command.

```
yum install pam_radius_auth
```

Step 3: Edit the RADIUS configuration file, `/etc/raddb/server` as follows and add the configurations for radius server:

```
# server[:port] shared_secret timeout (s)
server secret 3
```

For example - 111.222.33.44 secret 1

Step 4: Edit the NetWitness Server PAM configuration file `/etc/pam.d/securityanalytics` to add the following line. If the file does not exist, create it and add the following line:

```
auth sufficient pam_radius_auth.so
```

Step 5: Provide the write permission to `/etc/raddb/server` files using the following command.

```
chown netwitness:netwitness /etc/raddb/server
```

Step 6: To copy the `pam_radius_auth` library, run the following command.

```
cp /usr/lib/security/pam_radius_auth.so /usr/lib64/security/
```

Step 7: Restart the jetty server after making the changes to `pam_radius_auth` configurations and run the following command.

```
systemctl restart jetty
```

Task 4 - Restart the Respond Server

Restart the Respond server:

```
systemctl restart rsa-nw-respond-server
```

To enable the Capture Autostart field:

1. Go to **ADMIN** > **Services**.
   The Administration Services view is displayed.
2. Select a Network Decoder or Network Hybrid service and select > **View** > **Config**.

The services Config view for the selected Network Decoder or Network Hybrid is displayed.

3. In the **Decoder Configuration** panel, select the **Capture Autostart** field and click **Apply**.

Product Documentation

The following documentation is provided with this release.

Document	Location
RSA NetWitness Platform 11.3.0.0 Online Documentation	https://community.rsa.com/community/products/netwitness/113

Known Issues

Issues that remain unresolved in this release are documented here: https://community.rsa.com/community/products/netwitness/documentation/known-issues. Wherever a workaround is available, it is noted or referenced in detail.

Feedback on Product Documentation

You can send an email to sahelpfeedback@emc.com to provide feedback on RSA NetWitness Platform documentation.

Contacting Customer Care

Use the following contact information if you have any questions or need assistance.

RSA Link	https://community.rsa.com/
Phone	1-800-995-5095, option 3
International Contacts	http://www.emc.com/support/rsa/contact/phone-numbers.htm
Community	https://community.rsa.com/community/rsa-customer-support
Basic Support	Technical Support for your technical issues is available from 8 AM to 5 PM your local time, Monday through Friday.
Enhanced Support	Technical Support is available by phone 24 x 7 x 365 for Severity 1 and Severity 2 issues only.

Preparing to Contact Customer Care

When you contact Customer Care, you should be at your computer. Be prepared to give the following information:

- The version number of the RSA NetWitness Platform product or application you are using.
- The type of hardware you are using.

Introduction

This document lists enhancements and fixes in RSA NetWitness® Platform 11.3.0.0. Read this document before deploying or updating to RSA NetWitness® Platform 11.3.0.0.

What's New

RSA NetWitness® Platform 11.3.0.0 provides new features and enhancements for every role in the Security Operation Center. These include:

- Additional capabilities for analyzing hosts and files for malicious or suspicious activity.
- Usability enhancements to make work easier for incident responders and threat hunters.
- Policy and licensing enhancements to help administrators manage their environments more efficiently.

NetWitness Endpoint

Endpoint Agent

In 11.3, the agent supports Endpoint Detection and Response (EDR) capabilities along with Windows Log Collection.

The Advanced (licensed) agent provides EDR capabilities with continuous monitoring of activities on the host for deep visibility, and analysis of all behavior and processes on the endpoint. The agent records data about every critical action, such as process, file, registry modification, and network connections, and posts them as events, in near real-time, to the server. The agent can detect anomalies such as image hooks, kernel hooks, registry discrepancies, and suspicious threads. In addition, it collects Windows logs. For more information, see the *NetWitness Endpoint User Guide*.

The following are key capabilities:

- User console interactions that are crucial for investigating malware attacks that use Windows legitimate files, such as `cmd.exe` or `powershell.exe`, to execute commands on a compromised host.
- Visibility into complete command line argument strings that are important for forensics and investigations.

- Detection of file or file-less based scripts by reporting scripts directly on process events instead of script engines. Currently supported engines include `powershell`, `cmd`, `cscript`, `wscript`, `rundll32`, `mshtml`, and `javascript`.
- Tamper Proof Agent - Registry keys, `exe` and `sys` files of both user-mode and kernel-mode agents are protected.

Endpoint agents can operate in an Insights or Advanced mode depending on the policy configuration. For more information on policies, see the *NetWitness Endpoint Configuration Guide*.

Key Improvements in 11.3 Agents over Legacy NetWitness Endpoint Agents

- Decoupled dependencies with kernel internal structures.
- Performance improvements in file blocking with huge increase in number of hashes that can be blocked.
- Increased event capture limits. Events are no longer tied to executable-hash but to the entire creation chain.
- Better compatibility and interoperability with third-party applications.

Supported Agent Operating Systems

The following operating systems are now supported:

- Windows 2019 Server
- Windows 10 (32 and 64-bit) (up to version 1809)
- Red Hat Linux 7.x
- macOS 10.13 (High Sierra)
- macOS 10.14 (Mojave)

Agents can also be installed on Virtual Desktop Infrastructure (VDI) on VMware environments. For more information, see the *NetWitness Endpoint Agent Installation Guide*.

Scalable and Distributed Deployments

You can scale your deployment by adding multiple Endpoint Log Hybrids, depending on the number, location, distribution of agents, and data collected from endpoints. Install Endpoint Broker to get a consolidated view of all Endpoint servers in your deployment. For more information, see the *NetWitness Endpoint User Guide* and the *NetWitness Endpoint Configuration Guide*.

Groups and Policies

To efficiently manage and update endpoint agent configurations, administrators can group agents and manage their behavior using policies. Administrators can either use default or customized policies. You can enable Windows Log configuration through the Windows Log policy instead of generating it through the agent packager. For more information, see the *NetWitness Endpoint Configuration Guide*.

Analyze Files and Hosts Using Risk Score

Analysts can investigate a file or host using risk scores ranging from 1 to 100. Detailed context of risk contributors (alerts and events) is available to help you rapidly investigate suspicious or malicious activity. For more information, see the *NetWitness Endpoint User Guide*.

Process Visualization

For a better analyst experience during process investigation, an intuitive user interface is introduced to:

- Understand the entire process event chain, process parent-child relationships, and all associated events in a timeline view.
- Analyze important process attributes, such as username, launch arguments, reputation, file status, signer, signature, and file path.

For more information, see the *NetWitness Endpoint User Guide*.

File Analysis and Response

Analysts can:

- Analyze files using file reputation (such as known good, invalid, suspicious) from the Context Hub, risk score, and certificate status.
- Perform external lookup using Google or VirusTotal.
- Download a file and perform deeper file analysis, such as string search and text content for scripts.

After investigation, analysts can:

- Assign statuses to files to categorize them as blacklist, whitelist, and so on.
- Remediate threats by blocking malicious or infected files.

For more information, see the *NetWitness Endpoint User Guide*.

Application Rules for Existing IIOCs

The existing IIOCs from NetWitness Endpoint 4.4.0.x are available as out-of-the-box application rules in NetWitness Platform 11.3. For more information, see the *NetWitness Endpoint Configuration Guide*.

Added Endpoint Risk Scoring Rules for ESA

In addition to the ESA sample rules, NetWitness Platform now includes an Endpoint Risk Scoring Bundle with approximately 400 rules. These rules generate alerts that are used to calculate risk scores for suspicious files and hosts that cross defined risk score thresholds. If you have NetWitness Endpoint, you can add this rule bundle to an ESA rule deployment in the same way that you would add any ESA rule. However, you must specify endpoint data sources (Concentrators) during ESA rule deployments. For more information, see the *ESA Configuration Guide*.

Updates to the Investigate > Event Analysis View for Endpoint Events

- Text Analysis for Endpoint events provides meaningful text explaining the event. You can also view metadata with values greater than 255 characters.
- For each session, you can view the event in the Process Analysis, or view the details of the host associated with the event by pivoting to the Hosts details view.

NetWitness Respond

Redesigned the Events List for NetWitness Endpoint Events

To improve the analyst experience and incorporate Endpoint events into NetWitness Respond, the redesigned Events List has a flexible layout that better renders diverse data. The redesigned list empowers analysts to quickly understand and triage events with a more scannable event preview, which is customized for NetWitness Endpoint and inline event details. For more information, see the *NetWitness Respond User Guide*.

Improved the Alerts List Filter for NetWitness Endpoint

When you filter the alerts list for the Endpoint source, it includes both NetWitness Endpoint 4.4.x and NetWitness Endpoint 11.x alerts.

Added a UEBA Incident Rule

A new User Entity Behavior Analytics (UEBA) default incident rule is available, which captures user entity behavior grouped by Classifier ID to create incidents from alerts.

Updated the NetWitness Endpoint Incident Rule

If you have NetWitness Endpoint, the High Risk Alerts: NetWitness Endpoint default incident rule captures alerts generated by NetWitness Endpoint with a risk score of High or Critical. This rule now groups alerts into incidents by Host Name. For more information, see the *NetWitness Respond Configuration Guide*.

Added the Ability to Automatically Create Endpoint Risk Scoring Incidents

If you have NetWitness Endpoint, you can configure Endpoint Risk Score Threshold settings to automatically create risk scoring incidents for suspicious files and hosts that cross the defined risk score thresholds. For more information about configuring risk score threshold settings, see the *NetWitness Respond Configuration Guide*. For more information about NetWitness Endpoint, see the *NetWitness Endpoint Configuration Guide*.

Pivot to the Investigate > Hosts and Files Views from the Respond View

For a detailed investigation of an incident, analysts can access the Investigate > Hosts and Files views through context tooltips in the Respond view.

Look Up File Reputation Status and Information From the Respond View

In the Respond view and Investigate views where Context Hub is integrated into NetWitness Platform, analysts can hover over a file hash entity to open a context tooltip, which shows the reputation status of the file. Analysts can also click a View Context button, which opens a Context Lookup panel with additional file information.

NetWitness UEBA

Advanced Analytics Using RSA NetWitness Endpoint

UEBA is integrated with NetWitness Endpoint to enhance the current detection coverage on NetWitness Platform. The purpose of this integration is to identify potential attacker activity. This focuses on two primary data sources:

- Process Executions
- Registry Changes

For more information, see the *NetWitness UEBA User Guide*.

Access Host Details or Analyze Process Views from the User Profile View

An analyst can pivot to the Host Details view or the Analyze Process view from the User Profile view to look for more detailed information about an anomalous process or a host that is associated with the user risk. For more information, see the *NetWitness UEBA User Guide*.

Support for Additional Data Source

NetWitness UEBA now supports the RSA SecurID data source.

NetWitness Investigate

Analysts Can View a Large Number of Events Simultaneously in the Event Analysis View Events List

Up to 50,000 events are loaded in the Events list in ascending order based on collection time. A row number indicator every 100 rows helps with navigation through the list. User interface features help you to understand what is being displayed and the sorting order. For detailed information, see "Analyzing Events in the Event Analysis View" in the *NetWitness Investigate User Guide*.

Analysts Can See Detailed Status of a Query in the Event Analysis View

Clicking the information icon ( ) in the Event Analysis view query builder opens the query console, a new user interface feature that provides a status bar, warnings, errors, and other details about what is occurring as a query is being executed. When a query is complete, the query console displays the time range, the query, the services queried, any services that could not be queried, and the amount of time each service took to find results and retrieve events based on the query. You can copy the complete query as text. For detailed information, see "Filtering Data in the Event Analysis View" in the *NetWitness Investigate User Guide*.

Improved Analyst Workflow in the Navigate View, Events View, and Event Analysis View

To make it easier for analysts to conduct investigations, these improvements have been implemented:

- When you are switching between pages in the Events view, log events load faster due to caching of query results.
- The time range used in Navigate is used when transitioning to the Events view.
- In the Navigate view, an easily understood meta key description is displayed next to the meta key name. For detailed information, see "Navigate View" in the *NetWitness Investigate User Guide*.
- Custom time range input has been added in the Event Analysis view. In addition to the predefined time windows, you can enter a custom time range, and then click the month, day, year, hour, and minute to edit the time range directly in the breadcrumb. For detailed information, see "Filtering Data in the Event Analysis View" in the *NetWitness Investigate User Guide*.

Detailed Information about Loaded Events in the Events View is Displayed in the Footer

The message in the footer helps analysts to understand what they are viewing in the Events view. If no events are loaded, this message is displayed: "0 event matches." Other messages let you know if the scan limit or results limit set by the administrator has been met and which services have results displayed. For example, the following message lets you know that the scan limit has been reached and further data is available to scan: "Displaying 1-25 of 100000+ event matches (scan limit of 100000 events has been reached)." For detailed information, see "Events View" in the *NetWitness Investigate User Guide*.

Faster Search and Query Speed in the Navigate View and Events View

When analysts working in the Navigate view query a Broker or Concentrator, subsequent queries that share all or some of a previous query's criteria return results faster by using a new caching built into the services. In the Events view, queries using complex operations with text values are cached so subsequent queries that share all or some of a previous query's criteria return results quicker.

New Query Builder Capabilities in the Event Analysis View

- You can create complex filters in the Guided Mode query builder using the Free Form Filter in the Advanced Options submenu, which is in all of the Guided Mode drop-down menus. Free-Form Mode is still available if you want to paste a long, complex query.

- When you submit a query that contains free-form filters, the free-form filters are validated on the server side before execution. If any of the filters are invalid the query is not executed.
- While a query is executing, you can cancel the query in progress. When a query is canceled, the Events panel event count, the footer message, and the query console reflect the number of events retrieved rather than the total number of events found.

For detailed information, see "Filtering Events in the Event Analysis View" in the *NetWitness Investigate User Guide*.

Updated Meta Keys in the Endpoint Analysis Column Group

The Endpoint Analysis column group is updated to include new meta keys for endpoint investigation, which are displayed when viewing an Endpoint event in the Events view and the Event Analysis view.

New Preference Option to Control Automatic Update of Time Range in Breadcrumb

In the Event Analysis view, a new preference in the Event Preference dialog controls automatic update of the time range in the breadcrumb. While you are viewing results for a specific time range, the service is being polled at one minute intervals to detect if there are new results, but any new results are not loaded to the current view. By default, the time range window in the breadcrumb stays synchronized with the current search. You can choose to automatically update the time range window in the breadcrumb when the service indicates that it has the latest updated results by selecting the **Update Time Window Automatically** checkbox. When the time range is updated and the Submit Query button is activated, you can get the latest updated results.

Access UEBA from the Investigate > Host Details View

If you have NetWitness UEBA installed, you can analyze risks associated with users logged-in on the host by pivoting to the Users view. For more information, see the *NetWitness UEBA User Guide*.

Event Stream Analysis (ESA)

Introduced a New Improved ESA Correlation Service for ESA Correlation Rules

The ESA Correlation service in NetWitness Platform 11.3 replaces the Event Stream Analysis service found in previous versions. Like the Event Stream Analysis service, the ESA Correlation service installs on the ESA Primary and ESA Secondary host types.

There are two ESA services that can run on an ESA host:

- ESA Correlation (ESA Correlation Rules)
- Event Stream Analytics Server (ESA Analytics)

The Contexthub server service, which provides enrichment lookup capability in the Respond and Investigate views, runs only on an ESA Primary host.

Support for Different Data Sources for Your ESA Correlation Rules

Instead of adding data sources, such as Concentrators, to the entire service, you can specify different data sources for each ESA rule deployment. For example, you may want to use Concentrators with HTTP packet data in one deployment and Concentrators with HTTP log data in another deployment. For more information, see the *Alerting with ESA Correlation Rules User Guide*.

For upgrade considerations for ESA rule deployments, see the applicable upgrade and update instructions as well as the *ESA Configuration Guide*.

The new ESA Correlation service supports Endpoint and UEBA content

To support Endpoint and UEBA content as well as changes to ESA rules from Live, a data change from single-value (string) to multi-value (string array) was made for several meta keys within the ESA Correlation service.

The following default string array meta keys included in the "multi-valued" parameter on the ESA Correlation service are required in version 11.3 and should not be removed:

action , alert , alert.id , alias.host , alias.ip , alias.ipv6 , analysis.file , analysis.service , analysis.session , boc , browserprint , cert.thumbprint , checksum , checksum.all , checksum.dst , checksum.src , client.all , content , context , context.all , context.dst , context.src , dir.path , dir.path.dst , dir.path.src , directory , directory.all , directory.dst , directory.src , email , email.dst , email.src , eoc , feed.category , feed.desc , feed.name , file.cat , file.cat.dst , file.cat.src , filename.dst , filename.src , filter , function , host.all , host.dst , host.orig , host.src , host.state , inv.category , inv.context , ioc , ip.orig , ipv6.orig , netname , OS , param , param.dst , param.src , registry.key , registry.value , risk , risk.info , risk.suspicious , risk.warning , threat.category , threat.desc , threat.source , user.agent , username

When updating or upgrading to NetWitness Platform 11.3, some ESA Rules from Live must be updated to use array syntax and redeployed. For more information, see the Event Stream Analysis (ESA) tasks in the upgrade or update instructions. To change the string type meta keys to string array type meta keys in 11.3, see "Configure Meta Keys as Arrays in ESA Correlation Rule Values" in the *ESA Configuration Guide*.

Support for Adjusting the Compression Level for Concentrators on ESA

When you set up an ESA rule deployment and configure a Concentrator to use as a data source, you have the option to set the data compression level for the Concentrator on ESA. For more information, see the *Alerting with ESA Correlation Rules User Guide*.

Enable or Disable Forwarding Individual ESA Rule Alerts to the Respond View

You can turn alerts on or off for individual ESA rules. For more information, see the *ESA Configuration Guide*.

ESPER Version Upgraded from Version 5.3 to 7.1

Upgraded ESPER to the latest 7.1 release.

Log Collectors

Sorted List of Log Collectors and Virtual Log Collectors

For Log Collector services, Local Collectors, and Remote Collectors, drop-down menus are sorted alphabetically to make it easier to locate the collector you want to view:

- On a Local Collector, in the Remote Collectors tab, the Remote Collectors field in the Add Source dialog box is sorted.
- On a Virtual Log Collector, the Local Collectors tab has sorted fields for Destinations and Sources.

Sorted List of Log Collectors and Log Decoders

In the ADMIN > Health & Wellness > Event Source Monitoring view, the Log Collectors and Log Decoders drop-down menus are sorted alphabetically to make it easier to locate the items you want to view.

Local Log Collectors Syslog Ports

In 11.3, local Log Collectors (Log Collectors residing on Log Decoder appliances) are capable of receiving syslog on ports other than 514 and 6514 in order to support receiving syslog messages with different encodings, such as EUC-KR, ISO8897-9, and so on. The Log Decoder service is still the collection point for receiving ASCII/UTF-8 logs on port 514 and 6514.

Improved "Pass-Through-Logic" for Non-conformant Syslog

Remote Log Collectors now accept all non-conformant syslog messages except for those with an empty message header or body. Unwanted messages should be filtered out at syslog collection using event filters. For details, see the "Configure Event Filters for a Collector" section in the *Log Collection Guide*. Refer to syslog RFC3164 and RFC5424 for details about syslog format (https://www.ietf.org/standards/rfcs/).

Core Services

Snort Parser with UDM Support

Snort parser support has been updated with a new option, `udm=true`, that uses the aligned Unified Data Model (UDM) key set. For more information, see "Snort Parsers" in the *Decoder and Log Decoder Configuration Guide*.

Decryption of Secure SMTP

NetWitness Platform supports opportunistic SSL/TLS decryption, which addresses RFC 3207 (https://tools.ietf.org/html/rfc3207). You can add an HTTPS parser option that provides a comma-separated-values (.csv) formatted list of destination ports of the session where the STARTTLS command will be searched, with at least one encryption key that has been uploaded. This enables the STARTTLS functionality. For more information, see "Decryption of Secure SMTP" in the *Decoder and Log Decoder Configuration Guide*.

GeoIP Parser No Longer Supported, Replaced With GeoIP2 Parser

The original GeoIP parser is no longer supported. The new GeoIP2 parser that was introduced in 11.2 fully replaces it. The GeoIP2 parser supports all the previous functionality, as well as the new Maxmind package including IPv4 and IPv6 conversions.

Limit Query Memory Usage with the SDK max.query.memory Parameter

The `max.where.clause.sessions` parameter is used to impose a limit on how many sessions can be scanned by a single query. For example, if a user selects all meta from the database, the database stops processing results once the number of sessions read for the query reaches this configuration value. This parameter will be deprecated in a future release. Use the `max.query.memory` parameter to limit overall query memory usage.

PowerVault SEDs Can Be Used for External Storage

You can now configure PowerVault SEDs (self-encrypted drives) for use as external storage to store logs and packets data for retrieval.

N-Gram Indexes Have Better Performance than in 11.2, Improving Full-text Searches

There have been improvements to the insert rate of N-Gram indexes for full-text searches. N-Gram mode indexes are approximately twice as fast for updates, which means that they can be leveraged in more Concentrators without having as much of an impact on aggregation performance. This feature is disabled by default. For information about N-gram indexes, see "Index Customization" in the *NetWitness Platform Core Database Tuning Guide*.

New `avglen` Function in Database Query Syntax

The `avglen` function has been added to query syntax. It returns a single value, which is the average length of a meta value within a function.

Administration

Ability to Configure Hybrid Components onto Core Appliances (allows use of multiple PowerVaults for Hybrid components)

You can install Hybrid categories, such as Log Hybrid and Network (Packet) Hybrid service categories, on a Series 6 (R640) Physical host. This gives you the ability to attach multiple PowerVault external storage devices to the Series 6 (R640) physical host.

Public Key Infrastructure (PKI) Authentication

PKI Authentication enables users to authenticate and access the NetWitness Platform UI using digital certificates. For more information, see PKI Authentication in *System Security and User Management Guide*.

DISA STIG Support

RSA supports all Audit Rules in the DISA STIG (Defense Information Systems Agency Security Technical Implementation Guide) Control Group in release 11.3. For detailed information on STIG supported in 11.3, refer to the *System Maintenance Guide*.

Certificate Reissue Command

RSA added the `cert-reissue` command and its arguments so that you can reissue host certificates. After you update all your hosts to 11.3, you should reissue certificates for all of them as soon as possible to avoid having them expire. If the certificates expire, your NetWitness deployment is placed in an unrecoverable state. For detailed information on how to reissue certificates in 11.3, refer to the *Security Configuration Guide*.

Warm, Standby NW Server Host (For FailOver/High Availability) - Physical Host Only

The Warm Standby NW Server duplicates the critical components and configurations of your active NW Server Host to increase reliability. The Warm Standby NW Server can be configured to remain in standby mode and receive backups of the Active NW Server Host at regular intervals. If the Active NW Server fails (goes offline), the failover procedure can be executed and the Standby NW Server becomes active. For detailed information on how to set up and manage a Warm Standby NW Server in 11.3, refer to the NetWitness Platform *Deployment Guide*.

New Tool for Consolidating Hosts and Services Configuration Data into a Single Instance

The NW-Consolidator tool is available for selective 10.6.6 customers who want to migrate the configuration and data from 10.6.6 to NetWitness Platform 11.3. This tool can be used if your deployment has multiple Security Analytics and Reporting Engine instances and you want to consolidate the Hosts and Services configuration and data into a single instance. You can also consolidate the data related to users, groups, roles, feeds and reports.

Licensing

Support for Endpoint and ESA Correlation Server Licensing and Consolidation of all Entitlements for Throughput Licenses

The enhanced licensing user interface make it easy for administrators to view the license information. The Licensing Details page displays the aggregated throughput usage for different entitlements with throughput usage trends. Administrators can view all the licenses in the deployment, including those for Endpoint and the ESA Correlation Server. In addition, administrators can configure the licenses for multiple NetWitness servers and hot and warm servers. For more information, see the *Licensing Management Guide*.

Threat Aware Authentication

NetWitness Platform Integration with RSA SecureID Access

NetWitness Platform Integration with RSA SecureID Access enables you to identify suspicious users in Netwitness Platform and elevate the access levels or block the users in RSA Secure ID Access based on the assurance level and policies defined in Secure ID. The NetWitness Respond server sends email identifiers of suspicious users from incidents to RSA SecureID Access. To configure this integration on the Respond Server, see the *Respond Configuration Guide*.

Fixed Issues

This section lists issues fixed since the last major release.

Security

Tracking Number	Description
ASOC-59254	Kernel Security Update https://access.redhat.com/errata/RHSA-2018:1965.
ASOC-58383	policycoreutils Security Update https://access.redhat.com/errata/RHSA-2018:0913.
ASOC-58382	Openssl Security Update https://access.redhat.com/errata/RHSA-2018:0998.

Investigate

Tracking Number	Description
ASOC-61230	When you import Profiles to the Navigate view or the Events view using the Manage Profiles dialog, the newly imported profiles are not added to the Profiles drop-down menu.
ASOC-60941	Network and log events are interleaved and sorted in time order in the Events view, but in the Event Analysis view, events are sorted differently. In the Event Analysis view, the events are not interleaved as they should be; instead all log events sorted in time order are displayed before all network events sorted in time order.

Tracking Number	Description
ASOC-50196	If the URL for a drill point is very long and you use the query in the Event Analysis view, an error (414 Request error) is returned.
ASOC-49427	The query builder in the Event Analysis view is unresponsive for filters that contain a space.

Respond

Tracking Number	Description
ASOC-59243	When all alerts are deleted for an alert rule, the filter for the rule is not properly removed.
ASOC-37533	When a custom In-memory table is created and added as an enrichment source in ESA, that information is not displayed for ESA alerts.

Event Stream Analysis (ESA)

Tracking Number	Description
ASOC-60511	ESA CH rules get disabled during upgrade or ESA host reboot.
ASOC-60367	ESA Rules with custom meta keys do not deploy on the ESA Server.
ASOC-26481	Cannot set ESA compression level as in other appliances.
ASOC-14157	ESA Displays Warning For Array Operators.

Core Services

Tracking Number	Description
ASOC-41902	SSL FIPS Mode (Checkbox) for Broker, Concentrator and Archiver needs to be disabled.

Upgrade

Tracking Number	Description
ASOC-49843	Audit log templates are not getting updated in Logstash output conf file while upgrading to 11.x.
ASOC-42136	Post-upgrade, the investigation links are disabled for static charts.

Upgrade Notes

The following upgrade paths are supported for RSA NetWitness® Platform 11.3.0.0:

- RSA NetWitness® Platform 10.6.6.x to 11.3.0.0
- RSA NetWitness® Platform 11.0.x, 11.1.x or 11.2.x to 11.3.0.0

For more information on installing and upgrading to 11.3.0.0, see the Installation and Upgrade Guides in https://community.rsa.com/community/products/netwitness/113 > Installation and Upgrade Guides.

Product Documentation

The following documentation is provided with this release.

Documentation	Location URL
RSA NetWitness Platform 11.3 Online Documentation	https://community.rsa.com/community/products/netwitness/documentation
RSA NetWitness Platform 11.3 Upgrade Instructions and Checklists	https://community.rsa.com/community/products/netwitness/documentation
RSA NetWitness Platform Hardware Setup Guides	https://community.rsa.com/community/products/netwitness/hardware-setup-guides

Documentation	Location URL
RSA Content for RSA NetWitness Platform	https://community.rsa.com/community/products/netwitness/rsa-content

Known Issues

Issues that remain unresolved in this release are documented here: https://community.rsa.com/community/products/netwitness/documentation/known-issues. Wherever a workaround is available, it is noted or referenced in detail.

Feedback on Product Documentation

You can send an email to sahelpfeedback@rsa.com to provide feedback on RSA NetWitness Platform documentation.

Features Not Supported

The following tables provide information on features no longer supported in RSA NetWitness® Platform 11.1 or later releases.

Features Not Supported in 11.1.0.0 or later releases

No.	Feature	Notes
1	Malware Colo	Malware co-located is not supported in 11.1.0.0 and later releases. Malware Analysis is supported using a standalone Malware Analysis.
2	All-In-One (AIO) Deployment	All-in-one deployment is not supported. Fresh Install AIO has been removed.
3	Standalone Warehouse Connector	Standalone Warehouse Connector is not supported.
4	Administration Features	1. Forgot my password. 2. Email Notification to user when password expires. 3. Test/Search AD user.
5.	Pivotal	Pivotal is not supported.
6.	Warehouse Analytics	Warehouse Analytics is not supported.

No.	Feature	Notes
7.	Some Event Stream Analysis service features from 11.2 and earlier	Event Stream Analysis service features (11.2 and earlier) that are not in the 11.3 ESA Correlation service: 1. Memory snapshot for trial rules 2. ESA SNMP notification method 3. Database as an enrichment source (replaced by Context Hub list) 4. Warehouse Analytics as an enrichment source (replaced by Context Hub list) 5. Database Connection as an enrichment source (replaced by Context Hub list) 6. Capture time ordering 7. Memory pool
8.	Endpoint Hybrid	Endpoint Hybrid host type is not supported in 11.3.0.0 and later releases.

Contacting Customer Care

When you contact Customer Care, you should be at your computer. Be prepared to give the following information:

- The version number of the RSA NetWitness Platform product or application you are using.
- The type of hardware you are using.

If you have any questions or need assistance, follow the instructions provided here:
https://community.rsa.com/docs/DOC-1294

Getting Started with NetWitness Platform

Overview

RSA NetWitness® Platform is a powerful threat detection suite that enables Security Operation Centers (SOCs) to quickly locate, prioritize, and triage threats. NetWitness Platform helps you to isolate and remediate known threats as well as those that were previously unknown. It provides deep insight into packets, logs, and endpoints that provide you with an unparalleled view into your enterprise or business.

NetWitness Platform is powerful, but it is easier for Tier 1 Analysts to use because it automates the process of identifying and prioritizing suspicious threats. Tier 2 and Tier 3 analysts can hunt for and locate threats by searching and filtering events and then examining events using reconstruction and analysis tools.

Architecture

RSA NetWitness Platform is a distributed and modular system that enables highly flexible deployment architectures that scale with the needs of the organization. NetWitness Platform allows administrators to collect three types of data from the network infrastructure, packet data, log data, and endpoint data. The key aspects of the architecture are:

- **Distributed Data Collection**. The **Decoder** ingests packet data while the **Log Decoder** ingests log data. Decoders parse and reconstruct all collected network traffic from Layers 2 - 7, or log and event data from hundreds of devices and event sources, including NetWitness Endpoint data (if installed and configured). The **Concentrator** indexes metadata extracted from network or log data and makes it available for enterprise-wide querying and real-time analytics while also facilitating reporting and alerting. The **Broker** aggregates data captured by other devices and event sources. Brokers aggregate data from configured Concentrators; Concentrators aggregate data from Decoders. Therefore, a Broker bridges the multiple real-time data stores held in the various Decoder/Concentrator pairs throughout the infrastructure.
- **Real-time Alerting**. The NetWitness Platform **Event Stream Analysis (ESA)** service provides advanced stream analytics such as correlation and complex event processing at high throughputs and low latency. It can process large volumes of disparate event data from Concentrators. ESA uses an advanced Event Processing Language (EPL) that allows analysts to express filtering, aggregation, joins, pattern recognition, and correlation across multiple disparate event streams. Event Stream Analysis helps to perform powerful incident detection and alerting.
- **Real-time Analytics** (Automatic analysis of events) The RSA Automated Threat Detection functionality includes preconfigured ESA analytics modules for detecting Command and Control traffic.
- **NetWitness Server**. The NetWitness Server provides reporting, investigation, administration, and other aspects of the user interface.
- **Capacity**. NetWitness Platform has a modular-capacity architecture enabled with direct-attached capacity (DACs) or storage area networks (SANs), that adapts to the organization's short-term investigation and longer-term analytic and data-retention needs.

NetWitness Platform provides large deployment flexibility. You can design its architecture using as many as multiple dozens of physical hosts or a single physical host, based on the particulars of the customer's performance and security-related requirements. In addition, the entire NetWitness Platform system has been optimized to run on virtualized infrastructure.

The System Architecture comprises these major components: Decoders, Brokers, Concentrators, Archivers, ESA, and Warehouse Connectors. NetWitness Platform components can be used together as a system or can be used individually.

- In a security information and event management (SIEM) implementation, the base configuration requires these components: Log Decoder, Concentrator, Broker, Event Stream Analysis (ESA), and the NetWitness Server.
- In a forensics implementation, the base configuration requires these components: Decoder, Concentrator, Broker, ESA, Malware Analysis, and Endpoint Log Hybrid. The Respond Server service is also required and is used to prioritize alerts.

The table provides a synopsis of each major component:

System Component	Description
Decoder / Log Decoder	• NetWitness Platform collects packet, log, and endpoint data. • Packet data, that is, network packets, are collected using the Decoder through the network tap or span port, which is typically determined to be an egress point on an organization's network. • A Log Decoder can collect four different log types - Syslog, ODBC, Windows eventing, and flat files. • Windows eventing refers to the Windows 2008 collection methodology and flat files can be obtained via SFTP. • Both types of Decoders ingest raw transactional data that is enriched, closed out, and aggregated to other NetWitness Platform components. • The process for ingesting and parsing transactional data is a dynamic and open framework.
Endpoint Log Hybrid	• Collects and manages endpoint (host) data from Windows, Mac, or Linux hosts. • Records data about every critical action, such as process, file, registry modification, network connections, and user console interactions. • Collect logs from Windows hosts if collection is configured. • Generates metadata to correlate endpoint data with sessions from other events sources, such as logs and network. • Performs live memory analysis, network traffic analysis, and suspicious user behavior detection.

System Component	Description
Concentrator	• Provides index and query capability to NetWitness Collections. • Can optionally forward data to ESA.
Broker	• Distributes NetWitness Collection access across many Concentrators or Archivers, making the entire NetWitness Platform enterprise appear as a single collection.
Archiver	• The Archiver service enables long-term log archiving by indexing and compressing log data and sending it to archiving storage. • The archiving storage is optimized for long-term data retention, and compliance reporting. • Archiver stores raw logs and log metadata from Log Decoders for long term-retention, and it uses Direct-Attached Capacity (DAC) for storage. **Note:** Raw packets and packet metadata are not stored in the Archiver.
Event Stream Analysis (ESA)	• The Event Stream Analysis service provides event stream analytics such as correlation and complex event processing at high throughputs and low latency. It can process large volumes of disparate event data from Concentrators. • ESA uses advanced Event Processing Language that allows users to express filtering, aggregation, joins, pattern recognition, and correlation across multiple disparate event streams. • ESA helps to perform powerful incident detection and alerting. • The RSA Automated Threat Detection functionality includes preconfigured ESA analytics modules for detecting Command and Control traffic.

Core Versus Downstream Components

In NetWitness Platform, the Core services ingest and parse data, generate metadata, and aggregate generated metadata with the raw data. The Core services are Decoder, Log Decoder, Concentrator, and Broker. Downstream systems use data stored on Core services for analytics; therefore, the operations of downstream services are dependent on Core services. The downstream systems are Archiver, ESA, Malware Analysis, Investigate, and Reporting.

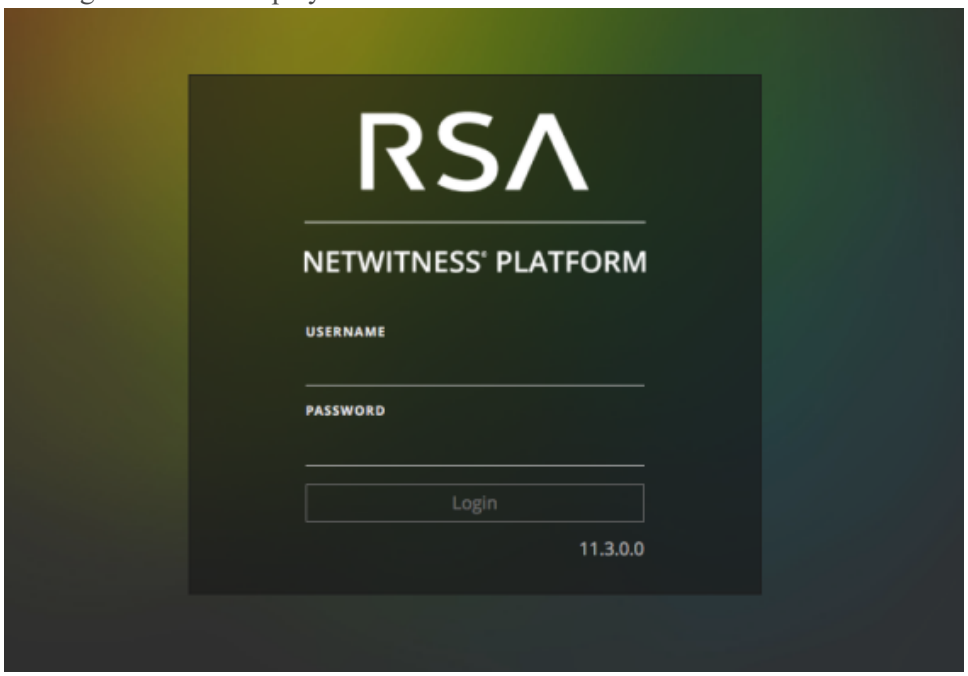
Although the Core services can operate and provide a good analytics solution without the downstream systems, the downstream components provide additional analytics. ESA provides real-time correlation across sessions and events as well as between different types of events, such as log, packet, and endpoint data. Investigate provides the ability to drill into data, examine events and files, and reconstruct events in a safe environment. The Malware Analysis service provides real-time, automated inspection for malicious activity in network sessions and associated files.

Logging in to NetWitness Platform

Logging in to RSA NetWitness® Platform can vary based on your environment. You may have an internal user account or an external user account. Internal user accounts are local to the NetWitness Platform and internal users can log in to NetWitness Platform and receive role-based permissions. External user accounts authenticate outside of the NetWitness Platform and are mapped to NetWitness Platform roles. If you are an external user and you cannot access NetWitness Platform or view the information that you need, contact your System Administrator. Your Administrator can assign the appropriate roles to your account.

Note: NetWitness Platform supports modern (or current) versions of Google Chrome, Mozilla Firefox, and Apple Safari. It is possible to use a different browser, but some features may not function as expected.

1. Use an icon provided by your Administrator, or type the following in your web browser:
   `https://<hostname or IP address>/login`
   Where `<hostname or IP address>` is the hostname or IP address of your NetWitness server.
   The login screen is displayed.



2. Type your username and password, and then click **Login**.
   If your login is successful, you will be logged in to the landing page specified in your user preferences.

If you are locked out:

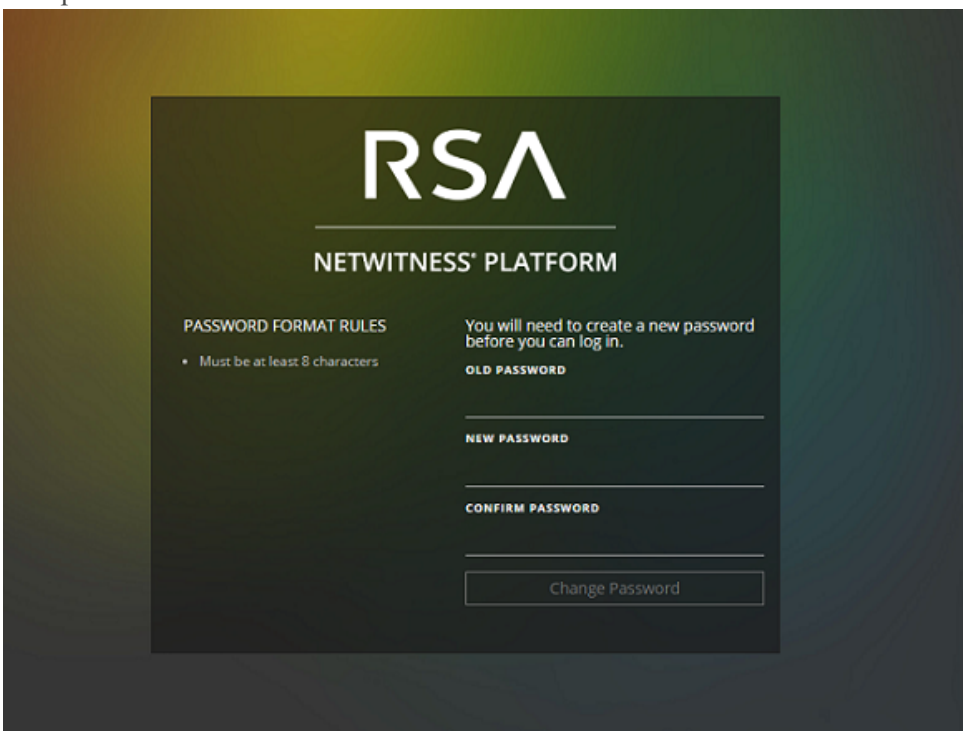
Note: This information applies to internal accounts only. It does not apply to Active Directory or PAM accounts.

If you try too many times to log in with an incorrect username or password, your account will be locked. Contact your Administrator to unlock your account.

If you have a new account or your account is expired:

Note: This procedure applies to internal accounts only. It does not apply to Active Directory or PAM accounts.

1. In the dialog to create a new password, enter your old password, type a new password, and confirm it. Password format rules (as defined by your system administrator) are provided on the left and your new password must conform to the indicated format rules.



2. Click **Change Password**.

If you do not have the appropriate access to NetWitness Platform:

If you are able to log in successfully, but you are not able to view the information that you need, it is possible that you need a user role assigned to your user account. Contact your Administrator for assistance.

Log Off NetWitness Platform

To log off from the Respond and some Investigate views:

1. In the main menu bar, select .
2. In the User Preferences, click **Sign Out**.

To log off from the other views:

In the main menu bar, select > **Sign Out**.

Changing Your Password

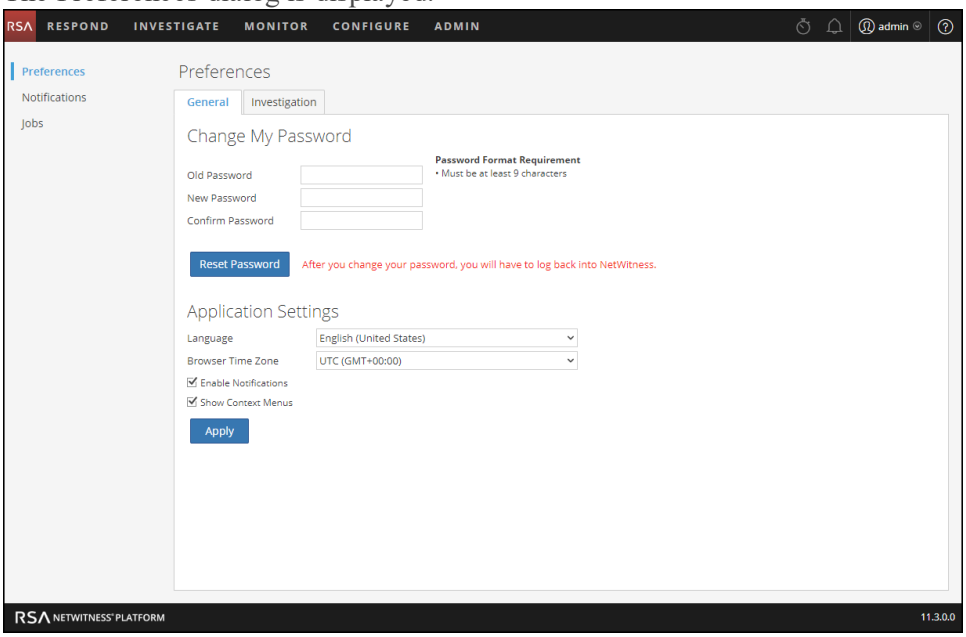
You can change the password that you use for RSA NetWitness® Platform authentication at any time in your user preferences. Your administrator defines the appropriate password strength requirements for your NetWitness Platform password, such as minimum password length and minimum number of uppercase, lowercase, decimal, non-Latin alphabetic, and special characters. These requirements are then displayed when changing your password.

Note: This procedure applies to internal accounts only. It does not apply to Active Directory or PAM accounts.

To change your password:

1. Do one of the following:
   - For most views, such as Monitor, Configure, Admin, or Investigate, select > **Profile**.
   - In the Respond and some Investigate views (Event Analysis, Hosts, Files, and Users), select and in the User Preferences dialog click **Change my password**.

   The Preferences dialog is displayed.



2. In the **Change My Password** section, enter the password that you used to authenticate to NetWitness Platform in the **Old Password** field.
3. In the **New Password** field, enter the password that you want to use for the next login.
4. In the **Confirm Password** field, retype the new password.
5. Click **Reset Password**.
   You will be logged out of NetWitness Platform for the changes to take effect. The new password becomes effective the next time you log in to NetWitness Platform.

Identifying Your Role

The roles listed here are the typical roles or functions of a Security Operations Center (SOC). Determine the role or roles that you perform in the SOC. You can use these functions as a guide to decide how to set up and navigate RSA NetWitness® Platform so that you can efficiently perform your job tasks.

SOC Team

SOC Manager
(SOC Management and Reporting)

- Manage SOC readiness
- Respond to incidents
- Respond to data breaches

Data Privacy Officer

- Monitor and protect privacy and sensitive information

Incident Reponder
(T1 Analyst)

- Respond to incidents
- Remediate incidents

Threat Hunter
(T2/T3 Analyst)

- Hunt for threats
- Conduct forensic analysis
- Recommend issues for remediation
- Remediate issues

Content Expert
(Threat Intelligence)

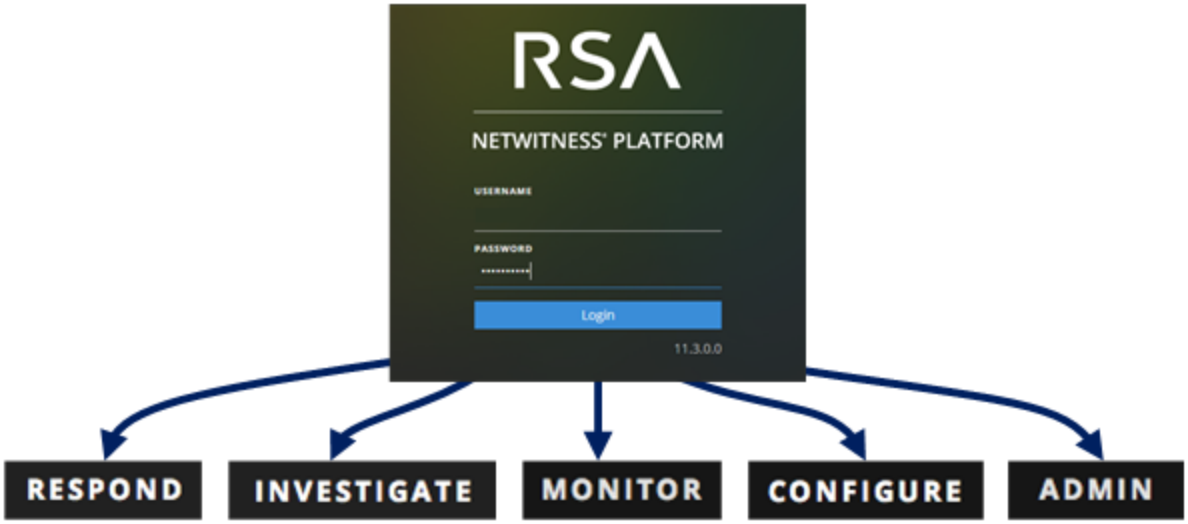
- Investigate new threat intelligence
- Evaluate and create new feeds
- Create correlation rules to flag indicators of compromise

System Administrator

- Install and configure equipment and software
- Manage user access
- Monitor and fine tune performance
- Backup and restore data
- Manage storage and archives
- Update software
- Create reports for regulatory compliance

NetWitness Platform Basic Navigation

The RSA NetWitness® Platform application is divided into five main functional areas, known as views, that are based on typical Security Operation Center (SOC) roles.



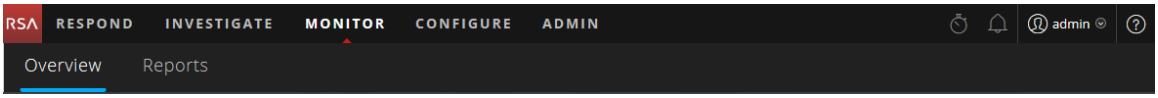
- **RESPOND**: This view is for Incident Responders, who can view a list of prioritized incidents to triage. These incidents come from sources such as ESA rules, NetWitness Endpoint, or ESA Analytics modules for Automated Threat Detection. You can also view all of the alerts received by NetWitness Platform here.
  For legacy 10.6 users, this view was known as the Incident Management view. The Alerts List in the Respond view replaces the ESA 10.6 Alerts > Summary view.
- **INVESTIGATE**: This view is primarily for advanced Threat Hunters, who prefer to manually hunt for threats using NetWitness Platform metadata, raw event data, and event reconstruction and analysis. Incident Responders also use this view to get details about events associated with an incident being investigated. Both Threat Hunters and Incident Responders can use the forensic event reconstruction and event analysis features in this view.
- **MONITOR**: This view is for all users. You can view dashboards and reports on different areas of interest depending on your user permissions. NetWitness Platform opens to this view by default.
  For legacy 10.6 users, this is the Dashboard view.
- **CONFIGURE**: This view is for Threat Intel personnel (Content Experts), who configure data sources and inputs to NetWitness Platform. Content Experts use this area to download and manage Live content. They can also create and manage incident and ESA rules.
  For legacy 10.6 users, this view contains Live, Incidents > Configure, and Alerts > Configure from the previous version.
- **ADMIN**: This view is for System Administrators, who set up and maintain the overall application.
  For legacy 10.6 users, this is the Administration view less the sections added to the Configure view.

Accessing Main Views

The options that open each of the main views are listed at the top of the browser window. With the appropriate permissions, you can access any of these views at the top of every browser window at any time.

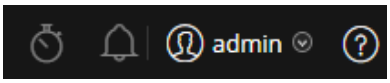
Secondary Menus

Some views have secondary menus with additional views that you can select, which vary according to the tasks that you can complete. The following example shows the MONITOR menu.



Additional Options

In addition to the main views, there are additional options at the top of the browser window that are common to the entire application.



The following table describes these common options:

Common Option	Name	Description
	Jobs	In the INVESTIGATE, MONITOR, CONFIGURE, and ADMIN views, click this icon to view and manage your jobs in the Jobs tray. Jobs are on-demand or scheduled tasks that take some time to complete in the NetWitness Platform application.
	Notifications	Click this icon to view notifications from the application.
	User Preferences	Click this icon to view your available user preference options. You can manage your user preferences and log out of NetWitness Platform.
	User Profile	Click your user profile to view the available options. You can manage your user preferences, change your password, and log out of NetWitness Platform.

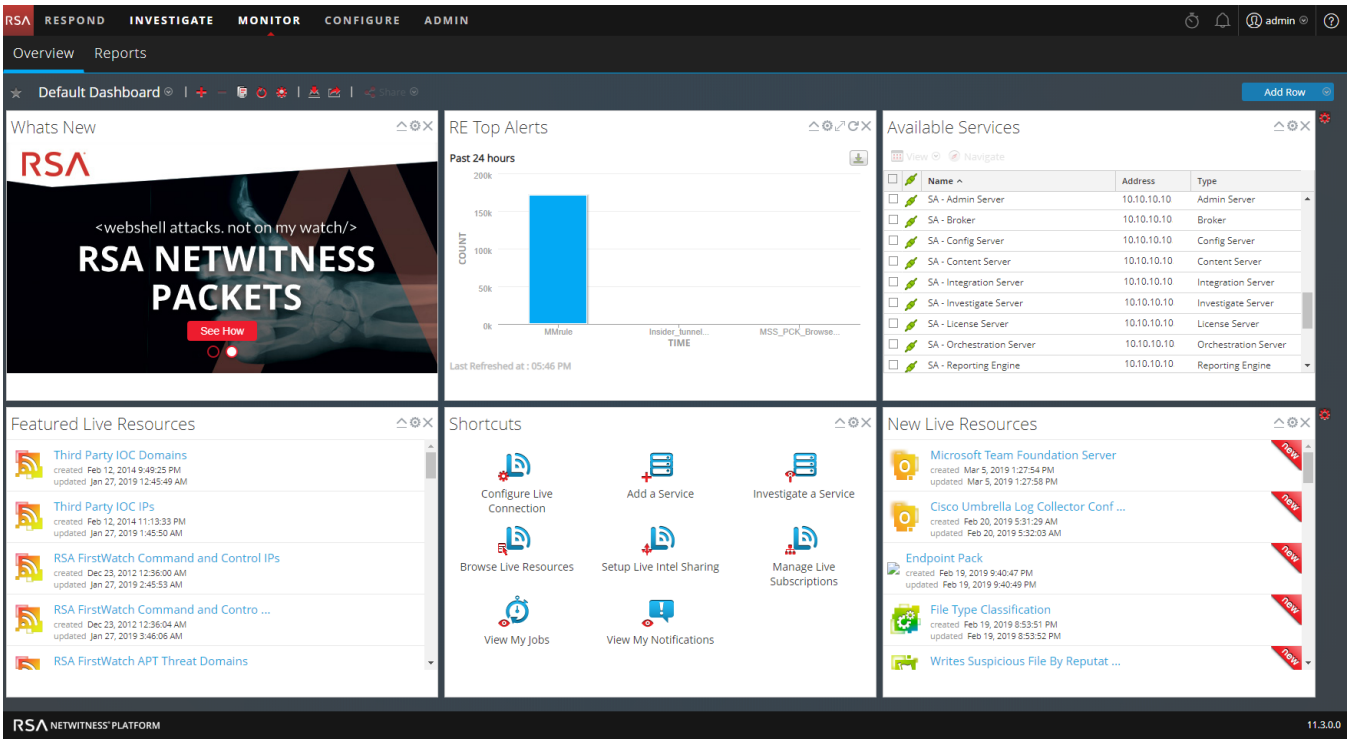
Common Option	Name	Description
	Help	Click this icon to view NetWitness Platform help topics.

Main Views

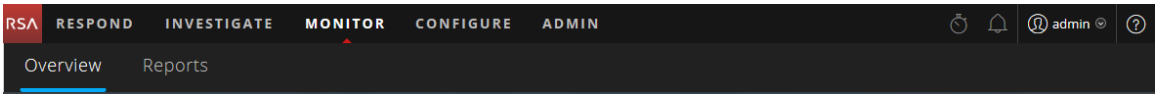
The following sections explain the main views.

MONITOR

The MONITOR view contains the NetWitness Platform dashboard. Monitor offers preconfigured dashboards and reports that you can use and you can also create your own.



MONITOR Menu



The MONITOR menu has the following options:

- **Overview**: The Overview view enables you to view and manage your dashboards. You can select the following preconfigured dashboards:

- Default
- Identity
- Investigation
- Operations - File Analysis
- Operations - Logs
- Operations - Network
- Operations - Protocol Analysis
- Overview
- RSA SecurID
- Threat - Hunting
- Threat - Intrusion
- Threat - Malware Indicators

For legacy 10.6 users, this was the Dashboard view.

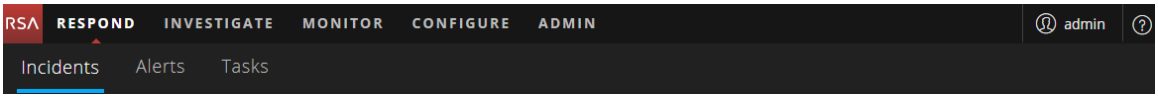
- **Reports**: The Reports view enables you to view and manage reports relevant to your SOC role according to your assigned permissions.

What can I do here?	Path	Show me how
Select a Dashboard	MONITOR > Overview	See Managing Dashboards.
Create a Dashboard	MONITOR > Overview	See Managing Dashboards.
Manage Dashboards	MONITOR > Overview	See Managing Dashboards.
View a Report	MONITOR > Reports > View	See the *Reporting User Guide*.
Manage Reports	MONITOR > Reports > Manage	See the *Reporting User Guide*.

RESPOND

The Respond view presents analysts with a queue of incidents in severity order. When you take an incident from the queue, you receive relevant supporting data to help you investigate the incident. From there, you can determine the incident scope and escalate or remediate it as appropriate.

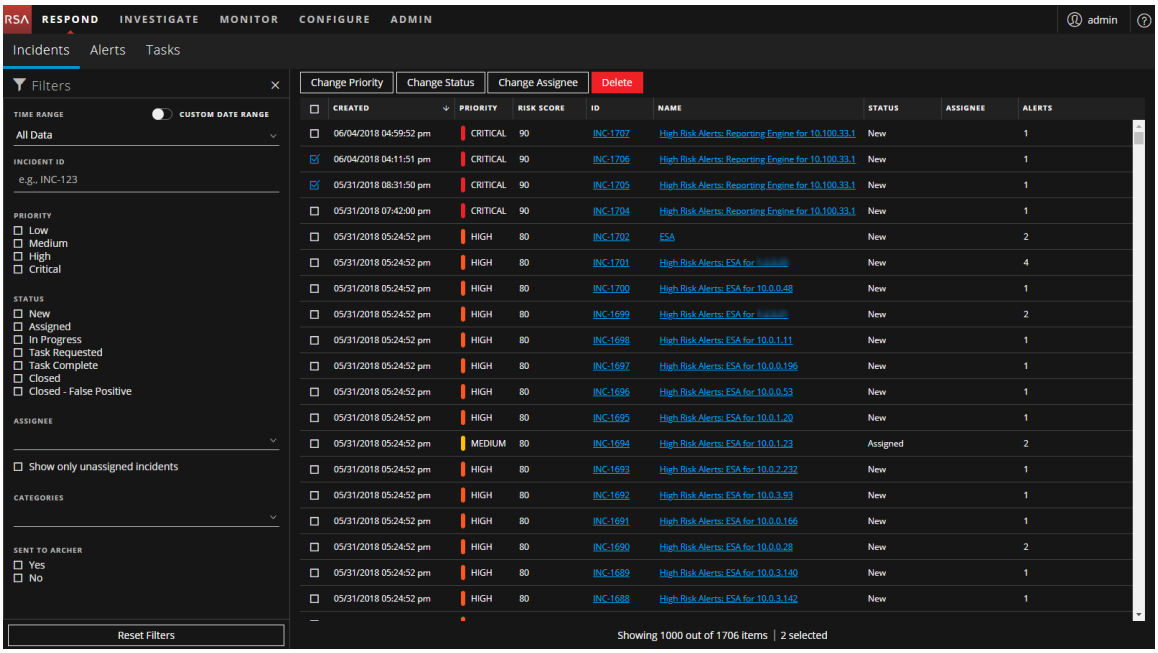
RESPOND Menu



The RESPOND menu has the following options:

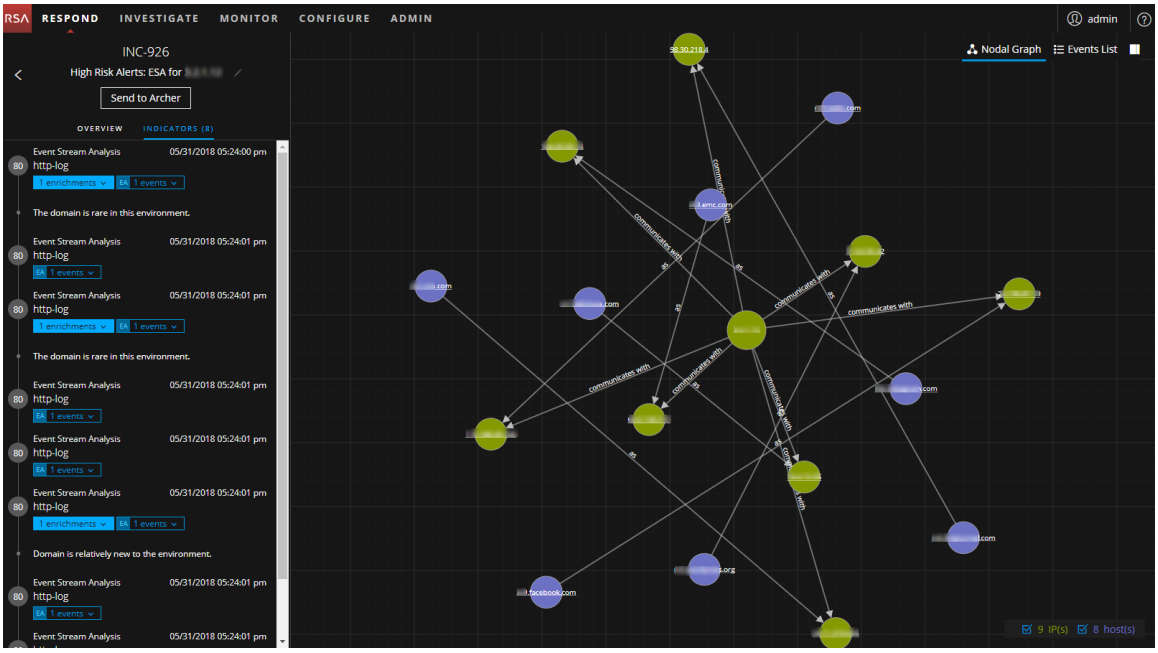
- **Incidents**: The Incidents List view contains a list of all incidents with basic information. The Incident Details view provides extensive details about the incident.
- **Alerts**: The Alerts List and Alert Details views provide information about all of the threat alerts and indicators received by NetWitness Platform in one location.
- **Tasks**: The Tasks List view enables you to create tasks and track them to completion.

The following figure shows the Respond view - Incident List view, which shows a list of prioritized incidents.

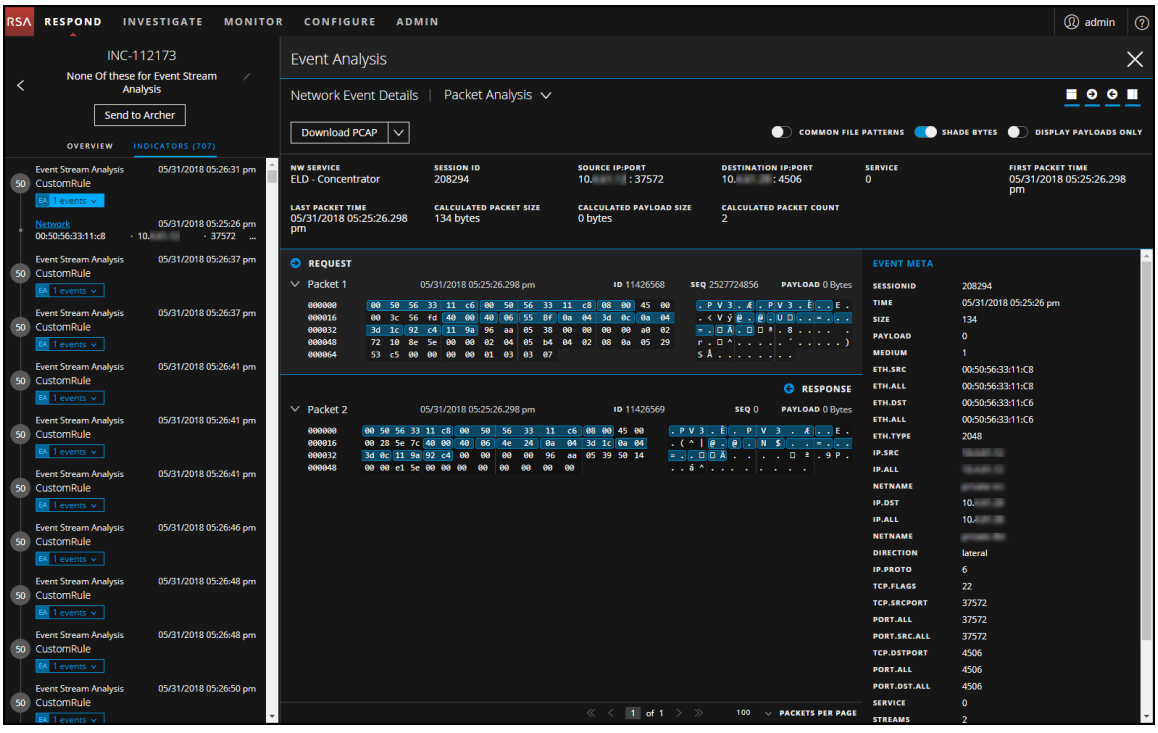


When using NetWitness Platform as your case management tool, you can also manage incidents from this view. New incidents appear at the top of the incident queue.

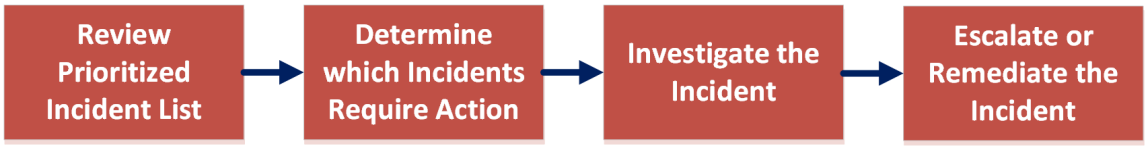
The following figure shows an example of the Respond view - Incident Details view, which shows details for a selected incident.



The Respond view is designed to make it easy to evaluate incidents, contextualize that data, collaborate with other analysts, and pivot to a deep-dive investigation as needed. The following figure shows an example of an event analysis in the Incident Details view.



The following figure shows a high-level Respond view workflow.



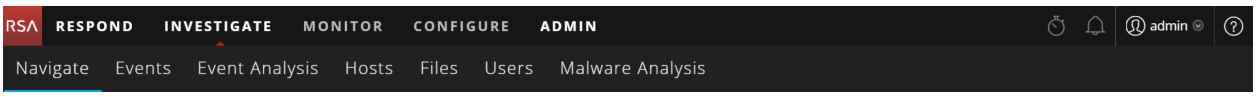
In the Respond view, analysts look at the prioritized list of incidents and determine which incidents require action. They click an incident for a clear picture of the incident with supporting details and they can investigate the incident further. Analysts can then determine how to respond to the threat, by escalating or remediating it.

What can I do here?	Path	Show me how
View prioritized incident lists	RESPOND > Incidents (Incident List view)	See the *NetWitness Respond User Guide*.
Determine which incidents require action (Triage an incident)	RESPOND > Incidents (Incident Details view)	See the *NetWitness Respond User Guide*.
Investigate the incident	RESPOND > Incidents (Incident Details view)	See the *NetWitness Respond User Guide*. (You can also pivot to the Investigate view.)
Escalate or Remediate the Incident	RESPOND > Incidents (Incident Details view) and RESPOND > Tasks (Tasks List view)	See the *NetWitness Respond User Guide*.
Review Alerts	RESPOND > Alerts (Alerts List and Alert Details views)	See the *NetWitness Respond User Guide*.

INVESTIGATE

The Investigate view presents seven different views into a set of data, allowing analysts to see metadata and raw data for endpoints, logs, and events, as well as potential indicators of compromise. In addition to investigating data on a specific service, you can pivot into Investigate from Respond, the Monitor view, an entry in a report generated by the Reporting Engine, or a properly configured third-party application. You can begin your investigation in any of the seven Investigate views, then continue the investigation in another Investigate view; the manner in which you proceed is determined by the question that needs to be answered. If you find an event that needs a response, you can create an incident in Respond where an incident responder will take further action. The *NetWitness Investigate User Guide* provides detailed information.

INVESTIGATE Menu



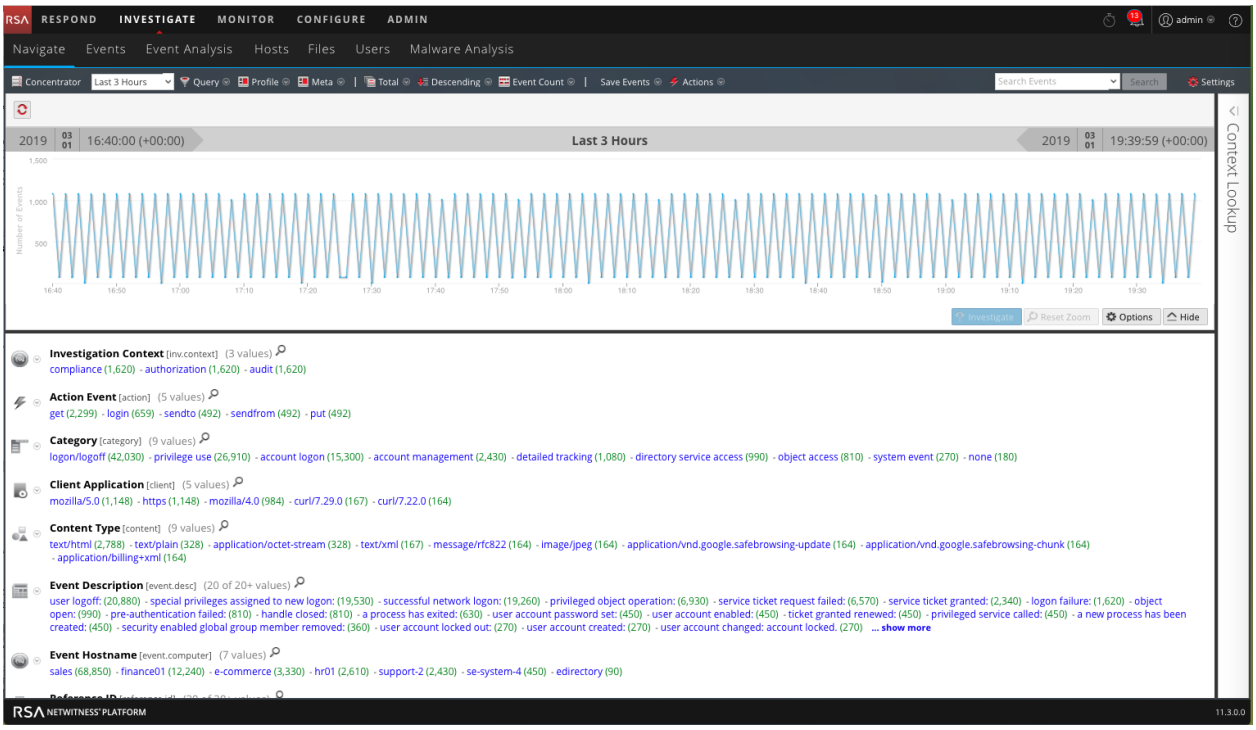
The INVESTIGATE menu has the following options:

- **Navigate**: The Navigate view provides a list of meta keys and meta values with a focus on metadata. You can drill into the data, open a selected event in the Events view or the Event Analysis view, view a reconstruction of an event, search for events, look up additional context from the Context Hub service, and configure Navigate view preferences.
- **Events**: The Events view provides a list of events with a focus on raw data. You can browse a simple list of events, a detailed list, and a log list. You can search for events, open a selected event in the Event Analysis view, view a reconstruction of the event, look up additional context from the Context Hub service, and configure Events view preferences.
- **Event Analysis**: The Event Analysis view provides a list of events with focus on metadata and raw data. You can view a reconstruction that offers helpful cues to identify points of interest in a reconstruction, pivot to standalone Endpoint, look up additional context from the Context Hub service (Version 11.2 and later), look up data in Live, and do external lookups.
- **Hosts view**: (Version 11.1 and later) The Hosts view lists all hosts with a NetWitness Endpoint Agent running. For every host, you can view scan details, tracking events related to alerts, anomalies, process details, and information related to logged-in users. From the Hosts view, you can go to the Navigate, Event Analysis, and Users views.
- **Files view**: (Version 11.1 and later) The Files view provides a holistic view of all files in your deployment. You can apply various filters, sort, and categorize files into different status to reduce the number of files for analysis, and identify suspicious or malicious files. From the Files view, you can go to the Navigate and Event Analysis views.
- **Users view**: (Version 11.2 and later) The Users view provides visibility into risky user behaviors across your enterprise with RSA NetWitness UEBA. You can view a list of high-risk users and a summary of the top alerts for risky behavior for your environment, and then select a user or an alert and view details about the risky behavior and a timeline during which the behaviors occurred.

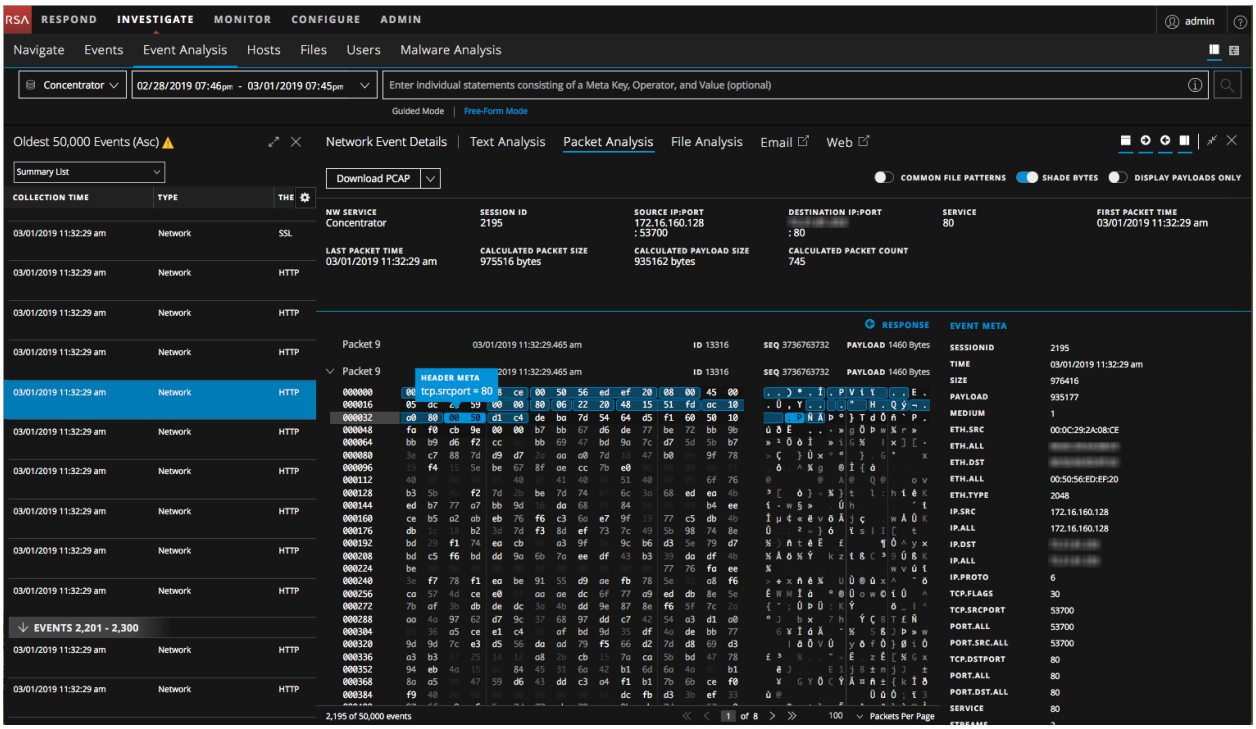
  Note: The Users view is only available if you are assigned the role of Administrator or UEBA Analyst.

- **Malware Analysis**: Malware Analysis is an automated malware analysis processor designed to analyze certain types of file objects (for example, Windows PE, PDF, and MS Office) to assess the likelihood that a file is malicious. Using Malware Analysis, you can prioritize the massive number of files captured in order to focus analysis efforts on the files that are most likely to be malicious.

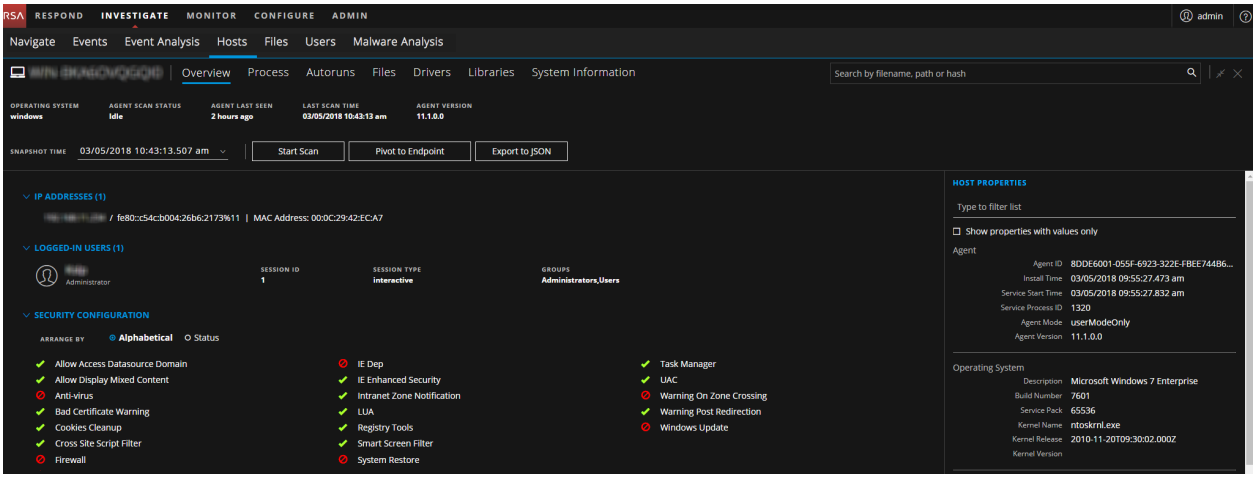
The following figure shows the Navigate view.



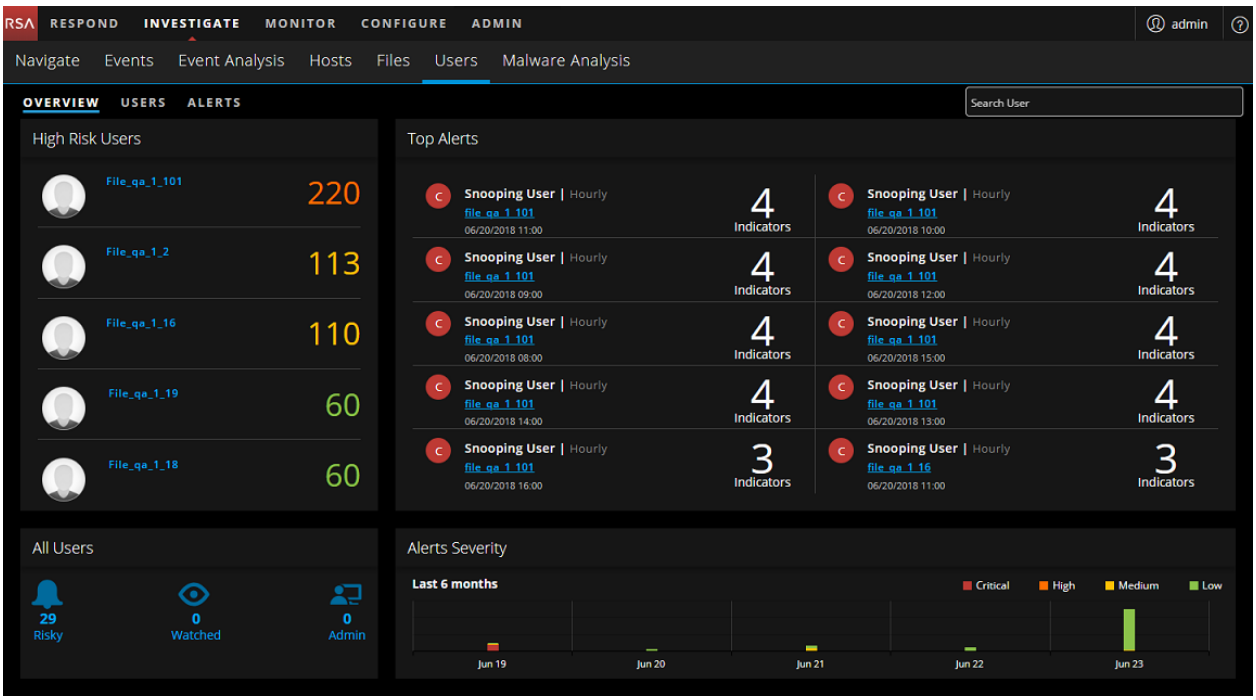
The following figure shows the Event Analysis view.



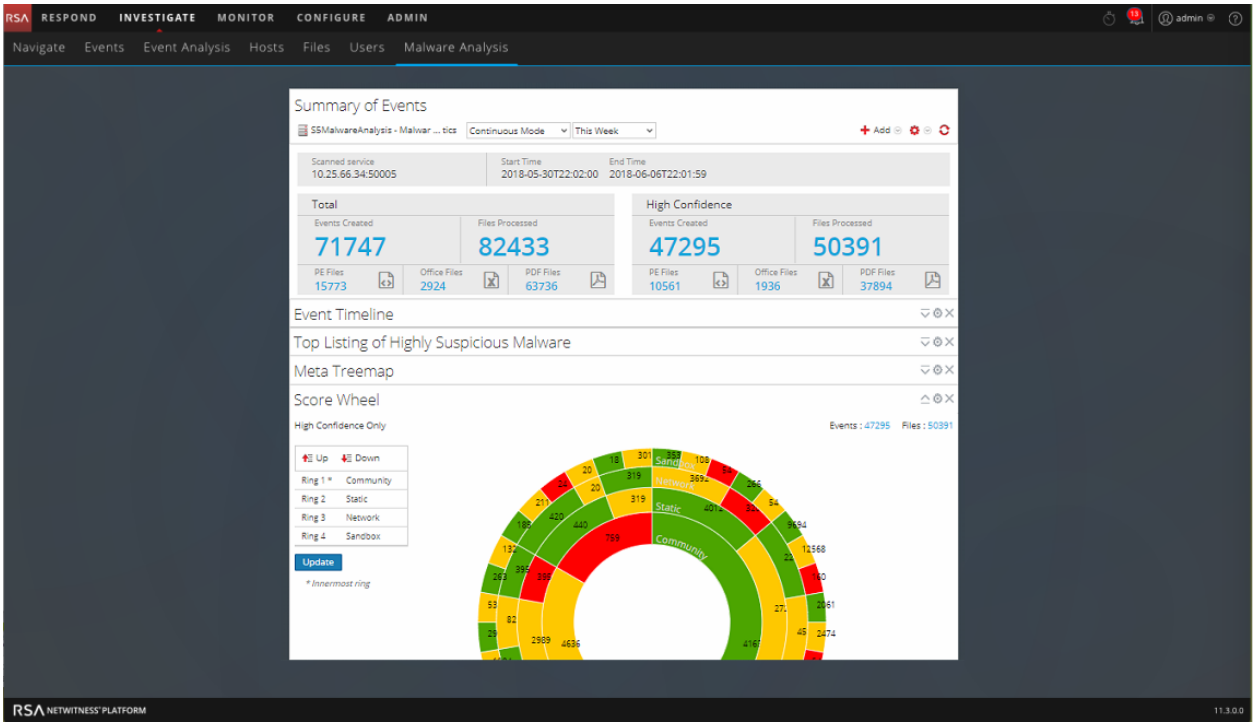
The following figure shows the Hosts view - Host Details view.



The following figure shows the Users view.



The following figure shows the Malware Analysis Summary of Events.



The following figure depicts the type of investigation for each view in the top block. The lower block shows tasks that you can perform as part of an investigation.

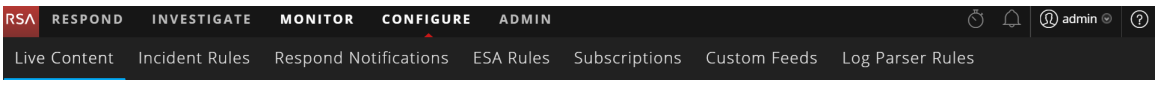
Triage an Incident	Pivot from the Respond view	See the *NetWitness Respond User Guide*.

CONFIGURE

The Configure view enables Threat Intel personnel (Content Experts) to configure data sources and inputs to NetWitness Platform in one convenient location.

CONFIGURE Menu



The CONFIGURE menu has the following options:

- **Live Content**: (Live Services) The Live Content view enables you to search for and subscribe to Live Services resources. Live Services is the component of the NetWitness Platform that manages communication and synchronization between NetWitness Platform services and a library of Live content available to RSA NetWitness Platform customers. You can view, search, deploy, and subscribe to content from the RSA Live Content Management System (CMS) to NetWitness Platform services and software. When you subscribe to a resource, you agree to receive updates on a regular basis from RSA Live Services.
  For Legacy 10.6 users, this was Live > Search.

- **Incident Rules**: The Incident Rules view enables you to create incident rules with various criteria to automatically create incidents. You can view prioritized incidents in the Respond view.
  For Legacy 10.6 users, this was Incidents > Configure. In 11.1 and later, Aggregation Rules are known as Incident Rules.
- **Respond Notifications**: The Respond Notifications view enables you to automatically send email notifications to SOC Managers and the Analysts assigned to the incidents when incidents are created or updated.
- **ESA Rules**: The ESA Rules view enables you to manage the Event Stream Analysis (ESA) rules that specify criteria for problem behavior or threatening events in your network. When ESA detects a threat that matches the rule criteria, it generates an alert.
  You can create ESA rules yourself or download them from Live Services. The Rule Library shows all ESA rules created or downloaded. To activate rules, you have to add them to a deployment. Deployments map rules from your rule library to the appropriate ESA services.
  For Legacy 10.6 users, this was Alerts > Configure.
- **Subscriptions**: (Live Services) The Subscriptions view enables you manage the Live content that you subscribed to in the Live Content view. To set up Live Services on NetWitness Platform, you configure the connection and synchronization between the CMS server and NetWitness Platform.
  For Legacy 10.6 users, this was Live > Configure.
- **Custom Feeds**: (Live Services) The Custom Feeds view streamlines the task of creating and managing custom feeds, as well as populating the feeds to selected Decoders and Log Decoders. You can set up and maintain custom and identity feeds.
  NetWitness Platform uses feeds to create metadata based on externally defined metadata values. A feed is a list of data that is compared to sessions as they are captured or processed. For each match, additional metadata is created.
  You can create custom feeds to provide extra metadata extraction, for example, to accommodate custom network applications.
  For Legacy 10.6 users, this was Live > Feeds.
- **Log Parser Rules**: The Log Parser Rules tab displays information about individual log parsers, as well as the default, "parse all" parser that can parse logs that are not associated with a particular log parser. This tab contains the following information:
  - You can view the rules for a particular event source type, including the default parser.
  - You can view the Names, Literals, patterns, and meta for each configured log parser.
  - You can add log parsers.
  - You can add, edit, and delete custom rules for log parsers.

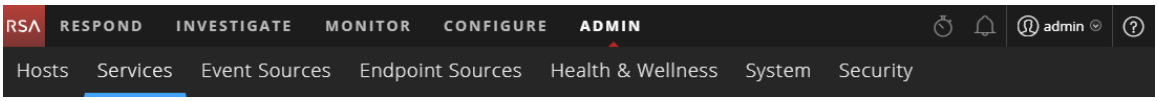
  Note: The Log Parser Rules tab is available in the Configure menu in versions 11.2 and later. For earlier versions, it is located in Admin > Event Sources.

What can I do here?	Path	Show me how
Create a Live Services account.	RSA Live Registration Portal: https://cms.netwitness.com/registration/	See the *Live Services Management Guide*.
Find and deploy Live Services resources.	CONFIGURE > Live Content	See the *Live Services Management Guide*.
Create incidents automatically.	CONFIGURE > Incident Rules	See the *NetWitness Respond Configuration Guide*.
Configure Respond notifications.	CONFIGURE > Respond Notifications	See the *NetWitness Respond Configuration Guide*.
Configure alerts.	CONFIGURE > ESA Rules	See the *Alerting with ESA Correlation Rules User Guide*.
Set up Live Services Services on NetWitness Platform.	CONFIGURE > Subscription	See the *Live Services Management Guide*.
Set up and maintain custom and identity feeds.	CONFIGURE > Custom Feeds	See the *Live Services Management Guide*.
View and edit log parsers and log parser rules.	CONFIGURE > Log Parser Rules	See the *Log Parser Customization Guide*.

ADMIN

In the Admin view, administrators can manage network hosts and services; monitor the health and Wellness of NetWitness Platform; and manage system-level security. They can also configure global system resources and manage event sources.

ADMIN Menu



The ADMIN menu has the following options:

- **Hosts**: The Hosts view is where you set up and maintain hosts. A host is the machine on which services run and a host can be a physical or virtual machine.
- **Services**: The Services view enables you to manage services, manage service users and roles, maintain service configuration files, and explore and edit service properties. A service performs a unique function, such as a Decoder service, which captures network data in packet form.
- **Event Sources**: The Event Sources view enables you to manage event sources and configure alerting policies for them. Organizations typically monitor event sources in groups based on the criticality of

the event sources. You can create monitoring policies for each event source group and order them based on priority.

- **Endpoint Sources**: The Endpoint Sources view enables you to manage and update endpoint agent configurations through groups and manage the agents behavior using policies. You can either use the default policies or customize these policies.
- **Health & Wellness**: The Health & Wellness view enables you to monitor the health of the NetWitness Platform hosts and services in your network environment.
- **System**: The System view enables you to set global NetWitness Platform configurations. You can configure global audit logging, email, system logging, jobs, RSA Live Services, URL integration, Investigation, Event Stream Analysis (ESA), ESA Analytics, and advanced performance settings. In addition, you can manage NetWitness Platform versions and configure the local licensing server.
- **Security**: The Administration Security view provides the capability to manage user accounts, manage user roles, map external groups to NetWitness Platform roles, and modify other security-related system parameters. These apply to the NetWitness Platform system and are used in conjunction with the security settings for individual services.

Note: For versions 11.2 and later, the Event Sources > Log Parser Rules tab can be found in the Configure view.

What can I do here?	Path	Show me how

Set up Public Key Infrastructure (PKI) authentication. PKI is available in NetWitness Platform 11.3 and later.	ADMIN > Security	See the *System Security and User Management Guide*.

Setting up Your Default View by SOC Role

After logging in to RSA NetWitness® Platform, you can make navigating the application easier by setting up your default view based on your Security Operations (SOC) role. You set your default view, also known as a landing page, in your user preferences.

The following figure shows the main NetWitness Platform views.

- **Respond**: This view is for Incident Responders, who can view a list of incidents to triage and alerts. For legacy 10.6 users, this view was known as the Incident Management view and the Respond > Alerts view replaces the ESA 10.6 Alerts > Summary view.
  Respond is the default opening view. If you do not have permission to see the Respond view, you will have Monitor as your default view.
- **Investigate**: This view is for Threat Hunters, who investigate and hunt for advanced threats. Other analysts such as Incident Responders may pivot into this view for deeper analysis of an incident.
- **Monitor**: This view is for all users and it is the classic view for previous application versions. You can view dashboards and reports on different areas of interest depending on your user permissions. You have the option to select a preconfigured dashboard, import a dashboard, or create your own custom dashboard.
- **Configure**: This view is for Threat Intel personnel (Content Experts), who configure data sources and inputs to NetWitness Platform. Content Experts use this area to download and manage Live content. They can also create and manage incident and ESA rules.
  For legacy 10.6 users, this view was Live, Incidents > Configure, and Alerts > Configure.
- **Admin**: This view is for System Administrators, who set up and maintain the overall application.

You can select any of the main NetWitness Platform views as your default view. In addition to the main views, NetWitness Platform has predefined dashboards that you can select in the Monitor view depending on the tasks you perform:

- Default Dashboard
- Identity Dashboard
- Operations - Logs Dashboard
- Operations - Network Dashboard
- Overview Dashboard
- Threat - Indicators Dashboard
- Threat - Intrusion Dashboard

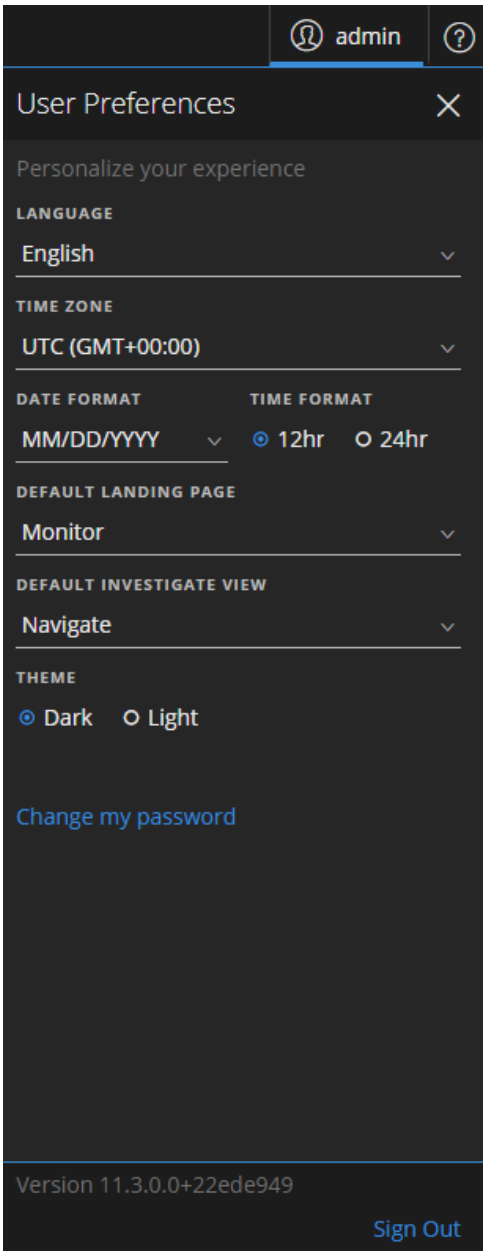
The following table shows typical SOC roles and the available views you can select as your landing page in your user preferences based on your SOC role. If you have more than one role, select the view that is most appropriate for you to start with when you log in to NetWitness Platform.

SOC Roles	Role Description	Consider this Default Landing Page
Incident Responder (Tier 1 Analyst)	Addresses incidents and alerts queued for them to review and mitigate.	**RESPOND**
Threat Hunter (Tier 2/Tier 3 Analyst)	Investigates and hunts for advanced threats.	**INVESTIGATE** For information on selecting the default Investigate view, see the *NetWitness Investigate User Guide*.
SOC Manager (SOC Management and Reporting)	Manages SOC readiness and responds to incidents and data breaches.	**MONITOR** (Dashboard is in the MONITOR view.) When you log in, select the appropriate predefined dashboard for your SOC role. You can also import a dashboard or create your own dashboard.)
Content Expert (Threat Intelligence)	Configures data sources and inputs to NetWitness Platform.	**MONITOR** or **CONFIGURE** (Dashboard is in the MONITOR view. When you log in, select the appropriate predefined dashboard for your SOC role. You can also import a dashboard or create your own dashboard. If you choose MONITOR as your default view, you can navigate to the CONFIGURE view from the main menu.)
Data Privacy Officer (DPO)	Similar to an Administrator, but a DPO monitors and protects privacy-sensitive information.	**MONITOR** (Dashboard is in the MONITOR view. When you log in, select the appropriate predefined dashboard for your SOC role. You can also import a dashboard or create your own dashboard.)
System Administrator	Focuses on the configuration and stability of the overall application. Manages user access.	**ADMIN**

Set Your Default View

1. (Respond view and some Investigate views) On the main menu bar, select .

   The User Preferences dialog shows your current preferences.



2. In the **Default Landing Page** field, select the default view that you would like to see when you log in to NetWitness Platform. Use the above table to make your selection based on your SOC role. For example, if you are an Incident Responder, you can select **Respond** and if you are a Threat Hunter, you can select **Investigate**.

   Your preferences become effective immediately. You can change your default landing page at any time. For information on other preferences, see Setting User Preferences.

3. To verify that you can see the correct default view, click **Sign Out** to log out and then log back in to NetWitness Platform.

Basic Troubleshooting Tips for User Setup

The following table provides basic troubleshooting tips that may be helpful for user setup in NetWitness Platform.

Problem	Troubleshooting Tip
When I log in to NetWitness Platform, I see the wrong default view.	Verify that the correct default view is set in the Default Landing Page field in your user preferences. If you select the MONITOR view, you can select the predefined dashboard that is most appropriate for your SOC role. You can also import or create your own dashboard.
I see the correct view, but the metadata does not load.	Make sure that you are using the latest version of the browser. If that does not work, try using another browser. For example, if you are using Safari, try using Firefox or Chrome.
I am using Internet Explorer 10 and I get the following error: `The page can't be displayed.`	NetWitness Platform supports current versions of Firefox, Chrome, and Safari. If you use Internet Explorer, not all features work as designed. Try using one of the supported browsers.
When I log in, I cannot see anything.	See your administrator, you may need a user role assigned to your account or additional troubleshooting.
I can't see where to change my default landing page.	Go to the User Preferences in the Respond view or see your administrator.

Setting User Preferences

You can view and manage your RSA NetWitness® Platform global application preferences from your user profile. There are two global user preference dialogs that have different options. The user Preferences dialog is accessible from Respond and the following Investigate views: Event Analysis, Hosts, Files, and Users. The Preferences dialog is accessible from most other views. The dialog that you see depends on where you access the user preferences.

You can:

- Change the application language
- Set the application time zone
- Set the application date and time format*
- Select your default NetWitness Platform starting location*
- Select your default Investigate view*
- Choose a dark or light theme for the application*
- Change your password (See Changing Your Password for more information.)
- Enable or disable notifications**
- Enable or disable context menus**

* You can make this change from the **User Preferences** dialog accessible from Respond and some Investigate views: Event Analysis, Hosts, Files, and Users.

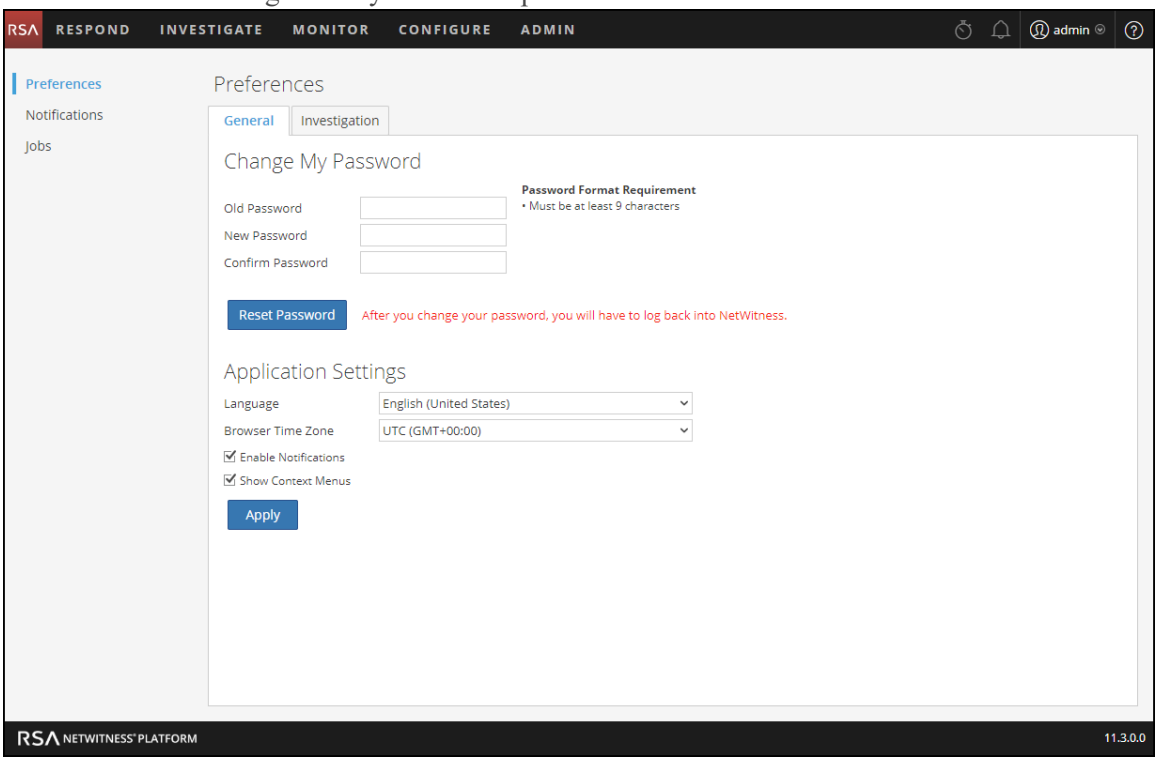
** You can make this change from the **Preferences** dialog accessible from most views (except Respond and some Investigate views: Event Analysis, Hosts, Files, and Users).

Preferences (Most Views except Respond and some Investigate Views)

This section gives instructions for various tasks that can be performed in the Preferences dialog that is accessible in most views except for Respond and some Investigate views.

View your Preferences

In the upper right corner of the NetWitness Platform browser window, select > **Profile**.
The Preferences dialog shows your current preferences.



Set the Language and Time Zone

Note: The Language preference option applies to NetWitness Platform 11.2 and later.

You can change your preferred language for the entire NetWitness Platform. The default language is English (United States).

1. In the User Preferences dialog, select your localization preferences:
   a. **Language**: Select your preferred language for NetWitness Platform.
   b. **Time Zone**: Set the time zone to use in the NetWitness Platform.
2. Click **Apply**.
   Your preferences become effective immediately.

Note: When Daylight Saving Time (DST) starts or ends, if the selected time zone for the currently logged in user observes DST, the user interface automatically updates to reflect the correct time.

Enable or Disable System Notifications for Your User Account

By default, NetWitness Platform system notifications are enabled when a new user account is created. You can disable and enable these notifications at any time.

1. In the Preferences dialog:
   - To enable notifications for your user account, select the **Enable Notifications** checkbox.
   - To disable notifications, clear the **Enable Notifications** checkbox.
2. Click **Apply**.
   Your preference becomes effective immediately.

Enable or Disable Context Menus for Your User Account

By default, context menus are enabled when a new user account is created. Context menus provide additional functions for specific views when you right-click a view.

1. In the Preferences dialog:
   - To enable context menus for your user account, select the **Enable Context Menus** checkbox.
   - To disable context menus, clear the **Enable Context Menus** checkbox.
2. Click **Apply**.
   Your preference becomes effective immediately.

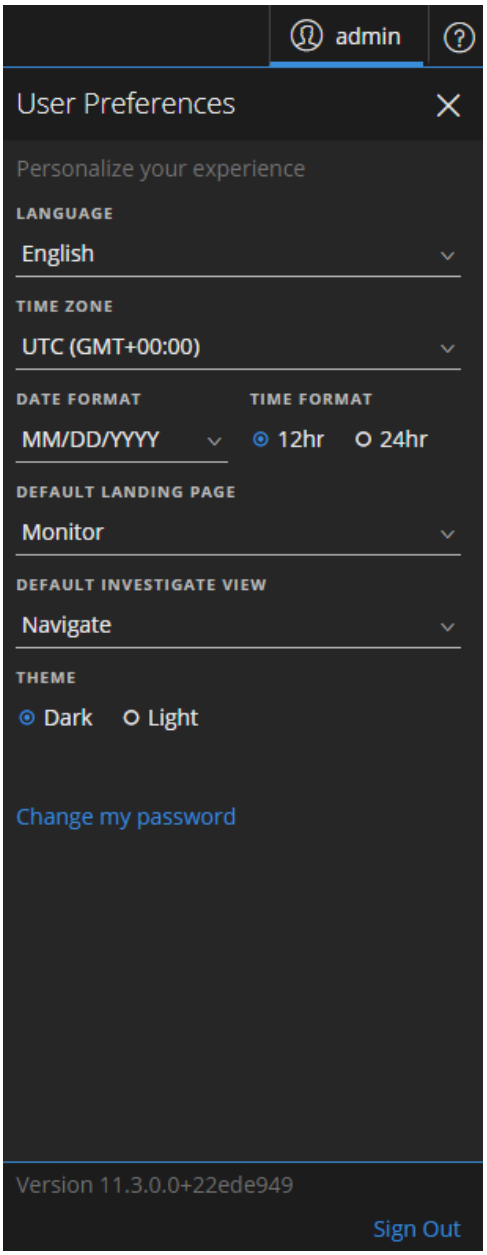
Note: Settings available on the Investigate tab in the Preferences dialog are documented in the *NetWitness Investigate User Guide*.

User Preferences (Respond and Some Investigate Views)

This section gives instructions for various tasks that can be performed in the User Preferences dialog that is accessible in the Respond and some Investigate views.

View Your User Preferences

In the upper right corner of the NetWitness Platform browser window, select .
The User Preferences dialog shows your current preferences when accessed through the Respond view and the following Investigate views: Event Analysis, Hosts, Files, and Users.



Any selections that you make become effective immediately.

Set the Language, Time Zone, and Date and Time Format

Note: The Language preference option applies to NetWitness Platform 11.2 and later.

You can change your preferred language for the entire NetWitness Platform. The default language is English (United States). You can also change the time zone and the format of the date and time for your location.

1. Open the User Preferences dialog.
2. In the User Preferences dialog, select your localization preferences:
   a. **Language**: Select your preferred language for NetWitness Platform.
   b. **Time Zone**: Set the time zone to use in the NetWitness Platform.
   c. **Date Format**: Set the format for the order of the display of the month (MM), day (DD), and year (YYYY). For example, the MM/DD/YYYY format shows the date as 05/11/2017.
   d. **Time Format**: Set the time as 12-hour or 24-hour time. For example, 2:00 PM in 12-hour time is 14:00 in 24-hour time.

   Changes in the Respond and Investigate views become effective immediately.

Note: When Daylight Saving Time (DST) starts or ends, if the selected time zone for the currently logged in user observes DST, the user interface automatically updates to reflect the correct time.

Select the Default NetWitness Platform Starting Location

1. Open the User Preferences dialog.
2. In the **Default Landing Page** field, select the opening view that you would like to see when you log in to NetWitness Platform. You can choose Respond, Investigate, Monitor, Configure, and Admin according to your user role. For example, you can choose Respond to go directly to the relevant section of the application for Incident Responders. See Setting up Your Default View by SOC Role to help you select the appropriate default view.
   This selection sets the default view for the entire application. Changes become effective immediately.

Select the Default Investigate View

1. Open the User Preferences Dialog.
2. In the **Default Investigate View** field, select the default landing page when you log in to NetWitness Platform and navigate to Investigate. You can choose Navigate, Events, Event Analysis, Hosts, Files, Users, or Malware Analysis as the default Investigate view. For example, you can choose Events for the default Investigate view to go directly to the Events page to view the events generated for a service. See Setting up Your Default View by SOC Role to help you select the appropriate default view. For more information, see the *NetWitness Investigate User Guide*.

Note: After you have applied the change in the drop-down, sometimes it takes few seconds for the changes to come in effect.

Choose the Appearance of NetWitness Platform

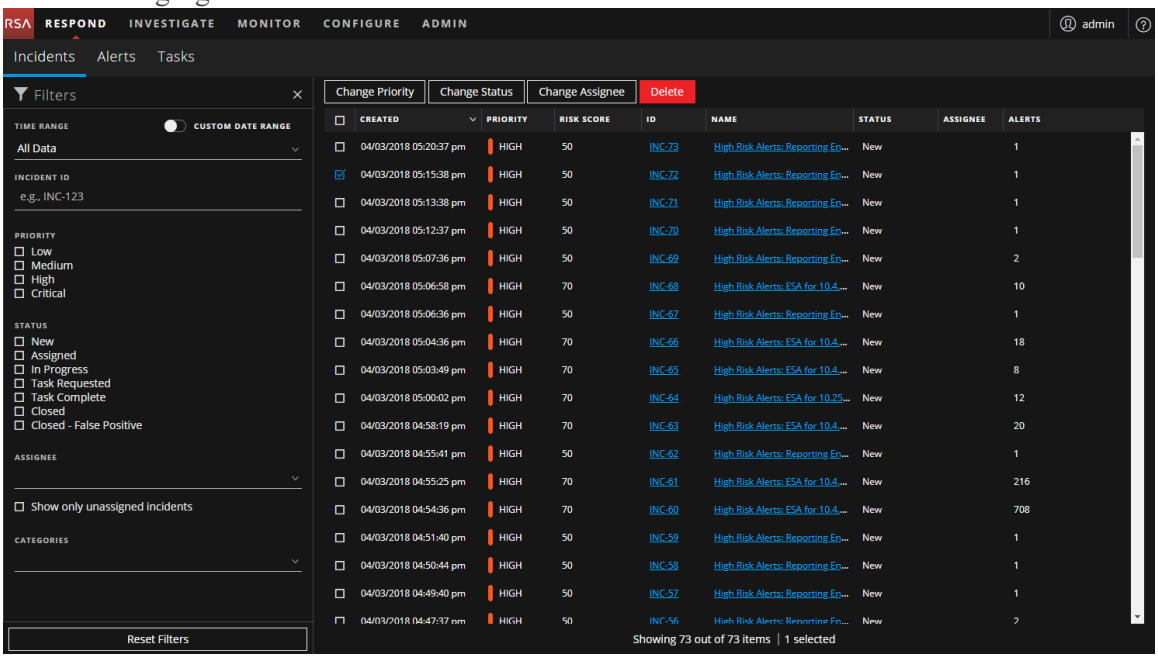
Note: This option is only available for NetWitness Platform versions 11.1 and later.

You can choose a dark theme or a light theme for your application, depending on your personal preference. When you change the theme, the Respond view and some Investigate views change to the light or dark theme. Your selection only changes how NetWitness Platform appears to you, not other users.

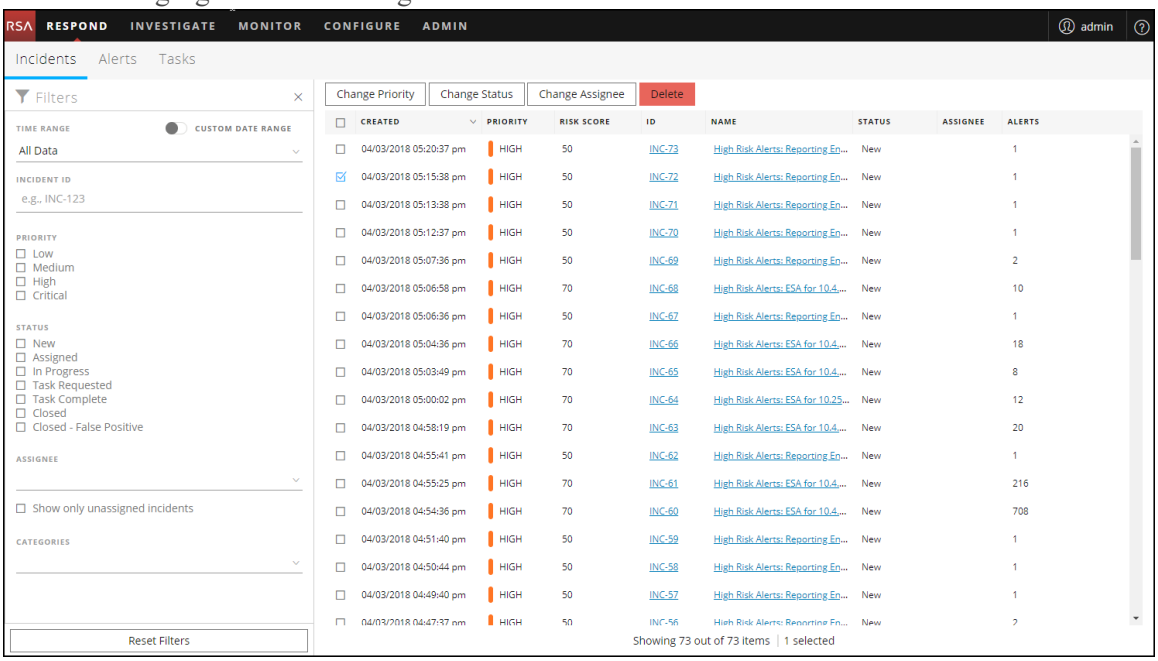
1. Open the User Preferences dialog.
2. Under **THEME**, select one of the following options:
   - **Dark**: The dark theme is best for darker environments or when you do not need as much contrast.
   - **Light**: The light theme is best for lighter environments, when you need more contrast, or when you are projecting the application for others to view. Since some views are not affected by the theme changes, you may want to choose the light theme for a more cohesive viewing experience.

Changes become effective immediately.

The following figure shows the dark theme.



The following figure shows the light theme.



Managing Dashboards

A dashboard is a group of dashlets that give you the ability to view in one space, the key snapshots of the various components that you consider important. In RSA NetWitness® Platform, you can compose dashboards to obtain high-level information and metrics that portray the overall picture of a NetWitness Platform deployment, displaying only the information that is most relevant to the day-to-day operations.

By default, the NetWitness Platform default dashboard is displayed when you log in to NetWitness Platform, and it is populated with a few useful dashlets to get you started with your own customizations. The dashboards for all NetWitness Platform components are available to add to the default NetWitness Platform dashboard or a custom NetWitness Platform dashboard.

You can view dashboards and reports on different areas of interest depending on your user permissions. You have the option to select a preconfigured dashboard, import a dashboard, or create your own custom dashboard. The dashboards help you to quickly and easily view reports. You can configure your dashboards to display the information that supports your workflow. This topic explains the high-level tasks that can be done when you are setting up a dashboard.

Dashboard Basics

If the Monitor view is your default landing page following logging in to NetWitness Platform, you always see either the default dashboard or the currently configured dashboard immediately after completing the login process. To return to the dashboard from another NetWitness Platform component, go to **MONITOR** > **Overview**.

Dashboard Title

The dashboard title reflects the currently active dashboard; for example, Default Dashboard.

Dashboard Selection List

You can access preconfigured and custom dashboards on the dashboard selection list. When you select a dashboard, its title is displayed below the NetWitness Platform toolbar.

A dashboard has:

- The dashboard toolbar
- The dashboard title and the dashboard selection list.

Dashboard Toolbar

The dashboard toolbar is available next to the title of the selected dashboard. The dashboard toolbar allows various operations on dashboards and dashlets.

Note: The Copy, Delete, Import, Export, Share, and Add Row options are disabled for preconfigured dashboards.

Option	Description
★	Sets the selected dashboard as the Favorite.
Default Dashboard	Displays the list of available dashboards from which you can make a selection.
+	Displays the Create a Dashboard dialog, where you define or add a custom dashboard.

Option	Description
	Deletes a custom dashboard. The default dashboard cannot be deleted.
	Allows you to copy a dashboard.
	Displays the Manage Dashlet dialog.
	Exports a dashboard as a .zip file.
	Imports a dashboard as .zip or.cfg file.
	Allows you to share a dashboard with another user.
	Enables user to add rows and columns to the dashboard based on the requirement. Click the icon in a row to add a dashlet.

The Default Dashboard

The default dashboard is configured to display specific dashlets in specific positions. The default dashboard serves as an example of dashboard composition and a starting point for customization.

- You can customize the information on the default dashboard by editing, adding, moving, maximizing, and deleting dashlets.
- After modifying the default dashboard, you can restore the default dashboard ( ) to its original layout.
- The default dashboard cannot be deleted or shared.

Selecting a Preconfigured Dashboard

On installation of NetWitness Platform Suite, the following preconfigured dashboards are automatically activated and are available to you:

- Default
- Identity
- Investigation
- Operations - File Analysis
- Operations - Logs
- Operations - Network
- Operations - Protocol Analysis

- Overview
- RSA SecurID
- Threat - Hunting
- Threat - Intrusion
- Threat - Malware Indicators

You cannot perform the following actions on a preconfigured dashboard:

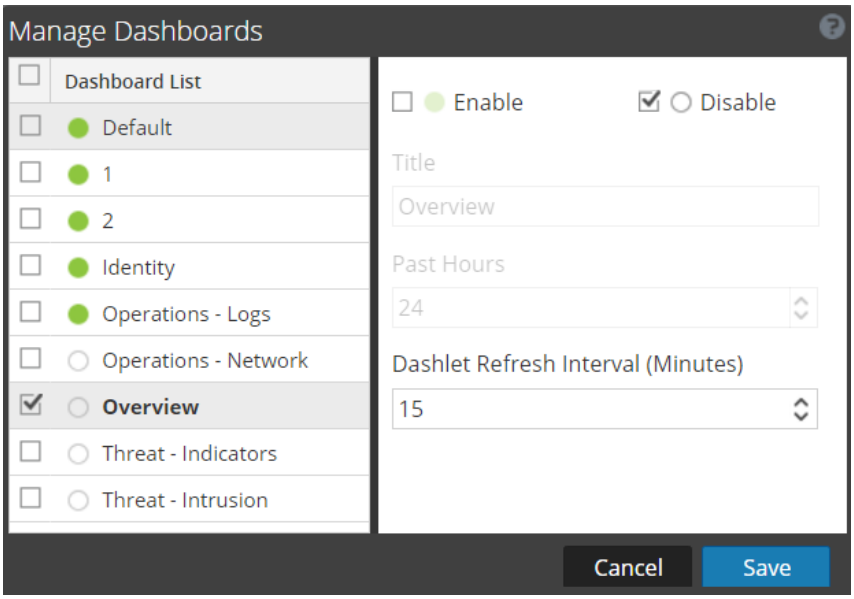
- Edit a dashboard
- Export a dashboard
- Share a dashboard
- Delete a dashboard

For more information on each Preconfigured dashboard, see the Dashboards Catalog in the RSA Content space on RSA Link.

Enabling or Disabling Dashboards

When you enable or disable a dashboard, all the dashlets within the dashboard are enabled or disabled along with the associated charts, unless they are used in any other dashboard.

NetWitness Platform modules can display only those dashlets presented in the Manage Dashlet dialog. The main dashboard offers all NetWitness Platform dashlets. This is an example of currently available dashlets.

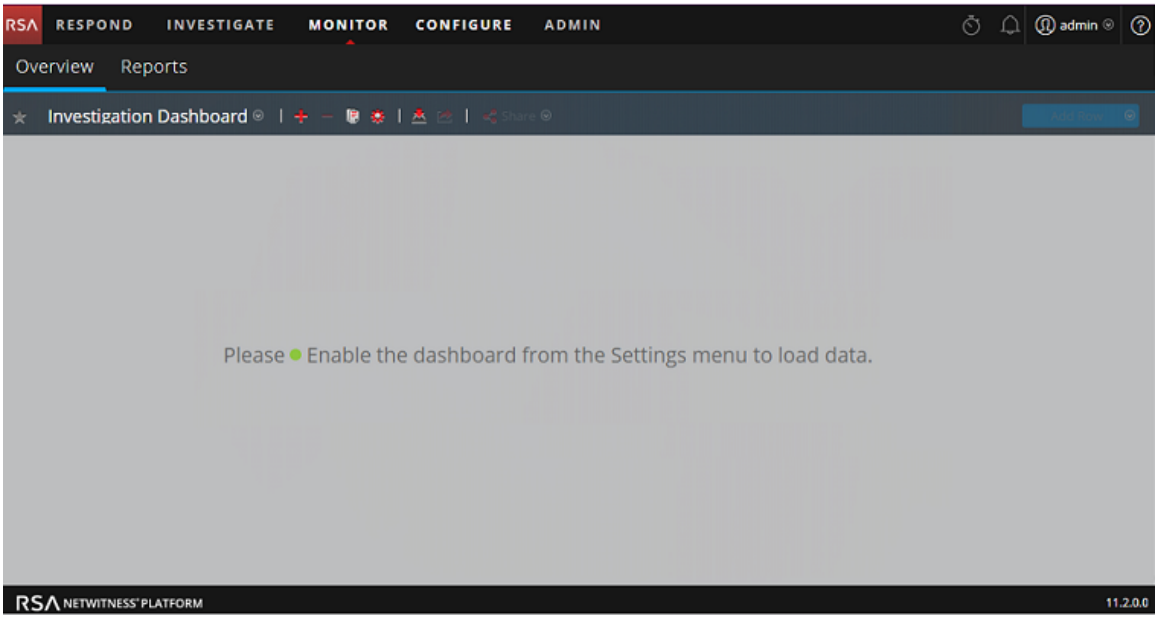


Name	Description
Dashboard List	Displays a list of the default, preconfigured, and custom dashboards.

Name	Description
Enable	Indicates if the selected dashlet is enabled.
Disable	Indicates if the selected dashlet is disabled.
Title	Displays the title of the selected dashlet and you can also rename the dashboard.
Past Hours	Displays the time for which the data is collected.
Dashlet Refresh Intervals (Minutes)	Displays the refresh interval time of a dashlet.

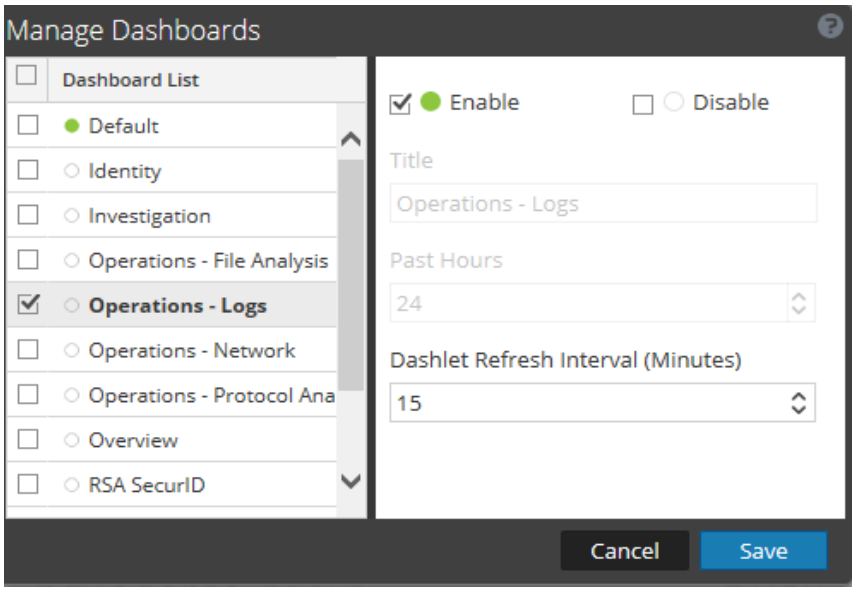
Enable a Dashboard

If you select a dashboard that is not enabled, a masked screen is displayed.



To enable one or more dashboard(s):

1. Navigate to the dashboard to be enabled.
2. In the dashboard toolbar, click (Manage Dashboards).
   The Manage Dashboards dialog is displayed.

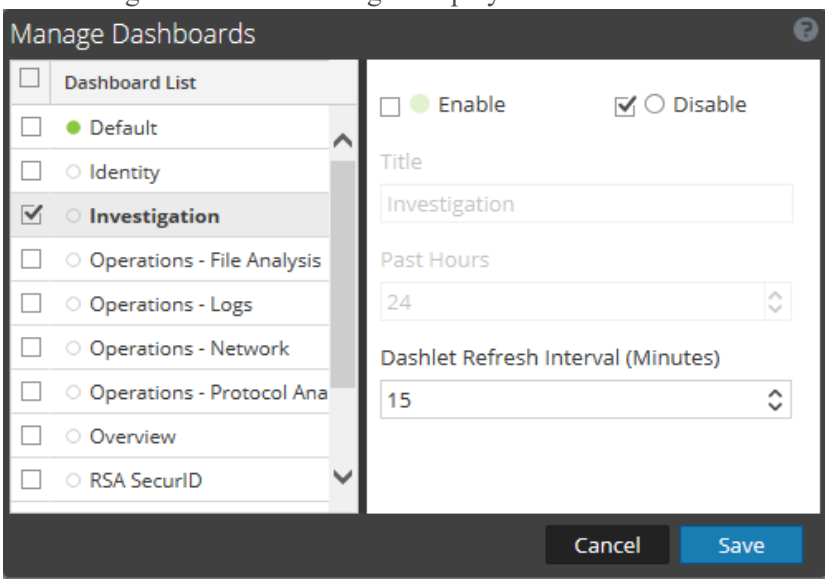


3. From the dashboard list, select the dashboards to be enabled.
4. Select the **Enable** checkbox.
5. Click **Save**.

Disable a Dashboard

To disable one or more dashboards:

1. Navigate to the dashboard to be disabled.
2. In the dashboard toolbar, click (Manage Dashboards).
   The Manage Dashboards dialog is displayed.



3. From the dashboard list, select the dashboards to be disabled.
4. select the **Disable** checkbox.
5. Click **Save**.

Setting a Dashboard as a Favorite

To customize the views in NetWitness Platform, you can set a preconfigured or custom dashboard as a Favorite. The NetWitness Platform dashboard offers all NetWitness Platform dashlets. The Favorite dialog sets a specific dashboard as your favorite dashboard and is listed as favorite every time you log in to NetWitness Platform.

1. Navigate to any dashboard.
2. In the dashboard toolbar, click

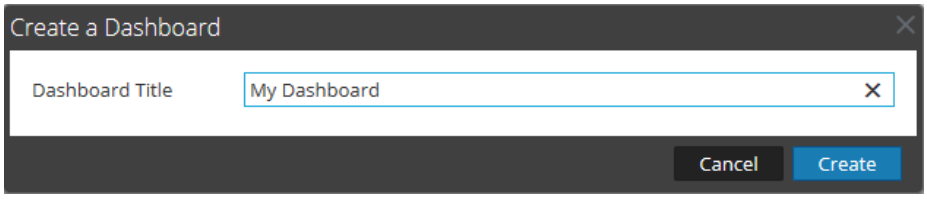
   If the favorite icon is red in color, it indicates that selected dashboard is set as a Favorite and is listed on top above the line.

Creating Custom Dashboards

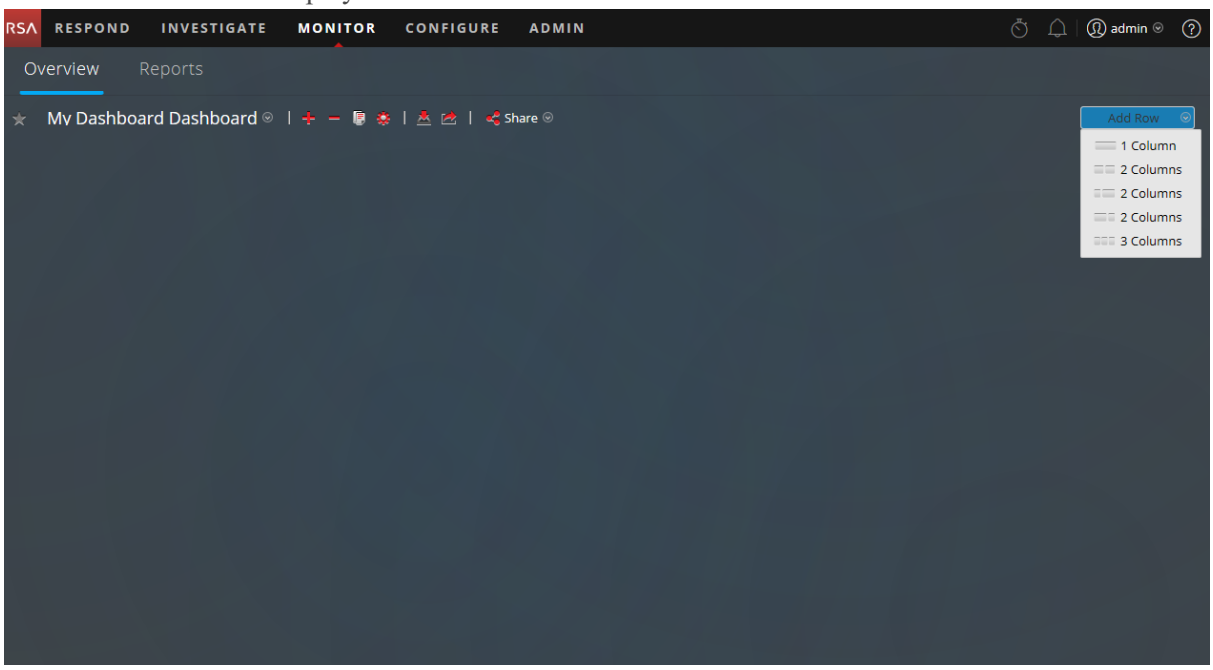
You can create custom dashboards to serve a particular purpose; for example, to represent a specific geographical or functional area of the network. Each custom dashboard is appended to the dashboard selection list.

To create a custom dashboard:

1. In the dashboard toolbar, click .
   The Create a Dashboard dialog is displayed.

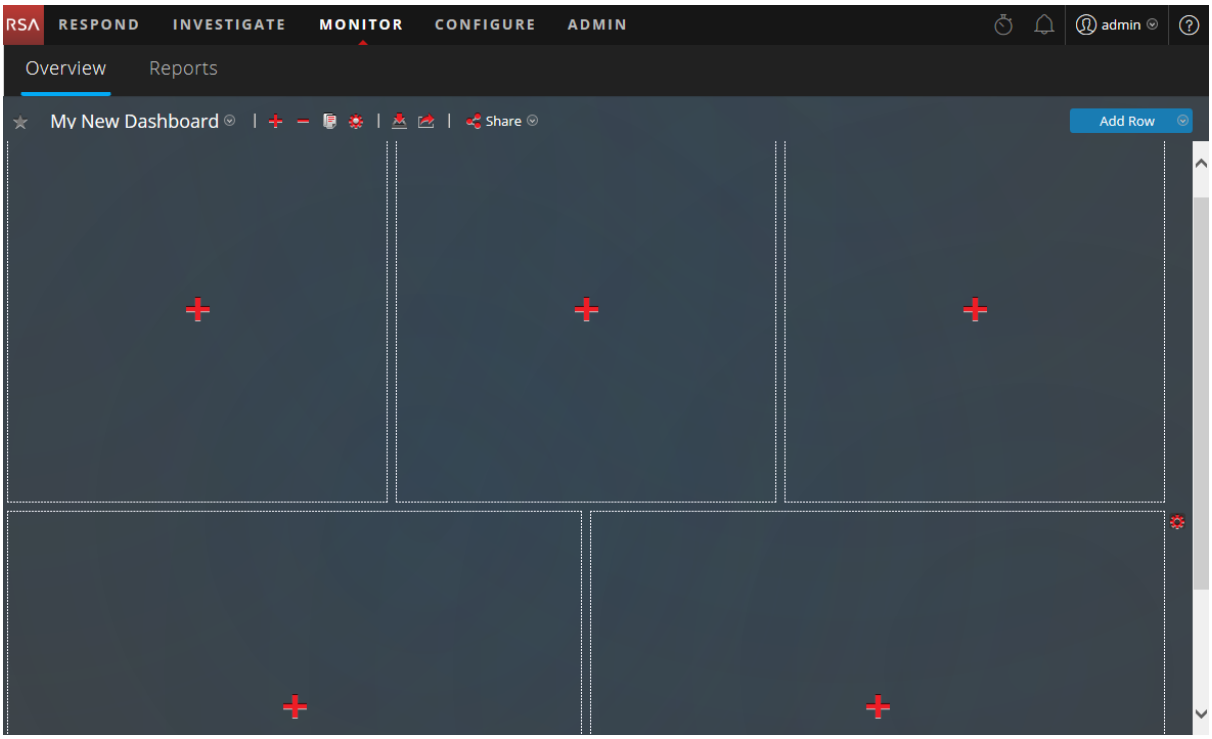


2. Enter a title for the new dashboard and click **Create**.
   The new dashboard is displayed as a blank screen.



3. Add rows to the dashboard, which can contain one or more columns, using the **Add Row** option on the right side of the screen ( ). Click the desired column configuration in the drop-down list to add one row to the dashboard with the selected number of columns. Repeat the process

to add more rows.



4. You can add any desired dashlets to the dashboard by clicking in an empty placeholder in a row. For complete details on adding and managing dashlets, see Working with Dashlets.

Once custom dashboards are created, you can:

- Switch between dashboards by selecting an option from the dashboard selection list.
- Delete any custom dashboard.
- Import or export a dashboard.

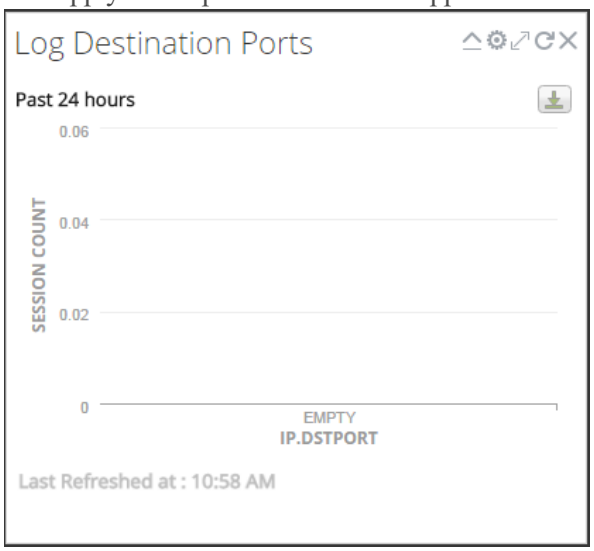
Each dashboard has:

- The dashboard toolbar.
- The dashboard title and the dashboard selection list.
- Zero or more dashlets.

Working with Dashlets

NetWitness Platform uses dashlets to display focused subsets of system information, services, jobs, resources, subscriptions, rules, and other information.

The controls for a dashlet are in the title bar. All dashlets use a common set of controls, and only those that apply to the particular dashlet appear in the title bar of the dashlet.



The following table displays the description of each icon on the dashlet.

Icon	Name	Description
	Collapse vertically	Collapses the dashlet vertically so that only the title is visible.
	Expand vertically	Expands the dashlet to its original size.
	Reload	Reloads the dashlet.
	Settings	Displays configurable settings for the dashlet.
	Maximize	In some dashlets with content that does not fit horizontally within the width of the dashlet, maximizes a chart or a dashlet to full screen.
	Delete	Deletes the dashlet from the dashboard.
Last Refreshed at		Displays the time at which the data is polled from the related chart.
View More		When clicked, navigates to the corresponding dashboard which is linked to the main dashlet and displays more details. If you have not linked the dashboard to an existing dashlet, this link with not be available on the dashlet. To configure this option, click , and in the Dashboard Link field select a related dashboard view more details of the specific dashlet.

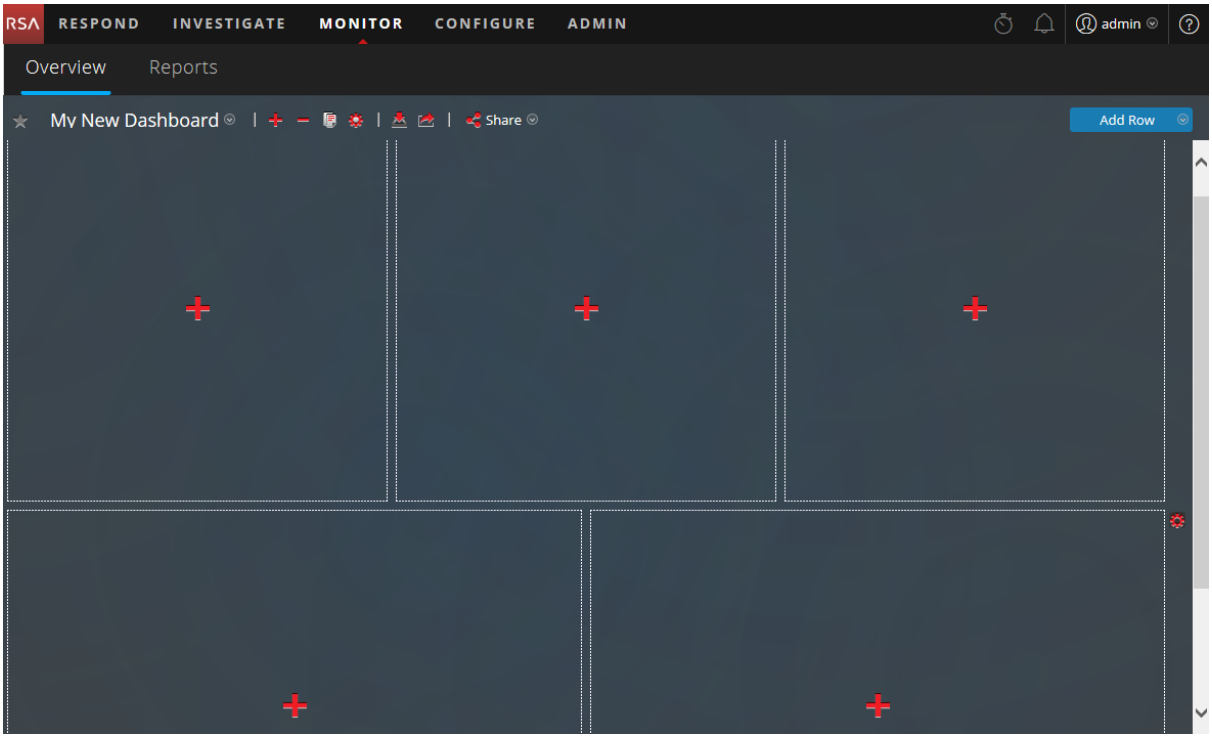
You can add dashlets to the default dashboard or construct a custom dashboard with your own useful set of dashlets to make your workflow more efficient.

Add a Dashlet

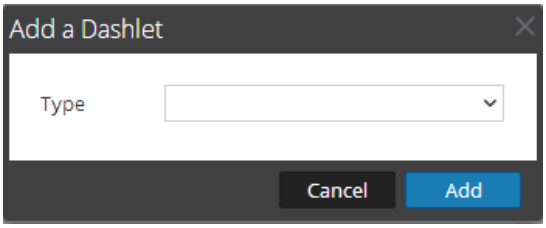
To customize the views in NetWitness Platform, you can add dashlets to a default dashboard or create custom dashboards. However, you cannot add dashlets to preconfigured dashboards.

To add a dashlet:

1. Navigate to any dashboard or create a new dashboard.

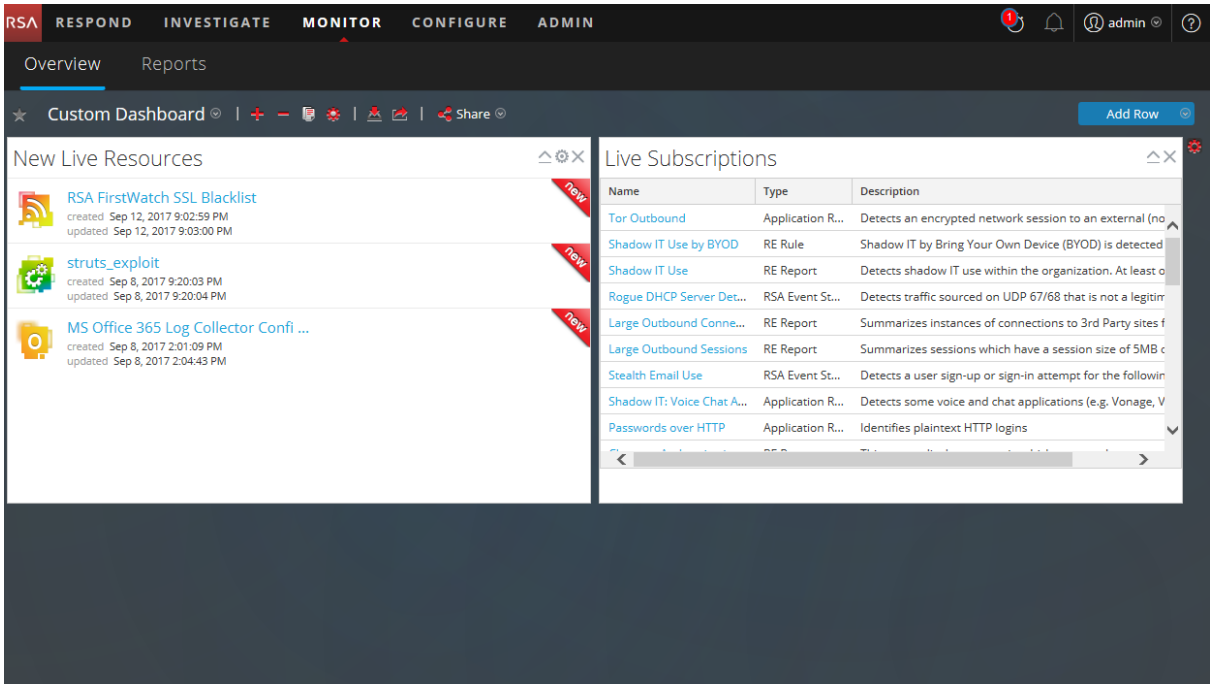


2. Click on the placeholder where you want to add the dashlet.
The Add a Dashlet dialog is displayed.



3. Click the **Type** selection list to view the available dashlets, and select the type of dashlet you want to add. Depending on the type of dashlet you are adding, some configurable fields appear in the **Add a Dashlet** dialog.
4. Type a title for the dashlet. The title can include letters, numbers, special characters, and spaces.
5. If there are additional configurable fields for the dashlet, set appropriate values.

6. When all required fields have been configured, click **Add**.
   The dashlet is added to the dashboard in the selected placeholder and is automatically saved.



Edit Dashlet Properties

All preconfigured dashlets are read-only and their properties cannot be edited. Other dashlets are editable and allow users to customize some aspect of the data displayed in the dashlet. A dashlet with editable properties has a settings (⚙) option that displays all the editing options.

After the dashlets are added, you can drag and drop them and they can be swapped.

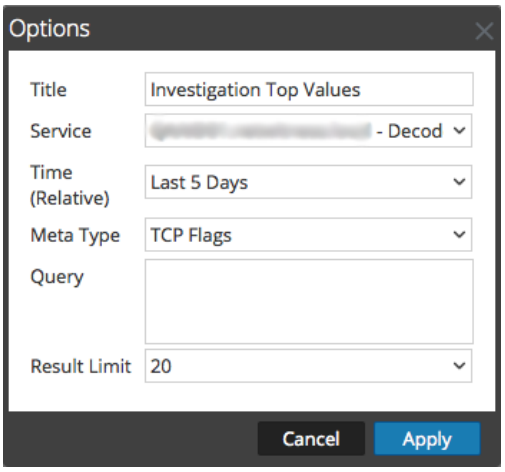
A dashlet without editable properties, such as the Live Subscriptions dashlet, does not display the settings option in the title bar. Many dashlets have an editable title where you can edit the following properties:

- Dashlet display title.
- Type of services to monitor; for example, you can monitor only Decoders, or you can monitor Decoders and Concentrators.

Other dashlets have parameters that you define to specify the kind and amount of information you want to see in the dashlet. For example, a Realtime Chart Dashlet has the settings option.

1. To display and modify the options for a dashlet, click settings (⚙) in the dashlet title bar.

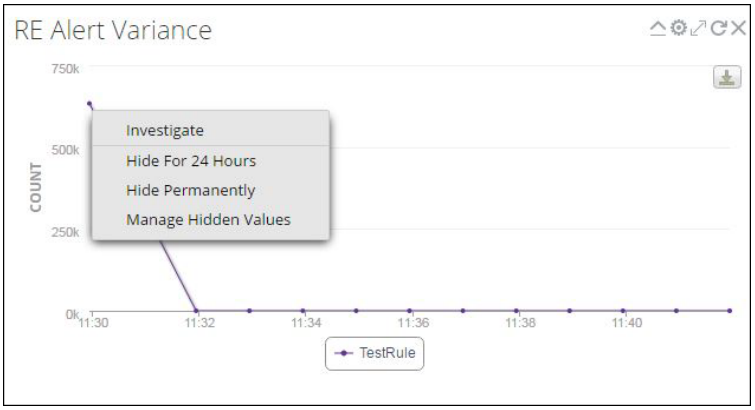
   The Options dialog is displayed.



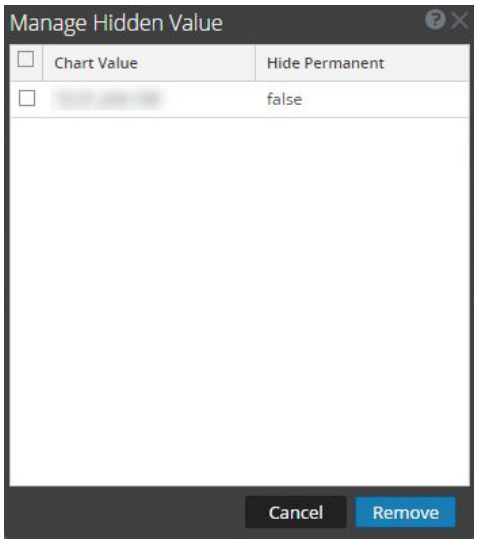
2. Edit any of the displayed properties. For example, in an Investigation Top Values dashlet, you can edit the Result Limit from 20 to 40.
3. Click **Apply**.

Some dashlets have configuration options to tailor the appearance or the contents of the dashlet. The following options are available for RE Top Alerts, RE Alert Variance, and RE Realtime Charts dashlets on left-click:

- **Hide For 24 Hours**: This option allows you to hide the selected value for the next 24 hours. After 24 hours, the data is automatically displayed on the dashlet, if the value is configured and listed on top.
- **Hide Permanently**: This option allows you to hide the selected value permanently until you add it back using the Manage Hidden Values option.



- **Manage Hidden Values**: This option displays a list of all the hidden values. You can select the checkbox for a value and click **Remove** to view the data back on the chart.



The options to Hide for 24 Hours, Hide Permanently, and Manage Hidden Values are not available for Geomap charts.

Note: When you edit a value in a preconfigured dashboard, it is a user-specific change. The changes made to a preconfigured dashboard are applicable only to your dashboard and cannot be viewed by other users who use the same preconfigured dashboard. For example, if you hide a value in an overview dashboard, the change is applicable only to your dashboard. If another user views the same overview dashboard, the value is still displayed. The same applies to a custom dashboard. When you hide a value in the custom dashboard and share the same dashboard with another user, the values are still displayed even though the dashboard is shared.

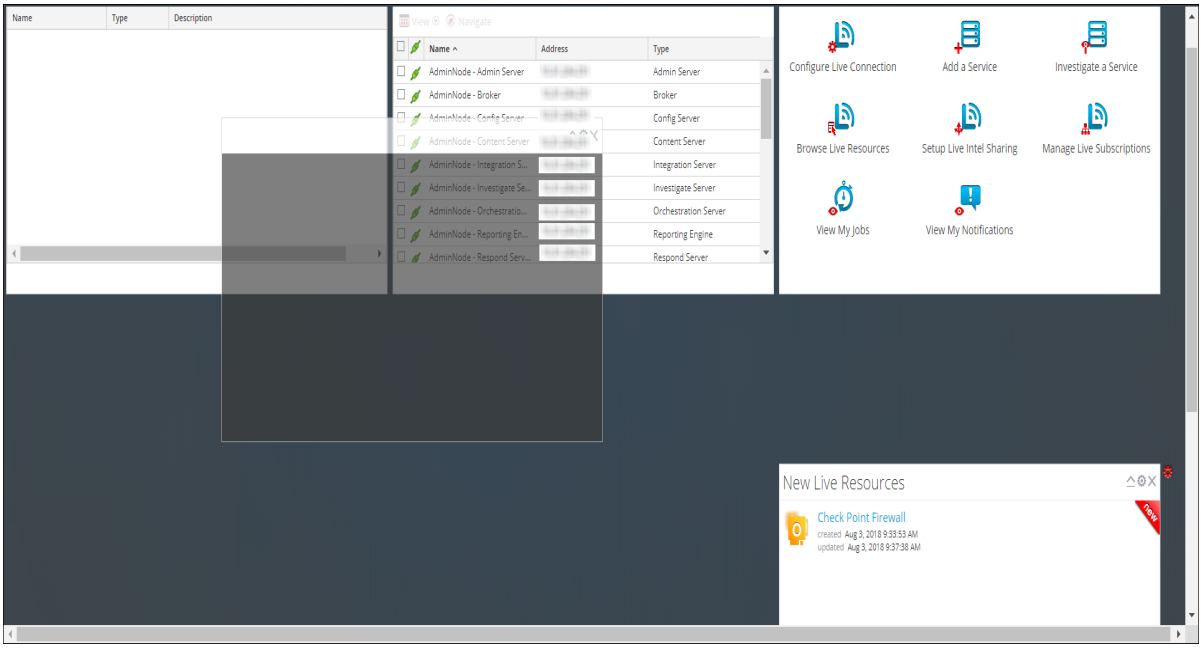
For more information on available dashlets, see the Dashboards Catalog in the RSA Content space on RSA Link.

Rearrange a Dashlet

You can arrange dashlets according to your preference by dragging and dropping them into a different order on the dashboard.

1. To move a dashlet, hover in the header of the dashlet that you want to move.
   The directional cursor appears over the dashlet. Click and hold in the header of the dashlet that you want to move.

2. Continue to hold the left mouse button and drag the window toward the new location.
   The figure below shows a dashlet as it is being re-arranged.



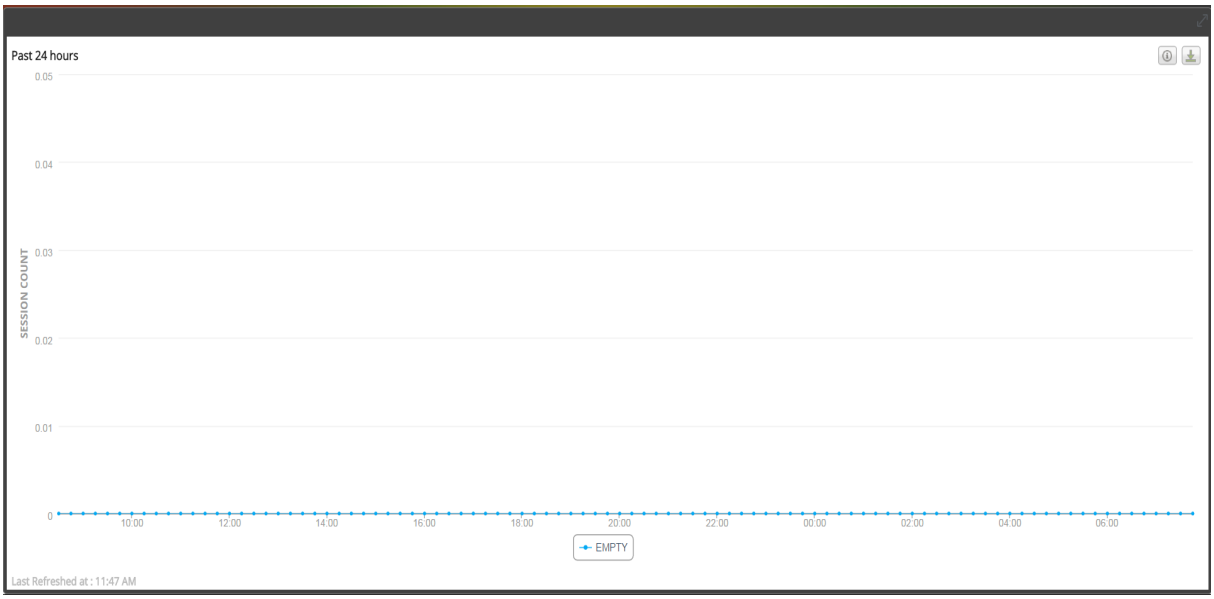
3. Release the mouse button when the dashlet is in the desired location.
   The dashlet that currently occupies that position moves down.

Maximize a Single Dashlet

This section explains how to open a dashlet on the entire area of the main NetWitness Platform dashboard with the same dashlet title. Dashlets that have a lot of columns or charts, for example some Reporting dashlets, are easier to view when maximized so that the entire contents is visible without scrolling.

To maximize a dashlet, click the maximize control icon in the dashlet title bar: ⤢. The dashlet is displayed on full screen.

To minimize a dashlet, click the same control icon in the dashlet title bar: ⤢. The dashlet is restored to previous size.



Delete a Dashlet

1. Click ✕ in the dashlet title bar:
   A confirmation pop-up is displayed to confirm if you want to delete the dashlet.
2. Click **Yes**, if you want to delete. The dashlet is removed from the dashboard.
   Click **No**, if you do not want to delete.

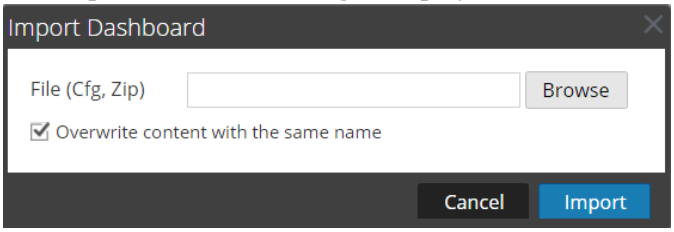
Note: After you remove the dashlet, the empty space is replaced by a placeholder where you can add another dashlet using the above Add a Dashlet procedure.

Importing and Exporting Dashboards

The ability to customize dashboards to changing circumstances and conditions could result in a large number of dashboards that are not needed on a daily basis. Rather than reinvent the wheel each time you want to recreate a particular custom dashboard, you can export your dashboards that are not currently in use. When you are ready to use a previously exported dashboard, import the dashboard into NetWitness Platform.

Import a Dashboard

1. In the dashboard toolbar, click (Import Dashboard).
   The Import Dashboard dialog is displayed.



2. Browse to the dashboard file in the **Import Dashboard** dialog. You can import .cfg and .zip files.
3. Click **Import**.
   The dashboard is displayed in NetWitness Platform

Note: If you import a dashboard from Security Analytics 10.6. x into NetWitness Platform11.x, the dashboard and the associated rules and charts must be imported separately. But when you import a dashboard from NetWitness Platform11.x into NetWitness Platform, the dashboard and all the rules and charts associated with it are imported in .zip format.

Export a Dashboard

Note: When you export a Reporter Realtime dashboard, the corresponding Reporting Engine contents is also exported.

Exported dashboards are designed to work within the same NetWitness Platform instance. It is also possible to share your custom dashboards with other users in your organization, provided they have equivalent permissions.

To export a dashboard, you must have the dashboard open to access the Export Dashboard option under the Edit drop-down menu in the dashboard toolbar.

1. Navigate to the dashboard that you want to export. All existing dashboards appear in the drop-down **Dashboard Selection List** in the currently displayed dashboard.
2. In the dashboard toolbar, click (Export Dashboard).
   The exported file is saved in .zip format.

Note: The Export feature is not applicable for preconfigured dashboards.

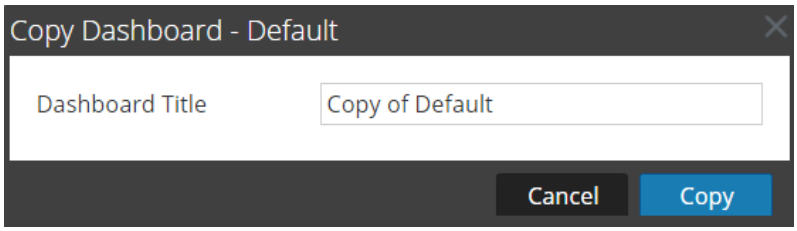
Copying a Dashboard

To customize the views in NetWitness Platform, you can copy dashboards to the NetWitness dashboard or a custom dashboard. The NetWitness Platform dashboard, as the name suggests, offers all NetWitness Platform dashlets. The Copy Dashboard dialog creates a duplicate dashboard, which can be customized. When you copy a dashboard, the default name is prefixed with `Copy of`. For example, if the name of the original dashboard is `XYZ`, the default title of the copied dashboard will be `Copy of XYZ`.

To copy a dashboard:

1. Navigate to any dashboard.
2. In the dashboard toolbar, click .
   The Copy Dashboard dialog is displayed. The following screenshot is an example of copying a

dashboard.



3. Enter the Dashboard Title.
4. Click **Copy**.

Sharing a Dashboard

In NetWitness Platform, as an administrator you can share dashboards for viewing purposes with other roles such as Administrators, Analysts, Operators and so on. When you share a dashlet, the users can only view the dashboard, make dashboard as favorite, copy the dashboard, and export the dashboard. In case of other roles such as Analysts, Operators, and so on, you can share the dashboard only with similar roles. For example, an analyst can share a dashboard with other analysts only.

1. Navigate to any dashboard.
2. In the dashboard toolbar, click

and select the checkbox of the role with whom you want to share the dashboard.

Note: If you do not want to share the dashboard, clear the checkbox of the role.

Managing Jobs

Inevitably, there are on-demand or scheduled tasks in RSA NetWitness® Platform that take a few minutes to be completed. The NetWitness Platform jobs system lets you begin a long-running task and continue using other parts of NetWitness Platform while the job is running. Not only can you monitor the progress of the task, but you can also receive notifications when the task has completed and whether the result was a success or failure.

While you are working in NetWitness Platform, you can open a quick view of your jobs from the toolbar. You can look anytime, but when a job status has changed, the Jobs icon ( ) is flagged with the number of running jobs. Once all jobs are completed, that number disappears.

You can also see the jobs in these two views:

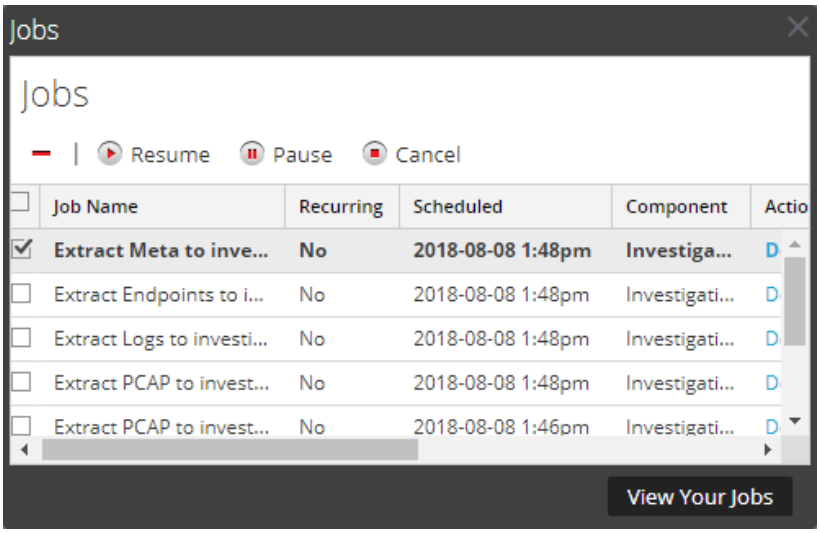
- In the user Profile Jobs panel, you see the same jobs in a full panel. These are only your jobs.
- In the System view, users with administrative privileges can view and manage all jobs for all users in a single jobs panel.

The structure of the jobs panel is the same in all views.

Display the Jobs Tray

In the NetWitness Platform toolbar, click the Jobs icon ( ).

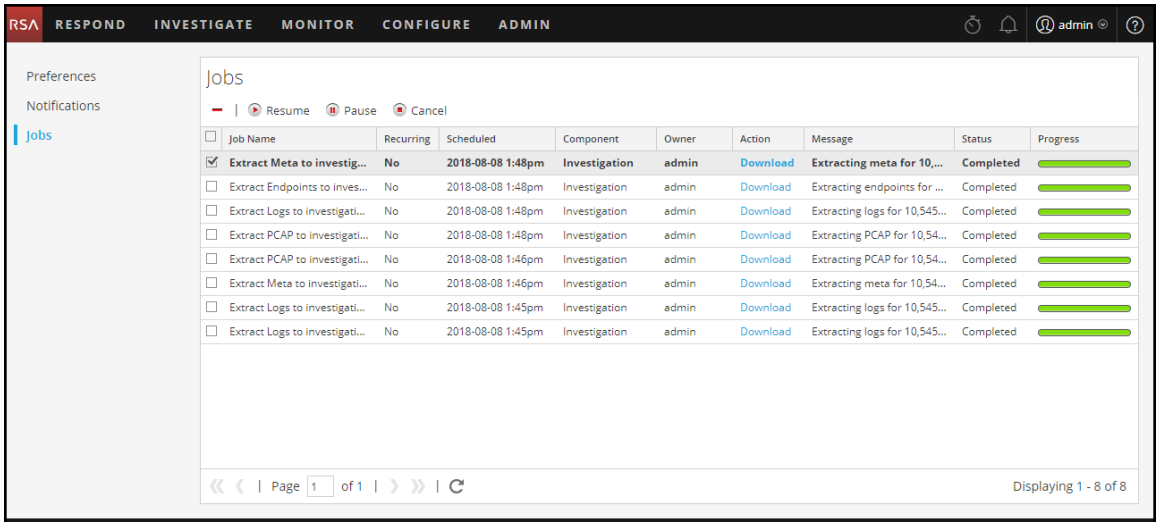
The Jobs Tray is displayed.



The Jobs Tray lists all recurring and non-recurring jobs that you own, using a subset of the columns available in the Jobs panel. Otherwise the Jobs Tray and the user Profile view Jobs panel are the same. In the Admin System view, the Jobs panel lists information about all NetWitness Platform jobs for all users.

View All of Your Jobs

To see a complete view of your jobs, in the Jobs tray, click **View Your Jobs**.
The Jobs panel is displayed.



Pause and Resume Scheduled Execution of a Recurring Job

The Pause and Resume options apply only to recurring jobs. You can pause a recurring job that is running; however, it has no effect on that execution. The next execution (assuming the job is still paused) is skipped.

1. To stop the next execution of a recurring job, in any **Jobs panel**, select the job, and click **Pause**.
   The next execution of the job is skipped, and the schedule is paused until you click Resume.
2. To restart execution of paused recurring jobs, select the job and click **Resume**.
   The next execution of the job occurs as scheduled, and the schedule for the job resumes.

Cancel a Job

To cancel jobs that are executing or in the queue to execute:

1. In the **Jobs Tray** or either **Jobs** panel, select one or more jobs.
2. Click **Cancel**.
   A confirmation dialog is displayed.
3. Click **Yes**.
   The jobs are canceled, and the entries remain in the list with a status of **canceled**.

   If you cancel a recurring job, it cancels that execution of the job. The next time the job is scheduled to run, it executes normally.

Delete a Job

Caution: When you delete a job, the job is instantly deleted from the list. No confirmation dialog is offered. If you delete a recurring job, all future executions are removed as well.

Users can delete their own jobs before, during, or after execution. Administrators can delete any job. To delete jobs:

1. Select one or more jobs.
2. Click .
   The jobs are deleted from the list.

Download a Job

When a job has the Download status in the Action column, you can download the result of the job. If you are working in the Investigate view and extract the packet data for a session as a PCAP file or extract the payload files (for example, Word documents and images) from a session, a file is created. To download the file to your local system, click **Download**.

Viewing and Deleting Notifications

While you are working in RSA NetWitness® Platform, you can view recent system notifications without leaving the area where you are working. You can open a quick view of notifications from the NetWitness Platform toolbar. You can look anytime, but when a new notification is received, the Notifications icon is flagged ( ).

Examples of notifications include:

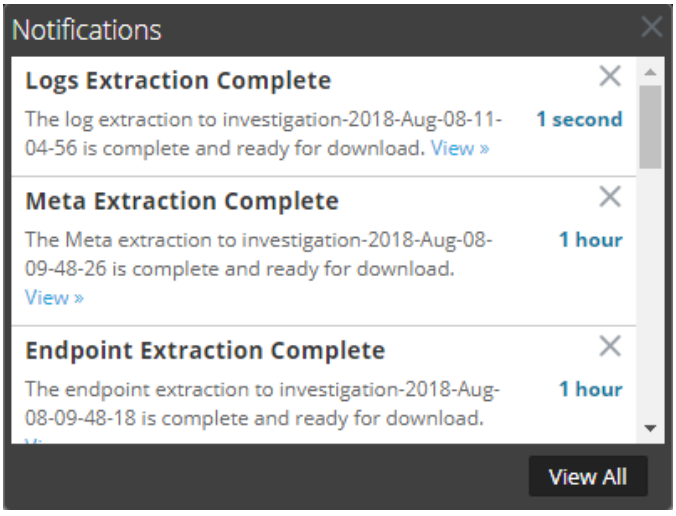
- A host upgrade completed.
- A parser push to decoders completed.
- A newer software version is available.

You can see notifications in these two views:

- In the Notifications tray, you can see your recent notifications.
- In the user Profile Notifications panel, you can view all of your notifications.

View Recent Notifications

To display recent notifications, click the Notifications icon ( ).
The Notifications tray is displayed.

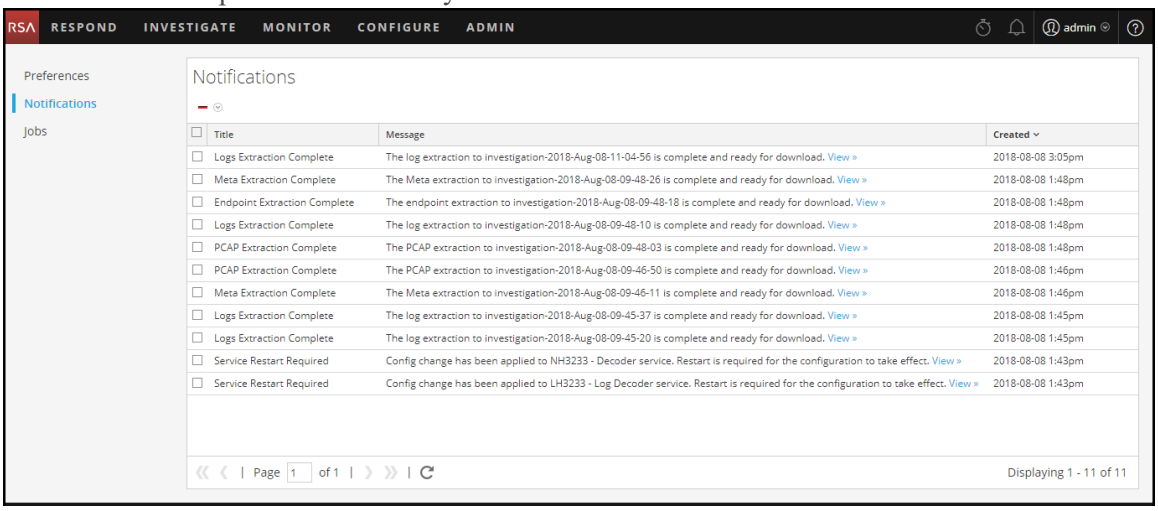


View All of Your Notifications

To view all of your notifications, do one of the following:

- Click to open the Notifications tray and then click **View All** in the Notifications tray.
- In the upper right corner of the NetWitness Platform browser window, select **> Profile** and then in the options panel of the Preferences dialog, select **Notifications**.

The Notifications panel shows all of your notifications.



Delete Notification Records

To delete notification records:

1. In the **Profile Notifications** list, select the notifications that you want to delete.
2. Click .

   The selected notifications are deleted from this list and from the Notifications tray.

Viewing Help in the Application

There are different ways available to get help while using RSA NetWitness® Platform. You can use inline help, tooltips, and online help links.

View Inline Help

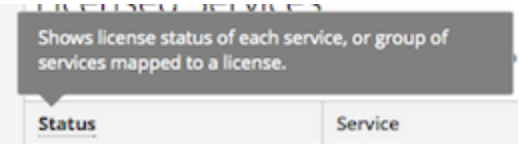
Inline help provides additional information about what to do in sections or fields that you are currently viewing in the NetWitness Platform user interface. To display inline help, hover over . The inline help shows a brief description of the element.

Inline help example:

View Tooltips

Tooltips are a quick way for you to see a description of the text or additional information about an action, field, or parameter. Tooltips appear as underlined text. To display the tooltip and see a brief description of the term, hover over the underlined text.

Tooltip example:

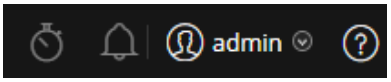


View Online Help

Online help links take you outside of NetWitness Platform to the RSA Link online documentation. This site has a complete documentation set for NetWitness Platform, and the links take you directly to the topic that describes the part of the user interface currently in view.

To view the online help topic for the current location, click in the NetWitness Platform toobar or in a dialog. The relevant help topic is displayed in a separate browser window. The topic describes the features and functions of the current view or dialog. From that topic, you can quickly navigate to the related procedures.

The following figure is an example of the online help icon in the NetWitness Platform toobar.



Finding Documents on RSA Link

The RSA NetWitness® Platform documentation is located on RSA Link, the RSA support portal and community. RSA Link brings all of your RSA resources together in one place. It includes advisories, product documentation, knowledge base articles, downloads, and training. To view a *Guided Tour of RSA Link*, see https://community.rsa.com/videos/21554.

Locate NetWitness Platform Documentation

NetWitness Platform Logs and Networks documentation is at the following link: https://community.rsa.com/docs/DOC-40370

To navigate to NetWitness Platform Logs and Networks documentation:

1. On the RSA Link homepage (https://community.rsa.com), click **RSA NETWITNESS PLATFORM**.
2. On the RSA NetWitness Platform page, click **DOCUMENTATION** and select **RSA NETWITNESS LOGS AND NETWORK**.

To navigate to NetWitness Endpoint 4.x documentation:

1. On the RSA Link homepage (https://community.rsa.com), click **RSA NETWITNESS PLATFORM**.
2. On the RSA NetWitness Platform page, click **DOCUMENTATION** and select **RSA NETWITNESS ENDPOINT**.

Locate RSA Content

RSA Content is at the following link: https://community.rsa.com/community/products/netwitness/rsa-content

To navigate to RSA Content:

1. On the RSA Link homepage (https://community.rsa.com), click **RSA NETWITNESS PLATFORM**.
2. On the RSA NetWitness Platform page, click **DOCUMENTATION** and select **ADDITIONAL RESOURCES** > **RSA LIVE CONTENT**.

Locate RSA Supported Event Sources

RSA Supported Event Sources are at the following link: https://community.rsa.com/community/products/netwitness/parser-network/event-sources

To navigate to RSA Supported Event Sources:

1. On the RSA Link homepage (https://community.rsa.com), click **RSA NETWITNESS PLATFORM**.
2. On the RSA NetWitness Platform page, click **DOCUMENTATION** and select **ADDITIONAL RESOURCES** > **EVENT SOURCE CONFIGURATION**.

Locate Hardware Setup Guides

The Hardware Setup Guides are at the following link:
https://community.rsa.com/community/products/netwitness/hardware-setup-guides

1. On the RSA Link homepage (https://community.rsa.com), click **RSA NETWITNESS PLATFORM**.
2. On the RSA NetWitness Platform page, click **DOCUMENTATION** and select **ADDITIONAL RESOURCES** > **HARDWARE SETUP GUIDES**.

Find Documents Using NetWitness Navigator

You can search for desired RSA NetWitness Platform documentation in RSA Link using the NetWitness Navigator tool.

1. On the RSA Link homepage (https://community.rsa.com), click **RSA NETWITNESS PLATFORM**.
2. Under PRODUCT RESOURCES (right side of page) click **RSA NetWitness Navigator**.
3. Select desired search criteria from the available options. When searching for documentation, you should select **User Documentation** as the Content Type. Also, the Cost option is ignored for user documentation.
4. Click **VIEW RESULTS** to view a list of matching documents.
5. Click **RESET OPTIONS** to clear your previous search options.

Follow Content for Updates

You can follow pages or documents to be notified of changes.

1. Log in to RSA Link.
2. Navigate to a page or a document and in the top right corner select either **Follow** or **Actions** > **Follow**.

Send Your Feedback to RSA

Your feedback is very important to us and helps us to provide a better experience for our customers. Please send your suggestions to sahelpfeedback@rsa.com.

NetWitness Platform Getting Started References

The following section contains user interface reference information related to getting started with the NetWitness Platform application.

- User Preferences
- Notifications Panel and Notifications Tray
- Jobs Panel and Jobs Tray

User Preferences

To adjust RSA NetWitness® Platform to best fit your environment and work practices, you can set your own global application preferences. You can:

- Change the application language
- Set the application time zone
- Set the date and time formats
- Select your default NetWitness Platform starting location
- Select your default Investigate view
- Choose a dark or light theme for the application
- Change your password
- Enable notifications
- Enable context menus
- Change Investigate preferences - Described in the *NetWitness Investigate User Guide*.

Your global preference options vary depending on whether you access them from the Respond view or other views, such as Investigate, Monitor, Configure, and Admin. There are two global user preferences dialogs accessible from the main menu bar:

- **User Preferences** dialog: Accessible from Respond and the following Investigate views: Event Analysis, Hosts, Files, and Users.
- **Preferences** dialog: Accessible from most other views.

What do you want to do?

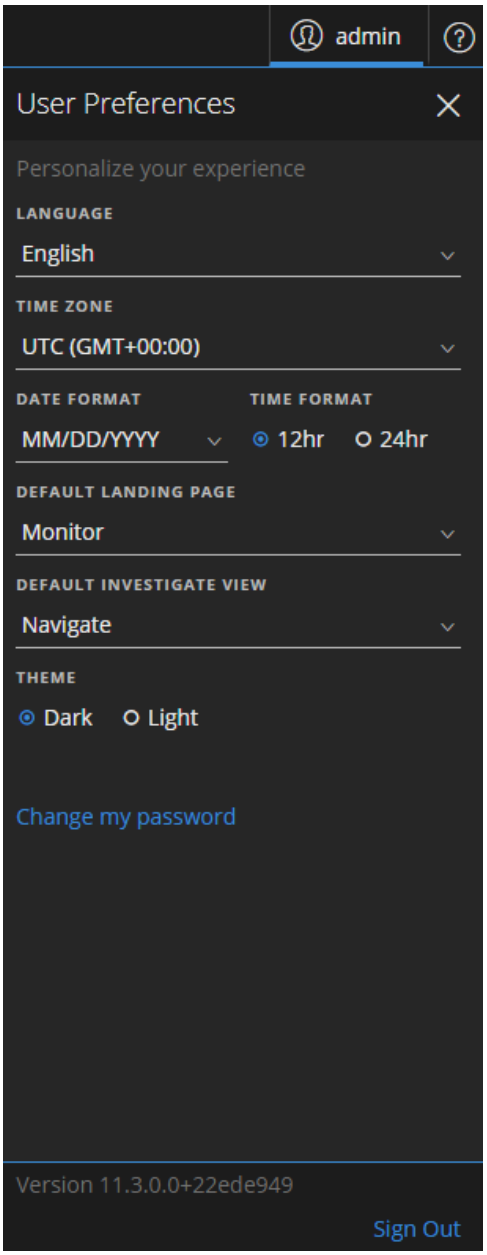
Role	I want to ...	Show me how
All	Change my Password	Change My Password
All	Choose my Default Landing Page	Setting up Your Default View by SOC Role
All	Set my User Preferences	Setting User Preferences

Related Topics

- NetWitness Platform Basic Navigation

User Preferences (Respond and Some Investigate views)

To access your user preferences, click .
The User Preferences dialog shows your current preferences and the NetWitness Platform version.



The following table describes the global application preference options that you can access from the User Preferences dialog.

Option	Description
Language	(This option applies to NetWitness Platform 11.2 and later.) Sets the preferred language for the entire NetWitness Platform. The default language is English (United States).
Time Zone	Sets the time zone to use in NetWitness Platform.

Option	Description
Date Format	Sets the format for the order of the display of the month (MM), day (DD), and year (YYYY). For example, the MM/DD/YYYY format shows the date as 05/11/2017.
Time Format	Sets the time as 12-hour or 24-hour time. For example, 2:00 PM in 12-hour time is 14:00 in 24-hour time.
Default Landing Page	Enables you to select the default view when you log in to NetWitness Platform. You can choose Respond, Investigate, Monitor, Configure, and Admin according to your user role. For example, you can choose Respond to go directly to the relevant section of the application for Incident Responders. This selection sets the default view for the entire application.
Default Investigate View	(This option applies to NetWitness Platform 11.1 and later.) Select the default landing page for the Investigate view. You can choose Navigate, Events, Event Analysis, Hosts, Files, Users, or Malware Analysis as the default Investigate view. For example, you can choose Events for the default Investigate view to go directly to the Events page to view the events generated for a service.
Theme	(This option applies to NetWitness Platform 11.1 and later.) Changes the appearance of the Respond view and some Investigate views that you see in the application. You can choose between light and dark themes: • **Dark**: The dark theme is best for darker environments or when you do not need as much contrast. • **Light**: The light theme is best for lighter environments, when you need more contrast, or when you are projecting the application for others to view. Since some views are not affected by the theme changes, you may want to choose the light theme for a more cohesive viewing experience. Your selection only changes how NetWitness Platform appears to you, not other users.
Change my password	Opens the Preferences dialog where you can change your password.
Version	Shows the NetWitness Platform version.
Sign Out	Enables you to log out of NetWitness Platform.

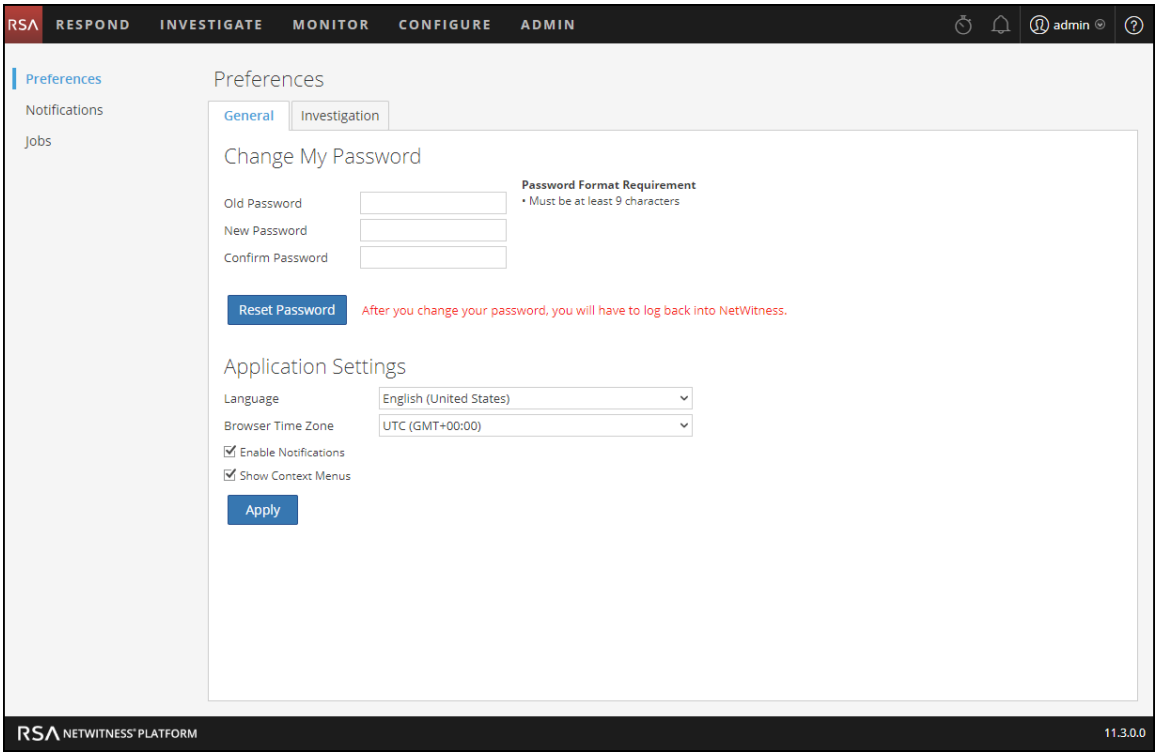
Any selections that you make become effective immediately.

Preferences

To access additional global user preferences, do one of the following:

- For most views, such as Investigate, Monitor, Configure, or Admin, go to > **Profile**.
- In the Respond and some Investigate views (Event Analysis, Hosts, Files, and Users), select and in the User Preferences dialog click **Change my password**.

The Preferences dialog shows your current preferences.



The following tables describe the global application preference options that you can access from the Preferences dialog.

Change My Password

This section enables you to change your password. Your administrator defines the appropriate password strength requirements for your NetWitness Platform password, such as minimum password length and minimum number of uppercase, lowercase, decimal, non-Latin alphabetic, and special characters. These requirements are then displayed when changing your password.

The following tables describes the options in the Change My Password section.

Option	Description
Old Password	Enter the password that you used to log in to NetWitness Platform.
New Password	Enter the password that you want to use for the next login.
Confirm Password	Retype the new password.

Option	Description
Reset Password	Updates your user profile with the new password. You will be logged out of NetWitness Platform for the changes to take effect. The new password becomes effective the next time you log in to NetWitness Platform. The password change is applied to your system login and to all NetWitness Platform services on which your account has been added.

If you changed your password, you will be logged out of NetWitness Platform for the changes to take effect. The new password becomes effective the next time you log in to NetWitness Platform.

Application Settings

The following tables describes the options in the Application Settings section.

Option	Description
Language	(This option applies to NetWitness Platform 11.2 and later.) Sets the preferred language for the entire NetWitness Platform. The default language is English (United States).
Browser Time Zone	Sets the time zone to use in NetWitness Platform. Your time zone preference is displayed on the toolbar.
Enable Notifications	This checkbox enables and disables notifications for your user account. By default, NetWitness Platform system notifications are enabled when a new user account is created.
Enable Context Menus	This checkbox enables and disables context menus for your user account. By default, context menus are enabled when a new user account is created. Context menus provide additional functions for specific views when you right-click in a view.
Apply	Updates your preferences and applies the changes immediately.

Notifications Panel and Notifications Tray

RSA NetWitness® Platform provides system notifications to advise users about certain actions or conditions:

- A host upgrade completed.
- A parser push to decoders completed.
- A service went down (critical log of a certain type).
- A visualization completed.
- A report completed.
- A newer software version is available.

While you are working in NetWitness Platform, you can view recent system notifications without leaving the area where you are working. You can open a quick view of notifications from the NetWitness Platform toolbar. You can look anytime, but when a new notification is received, the Notifications icon is flagged ( ).

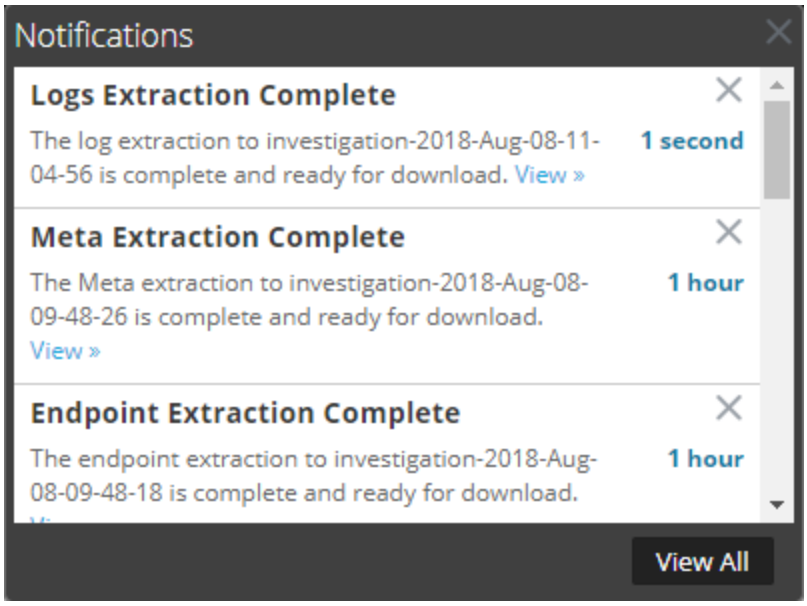
When you are viewing notifications in the Notifications tray, only recent notifications are displayed. You can access all of your notifications from your user Profile and from the Notifications tray by selecting the View All option. Procedures for viewing notifications are provided in Viewing and Deleting Notifications.

What do you want to do?

Role	I want to ...	Show me how
All	View all notifications	Viewing and Deleting Notifications
All	Delete notifications	Viewing and Deleting Notifications

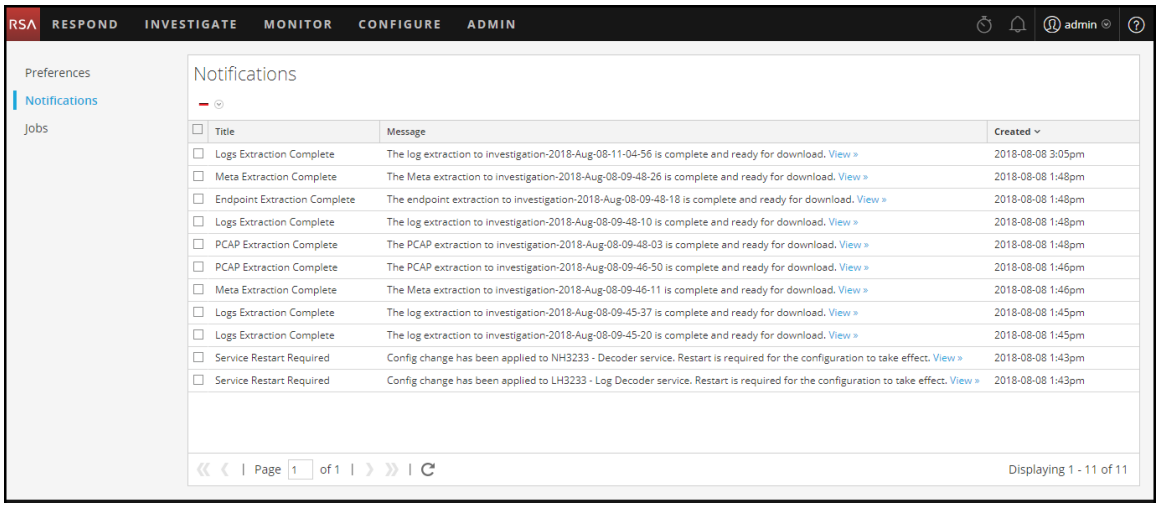
To access the Notifications panel, do one of the following:

- Click to open the Notifications tray and then click **View All** in the Notifications tray.



- In the upper right corner of the NetWitness Platform browser window, select > **Profile** and then in the options panel of the Preferences dialog, select **Notifications**.

  The Notifications panel is displayed.



The Notifications tray shows your recent notifications. It contains a subset of the information in the Notifications panel. The Notifications panel shows all of your notifications. The following table describes the Notifications panel and Notifications tray features.

Feature	Description
	(Notifications panel only) Displays a drop-down menu where you can delete the selected notification or all of your notifications in the Notifications panel and in the Notifications tray.
Title	The title of the notification, for example, **Logs Extraction Complete**.
Message	The entire message, for example, **The log extraction to Investigation is complete and ready for download.**
View	Some messages include a **View** link that displays a view where you can take action. For example, if there is a file to download, clicking this link opens the Jobs panel, the view where you can download the file.
Created	The date and time the notification was created. In the Notifications tray, it shows the number of hours or days since the notification was created.
View All	(Notification tray only) Opens the Notifications panel, which lists all of your notifications.

Jobs Panel and Jobs Tray

Jobs are started by various RSA NetWitness® Platform components; for example, downloading Content Management System (CMS) resources from Live Services and extracting logs, meta, and PCAP files from NetWitness Investigate.

In the ADMIN > System view, Administrators can manage all NetWitness Platform jobs in the Jobs panel. Other non-administrative users can view their own jobs in the user Profile Jobs panel.

In addition, while working in NetWitness Platform, you can open a quick view of your jobs from the NetWitness Platform toolbar. When a job status has changed, the Jobs icon ( ) is flagged with the number of running jobs. Once all jobs are completed, that number disappears.

In the Jobs panel, you can:

- View and sort the jobs
- Pause or resume a job
- Cancel a job
- Delete a job
- Download a job

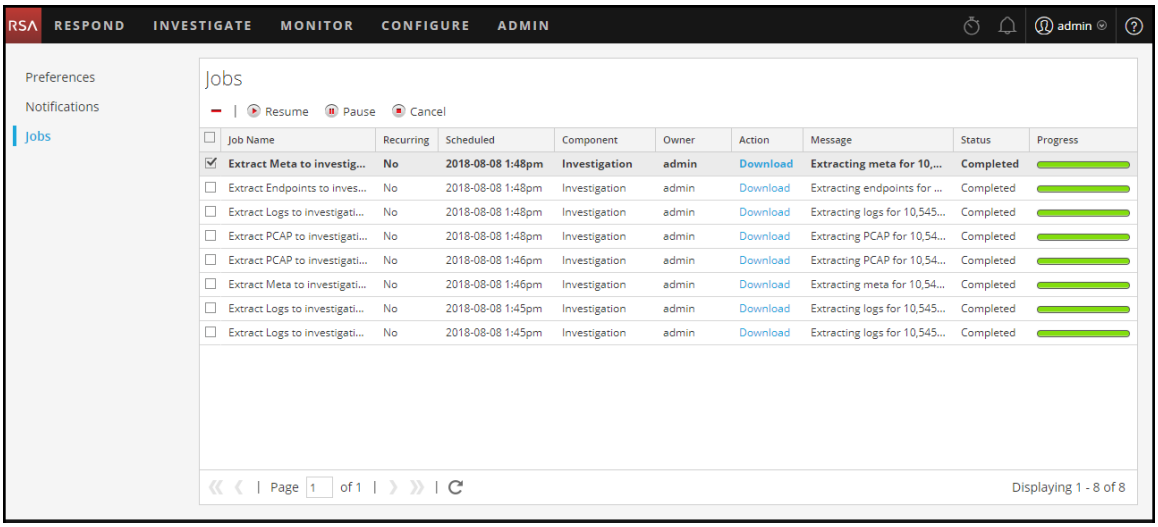
The structure of the jobs panel is the same in all views.

What do you want to do?

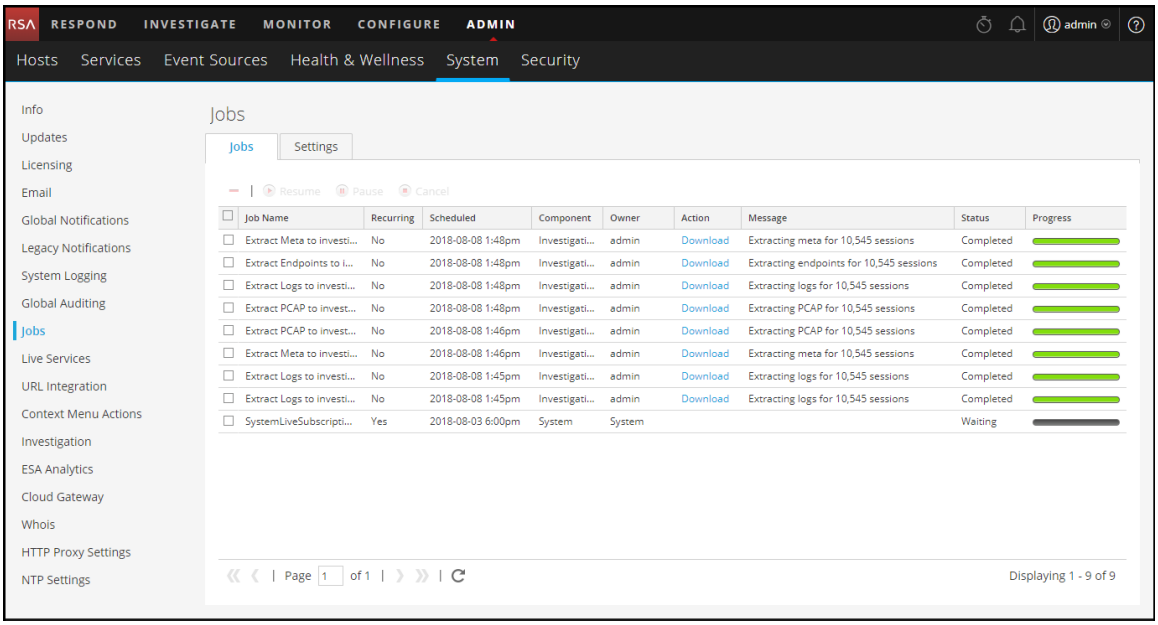
Role	I want to ...	Show me how
All	Pause and Resume a Scheduled Job	Managing Jobs
All	Cancel or Delete a Job	Managing Jobs
	Download a Job	Managing Jobs

To access the Jobs panel, do one of the following:

- In the upper right corner of the NetWitness Platform browser window, select > **Profile** and then in the options panel of the Preferences dialog, select **Jobs**.
  The Jobs panel is displayed. It shows the jobs of a particular user.

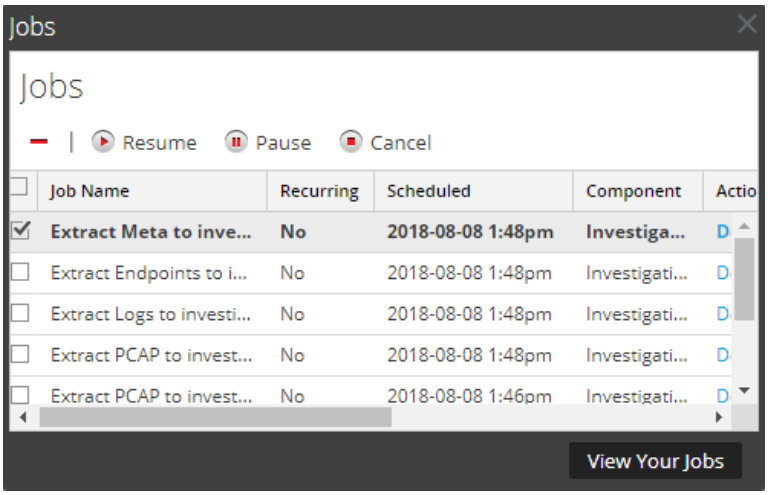


- Go to **ADMIN > System**, and in the options panel, select **Jobs**.
  The Jobs panel in the Admin System view is displayed. It shows the jobs for all users.



The Jobs panel organizes information about jobs into a list. The columns present a job progress bar, the job name, an indication that the job is recurring or not recurring, the NetWitness Platform component that is controlling the job, the owner of the job, the status, any associated message, and a download button to allow downloading of a job's packet capture files or payload files.

To display the Jobs tray, click the **Jobs** icon .



The Jobs tray lists all jobs that you own, recurring and non-recurring, using a subset of the columns available in the **Jobs** panel. Otherwise the Jobs tray and the user Profile Jobs panel are the same. In the Admin System view, the Jobs panel lists information about all NetWitness Platform jobs for all users.

The following table describes the available options in the Jobs panel.

Option	Description
Resun	The Resume option applies only to recurring jobs that have been paused. When you resume a paused job, the next execution of the job executes as scheduled.
Pause	The Pause option applies only to recurring jobs. When you pause a recurring job that is running, it has no effect on that execution. The next execution (assuming the job is still paused) is skipped.
Cance	Cancels a recurring or non-recurring job. You can cancel a job while it is running. If you cancel a recurring job, it cancels that execution of the job. The next time the job is scheduled to run, it executes normally.
	Deletes a recurring or non-recurring job from the Jobs panel. When you delete a job, the job is instantly deleted from the Jobs panel. No confirmation dialog is offered. If you delete a recurring job, all future executions are removed as well.

The following table describes the Jobs tray and Jobs panel columns.

Feature	Description
Selection box	Enables you to select one or more jobs.
Job Name	Displays the name of the job; for example, **Extract Files** or **Upgrade Service**.
Recurring	Indicates whether the job is recurring or non-recurring. **Yes** = recurring, **No** = non-recurring.
Scheduled	Indicates the date and time at which the job was scheduled to begin.
Component	Indicates the component in which the job originated; for example, **Investigation** or **Administration**.
Owner	Indicates the owner of the job. The owner of the job is not included in the default **Jobs Tray**, because only the current user's jobs are displayed here. The column is available to add.
Action	Views the job in another view or downloads job files for the job to the default **Downloads** directory on the local system. Only successfully completed jobs have the **View** link in the **Action** column. Only jobs that create a file have the **Download** link in the **Action** column.
Message	Displays additional information about the job; for example, **Extracting files** or **No sessions found.**
Status	Indicates the status of the job. Common values for status are **Paused**, **Running**, **Canceled**, **Failed**, **Completed**, and other status values are possible.
Progress	Shows the percentage complete for a job.
View Your Jobs	(Jobs tray only) Displays your jobs in the **Jobs panel.**

Hosts and Services Basics

This guide gives administrators the standard procedures for add and configure hosts and services in NetWitness Platform. After introducing you to the basic purpose of hosts and services and how they function within in the NetWitness Platform network, this guide covers:

- Tasks you must complete to set up hosts and services in your network
- Additional procedures that you complete based on the long-term and daily, operational needs of your enterprise
- Reference topics that describe the user interface

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

What Is a Host

A host is the machine on which a service runs and can be a physical or virtual machine. See the "NetWitness Platform Detailed Host Deployment Diagram" in the *NetWitness Platform Deployment Guide* for an illustration of how host are deployed.

What Is a Category

A category assigns a service or services to a host when you install a host from the Hosts view. You choose a host **Category** in the **Install Services** dialog which is displayed when you select a host in the Hosts view and click 
. The following table lists each host type and the services it installs. See the "NetWitness Platform Detailed Host Deployment Diagram" in the *NetWitness Platform Deployment Guide* for an illustration of how host are deployed.

Category	Services Installed
Archiver	Workbench and Archiver
Broker	Broker
Cloud Gateway	Cloud Gateway
Concentrator	Concentrator
Endpoint Broker	Endpoint Broker
Endpoint Log Hybrid	Log Collector, Log Decoder, Endpoint Server, and Concentrator
ESA Primary	Entity Behavior Analytics, Contexthub, and ESA Correlation
ESA Secondary	Entity Behavior Analytics and ESA Correlation
Log Collector	Log Collector

Category	Services Installed
Log Decoder	Log Collector and Log Decoder
Log Hybrid	Log Collector, Log Decoder, and Concentrator
Malware Analysis	Malware Analysis and Broker
Network Decoder	Decoder (Packets)
Network Hybrid	Concentrator and Decoder
UEBA	UEBA
Warehouse Connector	Warehouse Connector

What Is a Service

A service performs a unique function, such as collecting logs or archiving data. Each service runs on a dedicated port and is modeled as a plug-in to enable or disable, according to the function of the host.

You must configure the following core services first:

- Decoder
- Concentrator
- Broker
- Log Decoder

All the services are listed below and each service except the Log Collector has its own guide or shares a guide in the *Host and Services Configuration Guides*. The Log Collector has its own set of configuration guides to handle the configuration for all the supported event collection protocols. For Log Collector information, see *Log Collection Guides*.

Category	Services	Unencrypted Non-SSL Port	Encrypted SSL Port	Notes

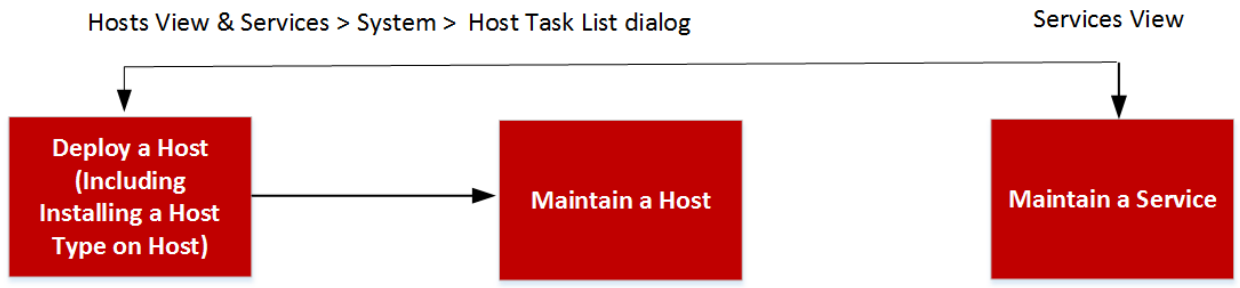
Warehouse Connector	Warehouse Connector	50020	56020	Command line installation

You must configure hosts and services to communicate with the network and each other so they can perform their functions such as storing or capturing data.



Setting Up a Host

You use the Hosts view to add a host to NetWitness Platform. See Step 1. Deploy a Host for detailed instructions.

Maintaining Hosts

You use the main ADMIN > Hosts view to add, edit, delete, and perform other maintenance tasks for the hosts in your deployment. You use the Task List dialog to perform tasks relating to a host and its communications with the network. See Hosts and Services Procedures for detailed instructions.

After initial implementation of NetWitness Platform, the major task you perform from the Hosts view is updating your NetWitness Platform deployment to a new version.

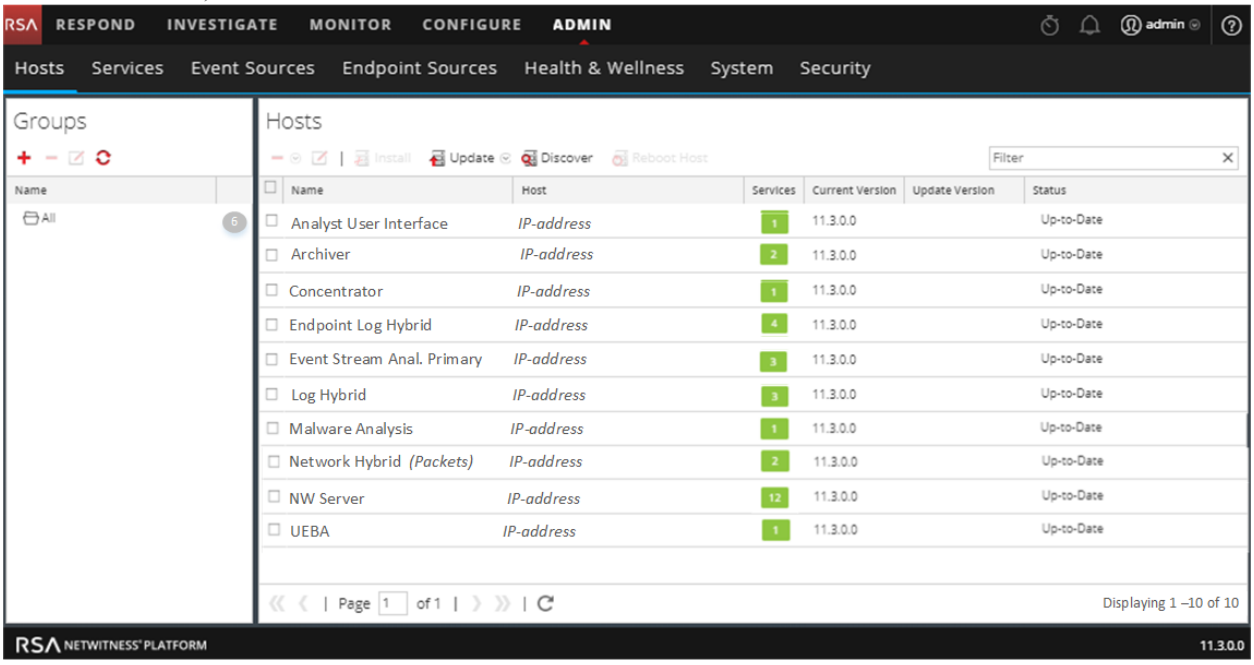
Update Version Naming Convention

You use the Hosts view to apply the latest version updates from your Populate Local Update Repository. You must understand the update version naming convention to know which version you want to apply to the host. The naming convention is ***major-release.minor-release.service-pack.patch***. For example, if you choose 11.6.1.2, you apply the following version to the host.

- 11 = major release
- 6 = minor release
- 1 = service pack
- 2 = patch

NetWitness Platform supports multiple versions in your deployment. The NetWitness Server (NW Server Host) is updated first and all other hosts must have the same or earlier version as the NW Server Host.

The following example is a single version deployment with all hosts updated to 11.3.0.0 (latest RSA release available).



Maintaining Services

You use the ADMIN > Services view to add, edit, delete, monitor, and perform other maintenance tasks for the services in your deployment. See Hosts and Services Procedures for detailed instructions.

Services Implemented with the NetWitness Server

The services in the following table are implemented when you deploy the NW Server to support:

- the expansion of physical and virtual deployment platforms and improvements to host and service maintenance.
- Content, Investigate, Respond, and Source functionality.

Caution: You do not need to configure these services to deploy NetWitness Platform. RSA recommends that you monitor the operating status of these services using Health-and-Wellness. Do not attempt to modify the parameters in the Explore view without contacting Customer Support (https://community.rsa.com/docs/DOC-1294).

Service	Purpose
Admin	The Administration Server (**Admin server**) is the back-end service for administrative tasks in the NetWitness Platform User Interface (UI). It abstracts authentication, global preferences management, and authorization support for the UI. The **Admin server** requires the **Config server** and the **Security server** to be online to perform its role.

Service	Purpose
Config	The Configuration Server (**Config server**) stores and manages configuration sets. A configuration set is any logical configuration group that is managed independently. The **Config server** facilitates the sharing of properties among services, provides configuration backup and restore facilities, and tracks changes to properties.
Content	The Content server manages the RSA provided and user created parser rules. For more information on parser management search for "parsers" in RSA Link.
Integration	The Integration Server manages interactions with external systems. The service handles the following outbound or inbound channels. • REST API Gateway - gateway to external REST clients that assigns calls to the NetWitness Application Programming Interface (API). • Notifications Dispatcher - centralized dispatcher for all outbound notifications originating in the NetWitness deployment.
Investigate	The Investigate server supports Investigate and Malware Analysis functionality. For more information see the *NetWitness Platform Investigate and Malware Analysis User Guide*.
Orchestration	The Orchestration server provisions, installs, and configures all services in your NetWitness Platform deployment.
Respond	The Respond server supports Respond functionality. For more information see the *NetWitness Platform Respond Configuration Guide*.
Security	The NetWitness Platform Security Server (**Security server**) manages the security infrastructure of a NetWitness Platform deployment. It handles the following security-related concerns. • Users and the authentication accounts • Role Based Access Control (RBAC) • Deployment PKI infrastructure A NetWitness Platform deployment has users with authentication accounts. Independent of how you verify the identity of the analyst (for example, Active Directory), NetWitness Platform must maintain user state that is not provided by all authentication providers (for example, last login time, failed login attempts, and roles). The concept of a user is separate from the identify associated with the user and the **Security server** maintains these as separate User and Account entities. In addition to the out-of-the-box local NetWitness accounts available to all NetWitness deployments, the server supports external authentication providers. The **Security server** also implements RBAC by managing Role and Permission entities. Permissions can be assigned to roles and roles to users. Together these enable a flexible authorization policy for the deployment. The server also manages generation of cryptographically secure tokens that encode the applicable authorization for a user. These tokens form the basis for deployment wide authorization.
Source	The Source server is reserved for future use and will provide a centralized location to configure sources (for example, Endpoints and Log Sources).

Running in Mixed Mode

Mixed mode occurs when some services are updated to the latest version and some are still on older versions. This happens when you update the hosts in your deployment to the latest version in phases (or stagger the update).

Functionality Gaps Encountered During in Staggered Updates

If you stagger the update, you:

- May not have all the features operational until you update your entire deployment.
- Will not have service administrative features available until you update all the hosts in your deployment.
- May be without data capture for a period of time.

Examples of Staggered Updates

In the following examples, all the hosts are on 11.3.0.x and you want to stagger the host updates to version 11.3.1.0.

Example 1. Multiple Decoders and Concentrators, Alternative 1

In this example, the 11.3.0.x deployment includes one NW Server host, two Decoder hosts, two Concentrator hosts, one Archiver host, one Broker host, one Event Stream Analysis host, and one Malware Analysis host.

You must complete Phase 1 first and update the hosts in the order listed for Phase 1.

RSA recommends that you update the Phase 2 hosts in the order listed for Phase 2.

Phase 1 - session 1

1. Update the NetWitness Server host.
2. Update the Event Stream Analysis host.
3. Update the Endpoint Log Hybrid host.
4. Update the Malware Analysis host.
5. Update the Broker or Concentrator host.

Phase 2 - session 2

1. Update 2 Decoder hosts.
2. Update 2 Concentrator hosts and Archiver host.

Phase 2 - session 3

1. Update all other hosts.

Example 2. Multiple Decoders and Concentrators, Alternative 2

In this example, the 11.3.0.x deployment includes one NW Server host, two Decoder hosts, two Concentrator hosts, one Broker host, one Event Stream Analysis host, and one Malware Analysis host. RSA recommends that you update the Phase 2 hosts the following sequence (you must complete Phase 1 first and update the hosts in the order listed).

Phase 1 - session 1

1. Update the NetWitness Server host.
2. Update the Event Stream Analysis host.
3. Update the Endpoint Log Hybrid host.
4. Update the Malware Analysis host.
5. Update the Broker host.

Phase 2 - session 2

1. Update one Decoder host and one Concentrator host.
   Time elapses during which NetWitness Platform processes a significant amount of data.

Phase 2 - session 3

1. Update one Decoder host, one Concentrator host, and the Broker host.
2. Update all Log Decoder hosts before you update Virtual Log Collectors.
3. Update all other hosts.

Example 3. Multiple Regions

In this example, the 11.3.0.x deployment includes one NW Server host, one Event Stream Analysis host, one Malware Analysis host, four Decoder hosts, four Concentrator hosts, two Broker hosts, (two sites, each with two Decoders, two Concentrators, and one Broker).

Phase 1 - Update Site 1

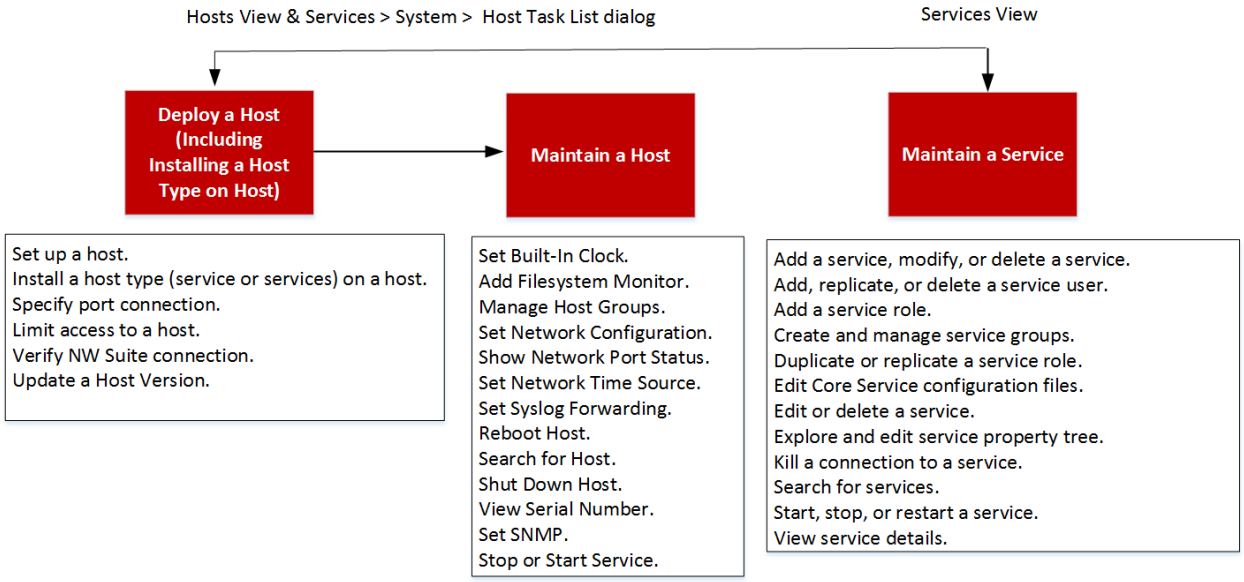
1. Update the NW Server host.
2. Update the Event Stream Analysis host.
3. Update the Endpoint Log Hybrid host.
4. Update the Malware Analysis host.
5. Update one Broker host, two Decoder hosts, and two Concentrator hosts.
6. Update all the other hosts.

Phase 2 - Update Site 2

1. Update the Broker hosts.
2. Update two Decoder hosts.
3. Update two Concentrator hosts.
4. Update all the other hosts.

Hosts and Services Procedures

Every service requires a host. After you set up a host, you can assign services to and from this host to other hosts in your NetWitness Platform deployment.



High-Level Task	Description
Set Up a Host	Complete the following tasks in the order shown to set up a host. Step 1. Deploy a host Step 2. Install a service on a host Step 3. Review SSL Ports for Trusted Connections Step 4. Manage access to a service

High-Level Task	Description

Maintain a Host - Basics	The following maintenance tasks are shown in alphabetical order.
	• Apply version updates to a host.
	  • Populate Local Update Repository
	  • Set Up an External Repository with RSA and OS Updates
	• Create and manage host groups
	• Search for hosts
	• Set network configuration
	• Set network time source
	• Show network port status
	• Show serial number
	• Shut down a host
	• Stop and start a service on a host

Maintain a Host from the Host Task List Dialog	You use the Host Task List dialog to manage tasks that relate to a host and its communications with the network. Several service and host configuration options are available for core hosts. • Execute a task from the Host Task List • Add and delete a Filesystem monitor • Reboot a host • Set host built-in clock • Set network configuration. • Set network time source • Set SNMP • Set Syslog forwarding • Show network port status • Show serial number • Shut down host • Stop and start a service on a host

High-Level Task	Description
Maintain a Service	The following procedures describe how to maintain services. • Add, replicate or delete a service user • Add a service user role • Change a service user password • Create and manage service groups • Duplicate or replicate a service role • Edit core service configuration files • Edit or delete a service • Explore and edit service property tree • Terminate a connection to a service • Search for services • Start, stop or restart a service • View service details

Step 1. Deploy a Host

Caution: If you include "." in a host name, the host name must also include a valid domain name.

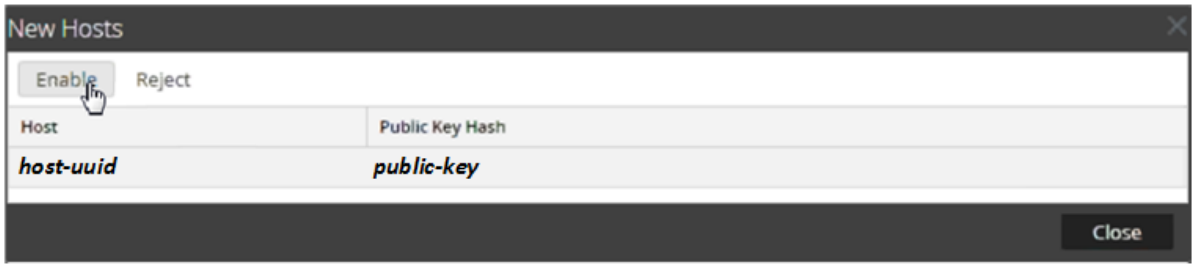
1. Deploy a host.

   You can deploy a physical host (RSA Appliance), virtual host on-prem, a virtual in AWS, or a virtual host in Azure. See the following guides for instructions on how to deploy hosts.

   - *RSA NetWitness® Platform Physical Host Deployment Guide*
   - *RSA NetWitness® Platform Virtual Host Installation Guide*
   - *RSA NetWitness® Platform AWS Installation Guide*
   - *RSA NetWitness® Platform Azure Installation Guide*
2. Go to **Administration** > **Hosts**.

   The **New Hosts** dialog is displayed with the hosts that you deployed.
3. Select the hosts that you want to enable.

   The **Enable** menu option becomes active.
4. Click **Enable**.



5. Select the host you enabled.

   The host is displayed in the Hosts view. At this point, you can install a service on the host.

Step 2. Install a Service on a Host

Perform the following steps to install a service on a host.

1. In NetWitness Platform, go to **ADMIN > Hosts**.

   The **Hosts** view is displayed.

2. Select the host on which you want to install the service (for example, **Event Stream Analysis**).

3. Click 
in the toolbar.

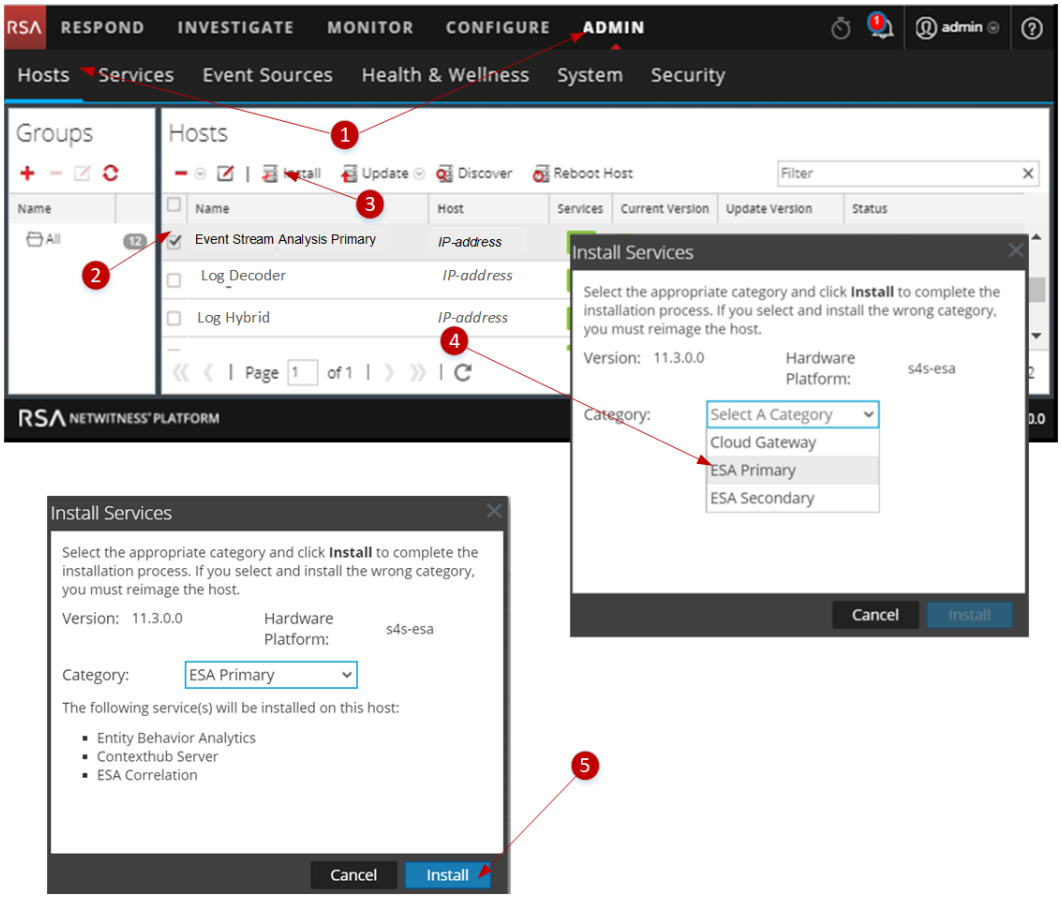
   The **Install Services** dialog is displayed.

4. Select a service from the **Host Type** drop-down list (for example, **ESA Primary**).

   The

becomes active in the **Install Services** dialog.

5. Click Install.



Step 3. Review SSL Ports for Trusted Connections

To support trusted connections each core service has two ports, an unencrypted non-SSL port and an encrypted SSL port. Trusted connections require the encrypted SSL port.

Encrypted SSL Ports

When you install or upgrade to 10.4 or later, trusted connections are established by default with two settings:

- SSL is enabled.
- Core service is connected to an encrypted SSL port.

Each NetWitness Platform Core service has two ports:

- Unencrypted **non-SSL port**
  Example: Archiver 50008
- Encrypted **SSL port**
  Example: Archiver 56008

The SSL port is the non-SSL port + 6000.

The following table lists all NetWitness Platform services with their respective ports and shows that each core service has two ports. All port numbers listed are TCP.

Category	Services	Unencrypted Non-SSL Port	Encrypted SSL Port	Notes
Admin Server	Admin Config Content Integration Investigate License Orchestration Reporting Engine Respond Security	N/A N/A N/A N/A N/A N/A N/A 51113 N/A N/A	N/A N/A N/A N/A N/A N/A N/A N/A N/A N/A	Implemented with the NW Server Implemented with the NW Server Implemented with the NW Server Implemented with the NW Server Implemented with the NW Server Implemented with the NW Server Implemented with the NW Server Implemented with the NW Server Implemented with the NW Server
Archiver	Archiver Workbench	50008 50007	56008 56007	
Broker	Broker	50003	56003	Core Service
Cloud Gateway	Cloud Gateway	N/A	N/A	
Concentrator	Concentrator	50005	56005	Core Service
Endpoint Broker	Endpoint Broker	N/A	N/A	

Category	Services	Unencrypted Non-SSL Port	Encrypted SSL Port	Notes
Endpoint Log Hybrid	Log Collector Log Decoder Endpoint Server Concentrator	50001 50002 N/A 50005	56001 56002 N/A 56005

Network Hybrid	Concentrator Decoder	50005	56005	
UEBA	UEBA	N/A	N/A	
Warehouse Connector	Warehouse Connector	50020	56020	Command line installation

Step 4. Manage Access to a Service

In a trusted connection, a service explicitly trusts the NW Server to manage and authenticate users. With this trust, services in **ADMIN > Services** no longer require credentials to be defined for every NetWitness Platform Core service. Instead, users who have been authenticated by the server can access the service without entering another password.

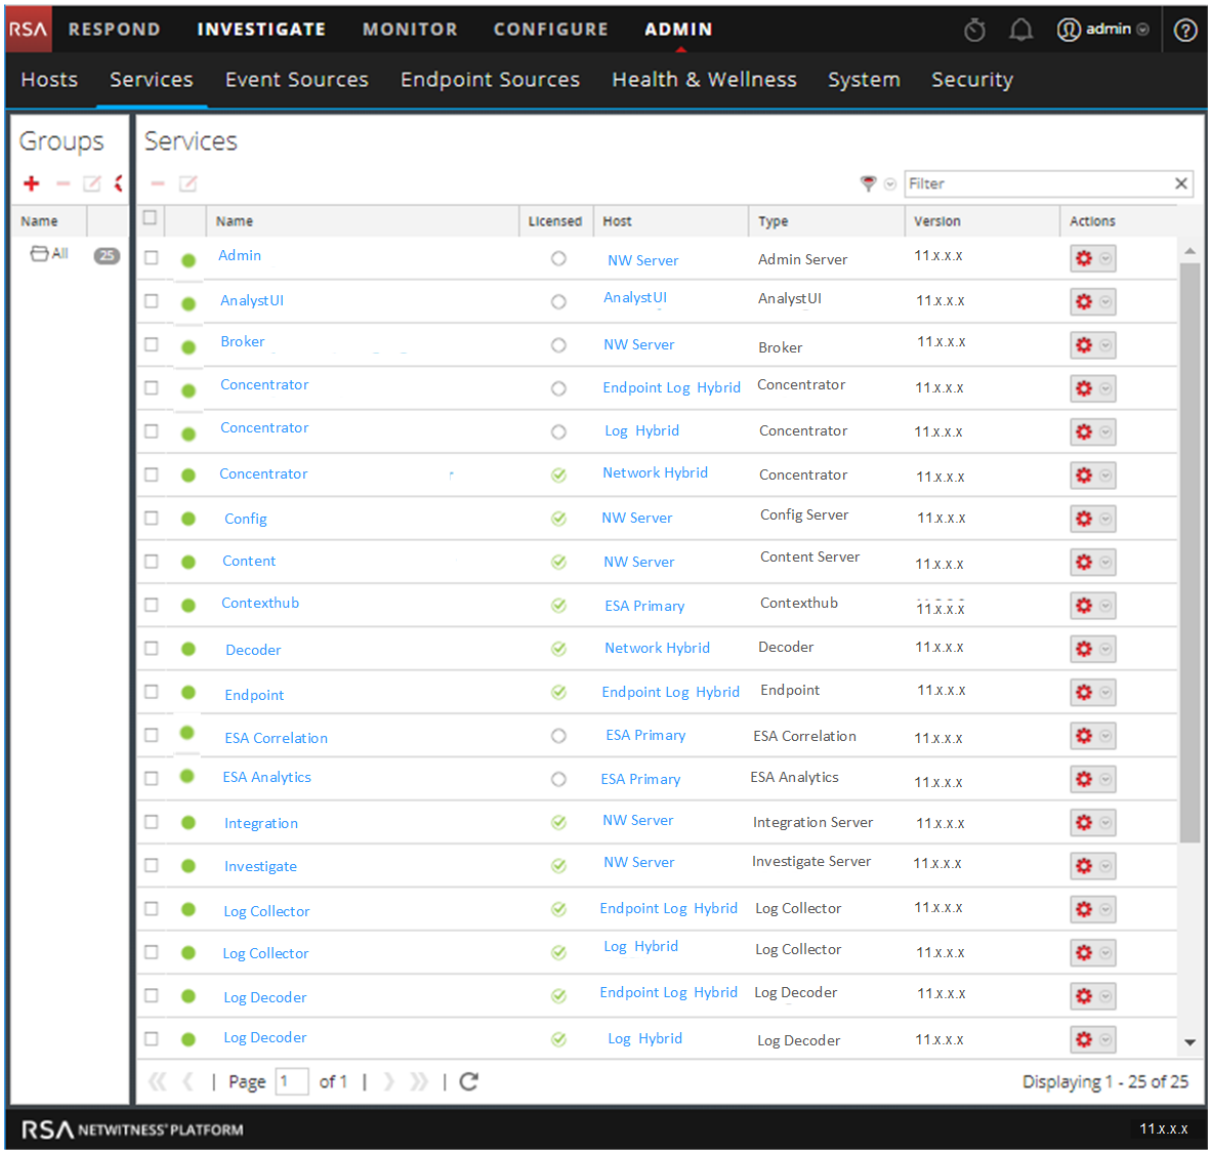
Test a Trusted Connection

Prerequisites

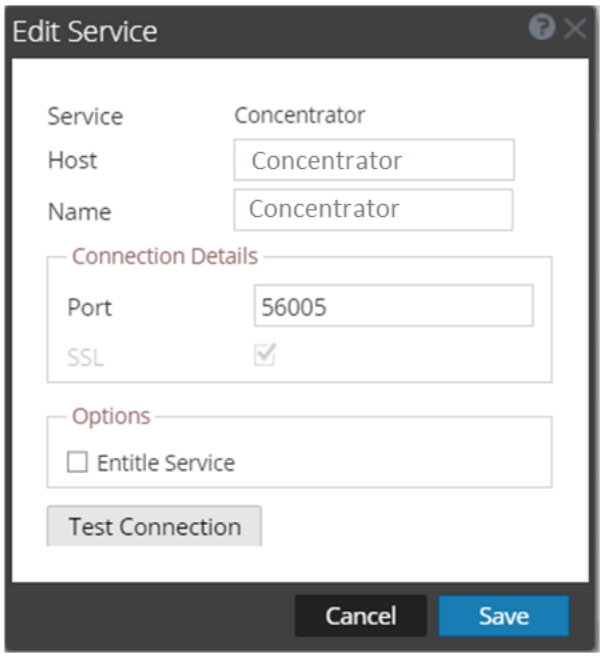
1. A role must be assigned to the user.
   For more information see **Add a User and Assign a Role** topic in the *System Security and User Management Guide*.
2. The user must:
   - Log in to NetWitness Platform for the server to authenticate the user.
   - Have access to the service.

Procedure

1. In NetWitness Platform, go to **ADMIN > Services**.
   The Services view is displayed.



2. Select the service (for example, a Concentrator) to test and click .
   The **Edit Service** dialog is displayed.



3. Remove the **Username** to test the connection without credentials.
4. Click **Test Connection**.

   The message **Test connection successful** confirms the trusted connection is established.
   The previously authenticated user can access the service without typing a username and password on the service.

5. Click **Save**.

Apply Version Updates to a Host

Complete the following tasks to update a host to a new version update.

Use the following methods to apply version updates to a host.

Note: If you have changed your location of the repository, see Set Up an External Repository with RSA and OS Updates for instructions.

- Apply updates from the Host view (Web Access)
- Apply update from the command line (No Web Access)

Apply Updates from the Hosts View (Web Access)

Task 1. Populate Local Repo or Set Up an External Repo

When you set up your NW Server, you select the Local Repository (Repo) or an External Repository (Repo). The Hosts view retrieves version updates from the repo you selected.

If you select the Local Repo, you do not need to set it up, but you must make sure that it is populated with the latest version updates. See Populate Local Repository for instructions on how to populate it with a version update.

Note: If you selected an External Repo, you must set it up. For more information on how for instructions on how to populate it with a version update see Set Up an External Repository with RSA and OS Updates .

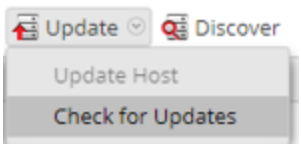
Task 2. Apply Updates from the Hosts View to Each Host

The Hosts view displays the software version updates available in your Local Update Repository and you choose and apply the updates you want from the Host view.

This procedure tells you how to update a host to a new version of NetWitness Platform.

Note: This topic uses NetWitness Platform 11.0.x.x to 11.1.0.0 as an example.

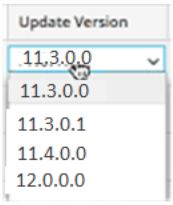
1. Log in to NetWitness Platform.
2. Go to **ADMIN > HOSTS**.
3. (Conditional) Check for the latest updates.



4. Select a host or hosts.

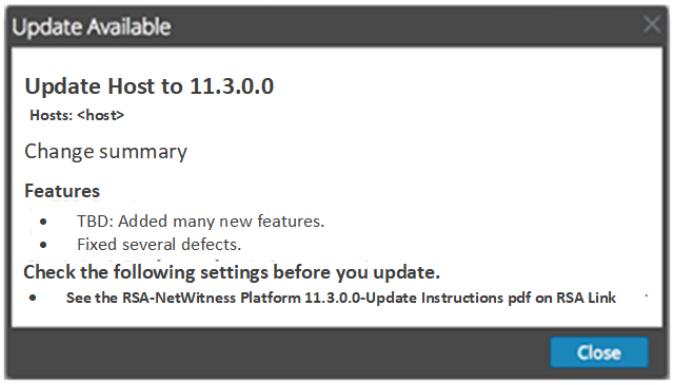
You must update the NW Server to the latest version first. You can update the other hosts in any sequence you prefer, but RSA recommends that you follow the guidelines in Running in Mixed Mode.
Update Available is displayed in the **Status** column if you have an version update in your Local Update Repository for the selected hosts.

5. Select the version you want to apply from the **Update Version** column.



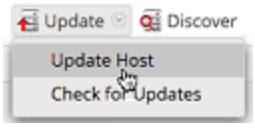
If you:

- Want to update more than one host to that version, after you update the NW Server host, select the checkbox to the left of the hosts. Only currently supported update versions are listed.
- Want to view a dialog with the major features in the update, click the ⓘ to the right of the update version number. The following is an example of this dialog.

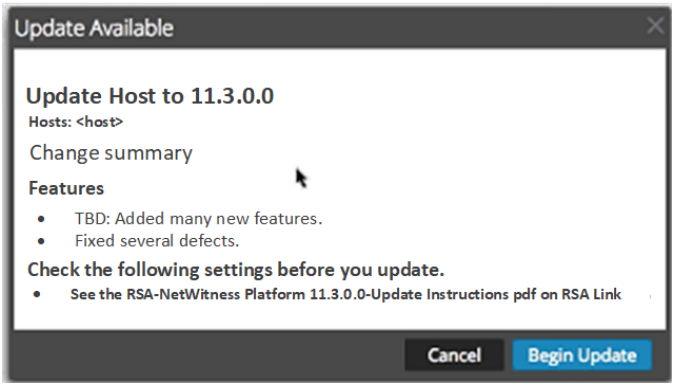


- Cannot find the version you want, select **Update > Check for Updates** to check the repository for any available updates. If an update is available, the message "New updates are available" is displayed, and the **Status** column updates automatically to show **Update Available**. By default, only supported updates for the selected host are displayed.

6. Click **Update > Update Host** from the toolbar.



A dialog is displayed with information on the selected update. Click **Begin Update**.



The **Status** column tells you what is happening in each of the following stages of the update:

- Stage 1 - **Downloading update packages** - downloads the repository artifacts to the NW Server applicable to the services on the host you chose.
- Stage 2 - **Configuring update packages** - configures update files in to correct format.
- Stage 3 - **Update in progress** - updates host to the new version.

7. When you see **Update in progress**, refresh the browser.

   This may display the NetWitness Log In screen from which you log in again and navigate back to the Host view.

   After the host is updated, NetWitness Platform prompts you to **Reboot Host**.

8. Click **Reboot Host** from the toolbar.

   NetWitness Platformshows the status as **Rebooting...** until the host comes back online and the **Status** shows **Up-to-Date**. Contact Customer Care if the host does not come back online.

Note: If you have the Defense Information Systems Agency Security Technical Implementation Guide (DISA STIG) enabled, opening core services can take approximately 5 to 10 minutes. This delay is caused by the generation of new certificates.

Apply Updates from the Command Line (No Web Access)

If your NetWitness Platform deployment does not have Web access, complete the following procedure to apply a version update.

Note: In the following procedure, 11.1.0.0 is the version update used as an example in the code strings.

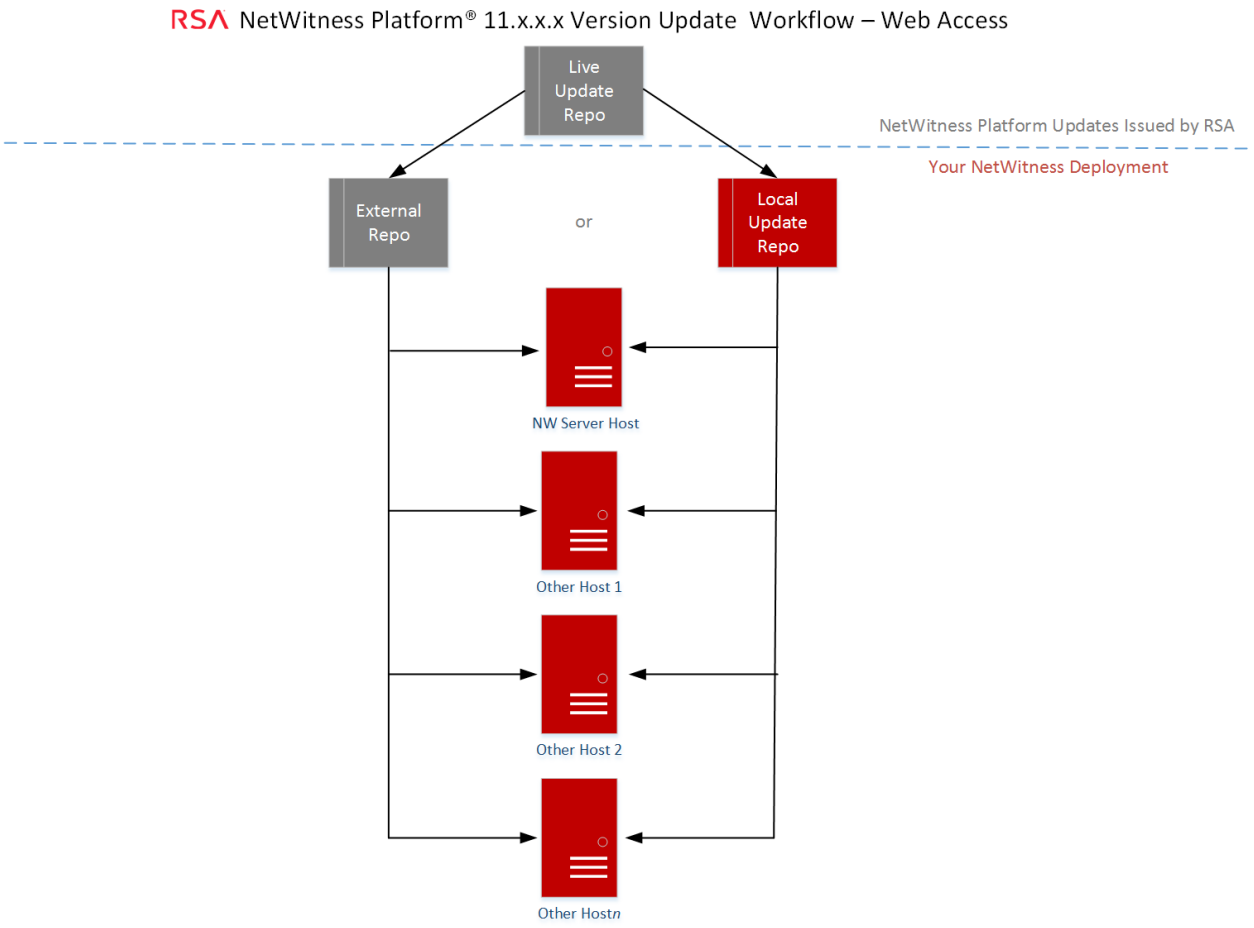
1. Download `.zip` update package for the version you want (for example, `netwitness-11.1.0.0.zip`) from RSA Link to a local directory.
2. SSH to the NW Server host.
3. Make a `/tmp/upgrade/<version>` staging directory for the version you want (for example, `tmp/upgrade/11.1.0.0`).
   ```
   mkdir -p /tmp/upgrade/11.1.0.0
   ```

4. Copy the `.zip` update package a directory on the to the NW Server other than the staging directory (for example `/tmp` directory).
5. Unzip the package into the staging directory you created (for example, `/tmp/upgrade/11.1.0.0`).
   ```
   unzip /<download-location>/netwitness-11.1.0.0.zip -d /tmp/upgrade/11.1.0.0
   ```
6. Initialize the update on the NW Server.
   ```
   upgrade-cli-client --init --version 11.1.0.0 --stage-dir /tmp/upgrade/
   ```
7. Apply the update to the NW Server.
   ```
   upgrade-cli-client --upgrade --host-addr <NW Server IP> --version 11.1.0.0
   ```
8. Log in to NetWitness Platform and reboot the NW Server host in the Host View.
9. Apply update to each non-NW Server host.
   ```
   upgrade-cli-client --upgrade --host-addr <non-NW Server IP address> --
   version 11.1.0.0
   ```
   The update is complete when the polling is completed.
10. Log in to NetWitness Platform and reboot the host in the Host View.
    You can verify the version applied to the host with the following command:
    ```
    upgrade-cli-client --list
    ```

Populate Local Update Repository

NetWitness Platform sends version updates to the Local Update Repository from the Live Update Repository. Access to the Live Update Repository requires and uses the Live Account credentials configured under **ADMIN > System > Live**. In addition, you must check the `Automatically download information about new updates every day` checkbox under **ADMIN > System > Updates** to populate the Local Repo daily.

The following diagram illustrates how you obtain version updates if your NetWitness Platform deployment has Web Access.



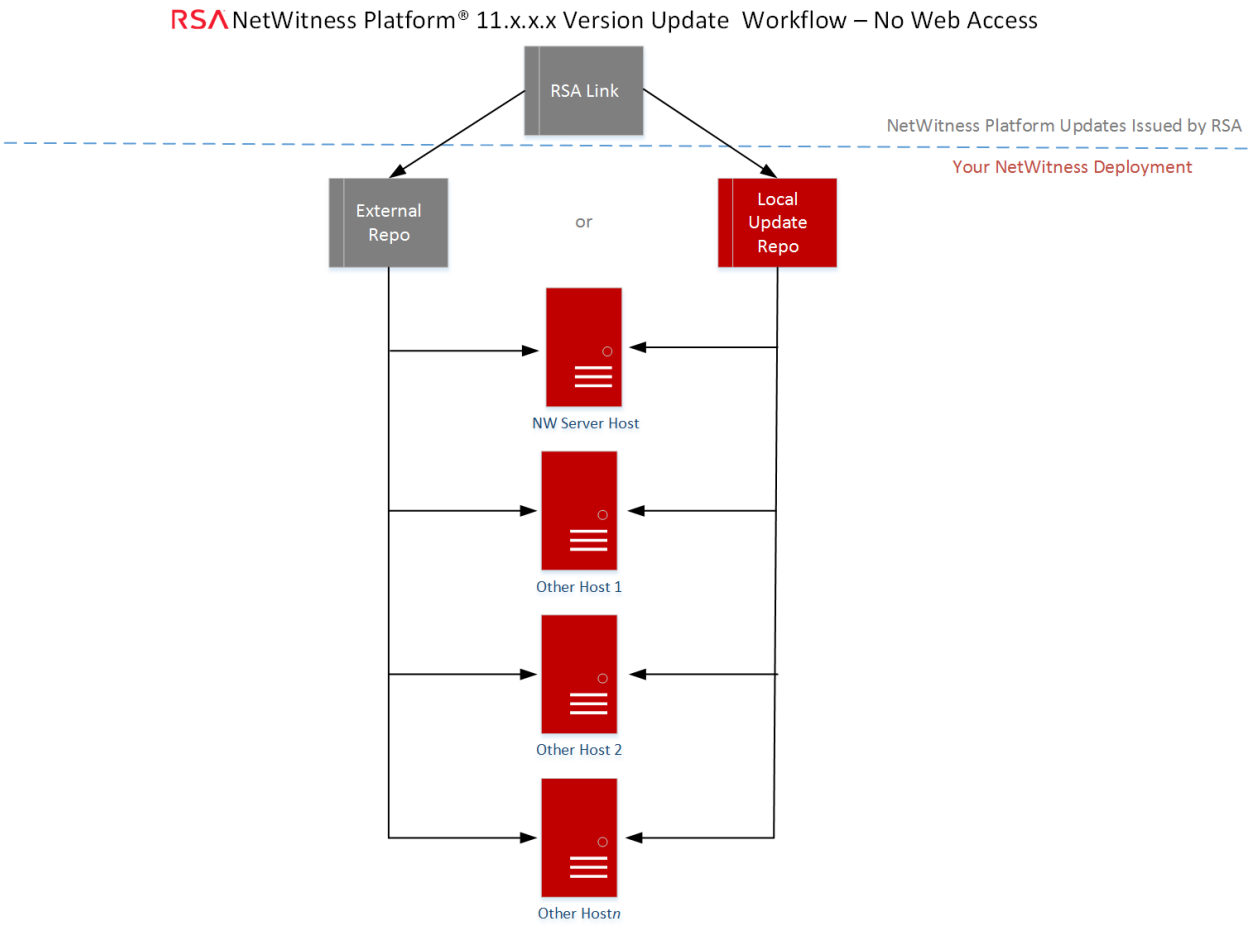
Note: When you make the initial connection with the Live Update Repository, you will be accessing all the CentOS 7 system packages and the RSA Production packages. This download of over 2.5 GB of data takes an indeterminate amount of time depending on your NW Server Internet connection and the traffic of the RSA Repository. It is not mandatory to use the Live Update Repository. Alternatively you can use an External Repo.

To connect to the Live Update Repository, go to the ADMIN > System view, select **Live Services** in the options panel and make sure that credentials are configured (**Connection** light should be green). If it is not green, click **Sign In** and connect.

Note: If you need to use proxy to reach out to the Live Update Repository, you can configure the Proxy Host, Proxy Username, and Proxy Password. For more information see "Configure Proxy forNetWitness Platform" in the *System Configuration Guide*.

See Apply Updates from the Command Line (No Web Access) if your NetWitness Platform deployment does not have Web Access.

The following diagram illustrates how you obtain version updates if your NetWitness Platform deployment does not have Web Access.



Set Up an External Repository with RSA and OS Updates

Note: In the following procedure, 11.1.0.0 is the version update used as an example in the code strings.

Complete the following procedure to set up an external repository (Repo).

Note: 1.) You need an unzip utility installed on the host to complete this procedure. 2.) You must know how to create a web server before you complete the following procedure.

1. (Conditional) Complete this step if you have an external repo and you want to override it.
   - Case 1: You bootstrapped the host from an external repo and you want to upgrade using a local repo on the Admin Server.
     a. Create the `/etc/netwitness/platform/repobase` file.
        `vi /etc/netwitness/platform/repobase`
     b. Edit the `repobase` file so that the only information in the file is the following URL.

```
https://nw-node-zero/nwrpmrepo
```

c. Complete the instructions on how to run the upgrade using the `upgrade-cli-client` tool.

- Case 2: You bootstrapped the host from local repo on the Admin server (NW Server host) and you want to use an external repo for the upgrade.

  a. Create the `/etc/netwitness/platform/repobase` file.
  ```
  vi /etc/netwitness/platform/repobase
  ```

  b. Edit the `repobase` file so that the only information in the file is the following URL.
  ```
  https://<webserver-ip>/<alias-for-repo>
  ```

  c. Complete the instructions on how to run the upgrade using the `upgrade-cli-client` tool. The instructions are in the Apply Updates from the Command Line (No Web Access).

2. Set up the external repo.

   a. Log in to the web server host.

   b. Create directory to host the NW repository (`netwitness-11.3.0.0.zip`), for example `ziprepo` under `web-root` of the web server. For example, /var/netwitness is the web-root, run the following command string.
   ```
   mkdir -p /var/netwitness/<your-zip-file-repo>
   ```

   c. Create the 11.3.0.0 directory under `/var/netwitness/<your-zip-file-repo>`.
   ```
   mkdir -p /var/netwitness/<your-zip-file-repo>/11.3.0.0
   ```

   d. Create the `OS` and `RSA` directories under `/var/netwitness/<your-zip-file-repo>/11.3.0.0`.
   ```
   mkdir -p /var/netwitness/<your-zip-file-repo>/11.3.0.0/OS
   mkdir -p /var/netwitness/<your-zip-file-repo>/11.3.0.0/RSA
   ```

   e. Unzip the `netwitness-11.3.0.0.zip` file into the `/var/netwitness/<your-zip-file-repo>/11.3.0.0` directory.
   ```
   unzip netwitness-11.3.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.3.0.0
   ```
   Unzipping `netwitness-11.3.0.0.zip` results in two zip files (`OS-11.3.0.0.zip` and `RSA-11.3.0.0.zip`) and some other files.

f. Unzip the:
`OS-11.3.0.0.zip` into the `/var/netwitness/<your-zip-file-repo>/11.3.0.0/OS` directory.
`unzip /var/netwitness/<your-zip-file-repo>/11.3.0.0/OS-11.3.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.3.0.0/OS`
The following example illustrates how the Operating System (OS) file structure appears after you unzip the file.

Parent Directory		-
GeoIP-1.5.0-11.el7.x86_64.rpm	20-Nov-2016 12:49	1.1M

h. (Conditional - For Azure) Follow these steps for Azure update.

   i. `mkdir -p /var/netwitness/<your-zip-file-repo>/11.3.0.0/OS/other`

   ii. `unzip nw-azure-11.3-extras.zip -d /var/netwitness/<your-zip-file-repo>/11.3.0.0/OS/other`

   iii. `cd /var/netwitness/<your-zip-file-repo>/11.3.0.0/OS`

   iv. `createrepo`

i. Use the `http://<web server IP address>/<your-zip-file-repo>` in response to **Enter the base URL of the external update repositories** prompt from NW 11.3.0.0 Setup program (`nwsetup-tui`) prompt.

Create and Manage Host Groups

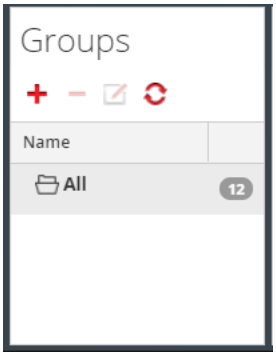
The Hosts view provides options for creating and managing groups of hosts. The Groups panel toolbar includes options for creating, editing, and deleting host groups. Once groups are created, you can drag individual hosts from the Hosts panel into a group.

Groups may reflect functional, geographical, project-oriented, or any other organization principle that is useful. A host may belong to more than one group. Here are some examples of possible groupings:

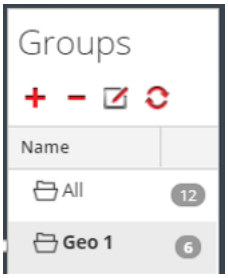
- Group different host types to make it easier to configure and monitor all Brokers, Decoders, or Concentrators.
- Group hosts that are part of the same data flow; for example, a Broker, and all associated Concentrators and Decoders.
- Group hosts according to their geographic region and location within the region. If a major power outage occurs in a location, potentially affected hosts are easily identifiable.

Create a Group

1. Select **ADMIN** > **Hosts**.
   The Hosts view is displayed.
2. In the **Groups** panel toolbar, click +.
   A field for the new group opens with a blinking cursor.



3. Type the name of the new group in the field (for example, **Geo 1**) and press **Enter**.
   The group is created as a folder in the tree. The number next to the group indicates the number of hosts in that group.



Change the Name of a Group

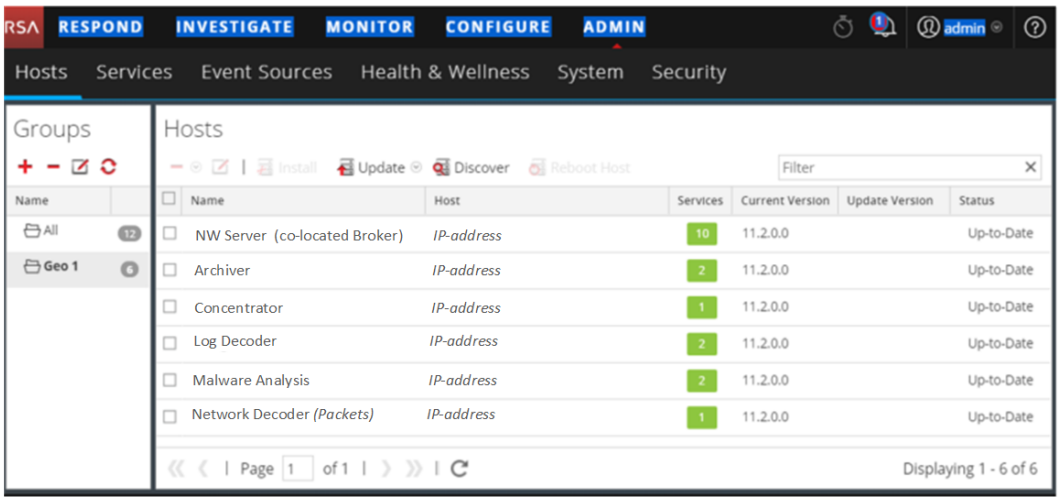
1. In the Hosts view **Groups** panel, double-click the group name or select the group and click .
   The name field opens with a blinking cursor.
2. Type the new name of the group and press **Enter**.
   The name field closes and the new group name is displayed in the tree.

Add a Host to a Group

In the Hosts view **Hosts** panel, select a host and drag the host to a group folder in the Groups panel. The host is added to the group.

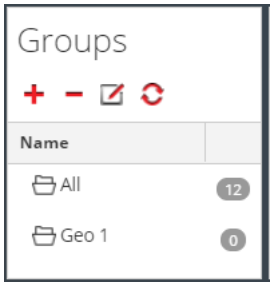
View the Hosts in a Group

To view the hosts in a group, click the group in the **Groups panel**.
The **Hosts panel** lists the hosts in that group.



Remove a Host from a Group

1. In the Hosts view **Groups panel**, select the group that contains the host that you want to remove. The hosts in that group appear in the Hosts panel.
2. In the **Hosts panel**, select one or more hosts that you want to remove from the group, and in the toolbar, select > **Remove from Group**.
   The selected hosts are removed from the group, but are not removed from the NetWitness Platform user interface. The number of hosts in the group, which is listed near the group name, decreases by the number of hosts removed from the group. The **All** group contains the hosts that were removed from the group.
   In the following example, the host group called **Geo 1** does not contain any hosts, because all the hosts in that group are removed.



Delete a Group

1. In the Hosts view **Groups panel**, select the group that you want to delete.
2. Click .
   The selected group is removed from the Groups panel. The hosts that were in the group are not removed from the NetWitness Platform user interface. The **All** group contains the hosts from the deleted group.

Search for Hosts

You can search for hosts from a list of hosts in the Hosts view. The Hosts view enables you quickly filter the list of hosts by Name and Host. It is possible to have numerous NetWitness Platform hosts in use for various purposes. Instead of scrolling through the host list, you can quickly filter the host list to locate the hosts that you want to administer.

In the Services view, you can search for a service and quickly find the host that runs that service.

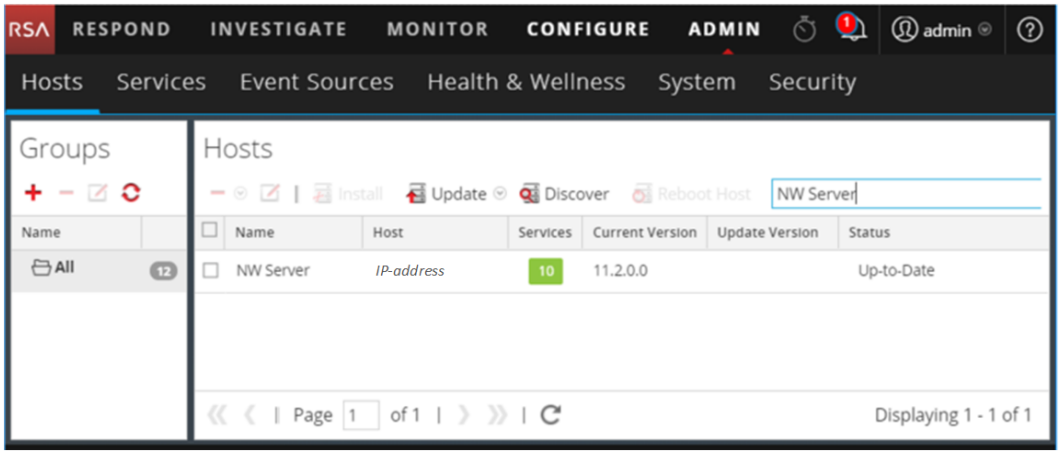
Search for a Host

1. Select **ADMIN** > **Hosts**.
2. In the **Hosts Panel** toolbar, type a host **Name** or **Hostname** in the **Filter** field.

   The Hosts panel lists the hosts that match the names entered in the Filter field.

Find the Host that Runs a Service

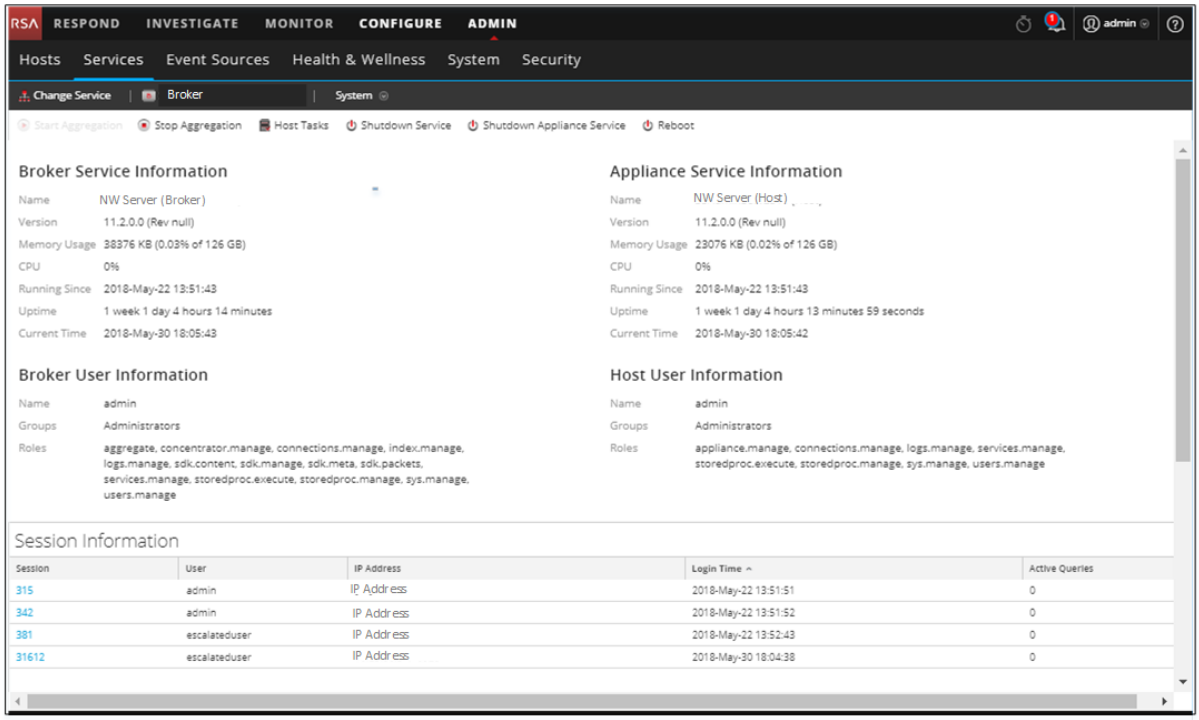
1. Select **ADMIN > Services**.
2. In the Services view, select a service. The associated host is listed in the **Host** column for that service.
3. To administer the host in the Hosts view, click the link in the **Host** column for that service. The host associated with the selected service is displayed in the Hosts view.



Execute a Task From the Host Task List

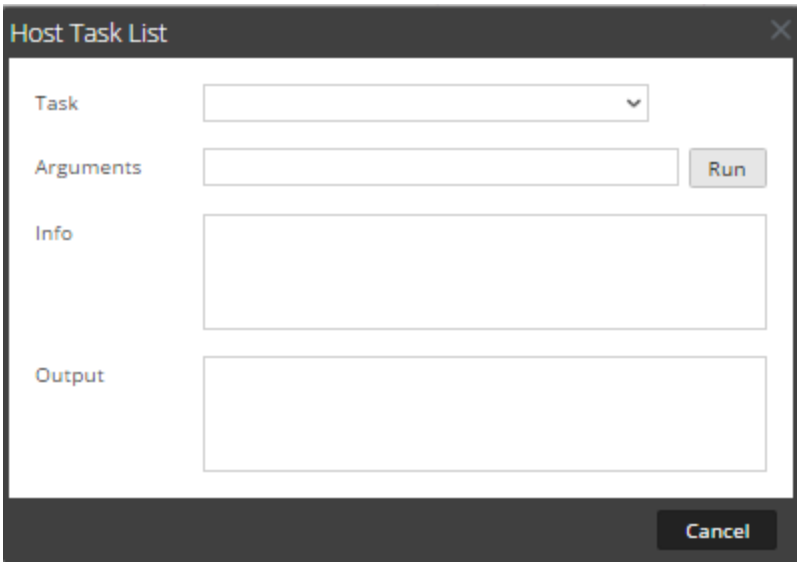
1. Select **ADMIN > Services**.
2. In the **Services** grid, select a service and click > **View** > **System**.

Note: The Admin, Config, Orchestration, Security, Investigate, and Respond services do have access to the System view. They only have access to the Explore view.
The System view for the service is displayed.

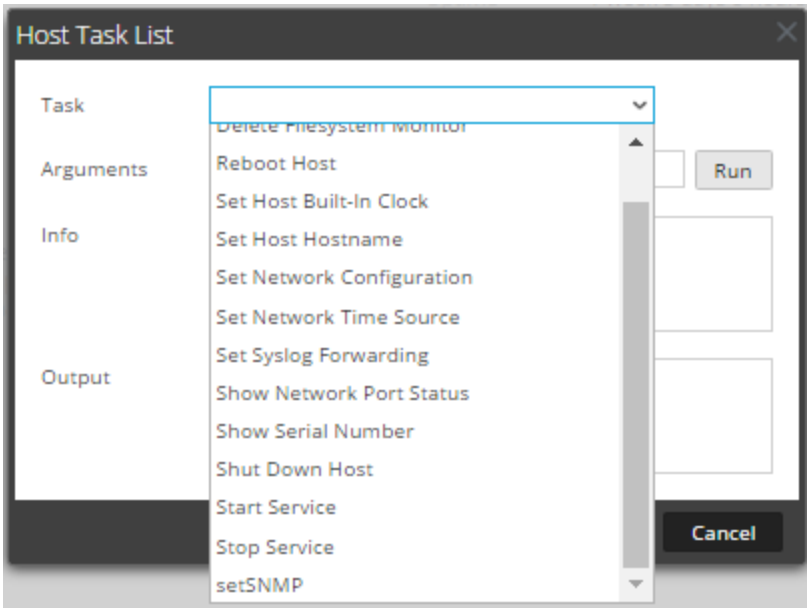


3. In the **Services System** view toolbar, click

.

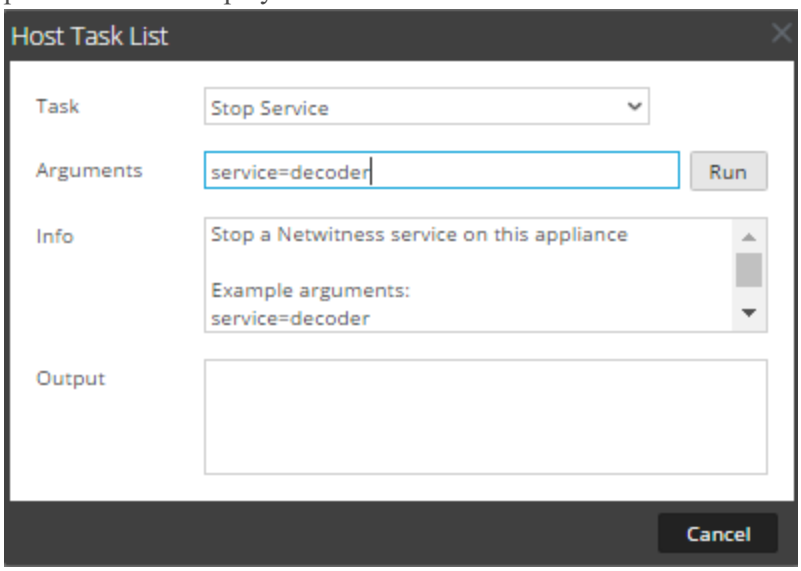


4. In the **Host Task List,** click in the **Task** field to display a drop-down list of tasks that run on a host.



5. Select a task; for example, click **Stop Service**.
   The task is displayed in the **Task** field and task description, example arguments, security roles, and

parameters are displayed in the **Info** area.



6. Type arguments if necessary and click **Run**.
   The command executes and the result is displayed in the **Output** section.

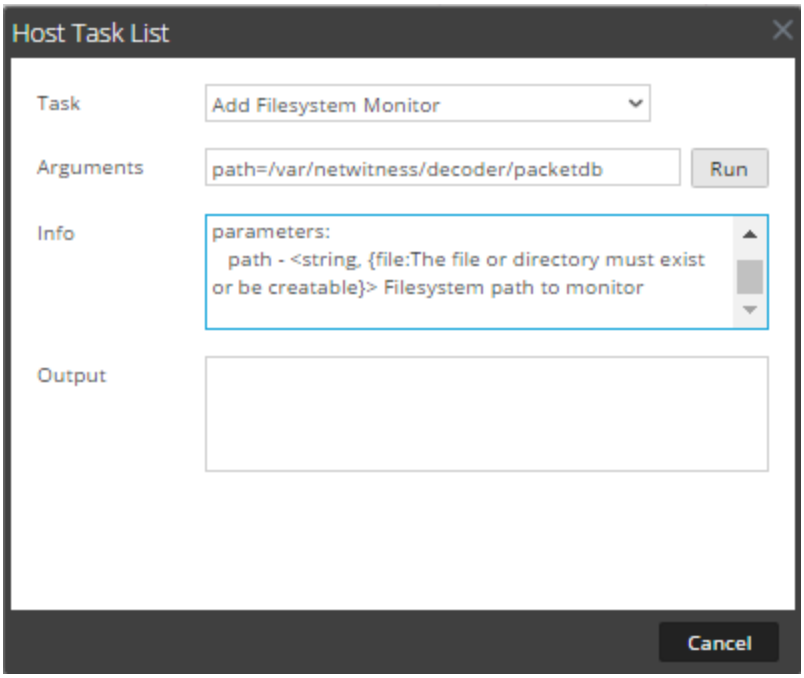
Add and Delete a Filesystem Monitor

When you want a service to monitor traffic on a specific file system, you can select the service and then specify the path. NetWitness Platform adds a filesystem monitor. Once a file system monitor is added to a service, the service continues to monitor traffic on that path until the file system monitor is deleted.

Configure the Filesystem Monitor

1. Select **ADMIN > Services**.
2. In the **Services** grid, select a service and click > **View** > **System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Add Filesystem Monitor**.
   In the **Info** area, a brief explanation of the task and the task arguments is displayed.

5. To identify the file system to monitor, type the path in the **Arguments** field. For example: **path=/var/netwitness/decoder/packetdb**

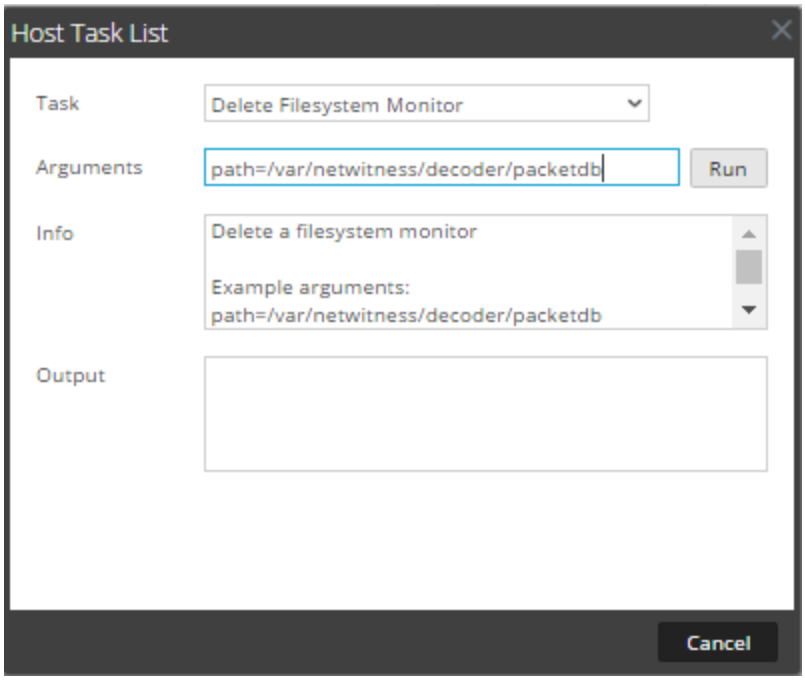


6. Click **Run**.
   The result is displayed in the **Output** area. The service begins to monitor the file system and continues to monitor it until you delete the filesystem monitor.

Delete a Filesystem Monitor

1. Navigate to the **Host Task List** dialog.
2. In the **Host Task List**, select **Delete Filesystem Monitor**.
   In the **Info** area, a brief explanation of the task and the task arguments is displayed.

3. To identify the filesystem to stop monitoring, type the path in the **Arguments** field. For example: **path=/var/netwitness/decoder/packetdb**



4. Click **Run**.
   The result is displayed in the **Output** area. The service stops monitoring the file system.

Reboot a Host

Under certain conditions, you must reboot a host; for example, after installing a software upgrade. This procedure uses a Host Task List message to shut down and restart a host.

NetWitness Platform also offers other options for shutting down a host:

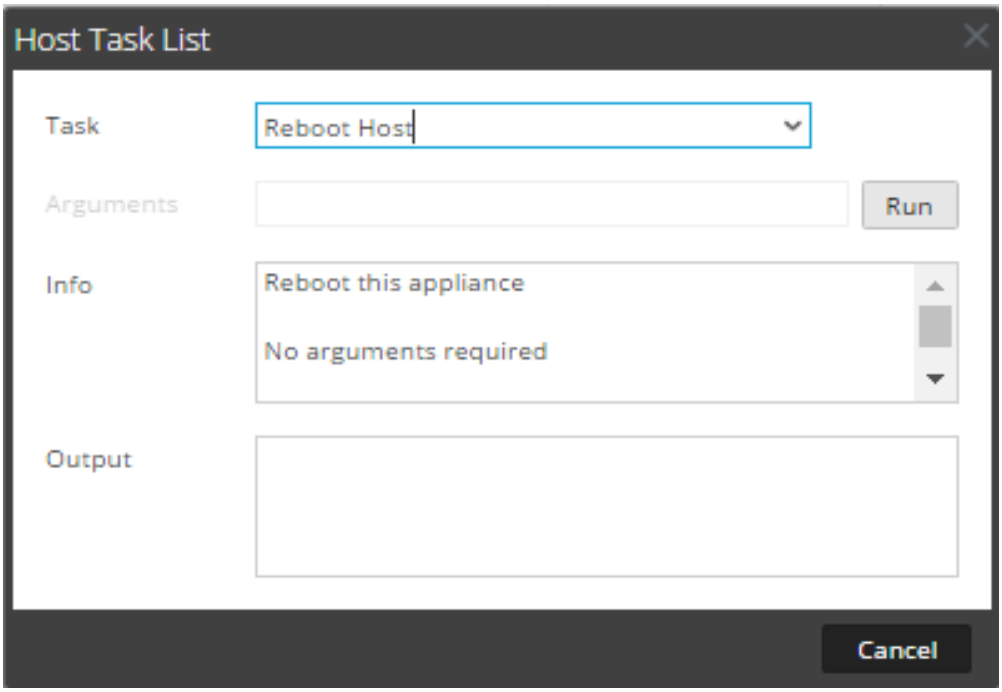
- To shut down and restart a host through an attached service, go to the Hosts view from a service in the Services view (see Search for Hosts) and then follow the *Shut Down and Restart a Host from the Hosts View* procedure below.
- To shut down the physical host without restarting, see Shut Down Host.

Shut Down and Restart a Host from the Hosts View

1. Select **ADMIN > Hosts**.
2. In the **Hosts** panel, select a host.
3. Select Reboot Host from the toolbar.

Shut Down and Restart a Host from the Host Task List

1. Select **ADMIN** > **Services**.
2. In the **Services** panel, select a service and click > **View** > **System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Reboot Host** in the **Task** field.
   No arguments are required.



5. Click **Run**.
   The host is rebooted and the result is displayed in the **Output** area.

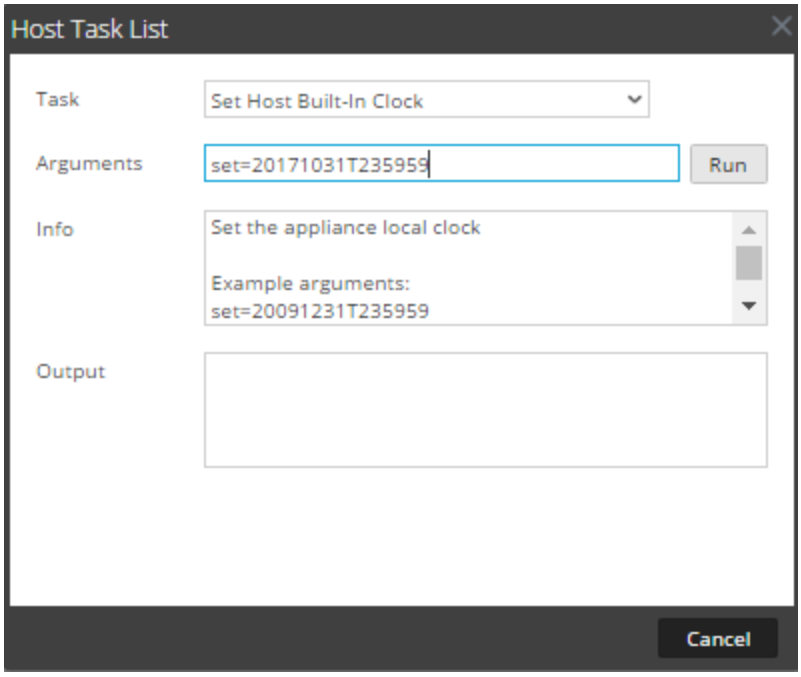
Set Host Built-In Clock

After a shutdown or battery failure, it may be necessary to set the local clock on a host. The Set Host Built-In Clock task resets the clock time.

Set the Time on the Local Clock

1. Select **ADMIN** > **Services**.
2. In the **Services** grid, select a service and > **View** > **System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.

4. In the **Host Task List**, select **Set Host Built-In Clock**. Help for the task is displayed in the **Info** area.
5. Enter the date and time arguments in the **Arguments** field; for example, to specify October 31, 2017 at 11:59:59 PM, type:
   set=20171031T235959



6. Click **Run**.
   The clock is set to the specified time and a message is displayed in the **Output** area.

Set Network Configuration

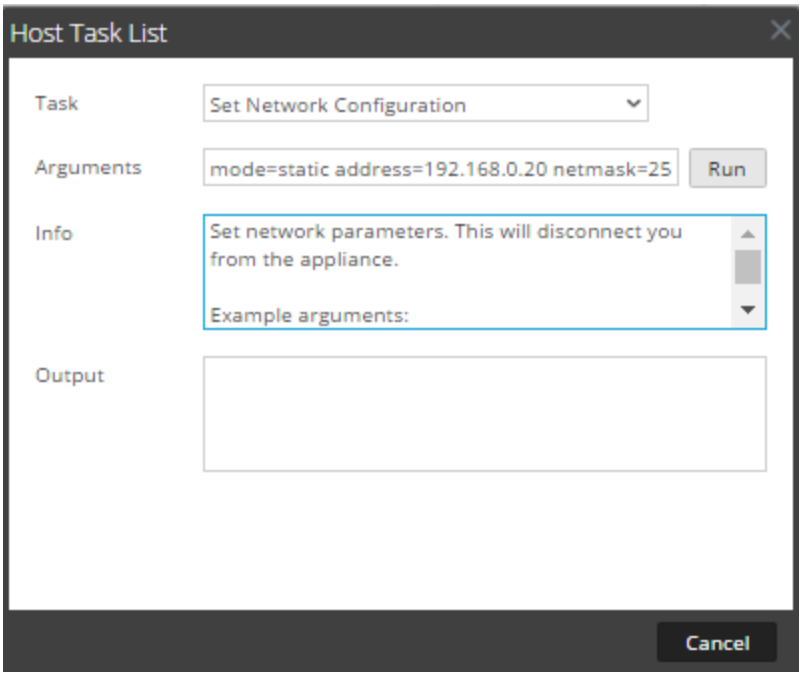
When a configured core host needs its address changed, you can set a new network address, subnet mask, and gateway for the host using the **Set Network Configuration** message in the **Host Task List**.

Caution: The change goes into effect immediately, and the host is disconnected from NetWitness Platform. You must then add the host to NetWitness Platform again using the new network address.

Specify the Network Address for a Host

1. Select **ADMIN > Services**.
2. In the **Services** grid, select a service and click > **View System**.
   The System view for the service is displayed.
3. In the **Services System view** toolbar, click **Host Tasks**.
4. In the **Host Task List**, click **Set Network Configuration**.
   The task is displayed in the **Task** field and help is displayed in the **Info** area.

5. Enter the arguments in the **Arguments** field. For example:
   mode=static address=192.168.0.20 netmask=255.255.255.0 gateway=192.168.0.1



6. Click **Run.**
   The task executes and the result is displayed in the **Output** area. The host is disconnected from NetWitness Platform. You must add the host again with the new address.

Note: If the mode is DHCP, there may be no way to determine the new address. You may have to connect to the host directly to determine the new address.

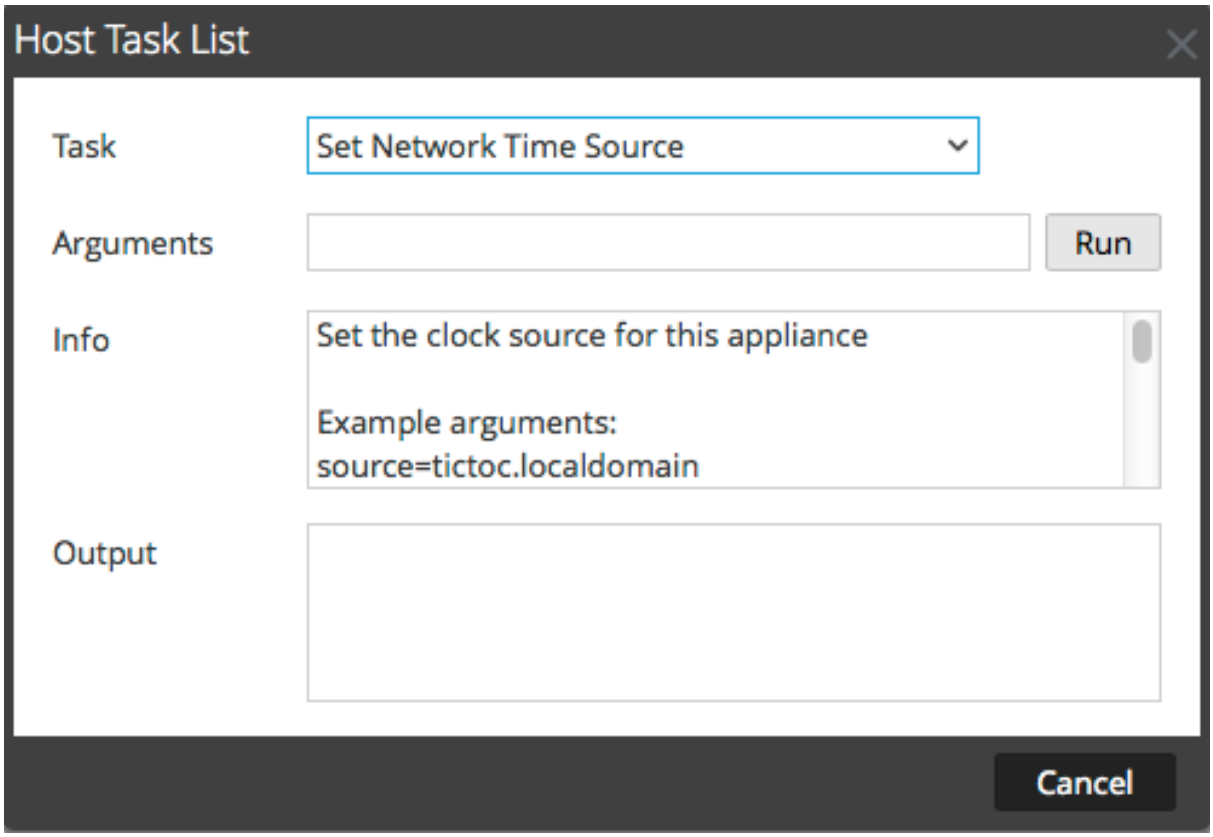
Set Network Time Source

When setting the clock source for a host, set the hostname or address of an NTP server to be the network clock source for the host. If the host is using a local clock source, you must specify **local** here to allow **Set the Local Clock Source** to be effective.

Specify the Network Clock Source

1. Select **ADMIN > Services**.
2. In the **Services** grid, select a service and click **View > System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.

4. In the **Host Task List**, select **Set Network Time Source**.



5. Do one of the following:
   - Type the hostname or address of the NTP server to serve as the clock source for this host; for example: **source=tictoc.localdomain**
   - If you want to use the host clock as a clock source, type: **source=local**

6. Click **Run**.
   The clock source is set and a message is displayed in the **Output** area.

Note: If you specified a NTP clock source of **local**, the host clock serves as the clock source and the time is configured using Set Host Built-In Clock.

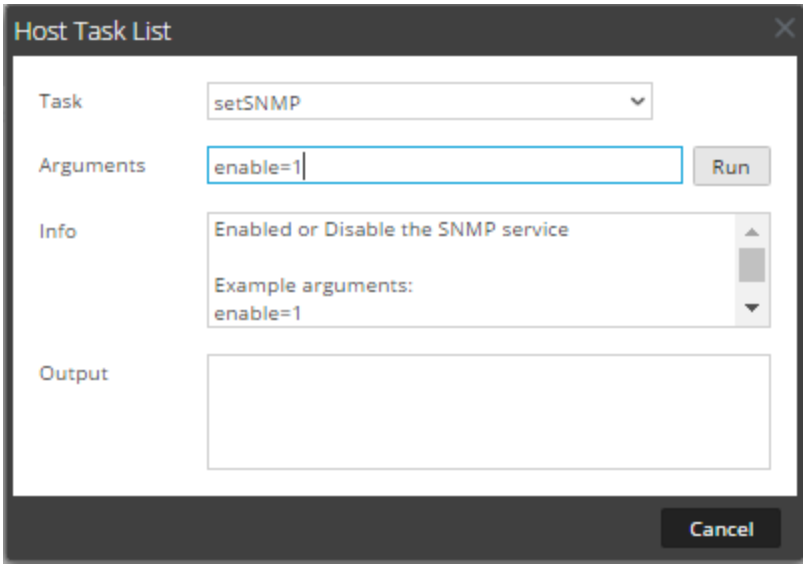
Set SNMP

Set SNMP in the Host Task List enables or disables the SNMP service on a host. For a host to receive SNMP notifications, enable the SNMP service. If you are not using SNMP for NetWitness Platform notifications, it is not necessary to enable the service.

Toggle SNMP Service on the Host

1. Select **ADMIN > Services**.
2. In the **Services** grid, select a service and click > **View** > **System**.
   The System view for the service is displayed.
3. In the **Services System view** toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **setSNMP**.
   In the **Info** area, a brief explanation of the task and the task arguments is displayed.
5. Do one of the following:
   - If you want to disable the service, type **enable=0** in the **Arguments** field.

   - If you want to enable the service, type **enable=1** in the **Arguments** field.



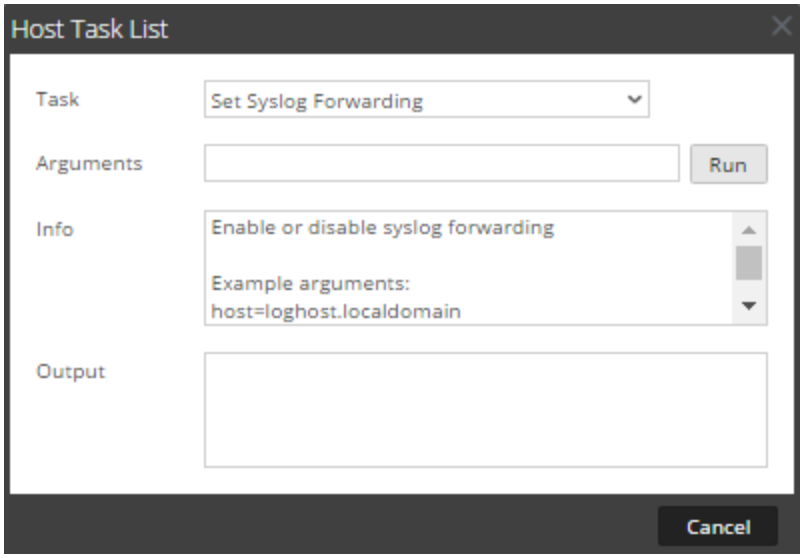
6. Click **Run**.
   The result is displayed in the **Output** area.

Set Syslog Forwarding

You can configure Syslog forwarding to forward the operating system logs of your NetWitness Platform Hosts to a remote syslog server. You can use the Set Syslog Forwarding task in the Host Task List to enable or disable syslog forwarding.

Set Up and Start Syslog Forwarding

1. Select **ADMIN > Services**.
2. In the **Services** grid, select a service and click > **View** > **System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Set Syslog Forwarding**.
   In the **Info** area, a brief explanation of the task and the task arguments is displayed.



5. In the **Arguments** field, do any one of the following.
   - To enable syslog forwarding, specify any one of the following formats:
     - **host=<loghost>.<localdomain>** (for example, host=syslogserver.local).
     - **host=<loghost>.<localdomain>:<port>** (for example, host=syslogserver.local:514).
     - **host=<IP>** (for example, host=10.31.244.244).
     - **host=<IP>:<port>** (for example, host=10.31.244.244:514).
       The following table lists the parameters used to enable syslog forwarding.

Parameter	Description
loghost	The host name of the remote syslog server.
localdomain	The domain of the remote syslog server.
port	IP address of the remote syslog server.
IP	The port number on which the remote syslog server receives a syslog messages.

- To disable syslog forwarding, type **host=disable**.

6. Click **Run**.
   The result is displayed in the **Output** area.

Once syslog forwarding is enabled or disabled, the `/etc/rsyslog.conf` file is updated automatically to enable or disable syslog forwarding to the remote syslog destination and the syslog service is restarted.

If you enable syslog forwarding, the logs from the configured service are forwarded to the defined syslog server and continues forwarding until disabled.

Note: You can now log in to the remote syslog server and verify if the messages are being received from the NetWitness Platform services configured for syslog forwarding.

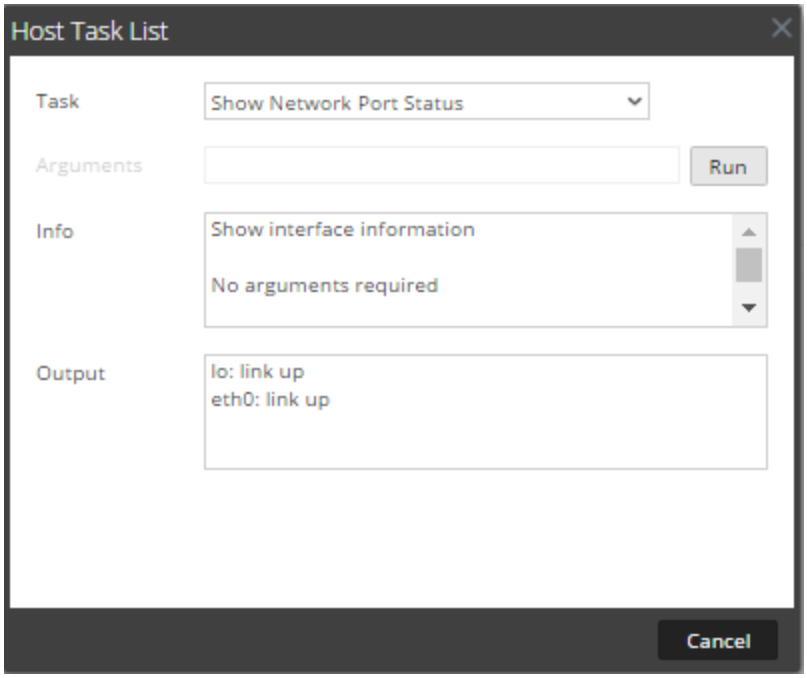
Show Network Port Status

The Show Network Port Status task in the Host Task List gives you the status of all configured ports on the host.

Display the Network Port Status

1. Select **ADMIN > Services**.
2. In the **Services** grid, select a service and > **View**> **System**.
   The System view for the selected service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, click **Show Network Port Status**.
   The task is displayed in the **Task** field, and information about the task is displayed in the **Info** area.

5. To execute the task, click **Run**.
   The status for each port on the host is displayed in the **Output** area.



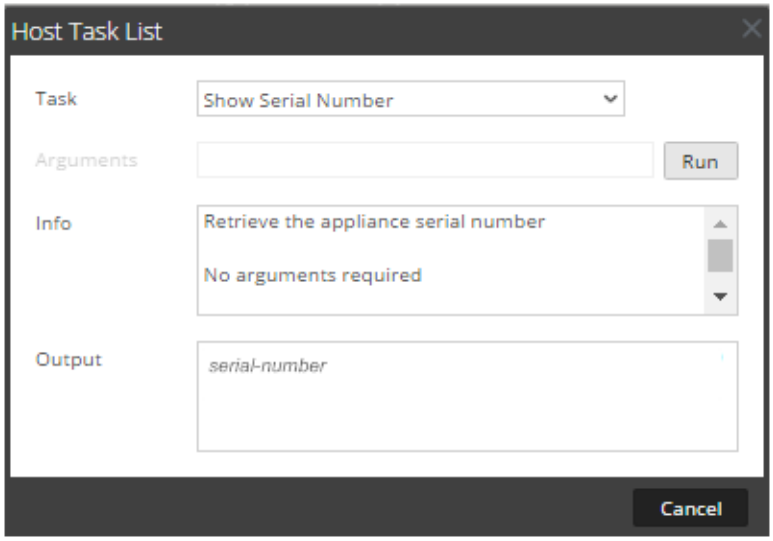
Show Serial Number

The Show Serial Number task in the Host Task List displays the serial number of a host.

Show the Serial Number

1. Select **ADMIN > Services**.
2. In the **Services** grid, select a service and click > **View> System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Show Serial Number**.
   In the **Info** area, a brief explanation of the task and the task arguments is displayed.

5. No arguments are required for this task. Click **Run**.
   The serial number of the selected host is displayed in the **Output** area.



Shut Down Host

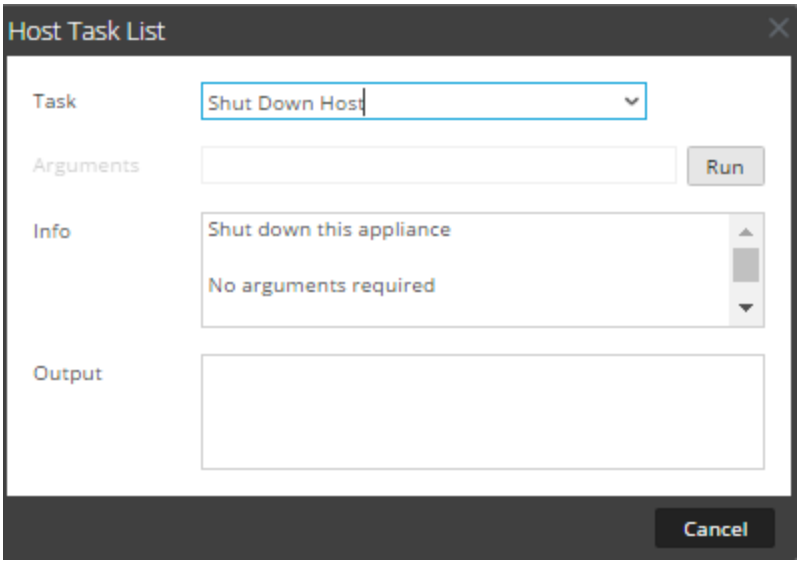
Under certain circumstances; for example, a hardware upgrade or an extended power outage that exceeds backup power capacity, it may be necessary to shut down a physical host. When you shut down a host, all services running on the host are stopped and the physical host turns off.

The physical host does not restart automatically. Use the power switch to restart the host. Once the physical host restarts, the host and services are configured to restart automatically.

Reboot a Host to start and stop a host without shutting down the host.

Shut Down the Host

1. In the Host Task List dialog, select **Shut Down Host** in the **Task** field.



2. To execute the task, click **Run**.
   The host shuts down, and the host turns off.

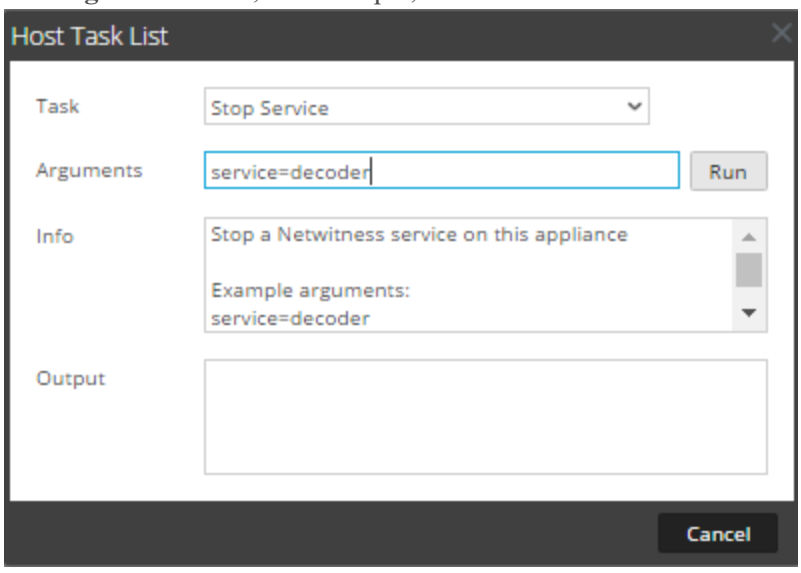
Stop and Start a Service on a Host

The Host Task List has two options for stopping and starting a service on a host. When you stop a service using the **Stop Service** message, all processes of the service are stopped and users connecting to the service are disconnected. Unless there is a problem with the service, it restarts automatically. This is the same as the **Shutdown Service** option in the Services System view.

If a service does not restart automatically after being stopped, you can restart it manually using the **Start Service** message.

Stop a Service on a Host

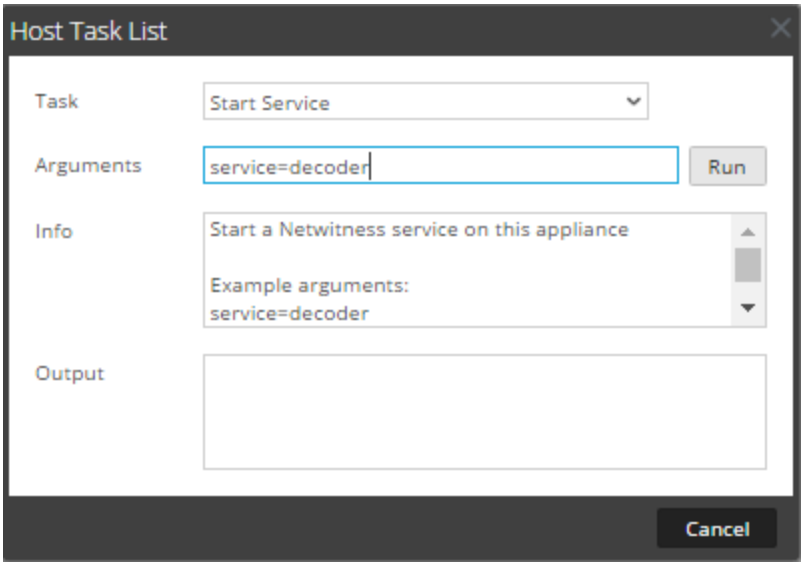
1. Select **ADMIN** > **Services**.
2. In the **Services** grid, select a service and click > **View**> **System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, click **Stop Service**.
   The task is displayed in the **Task** field, and information about the task is displayed in the **info** area.
5. Specify the service (`decoder`, `concentrator`, `broker`, `logdecoder`, `logcollector`) to stop in the **Arguments** field; for example, **service=decoder**.



6. To execute the task, click **Run**.
   The service stops and the status is displayed in the **Output** area. All processes of the service are stopped and users connecting to the service are disconnected. Unless there is a problem with the service, it restarts automatically.

Start a Service on a Host

1. In the **Host Task List**, select **Start Service** from the Task drop-down menu.
   The task is displayed in the **Task** field, and information about the task is displayed in the **info** area.
2. Specify the service (decoder, concentrator, broker, logdecoder, logcollector) to start in the **Arguments** field; for example,
   service=decoder



3. To execute the task, click **Run**.
   The service starts and the status is displayed on the **Output** area.

Add, Replicate, or Delete a Service User

You must add a user to a service for:

- Aggregation
- Accessing the service with the:
  - Thick client
  - REST API

Note: This topic does not apply to users who access services through the user interface on NetWitness Server. You must add those users to the system, not a service. For details, see the **Set Up a User** topic in *System Security and User Management*.

For each service user, you can:

- Configure user authentication and query handling properties for the service
- Make the user a member of a role, which has a set of permissions the user receives

- Replicate the user account to other services
- Change the service user password on selected services

Change a Service User Password provides instructions for changing the service user password across services.

Procedures

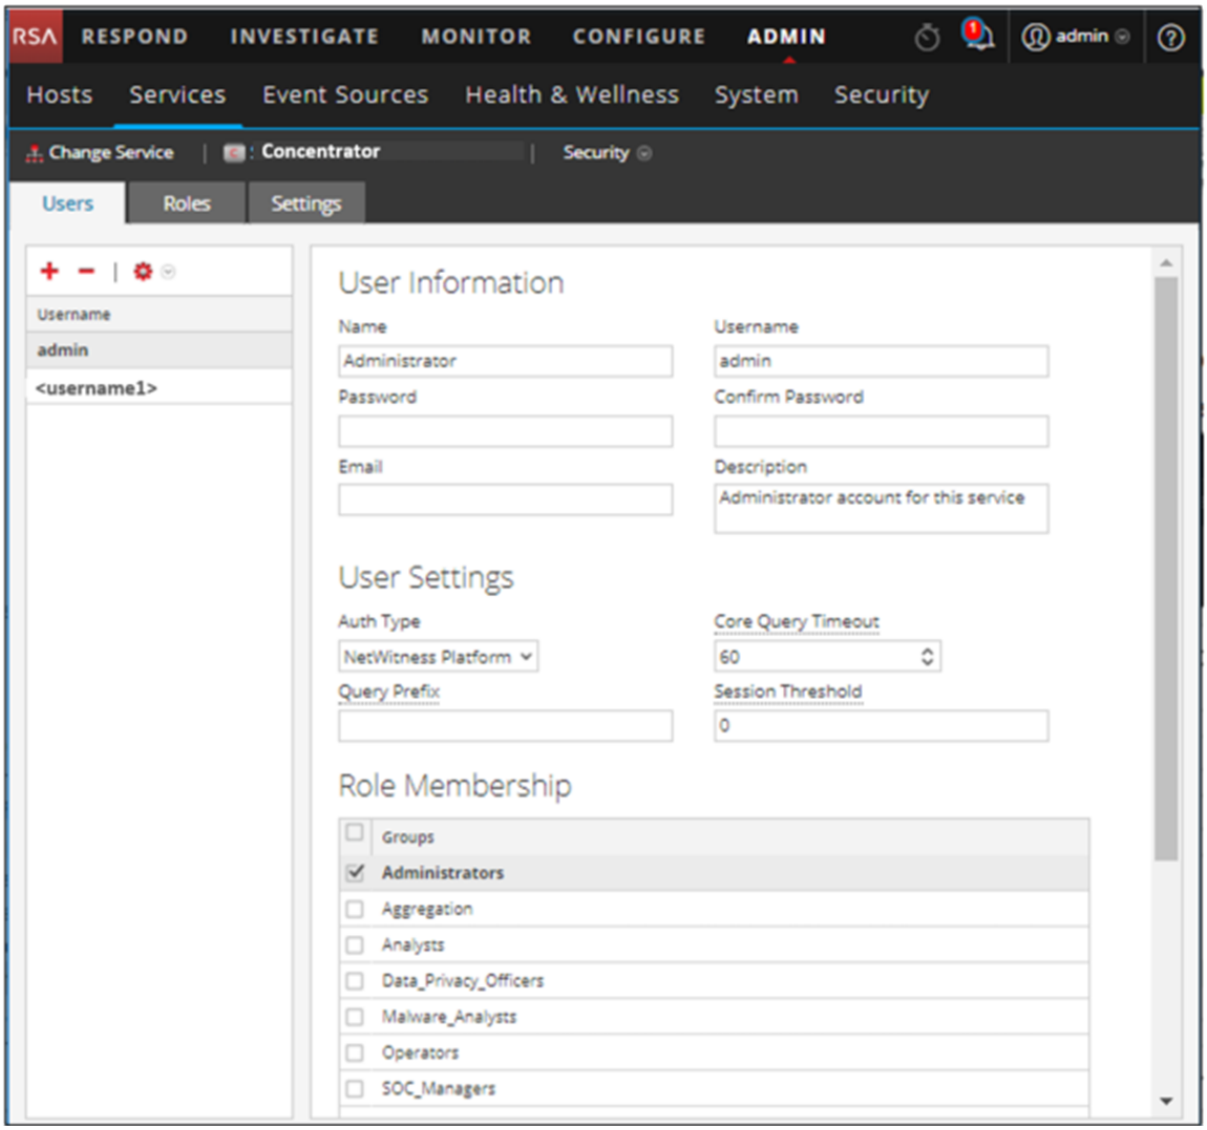
Access the Security View

Each of the following procedures starts in the Services Security view.

To navigate to the Services Security view:

1. In NetWitness Platform, go to **ADMIN > Services**.

2. Select a service, then click > **View** > **Security**.
   The Security view for the selected service is displayed with the Users tab open.



Note: For NetWitness Platform 10.4 and earlier service versions, in the User Settings section, the **Query Level** field is displayed instead of **Core Query timeout**.

Add a Service User

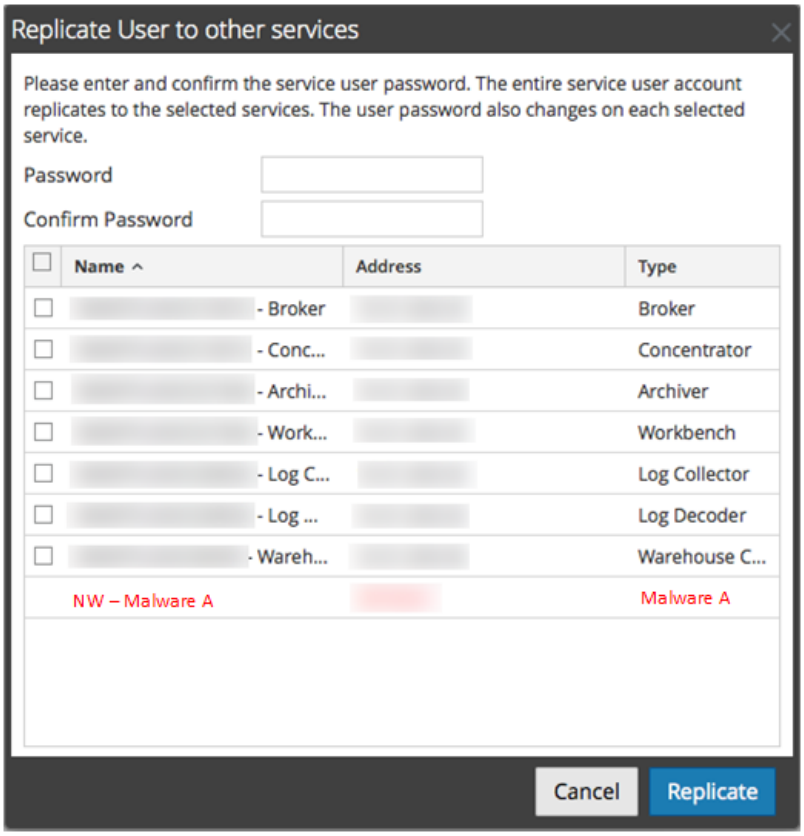
1. On the **Users** tab, click .
2. Type the user name to access the service, then press **Enter**.
   The User Information section displays the user name and the rest of the fields are available for editing.
3. Type the password for logging on to the service in the **Password** and **Confirm Password** fields.
4. (Optional) Provide additional information:

- **Name** for logging on to NetWitness Platform
- **Email** address
- **Description** of the user

5. In the User Settings section, select the following information:
   - **Authentication Type**
     - If NetWitness Platform authenticates the user, select NetWitness.
     - If Active Directory or PAM is configured on NetWitness Server to authenticate the user, select External.
   - **Core Query Timeout** is the maximum number of minutes a user can run a query on the service. This field applies to NetWitness Platform 10.5 and later service versions and does not appear for 10.4 and earlier versions.
6. (Optional) Specify additional query criteria:
   - **Query Prefix** filters queries. Type a prefix to restrict results the user sees.
   - **Session Threshold** controls how the service scans meta values to determine session counts. Any meta value with a session count that is above the threshold stops its determination of the true session count.
7. In the **Role Membership** section, select each role to assign to the user. When a user is a member of a role on a service, the user has the permissions assigned to the role.
8. To activate the new service user, click **Apply**.

Replicate a User to Other Services

1. In the Users tab, select a user and click **> Replicate**.
   The Replicate Users to Other Services dialog is displayed.



2. Enter and confirm the password.
3. Select each service to which you are replicating the user.
4. Click **Replicate**.

Delete a Service User

1. On the **Users** tab, select the **Username** and click . NetWitness Platform requests confirmation that you want to delete the selected user.
2. To confirm, click **Yes**.

Add a Service User Role

There are pre-configured roles in NetWitness Platform that are installed on the server and on each service. You can also add custom roles. The following table lists the pre-configured system roles and their permissions.

Role	Permission
Administrators	Full system access
Operators	Access to configurations but not to meta and session content
Analysts	Access to meta and session content but not to configurations

Role	Permission
SOC_ Managers	Same access as Analysts and additional permissions to handle incidents
Malware_ Analysts	Access to malware events and to meta and session content
Data_Privacy_ Officers	Access to meta and session content and configuration options that manage obfuscation and viewing of sensitive data within the system (see Data Privacy Management).

You must add a service role when you have added a:

- **Service** user or users that requires a new set of permissions.
- **Custom role on NetWitness Server** because trusted connections require that the same custom role exists both on the server and on each service the custom role will access. The names must be identical. For example, if you add a Junior Analysts role on the server then you must add a Junior Analysts role on each service the role will access. For more information, see the **Add a Role and Assign Permissions** topic in *System Security and User Management*.

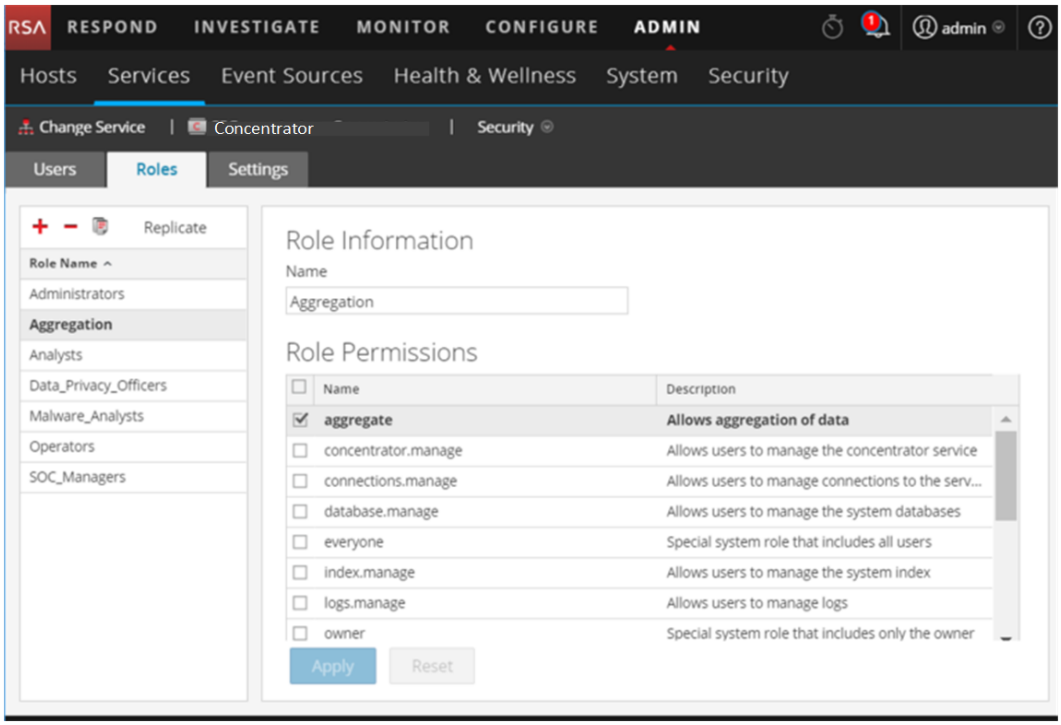
There is also a pre-configured **Aggregation** service role. Aggregation Role and Service User Roles and Permissions provide additional information.

Procedure

To add a service user role and assign permissions to it:

1. In NetWitness Platform, go to **ADMIN > Services**.
2. Select a service, then **> View > Security**.
   The Security view for the selected service is displayed with the Users tab open.

3. Select the **Roles** tab and click +.
   The Services Security view is displayed and five pre-configured roles are already listed.



4. Click +, type the **Role Name** and press **Enter**.
   The Role Name is displayed above a list of **Role Permissions**.
5. Select each permission the role will have on the service.
6. Click **Apply**.

You can add service users to it in the **Users** tab.

Change a Service User Password

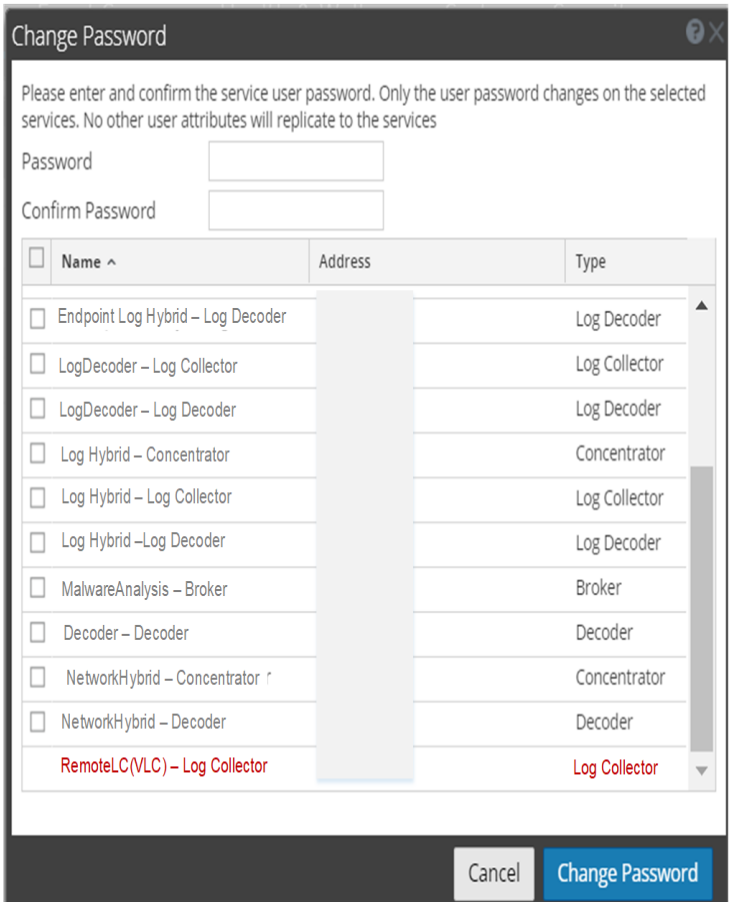
This procedure allows administrators to change the password of a service user and replicate the new password to all Core services with that user account defined. It replicates only the password change to the Core services selected and does not replicate the entire user account. Administrators can also change the password of the **admin** account on the Core services.

Note: The Change Password option does not apply to external users.

To change the password of a service user:

1. In NetWitness Platform, go to **ADMIN > Services**.
   The Administration Services view is displayed.
2. Select a service, then click **> View > Security**.
   The Security view for the selected services is displayed.

3. In the **Users** tab, select a user and select **Change Password** from the actions icon.
   The **Change Password** dialog is displayed.



4. Type a new password for the user and confirm the password.
5. Select the services where you want the user password to change.
6. Click **Change Password**.
   The status of the password change on the selected services is displayed.

Create and Manage Service Groups

The Administration Services view provides options to create and manage groups of services. The Services panel toolbar includes options to create, edit, and delete service groups. Once groups are created, you can drag individual services from the Services panel into a group.

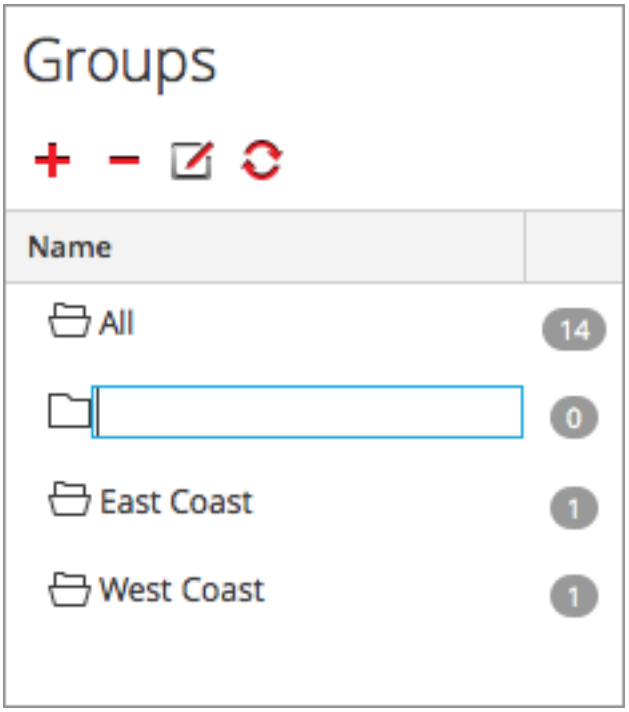
Groups may reflect functional, geographical, project-oriented, or any other organization principle that is useful. A service may belong to more than one group. Here are some examples of possible groupings.

- Group different service types to make it easier to configure and monitor all Brokers, Decoders, or Concentrators.

- Group services that are part of the same data flow; for example, a Broker, and all associated Concentrators and Decoders.
- Group services according to their geographic region and location within the region. If a major power outage occurs in a location, potentially affected services are easily identifiable.

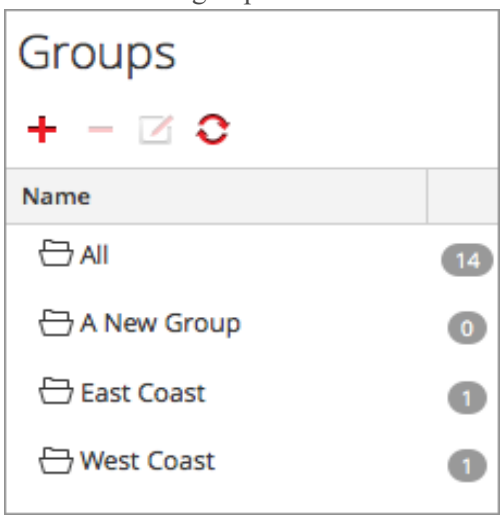
Create a Group

1. In NetWitness Platform, go to **ADMIN** > **Services**.
   The Administration Services view is displayed.
2. In the **Groups** panel toolbar, click +.
   A field for the new group opens with a blinking cursor.



3. Type the name of the new group in the field (for example, **A New Group**) and press **Enter**.
   The group is created as a folder in the tree. The number next to the group indicates the number of

services in that group.



Change the Name of a Group

1. In the **Services** view **Groups** panel, double-click the group name or select the group and click .
   The name field opens with a blinking cursor.
2. Type the new name of the group and press **Enter**.
   The name field closes and the new group name is displayed in the tree.

Add a Service to a Group

In the Services view **Services** panel, select a service and drag the service to a group folder in the groups panel; for example, **Log Collectors**.
The service is added to the group.

View the Services in a Group

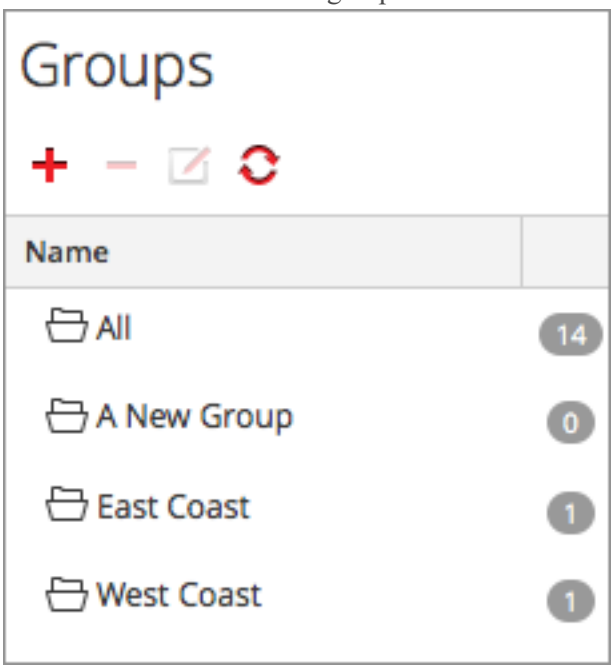
To view the services in a group, click the group in the **Groups** panel.

The **Services** panel lists the services in that group.

Remove a Service from a Group

1. In the Services view **Groups** panel, select the group that contains the service that you want to remove. The services in that group appear in the Services panel.
2. In the **Services** panel, select one or more services that you want to remove from the group, and in the toolbar, select > **Remove from Group**.
   The selected services are removed from the group, but are not removed from the NetWitness Platform user interface. The number of services in the group, which is listed near the group name, decreases by the number of services removed from the group. The **All** group contains the services that are removed from the group.
   In the following example, the service group called **A New Group** does not contain any services,

because the service in that group is removed.



Delete a Group

1. In the Services view **Groups** panel, select the group that you want to delete.
2. Click .
   The selected group is removed from the Groups panel. The services that were in the group are not removed from the NetWitness Platform user interface. The **All** group contains the services from the deleted group.

Duplicate or Replicate a Service Role

An efficient way to add a new service role is to duplicate a similar role, save it with a new name and revise the permissions that are already assigned. For example, you could duplicate the Analysts role. Then, save it as **JuniorAnalysts** and modify the permissions.

The quick way to add an existing role to other services is to replicate the role. For example, you could replicate the **JuniorAnalysts** role that exists on a broker to a concentrator and log decoder.

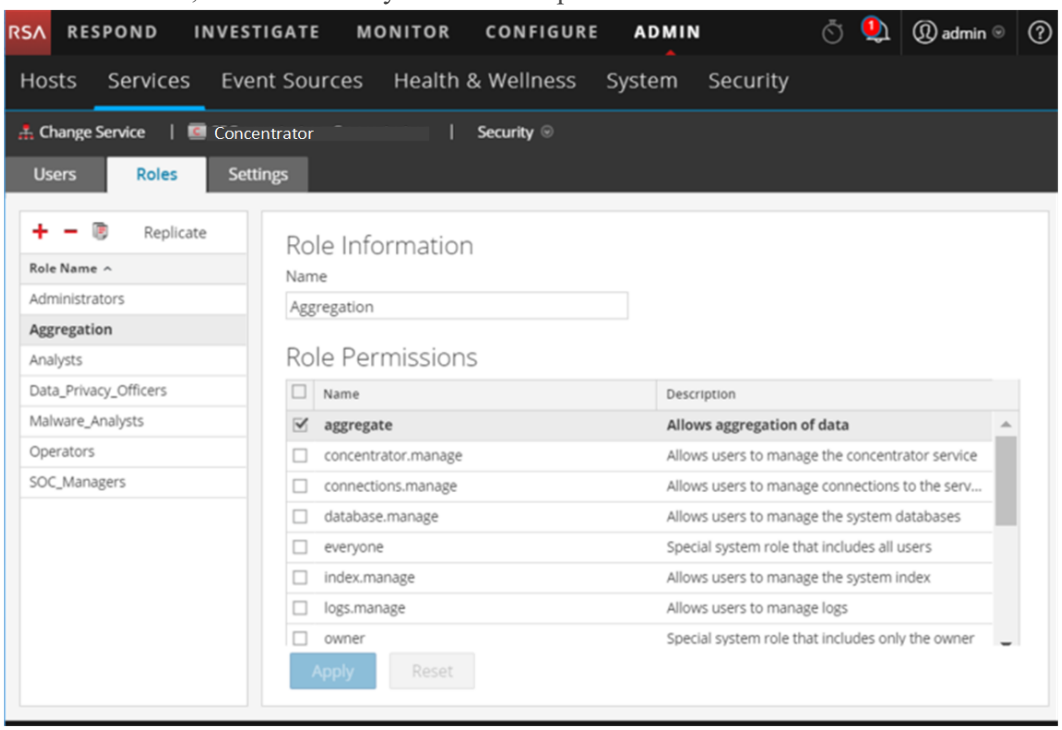
Each of the following procedures starts in the Services Security view.

To navigate to the Services Security view:

1. In NetWitness Platform, go to **ADMIN > Services**.
2. Select a service, then click **> View > Security**.
   The Security view for the selected service is displayed with the Users tab open.
3. Select the **Roles** tab.

Duplicate a Service Role

1. In the Roles tab, select the role you want to duplicate.



2. Click **Duplicate Role.**
3. Type a new name and click **Apply**.
4. Select the new role.
5. In the **Role Permissions** section, select or deselect permissions to modify what the new role can do.

Replicate a Role

1. In the **Roles** tab, select the role you want to replicate and click **Replicate**.
2. In the **Replicate Role to Other Services** dialog, select each service on which to add the role.
3. Click **Replicate**.

Edit Core Service Configuration Files

The service configuration files for Decoder, Log Decoder, Broker, Concentrator, Archiver, and Workbench services are editable as text files. In the Service Config view > Files tab, you can:

- View and edit a service configuration file that the NetWitness Platform system is currently using.
- Retrieve and restore the latest backup of the file you are editing.

- Push the open file to other services.
- Save changes made to a file.

The files available to edit vary depending upon the type of service being configured. The files that are common to all core services are the:

- service index file
- netwitness file
- crash reporter file
- scheduler file

In addition, the Decoder has files that configure parsers, feed definitions, and a wireless LAN adapter.

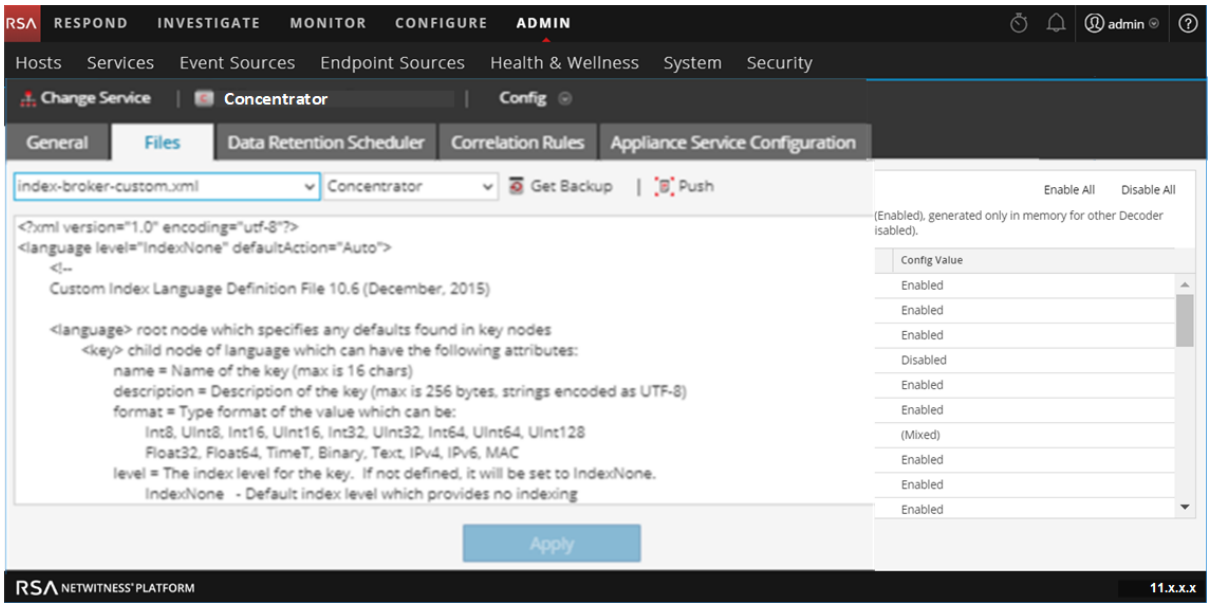
Note: The default values in these configuration files are good for the most common situations, however some editing is necessary for optional services, such as the crash reporter or scheduler. Only administrators with a good understanding of the networks and the factors that affect the way services collect and parse data should make changes to these files in the Files tab.

Edit a Service Configuration File

To edit a file:

1. In NetWitness Platform, go to **ADMIN > Services**.
2. In the Services grid, select a service.
3. Select **> View > Config**.
   The Service Config view is displayed with the General tab open.
4. Click the **Files** tab.
   The selected service, such as Concentrator, appears in the drop-down list on the right.
5. (Optional) To edit a file for the host instead of the service, select **Host** in the drop-down list.

6. Choose a file from the **Please Select A File To Edit** drop-down list.
   The file content is displayed in edit mode.



7. Edit the file and click **Apply**.

The current file is overwritten and a backup file is created. The changes go into effect after the service is restarted.

Revert to a Backup Version of a Service Configuration File

After you make changes to a configuration file, save the file, and restart the service, a backup file is available. To revert to a backup of a configuration file:

1. Select a configuration file by completing steps 1-6 of the procedure at the beginning of this topic.
2. Click Get Backup.
   The backup file opens in the text editor.
3. To revert to the backup version, click **Save**.

The changes go into effect after the service is restarted.

Push a Configuration File to Other Services

Once you have edited a service configuration file, you can push the same configuration to other services of the same type.

1. Select a configuration file by completing steps 1-6 of the Edit Service Configuration Files procedure at the beginning of this topic.
2. Click Push. The Select Services dialog is displayed.
3. Select each service to push the configuration file on it.
   Each service must be the same type as the one you selected in the Services view.

Caution: If you decide not to push the configuration file, click **Cancel**.

4. To push the configuration file to all selected services, click **OK**.

The configuration file is pushed to all selected services.

Configure the Task Scheduler

Scheduler file

You can edit the **scheduler** file that in the Service Config view > Files tab. This file configures the built-in task scheduler for a service. The task scheduler can automatically send messages at predefined intervals or specific times of the day.

Scheduler task syntax

A task line in the scheduler file consists of the following syntax, where **<Value>** has no spaces:

```
<ParamName>=<Value>
```

if **<Value>** has any spaces, this is the syntax:

```
<ParamName>="<Value>"
```

In each task line, these guidelines apply:

- Parameter **time** or one of the interval parameters (**seconds**, **minutes** or **hours**) is required.
- Escape special characters with a \ (backslash).

Task line parameters

The following task line parameters are accepted by the scheduler.

Syntax	Description
daysOfWeek: <string, optional, {enum-any:sun|mon|tue|wed|thu|fri|sat|all}>	The days of week to execute a task. The default value is all.
deleteOnFinish: <bool, optional>	Delete the task when it has successfully finished.
hours: <uint32, optional, {range:1 to 8760}>	The number of hours between executions.
logOutput: <string, optional>	Output the response to log using the specified module name.
minutes: <uint32, optional, {range:1 to 525948}>	The number of minutes between executions.
msg: <string>	The message to send the node.
params: <string, optional>	The parameters for the message.
pathname: <string>	The path of the node that receives the message.
seconds: <uint32, optional, {range:1 to 31556926}>	The number of seconds between executions.
time: <string>	The time of execution in HH::MM:SS format (local time of this server).

Syntax	Description
timesToRun: <uint32, optional>	How many times to run because service start, **0** = means unlimited (default).

Messages

The following are the message strings to use in the Task Scheduler **msg** parameter.

Message	Description
addInter	Add a task to run at a defined interval. For example, this message runs the **/index save** command every 6 hours: addInter hours=6 pathname=/index msg=save
addMil	Add a task to run at a specific time of day or even day(s) of the week. For example, this message runs the **/index save** command at 1 AM every business day: addMil time= 01:00:00 pathname=/index msg=save daysOfWeek=mon,tue,wed,thu,fri
delSched	Deletes an existing scheduled task. The **id** parameter of the task must be retrieved from the print message.
print	Prints all scheduled tasks.
replace	Assign all scheduled tasks in one message, deleting any existing tasks.
save	Save node

Sample Task Line

The following example task line in the scheduler file downloads the feeds package file (**feeds.zip**) to the selected Decoder every 120 minutes from the feeds host server:

```
minutes=120 pathname=/parsers msg=feed params="type\=wget
file\=http://feedshost/nwlive/feeds.zip"
```

Edit a Service Index File

This topic provides important information and guidelines for configuring service custom index files, which are editable in the Service Config view > Files tab.

The index file, along with other configuration files, controls operation of each core service. Accessing the index file through the Service Config view in NetWitness Platform opens the file in a text editor, where you can edit the file.

Note: Only administrators with a thorough and comprehensive understanding of core service configuration are qualified to make changes to an index file, which is one of the central configuration files for the appliance service. Changes made should be consistent across all core services. Invalid entries or a misconfigured file can prevent the system from starting and can require the assistance of RSA Support to bring the system back into a working state.

These are the index files:

- `index-broker.xml`, and `index-brokercustom.xml`
- `index-concentrator.xml`, and `index-concentratorcustom.xml`

- index-decoder.xml, and index-decodereustom.xml
- index-logdecoder.xml, and index-logdecodereustom.xml
- index-archiver.xml, and index-archiver custom.xml
- index-workbench.xml, and index-workbench custom.xml

Index and Custom Index Files

All customer-specific index changes are made in **index-<service>-custom.xml**. This file overrides any settings in index-<service>.xml, which is solely controlled by RSA.

The custom index file, **index-<service>-custom.xml,** allows creation of custom definitions or overrides of your own language keys that are not overwritten during the upgrade process.

- Keys that are defined in index-<service>-custom.xml replace the definitions found in index-<service>.xml.
- Keys that are added to index-<service>custom.xml and not found in index -<service>.xml are added to the language as a new key.

Some common applications for editing the index file are:

- To add new custom meta keys to add new fields to the NetWitness Platform user interface.
- To configure protected meta keys as part of a data privacy solution as described in the *Data Privacy Management* guide.
- To adjust the NetWitness Platform core database query performance as described in the *NetWitness Platform Core Database Tuning Guide*.

Caution: Never set the index level to IndexKeys or IndexValues on a Decoder if you have a Concentrator or Archiver aggregating from the Decoder. The index partition size is too small to support any indexing beyond the default time meta key.

Enable Crash Reporter Service

The Crash Reporter is an optional service for NetWitness Platform services. When activated for any of the core services, the Crash Reporter automatically generates a package of information to be used for diagnosing and solving the problem that resulted in the service failure. The package is automatically sent to RSA for analysis. The results are forwarded to RSA support for any further action.

The information package sent to RSA does not contain captured data. This information package consists of the following information:

- Stack trace
- Logs
- Configuration settings
- Software version
- CPU information
- Installed RPMs
- Disk geometry

The Crash Reporter crash analysis can be activated for any core product.

The crashreporter.cfg File

One of the files available for editing in the Service Config view > Files tab is **crashreporter.cfg**, the Crash Reporter Client Server configuration file.

This file is used by the script that checks, updates, and builds crash reports on the host. The list of products to monitor can include Decoders, Concentrators, hosts, and Brokers.

This table lists the settings for the **crashreporter.cfg** file.

Setting	Description
applicationlist=decoder, concentrator, host	Define the list of products to monitor.
sitedir=/var/crashreporter	Location of the site directory for the report.
webdir=/usr/share/crashreporter/Web	Location of the web directory.
devdir=/var/crashreporter/Dev	Location of the development directory.
datadir=/var/crashreporter/data	Location of the directory storing data files.
perldir=/usr/share/crashreporter/perl	Location of the perl files.
bindir=/usr/share/crashreporter/bin	Location of the binary executables.
libdir=/usr/share/crashreporter/lib	Location of the binary libraries.
cfgdir=/etc/crashreporter	Location of the configuration files.
logdir=/var/log/crashreporter	Location of the log files.
scriptdir=/usr/share/crashreporter/scripts	Location of the directory containing scripts.
workdir=/var/crashreporter/work	Location of the process work directory.
sqldir=/var/crashreporter/sql	Location where created sql files are placed.
reportdir=/var/crashreporter/reports	Location where temporary reports are created.
packagedir=/var/crashreporter/packages	Location of the created package files.
gdbconfig=/etc/crashreporter/crashreporter.gdb	Location of the gdb configuration file.
corewaittime=30	Define the number of seconds to wait after finding a core to determine if the core is still being written.
cyclewaittime=10	Define the number of minutes to wait between search cycles

Setting	Description
deletecores=1	Specify if the core files should be deleted after report. 0 = No 1 = Yes **NOTE:** Until the core file is deleted, it is reported each time crashreporter is restarted.
deletereportdir=1	Specify if the report directory should be deleted after the report. Useful to view core reports on box. 0 = No 1 = Yes **NOTE:** If not deleted, the directory will be included in each subsequent package.
debug=1	Specify whether debugging messages are turned on or off in the **crashreporter** logging output. 0 = No 1 = Yes
posturl=https://www.netwitnesslive.com/crash...ter/submit.php	Define the webserver post url.
postpackages=0	Specify if the packages should be posted to the webserver. 0 = No 1 = Yes
deletepackages=1	Specify if packages should be deleted after they are posted to webserver. 0 = No 1 = Yes

Configure the Crash Reporter Service

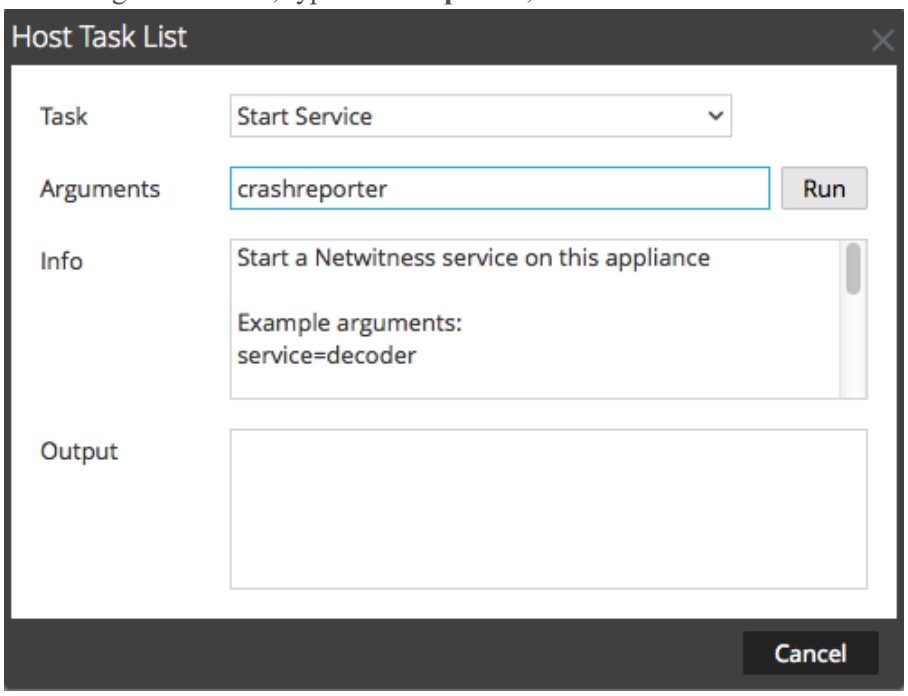
To configure the Crash Reporter service:

1. Select **ADMIN > Services**.
2. Select a service and click **> View > Config**.
3. Select the **Files** tab.
4. Edit **crashreporter.cfg**.
5. Click **Save**.
6. To display the Service System view, select **Config > System**.
7. To restart the service, click .
   The service shuts down and restarts.

Start and Stop the Crash Reporter Service

To start the Crash Reporter Service:

1. Select **ADMIN > Services**.
2. Select a service and click > **View** > **System**.
3. In the toolbar, click Host Tasks.
   The Host Task List is displayed.
4. In the Task drop-down list, select **Start Service**.
5. In the Arguments field, type **crashreporter**, then click **Run**.



The Crash Reporter service is activated and remains active until you stop it.

To stop the Crash Reporter service, select **Stop Service** from the Task drop-down list.

Maintain the Table Map Files

The table mapping file provided by RSA, `table-map.xml`, is a very significant part of the Log Decoder. It is a meta definition file which also maps the keys used in a log parser to the keys in the metadb.

Note: Do not edit the `table-map.xml` file. If you want to make changes to the table-map, make them in the `table-map-custom.xml` file. The latest `table-map.xml` file is available on Live and RSA updates it as required. If you make changes to the `table-map.xml` file, they can be overwritten during an upgrade of service or content.

The table-map and table-map-custom files have two purposes:

- To translate the variables used in the Log Parsers to NetWitness meta Key names, and
- To tell the system which keys to move on to the Concentrator.

For example, look at the out-of-the-box Palo Alto log parser, and examine one of its meta keys: **stransaddr**. This key represents the source translated address. If we look in the `table-map.xml` file we can see that this variable is listed as transient:

```
<mapping envisionName="stransaddr" nwName="stransaddr" flags="Transient"
format="Text" />
```

Because this variable is listed as, **transient**, it i never moved to the Concentrator. In fact, if you look at all the meta that we parse from that log in the Concentrator, it is not listed as an available key.

Assume we change the value in the table-map-custom to the following:

```
<mapping envisionName="stransaddr" nwName="stransaddr" flags="None"
format="Text" />
```

In this case, the **key:value** would get copied to the Concentrator, and from there you can choose whether or not to index it.

In the `table-map.xml`, some meta keys are set to `Transient` and some are set to `None`. To store and index a specific meta key, the key must be set to `None`. To make changes to the mapping, you need to create a copy of the file named `table-map-custom.xml` on the Log Decoder and set the meta keys to `None`.

For meta key indexing:

- When a key is marked as `None` in the `table-map.xml` file in the Log Decoder, it is indexed.
- When a key is marked as `Transient` in the **`table-map.xml`** file in the Log Decoder, it is not indexed. To index the key, copy the entry to the `table-map-custom.xml` file and change the keyword `flags="Transient"` to `flags="None"`.
- If a key does not exist in the `table-map.xml` file, add an entry to the `table-map-custom.xml` file in the Log Decoder.

Caution: Do not update the `table-map.xml` file because an upgrade can overwrite it. Add all of the changes that you want to make to the **`table-map-custom.xml`** file.

Prerequisites

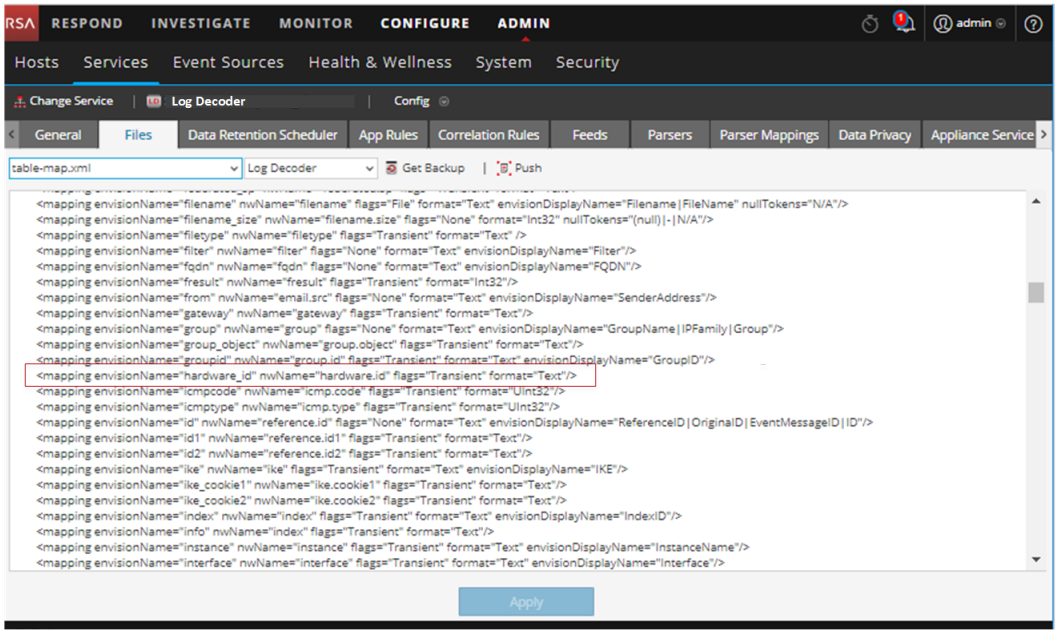
If you do not have a `table-map-custom.xml` file on the Log Decoder, create a copy of `table-map.xml` and rename it to `table-map-custom.xml`.

Procedure

To verify and update the table mapping file:

1. Go to **ADMIN** > **Services**.
2. In the Services grid, select a Log Decoder and click > **View** > **Config**.

3. Click the **Files** tab and select the **table-map.xml** file.



4. Verify that the flags keywords are set correctly to either `Transient` or `None`.
5. If you need to change an entry, do not change the `table-map.xml` file. Instead, copy the entry, select the `table-map-custom.xml` file, find the entry in the `table-map-custom.xml` file and change the flags keyword from `Transient` to `None`.
   For example, the following entry for the `hardware.id` meta key in the `table-map.xml` file is not indexed and the flags keyword shows as `Transient`:
   `<mapping envisionName="hardware_id" nwName="hardware.id" flags="Transient"/>`
   To index the `hardware.id` meta key, change the flags keyword from `Transient` to `None` in the `table-map-custom.xml`:
   `<mapping envisionName="hardware_id" nwName="hardware.id" flags="None"/>`
6. If an entry does not exist in the `table-map.xml` file, add an entry to the `table-map-custom.xml` file.
7. After making your changes to the `table-map-custom.xml` file, click **Apply**.

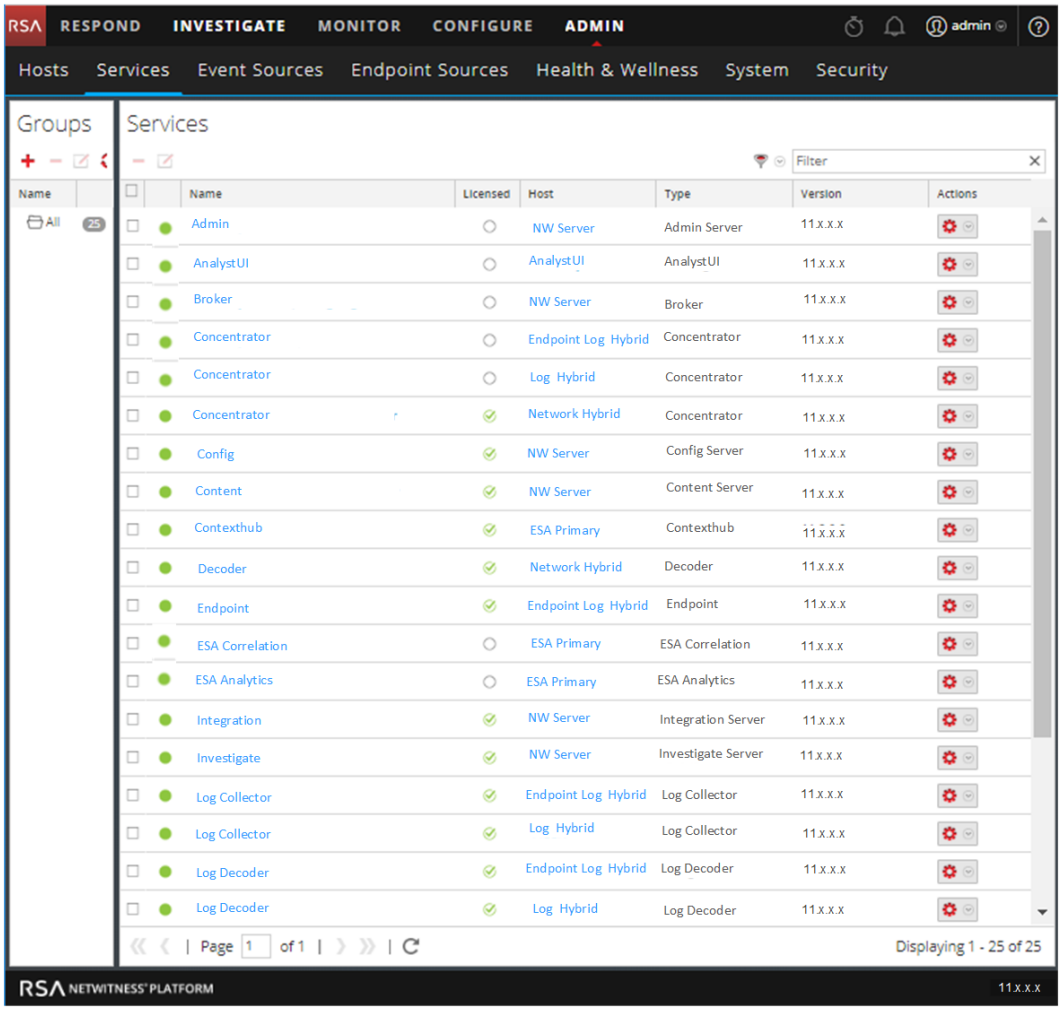
Caution: Before changing the table mapping files, carefully consider the effect of changing the index from `Transient` to `None` because it can impact the available storage and performance of the Log Decoder. For this reason, only certain meta keys are indexed out-of-the-box. Use the `table-map-custom.xml` file for different use cases.

Edit or Delete a Service

You can edit service settings, such as changing the host name or port number, or delete a service that you no longer need.

Each of the following procedures starts in the Services view.

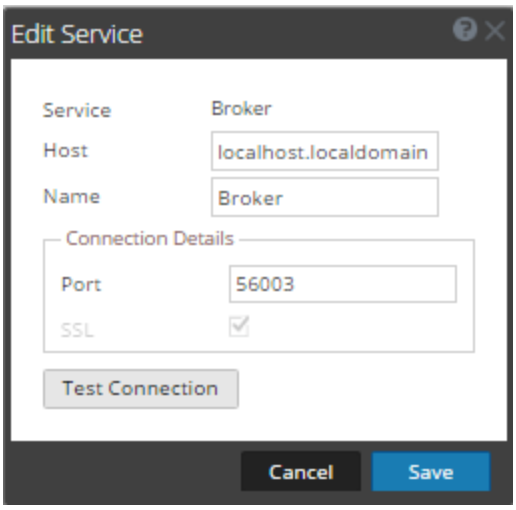
To navigate to the Services view, in NetWitness Platform, go to **ADMIN > Services**.



Procedures

Edit a Service

1. In the Services view, select a service and click or > **Edit**.
   The **Edit Service** dialog is displayed. It shows only the fields that apply to the selected service.



2. Edit the service details by changing any of the following fields:
   - **Name**
   - **Port** - Each core service has two ports, SSL and non-SSL. For trusted connections, you must use the SSL port.
   - **SSL** - For trusted connections, you must use SSL.
   - **Username** and **Password** - Use these credentials to test the connection to a service.
     a. If you use a trusted connection, delete the username.
     If you do not use a trusted connection, type a username and password.
     b. Click **Test Connection**.
3. Click **Save**.

Delete a Service

1. In the Services view, select one or more services and click or > **Delete**.
2. A dialog requests confirmation. To delete the service, click **Yes**.

The deleted service is no longer available to the NetWitness Platform modules.

Explore and Edit Service Property Tree

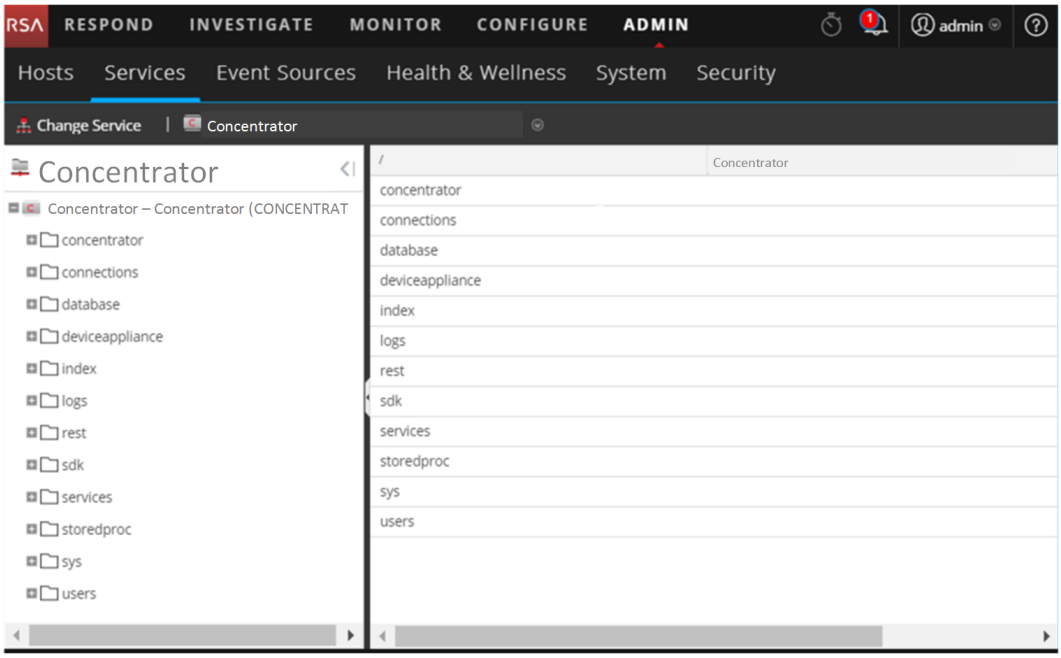
You have advanced access and control of service functionality in the Services Explore view, which consists of two parts. The Node list displays service functionality in a tree structure of folders. The Monitor panel displays properties of the folder or file selected in the Nodes list.

Each of the following procedures starts in the Explore view.

To navigate to the Explore view:

1. In NetWitness Platform, go to **ADMIN > Services**.

2. Select a service, then select **> View > Explore**.
   The Explore view is displayed. The Node list is on the left and the Monitor panel is on the right.



Display or Edit a Service Property

To display a service property:

1. Right-click a file in the Node list or Monitor panel.
2. Click **Properties**.

To edit the value of a service property:

1. In the **Monitor** panel, select an editable property value.
2. Type a new value.

Send a Message to a Node

1. In the Properties Dialog, select a **message type**. Options vary according to the file selected in the Node list.
   A description of the selected message type is displayed in the **Message Help** field.
2. (Optional) If the message requires them, type the **Parameters**.
3. Click **Send**.
   The value or format is displayed in the **Response Output** field.

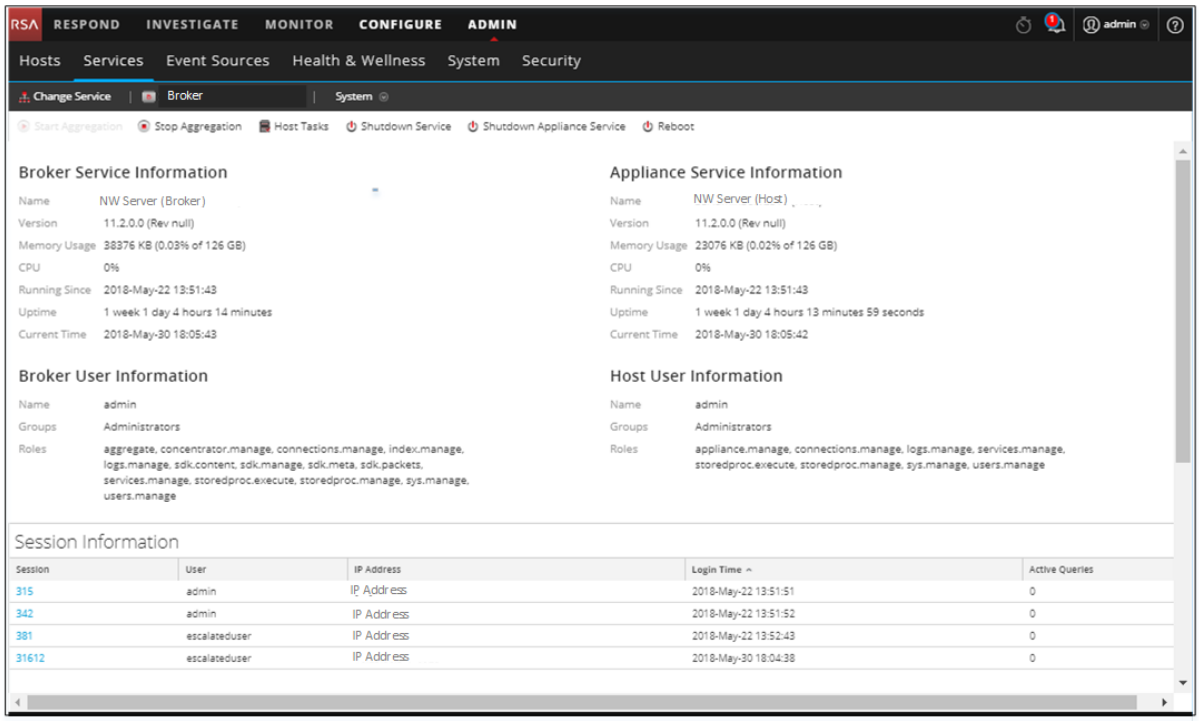
Terminate a Connection to a Service

You can view sessions that are running on a service in the Service System view. From within the list of sessions, you can terminate the session and terminate active queries in a session.

Terminate a Session on a Service

1. In NetWitness Platform, go to **ADMIN > Services**.
   The Admin Services view is displayed.

2. Select a service, and select **> View > System**.
   The Service System view is displayed.



3. In the **Session Information** grid at the bottom, click a ***session-number***.
   The confirmation dialog is displayed.

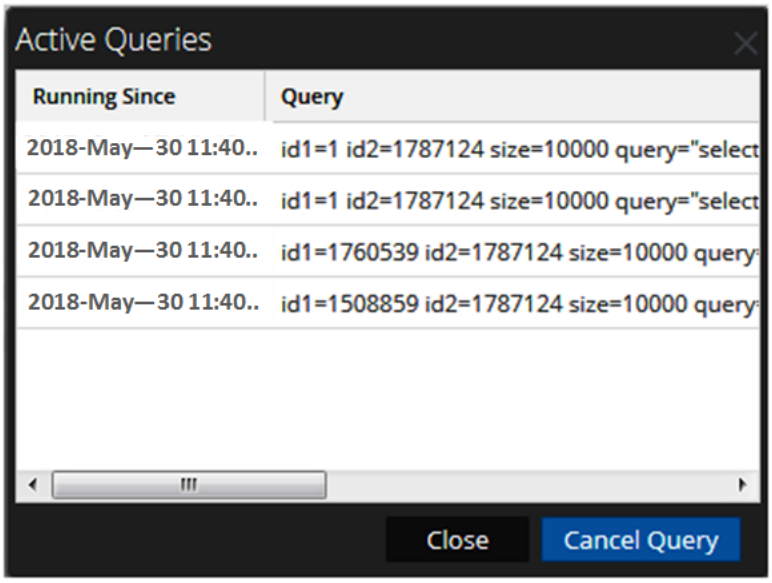
4. Click **Yes**.

Terminate an Active Query in a Session

1. Scroll down to the **Sessions** grid.

2. In the **Active Queries** column, click a non-zero count of active queries for a session. You cannot click on it if there are 0 active queries.

The Active Queries dialog is displayed.



3. Select a query and click **Cancel Query**.
   The query stops and the Active Queries column is updated.

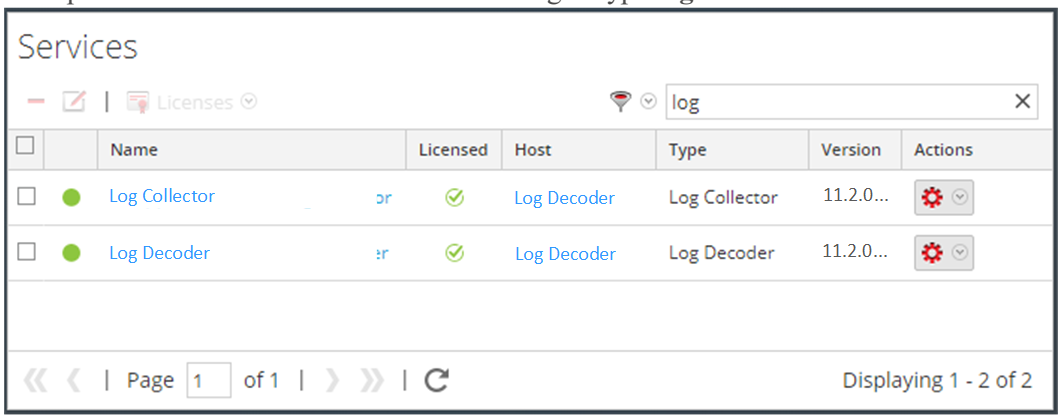
Search for Services

You can search for services from the list of services in the Services view. The Services view enables you to quickly filter the list of services by Name, Host, and Service Type. You can use the Filter drop-down menu and the Filter field separately or at the same time to filter the Services view.

Search for a Service

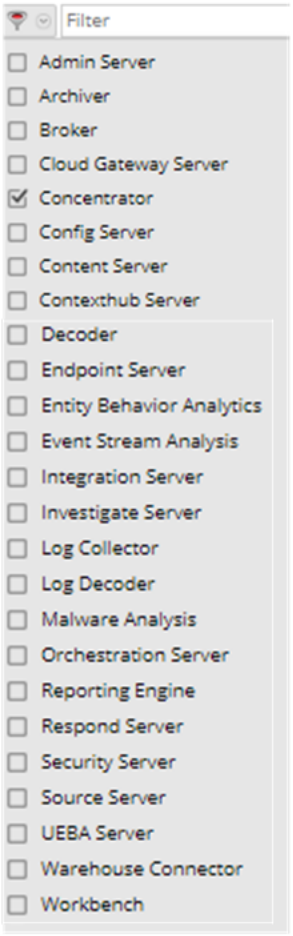
1. In NetWitness Platform, go to **ADMIN> Services**.
2. In the **Services** panel toolbar, type a service **Name** or **Host** in the **Filter** field.

The Services panel lists the services that match the names entered in the Filter field. The following example shows the search results after starting to type **log** in the filter field.

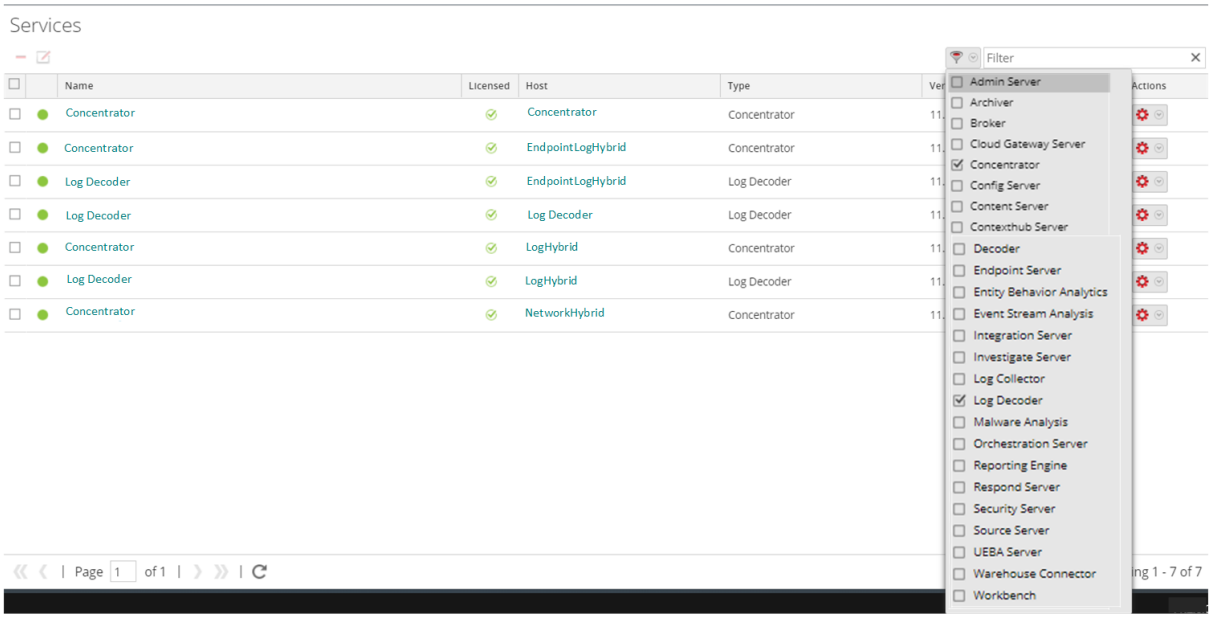


Filter Services by Type

1. In NetWitness Platform, go to **ADMIN > Services**.
2. In the Services view, click and select the service types that you want to appear in the Services view.



The selected service types appear in the Services view. The following example shows the Services view filtered for Concentrator and Log Decoder.

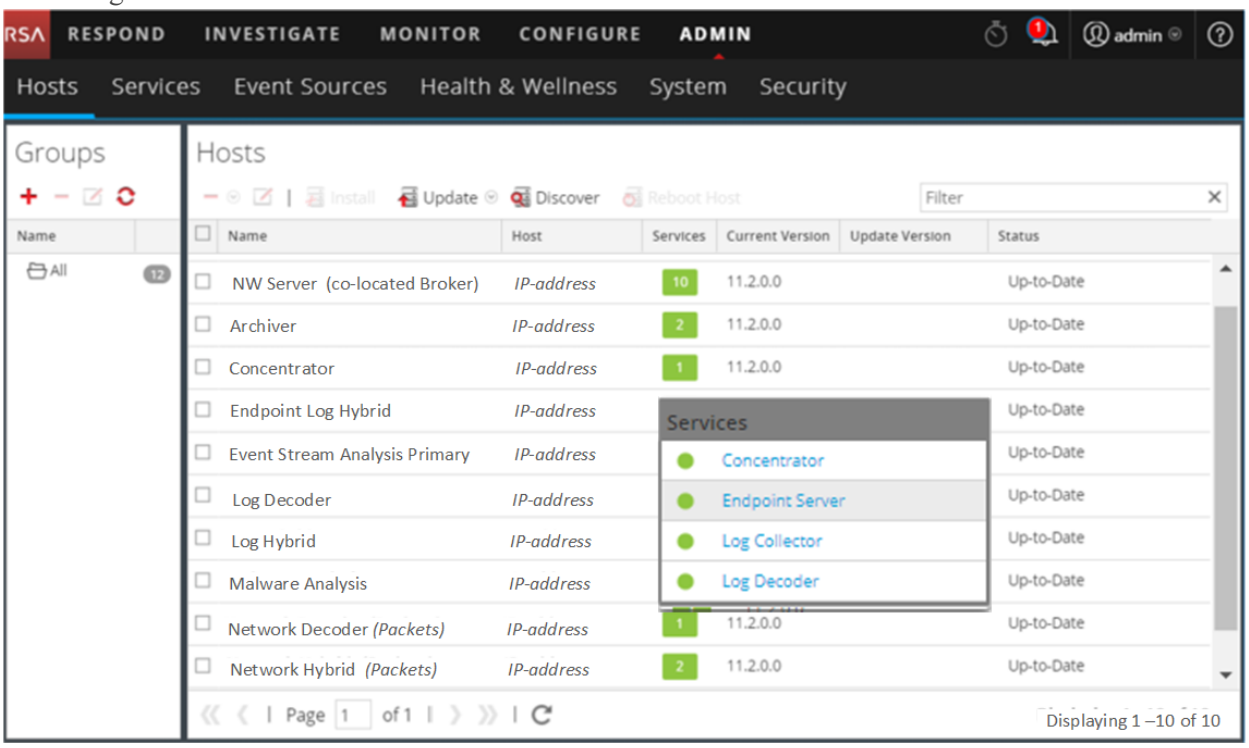


Find the Services on a Host

In addition to being able to locate the services for a host in the Services view, you can also quickly find the services that run on a host in the Hosts view.

1. In NetWitness Platform, go to **ADMIN > Hosts**.
2. In the Hosts view, select a host and click the box that contains a number (the number of services) in the **Services** column.
   A list of the services on the selected host is displayed.

In the following example, a list of four services on the selected host are listed after clicking the box containing the number 4.



3. You can click the service links to view the services in the Services view.

Start, Stop, or Restart a Service

These procedures apply to core services only.

Each of the following procedures starts in the Services view. In NetWitness Platform, go to **ADMIN > Services**.

Start a Service

Select a service and click **> Start**.

Stop a Service

When you stop a service, all of its processes stop and active users are disconnected from it.

To stop a service:

1. Select a service and click > **Stop**.
2. A dialog requests confirmation. To stop the service, click **Yes**.

Restart a Service

Occasionally, you have to restart a service for changes to take effect. When you change a parameter that requires a restart, NetWitness Platform displays a message.

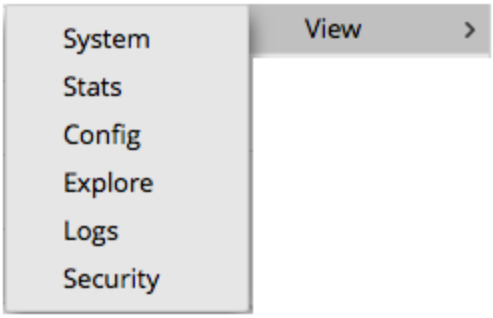
To restart a service:

1. Select a service and click > **Restart**.
2. A dialog requests confirmation. To stop the service, click **Yes**.

The service stops, then restarts automatically.

View Service Details

You can view and edit information about services using options in the View menu for a service.



Purpose of Each Service View

Each view displays a functional piece of a service and is described in detail in its own section:

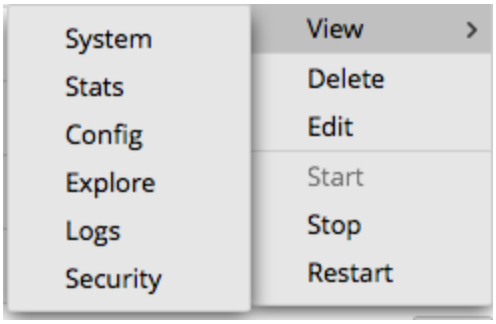
- System View shows a summary of service, appliance service, host user, and session information.
- Services Stats View provides a way to monitor service operations and status.
- Services Config View is for configuring all aspects of a service.
- Services Explore View is for viewing and editing host and service configurations.
- System Logging Panel shows service logs that you can search.
- Services Security View is a way to add NetWitness Platform Core user accounts for aggregation, thick client users, and REST API users.

Access a Service View

To access a view for a service:

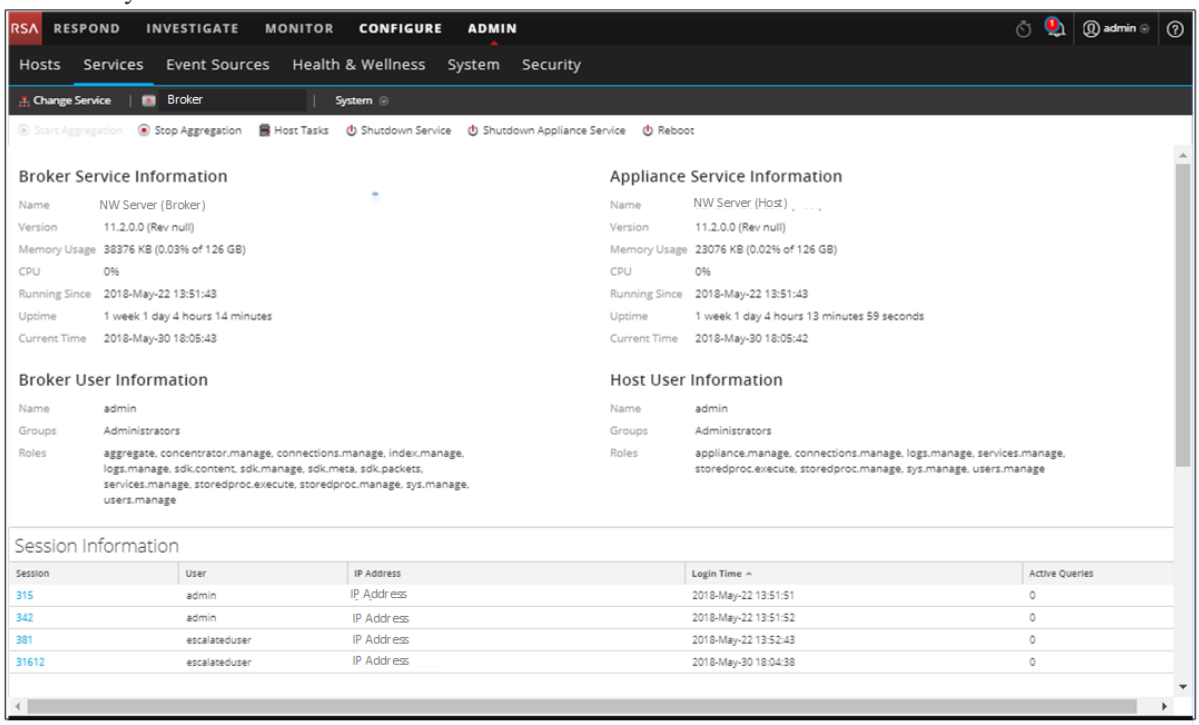
1. In NetWitness Platform, go to **ADMIN > Services**.
2. Select a service and click **> View**.

   The View menu is displayed.



3. From the options on the left, select a view.

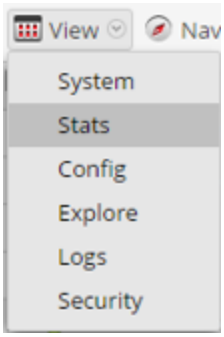
   This is a System view for a Broker.



4. Use the toolbar to navigate:

   a. Click **Change Service** to select another service.
      The **Administrate Service** dialog is displayed.

b. Select the checkbox to the left of the service that you want.
c. Select the view that you want for the service you selected in the View drop-down menu.



The new view (for example, Stats) is displayed for the service you selected.

Hosts and Services Views References

This topic is a reference for features in the NetWitness Platform ADMIN user interface.

This topic describes features available in the NetWitness Platform Admin user interface. The Admin module pulls NetWitness Platform Admin activities into a single view to monitor and manage hosts (appliances), services, tasks, and security.

- Services Stats View

Hosts View

You set up and maintain the physical or virtual machine on which NetWitness Platform services run in the **Hosts** view.

IMPORTANT: For help on resolving errors you receive during version installation and update, see Troubleshooting Version Installations and Updates .

A service performs a unique function, such as collecting logs or archiving data. Each service runs on a dedicated port and is modeled as a plug-in to enable or disable, according to the function of the host. You must configure the Core services first.

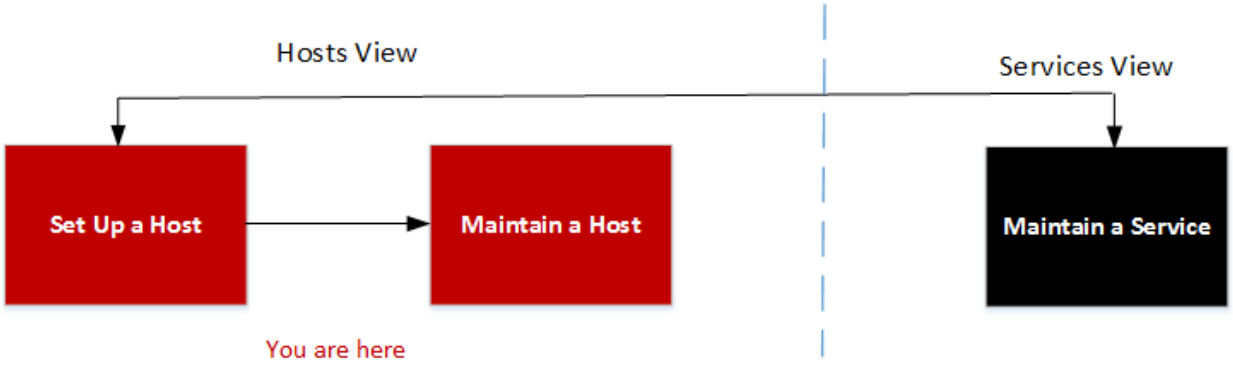
Warehouse Connector	Warehouse Connector	50020	56020	Command line installation

You must configure hosts and services to communicate with the network and each other so they can perform their functions such as storing or capturing data.

Workflow

This workflow shows the procedures you complete to set up a host, maintain a host, and update the host with new NetWitness Platform versions. Setting up a host is the first task in this workflow. The hosts with core services are set up out-of-the-box. After that, you can set up additional hosts to enhance your NetWitness Platform deployment. The other two tasks, maintaining a host and updating versions for a host, are performed when required and do not have a specific order of completion.



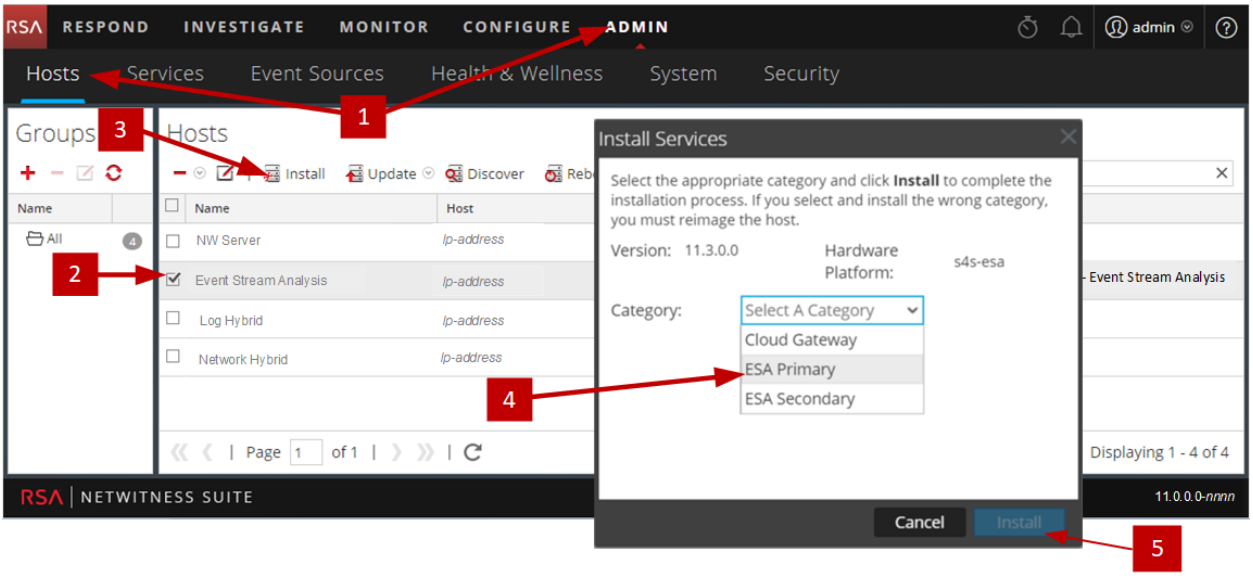
What do you want to do?

For detailed instructions of the following tasks, see Hosts and Services Procedures.

Role	I want to ...
Administrator	Setup up a host.
Administrator	Maintain a host.
Administrator	Apply version updates to a host.

* You can perform these tasks in the current view.

Quick Look



The following example shows you how to set up a host.

1. Select ADMIN > Hosts.
2. Select the host you deployed (for example, **Event Stream Analysis Primary**).
3. Click Install (Install icon).
4. Select the host type to install from the **Install Services** dialog (for example, **ESA Primary**). This host type installs the Entity behavior Analytics, Context Hub, and Event Stream Analysis services on this host.

Hosts Panel Toolbar

The Hosts view toolbar contains the tools that you use to maintain the hosts in your NetWitness Platform deployment.

In NetWitness Platform, go to **Admin** > **Hosts** to access the Hosts view. The Hosts panel toolbar is at the top of the Hosts grid in the Hosts view.

Features

The following table describes the features of the Hosts panel toolbar.

Features	Description
	**Remove From Group**: If the host is part of a host group, you can remove the host from the group.

Features	Description
	Open the Edit Host dialog in which you edits a host or service identification and basic communication settings. This dialog has the same features as the Add Host dialog. Related procedure: Step 1. Deploy a Host
	Opens the **Install Services** dialog from which you can install a service on a deployed host. Related procedures: Step 2. Install a Service on a Host
	• **Update** - Updates the host or hosts you have selected with the version you select in the **Update Version** column. • **Check for Updates** - Checks the Local Update Repo for the latest updates available from RSA. Related procedure: Apply Version Updates to a Host
	Most of the time, the Discovery function completes automatically and you do not need to click **Discover** . For a fresh installation, click **Discover** to access the Provision dialog box so you can complete the provisioning phase. After the provisioning phase, NetWitness Platform automatically discovers services running on the host and you do not need to click Discover. For a fresh installation, click **Discover** to access the Provision dialog box so you can complete the provisioning phase. After the provisioning phase, NetWitness Platform automatically discovers services running on the host.
	Restart the host.
Filter	Filter hosts by Name or Host.

Groups Panel Toolbar

The Groups panel toolbar provides options for managing groups of hosts. Use the toolbar to create, edit, and delete groups. After you create a group, you can drag individual hosts from the Hosts panel into that group.

Use groups may to organize hosts by function, geography, project, or any other organization principle that is useful. A host may belong to more than one group.

In NetWitness Platform, go to **ADMIN > Hosts**. The Groups panel toolbar is at the top of the Groups grid in the Hosts view.

The Groups panel provides a way to create logical groups of hosts. Once hosts are grouped, it is easier to perform operations on multiple hosts by interacting with each host in a group rather than individual hosts from an non-grouped list.

Note: In NetWitness Live, groups can subscribe to resources while individual hosts cannot.

The Groups panel consists of a grid populated with a list of defined host groups and the Groups Panel Toolbar.

Column	Description
	Displays a new row in the Group grid in which you enter the name of a new group.
	Asks for confirmation that you want to delete the group or host. You can confirm or cancel the deletion.
	Opens the name field in a row of the Group grid so that you can type a new name for an existing group.
	Refreshes the selected group.
Name	The name of the host group. Click the group name to list the hosts in that group on the Hosts panel.
<Blank>	Indicates the number of hosts in the group. Click the number of hosts in the group to list the hosts in that group on the Hosts panel.

Services View

You set up and maintain the NetWitness Platform services run in the **Services** view. With the Services view, you can:

- Quickly search for and locate a specific service or type of service, such as Log Decoder or Warehouse Connector
- Use shortcuts to get to administration tasks
- Add, edit, and remove services
- Sort services by name and host
- Filter services by type and by name and host
- Start, stop, and restart services

A service performs a unique function, such as collecting logs or archiving data. Each service runs on a dedicated port and is modeled as a plug-in to enable or disable, according to the function of the host. You must configure the following Core services first.

Category	Services	Unencrypted Non-SSL Port	Encrypted SSL Port	Notes
Admin Server	Admin Config Content Integration Investigate License Orchestration Reporting Engine Respond Security	N/A N/A N/A N/A N/A N/A N/A 51113 N/A N/A	N/A N/A N/A N/A N/A N/A N/A N/A N/A N/A	Implemented with the NW Server Implemented with the NW Server Implemented with the NW Server Implemented with the NW Server Implemented with the NW Server Implemented with the NW Server Implemented with the NW Server Implemented with the NW Server Implemented with the NW Server

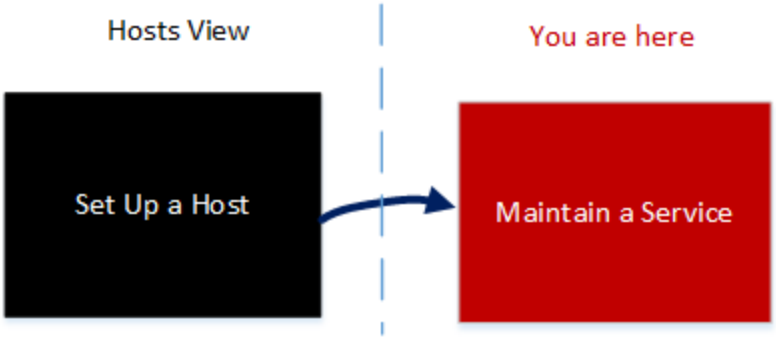
Category	Services	Unencrypted Non-SSL Port	Encrypted SSL Port	Notes
ESA Primary	Entity Behavior Analytics Contexthub ESA Correlation	N/A N/A N/A	N/A N/A 50030	
ESA Secondary	Entity Behavior Analytics ESA Correlation	N/A N/A	N/A N/A	
Log Collector	Log Collector	50001	56001	
Log Decoder	Log Collector Log Decoder	50001 50002	56001 56002	
Log Hybrid	Log Collector Log Decoder Concentrator	50001 50002 50005	56001 56002 56005	
Malware Analysis	Malware Analysis Broker	N/A	60007	
Network Decoder	Decoder	50004	56004	
Network Hybrid	Concentrator Decoder	50005	56005	
UEBA	UEBA	N/A	N/A	
Warehouse Connector	Warehouse Connector	50020	56020	Command line installation

You must configure hosts and services to communicate with the network and each other so they can perform their functions such as storing or capturing data.

Workflow

This workflow shows the procedures you complete to set up and maintain a service. Adding a service to a host is the first task in this workflow. The hosts with core services are set up out-of-the-box. After that, you can set up additional services on hosts to enhance your NetWitness Platform deployment.



What do you want to do?

See Hosts and Services Procedures for detailed instructions of the following tasks.

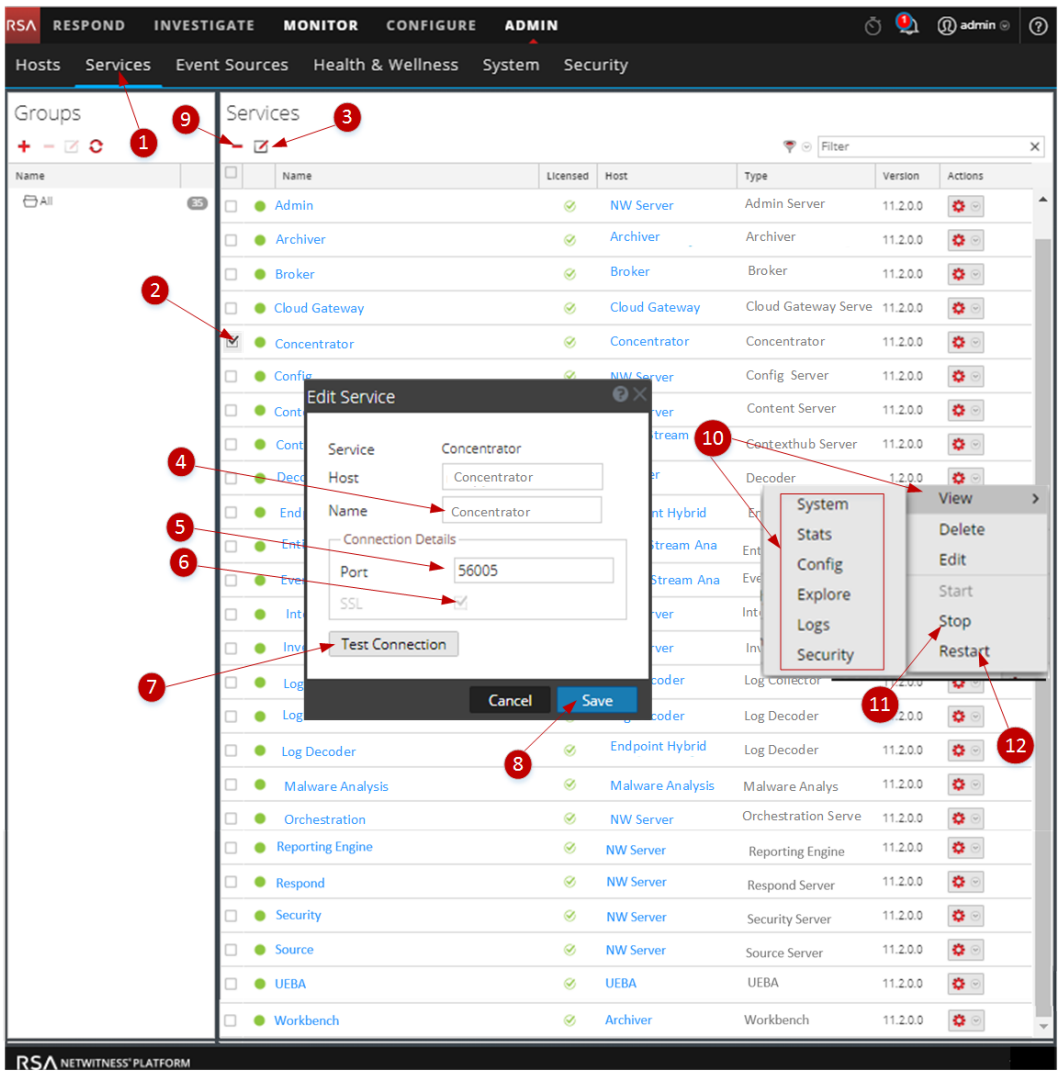
Role	I want to ...
Administrator	Maintain a service.
Administrator	Set up a host.

Related Topic

- Troubleshooting Version Installations and Updates

Quick Look

The following example shows you how to maintain a service.



Select a Service.

1. Go to **ADMIN** > **Services** view.
2. Click the checkbox to the left of the service you want to select.

Edit the Service Name and Connection.

3. Click (Alternatively, select Edit from the (Action drop-down menu).
4. Edit the **Host** name.
5. Edit the **Port** number.
6. Deselect or select SSL communication connection.
7. Click **Test Connection** .
8. Click Save.

Delete a Service.

9. **Select a Service** and click the delete icon.

View Service Statistics and Configure Parameters

10 Perform the following steps to view service statistics and configure a service parameters.

a. **Select a Service** and click the actions icon.

b. Click **View** and select:

- **System** to:
  - View current high-level information about the service and its host.
  - Access the System View toolbar.
- **Stats** to view detailed service statistics.
- **Config** to view and configure service parameters.
- **Explore** to view and configure service parameters in the NetWitness Platform Explore view.
- **Logs** to view log messages issued by the service.

11 **Select a Service**, click the actions icon, and click **Stop** a service that is running.

12 **Select a Service**, click the actions icon, and click **Restart** to restart a stopped service.

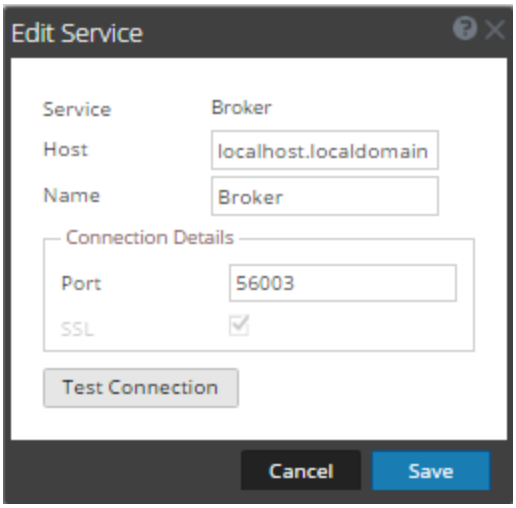
Edit Service Dialog

This topic introduces the Edit Service dialog accessible from the ADMIN Services view (ADMIN > Services).

NetWitness Platform services are automatically discovered in NetWitness Platform.

You can use the Edit Service dialog to modify services. To access the Edit Service dialog, go to **ADMIN > Services** and click in the **Services** panel toolbar.



Procedures related to services are described in Hosts and Services Procedures.

Features

This table describes the features of the Add Service or Edit Service dialogs.

Field or Option	Description
Service	Displays the service type. You can add the following services: Archiver, Broker, Concentrator, Decoder, Event Stream Analysis, Incident Management, IPDB Extractor, Log Collector, Log Decoder, Malware Analysis, Reporting Engine, Warehouse Connector, and Workbench.
Host	Specifies the host on which the service resides.
Name	Specifies the name used to identify the service; for example, **Broker**. An understandable naming convention can make administrative tasks easier. Some administrators find it convenient to use the hostname or IP address (specified in the **Host** field) for the **Name** as well.
Port	Specifies the port used to communicate with this service. The default port based on the selected service type in the **Service** field is autofilled here. If you select **SSL** below, this port becomes an SSL port. If you do not select **SSL**, it becomes a non-SSL port. You can customize this port by opening a firewall for the port that you add. For information on ports, see the **Network Architecture and Ports** topic in the *Deployment Guide*.
SSL	Indicates that NetWitness Platform uses SSL for communications with this service.

Field or Option	Description
Username	Specifies the user name used to log in to this service. The default username is **admin**.
Password	Specifies the password used to log in to this service. The default password is **netwitness**.
Test Connection	Tests the connection of a service that you are adding.
Cancel	Closes the Add Service or Edit Service dialog. If you do not save the service before closing the dialog, the service is not added or edited.
Save	Saves the new service.

Groups Panel Toolbar

This topic introduces the features and options in **ADMIN > Services** view > **Groups** panel toolbar.

The Groups panel toolbar provides options for managing groups of services. The toolbar includes options to create, edit, and delete groups. After you create a group, you can drag individual services from the Services panel into the group.

Groups may reflect functional, geographical, project-oriented, or any other organization principle that is useful. A service may belong to more than one group.

To access the Services view, in **NetWitness Platform**, go to **ADMIN > Services.** The Groups panel toolbar is at the top of the Groups grid in the Services view.

Features

This table describes toolbar features.

Option	Description
	Displays a new row in the Group grid in which you enter the name of a new group.
	Asks for confirmation that you want to delete the group or service. You can confirm or cancel the deletion.
	Opens the name field in a row of the Group grid so that you can type a new name for an existing group.
	Refreshes the selected group.

Services Panel Toolbar

This topic introduces the options in Service panel toolbar to add, remove, edit, and get a license for services. You can also filter the services listed in the Services Panel.

To access the Administration Services view, in **NetWitness Platform**, go to **ADMIN > Services.** The Services panel toolbar is at the top of the Services grid in the Services view.

Features

The table describes the features of the Services panel toolbar.

Feature	Description
	Adds a service for this instance of RSA NetWitness Platform to manage (see Step 2. Install a Service on a Host).
	Deletes a service from this instance of NetWitness Platform (see Edit or Delete a Service).
	Edits service identification and basic communication settings.
	Filters the services listed in Services view. In the Filter drop-down menu, you can filter the services by one or more selected service types. In this example, when you select Concentrator and Decoder, only the Concentrator and Decoder services appear in the Services view. In the Filter field, you can filter the services by Name and Host. You can use the Filter drop-down menu and the Filter field at the same time to filter the services listed in the Services view.

Services Config View

This topic introduces the features and functions of the Services Config view.

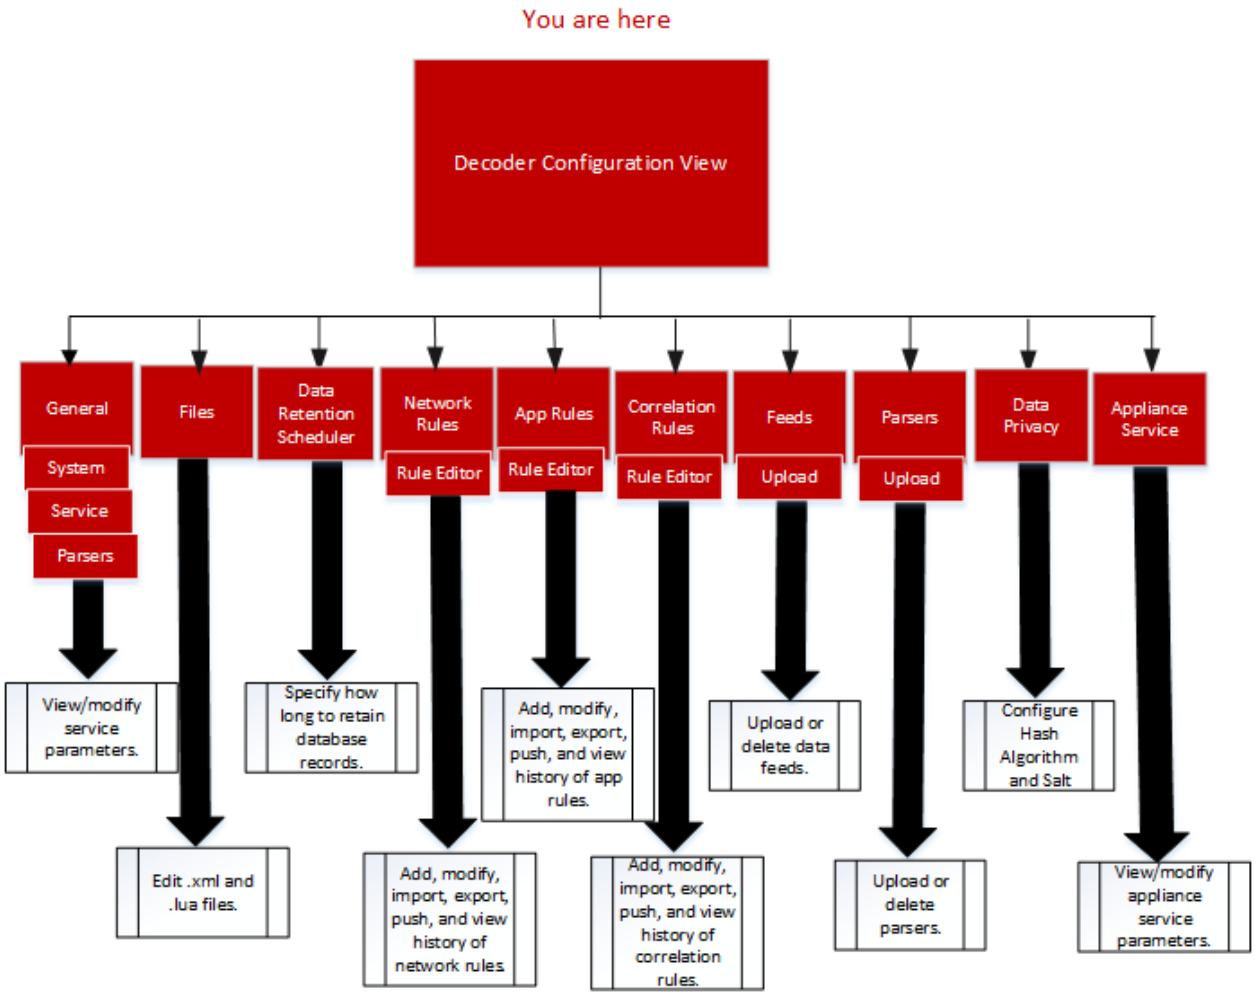
The Services Config view is one of the views available from the **Services** > Actions ( ) menu. It provides a user interface for configuring all aspects of a core service or NetWitness Platform service.

The configuration options in the Services Config view are organized as tabs, with each tab providing a view of a set of related parameters. Unlike the Services Explore view, which offers direct access to all configuration files for a service, these tabs present the most commonly modified parameters of service configuration in a user-friendly view.

Due to configuration requirements for different services; each type of service has variations in available tabs and configuration parameters in this view. Individual topics describe configuration parameters that are specific to a host (Brokers and Concentrators, Decoders and Log Decoders) or service (for example, Reporting Engine, IPDB Extractor, Log Collector, and Warehouse Connector).

Workflows

The following workflow shows the configuration tasks for the Decoder service as an example of this view. For details on their **ADMIN > Services > Config** views, see the individual service Configuration Guides (for example, the *RSA NetWitness® Platform Broker and Concentrator Configuration Guide*) .



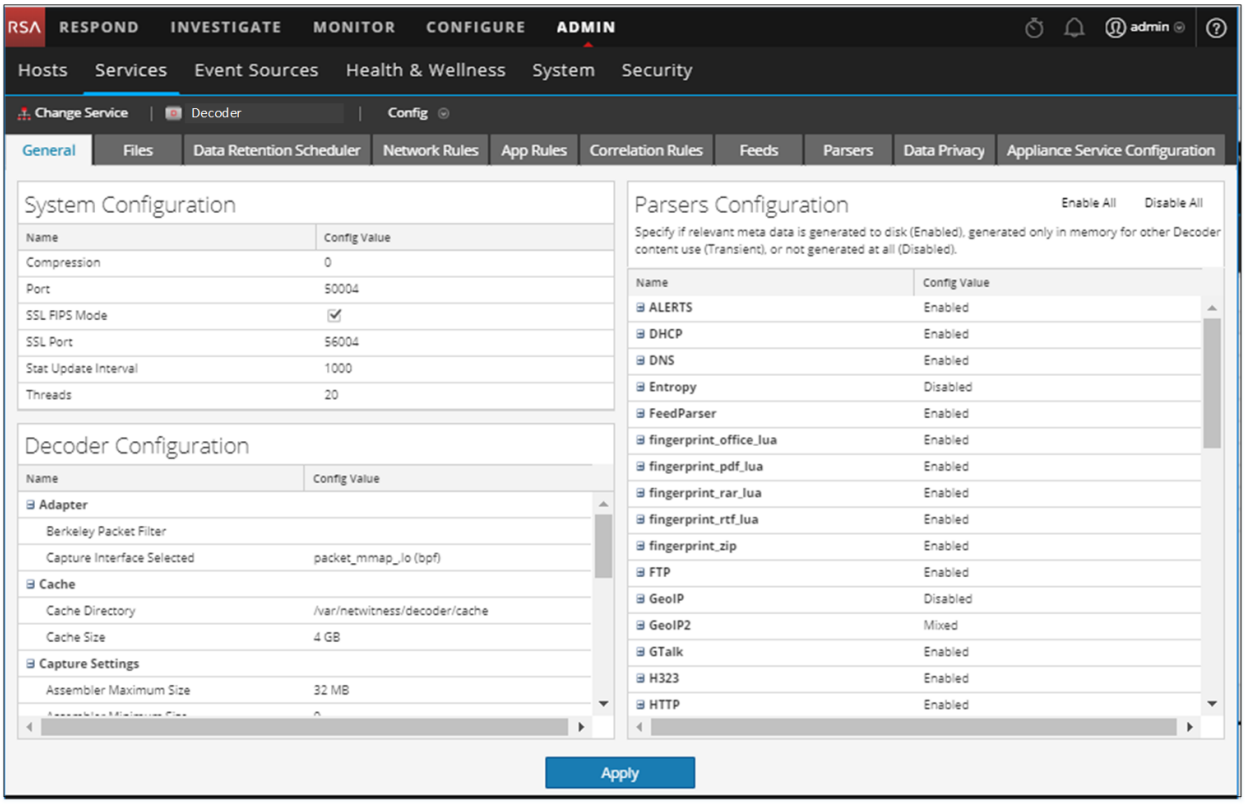
To access the Services Config view:

1. In **NetWitness Platform**, go to **ADMIN > Services**.
   The Administration Services view is displayed.

2. Select a service and select **>View > Config**.
   Services Config view for the selected service is displayed.

Quick Look

This is an example of the Services Config view for a Decoder.



This is an example of the Services Config view for a Concentrator.

Appliance Service Configuration Tab

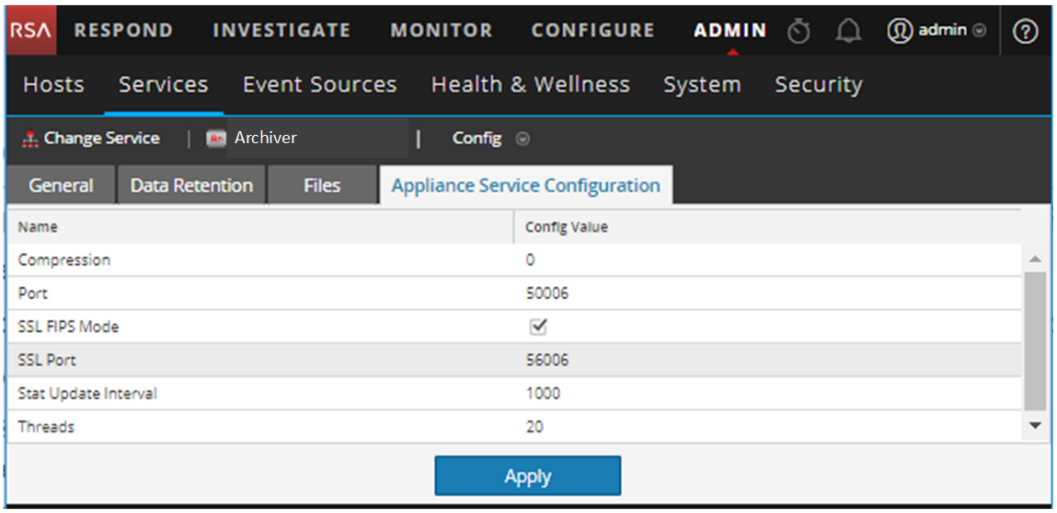
This topic lists and describes the available configuration parameters for the NetWitness Platform Core Appliance service. The NetWitness Platform Core Appliance service provides hardware monitoring on legacy NetWitness hardware.

The Configuration view for the Archiver, Broker, Concentrator, IPDB Extractor, Decoder, Log Collector, or Log Decoder service has an Appliance Service Configuration tab.

To access the Appliance Service Configuration tab:

1. In **NetWitness Platform**, go to **ADMIN > Services**.
   The Administration Services view is displayed.
2. Select a service and select **>View > Config**.
   Services Config view for the Archiver service is displayed.
3. Click the **Appliance Service Configuration** tab.

This is an example of the Appliance Service Configuration tab for an Archiver.



Name	Description of Configuration Value	When Changes Take Effect
Compression	Compresses a message when it reaches the positive number (in bytes) that you specify.	The next time you connect to this service.

Name	Description of Configuration Value	When Changes Take Effect
Port	Unencrypted listening port. **0** indicates that the port is disabled.	Upon restart of the service.
SSL FIPS Mode	One of the parameters you need to enable or disable Federal Information Processing Standards (FIPS). For detailed instructions, see "Activate or Deactivate FIPS" in the *RSA NetWitness® Platform System Maintenance Guide*.	Upon restart of the service.
SSL Port	SSL (Secure Sockets Layer) listening port. **0** indicates that the port is disabled. SSL is the standard security technology for establishing an encrypted link between a web server and a browser. This link ensures that all data passed between the web server and browsers remain private and integral.	Upon restart of the service.
Stat Update Interval	How often (in milliseconds) the system updates statistic nodes for monitoring Health and Wellness.	Immediately.
Threads	Threads in thread pool required to used to handle requests. The **Threads** parameter works with the **Polling Interval** parameter for event and log threads.	Immediately.

Topic

Appliance Service Configuration Parameters

Data Retention Scheduler Tab

This topic describes the configurable options in the Data Retention Scheduler tab for Decoder, Log Decoder, and Concentrator.

In the Data Retention Scheduler tab, you can define the criteria for removing database records from primary storage on Decoder, Log Decoder, and Concentrator services, and schedule the timing for checking the threshold.

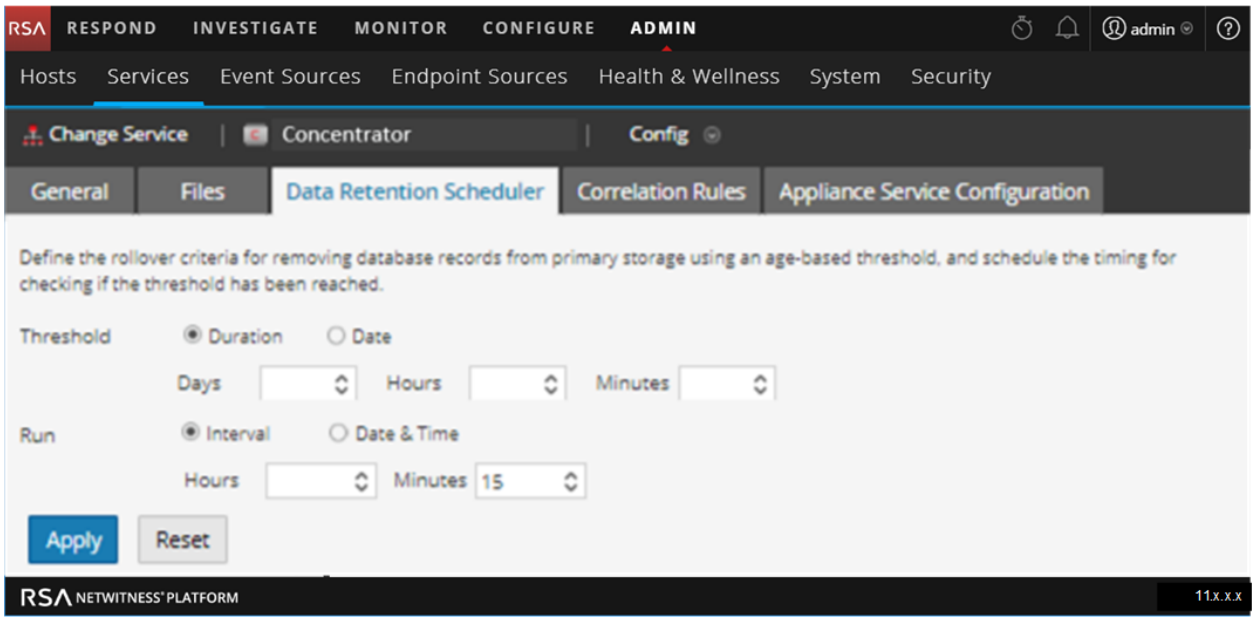
For information on the Data Retention tab for Archiver, see the **Data Retention Tab - Archiver** topic in the *Archiver Configuration Guide*.

Note: If additional customization is necessary,use the Scheduler under the Files tab in the Services Config view. For example, if you have storage available to save the RAW data versus the meta, use Capacity as the threshold and to set different thresholds per database (meta versus packet).

To access the Data Retention Scheduler tab:

1. In **NetWitness Platform**, go to **ADMIN > Services**.
2. Select a Decoder, Log Decoder, or Concentrator, and then select **> View > Config**.
3. In the **Services Config** view for the service, click the **Data Retention Scheduler** tab.

The following figure illustrates the parameters in the Data Retention Scheduler tab for a Concentrator.



Features

The Data Retention Scheduler tab has sections to specify Threshold settings and Run settings. The following table lists the parameters supported for data retention configuration.

Parameter	Description
Threshold	The threshold is based on the age of the data, the amount of time the data was stored or the date on which the data was stored. The date is from the database file, not from the actual session time. • **Duration**: The duration of time that data can be stored before removal. Specifies the number of days (365 maximum), hours (24 maximum), and minutes (60 maximum) that have elapsed since the time stamp on the data. • **Date**: The removal of data based on the date of the timestamp. Specifies the monthly date and time in the **Calendar** and **Time** fields.

Parameter	Description
Run	The schedule for running the job that checks rollover criteria. • **Interval**: Schedule the database check to occur at a regular interval. Specifies the **Hours** and **Minutes** between the scheduled checks. • **Date and Time**: Schedule the database check to occur at a regular day and time. Specifies the day from the drop-down list and the system clock time in `hh:mm:ss` format. Possible values for day are **Everyday**, **Weekdays**, **Weekends**, and **Custom**, where **Custom** allows you to select one or more specific days of the week.
Apply	Overwrites any previous schedule for this service and applies the new settings immediately. **Caution:** After you apply these settings, when the threshold is met the system deletes the old data from the database and you can no longer access it.
Reset	Resets the schedule to the last applied state.

Files Tab

This topic describes the service configuration files that are visible in the Services Config view > Files tab.

Use the Files tab in the Services Config view to edit service configuration files for Decoders, Log Decoders, Brokers, Archivers, and Concentrators as text files.

The files you can edit vary depending upon the type of service you are configuring. The following files are common to all core services.

- service index file
- netwitness file
- crash reporter file
- scheduler file
- feed definitions file

In addition, the Decoder has files that configure parsers, feed definitions, and a wireless LAN adapter.

Note: The default values in the configuration files cover most common situations. You may need to edit configuration parameters and values for optional services, such as the crash reporter or scheduler. Do not change these values in the Files tab unless you understand networks and the factors that affect the way services collect and parse data.

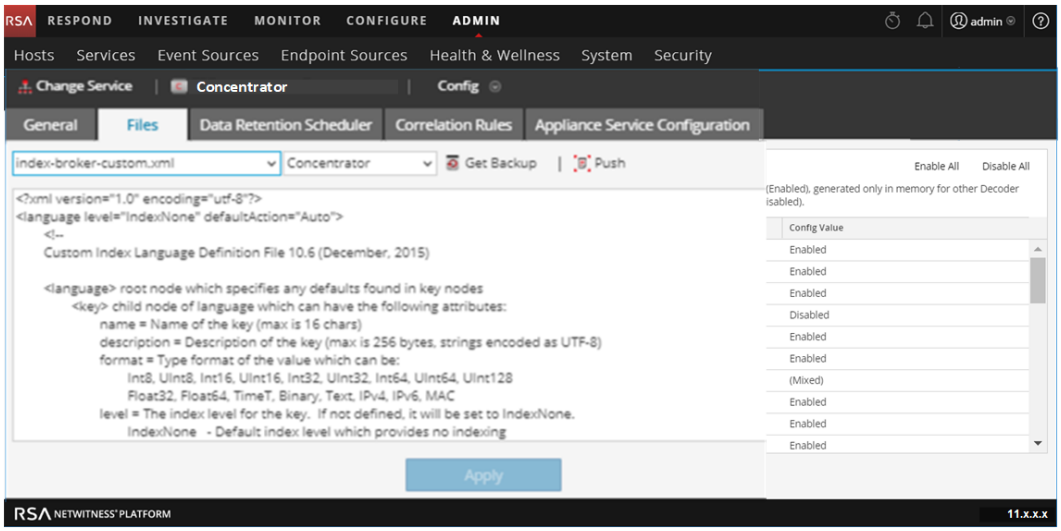
More detail on the service configuration parameters is available in the Service Configuration Settings.

To access the Files tab:

1. In **NetWitness Platform**, go to **ADMIN > Services**.
2. Select a service and select **> View > Config**.
   The Services Config view is displayed with the **General** tab open.
3. Click the **Files** tab.

Edit a Service Configuration File

This is an example of the Files tab.



Files Tab Toolbar

The Files tab has a toolbar and an edit window. This is an example of the toolbar.

These are the features of the Files tab toolbar.

Feature	Description
File drop-down list	Displays a list of files that the system is currently using. When you select a file, the text of the file is displayed in the text edit window. In the text window, you can edit the file and save the changes, or create alternate files to use.
Service / Host drop-down list	Displays the service type and host. You can open a file from either the service or the host for editing.
Get Backup	Retrieves the latest backup of the current file, which can prove useful when you have made changes and want to go back to the previous version of the file. The backup does not replace the current file unless you click **Save**.
Push	Displays a dialog in which you can select services of the same type and push the currently viewed file to the services.

Feature	Description
Apply	Overwrites the current file, creates a backup file.

Services Explore View

Use the NetWitness Platform Services Explore view, to display and edit host and service configurations.

The Services Explore View offers advanced access and control of all NetWitness Platform hosts and services. All services expose their functionality through a tree-like series of nodes, similar to the Windows Explorer view of your file system. Here you can:

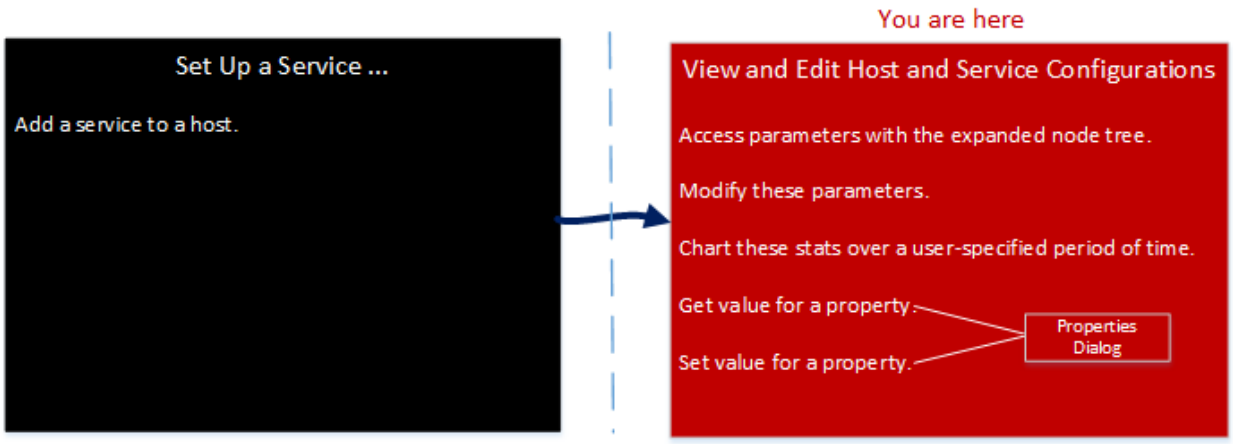
- View a directory tree showing common files for all selected services.
- Navigate down through the directory to a file.
- Open the same file for each service, and display the contents side by side.
- Select an entry in the file and edit the value.
- Apply a property value from one service to other services.

The Services Explore View can also display a Properties dialog, a simple interface for viewing properties of any node in the system and sending messages to the node, shown in the figure below.

Caution: A good understanding of the nodes and parameters is required when editing in this view. Incorrect settings can cause performance problems.

Workflow

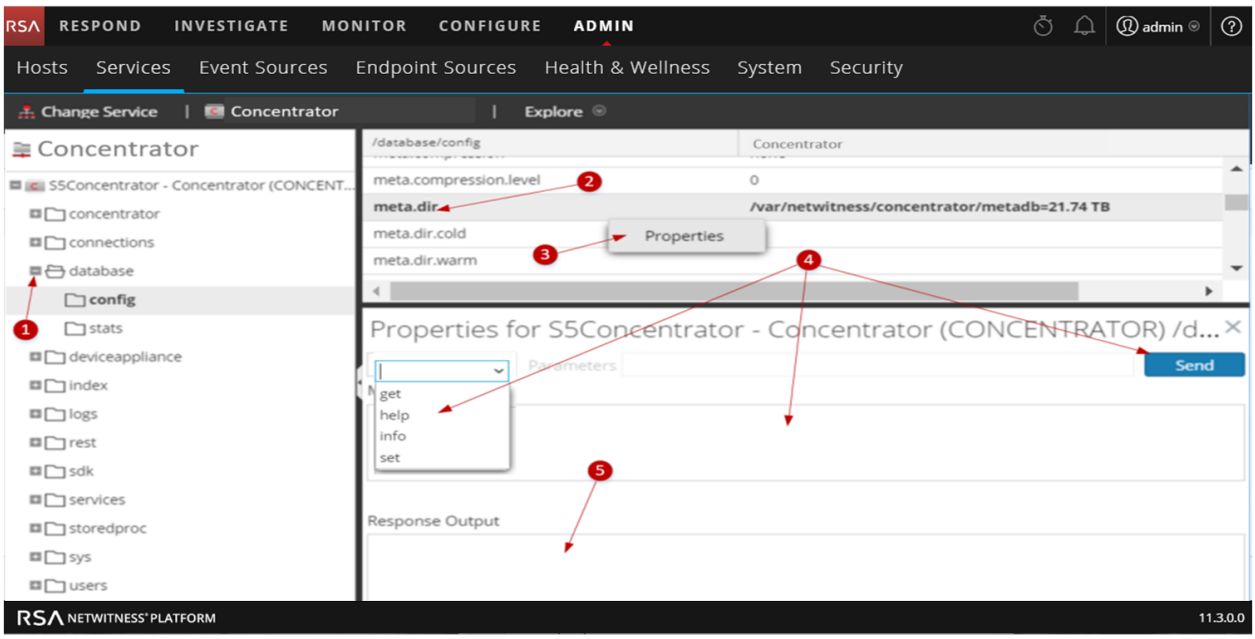
This workflow shows the tasks you perform from the Explore view.



Quick Look

To access the Services Explore view:

1. In **NetWitness Platform**, go to **ADMIN > Services**.
2. Select a service and select **> View > Explore**.



1. Expand the node to display its parameter categories.
2. Click a property (for example, **meta.dir**) to select it.
3. Right-click a node or category and click **Properties** to display the Properties dialog.
4. Perform an operation on a node or category:
   a. Select a command from the drop-down list.
   b. Enter a command string (if required).
   c. Click **Send**.
5. Review the output.

Features

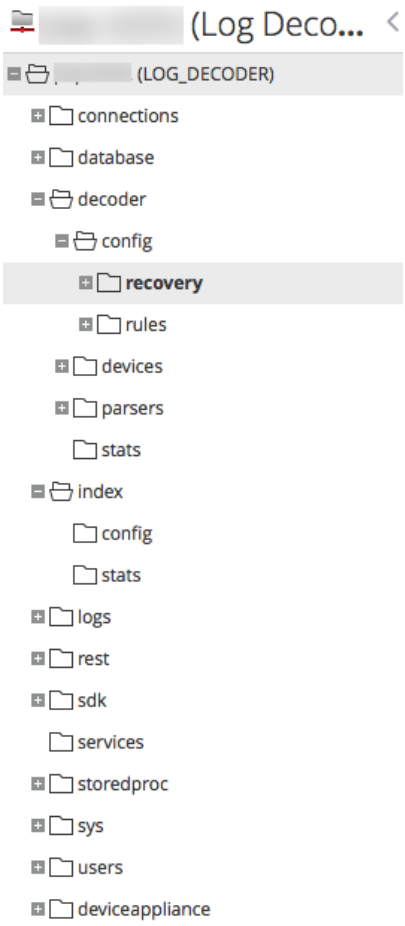
The **Services Explore View** has two main panels:

- The Node list
- The Monitor panel

Rick-click a file and select Properties to access it.

The Node List

The Node list displays the services as a tree-like series of nodes and folders. The levels in the Node list expand and collapse to display the full hierarchy.



Each root folder is named based on the functionality it exposes. For instance, the **/connections** folder shows all connected IP addresses. Underneath each **IP/Port** are two folders, **sessions** and **stats**.

- The **sessions** folder displays all authenticated user sessions originating from the IP/Port.
- The **stats** folder displays values, such as the number of messages sent/received, bytes sent/received, and others, set by the service. These are not editable.

Selecting any folder in the tree view displays its children in the **Monitor** panel. Every node in the tree is actively monitored, so when a statistic or configuration node changes value, it is immediately reflected in the tree and monitor panel.

The Monitor Panel

The **Monitor** panel displays properties and values for a selected node (such as **index**) and a child folder (such as **config**). There are two ways to edit values:

- Click the value and type a new value
- Send a **set** message in the Properties dialog

/Index/Config	(Concentrator)
index.dir	/var/netwitness/concentrator/index=7.08 GB
index.dir.cold	
index.dir.warm	
page.compression	huffhybrid
save.session.count	0

Topics

- Features
- Log Decoder Service Configuration Parameters

Properties Dialog

Use the Services Explore view > Properties dialog to perform the following tasks.

- Send messages to a system node
- Retrieve values for a property for multiple services
- Set values for a property for multiple services

When you select Properties from the context menu, the Properties dialog opens below the Monitor panel .

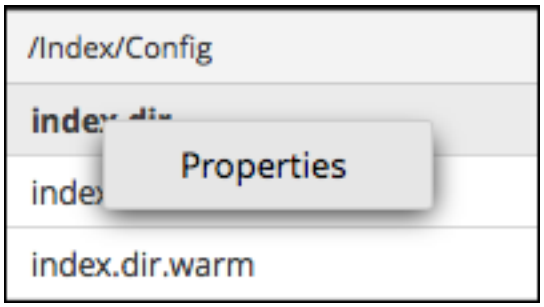
All nodes support have help that contains the following information.

- A description of the node
- The list of supported messages with a corresponding description
- Security roles needed to access the messages

The available messages vary according to the service and root folder. Many of these messages are also accessible as options with a NetWitness Platform dashboard or view.

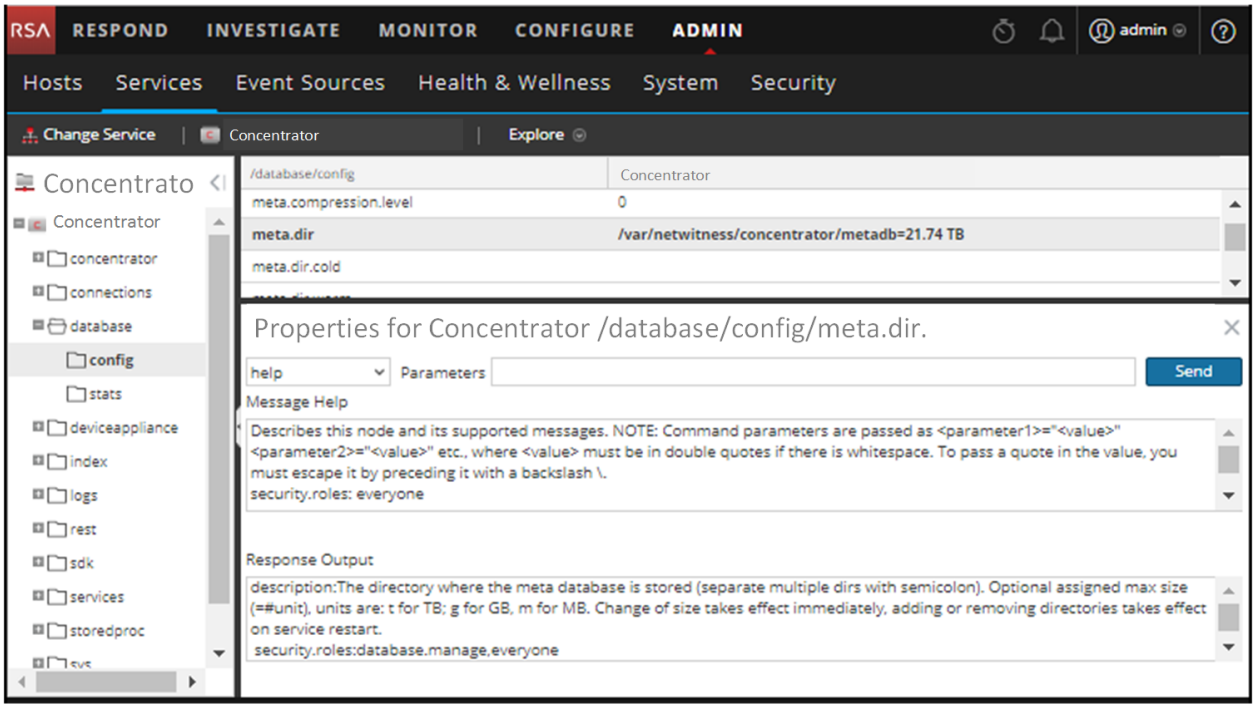
To access the Properties dialog:

1. In **NetWitness Platform**, go to **ADMIN > Services**.
2. Select a service and select **> View > Explore**.
3. In the **Node** list, select a file.
4. In the **Monitor** panel, right-click a property and select **Properties**.



The Properties dialog is displayed. You can also right-click any file in the Node list to display the Properties dialog.

The following example shows the Properties dialog with help for a message (**info**) displayed.



Features

The Properties dialog has the following features.

Feature	Description
Message drop-down list	Lists all available messages for the current node. Select a message to send the node.
Parameters input field	Type the message parameters in this field.
Send button	Sends the message to the node.
Message Help	Displays help text for the current message.
Response Output	Displays the response to a message or output from a message.

Services Logs View

This topic introduces the Services Logs view.

The Services Logs view provides the ability to view and search the logs for a specific service. The Services Logs view is identical to the System Logging Panel with two exceptions:

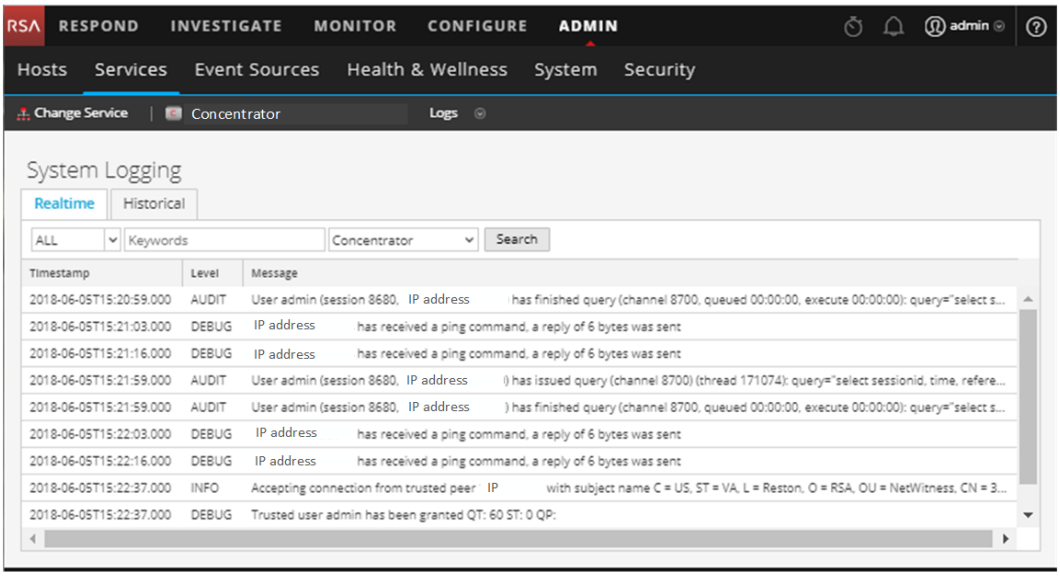
- The Services Logs view has an additional filter to select messages for the service or host.
- The System Logging panel has an additional tab for Settings.

For a complete description of NetWitness Platform logging features, see the **ADMIN** > **System**> **System Logging** panel.

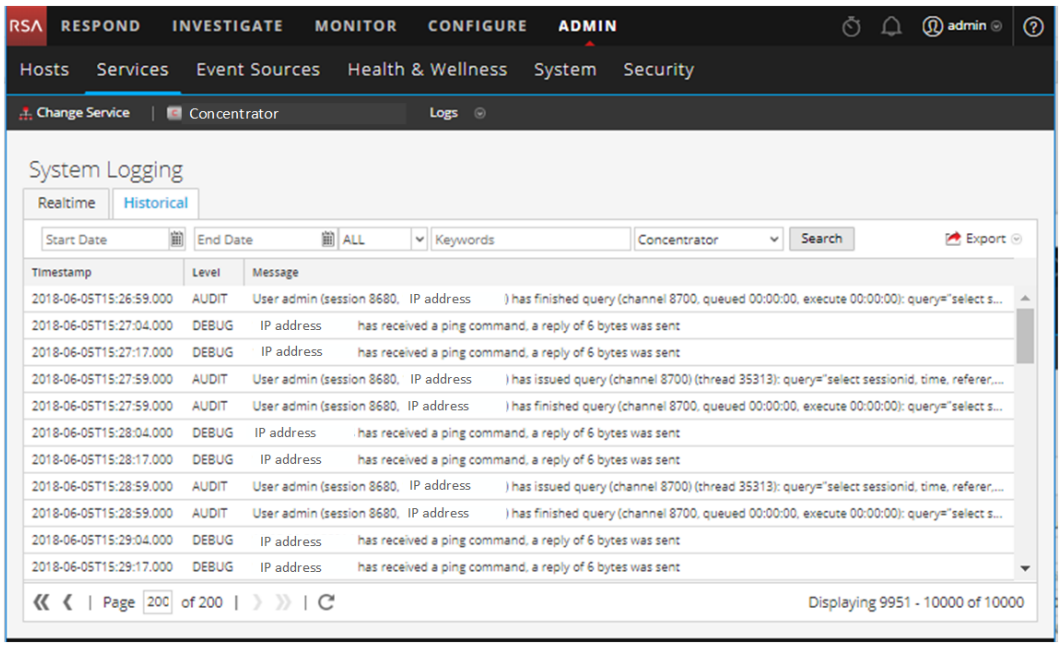
To view a service log:

1. In **NetWitness Platform**, go to **ADMIN > Services**.
2. Select a service and select **>View > Logs**.

The following figure shows the Services Logs view Realtime tab.



The following figure shows the Services Logs view Historical tab.



Features

The System Logging Panel has the following tabs, and the logging functions are described as part of system maintenance (see **Monitor Health and Wellness of NetWitness Platform** in the *System Maintenance* guide).

Feature	Description
Realtime tab	This is the monitor mode of the service log.
Historical tab	This is a searchable view of the service log.

Services Security View

This topic provides an overview of service security management in the Services Security view.

In NetWitness Platform, each service has a separate configuration of users, roles, and role permissions, which are managed in the Services Security view.

To access service information and perform service operations through NetWitness Platform, a user must belong to a role that has permissions on that service. For 10.4 or later NetWitness Platform Core services that utilize trusted connections, it is no longer necessary to create NetWitness Platform Core user accounts for users that log on through the web client. You only need to create NetWitness Platform Core user accounts for aggregation, thick client users, and REST API users.

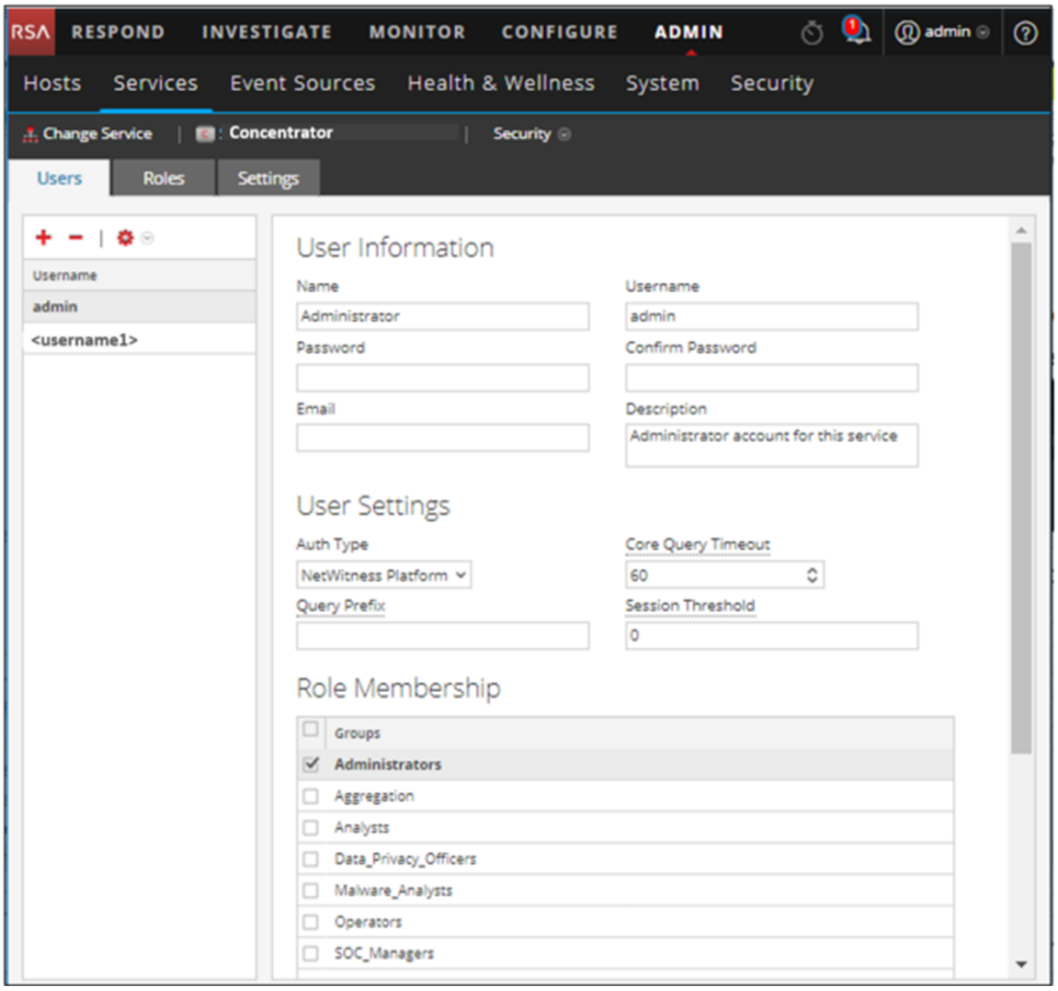
Note: Only the default admin user in NetWitness Platform is created by default on all services. As a prerequisite to managing service security, the default admin user account must be present in the NetWitness Platform Administration > Services view. For every other user, you must configure access to each particular service through NetWitness Platform.

Procedures related to this tab are described in Hosts and Services Procedures.

To access the Services Security view:

1. In **NetWitness Platform**, go to **ADMIN > Services.**

2. Select a service and select > **View > Security**.
   The Services Security view for the selected service is displayed.



Features

The Services Security view has three tabs, Users tab, Roles tab, and Settings tab.

Roles and Service Access

Primary considerations in configuring service security are defining the roles and assigning users to the roles. The Service Security view separates these two functions into the Users tab and the Roles tab.

- In the Roles tab, you can create roles and assign permissions to the roles for a selected service.
- In the Users tab, you can add a user, edit user settings, change the user password, and edit the role membership of the user for a selected service. Although you select a single service in the Services Security view, you can apply the settings for one service to other services.

Topics

- Roles Tab
- Service User Roles and Permissions
- Aggregation Role
- Settings Tab
- Users Tab

Roles Tab

This topic introduces the features of the Services Security View > Roles Tab.

The **Roles** tab enables you to create roles and assign permissions. Each role can have different permissions for different services. For example, the Analysts role can have different role permissions based on the selected service.

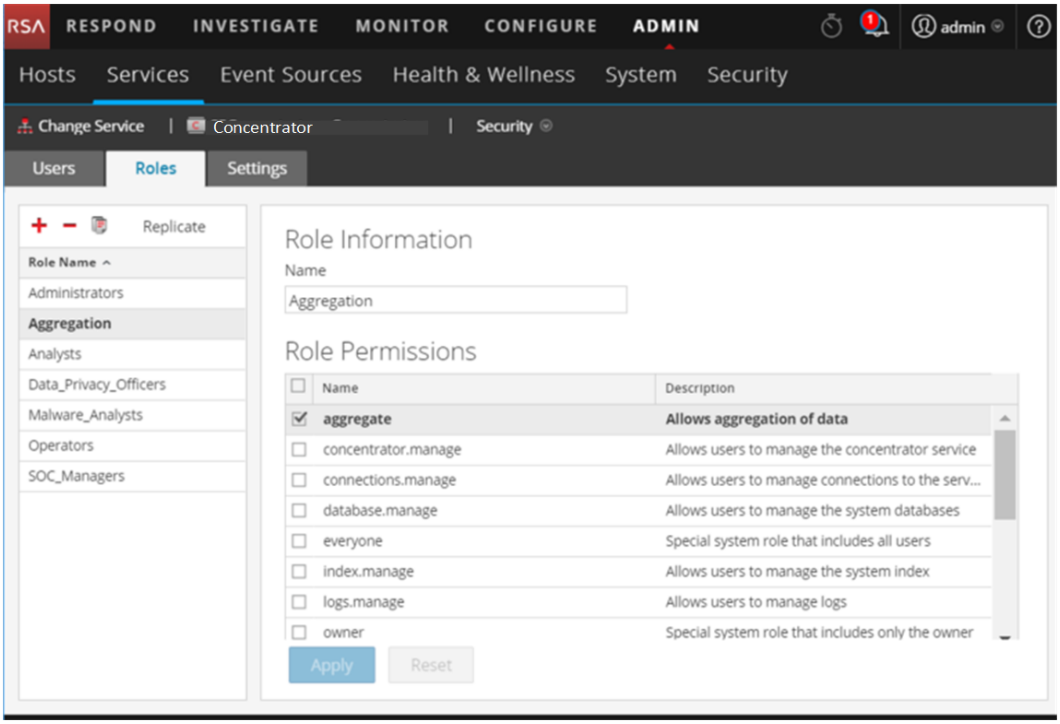
Before you can add users to roles, you need to define user roles, usually by function, and assign permissions to the roles.

Procedures related to this tab are described in Hosts and Services Procedures.

To display the **Services Security View > Roles** tab:

1. In **NetWitness Platform**, go to **ADMIN > Services.**
2. Select a service to which you want to add a user, and select **> View > Security**.
3. Select the **Roles** tab.

The following figure shows the Roles tab in the Services Security view.



Features

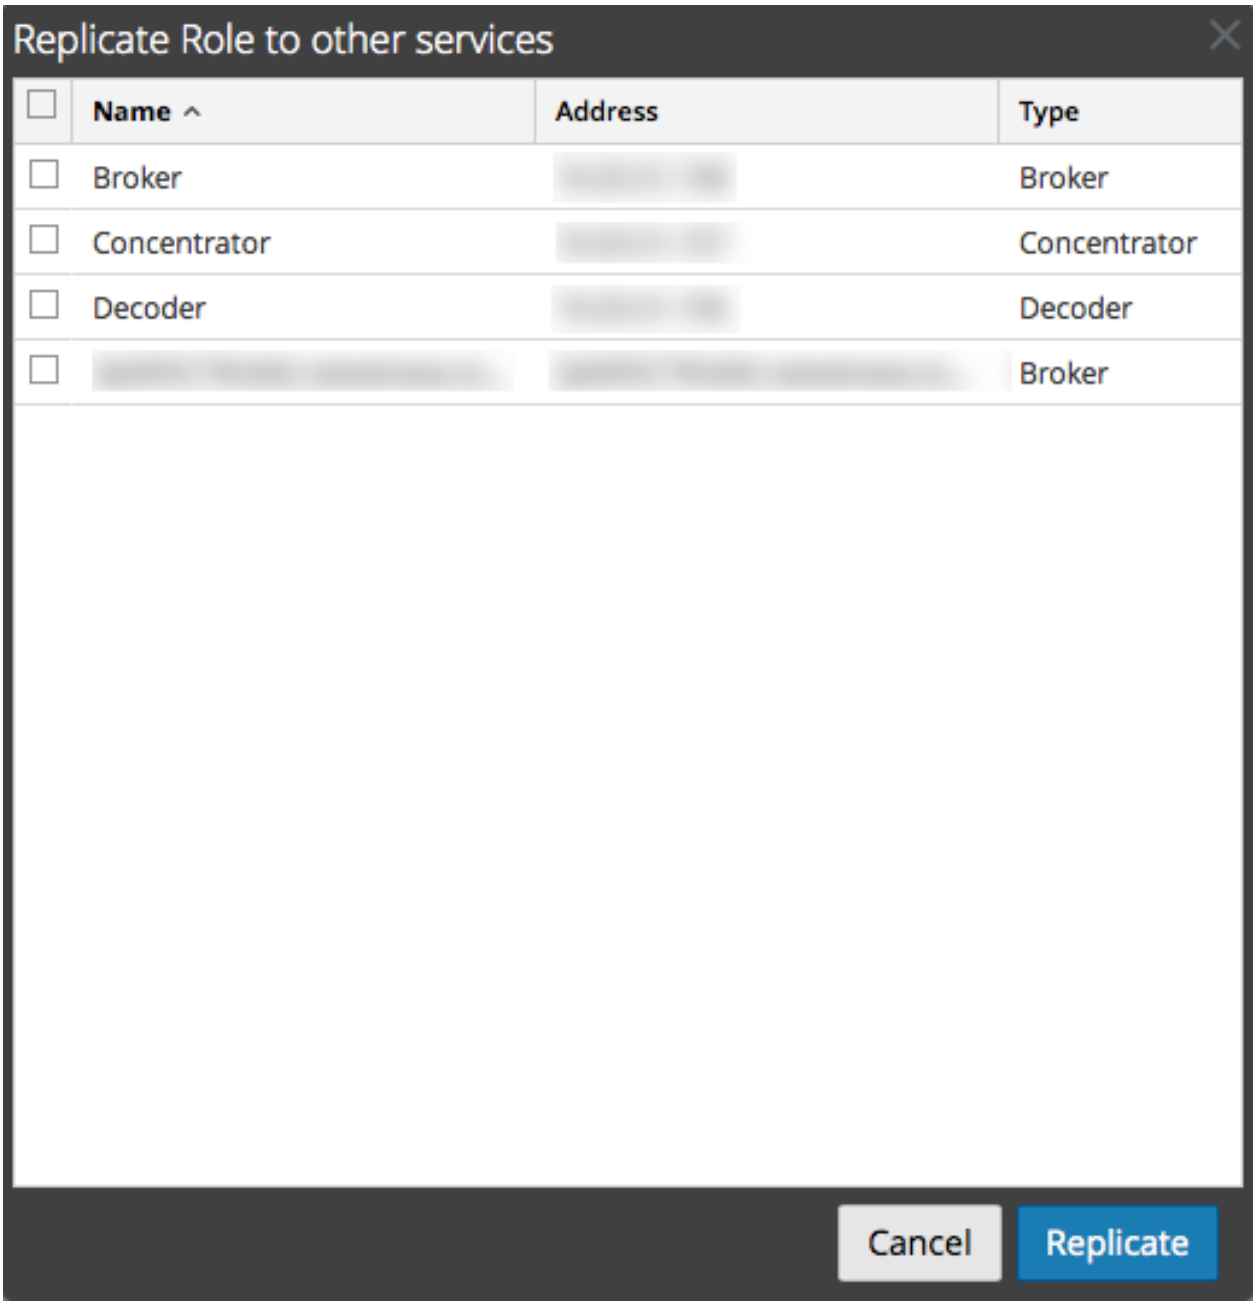
The Roles tab has a **Role Name** panel on the left. Selecting a role name shows the **Role Information** panel for the selected role on the right.

Role Name Panel

The **Role Name** panel has the following features.

Feature	Description
	Adds a new group to the current service.
	Deletes the selected group from the current service.
	Copies a role and its assigned permissions to a new role. The name of the new role must be unique. For example, you can copy the **Analysts** role and create another role with a new name, such as **Analyst_Managers**.
Replicate	Pushes a role and its assigned permissions to other services. After you select a role and click **Replicate**, the **Replicate Role to other services** dialog is displayed. In the dialog, you can select the services where you want to replicate the role.

The following figure shows the **Replicate Role to other services** dialog.



Role Information and Permissions Panel

The **Role Information and Permissions** panel defines role permissions.

There are two buttons:

- The **Apply** button saves the changes made in the Role Permissions panel and they become effective immediately.

- If you have not saved changes in the Role Permissions panel, the **Reset** button resets all fields and settings to their values before editing.

Service User Roles and Permissions

This topic describes the pre-configured service user roles and permissions.

The Services Security view Roles tab enables you to create service user roles and assign permissions. You can also use the pre-configured roles included with NetWitness Platform to assign user permissions.

Service User Roles

NetWitness Platform has the following pre-configured service user roles.

Role	Assigned Permissions	Personnel/Account
Administrators	All permissions	NetWitness Platform System Administrator
Aggregation	aggregate sdk.content sdk.meta sdk.packets	You can use this role to create an Aggregation account. This role provides the minimum permissions necessary to perform aggregation of data. It is only available on NetWitness Platform 10.5 and later services.
Analysts, Malware_ Analysts, and SOC_ Managers	sdk.meta sdk.content sdk.packets storedproc.execute	Users can use specific applications, run queries and view content for purposes of analysis.
Data_Privacy_ Officers	sys.manage users.manage sdk.meta sdk.content sdk.packets sdk.manage logs.manage database.manage index.manage dpo.manage	Data Privacy Officer Data Privacy Officers have the dpo.manage permission on Decoders and Log Decoders.

Role	Assigned Permissions	Personnel/Account
Operators	sys.manage services.manage connections.manage users.manage logs.manage parsers.manage rules.manage database.manage index.manage sdk.manage decoder.manage archiver.manage concentrator.manage storedproc.manage	Operators are responsible for the daily operation of the services.

Service User Permissions

There are many permissions that you can assign a service role in NetWitness Platform. Users can have different permissions on each service, depending on their role assignments and the permissions selected for each role. This table describes the permissions that you can assign to a role.

Permission	Definition
sys.manage	Allows the user to edit the service configuration settings.
services.manage	Allows the user to manage connections to other services.
connections.manage	Allows the user to manage connections to the service.
users.manage	Allows the user to create individual users and user roles and specify user permissions.
aggregate	Allows the user to perform aggregation of data.
sdk.meta	Allows the user to run queries in the Investigation and Reporting applications and to view the metadata returned by the query.
sdk.content	Allows the user to access raw packets and logs from any client application (Investigations and Reporting).
sdk.packets	Allows users to access raw packets and logs from any client application.
appliance.manage	Allows the user to manage the appliance (host) tasks. This permission is required by the Appliance service.
decoder. manage	Allows the user to edit the configuration settings for the Decoder service.
concentrator.manage	Allows the user to edit the configuration settings for the Concentrator/Broker service.

Permission	Definition
logs.manage	Allows the user to view the service logs and edit the logging configuration settings for the specified service.
parsers.manage	Allows the user to manage all attributes under the parsers node.
rules.manage	Allows the user to add and delete all rules.
database.manage	Allows the user to set database locations, sizes, and the various configuration settings for the session, meta and/or packet/log databases.
index.manage	Allows the user to manage all index-related attributes.
sdk.manage	Allows the user to view and set all SDK configuration items.
storedproc.execute	Allows the user to execute a Lua stored procedure.
storedproc.manage	Allows the user to manage Lua stored procedures.
archiver.manage	Allows the user to modify the Archiver configuration.
dpo.manage	Allows the user to manage the transform configuration and the applicable keys.

Aggregation Role

This topic describes the Aggregation role and permissions that allow service users to perform aggregation.

The Aggregation role is a service user role intended only for aggregation of data. It has the minimum role permissions required to do aggregation:

- aggregate
- sdk.meta
- sdk.packets
- sdk.content

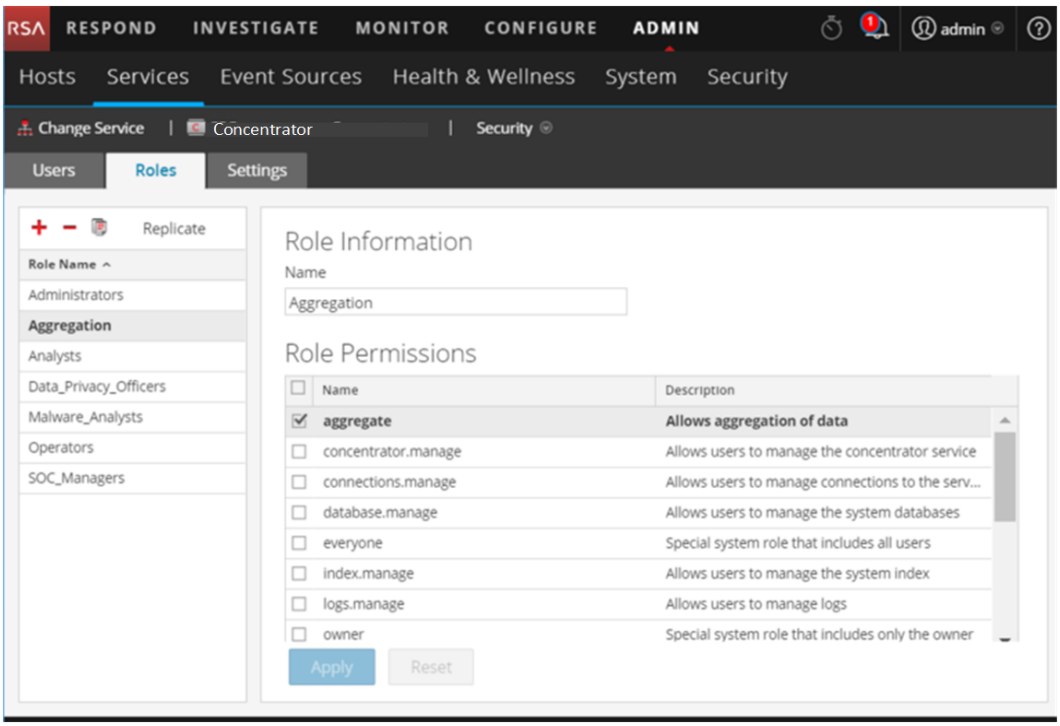
The Aggregation role is available only on NetWitness Platform 10.5 and later services and it can be used for an aggregation account. Members of this role or service users with these permissions can perform aggregation on Decoders, Concentrators, Archivers, and Brokers. The **aggregate** permission allows service users to perform aggregation of sessions and metadata along with raw packets and logs.

You can still use the decoder.manage, concentrator.manage, and archiver.manage permissions, but the Aggregation role permissions allow aggregation only and prevent the other available operations.

You access the service roles from the **ADMIN** > **Services** (select a service) > **Actions** > **View** > **Security** > **Roles** tab.

Procedures related to roles are described in Hosts and Services Procedures. Service User Roles and Permissions provides detailed information on the pre-configured roles.

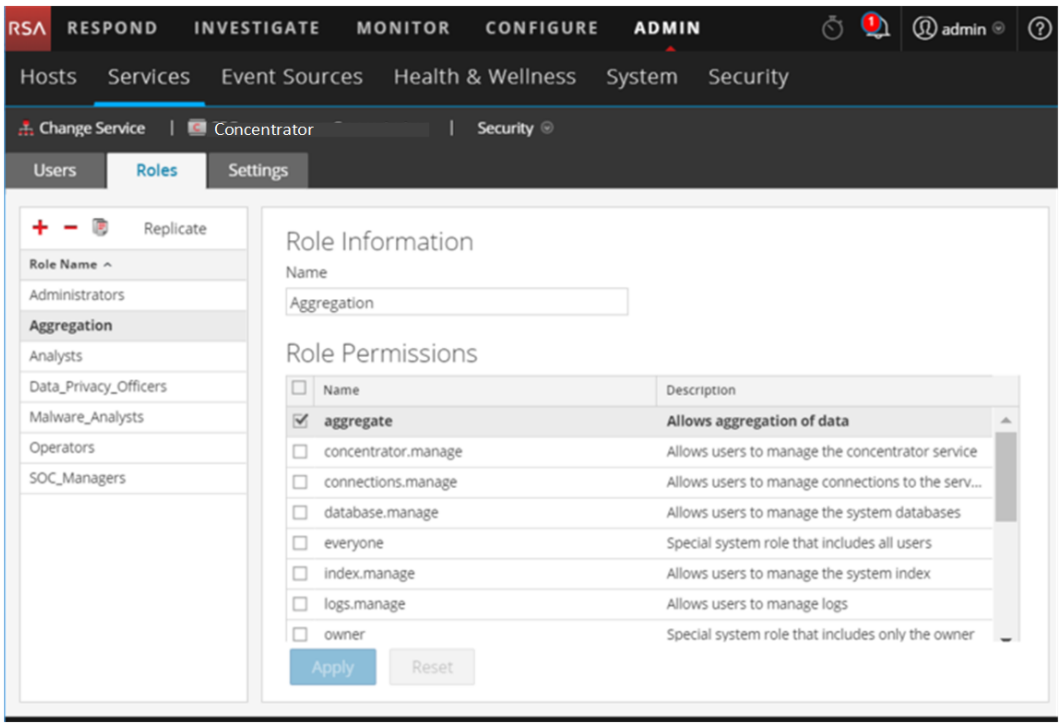
The following figure shows the permissions in the Aggregation role.



Settings Tab

This topic describes the features of the Services Security view > Settings tab.

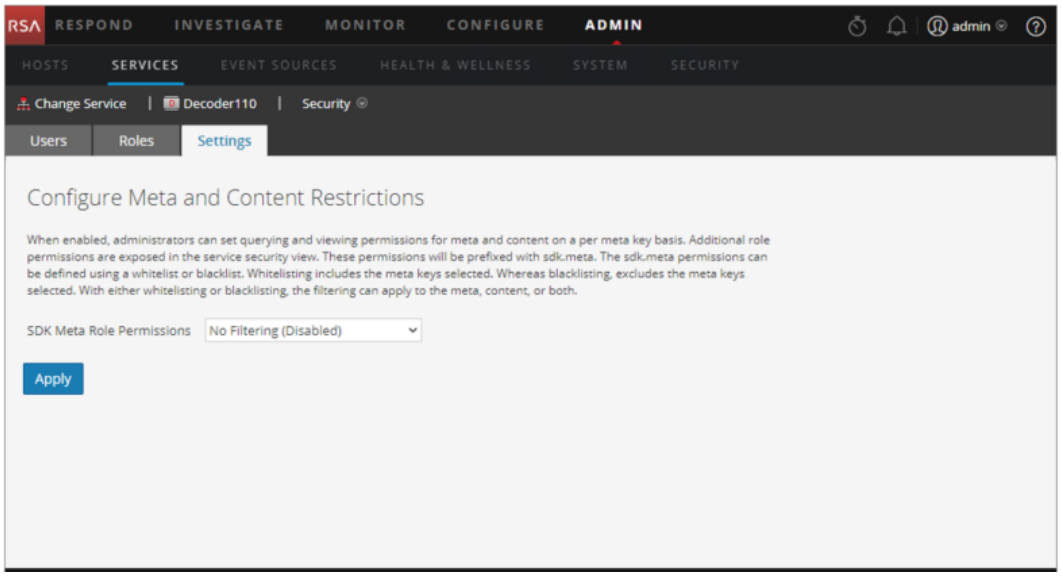
In the Services Security view Settings tab, Administrators can enable and configure system roles that define permissions on a per meta key basis for individual Brokers, Concentrators, Decoders, and Log Decoders. Configuring this feature adds configurable meta keys to the Services Security view > Roles tab so that individual meta keys can be applied to specific roles on a specific service. The following figure illustrates this.



This configuration is generally part of a data privacy plan implemented to ensure that specific types of content consumed or aggregated by a service are kept secure by limiting visibility of the meta data and content to privileged users (see *Data Privacy Management*).

To display the tab:

1. In **NetWitness Platform**, go to **ADMIN > Services**.
2. In the **Services** grid, select a Decoder or Log Decoder service, click **> View > Security,** and click the **Settings** tab.



Features

The tab includes two features.

Feature	Description
SDK Meta Role Permissions field	Provides option for disabling or configuring meta key and content restrictions. The filtering options are described.
Apply button	Applies the selected configuration immediately. If not disabled, the meta keys are added to the Roles tab so they can be applied to specific roles.

SDK Meta Role Permissions Options

The following table lists the filtering options available in the SDK Meta Role Permissions selection list, and the numeric values used to disable (0) and the types of filtering (1 through 6).

Note: There is no need to know the numeric value unless configuring meta and content visibility manually in the system.roles node.

system.roles Node Value	Settings Tab Option	Description
0	No Filtering (Disabled)	System roles that define permissions on a per meta key basis are disabled.
1	Whitelist meta and content	Meta and content for the specified SDK meta roles are white listed, or visible to users assigned the system role.
2	Whitelist only meta	Meta for the specified SDK meta roles is white listed, or visible to users assigned the system role.
3	Whitelist only content	Content for the specified SDK meta roles is white listed, or visible to users assigned the system role.
4	Blacklist meta and content	Meta and content for the specified SDK meta roles are black listed, or not visible to users assigned the system role.
5	Blacklist only meta	Meta for the specified SDK meta roles is black listed, or not visible to users assigned the system role.
6	Blacklist only content	Content for the specified SDK meta roles is black listed, or not visible to users assigned the system role.

Users Tab

This topic explains the features of the Services Security view > Users tab.

In the Services Security view, the Users tab enables you to configure the following for a service:

- Add user accounts.
- Change service user passwords.

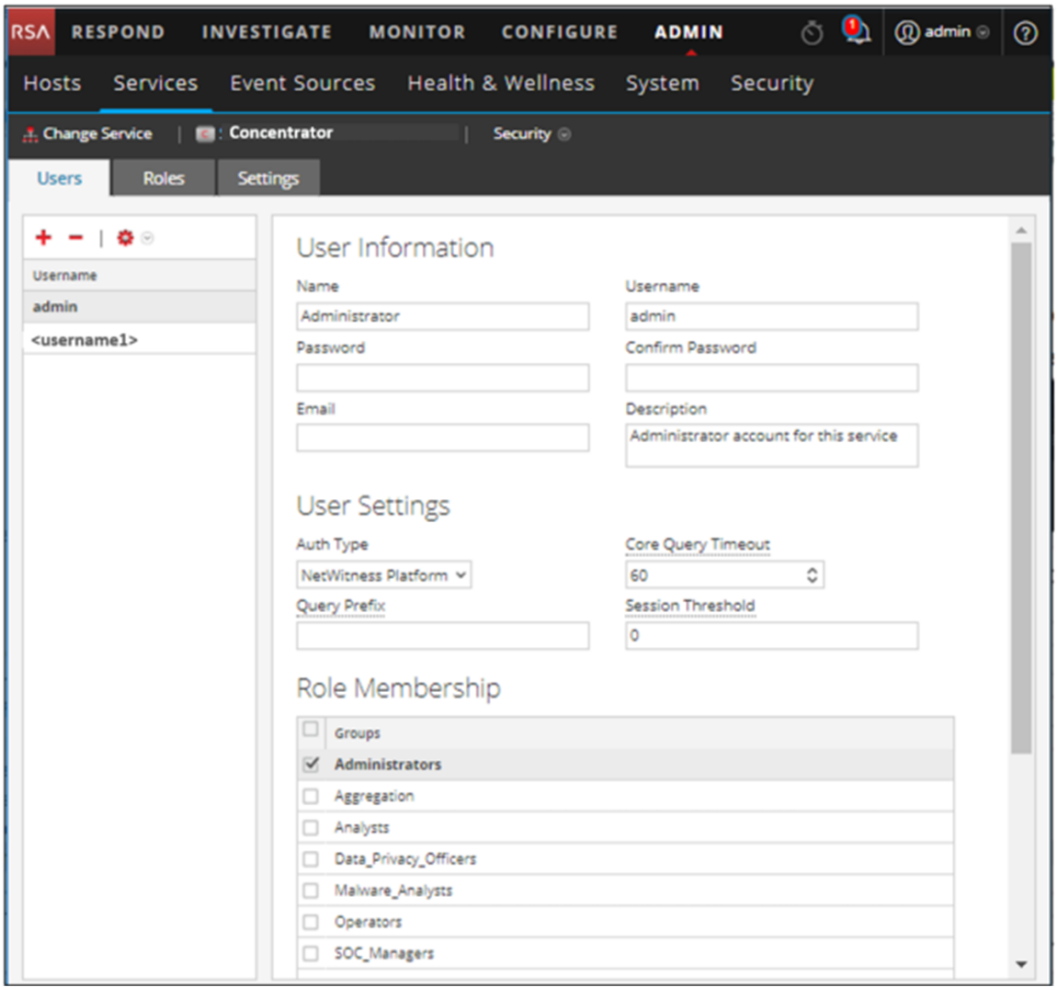
- Configure user authentication properties and query handling properties for the service.
- Specify the user role membership, which specifies the roles that the user belongs to on the selected service.

Note: For 10.4 or later NetWitness Platform Core services that utilize trusted connections, it is no longer necessary to create NetWitness Platform Core user accounts for users that log on through the web client. You only need to create NetWitness Platform Core user accounts for aggregation, thick client users, and REST API users.

Procedures related to this tab are described in Hosts and Services Procedures.

To access the Services Security view > Users tab:

1. In **NetWitness Platform**, go to **ADMIN > Services.**
2. Select a service to which you want to add a user, and select **> View > Security**.



Features

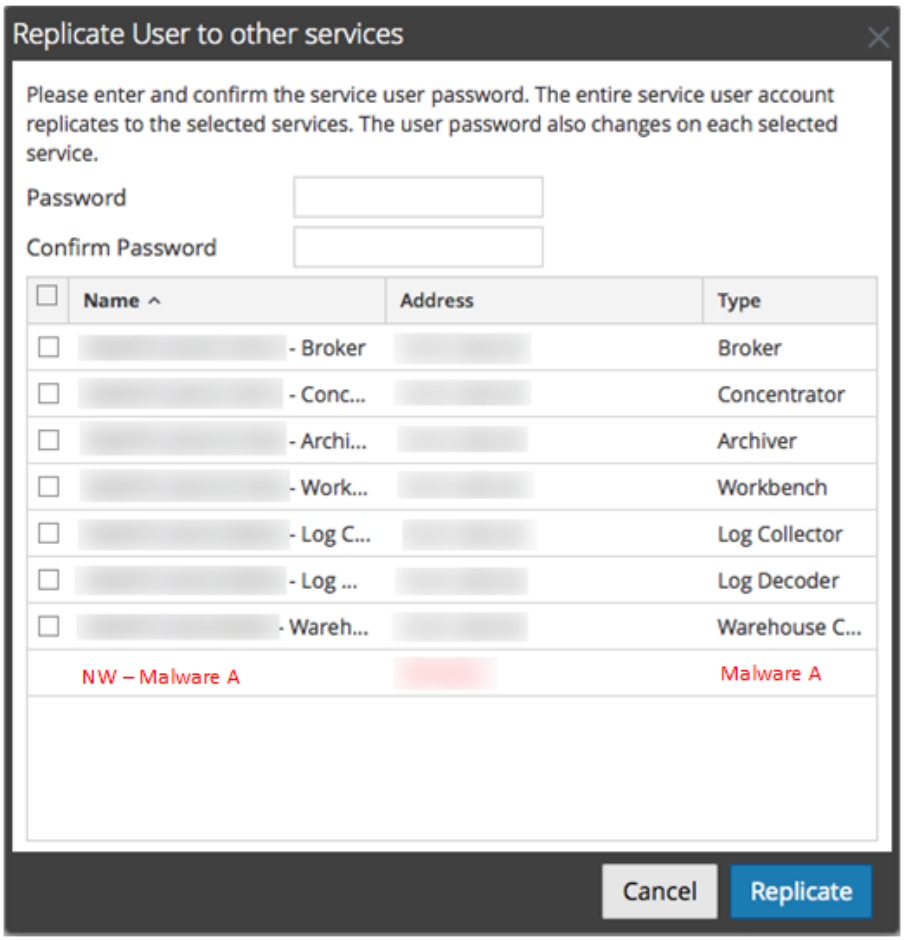
The Users tab has a User List panel on the left. Selecting a username makes the User Definition panel on the right available.

User List Panel

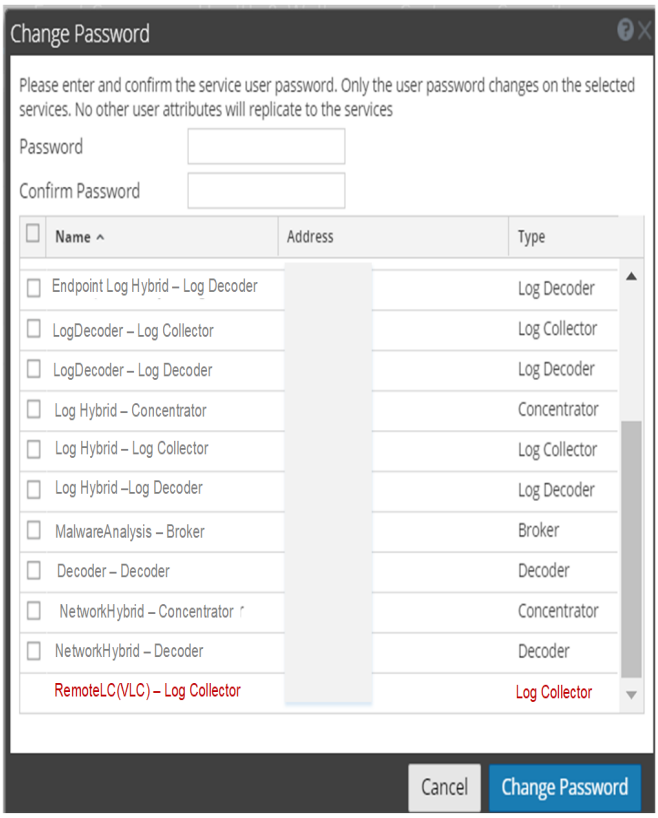
The User List panel has the following features.

Feature	Description
	Adds a new user to the current service.
	Deletes the selected users from the service.
	Performs one of the following actions on the selected service user account: • **Replicate:** Replicates the entire service user account to selected services. • **Change Password:** Changes the password of a service user and replicates the new password to Core services with that user account defined. The Change Password option replicates only the password change to the Core services selected and does not replicate the entire user account.
Username	The user names for all user accounts that access the service. The username must be one used to log on to NetWitness Platform.

The following figure shows the **Replicate User to other services** dialog.



The following figure shows the **Change Password** dialog.



User Definition Panel

The User Definition panel has three sections:

- User Information identifies the user as created in the Administration Security view.
- User Settings define parameters that apply to this user's access to the service.
- Role Membership defines user roles to which the user belongs.

There are two buttons:

- The **Save** button saves the changes made in the User Definition panel, and they become effective immediately.
- If you have not saved changes in the User Definition panel, the **Reset** button resets all fields and settings to their values before editing.

User Information

The User Information section has the following features.

Field	Description
Name	The name of the user.

Field	Description
Username	The username that this user enters to log in to the service. This is the NetWitness Platform username generated when the administrator added the user and the associated credentials in the **Administration Security** view (Administration > Security).
Password (and **Confirm Password**)	The password that the user enters to log on to the service. This is the NetWitness Platform password generated when the administrator added the user and the associated credentials in the **Administration Security** view. The NetWitness Platform account password and the service password must match in order to allow the user to connect to the service through NetWitness Platform.
Email	(Optional) The user's email address.
Description	(Optional) A general description field to describe this user.

User Settings

The User Settings section has the following features.

Field	Description
Auth Type	The authentication scheme for this user. The product line supports internal and external authentication. • **Netwitness** specifies internal authentication, and is enabled by default. In this mode, all users must authenticate with the user account and passwords that are generated when the administrator uses the NetWitness Platform Administration Security view (Administration > Security) to create the user and their associated credentials. • **External** specifies that authentication is enabled through the host interface with PAM (Pluggable Authentication Modules). For more information, see the **Configure PAM Login Capability** topic in the *System Security and User Management* guide.
Query Prefix	(Optional) Always append the query syntax to all queries by this user. For example, adding the query prefix **email != 'ceo@company.com'** prevents those email results from showing up in the sessions.
SA Core Query Timeout	**Note:** This field applies to NetWitness Platform 10.5 and later service versions and does not appear for 10.4 and earlier service versions. NetWitness Platform 10.4 and earlier services use Query Level instead of SA Core Query Timeout. Specifies the maximum number of minutes a user can run a query on the service. If this value is set to zero (0), the query timeout is not enforced for the user on the service. When replicating a user from a NetWitness Platform 10.5 or later service to a NetWitness Platform 10.4 service, Query Timeout migrates to Query Level based on the closest level. For example, if a user has a Query Timeout of 15 minutes, the user gets a Query Level of 3 after the migration. If a user has a Query Timeout of 35 minutes, the user gets a Query Level of 2 after the migration. If a user has a Query Timeout of 45 minutes, the user gets a Query Level of 2 after the migration.

Field	Description
Session Threshold	(Optional) Controls the behavior of the application when scanning meta values to determine session counts. Any meta value with a session count that is above the set threshold stops its determination of the true session count when the threshold is reached. If a threshold is set for a session, the Navigation view shows that the threshold was reached and the percentage of query time used to reach the threshold.

Role Membership

The Role Membership section shows the roles that a user is a member of for the selected service.

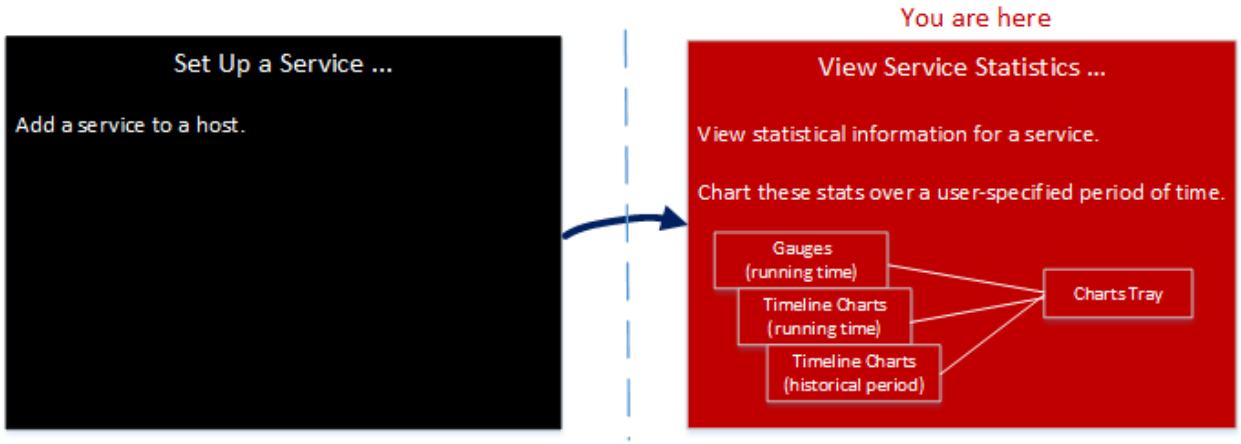
Services Stats View

This topic describes the features available in NetWitness Platform Services Stats view.

The Services Stats view provides a way to monitor the status and operations of a service. This view displays key statistics, service system information, and host system information for a service. In addition, more than 80 statistics are available for viewing as gauges and in timeline charts. In historical timeline charts, only statistics for session size, sessions, and packets are viewable.

Workflow

This workflow shows the tasks you perform from the Stats view.

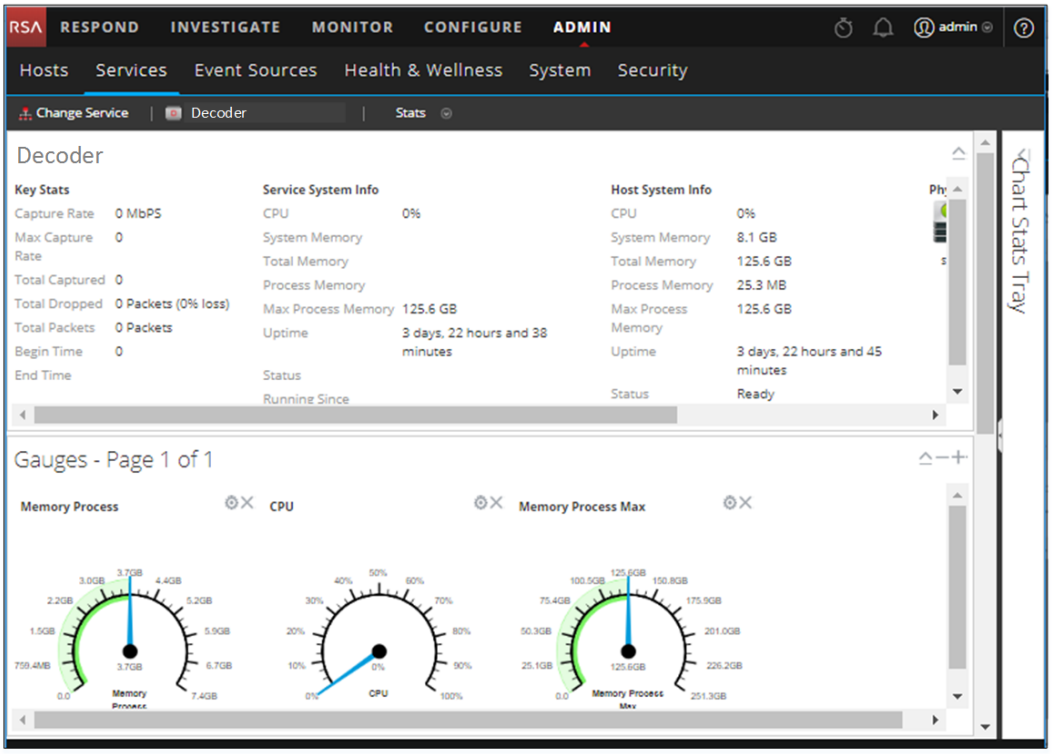


In the Stats view, you can customize the monitored statistics for individual services.

The following example shows you how to use the Stats view for a Decoder. The Stats view for all the services provide you with the same information for each service.

To access the Service Stats view:

1. In **NetWitness Platform** , go to **ADMIN > Services**.
   The Services view is displayed.
2. Select a service and select **> View > Stats**.



Features

Although different statistics are available for different types of services, certain elements are common to the Services Stats view for any Core service:

- Summary Stats section
- Gauges section
- Timelines section
- Historical Timelines section
- Chart Stats Tray

Summary Stats Section

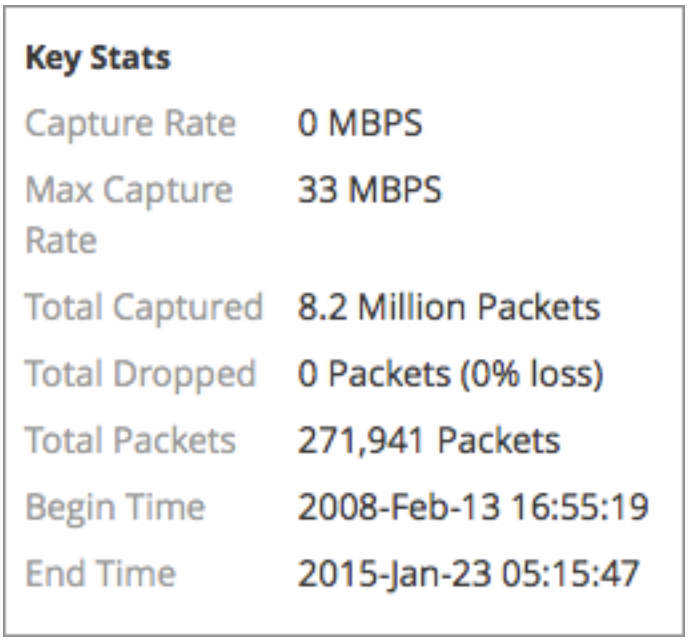
The Summary Stats section is at the top of the default view, and has no editable fields.

There are five panels in the Summary Stats section. The **Key Stats** panel displays different statistics for different types of services. The remaining panels in the Summary Stats section are the same for all types of services.

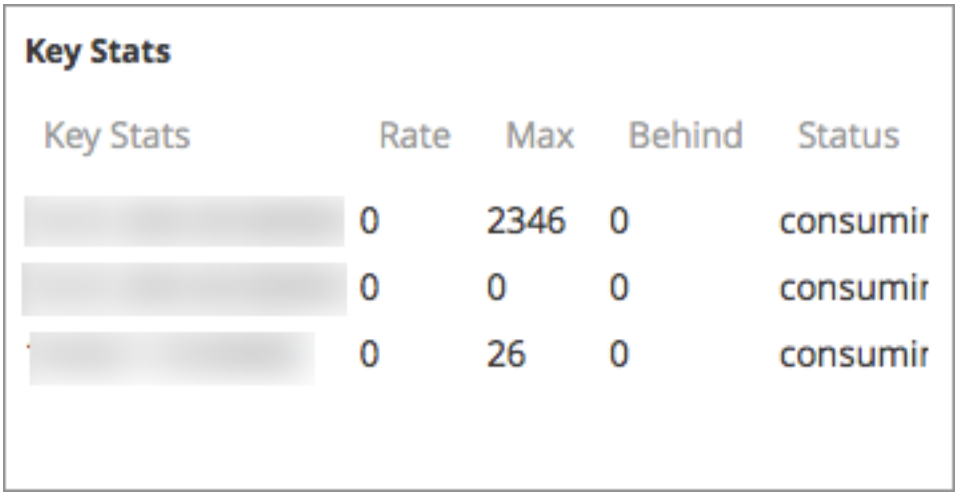
Key Stats

The Key Stats panel displays different statistics for different types of services.

- For a Decoder or Log Decoder, key statistics include capture statistics, such as capture rate, total packets or logs captured, total packets or logs dropped, the data capture begin time and end time.

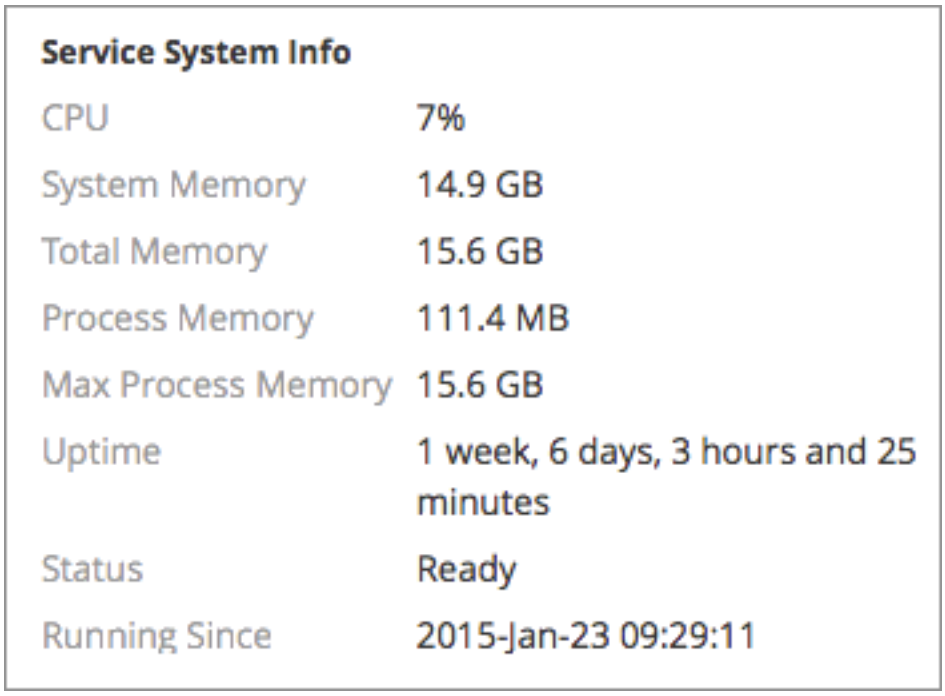


- A Broker or Concentrator aggregates data from multiple services. Therefore, the key statistics for all aggregate services are presented in a grid. The columns in the grid provide the service name, the capture rate, the maximum capture rate, the number of session behind (that need to be aggregated), and the service status.



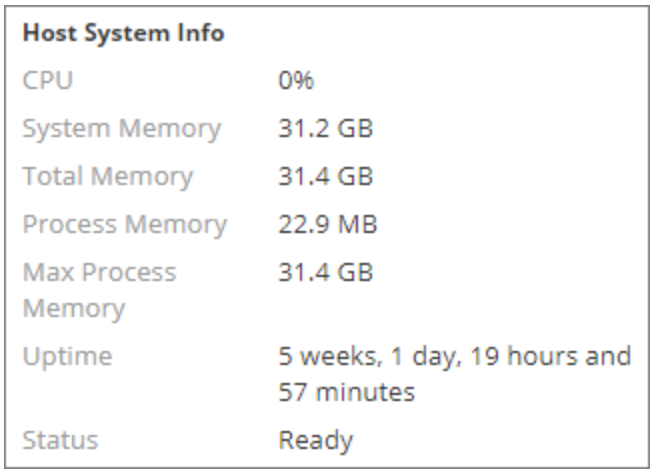
Service System Info

The Service System Info panel includes the percentage of CPU used by the service, the memory usage statistics (system, total, process, and maximum process), service uptime, status, running since time, and the current time.



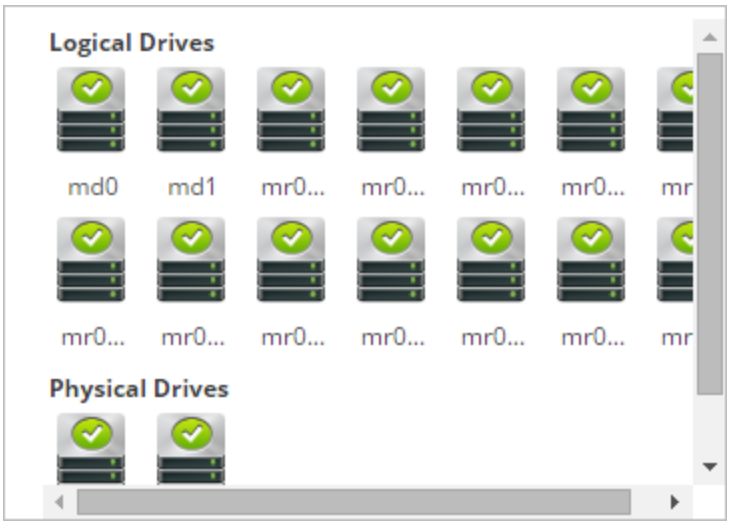
Service System Info	
CPU	7%
System Memory	14.9 GB
Total Memory	15.6 GB
Process Memory	111.4 MB
Max Process Memory	15.6 GB
Uptime	1 week, 6 days, 3 hours and 25 minutes
Status	Ready
Running Since	2015-Jan-23 09:29:11

Host System Info includes percentage of CPU used by the host, the memory usage statistics (system, total, process, and maximum), host uptime, status, running since time, and the current time.



Host System Info	
CPU	0%
System Memory	31.2 GB
Total Memory	31.4 GB
Process Memory	22.9 MB
Max Process Memory	31.4 GB
Uptime	5 weeks, 1 day, 19 hours and 57 minutes
Status	Ready

Logical Drives and **Physical Drives** are shown with an icon for the drive name and state. Drive types used in the names and the drive status options are listed below.



Drive Types and Status

Drive Type	Description	Comment	Status Options
sd	SCSI block device	Directly connected SAS, SATA MegaRAID volumes	OK (green) FAIL (red)
ld	MegaRAID Logical Volume	Defined in BIOS or with MegaCLI tool	OK (green) DEGRADED (yellow) BUILDING (yellow) FAIL (red)
pd	MegaRAID Physical Disks	Not directly exposed to Linux	OK (green) FAIL (red)
md	Linux software RAID Volume		OK (green) DEGRADED (yellow) BUILDING (yellow) FAIL (red)

Gauges

The Gauges section in the Stats View presents statistics in the form of analog gauges. See Features for details on configuring gauges.

Timelines

Timeline charts display the selected statistics in a running timeline with focus on the current time. This is the same for all types of services, and only the display name of the timeline is editable. See Timeline Charts for details on configuring timelines.

Historical Timelines

Historical timeline charts display statistics for session size, sessions, and packets in a historical timeline. This is the same for all types of services, and has an editable display name, begin date, and end date. See Timeline Charts for details on configuring timelines.

Note: Historical Timeline charts is being deprecated for Log Collector, Virtual Log Collector (VLC) and Windows Legacy Collector services.

Chart Stats Tray

The Chart Stats Tray lists all available statistics for the selected service type. Different services have different statistics to monitor. See Components for a detailed description.

- Timeline Charts

Chart Stats Tray

This topic describes the Chart Stats Tray in the Services Stats view.

In the Services Stats view, the Chart Stats Tray provides a way to customize the monitored statistics for individual services. The Chart Stats Tray lists all available statistics for the service. The number of statistics varies according to the type of service being monitored. Any statistic in the Chart Stats Tray can be displayed in a gauge or a timeline chart. Only statistics for session size, sessions, and packets are viewable in historical timeline charts.

To access the Services Stats view:

1. In the **NetWitness Platform** menu, select **ADMIN > Services**.

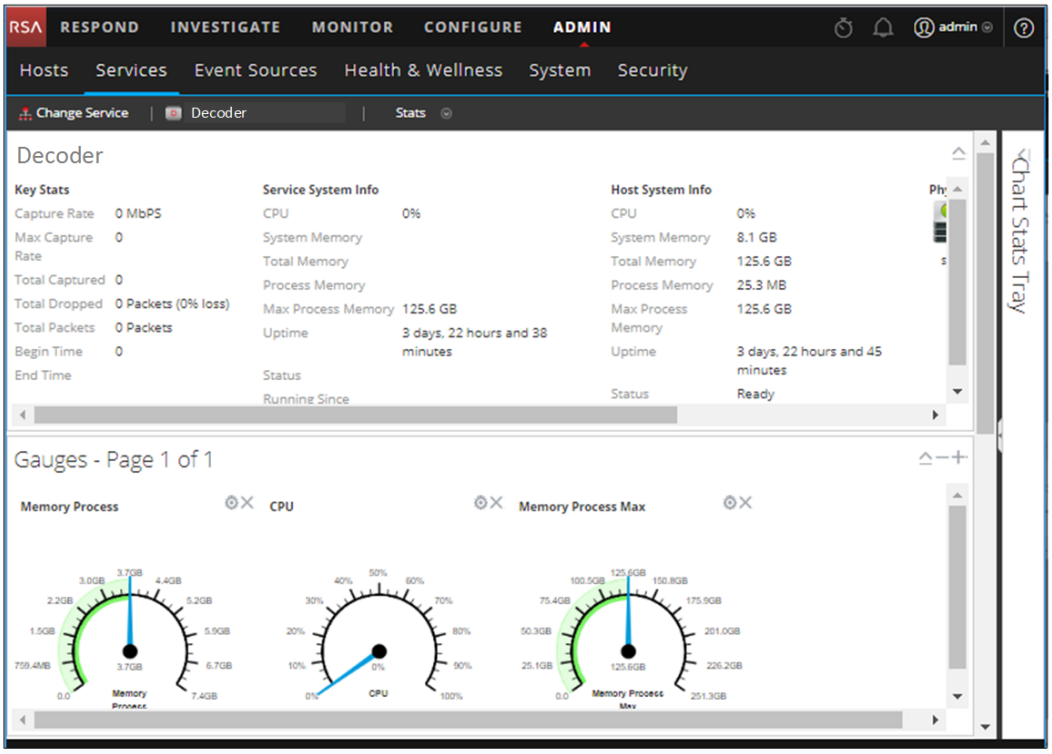
   The Administration Services view is displayed.

2. Select a service and select **> View > Stats**.

   The Chart Stats Tray is on the right side.

3. If the tray is collapsed, click to view the list of available statistics.

The following example shows the Services Stats view for a Decoder. The Chart Stats Tray is collapsed.



Components

The Chart Stats Tray has different statistics for different types of services. In the example above, 111 statistics are available for the Decoder. The following table describes features of the Chart Stat Tray.

Feature	Description
	Click to expand the panel horizontally.
	Click to collapse the panel horizontally.
Search	Type a search term in the field and press **RETURN**. Statistics that match are displayed with the matching word highlighted.
	Click to go to the first page.
	Click to go to the previous page.
	Type a page number in the Page field.
	Click to go to the next page.
	Click to go to the last page.
	Click to refresh the view.

Feature	Description
1 - 12 o	Displays the range of statistics being displayed. The total number statistics varies by service type.

Gauges

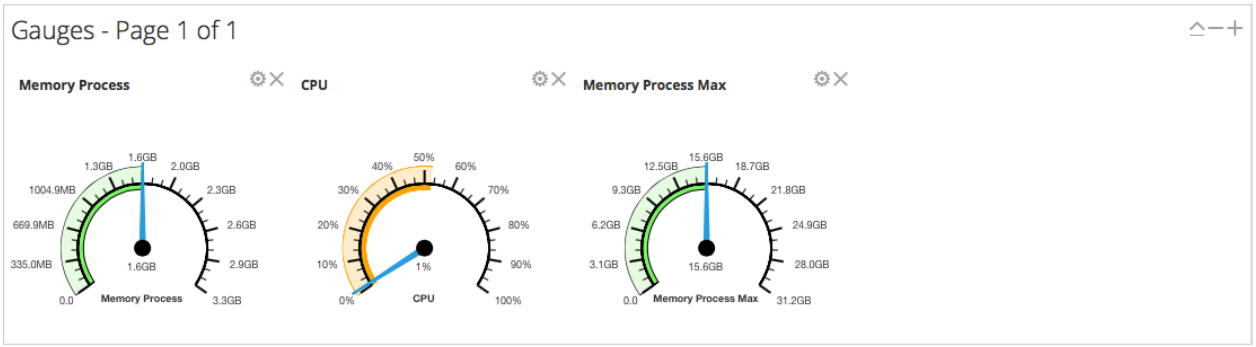
This topic introduces the features of the Gauges section in the Services Stats view.

The Gauges section of the Services Stats view presents statistics in the form of an analog gauge. You can drag any statistic available in the Chart Stats Tray to the Gauges section. The properties of each individual gauge are editable; all gauges have an editable title and some have additional editable properties.

To access the Services Stats view:

1. In the **NetWitness Platform** menu, select **ADMIN > Services**
   The Administration Services view is displayed.
2. Select a service and select **> View > Stats**.
   The Services Stats view includes the Gauges section.

The following figure shows the default gauges in the Services Stats view for a Log Decoder.



Features

The default gauges show these statistics:

- Process memory use
- CPU use
- Maximum process memory used

The controls in the Gauges title bar and in each gauge are the standard dashlet controls.

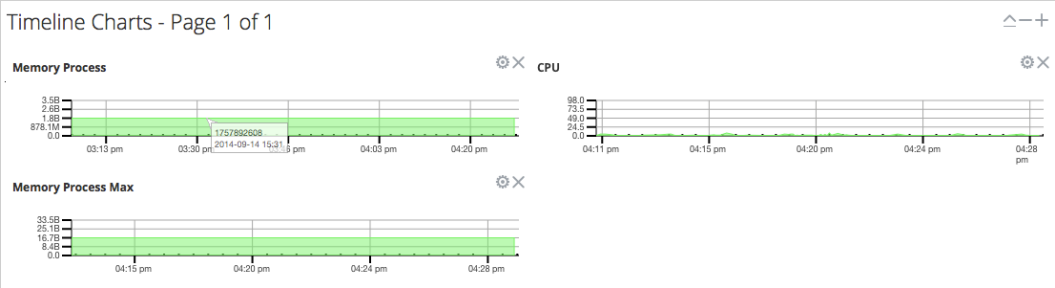
- In the Gauges title bar, you can collapse and expand the section and page forward or back.
- In each gauge, you can edit properties ( ) and delete ( ) the gauge.

Timeline Charts

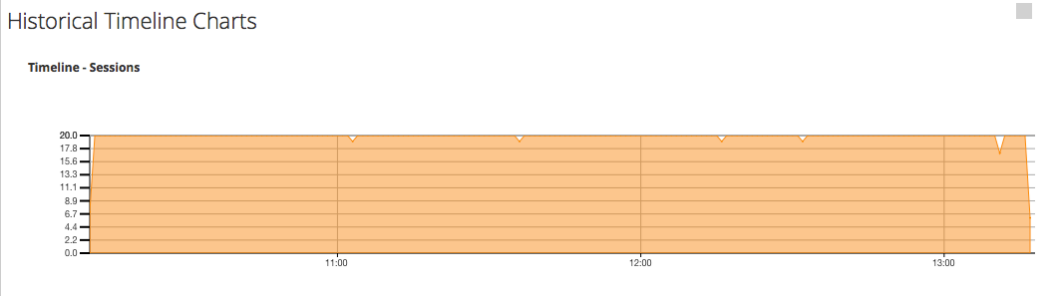
This topic describes the features of the timeline charts in the Services Stats view.

Timeline charts display statistics in a running timeline. The Services Stats view includes two types of timelines: current time and historical. You can drag any statistic available in the Chart Stats Tray to the Timeline Charts section. Only statistics for session size, sessions, and packets are viewable in historical timeline charts. The properties of an individual timeline chart are editable; all timeline charts have an editable title and some have additional editable properties.

The following figure is an example of a current timeline showing the value and timestamp of a data point.



The following figure is an example of a historical timeline chart.



The default current timeline charts show these statistics:

- Memory Process
- CPU
- Memory Process Max

The historical time charts show these statistics:

- Sessions
- Packets
- Session Size

The controls in the Timeline Charts title bar and in each timeline are the standard dashlet controls.

- In the Timeline Charts title bar, you can collapse and expand the section and page forward or back.
- In each timeline, you can edit Properties ( ) and delete ( ) the timeline.
- Hovering over a data point in the chart, displays the value and timestamp for the selected point.

System View

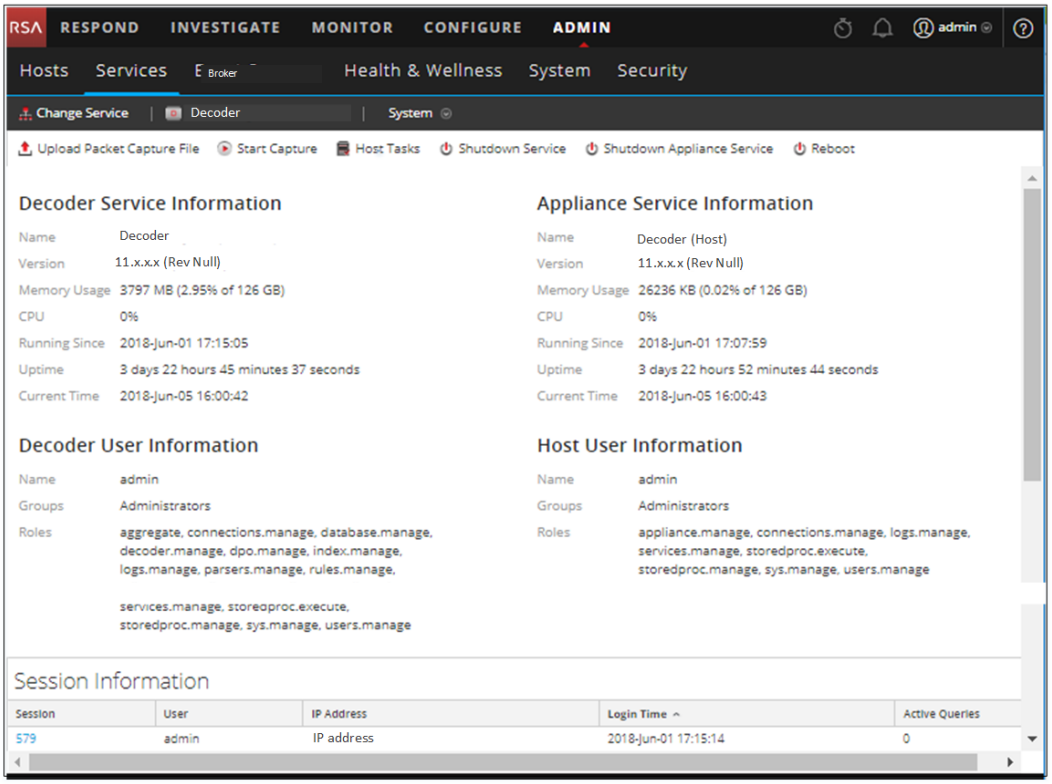
This topic introduces features in the System view using the Decoder and Log Decoder as an example. See the Configuration Guides individual services (for example for the *RSA NetWitness® Platform Broker and Concentrator Configuration Guide*) for details on their **ADMIN > Services > System** Views.

A Log Decoder is a special type of Decoder, and is configured and managed in a similar way to a Decoder. Therefore, most of the information in this section refers to both types of Decoders. Differences for Log Decoders are noted.

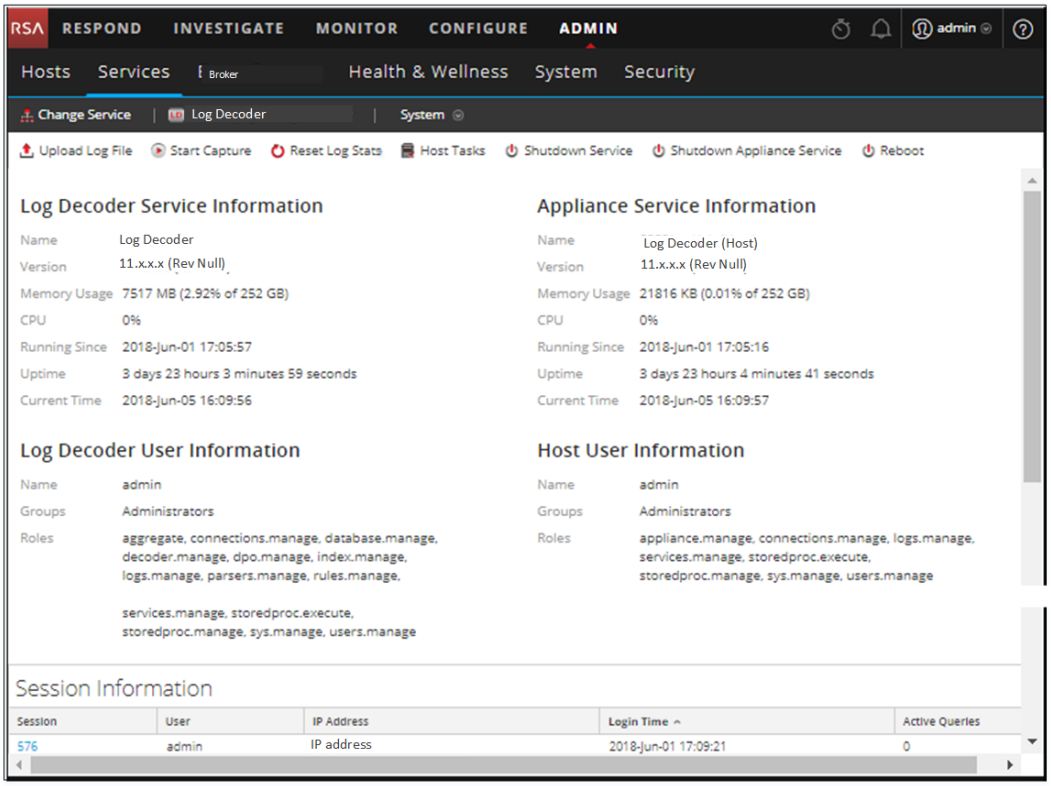
To access the Services System view for a Decoder:

1. In the **NetWitness Platform** menu, go to **ADMIN > Services**.
   The Services view is displayed.
2. Select a service and select **> View> System**.

The following figure shows an example of the Services System view for a Decoder.



The following figure shows the Services System view for a Log Decoder.



Features

Services Info Toolbar

The following toolbars show the options specific to Log Decoders and Decoders.

In addition to the common options in the Services System view toolbar, you can start and stop capture of packets or logs. The upload file options are different for the standard Decoder (packet capture file) and the Log Decoder (log file).

Action	Description
Upload Packet Capture File	Displays a dialog that provides a way to select a packet capture (.pcap) file for upload to the selected Decoder. For more information, see the **Upload Packet Capture File** topic in the *Decoder and Log Decoder Configuration Guide*. **Note:** This option does not apply to Log Decoders.
Upload Log File	Displays a dialog that provides a way to select a log (.log) file for upload to the selected Log Decoder. For more information, see the **Upload Log File to a Log Decoder** topic in the *Decoder and Log Decoder Configuration Guide*.

Action	Description
Start/Stop Capture	Starts packet capture on the selected Decoder. When packet capture is in progress, the option in the toolbar changes to Stop Capture, and the option to upload a file is unavailable.

Host Task List Dialog

This topic introduces the Services System view > Host Task List dialog.

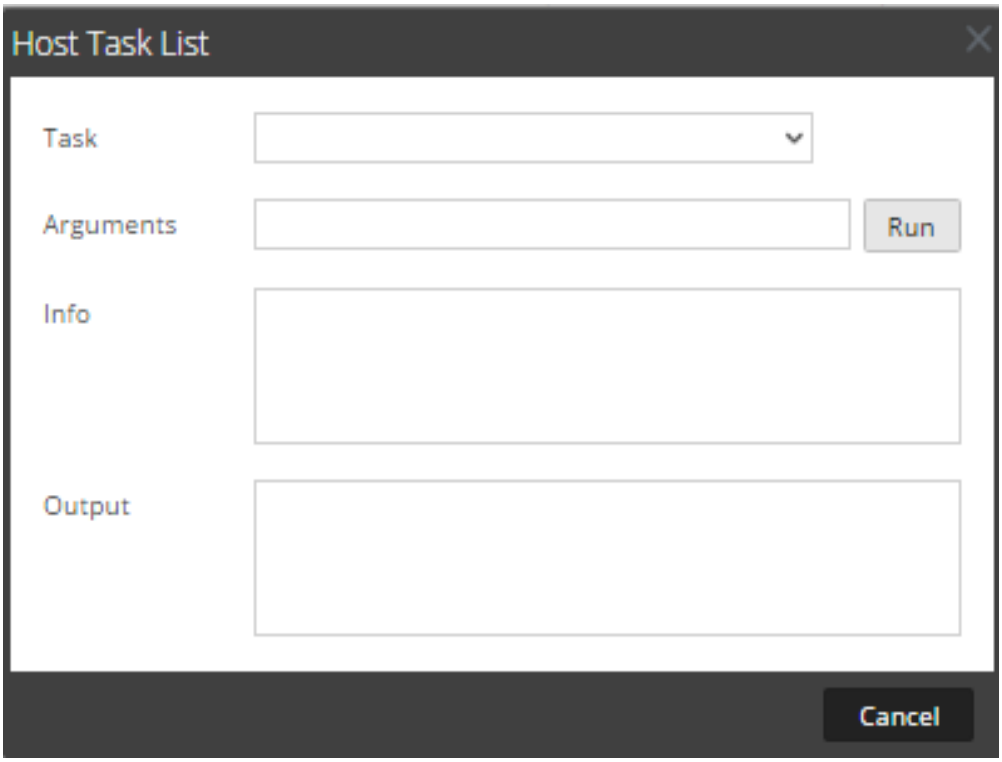
In the RSA NetWitness Platform Services System view, you can use the Host Tasks option to manage tasks that relate to a host and its communications with the network. Several service and host configuration options are available for Core services.

To access the Host Tasks dialog:

1. In **NetWitness Platform** , select **ADMIN >Services**.
2. Select a service and select > **View> System**.

   The System View for the service is displayed.
3. In the **Services System view** toolbar, click **Host Tasks**.

   The Host Task List dialog is displayed. The **Task** list offers a list of supported messages for the associated host.



Features

The table below describes the dialog features.

Field	Description
Task	An entry field in which you type or select a message for a Core host. When you click in this field a drop-down list of available host tasks is displayed.

Field	Description
Arguments	An entry field in which you enter the arguments, if any, for the message.
Run	Executes the task and arguments in the entry fields.
Info	Information about the message purpose and syntax.
Output	The output or result of an executed task.
Cancel	Closes the Host Task list dialog.

Host Task Selection List

These tasks are displayed as a drop-down list in the Task field. The available options are regulated by the security role required to execute the option.

Task	Description
Add Filesystem Monitor	Starts monitoring the storage services attached to the specified filesystem (see Add and Delete a Filesystem Monitor.
Delete Filesystem Monitor	Stops monitoring the storage services attached to the specified filesystem.
Reboot Host	Shuts down and restarts the host (see Reboot a Host).
Set Host Built-in Clock	Sets the host local clock (see Set Host Built-In Clock).
Set Host Hostname	This method of changing the hostname is deprecated in NetWitness Platform 10.6; replaced by the procedure described in Hosts and Services Procedures
Set Network Configuration	Sets network address parameters (see Set Network Configuration).
Set Network Time Source	Sets the clock source for this host (see Set Network Time Source).
Set Syslog Forwarding	Enables or disables syslog forwarding from a remote server to the selected service (see Set Syslog Forwarding).
Show Network Port Status	Shows the network interface information for a host (see Show Network Port Status).
Show Serial Number	Gets the host serial number (see Show Serial Number).
Shut Down Host	Shuts down the physical host and the host remains off (see Shut Down Host).
Start Service	Starts a service on this host (see Start, Stop, or Restart a Service).

Task	Description
Stop Service	Stops a service on this host.
setSNMP	Enables or disables the SNMP service on a host (see Set SNMP).

Service Configuration Settings

This topic introduces the available service configuration settings for RSA NetWitness Platform Core services.

NetWitness Platform Core services include Brokers, Concentrators, Decoders, Log Decoders, Archivers, and the Appliance service. The service configuration parameters listed in these tables constitute all viewable and configurable parameters. Some parameters are configurable in various parts of the NetWitness Platform user interface and others are viewable or configurable only on the Services Explore view.

Appliance Service Configuration Parameters

This topic lists and describes the available the configuration parameters for the NetWitness Platform Core Appliance service.

The NetWitness Platform Core Appliance service provides hardware monitoring on legacy NetWitness hardware.

This table describes the Appliance Configuration parameters.

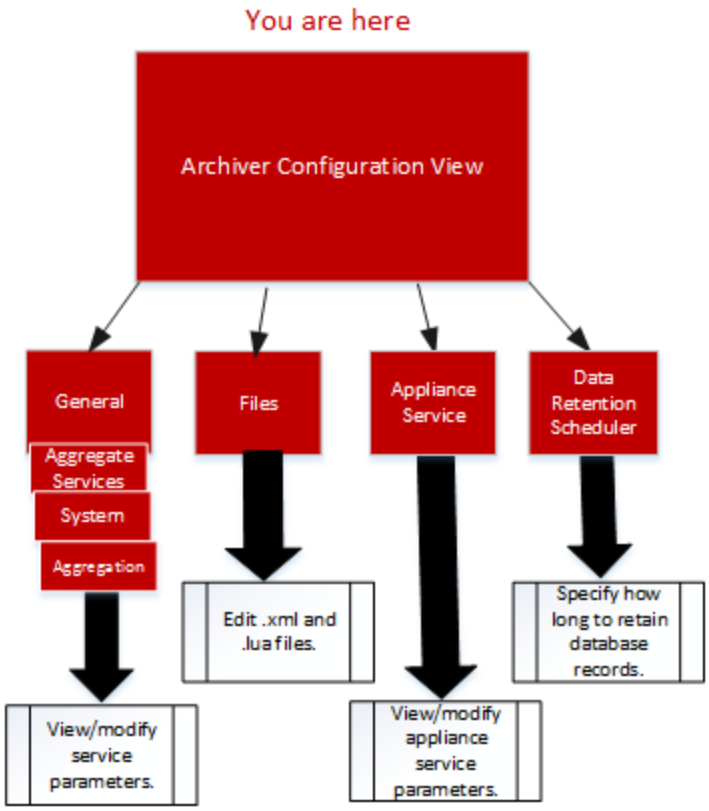
Appliance Parameter Field	Description
Logs	/logs/config, see Core Service Logging Configuration Parameters
REST	/rest/config, see REST Interface Configuration Parameters
Services	/services/<service name>/config, see Core Service-to-Service Configuration Parameters
System	/sys/config, see Core Service System Configuration Parameters

Archiver Service Configuration View

This topic lists and describes the available configuration settings for NetWitness Platform Archivers.

Workflow

The following workflow show the configuration tasks for the Archiver service.



Role	I want to ...
Administrator	Configure Meta Filters for Aggregation. Refer to "(Optional) Configure Meta Filters for Aggregation" in the *RSA NetWitness Platform Archiver Configuration Guide* for instructions.
Administrator	Configure Group Aggregation. Refer to "Configure Group Aggregation" in the *RSA NetWitness Platform Deployment Guide* for instructions.

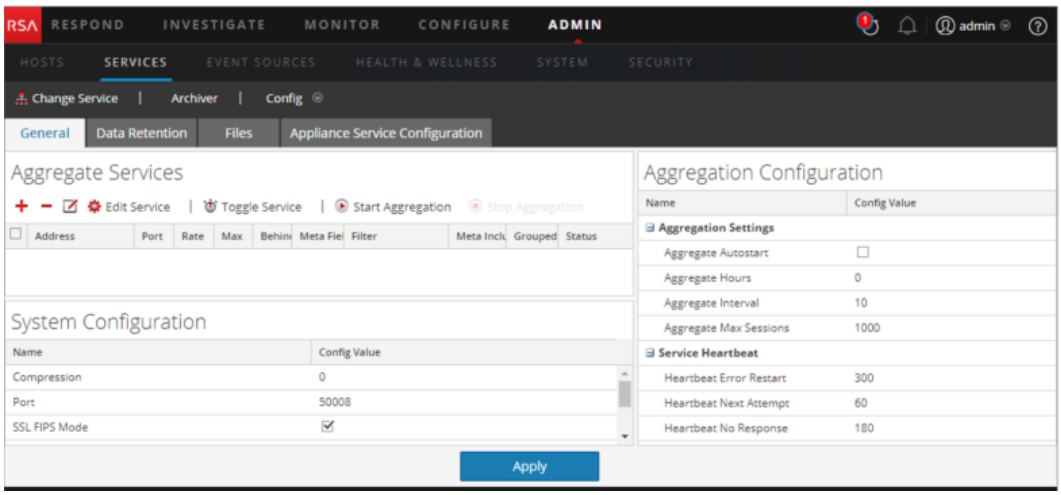
Quick Look

To access the Services Config view:

1. In **NetWitness Platform**, select **ADMIN > Services**.
   The Admin Services view is displayed.

2. Select an Archiver service and select **>View > Config**.
   Services Config view for the Archiver service is displayed.

This is an example of the Services Config view for an Archiver.



Broker Service Configuration Parameters

This topic lists and describes the configuration parameters for NetWitness Platform Brokers.

This table lists and describes the Broker configuration parameters.

Broker Parameter Field	Description
Broker	/broker/config refer to Aggregation Configuration Parameters
aggregate.interval.behind	Minimum number of milliseconds before another round of aggregation is requested when the broker is behind. Change takes effect immediately.
Database	/database/config refer to the **Database Configuration Nodes** topic in the *NetWitness Platform Core Services Database Tuning Guide*
Index	/index/config
index.dir	The directory where the broker device mapping files are stored. Change takes effect on service restart.
language.filename	The index language specification (XML) that is loaded on startup. Change requires service restart.
Logs	/logs/config refer to Core Service Logging Configuration Parameters
REST	/rest/config refer to REST Interface Configuration Parameters
SDK	/sdk/config refer to the **SDK Configuration Nodes** topic in the *NetWitness Platform Core Services Database Tuning Guide* and NetWitness Platform Core Service system.roles Modes
Services	/services/<service name>/config refer to Core Service-to-Service Configuration Parameters
System	/sys/config refer to Core Service System Configuration Parameters

Aggregation Configuration Parameters

This topic lists and describes the available configuration parameters that are common to services that perform aggregation, such as NetWitness Platform Concentrators and Archivers.

This table lists and describes the parameters that control aggregation on an aggregating service.

Configuration Path	/concentrator/config or /archiver/config
aggregate.autostart	Automatically restarts aggregation after a service restart, if enabled. Change takes effect immediately.
aggregate.buffer.size	Displays the size of the buffer (default unit is KB) used per round of aggregation. Larger buffers may improve aggregation performance but could impact query performance. Change takes effect after aggregation restart.
aggregate.crc	If enabled, all aggregation streams will be CRC validated. Change takes effect immediately.
aggregate.hours	Displays the maximum number of hours behind a service will be allowed to start aggregation. Change takes effect immediately.
aggregate.interval	Lists the minimum number of milliseconds before another round of aggregation is requested. Change takes effect immediately.
aggregate.meta.page.factor	Lists the allocated number meta pages per session used for aggregation. Change takes effect on service restart.
aggregate.meta.perpage	Lists the allocated number of meta stored on one page of data. Change takes effect on service restart.
aggregate.precache	Determines if the concentrator will precache the next round of aggregation for upstream services. Can improve aggregation performance but could impact query performance. Change takes effect immediately.
aggregate.sessions.max	Lists the number of sessions to aggregate on each round. Change takes effect after aggregation restart.
aggregate.sessions.perpage	Lists the number of sessions stored on one page of data. Change takes effect on service restart.
aggregate.time.window	Displays the maximum +/- time window, in seconds, that all services must be inside before another round of aggregation is requested. Zero turns off time window. Change takes effect immediately.
consume.mode	Determines if the concentrator can only aggregate locally or over a network, based on licensing restrictions. Change takes effect on service restart.
export.enabled	Allows export of session data, if enabled. Change takes effect on service restart.
export.expire.minutes	Lists the number of minutes before export cache files are expired and flushed. Change takes effect immediately.

Configuration Path	/concentrator/config or /archiver/config
export.format	Determines the file format used during data export. Change takes effect on service restart.
export.local.path	Displays the local location to cache exported data. Optional assigned max size (=#unit), units are: t for TB; g for GB, m for MB. Change takes effect on service restart.
export.meta.fields	Determines which meta fields are exported. Comma list of fields. Star means all fields. Star plus field list means all fields BUT listed fields. Just field list says just include those fields. Change takes effect immediately.
export.remote.path	Displays the remote protocol (nfs://) and location to export data. Change takes effect on service restart.
export.rollup	Determines the rollup interval for export files. Change takes effect on service restart.
export.session.max	Displays the maximum sessions per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.size.max	Displays the maximum bytes per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.usage.max	Displays the maximum percentage of cache space used before stopping aggregation. Zero is no limit. Change takes effect immediately.
heartbeat.error	Lists the number of seconds to wait after a service error before attempting a service reconnect. Change takes effect immediately.
heartbeat.interval	Lists the number of milliseconds between heartbeat service checks. Change takes effect immediately.
heartbeat.next.attempt	Lists the number of seconds to wait before attempting a service reconnect. Change takes effect immediately.
heartbeat.no.response	Lists the number of seconds to wait before taking unresponsive service offline. Change takes effect immediately.

Concentrator Service Configuration Parameters

This topic lists and describes the available configuration parameters for NetWitness Platform Concentrators.

This table lists and describes the Concentrator configuration parameters .

Concentrator Parameter Field	Description
Concentrator	/concentrator/config refer to Aggregation Configuration Parameters
Database	/database/config refer to the **Database Configuration Nodes** topic in the *NetWitness Platform Core Database Tuning Guide*
Index	/index/config refer to the **Index Configuration Nodes** topic in the *NetWitness Platform Core Database Tuning Guide*
Logs	/logs/config refer to Core Service Logging Configuration Parameters
REST	/rest/config refer to REST Interface Configuration Parameters
SDK	sdk/config refer to the **SDK Configuration Nodes** topic in the *NetWitness Platform Core Database Tuning Guide*and NetWitness Platform Core Service system.roles Modes
Services	/services/<service name>/config refer to Core Service-to-Service Configuration Parameters
System	/sys/config refer to Core Service System Configuration Parameters

Core Service Logging Configuration Parameters

This topic lists and describes the logging configuration parameters for all NetWitness Platform Core services.

Logging configuration is the same on all NetWitness Platform Core services.

The following table describes the logging configuration parameters:

Logs Configuration Folder	/logs/config
log.dir	Displays the directory where the log database is stored. Optional assigned max size (=#) is in MBs. Change takes effect on service restart.
log.levels	Controls what types of log messages are stored (comma separated). Module specific settings are defined like this: <Module>=[debug|info|audit|warning|failure|all|none]. Change takes effect immediately.
log.snmp.agent	Sets a remote SNMP Trap Receiving agent.
snmp.trap.version	Sets the SNMP version to be used for gets and traps (2c or 3).
snmpv3.engine.boots	Displays the SNMPv3 engine boots count. This field auto-increments on startup and should not normally need to be set by the user.

Logs Configuration Folder	/logs/config
snmpv3.engine.id	Sets the SNMPv3 engine ID, which is 10-64 hexadecimal digit number optionally preceded by 0x. You can add suffix values at the end of the engine ID for each of the SA Core services running on the same host. For example, if the generated Engine ID for the SA Core host is 0x1234512345, you can set the Engine ID for the Decoder service as 0x123451234501 and set 0x123451234504 for the Appliance service.
snmpv3.trap.auth.local.key	Sets the SNMPv3 Trap Authentication Local Key, which is a 16 or 20 hexadecimal digit number (depending on which authentication protocol is used) preceded by 0x. For MD5, the key is 16 hexadecimal digits, while SHA uses 20 hexadecimal digits. You can use any desired algorithm to generate the local keys. It is recommended that a generation method involving randomness be used as opposed to selecting key values manually.
snmpv3.trap.auth.protocol	Displays the SNMPv3 Trap Authentication Protocol (none, MD5 or SHA).
snmpv3.trap.priv.local.key	Sets the SNMPv3 Trap Privacy Local Key, which is a 16 hexadecimal digit number preceded by 0x.
snmpv3.trap.priv.protocol	Displays the SNMPv3 Trap Privacy Protocol (none or AES).
snmpv3.trap.security.level	Displays the SNMPv3 Trap Security Level, which indicates whether authentication and privacy are used or not. Possible values are noAuthNoPriv, authNoPriv or authPriv.
snmpv3.trap.security.name	Sets the SNMPv3 Trap Security Name used during SNMPv3 trap authentication.
syslog.size.max	Displays the maximum size of a log sent to syslog (some syslog daemons have issues with very large messages). Zero means no limit. Change takes effect immediately.

Core Service-to-Service Configuration Parameters

This topic lists and describes the configuration parameters that control how a Core service connects to another Core service. For example, when a Concentrator connects to a decoder, the parameters of that connection are controlled by these settings.

Whenever a Core service establishes a connection to another Core service, the service that acts as the **client** creates a new sub-folder in the /services folder of the configuration tree. The name of the sub-folder corresponds to the name of the service and has the form `host:port`. For example, the service connection folder for a Concentrator connection to a Decoder could be `/services/reston-va-decoder:50004`. Inside each service connection folder, there is a `config` sub-folder that holds configurable parameters.

The following table describes the Service Configuration parameters:

Services	/services/host:port/config

Services	/services/host:port/config
allow.nonssl.to.ssl	Allows a non-SSL connection to connect to a SSL service, when set to true. Otherwise, if false, non-secure to secure connections will be denied. Change takes effect immediately.
compression	Displays a config node that determines if data is compressed before sending. A positive value determines the number of bytes that need to be sent before it will be compressed. Zero means no compression.
crc.checksum	Displays a config node that determines if data streams are validated with a CRC checksum. A positive value determines the number of bytes that need to be sent before it will be CRC validated. Zero means no CRC validation.
ssl	Displays a config node that enables or disables SSL encryption on the connection.

Core Service System Configuration Parameters

This topic lists and describes the configuration parameters that are common to all NetWitness Platform Core services.

The following table lists and describes the System configuration parameters:

System Configuration Folder	/sys/config
compression	Displays the minimum amount of bytes before a message is compressed, when set to a positive value. Zero means no compression for any message. Change takes effect on subsequent connections.
crc.checksum	Displays the minimum bytes before a message is sent over the network with a CRC checksum (to be validated by the client), when set to a positive value. Zero means no CRC checksum validation with any message. Change takes effect on subsequent connections.
drives	Displays drives to monitor for usage stats. Change takes effect on service restart.
port	Displays the port this service will listen on. Change takes effect on service restart.
scheduler	Displays the folder for scheduled tasks.
service.name.override	Displays an optional service name used by upstream services for aggregation in lieu of hostname.
ssl	Encrypts all traffic using SSL, if enabled. Change takes effect on service restart.
stat.compression	Compresses stats as they are written to the database, if enabled. Change takes effect on service restart.

System Configuration Folder	/sys/config
stat.dir	Displays the directory where the historical stats database is stored (separate multiple dirs with semicolon). Optional assigned max size (=#unit), units are: t for TB; g for GB, m for MB. Change takes effect on service restart.
stat.exclude	Lists stat pathnames to be excluded from the stat database. The following wildcards are permitted: ? match any single character, * match zero or more characters to delimiter /, ** match zero or more characters including delimiter. Change takes effect immediately.
stat.interval	Determines how often (in milliseconds) statistic nodes are updated in the system. Change takes effect immediately.
threads	Lists the number of threads in the thread pool to handle incoming requests. Change takes effect immediately.

Decoder Service Configuration Parameters

This topic lists and describes the available configuration parameters for NetWitness Platform Decoders.

Decoder Parameter Field	Description
Decoder	/decoder/config refer to Decoder and Log Decoder Configuration Parameters
Database	/database/config refer to the **Database Configuration Nodes** topic in the *NetWitness Platform Core Database Tuning Guide*
Index	/index/config refer to the **Index Configuration Nodes** topic in the *NetWitness Platform Core Database Tuning Guide*
Logs	/logs/config refer to Core Service Logging Configuration Parameters
REST	/rest/config refer to REST Interface Configuration Parameters
SDK	/sdk/config refer to the **SDK Configuration Nodes** topic in the *NetWitness Platform Core Database Tuning Guide*and NetWitness Platform Core Service system.roles Modes
System	/sys/config refer to Core Service System Configuration Parameters

Decoder and Log Decoder Configuration Parameters

This topic lists and describes the configuration parameters that are identical on both Decoder and Log Decoder services.

Configuration Path	<service>/config
aggregate.buffer.size	Displays the size of the buffer (default unit is KB) used per round of aggregation. Larger buffers may improve aggregation performance but could impact capture performance. Change takes effect after capture restart.
aggregate.precache	Determines if the decoder will pre-cache the next round of aggregation for upstream services. Can improve aggregation performance but could impact capture performance. Change takes effect immediately.
assembler.pool.ratio	Displays the percentage of pool pages that assembler manages and uses for the assembly process. Change takes effect on service restart.
assembler.session.flush	Flushes sessions when they are complete (1) or flushes sessions when they are parsed (2). Change takes effect on service restart.
assembler.session.pool	Lists the number of entries in the session pool. Change takes effect on service restart.
assembler.size.max	Lists the maximum size that a session will obtain. A setting of 0 removes the session size limit. Change takes effect immediately.
assembler.size.min	Lists the minimum size that a session must be before persisting. Change takes effect immediately.
assembler.timeout.packet	Lists the number of seconds before packets are timed out. Change takes effect immediately.
assembler.timeout.session	Lists the number of seconds before sessions are timed out. Change takes effect immediately.
assembler.voting.weights	Displays the weights used to determine which session stream is marked client and server. Change takes effect immediately.
capture.autostart	Determines if capture begins automatically when the service starts. Change takes effect on service restart.
capture.buffer.size	Displays capture memory buffer allocation size (default unit is MB). Change takes effect on service restart.

Configuration Path	<service>/config
capture.device.params	Displays capture service specific parameters. Change takes effect on service restart. The parameters understood by this field are specific to the currently selected capture device. If any of the parameters are not recognized by the current capture device, they are ignored. On Log Decoders, there is only the Log Events capture device. It accepts some optional parameters. • **use-envision-time**: If this is set to 1, the time meta for each event will be imported from the Log Collector stream. If this is 0 or not set, the imported event time will be stored in the event.time meta. • **port**: This parameter can be set to a numeric value to override the default syslog port listener, 514.
capture.selected	Displays current capture service and interface. Change takes effect immediately.
export.expire.minutes	Lists the number of minutes before export cache files are expired and flushed. Change takes effect immediately.
export.packet.enabled	Allows export of packet data, if enabled. Change takes effect on service restart.
export.packet.local.path	Displays the local location to cache packet exported data. Optional assigned max size (=#unit), units are: t for TB; g for GB, m for MB. Change takes effect on service restart.
export.packet.max	Displays the maximum packets per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.packet.remote.path	Lists the remote protocol (nfs://) and location to export data. Change takes effect on service restart.
export.packet.size.max	Displays the packet maximum bytes per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.rollup	Determines the rollup interval for export files. Change takes effect on service restart.
export.session.enabled	Allows export of session data, if enabled. Change takes effect on service restart.
export.session.format	Determines the file format used during session export. Change takes effect on service restart.
export.session.local.path	Displays the local location to cache session exported data. Optional assigned max size (=#unit), units are: t for TB; g for GB, m for MB. Change takes effect on service restart.

Configuration Path	<service>/config
export.session.max	Displays the maximum sessions per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.session.meta.fields	Determines which meta fields are exported. Comma list of fields. Star means all fields. Star plus field list means all fields BUT listed fields. Just field list says just include those fields. Change takes effect immediately.
export.session.remote.path	Displays the remote protocol (nfs://) and location to export data. Change takes effect on service restart.
export.session.size.max	Lists the session maximum bytes per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.usage.max	Lists the session maximum bytes per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
parse.threads	Lists the number of parse threads to use for session parsing. Zero means let server decide. Change takes effect on service restart.
pool.packet.page.size	Displays the size of a packet page (default is KB). Change takes effect on service restart.
pool.packet.pages	Lists the number of packet pages decoder will allocate and use. Change takes effect on service restart.
pool.session.page.size	Displays the size of a session page (default is KB). Change takes effect on service restart.
pool.session.pages	Lists the number of session pages decoder will allocate and use. Change takes effect on service restart.

Log Decoder Service Configuration Parameters

This topic lists and describes the available configuration parameters for RSA NetWitness Platform Log Decoders.

Log Decoder Configuration Settings

This table lists and describes the Log Decoder configuration settings.

Log Decoder Setting Field	Description
Database	/database/config refer to the **Database Configuration Nodes** topic in the *NetWitness Platform Core Database Tuning Guide*.
Decoder	/decoder/config refer to Decoder and Log Decoder Configuration Parameters

Log Decoder Setting Field	Description
Index	/index/config refer to the **Index Configuration Nodes** topic in the *NetWitness Platform Core Database Tuning Guide*.
Logs	/logs/config refer to Core Service Logging Configuration.
REST	/rest/config refer to REST Interface Configuration
SDK	/sdk/config refer to the **SDK Configuration Nodes** topic in the *NetWitness Platform Core Database Tuning Guide*and Core Service system.role Modes.
System	/sys/config refer to Core Service System Configuration.

Log Tokenizer Configuration Settings

The log decoder has a set of configuration items that control how the automatic log tokenizer creates meta items from unparsed logs. The log tokenizer is implemented as a set of built-in parsers that each scan for a subset of recognizable tokens. The functionality of each of these native parsers is shown in the table below. These word items form a full-text index when they are fed to the indexing engine on the Concentrator and Archiver. By manipulating the parsers.disabled configuration entry, you can control which Log Tokenizers are enabled.

Parser Name	Description	Configuration Parameters
Log Tokens	Scans for runs of consecutive characters to produce 'word' meta items.	token.device.types, token.char.classes, token.max.length, token.min.length, token.unicode
IPSCAN	Scans for text that appears to be an IPv4 address to produce 'ip.addr' meta items.	token.device.types
IPV6SCAN	Scans for text that appears to be an IPv6 address to produce 'ipv6' meta items.	token.device.types
URLSCAN	Scans for text that appears to be a URI to produce 'alias.host', 'filename', 'username', and 'password' meta items.	token.device.types
DOMAINSCAN	Scans for text that appears to be a domain name to produce 'alias.host', 'tld', 'cctld', and 'sld' meta items.	token.device.types
EMAILSCAN	Scans for text that appears to be an email address to produce 'email' and 'username' meta items.	token.device.types

Parser Name	Description	Configuration Parameters
SYSLOGTIMESTAMPSCAN	Scans for text that appears to be syslog-format timestamps. Syslog is missing the year and time zone. When such text is located, it is normalized into UTC time to create 'event.time' meta items.	token.device.types
INTERNETTIMESTAMPSCAN	Scans for text that appears to be RFC 3339-format timestamps to create 'event.time' meta items.	token.device.types

These are the Log Tokenizer configuration parameters.

Log Decoder Parser Setting Field	Description
token.device.types	The set of device types that will be scanned for raw text tokens. By default, this is set to `unknown`, which means only logs that were not parsed will be scanned for raw text. You can add additional log types here to enrich parsed logs with text token information. If this field is empty, then log tokenization is disabled.
token.char.classes	This field controls the type of tokens that are generated. It can be any combination of the values `alpha`, `digit`, `space`, and `punct`. The default value is `alpha`. • **alpha**: Tokens may contain alphabetic characters • **digit**: Tokens may contain numbers • **space**: Tokens may contain spaces and tabs • **punct**: Tokens may contain punctuation marks
token.max.length	This field puts a limit on the length of the tokens. The default value is 5 characters. The maximum length setting allows the Log Decoder to limit the space needed to store the word metas. Using longer tokens requires more meta database space, but may provide slightly faster raw text searches. Using shorter tokens causes the text query resolver to have to perform more reads from the raw logs during searches, but it has the effect of using much less space in the metadb and index.
token.min.length	This is the minimum length of a searchable text token. The minimum token length will correspond to the minimum number of characters a user may type into the search box in order to locate results. The recommended value is the default, 3.

Log Decoder Parser Setting Field	Description
token.unicode	This boolean setting controls whether unicode classification rules are applied when classifying characters according to the token.char.classes setting. When this is set to true, each log is treated as a sequence of UTF-8 encoded code points and then classification is performed after the UTF-8 decoding is performed. When this is set to false, each log is treated as ASCII characters and only ASCII character classification is done. Unicode character classification requires more CPU resources on the Log Decoder. If you do not need non-English text indexing, you can disable this setting to reduce CPU utilization on the Log Decoder. The default is enabled.

REST Interface Configuration Parameters

This topic lists and describes the available configuration parameters for the REST interface built in to all NetWitness Platform Core Services.

Settings

The following table lists and describes the REST configuration parameters:

REST Configuration Path	/rest/config
cache.dir	Displays the host directory to use for temporarily creating and storing files. Change takes effect on service restart.
cache.size	Displays the total maximum size (default unit is MB) of all files in the cache directory before the oldest are deleted. Change takes effect on service restart.
enabled	Switches to enable or disable REST services, 1 is on, 0 is off. Change takes effect on service restart.
port	Displays the port the REST service will listen on. Change takes effect on service restart.
ssl	Encrypts all REST traffic using SSL, if enabled. The default 'system' means use setting from /sys/config/ssl. Change takes effect on service restart.

NetWitness Platform Core Service system.roles Modes

All NetWitness Platform Core services offer role-based authorization modes. This topic describes the modes that are available, and how they are configured within every service.

The configuration node `/sdk/config/system.roles` sets querying and viewing permissions for meta and content on a per key basis. This parameter supports the data privacy management function and when enabled using one of the non-zero values helps a data privacy officer to control access to specific meta keys and content. This parameter is configurable in the NetWitness Platform user interface (see the **Data Privacy Tab** topic in the *Data Privacy Management Guide* for details). When the value is edited, change takes effect immediately.

Zero means that service permissions based on SDK meta keys are disabled.

- 0 - disabled

When one of the non-zero values is specified, the data privacy officer can select a meta key to whitelist or blacklist the display of the associated meta, content, or both, for a specific user role on a service.

- 1 - whitelist meta and content filtered
- 2 - whitelist meta filtered
- 3 - whitelist content filtered
- 4 - blacklist meta and content filtered
- 5 - blacklist meta filtered
- 6 - blacklist content filtered

Troubleshooting Version Installations and Updates

This section describes the error messages displayed in the **Hosts** view when it encounters problems updating host versions and installing services on hosts in the **Hosts** view. If you cannot resolve an update or installation issue using the following troubleshooting solutions, contact Customer Support (https://community.rsa.com/docs/DOC-1294).

Update for Host fails

Error Message	Problem	When you select an update version and click **Update** > **Update Host**, the download process is successful, but the update process fails.

Solution	1. **Try to apply the version update to the host again.**
	Often this is all you need to do.
	2. f you still cannot apply the new version update, try the following:
	a. Monitor the following logs on NW Server as it progresses (for example, use submit the `tail -f` command string from the command line):
	`/var/netwitness/uax/logs/sa.log`
	`/var/log/netwitness/orchestration-server/orchestration-server.log`
	`/var/log/netwitness/deployment-upgrade/chef-solo.log`
	`/var/log/netwitness/config-management/chef-solo.log`
	`/var/lib/netwitness/config-management/cache/chef-stacktrace.out`
	The error will appear in one or more of these logs.
	b. Try to resolve the issue and reapply the version update.
	• Cause 1: `deploy_admin` password has expired.
	Solution: Reset your `deploy_admin` password. To reset your `deploy_admin` password, see the procedure decribed below in deploy_admin Password Expired

	• Cause 2: The `deploy_admin` password was changed on NW Server host but not changed on non-NW Server hosts. In this case, on all non-NW Server hosts on 11.x , run the following command using the matching `deploy_admin` password from NW Server host: `/opt/rsa/saTools/bin/set-deploy-admin-password` 3. If you still cannot apply the update, gather the logs from step 2 and contact Customer Support: https://community.rsa.com/docs/DOC-1294.

Update for Service Fails

Error Message	Problem	When you select a host and click **Install** the install service process fails.

Solution	1. **Try to install the service again.**
	Often this is all you need to do.
	2. f you still cannot install the service, try the following:
	a. Monitor the following logs on NW Server as it progresses (for example, use submit the `tail -f` command string from the command line):
	`/var/netwitness/uax/logs/sa.log`
	`/var/log/netwitness/orchestration-server/orchestration-server.log`
	`/var/log/netwitness/deployment-upgrade/chef-solo.log`
	`/var/log/netwitness/config-management/chef-solo.log`
	`/var/lib/netwitness/config-management/cache/chef-stacktrace.out`
	The error will appear in one or more of these logs.
	b. Try to resolve the issue and reapply the service.
	• Cause 1: Entered the worong `deploy_admin` password in nwsetup-tui.
	Solution: Retrieve your `deploy_admin` password.

To retrieve your `deploy_admin` password:

1. In the NetWitness Platform menu, select **ADMIN** > **Security** > **Users** tab.
2. Select the `deploy_admin` and click **Reset Password**.
3. (Conitional) If NetWitness Platform does not allow you to reset expired `deploy_admin` password in the **Reset Password** dialog, complete the following steps.
   a. SSH to the NW Server host.

      ```
      security-cli-client --get-config-prop --prop-hierarchy
      nw.security-client --prop-name
      platform.deployment.password -quiet
      ```

   b. SSH to the host that failed installation/orchestration.
   c. Run the nwsetup-tui again using correct `deploy_admin` password.

- Cause 2: `deploy_admin` password has expired.

  Solution: Reset your `deploy_admin` password. To reset your `deploy_admin` password, see the procedure decribed below in deploy_admin Password Expired

3. If you still cannot apply the update, gather the logs from step 2 and contact Customer Support: https://community.rsa.com/docs/DOC-1294.

Update for Host Download Error

Error Message	Problem	When you select an update version and click **Update** >**Update Host**, the download starts but fails to complete.
Cause	Version download files can be large and take a long time to download. If there are communication issues during the download it will fail.
Solution	1. Try to download it again. 2. If the download still fails, try to download it outside of NetWitness Platform as described in Apply Updates from the Command Line (No Web Access). 3. If you still cannot download the update file, contact Customer Support: https://community.rsa.com/docs/DOC-1294.

deploy_admin Password Expired

Error Message	Cause	The `deploy_admin` user password has expired.
Solution	Reset your `deploy_admin` password password. 1. In the NetWitness Platform menu, select **ADMIN** > **Security** > **Users** tab. 2. Select the **deploy_admin** and click **Reset Password**. • If NetWitness Platform allows you to enter the expired `deploy_admin` password in the **Reset Password** dialog, complete the following steps. a. Enter the expired `deploy_admin` password. b. Uncheck the **Force password change on next login** checkbox. c. Click **Save** • If NetWitness Platform does not allow you to enter the expired `deploy_admin` password in the **Reset Password** dialog. a. On the NW Server host and all other hosts on 11.x , run the following command using the new `deploy_admin` password: `/opt/rsa/saTools/bin/set-deploy-admin-password` b. On the host that failed installation/orchestration, run the nwsetup-tui and use the new `deploy_admin` password.

What is NetWitness Endpoint?

RSA NetWitness Endpoint is an endpoint detection and response tool that continuously monitors the behavior of all endpoints in the network to provide deep visibility and analysis of executables and processes. It helps to detect new, unknown, and targeted attacks, highlights suspicious activity for investigation, exposes anomalous behaviors, and determines the scope of compromise to help analysts respond to advanced threats faster.

About this Guide

This guide provides end-to-end instructions to configure NetWitness Platform Endpoint and to use Endpoint features.

RSA NetWitness Platform 11.3 Documentation in RSA Link

NetWitness Platform product documentation is organized along functional lines. If you are looking for a specific guide or version, go to the Version 11.x Master Table of Contents.

Use these links to view the RSA NetWitness Platform 11.3 documentation. Both links provide the same documentation, in these two formats:

- HTML Guides include the latest information for currently supported 11.x versions: RSA NetWitness Platform 11.x Documentation.
- PDF Guides provide the information for a specific version: RSA NetWitness Platform 11.3 PDFs.

Use these links to access documentation that is not related to a particular version of the software:

- Hardware setup guides: https://community.rsa.com/community/products/netwitness/hardware-setup-guides
- Documentation for RSA Content such as feeds, parsers, application rules, and reports: https://community.rsa.com/community/products/netwitness/rsa-content.

Getting Started

The following tasks can be performed in any sequence.

Description	References
View information about product updates, improvements, and known issues.	Release Notes

Description	References
Understand NetWitness Endpoint.	"Getting Started with NetWitness Platform" and "Investigate" in the *NetWitness Platform Getting Started Guide*

Setup and Installation

Fresh Installation

The following tasks must be performed in the sequence listed.

Description	References
Obtain a license for Endpoint Log Hybrid.	Licensing Management Guide
Review the supported hardware.	"Supported Hardware" in the *Physical Host Installation Guide*
Review the Endpoint architecture; plan your deployment based on the number of endpoints, distribution, and location of these endpoints; and choose one of the following deployments: • Single Endpoint server • Multiple Endpoint server	"NetWitness Endpoint Architecture" in the *Deployment Guide*
Configure the ports on your firewall.	"Network Architecture and Ports" in the *Deployment Guide*
Install NetWitness Server and other components. For a single Endpoint server deployment, you need to install - NetWitness Server, Endpoint Log Hybrid, and ESA. For a multiple Endpoint server, in addition to the above components, you need to install - Additional Endpoint Log Hybrid, NetWitness Broker along with Endpoint Broker installed on it.	- *Physical Host Installation Guide* for instructions on how to set up physical hosts - *Virtual Host Installation Guide* for instructions on how to set up virtual hosts
Install Endpoint Log Hybrid.	"RSA NetWitness Endpoint" in the *Physical Host Installation Guide*
Review the services installed.	*Hosts and Services Getting Started Guide*

Description	References
Note: Review the default policies and modify them accordingly. Install Endpoint agent on hosts.	"Endpoint Sources" topic in the *Endpoint Configuration Guide* *NetWitness Endpoint Agent Installation Guide*

Upgrade

The following tasks must be performed in the sequence listed.

Description	References
Upgrade from 10.6.5 to 11.3 - After the NetWitness Platform 11.3 upgrade, install the Endpoint Log Hybrid and other Endpoint components.	- *Physical Host Upgrade Guide* for instructions on upgrade of physical hosts - *Virtual Host Upgrade Guide* for instructions on upgrade of virtual hosts
Update from 11.x to 11.3 - Update the Endpoint server and agents.	*Update Guide*
Upgrade Endpoint Agents from 11.1.x and 11.2.x to 11.3.	"Upgrade Agents" in the *Endpoint Agent Installation Guide*
Migrate NetWitness Endpoint 4.4.0.x to NetWitness Platform.	*NetWitness Endpoint 4.4.0.x to RSA NetWitness Platform 11.3 Migration Guide*

Configuration

The following tasks can be performed in any sequence.

Description	References
Understand NetWitness Endpoint and high-level tasks required for configuration.	"NetWitness Endpoint Overview and Endpoint Server Configuration" in the *Endpoint Configuration Guide*
Review Groups and Policies for agents.	"Endpoint Sources" topic in the *Endpoint Configuration Guide*

Description	References
Set up the RSA Live account and verify if the ESA content and Application Rules for Endpoint are available. **Note:** The file reputation service is automatically enabled on RSA Live.	*Live Services Management Guide*
Create role-based access control (RBAC).	"Role Permissions" in the System Security and User Management Guide
Configure data retention policy.	"Configure Data Retention" in the *Endpoint Configuration Guide*
Manage inactive agents.	"Manage Inactive Agents" in the *Endpoint Configuration Guide*

Investigation

The following tasks can be performed in any sequence.

Description	References
Understand how investigation works.	"How NetWitness Investigate Works" in the *NetWitness Investigate User Guide*
Configure investigate views.	"Configuring NetWitness Investigate Views and Preferences" in the *NetWitness Investigate User Guide*
Begin an investigation in different Investigate views.	"Beginning an Investigation" in the *NetWitness Investigate User Guide*
Review best practices for files and hosts and set up your Investigate view for investigation.	"Best Practices" under Investigating Files and Investigating Hosts in the*NetWitness Endpoint User Guide*
Investigate files.	"Investigating Files" in the *NetWitness Endpoint User Guide*
Investigate hosts.	"Investigating Hosts" in the *NetWitness Endpoint User Guide*
Investigate process.	"Investigating Hosts" in the *NetWitness Endpoint User Guide*

Description	References
Analyze downloaded files.	"Analyzing Downloaded Files" in the *NetWitness Endpoint User Guide*
Change file status and remediate.	"Changing File Status or Remediate" in the *NetWitness Endpoint User Guide*
Analyze events.	"Analyzing Events" in the *NetWitness Endpoint User Guide* "Analyzing Raw Data and Metadata in the Event Analysis View", "Investigating Metadata in the Navigate View", and "Examining Raw Events in the Events View" in the *NetWitness Investigate User Guide*

Respond and Reporting

The following tasks can be performed in any sequence.

Description	References
Respond to Endpoint incidents.	*NetWitness Respond User Guide*
View reports related to Endpoint data.	*Reporting User Guide*

Maintenance

The following tasks can be performed in any sequence.

Description	References
Monitor health and wellness.	System Maintenance Guide

Integration (for Legacy NetWitness Endpoint)

The following tasks can be performed in any sequence.

Description	References
Configure NetWitness Endpoint 4.4.x metadata with NetWitness Platform.	"Integrating NetWitness Endpoint 4.4.0.2 or Later with NetWitness Platform" topic in the *Endpoint Configuration Guide*
Configure integrated operation of NetWitness Endpoint 4.4.x with NetWitness Platform.	*RSA NetWitness Endpoint Integration Guide*

What Is NetWitness® Investigate?

NetWitness Platform audits and monitors all traffic on a network. One type of service--a Decoder--ingests, parses, and stores the packets, logs, and endpoint data traversing the network. The configured parsers and feeds on the Decoder create *metadata* that analysts can use to investigate the ingested logs and packets. Another type of service, called a Concentrator, indexes and stores the metadata. NetWitness Investigate provides the data analysis capabilities in RSA NetWitness® Platform, so that analysts can analyze packet, log, and endpoint data, and identify possible internal or external threats to security and the IP infrastructure.

About This Guide

This guide provides end-to-end guidelines for all members of the SOC team to configure NetWitness Investigate and to investigate log and network events. End-to-end guidelines for investigating endpoints and user entity behavior using NetWitness Investigate are provided in separate documents:

- *NetWitness Endpoint Quick Start Guide*
- *NetWitness UEBA Quick Start Guide*

RSA NetWitness Platform 11.3 Documentation in RSA Link

NetWitness Platform product documentation is organized along functional lines. If you are looking for a specific guide or version, go to the Version 11.x Master Table of Contents.

Use these links to view the RSA NetWitness Platform 11.3 documentation. Both links provide the same documentation, in these two formats:

- HTML Guides include the latest information for currently supported 11.x versions: RSA NetWitness Platform 11.x Documentation.
- PDF Guides provide the information for a specific version: RSA NetWitness Platform 11.3 PDFs.

Use these links to access documentation that is not related to a particular version of the software:

- Hardware setup guides: https://community.rsa.com/community/products/netwitness/hardware-setup-guides
- Documentation for RSA Content such as feeds, parsers, application rules, and reports: https://community.rsa.com/community/products/netwitness/rsa-content.

Getting Started

The following tasks can be performed in any sequence and are for the entire SOC team.

Description	References
View information about product updates, improvements, and known issues	*Release Notes for RSA NetWitness Platform 11.3*
Understand how NetWitness Investigate works	"How NetWitness Investigate Works" in the *NetWitness Investigate User Guide*

Setup, Installation, or Upgrade

No special setup, installation, or upgrade tasks are required for Investigate; it is part of NetWitness Platform for Logs and Network. However, setup is required for several components with which NetWitness Investigate works if you plan to do this type of analysis. These tasks are for the Administrator, and the SOC Manager may want to understand the setup.

Description	References
Install and set up the Malware Analysis (standalone or service)	Malware Analysis Configuration Guide
Install and set up NetWitness Endpoint (standalone or service)	NetWitness Endpoint Quick Start Guide
Install and set up NetWitness UEBA (standalone or service)	NetWitness UEBA Quick Start Guide

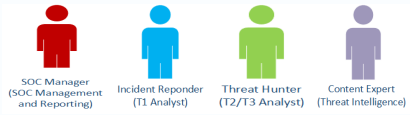
System-Level Configuration

Administrators configure system-level preferences for NetWitness Investigate.The following tasks are for the administrator, and the tasks can be performed in any sequence. SOC Managers should understand the possible configuration options.

Description	References
Configure role-based access control (RBAC) for analysts who will be using Investigate. These components have permissions related to investigate: investigate (Navigate view and Events view), investigate-server (Event Analysis view), Malware (Malware Analysis view), Endpoint-broker-server, and Endpoint-server.	"Role Permissions" in the System Security and User Management Guide
Configure Investigate to limit content available for different user roles (preQueries).	"Verify Query and Session Attributes per Role" in the System Security and User Management Guide
Configure default settings and limits for NetWitness Investigate on a system level.	"Configure Investigation Settings" in the System Configuration Guide

User Preference Configuration

The following tasks are for Threat Hunters, Content Experts, and Incident Responders, and SOC Managers. The tasks can be performed in any sequence.

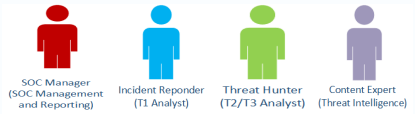
Description	References
	


Configure Navigate view and Events view preferences.	"Configure the Navigate and Events View" in the *NetWitness Investigate User Guide*
Configure Event Analysis view preferences.	"Configure the Event Analysis View" in the *NetWitness Investigate User Guide*
Configure the Malware Analysis view preferences.	"Configure Malware Analysis" in the *Malware Analysis User Guide*

Investigation

Different types of investigation may be handled by analysts with different skill levels and goals.

- Incident Responders (T1 Analysts) typically pivot to Investigate from NetWitness Respond to find detailed information about an incident so that they can respond to and remediate incidents.
- Threat Hunters (T2/T3 Analysts) typically peruse events, metadata, and raw content so that they can recommend issues for remediation and remediate issues.
- Content Experts (Threat Intelligence) typically peruse events, metadata, raw content, user and host data, and UEBA data so that they can investigate new threat intelligence, evaluate and create new feeds, and create correlation rules to flag indicators of compromise.
- SOC Managers need to understand the use cases.

Description	References
	


Learn about practical use cases	"Sample Use Cases for NetWitness Investigate" in the *NetWitness Investigate User Guide*
Investigate metadata and raw events in logs and network traffic	"Beginning an Investigation" in the *NetWitness Investigate User Guide*
Investigate possible malware	Malware Analysis User Guide
Investigate endpoints	NetWitness Endpoint User Guide
Perform user and entity behavior analysis	NetWitness UEBA User Guide

Maintenance

The administrator can perform the following tasks in any sequence.

Description	References
Maintain the list of queries and analyze the query patterns of other users of the NetWitness Platform system.	"Maintaining Queries Using URL Integration" in the System Maintenance Guide

Description	References
Fine tune system-level configuration settings to improve performance or limit access to data.	"Verify Query and Session Attributes per Role" in the System Security and User Management Guide "Configure Investigation Settings" in the System Configuration Guide

What is NetWitness UEBA?

RSA NetWitness UEBA (User and Entity Behavior Analytics) is an advanced analytics solution for discovering, investigating, and monitoring risky behaviors across all users and entities in your network environment. NetWitness UEBA is used for:

- Detecting malicious and rogue users
- Pinpointing high-risk behaviors
- Discovering attacks
- Investigating emerging security threats
- Identify potential attacker activity

About this Guide

This guide provides end-to-end instructions to configure NetWitness Platform UEBA and to use UEBA features.

RSA NetWitness Platform 11.3 Documentation in RSA Link

NetWitness Platform product documentation is organized along functional lines. If you are looking for a specific guide or version, go to the Version 11.x Master Table of Contents.

Use these links to view the RSA NetWitness Platform 11.3 documentation. Both links provide the same documentation, in these two formats:

- HTML Guides include the latest information for currently supported 11.x versions: RSA NetWitness Platform 11.x Documentation.
- PDF Guides provide the information for a specific version: RSA NetWitness Platform 11.3 PDFs.

Getting Started

The following tasks can be performed in any sequence.

Description	References
View information about product updates, improvements, and known issues.	Release Notes
Understand NetWitness UEBA	*RSA NetWitness UEBA User Guide*

Setup and Installation

Standalone Installation

The following tasks must be performed in the following sequence.

Description	References
Review the supported hardware.	"System Requirement" topic in *UEBA Standalone Installation Guide*
Review the UEBA deployment.	"RSA NetWitness UEBA Standalone Installation " topic in *UEBA Standalone Installation Guide*
Configure the ports on your firewall.	"RSA NetWitness UEBA Standalone Installation " topic in *UEBA Standalone Installation Guide*
Install NetWitness Server host.	"Installation Tasks" topic in *UEBA Standalone Installation Guide*
Install 11.3 Log Hybrid Host.	"Installation Tasks" topic in *UEBA Standalone Installation Guide*
Install and Configure NetWitness UEBA.	"Installation Tasks" topic in *UEBA Standalone Installation Guide*
Assign the UEBA_Analysts and Analysts roles to the UEBA users.	"Role Permissions" in the System Security and User Management Guide

Fresh Installation

The following tasks must be performed in the following sequence.

Description	References
Review the supported hardware.	"Supported Hardware" in the *Physical Host Installation Guide*
Review the UEBA architecture.	"NetWitness Platform Network Architecture Diagram" topic in the *Deployment Guide*
Configure the ports on your firewall.	"Network Architecture and Ports" topic in the *Deployment Guide*
Install NetWitness Server host and other components.	"Task 1 - Install 11.3 on the NetWitness Server (NW Server) Host" and "Task 2 - Install 11.3 on Other Component Hosts" in the *Physical Host Installation Guide* "Install NetWitness Platform Virtual Host in Virtual Environment" in the *Virtual Host Installation Guide*
Install UEBA.	"RSA NetWitness® UEBA" in the *Physical Host Installation Guide*
Assign the UEBA_Analysts and Analysts roles to the UEBA users.	"Role Permissions" in the *System Security and User Management Guide*

Update

The following tasks must be performed in the following sequence.

Description	References
Deploy the Endpoint Pack from RSA Live, which contains File Category Lua Parser for the UEBA integration with Endpoint.	During deployment, you must specify Endpoint Log Hybrid Log Decoder service. In case of multiple Endpoint servers, select all the Endpoint Log Hybrid Log Decoder services
Enable Endpoint data sources such as Process and Registry to generate alerts in UEBA.	"Enable Endpoint Data Sources" in the *Update Instructions*
Enable UEBA indicator forwarder to transfer the UEBA indicators to the NetWitness Respond server and to the correlation server to create an incidents.	"Enable UEBA Indicator Forwarder" in the *Update Instructions*

Description	References
After you update to NetWitness Platform 11.3 the Broker or Concentrator UUID changes. You must update the NetWitness Platform core services, and update the Broker or Concentrator UUID.	"Update Broker or Concentrator UUID" in the *Update Instructions*
Update Airflow Configuration.	"Update Airflow Configuration" in the *Update Instructions*
Restart the Airflow scheduler service after the presidio_upgrade DAG is successful.	"Restart Airflow scheduler service" in the *Update Instructions*

Investigation

The following tasks can be performed in any sequence.

Description	References
Investigate high risk users.	"Investigate High-Risk Users" topic in the *RSA NetWitness UEBA User Guide*
Investigate top alerts.	"Investigate Top Alerts" topic in the *RSA NetWitness UEBA User Guide*

Monitoring

The following tasks can be performed in any sequence.

Description	References
Review NetWitness UEBA metrics in Health and Wellness.	"View NetWitness UEBA Metrics in Health and Wellness" topic in the RSA NetWitness UEBA User Guide
Monitor Health and Wellness of UEBA.	"Monitor Health and Wellness of UEBA" topic in the RSA NetWitness UEBA User Guide

The Basics

This guide describes the basic requirements of a NetWitness Platform deployment and outlines optional scenarios to address needs of your enterprise. Even in small networks, planning can ensure that all goes smoothly when you are ready to bring the hosts online.

Note: This document refers to several additional documents available on RSA Link. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

There are many factors you must consider before you deploy NetWitness Platform. The following items are just some of these factors. You need to estimate growth and storage requirements when you consider these factors

- The size of your enterprise (that is, the number of locations and people that will use NetWitness Platform)
- The volume of network data and logs you need to process
- The performance each NetWitness Platform user role needs to do their jobs effectively.
- The prevention of downtime (that is, how to avoid a single point of failure).
- The environment in which you plan to run NetWitness Platform
  - RSA Physical Hosts (software running on hardware supplied by RSA)
    See the *RSA NetWitness® Platform Physical Host Installation Guide* for detailed instructions on how to deploy RSA Physical Hosts.
  - Software Only provided by RSA:
    - On-Premises (On-Prem) Virtual Hosts
      See the *RSA NetWitness® Platform Virtual Host Installation Guide* for detailed instructions on how to deploy on-prem virtual hosts.
    - VCloud:
      - Amazon Web Services (AWS)
        See the *RSA NetWitness® Platform AWS Installation Guide* for detailed instructions on how to deploy virtual hosts in AWS.
      - Azure
        See the *RSA NetWitness® Platform Azure Installation Guide* for detailed instructions on how to deploy virtual hosts in Azure.

Basic Deployment

Before you can deploy NetWitness Platform you need to:

- Consider the requirements of your enterprise and understand the deployment process.
- Have a high-level picture of the complexity and scope of a NetWitness Platform deployment.

Process

The components and topology of a NetWitness Platform network can vary greatly between installations, and should be carefully planned before the process begins. Initial planning includes:

- Consideration of site requirements and safety requirements.
- Review of the network architecture and port usage.
- Support of group aggregation on Archivers and Concentrators, and virtual hosts.

When ready to begin deployment, the general sequence is:

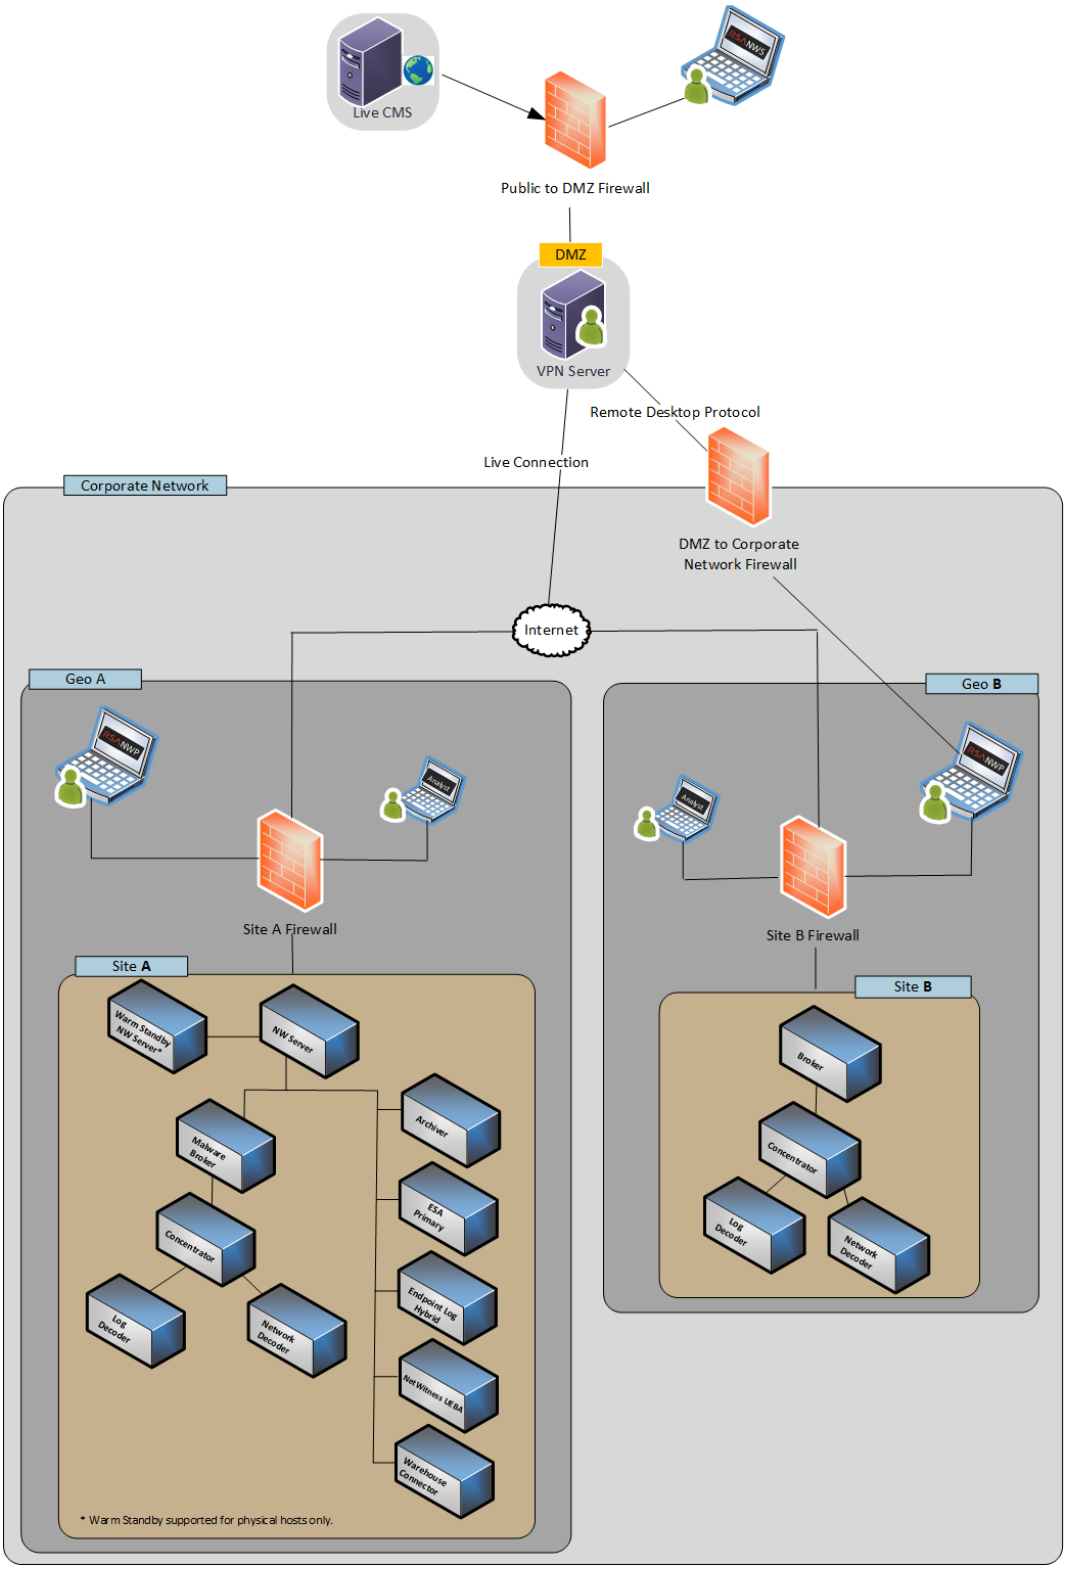
- For RSA Physical Hosts:
  1. Install physical hosts and connect to the network as described in the RSA NetWitness® Platform Hardware Setup Guides and the *RSA NetWitness® Platform Physical Host Installation Guide*.
  2. Set up licensing for NetWitness Platform as described in the *RSA NetWitness® Platform Licensing Guide*.
  3. Configure individual physical hosts and services as described in *RSA NetWitness® Platform Host and Services Getting Started Guide*. This guide also describes the procedures for applying updates and preparing for version upgrades.
- For On-Prem virtual hosts, follow the instructions in the *RSA NetWitness® Platform Virtual Host Setup Guide*.
- For AWS, follow the instructions in the *RSA NetWitness® Platform AWS Installation Guide*.
- For Azure, follow the instructions in the *RSA NetWitness® Platform Azure Installation Guide*.

When updating hosts and services, follow recommended guidelines under the "Running in Mixed Mode" topic in the *RSA NetWitness Platform Host and Services Getting Started Guide*.

You should also become familiar with Hosts, Host Types, and Services as they are used in the context of NetWitness Platform also described in the *RSA NetWitness Platform Host and Services Getting Started Guide*.

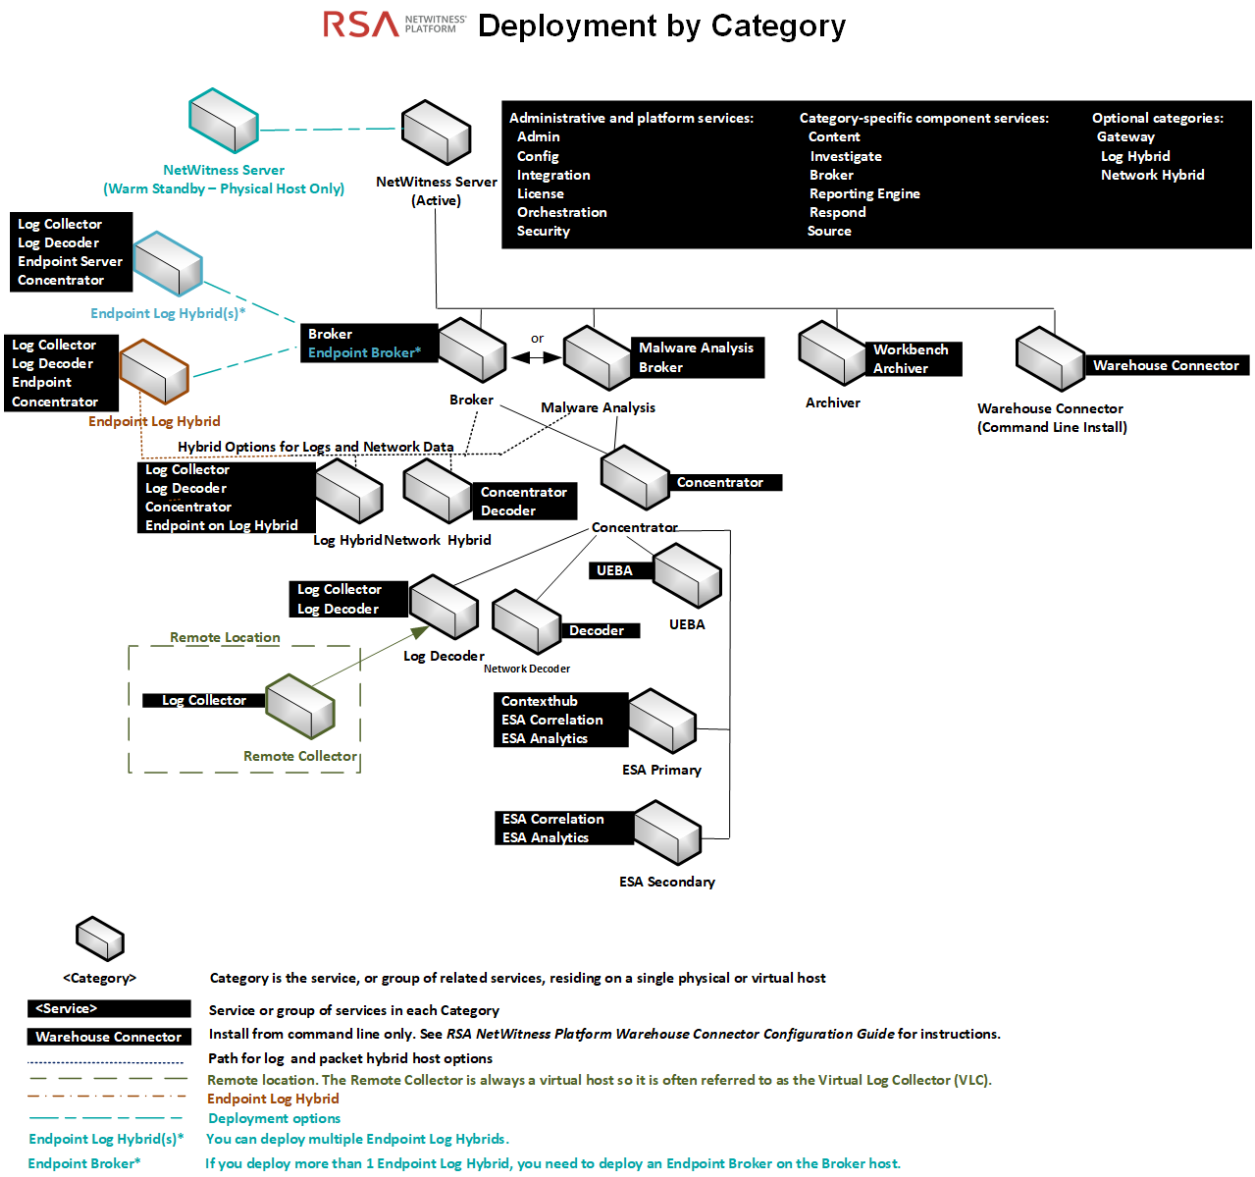
NetWitness Platform High-Level Deployment Diagram

The following diagram illustrates a basic, multi-site NetWitness Platform Deployment.



RSA NetWitness Platform Detailed Host Deployment Diagram

The following diagram is an example of a NetWitness Platform deployment hosted on physical or virtual machines. For instructions on how to install NetWitness Platform see the *Physical Host Installation Guide*, *Virtual Host Installation Guide*, *AWS Installation Guide*, or *Azure Installation Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.



Deployment Options

You deploy RSA NetWitness Platform with the following options.

- Group Aggregation
- Second Endpoint Server
- Warm Standby NW Server Host
- Hybrid Categories on the NW Server

See Deployment Optional Setup Procedures for instructions.

Deployment Optional Setup Procedures

Group Aggregation
Hybrid Categories on the NW Server
Second Endpoint Server
Warm Standby NW Server

Group Aggregation

You use Group Aggregation to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them. You can configure multiple Archiver services or Concentrator services to efficiently aggregate from multiple Log Decoder services to improve query performance on the data:

- Stored in the Archiver.
- Processed through the Concentrator.

RSA Group Aggregation Deployment Recommendations

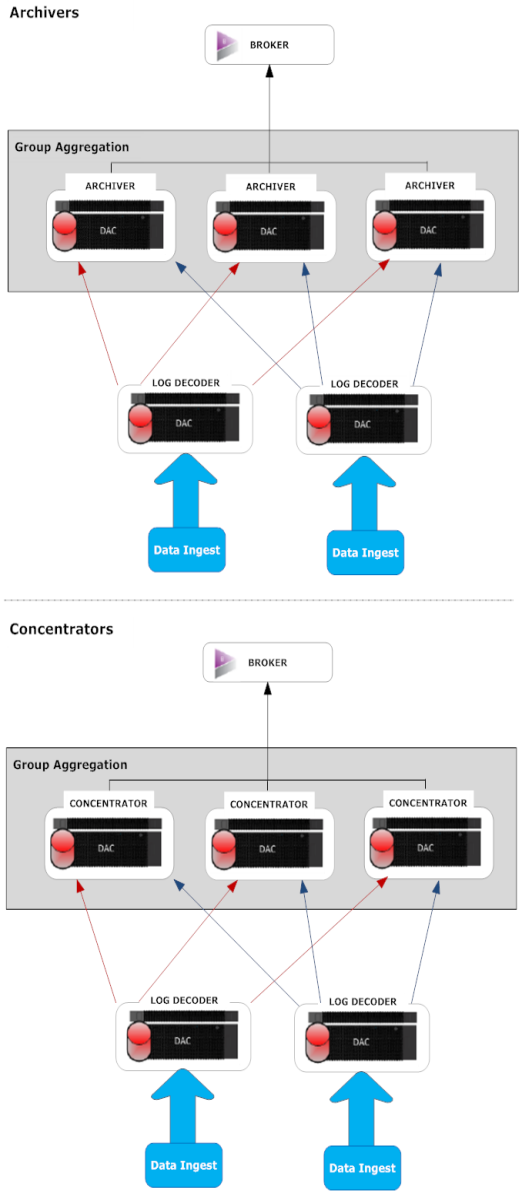
RSA recommends the following deployment for Group Aggregation:

- 1 - 2 Log Decoders
- 3 - 5 Archivers or Concentrators

Advantages of Using Group Aggregation

- Increases the speed of RSA NetWitness® Platform queries.
- Improves the performance of aggregate queries (Count and Sum) on the environment.
- Enhances investigation service performance.
- Gives you the option of storing data for a longer duration for investigation purposes.

The following diagram illustrates Group Aggregation.



You can have any number of Archivers or Concentrators grouped together and form an aggregation group. The Archiver or Concentrator services in the group divide all the aggregated session between them based on the number of sessions defined in the Aggregate Max Sessions parameter.

For example, in an aggregation group containing two Archiver services or two Concentrator services with the Aggregate Max Sessions parameter, set to 10000 the services would divide the session between themselves as illustrated in the following table.

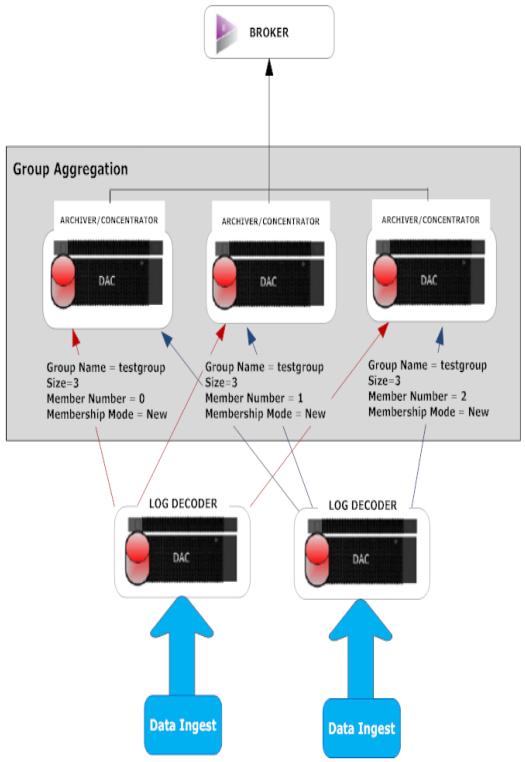
Archiver 0 or Concentrator 0	Archiver 1 or Concentrator 1
1 - 9,999	10,000 - 19,999
20,000 - 29,999	30,000 - 39,999
40,000 - 49,999	50,000 - 59,999

Configure Group Aggregation

Complete this procedure to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them.

Prerequisites

Plan the network design for group aggregation. The following figure is an example of a group aggregation setup.



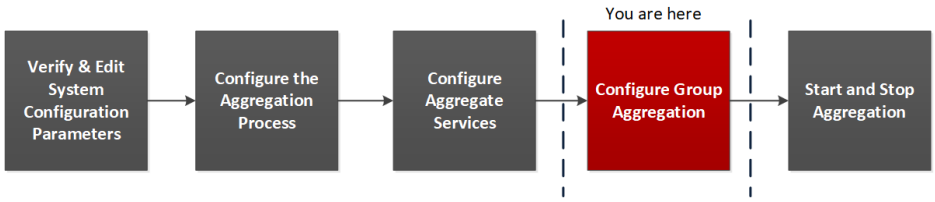
Ensure that you understand the Group aggregation parameters in the following table, and create a group aggregation plan.

Parameter	Description
Group Name	It determines the group to which the Archiver or Concentrator belongs. You can add any number of groups aggregating data from a Log Decoder. The Group Name parameter is used by the Log Decoder to identify which Archiver or Concentrator services are working together. All Archiver or Concentrator services in the group should have the same group name.
Size	It determines the number of Archiver or Concentrator services in the aggregation group.
Member Number	It determines the position of the Archiver or Concentrator in the aggregation group. For a group of size N, member number from 0 to N-1 must be set on each of the Archiver or Concentrators services in the aggregation group. For example: If the size of the aggregation group is 2, the member number of one of the Archiver or Concentrator service should be set to 0 and the member number of the other Archiver or Concentrator should be set to 1.
Membership Mode	There are two membership modes: • New: Adding a new Archiver or Concentrator service as a member to the existing aggregation group or creating an aggregation group. The Archiver or Concentrator service does not aggregate any existing sessions from the service as other members of the group would have already aggregated all the sessions on the service. This Archiver or Concentrator service will only aggregate new sessions as they appear on the service. • Replace: Replacing an existing aggregation group member. The Archiver or Concentrator will begin aggregation from the oldest session available on the service it is aggregating from.

Note: Membership mode parameter has an effect only when no sessions have been aggregated from the service. After some sessions are aggregated, this parameter has no effect.

Set up Group Aggregation

This workflow shows the procedures you complete to configure group aggregation.



Complete the following steps to set up group aggregation.

1. Configure multiple Archiver or Concentrator services in your environment. Make sure that you add the same Log Decoder as data source to all the services.
2. Perform the following on all the Archiver or Concentrator services that you want to be part of aggregation group:

a. Go to **ADMIN > Services**.

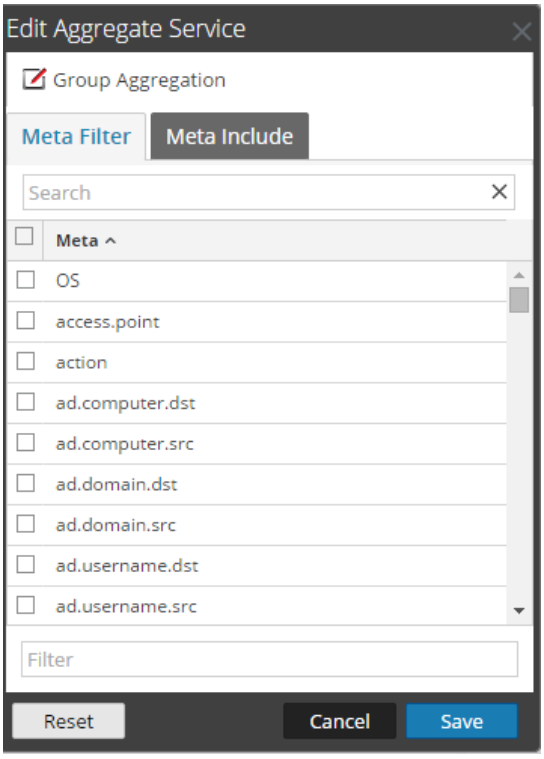
b. Select the Archiver or Concentrator service, and in the **Actions** column, select **View > Config**. The Service Config view of the Archiver or Concentrator is displayed.

c. In the **Aggregate Services** section, select **Log Decoder**.

d. Click Toggle Service to change the status of the Log Decoder to offline if it is online.

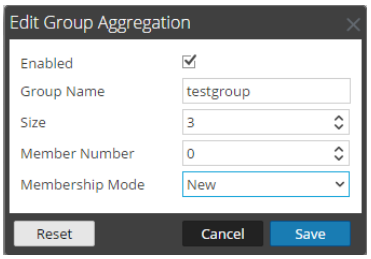
e. Click .

The **Edit Aggregate Service** dialog is displayed.



f. Click Group Aggregation.

The **Edit Group Aggregation** dialog is displayed.



g. Select the **Enabled** checkbox and set the following parameters:

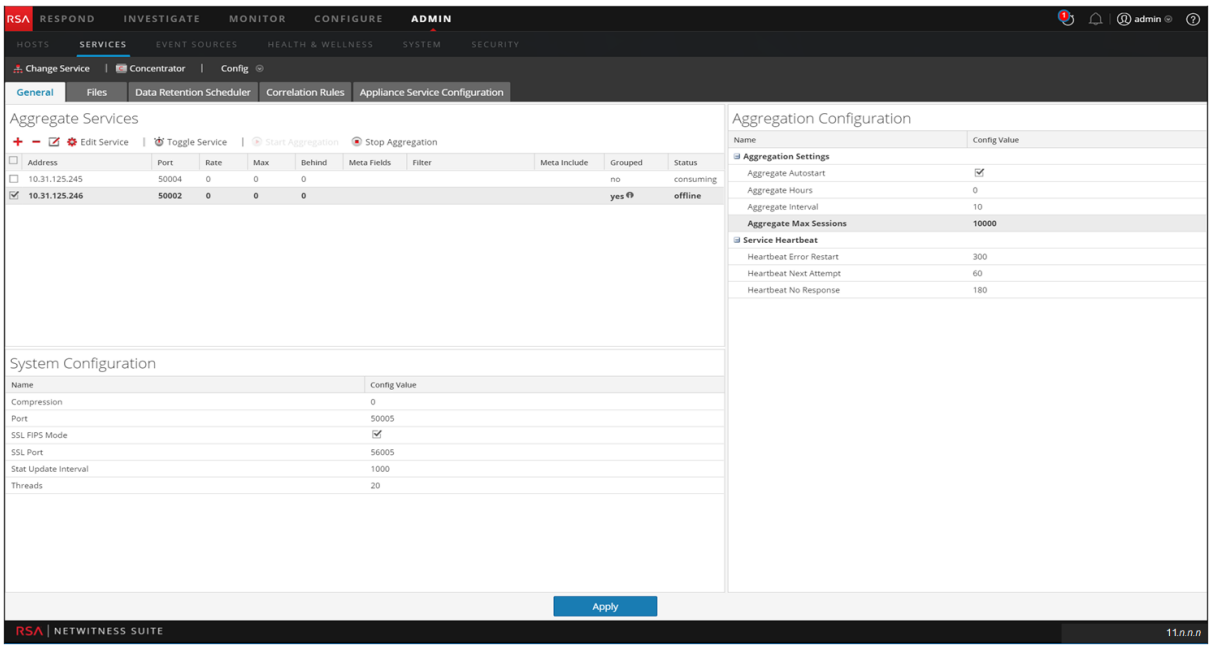
- In the **Group Name** field, type the group name.
- In the **Size** field, select the number of Archiver or Concentrator services in the aggregation group.
- In the **Member Number** field, select the position of the Archiver or Concentrator in the aggregation group.
- In the **Membership Mode** drop-down menu, select the mode.

h. Click **Save**.

i. In the Service Config View page, click **Apply**.

j. Perform **Step b** to **Step i** on all other Archiver or Concentrator services that need to be part of group aggregation.

3. In the **Aggregation Configuration** section, set the **Aggregate Max Sessions** parameter set to **10000**.



Hybrid Categories on NW Server

You can install Hybrid Categories such as Log Hybrid and Network (Packet) Hybrid service categories on a Series 6 (R640) Physical host. This gives you the ability to attach multiple PowerVault external storage devices to the Series 6 (R640) Physical host.

Second Endpoint Server

Complete the following procedure to deploy a second Endpoint Server.

1. Set up a new host in NetWitness Platform.
   - For a physical host, complete steps 1 to 14 inclusive in the in "Task 2 - Install 11.3 on Other Component Hosts" under "Installation Tasks" of the *Physical Host Installation Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.
   - For a virtual host, follow the instructions in the *Virtual Host Installation Guide* in "Task 2 - Install 11.3 on Other Component Hosts" under "Step 4. Install RSA NetWitness Platform."
2. SSH to the host that you set up in step 1.
3. Submit the following command string.
   `mkdir -p /etc/pki/nw/nwe-ca`

   Note: You do not need to modify permissions.
4. Copy the following two files from the previously deployed endpoint server to the new/second endpoint server:
   `/etc/pki/nw/nwe-ca/nwerootca-cert.pem`
   `/etc/pki/nw/nwe-ca/nwerootca-key.pem`
5. Install Endpoint on the host.
   a. Log into NetWitness Platform and go to **ADMIN** > **Hosts**.
   The **New Hosts** dialog is displayed with the Hosts view grayed out in the background.

   Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

   b. Select the new host in the **New Hosts** dialog and click **Enable**.
   The New Hosts dialog closes and the host is displayed in the **Hosts** view.

   c. Select that host in the Hosts view (for example, Endpoint Server II) and click 
   .
   The **Install Services** dialog is displayed.

   d. Select **Endpoint** in **Host Type** and click **Install**.

Warm Standby NW Server Host

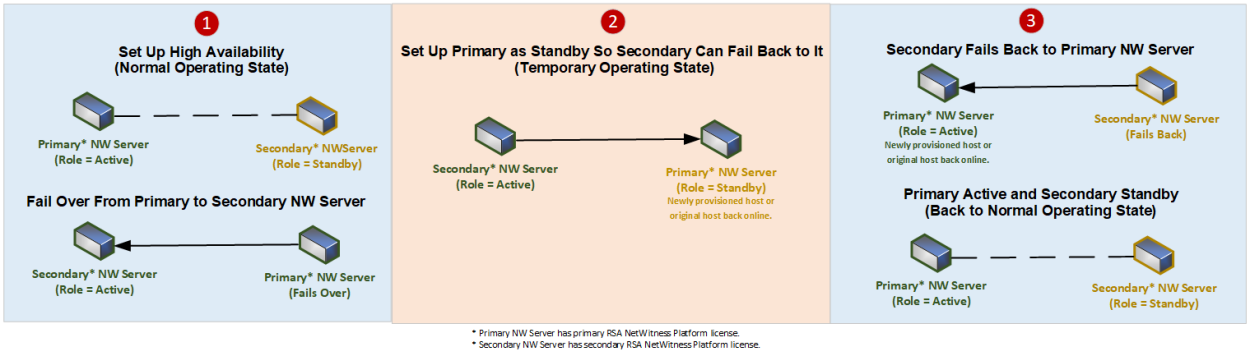
The Warm Standby NW Server duplicates the critical components and configurations of your active NW Server Host to increase reliability.

A secondary NW Server remains in the standby role and, when configured, receives backups of the primary NW Server in the active role at regular intervals. If the primary NW Server fails (goes offline), the fail-over procedure must be executed allowing the secondary NW Server to assume the active role.

When you set up a secondary NW Server as a Warm Standby, a failure or scheduled switch from the primary NW Server to the secondary NW Server is referred to as a fail-over. You fail back to return to the normal operating state (that is, primary NW Server in the active role and the secondary NW Server in the standby role).

The following diagram illustrates the fail-over and fail-back process.

1. Set up secondary NW Server as standby (initial setup). This is the normal operating state.
2. The primary NW Server fails over to the secondary NW Server. After the fail-over, get the primary NW Server back online and set it up in the standby role. This is a temporary operating state.
3. Fail the secondary NW Server back to the primary. The primary NW Server is back to the active role and secondary is back to the standby role. This is the normal operating state.



IMPORTANT: During a Fail-Over, you must assign the same IP address as the primary NW Server to the secondary NW Server so it can assume the active role.

Procedures

Complete the following task to set up a secondary NW Server in the standby role for fail-over:

- Set up a secondary NW Server in the standby role.

Complete the following tasks when required to maintain high availability.

- Fail over the primary NW Server to secondary NW Server.
- Fail back the secondary NW Server to primary NW Server.

Planned Fail-Over Scenario

This scenario occurs when you schedule a fail over (see **Planned Fail-Over** under step 3 in the Fail Over primary NW Server to Secondary NW Server procedure). You should not need do anything after the fail-over completes.

Required Fail-Over Scenario without Hardware Replacement

This scenario occurs when the primary NW Server fails (see *Required Fail-Over* under step 3 in the Fail Over Primary NW Server to Secondary NW Server topic), but you are able to recover it easily without re-imaging (for example, the active NW Server has corrupt or insufficient RAM). You do not need to run the `nwsetup-tui` and you do not need to contact Customer Support (https://community.rsa.com/docs/DOC-1294) to reestablish correct licensing when:

1. The active (primary NW Server) fails over to the Standby (secondary NW Server) and that secondary host temporarily assumes the role of the active NW Server.
2. You fix the problem with the primary NW Server (for example, install new RAM) and fail back to it from the secondary host.

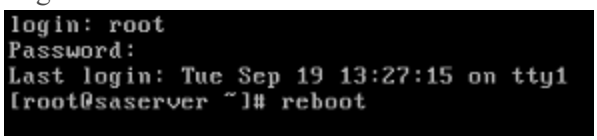
Required Fail-Over Scenario with Hardware Replacement

This scenario occurs when the active NW Server completely fails and the hardware requires replacement, for example you receive a Return Merchandise Authorization (RMA). You need to run reconfigure the host with the `nwsetup-tui` and contact Customer Support (https://community.rsa.com/docs/DOC-1294) to reestablish licensing. If you choose to rebuild the replacement host as a temporary standby (for example, until your scheduled fail-back occurs), you must answer "**Yes**" to the **Standby Host Recovery Mode** `nw-setup-tui` prompt when configuring this temporary standby for failing back (see step 4 in the Set Up Secondary NW Server in Standby Role procedure for the context of this prompt).

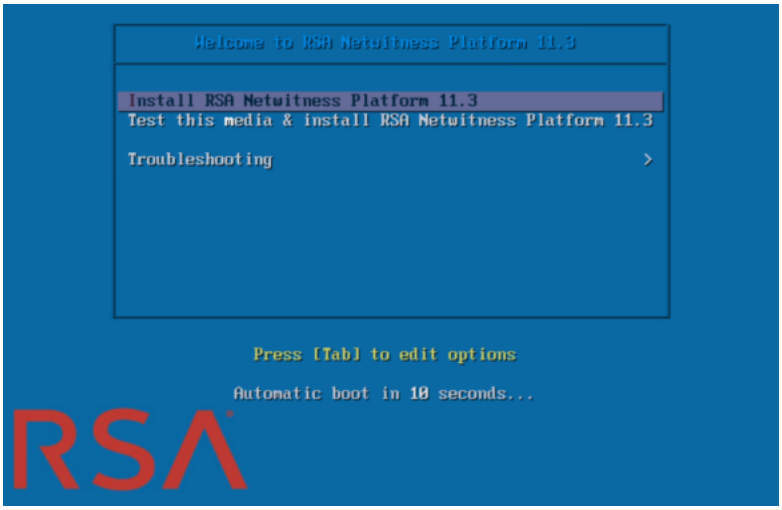
Set Up Secondary NW Server in Standby Role

1. Before you install a secondary NW Server host for the standby role, make sure that your:
   a. primary NW Server is running 11.3.
   b. All your component hosts are running 11.3
   If you are:
   - Installing NetWitness Platform 11.3, follow the instructions in the *RSA NetWitness Platform Physical Host Installation Guide for Version 11.3*.
   - Upgrading from 10.6.x to 11.3, follow the instructions in the *RSA NetWitness Platform Physical Host Upgrade Guide for Version 10.6.6.x to 11.3* .
   - Updating from 11.x to 11.3, follow the instructions in *RSA NetWitness Platform Update Guide for Version 11.x to 11.3*.
   Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.
2. Create a base image on the secondary NW Server:
   a. Attach media (ISO) to the host.
   See the *RSA NetWitness Platform Build Stick Instructions* for more information.
   - Physical media - use the ISO to create bootable flash drive media the **Etcher®** or another suitable imaging tool etch an Linux file system on the USB drive. See the *RSA NetWitness® PlatformBuild Stick Instructions* for information on how to create a build stick from the ISO. Etcher is available at: https://etcher.io.
   - iDRAC installations - the virtual media type is:
     - **Virtual Floppy** for mapped flash drives.
     - **Virtual CD** for mapped optical media devices or ISO file.

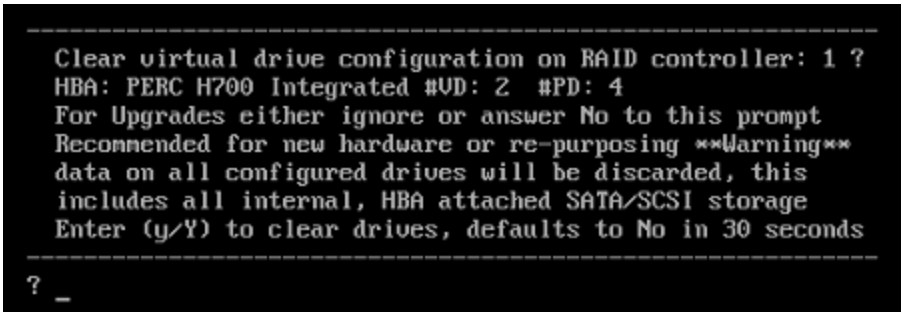
   b. Log in to the host and reboot it.



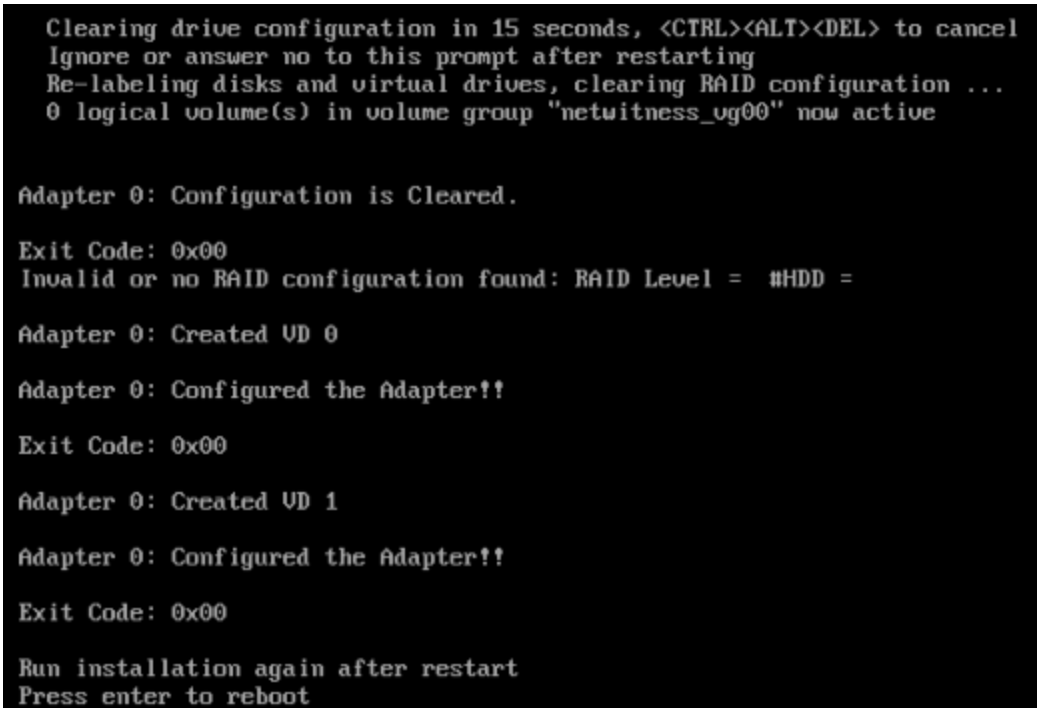
c. Select **F11** (boot menu) during reboot to select a boot device and boot to the connected media. After some system checks during booting, the following **Welcome to RSA NetWitness Platform 11.3** installation menu is displayed. The menu graphics will render differently if you use a physical USB flash media.



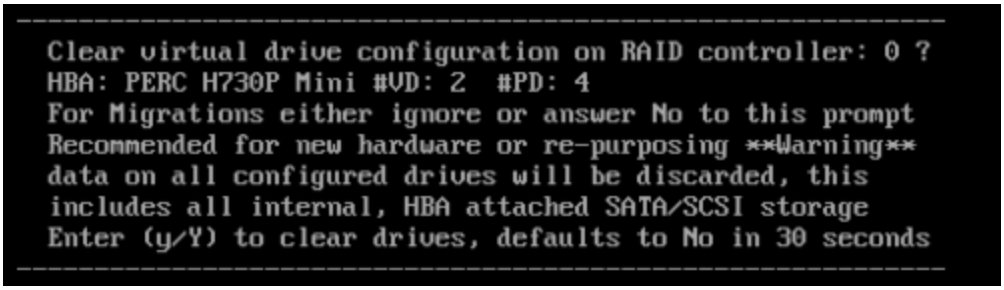
d. Select **Install RSA Netwitness Platform 11.3** (default selection) and press **Enter**.
The Installation program runs and stops at the **Enter (y/Y) to clear drives** prompt that asks you to format the drives.



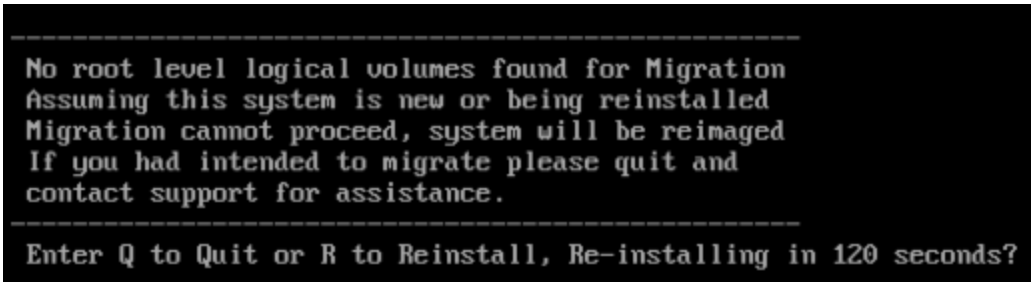
e. Type **Y** to continue.
The default action is No, so if you ignore the prompt and it will select No in 30 seconds and will not clear the drives. The **Press enter to reboot** prompt is displayed.



f. Press **Enter** to reboot the host.
The Installation program asks you to clear the drives again.



g. Type **N** because you already cleared the drives.
The **Enter Q (Quit) or R (Reinstall)** prompt is displayed.



h. Type **R** to install the base image.
The installation program displays the components as they are installed, which varies depending on the appliance, and reboots.

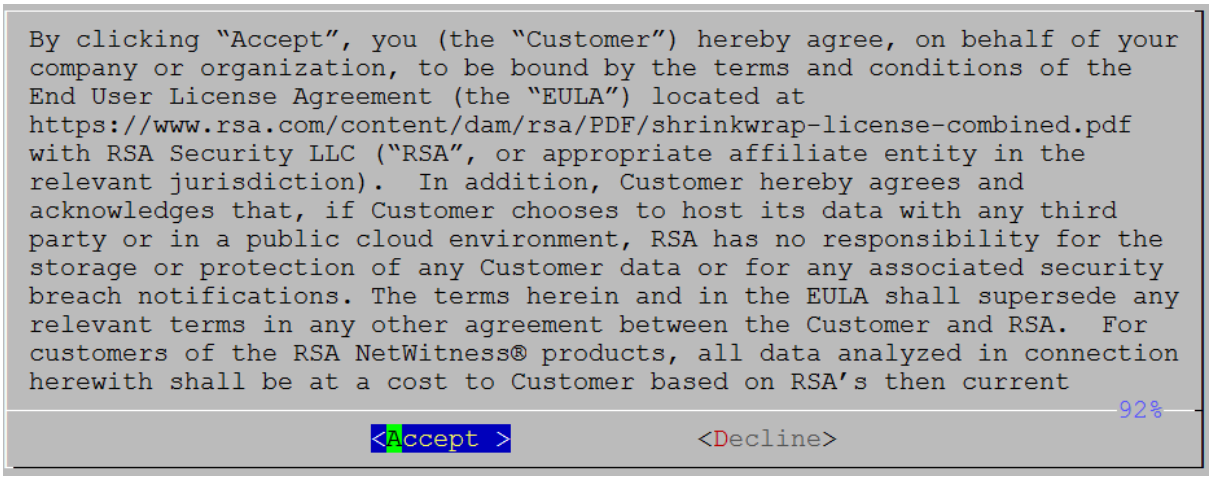
Caution: Do not reboot the attached media (media that contains the ISO file, for example a build stick).

i. Log in to the host with the `root` credentials.

2. Run the `nwsetup-tui` command.

Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use the Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press **Enter** to register your command response and move to the next prompt.
2.) The Setup program adopts the color scheme of the desktop or console you use access the host.
3.) During the Setup program, when you are prompted for the network configuration of the host, be sure to specify the same network configuration that was used for the original installation of 11.x on this host (it must be exactly the same).

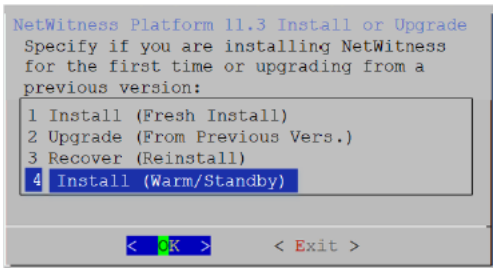
This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.



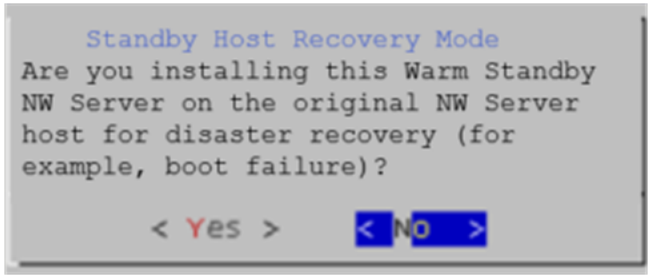
3. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 11.3 NW Server** prompt is displayed.

   Your response to this prompt identifies a host as either the primary or secondary during a fresh install (and the selected response stays constant regardless of the current or future role, that is active or standby of the host).

4. Tab to **Yes** and press **Enter**.
   The **Install or Upgrade** prompt is displayed.

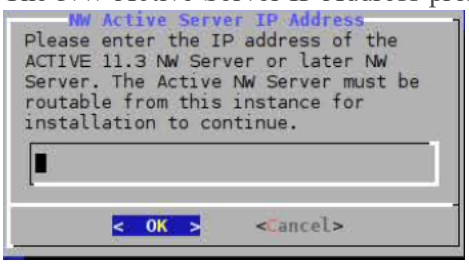


5. Tab to **4 Install (Warm Standby)** and press **Enter**.
   The Standby Host Recovery Mode prompt is displayed.

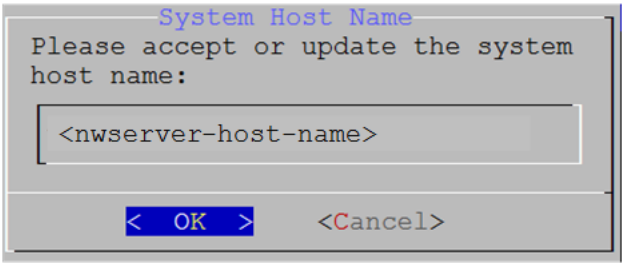


6. Tab to:
   - **No** and press **Enter** to set up a secondary NW Server with the standby role (most common scenario).
   - **Yes** and press **Enter** to set up a host that was previously used as a primary NW Server with the standby role so you can execute a fail-over and fail-back (less common scenario).

   The NW Active Server IP Address prompt is displayed.



7. Type the IP Address of the NW Server in the active role, tab to **OK**, and press **Enter**.
   The **Host Name** prompt is displayed



Caution: If you include "." in a host name, the host name must also include a valid domain name.

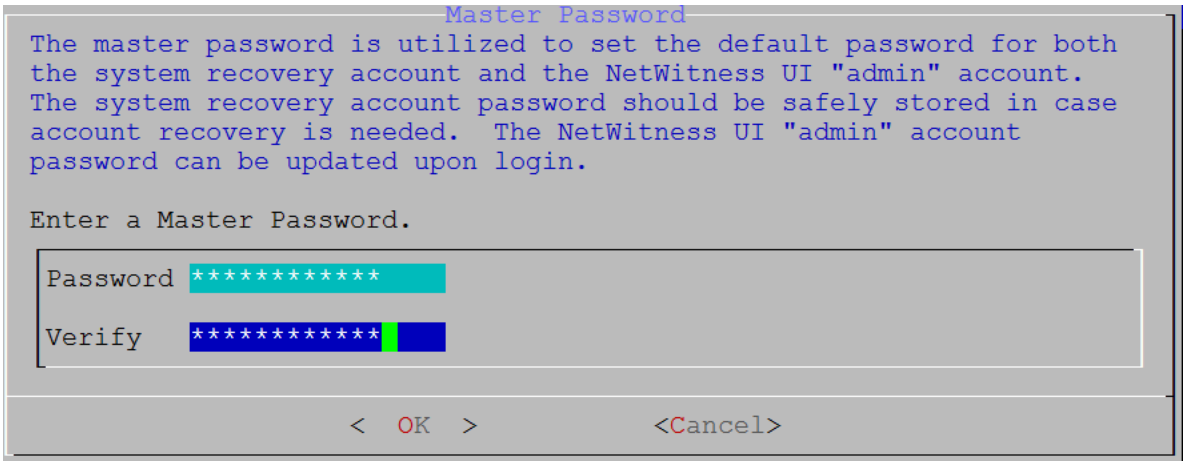
8. Press **Enter** if want to keep this name. If not edit the host name, tab to **OK**, and press **Enter** to change it.
   The **Master Password** prompt is displayed.

   Note: You must use the same Master and Deploy Admin credentials fot the Warm Standby NW Server Host that you used for the Active NW Server Host.

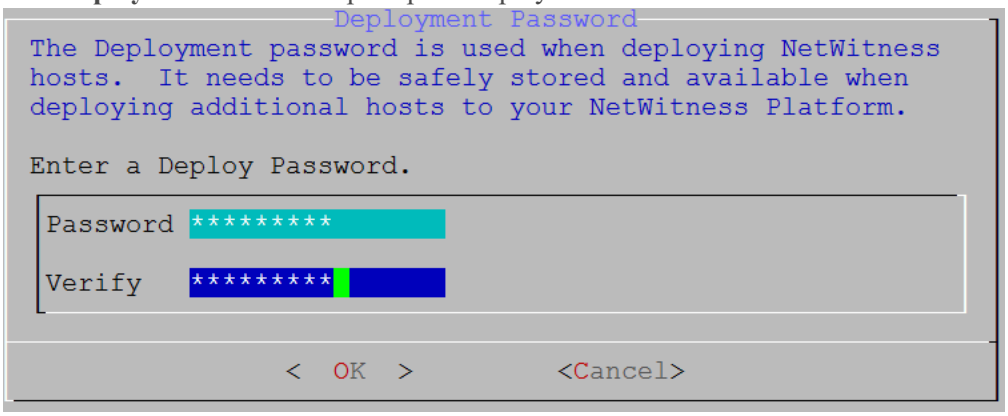
   The following list of characters are supported for Master Password and Deployment Password:

   - Symbols : ! @ # % ^ +
   - Lowercase Characters : a-z
   - Uppercase Characters : A-Z

   No ambiguous characters are supported for Master Password and Deployment Password. For example: space { } [ ] ( ) / \ ' " ` ~ ; : . < > -

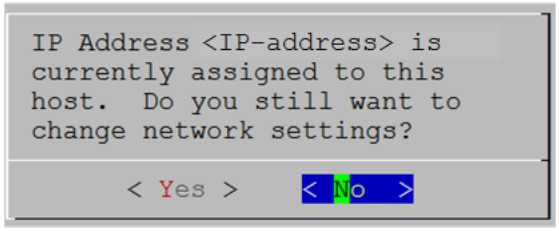


9. Type the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.
   The **Deployment Password** prompt is displayed.



10. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**. One of the following conditional prompts is displayed.

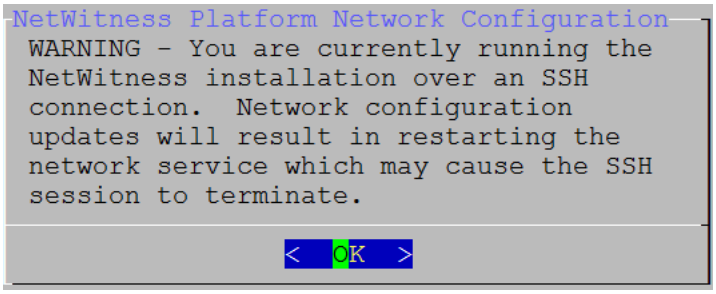
- If the Setup program finds a valid IP Address for this host, the following prompt is displayed.



Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** if you want to change the IP configuration found on the host.

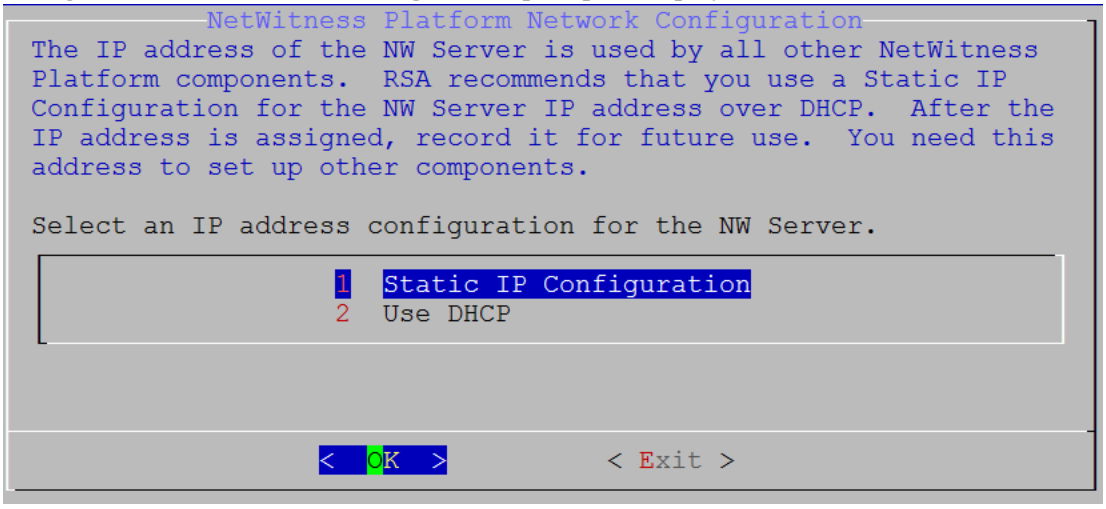
- If you are using an SSH connection, the following warning is displayed.

Note: If you connect directly from the host console, the following warning will not be displayed.

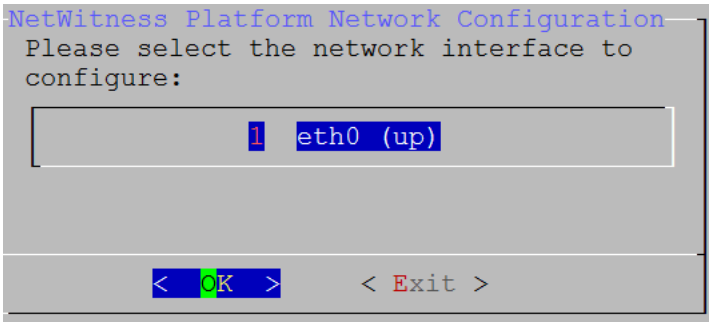


Press **Enter** to close warning prompt.

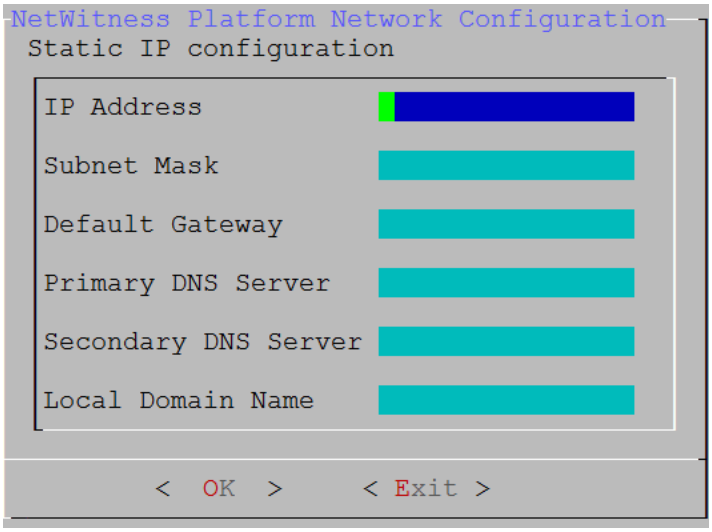
- If the Setup Program found an IP configuration and you chose to use it, the **Update Repository** prompt is displayed. Go to step 12 to and complete the installation.
- If the Setup Program did not find an IP configuration or if you chose to change the existing IP configuration, the **Network Configuration** prompt is displayed.



11. Tab to **OK** and press **Enter** to use **Static IP**.
    If you want to use DHCP, down arrow to **2 Use DHCP** and press **Enter**.
    The **Network Configuration** prompt is displayed.



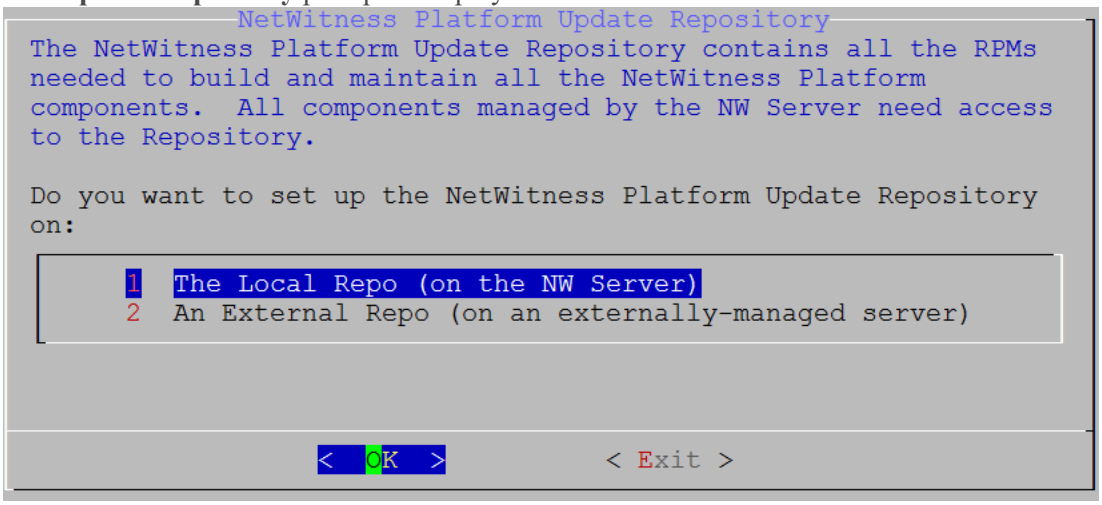
12. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit.**
    The following **Static IP Configuration** prompt is displayed.



13. Type the configuration values (using the down arrow to move from field to field), tab to **OK**, and press **Enter**. If you do not complete all the required fields, an `All fields are required` error message is displayed (**secondary DNS Server** and **Local Domain Name** fields are not required). If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

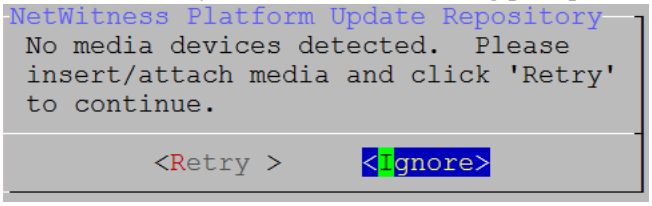
    Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

    The **Update Repository** prompt is displayed.

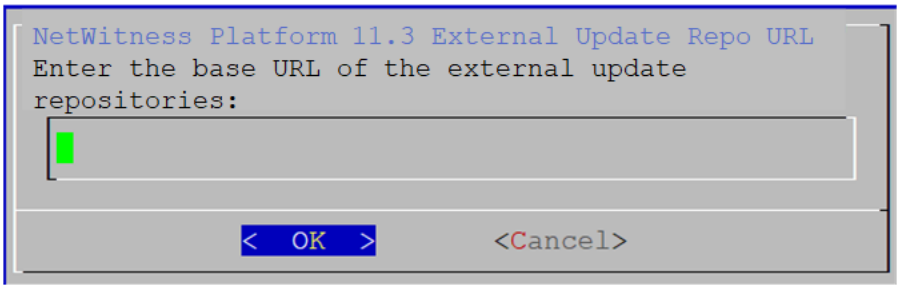


14. Press **Enter** to choose the **Local Repo** on the NW Server.
    If you want to use an external repo, down arrow to **External Repo**, tab to **OK**, and press **Enter**.

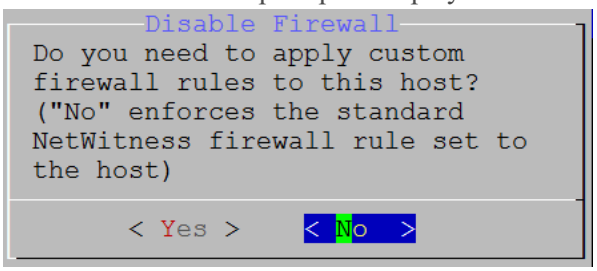
    - If you select **1 The Local Repo (on the NW Server)** in the Setup program, make sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can install NetWitness Platform 11.2.0.0. If the program cannot find the attached media, you receive the following prompt.



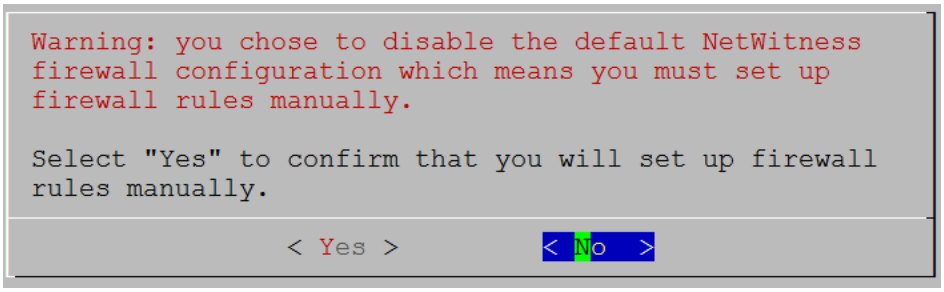
- If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access to RSA updates and CentOS updates. Refer to Appendix B. Create an External Repo for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.



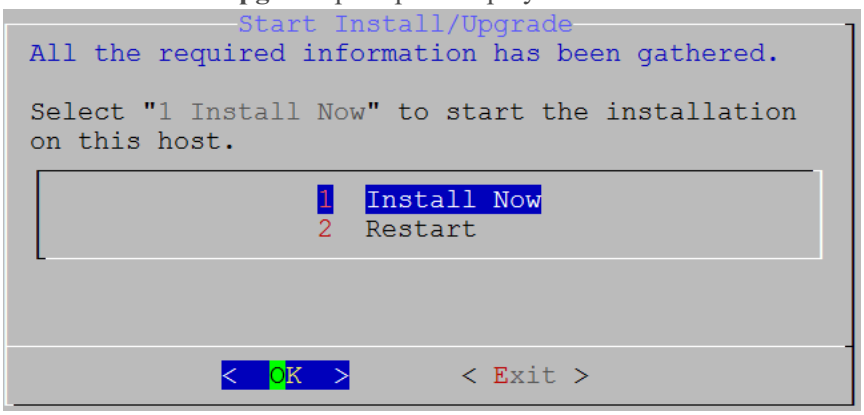
Enter the base URL of the NetWitness Platform external repo and click **OK.** The **Start Install** prompt is displayed.
See "Set Up an External Repository with RSA and OS Updates" under "Hosts and Services Procedures" in the *RSA NetWitness Platform Hosts and Services Getting Started Guide* for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.
The Disable firewall prompt is displayed.



15. Tab to **No** (default), and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.
If you select **Yes**, confirm your selection(select **Yes** again) or select **No** to use the standard firewall configuration.

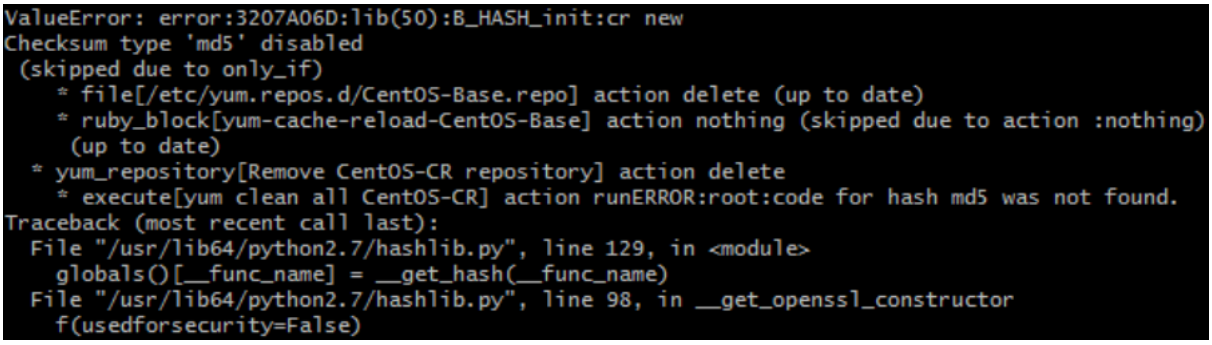


The **Start Install/Upgrade** prompt is displayed.



16. Press **Enter** to install 11.3 on the NW Server.
When **Installation complete** is displayed, you have installed the 11.3 NW Server on this host.

Note: Ignore the hash code errors similar to the errors shown in the following figure that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



17. License the secondary NW Server.
    a. Log in to the secondary NW Server User Interface, click **ADMIN** > **System** > **Info**, and note the **License Server ID** under **Version Information**.
    b. SSH to the primary NW Server.
    c. Edit the `/opt/netwitness/flexnetls/local-configuration.yaml` file and add the `back up hostid` (that is, the **License Server ID**).
    This is an example of the section of the `local-configuration.yaml` file before you add the **License Server ID**.
    ```
    # Hostid of the backup server, if in fail over configuration.
    #backup-hostid:
    ```
    This is an example of the section of the `local-configuration.yaml` file after you add the MAC address (for example, `000c2918c80d`) of the Warm Standby NW Server Host.
    ```
    # Hostid of the backup server, if in fail over configuration.
    backup-hostid: "000c2918c80d"
    ```

d. Restart the fneserver service.
```
systemctl restart flexnetls-RSALM
```

e. (Conditional) If your NetWitness Platform deployment is prohibited from accessing the Internet (Air Gap), you must:

i. Download the capability request from NetWitness Platform User Interface.

ii. Upload the request to FNO.

iii. Upload the response from FNO to the NetWitness Platform User Interface.

18. Schedule the backup of the primary NW Server and the copying of this backed-up data to the secondary NW Server.

a. SSH to the primary NW Server.

b. Submit the following commands.
```
/opt/rsa/saTools/bin/schedule-standby-admin-data-sync -di <warm-standby-admin-server-ip>
```
This backs up the primary NW Server data and copies the backup archive file to the secondary NW Server daily for future fail-over use. It also schedules the backup and copy to execute on a daily basis. You can display help for the `schedule-standby-admin-data-sync` script with the following command string.
```
/opt/rsa/saTools/bin/schedule-standby-admin-data-sync --help
```
This returns the following help to which you can refer to customize the host data backup (such as backup frequency).
```
Schedule Data Synch between AdminServer and Standby AdminServer
Script also executes a synchronization each time.

Usage:
schedule-standby-admin-data-sync command [options]

Commands:
-h, --help                        Display Help
-d, --daily                       Schedule daily data synchronization
-w, --weekly                      Schedule weekly data synchronization
-c, --custom <crontab formatted> Schedule custom data synchronization
                                  i.e. to schedule for midnight on 1st
                -                 and 10th of the month: '0 0 1,10 * *'
-i, --standby-ip <ip address>   IP address of standby Admin Server
-v, --verbose                   Enable verbose output
```

Fail Over Primary NW Server to Secondary NW Server

Initially, the primary NW Server fails over to the secondary NW Server. A subsequent fail-over that is the secondary NW Server to the primary NW Server and that is referred to as a fail-back. Complete the following procedure to fail over from the primary NW Server to the secondary NW Server.

1. SSH to the secondary NW Server.
2. Run the `nw-failover` script with the appropriate arguments. For example:
   ```
   nw-failover --make-active --ip-address <active-nw-server-host-ip> --name <primary-nw-server-hostname>
   ```
   After the script completes, the following message is displayed.
   ```
   *** Please update network ip and reboot host to complete the fail over process ***
   ```
3. Update the CentOS network configuration to swap IP Addresses.
   - **Planned Fail-Over** - primary NW Server did not fail:
     a. SSH to the primary NW Server.
     b. Assign an unused IP Address to the primary NW Server.
     c. Run the fail-over script with the appropriate arguments to assign the standby role to the primary NW Server. For example:
        ```
        nw-failover --make-standby --ip-address <unused-ip-or-previous-standby-ip> --name <previous-standby-nw-server-hostname>
        ```
     d. Shut down the primary NW Server.
     e. SSH to the secondary NW Server.
     f. Assign the IP Address of the primary NW Server that you recorded to the secondary NW Server.
   - **Required Fail-Over** - primary NW Server failed:
     a. SSH to the secondary NW Server.
     b. Assign the IP address of the primary NW Server to the secondary NW Server.

     > **Note:** If you have a catastrophic failure, you may need to provision a new host or re-image the primary NW Server and complete the Set Up secondary NW Server in Standby Role procedure for this host to create a new primary NW Server so you can fail back to it.
4. Reboot the host.

5. Make sure that the fail-over is set up correctly.
   a. SSH to the Standby NW Server.
   b. Make sure that the Active NW Server:
      i. Can resolve its uuid (Universal Unique Identifier).
         `source /usr/lib/netwitness/bootstrap/resources/nwcommon 2>/dev/null > /dev/null`
         `nslookup $(getNodeID)`
         `nslookup` should return the current Active NW Server IP address.
      ii. Matches the same IP address that was resolved in the previous step

Fail Back Secondary NW Server to Primary NW Server

After a fail-over from the primary NW Server to the secondary NW Server, you need to fail back to your original setup of the primary NW Server in the active role and the secondary NW Server in the standby role.

Essentially, you follow the same steps described under Fail Over Primary NW Server to Secondary NW Server to fail back to your original setup (that is primary NW Server-active and secondary NW Server-standby). The difference is that you now need to fail over from the secondary NW Server to the primary NW Server.

Network Architecture and Ports

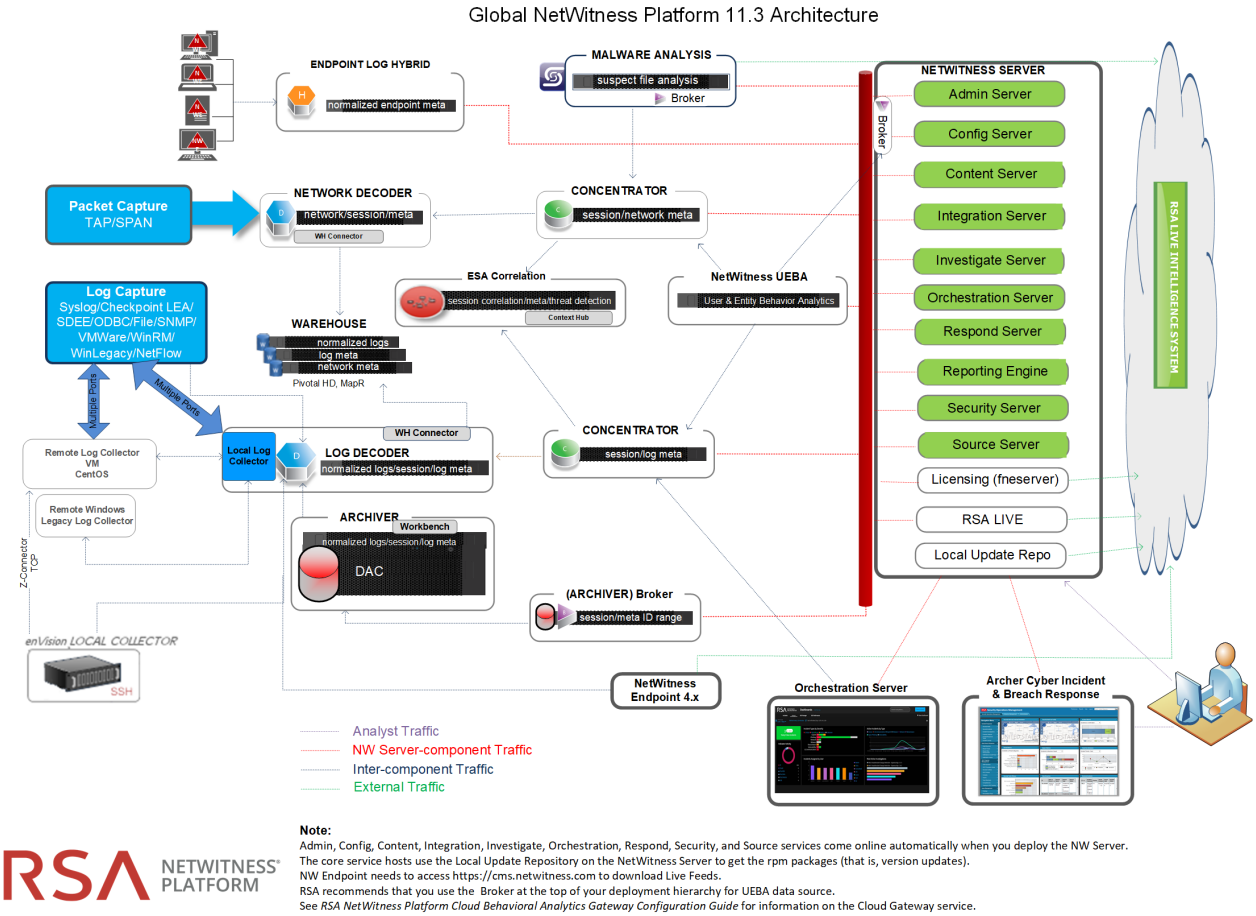
Refer to the following diagram and port table to ensure that all the relevant ports are opened for components in your NetWitness Platform deployment to communicate with each other.

See NetWitness Endpoint Architecture at the end of this topic for individual Endpoint Architectural diagrams.

NetWitness Platform Network Architecture Diagram

The following diagram illustrates the NetWitness Platform network architecture including all of its component products.

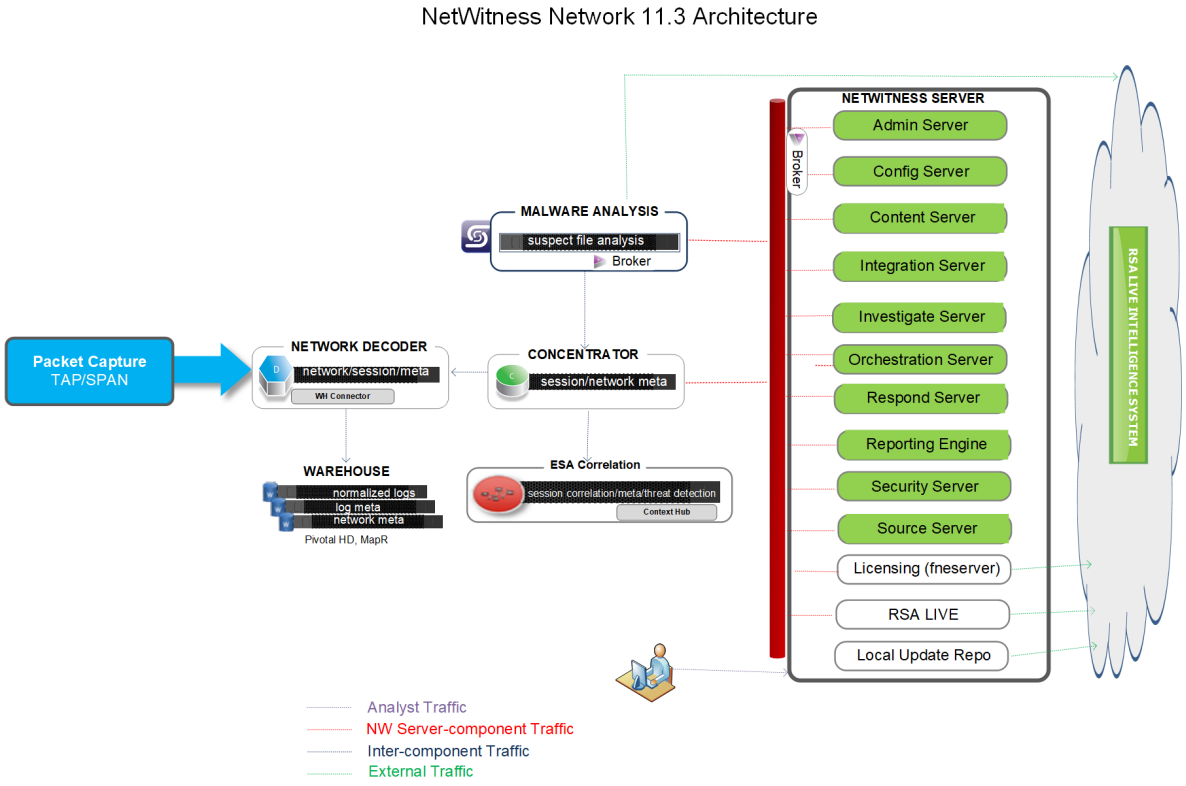
Note: NetWitness Platform core hosts must be able to communicate with the NetWitness Server (Primary Server in a multiple server deployment) through UDP port 123 for Network Time Protocol (NTP) time synchronization.



Note:
Admin, Config, Content, Integration, Investigate, Orchestration, Respond, Security, and Source services come online automatically when you deploy the NW Server.
The core service hosts use the Local Update Repository on the NetWitness Server to get the rpm packages (that is, version updates).
NW Endpoint needs to access https://cms.netwitness.com to download Live Feeds.
RSA recommends that you use the Broker at the top of your deployment hierarchy for UEBA data source.
See *RSA NetWitness Platform Cloud Behavioral Analytics Gateway Configuration Guide* for information on the Cloud Gateway service.

NetWitness Network (Packets) Network Architecture Diagram

The following diagram illustrates the NetWitness Network (Packets) network architecture.

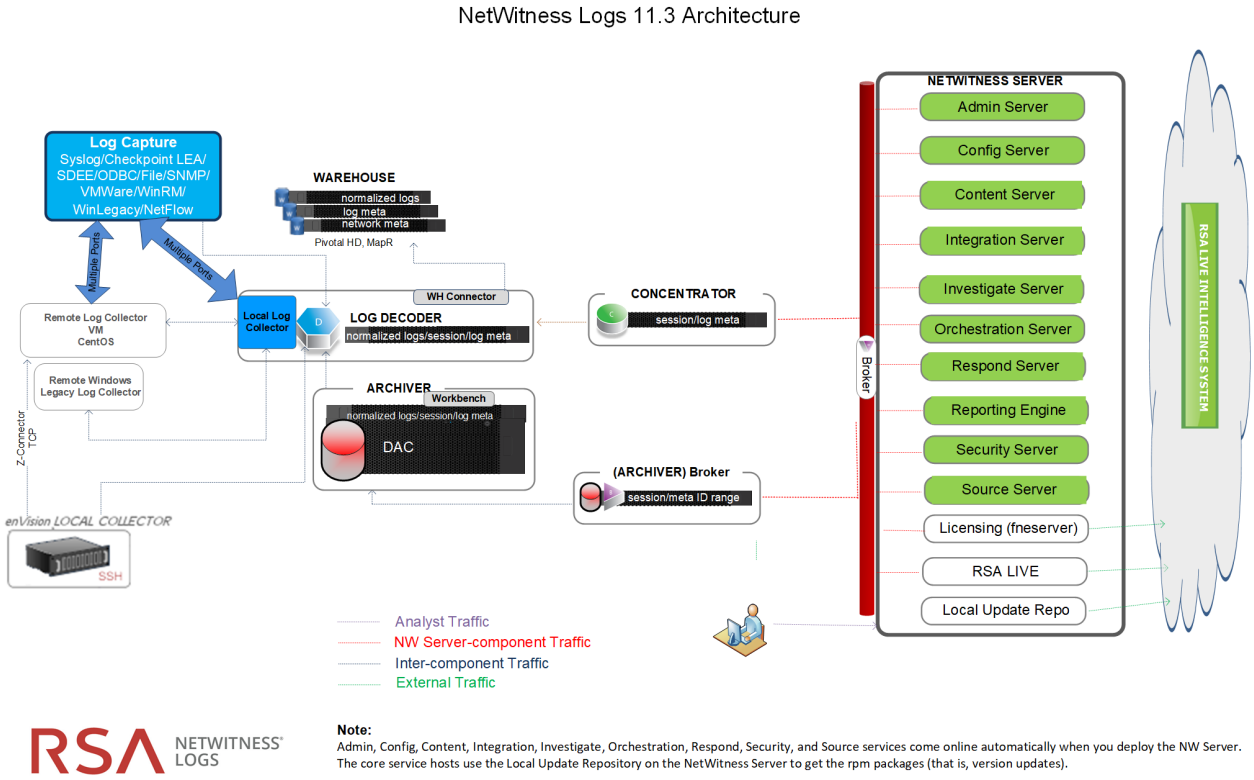


RSA NETWITNESS NETWORK

Notes:
Admin, Config, Content, Integration, Investigate, Orchestration, Respond, Security, and Source services come online automatically when you deploy the NW Server. The core service hosts use the Local Update Repository on the NetWitness Server to get the rpm packages (that is, version updates).

NetWitness Logs Network Architecture Diagram

The following diagram illustrates the NetWitness Logs network architecture.



RSA NETWITNESS LOGS

Note:
Admin, Config, Content, Integration, Investigate, Orchestration, Respond, Security, and Source services come online automatically when you deploy the NW Server. The core service hosts use the Local Update Repository on the NetWitness Server to get the rpm packages (that is, version updates).

Comprehensive List of NetWitness Platform Host, Service, and iDRAC Ports

Note: For ports used in event collection through the NetWitness Logs, see the "The Basics" in the *RSA NetWitness Suite Log Collection Deployment Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

This section contains the port specifications for the following hosts.

NW Server Host
Archiver Host
Broker Host
Concentrator Host
Endpoint Log Hybrid Host
Event Stream Analysis Host
iDRAC Ports
Log Collector Host
Log Decoder Host
Log Hybrid Host
Malware Host
Network Decoder Host
Network Hybrid Host
UEBA Host

NW Server Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	NW Server	TCP 443, 80	nginx - NetWitness UI
Admin Workstation	NW Server	TCP 15671	RabbitMQ Management UI
Admin Workstation	NW Server	TCP 22	SSH
NW Hosts	NW Server	TCP 53 UDP 53	DNS
NW Hosts	NW Server	TCP 15671	RabbitMQ Management UI
NW Hosts	NW Server	TCP 4505, 4506	Salt Master Ports
NW Hosts	NW Server	TCP 443	RSA Update Repository
NW Hosts	NW Server	TCP 5671	RabbitMQ-amqp
NW Hosts	NW Server	UDP 123	NTP
NW Hosts	NW Server	TCP 27017	MongoDB
NW Server	cloud.netwitness.com	TCP 443	Live
NW Server	cms.netwitness.com	TCP 443	Live
NW Server	smcupdate.emc.com	TCP 443	Live
NW Server	NFS Server	TCP 111, 2049, UDP 111, 2049	iDRAC Installations
NW Server	NW Hosts	UDP 123	NTP
NW Server	NW Endpoint	TCP 443, 9443	For NW Endpoint 4.x integrations

Archiver Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Archiver	TCP 15671	RabbitMQ Management UI
Archiver	NW Server	TCP 15671	RabbitMQ Management UI
Archiver	NW Server	TCP 443	RSA Update Repository
Admin Workstation	Archiver	TCP 22	SSH
NW Server	Archiver	TCP 50008 (Non-SSL), 56008 (SSL), 50108 (REST)	Archiver Application Ports
NW Server	Archiver	TCP 56006 (SSL), 50106 (REST)	NetWitness Appliance Ports
NW Server	Archiver	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
NW Server	Archiver	TCP 514, 6514, 50007 (Non-SSL) 56007 (SSL), 50107 (REST), UDP 514	Workbench Application Ports
Archiver	NFS Server	TCP 111 2049 UDP 111 2049	iDRAC Installations

Broker Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Broker	TCP 15671	RabbitMQ Management UI
Broker	Concentrator	TCP 50005 (Non-SSL), 56005	Concentrator Application Port
Broker	NW Server	TCP 15671	RabbitMQ Management UI
Broker	NW Server	TCP 443	RSA Update Repository
Admin Workstation	Broker	TCP 22	SSH
NW Server	Broker	TCP 50003 (Non-SSL), 56003 (SSL), 50103 (REST)	Broker Application Ports
NW Server	Broker	TCP 56006 (SSL), 50106 (REST)	NetWitness Appliance Ports
NW Server	Broker	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
Broker	NW Server	TCP 111 2049 UDP 111 2049	iDRAC Installations
Endpoint Broker	NW Server	TCP 443	RSA Update Repository

Concentrator Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Concentrator	TCP 15671	RabbitMQ Management UI
Concentrator	Log Decoder	TCP 50002 (Non-SSL), 56002 (SSL)	Concentrator Application Port
Concentrator	Network Decoder	TCP 56004	Concentrator Application Port
Concentrator	NW Server	TCP 15671	RabbitMQ Management UI
Concentrator	NW Server	TCP 443	RSA Update Repository
Admin Workstation	Concentrator	TCP 22	SSH
NW Server	Concentrator	TCP 50005 (Non-SSL), 56005 (SSL), 50105 (REST)	Concentrator Application Ports
Malware	Concentrator	TCP TCP 50005 (Non-SSL), 56005 (SSL)	Malware
NW Server	Concentrator	TCP 56006 (SSL), 50106 (REST)	NetWitness Appliance Ports
NW Server	Concentrator	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
Concentrator	NFS Server	TCP 111 2049 UDP 111 2049	iDRAC Installations

Endpoint Log Hybrid

Source Host	Destination Host	Destination Ports	Comments
Endpoint Agent	Endpoint Log Hybrid	TCP 443 UDP 444	NGINX HTTPS NGINX UDP. If UDP port 444 is not acceptable in your environment, see How to Change UDP Port for Endpoint Log Hybrid.
Endpoint Agent	Log Decoder or Virtual Log Collector	TCP 514 (Syslog) UDP 514 (Syslog) TLS 6514	Windows Log Collection
Endpoint Log Hybird	Log Decoder (External)	TCP 50102 (REST) 56202 (Protobuf SSL) 50202 (Protobuf)	To forward meta to an external Log Decoder
Endpoint Log Hybird	NW Server	TCP 443	RSA Update Repository
NW Server	Endpoint Log Hybrid	TCP 7050	UI web traffic
Endpoint Log Hybrid	NW Server	TCP 5671	Message Bus
Endpoint Log Hybird	NW Server	TCP 27017	MongoDB
NW Server	Endpoint Log Hybird	TCP 7054	UI web traffic
NW Server	NFS Server	TCP 111, 2049 UDP 111, 2049	iDRAC Installations

Event Stream Analysis (ESA) Host

Note: The ports in this table are for the ESA Primary an ESA Secondary hosts. The Content Hub, Correlation and ESA Analytics services are co-located on the ESA Primary host. The Correlation and ESA Analytics services are co-located on the ESA Secondary host.

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	ESA	TCP 15671	RabbitMQ Management UI
ESA Primary and Secondary	NW Server	TCP 15671	RabbitMQ Management UI
ESA Primary and Secondary	NW Server	TCP 443	RSA Update Repository
Admin Workstation	ESA	TCP 22	SSH
NW Server, ESA Secondary	ESA Primary	TCP 27017	MongoDB
NW Server	ESA Primary	TCP 7005	Context Hub Launch Port - (ESA Primary)
NW Server	ESA	TCP 50030 (SSL)	ESA Application Port
NW Server	ESA	TCP 50035 (SSL)	ESA Application Port
NW Server	ESA	TCP 50036 (SSL)	ESA Application Port
NW Server	ESA	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
ESA Primary and Secondary	cms.netwitness.com	TCP 443	Live
ESA Primary and Secondary	NFS Server	TCP 111 2049 UDP 111 2049	iDRAC Installations
ESA Primary and Secondary	Active Directory	636 (SSL)/389 (Non-SSL)	
NW Server	ESA	80 (HTTP)/ 443 (HTTPS)(REST)	
ESA Primary	Archer	443 (SSL)/80 (Non-SSL)	
ESA Primary	ESA Primary	TCP 7007	Launch Port

iDRAC Ports

Port	Function	Comments
22*	SSH	Default, configurable port through which iDRAC listens for connections
443*	HTTP	Default, configurable port through which iDRAC listens for connections
5900*	Virtual Console keyboard and mouse redirection, Virtual Media, Virtual Folders, and Remote File Share.	Default, configurable port through which iDRAC listens for connections
111, 2049	TCP	NetWitness Platform hosts to NFS Server
111, 2049	UDP	NetWitness Platform hosts to NFS Server

Log Collector Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Log Collector	TCP 15671	RabbitMQ Management UI
Log Collector	NW Server	TCP 15671	RabbitMQ Management UI
Log Collector	NW Server	TCP 443	RSA Update Repository
Admin Workstation	Log Collector	TCP 22	SSH
Log Collector	Log Event Sources	See *Log Collection Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.	
Log Event Sources	Log Collector	TCP 514 (Syslog) UDP 162 (SNMP), 514 (Syslog), 2055 (NetFlow), 4739 (NetFlow), 6343 (NetFlow), 9995 (NetFlow)"	Log Collection Ports
Log Event Sources	Log Collector	TCP 21, 64000, 64001, 64002, 64003, 64004, 64005, 64006, 64007, 64008,64009	Log Collection FTP/S Ports
NW Server	Log Collector	TCP 50001 (Non-SSL), 56001 (SSL), 50101 (REST)	Log Collector Application Ports
NW Server	Log Collector	TCP 56006 (SSL), 50106 (REST)	NetWitness Appliance Ports
NW Server	Log Collector	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
Log Collector	NFS Server	TCP 111 2049 UDP 111 2049	iDRAC installations
Log Collector	Virtual Log Collector	TCP 5671	In Pull Mode
Virtual Log Collector	Log Collector	TCP 5671	In Push Mode

Log Decoder Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Log Decoder	TCP 15671	RabbitMQ Management UI
Log Decoder	NW Server	TCP 443	RSA Update Repository
Admin Workstation	Log Decoder	TCP 22	SSH

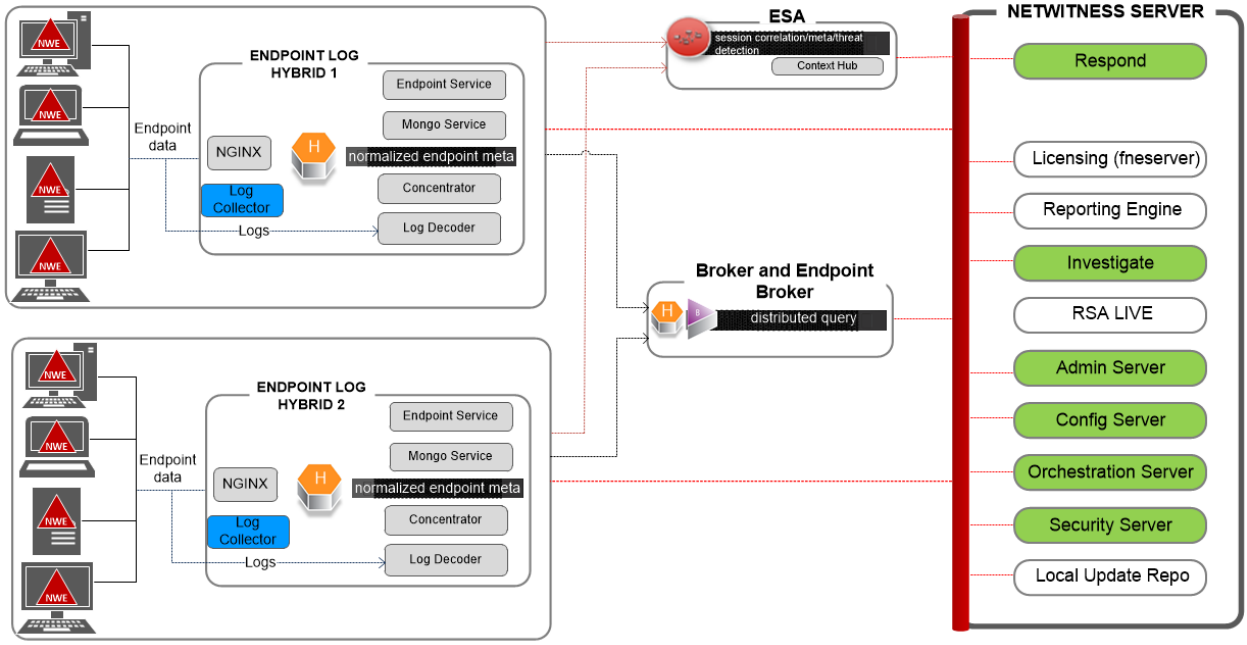
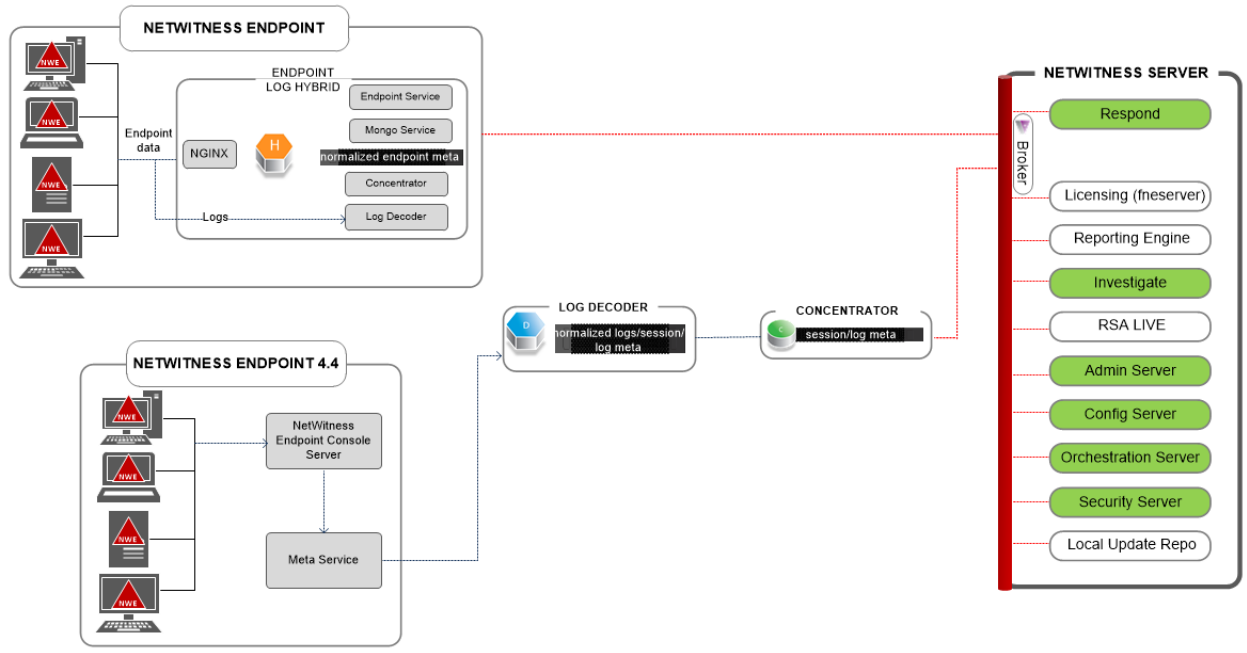
NetWitness Endpoint Architecture



NetWitness Endpoint 4.4 Integration with NetWitness Platform



For more information on the services running on Endpoint Log Hybrid, see *RSA NetWitness Endpoint Configuration Guide*.

How to Change UDP Port for Endpoint Log Hybrid

The following steps tell you how to change the Endpoint Log Hybrid default UDP port 444 if it is not acceptable in your environment. 555 is the example this procedures uses as a replacement for 444 UDP port.
There are two tasks you need to o change the Endpoint Log Hybrid default UDP port 444:

Task 1 - Tell All Agents to Use a New UDP Port

Task 2 - Update the Port on All Endpoint Log Hybrid Hosts in Your Environment

Note: If you did not select the custom firewall rules option when you ran the nwsetup-tui, NetWitness platform overwrites the firewall rules are overwritten after a period of time. Please refer to the following Knowledge Base Article 00036446 (https://community.rsa.com/docs/DOC-93651) if this is the case.

Task 1 - Tell All Agents to Use a New UDP Port

Complete the following steps to update the UDP port in the default Enterprise Data Replication (EDR) policy, and all other policies you have, to tell all agents to use a new UDP port.

1. In the **NetWitness Platform** menu, select **ADMIN** > **Endpoint Sources** > **Policies**.
   The **Policies** view is displayed.
2. Select the **Default EDR Policy** and click **Edit** from the toolbar.
3. roll down to find the **UDP PORT** and change the value (for example, change from **444** to **555**).
4. Click **Publish Policy** at the bottom of the view.

Task 2 - Update the Port on All Endpoint Log Hybrid Hosts in Your Environment

SSH to o each Endpoint Log Hybrid host in your environment with `admin` credentials and make the following updates.

1. Update the `iptables` rules to allow `555` in place of `444`.
   a. Replace `444` with `555` in the following file.
      `vi /etc/sysconfig/iptables`
   b. Restart `iptables` with the following command string.
      `systemctl restart iptables`
   c. Verify the change with the following command string.
      `iptables -L -n`
      The following is an example of what is displayed for a correct change.
      ```
      ACCEPT udp -- 0.0.0.0/0 0.0.0.0/0 udp multiport dports 555 /*
      EndpointNginxPort */ ctstate NEW
      ```
2. Update the SELinux policy. 555 is a privileged port, so you must update SELinux policy to allow this port.
   a. Run the following command string.
      `semanage port -a -t http_port_t -p udp 555`
      If you received any python errors or warnings, ignored them.

b. Verify the change with the following command string.
```
semanage port -l | grep http_port_t
```
The following is an example of what is displayed for a correct change.
```
http_port_t udp 555, 444
```

c. (Optional) Remove `444`.

3. Update nginx config.

a. Edit the following file.
```
vi /etc/nginx/nginx.conf
```

b. Search for the following string.
```
listen 444 udp;
```

c. Replace `444` with `555`.

d. Restart nginx with the following command string.
```
systemctl restart nginx
```

4. Verify that agents are communicating over the new port.

a. Run the following command string.
```
tcpdump -i eth0 port 555
```

b. Wait for 30 seconds because the port sends out a beacon every 30 seconds. If t everything is working correctly, information similar to the following will be displayed.
```
09:20:12.571316 IP 10.40.15.103.60807 >
NiranjanEPS1.rsa.lab.emc.com.dsf: UDP, length 20
09:20:12.572433 IP NiranjanEPS1.rsa.lab.emc.com.dsf >
10.40.15.103.60807: UDP, length 1
```
Both lines must be returned. One is the size request (`20` bytes) and the other is the response size (`1` byte).

Site Requirements and Safety

Make sure that you read this topic thoroughly and observe all warnings and precautions prior to installing or maintaining your RSA devices.

Intended Application Uses

This product was evaluated as Information Technology Equipment (ITE) that may be installed in offices, schools, computer rooms, and similar indoor commercial type locations. This device is not intended for any connection to an outdoor type cable.

Service

There are no user-serviceable components inside of this device. Please contact Customer Care in the event of a malfunction. In a fault condition, high temperatures may arise inside the system causing an alarm signal. In the event of the alarm signal, immediately disconnect the device from the power source and contact Customer Care. Further operation of the device will be unsafe and may cause personal injury or property damage.

Safety Information

Site Selection

The system is designed to operate in a typical office environment. Choose a site that is:

- Clean, dry, and free of airborne particles (other than normal room dust).
- Well-ventilated and away from sources of heat, including direct sunlight and radiators.
- Away from sources of vibration or physical shock.
- Isolated from strong electromagnetic fields produced by electrical devices.
- In regions that are susceptible to electrical storms, we recommend you plug your system into a surge suppressor.
- Provided with a properly grounded wall outlet.
- Provided with sufficient space to access the power supply cords, because they serve as the product′s main power disconnect.

Equipment Handling Practices

Reduce the risk of personal injury or equipment damage by:

- Conforming to local occupational health and safety requirements when moving and lifting equipment.
- Using mechanical assistance or other suitable assistance when moving and lifting equipment.

- Reducing the weight for easier handling by removing any easily detachable components.

Power and Electrical Warnings

Caution: The power button, indicated by the standby power marking, DOES NOT completely turn off the system AC power; 5V standby power is active whenever the system is plugged in. To remove power from system, you must unplug the AC power cord(s) from the wall outlet.

- Do not attempt to modify or use an AC power cord if it is not the exact type required. A separate AC cord is required for each system power supply.
- This product contains no user-serviceable parts. Do not open the system.
- When replacing a hot-plug power supply, unplug the power cord to the power supply being replaced before removing it from the server.

Rack Mount Warnings

- The equipment rack must be anchored to an unmovable support to prevent it from tipping when a server or piece of equipment is extended from it. The equipment rack must be installed according to the rack manufacturer's instructions.
- Mounting of the equipment in the rack should be such that a hazardous condition is not achieved due to uneven mechanical loading.
- Extend only one piece of equipment from the rack at a time.
- To avoid risk of potential electric shock, a proper safety ground must be implemented for the rack and each piece of equipment installed in it.

Cooling and Air Flow

Installation of the equipment should be such that the amount of air flow required for safe operation of the equipment is not compromised.

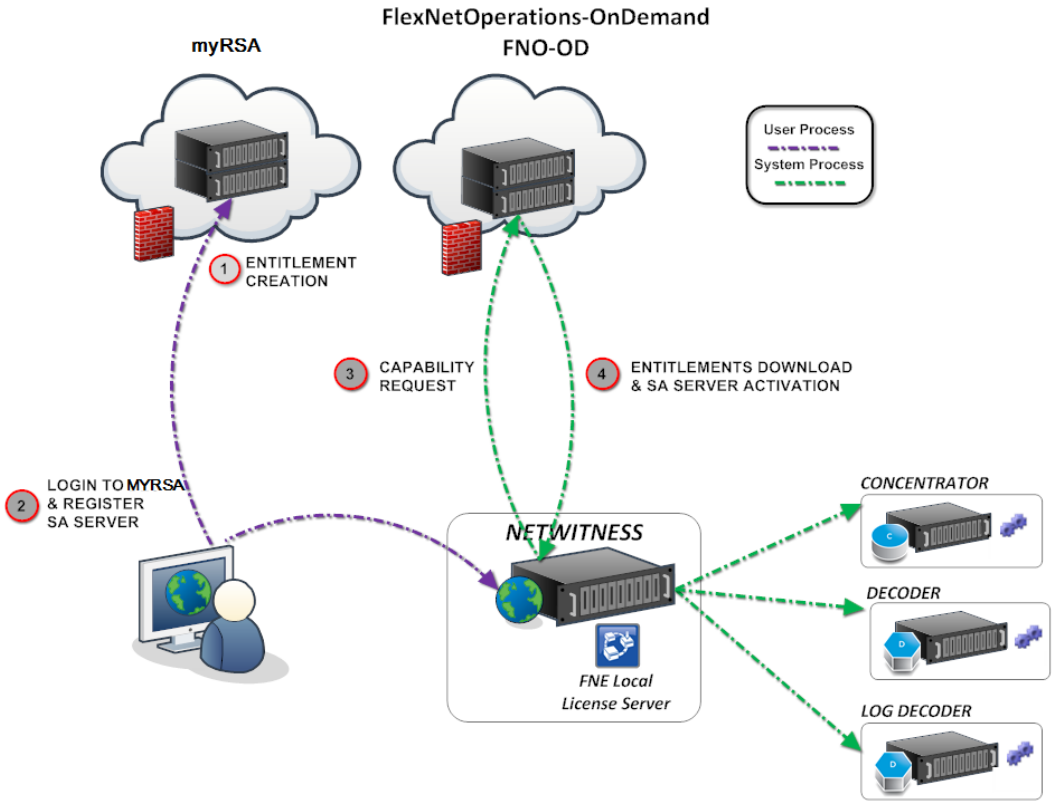
Entitlement Capability Implementation

This topic describes how licensing of appliances and services is implemented in NetWitness Platform. The entitlement capability leverages myRSA (https://my.rsa.com/) as the mechanism for entitlement delivery.



Key	Description
1	**Entitlements Created and Available to Customer.** After a customer order is processed, the entitlements (licenses) become available in myRSA. The entitlements are tied to an individual account.
2	**Register NetWitness Server on myRSA and Map Entitlements to the Local License Server (LLS).** • Customers log on to myRSA and view the entitlements to which they have access within their account. • Customers map entitlements to their Local License Server using the License Server ID (displayed in the NetWitness Platform ADMIN > System > Info panel). The License Server ID is used only for mapping entitlements to a Local License Server and does not pertain to appliance activation.

Key	Description
3	**Synchronize the Server and Download Mapped Entitlements.** There are two methods for customers to synchronize with FlexNet Operations-On Demand (FNO-OD) and download the mapped entitlements to their LLS. • **Sites with Internet connectivity.** If the LLS has Internet connectivity, the LLS attempts to synchronize with FNO-OD every 24 hours over HTTP (TCP-80). Customers with Internet connectivity can also perform on-demand synchronization, using the **Refresh** option in the ADMIN > System > Licensing panel on the NetWitness Server. For more information, see Register the Server (Online Registration). • **Sites in closed environments.** Customers can synchronize the mapped entitlements by downloading a capability request and importing it on the NetWitness Server. For more information, see Register the Server (Offline Capability Request). After the synchronization, entitlements that were mapped to the Local License Server on the NetWitness Platform appliance are synchronized, but the entitlements have not been used in any way. For example, if you have purchased 10 Decoders and 10 Concentrators, 10 of 10 Decoder entitlements and 10 of 10 Concentrator entitlements would be available on the NetWitness Server.

Note: FNO-OD is the license server in the cloud on myRSA. The URL is rsasecurity.subscribenet.com. The customer's firewall must allow communications between this URL on port 80 (whatever it resolves to when using lookup or whois) and the NetWitness Platform IP address.

NetWitness Platform Licensing Overview

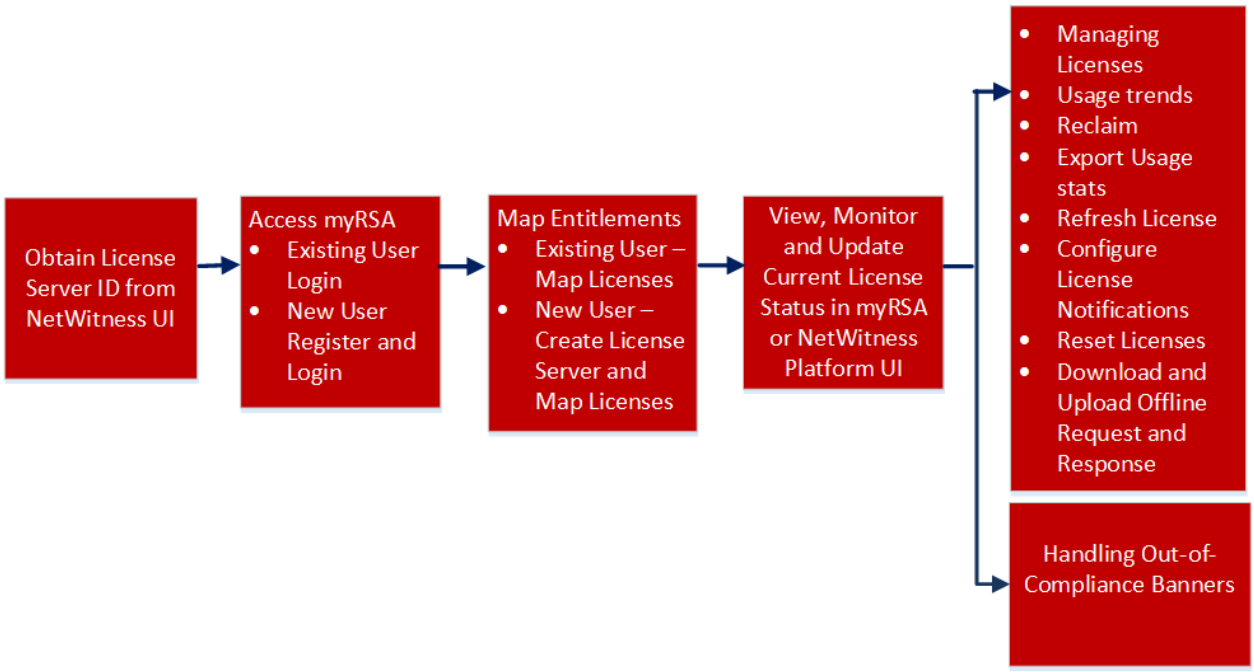
After you have purchased the licenses and have received all the relevant email communications, perform the steps required to map entitlements in NetWitness Platform. You must perform each step in the proper sequence.

This document is divided into three parts:

- How to obtain license information from myRSA and view in the NetWitness Platform UI
- Understanding License Types and its functionality
- Troubleshooting or maintenance information

Workflow

The following workflow illustrates the end-to-end licensing process after you have the NetWitness Platform product installed .

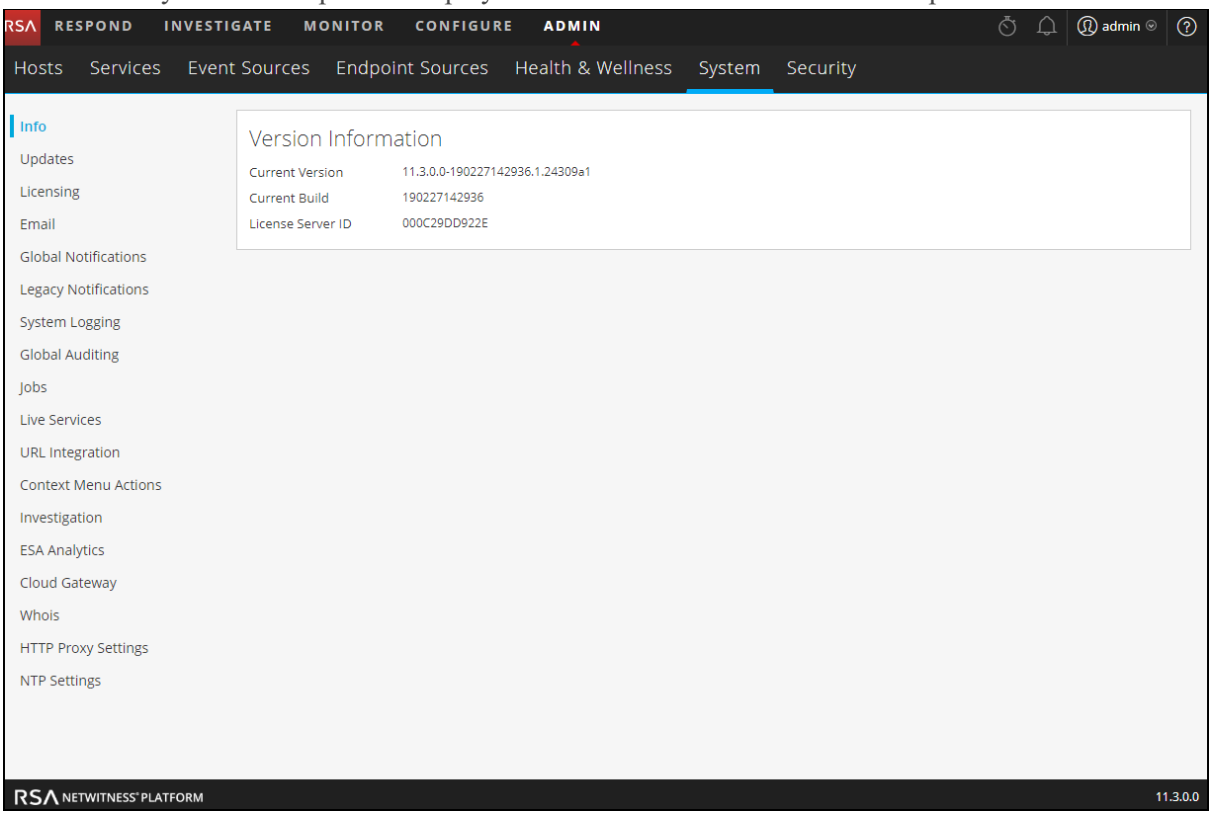


Obtain License Server ID from NetWitness Platform User Interface

Before you begin the licensing process, you must make sure that you obtain the License Server ID displayed in the NetWitness Platform User Interface which is generated on the successful installation of the product.

To obtain the license service ID:

1. Log in to the NetWitness Platform user interface.
2. Go to **ADMIN** > **System**.
   The Admin System view opens to display the Version Information in the **Info** panel.

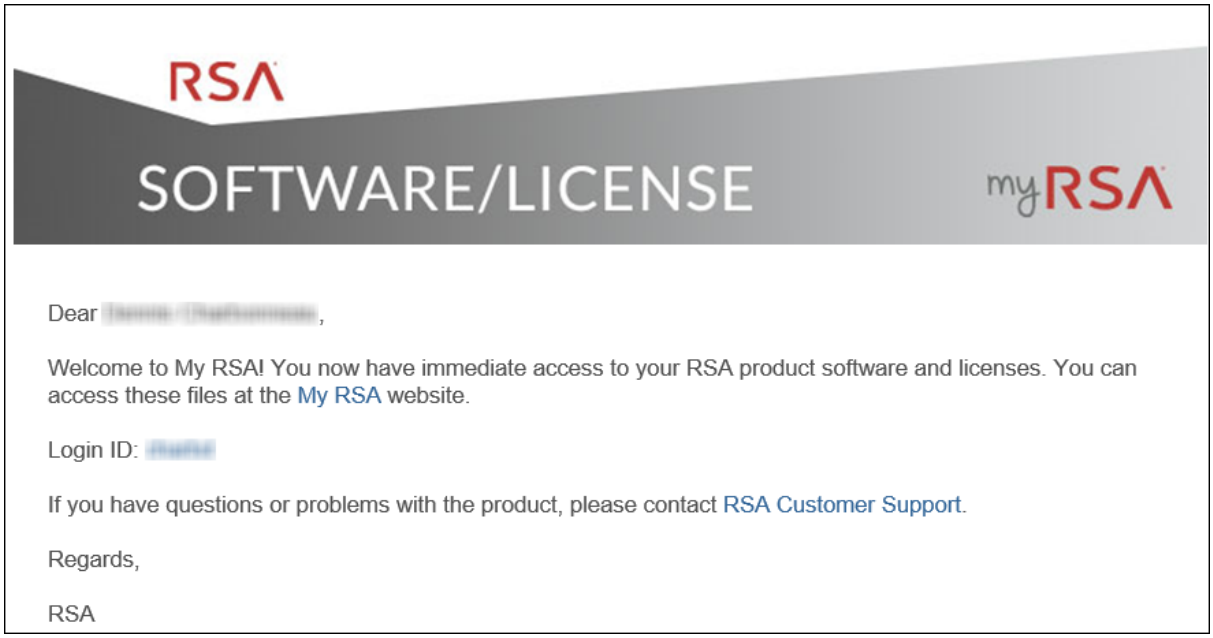


3. Under **Version Information**, locate the **License Server ID** and make a note.
   Log in to **myRSA** and enter the License Server ID to view your entitled license information. For more information, see Access myRSA.

Access myRSA

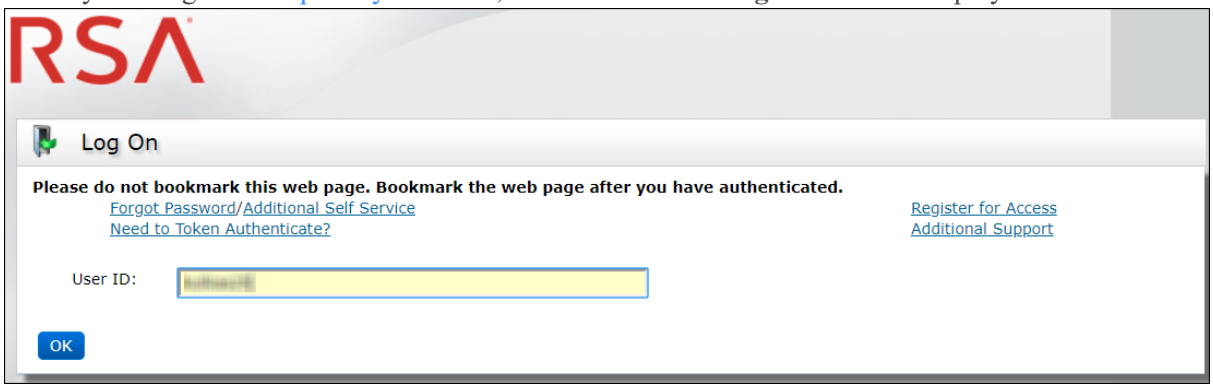
You will receive an order confirmation e-mail. Refer to your myRSA email for login information. If you are a new myRSA user, you also receive an e-mail containing instructions on how to create a new account. Your myRSA Welcome e-mail message contains system log in instructions to myRSA. This document provide you instructions on how to map your product licenses on the myRSA website.

1. The new users instruction e-mail contains a **Click Here** link. This link opens an Enrollment Portal, where the -Based Authentication (RBA) method must be configured for the account.
2. After the RBA method is enabled, a Confirmation e-mail message containing the User ID (which is your e-mail address), along with a temporary password is sent. After the first login, you are prompted to change the password. Once the password is changed, you are logged into myRSA.



Note: If you have a pre-existing account for the RSA Link or RSA Online websites, you receive only one e-mail on how to use your existing login credentials. You must log into myRSA with your existing User ID, password, and RSA method.

3. When you navigate to https://my.rsa.com/, the **RSA Secure Logon** screen is displayed.

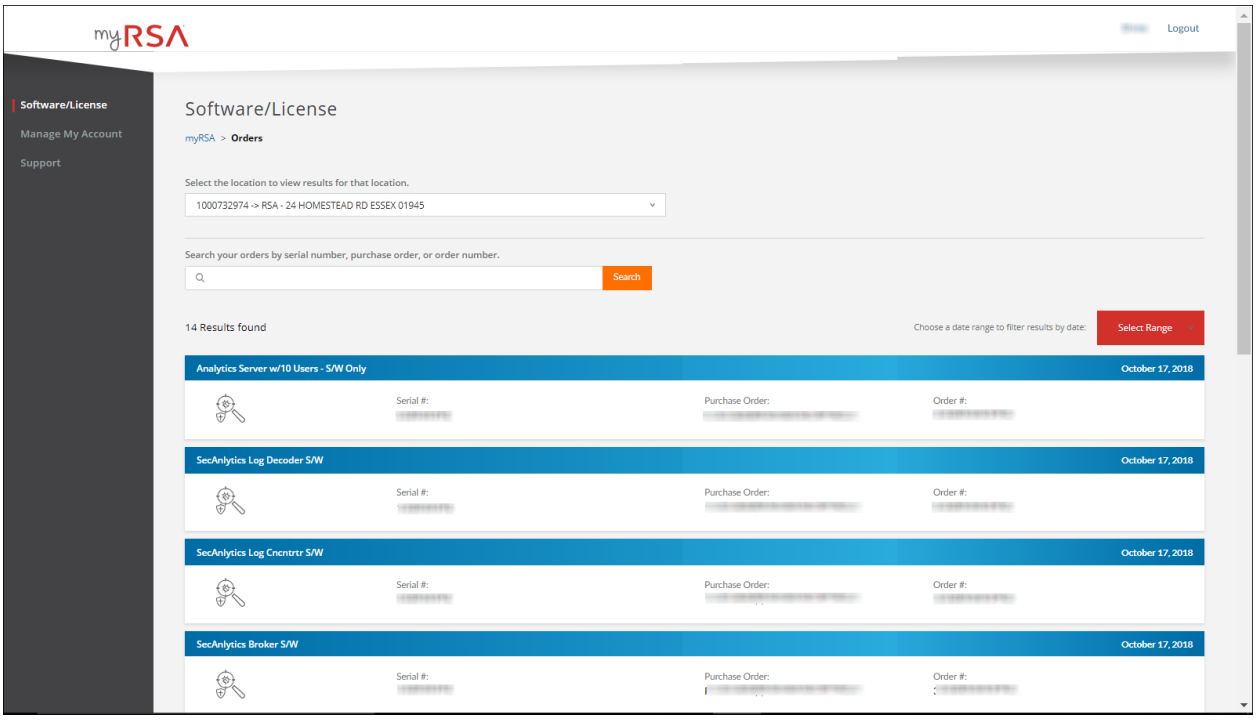


4. Enter your User ID and click **OK**, which displays the **Password** field. When you enter the password, you are logged into myRSA.
   Your contact e-mail address is used to authenticate your User ID. If the Customer Authentication process is successful, the myRSA Software/License page displays a list of all the following products available which are associated to your site location:
   - RSA Products
   - Serial Numbers
   - Purchase Orders
   - Sales Orders

Note: You may be prompted to verify your identity through your RBA method, if multiple log in failures occur in a row, or if you have not logged into myRSA within the past several months.

In the Sofware/License page, select the Order Location from the drop-down menu. The list of products, sales orders, and purchase orders are filtered and displayed.

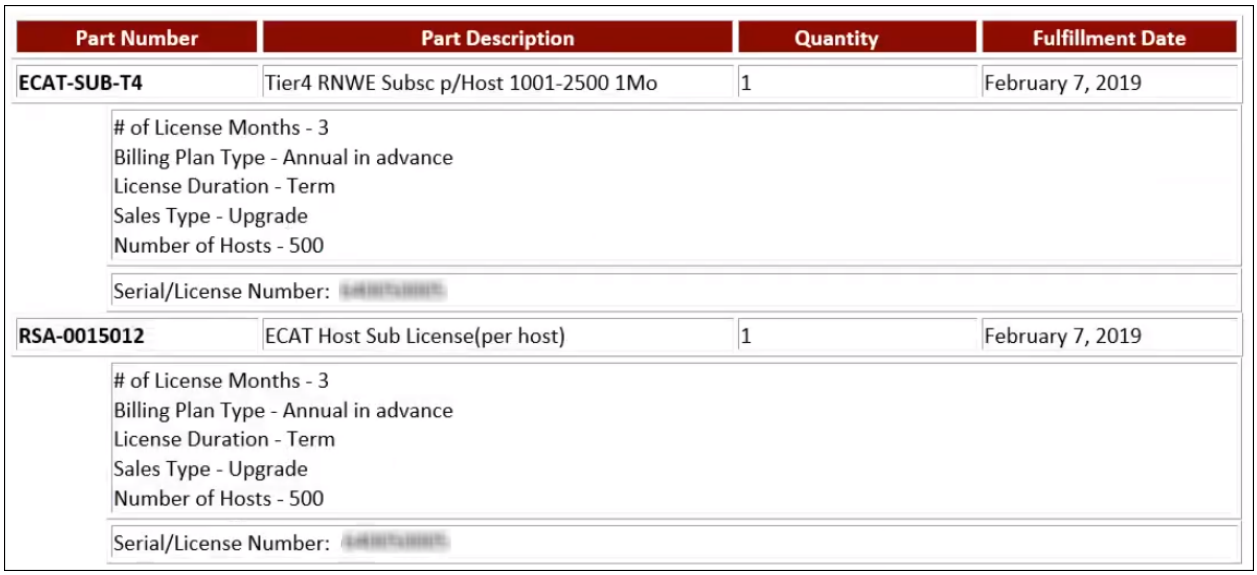
The **Order Detail** screen is displayed.



License for NetWitness Endpoint 4.4.0.x Agents

If you are an existing NetWitness Endpoint 4.4.0.x customer, who also has NetWitness Platform Server, Log Hybrid and an ESA box, you receive licenses for NetWitness Endpoint 4.4 and 11.3 agents. You receive the following RSA Order Fulfillment Confirmation email which contains the license details for NetWitness Endpoint 4.4.0.x and NetWitness Platform 11.3.

Note: If you are a new NetWitness Platform 11.3 customer, the RSA Order Fulfillment Confirmation email contains the license details for the current 11.3 version only.

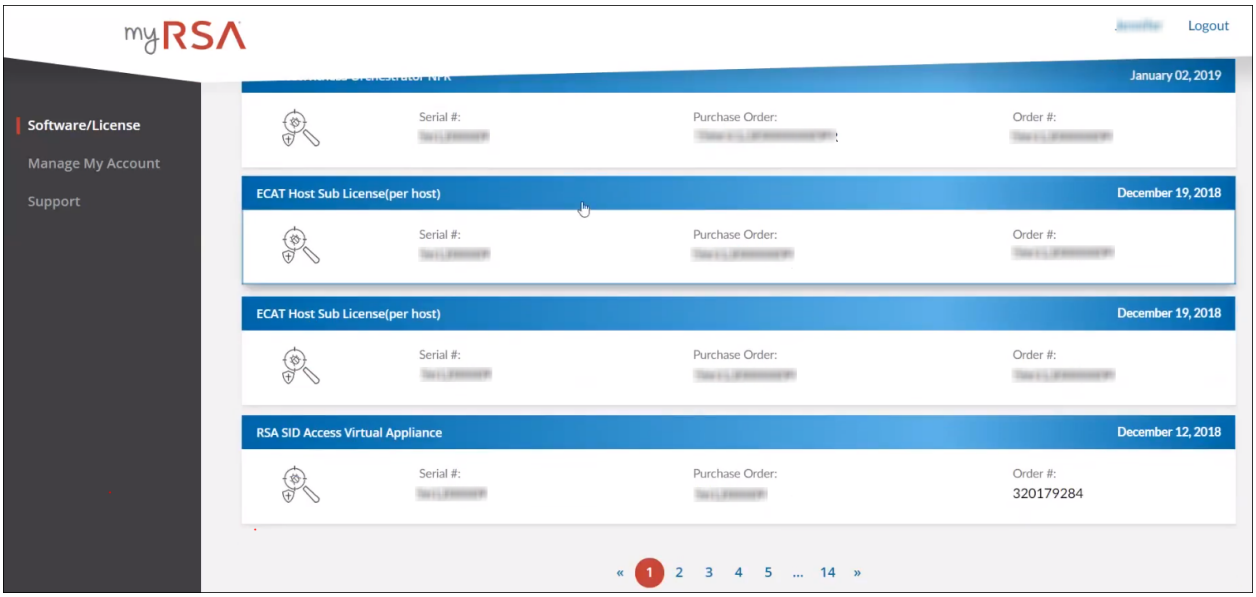


Part Number	Part Description	Quantity	Fulfillment Date
ECAT-SUB-T4	Tier4 RNWE Subsc p/Host 1001-2500 1Mo	1	February 7, 2019
	# of License Months - 3 Billing Plan Type - Annual in advance License Duration - Term Sales Type - Upgrade Number of Hosts - 500		
	Serial/License Number: [redacted]		
RSA-0015012	ECAT Host Sub License(per host)	1	February 7, 2019
	# of License Months - 3 Billing Plan Type - Annual in advance License Duration - Term Sales Type - Upgrade Number of Hosts - 500		
	Serial/License Number: [redacted]		

In the above screenshot, the part number with **RSA-0015012** indicates that it is aNetWitness Endpoint 4.4 license and the part number with **ECAT-SUB-TA** indicates that it is a NetWitness Platform 11.3 license. You will get NetWitness Platform 11.3 license and if you have NetWitness Endpoint 4.4 license, myRSA will upgrade the number of host for both licenses.

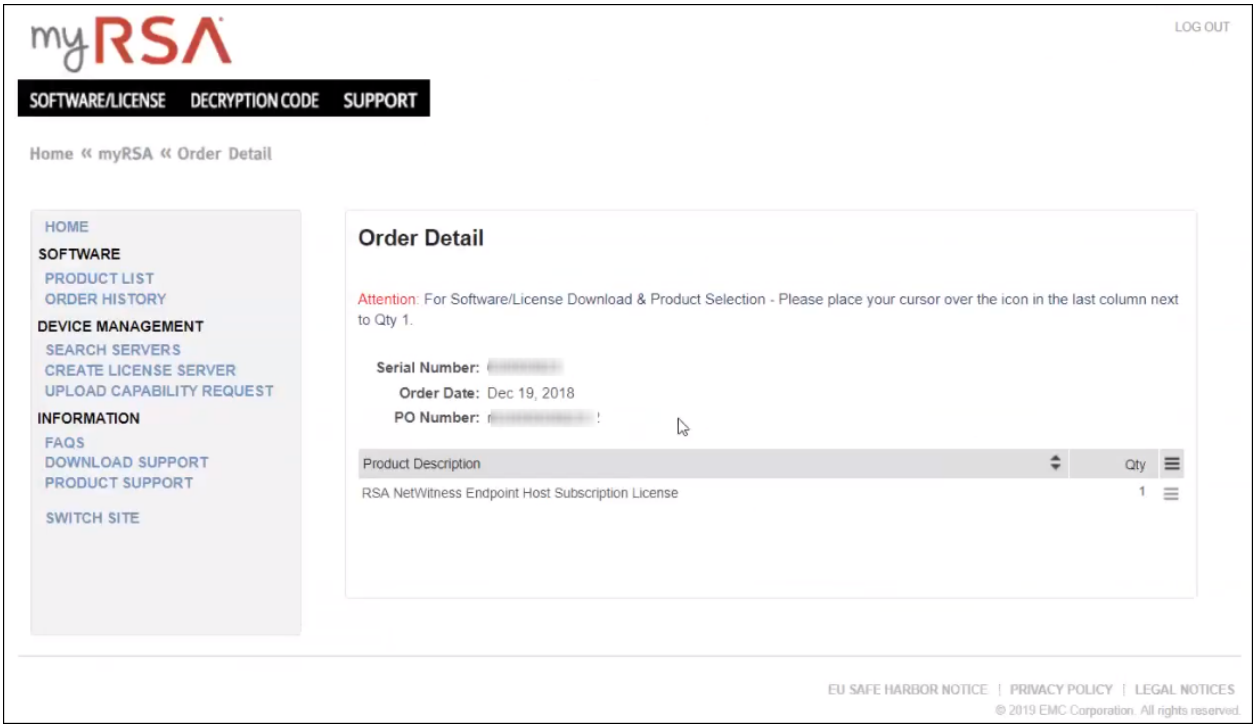
To download an Endpoint (ECAT) 4.4.x license, perform the following steps:

1. After you log in to myRSA, an ECAT Subscription Licenses option is displayed.

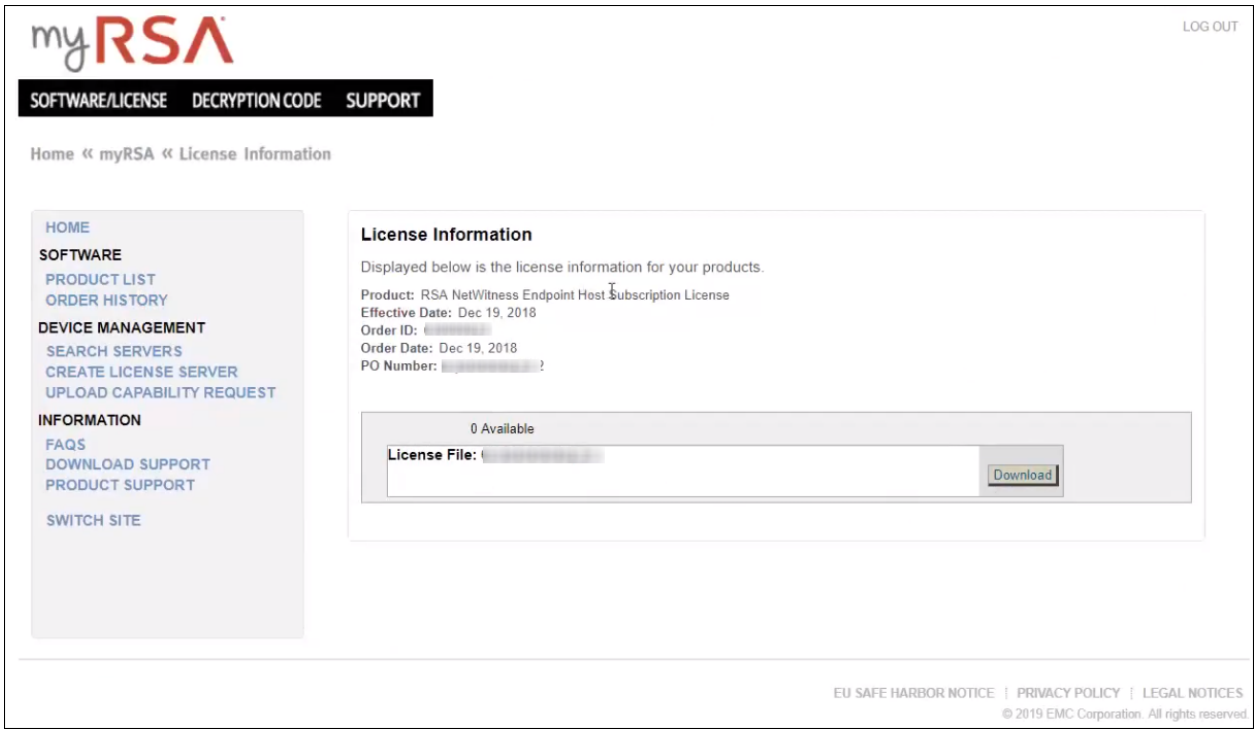


2. Click on ECAT Host Sub License (per host).
   The Order Detail page is displayed.

license



3. Click on **Product Description**.
   The License information page is displayed.



4. Click **Download** to download NetWitness Endpoint 4.4.0.x license.

If you have an existing NetWitness Endpoint 4.4.0.x and do not have RSA NetWitness Platform, then you must register to the license server. For more information. see Register the Server (Online Registration).

If you have an existing NetWitness Endpoint 4.4.0.x customer, and also NetWitness Platform, then you can use the same license in NetWitness Platform.

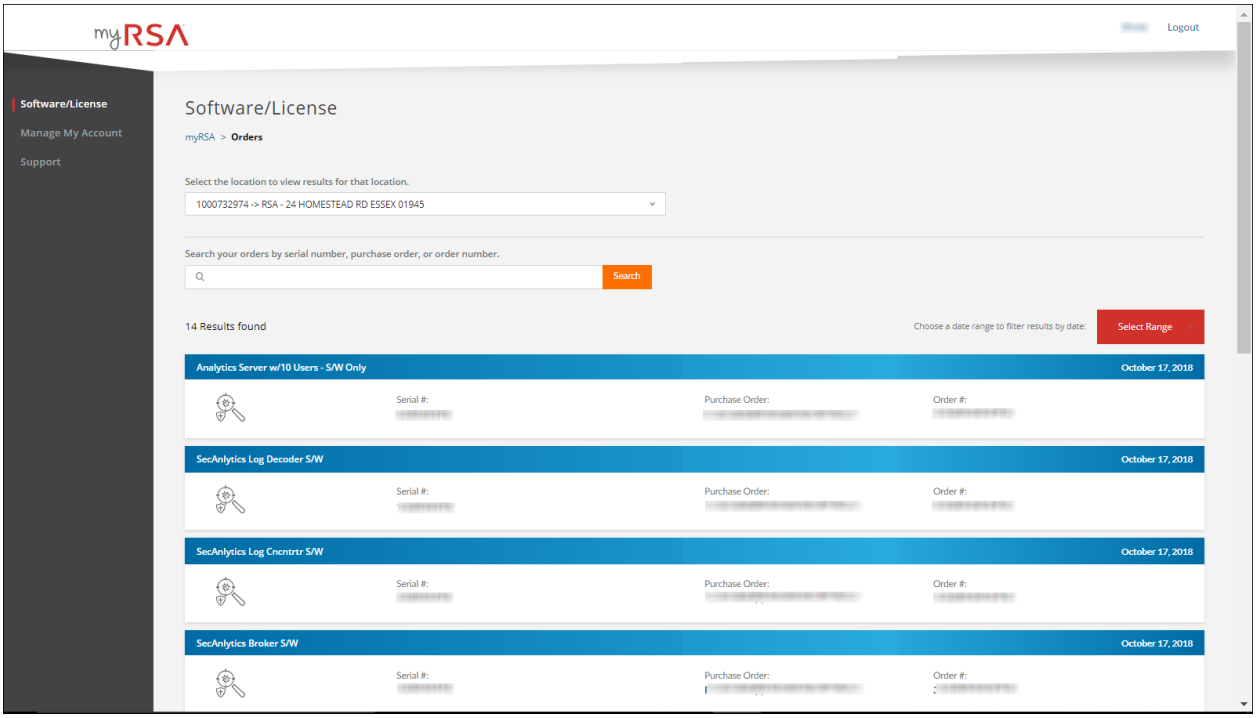
If you are new to NetWitness Platform 11.3 , and have NetWitness Endpoint, then you can view the license only for the current version in NetWitness Platform.

Register the Server (Online Registration)

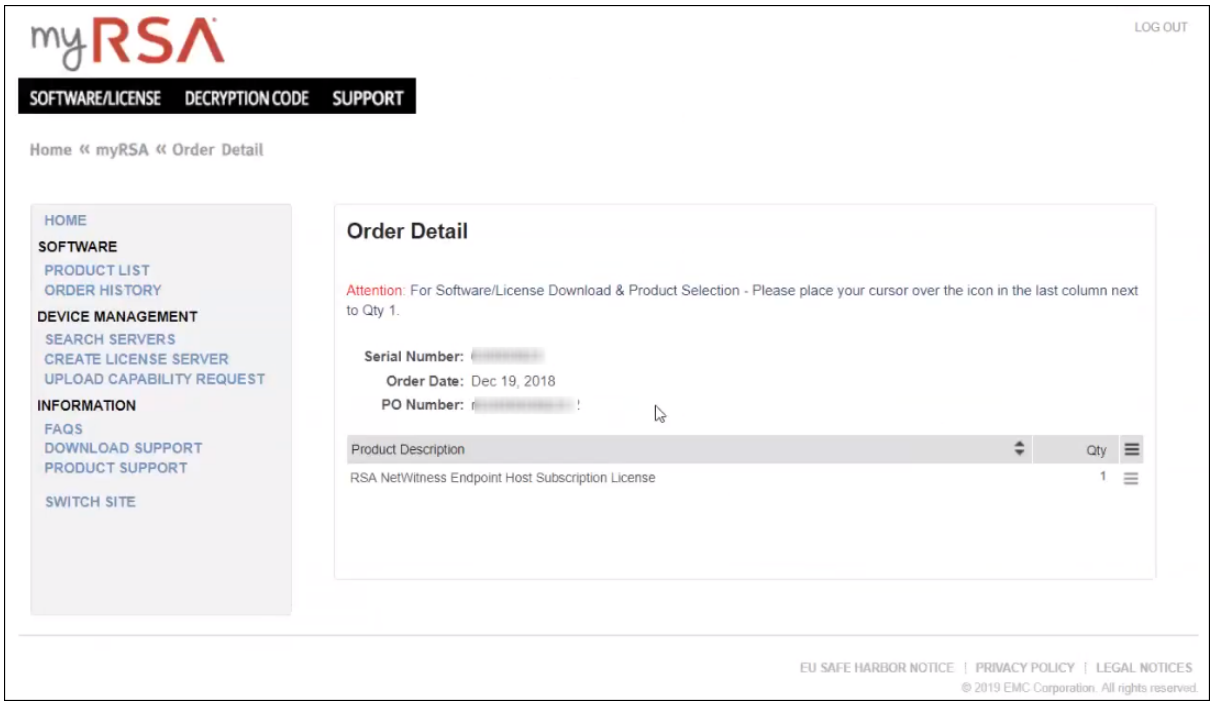
In the NetWitness Platform entitlement process, you need to register the NetWitness Server and map the entitlements to the Local License Server (LLS). There are two methods of synchronizing NetWitness Platform with myRSA: online and offline.

Note: By default NetWitness Platform is configured to synchronize with myRSA at regular intervals hence manual synchronization is not required.

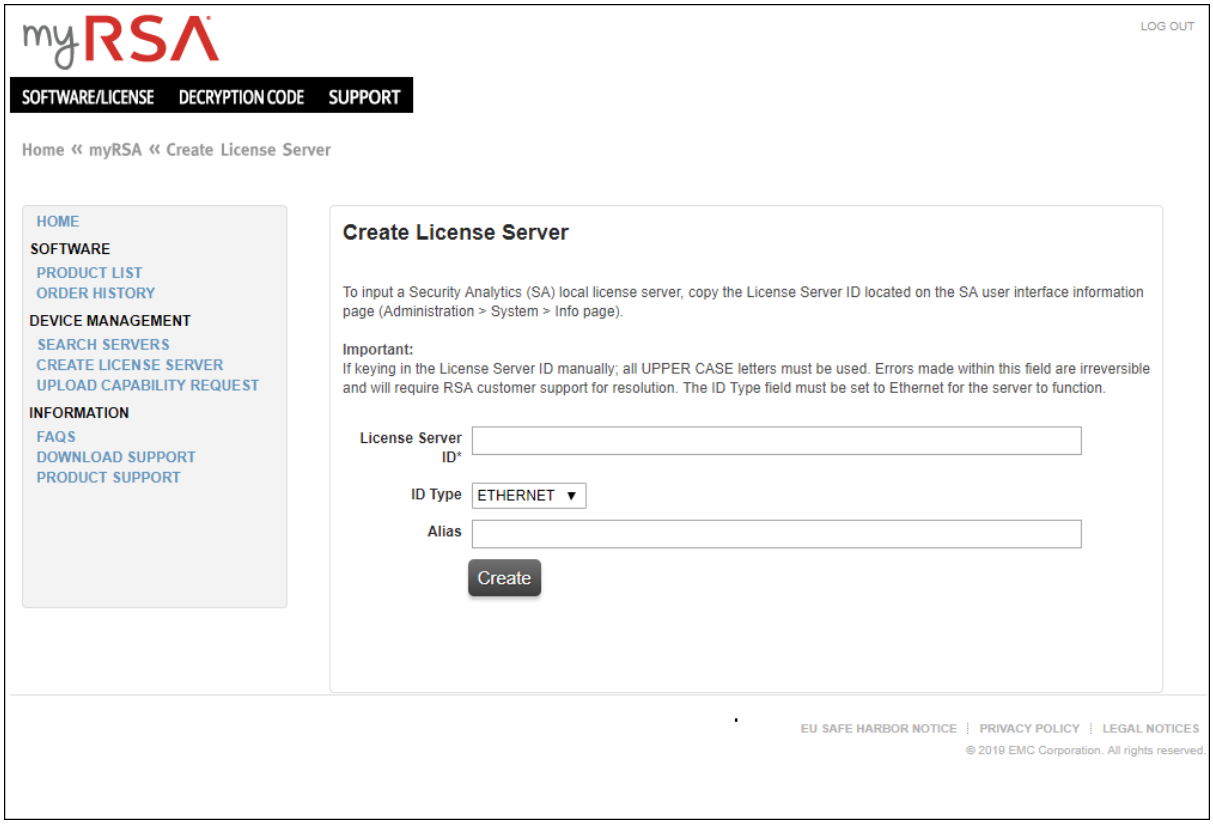
1. On the Sofware/License page, select the Order Location from the drop-down menu. The list of products, sales orders, and purchase orders are filtered and displayed.



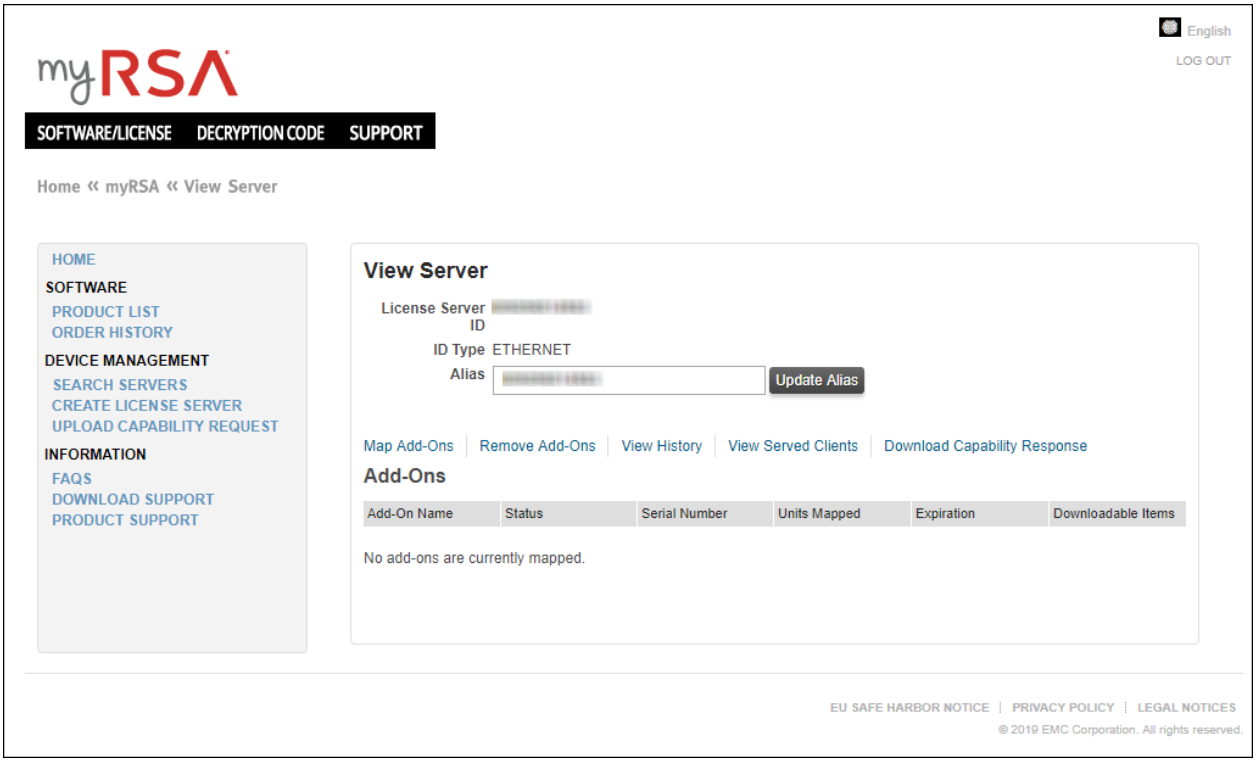
2. Click on a line item.
   The Order Detail page is displayed.



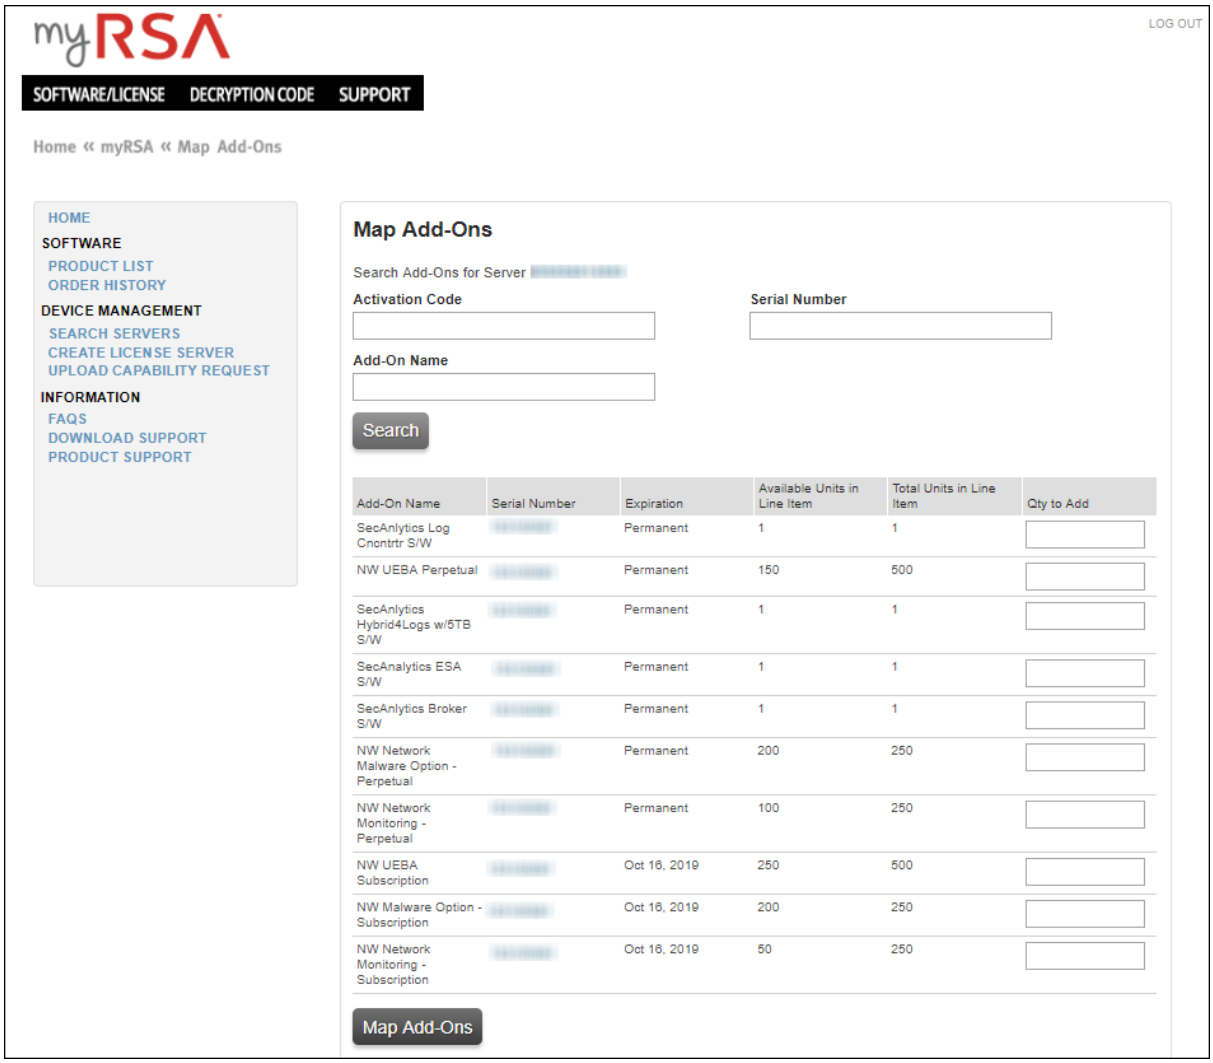
3. Click **Create License Server**.



4. Complete the following fields:
   - Copy or enter (in uppercase letters) the License Server ID in the License Server ID field.
   - In the **ID Type** drop-down, select **ETHERNET** (the default value).
   - In the **Type** drop-down, select **Ethernet** (the default value).
   - (Optional) In the **Alias** field, type an alias to your Appliance ID.
5. Click **Create**.
   The View Server page is displayed.



6. Click Map Add-Ons.
   The Map Add-Ons page is displayed.



7. After you have registered the license server and viewed the license details, you must map the entitlements. For more information, see Map Entitlements .

Note: By default NetWitness Platform host is configured to synchronize with myRSA at regular intervals and also a designated nameserver (DNS). No action is required.

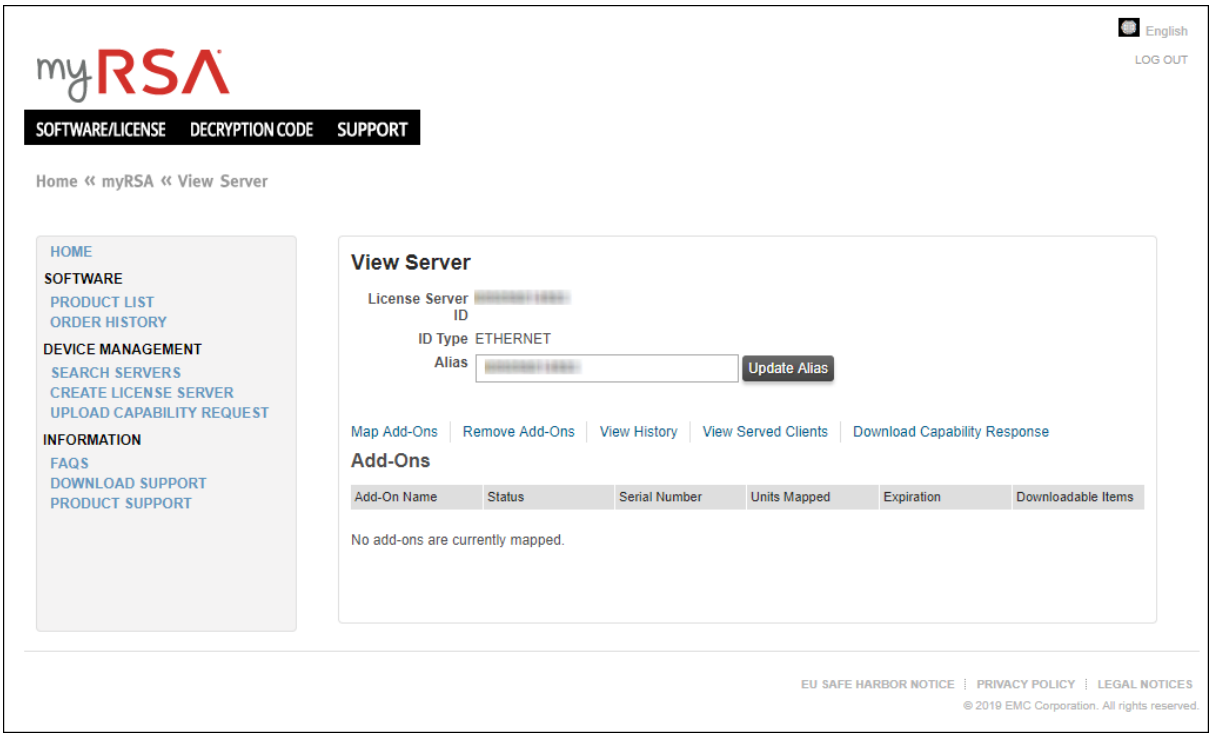
Note: In a multiple NetWitness Platform deployment where the services are connected to both primary and secondary NetWitness Platform hosts and the services are licensed only with the primary NetWitness Platform, a license expiry message is shown for the same services on the secondary NetWitness Platform. You can ignore the message and continue using the product.

Map Entitlements

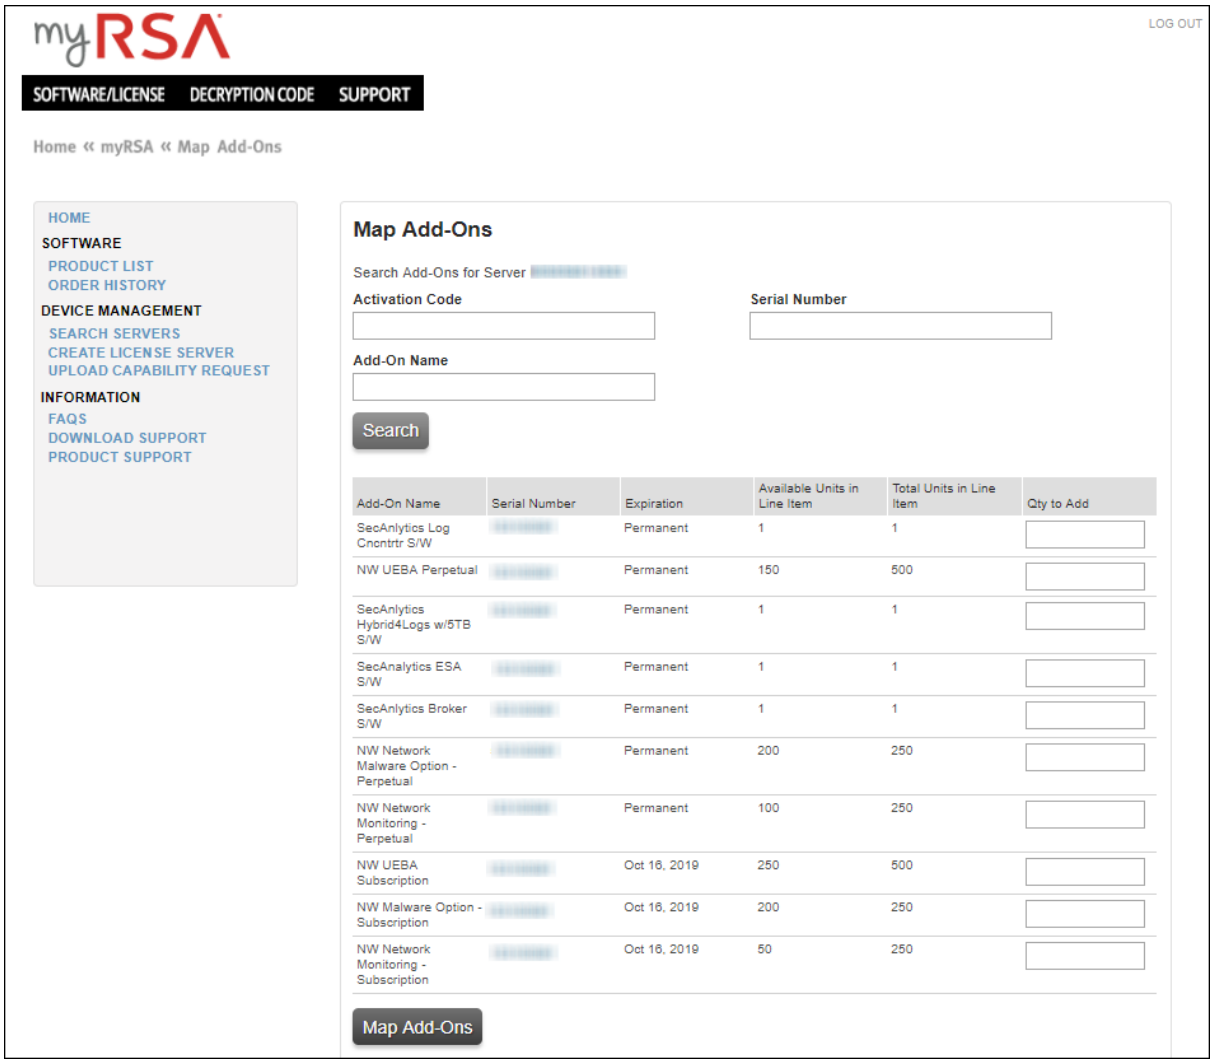
Mapping entitlements involves choosing the quantity of available entitlements to pull to the NetWitness Server during synchronization.

To map appliance entitlements to the server:

1. Log in to myRSA.
2. Click on the License Server ID to view the entitled Server Details.



3. Click **Map Add-Ons**.
   The Map Add-Ons page is displayed.



The Add-On table lists all entitlements that are available for your account. The table has a row for each NetWitness Platform product entitlement, with the following information:

- **Add-On Name**: The name of the entitlement; for example, SMC Concentrator or SMC Decoder.
- **Serial Number**: The serial number associated with a product.
- **Expiration**: For licenses that are not permanent, the expiration information is displayed. The value in this field is a specific date (for example, Oct 6, 2019) or a time range (for example, 90 days). If the value is a time range, the expiration period begins when the add-on is mapped to a server.
- **Available Units in Line Item**: The quantity of entitlements currently available for that license. This quantity is the difference between the Total Units and the entitlements that have been mapped to a NetWitness Server for licensing.
- **Total Units in Line Item**: The total quantity of entitlements tied to a specific license.
- **Quantity to Add**: The number of entitlements for a specific license.

4. To designate the quantity of entitlements to map to the NetWitness Server from a license, type a quantity in the **Units to Configure** column.
5. Click **Map Add-Ons**.

   The View Server page displays a message indicating that the entitlements were successfully mapped to the NetWitness Server.

   Entitlements are now dedicated and set aside from an accounts pool. The message **Waiting to add to appliance** is displayed in the **Status** for each entitlement. The entitlements are not yet synchronized with the server.
6. (Optional) If you want to add more entitlements, use the **Map Add-Ons** option.
7. (Optional) If you want to remove entitlements, use the **Remove Add-Ons** option.

Now you can synchronize and pull down the mapped entitlements to the NetWitness Server

View Current Licenses

After you have completed the license process, you can view the current licensing status in the NetWitness Platform UI.

Each NetWitness Server is a license server providing capabilities to entitle services connected to it. To make entitlements available for licensing services, the entitlements must be mapped to the Local License Server (LLS) on the NetWitness Server.

Note: If licensing a hybrid system, which has a Concentrator and Decoder on the same appliance, each component must be licensed separately.

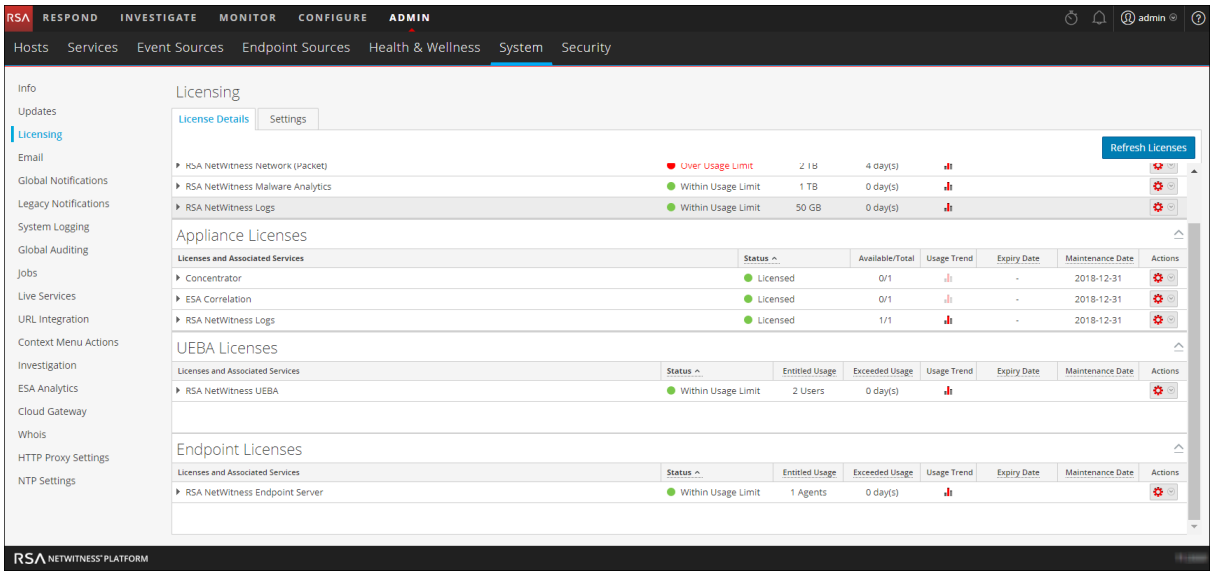
View and Manage Licenses

In NetWitness Platform, you can view and manage available licenses.

To view the licenses that are available on this instance of NetWitness Platform:

1. Go to **ADMIN > System.**
2. In the options panel, select **Licensing**.

   The **License Details** tab is displayed.



Each license is listed in the grid by license type. Information includes the status of the license indicated using color-coded circles and the related information.

Register the Server (Offline Capability Request)

NetWitness Platform manages licensing through a Local License Server (LLS). Each client appliance is shipped with an installed LLS. This topic provides instructions for offline synchronization of the Local License Server (LLS) with the online repository. For more information on the functional description of the LLS, see Entitlement Capability Implementation.

If you are unable to register the NetWitness Server online, you can download an offline capability request in NetWitness Platform and upload that binary request to the myRSA Portal. If the NetWitness Server is not connected to the Internet, you can perform offline synchronization of entitlements through the View Server page in myRSA.

Prerequisites

Before implementing the NetWitness Platform entitlements capability offline, ensure the following

- The NetWitness Server is registered to myRSA (https://my.rsa.com/) and entitlements are mapped. Internet access is not required for offline synchronization.
- An Offline Capability Request has been downloaded from the NetWitness Platform UI to be uploaded to myRSA.
- An Offline Response has been uploaded to NetWitness Platform that was received from myRSA within 72 hours.

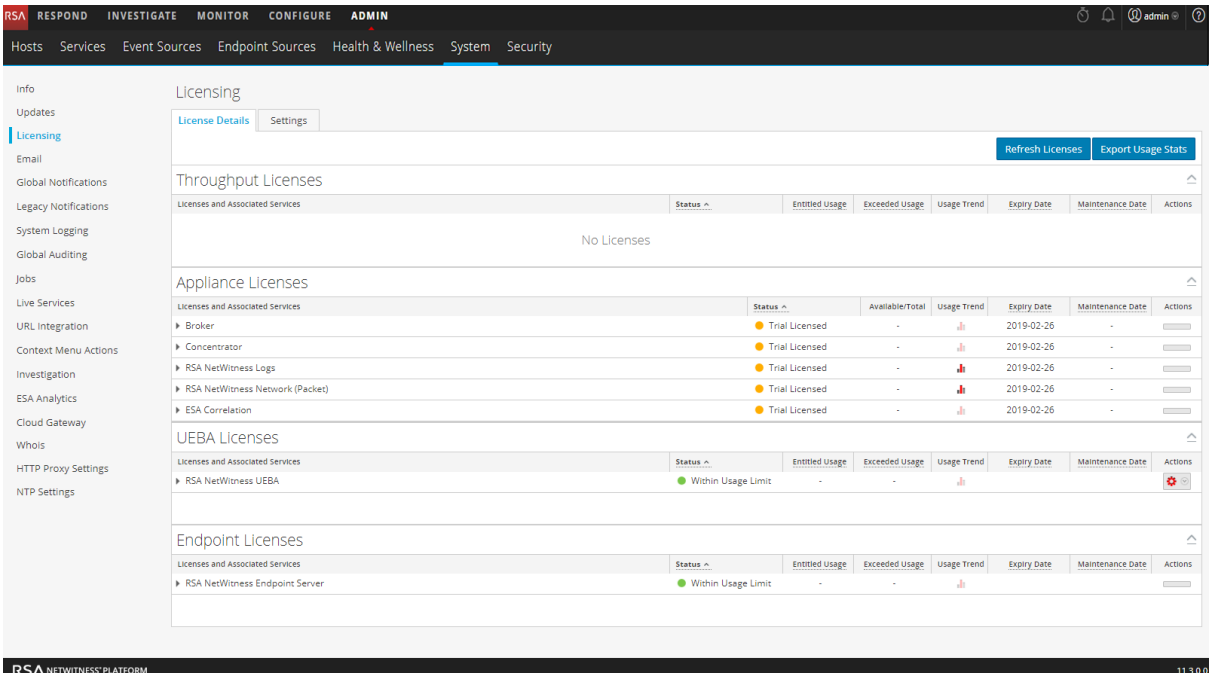
Here is a workflow that describes how to use the offline capability to acquire the licenses from myRSA and view them.

Download an Offline Request for Submission to myRSA

To register the server using an offline capability request:

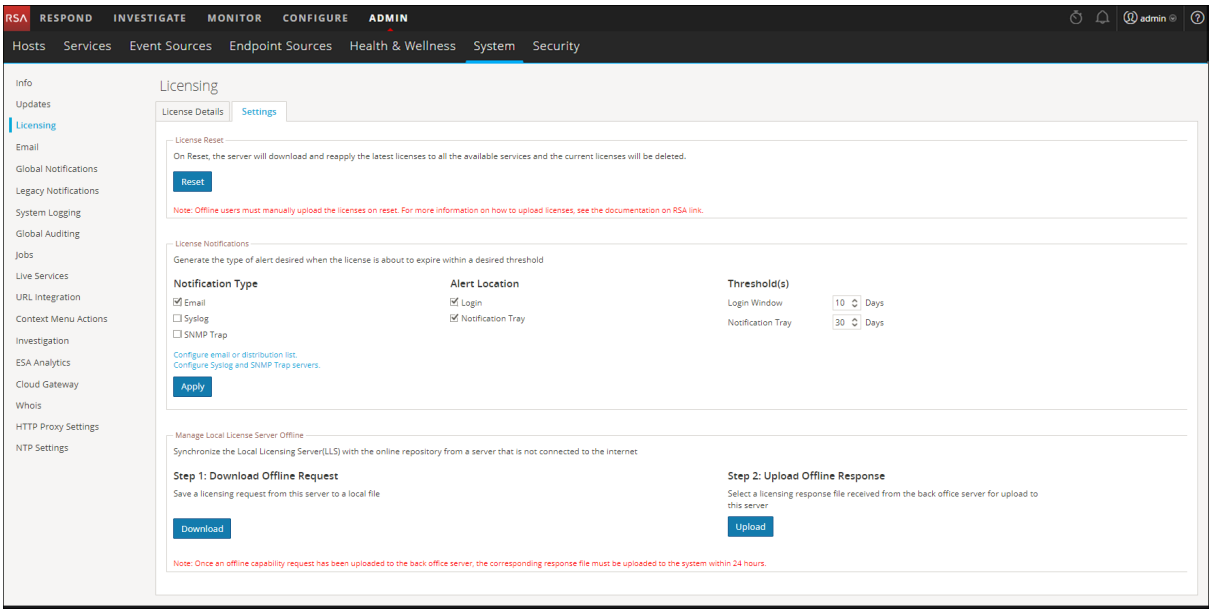
1. Log in to the NetWitness Platform user interface.
2. Go to **ADMIN** > **System**.
3. Click **Licensing**.

   The License Details page is displayed.



4. Select the **Settings** tab.

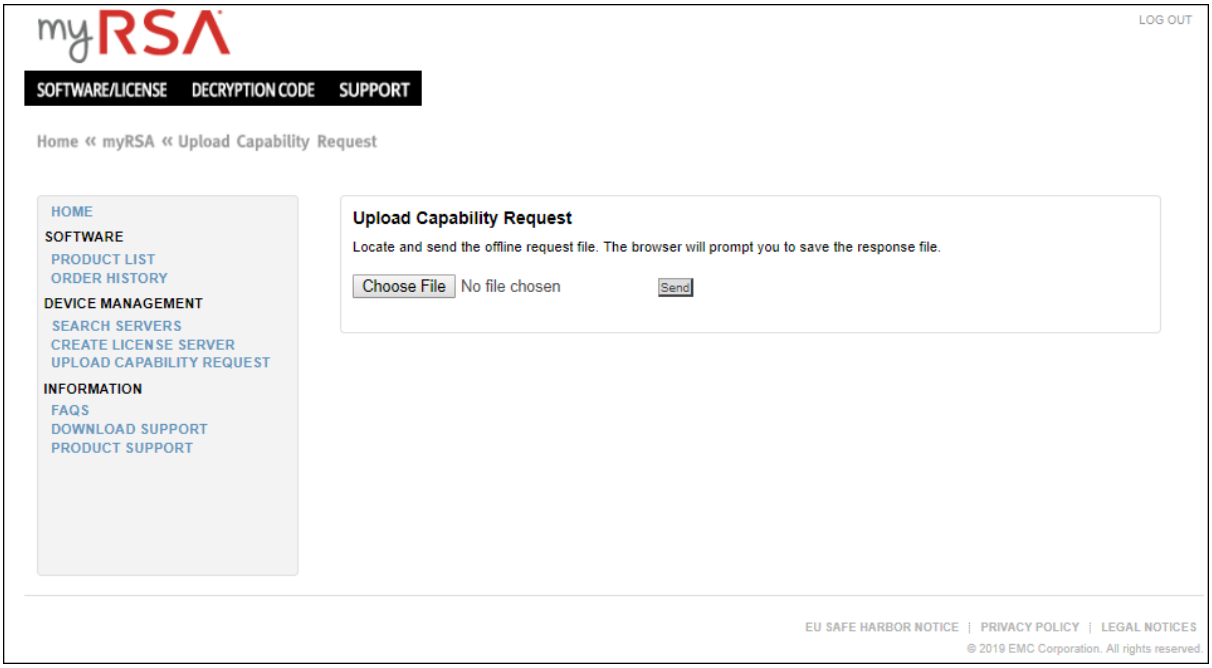
   The Settings page is displayed.



5. In the **Step 1. Download Offline Request** panel, click **Download**.
   A file called **OfflineCapabilityRequest.bin** is downloaded to the local system.
6. Login to the myRSA Portal at https://my.rsa.com/ with your user credentials.
7. Click on a service which needs to be licensed.

   Under **Device Management**, click **Upload Capability Request**.

The **Upload Capability Request** dialog is displayed.



8. Click **Choose File** and browse the local file system to find the file downloaded from the NetWitness Server. Select **OfflineCapabilityRequest.bin**.

   The filename is displayed next to the **Choose File** button.

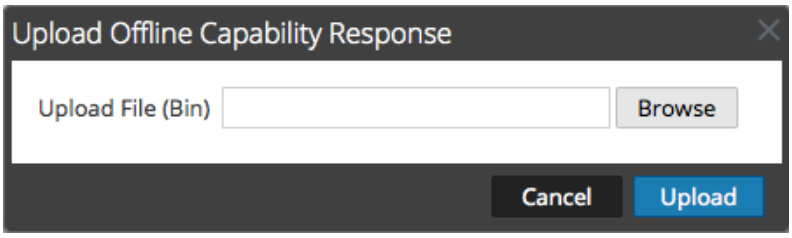
9. Click **Send**.
   The license data in a .bin file format is downloaded. The .bin file contains the data you entered as well as information about any entitlements that have been added to the NetWitness Server. If the server has just been added, there are no entries under **Add-Ons**. The server is registered and you can now map entitlements as described in the following sections.

10. After you download the .bin file from myRSA, login to NetWitness Platform UI to upload the .bin file on the Settings page. For more information, see Upload an Offline Capability Response to NetWitness Platform.

Upload an Offline Capability Response to NetWitness Platform

If the NetWitness Server is not connected to the Internet, you can perform offline synchronization of entitlements through the View Server page in myRSA. To upload an offline capability response (**response.bin**) file saved to the local file system from myRSA:

1. Follow the steps 1 to 3 mentioned in the Download a Capability Request for Submission to myRSA procedure.
2. Login to the NetWitness Platform user interface.
3. Go to **ADMIN** > **System** > **Licensing** > **Settings** tab.
4. In the **Upload Offline Response** section, click **Upload Response**.
   A dialog to upload the file is displayed.



5. Browse and select the **response.bin** file so that it is displayed in the Upload File (bin) field.
6. Click **Upload**.

   The entitlements are uploaded to NetWitness Platform and the licenses added to the grid in the **Licensing Details** tab. They are available for licensing appliances.

   After you have uploaded the entitlements, you can verify the synchronization by performing any one of the following:

   - To view results in NetWitness Platform, go to **ADMIN**>**System**>**Licensing** > **Licensing Details** tab. The individual product entitlements that have been pulled down to NetWitness Platform are displayed in the **Available/Total** column.
   - Within the myRSA interface, you can see the status for entitlements changed to **In Sync**.

Refresh Licenses

When a new license is added, to map the view with the new license, click **Refresh Licenses.**

Refreshing your licenses performs the following behind-the-scenes tasks:

- Restarts the LLS server to ensure the latest licenses are pulled down from the central Flexera server.
- Associates any unlicensed service with a valid license (if available).
- Replaces expired or Out-of-the-Box license with valid licenses (if available).

License Types

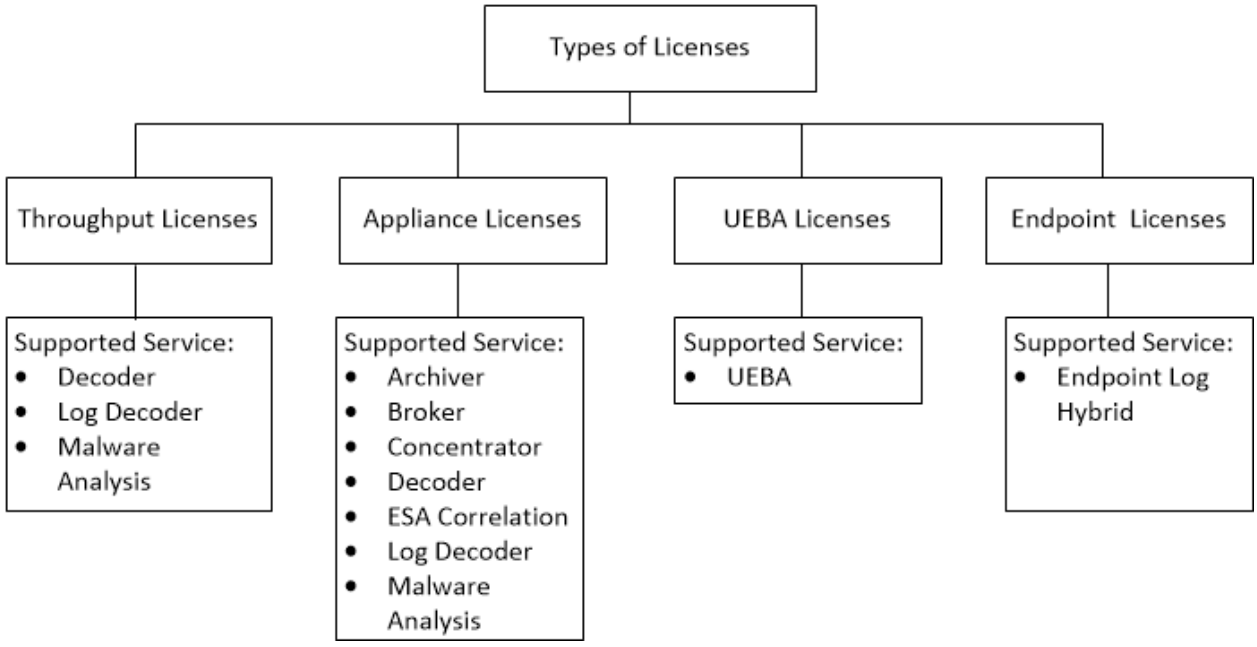
After you have installed the NetWitness Platform software and the required services, you need to acquire the relevant licenses for the each of the services or a group of services based on your requirements. NetWitness Platformentitlement uses a trust-based licensing model. Appliances continue to function as usual even when the license is out-of-compliance.

Choosing a License Type

The type of license you choose is based on your network requirements. The following types of licenses are available in RSA NetWitness Platform:

- Throughput License
- Appliance License
- UEBA (User and Entity Behavior Analytics)
- Endpoint License

Here is a chart, followed by a description of each license type available for the NetWitness Platform products and services.



Throughput Licenses

Throughput license are based on the amount of data used per day for logs (SIEM), or network packets (network monitoring) or malware.

The throughput per day are measured in Gigabytes per day for logs, and in Terabytes per day for packets. The total amount of throughput is selected based on the total amount of throughput per day that is being licensed across your entire enterprise deployment of NetWitness Platform. This license is measured as follows:

- License usage is based on the amount of data throughput per day.
- Throughput is measured in Gigabytes (GB) per day for Log Decoders, in Terabytes (TB) per day for Network Decoders, and in Terabytes (TB) per day for Malware Analysis.
- Usage is measured as an aggregate of all throughput services. For example, a Log Decoder can be licensed for 50 GB per day. You can to use multiple Log Decoder under the same license.
- Throughput license usage statistics are available in PNG or PDF formats for export.
- Throughput licenses are offered as subscription of perpetual, are offered in 1 TB increments
- SIEM or Log Decoder offered in 50 GB increments.
- Malware Analysis throughput licenses are offered in 1 TB increments on a per-day average usage.
- Only if the aggregate usage of licenses exceeds, then a corresponding banner is displayed. For example, if you have a two Log Decoder throughput license, and each Log Decoder is entitled for 50 GB, the total entitlement for that service is 100 GB. If one Log Decoder exceeds usage by 10GB, and the other does not exceed the entitled usage and the total usage limit does not exceed 100 GB, then no banner is displayed, as the aggregate usage is calculated. For more information, see Out-of-Compliance Banner.

Appliance Licenses

NetWitness Platform supports the Appliance license, which is applicable to all hosts that require a license. Other services do not require a license. Appliance licenses are measured as follows:

- Services are licensed automatically if you have a valid appliance based license for a specific service to be licensed.
- Appliance licenses can be purchased as a perpetual license that does not expire and will have a maintenance contract. If you purchase a subscription license, then it will expire if you do not renew the contract.

User and Entity Behavior Analytics Licenses

NetWitness Platform supports the User and Entity Behavior Analytics License (UEBA). This license is based on the number active of users.

Endpoint Licenses

Endpoint license are measured based on the number of active agents deployed. It functions similar to throughput licenses used for NetWitness Logs and Network.

There are two types of agents:

1. **Advanced Agents**: The license for these agents is based on the number of advanced agents in your deployment. A 90-days trail license period is provided. After the 90-days trial period , a zero MB and zero Agent throughput license is applicable to Log Decoder and Endpoint in the NetWitness Endpoint Log Hybrid. Archiver, Broker, Concentrator and ESA are automatically licensed because the license for advanced agents is a throughput license. An usage-exceeded banner is displayed when the license goes out-of-compliance in the following scenarios:
   a. If the allowed amount of entitled usage is exceeded
   b. If log data is collected without installing a valid log license.

For example, if you have purchased a license for 50k agents and if the number of agents exceeds more than 50k, the banner is displayed.

Or, if you have purchased a license for 50k agents but you have configured only 10k agents, and if the usage exceeds more than 10k, a banner is displayed only for those 10k configured active agents.

Note: In the case of multiple Endpoint Log Hybrids you may need an Endpoint Broker, which does not need a license.

2. **Insights Agents** - There is no license required for these agents if they are used to collect only endpoint data. And if only insights agents are used, a banner will never be displayed .

NetWitness Endpoint 4.4.0.x License

If you have a **NetWitness Endpoint** 4.4.0.x license, you can use the same amount of license on NetWitness Platform 11.3. For example, if you have purchased a 50k license for NetWitness Endpoint 4.4.0.x, you will get a 50k license on NetWitness Endpoint 4.4.0.x as well as on NetWitness Platform 11.3. For more information on how to get alicense for **NetWitness Endpoint 4.4.0.x**, see License for NetWitness Endpoint 4.4.0.x Agents.

Out-of-the-Box Trial License

RSA NetWitness Platform comes with an OOTB 90-days trial license.

Configure License Support For Multiple NetWitness Servers

If you have multiple NetWitness servers deployed in your environment, and require license support, you must configure multiple Mac addresses.

To configure online:

1. Log in to the NetWitness Server console.
2. Navigate to /opt/netwitness/flexnetls.
3. Edit the local-configuration.yaml file and add the mac address of the back up or secondary host.
   For example, `backup-hostid: 685B3596A5F3` or `backup-hostid: "685B3596A5F3:785B3596A5F3"`.
4. Restart `systemctl restart flexnetls-RSALM`.
5. Obtain the instance details from `wget http://localhost:3333/api/1.0/instances` and set the `"failOverRole"` to `MAIN` to verify the failover.
   For example, `"failOverRole" : "MAIN"`.

To configure offline:

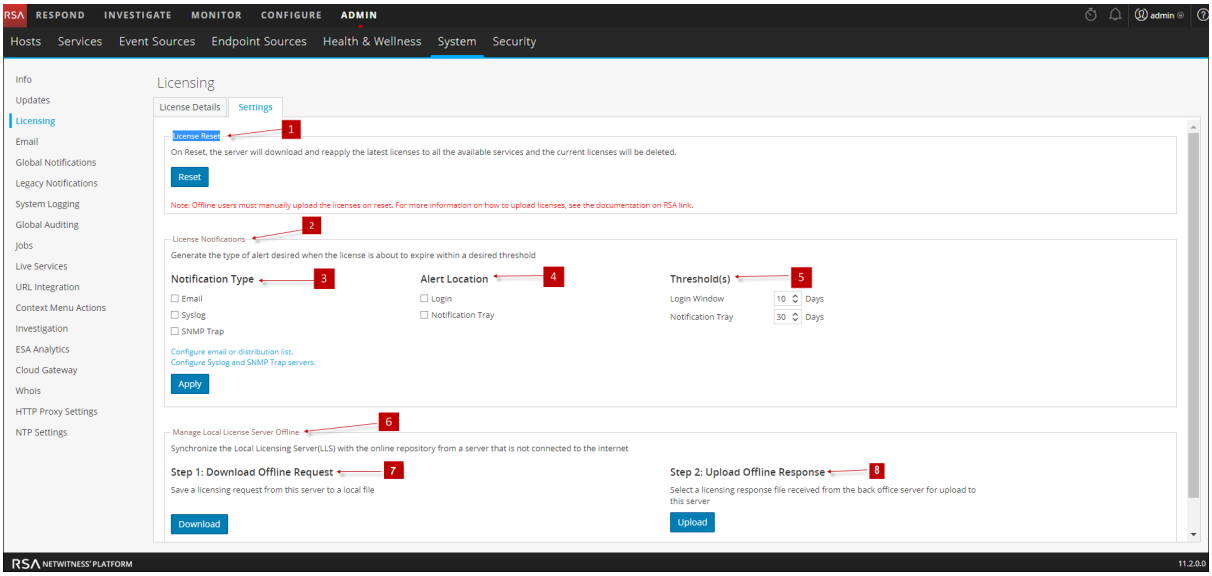
1. Perform the step 1 to step 6 from the online procedure .
2. Download the capability request from NetWitness Platform UI.
3. Upload the request to FNO (myRSA).
4. Upload the response from FNO (myRSA) to the NetWitness Platform UI.

Configure License Notifications

This topic provides instructions for configuring notification settings for the Local License Server (LLS). If you wish to receive alerts about the approaching license expiration date, you can configure NetWitness Platform to send notifications. You can receive notification by email, syslog and SNMP. You can also view the notification during system log on and in the Notification Tray. You can also specify the number of days before expiration as a threshold for notification.

To configure the notification:

1. Log on to NetWitness Platform,
2. Go to ADMIN > **System**.
3. Select **Licensing**.
4. Select the **Settings** tab.



5. Select each of the methods for NetWitness Platform to use when sending a notification about the license status.
   a. To receive a notification at log on, select **Login** and specify the number of days before the license expires that you want to receive notification in the **Login Window Threshold** field.
   b. To receive a notification in the Notifications tray, select **Notification Tray** and specify the number of days before the license expires that you want to receive notification in the **Notification Tray Threshold** field.
   c. To receive an Email notification to a configured distribution list, select **Email** and select **Configure email or distribution list**. The Email panel is displayed in a separate tab, and you can configure notifications in the Email Server Settings section. Refer to the *System Configuration Guide* for further details.

d. To receive syslog notifications, select **Syslog** and click **Configure Syslog and SNMP Trap servers**. The System Auditing panel opens in another tab and you can configure the system settings.

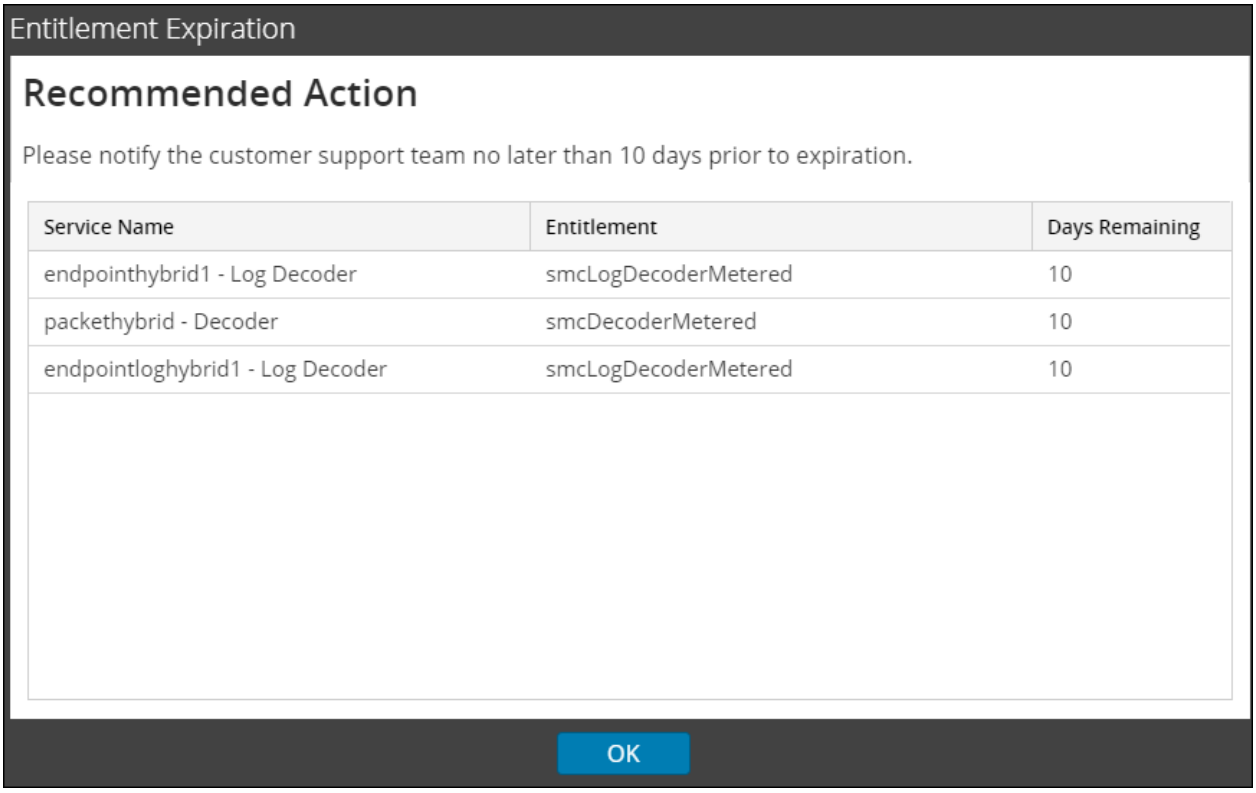
e. To receive notifications through SNMP Trap, select **SNMP Trap** and select **Configure Syslog and SNMP Trap servers.** The System Auditing panel opens in another tab and you can configure the SNMP auditing settings.

6. Click **Apply Notifications**.
   The settings are saved and go into effect immediately.

Out-of-Compliance Banner

This topic explains what you need to do if you see a yellow or red banner displayed. Banners let you know the status of your license and usage compliance.

When a license for a specific service is about to expire, an **Entitlement Expiration** message is displayed with the list of services about to expire.



A yellow banner is displayed when you are approaching your usage threshold or your licensing is approaching expiration. To dismiss the yellow banner, click **Reject**.

A red banner cannot be dismissed and is displayed in two scenarios:

1. When the license is out of compliance or you have exceeded your allotted threshold.

Note: A red banner cannot be dismissed. You must resolve your license issue.

Here is an of example of how the license usage is calculated and a way that you can resolve the license issues:

- Contracted daily usage can be exceeded three times in a calendar month. The fourth spike puts the system in an out-of-compliance state. If you are able to keep your usage within compliance for seven consecutive days until the end of calendar month, the Out-of-Compliance Red banner disappears.

- For example, if the fourth spike occurs on November 23, 2019, the Grace Period ends on December 31, 2019 and the Out-of-Compliance Red banner disappears.
- The breach period starts immediately after Grace Period ends.

Note: Even when the Red banner is displayed, there is no loss of functionality, all NetWitness appliances continue to work with full functionality. All other functionality is included in the license (ESA, storage, and so on).

Troubleshoot Licensing

This topic provides information about possible issues that NetWitness Platform users may encounter when setting up licensing in NetWitness Platform. You can look up explanations of issues and their solutions. NetWitness Platform notifies users of issues using the popup notifications and the system log as described in the "Troubleshoot NetWitness Platform" topic in the *System Maintenance Guide*.

Verifying License Installations

Problem	Solutions
How to verify that the server has a DNS	Check if DNS is configured, if not perform the following steps: a. Manually enter the `nameserver` information within `/etc/resolv.conf` for static IP environments. b. Verify the capability to reach external systems via a hostname.

Out-of-Compliance Banners

Problem	Possible Causes	Solutions
Yellow and Red Out-of-Compliance Banners	• A service is not licensed. • A license has expired, or is due to expire within the next two weeks. • Usage exceeds entitled limit. • Usage is approaching entitled limit.	• Contact Customer Support to buy or renew your license. • Reduce usage or • Adjust contracted usage amount

Common Log and Configuration Files

Problem	Solutions

When troubleshooting licensing, the following files contain information that may help to diagnose the problem. Specific conditions for searching the files are described in the troubleshooting tables.	On the NetWitness Server
	• `/var/netwitness/flexnetls/logs/flexnetls.log`
	• `/var/log/netwitness/license-server/license-server.log`
	• Run `wget` for the following flles when ssh'ed onto the NetWitness Server:
	  • `http://localhost:3333/api/1.0/features`
	  • `http://localhost:3333/api/1.0/instances`
	  • `http://localhost:3333//api/1.0/hostids`
	  • `http://localhost:3333/api/1.0/capability_request`

NetWitness Server Problems

This table lists possible problems with the NetWitness Server errors that can affect entitlements.

Problem	Possible Causes	Solutions
Some features have been mapped in the central Flexera server, but the NetWitness Server does not display them.	Ensure that the NetWitness Server is connected to the Internet.	To resolve the error execute a License Refresh as follows: 1. In NetWitness Platform, go to **ADMIN > Services > Licensing.** 2. In the License Details tab, click **Refresh Licenses**. **Note:** If the NetWitness Server is not connected to the Internet, try to synchronize offline. For more information, see Register the Server (Offline Capability Request)
NetWitness Platform Licensing page not showing any license information although there are services available.	Ensure that you have the required entitlements pulled down from the Central Flexera server.	To resolve the error execute a License Refresh as follows: 1. In main menu, go to **Admin > Services > Licensing**. 2. In the License Details tab, click **Refresh Licenses**.

Wrong License Mapping Issues

Problem	Possible Causes	Solution
Decoder license not available due to core appliances being removed from the NetWitness Server without releasing the license. Several core appliance licenses were not available for use.	Various possible causes.	Reset the license on NetWitness Server.
Archiver DACs are not mapped to the license server with all other appliances' licenses.	Various possible causes.	1. Enter **1** in Quantity field to add for each license. 2. Select **Map Add-ons** at the bottom of the screen. 3. Click **Download Capability Request** and upload license to the Offline Capability Request in the User Interface under the **License** tab.
Two new appliances were installed: oneLog Hybrid and one Log Archiver. Able to license the Log Hybrid, but the following error occurred when attempting to license the Archiver: "There is an issue with registering your product, please contact RSA Customer Support." Also, one of the Concentrators showed as a Trial license, and a separate Log Decoder showed as a Trial license when they should be licensed.	The new entitlements are not mapped to the license server.	Map add-ons to myRSA and upload the `.bin` file into the NetWitness Platform User Interface.

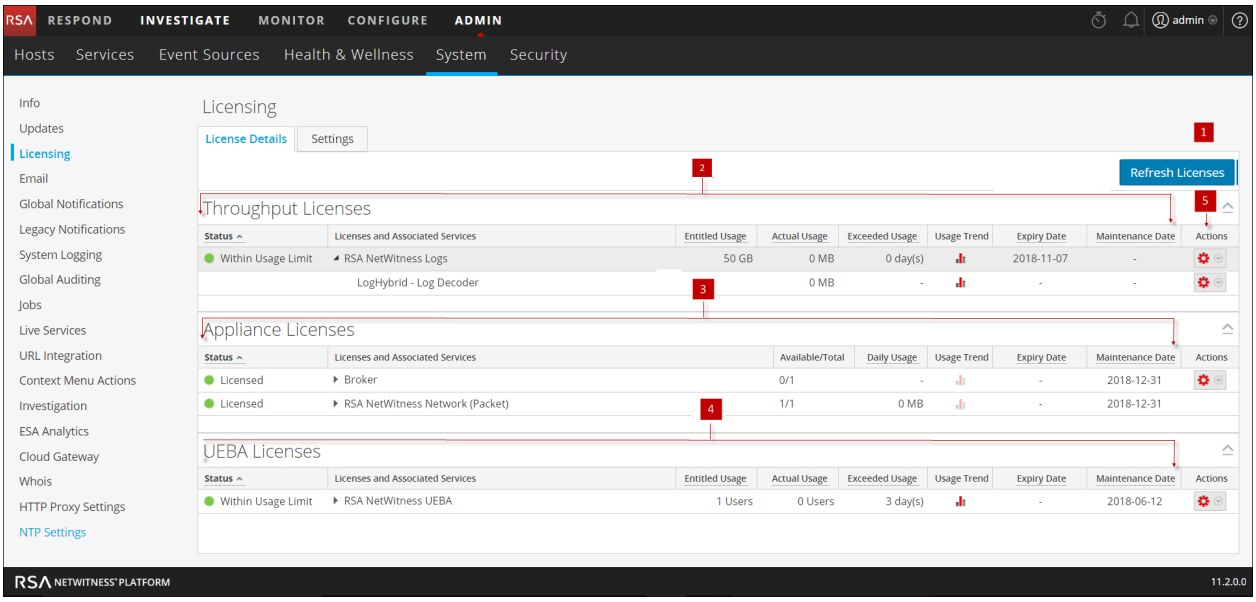
Note: On initial start up, the usage shown in the Licensing page displays zero usage for the initial one hour.

Quick Look



The following table describes the features of the License Details tab .

1	**Refresh Licenses**:Refreshes and maps the new licenses..
2	Displays the following details of the Throughput license or licenses. • **Status** - Displays the status of the license such as Expired License, Over Usage Limit, Near Usage Limit, and Within Usage limit. • **License and Associated Service** - Displays the license and the services assigned to it. • **Entitled Usage** - Displays the entitled usage for aggregate as well as individual services . • **Actual Usage** - Displays the daily actual aggregate usage. • **Exceeded Usage** - Displays the number of days the usage exceeded the entitled usage in the

last 30 days for each individual service.

- **Usage Trend** - Displays the trend of how the license usage has been for a period of time for aggregate as well as individual services.
- **Expiry Date** - Displays the expiry date of the customer subscription contract.
- **Maintenance Date** - Displays the maintenance expiration date for the permanent license or licenses and the date on which the license or licenses expire.
- **Actions** - Displays the Licensing Actions button that offers the following options:
  - **Export Usage Stats**: Exports license usage statistics for the selected service or license.
  - **Reassign to Another License**: Reassigns an extensively used Throughput license to another unused Throughput license. This is applicable only for Throughput and Appliance license.

3 Displays the following details of the Appliance license or licenses.

- **Status** - Displays the status of the license such as Expired License, Over Usage Limit, Near Usage Limit, and Within Usage limit.
- **License and Associated Service** - Displays the license and the services assigned to it.
- **Available/Total** - Displays the number of available license and the total number of licenses.
- **Daily Usage** - Displays the actual usage for the day.
- **Usage Trend** - Displays the trend of how the license usage has been for a period of time for aggregate as well as individual services
- **Expiry Date** - Displays the renewal date of the customer subscription contract.
- **Maintenance Date** - Displays the maintenance expiration date for the permanent license or licenses and the date on which the license or licenses expire.
- **Actions** - Displays the Licensing Actions button that offers the following options:
  - **Export Usage Stats**: Exports license usage statistics for the selected service or license.
  - **Reassign to Another License**: Move the license from Appliance to Throughput license.
  - **Reclaim**: This option gets activated when any appliance service is down. When you click **Reclaim** the license becomes available in the pool of the specific license service. This is applicable only for Appliance license.

4 Displays the following details of UEBA license or licenses.

- **Status** - Displays the status of the license such as Expired License, Over Usage Limit, Near Usage Limit, and Within Usage limit.
- **License and Associated Service** - Displays the license and the services assigned to it.
- **Entitled Usage** - Displays the number of entitled users.
- **Actual Usage** - Displays the daily active users.
- **Exceeded Usage** - Displays the number of days the usage exceeded the entitled usage in the last 30 days for each individual service.

- **Usage Trend** - Displays the trend of how the license usage has been for a period of time for aggregate as well as individual services
- **Expiry Date** - Displays the renewal date of the customer subscription contract.
- **Maintenance Date** - Displays the maintenance expiration date for the permanent license or licenses and the date on which the license or licenses expire.

5 Displays the following details of Endpoint license or licenses.

- **Status** - Displays the status of the license such as Expired License, Over Usage Limit, Near Usage Limit, and Within Usage limit.
- **License and Associated Service** - Displays the license and the services assigned to it. For example, Endpoint Hybrid or Endpoint Log Hybrid.
- **Entitled Usage** - Displays the users of the entitled agents .
- **Actual Usage** - Displays the number of daily active agents .
- **Exceeded Usage** - Displays the number of days on which the actual number of agents exceeded the entitled threshold.
- **Usage Trend** - Displays the trend of how the license usage has been for a period of time.
- **Expiry Date** - Displays the renewal date of the customer subscription contract.
- **Maintenance Date** - Displays the maintenance expiration date for the permanent license or licenses and the date on which the license or licenses expire.

7 Displays the Licensing Actions button that offers the following options:

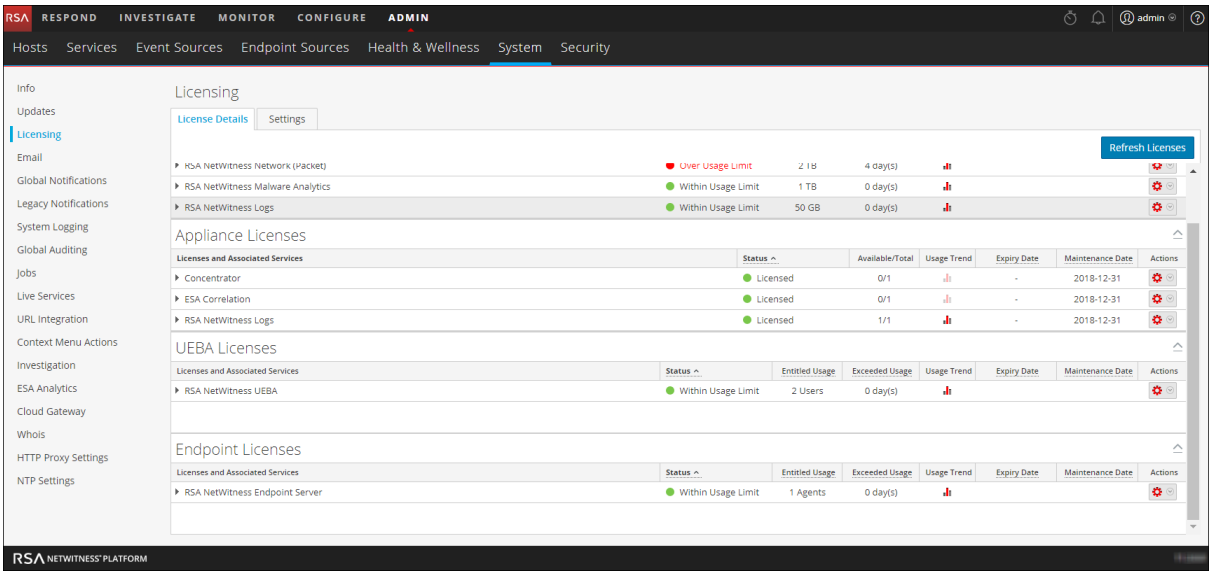
Export Usage Stats -Exports license usage statistics in PDF or CSV format.

Usage Trend

You can view the usage trend for aggregate licenses as well as individual licenses. The data displayed is for each day. When you click the usage trend icon, it opens a new window and displays the usage data as a chart. The user can use this data to analyze the license usage in the deployment.

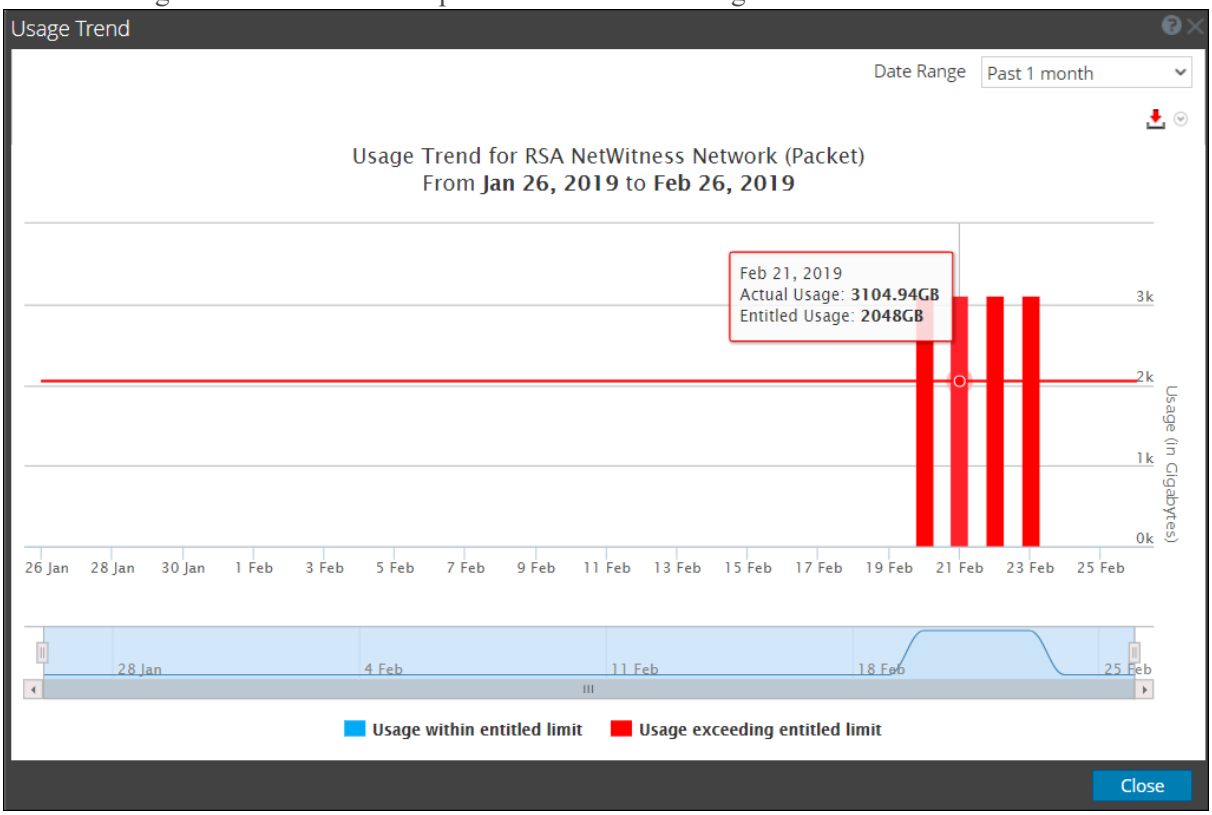
To access this view:

1. Go **ADMIN** > **System** and select **Licensing**.
   The Licensing page is displayed with the License Details tab opens.



2. Select a service or license and click the icon under the Usage Trend column.
The Usage Trend window is displayed.

The following screenshot is an example of the Exceeded Usage Trend.



The following screenshot is an example of Within Limits Exceeded Usage Trend.

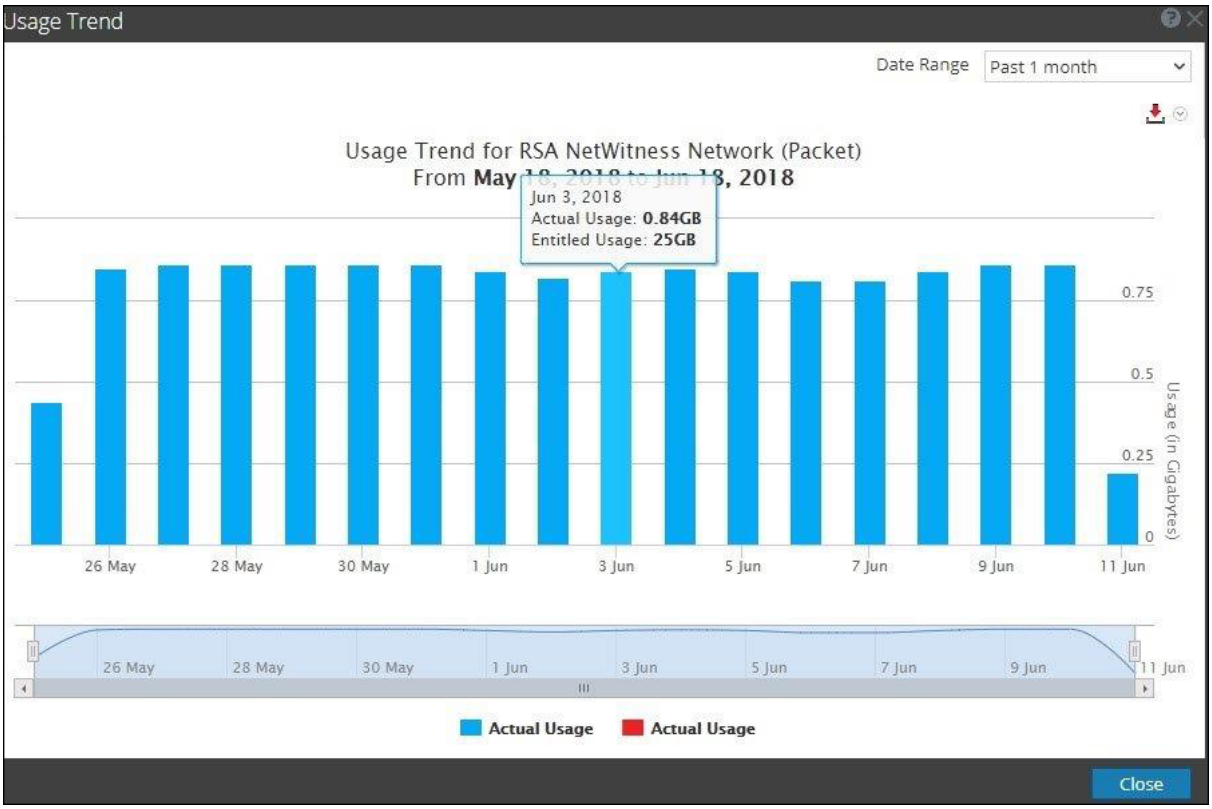
Usage exceeding entitled limit
Close

The following screenshot is an example of the Usage Trend chart for a license with multiple services.



The threshold limit is indicated as a horizontal red-dotted line across the chart. When actual data usage exceeds the entitled daily usage, those days are indicated by red colored bars.
The chart can be generated to collect data for 1 month, 3 months, 6 months, 12 months or custom date range.

These charts can be exported in CSV, PDF, and PNG formats by clicking the icon.

Note: The maximum range for which trend can be viewed is 12 months. The pan-zoom bar at the bottom of the chart can be used to narrow the chart to a smaller time range for better visibility in that range.

If the entitled limit exceeds the usage limit then an appropriate out-of-compliance banner is displayed. For more information, see Out-of-Compliance Banner.

Reassign Service Licenses

You can move service between licenses only if a similar service license is available.

You can move the services between the following licenses.

- Throughput License to Throughput License
- Throughput License to Appliance License
- Appliance License to Throughput License
- Appliance License to Appliance License

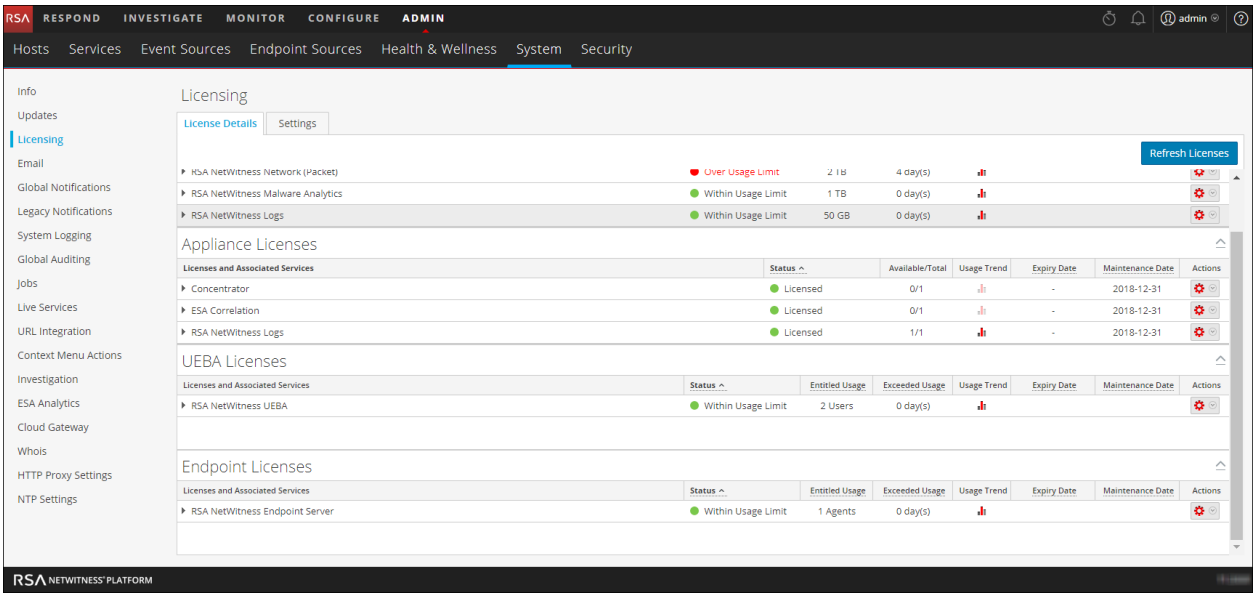
Note: If you want to change the licenses by moving between throughput and appliance, you can do this by selecting the license under the actions of each license. Trail licenses cannot be moved.

You can move the licenses for following reasons:

1. If the subscription based license has expired
2. If there are any unused available license for any service
3. If you want to reduce the usage of the service

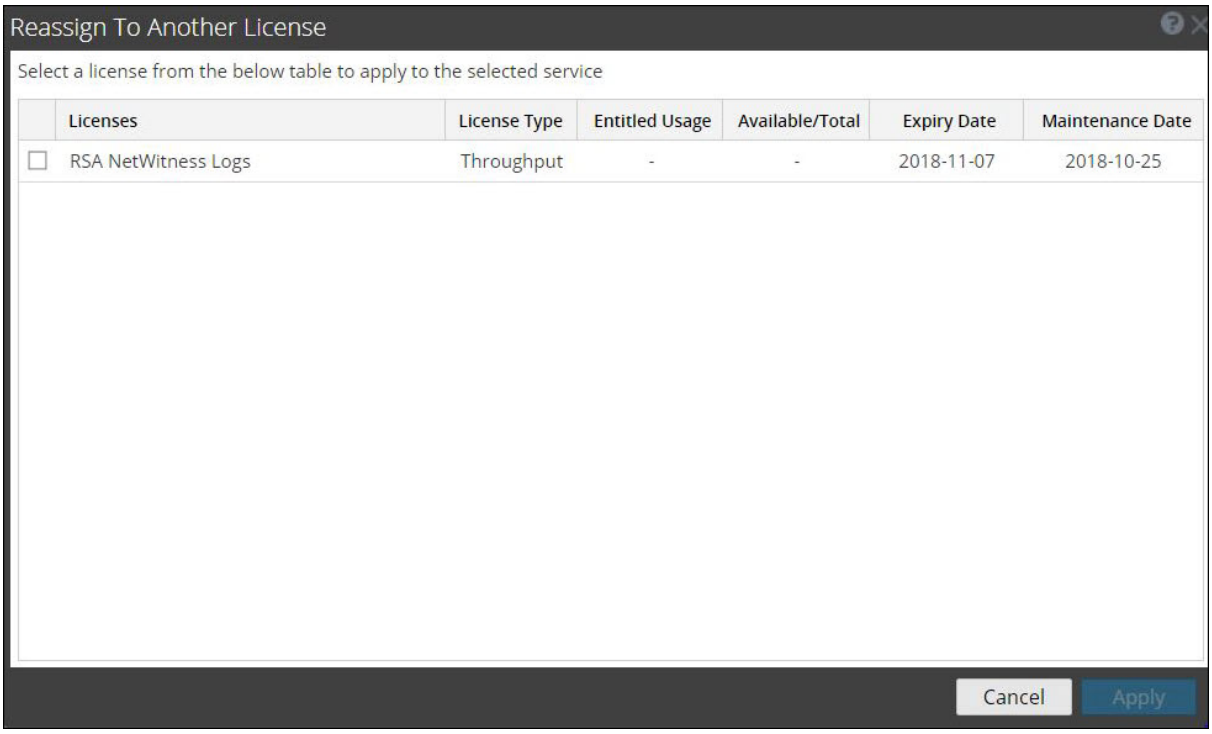
To access this view:

1. Go **ADMIN** > **System** and select **Licensing**.
   The License Details tab is displayed.



2. Select a service of which you want to move the license.
3. Click , and select the **Reassign to Another License** option.
   The Reassign To Another License dialog is displayed with a list of the available licenses that can be

moved.



4. Select a license to be applied for the selected service.
5. Click **Apply**.

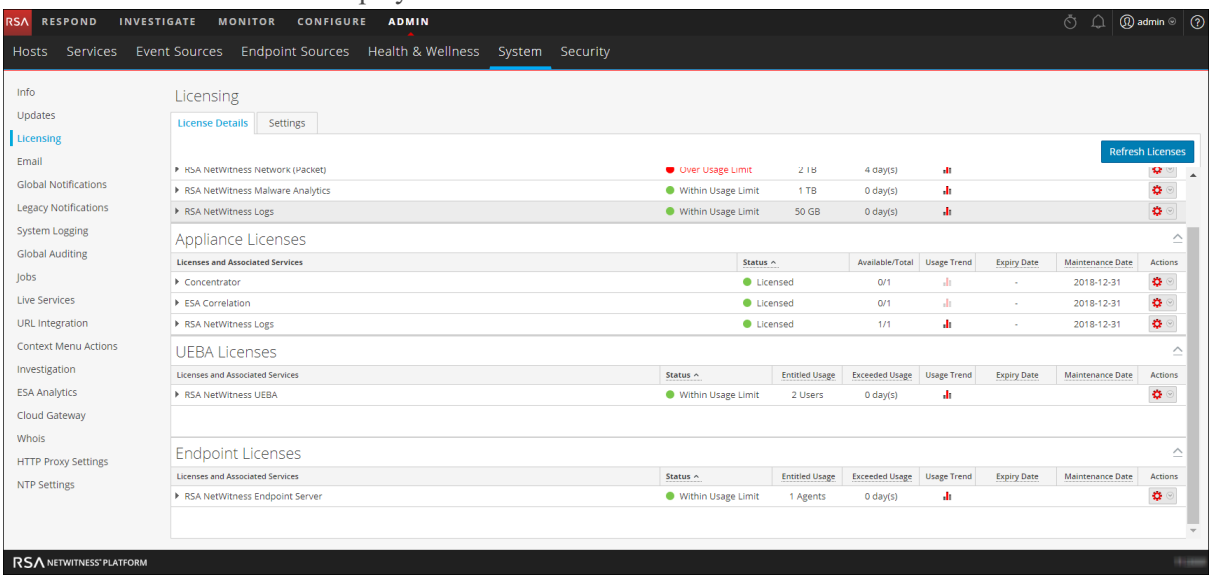
Note: The above procedure can be used to move both Throughput Licenses and Appliance Licenses. However, the UEBA and Endpoint licenses cannot be moved.

View and Export Usage Stats

NetWitness Platform provides the ability for Administrators to view usage statistics of device types that are eligible for a Throughput , Appliance Licenses such as Log Decoder, Decoder, Malware, UEBA and Endpoint Server licenses. An hourly usage statistics is captured for all supported services connected to the NetWitness Serverand are made available in CSV, PDF, ad PNG formats. Metrics can be tracked securely, allowing Administrators to save data locally on their systems to use in reporting usage compliance.

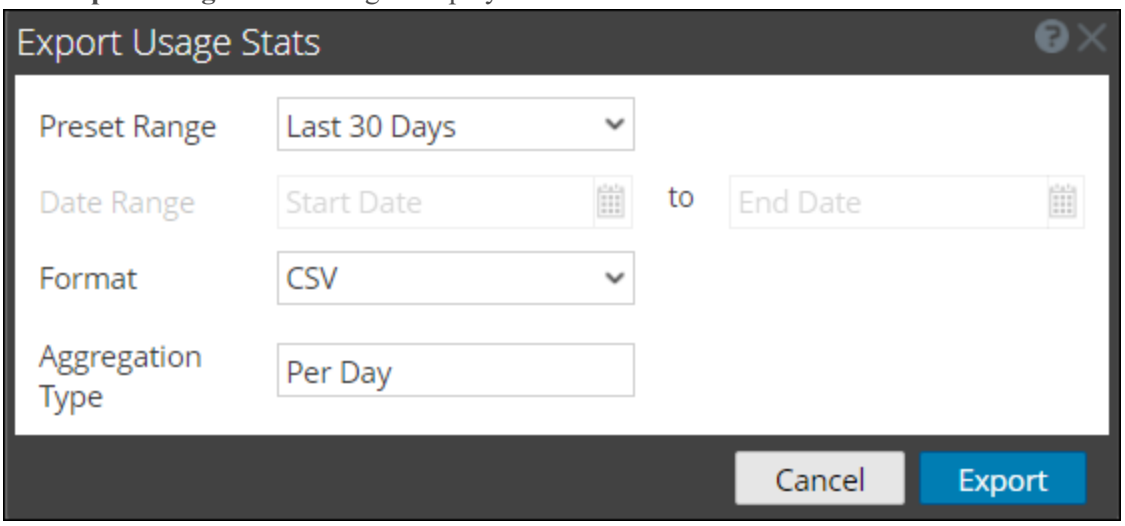
To access Export Usage Stats:

1. Go **ADMIN** > **System** and select **Licensing**.
   The License Details tab is displayed.



2. Select a service for which you want to export usage stats.

3. Click , and select the **Export Usage Stats** option.
   The **Export Usage Stats** dialog is displayed.



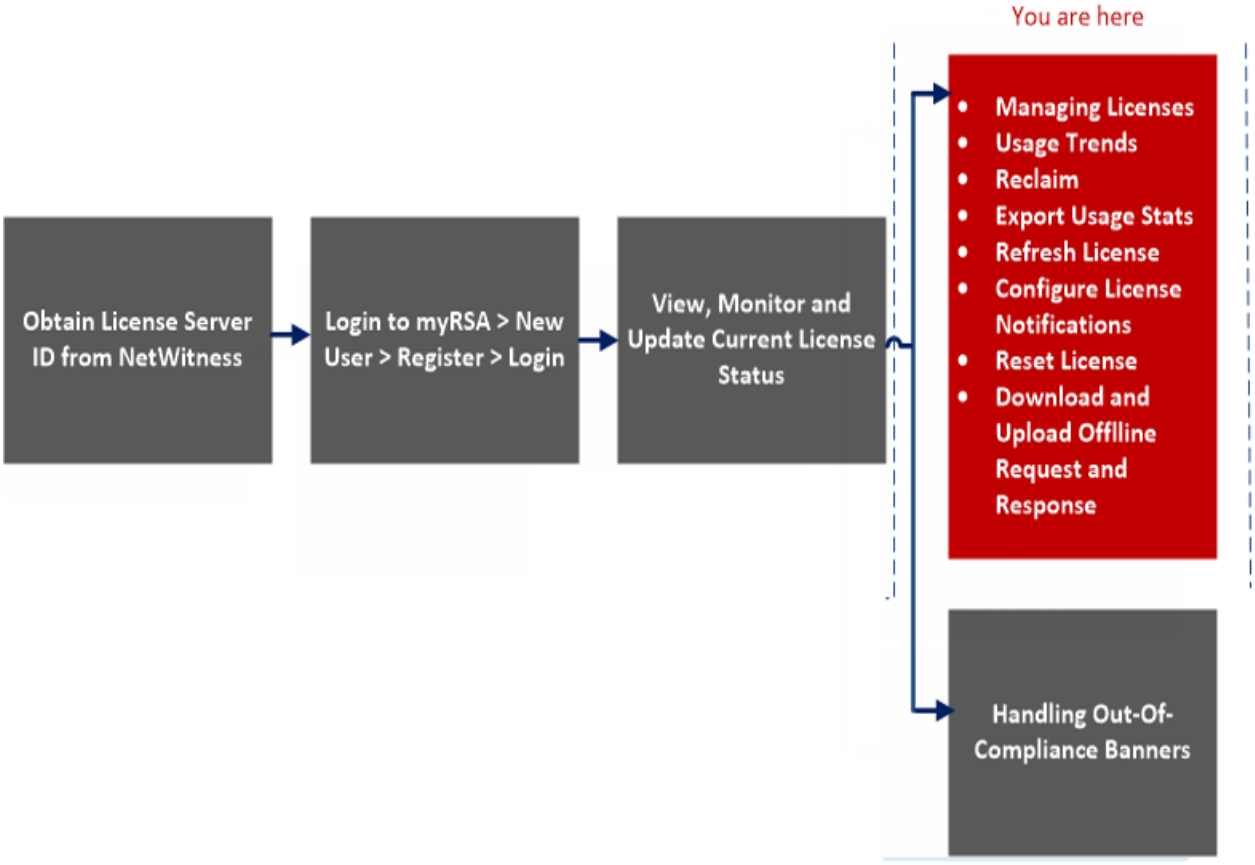
4. Select a **Preset Range**, **Date Range** (in case of custom range), **Format** and **Aggregation Type** to generate the report.
5. Click **Export** to export the report or click **Cancel** to return to the **License Details** tab.

Settings

This topic describes the notification settings for the NetWitness Platform in the **Licensing panel** > **Settings** tab.

Workflow

This workflow illustrates the end-to-end licensing process.



What do you want to do?

Role	I want to...	Show me how...
Administrator	Register NetWitness Server	Obtain License Server ID from NetWitness Platform User Interface
Administrator	Synchronize NetWitness Server	Register the Server (Online Registration)
Administrator	Install product licenses from DLC.	Access myRSA
Administrator	Monitor and update current licenses.	View Current Licenses

Role	I want to...	Show me how...
Administrator	*Configure licensing notifications.	Configure License Notifications
Administrator	View Out-of-Compliance banners	Out-of-Compliance Banner

*You can perform this task here.

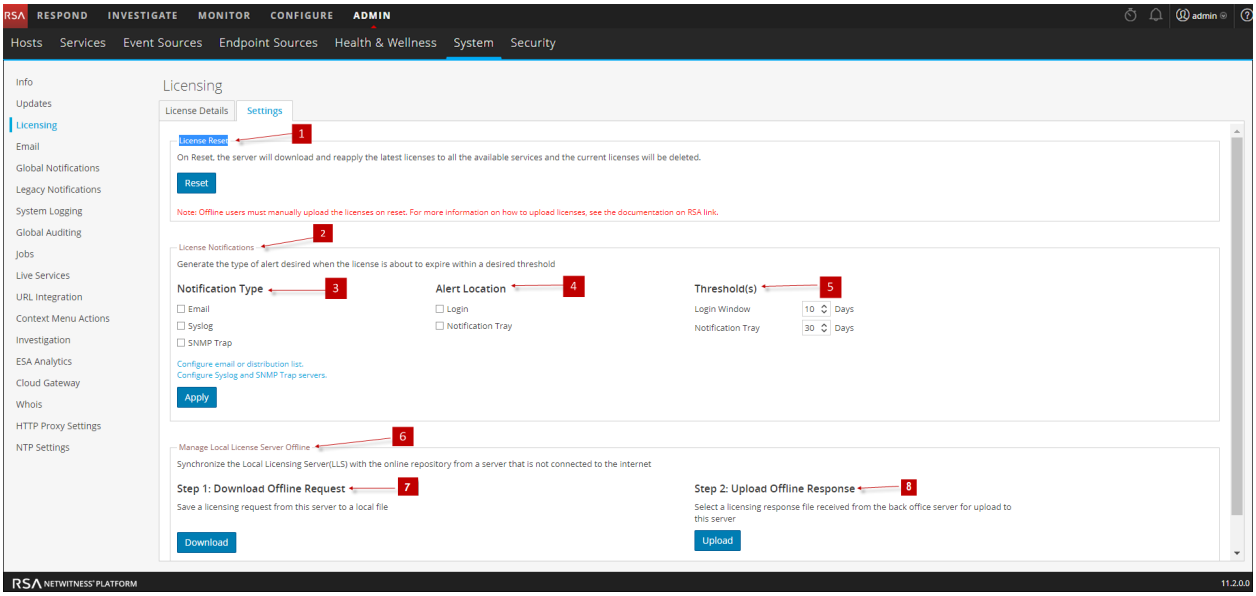
Obtain License Server ID from NetWitness Platform User Interface

Configure License Notifications

Quick Look

From the **Settings** tab you can:

- Configure licensing notifications.
- Download an Offline Capability Request in NetWitness Platform for submission to DLC.
- Within 72 hours, upload to NetWitness Platform an Offline Response that was received from DLC.



The following table describes the **Settings** tab features.

1	Displays the **License Reset** panel which applies the default license settings.
2	Displays the **Licensing Notifications** panel.
3	Displays the **Notification Type**. There are three types of notifications: • **Email:** Checkbox to receive a notification of approaching license expiration in an email message. The email is sent to the configured email or distribution list. • **Syslog:** Checkbox to receive a notification of approaching license expiration in an syslog message. The syslog is generated in accordance with the settings in the Syslog Auditing Settings.

- **SNMP Trap:** Checkbox to receive a notification of approaching license expiration in an SNMP trap. The trap is generated in accordance with the settings in the SNMP Auditing Settings.

4 Displays the type of **Alert Notification**.

- **Login:** Select this checkbox to receive a notification of your approaching license expiration when you log on to NetWitness Platform. The **Login Window Threshold** field specifies the number of days before the license expires to display the notification at log on.
- **Notification Tray:** Select this checkbox to receive a notification of approaching license expiration in the Notifications tray.

5 Displays the **Threshold** field, which specifies the number of days before the license expires to send a notification to the Notifications tray.

6 Displays the **Manage Local License Server Offline** panel.

7 Displays the **Download Offline Request** button. This button enables you to download a request from the NetWitness Platform LLS into a local file for processing by a back-office server. The downloaded bin file should be uploaded to DLC to generate the offline response.

8 Displays the **Upload Offline Request** button. This button enables you to browse for an offline response that you received from the back-office server, and uploads the selected response to NetWitness Platform. The file must be uploaded within 72 hours after receiving the file.

Out-of-Compliance Banners

This topic explains what to do when your license is out of compliance.

On system log on, two types of banners are displayed based on the license issue:

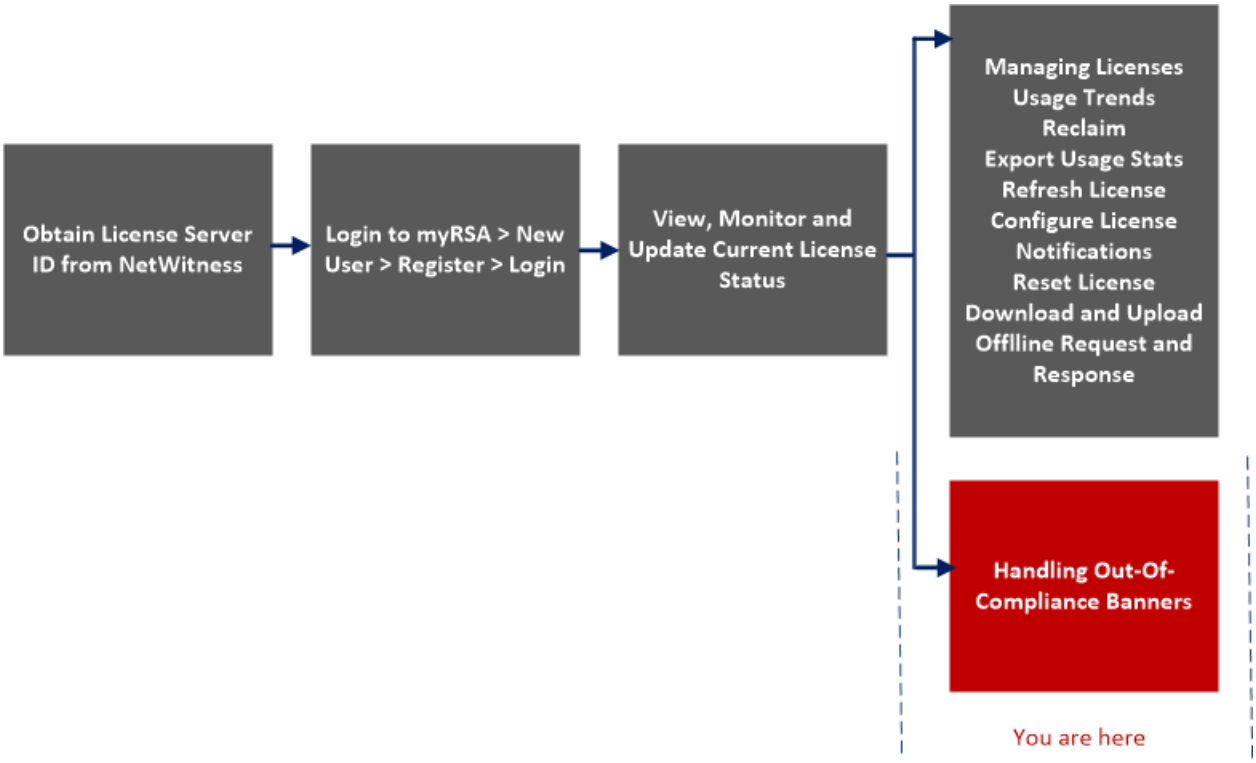
1. A red banner is displayed if your license has expired, or exceeded the allotted usage, or if the license has internal errors.

   Note: A red banner cannot be dismissed and the license issue must be resolved. No banners are displayed for UEBA license and NetWitness EndpointInsight Agents.

2. A yellow banner is displayed if the license is approaching expiration or the license is nearing the allotted usage. The banner can be dismissed by clicking the **Dismiss** button.

Workflow

This workflow illustrates the end-to-end licensing process.



What do you want to do?

Role	I want to...	Show me how...
Administrator	Register NetWitness Server	Obtain License Server ID from NetWitness Platform User Interface
Administrator	Synchronize NetWitness Server	Register the Server (Online Registration)

Role	I want to...	Show me how...
Administrator	Install product licenses from DLC.	Access myRSA
Administrator	Monitor and update current licenses.	View Current Licenses
Administrator	Configure licensing notifications.	Configure License Notifications
Administrator	*View Out-of-Compliance banners.	Out-of-Compliance Banner

*You can perform this task here.

Related Topics

Out-of-Compliance Banner

Note: When throughput devices are under trial period, warning messages will not be displayed unless usage is observed on the corresponding device.

Out-of-Compliance State

The following sample banner is displayed when a license expires:

If your license has internal errors, the following banner is displayed:

In addition to a red banner being displayed during system log on, an Out of Compliance Acknowledgment dialog is also displayed. Click **Accept** to continue using your NetWitness Platform product.

Licenses may become out-of-compliance due to reasons provided in the following table:

Red Banner Message	Possible Causes	Solutions
One or more services is not licensed.	Trial license period has expired. There are pre-11.0.0.0 services in the deployment that are not licensed.	Contact RSA Sales team to procure a NetWitness Platform license. Upgrade the services to NetWitness Platform version 11.0.0.0 or later.
One or more licenses is expired.	Log ingestion usage has been observed after the date of renewal. The license is not valid anymore for the corresponding usage.	Contact RSA Sales team to renew or resolve the license.
You have exceeded license usage limits.	If the allotted daily usage is exceeded on four or more occasions, the Grace Period begins. The Grace Period begins on the day of the fourth occurrence and ends at the end of the following calendar month. Seven continuous days of standard usage will end the Grace Period. If the daily allotted usage is still being exceeded at the end of the Grace Period, the 30-day Breach Period begins. Seven continuous days of standard usage will end the Breach Period.	Contact RSA Sales to extend or increase your allotted usage by purchasing a NetWitness Platform license.
Your Trial license has internal errors.	An internal licensing issue was reported during your Out-of-the-Box Trial period.	Contact RSA Technical Support to resolve this issue.

Note: If a license has not been installed within 90 days, you must contact RSA Sales to purchase a NetWitness Platform license.

License Approaching Out-of-Compliance

When your license is approaching expiration, or it is nearing its allotted usage, a yellow banner with a brief description is displayed. A yellow banner is displayed 14 days before your license is due to expire. You will also see a yellow banner if you are approaching your allotted license usage. You can get rid of the yellow banner by clicking the **Dismiss** button.

The following sample banner is displayed in the NetWitness Platform screen if your license is approaching its allotted usage:

The following table explains the messages that are displayed when you see a yellow banner.

Yellow Banner Message	Possible Causes	Solutions
You are nearing license usage limits.	One or more Throughput licenses has exceeded your allotted usage for three times during the current calendar month. The fourth time that you exceed your allotted usage during the current month will push the deployment into an Out-of-Compliance state.	Contact RSA Sales if your allotted usage spikes four times within a calendar month.
One or more licenses is expiring.	One or more licenses is due to expire within 14 days. Or Log ingestion usage has been observed. The license is not valid anymore for the corresponding usage.	Contact RSA Sales to purchase a new license.

AWS Deployment Overview

Before you can deploy RSA NetWitness® Platform in the Amazon Web Services (AWS) you need to:

- Understand the requirements of your enterprise.
- Know the scope of a NetWitness Platform deployment.

When you are ready to begin deployment:

- Make sure that you have a NetWitness Platform "Throughput" license.
- For packet capture in AWS, you can purchase either of the following Third-Party solutions. If you engage one of these third-parties, they will assign an account representative and a professional services engineer to you who will work closely with RSA Support.
  - Gigamon® GigVUE
  - Ixia Cloudlens™
  - f5BIG-IP

AWS Environment Recommendations

AWS instances have the same functionality as the NetWitness Platform hardware hosts. RSA recommends that you perform the following tasks when you set up your AWS environment.

- Based on the resource requirements of the different components, follow the best practices to use the system and the dedicated storage Elastic Block Store (EBS) Volumes appropriately.
- Make sure that the compute capacity provides a write speed of 10% greater than the required sustained capture and ingest rate for the deployment.
- Build Concentrator directory for index database on the Provisioned IOPS SSD.

Abbreviations and Other Terminology Used in this Guide

Abbreviations	Description
AMI	Amazon Machine Image
AWS	Amazon Web Services
BYOL	Bring your own licensing
CPU	Central Processing Unit

Abbreviations	Description
Dedicated Instance	AWS Dedicated Instances run in a VPC on hardware that is dedicated to a single customer. Dedicated instances are physically isolated at the host hardware level from instances that belong to other AWS accounts. Dedicated instances may share hardware with other instances from the same AWS account that are not Dedicated instances. For more information on the dedicated instances, see AWS "Amazon EC2 Dedicated Instance" documentation (https://aws.amazon.com/ec2/purchasing-options/dedicated-instances/) .
EBS Optimization	An Amazon EBS–optimized instance uses an optimized configuration stack and provides additional, dedicated capacity for Amazon EBS I/O. This optimization provides the best performance for your EBS volumes by minimizing contention between Amazon EBS I/O and other traffic from your instance. For more information on EBS-optimized instances, see the AWS "Amazon EBS–Optimized Instances" documentation (http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSOptimized.html).
EBS Volume	Elastic Block Store (EBS) volume is a highly available and reliable storage volume that you can attach to any running instance that is in the same Availability Zone. For more information on EBS Volumes, see the AWS "Amazon EBS Volumes" documentation (http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSVolumes.html) .
EC2 instance	Virtual server in AWS Elastic Compute Cloud (EC2) for running applications on the AWS infrastructure. Also, for more information, see **Instance**.
Enhanced Networking Enabled	Enhanced networking provides higher bandwidth, higher packet-per-second performance, and consistently lower inter-instance latencies. If your packets-per-second rate appears to have reached its threshold, you must consider moving to enhanced networking because you may have reached the upper thresholds of the virtual machine network interface (VIF) driver. For more information on enhanced networking, see AWS "How do I enable and configure enhanced networking on my EC2 instances" documentation (https://aws.amazon.com/premiumsupport/knowledge-center/enable-configure-enhanced-networking/).
EPS	Events Per Second
GB	Gigabyte. 1GB = 1,000,000,000 bytes
Gb	Gigbit. 1Gb = 1,000,000,000 bits.
Gbps	Gigabits per second or billions of bits per second. It measures bandwidth on a digital data transmission medium such as optical fiber.
GHz	GigaHertz 1 GHz = 1,000,000,000 Hz
HDD	Hard Disk Drive
Instance	A virtual host in the AWS (that is, virtual machine or server in the AWS infrastructure on which you run services or applications). See also **EC2 Instance**.

Abbreviations	Description
Instance Type	Specifies the required CPU and RAM for an instance. For more information on the instance types, see the AWS "Amazon EC2 Instance Types" documentation (https://aws.amazon.com/ec2/instance-types/).
IOPS	Input/Output Operations Per Second
Mbps	Megabits per second or millions of bits per second. It measures bandwidth on a digital data transmission medium such as optical fiber.
On-Premise	On-premise hosts are installed and run on computers on the premises (in the building) of the organization using the hosts, rather than in the AWS.
PPS	Packets Per Second
RAM	Random Access Memory (also known as memory)
Security Group	Set of firewall rules. For more information and a comprehensive list of the ports you must set up for all NetWitness Platform components, see the "Network Architecture and Ports" documentation on RSA Link (https://community.rsa.com/docs/) .
SSD	Solid-State Drive
Tag	A meaningful identifier for AWS instance.
Tap Vendor	Network Tapping Vendor
vCPU	Virtual Central Processing Unit (also known as a virtual processor)
VM	Virtual Machine
VPC	Virtual Public Cloud
vRAM	Virtual Random Access Memory (also known as virtual memory)

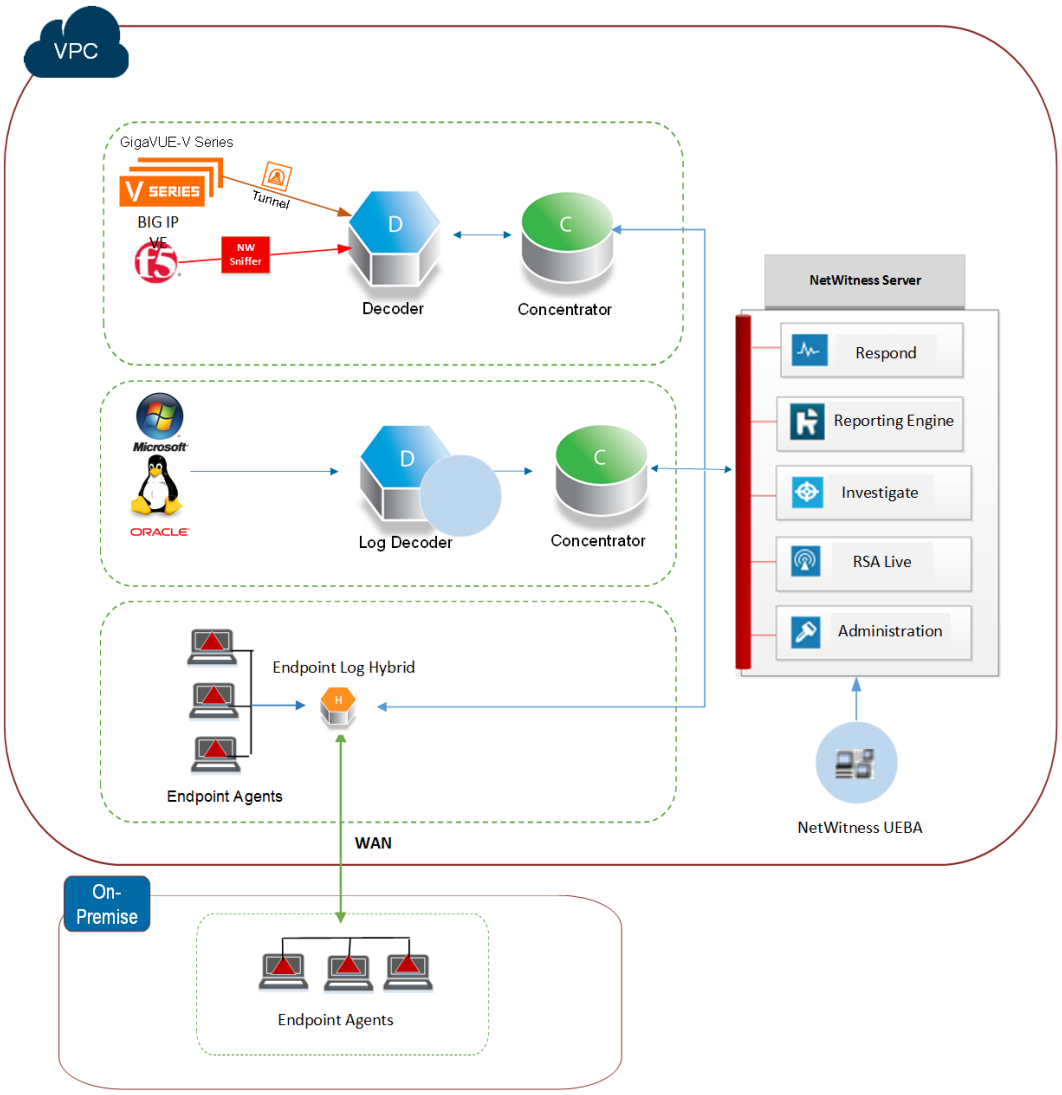
AWS Deployment Scenarios

The following diagrams illustrate some common AWS deployment scenarios. In the diagrams, the:

- **GigaVUE Series** (Gigamon® Solution) is an agent-based solution that uses **Tunneling** (implemented by the NetWitness Platform administrator) to facilitate packet data capture in AWS.
- **CloudLens™** (Ixia® Solution) is an agent-based solution that uses Ixia clients and the CloudLens Docker installed on the Packet Decoder to facilitate packet data capture in AWS.
- **BIG-IP** (f5® Solution) is a load balancing solution that uses a Packet Decoder acting as a sniffer (customized by the NetWitness Platform administrator) to facilitate packet capture in AWS.
- **Decoder** collects packet data. The **Decoder** captures, parses, and reconstructs all network traffic from Layers 2 – 7.
- **Log Decoder** collects logs. The **Log Decoder** collects log events from hundreds of devices and event sources.
- **Concentrator** indexes metadata extracted from network or log data and makes it available for enterprise-wide querying and real-time analytics while facilitating reporting and alerting.
- **Endpoint Log Hybrid** - collects endpoint data. The Endpoint Log Hybrid comprises of Endpoint Server, Log Decoder, and Concentrator. Log Decoder captures data from the Endpoint Server and processes the metadata. For more information, see *NetWitness Endpoint Configuration Guide*.
- NetWitness Server hosts **Respond**, **Reporting**, **Investigate**, **Live Content Management**, **Administration** and other aspects of the user interface.

Full NetWitness Platform Stack VPC Visibility

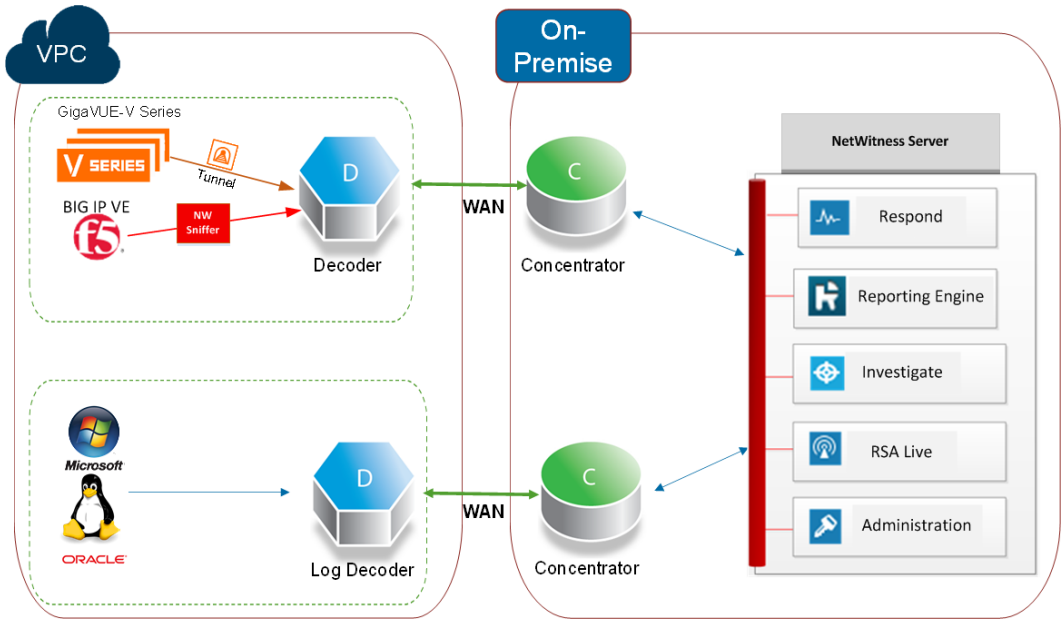
This diagram shows all NetWitness Platform components (full stack) deployed in AWS.



Note: You can add multiple Endpoint Log Hybrids. For a consolidated view of the endpoint data on multiple Endpoint Log Hybrids you must install an Endpoint Broker.

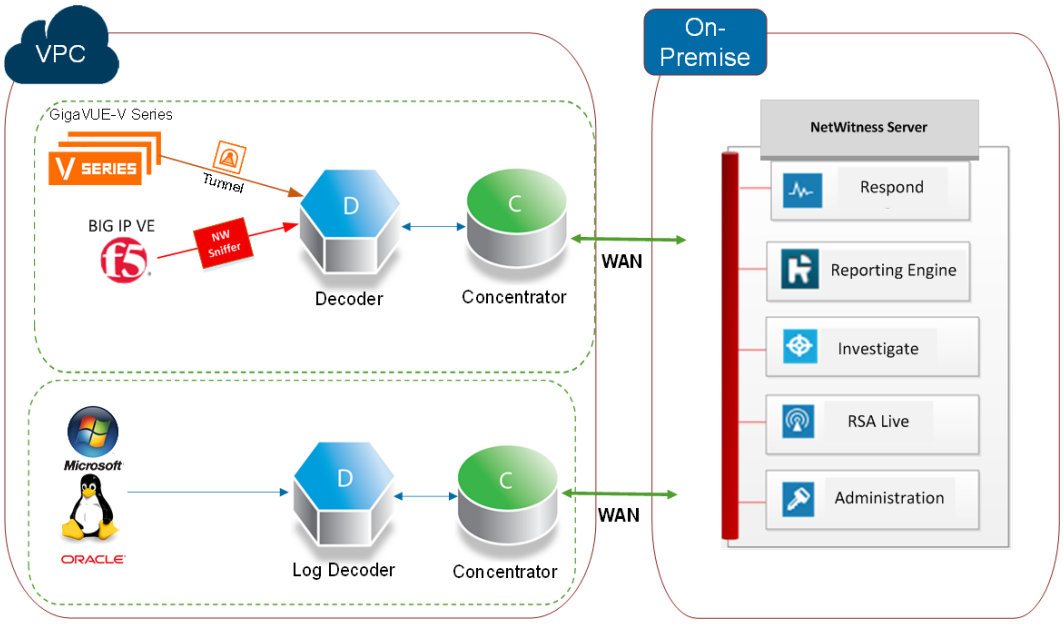
Hybrid Deployment - Decoder and Log Decoder

This diagram shows the Decoder, and Log Decoder deployed in AWS with all other NetWitness Platform components deployed on your premises.



Hybrid Deployment - Decoder, Log Decoder, and Concentrator

This diagram shows the Decoder, Log Decoder, and the Concentrator deployed in AWS with all other NetWitness Platform components deployed on your premises.



Prerequisites

You need the following items before you begin the integration process:

- Ixia account (https://login.ixiacom.com/)
- Access to AWS console
- Network rout-able (and proper AWS Security Groups) for the containers to transfer data to the NetWitness Platform Decoder.

Supported Services

RSA provides the following NetWitness Platform services.

- NetWitness Server
- Admin Server
- Archiver
- Broker
- Concentrator
- Config Server

- Event Stream Analysis
- Investigate Server
- Orchestration Server
- Reporting Engine
- Respond Server
- Security Server
- Log Decoder
- Decoder
- Remote Log Collector
- Endpoint Server
- User and Entity Behavior Analytics (UEBA)

AWS Deployment

This topic contains the rules and high-level tasks you must follow to deploy RSA NetWitness® Platform components in the AWS.

Rules

You must adhere to the following rules when deploying NetWitness Platform in AWS.

- SSH to the NetWitness Platform instance at least once after deployment to initialize the system.
- Do not interrupt the execution of **netconfig.sh** script during the first SSH console login to any NetWitness Platform AWS instance.
- Before you enable the out-of-the-box (OOTB) dashboards, set the default data source in Reporting Engine configuration page.
- If you reboot the Packet Decoder instance, the tunnel is not retained. Create the tunnel on Packet Decoder again and restart the decoder service.
- Always use private IP addresses when you provision AWS NetWitness Platform instances.

Note: If you assign a public IP to the Netwitness Server Host, update the /etc/nginx/conf.d/nginx.conf configuration file as follows:

```
location /nwrpmrepo
{
alias /var/lib/netwitness/common/repo;
index index.html index.htm;
allow <Subnet-Gateway>/Subnet mask ;
#example
# allow 10.0.0.1/25;
deny all;
autoindex on;
}
```

Checklist

Step	Description	√
1	Establish AWS Environment	
2	Find NetWitness Platform AMIs	
3	Launch an Instance and Configure a Host	
4	Configure Hosts (Instances) in NetWitness Platform	
5	Configure Packet Capture	

Establish AWS Environment

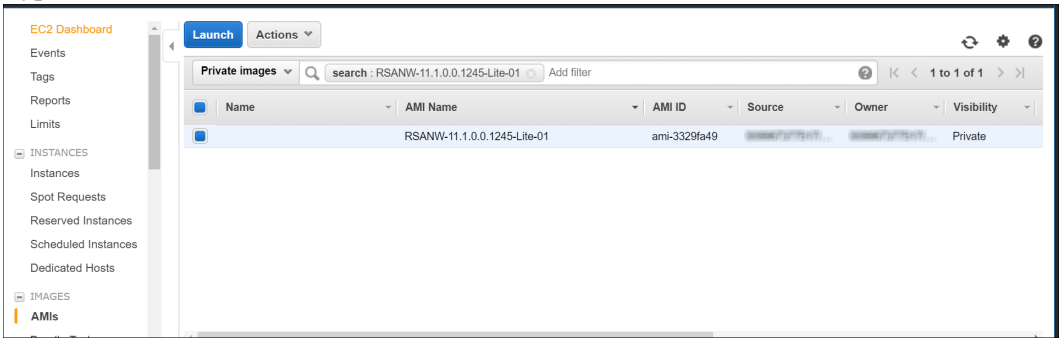
1. Make sure that you have an AWS environment with the capacity to meet or exceed the NetWitness Platform performance guidelines described in AWS Instance Configuration Recommendations.
2. Go to Find NetWitness Platform AMIs.

Find NetWitness Platform AMIs

You can search for NW- AMI files within the Public/Shared/Community repository, using the keyword "RSANW".

Note: For more information, see AWS **Finding Shared AMIs** documentation (http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/usingsharedamis-finding.html).

1. Open the Amazon EC2 console (New Subscriber Account) at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose AMIs.
3. In the first filter, choose Public images.
4. Type "RSANW" in the search field to find the NetWitness Platform AMIs.



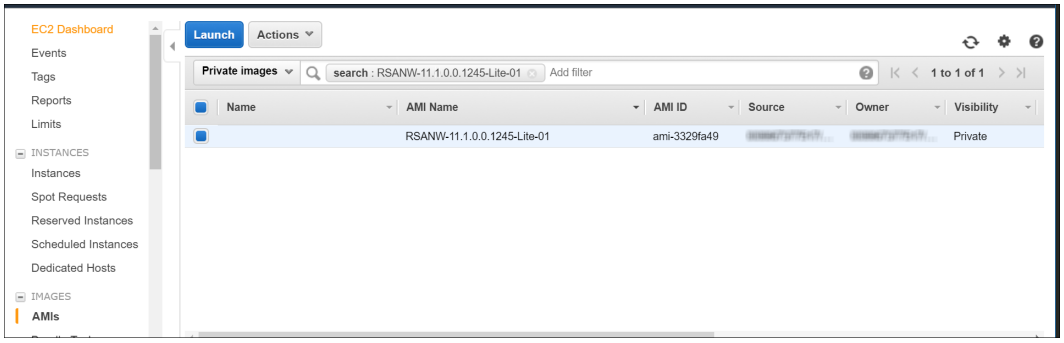
Note: Contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) to obtain access to the **RSA-11.3.0.0.10816-Full-01**.

5. Go to Launch an Instance and Configure a Host.

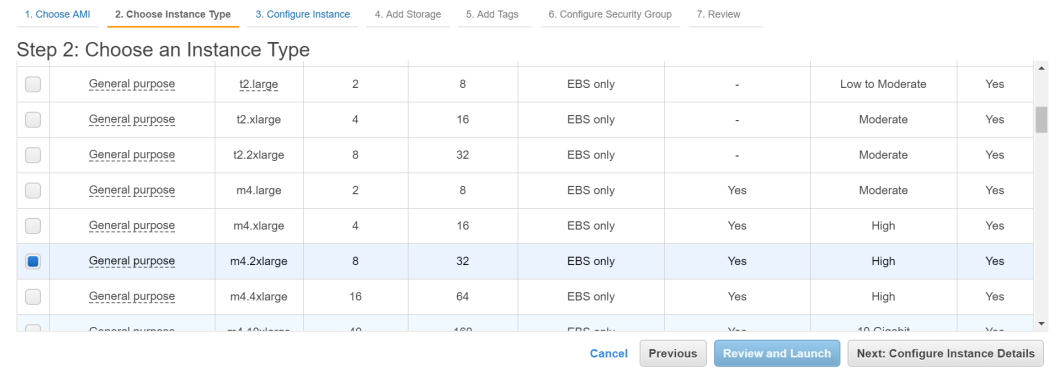
Launch an Instance and Configure a Host

Note: Fore more information, see AWS "Launching an Instance" documentation (http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/launching-instance.html).

1. Select an instance from the grid (for example, **RSA-NW-Concentrator-11.3.0.0-01**) and click **Launch**.

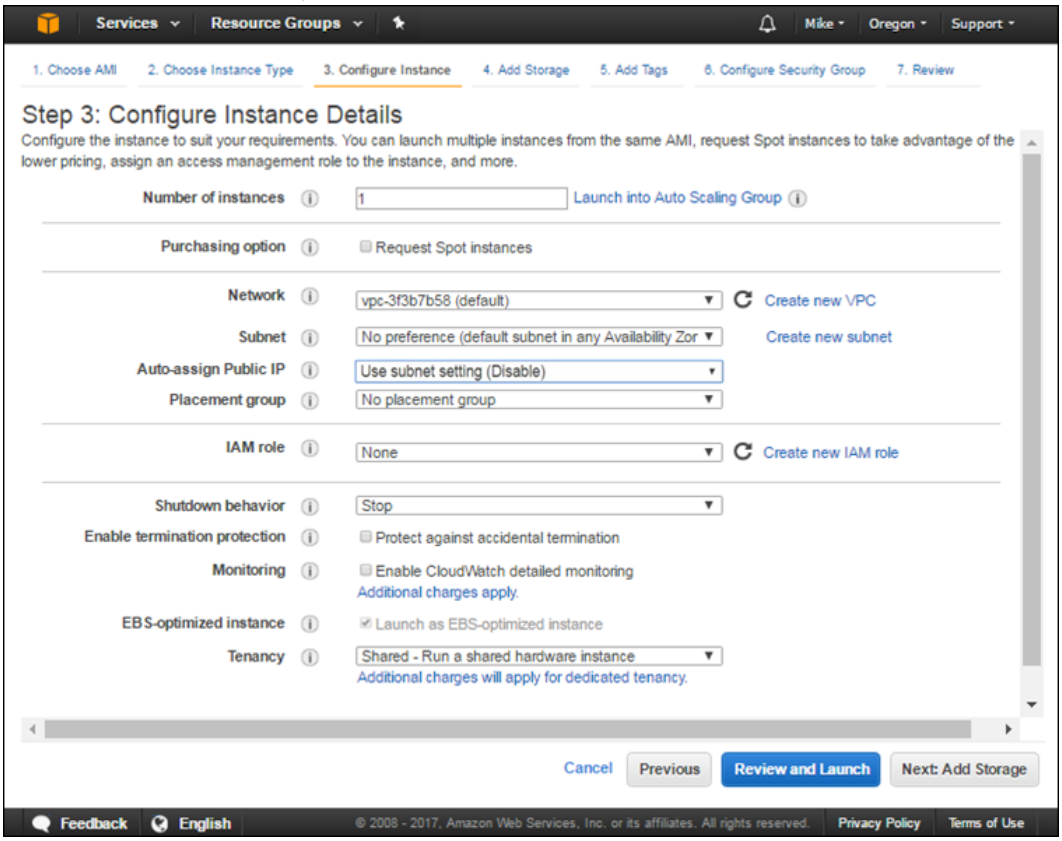


2. Choose the RAM and CPUs by selecting instance type.
   Fore more information, see AWS Instance Configuration Recommendations for guidelines on how to configure the EC2 Instance based on the requirements of the NetWitness Platform component (that is, service) for which you are launching an instance. The following example has the **m4.2xlarge** instance type selected with **8** CPUs and **32** GB of RAM.

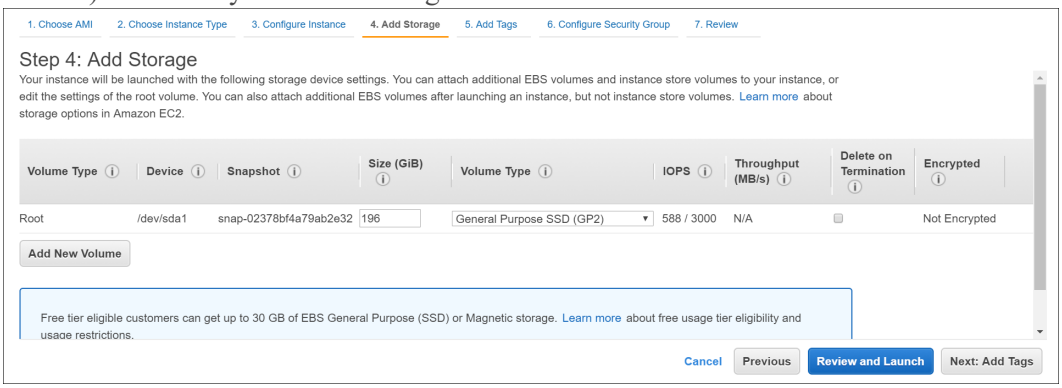


3. Click **Next: Configure Instance Details** at the bottom right of the **Step 2: Choose an Instance Type** page.
   The **Step 3. Configure Instance Details** page is displayed.

For NetWitness Platform, the subnet and VPC are defaulted to the values.



4. Click **Next: Add Storage** at the bottom right of the **Step 3: Configure Instance Details** page.
   The **Step 4. Add Storage** page is displayed.
   For more information, see AWS Instance Configuration Recommendations for guidelines on how to configure storage based on based on the requirements of the NetWitness Platform component (that is, service) for which you are launching an instance.

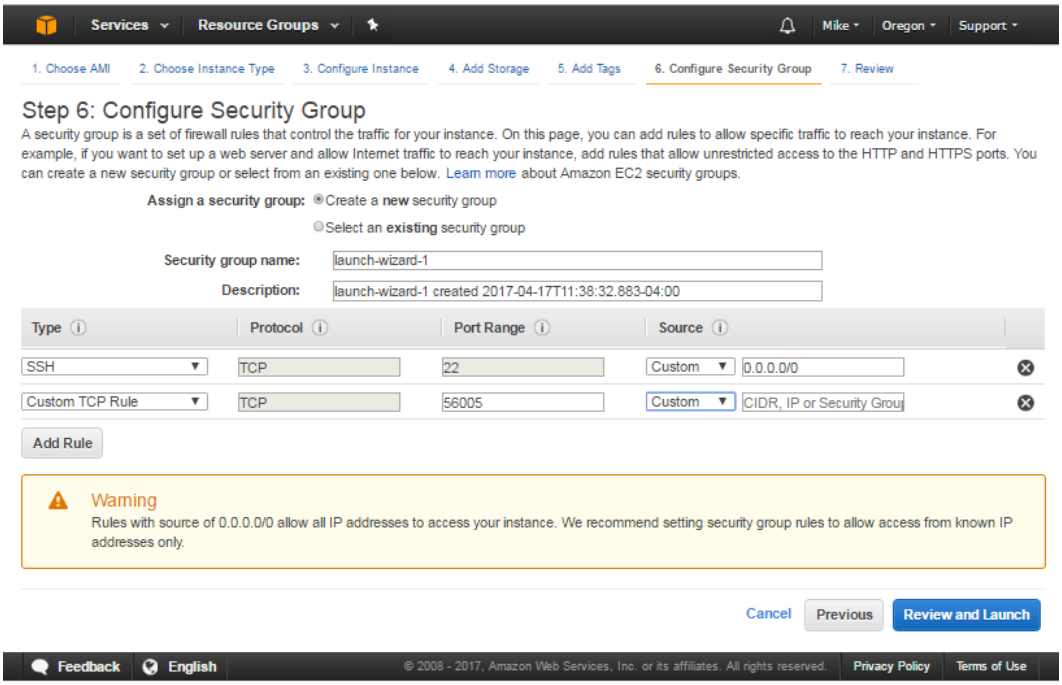


5. Click **Next: Add Tags** at the bottom right of the **Step 4: Add Storage** page.
   The **Step 5. Add Tags** page is displayed. Enter the name of your Instance.
6. Click **Next: Configure Security Group** at the bottom right of the **Step 5: Add Tags** page.
   The **Step 6. Configure Security Group** page is displayed.

a. Select the "Create a **new** security group" radio button.

b. Create a rule that opens all the firewall for the NetWitness Platform component.
You must configure the security group correctly to configure the instance (host) from the NetWitness Platform) User Interface and SSH to it.

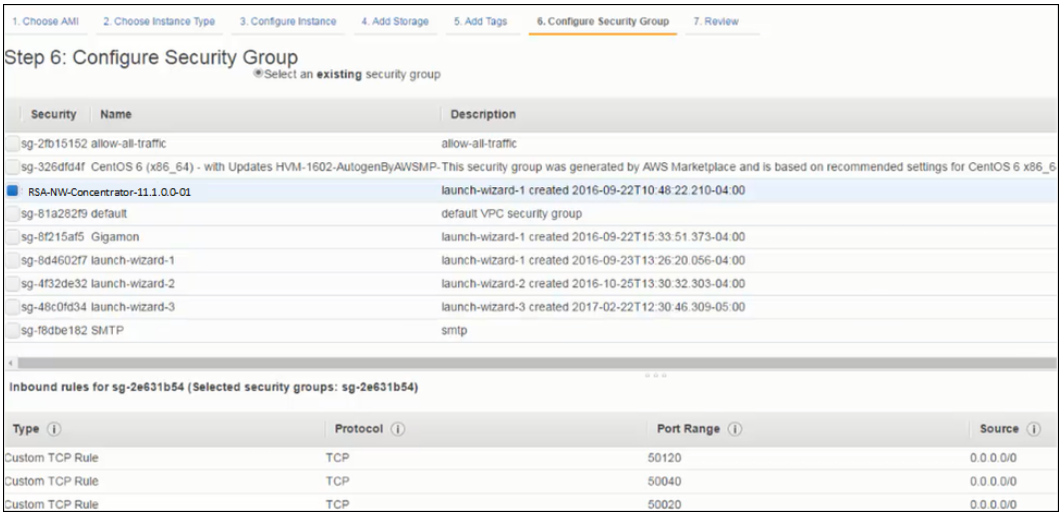
Note: Fore more information. see the "Network Architecture and Ports" documentation on RSA Link (https://community.rsa.com/docs/DOC-83050) for a comprehensive list of the ports you must set up for all NetWitness Platform components..



Note: After you configure a Security Group, you can change it at any time.

7. Click **Review and Launch** at the bottom right of the **Step 6: Configure Security Group** page.
The **Step 7. Review Instance Launch** page is displayed.
8. Click **Launch** at the bottom right of the **Step 7. Review Instance Launch** page.
The **Select an existing key pair or create a new key pair** dialog is displayed.
9. Choose **Proceed without key pair**.

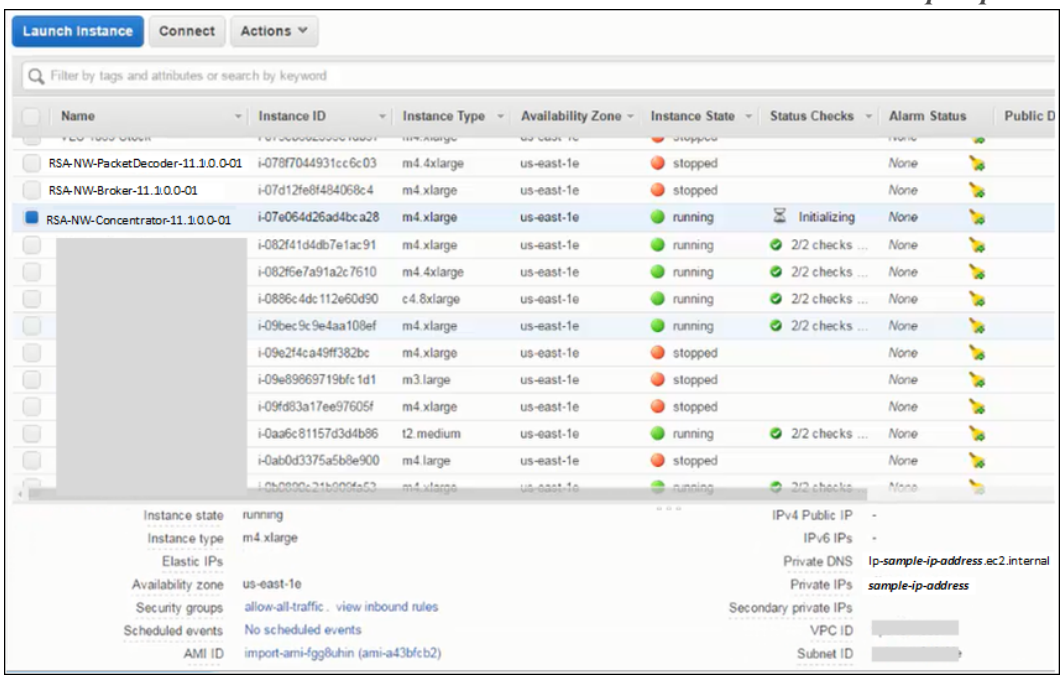
10. Click **Launch Instance**.
    AWS displays the following information as it builds the Instance.



11. Click **View Instances**.

12. Select **Instances** from the left navigation panel to review all instances that AWS is initializing (for example, the **NW-Concentrator**) .

The IP Address for the new **RSA-NW-Concentrator-11.3.0.0-01** host is ***sample-ip-address***.



13. SSH to the newly-created instance using the default NetWitness Platform credentials.
14. Go to Configure Hosts (Instances) in NetWitness Platform .

Partition Recommendations

This topic contains the recommended AWS partition.

Admin Server, ESA Primary, ESA Secondary and Malware Analysis

For an extension of `/var/netwitness/` partition, attach an external volume.

Run `lsblk` to get the physical volume name.

If you attach 2 TB disk, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `/dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`
4. `xfs_growfs /dev/netwitness_vg00/nwhome`

RSA recommends the following partition. However, you can change these values based on the retention days.

LVM	Folder	EBS
/dev/netwitness_vg00/nwhome	/var/netwitness/	Refer to the EBS Volume (storage) tables.

Log Collector

For an extension of `/var/netwitness/` partition, attach an external volume

Run `lsblk` to get the physical volume name.

If you attach one 500 GB volume, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvextend -L 600G /dev/netwitness_vg00/nwhome`
4. `xfs_growfs /dev/netwitness_vg00/nwhome`

RSA recommends the following partition. However, you can change these values based on the retention days.

LVM	Folder	EBS
/dev/netwitness_vg00/nwhome	/var/netwitness/	Refer to the EBS Volume (storage) tables.

Decoder

For an extension of `/var/netwitness/` partition, attach an external volume and other external volumes for the Decoder database partitions.

Note: No other partition should reside on this Decoder partition and should be used only for /var/netwitness/ partition.

Run `lsblk` to get the physical volume name.

If you attach 2 TB disk, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`
4. `xfs_growfs /dev/netwitness_vg00/nwhome`

Other Partition Required

The following partition should be on the volume group **decodersmall**.

Folder	LVM	Volume Group
/var/netwitness/decoder	decoroot	decodersmall
/var/netwitness/decoder/index	index	decodersmall
/var/netwitness/decoder/metadb	metadb	decodersmall
/var/netwitness/decoder/sessiondb	sessiondb	decodersmall

Run `lsblk` to get the physical volume name and run the following commands:

1. `pvcreate /dev/md0`
2. `vgcreate -s 32 decodersmall /dev/md0`
3. `lvcreate -L <disk_size> -n <lvm_name> decodersmall`
4. `mkfs.xfs /dev/decodersmall/<lvm_name>`
5. Repeat the above steps for all the LVMs mentioned above.

The following partition should be on the volume group **decoder**.

Folder	LVM	Volume Group
/var/netwitness/decoder/packetdb	packetdb	decoder

Run `lsblk` to get the physical volume name and run the following commands:

1. `pvcreate /dev/md1`
2. `vgcreate -s 32 decoder /dev/md1`
3. `lvcreate -L <disk_size> -n packetdb decoder`
4. `mkfs.xfs /dev/decoder/packetdb`

RSA recommends the following partition. However, you can change these values based on the retention days.

LVM	Folder	EBS
/dev/netwitness_ vg00/nwhome	/var/netwitness/	Refer to the EBS Volume (storage) tables.
/dev/decodersmall/decoroot	/var/netwitness/decoder	Refer to the EBS Volume (storage) tables.
/dev/decodersmall/index	/var/netwitness/decoder/index	Refer to the EBS Volume (storage) tables.
/dev/decodersmall/metadb	/var/netwitness/decoder/metadb	Refer to the EBS Volume (storage) tables.
/dev/decodersmall/sessiondb	/var/netwitness/decoder/sessiondb	Refer to the EBS Volume (storage) tables.
/dev/decoder/packetdb	/var/netwitness/decoder/packetdb	Refer to the EBS Volume (storage) tables.

Create each directory and mount the LVM on it in a serial manner, except `/var/netwitness`, which is already created.

After mounting the directory, add the following entries in `/etc/fstab` in the same order:

1. `/dev/decodersmall/decoroot /var/netwitness/decoder xfs noatime,nosuid 1 2`
2. `/dev/decodersmall/index /var/netwitness/decoder/index xfs noatime,nosuid 1 2`

3. `/dev/decodersmall/metadb /var/netwitness/decoder/metadb xfs noatime,nosuid 1 2`
4. `/dev/decodersmall/sessiondb /var/netwitness/decoder/sessiondb xfs noatime,nosuid 1 2`
5. `/dev/decoder/packetdb /var/netwitness/decoder/packetdb xfs noatime,nosuid 1 2`

Log Decoder

For an extension of `/var/netwitness/` partition, attach an external volume and other external volumes for the Log Decoder database partitions.

Note: No other partition should reside on this Log Decoder partition and should be used only for /var/netwitness/ partition.

Run `lsblk` to get the physical volume name.

If you attach 2 TB disk, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`
4. `xfs_growfs /dev/netwitness_vg00/nwhome`

Other Partition Required

The following partition should be on the volume group **logdecodersmall**.

Folder	LVM	Volume Group
/var/netwitness/logdecoder	decoroot	logdecodersmall
/var/netwitness/logdecoder/index	index	logdecodersmall
/var/netwitness/logdecoder/metadb	metadb	logdecodersmall
/var/netwitness/logdecoder/sessiondb	sessiondb	logdecodersmall

Run `lsblk` to get the physical volume name and run the following commands:

1. `pvcreate /dev/md0`
2. `vgcreate -s 32 logdecodersmall /dev/md0`
3. `lvcreate -L <disk_size> -n <lvm_name> logdecodersmall`
4. `mkfs.xfs /dev/logdecodersmall/<lvm_name>`
5. Repeat the above steps for all the LVMs mentioned above.

The following partition should be on the volume group **logdecoder**.

Folder	LVM	Volume Group
/var/netwitness/logdecoder/packetdb	packetdb	logdecoder

Run `lsblk` to get the physical volume name and run the following commands:

1. `pvcreate /dev/md1`
2. `vgcreate -s 32 logdecoder /dev/md1`
3. `lvcreate -L <disk_size> -n packetdb logdecoder`
4. `mkfs.xfs /dev/logdecoder/packetdb`

RSA recommends the following partition. However, you can change these values based on the retention days.

LVM	Folder	EBS
/dev/netwitness_vg00/nwhome	/var/netwitness/	Refer to the EBS Volume (storage) tables.
/dev/logdecodersmall/decoroot	/var/netwitness/logdecoder	Refer to the EBS Volume (storage) tables.
/dev/logdecodersmall/index	/var/netwitness/logdecoder/index	Refer to the EBS Volume (storage) tables.
/dev/logdecodersmall/metadb	/var/netwitness/logdecoder/metadb	Refer to the EBS Volume (storage) tables.
/dev/logdecodersmall/sessiondb	/var/netwitness/logdecoder/sessiondb	Refer to the EBS Volume (storage) tables.
/dev/logdecoder/packetdb	/var/netwitness/logdecoder/packetdb	Refer to the EBS Volume (storage) tables.

Create each directory and mount the LVM on it in a serial manner, except `/var/netwitness`, which is already created.

After mounting the directory, add the following entries in `/etc/fstab` in the same order:

1. `/dev/logdecodersmall/decoroot /var/netwitness/logdecoder xfs noatime,nosuid 1 2`
2. `/dev/logdecodersmall/index /var/netwitness/logdecoder/index xfs noatime,nosuid 1 2`
3. `/dev/logdecodersmall/metadb /var/netwitness/logdecoder/metadb xfs noatime,nosuid 1 2`
4. `/dev/logdecodersmall/sessiondb /var/netwitness/logdecoder/sessiondb xfs noatime,nosuid 1 2`
5. `/dev/logdecoder/packetdb /var/netwitness/logdecoder/packetdb xfs noatime,nosuid 1 2`

Concentrator

For an extension of `/var/netwitness/` partition, attach an external disk and other external disks for the Concentrator database partitions.

Note: No other partition should reside on this Concentrator partition and should be used only for /var/netwitness/ partition.

Run `lsblk` to get the physical volume name.

If you attach 2 TB disk, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`
4. `mkfs.xfs /dev/logdecoder/packetdb`

Other Partition Required

The following partition should be on the volume group concentrator.

Folder	LVM	Volume Group
/var/netwitness/concentrator	root	concentrator
/var/netwitness/concentrator /sessiondb	index	concentrator
/var/netwitness/concentrator /metadb	metadb	concentrator

Run `lsblk` to get the physical volume name and run the following commands:

1. `pvcreate /dev/md0`
2. `vgcreate -s 32 logdecodersmall /dev/md0`
3. `lvcreate -L <disk_size> -n <lvm_name> logdecodersmall`
4. `mkfs.xfs /dev/logdecodersmall/<lvm_name>`
5. Repeat the above steps all the LVMs mentioned

The following partition should be on volume group index.

Folder	LVM	Volume Group
/var/netwitness/concentrator/index	index	index

Run `lsblk` to get the physical volume name and run the following commands:

1. `pvcreate /dev/md1`
2. `vgcreate -s 32 lindex /dev/md1`
3. `lvcreate -L <disk_size> -n index index`
4. `mkfs.xfs /dev/index/index`

RSA recommends the following partition. However, you can change these values based on the retention days.

LVM	Folder	EBS
/dev/netwitness_ vg00/nwhome	/var/netwitness/	Refer to the EBS Volume (storage) tables.
/dev/concentrator/decoroot	/var/netwitness/concentrator	Refer to the EBS Volume (storage) tables.
/dev/concentrator/metadb	/var/netwitness/concentrator/metadb	Refer to the EBS Volume (storage) tables.
/dev/concentrator/sessiondb	/var/netwitness/concentrator/sessiondb	Refer to the EBS Volume (storage) tables.
/dev/index/index	/var/netwitness/concentrator/index	Refer to the EBS Volume (storage) tables.

Create each directory and mount the LVM on it in a serial manner, except `/var/netwitness`, which is already created.

After mounting the directory, add the following entries in `/etc/fstab` in the same order:

1. `/dev/concentrator/root /var/netwitness/concentrator xfs noatime,nosuid 1 2`
2. `/dev/concentrator/sessiondb /var/netwitness/concentrator/sessiondb xfs noatime,nosuid 1 2`
3. `/dev/concentrator/metadb /var/netwitness/concentrator/metadb xfs noatime,nosuid 1 2 2`
4. `/dev/index/index /var/netwitness/concentrator/index xfs noatime,nosuid 1 2`

Archiver

For an extension of `/var/netwitness/` partition, attach an external volume and other external disks for the Archiver database partitions.

Note: No other partition should reside on this Archiver partition and should be used only for /var/netwitness/partition.

Run `lsblk` to get the physical volume name.

If you attach 2 TB disk, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`
4. `xfs_growfs /dev/netwitness_vg00/nwhome`

Other Partition Required

The following partition should be on the volume group archiver.

Folder	LVM	Volume Group
/var/netwitness/archiver	archiver	archiver

Run `lsblk` to get the physical volume name and run the following commands:

1. `pvcreate /dev/md0`
2. `vgcreate -s 32 archiver /dev/md0`
3. `lvcreate -L <disk_size> -n archiver archiver`
4. `mkfs.xfs /dev/archiver/archiver`

RSA recommends the following partition. However, you can change these values based on the retention days.

LVM	Folder	
/dev/netwitness_vg00/nwhome	/var/netwitness/	
/dev/archiver/archiver	/var/netwitness/archiver	

Create each directory and mount the LVM on it in a serial manner, except `/var/netwitness`, which is already created.

After mounting the directory, add the following entries in `/etc/fstab` in the same order:

1. `/dev/archiver/archiver /var/netwitness/archiver xfs noatime,nosuid 1 2`

Endpoint Log Hybrid

For an extension of /var/netwitness/ partition, attach an additional volume,

and make sure that no other partition resides on this Endpoint Hybrid or Endpoint Log Hybrid. Also, attach other additional volumes for the endpoint database partitions.

Run `lsblk` to get the physical volume name.

If you attach 1 TB disk, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name is dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvextend -L 1T /dev/netwitness_vg00/nwhome`
4. `xfs_growfs /dev/netwitness_vg00/nwhome`

Other Partition Required

The following partition should be on the volume group endpoint and should be in a single RAID 0 array.

Folder	LVM	Volume Group
/var/netwitness/mongo	hybrid-mongo	endpoint
/var/netwitness/concentrator	concentrator-concroot	endpoint

Folder	LVM	Volume Group
/var/netwitness/concentrator/index	hybrid-concinde	endpoint
/var/netwitness/logdecoder	hybrid-ldecroot	endpoint

Run `lsblk` to get the physical volume name and run the following commands:

1. `pvcreate /dev/md0`
2. `vgcreate -s 32 endpoint /dev/md0`
3. `lvcreate -L <disk_size> -n <lvm_name> endpoint`
4. `mkfs.xfs /dev/ endpoint /<lvm_name>`
5. Repeat the above steps for all the LVMs mentioned.

RSA recommends the following partition. However, you can change these values based on the retention days.

LVM	Folder	EBS
/dev/netwitness_vg00/nwhome	/var/netwitness/	Refer to the EBS Volume (storage) tables.
/dev/endpoint/hybridmongo	/var/netwitness/mongo	Refer to the EBS Volume (storage) tables.
/dev/endpoint/concentratorconcroot	/var/netwitness/concentrator	Refer to the EBS Volume (storage) tables.
/dev/endpoint/hybridconcinde	/var/netwitness/concentrator/index	Refer to the EBS Volume (storage) tables.
/dev/endpoint/hybridldecroot	/var/netwitness/logdecoder	Refer to the EBS Volume (storage) tables.

Installation Tasks

Before you begin the installation tasks make sure you open the firewall ports. For more information on the lists of all the ports in a deployment, see the"Network Architecture and Ports" topic in the *Deployment Guide for RSA NetWitness Platform 11.3.*

Caution: Do not proceed with the installation until the ports on your firewall are configured.

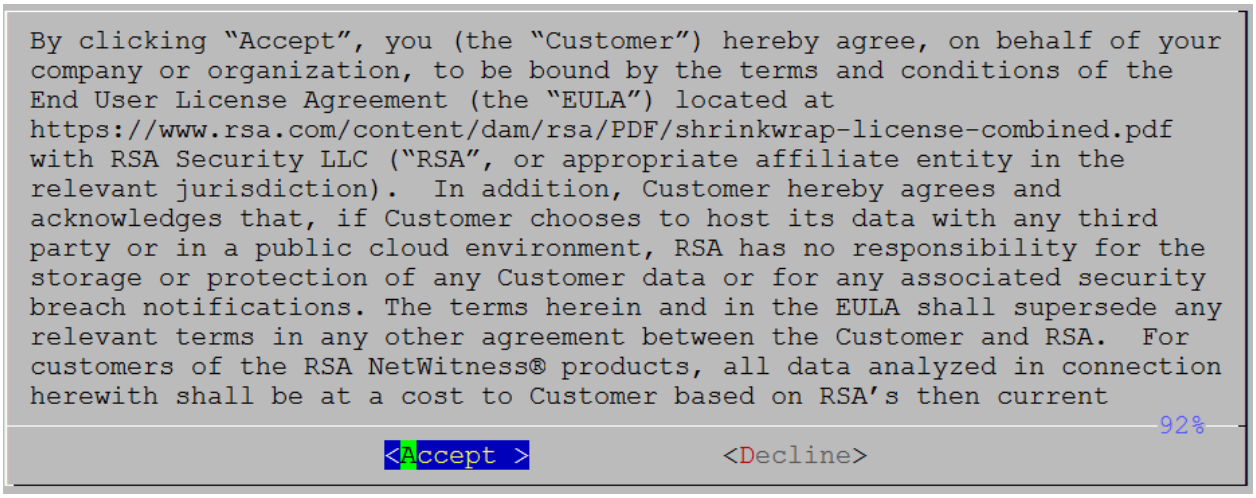
Task 1 - Install 11.3.0.0 on the NetWitness Server (NW Server) Host

Note: You can perform this task for RSA-11.3.0.0.10816-Full-01 instance.

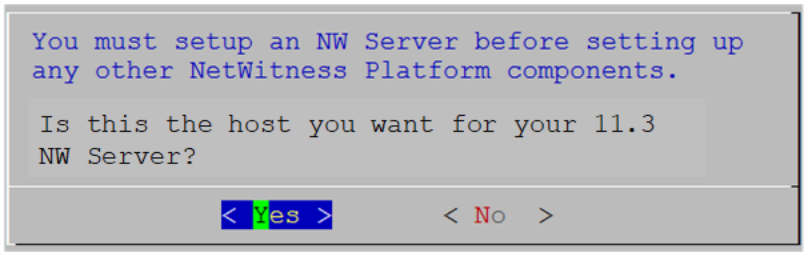
1. Run the `nwsetup-tui` command to set up the host.

This initiates the Setup program and the EULA is displayed.

Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press **Enter** to register your command response and move to the next prompt.
2.) The Setup program adopts the color scheme of the desktop or console you use access the host.
3.) If you specify DNS servers during Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` to proceed. Any misconfigured DNS servers cause the Setup to fail. If you need to reach DNS server after setup that unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see the "Post Installation Tasks" topic in the *Physical Host Installation Guide*.
If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Platform Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).



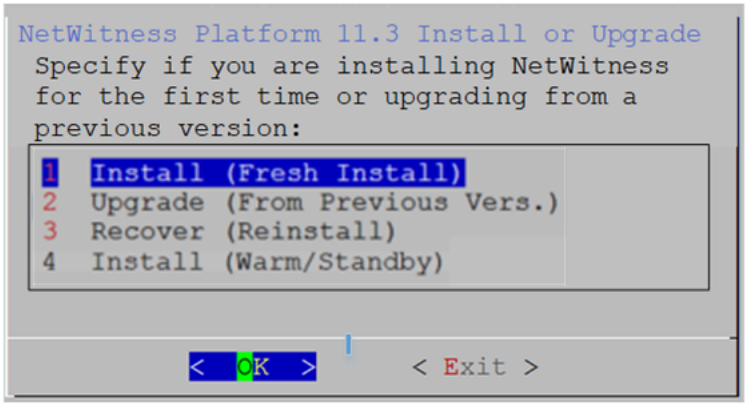
2. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 11.3 NW Server** prompt is displayed.



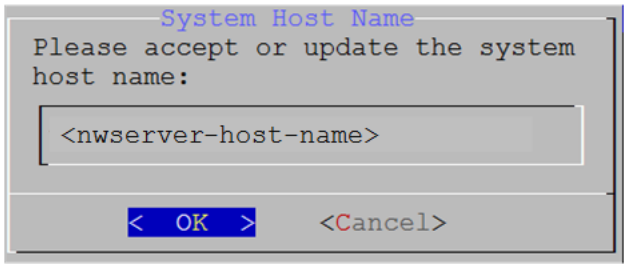
3. Tab to **Yes** and press **Enter**.
   Choose **No** if you already installed 11.3 on the NW Server.

   Caution: If you choose the wrong host for the NW Server and complete the Setup, you must restart the Setup Program (step 2) and complete all the subsequent steps to correct this error.

The **Install** or **Upgrade** prompt is displayed.



4. Press **Enter**. **Install (Fresh Install)** is selected by default.
   The **Host Name** prompt is displayed.

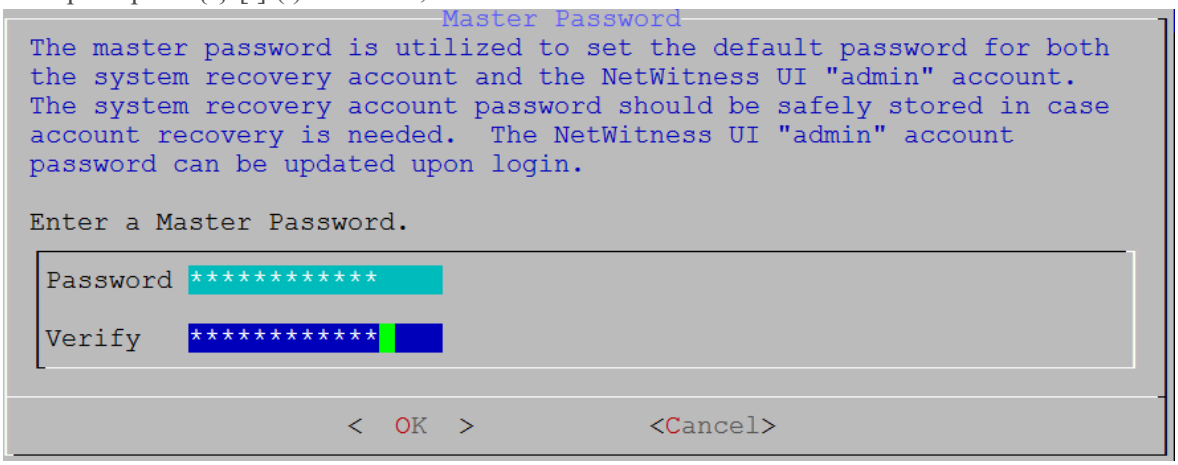


Caution: If you include "." in a host name, the host name must also include a valid domain name.

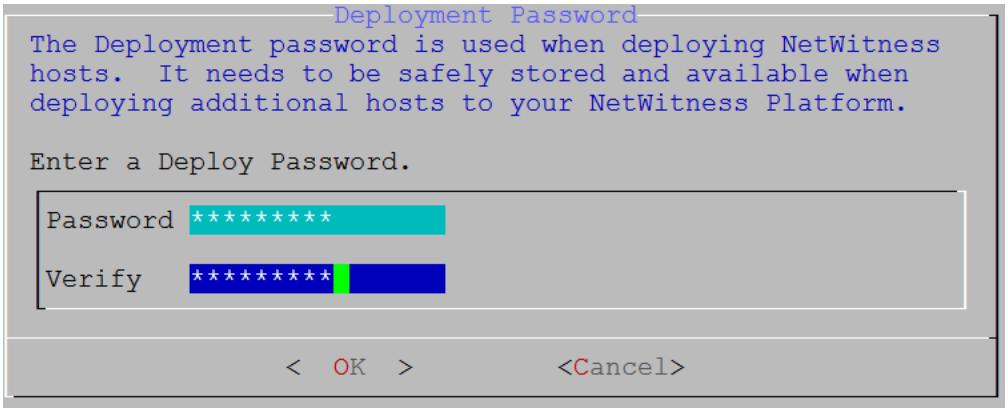
5. Press **Enter** if want to keep this name. If not edit the host name, tab to **OK**, and press **Enter** to change it.
   The **Master Password prompt** is displayed.
   The following list of characters are supported for Master Password and Deployment Password:

   - Symbols : ! @ # % ^ + ,
   - Numbers :0-9
   - Lowercase Characters : a-z
   - Uppercase Characters : A-Z
     No ambiguous characters are supported for Master Password and Deployment Password (for

example: space { } [ ] ( ) / \ ' " ` ~ ; : . < > -.

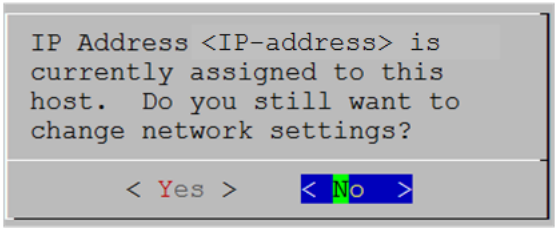


6. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**. The **Deployment Password** prompt is displayed.

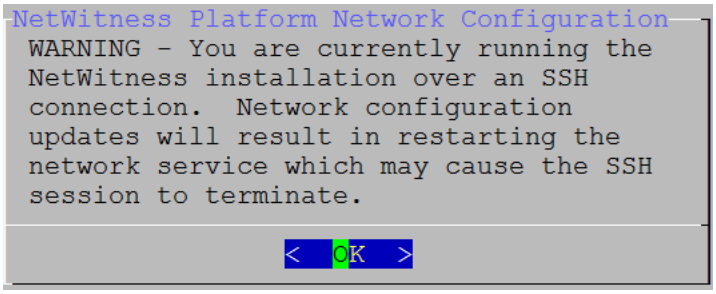


7. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**. If:

- The Setup program finds a valid IP address for this host, the following prompt is displayed.

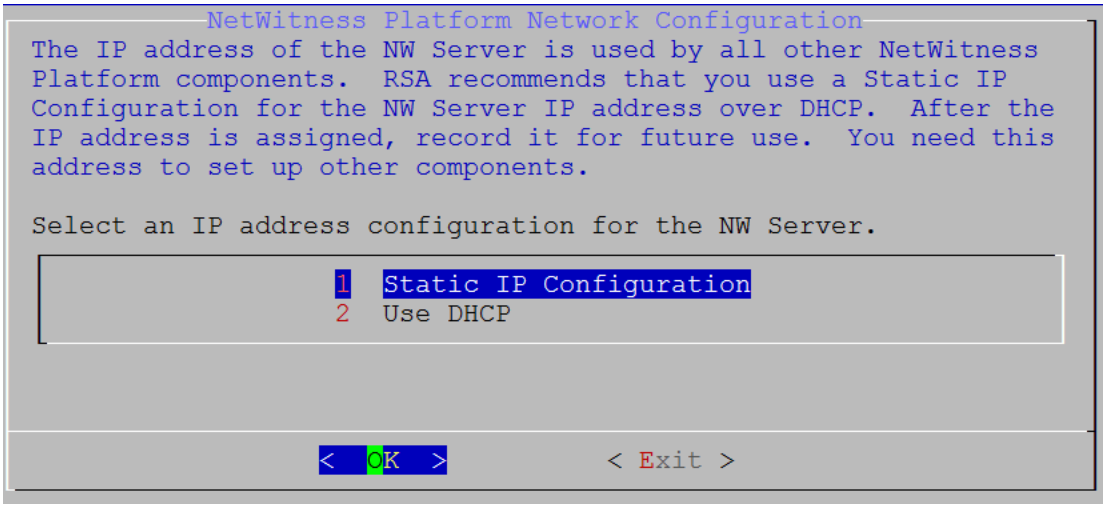


- Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** if you want to change the IP configuration found on the host.
- If you are using an SSH connection, the following warning is displayed. Press **Enter** to close warning prompt.



Note: If you connect directly from the host console, the following warning will not be displayed.

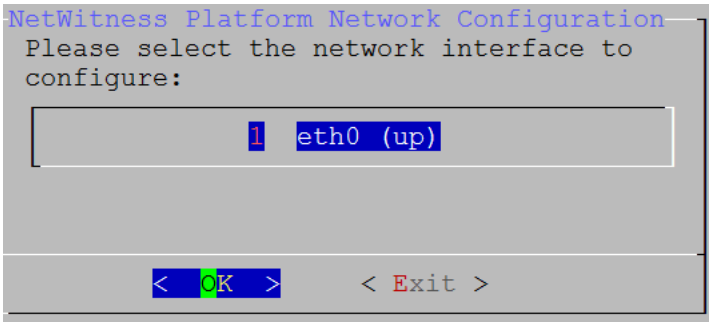
- If the Setup Program found an IP configuration and you chose to use it, the Update Repository prompt is displayed. Go to step 10 to complete the installation.
- If The Setup Program did not find an IP configuration or if you chose to change the existing IP configuration, the Network Configuration prompt is displayed.



8. Tab to **OK** and press **Enter** to use **Static IP**.

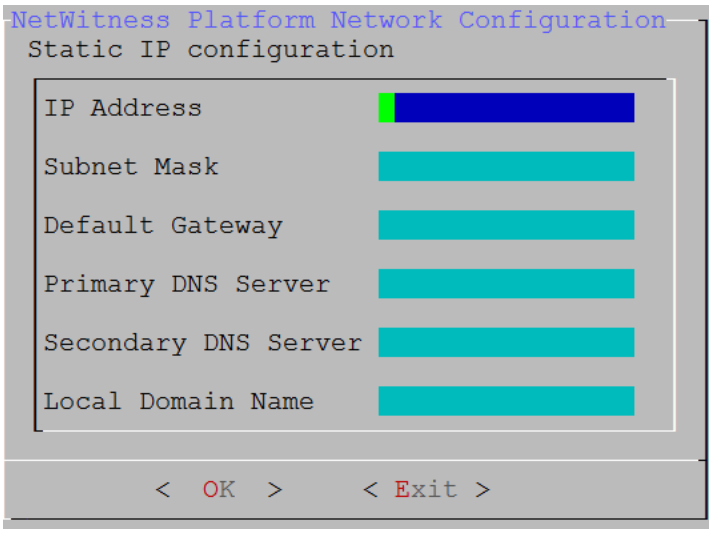
   If you want to use **DHCP**, press the down arrow to **2 Use DHCP** and press **Enter**.

The **Network Configuration** prompt is displayed.



9. Press the down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit**.

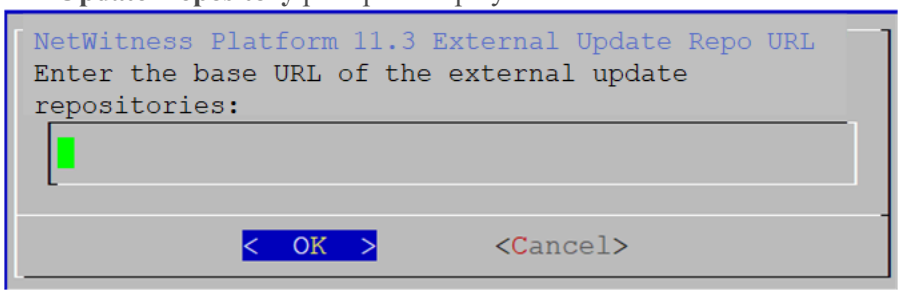
   The **Static IP Configuration** prompt is displayed.



10. Type the configuration values (using the down arrow to move from field to field), tab to **OK**, and press **Enter**.
    If you do not complete all the required fields, an **All fields are required** error message is displayed (**Primary DNS Server**, **Secondary DNS Server**, and **Local Domain Name** fields are not required.)
    If you use the wrong syntax or character length for any of the fields, an **Invalid*field-name*** error message is displayed.

Caution: If you select DNS Server, make sure that the DNS Server is correct and the host can access it before proceeding with the install.

The **Update Repository** prompt is displayed.



11. Apply the standard firewall configuration, press **Enter**.
    - Disable the standard configuration, tab to **Yes** and press **Enter**.
      The Disable Firewall prompt is displayed.

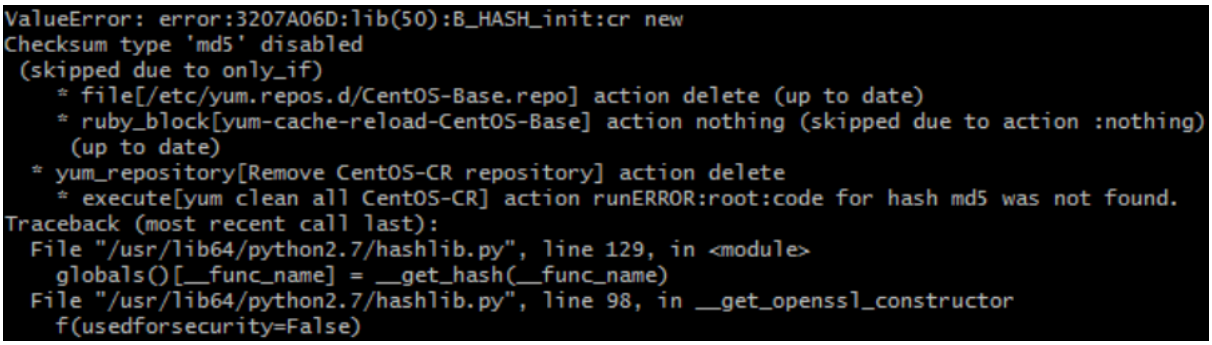
      
      The disable firewall configuration confirmation prompt is displayed.

      
    - Tab to **Yes** and press **Enter** to confirm (press **Enter** to use standard firewall configuration).
12. Press **Enter** to install 11.3 on the NW Server.

    The **Start Install** prompt is displayed.

    
    When **Installation complete** is displayed, you have installed the 11.3 NW Server on this host.

Note: Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



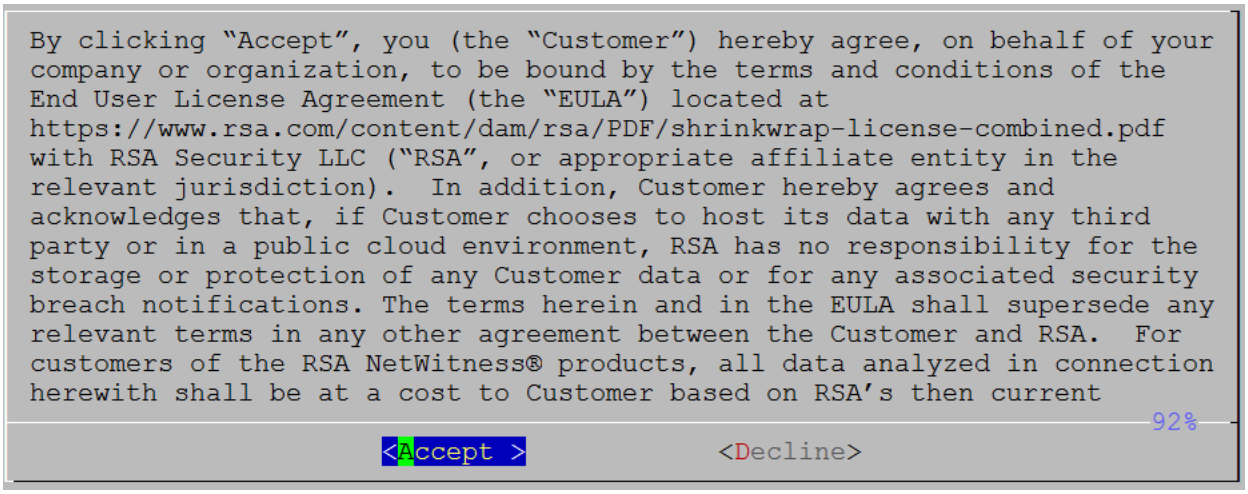
Task 2 - Install 11.3 on Other Component Hosts

Note: You can perform this task for RSA-11.3.0.0.10816-LITE instance.

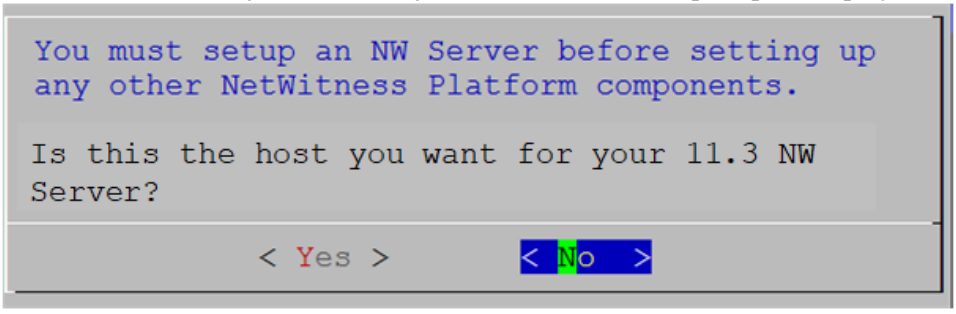
1. Run the `nwsetup-tui` command to set up the host.

This initiates the Setup program and the EULA is displayed.

Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press **Enter** to register your command response and move to the next prompt.
2.) The Setup program adopts the color scheme of the desktop or console you use access the host.
3.) If you specify DNS servers during Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` to proceed. Any misconfigured DNS servers cause the Setup to fail. If you need to reach DNS server after setup that unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see the "Post Installation Tasks" topic in the *Physical Host Installation Guide*..
If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Platform Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).

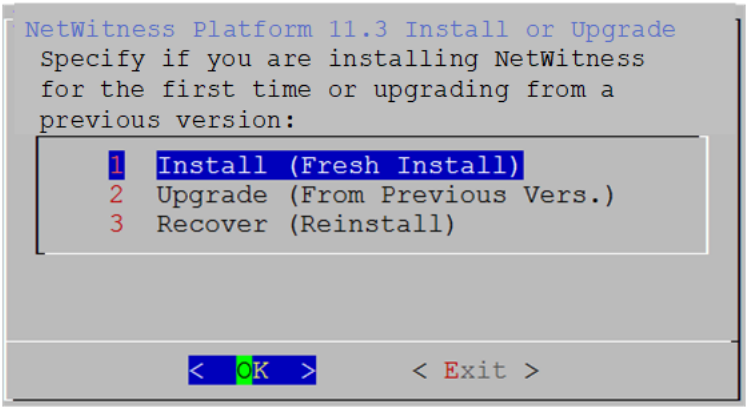


2. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 11.3 NW Server** prompt is displayed.

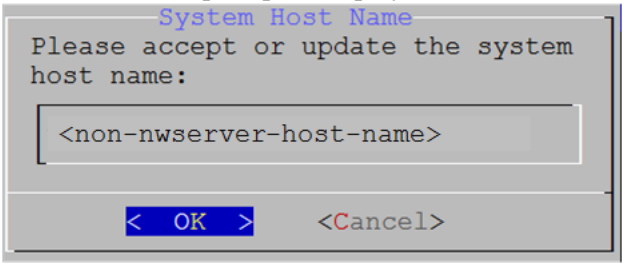


Caution: If you choose the wrong host for the NW Server and complete the Setup, you must restart the Setup Program (step 2) and complete all the subsequent steps to correct this error.

3. Press **Enter**(No).



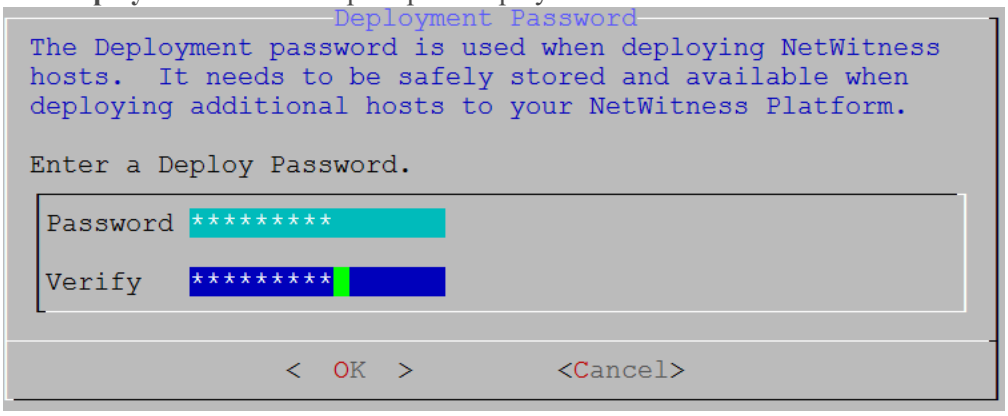
4. Press **Enter**. **Install (Fresh Install)** is selected by default.
The **Host Name** prompt is displayed.



Caution: If you include "." in a host name, the host name must also include a valid domain name.

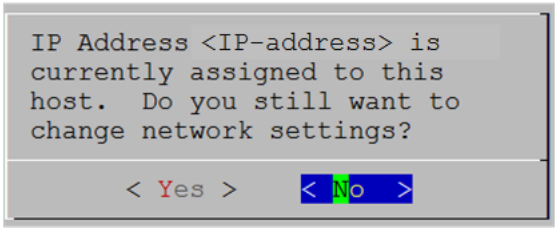
5. If want to keep this name, press **Enter**. If you want to change this name, edit it, tab to **OK**, and press **Enter**.

The **Deployment Password** prompt is displayed.



6. Type in the **Password**, press the down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

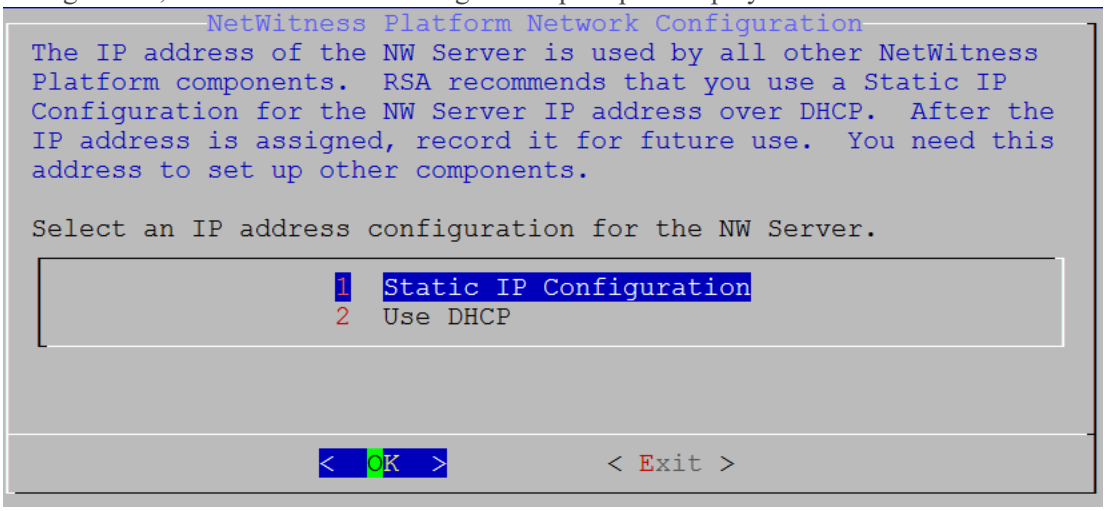
- If the Setup program finds a valid IP address for this host, the following prompt is displayed.



- Press **Enter** if you want to use this IP and avoid changing your network settings.
- Tab to **Yes** and press **Enter** if you want to change the IP configuration found on the host.
  If you are using an SSH connection, the following warning is displayed. Press **Enter** to close warning prompt.

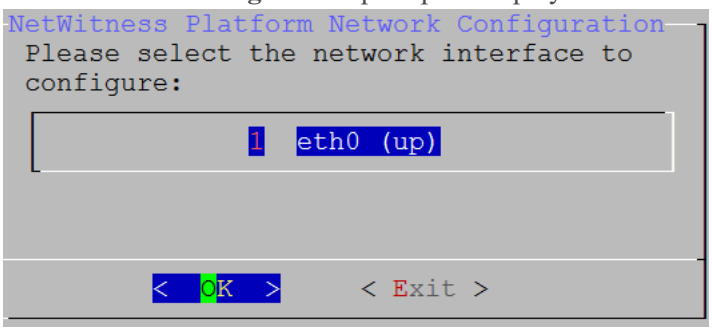
  If the Setup Program finds an IP configuration and you chose to use it, then the Update Repository prompt is displayed. Go to step 10 to complete the installation.

If the Setup Program does not find an IP configuration or if you chose to change the existing IP configuration, then the Network Configuration prompt is displayed.

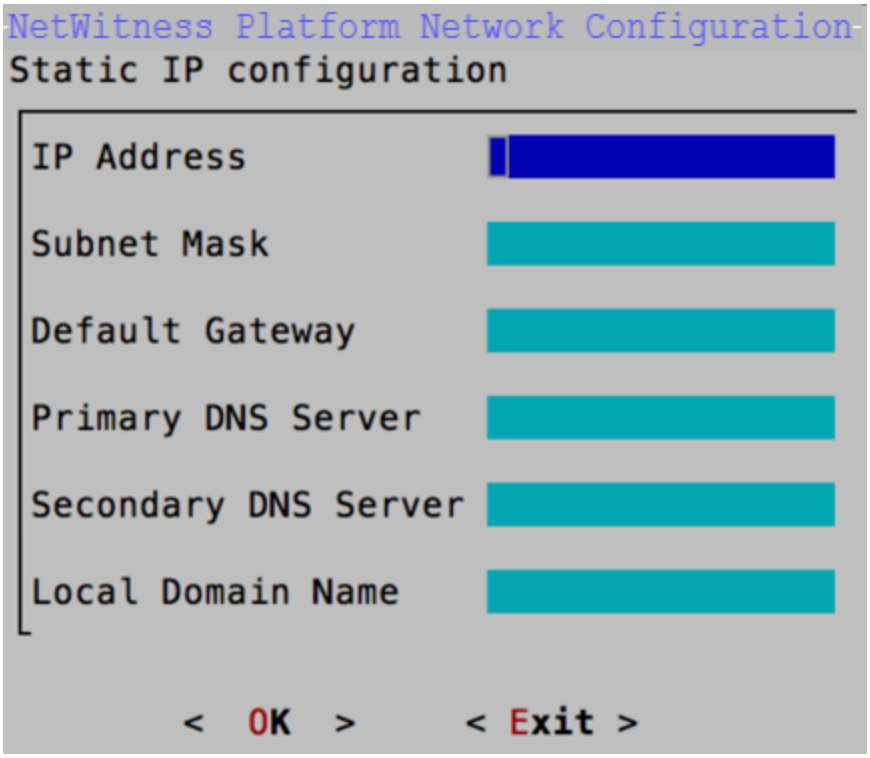


7. Tab to **OK** and press **Enter** to use **Static IP**.
   If you want to use **DHCP**, down arrow to 2 Use DHCP and press **Enter**.

The **Network Configuration** prompt is displayed.



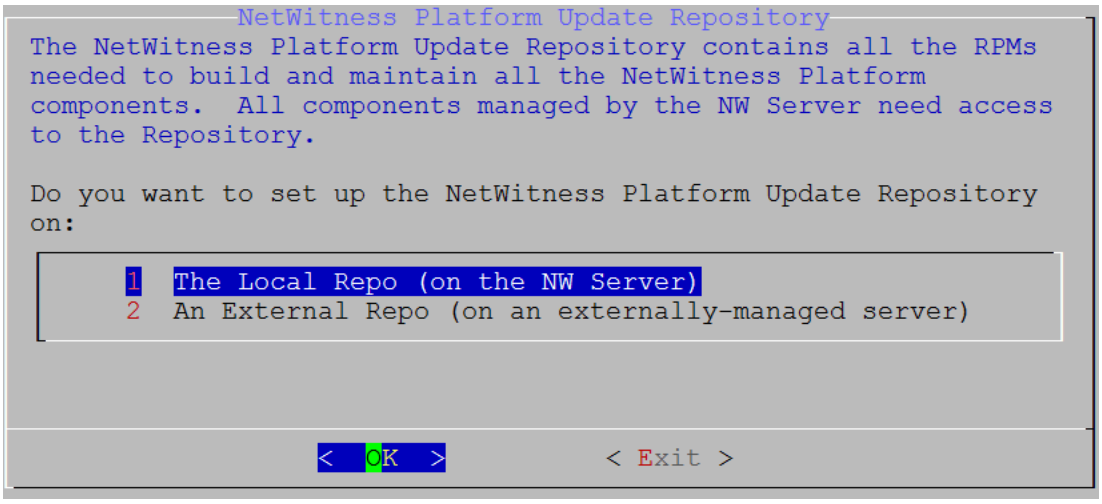
8. Press the down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit**.
   The **Static IP Configuration** prompt is displayed.



9. Type the configuration values (using the down arrow to move from field to field), tab to **OK**, and press **Enter**.
   If you do not complete all the required fields, an **All fields are required** error message is displayed (**Primary DNS Server**, **Secondary DNS Server**, and **Local Domain Name** fields are not required.)
   If you use the wrong syntax or character length for any of the fields, an **Invalid *field-name*** error message is displayed.

   Caution: If you select DNS Server, make sure that the DNS Server is correct and the host can access it before proceeding with the install.

10. The **Update Repository** prompt is displayed. Press **Enter** to choose the **Local Repo** on the NW Server.



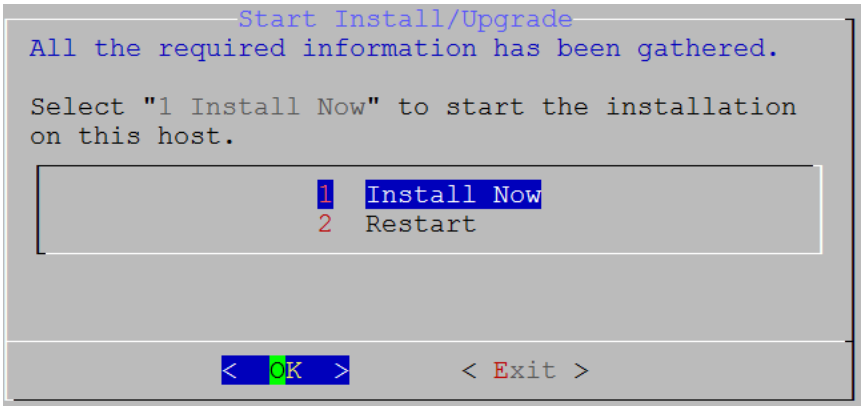
NetWitness Platform Update Repository
The NetWitness Platform Update Repository contains all the RPMs needed to build and maintain all the NetWitness Platform components. All components managed by the NW Server need access to the Repository.
Do you want to set up the NetWitness Platform Update Repository on:
1 The Local Repo (on the NW Server)
2 An External Repo (on an externally-managed server)
< OK >
< Exit >

11. To:
    - Apply the standard firewall configuration, press **Enter**.
    - Disable the standard configuration, tab to **Yes** and press **Enter**.
      The Disable firewall prompt is displayed.

      The disable firewall configuration confirmation prompt is displayed.

    - Tab to **Yes** and press **Enter** to confirm (press **Enter** to use standard firewall configuration).

12. The **Start Install** prompt is displayed.



13. Press **Enter** to install 11.3 on the NW Server.

    When **Installation Complete** is displayed, you have installed the 11.3 NW Server on this host.

> **Note:** Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.

Configure Hosts (Instances) in NetWitness Platform

Configure individual hosts and services as described in RSA NetWitness® Platform *Host and Services Configuration Guide*. This guide also describes the procedures for applying updates and preparing for version upgrades.

Note: After you successfully launch an instance, AWS assigns a default hostname to it. For more information on how to change a hostname, see "Change the Name and Hostname of a Host" documentation on RSA Link (https://community.rsa.com).

Configure Packet Capture

You can integrate any of the following Third-Party solutions with the Packet Decoder to capture packets in the AWS cloud:

- Gigamon® GigaVUE
- Ixia CloudLens™
- f5® BIG-IP

Integrate Gigamon GigaVUE with the Packet Decoder

There are two main tasks to configure the Gigamon® third-party Tap vendor packet capture solution:

Task 1. Integrate the Gigamon® solution.

Task 2. Configure a tunnel on Packet Decoder.

Task 1. Integrate the Gigamon Solution

Gigamon® Visibility Platform on AWS will be available through the AWS Marketplace and activated by a BYOL license. A thirty-day free trial is also available.

For more information on the Gigamon® solution, see "Gigamon® Visibility Platform for AWS Data Sheet"https://www.gigamon.com/sites/default/files/resources/datasheet/ds-gigamon-visibility-platform-for-aws-4095.pdf.

For more information on the deployment details, see "Gigamon® Visibility Platform for AWS Getting Started Guide" https://www.gigamon.com/sites/default/files/resources/deployment-guide/dg-visibility-platform-for-aws-getting-started-guide-4111.pdf.

After the “Monitoring Session” is deployed within the Gigamon GigaVUE-FM, you can configure the Packet Decoder Tunnel.

Task 2. Configure Tunnel on the Packet Decoder

1. SSH to the Decoder.
2. Submit the following command strings.

```
$ sudo ip link add tun0 type gretap local any remote <ip_address_of_
VSERIES_NODE_TUNNEL_INTERFACE> ttl 255 key 0

$ sudo ip link set tun0 up mtu <MTU-SIZE>

$ sudo ifconfig (to verify if the tunnel tun0 is being listed in the list
of interfaces)

$ sudo lsmod | grep gre ( to make sure if the below kernel modules are
running:

ip_gre 18245 0

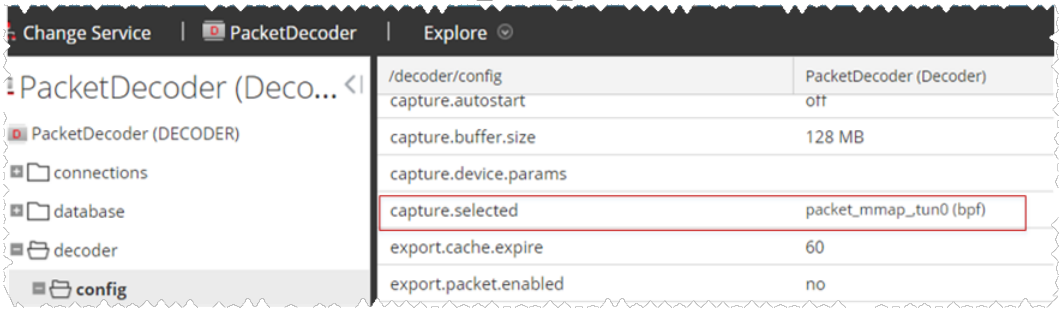
ip_tunnel 25216 1)

If they are not running then execute the below commands to enable the
modules

$ sudo modprobe act_mirred

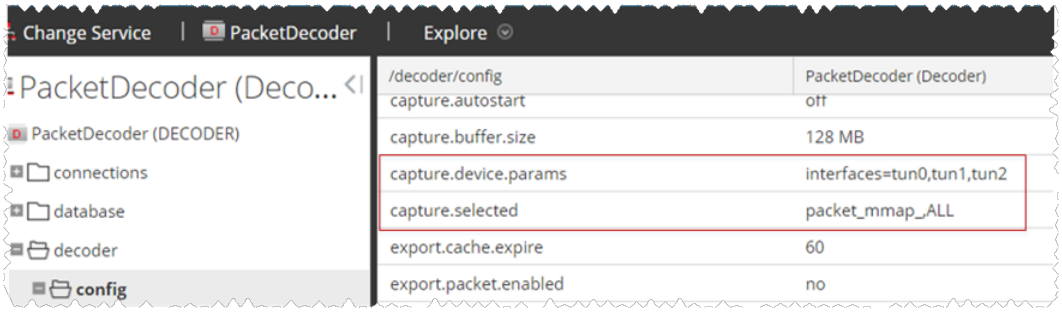
$ sudo modprobe ip_gre
```

3. Create a firewall rule in the Packet Decoder to allow traffic through the tunnel.
   a. Open the `iptables` file.
      `vi /etc/sysconfig/iptables`
   b. Append the line `-A INPUT -p gre -j ACCEPT` before the `commit` statement
   c. Restart `iptables` by executing the following commands.
      `service iptables restart`
      `service ip6tables restart`
4. Set the interface in the Packet Decoder.
   a. Log in NetWitness Platform, select the `decoder/config` node in Explorer view for the Packet Decoder service.
   b. Set the `capture.selected` = `packet_mmap_,tun0`.



5. (Conditional) - If you have multiple tunnels on the Packet Decoder.
   a. Restart Decoder service after you create the tunnel in Packet Decoder.
   b. Log in to NetWitness Platform, select the `decoder/config` node in Explorer view for the Packet Decoder service, and set the following parameters.

      ```
      capture.device.params = interfaces=tun0,tun1,tun2
      capture.selected = packet_mmap_,All
      ```



6. Restart decoder service.

   ```
   $ sudo restart nwdecoder
   ```

   The user should be all set to capture the network traffic in Decoder.

Integrate Ixia with the Packet Decoder

You must complete the following tasks to integrate the Packet Decoder with Ixia CloudLens.

Task 1. Deploy Client Machines

Task 2. Create CloudLens Project

Task 3. Install Docker Container on Decoder

Task 4. Install Docker Container on Clients

Task 5. Map Packet Decoder to Ixia Clients

Task 6. Validate CloudLens Packets Arriving at Decoder

Task 7. Set Interface in Packet Decoder

Task 1. Deploy Client Machines

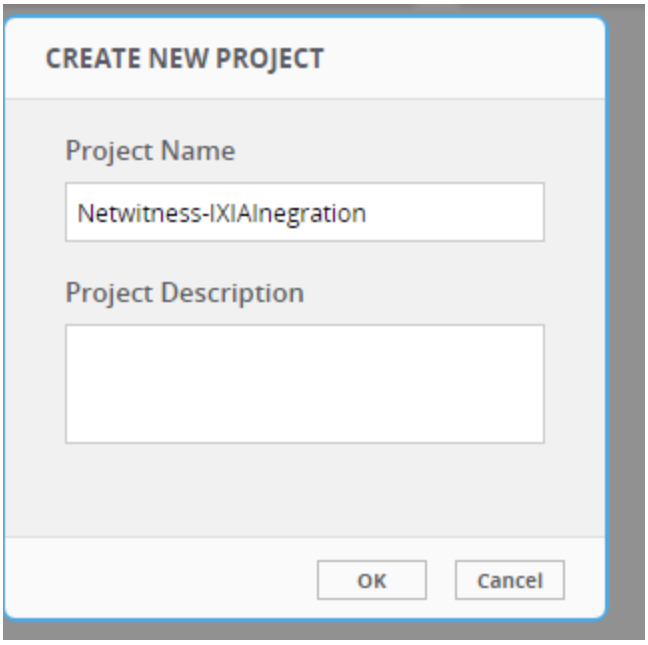
- Deploy client machines onto which you want to route the traffic to the Packet Decoder. See the Ixia CloudLens documentation (https://www.ixia.cloud/help/Default.htm) for specifications needed for supported client machines.
- For Client Machines (as well as Decoder machine) the following ports must be opened on AWS Security Group Inbound Rules; UDP 19993 from all, TCP 22 from Admin IP.

Task 2. Create CloudLens Project

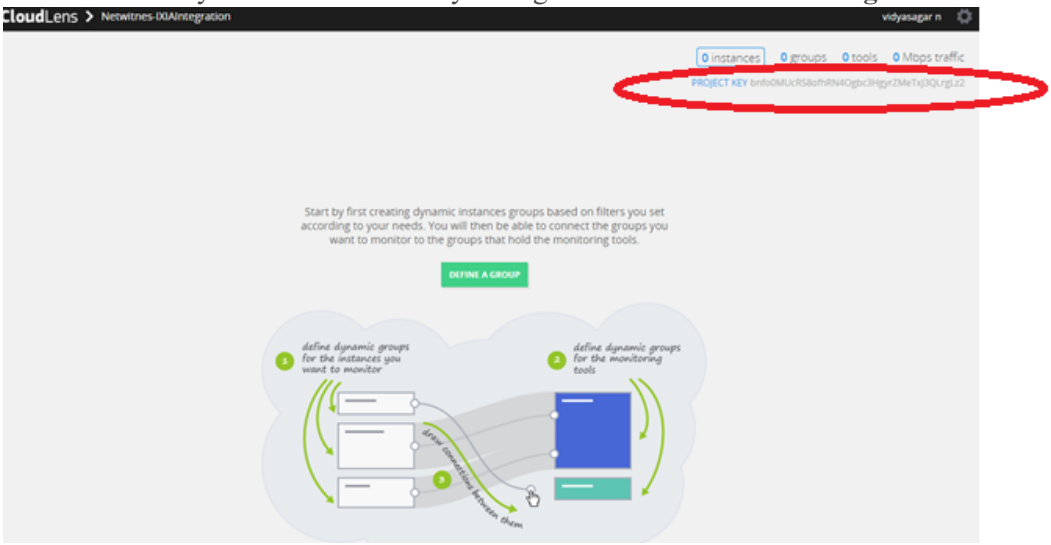
Complete the following steps to create a new project and get your project key.

1. Get Cloudlens login credentials and access to a free trial.
   a. Create an Ixia login account at https://www.ixiacom.com/products/cloudlens-trial-a.

2. Go to the Cloudlens public site (https://www.ixia.cloud).
3. Click + (add) to create a new project with a name of your choosing (for example, **Netwitness-IxiaIntegration**).



4. Click on your newly created project and make note of your Project Key.
   You need the key later for the API key configured on the **Host & Tool agents**.



Task 3. Install Docker Container on Decoder

Complete the following steps to install the Docker container onto the Packet Decoder.

1. SSH to the Packet Decoder.
2. Enter the following commands to complete the install the Docker service on the Decoder.

```
#yum clean all
# yum -y install docker
```

3. Enter the following command string to start the Docker service.
   ```
   # service docker start
   ```
4. Enter the following commands to:
   - Access the Ixia repository and obtain the cloudlens-agent container.
   - Replace the **ProjectKeyFromIxiaProjectPortal** variable, which identifies your project key in Ixia portal, with the Project Key you created in Task 2. Create CloudLens Project.

```
sudo docker run \
--name cloudlens \
 -v /:/host \
-v /var/run/docker.sock:/var/run/docker.sock \
-d --restart=always \
--net=host \
--privileged \
ixiacom/cloudlens-agent:latest \
--server agent.ixia.cloud \
--accept_eula y \
--apikey ProjectKeyFromIxiaProjectPortal \
```

Task 4. Install Docker Container on Clients

Complete the follow steps to Y install the Docker Container onto the client machines for which you want to route the traffic to the Packet Decoder.

1. SSH to the AWS Client instance.
2. Enable root access to OS CLI (for example `sudo su -`).
3. Enter the following commands to install Docker.
   ```
   # yum -y install docker
   ```
   Caution: The above example of the installed docker engine is for CentOS7. The instructions may vary slightly for different Linux Distributions. For more information, see the Docker docs at https://docs.docker/install.
4. Enter the following commands to start the Docker service.
   ```
   # service docker start
   ```
5. Enter the following commands to:
   - Access the Ixia repository and obtain the **cloudlens-agent** container.
   - Replace the variable **ProjectKeyFromIxiaProjectPortal**, which identifies your project key in Ixia portal, with the Project Key you created in the previous section.
     ```
     sudo docker run \
     --name cloudlens \
      -v /:/host \
     -v /var/run/docker.sock:/var/run/docker.sock \
     -d --restart=always \
     --net=host \
     --privileged \
     ixiacom/cloudlens-agent:latest \
     --server agent.ixia.cloud \
     ```

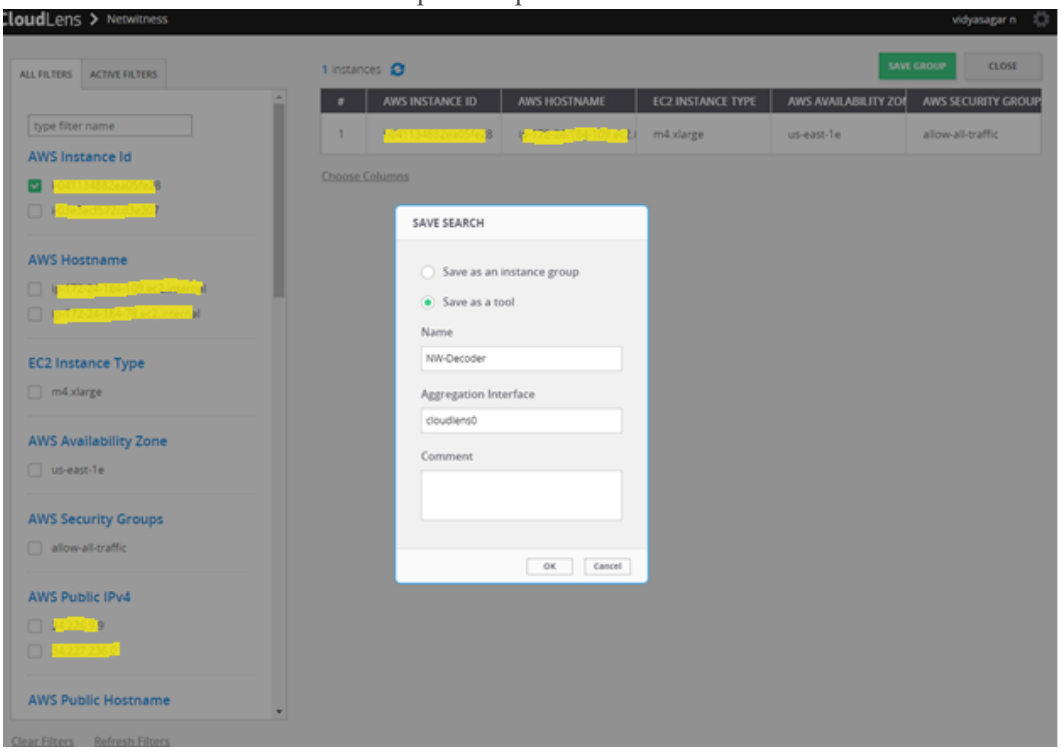
```
--accept_eula y \
--apikey ProjectKeyFromIxiaProjectPortal \
```

Warning: If you cut and paste commands from a PDF, first paste them into a test editor such as Notepad to confirm the syntax before pasting into the OS CLI. Direct cut and paste between PDF and CLI can contain dashes or other special characters that should not be part of the commands.

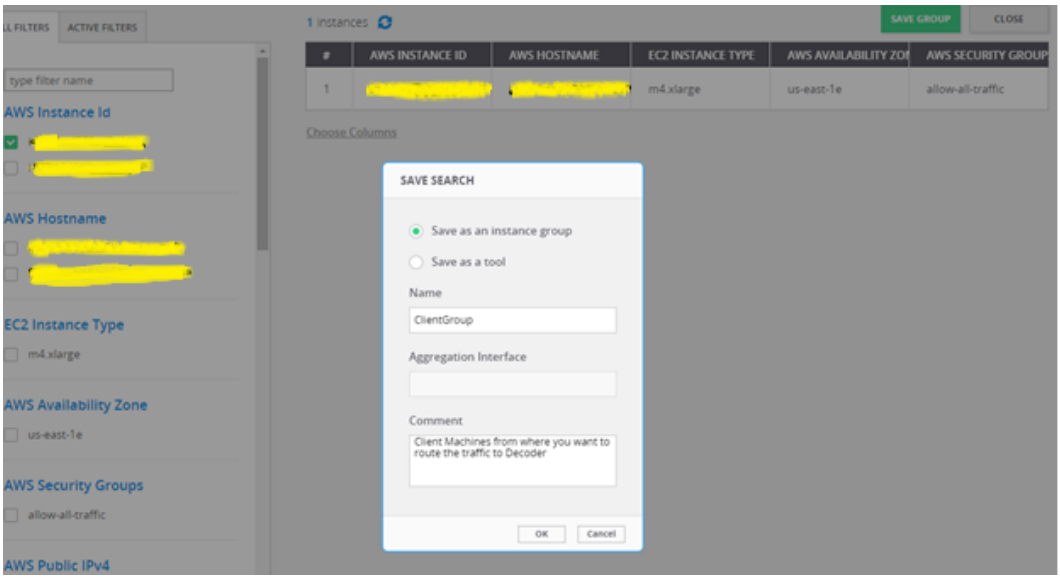
Task 5. Map the Packet Decoder to Ixia Clients

Complete the following steps to map the Packet Decoder to the client machines to route the traffic to the Packet Decoder.

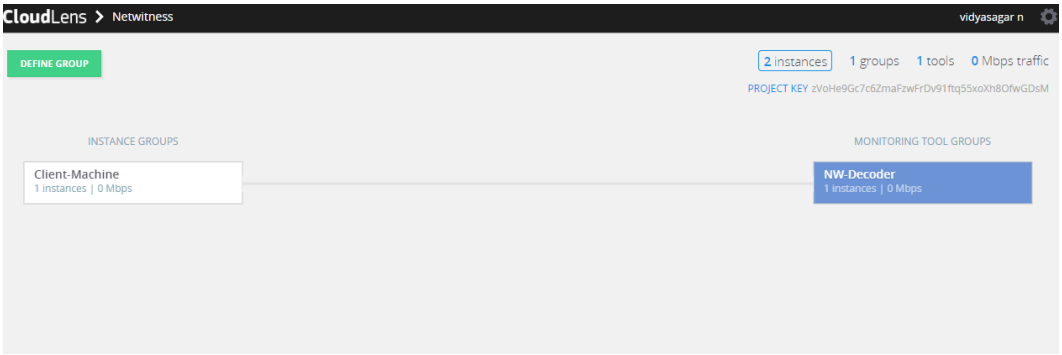
1. Go to the Cloudlens public site (https://www.ixia.cloud).
2. Double-click on your project to open it.
3. Click the **Define Group** button or the Instances count.
   You should see two instances listed, one for your decoder and the other for the client machines.
4. Filter for the decoder instance and click **Save Search**.
5. Choose **Save as a tool**.
6. Specify a name for the tool, and the **Aggregation Interface**.
   Use a meaningful name for the Aggregation Interface (for example **cloudlens0**. This is a virtual interface that appears in the OS where your Tool is installed. You need to instruct your tool to 'listen' to that interface in a subsequent step.



7. Filter the client host instance from the list, and click **Save Search**.



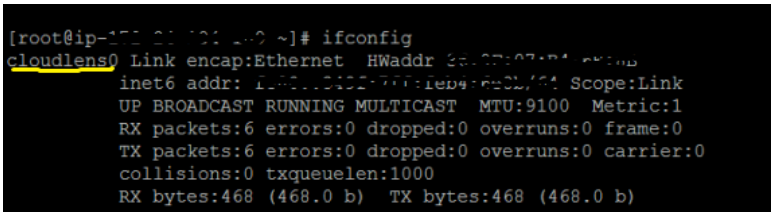
8. Navigate back to the top-level view of the project.
   Your client machine instance and Decoder instance are now displayed.
9. Drag a connection between the your client machine instance and Decoder instance to allow the flow of packets.



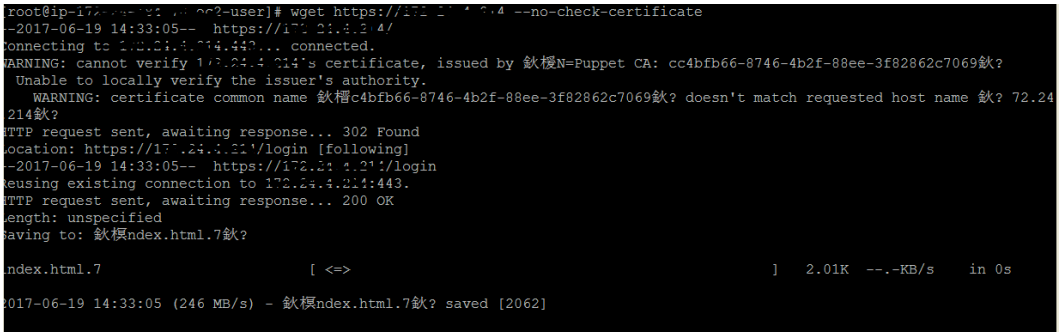
Task 6. Validate CloudLens Packets Arriving at Decoder

Complete the following steps to validate that packets are actually arriving at the Packet Decoder.

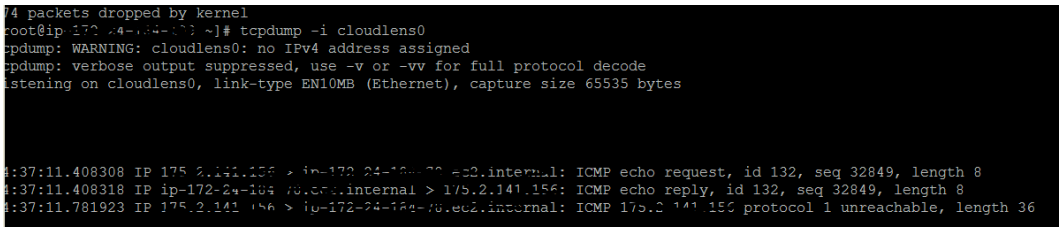
1. SSH to the Packet Decoder.
2. Enter the following command.
   `ifconfig`
   The new aggregation interface you created is displayed.



3. Generate traffic from the client OS instance CLI (for example, `wget http://www.google.com/`).



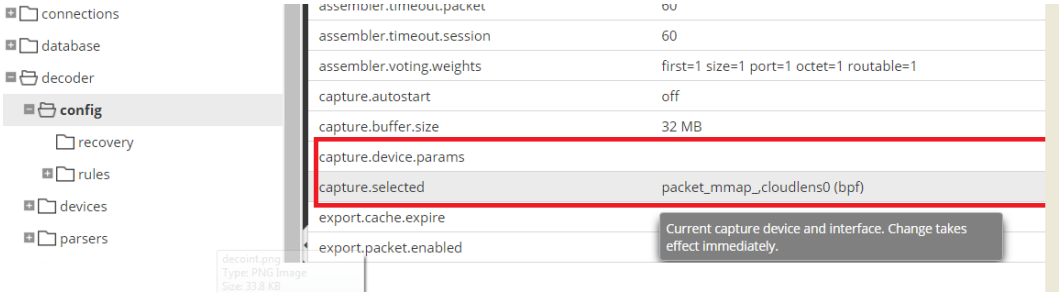
4. SSH to Packet Decoder to go to your Packet Decoder instance CLI.
5. Enter the following commands to look for suitable results in the tcpdump.
   `tcpdump -I Cloudlens0`



Task 7. Set the Interface in the Packet Decoder

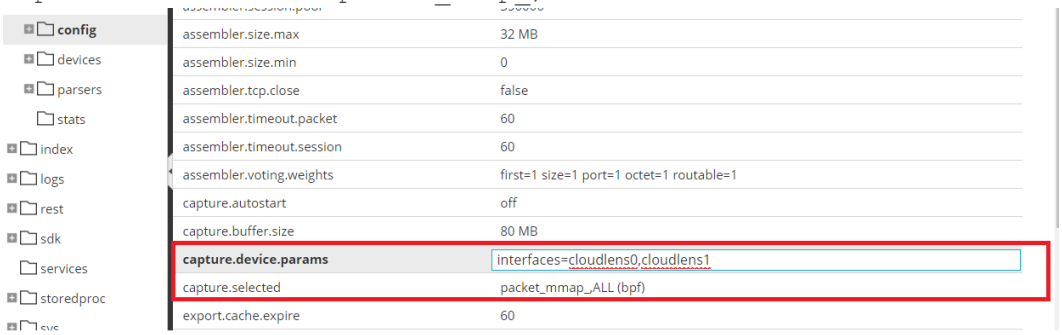
Complete the following steps in the Packet Decoder to set the interface to use for the Ixia integration.

1. SSH to the Packet Decoder.
2. Enter the following commands to restart decoder service.
   `$ sudo restart nwdecoder`
   The Packet Decoder is now set to capture network traffic.
3. Log in to NetWitness Platform and click **Administration > Services**.
4. In the Admin Services view, select a Decoder service and click > **View > Explore**.
5. Expand the **decoder** node and click **config** to view the configuration settings.
6. Set the **capture.selected** parameter to the following value.
   packet_mmap_,cloudlens0(bpf)



7. (Conditional) - If you have multiple capture interfaces on the Packet Decoder, set the parameters with the following values.

```
capture.device.params --> interfaces=cloudlens0,cloudlens1
capture.selected --> packet_mmap_,All
```



8. Restart the Decoder service after you set the **capture.selected** parameter.

Integrate f5® BIG-IP with the Packet Decoder

IG-IP Virtual Edition (VE) is an inline virtual server and load balancer. A common use case would be for the f5® box to be a virtual web server that presents a single IP address / host name that manages requests to a pool of web servers in the cloud.

All traffic to RSA NetWitness® Platform flows through the f5® BIG-IP VE virtual server.

The virtual server functions of the BIG-IP clone all traffic to a designated computer by re-writing mac addresses and loading them into a subnet shared with the destination sniffer. This guide describes how to set up the Decoder as the sniffer.

f5® BIG-IP VE Deployment Information

f5® BIG-IP VE on AWS will be available through the AWS Marketplace and activated by a BYOL license. A thirty-day free trial is also available.

For more information on this solution refer to the f5® BIG-IP DNS Data Sheet (https://www.f5.com/pdf/products/big-ip-dns-datasheet.pdf).

Task 1: Set Up a BIG-IP VE Virtual Server Instance

Set up a BIG-IP VE Virtual Server Instance according to the instructions in the "BIG-IP Virtual Edition 12.1.0 and Amazon Web Services: Multi-NIC Manual" (https://support.f5.com/kb/en-us/products/big-ip_ltm/manuals/product/bigip-ve-multi-nic-setup-amazon-ec2-12-1-0.html). Complete all the steps through the last steps, "Creating a virtual server."

This virtual server performs packet capture. You may need to create multiple virtual servers to depending on your volume.

As part of creating the virtual server, you must have at least one server in your NetWitness Platform domain to handle the traffic routed by the virtual server (for example, you can create another instance in AWS to host the internal server).

Task 2: Create a Clone Pool

1. Make sure that your Decoder has a network interface on the same subnet as one of the network interfaces on the BIG-IP VE instance.
   The clone pool sends packets to the Decoder by rewriting MAC addresses and sending them out a network interface. MAC address rewriting can be used to route packets to another subnet.
2. Set up the clone pool within the BIG-IP VE virtual server according to the instructions in "K13392: Configuring the BIG-IP system to send traffic to an intrusion detection system (11.x - 13.x)" article (https://support.f5.com/kb/en-us/solutions/public/13000/300/sol13392.html).
   This document explains how to create the clone pool, and how to make an existing virtual server copy traffic to the clone pool. In this case, we will place the Decoder instance in the clone pool.

Guidelines

The following guidelines will help you to configure packet capture correctly using BIG-IP VE.

- The Decoder instance must have its own IP address on one of the same subnets as BIG-IP VE. BIG-IP uses that IP address to identify the Decoder as being part of the clone pool.
- When adding the Decoder instance to the clone pool, BIG-IP asks for a port number in addition to the IP address. This port number does not matter for the cloned traffic. The Decoder will receive all the cloned traffic, regardless of what port number was used here.
- By default, the AWS subnet shared by the Decoder and BIG-IP VE will not allow the cloned traffic to travel from the BIG-IP VE interface to the Decoder interface. You must disable the **`source/dest. check`** on both the Decoder and BIG-IP VE network interfaces in AWS.
- The Decoder instance must have a single network interface, eth0, by default. The Decoder captures traffic on this interface, but it may also receive administrative traffic on this interface. RSA recommends using network rules to filter out ssh and nwdecoder traffic from the capture stream. These are ports 22 (ssh) and 50004/56004 (nwdecoder).

Troubleshooting Tips

There are areas to troubleshoot if packets are not being accepted by the Decoder.

- Make sure that the BIG-IP VE is sending the packets out of the correct interface.
  The BIG-IP VE instance contains tcpdump. Use it to verify the cloned packets are being sent out the expected interface. If they are not, there is a problem in the setup of the clone pool or the virtual server.
- Make sure that the Decoder is receiving packets.
  The Decoder has `tcpdump` installed on it. Use it to verify that the Decoder is receiving packets. If the Decoder is not capturing packets, make sure that
  - The AWS **`source/dest. check`** is turned off.
  - The Decoder is on the same subnet as the interface the BIG-IP VE is using to clone packets.

AWS Instance Configuration Recommendations

Note: These recommendations can be used as a baseline for 11.3.0.0 and adjusted as needed.

Note: For a description of terms and abbreviations used in this topic, refer to Abbreviations and Other Terminology Used in this Guide.

This topic contains the minimum AWS instance configuration settings recommended for the RSA NetWitness® Platform virtual stack components.

- EC2 Instance:
  - Minimum instance type - **m4-2xlarge** is the minimum instance type required for any NetWitness Platform component AMI so that it can function.
  - Instance type adjustments -you must adjust instance types according to your ingestion rate, content and parsers, dashboard reports, scheduled reports, investigations, and active users.
  - Recommended settings - the recommended settings in the SA component instance tables below were calculated under the following conditions.
    - Ingestion rates of 15,000 EPS and 1.5 Gbps were used.
    - All the components were integrated.
    - The Log stream includes a Log Decoder, Concentrator, and Archiver.
    - The Packet stream includes a Packet Decoder and Concentrator.
    - The Endpoint Hybrid stream includes a Endpoint Server, Concentrator and Log Decoder.
    - Respond was receiving alerts from the Reporting Engine and Event Stream Analysis.
    - The background load includes reports, charts, alerts, investigation, and respond.
- EBS Volumes (Storage)

  Contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) for assistance on how to increase the number of volumes based on your storage requirements using the RSA Sizing & Scoping Calculator.

  Note: The Concentrator index volume must be allocated on Provisioned IOPS SSD.

Contents

Introduction **7**

CentOS6 to CentOS7 Upgrade 7

RSA NetWitness® Platform 11.3 Upgrade Path 8

Hardware, Deployments, Services, and Features Not Supported in 11.3 8

Event Stream Analysis (ESA) Upgrade Considerations 8

User Attribute and Role Changes Affecting Investigate 9

Contact Customer Support 10

Upgrade Preparation Tasks **11**

General 11

Task 1 - Review Core Ports and Open Firewall Ports 11

Task 2 - Record Your 10.6.6.x admin user Password 12

Task 3 - Create a Backup of the /etc/fstab File 12

Task 4 - Make Sure Password Strength Settings Check Boxes Are Set in 10.6.6.x 12

Task 5 (Conditional) - Extract 10.6.x Public Key Infrastructure (PKI) Certificates 13

Event Stream Analysis (ESA) 16

Task 6 (Conditional) - Record Any String Array Type Meta Keys on the Event Stream Analysis Service 16

Respond 16

Task 7 - Check Aggregation Rules Match Conditions for “Domain” or “Domain for Suspected C&C” 16

Task 8 - Set Data Retention Run Interval to ≥ 24 Hours 17

Reporting Engine 18

(Conditional) Task 9 - Unlink External Storage 18

Warehouse Connector 19

(Conditional) Task 10 - Copy keytab files in root or etc Directory Stored in Other Directory 19

Other Tasks 19

Backup Instructions **20**

Task 1 - Set up an External Host for Backing up Files 21

Task 2 - Create a List of Hosts to Back up 22

Troubleshooting Information 23

Task 3 - Set up Authentication Between Backup and Target Hosts 25

Task 4 - Check for Backup Requirements for Specific Types of Hosts 25

For All Host Types 25

For Decoder, Concentrator, or Broker Hosts: Stop Data Capture and Aggregation 26

Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh 26

For Integrations with Web Threat Detection, Archer Cyber Incident & Breach Response or 27

NetWitness Endpoint: List RabbitMQ Usernames and Passwords
For Bluecoat Event Sources 27
Task 5 - Check for Adequate Space for the Backup 28
Task 6 - Back up Your Host Systems 29
Post Backup Tasks 31
Task 1 - Save a Copy of the all-systems File and the Backup Tar files 31
Task 2 - Ensure Required Backup Files Were Generated 31
(Conditional) Task 3 - For Multiple ESA Hosts, Copy mongodb tar files to Primary ESA Host 32
Task 4 - Ensure All Required Backup Files are on Each Host 32
Migrate Disk Drives from 10.6.6.x to 11.3 35
Task 1 - Backup the 10.6.6.x EC2 appliance 35
(Optional) Task 2 - Run the backup script to take backup data of 10.6.6.x instance 36
Task 3 - Stop the instances and detach volumes from 10.6.6.x instances 37
Task 4 - Note the IP addresses of 10.6.6.x instances and then terminate the EC2 instances 38
Task 5 - (IP retention) Create 11.3 instances using 11.3 AMI. 38
Task 6 - Attach volumes to the corresponding 11.3 instance 39
Task 7 - Restore backup data in 10.6.6.x to 11.3 Instances (Data Restoration) 40
Task 8 Run nwsetup-tui script 42
Set Up Virtual Hosts in 11.3 43
Phase 1 - Set Up NW Server, Event Stream Analysis, Malware Analysis, and Broker or Concentrator Hosts 43
Task 1 - Set Up 11.3 NetWitness Server 43
Task 2 - Setup 11.3 ESA 43
Task 3 - Set Up 11.3 Malware Analysis 43
Task 4 - Set Up 11.3 Broker or Concentrator 43
Phase 2 - Set Up The Rest of the Component Hosts 44
Decoder and Concentrator Hosts 44
Log Decoder Host 44
Virtual Log Collector Host 44
Set Up 11.3 NW Server Host 45
Set Up 11.3 Non-NW Server Host 50
Update or Install Legacy Windows Collection 56
Post Upgrade Tasks 57
General 57
Task 1 - Remove Backup-Related Files from Host Local Directories 57
Task 2 - Make Sure Port 15671 Is Configured Correctly 58
(Optional) Task 3 - Reissue Certificates for Your Hosts 58
(Conditional) Task 4 - Restore Custom Analysts Roles 58
(Conditional) Task 5 - If NetWitness Platform Has No Web Access, Upload Response .bin File Again (License Server) 58

Task 6 - Migrate Active Directory (AD) 58
Task 7 - Modify Migrated AD Configuration to Upload Certificate 59
Task 8 - Reconfigure Pluggable Authentication Module (PAM) in 11.3 59
Task 9 - Restore NTP Servers 59
Task 10 - Restore Licenses for Environments without FlexNet Operations-On Demand Access 59
(Conditional) Task 11 - If You Disabled Standard Firewall Config - Add Custom IPtables 60
(Conditional) Task 12 - Specify SSL Ports If You Never Set Up Trusted Connections 60
Task 13 (Conditional) Reconfigure Public Key Infrastructure (PKI) Certificates 61
Event Stream Analysis (ESA) 61
Task 14 - Reconfigure Automated Threat Detection for ESA 61
Task 15 (Conditional) Verify String Array Type Meta Keys on the ESA Correlation Service 62
Task 16 (Conditional) Update RSA Live ESA Rules with Meta Type Changes from String to Array 62
Task 17 (Conditional) - Verify ESA Rule Deployment 63
Investigate 63
Task 18 - Make Sure Customized User Roles Have Investigate-server Permissions for Event Analysis Access 63
Log Collection 65
Task 19 - Reset Stable System Values for Log Collector after Upgrade 65
Task 20 - (Conditional) Update SSHD Configuration after Upgrade with Older Windows and UNIX SFTP Agents 65
Task 21 - Enable FIPS Mode 66
Log Decoder and Decoder 66
(Conditional) Task 23 - Enable Metadata for GeoIP2 Parser 66
Malware Analysis 67
Task 24 - Enable Threat - Malware Indicators Dashboard 67
Reporting Engine 67
(Conditional) Task 25 - Restore the CA certificates for External Syslog Servers for Reporting Engine 67
(Conditional) Task 26 - Restore External Storage for Reporting Engine 67
Respond 68
Task 27 - Restore Respond Service Custom Keys 68
Task 28 - Restore Customized Respond Service Normalization Scripts 68
Task 29 - Add Respond Notification Settings for Custom Roles 69
Task 30 - Manually Configure Respond Notification Settings 69

Introduction

The instructions in this guide apply to the upgrade of AWS for RSA NetWitness Platform 10.6.6.x to 11.3 exclusively.For instructions on how to upgrade your 10.6.6.x physical hosts to 11.3See the *RSA NetWitness Platform Physical Host Upgrade Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.This document assumes that the appliances are in AWS cloud.

NetWitness Platform 11.3 is a major release that affects all products in the NetWitness Platform suite. The components of the suite are the NetWitness Server (NW Server), Archiver, Broker, Concentrator, Context Hub, Decoder, Endpoit Log Hybrid, Endpoint Broker, User Entity Behavior Analytics , Event Stream Analysis, Investigate, Log Collector, Log Decoder, Malware Analysis, Reporting Engine, Response, and Workbench.

CentOS6 to CentOS7 Upgrade

NetWitness Platform 11.3 is a major release that involves upgrading to a newer version of the operating system (CentOS6 to CentOS7). In addition, the 11.3 platform environment is improved to accommodate current and future physical and virtual deployment types. These changes require an upgrade to the new environment and an upgrade of the functionality.

RSA NetWitness® Platform 11.3 Upgrade Path

The supported upgrade path for RSA NetWitness® Platform 11.3 is Security Analytics 10.6.6.x. If you are running a version of NetWitness Platform that is prior to 10.6.6.x, you must update to 10.6.6.x before you can upgrade to 11.3. For more information, see the *RSA Security Analytics 10.6.6 Update Guide* on RSA Link.

Caution: There is a known issue if you have Active Directory users configured in 10.6.6.x. You have two options to address this issue:
• Apply the 10.6.4.2 patch before you back up your data for the 11.3 upgrade.

Note: If you are updating from 11.0 to 11.3, see *Update Guide for Version 11.1 to 11.3* on RSA link.

Hardware, Deployments, Services, and Features Not Supported in 11.3

RSA does not support upgrade of the following hardware, deployments, services, and features to 11.3.

- RSA All-in-One (AIO) Appliance
- Multiple NetWitness Server Deployment
- Malware Analysis service co-located on the SA Server (Upgrade of Malware Analysis Enterprise is supported in 11.0.)
- Custom Health & Wellness policy in 10.6.x for the Context Hub Service
  After you upgrade to NetWitness 11.3, your custom policy is not present. Instead for version 11.3, there is an OOTB Context hub Server Monitoring Policy in the user interface.
- Defense Information Strategic Agency-Security Technical Information Guide (DISA-STIG) hardened deployments.
- Warehouse Analytics (Data Science)

Event Stream Analysis (ESA) Upgrade Considerations

In RSA NetWitness® Platform 11.3, RSA changed how ESA Correlation Rules store and transmit the alerts the system generates. In 11.0, ESA sends all alerts to a central Alert system. The local mongo storage in ESA 10.6.4.x is removed.

Caution: If you have not used Incident Management in 10.6.4.x, carefully consider whether or not to upgrade to version 11.0.

The following guidelines help you determine whether or not to upgrade your ESA hosts to 11.3.

In your 10.6.4.x deployment, if you have:

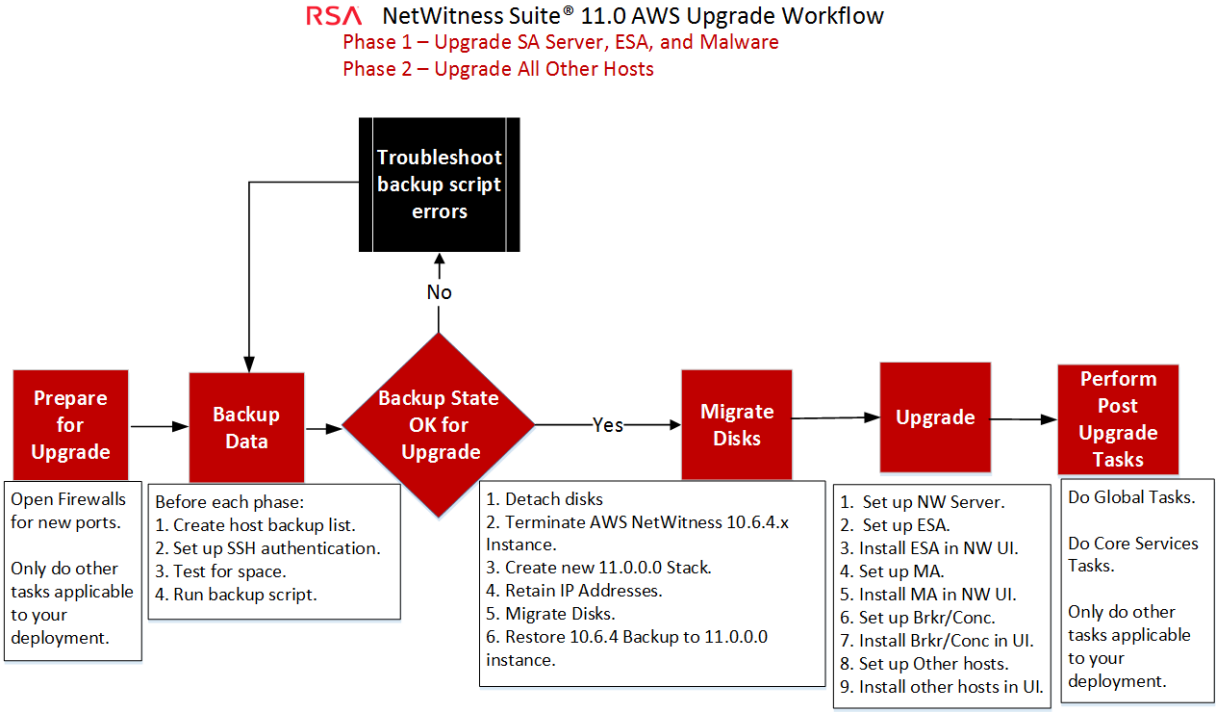
- One ESA host, with or without Incident Management configured, upgrade to 11.0.
  - Multiple ESA hosts configured to use Incident Management – The system continues to aggregate alerts centrally. If the system is correctly sized and operating as intended in 10.6.4.x, you can upgrade to version 11.0.
- Multiple ESA hosts without configuration to use Incident Management and you are connecting to individual ESA hosts to view alerts, do not upgrade to version 11.0.

Note: If you have not used Incident Management in 10.6.4.x, you cannot view the 10.6.4.x ESA alerts in the 11.0 Respond component without running a migration script. Use the ESA Alert Migration script to migrate these alerts to the location in 11.0 that will allow Respond to view them. For more information for instructions on how to run the script, see the *ESA Alert Migration Instructions for 10.6.4.x to 11.0* knowledge base article (https://community.rsa.com/docs/DOC-81680) in RSA Link .

User Attribute and Role Changes Affecting Investigate

The following changes affect how NetWitness Platform 11.3 handles user and role attributes in the Investigate component.

- User Attributes
  When you upgrade to 11.3, the user attributes (query prefix, session timeout, and query threshold) available in SA 10.6.6.x no longer exist. The same attributes are available at the role level for use.
- User and Role Attributes (Query Prefix) is not applicable to Investigate Event Analysis. The user and role attributes, most importantly the query prefix, do not apply to the new Investigate Event Analysis. Any user can modify the URL in browser to access data that should be restricted from viewing even when query prefix is applied.



Contact Customer Support

Refer to the Contact RSA Customer Support page (https://community.rsa.com/docs/DOC-1294) in RSA Link for instructions on how to get help on RSA NetWitness Platform 11.3.

Upgrade Preparation Tasks

This is a snippetComplete the following tasks to prepare for the upgrade to NetWitness Platform 11.3. These tasks are organized by the following categories.

- General
- Event Stream Analysis (ESA)
- Reporting Engine
- Respond
- Warehouse Connector
- Other

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

General

Task 1 - Review Core Ports and Open Firewall Ports

The following tables list new ports in 11.3.

Caution: Make sure that the new ports are implemented and tested before upgrading so that upgrade does not fail due to missing ports.

NW Server Host

Source Host	Destination Host	Destination Ports	Comments
NW Hosts	NW Server	TCP 4505, 4506	Salt Master Ports
NW Hosts	NW Server	TCP 27017	MongoDB
Admin Workstation	NW Server	TCP 15671	RabbitMQ Management UI
NW Hosts	NW Server	TCP 15671	RabbitMQ Management UI

ESA Host

Source Host	Destination Host	Destination Ports	Comments
NW Server, NW Endpoint, ESA Secondary	ESA Primary	TCP 27017	MongoDB

Endpoint Log Hybrid

Source Host	Destination Host	Destination Ports	Comments
Endpoint Log Hybrid	NW Server	TCP 5672	Message Bus
Endpoint Server	NW Server	TCP 27017	MongoDB

All NetWitness Platform core ports are listed in the "Network Architecture and Ports" topic in the *Deployment Guide* in case you need to reconfigure NetWitness Platform services and firewalls.

Task 2 - Record Your 10.6.6.x `admin user` Password

Record your 10.6.6.x `admin user` password. You will need it to complete the upgrade.

Task 3 - Create a Backup of the `/etc/fstab` File

Copy the `/etc/fstab` file from all the physical hosts and into your local machine (backup host or remote machine).

Note: You need this file to restore a physical host with external storage mounts.

Task 4 - Make Sure Password Strength Settings Check Boxes Are Set in 10.6.6.x

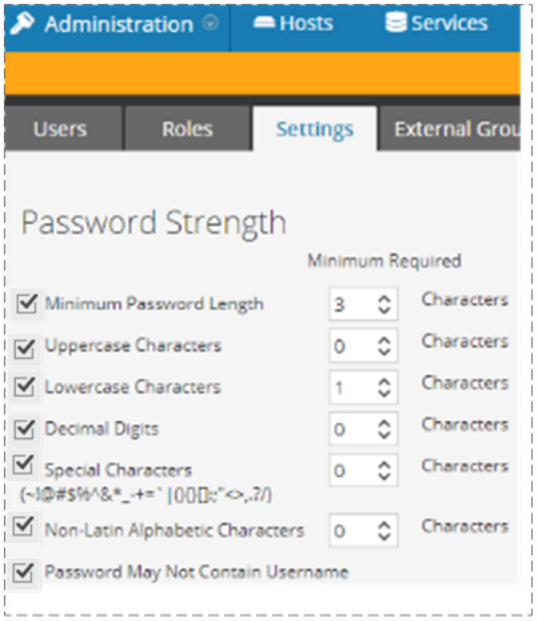
Note: You can skip this task if you do not want to migrate the password strength setting to 11.3

The check box to the left of the **Password Strength Settings** in the **Administration** > **Security** > **Settings** tab must be set in 10.6.6.x or these settings will not be migrated to 11.3.

Complete the following task to make sure that the Password Strength Settings check boxes are set in 10.6.6.x.

1. In Security Analytics 10.6.6.x, go to the **Administration** > **Security** > **Settings** tab.
2. Make sure that the required check boxes to the left of the **Password Strength Settings** are set and click **Apply**.
   The following example shows the required check boxes as set (required in 10.6.6.x before upgrading

to 11.3).



Task 5 (Conditional) - Extract 10.6.x Public Key Infrastructure (PKI) Certificates

Before you upgrade to from 10.6.6.x to 11.3, complete the following procedure to extract the existing 10.6.x PKI keystores that contain server certificates with private keys, and the truststores that contain the trusted CA certificates.

1. Download the `rsa-nw-pki-migration-10.6.6.zip` file from **RSA Link** > **RSA NetWitness Platform** > **Downloads** > **RSA NetWitness LOGS & NETWORK** > **Version 11.3**.
2. Extract the `pki-migration-1.0.jar` file from the `rsa-nw-pki-migration-10.6.6.zip` file.
3. SSH to the 10.6.6.x Security Analytics Server host and log in with the root credentials.
4. Copy the `pki-migration-1.0.jar` file into `/tmp` folder.
5. Run the following command strings to extract the certificates.
   ```
   cd /tmp
   java -jar pki-migration-1.0.jar
   extract
   ```
   This :
   - Creates the `rsa-pki-migration-tool-<yyyy-MM-dd-hh-mm>` directory under the `tmp` directory.
   - Extracts output files into the `/tmp/rsa-pki-migration-<yyyy-MM-dd-hh-mm>` directory.
   - Creates a keystore (for example, `<keystore-x>.p12`) for each server certificate.
     The keystore is encrypted with **netwitness** as the password.
   - Creates a certificate file (for example, `<certificate-X>.cer`) for each trusted CA certificate in truststore.

Note: Refer to the line in the console output to find the storage location of the

- server certificate (`<keystore-X>.p12`). For Example:

```
The Entry le-056cdfb6-7577-4287-a791-64fbf999ff2d is a Private Key Entry
Storing the entry le-056cdfb6-7577-4287-a791-64fbf999ff2d into store at /tmp/rsa-pki-migration-tool-2019-03-04-13-48/keystore-2.p12
```

- trusted CA certificate (`<certificate-x>.cer`). For example

```
The Entry srv3-server3-ca-291745768375599843303243311352845599851 is a Certificate Key Entry
Writing certificate Entry srv3-server3-ca-291745768375599843303243311352845599851 into file /tmp/rsa-pki-migration-tool-2019-03-04-13-48/certificate-4.cer
```

This process does not modify the original keystores and trusted CA certificates of 10.6.6.x. You can run these steps multiple times, if required.

6. Open any keystore and display its contents to verify that the extracted keystores and the trusted CA certificates are correct.

```
cd rsa-pki-migration-tool-<yyyy-MM-dd-hh-mm>
ls -ltrh
 Openssl x509 -in <certificate-X>.cer -inform DER
```

The certificate in displayed in PEM (Base64) format. For example:

```
-----BEGIN CERTIFICATE-----
MIIDZTCCAk2gAwIBAgIQZ4o94d5AiLBC4sPXgDYXpTANBgkqhkiG9w0BAQUFADBF

3lAXU6iWqYZP
-----END CERTIFICATE-----
```

```
keytool -list -keystore <keystore-X>.p12 -storetype PKCS12 – storepass
netwitness
```

The following is an example of the output.

```
Keystore type: PKCS12
Keystore provider: <XXXXX>
```

7. Exit the keystore.

```
exit
```

You can use:

- One of the `.p12` keystore files as a server certificate. Refer to the command output to find `.p12` file that corresponds to the server certificate you must use.
- The extracted certificate files (.cer) as trusted CA certificates.

For instructions on how to configure PKI authentication, see the "*System Security and User Management Guide*".

Event Stream Analysis (ESA)

Task 6 (Conditional) - Record Any String Array Type Meta Keys on the Event Stream Analysis Service

If you added any string array type meta keys to the Event Stream Analysis service for your ESA correlation rules in 10.6.6.x or earlier, record these meta keys so you can verify that they exist after upgrade to 11.3.

To record your 10.6.6.x string array type meta keys before the 11.3 upgrade:

1. In Security Analytics 10.6.6.x:
   a. Go to the **Administration** > **Services** view.
   b. Select the Event Stream Analysis service.
   c. Click (actions) > **View** > **Explore**.
2. In the **Explore** view node list, select **Workflow** > **Source** > **netgenAggregationSource**.
3. In the **ArrayFieldNames** list, make a note of any string array type meta keys added to the Event Stream Analysis service so you can verify that they are on the ESA Correlation service after the upgrade.

Respond

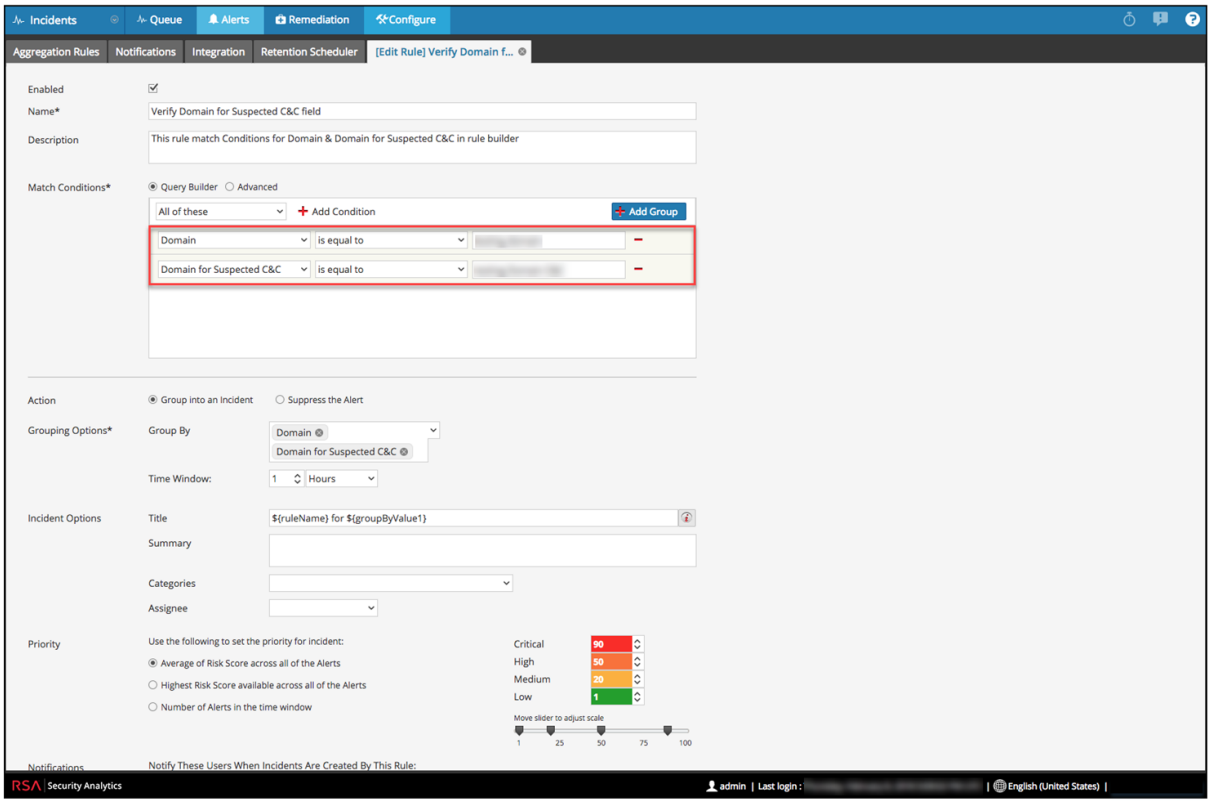
Task 7 - Check Aggregation Rules Match Conditions for “Domain” or “Domain for Suspected C&C”

Make a note of any Incident Management aggregation rules that have match conditions using Domain or Domain for Suspected C&C in the drop-down list in the rule builder. You will need to add back these conditions after you upgrade to 11.3 as described in the "Respond" Post Upgrade Tasks later in this document.

Complete the task for each aggregation rule.

1. In Security Analytics 10.6.6.x, go to **Incidents** > **Configure** > **Aggregation Rules** tab and edit the rules to view the matching conditions.

2. In the **Match Conditions** section, look for **Domain** or **Domain for Suspected C&C** listed in the drop-down lists for the conditions.



3. Make a note of the rule name and the entire condition that uses **Domain** or **Domain for Suspected C&C**, including operators and values.

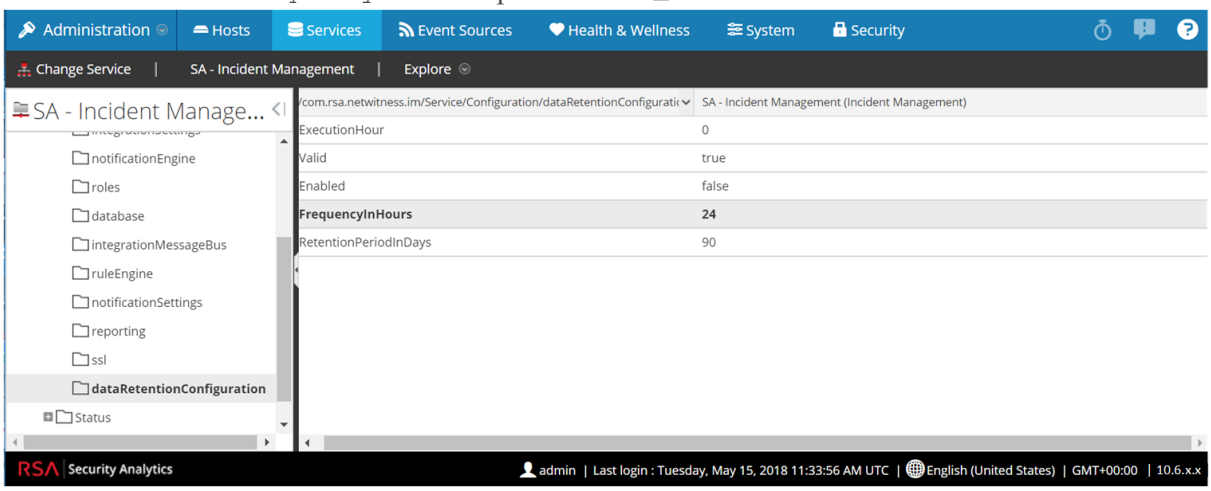
Task 8 - Set Data Retention Run Interval to ≥ 24 Hours

In Security Analytics 10.6.6.x, the Data Retention run interval does not have any minimum value check. In 11.3, RSA added a validation check to make sure that it is run at least every 24 hours. When you upgrade to 11.3, if this value is less than 24 hours, the Respond service will not start.

Complete the following task to ensure that the Respond service starts after upgrading to 11.3.

1. In Security Analytics 10.6.6.x, go to **ADMIN** > **Services**.
2. Select the **Incident Management** service, and then select > **View** > **Explore**.
3. In the Incident Management **Explore** view, go to **`Service` > `Configuration` > `dataRetentionConfiguration`.**

4. Make sure that the `FrequencyInHours` parameter is ≥ **24**.



Reporting Engine

(Conditional) Task 9 - Unlink External Storage

If the Reporting Engine has external storage, such as Storage Area Network (SAN) or Network Attached Storage (NAS) for storing reports, complete the following task to unlink the storage.

Note: In these steps:
`/home/rsasoc/rsa/soc/reporting-engine/` is the Reporting Engine home directory.
`/externalStorage/` is where the external storage is mounted.

1. SSH to the Reporting Engine host and log in with your `root` credentials.
2. Stop the Reporting Engine service.
   ```
   stop rsasoc_re
   ```
3. Switch to `rsasoc` user.
   ```
   su rsasoc
   ```
4. Change to the Reporting Engine the home directory.
   ```
   cd /home/rsasoc/rsa/soc/reporting-engine/
   ```
5. Unlink the `resultstore` directory mounted to external storage.
   ```
   unlink /externalStorage/resultstore
   ```
6. Unlink the `formattedReports` directory mounted to external storage.
   ```
   unlink /externalStorage/formattedReports
   ```

Warehouse Connector

(Conditional) Task 10 - Copy `keytab` files in `root` or `etc` Directory Stored in Other Directory

Complete the following task to copy the `keytab` files in the `root` or `etc` directory if it is stored in another directory.

1. Record the absolute path of NFS mount directory and the `keytab` file.
   You need this information to restore the Warehouse Connector after upgrade.
2. Unmount the NFS directory.
   a. SSH to the Warehouse Connector and log in with `root` credentials.
   b. Submit the following command to unmount the NFS directory.
   `umount <NFS-absolute-path>`

Other Tasks

None

Backup Instructions

Backing up your configuration data for all your hosts from 10.6.6.x is the first step in upgrading from 10.6.6.x releases to 11.3.0.0.

Note: It is important that you place Custom Certificate files and any other certificate authority (CA) files in the `/root/customcerts` folder to make sure that these certificate files are backed up. Your custom certificate files will be automatically restored during the upgrade process. After upgrading to 11.3.0.0, the custom certificate files will be located in `/etc/pki/nw/trust/import`. For more information about backing up these types of files, see step 1 in For All Host Types

Caution: 1) These services are not supported in the 10.6.6.x backup and upgrade process.
- IPDB
- All in One servers
- Malware Analysis Co-Located on the NetWitness Server
- Standalone Warehouse Connector

2) There is a known issue if you have Active Directory users configured in 10.6.6.x. You have two options to address this issue:
• Apply the 10.6.6.2 patch before you back up your data for the 11.3 upgrade.
• If you failed to apply the 10.6.6.2 patch, you can apply the 11.0.0.1 patch immediately after you upgrade to 11.3.

The following types of hosts can be backed up and are automatically restored during the upgrade process:

- **NetWitness Server** (may include Malware Analysis, NetWitness Respond, Health and Wellness, and Reporting Engine)
- **Archiver**
- **Broker**
- **Event Stream Analysis** (including Context Hub and NetWitness Respond database)
- **Concentrator**
- **Log Decoder**
- **Packet Decoder**
- **Virtual Log Collector**

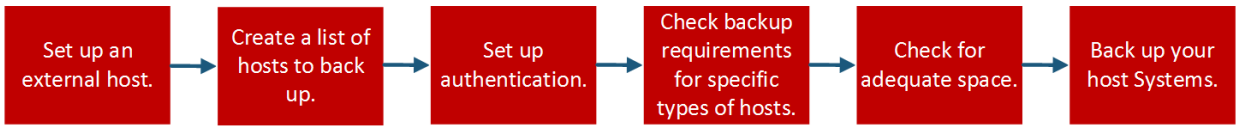
The following types of files are automatically backed up but must be restored manually after the upgrade process:

- PAM configuration files: For information about restoring the PAM configuration files, see "Task 5 - Reconfigure Plugable Authentication Module (PAM) in 11.3.0.0", in the "Global" section of the Post Upgrade Tasks.
- `/etc/pfring/mtu.conf` and `/etc/init.d/pf_ring`: To restore these files, you must manually retrieve them. The `/etc/pfring/mtu.conf` files will be located in `/var/netwitness/database/nw-backup/restore/etc/pfring/mtu.conf`, and the `/etc/init.d/pf_ring` files will be located in `/var/netwitness/database/nw-backup/restore/etc/init.d/pf_ring`. For information about how to restore these files, see "

(Conditional) Task 2 - Restore Files for 10G Decoder" in the "Hardware Related Tasks" section of Post Upgrade Tasks.

Note: If you have problems during the backup or upgrade processes and you lose data, you can recover the data and start the process again. For information about recovering lost data, see "Recover Data After System Failure" in the *System Maintenance Guide*.

The following diagram shows the high-level task flow of the steps you perform to back up your hosts.



Task 1 - Set up an External Host for Backing up Files

You must set up an external host to use for backing up files. The host must be running Centos 6 with connectivity through SSH to the NetWitness Platform stack of hosts.

Make sure that the host names for systems to be backed up are resolvable on the backup host machine, either by DNS or listed in the `/etc/hosts` file.

Note: These scripts are designed to run on CentOS 6 only. You must execute these scripts on CentOS 6 machines.

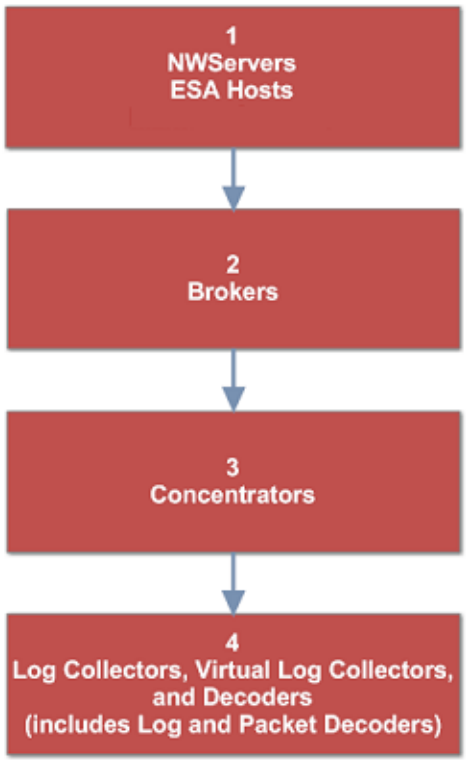
There are several scripts that you run during the backup process. You must download the zip file that contains the scripts (`nw-backup-v4.3.sh` or later) from RSA Link at this location: https://community.rsa.com/docs/DOC-81514 and copy it over to your CentOS 6 backup system. Extract the zip file to access the scripts. The scripts are:

- `get-all-systems.sh`: Creates the `all-systems` file, which contains a list of all your NetWitness Servers and host systems to be backed up.
- `ssh-propagate.sh`: Automates sharing keys between systems you are backing up and the backup host system so that you are not prompted for passwords multiple times.
- `nw-backup.sh`: Performs the backup of your hosts.

Note: The backup scripts do not support backing up data for STIG-hardened hosts.

Task 2 - Create a List of Hosts to Back up

The script that you use to back up your files depends on the `all-systems` and `all-systems-master-copy` files, which contain a list of hosts that you want to back up. The `all-systems-master-copy` file contains a list of all your hosts. The `all-systems` file is used for each backup session, and contains only those hosts which are being backed up for a particular session. You must run the `get-all-systems.sh` script to generate these files. RSA recommends that you back up your hosts in groups, and not all at once. The recommended order and grouping of hosts for backup sessions is shown in the following diagram:



Limit each backup session to five hosts to make sure that you do not run out of space for the backup files. You create `all-systems` files for your backup sessions by using the `all-systems-master-copy` file as a reference, and then manually edit the `all-systems` file to contain specific hosts.

To generate the `all-systems` and `all-systems-master-copy` files:

1. From the host on which you are running the backup process, make the `get-all-systems.sh` script executable by running the following command:

   ```
   chmod u+x get-all-systems.sh
   ```

2. At the root level, run the following script:

   ```
   ./get-all-systems.sh <IP-Address-of-NetWitness-Admin-Server>
   ```

   You will be prompted for the password for each host system once per host.
   This script saves the `all-systems` file and the `all-systems-master-copy` file to `/var/netwitness/database/nw-backup/`.

3. Validate that the `all-systems` and `all-systems-master-copy` files were generated and that they contain the right hosts.

4. Edit the `all-systems` file to contain only the systems you are backing up. You can do this by using the `all-systems-master-copy` file as a reference, and then opening the `all-systems` file in an editor (such as vi) and modifying it to include only the systems you want to back up.

   Note: If you use vi, be sure to include the path to the location of the `all-systems` file.

Here is an example of an `all-systems-master-copy` file:

```
nwserver,my-nw-server,10.0.0.1,af922b9f-cd61-49cd-afdc-a48e558cec3e,10.6.6.0
archiver,my-nw-archiver,10.0.0.2,a65c1236-5e46-4117-8529-8ea837074bd0,10.6.6.0
concentrator,my-nw-concentrator,10.0.0.3,dc620e94-bcf5-4d51-83fe-
c003cdfcd7a6,10.6.6.0
esa,my-nw-esa,10.0.0.4,8b608c0d-a7f9-40c0-baee-8407dec774ab,10.6.6.0
logdecoder,my-nw-logdecoder,10.0.0.5,c8be5d45-e19e-4a8d-90ce-
1cb2fe60077a,10.6.6.0
malwareanalysis,my-nw-malwareanalysis,10.0.0.6,2edc9585-7081-48c3-8f8c-
e0d02aa0a2fd,10.6.6.0
packetdecoder,my-nw-packetdecoder,10.0.0.7,a8f2f574-3dd0-4b65-9cf7-
d8141b78a192,10.6.6.0
vlc,my-nw-vlc,10.0.0.8,3ffefc4e-0b31-4951-bb77-dea5869fa98c,10.6.6.0
broker,my-nw-broker,10.0.0.9,0b65e7ce-61d5-4177-9647-c56ccfb0f737,10.6.6.0
```

And here is an example of an `all-systems` file based on the `all-systems-master-copy` file that could be used in the first backup session:

```
saserver,my-nw-server,10.0.0.1,af922b9f-cd61-49cd-afdc-a48e558cec3e,10.6.6.0
esa,my-nw-esa,10.0.0.4,8b608c0d-a7f9-40c0-baee-8407dec774ab,10.6.6.0
malwareanalysis,my-nw-malwareanalysis,10.0.0.6,2edc9585-7081-48c3-8f8c-
e0d02aa0a2fd,10.6.6.0
```

Troubleshooting Information

- Be sure to save copies of the `all-systems` and `all-systems-master-copy` files in a safe location.

  Follow these recommendations:

  - Do not edit the `all-systems-master-copy` file.
  - If you create several different versions of the `all-systems` file (for example, for several backup sessions), be sure to remove pre-existing entries from the file so that the file contains only those hosts that are currently being backed up.

    For more information, see Post Backup Tasks.

- If any host systems are down while you are running the `get-all-systems.sh` script, the script creates a list of hosts for which it cannot find information. After the script completes and the `all-systems` file is created, you must edit the `all-systems` file manually and add the missing information for these hosts.
- The `get-all-systems.sh` script generates a list of hosts that were defined in the NetWitness Platform user interface. Make sure that all hosts and services are provisioned properly. If any hosts or services are not provisioned properly, they will not be backed up. RSA recommends that when you add hosts and services to NetWitness Platform, you use the NetWitness Platform user interface to Msure that they are provisioned properly. However, if there are any hosts or services that were not defined in the user interface, you must add them to the `all-systems` file manually.

- At the end of the `get-all-systems.sh` script, the script will check for any differences between the systems that the NetWitness Server has listed, and the ones for which the script was able to find all the required information. If any Node ID's or system names are listed as missing, verify the existence of those systems, that their services are all running, and that they are properly communicating with the NetWitness Server. (Any Windows Legacy Collectors or AWS Cloud Collectors will not be added to the `all-systems` file, and may account for discrepancies. **DO NOT add these items to the `all-systems` file manually**.)
- If the syntax in the `all-systems` file is incorrect, the script will fail. For example, if there is an extra space at the beginning or the end of a host entry, the script will fail.

Task 3 - Set up Authentication Between Backup and Target Hosts

RSA recommends that you run the `ssh-propagate.sh` script to automate sharing keys between the backup host and the host systems.

Note: If you have SSH keys that are protected with pass phrases, you can use `ssh-agent` to save time. For more information, refer to the man page for `ssh-agent`.

1. On the external backup host system, make the `ssh-propagate.sh` script executable by running the following command:

   ```
   chmod u+x ssh-propagate.sh
   ```

2. At the root directory, run the following command, where `<path-to-all-systems-file>` is the path to the directory where the `all-systems` file is stored:

   ```
   ssh-propagate.sh <path-to-all-systems-file>
   ```

3. You are prompted for the password once per host, but you will not need to enter it repeatedly later during the backup process.

Task 4 - Check for Backup Requirements for Specific Types of Hosts

After you create the `all-systems` file to use for backup, you must check to see if any of the hosts listed in the file have requirements that must be met before you run the backup process.

For All Host Types

Perform the following steps for all host types:

1. On the NetWitness Server, place Custom Certificate files and any other certificate authority (CA) files in the `/root/customcerts` folder to make sure that these certificate files are backed up. Your custom certificate files that are placed in this directories will be automatically restored during the upgrade process. After upgrading to 11.3.0.0, your custom certificate files will be located in `/etc/pki/nw/trust/import`.
   You can convert CA certificates and keys to different formats to make them compatible with specific types of servers or software using OpenSSL. For example, you can convert a normal PEM file that would work with Apache to a PFX (PKCS#12) file and use it with Tomcat or IIS. To convert the files, SSH to the NetWitness Server and run the following command strings to perform the conversions listed.
   Convert a DER file (.crt .cer .der) to PEM
   ```
   openssl x509 -inform der -in certificate.cer -out certificate.pem
   ```
   Convert a PEM file to DER
   ```
   openssl x509 -outform der -in certificate.pem -out certificate.der
   ```
   Convert a PEM Certificate File and a Private Key to PKCS#12 (.pfx .p12)
   ```
   openssl pkcs12 -export -out certificate.pfx -inkey privateKey.key -in
   certificate.crt -certfile CACert.crt
   ```
   Convert a PKCS#12 File (.pfx .p12) Containing a Private Key and Certificates to PEM
   ```
   openssl pkcs12 -in keyStore.pfx -out keyStore.pem -nodes
   ```

> **Note:** Add the following qualifier to the command string to:
> `-nocerts` convert private keys exclusively.
> `-nokeys` convert certificates exclusively.

2. Manually record any custom configurations made to CentOS 6 (for example, driver customizations) for restoration after you update to CentOS 7. Custom configurations to CentOS 6 are not automatically backed up and restored.

For Decoder, Concentrator, or Broker Hosts: Stop Data Capture and Aggregation

In addition to the tasks described in For All Host Types, for Decoder, Concentrator, or Broker hosts, stop data capture and aggregation on all the systems that you are backing up. For instructions, refer to Appendix B. Stopping and Restarting Data Capture and Aggregation

Log Collectors (LC) and Virtual Log Collectors (VLCs): Run `prepare-for-migrate.sh`

> **Caution:** This task stops log collection so you must perform this step immediately before you upgrade to minimize the loss of event collection. Complete this task in accordance with the backup and upgrade tasks in this guide.

Prerequisites

You need the following information before you prepare LCs and VLCs for upgrade.

- If Lockbox was initialized on the LC and VLC, you must know the Lockbox password. It is required to reconfigure the Lockbox after upgrade.
- If you set the password for `logcollector` user for RabbitMQ , you must know the password so you can set it again after the upgrade.

Prepare LCs and VLCs for Upgrade

1. SSH to the Log Collector.
2. Submit the following command string.

   ```
   # /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --prepare
   ```

   This command:

   - Stops the Puppet Agent service.
   - Disables the file collection accounts (“sftp” and all users in the group “upload”) used for uploading log files to the Log Collector. The log files accumulate on the event sources until the Log Collector has been upgrade to 11.3.0.0.
   - Stops all the collection protocols in the Log Collector service.
   - Saves the list of Plugin accounts and RabbitMQ accounts.
   - Configures the RabbitMQ server so that new events cannot be published to it any longer. Consumers of events in the queues, such as shovels and Log Decoder Event Processors, will continue to run.

- Waits until the Log Collector queues are empty.
- Stops the Log Collector service.
- Creates a marker file indicating that the Log Collector has been successfully prepared for upgrade.

Troubleshooting Information

The `prepare-for-migrate.sh` script:

- Sends informational, warning, and error messages to the console.
- Saves a session log in the `/var/log/backup/` directory.

You must fix any of the following errors and resume the preparation. Contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) for assistance.

- Log Collector queues with events but without consumers are found.
- Unable to stop the Puppet Agent service.
- Unable to stop a collection protocol in the Log Collector service.
- Unable to block event publishers to the RabbitMQ server.
- Unable to or taking too long for queue events to be consumed. The script makes 30 attempts waiting for the events to be consumed. After each attempt, it sleeps for 30 seconds.
- Unable to stop the Log Collector service.

For more information about troubleshooting, see Appendix A. Troubleshooting

For Integrations with Web Threat Detection, Archer Cyber Incident & Breach Response or NetWitness Endpoint: List RabbitMQ Usernames and Passwords

On the 10.6.6.x host, on the NetWitness Server host, you must get a list of all RabbitMQ usernames and passwords so that after you perform the 11.3.0.0 upgrade, you can restore RabbitMQ user accounts.

To get a list of RabbitMQ usernames and passwords, run the following command:

```
rabbitmqctl list_users >> /root/rabbitmq_users.txt
```

To restore RabbitMQ user accounts, refer to *Task 2 - For Integrations with Web Threat Detection, NetWitness SecOps Manager or NetWitness Endpoint Configure Mutually Authenticated SSL* in Post Upgrade Tasks.

For Bluecoat Event Sources

Bluecoat ProxySG event sources use FTPS protocol to upload log files to the Log Collector (LC) and Virtual Log Collector (VLC). The event source documentation contains the steps to configure VSFTPD service on the LC and VLC.

- If key material exists in `/root/vsftpd/` directory in 10.6.6.x, this material area will be backed up and restored. **If the material was in another location, you must back it up and restore it**

manually.

- If the `/etc/vsftpd/vsftpd.conf` file exits in 10.6.6.x, it is backed up and restored.

Task 5 - Check for Adequate Space for the Backup

You can run the backup test script to check the amount of disk space that is required for the backup using the `-t` option described in Test Options. You run the script without actually backing up files or stopping any services. RSA recommends that you perform this step to make sure that you provide adequate space for the backup so that the backup captures all your data.

To check for adequate disk space:

1. Make the backup script executable by running the following command:
   `chmod u+x nw-backup.sh`
2. Run the following command at the root directory level:
   `./nw-backup.sh -t`
   The output displays the amount of disk space that is required for the backup.

> **Note:** The `./nw-backup.sh -t` command runs with the `-d` option by default. However, if you are looking for more accurate disk space results, you can override the `-d` option by using `-D`. Using the `-D` option will show how much space is required on each host for the data that will be backed up, but does not show how much space is available. If there is not enough space available, the `-D` option will throw an error. If you want to know how much space is available on the target host, you must run the `df -h` command on the host.

The following figure shows an example of the output from using the `-t` option.

```
********** NW-BACKUP SCRIPT - TEST MODE **********
* *  RSA nw-backup script is running in test mode where in it will only verify the disk space required for successful backup.

--------------------------------------------------------------------------------

Backup Storage Space...     [ OK ]
Total Execution Time : 0 d 0 h 0 m 19 s

Disk space check test completed with no errors.
[root@lab-cos6-RF ~]#
```

Task 6 - Back up Your Host Systems

Before you run the backup script to do the actual backup, be sure that you have plenty of space. To back up your hosts, you run the `nw-backup.sh` script using the `-u` option. This option is required for upgrading to 11.3.0.0.

Note: The script will stop services as it runs. However, you can stop services manually before you run the script if needed.

When you run the backup script, you can choose from several options that are described in the following sections.

Usage:
`./nw-backup.sh [-u -t -d -D -l -x -e] <external-mnt> -b <backup file path>`

General Options

`-u : This option is required for upgrading to 11.3. Enables the upgrade flag to run backup for upgrading to 11.3. It also enables disk space check (-d), backing up reporting engine reports (-r) and stores backup content locally (-l). Default: (no)`

`-d : enables disk space check in 'fast' mode (quick estimate of space using uncompressed data). Default: (no)`

`-D : enables disk space check in 'full' mode (estimate of space using compressed data, ~10X slower). Default: (no)`

`-l : stores backup content locally on each host (automatically set if -u is used). Default: (no)`

`-e <path to mount point> : copies backup files of all devices onto an external mount point. Default: (/mnt/external_backup)`

`-x : move all backup files to an external mount point. Default: (no) - COPY`

`-b <path to write backups> : path to the location for storing backup files on a backup server.` **`For upgrading to 11.3, please use the default location!`** `Default: (/var/netwitness/database/nw-backup)`

Note: Do **not** change the backup path in upgrade (-u) mode.

Advanced Content Selection Options

`-c : back up Colocated Malware Analysis on SA servers. Default: (no)`

`-i : back up IPDB data (/var/netwitness/ipdbextractor). Default: (no)`

`-m : back up Malware Analysis File Repository. Default: (no)`

`-r : back up Reporting Engine Report Repository (automatically set if -u is used). Default: (no)`

`-v : back up system logs (/var/log). Default: (no)`

`-y : back up YUM Web Server & RPM Repository. Default: (no)`

`-S : If set: DISABLES back up of SMS RRD files. Default: (not-set)`

`-C : If set: DISABLES back up of Context-Hub configuration and database. Default: (not-set)`

`-E : If set: DISABLES back up of ESA Mongo database. Default: (not-set)`

Test Options

```
 -t : performs script test run for disk space check only. Services are not
stopped and excludes execution of backup. Can be combined with (-d) or (-D)
and other flags. Default: (-t)
```

For example, the command:
`./nw-backup.sh`
would run the backup with options as set in the Header of the script itself.
OR, the command:
`./nw-backup.sh -ue /mnt/external_backup`
would run a normal backup using the backup path defined in the script, with the following options:

```
-u : enables the upgrade flag to run backup for upgrading to 11.3. It also
enables disk space check (-d), backing up reporting engine reports (-r) and
stores backup content locally (-l). Default: (no)
```

```
-e : Copy the backup files to external mount point, mounted on /mnt/external_
backup
```

```
For Help: ./nw-backup.sh -h
```

When you run the script, the following text is displayed at the top of the script:

Caution: `RSA nw-backup script backs up configuration files, data, and logs on the options provided in the script. It tars the content, with options to store the backup files on the backup server, move or copy them to external storage on a mount point (USB/NFS/SMB), or SCP them back to the target host. This backup script has been qualified on the following versions of Security Analytics:`
`10.6.6.x`
`Use of this script on any other versions of the product may not give expected results and may not be supported by RSA Customer Service.Note: All non-RSA custom files, scripts, Cronjobs and other important files should be placed in /root, /home/'user', OR /etc to be included in the backup.`

To run the backup script to back up your hosts:

1. Make sure that the `all-systems` file contains only the hosts to back up. For information, see Task 2 - Create a List of Hosts to Back up.
2. Make the backup script executable by running the following command:
   `chmod u+x nw-backup.sh`
3. Begin the backup process by running the following command at the root directory level:
   `./nw-backup.sh -u <additional options as needed>`

   Note: You must use the `-u` option so that your files will be restored correctly during the upgrade to 11.3.0.0.

   When the text "`Backup completed with no errors`" is displayed, the backup has completed successfully.

   A log file, with a name similar to the following example, is created in the backup directory which provides information on the files being backed up:
   `rsa-nw-backup-2017-03-15.log`
4. When the backup has completed, to make sure that the intended files were backed up, you can run the following command to see a list of all the files that were backed up:
   `tar -tzvf hostname-ip-address-backup.tar.gz`
   The following archive files are created:
   For all hosts:
   `<hostname-IPaddress>-root.tar.gz`

<hostname-IPaddress>-backup.tar.gz
tar checksum files
<hostname-IPaddress>-network.info.txt
For NetWitness Servers:
<hostname-IPaddress>-root.tar.gz
<hostname-IPaddress>-backup.tar.gz
<hostname-IPaddress>-mongodb.tar.gz
tar checksum files
<hostname-IPaddress>-network.info.txt
For ESA Hosts:
<hostname-IPaddress>-root.tar.gz
<hostname-IPaddress>-backup.tar.gz
<hostname-IPaddress>-mongodb.tar.gz
<hostname-IPaddress>-controldata-mongodb.tar.gz
tar checksum files
<hostname-IPaddress>-network.info.txt

The archived files are located in the /var/netwitness/database/nw-backup directory. If any of the tar files appear smaller than expected, open them to be sure that the files were properly backed up.

Post Backup Tasks

Task 1 - Save a Copy of the all-systems File and the Backup Tar files

Make copies of the all-systems file, the all-systems-master-copy file, and the backup tar files and put the copies in a secure location. You cannot regenerate these files after you upgrade the NetWitness Server (specifically the Admin service) to 11.3.0.0.

Task 2 - Ensure Required Backup Files Were Generated

After you run the backup scripts, several files are generated. These files are required for the 11.3.0.0 upgrade process. Before you begin the upgrade process, you must make sure that the required backup files are on the hosts that you are upgrading, and that you perform the following tasks.

The following files are generated on all hosts by the backup scripts:

- all-systems
- all-systems-master-copy
- appliance_info
- service_info
- <hostname>-<host-IP-address>-backup.tar.gz
- <hostname>-<host-IP-address>-backup.tar.gz.sha256
- <hostname>-<host-IP-address>-root.tar.gz

- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`

In addition to the files listed above, the following files will be generated on NetWitness Server and ESA hosts:

- *<hostname>-<host IP address>*-mongodb.tar.gz
- *<hostname>-<host IP address>*-mongodb.tar.gz.sha256

The backup script will also generate the following `controldata-mongodb.tar.gz` files.

Note: The backup script copies the following files from all ESA hosts to the NetWitness Server host's backup path .

- `<esa hostname>-<esa hostip>-controldata-mongodb.tar.gz`
- `<esa hostname>-<esa hostip>-controldata-mongodb.tar.gz.sha256`

(Conditional) Task 3 - For Multiple ESA Hosts, Copy `mongodb tar` files to Primary ESA Host

If you have multiple ESA host systems in your enterprise, copy the following two files from each ESA host to the `/opt/rsa/database/nw-backup/` directory on the Primary ESA host system (the host that has the ContextHub service running on it) :

- `<hostname>-<host-IP-address>-mongodb.tar.gz`
- `<hostname>-<host-IP-address>-mongodb.tar.gz.sha256`

Task 4 - Ensure All Required Backup Files are on Each Host

Before you upgrade to 11.3.0.0, make sure that the appropriate files exist on the hosts that you are upgrading as described in the following lists.

There should be note here mentioning default backup path locations for that user knows where to go and check these files.

Note: The default paths for backup files are:
- NetWitness Server hosts:`/var/netwitness/database/nw-backup`
- ESA hosts:`/opt/rsa/database/nw-backup`
- Malware hosts: `/var/lib/rsamalware/nw-backup`

Required Files for NetWitness Servers

- `all-systems-master-copy`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`

- <hostname>-<host-IP-address>-root.tar.gz.sha256
- <hostname>-<host-IP-address>-network.info.txt
- <hostname>-<host-IP-address>-mongodb.tar.gz
- <hostname>-<host-IP-address>-mongodb.tar.gz.sha256
- <esa-hostname>-<esa-host-IP-address>-controldata-mongodb.tar.gz
- <esa-hostname>-<esa-host-IP-address>-controldata-mongodb.tar.gz.sha256

Required Files for ESA Hosts

- all-systems-master-copy
- <hostname>-<host-IP-address>-backup.tar.gz
- <hostname>-<host-IP-address>-backup.tar.gz.sha256
- <hostname>-<host-IP-address>-root.tar.gz
- <hostname>-<host-IP-address>-root.tar.gz.sha256
- <hostname>-<host-IP-address>-network.info.txt
- <hostname>-<host-IP-address>-mongodb.tar.gz
- <hostname>-<host-IP-address>-mongodb.tar.gz.sha256

Required Files for All Other Hosts

- all-systems-master-copy
- <hostname>-<host-IP-address>-backup.tar.gz
- <hostname>-<host-IP-address>-backup.tar.gz.sha256
- <hostname>-<host-IP-address>-root.tar.gz
- <hostname>-<host-IP-address>-root.tar.gz.sha256
- <hostname>-<host-IP-address>-network.info.txt

Note: The following files are located in the <hostname>-<host-IP-address>-backup.tar.gz tar on all hosts:
appliance_info
service_info

Note: The paths to the location of the backup and restore files for iptables, NAT configurations, user accounts, and crontab entries are shown in the following list:
Backup paths:
`BUPATH=/opt/rsa/database/nw-backup` for the ESA Correlation Engine
`BUPATH=/var/lib/rsamalware/nw-backup` for the Malware Service
`BUPATH=/var/netwitness/database/nw-backup` for all other services
Restore locations:
`BUPATH/restore/etc/sysconfig` for Iptable rules
`BUPATH/restore/etc/sysconfig` for NAT configurations
`BUPATH/restore/etc` for Crontab entries
`BUPATH/restore/etc` for User Accounts (users are located in the `passwd` file, and groups are located in the `group` file. These are not restored during the upgrade process but can be restored manually.
`BUPATH/restore/etc/ntp.conf` for NTP configurations (must be restored using the NetWitness Platform UI)

Migrate Disk Drives from 10.6.6.x to 11.3

These instructions tell you how to upgrade virtual hosts from 10.6.6.x to 11.3.

Caution: 1.) Run the backup immediately before you upgrade hosts for each phase so that the data is not out-dated.
2.) This guide applies to AWS host upgrades exclusively. If have physical and virtual hosts in your deployment, see the *RSA NetWitness® Platform 11.0 Physical Host Upgrade Instructions* for the steps you must complete to upgrade physical hosts. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

There are five tasks you must complete to migrate from 10.6.6.x to 11.3:

Task 1 - Backup the 10.6.6.x EC2 appliance

(Optional) Task 2 - Run the backup script to take backup data of 10.6.6.x instance

Task 3 - Stop the instances and detach volumes from 10.6.6.x instances

Task 4 - Note the IP addresses of 10.6.6.x instances and then terminate the EC2 instances

Task 5 - (IP retention) Create 11.3 instances using 11.3 AMI.

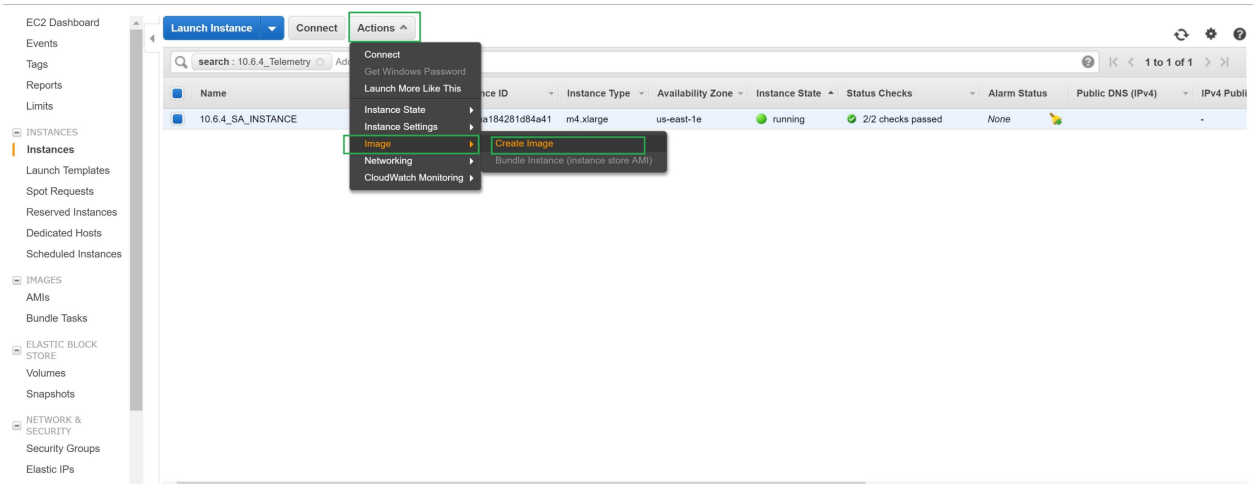
Task 6 - Attach volumes to the corresponding 11.3 instance

Task 7 - Restore backup data in 10.6.6.x to 11.3 Instances (Data Restoration)

Task 8 Run nwsetup-tui script

Task 1 - Backup the 10.6.6.x EC2 appliance

Select the 10.6.6.x EC2 Instance and navigate to Actions. Click Image and then select Create Image.



(Optional) Task 2 - Run the backup script to take backup data of 10.6.6.x instance

Note: If you have not taken a backup of the 10.6.6.x instance, follow these steps, otherwise skip to Task 3 - Stop the instances and detach volumes from 10.6.6.x instances.

If the stack contains Log Collector then prepare **Log Collector** for the migration:

1. Navigate to `/opt/rsa/nwlogcollector/nwtools/` and run the below command:

```
sh prepare-for-migrate.sh --prepare
```

2. Download backup scripts from GitHub: https://github.rsa.lab.emc.com/asoc/nw-backup (maintenance-11.0) and place it anywhere in a computer running an RPM-based Linux distribution (RHEL or CentOS for example) with a large amount of free hard drive space. In many cases the SA server will suffice. Now, navigate to `scripts` directory inside '`nw-backup-master`' and run the following commands:

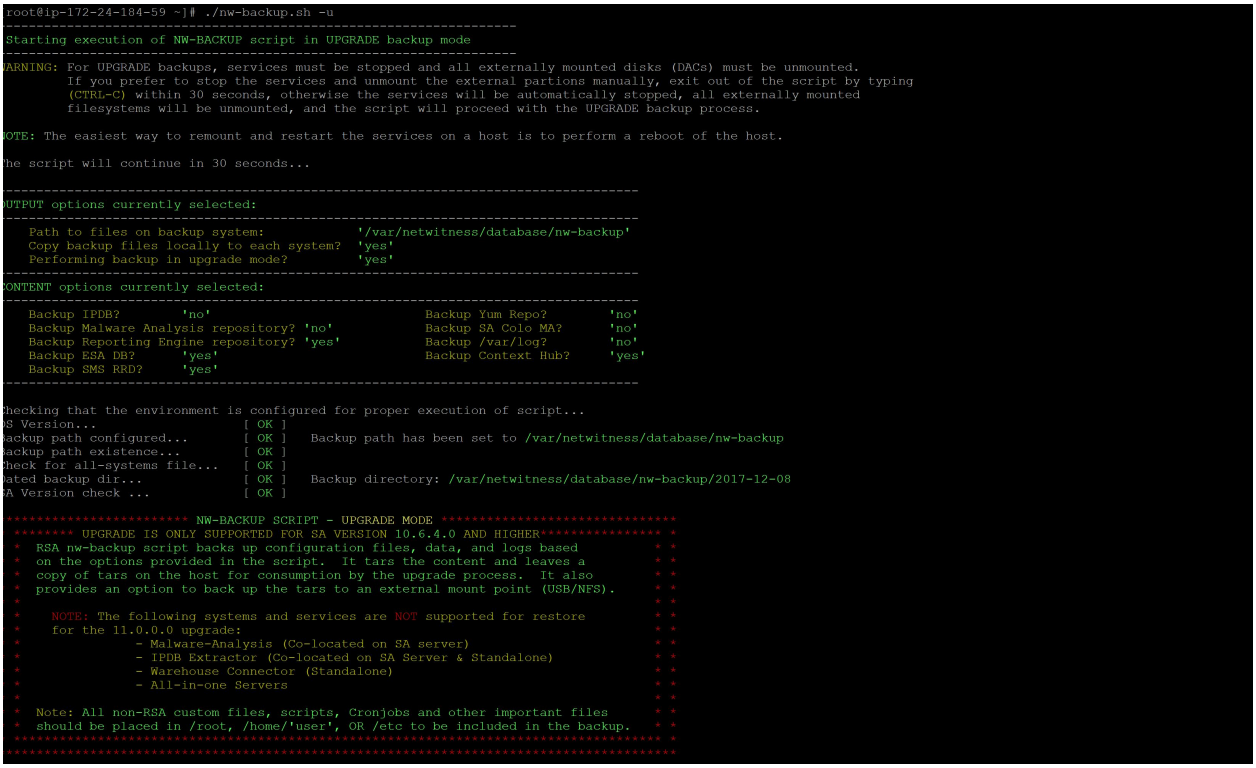
```
./get-all-systems.sh <SA server-IP>
```

```
./ssh-propagate.sh <path-to-backup-directory/all-systems>
```

```
./nw-backup.sh -u
```

Its safe to copy a backup of the tar balls created at `/var/netwitness/database`, in some safe location (not mandatory).

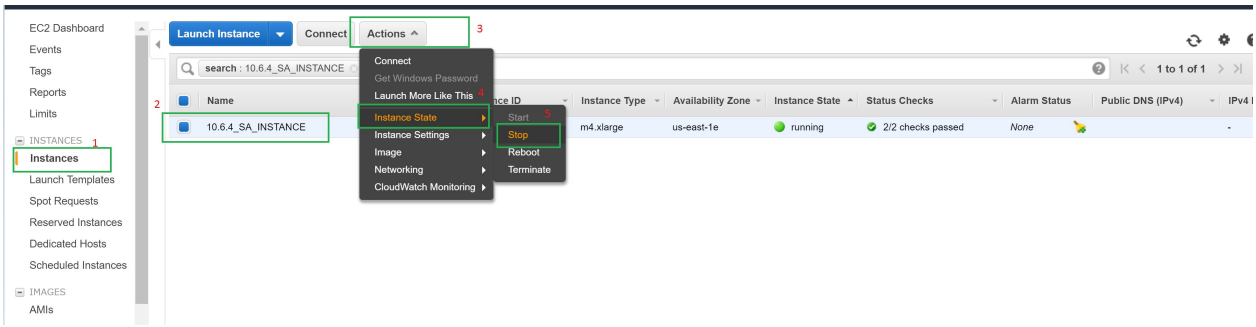
Before starting the restore process, if you have ESA deployment then copy the files `<hostname>-<IP>-controldata-mongodb.tar.gz` & `<hostname>-<IP>-controldata-mongodb.tar.gz.sha256` from the location `/opt/rsa/database/nw-backup` of ESA VM to `/var/netwitness/database/nw-backup/` of SA VM.



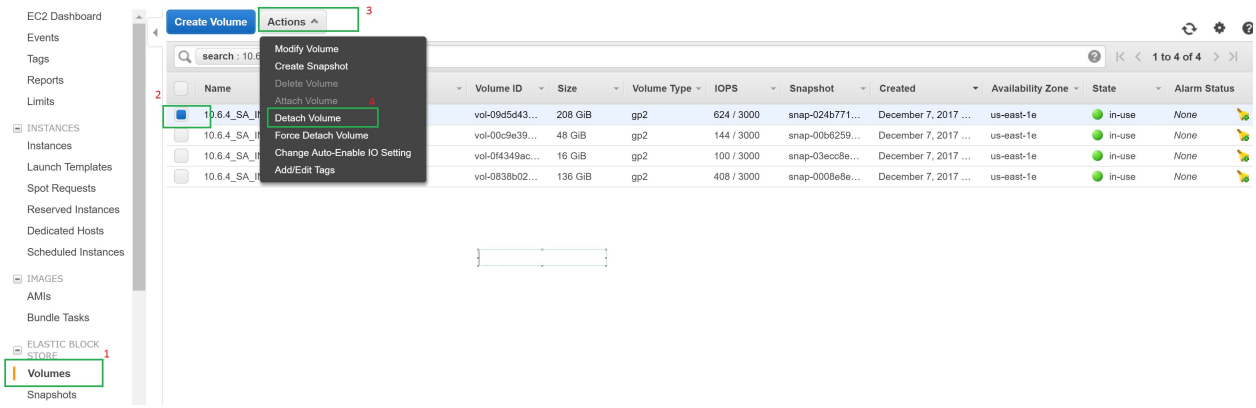
Task 3 - Stop the instances and detach volumes from 10.6.6.x instances

Note: If detach fails, do a forced detach on the volume.

Select the 10.6.6.x EC2 instance and navigate to Actions and then click Stop.



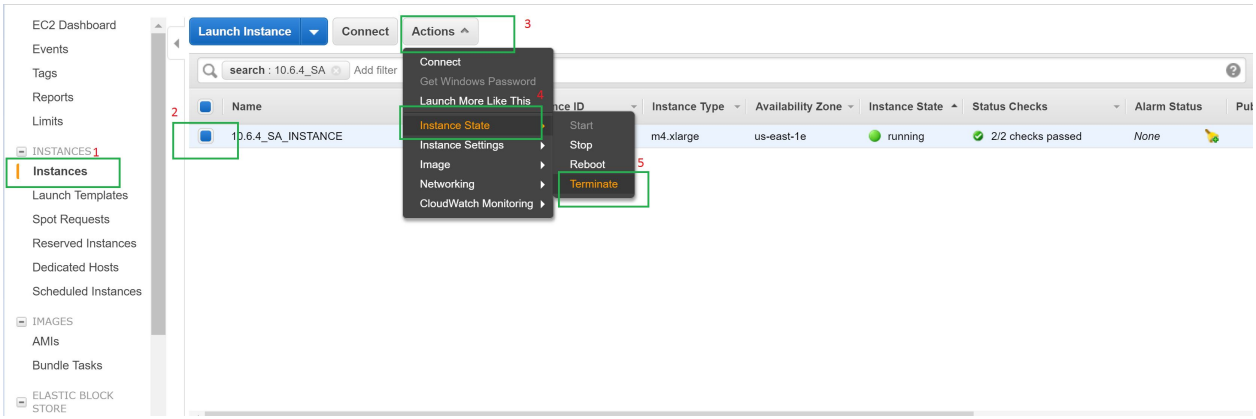
Click on Volumes and then select the 10.6.6.x instance volumes to detach Actions and then select Detach Volume.



Task 4 - Note the IP addresses of 10.6.6.x instances and then terminate the EC2 instances

Note: Termination is required to free the IP address.

1. Click on Instances and then select the Instance.
2. Click Actions and navigate to Instance State.
3. Click Terminate

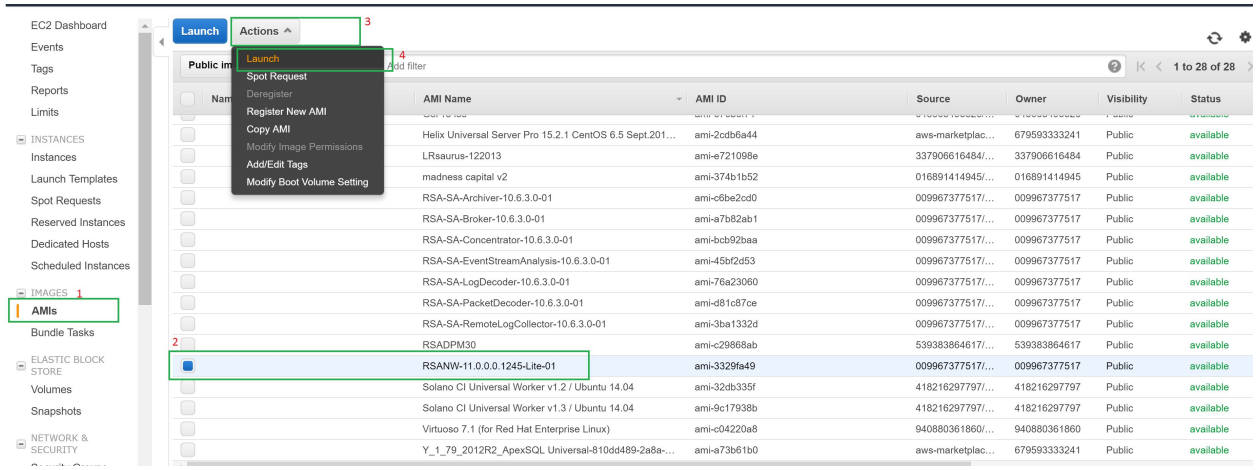


Task 5 - (IP retention) Create 11.3 instances using 11.3 AMI.

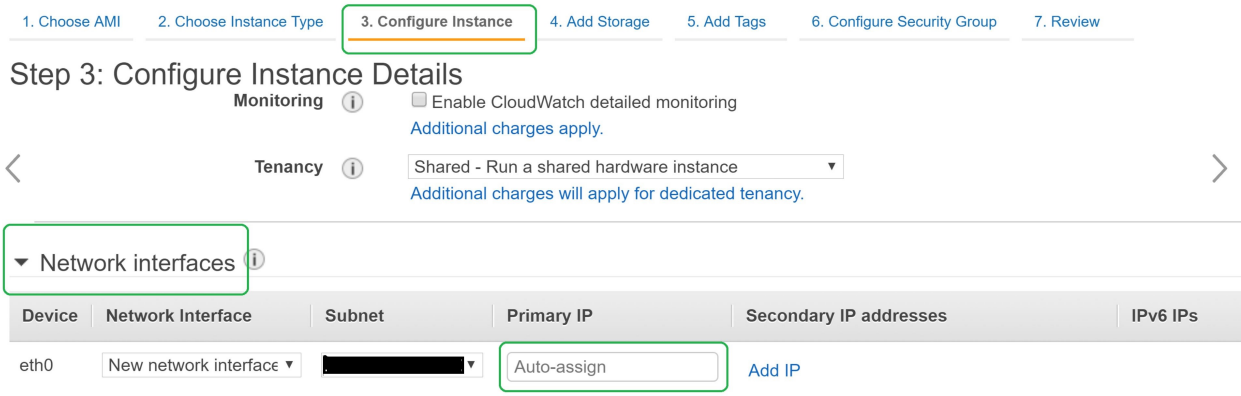
1. During the creation of EC2 instance, provide the IP address from task4. Click on AMIs and select 11.0 AMI.

Note: Refer to the *AWS Deployment Guide for version 11.0* for installing RSA NetWitness Platform11.0.0.0

2. Click Actions and then click Launch.



3. Assign the retained IP for the appropriate instances (IP retention). For example, If 10.6.1.xSA instance IP is 172.24.184.63 . Then assign the same IP(172.24.184.63) for 11.3 Instance.



Note: To deploy components other than NW, select the image(RSANW-11.0.0.0.1245-Lite-01) which is available under community AMIs section.

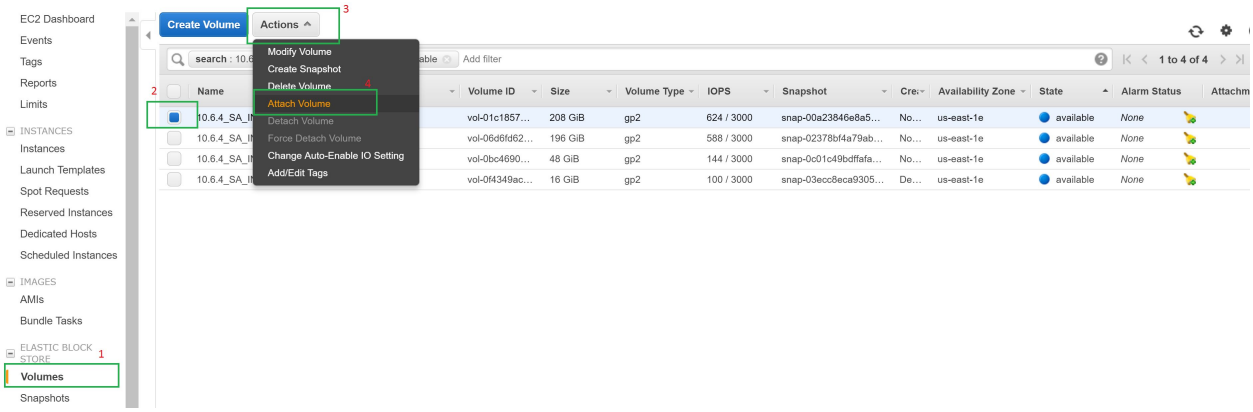
Task 6 - Attach volumes to the corresponding 11.3 instance

After NW 11.3 instance is deployed, stop the 11.0 instance and attach the available 10.6.1.x volumes (except the 'OS disk') to 11.3 instances.

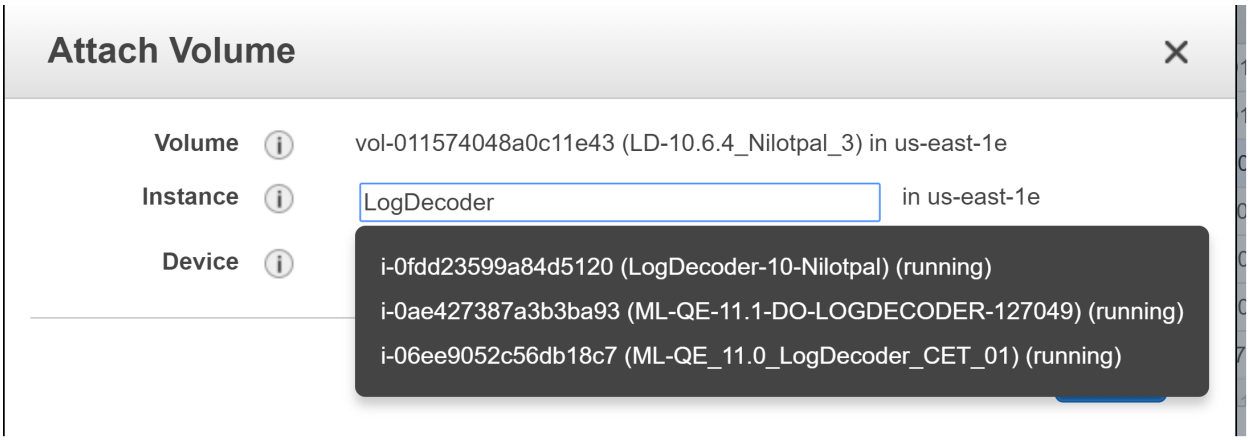
1. Click on Volumes.

2. Select the 10.6.6.x instance volume to attach.

3. Click Actions and then select Attach Volume.



4. Enter the 11.3 instance ID to which the volume has to be attached.



5. Power ON all the 11.3 instances once all the disks are attached.

Task 7 - Restore backup data in 10.6.6.x to 11.3 Instances (Data Restoration)

Execute the following steps for copying the backup data on SA, LD/LC, PD, Concentrator, Archiver, Broker:

1. Create a directory under `/tmp/` by the name `nwhome`.
2. Mount `VolGroup00-nwhome` on `/tmp/nwhome/` and make sure `/var/netwitness/database/` directory is present.

```
mount /dev/mapper/VolGroup00-nwhome /tmp/nwhome/
```

3. Copy the contents of `/tmp/nwhome/` directory to `/var/netwitness/`.
4. Unmount `VolGroup00-nwhome` from `/tmp/nwhome/`

```
umount /dev/mapper/VolGroup00-nwhome /tmp/nwhome/
```

Follow these steps for **ESA**:

1. Create a directory under `/tmp/` by the name `apps`.
2. Mount `VolGroup01-apps` temporarily on `/tmp/apps/`

```
mount /dev/mapper/VolGroup01-apps /tmp/apps/
```

3. Copy nw-backup directory from here to `/var/netwitness`

```
cp -r /tmp/apps/database/nw-backup /var/netwitness
```

4. Unmount VolGroup01-apps from `/tmp/apps/`

```
umount /tmp/apps
```

5. Add the following entries in `/etc/fstab` for `mounts`:(Disk Mounting) and then run mount `-a`

For SA:

```
/dev/mapper/VolGroup01-ipdbext /var/netwitness/ipdbextractor/ xfs
defaults,noatime,nosuid 1 2
```

```
/dev/mapper/VolGroup02-redb /var/netwitness/database/ xfs
defaults,noatime,nosuid 1 2
```

For LogDecoder/LogCollector:

```
/dev/mapper/VolGroup01-decoroot /var/netwitness/logdecoder ext4
defaults,noatime,nosuid 1 2
```

```
/dev/mapper/VolGroup01-index /var/netwitness/logdecoder/index xfs
defaults,noatime,nosuid 1 2
```

```
/dev/mapper/VolGroup01-sessiondb /var/netwitness/logdecoder/sessiondb xfs
defaults,noatime,nosuid 1 2
```

```
/dev/mapper/VolGroup01-metadb /var/netwitness/logdecoder/metadb xfs
defaults,noatime,nosuid 1 2
```

```
/dev/mapper/VolGroup01-logcoll /var/netwitness/logcollector xfs
defaults,noatime,nosuid 1 2
```

```
/dev/mapper/VolGroup01-packetdb /var/netwitness/logdecoder/packetdb xfs
defaults,noatime,nosuid 1 2
```

For PacketDecoder:

```
dev/mapper/VolGroup01-decoroot /var/netwitness/decoder ext4
defaults,noatime,nosuid 1 2
```

```
/dev/mapper/VolGroup01-sessiondb /var/netwitness/decoder/sessiondb xfs
defaults,noatime,nosuid 1 2
```

```
/dev/mapper/VolGroup01-index /var/netwitness/decoder/index xfs
defaults,noatime,nosuid 1 2
```

```
/dev/mapper/VolGroup01-metadb /var/netwitness/decoder/metadb xfs
defaults,noatime,nosuid 1 2
```

```
/dev/mapper/VolGroup01-packetdb /var/netwitness/decoder/packetdb xfs
defaults,noatime,nosuid 1 2
```

For Concentrator:

```
/dev/mapper/VolGroup01-concroot /var/netwitness/concentrator ext4
defaults,noatime,nosuid 1 2
```

```
/dev/mapper/VolGroup01-sessiondb /var/netwitness/concentrator/sessiondb xfs
defaults,nosuid,noatime 1 2
```

```
/dev/mapper/VolGroup01-index /var/netwitness/concentrator/index xfs
defaults,noatime,nosuid 1 2
```

```
/dev/mapper/VolGroup01-metadb /var/netwitness/concentrator/metadb xfs
defaults,noatime,nosuid 1 2
```

For Archiver:

```
/dev/mapper/VolGroup01-archiver /var/netwitness/archiver xfs
defaults,nosuid,noatime 1 2
```

```
/dev/mapper/VolGroup02-workbench /var/netwitness/workbench xfs
defaults,nosuid,noatime 1 2
```

For Broker:

```
/dev/mapper/VolGroup01-broker /var/netwitness/broker xfs
defaults,nosuid,noatime 1 2
```

6. Then run mount command
   `mount -a`

Task 8 Run nwsetup-tui script

Note: Please provide appropriate host names for all the 11.3 instances after launching. (for 10.6.6.x instance names refer all-systems-master-copy file, which contains 10.6.6.x instance names with IP address)

Execute the command to set the hostname: `hostnamectl set-hostname <hostname>`

Login to SA Sever CLI and run `nwsetup-tui` script for rest of the process completion.

Run 'nwsetup-cli' on rest of the components for Bootstrap and Orchestration. For more information, refer to the Set Up Virtual Hosts in 11.3 section.

Set Up Virtual Hosts in 11.3

There two phases to set up your 11.3 virtual stack that you must complete in the order shown.

- Phase 1 - Set Up NW Server, Event Stream Analysis, Malware Analysis, and Broker or Concentrator Hosts

  Note: For Event Stream Analysis, if you had C2 modules enabled in 10.6.6.x, the modules will enter a warm-up after you upgrade the Event Stream Analysis service to 11.5 and they will not be available until the warm up completes.

- Phase 2 - Set Up The Rest of the Component Hosts

Phase 1 - Set Up NW Server, Event Stream Analysis, Malware Analysis, and Broker or Concentrator Hosts

Task 1 - Set Up 11.3 NetWitness Server

Follow the instructions under Set Up 11.3 NW Server Host.

Task 2 - Setup 11.3 ESA

Caution: If you had C2 modules enabled in 10.6.4.x, the modules will enter a warm-up after you upgrade the Event Stream Analysis service to 11.0 and they will not be available until the warm up completes.

Follow the instructions under Set Up 11.3 Non-NW Server Host to set up your ESA hosts.

1. Set up your primary ESA host through the Setup program and install **ESA Primary** on the host in the user interface on the **Admin Hosts** view.

   Note: If you have multiple ESA hosts in your enterprise, you must upgrade the ESA Primary host, where all the `mongodb` (Mongo Database) backup tar files are located, first, before you upgrade ESA Secondary hosts.

2. (Conditional) If you have a secondary ESA host, set it up through the Setup program and install **ESA Secondary** on the host in the user interface on the **Admin Hosts** view.

Task 3 - Set Up 11.3 Malware Analysis

Follow the instructions under Set Up 11.3 Non-NW Server Host.

Task 4 - Set Up 11.3 Broker or Concentrator

Follow the instructions under Set Up 11.0 Non-NW Server Host.

Note: If you do not have a Broker, upgrade your Concentrator hosts. The 11.3 NW Server cannot communicate with 10.6.6.x core services for the new Investigate functionality. This is why you must upgrade the Broker or Concentrator hosts in Phase 1.

Phase 2 - Set Up The Rest of the Component Hosts

See Appendix B. Stopping and Restarting Data Capture and Aggregation for instructions on how to stop and restart data capture and aggregation when upgrading the Decoder, Concentrator, and Log Collection hosts.

Decoder and Concentrator Hosts

1. Stop data capture and aggregation.
2. Complete the steps in Set Up 11.3 Non-NW Server Host.
3. Restart data capture and aggregation.

Log Decoder Host

1. Make sure you have prepared the Log Collector as described in the *Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh* in the **Backup Instructions**.
2. Stop data capture on the Log Decoder.
3. Complete the steps in Set Up 11.3 Non-NW Server Host.
4. Restart data capture on Log Decoder.

   Note: After you upgrade, you will restart log collection after completing the Task 11 - Reset Stable System Values for Log Collector after Upgrade in the **Post Upgrade Tasks**

Virtual Log Collector Host

1. Make sure you have prepared the Virtual Log Collector as described in the *Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh*.
2. Back up your 10.6.6.x VLC by editing the `all-systems` file on host where you performed the backup.
   a. Make sure your `all-systems` file contents has this information before you perform this step.
      `vlc,<host-name>,<IP-address>,<UUID>,10.6.6.0`
   b. Run the following command to create backup.
      `./nw-backup.sh -u`
      See Backup Instructions for detailed procedures on how to back up the host.
3. Make sure the backup host contains the VLC backup in the following format.
   `<hostname>-<IPaddress>-root.tar.gz`
   `<hostname>-<IPaddress>-root.tar.gz.sha256`
   `<hostname>-<IPaddress>-backup.tar.gz`
   `<hostname>-<IPaddress>-backup.tar.gz.sha256`

`<hostname-IPaddress>-network.info.txt`
`all-systems-master-copy`

4. Power off the 10.6.6.x VLC so that a new 11.3 VM can be created with the same network configuration.
5. Deploy a fresh Non-NW Server host using the 11.0 NetWitness Platform ova.
6. Connect to the VM console of the new VLC.
7. Update the network configuration to be the same as the 10.6.6.x VLC.
   This information is stored in the `<hostname-IPaddress>-network.info.txt` 10.6.6.x VLC backup file.

   Note: Make sure IPv6 is disabled.

   a. Edit the `/etc/sysconfig/network-scripts/ifcfg-eth0` file and update the settings.
      Contents of `ifcfg-eth0` should be as follows.

```
TYPE=Ethernet
DEFROUTE=yes
NAME=eth0
UUID=<uuid>
DEVICE=eth0
DNS1=<nameserver from <hostname>-<ipaddress>-network-info.txt>
DNS2=<nameserver from <hostname>-<ipaddress>-network-info.txt>
BOOTPROTO=static
IPADDR=<ipaddress from <hostname>-<ipaddress>-network-info.txt>
NETMASK=<netmask from <hostname>-<ipaddress>-network-info.txt>
GATEWAY=<gateway from <hostname>-<ipaddress>-network-info.txt>
NM_CONTROLLED=no
ONBOOT=yes
```

   b. Submit the following command string.

```
systemctl restart network.service
```

8. Create the backup directory.

```
# mkdir -p /var/netwitness/database/nw-backup/
```

9. Copy the backup from the backup host from `/var/netwitness/database/nw-backup` to the new VLC in the `/var/netwitness/database/nw-backup` directory.
10. Complete the steps 2 through 12 inclusive in Set Up 11.3 Non-SA Server Host for the rest of the NetWitness Platform components . Make sure that you select **Log Collector** for the service in step 12.

Set Up 11.3 NW Server Host

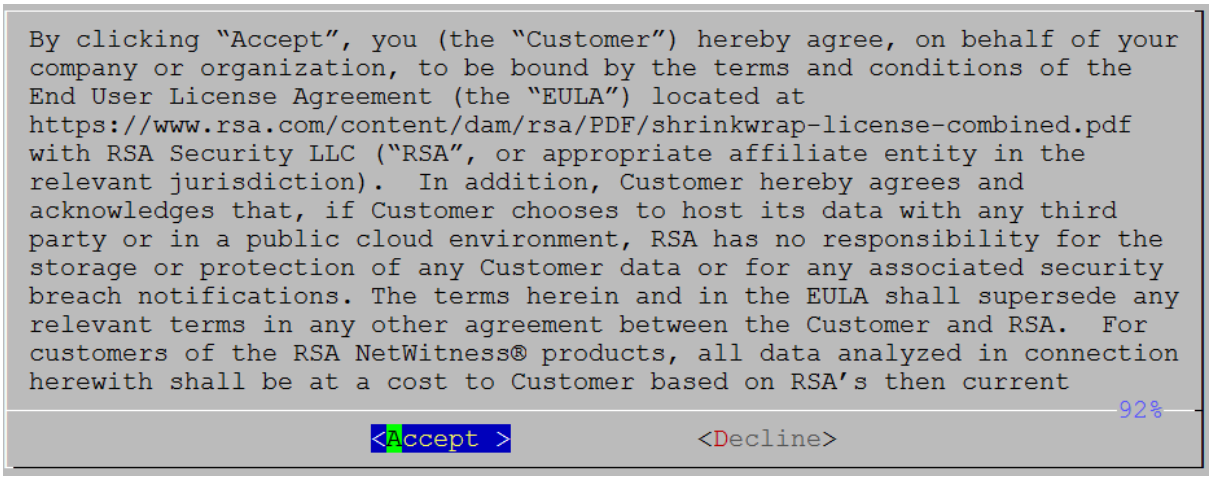
Make sure that you have backed up 10.6.6.x data for the SA Server host. **You must follow the instructions in Backup Instructions to back up the host.**

Caution: Run the backup immediately before upgrading the SA Server to 11.3 so that the data is as recent as possible. You must create the **all-systems** file before you upgrade the SA Server because you cannot do this after the SA Server has been upgraded to 11.3.

Complete the following steps to set up the 11.3 NW Server host.

1. Power on the NW Server VM and run the `nwsetup-tui` command.
   This initiates the Setup program and the EULA is displayed.

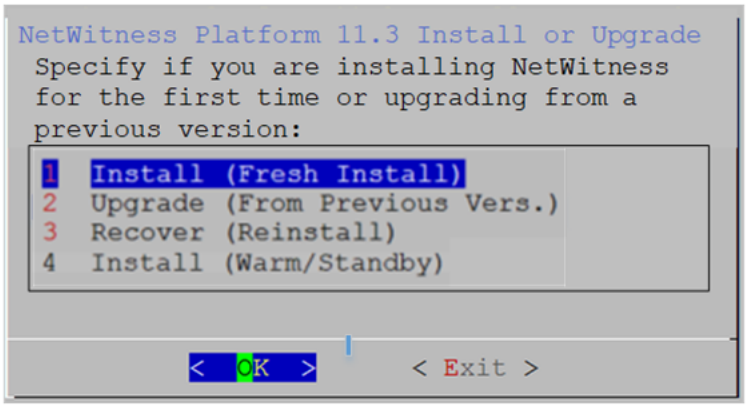
   Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press the Enter key to register your command response and move to the next prompt.
   2.) The Setup program adopts the color scheme of the desktop or console you use access the host.

2. Tab to **Accept** and press **Enter**.
   The "Is this the NW Server" prompt is displayed.

   Caution: If you choose the wrong host for the NW Server and complete the upgrade, you must repeat steps 1 through 11 of Set Up 11.3 NW Server Host to correct this error.

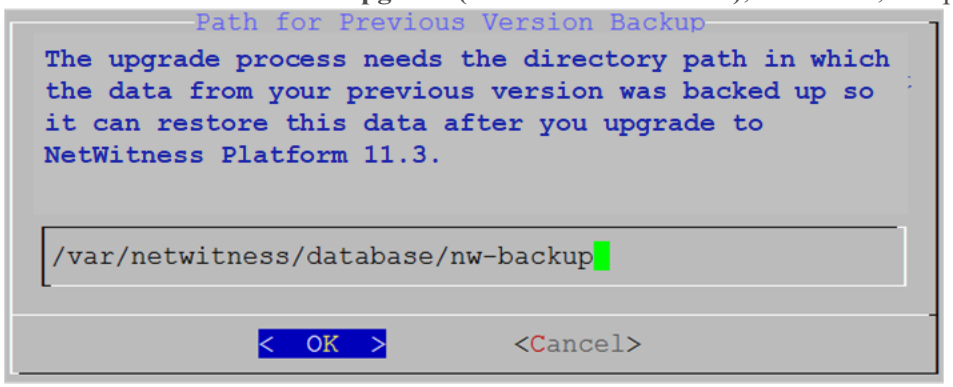
3. Tab to **Yes** and press **Enter**.
   Choose No if you already upgraded the NW Server to 11.3.
   The Install or Upgrade prompt is displayed.



The backup path is displayed.

Caution: The backup path in the following prompt must be the same as the path in which your backup is stored. For example, the backup script assigns **/var/netwitness/database/nw-backup** as the default path. If you used the default backup path during backup and did not change it subsequently, you must keep **/var/netwitness/database/nw-backup** as the path in the following prompt.

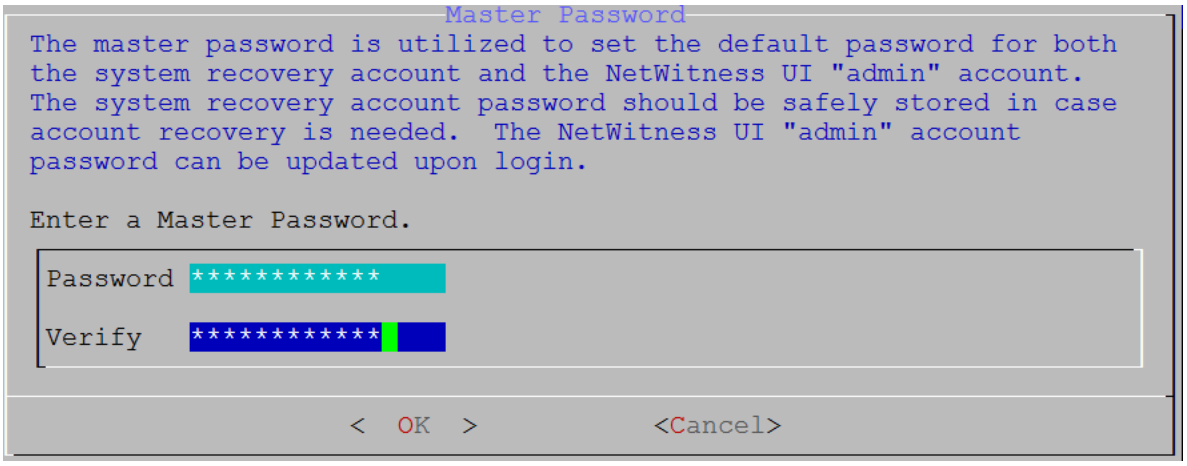
4. Use down arrow to select **2 Upgrade (From Previous Vers.)**, tab to **OK**, and press **Enter**.



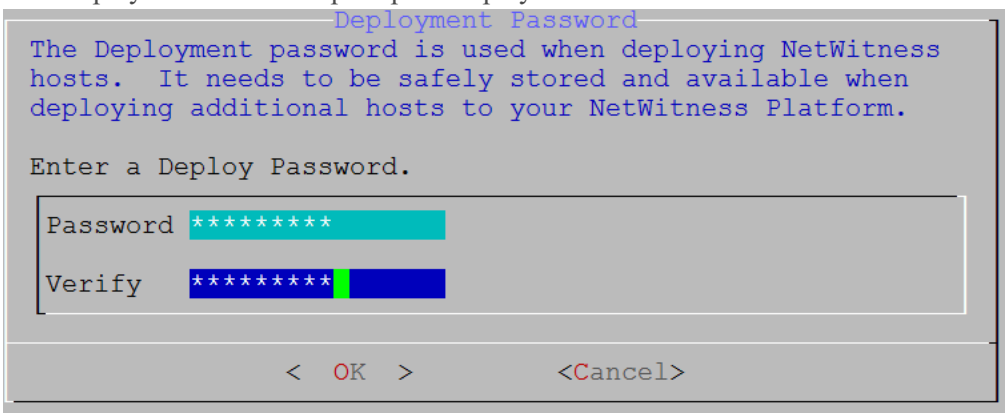
5. Tab to **OK** and press **Enter** if want to keep this path. If not, edit the path, tab to **OK** and press **Enter** to change it.
   The Master Password prompt is displayed.
   The following list of characters are supported for Master Password and Deployment Password:

   - Symbols : ! @ # % ^ + ,
   - Numbers :0-9
   - Lowercase Characters : a-z
   - Uppercase Characters : A-Z

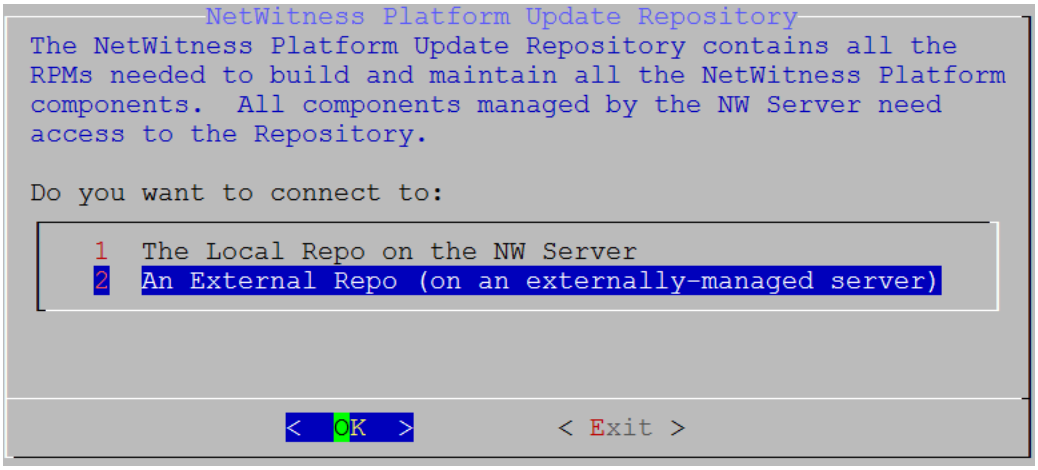
   No ambiguous characters are supported for Master Password and Deployment Password (for example: space { } [ ] ( ) / \ ' " ` ~ ; : . < > -.



6. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**. The Deployment Password prompt is displayed.

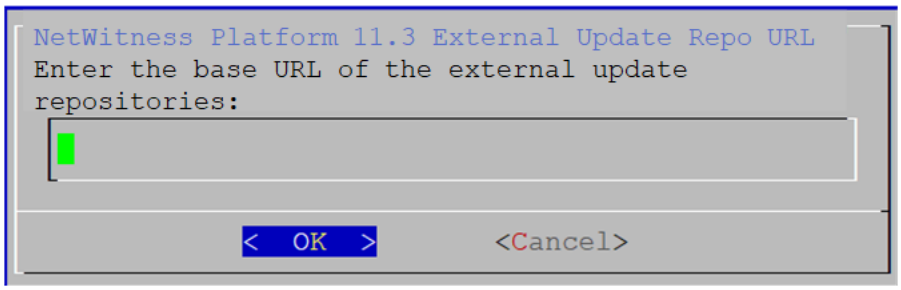


7. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**. The Update Repo prompt is displayed.



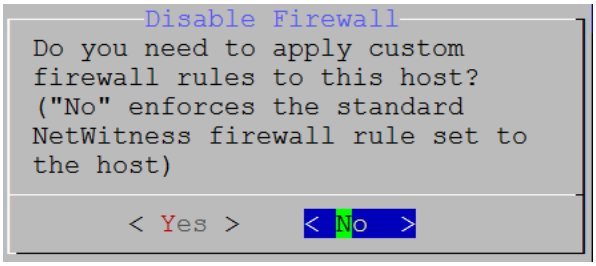
You must use the same repo that you used for the NW Server hosts for all hosts.

8. Use the down and up arrows to select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL.



See "Set Up an External Repository with RSA and OS Updates" under "Hosts and Services Procedures" in the *Hosts and Services Getting Started Guide for Version 11.3* for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

9. Enter the base URL of the NetWitness Platform external repo and click **OK**.
   The disable or use standard firewall configuration prompt is displayed.

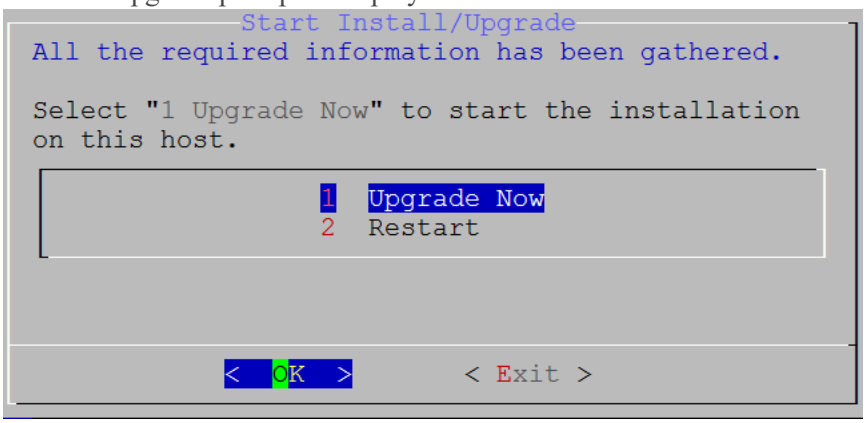


10. Tab to **No**, and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.

    - If you select Yes, confirm your selection.

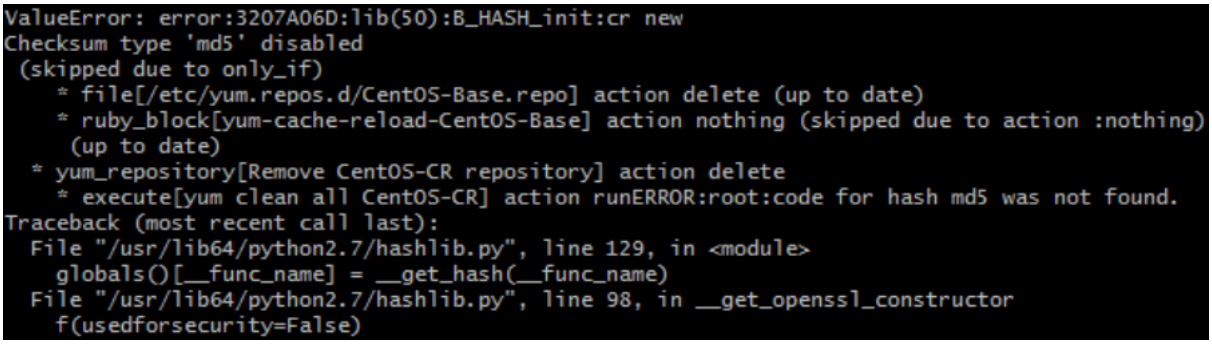
    - If you select No, the standard firewall configuration is applied.

The start upgrade prompt is displayed.



11. Select 1 **Upgrade Now**, tab to **OK**, and press Enter.
When "Installation complete" is displayed, you have upgraded the 10.6.6.x SA Server to the 11.3 NW Server.

Note: Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



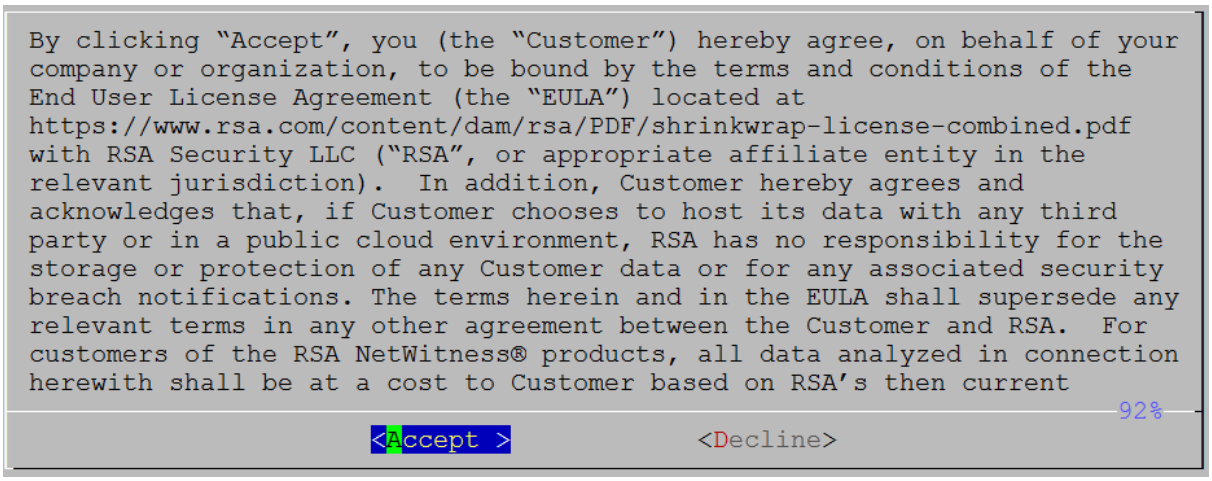
Set Up 11.3 Non-NW Server Host

Make sure that you Back up your 10.6.6.x data for the host. You must follow the instructions in Backup Instructions to back up the host.

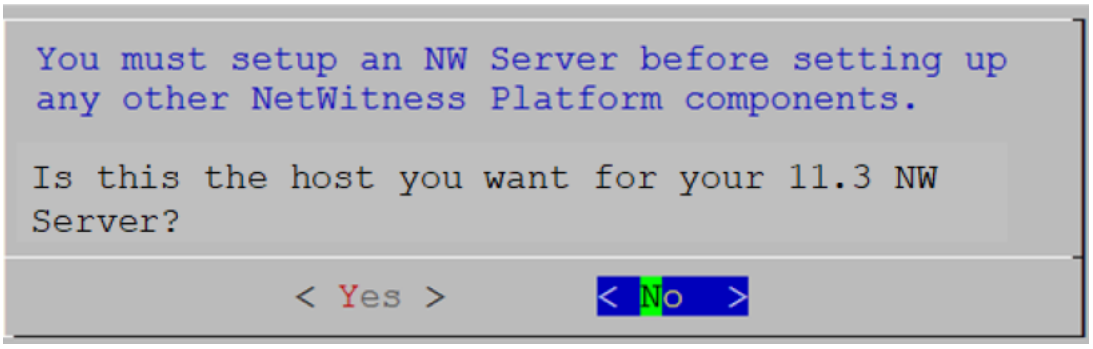
Caution: Run the backup immediately before upgrading the host to 11.3 so that the data is as recent as possible.

Complete the following steps to set up an 11.3 Non-NW Server host.

1. **Power On** the non-NW Server VM and run the `nwsetup-tui` command.
This initiates the Setup program and the EULA is displayed.

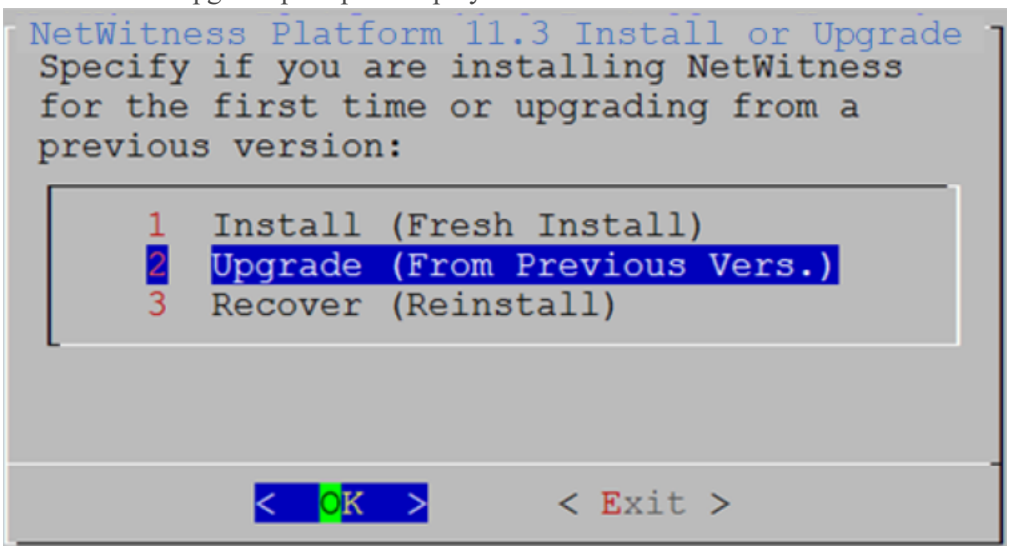


2. Tab to **Accept** and press **Enter**.
   The "Is this the NW Server" prompt is displayed.

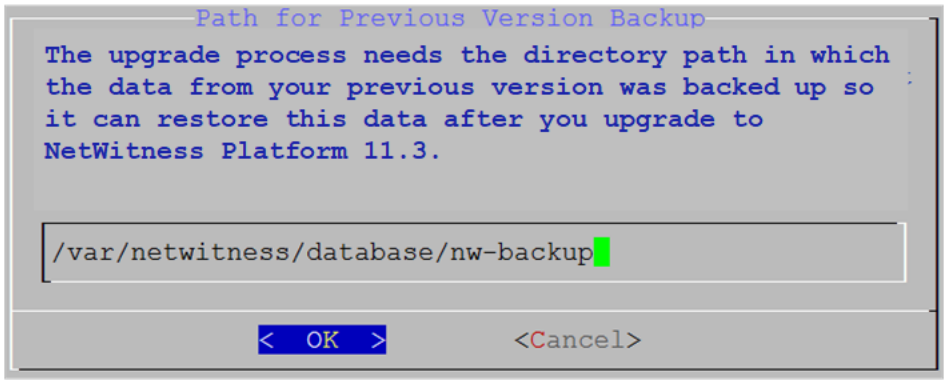


Caution: If you choose the wrong the host for the NW Server and complete the upgrade, you must repeat steps 1 through 11 of Set Up 11.3 NW Server Host to correct this error.

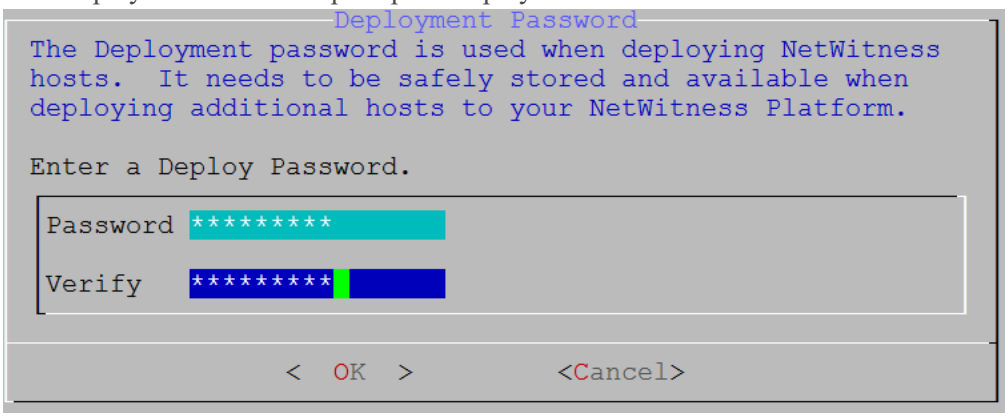
3. Tab to **No** and press **Enter**.
   The Install or Upgrade prompt is displayed.



4. Use down arrow to select **2 Upgrade (From Previous Vers.)**, tab to **OK**, and press **Enter**.
   The backup path prompt is displayed.

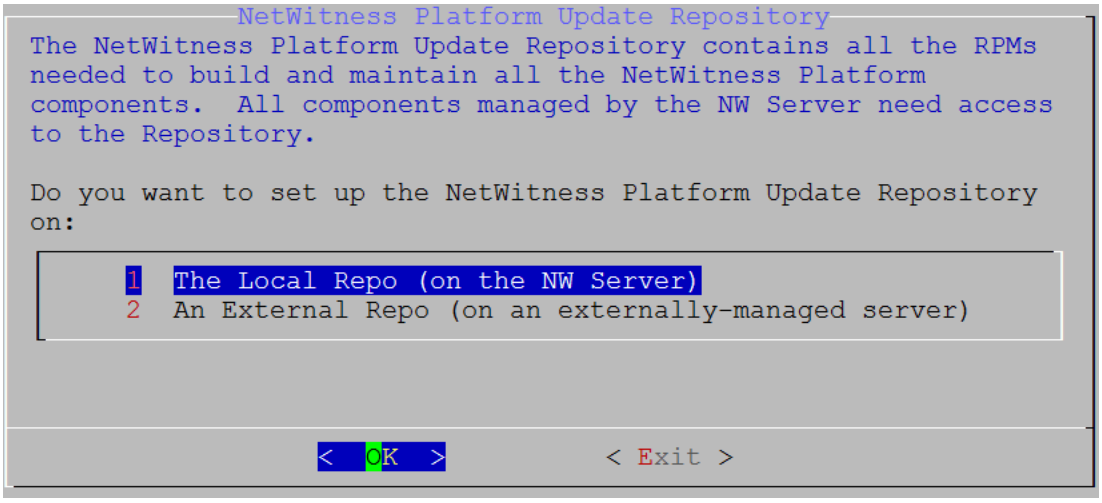


5. Tab to **OK** and press **Enter** if want to keep this path. If not, edit the path, tab to **OK** and press **Enter** to change it.
   The Deployment Password prompt is displayed.

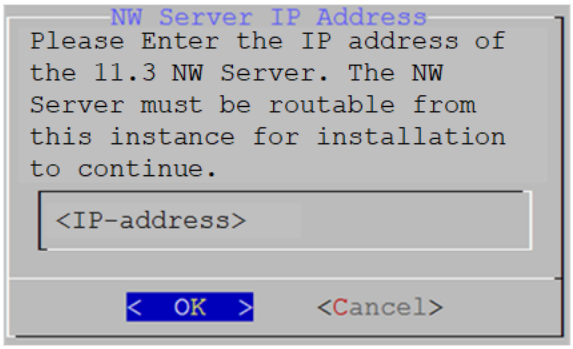


Note: You must use the same deployment password that you used when you upgraded the NW Server.

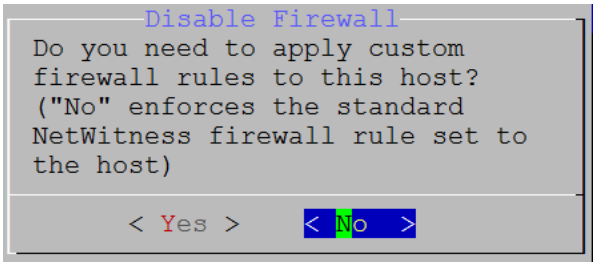
6. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.
   The Update Repo prompt is displayed.



7. Use the down and up arrows to select **1 The Local Repo on the NW Server**, tab to **OK**, and press **Enter**.
8. The NW Server IP Address is displayed.

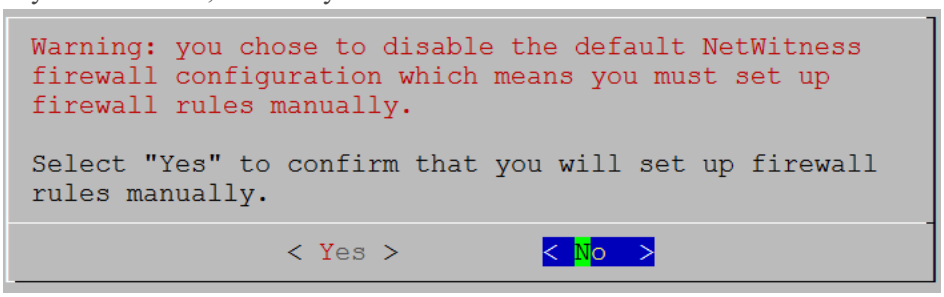


9. Type the IP address of the NW Server, tab to **OK**, and press **Enter**.
   The disable or use standard firewall configuration prompt is displayed.



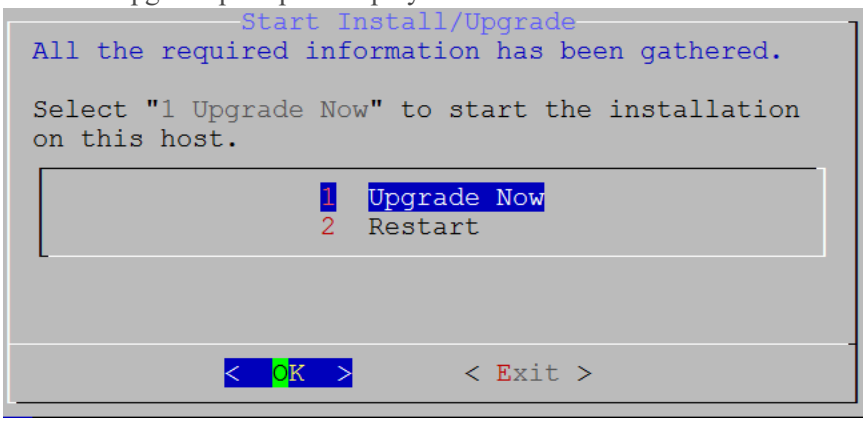
10. Tab to **No**, and press Enter to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.

- If you select **Yes**, confirm your selection.



- If you select **No**, the standard firewall configuration is applied.

The start upgrade prompt is displayed.

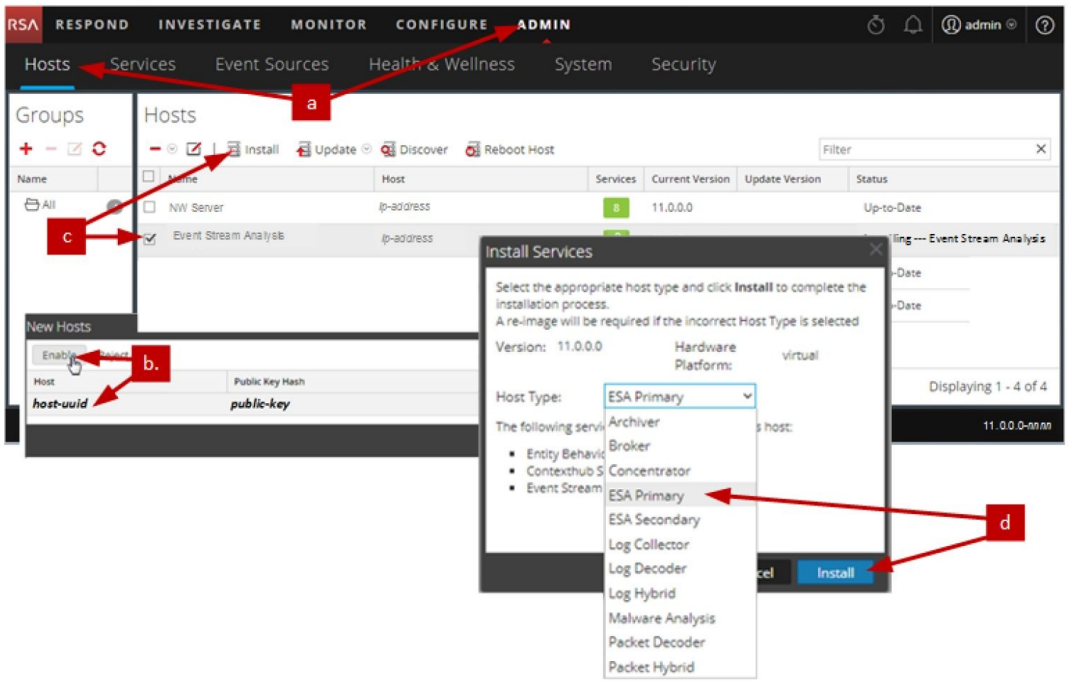


11. Select 1 **Upgrade Now**, tab to **OK**, and press **Enter**.
    When "Installation complete" is displayed, you have upgraded the host to the 11.3.

Once 'nwsetup-cli' script ran successfully on all the components, follow the below steps to complete NW 11.3 Upgrade or Migration:

1. Log into NetWitness Platform. (Type `https://<NW-Server-IP-Address>/login` in your browser to get to the NetWitness Platform Login screen)
2. Click ADMIN > Hosts. The New Hosts dialog is displayed with the Hosts view grayed out in the background. Note: If the New Hosts dialog is not displayed, click Discover in the Hosts view toolbar.
3. Click on the host in the New Hosts dialog and click Enable. The New Hosts dialog closes and the host is displayed in the Hosts view.
4. Select that host (for example, ESA Primary) and click The Install Services dialog is displayed.

e. Select the appropriate service (for example, **ESA Primary**) and click **Install**.



Update or Install Legacy Windows Collection

Refer to the *RSA NetWitness 11.3 Legacy Windows Collection Guide* on RSA Link (https://community.rsa.com/docs/DOC-75593) for details about how to install or update Legacy Windows collection.

Note: After you update or install Legacy Windows Collection, reboot the system to ensure that Log Collection functions correctly.

Post Upgrade Tasks

You must complete the following tasks after you upgrade your hosts from 10.6.6.x to 11.3. These tasks are organized by the following categories.

- General
- Event Stream Analysis
- Investigate
- Log Collection
- Log Decoder and Decoder
- Malware Analysis
- Reporting Engine
- Respond
- Warehouse
- RSA Archer® Cyber Incident & Breach Response
- RSA NetWitness® Endpoint
- RSA NetWitness® UEBA
- NetWitness Platform Integrations
- Other

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

General

General tasks apply to all customers regardless of the NetWitness Components you deploy.

Task 1 - Remove Backup-Related Files from Host Local Directories

Caution: 1) You must retain a copy of all backup files on an external host. 2) Validate that you have all your data from your backup restored in 11.3 before you remove the backup-related files from the local directories on your 11.3 hosts.

Backup `.tar` Files

After all the hosts are upgraded to 11.3, you must remove:

- The backup files from the local directories on the hosts.
- All the files from `nw-backup` and `restore` directories on the hosts.

Host	Backup Path	Restore Path
Malware	`/var/lib/rsamlware/nw-backup`	`/var/netwitness/malware_analytics_server/nw-backup/restore`
Event Stream Analysis	`/opt/rsa/database/nw-backup`	`/var/netwitness/database/nw-backup/restore`
NW Server	`/var/netwitness/database/nw-backup`	`/var/netwitness/restore`
All Other Hosts	`/var/netwitness/database/nw-backup`	`/var/netwitness/database/nw-backup/restore`

Task 2 - Make Sure Port 15671 Is Configured Correctly

Port 15671 is new in 11.x, but you do not need to open a firewall for this port. Make sure that port 15671, and all ports, are configured as shown in the "Network Architecture and Ports" topic in the *Deployment Guide*.

(Optional) Task 3 - Reissue Certificates for Your Hosts

In 11.3.0.0, RSA introduced a `cert-reissue` command line command and its arguments to reissue host certificates. After you update all your hosts to 11.3, you should reissue certificates for all of them as soon as possible to avoid having them expire. If the certificates expire, this places your NetWitness deployment in a bad security state. Refer to the *Security Configuration Guide* for instructions on how to use the `cert-reissue` command.

(Conditional) Task 4 - Restore Custom Analysts Roles

If you had custom analyst roles in 10.6.6.x, you must reinstate them in 11.3. See "Add a Role and Assign Permissions" in the *System Security and User Management Guide*.

(Conditional) Task 5 - If NetWitness Platform Has No Web Access, Upload Response `.bin` File Again (License Server)

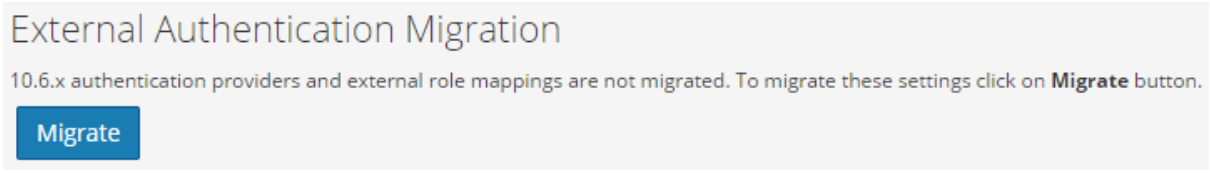
If your NetWitness Deployment does not have Internet access, after you upgrade to 11.3, you must upload the response `.bin` file again to view the license information in the **ADMIN** > **System** > **Licensing** view in the NetWitness Platform User Interface. See “Upload an Offline Capability Response to NetWitness Platform” in the *Licensing Management Guide* for instructions.

Task 6 - Migrate Active Directory (AD)

The first time you log into the NetWitness Platform 11.3 User Interface, you must click on the Migrate button to complete the migration of AD.

1. Log in to NetWitness Platform 11.3 with your `admin user` credentials.

2. Go to **ADMIN** > **SECURITY** and click the **Settings** tab.
   The following dialog is displayed.



3. Click **Migrate**.
   The migration is complete and the dialog closes.

Task 7 - Modify Migrated AD Configuration to Upload Certificate

If you authenticated through Active Directory (AD) server, and enabled SSL for the AD connection in 10.6.6.x, you must modify the migrated AD configuration to upload the Active Directory server certificate.

Complete the following procedure to modify the migrated AD configuration to upload the certificate.

1. Log in to **NetWitness Platform** 11.3, go to **ADMIN** > **Security** and click the **Settings** tab.
2. Under **Active Directory Settings**, select an AD configuration and click .
   The Edit Configuration dialog is displayed.
3. Go to the **Certificate File** field, click **Browse**, and select a certificate from your network.
4. Click **Save**.

Task 8 - Reconfigure Pluggable Authentication Module (PAM) in 11.3

You must reconfigure PAM after you upgrade to 11.3. See "Configure PAM Login Capability" in the *System Security and User Management Guide* for instructions.

You can refer to your 10.6.6.x PAM configuration files in the **/etc** directory in the your 10.6.6.x backup data for guidance.

Task 9 - Restore NTP Servers

You must use the NetWitness Platform 11.3 user interface to restore NTP server configurations. NTP server configuration information is located in `$BUPATH/restore/etc/ntp.conf`. Use the NTP server name and hostname from the `/var/netwitness/restore/etc/ntp.conf` file. See "Configure NTP Servers" in the *System Configuration Guide* for detailed instructions on how to add NTP servers.

Task 10 - Restore Licenses for Environments without FlexNet Operations-On Demand Access

If your environment does not have access to FlexNet Operations-On Demand, you need to re-download your NetWitness Platform licenses. Refer to "Step 1. Register the NetWitness Server" in the *Licensing Management Guide* for instructions on how to re-download licenses.

(Conditional) Task 11 - If You Disabled Standard Firewall Config - Add Custom IPtables

During the upgrade, you have the option of using these rules or disabling them. If you disabled them, follow these instructions as a baseline to create user-managed firewall rule sets on all the hosts for which you disabled the standard firewall configuration.

Note: You can refer to the `$BUPATH/restore/etc/sysconfig/iptables` and `$BUPATH/restore/etc/sysconfig/ip6tables` in the restore folder of the backup to update the `ip6tables` and `iptables` files. The `/etc/netwitness/firewall.cfg` file contains the standard `iptables` firewall rules.

1. SSH to each host and log in with your root credentials.
2. Update the following `ip6tables` and `iptables` files with the custom firewall rules.
   ```
   /etc/sysconfig/iptables
   /etc/sysconfig/ip6tables
   ```
3. Reload the `iptables` and `ip6tables` services.
   ```
   service iptables reload
   service ip6tables reload
   ```

(Conditional) Task 12 - Specify SSL Ports If You Never Set Up Trusted Connections

Complete this task only if you never set up Trusted Connections. You would not have set up Trusted Connections if you:

- Used the base ISO image for 10.3.2 or earlier.
- Updated the system using RPMs exclusively to get to 10.6.6.x.

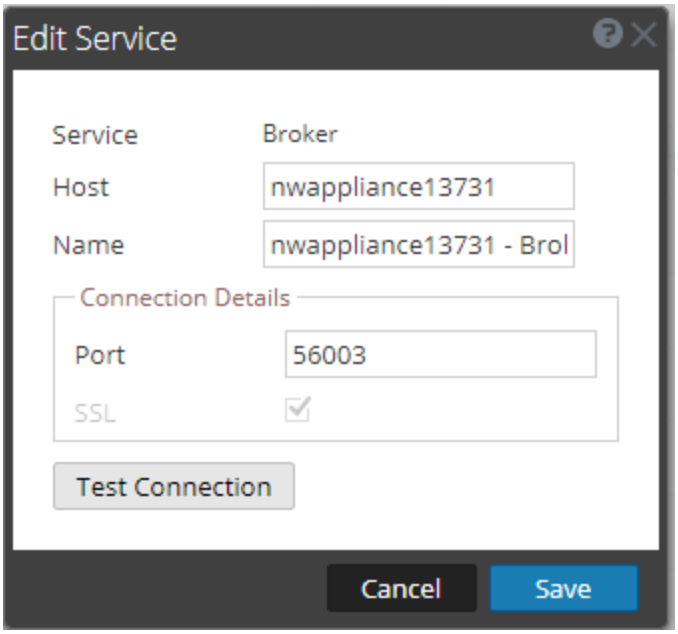
NetWitness Platform 11.3 cannot communicate with the Core services if you are using a non-SSL port 500XX. You must update the Core service ports to an SSL port in the Edit Service dialog.

1. Log in to **NetWitness Platform** and go to **ADMIN** > **Services**.
2. Select each core service and change the ports from Non-SSL to SSL ports.

Service	Non-SSL	SSL
Broker	50003	56003
Concentrator	50005	56005
Decoder	50004	56004
Log Decoder	50002	56002

3. Click (Edit icon) from the SERVICES view toolbar.
   The Edit Service dialog is displayed.

4. Change the port from Non-SSL to SSL as shown in the table and click **Save** (for example, change the Broker port from 50003 to 56003).



Task 13 (Conditional) Reconfigure Public Key Infrastructure (PKI) Certificates

If you had PKI keystores that contained server certificates with private keys and the truststores that contain the trusted CA certificates, you must reconfigure after you upgrade to 11.3. For instructions on how to configure PKI authentication, see the "*System Security and User Management Guide*".

Event Stream Analysis (ESA)

Task 14 - Reconfigure Automated Threat Detection for ESA

If you used Automated Threat Detection in 10.6.6.x, you must complete the following steps to reconfigure it using the ESA Analytics service in 11.3.

1. Log in to **NetWitness Platform** and go to **ADMIN** > **System** > **ESA Analytics**.
   The Suspicious Domains modules, Command and Control (C2) for Network data and C2 for Logs, require a whitelist named "**domains_whitelist**".
2. Conditional - If your previous Automated Threat Detection whitelist appears on the **Lists** tab of the Context Hub service:
   a. Go to **ADMIN** > **Services**, select the Context Hub service, in the action commands ( ) drop-down menu, click **View** > **Config** > **Lists** tab.
   b. Rename your old Automated Threat Detection whitelist to "`domains_whitelist`" for the Suspicious Domains module.

For more information, see the *Automated Threat Detection Guide* and the "Configure ESA Analytics" section of the *ESA Configuration Guide*.

Task 15 (Conditional) Verify String Array Type Meta Keys on the ESA Correlation Service

If you added any string array type meta keys to the Event Stream Analysis service for your ESA correlation rules in 10.6.6.x or earlier, verify that they appear on the ESA Correlation service in 11.3.

1. Follow the "Configure Meta Keys as Arrays in ESA Correlation Rule Values" procedure in the *ESA Configuration Guide* to verify if the string array type meta keys that were added before the upgrade are on the ESA Correlation service. Add any missing string array type meta keys.
2. Do not remove any meta keys from the multi-valued parameter on the ESA Correlation service. In NetWitness Platform 11.3, the ESA rules from Live use meta keys with array syntax and they depend on these meta keys to work correctly. Removing values from the multi-valued list can cause the ESA Rule Deployments to fail.

Task 16 (Conditional) Update RSA Live ESA Rules with Meta Type Changes from String to Array

The following table lists the ESA rules from RSA Live that had meta key type changes from String to Array in NetWitness Platform 11.3.

Rule #	Rule Name	Array Type Meta Keys in 11.3
1	RIG Exploit Kit	threat_category
2	AWS Critical VM Modified	alert
3	Multiple Successful Logins from Multiple Diff Src to Same Dest	host.src and host.dst
4	Multiple Successful Logins from Multiple Diff Src to Diff Dest	host.src and host.dst
5	Multiple Failed Logins from Multiple Diff Sources to Same Dest	host.src and host.dst
6	Multiple Failed Logins from Multiple Users to Same Destination	host.src and host.dst
7	User Login Baseline	host.src and host.dst

1. If you:
   - Deployed these rules before version 11.3:
     a. Note any rule parameters that you have changed so you can adjust the rules for your environment.
     b. Download the updated rules from RSA Live.

c. Reapply any changes to the default rule parameters and deploy the rules.
(For instructions, see "Download RSA Live ESA Rules" in the Alerting with ESA Correlation Rules User Guide.)

- Are deploying these rules for the first time in version 11.3, follow the customization directions with the ESA rule descriptions. Rules 3 to 7 in the above table require that the Context Hub lists for `User_Whitelist`, `Host_Whitelist` and `IP_Whitelist` to be added as enrichments to ESA. (See "Configure Context Hub List as an Enrichment Source" in the *Alerting with ESA Correlation Rules User Guide*.)

2. Deploy the ESA rule deployment that contains these rules. (See "ESA Rule Deployment Steps" in the *Alerting with ESA Correlation Rules User Guide*.)

Task 17 (Conditional) - Verify ESA Rule Deployment

After you upgrade to 11.3, verify your ESA rule deployments. For every ESA host, a new deployment is created in the format "<ESA Host name> – ESA Correlation".

1. Make sure that a new deployment was created.
2. Make sure that the new deployment contains an ESA Correlation service, data sources, and rules for all previous deployments on that ESA host.
3. Make sure that the ESA Correlation service has status of "Deployed".

For a detailed example, see the *ESA Configuration Guide*. For Deployment information, see "ESA Rule Deployment Steps" in the *Alerting with ESA Correlation Rules User Guide*. For troubleshooting information, see the *Alerting with ESA Correlation Rules User Guide*.

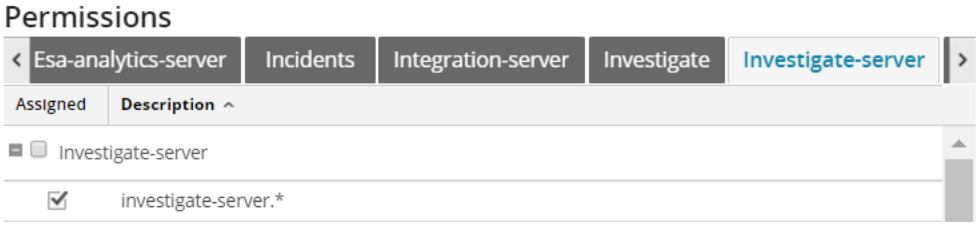
Investigate

Task 18 - Make Sure Customized User Roles Have `Investigate-server` Permissions for Event Analysis Access

After you upgrade to 11.3.0.0, any customized user role does not have `investigate-server.*` permission enabled by default. Complete the following procedure to make sure that the appropriate user roles have permission to access Event Analysis.

1. Log in to NetWitness Platform 11.3.0.0 with your `Admin user` credentials and go to **ADMIN** > **Security**.
2. Click the **Roles** tab.
3. Select the roles that need `investigate-server.*` permissions and click (Edit icon).
4. Select the **Investigate-server** tab under under **Permissions**.

5. If the **investigate-server** checkbox is not set, set it for the Roles that require Event Analysis access.



6. Click **Save**.

Log Collection

Task 19 - Reset Stable System Values for Log Collector after Upgrade

Complete the following tasks to reset stable system values for the Log Collector after you upgrade it to 11.3 to ensure that all collection protocols resume normal operation.

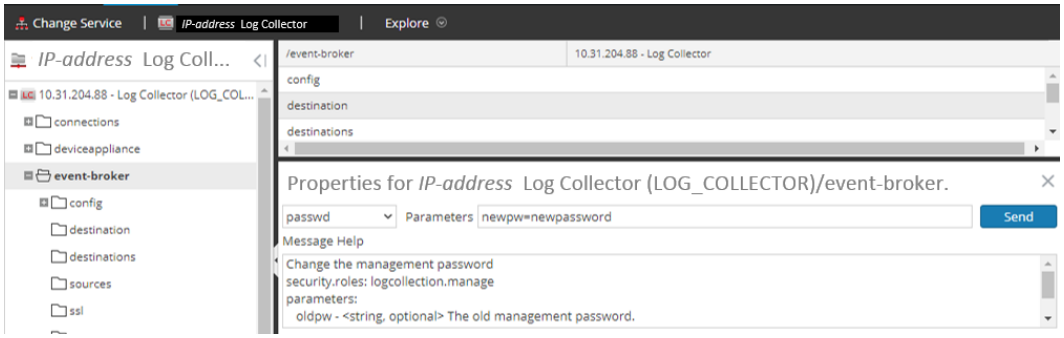
Reset Stable System Values for the Lockbox

The Lockbox stores the key for encrypting event source and other passwords for the Log Collector. The Log Collector service cannot open the Lockbox because of the stable system value changes. As a result, you must Reset Stable System Values for the Lockbox . See "Log Collection: Step 3. Set Up a Lockbox" in the *Log Collection Configuration Guide* for instructions.

Update Log Collector Service RabbitMQ User Account Password

If the `logcollector` service RabbitMQ user account password was changed, you must reenter it after the 11.3 upgrade.

1. Log in to **NetWitness Platform** and go to **ADMIN** > **Services**.
2. Select the Log Collector service.
3. Click (Actions) > **View** > **Explore**.
4. Right click `event-broker` > **Properties** .
5. Select `passwd` from the drop-down list, enter `newpw=><newpassword>` in Parameters (where `<newpassword>` is the RabbitMQ user account password), and click **Send**.



Task 20 - (Conditional) Update SSHD Configuration after Upgrade with Older Windows and UNIX SFTP Agents

This task applies if you have Log Collection, Log Collector (LC) and or Virtual Log Collector (VLC), with File Collection event sources.

If all the event sources:

- Resume collection after upgrade, you do not need to do anything.
- Do not resume collection after the upgrade, you may have to restore Cipher, MACs and Key Exchange Algorithms to the SSHD configuration from the original LC/VLC. Change the `/etc/ssh/sshd_config` file.

1. Make the following changes to `/etc/ssh/sshd_config` file.
   a. If the `KexAlgorithms` line:
      - Exists, append "`,diffie-hellman-group1-sha1`" to the file.
      - Does not exist, add "`KexAlgorithms +diffie-hellman-group1-sha1`" line.
   b. If the `Ciphers` line:
      - Exists, append "`,aes128-cbc`" to the file.
      - Does not exist, add the "`Ciphers +aes128-cbc`" line to the file.
2. Restart SSHD service.
3. If collection still fails, edit the `/etc/systemd/system/sshd.service.d/sshd-opts-managed.conf` file and change "`OWB_ALLOW_NON_FIPS=on`" to "`OWB_FIPS_MODE=off`" in the Environment line and restart SSHD service.
4. If collection still fails, contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294).

Task 21 - Enable FIPS Mode

Note: This task is optional for Upgrades from 10.6.6.x with FIPS enabled for Log Collectors, Log Decoders and Network Decoders)

FIPS is enabled on all services except Log Collector, Log Decoder, and Decoder. FIPS cannot be disabled on any services except Log Collector, Log Decoder, and Decoder.

Log Decoder and Decoder

(Conditional) Task 23 - Enable Metadata for GeoIP2 Parser

By default, the GeoIP2 parser generates less metadata than the GeoIP parser did. After updating to 11.3, if you require any of the additional metadata, you must enable them (once only) for each Decoder. This can also be altered post-upgrade. Note that the `isp` and `org` meta fields usually produce an equivalent value to `domain`.

To enable metadata:

1. Go to **ADMIN** > **Services**.
2. In the **Administration services** view, select a Log Decoder or a Decoder.
3. Click the settings icon ( ) and select **View** > **Config**. The Parsers Configuration panel is displayed, from which you can select **GeoIP2** to enable the desired metadata.

For more information about GeoIP2 parsers, see the "GeoIP2 and GeoIP Parsers" topic in the *Decoder and Log Decoder Configuration Guide*.

Malware Analysis

Task 24 - Enable Threat - Malware Indicators Dashboard

In 11.3, the 10.6.6.x **Threat -Indicators Dashboard** was renamed to **Threat - Malware Indicators Dashboard**. If you used this dashboard in 10.6.6.x, you must:

1. Enable the **Threat - Malware Indicators Dashboard** in 11.3.
2. Set datasource for new dashlets.
   See "Dashlets" in RSA Link (https://community.rsa.com/docs/DOC-81463) for a description of Dashlets in the context of NetWitness Platform.

Note: After upgrading to 11.3, both the Threat-Indicators and the Threat-Malware Indicators dashboards can be displayed in the User Interface. If this is the case, disable the Threat-Indicators dashboard, and enable the Threat-Malware Indicators report charts and dashboard. For information about disabling dashboards, see the "Managing Dashboards" topic in the *NetWitness Getting Started Guide*.

Reporting Engine

(Conditional) Task 25 - Restore the CA certificates for External Syslog Servers for Reporting Engine

You must restore CA certificates after the upgrade from the backup you made prior to the upgrade. The Backup script backs up the 10.6.6.x CA certificates into the `/usr/lib/jvm/java-1.8.0-openjdk-1.8.0.111-0.b15.el6_8.x86_64/jre/lib/security/cacerts` directory.

Complete the following procedure to restore the CA certificates in 11.3.

1. SSH to the NW Server host.
2. Export the CA certificates.
   ```
   keytool -export -alias <alias_name> -keystorepath_to_keystore_file -rfc -file path_to_certificate_file
   ```
3. Copy the CA PEM file into `/etc/pki/nw/trust/import` directory.

(Conditional) Task 26 - Restore External Storage for Reporting Engine

If you have external storage for the Reporting Engine (such as SAN or NAS for storing reports), you must restore the mount you unlinked before the upgrade. See "Reporting Engine: Add Additional Space for Large Reports" in the *Reporting Engine Configuration Guide* for instructions.

Respond

Task 27 - Restore Respond Service Custom Keys

In 10.6.6.x, if you added custom keys for use in the **groupBy** clause, the `alert_rules.json` file was modified. The `alert_rules.json` file contains aggregation rule schema. RSA moved the `alert_rules.json` file to the following new location:
`/var/lib/netwitness/respond-server/scripts`

1. Copy the custom keys from `/opt/rsa/im/fields/alert_rules.json` file in the backup directory.
   This directory is where the `alert_rules.json` file is restored from the 10.6.6.x backup.
2. Go to the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` in 11.3.
   This is the new file for 11.3.
3. Edit the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` to include the custom keys you copied in step one.

Task 28 - Restore Customized Respond Service Normalization Scripts

RSA re-factored the Respond service normalization scripts in 11.3 and moved them to the following new location:
`/var/lib/netwitness/respond-server/scripts`
If you customized these scripts in 10.6.6.x, you must:

1. Go to the to the `/opt/rsa/im/scripts` directory.
   This directory is where the following Respond service normalization scripts are restored from the 10.6.6.x backup.
   `data_privacy_map.js`
   `normalize_alerts.js`
   `normalize_core_alerts.js`
   `normalize_ecat_alerts.js`
   `normalize_ma_alerts.js`
   `normalize_wtd_alerts.js`
   `utils.js`
2. Copy any custom logic from the 10.6.6.x scripts.
3. Go to the `/var/lib/netwitness/respond-server/scripts` directory.
   This directory is where NetWitness Platform 11.3 stores the re-factored scripts.
4. Edit the new scripts to include the custom logic you copied in step 2 from the 10.6.6.x scripts.
5. Copy any custom logic from `/opt/rsa/im/fields/alert_rules.json` file.
   The `alert_rules.json` file contains aggregation rule schema.

Task 29 - Add Respond Notification Settings for Custom Roles

Respond Notification Setting permissions enable Respond Administrators, Data Privacy Officers, and SOC Managers to access Respond Notification Settings (**CONFIGURE** > **Respond Notifications**), which enable them to send email notifications when incidents are created or updated.

To access these settings, you will need to add additional permissions to your existing built-in NetWitness Platform user roles. You will also need to add permissions to your custom roles. See the "Respond Notification Settings Permissions" topic in the *NetWitness Respond Configuration Guide*. For detailed information about user permissions, see the *System Security and User Management Guide*.

Task 30 - Manually Configure Respond Notification Settings

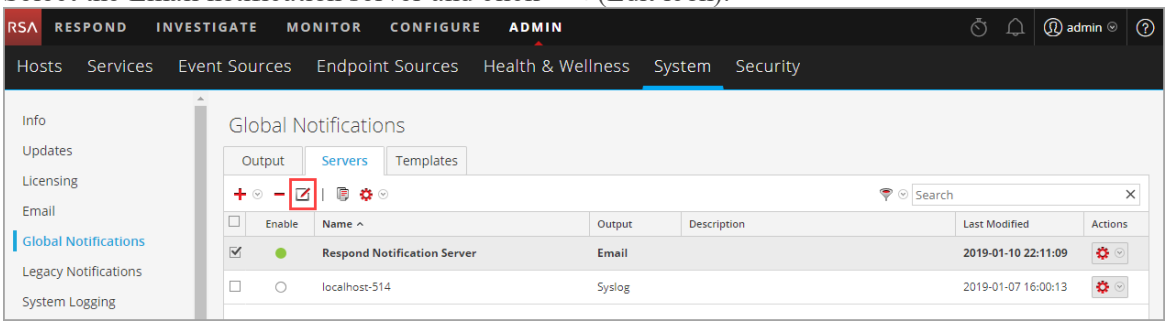
The Incident Management notification settings in NetWitness Platform 10.6.6.x are different from the Respond notification settings available in 11.3, so your existing 10.6.6.x settings will not migrate to 11.3.

NetWitness Respond notification settings enable email notifications to be sent to SOC Managers and the Analyst assigned to an incident when an incident is created or updated.

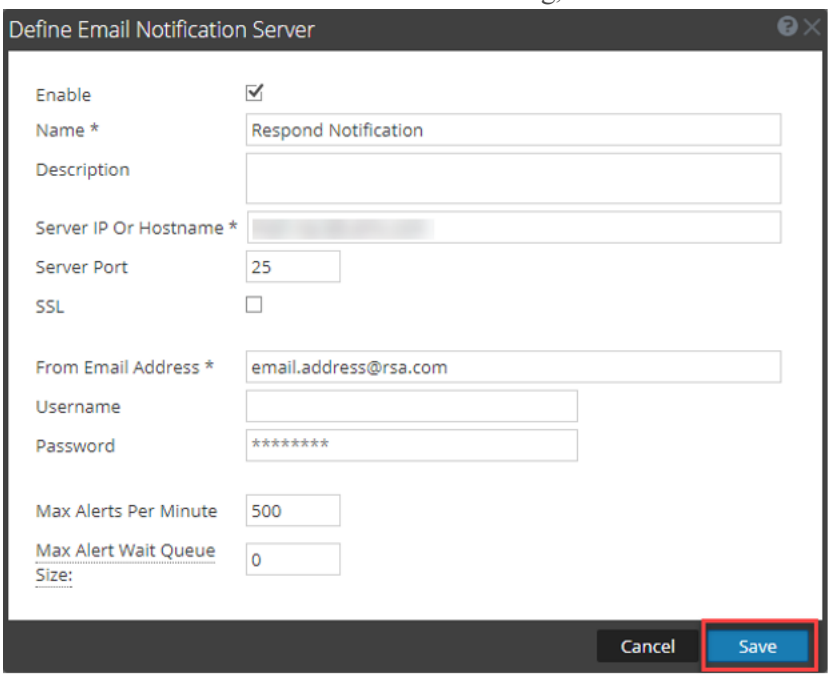
To manually configure the Respond Notification Settings, go to **CONFIGURE** > **Respond Notifications.** See the "Configure Respond Email Notification Settings" procedure in the *NetWitness Respond Configuration Guide*.

Notification Servers from 10.6.6.x will not display in the Email Server drop-down list. The email servers must be edited and saved in the Global Notification Servers panel (**ADMIN** > **System** > **Global Notifications** > **Server** tab).

1. Log in to **NetWitness Platform** and go to **CONFIGURE** > **Respond Notifications**.
   The Respond Notifications Settings view is displayed. Notice that the email notification servers do not appear in the EMAIL SERVER drop-down list.
2. Click the **Email Server Settings** link.
   You will see the Global Notifications panel.
3. Click the **Servers** tab.
4. For each of your email notification servers:
   a. Select the Email notification server and click (Edit icon).



b. In the Define Email Notification Server dialog, click **Save**.



5. Go back to **CONFIGURE** > **Respond Notifications**. Your servers will appear in the **EMAIL SERVER** drop-down list.
   Custom Incident Management notification templates cannot be migrated to 11.3. No custom templates are supported in 11.3.

Task 31 - Update Default Incident Rule Group By Values

The following default incident rules now use “Source IP Address” as the Group By value.

- **High Risk Alerts: Reporting Engine**
- **High Risk Alerts: Malware Analysis**
- **High Risk Alerts: ESA**

To update the above default rules, change the Group By value to “Source IP Address.”

Note: If you already updated the Group By values for the default rules listed above in 11.1 or later, you do not have to do it again.

The **High Risk Alerts: NetWitness Endpoint** default incident rule now uses Host Name as the Group By value. If you have NetWitness Endpoint you can use this rule. Change the Group By value of the default NetWitness Endpoint rule to "Host Name."

1. In the **NetWitness Platform** menu, select **CONFIGURE** > **Incident Rules** and click on the rule that you want to update in the **Name** column. The **Incident Rule Details** view is displayed.
2. In the **GROUP BY** field, select the new Group By value from the drop-down list.
3. Click **Save** to update the rule.

To aggregate NetWitness Endpoint alerts based on the File Hash, complete the following steps to clone the default NetWitness Endpoint incident rule and change the Group By value.

1. In the **NetWitness Platform** menu, select **CONFIGURE** > **Incident Rules**. The **Incident Rules List** view is displayed.
2. Select the **High Risk Alerts: NetWitness Endpoint** default incident rule and click **Clone**. You will receive a message that you successfully cloned the selected rule.
3. Change the Name of the rule to an appropriate name, such as High Risk Alerts: NetWitness Endpoint File hash.
4. In the **GROUP BY** field, remove the previous Group By value and add **File MD5 Hash**. It is important that File MD5 Hash is the only Group By value listed.
5. Click **Save** to create the rule.

For detailed information, see the *Respond Configuration Guide*.

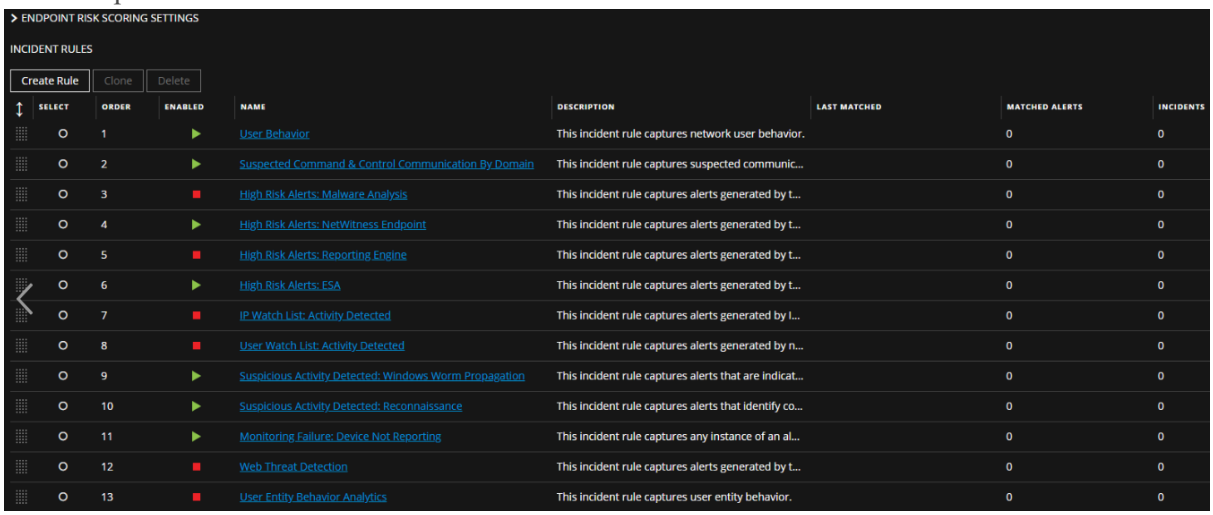
Task 32 - Add Group By Field to Incident Rules

The **Group By** field is not required in 10.6.6, but it is required in 11.3. After you upgrade to

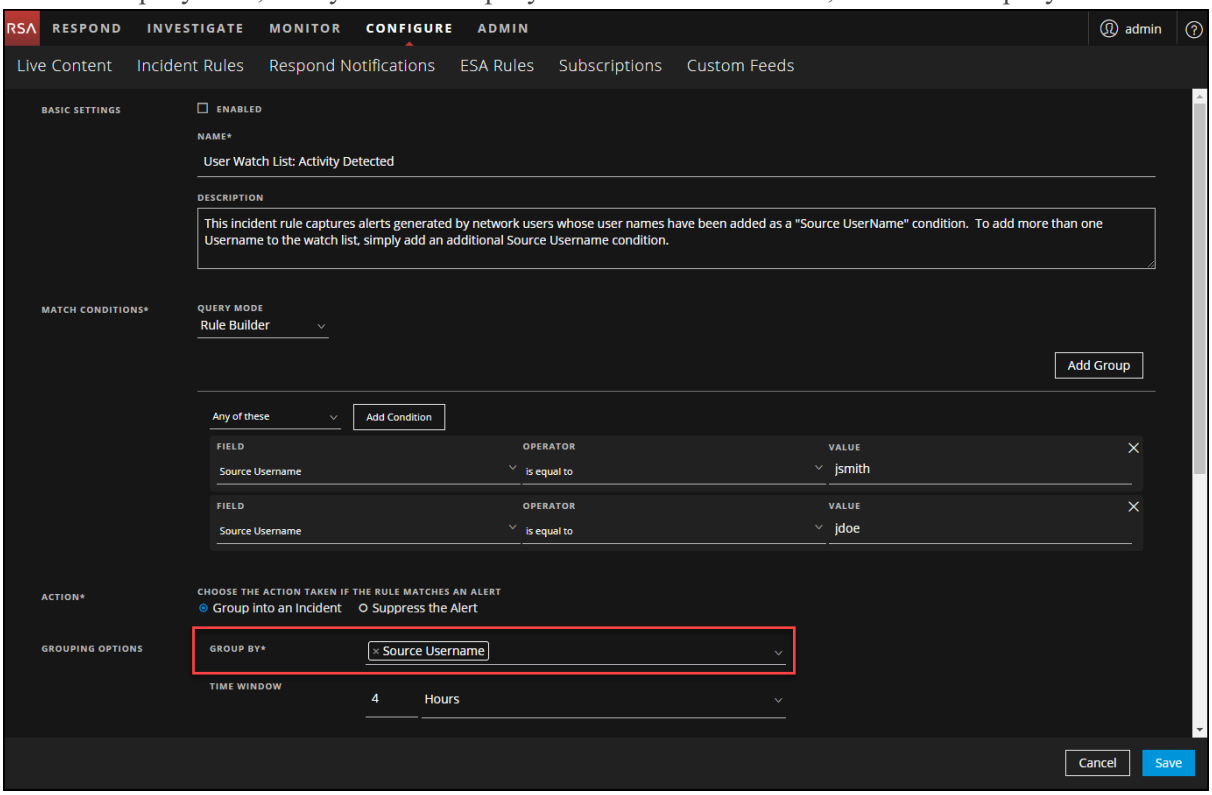
11.3, some incident rules will not have a **Group By** field, so you must add them to the rules or the rules will not work and they will not create incidents.

Complete the following steps for each incident rule:

1. Log in to NetWitness Platform.
2. Go to **CONFIGURE** > **Incident Rules** and click the link in the Name column for the rule that you want to update.



3. In the Group By field, verify that a Group By value is selected. If not, select a Group By value.



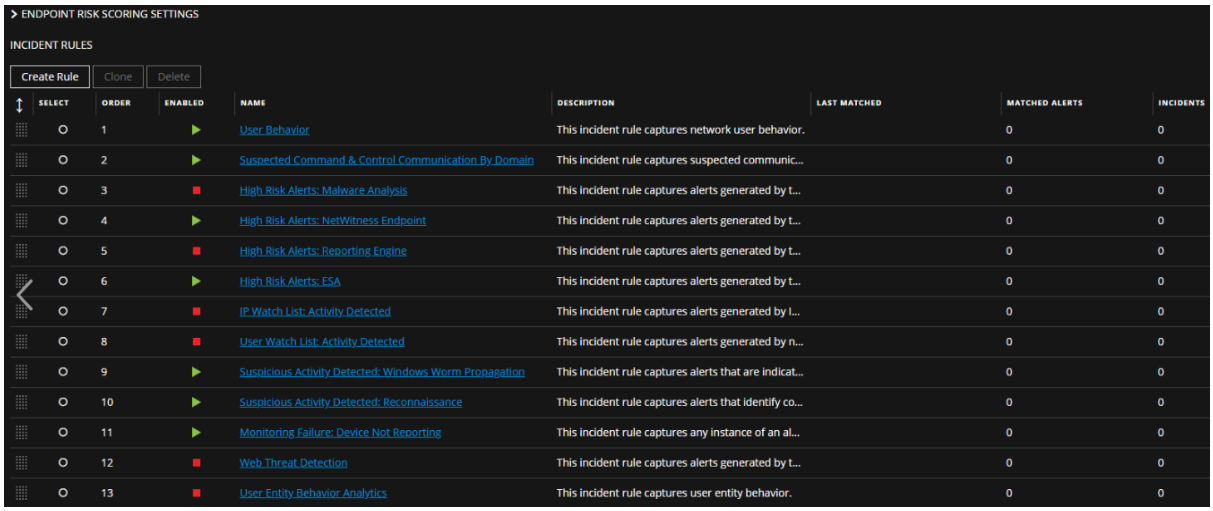
4. Click **Save** to update the rule.
   For information about incident rules, see the *NetWitness Respond Configuration Guide*.

Task 33 - Update Incident Rules Identified in the Domain Matching Conditions Upgrade Preparation Task

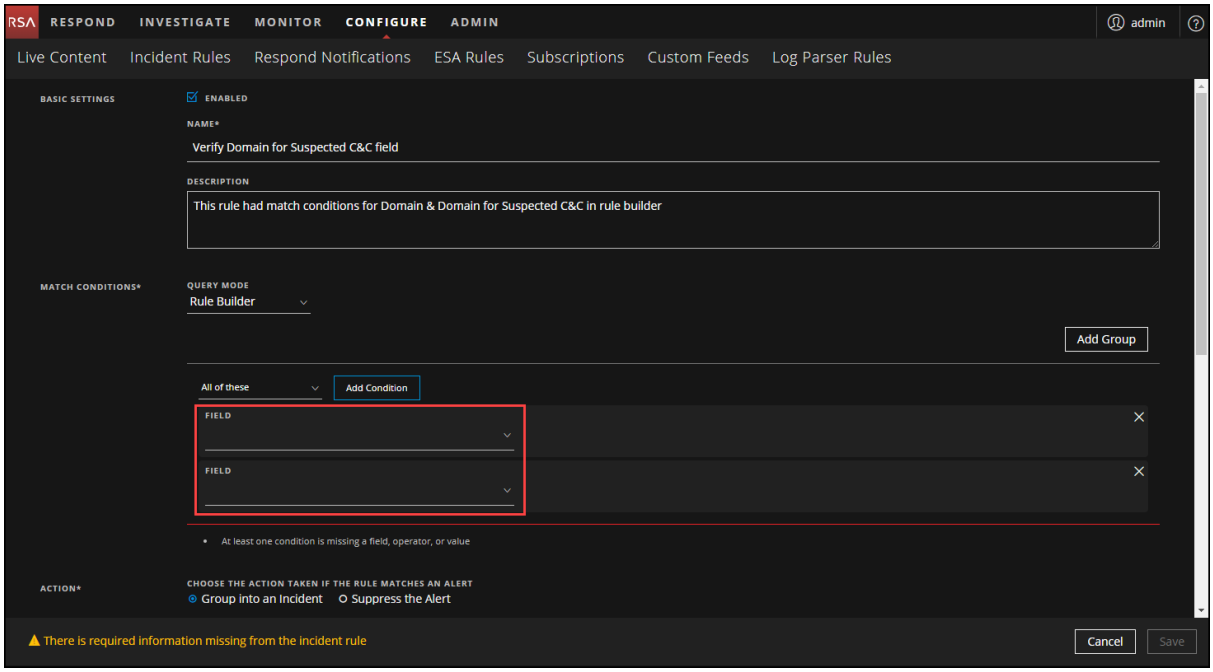
Modify the incident rules that you identified in the Task 4 - Check Aggregation Rules Match Conditions for “Domain” or “Domain for Suspected C&C” upgrade preparation task, which contained Domain or Domain for Suspected C&C in the matching conditions in rule builder.

For each rule that you previously identified:

1. Log in to **NetWitness Platform**, go to **CONFIGURE** > **Incident Rules** and click the link in the Name column for the rule that you want to update.



2. In the **Match Conditions** section, in the blank fields, select **Domain** and **Domain for Suspected CC** in the drop-down list and then select the conditions that you previously identified in the pre-upgrade tasks.



3. Click **Save** to update the rule.
For information about incident rules, see the *NetWitness Respond Configuration Guide*.

Warehouse

Task 34 - Restore `keytab` Files, Mount NFS, Install Service

1. Restore the `keytab` files from `<backup-path>/restore` directory.
2. Restore the Kerberos Realm Configuration from the `<backup-path>/restore/etc/krb5.conf` into `/etc/krb5.conf`.
3. (Conditional) If you perform the upgrade from a Non - FIPS environment and the `isCheckValidationRequired` parameter is not enabled in the destination, to configure the SFTP destination:
   a. SSH to the Warehouse Connector host and submit the following commands:
      ```
      cd /root/.ssh/
       mv id_dsa id_dsa.old
      OWB_FORCE_FIPS_MODE_OFF=1 openssl pkcs8 -topk8 -v2 des3 -in id_dsa.old -
      out id_dsa
      ```
      You are prompted for the pass phrase.
   b. Enter the Encryption password.
   c. Run the following command.
      ```
      chmod 600 id_dsa
      ```
4. Install the Warehouse Connector.
   See the *Warehouse Connector Configuration Guide* for instructions.

Task 35 - Refresh Warehouse Connector Lockbox and Start Stream

Note: If the streams have auto start turned on in 10.6.6.x, there will be a small delay before you will see the Warehouse Connector service in the NetWitness Platform User Interface.

1. Refresh the Lockbox of Warehouse Connector.
2. SSH to the Warehouse Connector and log in with root credentials.
3. Restart the service.
   ```
   service nwwarehouseconnector restart
   ```
4. (Conditional) If the auto start was not enabled in 10.6.6.x, you must start the stream manually after the service restarts.

Task 36 - Update Hive Version

After you update to 11.3, you must update to the Hive version that is compatible with the 11.3 Warehouse (either Hive version 0.12 or version 1.0).

- Hive Version 0.12
  SSH to the NW Server and run the following command.
  ```
  rpm -ivh rsa-nw-hive-jdbc-0.12.0-1.x86_64.rpm
  ```

- Hive Version 1.0
  SSH to the NW Server and run the following command.
  `rpm -ivh rsa-nw-hive-jdbc-1.0.0-1.x86_64.rpm`

RSA Archer Cyber Incident & Breach Response

Task 37 - Reconfigure RSA Archer Cyber Incident & Breach Response Integration

For information on how to reconfigure RSA Archer Cyber Incident & Breach Response for Event Stream Analysis, Reporting Engine, and Respond, see *RSA Archer Integration Guide*.

RSA NetWitness® Endpoint

Task 38 - Reconfigure Endpoint Alerts Via Message Bus

1. On the NetWitness Endpoint Server, modify the virtual host configuration in the `C:\Program Files\RSA\ECAT\Server\ConsoleServer.exe` file to reflect the following configuration.
   `<add key="IMVirtualHost" value="/rsa/system" />`

   Note: In NetWitness Platform 11.3, the virtual host is `/rsa/system`. For 10.6.6.x and earlier versions, the virtual host is `/rsa/sa`.
2. Restart the API Server and Console Server.
3. SSH to the NW Server and log in with `root` credentials.
4. Submit the following command to add all certificates to the truststore.
   `orchestration-cli-client --update-admin-node`
5. Submit the following command to restart the RabbitMQ server.
   `systemctl restart rabbitmq-server`
   The NetWitness Endpoint account should automatically be available on RabbitMQ.
6. Import the `/etc/pki/nw/ca/nwca-cert.pem` and `/etc/pki/nw/ca/ssca-cert.pem` files from the NW Server and add them to the Trusted Root Certification stores in the Endpoint Server.

Task 39 - Reconfigure Recurring Feed Configured from Legacy Endpoint Because Java Version Changed

You must reconfigure the Legacy Endpoint recurring feed due to the change in Java version. Complete the following step to fix this problem.

- Import the NetWitness Endpoint CA certificate into the NetWitness Platform Trusted store as described in "Export the NetWitness Endpoint SSL Certificate" under the "Configure Contextual Data from Endpoint via Recurring Feed" topic in the *RSA NetWitness Endpoint Integration Guide* to import the certificate.

(Optional) Task 40 - Install Endpoint Log Hybrid and Endpoint Agents

See:

RSA NetWitness Platform 11.3 Physical Host Installation Guide for instructions for installation on a physical host.

RSA NetWitness Platform 11.3 Virtual Host Installation Guide for instructions for installation on a virtual host.

RSA NetWitness® UEBA

Task 41 - Install NetWitness UEBA

NetWitness UEBA is new a new feature as of NetWitness Platform 11.3.

See:

RSA NetWitness Platform 11.3 Physical Host Installation Guide for instructions for installation on a physical host.

RSA NetWitness Platform 11.3 Virtual Host Installation Guide for instructions for installation on a virtual host.

RSA NetWitness UEBA User Guide for information about NetWitness UEBA.

NetWitness Platform Integrations

(Conditional) Task 42 - For Integrations with Web Threat Detection, RSA Archer® Cyber Incident & Breach Response or NetWitness Endpoint.

If you integrate with Web Threat Detection, Archer Cyber Incident & Breach Response or NetWitness Endpoint, you must configure Mutually Authenticated SSL on each integrated system so that the application can authenticate itself when connecting to the RabbitMQ message bus.

Note: Use the RabbitMQ usernames and passwords that were obtained when you backed up your 10.6.6.x data (see Backup Instructions).

1. Create a user on the host system that is integrating with NetWitness Platform by logging into the host and running the following `rabbitmqctl` command.
   ```
   > rabbitmqctl add_user <username> <password>
   ```
2. Set permissions for users by running the following command (use the username from step 1).
   ```
   > rabbitmqctl set_permissions -p /rsa/system <username> ".*", ".*", ".*"
   ```
   For example:
   ```
   > rabbitmqctl set_permissions -p /rsa/system wtd-incidents ".*", ".*", ".*"
   ```

Appendix A. Troubleshooting

This section describes problems that you may encounter during the upgrade with solutions. In most cases, NetWitness Platform creates log messages when it encounters these problems.

Note: If you cannot resolve any upgrade issue using the following troubleshooting solutions, contact Customer Support (https://community.rsa.com/docs/DOC-1294)

This section has troubleshooting documentation for the following services, features, and processes.

- 11.3 Setup Program (nwsetup-tui)
- Backup
- Event Stream Analysis
- General
- Log Collector Service (`nwlogcollector`)
- NW Server
- Reporting Engine

11.3 Setup Program (`nwsetup-tui`)

Problem	Host Setup Program (`nwsetup-tui`) exits and creates the following error message in `/var/log/netwitness/bootstrap/launch/security-server/security-server.log`: `<yyyy-mm-dd hh:mm:ss,nnn> [main] ERROR SystemOperation|Service startup failed. Running in safe mode org.h2.jdbc.JdbcSQLException: The database is read only [90097-193] at org.h2.message.DbException. getJdbcSQLException(DbException.java:345) ... at org.springframework.jdbc.datasource. AbstractDriverBasedDataSource.getConnection (AbstractDriverBasedDataSource.java:159) at com.rsa.asoc.security.upgrade.legacy. MigrationDatabase.<init>(MigrationDatabase.java:113)`
Cause	The H2 database needs write permission to complete the host setup.

Solution	From the NW Server command line, provide write permission to `H2.db`, restart the NW Server, and restart nwsetup-tui Setup Program.
	`chmod o+w /var/lib/netwitness/uax/db/platform.h2.db`
	`systemctl restart rsa-nw-security-server.service`
	`nwsetup-tui`

Backup (`nw-backup` script)

Message	`WARNING: Incorrect ESA Mongo admin password for host <hostname>.`
Cause	ESA Mongo admin password contains special characters (for example, '!@#$%^qwerty').
Solution	Change the ESA mongo admin password back to the original default of 'netwitness' before running backup. See "ESA Config: Change MongoDB Password for admin Account" the the *RSA NetWitness® Platform Event Stream Analysis Configuration Guide. Go to the* Master Table of Contents *to find all NetWitness Platform Logs & Network 11.x documents.*

Event Stream Analysis

Problem	ESA service crashes after you upgrade to 11.3 from a FIPS enabled setup.
Cause	ESA service is pointing to an invalid keystore.

Solution	1. SSH to the ESAPrimary host and log in.
	2. In the `/opt/rsa/esa/conf/wrapper.conf` file, replace the following line:
	`wrapper.java.additional.5=-Djavax.net.ssl.keyStore=/opt/rsa/esa/../carlos/keystore`
	with:
	`wrapper.java.additional.5=-Djavax.net.ssl.keyStore=/opt/rsa/carlos/keystore`
	3. Submit the following command to restart ESA .
	`systemctl restart rsa-nw-esa-server`
	Note: If you have multiple ESA hosts and you encounter that same problem, repeat steps 1 through 3 inclusive on each secondary ESA host.

General

Logs referred to in this section are posted to `/var/log/install/install.log` on the NW Server Host.

Message	`ERROR com.rsa.smc.sa.admin.web.controller.ajax.health. AlarmsController - Cannot connect to System Management Service`
Cause	NetWitness Platform sees the Service Management Service (SMS) as down after successful upgrade even though the service is running.
Solution	Restart SMS service using below command. `systemctl restart rsa-sms`

Message	`<timestamp> <host>: SMS_PostInstall: INFO: Free disk space on /opt is nGB` `<timestamp> <host>: SMS_PostInstall: WARN: Disk space check failed on /opt. The available disk space nGB is less than the recommended minimum disk space of 10GB.`
Cause	Low or insufficient disk space allocated for the SMS service.
Solution	RSA recommends that you provide a minimum of 10 GB of disk space for the SMS service to run optimally.

Problem	After you run the Setup Program for a non-NW Server host, you must go in to the UI, enable the host, and install the service on the host from the Hosts View. If you see "Install error View Details" in the **Status** column of the Hosts view, the host lost connectivity due to network issues.
Solution	Re-install the service on the host from the Hosts view.

Log Collector Service (`nwlogcollector`)

Log Collector logs are posted to `/var/log/install/nwlogcollector_install.log` on the host running the `nwlogcollector` service.

Message	`<timestamp>.NwLogCollector_PostInstall: Lockbox Status : Failed to open lockbox: The lockbox stable value threshold was not met because the system fingerprint has changed. To reset the system fingerprint, open the lockbox using the passphrase.`
Cause	The Log Collector Lockbox failed to open after the update.
Solution	Log in to NetWitness Platform and reset the system fingerprint by resetting the stable system value password for the Lockbox as described in the "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Message	*timestamp* `NwLogCollector_PostInstall: Lockbox Status : Not Found`
Cause	The Log Collector Lockbox is not configured after the update.
Solution	(Conditional) If you use a Log Collector Lockbox, log in to NetWitness Platform and configure the Lockbox as described in the"Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents..

Message	`<timestamp>: NwLogCollector_PostInstall: Lockbox Status : Lockbox maintenance required: The lockbox stable value threshold requires resetting. To reset the system fingerprint, select Reset Stable System Value on the settings page of the Log Collector.`
Cause	You need to reset the stable value threshold field for the Log Collector Lockbox.
Solution	Log in to NetWitness Platform and reset the stable system value password for the Lockbox as described in "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Problem	You have prepared a Log Collector for upgrade and no longer want to upgrade at this time.
Cause	Delay in upgrade.
Solution	Use the following command string to revert a Log Collector that has been prepared for upgrade back to resume normal operation. `# /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --revert`

NW Server

These logs are posted to `/var/netwitness/uax/logs/sa.log` on the NW Server Host.

Problem	After upgrade, you notice that Audit logs are not getting forwarded to the configured Global Audit Setup; or, The following message seen in the sa.log. `Syslog Configuration migration failed. Restart jetty service to fix this issue`
Cause	NW Server Global Audit setup migration failed to migrate from 10.6.6 to 11.3.
Solution	1. SSH to the NW Server. 2. Submit the following command. `orchestration-cli-client --update-admin-node`

Reporting Engine Service

Reporting Engine Update logs are posted to to`/var/log/re_install.log` file on the host running the Reporting Engine service.

Message	`<timestamp> : Available free space in /home/rsasoc/rsa/soc/reporting-engine [ existing-GB ] is less than the required space [ required-GB ]`
Cause	Update of the Reporting Engine failed because you do not have enough disk space.
Solution	Free up the disk space to accommodate the required space shown in the log message. See the "Add Additional Space for Large Reports" topic in the *Reporting Engine Configuration Guide* for instructions on how to free up disk space. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Appendix B. Stopping and Restarting Data Capture and Aggregation

RSA recommends that you stop packet and log capture and aggregation before upgrading a Decoder, Concentrator, and Broker host to 11.3. If you do this, you must restart packet and log capture and aggregation after updating these hosts.

Stop Data Capture and Aggregation

Stop Packet Capture

To stop packet capture:

1. Log in to NetWitness Platform and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Decoder** service.

3. Under (actions), select **View** > **System**.
4. In the toolbar, click

   .

Stop Log Capture

To stop log capture:

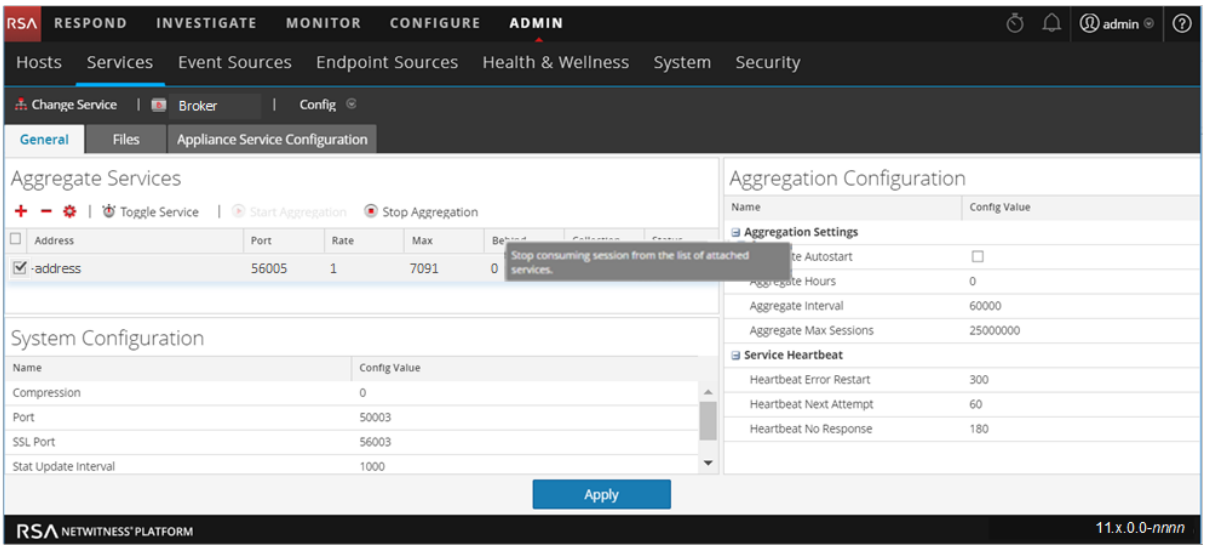
1. Log in to NetWitness Platform and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Log Decoder** service.

3. Under (actions), select **View** > **System**.
4. In the toolbar, click

   .

Stop Aggregation

1. Log in to NetWitness Platform
2. Go to **ADMIN** > **Services**.
3. Select the **Broker** service.
4. Under (actions), select **View** > **Config**.
5. The **General** tab is displayed.



6. Under **Aggregated Services** click 
.

Start Data Capture and Aggregation

Restart packet and log capture and aggregation after updating to 11.3.

Start Packet Capture

To start packet capture:

1. Login to **NetWitness Platform**.
2. Go to **ADMIN** > **Services**.

   The Services view is displayed.
3. Select each **Decoder** service.
4. Under (actions), select **View** > **System**.
5. In the toolbar, click 
.

Start Log Capture

To start log capture:

1. In the **NetWitness Platform** menu, select **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Log Decoder** service.
3. Under (actions), select **View** > **System**.
4. In the toolbar, click 
.

Start Aggregation

1. Log in to .NetWitness Platform.
2. Go to **ADMIN** > **Services**.
3. Select the **Broker** service.
4. Under (actions), select **View** > **Config**.
5. The **General** tab is displayed.
6. Under **Aggregated Services** click 
.

- Task 2 - Install 11.3 on Other Component Hosts 53

Log in to NetWitness Platform 58

Deployment Overview

Before you can deploy RSA NetWitness® Platform in Azure, you need to:

- Understand the requirements of your enterprise.
- Know the scope of a NetWitness Platform deployment.

When you are ready to begin the deployment:

- Make sure that you have a NetWitness Platform "Throughput" license.
- Use Chrome for your browser (Internet Explorer is not supported).

Azure Environment Recommendations

Azure instances have the same functionality as the NetWitness Platform hardware hosts. RSA recommends that you perform the following tasks when you set up your Azure environment.

- Based on the resource requirements of the different components, follow best practices to use the system and dedicated storage appropriately.
- Build Concentrator directory for index database on SSD.

Abbreviations and Other Terminology Used in this Guide

Abbreviation	Description
Azure	Azure is Microsoft's public cloud computing platform. It provides a range of cloud services, including those for compute, analytics, storage and networking. You can pick and choose from these services to develop and scale new applications, or run existing applications, in the public cloud.
BYOL	Bring Your Own Licensing
CPU	Central Processing Unit
EPS	Events Per Second
GB	Gigabyte. 1GB = 1,000,000,000 bytes
Gb	Gigbit. 1Gb = 1,000,000,000 bits.
Gbps	Gigabits per second or billions of bits per second. It measures bandwidth on a digital data transmission medium such as optical fiber.
GHz	GigaHertz 1 GHz = 1,000,000,000 Hz
HDD	Hard Disk Drive
IOPS	Input/Output Operations Per Second

Abbreviation	Description
Mbps	Megabits per second or millions of bits per second. It measures bandwidth on a digital data transmission medium such as optical fiber.
On-Premise	On-premise hosts are installed and run on computers on the premises (in the building) of the organization using the hosts, rather than in the Azure.
RAM	Random Access Memory (also known as memory)
Security	Set of firewall rules. Refer to Deployment: Network Architecture and Ports (https://community.rsa.com/docs/DOC-83050) for a comprehensive list of the ports you must set up for all NetWitness Platform components.
SSD	Solid-State Drive
vCPU	Virtual Central Processing Unit (also known as a virtual processor)
VHD	Virtual Hard Disk
VM	Virtual Machine
vRAM	Virtual Random Access Memory. This is the memory for a virtual machine.

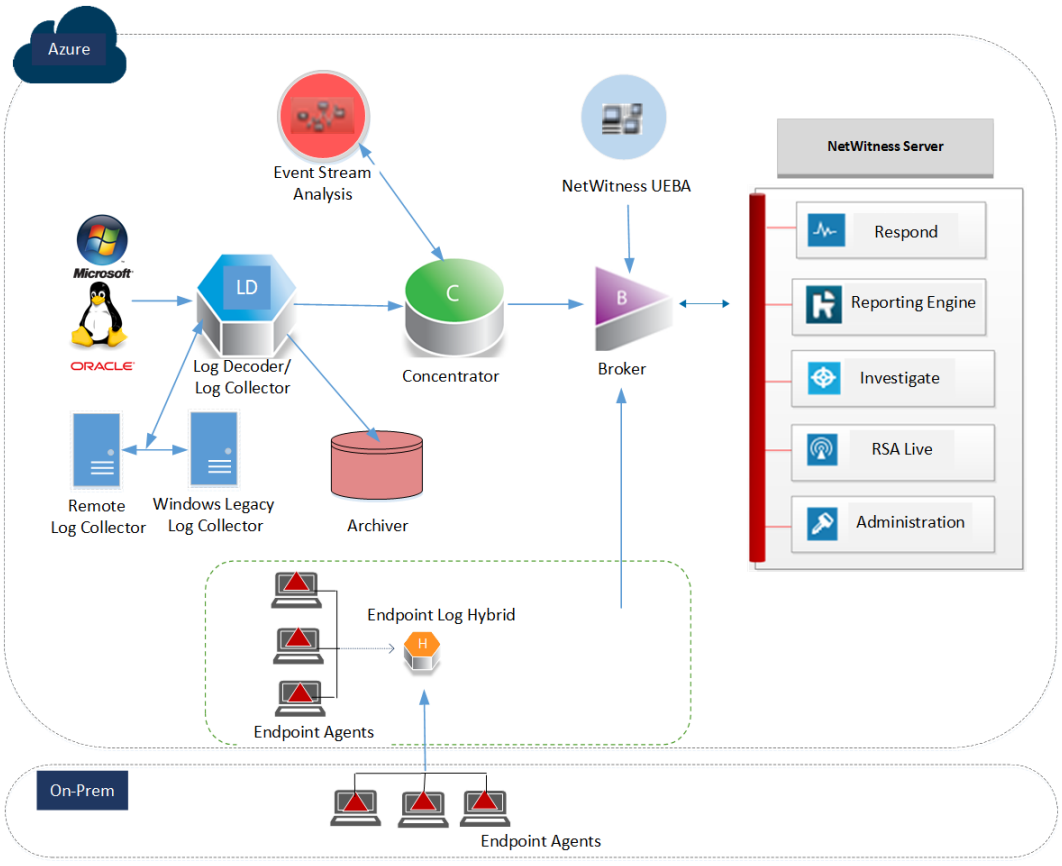
Azure Deployment Scenarios

The following diagrams illustrate some common Azure deployment scenarios. In the diagrams, the:

- **Log Decoder** receives logs collected by the Log Collector. The Log Collector collects log events from hundreds of devices and event sources.
- **Concentrator** indexes metadata extracted from network or log data and makes it available for enterprise-wide querying and real-time analytics while facilitating reporting and alerting.
- **Endpoint Log Hybrid** is used for collection of endpoint and log data. The Endpoint Log Hybrid comprises of an Endpoint Server, Log Decoder, and a Concentrator. The Log DecoderDecoder captures data from the Endpoint Server and processes the metadata.
- NetWitness Server hosts **Respond**, **Reporting Engine**, **Investigate**, **RSA Live**, **Administration**, **Endpoint Log Hybrid** and other aspects of the user interface.

Full NetWitness Platform Stack Azure Visibility

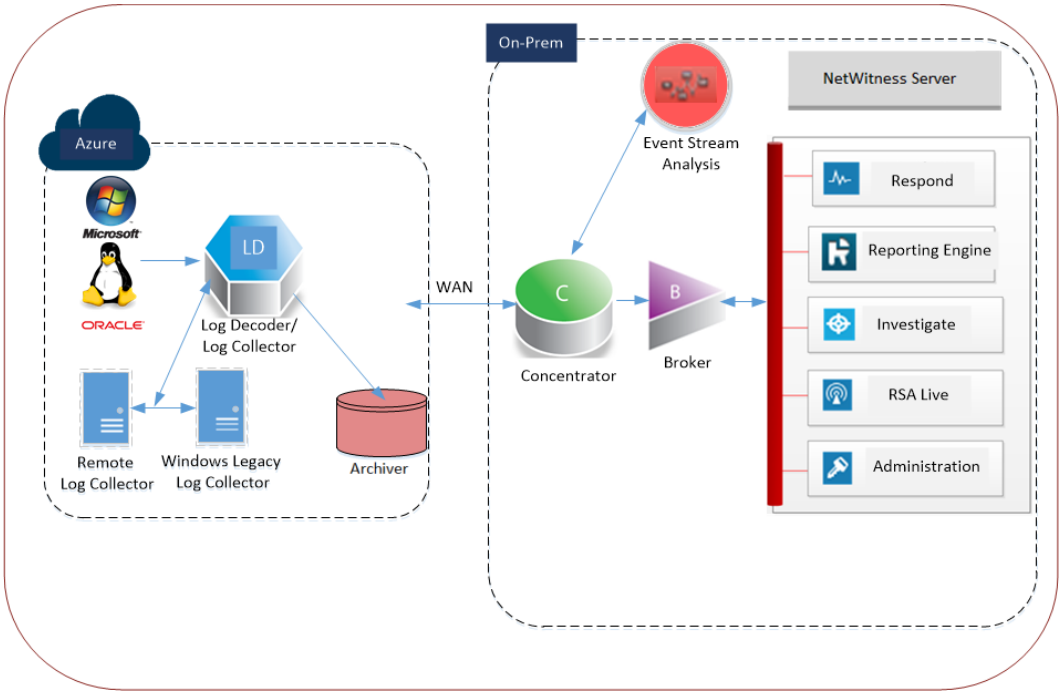
This diagram shows all NetWitness Platform components (full stack) deployed in Azure.



Note: You can add multiple Endpoint Log Hybrids. For a consolidated view of the endpoint data on multiple Endpoint Log Hybrids you must install the Endpoint Broker.

Hybrid Deployment - Log Decoder

This diagram shows the Log Decoder and Archiver deployed in Azure with all other NetWitness Platform components deployed on your premises.



Supported Services

RSA provides the following NetWitness Platform services.

- NetWitness Server
- Archiver
- Admin Server
- Config Server
- Investigate Server
- Orchestration Server
- Reporting Engine
- Respond Server
- Security Server
- Broker
- Concentrator
- Event Stream Analysis

- Log Decoder
- Decoder
- Remote Log Collector
- Endpoint Server
- User Entity and Behavior Analytics (UEBA)

VM Configuration Recommendations

Note: For a description of terms and abbreviations used in this topic, refer to Deployment Overview.

This topic contains the minimum Azure VM configuration settings recommended for the NetWitness Platform (NW) virtual stack components.

- VM:
  - The recommended settings in the NetWitness Platform component VM tables below were calculated under the following conditions.
    - Ingestion rates of 15,000 EPS were used.
    - All the components were integrated.
    - The Log stream included a Log Decoder, Concentrator, and Archiver.
    - Incident Management was receiving alerts from the Reporting Engine and Event Stream Analysis.
    - The background load included reports, charts, alerts, investigation, and respond.
- **Note:** For higher EPS rates, the Concentrator index volume must be allocated SSDs.

Azure Storage Recommendations

The following table displays are the storage recommendations for NetWitness Azure VMs.

Azure Image Type	Rate (EPS)	CPU (GB)	RAM (GB)	Instance Type (Azure Name)	Cache
NW	Does not apply	16	112	Standard D14_v2	Read/ Write
Log Decoder	15,000	32	128	Standard D32s_v3	Read/ Write
Log Concentrator	15,000	16	112	Standard DS14_v2	Read/ Write
Archiver	15,000	16	112	Standard D14_v2	Read/ Write
ESA	15,000	20	140	Standard D15_v2	Read/ Write
Log Collector	15,000	8	32	Standard D8s_v3	Read/ Write

The following table displayed the storage recommendations of volume group, folder, size, and disk type

Storage Recommendations - Volume Group, Folder, Size, and Disk Type (Contd..)

Volume Group	Folder	Size	Disk Type
/dev/mapper/netwitness-nwhome /dev/mapper/netwitness-log	/var/netwitness /var/log	2 TB 10 GB	SSD HDD
/dev/decodersmall/decoroot /dev/decodersmall/index /dev/decodersmall/sessiondb /dev/decodersmall/metadb /dev/decoder/packetdb /dev/mapper/netwitness-nwhome /dev/mapper/netwitness-log	/var/netwitness/decoder /var/netwitness/decoder/index /var/netwitness/decoder/sessiondb /var/netwitness/decoder/metadb /var/netwitness/decoder/packetdb /var/netwitness /var/log	10 GB 30 GB 370 GB 3 TB 18 TB 1 TB 10 GB	HDD HDD HDD HDD HDD HDD HDD
/dev/mapper/netwitness-nwhome /dev/index/index /dev/concentrator/root /dev/concentrator/sessiondb /dev/concentrator/metadb /dev/mapper/netwitness-log	/var/netwitness /var/netwitness/concentrator/index /var/netwitness/concentrator/ /var/netwitness/concentrator/sessiondb/ /var/netwitness/concentrator/metadb /var/log	1 TB 2 TB 30 GB 2.5 TB 23 TB 10 GB	HDD SSD HDD HDD HDD HDD
/dev/mapper/netwitness-nwhome /dev/mapper/archiver /dev/mapper/netwitness-log	/var/netwitness /var/netwitness/archiver /var/log	1 TB 4 TB 10 GB	HDD HDD HDD
/dev/mapper/netwitness-nwhome /dev/mapper/netwitness-log	/var/netwitness /var/log	6 TB 10 GB	HDD HDD
/dev/mapper/netwitness-nwhome /dev/mapper/netwitness-log	/var/netwitness /var/log	300 GB 10 GB	HDD HDD

*Reporting Engine, Respond, and Health & Wellness can be co-located on NetWitness Server host.

Partition Recommendations

This topic contains the recommended Azure partition.

Admin Server or Broker

For an extension of `/var/netwitness/` partition, attach an addititional disk with name suffix `nwhome`. If there are multiple disk, create a RAID 0 array.

Run `lsblk` to get the physical volume name.

If you attach one 2 TB disk, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `/dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`
4. `xfs_growfs /dev/netwitness_vg00/nwhome`

If you attach two 1 TB disk, run the following commands:

1. `mdadm --create /dev/md0 --assume-clean --level 0 --raid-devices=2 /dev/sde /dev/sdf`
2. `pvcreate /dev/md0`
3. `vgextend netwitness_vg00 /dev/md0`
4. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`
5. `xfs_growfs /dev/netwitness_vg00/nwhome`
6. `mdadm --detail --scan > /etc/mdadm.conf`

RSA recommends the following partition. However, you can change these values based on the retention days.

LVM	Folder	Size	Disk Type	Cache
/dev/netwitness_vg00/nwhome	/var/netwitness/	2 TB	SSD	Read/Write

ESA Primary or ESA Secondary

For an extension of `/var/netwitness/` partition, attach an addititional disk with name suffix `nwhome`. If there are multiple disk, create a RAID 0 array.

Run `lsblk` to get the physical volume name.

If you attach one 6 TB disk, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`

3. `lvextend -L 5.9T /dev/netwitness_vg00/nwhome`
4. `xfs_growfs /dev/netwitness_vg00/nwhome`

If you attach two 3 TB disk, run the following commands:

1. `mdadm --create /dev/md0 --assume-clean --level 0 --raid-devices=2 /dev/sde /dev/sdf`
2. `pvcreate /dev/md0`
3. `vgextend netwitness_vg00 /dev/md0`
4. `lvextend -L 5.9T /dev/netwitness_vg00/nwhome`
5. `xfs_growfs /dev/netwitness_vg00/nwhome`
6. `mdadm --detail --scan > /etc/mdadm.conf`

RSA recommends the following partition. However, you can change these values based on the retention days.

LVM	Folder	Size	Disk Type	Cache
/dev/netwitness_vg00/nwhome	/var/netwitness/	6 TB	HDD	Read/Write

Log Collector

For an extension of `/var/netwitness/` partition, attach an addititional disk with name suffix `nwhome`.

Run `lsblk` to get the physical volume name.

If you attach one 500 GB disk, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvextend -L 600G /dev/netwitness_vg00/nwhome`
4. `xfs_growfs /dev/netwitness_vg00/nwhome`

RSA recommends the following partition. However, you can change these values based on the retention days.

LVM	Folder	Size	Disk Type	Cache
/dev/netwitness_vg00/nwhome	/var/netwitness/	500 GB	HDD	Read/Write

Log Decoder

For an extension of `/var/netwitness/` partition, attach an addititional disk with name suffix `nwhome`, and make sure that no other partition resides on this Log Decoder. Attach additional disks for the Log Decoder database partition with the name suffix `external`. If there are multiple disks, create a RAID 0 array.

Run `lsblk` to get the physical volume name.

If you attach one 2 TB disk, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`
4. `xfs_growfs /dev/netwitness_vg00/nwhome`

If you attach two 1 TB disk, run the following commands:

1. `mdadm --create /dev/md0 --assume-clean --level 0 --raid-devices=2 /dev/sde /dev/sdf`
2. `pvcreate /dev/md0`
3. `vgextend netwitness_vg00 /dev/md0`
4. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`
5. `xfs_growfs /dev/netwitness_vg00/nwhome`
6. `mdadm --detail --scan > /etc/mdadm.conf`

Other Partition Required

The following partitions must on the volume group **logdecodersmall** and must be in a single RAID 0 array.

Note: The following disks should have a suffix `external`.

Folder	LVM	Volume Group
/var/netwitness/logdecoder	decoroot	logdecodersmall
/var/netwitness/logdecoder/index	index	logdecodersmall
/var/netwitness/logdecoder/metadb	metadb	logdecodersmall
/var/netwitness/logdecoder/sessiondb	sessiondb	logdecodersmall

Run `lsblk` to get the physical volume name and run the following commands:

1. `mdadm --create /dev/md0 --assume-clean --level 0 --raid-devices=2 /dev/sde /dev/sdf` (depending on the number of disk attached)
2. `pvcreate /dev/md0`
3. `vgcreate -s 32 logdecodersmall /dev/md0`
4. `lvcreate -L <disk_size> -n <lvm_name> logdecodersmall`
5. `mkfs.xfs /dev/logdecodersmall/<lvm_name>`
6. Repeat steps 4 and 5 for all the LVMs mentioned.
7. `mdadm --detail --scan > /etc/mdadm.conf`

The following partitions must be on the volume group **logdecoder** and must be in a single RAID 0 array:

Folder	LVM	Volume Group
/var/netwitness/logdecoder/packetdb	packetdb	logdecoder

Run `lsblk` to get the physical volume name and run the following commands:

1. `mdadm --create /dev/md1 --assume-clean --level 0 --raid-devices=2 /dev/sde /dev/sdf` (depending on the number of disk attached)
2. `pvcreate /dev/md1`
3. `vgcreate -s 32 logdecoder /dev/md1`
4. `lvcreate -L <disk_size> -n packetdb logdecoder`
5. `mkfs.xfs /dev/logdecoder/packetdb`
6. `mdadm --detail --scan > /etc/mdadm.conf`

RSA recommends the following partition. However, you can change these values based on the retention days.

Note: Create the `/var/netwitness/logdecoder` partition, mount it, and then create the remaining partition.

LVM	Folder	Size	Disk Type	Cache
/dev/netwitness_vg00/nwhome	/var/netwitness/	1 TB	HDD	Read/Write
/dev/logdecodersmall/decoroot	/var/netwitness/logdecoder	10 GB	HDD	Read/Write
/dev/logdecodersmall/index	/var/netwitness/logdecoder/index	30 GB	HDD	Read/Write
/dev/logdecodersmall/metadb	/var/netwitness/logdecoder/metadb	370 GB	HDD	Read/Write
/dev/logdecodersmall/sessiondb	/var/netwitness/logdecoder/sessiondb	3 TB	HDD	Read/Write
/dev/logdecoder/packetdb	/var/netwitness/logdecoder/packetdb	18 TB	HDD	Read/Write

Create each directory and mount the LVM on it in a serial manner, except `/var/netwitness`, which is already created.

After mounting the directory, add the following entries in `/etc/fstab` in the same order:

1. `/dev/logdecodersmall/decoroot /var/netwitness/logdecoder xfs noatime,nosuid 1 2`

2. `/dev/logdecodersmall/index /var/netwitness/logdecoder/index xfs noatime,nosuid 1 2`
3. `/dev/logdecodersmall/metadb /var/netwitness/logdecoder/metadb xfs noatime,nosuid 1 2`
4. `/dev/logdecodersmall/sessiondb /var/netwitness/logdecoder/sessiondb xfs noatime,nosuid 1 2`
5. `/dev/logdecoder/packetdb /var/netwitness/logdecoder/packetdb xfs noatime,nosuid 1 2`

Concentrator

For an extension of `/var/netwitness/` partition, attach an addititional disk with name suffix `nwhome`, and make sure that no other partition resides on this Concentrator. Attach additional disks for the Concentrator database partition with the name suffix `external`. If there are multiple disk, create a RAID 0 array.

Run `lsblk` to get the physical volume name.

If you attach one 2 TB disk, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`
4. `xfs_growfs /dev/netwitness_vg00/nwhome`

If you attach two 1 TB disk, run the following commands:

1. `mdadm --create /dev/md0 --assume-clean --level 0 --raid-devices=2 /dev/sde /dev/sdf`
2. `pvcreate /dev/md0`
3. `vgextend netwitness_vg00 /dev/md0`
4. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`
5. `xfs_growfs /dev/netwitness_vg00/nwhome`
6. `mdadm --detail --scan > /etc/mdadm.conf`

Other Partition Required

The following partitions must be on the volume group **concentrator** and must be in a single RAID 0 array.

Note: The following disks should have a suffix `external`.

Folder	LVM	Volume Group
/var/netwitness/concentrator	root	concentrator

Folder	LVM	Volume Group
/var/netwitness/concentrator /sessiondb	index	concentrator
/var/netwitness/concentrator /metadb	metadb	concentrator

Run `lsblk` to get the physical volume name and run the following commands:

1. `mdadm --create /dev/md0 --assume-clean --level 0 --raid-devices=2 /dev/sde /dev/sdf` (depending on the number of disk attached)
2. `pvcreate /dev/md0`
3. `vgcreate -s 32 concentrator /dev/md0`
4. `lvcreate -L <disk_size> -n <lvm_name> concentrator`
5. `mkfs.xfs /dev/concentrator /<lvm_name>`
6. Repeat steps 4 and 5 for all the LVMs mentioned
7. `mdadm --detail --scan > /etc/mdadm.conf`

The following partitions must be on the volume group index and must be in single RAID 0 array:

Folder	LVM	Volume Group
/var/netwitness/concentrator/index	index	index

Run `lsblk` to get the physical volume name and run the following commands:

1. `mdadm --create /dev/md1 --assume-clean --level 0 --raid-devices=2 /dev/sde /dev/sdf` (depending on the number of disk attached)
2. `pvcreate /dev/md1`
3. `vgcreate -s 32 index /dev/md1`
4. `lvcreate -L <disk_size> -n index index`
5. `mkfs.xfs /dev/index/index`
6. `mdadm --detail --scan > /etc/mdadm.conf`

RSA recommends the following partition. However, you can change these values based on the retention days.

Note: Create the `/var/netwitness/concentrator` partition, mount it, and then create the remaining partition.

LVM	Folder	Size	Disk Type	Cache
/dev/netwitness_ vg00/nwhome	/var/netwitness/	1 TB	HDD	Read/Write

LVM	Folder	Size	Disk Type	Cache
/dev/concentrator/root	/var/netwitness/concentrator	30 GB	HDD	Read/Write
/dev/concentrator/metadb	/var/netwitness/concentrator/metadb	8 TB	HDD	Read/Write
/dev/concentrator/sessiondb	/var/netwitness/concentrator/sessiondb	2 TB	HDD	Read/Write
/dev/index/index	/var/netwitness/concentrator/index	2 TB	SSD	Read/Write

Create each directory and mount the LVM on it, except `/var/netwitness`, which is already created.

After mounting the directory, add the following entries in `/etc/fstab` in the same order:

1. `/dev/concentrator/root /var/netwitness/concentrator xfs noatime,nosuid 1 2`
2. `/dev/concentrator/sessiondb /var/netwitness/concentrator/sessiondb xfs noatime,nosuid 1 2`
3. `/dev/concentrator/metadb /var/netwitness/concentrator/metadb xfs noatime,nosuid 1 2 2`
4. `/dev/index/index /var/netwitness/concentrator/index xfs noatime,nosuid 1 2`

Archiver

For an extension of `/var/netwitness/` partition, attach an addititional disk with name suffix `nwhome`, and make sure that no other partition resides on this Archiver. Attach other addititional disks for the Archiver database partition with the name suffix `external`. If there are multiple disk, create a RAID 0 array.

Run `lsblk` to get the physical volume name.

If you attach one 2 TB disk, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`
4. `xfs_growfs /dev/netwitness_vg00/nwhome`

If you attach two 1 TB disk, run the following commands:

1. `mdadm --create /dev/md0 --assume-clean --level 0 --raid-devices=2 /dev/sde /dev/sdf`
2. `pvcreate /dev/md0`
3. `vgextend netwitness_vg00 /dev/md0`
4. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`

5. `xfs_growfs /dev/netwitness_vg00/nwhome`
6. `mdadm --detail --scan > /etc/mdadm.conf`

Other Partition Required

The following partitions must be available in the volume group **archiver** and must be in a single RAID 0 array.

Note: The following disks should have a suffix `external`.

Folder	LVM	Volume Group
/var/netwitness/archiver	archiver	archiver

Run `lsblk` to get the physical volume name and run the following commands:

1. `mdadm --create /dev/md0 --assume-clean --level 0 --raid-devices=2 /dev/sde /dev/sdf` (depending on the number of disk attached)
2. `pvcreate /dev/md0`
3. `vgcreate -s 32 archiver /dev/md0`
4. `lvcreate -L <disk_size> -n archiver archiver`
5. `mkfs.xfs /dev/archiver/archiver`
6. `mdadm --detail --scan > /etc/mdadm.conf`

RSA recommends the following partition. However, you can change these values based on the retention days.

LVM	Folder	Size	Disk Type	Cache
/dev/netwitness_ vg00/nwhome	/var/netwitness/	1 TB	HDD	Read/Write
/dev/archiver/archiver	/var/netwitness/archiver	4 TB	HDD	Read/Write

Create each directory and mount the LVM on it in a serial manner, except `/var/netwitness`, which is already created.

After mounting the directory, add the following entries in `/etc/fstab` in the same order:

1. `/dev/archiver/archiver /var/netwitness/archiver xfs noatime,nosuid 1 2`

Endpoint Hybrid or Endpoint Log Hybrid

For an extension of `/var/netwitness/` partition, attach an addititional disk with name suffix `nwhome`, and make sure that no other partition resides on this Endpoint Hybrid or Endpoint Log Hybrid. Attach other addititional disks for the endpoint database partition with the name suffix `external`. If there are multiple disk, create a RAID 0 array.

Run `lsblk` to get the physical volume name.

If you attach one 1 TB disk, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvextend -L 1T /dev/netwitness_vg00/nwhome`
4. `xfs_growfs /dev/netwitness_vg00/nwhome`

Other Partition Required

The following partition must be on the volume group **endpoint** and must be in a single RAID 0 array.

Note: The following disks should have a suffix `nwhome`.

Folder	LVM	Volume Group
/var/netwitness/mongo	hybrid-mongo	endpoint
/var/netwitness/concentrator	concentrator-concroot	endpoint
/var/netwitness/concentrator/index	hybrid-concinde	endpoint
/var/netwitness/logdecoder	hybrid-ldecroot	endpoint

Run `lsblk` to get the physical volume name and run the following commands:

1. `mdadm --create /dev/md0 --assume-clean --level 0 --raid-devices=2 /dev/sde /dev/sdf` (depending on the number of disk attached)
2. `pvcreate /dev/md0`
3. `vgcreate -s 32 endpoint /dev/md0`
4. `lvcreate -L <disk_size> -n <lvm_name> endpoint`
5. `mkfs.xfs /dev/ endpoint /<lvm_name>`
6. Repeat steps 4 and 5 for all the LVMs mentioned.
7. `mdadm --detail --scan > /etc/mdadm.conf`

RSA recommends the following partition. However, you can change these values based on the retention days.

LVM	Folder	Size	Disk Type	Cache
/dev/netwitness_vg00/nwhome	/var/netwitness/	1 TB	HDD	Read/Write
/dev/endpoint/hybrid-mongo	/var/netwitness/mongo	2 TB	HDD	Read/Write
/dev/endpoint/concentrator-concroot	/var/netwitness/concentrator	4 TB	HDD	Read/Write
/dev/endpoint/hybrid-concinde	/var/netwitness/concentrator/index	500 GB	SSD	Read/Write
/dev/endpoint/hybrid-ldecroot	/var/netwitness/logdecoder	2 TB	HDD	Read/Write

Deployment Rules and Checklist

This topic contains the rules and high-level tasks you must perform to deploy RSA NetWitness® Platform components in Azure.

Rules

You must adhere to the following rules:

- Always use private IP addresses when you provision Azure NetWitness Platform VMs.
- Before you enable the out-of-the-box (OOTB) dashboards, set the default data source in Reporting Engine configuration page.

Checklist

Step	Description	√
1.	Step 1. Deploy NW Server Host	
2.	Deploy Component Core Services in Azure	
3.	Configure Host VMs in NetWitness Platform	

Step 1. Deploy NW Server Host

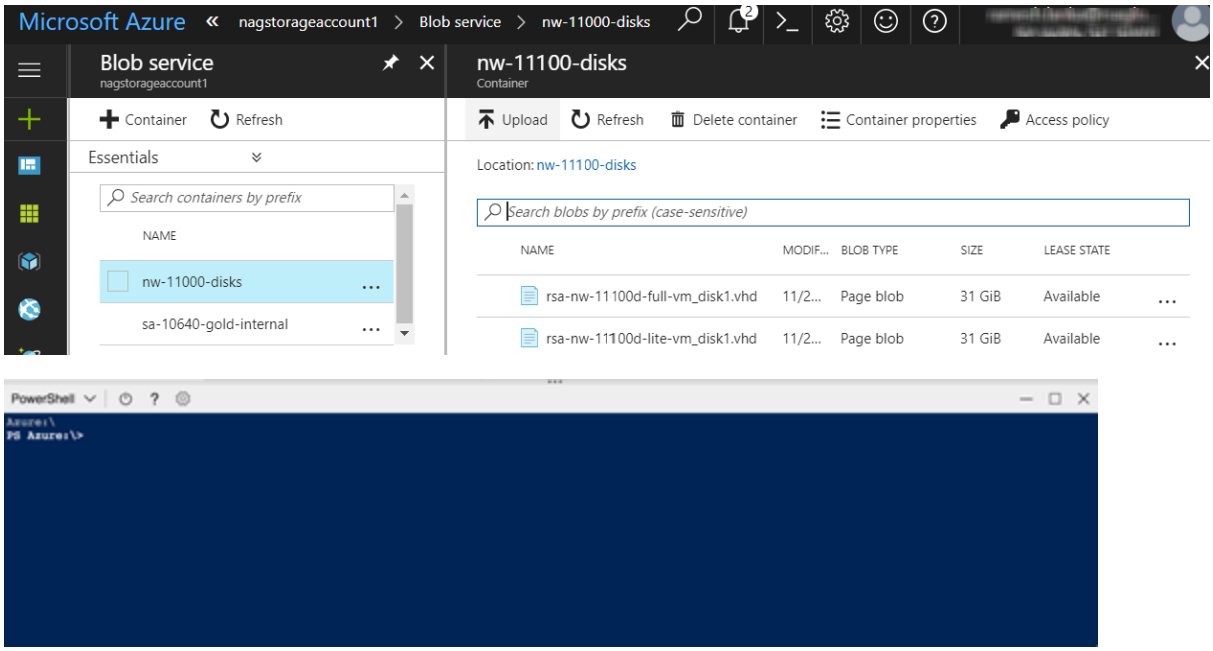
The following tasks must be performed to deploy a NetWitness Server (NW Server) on a virtual machine (VM) in the Azure Cloud environment.

Note: It is not mandatory to deploy the NW Server in the Azure Cloud environment . For more information on how to deploy other components, see Azure Deployment Scenarios.

Task 1. - Upload NW Server VHDs

To upload NW Server VHDs to Azure.

1. Contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) to open a support case requesting the NW Server VHDs. A valid throughput license is required.
2. Customer Support will update the case with VHD URI's.
3. In the Azure Portal, open the Powershell CLI.



You will need a storage account, blob service and container setup. This is where the VHD's are copied. After these are in place, you can execute the following command within the Azure Portal Powershell CLI. Alternatively, you can also run these commands from the Powershell on your workstation:

a. Run this command from Powershell to install AzureRM: `Install-Module -Name AzureRM -AllowClobber`

b. Execute this command to verify the installation process has been successfully done: `Import-Module -Name AzureRM`

c. If you find any error regarding execution policy, execute this command: - `Set-ExecutionPolicy -ExecutionPolicy RemoteSigned` (then repeat step b)

d. (Optional) If you are running the commands from the Powershell on your workstation, log in to your Azure account using this command: `Login-AzureRmAccount`

e. Select the Subscription: `Select-AzureRmSubscription -SubscriptionId <subscriptionid>`

f. Create a target context: `$targetStorageContext = (Get-AzureRmStorageAccount -ResourceGroupName <resource-group-name> -Name <storage-account-name>).Context`

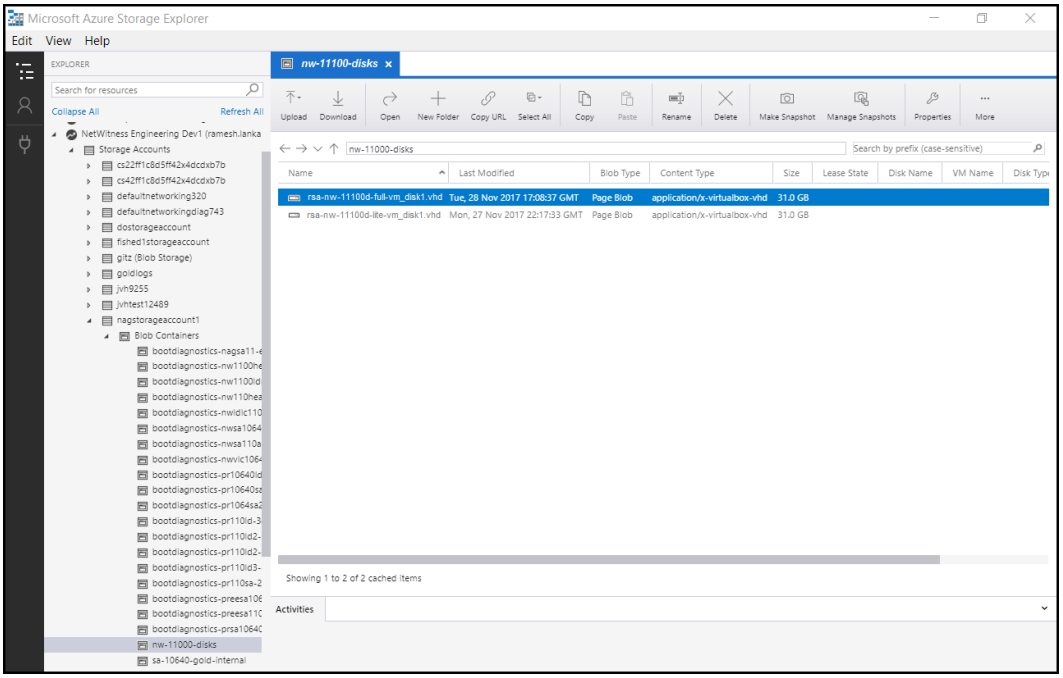
g. Start the copy: `Start-AzureStorageBlobCopy -AbsoluteUri "<SAS-URL>" -DestContainer <container-name> -DestBlob <destination-blob-name> -DestContext $targetStorageContext`

h. Obtain the Blob copy status by using the command: `Get-AzureStorageBlobCopyState -Blob "< destination-blob-name>" -Container "<container-name> " –Context $targetStorageContext`

4. Once the VHD's are successfully copied. You'll must create an image and a VM.

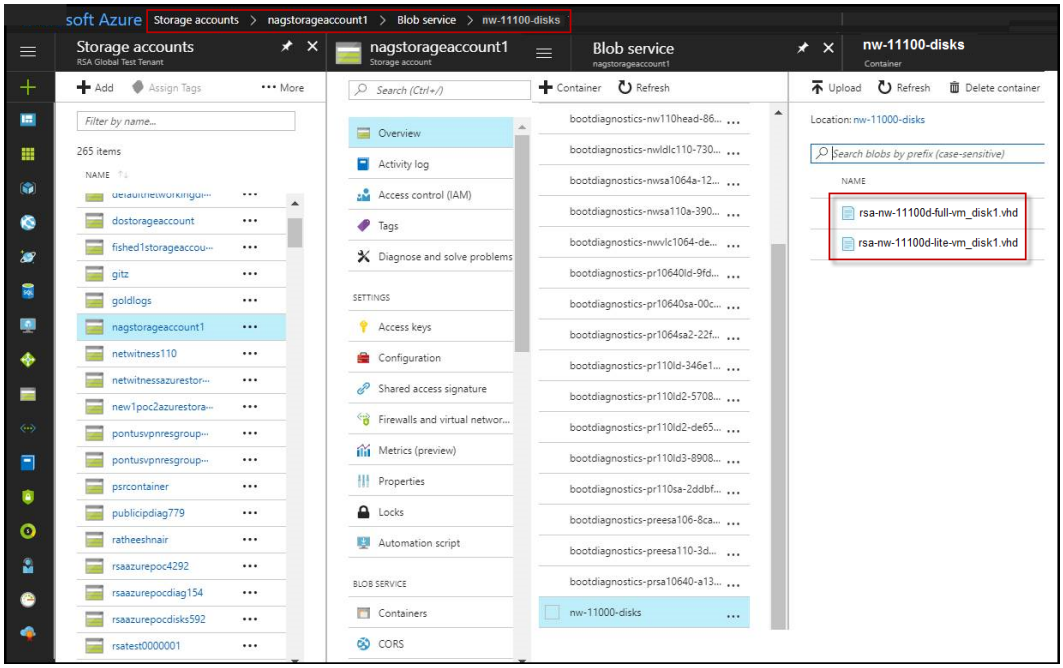
5. Verify if all the NW Server VHDs are uploaded into the Azure Cloud.

Note: Alternatively, you can use the Microsoft Azure Storage Explorer windows utility (http://storageexplorer.com/) to verify that all the VHDs from the following location subscription exist. This utility helps you manage the contents of your storage.



a. Log in to the Azure portal (https://portal.azure.com).

b. From the right panel, click **Storage accounts** > **netwitnessazurestorage1** > **Blob service** > **nwazurevhdstore**.



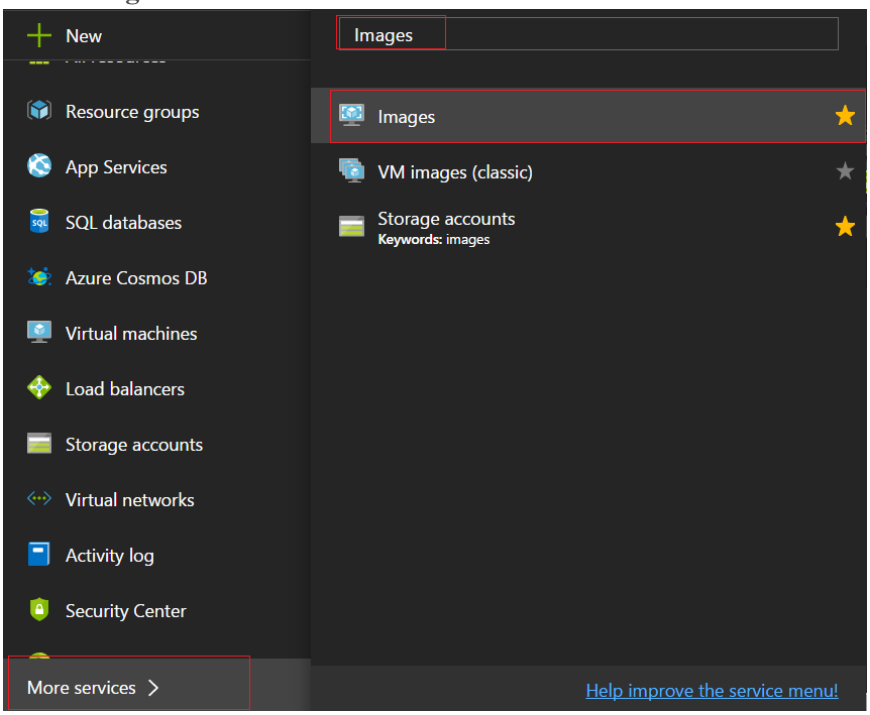
6. (Optional) In the Azure Explorer, go to the **NetWitness** group > **Storage Accounts** > **netwitnessazurestorage1**) > **Blob Containers** > **nwazurevhdstore**).

Task 2. - Create NW Server Image

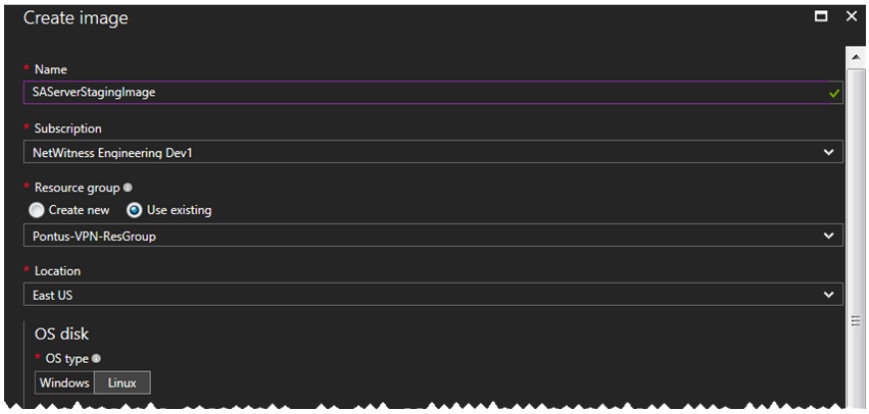
To create a NW Server image in Azure from upload VHDs, perform the following steps:

1. Log in to https://portal.azure.com.
2. From the left panel, click **More Services** and filter by Images.

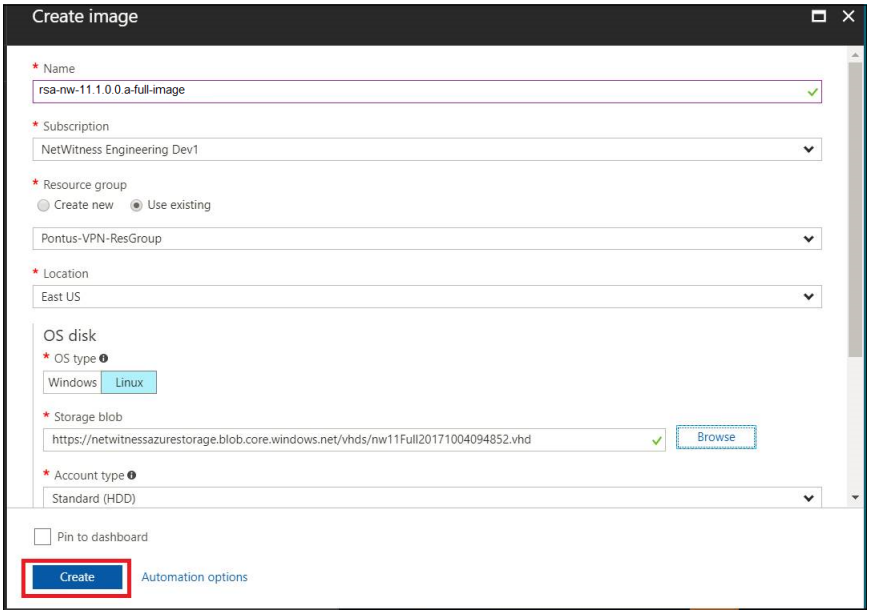
3. Click **Images**.



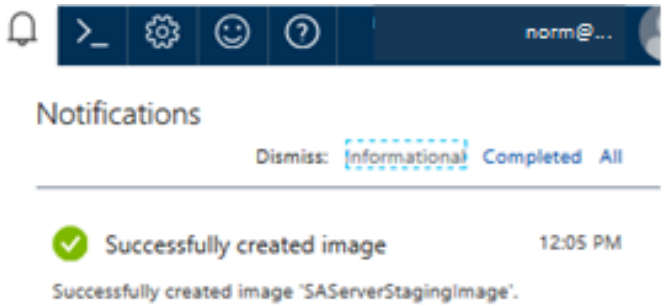
4. To create and configure the Image.
   a. Click **Add**.
   b. Enter an image **Name**, select the correct **Resource Group**, select a valid **Location**, and set the **OS Disk** to Linux.
   In the **Storage blob**, browse to the uploaded location of the VHDs .



c. Make sure that **Standard (HDD)** is selected for **Account Type**.
The following screen shot illustrates a completed **Create Image** view.



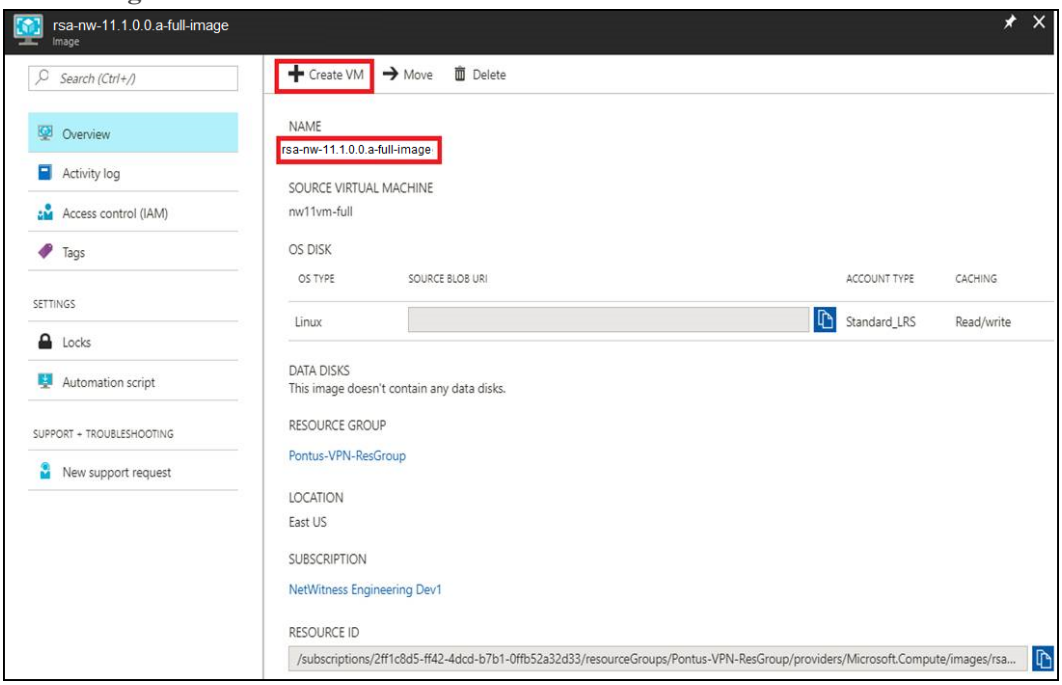
d. Click **Create** to create the image.
A confirmation message is displayed when the image is created.



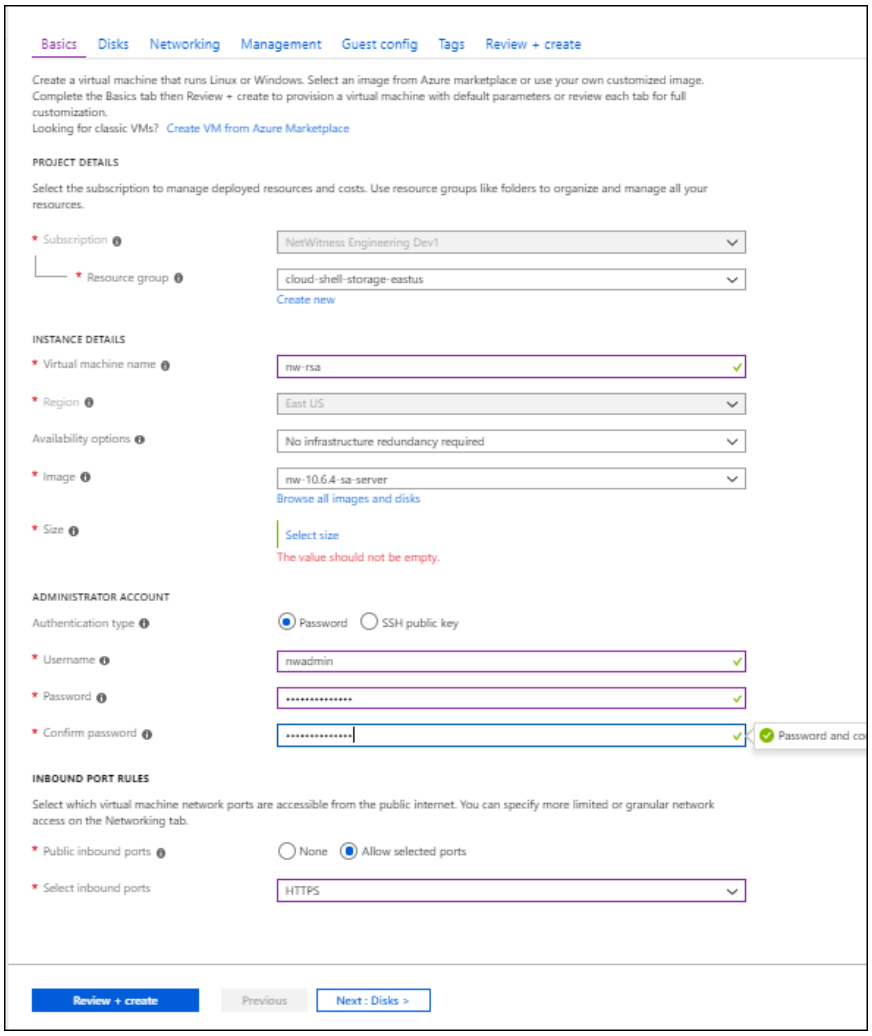
Task 3. Create Virtual Machine (VM)

To create a VM in Azure using the SA Server image:

1. Go to **Images** and click **Create VM**.



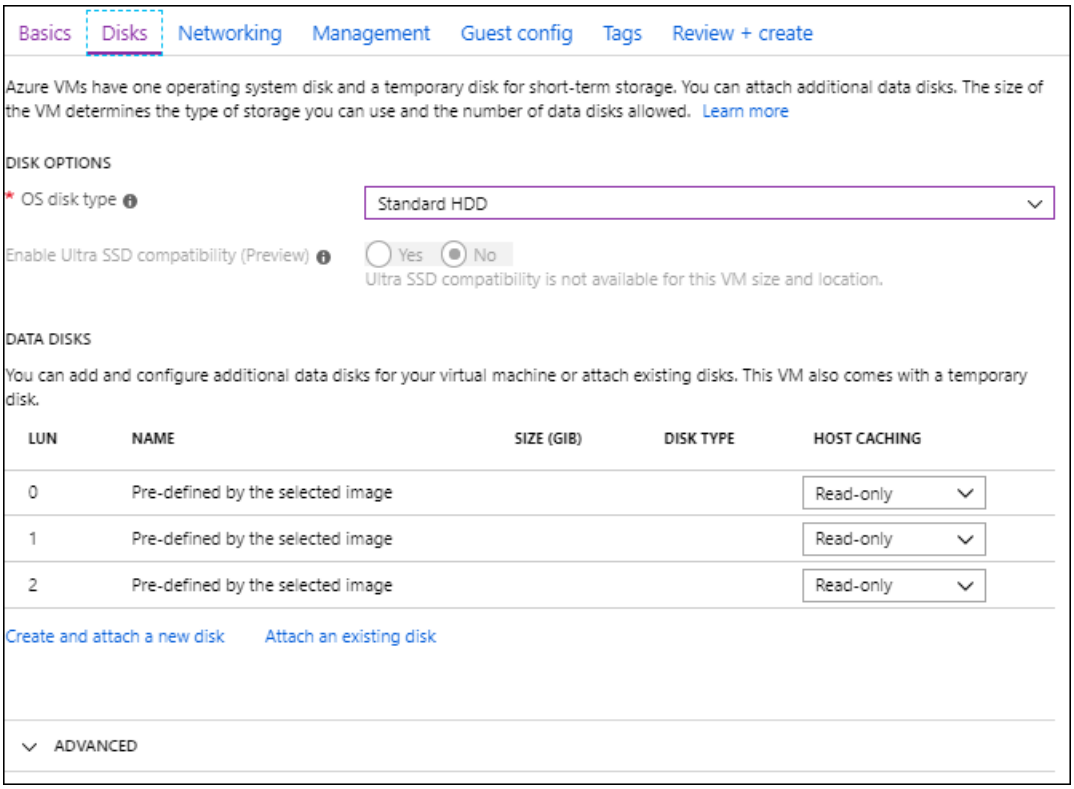
The **Basics** tab is displayed.



2. Enter the values in following fields.
   a. In the **Name** field, enter a user-defined name (for example, **NWServer1100**).
   b. In the **VM disk type** field, select **HDD** from the drop-down list.

      Caution: The username and password that you define is used to login to the system as a non-administrator user. Do not use the root user (the login does not have superuser permissions). You must change the root password the first time that you log in to the VM by executing the `su passwd root` command. This is a critical step and should not be missed. You cannot use `root` for a username (Azure-specific).

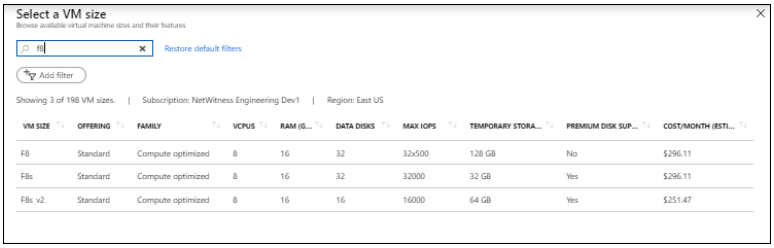
   c. In the **User name** field, enter a valid username.
   d. In the **Authentication type** field, click **Password** and enter a strong password that is a combination of lowercase, uppercase, numeral and a symbol (for example, **Password@123**).
   e. Make sure that the values selected in the **Subscription**, **Resource group and Location** fields are correct.
   f. Click **Next** > **Disks**.
      The **Disks** tab is displayed.



The **Select a VM size** dialog is displayed.

3. Click ***size-required-based-on-capacity*** (for example, **F8 Standard**) field, and click **Select**.

Note: THe sizing is based upon the capacity requirements of your enterprise. For more information on RSA VM size recommendations based on log capture rates, see VM Configuration Recommendations. The minimum size RSA recommends for the SA Server is **F8 Standard**.



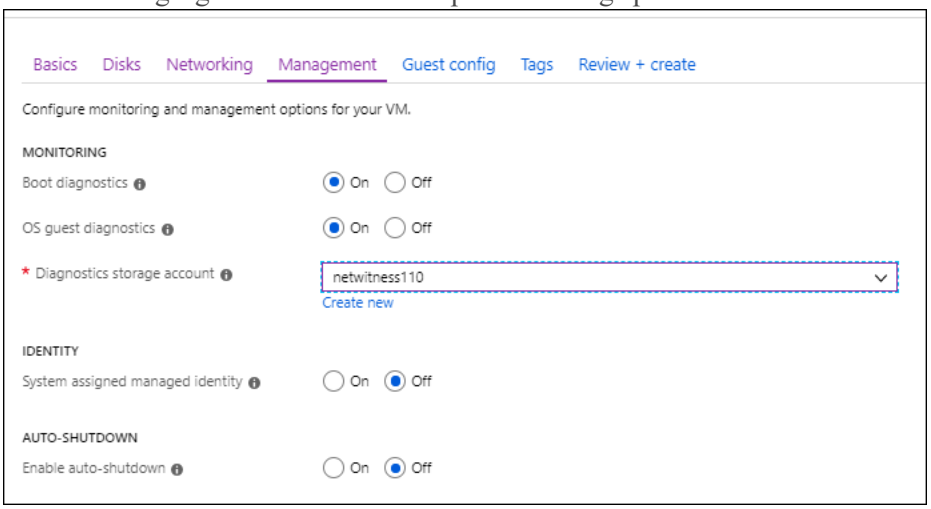
The **Networking** tab is displayed.

4. Click and define the fields.
   a. In the **Networking** tab, select:
      - A valid **Virtual network** and **Subnet**.

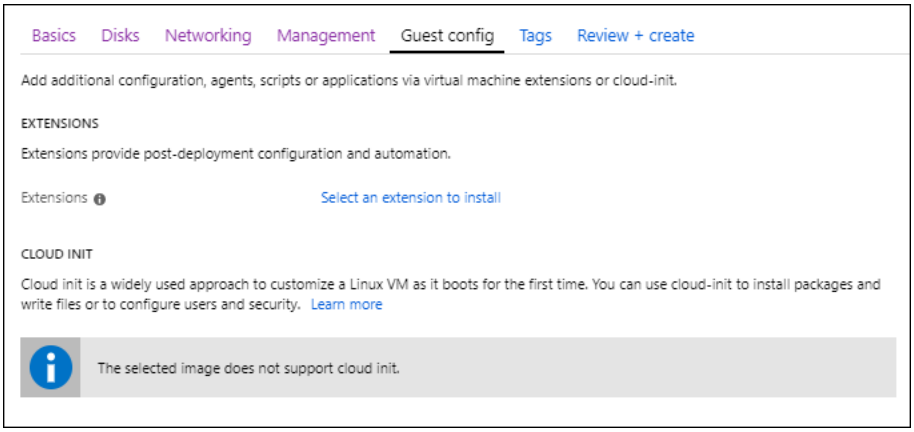
      - **None** for the **Public IP address**.
        RSA recommends **None** for the **Public IP address** (this is not mandatory). You can assign a public IP address, but it countermands Best Practices to assign a public IP to something that is based in the Azure Cloud.
      - A valid **Network security group**.
        For information on Network security groups, see the Microsoft Azure documentation (https://docs.microsoft.com/en-us/azure/virtual-network/virtual-networks-nsg).

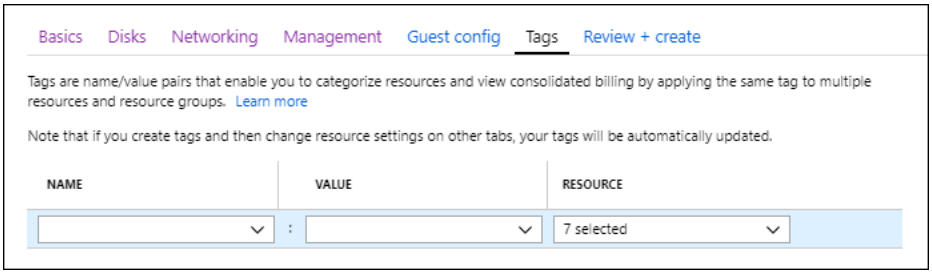
   b. In the **Management** tab, select:
      - **On** for **Boot Diagnostics**
      - **On** for **Guest OS diagnostics**
      - a valid **Diagnostics storage account**

The following figure illustrates a completed Settings panel.

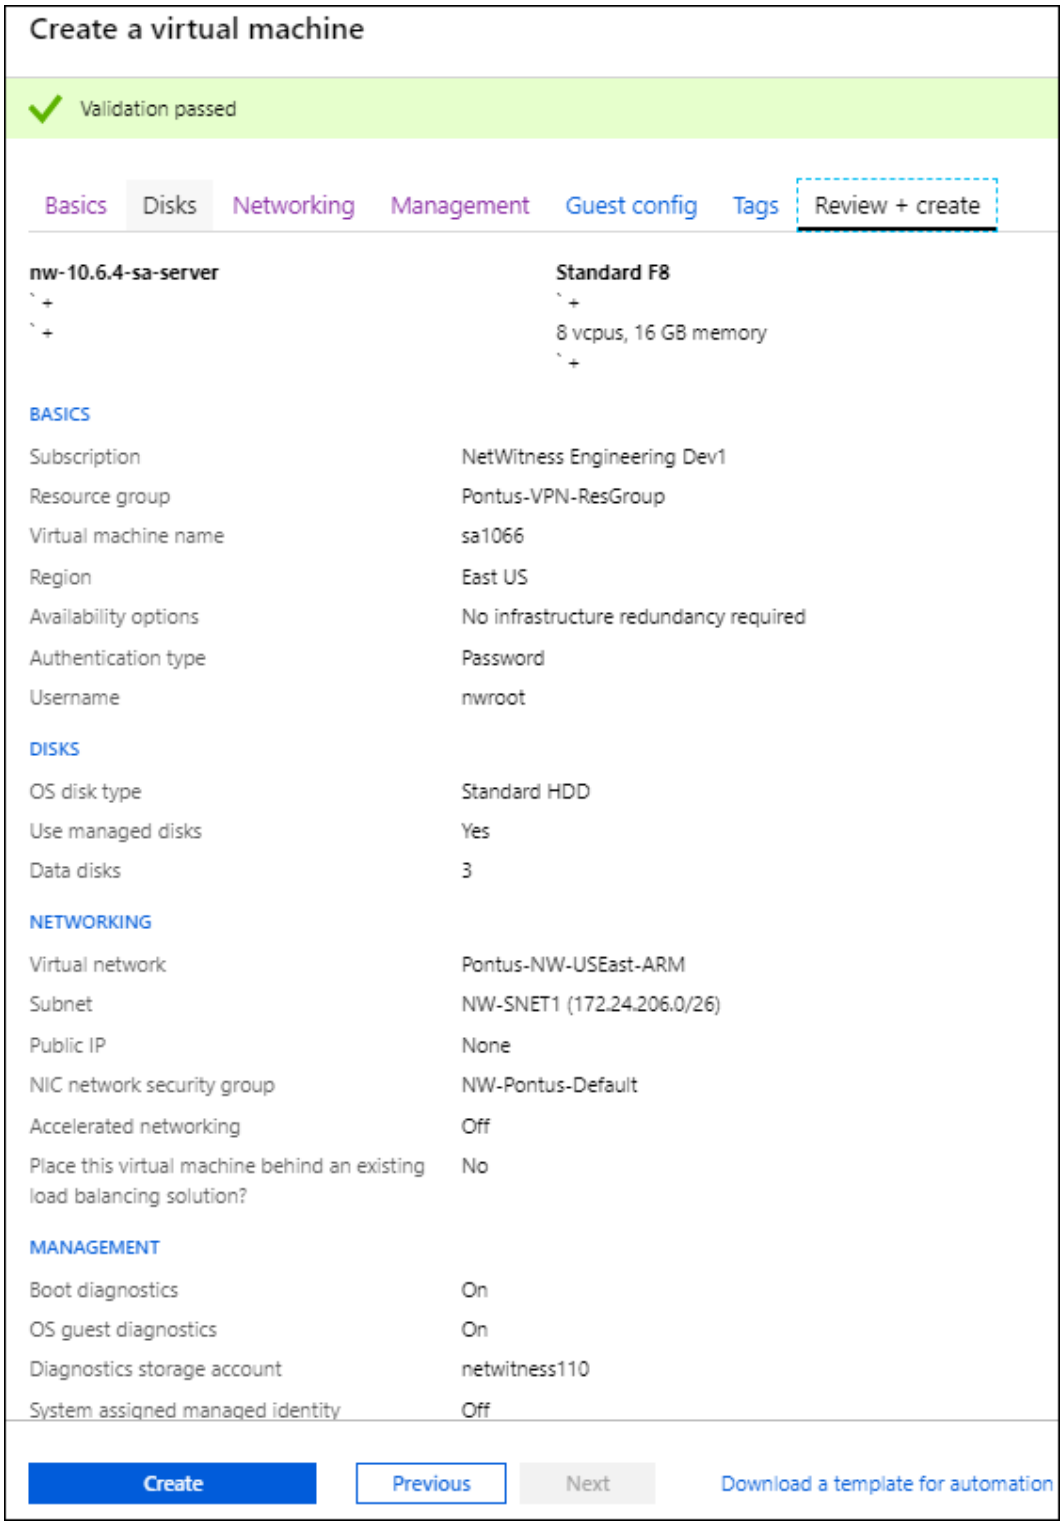


c. Click **OK**.
In the **Guest config** and **Tags** tab the settings remain unchanged.



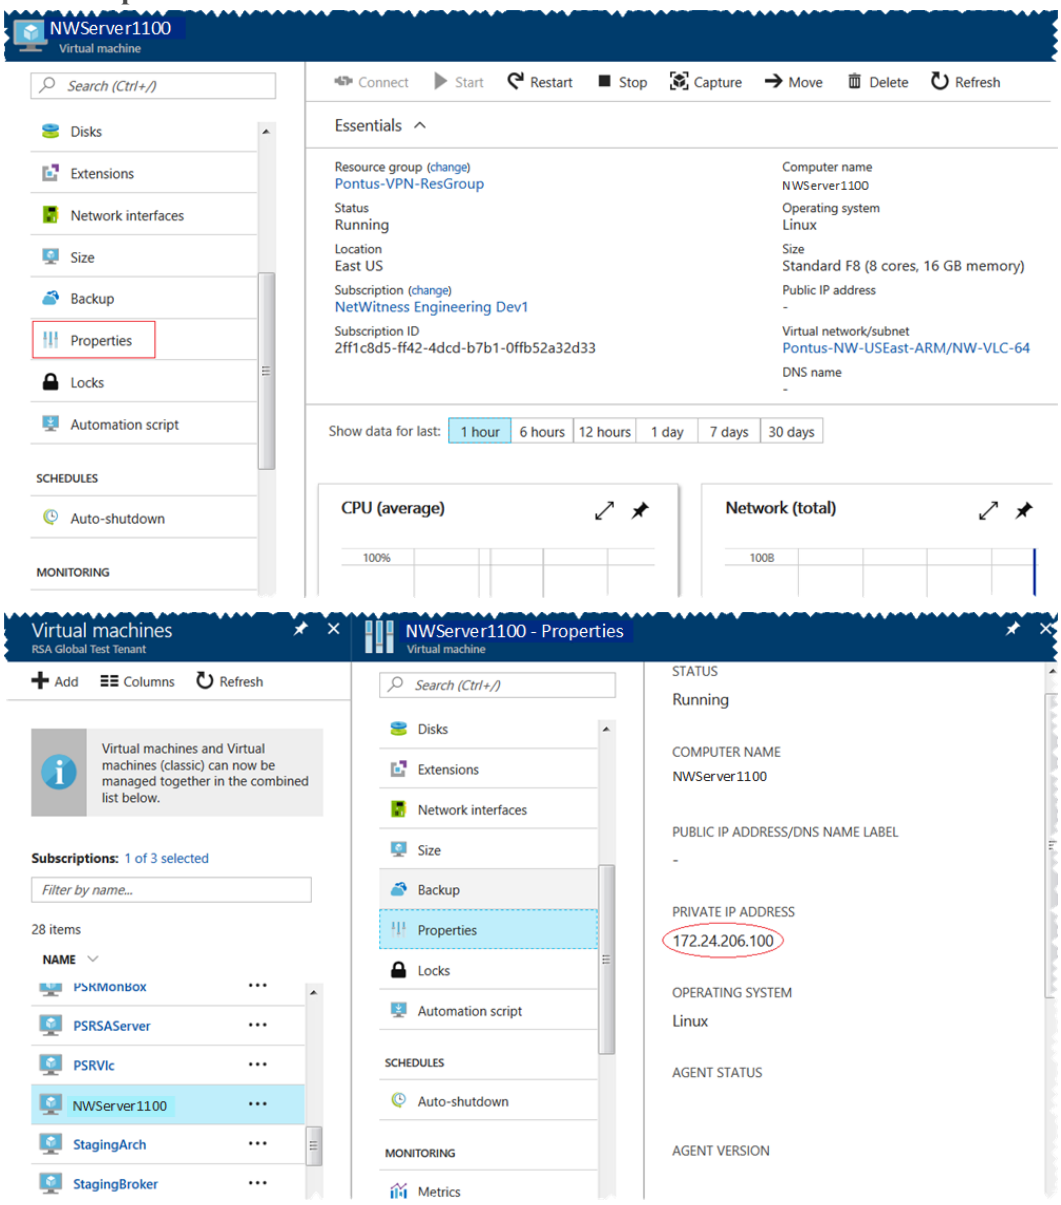


5. Click **Create** after the validation is successful.

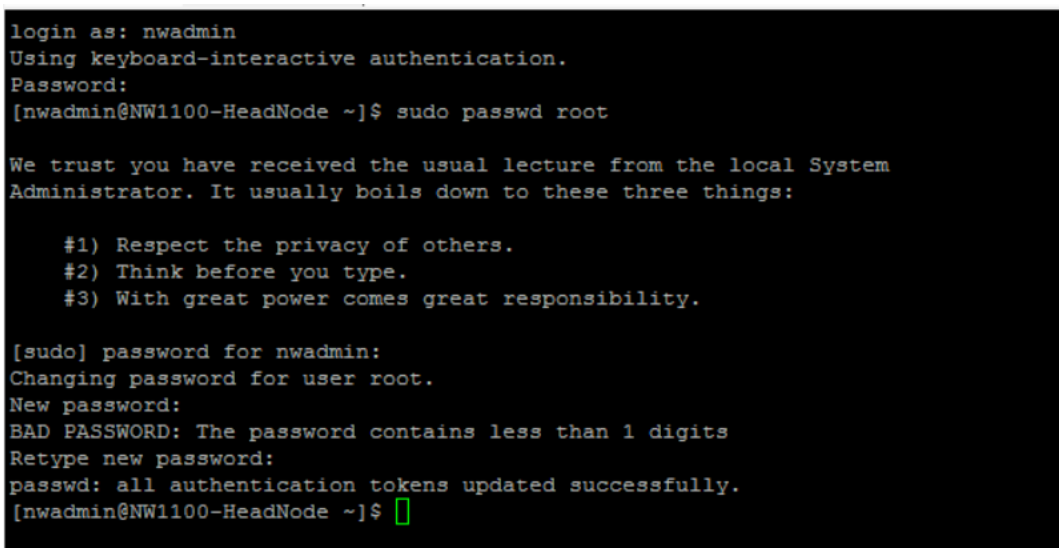


The NW Server VM Deployment is successful when you see the VM status as **Running**.

6. Click **Properties** to view the **IP Address** details.



7. SSH to the VM using the username that you specified in Step 2d of Task 3 and reset the **root** password. Use the `su passwd root` command string to reset the root password.



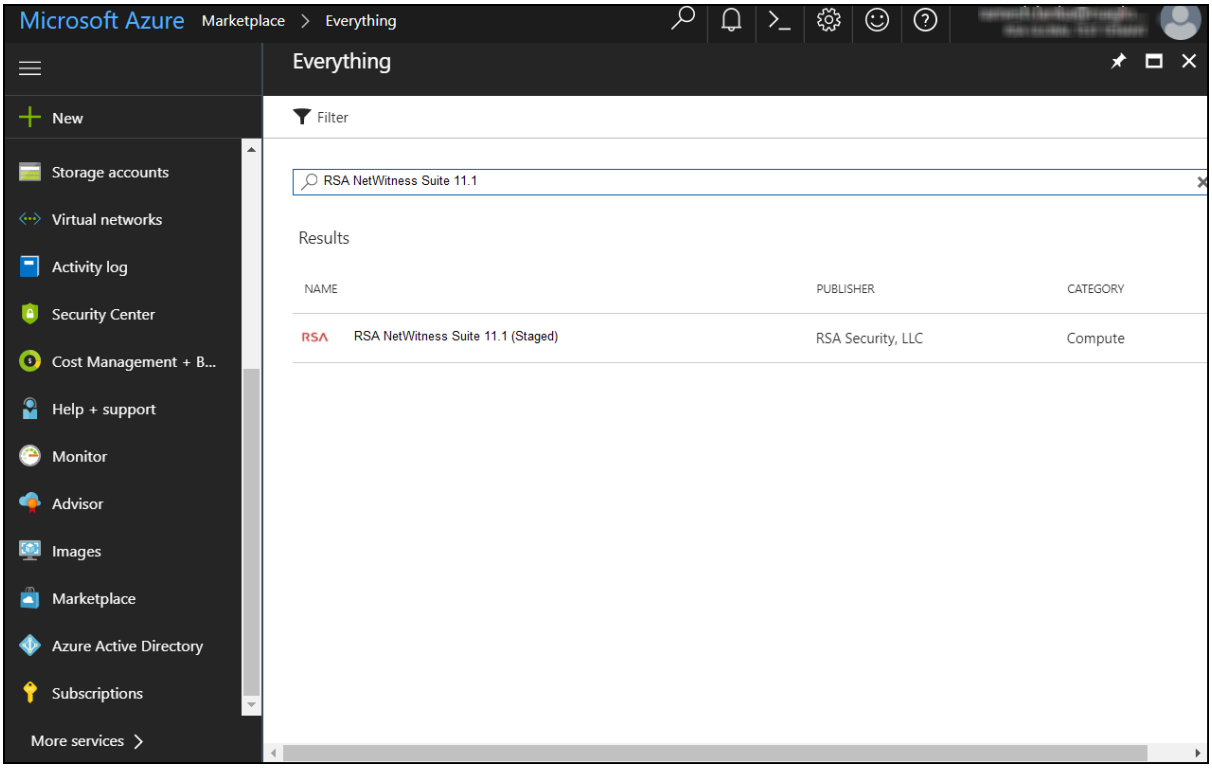
8. Close the current SSH session and open a new SSH session with **root** using the username and the password created in the previous step.

Note: Step 8 is a critical, one-time step for a new deployment. If you do not complete this step, the NetWitness Platform User Interface will not load.

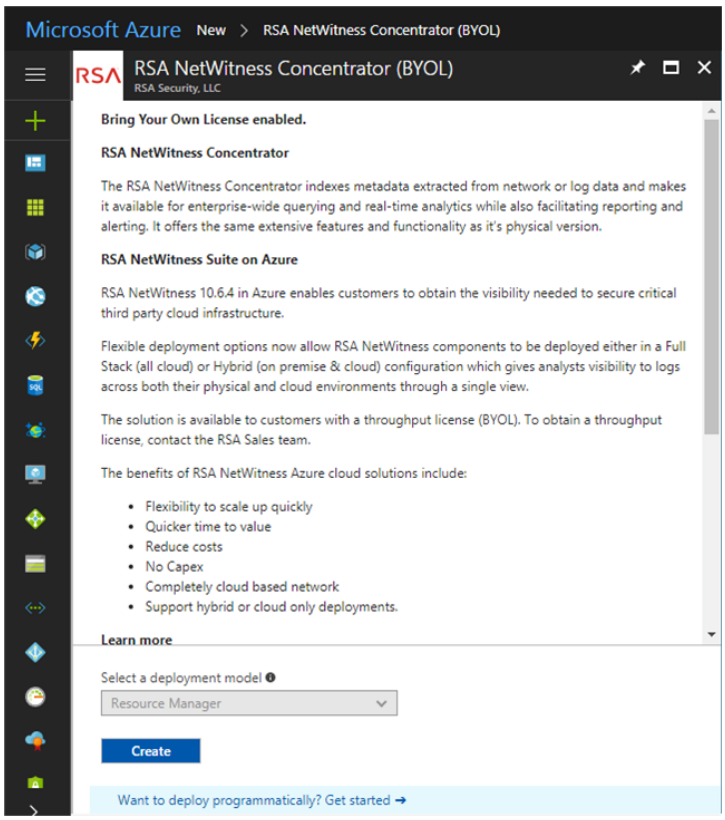
Deploy Component Core Services in Azure

The following tasks must be performed to configure the core RSA NetWitness® Platform component services on a virtual machine (VMs) in the Azure Cloud environment.

1. Go to azuremarketplace.microsoft.com and sign in with your credentials.
2. Search for RSA.

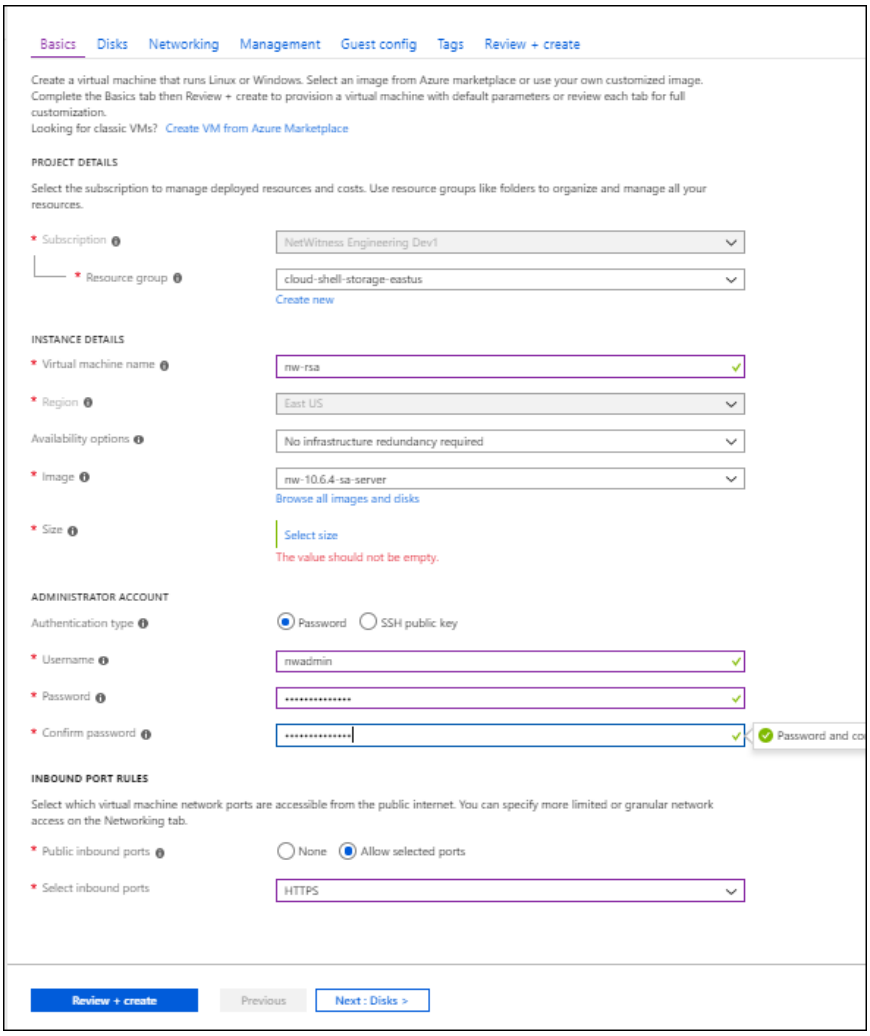


3. Click RSA NetWitness® Platform core service (for example, **RSA NetWitness Concentrator**) and click **Create**.



The **Create virtual machine** wizard opens and displays the **Basics** tab.

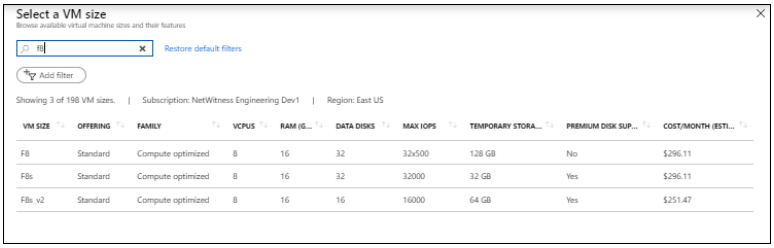
4. Enter the values in the following fields:
   a. Specify a VM **Name** (for example, **Concentrator**).
   b. Select **SSD** for the **VM disk type** of the Concentrator or **HDD** for all other components. Solid State Disk (SSD) performs better than a Hard Drive (HDD).
   c. Select **Password** for **Authentication type**.
   d. Enter your credentials (that is **User name** and **Password**) and **Confirm Password**.
   e. Click **OK**.



Azure validates the **Basic** specifications and the **2 Size** page is displayed.

5. Click on the appropriate VM size (for example, **Standard DS14 v2** for the Concentrator) for the service and click **Select** for a VM **Size**.

   For more information on RSA's recommendations of the VM sizes for each service, see VM Configuration Recommendations.



Azure validates the **Size** specifications and the **Networking** page is displayed.

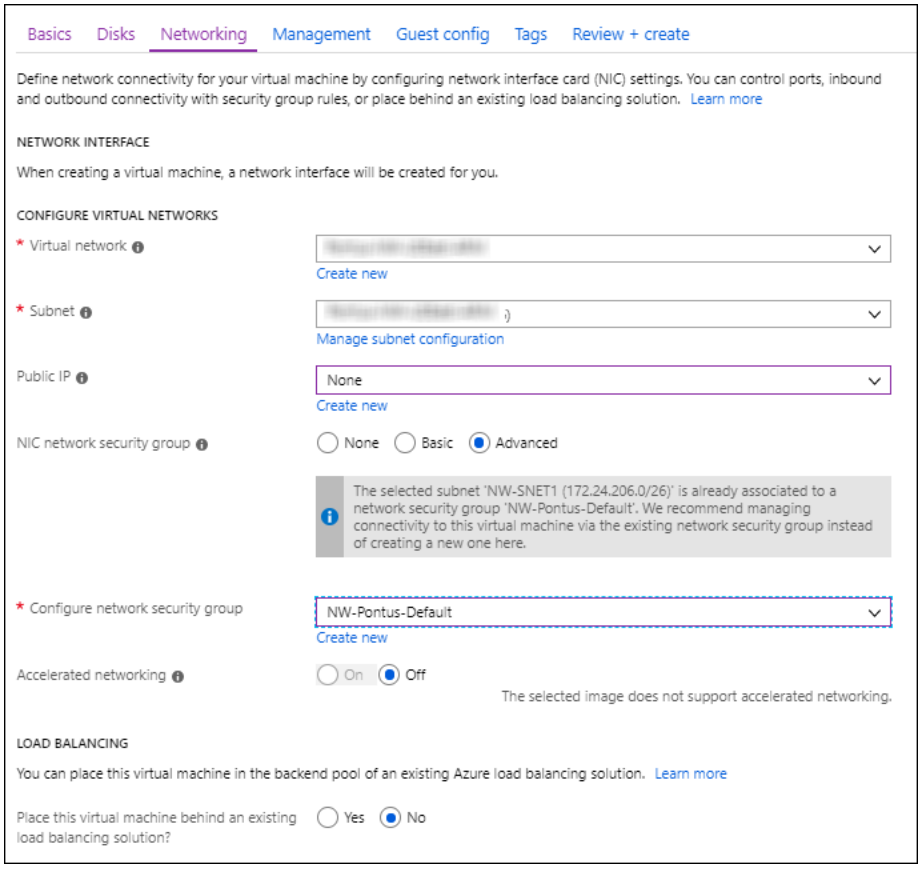
6. Enter the **Settings**.

   a. In the **Storage** field, make sure **Use manage disks** is set to **Yes** .

   b. Under **Networking**:

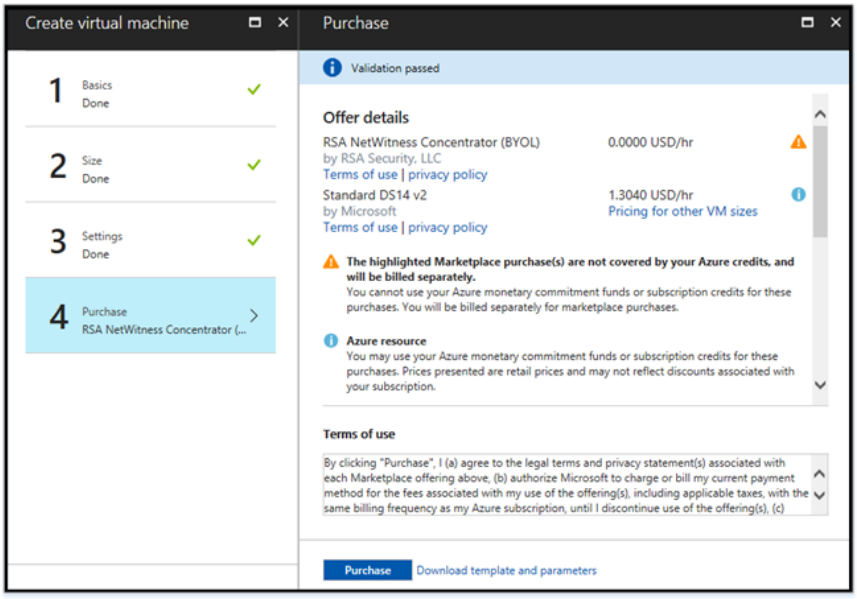
- Adjust **Virtual network**, **Subnet** and **Public IP address** according to the requirements of your network.
- Specify a valid **Network ecurity group**.

  For information on Network security groups, see the Microsoft Azure documentation (https://docs.microsoft.com/en-us/azure/virtual-network/virtual-networks-nsg). Refer to Deployment: Network Architecture and Ports (https://community.rsa.com/docs/DOC-83050) for a comprehensive list of the ports you must set up for all RSA NetWitness® Platform components.



c. Click **OK**.

   Azure validates the VM and the **Purchase** page is displayed.



7. Click **Purchase** to create the core RSA Security Analytics component service (for example, **Concentrator**) VM in Azure.
8. Configure the host VM in RSA NetWitness® Platform 11.3.0.0.

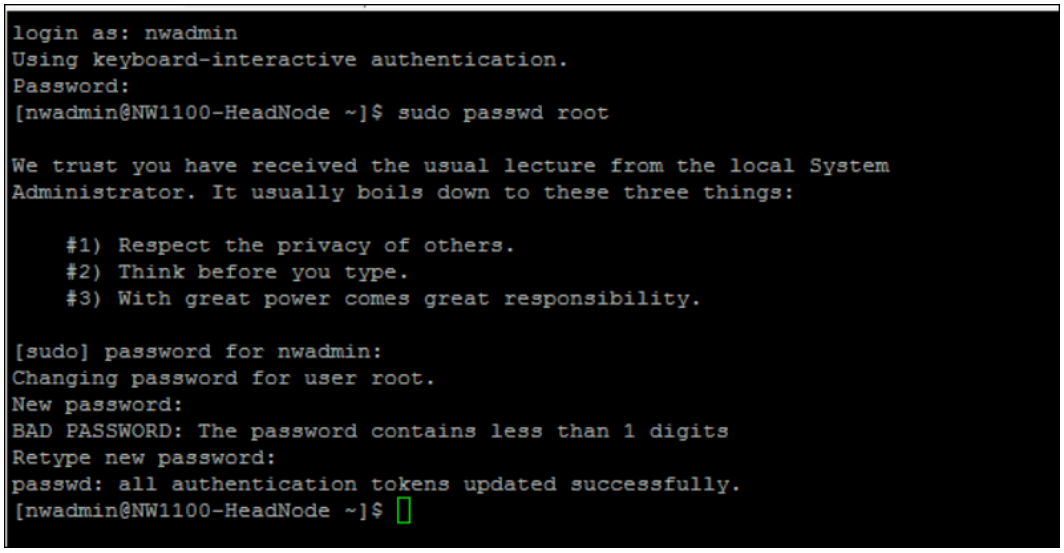
   For more information, see Configure Host VMs in NetWitness Platform .
9. Repeat steps 1 through 8 inclusive for the rest of the core RSA NetWitness component services.

Configure Host VMs in NetWitness Platform

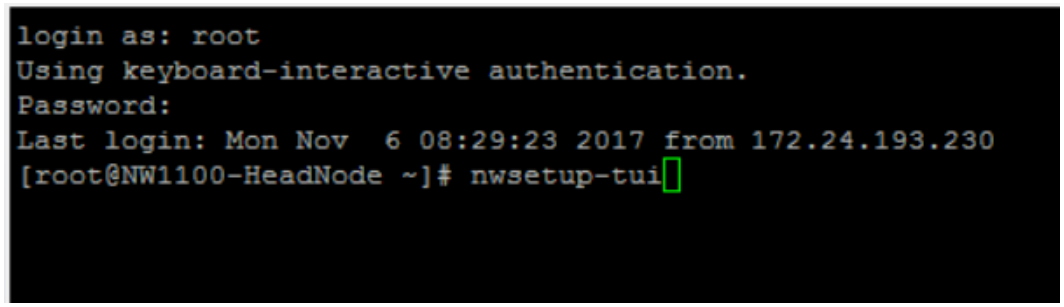
You can configure individual hosts and services as described in RSA NetWitness® Platform *Host and Services Configuration Guide*. This guide also describes the procedures for applying updates and preparing for version upgrades.

Note: After you successfully create a VM, Azure assigns a default hostname to it. Refer to "Change the Name and Hostname of a Host" see *Edit a Host* (https://community.rsa.com/docs/DOC-84841) in the RSA NetWitness® Platform help for instructions on changing a hostname.

1. SSH to the host using the credentials you specified in the **Basics** ta b of the **Create VM** wizard when you created the VM in Azure (in item 4d of Deploy Component Core Services in Azure).
2. Reset the password for **root**.



3. SSH to the host using **root** for username and the password created in the previous step and provide NetWitness Platform an IP for provisioning.

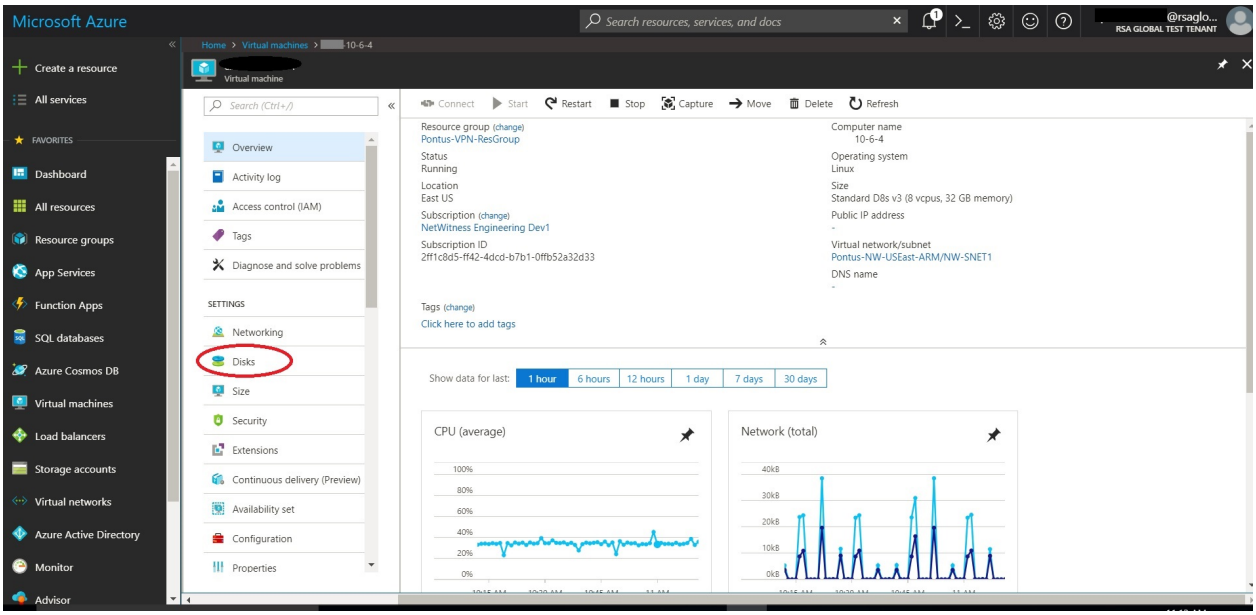


For more information, see the Installation Tasks section to install 11.3.0.0 on the NW Server Host.

NetWitness Azure Storage Allocation Procedure

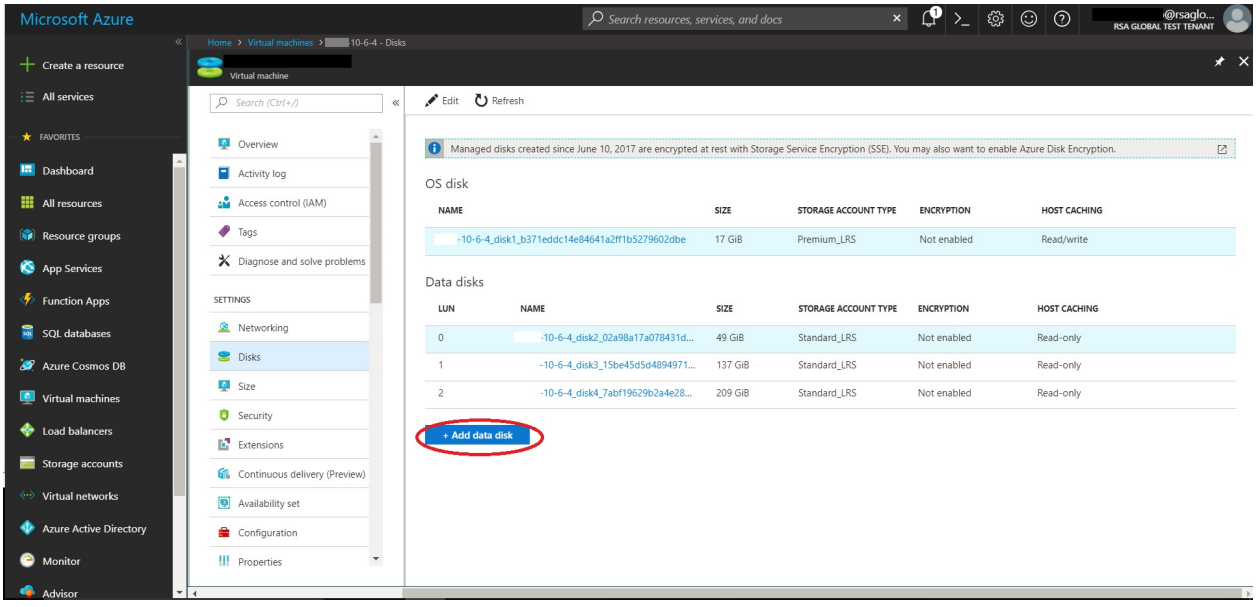
TO allocate storage in NetWitness Platform 11.3.0.0, perform the following steps:

1. In Microsoft Azure portal (https://portal.azure.com/), go to **Virtual Machines**.
2. Click on the required VM > **Disks**.

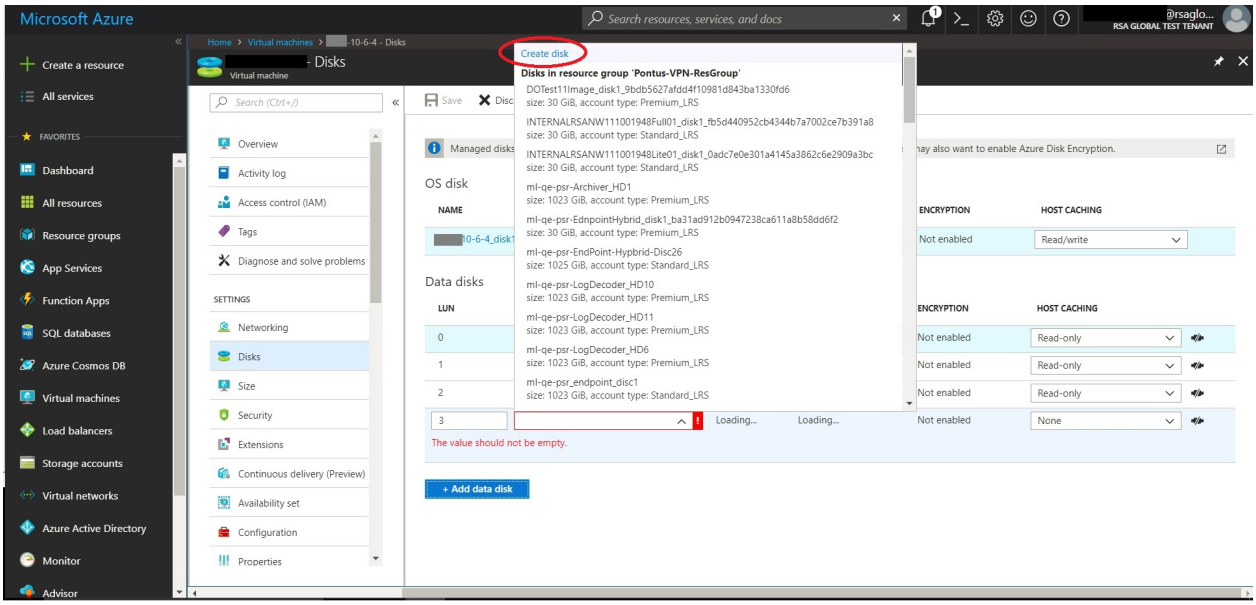


3. Click **Add data disk**.

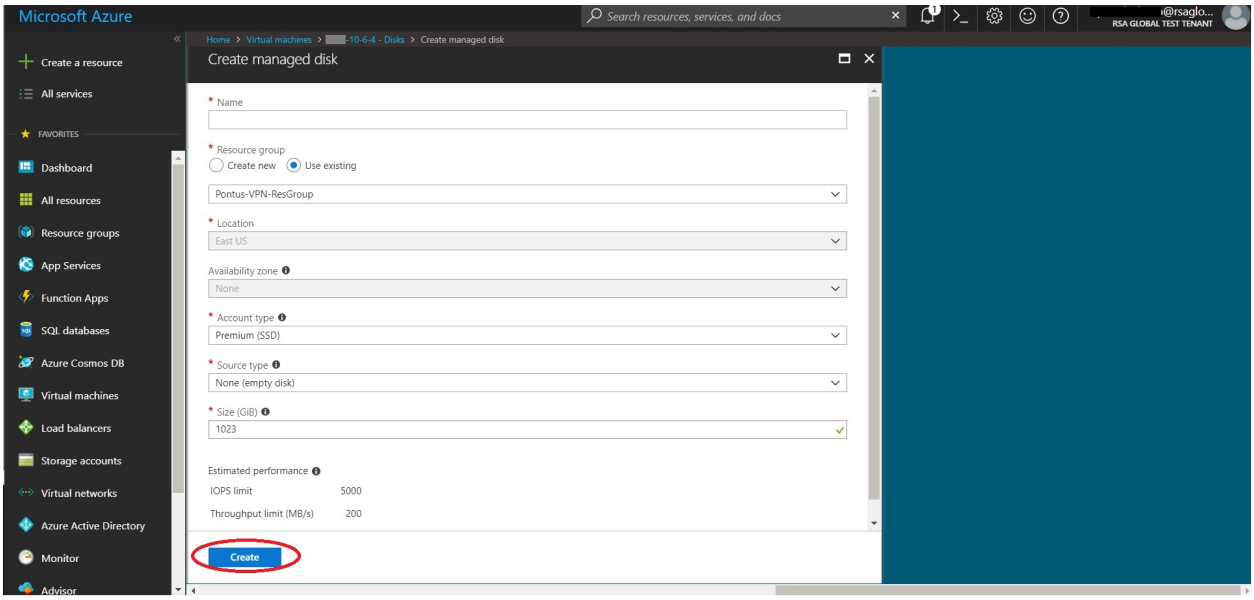
Note: You need to add the appropriate amount of disks to meet the retention requirements. If you need to add more than a single disk, a RAID configuration is needed. For more information, see RAID Configuration Instructions.



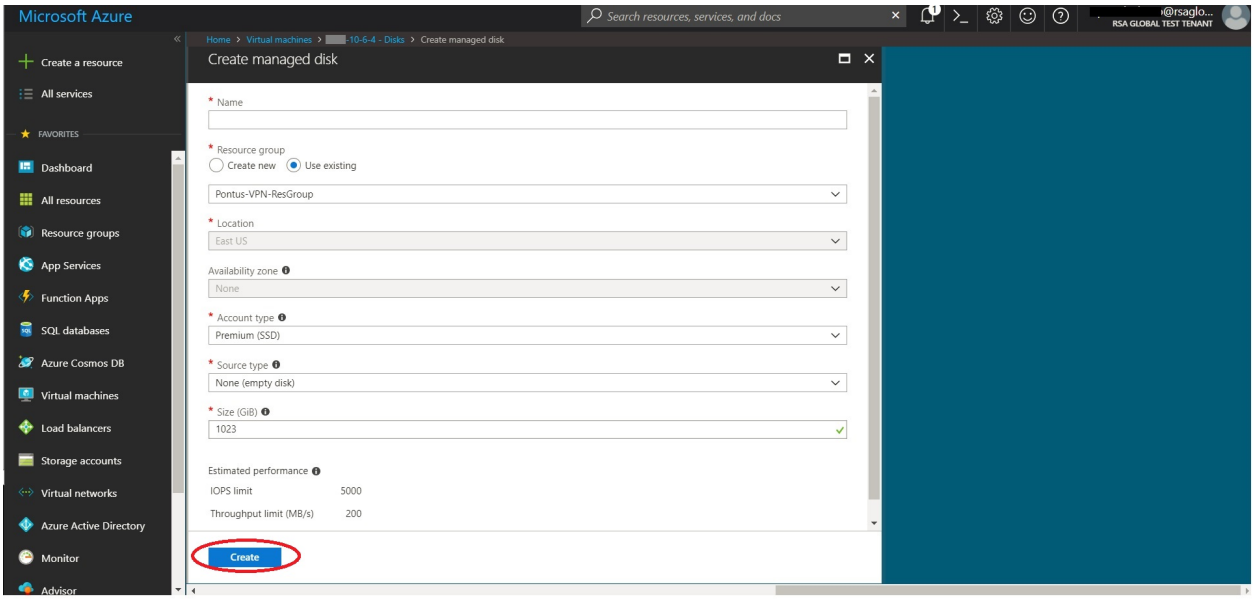
4. In the drop-down list, select **Create disk**.



5. Enter the **Name**, **Resource group** (Select Use existing), **Account type** (SSD for Concentrator Index DB and HDD for others), **Source type** (select **None (empty disk)**), **Size** and fill the other fields.



6. Click **Create**.
7. Select **Read/Write** for HOST CACHING. and click **Save**.



RAID Configuration Instructions

The following steps need to be followed in order to configure RAID on different components such as Log Decoder, Concentrator, Archiver and Event Stream Analysis. Make sure the VM **Stopped** before performing any of the below mentioned steps. The changes will reflect only if the changes are made in **Stopped** state and then the machine is started.

Note: The storage recommendations provided in the steps below are only examples.

1. Stop the VM to which the disks need to be attached.
2. Attach the required number of disks to the VM on Azure portal.
3. Start the VM.
4. Once the VM is up and running, run the command `lsblk`. This command should list out the disks attached with the size for each disk.
5. Select the set of disks to be a part of your RAID-0 configuration. For example, if you have chosen disks /dev/sde, /dev/sdf, /dev/sdg, /dev/sdh to be a part of your metadb for LogDecoder.
6. Create physical volume on each of these disks using the command `pvcreate /dev/sd[e-h`. If you see any errors in this step like "incorrect offset" or "incorrect alignment", then run the command `pvremove /dev/sd[e-h]` and then run `pvcreate /dev/sd[e-h] --force`.
7. You can check the physical volume info using the commands `pvs` or `pvdisplay`. Run the command `mdadm --create /dev/md0 --assume-clean --level 0 --raid-devices=4 /dev/sde /dev/sdf /dev/sdg /dev/sdh`.
8. Once the RAID config is created, you can check the status of the disks using `mdadm --detail` command.

9. Run the command `pvcreate /dev/md0` to create a physical volume on the RAID 0 configured above. If you see any errors in this step like "incorrect offset" or "incorrect alignment", then run the command `pvremove /dev/sd[e-h]` and then run `pvcreate /dev/md0 --force`.
10. Run the command `vgcreate -s 32 VolGroup02 /dev/md0`. This will create a volume group named "VolGroup02" which will span across the entire RAID configuration.
11. Run the command `lvcreate -L 3T -n metadb VolGroup02`. This will create a logical volume named "metadb" on VolGroup02.
12. Run the command `mkfs.xfs /dev/mapper/VolGroup02-metadb`. This will format the newly created logical volume to an xfs partition that is required by the netwitness services.
13. Make entries in /etc/fstab to mount the created logical volume so that the LVs are retained even after a system reboot.
14. Run the command `mdadm --detail --scan > /etc/mdadm.conf`. This command will create and store the info about the RAID configurations in the file so that the RAID configuration is also retained on system reboot.

Installation Tasks

Before you begin the installation tasks make sure you open the firewall ports. For more information on the lists of all the ports in a deployment, see the"Network Architecture and Ports" topic in the *Deployment Guide for RSA NetWitness Platform 11.3.*

Caution: Do not proceed with the installation until the ports on your firewall are configured.

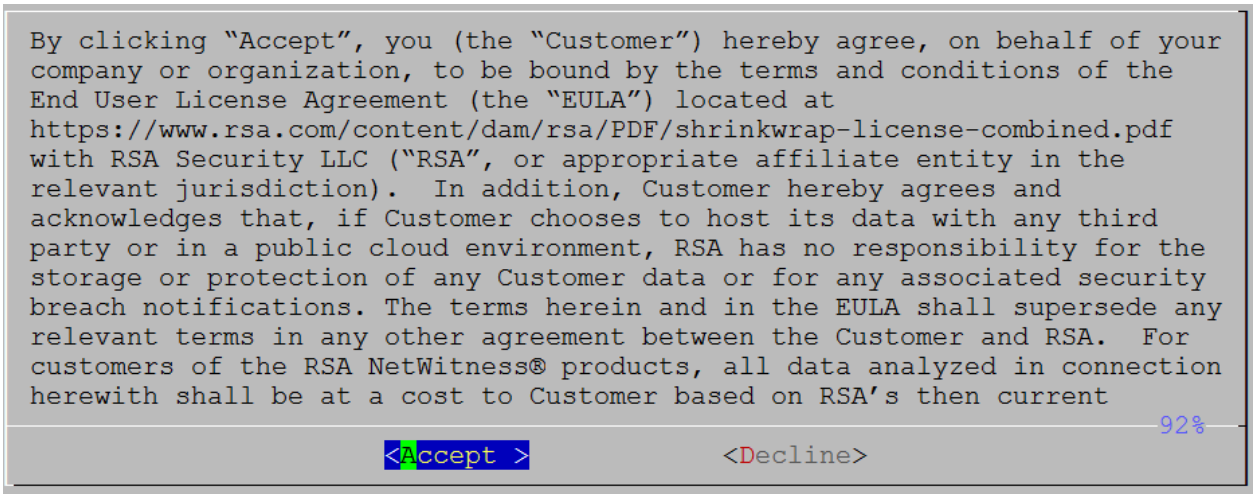
Task 1 - Install 11.3.0.0 on the NetWitness Server (NW Server) Host

Note: You can perform this task for RSANW-11.3.0.0.10816-Full instance.

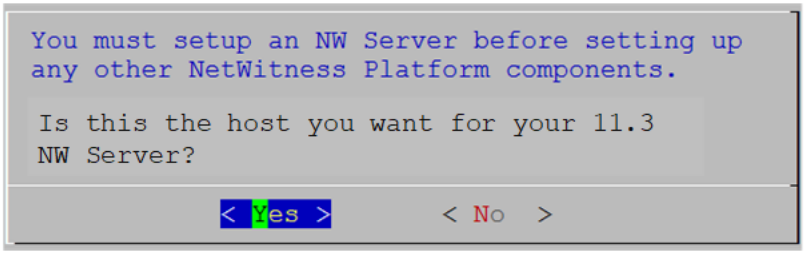
1. Run the `nwsetup-tui` command to set up the host.

   This initiates the `nwsetup-tui` (setup program) and the EULA is displayed.

Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press **Enter** to register your command response and move to the next prompt.
2.) The Setup program adopts the color scheme of the desktop or console you use access the host.
3.) If you specify DNS servers during Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` to proceed. Any misconfigured DNS servers cause the Setup to fail. If you need to reach DNS server after setup that unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see the "Post Installation Tasks" topic in the *Physical Host Installation Guide*.
If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Platform Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).



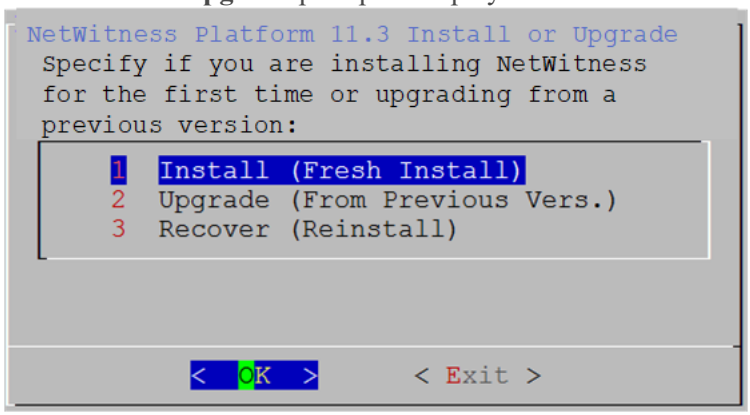
2. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 11.3 NW Server** prompt is displayed.



3. Tab to **Yes** and press **Enter**.
   Choose **No** if you already installed 11.3 on the NW Server.

   Caution: If you choose the wrong host for the NW Server and complete the Setup, you must restart the Setup Program (step 2) and complete all the subsequent steps to correct this error.

   The **Install or Upgrade** prompt is displayed.



4. Press **Enter Install (Fresh Install)** is selected by default.
   The **Host Name** prompt is displayed.

   Caution: If you include "." in a host name, the host name must also include a valid domain name.

5. Press **Enter** if want to keep this name. If not edit the host name, tab to **OK**, and press **Enter** to change it.

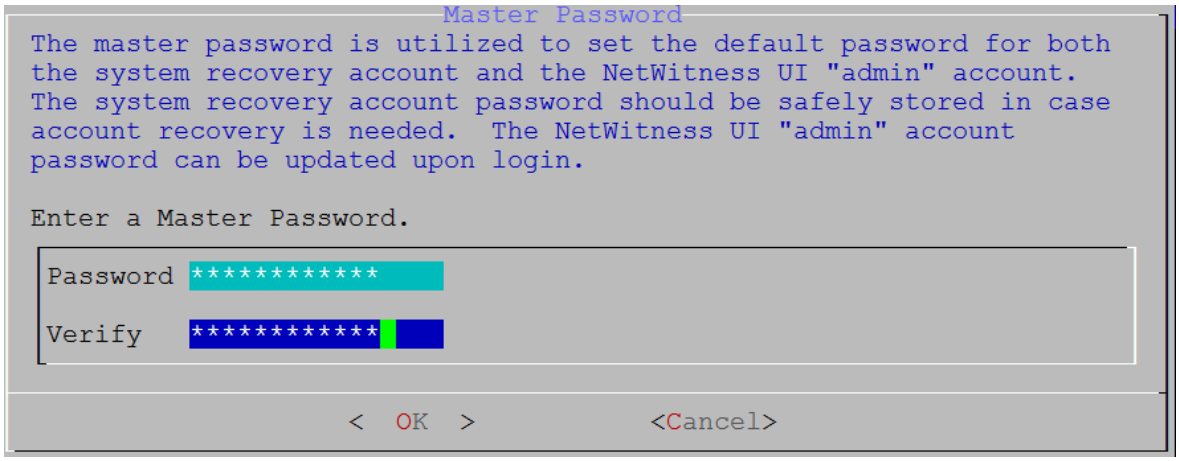
   The **Master Password** prompt is displayed.

   The following list of characters are supported for Master Password and Deployment Password:

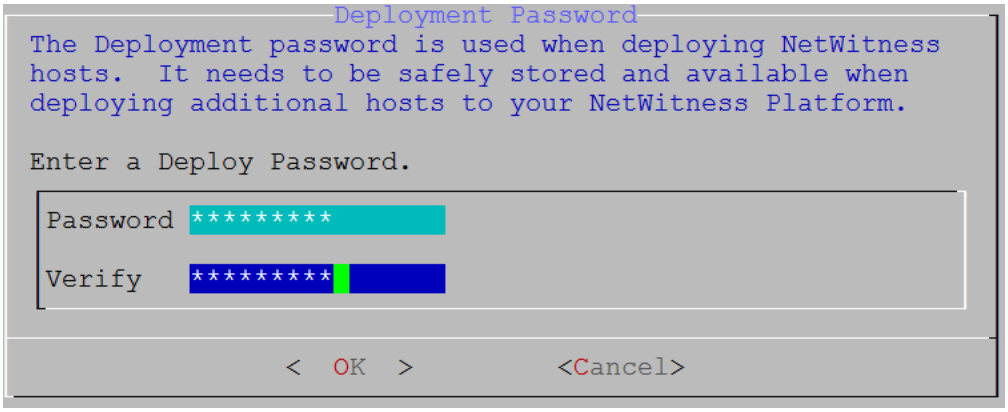
   - Symbols : ! @ # % ^ + ,
   - Numbers :0-9

- Lowercase Characters : a-z
- Uppercase Characters : A-Z

  No ambiguous characters are supported for Master Password and Deployment Password (for example: space { } [ ] ( ) / \ ' " ` ~ ; : . < > -.

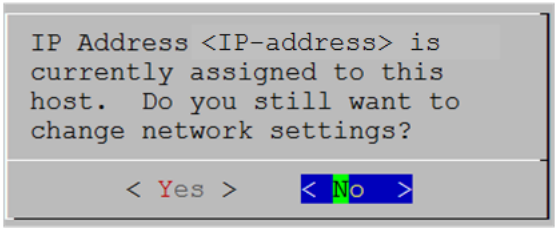


6. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**. The **Deployment Password** prompt is displayed.



7. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**. One of the following conditional prompts is displayed.

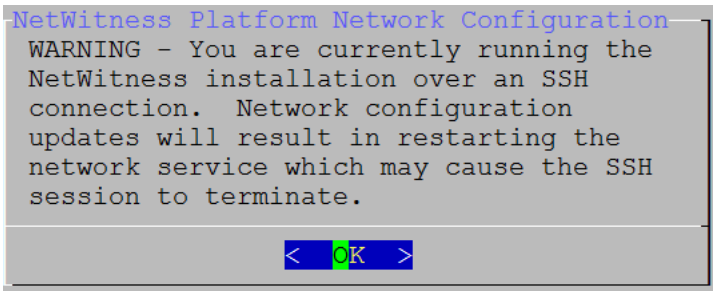
- The Setup program finds a valid IP address for this host, the following prompt is displayed.



Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** if you want to change the IP configuration found on the host.

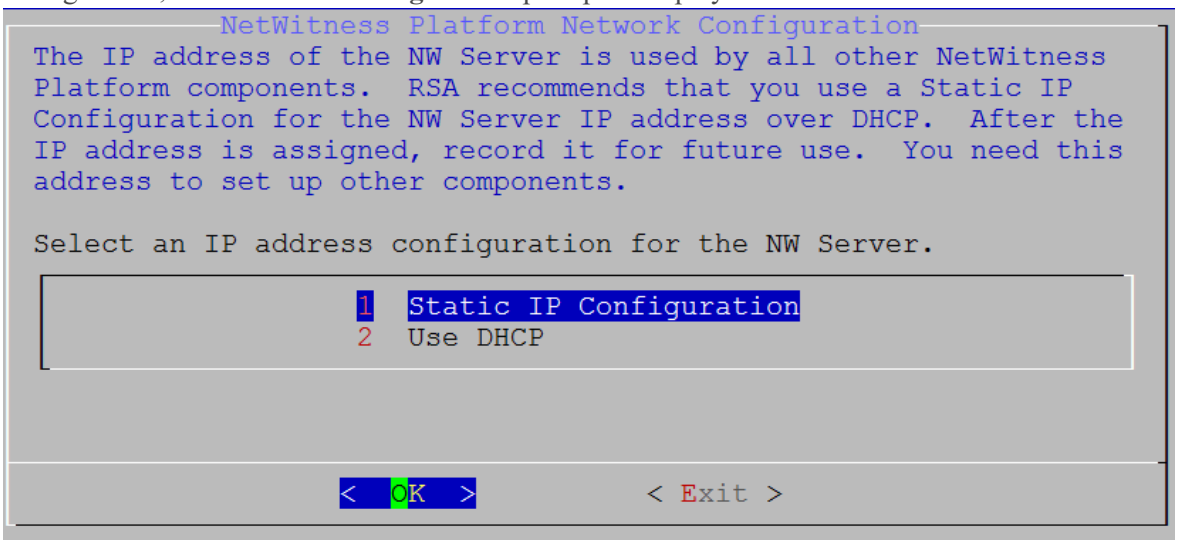
- If you are using an SSH connection, the following warning is displayed.

Note: If you connect directly from the host console, the following warning will not be displayed.



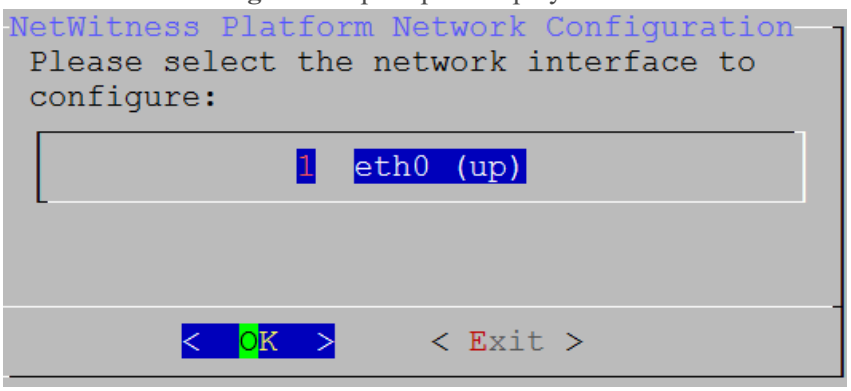
Press **Enter** to close warning prompt.

- If the Setup Program found an IP configuration and you chose to use it, the **Update Repository** prompt is displayed. Go to step 10 to and complete the installation.
- If the Setup Program did not find an IP configuration or if you chose to change the existing IP configuration, the **Network Configuration** prompt is displayed.

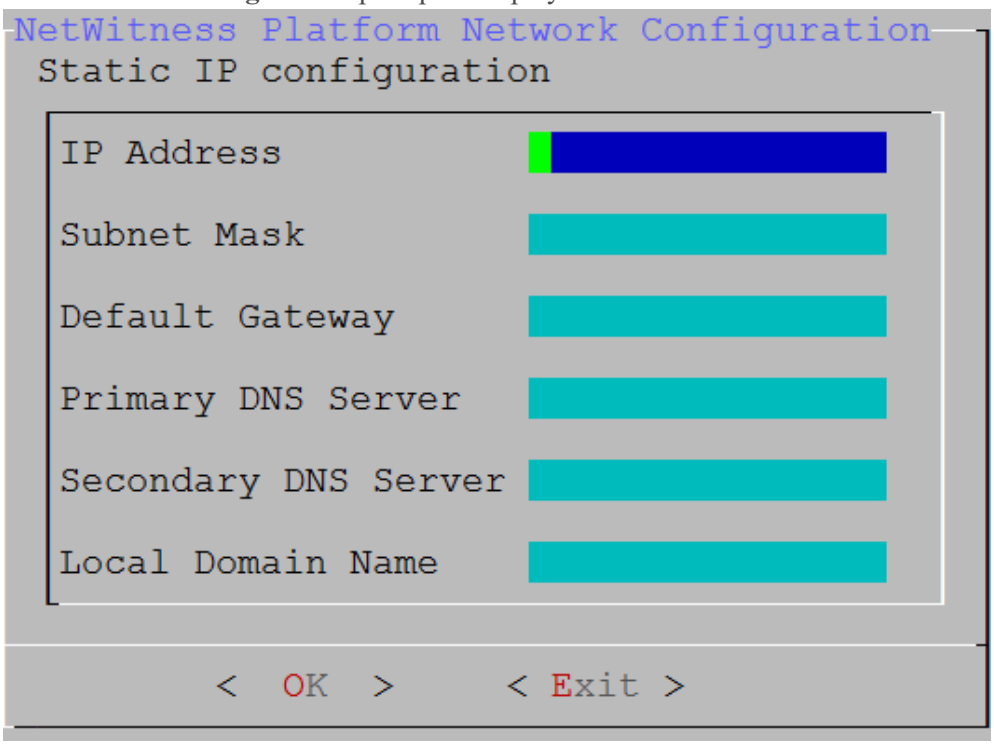


8. Tab to **OK** and press **Enter** to use **Static IP**.
   If you want to use **DHCP**, down arrow to 2 Use DHCP and press **Enter**.

The **Network Configuration** prompt is displayed.



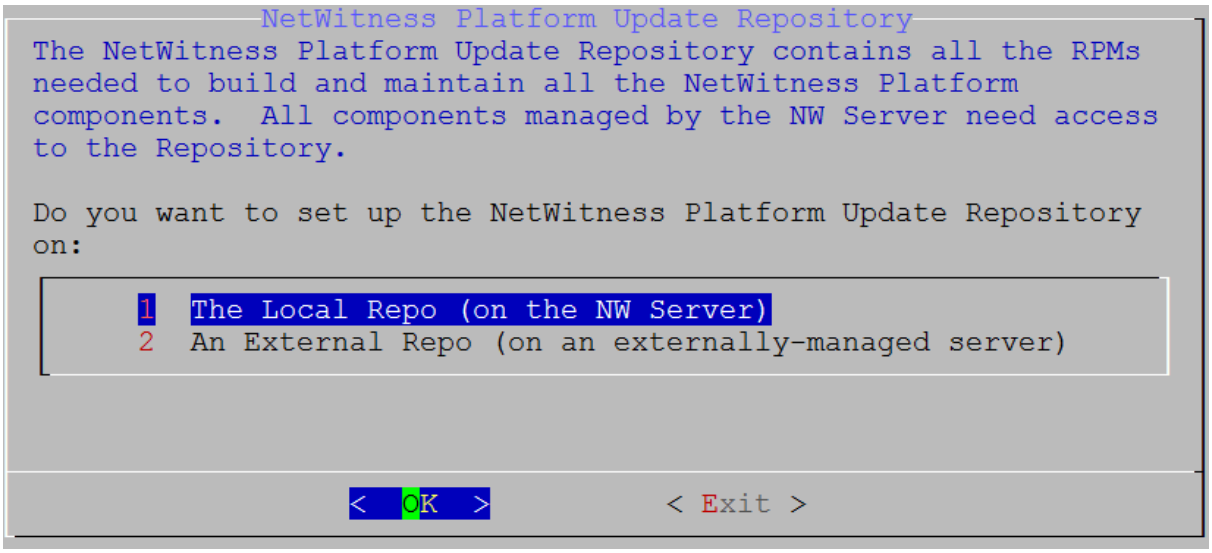
9. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit**.
   The **Static IP Configuration** prompt is displayed.



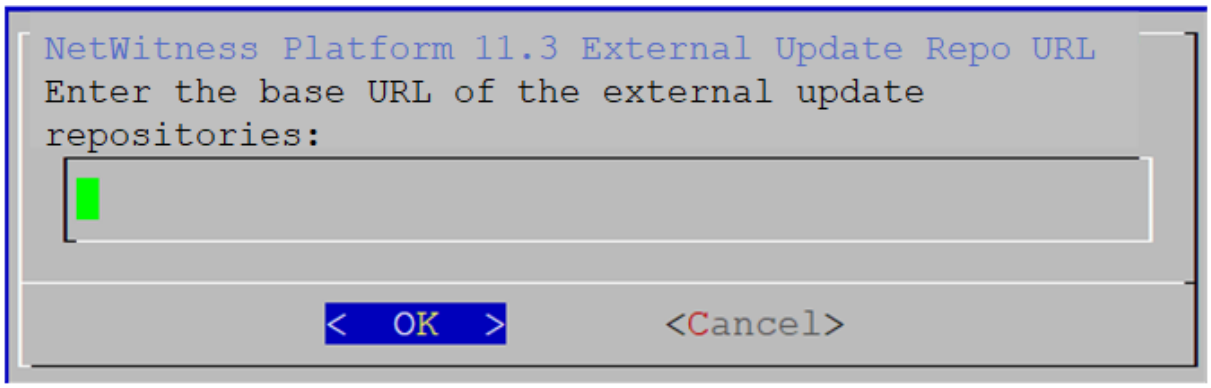
10. Type the configuration values (using the down arrow to move from field to field), tab to **OK**, and press **Enter**. If you do not complete all the required fields, an `All fields are required` error message is displayed (**Secondary DNS Server** and **Local Domain Name** fields are not required). If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

    Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

    The **Update Repository** prompt is displayed.



11. If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL.



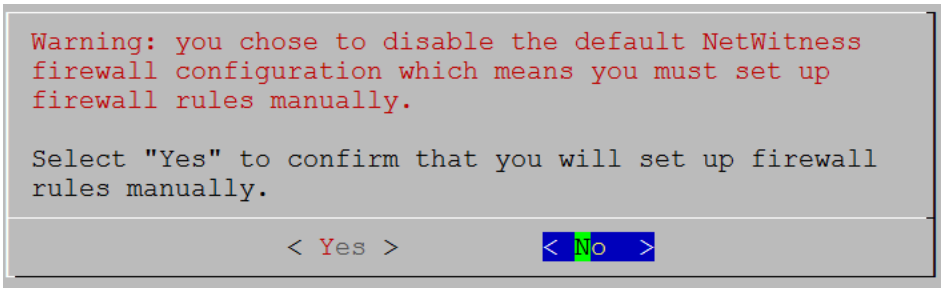
Enter the base URL of the NetWitness Platform external repo and click OK. The Start Install prompt is displayed.

12. Apply the standard firewall configuration, press **Enter**.
    - Disable the standard configuration, tab to **Yes** and press **Enter**.

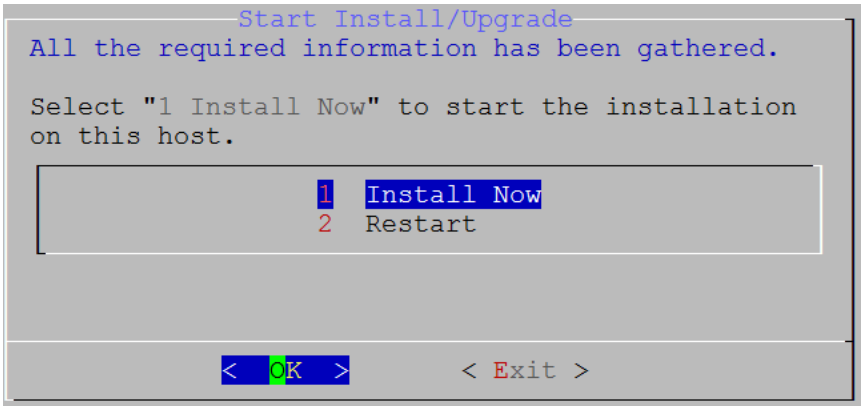
      The Disable firewall prompt is displayed.

      Tab to **No** (default), and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration. If you select **Yes**, confirm your

selection or **No** to use the standard firewall configuration.

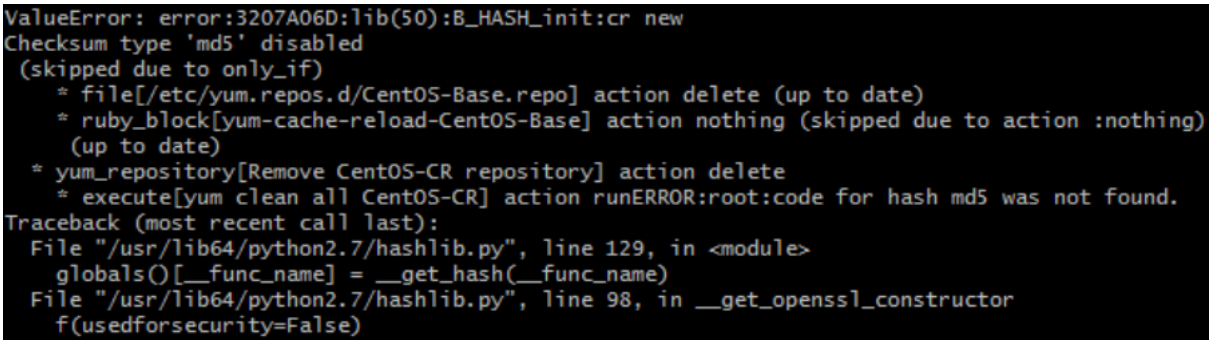


13. Press **Enter** to install 11.3 on the NW Server.
The **Start Install/Upgrade** prompt is displayed.



When **Installation complete** is displayed, you have installed the 11.3 NW Server on this host.

Note: Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



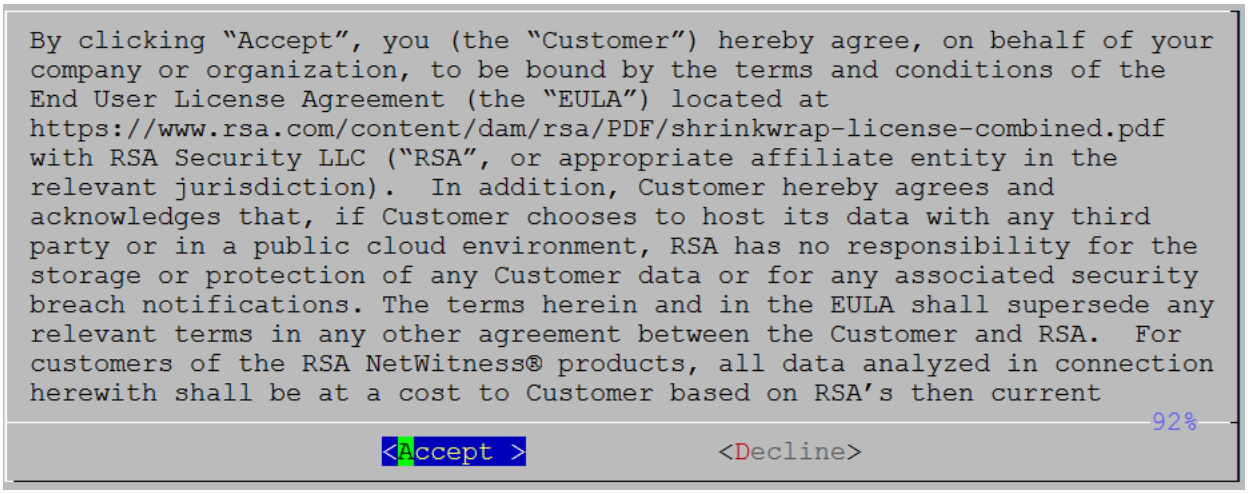
Task 2 - Install 11.3 on Other Component Hosts

Note: You can perform this task for RSANW-11.3.0.0.10816-Lite instance.

1. Run the `nwsetup-tui` command to set up the host.

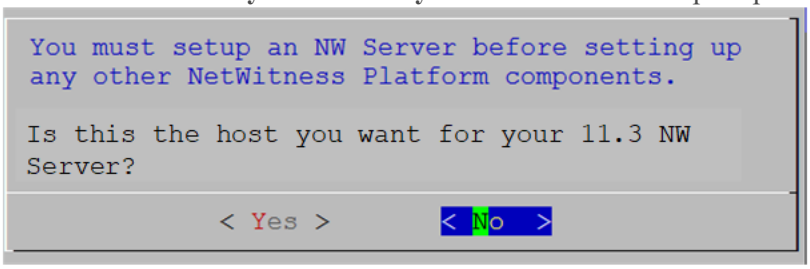
   This initiates the Setup program and the EULA is displayed.

Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press **Enter** to register your command response and move to the next prompt.
2.) The Setup program adopts the color scheme of the desktop or console you use access the host.
3.) If you specify DNS servers during Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` to proceed. Any misconfigured DNS servers cause the Setup to fail. If you need to reach DNS server after setup that unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see the "Post Installation Tasks" topic in the *Physical Host Installation Guide*..
If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Platform Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).



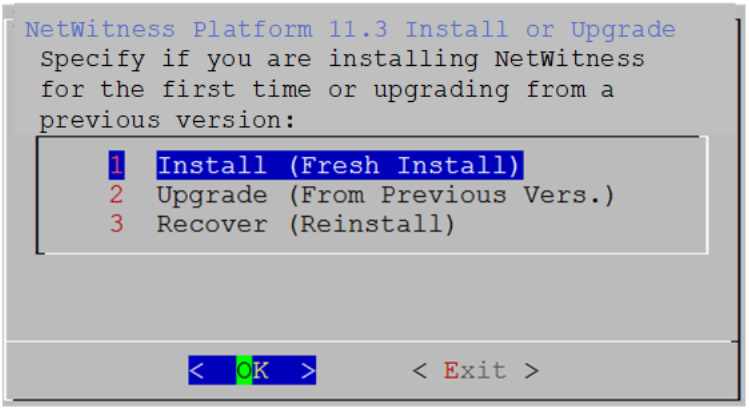
2. Tab to **Accept** and press **Enter**.

   The **Is this the host you want for your 11.3 NW Server** prompt is displayed.



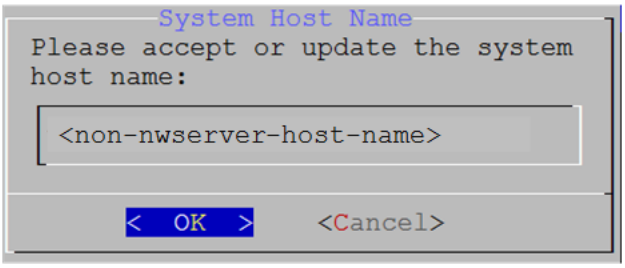
Caution: If you choose the wrong host for the NW Server and complete the Setup, you must restart the Setup Program (step 2) and complete all the subsequent steps to correct this error.

3. Press **Enter** (No).



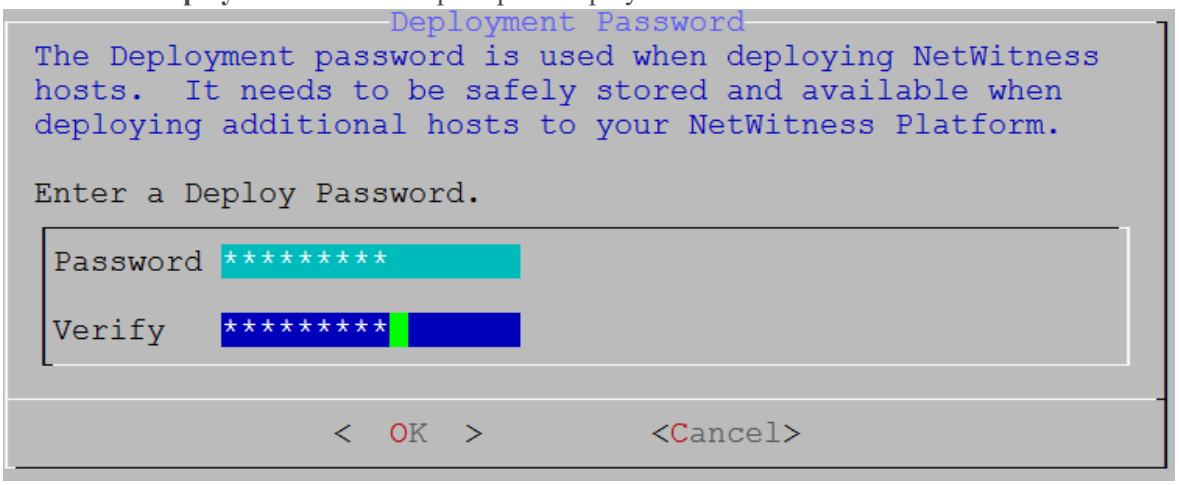
4. Press **Enter**. **Install (Fresh Install)** is selected by default.

   The **Host Name** prompt is displayed.



Caution: If you include "." in a host name, the host name must also include a valid domain name.

5. If want to keep this name, press **Enter**. If you want to change this name, edit it, tab to **OK**, and press **Enter**. The **Deployment Password** prompt is displayed.



6. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

- If the Setup program finds a valid IP address for this host, the following prompt is displayed.

  Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter**. If you want to change the IP configuration found on the host.

- If you are using an SSH connection, the following warning is displayed.

  Press **Enter** to close warning prompt.

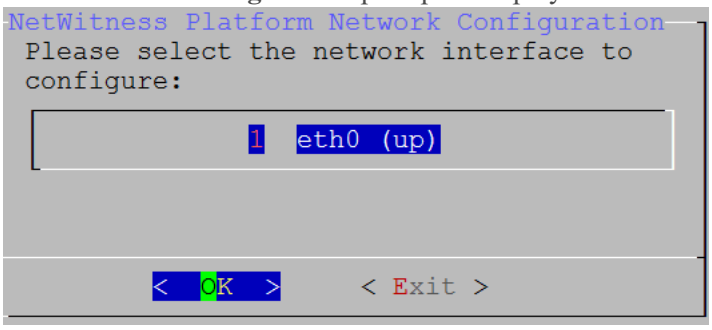
- If the Setup Program found an IP configuration and you chose to use it, the **Update Repository** prompt is displayed. Go to step 10 to and complete the installation.

- If the Setup Program could not find an IP configuration or if you chose to change the existing IP configuration, the **Network Configuration** prompt is displayed.

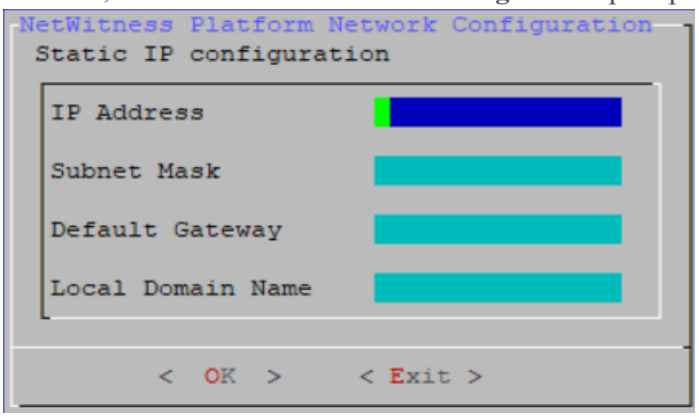
  Tab to **OK** and press **Enter** to use **Static IP**.If you want to use **DHCP**, down arrow to 2 Use DHCP and press **Enter**.

7. Tab to **OK** and press **Enter** to use a **Static IP**.

If you want to use **DHCP**, down arrow to **2 Use DHCP** and press **Enter**.
The **Network Configuration** prompt is displayed.



8. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit**.The **Static IP Configuration** prompt is displayed.



9. Type the configuration values (using the down arrow to move from field to field), tab to **OK**, and press **Enter**.
   If you do not complete all the required fields, an `All fields are required` error message is displayed (**Secondary DNS Server** and **Local Domain Name** fields are not required).
   If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

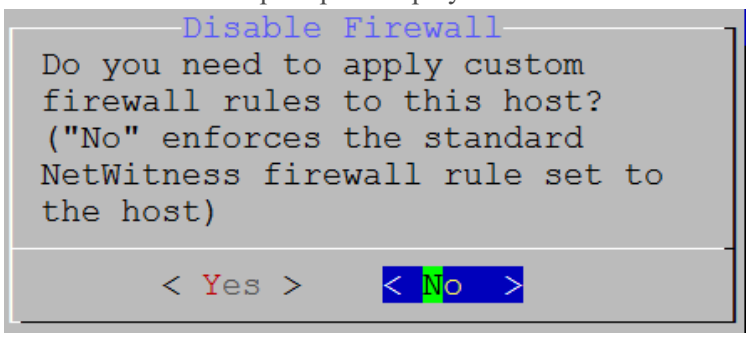
   Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

10. The Update Repository prompt is displayed.

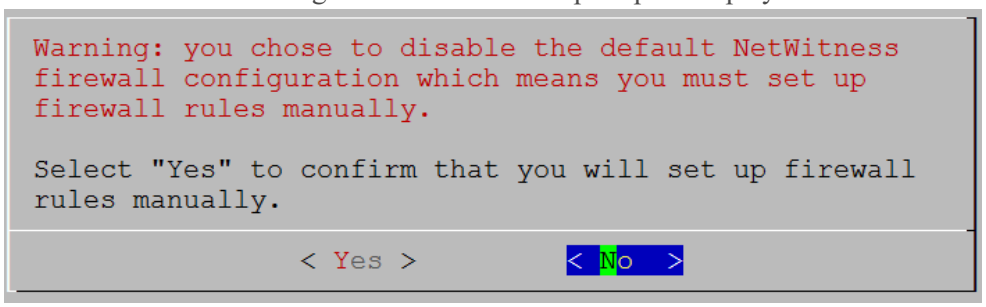
    Press **Enter** to choose the **Local Repo** on the NW Server.

11. To:

- Apply the standard firewall configuration, press **Enter**.
- Disable the standard configuration, tab to **Yes** and press **Enter**.
  The Disable firewall prompt is displayed.

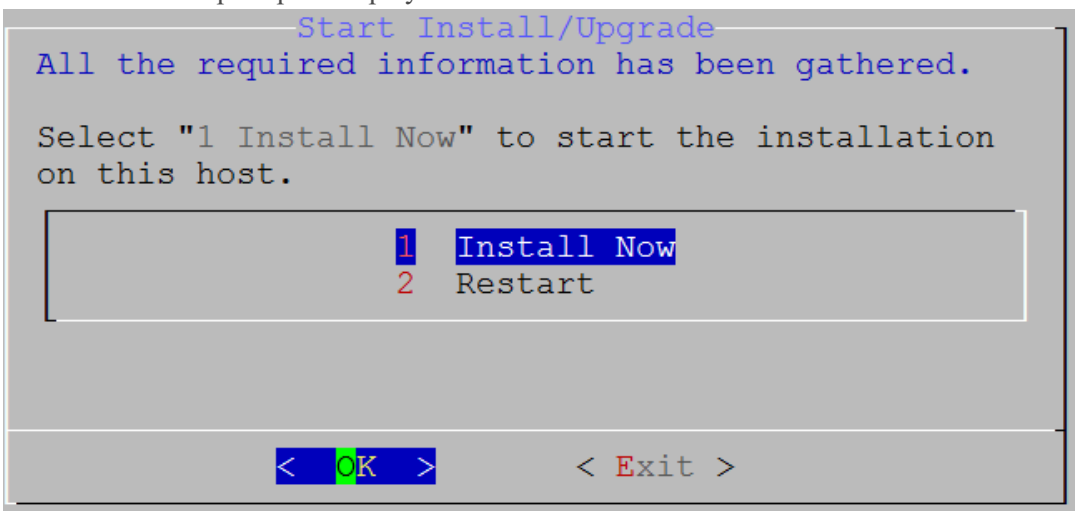


The disable firewall configuration confirmation prompt is displayed.



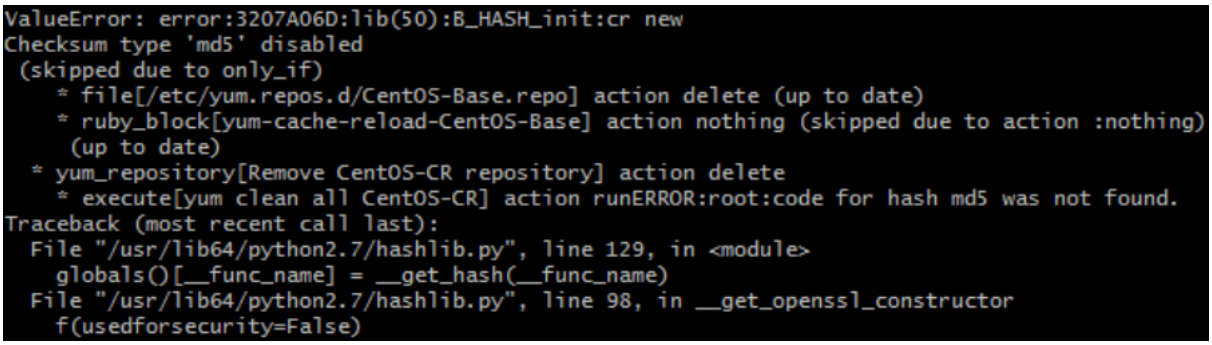
Tab to **Yes** and press **Enter** to confirm (press **Enter** to use standard firewall configuration).

12. The **Start Install** prompt is displayed.



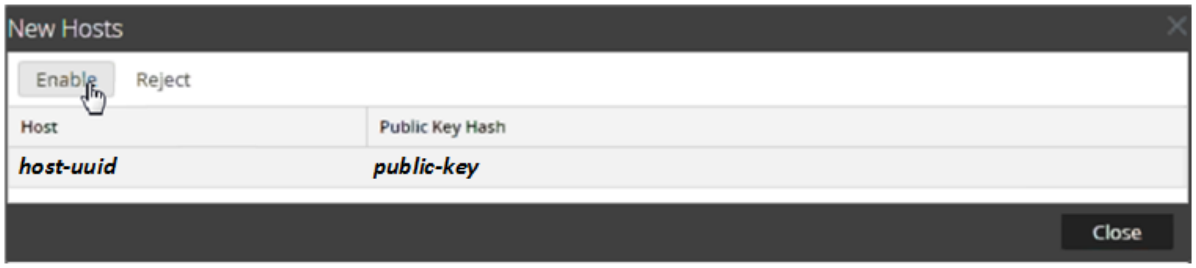
13. Press **Enter** to install 11.3 on the NW Server.
When **Installation complete** is displayed, you have installed the 11.3.0.0 NW Server on this host.

Note: Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



Log in to NetWitness Platform

1. Log in to RSA NetWitness Platform.
2. Go to **Administration** > **Hosts**.
The **New Hosts** dialog is displayed with the host VMs that you created in Azure.
3. Select the hosts that you want to enable.
The **Enable** menu option becomes active.
4. Click **Enable**.



5. Select the host you enabled.
6. Click Install and select the component you deployed in Azure (for example, Event Stream Analysis). For more information, see the *Hosts and Services Getting Started Guide for Version 11.3*.

Contents

Introduction **8**

CentOS6 to CentOS7 Upgrade 8

RSA NetWitness® Platform 11.3 Upgrade Path 9

Hardware, Deployments, Services, and Features Not Supported in 11.3 9

Event Stream Analysis (ESA) Upgrade Considerations 9

Upgrade Phases 10

Investigate in Mixed Mode 11

Contact Customer Support 13

Upgrade Preparation Tasks **14**

General 14

Task 1 - Review Core Ports and Open Firewall Ports 14

Task 2 - Record Your 10.6.6.x admin user Password 15

Task 3 - Create a Backup of the /etc/fstab File 15

Task 4 - Make Sure Password Strength Settings Check Boxes Are Set in 10.6.6.x 15

Task 5 (Conditional) - Extract 10.6.x Public Key Infrastructure (PKI) Certificates 16

Event Stream Analysis (ESA) 19

Task 6 (Conditional) - Record Any String Array Type Meta Keys on the Event Stream Analysis Service 19

Respond 19

Task 7 - Check Aggregation Rules Match Conditions for “Domain” or “Domain for Suspected C&C” 19

Task 8 - Set Data Retention Run Interval to ≥ 24 Hours 20

Reporting Engine 21

(Conditional) Task 9 - Unlink External Storage 21

Warehouse Connector 22

(Conditional) Task 10 - Copy keytab files in root or etc Directory Stored in Other Directory 22

Other Tasks 22

Backup Instructions **23**

Task 1 - Set up an External Host for Backing up Files 24

Task 2 - Create a List of Hosts to Back up 25

Troubleshooting Information 26

Task 3 - Set up Authentication Between Backup and Target Hosts 28

Task 4 - Check for Backup Requirements for Specific Types of Hosts 28

For All Host Types 28

For Concentrator, or Broker Hosts: Stop Data Capture and Aggregation 29

Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh 29

For Integrations with Web Threat Detection, Archer Cyber Incident & Breach Response or NetWitness Endpoint: List RabbitMQ Usernames and Passwords 30
For Bluecoat Event Sources 30
Task 5 - Check for Adequate Space for the Backup 31
Task 6 - Back up Your Host Systems 31
Post Backup Tasks 34
Task 1 - Save a Copy of the all-systems File and the Backup Tar files 34
Task 2 - Ensure Required Backup Files Were Generated 34
Task 3 - (Conditional) For Multiple ESA Hosts, Copy mongodb tar files to Primary ESA Host 35
Task 4 - Ensure All Required Backup Files are on Each Host 35
Migrate Disk Drives from 10.6.6.x to 11.3 37
Prerequisites: 37
Task 1 - Deploy NW 11.3 VM 39
Task 2 - Delete Virtual Machine and OS disk resource of NW 10.6.6 VM 39
Task 3 - Install Azure PowerShell modules on a local Windows machine 41
Task 4 - IP Retention: Run the PowerShell script 41
Task 5 - Perform Disk Migration 43
Task 6 - Data Restoration 44
Task 7 - Delete all NW 11.3 Deployment 'Network interface' Resources 46
Set Up Virtual Hosts in 11.3 47
Phase 1 - Set Up NW Server, Event Stream Analysis, and Broker or Concentrator Hosts 47
Task 1 - Set Up 11.3 NetWitness Server 47
Task 2 - Setup 11.3 ESA 47
Task 3 - Set Up 11.3 Broker or Concentrator 47
Phase 2 - Set Up The Rest of the Component Hosts 48
Concentrator Hosts 48
Log Decoder Host 48
Virtual Log Collector Host 48
Set Up 11.3 NW Server Host 49
Set Up 11.3 Non-NW Server Host 54
Update or Install Legacy Windows Collection 60
Post Upgrade Tasks 61
Global Tasks 61
61
Task 1 - Make Sure Port 15671 Is Configured Correctly 61
Task 2 - Remove Backup-Related Files from Host Local Directories 61
Task 3 - Restore NTP Servers 62
Task 4 - Restore Licenses for Environments without FlexNet Operations-On Demand Access 62
Task 5 - Remap Virtual NW Server License to 10.6.6.x MAC Address 62
(Conditional) Task 6 - If You Disabled Standard Firewall Config - Add Custom IPtables 62

(Conditional) Task 7 - Specify SSL Ports If You Never Set Up Trusted Connections 63
NetWitness Endpoint 64
Task 8 - Reconfigure Endpoint Alerts Via Message Bus 64
Event Stream Analysis Tasks (ESA) 65
Task 9 - Reconfigure Automated Threat Detection for ESA 65
Task 10 - For Integrations with Web Threat Detection, Archer Cyber Incident & Breach Response or NetWitness Endpoint Configure Mutually Authenticated SSL 65
Task 11 - Enable Threat - Malware Indicators Dashboard 65
Log Collection 66
Task 12 - Reset Stable System Values for Log Collector after Upgrade 66
(Optional for Upgrades from 10.6.6.x with FIPS enabled for Log Collectors, Log Decoders and Packet Decoders) Task 13 - Enable FIPS Mode 67
Reporting Engine 67
Task 14 - Restore the CA certificates for External Syslog Servers for Reporting Engine 67
(Conditional) Task 15 - Restore External Storage for Reporting Engine 67
Respond 67
Task 16 - Restore Respond Service Custom Keys 67
Task 17 - Restore Customized Respond Service Normalization Scripts 69
(Conditional) Task 18 - Restore Custom Analysts Roles 69
NetWitness SecOps Manager 69
Task 19 -Reconfigure NW SecOps Manager Integration 69
Security 69
Task 20 - Migrate Active Directory (AD) 69
Task 21 - Modify Migrated AD Configuration to Upload Certificate 70
Task 22 - Reconfigure Pluggable Authentication Module (PAM) in 11.3 70
Post Upgrade Tasks 71
General 71
Task 1 - Remove Backup-Related Files from Host Local Directories 71
Task 2 - Make Sure Port 15671 Is Configured Correctly 72
(Optional) Task 3 - Reissue Certificates for Your Hosts 72
(Conditional) Task 4 - Restore Custom Analysts Roles 72
(Conditional) Task 5 - If NetWitness Platform Has No Web Access, Upload Response .bin File Again (License Server) 72
Task 6 - Migrate Active Directory (AD) 72
Task 7 - Modify Migrated AD Configuration to Upload Certificate 73
Task 8 - Reconfigure Pluggable Authentication Module (PAM) in 11.3 73
Task 9 - Restore NTP Servers 73
Task 10 - Restore Licenses for Environments without FlexNet Operations-On Demand Access 73
(Conditional) Task 11 - If You Disabled Standard Firewall Config - Add Custom IPtables 74
(Conditional) Task 12 - Specify SSL Ports If You Never Set Up Trusted Connections 74
Task 13 (Conditional) Reconfigure Public Key Infrastructure (PKI) Certificates 75

Event Stream Analysis (ESA) 75
Task 14 - Reconfigure Automated Threat Detection for ESA 75
Task 15 (Conditional) Verify String Array Type Meta Keys on the ESA Correlation Service 76
Task 16 (Conditional) Update RSA Live ESA Rules with Meta Type Changes from String to Array 76
Task 17 (Conditional) - Verify ESA Rule Deployment 77
Investigate 77
Task 18 - Make Sure Customized User Roles Have Investigate-server Permissions for Event Analysis Access 77
Log Collection 79
Task 19 - Reset Stable System Values for Log Collector after Upgrade 79
Task 20 - (Conditional) Update SSHD Configuration after Upgrade with Older Windows and UNIX SFTP Agents 79
Task 21 - Enable FIPS Mode 80
Log Decoder and Decoder 80
(Conditional) Task 23 - Enable Metadata for GeoIP2 Parser 80
Malware Analysis 81
Task 24 - Enable Threat - Malware Indicators Dashboard 81
Reporting Engine 81
(Conditional) Task 25 - Restore the CA certificates for External Syslog Servers for Reporting Engine 81
(Conditional) Task 26 - Restore External Storage for Reporting Engine 81
Respond 82
Task 27 - Restore Respond Service Custom Keys 82
Task 28 - Restore Customized Respond Service Normalization Scripts 82
Task 29 - Add Respond Notification Settings for Custom Roles 83
Task 30 - Manually Configure Respond Notification Settings 83
Task 31 - Update Default Incident Rule Group By Values 84
Task 32 - Add Group By Field to Incident Rules 85
Task 33 - Update Incident Rules Identified in the Domain Matching Conditions Upgrade Preparation Task 86
Warehouse 88
Task 34 - Restore keytab Files, Mount NFS, Install Service 88
Task 35 - Refresh Warehouse Connector Lockbox and Start Stream 88
Task 36 - Update Hive Version 88
RSA Archer Cyber Incident & Breach Response 89
Task 37 - Reconfigure RSA Archer Cyber Incident & Breach Response Integration 89
RSA NetWitness® Endpoint 89
Task 38 - Reconfigure Endpoint Alerts Via Message Bus 89
Task 39 - Reconfigure Recurring Feed Configured from Legacy Endpoint Because Java Version Changed 89
(Optional) Task 40 - Install Endpoint Log Hybrid and Endpoint Agents 90

RSA NetWitness® UEBA 90
Task 41 - Install NetWitness UEBA 90
NetWitness Platform Integrations 90
(Conditional) Task 42 - For Integrations with Web Threat Detection, RSA Archer® Cyber Incident & Breach Response or NetWitness Endpoint. 90
Task 43 - Remap Virtual NW Server License to 10.6.6.x MAC Address 91
Task 43 - Retain MAC Address of Upgraded SA Server VM 91

Revision History 105

Introduction

The instructions in this guide apply to the upgrade of Azure for RSA NetWitness Platform 10.6.6.x to 10.6.6.x to 11.3 exclusively. See the *RSA NetWitness Platform Physical Host Upgrade Guide* for instructions on how to upgrade your 10.6.6.x physical hosts to 11.3. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents. This document assumes that the appliances are in Azure cloud.

NetWitness Platform 11.3 is a major release that affects all products in the NetWitness Platform in Azure. The components of the suite are the NetWitness Server (NW Server), Archiver, Broker, Concentrator, Context Hub, Entity Behavior Analytics, Event Stream Analysis, Investigate, Log Collector, Log Decoder, Malware Analysis, Reporting Engine, Response, and Workbench.

CentOS6 to CentOS7 Upgrade

NetWitness Platform 11.3 is a major release that involves upgrading to a newer version of the operating system (CentOS6 to CentOS7). In addition, the 11.3 platform environment has been improved greatly to accommodate current and future, physical and virtual deployment types. These changes require an upgrade to the new environment and an upgrade of the functionality.

RSA NetWitness® Platform 11.3 Upgrade Path

The supported Upgrade path for RSA NetWitness® Platform 11.3 is Security Analytics 10.6.6.x. If you are running a version of NetWitness Platform that is prior to 10.6.6.x, you must update to 10.6.6.x before you can upgrade to 11.3. See the *RSA Security Analytics 10.6.6 Update Guide* (https://community.rsa.com/docs/DOC-85119) on RSA Link.

For updating from RSA NetWitness® Platform 11.0.0.0 to RSA NetWitness® Platform 11.3.0.0, please see the *Update Guide from 11.0.x to 10.6.6.x to 11.3Guide*.

Hardware, Deployments, Services, and Features Not Supported in 11.3

RSA does not support upgrade of the following hardware, deployments, services, and features to 11.3.

- RSA All-in-One (AIO) Appliance
- Multiple NetWitness Server Deployment
- IPDB service
- Malware Analysis service co-located on the SA Server (Upgrade of Malware Analysis Enterprise is supported in 11.3.)
- Standalone Warehouse Connector service (Upgrade of a co-located Warehouse Connector is supported in 11.3.)
- Custom Health & Wellness policy in 10.6.x for the Context Hub Service
  After you upgrade to NetWitness 11.3, your custom policy is not present. In its place, there is the out-of-the-box Context hub Server Monitoring Policy in the user interface, which is specific for version 11.3.
- Defense Information Strategic Agency-Security Technical Information Guide (DISA-STIG) hardened deployments.
- Warehouse Analytics (Data Science)
- Malware Analysis
- Packet Decoder

Event Stream Analysis (ESA) Upgrade Considerations

In RSA NetWitness® Platform 11.3, RSA changed how ESA Correlation Rules store and transmit the alerts the system generates. In 11.3, ESA sends all alerts to a central Alert system. The local mongo storage in ESA 10.6.6.x has been removed.

Caution: If you do not use Incident Management in 10.6.6.x, carefully consider whether or not to upgrade to version 11.3.

The following guidelines should help you determine whether or not to upgrade your ESA hosts to 11.3.

In your 10.6.6.x deployment, if you have:

- One ESA host, with or without Incident Management configured, upgrade to 11.3.
- Multiple ESA hosts configured to use Incident Management – The system will continue to aggregate alerts centrally. If the system is correctly sized and operating as intended in 10.6.6.x, you can upgrade to version 11.3.
- Multiple ESA hosts without configuration to use Incident Management and you are connecting to individual ESA hosts to view alerts, do not upgrade to version 11.3.

Upgrade Phases

RSA recommends that you stagger host upgrades as described in this section. The update to CentOS7 and the need of a physical or iDRAC access cause the 11.3 upgrade to take more time than most upgrades.

Caution: If you stagger the upgrade, you:
• must upgrade the hosts in Phase 1 first, in the order shown.
• may not have all the features operational until you update your entire deployment.
• will not have service administrative features available until you upgrade all the hosts in your deployment.

Phase 1

You perform Phase 1 first and you must upgrade the hosts in the following order:

1. Security Analytics Server host
2. Event Stream Analysis hosts
3. Broker hosts (if you do not have a Broker, upgrade your Concentrator hosts)
   The 11.3 NW Server cannot communicate with 10.6.6.x core services for the new Investigate functionality. This is why you must upgrade the Broker or Concentrator hosts in Phase 1.

Phase 2

Upgrade the rest of your hosts.

In Phase 2, (other than Log Collection hosts with downstream event destinations) there is no technical reason to upgrade your hosts in the following order. RSA recommends that you follow the order in Phase 2 to reduce:

- functionality loss during investigation.
- downtime that results in the loss of packet and log capture.

1. Concentrator hosts
2. Archiver hosts
3. Log Collection hosts - Log Collectors on Log Decoder hosts (LDs), Virtual Log Collectors (VLCs) and Legacy Windows Collectors (LWCs)
   Before you upgrade a log collection host , you must prepare it for the upgrade. Part of this preparation ensures that no event data remains in the queues. This requires you to keep the downstream destinations of event data (Log Collectors, Virtual Log Collectors and Log Decoders) up and functioning properly.

If you have event data destinations downstream from the Log Decoder, you must prepare and upgrade log collectors in the following order.

a. LDs (one LD at a time)

b. VLCs and LWCs

If you do not have event data destinations, downstream from the Log Decoder, you can prepare and upgrade multiple LDs, VLCs, and LWCs together.

4. All other hosts

See "Running in Mixed Mode" under "The Basics" in the RSA 11.3 *NetWitness Platform Hosts and Services Getting Started Guide* for:

- Functionality gaps encountered while running in this mode.
- Examples of staggered upgrades.

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Investigate in Mixed Mode

Mixed mode occurs when some services are upgraded to 11.3 and some are still on 10.6.x. This happens when you upgrade to 11.3 in phases.

Note: You must follow the host upgrade sequence as shown in Upgrade Phases to ensure complete Investigate functionality. The 11.3 Investigate server is installed when you upgrade the SA Server, but Broker hosts need to be upgraded to 11.0 to access the Event Analysis View.

After you upgrade all services to 11.3, when an analyst conducts an investigation, Role-Based Access Control (RBAC) of downloads works consistently to limit access to restricted data.

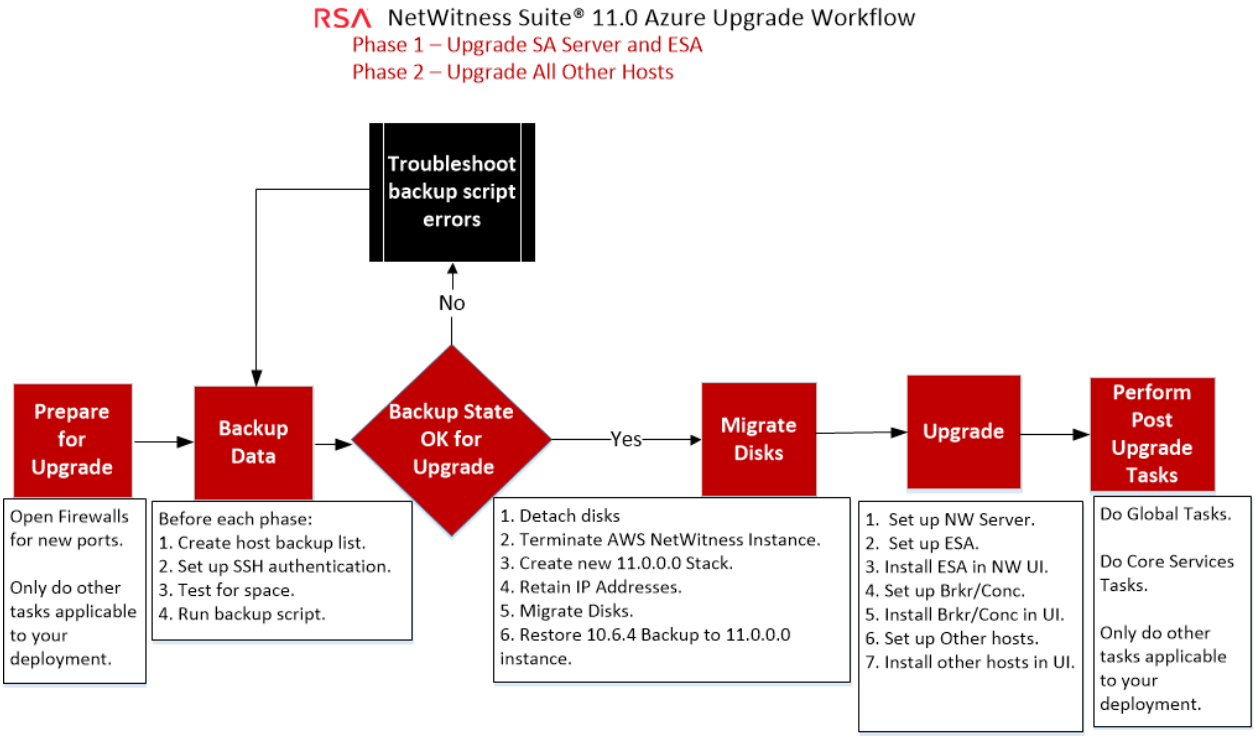
In mixed mode (that is, some services are upgraded to 11.3 and some are still on 10.6.x), when an analyst conducts an investigation, RBAC is not applied uniformly to viewing and downloads.

If the `sdk.packets` setting has not been disabled on the 10.6.x services, analysts with SDK meta and roles permissions in place to restrict viewing and reconstructing an event's content can download the PCAP of an event that has content restrictions. Other types of downloads appear to download, then generate errors due to insufficient permissions, and the data is still protected.

During a phased update, you can disable the `sdk.packets` setting on 10.6.x services to limit the analyst from downloading any PCAPs or logs during mixed mode. After you update all services to 11.3, RBAC works consistently across all services.

This table identifies what you can see and download in Investigate when your NetWitness Server is on version 11.3 connected to services at a lower version.

Connecting Service Version	Affected View	User Role	Can See	Can Download Successfully	Can Download with Errors
11.3 Broker -> 10.x Concentrator	Events View	Analyst		PCAP	File archive is downloaded but cannot unzip
	Event Reconstruction View	Analyst		PCAP	File archive is downloaded but cannot unzip
	Event Analysis View	Analyst		PCAP	Error Retrieving Payload from Service for Payload, Request Payload, Response Payload
	Event Reconstruction View	Admin			Files archive is downloaded but cannot unzip
11.3 Broker -> 11.3 Concentrator	Event Reconstruction View	Analyst and Data Privacy Officer	RBAC permitted items		Files archive is downloaded but cannot unzip PCAPs and logs are downloaded as zero bytes
	Event Reconstruction View				



Contact Customer Support

Refer to the Contact RSA Customer Support page (https://community.rsa.com/docs/DOC-1294) in RSA Link for instructions on how to get help on RSA NetWitness Platform 11.3.

Upgrade Preparation Tasks

Complete the following tasks to prepare for the upgrade to NetWitness Platform 11.3. These tasks are organized by the following categories.

- General
- Event Stream Analysis (ESA)
- Reporting Engine
- Respond
- Warehouse Connector
- Other

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

General

Task 1 - Review Core Ports and Open Firewall Ports

The following tables list new ports in 11.3.

Caution: Make sure that the new ports are implemented and tested before upgrading so that upgrade does not fail due to missing ports.

NW Server Host

Source Host	Destination Host	Destination Ports	Comments
NW Hosts	NW Server	TCP 4505, 4506	Salt Master Ports
NW Hosts	NW Server	TCP 27017	MongoDB
Admin Workstation	NW Server	TCP 15671	RabbitMQ Management UI
NW Hosts	NW Server	TCP 15671	RabbitMQ Management UI

ESA Host

Source Host	Destination Host	Destination Ports	Comments
NW Server, NW Endpoint, ESA Secondary	ESA Primary	TCP 27017	MongoDB

Endpoint Log Hybrid

Source Host	Destination Host	Destination Ports	Comments
Endpoint Log Hybrid	NW Server	TCP 5672	Message Bus
Endpoint Server	NW Server	TCP 27017	MongoDB

All NetWitness Platform core ports are listed in the "Network Architecture and Ports" topic in the *Deployment Guide* in case you need to reconfigure NetWitness Platform services and firewalls.

Task 2 - Record Your 10.6.6.x `admin user` Password

Record your 10.6.6.x `admin user` password. You will need it to complete the upgrade.

Task 3 - Create a Backup of the `/etc/fstab` File

Copy the `/etc/fstab` file from all the physical hosts and into your local machine (backup host or remote machine).

Note: You need this file to restore a physical host with external storage mounts.

Task 4 - Make Sure Password Strength Settings Check Boxes Are Set in 10.6.6.x

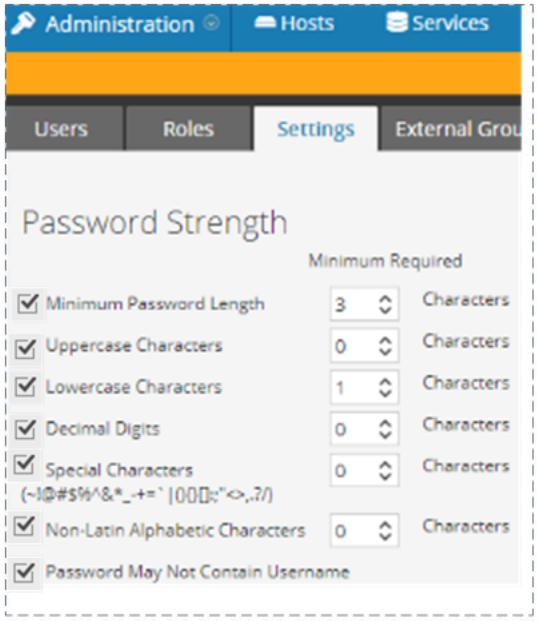
Note: You can skip this task if you do not want to migrate the password strength setting to 11.3.

The check box to the left of the **Password Strength Settings** in the **Administration** > **Security** > **Settings** tab must be set in 10.6.6.x or these settings will not be migrated to 11.3.

Complete the following task to make sure that the Password Strength Settings check boxes are set in 10.6.6.x.

1. In Security Analytics 10.6.6.x, go to the **Administration** > **Security** > **Settings** tab.
2. Make sure that all of the check boxes to the left of the **Password Strength Settings** are set. If they are not, set them and click **Apply**.

The following example shows all check boxes as set (required in 10.6.6.x before upgrading to 11.3).



Task 5 (Conditional) - Extract 10.6.x Public Key Infrastructure (PKI) Certificates

Before you upgrade to from 10.6.6.x to 11.3, complete the following procedure to extract the existing 10.6.x PKI keystores that contain server certificates with private keys, and the truststores that contain the trusted CA certificates.

1. Download the `rsa-nw-pki-migration-10.6.6.zip` file from **RSA Link** > **RSA NetWitness Platform** > **Downloads** > **RSA NetWitness LOGS & NETWORK** > **Version 11.3**.
2. Extract the `pki-migration-1.0.jar` file from the `rsa-nw-pki-migration-10.6.6.zip` file.
3. SSH to the 10.6.6.x Security Analytics Server host and log in with the root credentials.
4. Copy the `pki-migration-1.0.jar` file into `/tmp` folder.
5. Run the following command strings to extract the certificates.

   ```
   cd /tmp
   java -jar pki-migration-1.0.jar
   extract
   ```

   This :

   - Creates the `rsa-pki-migration-tool-<yyyy-MM-dd-hh-mm>` directory under the `tmp` directory.
   - Extracts output files into the `/tmp/rsa-pki-migration-<yyyy-MM-dd-hh-mm>` directory.
   - Creates a keystore (for example, `<keystore-x>.p12`) for each server certificate.
     The keystore is encrypted with **netwitness** as the password.
   - Creates a certificate file (for example, `<certificate-X>.cer`) for each trusted CA certificate in truststore.

Note: Refer to the line in the console output to find the storage location of the

- server certificate (`<keystore-X>.p12`). For Example:

```
The Entry le-056cdfb6-7577-4287-a791-64fbf999ff2d is a Private Key Entry
Storing the entry le-056cdfb6-7577-4287-a791-64fbf999ff2d into store at /tmp/rsa-pki-migration-tool-2019-03-04-13-48/keystore-2.p12
```

- trusted CA certificate (`<certificate-x>.cer`). For example

```
The Entry srv3-server3-ca-291745768375599843303243313528455998 51 is a Certificate Key Entry
Writing certificate Entry srv3-server3-ca-291745768375599843303243313528455998 51 into file /tmp/rsa-pki-migration-tool-2019-03-04-13-48/certificate-
4.cer
```

This process does not modify the original keystores and trusted CA certificates of 10.6.6.x. You can run these steps multiple times, if required.

6. Open any keystore and display its contents to verify that the extracted keystores and the trusted CA certificates are correct.

   ```
   cd rsa-pki-migration-tool-<yyyy-MM-dd-hh-mm>
   ls -ltrh
    Openssl x509 -in <certificate-X>.cer -inform DER
   ```

   The certificate in displayed in PEM (Base64) format. For example:

   ```
   -----BEGIN CERTIFICATE-----
   MIIDZTCCAk2gAwIBAgIQZ4o94d5AiLBC4sPXgDYXpTANBgkqhkiG9w0BAQUFADBF
   MRUwEwYKCZImiZPyLGQBGRYFbG9jYWwxEzARBgoJkiaJk/IsZAEZFgNwa2kxFzAV

   qJ+la1VnMeDWH+VrZtZf1SeMiAh6qObwk6sXxQyKAuB8vlvG4svPIFrqlT4KpRXQ
   3lAXU6iWqYZP
   -----END CERTIFICATE-----
   ```

   ```
   keytool -list -keystore <keystore-X>.p12 -storetype PKCS12 – storepass
   netwitness
   ```

   The following is an example of the output.

   ```
   Keystore type: PKCS12
   Keystore provider: <XXXXX>
   ```

7. Exit the keystore.

   ```
   exit
   ```

You can use:

- One of the `.p12` keystore files as a server certificate. Refer to the command output to find `.p12` file that corresponds to the server certificate you must use.
- The extracted certificate files (.cer) as trusted CA certificates.

For instructions on how to configure PKI authentication, see the "*System Security and User Management Guide*".

Event Stream Analysis (ESA)

Task 6 (Conditional) - Record Any String Array Type Meta Keys on the Event Stream Analysis Service

If you added any string array type meta keys to the Event Stream Analysis service for your ESA correlation rules in 10.6.6.x or earlier, record these meta keys so you can verify that they exist after upgrade to 11.3.

To record your 10.6.6.x string array type meta keys before the 11.3 upgrade:

1. In Security Analytics 10.6.6.x:
   a. Go to the **Administration** > **Services** view.
   b. Select the Event Stream Analysis service.
   c. Click (actions) > **View** > **Explore**.
2. In the **Explore** view node list, select **Workflow** > **Source** > **netgenAggregationSource**.
3. In the **ArrayFieldNames** list, make a note of any string array type meta keys added to the Event Stream Analysis service so you can verify that they are on the ESA Correlation service after the upgrade.

Respond

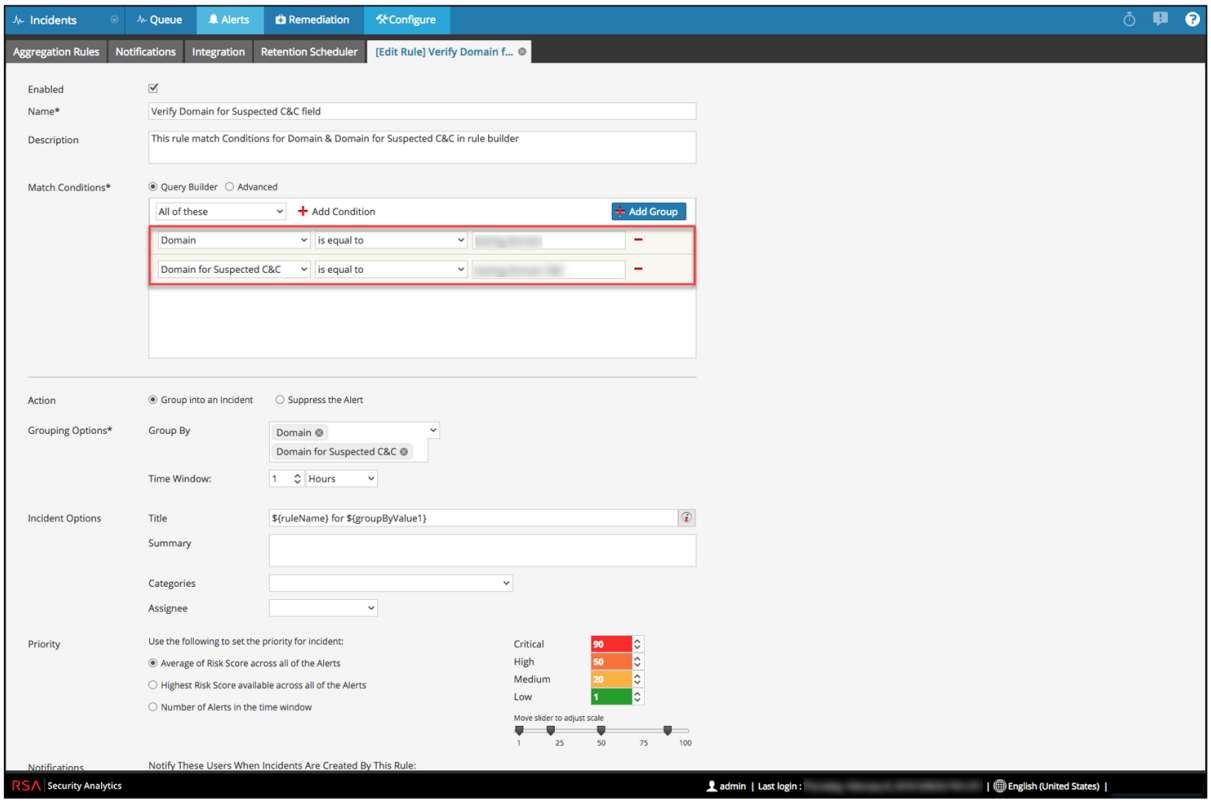
Task 7 - Check Aggregation Rules Match Conditions for “Domain” or “Domain for Suspected C&C”

Make a note of any Incident Management aggregation rules that have match conditions using Domain or Domain for Suspected C&C in the drop-down list in the rule builder. You will need to add back these conditions after you upgrade to 11.3 as described in the "Respond" Post Upgrade Tasks later in this document.

Complete the task for each aggregation rule.

1. In Security Analytics 10.6.6.x, go to **Incidents** > **Configure** > **Aggregation Rules** tab and edit the rules to view the matching conditions.

2. In the **Match Conditions** section, look for **Domain** or **Domain for Suspected C&C** listed in the drop-down lists for the conditions.



3. Make a note of the rule name and the entire condition that uses **Domain** or **Domain for Suspected C&C**, including operators and values.

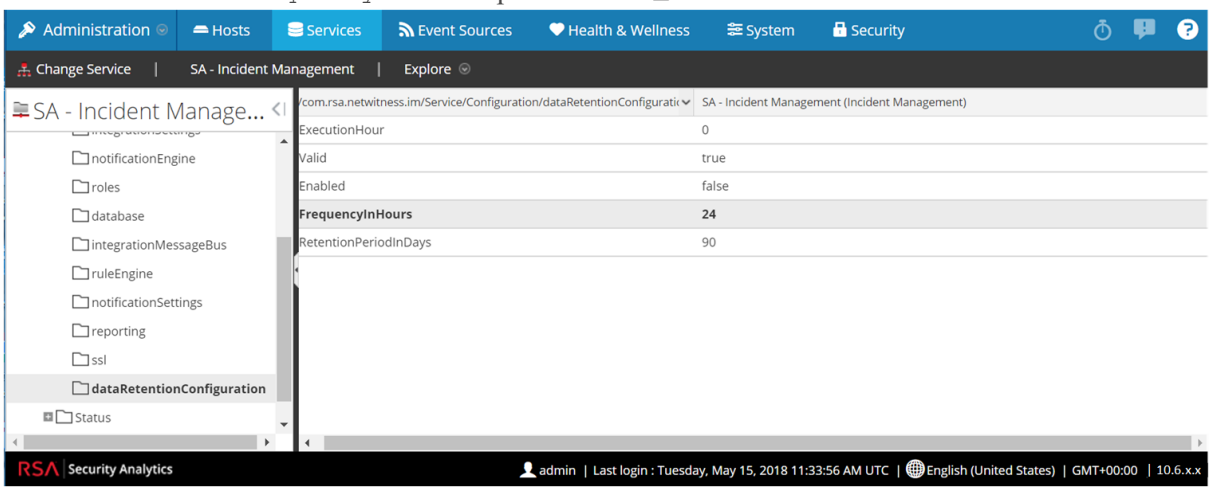
Task 8 - Set Data Retention Run Interval to ≥ 24 Hours

In Security Analytics 10.6.6.x, the Data Retention run interval does not have any minimum value check. In 11.3, RSA added a validation check to make sure that it is run at least every 24 hours. When you upgrade to 11.3, if this value is less than 24 hours, the Respond service will not start.

Complete the following task to ensure that the Respond service starts after upgrading to 11.3.

1. In Security Analytics 10.6.6.x, go to **ADMIN** > **Services**.
2. Select the **Incident Management** service, and then select > **View** > **Explore**.
3. In the Incident Management **Explore** view, go to **`Service` > `Configuration` > `dataRetentionConfiguration`.**

4. Make sure that the `FrequencyInHours` parameter is ≥ **24**.



Reporting Engine

(Conditional) Task 9 - Unlink External Storage

If the Reporting Engine has external storage, such as Storage Area Network (SAN) or Network Attached Storage (NAS) for storing reports, complete the following task to unlink the storage.

Note: In these steps:
`/home/rsasoc/rsa/soc/reporting-engine/` is the Reporting Engine home directory.
`/externalStorage/` is where the external storage is mounted.

1. SSH to the Reporting Engine host and log in with your `root` credentials.
2. Stop the Reporting Engine service.
   ```
   stop rsasoc_re
   ```
3. Switch to `rsasoc` user.
   ```
   su rsasoc
   ```
4. Change to the Reporting Engine the home directory.
   ```
   cd /home/rsasoc/rsa/soc/reporting-engine/
   ```
5. Unlink the `resultstore` directory mounted to external storage.
   ```
   unlink /externalStorage/resultstore
   ```
6. Unlink the `formattedReports` directory mounted to external storage.
   ```
   unlink /externalStorage/formattedReports
   ```

Warehouse Connector

(Conditional) Task 10 - Copy `keytab` files in `root` or `etc` Directory Stored in Other Directory

Complete the following task to copy the `keytab` files in the `root` or `etc` directory if it is stored in another directory.

1. Record the absolute path of NFS mount directory and the `keytab` file.
   You need this information to restore the Warehouse Connector after upgrade.
2. Unmount the NFS directory.
   a. SSH to the Warehouse Connector and log in with `root` credentials.
   b. Submit the following command to unmount the NFS directory.
   `umount <NFS-absolute-path>`

Other Tasks

None

Backup Instructions

Backing up your configuration data for all your hosts from 10.6.6.x is the first step in upgrading from 10.6.6.x releases to 11.3.0.0.

Note: It is important that you place Custom Certificate files and any other certificate authority (CA) files in the `/root/customcerts` folder to ensure that these certificate files are backed up. Your custom certificate files that are placed in this directory will be automatically restored during the upgrade process. After upgrading to 11.3.0.0, your custom certificate files will be located in `/etc/pki/nw/trust/import`. For more information about backing up these types of files, see step 1 in For All Host Types

Caution: 1) These services are not supported in the 10.6.6.x backup and upgrade process.
- IPDB
- All in One servers
- Malware Analysis Co-Located on the NetWitness Server
- Standalone Warehouse Connector

The following types of hosts can be backed up and are automatically restored during the upgrade process:

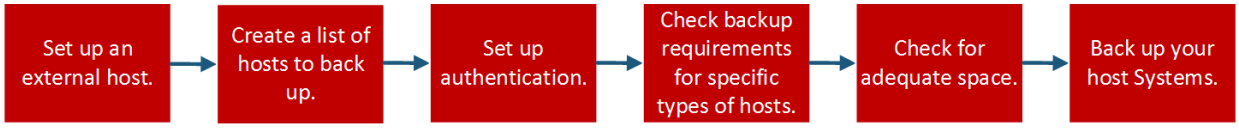
- **NetWitness Server** (may include Malware Analysis, NetWitness Respond, Health and Wellness, and Reporting Engine)
- **Archiver**
- **Broker**
- **Event Stream Analysis** (including Context Hub and NetWitness Respond database)
- **Concentrator**
- **Log Decoder** (including Local LogCollector and Warehouse Connector, if installed)
- **Virtual Log Collector**

The following types of files are automatically backed up but must be restored manually after the upgrade process:

- PAM configuration files: For information about restoring the PAM configuration files, refer to "Task 5 - Reconfigure Plugable Authentication Module (PAM) in 11.3.0.0", in the "Global" section of the Post Upgrade Tasks.
- `/etc/pfring/mtu.conf` and `/etc/init.d/pf_ring`: To restore these files you must manually retrieve them. The `/etc/pfring/mtu.conf` files will be located in `/var/netwitness/database/nw-backup/restore/etc/pfring/mtu.conf`, and the `/etc/init.d/pf_ring` files will be located in `/var/netwitness/database/nw-backup/restore/etc/init.d/pf_ring`. For information about how to restore these files, see " (Conditional) Task 2 - Restore Files for 10G Decoder" in the "Hardware Related Tasks" section of Post Upgrade Tasks.

Note: If you have problems during the backup or upgrade processes and you lose data, you can recover the data and start the process again. For information about recovering lost data, see "Recover Data After System Failure" in the *System Maintenance Guide*.

The following diagram shows the high-level task flow of the steps you perform to back up your hosts.



The following sections describe each of these tasks:

- Task 1 - Set up an External Host for Backing up Files
- Task 2 - Create a List of Hosts to Back up
- Task 3 - Set up Authentication Between Backup and Target Hosts
- Task 4 - Check for Backup Requirements for Specific Types of Hosts
- Task 5 - Check for Adequate Space for the Backup
- Task 6 - Back up Your Host Systems
- Post Backup Tasks

Task 1 - Set up an External Host for Backing up Files

You must set up an external host to use for backing up files. The host must be running Centos 6 with connectivity through SSH to the NetWitness Platform stack of hosts.

Ensure that the host names for the systems to be backed up are resolvable on the backup host machine, either by DNS or listed in the `/etc/hosts` file.

Note: These scripts are designed to run on CentOS 6 only. You must execute these scripts on CentOS 6 machines.

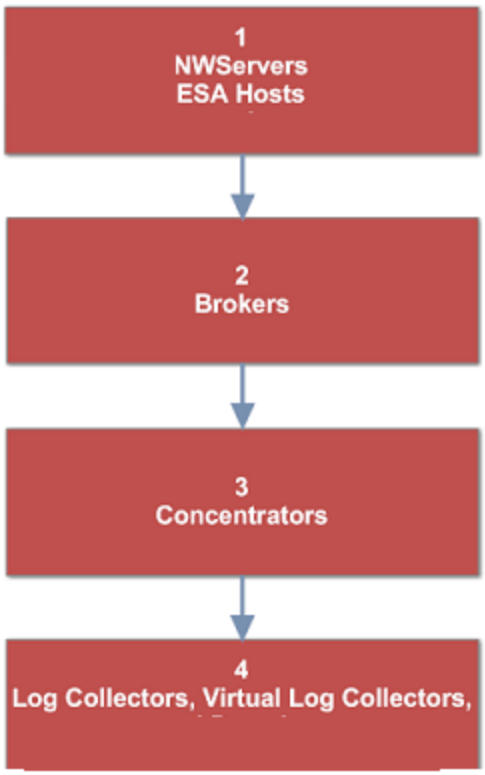
There are several scripts that you run during the backup process. You must download the zip file that contains the scripts (`nw-backup-v4.3.zip` or later) from RSA Link at this location: https://community.rsa.com/docs/DOC-81514 and copy it over to your CentOS 6 backup system. Click the **RSA NetWitness Logs & Packets 11.3 Backup Script (nw-backup-v4.3.sh or later)** link and extract the zip file to access the scripts. The scripts are:

- `get-all-systems.sh`: Creates the `all-systems` file, which contains a list of all your NetWitness Servers and host systems to be backed up.
- `ssh-propagate.sh`: Automates sharing keys between the systems you are backing up and the backup host system so that you are not prompted for passwords multiple times.
- `nw-backup.sh`: Performs the backup of your hosts.

Note: The backup scripts do not support backing up data for STIG-hardened hosts.

Task 2 - Create a List of Hosts to Back up

The script that you use to back up your files depends on the `all-systems` and `all-systems-master-copy` files, which contain a list of the hosts that you want to back up. The `all-systems-master-copy` file contains a list of all your hosts. The `all-systems` file is used for each backup session, and contains only those hosts which are being backed up for a particular session. You run the `get-all-systems.sh` script to generate these files. RSA recommends that you back up your hosts in groups, and not all at once. The recommended order and grouping of hosts for backup sessions is shown in the following diagram:



Limit each backup session to five hosts to ensure that you do not run out of space for the backup files. You create `all-systems` files for your backup sessions by using the `all-systems-master-copy` file as a reference and then manually editing the `all-systems` file to contain specific hosts.

To generate the `all-systems` and the `all-systems-master-copy` files:

1. From the host on which you are running the backup process, make the `get-all-systems.sh` script executable by running the following command:
   `chmod u+x get-all-systems.sh`
2. At the root level, run the `get-all-systems.sh` script:
   `./get-all-systems.sh <IP-Address-of-NetWitness-Admin-Server>`
   You will be prompted for the password for each host system once per host.
   This script saves the `all-systems` file and the `all-systems-master-copy` file to `/var/netwitness/database/nw-backup/`.
3. Validate that the `all-systems` and `all-systems-master-copy` files were generated and that they contain the right hosts.

4. Edit the `all-systems` file to contain only the systems you are backing up. You can do this by using the `all-systems-master-copy` file as a reference, and then opening the `all-systems` file in an editor (such as vi) and modifying it to include only the systems you want to back up.

> **Note:** If you use vi, be sure to include the path to the location of the `all-systems` file.

Here is an example of an `all-systems-master-copy` file:

```
nwserver,my-nw-server,10.0.0.1,af922b9f-cd61-49cd-afdc-a48e558cec3e,10.6.4.0
archiver,my-nw-archiver,10.0.0.2,a65c1236-5e46-4117-8529-8ea837074bd0,10.6.4.0
concentrator,my-nw-concentrator,10.0.0.3,dc620e94-bcf5-4d51-83fe-
c003cdfcd7a6,10.6.4.0
esa,my-nw-esa,10.0.0.4,8b608c0d-a7f9-40c0-baee-8407dec774ab,10.6.4.0
logdecoder,my-nw-logdecoder,10.0.0.5,c8be5d45-e19e-4a8d-90ce-
1cb2fe60077a,10.6.4.0
vlc,my-nw-vlc,10.0.0.8,3ffefc4e-0b31-4951-bb77-dea5869fa98c,10.6.4.0
broker,my-nw-broker,10.0.0.9,0b65e7ce-61d5-4177-9647-c56ccfb0f737,10.6.4.0
```

And here is an example of an `all-systems` file based on the `all-systems-master-copy` file that could be used in the first backup session:

```
saserver,my-nw-server,10.0.0.1,af922b9f-cd61-49cd-afdc-a48e558cec3e,10.6.4.0
esa,my-nw-esa,10.0.0.4,8b608c0d-a7f9-40c0-baee-8407dec774ab,10.6.4.0
```

Troubleshooting Information

- Be sure to save copies of the `all-systems` and `all-systems-master-copy` files in a safe location. Follow these recommendations:
  - Do not edit the `all-systems-master-copy` file.
  - If you create several different versions of the `all-systems` file (for example, for several backup sessions), be sure to remove pre-existing entries from the file so that the file contains only those hosts that are currently being backed up.
    For more information, see Post Upgrade Tasks.

- If any host systems are down while you are running the `get-all-systems.sh` script, the script creates a list of hosts for which it cannot find information. After the script completes and the `all-systems` file is created, you must edit the `all-systems` file manually and add the missing information for these hosts.

- The `get-all-systems.sh` script generates a list of hosts that were defined in the NetWitness Platform user interface. Ensure that all hosts and services are provisioned properly. If any hosts or services are not provisioned properly, they will not be backed up. RSA recommends that when you add hosts and services to NetWitness Platform, you use the NetWitness Platform user interface to ensure that they are provisioned properly. However, if there are any hosts or services that were not defined in the user interface, you must add them to the `all-systems` file manually.

- At the end of the `get-all-systems.sh` script, the script will check for any differences between the systems that the NetWitness Server has listed, and the ones for which the script was able to find all the required information. If any Node ID's or system names are listed as missing, verify the existence

of those systems, that their services are all running, and that they are properly communicating with the NetWitness Server. (Any Windows Legacy Collectors or Azure Cloud Collectors will not be added to the `all-systems` file, and may account for discrepancies. **DO NOT add these items to the `all-systems` file manually**.)

- If the syntax in the `all-systems` file is incorrect, the script will fail. For example, if there is an extra space at the beginning or the end of a host entry, the script will fail.

Task 3 - Set up Authentication Between Backup and Target Hosts

RSA recommends that you run the `ssh-propagate.sh` script to automate sharing keys between the backup host and the host systems.

Note: If you have SSH keys that are protected with pass phrases, you can use `ssh-agent` to save time. For more information, refer to the man page for `ssh-agent`.

1. On the external backup host system, make the `ssh-propagate.sh` script executable by running the following command:
   `chmod u+x ssh-propagate.sh`
2. At the root directory, run the following command, where `<path-to-all-systems-file>` is the path to the directory where the `all-systems` file is stored:
   `ssh-propagate.sh <path-to-all-systems-file>`
3. You are prompted for the password once per host, but you will not need to enter it again later during the backup process.

Task 4 - Check for Backup Requirements for Specific Types of Hosts

After you create the `all-systems` file to use for backup, you must check to see if any of the hosts listed in the file have requirements that must be met before you run the backup process.

For All Host Types

Perform the following steps for all host types:

1. On the NetWitness Server, place Custom Certificate files and any other certificate authority (CA) files in the `/root/customcerts` folder to ensure that these certificate files are backed up. Your custom certificate files that are placed in this directories will be automatically restored during the upgrade process. After upgrading to 11.3.0.0, your custom certificate files will be located in `/etc/pki/nw/trust/import`.
   You can convert CA certificates and keys to different formats to make them compatible with specific types of servers or software using OpenSSL. For example, you can convert a normal PEM file that would work with Apache to a PFX (PKCS#12) file and use it with Tomcat or IIS. To convert the files, SSH to the NetWitness Server and run the following command strings to perform the conversions listed.
   Convert a DER file (.crt .cer .der) to PEM
   `openssl x509 -inform der -in certificate.cer -out certificate.pem`
   Convert a PEM file to DER
   `openssl x509 -outform der -in certificate.pem -out certificate.der`
   Convert a PEM Certificate File and a Private Key to PKCS#12 (.pfx .p12)
   `openssl pkcs12 -export -out certificate.pfx -inkey privateKey.key -in certificate.crt -certfile CACert.crt`
   Convert a PKCS#12 File (.pfx .p12) Containing a Private Key and Certificates to PEM
   `openssl pkcs12 -in keyStore.pfx -out keyStore.pem -nodes`

> **Note:** Add the following qualifier to the command string to:
> `-nocerts` convert private keys exclusively.
> `-nokeys` convert certificates exclusively.

2. Manually record any custom configurations made to CentOS 6 (for example, driver customizations) for restoration after you update to CentOS 7. Custom configurations to CentOS 6 are not automatically backed up and restored.

For Concentrator, or Broker Hosts: Stop Data Capture and Aggregation

In addition to the tasks described in For All Host Types, for Concentrator, or Broker hosts, stop data capture and aggregation on all the systems that you are backing up. For instructions, refer to Appendix B. Stopping and Restarting Data Capture and Aggregation

Log Collectors (LC) and Virtual Log Collectors (VLCs): Run `prepare-for-migrate.sh`

> **Caution:** This task stops log collection so you must perform this step immediately before you upgrade to minimize the loss of event collection. Complete this task in accordance with the backup and upgrade tasks in this guide.

Prerequisites

You need the following information before you prepare LCs and VLCs for upgrade.

- If Lockbox was initialized on the LC and VLC, you must know the Lockbox password. It is required to reconfigure the Lockbox after upgrade.
- If you set the password for `logcollector` user for RabbitMQ , you must know the password so you can set it again after the upgrade.

Prepare LCs and VLCs for Upgrade

1. SSH to the Log Collector.
2. Submit the following command string.
   ```
   # /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --prepare
   ```
   This command:
   - Stops the Puppet Agent service.
   - Disables the file collection accounts (“sftp” and all users in the group “upload”) used for uploading log files to the Log Collector. The log files accumulate on the event sources until the Log Collector has been upgrade to 11.3.0.0.
   - Stops all the collection protocols in the Log Collector service.
   - Saves the list of Plugin accounts and RabbitMQ accounts.
   - Configures the RabbitMQ server so that new events cannot be published to it any longer. Consumers of events in the queues, such as shovels and Log Decoder Event Processors, will continue to run.
   - Waits until the Log Collector queues are empty.

- Stops the Log Collector service.
- Creates a marker file indicating that the Log Collector has been successfully prepared for upgrade.

Troubleshooting Information

The `prepare-for-migrate.sh` script:

- Sends informational, warning, and error messages to the console.
- Saves a session log in the `/var/log/backup/` directory.

You must fix any of the following errors and resume the preparation. Contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) for assistance.

- Log Collector queues with events but without consumers are found.
- Unable to stop the Puppet Agent service.
- Unable to stop a collection protocol in the Log Collector service.
- Unable to block event publishers to the RabbitMQ server.
- Unable to or taking too long for queue events to be consumed. The script makes 30 attempts waiting for the events to be consumed. After each attempt, it sleeps for 30 seconds.
- Unable to stop the Log Collector service.

For more information about troubleshooting, see Appendix A. Troubleshooting

For Integrations with Web Threat Detection, Archer Cyber Incident & Breach Response or NetWitness Endpoint: List RabbitMQ Usernames and Passwords

On the 10.6.6.x host, on the NetWitness Server host, you must get a list of all RabbitMQ usernames and passwords so that after you perform the 11.3.0.0 upgrade, you can restore RabbitMQ user accounts.

To get a list of RabbitMQ usernames and passwords, run the following command:

```
rabbitmqctl list_users >> /root/rabbitmq_users.txt
```

To restore RabbitMQ user accounts, refer to *Task 2 - For Integrations with Web Threat Detection, NetWitness SecOps Manager or NetWitness Endpoint Configure Mutually Authenticated SSL* in Post Upgrade Tasks.

For Bluecoat Event Sources

Bluecoat ProxySG event sources use FTPS protocol to upload log files to the Log Collector (LC) and Virtual Log Collector (VLC). The event source documentation contains the steps to configure VSFTPD service on the LC and VLC.

- If key material exists in `/root/vsftpd/` directory in 10.6.6.x, this material area will be backed up and restored. **If the material was in another location, you must back it up and restore it manually.**
- If the `/etc/vsftpd/vsftpd.conf` file exits in 10.6.6.x, it is backed up and restored.

Task 5 - Check for Adequate Space for the Backup

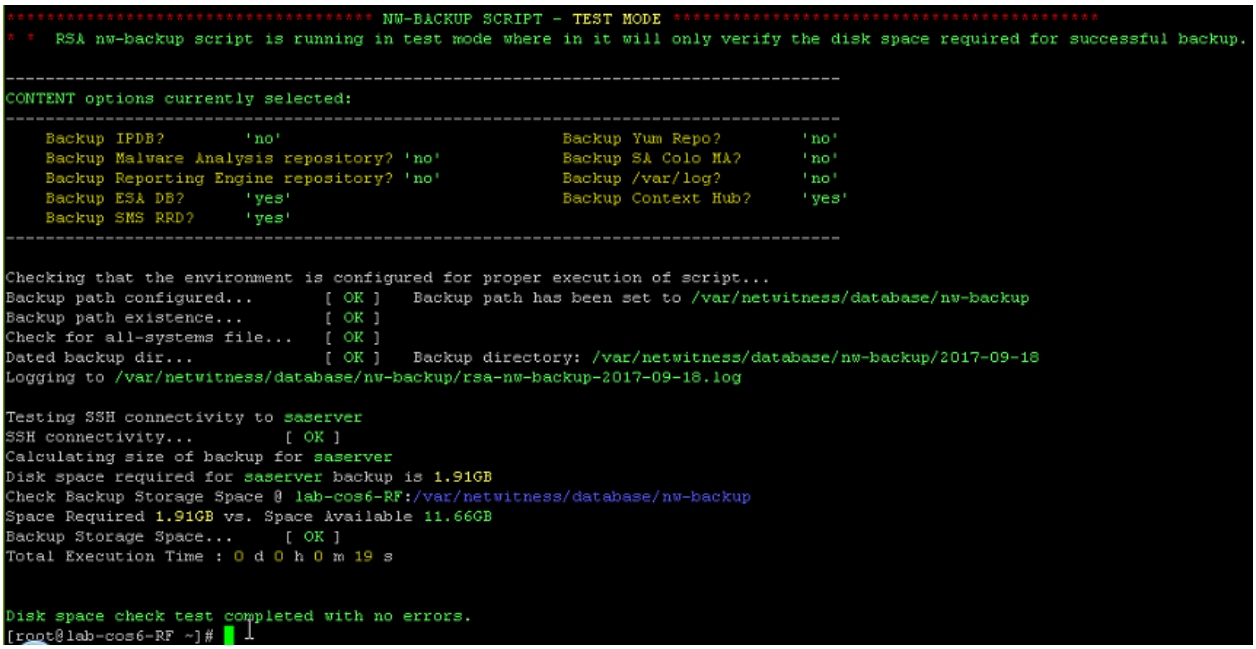
You can run the backup test script to check the amount of disk space that is required for the backup using the `-t` option described in Test Options. You run the script without actually backing up files or stopping any services. RSA recommends that you perform this step to ensure that you provide adequate space for the backup so that the backup captures all your data.

To check for adequate disk space:

1. Make the backup script executable by running the following command:
   `chmod u+x nw-backup.sh`
2. Run the following command at the root directory level:
   `./nw-backup.sh -t`
   The output displays the amount of disk space that is required for the backup.

> **Note:** The `./nw-backup.sh -t` command runs with the `-d` option by default. However, if you are looking for more accurate disk space results, you can override the `-d` option by using `-D`. Using the `-D` option will show how much space is required on each host for the data that will be backed up, but does not show how much space is available. If there is not enough space available, the `-D` option will throw an error. If you want to know how much space is available on the target host, you must run the `df -h` command on the host.

The following figure shows an example of the output from using the `-t` option.



Task 6 - Back up Your Host Systems

Before you run the backup script to do the actual backup, be sure that you have plenty of space. To back up your hosts, you run the `nw-backup.sh` script using the `-u` option. This option is required for upgrading to 11.3.0.0.

Note: The script will stop services as it runs. However, you can stop services manually before you run the script if needed.

When you run the backup script, you can choose from several options that are described in the following sections.

Usage:
```
./nw-backup.sh [-u -t -d -D -u -l -x -e <external-mnt> -b <backup file path>
```

General Options

-u : This option is required for upgrading to 11.3. Enables the upgrade flag to run backup for upgrading to 11.3. It also enables disk space check (-d), backing up reporting engine reports (-r) and stores backup content locally (-l). Default: (no)

-d : enables disk space check in 'fast' mode (quick estimate of space using uncompressed data). Default: (no)

-D : enables disk space check in 'full' mode (estimate of space using compressed data, ~10X slower). Default: (no)

-l : stores backup content locally on each host (automatically set if -u is used). Default: (no)

-e <path to mount point> : copies backup files of all devices onto an external mount point. Default: (/mnt/external_backup)

-x : move all backup files to an external mount point. Default: (no) - COPY

-b <path to write backups> : path to the location for storing backup files on a backup server. **For upgrading to 11.0, please use the default location!** Default: (/var/netwitness/database/nw-backup)

Note: Do **not** change the backup path in upgrade (-u) mode.

Advanced Content Selection Options

-c : back up Colocated Malware Analysis on SA servers. Default: (no)

-i : back up IPDB data (/var/netwitness/ipdbextractor). Default: (no)

-m : back up Malware Analysis File Repository. Default: (no)

-r : back up Reporting Engine Report Repository (automatically set if -u is used). Default: (no)

-v : back up system logs (/var/log). Default: (no)

-y : back up YUM Web Server & RPM Repository. Default: (no)

-S : If set: DISABLES back up of SMS RRD files. Default: (not-set)

-C : If set: DISABLES back up of Context-Hub configuration and database. Default: (not-set)

-E : If set: DISABLES back up of ESA Mongo database. Default: (not-set)

Test Options

-t : performs script test run for disk space check only. Services are not stopped and excludes execution of backup. Can be combined with (-d) or (-D) and other flags. Default: (-t)

For example, the command:
```
./nw-backup.sh
```
would run the backup with options as set in the Header of the script itself.
OR, the command:
```
./nw-backup.sh -ue /mnt/external_backup
```
would run a normal backup using the backup path defined in the script, with the following options:

```
-u : enables the upgrade flag to run backup for upgrading to 11.3. It also
enables disk space check (-d), backing up reporting engine reports (-r) and
stores backup content locally (-l). Default: (no)

-e : Copy the backup files to external mount point, mounted on /mnt/external_
backup

For Help: ./nw-backup.sh -h
```

When you run the script, the following text is displayed at the top of the script:

Caution:
```
RSA nw-backup script backs up configuration files, data, and logs on
the options provided in the script. It tars the content, with options to
store the backup files on the backup server, move or copy them to external
storage on a mount point (USB/NFS/SMB), or SCP them back to the target host.
This backup script has been qualified on the following versions of Security
Analytics:
10.6.3.x and 10.6.4.x
Use of this script on any other versions of the product may not give
expected results and may not be supported by RSA Customer Service.Note: All
non-RSA custom files, scripts, Cronjobs and other important files should be
placed in /root, /home/'user', OR /etc to be included in the backup.
```

To run the backup script to back up your hosts:

1. Ensure that the `all-systems` file contains only the hosts to back up.
2. Make the backup script executable by running the following command:
   `chmod u+x nw-backup.sh`
3. Begin the backup process by running the following command at the root directory level:
   `./nw-backup.sh -u <additional options as needed>`

   Note: You must use the `-u` option so that your files will be restored correctly during the upgrade to 11.3.0.0.

   When the text "`Backup completed with no errors`" is displayed, the backup has completed successfully.

   A log file, with a name similar to the following example, is created in the backup directory which provides information on the files being backed up:
   `rsa-nw-backup-2017-03-15.log`
4. When the backup has completed, to ensure that the intended files were backed up, you can run the following command to see a list of all the files that were backed up:
   `tar -tzvf hostname-ip-address-backup.tar.gz`
   The following archive files are created:
   For all hosts:
   `<hostname-IPaddress>-root.tar.gz`
   `<hostname-IPaddress>-backup.tar.gz`
   `tar checksum` files
   `<hostname-IPaddress>-network.info.txt`
   For NetWitness Servers:
   `<hostname-IPaddress>-root.tar.gz`
   `<hostname-IPaddress>-backup.tar.gz`
   `<hostname-IPaddress>-mongodb.tar.gz`
   `tar checksum` files
   `<hostname-IPaddress>-network.info.txt`

For ESA Hosts:
<hostname-IPaddress>-root.tar.gz
<hostname-IPaddress>-backup.tar.gz
<hostname-IPaddress>-mongodb.tar.gz
<hostname-IPaddress>-controldata-mongodb.tar.gz
tar checksum files
<hostname-IPaddress>-network.info.txt

The archived files are located in the /var/netwitness/database/nw-backup directory. If any of the tar files appear smaller than expected, open them to be sure that the files were properly backed up.

Post Backup Tasks

Task 1 - Save a Copy of the all-systems File and the Backup Tar files

Make copies of the all-systems file, the all-systems-master-copy file, and the backup tar files and put the copies in a secure location. You cannot regenerate these files after you upgrade the NetWitness Server (specifically the Admin service) to 11.3.0.0.

Task 2 - Ensure Required Backup Files Were Generated

After you run the backup scripts, several files are generated. These files are required for the 11.3.0.0 upgrade process. Before you begin the upgrade process, you must ensure that the required backup files are on the hosts that you are upgrading, and that you perform the following tasks.

The following files are generated on all hosts by the backup scripts:

- all-systems
- all-systems-master-copy
- appliance_info
- service_info
- <hostname>-<host-IP-address>-backup.tar.gz
- <hostname>-<host-IP-address>-backup.tar.gz.sha256
- <hostname>-<host-IP-address>-root.tar.gz
- <hostname>-<host-IP-address>-root.tar.gz.sha256
- <hostname>-<host-IP-address>-network.info.txt

In addition to the files listed above, the following files will be generated on NetWitness Server and ESA hosts:

- *<hostname>*-*<host IP address>*-mongodb.tar.gz
- *<hostname>*-*<host IP address>*-mongodb.tar.gz.sha256

The backup script will also generate the following controldata-mongodb.tar.gz files.

Note: The backup script copies the following files from all ESA hosts to the NetWitness Server host's backup path .

- `<esa hostname>-<esa hostip>-controldata-mongodb.tar.gz`
- `<esa hostname>-<esa hostip>-controldata-mongodb.tar.gz.sha256`

Task 3 - (Conditional) For Multiple ESA Hosts, Copy `mongodb tar` files to Primary ESA Host

If you have multiple ESA host systems in your enterprise, copy the following two files from each ESA host to the `/opt/rsa/database/nw-backup/` directory on the Primary ESA host system (the host that has the ContextHub service running on it) :

- `<hostname>-<host-IP-address>-mongodb.tar.gz`
- `<hostname>-<host-IP-address>-mongodb.tar.gz.sha256`

Task 4 - Ensure All Required Backup Files are on Each Host

Before you upgrade to 11.3.0.0, ensure that the appropriate files exist on the hosts that you are upgrading as described in the following lists.

There should be note here mentioning default backup path locations for that user knows where to go and check these files.

Note: The default paths for backup files are:
- NetWitness Server hosts:`/var/netwitness/database/nw-backup`
- ESA hosts:`/opt/rsa/database/nw-backup`

Required Files for NetWitness Servers

- `all-systems-master-copy`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`
- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`
- `<hostname>-<host-IP-address>-mongodb.tar.gz`
- `<hostname>-<host-IP-address>-mongodb.tar.gz.sha256`
- `<esa-hostname>-<esa-host-IP-address>-controldata-mongodb.tar.gz`
- `<esa-hostname>-<esa-host-IP-address>-controldata-mongodb.tar.gz.sha256`

Required Files for ESA Hosts

- all-systems-master-copy
- <hostname>-<host-IP-address>-backup.tar.gz
- <hostname>-<host-IP-address>-backup.tar.gz.sha256
- <hostname>-<host-IP-address>-root.tar.gz
- <hostname>-<host-IP-address>-root.tar.gz.sha256
- <hostname>-<host-IP-address>-network.info.txt
- <hostname>-<host-IP-address>-mongodb.tar.gz
- <hostname>-<host-IP-address>-mongodb.tar.gz.sha256

Required Files for All Other Hosts

- all-systems-master-copy
- <hostname>-<host-IP-address>-backup.tar.gz
- <hostname>-<host-IP-address>-backup.tar.gz.sha256
- <hostname>-<host-IP-address>-root.tar.gz
- <hostname>-<host-IP-address>-root.tar.gz.sha256
- <hostname>-<host-IP-address>-network.info.txt

Note: The following files are located in the <hostname>-<host-IP-address>-backup.tar.gz tar on all hosts:
appliance_info
service_info

Note: The paths to the location of the backup and restore files for iptables, NAT configurations, user accounts, and crontab entries are shown in the following list:
Backup paths:
BUPATH=/opt/rsa/database/nw-backup for the ESA Correlation Engine
BUPATH=/var/lib/rsamalware/nw-backup for the Malware Service
BUPATH=/var/netwitness/database/nw-backup for all other services
Restore locations:
BUPATH/restore/etc/sysconfig for Iptable rules
BUPATH/restore/etc/sysconfig for NAT configurations
BUPATH/restore/etc for Crontab entries
BUPATH/restore/etc for User Accounts (users are located in the passwd file, and groups are located in the group file. These are not restored during the upgrade process but can be restored manually.
BUPATH/restore/etc/ntp.conf for NTP configurations (must be restored using the NetWitness Platform UI)

Migrate Disk Drives from 10.6.6.x to 11.3

These instructions tell you how to upgrade Azure NetWitness VMs from 10.6.6.x to 11.3.0.0 on Azure Cloud Platform.

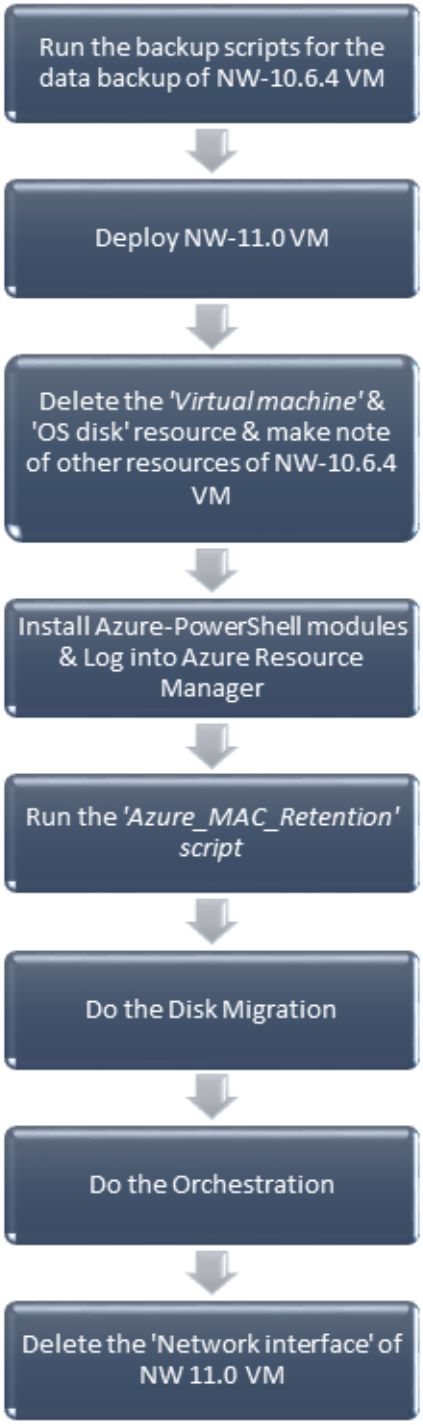
Prerequisites:

- Download and install the latest version of Azure PowerShell from https://github.com/Azure/azure-powershell/releases on a Windows machine.
- Upload the same latest version of Azure modules in automation account. [https://docs.microsoft.com/en-us/azure/automation/automation-update-azure-modules]

Note: Azure PowerShell 4.4.1 was used for qualification.

Note: Both versions of VMs must be on the same Virtual Network and Resource Group for the migration.

Caution: 1) You cannot perform the migration if you have a snapshot for your VM.
2). Run the backup immediately before you upgrade hosts for each phase so that the data is not out-dated.
3.) This guide applies to virtual host upgrades exclusively. If have physical and virtual hosts in your deployment, see the *RSA NetWitness® Platform Physical Host Upgrade Instructions* for the steps you must complete to upgrade physical hosts. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.



Complete the following tasks to migrate your Virtual Machine (VM) deployment disk drives from 10.6.6.x to 11.3:

Task 1 - Deploy NW 11.3 VM

Task 2 - Delete Virtual Machine and OS disk resource of NW 10.6.6 VM

Task 3 - Install Azure PowerShell modules on a local Windows machine

Task 4 - IP Retention: Run the PowerShell script

Task 5 - Perform Disk Migration
Task 6 - Data Restoration

Task 1 - Deploy NW 11.3 VM

1. Deploy NW 11.3 VMs. [Refer to the Azure deployment guide for v 10.6.6.x to 11.3.
2. Power OFF all the NW 10.6.6 and 11.3 VMs.
3. In the Azure Portal, navigate to Virtual machines.
4. Click on the <Name_of_the_VM>.
5. Click Overview and then click Stop.

Task 2 - Delete Virtual Machine and OS disk resource of NW 10.6.6 VM

Note the other resources like Data disks and Network Interface.

1. Delete the ‘Virtual machine’ and the 'OS disk' (usually disk1 of VM) resource of NW 10.6.6 VM and make a note of these Network interface and Data disks.

Note: Delete only these 2 resources and retain all other resources of NW 10.6.6 VMs like 'Network interface', 'Network security group' and 'Data disks') and make a note of these 'Network interface' and 'Data disks'.

2. In the Azure Portal, navigate to All resources. Select the Name_of_NW_10.6.6_VM.
3. Click Delete.

Azure now supports additional premium disk sizes: 32 GiB (P4), 64 GiB (P6), 2048 GiB (P40), and 4095 GiB (P60). Disks created be
15, 2017 retain their existing performance and billing rates.
Azure now supports premium disk size 256 GiB (P15). Managed disks (<=256 GiB) created before October 1, 2017 will retain the
P20 tier performance and billing rates.

Task 3 - Install Azure PowerShell modules on a local Windows machine

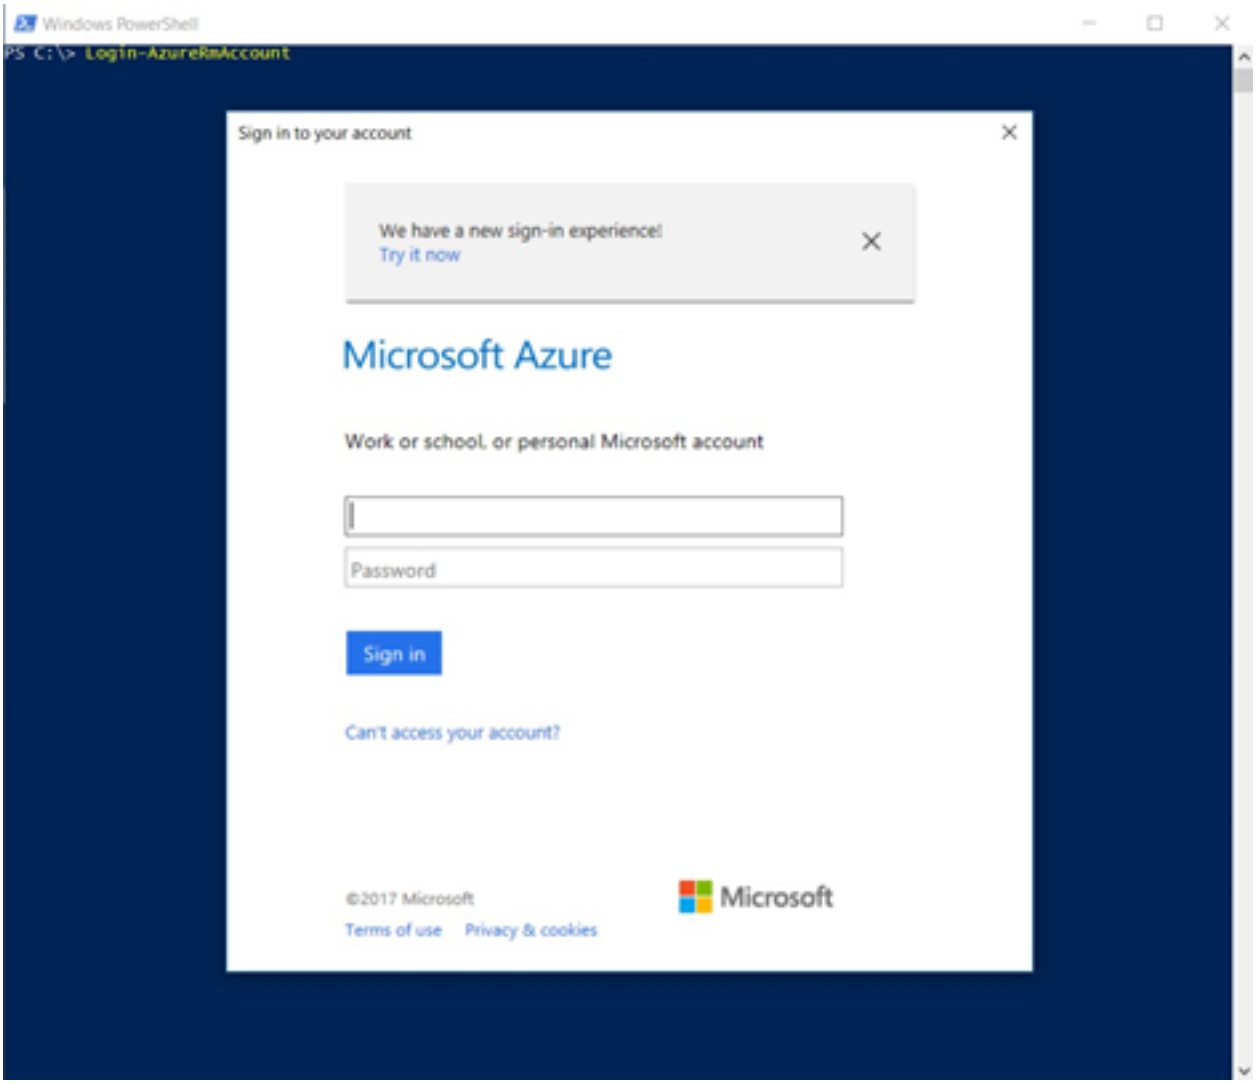
Install the Azure PowerShell modules on a local Windows machine and Login to Azure Resource Manager.

Navigate to Azure PowerShell on the Windows machine where you have installed the Azure PowerShell modules and log in to Azure Resource Manager using the below command

Note: Make sure you have followed the steps mentioned in the Prerequisites section above before executing the below command.

```
Login-AzureRmAccount
```

Login using the Azure credentials in the window that appears.



Task 4 - IP Retention: Run the PowerShell script

Run the PowerShell script for MAC retention for all NW Components. MAC address and IP retention:

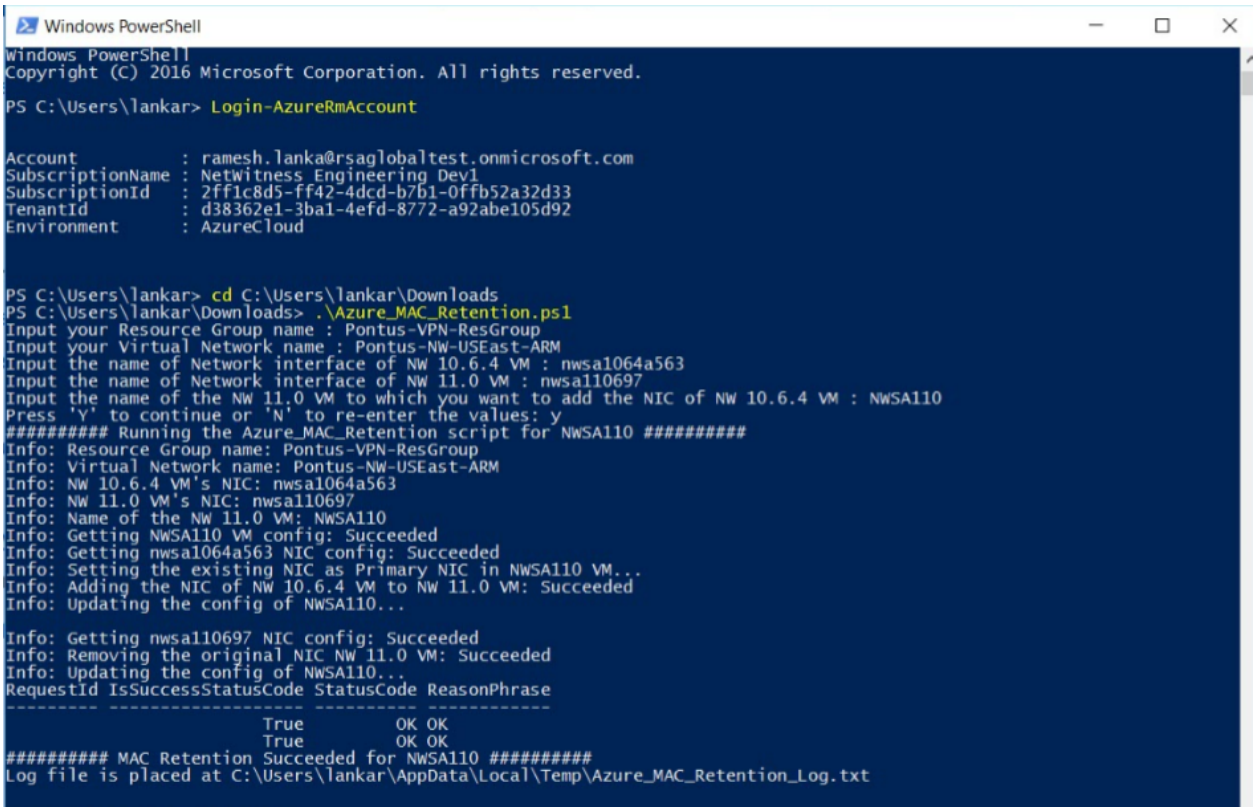
MAC address and IP are bound to the 'Network interface' resource of a VM.

The Azure portal doesn't allow us to

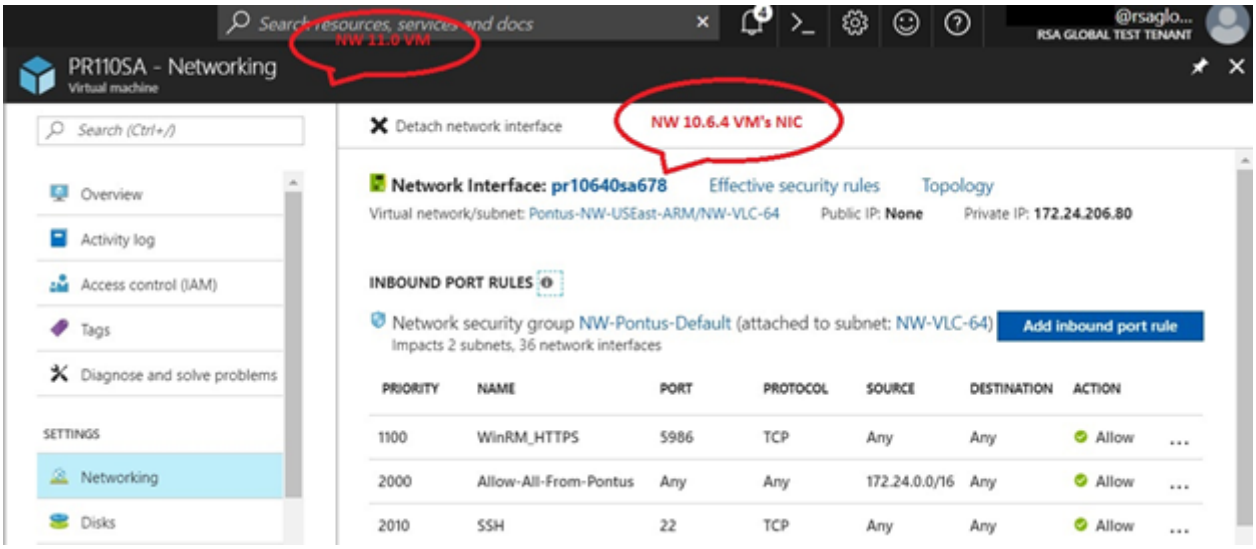
- Specify an existing network interface to add when creating the VM
- Create a VM with multiple network interfaces
- Specify a name for the network interface (the portal creates the network interface with a default name)

This can be achieved using the Azure PowerShell. [https://docs.microsoft.com/en-us/azure/virtual-network/virtual-network-network-interface-vm]

Click here to download and run the script by providing the requested parameters on the Windows machine installed with Azure PowerShell to retain the 'Network interface' from NW 10.6.6 VM to 11.3 VM.



You should be able to see NW 10.6.6 VM's NIC attached to 11.3 VM under 'Networking' settings after successful execution of the script.

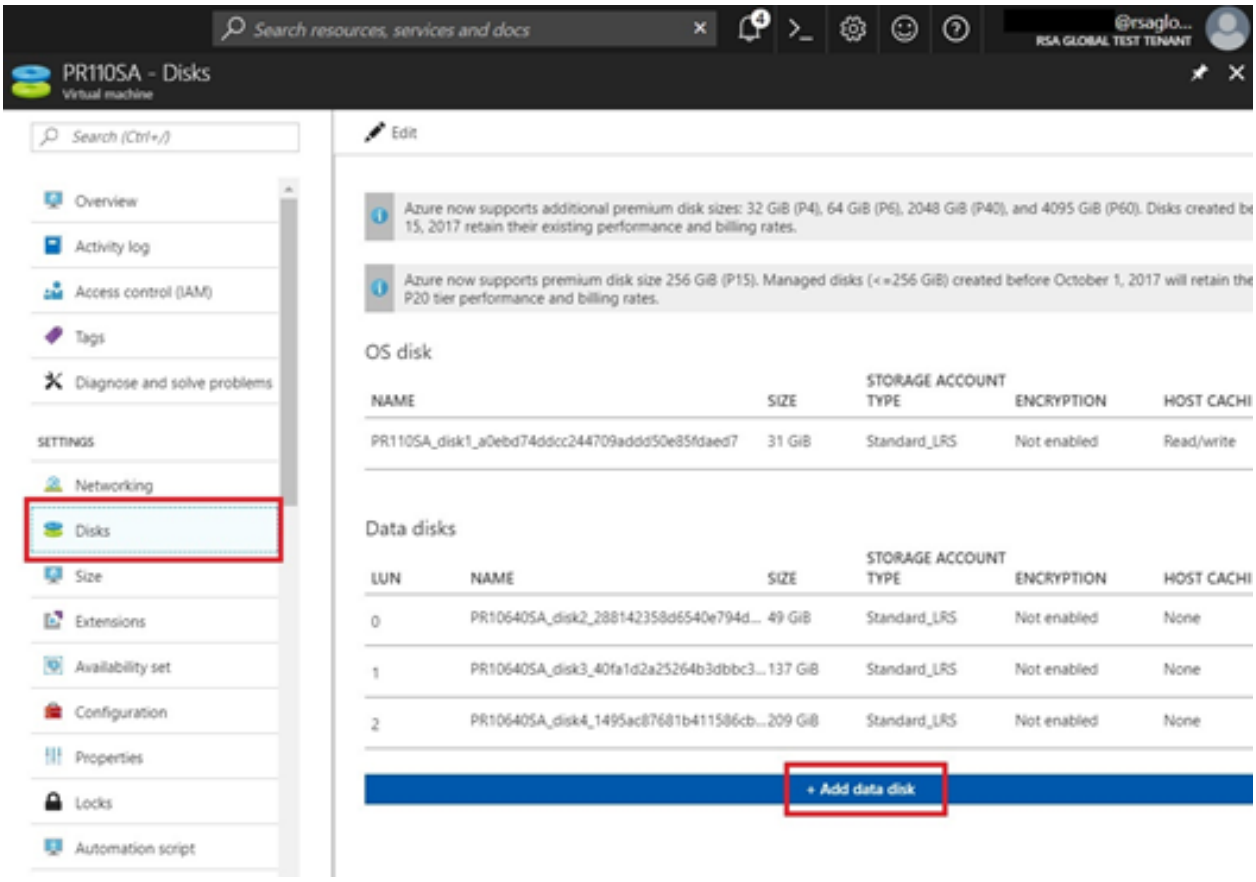


Task 5 - Perform Disk Migration

Add all the disks (except the 'OS disk') of NW 10.6.6 VM to the corresponding NW 11.3 VM under the ‘Disks’ settings.

In Azure Portal, navigate to Virtual machines and then Name_of_the_11.3_VM. Click **Disks** and then click + **Add data disk**. Select all disks of corresponding NW-10.6.6 VM which you had noted down earlier in the dropdown list that appears.

Click **Save**.



Power ON the NW 11.3 VM and login with the credentials provided during VM deployment and set the root password as netwitness.

Task 6 - Data Restoration

Copy NW 10.6.6 VM's backed up data (nw-backup) to NW 11.3 VM.

Note: Do the Data Restoration for SA Server first followed by other components

For SA, LD/LC, Virtual Log Collector, Concentrator, Archiver, Broker:

1. Create a directory under `/tmp/` by the name `nwhome`.
2. Mount `VolGroup00-nwhome` on `/tmp/nwhome/`.

```
mount /dev/mapper/VolGroup00-nwhome /tmp/nwhome/
```

3. Copy the contents of `/tmp/nwhome/` directory to `/var/netwitness/`

```
cp -R /tmp/nwhome/* /var/netwitness/
```

4. Unmount `VolGroup00-nwhome` from `/tmp/nwhome/`

```
umount /dev/mapper/VolGroup00-nwhome /tmp/nwhome/
```

For ESA:

1. Create a directory under `/tmp/` by the name apps.
2. Mount `VolGroup01-apps` temporarily on `/tmp/apps/`

```
mount /dev/mapper/VolGroup01-apps /tmp/apps/
```

3. Copy `nw-backup` directory from here to `/var/netwitness`

```
cp -r /tmp/apps/database/nw-backup /var/netwitness
```

4. Unmount `VolGroup01-apps` from `/tmp/apps/`

```
umount /tmp/apps/
```

Perform disk mounting by running the below commands:

For NW Server:

```
mount /dev/mapper/VolGroup01-ipdbext /var/netwitness/ipdbextractor/
mount /dev/mapper/VolGroup02-redb /var/netwitness/database/
```

Add below entries for these mounts in `/etc/fstab`:

```
/dev/mapper/VolGroup01-ipdbext /var/netwitness/ipdbextractor/ xfs
defaults,noatime,nosuid 1 2
/dev/mapper/VolGroup02-redb /var/netwitness/database/ xfs
defaults,noatime,nosuid 1 2
```

For LogDecoder/LogCollector:

```
mount /dev/mapper/VolGroup01-decoroot /var/netwitness/logdecoder
mount /dev/mapper/VolGroup01-index /var/netwitness/logdecoder/index
mount /dev/mapper/VolGroup01-sessiondb /var/netwitness/logdecoder/sessiondb
mount /dev/mapper/VolGroup01-metadb /var/netwitness/logdecoder/metadb
mount /dev/mapper/VolGroup01-logcoll /var/netwitness/logcollector
mount /dev/mapper/VolGroup01-packetdb /var/netwitness/logdecoder/packetdb
```

Add below entries for these mounts in `/etc/fstab`:

```
/dev/mapper/VolGroup01-decoroot /var/netwitness/logdecoder ext4
defaults,noatime,nosuid 1 2
/dev/mapper/VolGroup01-index /var/netwitness/logdecoder/index xfs
defaults,noatime,nosuid 1 2
/dev/mapper/VolGroup01-sessiondb /var/netwitness/logdecoder/sessiondb xfs
defaults,noatime,nosuid 1 2
/dev/mapper/VolGroup01-metadb /var/netwitness/logdecoder/metadb xfs
defaults,noatime,nosuid 1 2
/dev/mapper/VolGroup01-logcoll /var/netwitness/logcollector xfs
defaults,noatime,nosuid 1 2
/dev/mapper/VolGroup01-packetdb /var/netwitness/logdecoder/packetdb xfs
defaults,noatime,nosuid 1 2
```

For Virtual LogCollector:

```
mount /dev/mapper/VolGroup01-logcoll /var/netwitness/logcollector
```

Add below entry for these mounts in `/etc/fstab`:

```
/dev/mapper/VolGroup01-logcoll /var/netwitness/logcollector xfs
defaults,noatime,nosuid 1 2
```

For Concentrator:

```
mount /dev/mapper/VolGroup01-concroot /var/netwitness/concentrator
mount /dev/mapper/VolGroup01-sessiondb /var/netwitness/concentrator/sessiondb
mount /dev/mapper/VolGroup01-index /var/netwitness/concentrator/index
mount /dev/mapper/VolGroup01-metadb /var/netwitness/concentrator/metadb
```

Add below entries for these mounts in `/etc/fstab`:

```
/dev/mapper/VolGroup01-concroot /var/netwitness/concentrator ext4
defaults,noatime,nosuid 1 2
/dev/mapper/VolGroup01-sessiondb /var/netwitness/concentrator/sessiondb xfs
defaults,nosuid,noatime 1 2
/dev/mapper/VolGroup01-index /var/netwitness/concentrator/index xfs
defaults,noatime,nosuid 1 2
/dev/mapper/VolGroup01-metadb /var/netwitness/concentrator/metadb xfs
defaults,noatime,nosuid 1 2
```

For Archiver:

```
mount /dev/mapper/VolGroup01-archiver /var/netwitness/archiver
mount /dev/mapper/VolGroup02-workbench /var/netwitness/workbench
```

Add below entries for these mounts in `/etc/fstab`:

```
/dev/mapper/VolGroup01-archiver /var/netwitness/archiver xfs
defaults,nosuid,noatime 1 2
/dev/mapper/VolGroup02-workbench /var/netwitness/workbench xfs
defaults,nosuid,noatime 1 2
```

For Broker:

```
mount /dev/mapper/VolGroup01-broker /var/netwitness/broker
```

Add below entry for these mounts in `/etc/fstab`:

```
/dev/mapper/VolGroup01-broker /var/netwitness/broker xfs
defaults,nosuid,noatime 1 2
```

Task 7 - Delete all NW 11.3 Deployment 'Network interface' Resources

1. In Azure Portal, go to All resources.
2. Click on <Name_of_NW_11.3_Network_interface> and select Delete.

Set Up Virtual Hosts in 11.3

There two phases to set up your 11.3 virtual stack that you must complete in the order shown.

- Phase 1 - Set Up NW Server, Event Stream Analysis, and Broker or Concentrator Hosts

  Note: For Event Stream Analysis, if you had C2 modules enabled in 10.6.6.x, the modules will enter a warm-up after you upgrade the Event Stream Analysis service to 11.3 and they will not be available until the warm up completes.

- Phase 2 - Set Up The Rest of the Component Hosts

Phase 1 - Set Up NW Server, Event Stream Analysis, and Broker or Concentrator Hosts

Task 1 - Set Up 11.3 NetWitness Server

Follow the instructions under Set Up 11.3 NW Server Host.

Task 2 - Setup 11.3 ESA

Caution: If you had C2 modules enabled in 10.6.6.x, the modules will enter a warm-up after you upgrade the Event Stream Analysis service to 11.3 and they will not be available until the warm up completes.

Follow the instructions under Set Up 11.3 Non-NW Server Host to set up your ESA hosts.

1. Set up your primary ESA host through the Setup program and install **ESA Primary** on the host in the user interface on the **Admin Hosts** view.

   Note: If you have multiple ESA hosts in your enterprise, you must upgrade the ESA Primary host, where all the `mongodb` (Mongo Database) backup tar files are located, first, before you upgrade ESA Secondary hosts.

2. (Conditional) If you have a secondary ESA host, set it up through the Setup program and install **ESA Secondary** on the host in the user interface on the **Admin Hosts** view.

Task 3 - Set Up 11.3 Broker or Concentrator

Follow the instructions under Set Up 11.3 Non-NW Server Host.

Note: If you do not have a Broker, upgrade your Concentrator hosts. The 11.3 NW Server cannot communicate with 10.6.6.x core services for the new Investigate functionality. This is why you must upgrade the Broker or Concentrator hosts in Phase 1.

Phase 2 - Set Up The Rest of the Component Hosts

See Appendix B. Stopping and Restarting Data Capture and Aggregation for instructions on how to stop and restart data capture and aggregation when upgrading the Decoder, Concentrator, and Log Collection hosts.

Concentrator Hosts

1. Stop data capture and aggregation.
2. Complete the steps in Set Up 11.3 Non-NW Server Host.
3. Restart data capture and aggregation.

Log Decoder Host

1. Make sure you have prepared the Log Collector as described in the Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh.
2. Stop data capture on the Log Decoder.
3. Complete the steps in Set Up 11.3 Non-NW Server Host.
4. Restart data capture on Log Decoder.

> **Note:** After you upgrade, you will restart log collection after completing the Task 12 - Reset Stable System Values for Log Collector after Upgrade in the **Post Upgrade Tasks**

Virtual Log Collector Host

1. Make sure you have prepared the Virtual Log Collector as described in the Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh.
2. Back up your 10.6.6.x VLC by editing the `all-systems` file on host where you performed the backup.
   a. Make sure your `all-systems` file contents has this information before you perform this step.
   `vlc,<host-name>,<IP-address>,<UUID>,10.6.6.0`
   b. Run the following command to create backup.
   `./nw-backup.sh -u`
   See Backup Instructions for detailed procedures on how to back up the host.
3. Make sure the backup host contains the VLC backup in the following format.

```
<hostname>-<IPaddress>-root.tar.gz
<hostname>-<IPaddress>-root.tar.gz.sha256
<hostname>-<IPaddress>-backup.tar.gz
<hostname>-<IPaddress>-backup.tar.gz.sha256
<hostname-IPaddress>-network.info.txt
all-systems-master-copy
```

4. Power off the 10.6.6.x VLC so that a new 11.3 VM can be created with the same network configuration.
5. Deploy a fresh Non-NW Server host using the 11.3 NetWitness Suite ova.
6. Connect to the VM console of the new VLC.
7. Update the network configuration to be the same as the 10.6.6.x VLC.
   This information is stored in the `<hostname-IPaddress>-network.info.txt` 10.6.6.x VLC backup file.

   Note: Make sure IPv6 is disabled.

   a. Edit the `/etc/sysconfig/network-scripts/ifcfg-eth0` file and update the settings.
   Contents of `ifcfg-eth0` should be as follows.

```
TYPE=Ethernet
DEFROUTE=yes
NAME=eth0
UUID=<uuid>
DEVICE=eth0
DNS1=<nameserver from <hostname>-<ipaddress>-network-info.txt>
DNS2=<nameserver from <hostname>-<ipaddress>-network-info.txt>
BOOTPROTO=static
IPADDR=<ipaddress from <hostname>-<ipaddress>-network-info.txt>
NETMASK=<netmask from <hostname>-<ipaddress>-network-info.txt>
GATEWAY=<gateway from <hostname>-<ipaddress>-network-info.txt>
NM_CONTROLLED=no
ONBOOT=yes
```

   b. Submit the following command string.

```
systemctl restart network.service
```

8. Create the backup directory.

```
# mkdir -p /var/netwitness/database/nw-backup/
```

9. Copy the backup from the backup host from `/var/netwitness/database/nw-backup` to the new VLC in the `/var/netwitness/database/nw-backup` directory.
10. Complete the steps 2 through 12 inclusive in Set Up 11.3 Non-SA Server Host for the rest of the NetWitness Platform components . Make sure that you select **Log Collector** for the service in step 12.

Set Up 11.3 NW Server Host

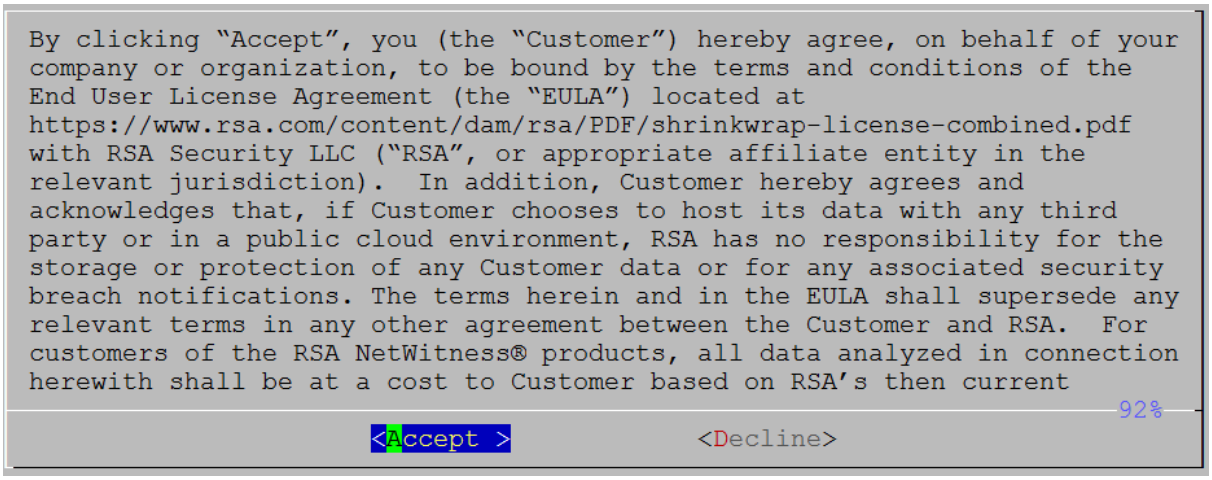
Make sure that you have backed up 10.6.6.x data for the SA Server host. **You must follow the instructions in Backup Instructions to back up the host.**

Caution: Run the backup immediately before upgrading the SA Server to 11.3 so that the data is as recent as possible. You must create the **all-systems** file before you upgrade the SA Server because you cannot do this after the SA Server has been upgraded to 11.3.

Complete the following steps to set up the 11.3 NW Server host.

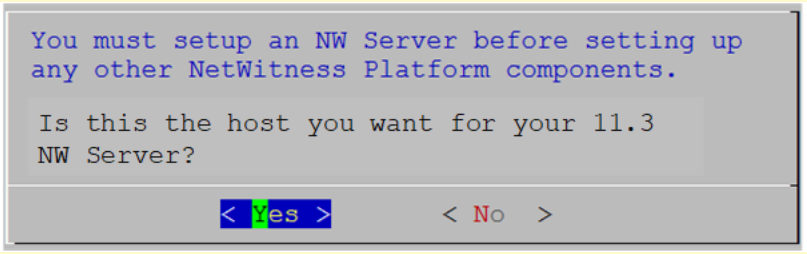
1. Power on the NW Server VM and run the `nwsetup-tui` command.
   This initiates the Setup program and the EULA is displayed.

   Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press the Enter key to register your command response and move to the next prompt.
   2.) The Setup program adopts the color scheme of the desktop or console you use access the host.

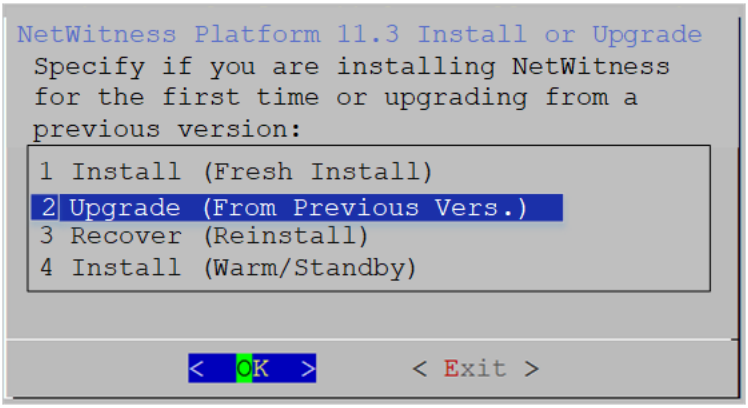


2. Tab to **Accept** and press **Enter**.
   The "Is this the NW Server" prompt is displayed.

   Caution: If you choose the wrong host for the NW Server and complete the upgrade, you must repeat steps 1 through 11 of Set Up 11.3 NW Server Host to correct this error.



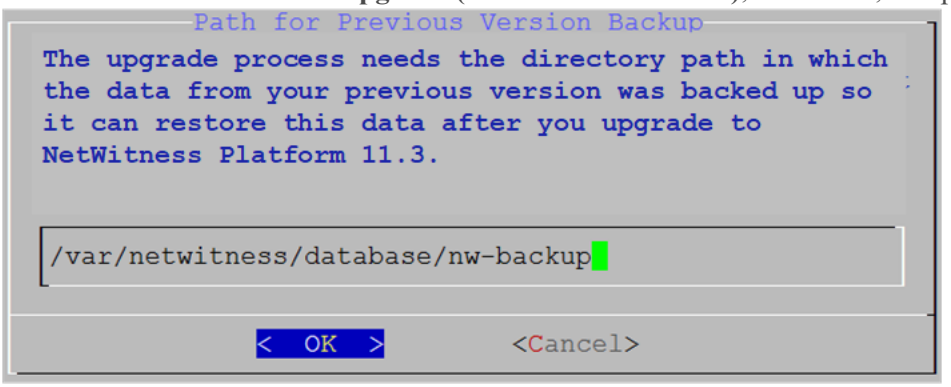
3. Tab to **Yes** and press **Enter**.
   Choose No if you already upgraded the NW Server to 11.3.
   The Install or Upgrade prompt is displayed.



The backup path is displayed.

Caution: The backup path in the following prompt must be the same as the path in which your backup is stored. For example, the backup script assigns **/var/netwitness/database/nw-backup** as the default path. If you used the default backup path during backup and did not change it subsequently, you must keep **/var/netwitness/database/nw-backup** as the path in the following prompt.

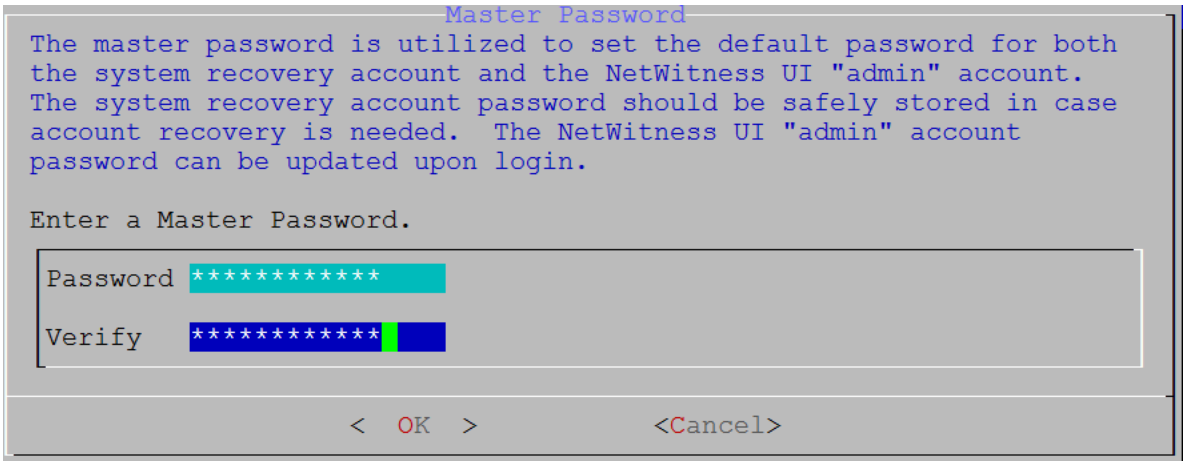
4. Use down arrow to select **2 Upgrade (From Previous Vers.)**, tab to **OK**, and press **Enter**.



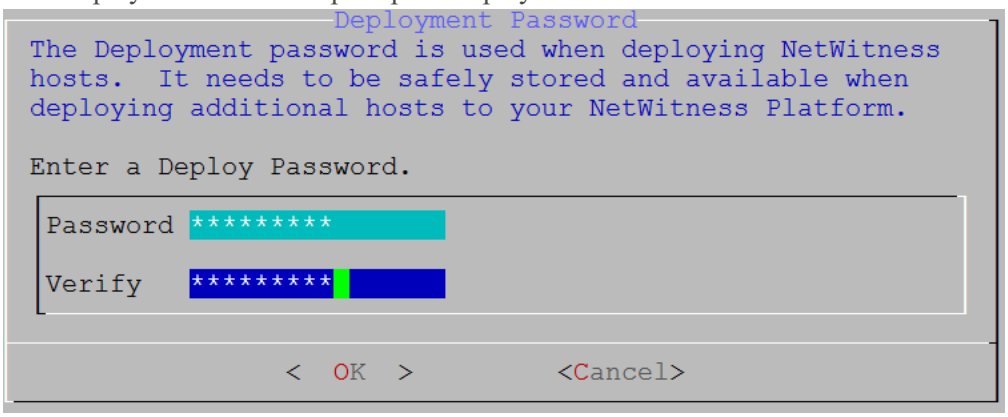
5. Tab to **OK** and press **Enter** if want to keep this path. If not, edit the path, tab to **OK** and press **Enter** to change it.
   The Master Password prompt is displayed.
   The following list of characters are supported for Master Password and Deployment Password:

   - Symbols : ! @ # % ^ +,
   - Numbers :0-9
   - Lowercase Characters : a-z
   - Uppercase Characters : A-Z

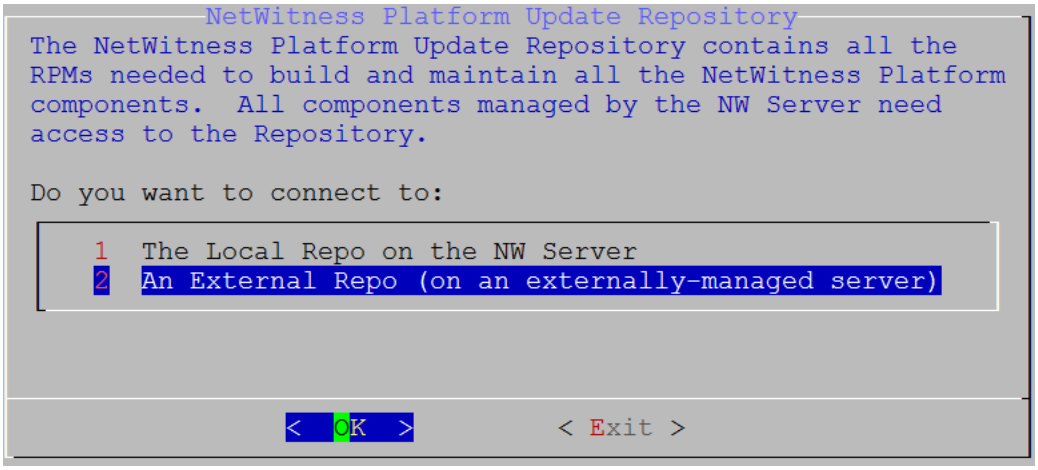
   No ambiguous characters are supported for Master Password and Deployment Password (for example: space { } [ ] ( ) / \ ' " ` ~ ; : . < > -).



6. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**. The Deployment Password prompt is displayed.

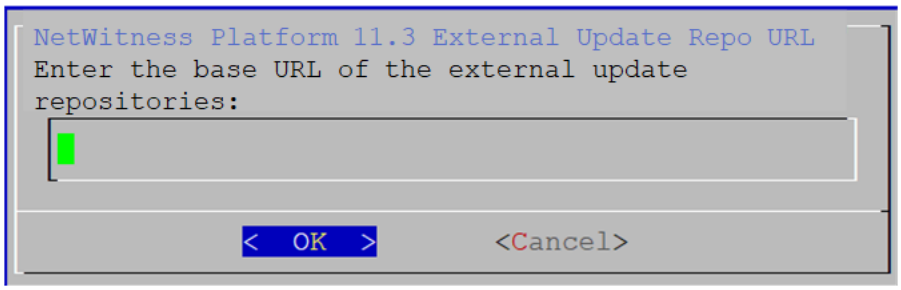


7. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**. The Update Repo prompt is displayed.



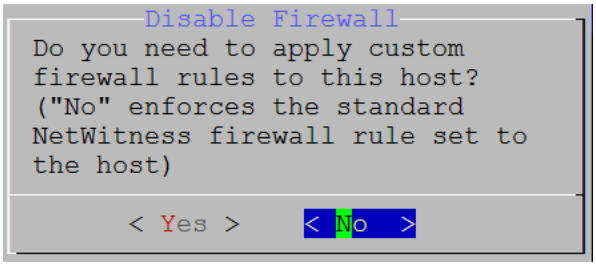
You must use the same repo that you used for the NW Server hosts for all hosts.

8. Use the down and up arrows to select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL.



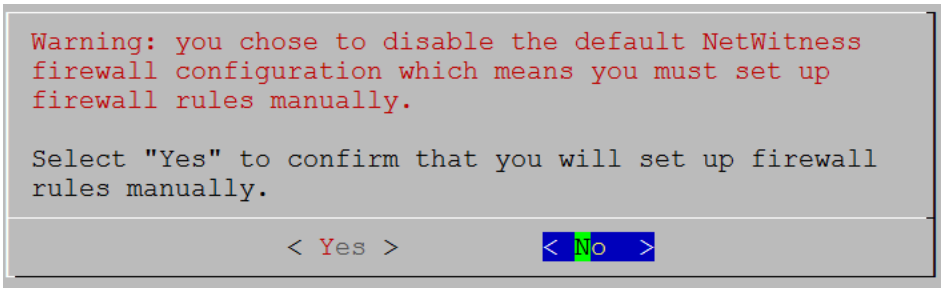
See "Set Up an External Repository with RSA and OS Updates" under "Hosts and Services Procedures" in the *RSA NetWitness Suite 11.3 Hosts and Services Getting Started Guide* for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

9. Enter the base URL of the NetWitness Platform external repo and click **OK**.
   The disable or use standard firewall configuration prompt is displayed.



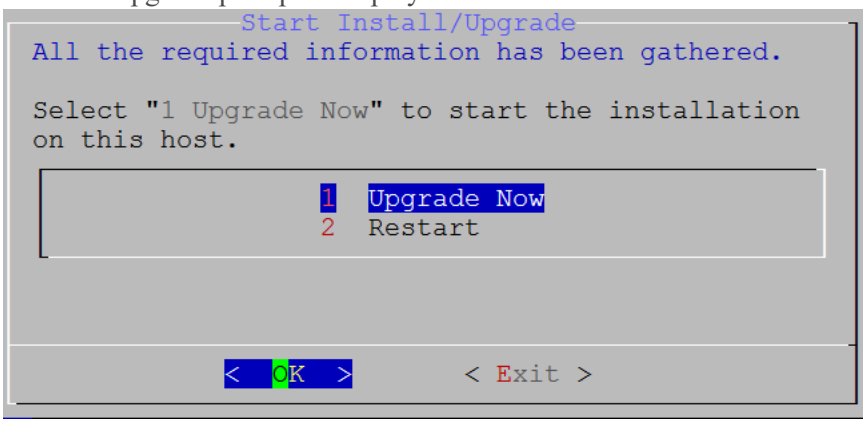
10. Tab to **No**, and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.

- If you select Yes, confirm your selection.



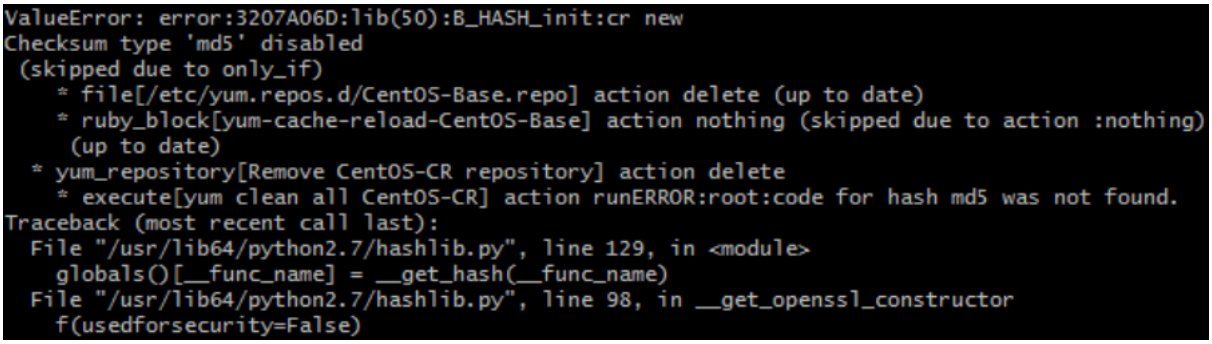
- If you select No, the standard firewall configuration is applied.

The start upgrade prompt is displayed.



11. Select 1 **Upgrade Now**, tab to **OK**, and press Enter.
When "Installation complete" is displayed, you have upgraded the 10.6.6.x SA Server to the 11.3 NW Server.

Note: Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



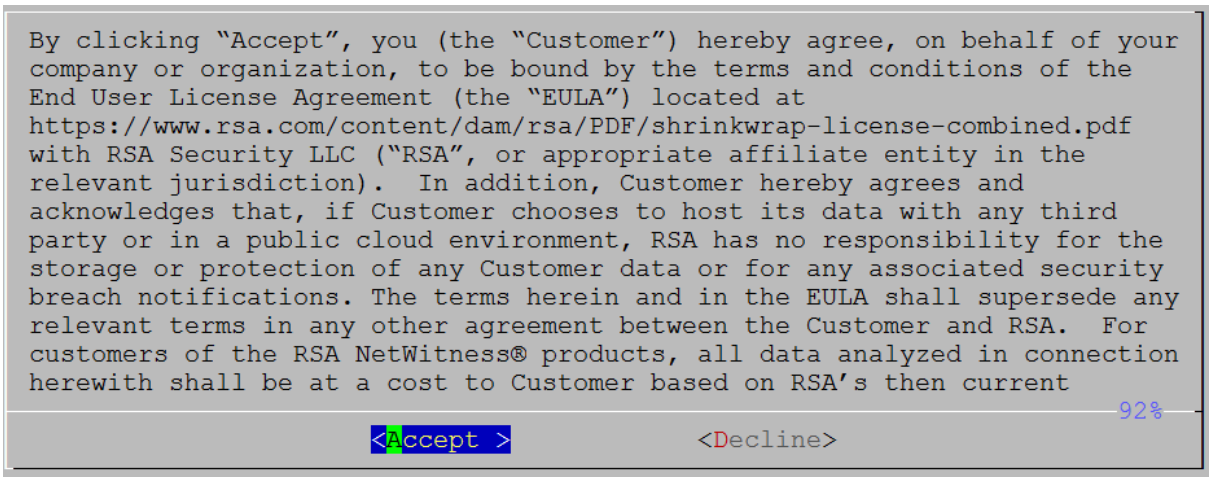
Set Up 11.3 Non-NW Server Host

Make sure that you Back up your 10.6.6.x data for the host. **You must follow the instructions in Backup Instructions to back up the host.**

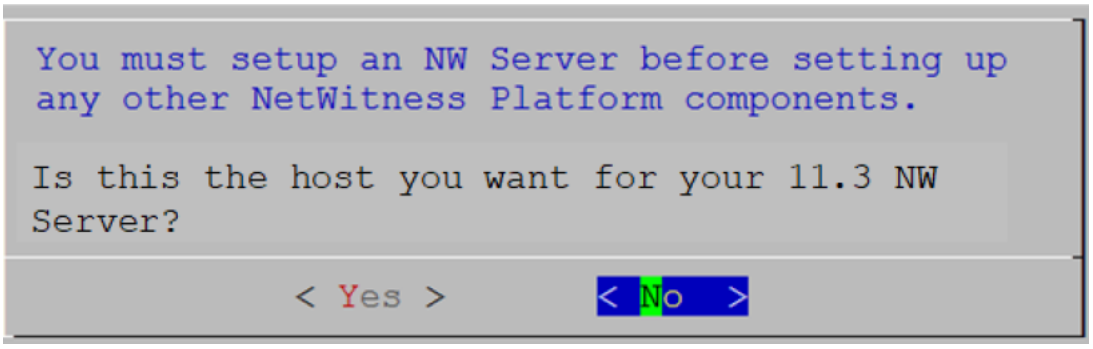
Caution: Run the backup immediately before upgrading the host to 11.3 so that the data is as recent as possible.

Complete the following steps to set up an 11.3 Non-NW Server host.

1. **Power On** the non-NW Server VM and run the `nwsetup-tui` command.
This initiates the Setup program and the EULA is displayed.

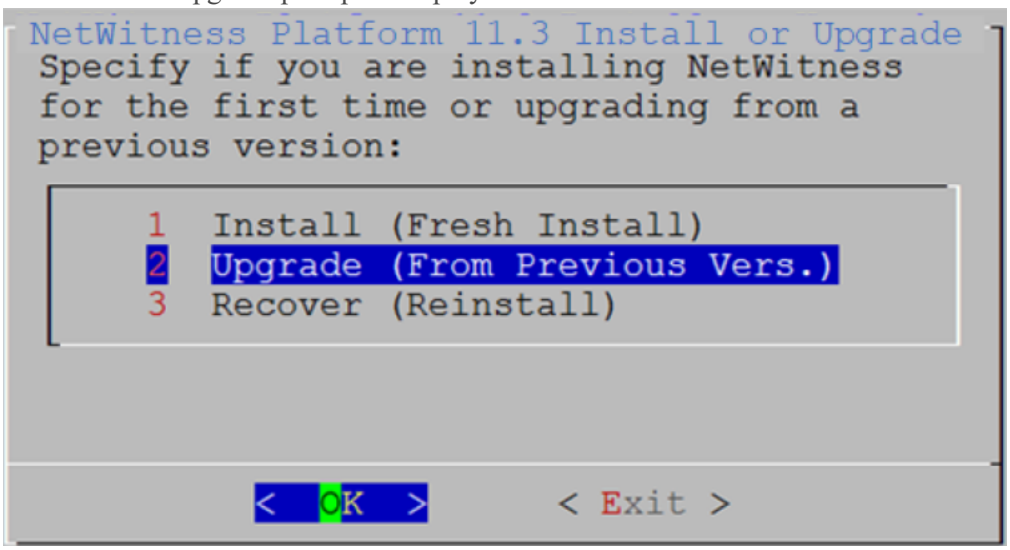


2. Tab to **Accept** and press **Enter**.
   The "Is this the NW Server" prompt is displayed.

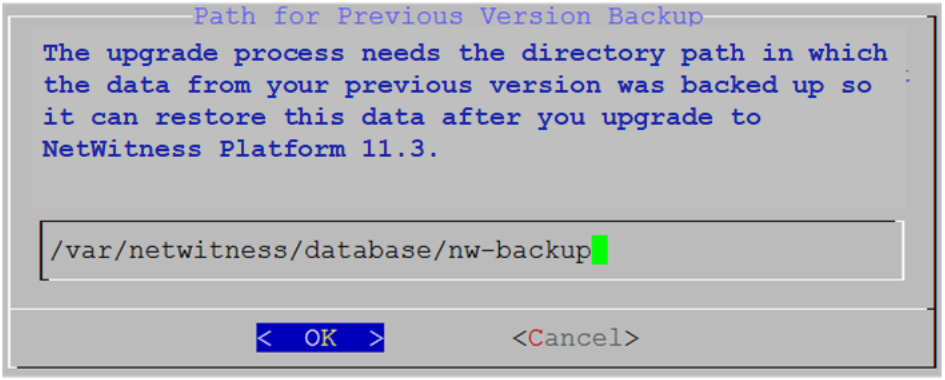


Caution: If you choose the wrong the host for the NW Server and complete the upgrade, you must repeat steps 1 through 11 of Set Up 11.3 NW Server Host to correct this error.

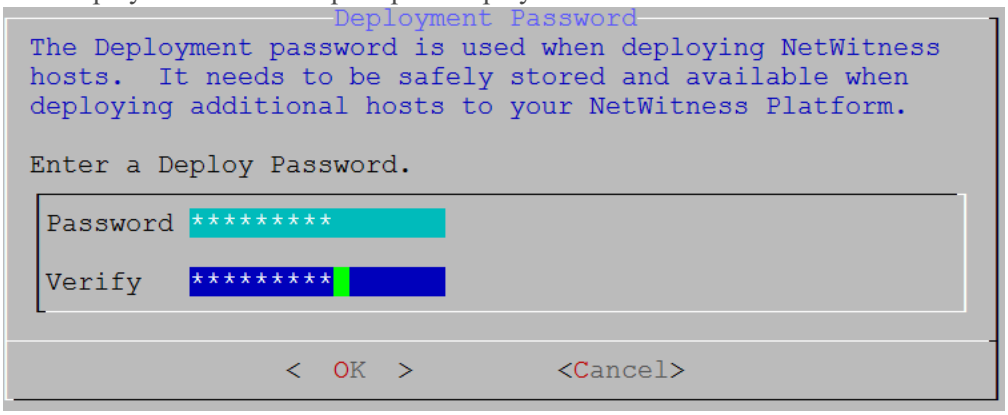
3. Tab to **No** and press **Enter**.
   The Install or Upgrade prompt is displayed.



4. Use down arrow to select **2 Upgrade (From Previous Vers.)**, tab to **OK**, and press **Enter**.
   The backup path prompt is displayed.

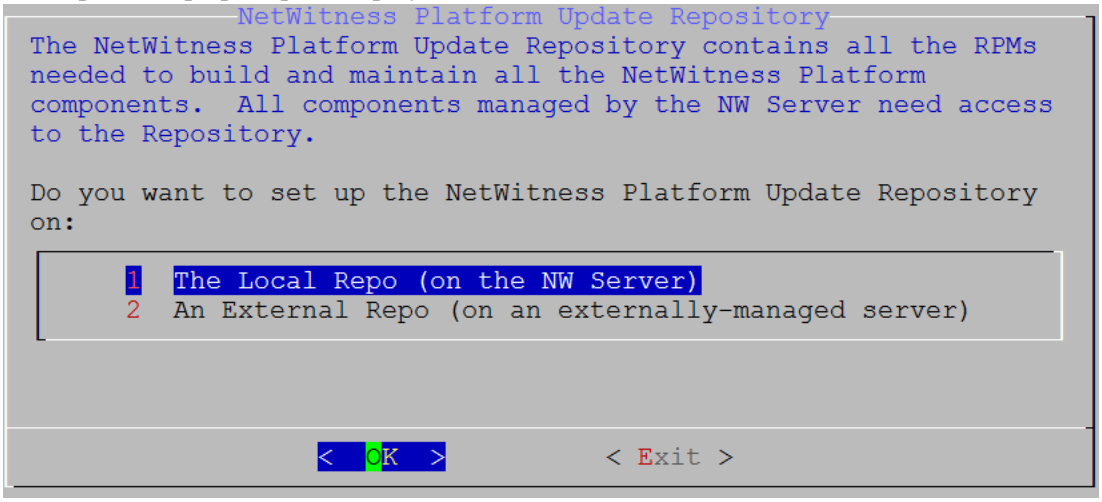


5. Tab to **OK** and press **Enter** if want to keep this path. If not, edit the path, tab to **OK** and press **Enter** to change it.
   The Deployment Password prompt is displayed.

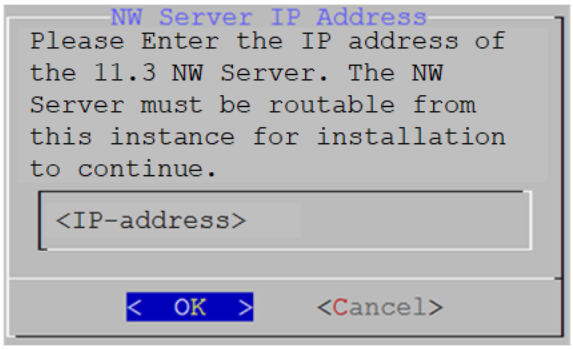


Note: You must use the same deployment password that you used when you upgraded the NW Server.

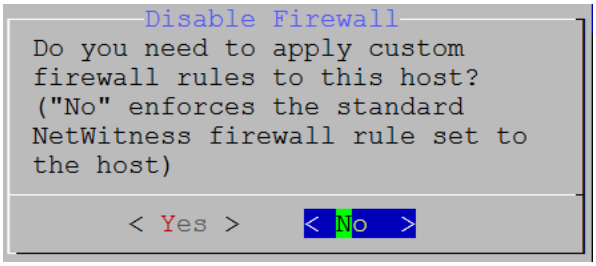
6. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.
   The Update Repo prompt is displayed.



7. Use the down and up arrows to select the **2 The Local Repo (on the NW Server)**, tab to **OK**, and press **Enter**.
8. Enter the base URL of the NetWitness Platform external repo and click **OK**.
   The NW Server IP Address is displayed.



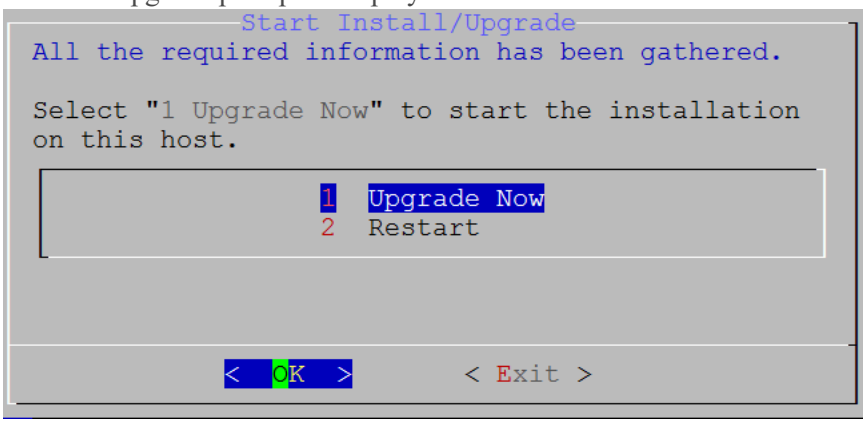
9. Type the IP address of the NW Server, tab to **OK**, and press **Enter**.
   The disable or use standard firewall configuration prompt is displayed.



10. Tab to **No**, and press Enter to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.
    - If you select **Yes**, confirm your selection.

    - If you select **No**, the standard firewall configuration is applied.

The start upgrade prompt is displayed.

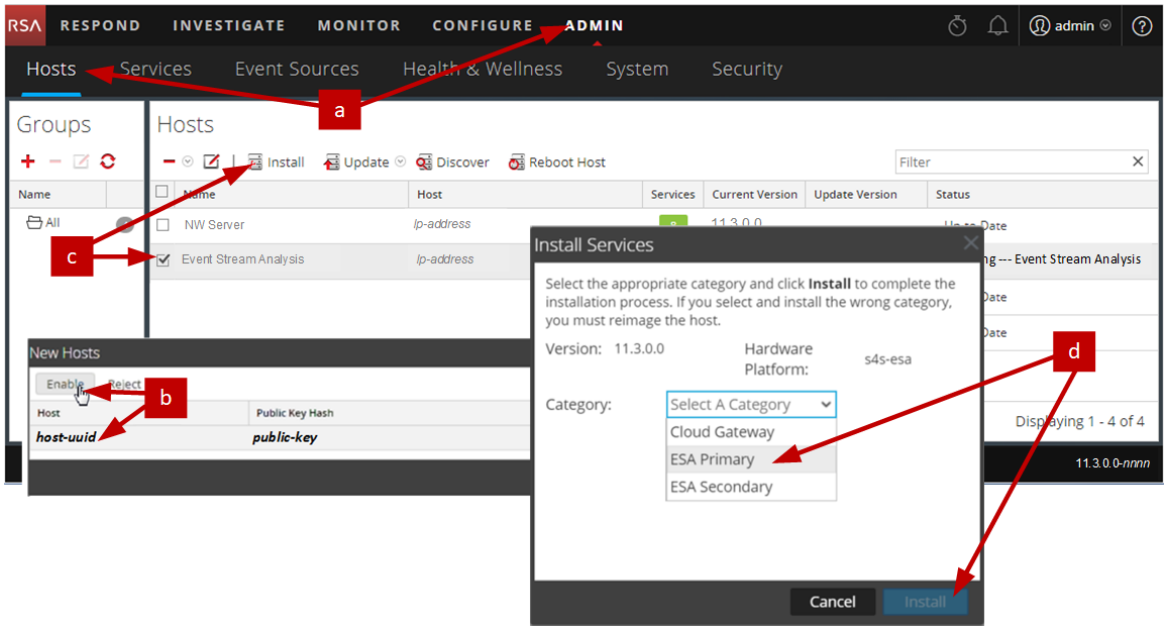


11. Select 1 **Upgrade Now**, tab to **OK**, and press **Enter**.
    When "Installation complete" is displayed, you have upgraded the host to the 11.3.
12. Install the service on this host:
    a. Log into NetWitness Platform.
       Type `https://<NW-Server-IP-Address>/login` in your browser to get to the NetWitness Platform Login screen
    b. Click **ADMIN** > **Hosts**.
       The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

       Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

    c. Click on the host in the **New Hosts** dialog and click **Enable**.
       The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.
    d. Select that host (for example, **Event Stream Analysis**) and click Install
       The **Install Services** dialog is displayed.

e. Select the appropriate service (for example, **ESA Primary**) and click **Install**.



You have completed the upgrade of the non-NW Server host in NetWitness Platform

Update or Install Legacy Windows Collection

Refer to the *RSA NetWitness 11.3 Legacy Windows Collection Guide* on RSA Link (https://community.rsa.com/docs/DOC-75593) for details about how to install or update Legacy Windows collection.

Note: After you update or install Legacy Windows Collection, reboot the system to ensure that Log Collection functions correctly.

Post Upgrade Tasks

This topic contains the tasks you must complete after you upgrade your hosts from 10.6.6.x to 11.3. These tasks are organized by the following categories.

- Global
- NetWitness Endpoint
  RSA supports NetWitness Endpoint versions 4.3.0.4, 4.3.0.5, and 4.4 only for NetWitness Platform 11.3.
- Event Stream Analysis
- Log Collection
- Reporting Engine
- Respond
- NetWitness SecOps Manager
- Security

Global Tasks

Task 1 - Make Sure Port 15671 Is Configured Correctly

Port 15671 is new in 11.x, but you do not need to open a firewall for this port. Make sure that 15671, and all ports, are configured as shown in the "Network Architecture and Ports" topic in the *RSA NetWitness® Platform Deployment Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 2 - Remove Backup-Related Files from Host Local Directories

Caution: 1) You must retain a copy of all backup files on an external host. 2) Validate that you have all your data from your backup restored in 11.3 before you remove the backup-related files from the local directories on your 11.3 hosts.

Backup `.tar` Files

After all the hosts are upgraded to 11.3, you must remove:

- the backup files from the local directories on the hosts.
- all the files from `nw-backup` and `restore` directories on the hosts.

Host	Backup Path	Restore Path
Event Stream Analysis	`/opt/rsa/database/nw-backup`	`/var/netwitness/database/nw-backup/restore`
NW Server	`/var/netwitness/database/nw-backup`	`/var/netwitness/restore`
All Other Hosts	`/var/netwitness/database/nw-backup`	`/var/netwitness/database/nw-backup/restore`

Task 3 - Restore NTP Servers

You must use the NetWitness Platform 11.3 user interface to restore NTP server configurations. NTP server configuration information is located in `$BUPATH/restore/etc/ntp.conf`. Use the NTP server name and hostname from the `/var/netwitness/restore/etc/ntp.conf` file. See "Configure NTP Servers" in the *RSA NetWitness® Platform 11.3 System Configuration Guide* for detailed instructions on how to add NTP servers. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 4 - Restore Licenses for Environments without FlexNet Operations-On Demand Access

If your environment does not have access to FlexNet Operations-On Demand, you need to re-download your NetWitness Platform licenses. Refer to "Step 1. Register the NetWitness Server" in the *RSA NetWitness Suite Licensing Management Guide* for instructions on how to re-download licenses. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 5 - Remap Virtual NW Server License to 10.6.6.x MAC Address

If you are upgrading a Security Analytics server running on a virtual machine, change the 11.3 NW Server virtual host to the 10.6.6.x MAC address to retain licensing. Refer to "Licensing: Step 1. Register the NetWitness Server" in the *RSA NetWitness Suite Licensing Management Guide* for instructions on remapping a license to a new MAC address." Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

(Conditional) Task 6 - If You Disabled Standard Firewall Config - Add Custom IPtables

During the upgrade, you have the option of using these rules or disabling them. If you disabled them, follow these instructions as a baseline to create a user-managed firewall rule sets on all the hosts for which you disabled the standard firewall configuration.

Note: You can refer to the `$BUPATH/restore/etc/sysconfig/iptables` and `$BUPATH/restore/etc/sysconfig/ip6tables` in the restore folder of the backup to update the `ip6tables` and `iptables` files. The `/etc/netwitness/firewall.cfg` file contains the standard `iptables` firewall rules.

1. SSH to each host and log in with your root credentials.
2. Update the following `ip6tables` and `iptables` files with the custom firewall rules.
   ```
   /etc/sysconfig/iptables
   /etc/sysconfig/ip6tables
   ```
3. Reload the `iptables` and `ip6tables` services.
   ```
   service iptables reload
   service ip6tables reload
   ```

(Conditional) Task 7 - Specify SSL Ports If You Never Set Up Trusted Connections

Complete this task only if you never set up Trusted Connections. You would not have set up Trusted Connections if you:

- Used the base ISO image for 10.3.2 or earlier.
- Updated the system using RPMs exclusively to get to 10.6.6.

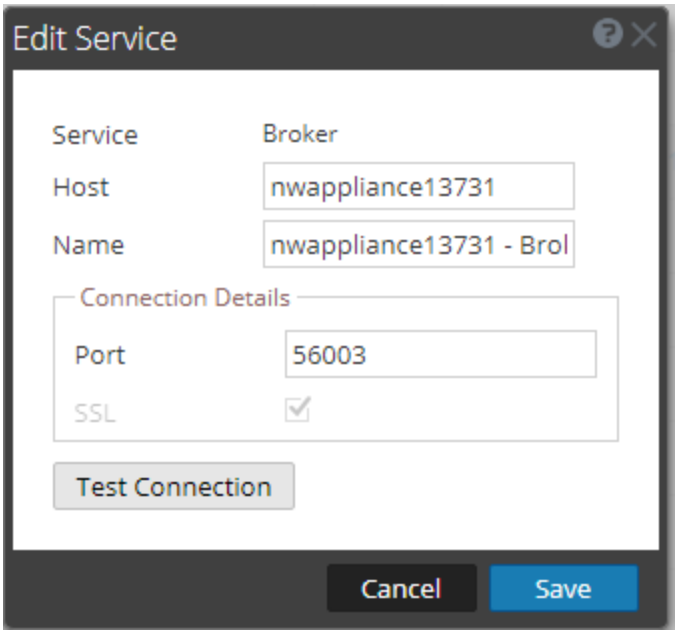
NetWitness Platform 11.3 cannot communicate with the core services for these customers because they are using a non-SSL port 500XX. You must update the Core service ports to an SSL port in the Edit Service dialog.

1. Log in to NetWitness Platform
2. Go to **ADMIN** > **Services**.
3. Select each core service and change there ports from Non-SSL to SSL ports.

Service	Non-SSL	SSL
Broker	50003	56003
Concentrator	50005	56005
Decoder	50004	56004
Log Decoder	50002	56002

4. Click (Edit) from the **Services** view toolbar.
   The Edit Service dialog is displayed.

5. Change the port from Non-SSL to SSL as shown in the table and click **Save**(for example, change the Broker port from 50003 to 56003).



NetWitness Endpoint

Task 8 - Reconfigure Endpoint Alerts Via Message Bus

1. On the NetWitness Endpoint Server, modify the virtual host configuration in the `C:\Program Files\RSA\ECAT\Server\ConsoleServer.exe` file to reflect the following configuration.
   `<add key="IMVirtualHost" value="/rsa/system" />`

   Note: In NetWitness Platform 11.3, the virtual host is `/rsa/system`. For 10.6.6.x and earlier versions, the virtual host is `/rsa/sa`.

2. Restart the API Server and Console Server.
3. SSH to the NW Server and log in with `root` credentials.
4. Submit the following command to add all certificates to the truststore.
   `orchestration-cli-client --update-admin-node`
5. Submit the following command to restart the RabbitMQ server.
   `systemctl restart rabbitmq-server`
   The NetWitness Endpoint account should automatically be available on RabbitMQ.
6. Import the `/etc/pki/nw/ca/nwca-cert.pem` and `/etc/pki/nw/ca/ssca-cert.pem` files from the NW Server and add them to the Trusted Root Certification stores in the Endpoint Server.

Event Stream Analysis Tasks (ESA)

Task 9 - Reconfigure Automated Threat Detection for ESA

If you used Automated Threat Detection in 10.6.6.x, you must complete the following steps to reconfigure it using the ESA Analytics service in 11.3.

1. Log in to NetWitness Platform 11.3
2. Click **ADMIN** > **System** > **ESA Analytics**.
   The Suspicious Domains modules, Command and Control (C2) for Packets and C2 for Logs, require a whitelist named "**domains_whitelist**".
3. Conditional - If your previous Automated Threat Detection whitelist appears on the **Lists** tab of the Context Hub service:
   a. Click **ADMIN**> **Services**, select the Context Hub service, in the action commands ( ) drop-down menu, click **View** > **Config** > **Lists** tab).
   b. Rename your old Automated Threat Detection whitelist to "`domains_whitelist`" for the Suspicious Domains module.

For more information, see the *NetWitness Suite Automated Threat Detection Guide* and the "Configure ESA Analytics" section of the *NetWitness Platform ESA Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 10 - For Integrations with Web Threat Detection, Archer Cyber Incident & Breach Response or NetWitness Endpoint Configure Mutually Authenticated SSL

If you integrate with Web Threat Detection, Archer Cyber Incident & Breach Response or NetWitness Endpoint, you must configure Mutually Authenticated SSL on each integrated system so that the application can authenticate itself when connecting to the RabbitMQ message bus.

Note: Use the RabbitMQ usernames and passwords that were obtained when you backed up your 10.6.6.x data (see Backup Instructions).

1. Create a user on the host system that is integrating with NetWitness Platform by logging into the host and running the following `rabbitmqctl` command.
   ```
   > rabbitmqctl add_user <username> <password>
   ```
   For example:
   ```
   > rabbitmqctl add_user wtd-incidents incidents
   ```
2. Set permissions for users by running the following command (use the username from step 1):
   ```
   > rabbitmqctl set_permissions -p /rsa/system <username> ".*", ".*", ".*"
   ```
   For example:
   ```
   > rabbitmqctl set_permissions -p /rsa/system wtd-incidents ".*", ".*", ".*"
   ```

Task 11 - Enable Threat - Malware Indicators Dashboard

In 11.0, the 10.6.6.x **Threat -Indicators Dashboard** was renamed to **Threat - Malware Indicators Dashboard**. If you used this dashboard in 10.6.6.x, you must:

1. Enable the **Threat - Malware Indicators Dashboard** in 11.3.
2. Set datasource for new dashlets.
   See "Dashlets" in the RSA Link (https://community.rsa.com/docs/DOC-81463).

Log Collection

Task 12 - Reset Stable System Values for Log Collector after Upgrade

Complete the following tasks to reset stable system values for the Log Collector after you upgrade it to 11.0 to ensure that all collection protocols resume normal operation.

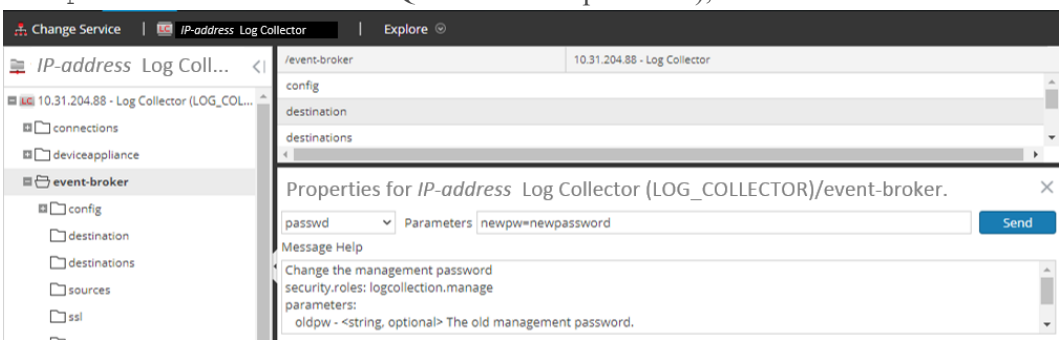
Reset Stable System Values for the Lockbox

The Lockbox stores the key for encrypting event source and other passwords for the Log Collector. The Log Collector service cannot open the Lockbox because of the stable system value changes. As a result, you must Reset Stable System Values for the Lockbox . See "Log Collection: Step 3. Set Up a Lockbox" in the *RSA NetWitness® PlatformLog Collection Configuration Guide* for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Update Log Collector Service RabbitMQ User Account Password

If the logcollector service RabbitMQ user account password was changed, you must reenter it after the 11.0 upgrade.

1. Log in to NetWitness Platform.
2. Click **ADMIN > Services**.
3. Select the Log Collector service.
4. Click (Actions) > **View** > **Explore**.
5. Right click `event-broker` > **Properties**.
6. Select `passwd` from the drop-down list, enter `newpw=><newpassword>` in Parameters (where `<newpassword>` is the RabbitMQ user account password), and click **Send**.



(Optional for Upgrades from 10.6.6.x with FIPS enabled for Log Collectors, Log Decoders and Packet Decoders) Task 13 - Enable FIPS Mode

FIPS is enabled on all services except Log Collector Log Decoder, and Decoder. FIPS cannot be disabled on any services except Log Collector, Log Decoder, and Decoder. For information about how to enable FIPS for these services, see the "Sys Maintenance: Activate or Deactivate FIPS" topic in the *RSA NetWitness® PlatformSystem Maintenance Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Reporting Engine

Task 14 - Restore the CA certificates for External Syslog Servers for Reporting Engine

You must restore CA certificates after the upgrade from the back up you made prior to the upgrade. The Backup script backs up the 10.6.6.x CA certificates into the `/usr/lib/jvm/java-1.8.0-openjdk-1.8.0.111-0.b15.el6_8.x86_64/jre/lib/security/cacerts` directory.

Complete the following procedure to restore the CA certificates in 11.3.

1. SSH to the NW Server host.
2. Export the CA certificates.
   `keytool -export -alias <alias_name> -keystorepath_to_keystore_file -rfc -file path_to_certificate_file`
3. Copy the CA pem into `/etc/pki/nw/trust/import` directory.

(Conditional) Task 15 - Restore External Storage for Reporting Engine

If you have external storage for the Reporting Engine (such as SAN or NAS for storing reports), you must restore the mount you unlinked before the upgrade. See "Reporting Engine: Add Additional Space for Large Reports" in the *RSA NetWitness® Platform Reporting Engine Configuration Guide* for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Respond

Task 16 - Restore Respond Service Custom Keys

In 10.6.6.x, if you added custom key for use in the groupBy clause, the `alert_rules.json` file was modified. The `alert_rules.json` file contains aggregation rule schema. RSA moved the `alert_rules.json` file to the following new location:
`/var/lib/netwitness/respond-server/scripts`

1. Copy the custom keys from `/opt/rsa/im/fields/alert_rules.json` file in the backup directory.
   This directory is where the `alert_rules.json` file is restored from the 10.6.6.x backup.

2. Go to the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` in 11.0.
   This is the new file for 11.0.
3. Edit the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` to include the custom keys you copied in step one.

Task 17 - Restore Customized Respond Service Normalization Scripts

RSA re-factored the Respond service normalization scripts in 11.0 and moved them to the following new location:
`/var/lib/netwitness/respond-server/scripts`
If you customized these scripts in 10.6.6.x, you must:

1. Go to the to the `/opt/rsa/im/scripts` directory.
   This directory is where the following Respond service normalization scripts are restored from the 10.6.6.x backup.
   `data_privacy_map.js`
   `normalize_alerts.js`
   `normalize_core_alerts.js`
   `normalize_ecat_alerts.js`
   `normalize_ma_alerts.js`
   `normalize_wtd_alerts.js`
   `utils.js`
2. Copy any custom logic from the 10.6.6.x scripts.
3. Go to the `/var/lib/netwitness/respond-server/scripts` directory.
   This directory is where NetWitness Platform 11.0 stores the re-factored scripts.
4. Edit the new scripts to include the custom logic you copied in step 2 from the 10.6.6.x scripts.
5. Copy any custom logic from `/opt/rsa/im/fields/alert_rules.json` file.
   The `alert_rules.json` file contains aggregation rule schema.

(Conditional) Task 18 - Restore Custom Analysts Roles

If you had custom analyst roles in 10.6.6.x, you must reinstate them in 11.3. See *Adding Roles and Assigning Permissions for the Roles* in the *RSA NetWitness Platform Warehouse Analytics Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

NetWitness SecOps Manager

Task 19 -Reconfigure NW SecOps Manager Integration

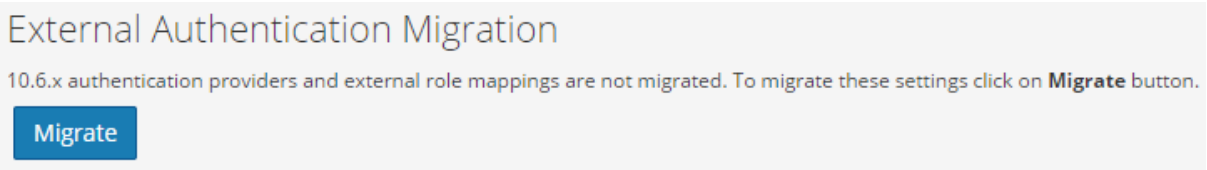
For information on how to reconfigure NW SecOps for Event Stream Analysis, Reporting Engine, and Respond, see *RSA Archer Integration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Security

Task 20 - Migrate Active Directory (AD)

The first time you log into the NetWitness Platform 11.3 User Interface, you must click on the Migrate button to complete the migration of AD.

1. Log in to NetWitness Platform with your `admin user` credentials.
2. Click **ADMIN** > **SECURITY** and click the **Settings** tab.
   The following dialog is displayed.



3. Click **Migrate**.
   The migration is complete and the dialog closes.

Task 21 - Modify Migrated AD Configuration to Upload Certificate

If the you used a self-signed certificate in Active Directory (AD) server, and enabled SSL for the AD connection in 10.6.6.x, you must modify the migrated AD configuration to upload the certificate (either the self-signed cert or the CA cert).

Complete the following procedure to modify the migrated AD configuration to upload the certificate (either the self-signed cert or the CA cert).

1. Log in to NetWitness Platform.
2. Click **ADMIN** > **Security** and click the **Settings** tab.
3. Under **Active Directory Settings**, select an AD configuration and click .
   The Edit Configuration dialog is displayed.
4. Go to the **Certificate File** field, click **Browse**, and select a certificate from your network.
5. Click **Save**.

Task 22 - Reconfigure Pluggable Authentication Module (PAM) in 11.3

You must reconfigure PAM after you upgrade to 11.3. See "Configure PAM Login Capability" in the *RSA NetWitness® Platform System Security and User Management Guide*for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

You can refer to your 10.6.6.x PAM configuration files in the **/etc** directory in the your 10.6.6.x backup data for guidance.

Post Upgrade Tasks

You must complete the following tasks after you upgrade your hosts from 10.6.6.x to 11.3. These tasks are organized by the following categories.

- General
- Event Stream Analysis
- Investigate
- Log Collection
- Log Decoder and Decoder
- Malware Analysis
- Reporting Engine
- Respond
- Warehouse
- RSA Archer® Cyber Incident & Breach Response
- RSA NetWitness® Endpoint
- RSA NetWitness® UEBA
- NetWitness Platform Integrations
- Other

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

General

General tasks apply to all customers regardless of the NetWitness Components you deploy.

Task 1 - Remove Backup-Related Files from Host Local Directories

Caution: 1) You must retain a copy of all backup files on an external host. 2) Validate that you have all your data from your backup restored in 11.3 before you remove the backup-related files from the local directories on your 11.3 hosts.

Backup `.tar` Files

After all the hosts are upgraded to 11.3, you must remove:

- The backup files from the local directories on the hosts.
- All the files from `nw-backup` and `restore` directories on the hosts.

Host	Backup Path	Restore Path
Malware	`/var/lib/rsamlware/nw-backup`	`/var/netwitness/malware_analytics_server/nw-backup/restore`
Event Stream Analysis	`/opt/rsa/database/nw-backup`	`/var/netwitness/database/nw-backup/restore`
NW Server	`/var/netwitness/database/nw-backup`	`/var/netwitness/restore`
All Other Hosts	`/var/netwitness/database/nw-backup`	`/var/netwitness/database/nw-backup/restore`

Task 2 - Make Sure Port 15671 Is Configured Correctly

Port 15671 is new in 11.x, but you do not need to open a firewall for this port. Make sure that port 15671, and all ports, are configured as shown in the "Network Architecture and Ports" topic in the *Deployment Guide*.

(Optional) Task 3 - Reissue Certificates for Your Hosts

In 11.3.0.0, RSA introduced a `cert-reissue` command line command and its arguments to reissue host certificates. After you update all your hosts to 11.3, you should reissue certificates for all of them as soon as possible to avoid having them expire. If the certificates expire, this places your NetWitness deployment in a bad security state. Refer to the *Security Configuration Guide* for instructions on how to use the `cert-reissue` command.

(Conditional) Task 4 - Restore Custom Analysts Roles

If you had custom analyst roles in 10.6.6.x, you must reinstate them in 11.3. See "Add a Role and Assign Permissions" in the *System Security and User Management Guide*.

(Conditional) Task 5 - If NetWitness Platform Has No Web Access, Upload Response `.bin` File Again (License Server)

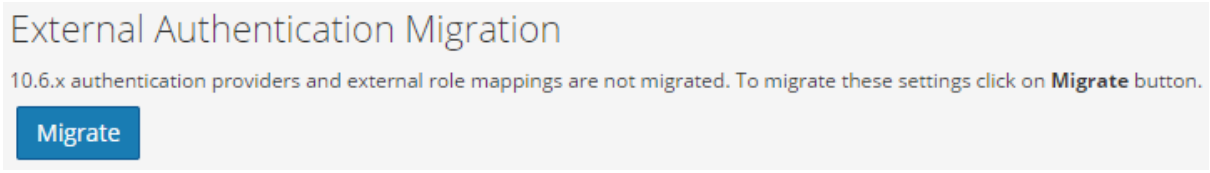
If your NetWitness Deployment does not have Internet access, after you upgrade to 11.3, you must upload the response `.bin` file again to view the license information in the **ADMIN** > **System** > **Licensing** view in the NetWitness Platform User Interface. See “Upload an Offline Capability Response to NetWitness Platform” in the *Licensing Management Guide* for instructions.

Task 6 - Migrate Active Directory (AD)

The first time you log into the NetWitness Platform 11.3 User Interface, you must click on the Migrate button to complete the migration of AD.

1. Log in to NetWitness Platform 11.3 with your `admin user` credentials.

2. Go to **ADMIN** > **SECURITY** and click the **Settings** tab.
   The following dialog is displayed.



3. Click **Migrate**.
   The migration is complete and the dialog closes.

Task 7 - Modify Migrated AD Configuration to Upload Certificate

If you authenticated through Active Directory (AD) server, and enabled SSL for the AD connection in 10.6.6.x, you must modify the migrated AD configuration to upload the Active Directory server certificate.

Complete the following procedure to modify the migrated AD configuration to upload the certificate.

1. Log in to **NetWitness Platform** 11.3, go to **ADMIN** > **Security** and click the **Settings** tab.
2. Under **Active Directory Settings**, select an AD configuration and click .
   The Edit Configuration dialog is displayed.
3. Go to the **Certificate File** field, click **Browse**, and select a certificate from your network.
4. Click **Save**.

Task 8 - Reconfigure Pluggable Authentication Module (PAM) in 11.3

You must reconfigure PAM after you upgrade to 11.3. See "Configure PAM Login Capability" in the *System Security and User Management Guide* for instructions.

You can refer to your 10.6.6.x PAM configuration files in the **/etc** directory in the your 10.6.6.x backup data for guidance.

Task 9 - Restore NTP Servers

You must use the NetWitness Platform 11.3 user interface to restore NTP server configurations. NTP server configuration information is located in `$BUPATH/restore/etc/ntp.conf`. Use the NTP server name and hostname from the `/var/netwitness/restore/etc/ntp.conf` file. See "Configure NTP Servers" in the *System Configuration Guide* for detailed instructions on how to add NTP servers.

Task 10 - Restore Licenses for Environments without FlexNet Operations-On Demand Access

If your environment does not have access to FlexNet Operations-On Demand, you need to re-download your NetWitness Platform licenses. Refer to "Step 1. Register the NetWitness Server" in the *Licensing Management Guide* for instructions on how to re-download licenses.

(Conditional) Task 11 - If You Disabled Standard Firewall Config - Add Custom IPtables

During the upgrade, you have the option of using these rules or disabling them. If you disabled them, follow these instructions as a baseline to create user-managed firewall rule sets on all the hosts for which you disabled the standard firewall configuration.

Note: You can refer to the `$BUPATH/restore/etc/sysconfig/iptables` and `$BUPATH/restore/etc/sysconfig/ip6tables` in the restore folder of the backup to update the `ip6tables` and `iptables` files. The `/etc/netwitness/firewall.cfg` file contains the standard `iptables` firewall rules.

1. SSH to each host and log in with your root credentials.
2. Update the following `ip6tables` and `iptables` files with the custom firewall rules.
   ```
   /etc/sysconfig/iptables
   /etc/sysconfig/ip6tables
   ```
3. Reload the `iptables` and `ip6tables` services.
   ```
   service iptables reload
   service ip6tables reload
   ```

(Conditional) Task 12 - Specify SSL Ports If You Never Set Up Trusted Connections

Complete this task only if you never set up Trusted Connections. You would not have set up Trusted Connections if you:

- Used the base ISO image for 10.3.2 or earlier.
- Updated the system using RPMs exclusively to get to 10.6.6.x.

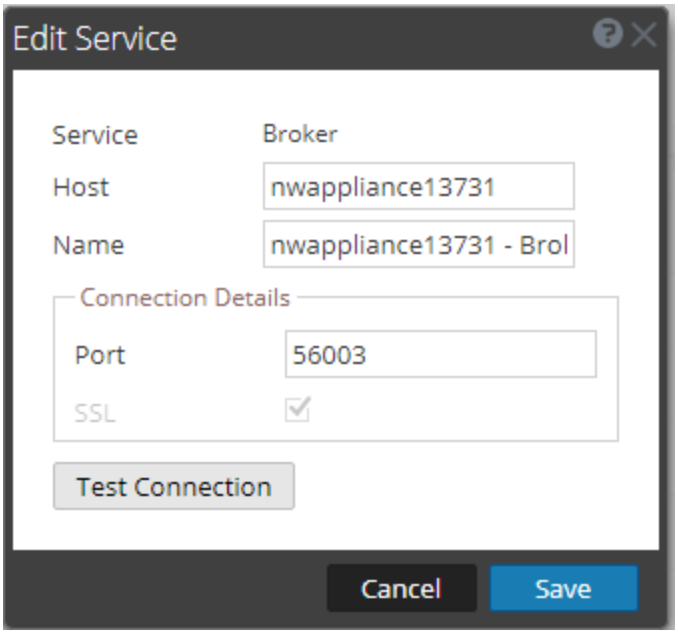
NetWitness Platform 11.3 cannot communicate with the Core services if you are using a non-SSL port 500XX. You must update the Core service ports to an SSL port in the Edit Service dialog.

1. Log in to **NetWitness Platform** and go to **ADMIN** > **Services**.
2. Select each core service and change the ports from Non-SSL to SSL ports.

Service	Non-SSL	SSL
Broker	50003	56003
Concentrator	50005	56005
Decoder	50004	56004
Log Decoder	50002	56002

3. Click (Edit icon) from the SERVICES view toolbar.
   The Edit Service dialog is displayed.

4. Change the port from Non-SSL to SSL as shown in the table and click **Save** (for example, change the Broker port from 50003 to 56003).



Task 13 (Conditional) Reconfigure Public Key Infrastructure (PKI) Certificates

If you had PKI keystores that contained server certificates with private keys and the truststores that contain the trusted CA certificates, you must reconfigure after you upgrade to 11.3. For instructions on how to configure PKI authentication, see the "*System Security and User Management Guide*".

Event Stream Analysis (ESA)

Task 14 - Reconfigure Automated Threat Detection for ESA

If you used Automated Threat Detection in 10.6.6.x, you must complete the following steps to reconfigure it using the ESA Analytics service in 11.3.

1. Log in to **NetWitness Platform** and go to **ADMIN** > **System** > **ESA Analytics**.
   The Suspicious Domains modules, Command and Control (C2) for Network data and C2 for Logs, require a whitelist named "**domains_whitelist**".
2. Conditional - If your previous Automated Threat Detection whitelist appears on the **Lists** tab of the Context Hub service:
   a. Go to **ADMIN** > **Services**, select the Context Hub service, in the action commands ( ) drop-down menu, click **View** > **Config** > **Lists** tab.
   b. Rename your old Automated Threat Detection whitelist to "`domains_whitelist`" for the Suspicious Domains module.

For more information, see the *Automated Threat Detection Guide* and the "Configure ESA Analytics" section of the *ESA Configuration Guide*.

Task 15 (Conditional) Verify String Array Type Meta Keys on the ESA Correlation Service

If you added any string array type meta keys to the Event Stream Analysis service for your ESA correlation rules in 10.6.6.x or earlier, verify that they appear on the ESA Correlation service in 11.3.

1. Follow the "Configure Meta Keys as Arrays in ESA Correlation Rule Values" procedure in the *ESA Configuration Guide* to verify if the string array type meta keys that were added before the upgrade are on the ESA Correlation service. Add any missing string array type meta keys.
2. Do not remove any meta keys from the multi-valued parameter on the ESA Correlation service. In NetWitness Platform 11.3, the ESA rules from Live use meta keys with array syntax and they depend on these meta keys to work correctly. Removing values from the multi-valued list can cause the ESA Rule Deployments to fail.

Task 16 (Conditional) Update RSA Live ESA Rules with Meta Type Changes from String to Array

The following table lists the ESA rules from RSA Live that had meta key type changes from String to Array in NetWitness Platform 11.3.

Rule #	Rule Name	Array Type Meta Keys in 11.3
1	RIG Exploit Kit	threat_category
2	AWS Critical VM Modified	alert
3	Multiple Successful Logins from Multiple Diff Src to Same Dest	host.src and host.dst
4	Multiple Successful Logins from Multiple Diff Src to Diff Dest	host.src and host.dst
5	Multiple Failed Logins from Multiple Diff Sources to Same Dest	host.src and host.dst
6	Multiple Failed Logins from Multiple Users to Same Destination	host.src and host.dst
7	User Login Baseline	host.src and host.dst

1. If you:
   - Deployed these rules before version 11.3:
     a. Note any rule parameters that you have changed so you can adjust the rules for your environment.
     b. Download the updated rules from RSA Live.

c. Reapply any changes to the default rule parameters and deploy the rules.
(For instructions, see "Download RSA Live ESA Rules" in the Alerting with ESA Correlation Rules User Guide.)

- Are deploying these rules for the first time in version 11.3, follow the customization directions with the ESA rule descriptions. Rules 3 to 7 in the above table require that the Context Hub lists for `User_Whitelist`, `Host_Whitelist` and `IP_Whitelist` to be added as enrichments to ESA. (See "Configure Context Hub List as an Enrichment Source" in the *Alerting with ESA Correlation Rules User Guide*.)

2. Deploy the ESA rule deployment that contains these rules. (See "ESA Rule Deployment Steps" in the *Alerting with ESA Correlation Rules User Guide*.)

Task 17 (Conditional) - Verify ESA Rule Deployment

After you upgrade to 11.3, verify your ESA rule deployments. For every ESA host, a new deployment is created in the format "<ESA Host name> – ESA Correlation".

1. Make sure that a new deployment was created.
2. Make sure that the new deployment contains an ESA Correlation service, data sources, and rules for all previous deployments on that ESA host.
3. Make sure that the ESA Correlation service has status of "Deployed".

For a detailed example, see the *ESA Configuration Guide*. For Deployment information, see "ESA Rule Deployment Steps" in the *Alerting with ESA Correlation Rules User Guide*. For troubleshooting information, see the *Alerting with ESA Correlation Rules User Guide*.

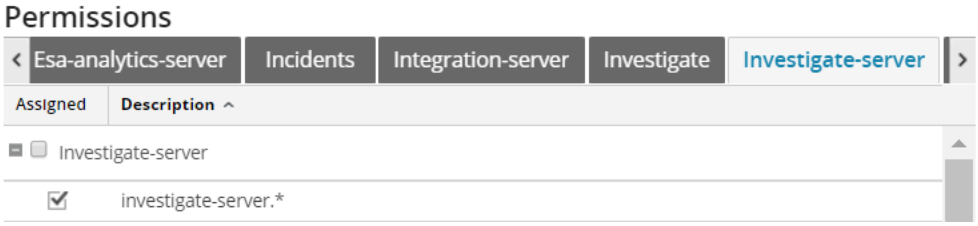
Investigate

Task 18 - Make Sure Customized User Roles Have `Investigate-server` Permissions for Event Analysis Access

After you upgrade to 11.3.0.0, any customized user role does not have `investigate-server.*` permission enabled by default. Complete the following procedure to make sure that the appropriate user roles have permission to access Event Analysis.

1. Log in to NetWitness Platform 11.3.0.0 with your `Admin user` credentials and go to **ADMIN** > **Security**.
2. Click the **Roles** tab.
3. Select the roles that need `investigate-server.*` permissions and click (Edit icon).
4. Select the **Investigate-server** tab under under **Permissions**.

5. If the **investigate-server** checkbox is not set, set it for the Roles that require Event Analysis access.



6. Click **Save**.

Log Collection

Task 19 - Reset Stable System Values for Log Collector after Upgrade

Complete the following tasks to reset stable system values for the Log Collector after you upgrade it to 11.3 to ensure that all collection protocols resume normal operation.

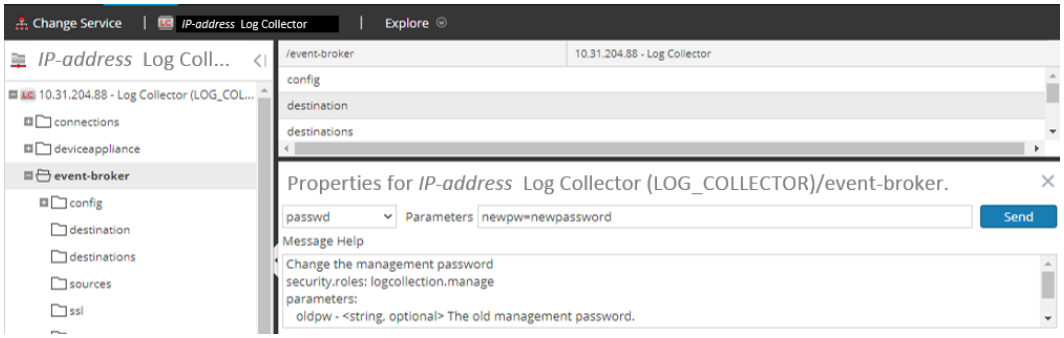
Reset Stable System Values for the Lockbox

The Lockbox stores the key for encrypting event source and other passwords for the Log Collector. The Log Collector service cannot open the Lockbox because of the stable system value changes. As a result, you must Reset Stable System Values for the Lockbox . See "Log Collection: Step 3. Set Up a Lockbox" in the *Log Collection Configuration Guide* for instructions.

Update Log Collector Service RabbitMQ User Account Password

If the `logcollector` service RabbitMQ user account password was changed, you must reenter it after the 11.3 upgrade.

1. Log in to **NetWitness Platform** and go to **ADMIN** > **Services**.
2. Select the Log Collector service.
3. Click (Actions) > **View** > **Explore**.
4. Right click `event-broker` > **Properties** .
5. Select `passwd` from the drop-down list, enter `newpw=><newpassword>` in Parameters (where `<newpassword>` is the RabbitMQ user account password), and click **Send**.



Task 20 - (Conditional) Update SSHD Configuration after Upgrade with Older Windows and UNIX SFTP Agents

This task applies if you have Log Collection, Log Collector (LC) and or Virtual Log Collector (VLC), with File Collection event sources.

If all the event sources:

- Resume collection after upgrade, you do not need to do anything.
- Do not resume collection after the upgrade, you may have to restore Cipher, MACs and Key Exchange Algorithms to the SSHD configuration from the original LC/VLC. Change the `/etc/ssh/sshd_config` file.

1. Make the following changes to `/etc/ssh/sshd_config` file.
   a. If the `KexAlgorithms` line:
      - Exists, append "`,diffie-hellman-group1-sha1`" to the file.
      - Does not exist, add "`KexAlgorithms +diffie-hellman-group1-sha1`" line.
   b. If the `Ciphers` line:
      - Exists, append "`,aes128-cbc`" to the file.
      - Does not exist, add the "`Ciphers +aes128-cbc`" line to the file.
2. Restart SSHD service.
3. If collection still fails, edit the `/etc/systemd/system/sshd.service.d/sshd-opts-managed.conf` file and change "`OWB_ALLOW_NON_FIPS=on`" to "`OWB_FIPS_MODE=off`" in the Environment line and restart SSHD service.
4. If collection still fails, contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294).

Task 21 - Enable FIPS Mode

Note: This task is optional for Upgrades from 10.6.6.x with FIPS enabled for Log Collectors, Log Decoders and Network Decoders)

FIPS is enabled on all services except Log Collector, Log Decoder, and Decoder. FIPS cannot be disabled on any services except Log Collector, Log Decoder, and Decoder.

Log Decoder and Decoder

(Conditional) Task 23 - Enable Metadata for GeoIP2 Parser

By default, the GeoIP2 parser generates less metadata than the GeoIP parser did. After updating to 11.3, if you require any of the additional metadata, you must enable them (once only) for each Decoder. This can also be altered post-upgrade. Note that the `isp` and `org` meta fields usually produce an equivalent value to `domain`.

To enable metadata:

1. Go to **ADMIN** > **Services**.
2. In the **Administration services** view, select a Log Decoder or a Decoder.
3. Click the settings icon ( ) and select **View** > **Config**. The Parsers Configuration panel is displayed, from which you can select **GeoIP2** to enable the desired metadata.

For more information about GeoIP2 parsers, see the "GeoIP2 and GeoIP Parsers" topic in the *Decoder and Log Decoder Configuration Guide*.

Malware Analysis

Task 24 - Enable Threat - Malware Indicators Dashboard

In 11.3, the 10.6.6.x **Threat -Indicators Dashboard** was renamed to **Threat - Malware Indicators Dashboard**. If you used this dashboard in 10.6.6.x, you must:

1. Enable the **Threat - Malware Indicators Dashboard** in 11.3.
2. Set datasource for new dashlets.
   See "Dashlets" in RSA Link (https://community.rsa.com/docs/DOC-81463) for a description of Dashlets in the context of NetWitness Platform.

Note: After upgrading to 11.3, both the Threat-Indicators and the Threat-Malware Indicators dashboards can be displayed in the User Interface. If this is the case, disable the Threat-Indicators dashboard, and enable the Threat-Malware Indicators report charts and dashboard. For information about disabling dashboards, see the "Managing Dashboards" topic in the *NetWitness Getting Started Guide*.

Reporting Engine

(Conditional) Task 25 - Restore the CA certificates for External Syslog Servers for Reporting Engine

You must restore CA certificates after the upgrade from the backup you made prior to the upgrade. The Backup script backs up the 10.6.6.x CA certificates into the `/usr/lib/jvm/java-1.8.0-openjdk-1.8.0.111-0.b15.el6_8.x86_64/jre/lib/security/cacerts` directory.

Complete the following procedure to restore the CA certificates in 11.3.

1. SSH to the NW Server host.
2. Export the CA certificates.
   ```
   keytool -export -alias <alias_name> -keystorepath_to_keystore_file -rfc -file path_to_certificate_file
   ```
3. Copy the CA PEM file into `/etc/pki/nw/trust/import` directory.

(Conditional) Task 26 - Restore External Storage for Reporting Engine

If you have external storage for the Reporting Engine (such as SAN or NAS for storing reports), you must restore the mount you unlinked before the upgrade. See "Reporting Engine: Add Additional Space for Large Reports" in the *Reporting Engine Configuration Guide* for instructions.

Respond

Task 27 - Restore Respond Service Custom Keys

In 10.6.6.x, if you added custom keys for use in the **groupBy** clause, the `alert_rules.json` file was modified. The `alert_rules.json` file contains aggregation rule schema. RSA moved the `alert_rules.json` file to the following new location:
`/var/lib/netwitness/respond-server/scripts`

1. Copy the custom keys from `/opt/rsa/im/fields/alert_rules.json` file in the backup directory.
   This directory is where the `alert_rules.json` file is restored from the 10.6.6.x backup.
2. Go to the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` in 11.3.
   This is the new file for 11.3.
3. Edit the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` to include the custom keys you copied in step one.

Task 28 - Restore Customized Respond Service Normalization Scripts

RSA re-factored the Respond service normalization scripts in 11.3 and moved them to the following new location:
`/var/lib/netwitness/respond-server/scripts`
If you customized these scripts in 10.6.6.x, you must:

1. Go to the to the `/opt/rsa/im/scripts` directory.
   This directory is where the following Respond service normalization scripts are restored from the 10.6.6.x backup.
   `data_privacy_map.js`
   `normalize_alerts.js`
   `normalize_core_alerts.js`
   `normalize_ecat_alerts.js`
   `normalize_ma_alerts.js`
   `normalize_wtd_alerts.js`
   `utils.js`
2. Copy any custom logic from the 10.6.6.x scripts.
3. Go to the `/var/lib/netwitness/respond-server/scripts` directory.
   This directory is where NetWitness Platform 11.3 stores the re-factored scripts.
4. Edit the new scripts to include the custom logic you copied in step 2 from the 10.6.6.x scripts.
5. Copy any custom logic from `/opt/rsa/im/fields/alert_rules.json` file.
   The `alert_rules.json` file contains aggregation rule schema.

Task 29 - Add Respond Notification Settings for Custom Roles

Respond Notification Setting permissions enable Respond Administrators, Data Privacy Officers, and SOC Managers to access Respond Notification Settings (**CONFIGURE** > **Respond Notifications**), which enable them to send email notifications when incidents are created or updated.

To access these settings, you will need to add additional permissions to your existing built-in NetWitness Platform user roles. You will also need to add permissions to your custom roles. See the "Respond Notification Settings Permissions" topic in the *NetWitness Respond Configuration Guide*. For detailed information about user permissions, see the *System Security and User Management Guide*.

Task 30 - Manually Configure Respond Notification Settings

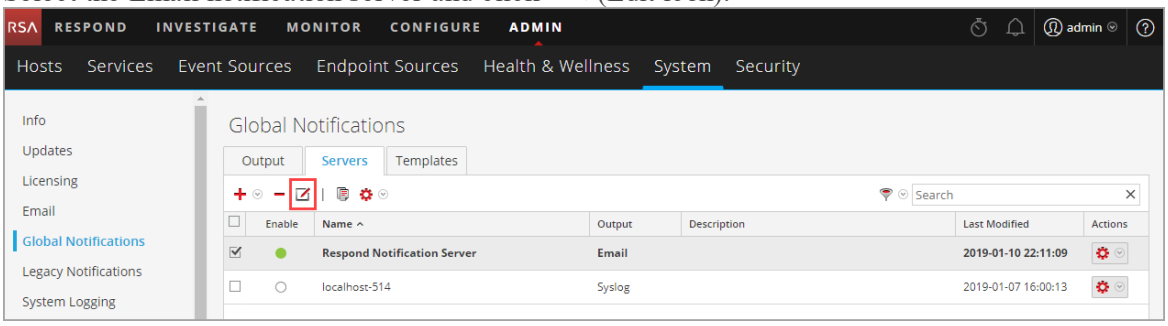
The Incident Management notification settings in NetWitness Platform 10.6.6.x are different from the Respond notification settings available in 11.3, so your existing 10.6.6.x settings will not migrate to 11.3.

NetWitness Respond notification settings enable email notifications to be sent to SOC Managers and the Analyst assigned to an incident when an incident is created or updated.

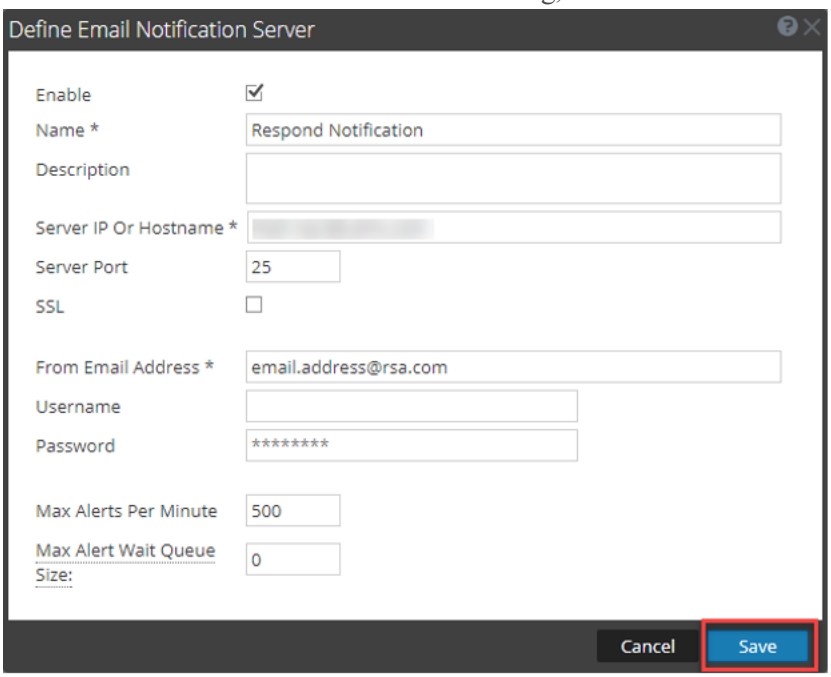
To manually configure the Respond Notification Settings, go to **CONFIGURE** > **Respond Notifications.** See the "Configure Respond Email Notification Settings" procedure in the *NetWitness Respond Configuration Guide*.

Notification Servers from 10.6.6.x will not display in the Email Server drop-down list. The email servers must be edited and saved in the Global Notification Servers panel (**ADMIN** > **System** > **Global Notifications** > **Server** tab).

1. Log in to **NetWitness Platform** and go to **CONFIGURE** > **Respond Notifications**.
   The Respond Notifications Settings view is displayed. Notice that the email notification servers do not appear in the EMAIL SERVER drop-down list.
2. Click the **Email Server Settings** link.
   You will see the Global Notifications panel.
3. Click the **Servers** tab.
4. For each of your email notification servers:
   a. Select the Email notification server and click (Edit icon).



b. In the Define Email Notification Server dialog, click **Save**.



5. Go back to **CONFIGURE** > **Respond Notifications**. Your servers will appear in the **EMAIL SERVER** drop-down list.
   Custom Incident Management notification templates cannot be migrated to 11.3. No custom templates are supported in 11.3.

Task 31 - Update Default Incident Rule Group By Values

The following default incident rules now use “Source IP Address” as the Group By value.

- **High Risk Alerts: Reporting Engine**
- **High Risk Alerts: Malware Analysis**
- **High Risk Alerts: ESA**

To update the above default rules, change the Group By value to “Source IP Address.”

Note: If you already updated the Group By values for the default rules listed above in 11.1 or later, you do not have to do it again.

The **High Risk Alerts: NetWitness Endpoint** default incident rule now uses Host Name as the Group By value. If you have NetWitness Endpoint you can use this rule. Change the Group By value of the default NetWitness Endpoint rule to "Host Name."

1. In the **NetWitness Platform** menu, select **CONFIGURE** > **Incident Rules** and click on the rule that you want to update in the **Name** column. The **Incident Rule Details** view is displayed.
2. In the **GROUP BY** field, select the new Group By value from the drop-down list.
3. Click **Save** to update the rule.

To aggregate NetWitness Endpoint alerts based on the File Hash, complete the following steps to clone the default NetWitness Endpoint incident rule and change the Group By value.

1. In the **NetWitness Platform** menu, select **CONFIGURE** > **Incident Rules**. The **Incident Rules List** view is displayed.
2. Select the **High Risk Alerts: NetWitness Endpoint** default incident rule and click **Clone**. You will receive a message that you successfully cloned the selected rule.
3. Change the Name of the rule to an appropriate name, such as High Risk Alerts: NetWitness Endpoint File hash.
4. In the **GROUP BY** field, remove the previous Group By value and add **File MD5 Hash**. It is important that File MD5 Hash is the only Group By value listed.
5. Click **Save** to create the rule.

For detailed information, see the *Respond Configuration Guide*.

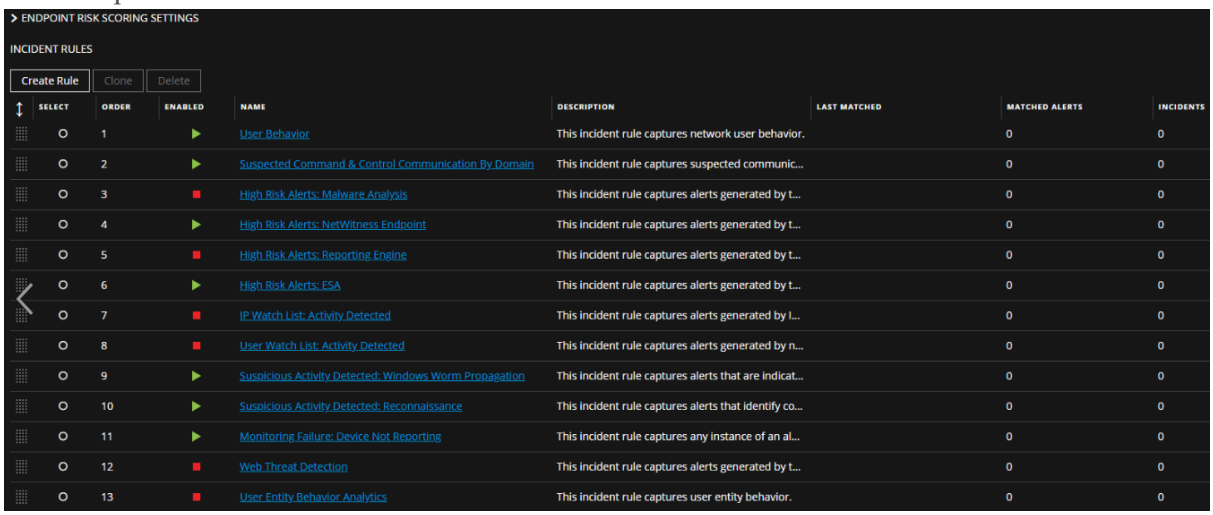
Task 32 - Add Group By Field to Incident Rules

The **Group By** field is not required in 10.6.6, but it is required in 11.3. After you upgrade to

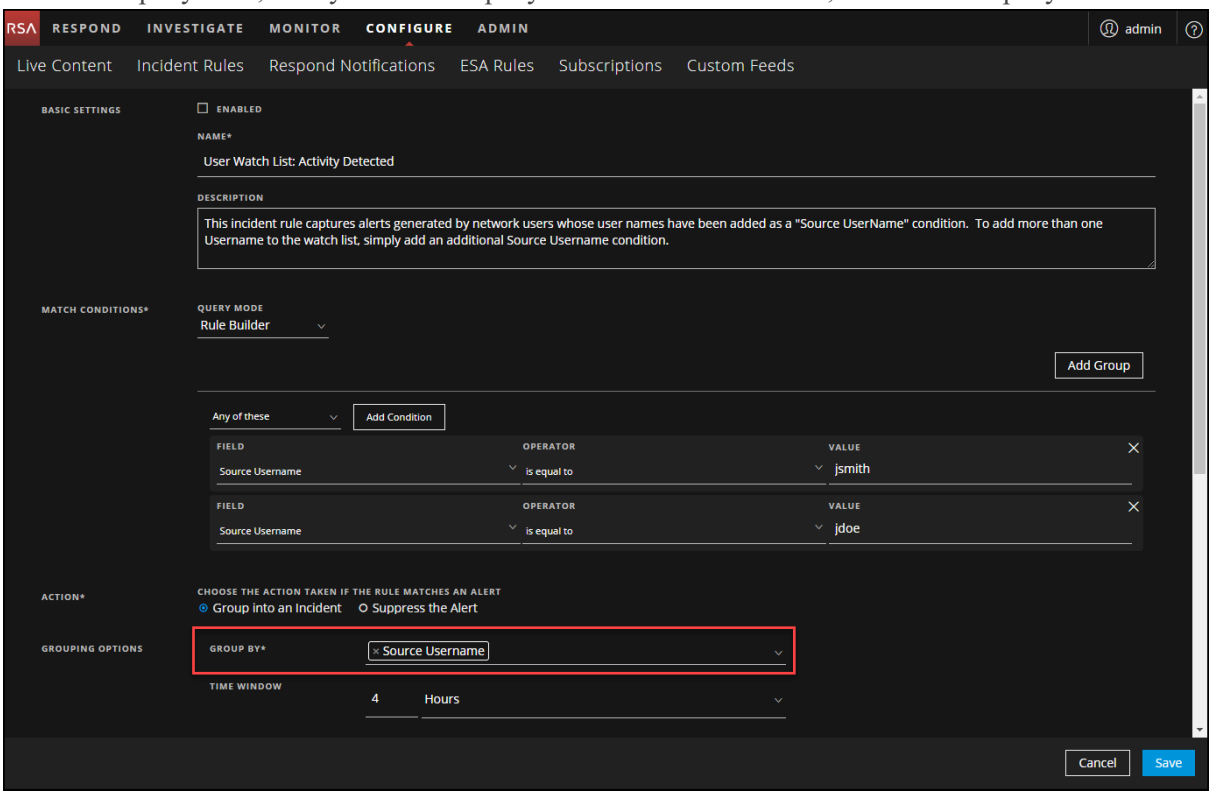
11.3, some incident rules will not have a **Group By** field, so you must add them to the rules or the rules will not work and they will not create incidents.

Complete the following steps for each incident rule:

1. Log in to NetWitness Platform.
2. Go to **CONFIGURE** > **Incident Rules** and click the link in the Name column for the rule that you want to update.



3. In the Group By field, verify that a Group By value is selected. If not, select a Group By value.



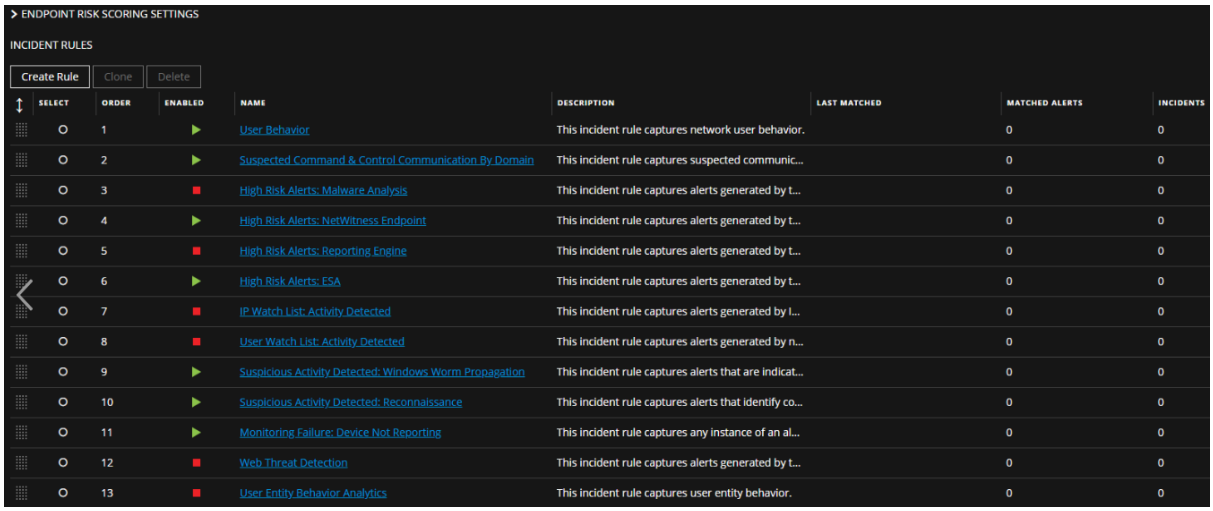
4. Click **Save** to update the rule.
   For information about incident rules, see the *NetWitness Respond Configuration Guide*.

Task 33 - Update Incident Rules Identified in the Domain Matching Conditions Upgrade Preparation Task

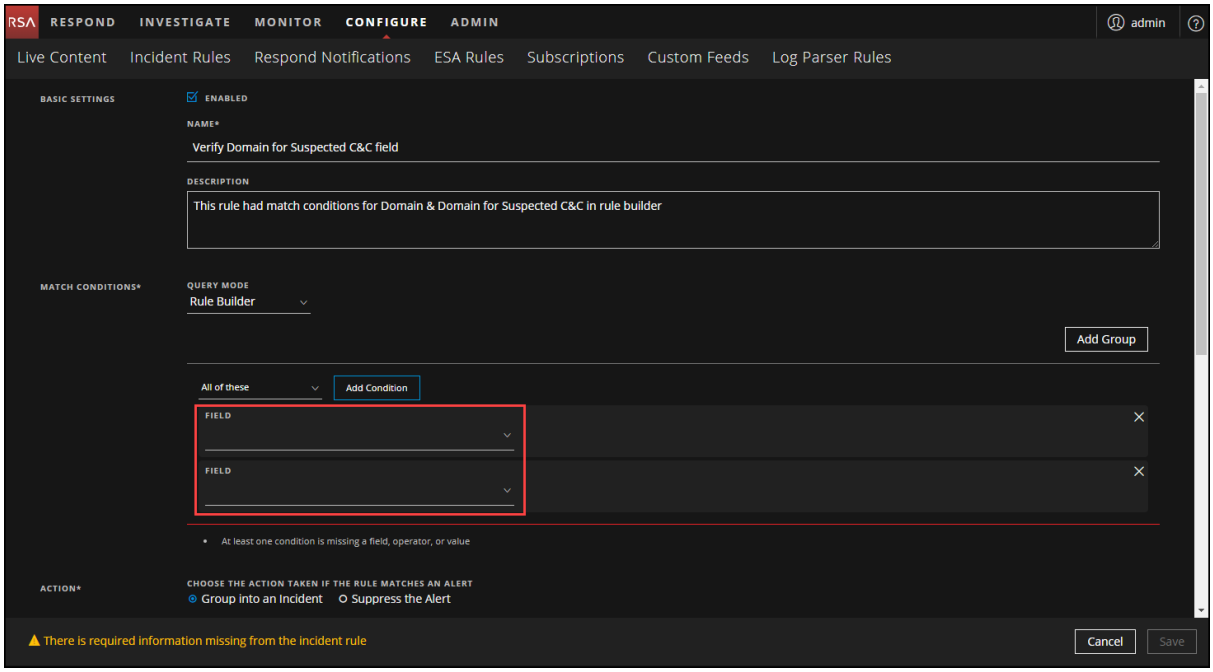
Modify the incident rules that you identified in the Task 4 - Check Aggregation Rules Match Conditions for "Domain" or "Domain for Suspected C&C" upgrade preparation task, which contained Domain or Domain for Suspected C&C in the matching conditions in rule builder.

For each rule that you previously identified:

1. Log in to **NetWitness Platform**, go to **CONFIGURE** > **Incident Rules** and click the link in the Name column for the rule that you want to update.



2. In the **Match Conditions** section, in the blank fields, select **Domain** and **Domain for Suspected CC** in the drop-down list and then select the conditions that you previously identified in the pre-upgrade tasks.



3. Click **Save** to update the rule.
For information about incident rules, see the *NetWitness Respond Configuration Guide*.

Warehouse

Task 34 - Restore `keytab` Files, Mount NFS, Install Service

1. Restore the `keytab` files from `<backup-path>/restore` directory.
2. Restore the Kerberos Realm Configuration from the `<backup-path>/restore/etc/krb5.conf` into `/etc/krb5.conf`.
3. (Conditional) If you perform the upgrade from a Non - FIPS environment and the `isCheckValidationRequired` parameter is not enabled in the destination, to configure the SFTP destination:
   a. SSH to the Warehouse Connector host and submit the following commands:
   ```
   cd /root/.ssh/
    mv id_dsa id_dsa.old
   OWB_FORCE_FIPS_MODE_OFF=1 openssl pkcs8 -topk8 -v2 des3 -in id_dsa.old -
   out id_dsa
   ```
   You are prompted for the pass phrase.
   b. Enter the Encryption password.
   c. Run the following command.
   ```
   chmod 600 id_dsa
   ```
4. Install the Warehouse Connector.
   See the *Warehouse Connector Configuration Guide* for instructions.

Task 35 - Refresh Warehouse Connector Lockbox and Start Stream

Note: If the streams have auto start turned on in 10.6.6.x, there will be a small delay before you will see the Warehouse Connector service in the NetWitness Platform User Interface.

1. Refresh the Lockbox of Warehouse Connector.
2. SSH to the Warehouse Connector and log in with root credentials.
3. Restart the service.
   ```
   service nwwarehouseconnector restart
   ```
4. (Conditional) If the auto start was not enabled in 10.6.6.x, you must start the stream manually after the service restarts.

Task 36 - Update Hive Version

After you update to 11.3, you must update to the Hive version that is compatible with the 11.3 Warehouse (either Hive version 0.12 or version 1.0).

- Hive Version 0.12
  SSH to the NW Server and run the following command.
  ```
  rpm -ivh rsa-nw-hive-jdbc-0.12.0-1.x86_64.rpm
  ```

- Hive Version 1.0
  SSH to the NW Server and run the following command.
  `rpm -ivh rsa-nw-hive-jdbc-1.0.0-1.x86_64.rpm`

RSA Archer Cyber Incident & Breach Response

Task 37 - Reconfigure RSA Archer Cyber Incident & Breach Response Integration

For information on how to reconfigure RSA Archer Cyber Incident & Breach Response for Event Stream Analysis, Reporting Engine, and Respond, see *RSA Archer Integration Guide*.

RSA NetWitness® Endpoint

Task 38 - Reconfigure Endpoint Alerts Via Message Bus

1. On the NetWitness Endpoint Server, modify the virtual host configuration in the `C:\Program Files\RSA\ECAT\Server\ConsoleServer.exe` file to reflect the following configuration.
   `<add key="IMVirtualHost" value="/rsa/system" />`

   Note: In NetWitness Platform 11.3, the virtual host is `/rsa/system`. For 10.6.6.x and earlier versions, the virtual host is `/rsa/sa`.
2. Restart the API Server and Console Server.
3. SSH to the NW Server and log in with `root` credentials.
4. Submit the following command to add all certificates to the truststore.
   `orchestration-cli-client --update-admin-node`
5. Submit the following command to restart the RabbitMQ server.
   `systemctl restart rabbitmq-server`
   The NetWitness Endpoint account should automatically be available on RabbitMQ.
6. Import the `/etc/pki/nw/ca/nwca-cert.pem` and `/etc/pki/nw/ca/ssca-cert.pem` files from the NW Server and add them to the Trusted Root Certification stores in the Endpoint Server.

Task 39 - Reconfigure Recurring Feed Configured from Legacy Endpoint Because Java Version Changed

You must reconfigure the Legacy Endpoint recurring feed due to the change in Java version. Complete the following step to fix this problem.

- Import the NetWitness Endpoint CA certificate into the NetWitness Platform Trusted store as described in "Export the NetWitness Endpoint SSL Certificate" under the "Configure Contextual Data from Endpoint via Recurring Feed" topic in the *RSA NetWitness Endpoint Integration Guide* to import the certificate.

(Optional) Task 40 - Install Endpoint Log Hybrid and Endpoint Agents

See:

RSA NetWitness Platform 11.3 Physical Host Installation Guide for instructions for installation on a physical host.

RSA NetWitness Platform 11.3 Virtual Host Installation Guide for instructions for installation on a virtual host.

RSA NetWitness® UEBA

Task 41 - Install NetWitness UEBA

NetWitness UEBA is new a new feature as of NetWitness Platform 11.3.

See:

RSA NetWitness Platform 11.3 Physical Host Installation Guide for instructions for installation on a physical host.

RSA NetWitness Platform 11.3 Virtual Host Installation Guide for instructions for installation on a virtual host.

RSA NetWitness UEBA User Guide for information about NetWitness UEBA.

NetWitness Platform Integrations

(Conditional) Task 42 - For Integrations with Web Threat Detection, RSA Archer® Cyber Incident & Breach Response or NetWitness Endpoint.

If you integrate with Web Threat Detection, Archer Cyber Incident & Breach Response or NetWitness Endpoint, you must configure Mutually Authenticated SSL on each integrated system so that the application can authenticate itself when connecting to the RabbitMQ message bus.

Note: Use the RabbitMQ usernames and passwords that were obtained when you backed up your 10.6.6.x data (see Backup Instructions).

1. Create a user on the host system that is integrating with NetWitness Platform by logging into the host and running the following `rabbitmqctl` command.
   ```
   > rabbitmqctl add_user <username> <password>
   ```
2. Set permissions for users by running the following command (use the username from step 1).
   ```
   > rabbitmqctl set_permissions -p /rsa/system <username> ".*", ".*", ".*"
   ```
   For example:
   ```
   > rabbitmqctl set_permissions -p /rsa/system wtd-incidents ".*", ".*", ".*"
   ```

Task 43 - Remap Virtual NW Server License to 10.6.6.x MAC Address

If you are upgrading a Security Analytics server running on a virtual machine, change the 11.3 NW Server virtual host to the 10.6.6.x MAC address to retain licensing. Refer to "Licensing: Step 1. Register the NetWitness Server" in the *RSA NetWitness Suite Licensing Management Guide* for instructions on remapping a license to a new MAC address." Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 43 - Retain MAC Address of Upgraded SA Server VM

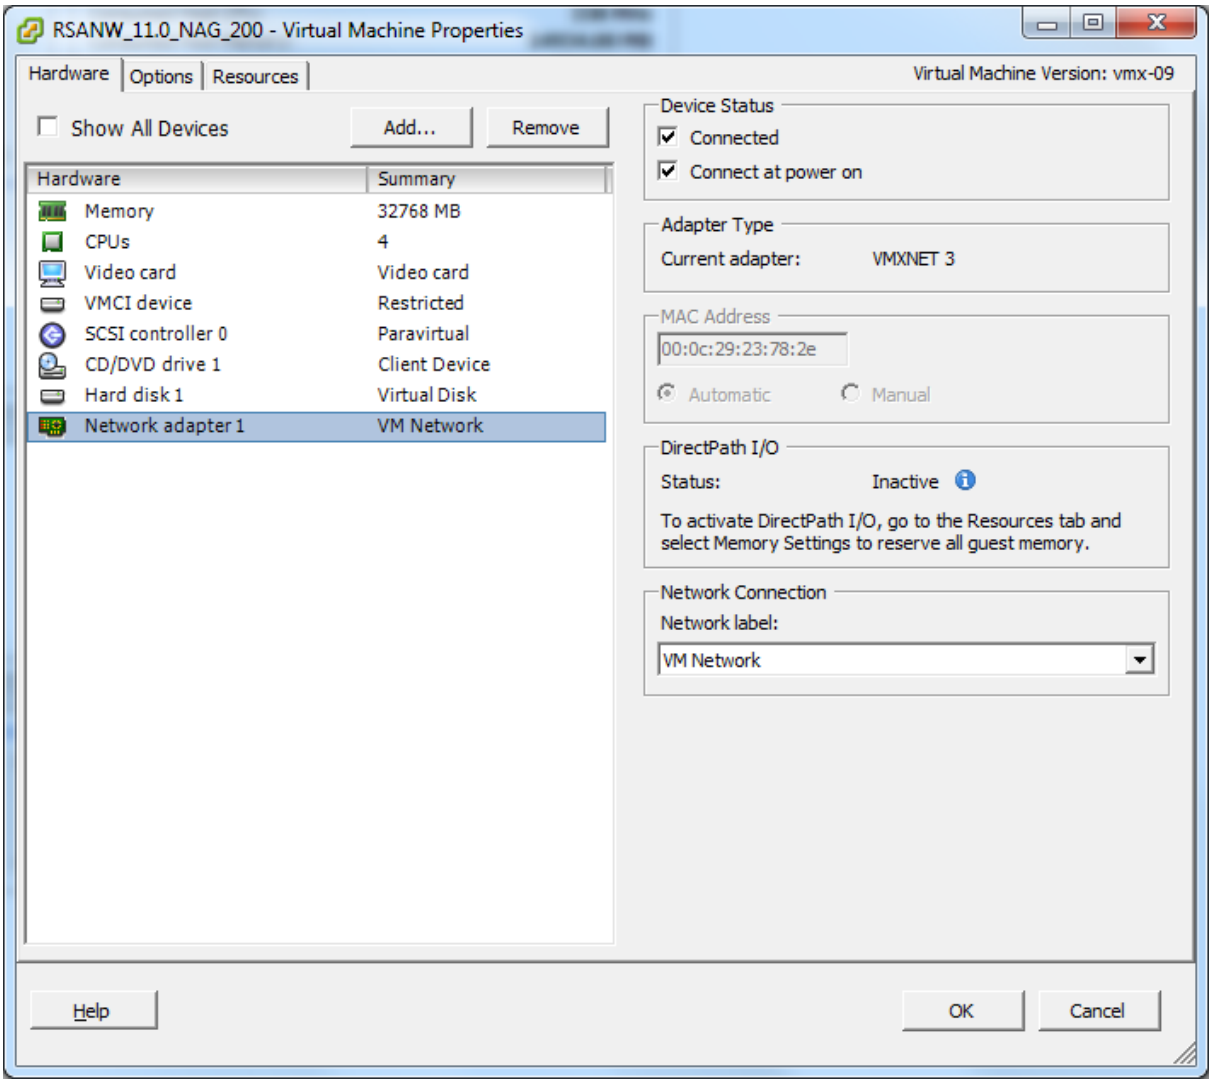
To retain the MAC address of migrated Security Analytics (SA) Server Virtual Machine (VM):

Note: These steps apply to the SA Server VM (created with "Automatic" MAC address assignment selected) to the 11.3 NetWitness Server. For VMs with a Static MAC address, you can change the MAC address by going to Edit Settings for a VM and typing in the MAC address.

1. Log in to vCenter server.

   Note: The supported versions of vCenter is 5.5 through 6.5 inclusive.

2. (Conditional) If vCenter server are powered on, **Power Off** both VMs (NetWitness 10.6.6.x and 11.3).
3. Click **Summary** tab, right-click **Datastore** and browse for the datastore location.
4. Go to the VM folder and download the `.vmx` file of 10.6.6.x and 11.3 to the local repository.
   By default, the VM generated with the MAC address is created in the format (as shown in the below figure).



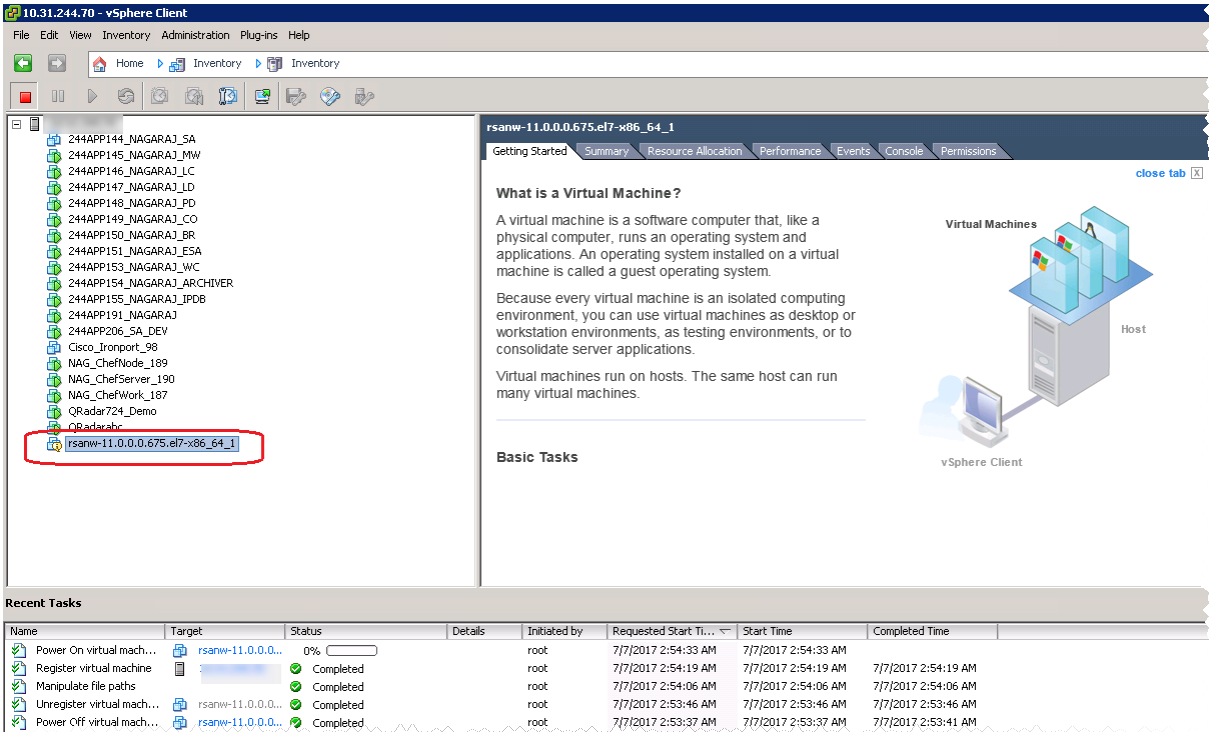
Note: 00:0c:29:XX:YY:ZZ – 00:0c:29 is the unique identifier for an automatically generated MAC address. **00:50:56:XX:YY:ZZ – 00:50:56** is the unique identifier for a static or manually generated MAC address. This is valid only if the vCenter is not deployed. If vCenter is deployed, this MAC address denotes the unique identifier for an automatically generated MAC address.

5. Using a text editor, copy the `uuid.location` and `ethernet0.generatedAddress` values from 10.6.6.x **.vmx** file into the 11.3 **.vmx** file.

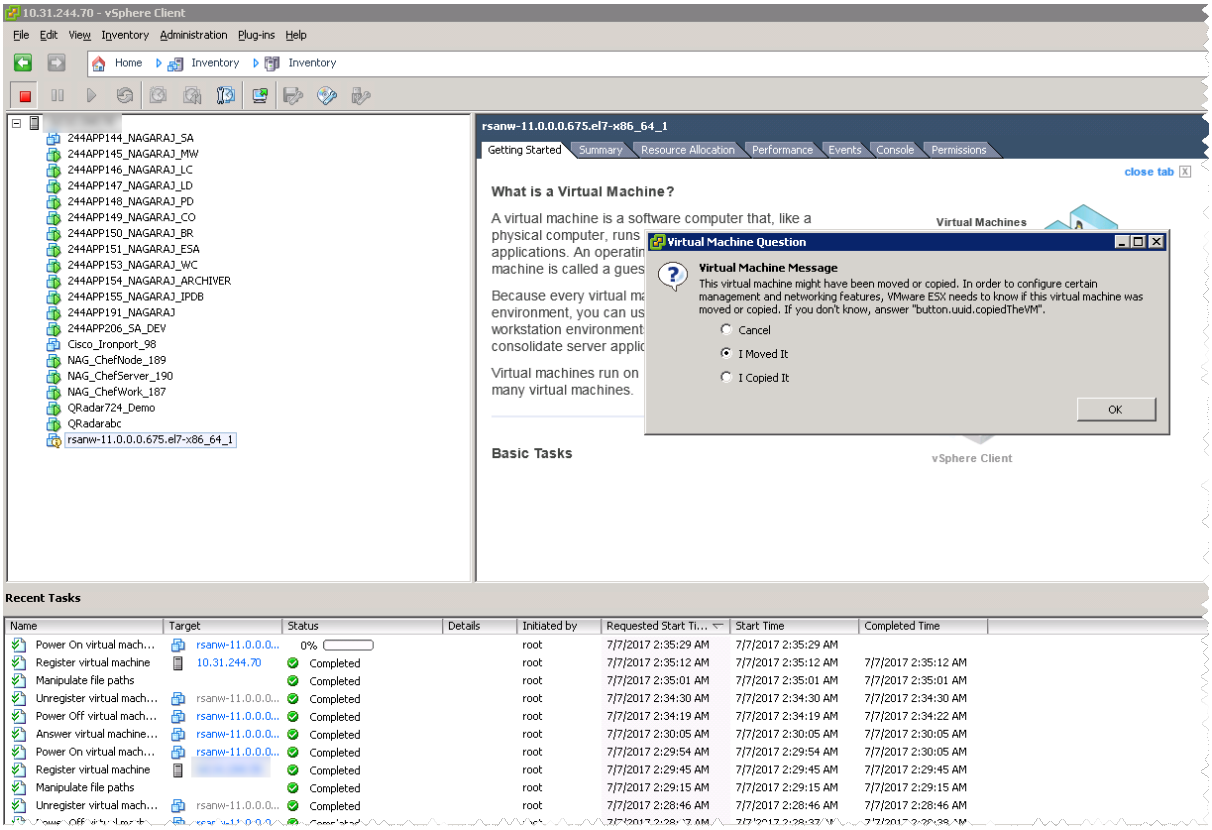
Note: If you deployed the 10.6.6.x stack on the ESX server directly (not through VCenter), you must copy the value for `uuid.bios` in addition to `uuid.location` and `ethernet0.generatedAddress` from 10.6.6.x **.vmx** file into the 11.3 **.vmx** file.

6. Remove both the 10.6.6.x and the 11.3 VMs from inventory.
   a. Navigate to the vCenter server.
   b. Right-click both the 10.6.6.x and the 11.3 VMs.
   c. Select Remove from Inventory.

7. Upload the modified 11.3 **.vmx** file to the datastore location by replacing it with the existing **.vmx** file.
8. From the datastore, right-click the 11.3 **.vmx** file and select Add to Inventory.
9. Navigate to the vCenter server and **Power On** the 11.3 VM.
   The following message is displayed.
   The virtual machine might have been moved or copied. In order to configure certain management and networking features, VMware ESX needs to know if this virtual machine was moved or copied. If you don't know, answer "I Copied it."



10. Right-click the VM and select **Guest** > **Answer Question**.
    The following figure is displayed.



11. Select **I Moved It**.
12. Click **OK**.
    The MAC address is retained to the MAC address from 10.6.6.x to 11.3.

Appendix A. Troubleshooting

This section describes problems that you may encounter during the upgrade with solutions. In most cases, NetWitness Platform creates log messages when it encounters these problems.

Note: If you cannot resolve any upgrade issue using the following troubleshooting solutions, contact Customer Support (https://community.rsa.com/docs/DOC-1294)

This section has troubleshooting documentation for the following services, features, and processes.

- 11.3 Setup Program (`nwsetup-tui`)
- Backup
- Event Stream Analysis
- General
- Log Collector Service (`nwlogcollector`)
- NW Server
- Reporting Engine

11.3 Setup Program (`nwsetup-tui`)

Problem	Host Setup Program (`nwsetup-tui`) exits and creates the following error message in `/var/log/netwitness/bootstrap/launch/security-server/security-server.log`: `<yyyy-mm-dd hh:mm:ss,nnn> [main] ERROR SystemOperation|Service startup failed. Running in safe mode org.h2.jdbc.JdbcSQLException: The database is read only [90097-193] at org.h2.message.DbException. getJdbcSQLException(DbException.java:345) ... at org.springframework.jdbc.datasource. AbstractDriverBasedDataSource.getConnection (AbstractDriverBasedDataSource.java:159) at com.rsa.asoc.security.upgrade.legacy. MigrationDatabase.<init>(MigrationDatabase.java:113)`
Cause	The H2 database needs write permission to complete the host setup.

Solution	From the NW Server command line, provide write permission to `H2.db`, restart the NW Server, and restart nwsetup-tui Setup Program.
	`chmod o+w /var/lib/netwitness/uax/db/platform.h2.db`
	`systemctl restart rsa-nw-security-server.service`
	`nwsetup-tui`

Backup (`nw-backup` script)

Message	`WARNING: Incorrect ESA Mongo admin password for host <hostname>.`
Cause	ESA Mongo admin password contains special characters (for example, '!@#$%^qwerty').
Solution	Change the ESA mongo admin password back to the original default of 'netwitness' before running backup. See "ESA Config: Change MongoDB Password for admin Account" the the *RSA NetWitness® Platform Event Stream Analysis Configuration Guide. Go to the* Master Table of Contents *to find all NetWitness Platform Logs & Network 11.x documents.*

Event Stream Analysis

Problem	ESA service crashes after you upgrade to 11.3 from a FIPS enabled setup.
Cause	ESA service is pointing to an invalid keystore.

Solution	1. SSH to the ESAPrimary host and log in.
	2. In the `/opt/rsa/esa/conf/wrapper.conf` file, replace the following line:
	`wrapper.java.additional.5=-Djavax.net.ssl.keyStore=/opt/rsa/esa/../carlos/keystore`
	with:
	`wrapper.java.additional.5=-Djavax.net.ssl.keyStore=/opt/rsa/carlos/keystore`
	3. Submit the following command to restart ESA .
	`systemctl restart rsa-nw-esa-server`
	Note: If you have multiple ESA hosts and you encounter that same problem, repeat steps 1 through 3 inclusive on each secondary ESA host.

General

Logs referred to in this section are posted to `/var/log/install/install.log` on the NW Server Host.

Message	`ERROR com.rsa.smc.sa.admin.web.controller.ajax.health. AlarmsController - Cannot connect to System Management Service`
Cause	NetWitness Platform sees the Service Management Service (SMS) as down after successful upgrade even though the service is running.
Solution	Restart SMS service using below command. `systemctl restart rsa-sms`

Message	`<timestamp> <host>: SMS_PostInstall: INFO: Free disk space on /opt is nGB` `<timestamp> <host>: SMS_PostInstall: WARN: Disk space check failed on /opt. The available disk space nGB is less than the recommended minimum disk space of 10GB.`
Cause	Low or insufficient disk space allocated for the SMS service.
Solution	RSA recommends that you provide a minimum of 10 GB of disk space for the SMS service to run optimally.

Problem	After you run the Setup Program for a non-NW Server host, you must go in to the UI, enable the host, and install the service on the host from the Hosts View. If you see "Install error View Details" in the **Status** column of the Hosts view, the host lost connectivity due to network issues.
Solution	Re-install the service on the host from the Hosts view.

Log Collector Service (`nwlogcollector`)

Log Collector logs are posted to `/var/log/install/nwlogcollector_install.log` on the host running the `nwlogcollector` service.

Message	`<timestamp>.NwLogCollector_PostInstall: Lockbox Status : Failed to open lockbox: The lockbox stable value threshold was not met because the system fingerprint has changed. To reset the system fingerprint, open the lockbox using the passphrase.`
Cause	The Log Collector Lockbox failed to open after the update.
Solution	Log in to NetWitness Platform and reset the system fingerprint by resetting the stable system value password for the Lockbox as described in the "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Message	*timestamp* `NwLogCollector_PostInstall: Lockbox Status : Not Found`
Cause	The Log Collector Lockbox is not configured after the update.
Solution	(Conditional) If you use a Log Collector Lockbox, log in to NetWitness Platform and configure the Lockbox as described in the"Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents..

Message	`<timestamp>: NwLogCollector_PostInstall: Lockbox Status : Lockbox maintenance required: The lockbox stable value threshold requires resetting. To reset the system fingerprint, select Reset Stable System Value on the settings page of the Log Collector.`
Cause	You need to reset the stable value threshold field for the Log Collector Lockbox.
Solution	Log in to NetWitness Platform and reset the stable system value password for the Lockbox as described in "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Problem	You have prepared a Log Collector for upgrade and no longer want to upgrade at this time.
Cause	Delay in upgrade.
Solution	Use the following command string to revert a Log Collector that has been prepared for upgrade back to resume normal operation. `# /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --revert`

NW Server

These logs are posted to `/var/netwitness/uax/logs/sa.log` on the NW Server Host.

Problem	After upgrade, you notice that Audit logs are not getting forwarded to the configured Global Audit Setup; or, The following message seen in the sa.log. `Syslog Configuration migration failed. Restart jetty service to fix this issue`
Cause	NW Server Global Audit setup migration failed to migrate from 10.6.6 to 11.3.
Solution	1. SSH to the NW Server. 2. Submit the following command. `orchestration-cli-client --update-admin-node`

Reporting Engine Service

Reporting Engine Update logs are posted to to`/var/log/re_install.log` file on the host running the Reporting Engine service.

Message	`<timestamp> : Available free space in /home/rsasoc/rsa/soc/reporting-engine [ existing-GB ] is less than the required space [ required-GB ]`
Cause	Update of the Reporting Engine failed because you do not have enough disk space.
Solution	Free up the disk space to accommodate the required space shown in the log message. See the "Add Additional Space for Large Reports" topic in the *Reporting Engine Configuration Guide* for instructions on how to free up disk space. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Appendix B. Stopping and Restarting Data Capture and Aggregation

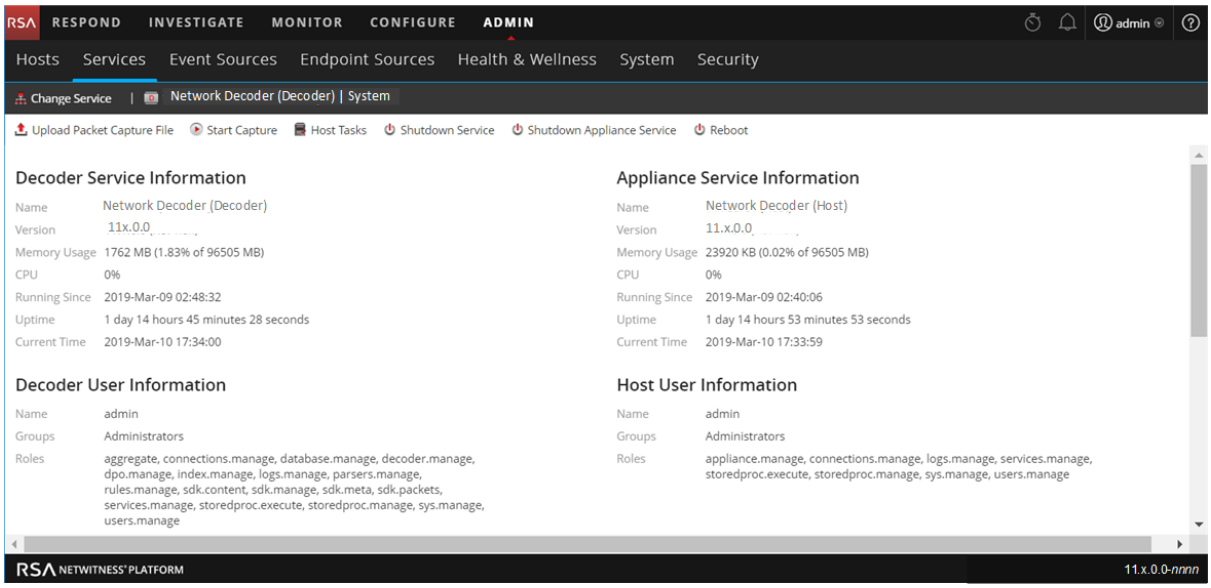
RSA recommends that you stop packet and log capture and aggregation before upgrading a Decoder, Concentrator, and Broker host to 11.3. If you do this, you must restart packet and log capture and aggregation after updating these hosts.

Stop Data Capture and Aggregation

Stop Packet Capture

To stop packet capture:

1. Log in to NetWitness Platform and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Decoder** service.



3. Under (actions), select **View** > **System**.
4. In the toolbar, click

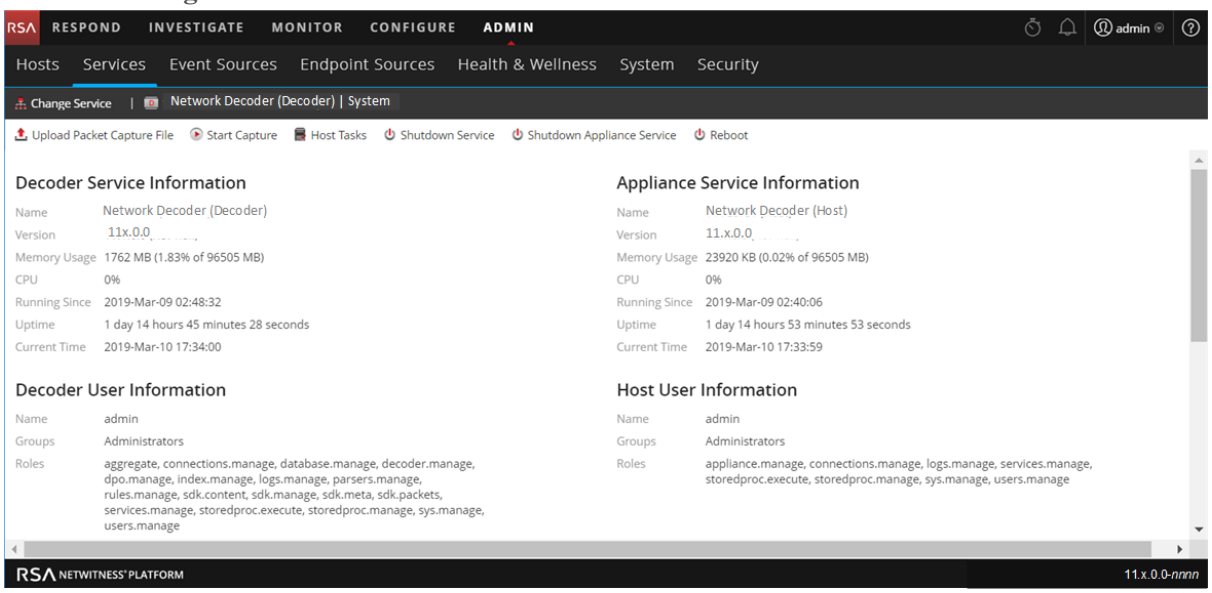
.

Stop Log Capture

To stop log capture:

1. Log in to NetWitness Platform and go to **ADMIN** > **Services**.
   The Services view is displayed.

2. Select each **Log Decoder** service.



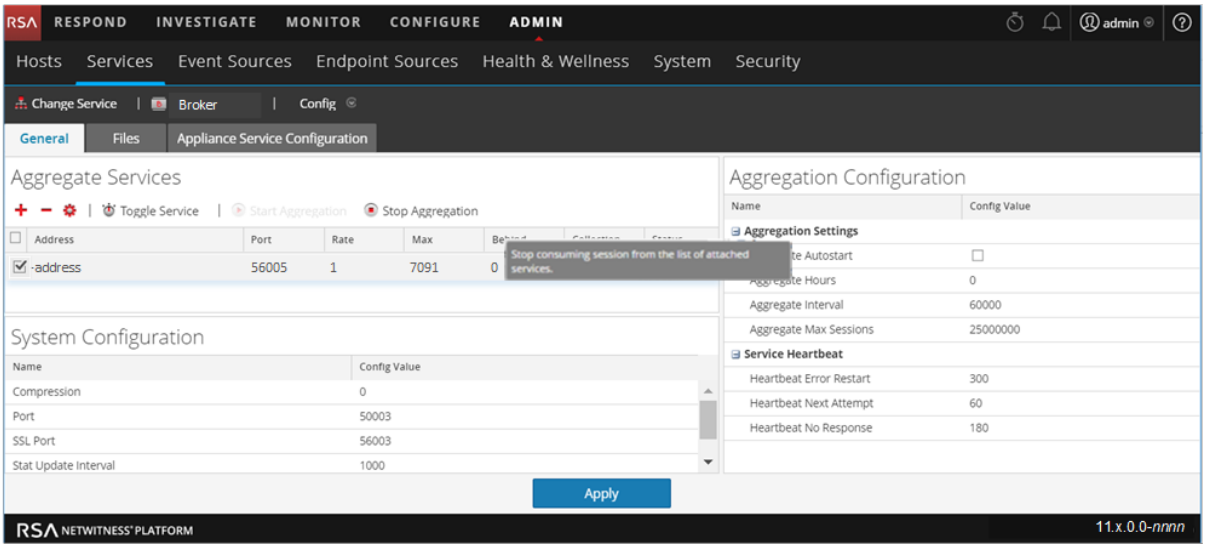
3. Under (actions), select **View** > **System**.

4. In the toolbar, click

.

Stop Aggregation

1. Log in to NetWitness Platform and go to **ADMIN** > **Services**.
2. Select the **Broker** service.
3. Under (actions), select **View** > **Config**.
4. The **General** tab is displayed.



5. Under **Aggregated Services** click 
.

Start Data Capture and Aggregation

Restart packet and log capture and aggregation after updating to 11.3.

Start Packet Capture

To start packet capture:

1. In the **NetWitness Platform** menu, select **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Decoder** service.
3. Under (actions), select **View** > **System**.
4. In the toolbar, click 
.

Start Log Capture

To start log capture:

1. In the **NetWitness Platform** menu, select **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Log Decoder** service.
3. Under (actions), select **View** > **System**.
4. In the toolbar, click 
.

Start Aggregation

During the upgrade from 10.6.6.x to 11.3, the Broker Service is restarted and this automatically starts aggregation.

Importing NetWitness Endpoint 4.4.0.x Configurations to NetWitness Platform10

Prerequisites 10

Import File and Certificate Status 10

Introduction

This guide provides instructions on how to migrate an existing NetWitness Endpoint 4.4.0.x to NetWitness Platform 11.3.

The migration broadly involves:

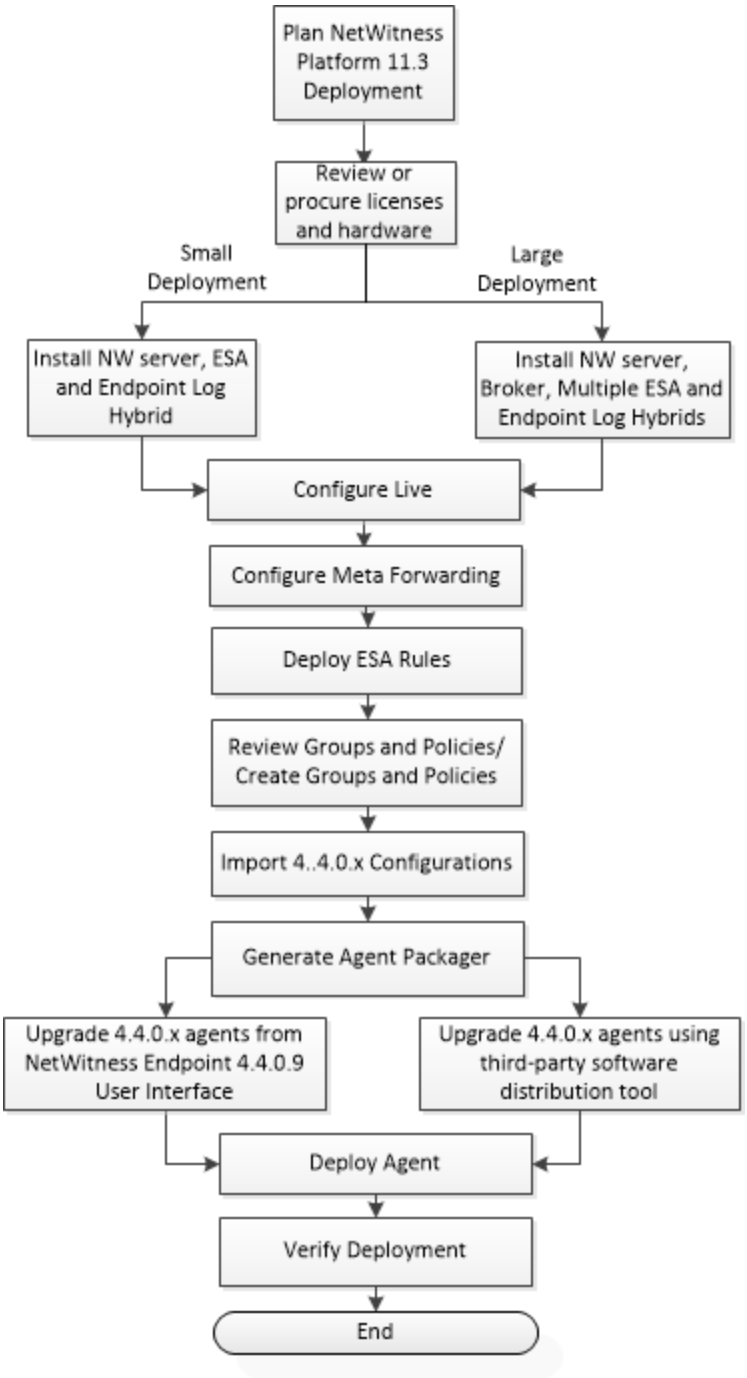
- Planning and setting up NetWitness Platform 11.3. Contact your account manager for sizing the deployment. For more information on sizing guidelines, see the *Virtual Host Installation Guide*.
- Importing file status, certificate status, and blocked hashes from NetWitness Endpoint 4.4.0.x to NetWitness Platform 11.3.

  Note: Endpoint scan and tracking data in the SQL database, users, IIOCs, custom queries, bad certificates, bad domains, bad IPs, and bad file hashes in NetWitness Endpoint 4.4.0.x cannot be migrated.
- Upgrading 4.4.0.x agents to 11.3.

For more information on the new features of NetWitness Endpoint 11.3, see the *Release Notes*.

Migration Flowchart

The following flowchart illustrates the migration process:



Note: The instructions for each step is provided in the sections below.

How to Find the List of Documents

If you want to view the NetWitness Platform product documentation, use the below links:

- HTML - https://community.rsa.com/community/products/netwitness/documentation
- PDF - https://community.rsa.com/community/products/netwitness/113

Migrating NetWitness Endpoint 4.4.0.x to NetWitness Platform 11.3

This topic describes tasks required to migrate NetWitness Endpoint 4.4.0.x to NetWitness Platform 11.3.

Task 1 - Plan your NetWitness Platform 11.3 Deployment

1. Review the Endpoint architecture and choose one of the following deployments based on number, distribution, and location of endpoints, and data collected from the agents. For more information, see the "NetWitness Endpoint Architecture" topic in the *Deployment Guide*.
   - Small deployment includes NetWitness Server, an Endpoint Log Hybrid, and Event Stream Analysis (ESA).
   - Large deployment includes NetWitness Server, one or more Endpoint Log Hybrids, one or more ESA.

     If you have multiple Endpoint Log Hybrids, install an Endpoint Broker. Once installed, it automatically queries all Endpoint servers in your deployment and provides a consolidated view of all Endpoint servers.

     Note: RSA recommends that you install the Endpoint Broker on the NetWitness Broker host. It is also supported on a separate host, NetWitness Server, and on an Endpoint Log Hybrid.
2. Review existing licenses and hardware, and procure them as required.

   Make sure you have the required hardware for your deployment. For more information, see the "Supported Hardware" topic in the *Physical Host Installation Guide*.

   If you have existing NetWitness Endpoint 4.4.0.x licenses, you do not need to procure a new license. Your existing NetWitness Endpoint 4.4.0.x licenses will be available on myRSA as a NetWitness Platform 11.3 license, with a different serial/license number.

   For more information, see the *Licensing Management Guide*.

Task 2 - Set up NetWitness Platform 11.3

1. Configure the ports on your firewall. For more information, see the "Network Architecture and Ports" topic in the *Deployment Guide*.
2. Install the following NetWitness Platform 11.3 components:
   - NetWitness Server
   - Endpoint Log Hybrid
   - ESA
   - Endpoint Broker (for more than one Endpoint Log Hybrids)

   For more information, see the *Physical Host Installation Guide*.

3. If you have NetWitness Endpoint 4.4.0.x licenses:
   - With NetWitness Platform - Map your entitlements to the existing license server.
   - Without NetWitness Platform:

     a. Install NetWitness Platform (see Task 2 - Set up NetWitness Platform 11.3)

     b. Obtain License Server ID

     c. Map entitlements
4. Verify if licenses are reflected on **ADMIN > System > Licenses**.

Task 3 - Configure NetWitness Platform for Endpoints

- Configure your RSA Live account and make sure the File Reputation service is enabled. For more information, see the *Live Services Management Guide*.
- Create users and assign appropriate roles. For more information, see the *System Security and User Management Guide*.
- Configure Endpoint Meta forwarding on Endpoint Log Hybrid. For more information, see the *NetWitness Endpoint Configuration Guide*.
- Deploy ESA rules.

  The existing NetWitness Endpoint 4.4.0.x IIOCs are available as out-of-the-box Application rules and automatically available on installation.

  You must configure the ESA Correlation server with an Endpoint Concentrator and deploy the ESA content for risk score calculation. For more information, see the *ESA Configuration Guide*.
- Review the default Agent Endpoint (EDR) policy and create groups as required. If you want to enable agents for log collection, review and apply the Windows Log policy.

  For more information, see the *NetWitness Endpoint Configuration Guide*.

Task 4 - Import NetWitness Endpoint 4.4.0.x Configurations

Import file status, certificate status, and blocked hashes from NetWitness Endpoint 4.4.0.x to NetWitness Platform. For more information, see Importing NetWitness Endpoint 4.4.0.x Configurations to NetWitness Platform.

Task 5 - Set up Other NetWitness Endpoint 4.4.0.x Configurations

You have to manually set up the following configurations:

- Deploy Blacklisted IP addresses and other feeds that are relevant for your deployment from RSA Live through the NetWitness Platform user interface.
- (Optional) For any other external threat feeds, such as blacklisted IP address, domain, and checksum, that you may want to use to tag endpoint metadata, see the "Create a Custom Feed" topic in the *Live*

Services Management Guide.

For example, to notify an analyst about any communication from a host or file to a certain blacklisted IP address, domain, or hash, create a feed on the Log Decoder, and tag appropriate sessions for investigation and alerting .

- (Optional) Review custom IIOCs and write Endpoint rule. For more information, see the "Custom Endpoint Rule for Risk Scoring" topic in the *NetWitness Endpoint Configuration Guide*.

Task 6 - Deploy Agents

1. Generate an agent packager from NetWitness Platform 11.3.
2. Copy the agent packager (`AgentPackager.zip`) to a Windows machine and generate the 11.3 agent installers.
3. Do one of the following to upgrade 4.4.0.x agents to 11.3:
   - If you have NetWitness Endpoint 4.4.0.9 Console Server, copy the agent installers to the NetWitness Endpoint Console Server, and upgrade from the NetWitness Endpoint user interface.
   - If you have 4.4.0.0 or 4.4.0.8, copy the agent installers, and use the third-party software distribution tool.
4. Deploy the agents.

For more information, see the *NetWitness Endpoint Agent Installation Guide*.

Task 7 - Verify the Agent Migration

After the agent migration, verify the following:

- Agents are able to communicate with the Endpoint Server and are listed in the INVESTIGATE > Hosts view.
- Perform a scan and make sure that the snapshot details are displayed in the INVESTIGATE > Host Details view.
- Hosts metadata is available in INVESTIGATE > Navigate and Event Analysis view.

  If the Windows Log collection is enabled, make sure that the Windows logs are available in the Navigate and Event Analysis view.
- File reputation, file status, risk scores are available in Hosts and Files view.

For detailed information on the features supported in NetWitness Platform 11.3, see the *NetWitness Endpoint Configuration Guide*.

Importing NetWitness Endpoint 4.4.0.x Configurations to NetWitness Platform

You can import file status, certificate status, and blocked hashes from NetWitness Endpoint 4.4.0.x to NetWitness Platform using the MigrationHelper python script.

Note: The MigrationHelper python script must be run only on a Windows host.

You can download the script from RSA Link:

RSA NetWitness Platform > **Downloads** > **RSA NetWitness Logs & Network** > **Version 11.3** > **Tools**.

Prerequisites

To run the python script:

- Install Python 3.6.x or later on a Windows host that can connect to the NetWitness Endpoint 4.4.0.x primary database.
- Install pyodbc by downloading the wheel file from https://pypi.org/project/pyodbc/#files, and run the following command:

  ```
  pip install wheel-file.whl
  ```

- If json and os.path libraries are not available on Python installation, install these libraries by downloading the corresponding wheel file from https://pypi.org/, and run the following command:

  ```
  pip install wheel-file.whl
  ```

Import File and Certificate Status

Note: If the certificate status is graylisted in NetWitness Endpoint, this status is not exported as graylist is not supported for certificates in NetWitness Platform 11.3.

1. Run the MigrationHelper python script.

   Note: Run this script from any host that has access to NetWitness Endpoint primary database.

2. Enter the following:
   a. Database server host name or IP address (for example, 10.40.40.10)
   b. Database name (for example, ECATPrimary)
   c. Database credentials
3. Enter the path to store the exported files and press **Enter**. Make sure that the path exist. The file and certificate status are exported to JSON files.
4. Log in to the Context Hub server and copy the exported file to the `/var/netwitness/contexthub-server/data/` directory.
5. On the NW server, run the `nw-shell` command from the command line.

Note: Make sure all Endpoint servers on NetWitness Platform 11.3 are online while importing data.

6. Run the `login` command and enter the credentials.
7. Connect to the Context Hub server using the following command:

   ```
   connect --service contexthub-server
   ```

8. Run the following commands to import the file status:

   ```
   cd contexthub/file/status/import
   show
   invoke <file path>/FileStatus.json
   ```

   Note: `<file path>` is the path in the Context Hub server where the file is saved. The Context Hub server is located in the ESA primary host.

9. Run the following commands to import the certificate status:

   ```
   cd contexthub/certificate/status/import
   show
   invoke <file path>/CertificateStatus.json
   ```

   Note: `<file path>` is the path in the Context Hub server where the file is saved. The Context Hub server is located in the ESA primary host.

10. Check the progress of the import in the `/var/log/netwitness/contexthub-server/contexthub-server.log` file.

    Once the import is complete, a message `Imported File status successfully` or `Imported Certificate status successfully` is displayed in the log file.

If you want to unblock the imported 4.4.0.x blocked files:

1. On the NW server, run the `nw-shell` command from the command line.
2. Run the `login` command and enter the credentials.
3. Connect to the Context Hub server using the following command:

   ```
   connect --service contexthub-server
   ```

4. Run the following commands to unblock the file status:

   ```
   cd contexthub/file/status/unblock
   invoke <checksum of blocked file>
   ```

Packager Issue 19

Introduction

Note: The information in this guide applies to Version 11.1 and later.

Hosts can be laptops, workstations, servers, physical or virtual, where a supported operating system is installed. An Endpoint Agent can be deployed on a host with either a Windows, Mac, or Linux operating system. The installation process involves:

1. Generating an agent packager
2. Generating the agent installer

You can run the agent installer specific to your operating system to deploy agents on the hosts. The agents collect endpoint data and tracking events from these hosts. It monitors key behaviors related to process, file, registry, console, and network, and forwards them as events to the Endpoint Server over HTTPs.

Supported Operating Systems

Windows

The agent software runs on the following Windows operating systems:

- Windows 7 (32 and 64-bit)
- Windows 8 (32 and 64-bit)
- Windows 8.1 (32 and 64-bit)
- Windows 10 (32 and 64-bit) (up to version 1809)
- Windows 2008 R2 (32 and 64-bit)
- Windows 2012 Server
- Windows 2012 Server R2
- Windows 2016 Server
- Windows 2019 Server

Linux

The agent software runs on either i386 or x84_64 architecture and on the following Linux operating systems:

- CentOS 6.x and 7.x
- Red Hat Linux 6.x and 7.x

Mac

The agent software runs on the following Mac operating systems:

- macOS X 10.9 (Mavericks)
- macOS X 10.10 (Yosemite)
- macOS X 10.11 (El Capitan)
- macOS X 10.12 (Sierra)
- macOS 10.13 (High Sierra)
- macOS 10.14 (Mojave)

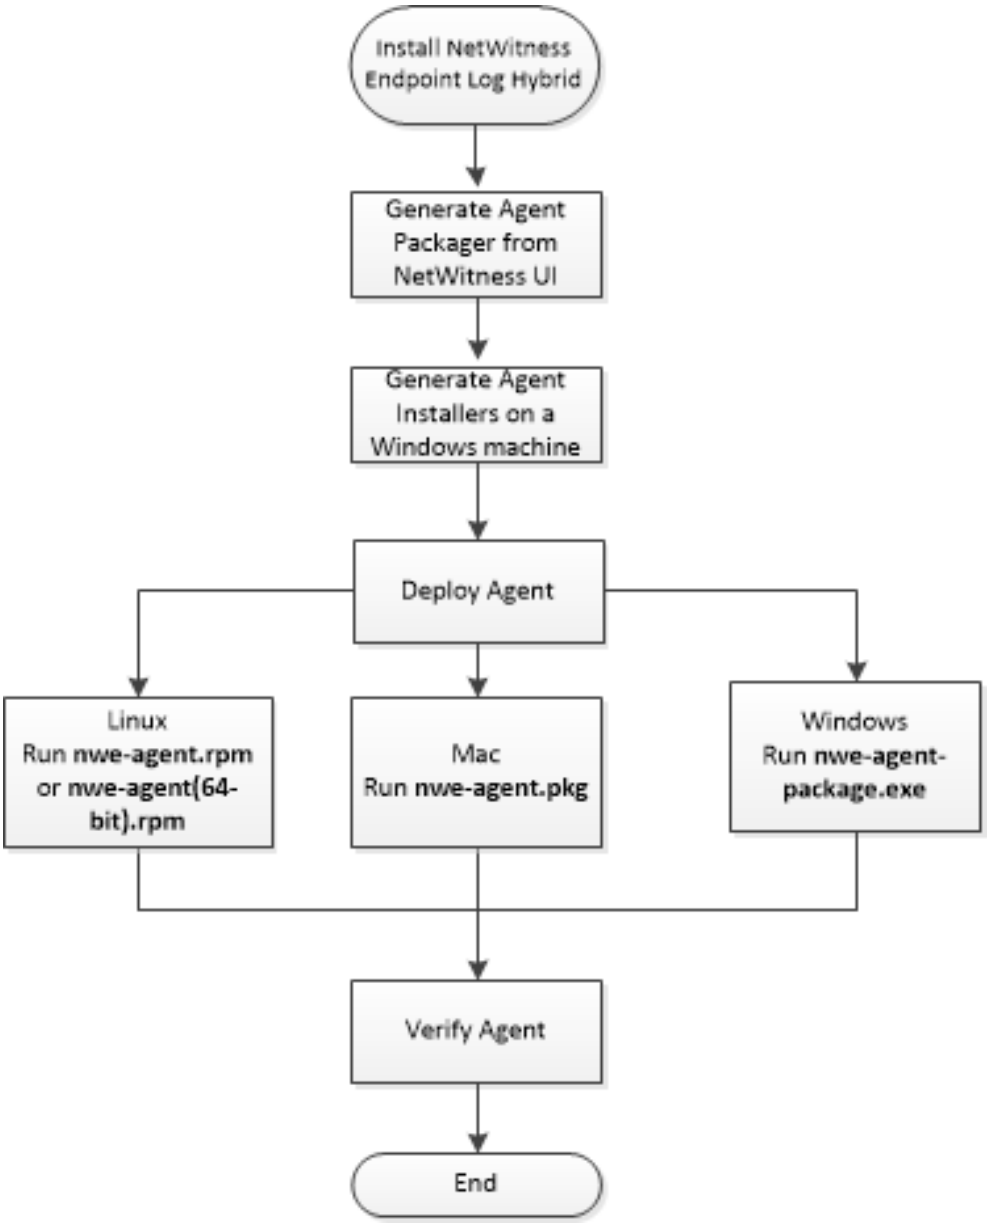
Hardware Requirements

The following are the minimum hardware requirements to deploy an agent:

- 256 MB RAM
- 300 MB disk space
- Single-core CPU

Installation Flowchart

The following flowchart illustrates the Endpoint agent installation process:



Install NetWitness Endpoint Log Hybrid
Generate Agent Packager from NetWitness UI
Generate Agent Installers on a Windows machine
Deploy Agent
Linux
Run nwe-agent.rpm or nwe-agent(64-bit).rpm
Mac
Run nwe-agent.pkg
Windows
Run nwe-agent-package.exe
Verify Agent
End

Prerequisites

- Install RSA NetWitness Platform. For more information, see the *Physical Host Installation Guide* or *Virtual Host Installation Guide*.
- Install NetWitness Endpoint Log Hybrid. For more information, see the *Physical Host Installation Guide* or *Virtual Host Installation Guide*.
- Deploy ESA Rules from the Endpoint Rule Bundle. For more information, see *ESA Configuration Guide*.
- Configure Endpoint Metadata forwarding. For more information, see *NetWitness Endpoint Configuration Guide*.
- Review the default policies and create groups to manage your agents. For more information, see *NetWitness Endpoint Configuration Guide*.

Generate an Endpoint Agent Packager

To generate an agent packager to collect endpoint data from hosts:

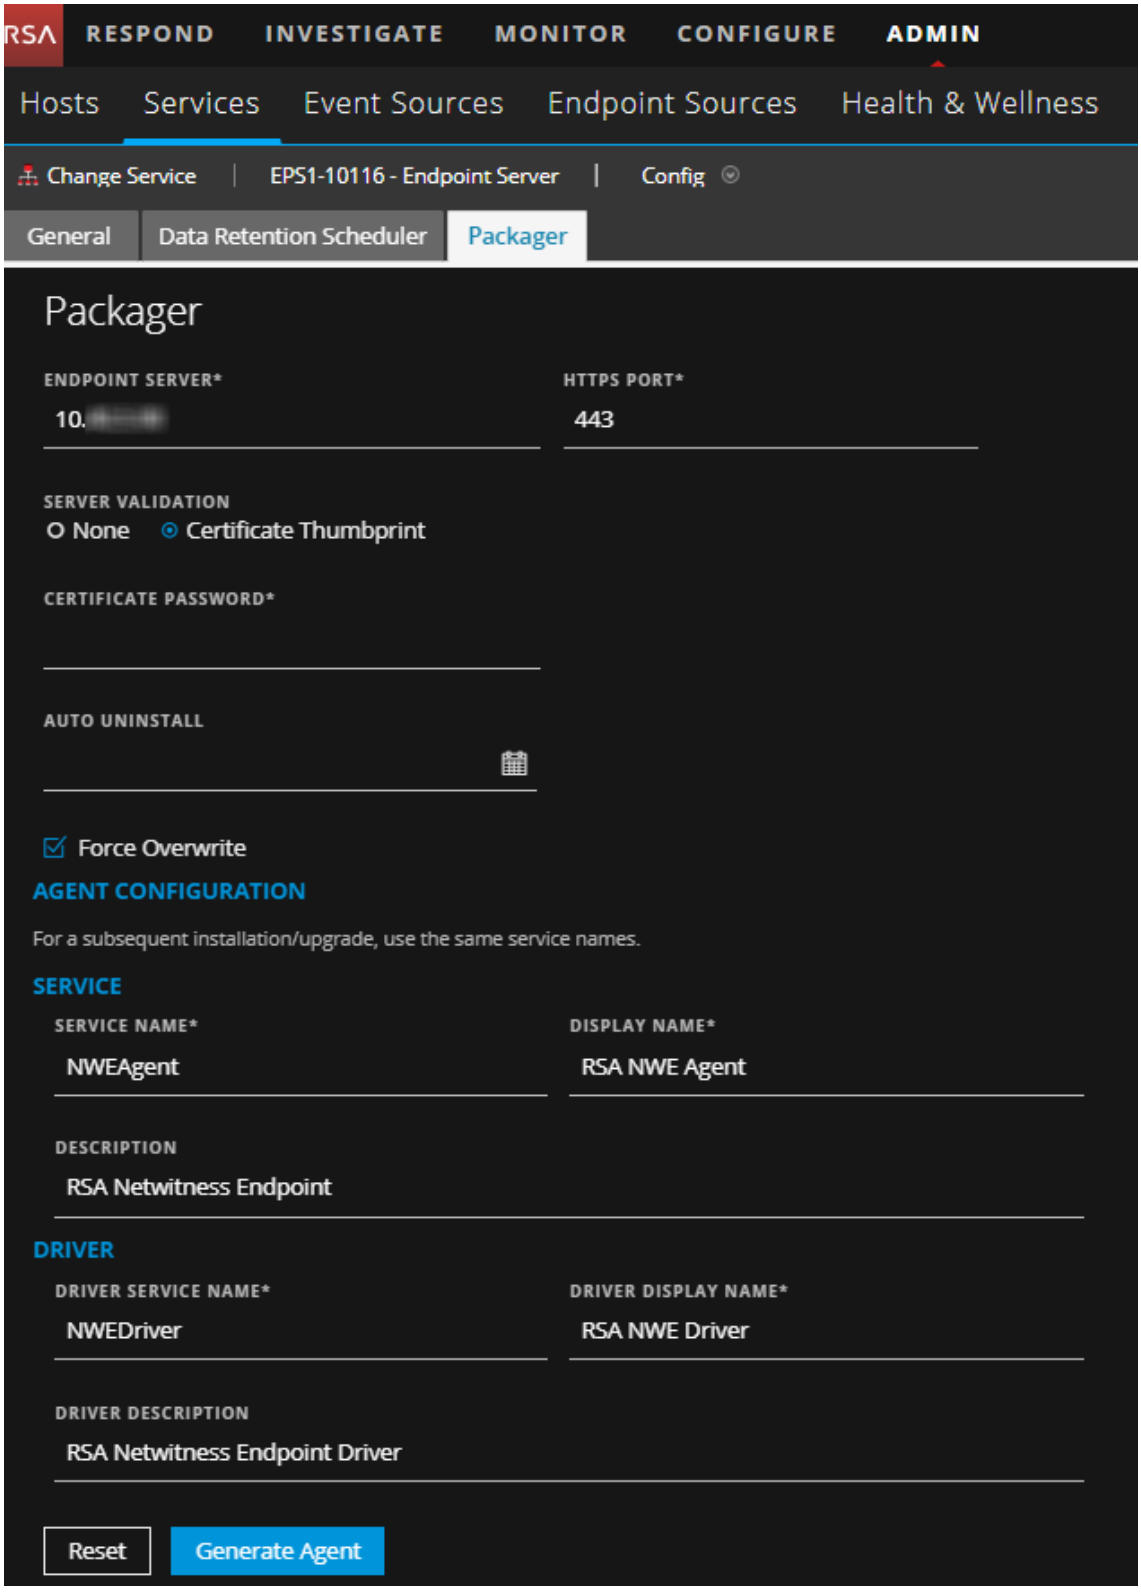
1. Log in to NetWitness Platform.

   Type `https://<NW-Server-IP-Address>/login` in your browser to get to the NetWitness Platform Login screen.

2. Click **ADMIN > Services**.

3. Select the **Endpoint Server** service and click **> View > Config > Packager** tab. The

Packager tab is displayed.



4. Enter the values in the following fields:

Field	Description
Endpoint Server	Host name or IP address of the Endpoint Server. For example, 10.10.10.3.
HTTPS Port	Port number. For example, 443.
Server Validation	Determines how the agent validates the Endpoint Server certificate: • None – The agent will not validate the server certificate. • Certificate Thumbprint – default selection. The agent identifies the server by validating the thumbprint of the Root CA of the server certificate.
Certificate Password	Password used to download the packager. The same password is used while generating the agent installer. For example, netwitness.
Auto Uninstall	Date and time the agent automatically uninstalls. You can leave it blank if not required.
Force Overwrite	Overwrites the installed Windows agent regardless of the version. If this option is not selected, the same installer can be run multiple times on a system, but installs the agent only once. If you enable this option, make sure that you provide the same service name and driver service name as the previously installed agent, while creating a new agent. **Note:** If you want to force overwrite with MSI, run the following command: `msiexec /fvam <msifilename.msi>`
Agent Configuration	
Note: The following Service and Driver fields are applicable only for Windows.	
Service	
Service Name	Name of the agent service. For example, NWEAgent.
Display Name	Display name of the agent service. For example, NWE.
Description	Description of the agent service. For example, RSA NetWitness Endpoint.
Driver	
Driver Service Name	Name of the driver service. For example, NWEDriver.
Driver Display Name	Display name of the driver service. For example, RSA NWE Driver.
Driver Description	Description of the driver service. For example, RSA Netwitness Endpoint Driver.
Generate Agent	Generates an agent packager.

5. Click **Generate Agent**.

This downloads an agent packager (**AgentPackager.zip**) on the host where you are accessing the NetWitness Platform user interface.

Generate Endpoint Agent Installers

To generate endpoint agent installers to deploy on hosts:

Note: Use a Windows machine to execute the agent packager file.

1. Unzip the **AgentPackager.zip** file. It includes the following:
   - **agents** folder – Contains executables for Linux, Mac, and Windows.
   - **config** folder – Contains configuration file and the certificates required to communicate between the Endpoint Server and the agent.
   - **AgentPackager.exe** file.
2. Run the **AgentPackager.exe** file.
3. Enter the same password used while generating the agent packager and press **Enter**.
   This creates the following installers in the root folder:
   - nwe-agent-package.exe (for Windows)
   - NWE000032.msi (for Windows)
   - NWE000064.msi (for Windows)
   - nwe-agent.pkg (for Mac)
   - nwe-agent.rpm (for Linux 32-bit)
   - nwe-agent(64-bit).rpm (for Linux 64-bit)

   Note: The MSI files should not be renamed.

Deploy and Verify Endpoint Agents

This section provides instruction on how to deploy and verify agents.

Note: By default, the agent is installed in the Insights mode. Depending on the policy assigned, the agent can operate in Insights or Advanced mode. Make sure you review the policy before deploying the agent. For more information, see *NetWitness Endpoint Configuration Guide*.

Deploying Agents (Windows)

To deploy the agent, run the **nwe-agent-package.exe** file on the hosts you want to monitor.

Verifying Windows Agents

After deploying the Windows agents, you can verify if a Windows agent is running by using any of the following methods:

- Using the NetWitness UI

  The Investigate > Hosts view contains the list of all hosts with an agent. You can look for the host name on which the agent is installed.

  Note: Click **Investigate** > **Hosts** or press F5 to refresh the list for latest data.

- Using Task Manager

  Open Task Manager and look for service name that you configured while generating the agent packager on the host machine.

- Using Services.msc

  Open `Services.msc` in run and look for NWEAgent.

Deploying Agent (Linux)

To deploy the agent, run the **nwe-agent.rpm** (for 32-bit) or **nwe-agent(64-bit).rpm** (for 64-bit) file on the hosts you want to monitor.

To run the command, open Terminal on the Linux machine and run the following command as root:

```
rpm -iv <installer file name>.rpm
```

For example, using the default installer file names, you could enter one of the following commands:

`rpm -iv nwe-agent.i686.rpm` (for i386 architecture)

`rpm -iv nwe-agent.x86_64.rpm` (for x84_64 architecture)

(Enter the administrator password when prompted.)

Verifying Linux Agents

After deploying the Linux agents, you can verify if a Linux agent is running by using any of the following methods:

- Using the NetWitness UI

  The Investigate > Hosts view contains the list of all hosts with an agent.

  Note: Click **Investigate > Hosts** or press F5 to refresh the list for latest data.

- Using Command Line

  Run the following command to get the PID:

  ```
  pgrep nwe-agent
  ```

- To check the NetWitness Endpoint version, run the following command:

  ```
  cat /opt/rsa/nwe-agent/config/nwe-agent.config | grep version
  ```

Deploying Agent (Mac)

To deploy the agent, run the **nwe-agent.pkg** file on the hosts you want to monitor.

Verifying Mac Agents

After deploying the Mac agents, you can verify if a Mac agent is running by using any of the following methods:

- Using the NetWitness UI

  The Investigate > Hosts view contains the list of all hosts with an agent.

  Note: Click **Investigate > Hosts** or press F5 to refresh the list for the latest data.

- Using Activity Monitor

  Open Activity Monitor (/Applications/Utilities/Activity Monitor.app) and look for NWEAgent.

- Using Command Line

  Run the following command to get the PID

  ```
  pgrep NWEAgent
  ```

- To check the NetWitness Endpoint version, run the command:

  ```
  grep a /var/log/system.log | grep NWEAgent | grep Version
  ```

Configuring the Communication Between Endpoint Server and Endpoint Agents on Windows Vista, and 2008 Server

By default, the FIPS mode is enabled on the Endpoint Server, which means that agents installed on Windows Vista, and 2008 Server cannot communicate with the Endpoint server.

To resolve this, perform the following steps on the Endpoint Log Hybrid to disable the FIPS mode:

1. Go to `/etc/pki/tls/owb.cnf` and edit the file to disable the FIPS mode.

```
# FIPS Mode
#   Configures the BSAFE Libraries to be in FIPS Mode.
#
#   Values: "on", "off".
#   Default: "off"
fips mode = off
```

2. Go to `/etc/nginx/conf.d/nginx.conf` and edit the file to comment the following lines:

```
#    ssl_ciphers AES256+EECDH:AES256+EDH:!aNULL;
#    ssl_prefer_server_ciphers on;
```

3. Restart the Nginx server using the following command:

```
systemctl restart nginx
```

Uninstall Agents

This section provides the commands to uninstall the agent.

Uninstalling Windows Agent

Run the following command:

```
msiexec /x{63AC4523-5F19-42F0-BC43-97C8B5373589}
```

Uninstalling Linux Agent

Run the following command:

```
rpm –ev nwe-agent
```

Uninstalling Mac Agent

Run the following commands:

1. `sudo launchctl unload /Library/LaunchDaemons/com.rsa.nwe.agent.daemon.plist`
2. `sudo rm -Rf /usr/local/nwe`
3. `sudo rm -Rf '/Library/Application Support/NWE'`
4. `sudo rm –Rf /Library/LaunchDaemons/com.rsa.nwe.agent.daemon.plist`
5. `sudo pkgutil –-forget com.rsa.pkg.nwe`

Upgrade Agents

You can upgrade the following versions of Endpoint agent to 11.3:

- 4.4.0.0, 4.4.0.8, and 4.4.0.9
- 11.1.x and later

Note: For a subsequent installation or upgrade, use the same service and driver service name.

To upgrade from 11.1.x and later, download the 11.3 agent packager, and deploy the agent. For more information, see Generate an Endpoint Agent Packager. After upgrading, the same host can be listed twice under **Investigate > Hosts** due to a change in the agent ID. To delete hosts with older agent version, see *NetWitness Endpoint User Guide.*

Note: This is only applicable for Windows hosts. The agent ID remains the same for Linux and Mac.

To upgrade from 4.4.0.x, see *NetWitness Endpoint 4.4.0.x to NetWitness Platform 11.3 Migration Guide*.

Recommendations for Installing Agents in Virtual Desktop Infrastructure (VDI) Environment

Agent ID is generated based on various parameters, such as security identifier (SID) and SMBIOS Universal Unique Identifier (UUID). A SMBIOS UUID is a 128-bit number used to uniquely identify a host.

When you clone a VDI image, make sure that the SMBIOS UUID changes on the following VDIs to avoid duplication of agent IDs:

- Citrix XenServer
- VMWare Workstation

  Note: In the .vmx file, make sure the `uuid.action = keep` is not set. For more information, see Configure a Virtual Machine to Keep the Same UUID.

- VMware vCloud Director

  For more information, see VMware Knowledge Base.

- vCenter hosted ESXi Server

To get the SMBIOS UUID on a virtual host, execute the following command:

```
wmic csproduct get UUID
```

Troubleshooting

This section provides information about possible issues when using the RSA NetWitness Endpoint.

Packager Issue

Issue	Failed to generate the agent installers.
Explanation	Some encryption software may create additional files that fails to generate the agent installers.
Resolution	Copy the packager to a machine that does not have antivirus or encryption software and then generate the agent installers.

Introduction

The instructions in this guide apply to physical hosts exclusively. See the RSA *Virtual Host Installation Guide for RSA NetWitness Platform 11.3* for instructions on how to set up virtual hosts in 11.3.

Note: Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Supported Hardware

Series 4, Series 4S, Series 5, and Series 6.

Refer to the RSA *NetWitness Platform* Hardware Setup Guides for detailed information on each series type (https://community.rsa.com/community/products/netwitness/hardware-setup-guides).

Endpoint Log Hybrid Host Hardware Specifications

Series 5 (Dell R730) hardware or Series 6 (Dell R740 hardware. See "(Optional) Task 2 - Install Endpoint Log Hybrid" in Post Installation Tasks for instructions on how to install the Endpoint Log Hybrid.

Note: If you have RSA NetWitness® Endpoint 4.x hardware, you can re-purpose the same for NetWitness Endpoint Log Hybrid 11.3.

RSA NetWitness UEBA Host Hardware Specifications

S5 (Dell R630 appliance) or S6 (Dell R640) hardware. See "(Optional) Task 3 - Install NetWitness UEBA" in Post Installation Tasks for instructions on how to install NetWitness UEBA.

SERIES 5 (DELL R630) SPECIFICATIONS

Specification	Capacity
Model	Dell PowerEdge R630xl
Processor Type	Intel Xeon E5 -2680v3
Processor Speed	2.5 GHz
Cache	30MB
Number of Cores	12
Number of Processors	2
Number of Threads	24
Total Memory	256GB
Internal Disk Controller	Dell PERC H730
External Disk Controller	Dell PERC H830

Specification	Capacity
SAN Connectivity (HBA) - Optional	N/A
Remote Management Card	iDRAC8 Enterprise
Drives	Total - 6 Drives 2 x 1TB, 2.5" HDD 4 x 2TB, 2.5" HDD
Chassis	1U
Weight	18.4 kg (40.5 lbs)
NIC Card*	On Board 2 x 10 Gb Copper 2 x 10 Gb & 2 x 1Gb Copper (Other options are available)
Dimensions	H: 4.28 cm (1.68 in.) x W: 48.23 cm (18.98 in.) x D: 75.51 cm (29.72 in.)
Power	1100W Redundant
BTU/hr	4100 BTU/hr (max)
Amps (Spec)	1100W / 220VAC = 5A
Actual Amp Draw (Post Startup)	2.1 Amps
Events Per Second (EPS)	100K EPS
Throughput	N/A

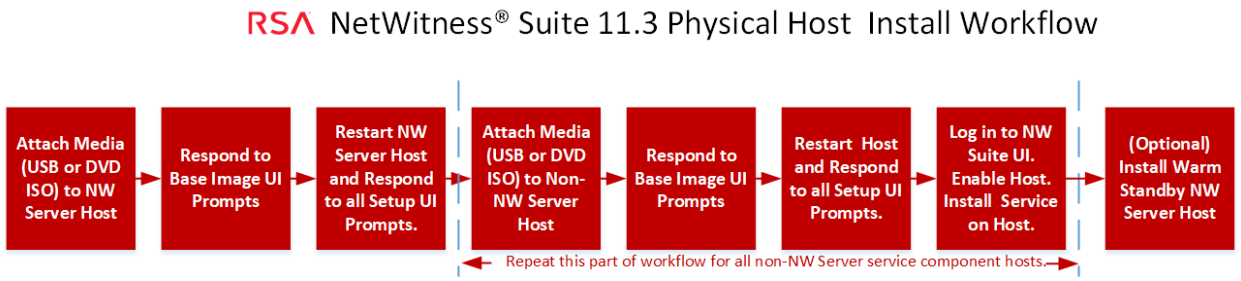
* NIC Card options are available for swap with on-board daughter card or add on.

External Attached Storage

If you have an external storage device or devices (for example, DACs or PowerVaults) attached to a physical host, refer to the Hardware Setup Guides for information on how to configure this storage on RSA Link (https://community.rsa.com/community/products/netwitness/hardware-setup-guides)."

Physical Host Installation Workflow

The following diagram illustrates the RSA NetWitness® Platform 11.3 Physical Host Installation workflow.



Contact Customer Support

Refer to the Contact RSA Customer Support page (https://community.rsa.com/docs/DOC-1294) in RSA Link for instructions on how to get help on RSA NetWitness Platform 11.3.

Installation Preparation - Open Firewall Ports

The"Network Architecture and Ports" topic in the *Deployment Guide for RSA NetWitness Platform 11.3* lists all the ports in a deployment.

Caution: Do not proceed with the installation until the ports on your firewall are configured.

Installation Tasks

This topic contains the tasks you must complete to install NetWitness Platform 11.3 on physical hosts.

Complete the major installation tasks in the following order.

Task 1 - Install 11.3 on the NetWitness Server (NW Server) Host

Task 2 - Install 11.3 on All Other Component Hosts

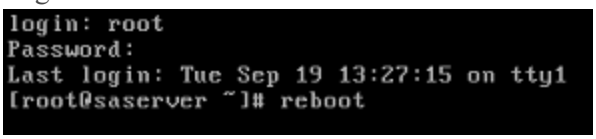
Task 3 - (Optional) - Install Warm Standby NW Server Host

Task 1 - Install 11.3 on the NetWitness Server (NW Server) Host

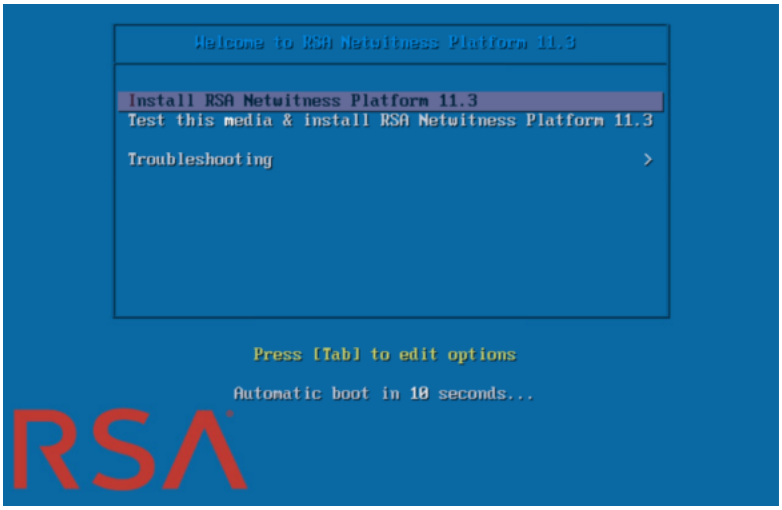
Complete the following steps to install the 11.3 NW Server host.

1. Create a base image on the host:
   a. Attach media (ISO) to the host.
   See the *USB Build Stick Instructions for RSA NetWitness 11.3 and Later* for more information.
      - Hypervisor installations - use the ISO image.
      - Physical media - use the ISO to create bootable flash drive media the **Etcher®** or another suitable imaging tool etch an Linux file system on the USB drive.Etcher is available at: https://etcher.io.
      - iDRAC installations - the virtual media type is:
        - **Virtual Floppy** for mapped flash drives.
        - **Virtual CD** for mapped optical media devices or ISO file.

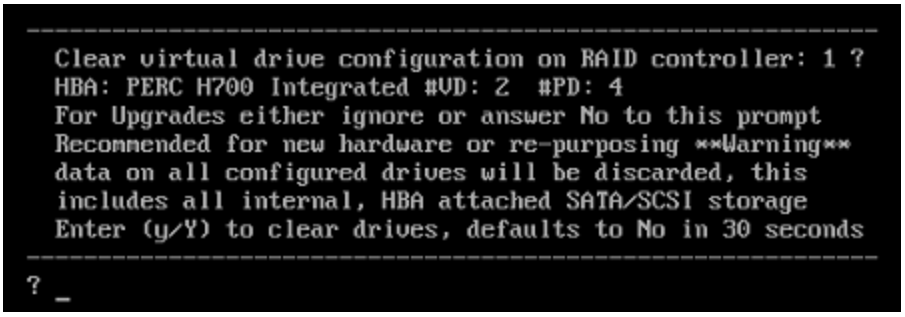
   b. Log in to the host and reboot it.



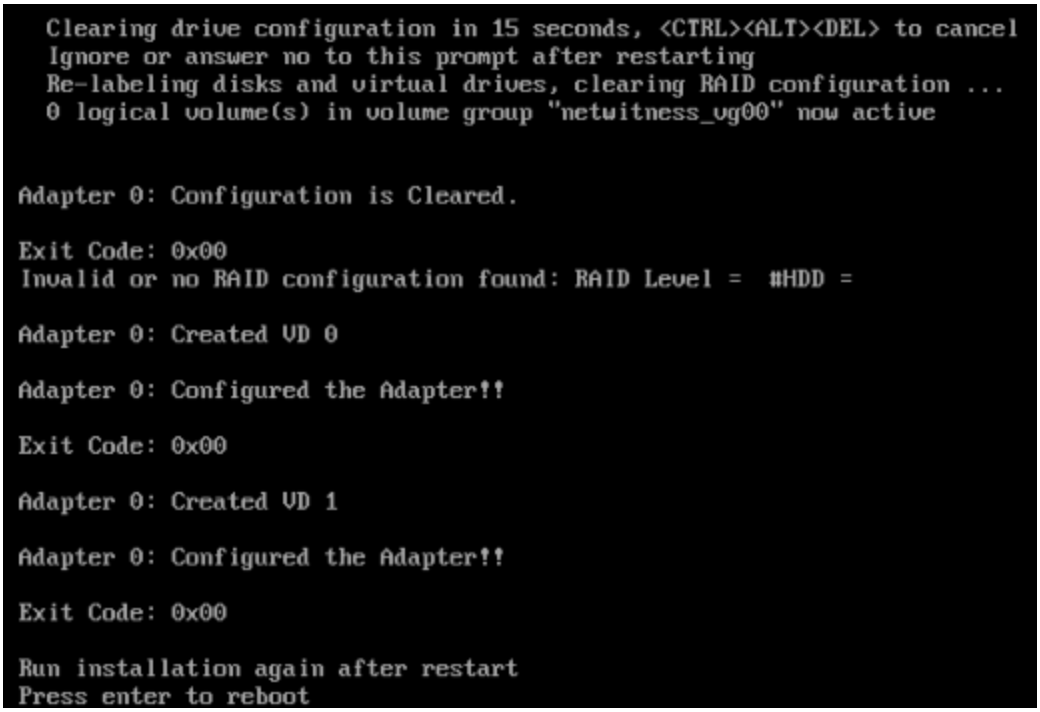
c. Select **F11** (boot menu) during reboot to select a boot device and boot to the connected media. After some system checks during booting, the following **Welcome to RSA NetWitness Platform 11.3** installation menu is displayed. The menu graphics will render differently if you use a physical USB flash media.



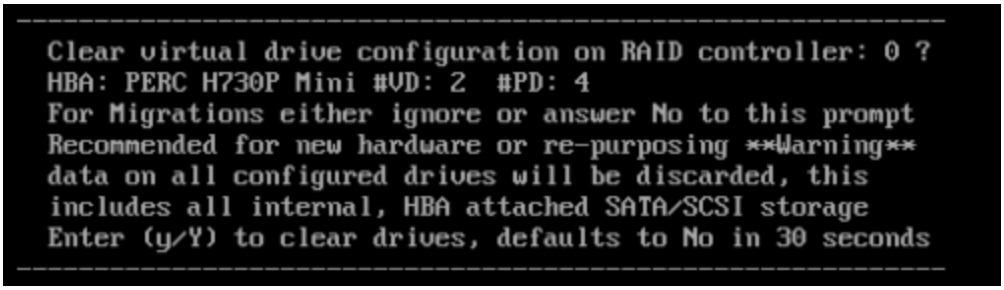
d. Select **Install RSA Netwitness Platform 11.3** (default selection) and press **Enter**.
The Installation program runs and stops at the **Enter (y/Y) to clear drives** prompt that asks you to format the drives.



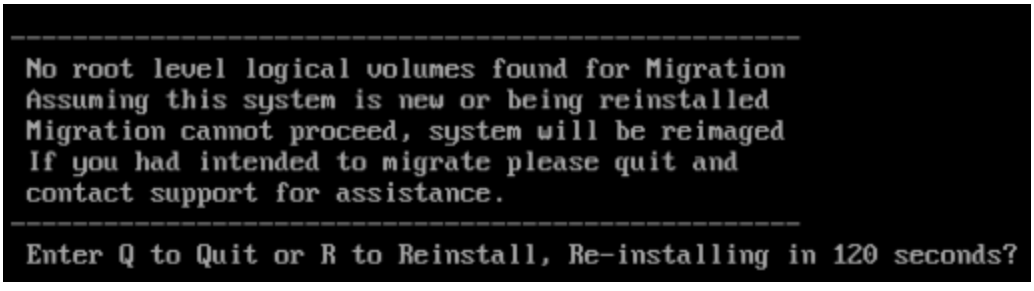
e. Type **Y** to continue.
The default action is No, so if you ignore the prompt and it will select No in 30 seconds and will not clear the drives. The **Press enter to reboot** prompt is displayed.



f. Press **Enter** to reboot the host.
The Installation program asks you to clear the drives again.



g. Type **N** because you already cleared the drives.
The **Enter Q (Quit) or R (Reinstall)** prompt is displayed.



h. Type **R** to install the base image.
The installation program displays the components as they are installed, which varies depending on the appliance, and reboots.

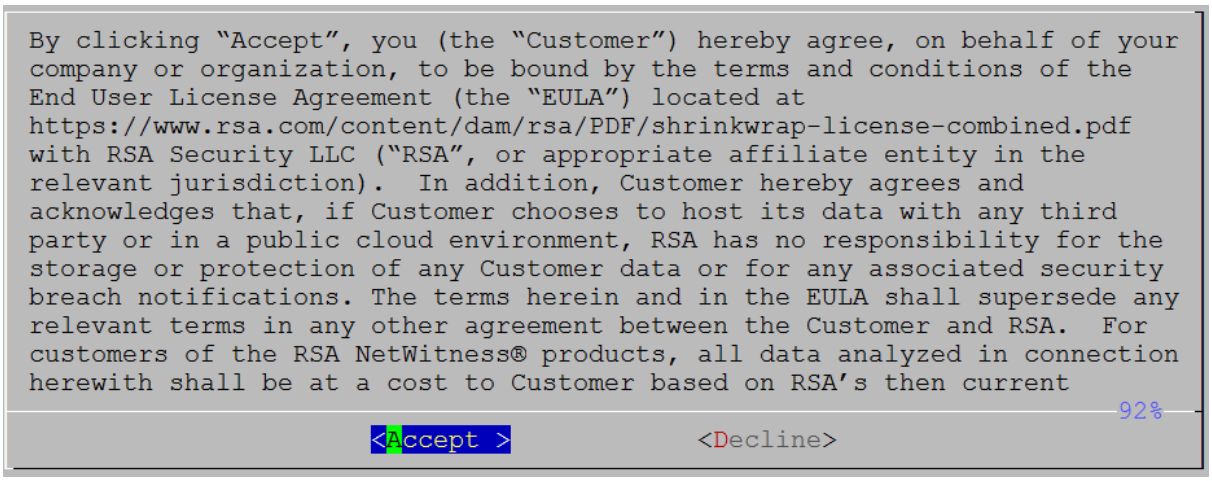
Caution: Do not reboot the attached media (media that contains the ISO file, for example a build stick).

i. Log in to the host with the `root` credentials.

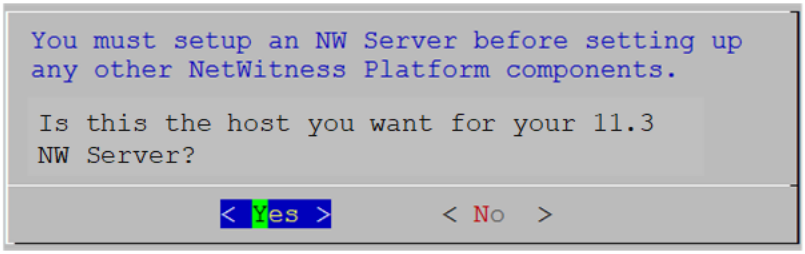
2. Run the `nwsetup-tui` command to set up the host.

This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.

Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use the Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press **Enter** to register your command response and move to the next prompt.
2.) The Setup program adopts the color scheme of the desktop or console you use to access the host.
3.) If you specify DNS servers during Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` to proceed. Any misconfigured DNS servers cause the Setup to fail. If you need to reach a DNS server after setup that is unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see "(Optional) Task 1 - Re-Configure DNS Servers Post 11.3" in Post Installation Tasks.
If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Platform Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).



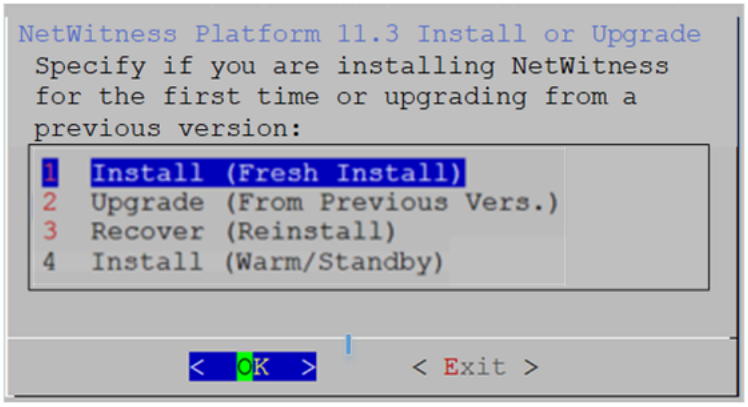
3. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 11.3 NW Server** prompt is displayed.



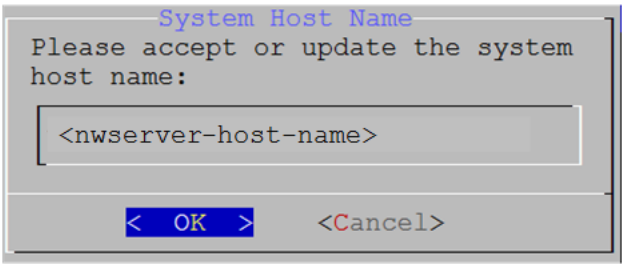
4. Tab to **Yes** and press **Enter**.
   Choose **No** if you already installed 11.3 on the NW Server.

   Caution: If you choose the wrong host for the NW Server and complete the Setup, you must restart the Setup Program and complete (steps 2 -14) to correct this error.

   The **Install or Upgrade** prompt is displayed (**Recover** does not apply to the installation. It is for 11.3 Disaster Recovery.).



5. Press **Enter**. **Install (Fresh Install)** is selected by default.
   The **Host Name** prompt is displayed.



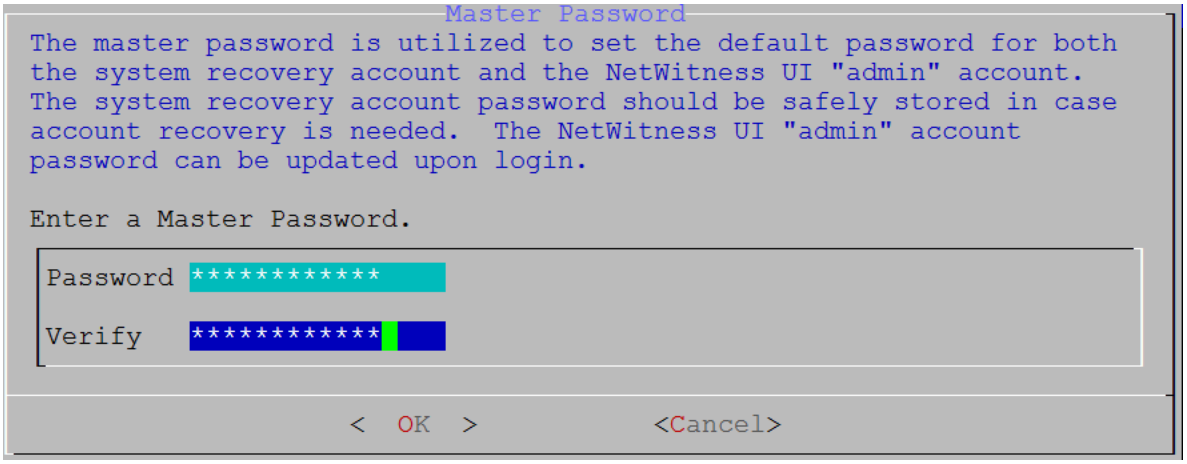
Caution: If you include "." in a host name, the host name must also include a valid domain name.

6. Press **Enter** if want to keep this name. If not edit the host name, tab to **OK**, and press **Enter** to change it.
   The **Master Password** prompt is displayed.
   The following list of characters are supported for Master Password and Deployment Password:

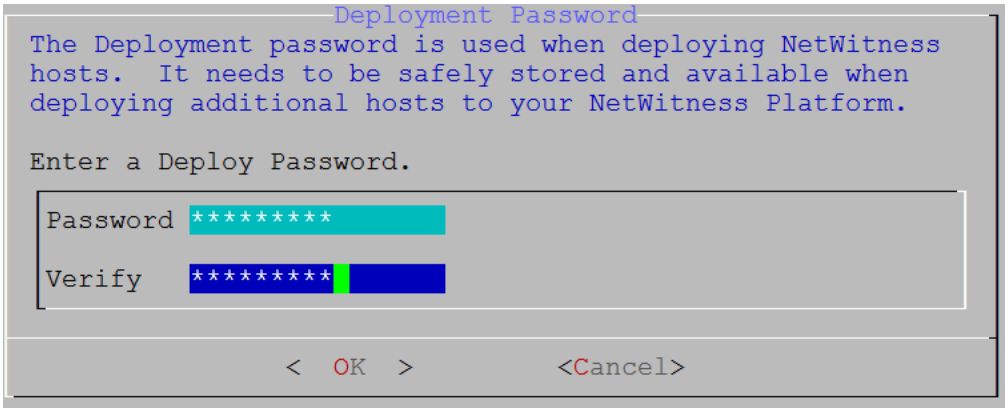
   - Symbols : ! @ # % ^ +
   - Numbers : 0-9
   - Lowercase Characters : a-z
   - Uppercase Characters : A-Z

   No ambiguous characters are supported for Master Password and Deployment Password. For example:

   space { } [ ] ( ) / \ ' " ` ~ ; : . < > -



7. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**. The **Deployment Password** prompt is displayed.



8. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**. One of the following conditional prompts is displayed.

- If the Setup program finds a valid IP address for this host, the following prompt is displayed.

  Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** if you want to change the IP configuration on the host.

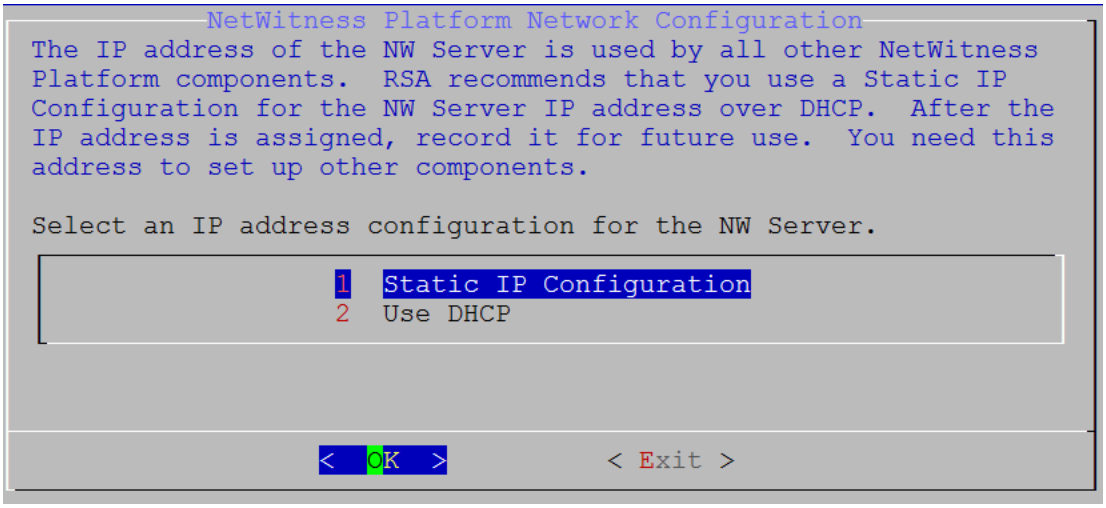
- If you are using an SSH connection, the following warning is displayed.

  Note: If you connect directly from the host console, the following warning will not be displayed.

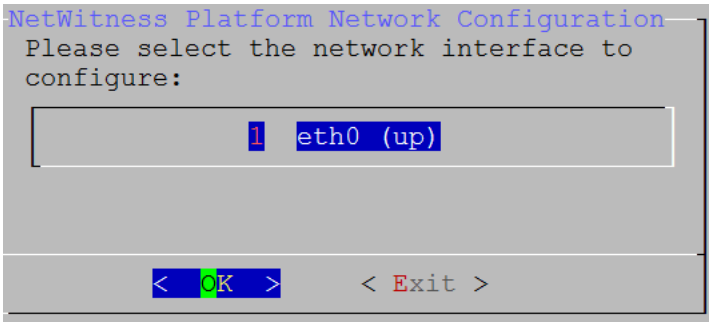
  Press **Enter** to close warning prompt.

- If the Setup Program finds an IP configuration and you choose to use it, the **Update Repository** prompt is displayed. Go to step 12 to and complete the installation.

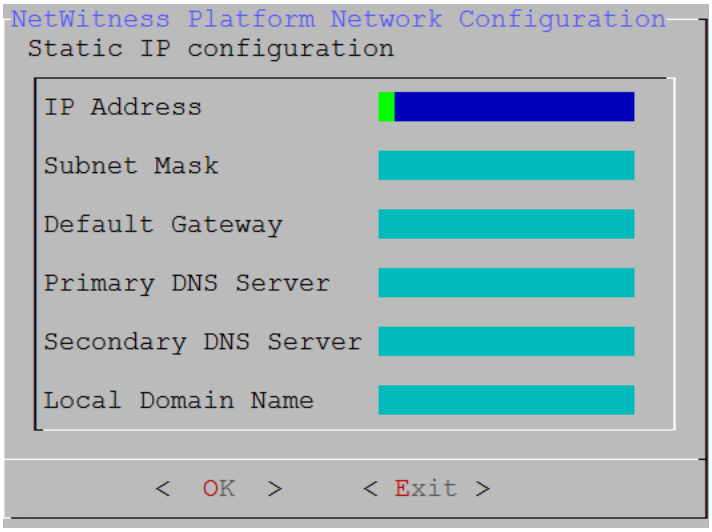
- If the Setup Program did not find an IP configuration or if you choose to change the existing IP configuration, the **Network Configuration** prompt is displayed.



9. Tab to **OK** and press **Enter** to use **Static IP**.
   If you want to use DHCP, down arrow to **2 Use DHCP** and press **Enter**.
   The **Network Configuration** prompt is displayed.



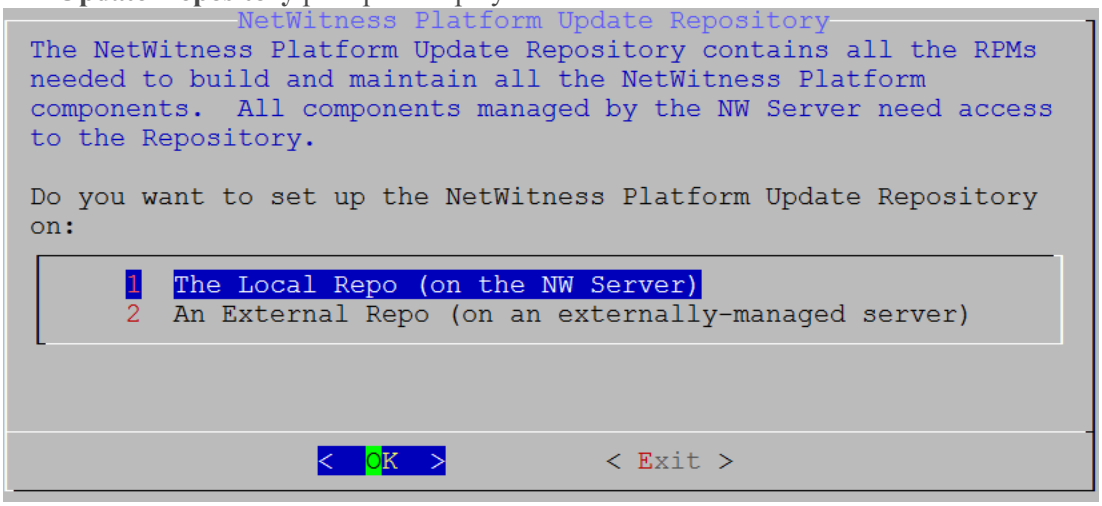
10. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit.**
    The following **Static IP Configuration** prompt is displayed.



11. Type the configuration values, tab to **OK**, and press **Enter**. If you do not complete all the required fields, an `All fields are required` error message is displayed (**Secondary DNS Server** and **Local Domain Name** fields are not required). If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

    Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

    The **Update Repository** prompt is displayed.

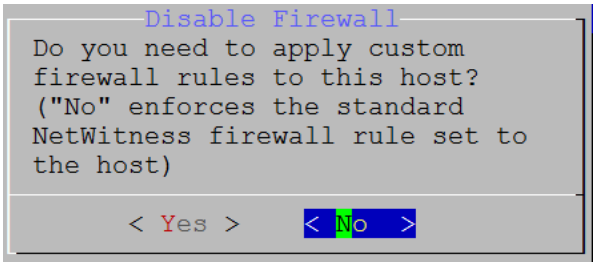


12. Press **Enter** to choose the **Local Repo** on the NW Server.
    If you want to use an external repo, down arrow to **External Repo**, tab to **OK**, and press **Enter**.

    - If you select **1 The Local Repo (on the NW Server)** in the Setup program, make sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can install NetWitness Platform 11.3.0.0. If the program cannot find the attached media, you receive the following prompt.

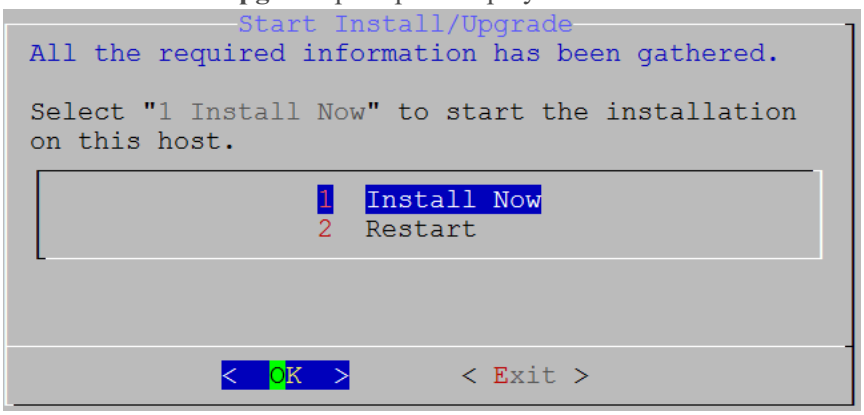
    - If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access to RSA updates and CentOS updates. Refer to Appendix B. Create an External Repository for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.

    Enter the base URL of the NetWitness Platform external repo and click **OK.** The **Start Install** prompt is displayed.
    See "Set Up an External Repository with RSA and OS Updates" under "Hosts and Services Procedures" in the *Hosts and Services Getting Started Guide for RSA NetWitness Platform 11.3* for instructions.
    The Disable firewall prompt is displayed.



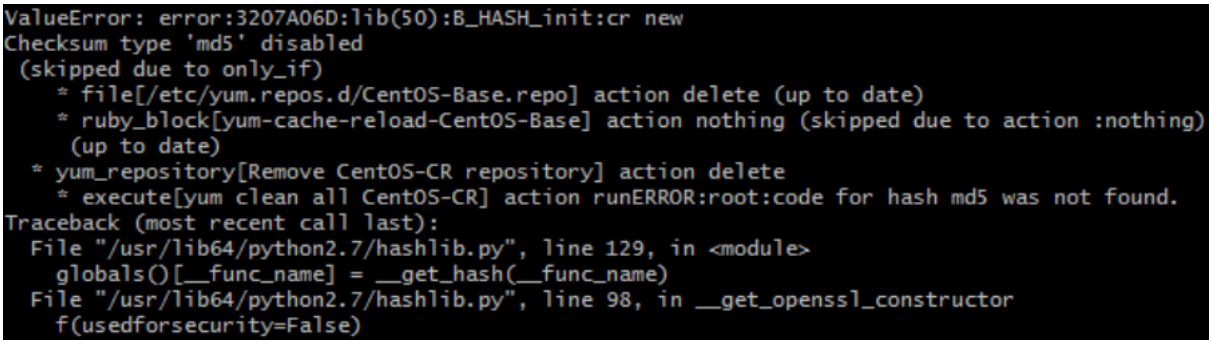
13. Tab to **No** (default), and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.
    If you select **Yes**, confirm your selection(select **Yes** again) or select **No** to use the standard firewall configuration.

    The **Start Install/Upgrade** prompt is displayed.



14. Press **Enter** to install 11.3 on the NW Server.
    When **Installation complete** is displayed, you have installed the 11.3 NW Server on this host.

> **Note:** Ignore the hash code errors similar to the errors shown in the following figure that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



Task 2 - Install 11.3 on Other Component Hosts

For a non-NW Server host this task:

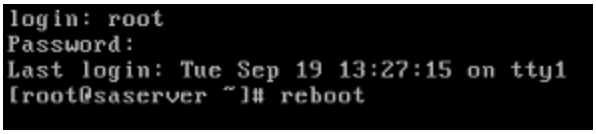
- Creates a base image.
- Sets up the 11.3 non-NW Server host.

For ESA hosts:

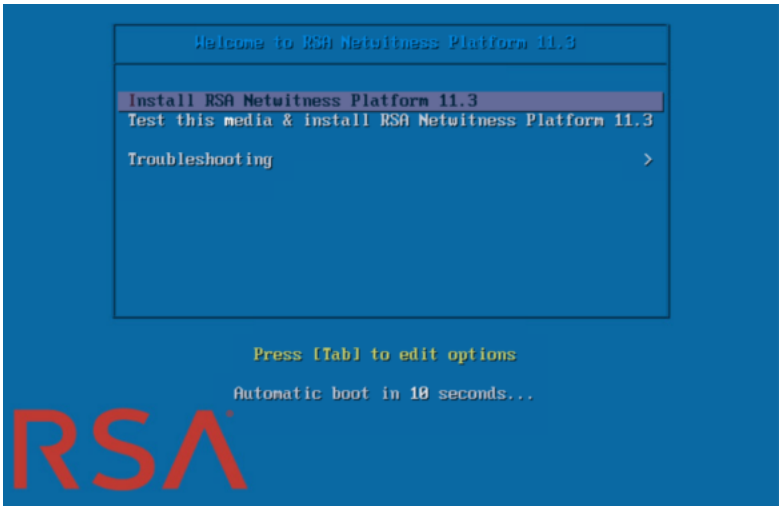
- Install your primary ESA host and install the **ESA Primary** service on it after you finish the Set Up program in the UI on the **ADMIN > Hosts** view.
- (Conditional) If you have a secondary ESA host, install it and install the **ESA Secondary** service on it after you finish the Set Up program in the UI on the **ADMIN > Hosts** view.

Complete the following steps to install NetWitness Platform 11.3 on a non-NW Server host.

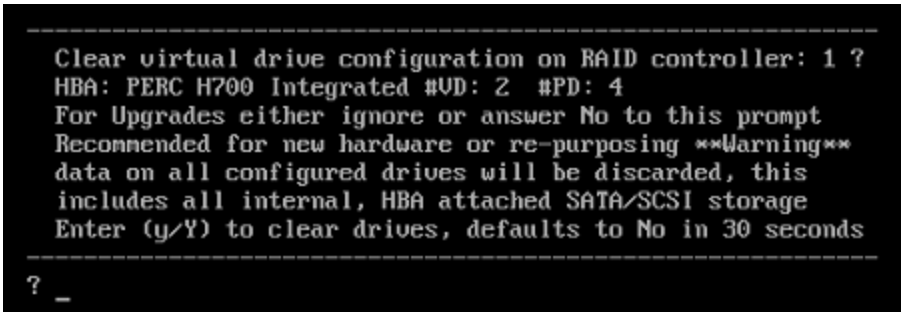
1. Create a base image on the host:
   a. Attach media (media that contains the ISO file, for example a build stick) to the host.
   See the *USB Build Stick Instructions for RSA NetWitness 11.3 and Later* for more information.
      - Hypervisor installs - use the ISO image.
      - Physical media - use the ISO to create bootable flash drive media the **Etcher®** or another suitable imaging tool etch an Linux file system on the USB drive. Etcher is available at: https://etcher.io.
      - iDRAC installations - the virtual media type is:
        - **Virtual Floppy** for mapped flash drives.
        - **Virtual CD** for mapped optical media devices or ISO file.
   b. Log in to the host and reboot it.



c. Select **F11** (boot menu) during reboot to select a boot device and boot to the connected media. After some system checks during booting, the following **Welcome to RSA NetWitness Platform 11.3** installation menu is displayed. The menu graphics will render differently if you use a physical USB flash media.



d. Select **Install RSA Netwitness Platform 11.3** (default selection) and press **Enter**.
The Installation program runs and stops at the **Enter (y/Y) to clear drives** prompt that asks you to format the drives.

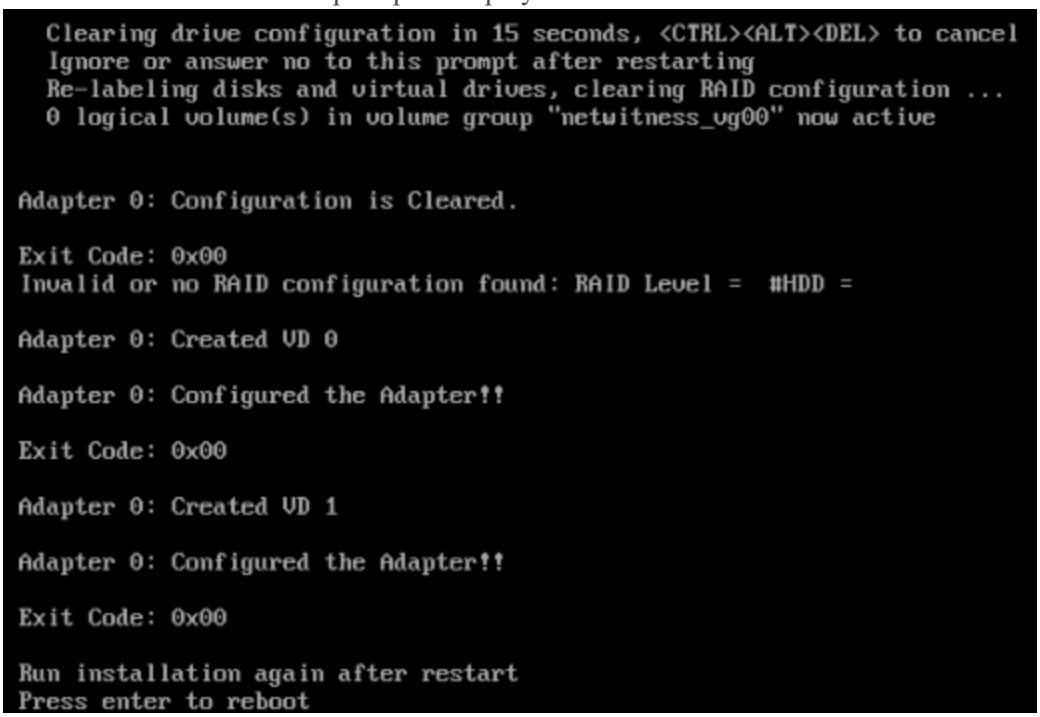


e. Type **Y** to continue.
The default action is No, so if you ignore the prompt and it will select No in 30 seconds and will not clear the drives.

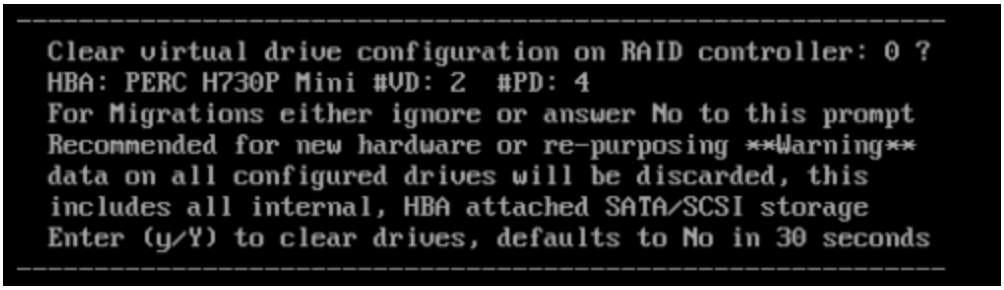
Note: (Conditional) If the host is a RSA Hybrid physical host, the **Series 5 - 6 Hybrid Image Selection Menu** is displayed next.

Tab to the Hybrid type you are installing (that is **Endpoint Hybrid**, **Log Hybrid**, or **Network Hybrid** - indicated by the underscore "_"), and press **Enter**.

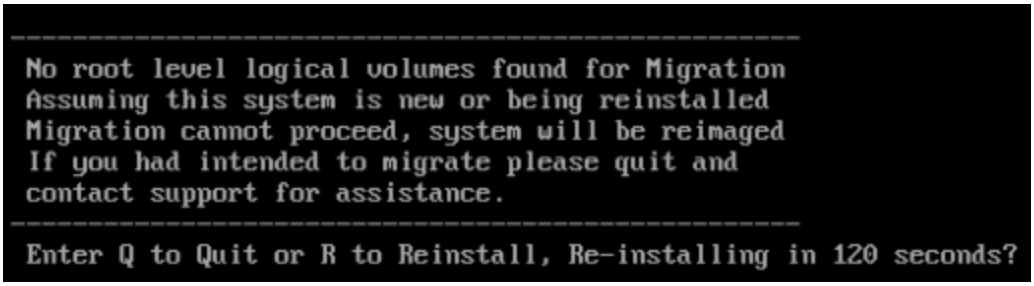
f. The **Press enter to reboot** prompt is displayed.



g. Press **Enter** to reboot the host.
The Installation program asks you to clear the drives again.

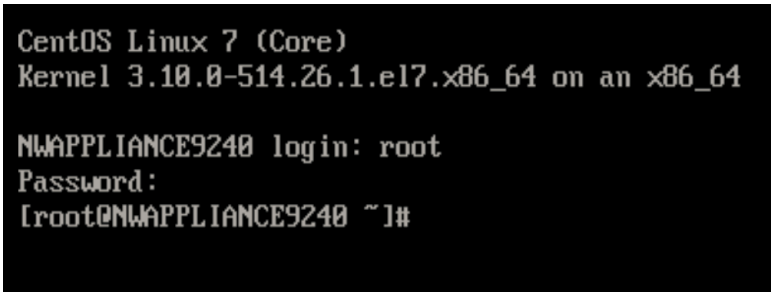


h. Type **N** because you already cleared the drives.
The **Enter Q (Quit) or R (Reinstall)** prompt is displayed.



i. Type **R** to install the base image.
The installation program displays the components as they are installed, which varies depending on the appliance, and reboots.

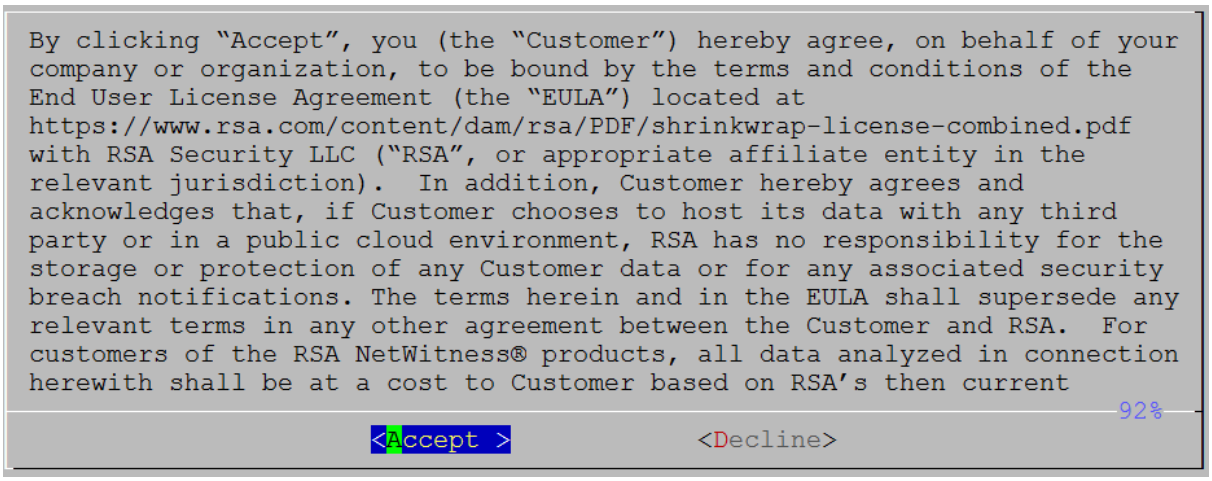
Caution: Do not reboot the attached media (media that contains the ISO file, for example a build stick).



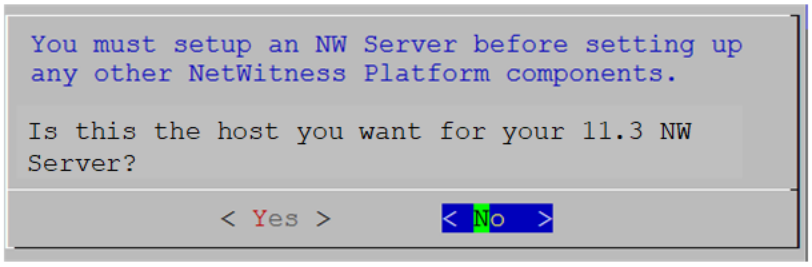
j. Log in to the host with the `root` credentials.

2. Run the `nwsetup-tui` command to set up the host..
This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.

Note: If you specify DNS servers during Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` to proceed. Any misconfigured DNS servers cause the Setup to fail. If you need to reach a DNS server after setup that is unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see "(Optional) Task 1 - Re-Configure DNS Servers Post 11.3" in Post Installation Tasks.
If you do not specify DNS servers during `nwsetup-tui`, you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Platform Update Repository** prompt in step 11 (the DNS servers are not defined so the system cannot access the external repo).

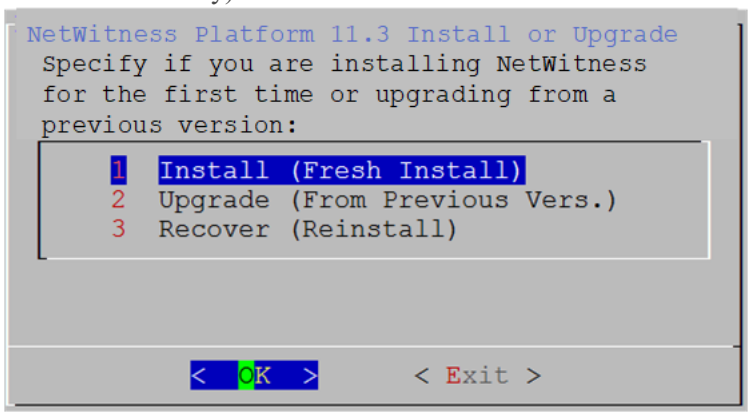


3. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 11.3 NW Server** prompt is displayed.

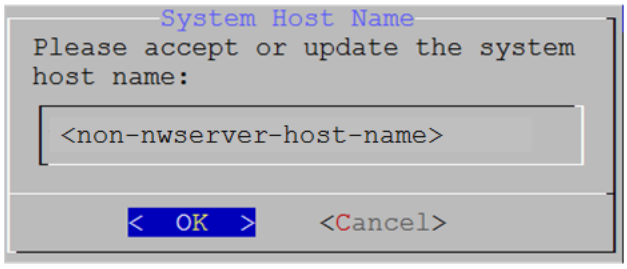


Caution: If you choose the wrong host for the NW Server and complete the installation, you must restart the step up program and complete (steps 2 - 14) of Task 1 - Install 11.3 on the NetWitness Server (NW Server) Host to correct this error.

4. Press **Enter** (No).
   The **Install** or **Upgrade** prompt is displayed (**Recover** does not apply to the installation. It is for 11.3 Disaster Recovery).



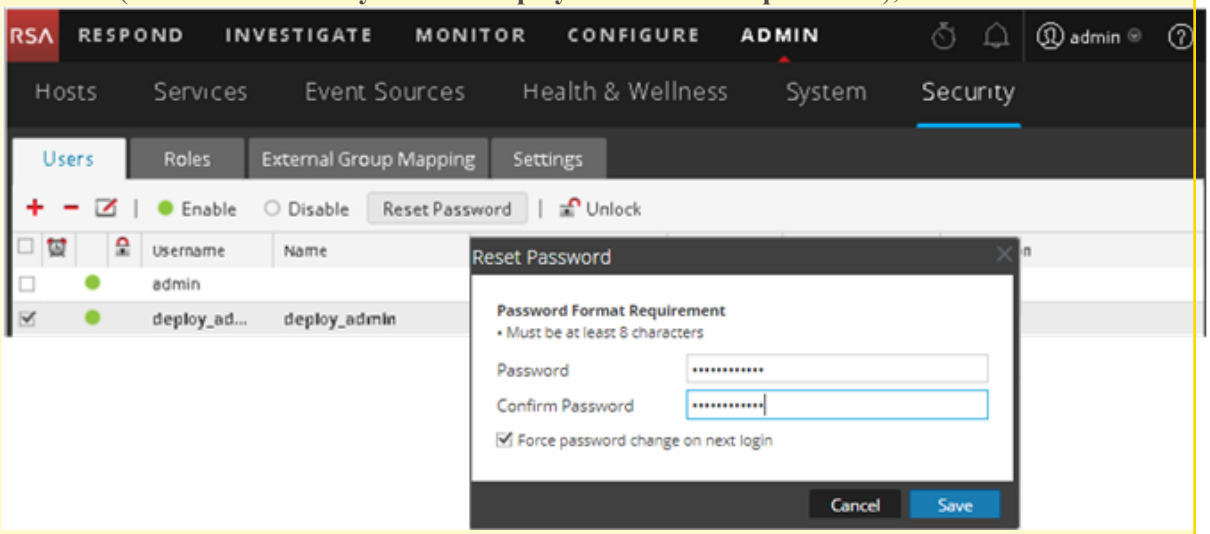
5. Press **Enter**. **Install (Fresh Install)** is selected by default.
   The **Host Name** prompt is displayed.



Caution: If you include "." in a host name, the host name must also include a valid domain name.

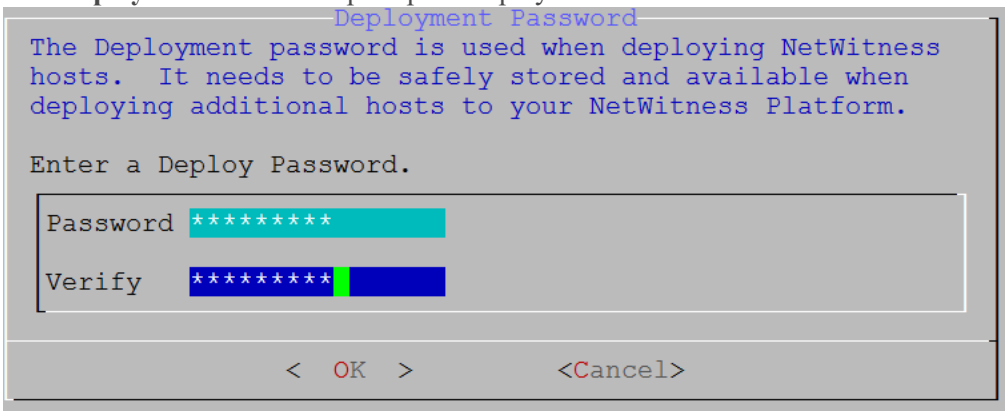
6. If want to keep this name, press **Enter**. If you want to change this name, edit it, tab to **OK**, and press **Enter**.

Caution: If you change the **deploy_admin** user password in the NetWitness Platform User Interface (**ADMIN** > **Security** > Select **deploy-admin - Reset password**),



you must:
1. SSH to the NW Server host.
2. Run the `(/opt/rsa/saTools/bin/set-deploy-admin-password` script.
3. Use the new password when installing any new non-NW Server hosts.
4. Run `(/opt/rsa/saTools/bin/set-deploy-admin-password` script on all non-NW Server hosts in your deployment.
5. Write down the password because you may need to refer to it later in the installation.

The **Deployment Password** prompt is displayed.



Note: You must use the same deployment password that you used when you installed the NW Server.

7. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

   - If the Setup program finds a valid IP address for this host, the following prompt is displayed.

     
     Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** If you want to change the IP configuration found on the host.

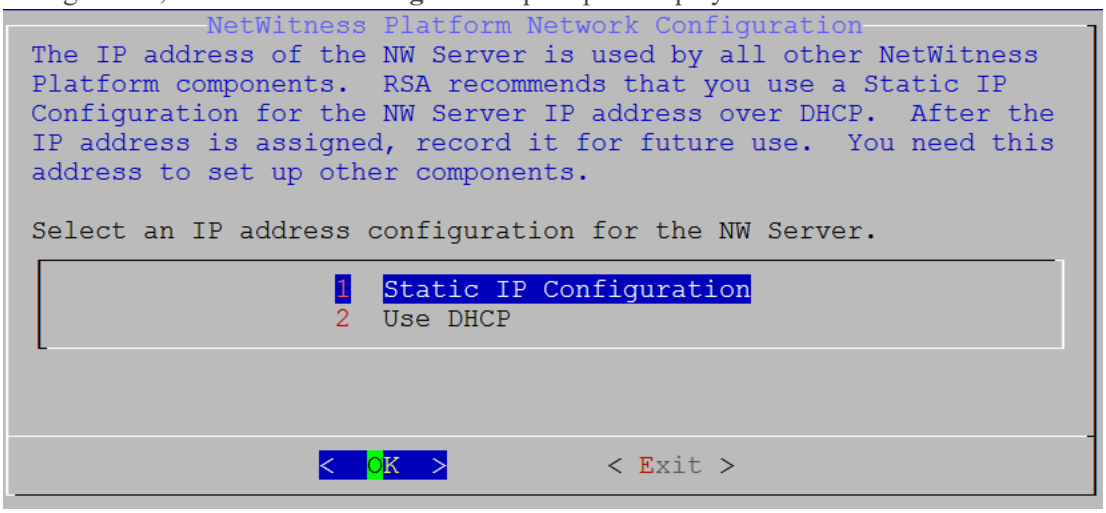
   - If you are using an SSH connection, the following warning is displayed.

     Note: If you connect directly from the host console, the following warning will not be displayed.

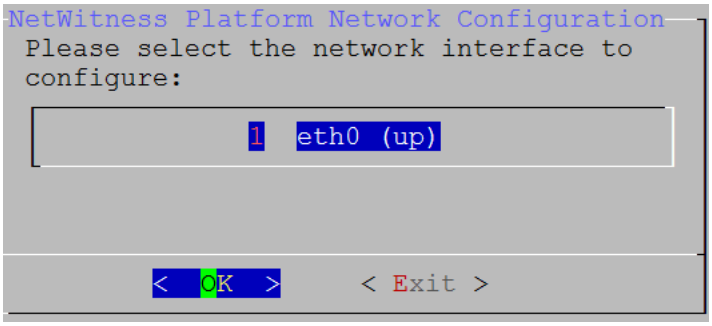
     
     Press **Enter** to close warning prompt.

   - If the Setup Program found an IP configuration and you chose to use it, the **Update Repository** prompt is displayed. Go to step 11 to and complete the installation.

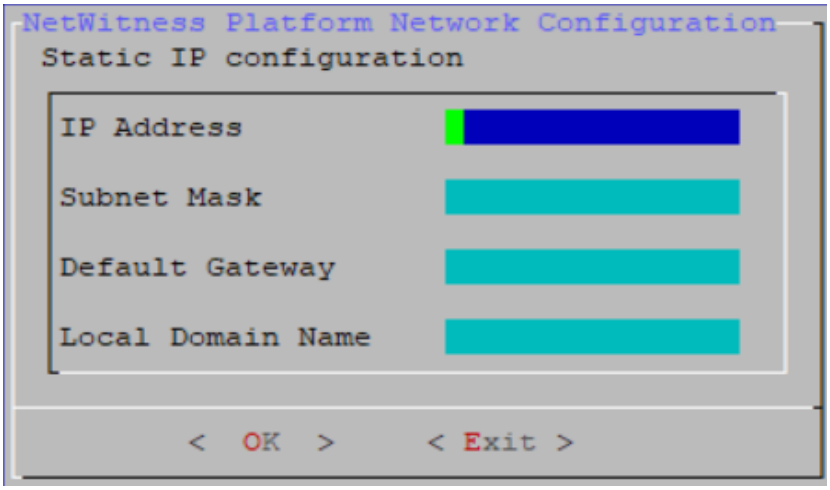
   - If the Setup Program could not find an IP configuration or if you chose to change the existing IP configuration, the **Network Configuration** prompt is displayed.

8. Tab to **OK** and press **Enter** to use a **Static IP**.
   If you want to use DHCP, down arrow to **2 Use DHCP** and press **Enter**.
   The **Network Configuration** prompt is displayed.



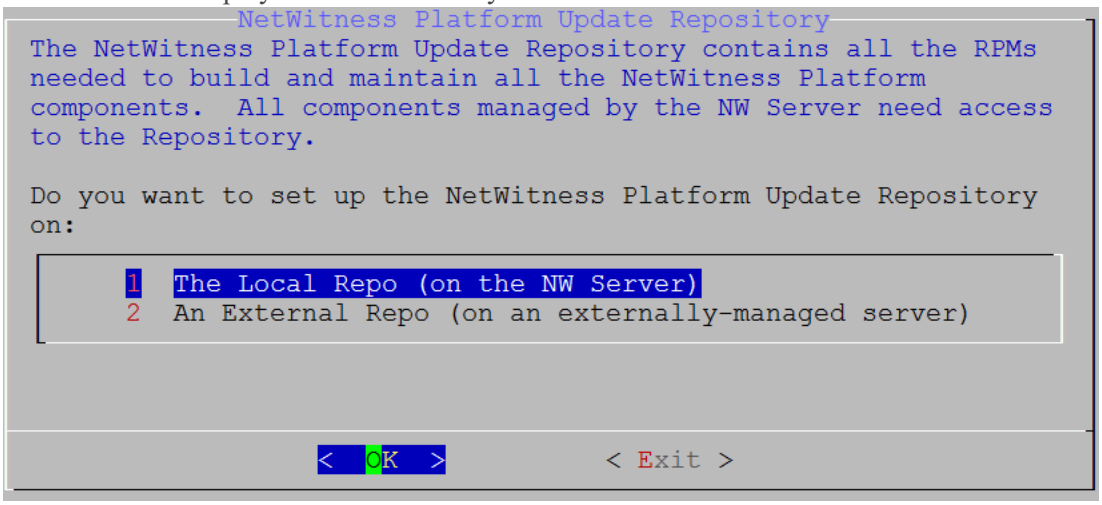
9. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit**.
   The following **Static IP Configuration** prompt is displayed.



10. Type the configuration values (using the down arrow to move from field to field), tab to **OK**, and press **Enter**.
    If you do not complete all the required fields, an `All fields are required` error message is displayed (**Secondary DNS Server** and **Local Domain Name** fields are not required).
    If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

    Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

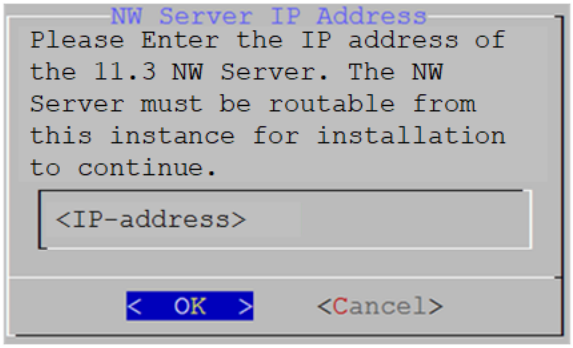
The **Update Repository** prompt is displayed.
Select the same repo you selected when you installed the NW Server Host for all hosts.



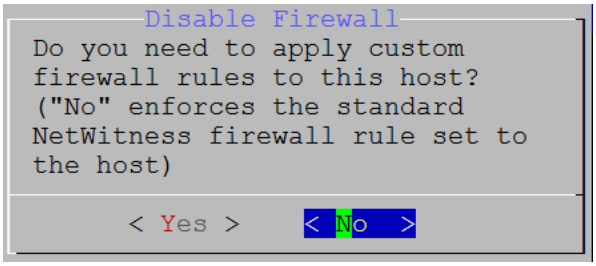
11. Press **Enter** to choose the **Local Repo** on the NW Server.
    If you want to use an external repo, down arrow to **External Repo**, tab to **OK**, and press **Enter**.

    - If you select **1 The Local Repo (on the NW Server)** in the setup program, make sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can install NetWitness Platform 11.3.0.0.
    - If you select **2 An External Repo (a server managed externally - not on the NW Server)**, the UI prompts you for a URL. The repositories give you access to RSA updates and CentOS updates. Refer to Appendix B. Create an External Repository for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.

    Enter the base URL of the NetWitness Platform external repo, tab to **OK** and press **Enter**.
    The **NW Server IP Address** prompt is displayed.

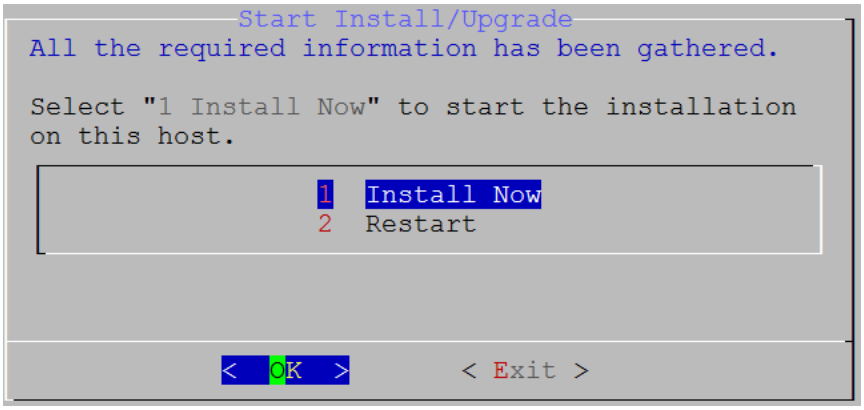


12. Type the NW Server IP address. Tab to **OK** and press **Enter**.
    The **Disable Firewall** prompt is displayed.



13. Tab to **No** (default), and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.
    - If you select **Yes**, confirm your selection or **No** to use the standard firewall configuration.

    The **Start Install** prompt is displayed.



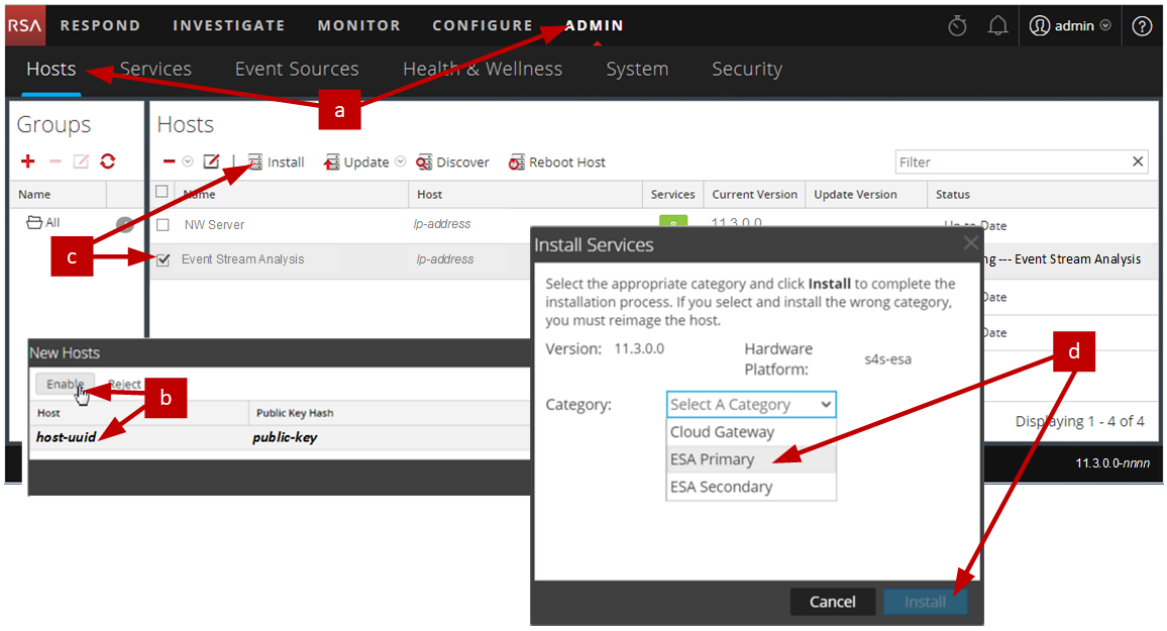
14. Press **Enter** to install 11.3 on the non-NW Server.
    When **Installation complete** is displayed, you have a generic non-NW Server host with an operating system compatible with NetWitness Platform 11.3.
15. Install a component service on the host.
    a. Log into NetWitness Platform and go to **ADMIN** > **Hosts**.
    The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

    Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

    b. Select the host in the **New Hosts** dialog and click **Enable**.
    The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

c. Select that host in the **Hosts** view (for example, **Event Stream Analysis**) and click Install. The **Install Services** dialog is displayed.

d. Select the appropriate host type (for example, **ESA Primary**) in **Host Type** and click **Install**.



You have completed the installation of the non-NW Server host in NetWitness Platform.

16. Complete steps 1 through 15 for the rest of the NetWitness Platform non-NW Server components.

17. Complete licensing requirements for installed services.
See the *NetWitness Platform 11.3 Licensing Management Guide* for more information. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 3 - (Optional) Install Warm Standby NW Server

Refer to "Warm Standby NW Server Host" under "Deployment Option Setup Procedures" in the *Deployment Guide for RSA NetWitness Platform 11.3* for instructions on how to set up a Warm Standby NW Server.

Update or Install Windows Legacy Collection

Refer to the *Windows Legacy Collection Guide for RSA NetWitness 11.x*.

Note: After you update or install Windows Legacy Collection, reboot the system to ensure that Log Collection functions correctly.

Post Installation Tasks

This topic contains the tasks you complete after you install 11.3.

- General
- RSA NetWitness® Endpoint
- RSA NetWitness® UEBA
- Federal Information Processing Standard (FIPS) Enablement

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

General

General tasks apply to all customers regardless of the NetWitness Components you deploy.

(Optional) Task 1 - Re-Configure DNS Servers Post 11.3

On the NetWitness Server, complete the following steps to re-configure the DNS servers in NetWitness Platform 11.3.

1. Log in to the server host with your `root` credentials.
2. Edit the `/etc/netwitness/platform/resolv.dnsmasq` file:
   a. Replace the IP address corresponding to `nameserver`.
   If you need to replace both DNS servers , replace the IP entries for both the hosts with valid addresses.
   The following example shows both DNS entries.

   The following example shows the new DNS values.

   b. Save the `/etc/netwitness/platform/resolv.dnsmasq` file.
   c. Restart the internal DNS by running the following command:
   `systemctl restart dnsmasq`

Task 2 - Update HIVE Version

After you update to 11.3, you must update to the HIVE version that is compatible with the 11.3 Warehouse (either HIVE version 0.12 or version 1.0)

- HIVE Version 0.12
  SSH to the NW Server and run the following command.
  `rpm -ivh rsa-nw-HIVE-jdbc-0.12.0-1.x86_64.rpmHIVE`
- Version 1.0
  SSH to the NW Server and run the following command.
  `rpm -ivh rsa-nw-HIVE-jdbc-1.0.0-1.x86_64.rpm`

RSA NetWitness Endpoint

The tasks in this section only apply to customers that use the RSA NetWitness Endpoint component of NetWitness Platform.

(Optional) Task 3 - Install Endpoint Log Hybrid

Depending on the number of agents and the location of the agents, you can choose to deploy a single Endpoint Log Hybrid host or multiple Endpoint Log Hybrid hosts. To deploy a host, you provision it and install a category on it.

- Single Endpoint Log Hybrid host - Deploy NetWitness Server host , Endpoint Log Hybrid host, and ESA host or hosts.
- Multiple Endpoint Log Hybrid hosts - Deploy NetWitness Server host, ESA host or hosts, Endpoint Log Hybrid hosts. For a consolidated view of all endpoint data from multiple Endpoint Log Hybrid hosts, install the Endpoint Broker.

  Note: RSA recommends that you co-locate the Endpoint Broker on the NetWitness Broker host. However, you can deploy the Endpoint Broker on a separate host or co-locate it on the Endpoint Log Hybrid.

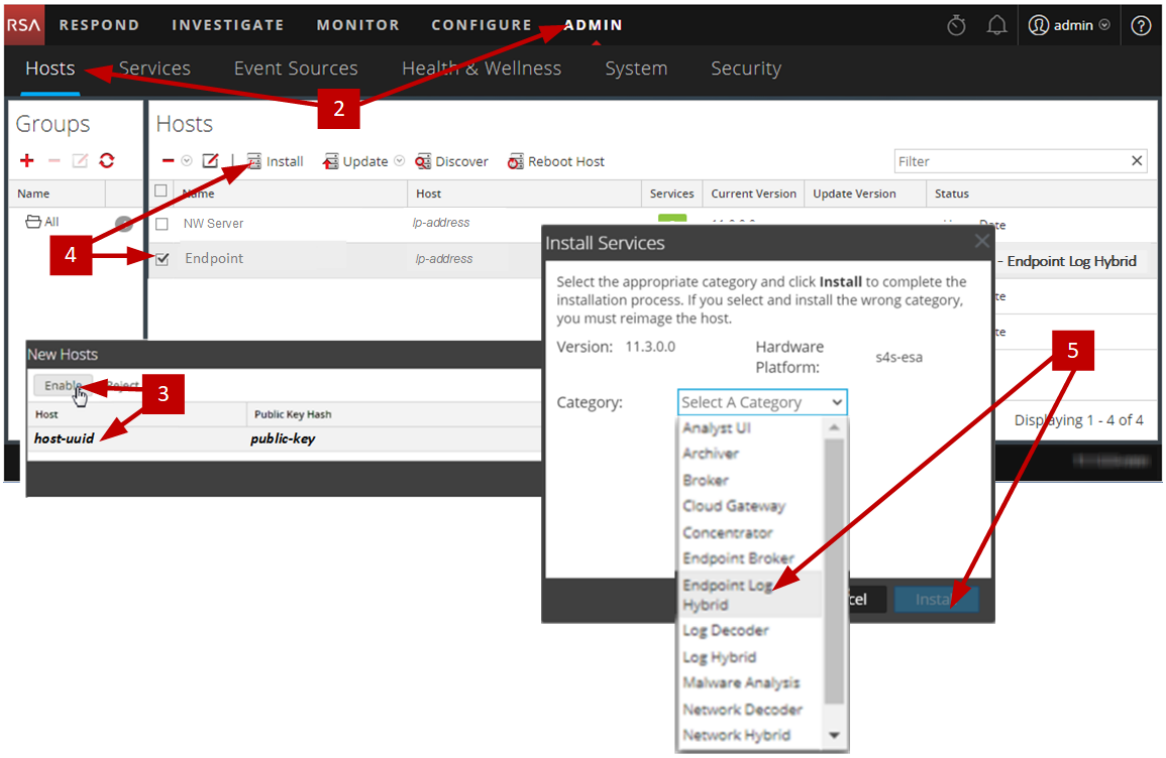
  Note: You must plan to scale your ESA deployment to support multiple Endpoint Log Hybrid hosts.

To deploy an Endpoint Log Hybrid host:

1. For:
   - A physical host, complete steps 1 - 14 under "Task 2 - Install 11.3 on Other Component Hosts" under "Installation Tasks" in the *Physical Host Installation Guide for NetWitness Platform 11.3*.
   - A virtual host, complete steps 1 - 15 under "Task 2 - Install 11.3 on Other Component Hosts" under "Step 4. Install RSA NetWitness Platform" in the *Virtual Host Installation Guide for NetWitness Platform 11.3*.
2. Log into NetWitness Platform and click **ADMIN** > **Hosts**.
   The New Hosts dialog is displayed with the Hosts view grayed out in the background.

Note: If the New Hosts dialog is not displayed, click **Discover** in the **Hosts** view toolbar.

3. Select the host in the **New Hosts** dialog and click **Enable**.
   The New Hosts dialog closes and the host is displayed in the Hosts view.
4. Select that host in the **Hosts** view (for example, **Endpoint**) and click Install.
   The Install Services dialog is displayed.
5. Select **Endpoint Log Hybrid** category and click **Install**.



6. Make sure that the Endpoint Log Hybrid service is running.
7. Configure Endpoint Meta forwarding.
   See *Endpoint Configuration Guide* for instructions on how to configure Endpoint Meta forwarding.
8. Deploy the ESA Rules from the Endpoint Rule Bundle. For more information, see "Deploy Endpoint Risk Scoring Rules on ESA" section in the ESA Configuration Guide.

Note: The Endpoint IIOCs are available as OOTB Endpoint Application rules.

9. Review the default policies and create groups to manage your agents. See *Endpoint Configuration Guide*.

Note: In 11.3, agents can operate in Insights or Advanced mode depending on the policy configuration. The default policy enables the agent in an advanced mode. If you want to continue to use the Insights agent, before updating, review the policy, and

make sure that the Agent mode is set to Insights.

10. Install the Endpoint Agent. You can install an Insights (free version) or an Advanced agent (licensed). See *Endpoint Agent Installation Guide* for detailed instructions on how to install the agent.

    Note: You can migrate the Endpoint Agent from 4.4.0.x to 11.3. For more information, see *NetWitness Endpoint 4.4.0.x to NetWitness Platform 11.3 Migration Guide*.

Task 4 - Configuring Multiple Endpoint Log Hybrid

To install another Endpoint Log Hybrid:

1. For
   - A physical host, complete steps 1 - 14 under "Task 2 - Install 11.3 on Other Component Hosts" under "Installation Tasks" in the *Physical Host Installation Guide for NetWitness Platform 11.3*.
   - A virtual host, complete steps 1 - 15 under "Task 2 - Install 11.3 on Other Component Hosts" under "Step 4. Install RSA NetWitness Platform" in the *Virtual Host Installation Guide for NetWitness Platform 11.3*.
2. Create a directory `mkdir -p /etc/pki/nw/nwe-ca`.
3. Copy the following certificates from the first Endpoint Log Hybrid to the second Endpoint Log Hybrid:

   Note: RSA recommends that you copy certificates from CentOS to Windows using the `SCP` command to avoid any corruption caused by Antivirus or third-party tools.

   `/etc/pki/nw/nwe-ca/nwerootca-cert.pem`

   `/etc/pki/nw/nwe-ca/nwerootca-key.pem`
4. Complete steps 2 - 10 under "Task 3 - Install Endpoint Log Hybrid" in "Post Installation Tasks" of the *Platform Physical Host Installation Guide*.
5. Repeat steps 1 - 4 to add more Endpoint Log Hybrids.

RSA NetWitness® UEBA

The tasks in this section only apply to customers that use the RSA UEBA component of NetWitness Platform.

(Optional) Task 5 - Install UEBA

To set up NetWitness UEBA in NetWitness Platform 11.3, you must install and configure the NetWitness UEBA service.

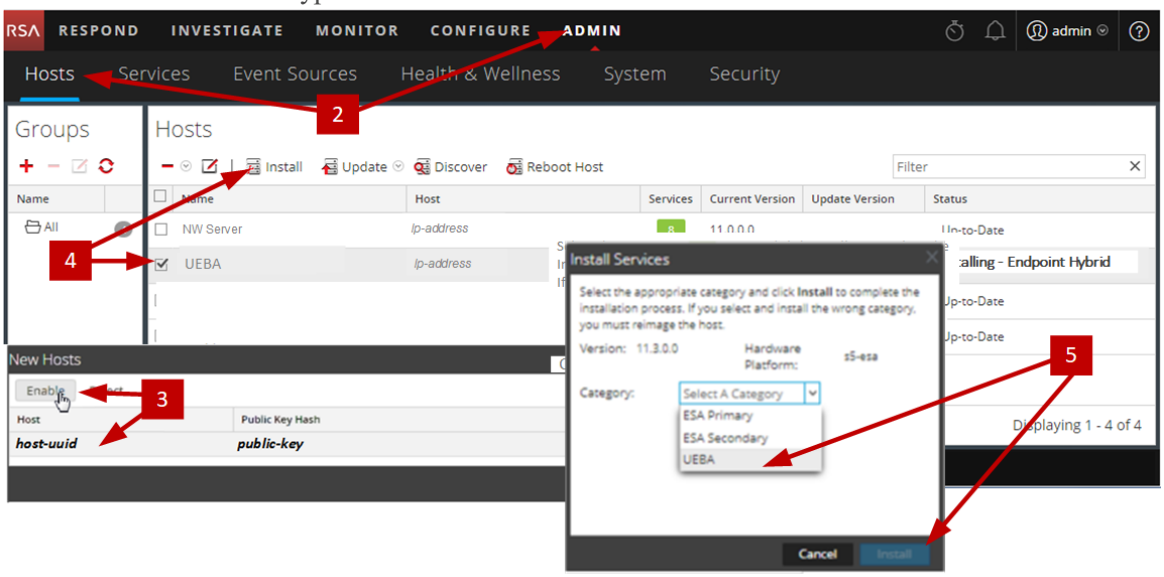
The following procedure shows you how to install the NetWitness UEBA service on a NetWitness UEBA Host Type and configure the service.

1. For:
   - A physical host, complete steps 1 - 14 under "Task 2 - Install 11.3 on Other Component Hosts" under "Installation Tasks" in the *Physical Host Installation Guide for NetWitness Platform 11.3*.
   - A virtual host, complete steps 1 - 15 under "Task 2 - Install 11.3 on Other Component Hosts" under "Installation Tasks" in the *Virtual Host Installation Guide for NetWitness Platform 11.3*.

   Note: The Kibana and Airflow webserver User Interface password is the same as the deploy admin password. Make sure that you record this password and store it in a safe location.
2. Log into NetWitness Platform and go to **ADMIN** > **Hosts**.
   The New Hosts dialog is displayed with the Hosts view grayed out in the background.

   Note: If the New Hosts dialog is not displayed, click **Discover** in the **Hosts** view toolbar.
3. Select the host in the **New Hosts** dialog and click **Enable**.
   The New Hosts dialog closes and the host is displayed in the Hosts view.
4. Select that host in the **Hosts** view (for example, **UEBA**) and click 
.
   The Install Services dialog is displayed.

5. Select the **UEBA** Host Type and click **Install**.



6. Make sure that the UEBA service is running.

7. Complete licensing requirements for NetWitness UEBA.
   See the *Licensing Management Guide* for more information.

   Note: NetWitness Platform supports the User and Entity Behavior Analytics License (UEBA). This license is used based on the number of users. The Out-of-the-Box Trial License is a 90-day trial license. In case of UEBA licenses, the 90-day trial period begins from the time the UEBA service deployed on the NetWitness Platform product.

8. Configure NetWitness UEBA.
   You need to configure a data source (Broker or Concentrator), historical data collection start date, and data schemas.

   IMPORTANT: If your deployment has multiple Concentrators, RSA recommends that you assign the Broker at the top of your deployment hierarchy for the NetWitness UEBA data source.

   a. Determine the earliest date in the NWDB of the data schema you plan to choose (`AUTHENTICATION`, `FILE`, `ACTIVE_DIRECTORY`, `PROCESS`, `REGISTRY` or any combination of these schemas) to specify in `startTime` in step c. If you plan to specify multiple schemas, use the earliest date among all the schemas. If you are not sure which data schema to choose, you can specify all five data schemas (that is, `AUTHENTICATION`, `FILE`, `ACTIVE_DIRECTORY`, `PROCESS` and `REGISTRY`) to have UEBA adjust the models it can support based on the Windows logs available. You can use one of the following methods to determine the data source date.

      - Use the Data Retention date (that is, if the Data Retention duration is 48 hours, `startTime` = <48 hours earlier than the current time>).

- Search the NWDB for the earliest date.

b. Create a user account for the data source (Broker or Concentrator) to authenticate to the data source.

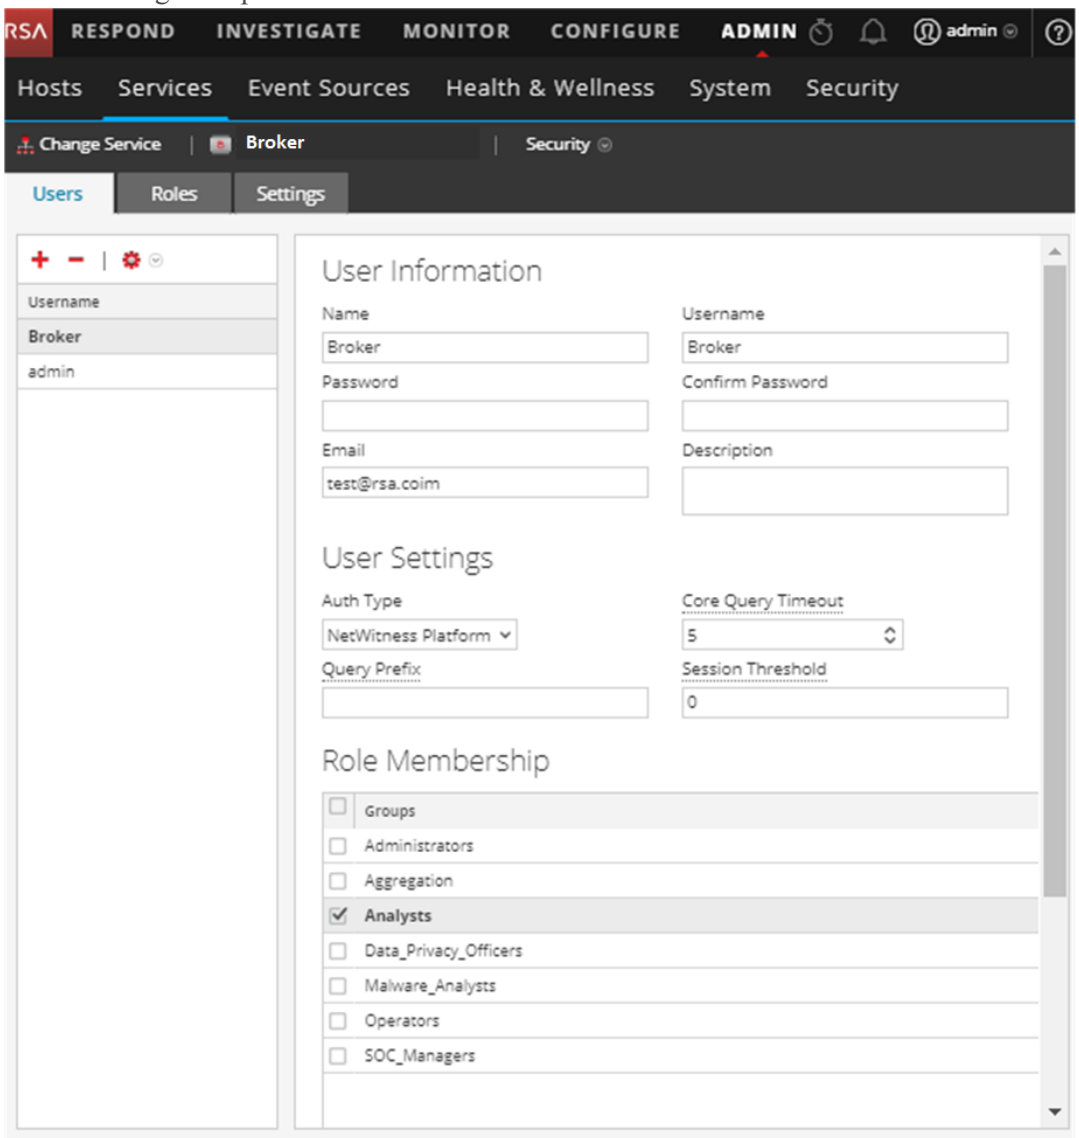
i. Log into NetWitness Platform.

ii. Go to **Admin** > **Services**.

iii. Locate the data source service (Broker or Concentrator).

Select that service, and select (Actions) > **View** > **Security**.

iv. Create a new user and assign the "Analysts" role to that user.
The following example shows a user account created for a Broker.



c. SSH to the NetWitness UEBA server host.

d. Submit the following commands.

```
/opt/rsa/saTools/bin/ueba-server-config -u <user> -p <password> -h
<host> -o <type> -t <startTime> -s <schemas> -v -e
```

Where:

Argument	Variable	Description
-u	<user>	User name of the credentials for the Broker or Concentrator instance that you are using as a data source.
-p	<password>	Password of the credentials for the Broker or Concentrator instance that you are using as a data source. The following special characters are supported in a password. !"#$%&()*+,-:;<=>?@[\]^_`\{\|} If you want to include a special character or special characters, you must delimit the password with an apostrophe sign, for example: sh /opt/rsa/saTools/bin/ueba-server-config -u brokeruser -p '!"UHfz?@ExMn#$' -h 10.64.153.104 -t 2018-08-01T00:00:00Z -s 'AUTHENTICATION FILE ACTIVE_ DIRECTORY' -o broker -v
-h	<host>	IP address of the Broker or Concentrator used as the data source. Currently, only one data source is supported.
-o	<type>	Data source host type (broker or concentrator).
-t	<startTime>	Historical start time as of which you start collecting data from the data source in YYYY-MM-DDTHH-MM-SSZ format (for example, 2018-08-15T00:00:00Z). **Note:** The script interprets the time you enter as UTC (Coordinated Universal Time) and it does not adjust the time to your local time zone.

Argument	Variable	Description
-s	<schemas>	Array of data schemas. If you want to specify multiple schemas, use a space to separate each schema (for example, 'AUTHENTICATION FILE ACTIVE_DIRECTORY PROCESS REGISTRY'). **Note:** If you specify all five data schemas (that is, AUTHENTICATION, FILE, ACTIVE_DIRECTORYPROCESS, and REGISTRY), UEBA adjusts the models it can support based on the Windows logs available.
-v		verbose mode.
-e	<argument>	Boolean Argument. This enables the UEBA indicator forwarder to Respond. **Note:** If the Respond server is configured in NetWitness platform, you can transfer the NetWitness UEBA indicators to the respond server and to the correlation server to create an Incidents.

9. Complete NetWitness UEBA configuration according to the needs of your organization. See the *NetWitness UEBA User Guide* for more information.

Note: If NetWitness Endpoint Server is configured, you can view the alerts associated with the Process and Registry data schemas.

Task 6 - Set up Permission

If you have installed UEBA, you need to assign the UEBA_Analysts and Analysts roles to the UEBA users. For more information, see *System Security and User Management Guide*.

After this configuration, UEBA users can access the **Investigate** > **Users** view.

Federal Information Processing Standard (FIPS) Enablement

Task 7 - Enable FIPS Mode

Note: This task is optional for Upgrades from 10.6.6.x with FIPS enabled for Log Collectors, Log Decoders and Network Decoders).

Federal Information Processing Standard (FIPS) is enabled on all services except Log Collector, Log Decoder, and Decoder. FIPS cannot be disabled on any services except Log Collector, Log Decoder, and Decoder.

Appendix A. Troubleshooting

This section describes solutions to problems that you may encounter during installations and upgrades. In most cases, NetWitness Platform creates log messages when it encounters these problems.

Note: If you cannot resolve an upgrade issue using the following troubleshooting solutions, contact Customer Support (https://community.rsa.com/docs/DOC-1294).

This section has troubleshooting documentation for the following services, features, and processes.

- Command Line Interface (CLI)
- Backup Script
- Event Stream Analysis
- Concentrator Service
- Log Collector Service (`nwlogcollector`)
- Orchestration
- NW Server
- Reporting Engine
- NetWitness UEBA

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Command Line Interface (CLI)

Error Message	Command Line Interface (CLI) displays: "Orchestration failed." `Mixlib::ShellOut::ShellCommandFailed: Command execution failed. STDOUT/STDERR suppressed for sensitive resource in/var/log/netwitness/config-management/chef-solo.log`
Cause	Entered the wrong `deploy_admin` password in `nwsetup-tui`.
Solution	Retrieve your `deploy_admin` password password. 1. SSH to the NW Server host. `security-cli-client --get-config-prop --prop-hierarchy nw.security-client --prop-name deployment.password` SSH to the host that failed. 2. Run the `nwsetup-tui` again using correct `deploy_admin` password.

Error Message	`ERROR com.rsa.smc.sa.admin.web.controller.ajax.health. AlarmsController - Cannot connect to System Management Service`
Cause	NetWitness Platform sees the Service Management Service (SMS) as down after successful upgrade even though the service is running.
Solution	Restart SMS service. `systemctl restart rsa-sms`

Error Message	You receive a message in the User Interface to reboot the host after you update and reboot the host offline.
Cause	You cannot use CLI to reboot the host. You must use the User Interface.
Solution	Reboot the host in the Host View in the User Interface.

Backup (`nw-backup` script)

Error Message	`WARNING: Incorrect ESA Mongo admin password for host <hostname>.`
Cause	ESA Mongo admin password contains special characters (for example, '!@#$%^qwerty').
Solution	Change the ESA Mongo admin password back to the original default of 'netwitness' before running backup.

Error	Backup errors caused by the `immutable` attribute setting. Here is an example of an error that can be displayed: Cause	If you have any files that have the immutable flag set (to keep the Puppet process from overwriting a customized file), the file will not be included in the backup process and an error will be generated.
Solution	On the host that contains the files with the immutable flag set, run the following command to remove the immutable setting from the files: `chattr -i <filename>`

Error	Error creating Network Configuration Information file due to duplicate or bad entries in primary network configuration file: `/etc/sysconfig/network-scripts/ifcfg-em1` Verify contents of `/var/netwitness/logdecoder/packetdb/nw-backup/2018-02-23/S5-BROK-36-10.25.53.36-network.info.txt`
Cause	There are incorrect or duplicate entries for any one of the following fields: DEVICE, BOOTPROTO, IPADDR, NETMASK or GATEWAY, that were found from reading the primary Ethernet interface configuration file from the host being backed up.

Solution	Manually create a file at the backup location on the external backup server, as well as the backup location local to the host where other backups have been staged. The file name should be of the format `<hostname>-<hostip>-network.info.txt`, and should contain the following entries:
	`DEVICE=<devicename> ; # from the host's primary ethernet interface config file`
	`BOOTPROTO=<bootprotocol> ; # from the host's primary ethernet interface config file`
	`IPADDR=<value> ; # from the host's primary ethernet interface config file`
	`NETMASK=<value> ; # from the host's primary ethernet interface config file`
	`GATEWAY=<value> ; # from the host's primary ethernet interface config file`
	`search <value> ; # from the host's /etc/resolv.conf file`
	`nameserver <value> ; # from the host's /etc/resolv.conf file`

Event Stream Analysis

- For ESA Correlation troubleshooting information, see the *Alerting with ESA Correlation Rules User Guide*.
- For ESA Analytics troubleshooting information, see the *Automated Threat Detection Configuration Guide*.

Concentrator Service

Problem	After you upgrade to 11.3.0.0, pivot to navigate query fails if the Concentrator service version is 10.6.x.
Cause	Pivot to Navigate query fails as it contains meta entities and 10.6.x Concentrator service does not support meta entities.
Solution	You must edit the query and remove meta entities. For example, if query is for user then remove the `user.all` meta entity and re-run the query.

Log Collector Service (`nwlogcollector`)

Log Collector logs are posted to `/var/log/install/nwlogcollector_install.log` on the host running the `nwlogcollector` service.

Error Message	`<timestamp>.NwLogCollector_PostInstall: Lockbox Status : Failed to open lockbox: The lockbox stable value threshold was not met because the system fingerprint has changed. To reset the system fingerprint, open the lockbox using the passphrase.`
Cause	The Log Collector Lockbox failed to open after the update.
Solution	Log in to NetWitness Platform and reset the system fingerprint by resetting the stable system value password for the Lockbox as described in the "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*.

Error Message	`<timestamp> NwLogCollector_PostInstall: Lockbox Status : Not Found`
Cause	The Log Collector Lockbox is not configured after the update.
Solution	If you use a Log Collector Lockbox, log in to NetWitness Platform and configure the Lockbox as described in the "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*.

Error Message	`<timestamp>: NwLogCollector_PostInstall: Lockbox Status : Lockbox maintenance required: The lockbox stable value threshold requires resetting. To reset the system fingerprint, select Reset Stable System Value on the settings page of the Log Collector.`
Cause	You need to reset the stable value threshold field for the Log Collector Lockbox.
Solution	Log in to NetWitness Platform and reset the stable system value password for the Lockbox as described in "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*.

Problem	You have prepared a Log Collector for upgrade and no longer want to upgrade at this time.
Cause	Delay in upgrade.
Solution	Use the following command string to revert a Log Collector that has been prepared for upgrade back to resume normal operation. `# /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --revert`

NW Server

These logs are posted to `/var/netwitness/uax/logs/sa.log` on the NW Server Host.

Problem	After upgrade, you notice that Audit logs are not getting forwarded to the configured Global Audit Setup; or, The following message seen in the `sa.log`. `Syslog Configuration migration failed. Restart jetty service to fix this issue`
Cause	NW Server Global Audit setup migration failed to migrate from 10.6.6.x to 11.3.0.0.
Solution	1. SSH to the NW Server. 2. Submit the following command. `orchestration-cli-client --update-admin-node`

Orchestration

The orchestration server logs are posted to `/var/log/netwitness/orchestration-server/orchestration-server.log` on the NW Server Host.

Problem	1. Tried to upgrade a non-NW Server host and it failed. 2. Retried the upgrade for this host and it failed again. You will see the following message in the `orchestration-server.log`. `"'file' _virtual_ returned False: cannot import name HASHES""`
Cause	Salt minion may have been upgraded and never restarted on failed non-NW Server host

Solution	1. SSH to the non-NW Server host that failed to upgrade.
	2. Submit the following commands.
	`systemctl unmask salt-minion`
	`systemctl restart salt-minion`
	3. Retry the upgrade of the non-NW Server host.

Reporting Engine Service

Reporting Engine Update logs are posted to to/var/log/re_install.log file on the host running the Reporting Engine service.

Error Message	<timestamp> : Available free space in /var/netwitness/re-server/rsa/soc/reporting-engine [><existing-GB] is less than the required space [<required-GB>]
Cause	Update of the Reporting Engine failed because you do not have enough disk space.
Solution	Free up the disk space to accommodate the required space shown in the log message. See the "Add Additional Space for Large Reports" topic in the *Reporting Engine Configuration Guide* for instructions on how to free up disk space.

NetWitness UEBA

Problem	The User Interface is not accessible.
Cause	You have more than one NetWitness UEBA service existing in your NetWitness deployment and you can only have NetWitness UEBA service in your deployment.

Solution	Complete the following steps to remove the extra NetWitness UEBA service.
	1. SSH to NW Server and run the following commands to query the list of installed NetWitness UEBA services.
	`# orchestration-cli-client --list-services|grep presidio-airflow`
	`... Service: ID=7e682892-b913-4dee-ac84-ca2438e522bf, NAME=presidio-airflow, HOST=xxx.xxx.xxx.xxx:null, TLS=true`
	`... Service: ID=3ba35fbe-7220-4e26-a2ad-9e14ab5e9e15, NAME=presidio-airflow, HOST=xxx.xxx.xxx.xxx:null, TLS=true`
	2. From the list of services, determine which instance of the `presidio-airflow` service should be removed (by looking at the host addresses).
	3. Run the following command to remove the extra service from Orchestration (use the matching service ID from the list of services):
	`# orchestration-cli-client --remove-service --id <ID-for-presidio-airflow-form-previous-output>`
	4. Run the following command to update node 0 to restore NGINX:
	`# orchestration-cli-client --update-admin-node`
	5. Log in to NetWitness Platform, go to **ADMIN** > **Hosts**, and remove the extra NetWitness UEBA host.

Appendix B. Create an External Repository

Complete the following procedure to set up an external repository (Repo).

1. Log in to the web server host.
2. Create the `ziprepo` directory to host the NW repository (`netwitness-11.2.0.0.zip`) under `web-root` of the web server. For example, if `/var/netwitness` is the web-root, submit the following command string.
   ```
   mkdir /var/netwitness/ziprepo
   ```
3. Create the 11.2.0.0 directory under `/var/netwitness/ziprepo`.
   ```
   mkdir /var/netwitness/ziprepo/11.2.0.0
   ```
4. Create the `OS` and `RSA` directories under `/var/netwitness/ziprepo/11.2.0.0`.
   ```
   mkdir /var/netwitness/ziprepo/11.2.0.0/OS
   mkdir /var/netwitness/ziprepo/11.2.0.0/RSA
   ```
5. Unzip the `netwitness-11.2.0.0.zip` file into the `/var/netwitness/ziprepo/11.2.0.0` directory.
   ```
   unzip netwitness-11.2.0.0.zip -d /var/netwitness/ziprepo/11.2.0.0
   ```
   Unzipping `netwitness-11.2.0.0.zip` results in two zip files (`OS-11.2.0.0.zip` and `RSA-11.2.0.0.zip`) and some other files.
6. Unzip the:
   a. `OS-11.2.0.0.zip` into the `/var/netwitness/ziprepo/11.2.0.0/OS` directory.
      ```
      unzip /var/netwitness/ziprepo/11.2.0.0/OS-11.2.0.0.zip -d
      /var/netwitness/ziprepo/11.2.0.0/OS
      ```

Physical Host Upgrade Checklist

for Version 10.6.6.x to 11.3

RSA NETWITNESS® PLATFORM

Task	Description	√
Prepare for Upgrade		
1.	Download *Physical Host Upgrade Guide* from RSA Link (https://community.rsa.com/docs/DOC-100385) and review it.	
2.	Carefully read the sections on Event Stream Analysis (ESA) Upgrade Considerations and Investigate in Mixed Mode.	
3.	Be aware of the hardware, deployments, services, and features not supported in 11.3.	
4.	Perform the upgrade preparation tasks for the features you use. **Caution:** Make sure that you implement and test the new ports so that upgrade does not fail due to missing ports.	
5.	Create CentOS 6 external host to save backup tar files.	
6.	Download the `nw-backup-v4.2.zip` (or later) file from RSA Link (https://community.rsa.com/docs/DOC-81514) to external host.	
7.	Execute `get-all-systems.sh` and `ssh-propagate.sh` script from external host.	
8.	Preserve a copy of the `get-all-systems-master` file for future reference.	
9.	Execute `nw-backup.sh` in `TEST` mode to evaluate the space requirements from external host (for example: `nw-backup -t -l -D`).	
10.	Review the back up options for `nw-backup.sh` by displaying the help menu (`nw-backup.sh -h`) .	

Task	Description	√
Phase 1 - Upgrade SA Server, ESA, Malware Analysis, and Broker/Concentrator Hosts		
11.	Update the contents of the `all-systems` so they consist of SA, ESA's, MA and Broker/Concentrator backup data.	
12.	For ESA hosts, reset the Mongo Database admin password to 'netwitness' if it contains special characters .	
13.	Execute `nw-backup.sh` with `-u` flag for all Phase 1 hosts and confirm that it completes with no errors.	
14.	If your environment has multiple ESA appliances, designate a primary ESA (Where the Context Hub service is running) and copy `controldata-mongodb.tar.gz.*` files from the secondary ESAs to designated primary ESA default backup path.	
15.	Confirm that backup tar files are saved locally and remotely.	
16.	Attach media (media that contains the ISO file, for example a build stick) to the SA Server host. Download *USB Build Stick Instruction - 11.3 and Later* document from RSA Link (https://community.rsa.com/docs/DOC-100386) for instructions on how to get ISO and prepare it. **IMPORTANT:** The ISO is unreadable in a Windows files system. Use a third-party tool (for example, Etcher - available at: https://etcher.io) to etch an Linux file system on the USB drive.	
17.	Create base image on the host from the attached media.	
18.	Upgrade the host to 11.3 by running the `nwsetup-tui` program on the host.	
19.	Repeat steps 16, 17, and 18 on the: a. ESA Primary host (and other ESA hosts if you have any). b. Malware Analysis host. c. Broker or Concentrator host.	
20.	Install the ESA, Malware Analysis, and Broker or Concentrator services in the NetWitness 11.3 User Interface.	

Task	Description	√
Phase 2 - Upgrade All Other Hosts		
21.	Update the contents of the `all-systems` so they consist of Phase 2 host backup data.	
22.	Execute `nw-backup.sh` in `TEST` mode to evaluate the space requirements from external host (for example: `nw-backup -t -l -D`).	
23.	Execute `nw-backup.sh` with `-u` flag for all Phase 2 hosts and confirm that it completes with no errors.	
24.	Confirm that backup tar files are saved locally and remotely.	
25.	For all other hosts: a. Attach media (that is Build Stick or DVD ISO) to the SA Server host. Refer the *USB Build Stick Instruction - 11.3 and Later* document that you downloaded in step 16 from RSA Link for instructions on how to get ISO and prepare it. b. Create base image on the host from the attached media. c. Upgrade the 10.6.6.x host to 11.3 by running the `nwsetup-tui` program on the host. d. Install the Category (service category) in the NetWitness 11.3 User Interface.	
Preform Post Upgrade Adjustments		
26.	Perform the post upgrade tasks for the features you use.

Contents

Introduction **7**

CentOS6 to CentOS7 Upgrade 7

RSA NetWitness® Platform 11.3 Upgrade Path 7

Supported Host Upgrade Path 7

Hardware, Deployments, Services, and Features Not Supported in 11.3 8

Event Stream Analysis (ESA) Upgrade Considerations 9

Upgrade Considerations for ESA Rule Deployments 9

Upgrade Phases 9

Phase 1 9

Phase 2 10

Phase 3 (Optional) 11

Investigate in Mixed Mode 11

Upgrade Workflow 13

Contact Customer Support 13

Upgrade Preparation Tasks **14**

General 14

Task 1 - Review Core Ports and Open Firewall Ports 14

Task 2 - Record Your 10.6.6.x admin user Password 15

Task 3 - Create a Backup of the /etc/fstab File 15

Task 4 - Make Sure Password Strength Settings Check Boxes Are Set in 10.6.6.x 15

Task 5 (Conditional) - Extract 10.6.x Public Key Infrastructure (PKI) Certificates 16

Event Stream Analysis (ESA) 19

Task 6 (Conditional) - Record Any String Array Type Meta Keys on the Event Stream Analysis Service 19

Respond 19

Task 7 - Check Aggregation Rules Match Conditions for “Domain” or “Domain for Suspected C&C” 19

Task 8 - Set Data Retention Run Interval to ≥ 24 Hours 20

Reporting Engine 21

(Conditional) Task 9 - Unlink External Storage 21

Warehouse Connector 22

(Conditional) Task 10 - Copy keytab files in root or etc Directory Stored in Other Directory 22

Other Tasks 22

Task 11 - Hardware - Check for BAD-INDEX BIOS Error before Upgrading 22

Backup Instructions **23**

Task 1 - Set up an External Host for Backing up Files 24

Task 2 - Create a List of Hosts to Back up 26
Troubleshooting Information 27
Task 3 - Set up Authentication Between Backup and Target Hosts 29
Task 4 - Check for Backup Requirements for Specific Types of Hosts 29
For All Host Types 29
For ESA Hosts with Mongo Databases 30
For Decoder, Concentrator, or Broker Hosts: Stop Data Capture and Aggregation 30
Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh 30
For File Collection Event Sources 32
For Bluecoat Event Sources 32
For Integrations with Web Threat Detection, Archer Cyber Incident & Breach Response or NetWitness Endpoint - List RabbitMQ Usernames and Passwords 32
Task 5 - Check for Adequate Space for the Backup 32
Task 6 - Back up Your Host Systems 33
Post Backup Tasks 36
Task 1 - Save a Copy of the all-systems File and the Backup Tar files 36
Task 2 - Ensure Required Backup Files Were Generated 36
Task 3 - (Conditional) For Multiple ESA Hosts, Copy mongodb tar files to Primary ESA Host 37
Task 4 - Ensure All Required Backup Files are on Each Host 37
Upgrade Tasks 40
Phase 1 - Upgrade SA Server, Event Stream Analysis, Malware Analysis, and Broker or Concentrator Hosts 40
Task 1 - Upgrade the 10.6.6.x SA Server to 11.3 NW Server 40
Task 2 - Upgrade 10.6.6.x ESA to 11.3 40
Task 3 - Upgrade 10.6.6.x Malware Analysis to 11.3 41
Task 4 - Upgrade 10.6.6.x Broker or 10.6.6.x Concentrator to 11.3 41
Phase 2 - Upgrade All Other Hosts 41
Decoder and Concentrator Hosts 41
Log Decoder Host 41
Virtual Log Collector Host 41
All Other 10.6.6.x Hosts to 11.3 43
Upgrade the 10.6.6.x SA Server Host to the 11.3 NW Server Host 43
Upgrade a 10.6.6.x Component Host to 11.3 51
Phase 3 - (Optional) Install Warm Standby NW Server 59
Update or Install Windows Legacy Collection 60
Post Upgrade Tasks 61
General 61
Task 1 - Remove Backup-Related Files from Host Local Directories 61
Task 2 - Make Sure Port 15671 Is Configured Correctly 62
(Optional) Task 3 - Reissue Certificates for Your Hosts 62

(Conditional) Task 4 - Restore Custom Analysts Roles 62
(Conditional) Task 5 - If NetWitness Platform Has No Web Access, Upload Response .bin File Again (License Server) 62
Task 6 - Migrate Active Directory (AD) 62
Task 7 - Modify Migrated AD Configuration to Upload Certificate 63
Task 8 - Reconfigure Pluggable Authentication Module (PAM) in 11.3 63
Task 9 - Restore NTP Servers 63
Task 10 - Restore Licenses for Environments without FlexNet Operations-On Demand Access 63
(Conditional) Task 11 - If You Disabled Standard Firewall Config - Add Custom IPtables 64
(Conditional) Task 12 - Specify SSL Ports If You Never Set Up Trusted Connections 64
Task 13 (Conditional) Reconfigure Public Key Infrastructure (PKI) Certificates 65
Event Stream Analysis (ESA) 65
Task 14 - Reconfigure Automated Threat Detection for ESA 65
Task 15 (Conditional) Verify String Array Type Meta Keys on the ESA Correlation Service 66
Task 16 (Conditional) Update RSA Live ESA Rules with Meta Type Changes from String to Array 66
Task 17 (Conditional) - Verify ESA Rule Deployment 67
Investigate 67
Task 18 - Make Sure Customized User Roles Have Investigate-server Permissions for Event Analysis Access 67
Log Collection 69
Task 19 - Reset Stable System Values for Log Collector after Upgrade 69
Task 20 - (Conditional) Update SSHD Configuration after Upgrade with Older Windows and UNIX SFTP Agents 69
Task 21 - Enable FIPS Mode 70
Log Decoder and Decoder 70
(Conditional) Task 23 - Enable Metadata for GeoIP2 Parser 70
Malware Analysis 71
Task 24 - Enable Threat - Malware Indicators Dashboard 71
Reporting Engine 71
(Conditional) Task 25 - Restore the CA certificates for External Syslog Servers for Reporting Engine 71
(Conditional) Task 26 - Restore External Storage for Reporting Engine 71
Respond 72
Task 27 - Restore Respond Service Custom Keys 72
Task 28 - Restore Customized Respond Service Normalization Scripts 72
Task 29 - Add Respond Notification Settings for Custom Roles 73
Task 30 - Manually Configure Respond Notification Settings 73
Task 31 - Update Default Incident Rule Group By Values 74
Task 32 - Add Group By Field to Incident Rules 75
Task 33 - Update Incident Rules Identified in the Domain Matching Conditions Upgrade Preparation Task 76

Warehouse 78
Task 34 - Restore keytab Files, Mount NFS, Install Service 78
Task 35 - Refresh Warehouse Connector Lockbox and Start Stream 78
Task 36 - Update Hive Version 78

Introduction

The instructions in this guide apply to the upgrade of physical hosts to RSA NetWitness® Platform 11.3 exclusively. See the *Virtual Host Upgrade Guide for NetWitness Platform 10.6.6.x to 11.3* for instructions on how to upgrade your virtual hosts to 11.3.

NetWitness Platform 11.3 is a major release that affects all products in the NetWitness Platform. The components of the platform are the NetWitness Server (Admin server, Config server, Integration server, Investigate server, Orchestration server, Respond server, Security sever, and Source server), Archiver, Broker, Concentrator, Context Hub, Decoder, Endpoint Log Hybrid, ESA Primary, ESA Secondary, Log Collector, Log Decoder, Malware Analysis, Reporting Engine, UEBA, Warehouse Connector, and Workbench.

Refer to the *Getting Started Guide for NetWitness Platform* to become familiar with the major changes to the 11.x User interface. Refer to the *Deployment Guide* to become familiar with the major platform changes in 11.x.

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Note: The Reporting Engine is installed on the NW Server host, Workbench is installed on the Archiver host, and Warehouse Connector can be installed on the Decoder host or Log Decoder host.

CentOS6 to CentOS7 Upgrade

NetWitness Platform 11.3 is a major release that involves upgrading to a newer version of the operating system (CentOS6 to CentOS7). In addition, the 11.3 platform environment has been improved greatly to accommodate current and future physical and virtual deployment types. These changes require an upgrade to the new environment and an upgrade of the functionality.

RSA NetWitness® Platform 11.3 Upgrade Path

The earliest supported upgrade path for RSA NetWitness® Platform 11.3 is Security Analytics 10.6.6.x. If you are running a version of NetWitness Platform that is prior to 10.6.6.x, you must update to 10.6.6.x before you can upgrade to 11.3. See the *RSA Security Analytics 10.6.6 Update Guide* (https://community.rsa.com/docs/DOC-95880) on RSA Link.

Supported Host Upgrade Path

You must upgrade a host to the same host type:

- Same Series RSA Physical Appliance to Same Series RSA Physical Appliance (that is, Series 4 to Series 4, Series 5 to Series 5).
  RSA does not support third-party physical hosts in 11.3.
- On-Prem Virtual to On-Prem Virtual

Caution: The 11.3 upgrade does not support mixed-platform upgrades (for example, it does not support physical to virtual).

Hardware, Deployments, Services, and Features Not Supported in 11.3

RSA does not support upgrade of the following hardware, deployments, services, and features to 11.3.

- RSA All-in-One (AIO) Appliance
- Multiple NetWitness Server Deployment
- IPDB service
- Malware Analysis service co-located on the SA Server (upgrade of Malware Analysis Enterprise is supported in 11.3.)
- Standalone Warehouse Connector service (Upgrade of a co-located Warehouse Connector is supported in 11.3.)
- Custom Health & Wellness policy in 10.6.x for the Context Hub Service
  After you upgrade to NetWitness 11.3, your custom policy is not present. In its place, there is the out-of-the-box Context Hub Server Monitoring Policy in the user interface, which is specific for version 11.3.
- Defense Information Strategic Agency-Security Technical Information Guide (DISA-STIG) hardened deployments.
- Warehouse Analytics (Data Science)

Event Stream Analysis (ESA) Upgrade Considerations

In RSA NetWitness® Platform 11.3, RSA changed how ESA Correlation Rules store and transmit the alerts the system generates. In 11.3, ESA sends all alerts to a central Alert system. The local MongoDB storage in ESA 10.6.6.x has been removed.

Note: If you did not use Incident Management in 10.6.6.x, you cannot view the 10.6.6.x ESA alerts in the 11.3 Respond component without running a migration script. Use the ESA Alert Migration script to migrate these alerts to the location in 11.3 that will allow Respond to view them. See the *ESA Alert Migration Instructions* knowledge base article (https://community.rsa.com/docs/DOC-84102) in RSA Link for instructions on how to run this script.

Upgrade Considerations for ESA Rule Deployments

Caution: In NetWitness Platform 11.3, the ESA Correlation service contains data source changes that require changes to migrated ESA rule deployments. The 11.3 ESA Correlation service replaces the Event Stream Analysis service in earlier versions.

After you upgrade to 11.3, migrated ESA rule deployments have the following changes.

1. If an ESA rule deployment contains two services before you upgrade to 11.3, the deployment splits into two deployments. You can only have one ESA Correlation service in an ESA rule deployment in version 11.3.
2. If an ESA service has multiple ESA rule deployments before you upgrade to 11.3, they are combined into one deployment in version 11.3.

You can still access your old deployments. For a detailed example, see the *ESA Configuration Guide for RSA NetWitness Platform 11.3*.

Upgrade Phases

RSA recommends that you stagger host upgrades as described in this section. The update to CentOS7 and the need of a physical or iDRAC access cause the 11.3 upgrade to take more time than most upgrades.

Caution: If you stagger the upgrade, you:
• Must upgrade the hosts in Phase 1 first, in the order shown.
• May not have all the features operational until you update your entire deployment.
• Will not have service administrative features available until you upgrade all the hosts in your deployment.

Phase 1

You perform Phase 1 first. You must upgrade the hosts in the following order:

1. Security Analytics Server host
2. Event Stream Analysis hosts

3. Malware Analysis hosts
4. Broker hosts (if you do not have a Broker, upgrade your Concentrator hosts)
   The 11.3 NetWitness Server (NW Server) cannot communicate with 10.6.6.x core services for the new Investigate functionality. This is why you must upgrade the Broker or Concentrator hosts in Phase 1.

Phase 2

Upgrade the rest of your hosts.

RSA recommends that you follow the order in Phase 2 to reduce:

- Functionality loss during investigation.
- Downtime that results in the loss of network and log capture.

Note: Other than Log Collection hosts with downstream event destinations, there is no technical reason to upgrade your hosts in the order shown in Phase 2.

This is the Phase 2 host upgrade order recommended by RSA.

1. Decoder hosts
2. Concentrator hosts
3. Archiver hosts
4. Log Collection hosts - Log Collectors on Log Decoder hosts (LDs), Virtual Log Collectors (VLCs) and Legacy Windows Collectors (LWCs)
   Before you upgrade a log collection host, you must prepare it for the upgrade. Part of this preparation ensures that no event data remains in the queues. This requires you to keep the downstream destinations of event data (Log Collectors, Virtual Log Collectors and Log Decoders) up and functioning properly.

   If you have event data destinations downstream from the Log Decoder, you must prepare and upgrade Log Collectors in the following order.

   a. LDs (one LD at a time)

   b. VLCs and LWCs

   If you do not have event data destinations downstream from the Log Decoder, you can prepare and upgrade multiple LDs, VLCs, and LWCs together.
5. All other hosts

See "Running in Mixed Mode" under "The Basics" in the *RSA NetWitness Platform Hosts and Services Getting Started Guide* for:

- Functionality gaps encountered while running in this mode.
- Examples of staggered upgrades.

Phase 3 (Optional)

After you have upgraded all hosts in your deployment to 11.3, you can install a Warm Standby NW Server. Refer to "Warm Standby NW Server Host" under "Deployment Option Setup Procedures" in the *Deployment Guide for NetWitness Platform for 11.3* for instructions on how to set up a Warm Standby NW Server.

Investigate in Mixed Mode

Mixed mode occurs when the NW Server host and Broker hosts are on the latest version (for example, 11.3) and the other core services such as Concentrators and Decoders are on any older version (for example, 10.6.6.x or 11.1.x.x-11.2.x.x). You must follow the host upgrade sequence as shown in Upgrade Phases to ensure complete Investigate functionality.

The 11.3 Investigate server is installed when you upgrade the SA Server, but Broker hosts need to be upgraded to 11.3 to access the Event Analysis view. If the Broker is not upgraded, analysts see a warning icon next to the Broker, and no data aggregated to that Broker can be displayed.

Mixed mode (that is, some services are upgraded to 11.3 and some are still at 10.6.6.x) also affects the functionality of Role-Based Access Control (RBAC). In mixed mode, when an analyst conducts an investigation, RBAC is not applied uniformly to viewing and downloads. After you upgrade all services to 11.3, when an analyst conducts an investigation, Role-Based Access Control of downloads works consistently to limit access to restricted data.

In mixed mode, if the `sdk.packets` setting has not been disabled on the 10.6.6.x services, analysts with SDK meta and roles permissions in place to restrict viewing and reconstructing an event's content can download the packet capture (PCAP) file of an event that has content restrictions. Other types of downloads appear to be successful, then generate errors due to insufficient permissions, and the data is still protected.

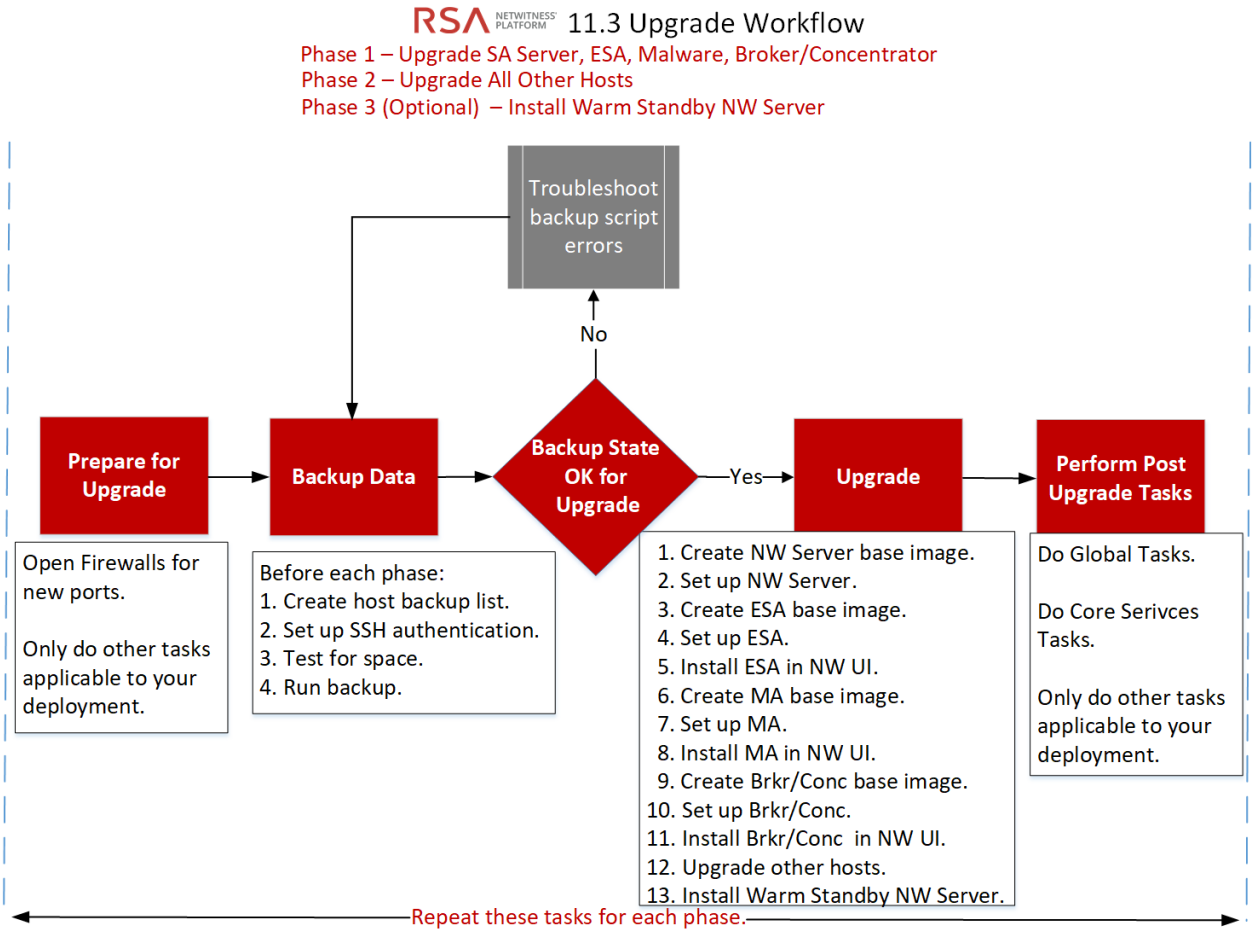
During a phased update, you can disable the `sdk.packets` setting on 10.6.6.x services to prevent analysts from downloading any PCAPs or logs. After you update all services to 11.3 and re-enable `sdk.packets`, RBAC works consistently across all services.

The following table identifies what users with the analysts role can see and download when the NW Server is at version 11.3, and the 11.3 Broker is connected to Concentrators and Decoders at version 10.6.6.x.

Investigate Views Affected	Information Analysts Can See	Restricted Content Analysts Can Download	Restricted Content Analysts Can Download with Errors
Events View	RBAC permitted items	PCAP	File archive (cannot unzip it)
Event Reconstruction View	RBAC permitted items	PCAP	File archive (cannot unzip it)
Event Analysis View	RBAC permitted items	PCAP	Payload (any option: all payloads, request only, response only)

Upgrade Workflow

The following diagram illustrates the RSA NetWitness® Platform 11.3 upgrade workflow.



Contact Customer Support

Refer to the Contact RSA Customer Support page (https://community.rsa.com/docs/DOC-1294) in RSA Link for instructions on how to get help on RSA NetWitness Platform 11.3.

Upgrade Preparation Tasks

Complete the following tasks to prepare for the upgrade to NetWitness Platform 11.3. These tasks are organized by the following categories.

- General
- Event Stream Analysis (ESA)
- Reporting Engine
- Respond
- Warehouse Connector
- Other

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

General

Task 1 - Review Core Ports and Open Firewall Ports

The following tables list new ports in 11.3.

Caution: Make sure that the new ports are implemented and tested before upgrading so that upgrade does not fail due to missing ports.

NW Server Host

Source Host	Destination Host	Destination Ports	Comments
NW Hosts	NW Server	TCP 4505, 4506	Salt Master Ports
NW Hosts	NW Server	TCP 27017	MongoDB
Admin Workstation	NW Server	TCP 15671	RabbitMQ Management UI
NW Hosts	NW Server	TCP 15671	RabbitMQ Management UI

ESA Host

Source Host	Destination Host	Destination Ports	Comments
NW Server, NW Endpoint, ESA Secondary	ESA Primary	TCP 27017	MongoDB

Endpoint Log Hybrid

Source Host	Destination Host	Destination Ports	Comments
Endpoint Log Hybrid	NW Server	TCP 5672	Message Bus
Endpoint Server	NW Server	TCP 27017	MongoDB

All NetWitness Platform core ports are listed in the "Network Architecture and Ports" topic in the *Deployment Guide* in case you need to reconfigure NetWitness Platform services and firewalls.

Task 2 - Record Your 10.6.6.x `admin user` Password

Record your 10.6.6.x `admin user` password. You will need it to complete the upgrade.

Task 3 - Create a Backup of the `/etc/fstab` File

Copy the `/etc/fstab` file from all the physical hosts and into your local machine (backup host or remote machine).

Note: You need this file to restore a physical host with external storage mounts.

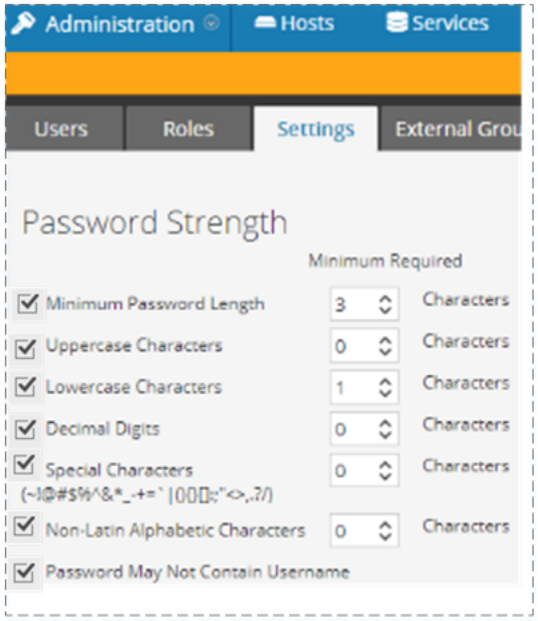
Task 4 - Make Sure Password Strength Settings Check Boxes Are Set in 10.6.6.x

The check box to the left of the **Password Strength Settings** in the **Administration** > **Security** > **Settings** tab must be set in 10.6.6.x or these settings will not be migrated to 11.3.

Complete the following task to make sure that the Password Strength Settings check boxes are set in 10.6.6.x.

1. In Security Analytics 10.6.6.x, go to the **Administration** > **Security** > **Settings** tab.
2. Make sure that all of the check boxes to the left of the **Password Strength Settings** are set. If they are not, set them and click **Apply**.

The following example shows all check boxes as set (required in 10.6.6.x before upgrading to 11.3).



Task 5 (Conditional) - Extract 10.6.x Public Key Infrastructure (PKI) Certificates

Before you upgrade to from 10.6.6.x to 11.3, complete the following procedure to extract the existing 10.6.x PKI keystores that contain server certificates with private keys, and the truststores that contain the trusted CA certificates.

1. Download the `rsa-nw-pki-migration-10.6.6.zip` file from **RSA Link** > **RSA NetWitness Platform** > **Downloads** > **RSA NetWitness LOGS & NETWORK** > **Version 11.3**.
2. Extract the `pki-migration-1.0.jar` file from the `rsa-nw-pki-migration-10.6.6.zip` file.
3. SSH to the 10.6.6.x Security Analytics Server host and log in with the root credentials.
4. Copy the `pki-migration-1.0.jar` file into `/tmp` folder.
5. Run the following command strings to extract the certificates.

   ```
   cd /tmp
   java -jar pki-migration-1.0.jar
   extract
   ```

   This :

   - Creates the `rsa-pki-migration-tool-<yyyy-MM-dd-hh-mm>` directory under the `tmp` directory.
   - Extracts output files into the `/tmp/rsa-pki-migration-<yyyy-MM-dd-hh-mm>` directory.
   - Creates a keystore (for example, `<keystore-x>.p12`) for each server certificate.
     The keystore is encrypted with **netwitness** as the password.
   - Creates a certificate file (for example, `<certificate-X>.cer`) for each trusted CA certificate in truststore.

Note: Refer to the line in the console output to find the storage location of the

- server certificate (`<keystore-X>.p12`). For Example:

```
The Entry le-056cdfb6-7577-4287-a791-64fbf999ff2d is a Private Key Entry
Storing the entry le-056cdfb6-7577-4287-a791-64fbf999ff2d into store at /tmp/rsa-pki-migration-tool-2019-03-04-13-48/keystore-2.p12
```

- trusted CA certificate (`<certificate-x>.cer`). For example

```
The Entry srv3-server3-ca-291745768375599843303243313528455998 51 is a Certificate Key Entry
Writing certificate Entry srv3-server3-ca-291745768375599843303243313528455998 51 into file /tmp/rsa-pki-migration-tool-2019-03-04-13-48/certificate-4.cer
```

This process does not modify the original keystores and trusted CA certificates of 10.6.6.x. You can run these steps multiple times, if required.

6. Open any keystore and display its contents to verify that the extracted keystores and the trusted CA certificates are correct.

   ```
   cd rsa-pki-migration-tool-<yyyy-MM-dd-hh-mm>
   ls -ltrh
    Openssl x509 -in <certificate-X>.cer -inform DER
   ```

   The certificate in displayed in PEM (Base64) format. For example:

   ```
   -----BEGIN CERTIFICATE-----
   MIIDZTCCAk2gAwIBAgIQZ4o94d5AiLBC4sPXgDYXpTANBgkqhkiG9w0BAQUFADBF

   3lAXU6iWqYZP
   -----END CERTIFICATE-----
   ```

   ```
   keytool -list -keystore <keystore-X>.p12 -storetype PKCS12 – storepass
   netwitness
   ```

   The following is an example of the output.

   ```
   Keystore type: PKCS12
   Keystore provider: <XXXXX>
   ```

7. Exit the keystore.

   ```
   exit
   ```

You can use:

- One of the `.p12` keystore files as a server certificate. Refer to the command output to find `.p12` file that corresponds to the server certificate you must use.
- The extracted certificate files (.cer) as trusted CA certificates.

For instructions on how to configure PKI authentication, see the "*System Security and User Management Guide*".

Event Stream Analysis (ESA)

Task 6 (Conditional) - Record Any String Array Type Meta Keys on the Event Stream Analysis Service

If you added any string array type meta keys to the Event Stream Analysis service for your ESA correlation rules in 10.6.6.x or earlier, record these meta keys so you can verify that they exist after upgrade to 11.3.

To record your 10.6.6.x string array type meta keys before the 11.3 upgrade:

1. In Security Analytics 10.6.6.x:
   a. Go to the **Administration** > **Services** view.
   b. Select the Event Stream Analysis service.
   c. Click (actions) > **View** > **Explore**.
2. In the **Explore** view node list, select **Workflow** > **Source** > **netgenAggregationSource**.
3. In the **ArrayFieldNames** list, make a note of any string array type meta keys added to the Event Stream Analysis service so you can verify that they are on the ESA Correlation service after the upgrade.

Respond

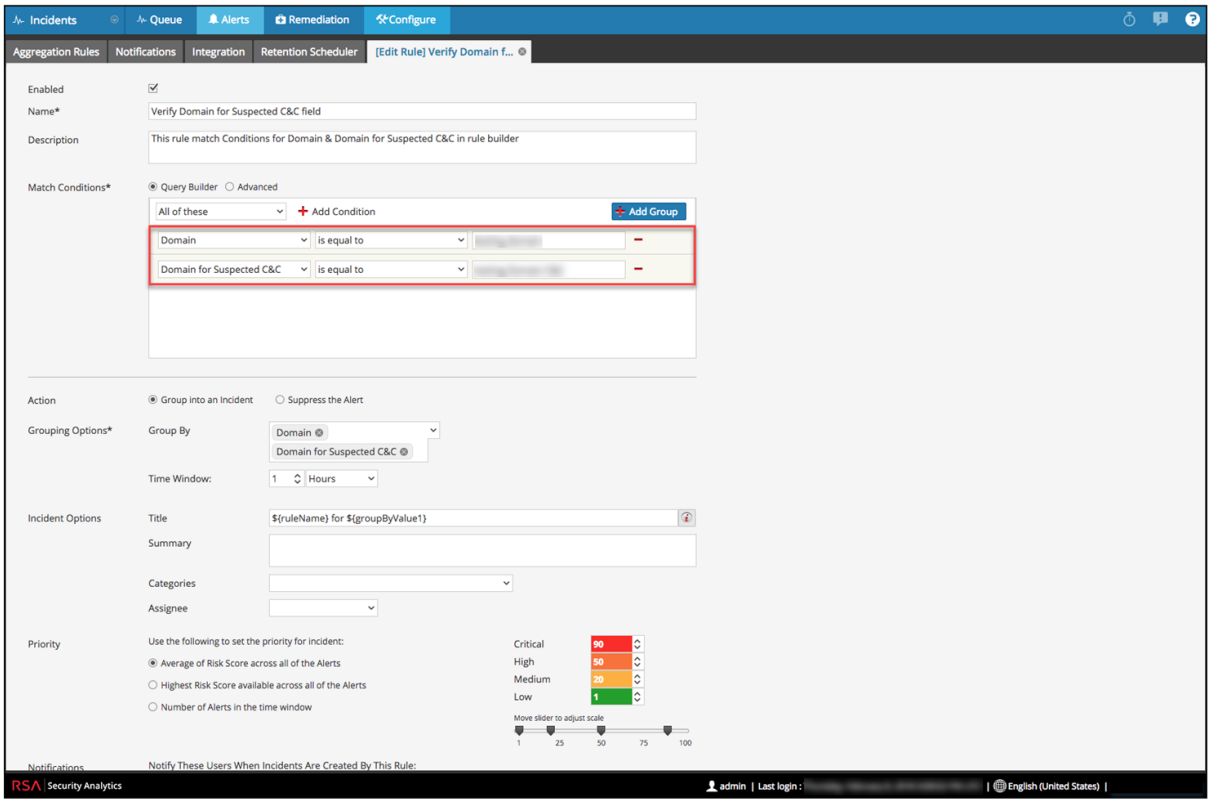
Task 7 - Check Aggregation Rules Match Conditions for “Domain” or “Domain for Suspected C&C”

Make a note of any Incident Management aggregation rules that have match conditions using Domain or Domain for Suspected C&C in the drop-down list in the rule builder. You will need to add back these conditions after you upgrade to 11.3 as described in the "Respond" Post Upgrade Tasks later in this document.

Complete the task for each aggregation rule.

1. In Security Analytics 10.6.6.x, go to **Incidents** > **Configure** > **Aggregation Rules** tab and edit the rules to view the matching conditions.

2. In the **Match Conditions** section, look for **Domain** or **Domain for Suspected C&C** listed in the drop-down lists for the conditions.



3. Make a note of the rule name and the entire condition that uses **Domain** or **Domain for Suspected C&C**, including operators and values.

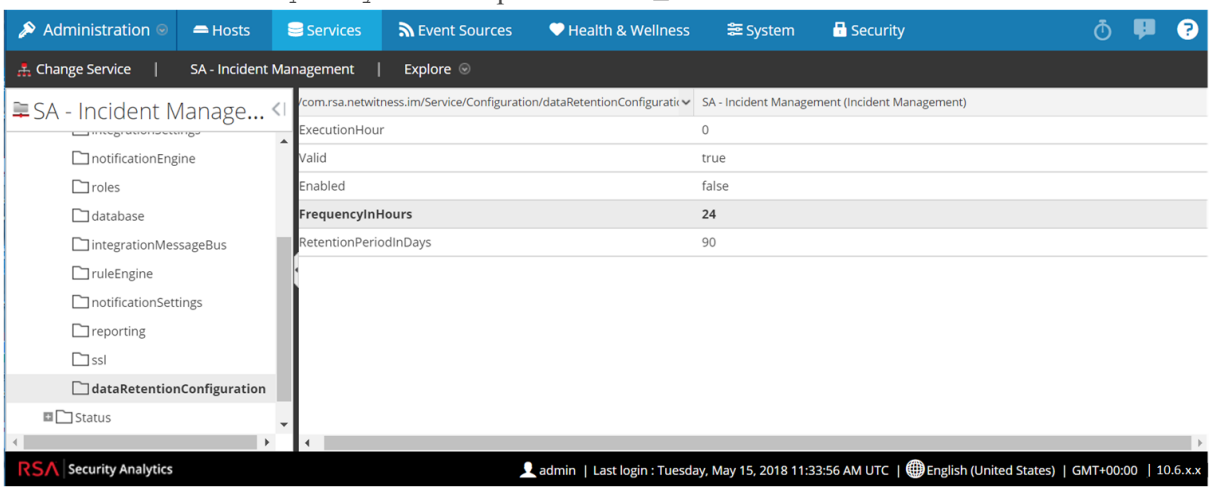
Task 8 - Set Data Retention Run Interval to ≥ 24 Hours

In Security Analytics 10.6.6.x, the Data Retention run interval does not have any minimum value check. In 11.3, RSA added a validation check to make sure that it is run at least every 24 hours. When you upgrade to 11.3, if this value is less than 24 hours, the Respond service will not start.

Complete the following task to ensure that the Respond service starts after upgrading to 11.3.

1. In Security Analytics 10.6.6.x, go to **ADMIN** > **Services**.
2. Select the **Incident Management** service, and then select > **View** > **Explore**.
3. In the Incident Management **Explore** view, go to **`Service` > `Configuration` > `dataRetentionConfiguration`.**

4. Make sure that the `FrequencyInHours` parameter is ≥ **24**.



Reporting Engine

(Conditional) Task 9 - Unlink External Storage

If the Reporting Engine has external storage, such as Storage Area Network (SAN) or Network Attached Storage (NAS) for storing reports, complete the following task to unlink the storage.

Note: In these steps:
`/home/rsasoc/rsa/soc/reporting-engine/` is the Reporting Engine home directory.
`/externalStorage/` is where the external storage is mounted.

1. SSH to the Reporting Engine host and log in with your `root` credentials.
2. Stop the Reporting Engine service.
   ```
   stop rsasoc_re
   ```
3. Switch to `rsasoc` user.
   ```
   su rsasoc
   ```
4. Change to the Reporting Engine the home directory.
   ```
   cd /home/rsasoc/rsa/soc/reporting-engine/
   ```
5. Unlink the `resultstore` directory mounted to external storage.
   ```
   unlink /externalStorage/resultstore
   ```
6. Unlink the `formattedReports` directory mounted to external storage.
   ```
   unlink /externalStorage/formattedReports
   ```

Warehouse Connector

(Conditional) Task 10 - Copy `keytab` files in `root` or `etc` Directory Stored in Other Directory

Complete the following task to copy the `keytab` files in the `root` or `etc` directory if it is stored in another directory.

1. Record the absolute path of NFS mount directory and the `keytab` file.
   You need this information to restore the Warehouse Connector after upgrade.
2. Unmount the NFS directory.
   a. SSH to the Warehouse Connector and log in with `root` credentials.
   b. Submit the following command to unmount the NFS directory.
   `umount <NFS-absolute-path>`

Other Tasks

Task 11 - Hardware - Check for BAD-INDEX BIOS Error before Upgrading

Complete the following steps to detect a `BAD-INDEX` BIOS error before you upgrade to 11.3.

1. SSH to each host appliance.
2. Run the following command.
   `dmidecode`
3. If you receive a `BAD-INDEX` error in the output, contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294).

Backup Instructions

Backing up your configuration data for all your hosts from 10.6.6.x is the first step in upgrading from Security Analytics 10.6.6.x releases to NetWitness Platform 11.3. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Note: 1.) It is important that you place Custom Certificate files and any other certificate authority (CA) files in the `/root/customcerts` folder to ensure that these certificate files are backed up. Your custom certificate files that are placed in this directory will be automatically restored during the upgrade process. After upgrading to 11.3, your custom certificate files will be located in `/etc/pki/nw/trust/import`. For more information about backing up these types of files, see step 1 in For All Host Types. 2.) Disable your Public Key Infrastructure (PKI) settings before starting the backup.

Caution: These services are not supported in the 10.6.6.x backup and upgrade process.
- IPDB
- All in One servers
- Malware Analysis Co-Located on the Security Analytics Server
- Standalone Warehouse Connector
- Warehouse Analytics (Datascience)

The following types of hosts can be backed up and are automatically restored during the upgrade process:

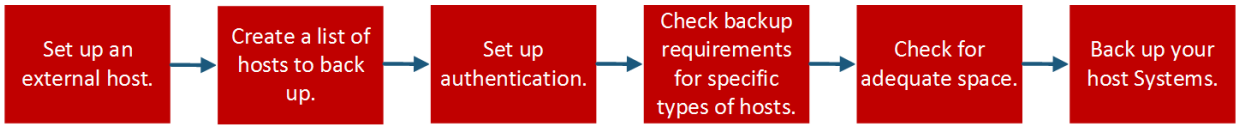
- **Security Analytics Admin Server**
- **Standalone Malware Analysis**
- **Archiver**
- **Broker**
- **Event Stream Analysis** (including Context Hub and Incident Management database)
- **Concentrator**
- **Log Decoder** (including Local Log Collector and Warehouse Connector, if installed)
- **Log Hybrid**
- **Network Decoder** (including Warehouse Connector, if installed)
- **Network Hybrid**
- **Virtual Log Collector**

The following types of files are automatically backed up but must be restored manually after the upgrade process:

- PAM configuration files: For information about restoring the PAM configuration files, refer to "Task 5 - Reconfigure Plugable Authentication Module (PAM) in 11.3.", in the "Global" section of the *Post Upgrade Tasks*.
- `/etc/pfring/mtu.conf` and `/etc/init.d/pf_ring`: To restore these files you must manually retrieve them. The `/etc/pfring/mtu.conf` files will be located in `/var/netwitness/database/nw-backup/restore/etc/pfring/mtu.conf`, and the

`/etc/init.d/pf_ring` files will be located in `/var/netwitness/database/nw-backup/restore/etc/init.d/pf_ring`. For information about how to restore these files, see " (Conditional) Task 2 - Restore Files for 10G Decoder" in the "Hardware Related Tasks" section of *Post Upgrade Tasks*.

The following diagram shows the high-level task flow of the steps you perform to back up your hosts.



The following sections describe each of these tasks:

- Task 1 - Set up an External Host for Backing up Files
- Task 2 - Create a List of Hosts to Back up
- Task 3 - Set up Authentication Between Backup and Target Hosts
- Task 4 - Check for Backup Requirements for Specific Types of Hosts
- Task 5 - Check for Adequate Space for the Backup
- Task 6 - Back up Your Host Systems
- Post Backup Tasks

Task 1 - Set up an External Host for Backing up Files

You must set up an external host to use for backing up files. The host must be running CentOS 6 with connectivity through SSH to the Security Analytics stack of hosts.

Note: If you are not able to use an external host for backing up files, contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) for assistance.

Ensure that the host names for the systems to be backed up are resolvable on the backup host machine, either by DNS or listed in the `/etc/hosts` file.

Note: These scripts are designed to run on CentOS 6 only. You must execute these scripts on CentOS 6 machines.

There are several scripts that you run during the backup process. You must download the zip file that contains the scripts (`nw-backup-v4.3.zip` or later) from RSA Link at this location: https://community.rsa.com/docs/DOC-81514 and copy it over to your CentOS 6 backup system. Extract the zip file to access the scripts. The scripts are:

- `get-all-systems.sh`: Creates the `all-systems` file, which contains a list of all your Security Analytics Servers and host systems to be backed up.

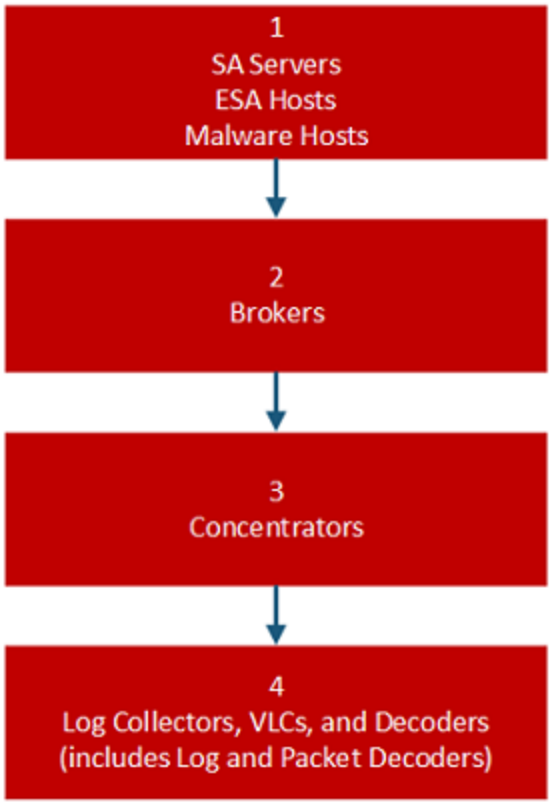
  Caution: When performing a mixed-mode upgrade, retain a master copy of the `all-systems` file upgrade until all the hosts in your deployment are upgraded to 11.3. You cannot run the `get-all-systems.sh` a second time because the NW Server, the first host that must be upgraded in mixed mode, will have CentOS7 as an operating system .

- `ssh-propagate.sh`: Automates sharing keys between the systems you are backing up and the backup host system so that you are not prompted for passwords multiple times.
- `nw-backup.sh`: Performs the backup of your hosts.
- `azure-mac-retention.ps1`: Applies only if you are using AZURE. See the *Azure Installation Guide* on for more information.

Note: 1.) If you have used the 10.6.x versions of the backup and restore scripts on your 10.6.6 hosts, you must still run all the scripts listed here. 2.) Do NOT use the scripts in the `nw-backup-v4.3.zip` (on later version of the nw-backup script) file for regular backups. These scripts are specifically designed for upgrading from 10.6.6.x to 11.3. 3.). 3.) The backup scripts do not support backing up data for STIG-hardened hosts.

Task 2 - Create a List of Hosts to Back up

The script that you use to back up your files depends on the `all-systems` and `all-systems-master-copy` files, which contain a list of the hosts that you want to back up. The `all-systems-master-copy` file contains a list of all your hosts. The `all-systems` file is used for each backup session, and contains only those hosts which are being backed up for a particular session. You run the `get-all-systems.sh` script to generate these files. RSA recommends that you back up your hosts in groups, and not all at once. The recommended order and grouping of hosts for backup sessions is shown in the following diagram:



Limit each backup session to five hosts to ensure that you do not run out of space for the backup files. You create `all-systems` files for your backup sessions by using the `all-systems-master-copy` file as a reference and then manually editing the `all-systems` file to contain specific hosts.

To generate the `all-systems` and the `all-systems-master-copy` files:

1. From the host on which you are running the backup process, make the `get-all-systems.sh` script executable by running the following command:
   ```
   chmod u+x get-all-systems.sh
   ```
2. At the root level, run the `get-all-systems.sh` script:
   ```
   ./get-all-systems.sh <IP-Address-of-SA-Admin-Server>
   ```
   You will be prompted for the password for each host system once per host.
   This script saves the `all-systems` file and the `all-systems-master-copy` file to `/var/netwitness/database/nw-backup/`.

3. Validate that the `all-systems` and `all-systems-master-copy` files were generated and that they contain the right hosts.
4. Edit the `all-systems` file to contain only the systems you are backing up. You can do this by using the `all-systems-master-copy` file as a reference, and then opening the `all-systems` file in an editor (such as vi) and modifying it to include only the systems you want to back up. RSA recommends that you comment out the hosts that you do not want to back up (add the number sign (#) to the beginning of the line that contains the host that will not be backed up).
   The following examples shows how to comment out the 10.6.6 Security Analytics Server:
   `loghybrid,loghyb,172.16.0.1,45fe9de1-1a82-49d7-9bb1-7ac5fa1d18d8,10.6.6.0`
   `#nwserver,nwserv106,172.31.255.23,67a9a0eb-1300-4fba-838f-7be4d8cf5e65,10.6.6.0`

> **Note:** If you use vi, be sure to include the path to the location of the `all-systems` file.

Here is an example of an `all-systems-master-copy` file:

```
nwserver,my-nw-server,10.0.0.1,af922b9f-cd61-49cd-afdc-a48e558cec3e,10.6.6.0
archiver,my-nw-archiver,10.0.0.2,a65c1236-5e46-4117-8529-8ea837074bd0,10.6.6.0
concentrator,my-nw-concentrator,10.0.0.3,dc620e94-bcf5-4d51-83fe-
c003cdfcd7a6,10.6.6.0
esa,my-nw-esa,10.0.0.4,8b608c0d-a7f9-40c0-baee-8407dec774ab,10.6.6.0
logdecoder,my-nw-logdecoder,10.0.0.5,c8be5d45-e19e-4a8d-90ce-
1cb2fe60077a,10.6.6.0
malwareanalysis,my-nw-malwareanalysis,10.0.0.6,2edc9585-7081-48c3-8f8c-
e0d02aa0a2fd,10.6.6.0
packetdecoder,my-nw-packetdecoder,10.0.0.7,a8f2f574-3dd0-4b65-9cf7-
d8141b78a192,10.6.6.0
vlc,my-nw-vlc,10.0.0.8,3ffefc4e-0b31-4951-bb77-dea5869fa98c,10.6.6.0
broker,my-nw-broker,10.0.0.9,0b65e7ce-61d5-4177-9647-c56ccfb0f737,10.6.6.0
```

And here is an example of an `all-systems` file that could be used in the first backup session, where only the Security Analytics Server, ESA host, and Malware Analysis host are backed up:

```
nwserver,my-nw-server,10.0.0.1,af922b9f-cd61-49cd-afdc-a48e558cec3e,10.6.6.0
#archiver,my-nw-archiver,10.0.0.2,a65c1236-5e46-4117-8529-

#vlc,my-nw-vlc,10.0.0.8,3ffefc4e-0b31-4951-bb77-dea5869fa98c,10.6.6.0
#broker,my-nw-broker,10.0.0.9,0b65e7ce-61d5-4177-9647-c56ccfb0f737,10.6.6.0
```

Troubleshooting Information

Be sure to save copies of the `all-systems` and `all-systems-master-copy` files in a safe location. Follow these recommendations.

- Do not edit the `all-systems-master-copy` file.
- If you create several different versions of the `all-systems` file (for example, for several backup sessions), be sure that each version of the file lists only those hosts that are currently being backed up, and the other hosts are commented out. For more information, see Post Backup Tasks.

If any host systems are down while you are running the `get-all-systems.sh` script, the script creates a list of hosts for which it cannot find information. After the script completes and the `all-systems` file is created, you must edit the `all-systems` file manually and add the missing information for these hosts.

The `get-all-systems.sh` script generates a list of hosts that were defined in the Security Analytics user interface. Ensure that all hosts and services are provisioned properly. If any hosts or services are not provisioned properly, they will not be backed up. RSA recommends that when you add hosts and services to Security Analytics, you use the Security Analytics user interface to ensure that they are provisioned properly. However, if there are any hosts or services that were not defined in the user interface, you must add them to the `all-systems` file manually.

At the end of the `get-all-systems.sh` script, the script will check for any differences between the systems that the Security Analytics Server has listed, and the ones for which the script was able to find all the required information. If any Node ID's or system names are listed as missing, verify the existence of those systems, that their services are all running, and that they are properly communicating with the Security Analytics Server. (Any Windows Legacy Collectors or AWS Cloud Collectors will not be added to the `all-systems` file, and may account for discrepancies. **DO NOT add these items to the `all-systems` file manually**.)

If the syntax in the `all-systems` file is incorrect, the script will fail. For example, if there is an extra space at the beginning or the end of a host entry, the script will fail.

Task 3 - Set up Authentication Between Backup and Target Hosts

RSA recommends that you run the `ssh-propagate.sh` script to automate sharing keys between the backup host and the host systems.

Note: If you have SSH keys that are protected with pass phrases, you can use `ssh-agent` to save time. For more information, refer to the main page for `ssh-agent`.

Complete the following task to set up authentication between backup and target hosts.

1. On the external backup host system, make the `ssh-propagate.sh` script executable by running the following command:
   `chmod u+x ssh-propagate.sh`
2. At the root directory, run the following command, where `<path-to-all-systems-file>` is the path to the directory where the `all-systems` file is stored:
   `./ssh-propagate.sh <path-to-all-systems-file>`
3. You are prompted for a password once on every host, but you will not need to enter it repeatedly later during the backup process.

Task 4 - Check for Backup Requirements for Specific Types of Hosts

After you create the `all-systems` file to use for backup, you must check to see if any of the hosts listed in the file have requirements that must be met before you run the backup process.

For All Host Types

Perform the following steps for all host types.

1. On the Security Analytics Server, place Custom Certificate files and any other certificate authority (CA) files in the `/root/customcerts` folder to ensure that these certificate files are backed up. Your custom certificate files that are placed in this directories will be automatically restored during the upgrade process. After upgrading to 11.3, your custom certificate files will be located in `/etc/pki/nw/trust/import`.
   You can convert CA certificates and keys to different formats to make them compatible with specific types of servers or software using OpenSSL. For example, you can convert a normal PEM file that would work with Apache to a PFX (PKCS#12) file and use it with Tomcat or IIS. To convert the files, SSH to the Security Analytics Server and run the following command strings to perform the conversions listed.
   Convert a DER file (.crt .cer .der) to PEM
   `openssl x509 -inform der -in certificate.cer -out certificate.pem`
   Convert a PEM file to DER
   `openssl x509 -outform der -in certificate.pem -out certificate.der`
   Convert a PEM Certificate File and a Private Key to PKCS#12 (.pfx .p12)
   `openssl pkcs12 -export -out certificate.pfx -inkey privateKey.key -in certificate.crt -certfile CACert.crt`
   Convert a PKCS#12 File (.pfx .p12) Containing a Private Key and Certificates to PEM
   `openssl pkcs12 -in keyStore.pfx -out keyStore.pem -nodes`

Note: Add the following qualifier to the command string to:
`-nocerts` convert private keys exclusively.
`-nokeys` convert certificates exclusively.

2. Manually record any custom configurations made to CentOS 6 (for example, driver customizations) for restoration after you update to CentOS 7. Custom configurations to CentOS 6 are not automatically backed up and restored.

For ESA Hosts with Mongo Databases

The default 10.6.x Mongo database password is `netwitness`. If you have customized this password, you could encounter an error while running the backup script. You can either use your custom Mongo database password during the backup, or you could change that password back to `netwitness` before running the `nw-backup.sh` script.

1. Find out if the Mongo database password is `netwitness` or if it has been modified.
2. If it has been modified, either change it back to `netwitness`, or be sure you know what the customized password is so that you can enter it during the backup.

For Decoder, Concentrator, or Broker Hosts: Stop Data Capture and Aggregation

In addition to the tasks described in For All Host Types, for Decoder, Concentrator, or Broker hosts, stop data capture and aggregation on all the systems that you are backing up. For instructions, refer to "Appendix B. Stopping and Restarting Data Capture and Aggregation."

Log Collectors (LC) and Virtual Log Collectors (VLCs): Run `prepare-for-migrate.sh`

Caution: This task stops log collection so you must perform this step immediately before you upgrade to minimize the loss of event collection. Complete this task in accordance with the backup and upgrade tasks in this guide.

Prerequisites

You need the following information before you prepare LCs and VLCs for upgrade.

- If Lockbox was initialized on the LC and VLC, you must know the Lockbox password. It is required to reconfigure the Lockbox after the upgrade.
- If you set the password for `logcollector` user for RabbitMQ, you must know the password so you can set it again after the upgrade.
- Read For File Collection Event Sources later in this chapter. You may need to restore some SSHD configuration settings from the 10.6.x LC/VLC.
- Read For Bluecoat Event Sources later in this chapter. You may need to backup VSFTPD key material manually.

Prepare LCs and VLCs for Upgrade

Complete the following task to prepare Log Collectors and Virtual Log Collectors for the upgrade.

1. SSH to the Log Collector.
2. Submit the following command string.
   ```
   # /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --prepare
   ```
   This command:
   - Stops the Puppet Agent service.
   - Disables the file collection accounts ("sftp" and all users in the group "upload") used for uploading log files to the Log Collector. The log files accumulate on the event sources until the Log Collector has been upgraded to 11.3.
   - Stops all the collection protocols in the Log Collector service.
   - Saves the list of Plugin accounts and RabbitMQ accounts.
   - Configures the RabbitMQ server so that new events cannot be published to it any longer. Consumers of events in the queues, such as shovels and Log Decoder Event Processors, will continue to run.
   - Waits until the Log Collector queues are empty.
   - Stops the Log Collector service.
   - Creates a marker file indicating that the Log Collector has been successfully prepared for upgrade.

Troubleshooting Information

The `prepare-for-migrate.sh` script:

- Sends informational, warning, and error messages to the console.
- Saves a session log in the `/var/log/backup/` directory.

You must fix any of the following errors and resume the preparation. Contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) for assistance.

- Log Collector queues with events but without consumers are found.
- Unable to stop the Puppet Agent service.
- Unable to stop a collection protocol in the Log Collector service.
- Unable to block event publishers to the RabbitMQ server.
- Unable to or taking too long for queue events to be consumed. The script makes 30 attempts waiting for the events to be consumed. After each attempt, it sleeps for 30 seconds.
- Unable to stop the Log Collector service.

For more information about troubleshooting, see Appendix A. Troubleshooting.

For File Collection Event Sources

If you are using older Windows and UNIX SFTP agents to upload log files, they may not be able to connect to the SSHD on the upgraded 11.x LC/VLC if they are using older Ciphers, MACs and Key Exchange Algorithms. If possible, upgrade to the latest Windows and UNIX SFTP agents. If you cannot upgrade to the latest Windows and UNIX SFTP agents, note the Ciphers, MACs and Key Exchange Algorithms, if any, from the `/etc/ssh/sshd_config` file on the 10.6.x LC/VLC on the 10.6.x LC/VLC so that they can be added back to the file after upgrade.

For Bluecoat Event Sources

Bluecoat ProxySG event sources use FTPS protocol to upload log files to the Log Collector (LC) and Virtual Log Collector (VLC). The Event Source Documentation on RSA Link contains the steps to configure VSFTPD service on the LC and VLC.

- If key material exists in the `/root/vsftpd/` directory in 10.6.6.x, this material area will be backed up and restored. If the material was in another location, you must back it up and restore it manually.
- If the `/etc/vsftpd/vsftpd.conf` file exits in 10.6.6.x, it is backed up and restored.

For Integrations with Web Threat Detection, Archer Cyber Incident & Breach Response or NetWitness Endpoint - List RabbitMQ Usernames and Passwords

On the 10.6.6.x Security Analytics Server host, you must get a list of all RabbitMQ usernames and passwords so that after you perform the 11.3. upgrade, you can restore RabbitMQ user accounts.

To get a list of RabbitMQ usernames and passwords, run the following command:

```
rabbitmqctl list_users >> /root/rabbitmq_users.txt
```

To restore RabbitMQ user accounts, refer to "Task 2 - For Integrations with Web Threat Detection, NetWitness SecOps Manager or NetWitness Endpoint Configure Mutually Authenticated SSL" in *Post Upgrade Tasks*.

Task 5 - Check for Adequate Space for the Backup

You can run the backup test script to check the amount of disk space that is required for the backup using the `-t` option described in Test Options. You run the script without actually backing up files or stopping any services. RSA recommends that you perform this step to ensure that you provide adequate space for the backup so that the backup captures all your data.

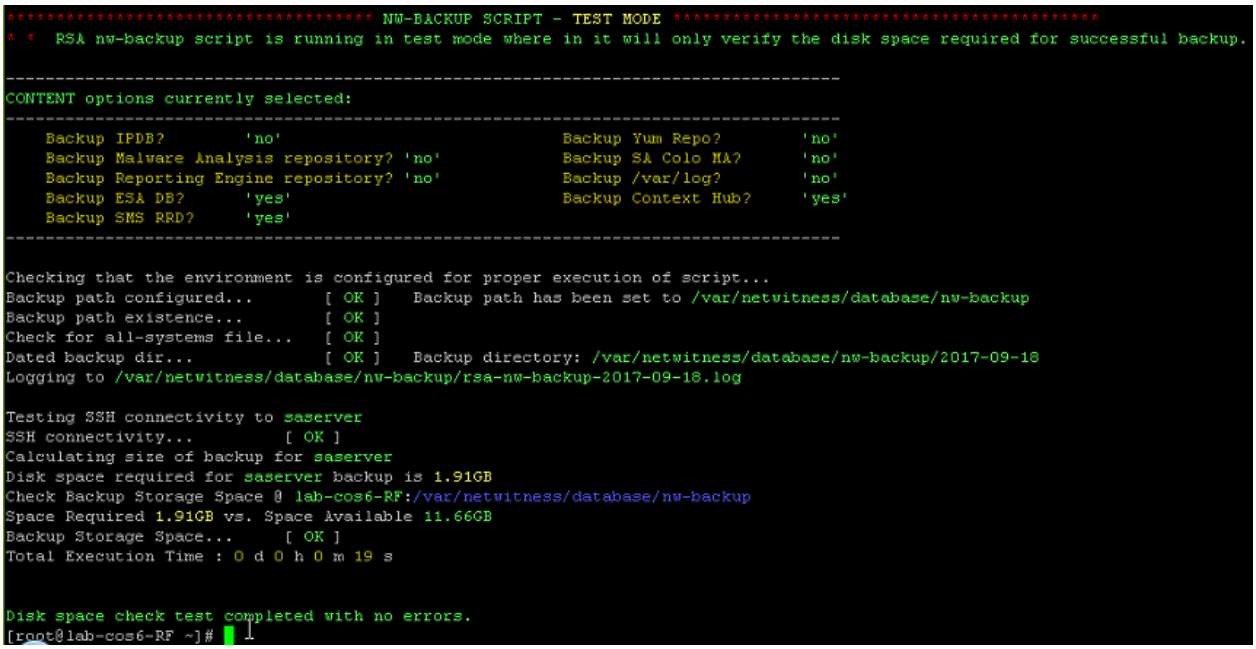
Complete the following task to check for adequate disk space.

1. Make the backup script executable by running the following command:
   ```
   chmod u+x nw-backup.sh
   ```
2. Run the following command at the root directory level:
   ```
   ./nw-backup.sh -t
   ```
   The output displays the amount of disk space that is required for the backup.

> **Note:** The `./nw-backup.sh -t` command runs with the `-d` option by default. However, if you are looking for more accurate disk space results, you can override the -

> d option by using -D. Using the -D option will show how much space is required on each host for the data that will be backed up, but does not show how much space is available. If there is not enough space available, the -D option will throw an error. If you want to know how much space is available on the target host, you must run the df -h command on the host.

The following figure shows an example of the output from using the -t option.



Task 6 - Back up Your Host Systems

Before you run the backup script to do the actual backup, be sure that you have plenty of space. To back up your hosts, you run the nw-backup.sh script using the -u option. This option is required for upgrading to 11.3.

> **Note:** The script will stop services as it runs. However, you can stop services manually before you run the script if needed.

When you run the backup script, you can choose from several options that are described in the following sections.

Usage

```
./nw-backup.sh [-u -t -d -D -l -x -e] <external-mnt> -b <backup file path>
```

General Options

-u : This option is required for upgrading to 11.3. Enables the upgrade flag to run backup for upgrading to 11.3. It also enables disk space check (-d), backing up reporting engine reports (-r) and stores backup content locally (-l). Default: (no)

-d : enables disk space check in 'fast' mode (quick estimate of space using uncompressed data). Default: (no)

```
-D : enables disk space check in 'full' mode (estimate of space using
compressed data, ~10X slower). Default: (no)

-l : stores backup content locally on each host (automatically set if -u is
used). Default: (no)

-e <path to mount point> : copies backup files of all devices onto an external
mount point. Default: (/mnt/external_backup)

-x : move all backup files to an external mount point. Default: (no) - COPY

-b <path to write backups> : path to the location for storing backup files on
a backup server. For upgrading to 11.3, please use the default location!
Default: (/var/netwitness/database/nw-backup)
```

Note: 1.) Do **not** change the backup path in upgrade (-u) mode. 2.) When you run a backup with the `-u` option, all services are stopped. If you need to continue to use the 10.6.x machine after running the backup, reboot the 10.6.x system so that services are restarted.

Advanced Content Selection Options

```
-c : back up Colocated Malware Analysis on SA servers. Default: (no)

-i : back up IPDB data (/var/netwitness/ipdbextractor). Default: (no)

-m : back up Malware Analysis File Repository. Default: (no)

-r : back up Reporting Engine Report Repository (automatically set if -u is
used). Default: (no)

-v : back up system logs (/var/log). Default: (no)

-y : back up YUM Web Server & RPM Repository. Default: (no)

-S : If set: DISABLES back up of SMS RRD files. Default: (not-set)

-C : If set: DISABLES back up of Context-Hub configuration and database.
Default: (not-set)

-E : If set: DISABLES back up of ESA Mongo database. Default: (not-set)
```

Test Options

```
 -t : performs script test run for disk space check only. Services are not
stopped and excludes execution of backup. Can be combined with (-d) or (-D)
and other flags. Default: (-t)
```

For example, the command:
`./nw-backup.sh`
would run the backup with options as set in the Header of the script itself.
OR, the command:
`./nw-backup.sh -ue /mnt/external_backup`
would run a normal backup using the backup path defined in the script, with the following options:

```
-u : enables the upgrade flag to run backup for upgrading to 11.3. It also
enables disk space check (-d), backing up reporting engine reports (-r) and
stores backup content locally (-l). Default: (no)

-e : Copy the backup files to external mount point, mounted on /mnt/external_
backup

For Help: ./nw-backup.sh -h
```

When you run the script, the following text is displayed at the top of the script:

Caution: RSA `nw-backup` script backs up configuration files, data, and logs on the options provided in the script. It tars the content, with options to store the backup files on the backup server, move or copy them to external storage on a mount point (USB/NFS/SMB), or SCP them back to the target host. This backup script has been qualified on the following versions of Security Analytics:
10.6.6.x
Use of this script on any other versions of the product may not give expected results and may not be supported by RSA Customer Service.
Note: All non-RSA custom files, scripts, Cronjobs and other important files should be placed in `/root`, `/home/'user'`, OR `/etc` to be included in the backup.

Complete the following task to back up your hosts.

1. Ensure that the `all-systems` file contains only the hosts to back up. For information, see Task 2 - Create a List of Hosts to Back up.
2. Make the backup script executable by running the following command:
   `chmod u+x nw-backup.sh`
3. Begin the backup process by running the following command at the root directory level:
   `./nw-backup.sh -u`

   Note: You must use the `-u` option so that your files will be restored correctly during the upgrade to 11.3. Do NOT make any changes to the header of the backup script for the backup path because the path is specific to the upgrade, and that data needs to be in a specific place.

   When the text "`Backup completed with no errors`" is displayed, the backup has completed successfully.

   A log file, with a name similar to the following example, is created in the backup directory which provides information on the files being backed up:
   `rsa-nw-backup-2018-03-15.log`
4. When the backup has completed, to ensure that the intended files were backed up, you can run the following command to see a list of all the files that were backed up:
   `tar -tzvf hostname-ip-address-backup.tar.gz`
   The following archive files are created:
   For all hosts:
   `<hostname-IPaddress>-root.tar.gz`
   `<hostname-IPaddress>-backup.tar.gz`
   `tar checksum` files
   `<hostname-IPaddress>-network.info.txt`
   For Security Analytics Servers:
   `<hostname-IPaddress>-root.tar.gz`
   `<hostname-IPaddress>-backup.tar.gz`
   `<All ESA hostname-IPaddress>-mongodb.tar.gz`
   `tar checksum` files
   `<hostname-IPaddress>-network.info.txt`
   For ESA Hosts:
   `<hostname-IPaddress>-root.tar.gz`
   `<hostname-IPaddress>-backup.tar.gz`
   `<hostname-IPaddress>-mongodb.tar.gz`
   `<hostname-IPaddress>-controldata-mongodb.tar.gz`

`tar checksum` files
`<hostname-IPaddress>-network.info.txt`

The archived files are located in the `/var/netwitness/database/nw-backup` directory. If any of the tar files appear smaller than expected, open them to be sure that the files were properly backed up.

Post Backup Tasks

Task 1 - Save a Copy of the `all-systems` File and the Backup Tar files

Make copies of the `all-systems` file, the `all-systems-master-copy` file, and the backup tar files and put the copies in a secure location. You cannot regenerate these files after you upgrade the Security Analytics Server (specifically the Admin service) to 11.3.

Task 2 - Ensure Required Backup Files Were Generated

After you run the backup scripts, several files are generated. These files are required for the 11.3 upgrade process. Before you begin the upgrade process, you must ensure that the required backup files are on the hosts that you are upgrading, and that you perform the following tasks.

The following files are generated on all hosts by the backup scripts:

- `all-systems`
- `all-systems-master-copy`
- `appliance_info`
- `service_info`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`
- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`

In addition to the files listed above, the following files will be generated on the Security Analytics Server and ESA hosts:

- `<hostname>-<host IP address>-mongodb.tar.gz`
- `<hostname>-<host IP address>-mongodb.tar.gz.sha256`

The backup script will also generate the following `controldata-mongodb.tar.gz` files.

Note: The backup script copies the following files from all ESA hosts to the Security Analytics Server's backup path.

- `<esa hostname>-<esa hostip>-controldata-mongodb.tar.gz`
- `<esa hostname>-<esa hostip>-controldata-mongodb.tar.gz.sha256`

Task 3 - (Conditional) For Multiple ESA Hosts, Copy `mongodb tar` files to Primary ESA Host

If you have multiple ESA host systems in your enterprise, copy the following two files from each ESA host to the `/opt/rsa/database/nw-backup/` directory on the Primary ESA host system (the host that has the ContextHub service running on it):

- `<hostname>-<host-IP-address>-mongodb.tar.gz`
- `<hostname>-<host-IP-address>-mongodb.tar.gz.sha256`

Task 4 - Ensure All Required Backup Files are on Each Host

Before you upgrade to 11.3, ensure that the appropriate files exist on the hosts that you are upgrading as described in the following lists.

Note: The default paths for backup files are:
- Security Analytics Servers:`/var/netwitness/database/nw-backup`
- ESA hosts:`/opt/rsa/database/nw-backup`
- Malware hosts: `/var/lib/rsamalware/nw-backup`

Required Files for NetWitness Servers

- `all-systems-master-copy`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`
- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`
- `<hostname>-<host-IP-address>-mongodb.tar.gz`
- `<hostname>-<host-IP-address>-mongodb.tar.gz.sha256`
- `<esa-hostname>-<esa-host-IP-address>-controldata-mongodb.tar.gz`
- `<esa-hostname>-<esa-host-IP-address>-controldata-mongodb.tar.gz.sha256`

Required Files for ESA Hosts

- `all-systems-master-copy`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`
- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`

- <hostname>-<host-IP-address>-mongodb.tar.gz
- <hostname>-<host-IP-address>-mongodb.tar.gz.sha256

Required Files for All Other Hosts

- all-systems-master-copy
- <hostname>-<host-IP-address>-backup.tar.gz
- <hostname>-<host-IP-address>-backup.tar.gz.sha256
- <hostname>-<host-IP-address>-root.tar.gz
- <hostname>-<host-IP-address>-root.tar.gz.sha256
- <hostname>-<host-IP-address>-network.info.txt

Note: The following files are located in the <hostname>-<host-IP-address>-backup.tar.gz tar on all hosts:
appliance_info
service_info

Note: The paths to the location of the backup and restore files for iptables, NAT configurations, user accounts, and crontab entries are shown in the following list:
Backup paths:
`BUPATH=/opt/rsa/database/nw-backup` for the ESA Correlation Engine
`BUPATH=/var/lib/rsamalware/nw-backup` for the Malware Service
`BUPATH=/var/netwitness/database/nw-backup` for all other services
Restore locations:
`BUPATH/restore/etc/sysconfig` for Iptable rules
`BUPATH/restore/etc/sysconfig` for NAT configurations
`BUPATH/restore/etc` for Crontab entries
`BUPATH/restore/etc` for User Accounts (users are located in the `passwd` file, and groups are located in the `group` file. These are not restored during the upgrade process but can be restored manually.
`BUPATH/restore/etc/ntp.conf` for NTP configurations (must be restored using the NetWitness Platform UI)

Upgrade Tasks

This topic contains the tasks you must complete to upgrade Security Analytics 10.6.6.x to NetWitness Platform 11.3. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Caution: 1.) Make sure that you backed up your Security Analytics 10.6.6.x data before attempting to upgrade to NetWitness Platform 11.3.
2). Run the backup immediately before upgrading the hosts for each phase so that the data to avoid restoring stale data.
3.) This guide applies to physical host upgrades exclusively. If have physical and virtual hosts in your deployment, see the *Virtual Host Upgrade Guide* for the steps to upgrade virtual hosts.

Complete the major upgrade tasks in the following order.

- Phase 1 - Upgrade SA Server, Event Stream Analysis, Malware Analysis, and Broker or Concentrator Hosts

  Note: For Event Stream Analysis, if you had C2 modules enabled in 10.6.6.x, the modules will enter a warm-up after you upgrade the Event Stream Analysis service to 11.3 and they will not be available until the warm up completes.

- Phase 2 - Upgrade All Other Hosts
- Phase 3 (Optional) Install Warm Standby NW Server

Phase 1 - Upgrade SA Server, Event Stream Analysis, Malware Analysis, and Broker or Concentrator Hosts

Task 1 - Upgrade the 10.6.6.x SA Server to 11.3 NW Server

Follow the instructions under Upgrade 10.6.6.x SA Server Host to 11.3 NW Server Host.

Task 2 - Upgrade 10.6.6.x ESA to 11.3

Caution: If you had C2 modules enabled in 10.6.6.x, the modules will enter a warm-up after you upgrade the Event Stream Analysis service to 11.3 and they will not be available until the warm up completes.

Follow the instructions under Upgrade a 10.6.6.x Component Host to 11.3 to upgrade your ESA hosts to 11.3 plus the following two tasks.

1. Create the base image on your primary ESA host, set it up through the Setup program, and install **ESA Primary** on the host in the user interface on the **Admin Hosts** view.

   Note: If you have multiple ESA hosts in your enterprise, you must upgrade the ESA Primary host, where all the `mongodb` (Mongo Database) backup tar files are located, first, before you upgrade ESA Secondary hosts.

2. (Conditional) If you have a secondary ESA host, create the base image on your secondary ESA host, set it up through the Setup program, and install **ESA Secondary** on the host in the user interface on the **Admin Hosts** view.

Task 3 - Upgrade 10.6.6.x Malware Analysis to 11.3

Follow the instructions under Upgrade a 10.6.6.x Component Host to 11.3.

Task 4 - Upgrade 10.6.6.x Broker or 10.6.6.x Concentrator to 11.3

Follow the instructions under Upgrade a 10.6.6.x Component Host to 11.3.

Note: If you do not have a Broker, upgrade your Concentrator hosts. The 11.3 NW Server cannot communicate with 10.6.6.x core services for the new Investigate functionality. This is why you must upgrade the Broker or Concentrator hosts in Phase 1.

Phase 2 - Upgrade All Other Hosts

See Appendix B. Stopping and Restarting Data Capture and Aggregation for instructions on how to stop and restart data capture and aggregation when upgrading the Decoder, Concentrator, and Log Collection hosts.

Decoder and Concentrator Hosts

1. Stop data capture and aggregation.
2. Complete the steps in Upgrade a 10.6.6.x Component Host to 11.3.
3. Restart data capture and aggregation.

Log Decoder Host

1. Make sure you have prepared the Log Collector as described in "Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh" in the Backup Instructions.
2. Stop data capture on the Log Decoder.
3. Complete the steps in Upgrade a 10.6.6.x Component Host to 11.3.
4. Restart data capture on Log Decoder.

Note: After you upgrade, you will restart log collection after completing the Task 33 - Update Incident Rules Identified in the Domain Matching Conditions Upgrade Preparation Task in the **Post Upgrade Tasks**.

Virtual Log Collector Host

1. Make sure you have prepared the Virtual Log Collector as described the "Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh" in the Backup Instructions.
2. Back up your 10.6.6.x VLC by editing the `all-systems` file on host where you performed the

backup.

a. Make sure your `all-systems` file contents has this information before you perform this step.
`vlc,<host-name>,<IP-address>,<UUID>,10.6.6.x`

b. Run the following command to create backup.
`./nw-backup.sh -u`
See Backup Instructions for detailed procedures on how to back up the host.

3. Make sure the backup host contains the VLC backup in the following format.
```
<hostname>-<IPaddress>-root.tar.gz
<hostname>-<IPaddress>-root.tar.gz.sha256
<hostname>-<IPaddress>-backup.tar.gz
<hostname>-<IPaddress>-backup.tar.gz.sha256
<hostname-IPaddress>-network.info.txt
all-systems-master-copy
```
4. Power off the 10.6.6.x VLC so that a new 11.3 VM can be created with the same network configuration.
5. Deploy a fresh NetWitness 11.3 Component Host using the 11.3 NetWitness Platform ova.
6. Connect to the VM console of the new VLC.
7. Update the network configuration to be the same as the 10.6.6.x VLC.
This information is stored in the `<hostname-IPaddress>-network.info.txt` 10.6.6.x VLC backup file.

Note: Make sure IPv6 is disabled.

a. Edit the `/etc/sysconfig/network-scripts/ifcfg-eth0` file and update the settings.
Contents of `ifcfg-eth0` should be as follows.
```
TYPE=Ethernet
DEFROUTE=yes
NAME=eth0
UUID=<uuid>
DEVICE=eth0
DNS1=<nameserver from <hostname>-<ipaddress>-network-info.txt>
DNS2=<nameserver from <hostname>-<ipaddress>-network-info.txt>
BOOTPROTO=static
IPADDR=<ipaddress from <hostname>-<ipaddress>-network-info.txt>
NETMASK=<netmask from <hostname>-<ipaddress>-network-info.txt>
GATEWAY=<gateway from <hostname>-<ipaddress>-network-info.txt>
NM_CONTROLLED=no
ONBOOT=yes
```

b. Submit the following command string.
`systemctl restart network.service`

8. Create the backup directory.
`# mkdir -p /var/netwitness/database/nw-backup/`
9. Copy the backup from the backup host from `/var/netwitness/database/nw-backup` to the new

VLC in the `/var/netwitness/database/nw-backup` directory.

10. Complete the steps 2 through 12 inclusive in Upgrade a 10.6.6.x Component Host to 11.3 for the rest of the NetWitness Platform components. Make sure that you select **Log Collector** for the service in step 12.

All Other 10.6.6.x Hosts to 11.3

Follow the instructions under Upgrade a 10.6.6.x Component Host to 11.3.

Upgrade the 10.6.6.x SA Server Host to the 11.3 NW Server Host

Make sure that you have backed up 10.6.6.x data for the SA Server host. **You must follow the instructions in Backup Instructions to back up the host.**

Caution: Run the backup immediately before upgrading the SA Server to 11.3 so that the data is as recent as possible. You must create the **all-systems** file before you upgrade the SA Server because you cannot do this after the SA Server has been upgraded to 11.3.

Complete the following steps to upgrade the 10.6.6.x SA Server host to the 11.3 NW Server host.

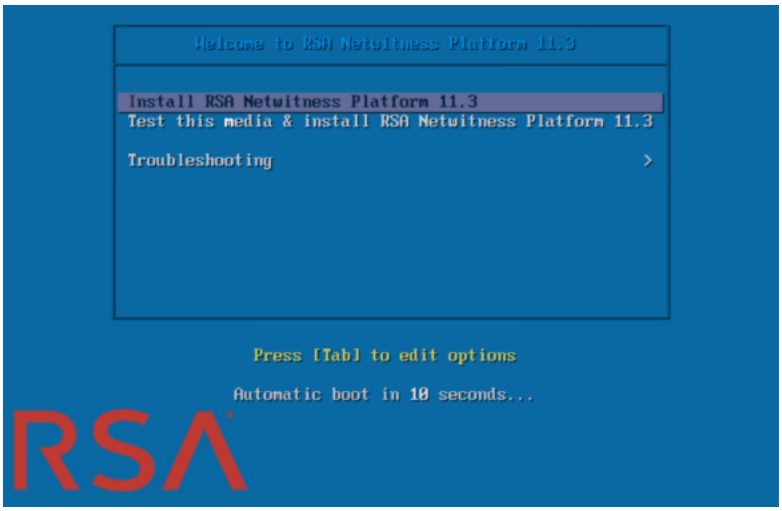
1. Create a base image on the host.
   a. Attach media (media that contains the ISO file, for example, a build stick) to the host. **You must use the build stick labeled "OEMDRV".**
      - Hypervisor installations - use the ISO image.
      - Physical media - use the ISO to create bootable flash drive media the **Etcher®** or another suitable imaging tool etch an Linux file system on the USB drive. See the *USB Build Stick Instructions and Later* for information on how to create a build stick from the ISO. Etcher is available at: https://etcher.io.
      - iDRAC installations - the virtual media type is:
        - **Virtual Floppy** for mapped flash drives.
        - **Virtual CD** for mapped optical media devices or ISO file.

   b. Log in to the host with and reboot it.

```
login: root
Password:
Last login: Tue Sep 19 13:27:15 on tty1
[root@saserver ~]# reboot
```

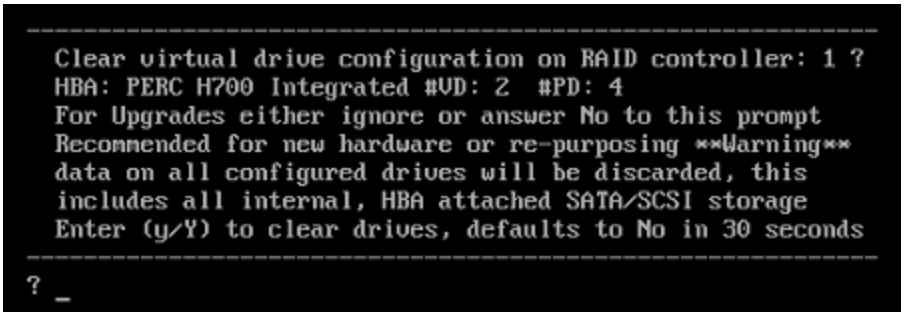
   c. Select **F11 (boot menu)** during reboot to select a boot device and boot to the connected media. After system checks during booting, the following **Welcome to RSA NetWitness® Platform 11.3** installation menu is displayed. The menu graphics will render differently if you use a physical USB flash media.

d. Select **Install RSA Netwitness Platform 11.3** (default selection) and press **Enter**.



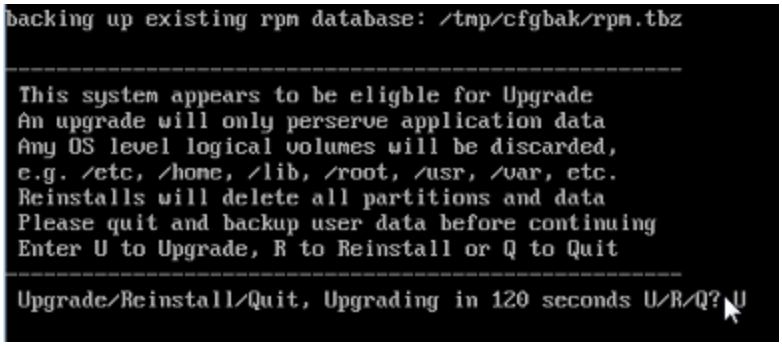
The Operating System installation runs and stops at the **Enter (y/Y) to clear drives**.

e. Enter **n** (No).
The default action is No, so if you ignore the prompt, it will select No in 30 seconds and will not clear the drives.



The **Upgrade/Reinstall/Quit(U/Q/R)?** prompt is displayed.

f. Type **U** to upgrade the host.
If you ignore the prompt, it will select U in 120 seconds.



It takes a few minutes for CentOS7 components to install. The installation program displays the components as they are installed, which varies depending on the appliance. When CentOS7 installation is complete, the **Continue (Y/N)?** prompt is displayed.

g. Type **Y** and press **Enter** to confirm that you want to upgrade this host.

```
-------------------------------------------------------
 Steps to be executed listed below.   Warning:
 this is irreversible.
-------------------------------------------------------
lvremove -f /dev/VolGroup00/rabmq
lvremove -f /dev/VolGroup00/root
lvremove -f /dev/VolGroup00/swap
lvremove -f /dev/VolGroup00/tmp
lvremove -f /dev/VolGroup00/usrhome
lvremove -f /dev/VolGroup00/var
lvremove -f /dev/VolGroup00/vartmp
lvremove -f /dev/mapper/VolGroup01-uax
lvremove -f /dev/mapper/VolGroup01-rsasoc
vgrename VolGroup00 netwitness_vg00
vgchange -a n VolGroup01
vgmerge netwitness_vg00 VolGroup01
vgchange -a y netwitness_vg00
 Continue (Y/N)? Y
```

The old operating system is about to be removed. Continue (Y/N)? warning is displayed.

h. Type **Y** and press **Enter** to confirm that you want to replace the operating system.

```
Warning: The old operating system is about to be removed.  Continue (Y/N)?
```

When the host is upgraded to CentOS7, the host automatically reboots and prompts you to log in.

Caution: Do not reboot the attached media (media that contains the ISO file, for example a build stick).

i. Log in to the host with the `root` credentials.

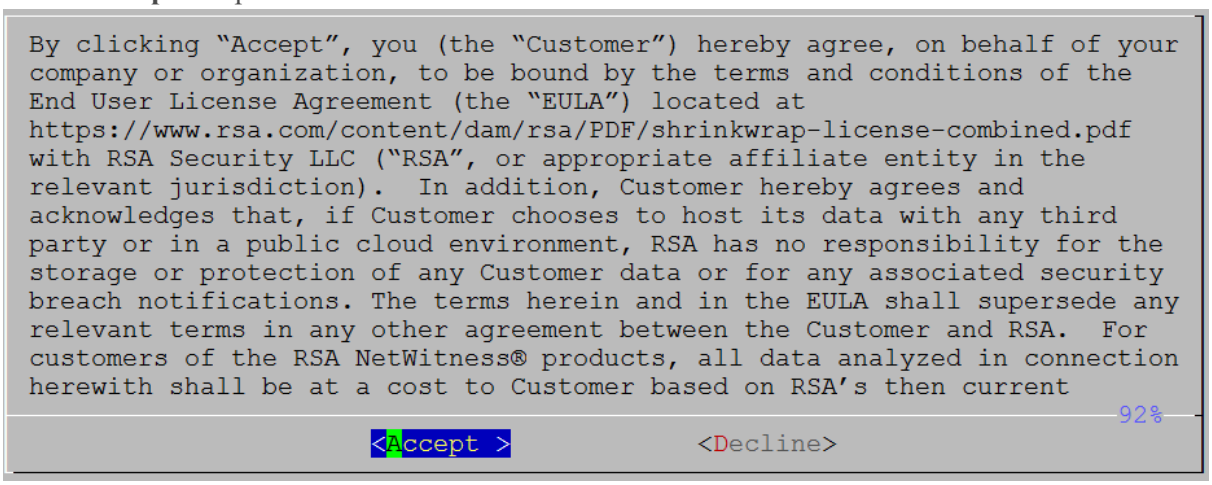
```
CentOS Linux 7 (Core)
Kernel 3.10.0-514.26.1.el7.x86_64 on an x86_64

NWAPPLIANCE9240 login: root
Password:
[root@NWAPPLIANCE9240 ~]#
```

2. Run the `nwsetup-tui` command to set up the host.
   This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.

Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press **Enter** to register your command response and move to the next prompt.
2.) The Setup program adopts the color scheme of the desktop or console you use access the host.

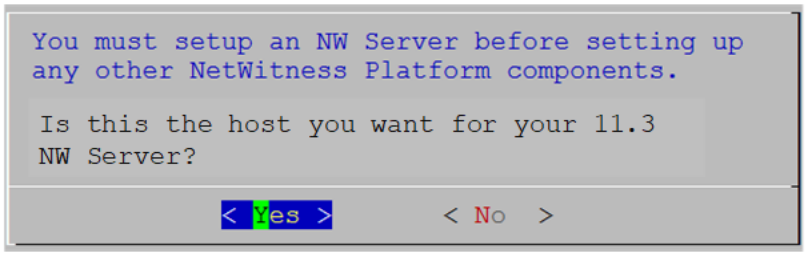
3. Tab to **Accept** and press **Enter**.



The **Is this the host you want for your 11.3 NW Server** NW Server prompt is displayed.

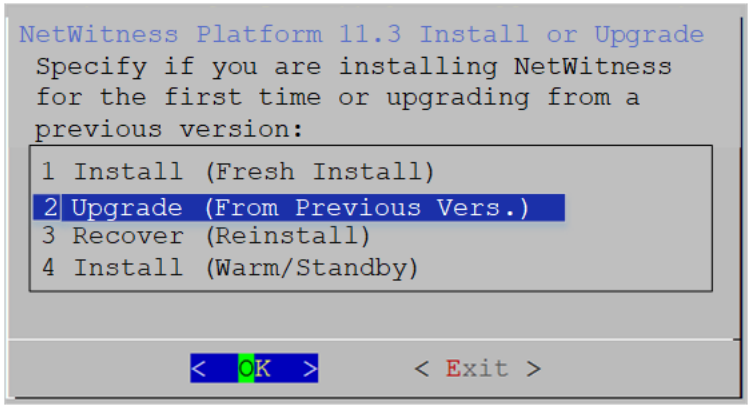
Caution: If you choose the wrong host for the NW Server and complete the upgrade, you must restart the step up program and complete the all the steps (steps 2 through 11) to correct this error.

4. Tab to **Yes** and press **Enter**.



Choose **No** if you already upgraded the NW Server to 11.3.
The **Install** or **Upgrade** prompt is displayed.

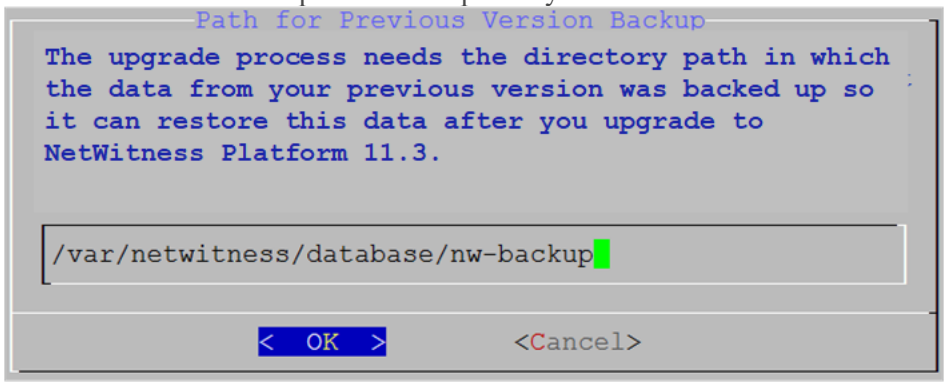
5. Use down arrow to select **2 Upgrade (From Previous Vers.)**, tab to **OK**, and press **Enter**.



The **Backup** path prompt is displayed.

Caution: The backup path in the following prompt must be the same as the path in which your backup is stored. For example, the backup script assigns `/var/netwitness/database/nw-backup` as the default path. If you used the default backup path during backup and did not change it subsequently, you must keep `/var/netwitness/database/nw-backup` as the path in the following prompt.

6. Tab to **OK** and press **Enter** if want to keep this path. If not, edit the path, tab to **OK** and press **Enter** to change it.
This table lists the backup and restore paths by host/service.



Host	Backup Path	Restore Path
Malware	`/var/lib/rsamlware/nw-backup`	`/var/netwitness/malware_analytics_server/nw-backup/restore`
Event Stream Analysis	`/opt/rsa/database/nw-backup`	`/var/netwitness/database/nw-backup/restore`
NW Server	`/var/netwitness/database/nw-backup`	`/var/netwitness/restore`
All Other Hosts	`/var/netwitness/database/nw-backup`	`/var/netwitness/database/nw-backup/restore`

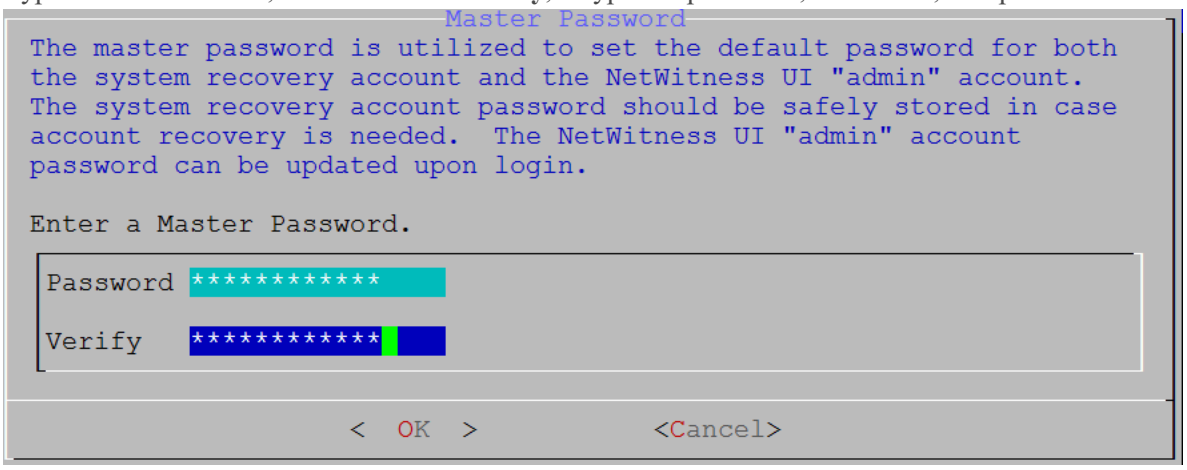
The **Master Password** prompt is displayed.

The following list of characters are supported for Master Password and Deployment Password:

Symbols	! @ # % ^ + ,
Numbers	0-9
Lowercase Characters	a-z
Uppercase Characters	A-Z

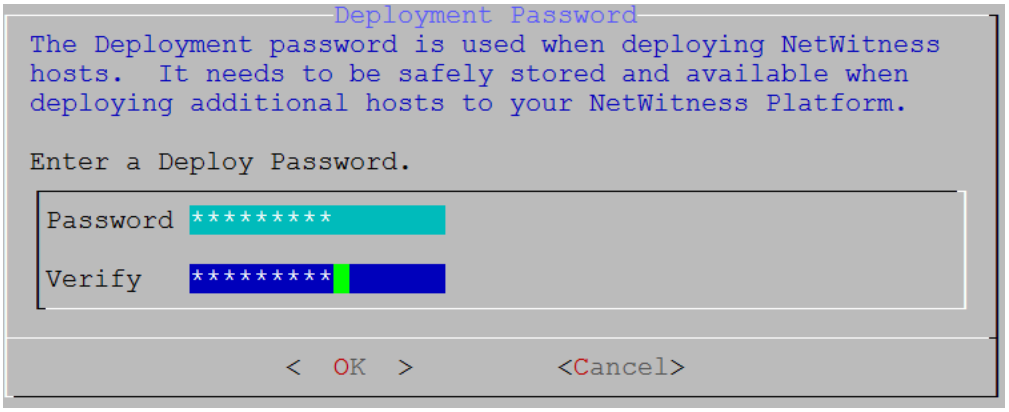
No ambiguous characters are supported for Master Password and Deployment Password. For example:
space { } [ ] ( ) / \ ' " ` ~ ; : . < > -

7. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.



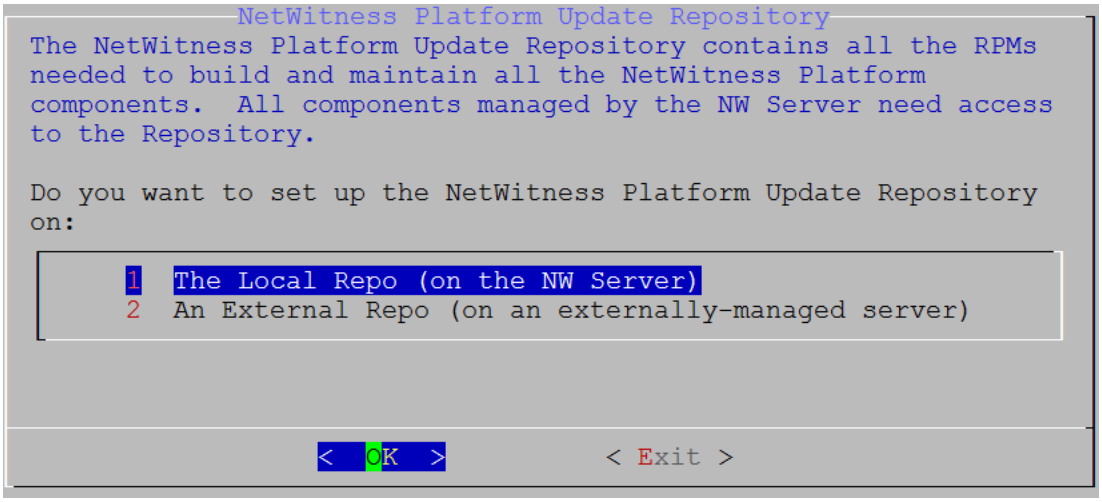
The **Deployment Password** prompt is displayed.

8. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

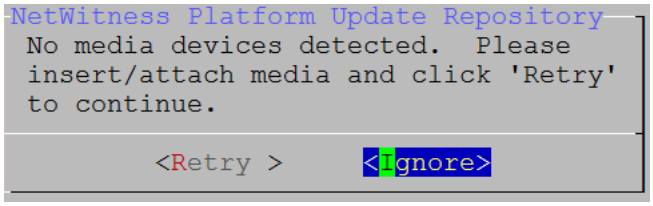


The **Update Repository** prompt is displayed.

9. Use the down and up arrows to select the location from which you want to apply version updates to your hosts, tab to **OK**, and press **Enter**.



- If you select **1 The Local Repo (on the NW Server)** the setup program makes sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which upgrade to NetWitness Platform 11.3. If the program cannot find the attached media, you receive the following prompt.

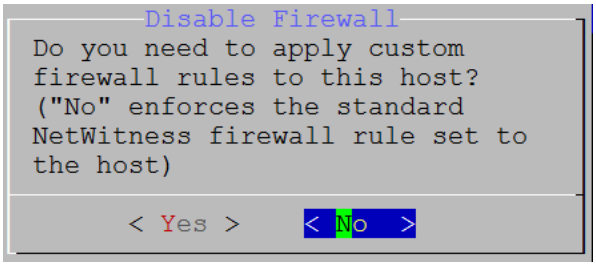


- If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access RSA updates and CentOS updates. Refer to Appendix D. Create External Repository for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.

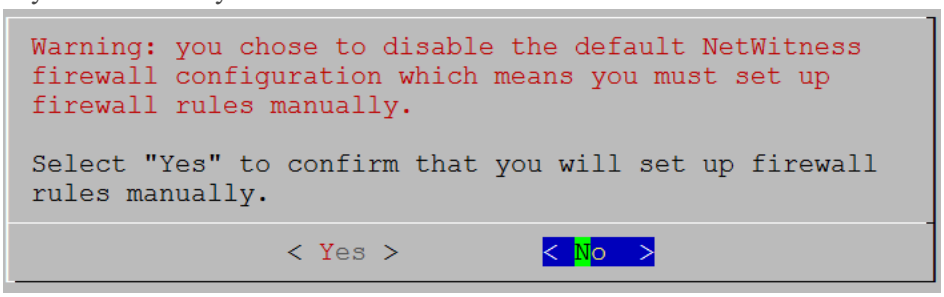
  Enter the base URL of the NetWitness Platform external repo and click **OK**.
  See "Set Up an External Repository with RSA and OS Updates" under "Hosts and Services Procedures" in *Hosts and Services Getting Started Guide* for instructions.

The **Disable** or use standard **Firewall** configuration prompt is displayed.

10. Tab to **No**, and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.



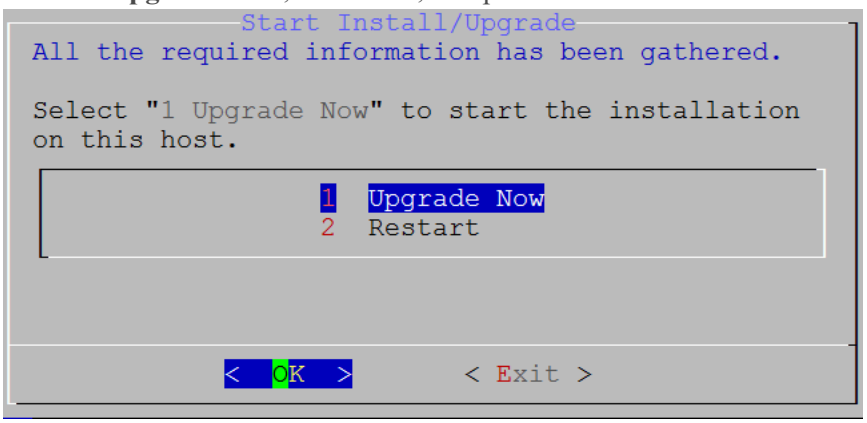
- If you select **Yes** your selection is confirmed.



- If you select **No**, the standard firewall configuration is applied.

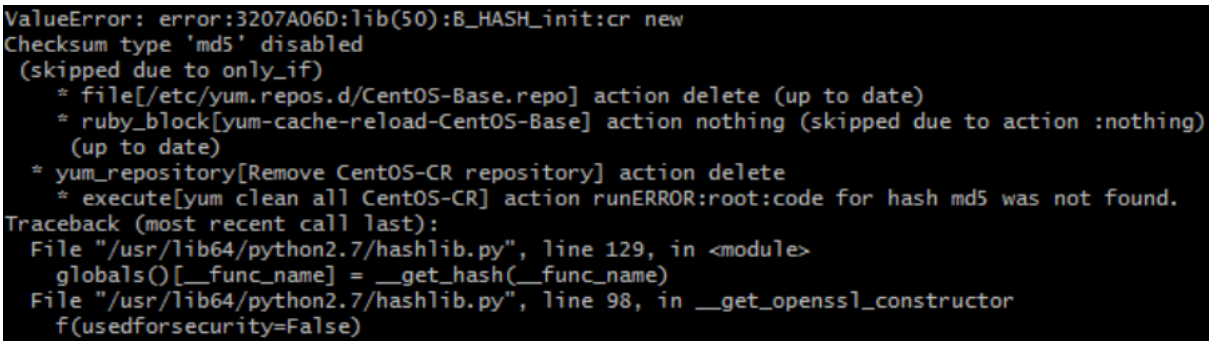
The **Install** or **Upgrade** prompt is displayed (**Recover** does not apply to the installation. It is for 11.3 Disaster Recovery).

11. Select 1 **Upgrade Now**, tab to **OK**, and press **Enter**.



When **Installation complete** is displayed, you have upgraded the 10.6.6.x SA Server to the 11.3 NW Server.

Note: Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



12. Complete the Post Upgrade Tasks before you upgrade any of the component hosts to 11.3.

Upgrade a 10.6.6.x Component Host to 11.3

Make sure that you backed up 10.6.6.x data for the host. **You must follow the instructions in** Backup Instructions **to back up the host.**

Caution: Run the backup immediately before upgrading the host to 11.3 so that the data is as recent as possible.

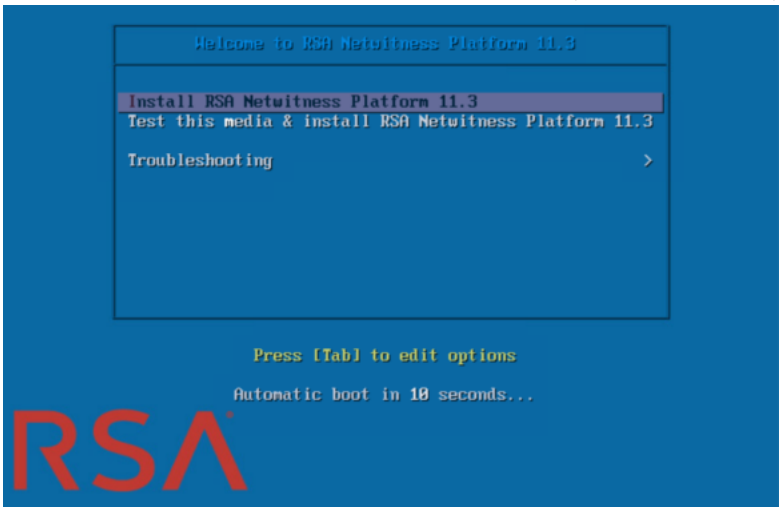
Complete the following steps to upgrade a 10.6.6.x component host to 11.3.

1. Create a base image on the host.
   a. Attach media (media that contains the ISO file, for example a build stick) to the host. See the *USB Build Stick Instructions and Later* for more information.
      - Hypervisor installations - use the ISO image.
      - Physical media - use the ISO to create bootable flash drive media the **Etcher®** or another suitable imaging tool etch an Linux file system on the USB drive. Etcher is available at: https://etcher.io.
      - iDRAC installations - the virtual media type is:
        - **Virtual Floppy** for mapped flash drives.
        - **Virtual CD** for mapped optical media devices or ISO file.
   b. Log in to the host and reboot it.

```
login: root
Password:
Last login: Tue Sep 19 13:27:15 on tty1
[root@saserver ~]# reboot
```

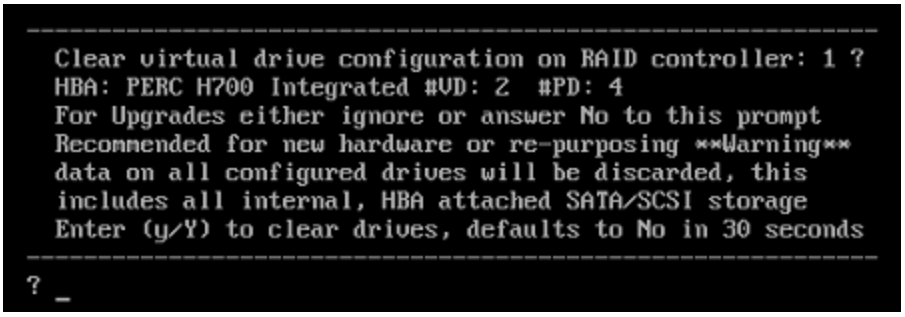
   c. Select **F11 (boot menu)** during reboot to select a boot device and boot to the connected media. After some system checks during booting, the following **Welcome to RSA NetWitness® Platform 11.3** installation menu is displayed. The menu graphics will render differently if you use a physical USB flash media.

d. Select **Install RSA Netwitness Platform 11.3** (default selection) and press **Enter**.



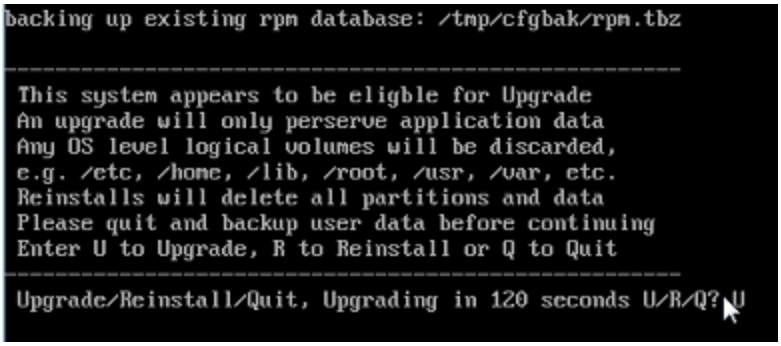
The Operating System installation runs and stops at the **Enter (y/Y) to clear drives**.

e. Enter **n** (No).
The default action is **No**. If you ignore the prompt, it will select **No** in 30 seconds and will not clear the drives.



The **Upgrade/Reinstall/Quit (U/R/Q?)** prompt is displayed.

f. Type **U** to upgrade the host.
If you ignore the prompt, it will select **U** in 120 seconds.



It takes a few minutes for CentOS7 components to install. The installation program displays the components as they are installed which varies depending on the appliance. When CentOS7 installation is complete, the **Continue (Y/N)?** prompt is displayed.

g. Type **Y** and press **Enter** to confirm that you want to upgrade this host.

```
-------------------------------------------------------
 Steps to be executed listed below.   Warning:
 this is irreversible.
-------------------------------------------------------
lvremove -f /dev/VolGroup00/rabmq
lvremove -f /dev/VolGroup00/root
lvremove -f /dev/VolGroup00/swap
lvremove -f /dev/VolGroup00/tmp
lvremove -f /dev/VolGroup00/usrhome
lvremove -f /dev/VolGroup00/var
lvremove -f /dev/VolGroup00/vartmp
lvremove -f /dev/mapper/VolGroup01-uax
lvremove -f /dev/mapper/VolGroup01-rsasoc
vgrename VolGroup00 netwitness_vg00
vgchange -a n VolGroup01
vgmerge netwitness_vg00 VolGroup01
vgchange -a y netwitness_vg00
 Continue (Y/N)? Y
```

The old operating system is about to be removed. Continue (Y/N)? warning is displayed.

h. Type **Y** and press **Enter** to confirm that you want to replace the operating system.

```
Warning: The old operating system is about to be removed.  Continue (Y/N)?
```

When the host is upgraded to CentOS7, the host automatically reboots and prompts you to log in.

Caution: Do not reboot the attached media (media that contains the ISO file, for example a build stick).

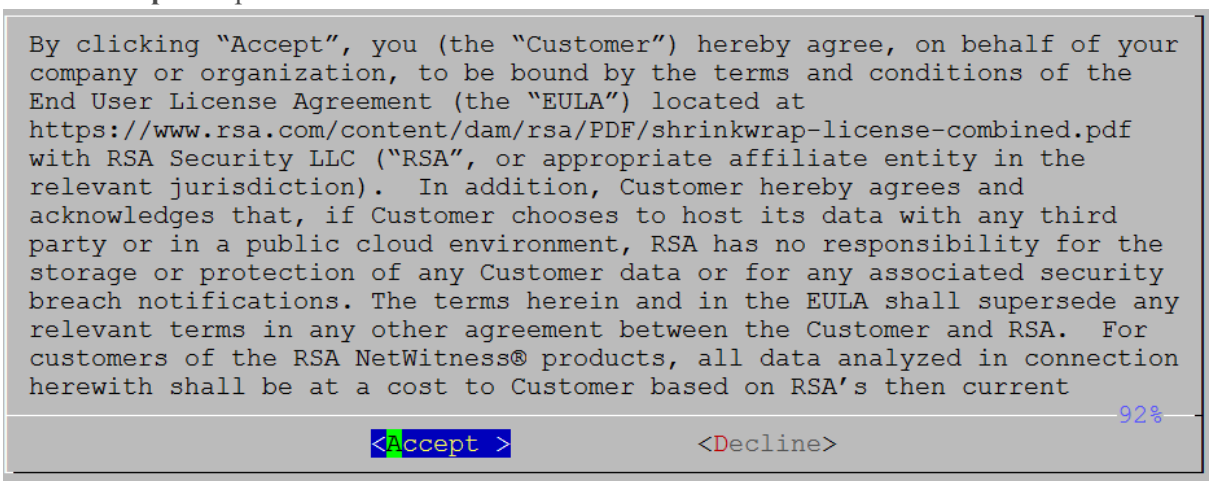
i. Log in to the host with the `root` credentials.

```
CentOS Linux 7 (Core)
Kernel 3.10.0-514.26.1.el7.x86_64 on an x86_64

NWAPPLIANCE9240 login: root
Password:
[root@NWAPPLIANCE9240 ~]#
```

2. Run the `nwsetup-tui` command to set up the host.
   This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.

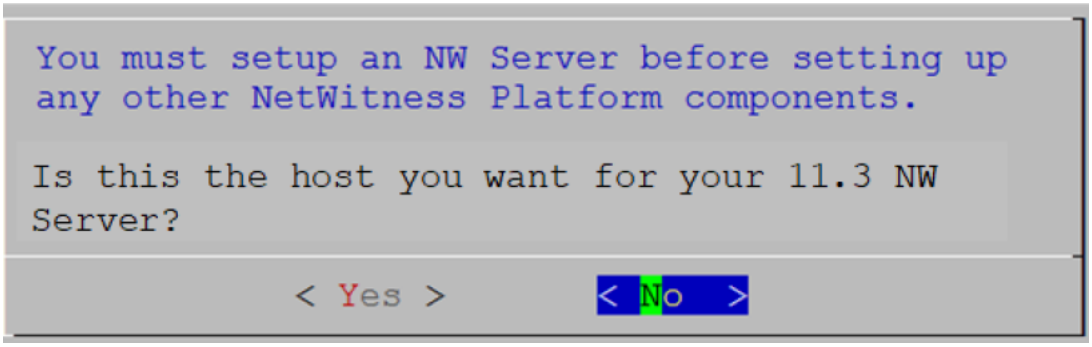
3. Tab to **Accept** and press **Enter**.



The **Is this the host you want for your 11.3 NW Server** prompt is displayed.

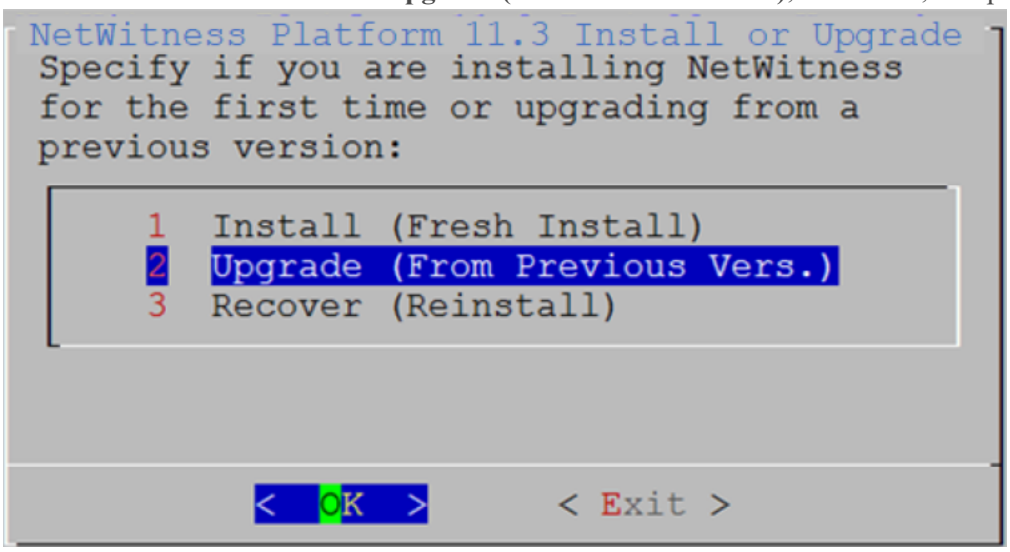
Caution: If you choose the wrong host for the NW Server and complete the upgrade, you must restart the step up program and complete the all the steps (steps 2 through 11) of Upgrade the 10.6.6.x SA Server Host to the 11.3 NW Server Host to correct this error.

4. Tab to **No** and press **Enter**.



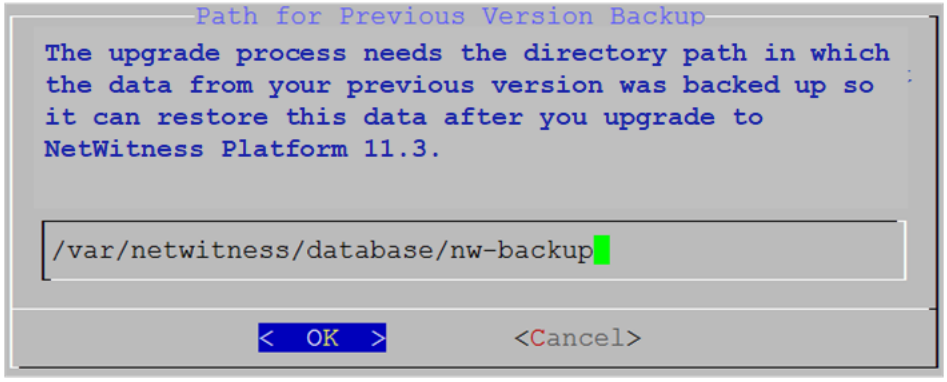
The **Install** or **Upgrade** prompt is displayed.

5. Use the down arrow to select **2 Upgrade (From Previous Vers.)**, tab to **OK**, and press **Enter**.



The **Backup** path prompt is displayed.

6. Tab to **OK** and press **Enter** if want to keep this path. If not, edit the path, tab to **OK** and press **Enter** to change it.



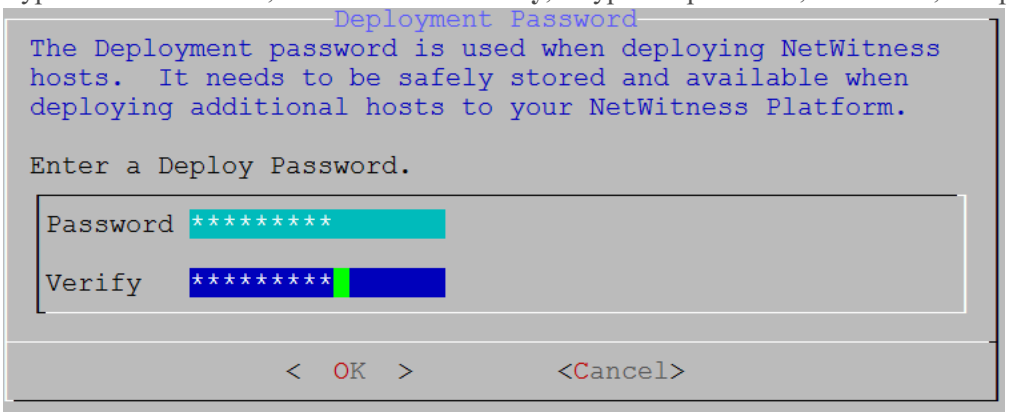
This table lists the backup and restore paths by host/service.

Host	Backup Path	Restore Path
Malware	/var/lib/rsamlware/nw-backup	/var/netwitness/malware_analytics_server/nw-backup/restore
Event Stream Analysis	/opt/rsa/database/nw-backup	/var/netwitness/database/nw-backup/restore
NW Server	/var/netwitness/database/nw-backup	/var/netwitness/restore
All Other Hosts	/var/netwitness/database/nw-backup	/var/netwitness/database/nw-backup/restore

The **Deployment Password** prompt is displayed.

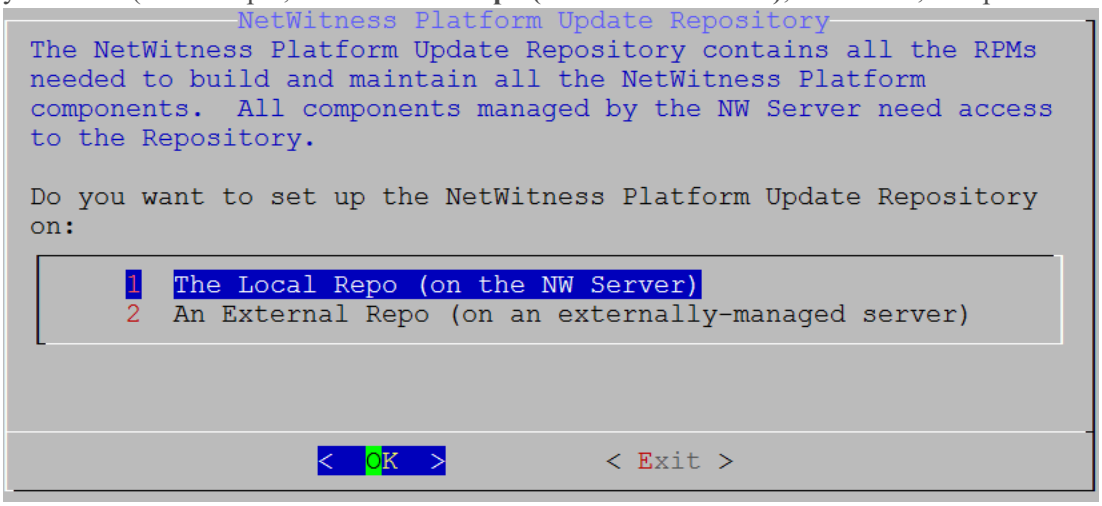
Note: You must use the same deployment password that you used when you upgraded the NW Server.

7. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.



The **Update Repository** prompt is displayed.
Select the same repo you selected when you upgraded the NW Server Host for all hosts.

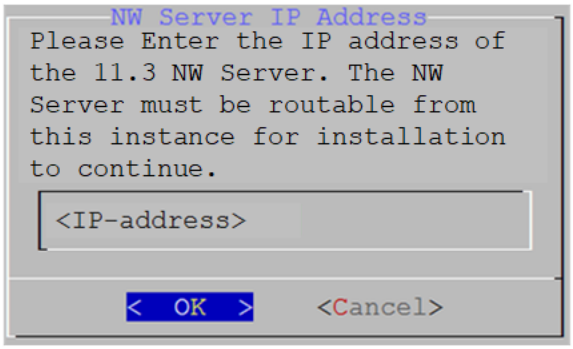
8. Use the down and up arrows to select the location from which you want to apply version updates to your hosts (for example, **1 The Local Repo (on the NW Server)**, tab to **OK**, and press **Enter**.



- If you select **1 The Local Repo (on the NW Server)**, the setup program makes sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can upgrade to NetWitness Platform 11.3.
- If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access RSA updates and CentOS updates. Enter the base URL of the NetWitness Platform external repo and click **OK**. The repositories give you access RSA updates and CentOS updates. Refer to Appendix D. Create External Repository for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.

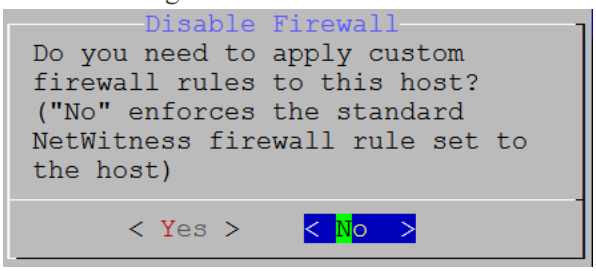
The **NW Server IP Address** prompt is displayed.

9. Type the IP address of the NW Server, tab to **OK**, and press **Enter**.

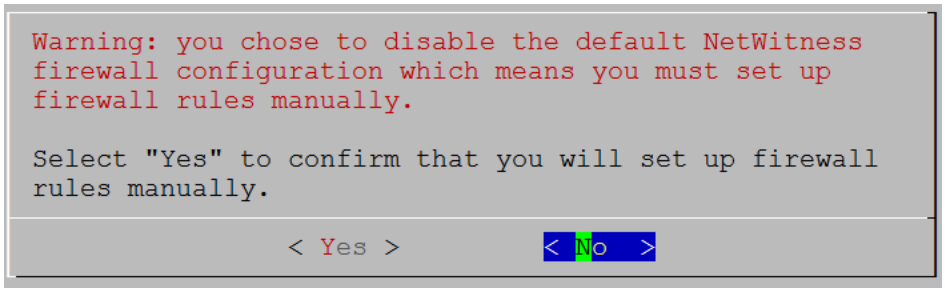


The **Disable** or use standard **Firewall** configuration prompt is displayed.

10. Tab to **No**, and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration. The following example shows **No** with the standard firewall configuration selected.



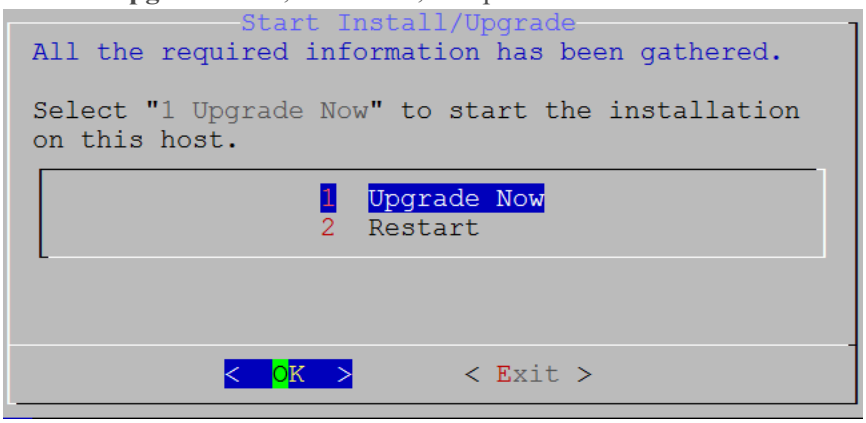
- If you select **Yes**, confirm your selection.



- If you select **No**, the standard firewall configuration is applied.

The **Install** or **Upgrade** prompt is displayed (**Recover** does not apply to the installation. It is for 11.3 Disaster Recovery).

11. Select 1 **Upgrade Now**, tab to **OK**, and press **Enter**.



When **Installation complete** is displayed, you have upgraded the host to the 11.3.

12. Install the service on this host:

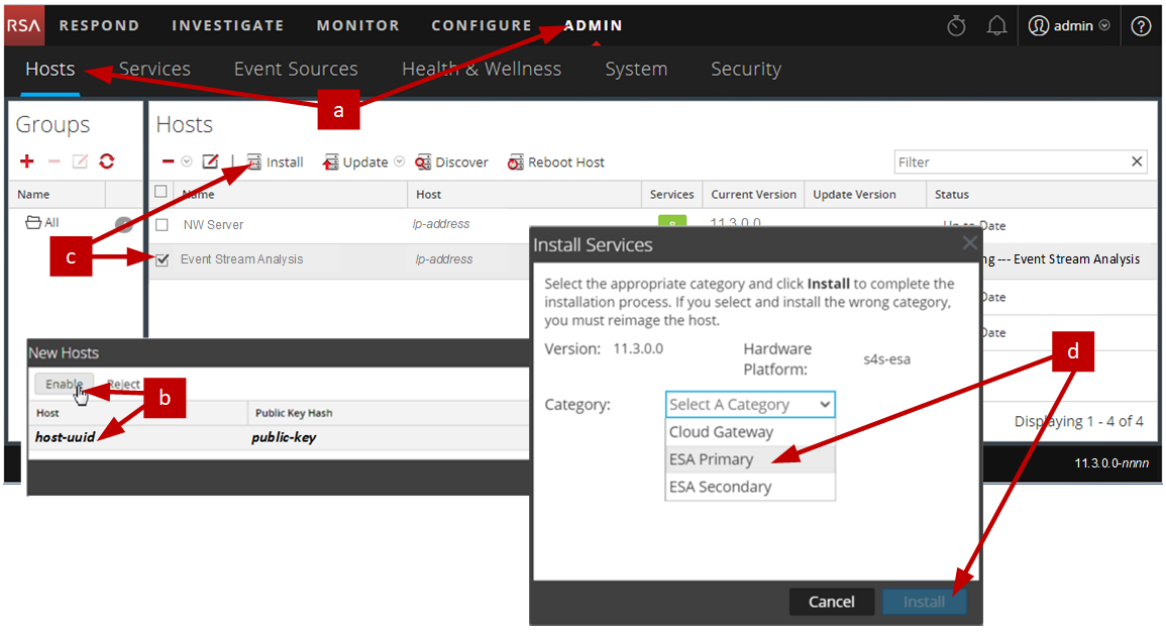
    a. Log into NetWitness Platform and go to **ADMIN** > **Hosts**.
    The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

    Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

    b. Click on the host in the **New Hosts** dialog and click **Enable**.
    The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

    c. Select that host in the **Hosts** view (for example, **Event Stream Analysis**) and click Install.
    The **Install Services** dialog is displayed.

    d. Select the appropriate service (for example, **ESA Primary**) and click **Install**.



You have completed the upgrade of the Component Host in NetWitness Platform

Phase 3 - (Optional) Install Warm Standby NW Server

Refer to "Warm Standby NW Server Host" under "Deployment Option Setup Procedures" in the *Deployment Guide* for instructions on how to set up a Warm Standby NW Server.

Update or Install Windows Legacy Collection

Refer to the *Windows Legacy Collection Guide for RSA NetWitness 11.x*.

Note: After you update or install Windows Legacy Collection, reboot the system to ensure that Log Collection functions correctly.

Post Upgrade Tasks

You must complete the following tasks after you upgrade your hosts from 10.6.6.x to 11.3. These tasks are organized by the following categories.

- General
- Event Stream Analysis
- Investigate
- Log Collection
- Log Decoder and Decoder
- Malware Analysis
- Reporting Engine
- Respond
- Warehouse
- RSA Archer® Cyber Incident & Breach Response
- RSA NetWitness® Endpoint
- RSA NetWitness® UEBA
- NetWitness Platform Integrations
- Other

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

General

General tasks apply to all customers regardless of the NetWitness Components you deploy.

Task 1 - Remove Backup-Related Files from Host Local Directories

Caution: 1) You must retain a copy of all backup files on an external host. 2) Validate that you have all your data from your backup restored in 11.3 before you remove the backup-related files from the local directories on your 11.3 hosts.

Backup `.tar` Files

After all the hosts are upgraded to 11.3, you must remove:

- The backup files from the local directories on the hosts.
- All the files from `nw-backup` and `restore` directories on the hosts.

Host	Backup Path	Restore Path
Malware	`/var/lib/rsamlware/nw-backup`	`/var/netwitness/malware_analytics_server/nw-backup/restore`
Event Stream Analysis	`/opt/rsa/database/nw-backup`	`/var/netwitness/database/nw-backup/restore`
NW Server	`/var/netwitness/database/nw-backup`	`/var/netwitness/restore`
All Other Hosts	`/var/netwitness/database/nw-backup`	`/var/netwitness/database/nw-backup/restore`

Task 2 - Make Sure Port 15671 Is Configured Correctly

Port 15671 is new in 11.x, but you do not need to open a firewall for this port. Make sure that port 15671, and all ports, are configured as shown in the "Network Architecture and Ports" topic in the *Deployment Guide*.

(Optional) Task 3 - Reissue Certificates for Your Hosts

In 11.3.0.0, RSA introduced a `cert-reissue` command line command and its arguments to reissue host certificates. After you update all your hosts to 11.3, you should reissue certificates for all of them as soon as possible to avoid having them expire. If the certificates expire, this places your NetWitness deployment in a bad security state. Refer to the *Security Configuration Guide* for instructions on how to use the `cert-reissue` command.

(Conditional) Task 4 - Restore Custom Analysts Roles

If you had custom analyst roles in 10.6.6.x, you must reinstate them in 11.3. See "Add a Role and Assign Permissions" in the *System Security and User Management Guide*.

(Conditional) Task 5 - If NetWitness Platform Has No Web Access, Upload Response `.bin` File Again (License Server)

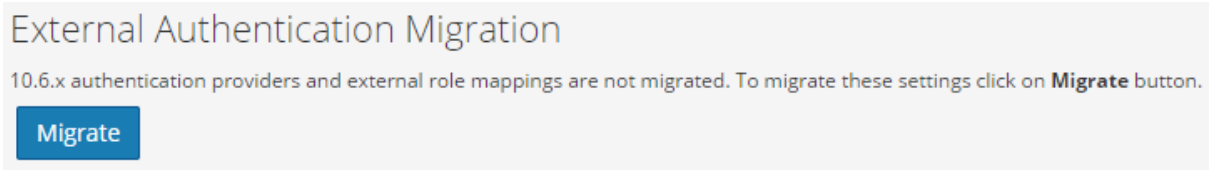
If your NetWitness Deployment does not have Internet access, after you upgrade to 11.3, you must upload the response `.bin` file again to view the license information in the **ADMIN** > **System** > **Licensing** view in the NetWitness Platform User Interface. See “Upload an Offline Capability Response to NetWitness Platform” in the *Licensing Management Guide* for instructions.

Task 6 - Migrate Active Directory (AD)

The first time you log into the NetWitness Platform 11.3 User Interface, you must click on the Migrate button to complete the migration of AD.

1. Log in to NetWitness Platform 11.3 with your `admin user` credentials.

2. Go to **ADMIN** > **SECURITY** and click the **Settings** tab.
   The following dialog is displayed.



3. Click **Migrate**.
   The migration is complete and the dialog closes.

Task 7 - Modify Migrated AD Configuration to Upload Certificate

If you authenticated through Active Directory (AD) server, and enabled SSL for the AD connection in 10.6.6.x, you must modify the migrated AD configuration to upload the Active Directory server certificate.

Complete the following procedure to modify the migrated AD configuration to upload the certificate.

1. Log in to **NetWitness Platform** 11.3, go to **ADMIN** > **Security** and click the **Settings** tab.
2. Under **Active Directory Settings**, select an AD configuration and click .
   The Edit Configuration dialog is displayed.
3. Go to the **Certificate File** field, click **Browse**, and select a certificate from your network.
4. Click **Save**.

Task 8 - Reconfigure Pluggable Authentication Module (PAM) in 11.3

You must reconfigure PAM after you upgrade to 11.3. See "Configure PAM Login Capability" in the *System Security and User Management Guide* for instructions.

You can refer to your 10.6.6.x PAM configuration files in the **/etc** directory in the your 10.6.6.x backup data for guidance.

Task 9 - Restore NTP Servers

You must use the NetWitness Platform 11.3 user interface to restore NTP server configurations. NTP server configuration information is located in `$BUPATH/restore/etc/ntp.conf`. Use the NTP server name and hostname from the `/var/netwitness/restore/etc/ntp.conf` file. See "Configure NTP Servers" in the *System Configuration Guide* for detailed instructions on how to add NTP servers.

Task 10 - Restore Licenses for Environments without FlexNet Operations-On Demand Access

If your environment does not have access to FlexNet Operations-On Demand, you need to re-download your NetWitness Platform licenses. Refer to "Step 1. Register the NetWitness Server" in the *Licensing Management Guide* for instructions on how to re-download licenses.

(Conditional) Task 11 - If You Disabled Standard Firewall Config - Add Custom IPtables

During the upgrade, you have the option of using these rules or disabling them. If you disabled them, follow these instructions as a baseline to create user-managed firewall rule sets on all the hosts for which you disabled the standard firewall configuration.

Note: You can refer to the `$BUPATH/restore/etc/sysconfig/iptables` and `$BUPATH/restore/etc/sysconfig/ip6tables` in the restore folder of the backup to update the `ip6tables` and `iptables` files. The `/etc/netwitness/firewall.cfg` file contains the standard `iptables` firewall rules.

1. SSH to each host and log in with your root credentials.
2. Update the following `ip6tables` and `iptables` files with the custom firewall rules.
   ```
   /etc/sysconfig/iptables
   /etc/sysconfig/ip6tables
   ```
3. Reload the `iptables` and `ip6tables` services.
   ```
   service iptables reload
   service ip6tables reload
   ```

(Conditional) Task 12 - Specify SSL Ports If You Never Set Up Trusted Connections

Complete this task only if you never set up Trusted Connections. You would not have set up Trusted Connections if you:

- Used the base ISO image for 10.3.2 or earlier.
- Updated the system using RPMs exclusively to get to 10.6.6.x.

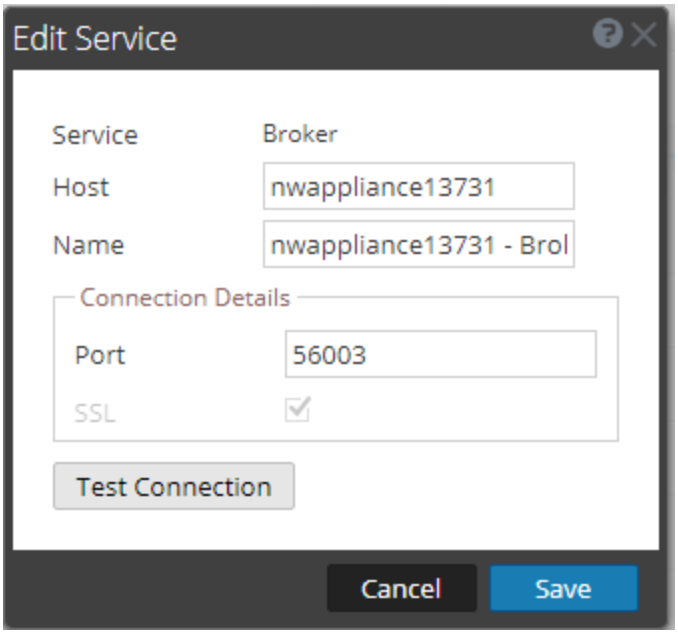
NetWitness Platform 11.3 cannot communicate with the Core services if you are using a non-SSL port 500XX. You must update the Core service ports to an SSL port in the Edit Service dialog.

1. Log in to **NetWitness Platform** and go to **ADMIN** > **Services**.
2. Select each core service and change the ports from Non-SSL to SSL ports.

Service	Non-SSL	SSL
Broker	50003	56003
Concentrator	50005	56005
Decoder	50004	56004
Log Decoder	50002	56002

3. Click (Edit icon) from the SERVICES view toolbar.
   The Edit Service dialog is displayed.

4. Change the port from Non-SSL to SSL as shown in the table and click **Save** (for example, change the Broker port from 50003 to 56003).



Task 13 (Conditional) Reconfigure Public Key Infrastructure (PKI) Certificates

If you had PKI keystores that contained server certificates with private keys and the truststores that contain the trusted CA certificates, you must reconfigure after you upgrade to 11.3. For instructions on how to configure PKI authentication, see the "*System Security and User Management Guide*".

Event Stream Analysis (ESA)

Task 14 - Reconfigure Automated Threat Detection for ESA

If you used Automated Threat Detection in 10.6.6.x, you must complete the following steps to reconfigure it using the ESA Analytics service in 11.3.

1. Log in to **NetWitness Platform** and go to **ADMIN** > **System** > **ESA Analytics**.
   The Suspicious Domains modules, Command and Control (C2) for Network data and C2 for Logs, require a whitelist named "**domains_whitelist**".
2. Conditional - If your previous Automated Threat Detection whitelist appears on the **Lists** tab of the Context Hub service:
   a. Go to **ADMIN** > **Services**, select the Context Hub service, in the action commands ( ) drop-down menu, click **View** > **Config** > **Lists** tab.
   b. Rename your old Automated Threat Detection whitelist to "`domains_whitelist`" for the Suspicious Domains module.

For more information, see the *Automated Threat Detection Guide* and the "Configure ESA Analytics" section of the *ESA Configuration Guide*.

Task 15 (Conditional) Verify String Array Type Meta Keys on the ESA Correlation Service

If you added any string array type meta keys to the Event Stream Analysis service for your ESA correlation rules in 10.6.6.x or earlier, verify that they appear on the ESA Correlation service in 11.3.

1. Follow the "Configure Meta Keys as Arrays in ESA Correlation Rule Values" procedure in the *ESA Configuration Guide* to verify if the string array type meta keys that were added before the upgrade are on the ESA Correlation service. Add any missing string array type meta keys.
2. Do not remove any meta keys from the multi-valued parameter on the ESA Correlation service. In NetWitness Platform 11.3, the ESA rules from Live use meta keys with array syntax and they depend on these meta keys to work correctly. Removing values from the multi-valued list can cause the ESA Rule Deployments to fail.

Task 16 (Conditional) Update RSA Live ESA Rules with Meta Type Changes from String to Array

The following table lists the ESA rules from RSA Live that had meta key type changes from String to Array in NetWitness Platform 11.3.

Rule #	Rule Name	Array Type Meta Keys in 11.3
1	RIG Exploit Kit	threat_category
2	AWS Critical VM Modified	alert
3	Multiple Successful Logins from Multiple Diff Src to Same Dest	host.src and host.dst
4	Multiple Successful Logins from Multiple Diff Src to Diff Dest	host.src and host.dst
5	Multiple Failed Logins from Multiple Diff Sources to Same Dest	host.src and host.dst
6	Multiple Failed Logins from Multiple Users to Same Destination	host.src and host.dst
7	User Login Baseline	host.src and host.dst

1. If you:
   - Deployed these rules before version 11.3:
     a. Note any rule parameters that you have changed so you can adjust the rules for your environment.
     b. Download the updated rules from RSA Live.

c. Reapply any changes to the default rule parameters and deploy the rules.
(For instructions, see "Download RSA Live ESA Rules" in the Alerting with ESA Correlation Rules User Guide.)

- Are deploying these rules for the first time in version 11.3, follow the customization directions with the ESA rule descriptions. Rules 3 to 7 in the above table require that the Context Hub lists for `User_Whitelist`, `Host_Whitelist` and `IP_Whitelist` to be added as enrichments to ESA. (See "Configure Context Hub List as an Enrichment Source" in the *Alerting with ESA Correlation Rules User Guide*.)

2. Deploy the ESA rule deployment that contains these rules. (See "ESA Rule Deployment Steps" in the *Alerting with ESA Correlation Rules User Guide*.)

Task 17 (Conditional) - Verify ESA Rule Deployment

After you upgrade to 11.3, verify your ESA rule deployments. For every ESA host, a new deployment is created in the format "<ESA Host name> – ESA Correlation".

1. Make sure that a new deployment was created.
2. Make sure that the new deployment contains an ESA Correlation service, data sources, and rules for all previous deployments on that ESA host.
3. Make sure that the ESA Correlation service has status of "Deployed".

For a detailed example, see the *ESA Configuration Guide*. For Deployment information, see "ESA Rule Deployment Steps" in the *Alerting with ESA Correlation Rules User Guide*. For troubleshooting information, see the *Alerting with ESA Correlation Rules User Guide*.

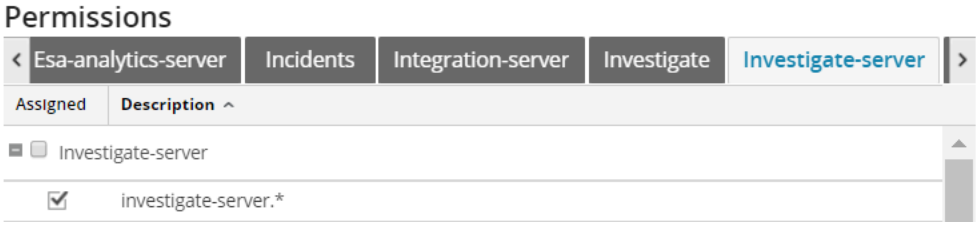
Investigate

Task 18 - Make Sure Customized User Roles Have `Investigate-server` Permissions for Event Analysis Access

After you upgrade to 11.3.0.0, any customized user role does not have `investigate-server.*` permission enabled by default. Complete the following procedure to make sure that the appropriate user roles have permission to access Event Analysis.

1. Log in to NetWitness Platform 11.3.0.0 with your `Admin user` credentials and go to **ADMIN** > **Security**.
2. Click the **Roles** tab.
3. Select the roles that need `investigate-server.*` permissions and click (Edit icon).
4. Select the **Investigate-server** tab under under **Permissions**.

5. If the **investigate-server** checkbox is not set, set it for the Roles that require Event Analysis access.



6. Click **Save**.

Log Collection

Task 19 - Reset Stable System Values for Log Collector after Upgrade

Complete the following tasks to reset stable system values for the Log Collector after you upgrade it to 11.3 to ensure that all collection protocols resume normal operation.

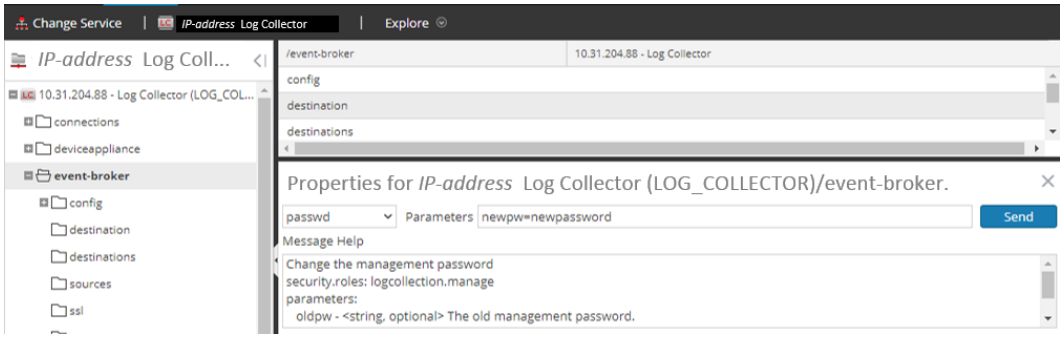
Reset Stable System Values for the Lockbox

The Lockbox stores the key for encrypting event source and other passwords for the Log Collector. The Log Collector service cannot open the Lockbox because of the stable system value changes. As a result, you must Reset Stable System Values for the Lockbox . See "Log Collection: Step 3. Set Up a Lockbox" in the *Log Collection Configuration Guide* for instructions.

Update Log Collector Service RabbitMQ User Account Password

If the `logcollector` service RabbitMQ user account password was changed, you must reenter it after the 11.3 upgrade.

1. Log in to **NetWitness Platform** and go to **ADMIN** > **Services**.
2. Select the Log Collector service.
3. Click (Actions) > **View** > **Explore**.
4. Right click `event-broker` > **Properties** .
5. Select `passwd` from the drop-down list, enter `newpw=><newpassword>` in Parameters (where `<newpassword>` is the RabbitMQ user account password), and click **Send**.



Task 20 - (Conditional) Update SSHD Configuration after Upgrade with Older Windows and UNIX SFTP Agents

This task applies if you have Log Collection, Log Collector (LC) and or Virtual Log Collector (VLC), with File Collection event sources.

If all the event sources:

- Resume collection after upgrade, you do not need to do anything.
- Do not resume collection after the upgrade, you may have to restore Cipher, MACs and Key Exchange Algorithms to the SSHD configuration from the original LC/VLC. Change the `/etc/ssh/sshd_config` file.

1. Make the following changes to `/etc/ssh/sshd_config` file.
   a. If the `KexAlgorithms` line:
      - Exists, append "`,diffie-hellman-group1-sha1`" to the file.
      - Does not exist, add "`KexAlgorithms +diffie-hellman-group1-sha1`" line.
   b. If the `Ciphers` line:
      - Exists, append "`,aes128-cbc`" to the file.
      - Does not exist, add the "`Ciphers +aes128-cbc`" line to the file.
2. Restart SSHD service.
3. If collection still fails, edit the `/etc/systemd/system/sshd.service.d/sshd-opts-managed.conf` file and change "`OWB_ALLOW_NON_FIPS=on`" to "`OWB_FIPS_MODE=off`" in the Environment line and restart SSHD service.
4. If collection still fails, contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294).

Task 21 - Enable FIPS Mode

Note: This task is optional for Upgrades from 10.6.6.x with FIPS enabled for Log Collectors, Log Decoders and Network Decoders)

FIPS is enabled on all services except Log Collector, Log Decoder, and Decoder. FIPS cannot be disabled on any services except Log Collector, Log Decoder, and Decoder.

Log Decoder and Decoder

(Conditional) Task 23 - Enable Metadata for GeoIP2 Parser

By default, the GeoIP2 parser generates less metadata than the GeoIP parser did. After updating to 11.3, if you require any of the additional metadata, you must enable them (once only) for each Decoder. This can also be altered post-upgrade. Note that the `isp` and `org` meta fields usually produce an equivalent value to `domain`.

To enable metadata:

1. Go to **ADMIN** > **Services**.
2. In the **Administration services** view, select a Log Decoder or a Decoder.
3. Click the settings icon ( ) and select **View** > **Config**. The Parsers Configuration panel is displayed, from which you can select **GeoIP2** to enable the desired metadata.

For more information about GeoIP2 parsers, see the "GeoIP2 and GeoIP Parsers" topic in the *Decoder and Log Decoder Configuration Guide*.

Malware Analysis

Task 24 - Enable Threat - Malware Indicators Dashboard

In 11.3, the 10.6.6.x **Threat -Indicators Dashboard** was renamed to **Threat - Malware Indicators Dashboard**. If you used this dashboard in 10.6.6.x, you must:

1. Enable the **Threat - Malware Indicators Dashboard** in 11.3.
2. Set datasource for new dashlets.
   See "Dashlets" in RSA Link (https://community.rsa.com/docs/DOC-81463) for a description of Dashlets in the context of NetWitness Platform.

Note: After upgrading to 11.3, both the Threat-Indicators and the Threat-Malware Indicators dashboards can be displayed in the User Interface. If this is the case, disable the Threat-Indicators dashboard, and enable the Threat-Malware Indicators report charts and dashboard. For information about disabling dashboards, see the "Managing Dashboards" topic in the *NetWitness Getting Started Guide*.

Reporting Engine

(Conditional) Task 25 - Restore the CA certificates for External Syslog Servers for Reporting Engine

You must restore CA certificates after the upgrade from the backup you made prior to the upgrade. The Backup script backs up the 10.6.6.x CA certificates into the `/usr/lib/jvm/java-1.8.0-openjdk-1.8.0.111-0.b15.el6_8.x86_64/jre/lib/security/cacerts` directory.

Complete the following procedure to restore the CA certificates in 11.3.

1. SSH to the NW Server host.
2. Export the CA certificates.
   ```
   keytool -export -alias <alias_name> -keystorepath_to_keystore_file -rfc -file path_to_certificate_file
   ```
3. Copy the CA PEM file into `/etc/pki/nw/trust/import` directory.

(Conditional) Task 26 - Restore External Storage for Reporting Engine

If you have external storage for the Reporting Engine (such as SAN or NAS for storing reports), you must restore the mount you unlinked before the upgrade. See "Reporting Engine: Add Additional Space for Large Reports" in the *Reporting Engine Configuration Guide* for instructions.

Respond

Task 27 - Restore Respond Service Custom Keys

In 10.6.6.x, if you added custom keys for use in the **groupBy** clause, the `alert_rules.json` file was modified. The `alert_rules.json` file contains aggregation rule schema. RSA moved the `alert_rules.json` file to the following new location:
`/var/lib/netwitness/respond-server/scripts`

1. Copy the custom keys from `/opt/rsa/im/fields/alert_rules.json` file in the backup directory.
   This directory is where the `alert_rules.json` file is restored from the 10.6.6.x backup.
2. Go to the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` in 11.3.
   This is the new file for 11.3.
3. Edit the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` to include the custom keys you copied in step one.

Task 28 - Restore Customized Respond Service Normalization Scripts

RSA re-factored the Respond service normalization scripts in 11.3 and moved them to the following new location:
`/var/lib/netwitness/respond-server/scripts`
If you customized these scripts in 10.6.6.x, you must:

1. Go to the to the `/opt/rsa/im/scripts` directory.
   This directory is where the following Respond service normalization scripts are restored from the 10.6.6.x backup.
   `data_privacy_map.js`
   `normalize_alerts.js`
   `normalize_core_alerts.js`
   `normalize_ecat_alerts.js`
   `normalize_ma_alerts.js`
   `normalize_wtd_alerts.js`
   `utils.js`
2. Copy any custom logic from the 10.6.6.x scripts.
3. Go to the `/var/lib/netwitness/respond-server/scripts` directory.
   This directory is where NetWitness Platform 11.3 stores the re-factored scripts.
4. Edit the new scripts to include the custom logic you copied in step 2 from the 10.6.6.x scripts.
5. Copy any custom logic from `/opt/rsa/im/fields/alert_rules.json` file.
   The `alert_rules.json` file contains aggregation rule schema.

Task 29 - Add Respond Notification Settings for Custom Roles

Respond Notification Setting permissions enable Respond Administrators, Data Privacy Officers, and SOC Managers to access Respond Notification Settings (**CONFIGURE** > **Respond Notifications**), which enable them to send email notifications when incidents are created or updated.

To access these settings, you will need to add additional permissions to your existing built-in NetWitness Platform user roles. You will also need to add permissions to your custom roles. See the "Respond Notification Settings Permissions" topic in the *NetWitness Respond Configuration Guide*. For detailed information about user permissions, see the *System Security and User Management Guide*.

Task 30 - Manually Configure Respond Notification Settings

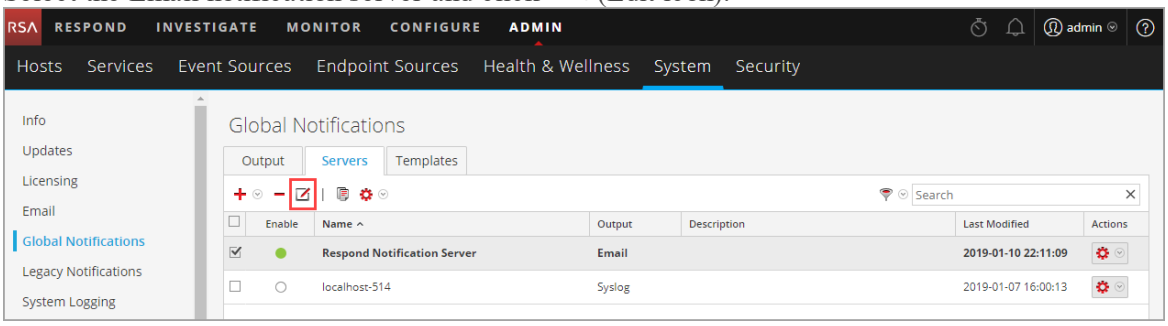
The Incident Management notification settings in NetWitness Platform 10.6.6.x are different from the Respond notification settings available in 11.3, so your existing 10.6.6.x settings will not migrate to 11.3.

NetWitness Respond notification settings enable email notifications to be sent to SOC Managers and the Analyst assigned to an incident when an incident is created or updated.

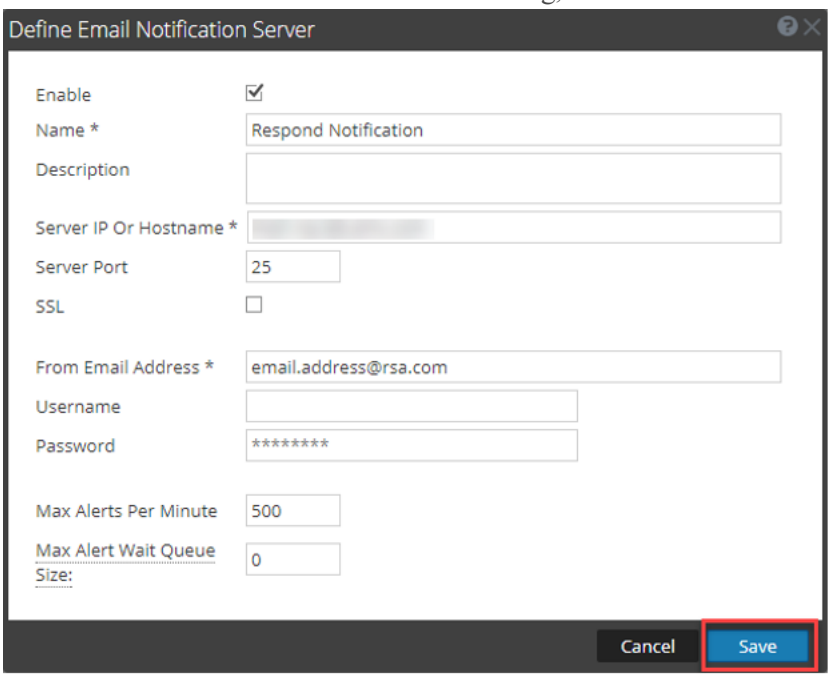
To manually configure the Respond Notification Settings, go to **CONFIGURE** > **Respond Notifications.** See the "Configure Respond Email Notification Settings" procedure in the *NetWitness Respond Configuration Guide*.

Notification Servers from 10.6.6.x will not display in the Email Server drop-down list. The email servers must be edited and saved in the Global Notification Servers panel (**ADMIN** > **System** > **Global Notifications** > **Server** tab).

1. Log in to **NetWitness Platform** and go to **CONFIGURE** > **Respond Notifications**.
   The Respond Notifications Settings view is displayed. Notice that the email notification servers do not appear in the EMAIL SERVER drop-down list.
2. Click the **Email Server Settings** link.
   You will see the Global Notifications panel.
3. Click the **Servers** tab.
4. For each of your email notification servers:
   a. Select the Email notification server and click (Edit icon).



b. In the Define Email Notification Server dialog, click **Save**.



5. Go back to **CONFIGURE** > **Respond Notifications**. Your servers will appear in the **EMAIL SERVER** drop-down list.
   Custom Incident Management notification templates cannot be migrated to 11.3. No custom templates are supported in 11.3.

Task 31 - Update Default Incident Rule Group By Values

The following default incident rules now use “Source IP Address” as the Group By value.

- **High Risk Alerts: Reporting Engine**
- **High Risk Alerts: Malware Analysis**
- **High Risk Alerts: ESA**

To update the above default rules, change the Group By value to “Source IP Address.”

Note: If you already updated the Group By values for the default rules listed above in 11.1 or later, you do not have to do it again.

The **High Risk Alerts: NetWitness Endpoint** default incident rule now uses Host Name as the Group By value. If you have NetWitness Endpoint you can use this rule. Change the Group By value of the default NetWitness Endpoint rule to "Host Name."

1. In the **NetWitness Platform** menu, select **CONFIGURE** > **Incident Rules** and click on the rule that you want to update in the **Name** column. The **Incident Rule Details** view is displayed.
2. In the **GROUP BY** field, select the new Group By value from the drop-down list.
3. Click **Save** to update the rule.

To aggregate NetWitness Endpoint alerts based on the File Hash, complete the following steps to clone the default NetWitness Endpoint incident rule and change the Group By value.

1. In the **NetWitness Platform** menu, select **CONFIGURE** > **Incident Rules**. The **Incident Rules List** view is displayed.
2. Select the **High Risk Alerts: NetWitness Endpoint** default incident rule and click **Clone**. You will receive a message that you successfully cloned the selected rule.
3. Change the Name of the rule to an appropriate name, such as High Risk Alerts: NetWitness Endpoint File hash.
4. In the **GROUP BY** field, remove the previous Group By value and add **File MD5 Hash**. It is important that File MD5 Hash is the only Group By value listed.
5. Click **Save** to create the rule.

For detailed information, see the *Respond Configuration Guide*.

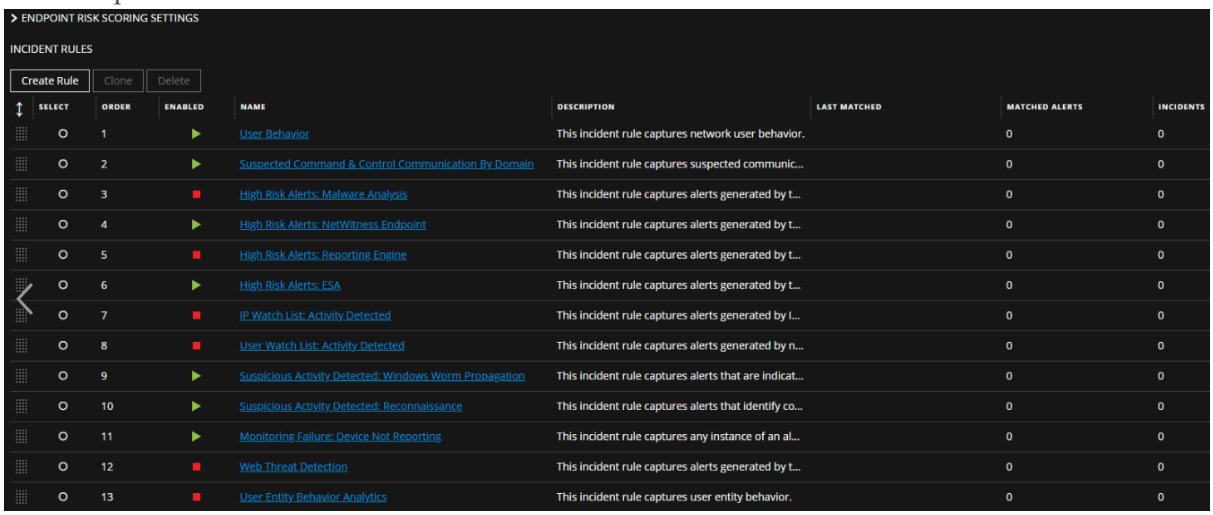
Task 32 - Add Group By Field to Incident Rules

The **Group By** field is not required in 10.6.6, but it is required in 11.3. After you upgrade to

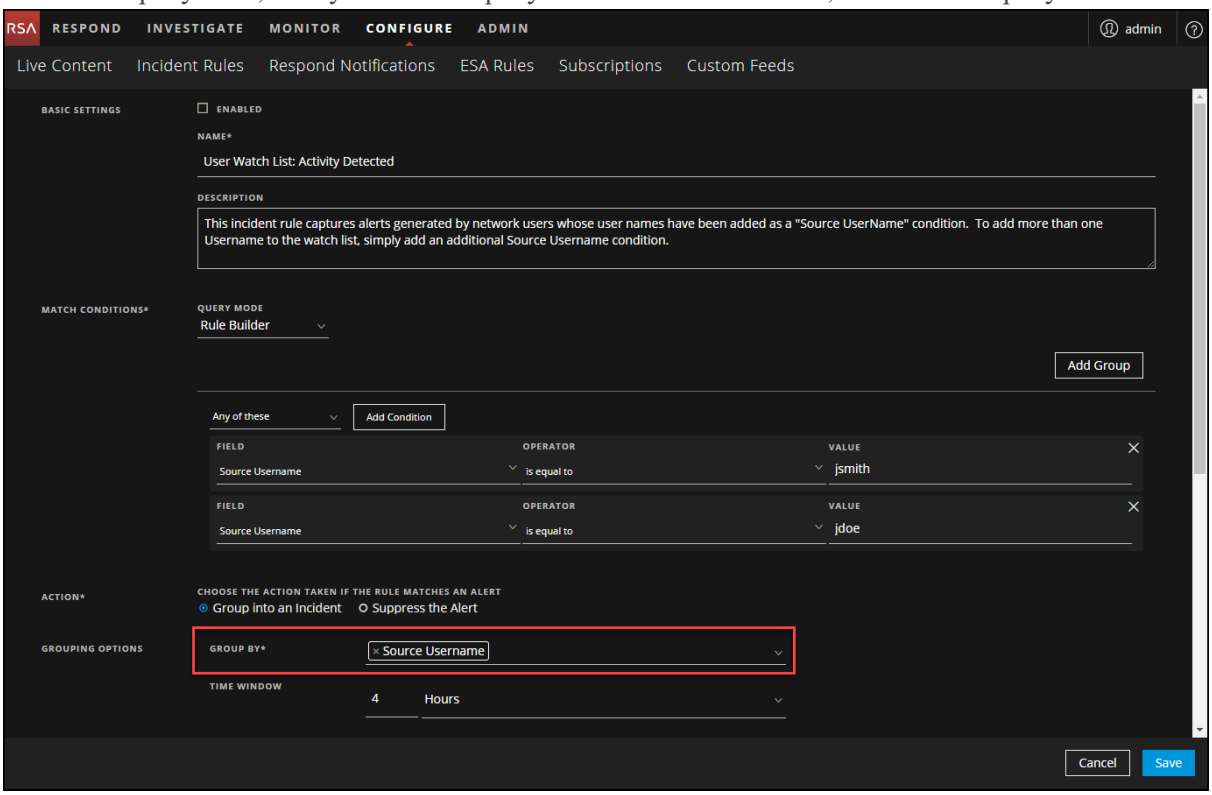
11.3, some incident rules will not have a **Group By** field, so you must add them to the rules or the rules will not work and they will not create incidents.

Complete the following steps for each incident rule:

1. Log in to NetWitness Platform.
2. Go to **CONFIGURE** > **Incident Rules** and click the link in the Name column for the rule that you want to update.



3. In the Group By field, verify that a Group By value is selected. If not, select a Group By value.



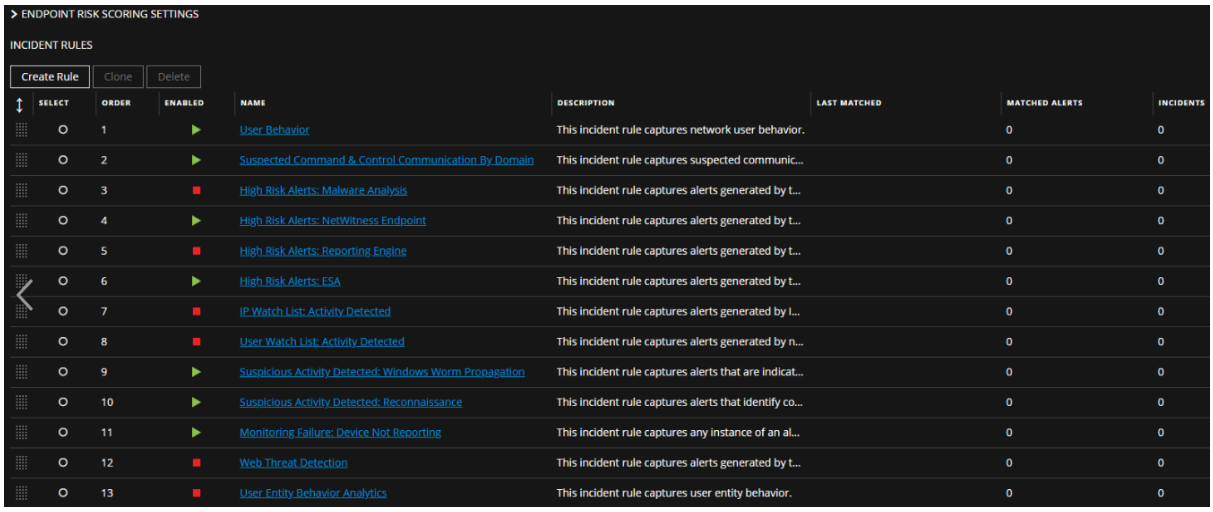
4. Click **Save** to update the rule.
   For information about incident rules, see the *NetWitness Respond Configuration Guide*.

Task 33 - Update Incident Rules Identified in the Domain Matching Conditions Upgrade Preparation Task

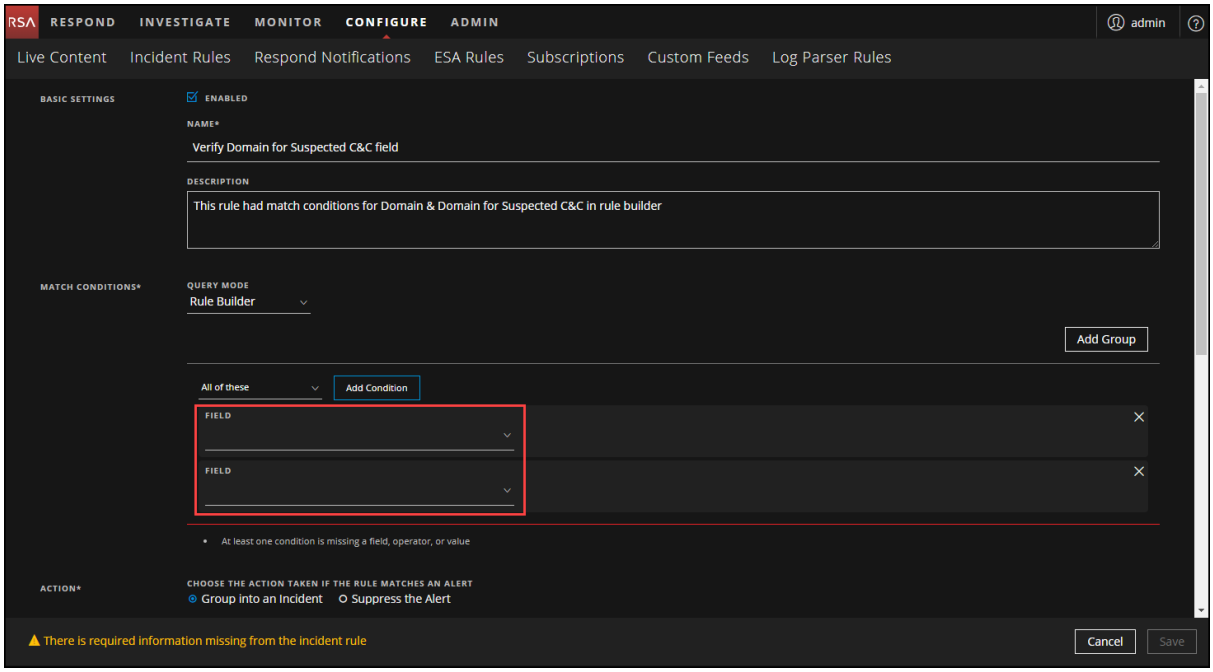
Modify the incident rules that you identified in the Task 7 - Check Aggregation Rules Match Conditions for "Domain" or "Domain for Suspected C&C" upgrade preparation task, which contained Domain or Domain for Suspected C&C in the matching conditions in rule builder.

For each rule that you previously identified:

1. Log in to **NetWitness Platform**, go to **CONFIGURE** > **Incident Rules** and click the link in the Name column for the rule that you want to update.



2. In the **Match Conditions** section, in the blank fields, select **Domain** and **Domain for Suspected CC** in the drop-down list and then select the conditions that you previously identified in the pre-upgrade tasks.



3. Click **Save** to update the rule.
   For information about incident rules, see the *NetWitness Respond Configuration Guide*.

Warehouse

Task 34 - Restore `keytab` Files, Mount NFS, Install Service

1. Restore the `keytab` files from `<backup-path>/restore` directory.
2. Restore the Kerberos Realm Configuration from the `<backup-path>/restore/etc/krb5.conf` into `/etc/krb5.conf`.
3. (Conditional) If you perform the upgrade from a Non - FIPS environment and the `isCheckValidationRequired` parameter is not enabled in the destination, to configure the SFTP destination:
   a. SSH to the Warehouse Connector host and submit the following commands:
      ```
      cd /root/.ssh/
       mv id_dsa id_dsa.old
      OWB_FORCE_FIPS_MODE_OFF=1 openssl pkcs8 -topk8 -v2 des3 -in id_dsa.old -
      out id_dsa
      ```
      You are prompted for the pass phrase.
   b. Enter the Encryption password.
   c. Run the following command.
      ```
      chmod 600 id_dsa
      ```
4. Install the Warehouse Connector.
   See the *Warehouse Connector Configuration Guide* for instructions.

Task 35 - Refresh Warehouse Connector Lockbox and Start Stream

Note: If the streams have auto start turned on in 10.6.6.x, there will be a small delay before you will see the Warehouse Connector service in the NetWitness Platform User Interface.

1. Refresh the Lockbox of Warehouse Connector.
2. SSH to the Warehouse Connector and log in with root credentials.
3. Restart the service.
   ```
   service nwwarehouseconnector restart
   ```
4. (Conditional) If the auto start was not enabled in 10.6.6.x, you must start the stream manually after the service restarts.

Task 36 - Update Hive Version

After you update to 11.3, you must update to the Hive version that is compatible with the 11.3 Warehouse (either Hive version 0.12 or version 1.0).

- Hive Version 0.12
  SSH to the NW Server and run the following command.
  ```
  rpm -ivh rsa-nw-hive-jdbc-0.12.0-1.x86_64.rpm
  ```

- Hive Version 1.0
  SSH to the NW Server and run the following command.
  `rpm -ivh rsa-nw-hive-jdbc-1.0.0-1.x86_64.rpm`

RSA Archer Cyber Incident & Breach Response

Task 37 - Reconfigure RSA Archer Cyber Incident & Breach Response Integration

For information on how to reconfigure RSA Archer Cyber Incident & Breach Response for Event Stream Analysis, Reporting Engine, and Respond, see *RSA Archer Integration Guide*.

RSA NetWitness® Endpoint

Task 38 - Reconfigure Endpoint Alerts Via Message Bus

1. On the NetWitness Endpoint Server, modify the virtual host configuration in the `C:\Program Files\RSA\ECAT\Server\ConsoleServer.exe` file to reflect the following configuration.
   `<add key="IMVirtualHost" value="/rsa/system" />`

   Note: In NetWitness Platform 11.3, the virtual host is `/rsa/system`. For 10.6.6.x and earlier versions, the virtual host is `/rsa/sa`.
2. Restart the API Server and Console Server.
3. SSH to the NW Server and log in with `root` credentials.
4. Submit the following command to add all certificates to the truststore.
   `orchestration-cli-client --update-admin-node`
5. Submit the following command to restart the RabbitMQ server.
   `systemctl restart rabbitmq-server`
   The NetWitness Endpoint account should automatically be available on RabbitMQ.
6. Import the `/etc/pki/nw/ca/nwca-cert.pem` and `/etc/pki/nw/ca/ssca-cert.pem` files from the NW Server and add them to the Trusted Root Certification stores in the Endpoint Server.

Task 39 - Reconfigure Recurring Feed Configured from Legacy Endpoint Because Java Version Changed

You must reconfigure the Legacy Endpoint recurring feed due to the change in Java version. Complete the following step to fix this problem.

- Import the NetWitness Endpoint CA certificate into the NetWitness Platform Trusted store as described in "Export the NetWitness Endpoint SSL Certificate" under the "Configure Contextual Data from Endpoint via Recurring Feed" topic in the *RSA NetWitness Endpoint Integration Guide* to import the certificate.

(Optional) Task 40 - Install Endpoint Log Hybrid and Endpoint Agents

See:

RSA NetWitness Platform 11.3 Physical Host Installation Guide for instructions for installation on a physical host.

RSA NetWitness Platform 11.3 Virtual Host Installation Guide for instructions for installation on a virtual host.

RSA NetWitness® UEBA

Task 41 - Install NetWitness UEBA

NetWitness UEBA is new a new feature as of NetWitness Platform 11.3.

See:

RSA NetWitness Platform 11.3 Physical Host Installation Guide for instructions for installation on a physical host.

RSA NetWitness Platform 11.3 Virtual Host Installation Guide for instructions for installation on a virtual host.

RSA NetWitness UEBA User Guide for information about NetWitness UEBA.

NetWitness Platform Integrations

(Conditional) Task 42 - For Integrations with Web Threat Detection, RSA Archer® Cyber Incident & Breach Response or NetWitness Endpoint.

If you integrate with Web Threat Detection, Archer Cyber Incident & Breach Response or NetWitness Endpoint, you must configure Mutually Authenticated SSL on each integrated system so that the application can authenticate itself when connecting to the RabbitMQ message bus.

Note: Use the RabbitMQ usernames and passwords that were obtained when you backed up your 10.6.6.x data (see Backup Instructions).

1. Create a user on the host system that is integrating with NetWitness Platform by logging into the host and running the following `rabbitmqctl` command.
   ```
   > rabbitmqctl add_user <username> <password>
   ```
2. Set permissions for users by running the following command (use the username from step 1).
   ```
   > rabbitmqctl set_permissions -p /rsa/system <username> ".*", ".*", ".*"
   ```
   For example:
   ```
   > rabbitmqctl set_permissions -p /rsa/system wtd-incidents ".*", ".*", ".*"
   ```

Other

none

Appendix A. Troubleshooting

There two sections in this appendix.

- Section 1 - General Troubleshooting Information
- Section 2 - Hardware-Related Troubleshooting Information

Section 1 - General Troubleshooting information

This section describes solutions to problems that you may encounter during installations and upgrades. In most cases, NetWitness Platform creates log messages when it encounters these problems.

Note: If you cannot resolve an upgrade issue using the following troubleshooting solutions, contact Customer Support (https://community.rsa.com/docs/DOC-1294).

This section has troubleshooting documentation for the following services, features, and processes.

- Command Line Interface (CLI)
- Backup Script
- Event Stream Analysis
- Concentrator Service
- Log Collector Service (`nwlogcollector`)
- Orchestration
- NW Server
- Reporting Engine
- NetWitness UEBA

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Command Line Interface (CLI)

Error Message	Command Line Interface (CLI) displays: "Orchestration failed." `Mixlib::ShellOut::ShellCommandFailed: Command execution failed. STDOUT/STDERR suppressed for sensitive resource in/var/log/netwitness/config-management/chef-solo.log`
Cause	Entered the wrong `deploy_admin` password in `nwsetup-tui`.
Solution	Retrieve your `deploy_admin` password password. 1. SSH to the NW Server host. `security-cli-client --get-config-prop --prop-hierarchy nw.security-client --prop-name deployment.password` SSH to the host that failed.

2. Run the `nwsetup-tui` again using correct `deploy_admin` password.

Error Message	`ERROR com.rsa.smc.sa.admin.web.controller.ajax.health. AlarmsController - Cannot connect to System Management Service`
Cause	NetWitness Platform sees the Service Management Service (SMS) as down after successful upgrade even though the service is running.
Solution	Restart SMS service. `systemctl restart rsa-sms`

Error Message	You receive a message in the User Interface to reboot the host after you update and reboot the host offline.
Cause	You cannot use CLI to reboot the host. You must use the User Interface.
Solution	Reboot the host in the Host View in the User Interface.

Backup (`nw-backup` script)

Error Message	`WARNING: Incorrect ESA Mongo admin password for host <hostname>.`
Cause	ESA Mongo admin password contains special characters (for example, '!@#$%^qwerty').
Solution	Change the ESA Mongo admin password back to the original default of 'netwitness' before running backup.

Error	Backup errors caused by the `immutable` attribute setting. Here is an example of an error that can be displayed: Cause	If you have any files that have the immutable flag set (to keep the Puppet process from overwriting a customized file), the file will not be included in the backup process and an error will be generated.
Solution	On the host that contains the files with the immutable flag set, run the following command to remove the immutable setting from the files: `chattr -i <filename>`

Error	Error creating Network Configuration Information file due to duplicate or bad entries in primary network configuration file: `/etc/sysconfig/network-scripts/ifcfg-em1` Verify contents of `/var/netwitness/logdecoder/packetdb/nw-backup/2018-02-23/S5-BROK-36-10.25.53.36-network.info.txt`
Cause	There are incorrect or duplicate entries for any one of the following fields: DEVICE, BOOTPROTO, IPADDR, NETMASK or GATEWAY, that were found from reading the primary Ethernet interface configuration file from the host being backed up.

Solution	Manually create a file at the backup location on the external backup server, as well as the backup location local to the host where other backups have been staged. The file name should be of the format `<hostname>-<hostip>-network.info.txt`, and should contain the following entries:
	`DEVICE=<devicename> ; # from the host's primary ethernet interface config file`
	`BOOTPROTO=<bootprotocol> ; # from the host's primary ethernet interface config file`
	`IPADDR=<value> ; # from the host's primary ethernet interface config file`
	`NETMASK=<value> ; # from the host's primary ethernet interface config file`
	`GATEWAY=<value> ; # from the host's primary ethernet interface config file`
	`search <value> ; # from the host's /etc/resolv.conf file`
	`nameserver <value> ; # from the host's /etc/resolv.conf file`

Event Stream Analysis

- For ESA Correlation troubleshooting information, see the *Alerting with ESA Correlation Rules User Guide*.
- For ESA Analytics troubleshooting information, see the *Automated Threat Detection Configuration Guide*.

Concentrator Service

Problem	After you upgrade to 11.3.0.0, pivot to navigate query fails if the Concentrator service version is 10.6.x.
Cause	Pivot to Navigate query fails as it contains meta entities and 10.6.x Concentrator service does not support meta entities.
Solution	You must edit the query and remove meta entities. For example, if query is for user then remove the `user.all` meta entity and re-run the query.

Log Collector Service (`nwlogcollector`)

Log Collector logs are posted to `/var/log/install/nwlogcollector_install.log` on the host running the `nwlogcollector` service.

Error Message	`<timestamp>.NwLogCollector_PostInstall: Lockbox Status : Failed to open lockbox: The lockbox stable value threshold was not met because the system fingerprint has changed. To reset the system fingerprint, open the lockbox using the passphrase.`
Cause	The Log Collector Lockbox failed to open after the update.
Solution	Log in to NetWitness Platform and reset the system fingerprint by resetting the stable system value password for the Lockbox as described in the "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*.

Error Message	`<timestamp> NwLogCollector_PostInstall: Lockbox Status : Not Found`
Cause	The Log Collector Lockbox is not configured after the update.
Solution	If you use a Log Collector Lockbox, log in to NetWitness Platform and configure the Lockbox as described in the "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*.

Error Message	`<timestamp>: NwLogCollector_PostInstall: Lockbox Status : Lockbox maintenance required: The lockbox stable value threshold requires resetting. To reset the system fingerprint, select Reset Stable System Value on the settings page of the Log Collector.`
Cause	You need to reset the stable value threshold field for the Log Collector Lockbox.
Solution	Log in to NetWitness Platform and reset the stable system value password for the Lockbox as described in "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*.

Problem	You have prepared a Log Collector for upgrade and no longer want to upgrade at this time.
Cause	Delay in upgrade.
Solution	Use the following command string to revert a Log Collector that has been prepared for upgrade back to resume normal operation. `# /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --revert`

NW Server

These logs are posted to `/var/netwitness/uax/logs/sa.log` on the NW Server Host.

Problem	After upgrade, you notice that Audit logs are not getting forwarded to the configured Global Audit Setup; or, The following message seen in the `sa.log`. `Syslog Configuration migration failed. Restart jetty service to fix this issue`
Cause	NW Server Global Audit setup migration failed to migrate from 10.6.6.x to 11.3.0.0.
Solution	1. SSH to the NW Server. 2. Submit the following command. `orchestration-cli-client --update-admin-node`

Orchestration

The orchestration server logs are posted to `/var/log/netwitness/orchestration-server/orchestration-server.log` on the NW Server Host.

Problem	1. Tried to upgrade a non-NW Server host and it failed. 2. Retried the upgrade for this host and it failed again. You will see the following message in the `orchestration-server.log`. `"'file' _virtual_ returned False: cannot import name HASHES""`
Cause	Salt minion may have been upgraded and never restarted on failed non-NW Server host

Solution	1. SSH to the non-NW Server host that failed to upgrade.
	2. Submit the following commands.
	`systemctl unmask salt-minion`
	`systemctl restart salt-minion`
	3. Retry the upgrade of the non-NW Server host.

Reporting Engine Service

Reporting Engine Update logs are posted to to/var/log/re_install.log file on the host running the Reporting Engine service.

Error Message	<timestamp> : Available free space in /var/netwitness/re-server/rsa/soc/reporting-engine [><existing-GB] is less than the required space [<required-GB>]
Cause	Update of the Reporting Engine failed because you do not have enough disk space.
Solution	Free up the disk space to accommodate the required space shown in the log message. See the "Add Additional Space for Large Reports" topic in the *Reporting Engine Configuration Guide* for instructions on how to free up disk space.

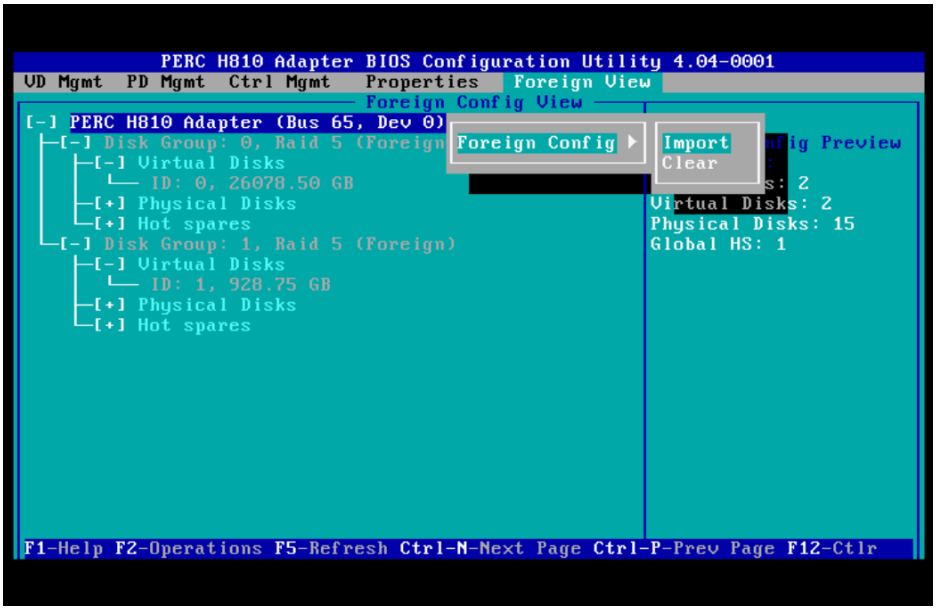
NetWitness UEBA

Problem	The User Interface is not accessible.
Cause	You have more than one NetWitness UEBA service existing in your NetWitness deployment and you can only have NetWitness UEBA service in your deployment.

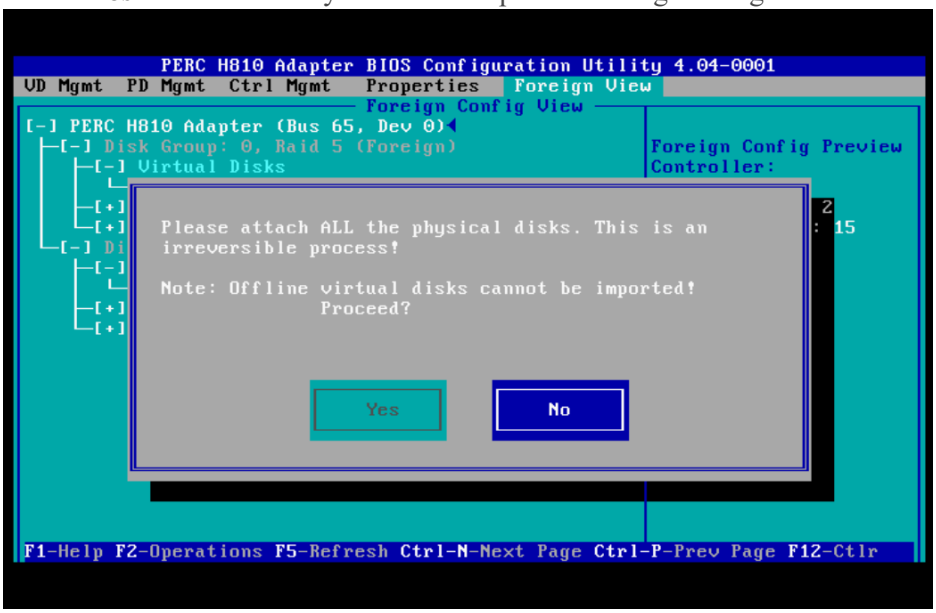
Solution	Complete the following steps to remove the extra NetWitness UEBA service.
	1. SSH to NW Server and run the following commands to query the list of installed NetWitness UEBA services.
	`# orchestration-cli-client --list-services|grep presidio-airflow`
	`... Service: ID=7e682892-b913-4dee-ac84-ca2438e522bf, NAME=presidio-airflow, HOST=xxx.xxx.xxx.xxx:null, TLS=true`
	`... Service: ID=3ba35fbe-7220-4e26-a2ad-9e14ab5e9e15, NAME=presidio-airflow, HOST=xxx.xxx.xxx.xxx:null, TLS=true`
	2. From the list of services, determine which instance of the `presidio-airflow` service should be removed (by looking at the host addresses).
	3. Run the following command to remove the extra service from Orchestration (use the matching service ID from the list of services):
	`# orchestration-cli-client --remove-service --id <ID-for-presidio-airflow-form-previous-output>`
	4. Run the following command to update node 0 to restore NGINX:
	`# orchestration-cli-client --update-admin-node`
	5. Log in to NetWitness Platform, go to **ADMIN** > **Hosts**, and remove the extra NetWitness UEBA host.

Section 2 - Hardware-Related Troubleshooting Information

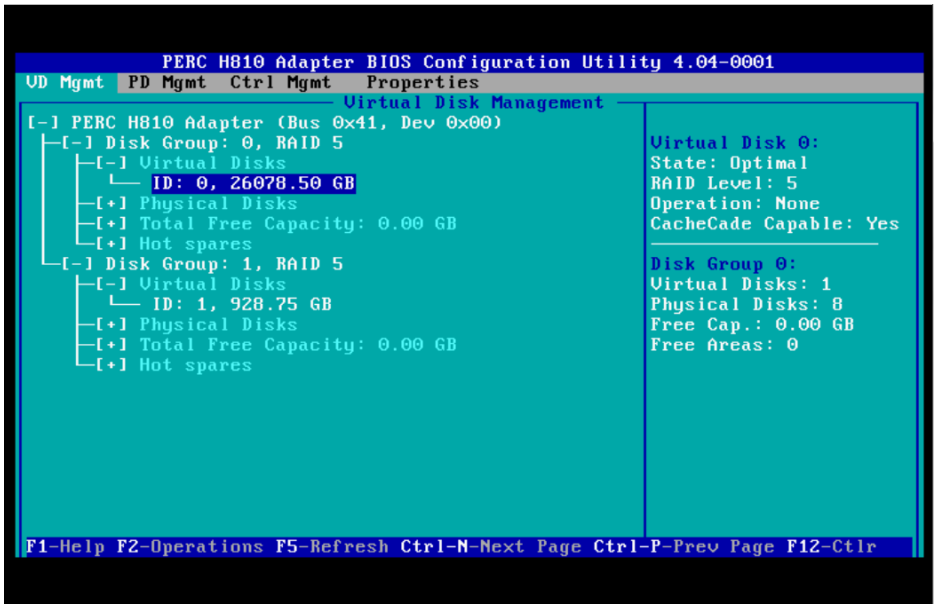
Error Message	When you restart a Series 4 Appliance with external storage, the following messages are displayed. Foreign configuration(s) found on adapter Press any key to continue or 'C' to load the configuration utility, or 'F' to import foreign configuration(s) and continue. All of the disks from your previous configuration are gone. If this is an unexpected message, then please power off your system and check your cables to ensure all disks are present. Press any key to continue, or 'C' to load the configuration utility. Entering the configuration utility in this state will result in drive configuration changes. Press 'Y' to continue loading the configuration utility or please power off your system and check your cables to ensure all disks are present and reboot.
Cause	If you upgrade a Series 4 Appliance host with an external storage (for example, a DAC) to 11.2 and try to restart the appliance, the system may recognize it as having a foreign configuration.
Solution	1. Press the **F** key and restart the appliance. If this successfully imports the configuration and restarts the appliance, you are finished. If it does not work, go to step 3. 2. Press **C** to start the Configuration utility. a. Select the **PERC H8x0 Adapter**.  b. Highlight the top row [for example, **PERC H810 Adapter (Bus 65, Dev 0)**]. c. Select **Foreign View** from the menu bar. d. Press **F2** to display the **Foreign Config** drop down menu and select **Import**.



e. Select **Yes** to confirm that you want to import the foreign config.

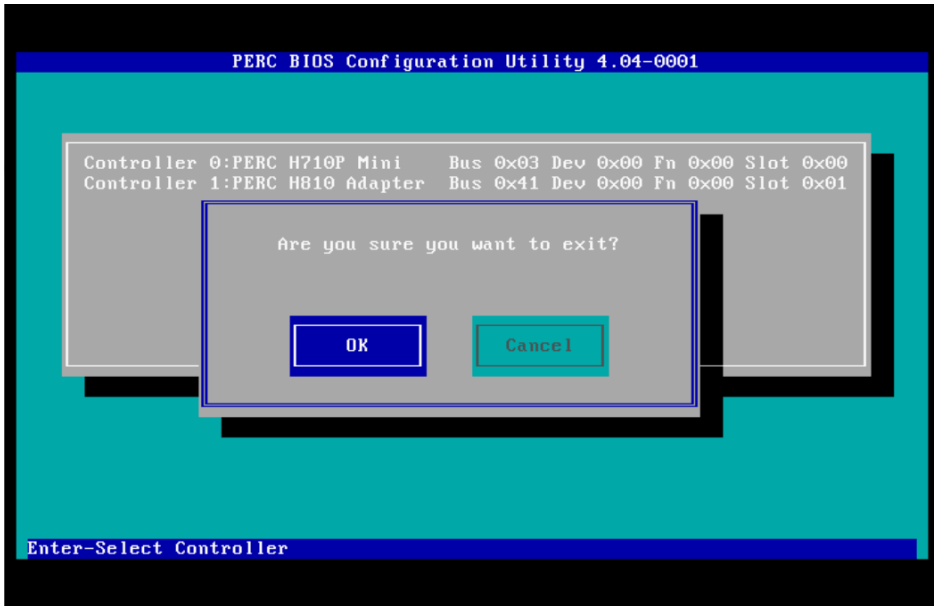


f. Verify that there are no more foreign configs present on the system.



g. Press the **Esc** key to exit.

h. Select **Yes** to confirm that you want to exit.



3. Press **Ctrl-Alt-Delete** to restart (reboot) the appliance.

Caution: If the foreign config fails, Contact Customer Support (https://community.rsa.com/docs/DOC-1294).

Problem	The `mtu.conf` and `pf_ring` files for the 10G Decoder were not restored from the `./etc/init/pfring_bkup` directory after upgrade.
Cause	If you use the 10G Decoder hardware driver and you customized the `/etc/init.d/pf_ring` script to use MTU from the `/etc/pf_ring/mtu.conf` file, the `mtu.conf` and `pf_ring` files from the `./etc/init/pfring_bkup` directory are not restored after upgrade.
Solution	Complete the following steps to restore the files. 1. Restore the `pf_ring` file to `/etc/init.d/` directory in 11.2. `/etc/init.d/pf_ring` 2. Restore the `mtu.conf` file to `/etc/pf_ring/` directory in 11.2. `/etc/pf_ring/mtu.conf`

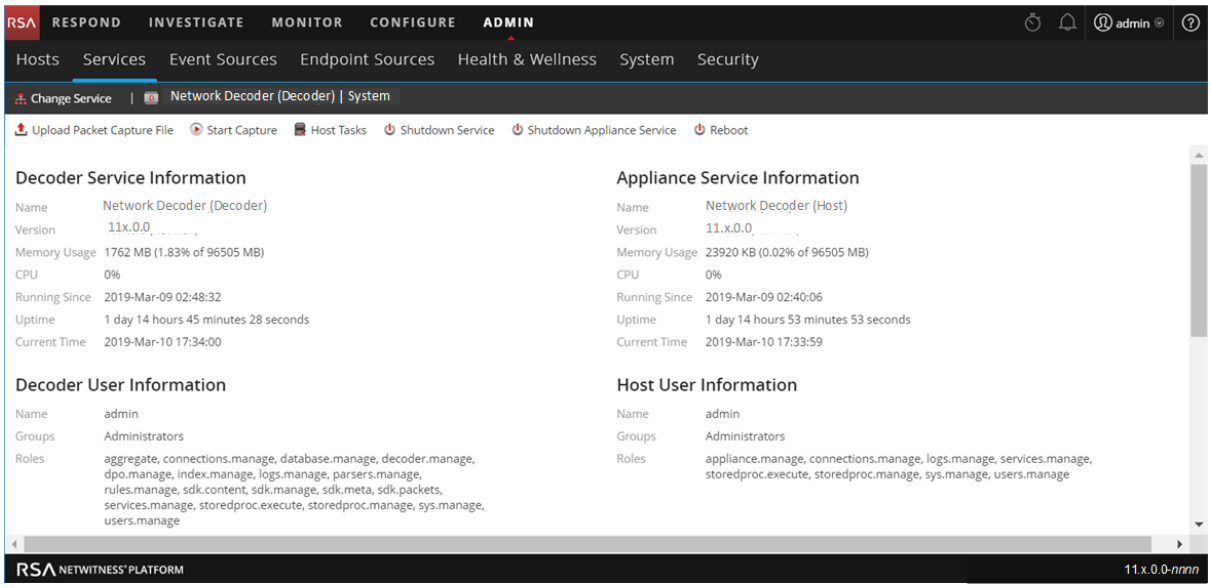
Appendix B. Stopping and Restarting Data Capture and Aggregation

RSA recommends that you stop network and log capture and aggregation before upgrading a Decoder, Concentrator, and Broker host to 11.3.0.0. If you do this, you must restart network and log capture and aggregation after updating these hosts.

Stop Data Capture and Aggregation

Stop Network Capture

1. Log in to NetWitness Platform and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Decoder** service.



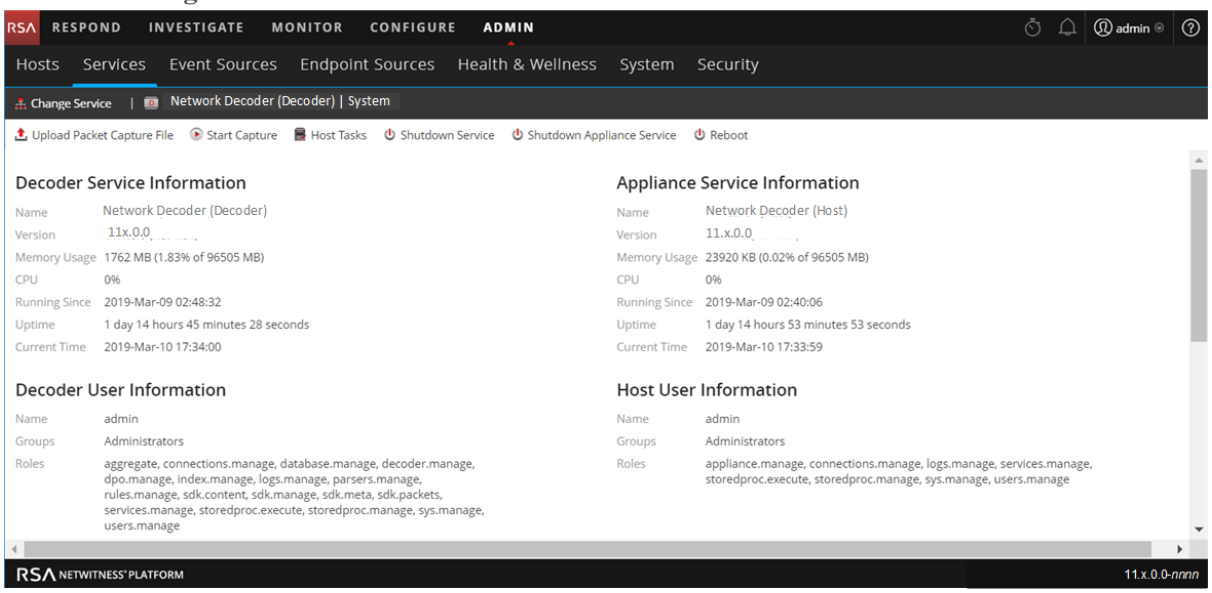
3. Under (actions), select **View** > **System**.
4. In the toolbar, click

.

Stop Log Capture

1. Log in to NetWitness Platform and go to **ADMIN** > **Services**.
   The Services view is displayed.

2. Select each **Log Decoder** service.



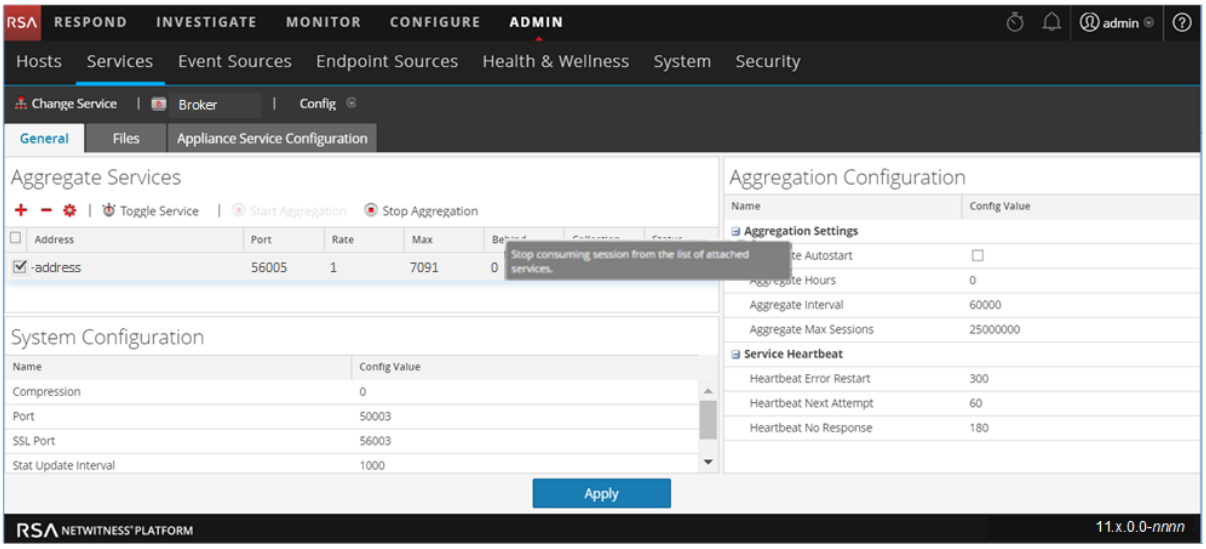
3. Under (actions), select **View** > **System**.

4. In the toolbar, click

.

Stop Aggregation

1. Log in to NetWitness Platform and go to **ADMIN** > **Services**.
2. Select the **Broker** service.
3. Under (actions), select **View** > **Config**.
4. The **General** tab is displayed.



5. Under **Aggregated Services** click 
.

Start Data Capture and Aggregation

Restart network and log capture and aggregation after updating to 11.3.0.0.

Start Network Capture

1. Log in to **NetWitness Platform** and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Decoder** service.
3. Under (actions), select **View** > **System**.
4. In the toolbar, click .

Start Log Capture

1. Log in to **NetWitness Platform** and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Log Decoder** service.
3. Under (actions), select **View** > **System**.
4. In the toolbar, click .

Start Aggregation

1. Log in to **NetWitness Platform** and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. For each Concentrator and Broker service.
   a. Select the service.
   b. Under (actions), select **View** > **Config**.
   c. In the toolbar, click .

Appendix C. Using iDRAC with the DVD ISO Image

Many customers have remote sites with limited physical access and limited bandwidth from the administrator's desktop. If this the case, you may want to use iDRAC with the ISO Image shared out from an NFS share that is local to the devices being upgraded or installed. This also gives you the ability to use an existing NetWitness device as the sharing host.

For example:

- You have a Concentrator and Decoder at a site in a remote geographic location.
- The bandwidth is relatively low to that site from the administrator's site.
- Shipping a USB stick and arranging to have person to go plug it into the boxes while you upgrade is not practical.

In this situation, you can:

1. Install the nfs-utils RPM.
2. Configure the NFS share.
3. Configure iDRAC to connect to that share.
   Make sure that you update your iDRAC firmware supported Windows and Linux operating systems. Download and run the Dell Update Packages for supported Windows and Linux operating systems from the Dell Support website at http://www.support.dell.com. For more information, see the Dell Update Package User's Guide available on the Dell Support website at http://topics-cdn.dell.com/pdf/dell-update-packages-v17.10.00_User's%20Guide_en-us.pdf.
4. Boot to the virtual media that contains the ISO file and continue with the upgrade.

Configure NFS Server - NFS Server config File

1. Install NFS and its common utilities using yum.
   ```
   yum install nfs-utils
   ```
2. Configure the NFS service to run at boot.
   ```
   chkconfig nfs on
   ```
3. Configure the rpcbind service to run at boot.
   This service is required by NFS and must be running before NFS can be started.
   ```
   chkconfig rpcbind on
   ```
4. Start the rpcbind service.
   ```
   service rpcbind start
   ```
5. Start the NFS service.
   ```
   service nfs start
   ```
6. Create a directory for our first export.
   ```
   mkdir /exports/files
   ```
7. Open the NFS exports file into a text editor.
   ```
   vi /etc/exports
   ```

8. To export the directory to everyone with read-only access, add the following line.
   `/exports/files *(ro)`
9. Save your changes and exit the editor.
   `:wq!`
10. Export the directory defined above.
    `exportfs -a`
11. Disable firewall rules while performing upgrades.
    `service iptables stop`
12. Copy install media that contains the ISO file to `/exports/files` directory.

Boot iDRAC to NFS Configuration

Note: You must verify that the iDRAC firmware is at least 1.57.57 for Series 4 (R620).

1. Log in to the iDRAC interface.
2. Attach media using Remote File Share.
   `<server ip>:/export/files/11.3.0.0.iso`
   For example: `10.10.10.10:/exports/files/rsa-11.3.0.0.1948.el7-usb.iso`
3. Click **Connect**.
4. Launch **Console**.
5. From the **next boot** menu, select **Virtual DVD/CD**.
6. Reboot the device.

Appendix D. Create External Repository

Complete the following procedure to set up an external repository (Repo).

Note: 1.) You need an unzip utility installed on the host to complete this procedure. 2.) You must know how to create a web server before you complete the following procedure.

1. Log in to the web server host.
2. Create a directory to host the NW repository (`netwitness-11.3.0.0.zip`), for example `ziprepo` under `web-root` of the web server. For example, if `/var/netwitness` is the `web-root`, submit the following command string.
   `mkdir -p /var/netwitness/<your-zip-file-repo>`
3. Create the 11.3.0.0 directory under `/var/netwitness/<your-zip-file-repo>`.
   `mkdir -p /var/netwitness/<your-zip-file-repo>/11.3.0.0`
4. Create the `OS` and `RSA` directories under `/var/netwitness/<your-zip-file-repo>/11.3.0.0`.
   `mkdir -p /var/netwitness/<your-zip-file-repo>/11.3.0.0/OS`
   `mkdir -p /var/netwitness/<your-zip-file-repo>/11.3.0.0/RSA`
5. Unzip the `netwitness-11.3.0.0.zip` file into the `/var/netwitness/<your-zip-file-repo>/11.3.0.0` directory.
   `unzip netwitness-11.3.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.3.0.0`
   Unzipping `netwitness-11.3.0.0.zip` results in two zip files (`OS-11.3.0.0.zip` and `RSA-11.3.0.0.zip`) and some other files.
6. Unzip the:
   a. `OS-11.3.0.0.zip` into the `/var/netwitness/<your-zip-file-repo>/11.3.0.0/OS` directory.
      `unzip /var/netwitness/<your-zip-file-repo>/11.3.0.0/OS-11.3.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.3.0.0/OS`
      The following example illustrates how the Operating System (OS) file structure will appear after

you unzip the file.

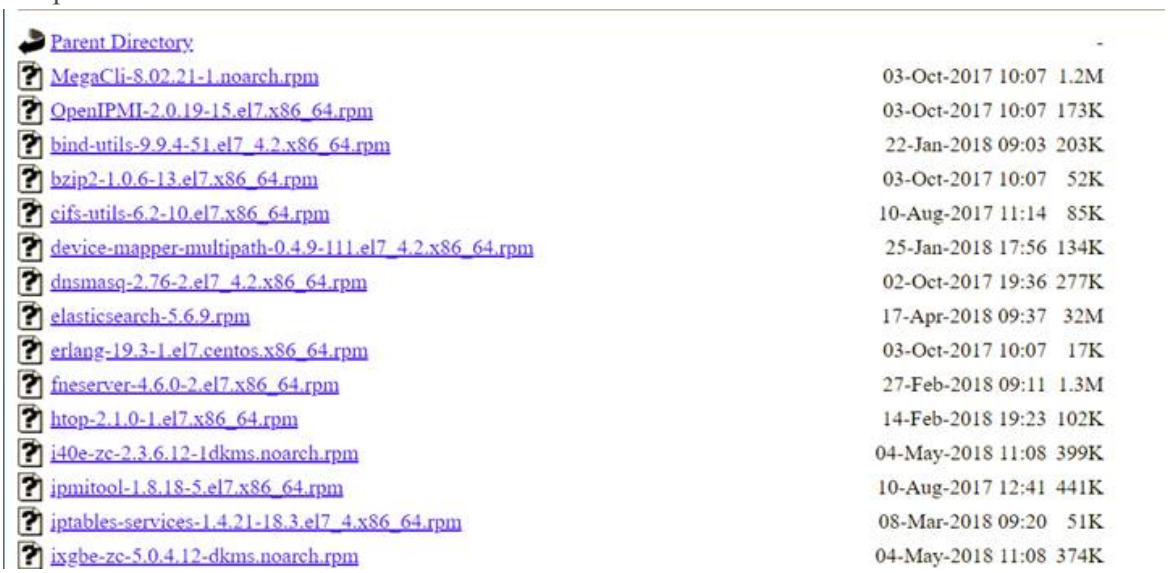
b. `RSA-11.3.0.0.zip` into the `/var/netwitness/<your-zip-file-repo>/11.3.0.0/RSA` directory.
`unzip /var/netwitness/<your-zip-file-repo>/11.3.0.0/RSA-11.3.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.3.0.0/RSA`
The following example illustrates how the RSA version update file structure will appear after you unzip the file.



The external URL for the repo is `http://<web server IP address>/<your-zip-file-repo>`.

7. Use the `http://<web server IP address>/<your-zip-file-repo>` in response to **Enter the base URL of the external update repositories** prompt from NW 11.3.0.0 Setup program (`nwsetup-tui`) prompt.

Introduction

RSA NetWitness® UEBA standalone installation is designed to support other security tools such as Security Information and Event Management (SIEM). It allows users of a third-party SIEM solutions to leverage RSA NetWitness for UEBA.

RSA NetWitness® UEBA standalone installation includes:

1. NetWitness Admin Server
2. NetWitness Log Hybrid
3. NetWitness UEBA

Note: RSA NetWitness® UEBA standalone installation supports up to 100,000 users on a single running instance. If you have more than 100,000 users, contact RSA Customer Support.

Windows Log Sources

NetWitness UEBA standalone installation natively supports the following Windows log sources:

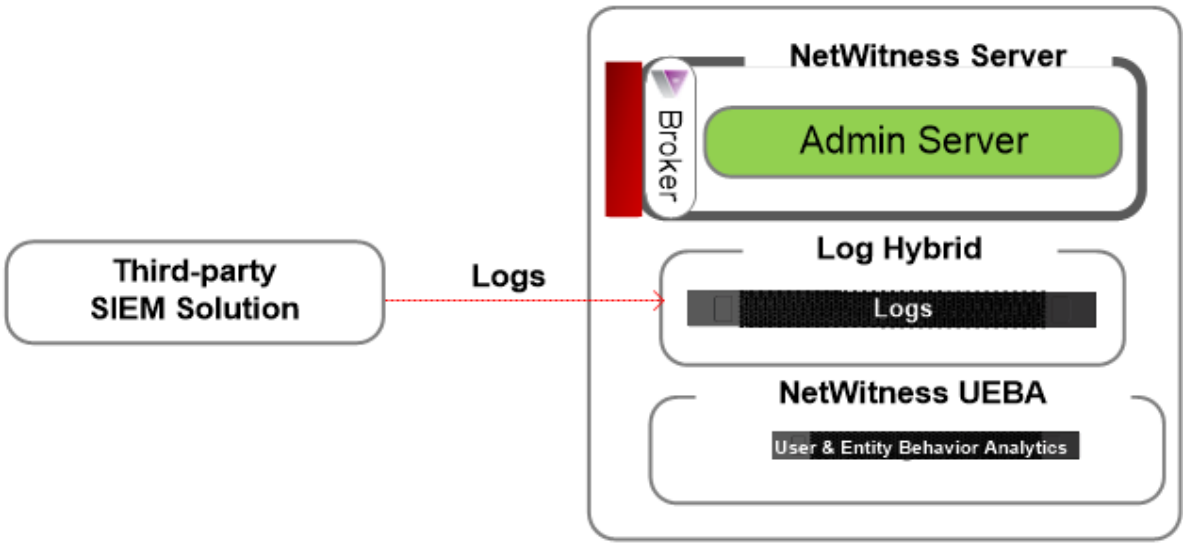
- Windows Active Directory
- Windows Logon and Authentication Activity
- Windows File Servers

For more information, see the "NetWitness UEBA Use Cases for Windows Logs" topic in the *RSA NetWitness UEBA User Guide*.

RSA NetWitness UEBA Standalone Installation

This section contains a high-level UEBA standalone installation diagram and a list of NetWitness UEBA ports.

The following diagram illustrates the NetWitness UEBA standalone installation.



Note:

- UEBA connects to the Broker or Log Hybrid host.
- To configure the Log Hybrid for logs from a third-party SIEM, contact your RSA Account Manager.

UEBA Host and Service Ports

Source Host	Destination Host	Destination Ports	Comments
UEBA Server	NW Server	TCP 443	RSA Update Repository
UEBA Server	NW Server	TCP 56003 (SSL), 50003 (Non-SSL), 50103 (REST)	Broker Application Ports
UEBA Server	NW Server	TCP 56005 (SSL), 50005 (Non-SSL), 50105 (REST)	Log Hybrid, Concentrator Application Ports
Admin Workstation	UEBA Server	443	UEBA Monitoring
Admin Workstation	UEBA Server	22	SSH

System Requirements

You can run the RSA NetWitness® UEBA standalone installation as follows:

- RSA Physical Hosts (software running on hardware supplied by RSA)
  - Install physical hosts and connect to the network as described in the RSA NetWitness® Platform Hardware Setup Guides and the *RSA NetWitness® Platform Physical Host Installation Guide*.
  - Set up licensing for NetWitness Platform as described in the *RSA NetWitness® Platform Licensing Guide*.
- On-Premises (On-Prem) Virtual Hosts (Software Only provided by RSA)

Physical Host Hardware Specifications

You must install the NetWitness UEBA host on the S5 (Dell R630) or S6 (Dell R640) hardware.

SERIES 5 (DELL R630) SPECIFICATIONS

Specification	Capacity
Model	Dell PowerEdge R630xl
Processor Type	Intel Xeon E5 -2680v3
Processor Speed Cache Number of Cores Number of Processors Number of Threads	2.5 GHz 30MB 12 2 24
Total Memory	256GB
Internal Disk Controller	Dell PERC H730
External Disk Controller	Dell PERC H830
SAN Connectivity (HBA) - Optional	N/A
Remote Management Card	iDRAC8 Enterprise
Drives	Total - 6 Drives 2 x 1TB, 2.5" HDD 4 x 2TB, 2.5" HDD
Chassis	1U
Weight	18.4 kg (40.5 lbs)

Specification	Capacity
NIC Card*	On Board 2 x 10 Gb Copper 2 x 10 Gb & 2 x 1Gb Copper (Other options are available)
Dimensions	H: 4.28 cm (1.68 in.) x W: 48.23 cm (18.98 in.) x D: 75.51 cm (29.72 in.)
Power	1100W Redundant
BTU/hr	4100 BTU/hr (max)
Amps (Spec)	1100W / 220VAC = 5A
Actual Amp Draw (Post Startup)	2.1 Amps
Events Per Second (EPS)	100K EPS
Throughput	N/A

* NIC Card options are available for swap with on-board daughter card or add on.

Virtual Host Specifications

Following is the recommended system requirements for a UEBA virtual host.

CPU	Memory	Read IOPS	Write IOPS
16 or 2.4GHz	64 GB	500	500

Note: RSA recommends that you only deploy UEBA on a virtual host if your log collection volume is low. If you have a moderate to high log collection volume, RSA recommends that you deploy UEBA on the physical host.

Installation Media

Installation media are in the form of OVA packages, which are available for download and installation from Download Central (https://download.rsasecurity.com). As part of your order fulfillment, RSA gives you access to the OVA.

Installation Tasks

This topic contains the tasks you must complete to install NetWitness UEBA standalone installation.

Note: Download or make sure you have access to the *Physical Host Installation Guide* for Version 11.3 before beginning the tasks. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

For Physical Hosts:

You must complete the following tasks in the order shown below.

Task 1. Install 11.3 on the NetWitness Server Host

Task 2. Install 11.3 Log Hybrid Host

Task 3. Install and Configure RSA NetWitness® UEBA

Task 1. Install 11.3 on the NetWitness Server Host

For the NetWitness Server (NW Server), this task:

- Creates a base image.
- Sets up the 11.3 NW Server host.

For more information on how to install the NetWitness Server host, see "Install 11.3 on the NetWitness Server (NW Server) Host" section in the *Physical Host Installation Guide for Version 11.3*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 2. Install 11.3 Log Hybrid Host

For a non-NW Server host, this task:

- Creates a base image.
- Sets up the 11.3 non-NW Server host or Log Hybrid.

For more information on how to install the Log Hybrid host, see "Task 2 - Install 11.3 on Other Component Hosts" section in the *Physical Host Installation Guide for Version 11.3*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 3. Install and Configure RSA NetWitness® UEBA

To set up NetWitness UEBA, you must install and configure the NetWitness UEBA service.

The following procedure shows you how to install the NetWitness UEBA service on a NetWitness UEBA Host Type and configure the service.

1. Complete steps 1 - 14 under "Task 2 - Install 11.3 on Other Component Hosts" in "Installation Tasks" of the *NetWitness Platform Physical Host Installation Guide for Version 11.3*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Note: The Kibana and Airflow webserver User Interface password is the same as the deploy_admin password. Make sure that you record this password and store it in a safe location.

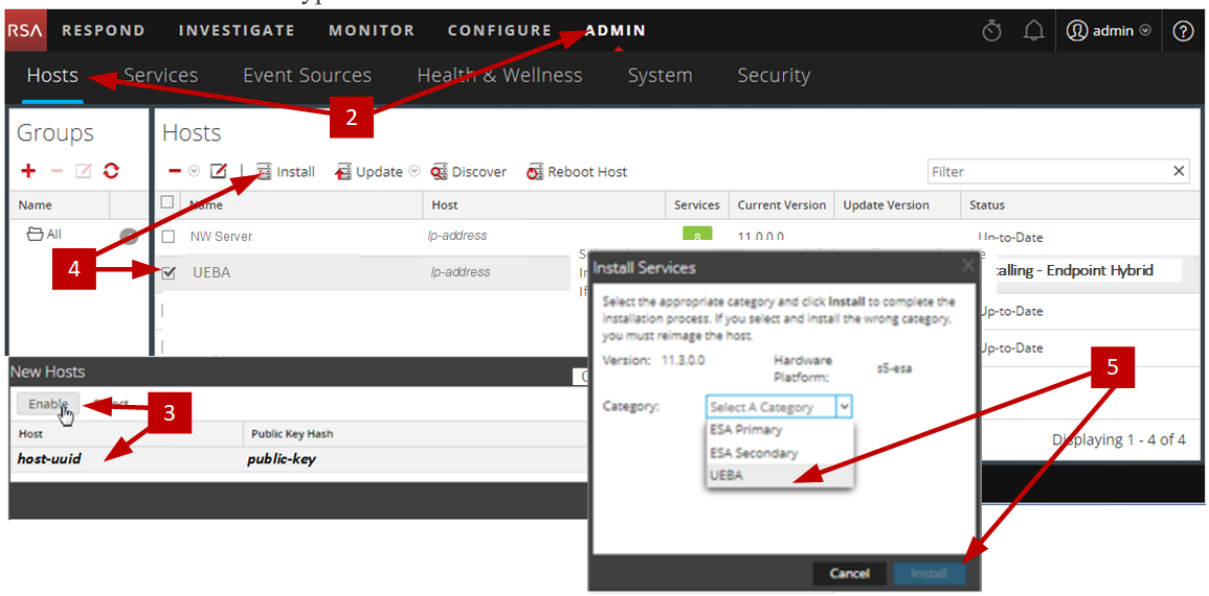
2. Log in to NetWitness Platform and go to **ADMIN** > **Hosts**.
   The New Hosts dialog is displayed with the Hosts view grayed out in the background.

   Note: If the New Hosts dialog is not displayed, click **Discover** in the **Hosts** view toolbar.

3. Select the host in the **New Hosts** dialog and click **Enable**.
   The New Hosts dialog closes and the host is displayed in the Hosts view.

4. Select that host in the **Hosts** view (for example, **UEBA**) and click Install.
   The Install Services dialog is displayed.

5. Select the **UEBA** Host Type and click **Install**.



6. Make sure that the UEBA service is running.

7. Complete licensing requirements for NetWitness UEBA.
   See the *NetWitness Platform 11.3 Licensing Management Guide* for more information. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Note: NetWitness Platform supports the User and Entity Behavior Analytics License (UEBA). This license is used based on the number of users. The Out-of-the-Box Trial License is a 90-day trial license. In case of UEBA licenses, the 90-day trial period begins from the time the UEBA service deployed on the NetWitness Platform product.

8. Configure NetWitness UEBA.
   You need to configure a data source (Broker or Concentrator), historical data collection start date, and data schemas.

IMPORTANT: If your deployment has multiple Concentrators, RSA recommends that you assign the Broker at the top of your deployment hierarchy for the NetWitness UEBA data source.

a. Determine the earliest date in the NWDB of the data schema you plan to choose (`AUTHENTICATION`, `FILE`, `ACTIVE_DIRECTORY`, `PROCESS`, `REGISTRY` or any combination of these schemas) to specify in `startTime` in step c. If you plan to specify multiple schemas, use the earliest date among all the schemas. If you are not sure which data schema to choose, you can specify all five data schemas (that is, `AUTHENTICATION`, `FILE`, `ACTIVE_DIRECTORY`, `PROCESS` and `REGISTRY`) to have UEBA adjust the models it can support based on the Windows logs available. You can use one of the following methods to determine the data source date.

- Use the Data Retention date (that is, if the Data Retention duration is 48 hours, `startTime` = <48 hours earlier than the current time>).
- Search the NWDB for the earliest date.

b. Create a user account for the data source (Broker or Concentrator) to authenticate to the data source.

i. Log into NetWitness Platform.

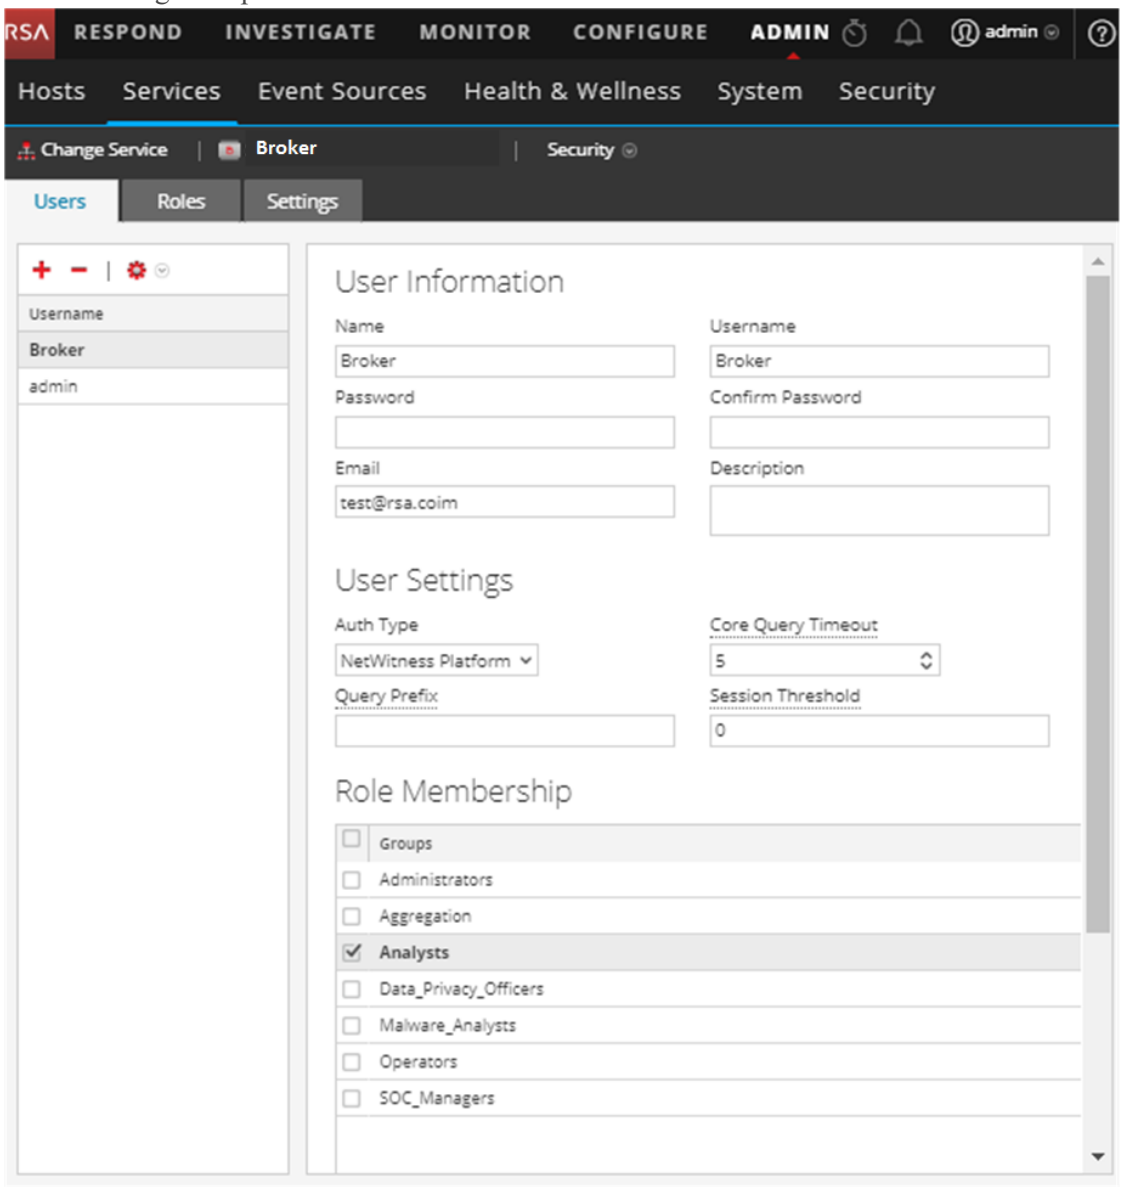
ii. Go to **Admin** > **Services**.

iii. Locate the data source service (Broker or Concentrator).

Select that service, and select (Actions) > **View** > **Security**.

iv. Create a new user and assign the “Analysts” role to that user.

The following example shows a user account created for a Broker.



c. SSH to the NetWitness UEBA server host.

d. Submit the following commands.

```
/opt/rsa/saTools/bin/ueba-server-config -u <user> -p <password> -h
<host> -o <type> -t <startTime> -s <schemas> -v -e <argument>
```

Where:

Argument	Variable	Description
-u	<user>	User name of the credentials for the Broker or Concentrator instance that you are using as a data source.
-p	<password>	Password of the credentials for the Broker or Concentrator instance that you are using as a data source. The following special characters are supported in a password. !"#$%&()*+,-:;<=>?@[\]^_`\{\|} If you want to include a special character or special characters, you must delimit the password with an apostrophe sign, for example: sh /opt/rsa/saTools/bin/ueba-server-config -u brokeruser -p '!"UHfz?@ExMn#$' -h 10.64.153.104 -t 2018-08-01T00:00:00Z -s 'AUTHENTICATION FILE ACTIVE_DIRECTORY' -o broker -v
-h	<host>	IP address of the Broker or Concentrator used as the data source. Currently, only one data source is supported.
-o	<type>	Data source host type (broker or concentrator).
-t	<startTime>	Historical start time as of which you start collecting data from the data source in YYYY-MM-DDTHH-MM-SSZ format (for example, 2018-08-15T00:00:00Z). **Note:** The script interprets the time you enter as UTC (Coordinated Universal Time) and it does not adjust the time to your local time zone.

Argument	Variable	Description
-s	<schemas>	Array of data schemas. If you want to specify multiple schemas, use a space to separate each schema (for example, 'AUTHENTICATION FILE ACTIVE_DIRECTORY PROCESS REGISTRY'). **Note:** If you specify all five data schemas (that is, AUTHENTICATION, FILE, ACTIVE_DIRECTORY PROCESS, and REGISTRY), UEBA adjusts the models it can support based on the Windows logs available.
-v	NA	verbose mode.
-e	<argument>	Boolean Argument. This enables the UEBA indicator forwarder to Respond. **Note:** If the Respond server is configured in NetWitness platform, you can transfer the NetWiness UEBA indicators to the respond server and to the correlation server to create an Incidents.

9. Complete NetWitness UEBA configuration according to the needs of your organization. See the *RSA NetWitness UEBA User Guide* for more information. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Note: If NetWitness Endpoint Server is configured, you can view the alerts associated with the Process and Registry data schemas.

For Virtual Hosts:

You must complete the following tasks in the order shown below.

Task 1. Install 11.3 on the NetWitness Server Host

Task 2. Install 11.3 Log Hybrid Host

Task 3. Install and Configure RSA NetWitness® UEBA

Task 1. Install 11.3 on the NetWitness Server Host

On the host you have deployed for the NetWitness Server (NW Server), this task installs:

- The 11.3.0.0 NW Server environmental platform.
- The NW Admin Server.
- A repository with the RPM files required to install the other functional components or services.

For more information on how to install the NetWitness Server host, see "Task 1- Install 11.3.0.0 on the NW Server Host" section in the *Virtual Host Installation Guide for Version 11.3*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 2. Install 11.3 Log Hybrid Host

Complete the following tasks on a non-NW Server host:

- Install the 11.3.0.0 environmental platform.
- Apply the 11.3.0.0 RPM files to the service from the NW Server Update Repository.

Note: You must install the Log Hybrid host.

For more information on how to install the non-NetWitness Server host, see "Task 3 - Install 11.3 for on Other Component Hosts" section in the *Virtual Host Installation Guide for Version 11.3*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents..

Task 3. Install and Configure RSA NetWitness® UEBA

Prerequisite: Increase Memory for Virtual Deployment

Virtual Machines are deployed with approximately 104 GB in the storage mount by default. To install NetWitness UEBA, you must increase the storage space in your virtual environment to at least 800 GB.

To set up NetWitness UEBA, you must install and configure the NetWitness UEBA service.

The following procedure shows you how to install the NetWitness UEBA service on a NetWitness UEBA Host Type and configure the service.

1. Complete steps 1 - 15 for Virtual Hosts under "Task 3 - Install 11.3 on Other Component Hosts" in "Installation Tasks" of the *NetWitness Platform Physical Host Installation Guide for Version 11.3*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

   Note: The Kibana and Airflow webserver User Interface password is the same as the deploy admin password. Make sure that you record this password and store it in a safe location.

2. Complete steps 2 - 9 under Task 3. Install and Configure RSA NetWitness® UEBA.

Post Installation Task

This topic contains the task you must complete after you install NetWitness UEBA standalone 11.3.

Set up Permission

You need to assign the UEBA_Analysts and Analysts roles to the UEBA users. For more information, see *System Security and User Management Guide*.

After this configuration, UEBA users can access the **Investigate** > **Users** view.

Appendix: NetWitness UEBA Standalone Installation Windows Audit Policy

In order to achieve the maximum benefit from RSA NetWitness UEBA, RSA recommends that you implement the Windows audit policies described here.

For a base set of policies to audit, refer to the "Windows Server 2016, Windows Server 2012 R2, Windows Server 2012, Windows Server 2008 R2, and Windows Server 2008 Audit Settings Recommendations" section of this article from Microsoft: Audit Policy Recommendations.

The policies under "Stronger Recommendation" are required, as well as the following policies, to ensure that all of the required Authentication and Active Directory events are audited:

- Audit Detailed File Share
- Audit File Share
- Audit File System

RSA recommends that you enable auditing for both success and failures.

The following Windows events must be audited:

For the Authentication models:

4624	4625	4769	4628

For the AD models:

4670	4717	4720	4722	4723	4724	4725	4726
4727	4728	4729	4730	4731	4732	4733	4734
4735	4737	4738	4739	4740	4741	4742	4743
4754	4755	4756	4757	4758	4764	4767	4794
5136	5376	5377					

For File Access Models:

4660	4663	4670	5145

Troubleshooting

Install Only One Instance of the NetWitness UEBA Server

RSA supports only one instance of the NetWitness UEBA server. If you have added more than one NetWitness UEBA server, follow these steps to remove the extra NetWitness UEBA server.

1. From the Admin server (node 0), run the following commands to query the list of installed NetWitness UEBA services:

   ```
   # orchestration-cli-client --list-services|grep presidio-airflow
   ... Service: ID=7e682892-b913-4dee-ac84-ca2438e522bf, NAME=presidio-
   airflow, HOST=xxx.xxx.xxx.xxx:null, TLS=true
   ... Service: ID=3ba35fbe-7220-4e26-a2ad-9e14ab5e9e15, NAME=presidio-
   airflow, HOST=xxx.xxx.xxx.xxx:null, TLS=true
   ```

2. From the list of services, determine which instance of the `presidio-airflow` service should be removed (by looking at the host addresses).

3. Run the following command to remove the extra service from Orchestration (use the matching service ID from the list of services):

   ```
   # orchestration-cli-client --remove-service --id <ID-for-presidio-airflow-
   form-previous-output>
   ```

4. Run the following command to update node 0 to restore NGINX:

   ```
   # orchestration-cli-client --update-admin-node
   ```

5. Log in to NetWitness Platform, go to **ADMIN** > **Hosts**, and remove the extra NetWitness UEBA host.

Contact Customer Support

Refer to the **Contact RSA Customer Support** page (https://community.rsa.com/docs/DOC-1294) in RSA Link for instructions on how to get help on RSA NetWitness Platform.

Revision History 50

Introduction

RSA NetWitness® Platform 11.3.0.0 provides fixes for all products in the Platform. The components of the Platform are the NetWitness Server (Admin server, Config server, Integration server, Investigate server, Orchestration server, Respond server, Security sever, and Source server), Archiver, Broker, Concentrator, Context Hub, Decoder, Endpoint Log Hybrid, ESA Primary, ESA Secondary, Log Collector, Log Decoder, Malware Analysis, Reporting Engine, UEBA, Warehouse Connector, and Workbench.

Note: The Reporting Engine is installed on the NetWitness Server (NW Server) host, Workbench is installed on the Archiver host, Warehouse Connector can be installed on the Decoder host or Log Decoder host.

The instructions in this guide apply to both physical and virtual hosts (including AWS and Azure Public Cloud) unless stated to the contrary.

Update Path

The following update paths are supported for NetWitness Platform 11.3.0.0:

- 11.0.x to 11.3.0.0
- 11.1.x to 11.3.0.0
- 11.2.x to 11.3.0.0
- 10.6.6.x to 11.3.0.0

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents. See the *RSA NetWitness Platform 10.6.6.x to 11.3 Physical Host Upgrade Guide* and *RSA NetWitness Platform 10.6.6.x to 11.3 Virtual Host Upgrade Guide* for instructions on how to upgrade 10.6.6.x to 11.3.0.0.

Running in Mixed Mode

Running in mixed mode occurs when some services are updated to the latest version and some services are on older versions. See "Running in Mixed Mode" in the *RSA NetWitness Platform Hosts and Services Getting Started Guide* for further information.

Update Considerations for ESA Rule Deployments

Caution: In NetWitness Platform 11.3, the ESA Correlation service contains data source changes that require changes to migrated ESA rule deployments. The 11.3 ESA Correlation service replaces the Event Stream Analysis service in earlier versions.

After you update to 11.3, migrated ESA rule deployments have the following changes.

1. If an ESA rule deployment contains two services before you upgrade to 11.3, the deployment splits into two deployments. You can only have one ESA Correlation service in an ESA rule deployment in version 11.3.
2. If an ESA service has multiple ESA rule deployments before you upgrade to 11.3, they are combined into one deployment in version 11.3.

You can still access your old deployments. For a detailed example, see the *ESA Configuration Guide for RSA NetWitness Platform 11.3*.

Update Preparation Tasks

Complete the following tasks to prepare for the update to NetWitness Platform 11.3.0.0. These tasks are organized by the following categories.

General

Azure Hosts

Endpoint

Event Stream Analysis

Reporting Engine

Respond

Note: Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

General

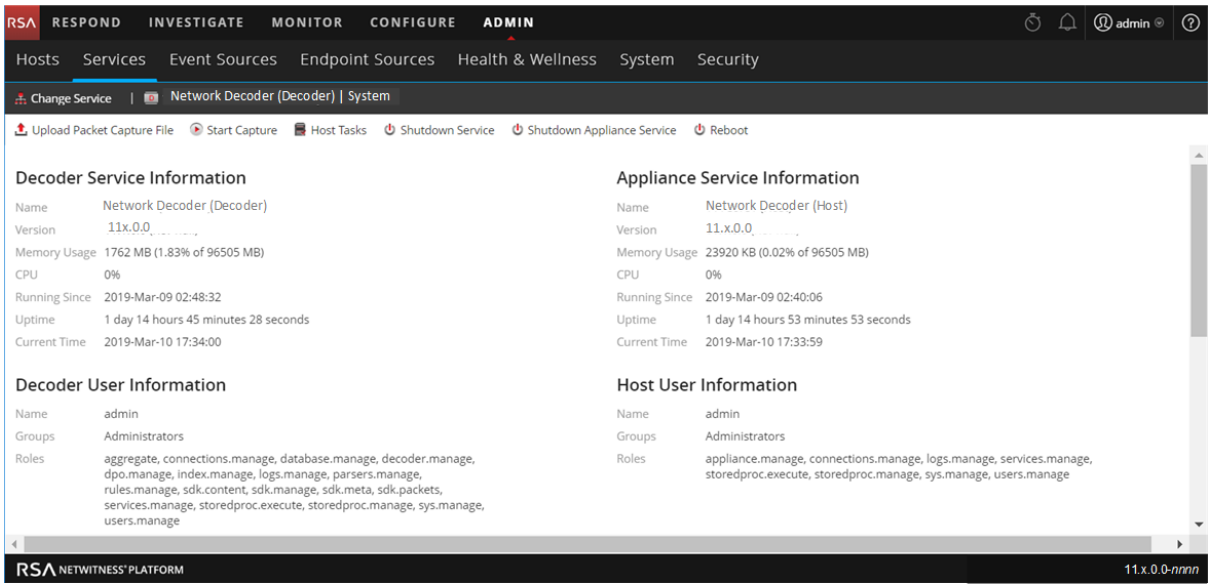
Task 1- Back Up Malware Analysis Configuration File to Another Directory

1. Make a backup of the following file to another, safe directory.
   `/var/lib/netwitness/malware-analytics-server/spectrum/conf/malwareCEFDictionaryConfiguration.xml`
   You need to retrieve your custom parameter values from this backup after you update the Malware Analysis host to 11.3.0.0. The update creates a new configuration file with all the parameters set to the default values.
2. Delete the following file.
   `/var/lib/netwitness/malware-analytics-server/spectrum/conf/malwareCEFDictionaryConfiguration.xml`

Task 2 - Stop Data Capture and Aggregation

Stop Network Capture

1. Log in to NetWitness Platform and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Decoder** service.



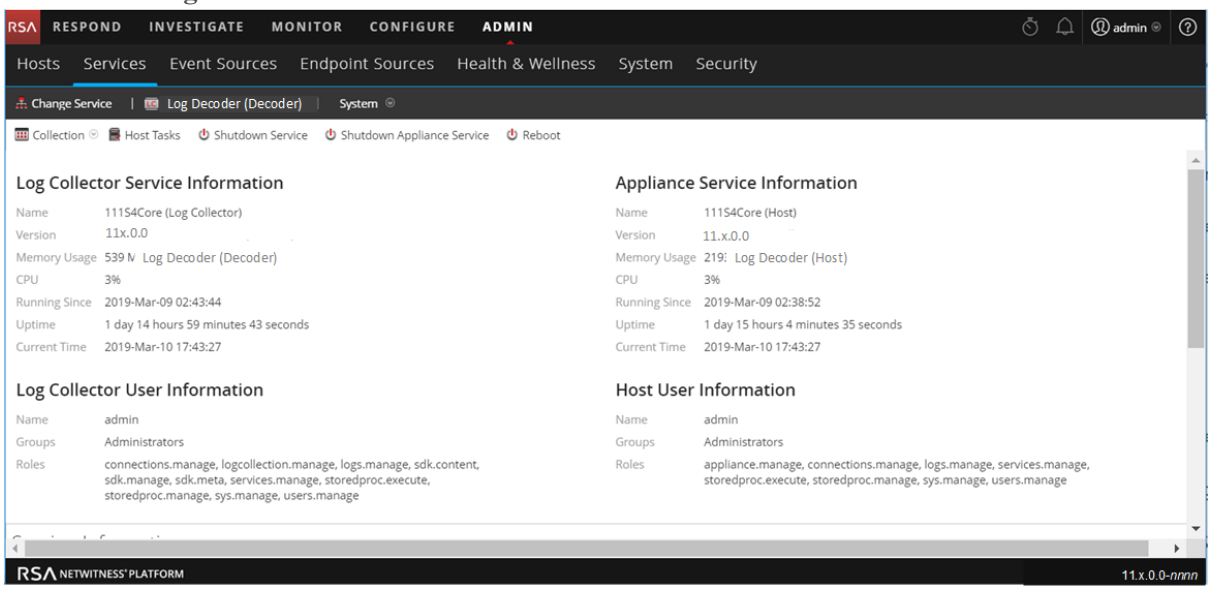
3. Under (actions), select **View** > **System**.
4. In the toolbar, click

.

Stop Log Capture

1. Log in to NetWitness Platform and go to **ADMIN** > **Services**.
   The Services view is displayed.

2. Select each **Log Decoder** service.



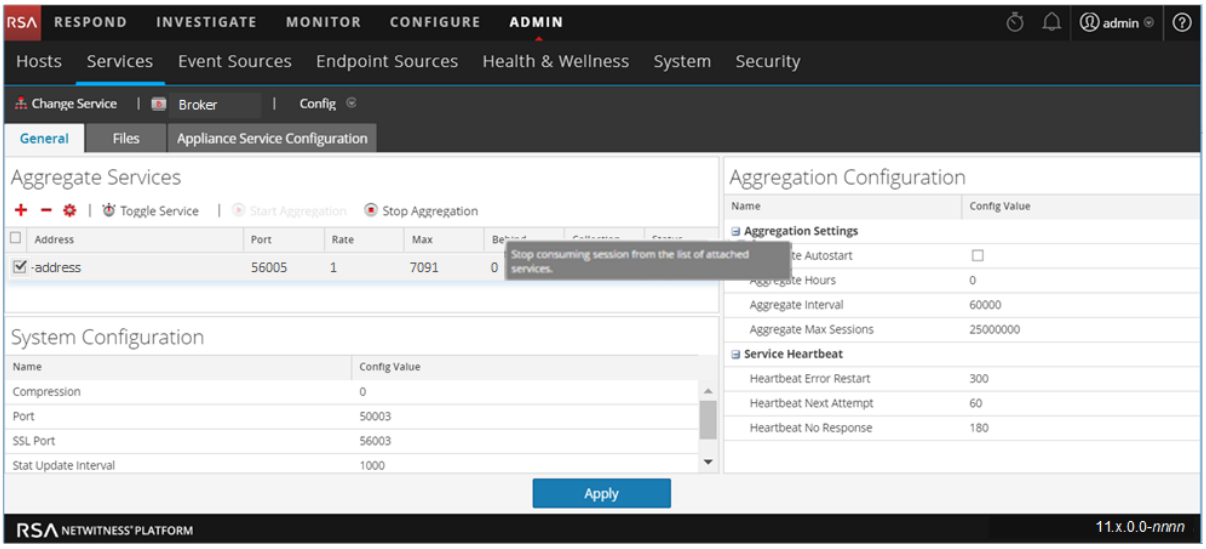
3. Under (actions), select **View** > **System**.

4. In the toolbar, click

.

Stop Aggregation

1. Log in to NetWitness Platform and go to **ADMIN** > **Services**.
2. Select the **Broker** service.
3. Under (actions), select **View** > **Config**.
4. The **General** tab is displayed.



5. Under **Aggregated Services** click 
.

Azure Hosts

Task 3 - (Conditional) Azure Host Update Preparation Requirements

Review your Azure Host deployment for the following three conditions and complete the tasks under these conditions if required.

- If you have an 11.0.0.0 Azure base image on the host (even you updated the host to 11.1.0.x), create a Centos-Base repo.

  Caution: If the `libgudev1-219-30.el7_3.9.x86_64` RPM does not exist, do not complete the following steps.

  1. SSH to the NW Server host.
  2. Run the following command from the NW Server Host `root` directory.
     ```
     yum remove libgudev1-219-30.el7_3.9.x86_64
     ```
  3. Create a Centos-Base repo as described in step 6 in the **CentOS 7.0+** procedure (https://docs.microsoft.com/en-us/azure/virtual-machines/linux/create-upload-centos#centos-70).
  4. Run the following command strings from the NW Server Host `root` directory.
     ```
     yum clean all
     yum install WALinuxAgent
     sudo systemctl enable waagent
     ```
  5. Delete the CentOS-base repo.

- If the update path is 11.0.0.x to 11.3, populate the Repo with additional packages. Contact Customer Support (https://community.rsa.com/docs/DOC-1294) for the `nw-azure-11.1-extras.zip` file).

  1. SSH to the NW Server host.
  2. Go to the `root` directory of the On the NW Server host.
  3. Run the following command strings to extract the Azure zip file.
     ```
     mkdir -p /var/lib/netwitness/common/repo/11.3.0.0/OS/other+
     unzip nw-azure-11.1-extras.zip -d
     /var/lib/netwitness/common/repo/11.3.0.0/OS/other
     ```

- If you use an External Repo to apply updates, update the External Repo with the additional packages.

  1. After you set up the 11.3.0.0 content on the external repo, go to the `<base-directory>11.3.0.0/OS/other` of the external repo.
  2. Run the following command string to extract the Azure zip file from the external repo `11.3.0.0/OS` directory.
     ```
     unzip nw-azure-11.1-extras.zip -d /<base-directory/11.3.0.0/OS/other
     ```
  3. Run the following command from the external repository's `11.3.0.0/OS` directory.
     ```
     createrepo
     ```

Endpoint

Task 4 - Install or Update Endpoint Log Hybrid

Note: In 11.3, Endpoint Hybrid host is deprecated. If you have an existing Endpoint Hybrid, you must install a new version of an Endpoint Log Hybrid.
There is no support to migrate data from Endpoint Hybrid to Endpoint Log Hybrid 11.3.

Depending on the number of agents and the location of the agents, you can choose to install single or multiple Endpoint Log Hybrid. For a consolidated view of all endpoint data from multiple Endpoint Log Hybrid, install the Endpoint Broker. For more information, see *Physical Host Installation Guide*.

Task 5 - Deploy the Endpoint Pack and Endpoint ESA Rules

a. RSA recommends you to deploy the Endpoint Pack from RSA Live, which includes the Endpoint Application Rules, File Category Lua Parser for the UEBA integration and the Endpoint Reports. At a minimum, you must deploy the Endpoint Application rules from RSA Live. During deployment, you must specify Endpoint Log Hybrid Log Decoder service. In case of multiple Endpoint servers, select all the Endpoint Log Hybrid Log Decoder services. For more information, see *Endpoint Configuration guide*.

b. You must deploy the ESA Rules from the Endpoint Rule Bundle. For more information, see "Deploy Endpoint Risk Scoring Rules on ESA" section in the *ESA Configuration Guide*.

Task 6 - (Conditional) Update Endpoint Agents

Note: If you upgrade the Endpoint Log Hybrid to 11.3, you must upgrade all agents to 11.3. If you fail to upgrade all agents to 11.3, you will not be able to use all of the 11.3 functionality and you will encounter issues.

Note: In 11.3, agents can operate either in Insights (free) or Advanced (licensed) mode depending on the policy settings. The default EDR policy enables the agent to operate in an Advanced mode.
If you want to continue to use the Insights agent, before deploying the agent, set the Agent mode to **Insights** in the policy. For more information, see *NetWitness Endpoint Configuration Guide*.

To update the Endpoint Agent from 11.1.x and 11.2.x to 11.3, download the agent packager from NetWitness Platform 11.3, generate the agent installers, and deploy the agents. For more information, see *Endpoint Agent Installation Guide*.

If you want to migrate the Endpoint Agent from 4.4.0.x to 11.3, see *NetWitness Endpoint 4.4.0.x to NetWitness Platform 11.3 Migration Guide*.

Task 7 - (Conditional) Back Up Existing Custom Meta Data Mappings before Applying 11.2-11.3 Update to Endpoint Host

If you are updating from 11.2.x.x, you already performed this task so ignore it.

In 11.2, RSA enhanced the Endpoint meta data mappings to align with the current Unified Data Model (UDM) changes. If you are updating from 11.1.x.x - 11.2.x.x, when you apply the 11.3 update your Endpoint Log Hybrid host, it clears the existing custom mapping to avoid overriding the newly added default meta data mappings. If you want to use the existing custom metadata mapping, RSA recommends that you back up the existing custom mappings before you update to 11.3. To back up:

1. Run the `get-custom` API through nw-shell. The list of custom mappings is displayed.
2. Copy the custom mappings manually to a safe directory.

For more information, see *Endpoint Configuration Guide for RSA NetWitness Platform 11.3*.

Event Stream Analysis (ESA)

Task 8 - (Conditional) Record Any String Array Type Meta Keys on the Event Stream Analysis Service

If you added any string array type meta keys to the Event Stream Analysis service for your ESA correlation rules, record these meta keys so you can verify that they exist after upgrade to 11.3.

To record your 11.x string array type meta keys before the 11.3 upgrade:

1. Log in to NetWitness Platform and go to **ADMIN** > **Services**.
2. Select the Event Stream Analysis service and click (actions) > **View** > **Explore**.
3. In the **Explore** view node list, select **Workflow** > **Source** > **netgenAggregationSource**.
4. In the **ArrayFieldNames** list, make a note of any string array type meta keys added to the Event Stream Analysis service so you can verify that they are on the ESA Correlation service after the upgrade.

Reporting Engine

Task 9 - Configure Reporting Engine for Out-of-the-Box Charts

For Out-of-the-Box charts to run after the update, you must configure the default data source on the Reporting Engine Configuration view before you perform the update. If you do not perform this task, you must manually set up the data source after the update. For more information on Reporting Engine data sources, see the *Reporting Engine Configuration Guide for RSA NetWitness Platform 11.3*.

Respond

Task 10 - (Conditional) Restore Respond Service Custom Keys

If you added custom keys in `var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` for use in the groupBy Clause in 11.0, copy and save the custom keys in a file.

Task 11 - (Conditional) Back Up Customized Respond Service Normalization Scripts

RSA re-factored Respond service normalization scripts are stored in the `/var/lib/netwitness/respond-server/scripts` directory in 11.2 and later versions. You need to back them up in 11.0.x before you update to 11.3.0.0 so you can restore them in 11.3.0.0 as described in the Respond Post Update Tasks.

1. Go to the `/var/lib/netwitness/respond-server/scripts` directory.
2. Back up the following files:
   ```
   data_privacy_map.js
   normalize_alerts.js
   normalize_core_alerts.js
   normalize_ecat_alerts.js
   normalize_ma_alerts.js
   normalize_wtd_alerts.js
   utils.js
   ```
3. (Conditional) If you have any custom logic added in 11.0.x or any previous release, copy and save this logic from the backed up scripts so you can restore it in 11.3.0.0.

Update Tasks

There are two major tasks update NetWitness Platform 11.0.x.x, 11.1.x.x, or 11.2.x.x to 11.3.0.0.

Task I - Apply 11.3 Updates to Each Host Your Deployment

Task II (Optional) - Install a Warm Standby NW Server

For RSA NetWitness Endpoint Customers Only

Endpoint Hybrid is not supported in 11.3 and later release.
If you deployed an Endpoint Hybrid host in 11.1.x.x or 11.2.x.x, you must install an Endpoint Log Hybrid host in 11.3. See:

- *Physical Host Installation Guide for RSA NetWitness Platform 11.3* for instructions on how to install an 11.3 Endpoint Log Hybrid on a physical host.
- *Virtual Host Installation Guide for RSA NetWitness Platform 11.3* for instructions on how to install an 11.3 Endpoint Log Hybrid on a virtual host.

If you deployed an Endpoint Log Hybrid in 11.1.x.x or 11.2.x.x, you can update this host as described in this document.

Task I - Apply 11.3 Updates to Each Host Your Deployment.

There are two methods you can use to apply version updates to a host.

Note: If you plan to use an update repository (repo) for NetWitness Platform 11.3.0.0 that is different from the repo you have set up now for 11.0.x.x - 11.2.x.x, refer to Appendix C. Set Up External Repo for instructions.

- Apply updates from the Host view (Web Access)
- Apply update from the command line (No Web Access)

Apply Updates from the Hosts View (Web Access)

There are two tasks you must complete to apply updates from the Hosts view:

- Task 1. Populate Local Repo or Set Up an External Repo - make sure that you have the latest version updates.
- Task 2. Apply updates from the Hosts View to each host.

Task 1. Populate Local Repo or Set Up an External Repo

When you set up your NW Server in 11.3.0.0, you select the Local Repo or an external repo. The Hosts view retrieves version updates from the repo you selected.

If you selected the Local Repo, you do not need to set it up, but you must make sure that it is populated with the latest version updates. See Appendix B. Populate Local Repo for instructions on how populate it with version update.

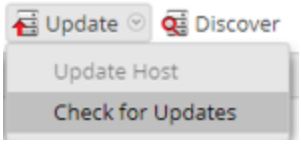
If you selected an External Repo, you must set it up. See Appendix C. Set Up External Repo for instructions on how to set up an external repo.

Task 2. Apply Updates from the Hosts View to Each Host

The Hosts view displays the software version updates available in your Local Update Repository and you choose and apply the updates you want from the Host view.

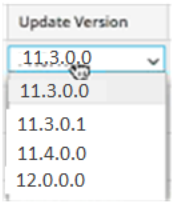
This procedure tells you how to update a host to a new version of NetWitness Platform.

1. Log in to NetWitness Platform.
2. Go to **ADMIN > Hosts**.
3. (Conditional) Check for the latest updates.



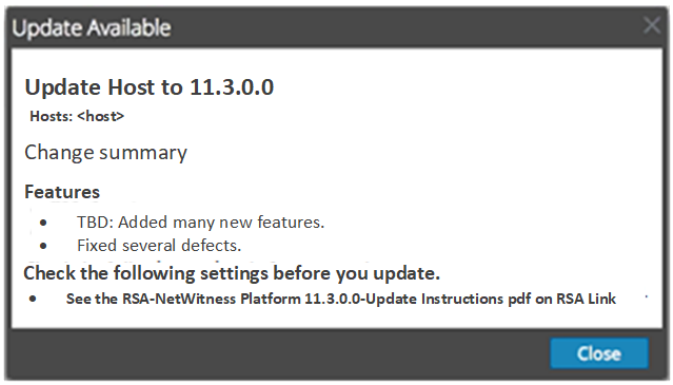
4. Select a host or hosts.
   You must update the NW Server to latest version first. You can update the other hosts in any sequence you prefer, but RSA recommends that you follow the guidelines in "Running in Mixed Mode" in the *RSA NetWitness Platform Hosts and Services Getting Started Guide* for further information.
   Update Available is displayed in the **Status** column if you have a version update in your Local Update Repository for the selected hosts.

5. Select the version you want to apply from the **Update Version** column.



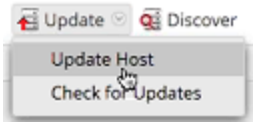
If you:

- Want to update more than one host to that version, after you update the NW Server host, select the checkbox to the left of the hosts. Only currently supported update versions are listed.
- Want to view a dialog with the major features in the update and information on the updates click the information icon ( ) to the right of the update version number. The following is an example of this dialog.

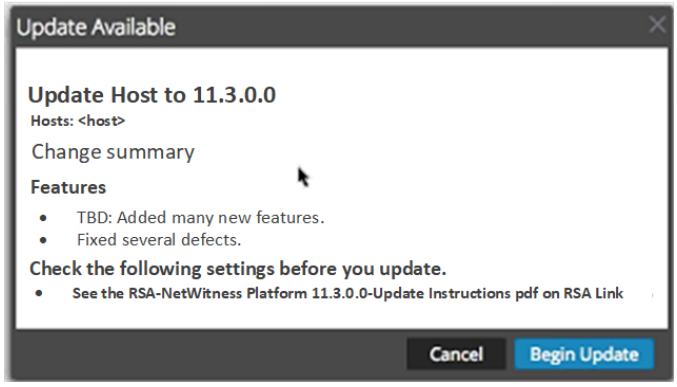


- Cannot find the version you want, select **Update > Check for Updates** to check the repository for any available updates. If an update is available, the message "New updates are available" is displayed and the **Status** column updates automatically to show Update Available. By default, only supported updates for the selected host are displayed.

6. Click **Update > Update Host** from the toolbar.



A dialog is displayed with information on the selected update. Click **Begin Update**.



The **Status** column tells you what is happening in each of the following stages of the update:

- Stage 1 - **Downloading update packages** - downloads the repository artifacts to the NW Server applicable to the services on the host you chose.
- Stage 2 - **Configuring update packages** - configures update files in to correct format.
- Stage 3 - **Update in progress** - updates host to new version.

7. When you see **Update in progress**, refresh the browser.
   This may send you to the NetWitness Log In screen. If this happens, log in and navigate back to the Host view.
   After the host is updated, NetWitness Platform prompts you to **Reboot Host**.

8. (Conditional - For Host with Unity Storage Only) If the host (for example, the Network Decoder host) has Unity storage configured with PowerPath on 11.1.x.x , and the Powerpath version installed is EMCPower.LINUX.6.3.0.b049, SSH to the host and submit the following commands to install the new PowerPath version (that is, DellEMCPower.LINUX.6.4.0.b095).

```
systemctl stop nwdecoder
umount -R /var/netwitness/decoder
yum update DellEMCPower.LINUX-6.4.0.00.00-095.RHEL7.x86_64.rpm
```

9. Click **Reboot Host** from the toolbar.
   NetWitness Platform shows the status as **Rebooting...** until the host comes back online. After the host comes back online, the **Status** shows **Up-to-Date**. Contact Customer Care if the host does not come back online.

Note: 1.) If you have DISA STIG enabled, opening Core Services can take approximately 5 to 10 minutes. This delay is caused by the generating of new certificates. 2.) If you have Unity storage, check the PowerPath status and verify the it can see the Unity device.

Apply Updates from the Command Line (No Web Access)

If your RSA NetWitness Platform deployment does not have Web access, complete the following procedure to apply a version update.

1. Download the `.zip` update package for the version you want (for example, `netwitness-11.3.0.0.zip`) from RSA Link to a local directory.
2. SSH to the NW Server host.
3. Make a `/tmp/upgrade/<version>` staging directory for the version you want (for example, `/tmp/upgrade/11.3.0.0`).
   ```
   mkdir -p /tmp/upgrade/11.3.0.0
   ```
4. Copy the `.zip` update package to a directory on the NW Server other than the staging directory (for example `/tmp` directory).

   Note: 1.) Make sure that you copy the `netwitness-11.3.0.0.zip` file to a directory path other than the staging directory path (for example `/tmp` directory). 2.) Make sure that you extract the rpm files to staging directory path (for example, `/tmp/upgrade/11.3.0.0` directory).

5. Unzip the package into the staging directory you created (for example, `/tmp/upgrade/11.3.0.0`).
   ```
   unzip /<download-location>/netwitness-11.3.0.0.zip -d /tmp/upgrade/11.3.0.0
   ```
6. Initialize the update on the NW Server.
   ```
   upgrade-cli-client --init --version 11.3.0.0 --stage-dir /tmp/upgrade/
   ```
7. Apply the update to the NW Server.
   ```
   upgrade-cli-client --upgrade --host-addr <NW Server IP> --version 11.3.0.0
   ```
8. Log in to NetWitness Platform and reboot the NW Server host in the Host view.
9. Apply update to each non-NW Server host.
   ```
   upgrade-cli-client --upgrade --host-addr <non-NW Server IP address> --
   version 11.3.0.0
   ```
   The update is complete when the polling is completed.
10. (Conditional) If the host (for example, the Network Decoder host) has Unity storage configured with PowerPath on 11.1.x.x , and the Powerpath version installed is EMCPower.LINUX.6.3.0.b049, SSH to the host and submit the following commands to install the new PowerPath version (that is, DellEMCPower.LINUX.6.4.0.b095).
    ```
    systemctl stop nwdecoder
    umount -R /var/netwitness/decoder
    yum update DellEMCPower.LINUX-6.4.0.00.00-095.RHEL7.x86_64.rpm
    ```
11. Log in to NetWitnesss Platform and reboot the host in the Host view.
    You can verify the version applied to the host with the following command:
    ```
    upgrade-cli-client --list
    ```

    Note: 1.) If you have DISA STIG enabled, opening Core Services can take approximately 5 to 10 minutes. This delay is caused by the generating of new certificates. 2.) If you have Unity storage, check the PowerPath status and verify the it can see the Unity device.

Task II (Optional) - Install Warm Standby NW Server

Refer to "Warm Standby NW Server Host" under "Deployment Option Setup Procedures" in the *Deployment Guide for RSA NetWitness Platform 11.3* for instructions on how to set up a Warm Standby NW Server.

Update or Install Windows Legacy Collection

Refer to the *Windows Legacy Collection Guide for RSA NetWitness 11.x*.

Note: After you update or install Windows Legacy Collection, reboot the system to ensure that Log Collection functions correctly.

Post Update Tasks

Complete the following tasks after you update to NetWitness Platform 11.3.0.0.

- General
- NW Server
- Decoder and Log Decoder
- NetWitness Endpoint
- Event Stream Analysis
- Respond
- NetWitness UEBA
- Warehouse

General

These tasks apply to all NetWitness Platform 11.3.0.0 customers.

Task 1 - Start Data Capture and Aggregation

Restart network and log capture and aggregation after updating to 11.3.0.0.

Start Network Capture

1. In the **NetWitness Platform** menu, select **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Decoder** service.
3. Under (actions), select **View** > **System**.
4. In the toolbar, click .

Start Log Capture

1. In the **NetWitness Platform** menu, select **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Log Decoder** service.
3. Under (actions), select **View** > **System**.
4. In the toolbar, click .

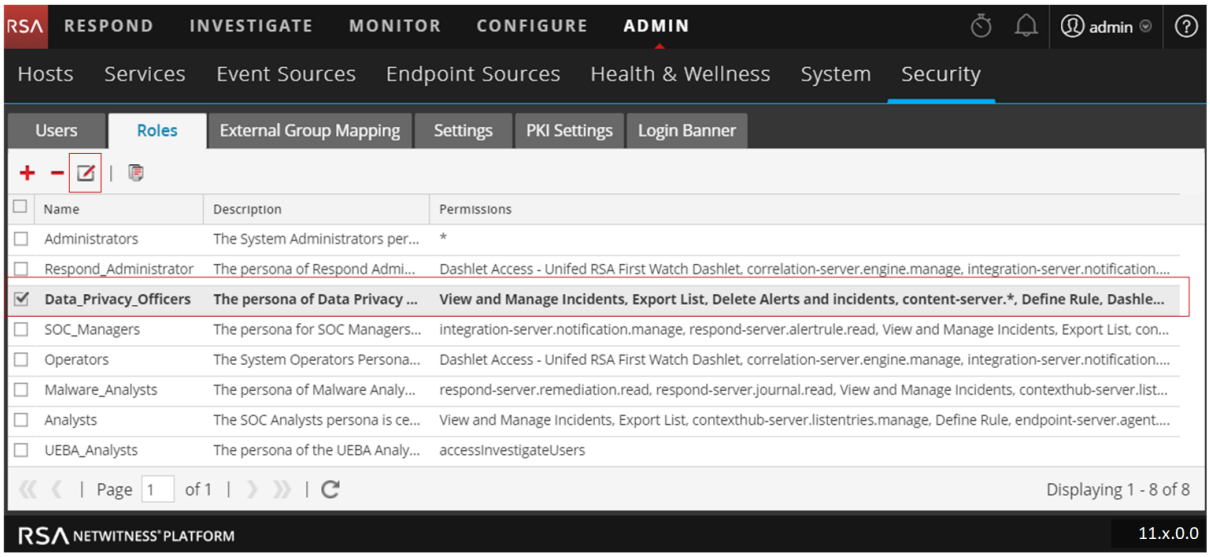
Start Aggregation

1. In the **NetWitness Platform** menu, select **ADMIN** > **Services**.
   The Services view is displayed.
2. For each Concentrator and Broker service.
   a. Select the service.
   b. Under (actions), select **View** > **Config**.
   c. In the toolbar, click  .

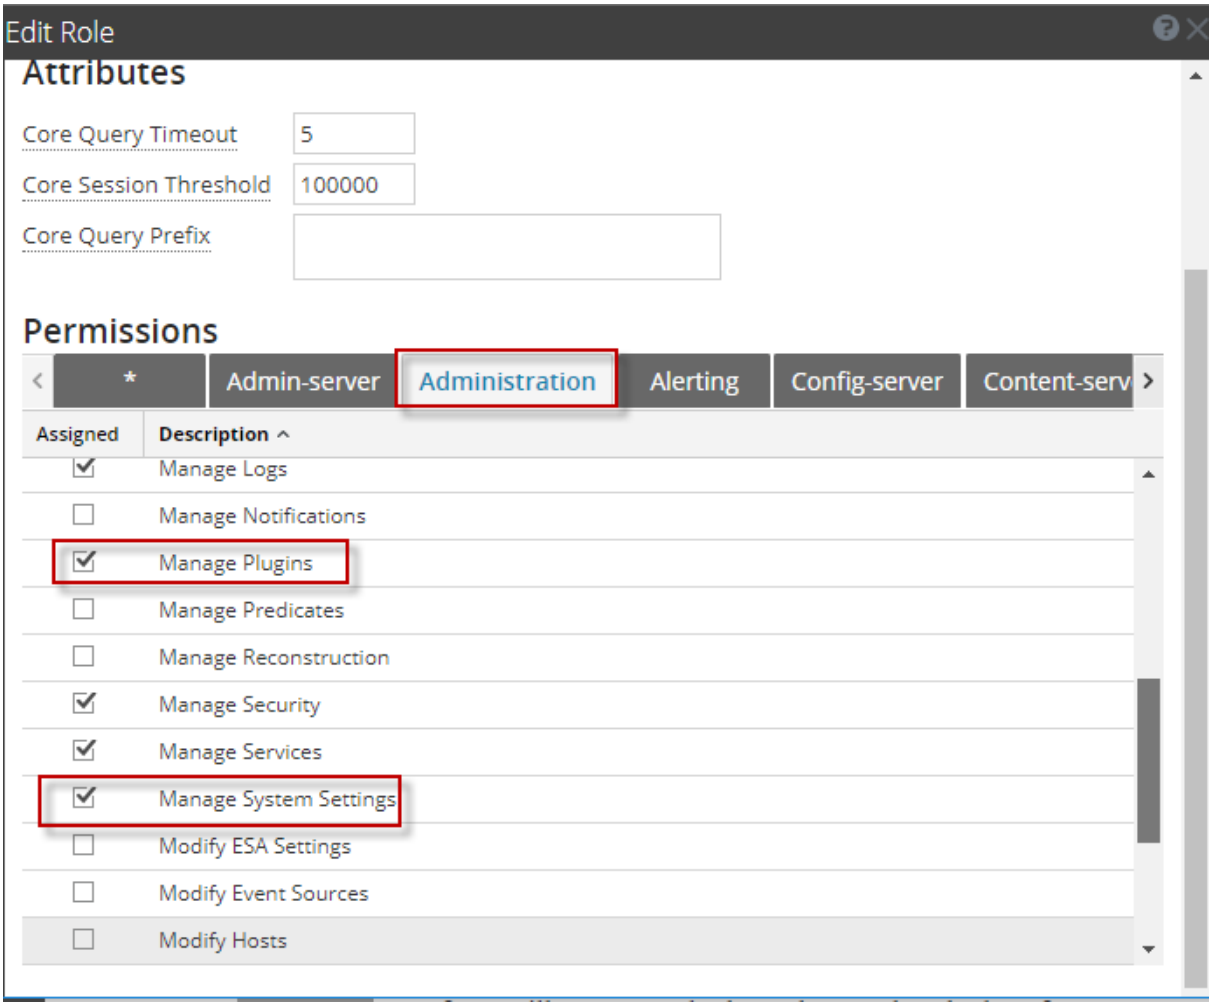
Task 2 - Set Up Context Menu Actions User Permissions

Complete the following steps for **Analysts**, **SOC Managers**, **Data Privacy Officers** roles to set up their Context Menu Actions. You must complete these steps for the **Analysts**, **SOC Managers**, and **Data Privacy Officers** roles.

1. In the **NetWitness Platform** menu, select **ADMIN** > **Security** > **Roles**.
2. Double-click on the user role (for example, **Data Privacy Officers**), or click to select the role and click (Edit).



3. In the **Edit Role** view under **Permissions**, check the **Manage Logs**, **Manage Plugins**, and **Manage System Settings** check boxes and click **Save**.



4. Complete steps 1 through 3 for the **Analysts** and **SOC Managers** roles in addition to **Data Privacy Officers**.

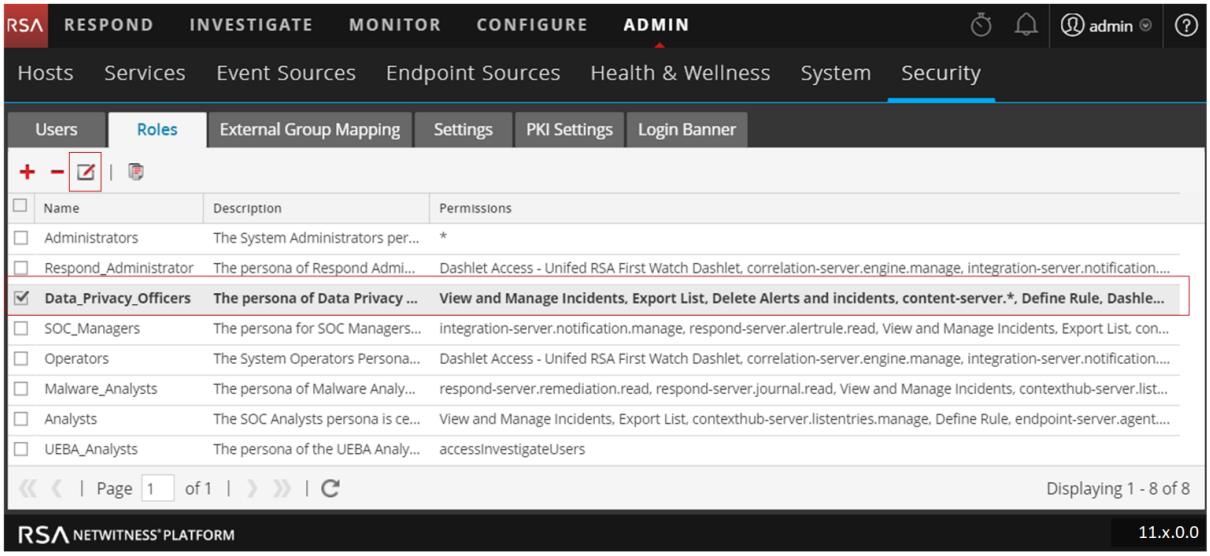
Task 3 - Add "Manage Jobs" Permission to Roles Missing this Permission

Add the 'Manage Jobs' Administration permission to the following roles:

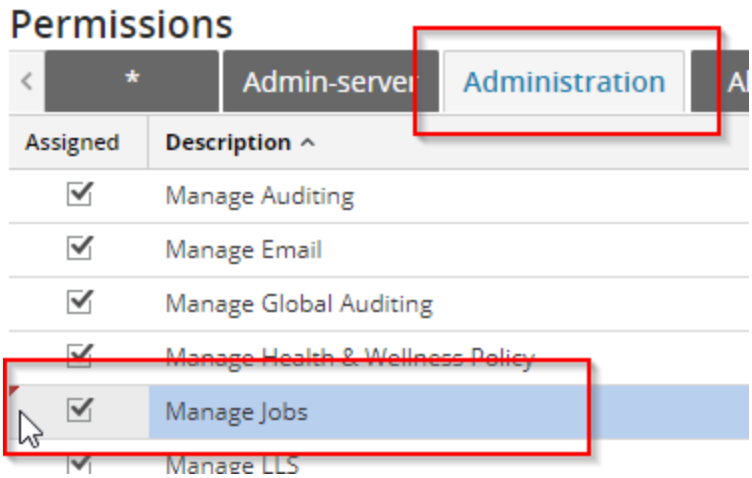
- SOC_Managers
- Operators
- Data_Privacy_Officers

1. In the **NetWitness Platform** menu, select **ADMIN** > **Security** and click **Roles**.

2. Select the role you need to update (that is, **SOC_Managers**, **Operators**, or **Data_Privacy_Officers**) and click .



3. Click **Administration**, check the **Manage Jobs** checkbox, and click **Save**.



4. Complete steps 1 through 3 inclusive for all three roles (**SOC_Managers**, **Operators**, and **Data_Privacy_Officers**).

Task 4 - Modify the Analyst Role - `investigate-server` Permissions

The default permissions for the **SOC Managers**, **Malware Analysts**, and **Analysts** roles are fixed in 11.3 so that these roles have specific permissions required to view and work in Event Analysis view. Prior to 11.3, the default permissions were different.

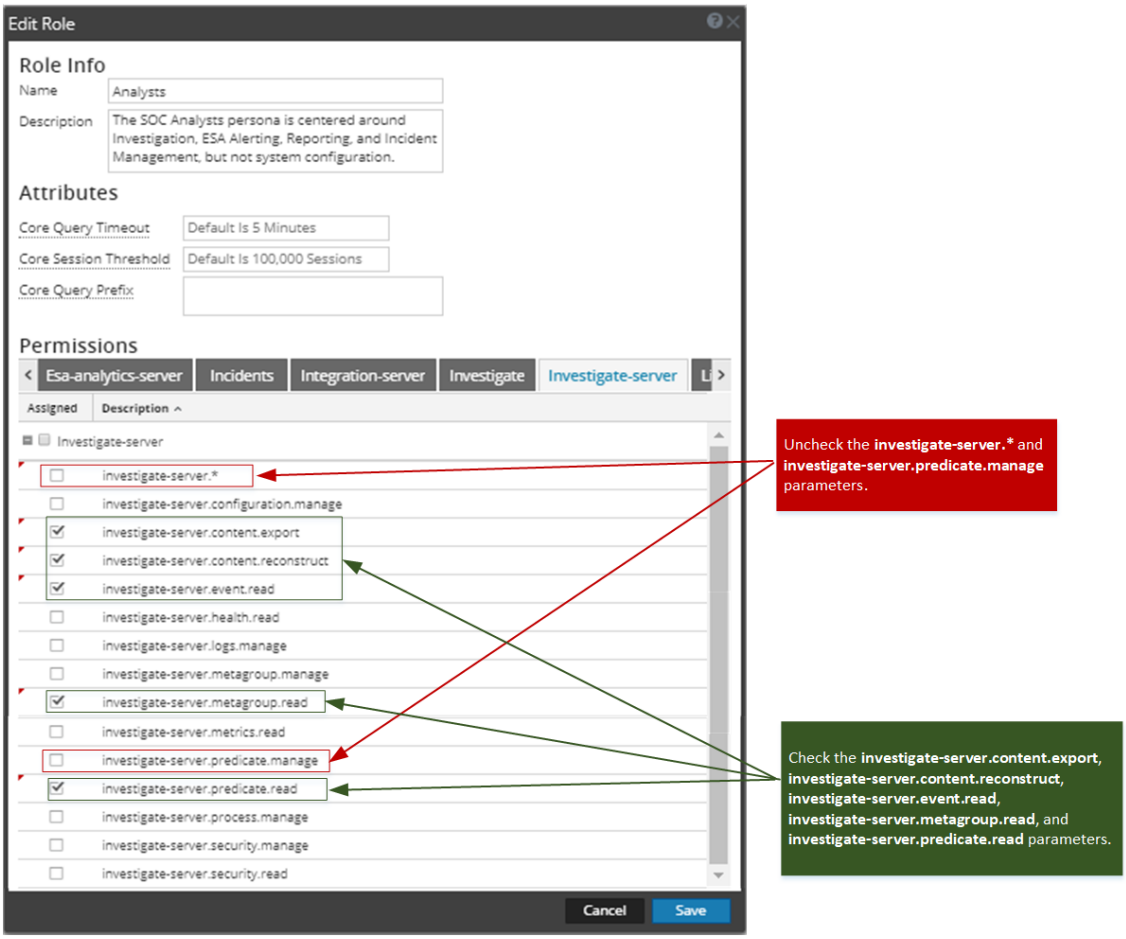
In addition, the `predicate.manage` permission should not be assigned to the **SOC Managers**, **Malware Analysts**, and **Analysts** roles because it grants them access to get-predicates, edit-predicates, remove-predicates, remove-all-predicates and so on. This access could be a security risk because it allows them to circumvent settings that restrict access to certain data.

As a result, you must update the default permissions and to match the 11.3 default permissions as described in the following procedure.

1. In the **NetWitness Platform** menu, select **ADMIN** > **Security** > **Roles**.
2. Complete the following steps for **SOC Managers**, **Malware Analysts**, and **Analysts** roles.
   a. Check the user role checkbox (for example, **Analysts**) and click (Edit icon).

   b. Under **Permissions**, click the **Investigate-server** tab.
   c. Make sure that the following permissions are not checked.
      - `investigate-server.*`
      - `investigate-server.predicate.manage`
   d. Check the following permissions.
      - `investigate-server.content.export`
      - `investigate-server.content.reconstruct`
      - `investigate-server.event.read`
      - `investigate-server.metagroup.read`

- `investigate-server.predicate.read`



e. Click **Save**.

(Optional) Task 5 - Reissue Certificates for Your Hosts

In 11.3.0.0, RSA introduced a `cert-reissue` command line command and its arguments to reissue host certificates. After you update all your hosts to 11.3, you should reissue certificates for all of them as soon as possible to avoid having them expire. If the certificates expire, this places your NetWitness deployment in a bad security state. Refer to the *RSA NetWitness® Platform 11.3 Security Configuration Guide* for instructions on how to use the `cert-reissue` command.

(Conditional) Task 6 - If NetWitness Platform Has No Web Access, Upload Response `.bin` File Again (License Server)

If your NetWitness Deployment does not have Internet access, after you update to 11.3, you must upload the response `.bin` file again to view the license information in the **ADMIN** > **System** > **Licensing** view in the NetWitness Platform User Interface. See "Upload an Offline Capability Response to NetWitness Platform" in the *RSA NetWitness Platform Licensing Management Guide for Version 11.3* for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

NW Server

(Conditional) Task 7 - Reconfigure PAM Radius Authentication

If you configured PAM Radius authentication in 11.0.x.x using the `pam_radius` package, you must reconfigure it in 11.3.0.0 using the `pam_radius_auth package` to achieve better performance. See "Configure PAM Login Capability" in the *RSA NetWitness® Platform 11.3 System Security and User Management Guide* for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Decoder and Log Decoder

(Conditional - for 11.0.x.x and 11.1.x.x Update paths, Not 11.2.x.x) Task 8 - Enable Metadata for GeoIP2 Parser

By default, the GeoIP2 parser generates less metadata than the GeoIP parser did. After updating to 11.3, if you require any of the additional metadata, you must enable them (once only) for each Decoder. This can also be altered post-update. Keep in mind that the `isp` and `org` meta fields usually produce an equivalent value to `domain`.

To enable metadata:

1. Go to **ADMIN** > **Services**.
2. In the **Administration services** view, select a Log Decoder or a Decoder.
3. Click the settings icon ( ) and select **View** > **Config**. The Parsers Configuration panel is displayed, from which you can select **GeoIP2** to enable the desired metadata.

For more information about GeoIP2 parsers, see the "GeoIP2 and GeoIP Parsers" topic in the *Decoder and Log Decoder Configuration Guide*.

NetWitness Endpoint

Task 9 - Reconfigure Recurring Feed Configured from Legacy Endpoint Because Java Version Changed

You must reconfigure the Legacy Endpoint recurring feed due to the change in Java version. Complete the following step to fix this problem.

1. Import the NetWitness Endpoint CA certificate into the NetWitness Platform Trusted store as described in "Export the NetWitness Endpoint SSL Certificate" under the "Configure Contextual Data from Endpoint via Recurring Feed" topic in the *RSA NetWitness Endpoint Integration Guide* to import the certificate.
   Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 10 - Restore Backed Up Endpoint Custom Meta Data Mappings

RSA recommends not to override any 11.3 default mappings unless required. If you backed up 11.1.x.x custom mappings, before updating to 11.3, review the list of custom mappings, and restore only those mappings that are not already in the default, using the `set-custom API` through nw-shell.

To modify any mappings, see *Endpoint Insights Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Event Stream Analysis

These tasks apply to NetWitness Platform 11.3.0.0 customers using Event Stream Analysis.

Task 11 (Conditional) Verify String Array Type Meta Keys on the ESA Correlation Service

If you added any string array type meta keys to the Event Stream Analysis service for your ESA correlation rules prior to updating to 11.3, verify that they appear on the ESA Correlation service in 11.3.

1. Follow the "Configure Meta Keys as Arrays in ESA Correlation Rule Values" procedure in the *ESA Configuration Guide* to verify if the string array type meta keys that were added before the update are on the ESA Correlation service. Add any missing string array type meta keys. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.
2. Do not remove any meta keys from the multi-valued parameter on the ESA Correlation service. In NetWitness Platform 11.3, the ESA rules from Live use meta keys with array syntax and they depend on these meta keys to work correctly. Removing values from the multi-valued list can cause the ESA Rule Deployments to fail.

Task 12 (Conditional) Update RSA Live ESA Rules with Meta Type Changes from String to Array

The following table lists the ESA rules from RSA Live that had meta key type changes from String to Array in NetWitness Platform 11.3.

Rule #	Rule Name	Array Type Meta Keys in 11.3
1	RIG Exploit Kit	threat_category
2	AWS Critical VM Modified	alert
3	Multiple Successful Logins from Multiple Diff Src to Same Dest	host.src and host.dst
4	Multiple Successful Logins from Multiple Diff Src to Diff Dest	host.src and host.dst
5	Multiple Failed Logins from Multiple Diff Sources to Same Dest	host.src and host.dst
6	Multiple Failed Logins from Multiple Users to Same Destination	host.src and host.dst
7	User Login Baseline	host.src and host.dst

1. If you:
   - Deployed these rules before version 11.3:
     a. Note any rule parameters that you have changed so you can adjust the rules for your environment.
     b. Download the updated rules from RSA Live.
     c. Reapply any changes to the default rule parameters and deploy the rules.
     (For instructions, see "Download RSA Live ESA Rules" in the Alerting with ESA Correlation Rules User Guide.)
   - Are deploying these rules for the first time in version 11.3, follow the customization directions with the ESA rule descriptions. Rules 3 to 7 in the above table require that the Context Hub lists for `User_Whitelist`, `Host_Whitelist` and `IP_Whitelist` to be added as enrichments to ESA. (See "Configure Context Hub List as an Enrichment Source" in the *Alerting with ESA Correlation Rules User Guide*.)
2. Deploy the ESA rule deployment that contains these rules. (See "ESA Rule Deployment Steps" in the *Alerting with ESA Correlation Rules User Guide*.)

Task 13 (Conditional) - Verify ESA Rule Deployment

After you update to 11.3, verify your ESA rule deployments. For every ESA host, a new deployment is created in the format "<ESA Host name> – ESA Correlation".

1. Make sure that a new deployment was created.
2. Make sure that the new deployment contains an ESA Correlation service, data sources, and rules for all previous deployments on that ESA host.
3. Make sure that the ESA Correlation service has status of "Deployed".

For a detailed example, see the *ESA Configuration Guide for RSA NetWitness Platform 11.3*. For Deployment information, see "ESA Rule Deployment Steps" in the *Alerting with ESA Correlation Rules User Guide for RSA NetWitness Platform 11.3*. For troubleshooting information, see the *Alerting with ESA Correlation Rules User Guide for RSA NetWitness Platform 11.3*.

Respond

Task 14 - Get the Latest Version of the Aggregation Rule Schema and Restore any Respond Service Custom Keys

Complete the following procedure to get the latest version of the Aggregation Rule Schema and restore any Respond service custom keys.

1. Delete the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` file.
2. Restart the Respond server to get the latest version of the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` file.
   `systemctl restart rsa-nw-respond-server`
3. If you added custom keys in `var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` file for use in the groupBy clause for 11.0, modify the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` file and add the custom keys that you previously saved as an Update Preparation task.

Note: New Group By fields have been added to Respond. The new Group By fields will not be visible in the NetWitness Platform user interface if you do not get the latest version of the file from the server.

Task 15 - Get the Latest Version of the Respond Service Normalization Scripts and Restore any Customized Respond Service Normalization Scripts

RSA re-factored Respond service normalization scripts in the `/var/lib/netwitness/respond-server/scripts` directory in 11.3.0.0. You must replace the old versions.

Before the update to 11.3.0.0, you backed up the following files from the `/var/lib/netwitness/respond-server/scripts` directory.

```
data_privacy_map.js
normalize_alerts.js
normalize_core_alerts.js
normalize_ecat_alerts.js
normalize_ma_alerts.js
normalize_wtd_alerts.js
utils.js
```

Complete the following procedure to get the latest version of the normalization scripts.

1. After backing up the files listed above, delete the `/var/lib/netwitness/respond-server/scripts` directory and its contents.
2. Restart the Respond server.
   ```
   systemctl restart rsa-nw-respond-server
   ```
3. (Conditional) Edit the new files to include any custom logic from the 11.0 scripts that were backed up.

Note: The following files changed with the 11.3.0.0 release:

```
normalize_alerts.js
aggregation_rule_schema.json
```

Task 16 - Add Respond Notification Settings Permissions

Note: If you already configured these permissions in 11.1 or later, you can skip this task.

Respond Notification Setting permissions enable Respond Administrators, Data Privacy Officers, and SOC Managers to access Respond Notification Settings (**CONFIGURE** > **Respond Notifications**), which enable them to send email notifications when incidents are created or updated.

To access these settings, you will need to add additional permissions to your existing built-in NetWitness Platform user roles. You will also need to add permissions to your custom roles. See the “Respond Notification Settings Permissions” topic in the *NetWitness Respond Configuration Guide*. For detailed information about user permissions, see the *System Security and User Management Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 17 - Update Default Incident Rule Group By Values

The following default incident rules now use “Source IP Address” as the Group By value.

- **High Risk Alerts: Reporting Engine**
- **High Risk Alerts: Malware Analysis**
- **High Risk Alerts: ESA**

To update the above default rules, change the Group By value to “Source IP Address.”

Note: If you already updated the Group By values for the default rules listed above in 11.1 or later, you do not have to do it again.

The **High Risk Alerts: NetWitness Endpoint** default incident rule now uses Host Name as the Group By value. If you have NetWitness Endpoint you can use this rule. Change the Group By value of the default NetWitness Endpoint rule to "Host Name."

1. In the **NetWitness Platform** menu, select **CONFIGURE** > **Incident Rules** and click on the rule that you want to update in the **Name** column. The **Incident Rule Details** view is displayed.
2. In the **GROUP BY** field, select the new Group By value from the drop-down list.
3. Click **Save** to update the rule.

To aggregate NetWitness Endpoint alerts based on the File Hash, complete the following steps to clone the default NetWitness Endpoint incident rule and change the Group By value.

1. In the **NetWitness Platform** menu, select **CONFIGURE** > **Incident Rules**. The **Incident Rules List** view is displayed.
2. Select the **High Risk Alerts: NetWitness Endpoint** default incident rule and click **Clone**. You will receive a message that you successfully cloned the selected rule.
3. Change the Name of the rule to an appropriate name, such as High Risk Alerts: NetWitness Endpoint File hash.
4. In the **GROUP BY** field, remove the previous Group By value and add **File MD5 Hash**. It is important that File MD5 Hash is the only Group By value listed.
5. Click **Save** to create the rule.

For detailed information, see the *Respond Configuration Guide for NetWitness Platform 11.3*.

NetWitness UEBA

(Optional) Task 18 - Enable Endpoint Data Sources

If NetWitness Endpoint Server is configured in NetWitness Platform 11.3, you can enable the Endpoint data sources such as Process and Registry to generate alerts in UEBA.

To enable Endpoint data sources:

```
curl -X PATCH http://localhost:8881/configuration -H 'content-type:
application/json' -d '{"operations":
[{"op":"add","path":"/dataPipeline/schemas/-","value":"PROCESS"},
{"op":"add","path":"/dataPipeline/schemas/-","value":"REGISTRY"}]}'
```

Task 19 - Enable UEBA Indicator Forwarder

If NetWitness Respond server is configured in NetWitness Platform 11.3, you can transfer the NetWitness UEBA indicators to the NetWitness Respond server and to the correlation server to create an Incidents.

To enable the UEBA indicator forwarder:

```
curl -X PATCH http://localhost:8881/configuration -H 'content-type:
application/json' -d '{"operations":
[{"op":"replace","path":"/outputForwarding/enableForwarding","value":true}]}'
```

Task 20 - Update Broker or Concentrator UUID

After you update to NetWitness Platform 11.3 the Broker or Concentrator UUID changes. You must update the NetWitness Platform core services, and update the Broker or Concentrator UUID.

To update the Broker or Concentrator UUID:

```
python /var/netwitness/presidio/airflow/venv/lib/python2.7/site-
packages/presidio_workflows-1.0-py2.7.egg/presidio/resources/rerun_ueba_
server_config.py
```

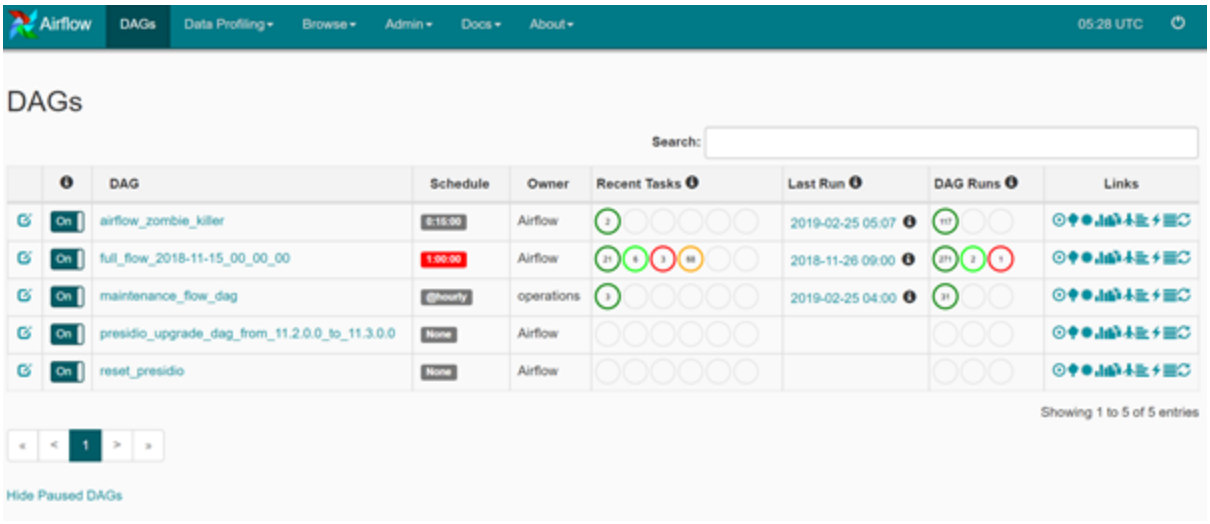
Task 21 - Update Airflow Configuration

After an update to NetWitness Platform 11.3, you must update Aiflow configurations. Perform the following:

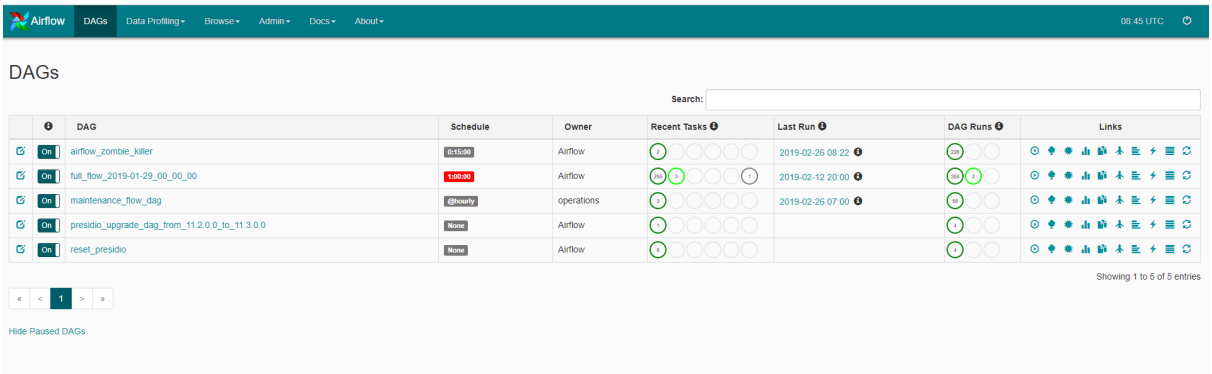
1. To access Airflow, go to https://<UEBA_host>/admin/, and the enter user name and password.

   Note: The Airflow web server UI username is admin and the password is same as deploy_admin password.

You may see some task in red in the full flow DAG due to mismatch of tasks between the NetWitness Platform 11.2 and the NetWitness Platform 11.3.



2. Click (Trigger Dag) on presidio_upgrade_dag_from_11.2.0.0_to_11.3.0.0 DAG.
   This will pause the full flow DAG and run reset_presidio DAG, to:
   - Create a new full flow DAG where the start date is 27 days ago.
   - Remove the old full flow DAG.
   - Start the new full flow DAG.
3. Once the update DAG is successful, presidio_upgrade DAG task is marked in green with one task in the **Recent Tasks** Column as shown below.



Task 22 - Restart Airflow scheduler service

You must restart the Airflow scheduler service after the presidio_upgrade DAG is successful.

Note: A presidio_upgrade DAG with dark green circle in the **resent tasks** column indicates that the presidio_upgrade DAG is successful.

To restart the airflow scheduler service:

```
systemctl restart airflow-scheduler
```

Warehouse

Task 23 - Update Hive Version

After you update to 11.3, you must update to the Hive version that is compatible with the 11.3 Warehouse (either Hive version 0.12 or version 1.0).

- Hive Version 0.12
  SSH to the NW Server and run the following command.
  `rpm -ivh rsa-nw-hive-jdbc-0.12.0-1.x86_64.rpm`
- Hive Version 1.0
  SSH to the NW Server and run the following command.
  `rpm -ivh rsa-nw-hive-jdbc-1.0.0-1.x86_64.rpm`

Appendix A. Troubleshooting Version Installations and Updates

This section describes the error messages displayed in the **Hosts** view when it encounters problems updating host versions and installing services on hosts in the **Hosts** view. If you cannot resolve an update or installation issue using the following troubleshooting solutions, contact Customer Support (https://community.rsa.com/docs/DOC-1294).

Error Message	**Host Update Failed** Problem	When you select an update version and click **Update** > **Update Host**, the download process is successful, but the update process fails.

Solution	1. Try to apply the version update to the host again.
	Often this is all you need to do.
	2. If you still cannot apply the new version update:
	a. Monitor the following logs on NW Server as it progresses (for example, run the `tail -f` command from the command line):
	`/var/netwitness/uax/logs/sa.log`
	`/var/log/netwitness/orchestration-server/orchestration-server.log`
	`/var/log/netwitness/deployment-upgrade/chef-solo.log`
	`/var/log/netwitness/config-management/chef-solo.log`
	`/var/lib/netwitness/config-management/cache/chef-stacktrace.out`
	The error appears in one or more of these logs.
	b. Try to resolve the issue and reapply the version update.
	• Cause 1 - `deploy_admin` password has expired.
	Solution - Reset your `deploy_admin` password .
	Complete the following steps to resolve Cause 1.
	1. In the NetWitness Suite menu, select **ADMIN** > **Security** > **Users** tab.
	2. Select the `deploy_admin` and click **Reset Password**.
	3. (Conitional) If NetWitness Suite does not allow you to expired `deploy_admin` password in the **Reset Password** dialog, complete the following steps.

a. Reset `deploy_admin` to use a new password.

b. On all non-NW Server hosts on 11.x , run the following command using the matching `deploy_admin` password from NW Server host.
`/opt/rsa/saTools/bin/set-deploy-admin-password`

- Cause 2 -The `deploy_admin` password was changed on NW Server host but not changed on non-NW Server hosts.
  Complete the following step to resolve Cause 2.
  - On all non-NW Server hosts on 11.x , run the following command using the matching `deploy_admin` password from NW Server host.
    `/opt/rsa/saTools/bin/set-deploy-admin-password`

3. If you still cannot apply the update, gather the logs from step 2 and contact Customer Support (https://community.rsa.com/docs/DOC-1294).

Error Message	**Host Installation Failed**
Problem	When you select a host and click **Install** the install service process fails.

Solution	1. Try to install the service again.
	Often this is all you need to do.
	2. If you still cannot install the service:
	a. Monitor the following logs on NW Server as it progresses (for example, submit the `tail -f` command string from the command line'):
	`/var/netwitness/uax/logs/sa.log`
	`/var/log/netwitness/orchestration-server/orchestration-server.log`
	`/var/log/netwitness/deployment-upgrade/chef-solo.log`
	`/var/log/netwitness/config-management/chef-solo.log`
	`/var/lib/netwitness/config-management/cache/chef-stacktrace.out`
	The error appears in one or more of these logs.
	b. Try to resolve the issue and reinstall the service.
	• Cause 1 - Entered the wrong `deploy_admin` password in the nwsetup-tui.
	Solution - Retrieve your `deploy_admin` password.
	Complete the following steps to resolve Cause 1.
	1. In the NetWitness Suite menu, select **ADMIN** > **Security** > **Users** tab.
	2. Select the `deploy_admin` and click **Reset Password**.
	3. (Conitional) If NetWitness Suite does not allow you to expired `deploy_admin` password in the **Reset Password** dialog, complete the following steps.
	a. SSH to the NW Server host.
	`security-cli-client --get-config-prop --prop-hierarchy nw.security-client --prop-name platform.deployment.password -quiet`
	b. SSH to the host that failed installation/orchestration.
	c. Run the nwsetup-tui again using correct `deploy_admin` password.
	• Cause 2 -The `deploy_admin` password has expired.
	Complete the following step to resolve Cause 2.
	1. In the NetWitness Suite menu, select **ADMIN** > **Security** > **Users** tab.
	2. Select the `deploy_admin` and click **Reset Password**.
	3. (Conditional) If NetWitness Suite allows you enter the expired `deploy_admin` password in the **Reset Password** dialog, complete the following steps.
	a. Enter the expired `deploy_admin` password.

b. Uncheck the Force password change on next login checkbox.

c. Click **Save**.

4. (Conditional) If NetWitness Suite does not allow you to enter the expired `deploy_admin` password in the Reset Password dialog, complete the following steps.

a. Reset `deploy_admin` to use a new password.

b. On all the NW Server host and all other hosts on 11.x, run the following command using the new `deploy_admin` password.
`/opt/rsa/saTools/bin/set-deploy-admin-password`

c. On the host that failed installation/orchestration, run the nwsetup-tui and use the new `deploy_admin` password.

3. If you still cannot apply the update, gather the logs from step 2 and contact Customer Support (https://community.rsa.com/docs/DOC-1294).

Error Message	**Downloading Error**
Problem	When you select an update version and click **Update** >**Update Host**, the download starts but fails to complete.
Cause	Version download files can be large and take a long time to download. If there are communication issues during the download it will fail.
Solution	1. Try to download it again. 2. If the download still fails, try to download it outside of NetWitness Suite as described in Apply Updates from the Command Line (No Web Access). 3. If you still cannot download the update file, contact Customer Support (https://community.rsa.com/docs/DOC-1294).

Error Message	**`deploy_admin` User's Password Has Expired**
Cause	The `deploy_admin` user password has expired.
Solution	Reset your `deploy_admin` password password. 1. In the NetWitness Suite menu, select **ADMIN** > **Security** > **Users** tab. 2. Select the **deploy_admin** and click **Reset Password**. • If NetWitness Suite allows you to enter the expired `deploy_admin` password in the **Reset Password** dialog, complete the following steps. a. Enter the expired `deploy_admin` password. b. Uncheck the **Force password change on next login** checkbox. c. Click **Save** • If NetWitness Suite does not allow you to enter the expired `deploy_admin` password in the **Reset Password** dialog. a. On the NW Server host and all other hosts on 11.x , run the following command using the new `deploy_admin` password. `/opt/rsa/saTools/bin/set-deploy-admin-password` b. On the host that failed installation/orchestration, run the `nwsetup-tui` and use the new `deploy_admin` password.

Error Message	The `/var/log/netwitness/orchestration-server/orchestration-server.log` has an error similar to the following error: `API|Failure /rsa/orchestration/task/update-config-management [counter=10 reason=IllegalArgument Exception::Version '11.0.0.n' is not supported`
Problem	After you update the NW Server host to 11.1, the only update path for the non-NW Server hosts is 11.1. If you try to update any non-NW Server host to an 11.0.0.n patch (for example from 11.0.0.0 to 11.0.0.3), you will get this error.
Solution	You have two options: • Update the non-NW Server host to 11.1, or • Do not update the non-NW Server host (keep it at its current version).

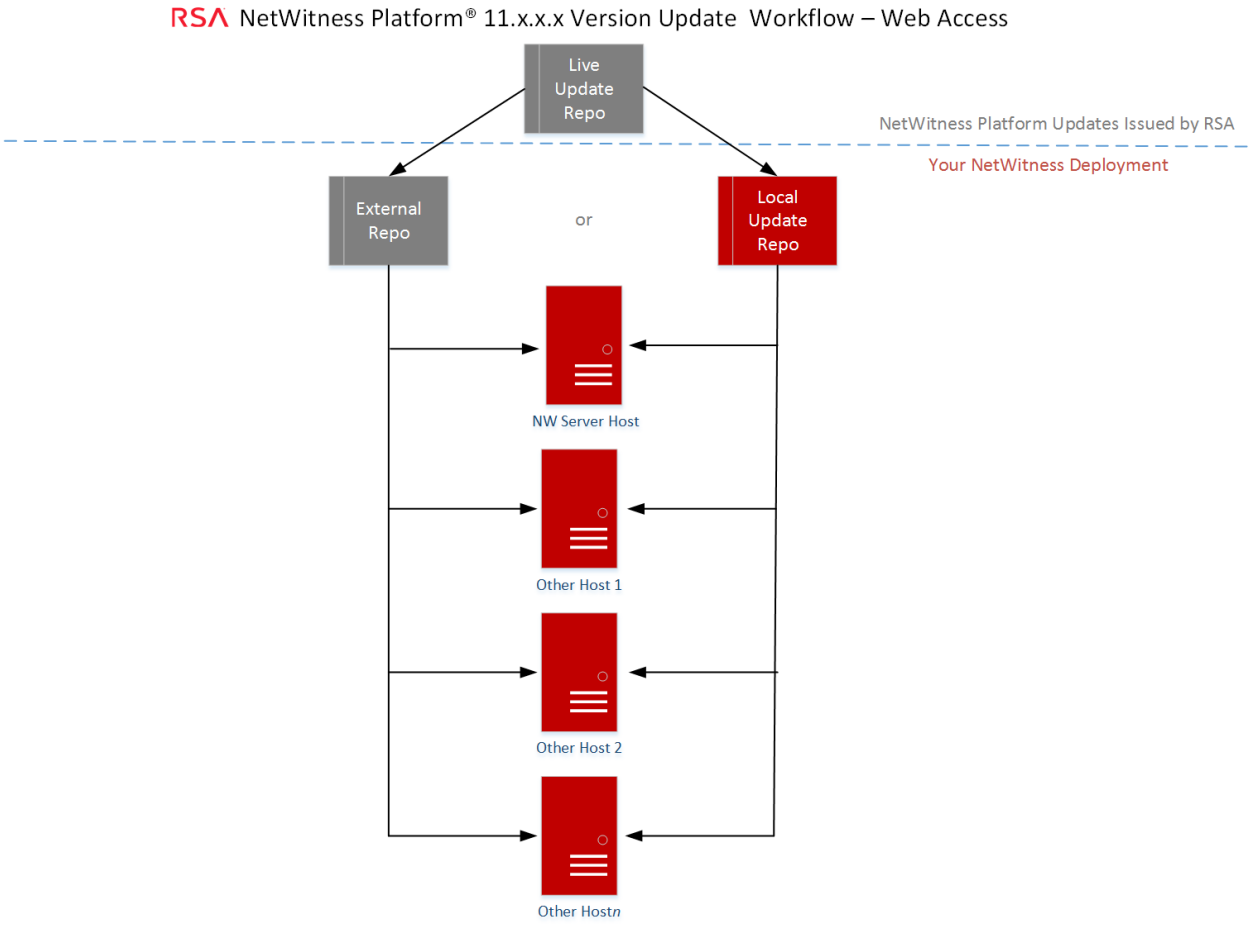
Error Message	You receive a message in the User Interface to reboot the host after you update and reboot the host offline.
Cause	You cannot use CLI to reboot the host. You must use the User Interface.
Solution	Reboot the host in the Host View in the User Interface.

Error Message	Received an error similar to the following error when trying to update to a new version from the : `.Repository 'nw-rsa-base': Error parsing config: Error parsing "baseurl = 'https://nw-node-zero/nwrpmrepo /<version-number>/RSA'": URL must be http, ftp, file or https not ""`
Cause	There is an error the path you specified.
Solution	Make sure that: • the URL does exist on the NW Server host. • you used the correct path and remove any spaces from it.

Appendix B. Populate Local Repo

NetWitness Platform sends version updates to the Local Update Repository from the Live Update Repository. Access to the Live Update Repository requires and uses the Live Account credentials configured under **ADMIN > System > Live**. In addition, you must check the `Automatically download information about new updates every day` checkbox under **ADMIN > System > Updates** to populate the Local Repo daily.

The following diagram illustrates how you obtain version updates if your NetWitness Platform deployment has Web Access.



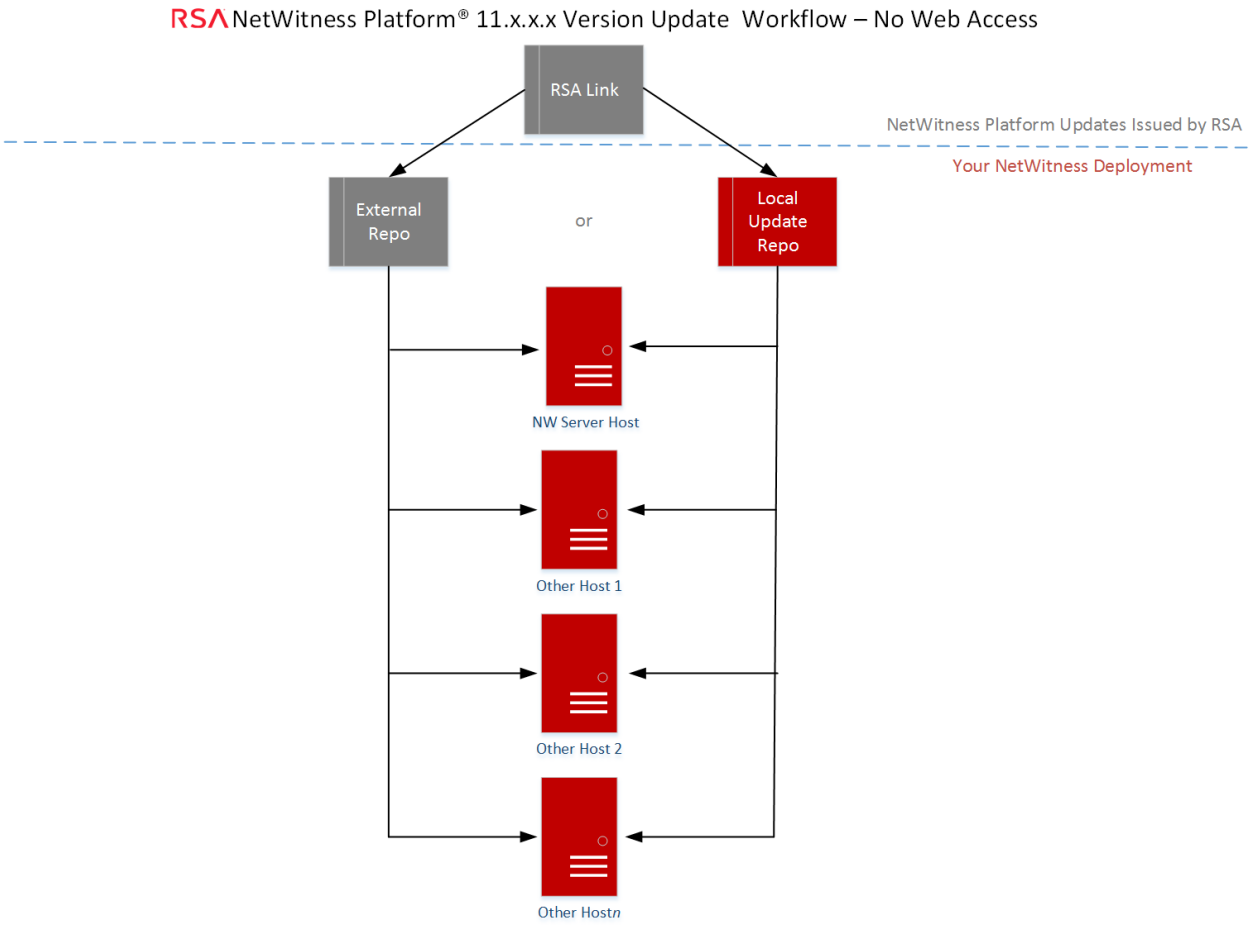
Note: When you make the initial connection with the Live Update Repository, you will be accessing all the CentOS 7 system packages and the RSA Production packages. This download of over 2.5 GB of data takes an indeterminate amount of time depending on your NW Server Internet connection and the traffic of the RSA Repository. It is not mandatory to use the Live Update Repository. Alternatively you can use an External Repo as described in Appendix C. Set Up External Repo.

To connect to the Live Update Repository, go to the ADMIN > System view, select **Live Services** in the options panel and make sure that credentials are configured (**Connection** light should be green). If it is not green, click **Sign In** and connect.

Note: If you need to use proxy to reach out to the Live Update Repository, you can configure the Proxy Host, Proxy Username, and Proxy Password. For more information see "Configure Proxy forNetWitness Platform" in the *System Configuration Guide*.

See Apply Updates from the Command Line (No Web Access) if your NetWitness Platform deployment does not have Web Access.

The following diagram illustrates how you obtain version updates if your NetWitness Platform deployment does not have Web Access.



Appendix C. Set Up External Repo

Complete the following procedure to set up an external repository (Repo).

Note: 1.) You need an unzip utility installed on the host to complete this procedure. 2.) You must know how to create a web server before you complete the following procedure.

1. (Conditional) Complete this step if you have an external repo and you want to override it.
   - Case 1: You bootstrapped the host from an external repo and you want to upgrade using a local repo on the Admin Server.
     a. Create the `/etc/netwitness/platform/repobase` file.
        `vi /etc/netwitness/platform/repobase`
     b. Edit the `repobase` file so that the only information in the file is the following URL.
        `https://nw-node-zero/nwrpmrepo`
     c. Complete the instructions on how to run the upgrade using the `upgrade-cli-client` tool.
   - Case 2: You bootstrapped the host from local repo on the Admin server (NW Server host) and you want to use an external repo for the upgrade.
     a. Create the `/etc/netwitness/platform/repobase` file.
        `vi /etc/netwitness/platform/repobase`
     b. Edit the `repobase` file so that the only information in the file is the following URL.
        `https://<webserver-ip>/<alias-for-repo>`
     c. Complete the instructions on how to run the upgrade using the `upgrade-cli-client` tool. The instructions are in the Apply Updates from the Command Line (No Web Access).
2. Set up the external repo.
   a. Log in to the web server host.
   b. Create directory to host the NW repository (`netwitness-11.3.0.0.zip`), for example `ziprepo` under `web-root` of the web server. For example, /var/netwitness is the web-root, run the following command string.
      `mkdir -p /var/netwitness/<your-zip-file-repo>`
   c. Create the 11.3.0.0 directory under `/var/netwitness/<your-zip-file-repo>`.
      `mkdir -p /var/netwitness/<your-zip-file-repo>/11.3.0.0`
   d. Create the `OS` and `RSA` directories under `/var/netwitness/<your-zip-file-repo>/11.3.0.0`.
      `mkdir -p /var/netwitness/<your-zip-file-repo>/11.3.0.0/OS`
      `mkdir -p /var/netwitness/<your-zip-file-repo>/11.3.0.0/RSA`
   e. Unzip the `netwitness-11.3.0.0.zip` file into the `/var/netwitness/<your-zip-file-repo>/11.3.0.0` directory.
      `unzip netwitness-11.3.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.3.0.0`

Unzipping `netwitness-11.3.0.0.zip` results in two zip files (`OS-11.3.0.0.zip` and `RSA-11.3.0.0.zip`) and some other files.

f. Unzip the:
`OS-11.3.0.0.zip` into the `/var/netwitness/<your-zip-file-repo>/11.3.0.0/OS` directory.
`unzip /var/netwitness/<your-zip-file-repo>/11.3.0.0/OS-11.3.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.3.0.0/OS`
The following example illustrates how the Operating System (OS) file structure appears after you unzip the file.

Parent Directory		-
GeoIP-1.5.0-11.el7.x86_64.rpm	20-Nov-2016 12:49	1.1M
HostAgent-Linux-64-x86-en_US-1.2.25.1.0163-1.x86_64.rpm	03-Oct-2017 10:07	4.6M

ixgbe-zc-5.0.4.12-dkms.noarch.rpm	04-May-2018 11:08	374K

h. (Conditional - For Azure) Follow these steps for Azure update.

   i. `mkdir -p /var/netwitness/<your-zip-file-repo>/11.3.0.0/OS/other`

   ii. `unzip nw-azure-11.3-extras.zip -d /var/netwitness/<your-zip-file-repo>/11.3.0.0/OS/other`

   iii. `cd /var/netwitness/<your-zip-file-repo>/11.3.0.0/OS`

   iv. `createrepo`

i. Use the `http://<web server IP address>/<your-zip-file-repo>` in response to **Enter the base URL of the external update repositories** prompt from NW 11.3.0.0 Setup program (`nwsetup-tui`) prompt.

Create Host Build Stick **4**

Resources Required 4

Build Stick Installation Media 4

NetWitness Platform ISO Files 4

Create a NetWitness Platform USB Build Stick 5

Reinstate Windows File System on USB Device after Creating Build Stick with Etcher 8

Create Host Build Stick

These instructions tell you how to apply a NetWitness Platform software image (ISO file) to a thumb drive so you can image an RSA NetWitness Platform host with the NetWitness Platform software image.

IMPORTANT: You no longer need to label the flash drive when imaging RSA NetWitness Platform 11.3 and later ISO files to the flash drive (USB medium). The 11.3 ISO requires an imaging tool [for example, **ETCHER** (https://etcher.io)] to write to a flash drive. For the 11.0 - 11.2 ISO files, you were required to format and label the flash drive. UNetbootin does not work with 11.3 and later ISOs.

Resources Required

You need the following tools to complete these instructions.

- Automated tool to create a build stick [for example ETCHER (https://etcher.io)].
- Automated tool to reinstate the Windows file system on USB Device after you create the build stick [For example, Minitool Partition Wizard (http://download3.minitool.com/10.2.2/pw102-free.exe)].
- NetWitness Platform USB ISO file.
- USB drive with capacity sufficient enough to accommodate the NetWitness Platform ISO file.

Note: Make sure that you have all of the resources listed above before starting the process.

Build Stick Installation Media

Installation media is in the form of ISO files, which are available for download from Download Central (https://download.rsasecurity.com). As part of your order fulfillment, RSA gives you access to the ISO files that pertain to each customer order.

NetWitness Platform ISO Files

The `rsa-<release number>.<build-number>.<OS number>-usb.iso` is the file naming convention for ISO files. When installing software on your NetWitness Platform host, make sure you are using the correct release. This document uses `rsa-11.x.x.x.<build-number>.el7-usb.iso` as an example of an ISO file.

Contact Customer Care at nwsupport@rsa.com for assistance.

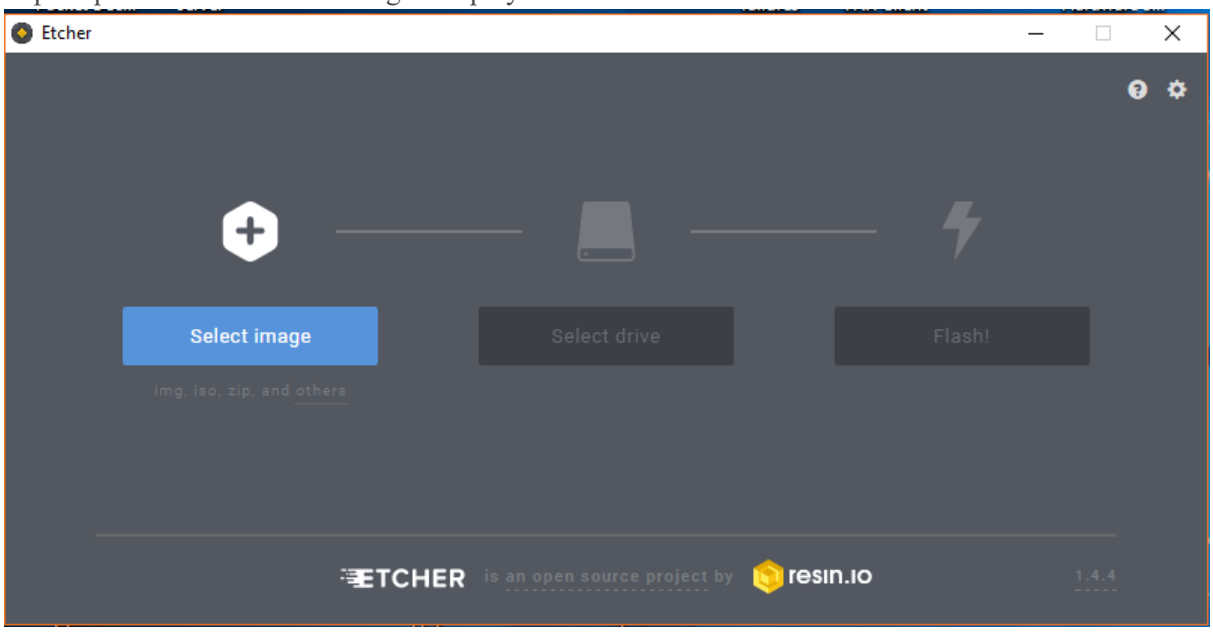
Create a NetWitness Platform USB Build Stick

Note: You must use a USB drive with capacity sufficient enough to accommodate the NetWitness Platform ISO file.

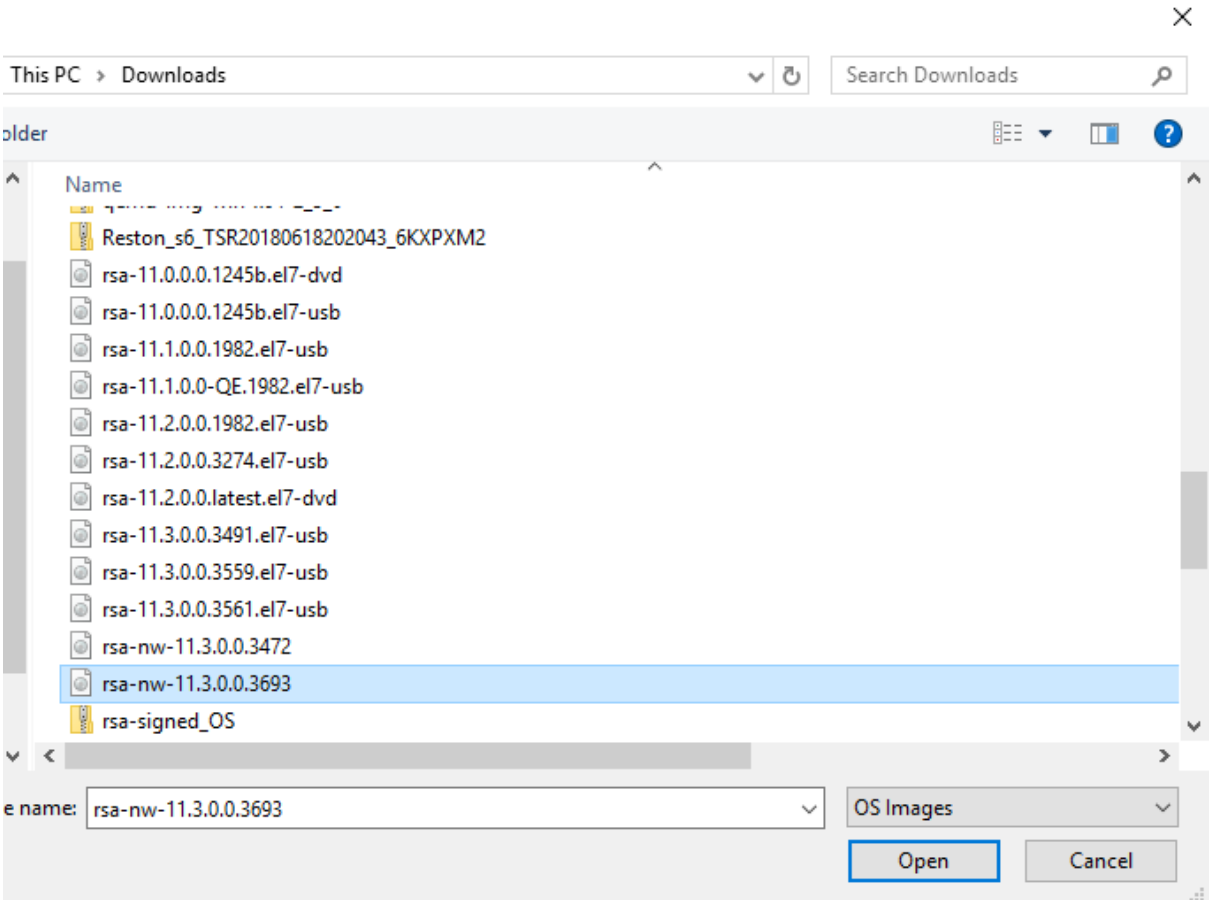
These instructions tell you how to create a USB "build-stick" to load the operating system and NetWitness Platform software onto your NetWitness Platform host.

Caution: All existing data on the USB drive will be destroyed.

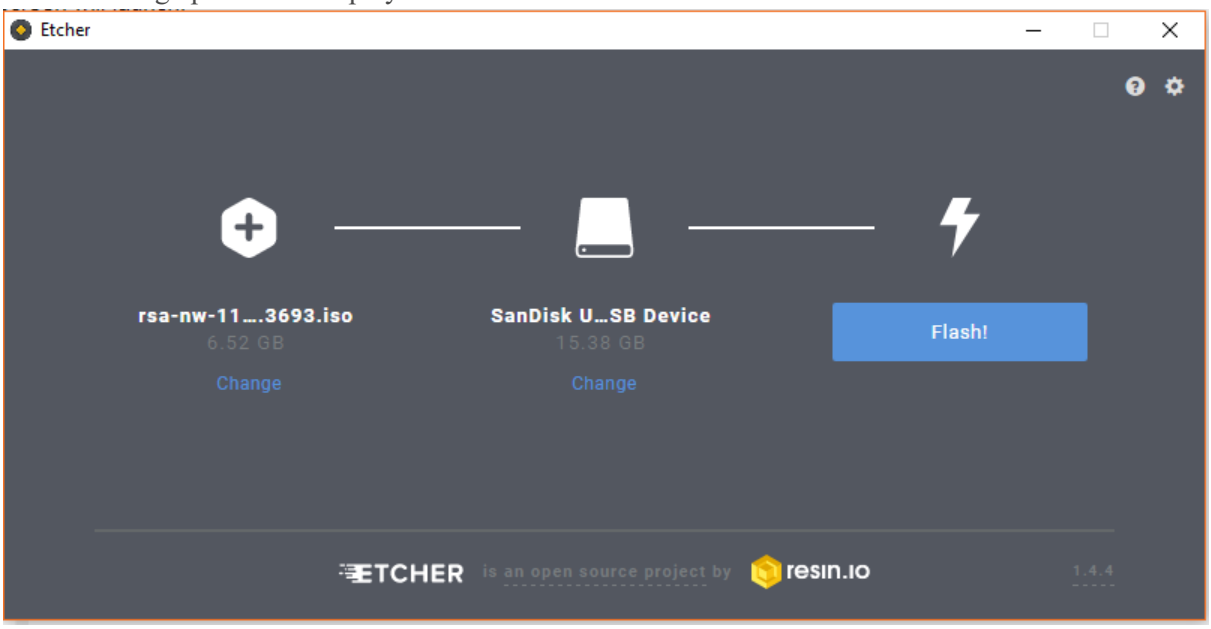
1. Download a automated tool to create the build stick onto your windows PC install it.
   You need a tool that etches an Linux file system on the USB drive to burn the NetWitness Platform ISO image on the USB drive. The ISO is unreadable in a Windows files system. Etcher is an example of a tool that will etch an Linux file system on the USB drive and Etcher is used as an example in this procedure. Etcher is available at: https://etcher.io.
2. Download the NetWitness Platform USB ISO image.
3. Insert the USB drive that you will use as the build stick.
4. Start the automated tool.
   A prompt similar to the following is displayed.



5. Click **Select Image**.
   A File explorer with the available OS images similar to the following Explorer displayed.

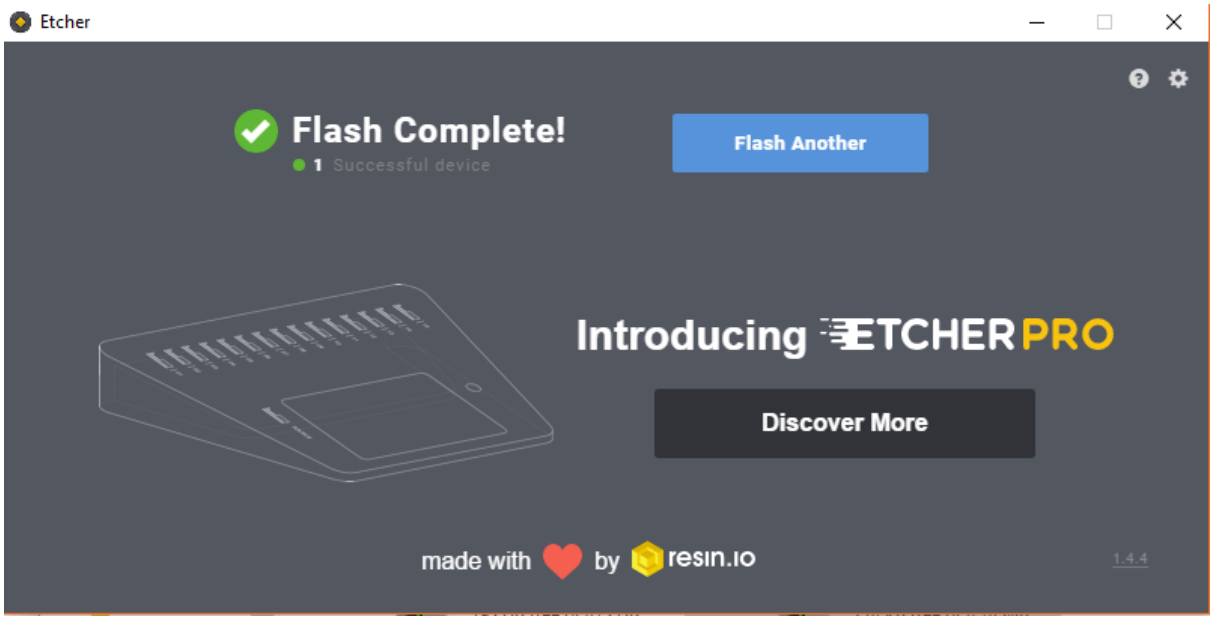


6. Select the appropriate ISO from the File explorer and click **Open**.
   The following options are displayed.



7. Click **Flash!**.
   The completion progress of creating the flash drive is displayed as shown in the following example.

8. Type yes in response to any other prompts until the process completes .
   When the process is complete, the following information is displayed.



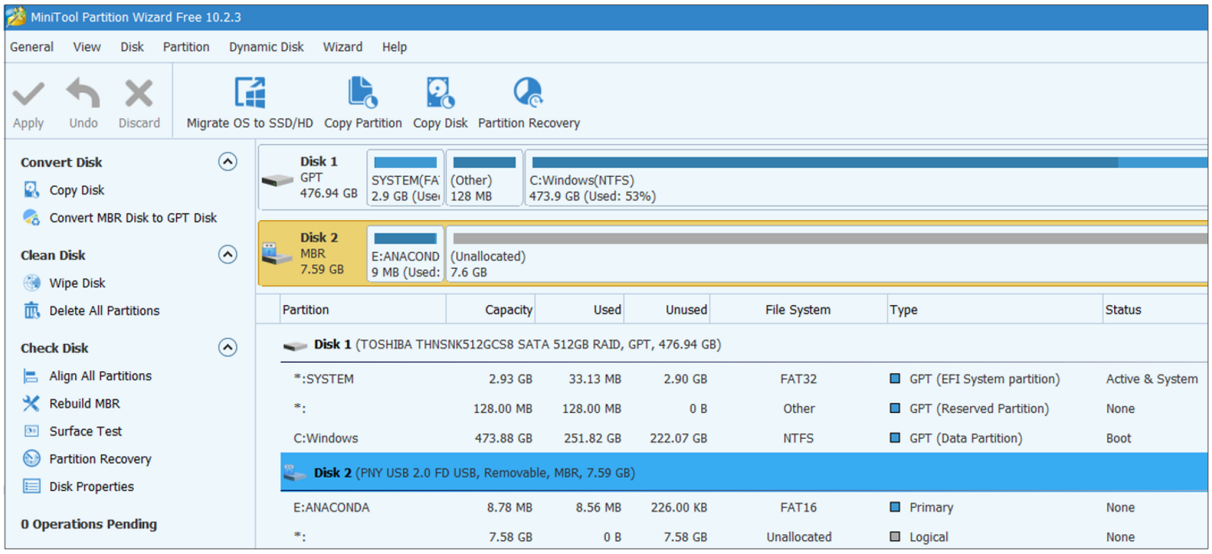
9. Close Etcher.
10. Go to My Computer, right click **USB** and click **Safely Remove or Eject**.
11. After the USB drive is ejected, unplug the USB device.
    The bootable USB is now ready.

Reinstate Windows File System on USB Device after Creating Build Stick with Etcher

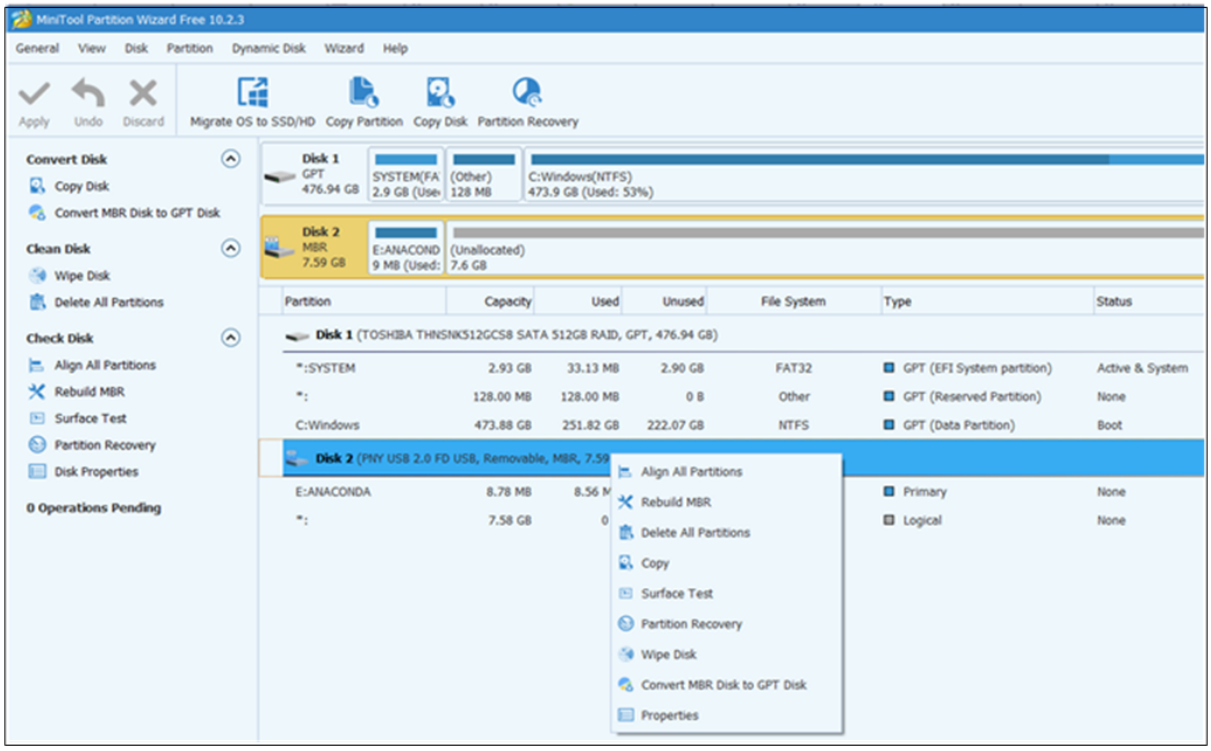
After you use Etcher to create a USB stick bootable on a host running CentOS, it becomes unusable by default on a Windows. If want to put a new ISO on this USB drive, use Etcher again to copy over the old ISO.

However, if you want to use the USB drive for other general storage purposes, you need to follow the following procedure to make it readable in Windows.

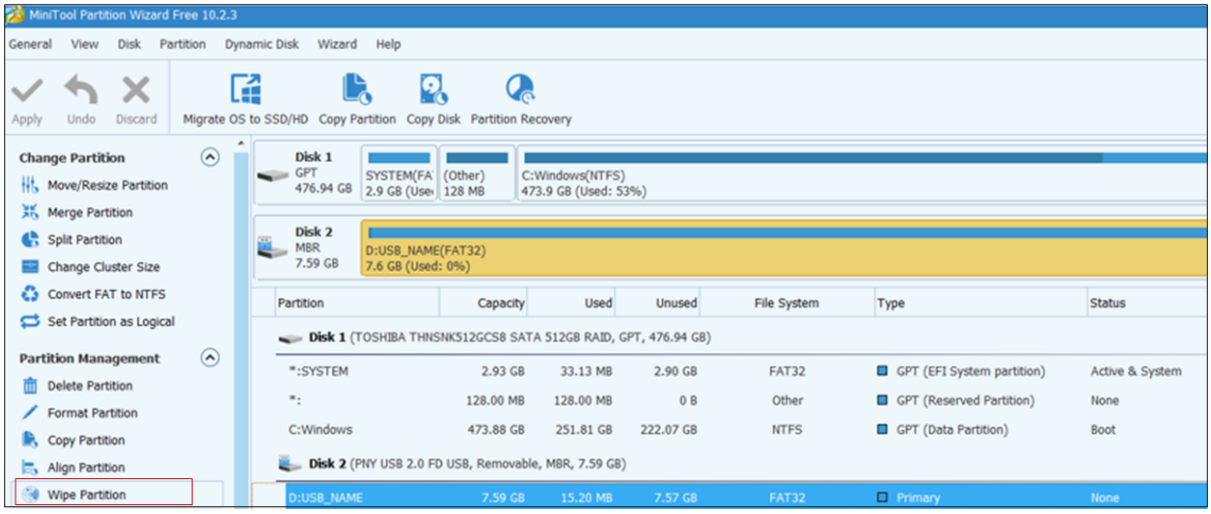
1. Download and install the Minitool Partition Wizard (http://download3.minitool.com/10.2.2/pw102-free.exe).
2. Make sure that the USB device is inserted in the correct drive.
3. Run the MiniTool Wizard.
   Your hard drive (for example, **Disk 1**) and the USB device drive (for example, **Disk 2**) are displayed.
4. Select the USB Device drive (for example, **Disk 2**).



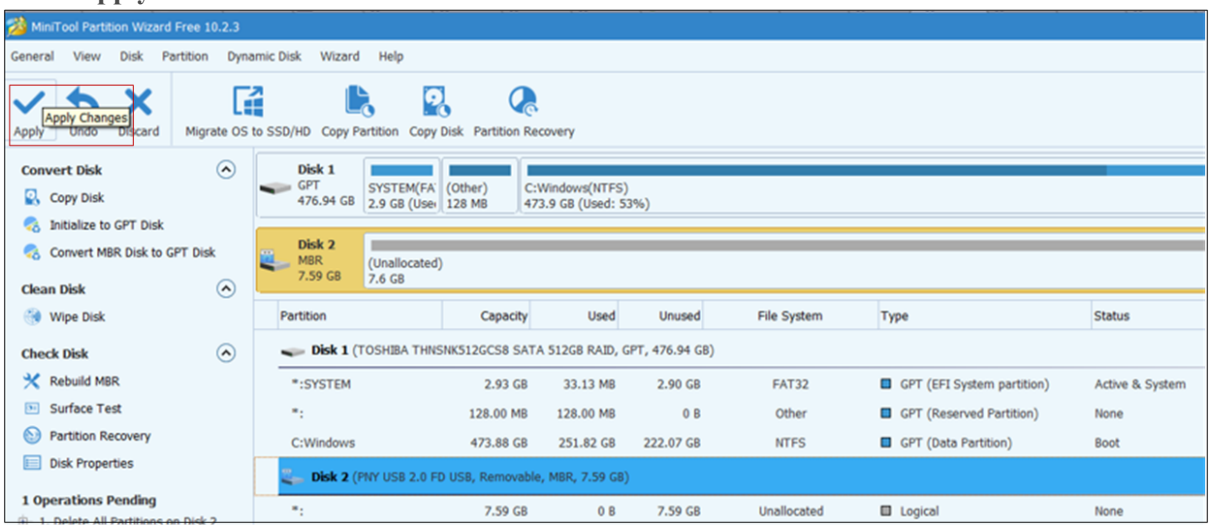
5. Right click the USB Device drive (for example, **Disk 2**) displayed in the Partition detail table. The disk partitioning commands are displayed.



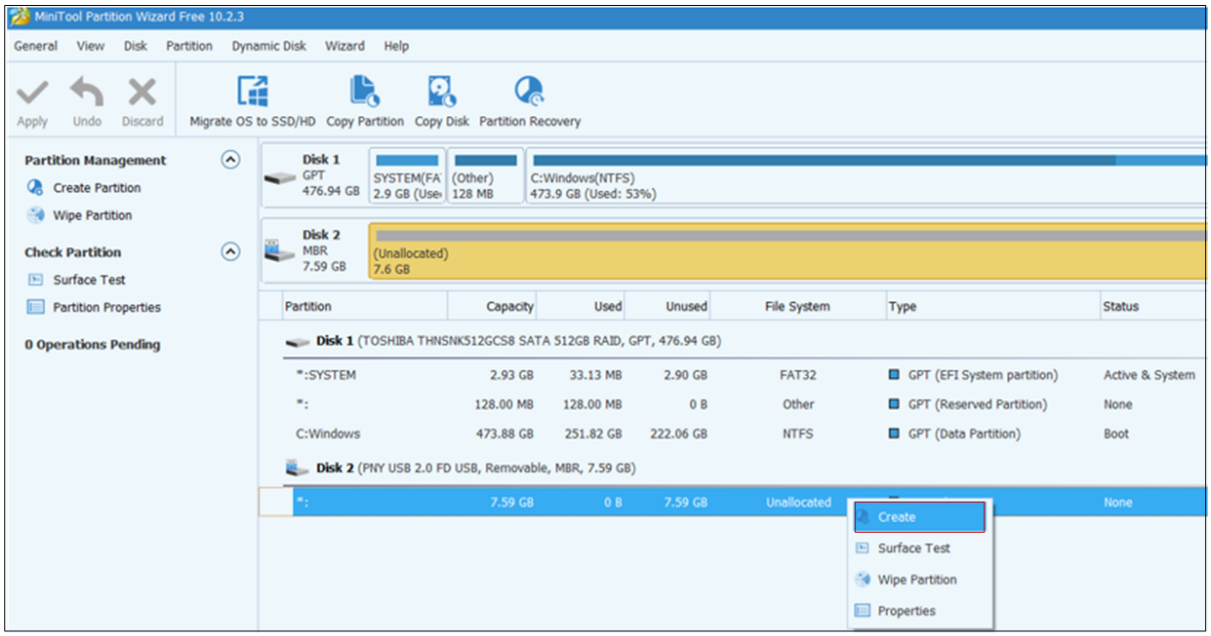
6. Click **Wipe Partition** in the left panel.



7. Click **Apply** in the toolbar.

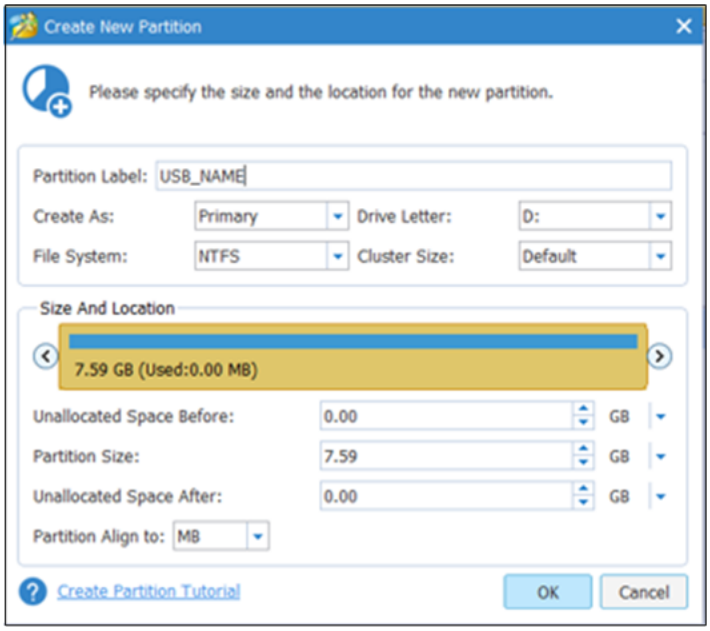


8. Right click on the same disk (for example, **Disk 2**) and click **Create**.



The **Create New Partition** dialog is displayed.

9. Complete the dialog with the USB Drive information you want and click **OK.**



10. Click **Apply** in the toolbar.
    Your USB Drive is displayed in Windows File ERxplorer after the process completes.

Virtual Host Setup Guide

This document provides instructions on the installation and configuration of RSA NetWitness® Platform 11.3.0.0 hosts running in a virtual environment.

Basic Virtual Deployment

This topic contains general guidelines and requirements for deploying RSANetWitness Platform 11.3.0.0 in a virtual environment.

Abbreviations Used in the Virtual Deployment Guide

Abbreviations	Description
CPU	Central Processing Unit
EPS	Events Per Second
VMware ESX	Enterprise-class, type-1 hypervisor, Supported versions - 6.5, 6.0 and 5.5
GB	Gigabyte. 1GB = 1,000,000,000 bytes
Gb	Gigbit. 1Gb = 1,000,000,000 bits.
Gbps	Gigabits per second or billions of bits per second. It measures bandwidth on a digital data transmission medium such as optical fiber.
GHz	GigaHertz 1 GHz = 1,000,000,000 Hz
IOPS	Input/Output Operations Per Second
Mbps	Megabits per second or millions of bits per second. It measures bandwidth on a digital data transmission medium such as optical fiber.
NAS	Network Attached Storage
OVF	Open Virtualization Format
OVA	Open Virtual Appliance. For purposes of this guide, OVA stands for Open Virtual Host.
RAM	Random Access Memory (also known as memory)
SAN	Storage Area Network
SSD/EFD HDD	Solid-State Drive/Enterprise Flash Drive Hard Disk Drive
SCSI	Small Computer System Interface
SCSI (SAS)	Point-to-point serial protocol that moves data to and from computer storage devices such as hard drives and tape drives.
vCPU	Virtual Central Processing Unit (also known as a virtual processor)
vRAM	Virtual Random Access Memory (also known as virtual memory)
RSA NetWitness UEBA	RSA NetWitness User and Entity Behavior Analysis
Hyper-V	Microsoft Hyper Visor, Supported version 2016 Server
VHDX	Hyper-V virtual hard disk

Supported Virtual Hosts

You can install the following NetWitness Platform hosts in your virtual environment as a virtual host and inherit features that are provided by your virtual environment:

- NetWitness Server
- Event Stream Analysis - ESA Primary and ESA Secondary
- Archiver
- Broker
- Concentrator
- Log Decoder
- Malware Analysis
- Decoder
- Remote Log Collector
- Endpoint Log Hybrid
- User and Entity Behavior Analysis (UEBA)

You must be familiar with the following VMware infrastructure concepts:

- VMware vCenter Server
- VMware ESXi
- Virtual machine

For information on VMware concepts, refer to the VMware product documentation.

The virtual hosts are provided as an OVA. You need to deploy the OVA file as a virtual machine in your virtual infrastructure.

Installation Media

Installation media are in the form of OVA and VHDX packages, which are available for download and installation from Download Central (https://download.rsasecurity.com). As part of your order fulfillment, RSA gives you access to the OVA and VHDX.

Virtual Environment Recommendations

The virtual hosts installed with the OVA and VHDX packages have the same functionality as the NetWitness Platform hardware hosts. This means that when you implement virtual hosts, you must account for the back-end hardware. RSA recommends that you perform the following tasks when you set up your virtual environment.

- Based on resource requirements of the different components, follow best practices to use the system and dedicated storage appropriately.
- Make sure that back-end disk configurations provide a write speed of 10% greater than the required sustained capture and ingest rate for the deployment.
- Build Concentrator directories for meta and index databases on the SSD/EFD HDD.
- If the database components are separate from the installed operating system (OS) components (that is, on a separate physical system), provide direct connectivity with either:
  - Two 8-Gbps Fiber Channel SAN ports per virtual host,
    or
  - 6-Gbps Serial Attached SCSI (SAS) connectivity.

Note: 1.) Currently, NetWitness Platform does not support Network Attached Storage (NAS) for Virtual deployments.
2.) The Decoder allows any storage configuration that can meet the sustained throughput requirement. The standard 8-Gbps Fiber Channel link to a SAN is insufficient to read and write packet data at 10 Gb. You must use multiple Fiber Channels when you configure to the connection from a **10G Decoder** to the SAN.

Virtual Host Recommended System Requirements

The following tables list the vCPU, vRAM, and Read and Write IOPS recommended requirements for the virtual hosts based on the EPS or capture rate for each component.

- Storage allocation is covered in Step 3 “Configure Databases to Accommodate NetWitness Platform”.
- vRAM and vCPU recommendations may vary depending on capture rates, configuration and content enabled.
- The recommendations were tested at ingest rates of up to 25,000 EPS for logs and two Gbps for packets, for non SSL.
- The vCPU specifications for all the components listed in the following tables are Intel Xeon CPU @2.59 Ghz.
- All ports are SSL tested at 15,000 EPS for logs and 1.5 Gbps for packets.

Note: The above recommended values might differ for 11.3.0.0 installation when you install and try the new features and enhancements.

Scenario One

The requirements in these tables were calculated under the following conditions.

- All the components were integrated.
- The Log stream included a Log Decoder, Concentrator, and Archiver.

- The Packet Stream included a Network Decoder and Concentrator.
- The background load included hourly and daily reports.
- Charts were configured.

Log Decoder

EPS	CPU	Memory	Read IOPS	Write IOPS
2,500	6 or 15.60 GHz	32 GB	50	75
5,000	8 or 20.79 GHz	32 GB	100	100
7,500	10 or 25.99 GHz	32 GB	150	150

Network Decoder

Mbps	CPU	Memory	Read IOPS	Write IOPS
50	4 or 10.39 GHz	32 GB	50	150
100	4 or 10.39 GHz	32 GB	50	250
250	4 or 10.39 GHz	32 GB	50	350

Concentrator - Log Stream

EPS	CPU	Memory	Read IOPS	Write IOPS
2,500	4 or 10.39 GHz	32 GB	300	1,800
5,000	4 or 10.39 GHz	32 GB	400	2,350
7,500	6 or 15.59 GHz	32 GB	500	4,500

Concentrator - Packet Stream

Mbps	CPU	Memory	Read IOPS	Write IOPS
50	4 or 10.39 GHz	32 GB	50	1,350
100	4 or 10.39 GHz	32 GB	100	1,700
250	4 or 10.39 GHz	32 GB	150	2,100

Archiver

EPS	CPU	Memory	Read IOPS	Write IOPS
2,500	4 or 10.39 GHz	32 GB	150	250
5,000	4 or 10.39 GHz	32 GB	150	250
7,500	6 or 15.59 GHz	32 GB	150	350

Scenario Two

The requirements in these tables were calculated under the following conditions.

- All the components were integrated.
- The Log stream included a Log Decoder, Concentrator, Warehouse Connector, and Archiver.
- The Packet Stream included a Network Decoder, Concentrator, and Warehouse Connector.
- Event Stream Analysis was aggregating at 90K EPS from three Hybrid Concentrators.
- Respond was receiving alerts from the Reporting Engine and Event Stream Analysis.
- The background load Included reports, charts, alerts, investigation, and Respond.
- Alerts were configured.

Log Decoder

EPS	CPU	Memory	Read IOPS	Write IOPS
10,000	16 or 41.58 GHz	50 GB	300	50
15,000	20 or 51.98 GHz	60 GB	550	100

Network Decoder

Mbps	CPU	Memory	Read IOPS	Write IOPS
500	8 or 20.79 GHz	40 GB	150	200
1,000	12 or 31.18 GHz	50 GB	200	400
1,500	16 or 41.58 GHz	75 GB	200	500

Concentrator - Log Stream

EPS	CPU	Memory	Read IOPS	Write IOPS
10,000	10 or 25.99 GHz	50 GB	1,550 + 50	6,500
15,000	12 or 31.18 GHz	60 GB	1,200 + 400	7,600

Concentrator - Packet Stream

Mbps	CPU	Memory	Read IOPS	Write IOPS
500	12 or 31.18 GHz	50 GB	250	4,600
1,000	16 or 41.58 GHz	50 GB	550	5,500
1,500	24 or 62.38 GHz	75 GB	1,050	6,500

Warehouse Connector - Log Stream

EPS	CPU	Memory	Read IOPS	Write IOPS
10,000	8 or 20.79 GHz	30 GB	50	50
15,000	10 or 25.99 GHz	35 GB	50	50

Warehouse Connector - Packet Stream

Mbps	CPU	Memory	Read IOPS	Write IOPS
500	6 or 15.59 GHz	32 GB	50	50
1,000	6 or 15.59 GHz	32 GB	50	50
1,500	8 or 20.79 GHz	40 GB	50	50

Archiver - Log Stream

EPS	CPU	Memory	Read IOPS	Write IOPS
10,000	12 or 31.18 GHz	40 GB	1,300	700
15,000	14 or 36.38 GHz	45 GB	1,200	900

Event Stream Analysis with Context Hub

EPS	CPU	Memory	Read IOPS	Write IOPS
90,000	32 or 83.16 GHz	94 GB	50	50

NetWitness Server and Co-Located Components

The NetWitness Server, Jetty, Broker, Respond, and Reporting Engine are in the same location.

CPU	Memory	Read IOPS	Write IOPS
12 or 31.18 GHz	64 GB	100	350

Scenario Three

The requirements in these tables were calculated under the following conditions.

- All the components were integrated.
- The Log stream included a Log Decoder and Concentrator.
- The Packet stream included a Network Decoder and the Concentrator.
- Event Stream Analysis was aggregating at 90K EPS from three Hybrid Concentrators.
- Respond was receiving alerts from the Reporting Engine and Event Stream Analysis.
- The background load included hourly and daily reports.
- Charts were configured.

Log Decoder

EPS	CPU	Memory	Read IOPS	Write IOPS
25,000	32 or 83.16 GHz	75 GB	250	150

Network Decoder

Mbps	CPU	Memory	Read IOPS	Write IOPS
2,000	16 or 41.58 GHz	75 GB	50	650

Concentrator - Log Stream

EPS	CPU	Memory	Read IOPS	Write IOPS
25,000	16 or 41.58 GHz	75 GB	650	9,200

Concentrator - Packet Stream

Mbps	CPU	Memory	Read IOPS	Write IOPS
2,000	24 or 62.38 GHz	75 GB	150	7,050

Log Collector (Local and Remote)

The Remote Log Collector is a Log Collector service running on a remote host and the Remote Collector is deployed virtually.

EPS	CPU	Memory	Read IOPS	Write IOPS
15,000	8 or 20.79 GHz	8 GB	50	50
30,000	8 or 20.79 GHz	15 GB	100	100

Scenario Four

The requirements in these tables were calculated under the following conditions for Endpoint Log Hybrid.

- All the components were integrated.
- Endpoint Server is installed.
- The Log stream included a Log Decoder and Concentrator.

Endpoint Log Hybrid

The values provided below are qualified for NetWitness Platform 11.3 for a dedicated Endpoint Log Hybrid with no other log sources configured.

Agents	CPU	Memory	IOPS Values			Storage Requirements Per Scan
5000	16 core or 42 GHz	32 GB		Read IOPS	Write IOPS	
			Log Decoder	250	150	60 GB
			Concentrator	150	7,050	60 GB
			MongoDb	250	150	10 GB

Agents	CPU	Memory	IOPS Values			Storage Requirements Per Scan
20000	16 core or 42 GHz	64 GB		Read IOPS	Write IOPS	
			Log Decoder	250	150	240 GB
			Concentrator	150	7,050	240 GB
			MongoDb	250	150	40 GB

To retain more than one snapshot of all the agents, the Concentrator and MongoDb storage size needs to be increased. For example, for 2 snapshots, multiply the Concentrator and MongoDB * 2 = 120 GB and 20 GB respectively. (Log Decoder storage size is kept constant.)

The following is the storage requirement for an agent per day. You can increase the storage based on the number of agents. For example, if you want to deploy 100 agents, multiple the values for Concentrator and MongoDB * 100 * number of days.

Storage per agent per day		
	Tracking	Schedule Scan
Log Decoder	7.8 MB	9.8 MB

Storage per agent per day		
Concentrator	11.22 MB	13.31 MB
MongoDb	0.04 MB	0.61 MB

If you have more than 25K agents in your virtual deployment, RSA recommends you to do one of the following:

- Scale resources such as CPU, RAM, and storage
- Install a physical host (Endpoint Log Hybrid)

Endpoint Broker

Agents	CPU	RAM
50000	2%	4 GB

Log Collector (Local and Remote)

The Remote Log Collector is a Log Collector service running on a remote host and the Remote Collector is deployed virtually.

EPS	CPU	Memory	Read IOPS	Write IOPS
15,000	8 or 20.79 GHz	8 GB	50	50
30,000	8 or 20.79 GHz	15 GB	100	100

Legacy Windows Collectors Sizing Guidelines

Refer to the *RSA NetWitness Platform Legacy Windows Collection Update & Installation* for sizing guidelines for the Legacy Windows Collector.

UEBA

CPU	Memory	Read IOPS	Write IOPS
16 or 2.4GHz	64 GB	500MB	500MB

Note: RSA recommends that you only deploy UEBA on a virtual host if your log collection volume is low. If you have a moderate to high log collection volume, RSA recommends that you deploy UEBA on the physical host described under "RSA NetWitness UEBA Host Hardware Specifications" in the Physical Host Installation Guide. Contact Customer Support (https://community.rsa.com/docs/DOC-1294) for advice on choosing which host, virtual or physical, to use for UEBA.

Install NetWitness Platform Virtual Host in Virtual Environment

Complete the following procedures according to their numbered sequence to install RSA NetWitness® Platform in a virtual environment.

Prerequisites

Make sure that you have:

- A VMware ESX Server that meets the requirements described in the above section. Supported versions are 6.5, 6.0, and 5.5.
- vSphere 4.1, 5.0, or 6.0 Client installed to log on to the VMware ESX Server.
- Administrator rights to create the virtual machines on the VMware ESX Server.

Step 1a. Deploy the Virtual Host to create VM

Complete the following steps to deploy the OVA file on the vCenter Server or ESX Server using the vSphere client.

Prerequisites

Make sure that you have:

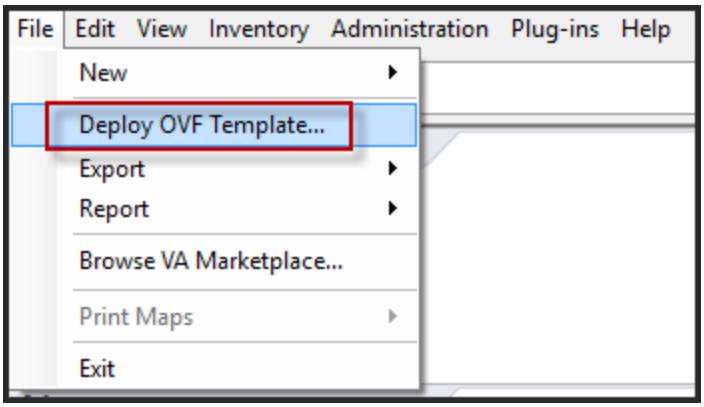
- Network IP addresses, netmask, and gateway IP addresses for the virtual host.
- Network names for all virtual hosts, if you are creating a cluster.
- DNS or host information.
- Password for virtual host access. The default username is `root` and the default password is `netwitness`.
- The NetWitness Platform virtual host package file for example, rsanw-11.3.0.0.xxxx.el7-x86_64.ova. (You download this package from Download Central (https://community.rsa.com).)

Procedure

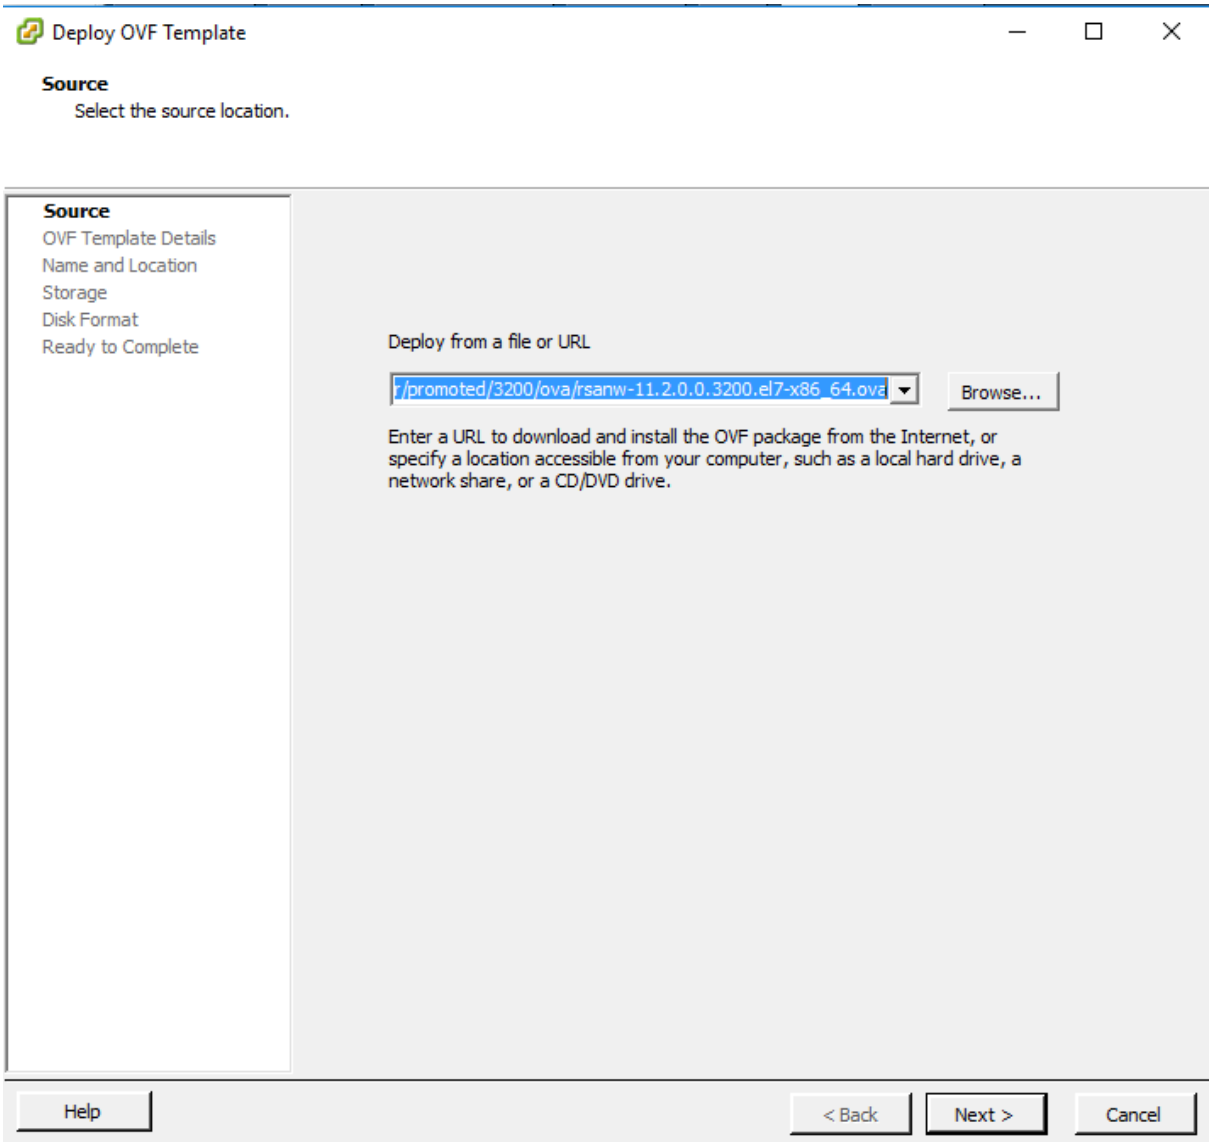
Note: The following instructions illustrate an example of deploying an OVA host in the ESXi environment. The screens you see may be different from this example.

To deploy the OVA host:

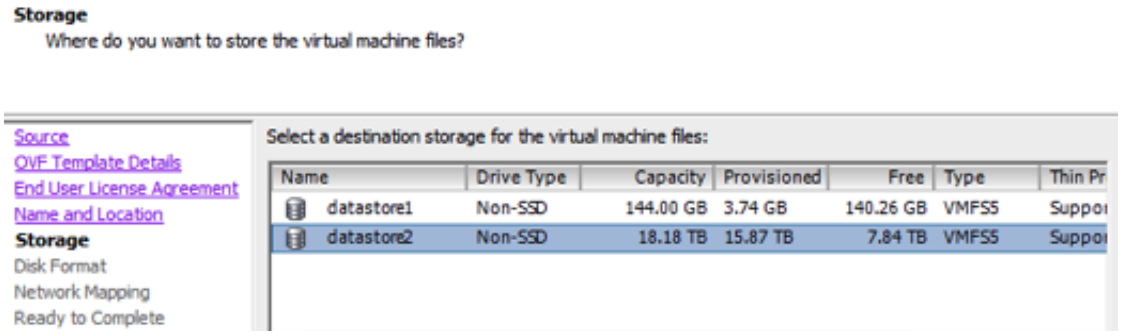
1. Log on to the ESXi environment.
2. In the **File** drop-down, select **Deploy OVF Template**.



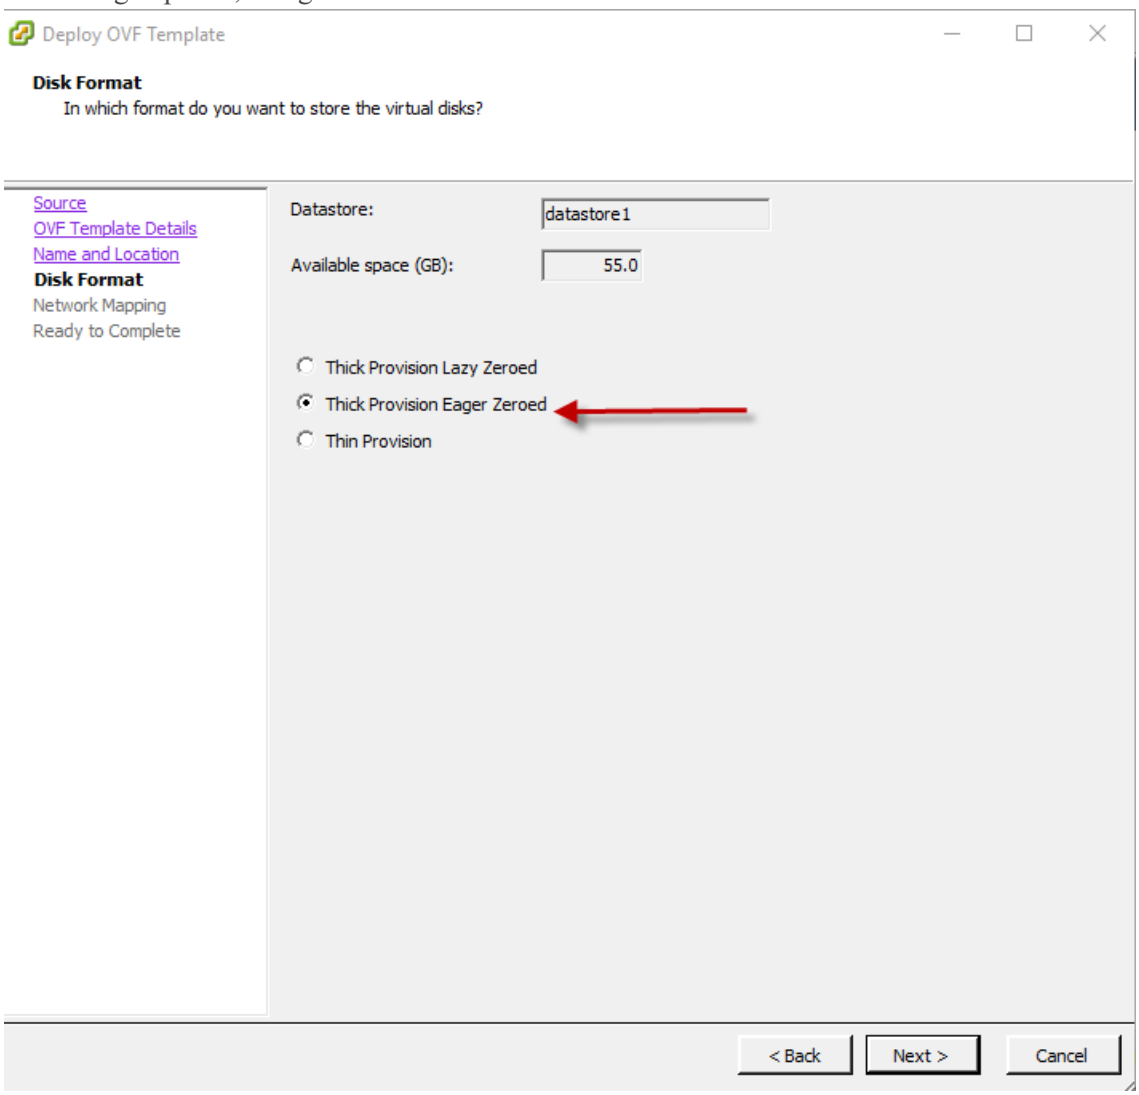
3. The Deploy OVF Template dialog is displayed. In the **Deploy OVF Template** dialog, select the OVF for the host that you want to deploy in the virtual environment (for example, **V11.3** GOLD\\rsanw-11.3.0.0.xxxx.el7-x86_64.ova), and click **Next**.



4. The Name and Location dialog is displayed. The designated name does not reflect the server hostname. The name displayed is useful for inventory reference from within ESXi.
5. Make a note of the name, and click **Next**.
   Storage Options are displayed.

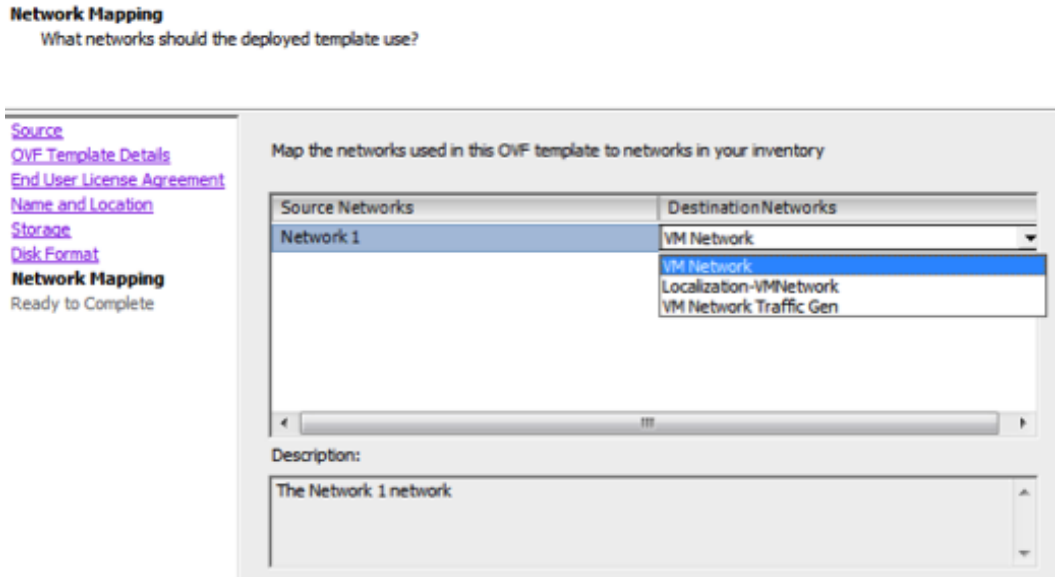


6. For Storage options, designate the datastore location for the virtual host and click **Next**.



Note: This location is for the host operating system (OS) exclusively. It does not have to be the same datastore needed to set up and configure additional volumes for the NetWitness Platform databases on certain hosts (covered in the following sections).

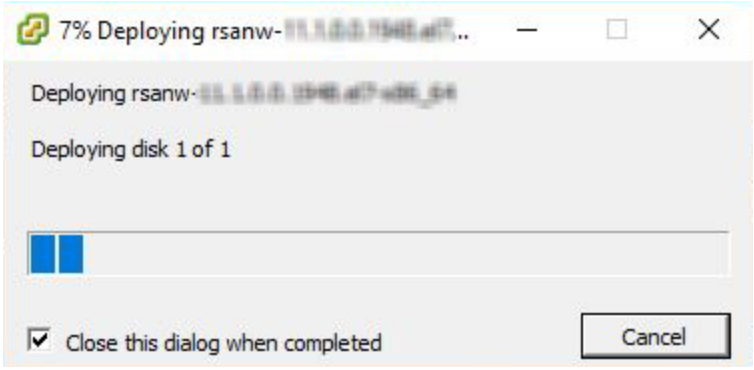
7. Click **Next**.
   The Network Mapping options are displayed.



8. Select the **Network label** based on your requirement (For example, VM Network), and click **Next**.

Note: If you want to configure Network Mapping now, you can select options, but RSA recommends that you keep the default values and configure network mapping after you configure the OVA. You configure the OVA in Step 4: Configure Host-Specific Parameters.

A status window showing deployment status is displayed.



After the process is complete, the new OVA is presented in the designated resource pool visible on ESXi from within vSphere. At this point, the core virtual host is installed, but is still not configured.

Step 1b. Create Virtual Machine for Microsoft Hyper-V

Complete the following steps according to their numbered sequence to deploy virtual host in Hyper-V.

Prerequisites

Make sure that you have:

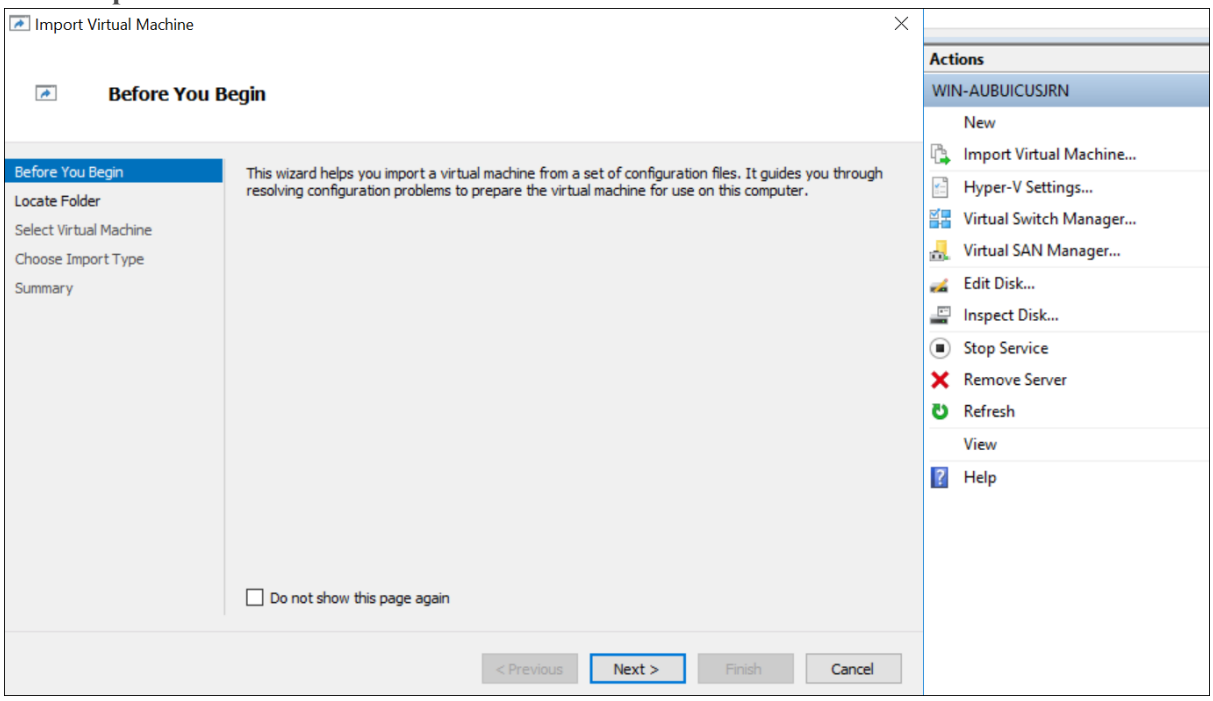
- Network IP addresses, netmask, and gateway IP addresses for the virtual host.
- Network names for all virtual hosts, if you are creating a cluster.
- DNS or host information.
- Password for virtual host access. The default username is `root` and the default password is `netwitness`.
- The NetWitness Platform virtual host package file for example, `rsa-nw-11.3.0.0.3274.zip`. (You download this package from Download Central https://community.rsa.com)

Procedure

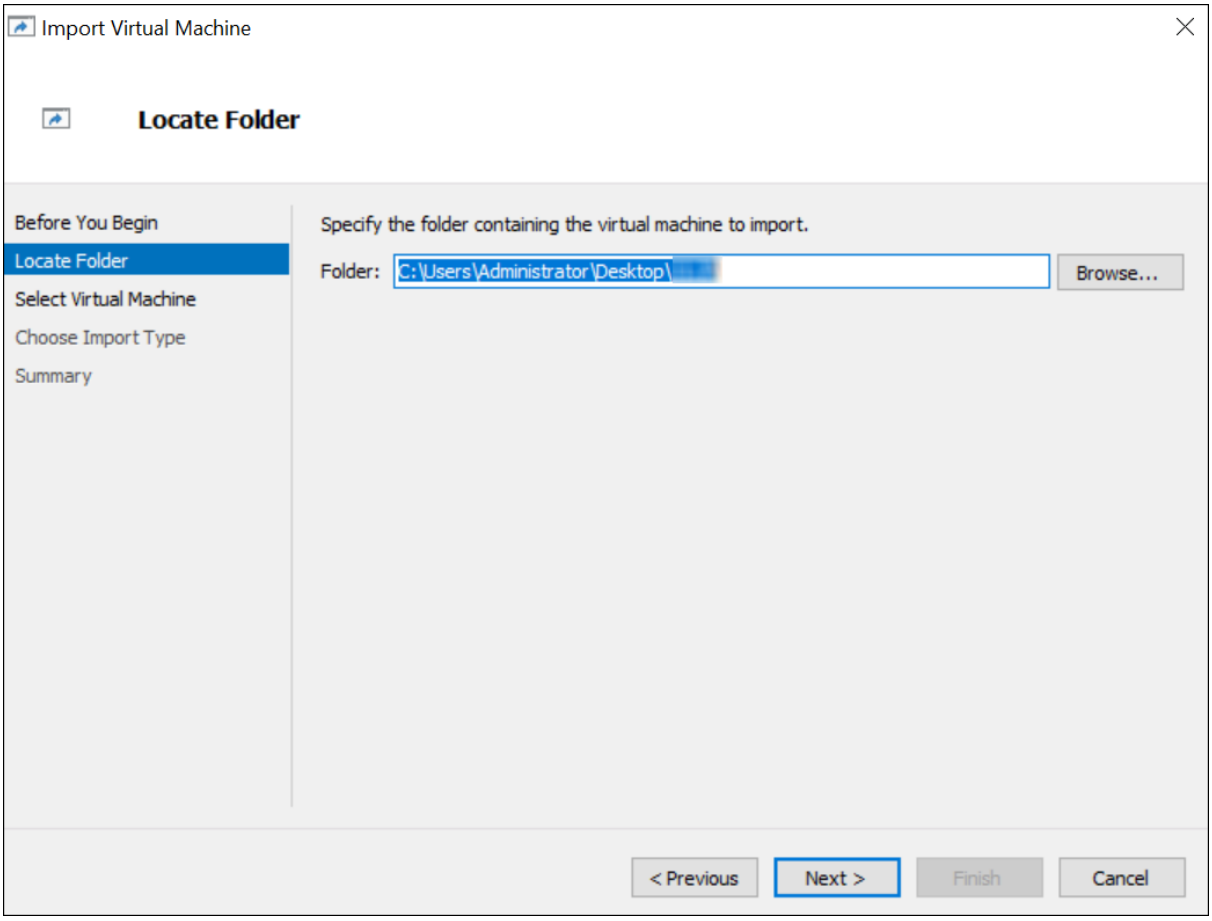
Note: The following instructions illustrate an example of deploying a VM in the Hyper-V environment. The screens you see may be different from this example.

To deploy virtual host in Hyper-V.

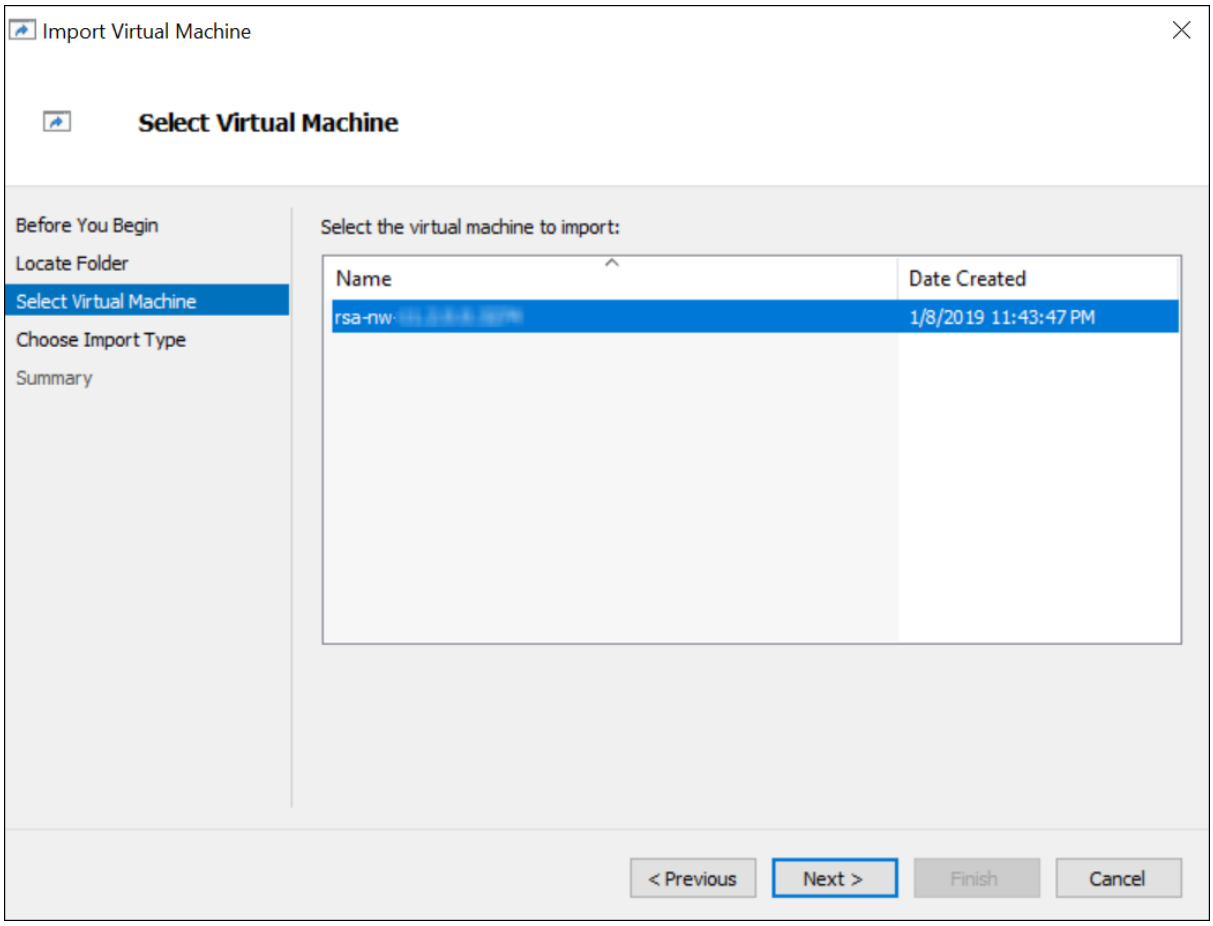
1. Log on to Hyper-V Manager.
2. Click **Import Virtual Machine** and Click **Next**.



3. In the **Import Virtual Machine** dialog, specify the path where the zip file is extracted and Click **Next**.



4. Select the Virtual Machine and Click **Next**.



Import Virtual Machine

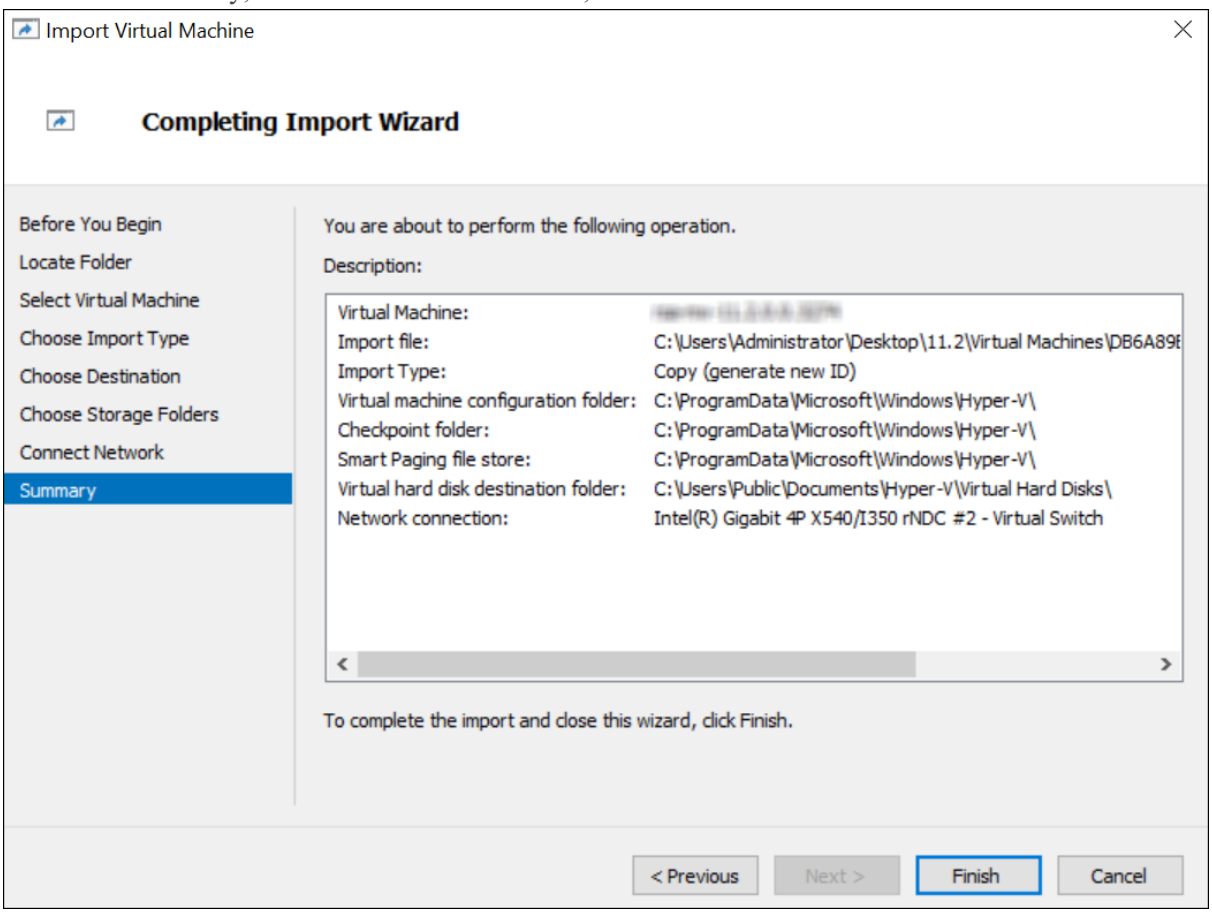
9. Check the Summary, if all the details are correct, click **Finish**.



Step 2. Configure the Network and Install RSA NetWitness Platform

Complete the following steps to configure the network of the Virtual Appliance.

Prerequisites

Make sure that you have:

- Network IP addresses, netmask, and gateway IP addresses for the virtual host.
- Network names for all virtual hosts, if you are creating a cluster.
- DNS or host information.

Procedure

Perform the following steps for all virtual hosts to get them on your network.

Review Open Firewall Ports

Review the ***Network Architecture and Ports*** topic in the ***Deployment Guide*** in the NetWitness Platform help so that you can configure NetWitness Platform services and your firewalls. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Caution: Do not proceed with the installation until the ports on your firewall are configured.

There are two main tasks that you must complete in the order listed below to install NetWitness Platform 11.3

Step 3. Configure Databases to Accommodate NetWitness Platform

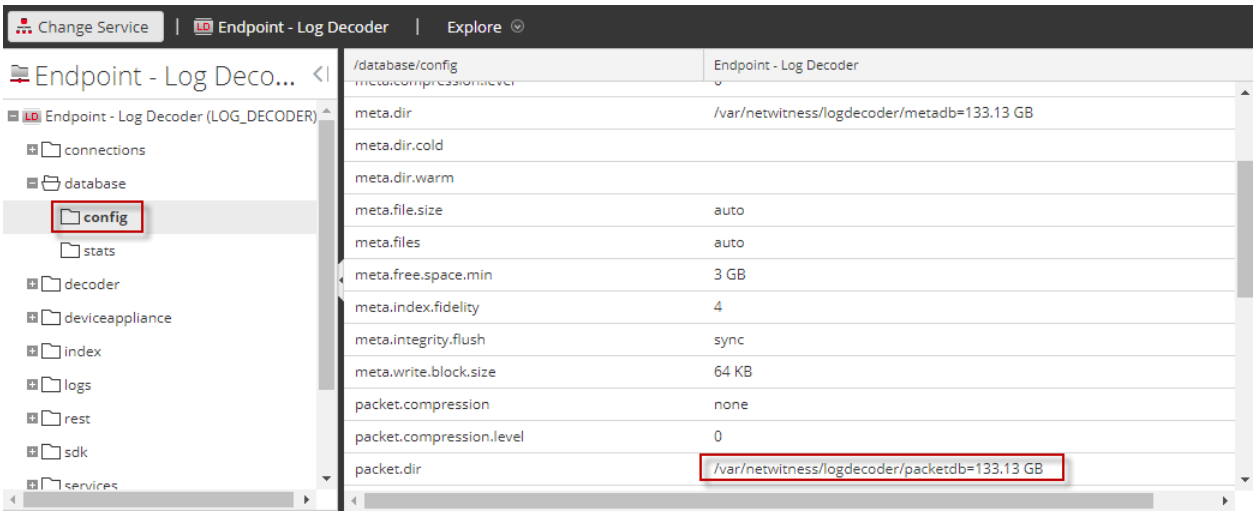
When you deploy databases from OVA or VHDX, the initial database space allocation may not be adequate to support NetWitness Server. You need to review the status of the datastores after initial deployment and expand them.

Task 1. Review Initial Datastore Configuration

Review the datastore configuration after initial deployment to determine if you have enough drive space to accommodate the needs of your enterprise. As an example, this topic reviews the datastore configuration of the PacketDB on the Log Decoder host after you first deploy it from an Open Virtualization Archive (OVA) file.

Initial Space Allocated to PacketDB

The allocated space for the PacketDB is about 133.13 GB. The following NetWitness Platform Explore view example shows the size of the PacketDB after you initially deploy it from OVA or VHDX.



Initial Database Size

By default, the database size is set to 95% of the size of file system on which the database resides. SSH to the Log Decoder host and enter the `df -k` command string to view the files system and its size. The following output is an example of the information that this command strings returns.

```
[root@LogDecoder ~]# df -kh
Filesystem                            Size  Used Avail Use% Mounted on
/dev/mapper/netwitness_vg00-root       30G  3.0G   27G  10% /
devtmpfs                               16G     0   16G   0% /dev
tmpfs                                  16G   12K   16G   1% /dev/shm
tmpfs                                  16G   25M   16G   1% /run
tmpfs                                  16G     0   16G   0% /sys/fs/cgroup
/dev/mapper/netwitness_vg00-usrhome    10G   33M   10G   1% /home
/dev/mapper/netwitness_vg00-varlog     10G   42M   10G   1% /var/log
/dev/mapper/netwitness_vg00-nwhome    141G  396M  140G   1% /var/netwitness
/dev/sda1                            1014M   73M  942M   8% /boot
tmpfs                                 3.2G     0  3.2G   0% /run/user/0
[root@LogDecoder ~]#
```

PacketDB Mount Point

The database is mounted on the `packetdb` logical volume in `netwitness_vg00` volume group. `netwitness_vg00` and this is where you start your expansion planning for the file system.

Initial Status of netwitness_vg00

Complete the following steps to review the status of `netwitness_vg00`.

1. SSH to the Log Decoder host.
2. Enter the `lvs` (Logical Volumes Show) command string to determine which logical volumes are grouped in `netwitness_vg00`.
   `[root@nwappliance32431 ~}# lvs netwitness_vg00.`

   The following output is an example of the information that this command strings returns.

```
[root@LogDecoder ~]# vgs
  VG             #PV #LV #SN Attr   VSize    VFree
  netwitness_vg00   1   5   0 wz--n- <194.31g 100.00m
```

3. Enter the pvs (Physical Volumes Show) command string to determine which physical volumes belong to a specific group.
   `[root@nwappliance32431 ~}# pvs`

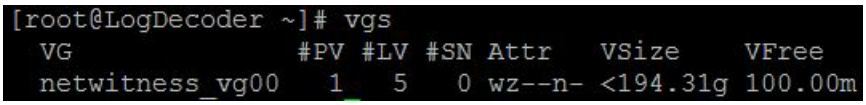
   The following output is an example of the information that this command strings returns.

```
[root@LogDecoder ~]# pvs
  PV         VG             Fmt  Attr PSize    PFree
  /dev/sda2  netwitness_vg00 lvm2 a--  <194.31g 100.00m
```

4. Enter the `vgs` (Volume Groups Show) command string to display the total size of specific volume group.

   ```
   [root@nwappliance32431 ~}# vgs
   ```

   The following output is an example of the information that this command strings returns.



Task 2. Review Optimal Datastore Space Configuration

You need to review the datastore space configuration options for the different hosts to get the optimal performance from your virtual NetWitness Platform deployment. Datastores are required for virtual host configuration, and the correct size is dependent on the host.

Note: (1.) Refer to the "**Optimization Techniques**" topic in the RSA NetWitness PlatformCore Database Tuning Guide for recommendations on how to optimize datastore space. (2.) Contact Customer Care for assistance in configuring your virtual drives and using the Sizing & Scoping Calculator.

Virtual Drive Space Ratios

The following table provides optimal configurations for packet and log hosts. Additional partitioning and sizing examples for both packet capture and log ingest environments are provided at the end of this topic.

Decoder			
Persistent Datastores	Cache Datastore		
PacketDB	SessionDB	MetaDB	Index
100% as calculated by Sizing & Scoping Calculator	6 GB per 100Mb/s of traffic sustained provides 4 hours cache	60 GB per 100Mb/s of traffic sustained provides 4 hours cache	3 GB per 100Mb/s of traffic sustained provides 4 hours cache

Concentrator		
Persistent Datastores	Cache Datastores	
MetaDB	SessionDB Index	Index
Calculated as 10% of the PacketDB required for a 1:1 retention ratio	30 GB per 1TB of PacketDB for standard multi protocol network deployments as seen at typical internet gateways	5% of the calculated MetaDB on the Concentrator. Preferred High Speed Spindles or SSD for fast access

Log Decoder			
Persistent Datastores	Cache Datastores		
PacketDB	SessionDB	MetaDB	Index
100% as calculated by Sizing & Scoping Calculator	1 GB per 1000 EPS of traffic sustained provides 8 hours cache	20 GB per 1000 EPS of traffic sustained provides 8 hours cache	0.5 GB per 1000 EPS of traffic sustained provides 4 hours cache

Log Concentrator		
Persistent Datastores	Cache Datastores	
MetaDB	SessionDB Index	Index
Calculated as 100% of the PacketDB required for a 1:1 retention ratio	3 GB per 1000 EPS of sustained traffic per day of retention	5% of the calculated MetaDB on the Concentrator. Preferred High Speed Spindles or SSD for fast access

Task 3. Add New Volume and Extend Existing File Systems

After reviewing your initial datastore configuration, you may determine that you need to add a new volume. This topic uses a Virtual Packet/Log Decoder host as an example.

Complete these tasks in the following order.

1. Add New Disk
2. Create New Volumes on the New Disk
3. Create LVM volume on New Partition
4. Extend Volume Group with Physical Volume
5. Expand the File System
6. Start the Services
7. Make Sure the Services Are Running
8. Reconfigure LogDecoder Parameters

Add New Disk

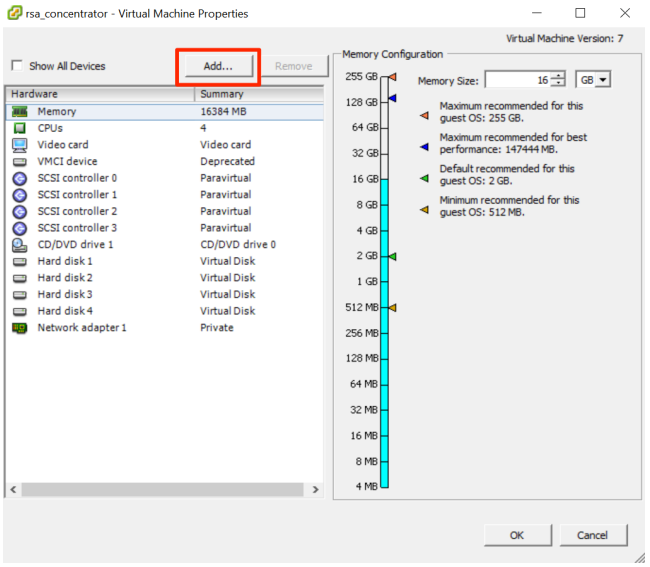
Add New Disk in VMware ESXi
Add New Disk in Hyper-V

Add New Disk in VMware ESXi

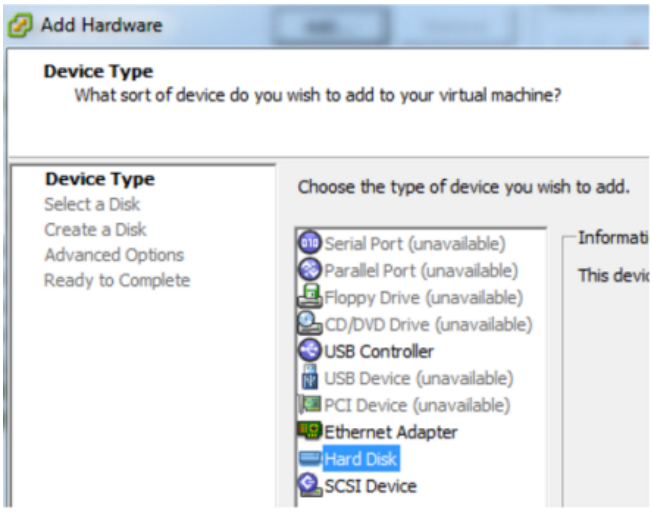
This procedure shows you how to add a new 100 GB disk on the same datastore.

Note: The procedure to add a disk on different datastore is similar to the procedure shown here.

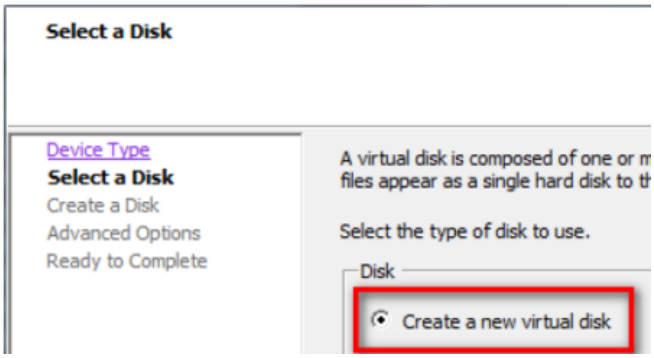
1. Shut down the machine, edit **Virtual Machine Properties**, click **Hardware** tab, and click **Add**.



2. Select **Hard Disk** as the device type.

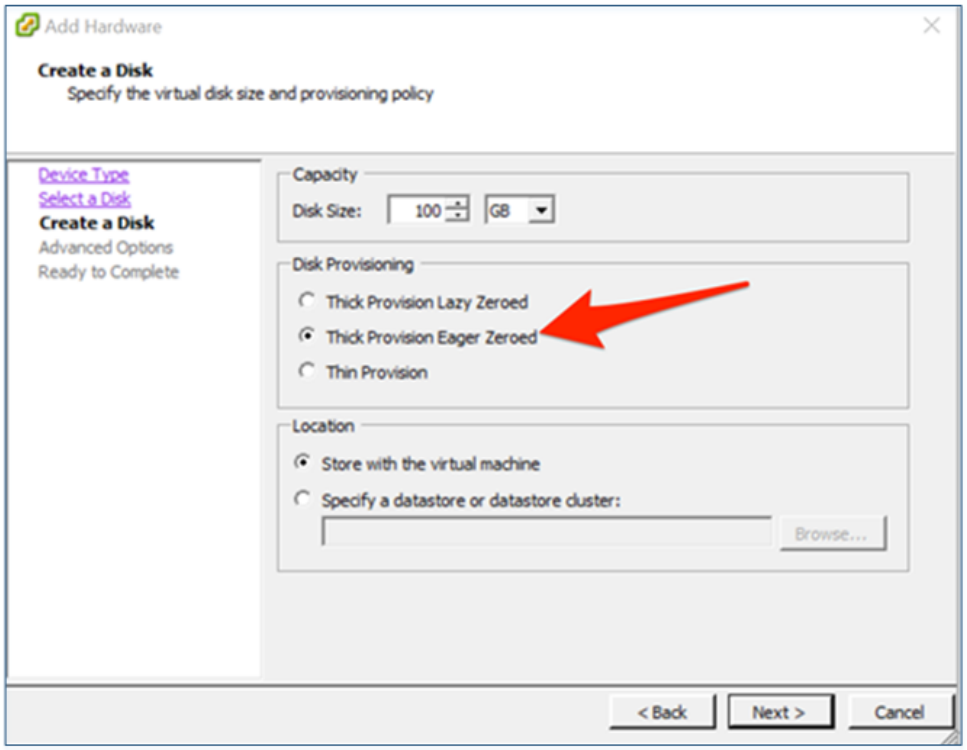


3. Select **Create a new virtual disk**.

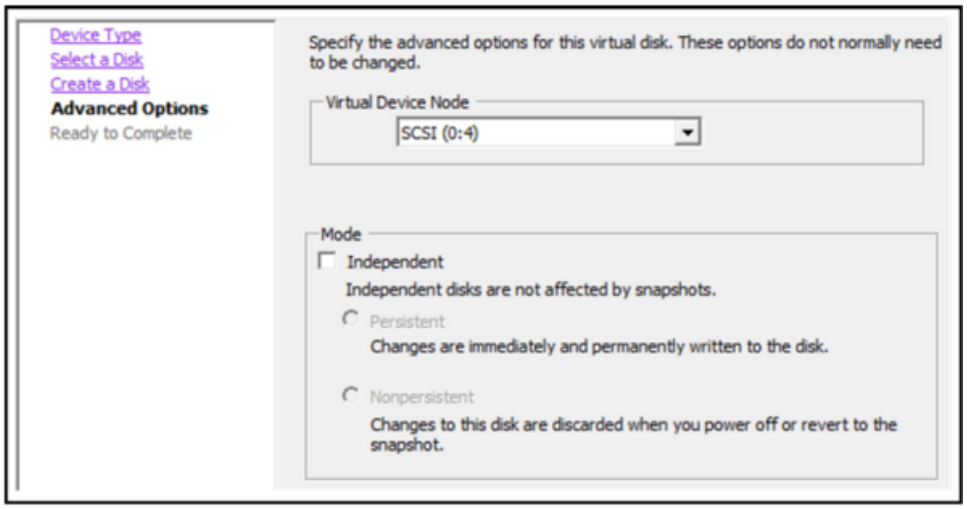


4. Choose the size of the new disk and where you want to create it (on the same datastore or a different datastore).

Note: Choose data provisioning based on your requirements

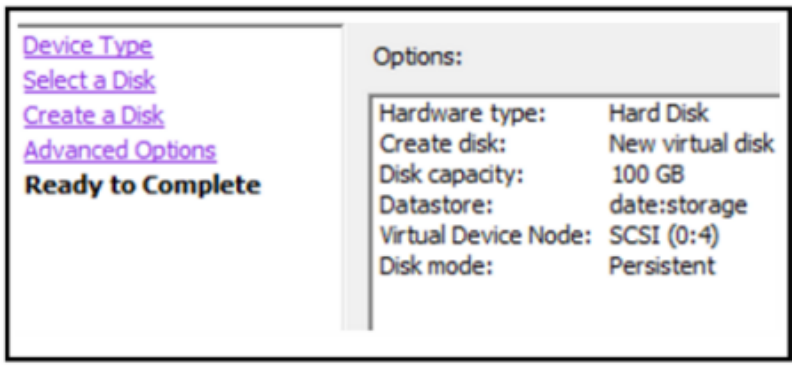


5. Approve the proposed Virtual Device Node.



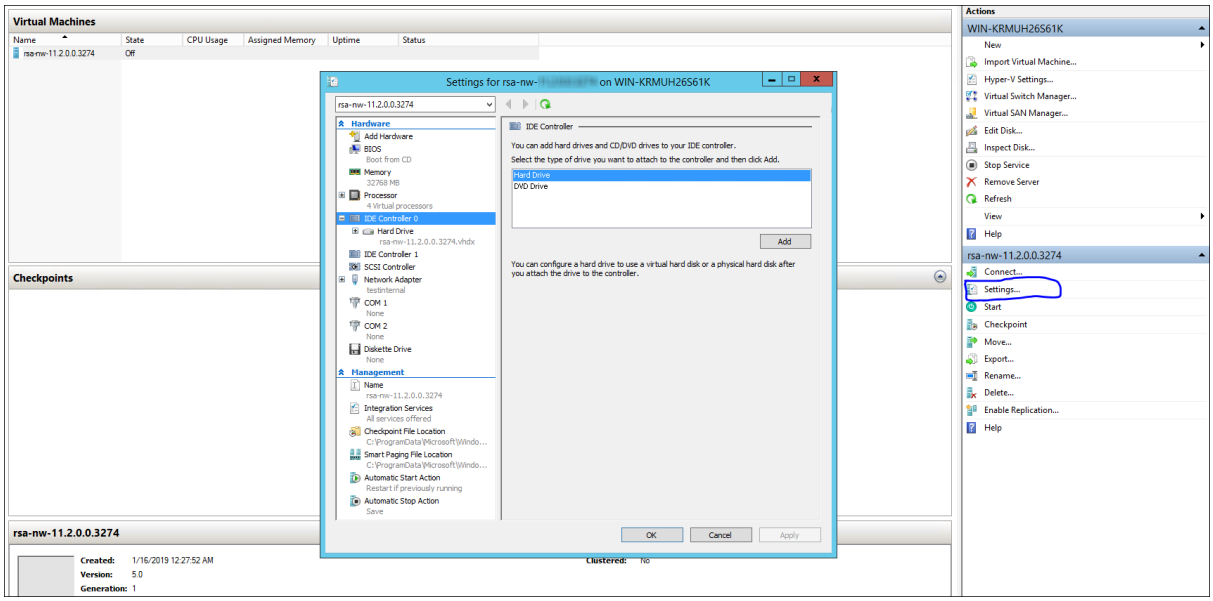
Note: The Virtual Device Node can vary, but it is pertinent to `/dev/sdX` mappings.

6. Confirm the settings.

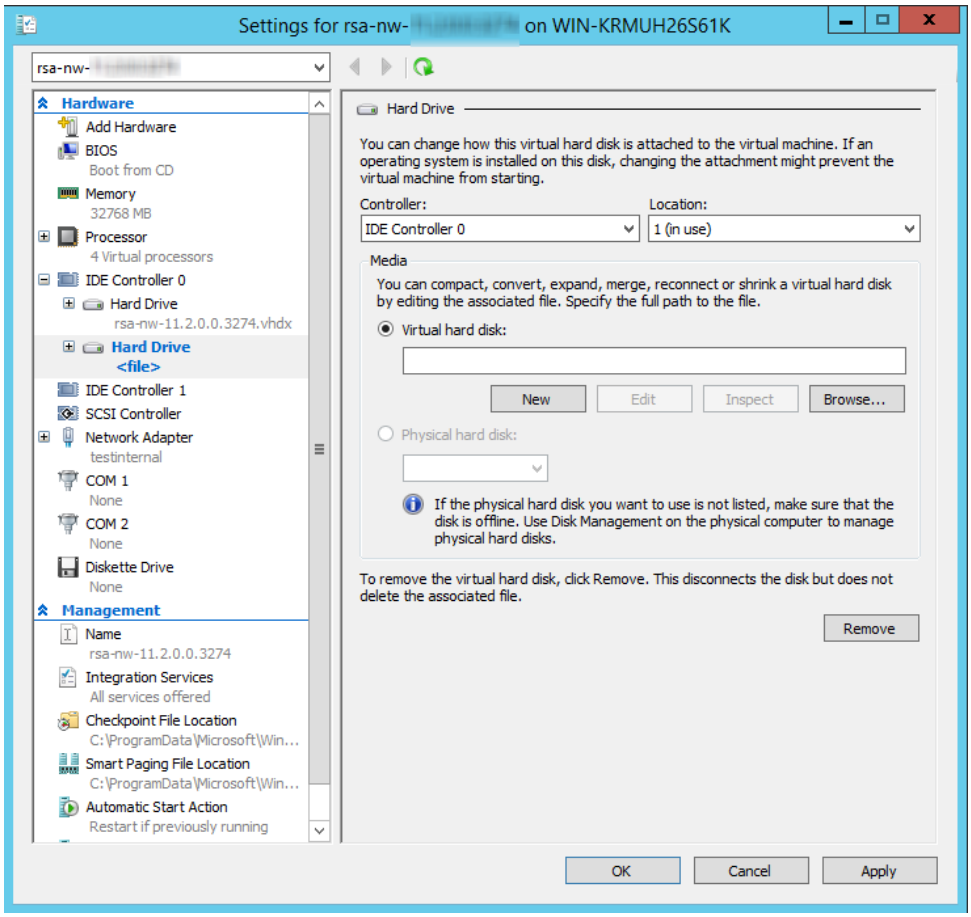


Add New Disk in Hyper-V

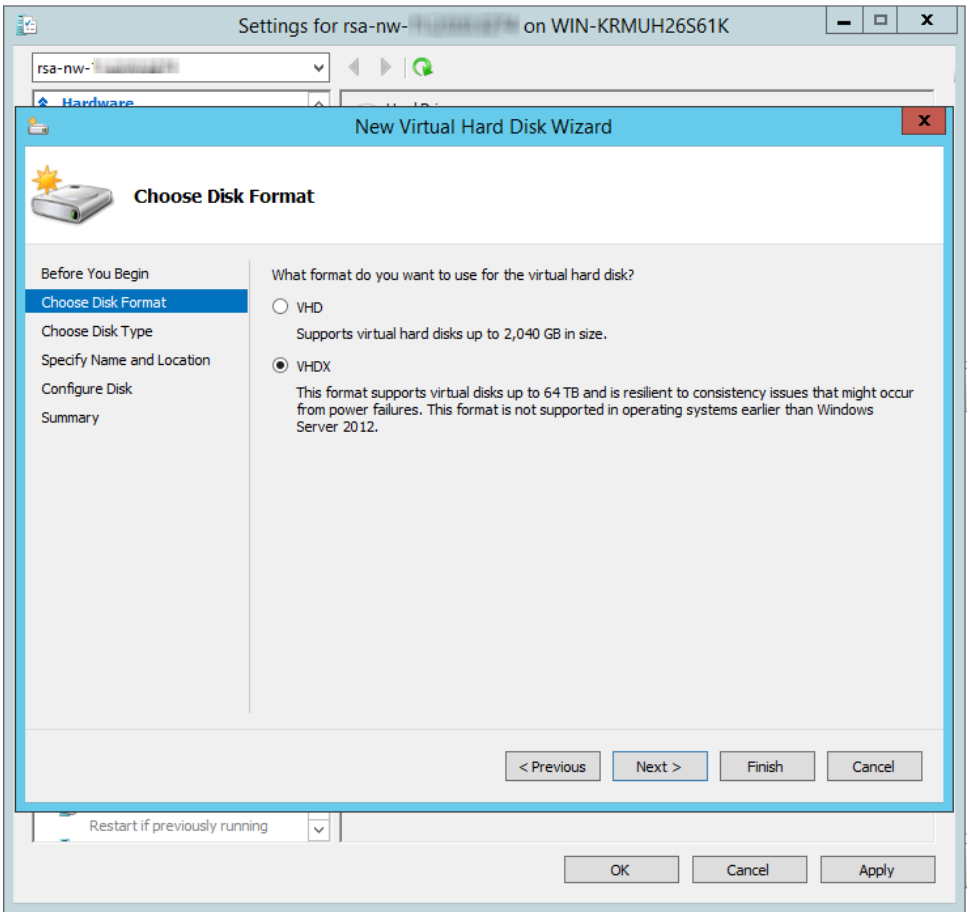
1. Shut down the VM and click **Settings and IDE Controller**, select the **Hard Drive** and click **Add**.



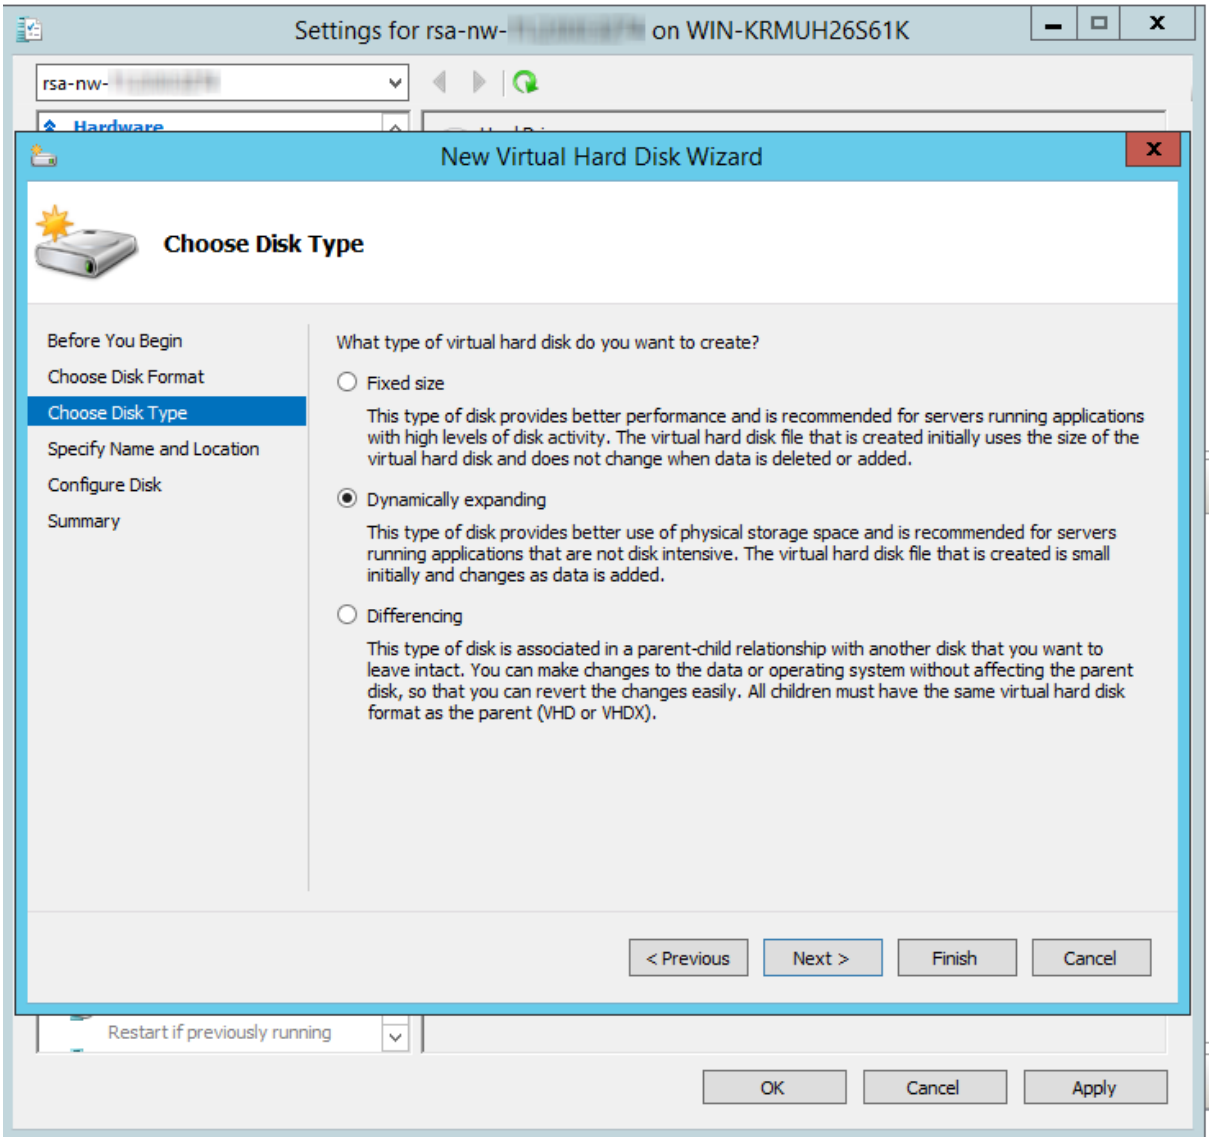
2. Select the New Virtual Hard disk.



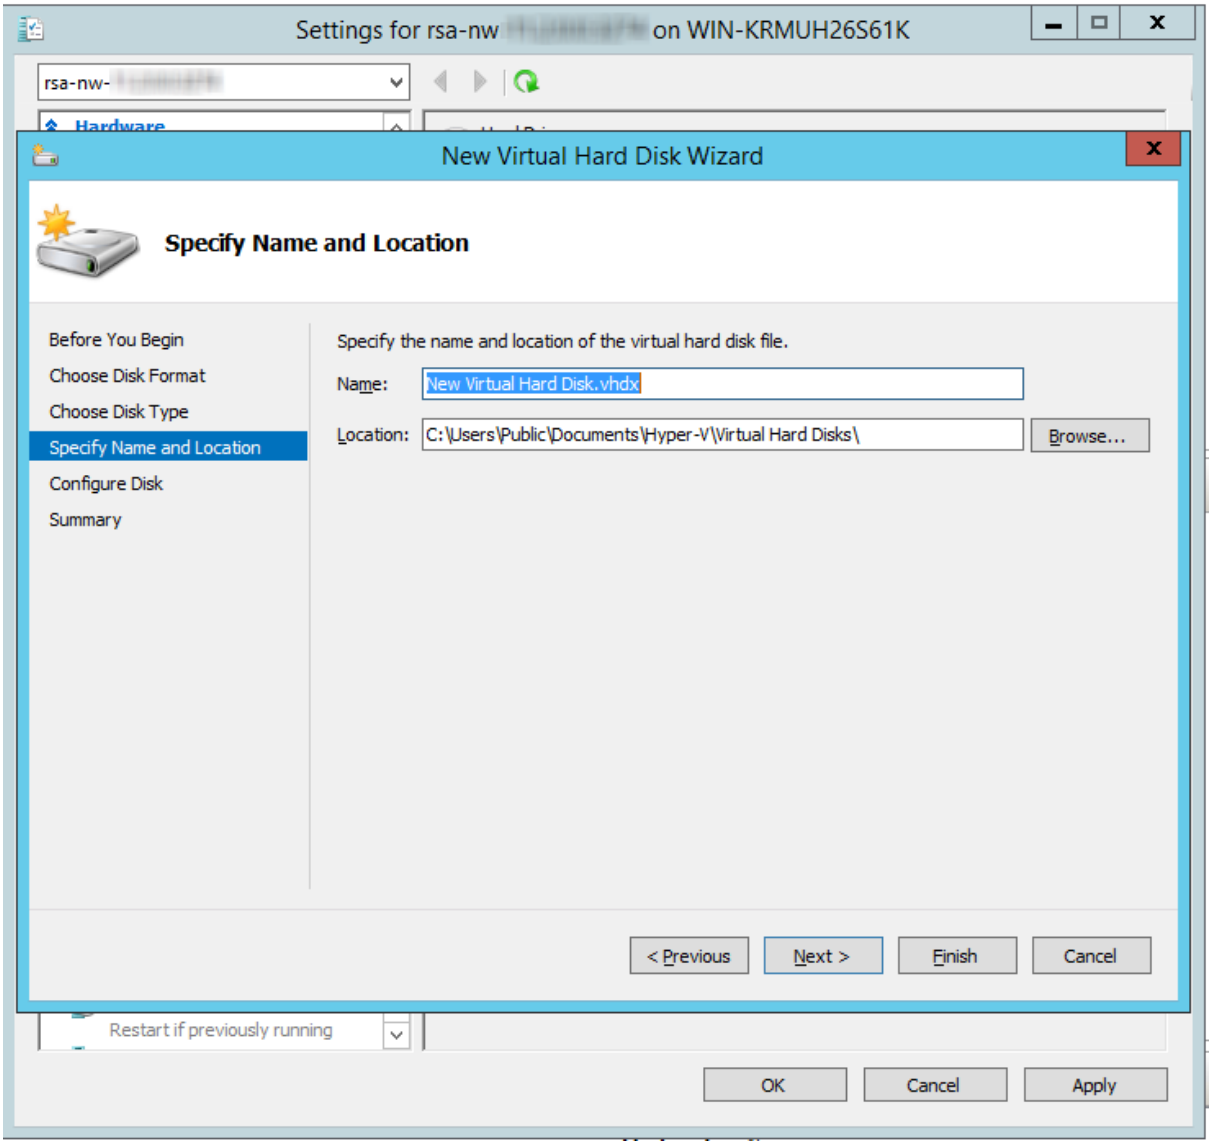
3. Select **VHDX** as a disk format.



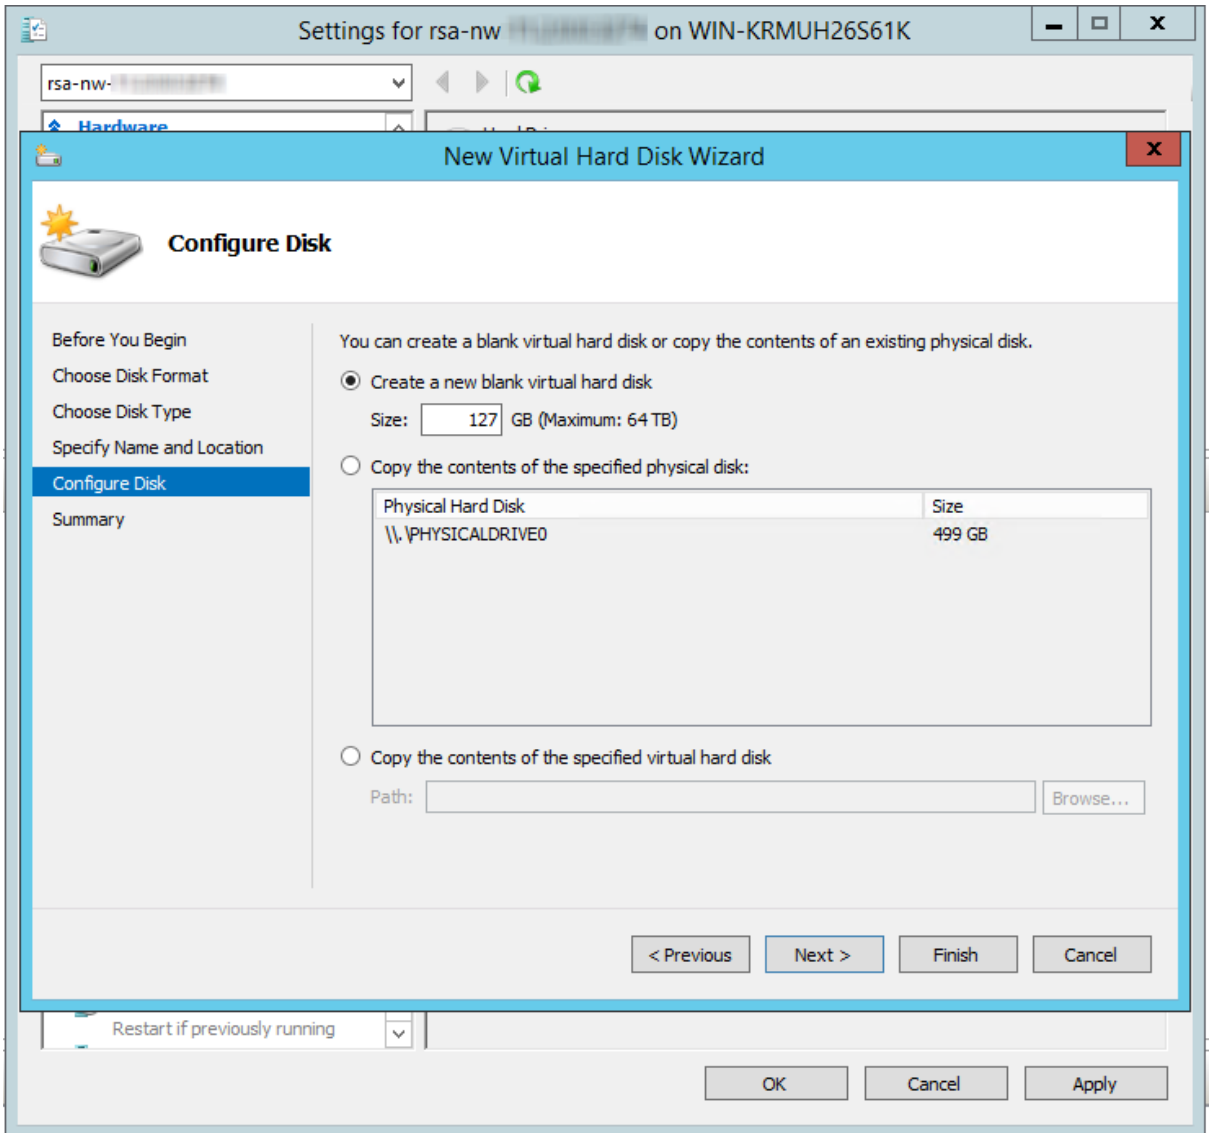
4. Select **Dynamically expanding** as a disk type.



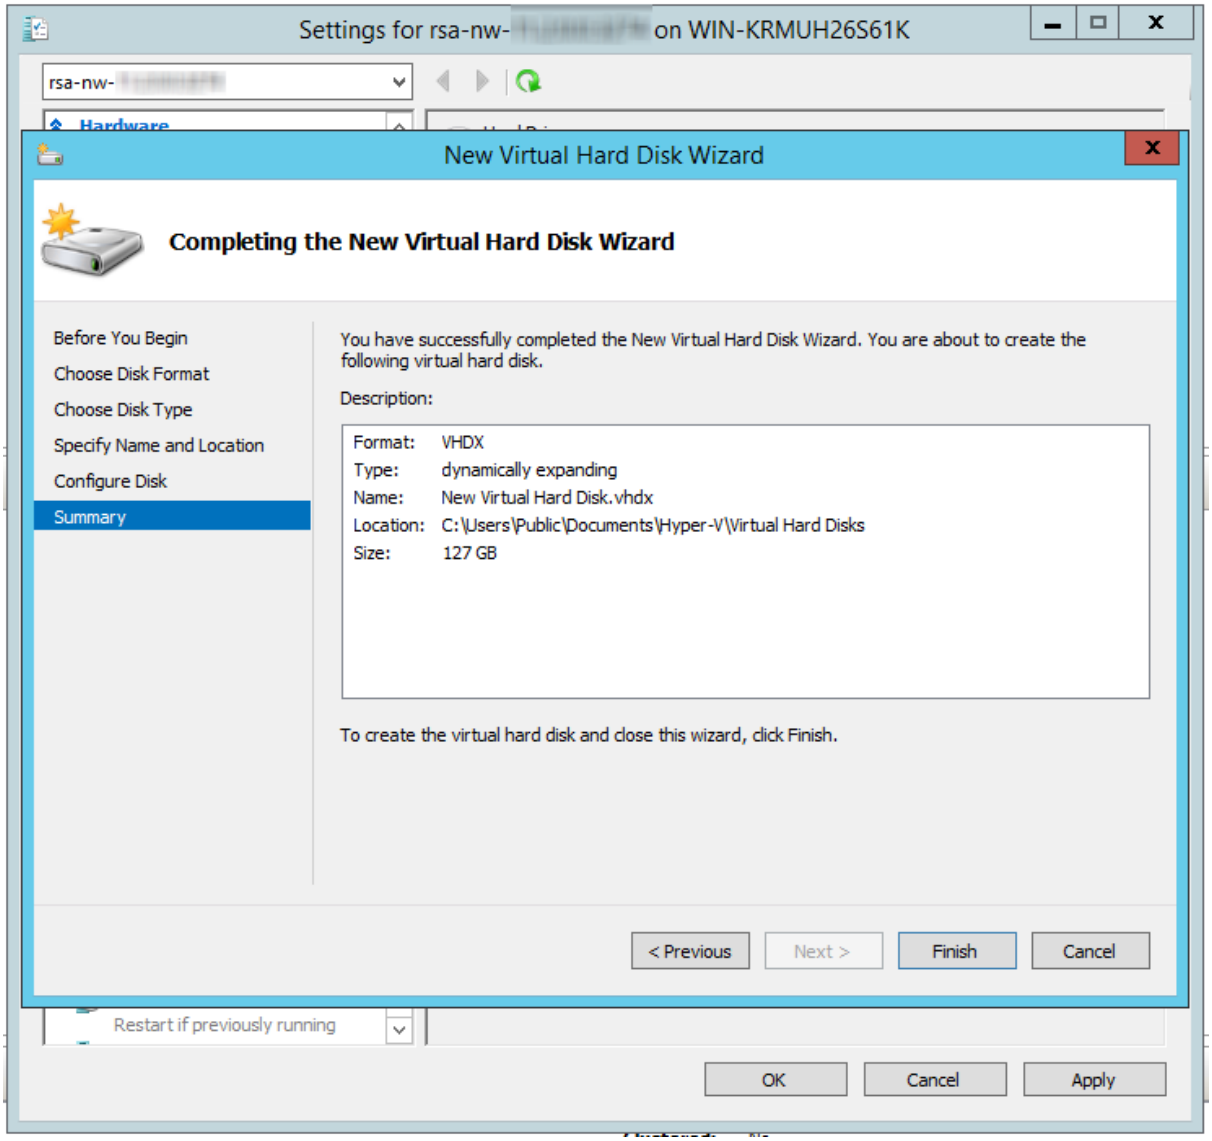
5. Specify the **Name** and **Location** of the virtual hard disk file.



6. Select **create a new blank virtual hard disk** and specify the size.



7. In the **Summary**, review the settings and click **Finish**.



Extending File Systems

Follow the below instructions to extend the file systems for the various components.

AdminServer

Attach external disk for extension of `/var/netwitness/` (refer to the steps in attaching the disk) partition. Create an additional disk with suffix as `nwhome`.

Follow these steps:

1. Execute `lsblk` and get the physical volume name, for example if you attach one 2TB disk.
2. `pvcreate <pv_name>` suppose the PV name is `/dev/sdc`
3. `vgextend netwitness_vg00 /dev/sdc`

4. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`
5. `xfs_growfs /dev/mapper/netwitness_vg00-nwhome`

RSA recommended partition for AdminServer (Can be changed based on the retention days).

LVM	Folder	Size	Disk Type
`/dev/netwitness_vg00/nwhome`	`/var/netwitness/`	2TB	SSD

ESAPrimary/ESASecondary/Malware

Attach external disk for extension of `/var/netwitness/` partition, create an external disk with suffix as `nwhome`.

Follow these steps:

1. Execute `lsblk` and get the physical volume name, for example, if you attach one 6TB disk
2. `pvcreate <pv_name>` suppose the PV name is `/dev/sdc`
3. `vgextend netwitness_vg00 /dev/sdc`
4. `lvextend -L 5.9T /dev/netwitness_vg00/nwhome`
5. `xfs_growfs /dev/mapper/netwitness_vg00-nwhome`

RSA recommended partition for ESAPrimary/ESASecondary/Malware (Can be changed based on the retention days).

LVM	Folder	Size	Disk Type
`/dev/netwitness_vg00/nwhome`	`/var/netwitness/`	6TB	HDD

LogCollector

Attach an external disk for extension of `/var/netwitness/` partition, create an external disk with suffix as `nwhome`.

1. Execute `lsblk` and get the physical volume name, for example if you attach one 500GB disk
2. `pvcreate <pv_name>` suppose the PV name is `/dev/sdc`
3. `vgextend netwitness_vg00 /dev/sdc`
4. `lvextend -L 488G /dev/netwitness_vg00/nwhome`
5. `xfs_growfs /dev/mapper/netwitness_vg00-nwhome`

RSA recommended partition for LogCollector (Can be changed based on the retention days).

LVM	Folder	Size	Disk Type
`/dev/netwitness_vg00/nwhome`	`/var/netwitness/`	500GB	HDD

LogDecoder

Attach an external disk for extension of `/var/netwitness/` partition, create an external disk with suffix as `nwhome`, attach other external disks for LogDecoder database partition. For extending `/var/netwitness` partition follow these steps:

Note: No other partition should reside on this volume, only to be used for `/var/netwitness/`

1. Execute `lsblk` and get the physical volume name, suppose if you had add attach one 2TB disk
2. `pvcreate <pv_name>` suppose the PV name is `/dev/sdc`
3. `vgextend netwitness_vg00 /dev/sdc`
4. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`
5. `xfs_growfs /dev/mapper/netwitness_vg00-nwhome`

Other partitions are also required. Create the following four partitions on volume group logdecodersmall

Folder	LVM	Volume Group
`/var/netwitness/logdecoder`	decoroot	logdecodersmall
`/var/netwitness/logdecoder/index`	index	logdecodersmall
`/var/netwitness/logdecoder/metadb`	metadb	logdecodersmall
`/var/netwitness/logdecoder/sessiondb`	sessiondb	logdecodersmall

Follow these steps to create the partitions mentioned in the table above:

1. Execute `lsblk` and get the physical volume names from the output
2. `pvcreate /dev/sdd`
3. `vgcreate -s 32 logdecodersmall /dev/sdd`
4. `lvcreate -L <disk_size> -n <lvm_name> logdecodersmall`
5. `mkfs.xfs /dev/logdecodersmall/<lvm_name>`
6. Repeat steps 4 and 5 for all the LVM's mentioned

The following partition should be on volume group LogDecoder

Folder	LVM	Volume Group
`/var/netwitness/logdecoder/packetdb`	packetdb	logdecoder

Follow these steps:

1. Execute `lsblk` and get the physical volume names from the output
2. `pvcreate /dev/sde`
3. `vgcreate -s 32 logdecoder /dev/sde`

4. `lvcreate -L <disk_size> -n packetdb logdecoder`
5. `mkfs.xfs /dev/logdecoder/packetdb`

RSA recommends below sizing partition for LogDecoder (Can be changed based on the retention days)

LVM	Folder	Size	Disk Type
`/dev/netwitness_vg00/nwhome`	`/var/netwitness/`	1TB	HDD
`/dev/logdecodersmall/decoroot`	`/var/netwitness/logdecoder`	10GB	HDD
`/dev/logdecodersmall/index`	`/var/netwitness/logdecoder/index`	30GB	HDD
`/dev/logdecodersmall/metadb`	`/var/netwitness/logdecoder/metadb`	370GB	HDD
`/dev/logdecodersmall/sessiondb`	`/var/netwitness/logdecoder/sessiondb`	3TB	HDD
`/dev/logdecoder/packetdb`	`/var/netwitness/logdecoder/packetdb`	18TB	HDD

Create each directory and mount the LVM on it in a serial manner, except `/var/netwitness` which will be already created.

Note: Create the folder `/var/netwitness/logdecoder` and mount on `/dev/logdecodersmall/decoroot` then create the other folders and mount them.

After that add the below entries in `/etc/fstab` in the same order and mount them using `mount -a`.

```
/dev/logdecodersmall/decoroot /var/netwitness/logdecoder xfs noatime,nosuid 1 2
/dev/logdecodersmall/index /var/netwitness/logdecoder/index xfs noatime,nosuid 1 2
/dev/logdecodersmall/metadb /var/netwitness/logdecoder/metadb xfs noatime,nosuid 1 2
/dev/logdecodersmall/sessiondb /var/netwitness/logdecoder/sessiondb xfs noatime,nosuid 1 2
/dev/logdecoder/packetdb /var/netwitness/logdecoder/packetdb xfs noatime,nosuid 1 2
```

Concentrator

Attach external disk for extension of `/var/netwitness/` partition, Create an external disk with suffix as `nwhome`, attach other external disks for Concentrator database partition.

For extending `/var/netwitness` partition follow below steps:

Note: No other partition should reside on this volume, only to be used for /var/netwitness/

1. Execute `lsblk` and get the physical volume name, for example if you attach one 2TB disk
2. `pvcreate /dev/sdc` suppose the PV name is `/dev/sdc`
3. `vgextend netwitness_vg00 /dev/sdc`
4. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`
5. `xfs_growfs /dev/mapper/netwitness_vg00-nwhome`

Below partitions are also required on volume group concentrator.

Folder	LVM	Volume Group
`/var/netwitness/concentrator`	root	concentrator
`/var/netwitness/concentrator/sessiondb`	sessiondb	concentrator
`/var/netwitness/concentrator/metadb`	metadb	concentrator

Follow these steps:

1. Execute `lsblk` and get the physical volume names from the output
2. `pvcreate /dev/sdd`
3. `vgcreate -s 32 concentrator /dev/sdd`
4. `lvcreate -L <disk_size> -n <lvm_name> concentrator`
5. `mkfs.xfs /dev/concentrator/<lvm_name>`
6. Repeat steps 4 and 5 for all the LVM's mentioned

Below partition should be on volume group index

Folder	LVM	Volume Group
`/var/netwitness/concentrator/index`	index	index

Follow these steps:

1. Execute `lsblk` and get the physical volume names from the output
2. `pvcreate /dev/sde`
3. `vgcreate -s 32 index /dev/md1`
4. `lvcreate -L <disk_size> -n index index`
5. `mkfs.xfs /dev/index/index`

RSA recommends below sizing partition for Concentrator (Can be changed based on the retention days)

LVM	Folder	Size	Disk Type
/dev/netwitness_vg00/nwhome	/var/netwitness/	1TB	HDD
/dev/concentrator/root	/var/netwitness/concentrator	10GB	HDD
/dev/concentrator/metadb	/var/netwitness/concentrator/metadb	370GB	HDD
/dev/concentrator/sessiondb	/var/netwitness/concentrator/sessiondb	3TB	HDD
/dev/index/index	/var/netwitness/concentrator/index	2TB	SSD

Create each directory and mount the LVM on it in a serial manner, except `/var/netwitness` which will be already created.

Note: Create the folder `/var/netwitness/concentrator` and mount on `/dev/concentrator/root` then create the other folders and mount them.

After that add the below entries in `/etc/fstab` in the same order

```
/dev/concentrator/root /var/netwitness/concentrator xfs noatime,nosuid 1 2
/dev/concentrator/sessiondb /var/netwitness/concentrator/sessiondb xfs noatime,nosuid 1 2
/dev/concentrator/metadb /var/netwitness/concentrator/metadb xfs noatime,nosuid 1 2 2
/dev/index/index /var/netwitness/concentrator/index xfs noatime,nosuid 1 2
```

Archiver

Attach an external disk for extension of `/var/netwitness/` partition, create an external disk with suffix as `nwhome`, attach other external disks for Archiver database partition.

For extending `/var/netwitness` partition follow these steps:

Note: No other partition should reside on this volume, only to be used for `/var/netwitness`

1. Execute `lsblk` and get the physical volume name, suppose if you had add attach one 2TB disk
2. `pvcreate /dev/sdc` suppose the PV name is `/dev/sdc`
3. `vgextend netwitness_vg00 /dev/sdc`
4. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`

Below partition is required for volume group archiver

Folder	LVM	Volume Group
/var/netwitness/archiver	archiver	archiver

Follow these steps:

1. Execute `lsblk` and get the physical volume names from the output
2. `pvcreate /dev/sde`
3. `vgcreate -s 32 archiver /dev/sde`
4. `lvcreate -L <disk_size> -n archiver archiver`
5. `mkfs.xfs /dev/archiver/archiver`

RSA recommends below sizing partition for archiver (Can be changed based on the retention days)

LVM	Folder	Size	Disk Type
/dev/netwitness_vg00/nwhome	/var/netwitness/	1TB	HDD
/dev/archiver/archiver	/var/netwitness/archiver	4TB	HDD

Create each directory and mount the LVM on it in a serial manner, except `/var/netwitness` which will be already created.

After that add the below entries in `/etc/fstab` in the same order

```
/dev/archiver/archiver /var/netwitness/archiver xfs noatime,nosuid 1 2
```

Decoder

Attach an external disk for extension of `/var/netwitness/` partition, create an external disk with suffix as `nwhome`, attach other external disks for decoder database partition. For extending `/var/netwitness` partition follow these steps:

Note: No other partition should reside on /var/netwitness/

1. Execute `lsblk` and get the physical volume name, suppose if you had add attach one 2TB disk
2. `pvcreate /dev/sdc`
3. `vgextend netwitness_vg00 /dev/sdc`
4. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`
5. `xfs_growfs /dev/mapper/netwitness_vg00-nwhome`

Below four partition should be on volume group decodersmall

Folder	LVM	Volume Group
/var/netwitness/decoder	decoroot	decodersmall
/var/netwitness/decoder/index	index	decodersmall
/var/netwitness/decoder/metadb	metadb	decodersmall
/var/netwitness/decoder/sessiondb	sessiondb	decodersmall

Follow these steps:

1. Execute `lsblk` and get the physical volume names from the output
2. `pvcreate /dev/sdd`

3. `vgcreate -s 32 decodersmall /dev/sdd`
4. `lvcreate -L <disk_size> -n <lvm_name> decodersmall`
5. `mkfs.xfs /dev/decodersmall/<lvm_name>`
6. Repeat steps 4 and 5 for all the LVM's mentioned

Below partition should be on volume group decoder

Folder	LVM	Volume Group
`/var/netwitness/decoder/packetdb`	packetdb	decoder

1. Execute `lsblk` and get the physical volume names from the output
2. `pvcreate /dev/sde`
3. `vgcreate -s 32 decoder /dev/sde`
4. `lvcreate -L <disk_size> -n packetdb decoder`
5. `mkfs.xfs /dev/decoder/packetdb`

RSA recommends below sizing partition for Decoder (Can be changed based on the retention days)

LVM	Folder	Size	Disk Type
`/dev/netwitness_vg00/nwhome`	`/var/netwitness`	1TB	HDD
`/dev/decodersmall/decoroot`	`/var/netwitness/decoder`	10GB	HDD
`/dev/decodersmall/index`	`/var/netwitness/decoder/index`	30GB	HDD
`/dev/decodersmall/metadb`	`/var/netwitness/decoder/metadb`	370GB	HDD
`/dev/decodersmall/sessiondb`	`/var/netwitness/decoder/sessiondb`	3TB	HDD
`/dev/decoder/packetdb`	`/var/netwitness/decoder/packetdb`	18TB	HDD

Create each directory and mount the LVM on it in serial manner, except `/var/netwitness` which will be already created.

Note: Create the folder `/var/netwitness/decoder` and mount on `/dev/decodersmall/decoroot` then create the other folders and mount them.

After that add the below entries in `/etc/fstab` in the same order and mount them using `mount -a`.

```
/dev/decodersmall/decoroot /var/netwitness/decoder xfs noatime,nosuid 1 2
/dev/decodersmall/index /var/netwitness/decoder/index xfs noatime,nosuid 1 2
/dev/decodersmall/metadb /var/netwitness/decoder/metadb xfs noatime,nosuid 1 2
/dev/decodersmall/sessiondb /var/netwitness/decoder/sessiondb xfs noatime,nosuid 1 2
/dev/decoder/packetdb /var/netwitness/decoder/packetdb xfs noatime,nosuid 1 2
```

Step 4. Install RSA NetWitness Platform

There are two main tasks that you must complete in the order listed below to install NetWitness Platform11.3

Task 1 - Install 11.3.0.0 on the NetWitness (NW) Server Host

Task 2 - Install 11.3.0.0 on Other Component Hosts

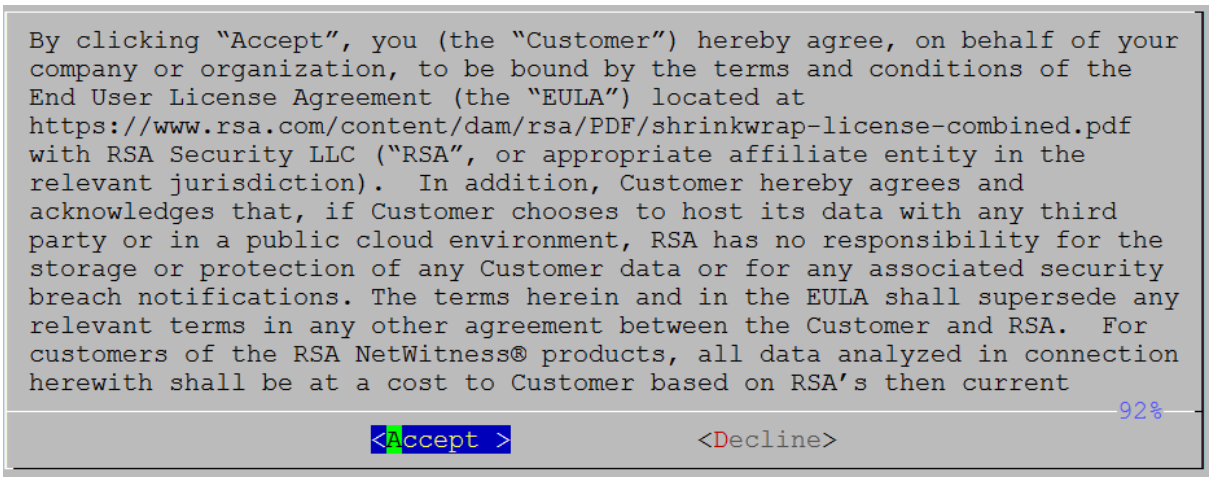
Task 1- Install 11.3.0.0 on the NW Server Host

On the host you have deployed for the NW Server, this task installs:

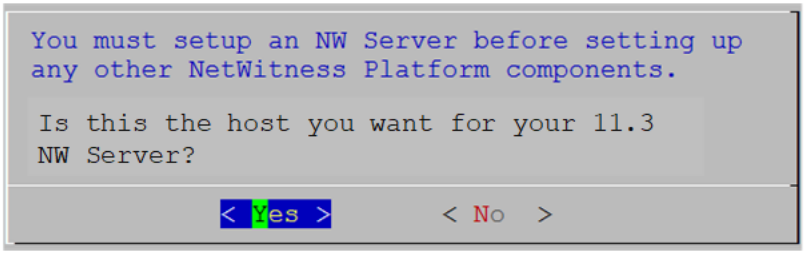
- The 11.3.0.0 NW Server environmental platform.
- The NW Server components (that is, Admin Server, Config Server, Orchestration Server, Integration Server, Broker, Investigate Server, Reporting Engine, Respond Server and Security server).
- A repository with the RPM files required to install the other functional components or services.

1. Deploy your 11.3.0.0 environment:
   a. Add new VM.
   b. Configure storage.
   c. Set up firewalls.
2. Run the `nwsetup-tui` command. This initiates the Setup program and the EULA is displayed.

Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use Tab key to move to and from commands (such as <Yes>, <No>, <OK>, and <Cancel>. Press Enter to register your command response and move to the next prompt.
2.) The Setup program adopts the color scheme of the desktop or console you use access the host.
3.) If you specify DNS servers during Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` to proceed. Any misconfigured DNS servers cause the Setup to fail. If you need to reach DNS server after setup that unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see (Optional) Task 1 - Re-Configure DNS Servers Post 11.3 section in Post Installation Tasks.
If you do not specify DNS Servers during `nwsetup-tui` , you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Platform Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).



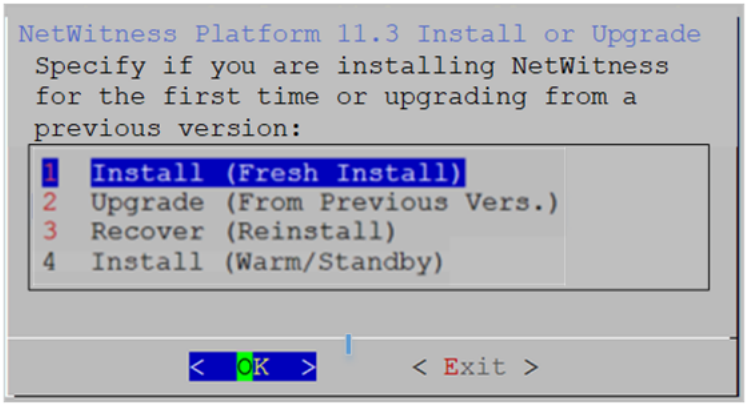
3. Tab to **Accept** and press Enter.
   The **Is this the host you want for your 11.3 NW Server** prompt is displayed.



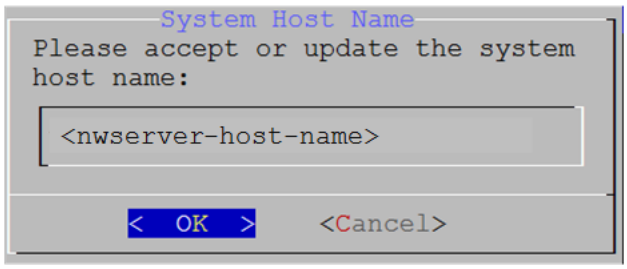
4. Tab to **Yes** and press Enter.
   Choose **No** if you already installed 11.3 on the NW Server.

   Caution: If you choose the wrong host for the NW Server and complete the Setup, you must restart the Setup Program and complete (steps 2 -14) to correct this error.

   The **Install** or **Upgrade** prompt is displayed (**Recover** does not apply to the installation. It is for 11.3 Disaster Recovery).



5. Press **Enter**. **Install (Fresh Install)** is selected by default.
   The **Host Name** prompt is displayed.

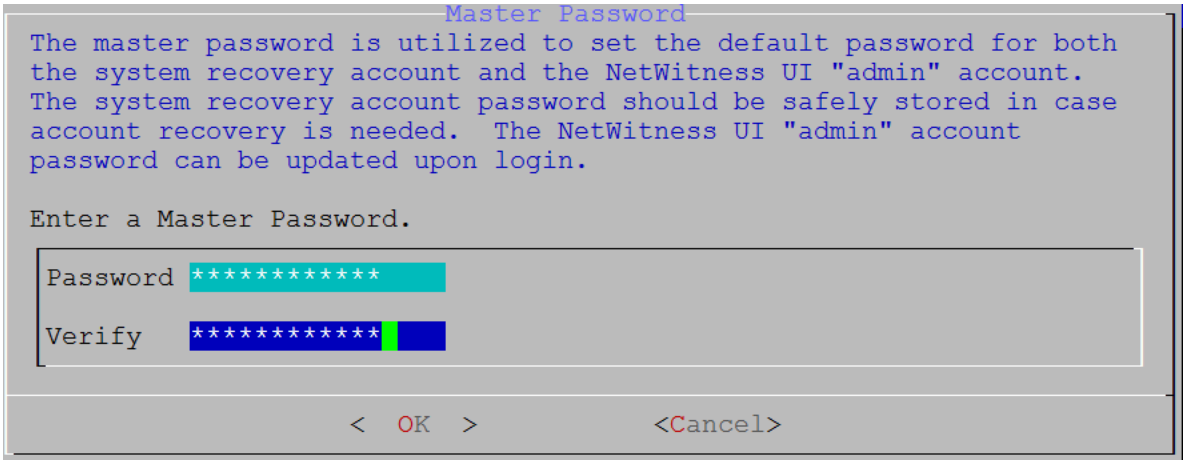


Caution: If you include "." in a host name, the host name must also include a valid domain name.

6. Press **Enter** if want to keep this name. If not edit the host name, Tab to **OK**, and press Enter to change it.
   The **Master Password** prompt is displayed.
   The following list of characters are supported for Master Password and Deployment Password:
   - Symbols : ! @ # % ^ +
   - Numbers : 0-9
   - Lowercase Characters : a-z
   - Uppercase Characters : A-Z

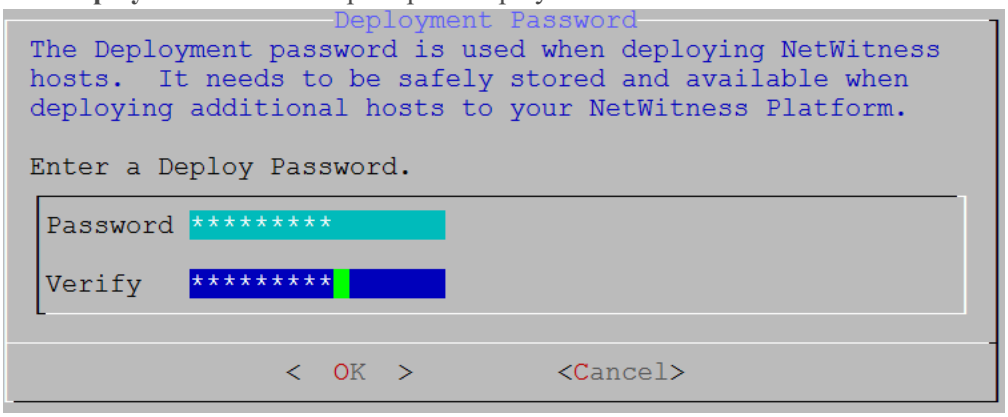
   No ambiguous characters are supported for Master Password and Deployment Password. For example:

   space { } [ ] ( ) / \ ' " ` ~ ; : . < > -



7. Type in **Password** and type it in, down arrow to **Verify** and retype the password, Tab to **OK**, and press Enter.

The **Deployment Password** prompt is displayed.



8. Type in the **Password**, down arrow to **Verify**, retype the password, Tab to **OK**, and press Enter.

   One of the following conditional prompts is displayed.

   - If the Setup program finds a valid IP address for this host, the following prompt is displayed.

     
     Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** If you want to change the IP configuration found on the host.

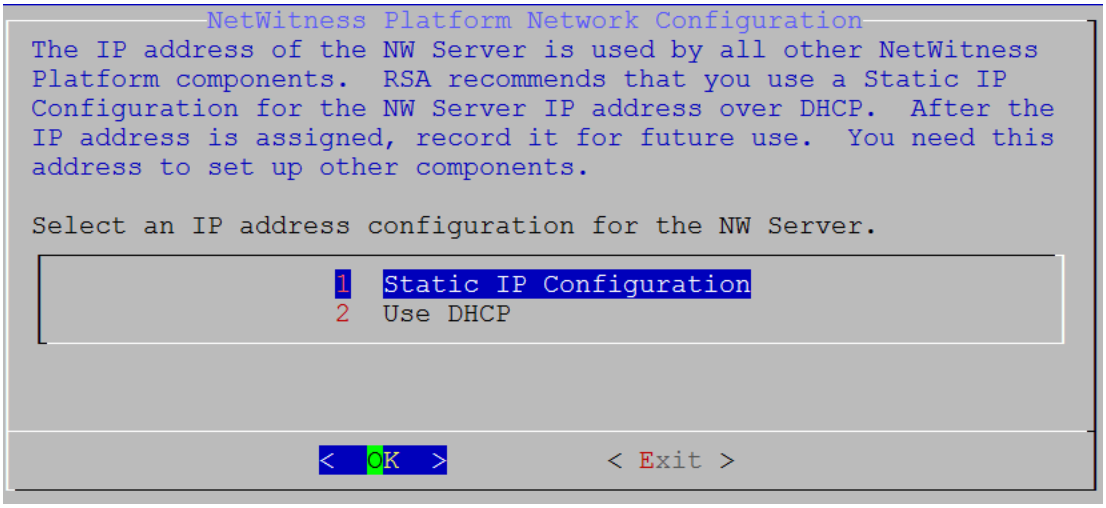
   - If you are using an SSH connection, the following warning is displayed.

     Note: If you connect directly from the host console, the following warning will not be displayed.

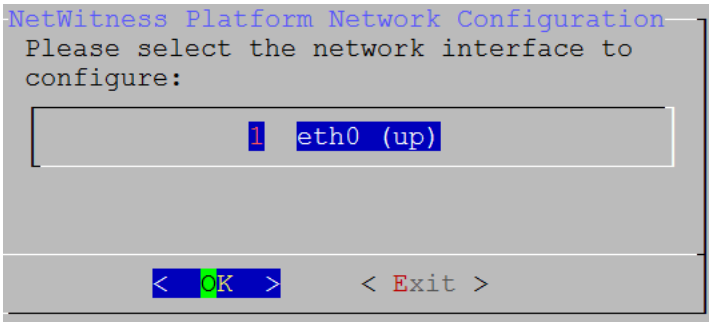
     
     Press **Enter** to close warning prompt.

   - If the Setup Program found an IP configuration and you chose to use it, the **Update Repository** prompt is displayed. Go to step 12 to and complete the installation.

- If the Setup Program did not find an IP configuration or if you choose to change the existing IP configuration, the **Network Configuration** prompt is displayed.

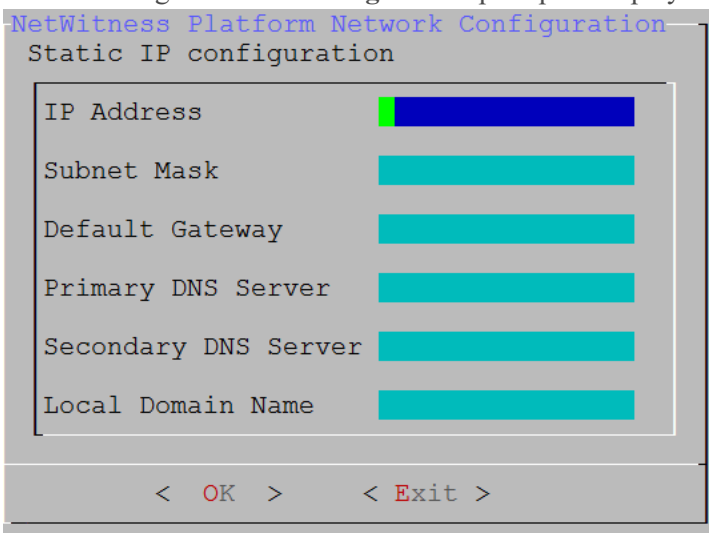


9. Tab to **OK** and press **Enter** to use **Static IP**.
   If you want to use **DHCP**, down arrow to 2 Use DHCP and press **Enter**.
   The **Static IP Configuration** prompt is displayed.



10. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit**.

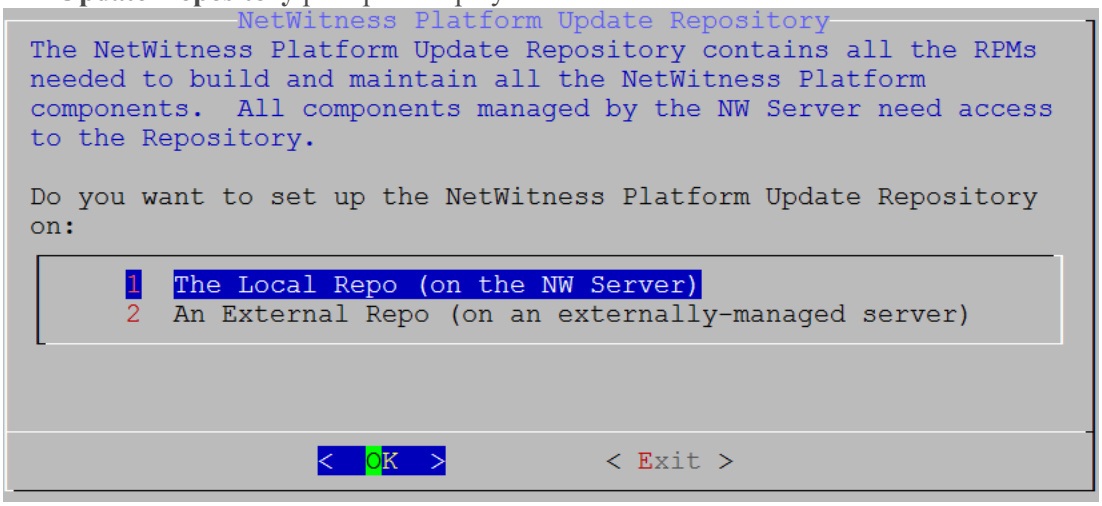
The following **Static IP Configuration** prompt is displayed.



11. Type the configuration values (using the down arrow to move from field to field), Tab to **OK**, and press **Enter**.
If you do not complete all the required fields, an an `All fields are required` error message is displayed (**Secondary DNS Server** and **Local Domain Name** fields are not required.)
If you use the wrong syntax or character length for any of the fields, an Invalid <field-name> error message is displayed.

Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the install.

The **Update Repository** prompt is displayed.

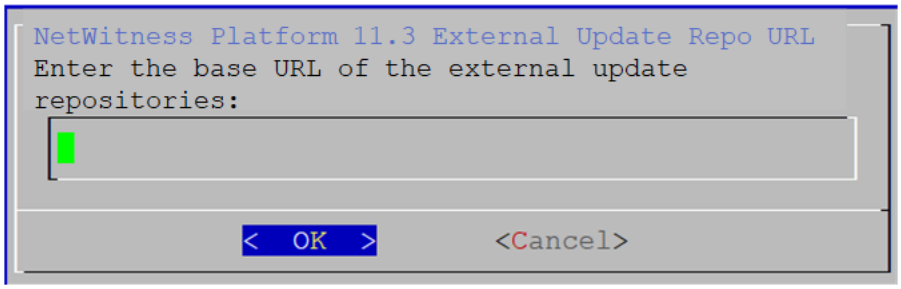


12. Select the same repo you selected when you installed the NW Server Host for all hosts.
Press **Enter** to choose the **Local Repo** on the NW Server. If you want to use an external repo, down arrow to **External Repo**, tab to **OK**, and press **Enter**. If you select **1 The Local Repo (on the NW Server)** in the setup program, make sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a Local Repo (on the NW Server) in the setup

program, make sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can install NetWitness Platform 11.3.0.0.

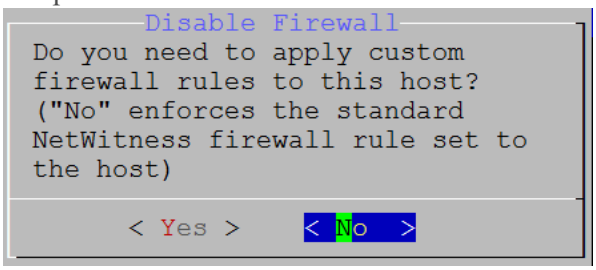
13. Use the down and up arrows to select **2 An External Repo (on an externally-managed server)**. The **External Update Repo URl** prompt is displayed.
Refer to Appendix B. Create External Repository for instructions to set up an external repository.

14. Enter the base URL of the NetWitness Platform external repo from the instructions followed in Appendix B. Create External Repository (for example, **http:/testserver/netwitness-repo**) and click **OK**.

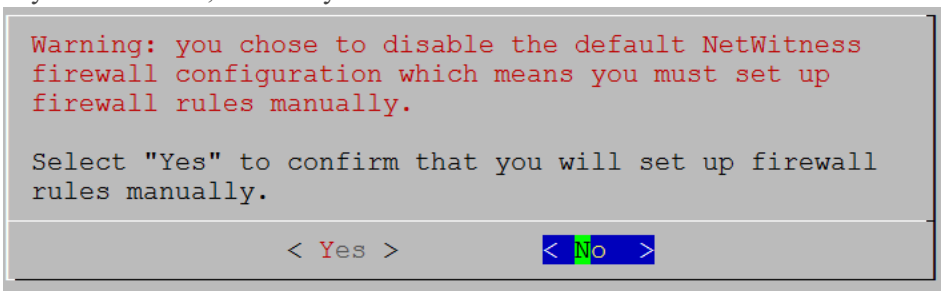


The **Disable** or use standard **Firewall** configuration prompt is displayed.

15. Tab to **No** (default), and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.

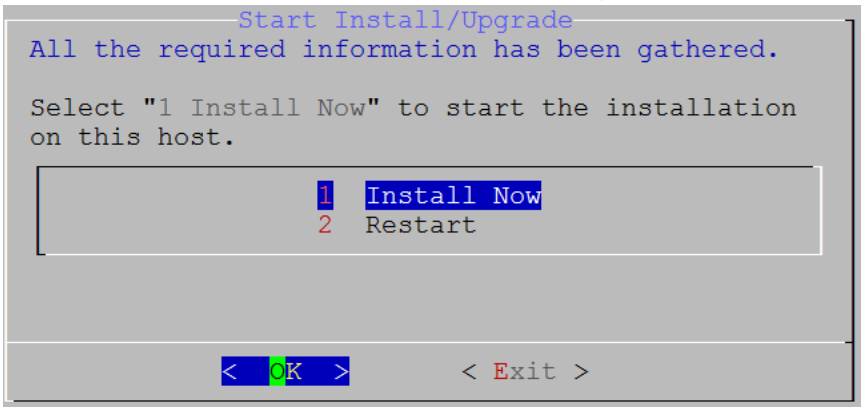


- If you select **Yes**, confirm your selection or **No** to use the standard firewall configuration.

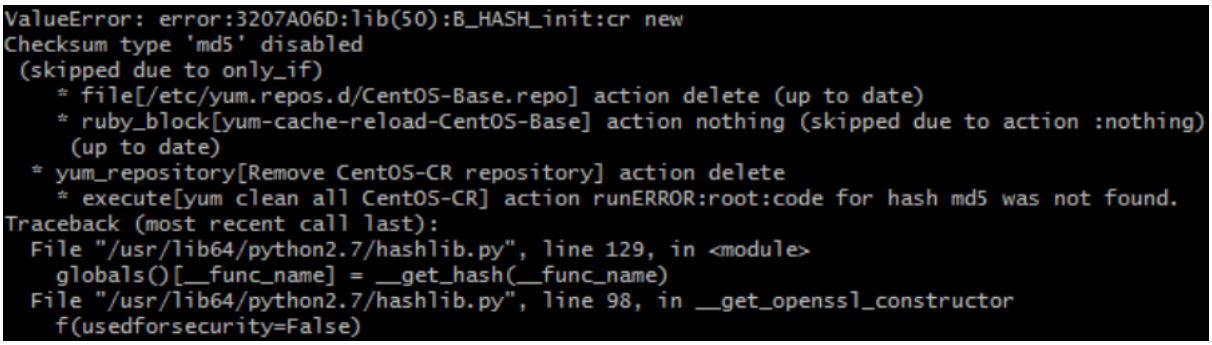


The **Start Install/Upgrade** prompt is displayed.

16. Press **Enter** to install 11.3.0.0 on the NW Server (**Install Now** is the default value).



Note: Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



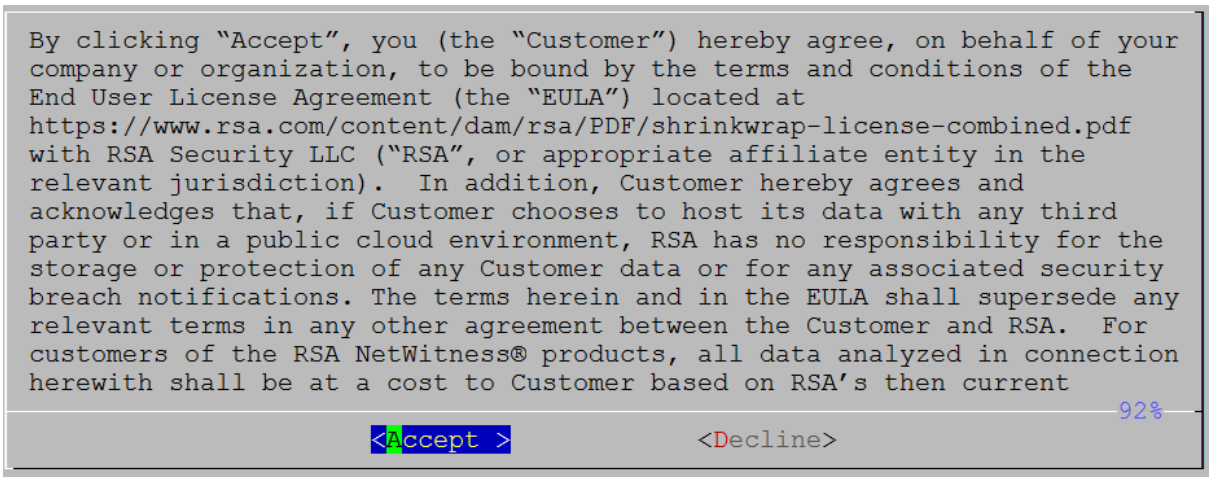
Task 2 - Install 11.3 on Other Component Hosts

For a functional service, complete the following tasks on a non-NW Server host.

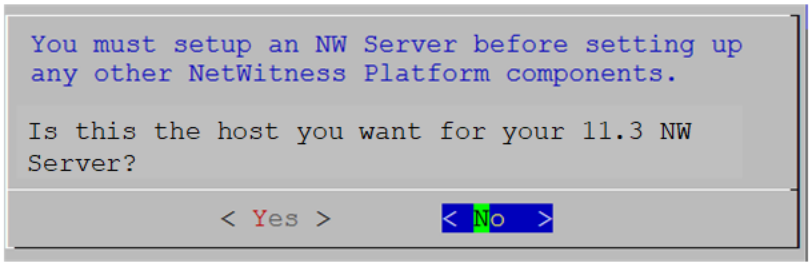
- Install the 11.3.0.0 environmental platform.
- Apply the 11.3.0.0 RPM files to the service from the NW Server Update Repository.

1. Deploy 11.3.0.0 OVA.
2. Run the `nwsetup-tui` command to set up the host..
   This initiates the Setup program and the EULA is displayed.

Note: If you specify DNS servers during Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` to proceed. Any misconfigured DNS servers cause the Setup to fail. If you need to reach DNS server after setup that unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see (Optional) Task 1 - Re-Configure DNS Servers Post 11.3 section in Post Installation Tasks.
If you do not specify DNS Servers during `nwsetup-tui` , you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Platform Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).

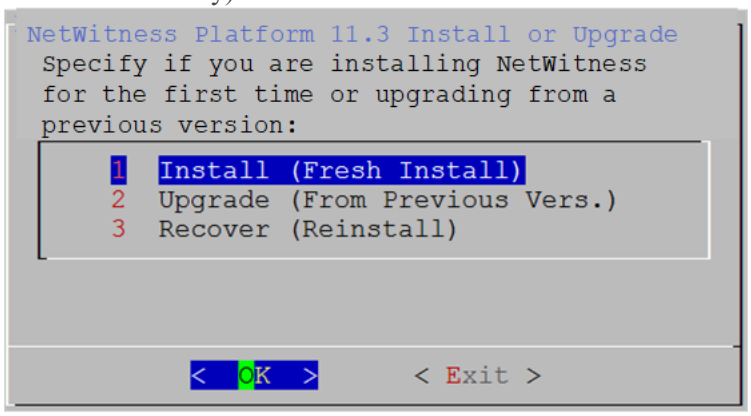


3. Tab to **Accept** and press Enter.
   The **Is this the host you want for your 11.3 NW Server** prompt is displayed.

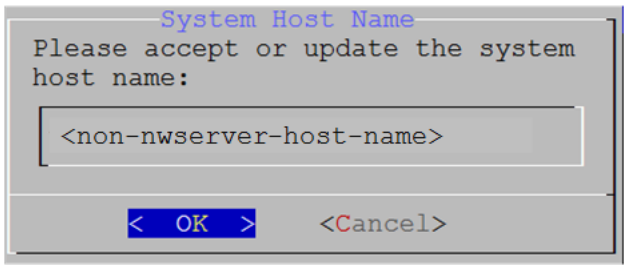


Caution: If you choose the wrong host for the NW Server and complete the installation, you must restart the step up program and complete (steps 2 - 17) of Task 1- Install 11.3.0.0 on the NW Server Host to correct this error.

4. Press **Enter** (No).
   The **Install** or **Upgrade** prompt is displayed (**Recover** does not apply to the installation. It is for 11.3 Disaster Recovery).



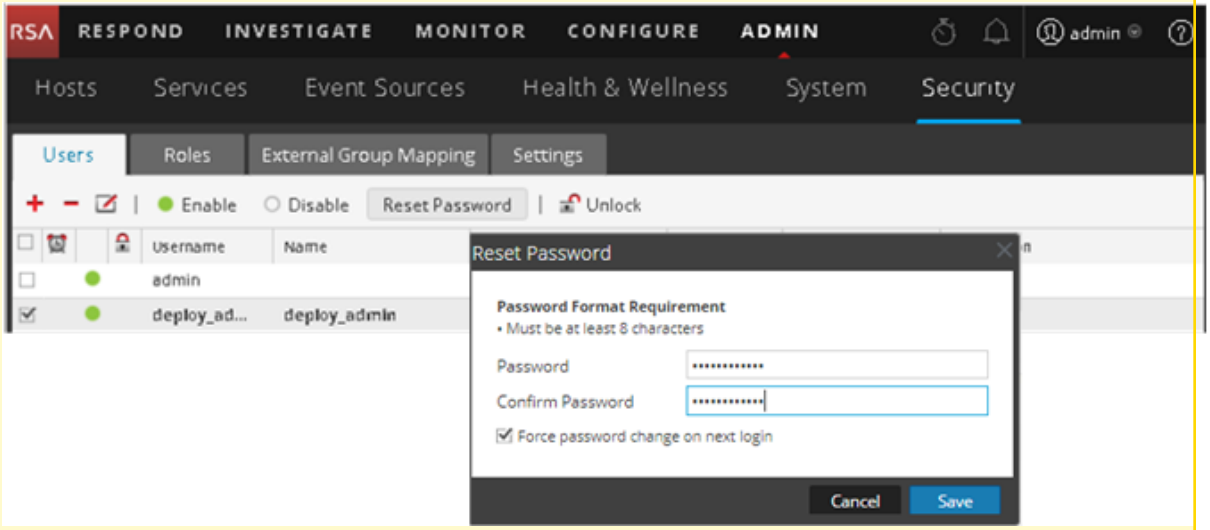
5. Press Enter. **Install (Fresh Install)** is selected by default).
   The **Host Name** prompt is displayed.



Caution: If you include "." in a host name, the host name must also include a valid domain name.

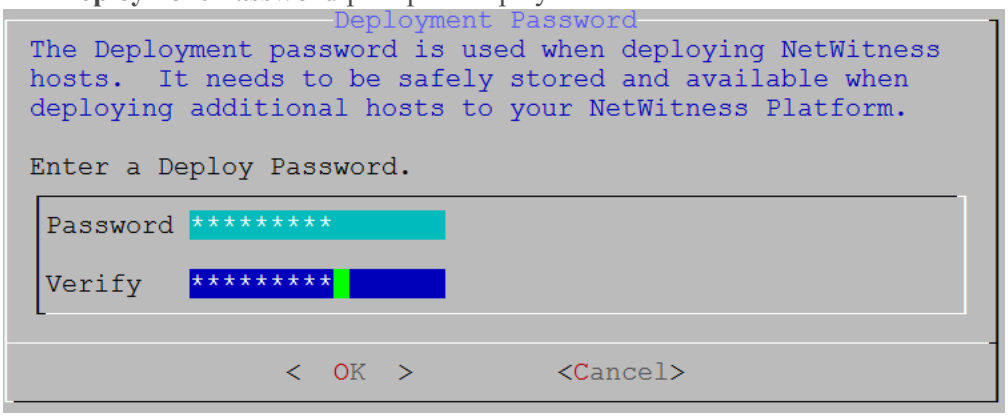
6. If want to keep this name, press **Enter**. If you want to change this name, edit it, tab to **OK**, and press **Enter**

Caution: If you change the **deploy_admin** user password in the NetWitness Platform User Interface (**ADMIN**>**Security** >Select **deploy-admin - Reset password**),



you must:
1. SSH to the NW Server host.
2. Run the `(/opt/rsa/saTools/bin/set-deploy-admin-password` script.
3. Use the new password when installing any new non-NW Server hosts.
4. Run `(/opt/rsa/saTools/bin/set-deploy-admin-password` script on all non-NW Server hosts in your deployment.
5. Write down the password because you may need to refer to it later in the installation.

The **Deployment Password** prompt is displayed.



Note: You must use the same deployment password that you used when you installed the NW Server.

7. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

   One of the following conditional prompts is displayed.

   - If the Setup program finds a valid IP address for this host, the following prompt is displayed.

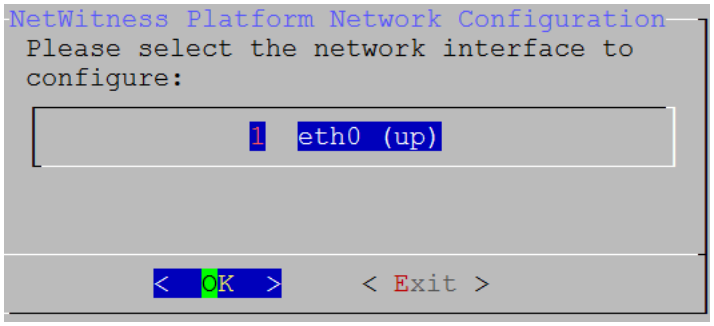
     
     Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** If you want to change the IP configuration found on the host.

   - If you are using an SSH connection, the following warning is displayed.

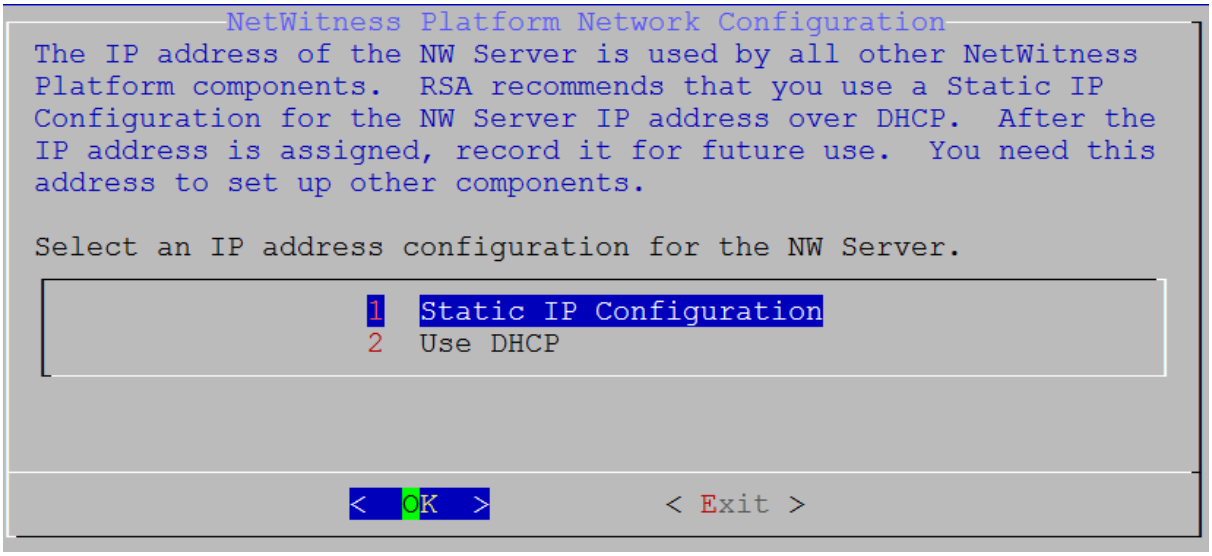
     
     Press **Enter** to close warning prompt.

Note: If you connect directly from the host console, the above warning will not be displayed.

- If the Setup Program found an IP configuration and you chose to use it, the **Update Repository** prompt is displayed. Go to step 11 to and complete the installation.
- If no IP configuration was found or If you chose to change the existing IP configuration, the **Network Configuration** prompt is displayed.

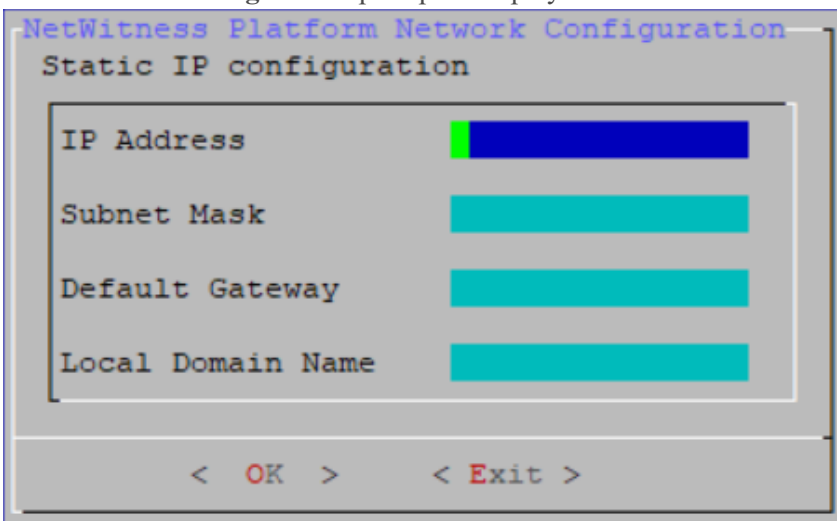


8. Down arrow to the network interface you want, Tab to **OK**, and press **Enter**. The **Network Configuration** prompt is displayed.
   If you do not want to continue, Tab to **Exit**



9. Tab to **OK** and press **Enter** to use **Static IP**.
   If you want to use **DHCP**, down arrow to **2 Use DHCP** and press **Enter**.

The **Static IP Configuration** prompt is displayed.



10. Type the configuration values (using the down arrow to move from field to field), Tab to **OK**, and press **Enter**.
    If you do not complete all the required fields, an an `All fields are required` error message is displayed (**Secondary DNS Server** and **Local Domain Name** fields are not required.)
    If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

    Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the install.

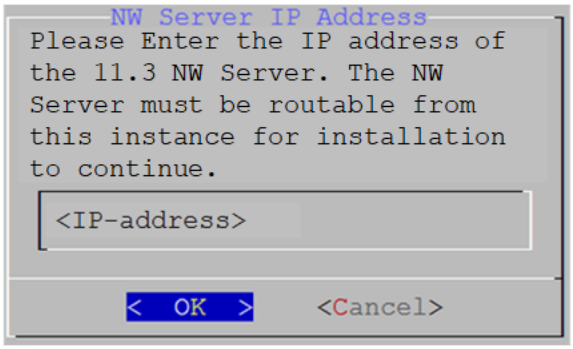
    The **Update Repository** prompt is displayed.

11. Use the down and up arrows to select **2 An External Repo (on an externally-managed server)**, tab to **OK**, and press **Enter**.
    The **External Update Repo URL** prompt is displayed.
    The repositories give you access RSA updates and CentOS updates.

12. Enter the base URL of the NetWitness Platform external repo used to setup NW server in the previous section (for example, **http://testserver/netwitness-repo**) and click **OK**.

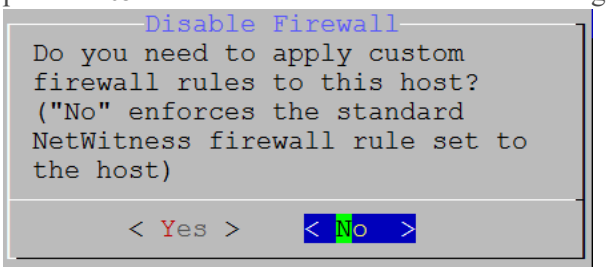
    The **NW Server IP Address** is displayed.

13. Type the IP address of the NW Server, tab to **OK**, and press **Enter**.

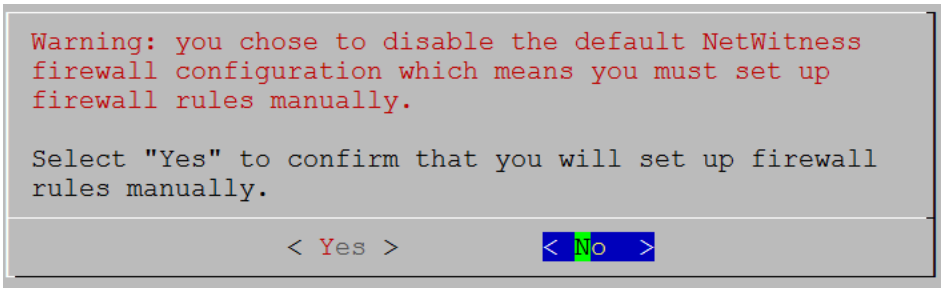


The **Disable** or use standard **Firewall** configuration prompt is displayed.

14. Tab to **No** (default), and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.



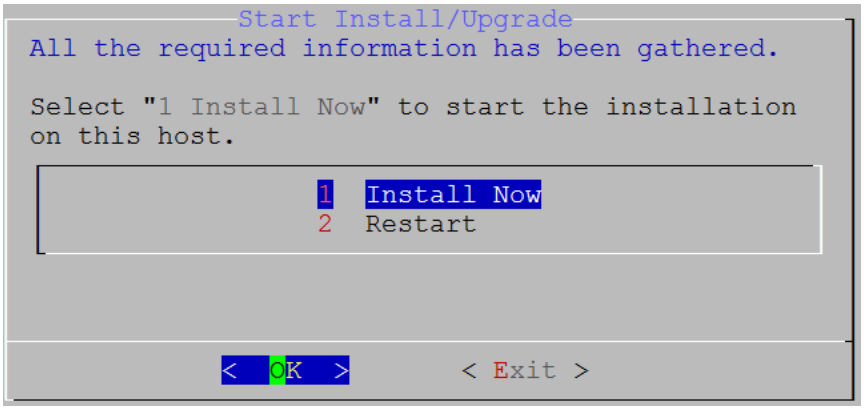
- If you select **Yes**, confirm your selection.



- If you select **No**, the standard firewall configuration is applied.

The **Start Install** prompt is displayed.

15. Press **Enter** to install 11.3.0.0 on the non-NW Server (**Install Now** is the default value).



When **Installation complete** is displayed, you have a generic host with an operating system compatible with NetWitness Platform 11.3.0.0.

16. Install a component service on the non-NW Server host.

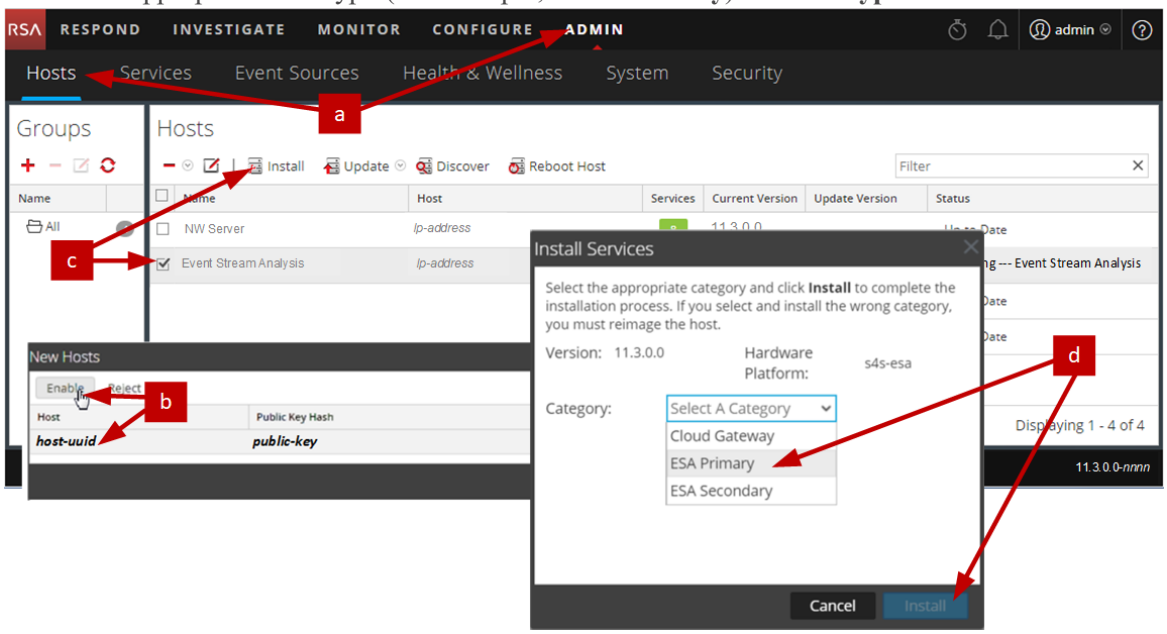
    a. Log into NetWitness Platform and click **ADMIN** > **Hosts**.
    The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

    Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

    b. Select the host (host UUID) in the **New Hosts** dialog and click **Enable**.
    The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

    c. Select that host (for example, **Event Stream Analysis**) and click Install.
    The **Install Services** dialog is displayed.

    d. Select the appropriate host type (for example, **ESA Primary**) in **Host Type** and click **Install**.



You have completed the installation of the non-NW Server host in NetWitness Platform.

17. Complete licensing requirements for installed services.
    See the *NetWitness Platform 11.3 Licensing Management Guide* for more information. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

18. Complete steps 1 through 16 for the rest of the NetWitness Platform non-NW Server components.

Step 5. Configure Host-Specific Parameters

Certain application-specific parameters are required to configure log ingest and packet capture in the Virtual Environment.

Configure Log Ingest in the Virtual Environment

Log ingest is easily accomplished by sending the logs to the IP address you have specified for the Decoder. The Decoder's management interface allows you to then select the proper interface to listen for traffic on if it has not already selected it by default.

Configure Packet Capture in the Virtual Environment

There are two options for capturing packets in a VMWare environment. The first is setting your vSwitch in promiscuous mode and the second is to use a third-party Virtual Tap.

Set a vSwitch to Promiscuous Mode

The option of putting a switch whether virtual or physical into promiscuous mode, also described as a SPAN port (Cisco services) and port mirroring, is not without limitations. Whether virtual or physical, depending on the amount and type of traffic being copied, packet capture can easily lead to over subscription of the port, which equates to packet loss. Taps, being either physical or virtual, are designed and intended for loss less 100% capture of the intended traffic.

Promiscuous mode is disabled by default, and should not be turned on unless specifically required. Software running inside a virtual machine may be able to monitor any and all traffic moving across a vSwitch if it is allowed to enter promiscuous mode as well as causing packet loss due to over subscription of the port..

To configure a portgroup or virtual switch to allow promiscuous mode:

1. Log on to the ESXi/ESX host or vCenter Server using the vSphere Client.
2. Select the ESXi/ESX host in the inventory.
3. Select the **Configuration** tab.
4. In the **Hardware** section, click **Networking**.
5. Select **Properties** of the virtual switch for which you want to enable promiscuous mode.
6. Select the virtual switch or portgroup you want to modify, and click **Edit**.
7. Click the **Security** tab. In the **Promiscuous Mode** drop-down menu, select **Accept**.

Use of a Third-Party Virtual Tap

Installation methods of a virtual tap vary depending on the vendor. Please refer to the documentation from your vendor for installation instructions. Virtual taps are typically easy to integrate, and the user interface of the tap simplifies the selection and type of traffic to be copied.

Virtual taps encapsulate the captured traffic in a GRE tunnel. Depending on the type you choose, either of these scenarios may apply:

- An external host is required to terminate the tunnel, and the external host directs the traffic to the Decoder interface.
- The tunnel send traffic directly to the Decoder interface, where NetWitness Platform handles the de-encapsulation of the traffic.

Step 6. Post Installation Tasks

This topic contains the tasks you complete after you install 11.3.

- General
- RSA NetWitness® Endpoint
- RSA NetWitness® UEBA
- Federal Information Processing Standard (FIPS) Enablement

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

General

General tasks apply to all customers regardless of the NetWitness Components you deploy.

(Optional) Task 1 - Re-Configure DNS Servers Post 11.3

On the NetWitness Server, complete the following steps to re-configure the DNS servers in NetWitness Platform 11.3.

1. Log in to the server host with your `root` credentials.
2. Edit the `/etc/netwitness/platform/resolv.dnsmasq` file:
   a. Replace the IP address corresponding to `nameserver`.
   If you need to replace both DNS servers , replace the IP entries for both the hosts with valid addresses.
   The following example shows both DNS entries.

   The following example shows the new DNS values.

   b. Save the `/etc/netwitness/platform/resolv.dnsmasq` file.
   c. Restart the internal DNS by running the following command:
   `systemctl restart dnsmasq`

Task 2 - Update HIVE Version

After you update to 11.3, you must update to the HIVE version that is compatible with the 11.3 Warehouse (either HIVE version 0.12 or version 1.0)

- HIVE Version 0.12
  SSH to the NW Server and run the following command.
  `rpm -ivh rsa-nw-HIVE-jdbc-0.12.0-1.x86_64.rpmHIVE`
- Version 1.0
  SSH to the NW Server and run the following command.
  `rpm -ivh rsa-nw-HIVE-jdbc-1.0.0-1.x86_64.rpm`

RSA NetWitness Endpoint

The tasks in this section only apply to customers that use the RSA NetWitness Endpoint component of NetWitness Platform.

(Optional) Task 3 - Install Endpoint Log Hybrid

Depending on the number of agents and the location of the agents, you can choose to deploy a single Endpoint Log Hybrid host or multiple Endpoint Log Hybrid hosts. To deploy a host, you provision it and install a category on it.

- Single Endpoint Log Hybrid host - Deploy NetWitness Server host , Endpoint Log Hybrid host, and ESA host or hosts.
- Multiple Endpoint Log Hybrid hosts - Deploy NetWitness Server host, ESA host or hosts, Endpoint Log Hybrid hosts. For a consolidated view of all endpoint data from multiple Endpoint Log Hybrid hosts, install the Endpoint Broker.

> **Note:** RSA recommends that you co-locate the Endpoint Broker on the NetWitness Broker host. However, you can deploy the Endpoint Broker on a separate host or co-locate it on the Endpoint Log Hybrid.

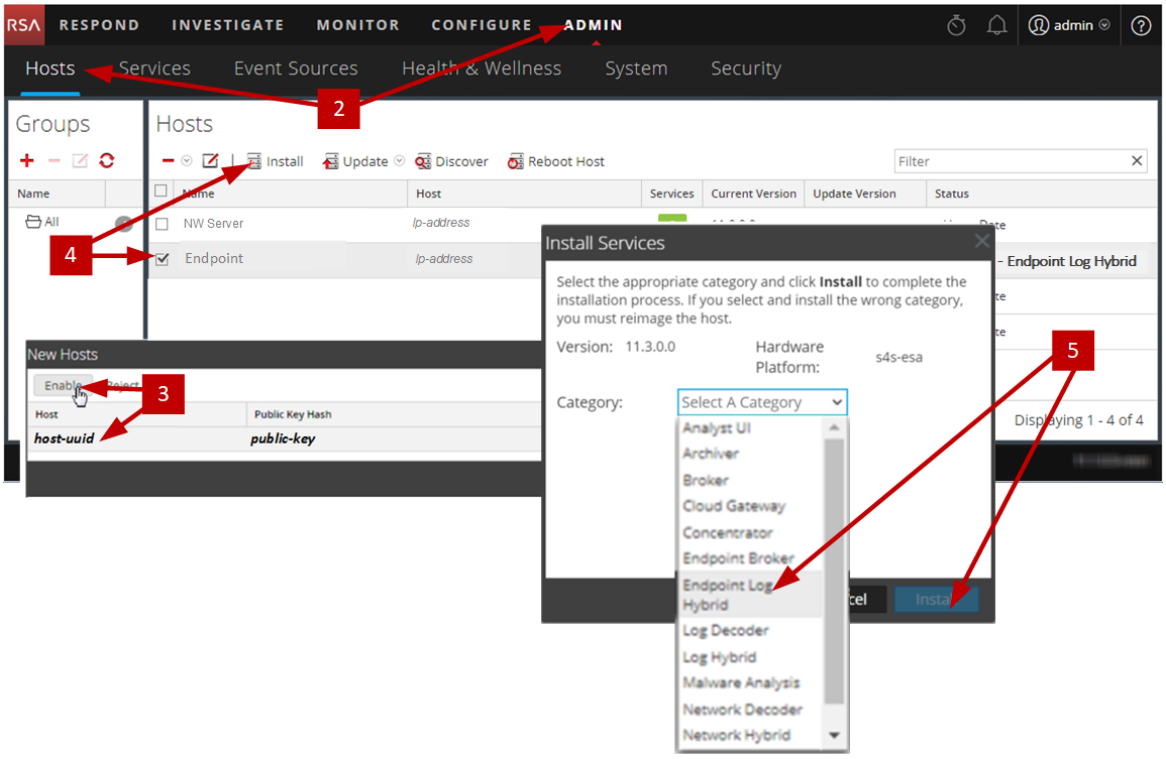
> **Note:** You must plan to scale your ESA deployment to support multiple Endpoint Log Hybrid hosts.

To deploy an Endpoint Log Hybrid host:

1. For:
   - A physical host, complete steps 1 - 14 under "Task 2 - Install 11.3 on Other Component Hosts" under "Installation Tasks" in the *Physical Host Installation Guide for NetWitness Platform 11.3*.
   - A virtual host, complete steps 1 - 15 under "Task 2 - Install 11.3 on Other Component Hosts" under "Installation Tasks" in the *Virtual Host Installation Guide for NetWitness Platform 11.3*.
2. Log into NetWitness Platform and click **ADMIN** > **Hosts**.
   The New Hosts dialog is displayed with the Hosts view grayed out in the background.

   > **Note:** If the New Hosts dialog is not displayed, click **Discover** in the **Hosts** view toolbar.
3. Select the host in the **New Hosts** dialog and click **Enable**.
   The New Hosts dialog closes and the host is displayed in the Hosts view.

4. Select that host in the **Hosts** view (for example, **Endpoint**) and click Install.
   The Install Services dialog is displayed.
5. Select **Endpoint Log Hybrid** category and click **Install**.



6. Make sure that the Endpoint Log Hybrid service is running.
7. Configure Endpoint Meta forwarding.
   See *Endpoint Configuration Guide* for instructions on how to configure Endpoint Meta forwarding.
8. Deploy the ESA Rules from the Endpoint Rule Bundle. For more information, see "Deploy Endpoint Risk Scoring Rules on ESA" section in the ESA Configuration Guide.

   Note: The Endpoint IIOCs are available as OOTB Endpoint Application rules.

9. Review the default policies and create groups to manage your agents. See *Endpoint Configuration Guide*.

   Note: In 11.3, agents can operate in Insights or Advanced mode depending on the policy configuration. The default policy enables the agent in an advanced mode. If you want to continue to use the Insights agent, before updating, review the policy, and make sure that the Agent mode is set to Insights.

10. Install the Endpoint Agent. You can install an Insights (free version) or an Advanced agent (licensed). See *Endpoint Agent Installation Guide* for detailed instructions on how to install the agent.

Note: You can migrate the Endpoint Agent from 4.4.0.x to 11.3. For more information, see *NetWitness Endpoint 4.4.0.x to NetWitness Platform 11.3 Migration Guide*.

Task 4 - Configuring Multiple Endpoint Log Hybrid

To install another Endpoint Log Hybrid:

1. For
   - A physical host, complete steps 1 - 14 under "Task 2 - Install 11.3 on Other Component Hosts" under "Installation Tasks" in the *Physical Host Installation Guide for NetWitness Platform 11.3*.
   - A virtual host, complete steps 1 - 15 under "Task 2 - Install 11.3 on Other Component Hosts" under "Installation Tasks" in the *Virtual Host Installation Guide for NetWitness Platform 11.3*.
2. Create a directory `mkdir -p /etc/pki/nw/nwe-ca`.
3. Copy the following certificates from the first Endpoint Log Hybrid to the second Endpoint Log Hybrid:

   Note: RSA recommends that you copy certificates from CentOS to Windows using the `SCP` command to avoid any corruption caused by Antivirus or third-party tools.

   `/etc/pki/nw/nwe-ca/nwerootca-cert.pem`

   `/etc/pki/nw/nwe-ca/nwerootca-key.pem`
4. Complete steps 2 - 10 under "Task 3 - Install Endpoint Log Hybrid" in "Post Installation Tasks" of the *Platform Physical Host Installation Guide*.
5. Repeat steps 1 - 4 to add more Endpoint Log Hybrids.

RSA NetWitness® UEBA

The tasks in this section only apply to customers that use the RSA UEBA component of NetWitness Platform.

(Optional) Task 5 - Install UEBA

To set up NetWitness UEBA in NetWitness Platform 11.3, you must install and configure the NetWitness UEBA service.

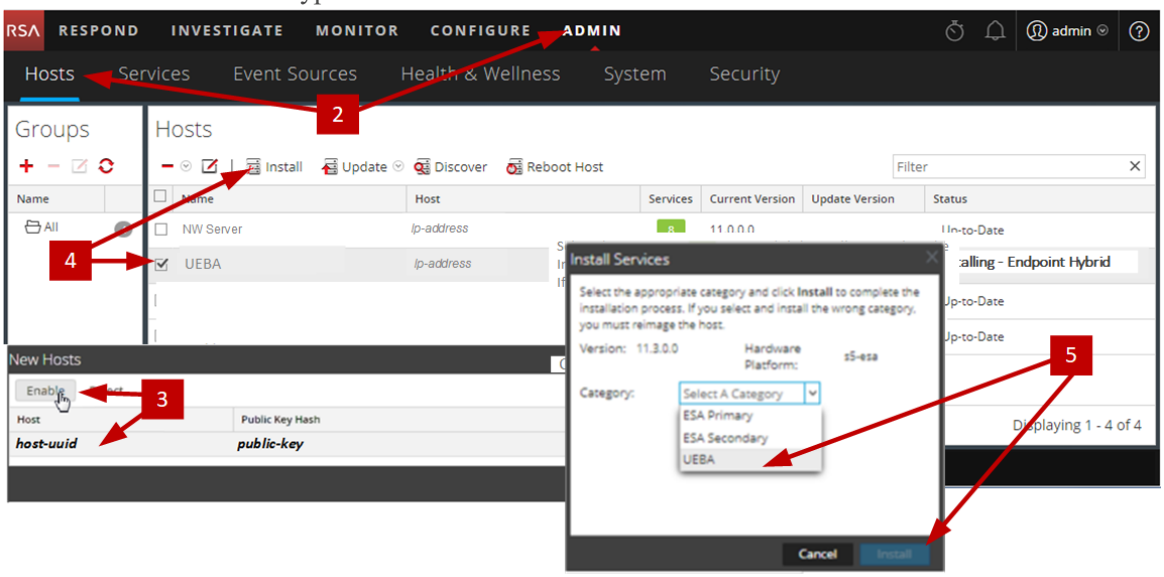
The following procedure shows you how to install the NetWitness UEBA service on a NetWitness UEBA Host Type and configure the service.

1. For:
   - A physical host, complete steps 1 - 14 under "Task 2 - Install 11.3 on Other Component Hosts" under "Installation Tasks" in the *Physical Host Installation Guide for NetWitness Platform 11.3*.
   - A virtual host, complete steps 1 - 15 under "Task 2 - Install 11.3 on Other Component Hosts" under "Installation Tasks" in the *Virtual Host Installation Guide for NetWitness Platform 11.3*.

   Note: The Kibana and Airflow webserver User Interface password is the same as the deploy admin password. Make sure that you record this password and store it in a safe location.
2. Log into NetWitness Platform and go to **ADMIN** > **Hosts**.
   The New Hosts dialog is displayed with the Hosts view grayed out in the background.

   Note: If the New Hosts dialog is not displayed, click **Discover** in the **Hosts** view toolbar.
3. Select the host in the **New Hosts** dialog and click **Enable**.
   The New Hosts dialog closes and the host is displayed in the Hosts view.
4. Select that host in the **Hosts** view (for example, **UEBA**) and click 
.
   The Install Services dialog is displayed.

5. Select the **UEBA** Host Type and click **Install**.



6. Make sure that the UEBA service is running.

7. Complete licensing requirements for NetWitness UEBA.
   See the *Licensing Management Guide* for more information.

   Note: NetWitness Platform supports the User and Entity Behavior Analytics License (UEBA). This license is used based on the number of users. The Out-of-the-Box Trial License is a 90-day trial license. In case of UEBA licenses, the 90-day trial period begins from the time the UEBA service deployed on the NetWitness Platform product.

8. Configure NetWitness UEBA.
   You need to configure a data source (Broker or Concentrator), historical data collection start date, and data schemas.

   IMPORTANT: If your deployment has multiple Concentrators, RSA recommends that you assign the Broker at the top of your deployment hierarchy for the NetWitness UEBA data source.

   a. Determine the earliest date in the NWDB of the data schema you plan to choose (`AUTHENTICATION`, `FILE`, `ACTIVE_DIRECTORY`, `PROCESS`, `REGISTRY` or any combination of these schemas) to specify in `startTime` in step c. If you plan to specify multiple schemas, use the earliest date among all the schemas. If you are not sure which data schema to choose, you can specify all five data schemas (that is, `AUTHENTICATION`, `FILE`, `ACTIVE_DIRECTORY`, `PROCESS` and `REGISTRY`) to have UEBA adjust the models it can support based on the Windows logs available. You can use one of the following methods to determine the data source date.

      - Use the Data Retention date (that is, if the Data Retention duration is 48 hours, `startTime` = <48 hours earlier than the current time>).

- Search the NWDB for the earliest date.

b. Create a user account for the data source (Broker or Concentrator) to authenticate to the data source.

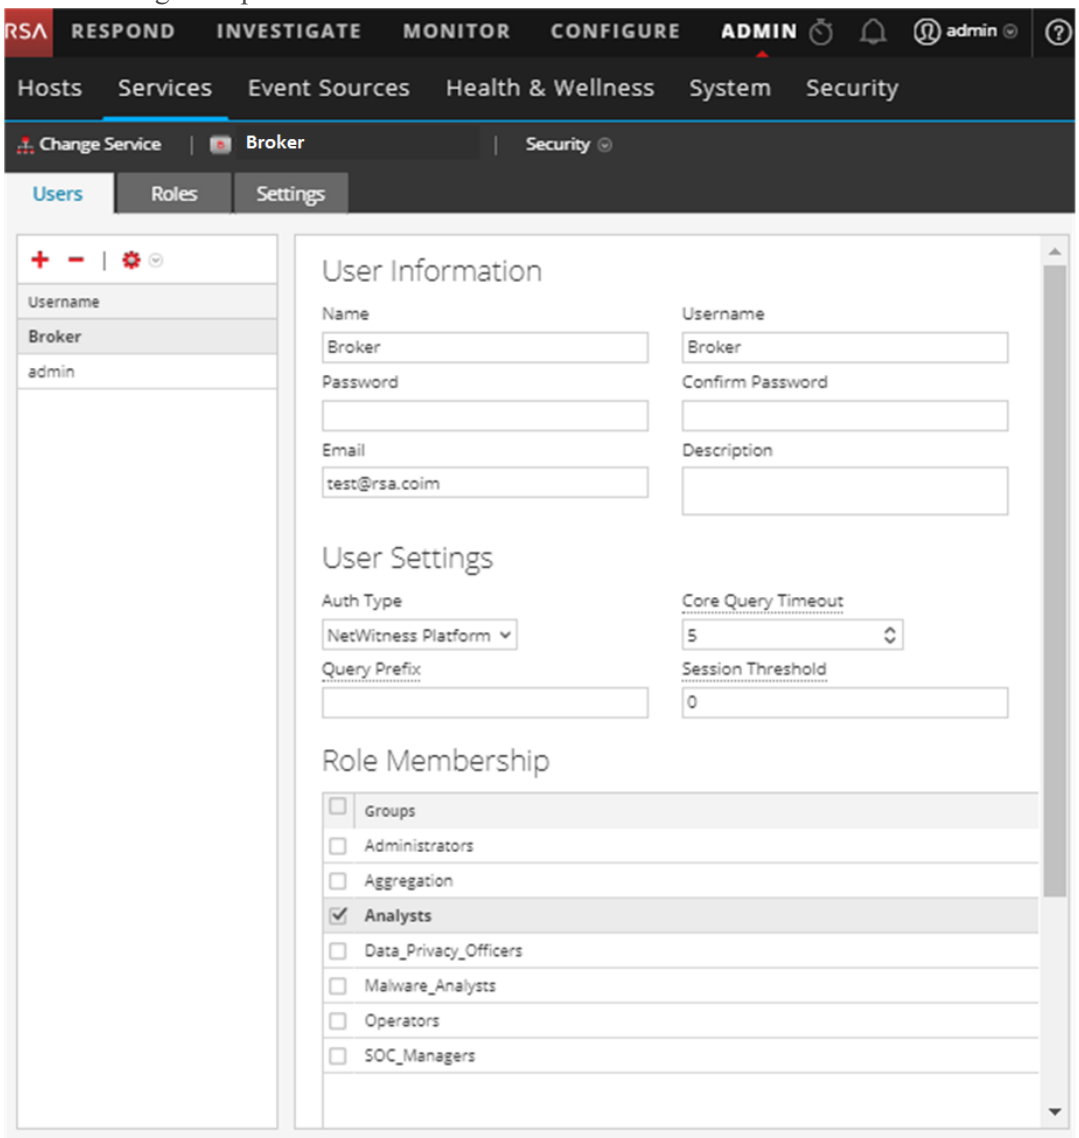
i. Log into NetWitness Platform.

ii. Go to **Admin** > **Services**.

iii. Locate the data source service (Broker or Concentrator).

Select that service, and select (Actions) > **View** > **Security**.

iv. Create a new user and assign the "Analysts" role to that user.
The following example shows a user account created for a Broker.



c. SSH to the NetWitness UEBA server host.

d. Submit the following commands.

```
/opt/rsa/saTools/bin/ueba-server-config -u <user> -p <password> -h
<host> -o <type> -t <startTime> -s <schemas> -v -e
```

Where:

Argument	Variable	Description
-u	<user>	User name of the credentials for the Broker or Concentrator instance that you are using as a data source.
-p	<password>	Password of the credentials for the Broker or Concentrator instance that you are using as a data source. The following special characters are supported in a password. !"#$%&()*+,-:;<=>?@[\]^_`\{\|} If you want to include a special character or special characters, you must delimit the password with an apostrophe sign, for example: sh /opt/rsa/saTools/bin/ueba-server-config -u brokeruser -p '!"UHfz?@ExMn#$' -h 10.64.153.104 -t 2018-08-01T00:00:00Z -s 'AUTHENTICATION FILE ACTIVE_ DIRECTORY' -o broker -v
-h	<host>	IP address of the Broker or Concentrator used as the data source. Currently, only one data source is supported.
-o	<type>	Data source host type (broker or concentrator).
-t	<startTime>	Historical start time as of which you start collecting data from the data source in YYYY-MM-DDTHH-MM-SSZ format (for example, 2018-08-15T00:00:00Z). **Note:** The script interprets the time you enter as UTC (Coordinated Universal Time) and it does not adjust the time to your local time zone.

Argument	Variable	Description
-s	<schemas>	Array of data schemas. If you want to specify multiple schemas, use a space to separate each schema (for example, 'AUTHENTICATION FILE ACTIVE_DIRECTORY PROCESS REGISTRY'). **Note:** If you specify all five data schemas (that is, AUTHENTICATION, FILE, ACTIVE_DIRECTORYPROCESS, and REGISTRY), UEBA adjusts the models it can support based on the Windows logs available.
-v		verbose mode.
-e	<argument>	Boolean Argument. This enables the UEBA indicator forwarder to Respond. **Note:** If the Respond server is configured in NetWitness platform, you can transfer the NetWitness UEBA indicators to the respond server and to the correlation server to create an Incidents.

9. Complete NetWitness UEBA configuration according to the needs of your organization. See the *NetWitness UEBA User Guide* for more information.

Note: If NetWitness Endpoint Server is configured, you can view the alerts associated with the Process and Registry data schemas.

Task 6 - Set up Permission

If you have installed UEBA, you need to assign the UEBA_Analysts and Analysts roles to the UEBA users. For more information, see *System Security and User Management Guide*.

After this configuration, UEBA users can access the **Investigate** > **Users** view.

Federal Information Processing Standard (FIPS) Enablement

Task 7 - Enable FIPS Mode

Note: This task is optional for Upgrades from 10.6.6.x with FIPS enabled for Log Collectors, Log Decoders and Network Decoders).

Federal Information Processing Standard (FIPS) is enabled on all services except Log Collector, Log Decoder, and Decoder. FIPS cannot be disabled on any services except Log Collector, Log Decoder, and Decoder.

Appendix A. Troubleshooting

This section describes solutions to problems that you may encounter during installations and upgrades. In most cases, NetWitness Platform creates log messages when it encounters these problems.

Note: If you cannot resolve an upgrade issue using the following troubleshooting solutions, contact Customer Support (https://community.rsa.com/docs/DOC-1294).

This section has troubleshooting documentation for the following services, features, and processes.

- Command Line Interface (CLI)
- Backup Script
- Event Stream Analysis
- Concentrator Service
- Log Collector Service (`nwlogcollector`)
- Orchestration
- NW Server
- Reporting Engine
- NetWitness UEBA

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Command Line Interface (CLI)

Error Message	Command Line Interface (CLI) displays: "Orchestration failed." `Mixlib::ShellOut::ShellCommandFailed: Command execution failed. STDOUT/STDERR suppressed for sensitive resource in/var/log/netwitness/config-management/chef-solo.log`
Cause	Entered the wrong `deploy_admin` password in `nwsetup-tui`.
Solution	Retrieve your `deploy_admin` password password. 1. SSH to the NW Server host. `security-cli-client --get-config-prop --prop-hierarchy nw.security-client --prop-name deployment.password` SSH to the host that failed. 2. Run the `nwsetup-tui` again using correct `deploy_admin` password.

Error Message	`ERROR com.rsa.smc.sa.admin.web.controller.ajax.health. AlarmsController - Cannot connect to System Management Service`
Cause	NetWitness Platform sees the Service Management Service (SMS) as down after successful upgrade even though the service is running.
Solution	Restart SMS service. `systemctl restart rsa-sms`

Error Message	You receive a message in the User Interface to reboot the host after you update and reboot the host offline.
Cause	You cannot use CLI to reboot the host. You must use the User Interface.
Solution	Reboot the host in the Host View in the User Interface.

Backup (`nw-backup` script)

Error Message	`WARNING: Incorrect ESA Mongo admin password for host <hostname>.`
Cause	ESA Mongo admin password contains special characters (for example, '!@#$%^qwerty').
Solution	Change the ESA Mongo admin password back to the original default of 'netwitness' before running backup.

Error	Backup errors caused by the `immutable` attribute setting. Here is an example of an error that can be displayed: Cause	If you have any files that have the immutable flag set (to keep the Puppet process from overwriting a customized file), the file will not be included in the backup process and an error will be generated.
Solution	On the host that contains the files with the immutable flag set, run the following command to remove the immutable setting from the files: `chattr -i <filename>`

Error	Error creating Network Configuration Information file due to duplicate or bad entries in primary network configuration file: `/etc/sysconfig/network-scripts/ifcfg-em1` Verify contents of `/var/netwitness/logdecoder/packetdb/nw-backup/2018-02-23/S5-BROK-36-10.25.53.36-network.info.txt`
Cause	There are incorrect or duplicate entries for any one of the following fields: DEVICE, BOOTPROTO, IPADDR, NETMASK or GATEWAY, that were found from reading the primary Ethernet interface configuration file from the host being backed up.

Solution	Manually create a file at the backup location on the external backup server, as well as the backup location local to the host where other backups have been staged. The file name should be of the format `<hostname>-<hostip>-network.info.txt`, and should contain the following entries:
	`DEVICE=<devicename> ; # from the host's primary ethernet interface config file`
	`BOOTPROTO=<bootprotocol> ; # from the host's primary ethernet interface config file`
	`IPADDR=<value> ; # from the host's primary ethernet interface config file`
	`NETMASK=<value> ; # from the host's primary ethernet interface config file`
	`GATEWAY=<value> ; # from the host's primary ethernet interface config file`
	`search <value> ; # from the host's /etc/resolv.conf file`
	`nameserver <value> ; # from the host's /etc/resolv.conf file`

Event Stream Analysis

- For ESA Correlation troubleshooting information, see the *Alerting with ESA Correlation Rules User Guide*.
- For ESA Analytics troubleshooting information, see the *Automated Threat Detection Configuration Guide*.

Concentrator Service

Problem	After you upgrade to 11.3.0.0, pivot to navigate query fails if the Concentrator service version is 10.6.x.
Cause	Pivot to Navigate query fails as it contains meta entities and 10.6.x Concentrator service does not support meta entities.
Solution	You must edit the query and remove meta entities. For example, if query is for user then remove the `user.all` meta entity and re-run the query.

Log Collector Service (`nwlogcollector`)

Log Collector logs are posted to `/var/log/install/nwlogcollector_install.log` on the host running the `nwlogcollector` service.

Error Message	`<timestamp>.NwLogCollector_PostInstall: Lockbox Status : Failed to open lockbox: The lockbox stable value threshold was not met because the system fingerprint has changed. To reset the system fingerprint, open the lockbox using the passphrase.`
Cause	The Log Collector Lockbox failed to open after the update.
Solution	Log in to NetWitness Platform and reset the system fingerprint by resetting the stable system value password for the Lockbox as described in the "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*.

Error Message	`<timestamp> NwLogCollector_PostInstall: Lockbox Status : Not Found`
Cause	The Log Collector Lockbox is not configured after the update.
Solution	If you use a Log Collector Lockbox, log in to NetWitness Platform and configure the Lockbox as described in the "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*.

Error Message	`<timestamp>: NwLogCollector_PostInstall: Lockbox Status : Lockbox maintenance required: The lockbox stable value threshold requires resetting. To reset the system fingerprint, select Reset Stable System Value on the settings page of the Log Collector.`
Cause	You need to reset the stable value threshold field for the Log Collector Lockbox.
Solution	Log in to NetWitness Platform and reset the stable system value password for the Lockbox as described in "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*.

Problem	You have prepared a Log Collector for upgrade and no longer want to upgrade at this time.
Cause	Delay in upgrade.
Solution	Use the following command string to revert a Log Collector that has been prepared for upgrade back to resume normal operation. `# /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --revert`

NW Server

These logs are posted to `/var/netwitness/uax/logs/sa.log` on the NW Server Host.

Problem	After upgrade, you notice that Audit logs are not getting forwarded to the configured Global Audit Setup; or, The following message seen in the `sa.log`. `Syslog Configuration migration failed. Restart jetty service to fix this issue`
Cause	NW Server Global Audit setup migration failed to migrate from 10.6.6.x to 11.3.0.0.
Solution	1. SSH to the NW Server. 2. Submit the following command. `orchestration-cli-client --update-admin-node`

Orchestration

The orchestration server logs are posted to `/var/log/netwitness/orchestration-server/orchestration-server.log` on the NW Server Host.

Problem	1. Tried to upgrade a non-NW Server host and it failed. 2. Retried the upgrade for this host and it failed again. You will see the following message in the `orchestration-server.log`. `"'file' _virtual_ returned False: cannot import name HASHES""`
Cause	Salt minion may have been upgraded and never restarted on failed non-NW Server host

Solution	1. SSH to the non-NW Server host that failed to upgrade.
	2. Submit the following commands.
	`systemctl unmask salt-minion`
	`systemctl restart salt-minion`
	3. Retry the upgrade of the non-NW Server host.

Reporting Engine Service

Reporting Engine Update logs are posted to to/var/log/re_install.log file on the host running the Reporting Engine service.

Error Message	<timestamp> : Available free space in /var/netwitness/re-server/rsa/soc/reporting-engine [><existing-GB] is less than the required space [<required-GB>]
Cause	Update of the Reporting Engine failed because you do not have enough disk space.
Solution	Free up the disk space to accommodate the required space shown in the log message. See the "Add Additional Space for Large Reports" topic in the *Reporting Engine Configuration Guide* for instructions on how to free up disk space.

NetWitness UEBA

Problem	The User Interface is not accessible.
Cause	You have more than one NetWitness UEBA service existing in your NetWitness deployment and you can only have NetWitness UEBA service in your deployment.

Solution	Complete the following steps to remove the extra NetWitness UEBA service.
	1. SSH to NW Server and run the following commands to query the list of installed NetWitness UEBA services.
	`# orchestration-cli-client --list-services|grep presidio-airflow`
	`... Service: ID=7e682892-b913-4dee-ac84-ca2438e522bf, NAME=presidio-airflow, HOST=xxx.xxx.xxx.xxx:null, TLS=true`
	`... Service: ID=3ba35fbe-7220-4e26-a2ad-9e14ab5e9e15, NAME=presidio-airflow, HOST=xxx.xxx.xxx.xxx:null, TLS=true`
	2. From the list of services, determine which instance of the `presidio-airflow` service should be removed (by looking at the host addresses).
	3. Run the following command to remove the extra service from Orchestration (use the matching service ID from the list of services):
	`# orchestration-cli-client --remove-service --id <ID-for-presidio-airflow-form-previous-output>`
	4. Run the following command to update node 0 to restore NGINX:
	`# orchestration-cli-client --update-admin-node`
	5. Log in to NetWitness Platform, go to **ADMIN** > **Hosts**, and remove the extra NetWitness UEBA host.

Appendix B. Create External Repository

Complete the following procedure to set up an external repository (Repo).

Note: 1.) You need an unzip utility installed on the host to complete this procedure. 2.) You must know how to create a web server before you complete the following procedure.

1. Log in to the web server host.
2. Create a directory to host the NW repository (`netwitness-11.3.0.0.zip`), for example `ziprepo` under `web-root` of the web server. For example, if `/var/netwitness` is the `web-root`, submit the following command string.
   `mkdir -p /var/netwitness/<your-zip-file-repo>`
3. Create the 11.3.0.0 directory under `/var/netwitness/<your-zip-file-repo>`.
   `mkdir -p /var/netwitness/<your-zip-file-repo>/11.3.0.0`
4. Create the `OS` and `RSA` directories under `/var/netwitness/<your-zip-file-repo>/11.3.0.0`.
   `mkdir -p /var/netwitness/<your-zip-file-repo>/11.3.0.0/OS`
   `mkdir -p /var/netwitness/<your-zip-file-repo>/11.3.0.0/RSA`
5. Unzip the `netwitness-11.3.0.0.zip` file into the `/var/netwitness/<your-zip-file-repo>/11.3.0.0` directory.
   `unzip netwitness-11.3.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.3.0.0`
   Unzipping `netwitness-11.3.0.0.zip` results in two zip files (`OS-11.3.0.0.zip` and `RSA-11.3.0.0.zip`) and some other files.
6. Unzip the:
   a. `OS-11.3.0.0.zip` into the `/var/netwitness/<your-zip-file-repo>/11.3.0.0/OS` directory.
      `unzip /var/netwitness/<your-zip-file-repo>/11.3.0.0/OS-11.3.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.3.0.0/OS`
      The following example illustrates how the Operating System (OS) file structure will appear after

you unzip the file.

Virtual Host Upgrade Checklist

for Version 10.6.6.x to 11.3

RSA NETWITNESS® PLATFORM

Task	Description	√
Prepare for Upgrade		
1.	Download *Physical Host Upgrade Guide* from RSA Link (https://community.rsa.com/docs/DOC-100385) and review it.	
2.	Carefully read the sections on Event Stream Analysis (ESA) Upgrade Considerations and Investigate in Mixed Mode.	
3.	Be aware of the hardware, deployments, services, and features not supported in 11.3.	
4.	Perform the upgrade preparation tasks for the features you use. **Caution:** Make sure that you implement and test the new ports so that upgrade does not fail due to missing ports.	
5.	Create CentOS 6 external host to save backup tar files.	
6.	Download the `nw-backup-v4.2.zip` (or later) file from RSA Link (https://community.rsa.com/docs/DOC-81514) to external host.	
7.	Execute `get-all-systems.sh` and `ssh-propagate.sh` script from external host.	
8.	Preserve a copy of the `get-all-systems-master` file for future reference.	
9.	Execute `nw-backup.sh` in `TEST` mode to evaluate the space requirements from external host (for example: `nw-backup -t -l -D`).	
10.	Review the back up options for `nw-backup.sh` by displaying the help menu (`nw-backup.sh -h`) .	
Migrate Disk Drives		
11.	Back up data in 10.6.6.x virtual machines (VMs).	
12.	Deploy the same 10.6.6.x VM stack in 11.3.	
13.	Copy VMDK files and add them as hard disk to the new VM.	
14.	Retain the MAC Address of upgraded SA Server VM.	
15.	Restore Backup data in 10.6.6.x to 11.3 VMs.	

Task	Description	√
Phase 1 - Set Up NW Server, Event Stream Analysis, Malware Analysis, and Broker or Concentrator Hosts		
16.	Update the contents of the `all-systems` so they consist of SA, ESA's, MA and Broker/Concentrator backup data.	
17.	For ESA hosts, reset the Mongo Database admin password to 'netwitness' if it contains special characters .	
18.	If your environment has multiple ESA appliances, designate a primary ESA (Where the Context Hub service is running) and copy `*-controldata-mongodb.tar.gz.*` files from the secondary ESAs to designated primary ESA default backup path.	
19.	Set up the 10.6.6.x SA Server host to 11.3 NW Server host by running the `nwsetup-tui` program on the host.	
20.	Repeat step 19 on the: a. ESA Primary host (and other ESA hosts if you have any). b. Malware Analysis host. c. Broker or Concentrator host.	
21.	Install the ESA, Malware Analysis, and Broker or Concentrator services in the NetWitness 11.3 User Interface.	
Phase 2 - Upgrade All Other Hosts		
22.	Set up the all other hosts on 11.3 by running the `nwsetup-tui` program on each host.	
23.	Install the Category (service category) in the NetWitness 11.3 User Interface.	
Preform Post Upgrade Adjustments		
24.	Perform the post upgrade tasks for the features you use.

Upgrade Preparation Tasks **14**

General 14

Task 1 - Review Core Ports and Open Firewall Ports 14

Task 2 - Record Your 10.6.6.x admin user Password 15

Task 3 - Create a Backup of the /etc/fstab File 15

Task 4 - Make Sure Password Strength Settings Check Boxes Are Set in 10.6.6.x 15

Task 5 (Conditional) - Extract 10.6.x Public Key Infrastructure (PKI) Certificates 16

Event Stream Analysis (ESA) 19

Task 6 (Conditional) - Record Any String Array Type Meta Keys on the Event Stream Analysis Service 19

Respond 19

Task 7 - Check Aggregation Rules Match Conditions for “Domain” or “Domain for Suspected C&C” 19

Task 8 - Set Data Retention Run Interval to ≥ 24 Hours 20

Reporting Engine 21

(Conditional) Task 9 - Unlink External Storage 21

Warehouse Connector 22

(Conditional) Task 10 - Copy keytab files in root or etc Directory Stored in Other Directory 22

Other Tasks 22

Backup Instructions **23**

Task 1 - Set up an External Host for Backing up Files 24

Task 2 - Create a List of Hosts to Back up 26

Troubleshooting Information 27
Task 3 - Set up Authentication Between Backup and Target Hosts 29
Task 4 - Check for Backup Requirements for Specific Types of Hosts 29
For All Host Types 29
For ESA Hosts with Mongo Databases 30
For Decoder, Concentrator, or Broker Hosts: Stop Data Capture and Aggregation 30
Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh 30
For File Collection Event Sources 32
For Bluecoat Event Sources 32
For Integrations with Web Threat Detection, Archer Cyber Incident & Breach Response or NetWitness Endpoint - List RabbitMQ Usernames and Passwords 32
Task 5 - Check for Adequate Space for the Backup 32
Task 6 - Back up Your Host Systems 33
Post Backup Tasks 36
Task 1 - Save a Copy of the all-systems File and the Backup Tar files 36
Task 2 - Ensure Required Backup Files Were Generated 36
Task 3 - (Conditional) For Multiple ESA Hosts, Copy mongodb tar files to Primary ESA Host 37
Task 4 - Ensure All Required Backup Files are on Each Host 37
Migrate Disk Drives from 10.6.6.x to 11.3 40
Task 1 - Back Up Data in 10.6.6.x VMs 40
Task 2 - Deploy Same 10.6.6.x VM Stack in 11.3 41
Task 3 - Copy VMDK Files and Add Them as Hard Disk to New VMs 41
Task 4 - Retain MAC Address of Upgraded SA Server VM 48
Task 5 - Restore Backup Data in 10.6.6.x to 11.3 VMs 52
Set Up Virtual Hosts in 11.3 56
Phase 1 - Set Up NW Server, Event Stream Analysis, Malware Analysis, and Broker or Concentrator Hosts 56
Task 1 - Set Up 11.3 NetWitness Server 56
Task 2 - Set Up 11.3 ESA 56
Task 3 - Set Up 11.3 Malware Analysis 56
Task 4 - Set Up 11.3 Broker or Concentrator 56
Phase 2 - Set Up The Rest of the Component Hosts 57
Decoder and Concentrator Hosts 57
Log Decoder Host 57
Virtual Log Collector Host 57
Set Up 11.3 NW Server Host 58
Set Up 11.3 Component Host 64
Update or Install Legacy Windows Collection 70
Post Upgrade Tasks 71
General 71

Task 1 - Remove Backup-Related Files from Host Local Directories 71
Task 2 - Make Sure Port 15671 Is Configured Correctly 72
(Optional) Task 3 - Reissue Certificates for Your Hosts 72
(Conditional) Task 4 - Restore Custom Analysts Roles 72
(Conditional) Task 5 - If NetWitness Platform Has No Web Access, Upload Response .bin File Again (License Server) 72
Task 6 - Migrate Active Directory (AD) 72
Task 7 - Modify Migrated AD Configuration to Upload Certificate 73
Task 8 - Reconfigure Pluggable Authentication Module (PAM) in 11.3 73
Task 9 - Restore NTP Servers 73
Task 10 - Restore Licenses for Environments without FlexNet Operations-On Demand Access 73
(Conditional) Task 11 - If You Disabled Standard Firewall Config - Add Custom IPtables 74
(Conditional) Task 12 - Specify SSL Ports If You Never Set Up Trusted Connections 74
Task 13 (Conditional) Reconfigure Public Key Infrastructure (PKI) Certificates 75
Event Stream Analysis (ESA) 75
Task 14 - Reconfigure Automated Threat Detection for ESA 75
Task 15 (Conditional) Verify String Array Type Meta Keys on the ESA Correlation Service 76
Task 16 (Conditional) Update RSA Live ESA Rules with Meta Type Changes from String to Array 76
Task 17 (Conditional) - Verify ESA Rule Deployment 77
Investigate 77
Task 18 - Make Sure Customized User Roles Have Investigate-server Permissions for Event Analysis Access 77
Log Collection 79
Task 19 - Reset Stable System Values for Log Collector after Upgrade 79
Task 20 - (Conditional) Update SSHD Configuration after Upgrade with Older Windows and UNIX SFTP Agents 79
Task 21 - Enable FIPS Mode 80
Log Decoder and Decoder 80
(Conditional) Task 23 - Enable Metadata for GeoIP2 Parser 80
Malware Analysis 81
Task 24 - Enable Threat - Malware Indicators Dashboard 81
Reporting Engine 81
(Conditional) Task 25 - Restore the CA certificates for External Syslog Servers for Reporting Engine 81
(Conditional) Task 26 - Restore External Storage for Reporting Engine 81
Respond 82
Task 27 - Restore Respond Service Custom Keys 82
Task 28 - Restore Customized Respond Service Normalization Scripts 82
Task 29 - Add Respond Notification Settings for Custom Roles 83
Task 30 - Manually Configure Respond Notification Settings 83
Task 31 - Update Default Incident Rule Group By Values 84

Task 32 - Add Group By Field to Incident Rules 85
Task 33 - Update Incident Rules Identified in the Domain Matching Conditions Upgrade Preparation Task 86
Warehouse 88
Task 34 - Restore keytab Files, Mount NFS, Install Service 88
Task 35 - Refresh Warehouse Connector Lockbox and Start Stream 88
Task 36 - Update Hive Version 88
RSA Archer Cyber Incident & Breach Response 89
Task 37 - Reconfigure RSA Archer Cyber Incident & Breach Response Integration 89
RSA NetWitness® Endpoint 89
Task 38 - Reconfigure Endpoint Alerts Via Message Bus 89
Task 39 - Reconfigure Recurring Feed Configured from Legacy Endpoint Because Java Version Changed 89
(Optional) Task 40 - Install Endpoint Log Hybrid and Endpoint Agents 90
RSA NetWitness® UEBA 90
Task 41 - Install NetWitness UEBA 90
NetWitness Platform Integrations 90
(Conditional) Task 42 - For Integrations with Web Threat Detection, RSA Archer® Cyber Incident & Breach Response or NetWitness Endpoint. 90
Other 91
Task 43 - Remap Virtual NW Server License to 10.6.6.x MAC Address 91
Appendix A. Troubleshooting 92
Command Line Interface (CLI) 92
Backup (nw-backup script) 93
Event Stream Analysis 94
Concentrator Service 94
Log Collector Service (nwlogcollector) 95
NW Server 96
Orchestration 96
Reporting Engine Service 97
NetWitness UEBA 97
Appendix B. Stopping and Restarting Data Capture and Aggregation 98
Stop Data Capture and Aggregation 98
Start Data Capture and Aggregation 100
Appendix C. Using iDRAC 101
Configure NFS Server - NFS Server config File 101
Boot iDRAC to NFS Configuration 102
Appendix D. Create External Repository 103
Revision History 106

Introduction

The instructions in this guide apply to the upgrade of virtual hosts to RSA NetWitness Platform11.3 exclusively. See the*Physical Host Upgrade Guide for RSA NetWitness Platform 11.3* for instructions on how to upgrade your 10.6.6.x physical hosts to 11.3.

NetWitness Platform 11.3 is a major release that affects all products in the NetWitness Platform. The components of the platform are the NetWitness Server (Admin server, Config server, Integration server, Investigate server, Orchestration server, Respond server, Security sever, and Source server), Archiver, Broker, Concentrator, Context Hub, Decoder, Endpoint Log Hybrid, ESA Primary, ESA Secondary, Log Collector, Log Decoder, Malware Analysis, Reporting Engine, UEBA, Warehouse Connector, and Workbench.

Refer to the *Getting Started Guide for NetWitness Platform* to become familiar with the major changes to the 11.x User interface. Refer to the *Deployment Guide* to become familiar with the major platform changes in 11.x.

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Note: The Reporting Engine is installed on the NW Server host, Workbench is installed on the Archiver host, and Warehouse Connector can be installed on the Decoder host or Log Decoder host.

CentOS6 to CentOS7 Upgrade

NetWitness Platform 11.3 is a major release that involves upgrading to a newer version of the operating system (CentOS6 to CentOS7). In addition, the 11.3 platform environment has been improved greatly to accommodate current and future physical and virtual deployment types. These changes require an upgrade to the new environment and an upgrade of the functionality.

RSA NetWitness® Platform 11.3 Upgrade Path

The earliest supported upgrade path for RSA NetWitness® Platform 11.3 is Security Analytics 10.6.6.x. If you are running a version of NetWitness Platform that is prior to 10.6.6.x, you must update to 10.6.6.x before you can upgrade to 11.3. See the *RSA Security Analytics 10.6.6 Update Guide* (https://community.rsa.com/docs/DOC-95880) on RSA Link.

Supported Host Upgrade Path

You must upgrade a host to the same host type:

- Same Series RSA Physical Appliance to Same Series RSA Physical Appliance (that is, Series 4 to Series 4, Series 5 to Series 5).
  RSA does not support third-party physical hosts in 11.3.
- On-Prem Virtual to On-Prem Virtual

Caution: The 11.3 upgrade does not support mixed-platform upgrades (for example, it does not support physical to virtual).

Hardware, Deployments, Services, and Features Not Supported in 11.3

RSA does not support upgrade of the following hardware, deployments, services, and features to 11.3.

- RSA All-in-One (AIO) Appliance
- Multiple NetWitness Server Deployment
- IPDB service
- Malware Analysis service co-located on the SA Server (upgrade of Malware Analysis Enterprise is supported in 11.3.)
- Standalone Warehouse Connector service (Upgrade of a co-located Warehouse Connector is supported in 11.3.)
- Custom Health & Wellness policy in 10.6.x for the Context Hub Service
  After you upgrade to NetWitness 11.3, your custom policy is not present. In its place, there is the out-of-the-box Context Hub Server Monitoring Policy in the user interface, which is specific for version 11.3.
- Defense Information Strategic Agency-Security Technical Information Guide (DISA-STIG) hardened deployments.
- Warehouse Analytics (Data Science)

Event Stream Analysis (ESA) Upgrade Considerations

In RSA NetWitness® Platform 11.3, RSA changed how ESA Correlation Rules store and transmit the alerts the system generates. In 11.3, ESA sends all alerts to a central Alert system. The local MongoDB storage in ESA 10.6.6.x has been removed.

Note: If you did not use Incident Management in 10.6.6.x, you cannot view the 10.6.6.x ESA alerts in the 11.3 Respond component without running a migration script. Use the ESA Alert Migration script to migrate these alerts to the location in 11.3 that will allow Respond to view them. See the *ESA Alert Migration Instructions* knowledge base article (https://community.rsa.com/docs/DOC-84102) in RSA Link for instructions on how to run this script.

Upgrade Considerations for ESA Rule Deployments

Caution: In NetWitness Platform 11.3, the ESA Correlation service contains data source changes that require changes to migrated ESA rule deployments. The 11.3 ESA Correlation service replaces the Event Stream Analysis service in earlier versions.

After you upgrade to 11.3, migrated ESA rule deployments have the following changes.

1. If an ESA rule deployment contains two services before you upgrade to 11.3, the deployment splits into two deployments. You can only have one ESA Correlation service in an ESA rule deployment in version 11.3.
2. If an ESA service has multiple ESA rule deployments before you upgrade to 11.3, they are combined into one deployment in version 11.3.

You can still access your old deployments. For a detailed example, see the *ESA Configuration Guide for RSA NetWitness Platform 11.3*.

Upgrade Phases

RSA recommends that you stagger host upgrades as described in this section. The update to CentOS7 and the need of a physical or iDRAC access cause the 11.3 upgrade to take more time than most upgrades.

Caution: If you stagger the upgrade, you:
• Must upgrade the hosts in Phase 1 first, in the order shown.
• May not have all the features operational until you update your entire deployment.
• Will not have service administrative features available until you upgrade all the hosts in your deployment.

Phase 1

You perform Phase 1 first. You must upgrade the hosts in the following order:

1. Security Analytics Server host
2. Event Stream Analysis hosts

3. Malware Analysis hosts
4. Broker hosts (if you do not have a Broker, upgrade your Concentrator hosts)
   The 11.3 NetWitness Server (NW Server) cannot communicate with 10.6.6.x core services for the new Investigate functionality. This is why you must upgrade the Broker or Concentrator hosts in Phase 1.

Phase 2

Upgrade the rest of your hosts.

RSA recommends that you follow the order in Phase 2 to reduce:

- Functionality loss during investigation.
- Downtime that results in the loss of network and log capture.

Note: Other than Log Collection hosts with downstream event destinations, there is no technical reason to upgrade your hosts in the order shown in Phase 2.

This is the Phase 2 host upgrade order recommended by RSA.

1. Decoder hosts
2. Concentrator hosts
3. Archiver hosts
4. Log Collection hosts - Log Collectors on Log Decoder hosts (LDs), Virtual Log Collectors (VLCs) and Legacy Windows Collectors (LWCs)
   Before you upgrade a log collection host, you must prepare it for the upgrade. Part of this preparation ensures that no event data remains in the queues. This requires you to keep the downstream destinations of event data (Log Collectors, Virtual Log Collectors and Log Decoders) up and functioning properly.

   If you have event data destinations downstream from the Log Decoder, you must prepare and upgrade Log Collectors in the following order.

   a. LDs (one LD at a time)

   b. VLCs and LWCs

   If you do not have event data destinations downstream from the Log Decoder, you can prepare and upgrade multiple LDs, VLCs, and LWCs together.
5. All other hosts

See "Running in Mixed Mode" under "The Basics" in the *RSA NetWitness Platform Hosts and Services Getting Started Guide* for:

- Functionality gaps encountered while running in this mode.
- Examples of staggered upgrades.

Phase 3 (Optional)

After you have upgraded all hosts in your deployment to 11.3, you can install a Warm Standby NW Server. Refer to "Warm Standby NW Server Host" under "Deployment Option Setup Procedures" in the *Deployment Guide for NetWitness Platform for 11.3* for instructions on how to set up a Warm Standby NW Server.

Investigate in Mixed Mode

Mixed mode occurs when the NW Server host and Broker hosts are on the latest version (for example, 11.3) and the other core services such as Concentrators and Decoders are on any older version (for example, 10.6.6.x or 11.1.x.x-11.2.x.x). You must follow the host upgrade sequence as shown in Upgrade Phases to ensure complete Investigate functionality.

The 11.3 Investigate server is installed when you upgrade the SA Server, but Broker hosts need to be upgraded to 11.3 to access the Event Analysis view. If the Broker is not upgraded, analysts see a warning icon next to the Broker, and no data aggregated to that Broker can be displayed.

Mixed mode (that is, some services are upgraded to 11.3 and some are still at 10.6.6.x) also affects the functionality of Role-Based Access Control (RBAC). In mixed mode, when an analyst conducts an investigation, RBAC is not applied uniformly to viewing and downloads. After you upgrade all services to 11.3, when an analyst conducts an investigation, Role-Based Access Control of downloads works consistently to limit access to restricted data.

In mixed mode, if the `sdk.packets` setting has not been disabled on the 10.6.6.x services, analysts with SDK meta and roles permissions in place to restrict viewing and reconstructing an event's content can download the packet capture (PCAP) file of an event that has content restrictions. Other types of downloads appear to be successful, then generate errors due to insufficient permissions, and the data is still protected.

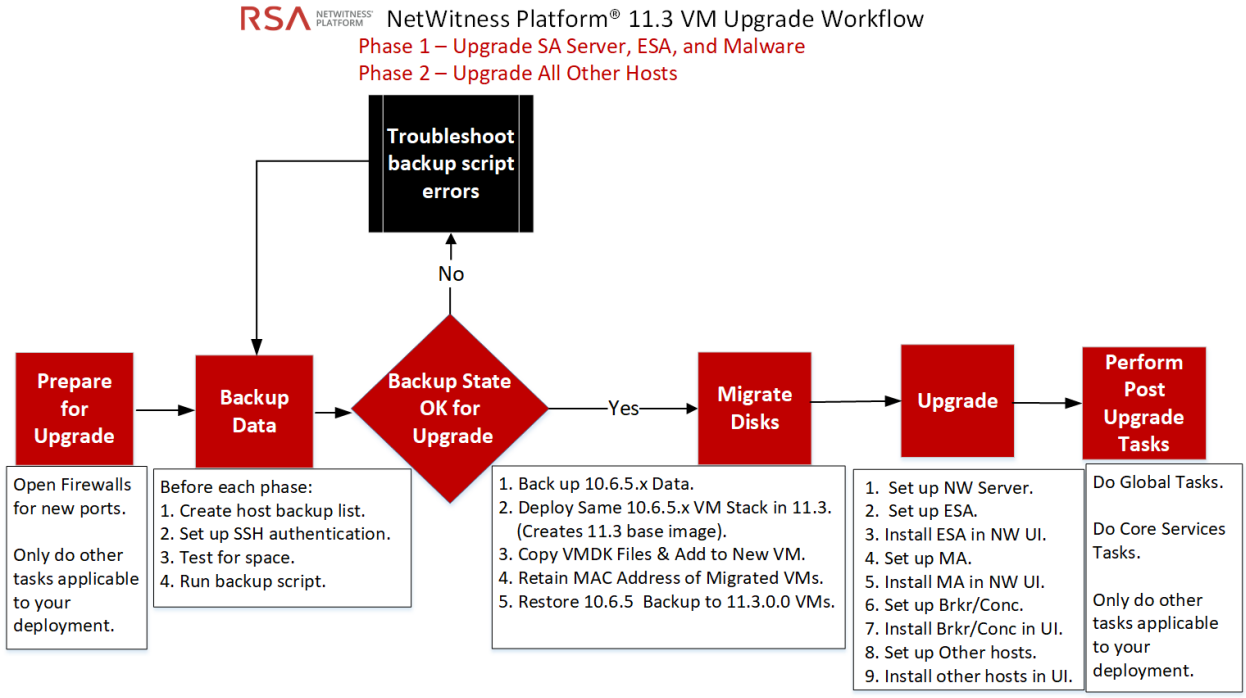
During a phased update, you can disable the `sdk.packets` setting on 10.6.6.x services to prevent analysts from downloading any PCAPs or logs. After you update all services to 11.3 and re-enable `sdk.packets`, RBAC works consistently across all services.

The following table identifies what users with the analysts role can see and download when the NW Server is at version 11.3, and the 11.3 Broker is connected to Concentrators and Decoders at version 10.6.6.x.

Investigate Views Affected	Information Analysts Can See	Restricted Content Analysts Can Download	Restricted Content Analysts Can Download with Errors
Events View	RBAC permitted items	PCAP	File archive (cannot unzip it)
Event Reconstruction View	RBAC permitted items	PCAP	File archive (cannot unzip it)
Event Analysis View	RBAC permitted items	PCAP	Payload (any option: all payloads, request only, response only)

Virtual Host Upgrade Workflow

The following diagram illustrates the RSA NetWitness® Platform 11.3 Virtual Host upgrade workflow.



Contact Customer Support

Refer to the Contact RSA Customer Support page (https://community.rsa.com/docs/DOC-1294) in RSA Link for instructions on how to get help on RSA NetWitness Platform 11.3.

Upgrade Preparation Tasks

Complete the following tasks to prepare for the upgrade to NetWitness Platform 11.3. These tasks are organized by the following categories.

- General
- Event Stream Analysis (ESA)
- Reporting Engine
- Respond
- Warehouse Connector
- Other

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

General

Task 1 - Review Core Ports and Open Firewall Ports

The following tables list new ports in 11.3.

Caution: Make sure that the new ports are implemented and tested before upgrading so that upgrade does not fail due to missing ports.

NW Server Host

Source Host	Destination Host	Destination Ports	Comments
NW Hosts	NW Server	TCP 4505, 4506	Salt Master Ports
NW Hosts	NW Server	TCP 27017	MongoDB
Admin Workstation	NW Server	TCP 15671	RabbitMQ Management UI
NW Hosts	NW Server	TCP 15671	RabbitMQ Management UI

ESA Host

Source Host	Destination Host	Destination Ports	Comments
NW Server, NW Endpoint, ESA Secondary	ESA Primary	TCP 27017	MongoDB

Endpoint Log Hybrid

Source Host	Destination Host	Destination Ports	Comments
Endpoint Log Hybrid	NW Server	TCP 5672	Message Bus
Endpoint Server	NW Server	TCP 27017	MongoDB

All NetWitness Platform core ports are listed in the "Network Architecture and Ports" topic in the *Deployment Guide* in case you need to reconfigure NetWitness Platform services and firewalls.

Task 2 - Record Your 10.6.6.x `admin user` Password

Record your 10.6.6.x `admin user` password. You will need it to complete the upgrade.

Task 3 - Create a Backup of the `/etc/fstab` File

Copy the `/etc/fstab` file from all the physical hosts and into your local machine (backup host or remote machine).

Note: You need this file to restore a physical host with external storage mounts.

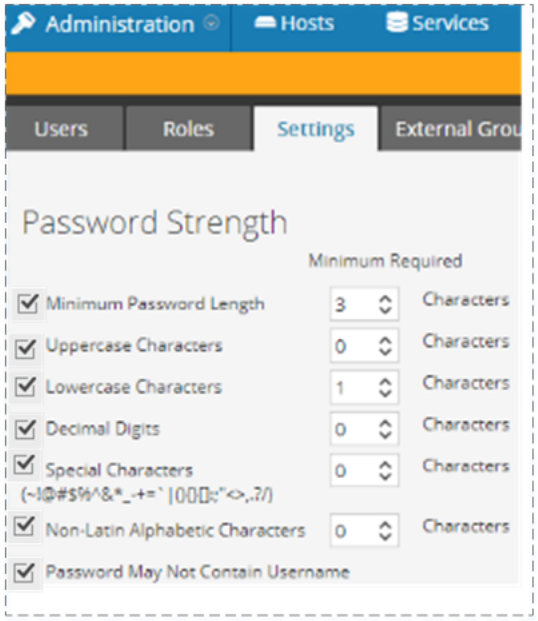
Task 4 - Make Sure Password Strength Settings Check Boxes Are Set in 10.6.6.x

The check box to the left of the **Password Strength Settings** in the **Administration** > **Security** > **Settings** tab must be set in 10.6.6.x or these settings will not be migrated to 11.3.

Complete the following task to make sure that the Password Strength Settings check boxes are set in 10.6.6.x.

1. In Security Analytics 10.6.6.x, go to the **Administration** > **Security** > **Settings** tab.
2. Make sure that all of the check boxes to the left of the **Password Strength Settings** are set. If they are not, set them and click **Apply**.

The following example shows all check boxes as set (required in 10.6.6.x before upgrading to 11.3).



Task 5 (Conditional) - Extract 10.6.x Public Key Infrastructure (PKI) Certificates

Before you upgrade to from 10.6.6.x to 11.3, complete the following procedure to extract the existing 10.6.x PKI keystores that contain server certificates with private keys, and the truststores that contain the trusted CA certificates.

1. Download the `rsa-nw-pki-migration-10.6.6.zip` file from **RSA Link** > **RSA NetWitness Platform** > **Downloads** > **RSA NetWitness LOGS & NETWORK** > **Version 11.3**.
2. Extract the `pki-migration-1.0.jar` file from the `rsa-nw-pki-migration-10.6.6.zip` file.
3. SSH to the 10.6.6.x Security Analytics Server host and log in with the root credentials.
4. Copy the `pki-migration-1.0.jar` file into `/tmp` folder.
5. Run the following command strings to extract the certificates.

   ```
   cd /tmp
   java -jar pki-migration-1.0.jar
   extract
   ```

   This :

   - Creates the `rsa-pki-migration-tool-<yyyy-MM-dd-hh-mm>` directory under the `tmp` directory.
   - Extracts output files into the `/tmp/rsa-pki-migration-<yyyy-MM-dd-hh-mm>` directory.
   - Creates a keystore (for example, `<keystore-x>.p12`) for each server certificate.
     The keystore is encrypted with **netwitness** as the password.
   - Creates a certificate file (for example, `<certificate-X>.cer`) for each trusted CA certificate in truststore.

Note: Refer to the line in the console output to find the storage location of the

- server certificate (`<keystore-X>.p12`). For Example:

```
The Entry le-056cdfb6-7577-4287-a791-64fbf999ff2d is a Private Key Entry
Storing the entry le-056cdfb6-7577-4287-a791-64fbf999ff2d into store at /tmp/rsa-pki-migration-tool-2019-03-04-13-48/keystore-2.p12
```

- trusted CA certificate (`<certificate-x>.cer`). For example

```
The Entry srv3-server3-ca-291745768375599843303243313528455998 51 is a Certificate Key Entry
Writing certificate Entry srv3-server3-ca-291745768375599843303243313528455998 51 into file /tmp/rsa-pki-migration-tool-2019-03-04-13-48/certificate-4.cer
```

This process does not modify the original keystores and trusted CA certificates of 10.6.6.x. You can run these steps multiple times, if required.

6. Open any keystore and display its contents to verify that the extracted keystores and the trusted CA certificates are correct.

   ```
   cd rsa-pki-migration-tool-<yyyy-MM-dd-hh-mm>
   ls -ltrh
    Openssl x509 -in <certificate-X>.cer -inform DER
   ```

   The certificate in displayed in PEM (Base64) format. For example:

   ```
   -----BEGIN CERTIFICATE-----
   MIIDZTCCAk2gAwIBAgIQZ4o94d5AiLBC4sPXgDYXpTANBgkqhkiG9w0BAQUFADBF

   3lAXU6iWqYZP
   -----END CERTIFICATE-----
   ```

   ```
   keytool -list -keystore <keystore-X>.p12 -storetype PKCS12 – storepass
   netwitness
   ```

   The following is an example of the output.

   ```
   Keystore type: PKCS12
   Keystore provider: <XXXXX>
   ```

7. Exit the keystore.

   ```
   exit
   ```

You can use:

- One of the `.p12` keystore files as a server certificate. Refer to the command output to find `.p12` file that corresponds to the server certificate you must use.
- The extracted certificate files (.cer) as trusted CA certificates.

For instructions on how to configure PKI authentication, see the "*System Security and User Management Guide*".

Event Stream Analysis (ESA)

Task 6 (Conditional) - Record Any String Array Type Meta Keys on the Event Stream Analysis Service

If you added any string array type meta keys to the Event Stream Analysis service for your ESA correlation rules in 10.6.6.x or earlier, record these meta keys so you can verify that they exist after upgrade to 11.3.

To record your 10.6.6.x string array type meta keys before the 11.3 upgrade:

1. In Security Analytics 10.6.6.x:
   a. Go to the **Administration** > **Services** view.
   b. Select the Event Stream Analysis service.
   c. Click (actions) > **View** > **Explore**.
2. In the **Explore** view node list, select **Workflow** > **Source** > **netgenAggregationSource**.
3. In the **ArrayFieldNames** list, make a note of any string array type meta keys added to the Event Stream Analysis service so you can verify that they are on the ESA Correlation service after the upgrade.

Respond

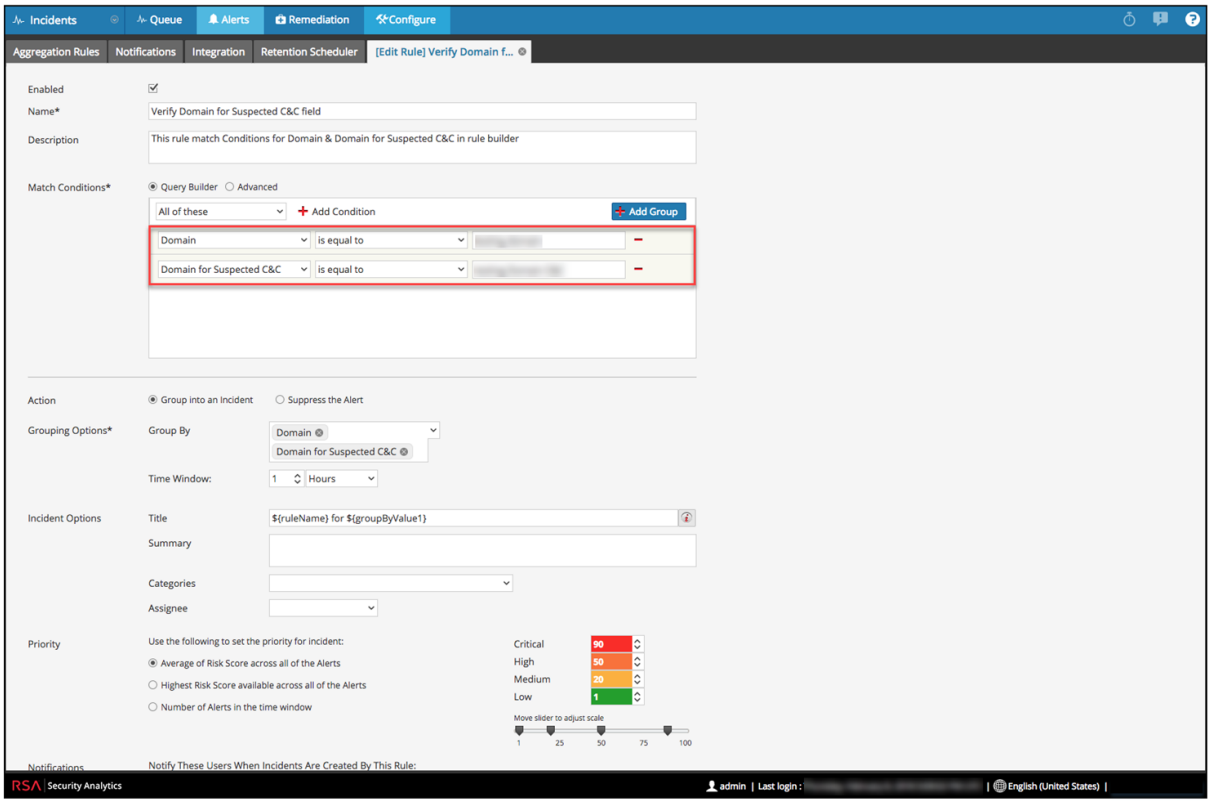
Task 7 - Check Aggregation Rules Match Conditions for “Domain” or “Domain for Suspected C&C”

Make a note of any Incident Management aggregation rules that have match conditions using Domain or Domain for Suspected C&C in the drop-down list in the rule builder. You will need to add back these conditions after you upgrade to 11.3 as described in the "Respond" Post Upgrade Tasks later in this document.

Complete the task for each aggregation rule.

1. In Security Analytics 10.6.6.x, go to **Incidents** > **Configure** > **Aggregation Rules** tab and edit the rules to view the matching conditions.

2. In the **Match Conditions** section, look for **Domain** or **Domain for Suspected C&C** listed in the drop-down lists for the conditions.



3. Make a note of the rule name and the entire condition that uses **Domain** or **Domain for Suspected C&C**, including operators and values.

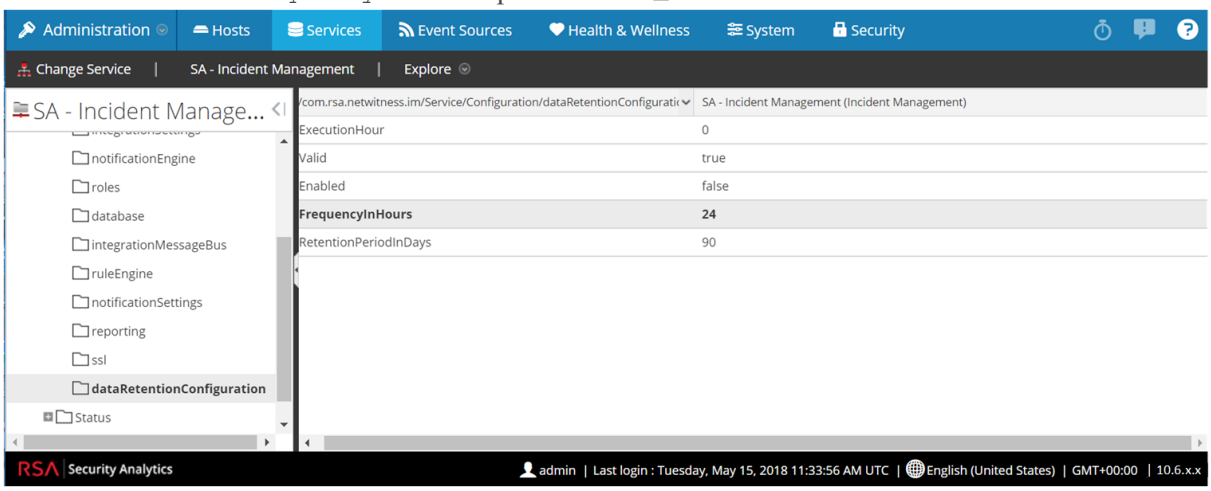
Task 8 - Set Data Retention Run Interval to ≥ 24 Hours

In Security Analytics 10.6.6.x, the Data Retention run interval does not have any minimum value check. In 11.3, RSA added a validation check to make sure that it is run at least every 24 hours. When you upgrade to 11.3, if this value is less than 24 hours, the Respond service will not start.

Complete the following task to ensure that the Respond service starts after upgrading to 11.3.

1. In Security Analytics 10.6.6.x, go to **ADMIN** > **Services**.
2. Select the **Incident Management** service, and then select > **View** > **Explore**.
3. In the Incident Management **Explore** view, go to **`Service` > `Configuration` > `dataRetentionConfiguration`.**

4. Make sure that the `FrequencyInHours` parameter is ≥ **24**.



Reporting Engine

(Conditional) Task 9 - Unlink External Storage

If the Reporting Engine has external storage, such as Storage Area Network (SAN) or Network Attached Storage (NAS) for storing reports, complete the following task to unlink the storage.

Note: In these steps:
`/home/rsasoc/rsa/soc/reporting-engine/` is the Reporting Engine home directory.
`/externalStorage/` is where the external storage is mounted.

1. SSH to the Reporting Engine host and log in with your `root` credentials.
2. Stop the Reporting Engine service.
   ```
   stop rsasoc_re
   ```
3. Switch to `rsasoc` user.
   ```
   su rsasoc
   ```
4. Change to the Reporting Engine the home directory.
   ```
   cd /home/rsasoc/rsa/soc/reporting-engine/
   ```
5. Unlink the `resultstore` directory mounted to external storage.
   ```
   unlink /externalStorage/resultstore
   ```
6. Unlink the `formattedReports` directory mounted to external storage.
   ```
   unlink /externalStorage/formattedReports
   ```

Warehouse Connector

(Conditional) Task 10 - Copy `keytab` files in `root` or `etc` Directory Stored in Other Directory

Complete the following task to copy the `keytab` files in the `root` or `etc` directory if it is stored in another directory.

1. Record the absolute path of NFS mount directory and the `keytab` file.
   You need this information to restore the Warehouse Connector after upgrade.
2. Unmount the NFS directory.
   a. SSH to the Warehouse Connector and log in with `root` credentials.
   b. Submit the following command to unmount the NFS directory.
   `umount <NFS-absolute-path>`

Other Tasks

There are no other tasks for a 10.6.6.x to 11.3 Virtual Host upgrade.

Backup Instructions

Backing up your configuration data for all your hosts from 10.6.6.x is the first step in upgrading from Security Analytics 10.6.6.x releases to NetWitness Platform 11.3. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Note: 1.) It is important that you place Custom Certificate files and any other certificate authority (CA) files in the `/root/customcerts` folder to ensure that these certificate files are backed up. Your custom certificate files that are placed in this directory will be automatically restored during the upgrade process. After upgrading to 11.3, your custom certificate files will be located in `/etc/pki/nw/trust/import`. For more information about backing up these types of files, see step 1 in For All Host Types. 2.) Disable your Public Key Infrastructure (PKI) settings before starting the backup.

Caution: These services are not supported in the 10.6.6.x backup and upgrade process.
- IPDB
- All in One servers
- Malware Analysis Co-Located on the Security Analytics Server
- Standalone Warehouse Connector
- Warehouse Analytics (Datascience)

The following types of hosts can be backed up and are automatically restored during the upgrade process:

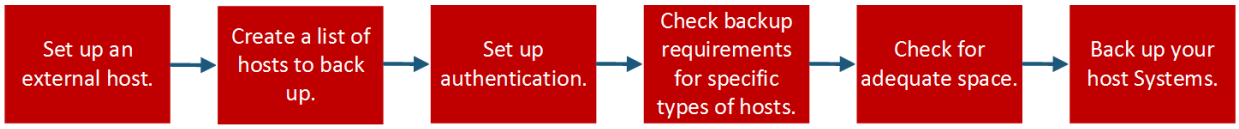
- **Security Analytics Admin Server**
- **Standalone Malware Analysis**
- **Archiver**
- **Broker**
- **Event Stream Analysis** (including Context Hub and Incident Management database)
- **Concentrator**
- **Log Decoder** (including Local Log Collector and Warehouse Connector, if installed)
- **Log Hybrid**
- **Network Decoder** (including Warehouse Connector, if installed)
- **Network Hybrid**
- **Virtual Log Collector**

The following types of files are automatically backed up but must be restored manually after the upgrade process:

- PAM configuration files: For information about restoring the PAM configuration files, refer to "Task 5 - Reconfigure Plugable Authentication Module (PAM) in 11.3.", in the "Global" section of the *Post Upgrade Tasks*.
- `/etc/pfring/mtu.conf` and `/etc/init.d/pf_ring`: To restore these files you must manually retrieve them. The `/etc/pfring/mtu.conf` files will be located in `/var/netwitness/database/nw-backup/restore/etc/pfring/mtu.conf`, and the

`/etc/init.d/pf_ring` files will be located in `/var/netwitness/database/nw-backup/restore/etc/init.d/pf_ring`. For information about how to restore these files, see " (Conditional) Task 2 - Restore Files for 10G Decoder" in the "Hardware Related Tasks" section of *Post Upgrade Tasks*.

The following diagram shows the high-level task flow of the steps you perform to back up your hosts.



The following sections describe each of these tasks:

- Task 1 - Set up an External Host for Backing up Files
- Task 2 - Create a List of Hosts to Back up
- Task 3 - Set up Authentication Between Backup and Target Hosts
- Task 4 - Check for Backup Requirements for Specific Types of Hosts
- Task 5 - Check for Adequate Space for the Backup
- Task 6 - Back up Your Host Systems
- Post Backup Tasks

Task 1 - Set up an External Host for Backing up Files

You must set up an external host to use for backing up files. The host must be running CentOS 6 with connectivity through SSH to the Security Analytics stack of hosts.

Note: If you are not able to use an external host for backing up files, contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) for assistance.

Ensure that the host names for the systems to be backed up are resolvable on the backup host machine, either by DNS or listed in the `/etc/hosts` file.

Note: These scripts are designed to run on CentOS 6 only. You must execute these scripts on CentOS 6 machines.

There are several scripts that you run during the backup process. You must download the zip file that contains the scripts (`nw-backup-v4.3.zip` or later) from RSA Link at this location: https://community.rsa.com/docs/DOC-81514 and copy it over to your CentOS 6 backup system. Extract the zip file to access the scripts. The scripts are:

- `get-all-systems.sh`: Creates the `all-systems` file, which contains a list of all your Security Analytics Servers and host systems to be backed up.

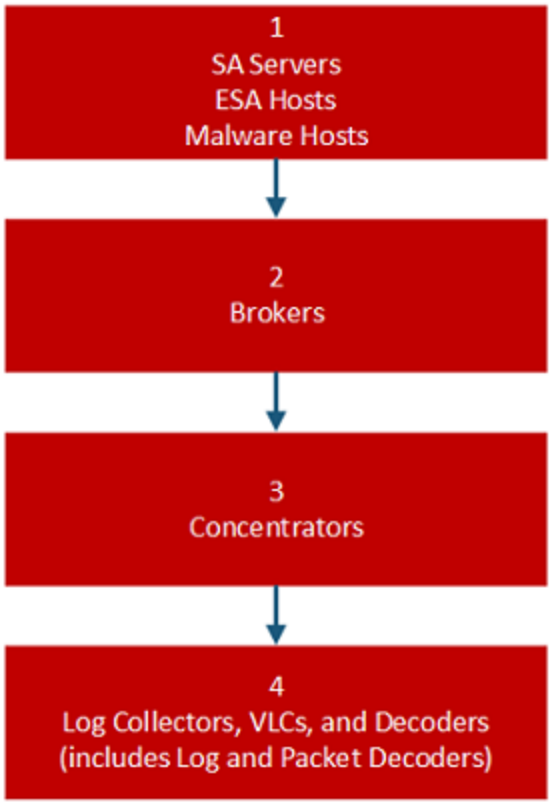
  Caution: When performing a mixed-mode upgrade, retain a master copy of the `all-systems` file upgrade until all the hosts in your deployment are upgraded to 11.3. You cannot run the `get-all-systems.sh` a second time because the NW Server, the first host that must be upgraded in mixed mode, will have CentOS7 as an operating system .

- `ssh-propagate.sh`: Automates sharing keys between the systems you are backing up and the backup host system so that you are not prompted for passwords multiple times.
- `nw-backup.sh`: Performs the backup of your hosts.
- `azure-mac-retention.ps1`: Applies only if you are using AZURE. See the *Azure Installation Guide* on for more information.

Note: 1.) If you have used the 10.6.x versions of the backup and restore scripts on your 10.6.6 hosts, you must still run all the scripts listed here. 2.) Do NOT use the scripts in the `nw-backup-v4.3.zip` (on later version of the nw-backup script) file for regular backups. These scripts are specifically designed for upgrading from 10.6.6.x to 11.3. 3.). 3.) The backup scripts do not support backing up data for STIG-hardened hosts.

Task 2 - Create a List of Hosts to Back up

The script that you use to back up your files depends on the `all-systems` and `all-systems-master-copy` files, which contain a list of the hosts that you want to back up. The `all-systems-master-copy` file contains a list of all your hosts. The `all-systems` file is used for each backup session, and contains only those hosts which are being backed up for a particular session. You run the `get-all-systems.sh` script to generate these files. RSA recommends that you back up your hosts in groups, and not all at once. The recommended order and grouping of hosts for backup sessions is shown in the following diagram:



Limit each backup session to five hosts to ensure that you do not run out of space for the backup files. You create `all-systems` files for your backup sessions by using the `all-systems-master-copy` file as a reference and then manually editing the `all-systems` file to contain specific hosts.

To generate the `all-systems` and the `all-systems-master-copy` files:

1. From the host on which you are running the backup process, make the `get-all-systems.sh` script executable by running the following command:
   ```
   chmod u+x get-all-systems.sh
   ```
2. At the root level, run the `get-all-systems.sh` script:
   ```
   ./get-all-systems.sh <IP-Address-of-SA-Admin-Server>
   ```
   You will be prompted for the password for each host system once per host.
   This script saves the `all-systems` file and the `all-systems-master-copy` file to `/var/netwitness/database/nw-backup/`.

3. Validate that the `all-systems` and `all-systems-master-copy` files were generated and that they contain the right hosts.
4. Edit the `all-systems` file to contain only the systems you are backing up. You can do this by using the `all-systems-master-copy` file as a reference, and then opening the `all-systems` file in an editor (such as vi) and modifying it to include only the systems you want to back up. RSA recommends that you comment out the hosts that you do not want to back up (add the number sign (#) to the beginning of the line that contains the host that will not be backed up).
   The following examples shows how to comment out the 10.6.6 Security Analytics Server:
   `loghybrid,loghyb,172.16.0.1,45fe9de1-1a82-49d7-9bb1-7ac5fa1d18d8,10.6.6.0`
   `#nwserver,nwserv106,172.31.255.23,67a9a0eb-1300-4fba-838f-7be4d8cf5e65,10.6.6.0`

> **Note:** If you use vi, be sure to include the path to the location of the `all-systems` file.

Here is an example of an `all-systems-master-copy` file:

```
nwserver,my-nw-server,10.0.0.1,af922b9f-cd61-49cd-afdc-a48e558cec3e,10.6.6.0
archiver,my-nw-archiver,10.0.0.2,a65c1236-5e46-4117-8529-8ea837074bd0,10.6.6.0
concentrator,my-nw-concentrator,10.0.0.3,dc620e94-bcf5-4d51-83fe-
c003cdfcd7a6,10.6.6.0
esa,my-nw-esa,10.0.0.4,8b608c0d-a7f9-40c0-baee-8407dec774ab,10.6.6.0
logdecoder,my-nw-logdecoder,10.0.0.5,c8be5d45-e19e-4a8d-90ce-

```

Troubleshooting Information

Be sure to save copies of the `all-systems` and `all-systems-master-copy` files in a safe location. Follow these recommendations.

- Do not edit the `all-systems-master-copy` file.
- If you create several different versions of the `all-systems` file (for example, for several backup sessions), be sure that each version of the file lists only those hosts that are currently being backed up, and the other hosts are commented out. For more information, see Post Backup Tasks.

If any host systems are down while you are running the `get-all-systems.sh` script, the script creates a list of hosts for which it cannot find information. After the script completes and the `all-systems` file is created, you must edit the `all-systems` file manually and add the missing information for these hosts.

The `get-all-systems.sh` script generates a list of hosts that were defined in the Security Analytics user interface. Ensure that all hosts and services are provisioned properly. If any hosts or services are not provisioned properly, they will not be backed up. RSA recommends that when you add hosts and services to Security Analytics, you use the Security Analytics user interface to ensure that they are provisioned properly. However, if there are any hosts or services that were not defined in the user interface, you must add them to the `all-systems` file manually.

At the end of the `get-all-systems.sh` script, the script will check for any differences between the systems that the Security Analytics Server has listed, and the ones for which the script was able to find all the required information. If any Node ID's or system names are listed as missing, verify the existence of those systems, that their services are all running, and that they are properly communicating with the Security Analytics Server. (Any Windows Legacy Collectors or AWS Cloud Collectors will not be added to the `all-systems` file, and may account for discrepancies. **DO NOT add these items to the `all-systems` file manually**.)

If the syntax in the `all-systems` file is incorrect, the script will fail. For example, if there is an extra space at the beginning or the end of a host entry, the script will fail.

Task 3 - Set up Authentication Between Backup and Target Hosts

RSA recommends that you run the `ssh-propagate.sh` script to automate sharing keys between the backup host and the host systems.

Note: If you have SSH keys that are protected with pass phrases, you can use `ssh-agent` to save time. For more information, refer to the main page for `ssh-agent`.

Complete the following task to set up authentication between backup and target hosts.

1. On the external backup host system, make the `ssh-propagate.sh` script executable by running the following command:
   `chmod u+x ssh-propagate.sh`
2. At the root directory, run the following command, where `<path-to-all-systems-file>` is the path to the directory where the `all-systems` file is stored:
   `./ssh-propagate.sh <path-to-all-systems-file>`
3. You are prompted for a password once on every host, but you will not need to enter it repeatedly later during the backup process.

Task 4 - Check for Backup Requirements for Specific Types of Hosts

After you create the `all-systems` file to use for backup, you must check to see if any of the hosts listed in the file have requirements that must be met before you run the backup process.

For All Host Types

Perform the following steps for all host types.

1. On the Security Analytics Server, place Custom Certificate files and any other certificate authority (CA) files in the `/root/customcerts` folder to ensure that these certificate files are backed up. Your custom certificate files that are placed in this directories will be automatically restored during the upgrade process. After upgrading to 11.3, your custom certificate files will be located in `/etc/pki/nw/trust/import`.
   You can convert CA certificates and keys to different formats to make them compatible with specific types of servers or software using OpenSSL. For example, you can convert a normal PEM file that would work with Apache to a PFX (PKCS#12) file and use it with Tomcat or IIS. To convert the files, SSH to the Security Analytics Server and run the following command strings to perform the conversions listed.
   Convert a DER file (.crt .cer .der) to PEM
   `openssl x509 -inform der -in certificate.cer -out certificate.pem`
   Convert a PEM file to DER
   `openssl x509 -outform der -in certificate.pem -out certificate.der`
   Convert a PEM Certificate File and a Private Key to PKCS#12 (.pfx .p12)
   `openssl pkcs12 -export -out certificate.pfx -inkey privateKey.key -in certificate.crt -certfile CACert.crt`
   Convert a PKCS#12 File (.pfx .p12) Containing a Private Key and Certificates to PEM
   `openssl pkcs12 -in keyStore.pfx -out keyStore.pem -nodes`

Note: Add the following qualifier to the command string to:
`-nocerts` convert private keys exclusively.
`-nokeys` convert certificates exclusively.

2. Manually record any custom configurations made to CentOS 6 (for example, driver customizations) for restoration after you update to CentOS 7. Custom configurations to CentOS 6 are not automatically backed up and restored.

For ESA Hosts with Mongo Databases

The default 10.6.x Mongo database password is `netwitness`. If you have customized this password, you could encounter an error while running the backup script. You can either use your custom Mongo database password during the backup, or you could change that password back to `netwitness` before running the `nw-backup.sh` script.

1. Find out if the Mongo database password is `netwitness` or if it has been modified.
2. If it has been modified, either change it back to `netwitness`, or be sure you know what the customized password is so that you can enter it during the backup.

For Decoder, Concentrator, or Broker Hosts: Stop Data Capture and Aggregation

In addition to the tasks described in For All Host Types, for Decoder, Concentrator, or Broker hosts, stop data capture and aggregation on all the systems that you are backing up. For instructions, refer to "Appendix B. Stopping and Restarting Data Capture and Aggregation."

Log Collectors (LC) and Virtual Log Collectors (VLCs): Run `prepare-for-migrate.sh`

Caution: This task stops log collection so you must perform this step immediately before you upgrade to minimize the loss of event collection. Complete this task in accordance with the backup and upgrade tasks in this guide.

Prerequisites

You need the following information before you prepare LCs and VLCs for upgrade.

- If Lockbox was initialized on the LC and VLC, you must know the Lockbox password. It is required to reconfigure the Lockbox after the upgrade.
- If you set the password for `logcollector` user for RabbitMQ, you must know the password so you can set it again after the upgrade.
- Read For File Collection Event Sources later in this chapter. You may need to restore some SSHD configuration settings from the 10.6.x LC/VLC.
- Read For Bluecoat Event Sources later in this chapter. You may need to backup VSFTPD key material manually.

Prepare LCs and VLCs for Upgrade

Complete the following task to prepare Log Collectors and Virtual Log Collectors for the upgrade.

1. SSH to the Log Collector.
2. Submit the following command string.
   ```
   # /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --prepare
   ```
   This command:
   - Stops the Puppet Agent service.
   - Disables the file collection accounts ("sftp" and all users in the group "upload") used for uploading log files to the Log Collector. The log files accumulate on the event sources until the Log Collector has been upgraded to 11.3.
   - Stops all the collection protocols in the Log Collector service.
   - Saves the list of Plugin accounts and RabbitMQ accounts.
   - Configures the RabbitMQ server so that new events cannot be published to it any longer. Consumers of events in the queues, such as shovels and Log Decoder Event Processors, will continue to run.
   - Waits until the Log Collector queues are empty.
   - Stops the Log Collector service.
   - Creates a marker file indicating that the Log Collector has been successfully prepared for upgrade.

Troubleshooting Information

The `prepare-for-migrate.sh` script:

- Sends informational, warning, and error messages to the console.
- Saves a session log in the `/var/log/backup/` directory.

You must fix any of the following errors and resume the preparation. Contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) for assistance.

- Log Collector queues with events but without consumers are found.
- Unable to stop the Puppet Agent service.
- Unable to stop a collection protocol in the Log Collector service.
- Unable to block event publishers to the RabbitMQ server.
- Unable to or taking too long for queue events to be consumed. The script makes 30 attempts waiting for the events to be consumed. After each attempt, it sleeps for 30 seconds.
- Unable to stop the Log Collector service.

For more information about troubleshooting, see Appendix A. Troubleshooting.

For File Collection Event Sources

If you are using older Windows and UNIX SFTP agents to upload log files, they may not be able to connect to the SSHD on the upgraded 11.x LC/VLC if they are using older Ciphers, MACs and Key Exchange Algorithms. If possible, upgrade to the latest Windows and UNIX SFTP agents. If you cannot upgrade to the latest Windows and UNIX SFTP agents, note the Ciphers, MACs and Key Exchange Algorithms, if any, from the `/etc/ssh/sshd_config` file on the 10.6.x LC/VLC on the 10.6.x LC/VLC so that they can be added back to the file after upgrade.

For Bluecoat Event Sources

Bluecoat ProxySG event sources use FTPS protocol to upload log files to the Log Collector (LC) and Virtual Log Collector (VLC). The Event Source Documentation on RSA Link contains the steps to configure VSFTPD service on the LC and VLC.

- If key material exists in the `/root/vsftpd/` directory in 10.6.6.x, this material area will be backed up and restored. If the material was in another location, you must back it up and restore it manually.
- If the `/etc/vsftpd/vsftpd.conf` file exits in 10.6.6.x, it is backed up and restored.

For Integrations with Web Threat Detection, Archer Cyber Incident & Breach Response or NetWitness Endpoint - List RabbitMQ Usernames and Passwords

On the 10.6.6.x Security Analytics Server host, you must get a list of all RabbitMQ usernames and passwords so that after you perform the 11.3. upgrade, you can restore RabbitMQ user accounts.

To get a list of RabbitMQ usernames and passwords, run the following command:

```
rabbitmqctl list_users >> /root/rabbitmq_users.txt
```

To restore RabbitMQ user accounts, refer to "Task 2 - For Integrations with Web Threat Detection, NetWitness SecOps Manager or NetWitness Endpoint Configure Mutually Authenticated SSL" in *Post Upgrade Tasks*.

Task 5 - Check for Adequate Space for the Backup

You can run the backup test script to check the amount of disk space that is required for the backup using the `-t` option described in Test Options. You run the script without actually backing up files or stopping any services. RSA recommends that you perform this step to ensure that you provide adequate space for the backup so that the backup captures all your data.

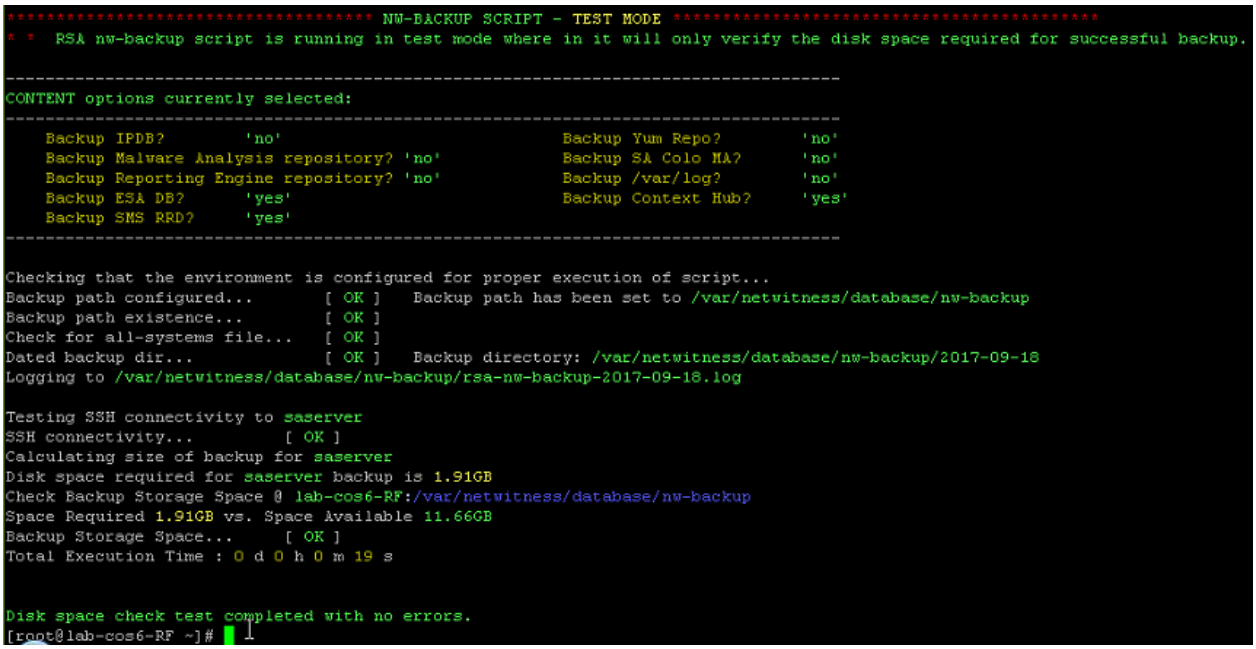
Complete the following task to check for adequate disk space.

1. Make the backup script executable by running the following command:
   ```
   chmod u+x nw-backup.sh
   ```
2. Run the following command at the root directory level:
   ```
   ./nw-backup.sh -t
   ```
   The output displays the amount of disk space that is required for the backup.

> **Note:** The `./nw-backup.sh -t` command runs with the `-d` option by default. However, if you are looking for more accurate disk space results, you can override the -

> d option by using -D. Using the -D option will show how much space is required on each host for the data that will be backed up, but does not show how much space is available. If there is not enough space available, the -D option will throw an error. If you want to know how much space is available on the target host, you must run the df -h command on the host.

The following figure shows an example of the output from using the -t option.



Task 6 - Back up Your Host Systems

Before you run the backup script to do the actual backup, be sure that you have plenty of space. To back up your hosts, you run the nw-backup.sh script using the -u option. This option is required for upgrading to 11.3.

> **Note:** The script will stop services as it runs. However, you can stop services manually before you run the script if needed.

When you run the backup script, you can choose from several options that are described in the following sections.

Usage

```
./nw-backup.sh [-u -t -d -D -l -x -e] <external-mnt> -b <backup file path>
```

General Options

-u : This option is required for upgrading to 11.3. Enables the upgrade flag to run backup for upgrading to 11.3. It also enables disk space check (-d), backing up reporting engine reports (-r) and stores backup content locally (-l). Default: (no)

-d : enables disk space check in 'fast' mode (quick estimate of space using uncompressed data). Default: (no)

```
-D : enables disk space check in 'full' mode (estimate of space using
compressed data, ~10X slower). Default: (no)

-l : stores backup content locally on each host (automatically set if -u is
used). Default: (no)

-e <path to mount point> : copies backup files of all devices onto an external
mount point. Default: (/mnt/external_backup)

-x : move all backup files to an external mount point. Default: (no) - COPY

-b <path to write backups> : path to the location for storing backup files on
a backup server. For upgrading to 11.3, please use the default location!
Default: (/var/netwitness/database/nw-backup)
```

Note: 1.) Do **not** change the backup path in upgrade (-u) mode. 2.) When you run a backup with the `-u` option, all services are stopped. If you need to continue to use the 10.6.x machine after running the backup, reboot the 10.6.x system so that services are restarted.

Advanced Content Selection Options

```
-c : back up Colocated Malware Analysis on SA servers. Default: (no)

-i : back up IPDB data (/var/netwitness/ipdbextractor). Default: (no)

-m : back up Malware Analysis File Repository. Default: (no)

-r : back up Reporting Engine Report Repository (automatically set if -u is
used). Default: (no)

-v : back up system logs (/var/log). Default: (no)

-y : back up YUM Web Server & RPM Repository. Default: (no)

-S : If set: DISABLES back up of SMS RRD files. Default: (not-set)

-C : If set: DISABLES back up of Context-Hub configuration and database.
Default: (not-set)

-E : If set: DISABLES back up of ESA Mongo database. Default: (not-set)
```

Test Options

```
 -t : performs script test run for disk space check only. Services are not
stopped and excludes execution of backup. Can be combined with (-d) or (-D)
and other flags. Default: (-t)
```

For example, the command:
`./nw-backup.sh`
would run the backup with options as set in the Header of the script itself.
OR, the command:
`./nw-backup.sh -ue /mnt/external_backup`
would run a normal backup using the backup path defined in the script, with the following options:

```
-u : enables the upgrade flag to run backup for upgrading to 11.3. It also
enables disk space check (-d), backing up reporting engine reports (-r) and
stores backup content locally (-l). Default: (no)

-e : Copy the backup files to external mount point, mounted on /mnt/external_
backup

For Help: ./nw-backup.sh -h
```

When you run the script, the following text is displayed at the top of the script:

Caution: RSA `nw-backup` script backs up configuration files, data, and logs on the options provided in the script. It tars the content, with options to store the backup files on the backup server, move or copy them to external storage on a mount point (USB/NFS/SMB), or SCP them back to the target host. This backup script has been qualified on the following versions of Security Analytics:
10.6.6.x
Use of this script on any other versions of the product may not give expected results and may not be supported by RSA Customer Service.
Note: All non-RSA custom files, scripts, Cronjobs and other important files should be placed in `/root`, `/home/'user'`, OR `/etc` to be included in the backup.

Complete the following task to back up your hosts.

1. Ensure that the `all-systems` file contains only the hosts to back up. For information, see Task 2 - Create a List of Hosts to Back up.
2. Make the backup script executable by running the following command:
   `chmod u+x nw-backup.sh`
3. Begin the backup process by running the following command at the root directory level:
   `./nw-backup.sh -u`

   Note: You must use the `-u` option so that your files will be restored correctly during the upgrade to 11.3. Do NOT make any changes to the header of the backup script for the backup path because the path is specific to the upgrade, and that data needs to be in a specific place.

   When the text "`Backup completed with no errors`" is displayed, the backup has completed successfully.

   A log file, with a name similar to the following example, is created in the backup directory which provides information on the files being backed up:
   `rsa-nw-backup-2018-03-15.log`
4. When the backup has completed, to ensure that the intended files were backed up, you can run the following command to see a list of all the files that were backed up:
   `tar -tzvf hostname-ip-address-backup.tar.gz`
   The following archive files are created:
   For all hosts:
   `<hostname-IPaddress>-root.tar.gz`
   `<hostname-IPaddress>-backup.tar.gz`
   `tar checksum` files
   `<hostname-IPaddress>-network.info.txt`
   For Security Analytics Servers:
   `<hostname-IPaddress>-root.tar.gz`
   `<hostname-IPaddress>-backup.tar.gz`
   `<All ESA hostname-IPaddress>-mongodb.tar.gz`
   `tar checksum` files
   `<hostname-IPaddress>-network.info.txt`
   For ESA Hosts:
   `<hostname-IPaddress>-root.tar.gz`
   `<hostname-IPaddress>-backup.tar.gz`
   `<hostname-IPaddress>-mongodb.tar.gz`
   `<hostname-IPaddress>-controldata-mongodb.tar.gz`

`tar checksum` files
`<hostname-IPaddress>-network.info.txt`

The archived files are located in the `/var/netwitness/database/nw-backup` directory. If any of the tar files appear smaller than expected, open them to be sure that the files were properly backed up.

Post Backup Tasks

Task 1 - Save a Copy of the `all-systems` File and the Backup Tar files

Make copies of the `all-systems` file, the `all-systems-master-copy` file, and the backup tar files and put the copies in a secure location. You cannot regenerate these files after you upgrade the Security Analytics Server (specifically the Admin service) to 11.3.

Task 2 - Ensure Required Backup Files Were Generated

After you run the backup scripts, several files are generated. These files are required for the 11.3 upgrade process. Before you begin the upgrade process, you must ensure that the required backup files are on the hosts that you are upgrading, and that you perform the following tasks.

The following files are generated on all hosts by the backup scripts:

- `all-systems`
- `all-systems-master-copy`
- `appliance_info`
- `service_info`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`
- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`

In addition to the files listed above, the following files will be generated on the Security Analytics Server and ESA hosts:

- `<hostname>-<host IP address>-mongodb.tar.gz`
- `<hostname>-<host IP address>-mongodb.tar.gz.sha256`

The backup script will also generate the following `controldata-mongodb.tar.gz` files.

Note: The backup script copies the following files from all ESA hosts to the Security Analytics Server's backup path.

- `<esa hostname>-<esa hostip>-controldata-mongodb.tar.gz`
- `<esa hostname>-<esa hostip>-controldata-mongodb.tar.gz.sha256`

Task 3 - (Conditional) For Multiple ESA Hosts, Copy `mongodb tar` files to Primary ESA Host

If you have multiple ESA host systems in your enterprise, copy the following two files from each ESA host to the `/opt/rsa/database/nw-backup/` directory on the Primary ESA host system (the host that has the ContextHub service running on it):

- `<hostname>-<host-IP-address>-mongodb.tar.gz`
- `<hostname>-<host-IP-address>-mongodb.tar.gz.sha256`

Task 4 - Ensure All Required Backup Files are on Each Host

Before you upgrade to 11.3, ensure that the appropriate files exist on the hosts that you are upgrading as described in the following lists.

Note: The default paths for backup files are:
- Security Analytics Servers:`/var/netwitness/database/nw-backup`
- ESA hosts:`/opt/rsa/database/nw-backup`
- Malware hosts: `/var/lib/rsamalware/nw-backup`

Required Files for NetWitness Servers

- `all-systems-master-copy`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`
- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`
- `<hostname>-<host-IP-address>-mongodb.tar.gz`
- `<hostname>-<host-IP-address>-mongodb.tar.gz.sha256`
- `<esa-hostname>-<esa-host-IP-address>-controldata-mongodb.tar.gz`
- `<esa-hostname>-<esa-host-IP-address>-controldata-mongodb.tar.gz.sha256`

Required Files for ESA Hosts

- `all-systems-master-copy`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`
- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`

- <hostname>-<host-IP-address>-mongodb.tar.gz
- <hostname>-<host-IP-address>-mongodb.tar.gz.sha256

Required Files for All Other Hosts

- all-systems-master-copy
- <hostname>-<host-IP-address>-backup.tar.gz
- <hostname>-<host-IP-address>-backup.tar.gz.sha256
- <hostname>-<host-IP-address>-root.tar.gz
- <hostname>-<host-IP-address>-root.tar.gz.sha256
- <hostname>-<host-IP-address>-network.info.txt

Note: The following files are located in the <hostname>-<host-IP-address>-backup.tar.gz tar on all hosts:
appliance_info
service_info

Note: The paths to the location of the backup and restore files for iptables, NAT configurations, user accounts, and crontab entries are shown in the following list:
Backup paths:
`BUPATH=/opt/rsa/database/nw-backup` for the ESA Correlation Engine
`BUPATH=/var/lib/rsamalware/nw-backup` for the Malware Service
`BUPATH=/var/netwitness/database/nw-backup` for all other services
Restore locations:
`BUPATH/restore/etc/sysconfig` for Iptable rules
`BUPATH/restore/etc/sysconfig` for NAT configurations
`BUPATH/restore/etc` for Crontab entries
`BUPATH/restore/etc` for User Accounts (users are located in the `passwd` file, and groups are located in the `group` file. These are not restored during the upgrade process but can be restored manually.
`BUPATH/restore/etc/ntp.conf` for NTP configurations (must be restored using the NetWitness Platform UI)

Migrate Disk Drives from 10.6.6.x to 11.3

Caution: 1) You cannot perform the migration if you have a snapshot for your VM.
2). Run the backup immediately before you upgrade hosts for each phase so that the data is not out-dated.
3.) This guide applies to virtual host upgrades exclusively. If have both physical and virtual hosts in your deployment, see the *Physical Host Upgrade Instructions for RSA NetWitness Platform 11.3* for the steps you must complete to upgrade physical hosts.

Note: The machines must be in VMware ESX.

There are five tasks you must complete to migrate your Virtual Machine (VM) deployment disk drives from 10.6.6.x to 11.3:

Task 1 - Back up data in your 10.6.6.x VMs.

Task 2 - Deploy the same VM Stack in 11.3 as you have in 10.6.6.x.

Task 3 - Copy the VMDK Files and add them as a hard disk to the new VMs.

Task 4 - Retain MAC address of upgraded SA Server VM.

Task 5 - Restore backup data in 10.6.6.x to 11.3 VMs.

Task 1 - Back Up Data in 10.6.6.x VMs

1. Prepare Log Collector for the migration:
   a. Log in to the Log Collector using root credentials.
   b. Go to the `/opt/rsa/nwlogcollector/nwtools/` directory and run the following command.
   `sh prepare-for-migrate.sh --prepare`
   See Virtual Log Collector Host (VLC) for detailed instructions on how to upgrade the VLC.
2. Download and extract the `.zip` file that contains the 10.6.6.x backup scripts from RSA Link https://community.rsa.com/docs/DOC-81514)) to the external backup host.

   Note: You must set up an external host to use for backing up files. The host must be running CentOS 6 with connectivity through SSH to the NetWitness Platform stack of hosts.

3. Update the permission of the script file, run the following commands:
   a. `cd <Script file>`
   b. `chmod 777 *`
4. Run the following commands from the `nw-backup/scripts` directory (see Backup Instructions for a detailed descriptions of the backup scripts).
   `./get-all-systems.sh <SA-IP>`
   `./ssh-propagate.sh <path-to-backup-directory/all-systems>`
   `./nw-backup.sh -u`

(if you have a Malware VM, substitute `-m -u` for `-u` in this command string (for example, `./nw-backup.sh -m -u`).

Task 2 - Deploy Same 10.6.6.x VM Stack in 11.3

You must set up the same virtual host stack in 11.3 that you had in 10.6.6.x. See the *RSA NetWitness® Platform 11.3 Virtual Host Installation Guide* for instructions.

The following steps are the high-level steps on how to deploy an OVA host in the ESXi environment.

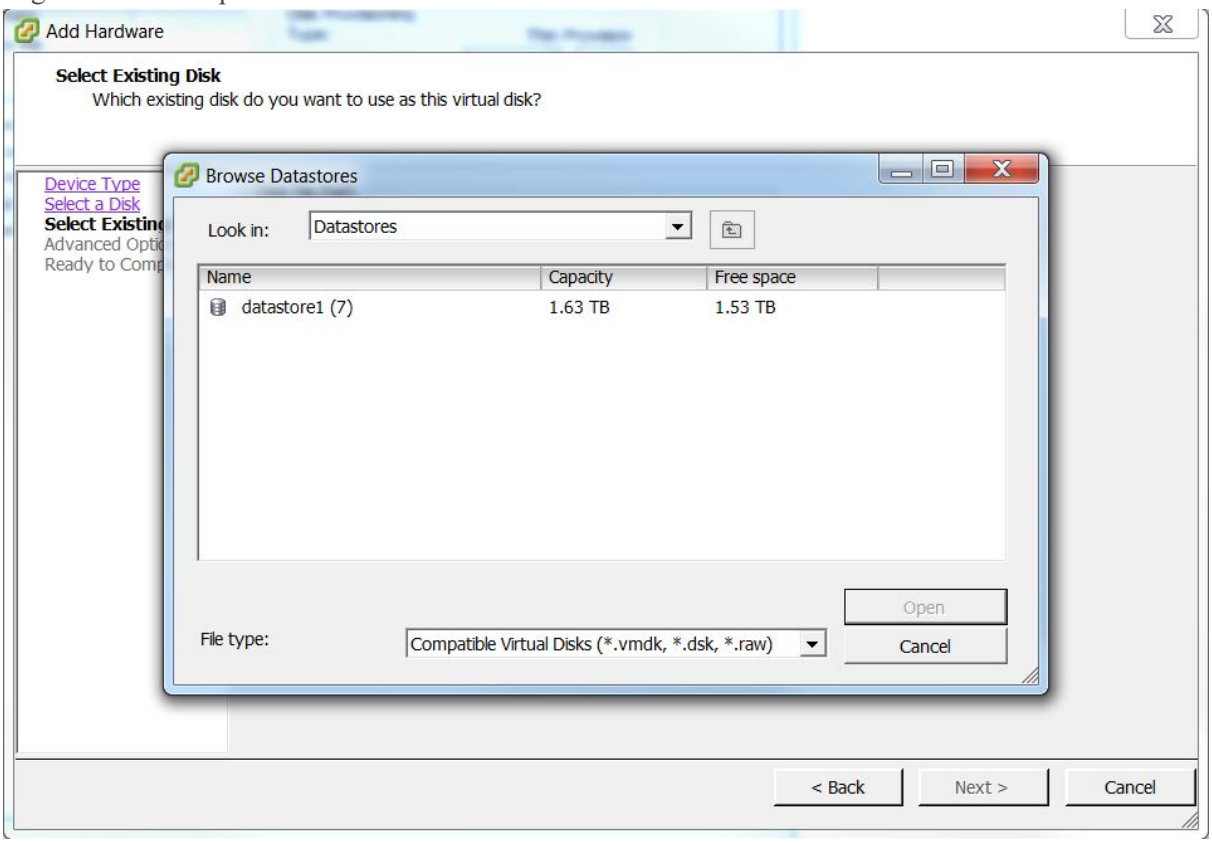
Download the 11.3 OVA, from RSA Link > NetWitness > Download to a local directory.

1. Log on to the ESXi environment.
2. In the **File** drop-down, select **Deploy OVF Template**.
   The Deploy OVA Template dialog is displayed.
3. Browse your local directory for the 11.3 OVAs you downloaded.
4. Select the to deploy in the virtual environment , and click **Next**.
5. Select the appropriate Configuration for the VM and click **Next**.
6. Power on the VM, go to Console, and log in to the machine.
   The VM now has the 11.3 base image required to run the Setup Program (that is, `nwsetup-tui`).

Task 3 - Copy VMDK Files and Add Them as Hard Disk to New VMs

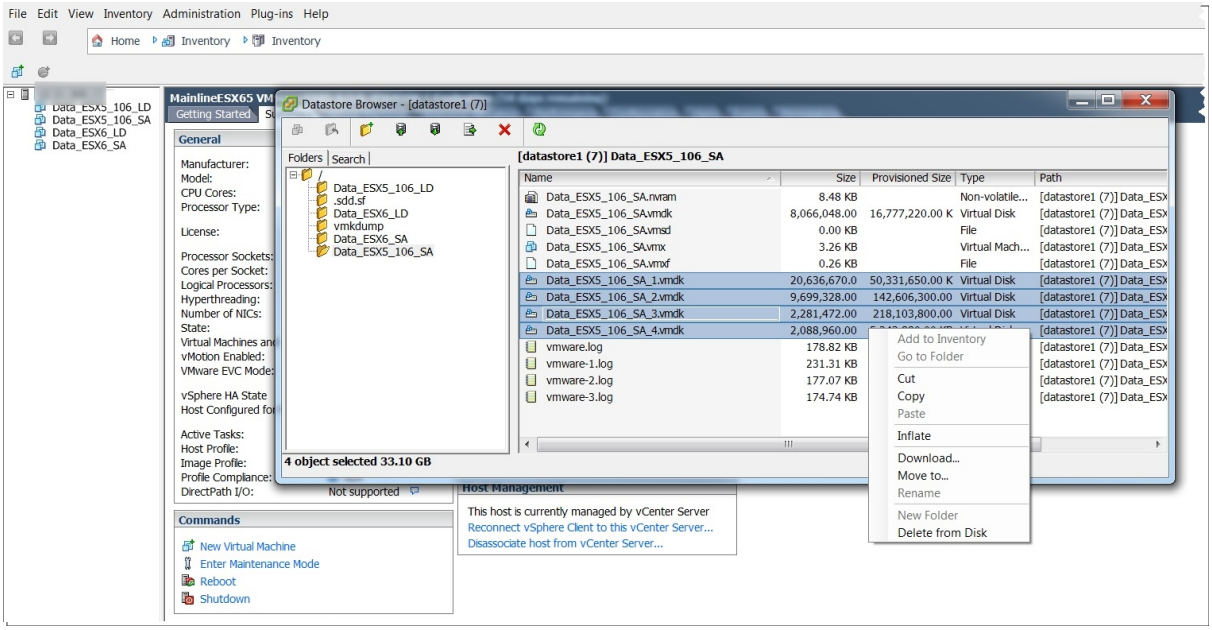
1. Power off both the 10.6.6.x and 11.3 VMs.
2. Go to the desired ESX server, click the **Configuration** tab > **Storage**.

3. Right-click the required datastore and click **Browse Datastore**.



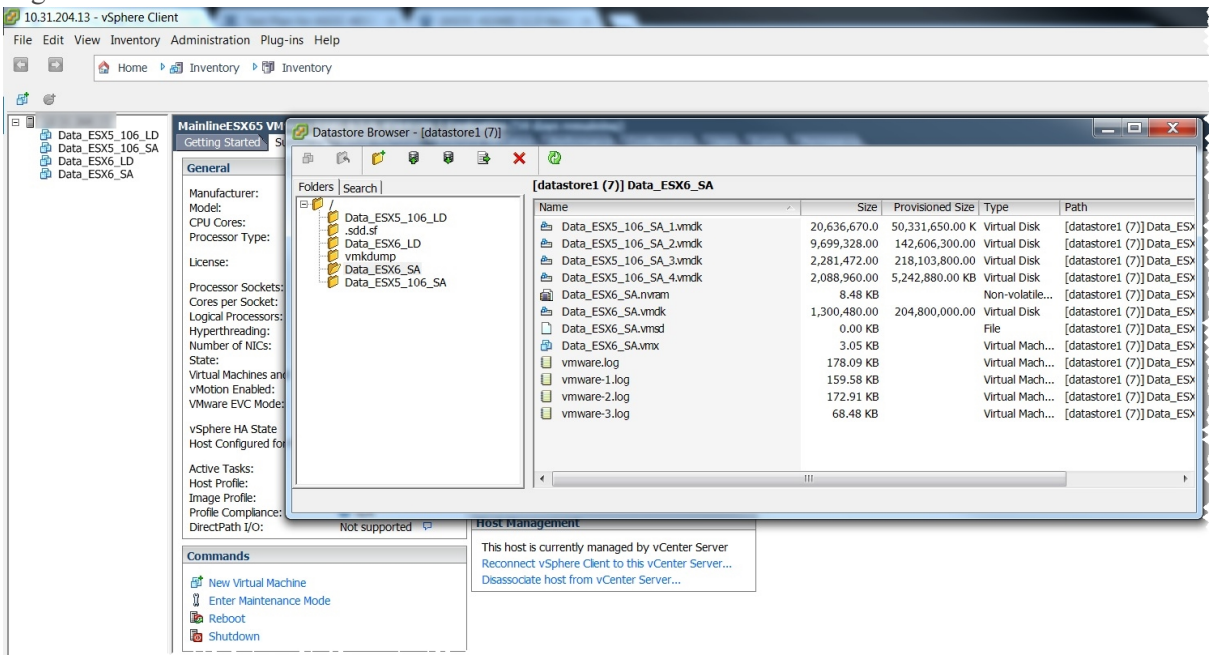
4. Navigate to the existing 10.6.6.x VM in the datastore.
5. Select all the VMDK files in the datastore, right-click, and click **Copy**.

> **Caution:** Do not copy the base VMDK file (for example, `Data_106_SA`) because it contains CentOS6.
>
> You must copy all the numbered VMDK files. For example, if the 10.6.6.x VM name is `Data_106_SA`, you would copy all the `Data_106_SA_1`, `Data_106_SA_2`, `Data_106_SA_3`, etc files.



6. Navigate to the new 11.3 VM in the datastore.

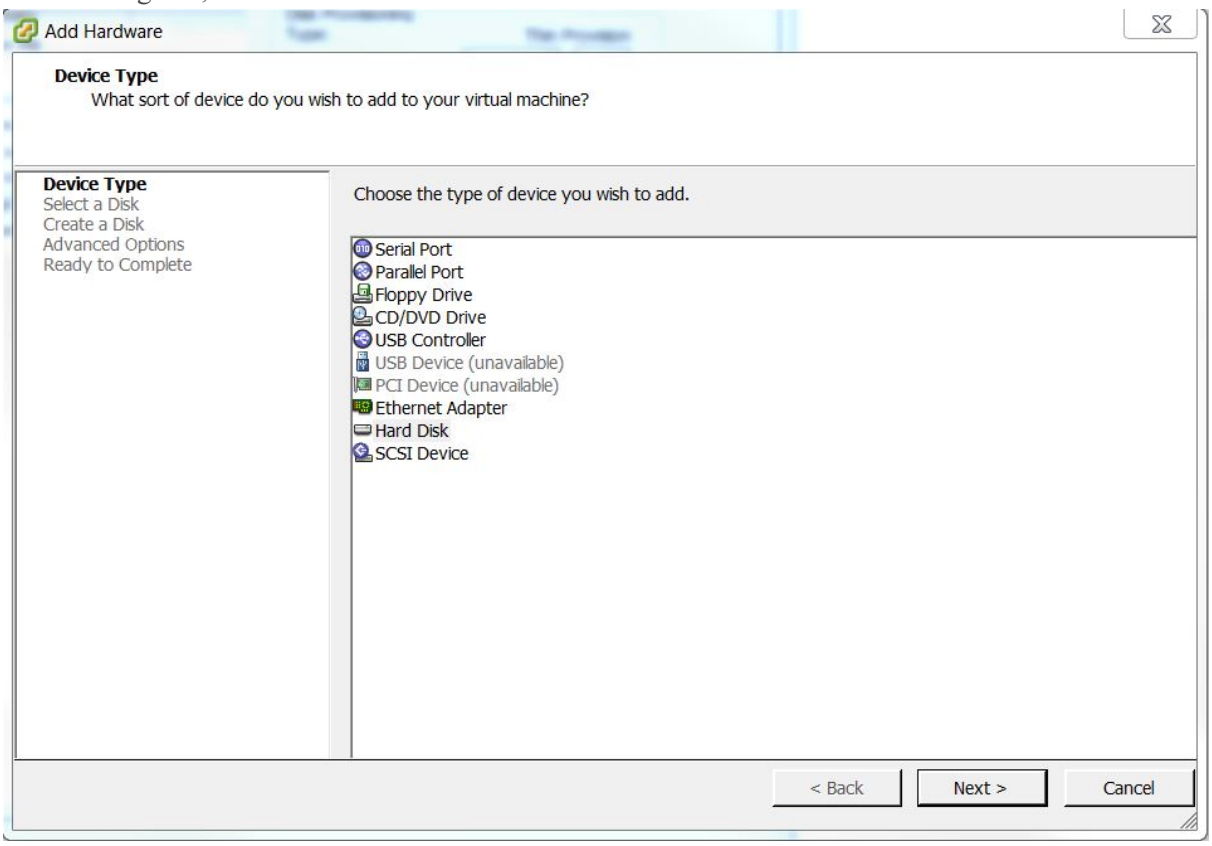
7. Right-click and click **Paste**.



Note: You must wait until all the VMDK files from the previous VM are completely copied into the datastore of the new VM.

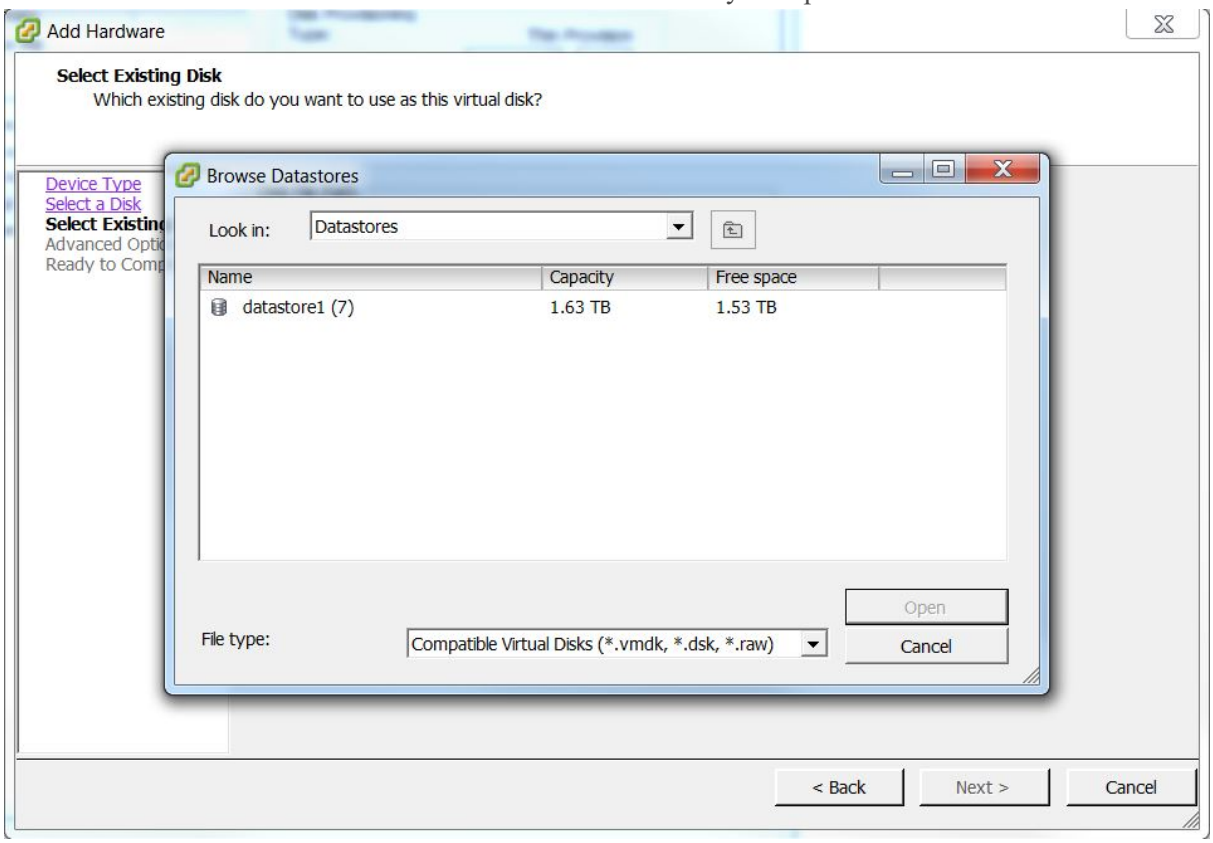
8. Select the 11.3 VM, click **Edit Settings** > **Add**.

9. In the dialog box, click **HardDisk** > **Next**.

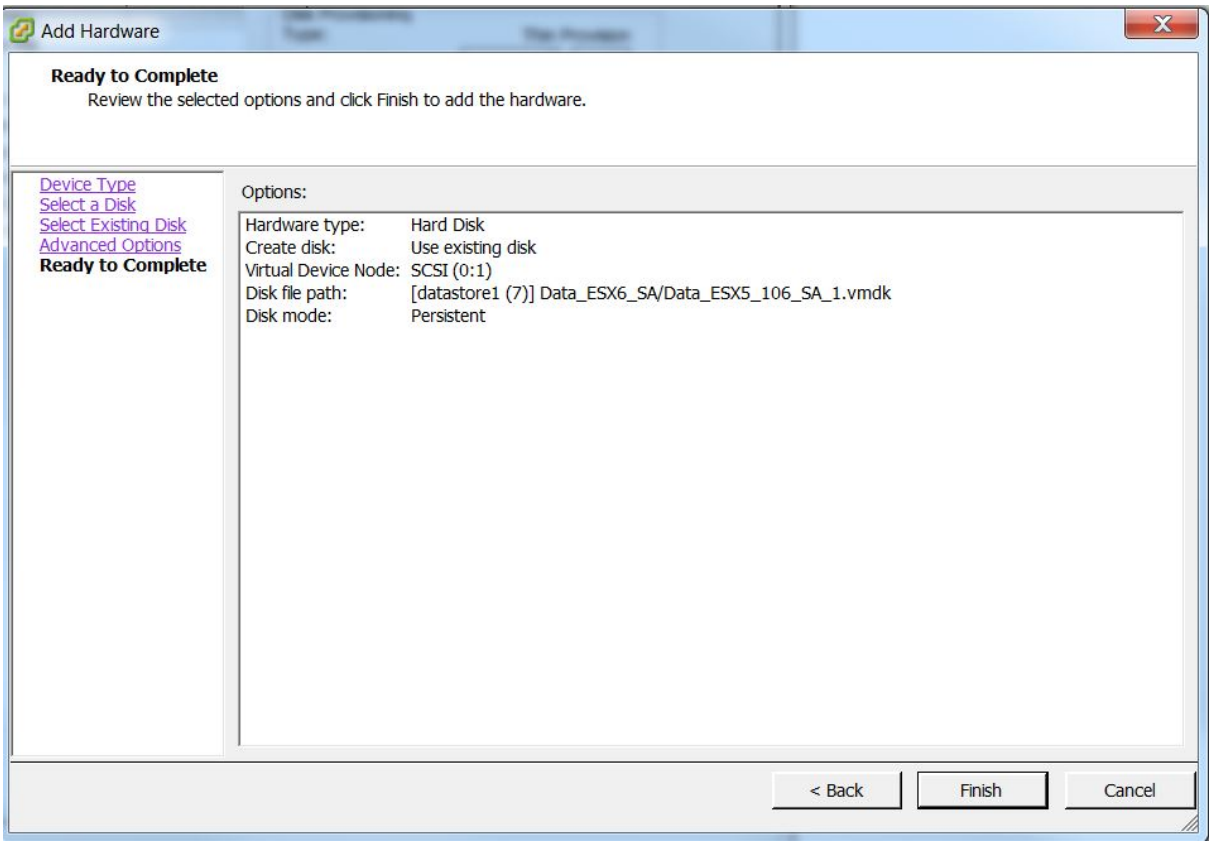


10. Click **Already existing hard disk** > **Next**.

11. Click **Browse** and browse to the datastore location to which you copied the vmdk files.



12. Select the VMDK file from the 11.3 VM that you want to add as a disk.



13. Repeat steps 8 through 12 for each disk you want to add.

Task 4 - Retain MAC Address of Upgraded SA Server VM

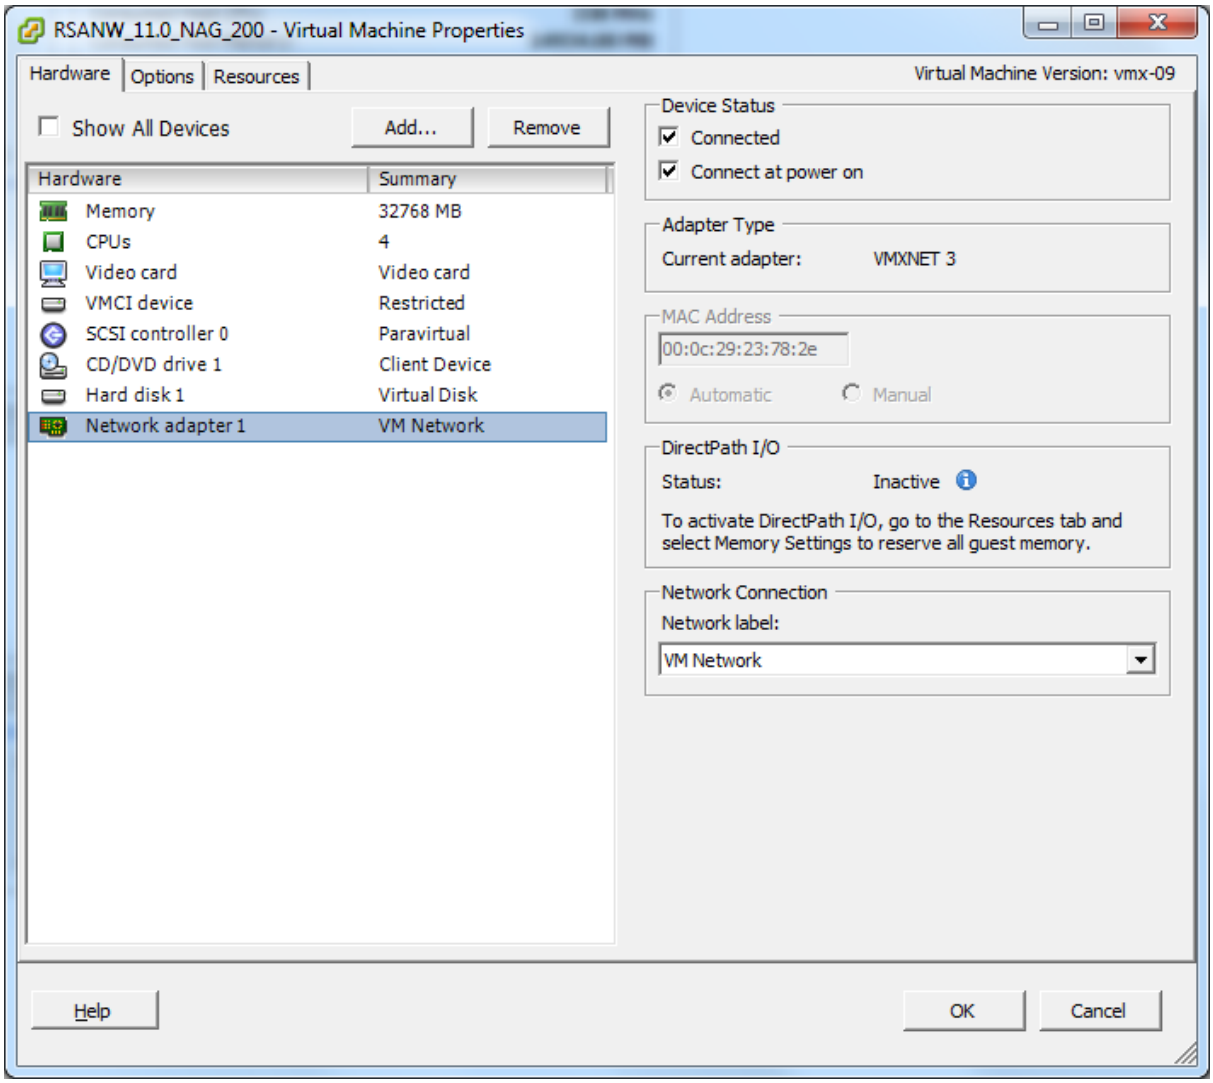
To retain the MAC address of migrated Security Analytics (SA) Server Virtual Machine (VM):

Note: These steps apply to the SA Server VM (created with "Automatic" MAC address assignment selected) to the 11.3 NetWitness Server. For VMs with a Static MAC address, you can change the MAC address by going to Edit Settings for a VM and typing in the MAC address.

1. Log in to vCenter server.

   Note: The supported versions of vCenter is 5.5 through 6.5 inclusive.

2. (Conditional) If vCenter server are powered on, **Power Off** both VMs (NetWitness 10.6.6.x and 11.3).
3. Click **Summary** tab, right-click **Datastore** and browse for the datastore location.
4. Go to the VM folder and download the `.vmx` file of 10.6.6.x and 11.3 to the local repository.
   By default, the VM generated with the MAC address is created in the format (as shown in the below figure).



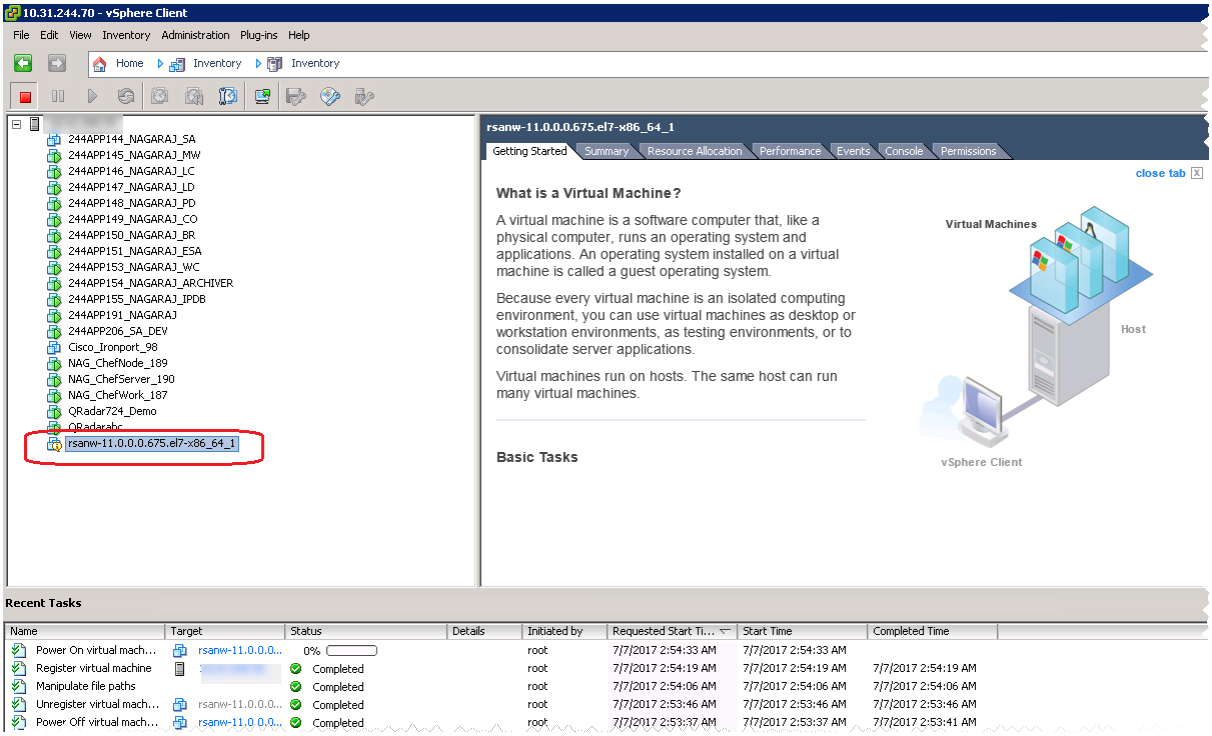
Note: 00:0c:29:XX:YY:ZZ – 00:0c:29 is the unique identifier for an automatically generated MAC address. **00:50:56:XX:YY:ZZ – 00:50:56** is the unique identifier for a static or manually generated MAC address. This is valid only if the vCenter is not deployed. If vCenter is deployed, this MAC address denotes the unique identifier for an automatically generated MAC address.

5. Using a text editor, copy the `uuid.location` and `ethernet0.generatedAddress` values from 10.6.6.x **.vmx** file into the 11.3 **.vmx** file.

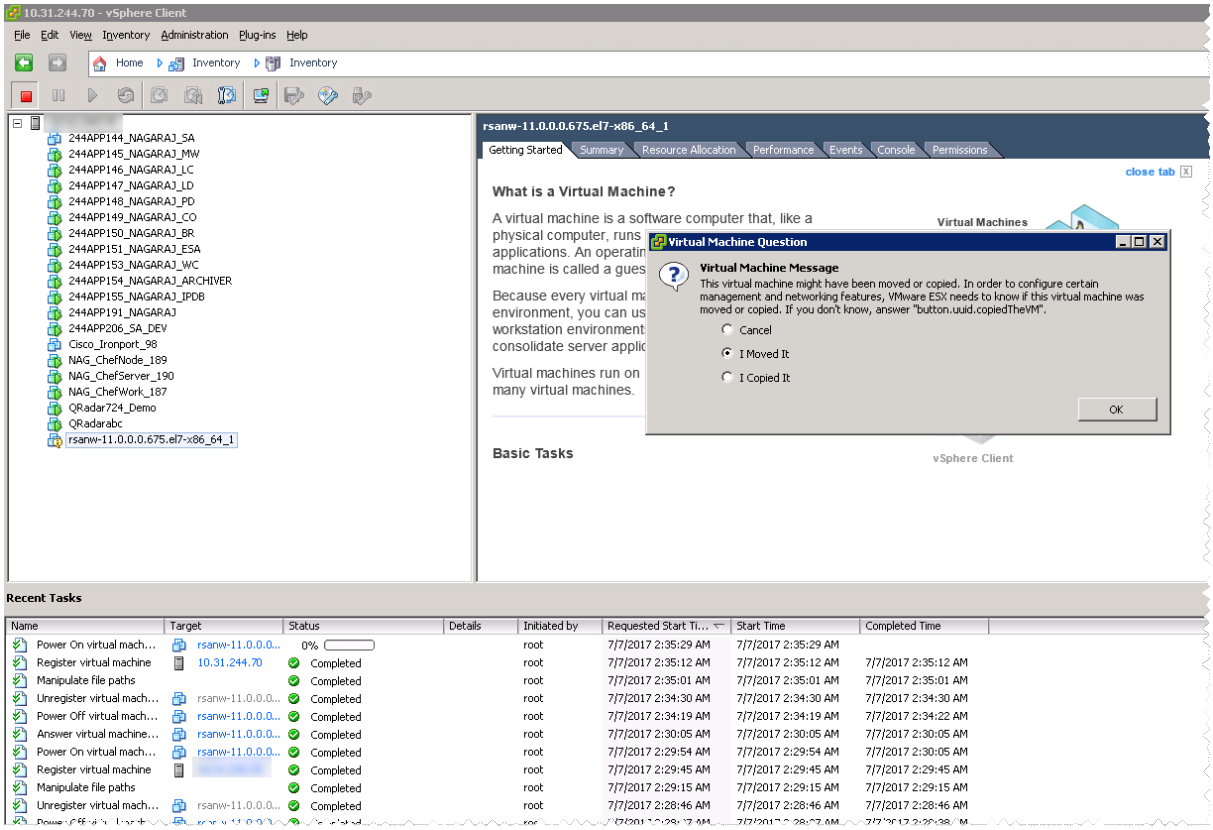
Note: If you deployed the 10.6.6.x stack on the ESX server directly (not through VCenter), you must copy the value for `uuid.bios` in addition to `uuid.location` and `ethernet0.generatedAddress` from 10.6.6.x **.vmx** file into the 11.3 **.vmx** file.

6. Remove both the 10.6.6.x and the 11.3 VMs from inventory.
   a. Navigate to the vCenter server.
   b. Right-click both the 10.6.6.x and the 11.3 VMs.
   c. Select Remove from Inventory.

7. Upload the modified 11.3 **.vmx** file to the datastore location by replacing it with the existing **.vmx** file.
8. From the datastore, right-click the 11.3 **.vmx** file and select Add to Inventory.
9. Navigate to the vCenter server and **Power On** the 11.3 VM.
   The following message is displayed.
   The virtual machine might have been moved or copied. In order to configure certain management and networking features, VMware ESX needs to know if this virtual machine was moved or copied. If you don't know, answer "I Copied it."



10. Right-click the VM and select **Guest** > **Answer Question**.
    The following figure is displayed.



11. Select **I Moved It**.
12. Click **OK**.
    The MAC address is retained to the MAC address from 10.6.6.x to 11.3.

Task 5 - Restore Backup Data in 10.6.6.x to 11.3 VMs

Complete the following steps to **Power On** the 11.3 VM.

1. Copy backed-up data from the `nw-backup` directory to the 11.3 VMs.
   - For the NW Server:

     Note: See Virtual Log Collector Host (VLC) for detailed instructions on how to upgrade the VLC.

     a. Create the `nwhome` directory under `/tmp`.

     b. Mount `VolGroup00-nwhome` on `/tmp/nwhome/`.
     ```
     mount /dev/mapper/VolGroup00-nwhome /tmp/nwhome/
     ```

     c. Copy the contents of `/tmp/nwhome/` directory to `/var/netwitness/`.
     ```
     cp -r /tmp/nwhome/* /var/netwitness/
     ```

     d. Mount `VolGroup02-redb` on `/var/netwitness/database`.
     ```
     mount /dev/mapper/VolGroup02-redb /var/netwitness/database/
     ```

     Note: Make sure that the `/var/netwitness/database/nw-backup` directory exists with backup tarballs of the appliance.

     e. Unmount `VolGroup00-nwhome` from `/tmp/nwhome/`.
     ```
     umount /tmp/nwhome
     ```

   - For the Archiver, Broker, Concentrator, Log Decoder, Log Collector, and Network Decoder:

     Note: If your 10.6.6.x Decoder or Log Decoder had multiple network interfaces:
     1. **Power Off** the 11.3 VM 11.3 Decoder or Log Decoder VM.
     2. Go to **Edit Settings** for the VM and add the required number of Ethernet Adapters.
     3. **Power On** the VM.
     4. Add the ethernet adapters before restoring the backup data.

     a. Create the `nwhome` directory under `/tmp`.

     b. Create a temporary mount `VolGroup00-nwhome` on `/tmp/nwhome/`.
     ```
     mount /dev/mapper/VolGroup00-nwhome /tmp/nwhome/
     ```

     c. Copy the contents of `/tmp/nwhome/` directory to `/var/netwitness/`.
     ```
     cp -r /tmp/nwhome/* /var/netwitness/
     ```

     d. Unmount `VolGroup00-nwhome` from `/tmp/nwhome/`.
     ```
     umount /tmp/nwhome
     ```

   - For Malware Analysis (Co-located Malware Not Supported in 11.3 Upgrade):

     a. Create the `apps` directory under `/tmp/`.

     b. Create a temporary mount `VolGroup01-apps` on `/tmp/apps/`.
     ```
     mount /dev/mapper/VolGroup01-apps /tmp/apps/
     mkdir /var/netwitness/database
     ```

     c. Copy the `nw-backup` directory to `/var/netwitness/`.
     ```
     cp -r /tmp/apps/nw-backup /var/netwitness/database
     ```

d. Unmount `VolGroup01-apps` from `/tmp/apps/`.
```
umount /tmp/apps
```

- For Event Stream Analysis:

a. Create the `apps` directory under `/tmp/`

b. Create a temporary mount `VolGroup01-apps` on `/tmp/apps/`.
```
mount /dev/mapper/VolGroup01-apps /tmp/apps/
mkdir /var/netwitness/database
```

c. Copy the `nw-backup` directory to `/var/netwitness`.
```
cp -r /tmp/apps/nw-backup /var/netwitness
```

d. Unmount `VolGroup01-apps` from `/tmp/apps/`.
```
umount /tmp/apps
```

2. Mount the disks.

Note: If you have configured any external mount points on the VMs in the stack for any of the following directories, re-mount the external mount points in place of the following mounts.

- For the NW Server:
```
mount /dev/mapper/VolGroup01-ipdbext /var/netwitness/ipdbextractor/
```

Note: Make sure that the `/var/netwitness/database/nw-backup` directory exists with backup tarballs of the appliance.

- For the Log Decoder/Log Collector:

Note: The following mounts are not required for the Virtual Log Collector.

```
mount /dev/mapper/VolGroup01-decoroot /var/netwitness/logdecoder
mount /dev/mapper/VolGroup01-index /var/netwitness/logdecoder/index
mount /dev/mapper/VolGroup01-sessiondb /var/netwitness/logdecoder/sessiondb
mount /dev/mapper/VolGroup01-metadb /var/netwitness/logdecoder/metadb
mount /dev/mapper/VolGroup01-logcoll /var/netwitness/logcollector
mount /dev/mapper/VolGroup01-packetdb /var/netwitness/logdecoder/packetdb
```

- For the Network Decoder:
```
mount /dev/mapper/VolGroup01-decoroot /var/netwitness/decoder
mount /dev/mapper/VolGroup01-sessiondb /var/netwitness/decoder/sessiondb
mount /dev/mapper/VolGroup01-index /var/netwitness/decoder/index
mount /dev/mapper/VolGroup01-metadb /var/netwitness/decoder/metadb
mount /dev/mapper/VolGroup01-packetdb /var/netwitness/decoder/packetdb
```

- For the Concentrator:
```
mount /dev/mapper/VolGroup01-concroot /var/netwitness/concentrator
mount /dev/mapper/VolGroup01-sessiondb
/var/netwitness/concentrator/sessiondb
mount /dev/mapper/VolGroup01-index /var/netwitness/concentrator/index
mount /dev/mapper/VolGroup01-metadb /var/netwitness/concentrator/metadb
```

- For the Archiver:
```
mount /dev/mapper/VolGroup01-archiver /var/netwitness/archiver
mount /dev/mapper/VolGroup02-workbench /var/netwitness/workbench
```

- For the Broker:
  `mount /dev/mapper/VolGroup01-broker /var/netwitness/broker`

3. Add the following mount entries to `/etc/fstab`.
   - For the NW Server:
     ```
     /dev/mapper/VolGroup01-ipdbext /var/netwitness/ipdbextractor/ xfs
     defaults,noatime,nosuid 1 2
     /dev/mapper/VolGroup02-redb /var/netwitness/database/ xfs
     defaults,noatime,nosuid 1 2
     ```
   - For the Log Decoder/Log Collector:

     Note: The following mounts are not required for the Virtual Log Collector.

     ```
     /dev/mapper/VolGroup01-decoroot /var/netwitness/logdecoder ext4
     defaults,noatime,nosuid 1 2
     /dev/mapper/VolGroup01-index /var/netwitness/logdecoder/index xfs
     defaults,noatime,nosuid 1 2
     /dev/mapper/VolGroup01-sessiondb /var/netwitness/logdecoder/sessiondb xfs
     defaults,noatime,nosuid 1 2
     /dev/mapper/VolGroup01-metadb /var/netwitness/logdecoder/metadb xfs
     defaults,noatime,nosuid 1 2
     /dev/mapper/VolGroup01-logcoll /var/netwitness/logcollector xfs
     defaults,noatime,nosuid 1 2
     /dev/mapper/VolGroup01-packetdb /var/netwitness/logdecoder/packetdb xfs
     defaults,noatime,nosuid 1 2
     ```
   - For the Network Decoder:
     ```
     /dev/mapper/VolGroup01-decoroot /var/netwitness/decoder ext4
     defaults,noatime,nosuid 1 2
     /dev/mapper/VolGroup01-sessiondb /var/netwitness/decoder/sessiondb xfs
     defaults,noatime,nosuid 1 2
     /dev/mapper/VolGroup01-index /var/netwitness/decoder/index xfs
     defaults,noatime,nosuid 1 2
     /dev/mapper/VolGroup01-metadb /var/netwitness/decoder/metadb xfs
     defaults,noatime,nosuid 1 2
     /dev/mapper/VolGroup01-packetdb /var/netwitness/decoder/packetdb xfs
     defaults,noatime,nosuid 1 2
     ```
   - For the Concentrator:
     ```
     /dev/mapper/VolGroup01-concroot /var/netwitness/concentrator ext4
     defaults,noatime,nosuid 1 2
     /dev/mapper/VolGroup01-sessiondb /var/netwitness/concentrator/sessiondb
     xfs defaults,nosuid,noatime 1 2
     /dev/mapper/VolGroup01-index /var/netwitness/concentrator/index xfs
     defaults,noatime,nosuid 1 2
     /dev/mapper/VolGroup01-metadb /var/netwitness/concentrator/metadb xfs
     defaults,noatime,nosuid 1 2
     ```

- For the Archiver:
  ```
  /dev/mapper/VolGroup01-archiver /var/netwitness/archiver xfs
  defaults,nosuid,noatime 1 2
  /dev/mapper/VolGroup02-workbench /var/netwitness/workbench xfs
  defaults,nosuid,noatime 1 2
  ```
- For the Broker:
  ```
  /dev/mapper/VolGroup01-broker /var/netwitness/broker xfs
  defaults,nosuid,noatime 1 2
  ```

Set Up Virtual Hosts in 11.3

There two phases to set up your 11.3 virtual stack as shown in the order below.

- Phase 1 - Set Up NW Server, Event Stream Analysis, Malware Analysis, and Broker or Concentrator Hosts

  Note: For Event Stream Analysis, if you had C2 modules enabled in 10.6.6.x, the modules will enter a warm-up after you upgrade the Event Stream Analysis service to 11.3 and they will not be available until the warm up completes.

- Phase 2 - Set Up The Rest of the Component Hosts

Phase 1 - Set Up NW Server, Event Stream Analysis, Malware Analysis, and Broker or Concentrator Hosts

Task 1 - Set Up 11.3 NetWitness Server

Follow the instructions under Set Up 11.3 NW Server Host.

Task 2 - Set Up 11.3 ESA

Caution: If you had C2 modules enabled in 10.6.6.x, the modules will enter a warm-up after you upgrade the Event Stream Analysis service to 11.3 and they will not be available until the warm up completes.

Follow the instructions under Set Up 11.3 Component Host to set up your ESA hosts.

1. Set up your primary ESA host through the Setup program and install **ESA Primary** on the host in the user interface on the **Admin Hosts** view.

   Note: If you have multiple ESA hosts in your enterprise, you must upgrade the ESA Primary host, where all the `mongodb` (Mongo Database) backup tar files are located, first, before you upgrade ESA Secondary hosts.

2. (Conditional) If you have a secondary ESA host, set it up through the Setup program and install **ESA Secondary** on the host in the user interface on the **Admin Hosts** view.

Task 3 - Set Up 11.3 Malware Analysis

Follow the instructions under Set Up 11.3 Component Host.

Task 4 - Set Up 11.3 Broker or Concentrator

Follow the instructions under Set Up 11.3 Component Host.

Note: If you do not have a Broker, upgrade your Concentrator hosts. The 11.3 NW Server cannot communicate with 10.6.6.x core services for the new Investigate functionality. This is why you must upgrade the Broker or Concentrator hosts in Phase 1.

Phase 2 - Set Up The Rest of the Component Hosts

See Appendix B. Stopping and Restarting Data Capture and Aggregation for instructions on how to stop and restart data capture and aggregation when upgrading the Decoder, Concentrator, and Log Collection hosts.

Decoder and Concentrator Hosts

1. Stop data capture and aggregation.
2. Complete the steps in Set Up 11.3 Component Host.
3. Restart data capture and aggregation.

Log Decoder Host

1. Make sure you have prepared the Log Collector as described in the "Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh" in the **Backup Instructions**.
2. Stop data capture on the Log Decoder.
3. Complete the steps in Set Up 11.3 Component Host.
4. Restart data capture on Log Decoder.

   Note: After you upgrade, you will restart log collection after completing the Task 33 - Update Incident Rules Identified in the Domain Matching Conditions Upgrade Preparation Task in the **Post Upgrade Tasks**

Virtual Log Collector Host

1. Make sure you have prepared the Virtual Log Collector as described in the "Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh" in the **Backup Instructions**.
2. Back up your 10.6.6.x VLC by editing the `all-systems` file on host where you performed the backup.
   a. Make sure your `all-systems` file contents has this information before you perform this step.
      `vlc,<host-name>,<IP-address>,<UUID>,10.6.6.x`
   b. Run the following command to create backup.
      `./nw-backup.sh -u`
      See Backup Instructions for detailed procedures on how to back up the host.
3. Make sure the backup host contains the VLC backup in the following format.
   `<hostname>-<IPaddress>-root.tar.gz`
   `<hostname>-<IPaddress>-root.tar.gz.sha256`
   `<hostname>-<IPaddress>-backup.tar.gz`

```
<hostname>-<IPaddress>-backup.tar.gz.sha256
<hostname-IPaddress>-network.info.txt
all-systems-master-copy
```

4. Power off the 10.6.6.x VLC so that a new 11.3 VM can be created with the same network configuration.
5. Deploy a fresh Component Host using the 11.3 NetWitness Platform ova.
6. Connect to the VM console of the new VLC.
7. Update the network configuration to be the same as the 10.6.6.x VLC.
   This information is stored in the `<hostname-IPaddress>-network.info.txt` 10.6.6.x VLC backup file.

   Note: Make sure IPv6 is disabled.

   a. Edit the `/etc/sysconfig/network-scripts/ifcfg-eth0` file and update the settings.
   Contents of `ifcfg-eth0` should be as follows.

```
TYPE=Ethernet
DEFROUTE=yes
NAME=eth0
UUID=<uuid>
DEVICE=eth0
DNS1=<nameserver from <hostname>-<ipaddress>-network-info.txt>
DNS2=<nameserver from <hostname>-<ipaddress>-network-info.txt>
BOOTPROTO=static
IPADDR=<ipaddress from <hostname>-<ipaddress>-network-info.txt>
NETMASK=<netmask from <hostname>-<ipaddress>-network-info.txt>
GATEWAY=<gateway from <hostname>-<ipaddress>-network-info.txt>
NM_CONTROLLED=no
ONBOOT=yes
```

   b. Submit the following command string.

```
systemctl restart network.service
```

8. Create the backup directory.

```
# mkdir -p /var/netwitness/database/nw-backup/
```

9. Copy the backup from the backup host from `/var/netwitness/database/nw-backup` to the new VLC in the `/var/netwitness/database/nw-backup` directory.
10. Complete the steps 2 through 12 inclusive in Set Up 11.3 Component Host for the rest of the NetWitness Platform components . Make sure that you select **Log Collector** for the service in step 12.

Set Up 11.3 NW Server Host

Make sure that you have backed up 10.6.6.x data for the SA Server host. You must follow the instructions in Backup Instructions to back up the host.

Caution: Run the backup immediately before upgrading the SA Server to 11.3 so that the data is as recent as possible. You must create the **all-systems** file before you upgrade the SA Server because you cannot do this after the SA Server has been upgraded to 11.3.

Complete the following steps to set up the 11.3 NW Server host.

1. Log in to 11.3 NW Server VM's console and run the `nwsetup-tui` command.
   This initiates the Setup program and the EULA is displayed.

   Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press the Enter key to register your command response and move to the next prompt.
   2.) The Setup program adopts the color scheme of the desktop or console you use access the host.

2. Tab to **Accept** and press **Enter**.

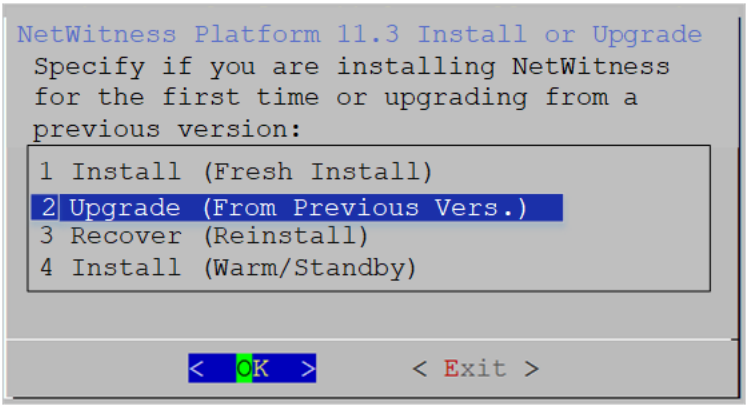
   
   The **Is this the host you want for your 11.3 NW Server** prompt is displayed.

   Caution: If you choose the wrong host for the NW Server and complete the upgrade, you must repeat steps 1 through 11 of Set Up 11.3 NW Server Host to correct this error.

3. Tab to **Yes** and press **Enter**.

   
   Choose **No** if you already upgraded the NW Server to 11.3.
   The **Install or Upgrade** prompt is displayed.

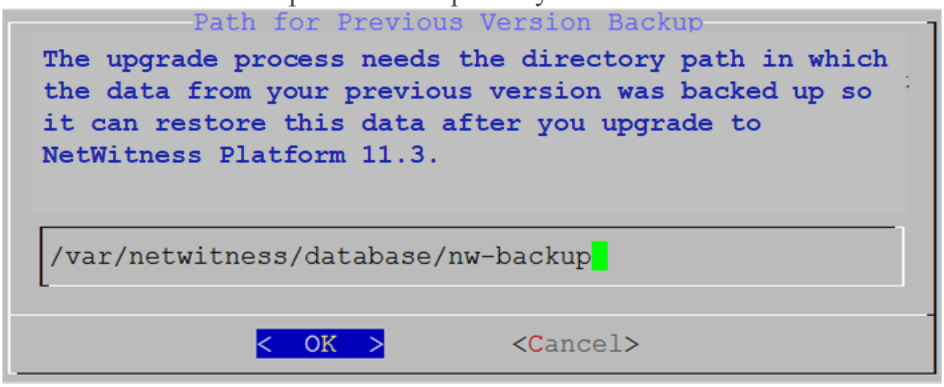
4. Use down arrow to select **2 Upgrade (From Previous Vers.)**, tab to **OK**, and press **Enter**.



The **Backup** path prompt is displayed.

Caution: The backup path in the following prompt must be the same as the path in which your backup is stored. For example, the backup script assigns **/var/netwitness/database/nw-backup** as the default path. If you used the default backup path during backup and did not change it subsequently, you must keep **/var/netwitness/database/nw-backup** as the path in the following prompt.

5. Tab to **OK** and press **Enter** if want to keep this path. If not, edit the path, tab to **OK** and press **Enter** to change it.
This table lists the backup and restore paths by host/service



Host	Backup Path	Restore Path
Malware	/var/lib/rsamlware/nw-backup	/var/netwitness/malware_analytics_server/nw-backup/restore
Event Stream Analysis	/opt/rsa/database/nw-backup	/var/netwitness/database/nw-backup/restore
NW Server	/var/netwitness/database/nw-backup	/var/netwitness/restore
All Other Hosts	/var/netwitness/database/nw-backup	/var/netwitness/database/nw-backup/restore

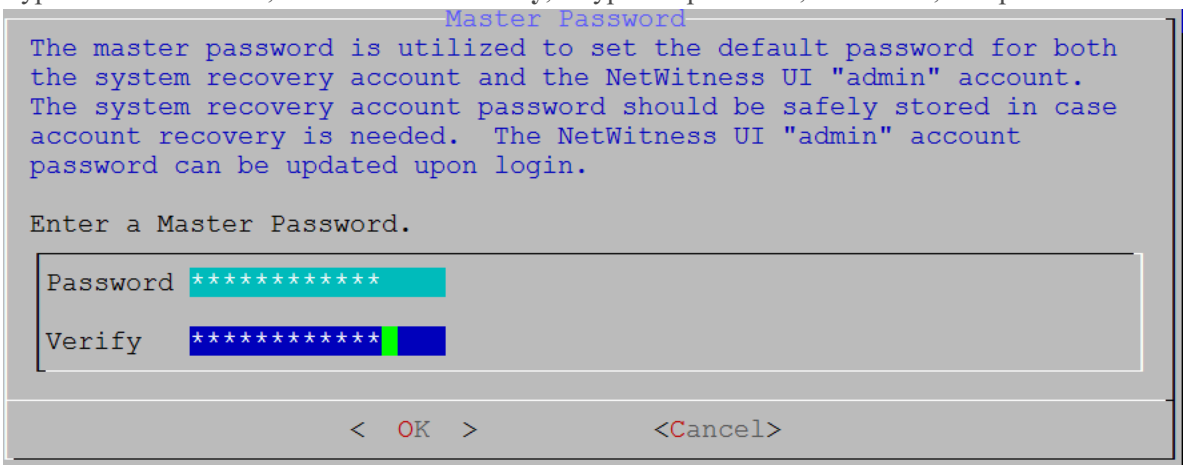
The **Master Password** prompt is displayed.

The following list of characters are supported for Master Password and Deployment Password:

- Symbols : ! @ # % ^ + ,
- Numbers : 0-9
- Lowercase Characters : a-z
- Uppercase Characters : A-Z

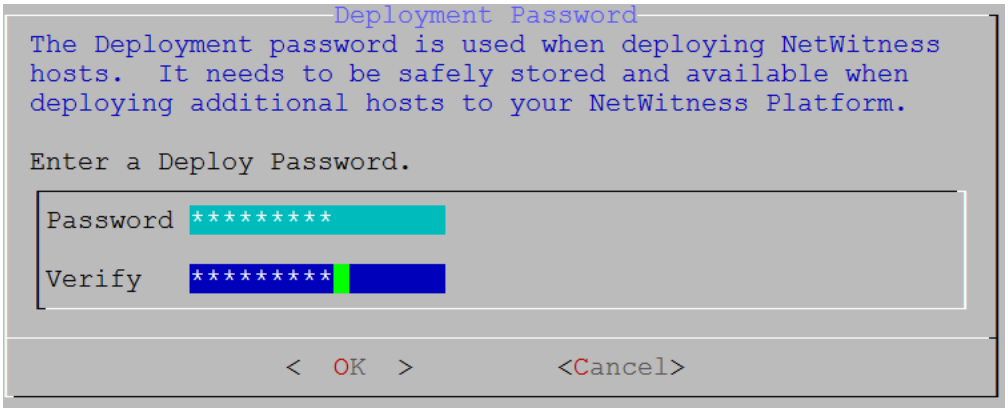
No ambiguous characters are supported for Master Password and Deployment Password. For example:
space { } [ ] ( ) / \ ' " ` ~ ; : . < > -

6. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.



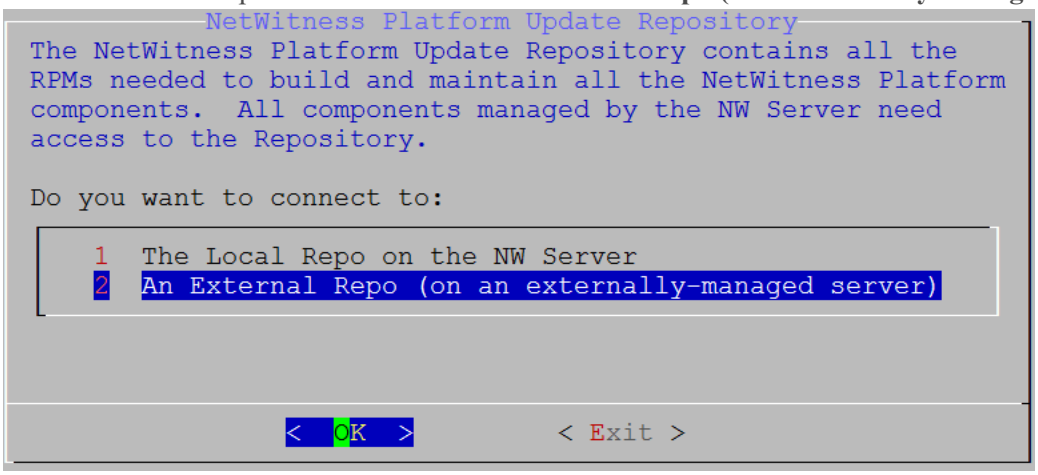
The **Deployment Password** prompt is displayed.

7. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.



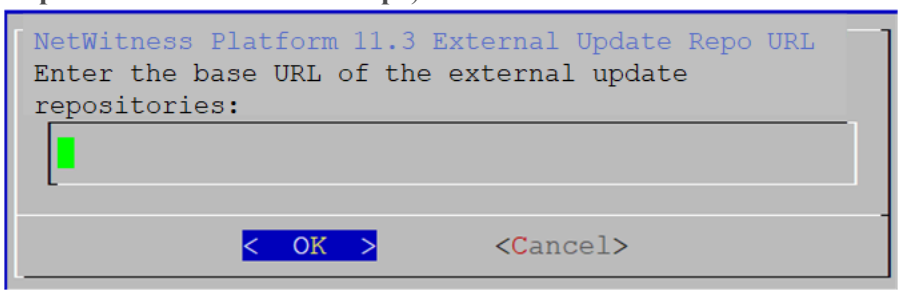
The **Update Repository** prompt is displayed.
You must use the same repo that you used for the NW Server hosts for all hosts.

8. Use the down and up arrows to select **2 An External Repo (on an externally-managed server)**.



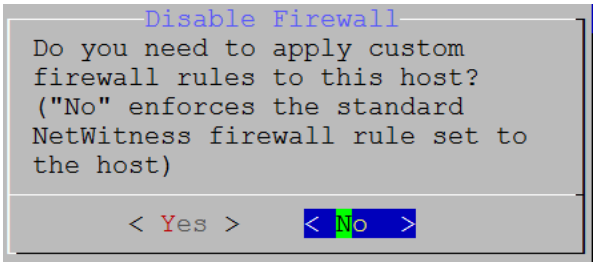
The **External Update Repo URl** prompt is displayed.
Refer to Appendix D. Create External Repository for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

9. Enter the base URL of the NetWitness Platform external repo (for example, **http:/testserver/netwitness-repo**)and click **OK**.

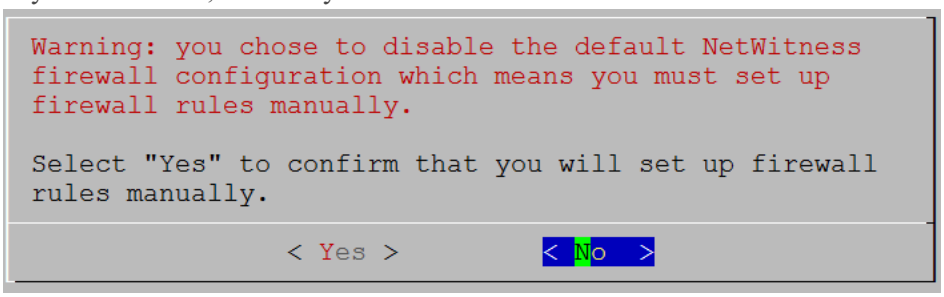


The **Disable** or use standard **Firewall** configuration prompt is displayed.

10. Tab to **No** (default), and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.

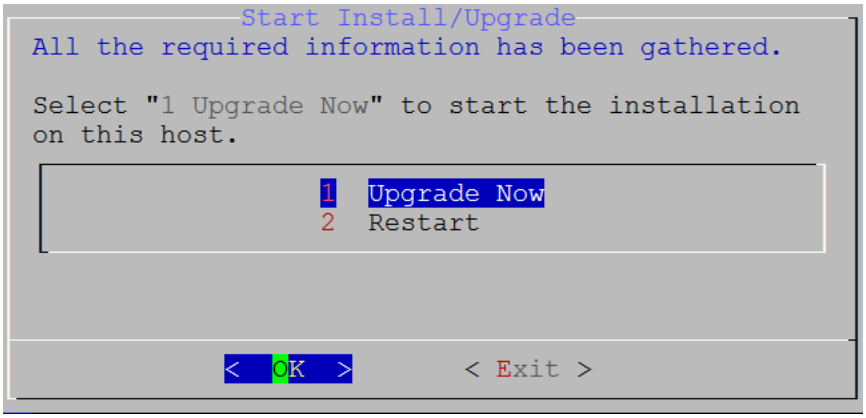


- If you select **Yes**, confirm your selection or **No** to use the standard firewall configuration.



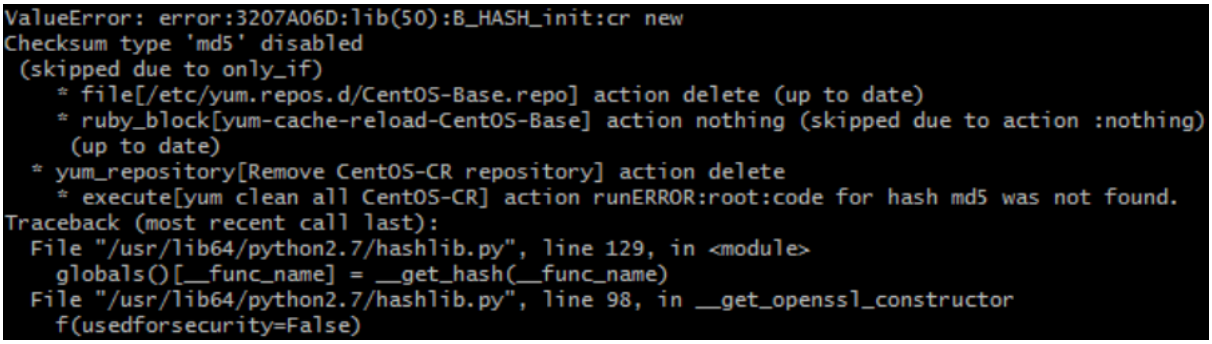
The **Install** or **Upgrade** prompt is displayed (**Recover** does not apply to the installation. It is for 11.3 Disaster Recovery).

11. Select 1 **Upgrade Now**, tab to **OK**, and press Enter.



When **Installation complete** is displayed, you have upgraded the 10.6.6.x SA Server to the 11.3 NW Server.

Note: Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



12. Complete the Post Upgrade Tasks before you upgrade any of the Component Hosts to 11.3.

Set Up 11.3 Component Host

Make sure that you Back up your 10.6.6.x data for the host. **You must follow the instructions in** Backup Instructions **to back up the host.**

Caution: Run the backup immediately before upgrading the host to 11.3 so that the data is as recent as possible.

Complete the following steps to set up an 11.3 Component Host.

1. Log in to 11.3 Component Host VM console and run the `nwsetup-tui` command.
   This initiates the Setup program and the EULA is displayed.
2. Tab to **Accept** and press **Enter**.

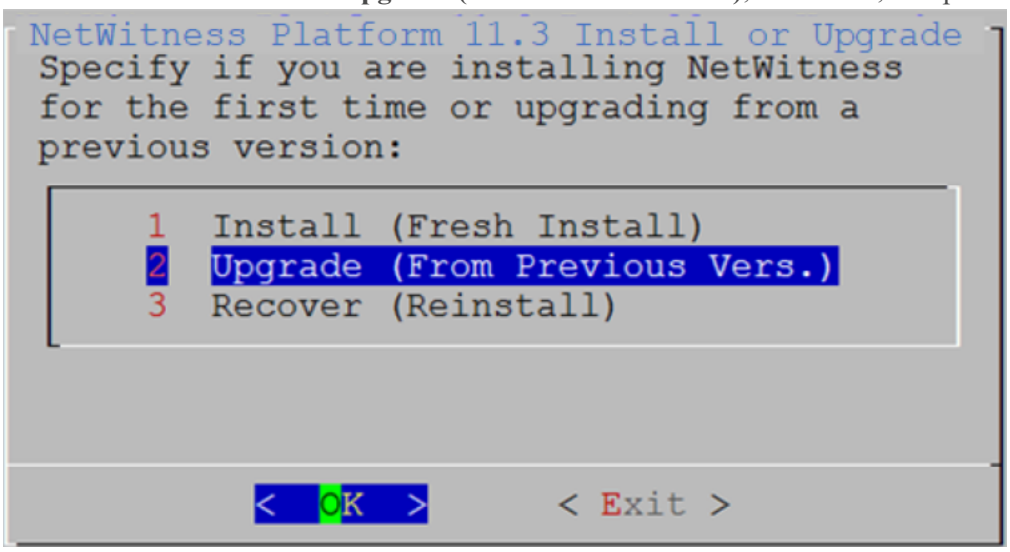
   The **Is this the host you want for your 11.3 NW Server** prompt is displayed.

   Caution: If you choose the wrong the host for the NW Server and complete the upgrade, you must repeat steps 1 through 11 of Set Up 11.3 NW Server Host to correct this error.

3. Tab to **No** and press **Enter**.

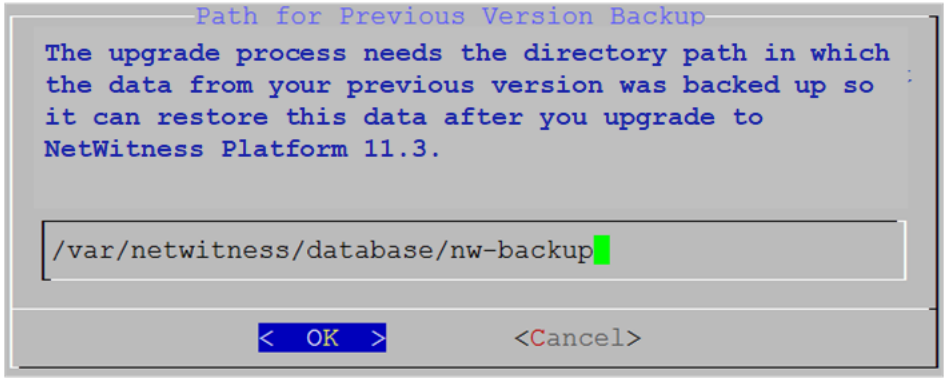
   The **Install** or **Upgrade** prompt is displayed (**Recover** does not apply to the installation. It is for 11.3 Disaster Recovery).

4. Use down arrow to select **2 Upgrade (From Previous Vers.)**, tab to **OK**, and press **Enter**.



The **Backup** path prompt is displayed.

5. Tab to **OK** and press **Enter** if want to keep this path. If not, edit the path, tab to **OK** and press **Enter** to change it.



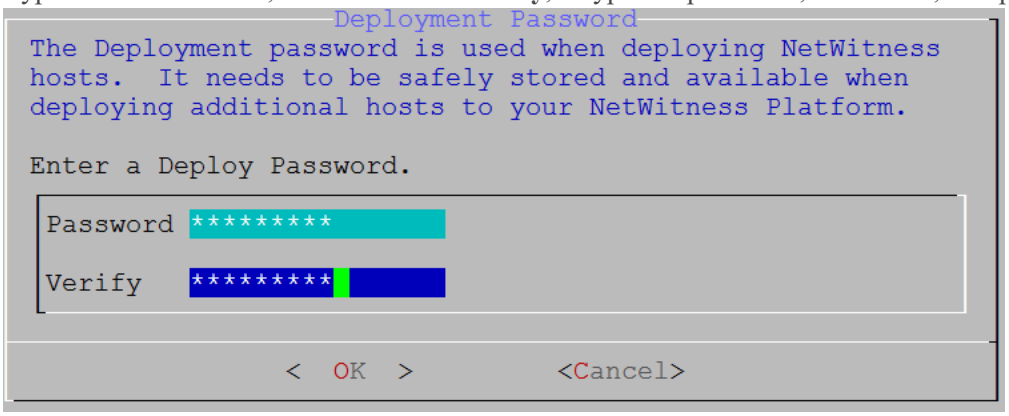
This table lists the backup and restore paths by host/service.

Host	Backup Path	Restore Path
Malware	`/var/lib/rsamlware/nw-backup`	`/var/netwitness/malware_analytics_server/nw-backup/restore`
Event Stream Analysis	`/opt/rsa/database/nw-backup`	`/var/netwitness/database/nw-backup/restore`
NW Server	`/var/netwitness/database/nw-backup`	`/var/netwitness/restore`
All Other Hosts	`/var/netwitness/database/nw-backup`	`/var/netwitness/database/nw-backup/restore`

The **Deployment Password** prompt is displayed.

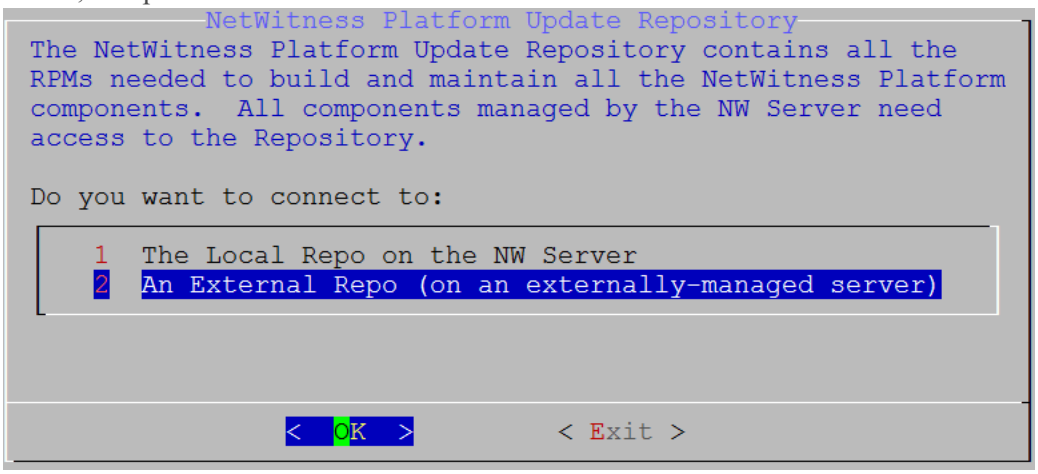
Note: You must use the same deployment password that you used when you upgraded the NW Server.

6. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.



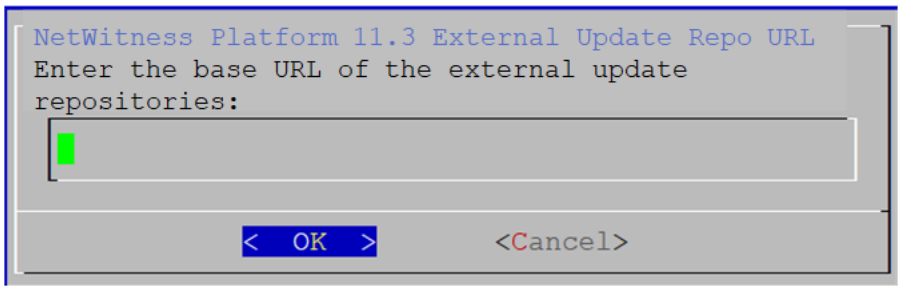
The **Update Repository** prompt is displayed.

7. Use the down and up arrows to select **2 An External Repo (on an externally-managed server)**, tab to **OK**, and press **Enter**.



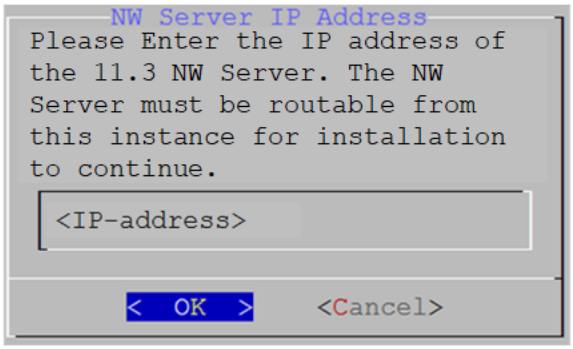
The **External Update Repo URL** prompt is displayed.
The repositories give you access RSA updates and CentOS updates.

8. Enter the base URL of the NetWitness Platform external repo (for example, **http://testserver/netwitness-repo**)and click **OK**. Refer to Appendix D. Create External Repository for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.



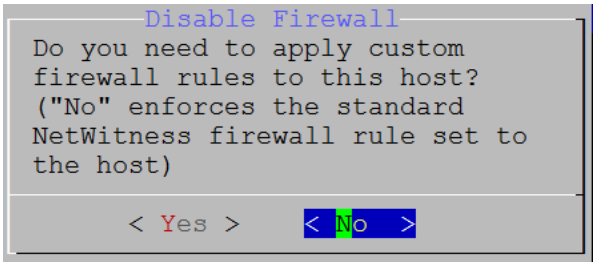
The **NW Server IP Address** is displayed.

9. Type the IP address of the NW Server, tab to **OK**, and press **Enter**.

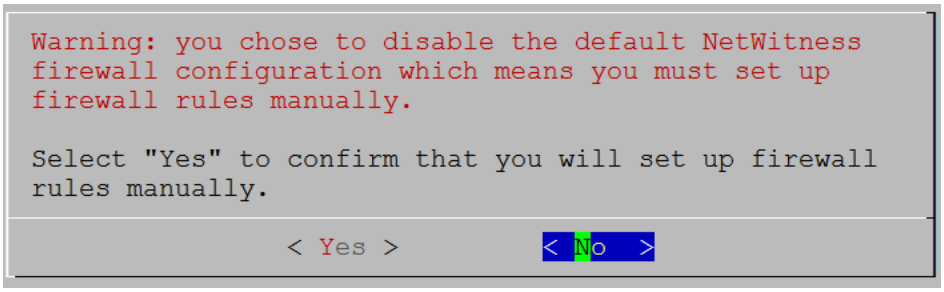


The **Disable** or use standard **Firewall** configuration prompt is displayed.

10. Tab to **No** (default), and press Enter to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.



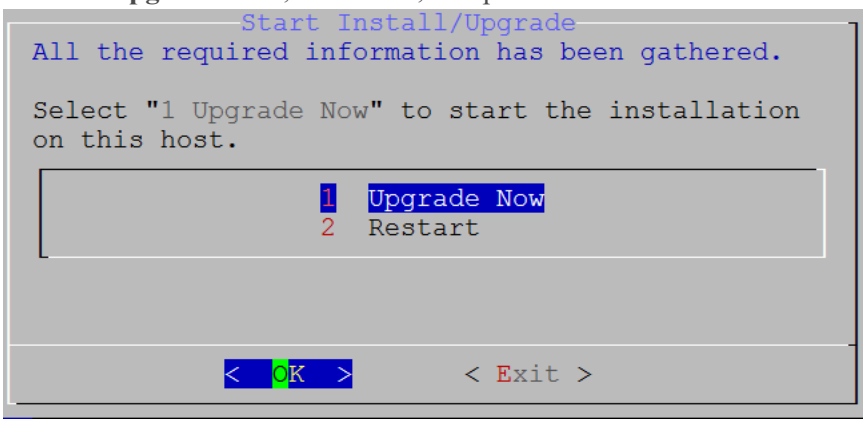
- If you select **Yes**, confirm your selection.



- If you select **No**, the standard firewall configuration is applied.

The **Install** or **Upgrade** prompt is displayed (**Recover** does not apply to the installation. It is for 11.3 Disaster Recovery).

11. Select 1 **Upgrade Now**, tab to **OK**, and press **Enter**.



When **Installation complete** is displayed, you have upgraded the host to the 11.3.

12. Install the service on this host:

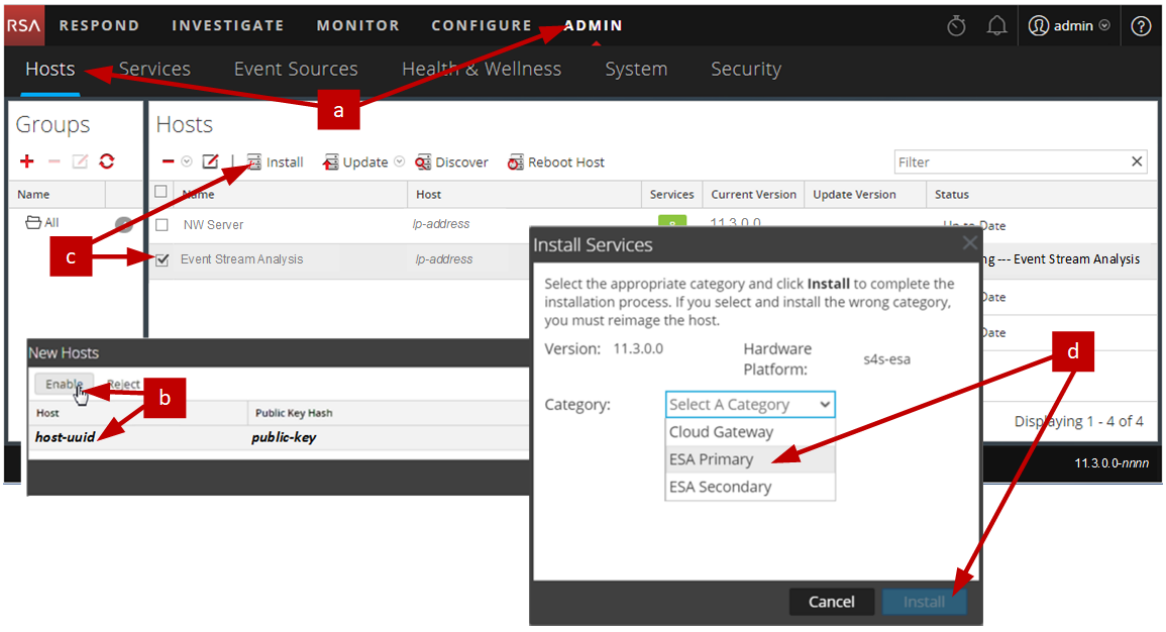
    a. Log into NetWitness Platform and click **ADMIN** > **Hosts**.
    The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

    Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

    b. Click on the host in the **New Hosts** dialog and click **Enable**.
    The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

    c. Select that host in the **Hosts** view (for example, **Event Stream Analysis**) and click Install.
    The **Install Services** dialog is displayed.

    d. Select the appropriate service (for example, **ESA Primary**) and click **Install**.



You have completed the upgrade of the Component Host in NetWitness Platform

Note: When you upgrade a Respond host from 10.6.6.x to 11.3, it takes a period of time for Respond to come back online. This is caused by Respond indexing data while it is restored. The size of the data in the Mongo database will determine the time.

Update or Install Legacy Windows Collection

Refer to the *Windows Legacy Collection Guide for RSA NetWitness 11.x*.

Note: After you update or install Windows Legacy Collection, reboot the system to ensure that Log Collection functions correctly.

Post Upgrade Tasks

You must complete the following tasks after you upgrade your hosts from 10.6.6.x to 11.3. These tasks are organized by the following categories.

- General
- Event Stream Analysis
- Investigate
- Log Collection
- Log Decoder and Decoder
- Malware Analysis
- Reporting Engine
- Respond
- Warehouse
- RSA Archer® Cyber Incident & Breach Response
- RSA NetWitness® Endpoint
- RSA NetWitness® UEBA
- NetWitness Platform Integrations
- Other

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

General

General tasks apply to all customers regardless of the NetWitness Components you deploy.

Task 1 - Remove Backup-Related Files from Host Local Directories

Caution: 1) You must retain a copy of all backup files on an external host. 2) Validate that you have all your data from your backup restored in 11.3 before you remove the backup-related files from the local directories on your 11.3 hosts.

Backup `.tar` Files

After all the hosts are upgraded to 11.3, you must remove:

- The backup files from the local directories on the hosts.
- All the files from `nw-backup` and `restore` directories on the hosts.

Host	Backup Path	Restore Path
Malware	`/var/lib/rsamlware/nw-backup`	`/var/netwitness/malware_analytics_server/nw-backup/restore`
Event Stream Analysis	`/opt/rsa/database/nw-backup`	`/var/netwitness/database/nw-backup/restore`
NW Server	`/var/netwitness/database/nw-backup`	`/var/netwitness/restore`
All Other Hosts	`/var/netwitness/database/nw-backup`	`/var/netwitness/database/nw-backup/restore`

Task 2 - Make Sure Port 15671 Is Configured Correctly

Port 15671 is new in 11.x, but you do not need to open a firewall for this port. Make sure that port 15671, and all ports, are configured as shown in the "Network Architecture and Ports" topic in the *Deployment Guide*.

(Optional) Task 3 - Reissue Certificates for Your Hosts

In 11.3.0.0, RSA introduced a `cert-reissue` command line command and its arguments to reissue host certificates. After you update all your hosts to 11.3, you should reissue certificates for all of them as soon as possible to avoid having them expire. If the certificates expire, this places your NetWitness deployment in a bad security state. Refer to the *Security Configuration Guide* for instructions on how to use the `cert-reissue` command.

(Conditional) Task 4 - Restore Custom Analysts Roles

If you had custom analyst roles in 10.6.6.x, you must reinstate them in 11.3. See "Add a Role and Assign Permissions" in the *System Security and User Management Guide*.

(Conditional) Task 5 - If NetWitness Platform Has No Web Access, Upload Response `.bin` File Again (License Server)

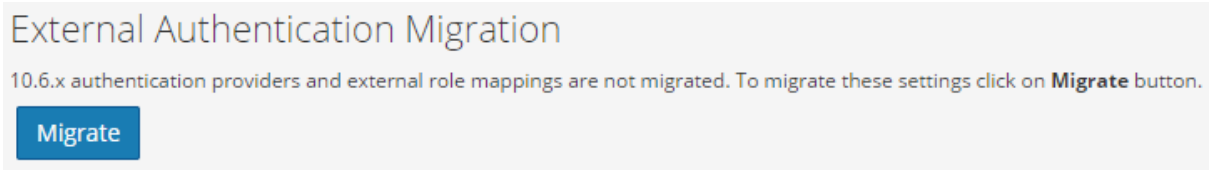
If your NetWitness Deployment does not have Internet access, after you upgrade to 11.3, you must upload the response `.bin` file again to view the license information in the **ADMIN** > **System** > **Licensing** view in the NetWitness Platform User Interface. See “Upload an Offline Capability Response to NetWitness Platform” in the *Licensing Management Guide* for instructions.

Task 6 - Migrate Active Directory (AD)

The first time you log into the NetWitness Platform 11.3 User Interface, you must click on the Migrate button to complete the migration of AD.

1. Log in to NetWitness Platform 11.3 with your `admin user` credentials.

2. Go to **ADMIN** > **SECURITY** and click the **Settings** tab.
   The following dialog is displayed.



3. Click **Migrate**.
   The migration is complete and the dialog closes.

Task 7 - Modify Migrated AD Configuration to Upload Certificate

If you authenticated through Active Directory (AD) server, and enabled SSL for the AD connection in 10.6.6.x, you must modify the migrated AD configuration to upload the Active Directory server certificate.

Complete the following procedure to modify the migrated AD configuration to upload the certificate.

1. Log in to **NetWitness Platform** 11.3, go to **ADMIN** > **Security** and click the **Settings** tab.
2. Under **Active Directory Settings**, select an AD configuration and click .
   The Edit Configuration dialog is displayed.
3. Go to the **Certificate File** field, click **Browse**, and select a certificate from your network.
4. Click **Save**.

Task 8 - Reconfigure Pluggable Authentication Module (PAM) in 11.3

You must reconfigure PAM after you upgrade to 11.3. See "Configure PAM Login Capability" in the *System Security and User Management Guide* for instructions.

You can refer to your 10.6.6.x PAM configuration files in the **/etc** directory in the your 10.6.6.x backup data for guidance.

Task 9 - Restore NTP Servers

You must use the NetWitness Platform 11.3 user interface to restore NTP server configurations. NTP server configuration information is located in `$BUPATH/restore/etc/ntp.conf`. Use the NTP server name and hostname from the `/var/netwitness/restore/etc/ntp.conf` file. See "Configure NTP Servers" in the *System Configuration Guide* for detailed instructions on how to add NTP servers.

Task 10 - Restore Licenses for Environments without FlexNet Operations-On Demand Access

If your environment does not have access to FlexNet Operations-On Demand, you need to re-download your NetWitness Platform licenses. Refer to "Step 1. Register the NetWitness Server" in the *Licensing Management Guide* for instructions on how to re-download licenses.

(Conditional) Task 11 - If You Disabled Standard Firewall Config - Add Custom IPtables

During the upgrade, you have the option of using these rules or disabling them. If you disabled them, follow these instructions as a baseline to create user-managed firewall rule sets on all the hosts for which you disabled the standard firewall configuration.

Note: You can refer to the `$BUPATH/restore/etc/sysconfig/iptables` and `$BUPATH/restore/etc/sysconfig/ip6tables` in the restore folder of the backup to update the `ip6tables` and `iptables` files. The `/etc/netwitness/firewall.cfg` file contains the standard `iptables` firewall rules.

1. SSH to each host and log in with your root credentials.
2. Update the following `ip6tables` and `iptables` files with the custom firewall rules.
   `/etc/sysconfig/iptables`
   `/etc/sysconfig/ip6tables`
3. Reload the `iptables` and `ip6tables` services.
   ```
   service iptables reload
   service ip6tables reload
   ```

(Conditional) Task 12 - Specify SSL Ports If You Never Set Up Trusted Connections

Complete this task only if you never set up Trusted Connections. You would not have set up Trusted Connections if you:

- Used the base ISO image for 10.3.2 or earlier.
- Updated the system using RPMs exclusively to get to 10.6.6.x.

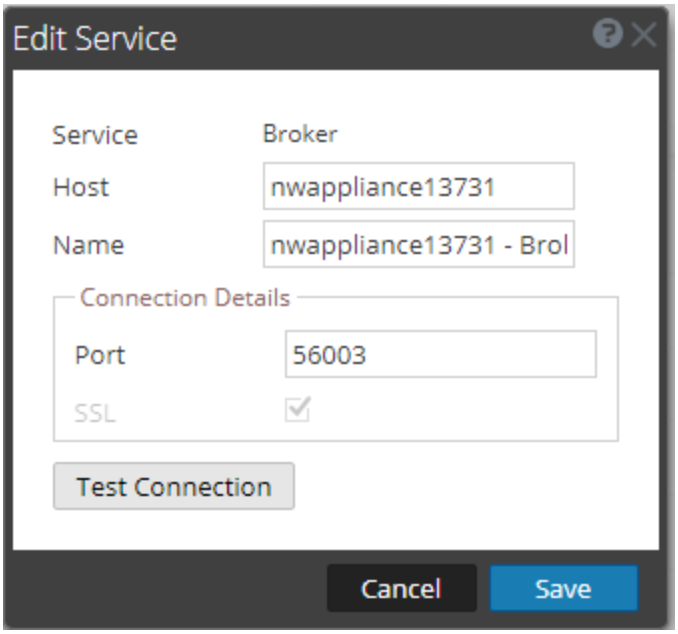
NetWitness Platform 11.3 cannot communicate with the Core services if you are using a non-SSL port 500XX. You must update the Core service ports to an SSL port in the Edit Service dialog.

1. Log in to **NetWitness Platform** and go to **ADMIN** > **Services**.
2. Select each core service and change the ports from Non-SSL to SSL ports.

Service	Non-SSL	SSL
Broker	50003	56003
Concentrator	50005	56005
Decoder	50004	56004
Log Decoder	50002	56002

3. Click (Edit icon) from the SERVICES view toolbar.
   The Edit Service dialog is displayed.

4. Change the port from Non-SSL to SSL as shown in the table and click **Save** (for example, change the Broker port from 50003 to 56003).



Task 13 (Conditional) Reconfigure Public Key Infrastructure (PKI) Certificates

If you had PKI keystores that contained server certificates with private keys and the truststores that contain the trusted CA certificates, you must reconfigure after you upgrade to 11.3. For instructions on how to configure PKI authentication, see the "*System Security and User Management Guide*".

Event Stream Analysis (ESA)

Task 14 - Reconfigure Automated Threat Detection for ESA

If you used Automated Threat Detection in 10.6.6.x, you must complete the following steps to reconfigure it using the ESA Analytics service in 11.3.

1. Log in to **NetWitness Platform** and go to **ADMIN** > **System** > **ESA Analytics**.
   The Suspicious Domains modules, Command and Control (C2) for Network data and C2 for Logs, require a whitelist named "**domains_whitelist**".
2. Conditional - If your previous Automated Threat Detection whitelist appears on the **Lists** tab of the Context Hub service:
   a. Go to **ADMIN** > **Services**, select the Context Hub service, in the action commands ( ) drop-down menu, click **View** > **Config** > **Lists** tab.
   b. Rename your old Automated Threat Detection whitelist to "`domains_whitelist`" for the Suspicious Domains module.

For more information, see the *Automated Threat Detection Guide* and the "Configure ESA Analytics" section of the *ESA Configuration Guide*.

Task 15 (Conditional) Verify String Array Type Meta Keys on the ESA Correlation Service

If you added any string array type meta keys to the Event Stream Analysis service for your ESA correlation rules in 10.6.6.x or earlier, verify that they appear on the ESA Correlation service in 11.3.

1. Follow the "Configure Meta Keys as Arrays in ESA Correlation Rule Values" procedure in the *ESA Configuration Guide* to verify if the string array type meta keys that were added before the upgrade are on the ESA Correlation service. Add any missing string array type meta keys.
2. Do not remove any meta keys from the multi-valued parameter on the ESA Correlation service. In NetWitness Platform 11.3, the ESA rules from Live use meta keys with array syntax and they depend on these meta keys to work correctly. Removing values from the multi-valued list can cause the ESA Rule Deployments to fail.

Task 16 (Conditional) Update RSA Live ESA Rules with Meta Type Changes from String to Array

The following table lists the ESA rules from RSA Live that had meta key type changes from String to Array in NetWitness Platform 11.3.

Rule #	Rule Name	Array Type Meta Keys in 11.3
1	RIG Exploit Kit	threat_category
2	AWS Critical VM Modified	alert
3	Multiple Successful Logins from Multiple Diff Src to Same Dest	host.src and host.dst
4	Multiple Successful Logins from Multiple Diff Src to Diff Dest	host.src and host.dst
5	Multiple Failed Logins from Multiple Diff Sources to Same Dest	host.src and host.dst
6	Multiple Failed Logins from Multiple Users to Same Destination	host.src and host.dst
7	User Login Baseline	host.src and host.dst

1. If you:
   - Deployed these rules before version 11.3:
     a. Note any rule parameters that you have changed so you can adjust the rules for your environment.
     b. Download the updated rules from RSA Live.

c. Reapply any changes to the default rule parameters and deploy the rules.
(For instructions, see "Download RSA Live ESA Rules" in the Alerting with ESA Correlation Rules User Guide.)

- Are deploying these rules for the first time in version 11.3, follow the customization directions with the ESA rule descriptions. Rules 3 to 7 in the above table require that the Context Hub lists for `User_Whitelist`, `Host_Whitelist` and `IP_Whitelist` to be added as enrichments to ESA. (See "Configure Context Hub List as an Enrichment Source" in the *Alerting with ESA Correlation Rules User Guide*.)

2. Deploy the ESA rule deployment that contains these rules. (See "ESA Rule Deployment Steps" in the *Alerting with ESA Correlation Rules User Guide*.)

Task 17 (Conditional) - Verify ESA Rule Deployment

After you upgrade to 11.3, verify your ESA rule deployments. For every ESA host, a new deployment is created in the format "<ESA Host name> – ESA Correlation".

1. Make sure that a new deployment was created.
2. Make sure that the new deployment contains an ESA Correlation service, data sources, and rules for all previous deployments on that ESA host.
3. Make sure that the ESA Correlation service has status of "Deployed".

For a detailed example, see the *ESA Configuration Guide*. For Deployment information, see "ESA Rule Deployment Steps" in the *Alerting with ESA Correlation Rules User Guide*. For troubleshooting information, see the *Alerting with ESA Correlation Rules User Guide*.

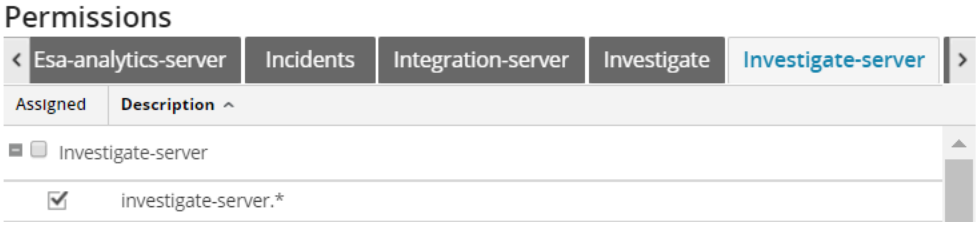
Investigate

Task 18 - Make Sure Customized User Roles Have `Investigate-server` Permissions for Event Analysis Access

After you upgrade to 11.3.0.0, any customized user role does not have `investigate-server.*` permission enabled by default. Complete the following procedure to make sure that the appropriate user roles have permission to access Event Analysis.

1. Log in to NetWitness Platform 11.3.0.0 with your `Admin user` credentials and go to **ADMIN** > **Security**.
2. Click the **Roles** tab.
3. Select the roles that need `investigate-server.*` permissions and click (Edit icon).
4. Select the **Investigate-server** tab under under **Permissions**.

5. If the **investigate-server** checkbox is not set, set it for the Roles that require Event Analysis access.



6. Click **Save**.

Log Collection

Task 19 - Reset Stable System Values for Log Collector after Upgrade

Complete the following tasks to reset stable system values for the Log Collector after you upgrade it to 11.3 to ensure that all collection protocols resume normal operation.

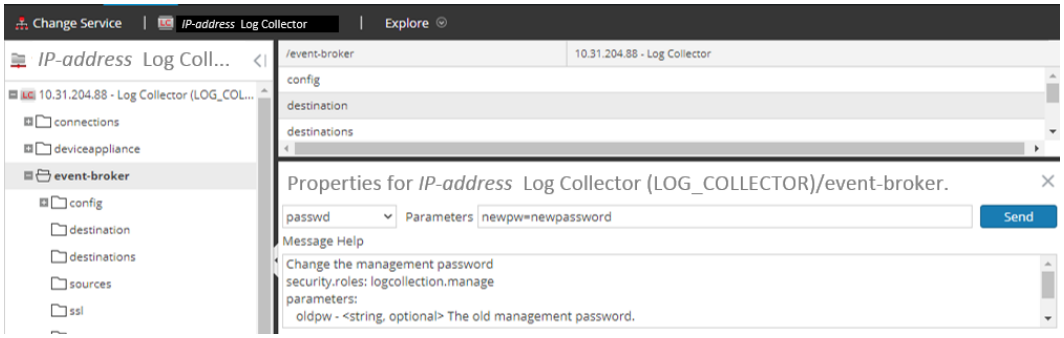
Reset Stable System Values for the Lockbox

The Lockbox stores the key for encrypting event source and other passwords for the Log Collector. The Log Collector service cannot open the Lockbox because of the stable system value changes. As a result, you must Reset Stable System Values for the Lockbox . See "Log Collection: Step 3. Set Up a Lockbox" in the *Log Collection Configuration Guide* for instructions.

Update Log Collector Service RabbitMQ User Account Password

If the `logcollector` service RabbitMQ user account password was changed, you must reenter it after the 11.3 upgrade.

1. Log in to **NetWitness Platform** and go to **ADMIN** > **Services**.
2. Select the Log Collector service.
3. Click (Actions) > **View** > **Explore**.
4. Right click `event-broker` > **Properties** .
5. Select `passwd` from the drop-down list, enter `newpw=><newpassword>` in Parameters (where `<newpassword>` is the RabbitMQ user account password), and click **Send**.



Task 20 - (Conditional) Update SSHD Configuration after Upgrade with Older Windows and UNIX SFTP Agents

This task applies if you have Log Collection, Log Collector (LC) and or Virtual Log Collector (VLC), with File Collection event sources.

If all the event sources:

- Resume collection after upgrade, you do not need to do anything.
- Do not resume collection after the upgrade, you may have to restore Cipher, MACs and Key Exchange Algorithms to the SSHD configuration from the original LC/VLC. Change the `/etc/ssh/sshd_config` file.

1. Make the following changes to `/etc/ssh/sshd_config` file.
   a. If the `KexAlgorithms` line:
      - Exists, append "`,diffie-hellman-group1-sha1`" to the file.
      - Does not exist, add "`KexAlgorithms +diffie-hellman-group1-sha1`" line.
   b. If the `Ciphers` line:
      - Exists, append "`,aes128-cbc`" to the file.
      - Does not exist, add the "`Ciphers +aes128-cbc`" line to the file.
2. Restart SSHD service.
3. If collection still fails, edit the `/etc/systemd/system/sshd.service.d/sshd-opts-managed.conf` file and change "`OWB_ALLOW_NON_FIPS=on`" to "`OWB_FIPS_MODE=off`" in the Environment line and restart SSHD service.
4. If collection still fails, contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294).

Task 21 - Enable FIPS Mode

Note: This task is optional for Upgrades from 10.6.6.x with FIPS enabled for Log Collectors, Log Decoders and Network Decoders)

FIPS is enabled on all services except Log Collector, Log Decoder, and Decoder. FIPS cannot be disabled on any services except Log Collector, Log Decoder, and Decoder.

Log Decoder and Decoder

(Conditional) Task 23 - Enable Metadata for GeoIP2 Parser

By default, the GeoIP2 parser generates less metadata than the GeoIP parser did. After updating to 11.3, if you require any of the additional metadata, you must enable them (once only) for each Decoder. This can also be altered post-upgrade. Note that the `isp` and `org` meta fields usually produce an equivalent value to `domain`.

To enable metadata:

1. Go to **ADMIN** > **Services**.
2. In the **Administration services** view, select a Log Decoder or a Decoder.
3. Click the settings icon ( ) and select **View** > **Config**. The Parsers Configuration panel is displayed, from which you can select **GeoIP2** to enable the desired metadata.

For more information about GeoIP2 parsers, see the "GeoIP2 and GeoIP Parsers" topic in the *Decoder and Log Decoder Configuration Guide*.

Malware Analysis

Task 24 - Enable Threat - Malware Indicators Dashboard

In 11.3, the 10.6.6.x **Threat -Indicators Dashboard** was renamed to **Threat - Malware Indicators Dashboard**. If you used this dashboard in 10.6.6.x, you must:

1. Enable the **Threat - Malware Indicators Dashboard** in 11.3.
2. Set datasource for new dashlets.
   See "Dashlets" in RSA Link (https://community.rsa.com/docs/DOC-81463) for a description of Dashlets in the context of NetWitness Platform.

Note: After upgrading to 11.3, both the Threat-Indicators and the Threat-Malware Indicators dashboards can be displayed in the User Interface. If this is the case, disable the Threat-Indicators dashboard, and enable the Threat-Malware Indicators report charts and dashboard. For information about disabling dashboards, see the "Managing Dashboards" topic in the *NetWitness Getting Started Guide*.

Reporting Engine

(Conditional) Task 25 - Restore the CA certificates for External Syslog Servers for Reporting Engine

You must restore CA certificates after the upgrade from the backup you made prior to the upgrade. The Backup script backs up the 10.6.6.x CA certificates into the `/usr/lib/jvm/java-1.8.0-openjdk-1.8.0.111-0.b15.el6_8.x86_64/jre/lib/security/cacerts` directory.

Complete the following procedure to restore the CA certificates in 11.3.

1. SSH to the NW Server host.
2. Export the CA certificates.
   ```
   keytool -export -alias <alias_name> -keystorepath_to_keystore_file -rfc -file path_to_certificate_file
   ```
3. Copy the CA PEM file into `/etc/pki/nw/trust/import` directory.

(Conditional) Task 26 - Restore External Storage for Reporting Engine

If you have external storage for the Reporting Engine (such as SAN or NAS for storing reports), you must restore the mount you unlinked before the upgrade. See "Reporting Engine: Add Additional Space for Large Reports" in the *Reporting Engine Configuration Guide* for instructions.

Respond

Task 27 - Restore Respond Service Custom Keys

In 10.6.6.x, if you added custom keys for use in the **groupBy** clause, the `alert_rules.json` file was modified. The `alert_rules.json` file contains aggregation rule schema. RSA moved the `alert_rules.json` file to the following new location:
`/var/lib/netwitness/respond-server/scripts`

1. Copy the custom keys from `/opt/rsa/im/fields/alert_rules.json` file in the backup directory.
   This directory is where the `alert_rules.json` file is restored from the 10.6.6.x backup.
2. Go to the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` in 11.3.
   This is the new file for 11.3.
3. Edit the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` to include the custom keys you copied in step one.

Task 28 - Restore Customized Respond Service Normalization Scripts

RSA re-factored the Respond service normalization scripts in 11.3 and moved them to the following new location:
`/var/lib/netwitness/respond-server/scripts`
If you customized these scripts in 10.6.6.x, you must:

1. Go to the to the `/opt/rsa/im/scripts` directory.
   This directory is where the following Respond service normalization scripts are restored from the 10.6.6.x backup.
   `data_privacy_map.js`
   `normalize_alerts.js`
   `normalize_core_alerts.js`
   `normalize_ecat_alerts.js`
   `normalize_ma_alerts.js`
   `normalize_wtd_alerts.js`
   `utils.js`
2. Copy any custom logic from the 10.6.6.x scripts.
3. Go to the `/var/lib/netwitness/respond-server/scripts` directory.
   This directory is where NetWitness Platform 11.3 stores the re-factored scripts.
4. Edit the new scripts to include the custom logic you copied in step 2 from the 10.6.6.x scripts.
5. Copy any custom logic from `/opt/rsa/im/fields/alert_rules.json` file.
   The `alert_rules.json` file contains aggregation rule schema.

Task 29 - Add Respond Notification Settings for Custom Roles

Respond Notification Setting permissions enable Respond Administrators, Data Privacy Officers, and SOC Managers to access Respond Notification Settings (**CONFIGURE** > **Respond Notifications**), which enable them to send email notifications when incidents are created or updated.

To access these settings, you will need to add additional permissions to your existing built-in NetWitness Platform user roles. You will also need to add permissions to your custom roles. See the "Respond Notification Settings Permissions" topic in the *NetWitness Respond Configuration Guide*. For detailed information about user permissions, see the *System Security and User Management Guide*.

Task 30 - Manually Configure Respond Notification Settings

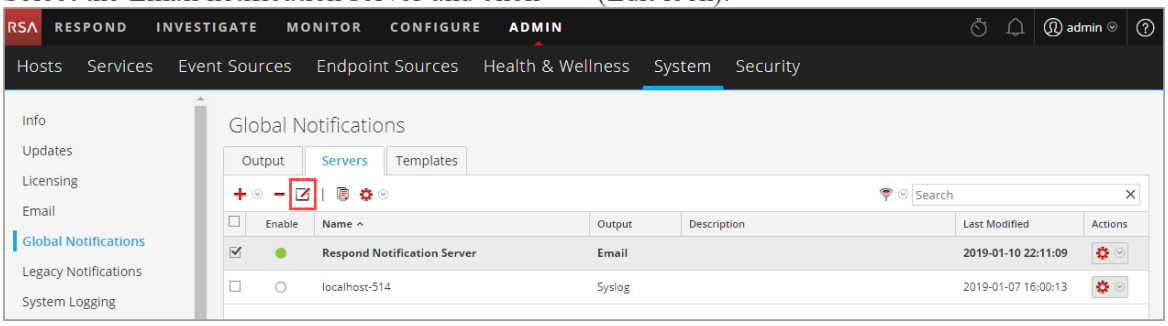
The Incident Management notification settings in NetWitness Platform 10.6.6.x are different from the Respond notification settings available in 11.3, so your existing 10.6.6.x settings will not migrate to 11.3.

NetWitness Respond notification settings enable email notifications to be sent to SOC Managers and the Analyst assigned to an incident when an incident is created or updated.

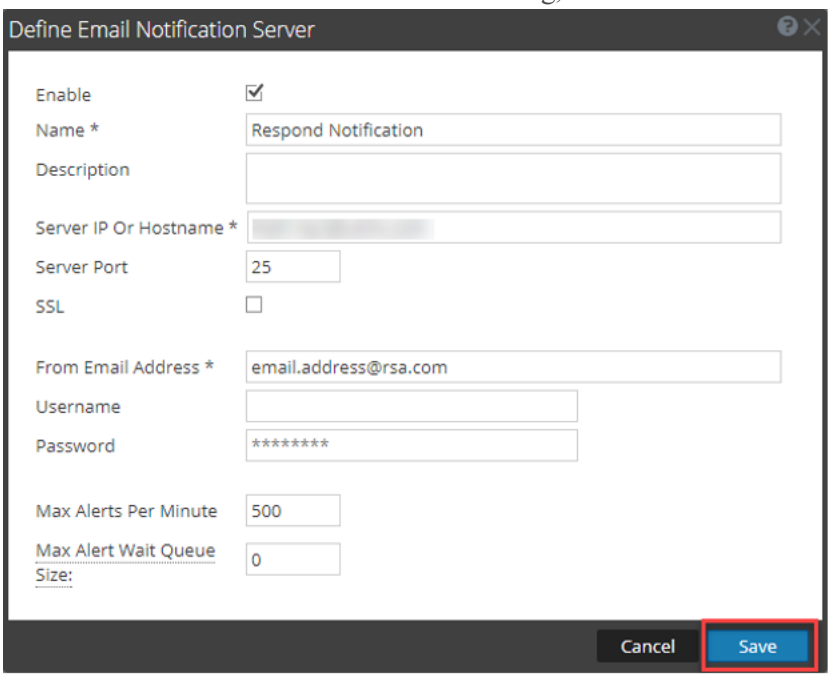
To manually configure the Respond Notification Settings, go to **CONFIGURE** > **Respond Notifications.** See the "Configure Respond Email Notification Settings" procedure in the *NetWitness Respond Configuration Guide*.

Notification Servers from 10.6.6.x will not display in the Email Server drop-down list. The email servers must be edited and saved in the Global Notification Servers panel (**ADMIN** > **System** > **Global Notifications** > **Server** tab).

1. Log in to **NetWitness Platform** and go to **CONFIGURE** > **Respond Notifications**.
   The Respond Notifications Settings view is displayed. Notice that the email notification servers do not appear in the EMAIL SERVER drop-down list.
2. Click the **Email Server Settings** link.
   You will see the Global Notifications panel.
3. Click the **Servers** tab.
4. For each of your email notification servers:
   a. Select the Email notification server and click (Edit icon).



b. In the Define Email Notification Server dialog, click **Save**.



5. Go back to **CONFIGURE** > **Respond Notifications**. Your servers will appear in the **EMAIL SERVER** drop-down list.
   Custom Incident Management notification templates cannot be migrated to 11.3. No custom templates are supported in 11.3.

Task 31 - Update Default Incident Rule Group By Values

The following default incident rules now use “Source IP Address” as the Group By value.

- **High Risk Alerts: Reporting Engine**
- **High Risk Alerts: Malware Analysis**
- **High Risk Alerts: ESA**

To update the above default rules, change the Group By value to “Source IP Address.”

Note: If you already updated the Group By values for the default rules listed above in 11.1 or later, you do not have to do it again.

The **High Risk Alerts: NetWitness Endpoint** default incident rule now uses Host Name as the Group By value. If you have NetWitness Endpoint you can use this rule. Change the Group By value of the default NetWitness Endpoint rule to "Host Name."

1. In the **NetWitness Platform** menu, select **CONFIGURE** > **Incident Rules** and click on the rule that you want to update in the **Name** column. The **Incident Rule Details** view is displayed.
2. In the **GROUP BY** field, select the new Group By value from the drop-down list.
3. Click **Save** to update the rule.

To aggregate NetWitness Endpoint alerts based on the File Hash, complete the following steps to clone the default NetWitness Endpoint incident rule and change the Group By value.

1. In the **NetWitness Platform** menu, select **CONFIGURE** > **Incident Rules**. The **Incident Rules List** view is displayed.
2. Select the **High Risk Alerts: NetWitness Endpoint** default incident rule and click **Clone**. You will receive a message that you successfully cloned the selected rule.
3. Change the Name of the rule to an appropriate name, such as High Risk Alerts: NetWitness Endpoint File hash.
4. In the **GROUP BY** field, remove the previous Group By value and add **File MD5 Hash**. It is important that File MD5 Hash is the only Group By value listed.
5. Click **Save** to create the rule.

For detailed information, see the *Respond Configuration Guide*.

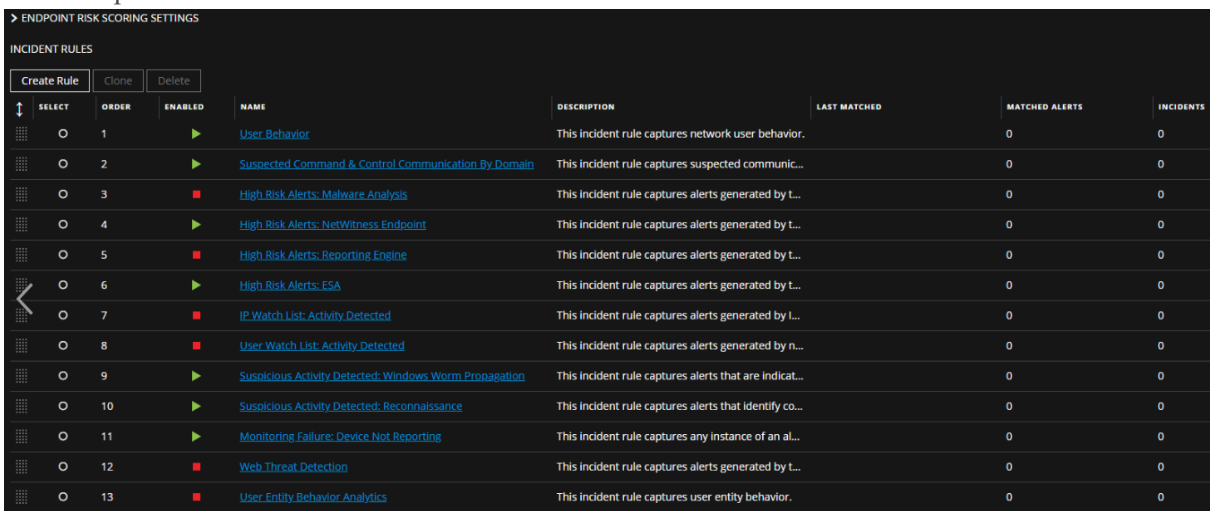
Task 32 - Add Group By Field to Incident Rules

The **Group By** field is not required in 10.6.6, but it is required in 11.3. After you upgrade to

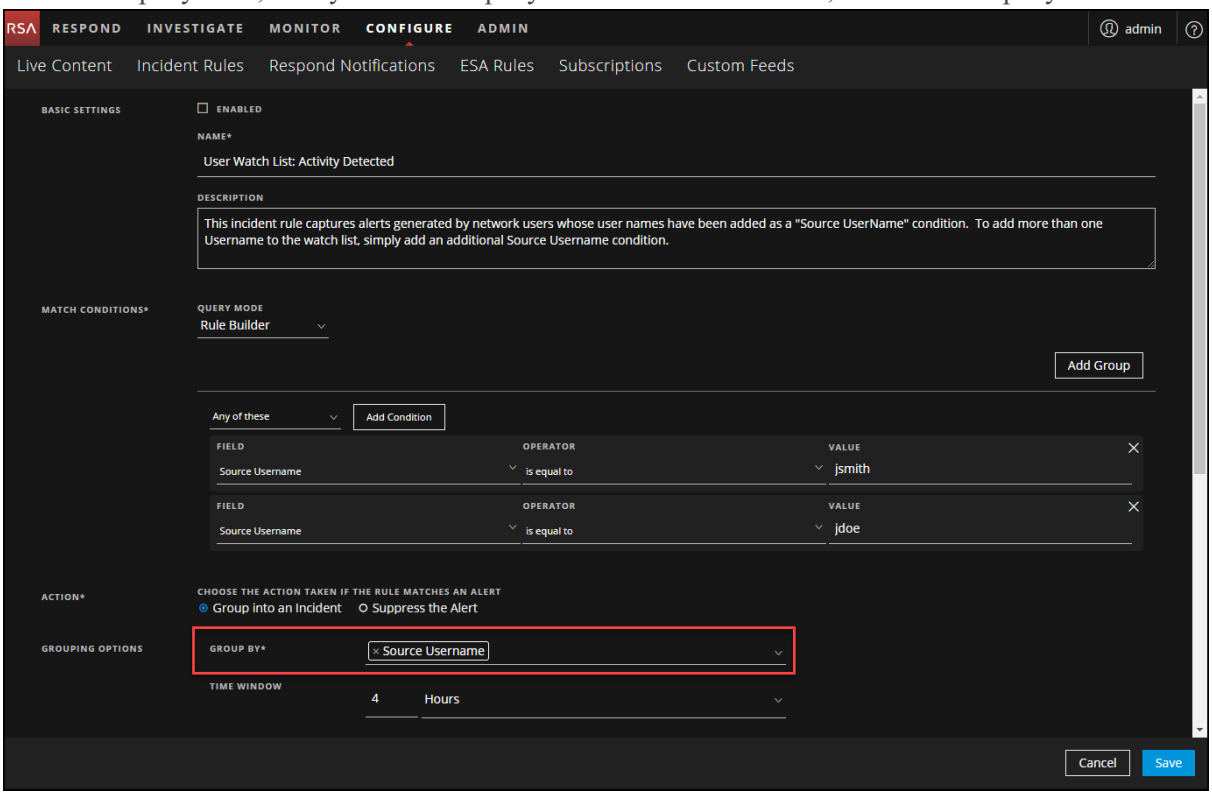
11.3, some incident rules will not have a **Group By** field, so you must add them to the rules or the rules will not work and they will not create incidents.

Complete the following steps for each incident rule:

1. Log in to NetWitness Platform.
2. Go to **CONFIGURE** > **Incident Rules** and click the link in the Name column for the rule that you want to update.



3. In the Group By field, verify that a Group By value is selected. If not, select a Group By value.



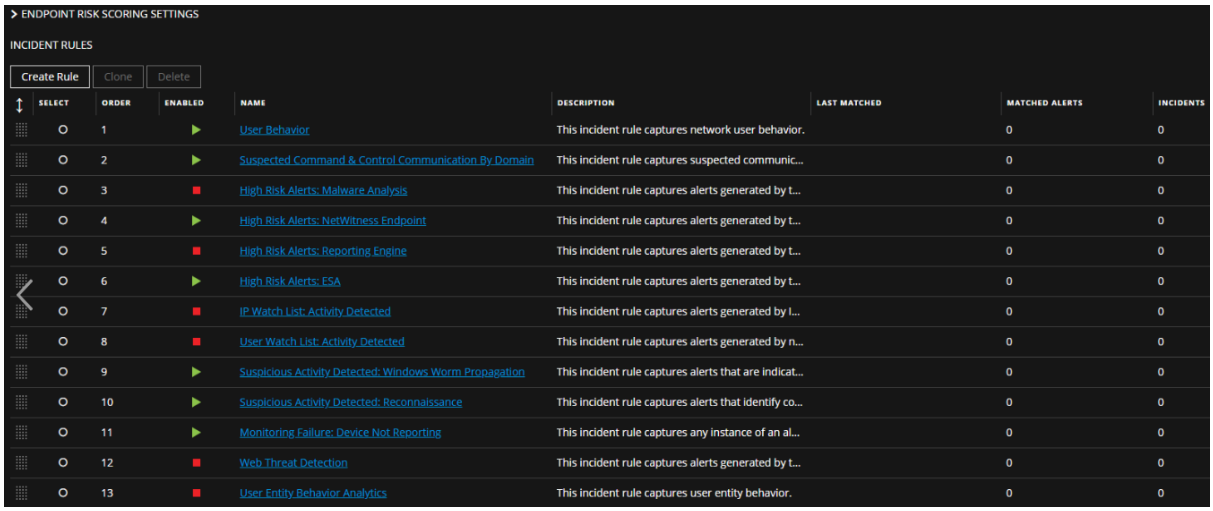
4. Click **Save** to update the rule.
   For information about incident rules, see the *NetWitness Respond Configuration Guide*.

Task 33 - Update Incident Rules Identified in the Domain Matching Conditions Upgrade Preparation Task

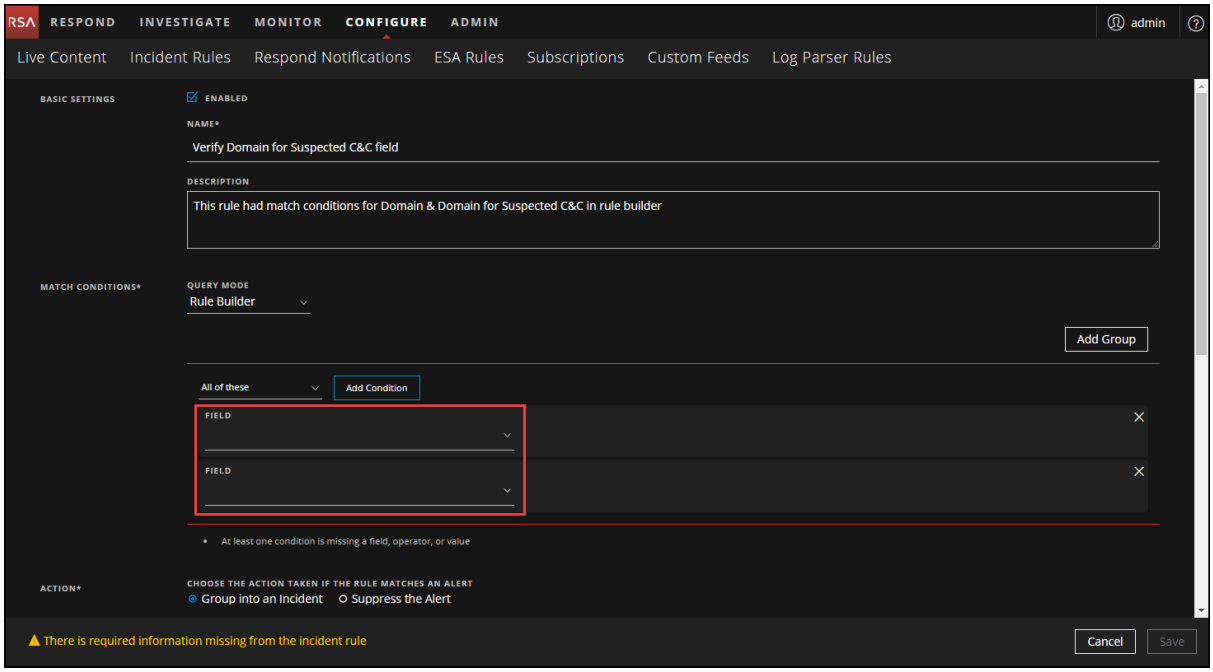
Modify the incident rules that you identified in the Task 4 - Check Aggregation Rules Match Conditions for "Domain" or "Domain for Suspected C&C" upgrade preparation task, which contained Domain or Domain for Suspected C&C in the matching conditions in rule builder.

For each rule that you previously identified:

1. Log in to **NetWitness Platform**, go to **CONFIGURE** > **Incident Rules** and click the link in the Name column for the rule that you want to update.



2. In the **Match Conditions** section, in the blank fields, select **Domain** and **Domain for Suspected CC** in the drop-down list and then select the conditions that you previously identified in the pre-upgrade tasks.



3. Click **Save** to update the rule.
   For information about incident rules, see the *NetWitness Respond Configuration Guide*.

Warehouse

Task 34 - Restore `keytab` Files, Mount NFS, Install Service

1. Restore the `keytab` files from `<backup-path>/restore` directory.
2. Restore the Kerberos Realm Configuration from the `<backup-path>/restore/etc/krb5.conf` into `/etc/krb5.conf`.
3. (Conditional) If you perform the upgrade from a Non - FIPS environment and the `isCheckValidationRequired` parameter is not enabled in the destination, to configure the SFTP destination:
   a. SSH to the Warehouse Connector host and submit the following commands:
      ```
      cd /root/.ssh/
       mv id_dsa id_dsa.old
      OWB_FORCE_FIPS_MODE_OFF=1 openssl pkcs8 -topk8 -v2 des3 -in id_dsa.old -
      out id_dsa
      ```
      You are prompted for the pass phrase.
   b. Enter the Encryption password.
   c. Run the following command.
      ```
      chmod 600 id_dsa
      ```
4. Install the Warehouse Connector.
   See the *Warehouse Connector Configuration Guide* for instructions.

Task 35 - Refresh Warehouse Connector Lockbox and Start Stream

Note: If the streams have auto start turned on in 10.6.6.x, there will be a small delay before you will see the Warehouse Connector service in the NetWitness Platform User Interface.

1. Refresh the Lockbox of Warehouse Connector.
2. SSH to the Warehouse Connector and log in with root credentials.
3. Restart the service.
   ```
   service nwwarehouseconnector restart
   ```
4. (Conditional) If the auto start was not enabled in 10.6.6.x, you must start the stream manually after the service restarts.

Task 36 - Update Hive Version

After you update to 11.3, you must update to the Hive version that is compatible with the 11.3 Warehouse (either Hive version 0.12 or version 1.0).

- Hive Version 0.12
  SSH to the NW Server and run the following command.
  ```
  rpm -ivh rsa-nw-hive-jdbc-0.12.0-1.x86_64.rpm
  ```

- Hive Version 1.0
  SSH to the NW Server and run the following command.
  `rpm -ivh rsa-nw-hive-jdbc-1.0.0-1.x86_64.rpm`

RSA Archer Cyber Incident & Breach Response

Task 37 - Reconfigure RSA Archer Cyber Incident & Breach Response Integration

For information on how to reconfigure RSA Archer Cyber Incident & Breach Response for Event Stream Analysis, Reporting Engine, and Respond, see *RSA Archer Integration Guide*.

RSA NetWitness® Endpoint

Task 38 - Reconfigure Endpoint Alerts Via Message Bus

1. On the NetWitness Endpoint Server, modify the virtual host configuration in the `C:\Program Files\RSA\ECAT\Server\ConsoleServer.exe` file to reflect the following configuration.
   `<add key="IMVirtualHost" value="/rsa/system" />`

   Note: In NetWitness Platform 11.3, the virtual host is `/rsa/system`. For 10.6.6.x and earlier versions, the virtual host is `/rsa/sa`.
2. Restart the API Server and Console Server.
3. SSH to the NW Server and log in with `root` credentials.
4. Submit the following command to add all certificates to the truststore.
   `orchestration-cli-client --update-admin-node`
5. Submit the following command to restart the RabbitMQ server.
   `systemctl restart rabbitmq-server`
   The NetWitness Endpoint account should automatically be available on RabbitMQ.
6. Import the `/etc/pki/nw/ca/nwca-cert.pem` and `/etc/pki/nw/ca/ssca-cert.pem` files from the NW Server and add them to the Trusted Root Certification stores in the Endpoint Server.

Task 39 - Reconfigure Recurring Feed Configured from Legacy Endpoint Because Java Version Changed

You must reconfigure the Legacy Endpoint recurring feed due to the change in Java version. Complete the following step to fix this problem.

- Import the NetWitness Endpoint CA certificate into the NetWitness Platform Trusted store as described in "Export the NetWitness Endpoint SSL Certificate" under the "Configure Contextual Data from Endpoint via Recurring Feed" topic in the *RSA NetWitness Endpoint Integration Guide* to import the certificate.

(Optional) Task 40 - Install Endpoint Log Hybrid and Endpoint Agents

See:

RSA NetWitness Platform 11.3 Physical Host Installation Guide for instructions for installation on a physical host.

RSA NetWitness Platform 11.3 Virtual Host Installation Guide for instructions for installation on a virtual host.

RSA NetWitness® UEBA

Task 41 - Install NetWitness UEBA

NetWitness UEBA is new a new feature as of NetWitness Platform 11.3.

See:

RSA NetWitness Platform 11.3 Physical Host Installation Guide for instructions for installation on a physical host.

RSA NetWitness Platform 11.3 Virtual Host Installation Guide for instructions for installation on a virtual host.

RSA NetWitness UEBA User Guide for information about NetWitness UEBA.

NetWitness Platform Integrations

(Conditional) Task 42 - For Integrations with Web Threat Detection, RSA Archer® Cyber Incident & Breach Response or NetWitness Endpoint.

If you integrate with Web Threat Detection, Archer Cyber Incident & Breach Response or NetWitness Endpoint, you must configure Mutually Authenticated SSL on each integrated system so that the application can authenticate itself when connecting to the RabbitMQ message bus.

Note: Use the RabbitMQ usernames and passwords that were obtained when you backed up your 10.6.6.x data (see Backup Instructions).

1. Create a user on the host system that is integrating with NetWitness Platform by logging into the host and running the following `rabbitmqctl` command.
   ```
   > rabbitmqctl add_user <username> <password>
   ```
2. Set permissions for users by running the following command (use the username from step 1).
   ```
   > rabbitmqctl set_permissions -p /rsa/system <username> ".*", ".*", ".*"
   ```
   For example:
   ```
   > rabbitmqctl set_permissions -p /rsa/system wtd-incidents ".*", ".*", ".*"
   ```

Other

Task 43 - Remap Virtual NW Server License to 10.6.6.x MAC Address

If you are upgrading a Security Analytics server running on a virtual machine, change the 11.3 NW Server virtual host to the 10.6.6.x MAC address to retain licensing. Refer to "Licensing: Step 1. Register the NetWitness Server" in the *RSA NetWitness Platform Licensing Management Guide* for instructions on remapping a license to a new MAC address." Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Appendix A. Troubleshooting

This section describes solutions to problems that you may encounter during installations and upgrades. In most cases, NetWitness Platform creates log messages when it encounters these problems.

Note: If you cannot resolve an upgrade issue using the following troubleshooting solutions, contact Customer Support (https://community.rsa.com/docs/DOC-1294).

This section has troubleshooting documentation for the following services, features, and processes.

- Command Line Interface (CLI)
- Backup Script
- Event Stream Analysis
- Concentrator Service
- Log Collector Service (`nwlogcollector`)
- Orchestration
- NW Server
- Reporting Engine
- NetWitness UEBA

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Command Line Interface (CLI)

Error Message	Command Line Interface (CLI) displays: "Orchestration failed." `Mixlib::ShellOut::ShellCommandFailed: Command execution failed. STDOUT/STDERR suppressed for sensitive resource in/var/log/netwitness/config-management/chef-solo.log`
Cause	Entered the wrong `deploy_admin` password in `nwsetup-tui`.
Solution	Retrieve your `deploy_admin` password password. 1. SSH to the NW Server host. `security-cli-client --get-config-prop --prop-hierarchy nw.security-client --prop-name deployment.password` SSH to the host that failed. 2. Run the `nwsetup-tui` again using correct `deploy_admin` password.

Error Message	`ERROR com.rsa.smc.sa.admin.web.controller.ajax.health. AlarmsController - Cannot connect to System Management Service`
Cause	NetWitness Platform sees the Service Management Service (SMS) as down after successful upgrade even though the service is running.
Solution	Restart SMS service. `systemctl restart rsa-sms`

Error Message	You receive a message in the User Interface to reboot the host after you update and reboot the host offline.
Cause	You cannot use CLI to reboot the host. You must use the User Interface.
Solution	Reboot the host in the Host View in the User Interface.

Backup (`nw-backup` script)

Error Message	`WARNING: Incorrect ESA Mongo admin password for host <hostname>.`
Cause	ESA Mongo admin password contains special characters (for example, '!@#$%^qwerty').
Solution	Change the ESA Mongo admin password back to the original default of 'netwitness' before running backup.

Error	Backup errors caused by the `immutable` attribute setting. Here is an example of an error that can be displayed: Cause	If you have any files that have the immutable flag set (to keep the Puppet process from overwriting a customized file), the file will not be included in the backup process and an error will be generated.
Solution	On the host that contains the files with the immutable flag set, run the following command to remove the immutable setting from the files: `chattr -i <filename>`

Error	Error creating Network Configuration Information file due to duplicate or bad entries in primary network configuration file: `/etc/sysconfig/network-scripts/ifcfg-em1` Verify contents of `/var/netwitness/logdecoder/packetdb/nw-backup/2018-02-23/S5-BROK-36-10.25.53.36-network.info.txt`
Cause	There are incorrect or duplicate entries for any one of the following fields: DEVICE, BOOTPROTO, IPADDR, NETMASK or GATEWAY, that were found from reading the primary Ethernet interface configuration file from the host being backed up.

Solution	Manually create a file at the backup location on the external backup server, as well as the backup location local to the host where other backups have been staged. The file name should be of the format `<hostname>-<hostip>-network.info.txt`, and should contain the following entries:
	`DEVICE=<devicename> ; # from the host's primary ethernet interface config file`
	`BOOTPROTO=<bootprotocol> ; # from the host's primary ethernet interface config file`
	`IPADDR=<value> ; # from the host's primary ethernet interface config file`
	`NETMASK=<value> ; # from the host's primary ethernet interface config file`
	`GATEWAY=<value> ; # from the host's primary ethernet interface config file`
	`search <value> ; # from the host's /etc/resolv.conf file`
	`nameserver <value> ; # from the host's /etc/resolv.conf file`

Event Stream Analysis

- For ESA Correlation troubleshooting information, see the *Alerting with ESA Correlation Rules User Guide*.
- For ESA Analytics troubleshooting information, see the *Automated Threat Detection Configuration Guide*.

Concentrator Service

Problem	After you upgrade to 11.3.0.0, pivot to navigate query fails if the Concentrator service version is 10.6.x.
Cause	Pivot to Navigate query fails as it contains meta entities and 10.6.x Concentrator service does not support meta entities.
Solution	You must edit the query and remove meta entities. For example, if query is for user then remove the `user.all` meta entity and re-run the query.

Log Collector Service (`nwlogcollector`)

Log Collector logs are posted to `/var/log/install/nwlogcollector_install.log` on the host running the `nwlogcollector` service.

Error Message	`<timestamp>.NwLogCollector_PostInstall: Lockbox Status : Failed to open lockbox: The lockbox stable value threshold was not met because the system fingerprint has changed. To reset the system fingerprint, open the lockbox using the passphrase.`
Cause	The Log Collector Lockbox failed to open after the update.
Solution	Log in to NetWitness Platform and reset the system fingerprint by resetting the stable system value password for the Lockbox as described in the "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*.

Error Message	`<timestamp> NwLogCollector_PostInstall: Lockbox Status : Not Found`
Cause	The Log Collector Lockbox is not configured after the update.
Solution	If you use a Log Collector Lockbox, log in to NetWitness Platform and configure the Lockbox as described in the "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*.

Error Message	`<timestamp>: NwLogCollector_PostInstall: Lockbox Status : Lockbox maintenance required: The lockbox stable value threshold requires resetting. To reset the system fingerprint, select Reset Stable System Value on the settings page of the Log Collector.`
Cause	You need to reset the stable value threshold field for the Log Collector Lockbox.
Solution	Log in to NetWitness Platform and reset the stable system value password for the Lockbox as described in "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*.

Problem	You have prepared a Log Collector for upgrade and no longer want to upgrade at this time.
Cause	Delay in upgrade.
Solution	Use the following command string to revert a Log Collector that has been prepared for upgrade back to resume normal operation. `# /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --revert`

NW Server

These logs are posted to `/var/netwitness/uax/logs/sa.log` on the NW Server Host.

Problem	After upgrade, you notice that Audit logs are not getting forwarded to the configured Global Audit Setup; or, The following message seen in the `sa.log`. `Syslog Configuration migration failed. Restart jetty service to fix this issue`
Cause	NW Server Global Audit setup migration failed to migrate from 10.6.6.x to 11.3.0.0.
Solution	1. SSH to the NW Server. 2. Submit the following command. `orchestration-cli-client --update-admin-node`

Orchestration

The orchestration server logs are posted to `/var/log/netwitness/orchestration-server/orchestration-server.log` on the NW Server Host.

Problem	1. Tried to upgrade a non-NW Server host and it failed. 2. Retried the upgrade for this host and it failed again. You will see the following message in the `orchestration-server.log`. `"'file' _virtual_ returned False: cannot import name HASHES""`
Cause	Salt minion may have been upgraded and never restarted on failed non-NW Server host

Solution	1. SSH to the non-NW Server host that failed to upgrade.
	2. Submit the following commands.
	`systemctl unmask salt-minion`
	`systemctl restart salt-minion`
	3. Retry the upgrade of the non-NW Server host.

Reporting Engine Service

Reporting Engine Update logs are posted to to/var/log/re_install.log file on the host running the Reporting Engine service.

Error Message	<timestamp> : Available free space in /var/netwitness/re-server/rsa/soc/reporting-engine [><existing-GB] is less than the required space [<required-GB>]
Cause	Update of the Reporting Engine failed because you do not have enough disk space.
Solution	Free up the disk space to accommodate the required space shown in the log message. See the "Add Additional Space for Large Reports" topic in the *Reporting Engine Configuration Guide* for instructions on how to free up disk space.

NetWitness UEBA

Problem	The User Interface is not accessible.
Cause	You have more than one NetWitness UEBA service existing in your NetWitness deployment and you can only have NetWitness UEBA service in your deployment.

Solution	Complete the following steps to remove the extra NetWitness UEBA service.
	1. SSH to NW Server and run the following commands to query the list of installed NetWitness UEBA services.
	`# orchestration-cli-client --list-services|grep presidio-airflow`
	`... Service: ID=7e682892-b913-4dee-ac84-ca2438e522bf, NAME=presidio-airflow, HOST=xxx.xxx.xxx.xxx:null, TLS=true`
	`... Service: ID=3ba35fbe-7220-4e26-a2ad-9e14ab5e9e15, NAME=presidio-airflow, HOST=xxx.xxx.xxx.xxx:null, TLS=true`
	2. From the list of services, determine which instance of the `presidio-airflow` service should be removed (by looking at the host addresses).
	3. Run the following command to remove the extra service from Orchestration (use the matching service ID from the list of services):
	`# orchestration-cli-client --remove-service --id <ID-for-presidio-airflow-form-previous-output>`
	4. Run the following command to update node 0 to restore NGINX:
	`# orchestration-cli-client --update-admin-node`
	5. Log in to NetWitness Platform, go to **ADMIN** > **Hosts**, and remove the extra NetWitness UEBA host.

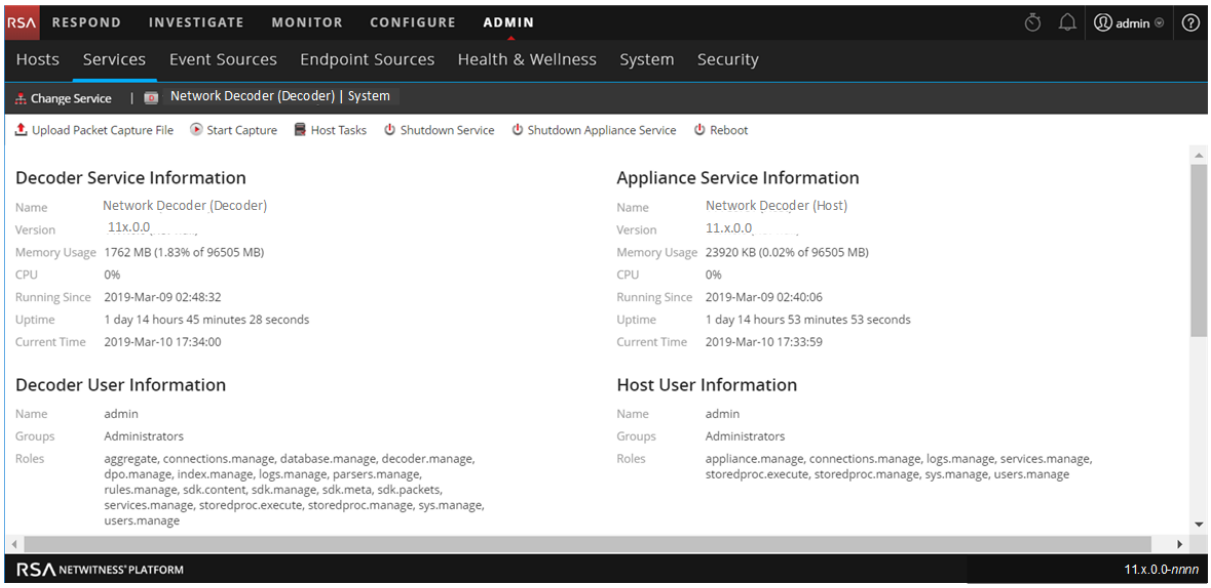
Appendix B. Stopping and Restarting Data Capture and Aggregation

RSA recommends that you stop network and log capture and aggregation before upgrading a Decoder, Concentrator, and Broker host to 11.3.0.0. If you do this, you must restart network and log capture and aggregation after updating these hosts.

Stop Data Capture and Aggregation

Stop Network Capture

1. Log in to NetWitness Platform and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Decoder** service.



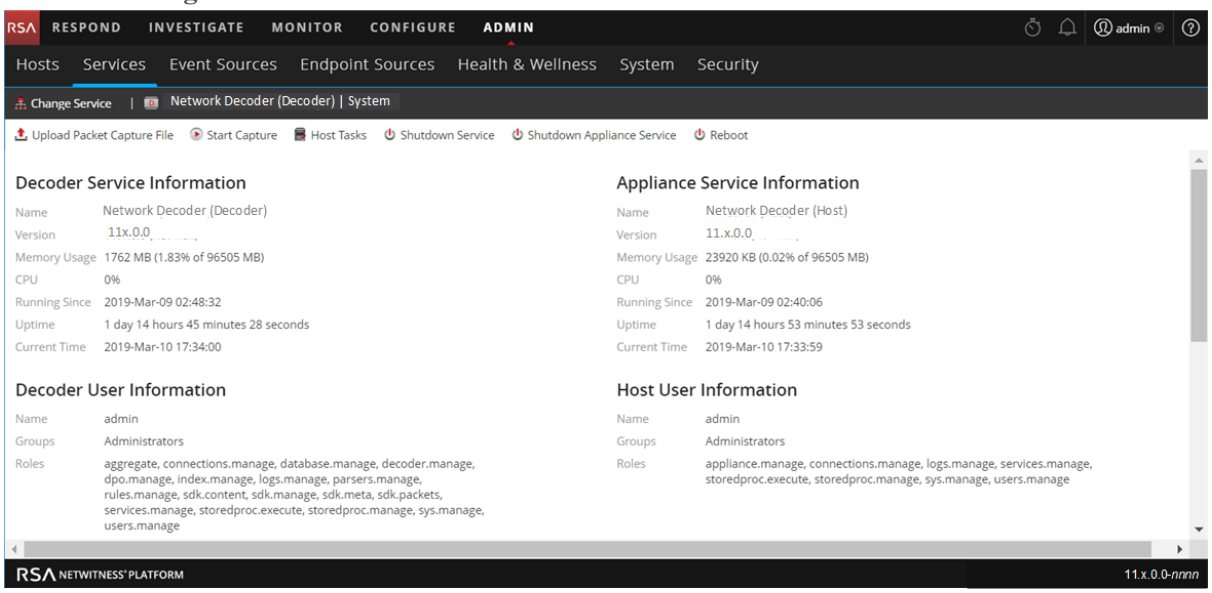
3. Under (actions), select **View** > **System**.
4. In the toolbar, click

.

Stop Log Capture

1. Log in to NetWitness Platform and go to **ADMIN** > **Services**.
   The Services view is displayed.

2. Select each **Log Decoder** service.



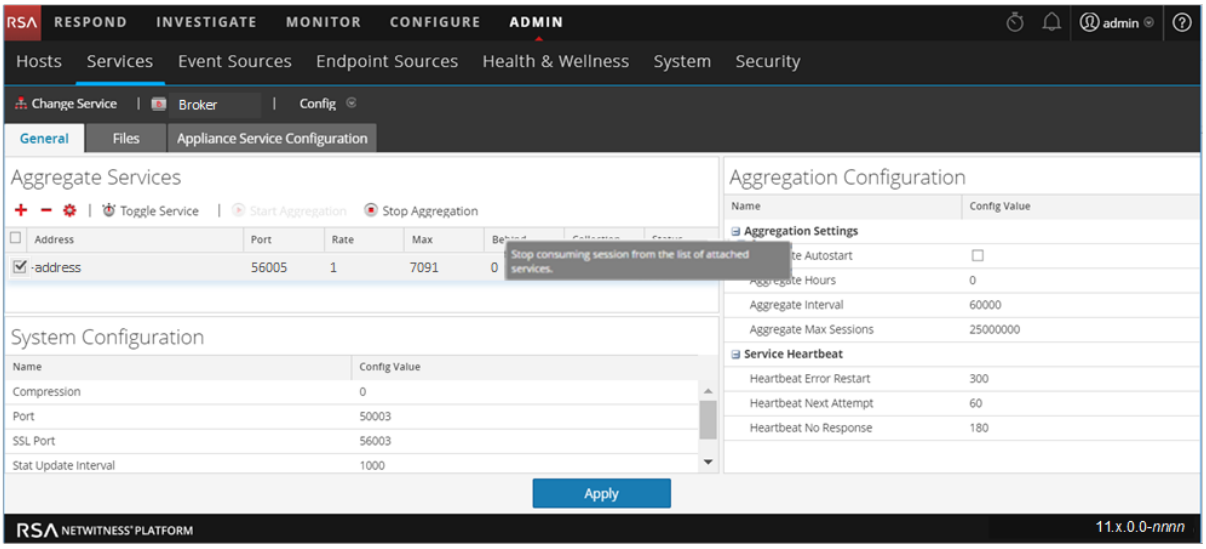
3. Under (actions), select **View** > **System**.

4. In the toolbar, click

.

Stop Aggregation

1. Log in to NetWitness Platform and go to **ADMIN** > **Services**.
2. Select the **Broker** service.
3. Under (actions), select **View** > **Config**.
4. The **General** tab is displayed.



5. Under **Aggregated Services** click 
.

Start Data Capture and Aggregation

Restart network and log capture and aggregation after updating to 11.3.0.0.

Start Network Capture

1. Log in to **NetWitness Platform** and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Decoder** service.
3. Under (actions), select **View** > **System**.
4. In the toolbar, click .

Start Log Capture

1. Log in to **NetWitness Platform** and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Log Decoder** service.
3. Under (actions), select **View** > **System**.
4. In the toolbar, click .

Start Aggregation

1. Log in to **NetWitness Platform** and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. For each Concentrator and Broker service.
   a. Select the service.
   b. Under (actions), select **View** > **Config**.
   c. In the toolbar, click .

Appendix C. Using iDRAC

Many customers have remote sites with limited physical access and limited bandwidth from the administrator's desktop. If this the case, you may want to use iDRAC with the ISO Image shared out from an NFS share that is local to the devices being upgraded or installed. This also gives you the ability to use an existing NetWitness device as the sharing host.

For example:

- You have a Concentrator and Decoder at a site in a remote geographic location.
- The bandwidth is relatively low to that site from the administrator's site.
- Shipping a USB stick and arranging to have person to go plug it into the boxes while you upgrade is not practical.

In this situation, you can:

1. Install the nfs-utils RPM.
2. Configure the NFS share.
3. Configure iDRAC to connect to that share.
   Make sure that you update your iDRAC firmware supported Windows and Linux operating systems. Download and run the Dell Update Packages for supported Windows and Linux operating systems from the Dell Support website at http://www.support.dell.com. For more information, see the Dell Update Package User's Guide available on the Dell Support website at http://topics-cdn.dell.com/pdf/dell-update-packages-v17.10.00_User's%20Guide_en-us.pdf.
4. Boot to the virtual media that contains the ISO file and continue with the upgrade.

Configure NFS Server - NFS Server config File

1. Install NFS and its common utilities using yum.
   ```
   yum install nfs-utils
   ```
2. Configure the NFS service to run at boot.
   ```
   chkconfig nfs on
   ```
3. Configure the rpcbind service to run at boot.
   This service is required by NFS and must be running before NFS can be started.
   ```
   chkconfig rpcbind on
   ```
4. Start the rpcbind service.
   ```
   service rpcbind start
   ```
5. Start the NFS service.
   ```
   service nfs start
   ```
6. Create a directory for our first export.
   ```
   mkdir /exports/files
   ```
7. Open the NFS exports file into a text editor.
   ```
   vi /etc/exports
   ```

8. To export the directory to everyone with read-only access, add the following line.
   `/exports/files *(ro)`
9. Save your changes and exit the editor.
   `:wq!`
10. Export the directory defined above.
    `exportfs -a`
11. Disable firewall rules while performing upgrades.
    `service iptables stop`
12. Copy install media that contains the ISO file to `/exports/files` directory.

Boot iDRAC to NFS Configuration

Note: You must verify that the iDRAC firmware is at least 1.57.57 for Series 4 (R620).

1. Log in to the iDRAC interface.
2. Attach media using Remote File Share.
   `<server ip>:/export/files/11.3.0.0.iso`
   For example: `10.10.10.10:/exports/files/rsa-11.3.0.0.1948.el7-usb.iso`
3. Click **Connect**.
4. Launch **Console**.
5. From the **next boot** menu, select **Virtual DVD/CD**.
6. Reboot the device.

Appendix D. Create External Repository

Complete the following procedure to set up an external repository (Repo).

Note: 1.) You need an unzip utility installed on the host to complete this procedure. 2.) You must know how to create a web server before you complete the following procedure.

1. Log in to the web server host.
2. Create a directory to host the NW repository (`netwitness-11.3.0.0.zip`), for example `ziprepo` under `web-root` of the web server. For example, if `/var/netwitness` is the `web-root`, submit the following command string.
   `mkdir -p /var/netwitness/<your-zip-file-repo>`
3. Create the 11.3.0.0 directory under `/var/netwitness/<your-zip-file-repo>`.
   `mkdir -p /var/netwitness/<your-zip-file-repo>/11.3.0.0`
4. Create the `OS` and `RSA` directories under `/var/netwitness/<your-zip-file-repo>/11.3.0.0`.
   `mkdir -p /var/netwitness/<your-zip-file-repo>/11.3.0.0/OS`
   `mkdir -p /var/netwitness/<your-zip-file-repo>/11.3.0.0/RSA`
5. Unzip the `netwitness-11.3.0.0.zip` file into the `/var/netwitness/<your-zip-file-repo>/11.3.0.0` directory.
   `unzip netwitness-11.3.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.3.0.0`
   Unzipping `netwitness-11.3.0.0.zip` results in two zip files (`OS-11.3.0.0.zip` and `RSA-11.3.0.0.zip`) and some other files.
6. Unzip the:
   a. `OS-11.3.0.0.zip` into the `/var/netwitness/<your-zip-file-repo>/11.3.0.0/OS` directory.
      `unzip /var/netwitness/<your-zip-file-repo>/11.3.0.0/OS-11.3.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.3.0.0/OS`
      The following example illustrates how the Operating System (OS) file structure will appear after

you unzip the file.

Parent Directory		-
GeoIP-1.5.0-11.el7.x86_64.rpm	20-Nov-2016 12:49	1.1M

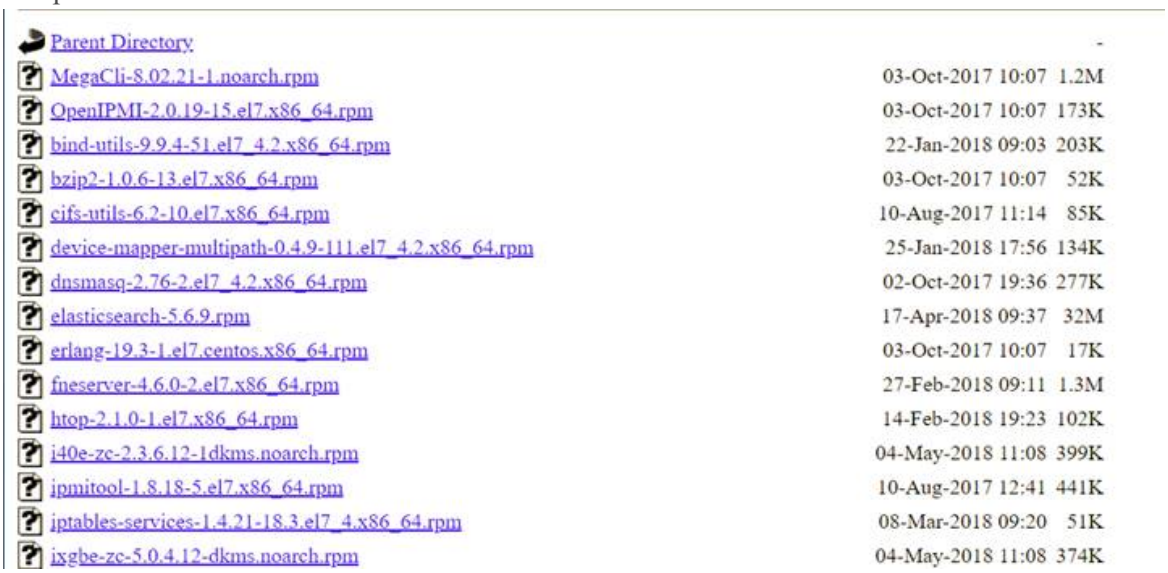
attr-2.4.46-12.el7.x86_64.rpm	03-Oct-2017 10:04	66K

b. `RSA-11.3.0.0.zip` into the `/var/netwitness/<your-zip-file-repo>/11.3.0.0/RSA` directory.
`unzip /var/netwitness/<your-zip-file-repo>/11.3.0.0/RSA-11.3.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.3.0.0/RSA`
The following example illustrates how the RSA version update file structure will appear after you unzip the file.



The external URL for the repo is `http://<web server IP address>/<your-zip-file-repo>`.

7. Use the `http://<web server IP address>/<your-zip-file-repo>` in response to **Enter the base URL of the external update repositories** prompt from NW 11.3.0.0 Setup program (`nwsetup-tui`) prompt.

Archiver Overview

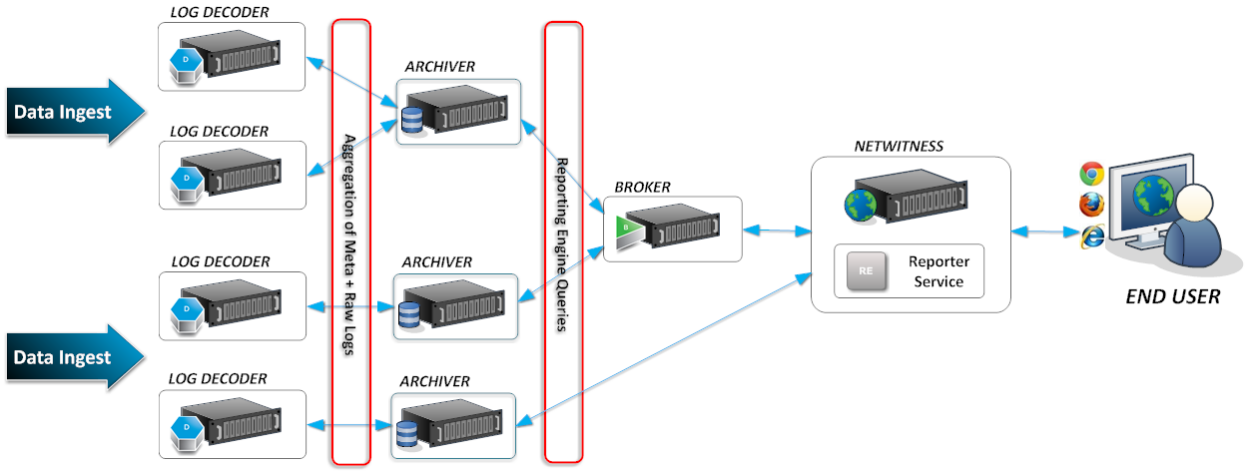
This guide provides detailed instructions on how to configure Archiver in your network, additional procedures that are used at other times, and reference materials that describe the user interface for configuring Archiver in your network.

The NetWitness Platform Archiver is an appliance that enables long-term log archiving by indexing and compressing log data and sending it to Archiving storage. The Archiving storage is then optimized for long-term data retention and compliance reporting.

Archiver stores raw logs and log meta from Log Decoders for long-term retention and it uses Direct-Attached Capacity (DAC) for storage.

Note: Raw packet and packet meta are not stored in the Archiver.

The following figure depicts the architecture of a NetWitness Platform network that implements the Archiver.



Configuring an Archiver

The NetWitness Platform Archiver is an appliance that enables long-term log archiving by indexing and compressing log data and sending it to Archiving storage. The Archiving storage is then optimized for long-term data retention and compliance reporting.

Archiver stores raw logs and log meta from Log Decoders for long-term retention and it uses Direct-Attached Capacity (DAC) for storage.

Note: Raw packet and packet meta are not stored in the Archiver.

Prerequisites

Ensure that you have:

- Installed the Archiver host in your network environment.
- Installed and configured Log Decoder version 11.2 in your network environment.

If you want to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them, refer to **Group Aggregation** in the *Deployment Guide*.

Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver.

The following table describes the basic steps for configuring an Archiver.The tasks must be completed in the sequence they are given.

Configuration Step	Description
Edit the Archiver Service	Provides information on how to add an Archiver service to the Archiver host and apply a license to it.
Add Log Decoder as a Data Source to Archiver	Provides instructions on how to add a Log Decoder to an Archiver.
Configure Archiver Storage and Log Retention	Provides instructions on how to configure storage and log retention on an Archiver.

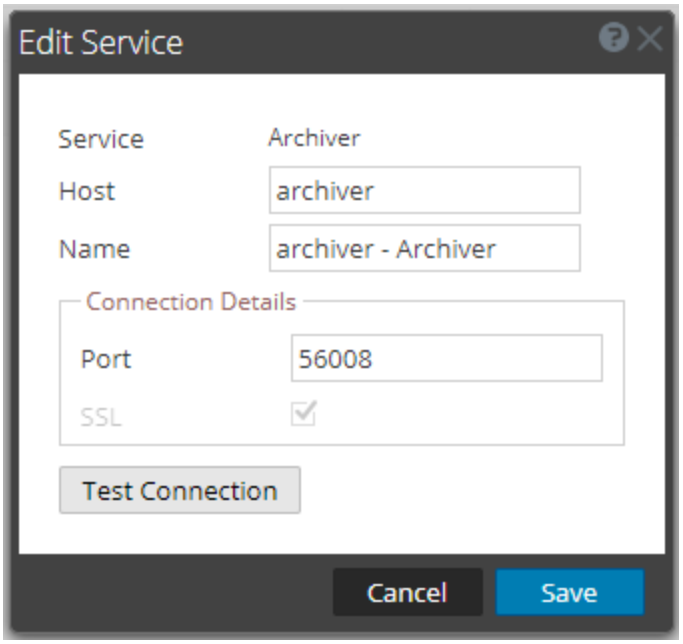
Configuration Step	Description
Add Archiver as a Data Source to Reporting Engine	Provides instructions on how to add an Archiver as a data source to Reporting Engine to generate reports for the data collected by an Archiver.
Configure Archiver Monitoring	Provides instructions on how to configure the alert mechanism related to Archiver storage.

Edit the Archiver Service

In order to add an Archiver service, ensure that you have installed an Archiver host on which you want to run the Archiver service. See "Step 1: Add or Update Host" topic in the *Host and Services Getting Started Guide* for the procedure that explains how to add a host.

Do the following steps to edit the Archiver service:

1. Go to **ADMIN > Services**.
   The Services panel is displayed.
2. Select an Archiver service and click in the **Services** panel toolbar.
   The Edit Service dialog is displayed.



3. Provide the following details.

Field	Description
Host	Select a host from the drop-down menu.
Name	Type a name for the service.
Port	Default port is 50008.
SSL	Select **SSL** if you want NetWitness Platform to communicate with the service using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates. **Note:** If you select SSL, ensure SSL is enabled in the System Configuration panel.

Field	Description
Username	(Optional) Type the username for the service.
Password	(Optional) Type the password for the service.
Entitle Service	Select if you want to apply the entitlements currently configured to this service. For more information, see "Entitlement Capability Implementation" topic in the *Licensing Guide*.

4. Click **Test Connection** to determine if NetWitness Platform connects to the service.
5. When the result is successful, click **Save**.

   The edited service is now displayed in the services panel.

   Note: If the test is unsuccessful, edit the service information and retry.

6. Apply license to the Archiver service.

   Refer to the "Synchronize NetWitness Server" topic in the *Licensing Guide* for details on the procedure to activate (apply a license to) the Archiver service.

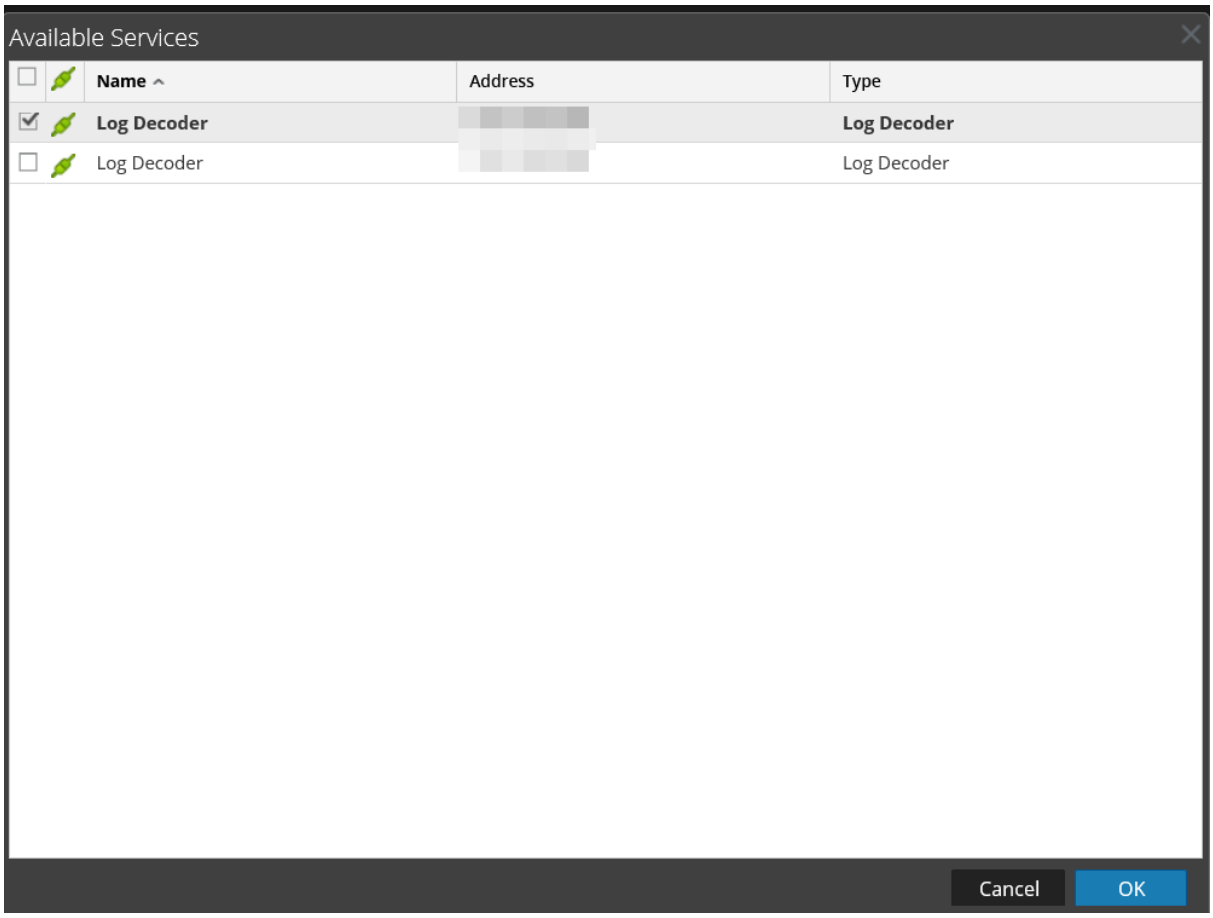
Add Log Decoder as a Data Source to Archiver

In order to add a Log Decoder as a data source to Archiver, you need to have installed the Archiver host in your network environment, installed and configured a Log Decoder in your network environment, and added the Archiver host to NetWitness Platform and make sure the Archiver service shows as active and licensed.

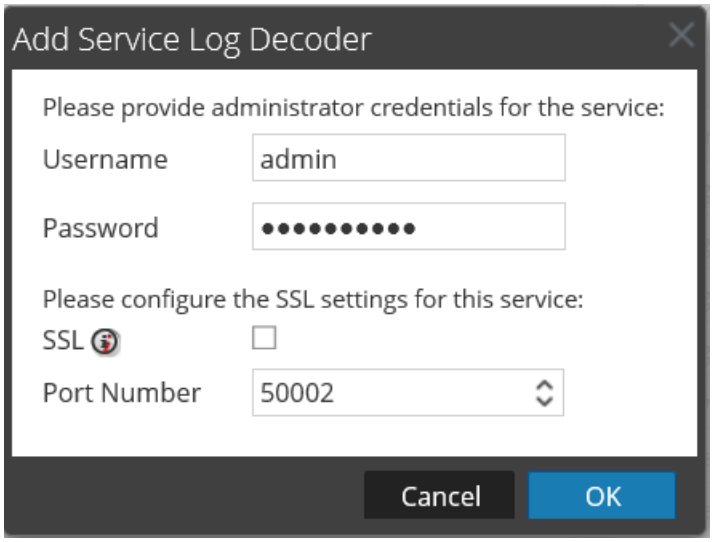
Add Log Decoder as a Data Source to Archiver

To add a Log Decoder as a data source to an Archiver:

1. Go to **ADMIN > Services**.
   The Services panel is displayed.
2. In the Services panel toolbar, click and select **Archiver**.
3. In the Actions column, click **> View > Config**.
   The Services Config view of Archiver is displayed.
4. On the **General** tab, in the **Aggregate Services** panel, click .
   The Available Services dialog is displayed.



5. Select the Log Decoder service to add as a data source to the Archiver and click **OK**.
6. If the Log Decoder is using the trust model, an Add Service dialog is displayed.



7. Type the username and password for the Log Decoder, and configure the SSL settings.

8. Click **OK**.
   The selected Log Decoder service is listed in the **Aggregate Services** panel.

Archiver Meta Settings Considerations

To maximize retention time, the meta items and index of the Archiver have been reduced (when compared to the Concentrator) to support common reporting needs. This means that, by default, you may not be able to run all of the reports you run on the Concentrator on the Archiver. You can view a list of the current meta and index items used by the Archiver in the following locations:

- **Explorer view**: The **/archiver/devices/<logdecoder>/config/options** path in the **metaInclude** field shows the current list of meta items.
- **Config view > Files tab**: The **index-archiver.xml** shows the default index configuration. The **index-archiver-custom.xml** shows any modifications.

The meta items and index of the Archiver can be customized to support customer specific reporting needs, however this will require additional storage, CPU resources, and Memory resources to support, and may impact retention time. As more meta items are added to the Archiver, the maximum aggregation rate will decrease, and the time to execute reports will increase.

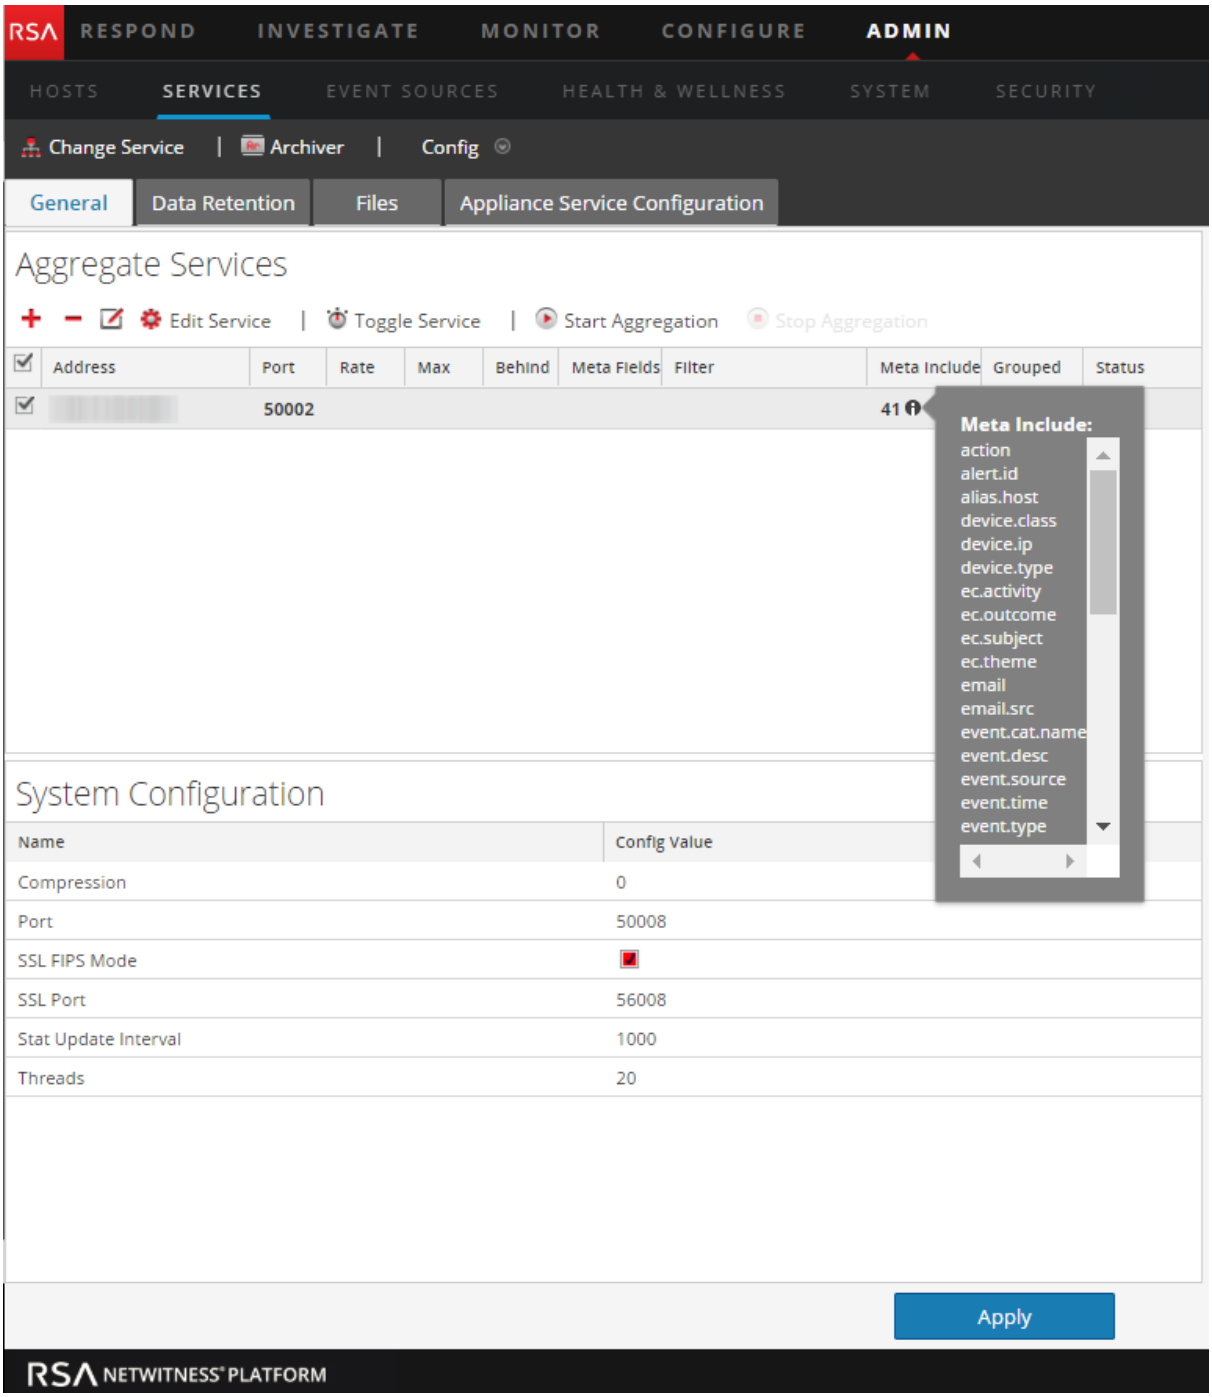
See (Optional) Configure Meta Filters for Aggregation and (Optional) Add Index Entries for Archiver Reporting for additional details.

(Optional) Configure Meta Filters for Aggregation

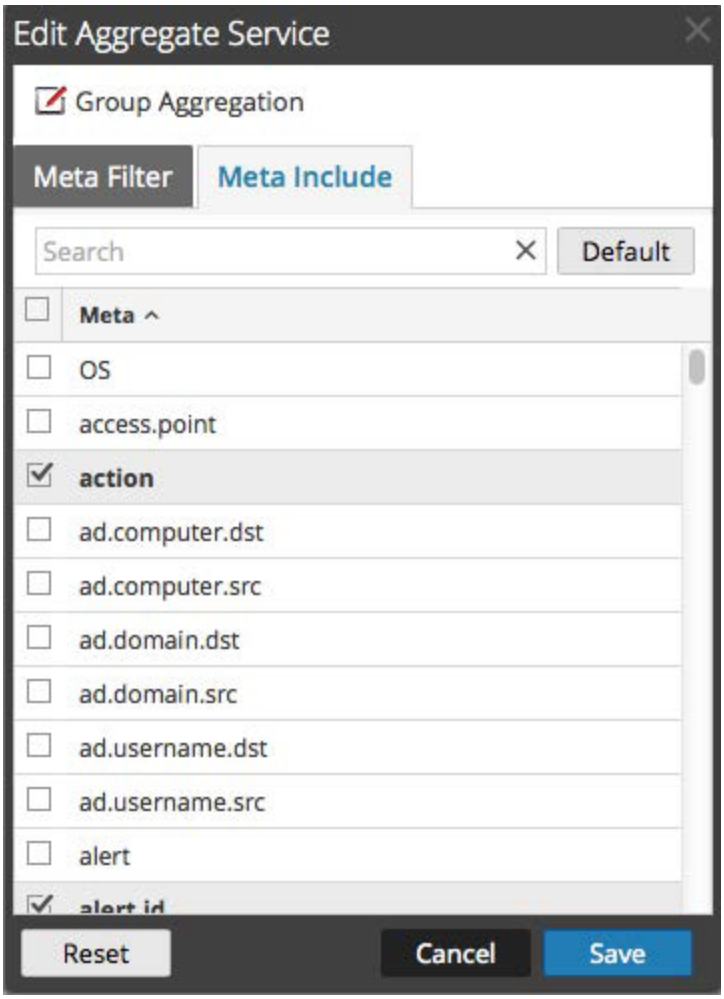
Follow this procedure to view and add additional meta items to the Archiver.

Caution: Adding meta or indexes will require additional storage, CPU resources, and Memory resources to support, and may impact retention time. As more meta items are added to the Archiver, the maximum aggregation rate will decrease, and the time to execute reports will increase.

1. To view the current meta items, in the **Aggregate Services** panel, select the Log Decoder service and click in the **Meta Include** field.



2. To add additional meta items, select the Log Decoder service and click .



3. In the Edit Aggregate Service dialog, select the meta items to include in the Meta Include list. For example, you may want to consider including ip.srcport, tcp.srcport, udp.srcport, msg, url, query, bytes, alias.host, ip.dst, ip.dstport, ip.src, tcp.dstport, megabytes, time, event.desc, and word.
4. Click **Save** and then click **Apply**.
5. See (Optional) Add Index Entries for Archiver Reporting below for information on how to index the additional meta keys.

(Optional) Add Index Entries for Archiver Reporting

Caution: Adding meta or indexes will require additional storage, CPU resources, and Memory resources to support, and may impact retention time. As more meta items are added to the Archiver, the maximum aggregation rate will decrease, and the time to execute reports will increase.

The Archiver's default index configuration only includes value indexes for these keys:

- time
- decoder source (did)

- destination user account (user.dst),
- alert ID (alert.id)
- device IP (device.ip)
- source IP address (ip.src)
- destination IP address (ip.dst)
- event description (event.desc)
- device class (device.class)
- medium
- object name (obj.name)
- word

For information on customizing this list, see "Index Customization" in the *Core Database Tuning Guide*.

Configure Archiver Storage and Log Retention

This topic provides instructions for Administrators to configure storage and log retention on an Archiver.

For compliance reasons, it is often necessary to retain some logs longer than other logs. Some logs are legally sensitive and cannot be retained for a long period of time. Other logs have a requirement to be retained for years. In addition to compliance, some logs are useful for historic forensics and other logs have little to no security or operationally relevant value and can be deleted after a short time.

Because business requirements vary, NetWitness Platform enables you to configure Collections, which are log retention sets for storing log data. For each collection, you can specify how much of the total storage space to use and how many days to retain the logs in the collection. To specify the type of logs to put in the collection, you define retention rules to associate with the collections. Retention rules for all of your collections execute sequentially in an order that you define.

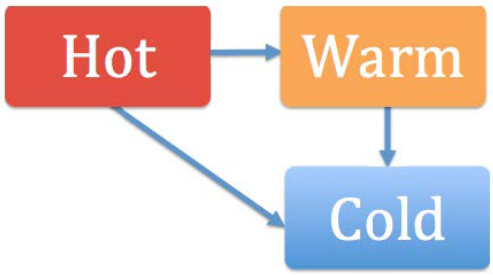
To do this, you must first define the total physical storage space for your collections. NetWitness Platform enables you to define three types of storage:

- **Hot Tier Storage**: This storage contains log data that is in active use as part of the business process. Users can access these logs faster than other types of storage and they can use these logs for reporting and other tasks. Hot storage is usually Direct-Access Capacity (DAC) or SAN storage.
- **Warm Tier Storage**: (Optional) This storage contains older log data aggregated by Archiver. Log data access is slower than hot storage. Users can also use these logs for reporting and other tasks. Warm storage is usually Network Attached Storage (NAS).
- **Cold Tier Storage**: (Optional) This storage contains the oldest log data that is either required for the operation of the business or mandated by regulatory requirements. The logs are offline and Archiver cannot access these logs for reporting or other tasks. However, if you want to access this log data, you can restore it to the collections created on the Archiver service and then use it for reporting. Cold storage is usually offline storage, such as NAS, or temporary storage before archiving to tape. Once data moves to the Cold Tier, that data is no longer managed by Archiver. Once moved, it is incumbent on external processes to back it up or manage that Cold Tier space such that it does not reach 100% capacity. If capacity is reached, this will cause the Archiver to stop aggregation until the problem is fixed.

Archivers are preconfigured to use available hot storage and a default log collection, so you do not have to configure Archiver storage and log retention if you do not have complex log retention requirements.

Logs can move from one type of storage to another in the following ways:

- Hot Storage > Cold Storage
- Hot Storage > Warm Storage > Cold Storage



When a collection reaches its retention limits for hot and warm storage, NetWitness Platform deletes the log data from hot or warm storage. With cold storage configured, a copy goes into cold storage before the logs are deleted from hot or warm storage. For example, if you have a collection with Hot Storage of 1 TB, Warm Storage of 1 TB, and Cold Storage enabled, when the log data reaches 1 TB of hot storage, the oldest log data moves to warm storage. When the log data in warm storage reaches 1 TB, the oldest log data from warm storage is copied to cold storage before it is removed from warm storage.

For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first. For example, if you have a collection with Hot Storage of 1 TB, no Warm or Cold Storage, and a Retention period of 20 days, if the Log data exceeds 1 TB after 11 days, the oldest logs over 1 TB are deleted even though the collection has a 20 day retention period.

After you create hot, warm, and cold storage, you configure your log retention storage collections. You can specify the maximum size of the Hot and Warm Storage for the collection, whether to use Cold Storage, the number of days to retain the logs in the collection, the data compression, and whether to use a hash algorithm to be able to verify the data integrity of the files being saved.

After configuring your collections, you define retention rules for your collection. These rules specify the type of logs to be stored in the collection. Each collection must have at least one retention rule associated with it in order to store log data.

Procedure

Perform the following tasks in the order shown to configure storage and log retention.

Task	Reference
1. Configure total hot, warm, and cold storage.	Refer to Configure Hot, Warm, and Cold Storage.
2. Configure log retention storage collections.	Refer to Configure Log Storage Collections.
3. Define retention rules for the collections and determine the order of execution of the overall list of retention rules.	Refer to Define Retention Rules.

Configure Hot, Warm, and Cold Storage

This topic provides instructions for Administrators on how to configure total hot, warm, and cold storage on an Archiver.

An Archiver host has hot storage pre-configured to the defaults. Administrators can configure total hot, warm, and cold storage to meet their specific business requirements. An Archiver must have total hot storage configured, but warm and cold storage configurations are optional. NetWitness Platform does not manage cold storage.

Prerequisites

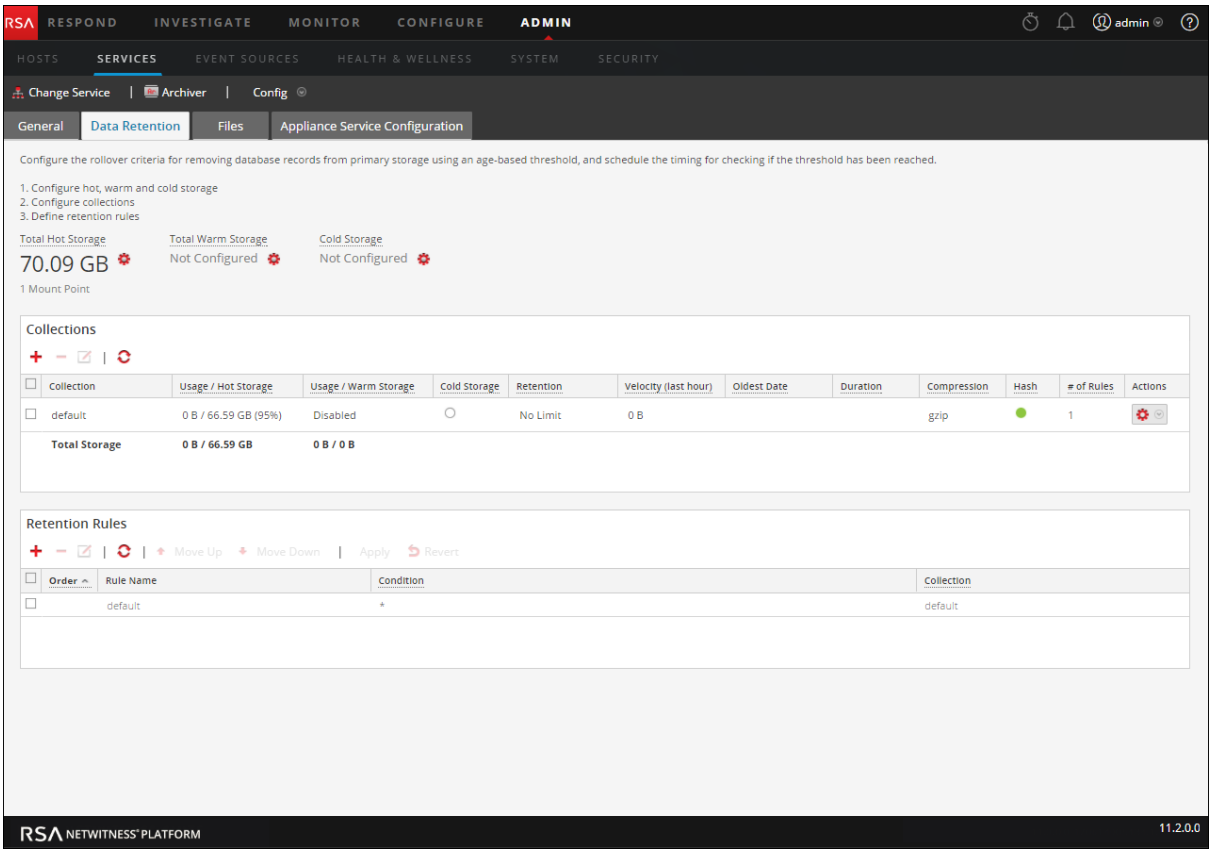
Ensure that you have:

1. Installed the Archiver host in your network environment.
2. Installed and configured Log Decoder in your network environment.
3. Added Archiver as a Core service to your NetWitness Platform deployment.
4. Added Log Decoder services as a data source for Archiver.
5. Installed and configured a DAC or other physical storage in your network environment.
6. Determined your log retention and storage requirements.

Procedures

Configure Total Hot Storage for an Archiver

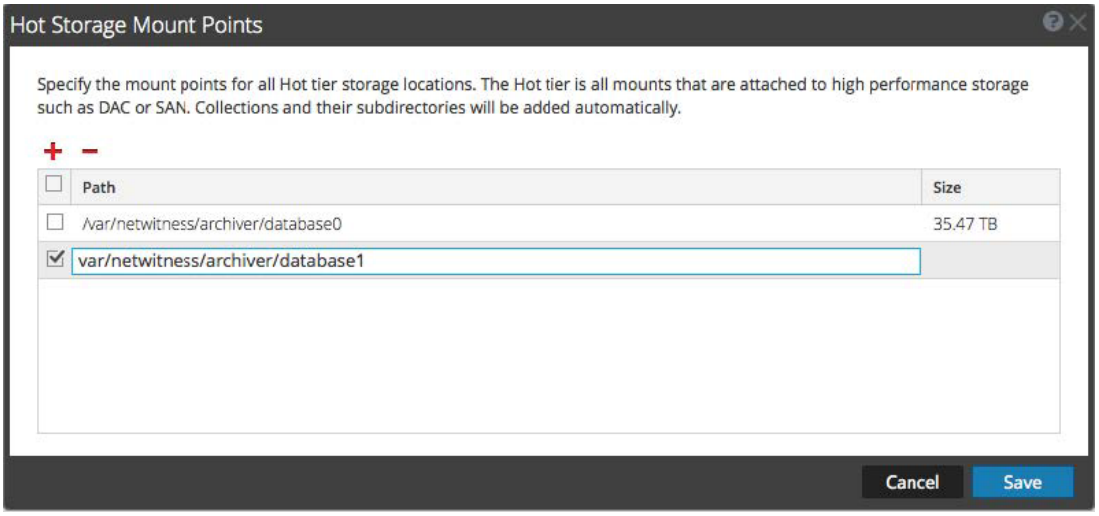
1. Go to **ADMIN > Services**.
   The Services panel is displayed.
2. In the Services panel toolbar, click and select **Archiver**.
3. In the Actions column, click **> View > Config**.
   The Services Config view of Archiver is displayed with General tab open.
4. Click the **Data Retention** tab, in the **Total Hot Storage** section, click to configure total hot storage.



5. In the **Hot Storage Mount Points** dialog, add the mount points attached to the Archiver host that you want to include in Total Hot Storage.

   These are the paths to high performance storage, such as DAC storage and SAN. Do not add collections or subdirectories to the mount points.

   To add a mount point, click + and type the path to the mount point.



6. Verify that your mount point paths are correct and click **Save**.

NetWitness Platformwill automatically create metadb, packetdb, sessiondb, and index directories for each collection defined on the Archiver:

```
<storageLocation>/<CollectionName>/metadb
<storageLocation>/<CollectionName>/packetdb
<storageLocation>/<CollectionName>/sessiondb
<storageLocation>/<CollectionName>/index
```

For example, if your mount point is /var/netwitness/archiver, then the following directories will be created for each of your collections:

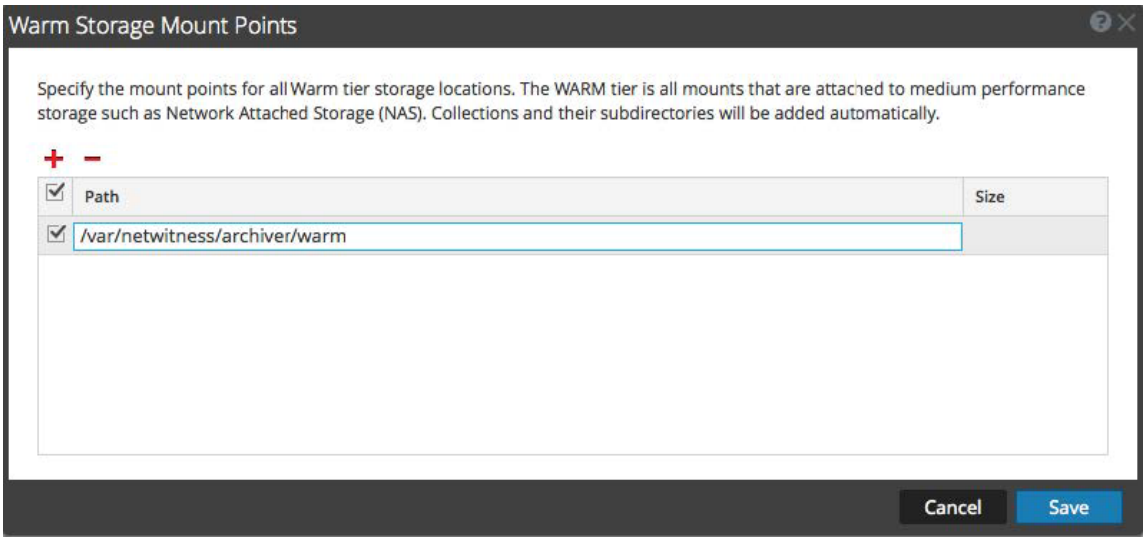
```
/var/netwitness/archiver/<CollectionName>/metadb
/var/netwitness/archiver/<CollectionName>/packetdb
/var/netwitness/archiver/<CollectionName>/sessiondb
/var/netwitness/archiver/<CollectionName>/index
```

After the Archiver service is restarted, data will start being saved to your defined collections. Ensure that your log retention collections are correct before restarting the Archiver service.

Caution: After data has been saved to a mount point, it cannot be removed from the user interface.

Configure Total Warm Storage for an Archiver

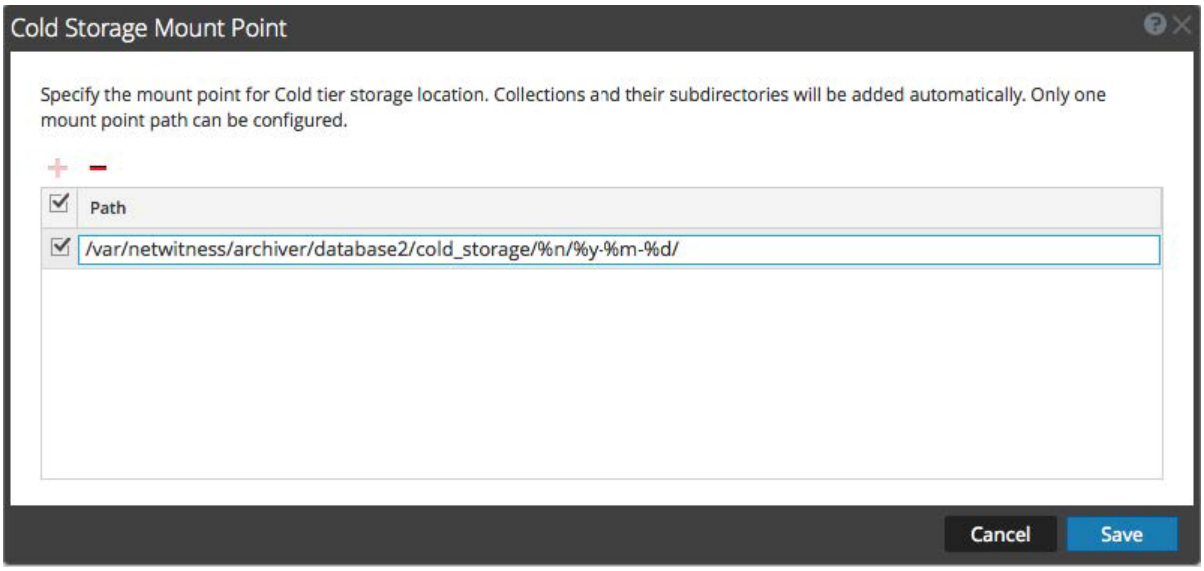
(Optional) The procedure to configure Total Warm Storage for an Archiver is the same as for Total Hot Storage, except that you click in the Total Warm Storage section and add the mount points that you want to use for warm storage, which are the physical paths to warm storage, such as Network Attached Storage (NAS).



Configure Total Cold Storage for an Archiver

(Optional) The procedure to configure Total Cold Storage for an Archiver is the same as for Total Hot Storage, except that you click in the Total Cold Storage section and you add only one mount point for cold storage. NetWitness Platform does not manage cold storage.

You must include the collection name format specifier `%n` somewhere in the cold storage mount point path name to avoid filename collisions between collections.



The following format specifiers are allowed in the path:

Format Specifier	Description
%n	collection name (required)
%y	year the data moved to cold storage
%m	month
%d	day
%h	hour
%##r	block of hours for the current day. For example, if you want three 8 hour blocks, you can set it to %8r. The first 8 hours of the day returns 0, the second 8 hours returns 1, and last 8 hours of the day returns 2.

Changes take effect immediately.

For example, if you have a collection named **compliance** and you create the following cold storage path:

`/sa-cold-storage/%n/%y-%m-%d/`

NetWitness Platform creates a directory each day with the following format:

/sa-cold-storage/compliance/2015-11-20/

Hot, Warm, and Cold Tier Storage Features

The following table describes features of the Hot, Warm, and Cold Tier Storage dialogs.

Feature	Description
+	Adds a mount point.

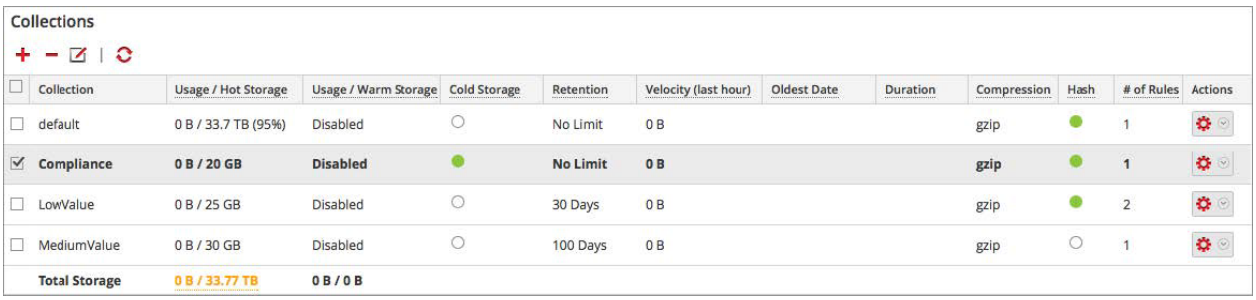
Feature	Description
	Removes a mount point. You cannot delete a mount point that is in use unless you delete the associated collections.
	Select the mount points that you want to include for the Total Hot, Warm, and Cold Storage. You can only select one mount point for Total Cold Storage.

Mount Point	Shows the path to the attached physical storage. For example: **/var/netwitness/archiver/database0**, which is the location of the hot storage DAC.
	Do not add collections or subdirectories to the mount points. NetWitness Platform will automatically create metadb, packetdb, sessiondb, and index directories for each collection defined on the Archiver:
	`<storageLocation>/<CollectionName>/metadb`
	`<storageLocation>/<CollectionName>/packetdb`
	`<storageLocation>/<CollectionName>/sessiondb`
	`<storageLocation>/<CollectionName>/index`
	For example, if your hot storage mount point is /var/netwitness/archiver, then the following directories will be created for each of your collections:
	`/var/netwitness/archiver/<CollectionName>/metadb`
	`/var/netwitness/archiver/<CollectionName>/packetdb`
	`/var/netwitness/archiver/<CollectionName>/sessiondb`
	`/var/netwitness/archiver/<CollectionName>/index`
	For Cold Storage, you must include the collection name format specifier `%n` somewhere in the cold storage mount point path name to avoid filename collisions between collections.

Storage Size	Shows the size of the attached storage. The Data Retention tab shows the total amount of storage for your reference.

Collections

The Collections section lists all of your storage collections along with Total Storage for Hot and Warm Storage.



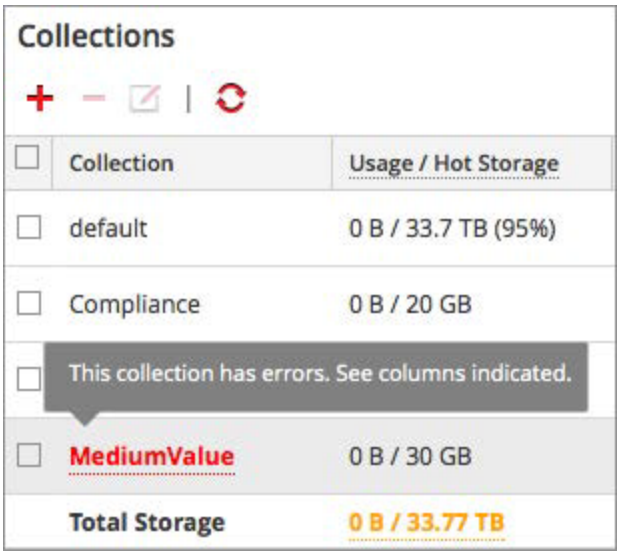
Collections Features

The following table describes the icons and columns of the Collections section. You can hide some of the columns based on your requirements.

Feature	Description
	Opens the Collections dialog, in which you can add a storage collection.
	Removes the selected collection. Deleting the collection permanently removes all stored data from the collection, but the empty data directories remain.
	Opens the Collections dialog, in which you can edit the selected collection.
	Refreshes collection information.
	Selects a collection. For example, you can select a collection for editing or removal.
Collection	Shows the name of your collection, such as Default, Compliance, MediumValue, and LowValue. You can create multiple collections with different criteria for retaining logs. If you do not create any collections, the Default collection is used. If a collection has errors, the collection name and the columns with errors appear in red text.
Usage / Hot Storage	Shows the current hot storage usage and the maximum hot storage for the collection. When the size of the logs reach the maximum hot storage amount, the logs are removed or they roll to the next available storage tier (warm or cold).
Usage / Warm Storage	Shows the current warm storage usage and the maximum warm storage for the collection. When the size of the logs reach the maximum warm storage amount, the logs are removed or they roll to available cold storage.
Cold Storage	Indicates whether cold storage is enabled or disabled. A solid colored green circle indicates that cold storage is enabled ( ). An blank white circle indicates that cold storage is disabled.
Retention	Shows the number of days that logs are retained before being removed or optionally moved to cold storage. No Limit indicates that log retention is not restricted by a specified number of days. For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first.
Velocity (last hour)	Shows the number of logs captured over the last hour.
Oldest Date	Shows the date and time of the last log capture.
Duration	Shows how may days ago that the last log was captured. For example: 20 days.
Compression	Shows the compression type used for the meta and raw data in the collection.
Hash	Shows whether hash is enabled or disabled. When enabled, the hash algorithm is used to ensure the data integrity of the files being saved. By default, the only data being hashed is raw logs and the hash files are saved in the same directory as data.

Feature	Description
# of Rules	Shows the number of rules applied to the collection. Define at least one rule for each collection. A collection without any associated rules shows a zero in red text as a warning: The collection name also appears in red text, which indicates an error in the collection. **Caution:** If a collection does not have a rule, no logs will ever go into that collection.
Actions	Enables you to see the rules associated with a collection in the Retention Rule section when you select <actions button> > **Select Rules**. In the Retention Rule section, you can change the overall priority of the collection rules.
Total Storage	Shows the current total hot storage usage and the maximum total hot storage at the bottom of the **Usage / Hot Storage** column. It also shows the current total warm storage usage and the maximum total warm storage at the bottom of the **Usage / Warm Storage** column.

Any errors in the collection appear in red text. A dotted underline indicates that a tooltip is available with information about the error.



Collections that have editing disabled (grayed out) also have tooltips that provide information on the problem.

Retention Rules

The Retention Rules section lists all of the retention rules used for your storage collections listed in the order of rule execution.

The following table describes the features of the Retention Rule section.

Feature	Description
	Opens the Rule Definition dialog, in which you can add a retention rule to use in a storage collection.
	Removes the selected retention rule. In order for your log collections to gather and store log data, you must associate them with at least one retention rule.
	Opens the Rule Definition dialog, in which you can edit the selected retention rule.
	Refreshes retention rule information.
Move Up	Moves the selected retention rule up in the Retention Rule priority list. Retention Rule order is very important. NetWitness Platform evaluates the the retention rules for all of the collections in numerical order by the number listed in the Order column in the Retention Rule section. You can also use drag and drop to reorder retention rules.
Move Down	Moves the selected retention rule down in the Retention Rule priority list. Retention Rule order is very important. NetWitness Platform executes the retention rules for all of the collections in numerical order by the number listed in the Order column in the Retention Rule section.
Apply	Saves the rule order change.
Revert	Reverts the rule order change.
	Selects or shows a selected retention rule.
Order	Shows the order of a rule in the overall list of retention rules.
Rule Name	Shows the name of rule, such as ComplianceDevices and GeneralWindowsLogs.
Condition	Shows the conditions for the rule. These conditions specify the type of logs to include in the collection. Define Retention Rules presents the guidelines for all queries and rule conditions in Core services.
Collection	Shows Collection name and how many days that the collection is retained. For example: MediumValue (30 Days)

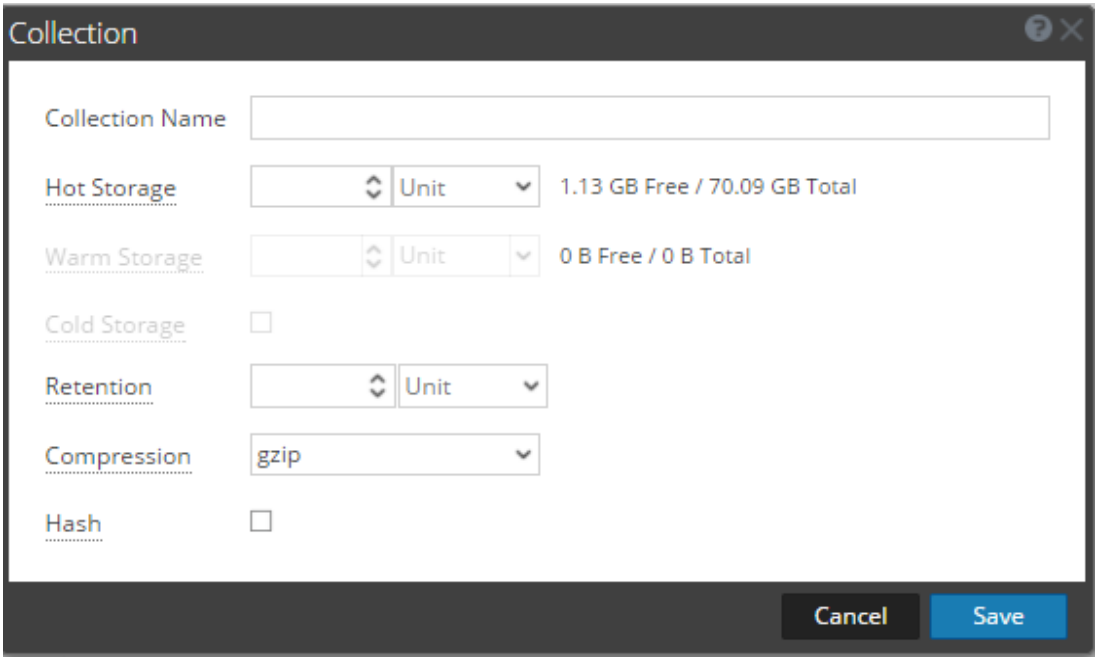
Collection Dialog

On the ADMIN > Services > Config view > Data Retention tab of an Archiver, Administrators can define the criteria for log retention and storage. In the Collection dialog, which is accessible from the Collections section, you can define individual storage collections to use for different log types. For example, you may want to create collections for compliance reasons or to selectively retain critical logs.

Procedures related to this dialog box are described in Configure Archiver Storage and Log Retention and Configure Log Storage Collections.

To access the Collection dialog:

1. Go to **ADMIN > Services**.
   The Services panel is displayed.
2. In the Services panel toolbar, click and select **Archiver**.
3. In the Actions column, click **> View > Config**.
   The Services Config view of Archiver is displayed with General tab open.
4. Click the **Data Retention** tab.
5. In the **Collections** section, click to add or edit the rule.
   The Collection dialog is displayed.



The following table describes the fields in the Collection dialog.

Field	Description
Collection Name	Specify a name for your collection, such as Compliance, MediumValue, or LowValue.
Hot Storage	Specify the maximum size or percentage of hot storage to use for this collection. The free space available to use for hot storage and the total hot storage are shown next to this field. When the size of the logs reach the maximum hot storage size, the logs are removed or they roll to the next available storage tier (warm or cold).

Field	Description
Warm Storage	(Optional) Specify the maximum size or percentage of warm storage to use for this collection. The free space available to use for warm storage and the total warm storage are shown next to this field. When the size of the logs reach the maximum warm storage size, the logs are removed or they roll to available cold storage.
Cold Storage	(Optional) Specify whether to use cold storage for this collection. If you use cold storage for the collection, logs outside of the specified size and retention limits roll over to cold storage. If you do not use cold storage, logs outside of the specified size and retention limits are removed.
Retention	(Optional) Specify the number of days that logs are retained before they are removed or rolled over to cold storage. For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first.
Compression	Specify the type of compression to use for meta and raw logs in the collection. You can compress the meta and raw logs using GZIP or LZMA to save space. GZIP is very fast at compressing and decompressing, but it does not compress as well as LZMA. LZMA offers better compression at a cost of decompression speed (roughly three times slower than GZIP). Compression ratios are highly dependent on your data. The default compression is GZIP.
Hash	Specify whether to enable or disable hash. When enabled, the hash algorithm is used to verify the data integrity of the files being saved. By default, the only data being hashed is raw logs and the hash files are saved in the same directory as data.

Note: When decreasing collection storage allocations or lowering retention time, it may take several minutes to hours for the data to move and space to become available depending on the amount of moving (rolling) data. The default times are every 20 minutes for a size roll and every six hours for a time roll.

Rule Definition Dialog

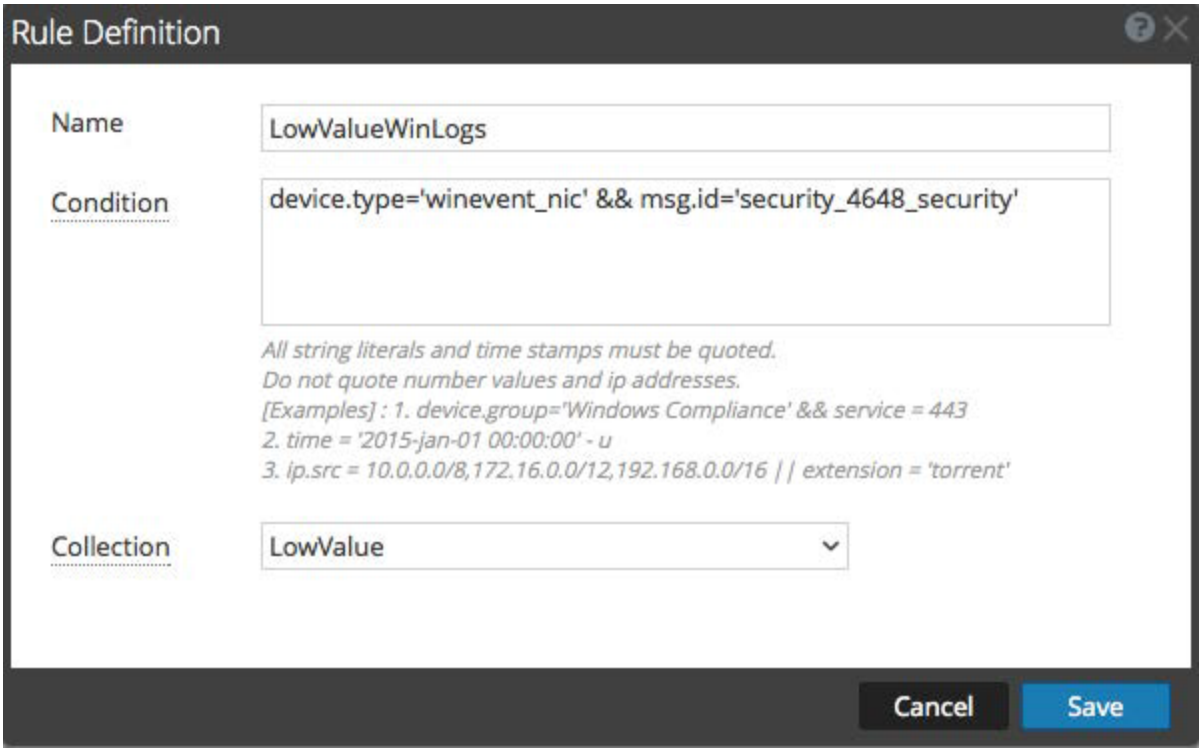
In the ADMIN > Services > Config view > Data Retention tab of an Archiver, Administrators can define the criteria for log retention and storage. In the Rule Definition dialog, which is accessible from the Retention Rules section, you can define retention rules to use for your storage collections.

Procedures related to this dialog box are described in Configure Archiver Storage and Log Retention and .Define Retention Rules

To access the Rule Definition dialog:

1. Go to **ADMIN > Services**.
   The Services panel is displayed.
2. In the Services panel toolbar, click and select **Archiver**.
3. In the Actions column, click **> View > Config**.
   The Services Config view of Archiver is displayed with General tab open.
4. Click the **Data Retention** tab.

5. In the **Retention Rule** section, click + or ✎.
   The Rule Definition dialog is displayed.



The following table describes fields in the Rule Definition dialog.

Field	Description
Name	Specify a unique name for your retention rule. For example: ComplianceDevices
Condition	Specify the conditions for the type of logs that you want to include in the collection. All sting literals and time stamps must be quoted. Do not quote number values and IP addresses. For example: `device.group='PCI Devices' || device.group='HIPPA Devices'`
Collection	Select the collection on which you want to apply this rule. For example: Compliance

Configure Log Storage Collections

This topic provides instructions for Administrators on how to configure log storage collections on an Archiver.

NetWitness Platform enables you to define individual storage collections for different log types. You can specify the maximum size of the Hot and Warm Storage space used by the collection, whether to use offline storage (Cold Storage), the number of days to retain the logs in the collection, the data compression, and whether to use a hash algorithm to be able to verify the data integrity of the files being saved. You should create collections based on your log retention storage requirements. Each collection that you create must be associated with at least one retention rule.

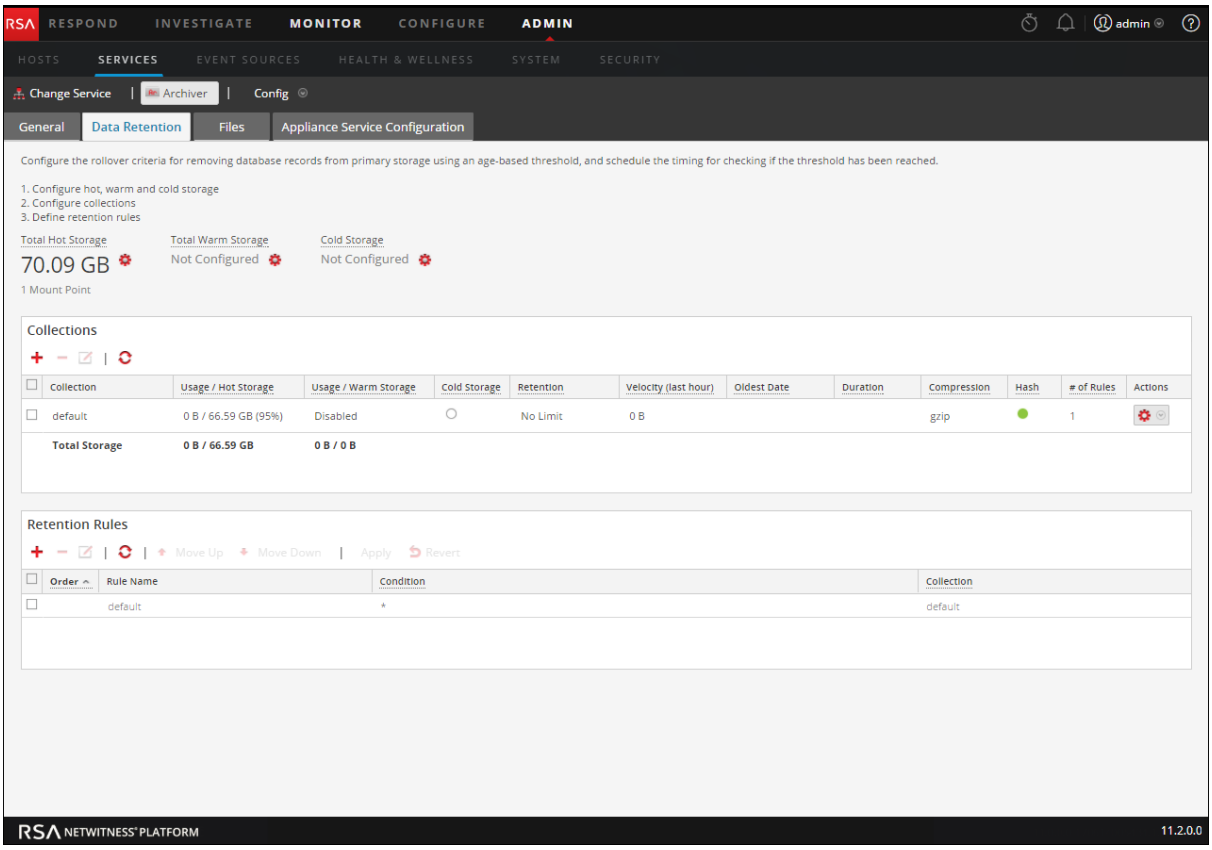
Prerequisites

Before you configure your log retention storage collections, configure total hot, warm, and cold storage.

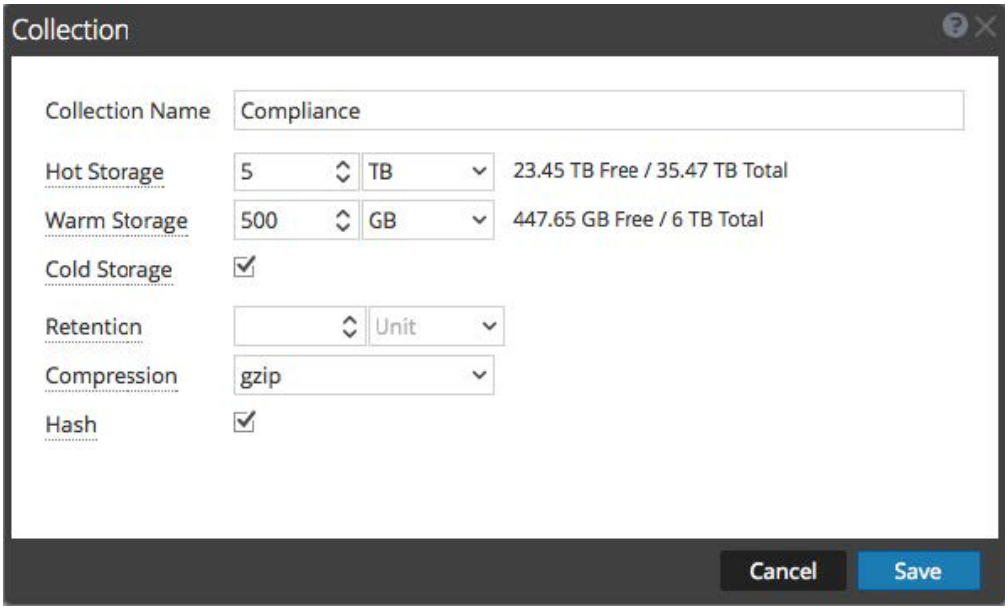
Configure a Log Storage Collection

To configure a log retention storage collection on an Archiver:

1. Go to **ADMIN > Services**.
   The Services panel is displayed.
2. In the Services panel toolbar, click and select **Archiver**.
3. In the Actions column, click **> View > Config**.
   The Services Config view of Archiver is displayed with General tab open.
4. Click the **Data Retention** tab, in the **Collections** section, click to add a collection.
   (If you decide to make changes to an existing collection, you can select the collection and click to change the settings.)



The **Collection** dialog is displayed.



5. Configure the collection as described in the following table.

Field	Description
Collection Name	Specify a unique name for your collection, such as Compliance, MediumValue, or LowValue.
Hot Storage	Specify the maximum size or percentage of hot storage to use for this collection. The free space available to use for hot storage and the total hot storage is shown next to this field.
Warm Storage	(Optional) Specify the maximum size or percentage of warm storage to use for this collection. The free space available to use for warm storage and the total warm storage is shown next to this field.
Cold Storage	(Optional) Specify whether to use cold storage for this collection. If you use cold storage for the collection, logs outside the storage limits are copied to cold storage before they are deleted from hot or warm storage.
Retention	(Optional) Specify the number of days that logs are retained before they are removed or rolled over to cold storage. For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first.
Compression	Specify the type of compression to use for meta and raw logs in the collection. You can compress the meta and raw logs using GZIP or LZMA to save space. GZIP is very fast at compressing and decompressing, but it does not compress as well as LZMA. LZMA offers better compression at a cost of decompression speed (roughly three times slower than GZIP). Compression ratios are highly dependent on your data. The default compression is GZIP.
Hash	Specify whether to enable or disable hash. When enabled, the hash algorithm is used to verify the data integrity of the files being saved. By default, the only data being hashed is raw logs and the hash files are saved in the same directory as data.

6. Click **Save**.

   Any errors in the collection appear in red text. A dotted underline indicates that a tooltip is available with information about the error. Your collection name appears in red text until at least one retention rule is defined for your collection.
   If you have a collection with editing disabled (grayed out), look at the associated tooltip for more information.

Note: When decreasing collection storage allocations or lowering retention time, it may take several minutes to hours for the data to move and space to become available depending on the amount of moving (rolling) data. The default times are every 20 minutes for a size roll and every six hours for a time roll.

Define Retention Rules

Administrators can define and order retention rules for log storage collections on an Archiver. Retention rules specify the type of logs to be stored in the collection. For your log collections to gather and store log data, you must associate them with at least one retention rule. When you configure a retention rule, you specify a condition and a collection for that rule. The condition (rule definition) determines the type of logs stored in that collection.

For the condition, you can use anything that works in a regular query `where` clause.

For example, to get logs from compliance services, you can use the following condition:

```
device.group='PCI Devices' || device.group='HIPPA Devices'
```

After you define the retention rules for your collections, it is important that you specify the order of your retention rules. NetWitness Platform evaluates the retention rules for all of the collections in numerical order by the number listed in the Order column in the Retention Rule section of the Data Retention tab of the Archiver (**ADMIN > Services Config view**).

Caution: Rule order is very important. It determines the priority for evaluating the log data for storage retention.

Prerequisites

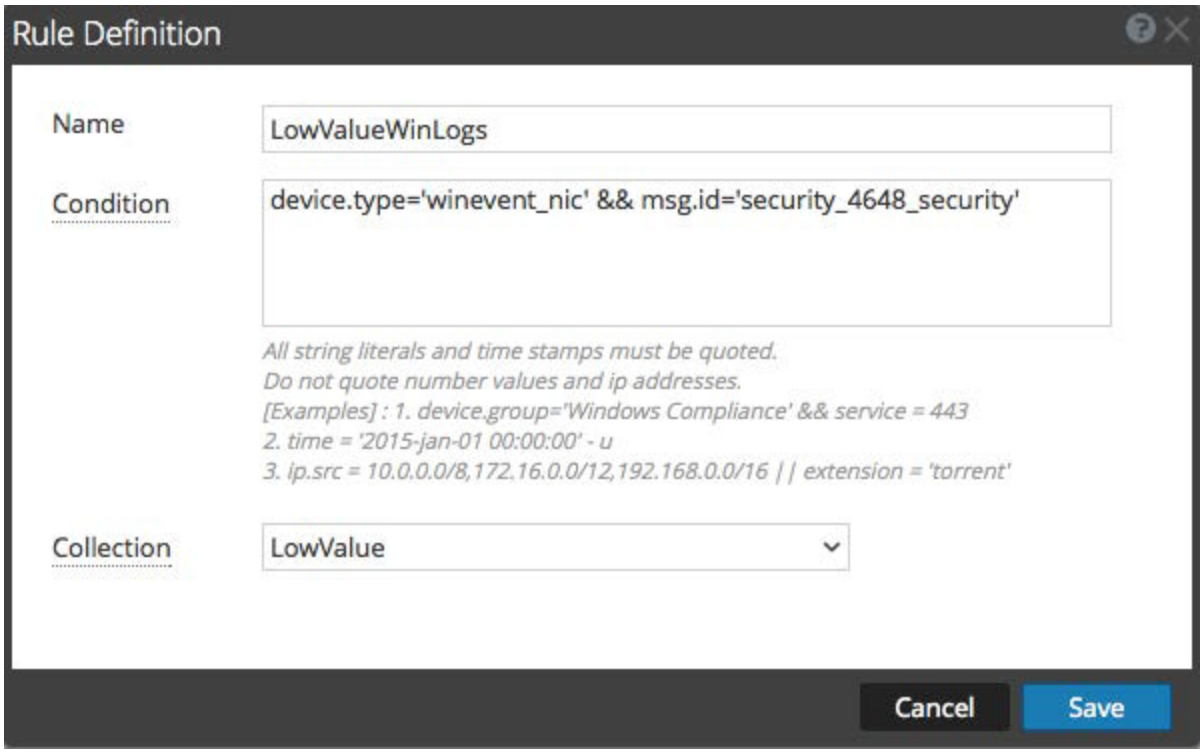
Before you configure your retention rules:

- Configure total hot, warm, and cold storage
- Configure log storage collections

Procedures

Define a Retention Rule for a Collection

1. Go to **ADMIN > Services**.
   The Services panel is displayed.
2. In the Services panel toolbar, click and select **Archiver**.
3. In the Actions column, click **> View > Config**.
   The Services Config view of Archiver is displayed with General tab open.
4. Click the **Data Retention** tab, in the **Retention Rules** section, click .
   The **Rule Definition** dialog is displayed.

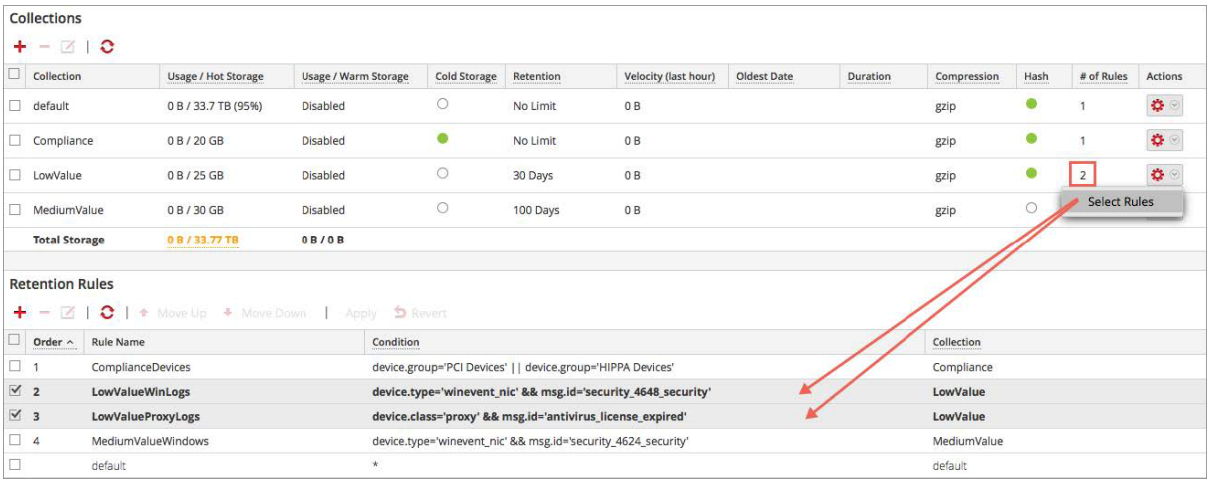


5. Configure the fields in the Rule Definition dialog as described in the following table:

Field	Description
Rule Name	Specify a unique name for your retention rule. It cannot include spaces. For example: LowValueWinLogs
Condition	Specify the conditions for the type of logs that you want to include in the collection. All string literals and time stamps must be quoted. Do not quote number values and IP addresses. For example: `device.type='winevent_nic' && msg.id='security_4648_security'`
Collection	Select the collection on which you want to apply this rule. For example: LowValue.

6. Click **Save**.

   The retention rule that you define becomes associated with the collection you selected. On the **Data Retention** tab, in the **Collections** section, you can click **> Select Rules** in the **Actions** column for the selected collection to view the retention rules associated with the collection in the **Retention Rule** section.



Specify the Order of your Retention Rules

To prioritize the complete list of all of your retention rules:

1. In the **Retention Rules** section of the **Data Retention** tab, select a retention rule and use drag and drop (or select **Move Up** and **Move Down**) to change its order in the priority list.

2. Click **Apply** to save the order of the retention rules.

Caution: Rule order is very important. It determines the priority for evaluating the log data for storage retention.

Add Archiver as a Data Source to Reporting Engine

This topic provides instructions on how to add Archiver Archiver as a data source to Reporting Engine to generate reports for the data collected by Archiver.

Prerequisites

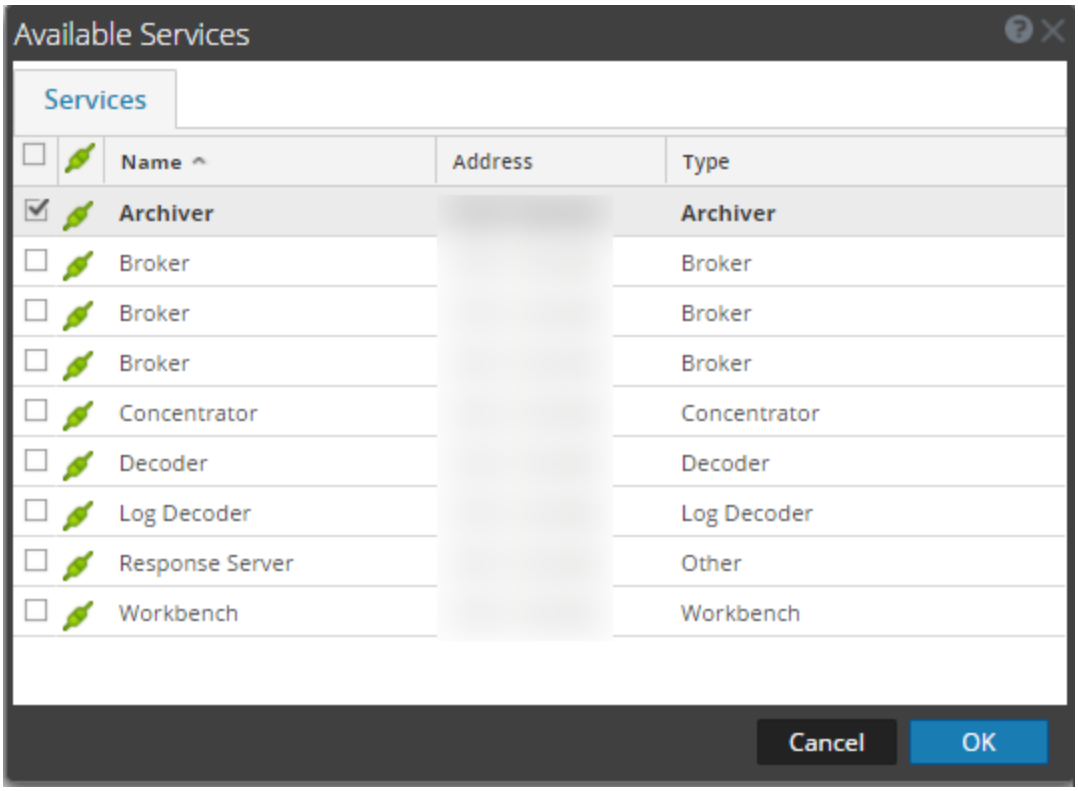
Ensure that you have:

1. Installed the Archiver host in your network environment.
2. Installed and configured a Log Decoder Decoder in your network environment.
3. Verified that Reporting Engine and Archiver services are active.

Procedure

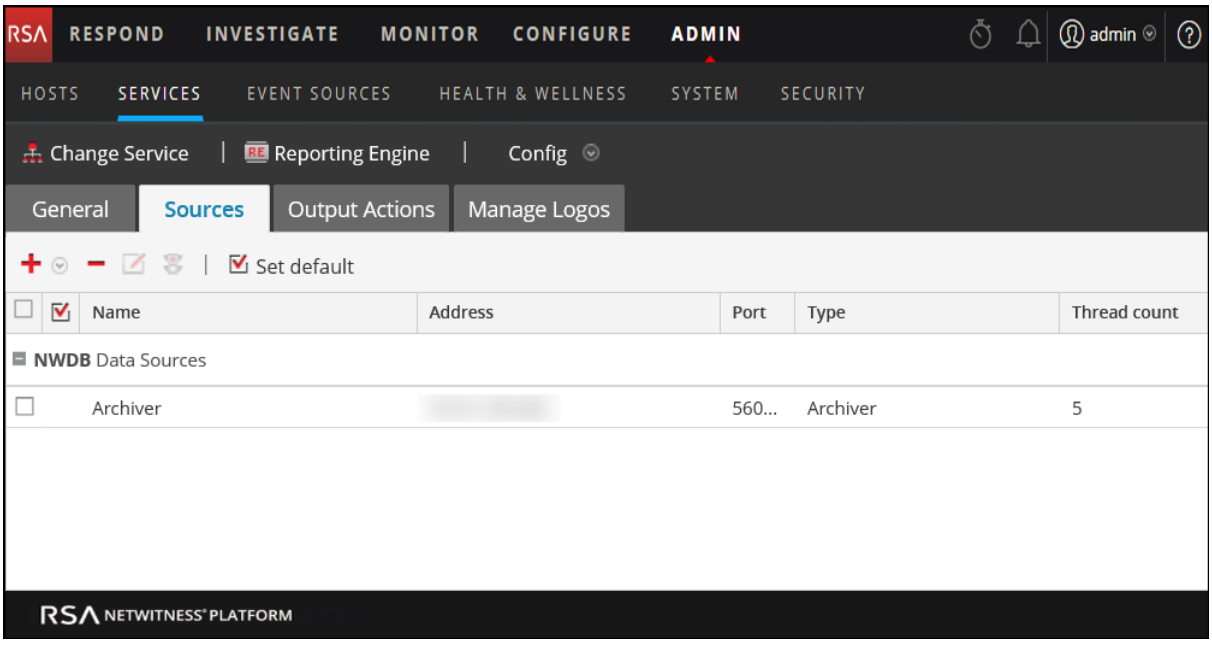
To associate an Archiver data source with Reporting Engine:

1. Go to **ADMIN > Services**.
   The Services panel is displayed.
2. In the Services panel toolbar, click and select **Reporting Engine**
3. In the **Actions** column, select **View > Config**.
   The Services Config view of Reporting Engine is displayed with General tab open.
4. Select the **Sources** tab.
5. Click and select **Available Services**.
   The Available Services dialog is displayed.



6. Select the Archiver that you want to add as data source to the Reporting Engine and click **OK**. The Service Information dialog is displayed.
7. Type the username and password for the Archiver.
8. Click **OK**.

   The selected Archiver is listed in the NWDB Data Sources category.

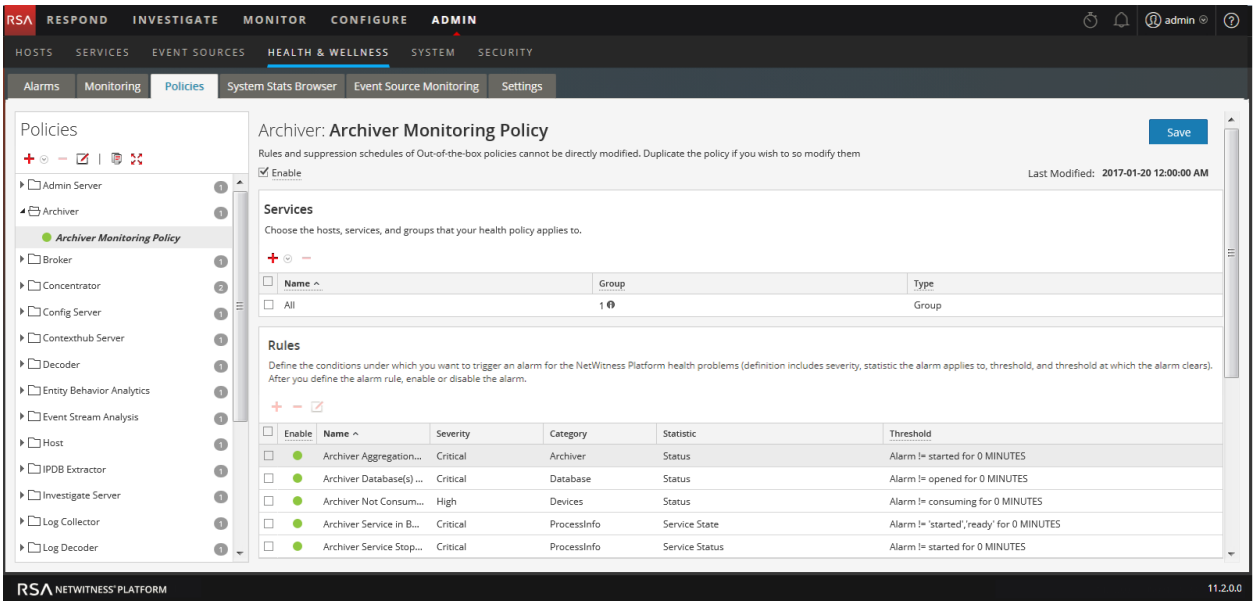


You can now create reports on the data collected by Archiver.

Configure Archiver Monitoring

Health & Wellness enables you to automatically generate notifications when critical thresholds are met.

Review the Health & Wellness policies for Archiver and Host in the Health & Wellness Policies section. Make updates as required.



For detailed information, see **Manage Policies** in the *System Maintenance* guide.

Additional Archiver Configuration

This topic is a collection of individual procedures, which an Administrator may perform at any time and they are not required to complete the initial setup of Archiver. These procedures are presented in alphabetical order.

Use this section when you are looking for instructions to perform a specific task after the initial setup of Archiver.

Configuring Data Backup and Restore

This topic provides information on the Data Backup and Restore feature for an Archiver. You can use this feature to back up Archiver data and retrieve the backed up data.

You can back up the data in the following ways:

- Use scripts to copy files from cold storage backup folders onto an offline storage.
- Use backup software to copy files from cold storage backup folders onto an offline storage.
- Run EMC Networker or other backup software on Archiver and have it do daily incremental backup of the database files.

Note: For details on the procedure to back up data using Networker, see the *Administration Guide for Networker*.

Once you have the data backup, you have to perform the following tasks to restore the backed up data that is installed on the Archiver.

Action	Description
1. Restore your data to a location accessible by the Archiver.	Refer to Create Collection
2. Create a collection in Archiver that uses that location.	Refer to "Manage Collections" topic in the *Workbench Configuration Guide*.
3. Add the Archiver service as a data source on Reporting Engine to generate reports for the data restored on the Archiver service.	Refer to Add Archiver as a Data Source to Reporting Engine

Add Archiver Service

The NetWitness Platform Archiver service enables you to create collections with restored data from Archiver offline (cold) storage. This procedure is only required if you do not have the Archiver service installed.

Prerequisites

Make sure you have added an Archiver host and applied a license to it.

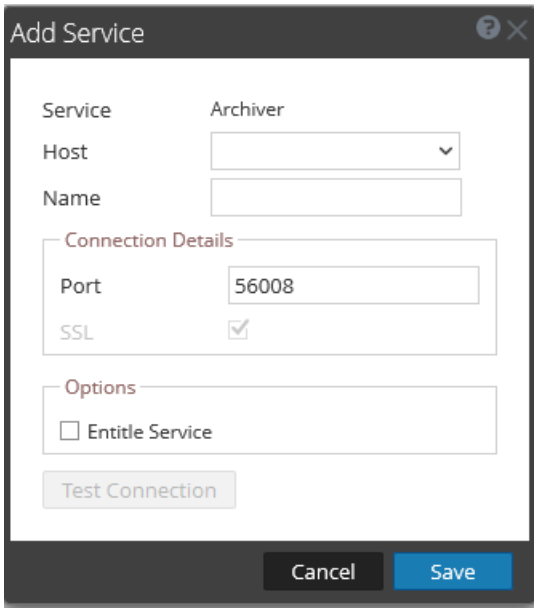
Procedure

Note: This procedure is only required if you do not have Archiver service installed.

Perform the following steps to add the Archiver service:

1. Go to **ADMIN > Services**.
2. In the **Services** panel, select + **>Archiver**.

The Add Service dialog is displayed, as shown below.



3. Provide the following details.

Field	Description
Host	Select an Archiver host from the drop-down menu.
Name	Type a name for the service.
Port	Default port is 50007.
SSL	Select **SSL** if you want NetWitness Platform to communicate with the service using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates. **Note:** If you select SSL, ensure SSL is enabled in the System Configuration panel.
Username	(Optional) Type the username for the service.
Password	(Optional) Type the password for the service.

4. Click **Test Connection** to determine if NetWitness Platform connects to the service.
5. When the result is successful, click **Save**.

   The added service is now displayed in the Services panel.

Note: If the test is unsuccessful, edit the service information and retry.

Create Collection

You can create a collection on an Archiver service using data restored from the backed-up data or an existing subset of data. When you recover the backed-up data, you have to place it in the collection folder created on the Archiver service to enable you to generate the required reports for the retrieved data. For example, if you have backed up the data using EMC Networker at <*location*>, you can use the restore options in Networker to restore the backed-up data to the collection folder created on the Archiver service. For restore procedure using EMC Networker, see the *Administration Guide for Networker*.

Prerequisites

Ensure that you have the following:

- Archiver service installed on an Archiver host.
- The Archiverservice has enough space to hold the collection.
- The backed-up data placed in a known location on your local host, if you are creating a collection using the data restored from the backed-up data.

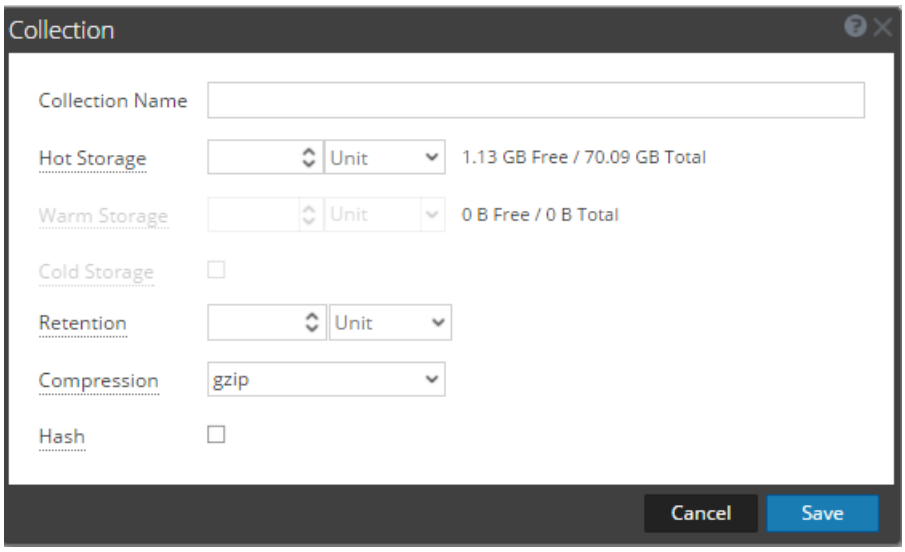
Procedure

The Data Retentions tab enables Administrators to restore and save data that is restored from a backup or from an existing set of data.

Note: The Administrator can point the source path to the location of the database files and the restore command copies them to the Archiver. The Administrator needs to mount those directories to the Archiver before a restoration collection can be created.

To create a collection using data restored from the backed-up data or existing subset of data:

1. Go to **ADMIN > Services**.
   The Services panel is displayed.
2. In the Services panel toolbar, click and select **Archiver**.
3. In the Actions column, click **> View > Config**.
   The Services Config view of Archiver is displayed with General tab open.
4. Click the **Data Retentions** tab and click in the **Collections** panel to add a collection.
   The **Collection** dialog is displayed.



5. Provide the following information:
   - **Collection Name:** Name of the Archiver collection that you want to restore.
   - **Hot Storage:**Enter the number of Archiver database files and unit size (either Gigabytes or Terabytes) that have been moved from cold storage.
   - **Retention:** Select the number of days or hours that you want to store the collection.
   - **Compression:** Select the compression type for the collection.
6. Click **Save** to restore the collection.
   Note the following:
   - Target is the location where the collection is created.
   - If the source path provided to create the restoration collection does not exist, the following error message is displayed:

"The source path does not exist '/xxx/xxx/'."

If there is insufficient storage to restore your collection, the following error is displayed:

"Error during disk space checking. Insufficient disk space in location '/xxx/xxx'."

7. The Schedule Job dialog is displayed with the following message:

   "Restoring data into a new collection. Check the jobs page for progress."

8. Click **Jobs** icon in the top right area of the main menu to expand the list of restoration collection jobs with their current status.

Note: When restoring a collection, the larger the dataset that you have to restore, the longer the restoration will take. If you are restoring a collection containing hundreds of gigabytes or more, restoration may take several hours.

Add Archiver Service as a Data Source to Reporting Engine

This topic provides instructions on how to add the Archiver service as a data source to Reporting Engine to generate reports for the data restored onto the Archiver.

Prerequisites

Ensure that you have:

- Installed the Archiver service on the Archiver host.
- Added a collection on the Archiver service.

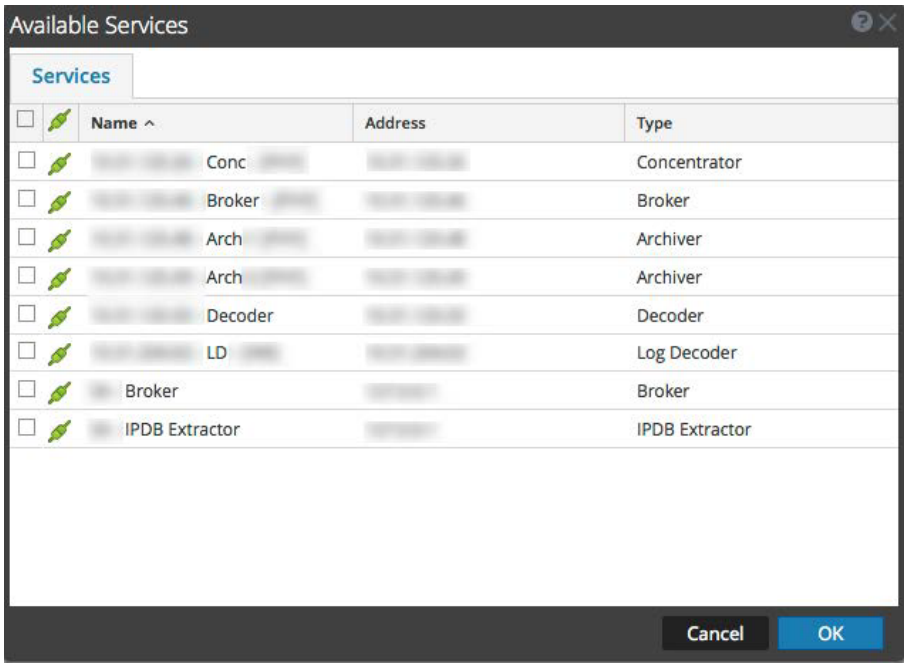
Procedure

Perform the following steps to add the Archiver service as a data source to Reporting Engine:

1. Select **ADMIN > Services**.
2. In the Services panel toolbar, click and select **Reporting Engine service**.
3. In the Actions column, click **> View > Config**.

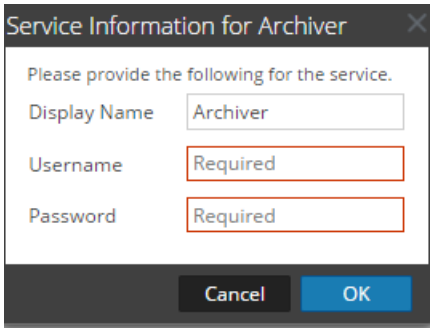
   The Services Config view of Archiver is displayed with General tab open.
4. Click the **Sources** tab.
5. Click and select **Available Services**.

   The Available Services dialog is displayed.



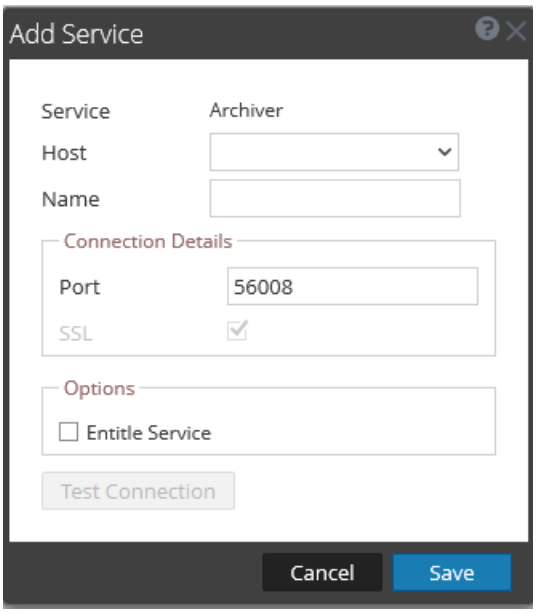
6. Select the Archiver service and click **OK**.

   If the Archiver service is using a Trust Model, the Service Information dialog for the selected service is displayed with the username and password fields required. If the service is not using a Trust Model, these fields will be optional.



7. Type the username and password for admin credentials for the service.
8. Click **OK**.

   The Add Service dialog is displayed.



9. Select a host from the drop-down list and click **Save**.

   The Archiver service is now added as a data source to the Reporting Engine and is listed in the NWDB Data Sources list.

Note: This procedure has to be performed for each collection.

An Administrator can create and delete Workbench collections. and view Workbench statistics and logs. This topic provides all of these procedures and an example procedure for restoring a collection for Reporting and Investigation.

- Mount Archiver Directories
- Create a Collection
- Delete a Collection
- Investigate a Collection
- View Workbench Collection Statistics
- View Workbench Logs

Mount Archiver Directories

If data is in offline storage or cold-tier storage, you need to mount the Archiver directories in order to restore the data for reporting and investigation purposes:

1. Go to **ADMIN > Services**.
2. Select an **Archiver** from the Services grid and select **> View > Explore**.

   The Explorer view for the Archiver is displayed
3. Right-click on the **Database** node in left-hand tree and select **Database** properties to open them in the right-hand panel.

4. Run the **manifest** command for a time range, for example, 2015-April-01 to 2015-April-10.

   The search returns all files that need to be restored for the selected query.

Create a Collection

Administrators can create collections of restored data from a backup or from an existing set of data.

Note: You can point the source path to the location of the database files and the restore command copies them to the Archiver. You need to mount those directories to the Archiver (where the Workbench is installed) before a restoration collection can be created.

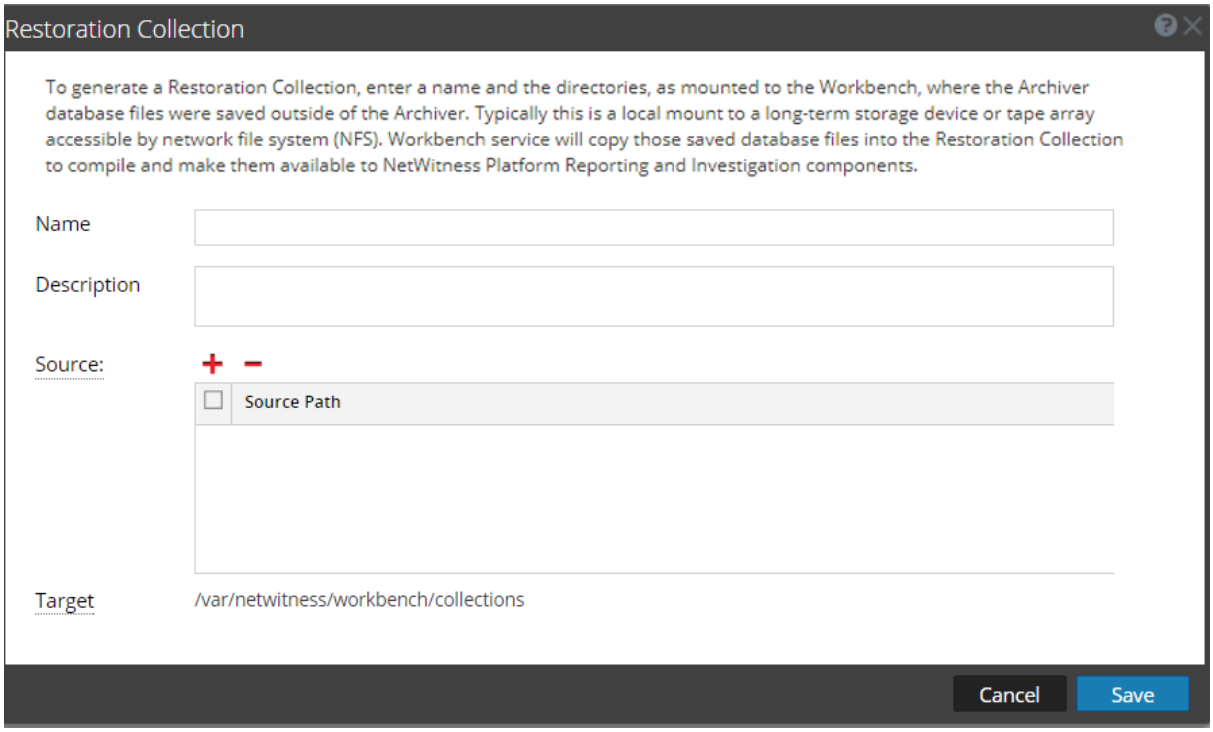
To create a collection using data restored from the backed up data or existing subset of data:

1. Go to **ADMIN> Services.**
2. In the Services view, select a **Workbench**, then select **> View > Config**.

   The Services Config view is displayed with the General tab open.
3. Click the **Collections** tab.

   The Collections grid is displayed.
4. Click + in the toolbar.

   The Restoration Collection dialog is displayed.



5. Provide the following information:

- **Name:** Name of the Workbench collection that you want to restore.
- **Source:** Location where the Archiver database files have been moved from cold storage.

Note: Target is the location where the collection is created.

6. Click **Save** to restore the collection.

Note: If the source path provided to create the restoration collection does not exist, the following error message is displayed:

```
The source path does not exist '/xxx/xxx/'.
```

If there is insufficient storage to restore your collection, the following error is displayed:

```
Error during disk space checking. Insufficient disk space in location
'/xxx/xxx'.
```

The Schedule Job dialog is displayed with the following message:

```
Restoring data into a new collection. Check the jobs page for progress.
```

7. Click the **Jobs** icon in the NetWitness Platform toolbar to expand the list of restoration collection jobs with their current status.

Note: Restoring a collection that is larger than 550 GB may take several hours to process.

Delete a Collection

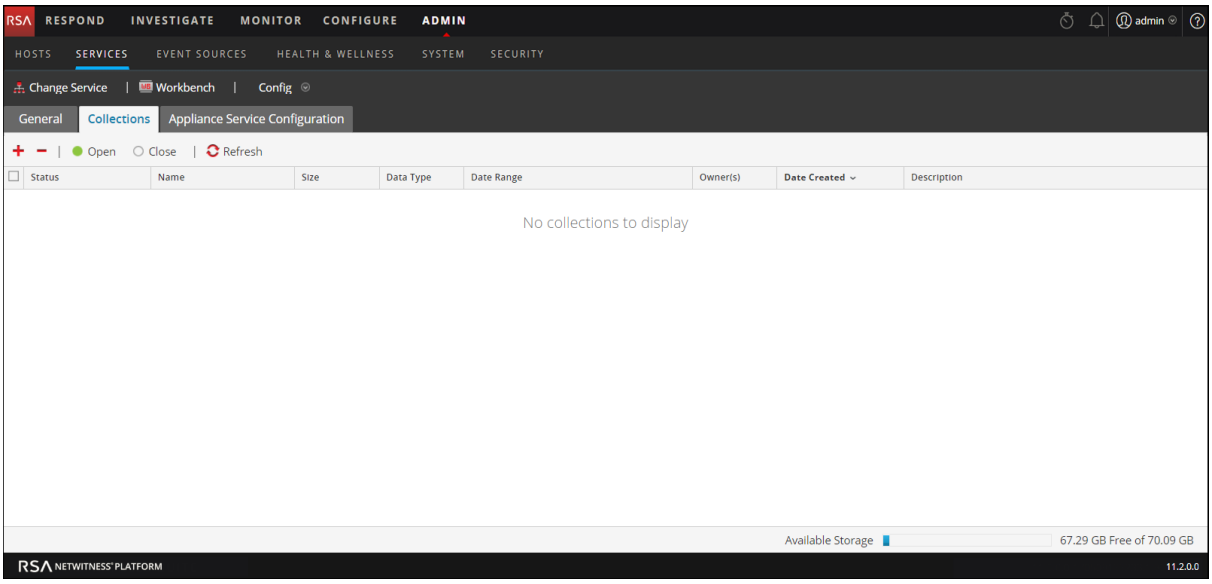
Administrators can delete collections from the Workbench service.

Perform the following steps to delete a collection:

1. Go to **ADMIN > Services.**
2. From the Services view, select a **Workbench** and click **> View > Config**.

   The Services Config view opens with the General tab displayed.
3. Select the **Collections** tab.

   The Collections grid is displayed.



4. In the Collections grid, select the collection that you want to delete.
5. Click − from the toolbar.

   A warning dialog requests confirmation.
6. If you want to delete the collection, click **Yes**.

   The collection is removed from the Workbench service.

Example Procedure: How to Restore a Collection for Reporting and Investigation

The following steps illustrate how to restore data for reporting and investigation purposes that is in offline storage or cold-tier storage. In the following example, data is restored for the time range beginning on 2015-April-01 through 2015-April-10.

To restore data for reporting and investigation purposes:

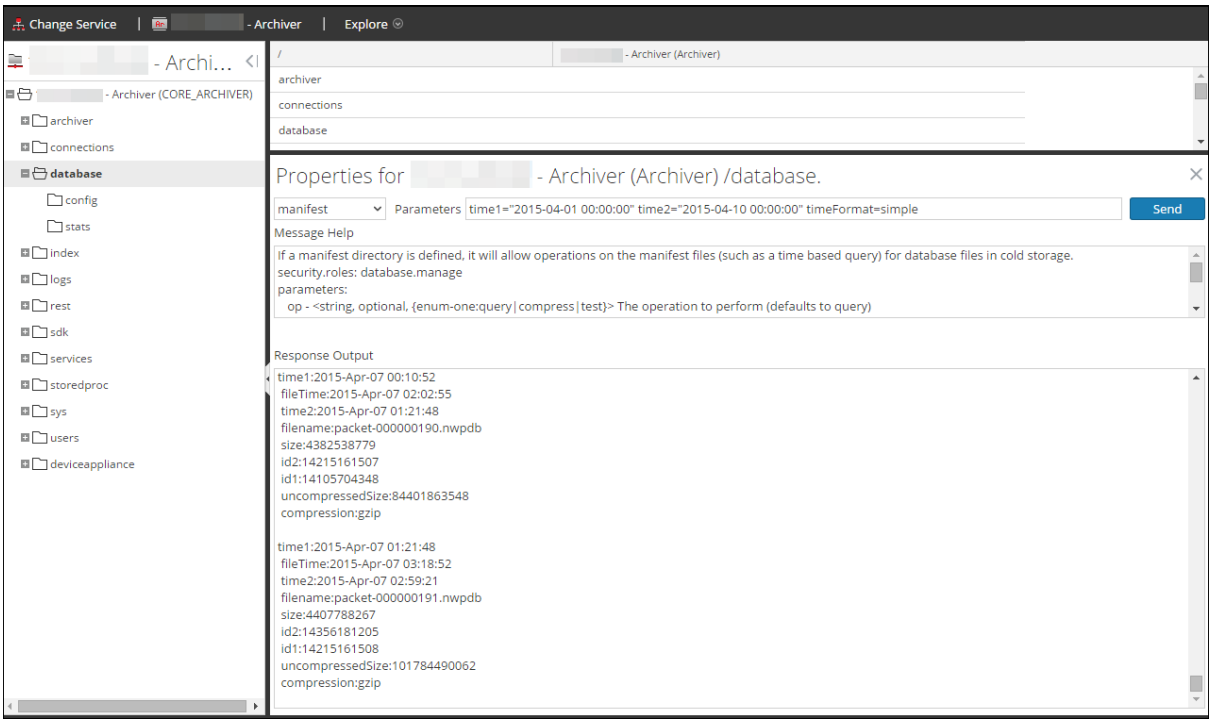
1. Go to **ADMIN > Services**.
2. Select the **Archiver** from the Services grid.
3. In the Actions column, click **> View > Explore**.

   The Explorer view for Archiver is displayed
4. Right click on **Database** node in left-hand tree and select **Database** properties to open them in the right-hand panel.
5. Run the **manifest** command for the selected time range 2015-April-01 to 2015-April-10.

   The search returns all files that need to be restored for your selected query.

   Example Search:

   ```
   time1="2015-04-01 00:00:00" time2="2015-04-10 00:00:00" timeFormat=simple
   ```



6. Go to **ADMIN > Services**.
7. In the Services view, select a **Archiver**, then select **> View > Config**.
   The Services Config view is displayed with the General tab open.
8. Select the **Collections tab.**
9. Create a restoration collection with the source path pointing to files listed in the manifest command output.
10. Save the collection.
    After successfully creating a collection, you can use this collection for reporting and investigation purposes.

Investigate a Collection

To perform an investigation on an Archiver collection:

1. Select **Investigate**.
   The Investigate dialog is displayed.
2. Click the **Collections** tab in the Investigate dialog.
3. Select an Archiver service in the left panel.
4. Select the collection you want to investigate in the right panel.
5. Click **Navigate**.

The Navigate view is displayed showing data pertaining to the Archiver collection that you selected.

Note: For detailed information about using Investigation, see the *Investigation and Malware Analysis Guide*..

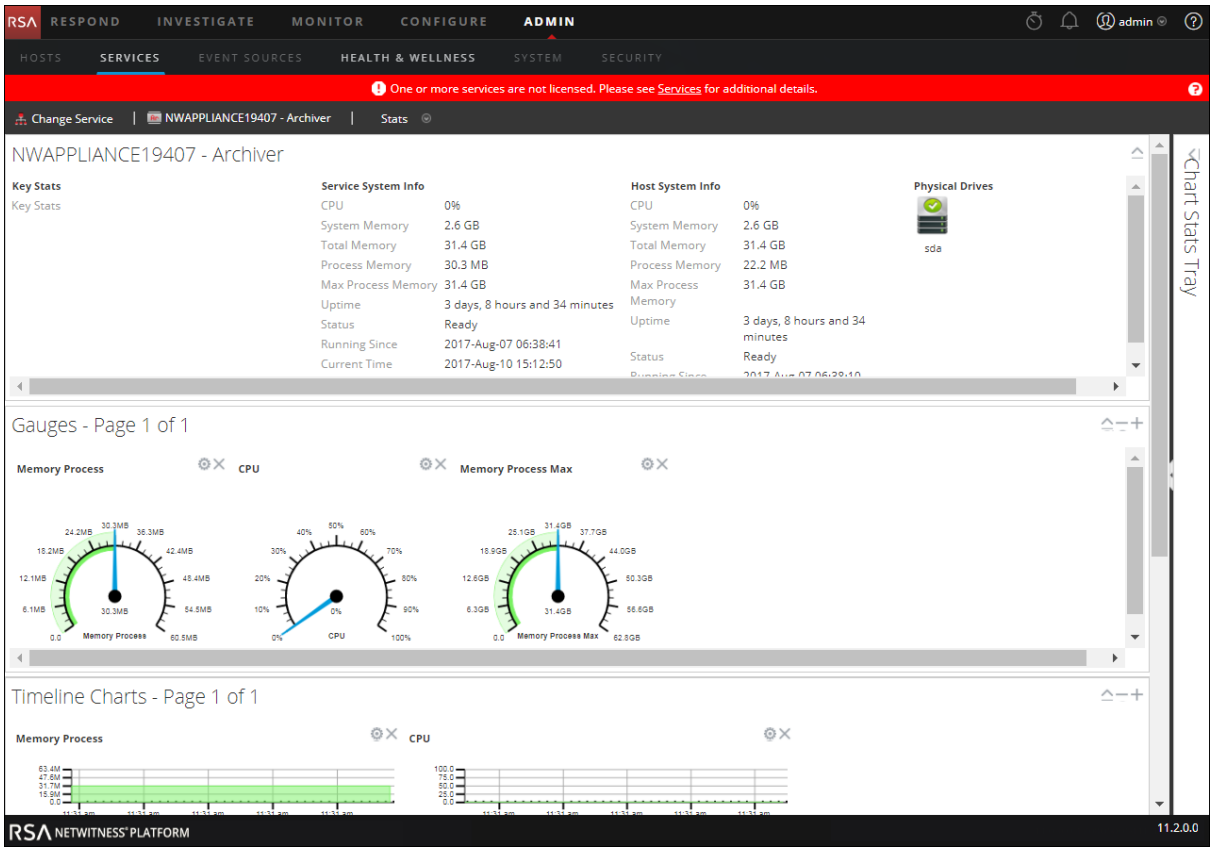
View Archiver Collection Statistics

The same statistics available for other services are provided for the Archiver service. The Services Stats view displays key statistics and system information that pertain to your selected Archiver service. The information is displayed in several different sections within the Stats view: Archiver, Gauges, Timeline Charts and Chart Stats Tray. The Chart Stats Tray lists all available statistics for the Archiver. Any statistic in the Chart Stats Tray can be displayed in a gouge or a timeline chart.

Perform the following steps to view Archiver statistics:

1. Go to **ADMIN > Services**.
2. In the Services view, select an Archiver, then select **> View > Stats**.

   The Services Stats view is displayed.



Note: For more information about Archiver statistics, see the *Host and Services Getting Started Guide*.

View Archiver Logs

Perform the following steps to view logs on an Archiver service:

1. Go to **ADMIN > Services.**
2. In the Services view, select a **Archiver**, then select **> View > Logs**.
   The Services Logs grid is displayed.

Note: For information about viewing and configuring audit logs, see "Configure Global Audit Logging" topic in the *System Configuration Guide* .

Add Archiver Service as a Data Source to Broker

Adding the Archiver service as a data source to Broker is useful when you have more than one collection and you want a report on the archived data. To do this, you can add more than one collection as a downstream service to a Broker and then generate a report on it.

Prerequisites

Ensure that you have:

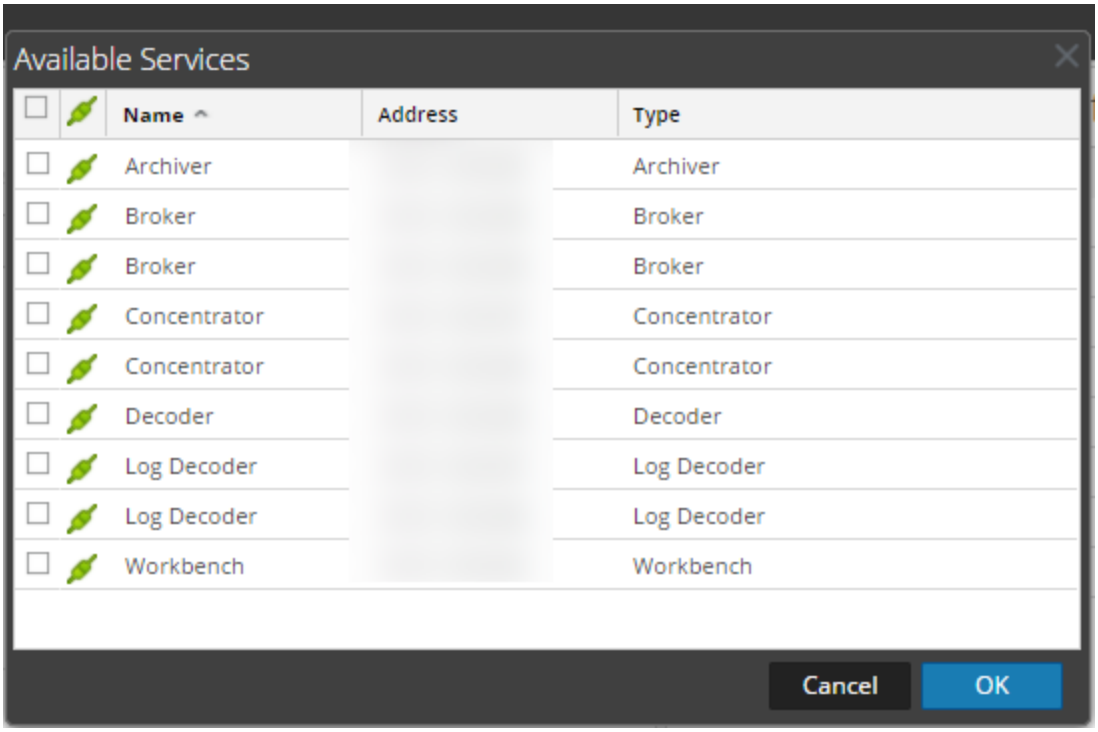
- Installed the Archiver service on the Archiver host.
- Added a collection on the Archiver service.

Procedure

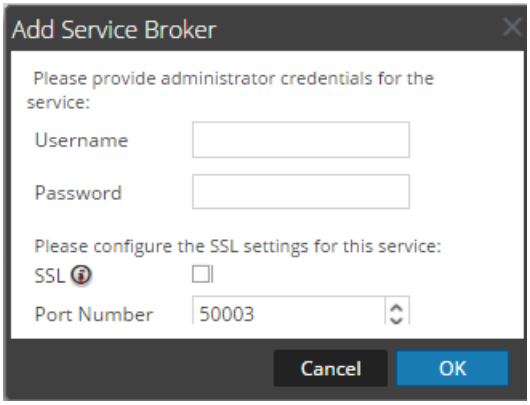
To add an Archiver service as a data source on the Broker:

1. Select **ADMIN > Services**.
2. In the **Services** panel, select a Broker service.
3. In the **Actions** column, select **> View > Config**.
   The Config view is displayed with the General tab open.
4. In the **Aggregate Services** section, click .

The Available Services dialog is displayed.

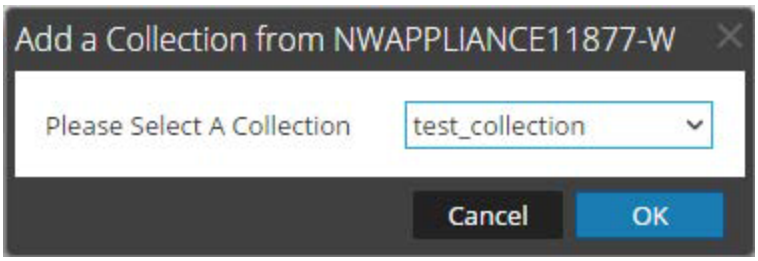


6. Select the Broker service and click **OK**.
7. If the Archiver service is using a Trust Model, a Service Information dialog for the selected service is displayed.



8. Type the username and password for admin credentials for the service.
9. Click **OK**.

   The Add Collection dialog is displayed.



10. Select a collection from the drop-down list and click **OK**.

    The Archiver service is now added as a data source to the Broker.

Note: This procedure has to be performed for each collection.

Retrieve Hash Information

Archiver provides a command, **hashInfo**, which you can use to retrieve the hash information for each session, meta, and packet database that meets the session list or date range criteria. The hash information retrieved is in the form of a list of string parameters, each string parameter corresponding to the hash information for a single database file. You can retrieve the hash information of the database files using the Archiver Service Explore view or REST interface of the Archiver service. The hash information thus retrieved is used to compare the database files in the original location and the exported location to validate data integrity.

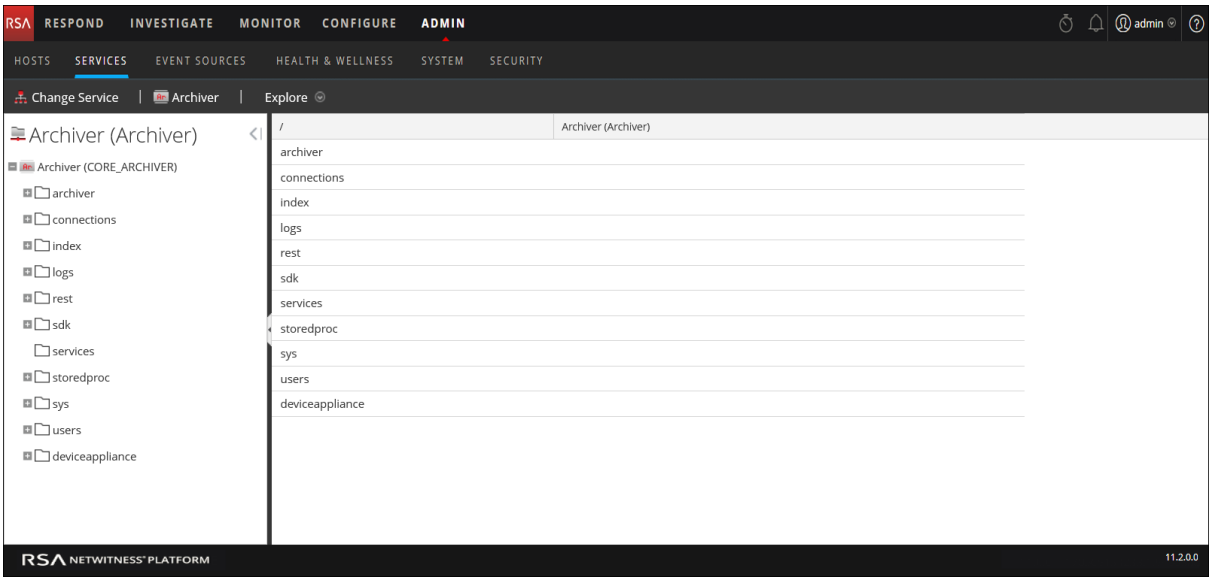
The following table lists the criteria that you can use to retrieve the hash files from the database.

Criteria	Description
sessions	You can retrieve the hash information of the database files by specifying the sessions that exist or read from the session database to determine the associated meta and packet id required to determine which meta and packet database files are needed to retrieve the hash information. **For example:** sessions=100 - Retrieves the hash information of all database files that contain the constituent components(session, meta, content) of session 100. sessions=100,500000 - Retrieves the hash information of all database files that contain the constituent components(session, meta, content) of session 100 and 500000
beginDate	You can specify a begin date as a filter against the database files. This finds the hash information for the files created after the specified date. The begin date specified has to be in the format YYYY-MM-DD HH:MM:SS.
endDate	You can specify an end date as a filter against the database files. This finds the hash information for the files created before the specified date. The end date specified has to be in the format YYYY-MM-DD HH:MM:SS **For example:** beginDate: “2014-Mar-25 05:52:00” endDate=”2014-Mar-27 05:52:00” – Retrieves the hash information of all the database files in between March 25, 2014 and March 27, 2014 in the specified time range on those days.
directories	By default, the hash information files are stored with the database files they were created for. You can also store the hash information file in different location by defining multiple locations in the hash.dir configuration parameter. You can define the location as a filter and retrieve the hash information files for the configured location. **For example:** directories="/home/hash" – Retrieves the hash information of the database files from the location /home/hash

Procedure

To retrieve hash information of the database files:

1. Go to **ADMIN > Services**.
   The Services panel is displayed.
2. In the Services panel toolbar, click and select **Archiver**.
3. In the **Actions** column, select **View > Explore**.
   The Explore view of the Archiver service is displayed.



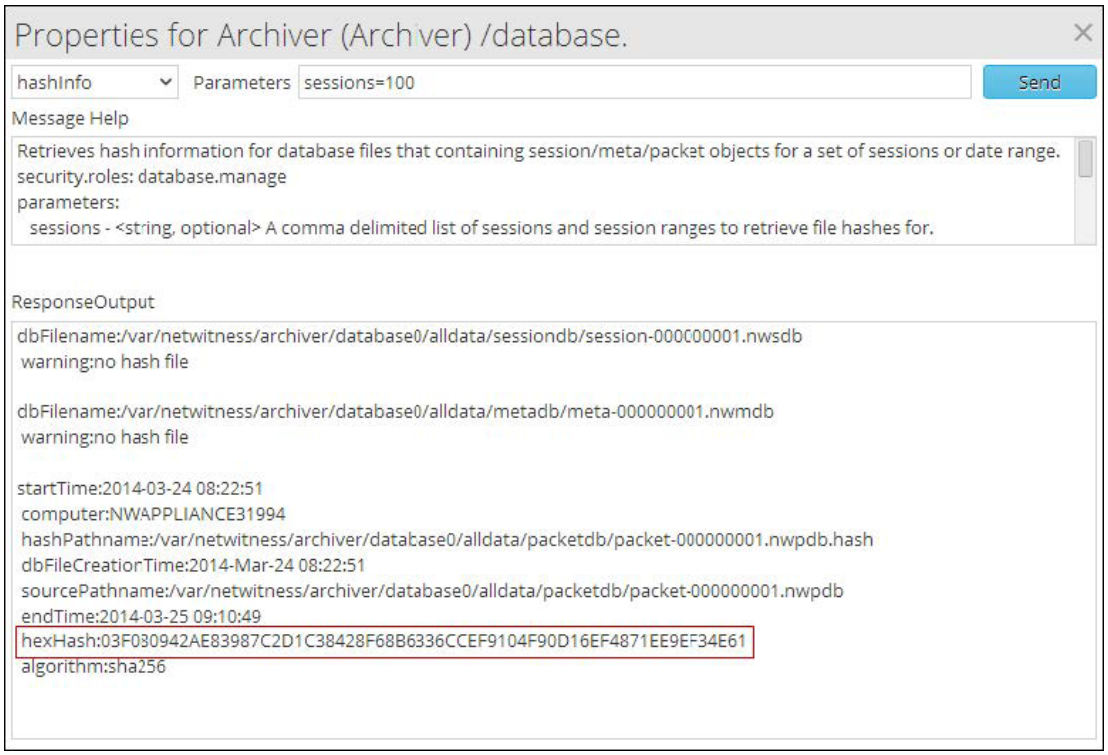
4. In the node tree, right-click on **archiver** and select **Properties**.
   The Properties dialog is displayed.

5. In the drop-down menu, select **hashInfo**.
6. In the **Parameters** field, type the criteria that you want to use to retrieve the hash information from the database.
7. Click **Send**.
   The output of the command is displayed in the ReponseOutput textbox. In the output, the hash information is shown in the hexHash parameter. You can use this hash information to verify data integrity manually.

Examples

Retrieve the hash information of the database files for the sessions that exist.
Criteria: sessions=100

Output

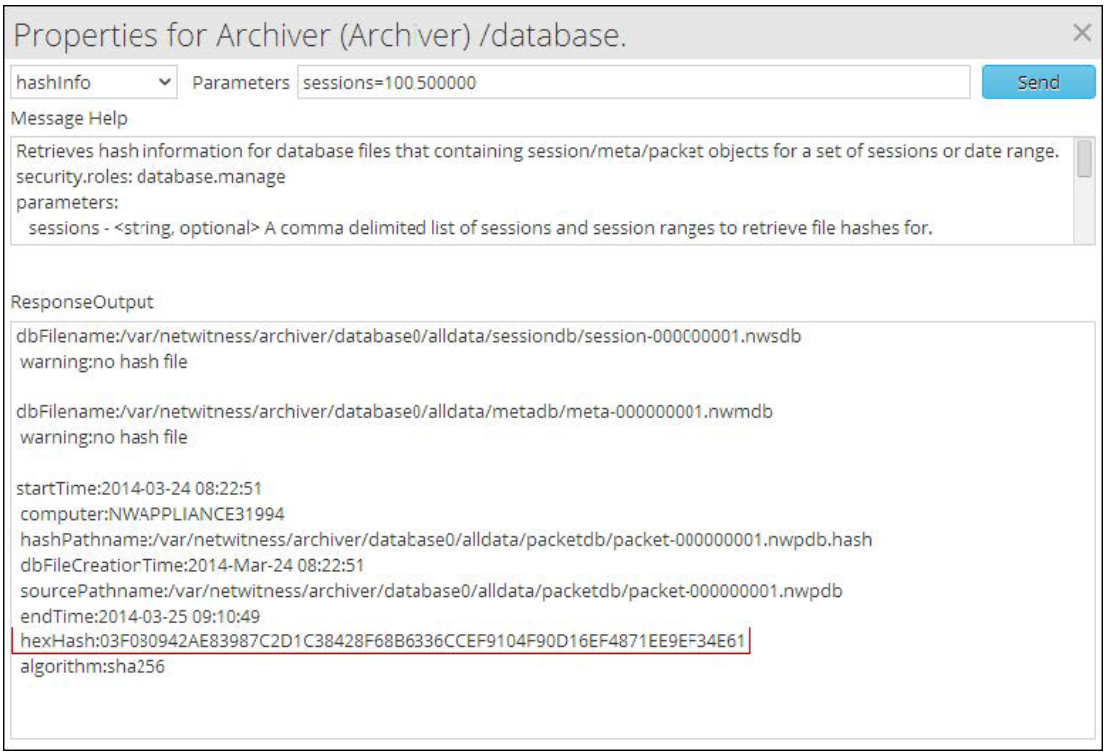


The hash information shown in the hexHash parameter is retrieved and you can use this to verify data integrity manually for session 100.

Retrieve the hash information of the database files for the session ranges that exist.

Criteria: sessions=100,500000

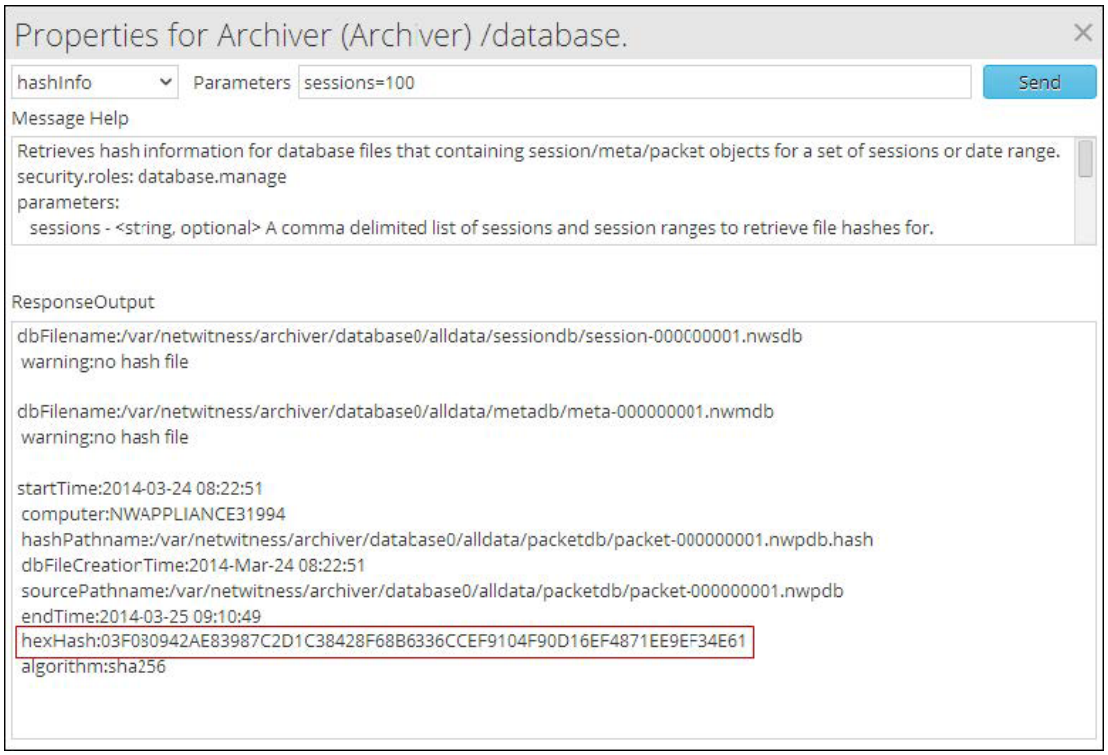
Output



The hash information shown in the hexHash parameter is retrieved and you can use this to verify data integrity manually for session range 100 - 500000

Retrieve the hash information of the database files created in the specified date range
Criteria: beginDate="2017-Mar-25 05:52:15" endDate="2017-Mar-27 05:52:15"

Output



The hash information shown in the hexHash parameter is retrieved and you can use this to verify data integrity manually for the date range specified.

Archiver Collection Dialog

On the ADMIN > Services > Config view > Data Retention tab of an Archiver, Administrators can define the criteria for log retention and storage. In the Collection dialog, which is accessible from the Collections section, you can define individual storage collections to use for different log types. For example, you may want to create collections for compliance reasons or to selectively retain critical logs.

Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver.

What do you want to do?

Role	I want to...	Show me how...
Administrator	Add an Archiver service	Edit the Archiver Service

Related Topics

Configuring an Archiver

Quick Look

To access the Collection dialog:

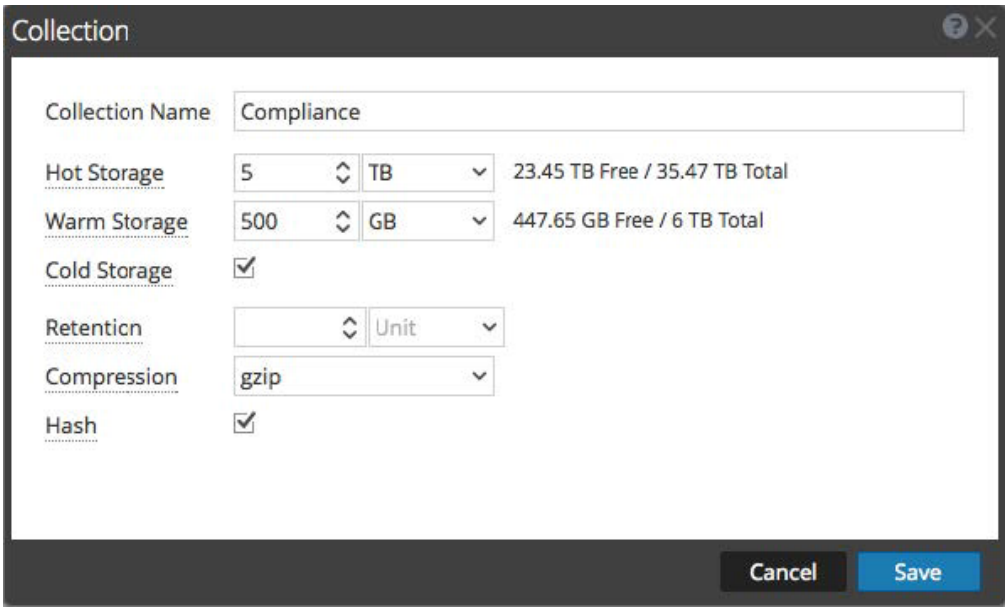
1. Go to **ADMIN > Services**.
   The Services panel is displayed.
2. In the Services panel toolbar, click and select **Archiver**.
3. In the Actions column, click

> **View > Config**.

The Services Config view of Archiver is displayed with General tab open.

4. Click the **Data Retention tab**.
5. In the Collections section, click +.

   The Collection dialog is displayed.



Note: When decreasing collection storage allocations or lowering retention time, it may take several minutes to hours for the data to move and space to become available depending on the amount of moving (rolling) data. The default times are every 20 minutes for a size roll and every six hours for a time roll.

The following table describes the fields in the Collection Dialog.

Field	Description
Collection Name	Specify a name for your collection, such as Compliance, MediumValue, or LowValue.
Hot Storage	Specify the maximum size or percentage of hot storage to use for this collection. The free space available to use for hot storage and the total hot storage are shown next to this field. When the size of the logs reach the maximum hot storage size, the logs are removed or they roll to the next available storage tier (warm or cold).
Warm Storage	(Optional) Specify the maximum size or percentage of warm storage to use for this collection. The free space available to use for warm storage and the total warm storage are shown next to this field. When the size of the logs reach the maximum warm storage size, the logs are removed or they roll to available cold storage.

Field	Description
Cold Storage	(Optional) Specify whether to use cold storage for this collection. If you use cold storage for the collection, logs outside of the specified size and retention limits roll over to cold storage. If you do not use cold storage, logs outside of the specified size and retention limits are removed.
Retention	(Optional) Specify the number of days that logs are retained before they are removed or rolled over to cold storage. For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first.
Compression	Specify the type of compression to use for meta and raw logs in the collection. You can compress the meta and raw logs using GZIP or LZMA to save space. GZIP is very fast at compressing and decompressing, but it does not compress as well as LZMA. LZMA offers better compression at a cost of decompression speed (roughly three times slower than GZIP). Compression ratios are highly dependent on your data. The default compression is GZIP.
Hash	Specify whether to enable or disable hash. When enabled, the hash algorithm is used to verify the data integrity of the files being saved.

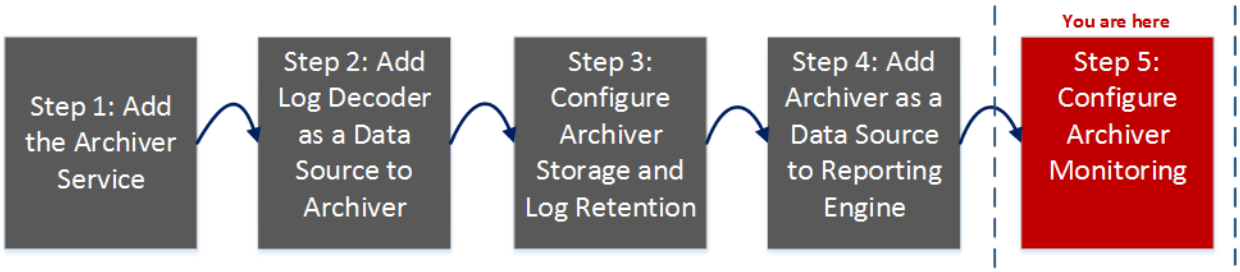
Archiver Services Config View - General Tab

The General tab for an Archiver in the Services Config view helps manage basic service configuration, configure the aggregate service, and configure the aggregation process between an Archiver and the aggregate service.

To access the General tab, go to ADMIN > Services, select an Archiver service, then select View > Config.

Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver.



Configuring the aggregate service (whose data is consumed and aggregated) includes:

- Adding, editing, and deleting Archivers as aggregate services
- Toggling an aggregate service online and offline
- Monitoring statistics for aggregate services
- Starting and stopping aggregation

Configuring the aggregation process includes setting:

- Aggregation autostart
- Timing and performance parameters, such as the number of sessions per round of aggregation and time between rounds
- The timing of attempts to restart, reconnect, or take offline a non-responsive aggregate service

What do you want to do?

Role	I want to...	Show me how...

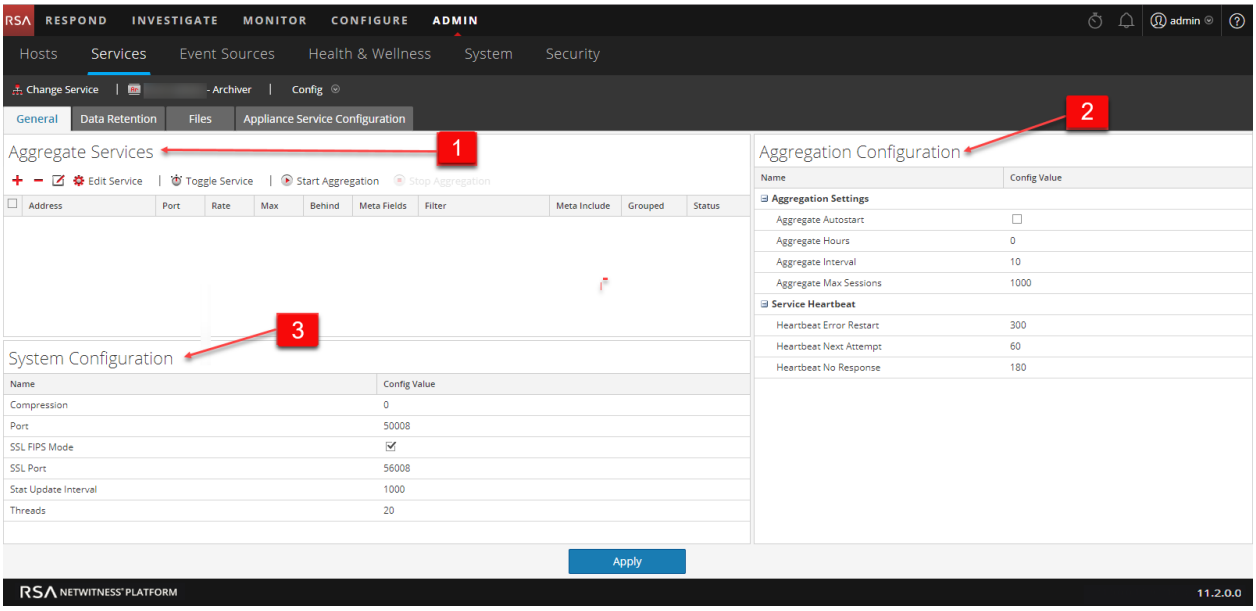
Configure Log Storage Collections

Quick Look

This is an example of the General tab.



These are the three major sections in the General tab for Archivers:

1. Aggregate Services section provides a way to start and stop aggregation, as well as add, edit, delete, and toggle an aggregate service.
2. System Configuration section manages service configuration for a service.
3. Aggregation Configuration section provides configuration settings that affect various aspects of the aggregation process.

Aggregate Services Section

This is an example of the Aggregate Services section for a Concentrator. The Aggregate Services section toolbar offers these options.

Option	Description
	Opens a dialog in which you can add a Concentrator, Decoder, or Log Decoder as an aggregate service.
	Removes the selected aggregate service.
	Opens a dialog to edit **Meta Fields** and **Filter** values.
	When aggregation has been stopped or has not started, starts aggregating data from the online service in the list using the rules defined for the service.
	When aggregation is in progress, stops aggregation on the Broker or Concentrator. This stops all services and flushes the index, which may take several minutes to complete. It is necessary to stop aggregate services in order to perform various administrative procedures.
	Toggles the state of a service between offline and online. Only data from online service is consumed during aggregation.

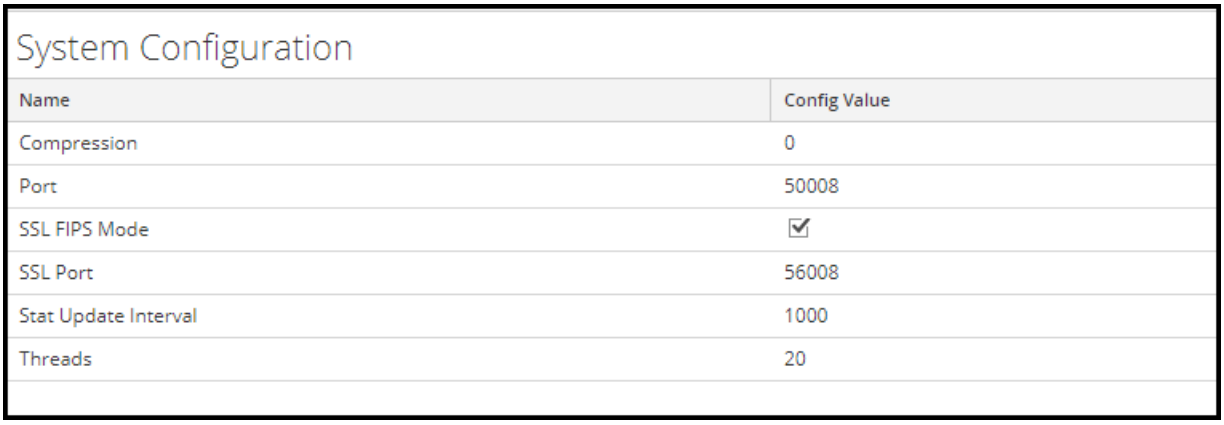
The Aggregate Services section list has these columns.

Column	Description
Address	Lists the address of the service.
Port	Lists the port on which the service listens. The default ports are: • 50001 for Log Collectors • 50002 for Log Decoders • 50003 for Brokers • 50004 for Decoders • 50005 for Concentrators • 50007 for other services
Rate	Lists the number of metadata objects being written to the database per second. Values are rolling average samples over a short time period (10 seconds). After capture stops, the rate is reset to **0**.
Max	Lists the maximum number of metadata objects written to the database per second since capture started. Values are rolling average samples over a short time period (10 seconds). After capture stops, **Max** continues to show the maximum value during capture.
Behind	Lists the number of sessions on the service that need to be aggregated.

Column	Description
Collection	For Brokers only, indicates the collection that was selected when the Analyst Workbench service was added to the Aggregate Services section.
Meta Fields	For Concentrators only, lists the types of metadata being consumed by the aggregate service.
Filter	For Concentrators only, lists any filter being applied to the metadata being consumed by the aggregate service.
Meta Include	For Concentrators only, lists the number of types of meta included in the aggregate service.
Grouped	Whether or not the aggregate service is part of a group.
Status	Lists the current status of the service: • online = available to provide data for consumption by the Broker or Concentrator • offline = not available to provide data for consumption by the Broker or Concentrator • consuming = providing data for consumption by the Broker or Concentrator

System Configuration Section

When a service is first added, default values are in effect. You can edit these values to tune performance.



System Configuration

Name	Config Value
Compression	0
Port	50008
SSL FIPS Mode	☑
SSL Port	56008
Stat Update Interval	1000
Threads	20

The System Configuration section has these parameters.

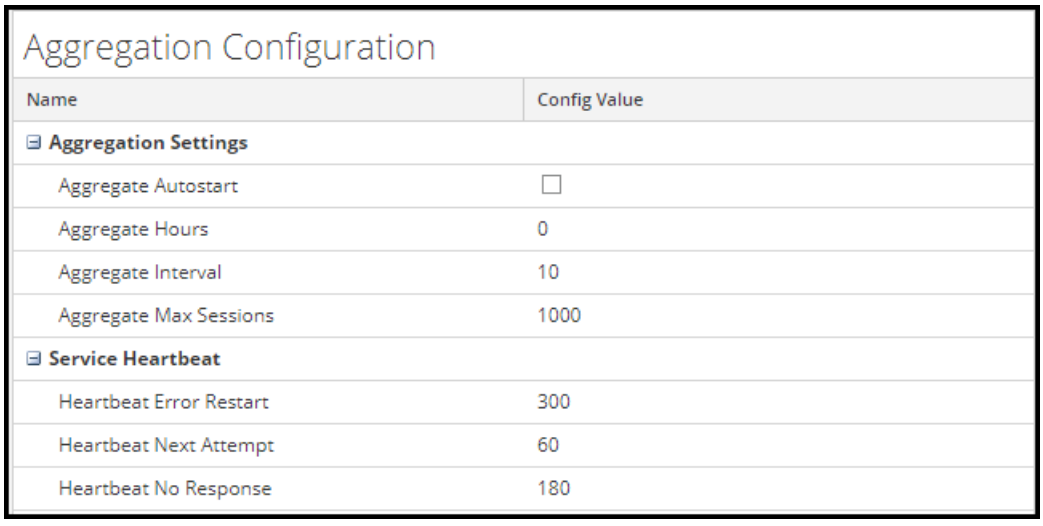
Parameter	Description
Compression	The minimum number of bytes that must be transmitted per response before compression. A setting of **0** disables compression. The default value is **0**. A change in value is effective immediately for all subsequent connections.

Parameter	Description
Port	The port on which the service listens. The default ports are: • 50001 for Log Collectors • 50002 for Log Decoders • 50003 for Brokers • 50004 for Decoders • 50005 for Concentrators • 50007 for other services
SSL FIPS Mode	When enabled (**on**), the security of data transmission is managed by encrypting information and providing authentication with SSL certificates. The default value is **off**.
SSL Port	Indicates the SSL port.
Stat Update Interval	The number of milliseconds between statistic updates on the system. Lower numbers cause more frequent updates and can slow down other processes. The default value is **1000**. A change in value is effective immediately.
Threads	The number of threads in the thread pool to handle incoming requests. A setting of **0** lets the system decide. The default value is **15**. Changes takes effect on service restart.

Aggregation Configuration Section

The Aggregation Configuration Section provides configuration settings for aggregation. When you click **Apply**, the changes are saved; however, not all settings take effect immediately. The tables for Aggregation Settings and Service Heartbeat provide details.

Caution: Do not edit any of these settings without guidance from Customer Support.



Archiver Service Configuration

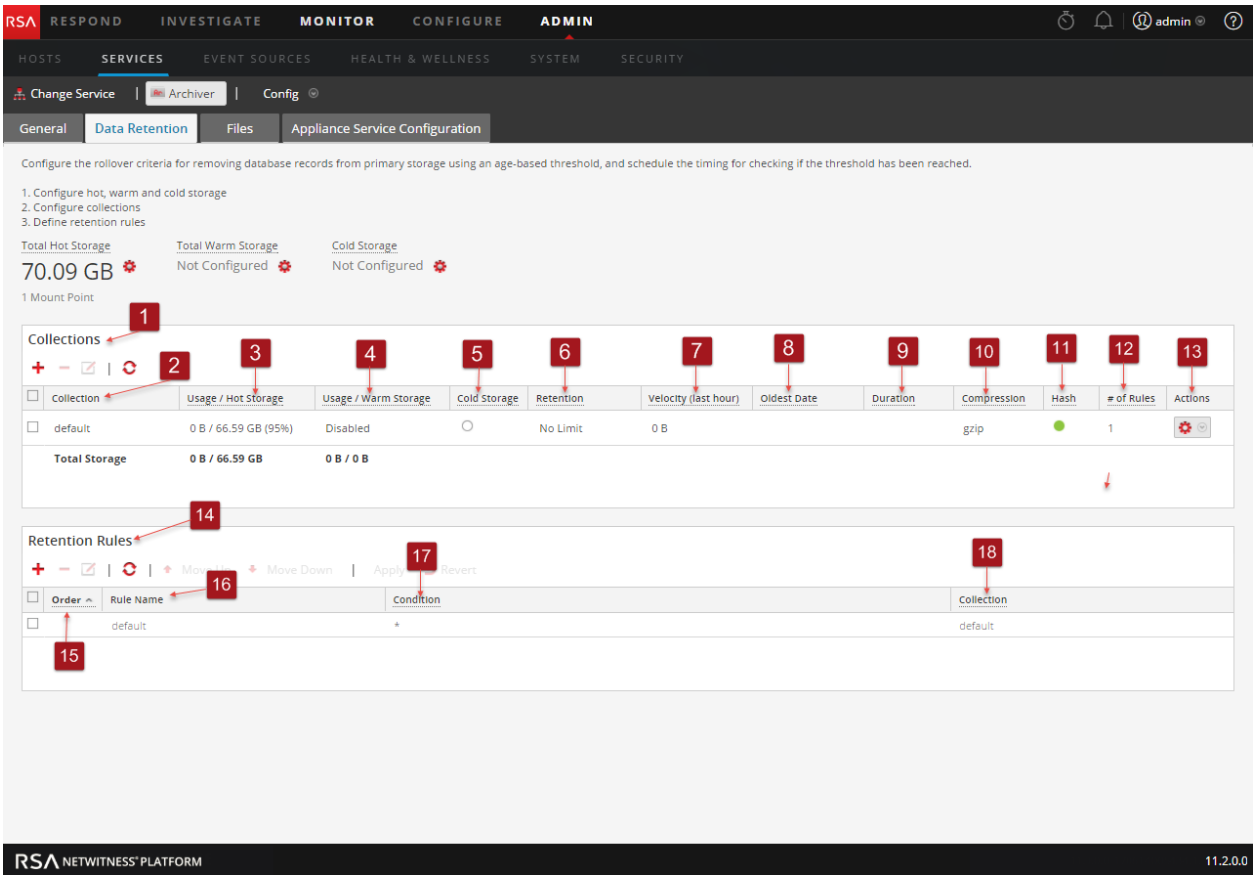
Configuring an Archiver

Configure Hot, Warm, and Cold Storage

Quick Look

As an Administrator, you can configure hot, warm, and cold storage as well as multiple storage collections with different locations and criteria for retaining logs. For example, you can create a Compliance collection that stores logs for a specific time period as required by government regulations. You can create another collection that stores low value logs in hot storage with a much shorter retention period. The flexibility of these collections enables you to have significantly less overall storage requirements.



1	Displays the Collections panel with the Data Retention tab open.
2	Allows you to sort the collections in ascending or descending order.
3	Displays the allocated hot storage space for the collection, as well as the approximate current usage.
4	Displays the allocated warm storage space for the collection, as well as the approximate current usage.
5	Displays whether the collection uses cold storage for long-term backup.
6	Displays the time range used to determine when data is moved to cold storage or discarded.
7	Displays the amount of data written to the collection during the past hour.
8	Displays the date of the oldest data stored in the collection.
9	Displays the approximate age of the oldest data stored in the collection.
10	Displays the compression type used in collection storage.
11	Displays whether or not hashes are used when storing data in the collection.
12	Displays the number of retention rules that use this collection for storing data.
13	Displays the Actions drop-down menu.
14	Displays the Retention Rules panel.
15	Displays the order in which Retention Rules are evaluated in the execution chain.
16	Displays the name of the Retention Rule.
17	Data that satisfies this condition is stored in the corresponding collection.
18	Displays the collection used to store the data that satisfies this particular rule condition.

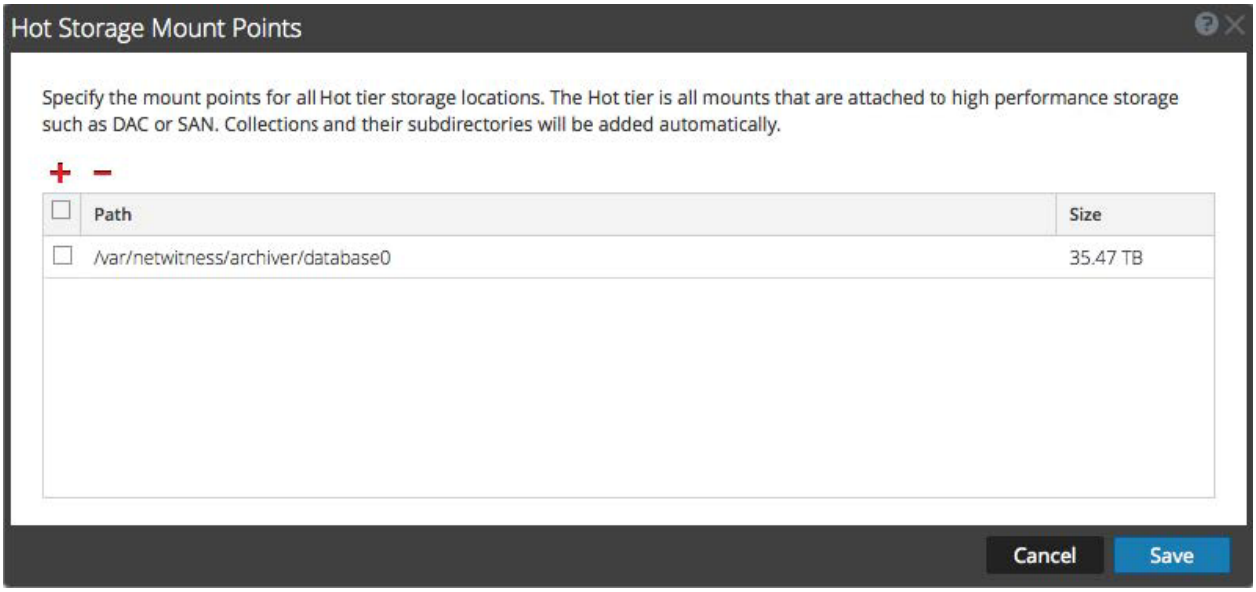
Total Hot, Warm, and Cold Storage

The Total Hot Storage section shows the total amount of Hot storage available and the number of hot storage mount points. The Total Hot Storage section shows the total amount of Warm storage available and the number of warm storage mount points. The Total Cold Storage section shows the total amount of Cold storage and the remaining free space available in Cold storage.

Hot, Warm, and Cold Storage Mount Points Dialogs

In the Hot, Warm, and Cold Storage Mount Points dialogs, you can specify the mount points for your storage locations. You can specify portions of this storage to use for your log storage collections.

To access the Hot, Warm, and Cold Storage Mount Points dialogs, click the icon near the respective section.

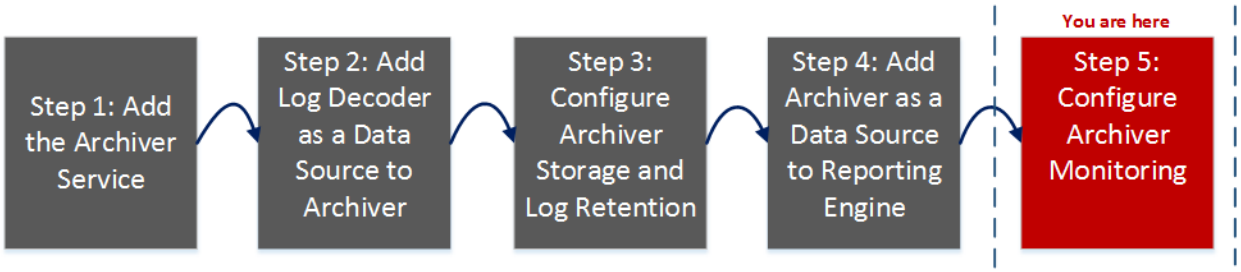


Services Config View - Archiver

The Services Config view (ADMIN > Services > select Archiver service and select >View > Config) provides a way to manage basic service configurations, configure aggregate services, configure log retention and storage, edit service configuration files, and configure the appliance service for an Archiver.

Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver.



What do you want to do?

Role	I want to...	Show me how...
Administrator	Add the Archiver service.	Edit the Archiver Service
Administrator	Add a Log Decoder as a Data Source to an Archiver.	Add Log Decoder as a Data Source to Archiver
Administrator	Configure Archiver Storage and Log Retention.	Configure Archiver Storage and Log Retention
Administrator	Add an Archiver as a Data Source to Reporting Engine..	Add Archiver as a Data Source to Reporting Engine
Administrator	Configure Archiver Monitoring.	Configure Archiver Monitoring
Administrator	*Add a Log Decoder as an aggregate service.	Click + in the Aggregate Services section.
Administrator	*Remove the selected aggregate service.	Click − in the Aggregate Services section.
Administrator	*Edit Meta Fields and Filter values of the aggregate service.	Click in the Aggregate Services section. You can specify the type of metadata that the Archiver consumes from this service. You can also specify a rule to filter data that the Archiver consumes from this service.

Role	I want to...	Show me how...
Administrator	*Communicate with the Archiver.	Click Edit Service in the Aggregate Services section. This enables you to enter the administrator credentials of the selected aggregate service so that it can communicate with the Archiver.
Administrator	*Toggle the state of a service between offline and online.	Click Toggle Service in the Aggregate Services section.
Administrator	*Aggregate data using the rules defined for the service.	Click Start Aggregation in the Aggregate Services section. Note that it is necessary to start aggregate service after aggregation has been stopped.
Administrator	*Stop aggregation on the Archiver.	Click Stop Aggregation in the Aggregate Services section. This stops all services and flushes the index, which may take several minutes to complete. It is necessary to stop aggregate services in order to perform various administrative procedures.

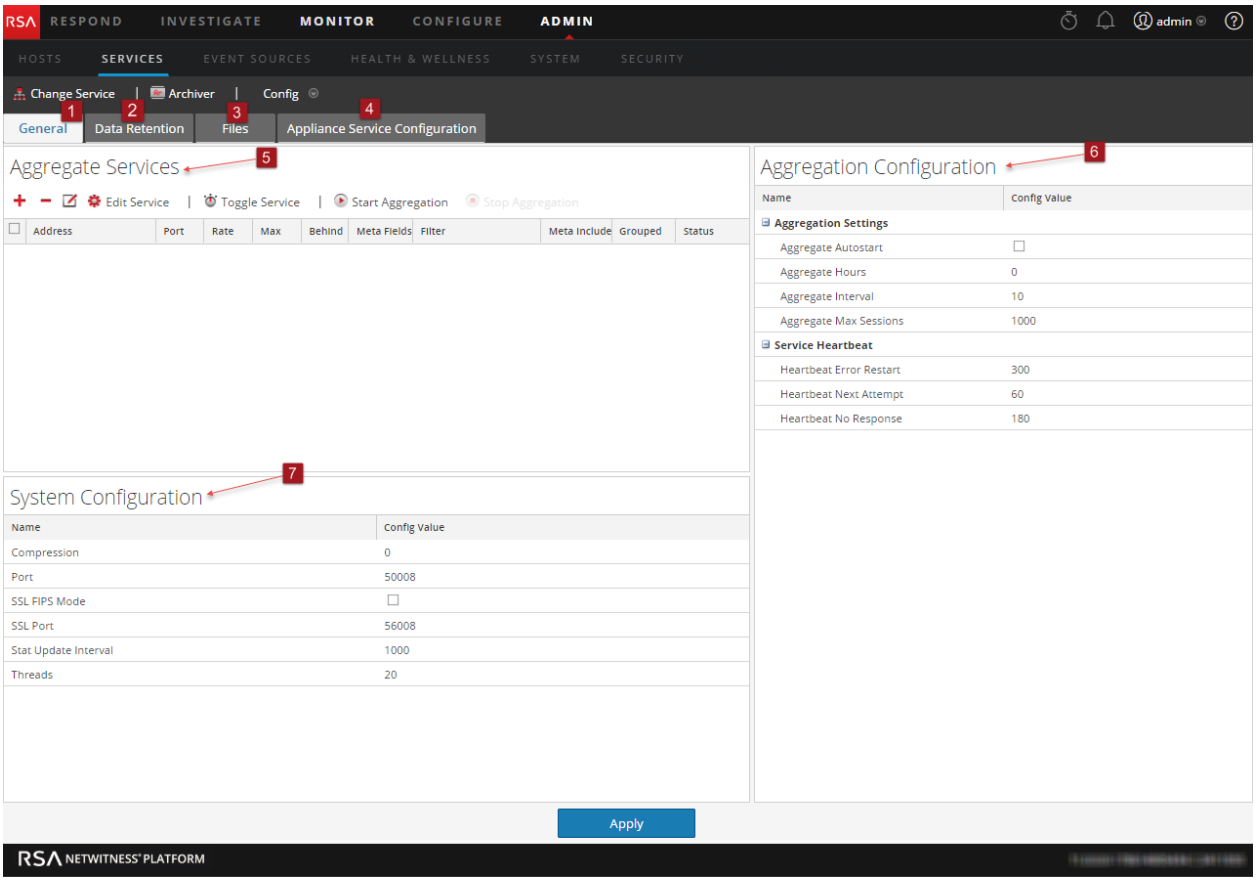
*You can perform this task in the current view.

Related Topics

Configure Log Storage Collections

Quick Look

The Services Config view has four tabs and three panels.



1	General tab provides a way to manage basic Archiver service configuration.
2	Data Retention tab provides a way to view and edit collections and retention rules.
3	Files tab allows you to edit enables you to edit the service configuration files for the Archiver as text files
4	Appliance Service Configuration tab provides a way to configure an Archiver service.
5	Aggregate Services panel provides a way to start and stop aggregation, as well as add, edit, delete, and toggle an aggregate service.
6	Aggregation Configuration panel provides configuration settings that affect various aspects of the aggregation process.
7	System Configuration panel provides a way to manage service configuration for an Archiver service.

General

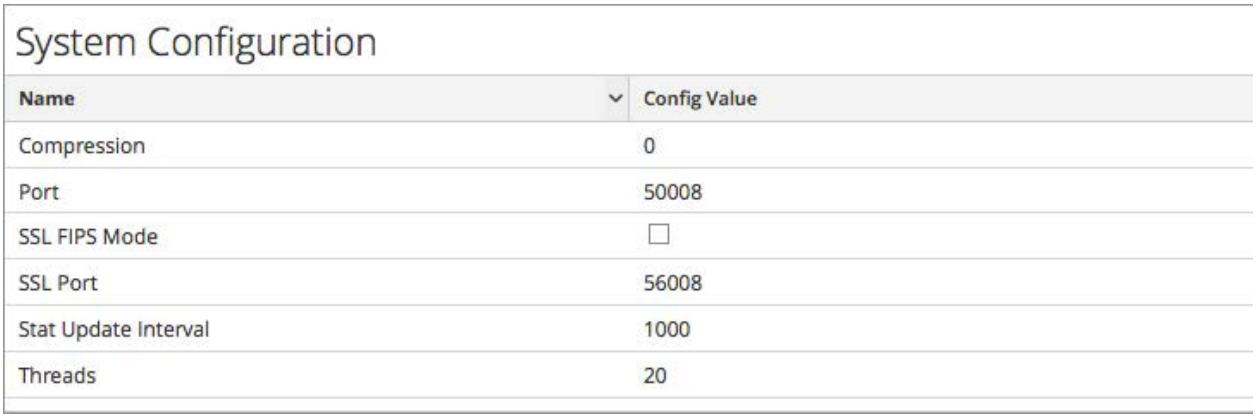
The General tab contains the following sections:

- Aggregate Services
- System Configuration
- Aggregation Configuration

Aggregate Services

The Aggregate Services section provides a way to start and stop aggregation, as well as add, edit, delete, and toggle an aggregate service.

System Configuration

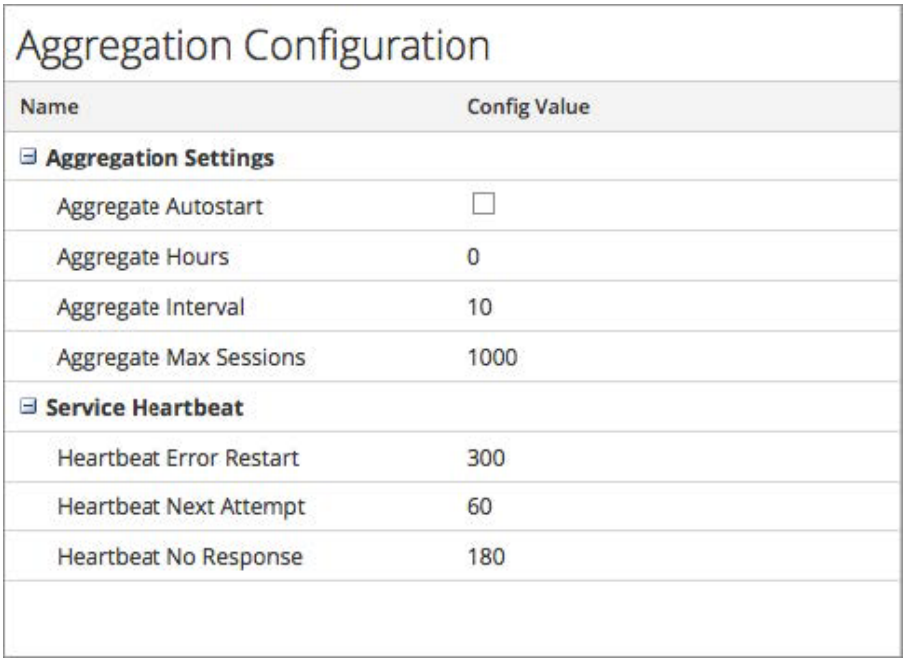


When you add an Archiver service, default values are in effect. RSA designed the default values to accommodate most environments and recommends that you do not edit these values because it may adversely affect performance. The following table describes the System Configuration parameters.

Task	Description
Compression	Determines the minimum amount of bytes before a message is compressed. If set to zero, messages are not compressed.
Port	Determines the port used by the service. **Note:** If you change the port number, ensure that you restart the service.
SSL FIPS mode	If enabled, all the data transferred in the network will be encrypted using SSL.
SSL Port	Indicates the port used for encrypting using SSL.

Task	Description
Stat Update Interval	Determines how often (in milliseconds) statistic nodes are updated in the system.
Threads	Determines the number of threads in the thread pool to handle incoming requests.

Aggregation Configuration



The Aggregation Configuration section contains the following sections:

- Aggregation Settings
- Service Heartbeat

Aggregation Settings

The Aggregations Settings section has the following parameters.

Parameter	Description
Aggregate Autostart	If enabled, data aggregation will automatically restart after a service restart.
Aggregate Hours	Determines the maximum number of hours a service is allowed to start aggregation.
Aggregate Interval	Determines the minimum number of milliseconds before another round of aggregation is requested.
Aggregate Max Sessions	Determines the number of sessions to aggregate on each round.

Service Heartbeat

The Service Heartbeat section has the following parameters.

Parameters	Description
Heartbeat Error Restart	Determines the number of seconds to wait after a service error before attempting a service reconnect.
Heartbeat Next Attempt	Determines the number of seconds to wait before attempting a service reconnect.
Heartbeat No Response	Determines the number of seconds to wait before taking unresponsive service to offline.

Files

The **Files** tab in the Service Config view enables you to edit the service configuration files for the Archiver as text files. The files available to edit vary depending upon the type of service being configured.

The following files are common to all core services:

- Service index file
- NetWitness file
- Crash reporter file
- Scheduler file
- Feed definitions file

For more information on the **Files** tab, see the "Files Tab" topic in the *Host and Services Getting Started Guide*.

NetWitness Platform Automated Threat Detection

RSA NetWitness® Platform Automated Threat Detection uses preconfigured ESA Analytics modules to identify specific types of threats. An ESA Analytics module is a pipeline composed of activity objects that enrich an event with additional information through mathematical computations. ESA Analytics modules reside within ESA Analytics services. The ESA Analytics services use query-based aggregation (QBA) to collect filtered events for the modules from Concentrators. Only the data required by a module is transferred between the Concentrator and the ESA Analytics system.

There are two ESA services that can run on an ESA host:

- ESA Correlation (ESA Correlation rules)
- Event Stream Analytics Server (ESA Analytics)

The first service is the ESA Correlation service that creates alerts from ESA rules, also known as ESA Correlation Rules, which you create manually or download from Live. The second service is the ESA Analytics service, which is used for Automated Threat Detection. Because the ESA Analytics service uses preconfigured modules for Automated Threat Detection, you do not have to create or download rules to use Automated Threat Detection.

Note: The Contexthub Server service, which provides enrichment lookup capability in the Respond and Investigate views, runs only on an ESA Primary host. For information, see the *Context Hub Configuration Guide*.

NetWitness Platform Automated Threat Detection currently has two Suspicious Domain modules available, Command and Control (C2) for Packets and C2 for Logs.

Because each ESA Analytics module has different data requirements, be sure that all module-specific requirements are met before you deploy a module for Automated Threat Detection.

Automated Threat Detection for Suspicious Domains

The Suspicious Domains modules examine your HTTP traffic to detect domains likely to be malware Command and Control servers connecting to your environment. After NetWitness Platform Automated Threat Detection for Suspicious Domains examines your HTTP traffic, it generates scores based on various aspects of your traffic behavior (such as the frequency and regularity with which a given domain is contacted). If these scores reach a set threshold, an ESA alert is generated. This ESA alert is forwarded to the Respond view. The alert in the Respond view is enriched with data that helps you to interpret the scores to determine what mitigation steps to take.

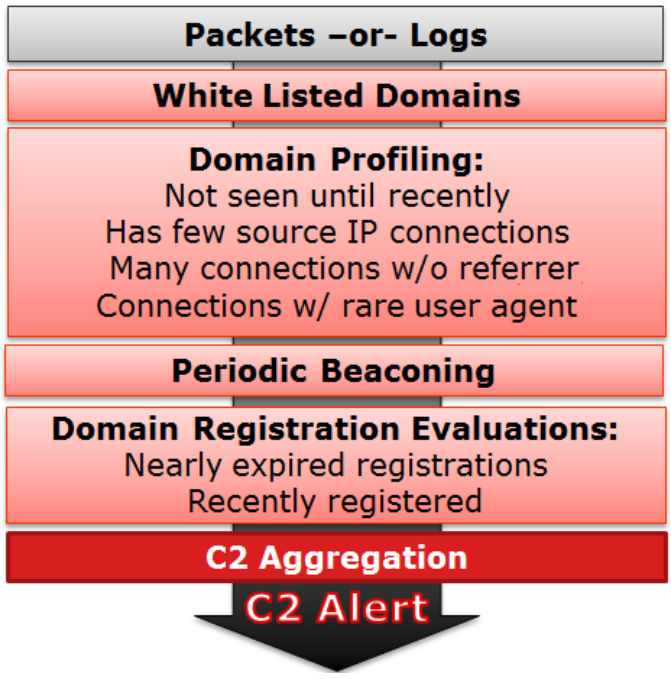
The Automated Threat Detection Suspicious Domain modules provide scoring to detect Command and Control communications. Command and Control communications occur when malware has compromised a system and is sending data back to a source. Often, Command and Control malware can be detected via beaconing behavior. Beaconing occurs when the malware regularly sends communications back to the Command and Control server to notify it that a machine has been compromised and the malware is awaiting further instructions. The ability to catch the malware at this stage of compromise can prevent any further harm from occurring to the compromised machine and is considered a critical stage in the "kill chain."

NetWitness Platform Automated Threat Detection solves several common problems that occur when searching for malware:

- **Ability to use algorithms rather than signatures**. Because many malware creators have begun using polymorphic or encrypted code segments, which are very difficult to create a signature for, this approach can sometimes miss malware. Because NetWitness Platform Automated Threat Detection uses a behavior-based algorithm, it is able to detect malware more quickly and effectively.
- **Ability to automate hunting**. Hunting through data manually is an effective but extremely time-consuming method of finding malware. Automating this process allows an analyst to use his or her time more effectively.
- **Ability to find an attack quickly**. Instead of batching and then analyzing the data, Automated Threat Detection analyzes data as it is ingested by NetWitness Platform, allowing for the attacks to be found in near real time.

Suspicious Domains Module Workflow

NetWitness Platform Automated Threat Detection works much like a filtering system. It checks to see if certain behavior occurs (or certain conditions exist), and if that behavior or condition occurs, it moves to the next step in the process. This helps to make the system efficient, and frees up resources so that events that are determined to be non-threatening are not held in memory. The following diagram provides a simplified version of the Suspicious Domains module workflow.



1.) **Packets or logs are routed to the ESA**. The HTTP packets or logs are parsed by the Decoder or Log Decoder and sent to the ESA host.

2.) **Whitelist is checked**. If you created a whitelist through the Context Hub, ESA checks this list to rule out domains. If a domain in the event is whitelisted, the event is ignored.

3.) **The domain profile is checked**. Automated Threat Detection checks to see if the domain is newly seen (approximately three days), has few source IP connections, has many connections without a referer, or has connections with a rare user agent. If one or several of these conditions is true, the domain is next checked for periodic beaconing.

4.) **The domain is checked for periodic beaconing**. Beaconing occurs when the malware regularly sends communications back to the command and control server to notify it that a machine has been compromised and the malware is awaiting further instructions. If the site displays beaconing behavior, then the domain registration information is checked.

5.) **Domain registration information is checked**. The Whois service is used to see if the domain is recently registered or nearly expired. Domains that have a very short lifespan are often hallmarks of malware.

6.) **Command and Control (C2) aggregates scores**. Each of the above factors generates a separate score, which is weighted to indicate various levels of importance. The weighted scores determine if an alert should be generated. If an alert is generated, the aggregated alerts appear in the Respond view and can then be investigated further from there. Once the alerts begin to appear in the Respond view, they continue to aggregate under the associated incident. This makes it easier to sort through volumes of alerts that can be generated for a command and control incident.

Analysts can view the alerts in the Respond view.

Suspicious Domains Automated Threat Detection on Packets vs. Web Proxy Logs

RSA NetWitness Platform provides you with the ability to perform Automated Threat Detection for Suspicious Domains using either packets or web proxy logs. While packet data can be streamed directly off of the wire into the NetWitness Platform installation and analyzed directly, if you have the ability to use a web proxy in your installation it may be beneficial to use it. Because some installations use network translation or SSL encryption, the true source IP of an outgoing connection may be masked if you are observing it at the packet level. By using a web proxy you gain the benefit of its ability to accelerate and decrypt SSL traffic as well as its ability to track the true source IP addresses of traffic it monitors.

Both Suspicious Domains for Packets (C2 for Packets) and Suspicious Domains for Logs (C2 for Logs) should produce the same results. From a results point of view, there is no real advantage to using one over the other.

Configuring Automated Threat Detection for Suspicious Domains

This topic tells administrators and analysts how to configure a Suspicious Domains module for NetWitness Platform Automated Threat Detection. The Automated Threat Detection functionality enables you to analyze the data that resides on one or more Concentrators by using preconfigured ESA Analytics modules. For example, using a Suspicious Domains module, an ESA Analytics service can examine your HTTP traffic to determine the probability that malicious activity is occurring in your environment.

There are two types of preconfigured Suspicious Domains modules available in NetWitness Platform: Command and Control (C2) for Packets and C2 for Logs. The Suspicious Domains module defines a subset of events and the activities executed on those events for identifying suspicious C2 domains.

Before you deploy an ESA Analytics module for Automated Threat Detection, it is important to note that there are many potential installation configurations that may be installed on the ESA, including: ESA Analytics, ESA Correlation Rules, and the Context Hub. Each of these may take up resources, so it is important to consider sizing before deploying Automated Threat Detection on your ESA.

Prerequisites

- If you are using Packet data, you must have configured a Decoder for HTTP packet data, and you must have configured an HTTP Lua or Flex parser.
- If you are using web proxy log data, you must have configured the appropriate Log Decoder with the correct parser for your web proxy.
- If you are using web proxy log data, you must have updated to the latest log parsers. The following parsers are supported: Blue Coat Cache Flow (cacheflowelff), Cisco IronPort WSA (ciscoiportwsa), and Zscaler (zscalernss).
- If you are using web proxy log data, for best results you should configure all web proxies the same way (set to the same time zone, use the same collection method -syslog or batch, and if you use batch use the same batching cadence).
- A connection from the ESA host to the Whois service (same location as RSA Live cms:netwitness.com:443) must be opened on port 443. Verify with your System Administrator that this is complete.
- To whitelist a domain, you need to enable the Context Hub service.

IMPORTANT: Automated Threat Detection requires a "warm-up" period that acclimates the scoring algorithm to the traffic in your network. You should plan to configure Automated Threat Detection so that the warm-up period can run during normal traffic. For example, starting Automated Threat Detection on a Tuesday at 8:00 am in the timezone that contains the majority of your users allows the module to accurately analyze a day of normal traffic.

Configure Automated Threat Detection for Suspicious Domains

This procedure provides the steps needed to configure an ESA analytics Suspicious Domains module for Automated Threat Detection. ESA analytics modules, such as Suspicious Domains, are considered preconfigured because you do not have to manually create ESA rules for them.

The basic steps required are:

1. **Configure Log settings (for Logs only)**. Before you can use Automated Threat Detection for Logs, you must configure several settings. Skip this step if you plan to use Automated Threat Detection for Packets.
2. **Create a whitelist (optional) using the Context Hub service**. Creating a whitelist allows you to ensure that commonly accessed websites are excluded from any Automated Threat Detection scoring.
3. **Configure the Whois Lookup service**. The Whois service enables you to get accurate data about domains that you connect to. In order to ensure effective scoring, it is important that you configure the Whois Lookup service. Verify that the Whois Service is reachable from your environment.
4. **Map data sources to ESA Analytics modules**. You define how NetWitness Platform Automated Threat Detection should automatically detect advanced threats by mapping a preconfigured ESA analytics module to multiple data sources, such as Concentrators, and an ESA analytics service.
5. **Verify that the C2 incident rule is enabled and monitor for activity**. After mapping your Suspicous Domains module, a period of time is required for the scoring algorithm to warm-up. After the warm-up period, verify that the C2 rule is enabled in the Incident Rules and monitor to see if the rule is triggered.
6. **Verify that the incident rules are configured correctly**. When you view incidents in the Respond view, it is helpful if the incidents are grouped by Suspected C&C.

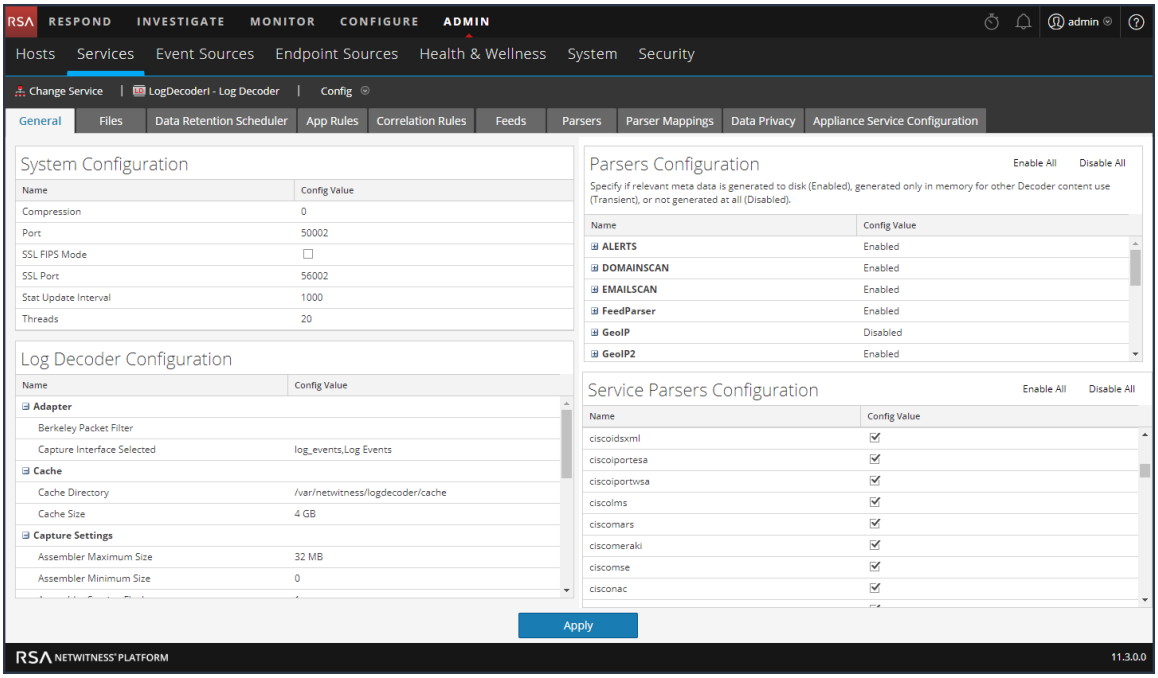
Step 1: (For Logs Only) Configure Log Settings

To configure Automated Threat Detection for Logs, you need to complete a few extra configuration steps:

- Verify that the supported parsers are enabled for your Log Decoder.
- Get the latest versions of the appropriate web proxy parser from RSA Live.
- Update the mapping on the Envision config file. This file is required to update the Log Decoder to work with the new meta available via the parsers.
- Verify that the table-map.xml file was updated correctly.
- Verify that the indexes were updated correctly.

To verify that your parsers are running on your Log Decoder:

1. Go to **ADMIN > Services**.
2. Select your Log Decoder and select **> View > Config**.
   The Service Parsers Configuration section shows a list of enabled parsers.
3. Verify that the appropriate web proxy parser is enabled.

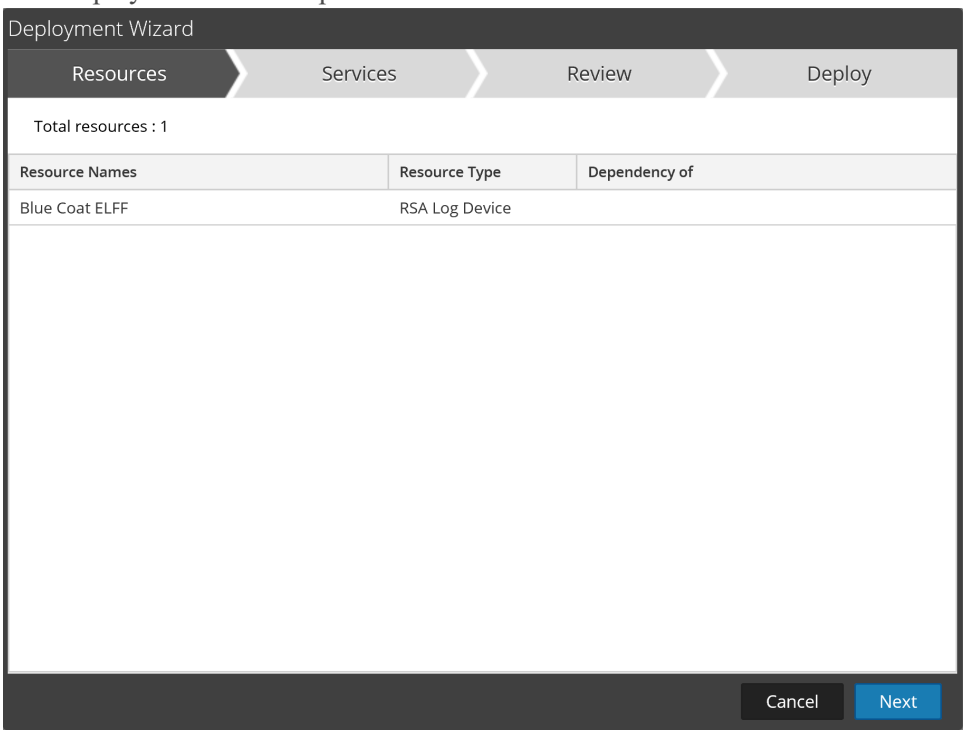


To get the latest parsers from RSA Live:

1. Go to **CONFIGURE > Live Content**.
2. Enter a search term for one of the supported web proxy parsers.
3. Select the appropriate web proxy parser [for example, the Blue Coat ELFF (cacheflowelff) parser].

   Note: You should have taken steps to configure logging to occur on your web proxy parser correctly.

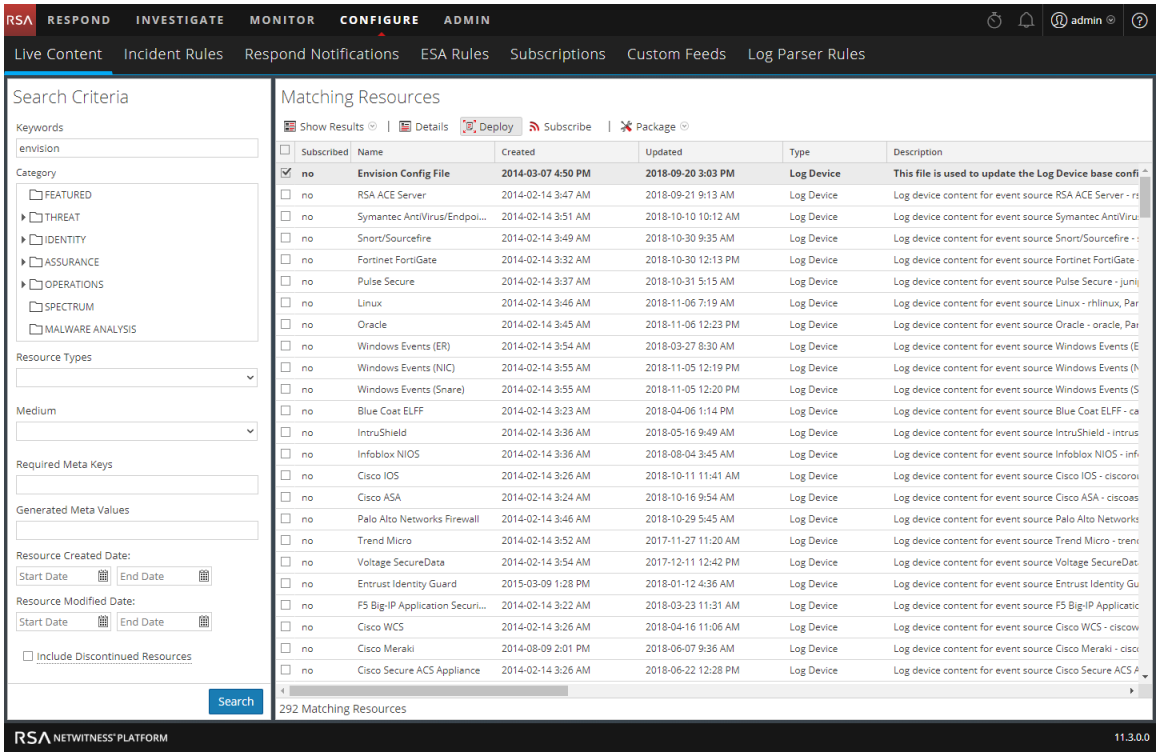
4. Click **Deploy**.
   The Deployment Wizard opens.



5. Click **Next** and under **Services**, select the Log Decoder as the Service.
6. Click **Next** and review your selection.
7. Click **Deploy** to deploy the parser to your Log Decoder.

To get the latest Envision Config file:

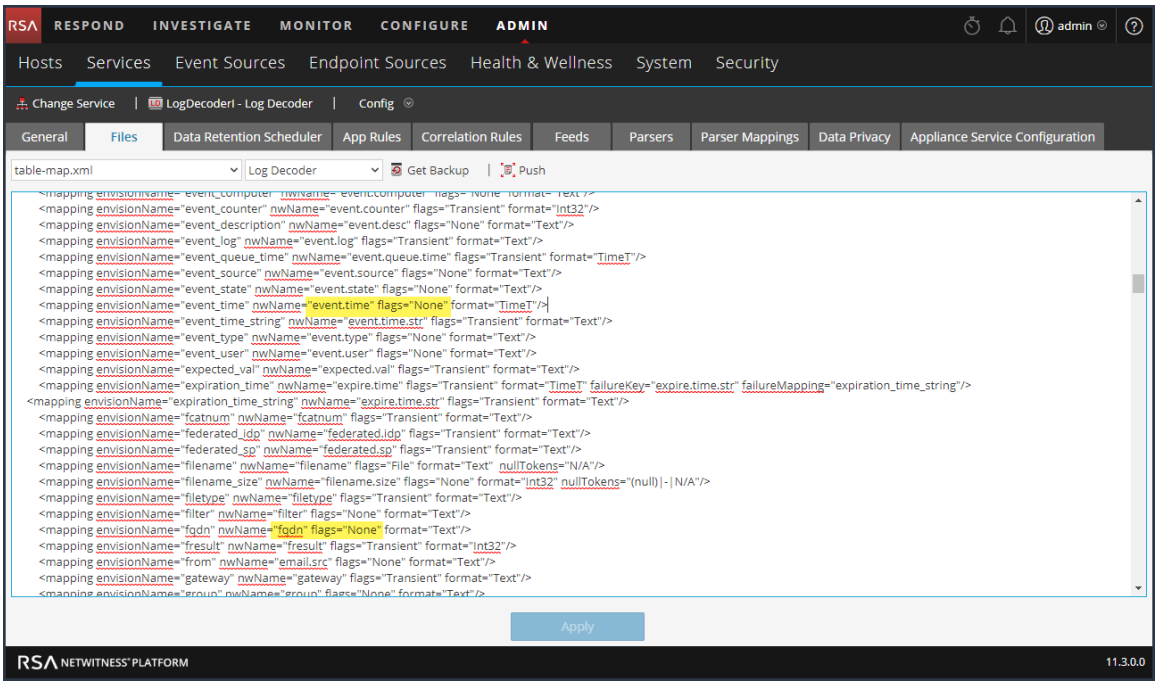
1. Go to **CONFIGURE > Live Content**.
2. Enter **envision** as the key word for the search.
3. Select the latest Envision Config File and click **Deploy**.



4. Click **Next**, and in the Deployment Wizard, under **Services**, select your Log Decoder.
5. Click **Next** and review your selection.
6. Click **Deploy** to deploy the Envision configuration file to the Log Decoder.

To verify that the Envision Configuration file was updated correctly:

1. Go to **ADMIN > Services**, select the Log Decoder, and then select **> View > Config > Files** tab.
2. Select the `table-map.xml` file. This file is modified when you update the Envision Configuration file.
3. Search for the term, *event.time*. The field should now read, *"event.time" flags ="None"*. This means that the event.time meta is now included in the mapping. Similarly, the fqdn flag should be set to "None".

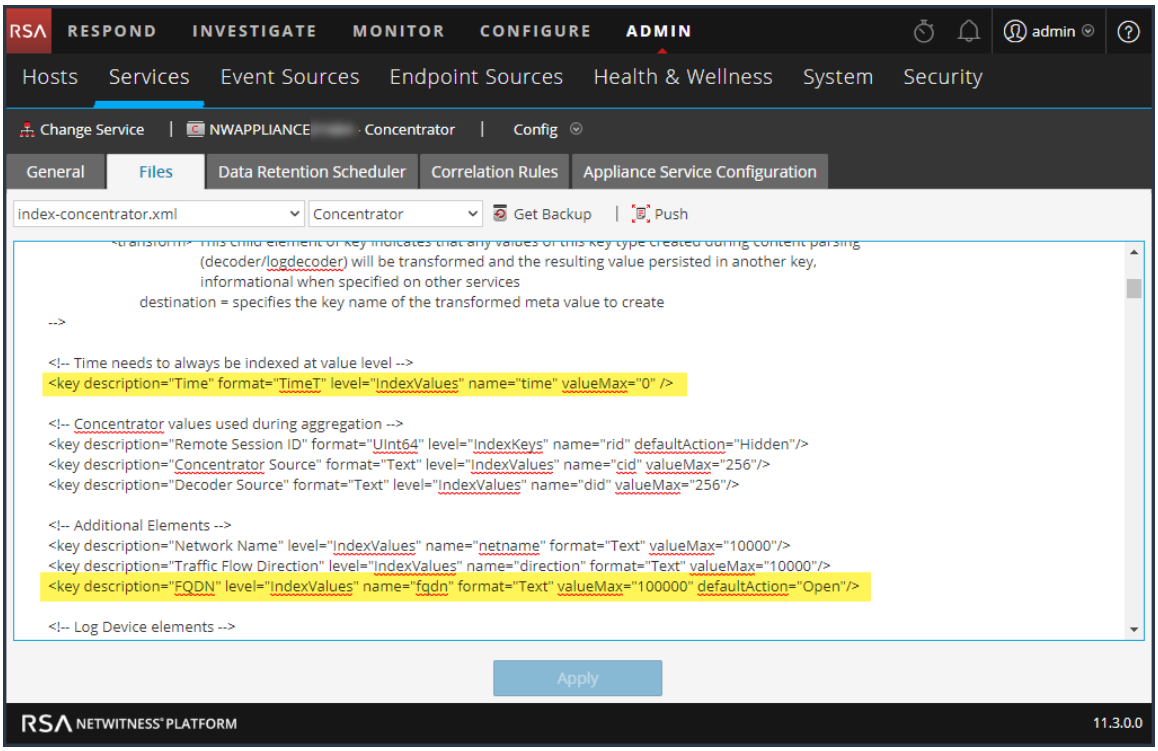


To verify that the Indices for the index-concentrator.xml file are updated:

You must verify that the `index-concentrator.xml` file includes both the `event.time` and `fqdn` meta.

1. Go to **ADMIN > Services**, select your Concentrator, and then select > **View > Config**.
2. On the **Files** tab, select the `index-concentrator.xml` file.
3. Verify that the following entry exists in your `index-concentrator.xml` file. If not, ensure that your Concentrator is upgraded to the correct version:

```
<key description="FQDN" level="IndexValues" name="fqdn" format="Text"
valueMax="100000" defaultAction="Open"/><key description="Event Time"
format="TimeT" level="IndexValues" name="event.time" valueMax="0" />
```



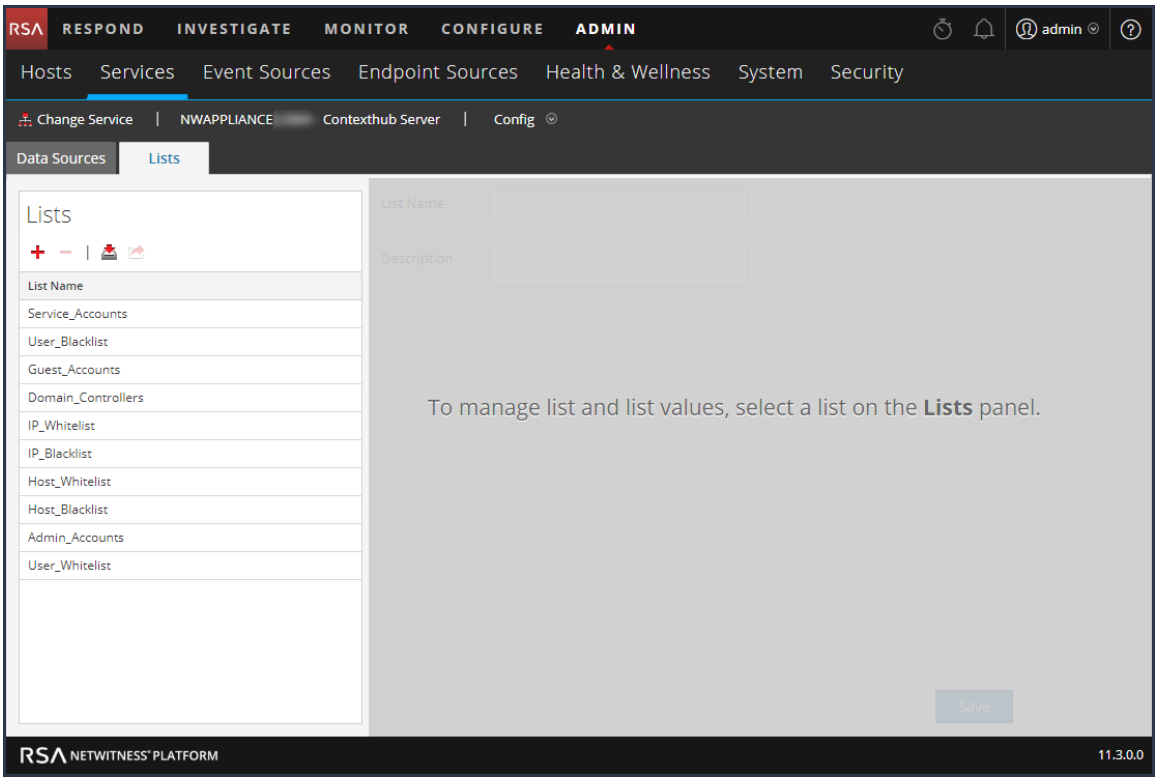
Step 2: Create a Domains Whitelist (Optional)

This procedure is used when working with Automated Threat Detection to ensure that certain domains do not trigger a threat score. Sometimes, a domain you access regularly may trigger an Automated Threat Detection score. For example, a weather service might have similar beaconing behavior as a Command and Control communication and trigger an unwarranted negative score. When this happens, it is called a false positive. To prevent triggering a false positive with a specific domain, you can add the domain to a whitelist. Most domains do not need to be whitelisted because the solution only alerts on very suspect behaviors. The domains you may want to whitelist are valid automated services that do not have many host connections.

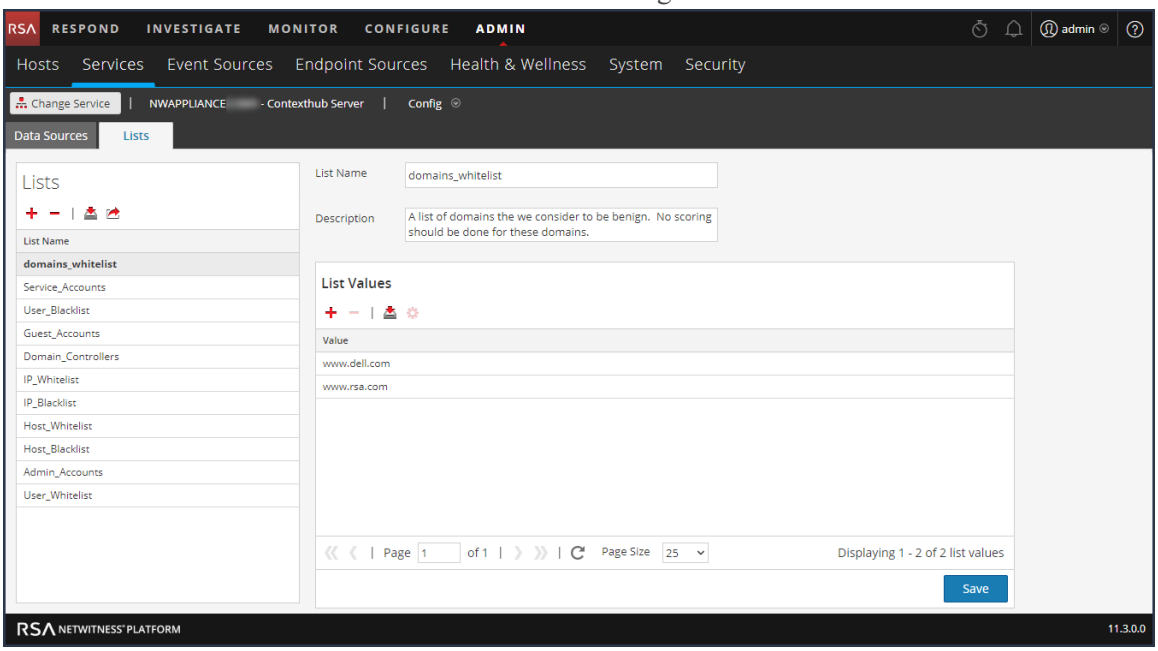
Note: For migrations from 10.6.x, if your previous Automated Threat Detection whitelist (Whitelisted Domains) appears on the Lists tab, you can rename it to **domains_whitelist** to use it for the Suspicious Domains modules.

1. Create a whitelist for domains in Context Hub named **`domains_whitelist:`**

   a. Go to **ADMIN > Services**, select the Context Hub Server service, and then select **> View > Config > Lists** tab.
   The Lists tab shows the current lists in the Context Hub.



b. In the Lists panel, click + to add a list. In the **List Name** field, type **`domains_whitelist`**. You must use this name in order for the module to recognize it.



2. Manually add domains to the list or import a .CSV file containing a list of domains.
   You can enter full domains, or you can use a wild card to include all sub-domains for a given domain. For example, you can enter *.gov to whitelist all government IP addresses. However, you cannot use other regex functions, such as [a-z]*.gov. This is because using *.gov replaces an entire

string, such as www.irs.gov.

a. To add domains manually, in the **List Values** section, click + to add domains.

b. To remove a domain, select the domain and click −.

c. To import a .CSV file, in the **List Values** section, click , and in the **Import List Values** dialog, navigate to the .CSV file. Choose from the following delimiters: Comma, LF (Line Feed), and CR (Carriage Return) depending on how you have separated the values in your file. Click **Upload**.

3. Click **Save**.
   The **domains_whitelist** appears in the Lists panel. Analysts can add to this list from the Respond view and the Investigate view. The *Context Hub Configuration Guide* provides additional information.

Step 3: Configure the Whois Lookup Service

See "Configure Whois Lookup Service" in the *ESA Confguration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Step 4: Map Data Sources to ESA Analytics Modules

See "Mapping ESA Data Sources to Analytics Modules" in the *ESA Confguration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

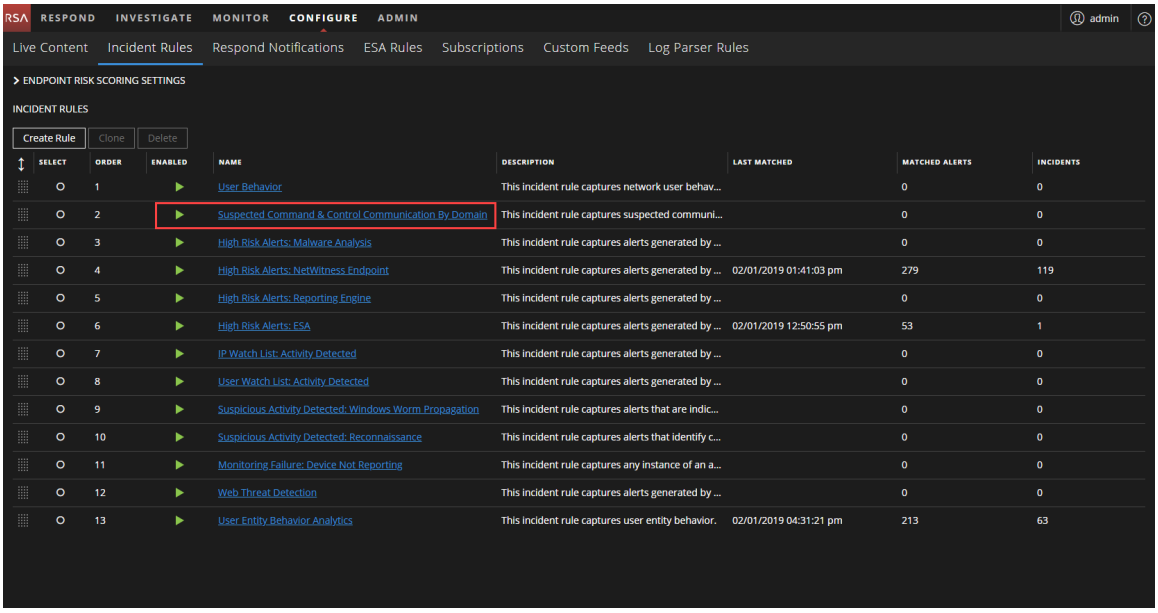
Step 5: Verify that the Suspected Command & Control By Domain Rule is Enabled and Monitor the Rule

Note: The information in this procedure applies to version 11.1 and later.

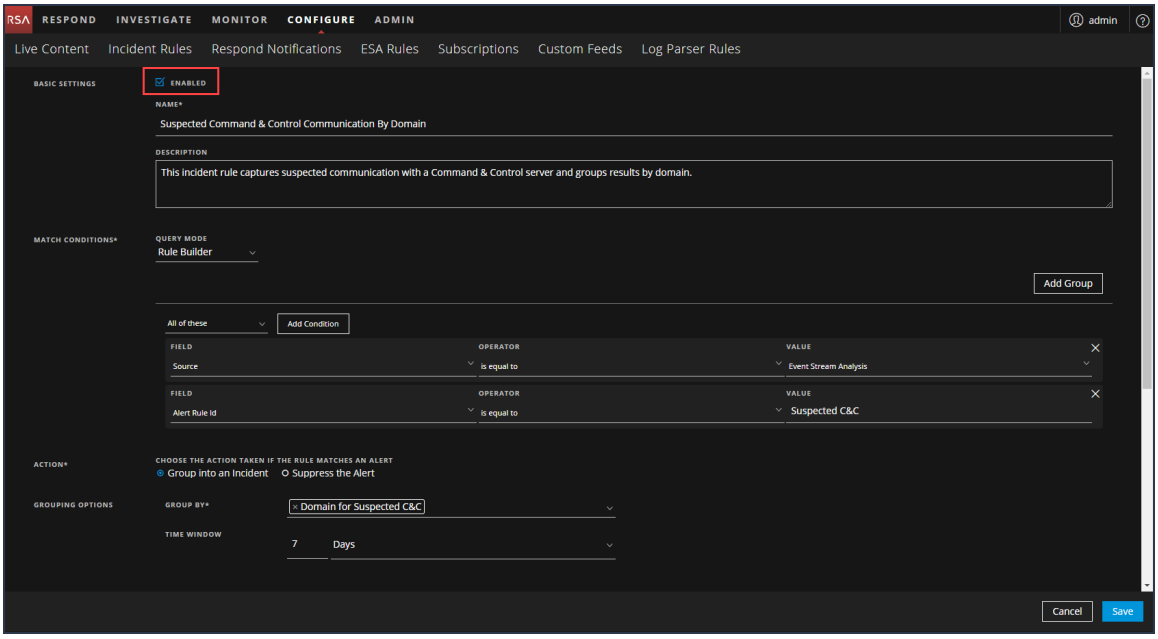
Verify and monitor the Suspected Command & Command Control by Domain rule in the Incident Rules list.

1. Go to **CONFIGURE > Incident Rules**.

2. In the Incident Rules list, locate the **Suspected Command & Control Communication by Domain** rule and verify that it displays a green Enabled icon (▶) next to the rule name.



3. If the rule is not enabled:
   a. Click the link in the NAME field to open it.
   b. In the Incident Rule Details view, select **Enabled** and click **Save**.



4. In the Incident Rules list, monitor the statistics in the following fields to see if the rule is triggered:
   - **Last Matched**: Shows the time when an alert was successfully matched with the rule.
   - **Matched Alerts**: Displays the number of alerts that matched the rule.
   - **Incidents**: Displays the number of incidents created by the rule.

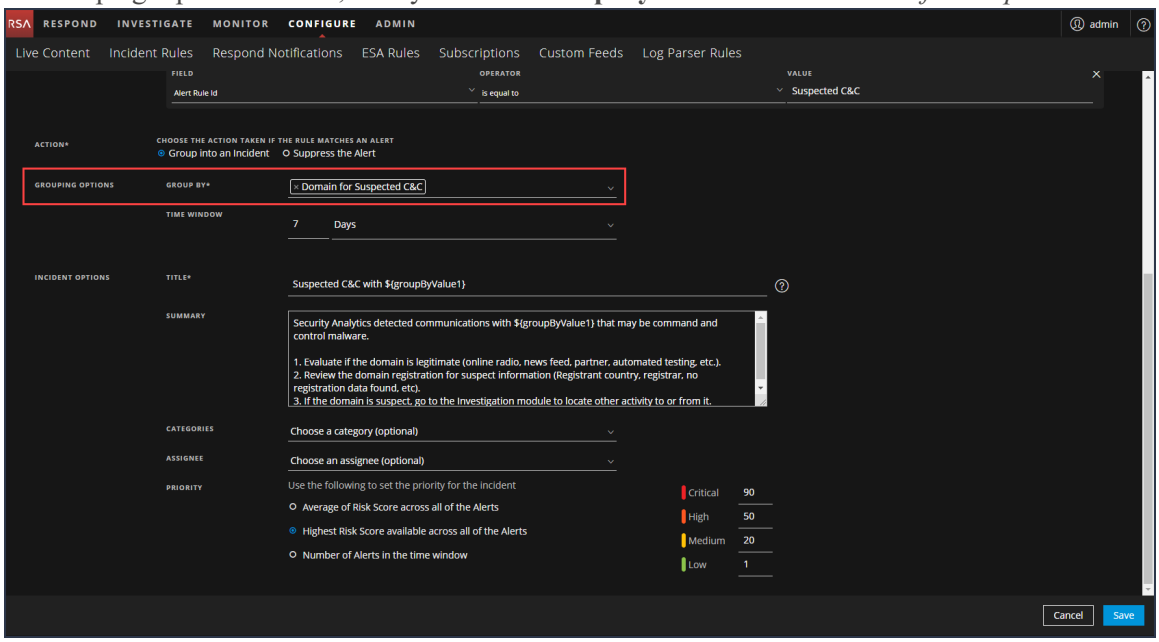
By default, these values reset to zero every 7 days. For more information, see "Set Counter for Matched Alerts and Incidents" in the *NetWitness Respond Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Step 6: Verify that the Incident is grouped by Suspected C&C

Note: The information in this procedure applies to version 11.1 and later.

In order to group incidents correctly in the Respond view, set the Group By condition to Domain for Suspected C&C.

1. Go to **CONFIGURE > Incident Rules**.
2. In the Incident Rules list, locate the **Suspected Command & Control Communication by Domain** rule and click the link in the NAME field to open it.
3. In Grouping Options section, verify that the **Group By** field is set to *Domain for Suspected C&C*.



This aggregates alerts and incidents are created for "Suspected C&C."

Result

After you deploy the ESA Analytics Suspicious Domains module mapping for Automated Threat Detection, your ESA begins to perform analytics on the HTTP traffic. You can view detailed information for each incident in the Respond view.

Next Steps

Monitor the Respond view to see if the rule is triggered. The *NetWitness Respond User Guide* provides additional information. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Troubleshooting Automated Threat Detection

NetWitness Platform Automated Threat Detection is an analytics engine that examines your HTTP data. It also makes use of other components, such as the Whois and Context Hub services, which can add complexity to your installation. This topic provides suggestions to help you find issues if your Automated Threat Detection deployment does not provide the results that you expect.

Possible Issues

Problem	Possible Causes	Solutions
I'm seeing too many alerts (false positives).	Several	One possible cause is that the Whois Lookup service is failing or is not configured. The Whois lookup is helpful in determining whether a URL is valid, and if the connection fails or is not properly configured, it can result in false positives. See "Configure Whois Lookup Service" in the *ESA Configuration Guide*.
		You may need to whitelist URLs. Sometimes the legitimate behavior for a URL triggers an alert. One way to prevent this from occurring is to add the URL to the whitelist. See "Add an Entity to a Whitelist" in the *NetWitness Respond User Guide*.
I'm not seeing any alerts.	The ESA host requires a "warm-up" period when you deploy an ESA Analytics Module Mapping for Automated Threat Detection.	When you deploy an ESA analytics module mapping for Automated Threat Detection, there is a "warm-up" period, during which no alerts are viewable. Each module type has a default warm-up period and you need to wait until the warm-up period is complete. For more information, see "Mapping ESA Data Sources to Analytics Modules" in the *ESA Configuration Guide*.
I'm seeing performance issues (more resource usage or a drop in throughput).	Several	If you are having performance issues on an ESA host that is running both Automated Threat Detection (ESA Analytics) and ESA rules, follow the troubleshooting steps for rules. For these troubleshooting steps, see "Troubleshoot ESA" in the *Alerting with ESA Correlation Rules User Guide*.

Problem	Possible Causes	Solutions
In NetWitness Platform 11.3, the Respond Event List in 11.3 does not show the Command and Control (C2) enrichment information for HTTP packet alerts in Suspected C&C Incidents.	In version 11.3, you can view the C2 enrichment information in the Alert Details view.	View C2 enrichment information for the Suspected C&C incidents in the corresponding alerts in the Alert Details view. 1. Go to **RESPOND > Incidents**, look for a **Suspected C&C** incident, and note the incident ID. 2. Go to **RESPOND > Alerts** and in the Filters panel, select the following to locate an alert in the Alerts list with the incident ID noted above: a. In **Alert Names** section, select **http-packet**. b. In the **Part of Incident** section, select **Yes**. If you are still not able to locate an alert in the Alerts list with the incident ID noted above, try filtering your alerts list more using the time range of the incident. 3. In the Alerts list, click the **http-packet** link in the **NAME** field of the alert associated with the incident ID. The Event Details view shows the C2 enrichment information.

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

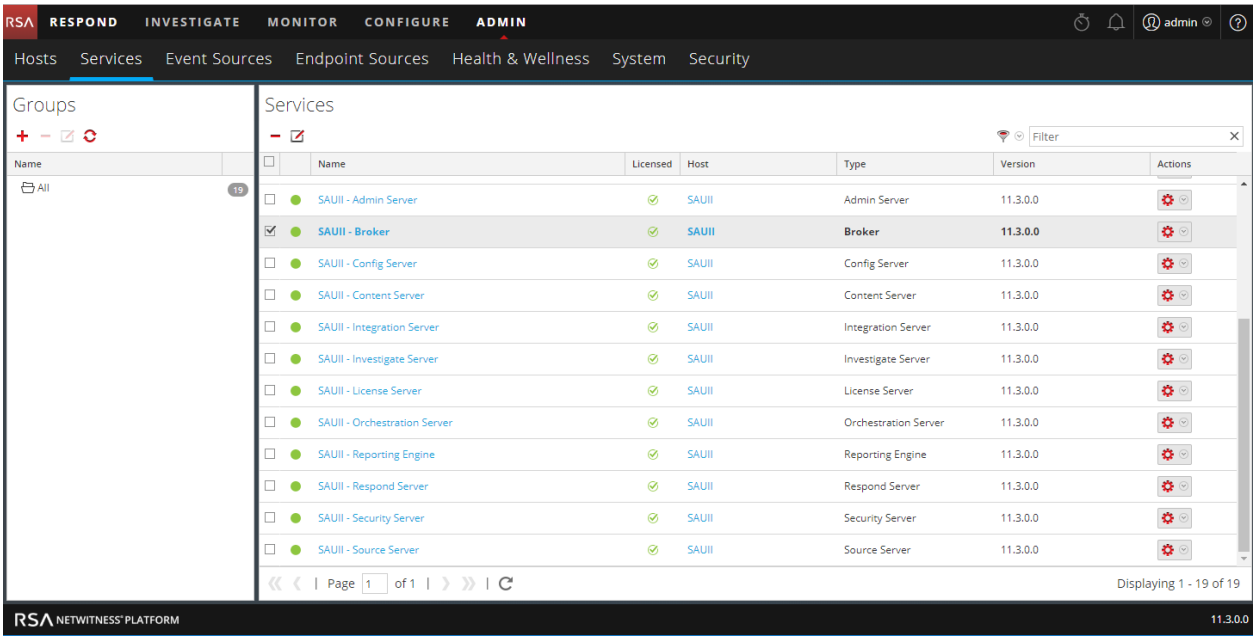
Broker and Concentrator Basics

Concentrators and Brokers aggregate data captured or aggregated by other services unlike Decoders, which capture data.

NetWitness Platform supports the following Broker and Concentrator services:

- Brokers - aggregate data across entire infrastructure from configured Concentrators. You can have multiple concentrators aggregating into one broker. You can also have multiple brokers aggregating into a single broker.
- Concentrators - aggregates and analyzes data across multiple capture locations from decoders, indexes and directs queries.

You can configure various Brokers and Concentrators together under a Broker. Brokers are able to pull in data quickly from the Concentrators because they acquire index information only. This configuration is done using the NetWitness Platform user interface. Most of the configuration is performed in the Administration Services view (**ADMIN** > **Services**).



You can also configure the aggregate services and perform the whole aggregation process using the Services view. This helps setup aggregation autostart, timing and performance parameters, maximum number of open meta and session files. In addition to this, you can also time the attempts to restart, reconnect, or take a non-responsive aggregate service offline. Configuring Aggregate services includes managing Concentrators and Decoders as aggregate services. You can also limit the data being consumed from an aggregate service using meta fields and filters. The aggregation tasks are performed in the General tab of Administration Services view (**ADMIN** > **Services**).

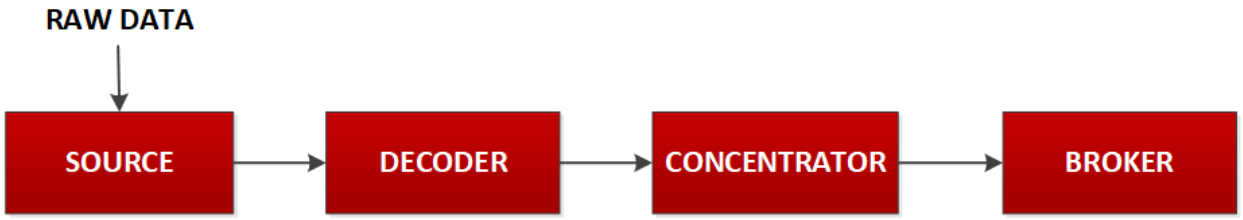
Overview of Broker and Concentrator

Brokers and Concentrators work in conjunction with Decoders and Log Decoders in the NetWitness Platform network. Unlike the two types of Decoders, which capture packets and logs, Concentrators and Brokers aggregate the data captured or aggregated by other services. Brokers aggregate data from configured Concentrators; Concentrators aggregate data from Decoders. A complete overview of the NetWitness Platform is provided in the *NetWitness Platform Getting Started Guide*.

Note: Go to the Master Table of Contents in RSA Link to find and view referenced documents.

As raw data is entered in the system from the source for analysis, it has to be collected and parsed. This raw data is collected, parsed, and stored using a Decoder. The packet data is then indexed, stored, and parsed by the Concentrator. Parsed packet data is also provided as an endpoint for queries. Eventually, the Broker routes queries across multiple Decoder and Concentrator appliances. Here is how information flows to a Concentrator and Broker.

In most cases, the default values for compression, statistics update interval, and number of threads in the thread pool are set at a good point for optimal system performance.

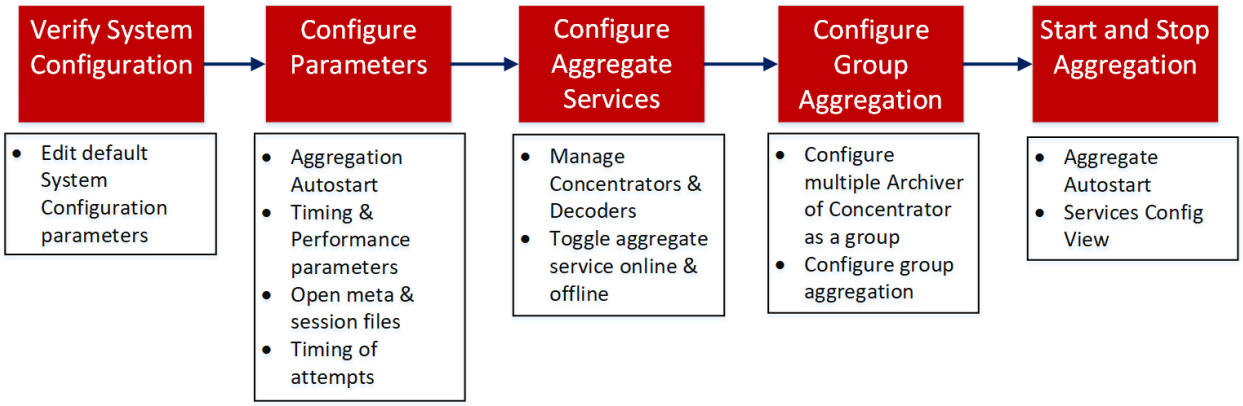


- Concentrator: is required for any large environment to store the Meta data that is generated by the parsers and feeds being triggered by packets and logs ingested into the decoders.
- Broker: The Broker service is similar to the Concentrator service except that it indexes the collected information. It performs virtual mapping of indices on all connected concentrators. Due to the less internal processing performed, the response time is fast. To allow investigation, multiple brokers and/or concentrators report data into a broker.

Broker and Concentrator Configuration

Setting up a Broker or Concentrator involves configuring the basic system parameters, the aggregate services, and the aggregation process between a Broker or Concentrator and the aggregate services.

These are the required configuration steps for a new Broker or Concentrator, and also for changing the configuration of an existing Broker. Perform the steps in the section in the sequence they are given.



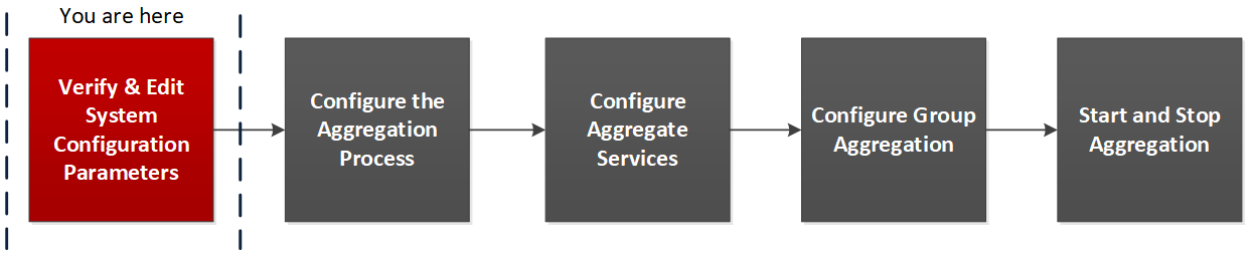
Basic Configuration Checklist

The following checklist provides the sequence for tasks that are required to configure a Broker or Concentrator that has been added to NetWitness Platform in accordance with the *Hosts and Services Guide*.

Configuration Step	Description
Step 1 - Verify System Configuration	Verify system configuration default values for the host and service are appropriate as described in Step 1. Verify Service System Configuration
Step 2 - Configure Parameters	Configure parameters that govern the overall aggregation process as described in Step 2. Configure the Aggregation Process
Step 3 - Configure Aggregate Services	Configure aggregate services as described in Step 3. Configure Aggregate Services
Step 4 - Configure Group Aggregation	(Optional) Configure group aggregation as described in Step 4. (Optional) Configuring Group Aggregation
Step 5 - Start and Stop Aggregation	Start and stop aggregation as described in Step 5. Start and Stop Aggregation

Step 1. Verify Service System Configuration

When a service is first added to NetWitness Platform, default values for the system configuration parameters are in effect. You can edit these values to tune performance.

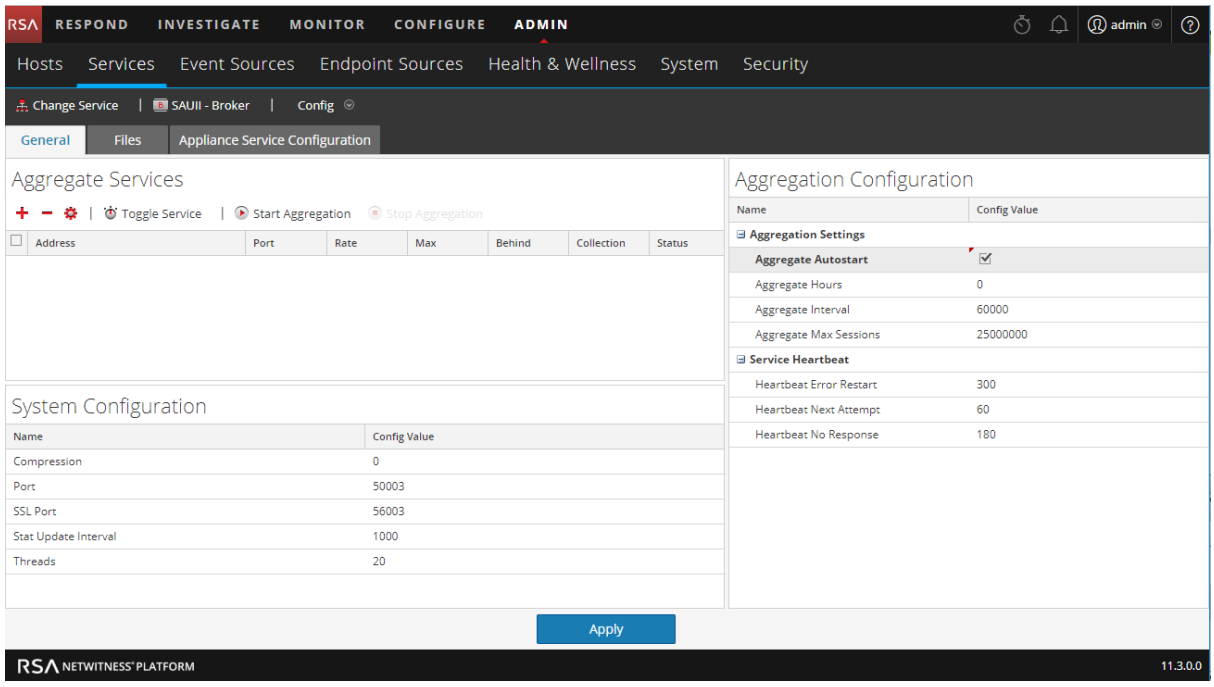


In most cases, the default values for compression, statistics update interval, and number of threads in the thread pool are set at a good point for optimal system performance.

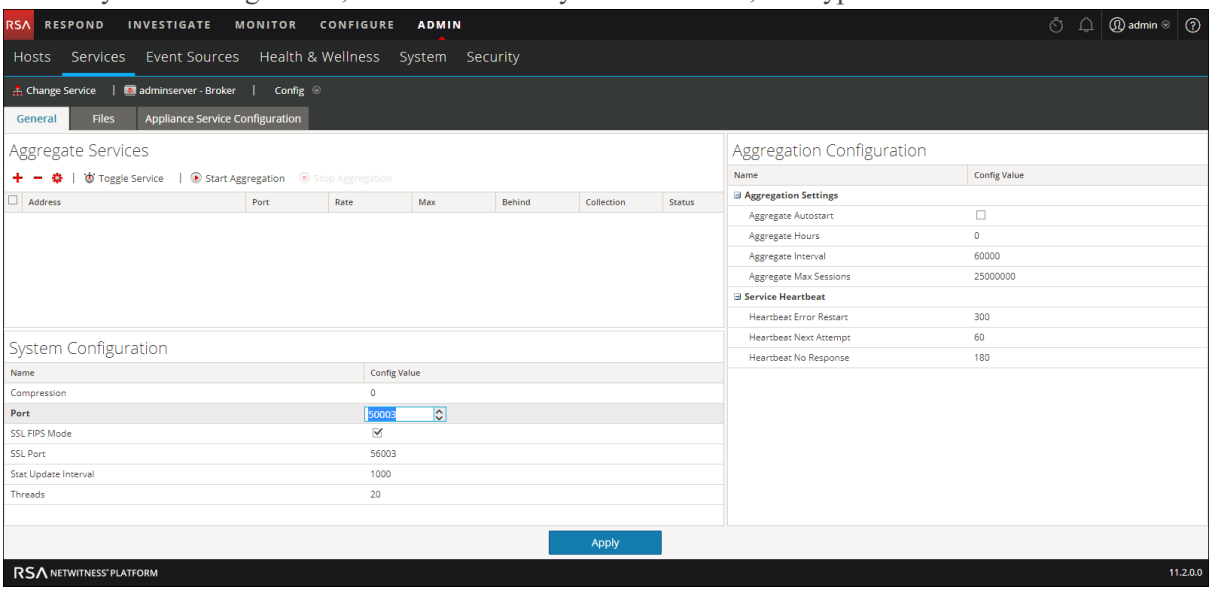
To edit system configuration parameters for a Broker or Concentrator:

1. Go to **ADMIN > Services**.
2. In the **Services** view, select a Broker or Concentrator, and in the Actions column, select > **View** > **Config**.

   The Services Config view for the selected service is displayed.



3. Under System Configuration, click a field that you want to edit, and type a new value.

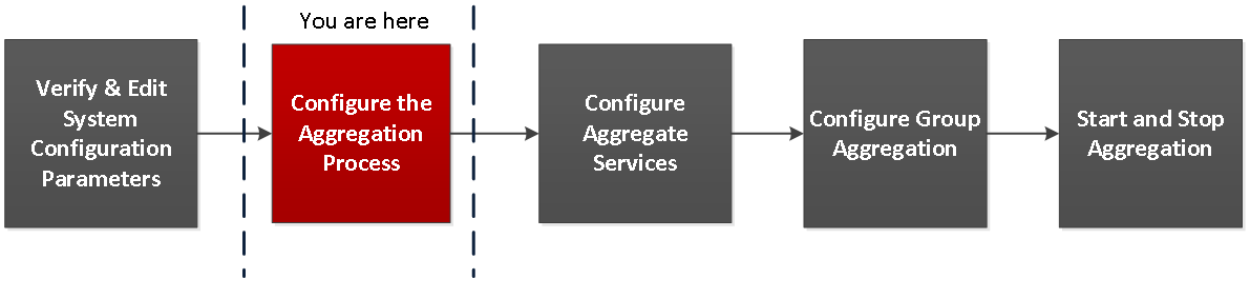


4. When finished editing, click **Apply**.

Step 2. Configure the Aggregation Process

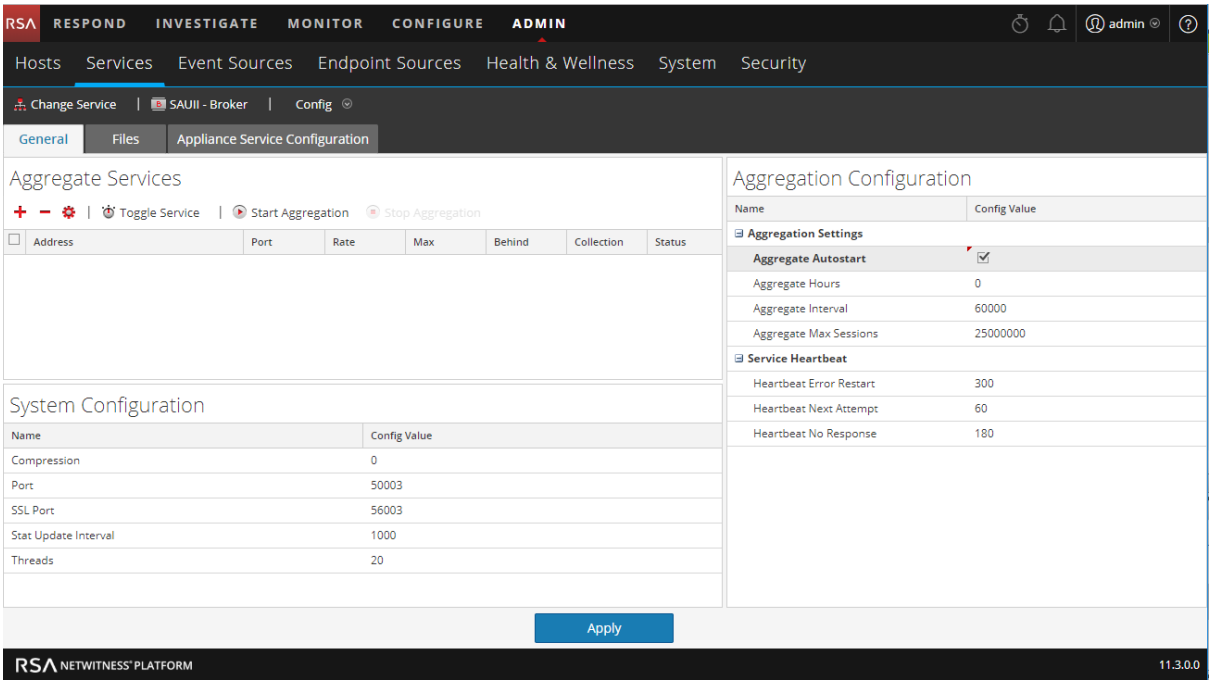
Configuring the aggregation process for a Broker or Concentrator includes setting:

- Aggregation autostart
- Timing and performance parameters, such as the number of sessions per round of aggregation and time between rounds
- Maximum number of open meta and session files
- The timing of attempts to restart, reconnect, or take offline a non-responsive aggregate service



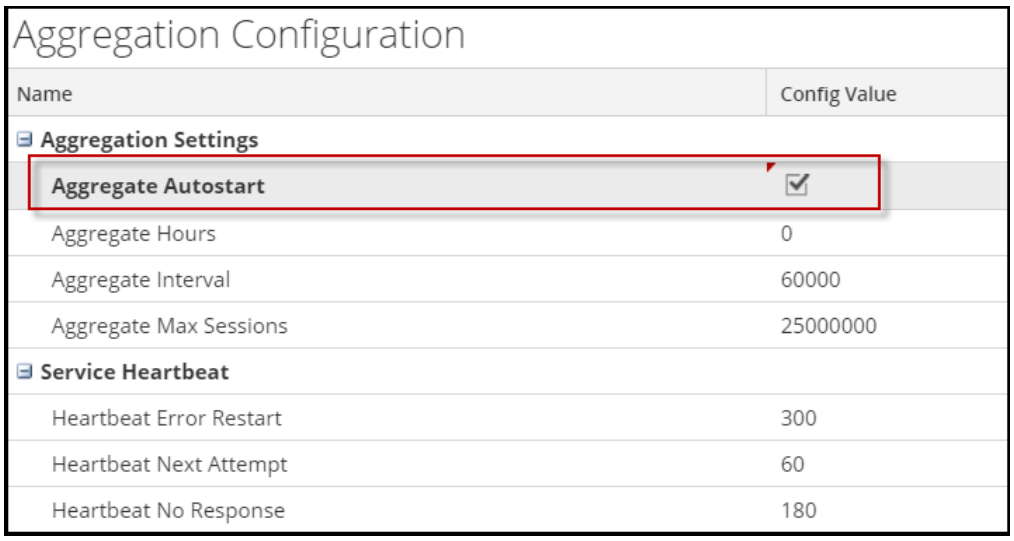
To configure the aggregation process on a Broker or Concentrator:

1. Go to **ADMIN > Services**.
2. In the **Services** view, select a Broker or Concentrator, and select > **View** > **Config**.
   The Services Config view, which includes the Aggregation Configuration section, is displayed.



3. (Optional) Select **Aggregate Autostart** to enable automatic start of aggregation when a service is

online.



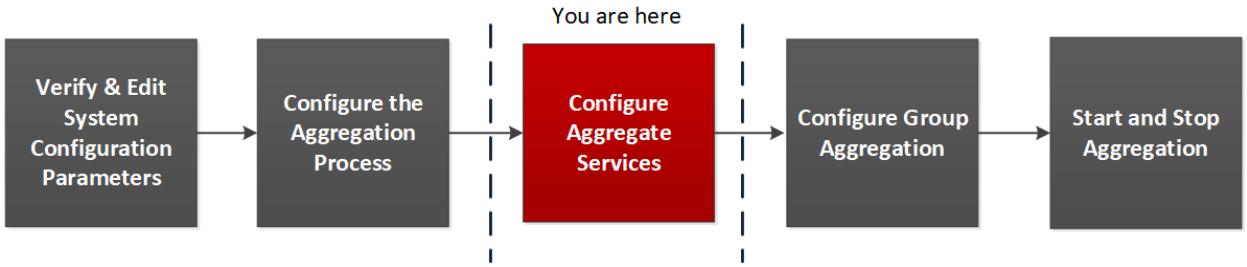
4. (Optional) Edit any of the aggregation settings: the hours back to begin aggregation, the milliseconds between rounds of aggregation, and maximum number of sessions per aggregation round.
5. (Optional) Edit any of the Service Heartbeat settings, which specify the timing of the first attempt to reconnect to a service after an error, the next attempt to reconnect, and taking the service offline after failure to reconnect.
6. When finished editing the settings, click **Apply**.
   The settings become effective immediately.

Step 3. Configure Aggregate Services

This topic introduces basic tasks related to data aggregation on Brokers and Concentrators. For information on the optional setup of group aggregation, see Step 4. (Optional) Configuring Group Aggregation.

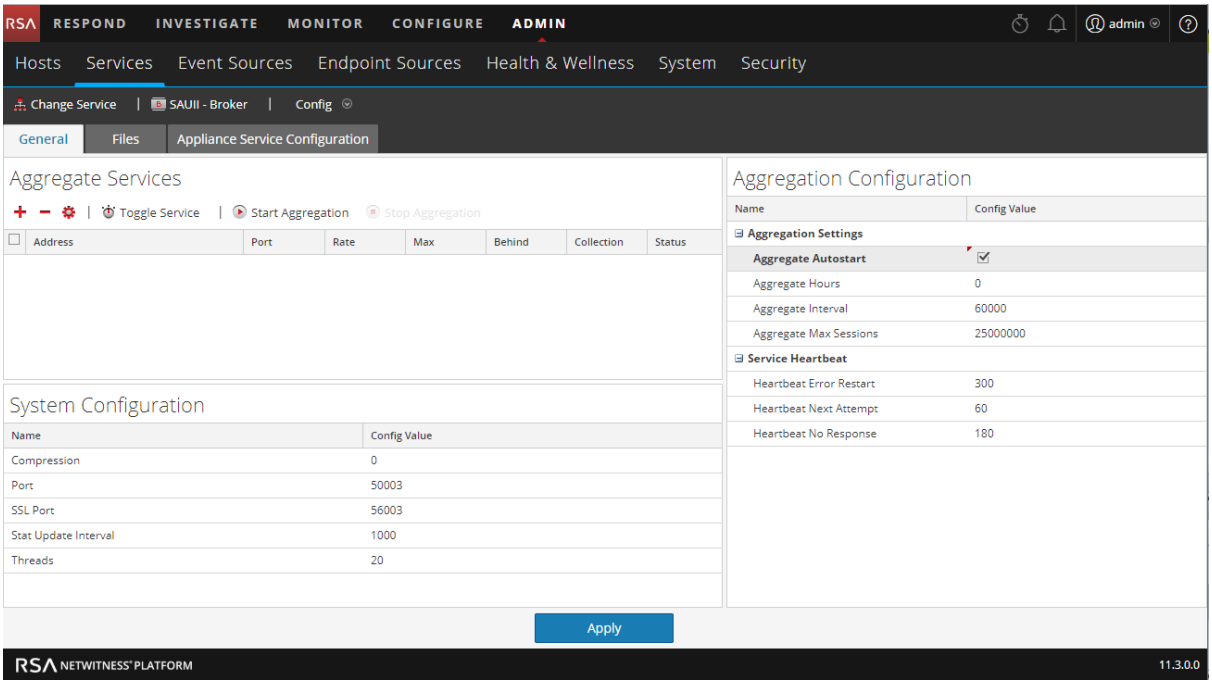
Configuring the aggregate services (whose data is consumed and aggregated) includes:

- Adding, editing, and deleting Concentrators and Decoders as aggregate services
- Toggling an aggregate service online and offline



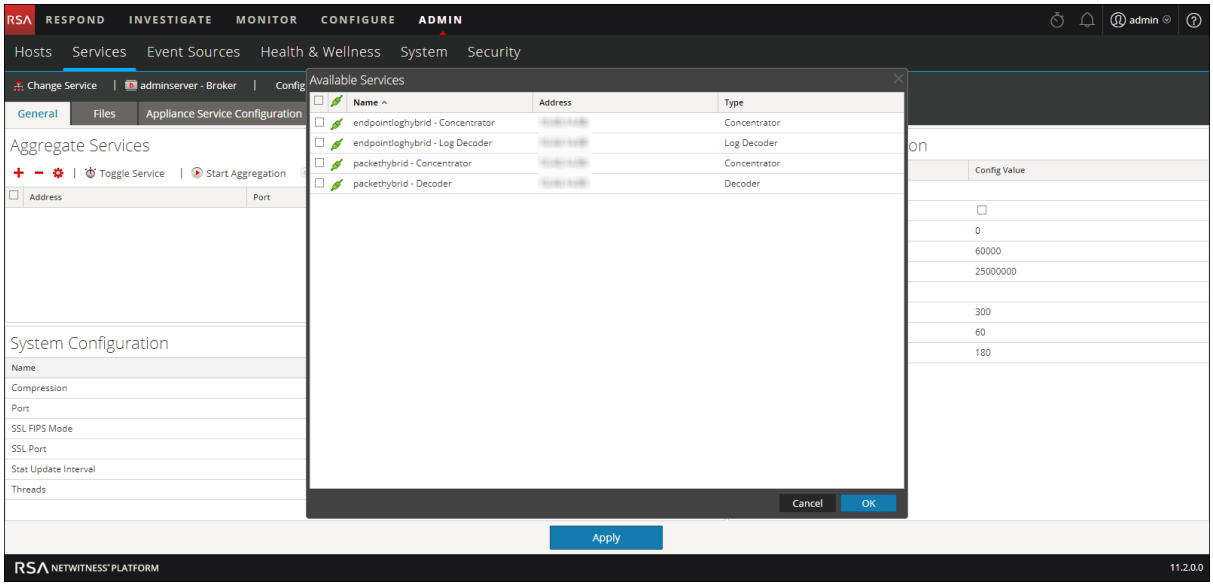
To configure aggregate services to a Broker or Concentrator:

1. Go to **ADMIN > Services**.
2. In the **ADMIN Services** view, select a Broker or Concentrator, and select **> View > Config**.
   The Services Config view for the selected service is displayed.

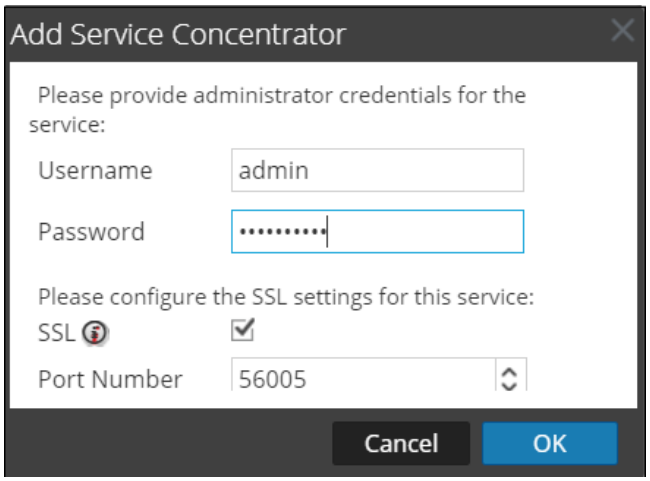


3. Click in the **Aggregate Services** toolbar.

The Available Services dialog is displayed.



4. Select one or more services to be added and click **OK**.
5. Enter the Administrator username and password to authenticate adding a service.



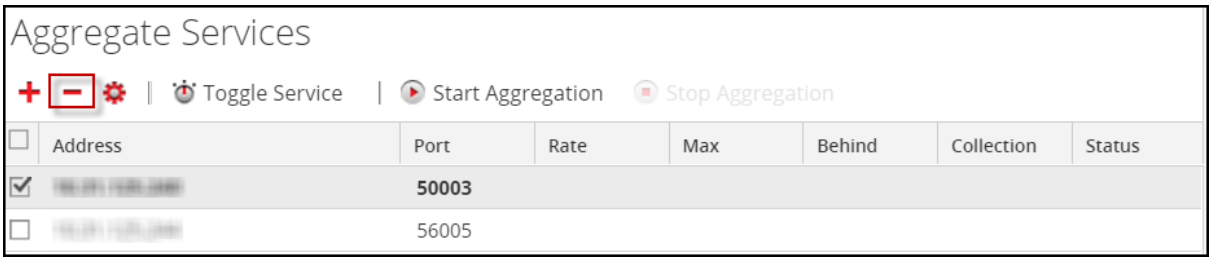
The added services are listed in the Aggregate Services list.

6. To save the changes, click **Apply**.

To remove aggregate services from a Broker or Concentrator:

Note: This option applies only to offline services. If the aggregate service is online, you must first toggle the service offline.

1. In the **Aggregate Services** list, select one or more services.
2. Click − in the toolbar.



The service is removed from Aggregate Services list.

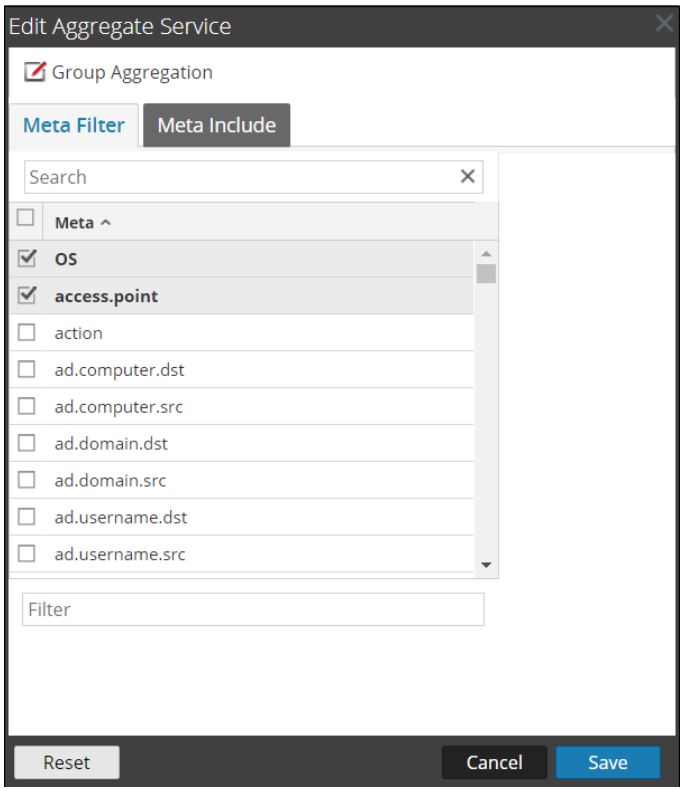
3. To save the change, click **Apply**.

To edit aggregate services on a Concentrator:

Note: This option applies only to offline services. If the aggregate service is online, you must first toggle the service offline. You can edit only one service at a time.

You can limit the data being consumed from an aggregate service using meta fields and filters.

1. Click **Change Service** to change the service to Concentrator.
2. In the **Aggregate Services** list, select one or more services.
3. Click in the toolbar. Enter the authentication information in the pop up dialog box.
   - If the service was added on a different instance of NetWitness Platform, you must add it to this instance of NetWitness Platform in order to edit. A warning dialog allows you to add the service. If you click **Yes**, the Add Service dialog is displayed.
   - If the service is online, a dialog notifies that the service must be offline and requests confirmation that you want to continue. If you click **Yes**, NetWitness Platform takes the service offline and the Edit Aggregate Service dialog is displayed.
   - If the service is offline, the Edit Aggregate Service dialog is displayed with the editable properties for an aggregate service on a Concentrator.
4. Click a type of metadata in the **Meta Include** tab to select the type of metadata for the Concentrator to consume from this service. Click **Save**.



5. To specify a rule to filter data that the Concentrator consumes from this service, compose a rule in the **Meta Filter** tab. Click **Save**.
6. Click **Close**.

   The Edit Aggregate Service dialog closes and the changes are shown in the Aggregate Services list. In this example, two meta were selected on the Meta Include tab. When you click the information icon in the Meta Include field, it shows the selections.
7. To save the changes, click **Apply**.

Toggle a Service

When data aggregation starts, Brokers and Concentrators consume data from aggregate services that are online. When first added to a Broker or Concentrator, aggregate services are offline.

To toggle a service between online and offline:

1. Select a service in the **Aggregate Services** list.
2. Click Toggle Service .

   The status is changed.

Step 4. (Optional) Configuring Group Aggregation

You use Group Aggregation to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them. You can configure multiple Archiver services or Concentrator services to efficiently aggregate from multiple Log Decoder services to improve query performance on the data:

- Stored in the Archiver.
- Processed through the Concentrator.

RSA Group Aggregation Deployment Recommendations

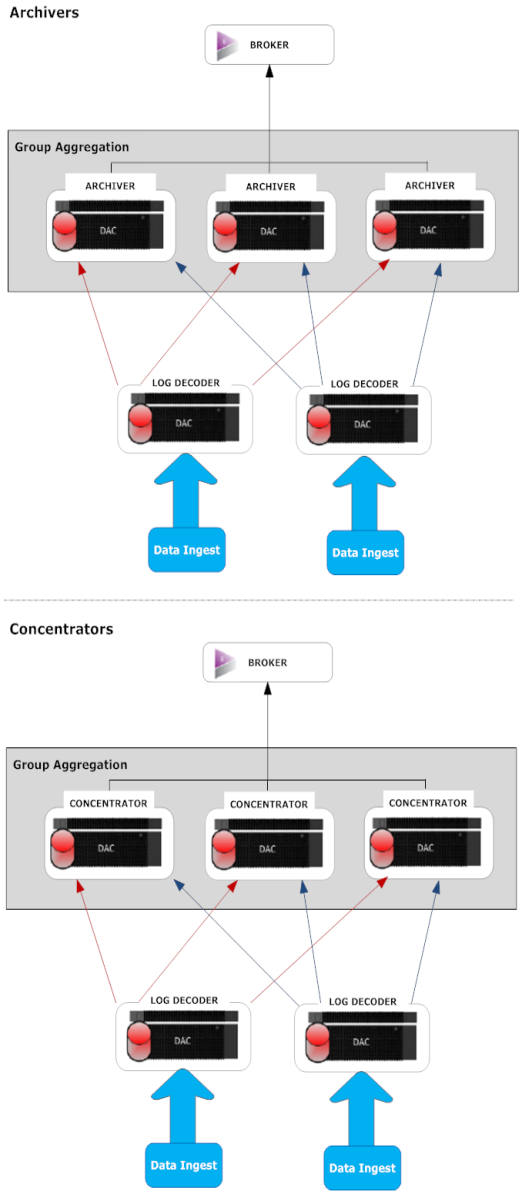
RSA recommends the following deployment for Group Aggregation:

- 1 - 2 Log Decoders
- 3 - 5 Archivers or Concentrators

Advantages of Using Group Aggregation

- Increases the speed of RSA NetWitness® Platform queries.
- Improves the performance of aggregate queries (Count and Sum) on the environment.
- Enhances investigation service performance.
- Gives you the option of storing data for a longer duration for investigation purposes.

The following diagram illustrates Group Aggregation.



You can have any number of Archivers or Concentrators grouped together and form an aggregation group. The Archiver or Concentrator services in the group divide all the aggregated session between them based on the number of sessions defined in the Aggregate Max Sessions parameter.

For example, in an aggregation group containing two Archiver services or two Concentrator services with the Aggregate Max Sessions parameter, set to 10000 the services would divide the session between themselves as illustrated in the following table.

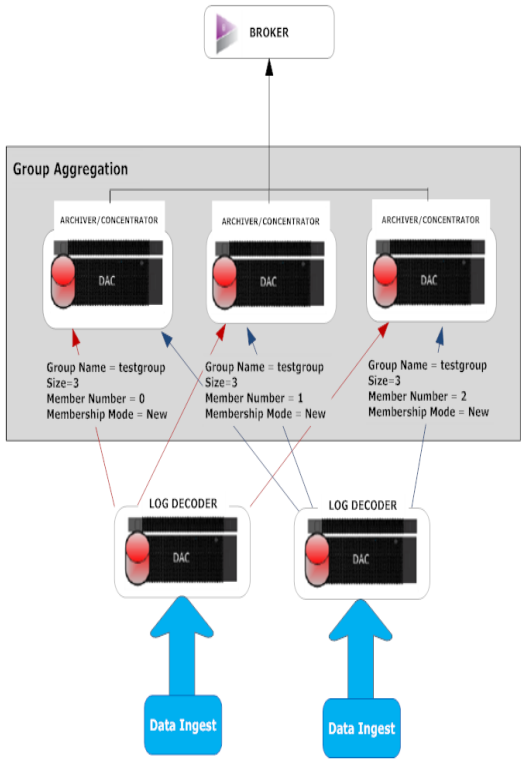
Archiver 0 or Concentrator 0	Archiver 1 or Concentrator 1
1 - 9,999	10,000 - 19,999
20,000 - 29,999	30,000 - 39,999
40,000 - 49,999	50,000 - 59,999

Configure Group Aggregation

Complete this procedure to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them.

Prerequisites

Plan the network design for group aggregation. The following figure is an example of a group aggregation setup.



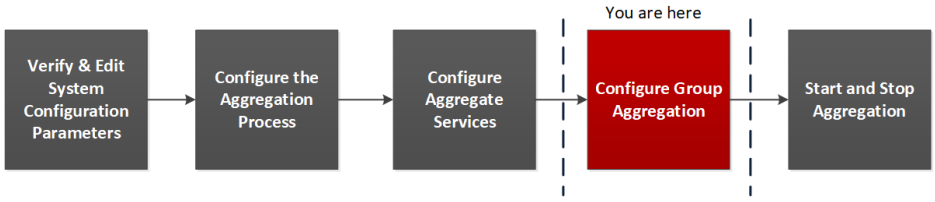
Ensure that you understand the Group aggregation parameters in the following table, and create a group aggregation plan.

Parameter	Description
Group Name	It determines the group to which the Archiver or Concentrator belongs. You can add any number of groups aggregating data from a Log Decoder. The Group Name parameter is used by the Log Decoder to identify which Archiver or Concentrator services are working together. All Archiver or Concentrator services in the group should have the same group name.
Size	It determines the number of Archiver or Concentrator services in the aggregation group.
Member Number	It determines the position of the Archiver or Concentrator in the aggregation group. For a group of size N, member number from 0 to N-1 must be set on each of the Archiver or Concentrators services in the aggregation group. For example: If the size of the aggregation group is 2, the member number of one of the Archiver or Concentrator service should be set to 0 and the member number of the other Archiver or Concentrator should be set to 1.
Membership Mode	There are two membership modes: • New: Adding a new Archiver or Concentrator service as a member to the existing aggregation group or creating an aggregation group. The Archiver or Concentrator service does not aggregate any existing sessions from the service as other members of the group would have already aggregated all the sessions on the service. This Archiver or Concentrator service will only aggregate new sessions as they appear on the service. • Replace: Replacing an existing aggregation group member. The Archiver or Concentrator will begin aggregation from the oldest session available on the service it is aggregating from.

Note: Membership mode parameter has an effect only when no sessions have been aggregated from the service. After some sessions are aggregated, this parameter has no effect.

Set up Group Aggregation

This workflow shows the procedures you complete to configure group aggregation.



Complete the following steps to set up group aggregation.

1. Configure multiple Archiver or Concentrator services in your environment. Make sure that you add the same Log Decoder as data source to all the services.
2. Perform the following on all the Archiver or Concentrator services that you want to be part of aggregation group:

a. Go to **ADMIN > Services**.

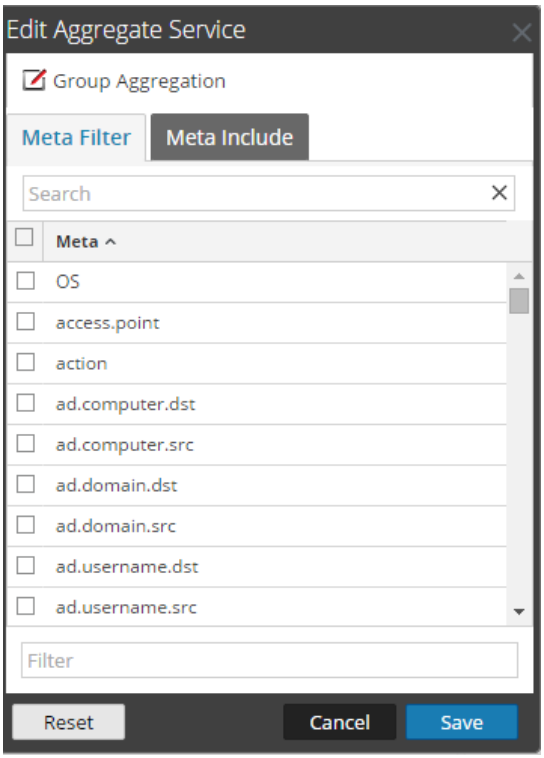
b. Select the Archiver or Concentrator service, and in the **Actions** column, select **View > Config**. The Service Config view of the Archiver or Concentrator is displayed.

c. In the **Aggregate Services** section, select **Log Decoder**.

d. Click Toggle Service to change the status of the Log Decoder to offline if it is online.

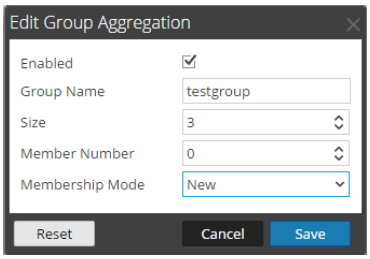
e. Click .

The **Edit Aggregate Service** dialog is displayed.



f. Click Group Aggregation.

The **Edit Group Aggregation** dialog is displayed.



g. Select the **Enabled** checkbox and set the following parameters:

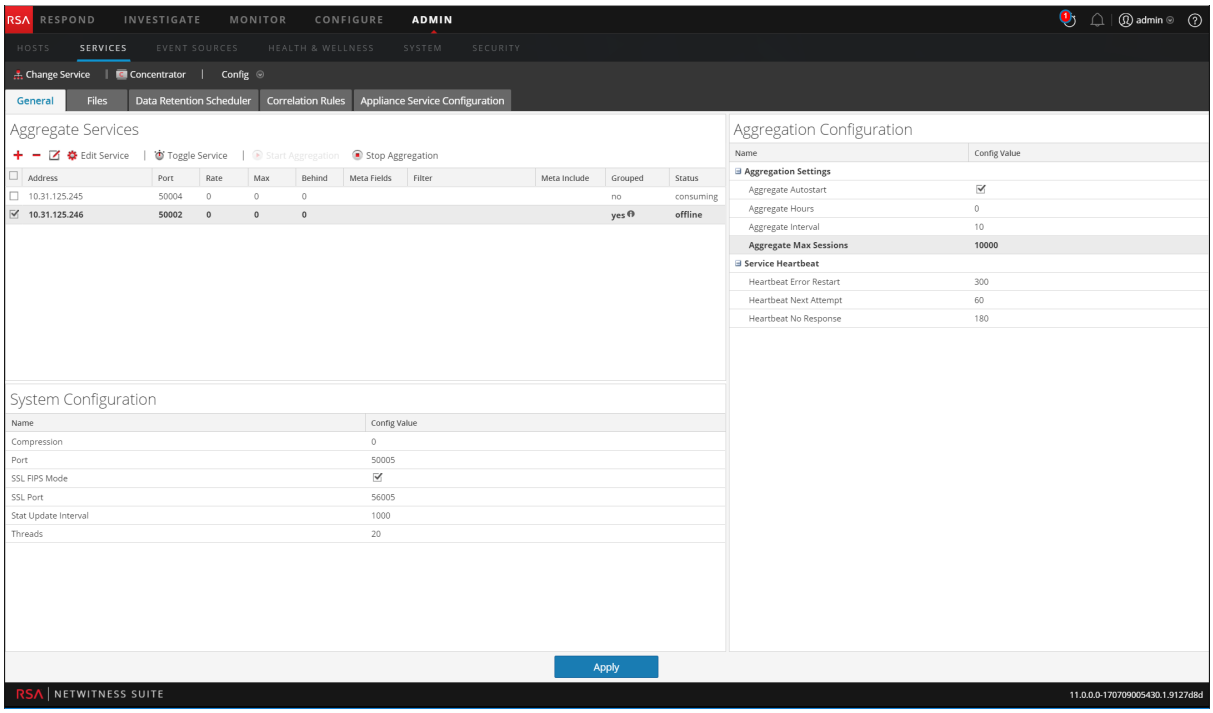
- In the **Group Name** field, type the group name.
- In the **Size** field, select the number of Archiver or Concentrator services in the aggregation group.
- In the **Member Number** field, select the position of the Archiver or Concentrator in the aggregation group.
- In the **Membership Mode** drop-down menu, select the mode.

h. Click **Save**.

i. In the Service Config View page, click **Apply**.

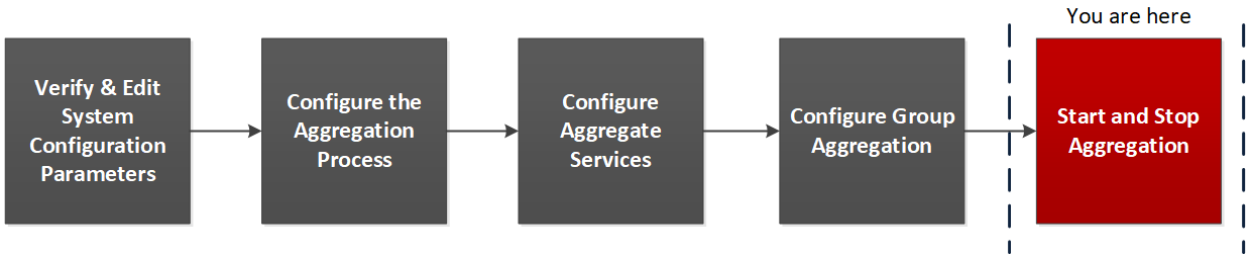
j. Perform **Step b** to **Step i** on all other Archiver or Concentrator services that need to be part of group aggregation.

3. In the **Aggregation Configuration** section, set the **Aggregate Max Sessions** parameter set to **10000**.



Step 5. Start and Stop Aggregation

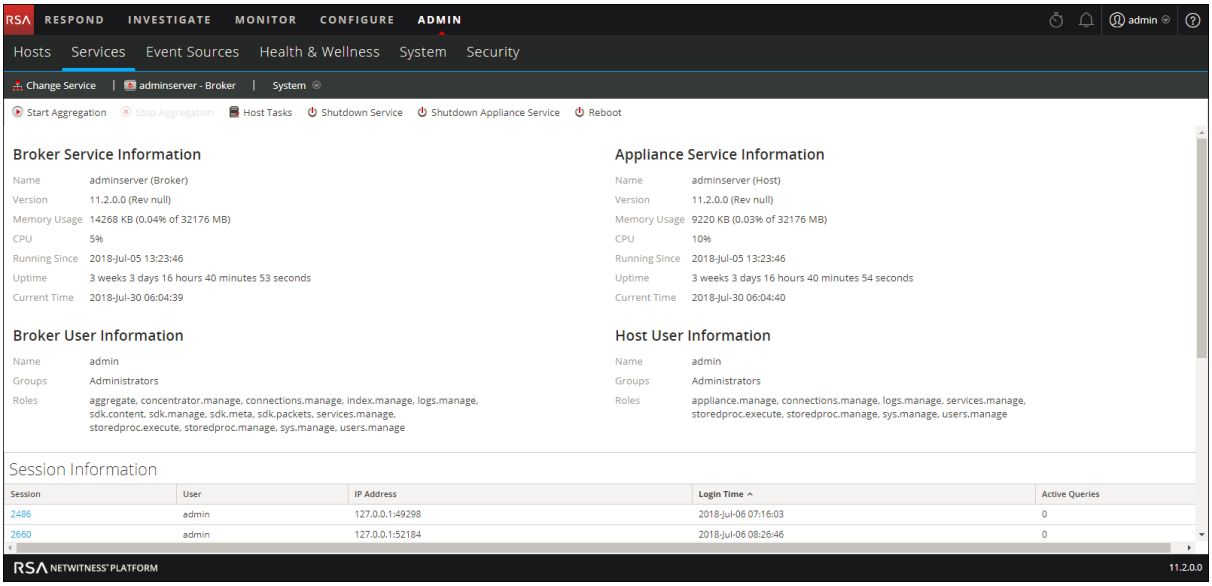
When a Broker or Concentrator starts up, it automatically begins aggregating data if Aggregate Autostart is enabled. When autostart is not enabled, you can start and stop data aggregation manually.



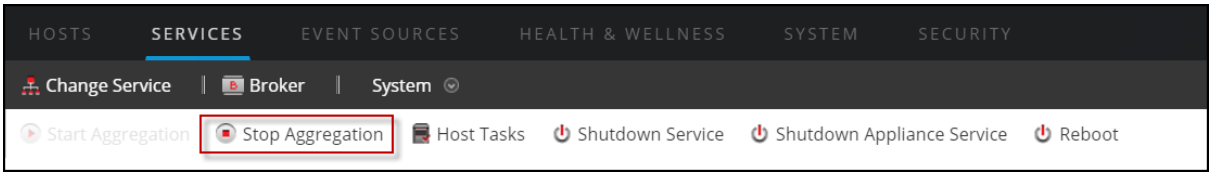
Note: The Aggregate Configuration Settings (in the Services Config View - Broker or Concentrator General Tab) determine whether Aggregate Autostart is enabled, as well as the size of a round of aggregation and time between rounds.

To start and stop data aggregation in the services system view:

1. Go to **ADMIN** > **Services**.
2. In the **ADMIN Services** view, select a Broker or Concentrator, and select > **View** > **System.**

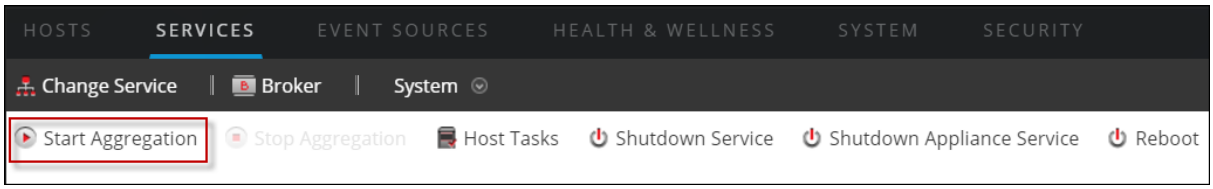


3. To stop a Broker or Concentrator that is capturing data, click **Stop Aggregation** in the toolbar. The service stops aggregating data and the **Stop Aggregation** option in the toolbar is unavailable. The **Start Aggregation** option becomes active.



4. If you want the service to start aggregating data again, click **Start Aggregation**.

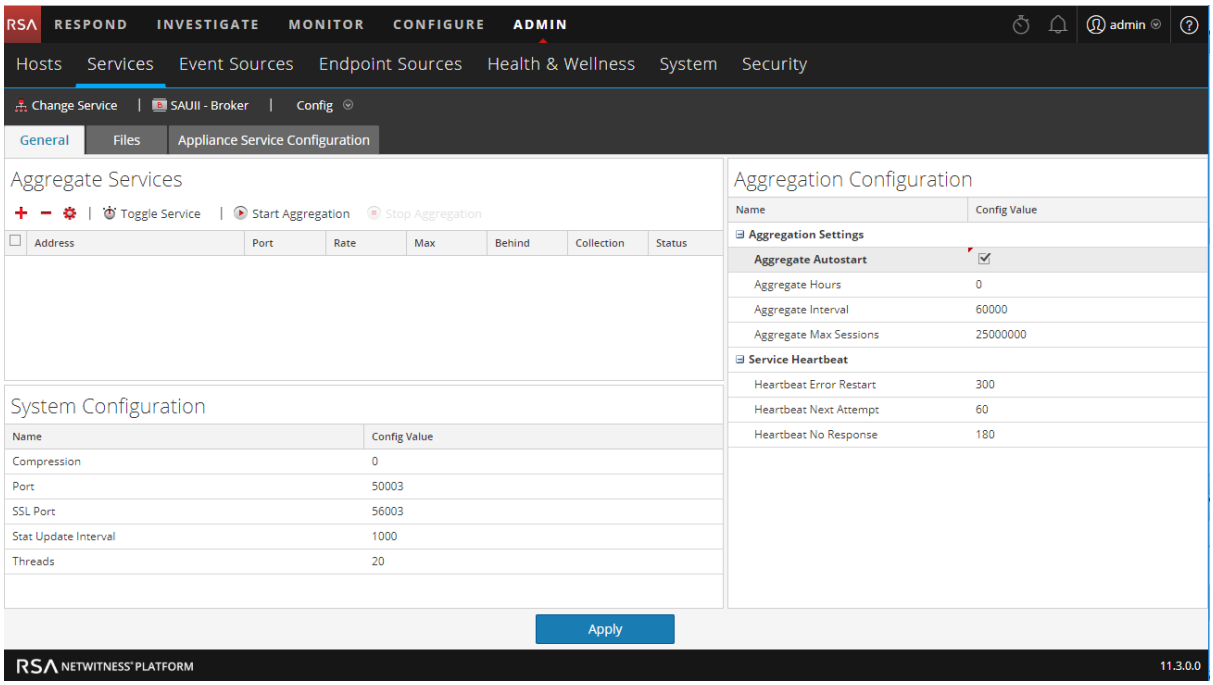
   You can now investigate the captured data in the Investigation module.



To start and stop aggregation in the services config view:

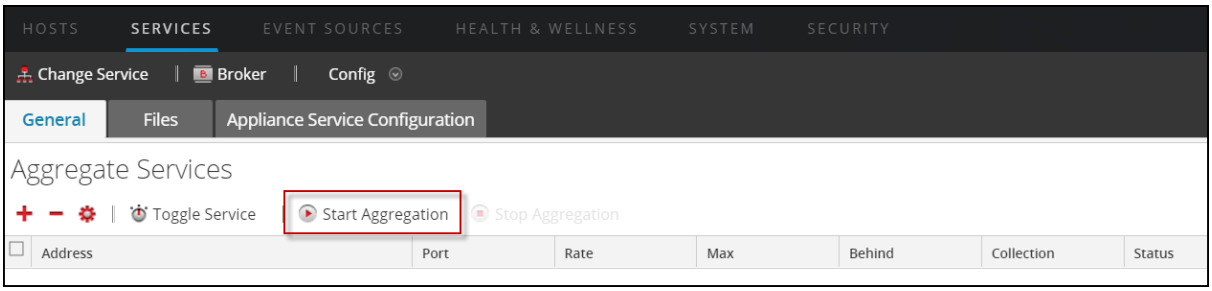
1. Go to **ADMIN** > **Services**.
2. In the **Admin Services** view, select a Broker or Concentrator, and select > **View** > **Config**.

   The Services Config view, which includes the Aggregate Services section, is displayed.



3. To start aggregation on the selected Broker or Concentrator, click  in the **Aggregate Services** toolbar.

   When aggregation starts, the status of all online aggregate services changes to **consuming**. The Start Aggregation button is disabled and the Stop Aggregation button is enabled.



4. To stop aggregation, click  in the **Aggregate Services** toolbar.

When aggregation stops, the status of all consuming aggregate services changes to **online**. The Stop Aggregation button is unavailable and the Start Aggregation button is available.

Broker and Concentrator Configuration References

You can configure Brokers and Concentrators using the NetWitness Platform user interface.

In addition to the views described here, you can view the complete service nodes in a tree form in the Services Explore view, see the "Services Explore View" topic in the *Hosts and Services Getting Started Guide*.

Services Config View - Broker or Concentrator General Tab

The General tab for a Broker or Concentrator in the Services Config helps manage basic service configuration, configure the aggregate service, and configure the aggregation process between a Broker or Concentrator and the aggregate service.

Configuring the aggregate service (whose data is consumed and aggregated) includes:

- Adding, editing, and deleting Concentrators and Brokers as aggregate services
- Toggling an aggregate service online and offline
- Monitoring statistics for aggregate services
- Starting and stopping aggregation

Configuring the aggregation process includes setting:

- Aggregation autostart
- Timing and performance parameters, such as the number of sessions per round of aggregation and time between rounds
- The timing of attempts to restart, reconnect, or take offline a non-responsive aggregate service

What do you want to do?

Role	I want to...	Refer to...
Administrator	Start and Stop aggregation Add, edit, delete, and toggle an aggregate service	Aggregate Services Section
Administrator	Manage System Configuration	System Configuration Section

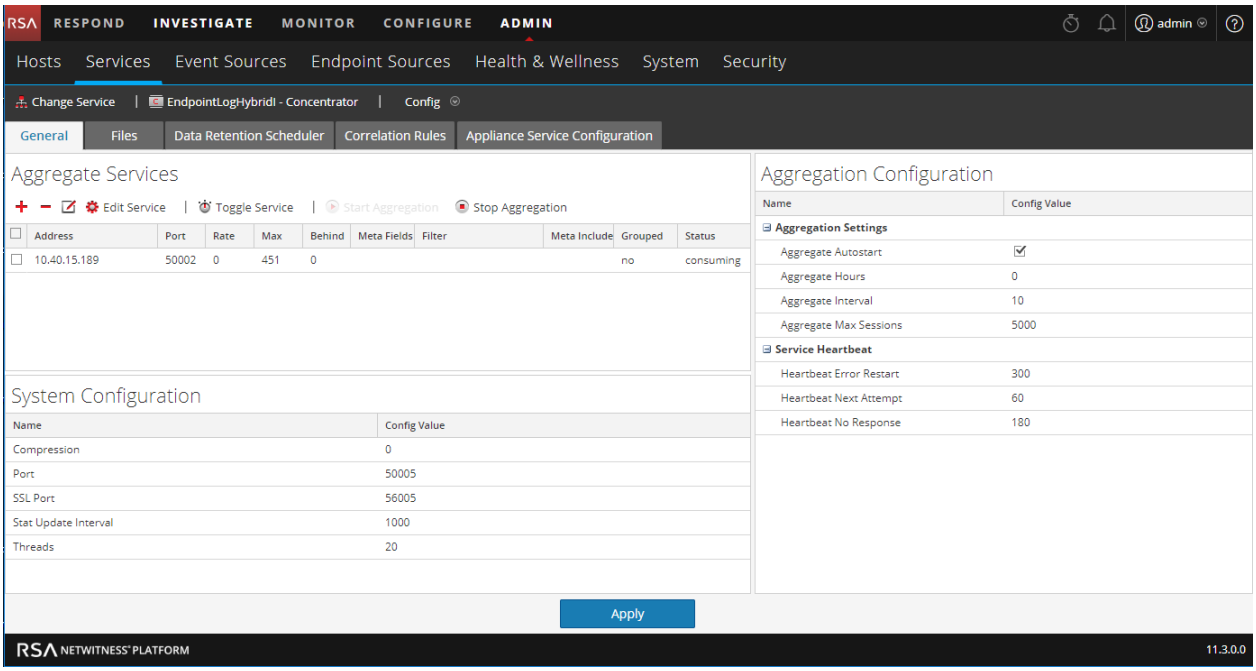
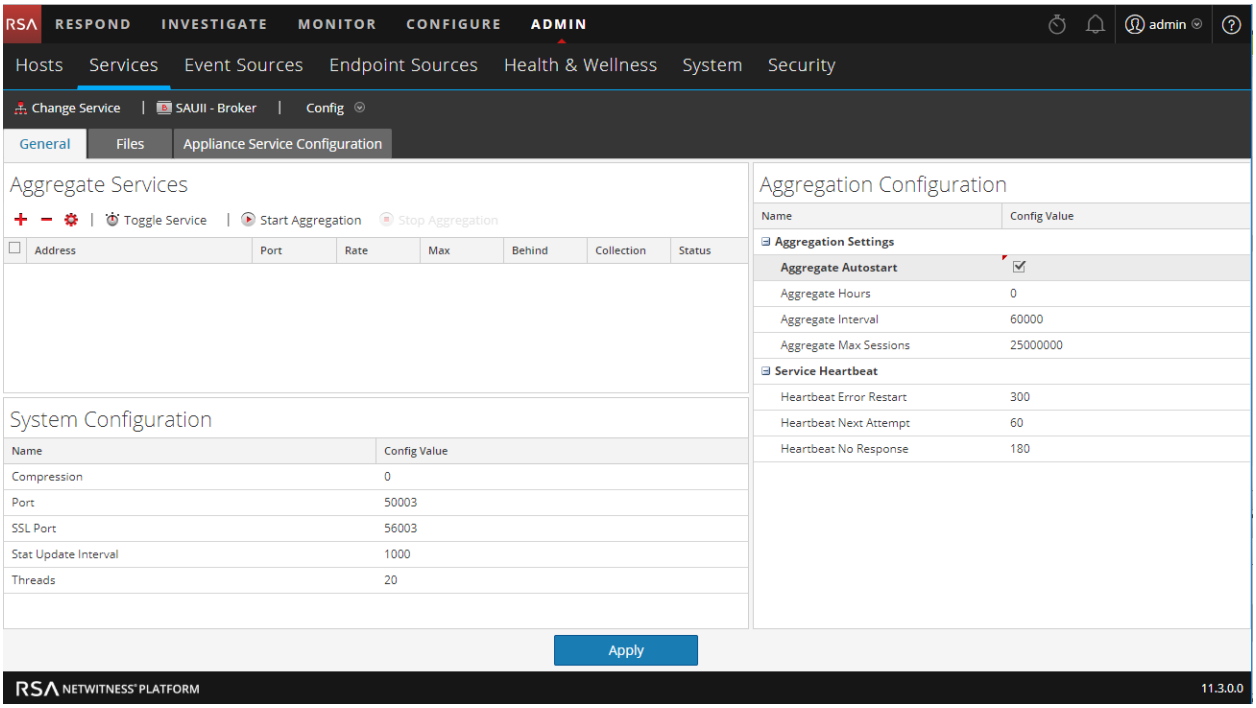
General tab

This is an example of the General tab for a Concentrator.



This is an example of the General tab for a Broker.

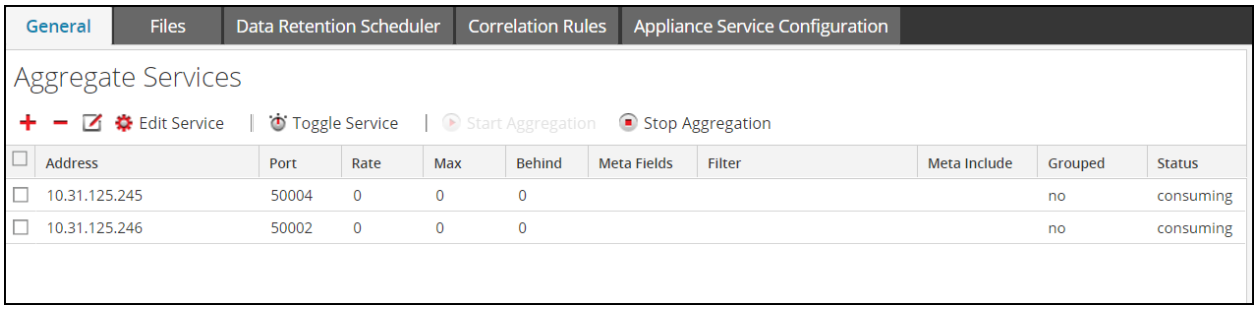


These are the three major sections in the General tab for Brokers and Concentrators:

- Aggregate Services
- System Configuration
- Aggregation Configuration

Aggregate Services Section

The Aggregate Services section provides a way to start and stop aggregation, as well as add, edit, delete, and toggle an aggregate service. This is an example of the Aggregate Services section for a Concentrator.



The Aggregate Services section toolbar offers these options.

Option	Description
+	Opens a dialog in which you can add a Concentrator, Decoder, or Log Decoder as an aggregate service.
−	Removes the selected aggregate service.
	For Concentrators only, opens a dialog to edit **Meta Fields** and **Filter** values for the Concentrator.
Edit Service	Enables you to enter the administrator credentials of the selected aggregate service so that it can communicate with the Broker or Concentrator.
Start Aggregation	When aggregation has been stopped or has not started, starts aggregating data from the online service in the list using the rules defined for the service.
Stop Aggregation	When aggregation is in progress, stops aggregation on the Broker or Concentrator. This stops all services and flushes the index, which may take several minutes to complete. It is necessary to stop aggregate services in order to perform various administrative procedures.
Toggle Service	Toggles the state of a service between offline and online. Only data from online service is consumed during aggregation.

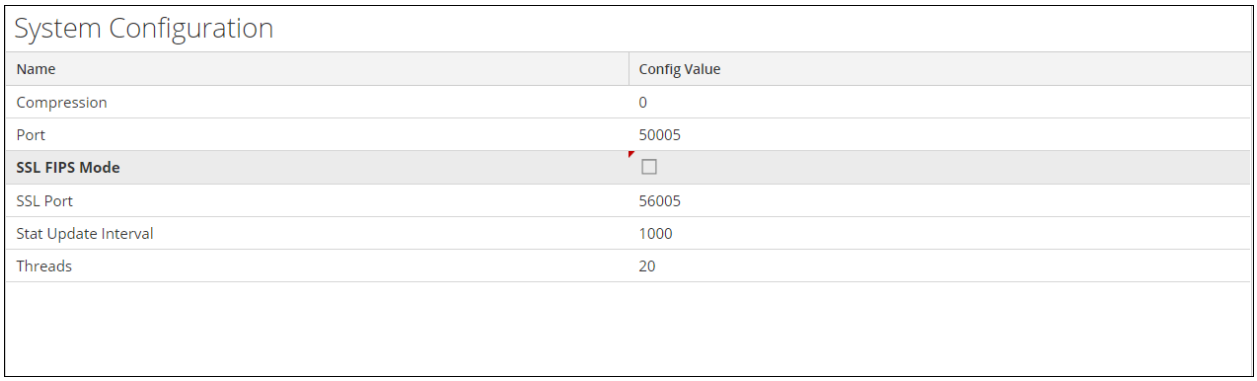
The Aggregate Services section list has these columns.

Column	Description
Address	Lists the address of the service.

Column	Description
Port	Lists the port on which the service listens. The default ports are: • 50001 for Log Collectors • 50002 for Log Decoders • 50003 for Brokers • 50004 for Decoders • 50005 for Concentrators • 50007 for other services
Rate	Lists the number of metadata objects being written to the database per second. Values are rolling average samples over a short time period (10 seconds). After capture stops, the rate is reset to **0**.
Max	Lists the maximum number of metadata objects written to the database per second since capture started. Values are rolling average samples over a short time period (10 seconds). After capture stops, **Max** continues to show the maximum value during capture.
Behind	Lists the number of sessions on the service that need to be aggregated.
Collection	For Brokers only, indicates the collection that was selected when the Analyst Workbench service was added to the Aggregate Services section.
Meta Fields	For Concentrators only, lists the types of metadata being consumed by the aggregate service.
Filter	For Concentrators only, a rule expression (as used in a 'where' clause) can be used to filter the results. You must add a meta key along with an operator and a value, for example `ip.src !=127.0.0.1 && word exists`
Meta Include	For Concentrators only, lists the number of types of meta included in the aggregate service.
Grouped	Whether or not the aggregate service is part of a group.
Status	Lists the current status of the service: • online = available to provide data for consumption by the Broker or Concentrator • offline = not available to provide data for consumption by the Broker or Concentrator • consuming = providing data for consumption by the Broker or Concentrator

System Configuration Section

The System Configuration section manages service configuration for a service. When a service is first added, default values are in effect. You can edit these values to tune performance.



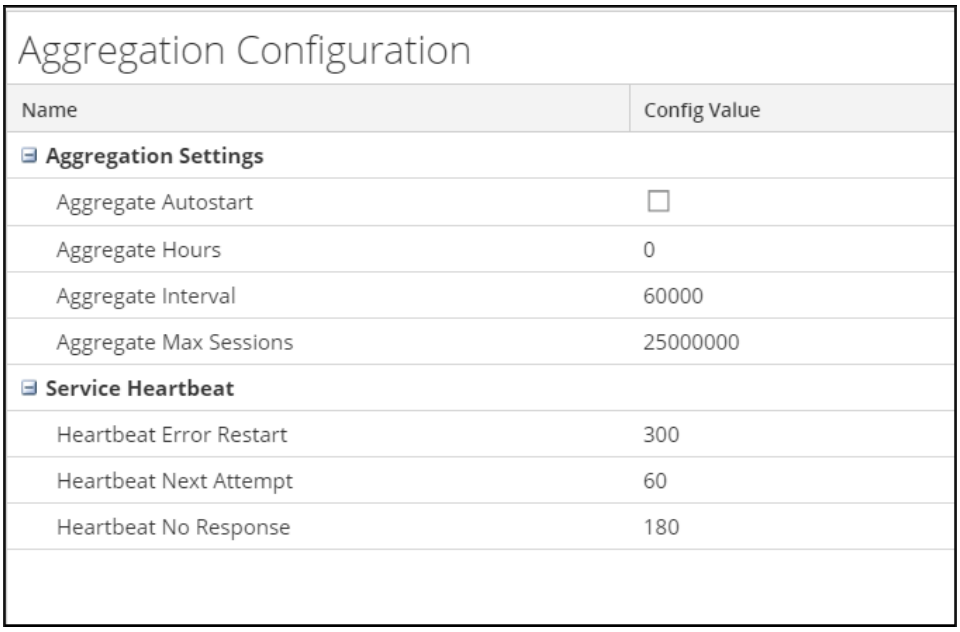
The System Configuration section has these parameters.

Parameter	Description
Compression	The minimum number of bytes that must be transmitted per response before compression. A setting of **0** disables compression. The default value is **0**. A change in value is effective immediately for all subsequent connections.
Port	The port on which the service listens. The default ports are: • 50001 for Log Collectors • 50002 for Log Decoders • 50003 for Brokers • 50004 for Decoders • 50005 for Concentrators • 50007 for other services
SSL FIPS Mode	When enabled (**on**), the security of data transmission is managed by encrypting information and providing authentication with SSL certificates. The default value is **off**.
SSL Port	Indicates the SSL port.
Stat Update Interval	The number of milliseconds between statistic updates on the system. Lower numbers cause more frequent updates and can slow down other processes. The default value is **1000**. A change in value is effective immediately.
Threads	The number of threads in the thread pool to handle incoming requests. A setting of **0** lets the system decide. The default value is **15**. A change takes effect on service restart.

Aggregation Configuration Section

The Aggregation Configuration section provides configuration settings that affect various aspects of the aggregation process. When you click **Apply**, the changes are saved; however, not all settings take effect immediately. The tables for Aggregation Settings and Service Heartbeat provide details.

Caution: Do not change any of these settings unless guided by the Developers or the Customer Support team. Contact the Customer Support for any questions before editing any of these settings.



The following table describes the aggregation settings

Setting	Description
Aggregate Autostart	Option to start aggregation automatically each time the Broker or Concentrator is started. Checked means yes, unchecked means no. This change takes effect immediately.
Aggregate Hours	The number of hours back for each service that the Concentrator or Broker attempts to recover at the beginning of aggregation. This change takes effect immediately. • If the value is set to 0, aggregation for each service starts where it last left off, no matter the number of hours behind. • If the value is any positive integer, the Concentrator or Broker only consumes sessions less than that number of hours back. For example, if a service's most current session is +10 hours from the last session, this is what happens with two different Aggregate Hours values: • With a value of 12, the Concentrator or Broker starts consuming where it left off. • With a value of 4, all sessions between 5 and 10 hours back are skipped and the Concentrator or Broker starts consuming the session that started 4 hours back.
Aggregate Interval	The number of milliseconds between rounds of service aggregation. All services managed by the Broker or Concentrator request additional rounds of session and metadata to be aggregated. If a Broker or Concentrator is still consuming the previous round of data, it cannot request more until it finishes. Change takes effect immediately.
Aggregate Max Sessions	The maximum number of sessions that the Broker or Concentrator requests in a given round of data aggregation. Change takes effect after restart.

Service Heartbeat

In communicating with each aggregate service, Brokers and Concentrators monitor the heartbeat of the service. These parameters specify the timing of the first attempt to reconnect to a service after an error, the next attempt to reconnect, and taking the service offline after failure to reconnect.

Setting	Description
Heartbeat Error Restart	After a heartbeat error is detected on an aggregate service, specifies the number of seconds for a Broker or Concentrator to wait before attempting a service reconnect.
Heartbeat Next Attempt	After a failed attempt to reconnect to an aggregate service, specifies the number of seconds for a Broker or Concentrator to wait before attempting another service reconnect. Change takes effect immediately.
Heartbeat No Response	After failing to reconnect to an unresponsive service, specifies the number of seconds for the Broker or Concentrator to wait before taking the unresponsive service offline. Change takes effect immediately.

When editing parameters in the General tab, you must click **Apply** to save changes.

Services System View - Broker or Concentrator

The Services System view displays information specific to specific to Brokers and Concentrators.

While information displayed in this view is the same for all types of Core services, several options in the toolbar are relevant only for Brokers and Concentrators.

What do you want to do?

Role	I want to...	Refer to...
Administrator	Start and Stop aggregation Add, edit, delete, and toggle an aggregate service	Services System View - Broker or Concentrator
Administrator	Manage System Configuration	Services System View - Broker or Concentrator

Related Topics

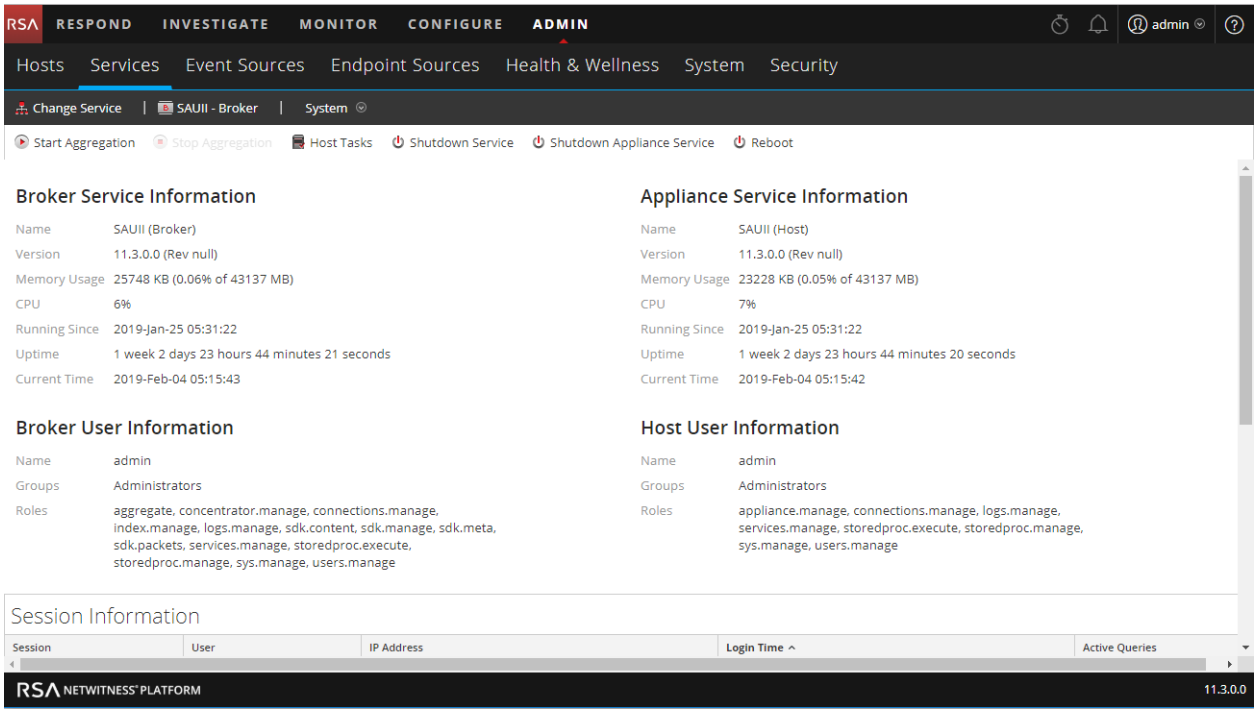
- Broker and Concentrator Basics
- Broker and Concentrator Configuration

Services System View

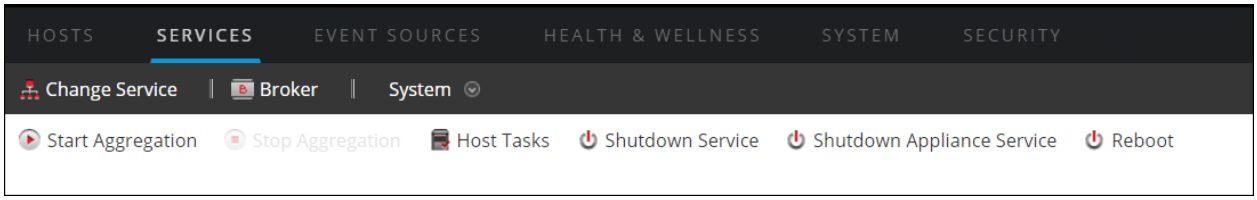
You can access this view by doing the following:

1. Go to **ADMIN** > **Services.**
2. Select a Concentrator or Broker, and select > **View** > **System**.

   The System view for the selected Concentrator or Broker is displayed.



The following figure is an example of the toolbar for a Broker or Concentrator.



Host Tasks, Shutdown Service, Shutdown Appliance Service or (Shutdown Appliance), and Reboot are common to all services and are described in the "Services System view" topic in the *Host and Services Getting Started Guide*.

This table describes toolbar options that apply only to a Concentrator or Broker. Both buttons are unavailable until aggregator services are configured and consuming data.

Action	Description
Start Aggregation	Starts aggregation of data being consumed on a Concentrator or Decoder configured as an aggregation service for the selected Broker or Concentrator. The Start Aggregation button is available only when aggregator services are configured and consuming data.
Stop Aggregation	Stops aggregation of data being consumed on a Concentrator or Decoder configured as an aggregation service for the selected Broker or Concentrator. The Stop Aggregation button is available only when aggregation is occurring.

How Context Hub Works

Context Hub service provides enrichment lookup capability in the Respond and Investigate views. An Administrator can configure the Context Hub service and the data sources to enable an Analyst to perform the context lookup for the required data sources.

By default, the Context Hub service supports enrichment lookups for meta types such as IP address, User, Domain, MAC address, File Name, File Hash, and Host.

The following data sources are supported by NetWitness Platform and provide enriched data when configured.

Lists- Provides contextual information from a list of blacklists, whitelists, or watchlists.

RSA Archer- Provides Criticality information of a device or specific asset based on the IP or Host which needs constant monitoring.

Active Directory - Provides contextual information of a user to help determine if the user is suspicious or not.

RSA NetWitness® Endpoint - Provides context information for endpoint module and machine indicators and to help determine if any of the Endpoint devices are compromised.

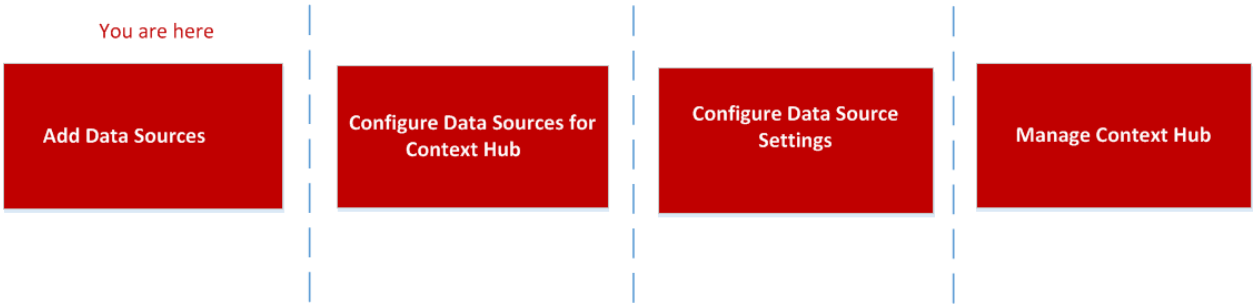
Respond- Provides contextual information of a specific meta available in respond and enables analyst to respond faster based on context data.

Live Connect - Provides contextual information for IP addresses, Domains and File Hashes from RSA Live Connect Threat intelligence community server.

Overview of Context Hub Configuration

The Administrator needs to perform each step in the proper sequence to configure the services to perform the context lookup effectively. In the **ADMIN**> **Services**. Services Config view of Context Hub service, an administrator can configure data sources for Context Hub Service. The administrator can also configure Context Lookups for custom meta keys, if required and also import lists or export lists.

The workflow below describes how the Context Hub service can be configured:



Context Hub service is pre-installed on primary ESA host, and automatically added to the NetWitness Platform.

Note: You can have only one Context Hub service instance enabled in your NetWitness Platform deployment. If there are multiple ESA service in NetWitness Platform, you must choose the appropriate ESA host for Context Hub. A minimum of 8GB space is required to configure Context Hub on ESA host.

Configure Lists as a Data Source

Lists as a Data Source use the Context Hub service to fetch contextual information for meta types that support context lookup. You can create one or more lists and add relevant list values to the list. Make sure that you create meaningful lists such as blacklisted IPs, whitelisted IPs, and so on. The lists can contain supported entities such as IP address, MAC address, User name, Host name, Domain name, File name or File hash. You can import a single-column list or a multi-column list from the Data Source tab. Additionally, all feeds (except STIX feeds) that are created are converted to lists and displayed on the context lookup. If Context Hub is not configured or the service is down, then the feeds will be made available whenever Context Hub is up and running. For more information on creating feeds, see the *Live Services Management Guide*.

Note: When you create a feed, a list is automatically generated with the same name as the feed. If the list name already exists, then the name of the new list is suffixed with the number '2". For example if the existing feed name is test1.csv, then the new list will be named as test2.csv.

List values are in CSV format available in an external location and can be accessed through the following two methods:

- **Local File Store**: You can share a file from a local location.
- **HTTP(S)**: You can share a file using a web server location.

Note: You can also set up recurring job to fetch data on regular intervals by using the Prefetch settings while configuring meta mapping.

Prerequisites

Before you configure Lists data source, ensure that:

- User should have admin permissions.
- Context Hub service is available in **ADMIN**> **Services** view of NetWitness Platform.
- If you are using Local File Store or HTTP(S) server, the path mentioned should contain the CSV file In case of remote Local File Store, the file must be mounted or placed on the local drive location `/var/lib/netwitness/contexthub-server/data`.
- The NetWitness user must have read permission to access the file.

Caution: If you are creating a Context Hub list for use as an enrichment source in ESA, the list name cannot include any spaces or special characters, or start with a number. If you do not follow this naming convention, when you attempt to add the list as an enrichment source in ESA, an error message will be displayed and you will not be allowed to add the list.

Add List data source using Local File Store

To add a List as a data source:

1. Go to **ADMIN > Services**.

   The services view is displayed.

2. Select the Context Hub service and click > **View** > **Config**.

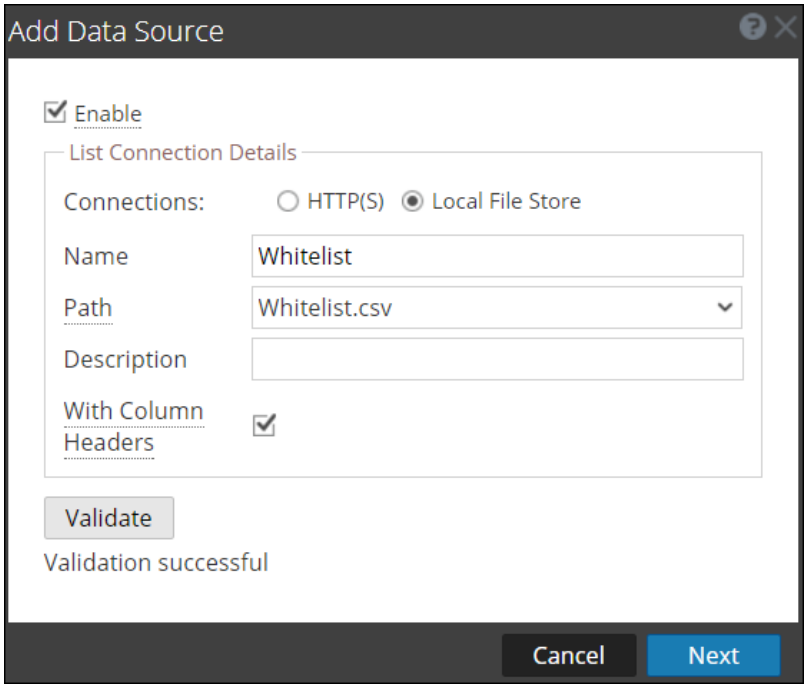
   The Services Config View of Context Hub is displayed.

3. In the **Data Sources** tab, click > **LISTS**.

   The **Add Data Source** dialog is displayed

4. By default, the **Enable** checkbox is selected. If this option is unchecked, the save button is disabled, you cannot add the data source, view the list in the list tab and view the contextual information.

5. Select the **Local File Store** Connection Type.



6. Provide the following database connection details. Enter the following fields for Local File Store Connection Type:

   - **Name:** Provide a name for the list data source.
   - **Path:** This field displays all the data files available in the data folder `/var/lib/netwitness/contexthub-server/data`, where context hub service is running. Select the file name from the drop-down.
     A maximum of 32 columns of CSV file are supported that adhere to the RFC1480 standards.
   - (Optional) **Description**: Add a description for the selected file.

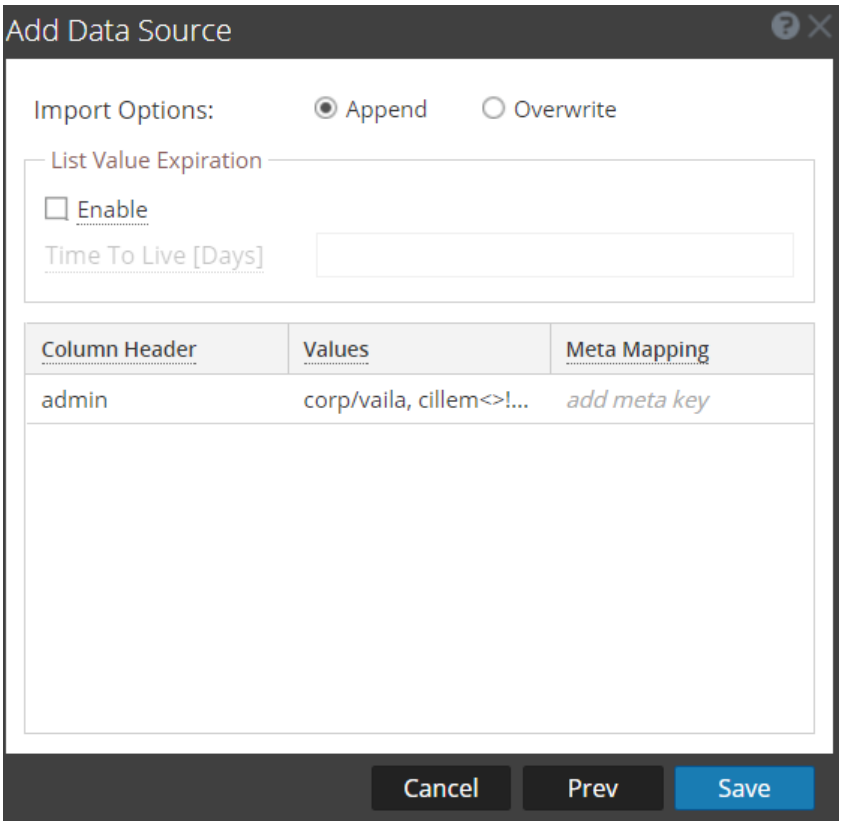
- **With Column Headers**: Select this option to consider the first row as column headers from the CSV file. If you don't select this option, you need to enter the column headers in the next screen.

7. Click **Validate**.

   If the validation fails, you cannot add the data source.

8. Click **Next**.

   The next dialog is displayed.

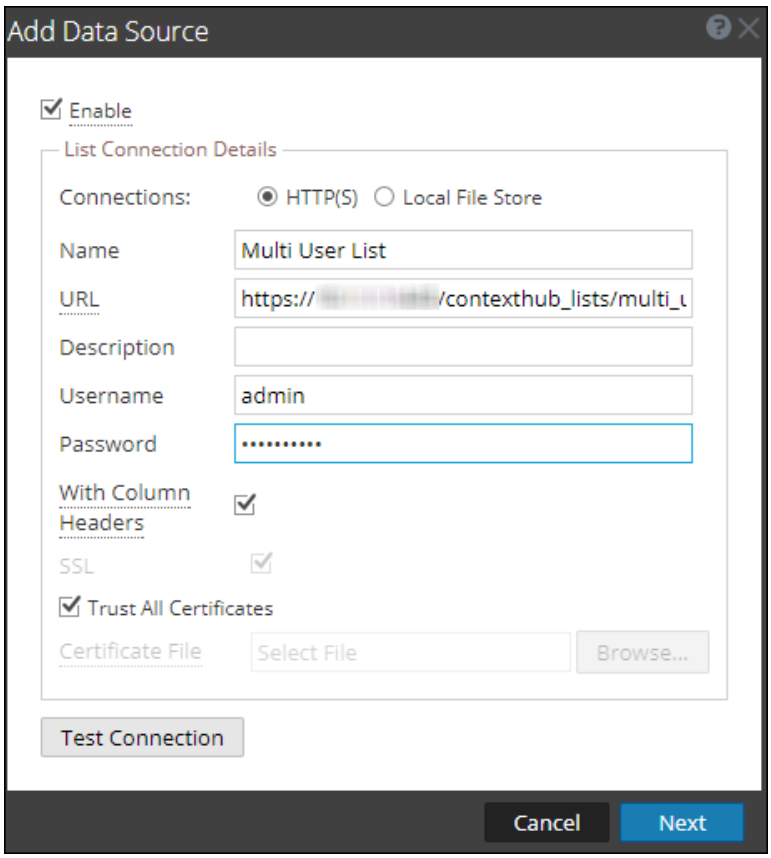


9. Select any one of the following options:
   - **Append** - Select this option to add the imported values to an existing list.
   - **Overwrite** - Select this option to replace the values in an existing list with the imported values.
10. In the **List Value Expiration** section, the **Enable** option is unchecked, by default. If you want to store the looked up list values in the cache for a specified number of days then select the **Enable** checkbox and enter the number of days in the **Time to Live (days)** field for the list values to be retained.
11. In the next screen, map at least one meta key with one or more meta types by mapping a column header with a meta. The description for each field is as follows:
    - **Column Header**: Display headers of the CSV file which must be mapped to a meta type.
    - **Meta Mapping**: Maps a column header field to a meta type.
    - **Values**: Displays the first three values from the imported list.
12. Click **Save**.

Add List data source using HTTP(S)

To add List as a data source:

1. Select **ADMIN** > **Services**.
   The services view is displayed.
2. Select the Context Hub service and click > **View** > **Config**.
   The Services Config View of Context Hub is displayed.
3. In the **Data Sources** tab, click > **LISTS**.
   The **Add Data Source** dialog is displayed.
4. Select the HTTP(S) Connection Type.



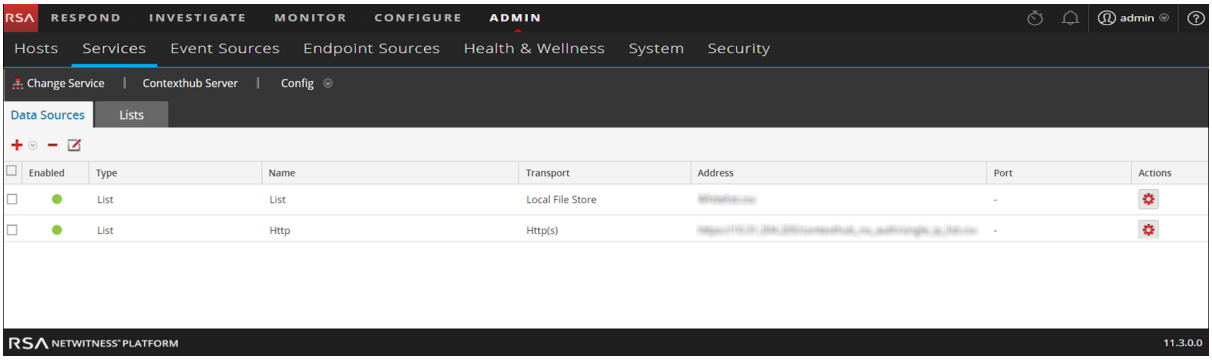
- Enter the following fields for HTTP(S) Connection Type:
  - **Name:** Provide a name for the list data source.
  - **URL**: Enter the path of the CSV file available on the HTTP(S) location along with the host name or IP address of the remote machine where the list is stored. The URL must be of the format: `https://<Hostname or IP-address of the HTTP(S)server>:<Port on`

which the HTTP(S) server is hosted>/<Absolute path of CSV file>. For example, https://10.1.1.1:443/contexthub_lists/multi_user_list.csv

- (Optional) **Description**: Add a description for the selected file.
- (Optional) **Username:** Enter the username to connect to the HTTP(S) server requires basic authentication.
- (Optional) **Password:** Enter the password to connect to the HTTP(S) server requires basic authentication.
- **With Column Headers**: Select this option if you want to import a CSV file with headers. If this option is selected and you import the CSV without headers, the first row will be considered as a header which can be edited.
- **SSL:** If you enter a URL with HTTPS in this field, then this is selected automatically. If you enter a URL with HTTP, then this checkbox is unselected.
- **Trust All Certificates**: Select this checkbox to add the data source without validating the certificate. If you uncheck this option, you need to upload a valid .cer or .crt format HTTP (S)server certificate for the connection to be successful.

5. Click **Test Connection** to test the connection between Context Hub and the data source.
6. Click **Save** to save the settings.

   List is added as a data source for the configured Context Hub and is displayed in the **Data Sources** tab.



Next Steps

- Add, edit, or remove values from a specific list.
- Configure the data source settings to determine the data source fields to be displayed in the Context panel. For instructions, see Configure Context Hub Data Source Settings .
- Import and export a list. For more information, see Import or Export Lists for Context Hub.
- View the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *RSA NetWitness Respond User Guide* and *RSA NetWitness Investigate User Guide*.

Configure Archer as Data Source

You can configure Archer as a data source for Context Hub and use the Context Hub service to fetch contextual information from Archer. Use the procedures in this topic to add Archer as a data source for Context Hub service and configure the settings (if required) for Archer.

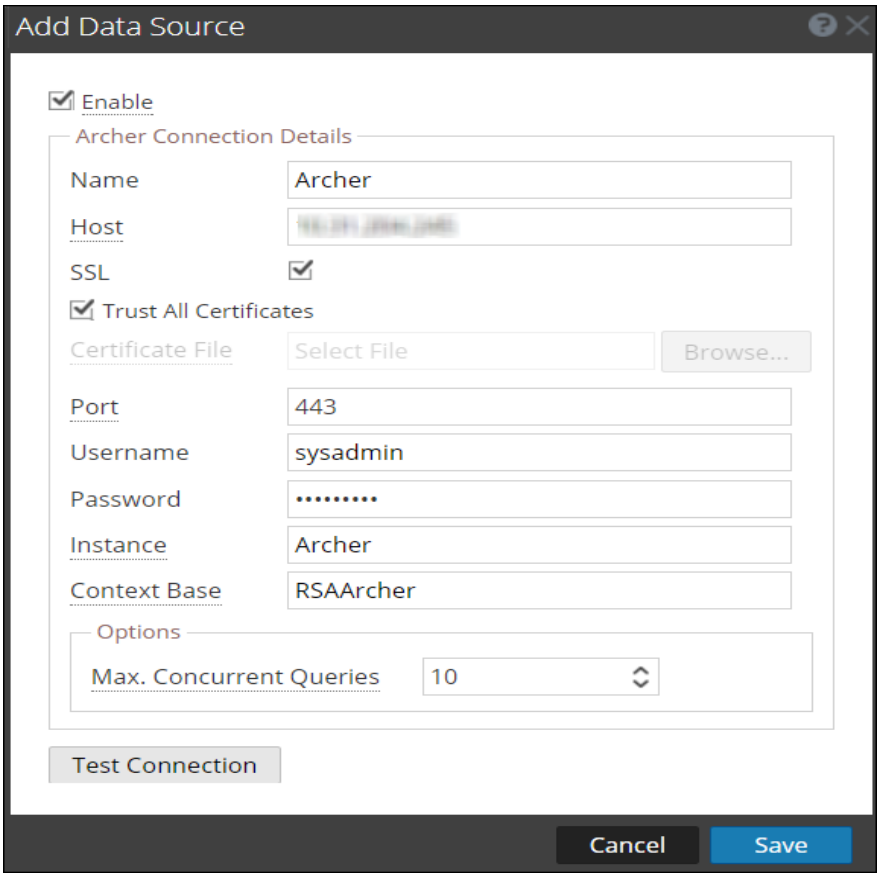
Prerequisites

Before you configure Archer data source, ensure that:

- Context Hub service is available in **ADMIN**>**Services** view of NetWitness Platform.
- Archer is installed with Licensed Devices application.

To add Archer as a data source for Context Hub:

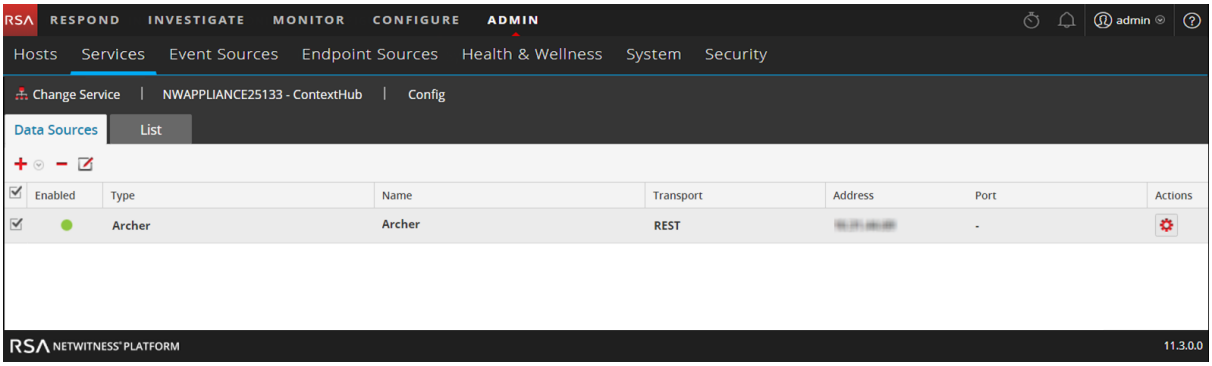
1. Go to **ADMIN** > **Services**.
   The Services view is displayed.
2. Select the Context Hub service, and click > **View** > **Config**
   The Services Config view is displayed.
3. In the **Data Sources** tab, click > **RSA Archer**.
   The **Add Data Source** dialog is displayed.



4. Provide the following information:

- By default, the **Enable** checkbox is selected. If this option is unchecked, the save button is disabled, you cannot add the data source, and cannot view the contextual information.
- Enter the following fields:
  - **Name**: Enter a name for Archer data source.
  - **Host**: Enter the hostname or IP address where Archer server is installed.
  - **SSL**: By default this option is selected and enables SSL communication to Archer .
  - **Trust All Certificates**: Select this checkbox to add the data source without validating the certificate. If you uncheck this option, you need to upload a valid Endpoint server certificate for the connection to be successful.
  - **Port**: The default port is 443.
  - **Username**: Enter the Archer Server username.
  - **Password**: Enter the Archer Server password.
  - **Instance**: Enter the Instance name from which you want to extract data. An RSA Archer instance is a single set up that includes unique content in a database, the connection to the database, the interface, and log-in. You might have individual instances for each office location or region or for development, test, and production environments. The Instance Database stores the RSA Archer content for a specific instance.
  - **Context Base**: Enter the virtual directory name where the files are stored. For example, rsaarcher located at the RSA Archer web address https://archer.company.com/**rsaarche**r/default.aspx. If the files are stored in the IIS default web address https://archer.company.com/default.aspx, then this field must be empty.
  - **Max. Concurrent Queries**: You can configure the maximum number of concurrent queries defined by the Context Hub service to be run against the configured data sources. The default value is 10.

5. Click **Test Connection** to test the connection between Context Hub and the Archer data source.
6. Click **Save**.
   Archer is added as a data source for Context Hub and is displayed in the **Data Sources** tab.



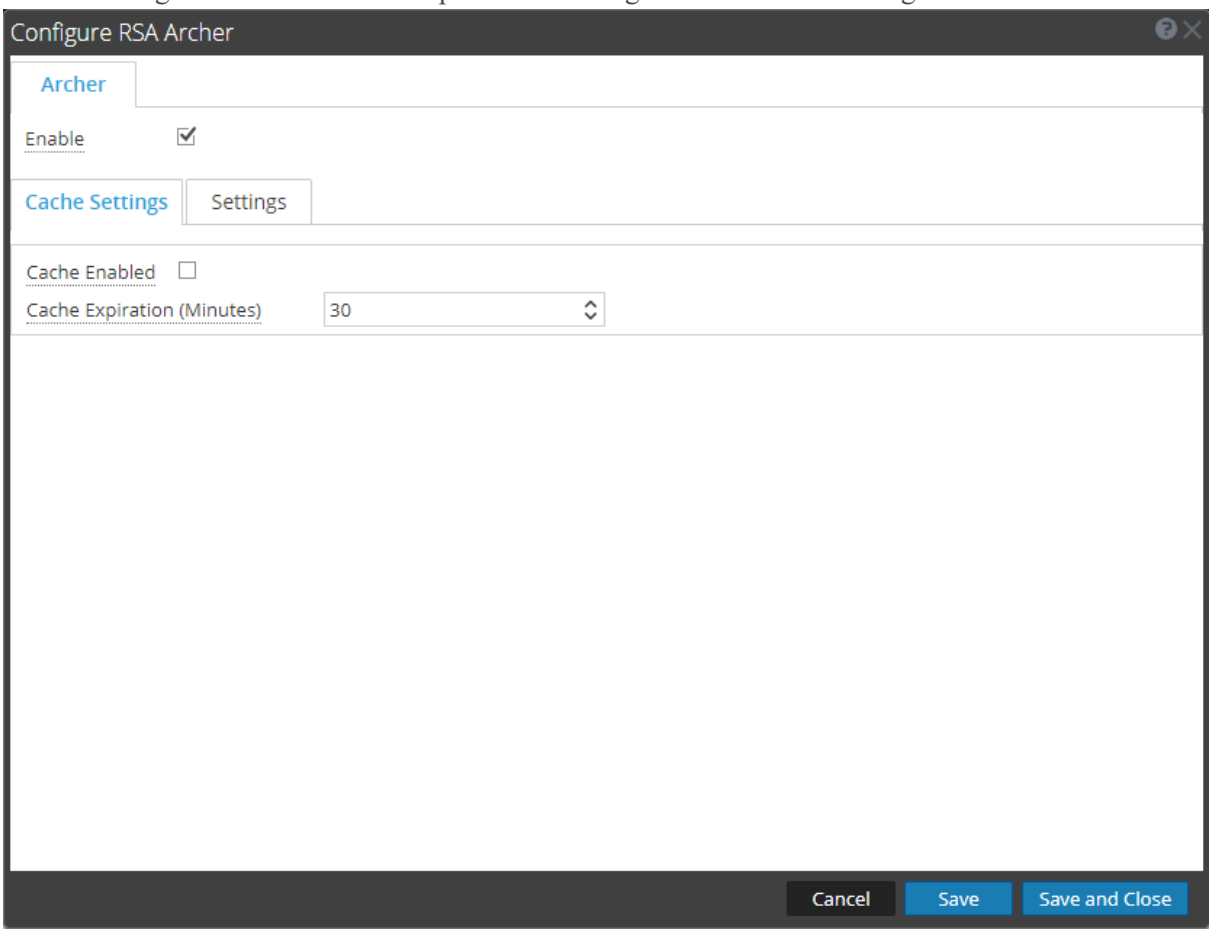
After adding the data source, you can configure data source settings. For instructions, see Configure Context Hub Data Source Settings . And View the contextual data in the Context Summary Panel of the Respond view or Investigate view. For instructions, see the *Netwitness Respond User Guide* and *Investigate User Guide*

Configure Archer Data Source

After you have configured the required data sources you can customize the settings for the data sources based on your requirement.

To access and configure settings:

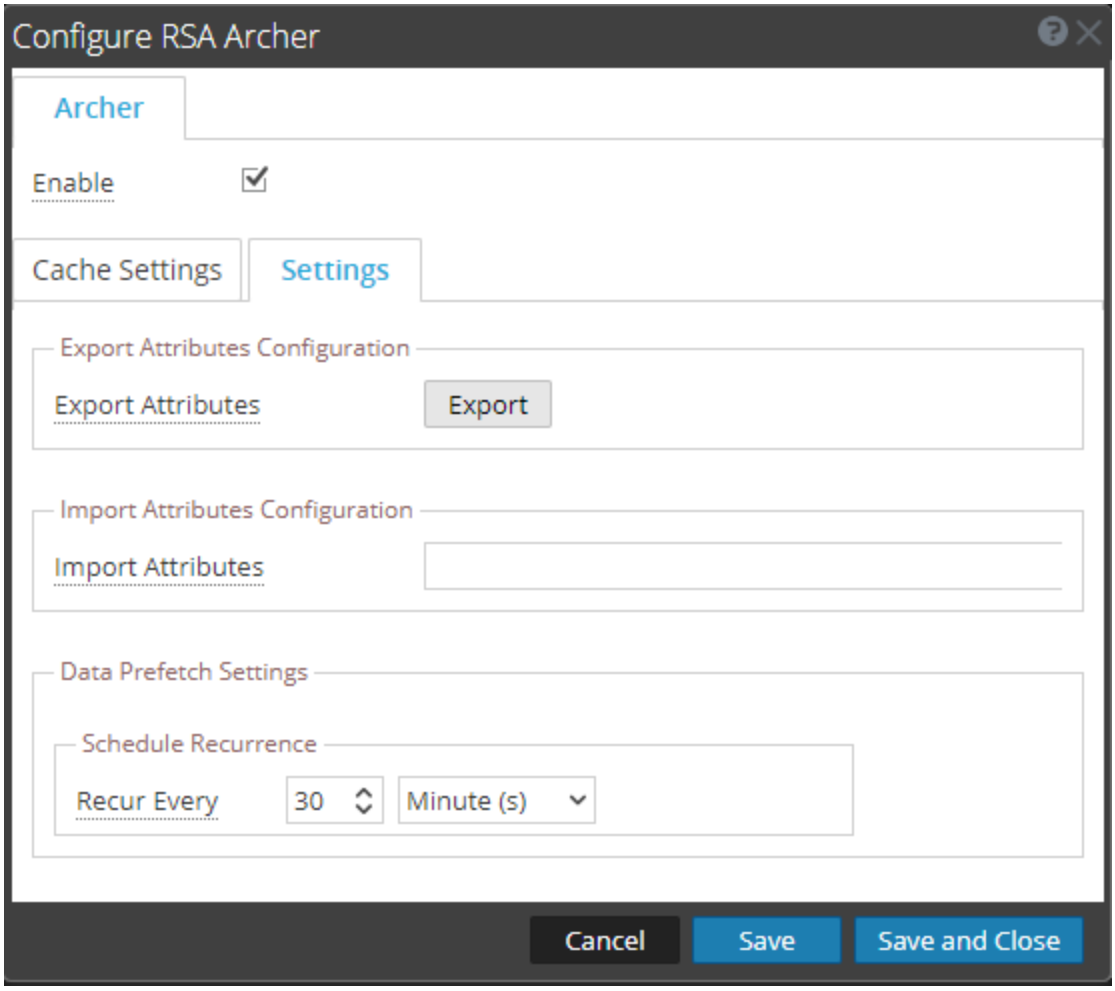
1. Go to **ADMIN**> **Services**.
   The services view is displayed.
2. In the Services panel, select the Context Hub service and click > **View** > **Config**.
   The Services Config view of Context Hub is displayed.
3. Select the data source for which you want to configure the settings and click in the Actions column.
   The following screenshot is an example of the Configure RSA Archer dialog:



4. In the **Settings** tab. Configure the following fields:

Field	Description
Enable	This option is enabled by default (checked) and can be used to enable or disable the response from the selected data source.
Cache Settings	Any lookup from Context Hub can be stored in the Context Hub cache for a configured time. Response to any subsequent matching request will be fetched from the Context Hub cache. Use this section to define the following cache settings for query lookup: • **Cache Enabled**: By default, this checkbox is selected and the query response is cached. • **Cache Expiration (Minutes)**: The maximum time the query lookup is retained in cache. The default time is 30 minutes and maximum is 7200 minutes that you can configure.

5. Click **Cache Settings**. Configure the following fields



Field	Description
Export Attributes Configuration	In **Settings**, **Export Attributes Configuration**, click **Export** to export the Archer Attributes Configuration. These are the attributes visible in Context Lookup while viewing Archer details for a IP, Host, or Mac. A JSON configuration file gets downloaded and the order of the attributes in sync with the listing in the context panel is maintained in the JSON file.
Import Attributes Configuration	If you want to update or edit the configuration settings, in **Settings**, **Import Attributes Configuration**, click **Browse**. Select the JSON file containing the configuration attributes. The attributes appear in the Context Lookup panel when a user views the context, in the order which they were imported. **Note**: You can backup the previous attributes before importing any changes made to existing attributes.
Data Prefetch Settings	In **Settings**, **Data Prefetch Settings** helps prefetch the data. Configure the **Schedule Recurrence** to provide data faster when you hover over the intended entity in Respond.
Schedule Recurrence	In the **Recur Every** field, enter a value or use the drop-down to configure the recurrence for prefetch. The default time duration can be selected from the drop-down list for configuring the duration of recurrence. Available values are minutes, hours, days, or weeks.

6. Click any one of the following options:
   - **Cancel** - select this option to cancel the changes.
   - **Save** - select this option to save the changes.
   - **Save and Close** - select this option to save and close the dialog.

Note: After you configure the data source settings, you can configure the Context Hub configuration parameters by navigating to **ADMIN**> **Services**> **View** > **Explore** view. Make sure you restart the Context Hub service if you make any configuration changes in the Explore view.

Configure Active Directory as a Data Source

You can configure Active Directory (AD) as a data source for Context Hub using LDAP and use the Context Hub service to fetch contextual information from AD. Use the procedures in this topic to add AD as a data source for Context Hub service and configure the settings(if required) for AD.

Prerequisites

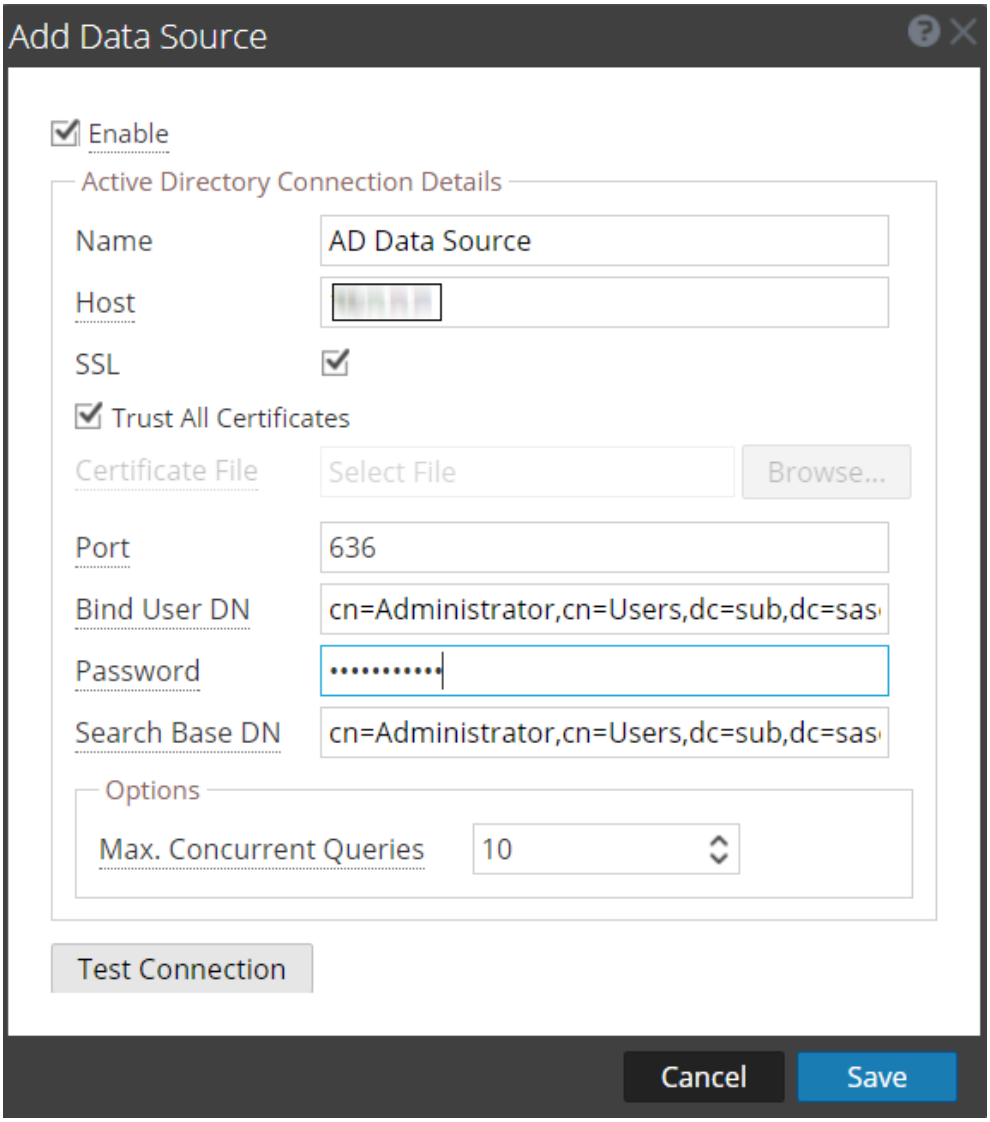
Before you configure Active Directory data source, ensure that:

- Context Hub service is available in **ADMIN** > **Services** view of NetWitness Platform.
- AD is available and is running on Windows versions 2003, 2008, and 2012 are supported.

To add AD as a data source for Context Hub:

1. Go to **ADMIN** > **Services**.
   The services view is displayed.
2. Select the Context Hub service and click > **View** > **Config**.
   The Services Config View of Context Hub is displayed.

3. In the **Data Sources** tab, click + > **Active Directory**.
   The **Add Data Source** dialog is displayed.



You need to configure the Active Directory schema to replicate the following attributes to view the data in the RESPOND page:

- Employee ID
- Department
- Company
- Title
- Postal Code

All the other attributes replicate automatically.

6. Provide the following database connection details:

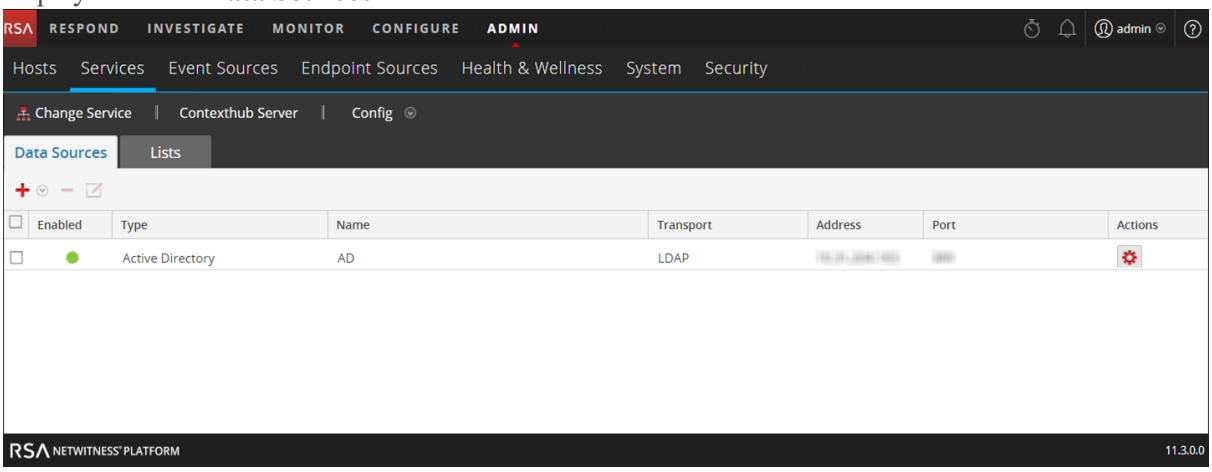
- By default, the **Enable** checkbox is selected. If this option is unchecked, the save button is disabled, you cannot add the data source, and cannot view the contextual information.
- Enter the following fields.
  - **Name:** Enter a name for the AD data source.
  - **Host:** Enter the host name or IP address of the AD.
  - **SSL:** By default this will be checked with 636 port number which will connect to the data source using Secure Sockets Layer (SSL) connection.
  - **Trust All Certificates**: Select this checkbox to add the data source without validating the certificate. If you uncheck this option, you need to upload a valid .cer or .crt format Active Directory server certificate for the connection to be successful. If you add multiple AD data sources with ssl, you should configure all the data sources with either a valid certificate or a Trust All Certificates.
  - **Port:** The default port is 636 with SSL and 389 without SSL.
    If you want to fetch data from multi-domains you can configure a single data source with the Global catalog port (3269 with SSL or 3268 without SSL).

    Alternately, for multi-domain, you can configure a single data source for each domain with the default port (389 with SSL or 636 without SSL).

    Multi-forest is a collection of multi-domains. If you want to fetch data from multi-forest you need to configure each forest with the Global catalog port (3269 with SSL or 3268 without SSL).
  - **Password:** Enter password of the user DN used to bind with AD.
  - **Bind User DN:** The distinguished name of the user that will authenticate to the search directory. For example, cn=Administrator,cn=Users,dc=sub,dc=saserver,dc=local.
  - **Search Base DN:** The base distinguished name, or base DN, identifies the entry in the directory from which searches are initiated; the base DN is often referred to as the search base. For example, dc=sub,dc=saserver,dc=local.

7. Click **Test Connection** to test the connection between Context Hub and the data source.
8. Click **Save**.
   AD is added as a data source for the configured Context Hub. The added AD data source is

displayed in the **Data Sources** tab.



After adding the data source, you can configure the data source settings. For instructions, see Configure Context Hub Data Source Settings .

Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For instructions, see the **Navigate to Context Summary Panel and View Additional Context** topic in the *Investigate User Guide*.

Configure Netwitness Endpoint as a Data Source

You can configure NetWitness Endpoint as a data source for Context Hub and use the Context Hub server to fetch contextual information from NetWitness Endpoint. Use the procedures in this topic to add NetWitness Endpoint as a data source for Context Hub service and configure the settings (if required) for NetWitness Endpoint.

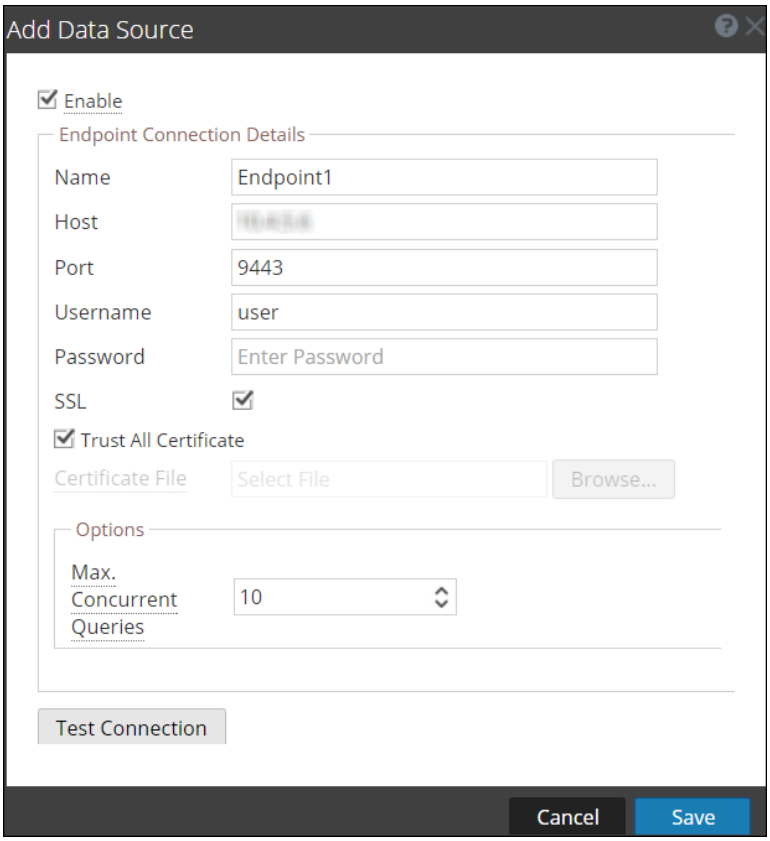
Prerequisites

Before you configure NetWitness Endpoint data source, ensure that:

- Context Hub service is available in **Admin** > **Services** view of NetWitness Platform.
- NetWitness Endpoint (v4.1.1 to 4.3.0.5) is installed and configured.
  For more information on how to install, configure and for detailed information on NetWitness Endpoint, see the NetWitness Endpoint documents available at RSA Link.

To add NetWitness Endpoint as a data source for Context Hub:

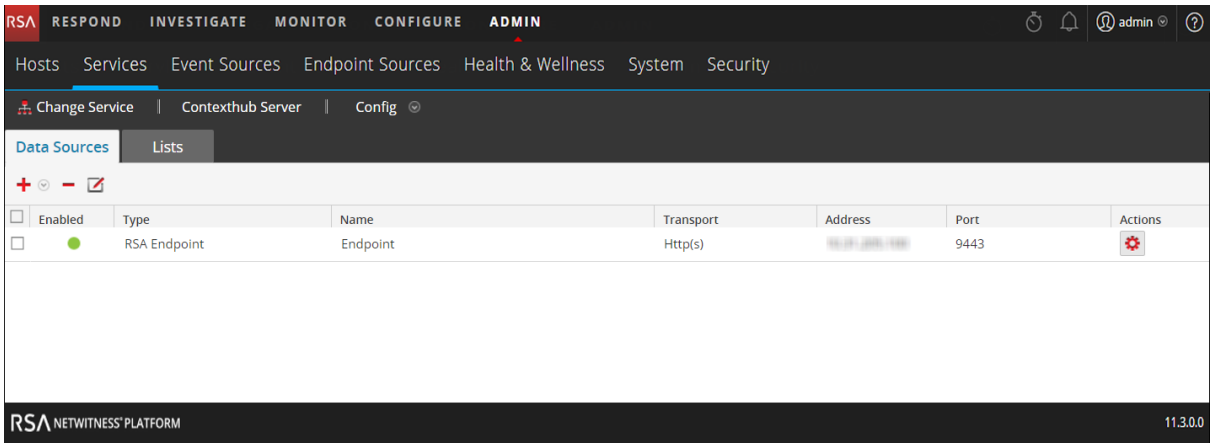
1. Go to **Admin** > **Services**.
   The Services view is displayed.
2. Select the Context Hub service, and click > **View** > **Config**.
   The Services Config view is displayed.
3. In the **Data Sources** tab, click > **RSA Endpoint**.
   The **Add Data Source** dialog is displayed.



4. Provide the following information:

- By default, the **Enable** checkbox is selected. If this option is unchecked, the save button is disabled, you cannot add the data source, and cannot view the contextual information.
- Enter the following fields:
  - **Name**: Enter a name for NetWitness Endpoint data source.
  - **Host**: Enter the hostname or IP address where NetWitness Endpoint API server is installed.
  - **Port**: The default port is 9443.
  - **SSL**: Select SSL if you want NetWitness Platform to communicate with the host using SSL. This is enabled by default.
  - **Username**: Enter the NetWitness Endpoint API Server username.
  - **Password**: Enter the NetWitness Endpoint API Server password.
  - **Trust All Certificates**: Select this checkbox to add the data source without validating the certificate. If you uncheck this option, you need to upload a valid server generated or CA certificate to authenticate the connection with the supported formats of .cer or .crt of Base64 [PEM] encoded or DER encoded.
  - **Max. Concurrent Queries**: You can configure the maximum number of concurrent queries to be run against the configured data sources. The default value is 10.

5. Click **Test Connection** to test the connection between Context Hub and the NetWitness Endpoint.
6. Click **Save**.
   NetWitness Endpoint is added as a data source for Context Hub and is displayed in the **Data Sources** tab.



Next steps

After adding the data source, you can configure the settings. For more information, see Configure Context Hub Data Source Settings .

Also you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *RSA NetWitness Respond User Guide* and the *RSA Netwitness Investigate User Guide*

Configure Respond as a Data Source

You can configure Respond as a data source for Context Hub and use the Context Hub service to fetch contextual information from Respond service. If Respond service is already configured, the configuration details are pre-populated while adding Respond as a data source. Use the procedures in this topic to add Respond as a data source for Context Hub service and configure the settings.

Prerequisites

Before you configure Respond data source, ensure that:

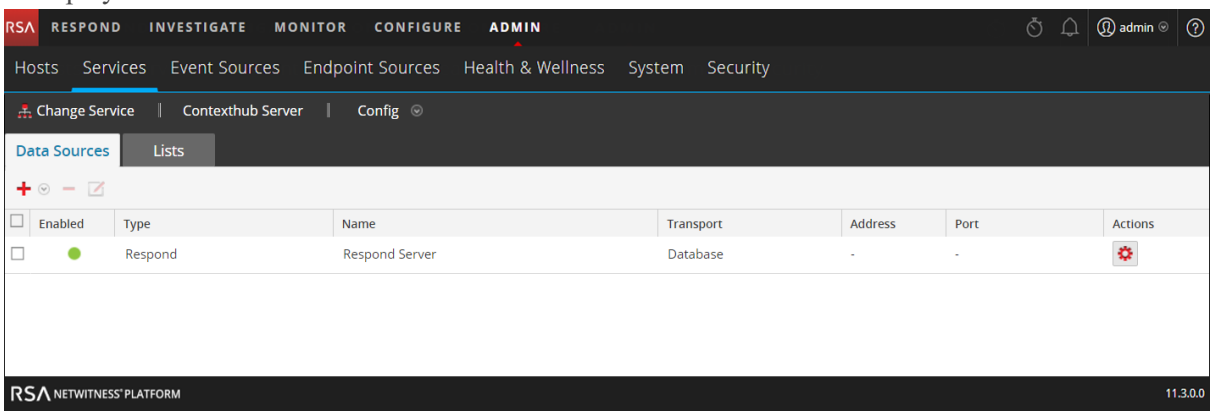
- Context Hub service is available in **ADMIN**> **Services** view of NetWitness Platform.
- Respond service is available.

To add Respond as a data source for Context Hub:

1. Go to **Admin** > **Services**.
   The services view is displayed.
2. Select the Context Hub service and click > **View** > **Config**.
   The Services Config View of Context Hub is displayed.
3. In the **Data Sources** tab, click > **Respond**.
   The **Add Data Source** dialog is displayed.

   The required fields to configure the Respond data source are automatically updated.
4. Click **Test Connection** to test the connection between Context Hub and the data source.
5. Click **Save**.
   Respond is added as a data source for the configured Context Hub. The added Respond data source

is displayed in the **Data Sources** tab.



After adding the data source, you can configure the settings. For more information, see Configure Context Hub Data Source Settings .

Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *RSA Netwitness Respond User Guide* and the *RSA Netwitness Investigate User Guide*.

Configure Live Connect as a Data Source for Context Hub

This topic describes the procedure to configure Live Connect data source for Context Hub.

RSA Live Connect is a cloud based threat intelligence service. This service collects, analyzes, and assesses threat intelligence data such as IP addresses, domains, and files collected from various sources including the RSA NetWitness® Platform and RSA NetWitness® Endpoint customer community.

RSA Live Connect is a part of Live Services and can be configured from the System View > Live Services Configuration panel. For more information about configuring Live Services, see the **Configure Live Services Settings** topic in the *System Configuration* Guide.

RSA Live Connect Threat Insights provides analysts the opportunity to pull threat intelligence data such as IP related information from the Live Connect service to be leveraged by analysts during the investigation process. By default, **Threat Insights** is enabled in **Additional Live Services**. If Context Hub service is configured, Live Connect is automatically added as a data source for Context Hub.

Prerequisites

Ensure that:

- Context Hub is enabled and the service is available in Admin > Services view of NetWitness Platform.
- RSA Live Account is available.

Note: To create a Live Account, see the **Step 1. Create Live Account** topic in the *Live Services Management Guide*.

By default, **Threat Insights** is enabled in **Additional Live Services** section. Before setting up Live Connect data source, make sure that you have signed in to your Live account with your Live Account Credentials and Context Hub is enabled. Live Connect is automatically added as a data source for context hub.

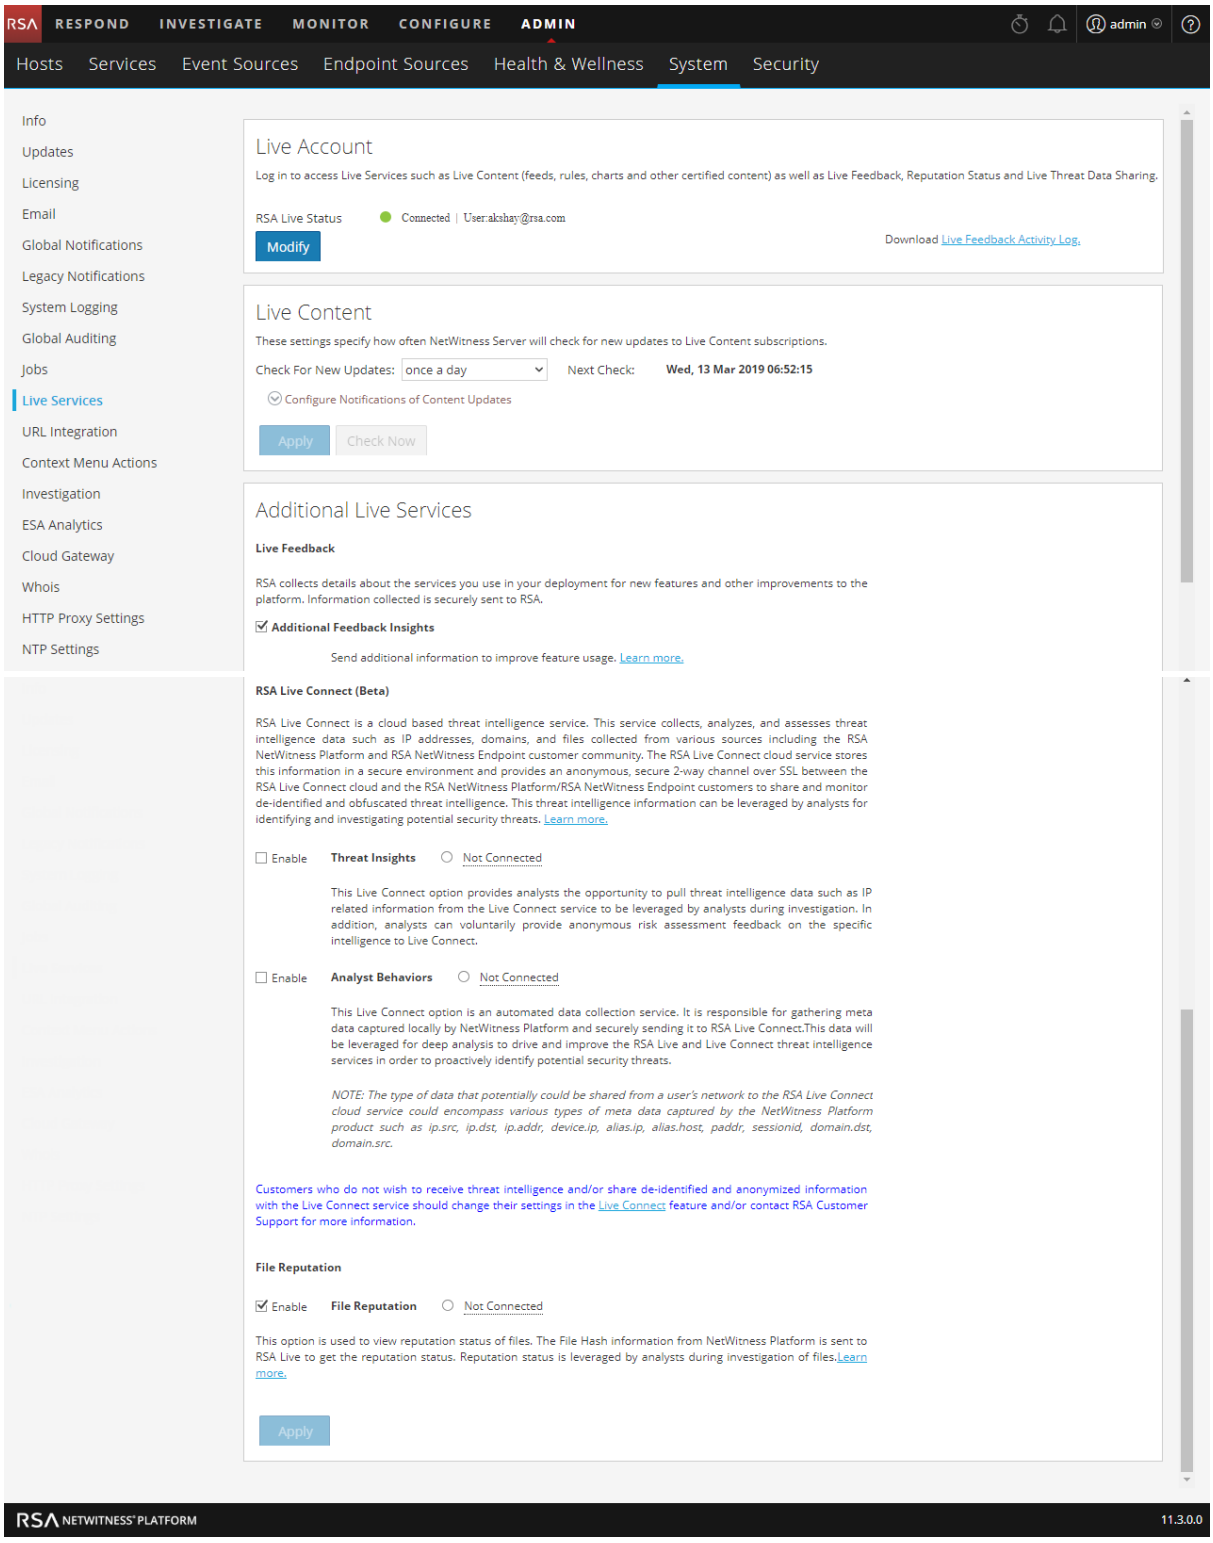
For information about configuring Live Account and Live Services, see the **Configure Live Services Settings** topic in the *System Configuration Guide*.

For information about configuring Context Hub service, see the **Step 1. Add the Context Hub Service** topic in the *Context Hub Configuration Guide*.

Enable or Disable Live Connect Data Source

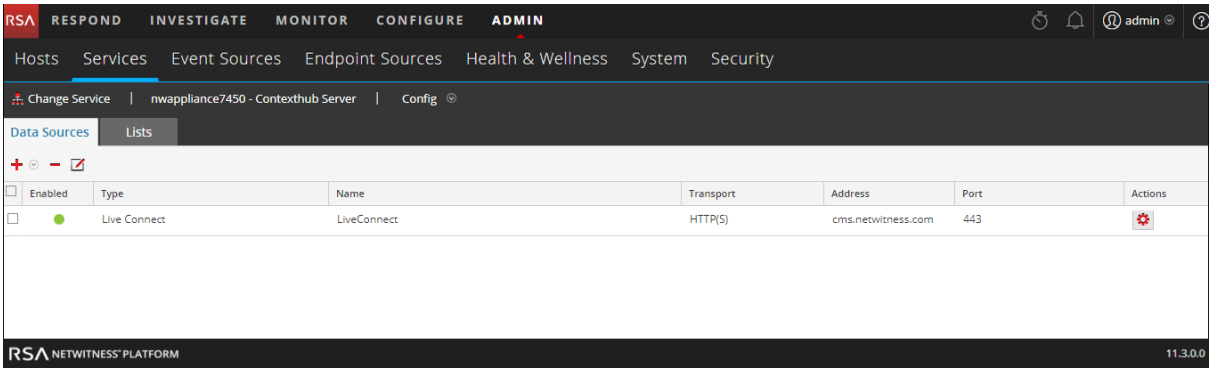
To enable or disable Live Connect data source for Context Hub:

1. Go to **ADMIN > System**.
2. In the left navigation pane, select **Live Services**.
3. In the **Additional Live Services** section, enable **Threat Insights**.



4. Click **Apply**.
   Live Connect data source is enabled for Context Hub service.
5. To verify, go to the **Data Sources** tab and view the available sources.
   Live Connect source must be added to the list of available sources and the **Enabled** field must

be a solid green circle ( ).



6. To disable Live Connect data source, disable **Threat Insights** in Additional Live Services panel and click **Apply**.

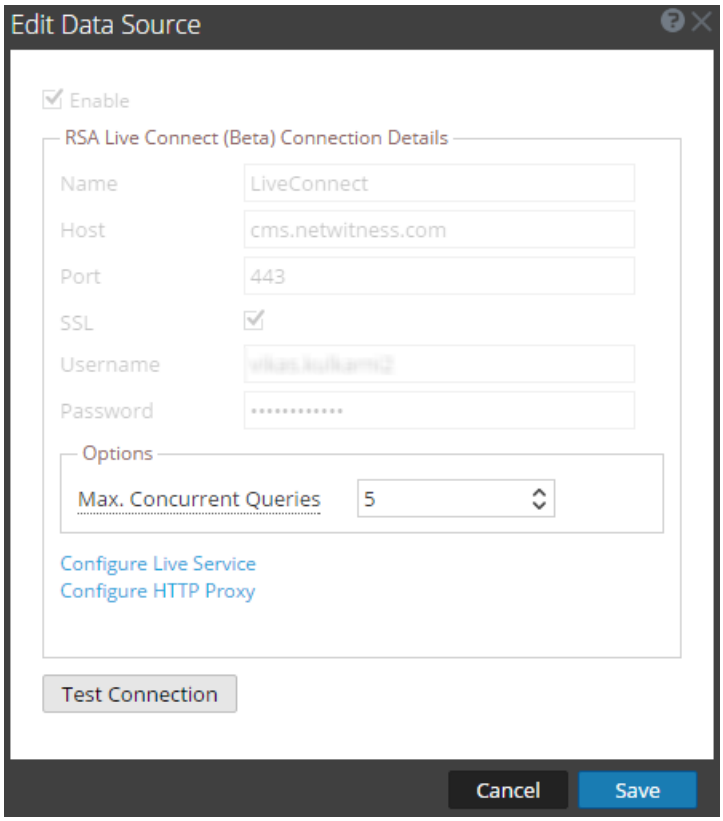
   Live Connect data source is disabled for Context Hub service.

   Note: If Threat Insights is disabled, the Context Lookup panel for Live Connect (in the Investigation Navigate view and Events view) displays a message to configure the Live Connect data source. To view contextual data for Live Connect, you must enable Threat Insights.

Edit Live Connect Data Source Settings

To edit live connect data source for Context Hub:

1. In the main menu, select **Admin > Services**.
   The Services view is displayed.
2. In the **Services** panel, select the Context Hub service, and > **View** > **Config**.
   The Services Config view is displayed.
3. In the **Data Sources** tab, select the live connect data source and click .
   The **Edit Data Source** dialog is displayed.



4. Edit the required fields:

Field	Description
Max. Concurrent Queries	You can configure the maximum number of concurrent queries defined by the Context Hub service to be run against the configured data sources. The default value is 25.

5. To edit the Live Connection and Proxy settings, do the following:
   - To edit the Live Connection settings, see the **Live Services Configuration Panel** topic in the *System Configuration Guide*.
   - To edit the proxy settings, see **the HTTP Proxy Settings Panel** topic in the *System Configuration Guide*.
6. Click **Test Connection** to test the connection between Context Hub and the data source.
7. Click **Save** to save the settings.

Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *RSA Netwitness Respond User Guide* and the *RSA NetWitness Investigate User Guide*.

Configure Context Hub Data Source Settings

After you have configured the required data sources you can customize the settings for the data sources based on your requirement.

To access and configure settings:

1. Go to **ADMIN**> **Services**.

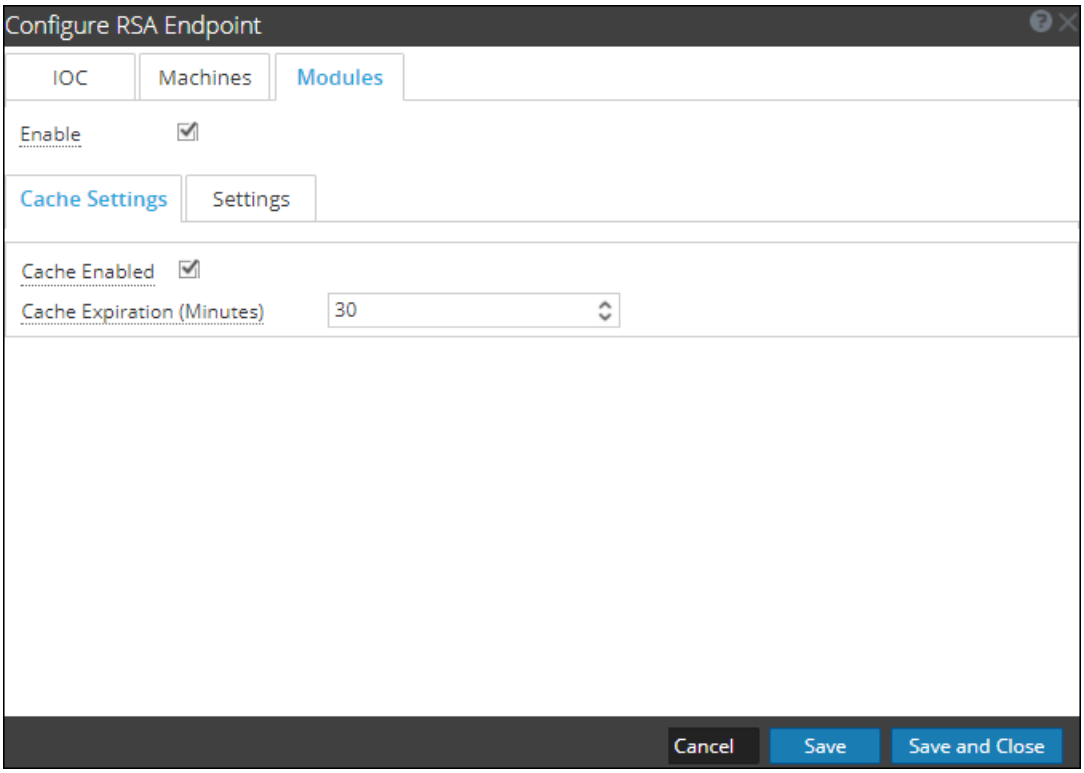
   The services view is displayed.

2. In the Services panel, select the Context Hub service and click > **View** > **Config**.

   The Services Config view of Context Hub is displayed.

3. Select the data source for which you want to configure the settings and click in the Actions column.

   The following screenshot is an example of the NetWitness Endpoint settings dialog:



4. Configure the following fields:

Field	Description
Enable	This option is enabled by default (checked) and can be used to enable or disable the response from the selected data source.

Field	Description
Cache Settings	Any lookup from Context Hub can be stored in the Context Hub cache for a configured time. Response to any subsequent matching request will be fetched from the Context Hub cache. Use this section to define the following cache settings for query lookup: • **Cache Enabled**: By default, this checkbox is selected and the query response is cached. • **Cache Expiration (Minutes)**: The maximum time the query lookup is retained in cache. The default time is 30 minutes and maximum is 7200 minutes that you can configure.
List value Expiration	**Enable**: Select Enable to define the number of days the list values must be available. By default, this option is disabled and the values are retained. **Time to Live (Days)**: Enter the number of days you want to the list values to be retained.
Meta Mapping	Any list stored in Context Hub should be made available for a lookup. The lookup in Context Hub is performed based on meta type or entities. Examples IP, HOST, MAC ADDRESS, DOMAIN, FILE_NAME, FILE_HASH, USER. **Meta Type**: Entities available in Context Hub. **Context Hub Fields**: Column headers from CSV file you have added when creating a list.
Minimum IIOC Score	The minimum IIOC score to be considered for fetching contextual information of Netwitness Endpoint modules.
Query Last (Days)	The duration (in days) for which the Context Data must be queried.
Limit	The maximum number of records to be displayed when Context Lookup is performed.
Recur Every	Configure recurring schedule to fetch and store contextual data for the required intervals.

5. Click any one of the following options:
   - **Cancel** - select this option to cancel the changes.
   - **Save** - select this option to save the changes.
   - **Save and Close** - select this option to save and close the dialog.

Based on the data source you select, the Response Groups differ. The following table describes the response groups for every data source.

Data Source (Connection)	Response Supported Groups	Field Settings
List	List	Meta Mapping Meta Type Context Hub Fields Settings Data Prefetch Settings Schedule Recurrence List Value Expiration Cache Settings Cache Enabled Cache Expiration (Minutes) [Min is 30 minutes Max is 7200 minutes]
RSA Archer	Archer	Cache Settings Cache Enabled Cache Expiration (Minutes) Settings Export Attributes Configuration Export Attributes Data Prefetch Settings Schedule Recurrence
Active Directory	Users	Meta Mapping Meta Type Context Hub Fields Settings Data Prefetch Settings Schedule Recurrence List Value Expiration Cache Settings Cache Enabled Cache Expiration (Minutes)[Min is 30 minutes Max is 7200 minutes]

Data Source (Connection)	Response Supported Groups	Field Settings
RSA Endpoint	IOC Machines Modules	Cache Settings Cache Enabled Cache Expiration (Minutes) Settings Context Panel Settings Cache Settings Cache Enabled Cache Expiration (Minutes) Settings Context Panel Settings Cache Settings Cache Enabled Cache Expiration (Minutes) Settings Minimum IIOC Score Context Panel Settings
Respond	Alerts Incidents	Context Panel Settings Data Prefetch Settings Query Last [Days Cache Settings Cache Enabled Cache Expiration (Minutes)
Live Connect	Domain File IP	Cache Settings Cache Enabled Cache Expiration (Minutes) Settings Context Panel Settings

Note: After you configure the data source settings, you can configure the Context Hub configuration parameters by navigating to **ADMIN**> **Services**> **View** > **Explore** view. Make sure you restart the Context Hub service if you make any configuration changes in the Explore view.

Import or Export Lists for Context Hub

As an administrator you can import or export a list that is configured in the Context Hub service which can be used by an analyst. The file to be imported or exported is a CSV file and you can add multiple lists as Data Sources.

Prerequisites

Ensure that Context Hub is enabled and the service is available in **Admin** > **Services** view of NetWitness Platform.

Import a List

After you have imported a list, you can perform the following tasks:

- Import values to an existing list
- Add row to a list
- Edit a list name and description
- Edit a value from a list
- Delete a list
- Delete row from a list

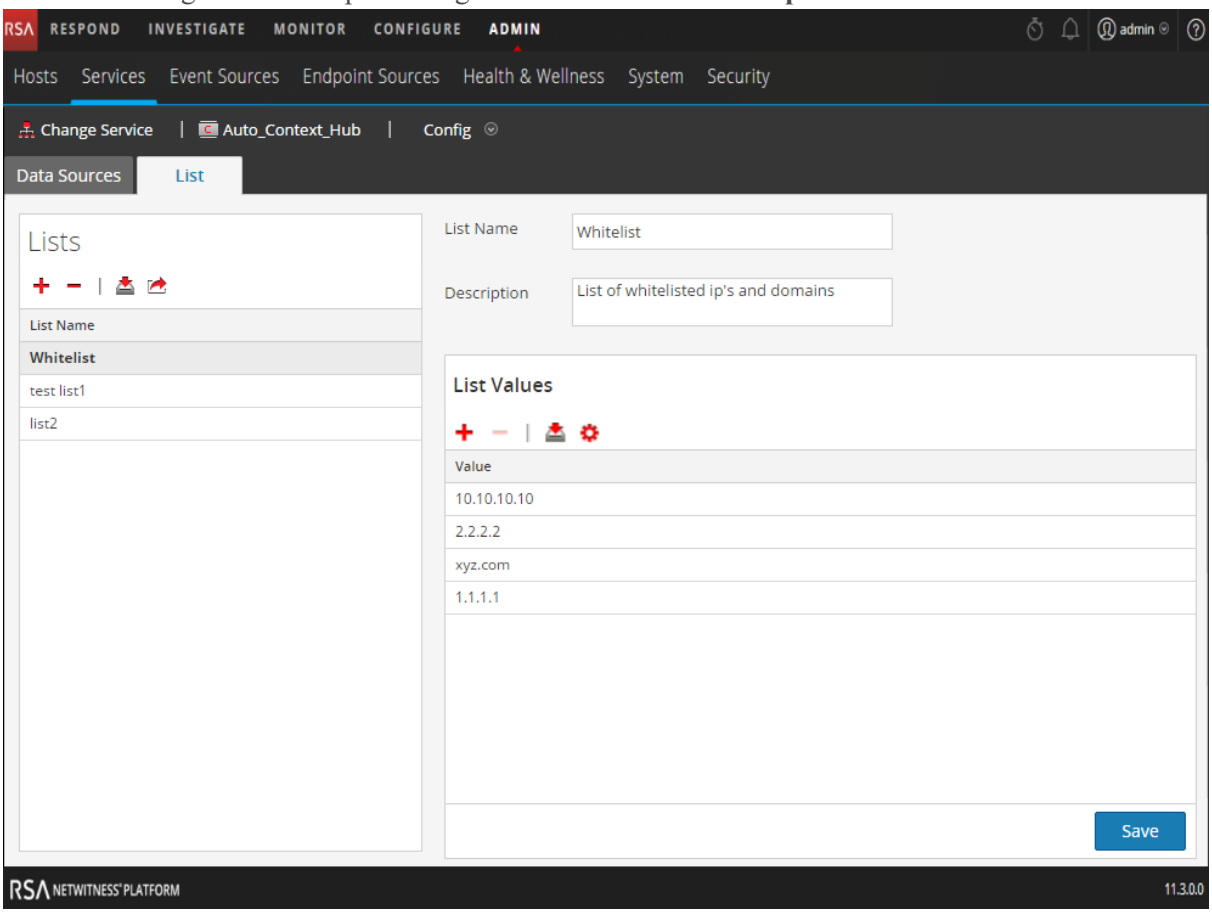
Note: You have to make the same changes to the relevant .CSV file, so that the changes get reflected the next time the schedule recurs. Otherwise, when you import values into an existing single-column or multi-column list, the data is overwritten from the source file when the schedule recurs. In case of a custom feed list, if the feed is edited or deleted, the corresponding Context Hub list also gets edited or deleted.

Import Single-Column List

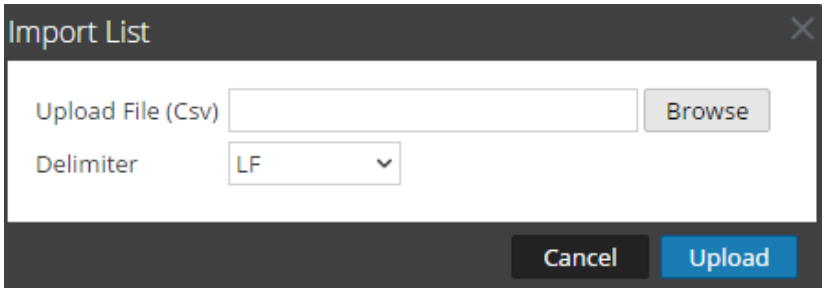
To import a list:

1. Select ADMIN > **Services**.
   The services view is displayed.
2. In the **Services** panel, select the Context Hub service and click > **View** > **Config**.
   The Services Config View of the Context Hub service is displayed.
3. Click the **Lists** tab.
   The Lists tab consists of the **Lists** panel and **List Values** panel.

The below image is an example of single-column list. **<need an updated screenshot>**



4. Click on the **Lists** panel.
   The **Import List** dialog is displayed.



5. In the **Import List** dialog, complete the following steps:
   a. In the **Upload File (.CSV)** field, browse and select the `CSV` file.
   b. In the **Delimiter** field, select the delimiter to separate the values in a list from the options—**Comma**, **CR** (Carriage Return), and **LF** (Line Feed).
6. Click **Upload** to upload the CSV file to Context Hub.

These lists are considered as data sources for retrieving contextual information. But you can append to an existing multi-column list. The data will be appended only if the number of columns match.

Note: You cannot create a new multi column list by directly importing a CSV file. However, all the feeds that are converted into multi-colum lists will be displayed in the List tab. For information on how to import multi-column list, see Configure Lists as a Data Source

Import Values to an existing List

When you are importing into existing multi- column list the data is overwritten from the source file when the schedule recurs.

To import values to a list:

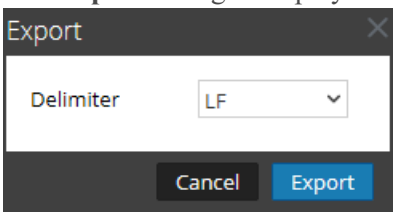
1. Go to **ADMIN** > **Services**.
   The services view is displayed.
2. Service and click > **View** > **Config**.
   The Services Config View of the Context Hub service is displayed.
3. Click the **Lists** tab.
   The Lists tab consists of the **Lists** panel and **List Values** panel.
4. In the Lists panel, select a list for which you want to import the values.
5. Click on the **List Values** panel.
   The **Import List** dialog is displayed.
6. In the **Import List** dialog, complete the following steps:
   a. In the **Upload File (Csv)** field, browse and select the `CSV` file.
   b. In the **Delimiter** field, select the delimiter to separate the values in a list from the options—**Comma**, **CR**(Carriage Return), and **LF**(Line Feed).
7. Click **Upload** to upload the CSV file to NetWitness Platform.

The list values are imported to the selected list. These lists are considered as data sources for retrieving contextual information. But you can append an existing multi column list. The data will be appended only if the number of column match.

Export List for Context Hub

To export a list:

1. On the **Lists** tab of the Services Config view of the Context Hub service, click .
   The **Export** dialog is displayed.



2. In the **Delimiter** field, select the delimiter to separate the values in an exported list from the drop-down [**Comma**, **CR** (Carriage Return), and **LF** (Line Feed)].
3. Click **Export**.

In case of a single-column list, you can select the delimiter. And, in case of a multi-column list, the list is exported as CSV file to the local machine.

Note: When a custom feed is converted into a Context Hub list, you must map at least one meta key with one or more entity mapping for a column header with a meta. However, if you want to add or edit more entities you can do so by clicking ⚙.

Configure Meta Type Mapping for Context Hub

As an administrator you manage the mapping of Context Hub meta types with Netwitness meta keys.

The Context Hub service provides context lookup for meta values in the Respond and Investigation views. These meta values are grouped into meta types based on the category they belong to. For example, meta keys of NetWitness Platform Respond and Investigation like `ip.src` and `ip.dst`are grouped into the meta type `IP` in Context Hub. The meta type `IP` is in turn mapped to metas like `alert.events.source.device.ip_address` and `alert.events.destination.device.ip_address` in the RESPOND database.

In the **ADMIN**> **System** > **Investigation** view, the Context Lookup tab enables the administrator to configure the Netwitness meta keys and meta type mapping. The administrator can add or remove meta keys to the list of meta types supported by Context Hub.

The Context Hub service is pre-configured with default meta type and meta key mapping, which is expected to work with most deployments, unless there are some custom mappings created for your specific deployment.

Note: You cannot add a new Meta Type.

The default mapping is given below:

Meta Type Name	Meta Keys
IP	device.ip, ip.src, ip.dst, ip.addr,ipv6.src, alias.ip, ipv6.addr, device.ipv6,forward.ip, forward.ipv6,ipv6.dst, ipv6.addr, stransaddr, transaddr
USER	user.src, user.dst, username, event user
DOMAIN	domain.src, domain.dst,fqdn, web.domain, domain, sdomain, ddomain
MAC_ ADDRESS	eth.dst, eth.src, alias.mac
FILE_ NAME	filename, sourcefile
FILE_ HASH	checksum
HOST	device.host, alias.host, host.src, host.dst

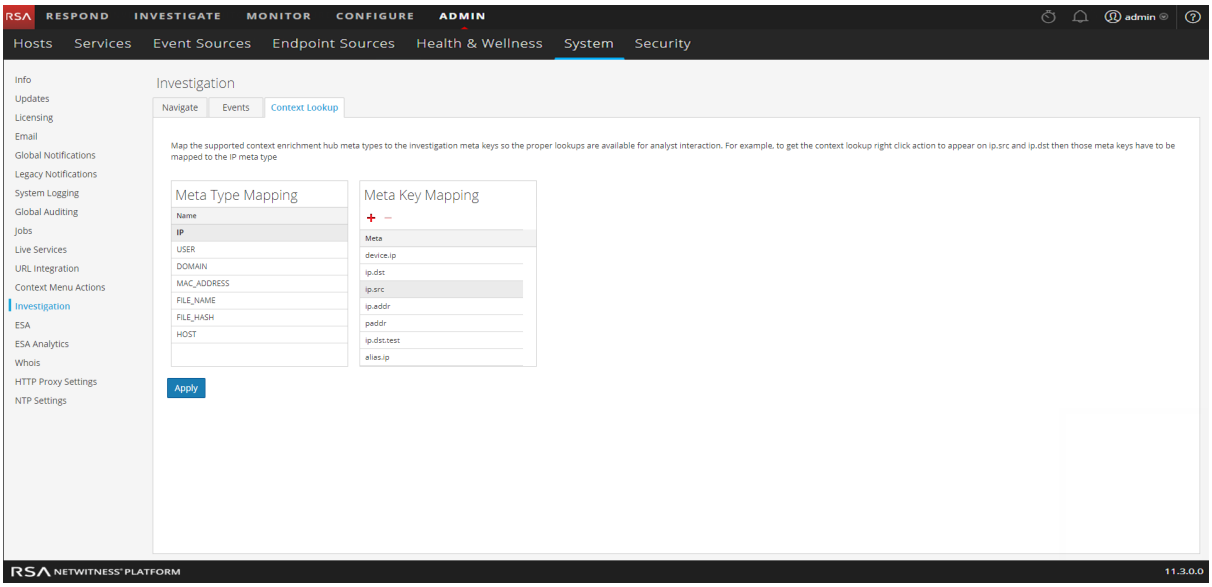
Procedure

To manage Investigation meta keys mapping:

1. Go to ADMIN > **System**.
2. In the options panel, select **Investigation**.

The Investigation Configuration panel is displayed.

3. Select the **Context Lookup** tab.



4. Select a meta type to view the default meta keys that are mapped with this meta type.
5. To add a meta key, click + and enter the meta key.
6. To remove a meta key, select the meta key and click −.
7. To save the changes, click **Apply**.
8. In order to add a new meta, they need to be included in the Concentrator's custom index file. For example, if you want to add a meta "**fqdn**" then you need to add an new entry: **<key name="fqdn" description="Fully Qualified Domain Name="IndexValues" form-at="Text" valueMax="100" />** in the index file. For more information on how to include a new meta in the index file, see Index Customization topic in the *Core Database Tuning Guide*. After you add the new meta, you can view the contextual information on clicking the Pivot to investigate option in the Respond view.

In case a new meta key is added, the Context Lookup menu option is enabled for the meta values under that meta key. For more information, see the "Investigation Configuration Panel" topic in the *System Configuration Guide*

Context Hub References

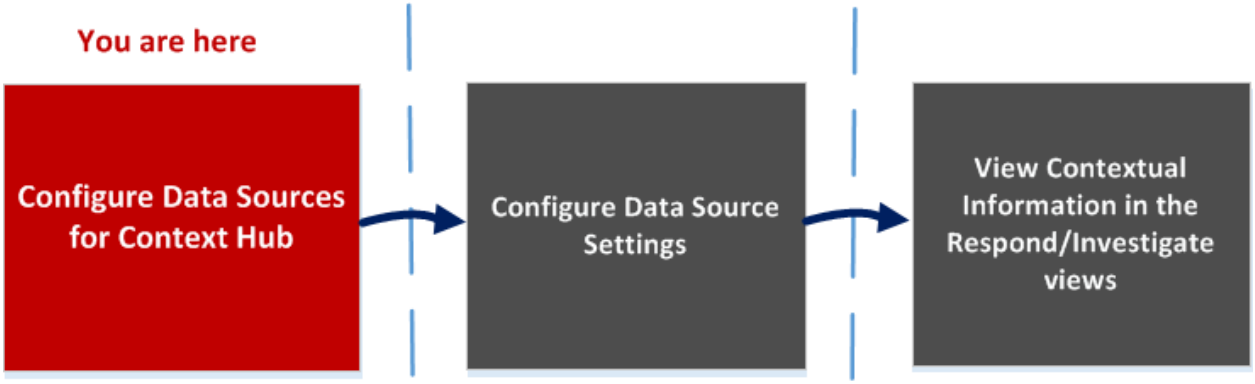
After you have configured the Context Hub service and the required data source, you can manage the settings for each data source. This will help in optimizing and customizing the lookup results.

Context Hub Data Sources Tab

In the **Data Sources** tab, you can configure one or more data sources for Context Hub service. Navigate to **ADMIN** > **SERVICES** > Select Context Hub service > **View** > **Config** > **Data Sources** tab.

Workflow

This workflow shows the procedure to configure data sources for Context Hub service to view contextual information in the Respond / Investigate views.



- The first task is to add a data source
- The second task is to configure data sources settings to enhance your deployment. This task is optional as the settings for each data source is already configured with default values for optimal performance.
- And the third task is to view and analyze the contextual information in the Context Summary panel of the Respond or Investigate views.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure Data Sources for Context Hub*	Configure Lists as a Data Source Configure Archer as Data Source Configure Active Directory as a Data Source Configure Netwitness Endpoint as a Data Source Configure Respond as a Data Source Configure Live Connect as a Data Source for Context Hub

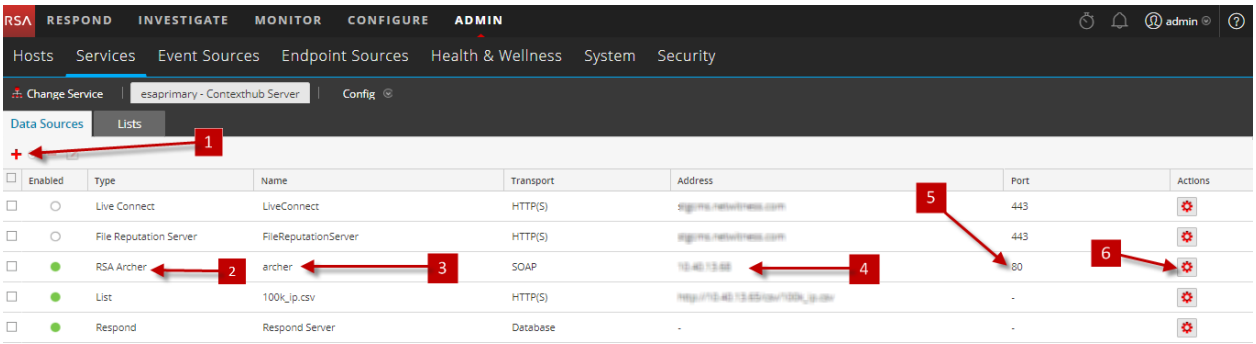
Related Topics

- Configure Lists as a Data Source
- Configure Archer as Data Source
- Configure Active Directory as a Data Source
- Configure Netwitness Endpoint as a Data Source
- Configure Respond as a Data Source
- Configure Live Connect as a Data Source for Context Hub

Quick Look

The following example illustrates how to add a data source for Context Hub service.



1. Click + to display the **Add Data Source** dialog.
2. Displays the type of Data Source.
3. Name that identifies the Data Source.
4. The IP address or hostname of the data source.
5. The connection port for the data source.
6. Opens the **Configure Settings** dialog. You can view and edit the settings to be displayed on the Context Summary panel in the Respond or Investigate views.
7. Click **Test Connection** to verify that the host is connected to the Context Hub service.

Toolbar

The following table describes the toolbar actions.

Feature	Description
	Opens the Add Data Source dialog so that you can add a data source. You can add only one data source of each type. Except in case of Lists and Active Directory data sources which can be added in multiples. For detailed instructions to add a data source, see Configure Lists as a Data Source.
	Delete a data source. If you delete a data source, Context Hub does not consider the deleted service as a data source. All contextual information fetched previously will not be available.
	Opens the Edit Data Source dialog. For description of each field in Edit Data Source panel, see Configure Live Connect as a Data Source for Context Hub.
	Opens the Configure Settings dialog. You can view and edit the settings for the data sources. For description of each field in Configure Responses dialog, see Configure Context Hub Data Source Settings .

Data Source Configurations

The following table describes the listed configurations.

Feature	Description
Enabled	Indicates whether the data source is enabled or disabled. A solid colored green circle indicates that data source is enabled ( ). An blank white circle indicates that data source is disabled.
Type	The type of data source. For example, Lists, Archer, Active Directory, Endpoint, Respond, or Live Connect.
Name	The unique name to identify the data source. For example, Respond.
Address	The IP address or hostname of the data source.
Port	The connection port for the data source and vary based on the data source being added. For example, for Endpoint the port is 9443, for Lists the port is 80 and so on.

Context Hub Lists Tab

In the **Lists** tab, you can create and configure lists for Context Hub. Navigate to **ADMIN** > **SERVICES** > Select Context Hub service > **View** > **Config** > **Lists** tab.

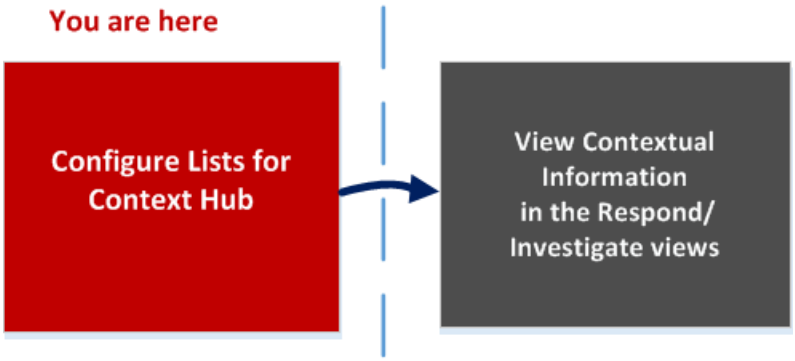
The Lists tab of the Context Hub service allows you to create one or more lists and add relevant list values to the list. These lists are automatically considered as data sources for the Context Hub service.

These lists may be populated with items either by importing external or custom feed CSV files or by adding meta values by using the option Add/Remove from List in Investigation and Respond views.

Note: You can also create lists and add list values from Respond and Investigation views. For more information, see the *RSA NetWitness Respond User Guide* and the *RSA Netwitness Investigate User Guide*.

Workflow

This workflow shows the procedure to configure lists for Context Hub service and to view contextual information in the Respond and Investigate views.



Creating one or more list is the first task in this workflow. The lists can contain supported metas such as an IP address, User, Host, Domain, MAC address, File Name or File Hash. The next task is to analyze or use the list data to view contextual data in Respond and Investigate views.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure List Data Source for Context Hub*	Configure Lists as a Data Source
Administrator/ Analyst	View Contextual Information in Respond View	See the *NetWitness Respond User Guide*.
Administrator/ Analyst	"Manage Lists and List Values in Investigation	See the *Investigate User Guide*.

Role	I want to ...	Show me how
Administrator/ Analyst	Create a list	See the *NetWitness Respond User Guide* and *Investigate User Guide*
Administrator/ Analyst	Update a list	See the *NetWitness Respond User Guide* and *Investigate User Guide*
Administrator/ Analyst	Delete list	See the *NetWitness Respond User Guide* and *Investigate User Guide*
Administrator/ Analyst	Import a list	Import or Export Lists for Context Hub
Administrator/ Analyst	Export list	Import or Export Lists for Context Hub

*You can complete this task here (that is in the Context Hub Lists Tab).

Quick Look

The following example illustrates how to add lists for Context Hub service.

The List tab consists of the **Lists** panel and **List Values** panel. The **Lists** panel has a toolbar with options to add, delete, import, and export lists. The entries under **List Name** are lists that are added or imported for the Context Hub service.

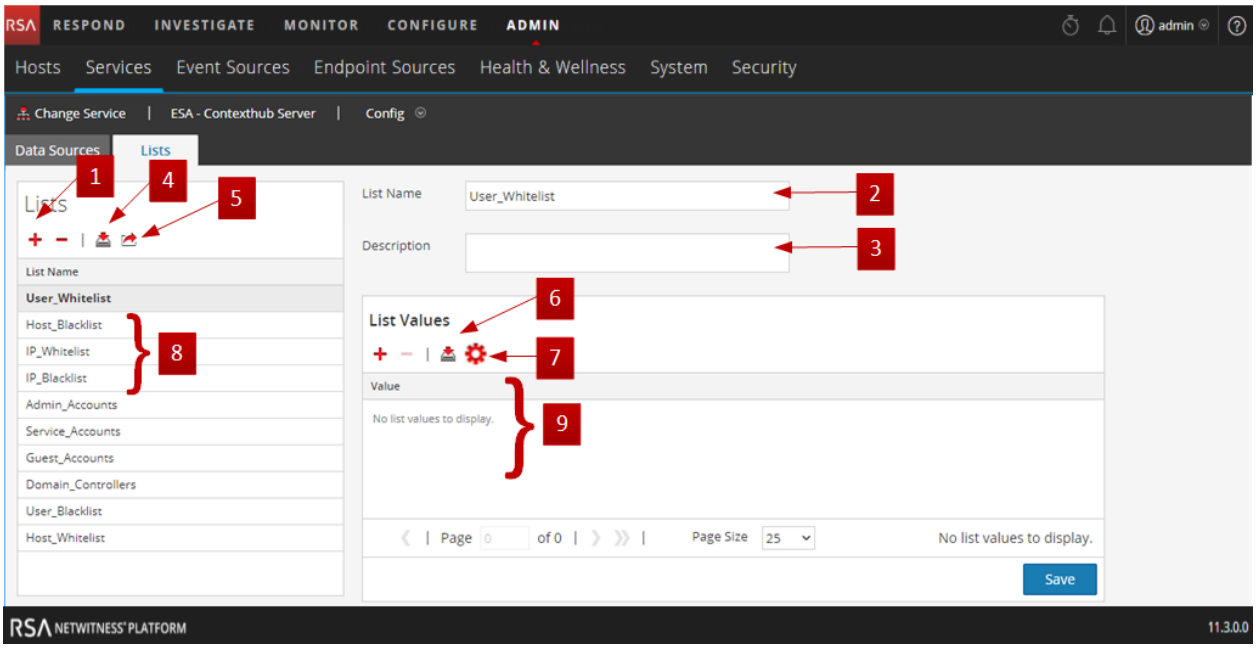
By default, 10 empty single-column lists are available in RSA NetWitness Platform11.1. These lists are empty and you need to add information to these lists. The out of the box 10 list names are used in ESA rules, for more information on ESA rules, see the *Alerting with ESA Correlation Rules User Guide*. For users upgrading from previous versions, they will be able to view these new lists in addition to their previously created lists. The lists available by default are:

- Admin_Accounts
- Guest_Accounts
- Service_Accounts
- User_Blacklist
- User_Whitelist
- Host_Whitelist
- Domain_Controllers
- IP_Blacklist

- IP_Whitelist
- Host_Blacklist

Note: If a list with the same name already exists prior to updating to or installing RSA NetWitness Platform11.3, then that list will be retained. Either rename that list before updating to 11.1 or update the contents in such a way that it can be used in ESA rules.

The lists are available in ESA rules tab in CONFIGURE > ESA Rules > Settings > Enrichment Sources. For more information on ESA rules, see the *Alerting with ESA Correlation Rules User Guide for Version 11.1*.
The **List Values** panel has a toolbar with options to add, delete, and import list values to the selected list. The entries under **Value** identify each list entry included in the list.



1	Click + to add a new list.
2	Name that identifies the list.
3	Description of the list.
4	Click to import list(s) to Context Hub.
5	Click to export a list to the local machine.
6	Click to import list values to selected list.
7	Click to add or edit entity mapping.
8	Displays the custom list(s) that are added to Context Hub.
9	Displays the list values that are added to the selected list.

Toolbar

The following table describes the toolbar actions.

Feature	Description
	Add a new list. For more information, see Configure Lists as a Data Source.
	Delete a list. If you delete a list from Context Hub, the list is no longer considered as a data source for retrieving contextual information.
	Import lists to Context Hub. For more information, see Import or Export Lists for Context Hub.
	Export a list to the local machine. For more information, see Import or Export Lists for Context Hub.

List View Options

The following table describes the Lists configurations.

Feature	Description
List Name	Unique name to identify the list.
Description	Description of the list.
Save	Saves the changes made to the list.

Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For instructions, **Navigate to Context Summary Panel and View Additional Context** topic in the *Investigate User Guide*.

Troubleshooting

This topic provides information about possible issues that NetWitness Platform users may encounter when setting up their Context Hub service in NetWitness Platform.

Problem	Solutions
Prefetch for list fails if the list is created in append mode. The following error message is displayed in logs indicating that, entries in list exceeds the max allowed. `Error setting data source entries com.rsa.asoc.contexthub.exception.ContextHubException: total.entries.exceed.max` Also, Health & Wellness sets the stat - `Contexthub.Datasource.Health.Data-Sources-Health` to `Unhealthy` and displays the names of the lists for which prefetch has failed. For example, number of entries in the list are 50001 and number of records in the CSV file are 50001 (user did not change the csv since last prefetch.). Upper limit on number of entries in list is 100k. Now on prefetch, Context Hub will try to append 50001 entries to the list but since 50001 + 50001 > 100k, prefetch fails.	You should add only those entries in the .csv file which they wish to append to the existing .csv file. If, you do not want to append any entries to the list then perform one of the options, as applicable: • If you created the list with headers: remove all rows from the csv except the header. • If you created list without headers: you should have 0 rows in csv.
SSL handshake with Archer certificate fails while adding it as a data source.	Use an archer generated certificate with the Trust All Certificates option configured.
Pivot to Investigate option on the Respond page does not navigate to the correct link.	When you stop and restart the RabbitMQ server, the Pivot to Investigate option available on the respond screen is not visible. And the context panel for Pivot to Investigate reopens the same page. You need to restart the jetty service on the Netwitness Server, login to the Netwitness Server Host and enter the service jetty restart command.

Problem	Solutions
When you import a list with missing quotes such as "172.16.0.0, the list is saved without any data to display. This is because of the Apache bug (CSV-141), which does not parse CSV files with incorrect formats.	Import a list with correct quotes to avoid displaying an empty file. For example, “172.16.0.0”, “host.mycompany.com” and so on.
Increasing the limit settings for Alerts and Incidents leads to lookup error. By default, the limit settings to view number of Alerts and Incidents is set to 50. If the limit is increased, the looked-up meta for alerts and incidents may lead to lookup error. This happens due to an internal database restriction.	To limit and view Alerts and Incidents to 50.

Decoder and Log Decoder Quick Setup

A basic RSA NetWitness® Platform network includes at minimum Brokers, Concentrators, and Decoders. Brokers aggregate data from Concentrators, and Concentrators consume data from at least one Network Decoder or Log Decoder. The basic network may include both types of Decoders. Network Decoders are usually referred to as Decoders, and they capture network data in packet form. Log Decoders capture log data as events.

Adding a Decoder makes it visible and available for use with NetWitness Platform Administration, Live Services, and Investigate. To add a service in NetWitness Platform, you select the service type, provide service connection information, and validate that the service can be reached. The *Hosts and Services Getting Started Guide* provides the information you need to understand and install all NetWitness Platform services.

After the services are added, you need to configure each service. This is the preferred order for configuring your system:

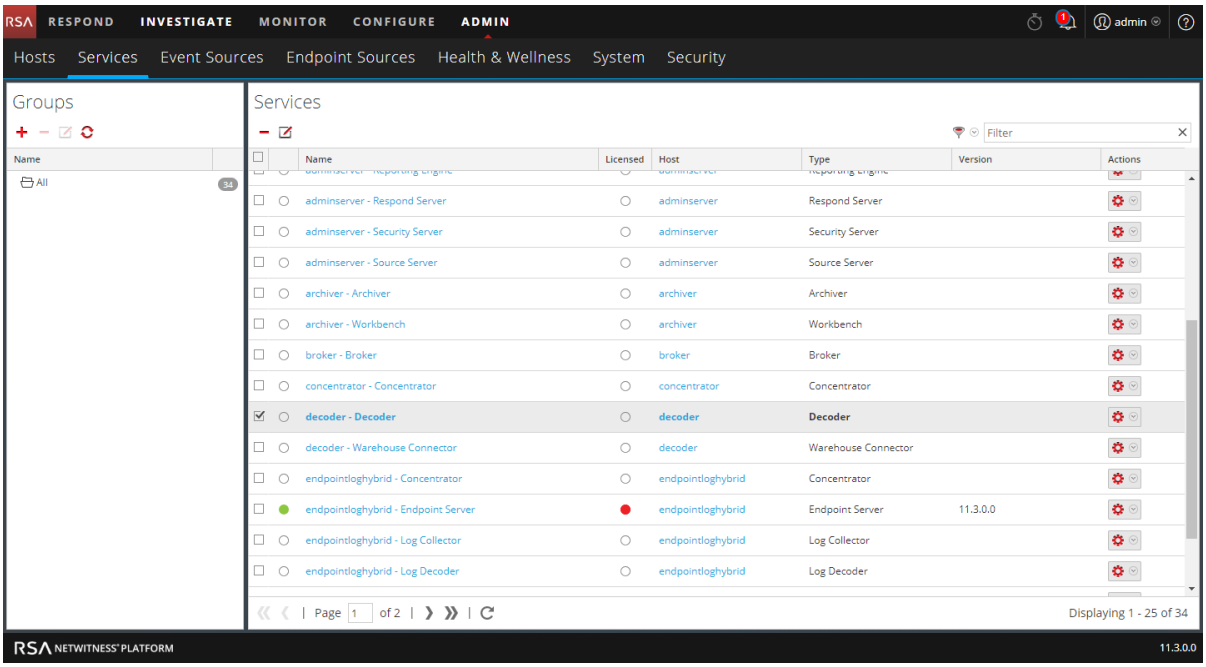
1. Decoders
2. Log Decoders
3. Concentrators (refer to the *Broker and Concentrator Configuration Guide*)
4. Brokers (refer to the *Broker and Concentrator Configuration Guide*)

Note: A Log Decoder is a special type of Decoder, which is configured and managed in a similar way to a Decoder. Most of the information in this guide refers to both types of Decoders. "Decoder" refers to both types of Decoders. Information that applies exclusively to Network Decoders or Log Decoders is clearly identified.

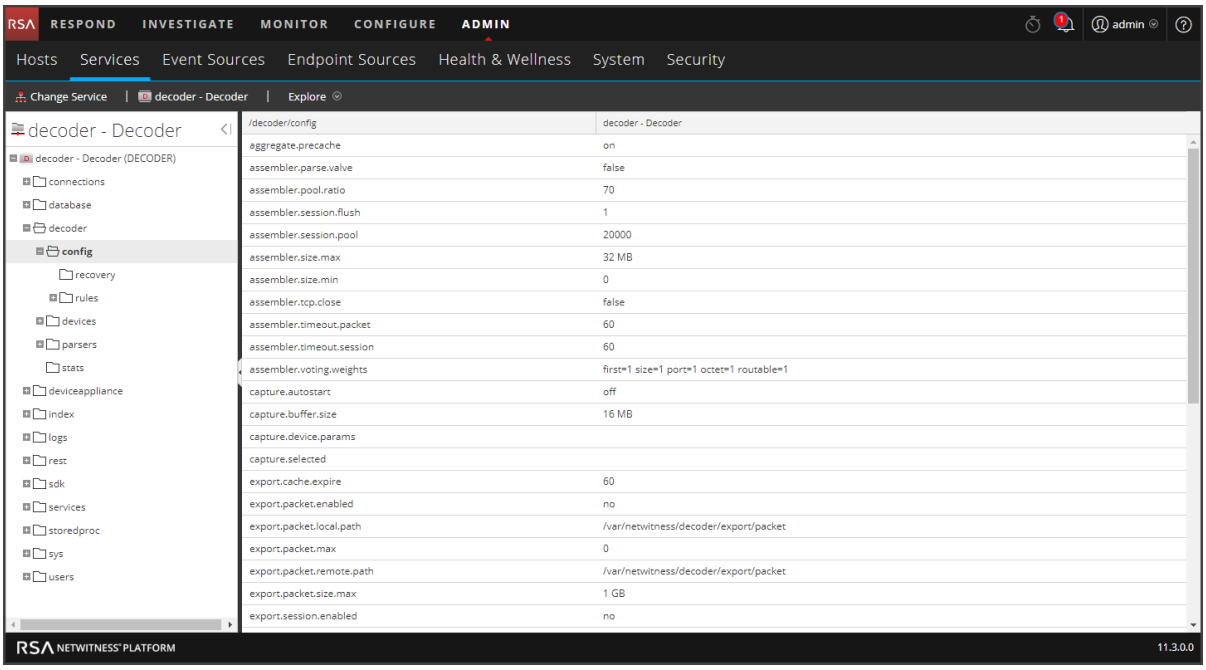
Basic configuration of the Decoder involves selecting a network adapter interface and starting data capture.

In addition, you can configure each Decoder to control the type of traffic captured using rules, feeds, and parsers. Advanced configuration tasks enable additional features that are relevant to specific applications. For example, configure a 10G Decoder, create custom meta keys, or decrypt incoming packets.

The easiest way to configure all of the required Decoder and Log Decoder settings is to use the options in the NetWitness Platform user interface. For the most part, configuration is performed in the Administration Services view (ADMIN > Services).



Administrators who feel comfortable working outside of the user interface can configure the basic parameters as well as advanced settings by editing database nodes in the Decoder node tree using the Services Explore view.



Perform Initial Quick Setup

This procedure accomplishes the initial, basic configuration of a Decoder, and starts data capture. When the basic setup is complete, the Decoder begins capturing data for the Concentrator to consume.

To configure a Decoder and start capturing data:

1. Assign a network interface for capturing data. For details, see "Select a Network Adapter" in Configure Capture Settings.
2. Do one of the following:
   a. To start capture, select the Decoder and > **View** > **System**. In the toolbar click Start Capture.

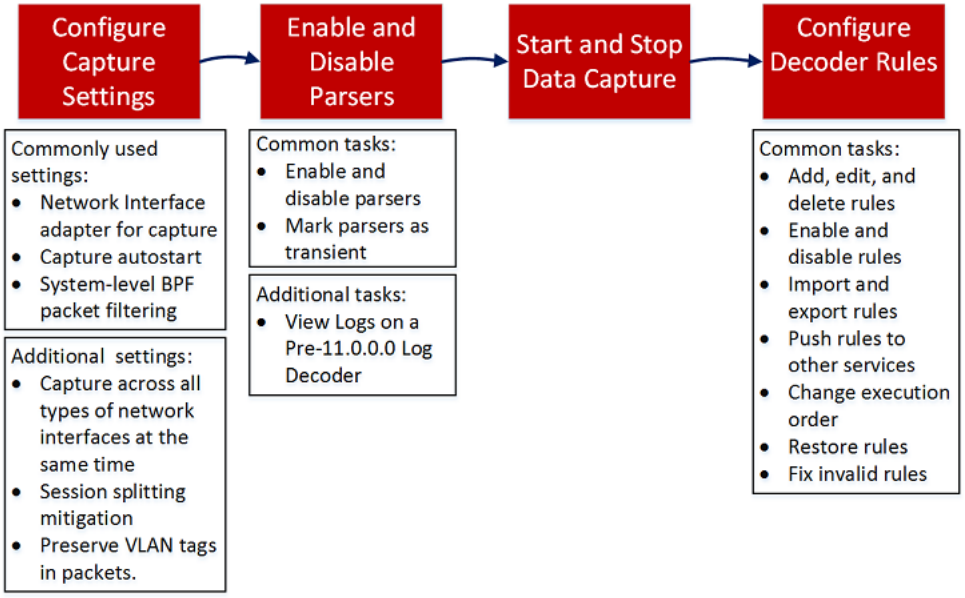
   b. To enable Capture Autostart, see "Configure a Decoder to Begin Capturing Data Automatically" in Configure Capture Settings.
   The Decoder begins capturing data for consumption by a Concentrator. For additional configuration options, refer to Configure Common Settings on a Decoder Configure Common Settings on a Decoder and Decoder and Log Decoder Additional Procedures

Configure Common Settings on a Decoder

This section introduces commonly used configuration settings on a Decoder with procedures and background information. After you have completed Decoder and Log Decoder Quick Setup, you can refine your configuration by using parsers, feeds, and rules to limit the captured data.

Note: A Log Decoder is a special type of Decoder, which is configured and managed in a similar way to a Decoder. Most of the information in this guide refers to both types of Decoders. "Decoder" refers to both types of Decoders. Information that applies exclusively to Network Decoders or Log Decoders is clearly identified.

The following workflow illustrates commonly used settings and breaks the configuration process into four steps.

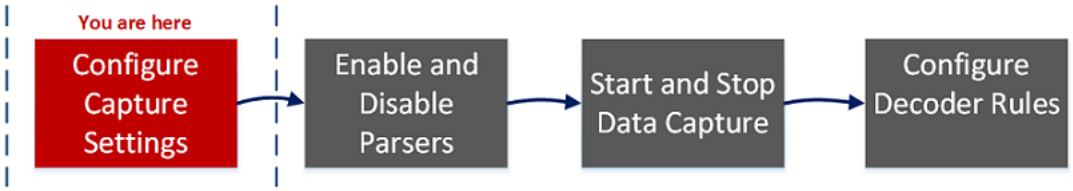


Configuration Step	Description
Configure Capture Settings	When initially setting up the Decoder, configuring the network adapter interface is required. Additional optional capture settings are available; one that is frequently used is Capture Autostart.
Enable and Disable Parsers and Log Parsers	View the parsers that have been downloaded and deployed from Live, and manage which ones are enabled or disabled.
Start and Stop Data Capture	When a Decoder starts up, it automatically begins aggregating data if Capture Autostart is enabled. When autostart is not enabled, you can start and stop data capture manually.

Configuration Step	Description
Configure Decoder Rules	Capture rules can add alerts or contextual information to sessions or logs. They can also define which data a Decoder or Log Decoder filters out. By default, no capture rules are defined when you first configure NetWitness Platform. Unless rules are specified and the rules are valid, the packets are not filtered. You can deploy the latest rules from Live as described in the *Live Services Management Guide*. You can define capture rules at any time, and you can fix rules that use invalid syntax (Fix Rules with Invalid Syntax).

Configure Capture Settings

When initially setting up the Decoder, configuring the network adapter interface is required. Additional optional capture settings are available; two that are frequently used are the Berkeley Packet Filter, and Capture Autostart.



Besides the basic network adapter interface setup, you may decide to use one of the special-purpose configurations described in (Optional) Preserve VLAN Tags When Using the Packet MMAP Capture Interface or (Optional) Configure a Decoder to Capture Data Across All Types of Network Interfaces

The rest of the capture settings have default values chosen to be effective in most cases (see a detailed list in Services Config View - General Tab). You can adjust these in some circumstances, for example, if Customer Support advises a change. You can edit the capture settings at any time.

Select a Network Adapter

The table below describes the Netword Adapter settings for a Decoder. The system administrator sets the default network adapters when the Decoder is installed. Consult your System Administrator for more information.

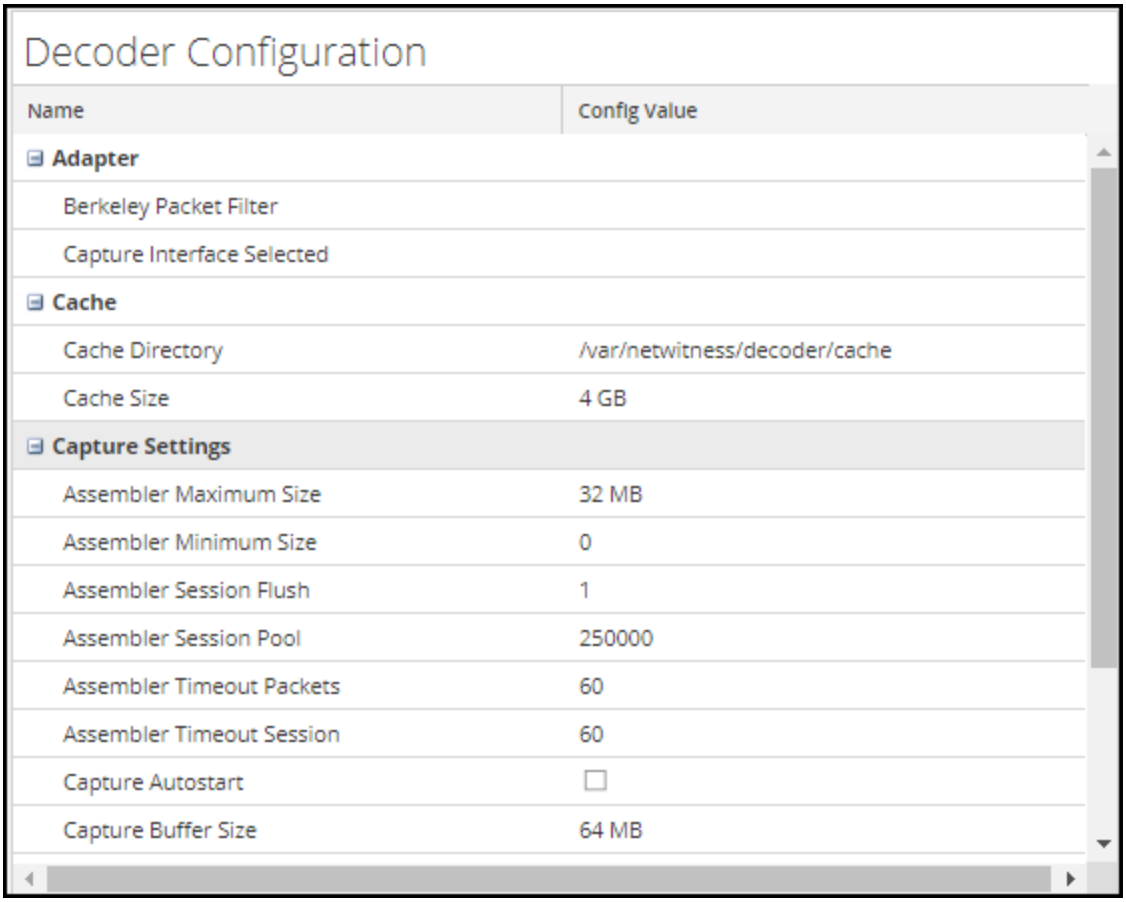
Adapter Parameter	Description
Berkley Packet Filter	Berkeley Packet Filters (BPF) are applied to the packet stream before the packets are copied to the Decoder adapter for analysis. This allows unwanted traffic to be efficiently discarded. However, any packets discarded are not accounted for in any Decoder statistics (capture rate, packets dropped, and packets filtered and total packets).

Adapter Parameter	Description
Capture Interface Selected	Select an adapter through which the Decoder captures packets. For the lower speed internal capture interface, use the `packet_mmap_,7,eth1` adapter, which corresponds to the monitor port located on the motherboard. There are six additional capture ports: • `packet_mmap_,1,lo (bpf)` • `packet_mmap_,2,eth2 (bpf)` • `packet_mmap_,3,eth3 (bpf)` • `packet_mmap_,4,eth4 (bpf)` • `packet_mmap_,5,eth5 (bpf)` • `packet_mmap_,8,ALL (bpf)` There are three wireless capture services available: • `packet_netmon_ (Microsoft Netmon)` • `packet_mac80211_ (Linux mac80211)` • `packet_airport_ (Mac OS X AirPort)`
Capture Interface Selected for Log Decoder	The following capture service is available: • `log_events,Log Events`

To configure the network adapter on a Decoder:

1. Go to **ADMIN > Services**.

2. In the **Administration Services view**, select the Decoder and > **View** > **Config.**
   The Services Config view is displayed with the General tab open.

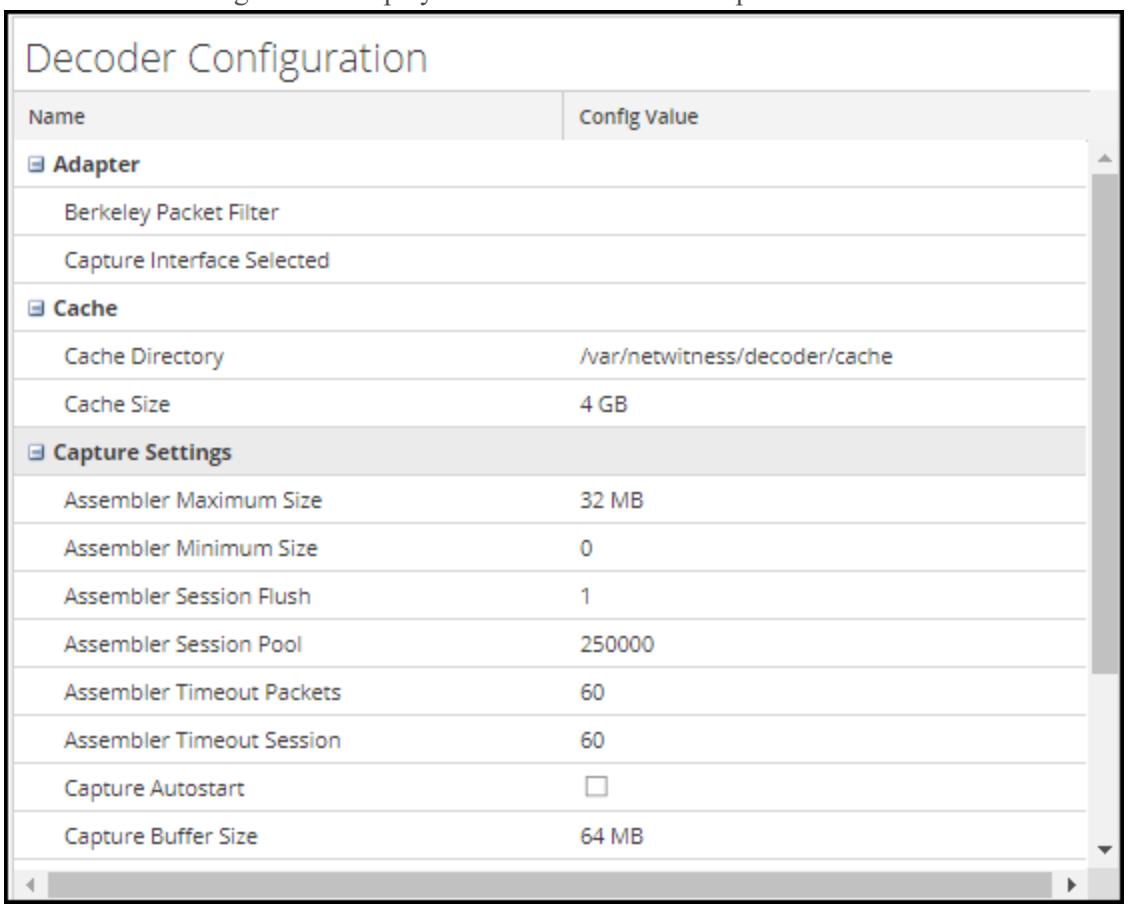


3. In the **Capture Interface Selected** field, select the network adapter that best suits the Decoder.
4. To save the changes, click **Apply.**
5. If necessary to put the changes into effect, navigate back up to the **Administration Services view**, select the Decoder, and select > **Restart**.

Configure a Decoder to Begin Capturing Data Automatically

1. Go to **ADMIN** > **Services**.

2. In the **Administration Services view**, select the Decoder and > **View** > **Config.**
   The Services Config view is displayed with the General tab open

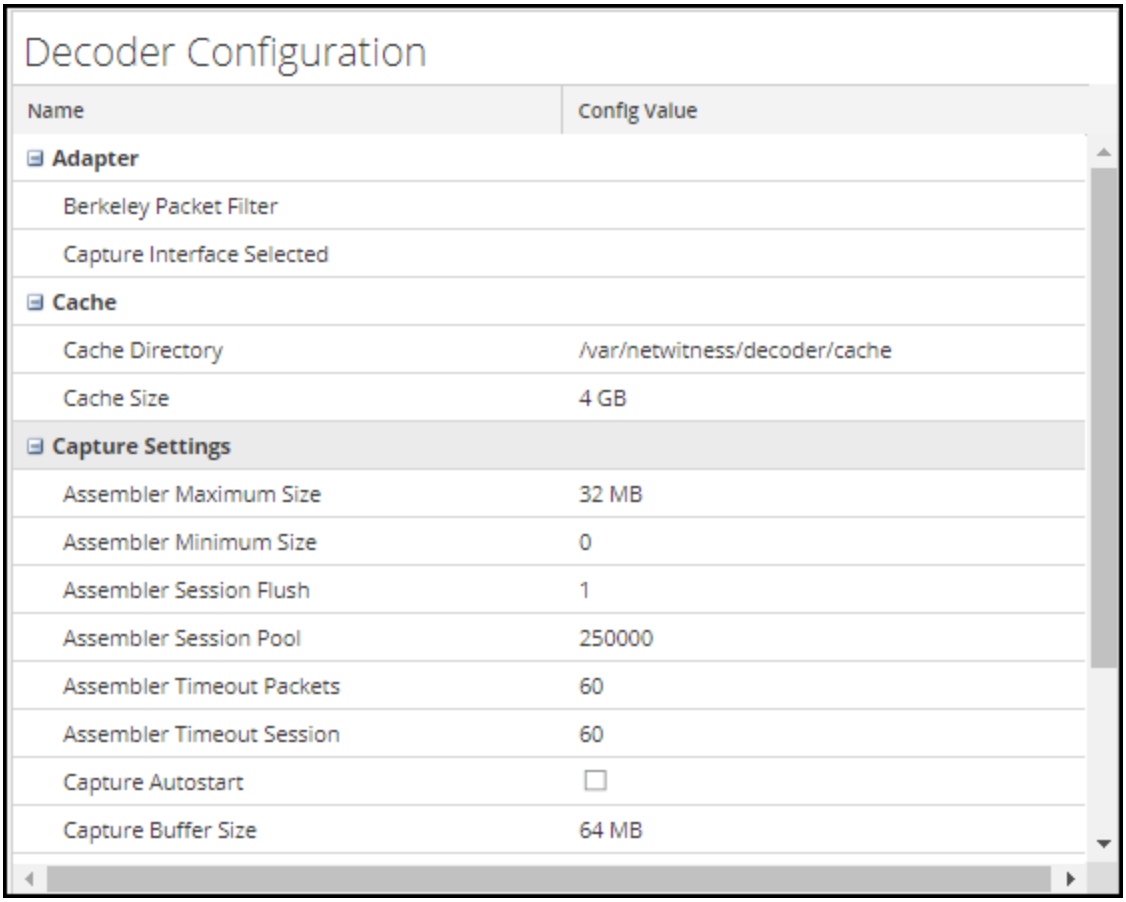


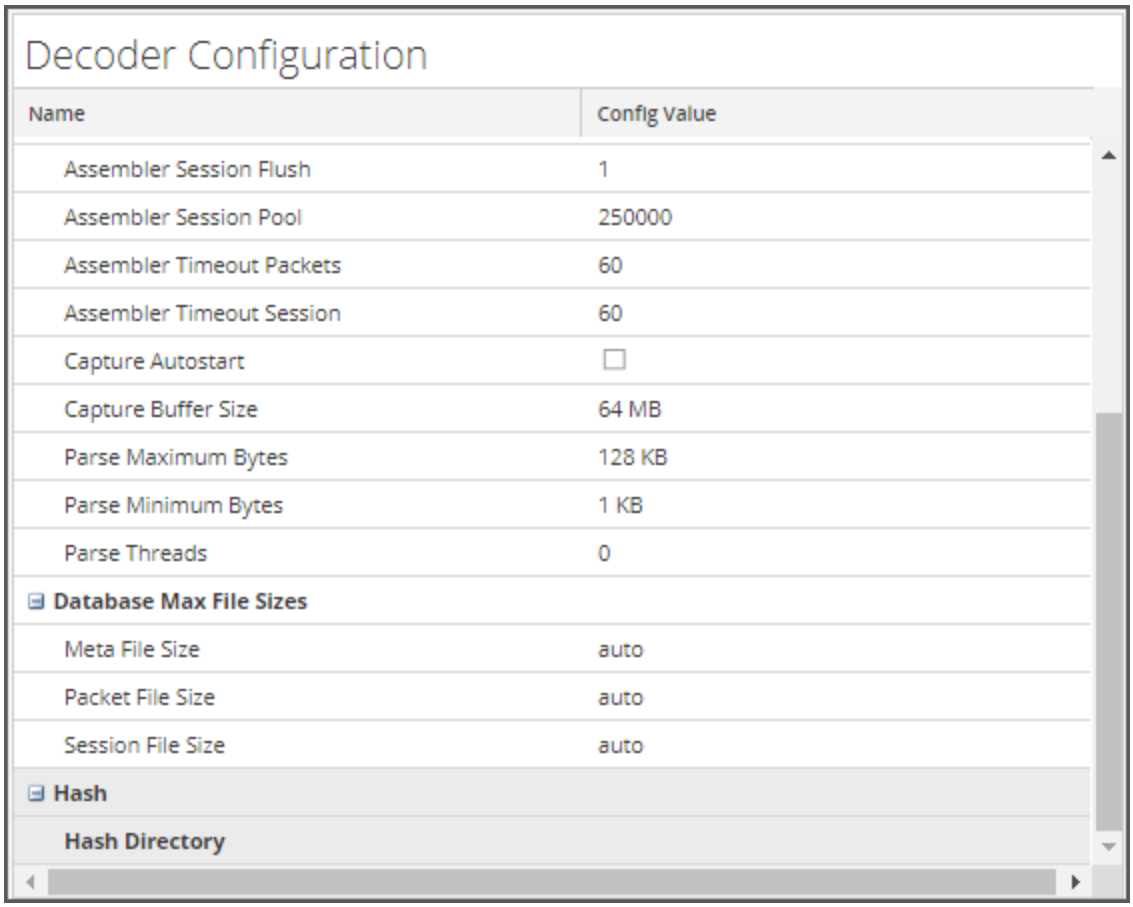
3. Under **Capture Settings**, select the **Capture Autostart** checkbox.
4. To save the changes, click **Apply.**
5. If necessary to put the changes into effect, navigate back up to the **Administration Services view**, select the Decoder, and select > **Restart**.

Configure Optional Capture Settings

1. Go to **ADMIN** > **Services**.

2. In the **Administration Services view**, select the Decoder and **> View > Config.**
   The Services Config view is displayed with the General tab open.





3. If you want to apply a system-level filter to the packet stream before the packets are copied to the Decoder adapter for analysis, configure the Berkeley Packet Filter as described in (Optional) Configure System-Level (BPF) Packet Filtering.
4. In the **Capture Settings** sections, review the default values. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change. See Services Config View - General Tab for an explanation of these settings.
5. In the **Database Max File Sizes** section, review the default values. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change. See Services Config View - General Tab for an explanation of these settings.
6. In the **Hash** section, define a directory for hash files if you are using this feature. See Services Config View - General Tab for an explanation of these settings.

(Optional) Configure System-Level (BPF) Packet Filtering

You can use Berkeley Packet Filters to control which packets and logs are processed by a Decoder.

Berkeley Packet Filters (BPF) are applied to the packet stream before the packets are copied to the Decoder adapter for analysis. This allows unwanted traffic to be efficiently discarded. These discarded packets are not accounted for in any Decoder statistics (capture rate, packets dropped, and packets filtered and total packets).

The Decoder also supports system-level packet filtering defined using `tcpdump/libpcap` syntax. Specifying a `Libpcap` filter can efficiently reduce packet volume based on Layer 2 - Layer 4 attributes. A `Libpcap` filter is appropriate for use when a Decoder is receiving a traffic volume that is placing a load against the physical resources of the platform. In this scenario, the Decoder may consistently drop packets and have a large number of capture pages available(`/decoder/stats/capture.pagefree` is high).
The following is an example of a `libpcap` filter to keep only packets that do not have both source and destination addresses in the 10.21.0.0/16 subnet.

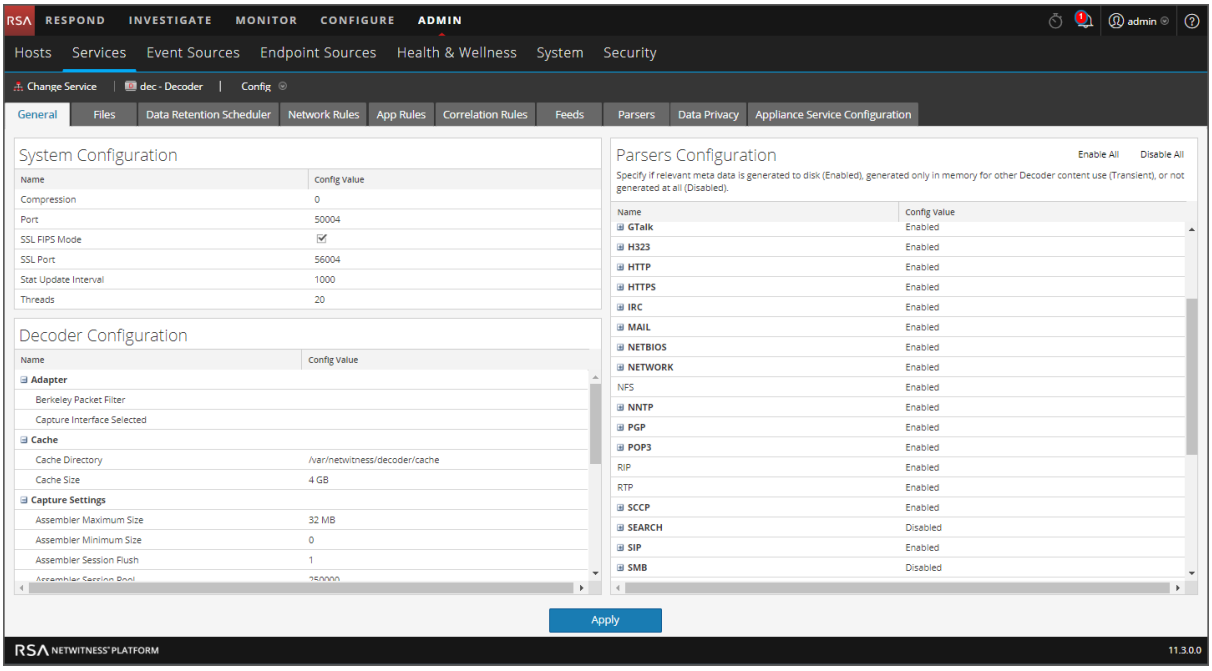
```
not (src net 10.21.0.0/16 and dst net 10.21.0.0/16)
```

For a full reference of the `Libpcap` filter syntax, see the main pages for:

- tcpdump (http://www.tcpdump.org/tcpdump_man.html).
- pcap-filter (http://www.unix.com/man-page/FreeBSD/7/pcap-filter/).

To add a system-level Berkeley Packet Filter:

1. Go to **ADMIN > Services.**
2. In the Administration Services view, select a Decoder service and **> View > Config.**
   The Services Config view is displayed with the General tab open.



3. In the **Decoder Configuration Section**, under **Adapter**, click in the field next to **Berkeley Packet Filter**.

4. Type only one filter in the field. If you want to filter multiple items, join multiple expressions using `and`. Several examples are provided below.
   The user interface validates input at the time you enter your filter string.
5. To save the filter, click **Apply**.
   If the syntax is correct, a confirmation message is displayed.
   If the syntax is incorrect, a **Packet filter is not valid** message is displayed and a corresponding log message will follow in the log messages on the Decoder:
   ```
   164474800     2015-May-01 19:03:08     warning     Decoder     Failed to
   parse filter 'example_badrule': syntax error
   ```
6. To activate the filter, you must stop and start capture on the Decoder:
   a. Change the **Config** view to the **System** view.
   b. Click **Stop Capture**.
   c. Click **Start Capture**.
      The active filter will be displayed in the Decoder logs.

Examples

These are several filter examples:

- Drop packets to or from any address in the 10.21.0.0/16 subnet:
  ```
  not (net 10.21.0.0/16)
  ```
- Drop packets that have both source and destination addresses in the 10.21.0.0/16 subnet:
  ```
  not (src net 10.21.0.0/16 and dst net 10.21.0.0/16)
  ```
- Drop packets that are from 10.21.1.2 or are headed to 10.21.1.3.
  ```
  not (src host 10.21.1.2 or dst host 10.21.1.3)
  ```
- Combine both IP and HOST:
  ```
  not (host 192.168.1.10) and not (host api.wxbug.net)
  ```
- Drop all port 53 traffic, both TCP & UDP:
  ```
  not (port 53)
  ```
- Drop only UDP port 53 traffic:
  ```
  not (udp port 53)
  ```
- Drop all IP protocol 50 (IPSEC) traffic:
  ```
  not (ip proto 50)
  ```
- Drop all traffic on TCP ports 133 through 135.
  ```
  not (tcp portrange 133-135
  ```

The following filters combine some of the above to demonstrate how to put multiple directives into one filter:

- Drop any port 53(DNS) traffic sourced from 10.21.1.2 or destined to 10.21.1.3.
  `not (port 53) and not (src host 10.21.1.2 or dst host 10.21.1.3)`

- Drop any traffic using IP proto 50 or port 53 or any traffic from net 10.21.0.0/16 destined to net 10.21.0.0/16
  `not (ip proto 50 or port 53) or not (src net 10.21.0.0/16 and dst net 10.21.0.0/16)`

Caution: The use of parentheses can have a large and potentially disruptive effect on the use of Packet Filters. As a best practice, keep "not" operations outside of parentheses and always test your rules before deploying them. Failure to properly format your rules (despite input validation) can cause a packet filter to drop ALL traffic or behave in other unexpected ways. This is due to the way packet `Libpcap` filters work and is not the result of any logic within NetWitness Platform software.

Testing

BPF filters can and should be tested using either `tcpdump` or `windump` to ensure that they will provide the expected behavior before implementing them. This example shows a test of a filter using windump:

```
windump -nni 2 not (port 53 or port 443) or not (ip proto 50)
```

Conversions

If for the sake of performance, you have decided that an existing network rule filter would be better running as a System-Level Packet Filter, you can convert it. There are a few things to remember when doing conversions.

- `&&` becomes `and`
- `ip.addr` becomes `host` if a single host or **net** if a network.
- `ip.src` becomes `src host` if a single host or `src net` if a network.
- `ip.dst` becomes `dst host` if a single host or `dst net` if a network.
- Use CIDR notation when listing a network (that is, 10.10.10.0/24).
- `||` becomes `or`
- `!` becomes `not`
- Multiple rules must be joined with `and`.

The manual for TCPDump also gives examples of filters and strings that can be used:
http://www.tcpdump.org/tcpdump_man.html

Additionally, the following site provides an excellent reference for BPF-style packet filters:
http://biot.com/capstats/bpf.html

Caution: If you are capturing `vlan` tagged packets, above standard bpf filter may not work. For example, if you use `not (udp port 123)` to filter `vlan` tagged NTP traffic on udp port 123, it will not work. This is because the bpf filter machinery is simple and does not account for protocols not referenced in the rule. So the OS executing the bpf filter will look for the `udp port` values at the byte offset they would occur in a standard Ethernet/udp packet; but the optional `vlan` tag fields in the Ethernet header pushes those values by 4 bytes, thus the bpf filter rule will fail. To fix it, you need to change the bpf filter to: `not (vlan and udp port 123)`.

(Optional) Configure a Decoder to Capture Data Across All Types of Network Interfaces

The `packet_mmap_,ALL` adapter is capable of capturing across all types of network interfaces at the same time. For example, this can include things like physical network interfaces over different media types and tunnel interfaces.

The default behavior of the `ALL` adapter is to capture from all interfaces from the system, except for the hard-coded defaults of `lo`, `eth0`, and `em1`.

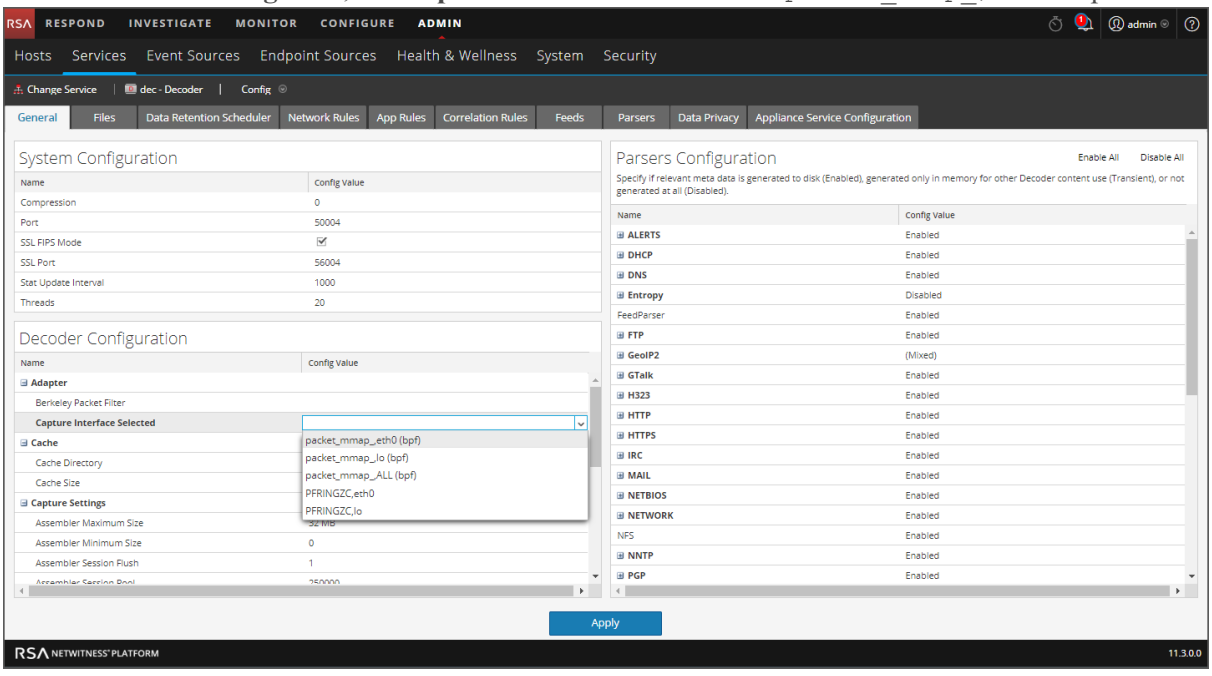
You can select any subset of the capture interfaces by editing the Decoder configuration node `/decoder/config/capture.device.params` to include an `interfaces=` parameter. The `interfaces` parameter contains a comma-separate list of interfaces that are used for capture. Instead of using all interfaces for capture, only the specified interfaces are used.

For example, if you want to force capture on interfaces `em1`, `em2`, and `em4`, and ignore `em3`, you can select the `packet_mmap_,ALL` adapter, and then add this line to `capture.device.params`: `interfaces=em1,em2,em4`

Note: Using the `interfaces` parameter to select `eth0`, `lo`, or `em1` overrides the default behavior, which is to drop traffic from those ports.

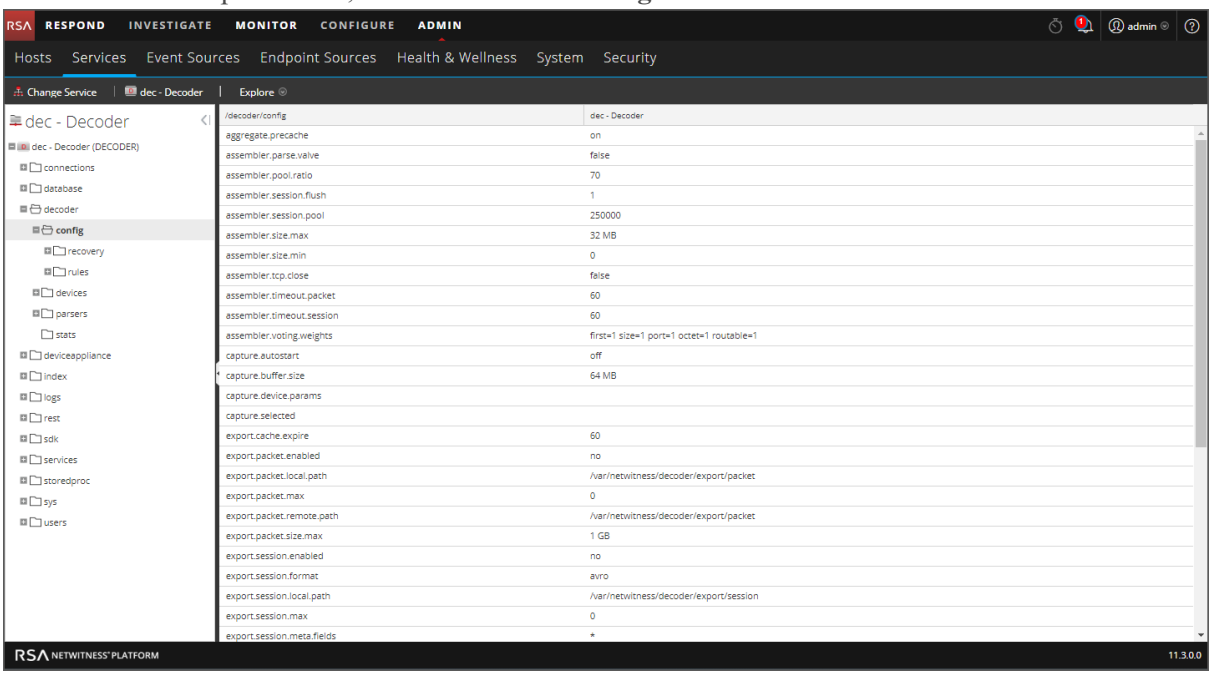
To configure the `packet_mmap_,ALL` adapter to capture from specific interfaces instead of all interfaces:

1. Go to **ADMIN** > **Services**, select the Decoder service and > **View** > **Config.**
2. In the **Services Config view**, set **Capture Interface Selected** to `packet_mmap_,ALL` adapter.

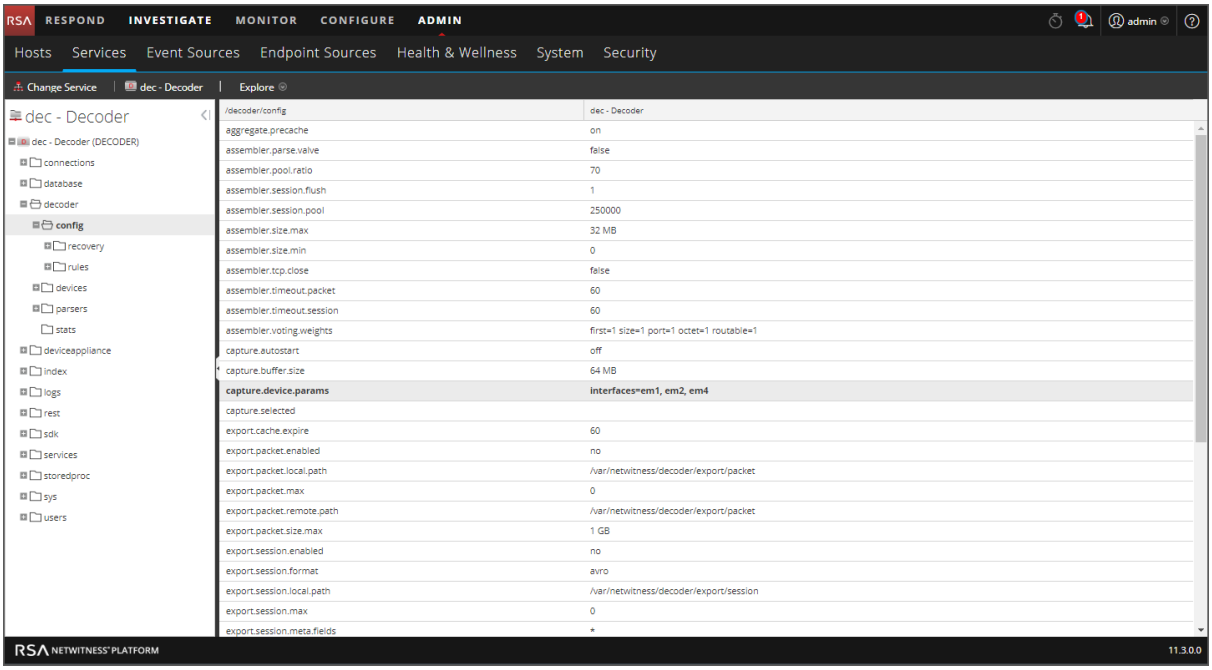


3. To go to the Services Explore view, click **Config** in the toolbar and select **Explore** in the drop-down list.

4. In the Services Explore view, select **decoder** > **config**.



5. Click in the values column next to `capture.device.params`, type **`interfaces=em1,em2,em4`**, and press **Enter**.



The change goes into effect immediately; only traffic on `em1`, `em2`, and `em4` interfaces is captured.

(Optional) Configure a Decoder to Write Standard pcap-formatted Files

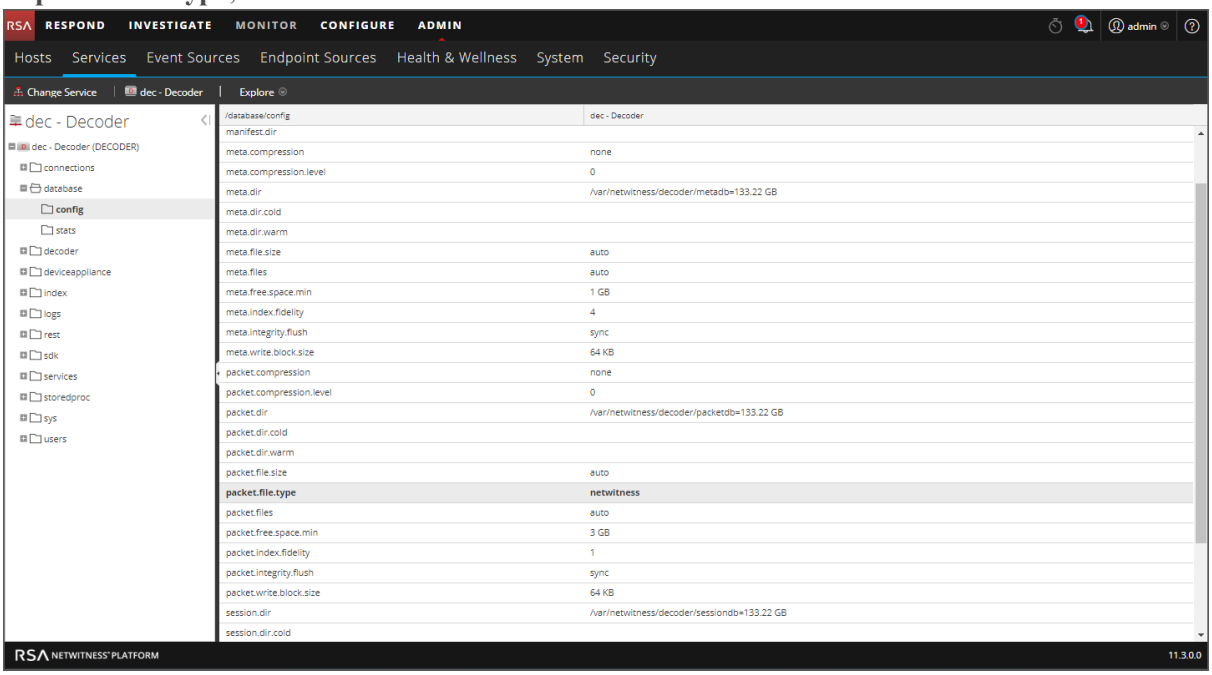
Note: The information in this topic applies to RSA NetWitness® Platform Version 11.2 and later.

To provide a more open database format, the Network Decoder can now write standard pcap-formatted files. You can enable pcapng-formatted database files with the new configuration node:
`/database/config/packet.file.type = 'netwitness' or 'pcapng'`

Note: This capability is enabled by default if you install 11.2 directly. If you upgrade from a previous version to 11.2, you must enable pcapng-formatted database files manually, which can result in an approximate 4% decrease in disk space (as the pcapng files require more space than the nwdb files). You can also use the pcapng format with 10 Gbps capture, which does not decrease performance significantly (< 1%).

To enable writing standard pcap-formatted files:

1. Go to **ADMIN** > **Services**, select a Network Decoder service, and then select > **View** > **Explore**.
2. Go to **database** > **config**.
3. In **packet.file.type**, the default is **netwitness**.



4. To change the packet file type to standard pcap formatting, type **pcapng** and press **Enter**. This change will take effect immediately on the next packet file that is created.

Note: In the pcapng database file format, the data is in clear text, and is not obfuscated by our proprietary format, which can improve security.

Caution: Please do not touch any files in the packet database directories! You must not read or edit any `pcapng` file in the packet database directories, as they are always in use while Decoder is running. Decoder always expects full and exclusive access to those files, and other processes reading those files prevent normal Decoder operation. The proper way to access the `pcapng` files is to set up a cold storage directory. This allows Decoder to copy `pcapng` files to the cold storage directory before deletion. At that point, you are responsible for managing the `pcapng` files, including making sure that the cold storage volume never fills up. Keep in mind that copying the `pcapng` files to cold storage requires a non-trivial amount of I/O and could interfere with packet capture. Cold storage for `pcapng` is not supported at 10G speeds.

(Optional) Preserve VLAN Tags When Using the Packet MMAP Capture Interface

When capturing traffic containing VLAN tags, you may need to configure the Packet MMAP capture interface to preserve the VLAN tags in the packets (VLAN fixup). By default, the network capture hardware removes the tags. Performing this procedure preserves the tags in the packets, and the tag values are parsed into VLAN meta data for further analysis.

There are two mechanisms for enabling the VLAN fixup.

- Option 1: Set `vlan-fix=true` within `capture.device.params`. This option performs the VLAN fixup on all traffic entering the Decoder. This option is appropriate in most cases, since it is assumed that all the traffic will be VLAN tagged.This mechanism works on either single-interface mode, or on all-interfaces mode. This option overrides the VLAN fixup settings on individual interfaces; even interfaces that are not configured to do VLAN fixup will have the feature enabled.
- Option 2: Use the `interfaces` parameter within `capture.device.params` on a per-device basis. The `interfaces` parameter accepts a comma-separated list of interface names on which to capture packets. By adding `:vlan` to an interface name, you can enable the VLAN fixup on individual interfaces. If the interface does not have the `:vlan` suffix added, then it will not perform the VLAN fixup.

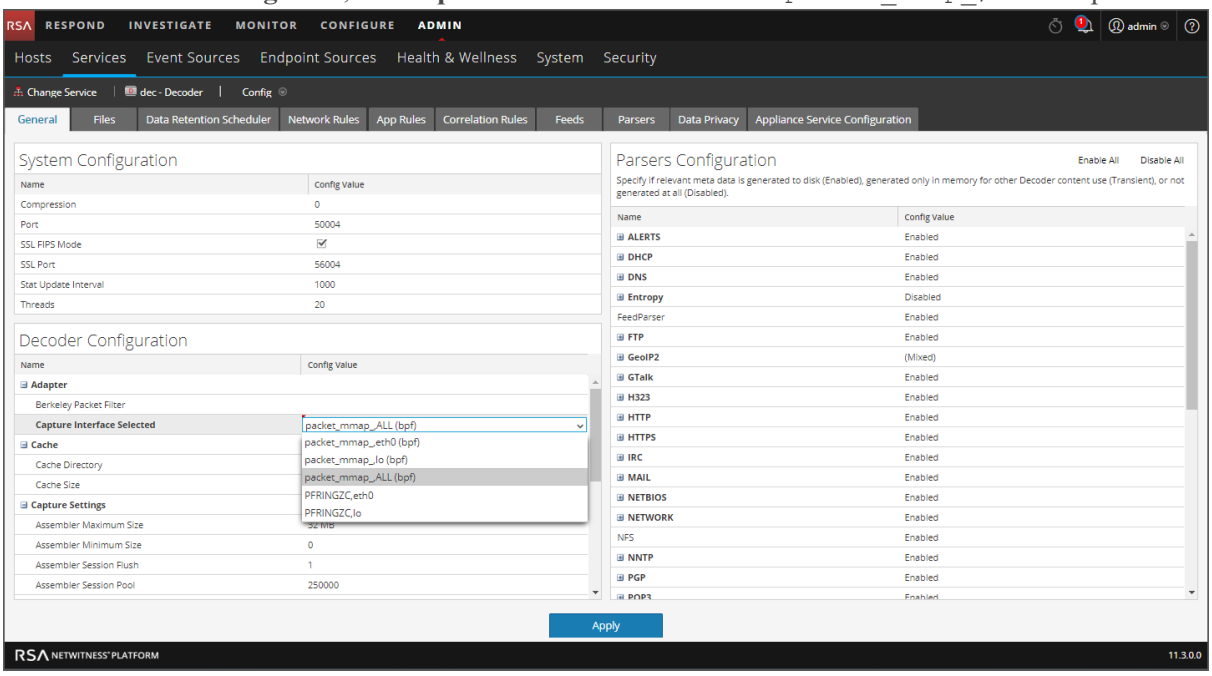
After editing this parameter, you must restart capture on the Decoder in order for changes to `capture.device.params` to take effect.

These are `vlan` examples of both options. If you need to pass multiple settings for `capture.device.params`, use the following synax. Notice that quotes are needed to delineate whitespace. For more information about how to use quotes for whitespace, see the "Connecting to a Service" topic in the *NwConsole User Guide for RSA NetWitness Platform*.
`name1="value1" name2="value2"`.

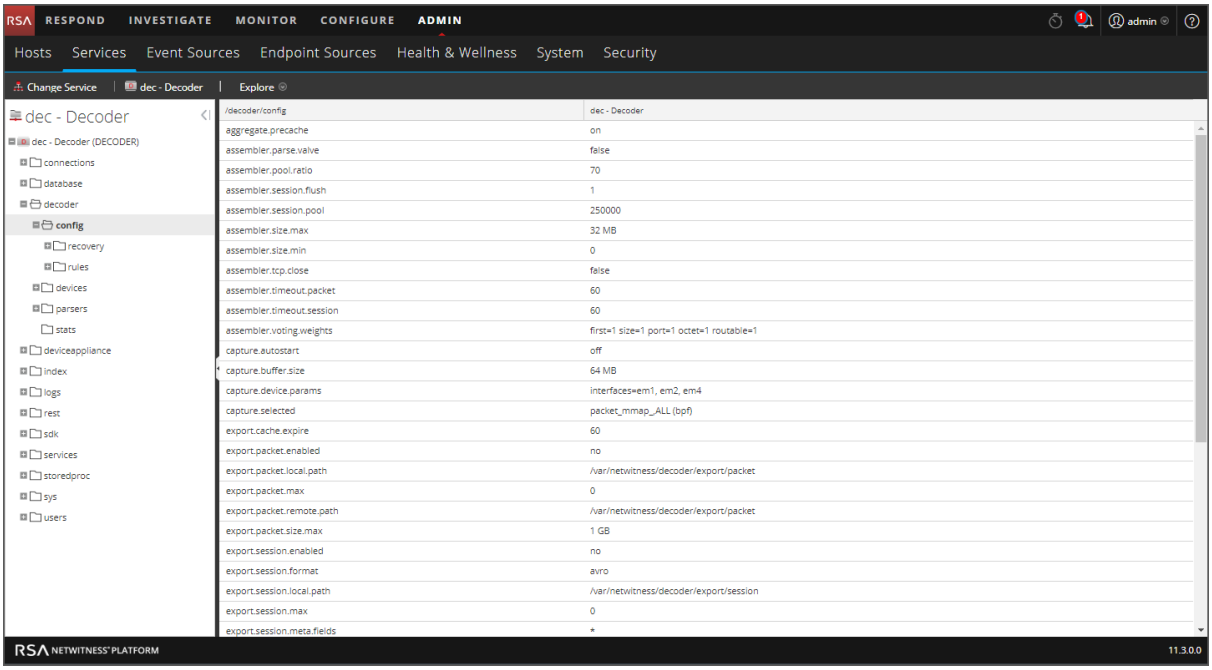
Parameter	Value	Effect
`capture.device.params`	`vlan-fix=true`	VLAN fixup always performed on all interfaces. The default value is `vlan-fix=false`.
`capture.device.params`	`interfaces=eth0:vlan,eth1`	VLAN fixup performed on traffic capture on `eth0` interface only
`capture.device.params`	`interfaces=eth0:vlan,eth1 vlan-fix=true`	VLAN fixup always performed because the `vlan-fix` setting overrides the interfaces setting.

To configure the `packet_mmap_` adapter to preserve the VLAN tags in packets:

1. In the **Administration Services view**, select the Decoder service and > **View** > **Config.**
2. In the **Services Config view**, set **Capture Interface Selected** to `packet_mmap_,ALL` adapter.



3. To go to the Services Explore view, click **Config** in the toolbar and select **Explore** in the drop-down list.
4. In the Services Explore view select **decoder** > **config**.



5. Click in the values column next to `capture.device.params`, and do one of the following:

   - To preserve VLAN tags on an interface in the interfaces list, add **`:vlan`** after the interface name and press **Enter**. For example, this specifies that VLAN tags are preserved on `em1`, but not on `em2` and `em4`:
     `interfaces=em1:vlan,em2,em4`

     The change goes into effect immediately; only traffic on `em1` has the VLAN tags preserved.

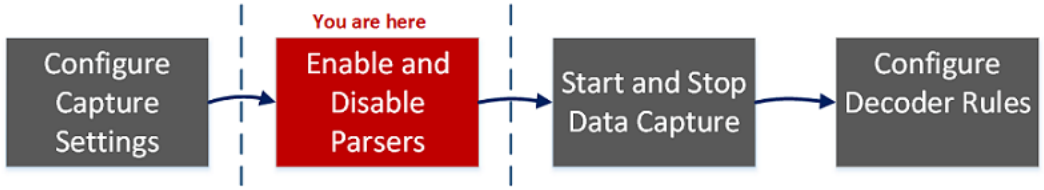
   - To preserve VLAN tags on all interfaces, enter the following and press **Enter**:
     `vlan-fix=true`

     The change goes into effect immediately; VLAN tags are preserved on all capture interfaces.

Enable and Disable Parsers and Log Parsers

Administrators can see which parsers have been downloaded from Live and deployed on a Decoder or Log Decoder, see which of these have been enabled, and enable or disable parsers and log parsers.

The following figure illustrates commonly used settings on a Decoder. For a quick basic setup with only the required steps, see Decoder and Log Decoder Quick Setup.



You should only download and deploy the parsers you need for the following reasons:

- There is an impact on performance as you increase the number of deployed parsers.
- The more parsers you deploy, the more meta data created, which impacts data retention.
- Not having extra (unnecessary) log parsers deployed reduces the potential for mis-identification of messages.

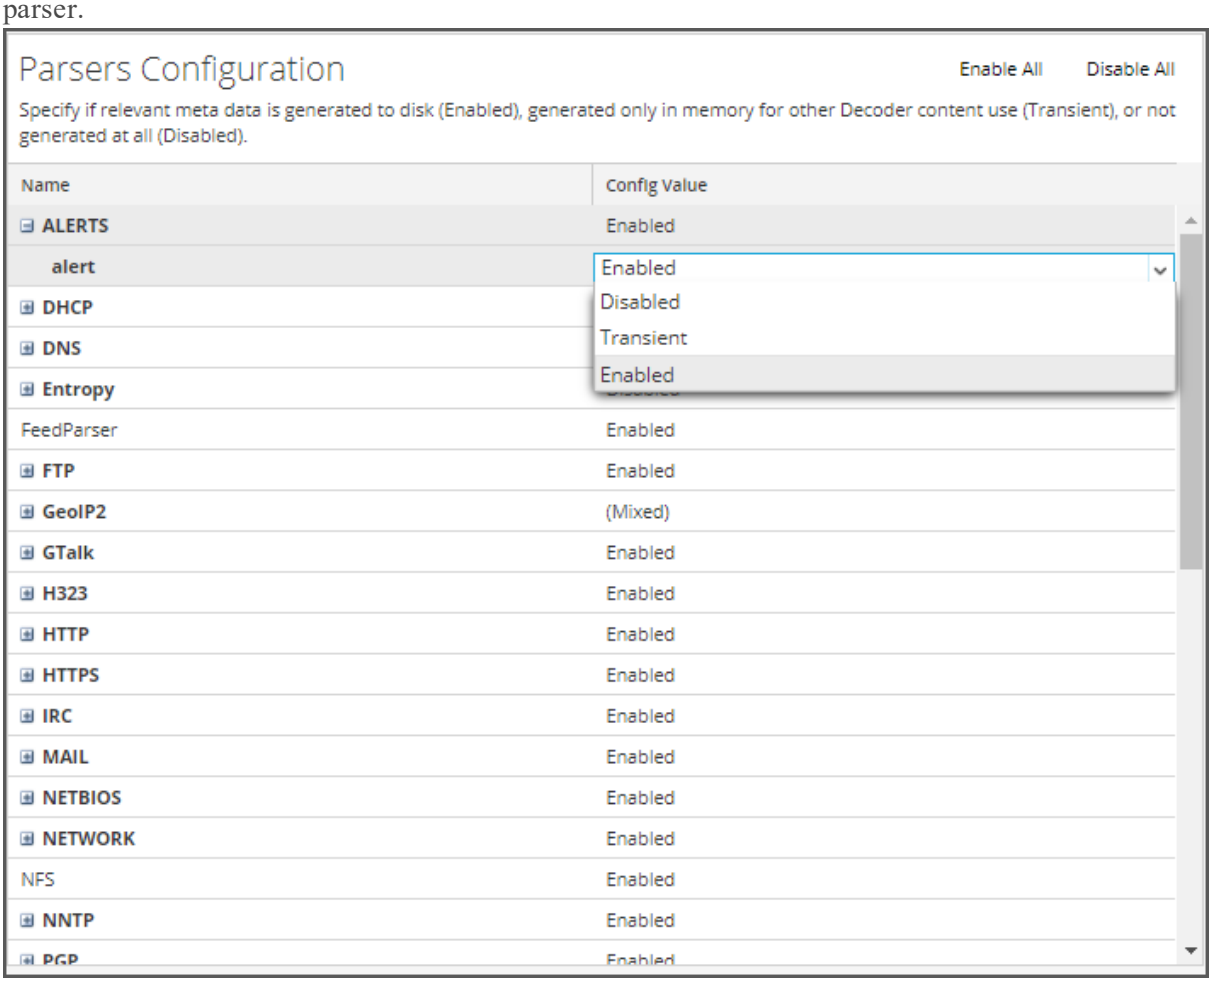
The Parsers Configuration panel provides a way to select parsers to use on the Decoder. Within some parsers, you can also configure the metadata that the parser creates. These are the options in the Parsers Configuration panel.

Option	Description
Enable All **Disable All**	These options provide a way to quickly select either all parsers or no parsers.
Name	The names of parsers available to the Decoder. A plus sign indicates that the metadata generated by the parser is configurable. Clicking the plus sign displays the metadata that the parser can create.
Config Value	A drop-down list changes the setting for the parser or metadata to **Enabled**, **Disabled**, or **Transient**. • When **Enabled**, the Decoder is using the parser to filter traffic. • When **Transient**, the Decoder is using the parser to filter traffic, and the generated metadata is not stored on disk. The transient metadata is available in memory to additional content (that is, parsers, feeds, and application rules) on that Decoder. This helps administrators to protect certain data and is usually done as part of a data privacy plan (see the *Data Privacy Management Guide*). • When **Disabled**, the Decoder is not using the parser. If the generated metadata for the parser is configurable, clicking the plus sign to expand the parser displays configurable meta keys and the same drop-down list selects the meta key the parser will create.

Note: For a Log Decoder, you must have previously deployed log parsers from Live. See the **Find and Deploy Live Resources** topic in the *Live Services Management* Guide for details. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

To enable or disable a parser, or to view the status for each parser:

1. Go to **ADMIN** > **Services**.
2. In the **Administration Services view**, select a Log Decoder or a Decoder, and **>View** > **Config**.
3. In the **Parsers Configuration** panel, look for the Decoder parser or the Log Decoder event source parser.



4. In the **Config Value** column, note the current status for your parser.

   You can update the status of any individual parser by selecting its **Config Value** and selecting **Disabled**, **Transient**, or **Enabled** from the drop-down menu. Alternatively, you can select **Enable All** or **Disable All** to update the status for all of your log parsers at once.

5. Click **Apply**.

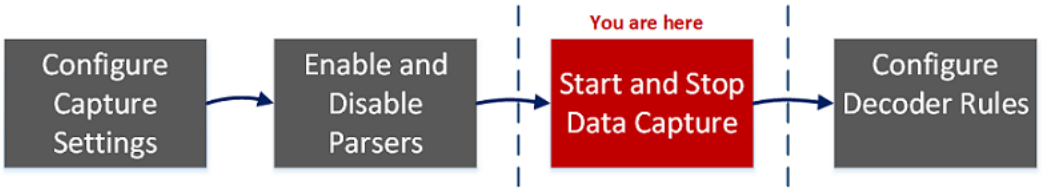
When you click **Apply**, note that all parsers are reloaded into NetWitness Platform. The status for each parser is updated, based on your selections.

Start and Stop Data Capture

When a Decoder starts up, it automatically begins aggregating data if **Capture Autostart** is enabled. When autostart is not enabled, you can start and stop data capture manually.

Note: The Capture Configuration Settings in the Service Config view for a Decoder determine whether Capture Autostart is enabled.

The following figure illustrates commonly used settings on a Decoder. For a quick basic setup with only the required steps, see Decoder and Log Decoder Quick Setup. You may want to stop and start capture at other times, for example, before you shut down the service.



To start and stop capture:

1. Go to **ADMIN > Services.**
2. In the **Admin Services** view, select a Decoder or Log Decoder service, and select > **View** > **System**.
3. In the toolbar, click **Start Capture**.

   If the service is a Decoder, it begins capturing packets. If the service is a Log Decoder, it begins capturing logs.

   When packet or log capture is in progress, the option in the toolbar changes to **Stop Capture**, and the option to upload a file is unavailable.
4. Whenever you want to discontinue traffic capture on a Decoder, click **Stop Capture**.

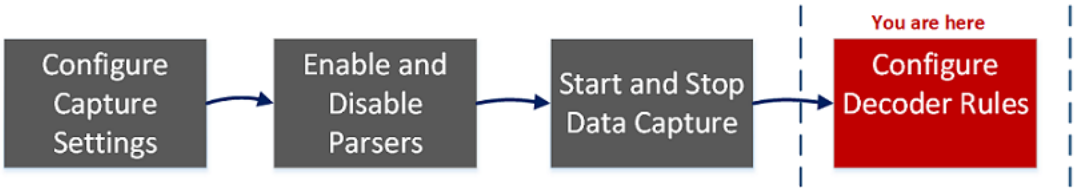
   Packet or log capture ceases, and the option to upload a file to the service is again available.

Note: When you stop the Log Decoder service while capture is running, all events currently in Log Decoder memory will be processed and persisted. Should an issue arise where it is necessary to quickly shutdown the service, use the Services Explore view to stop capture (`/decoder stop`), passing the parameters `flush=false` before stopping the Log Decoder service. For further information, see the "Services Explore View" in the *Host and Services Getting Started Guide*.

Configure Decoder Rules

This topic provides procedures for creating and managing rules for Decoder or Log Decoder traffic capture in the **Services Config view** > **Rules** tabs . Services Config View - Rules Tabs provides details about the Rules tab options.

The following figure illustrates commonly used settings on a Decoder. For a quick basic setup with only the required steps, see Decoder and Log Decoder Quick Setup.



Capture rules can add alerts or contextual information to sessions or logs. They can also define which data is filtered out by a Decoder or Log Decoder. Rules are created for specific metadata patterns, which result in predefined actions when matches are found. For example, to keep all traffic that fits certain criteria, but discard all other traffic, you can create a rule to perform the necessary actions. When applied, rules affect both packet capture file importing, as well as live network capture.

Rule and Query Guidelines provides guidelines that all queries and rule conditions in NetWitness Platform Core Services must follow.

By default, no rules are defined when you first install NetWitness Platform. Until rules are specified, the packets are not filtered. You can deploy the latest rules from Live. You can define three types of rules: Network Rules, Application Rules, and Correlation Rules.

- Network rules are applied at the packet level and are made up of rule sets from Layer 2, Layer 3, and Layer 4. Multiple rules can be applied to the Decoder. Rules can be applied to multiple layers (for example, when a network rule filters out specific ports for a specific IP address). Network rules are only available on Network Decoders.
- Application rules are applied at the session level. If the first rule listed is not a match, the Decoder then attempts to match the next rule listed, until a match is found.
- Correlation rules are applied over a configurable sliding time window. When a match is found, the service creates a new super session that identifies other sessions that match the rule, then creates a session list for analysis.

The two most common uses of rules are:

- To alert, and thereby create a custom alert meta value, when certain conditions are found.
- To filter out certain types of traffic that do not add value to the analysis of the data.

Groups of capture rules form rule sets, which you can import and export. This feature enables use of multiple rule sets for various scenarios. You can import the exported rule set, in the form of an .nwr file, to other NetWitness Platform services, simplifying the deployment and configuration of multiple services.

Rule Processing

These are the principles governing capture rule processing:

- Multiple rules can be applied to the Decoder.
- Capture rules are executed one after the other, in sequence.
- Rule processing stops when all rules are processed or after a rule configured to stop rule processing is matched.
- A default rule can be used to either include or exclude all traffic not otherwise selected by a rule. A default rule, if used, must always be placed at the bottom of the rule list. Otherwise, rule processing stops as soon as the default rule is evaluated since, by definition, all traffic is selected by the default rule.
- When rule processing stops, the session is saved using the configured session options and debug options.

Rule and Query Guidelines

All queries and rule conditions in RSA NetWitness Core services must follow these guidelines:

All string literals and time stamps must be quoted. Do not quote numbers, MAC, or IP addresses.

- `extension = 'torrent'`
- `time='2015-jan-01 00:00:00'`
- `service=80`
- `ip.src = 192.168.0.1`

Note: The space on the right and the left of an operator is optional. For example, you can type a rule as `service=80` or `service = 80` .

Rule Examples

The following table shows examples of rule conditions. You can use rule conditions for log retention collections in an Archiver and for application, network, and correlation rules on a Decoder, Log Decoder, or Concentrator. Rule conditions are also used in all `WHERE` clauses in all Core database queries.

For detailed information on rule syntax in NetWitness Platform, see "`WHERE` Clauses" in the "Queries" section of the *Core Database Tuning Guide* .

Rule Name	Condition
ComplianceDevices	`device.group='PCI Devices' || device.group='HIPPA Devices'`

Rule Name	Condition
HighValueWindows	`device.group='Windows Compliance'`
MediumValueWindows	`device.type='winevent_nic' && msg.id='security_4624_security'`
LowValueWinLogs	`device.type='winevent_nic' && msg.id='security_4648_security'`
LowValueProxyLogs	`device.class='proxy' && msg.id='antivirus_license_expired'`
GeneralWindows	`device.type='winevent_nic'`

Invalid Rules

NetWitness Platform uses a rule parser that strictly defines valid syntax for rules and queries. When a Core service encounters invalid syntax, it writes a warning in the NetWitness Platform logs indicating the error.

Note: NetWitness Platform 11.x does not support parsing of legacy syntax rules (as version 10.6 did). After you update to NetWitness Platform 11.x, rules with invalid syntax are highlighted in the user interface, and no rules will be applied until the invalid rules are corrected. The Rule Editor provides additional tooltips. After you fix the rules, the highlights disappear. See Fix Rules with Invalid Syntax.

The `/decoder/config/rules/rule.errors` and `/concentrator/config/rules/rule.errors` stats, contain the count of rules with errors. If `rule.errors` is nonzero, NetWitness Platform generates a Health and Wellness alert to indicate that you need to fix the rules.

General Syntax Guidelines

- All text values must quote literal values. Example: `username = 'user1'`
- Quotes can use single or double quotes; but they must match. (You cannot start with a single quote and finish with a double quote.)
- If the literal value has a quote, you can escape it using double quotes. Example: `username = "User's"`

The following are valid syntax rules:

- All time values should use quotes for dates in this form: `time = 'YYYY-MM-DD HH:MM:SS'`
- All time values that are the number of seconds since EPOCH (Jan 1, 1970), should not be quoted. Example: `time = 1448034064`
- **Everything** else is unquoted: IP addresses, MAC addresses, numerics, and so on. Example: `service = 80 && ip.src = 192.168.1.1/16`

Capture Rule Syntax

Capture rules compare fields to values or to other fields. This is an example of a simple expression with a meta key on the left side of the operator and a value on the right side.

```
ip.dst=192.168.1.1
```

The syntax allows a meta key on the right side of the operator in Decoders and Log Decoders for application and network rules. Meta key comparison does not apply in the `where` clause in queries. This is an example of a simple expression with a meta key on the left side of the operator and a meta key on the right side.

```
ip.src=ip.dst
```

Rules that include a meta key comparison support renamed meta keys; if a rule queries a meta key that has been renamed, the rule is parsed for the renamed meta key. For example, if the meta key `ip_dst` is used in a rule, it is transparently mapped to the renamed meta key: `ip.dst`. Existing rules that include original keys will trigger alerts that include data for the renamed meta key.

This is an example of a rule that finds packets having the same `ip.src` address and `ip.dst` address on a Decoder, and generates an alert on the Concentrator.

```
alert=alert.id name=testRule8 rule="ip.src=ip.dst" order=38
```

This rule would generate an error because `eth.src` and `ip.src` are incompatible formats.

```
rule="eth.src=ip.src" name="testRule99" alert=alert.id
```

Values can be expressed as discrete values, a range of values, an upper or lower bound, or a combination of these three. You can create a greater than or less than comparison, and test equality or inequality against a range of values or an upper/lower bound.

`key 0-5` (a range of values)

`key = 0-u` is the same as `key >= 0` (upper bound, greater than or equal to)

The following table summarizes the operators on meta keys.

Left Operand Format	Operator	Right Operand Format	Description
any	=	compatible with left operand	Equality operator. You can use values or meta keys on the right side of the equality operator.
any	!=	compatible with left operand	Inequality operator. You can use values or meta keys on the right side of the inequality operator.
any	<	compatible with left operand	Less than operator. You can use values or meta keys on the right side of this operator.

Left Operand Format	Operator	Right Operand Format	Description
any	<=	compatible with left operand	Less than or equal to operator. You can use values or meta keys on the right side of this operator.
any	>	compatible with left operand	Greater than operator. You can use values or meta keys on the right side of this operator.
any	>=	compatible with left operand	Greater than or equal to operator. You can use values or meta keys on the right side of this operator.
text	contains	text	Find values that contain the right operand. You can use meta keys or values on the right side of this operator.
text	begins	text	Find values that begin with the right operand. You can use meta keys or values on the right side of this operator.
text	ends	text	Find values that end with the right operand. You can use meta keys or values on the right side of this operator.
text	length	integer	Find strings of a certain length. You can use meta keys or values on the right side of this operator.
any	count	integer	Find values with a specific number of occurrences within the session. You can use meta keys or values on the right side of this operator.
any	ucount and unique	integer	Finds a number of uniquely occurring values. You can use meta keys or values on the right side of this operator. For example, if the results include instances of a meta key with five unique values and three of the same value, the ucount is six.
N/A	exists	any	Finds any values for the meta key. You can use meta keys or values on the right side of this operator.
N/A	!exists	any	Finds any sessions in which the meta key does not occur. You can use meta keys or values on the right side of this operator.
text	regex	text	Finds values matching a regular expression. You can use values on the right side of this operator.

The following table summarizes other syntax elements used in rules.

Syntax element	Description
*	Default rule. By using an asterisk (*) as the sole character in a rule, that rule will select all traffic.
u	Upper bound of a range a range of times, IP addresses, or numeric formats. For example, to select all TCP ports above 40000, the syntax would be: `tcp.port = 40000-u`
l	Lower bound of a range of times, IP addresses, or numeric values. For example, to select all TCP ports below 40000, the syntax would be: `tcp.port = 1-40000`
- (dash)	Denotes a range. This is only applicable to time values, IP or MAC addresses, or numeric values. Separate the lower and upper bounds of the range with a dash (-) character. For example, to select TCP ports between 25 and 443, the syntax would be: `tcp.port = 25-443`
, (comma)	Denotes a list of ranges or values or meta keys. Single values may be used as well as any combination of ranges and upper or lower bounds. Single meta keys may be used in a list. Meta keys and literal values cannot both appear on the right-hand side of an operator. For example, the following is valid syntax: `tcp.port = 1-10,25,110,143-225,40000-u`
( )	Grouping operator. An expression can be enclosed in parentheses to create a new logical expression. For example, the following would select traffic on port 80 to/from 192.168.1.1 OR traffic on port 443 to/from 10.10.10.1: `(ip.addr=192.168.1.1 && tcp.port=80) || (ip.addr=10.10.10.1 && tcp.port=443)`
~	Logical NOT operator, a negation of an expression.
&&	Logical AND operator, a conjunction of two expressions.
||	Logical OR operator, a disjunction of two expressions.

Configure Capture Rules

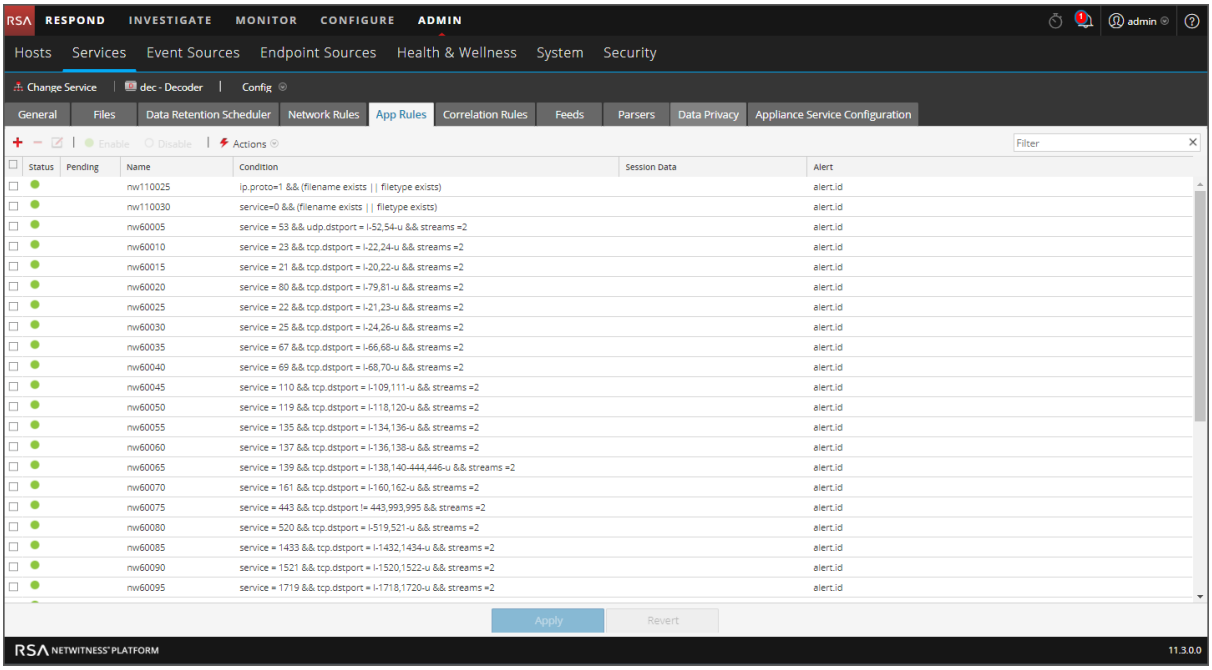
The Decoder and Log Decoder rules are editable in the Services Config view. While each type of rule (network, application, and correlation) has its own tab; the functions are similar for all types of rules. You can:

- Add, edit, and delete rules
- Enable and disable rules
- Change the execution sequence of rules
- Import rules from a file
- Export rules to a file
- Push rules to another service

- Revert or apply rule changes
- Restore one of the last ten rule configurations from a snapshot

To configure rules in the Rules tabs

1. Go to **ADMIN > Services**.
2. In the **Services** view, select a Decoder service and > **View** > **Config**.
3. In the **Services Config** view, select one of the Rules tabs: Network Rules, App Rules, or Correlation Rules.
   The rules list for the selected rule type is displayed.



Each type of rule has a list with slightly different columns and different parameters. Several basic guidelines apply to all rule management activities:

- The rules are executed in the sequence they are displayed in the list. To change the execution sequence of rules, drag and drop rules to the appropriate location in the list or use the context menu options to arrange the rules in the list.
- To select a single row, click the row.
- To select a group of adjacent rows, click the first, then shift-click the row at the end of the group.
- To select multiple non-adjacent rows, click the first, then control-click the others.
- When editing rules in the Rules tab, you must apply the configuration changes in order to activate.
- Until changes are applied, you can discard edits to the list and revert to the unedited rules.
- Once rules are applied, you can recover the last ten rules configurations using the **History** option in the **Actions** menu.

To add a rule in any Rules tab, do one of the following:

- Click + .
- Right-click a rule, and select **Insert Above** or **Insert Below** from the context menu.
  The Rule Editor dialog for that type of rule is displayed.

To remove a rule:

1. From any Rules tab, select the rules to remove from the rules list.
2. Click − .
   The selected rules are removed from the list, but still exist on the service.

To edit a rule

1. From any Rules tab, select the rule to edit.
2. Click or double-click the rule row.
   The Rule Editor dialog for that type of rule is displayed.

To disable a rule:

1. From any Rules tab, select the rules to disable.
2. Click Disable.
   The status changes to disabled in the rules list, but the rule is still enabled on the service.

To enable a rule:

1. From any Rules tab, select the rules to enable.
2. Click Enable.
   The status changes to enabled in the rules list, but the rule is still disabled on the service.

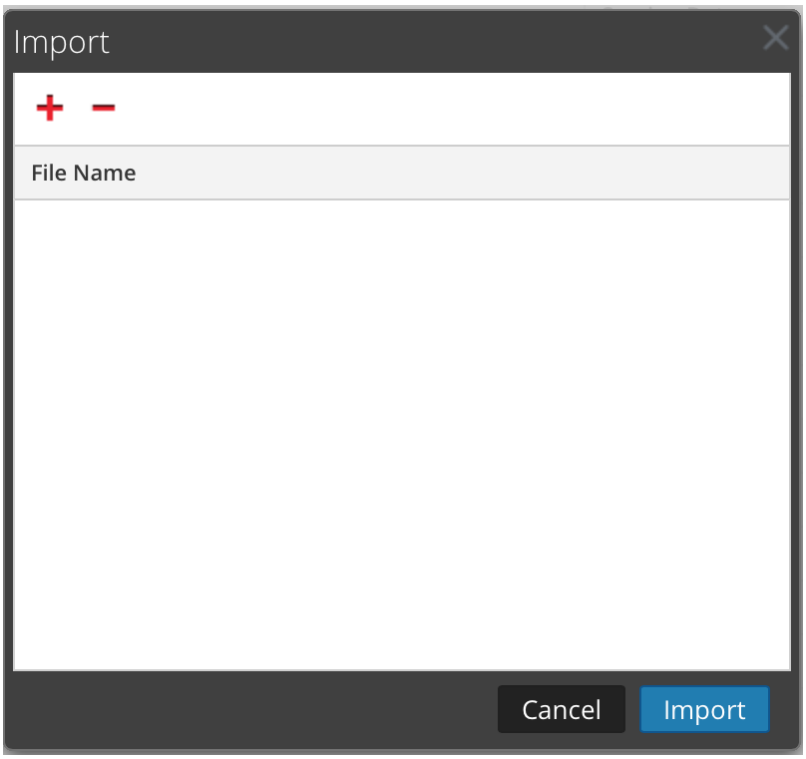
Import Rules from a File and Export Rules

You can import network, application, and correlation rules to a Decoder from a file that contains rules of the same type. After the rules are imported, you can edit and manage them as you would any other rules.

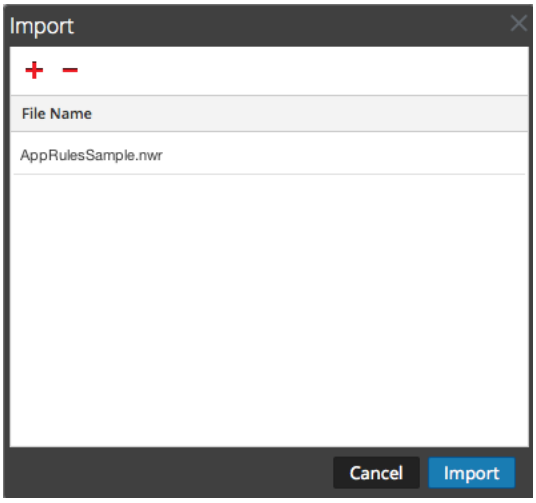
When you attempt to import a group of rules, NetWitness Platform Administration checks the type of rules imported. If you are successful, a message displays the number of rules imported. If the rule type differs from the active tab type, the rules are not imported. You must re-import the rules under the correct tab or select another file to import.

To import rules to a service:

1. From any Rules tab, select Actions > Import.
   The Import dialog is displayed.



2. Click + .
   A view of the directory structure is displayed.
3. Choose one or more NetWitness rules (.nwr) files to import, and click **Open**.
   The file is added to the list in the Import dialog.



4. Click **Import**.
   The rules are imported into the user interface. Imported rules have a red corner in each edited column.
5. Edit or reorder the rules if needed.
6. To save the rules to the service, click **Apply**.
   The rules for the service are updated with the changes.

To export a rule to a file:

1. To export a subset of the rules, select the rules to be exported.
2. Do one of the following:
   - In the toolbar, select 
 > **Export** > **Selection**. (**Export** > **All** exports all rules in the rules list even if you have a subset selected for export.)
   - Right-click the selected rules and select **Export Selection**.

     A prompt for the filename is displayed.
3. Enter the filename and click **Export**.
   The .**nwr** file is downloaded.

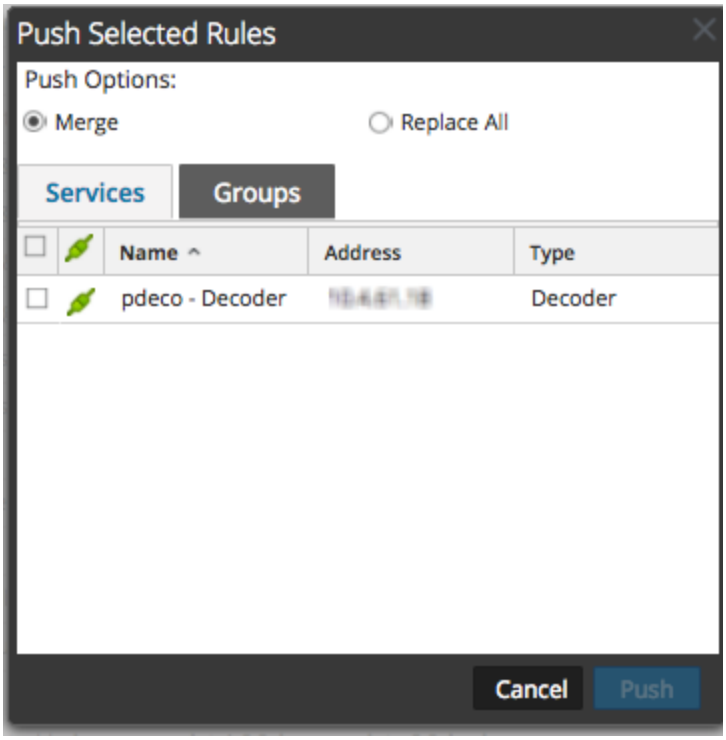
Push Rules to Other Services

You can apply (push) rules or selected rules to other services (Decoders or Log Decoders) or service groups. When you push all rules to other services, all rules on the target services are removed and replaced with all of the rules on the source service.

To push selected rules from this Decoder to other Decoders:

1. From any Rules tab, select the rules that you want to push to another Decoder.
2. Do one of the following:
   - Select 
 > **Push** > **Selection**.

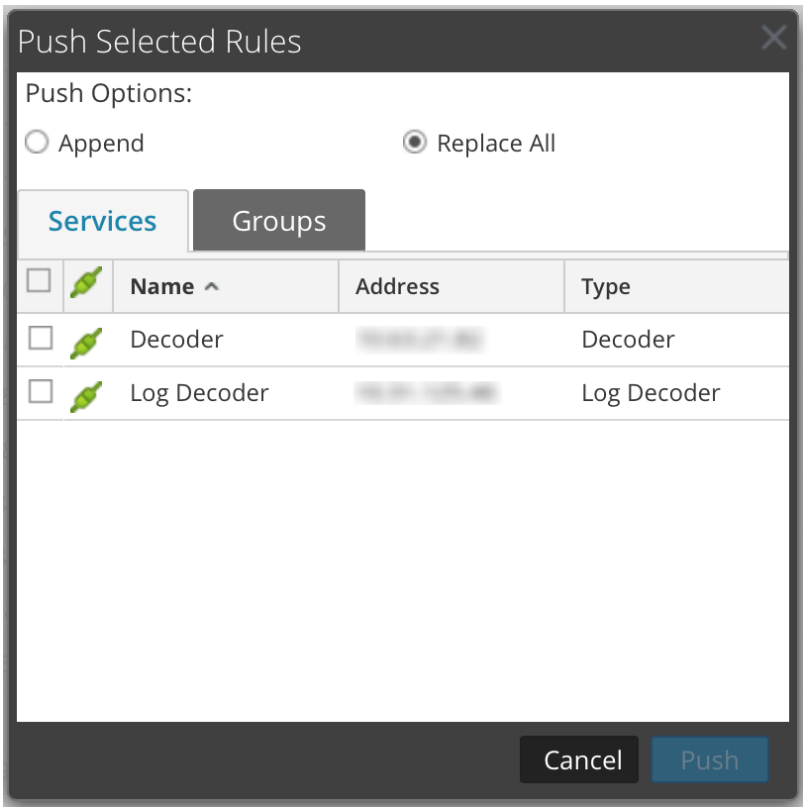
- Right-click the selected rules and select **Push Selected Rules**.
  The Push Selected Rules dialog is displayed.



3. Select a Push Option:
   - Select **Replace All** to delete all rules on the target services and replace them with the selected rules. This is the default selection.
   - Select **Merge** to merge the selected rules with the existing rules on the target services.
4. On the **Services** tab, select the target services to receive the pushed rules, or select the groups of services from the **Groups** tab.
5. Click **Push**.
   The rules are pushed to the selected services and become effective immediately.

To push all rules from this Decoder to other Decoders:

1. From any Rules tab, select Actions > **Push** > **All**.
   (**Push** > **All** pushes all rules in the rules list even if you have a subset selected to push.) The Push Selected Rules dialog is displayed.



2. On the **Services** tab, select the target services to receive the pushed rules, or select the groups of services from the **Groups** tab.
3. Click **Push**.
   All rules from the target services are deleted and replaced with all of the rules from source service. The rules become effective immediately.

Change Execution Order of Rules

Capture rules are applied in the order they are displayed in the rules list. To reorder rules, use either of these methods:

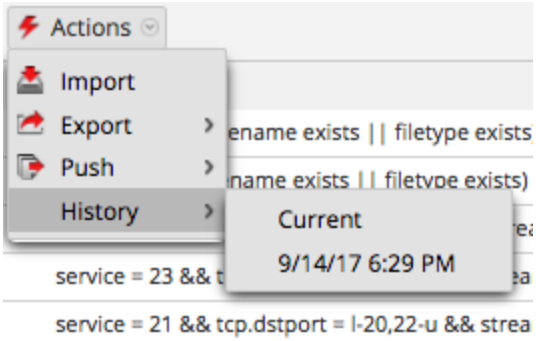
- Drag and drop the rules in the appropriate location in the rules list.
- Right-click a rule to display the context menu, and use the **Cut** and **Paste** options.

Restore a Rule Snapshot from History

NetWitness Platform keeps the last ten snapshots of rules applied to a service.

To restore a rules snapshot from history:

1. Select Actions > **History**.
   A submenu of snapshots is displayed.



2. Select the snapshot time from the submenu.
   The rules from the snapshot are loaded into the rules list, replacing the current set. But the current set is still in use on the service.
3. To apply the rules to the service, click **Apply**.
   The rules are applied to the service.

Configure Application Rules

Application layer rules are applied at the session level. The following are sample application rules.

To truncate packets carried via Server Message Block protocol (SMB), create a rule as follows:

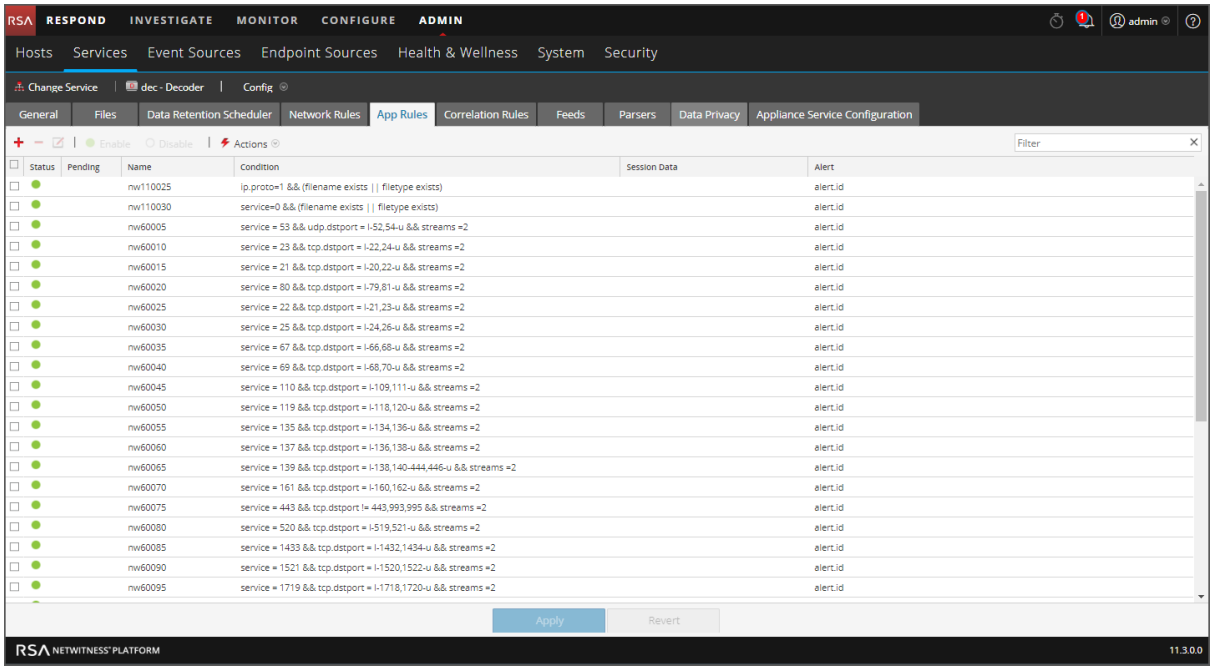
- Rule Name: Truncate SMB
- Condition: `service=139`
- Rule Action: Truncate All

To retain email to and from a specific e-mail address, create a rule as follows:

- Rule Name: Retain Email Tom Jones
- Condition: `email='Tom.Jones@TheShop.com'`
- Rule Action: Keep

To add or edit an application rule:

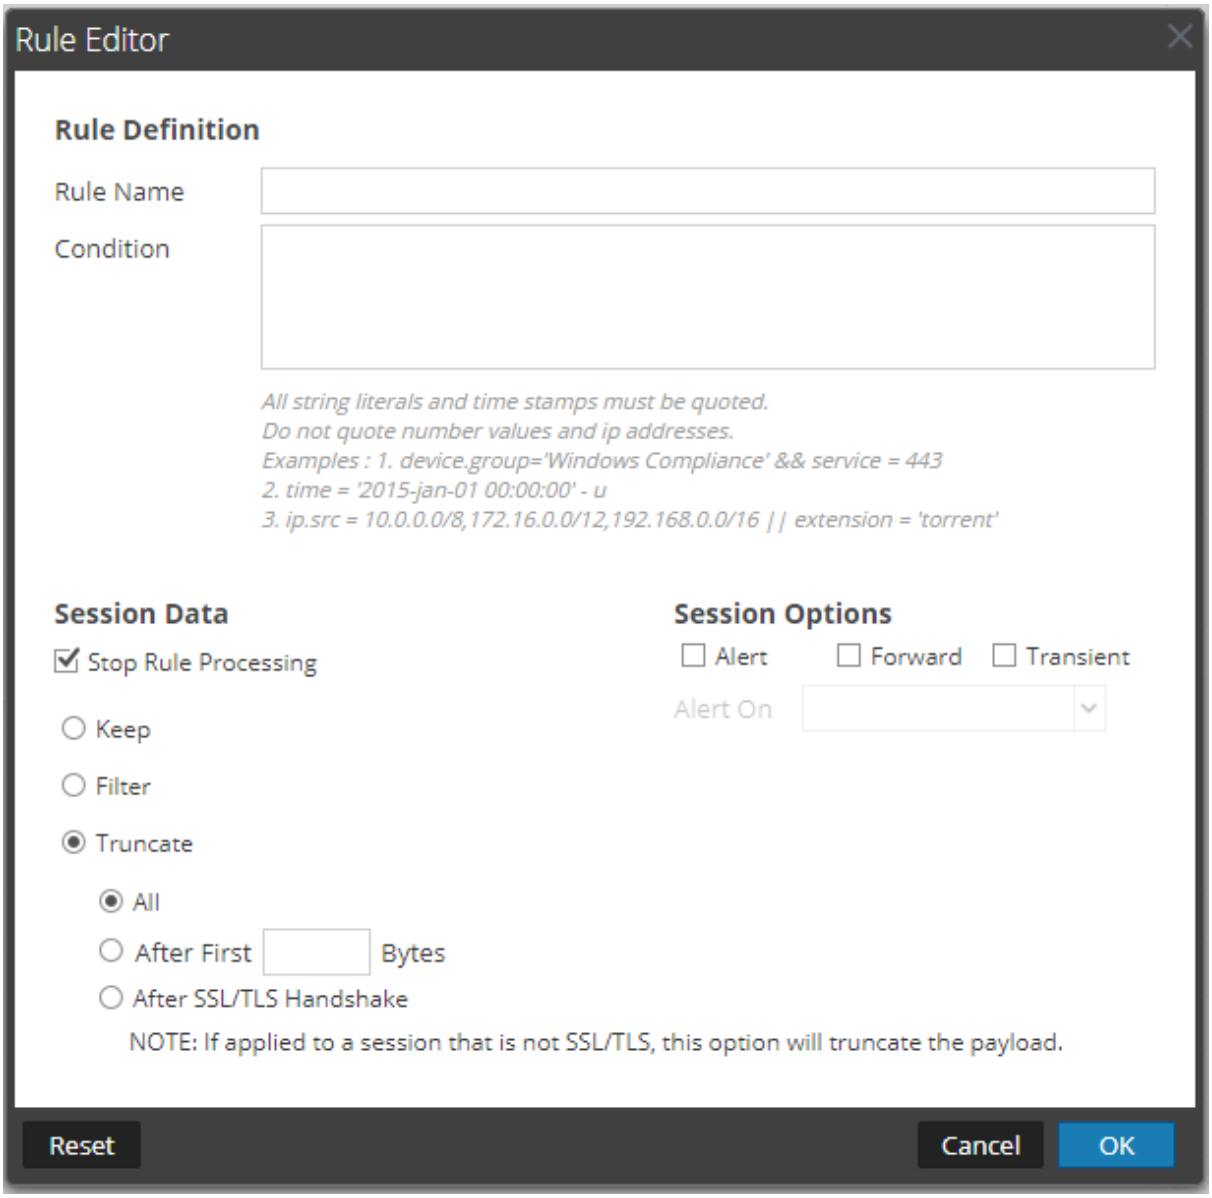
1. Go to **ADMIN > Services**.
2. Select a Decoder or Log Decoder service and **> View > Config**.
   The Systems Config view for the selected service is displayed.
3. Select the **App Rules** tab.



4. Do one of the following:

- If adding a new rule, click + .
- If editing a rule, select the rule from the rules list and click .

5. The Rule Editor Dialog is displayed with application rule parameters.



a. In the **Rule Name** field, type a name for the rule. For example, for a rule that truncates all SMB, type **Truncate SMB**.

b. In the **Condition** field, build the rule condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta from the window actions. As you build the rule definition, NetWitness Platform displays syntax errors and warnings. For example, to truncate all SMB, type **service=139**.

   All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details.

c. If you want rule evaluation to end with this rule, check the **Stop Rule Processing** checkbox.

d. In the **Session Data** section, choose one of the following actions to apply when a matching packet is found:

- **Keep**: The packet payload and associated meta are saved when they match the rule.
- **Filter**: The packet is not saved when it matches the rule.
- **Truncate**: Select a truncate option to execute when a packet matches the rule. The example uses the **All** option.
- **Truncate All** to save the packet headers and associated metadata, and do not save the packet payload.
- **Truncate After First <n> Bytes** to save the packet headers and associated metadata, and do not save the packet payload after the specified first <n> bytes, where <n> is a number of bytes.
- **Truncate SSL/TLS Handshake** to truncates the payload for all sessions except in the case of an SSL/TLS session, where the SSL exchange is preserved, but the rest of the payload is not saved. This option is for use with SSL parsers.

e. In the **Session Options** section, do any of the following:

- **To generate a custom alert** when a session metadata matches the rule, enable the Alert flag and select the name of the alert meta from the **Alert On** drop-down list.
- **To perform syslog forwarding** when the log matches the rule, enable the **Forward** flag. Make sure that:
  - You have enabled both the Alert and Forward flags to carry out syslog forwarding.
  - The name of the rule mentioned in the Rule Editor dialog matches the syslog forwarding destination name specified in the Log Decoder > View > Explore > `/decoder/config/logs.forwarding.destination` parameter
- **To prevent the alert metadata that is created from being written to the disk**, enable the **Transient** flag.

6. To save the rule and add it to the grid, click **OK**.

   The rule is added at the end of the grid or inserted where you specified in the context menu. The plus sign is displayed in the **Pending** column.

7. Check that the rule is in the correct execution sequence with other rules in the grid. If necessary, move the rule.
8. To apply the updated rule set to the Decoder or Log Decoder, click **Apply**.

NetWitness Platform saves a snapshot of the currently applied rules, then applies the updated set to the Decoder and removes the pending indicator from the rules that were pending.

Monitor Application Rules

The Decoder and Log Decoder keep track of how many times each application rule matches a session. These stats can be viewed by connecting to the Decoder or Log Decoder Explore view and viewing the properties on the `/decoder/config/rules/application` folder. Then, send the command "`statdump`" to that folder. The output of this message is a listing of the number of times each application rule is hit. The listing is ordered in the same order as the contents of the rule definitions in the `/decoder/config/rules/application` folder. For example, on a system with three application rules:

```
0001: hits=6543 loaded=true
0002: hits=9294 loaded=true
0003: hits=43 loaded=true
```

The hit counters for the application rules are reset whenever the parsers are reloaded.

Configure Correlation Rules

Basic Correlation Rules are applied at the session level and alert the user to specific activities that may be occurring in their environment. NetWitness Platform applies correlation rules over a configurable sliding time window. When the conditions are met, alert metadata is created for this activity and there is a visible indicator of the suspicious activity.

The following are sample correlation rules illustrating two use cases and the syntax.

Objective: In sessions where tcp.dstport exists, if there is any combination of ip.src and ip.dst where the count of unique instances of `tcp.dstport > 5` within one minute, then alert. To achieve this objective, create a rule as follows:

- Rule Name: IPv6 Vertical TCP Port Scan 5
- Rule: `tcp.dstport exists`
- Instance Key: `ip.src,ip.dst`
- Threshold: `u_count(tcp.dstport)>5`
- Time Window: 1 min

Objective: In sessions where `action==login` and `error==fail`, if there is any combination of `ip.src` and `ip.dst` that appears in more than 10 sessions within five minutes, then alert. To achieve this objective, create a rule as follows:

- Rule Name: IPv4 Potential Brute Force 10
- Rule: action=`'login' && error='fail'`
- Instance Key: `ip.src,ip.dst`
- Threshold: `count()>10`
- Time window: 5 mins

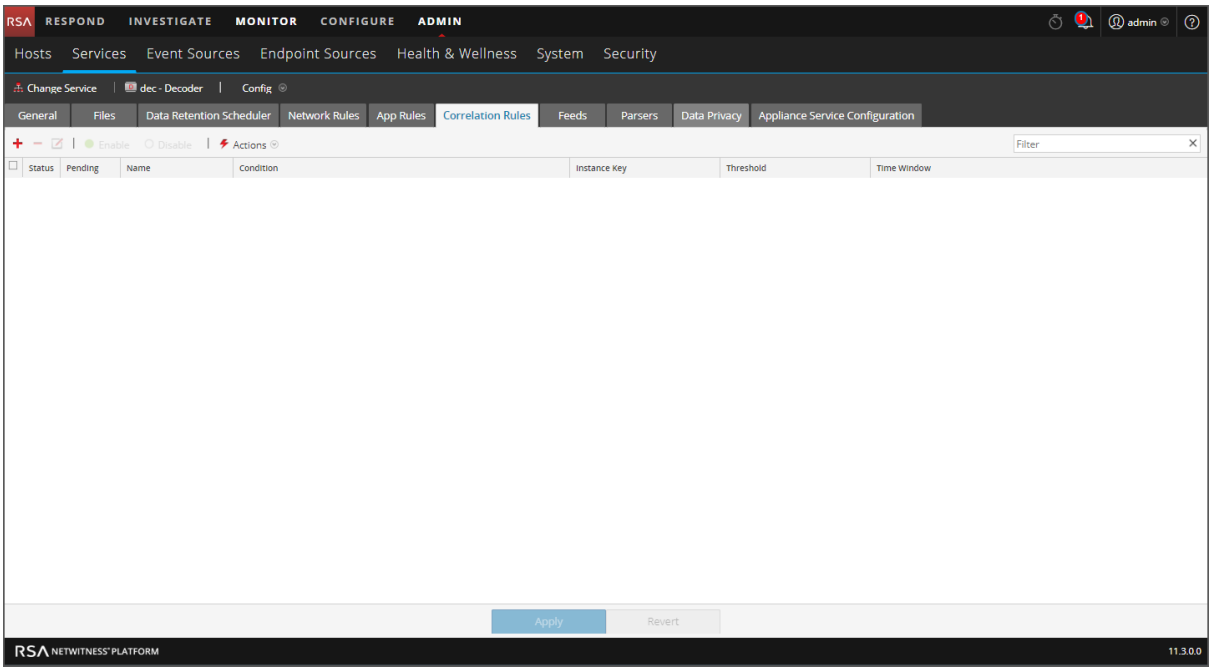
Both sample rules have the same instance key: `ip.src` and `ip.dst`. Because we are looking for unique combinations of `ip.src` and `ip.dst` that match the correlation condition, **`ip.src`** and **`ip.dst`** are **primary keys**.
Threshold can include an **associated key** that identifies the meta type that we are counting to determine if the condition is satisfied. In the first example, the associated key specified in Threshold is `tcp.dstport`. We are counting unique instances of `tcp.dstport` for every `ip.src/ip.dst` pair. In the second example, the associated key is not specified in the Threshold because it is merely a count of sessions. It is helpful to think of this scenario as counting unique session IDs and the associated meta is implicitly session.id. We are counting unique `session.id` for every `ip.src/ip.dst` pair.

Invalid use case: In sessions where (rule), if there is any combination of `ip.src` and `ip.dst` that have a unique count of `ipv6.dst > 5` within (time window), then alert. This case does not work because the associated key `ipv6.dst` is an IPv6 meta type. IPv4 and IPv6 meta types are not permitted to be used as associated keys.

To add or edit a correlation rule

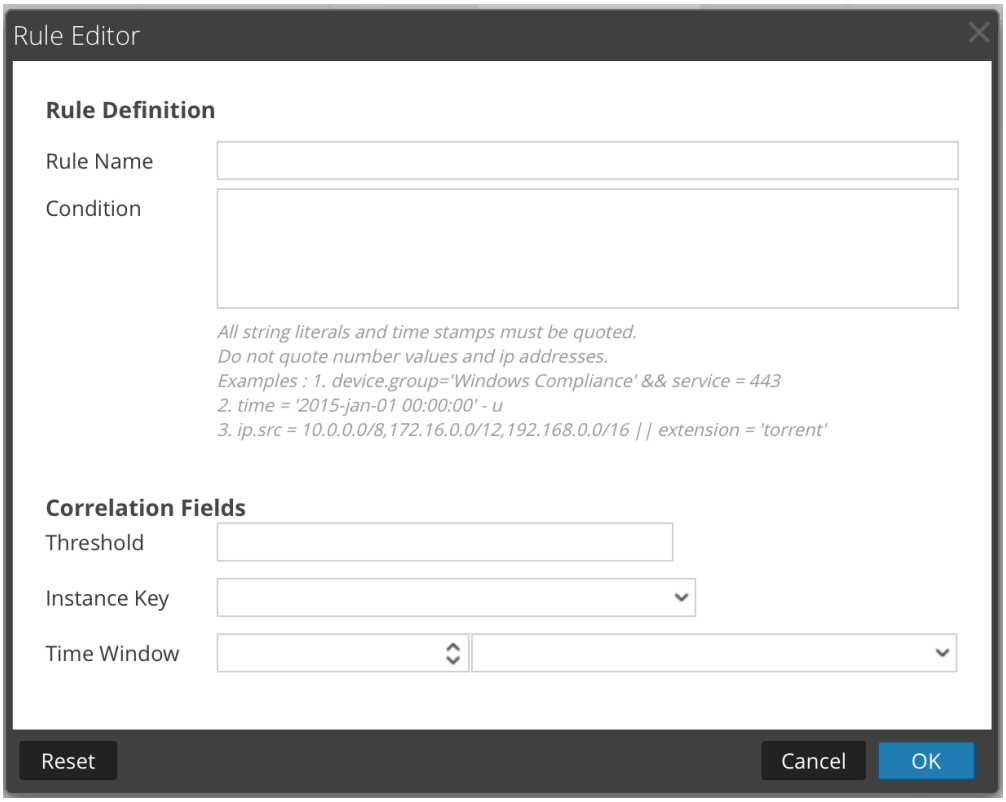
1. Go to **ADMIN > Services,** select a service, and **> View > Config**.
   The Service Config view for the selected service is displayed.

2. Select the **Correlation Rules** tab.



3. In the **Correlation Rules** tab, do one of the following:

   - If adding a new rule, click .
   - If editing a rule, select the rule from the rules grid and click .
     The Rule Editor dialog is displayed with correlation rule parameters.



4. In the **Rule Name** field, type a name for the rule. For example, to create the sample rule, **IPv6 Vertical TCP Port Scan 5**.
5. In the **Condition** field, build the rule condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta from the window actions. As you build the rule definition, syntax errors and warnings are displayed by NetWitness Platform. For example, to create the sample rule, type **tcp.dstport exists**. When this condition is matched, the session data action is performed.
   All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details.
6. In the **Threshold** field, use one of the threshold parameters to specify the minimum number of occurrences required to create a correlation session and an associated key if required. The associated key cannot be an IPv4 or IPv6 meta type.
   - `u_count(associated_key)` = the count of unique values of the specified key
   - `sum(associated_key)` = the values of the specified key
   - `count` = number of sessions (no associated key is specified)
7. In the **Instance Key** field, select the target indicator to base the event upon. This can be a single key or a compound key (two primary keys, separated by a comma).
8. In the **Time Window**, set the duration during which the threshold must be reached to create a correlation session.
9. To save the rule and add it to the grid, click **OK**.
   The rule is added at the end of the grid or inserted where you specified in the context menu. The plus sign is displayed in the **Pending** column.
10. Check that the rule is in the correct execution sequence with other rules in the grid. If necessary, move the rule.
11. To apply the updated rule set to the service, click **Apply**.
    NetWitness Platform saves a snapshot of the currently applied rules, then applies the updated set to the Decoder or Log Decoder.

Configure Network Rules

Network rules are applied at the packet level on a Decoder and are made up of rule sets from Layer 2, Layer 3, and Layer 4. Multiple rules can be applied at the packet level to a Decoder. Network rules can apply to multiple network layers (for example, when a network rule filters out specific ports for a specific IP address). Network rules do not apply to Log Decoders, they apply only to Network Decoders.

You can create and manage network rules in the Services Config view > Network Rules tab.

Note: Because network rules are applied on the packet level, you must specify both the source and destination meta keys in the rule condition. This is because the packet flow can occur on both sides at the packet level, while the directions are still not determined. For example, if you want to filter traffic on port 553 and port 55553, the condition should be written as follows:

```
tcp.srcport=553 || tcp.dstport=553 || tcp.srcport=55553 || tcp.dstport=55553
```

You must also specify both the source and destination meta keys in the conditions for `ip.src` and `ip.dst`. Specifying only source or destination in the condition will not work as expected.

Supported Meta Keys in Network Rule Conditions

The following table describes the meta keys that NetWitness Platform supports for use in network rule conditions.

Meta Key	Description
`eth.addr`	Ethernet source or destination address. Commonly known as the MAC address.
`eth.dst`	Destination Ethernet address. This is the same as the Ethernet address field except that it selects only packets where the destination address matches the selected value (s).
`eth.src`	Same as Ethernet destination except that it focuses on the source address.
`eth.type`	Ethernet frame type.
`hdlc.type`	Frame type of the HDLC frame.
`ip.addr`	IPv4 source or destination address in standard form. IP addresses can be entered in CIDR notation for subnets.
`ip.dst`	Destination IPv4 address in standard form. IP addresses can be entered in CIDR notation for subnets.
`ip.proto`	IPv4 protocol field.
`ip.src`	Source IPv4 address in standard form. IP addresses can be entered in CIDR notation for subnets.
`ipv6.addr`	IPv6 source or destination address in hex format. Generally IPv6 addresses are written as eight groups of four hex digits, thus expressing the entire 128 bit address length. Supports notation to represent multiple blocks of 0000 in an address. Does not support CIDR notation.

Meta Key	Description
ipv6.dst	Destination IPv6 address in hex format.
ipv6.proto	IPv6 protocol field. This maps to the Next Header field in the IPv6 header and uses the same values as the IPv4 protocol field.
ipv6.src	Source IPv6 address in hex format.
tcp.dstport	Destination TCP port.
tcp.port	TCP source or destination port.
tcp.srcport	Source TCP port.
udp.dstport	Destination UDP port.
udp.port	UDP source or destination port.
udp.srcport	Source UDP port.

The following are sample network rules.

To truncate all SSL from the source port, create a rule as follows:

- Rule Name: Truncate SSL
- Condition: `tcp.srcport=443`
- Rule Action: Truncate

To filter subnet traffic, create a rule as follows:

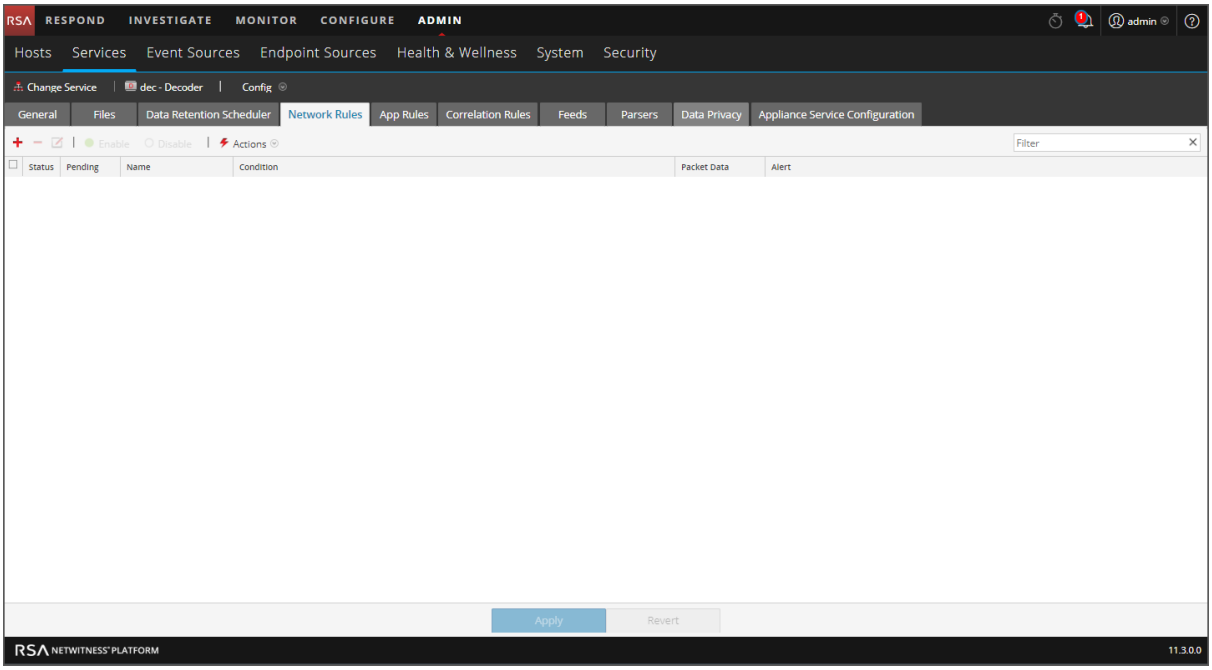
- Rule Name: Subnet Filter
- Condition: `ip.addr=192.168.2.0/24`
- Rule Action: Filter

Meta entities, which provide a way to work with several meta keys at the same time, can be used in application rules, but are not supported in network rules as the metadata available are too limited. For more information on meta entities, see the *Core Database Tuning Guide*.

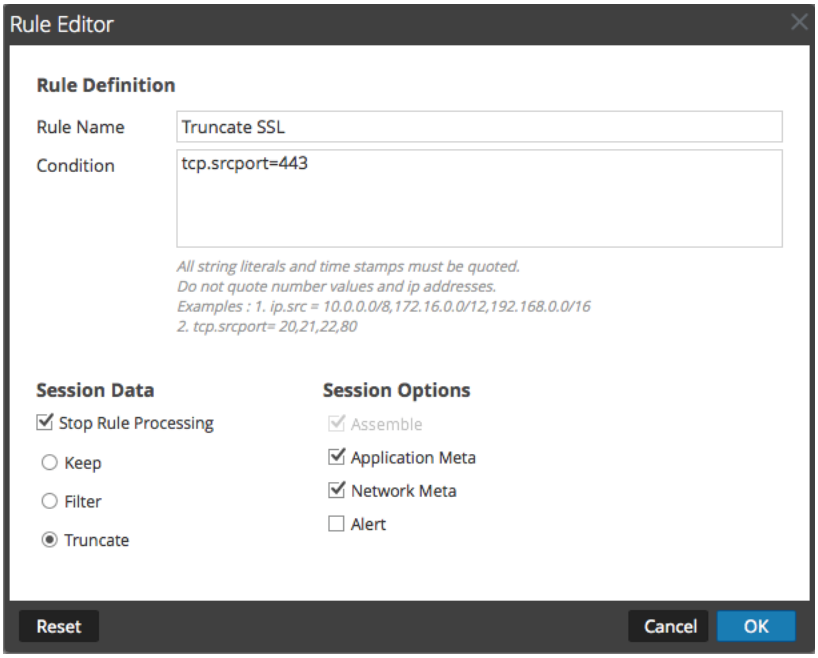
To add or edit a network rule:

1. Go to **ADMIN > Services,** select a Decoder service, and **> View > Config**.
   The Services Config view for the selected service is displayed.

2. Select the **Network Rules tab**.
   The Network Rules tab is displayed.



3. In the **Network Rules** tab, do one of the following:
   - If adding a new rule, click .
   - If editing a rule, select the rule from the rules list and click .
     The Rule Editor dialog is displayed.



4. In the **Rule Name** field, provide a name for the rule. For example, for a rule that truncates all SSL from the source port, type **SSL Truncate**.

5. In the **Condition** field, build the rule condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta values from the window actions. As you build the rule definition, NetWitness Platform displays syntax errors and warnings. For example, to truncate all SSL from the source port, `tcp.srcport=443`.
   All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details. Supported Meta Keys in Network Rule Conditions describes the meta keys that NetWitness Platform supports for use in network rule conditions.
6. If you want rule evaluation to end with this rule, select the **Stop Rule Processing** checkbox.
7. In the **Session Data** section, choose one of the following actions to apply when a matching packet is found:
   - **Keep**: The packet payload and associated metadata are saved when they match the rule.
   - **Filter**: The packet is not saved when it matches the rule.
   - **Truncate**: The packet payload is not saved when it matches the rule, but packet headers and associated metadata are retained.

8. In the **Session Options** section, select all options that apply of these four.
   - **Assemble**: The assembler assembles the packet chain when it matches the rule.
   - **Network Meta:** The packet generates network metadata when it matches the rule.
   - **Application Meta**: The packet generates application metadata when it matches the rule.
   - **Alert**: The packet generates a custom alert when metadata matches the rule.

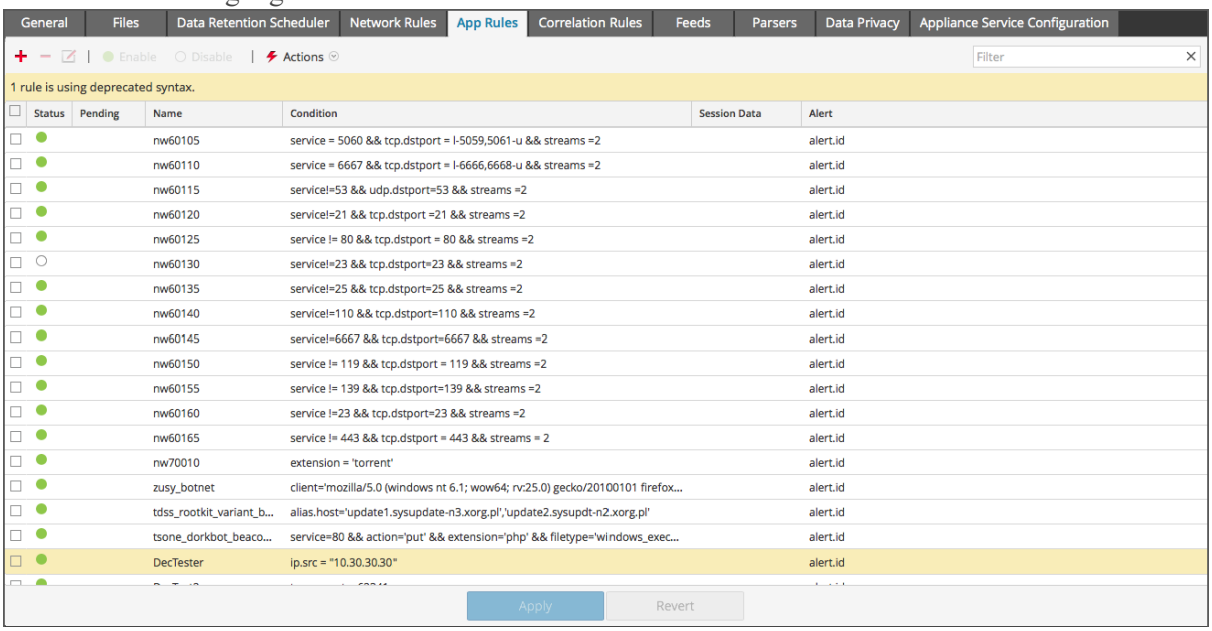
9. To save the rule and add it to the rules list, click **OK**.
   The rule is added at the end of the list or inserted where you specified in the context menu.
10. Check that the rule is in the correct execution sequence with other rules in the list. If necessary, move the rule.
11. To apply the updated rule set to the Decoder, click **Apply**.
    NetWitness Platform saves a snapshot of the currently applied rules, then applies the updated set to the Decoder and removes the pending indicator from the rules that were pending.

Fix Rules with Invalid Syntax

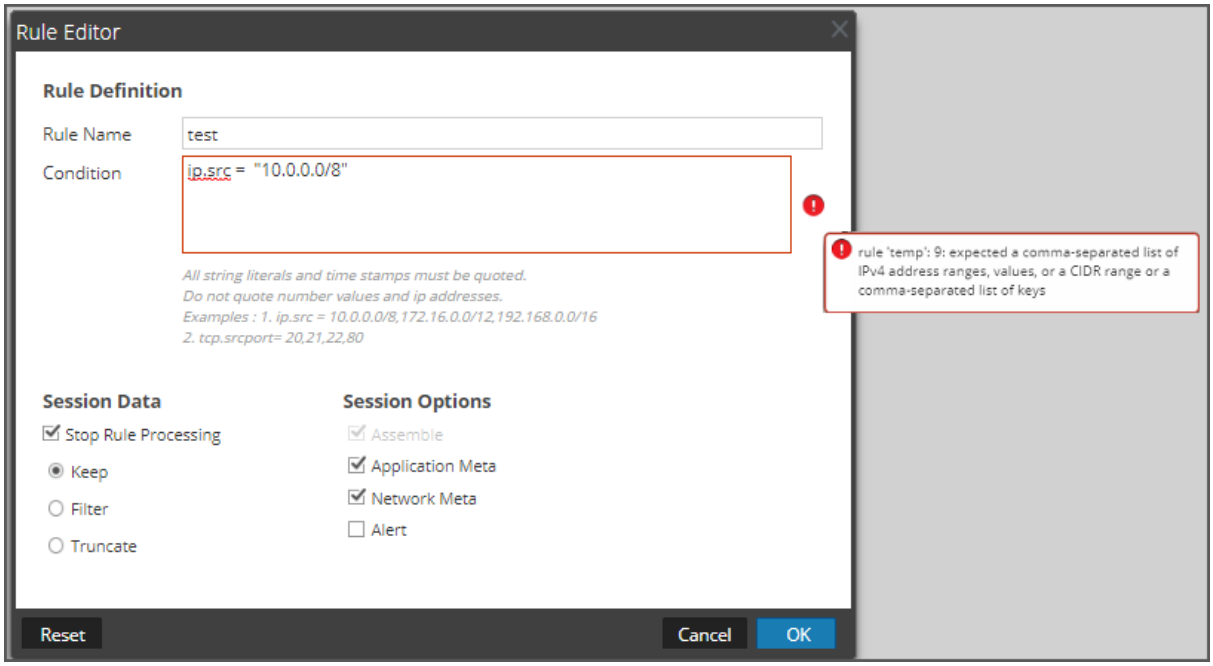
After an update to NetWitness Platform 11.x, the user interface highlights any rules with invalid syntax. The Rule Editor provides additional tooltips. After you fix the rules, the highlights disappear. Configure Decoder Rules provides guidelines that all queries and rule conditions in NetWitness Platform must follow.

To correct rules with invalid syntax:

1. Go to **ADMIN > Services**.
2. In the **Services** view, select a Decoder and **> View > Config**.
3. In the **Services Config** view, select one of the Rules tabs: Network Rules, App Rules, or Correlation Rules.
   The Rules tab for the selected rule type shows the number of rules using invalid syntax and the invalid rules are highlighted.



4. Select an invalid rule and click .
   The Rules Editor shows additional information for the invalid rule.



5. In the **Condition** field, correct the rule syntax.
   All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details.
   For example, if the invalid rule condition is `ip.src="10.30.30.30"`, correct the syntax by removing the quotes: `ip.src=10.30.30.30`
6. Do one of the following:
   - To correct the rule individually, click **Save**.
     The corrected rule is applied independently to the Decoder. The corrected rule appears on the Rules tab without highlights.
   - To correct the rule and apply the rule to the Decoder later with other rules, click **OK**.
     The corrected rule appears on the Rules tab without highlights. The rule is not applied to the Decoder.

Decoder Commands for Managing Rules

In the NetWitness Core database, the Rules tree holds the main functionality related to managing rules for all Core services that have rules: Concentrators, Decoders, Log Decoders, and Archivers. Although you can manage rules in the NetWitness Platform user interface, advanced users may prefer to manage rules using a command line to add, merge, replace, delete, and validate rules on a service. This section provides a brief overview of the commands and their usage. These are the available commands:

- `add` - Adds a single rule at the specified position.
- `clear` - Deletes all existing rules in the current node on the service. For example, using the command in `/decoder/config/rules/application` node deletes all existing application rules on the Decoder.
- `delete` - Deletes one or more rules at a specified position and count.
- `merge` - Merges a pushed rule set with an existing rule set. Existing rules that match the incoming rules (by name or rule) are replaced; otherwise, rules are inserted by the position indicated as described in merge Command.
- `replace` - Deletes all existing rules and replaces them with the incoming rule set.
- `validate` - Validates the syntax of a rule, but does not validate the meta keys.

add Command

The `add` command adds the rule to the existing rule set. Formatting is important because the API uses double quotes in the rule language and also uses double quotes as parameters to all RSA NetWitness® Platform APIs. Therefore, you must escape any double quotes in the rule itself by preceding it with a backslash (\) character. This is the syntax of the command:

```
add rule=<string> name=<string> alert=<string, optional> atPos=<<uint32, optional>
```

- `rule` is the rule to add. Be sure to place double quotes around any rules with white space and to escape any double quotes that are part of the rule with a backslash.
- `name` is the name of the rule.
- `alert` is the alert for the rule (if any).
- `atPos` is the position at which the rule should be added (1 based). Zero is the top of the list and any number larger than the current size of the list is appended to the list.

This is an example of command to add a rule using NwConsole

```
send /decoder/config/rules/application add rule="ip.src exists" order=1
alert=alert.id name=testrule
```

For example, take the following rule:

```
alias.host = "myPC" && country.src="china","russian federation"
```

To add this as a rule, you would need to send the parameters as follows:

```
rule="alias.host = \"myPC\" && country.src=\"china\",\"russian federation\""
name=myRule filter
```

Notice how all the double quotes had to be escaped inside the rule parameter. A simple trick to make this more readable is to use single quotes inside the rule. Single and double quotes are interchangeable in the rule and query language, but not in parameters for the API (only double quotes are supported there). Therefore, this is more readable:

```
rule="alias.host = 'myPC' && country.src='china','russian federation'"
name=myRule filter
```

merge Command

The `merge` command is used to merge an incoming list of rules with the existing rules on the service. This is how it works:

- It finds existing rules that match via the name OR via a matching rule, updates the existing rule name, and keeps the same position.
- It inserts new rules into the rule list based on the NUMBER position. If the number is zero, it goes to the top of the list.
- It processes the rules in the order received so if you have two rules numbered zero, the second rule is processed after the first and claims the top spot. All existing rules are pushed down two places. Any numbers higher than existing rule positions are appended after the last existing rule and numbered in sequence.
- Any non-numbered rule is appended after the last existing rule and numbered in sequence.

This is the syntax of the merge command:

```
merge --file-data=<string> --file-format<string>
```

- `file-data` is the full path and name of the rules file to merge.
- `file-format` is the format of the rules file. Valid values are `params-list`, `string`, `params`, `binary`, and `params-binary`.

Methods of Sending a List of Rules to a Service

There are two ways to send a list of rules. You can send them as a `.nwr` (NetWitness Rule) file or as a numbered set of parameters, each number indicates the position to insert the rule at as well as the encoded rule. If you want to see the current list of rules on a service, you need to run the `ls` command on the rule category (for instance, application rules on a Decoder are found in `/decoder/config/rules/application`).

This is an example of commands to list the existing rules using NwConsole:

```
login <hostname>:50004 <username> <password>
cd /decoder/config/rules/application
ls
```

This is another example to list existing rules in NwConsole:

```
send /decoder/config/rules/application ls
```

This is an example of the command to point to network rules in the RESTful port, which supports a basic `admin HTML` app.

```
http[s]://<decoder>:50104/decoder/config/rules/network
```

Send a NetWitness Rule File

Let's start with an example `nwr` file, each rule must be on a separate line:

```
rule="ip.src=192.168.0.1" name=first keep
rule="ip.src=192.168.1.1" name=second alert=risk.info
rule="ip.src=192.168.2.1" name=third filter
```

To push and merge rules using NwConsole, use the following commands:

```
login <hostname>:50004 <username> <password>
send /decoder/config/rules/application merge --file-data=/root/App_
Rules.nwr --file-format=params-list
```

To replace the existing rules with the rules in the file, instead of using the `merge` command, use the `replace` command.

```
send /decoder/config/rules/application replace --file-
data=<pathname> --file-format=params-list
```

To merge the rules in an `nwr` file using the RESTful port, you can use a `curl` command that pushes the rules:

```
curl -u "<username>:<password>" -H "Content-Type: application/octet-
stream" --data-binary @<pathname> -X POST
"http://<hostname>:50104/decoder/config/rules/application?msg=merge"
```

The examples are pushing application rules. To push network rules, send the rules to `/decoder/config/rules/network`. For correlation rules, send the rules to `/decoder/config/rules/correlation`.

Send Numbered Parameters

The other way to send a list of rules is to send them as numbered parameters. The difficulty with this method is remembering to escape the quotes within each numbered rule. Though it is only a problem if you are trying to do it by hand. For instance, to send the same rules above as parameters via NwConsole, use the following command:

```
send /decoder/config/rules/application merge
1="rule=\"ip.src=192.168.0.1\" name=first keep"
2="rule=\"ip.src=192.168.1.1\" name=second alert=risk.info"
3="rule=\"ip.src=192.168.2.1\" name=third filter"
```

This command is hard to read because you have to escape the inner quotes with a backslash (\). Otherwise, these two commands accomplish the same thing. Merging or adding three rules in positions 1, 2 and 3. If you think the above was hard to read, this is what the equivalent `curl` command looks like:

```
curl -u "<username>:<password>"
"http://<hostname>:50104/decoder/config/rules/application?msg=merge&1=rule%3D%
22ip.src%3D192.168.0.1%22%20name%3Dfirst%20keep&2=rule%3D%22ip.src%3D192.168.1
.1%22%20name%3Dsecond%20alert%3Drisk.info&3=rule%3D%22ip.src%3D192.168.2.1%22%
20name%3Dthird%20filter"
```

For more details on how to escape double quotes inside parameters, see add Command.

Ordering Rules When Pushing

Pushed rules are ordered in one of two ways. When passing as parameters, the number of each parameter determines the insertion order. If it is not actually a number, `merge` checks for an `order` parameter within the rule itself and uses that value if found.

Note: Using `order` is the only way to set the order with a `.nwr` file. If neither a number nor an `order` parameter is found, there are no guarantees of the insertion order.

Example

A Decoder has the following application rules installed; notice the numbering is ALWAYS consecutive and starts at 1:

```
0001 : rule="ip.src = 192.168.0.1 || ip.dst = 192.168.0.1 || alias.host = 'My-PC'" name=first keep
0002 : rule="ip.src=192.168.1.1" name=second alert=risk.info
0003 : rule="ip.src=192.168.2.1" name=third filter
```

And you want to merge the following four rules:

```
rule="ip.src=192.168.3.1" name=third keep
rule="ip.dst=192.168.4.1" name=NewRule filter order=0
rule="alias.host = 'pc1','pc2'" name=filterTheseNames filter order=append
rule="service=80,443" name=web filter order=3
```

Use any method to push your rules and this is what you end up with:

```
0001 : rule="ip.dst=192.168.4.1" name=NewRule filter order=1
0002 : rule="ip.src = 192.168.0.1 || ip.dst = 192.168.0.1 || alias.host = 'My-PC'" name=first keep order=2
0003 : rule="service=80,443" name=web filter order=3
0004 : rule="ip.src=192.168.1.1" name=second alert=risk.info order=4
0005 : rule="ip.src=192.168.3.1" name=third keep order=5
0006 : rule="alias.host = 'pc1','pc2'" name=filterTheseNames filter order=6
```

Are there any surprises here? This is how each rule was processed.

```
1. rule="ip.src=192.168.3.1" name=third keep
```

This rule had the same name as an existing rule on the Decoder (third). So the rule updated the existing rule, `changing _filter_ to _keep_`.

```
2. rule="ip.dst=192.168.4.1" name=NewRule filter order=0
```

This rule is new and had `order=0` in it, which means insert at the very top.

```
3. rule="alias.host = 'pc1','pc2'" name=filterTheseNames filter order=append
```

This rule had a non-number `append` for `order`, therefore, it went to the end of the list. You can accomplish the same thing by giving a very large number, like `999999`.

```
4. rule="service=80,443" name=web filter order=3
```

This rule is last but has `order=3`, therefore, if it does not match an existing rule by name or the text of the rule itself, it should be placed in position 3. And there it is, the third rule in the list. Any rules that follow were pushed further down.

replace Command

The `replace` command removes all existing rules and replaces them with the incoming rule list. Refer to merge Command for details on how to format the incoming rule list and how ordering works.

This is an example of the `replace` command using a Netwitness Rule File :

```
send /decoder/config/rules/application replace --file-data=/root/Decoder-AppRules.nwr --file-format=string
```

This is an example of the `replace` command using Numbered Parameters :

```
send /decoder/config/rules/application replace 1="rule=\"ip.src exists\" name=\"test rule\" order=1 alert=alert.id"
```

clear Command

The `clear` command removes all existing rules on the service. This is an example of the command:

```
send /decoder/config/rules/application clear
```

delete Command

The `delete` command deletes one or more rules on the service.

```
delete atPos <uint32> count <uint32, optional>
```

- `atPos` deletes the rule at the given position. Rules are numbered starting with 1 and go in sequential order.
- `count` deletes one or more rules starting `atPos`. This is an optional parameter defining the number of rules to delete starting `atPos`. The default value is 1.

This example of the command deletes four rules beginning at position 0003:

```
send /decoder/config/rules/application delete atPos=0003 count=4
```

validate Command

The `validate` command takes the provided rule and verifies that it parses correctly. Keep in mind that this command cannot verify whether language keys and entities are valid.

```
validate rule <string>
```

`rule` - is the name of the rule to validate. Make sure to place double quotes around any rules with white space.

Configure Feeds and Parsers

Feeds and parsers are responsible for analyzing the packets and logs when captured or imported in a Decoder or Log Decoder. Most commonly, they are used for static metadata extraction and service identification. The flexible definition allows custom extension of the core defined services to provide extra service type identification and metadata extraction. This is important due to the volume of custom applications that are used on networks.

Note: Unless otherwise stated, any reference to Decoders applies to Log Decoders as well.

Configure Parsers

NetWitness Platform has a set of core parsers that are defined by the system, and also has the ability to add additional parsers. Each parser is configurable in the Services Config View - General Tab. The Parser Configuration panel provides a way to enable or disable parsers to use on the Decoder in addition to limiting the metadata that the parser creates.

In addition, there are several types of custom configurable parsers:

- GeoIP2 – This parser associates IP addresses with geographical locations. For new installations and upgrades, the GeoIP2 parser is enabled by default. For more information on these parsers, see GeoIP2 Parsers.
- Search – This parser is user-configured to generate metadata by scanning for pre-defined keywords and regular expressions.
- FLEXPARSE (deprecated) – This is a generic parser definition language for extending the existing application protocol support of the Decoder. By default this parser is disabled (see Enable or Disable Lua and Flex Parsing Systems).
- Lua – This parser is defined using the Lua scripting language for extending the existing application protocol support of the Decoder.
- enVision – This application parser supports the Log Decoder and is configured to generate metadata by scanning log files.
- Snort® – This parser supports the payload detection capabilities of Snort IDS rules. Snort rules and configuration are added to the `parsers/snort` directory for Investigation and Decoder (see Snort Parsers).

In the Services Config view > Parsers tab, you can view deployed parsers on a Decoder, upload parsers, and delete deployed parsers. The user interface includes an Indicator if the parser originated from Live Services, installed through NetWitness Platform, or uploaded manually. Parsers can be added and removed while a Decoder is running without affecting capture.

In addition, you can download parsers using NetWitness Platform Live Services.

Configure Feeds

NetWitness Platform uses feeds to create metadata based on externally defined metadata values. A feed is a list of data that is compared to sessions as they are captured or processed. For each match, additional metadata is created. This data could identify and classify malicious IPs or incorporate additional information such as department and location based on internal network assignments. Some examples of feeds include threat feeds to identify BOTNets, DHCP mappings, or even Active Directory (AD) information such as physical location or logical department.

You can use the Live module in NetWitness Platform to obtain feeds from outside sources. "Live Content in NetWitness Platform" in the *Live Services Management Guide* provides an overview of the Live content management tool.

Within the NetWitness Platform user interface, you can view the list of currently deployed feeds, along with an indicator if a feed that originated from Live was installed through NetWitness Platform or manually. Feeds can be added, removed, and updated while a Decoder is running without affecting capture.

Custom Feed Definition File Structure

The NetWitness Platform Custom Feed wizard allows creation and deployment of custom Decoder feeds based on deterministic logic that offers the meta keys specific to the selected Decoders and Log Decoders. Although the wizard guides users through the process to create both on-demand and recurring feeds, it is helpful to understand the form and content of a feed file when you create a feed.

Feed filenames in RSA NetWitness Platform are in the form `<filename>.feed`. To create a feed, NetWitness Platform requires a feed data file in `.csv` or `.xml` format and a feed definition file in `.xml` format, which describes the structure of a feed data file. The Custom Feed wizard can create the feed definition file based on a feed data file, or based on a feed data file and the corresponding feed definition file.

The files that you use to create an on-demand feed must be stored on your local file system. The files used to create a recurring feed must be stored at an accessible URL, whence NetWitness Platform can fetch the most current version of the file for each recurrence. After a NetWitness Platform feed is created, you can download the feed to your local file system, edit the feed files, and then edit the NetWitness Platform feed to use the updated feed files.

Sample Feed Definition File

This is an example of a feed definition file named `dynamic_dns.xml`, which NetWitness Platform creates based on your entries in the Custom Feed wizard. It defines the structure of the feed data file named `dynamic_dns.csv`.

Note: The feed file path should be `.csv` regardless of the Feed Type (Default or STIX).

```
<?xml version="1.0" encoding="utf-8"?>
 <FDF xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">

   <FlatFileFeed name="Dynamic DNS Domain Feed"
   path="dynamic_dns.csv"
   separator=","
   comment="#"
   version="1">

   <MetaCallback
   name="alias.host"
   valuetype="Text"
   apptype="0"
   truncdomain="true"/>

   <LanguageKeys>
            <LanguageKey name="threat.source" valuetype="Text" />
            <LanguageKey name="threat.category" valuetype="Text" />
            <LanguageKey name="threat.desc" valuetype="Text" />
   </LanguageKeys>
```

```
    <Fields>
    <Field index="1" type="index" key="alias.host" />
    <Field index="4" type="value" key="threat.desc" />
    <Field index="2" type="value" key="threat.source" />
    <Field index="3" type="value" key="threat.category" />
    </Fields>
    </FlatFileFeed>

</FDF>
```

Define Multiple Values in a Single Field

The information in this section applies to RSA NetWitness® Platform version 11.3.1 and later.

Custom feeds support multiple values in a single field. This allows feeds to generate multiple values of the same meta.

For example:

```
<Fields>

    <Field index="1" type="index" key="lc.cid" />

    <Field index="2" type="value" key="username" separator=";"
    openchar="(" closechar=")"/>

</Fields>
```

The second field is defined to accept multiple values in the corresponding CSV file. The following is an example of the defined values:

```
clc1,(bob;tom;sam) clc12,susan clc123,doris
```

This definition means that when we see the `lc.id` with a value of `cic1`, three `username` meta values are generated with the values of `bob`, `tom` and `sam`.

The separator in the field definition for a multi-value field **must** be different than the separator for the feed file itself. Escaping the separator character in field values is **not** supported.

Feed Definition Equivalents for Custom Feed Wizard Parameters

The NetWitness Platform Custom Feed wizard provides options to define the structure of the data feed file. These correspond directly to attributes in the feed definition (`.xml`) file.

NetWitness Platform Parameter	Feed Definition File Equivalent
(Define Feed Tab) Feed Type	Select: **Default** - to define a feed based on a `.csv` formatted feed data file. **STIX** - to define a feed based on STIX formatted `.xml` file.

NetWitness Platform Parameter	Feed Definition File Equivalent
(Define Feed Tab) Feed Task Type	Select: **Adhoc** - to create an on-demand feed. **Recurring** - to update the `.csv` or `.xml` file persistently and store it in a location accessible by NetWitness Platform, so NetWitness Platform downloads a file at regular intervals and pushes it to the downstream devices.
(Define Feed tab) **Name**	The custom feed name in the feed data file. It corresponds to the `flatfeedfile name` attribute in the feed definition file. For example, Dynamic DNS Test Feed. **Note:** You can use special characters to define the name of the custom feed.
(Define Feed tab) **File/ Browse**	This is the name of the feed data file. It corresponds to the `flatfeedfile path` attribute in the feed definition file. For example, `dynamic_dns.csv`.
(Advanced Options tab) **XML Feed File**	The name of the feed definition file. For example, `dynamic_dns.xml`.
(Advanced Options tab) **Separator**	The separator character used to separate attributes in the feed data file. It corresponds to the `flatfeedfile separator` in the feed definition file. For example, a comma.
(Advanced Options tab) **Comment**	The character used to identify a comment in the feed data file. It corresponds to the `flatfeedfile comment` attribute in the feed definition file. For example, `#`.
(Define Columns tab, Define Index) **Type**	The type of lookup value in the index position of the feed data file. **IP** means that each row in the feed data file contains an IP address in the lookup value position. The IP value is in dotted-decimal format (for example, 10.5.187.42). **IP Range** means that each row in the feed data file contains a range of IP addresses in the lookup value position. The IP range is in CIDR format (for example, 192.168.2.0/24). **Non IP** means that the each row in the feed data file contains a metadata value other than IP address in the lookup value position. The Service Type and Truncate Domain, and Callback Keys fields become active for a Non IP index.
(Define Columns tab, Define Index) **CIDR**	Specifies that the IP value in the lookup position is in CIDR format. The **CIDR** attribute sets the IP address format in the field to Classless Inter-Domain Routing (CIDR) notation.
(Define Columns tab, Define Index) **Service Type**	For a Non IP index, the integer service type to filter meta lookups. It corresponds to the `MetaCallback apptype` attribute in the feed definition file. A value of `0` indicates no filtering by service type.

NetWitness Platform Parameter	Feed Definition File Equivalent
(Define Columns tab, Define Index) **Truncate Domain**	For a Non IP index, for meta values that contain domain names (for example, hostnames), the system can strip off the host specific element in the data. Truncate Domain corresponds to the `MetaCallback truncdomain` attribute. If the value is `www.example.com`, it is truncated to `example.com`. A value of **False** selects no truncation, and **True** selects truncation.
(Define Columns tab, Define Index) **Callback Keys**	For a Non IP index, the available meta keys to match on instead of ip.src/ip.dst (the defaults for IP index type) are selectable from the drop-down list. The Callback Key corresponds to the `MetaCallback name` attribute, and the index column of the csv file must contain data that can match the chosen meta key. For example, if the username meta key is chosen, the index column of the `.csv` file needs to be populated with users to be matched.
(Define Columns tab, Define Index) **Index Column**	Identifies the column in the feed data file that provides the lookup value for the row. Each position in each row of the feed data file is identified by a **Field index** attribute in the feed definition file. A field with an index of **1** is the first entry in a row, the second field has an index of **2**, the third field has an index of **3**, and so on.
(DEFINE VALUES) **Key**	The name of the `LanguageKey`, as defined in the feed definition file, for which meta is created from this row of the feed data file. It corresponds to the `Field key` attribute in the feed definition file. A key applies only to a field whose type is set to `value`. In the feed definition file, there is a list of `LanguageKeys` from `index.xml`, or a summary name if Source Name and Destination Name are used. For example, `reputation` is a summary name for `reputation.src` and `reputation.dst`. This value is referenced by the Field key attribute.

Sample Files for a MetaCallback Feed Using CIDR Index Range for IPv4 and IPv6

These sample files demonstrate how to use CIDR index ranges for IPv4 and IPv6 in custom MetaCallback feeds. As with other custom feeds, you must create feed data file in .csv format, and a feed definition file in .xml format.

Note: Using MetaCallback feeds with CIDR index ranges is supported only through the Advanced Configuration wizard or the REST interface.

The following example shows the contents of both a `.csv` file and an `.xml` file for a MetaCallback feed using CIDR index ranges for IPv4 or IPv6.

`.csv file:`

```
192.168.0.0/24, Sydney
192.168.1.0/24, Melbourne
```

`.xml file:`

```
<?xml version="1.0" encoding="UTF-8"?>
<FDF xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">
<FlatFileFeed name="ip_test" path="ip_test.csv" separator="," comment="#">
```

```
      <MetaCallback name="DstIP" valuetype="IPv4" apptype="0"
truncdomain="false">
            <Meta name="ip.dst"/>
      </MetaCallback>
      <LanguageKeys>
            <LanguageKey name="alert" valuetype="Text" />
      </LanguageKeys>
      <Fields>
            <Field index="1" type="index" range="cidr"/>
            <Field index="2" type="value" key="alert" />
      </Fields>
</FlatFileFeed>
</FDF>
```

Note: To configure a CIDR index range for feeds with single or multiple MetaCallbacks of value type IPv4 or IPv6, the field of type index MUST contain a range attribute with `range="cidr"`. Also, configuring "cidr" index ranges for feeds with MetaCallbacks of multiple different value types is not supported.

Create a Custom Feed

You can create a custom feed using the Custom Feed wizard. To complete this procedure, you need a feed data file in `.csv` or `.xml` format. If you also have an associated feed definition file in `.xml` format, which describes the structure of the feed data file, you can use the feed definition file to create a feed. The Custom Feed wizard can create the feed based on a feed data file, or based on a feed data file and corresponding feed definition file.

Note: From 10.6.1 or later, NetWitness Platform supports Structured Threat Information Expression (STIX). For more information about STIX and creating a STIX custom feed, see "Create a STIX Custom Feed" in the *Decoder and Log Decoder Configuration Guide*.

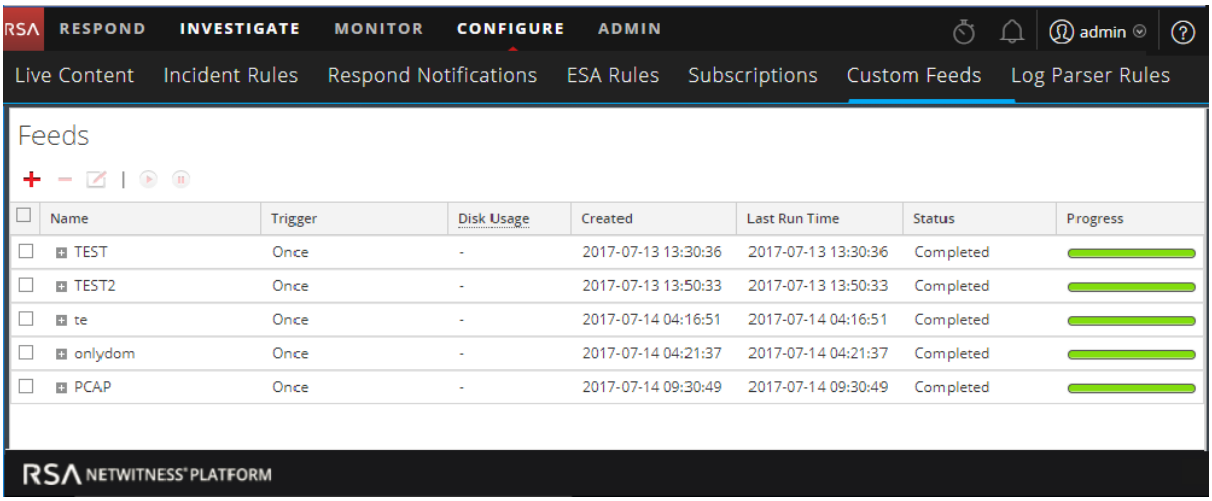
The feed data file and optionally the feed definition file (`.xml`) must be available on the local file system for an on-demand custom feed. For a recurring custom feed, the files must be available at a URL that is accessible to the NetWitness Platform server.

Note: When you create a source and destination-based feed on a Log Decoder, it only populates the source meta key. You cannot use a range-based or CIDR feed. You must list every single IP address. To resolve this issue, create two different feeds using IP addresses and you can use CIDR in these feeds.

To create a custom feed:

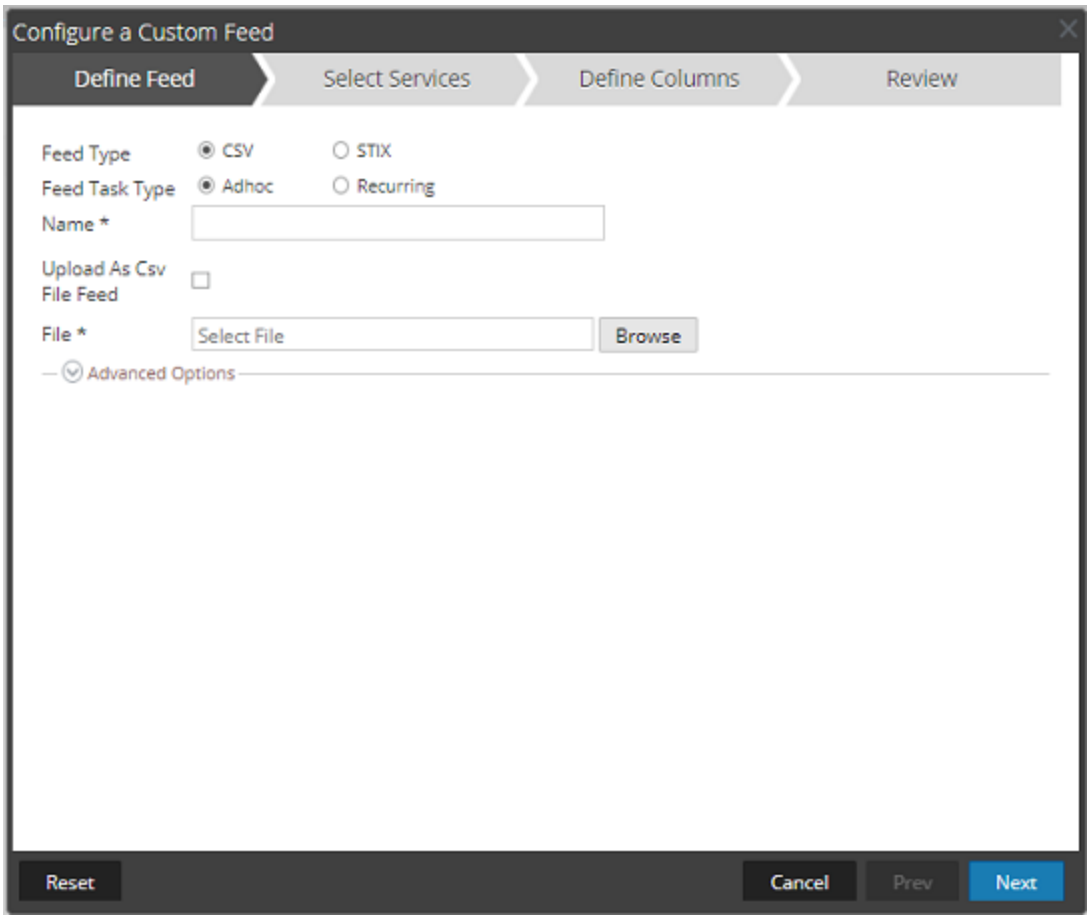
1. Go to **CONFIGURE > Custom Feeds.**
2. In the **Feeds** panel, click +.

   The Custom Feeds view is displayed.



3. Click **Custom Feed** and **Next**.

   The Configure a Custom Feed wizard is displayed, with the Define Feed form open.



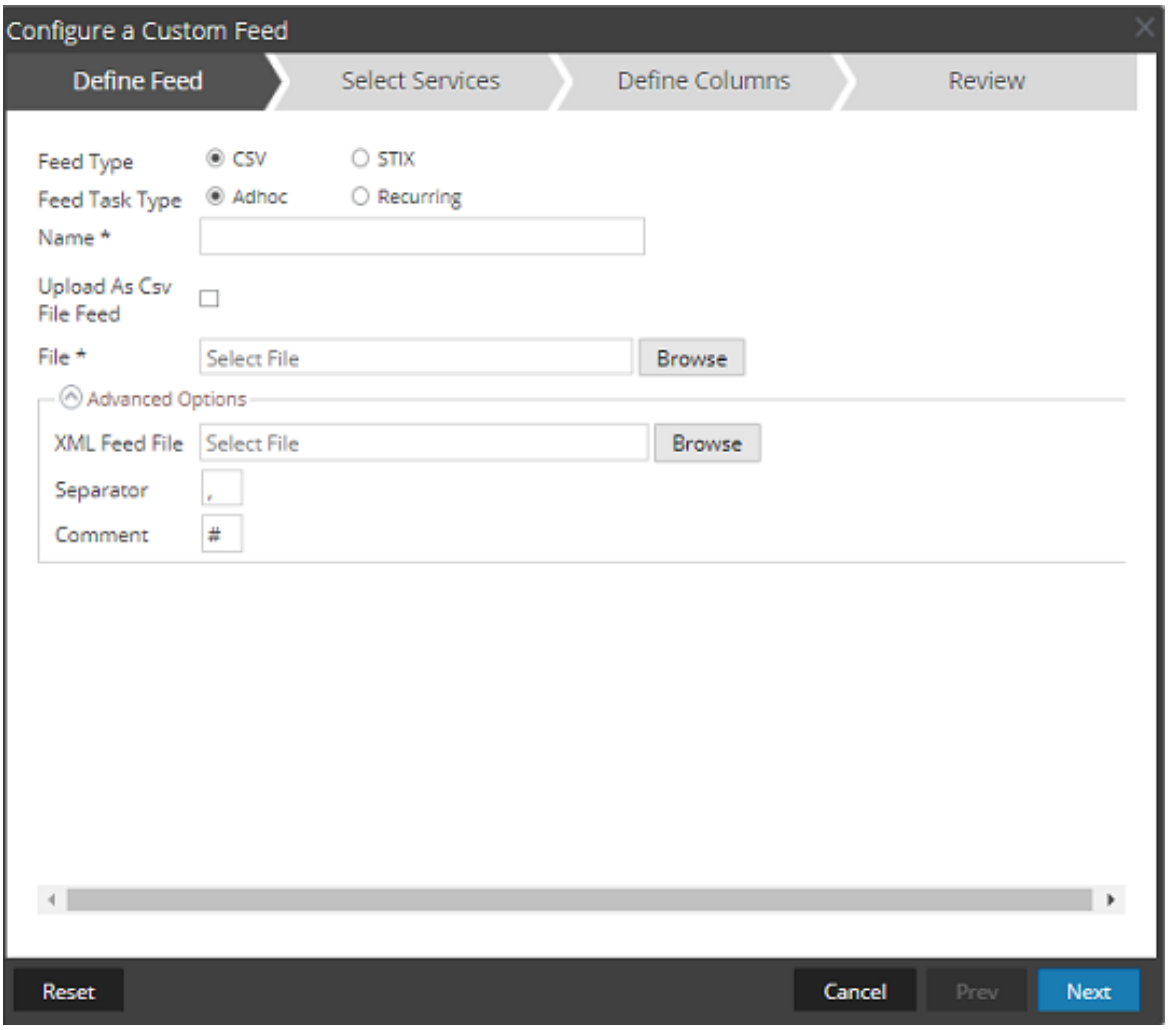
4. Select the Feed Type: **CSV** or **STIX**.
5. To define a feed based on a `.csv` formatted feed data file, select **CSV** (which is the default) in the **Feed Type** field.
6. To define an on-demand feed task that executes once, select **Adhoc** in the **Feed Task Type** field and do one of the following:
   a. (Conditional) To define a feed based on a CsvFileFeed file, select the **Upload as Csv File Feed** checkbox, type the feed **Name**, select a .csv content file from the local file system, and click **Next**. If you do not select the checkbox, the .csv file will be a FlatFileFeed file.

      Note: When you select the Upload as Csv File Feed checkbox, the XML feed options under Advanced are unavailable.

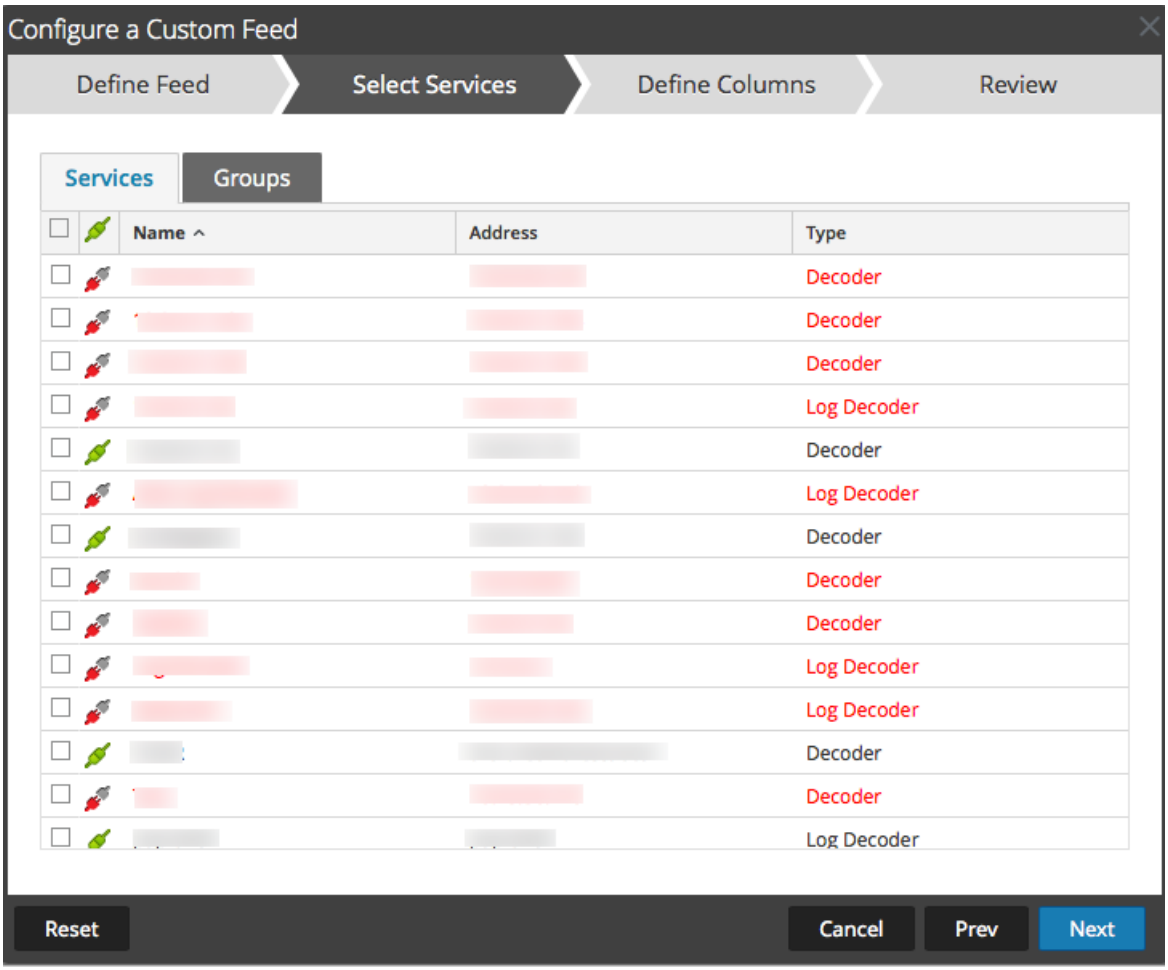
   b. (Conditional) To define a feed based on an XML feed file, select **Advanced Options**.

      Note: Ensure that the Upload as Csv File Feed checkbox is deselected.

      The Advanced Options are displayed:



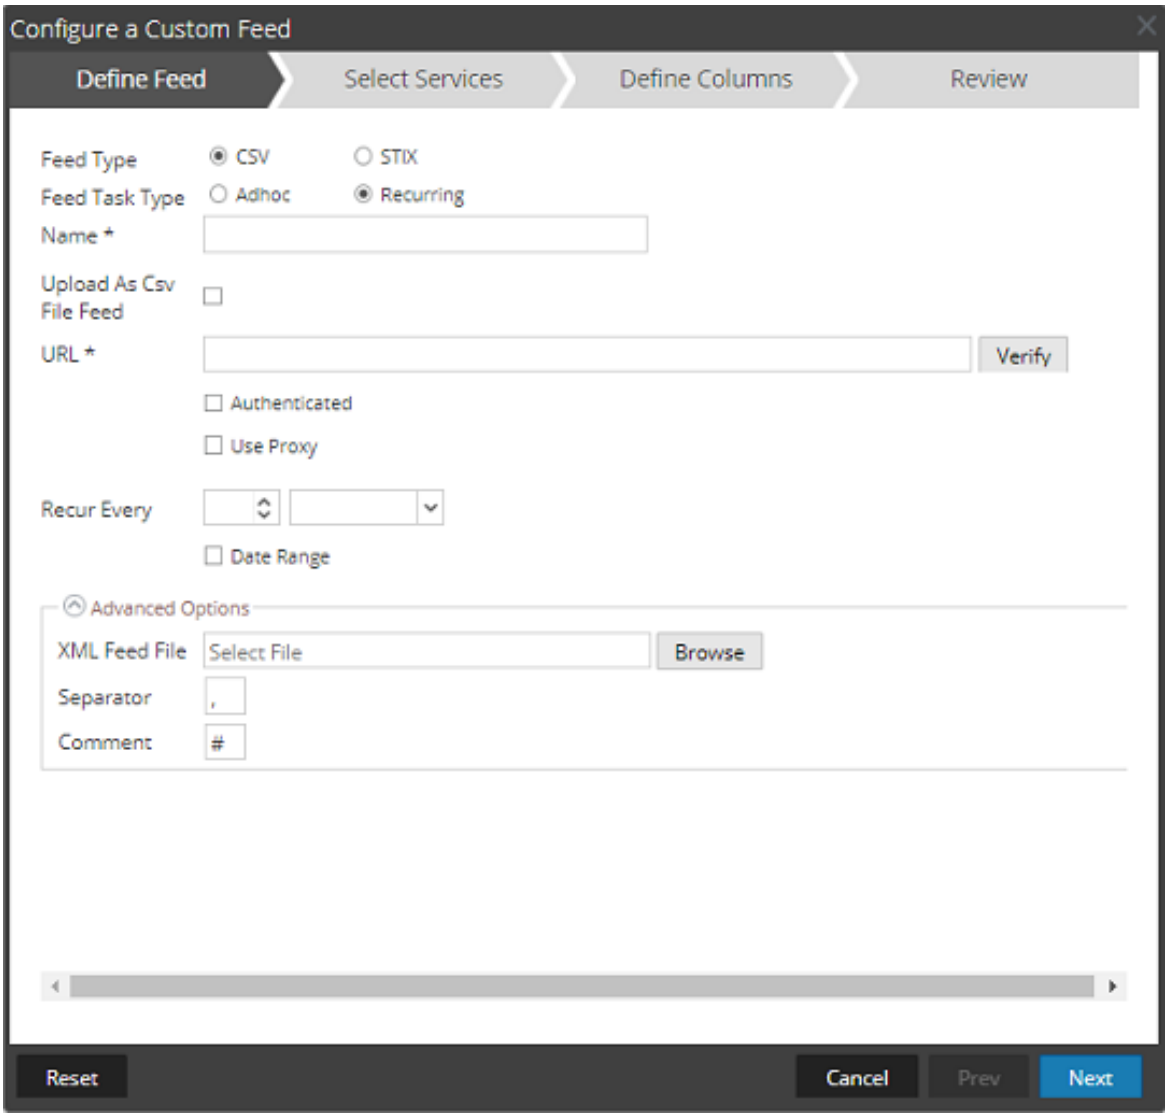
c. Select an XML feed file from the local file system, choose the separator (default is comma), specify the comment characters used in the feed data file (default is #), and click **Next**.
The Select Services form is displayed. This is an example of the form for a feed based on a feed data file with no feed definition file. If you are defining a feed based on a feed definition file, the Define Columns tab is not needed.



7. To define a recurring feed task that executes repeatedly at specified intervals, during a specified date range:

   a. Select **Recurring** in the **Feed Task Type** field.

      The Define Feed form includes the fields for a recurring feed.



b. In the **URL** field, enter the URL where the feed data file is located, for example, `http://<hostname>/<feeddatafile>.csv`, and click **Verify**. NetWitness Platform verifies the location where the file is stored in order to enable checking for the latest file automatically before each recurrence.

c. (Optional) If the URL has restricted access and requires authentication using your username and password, select **Authenticated**.
NetWitness Platform provides your user name and password for authentication to the URL.

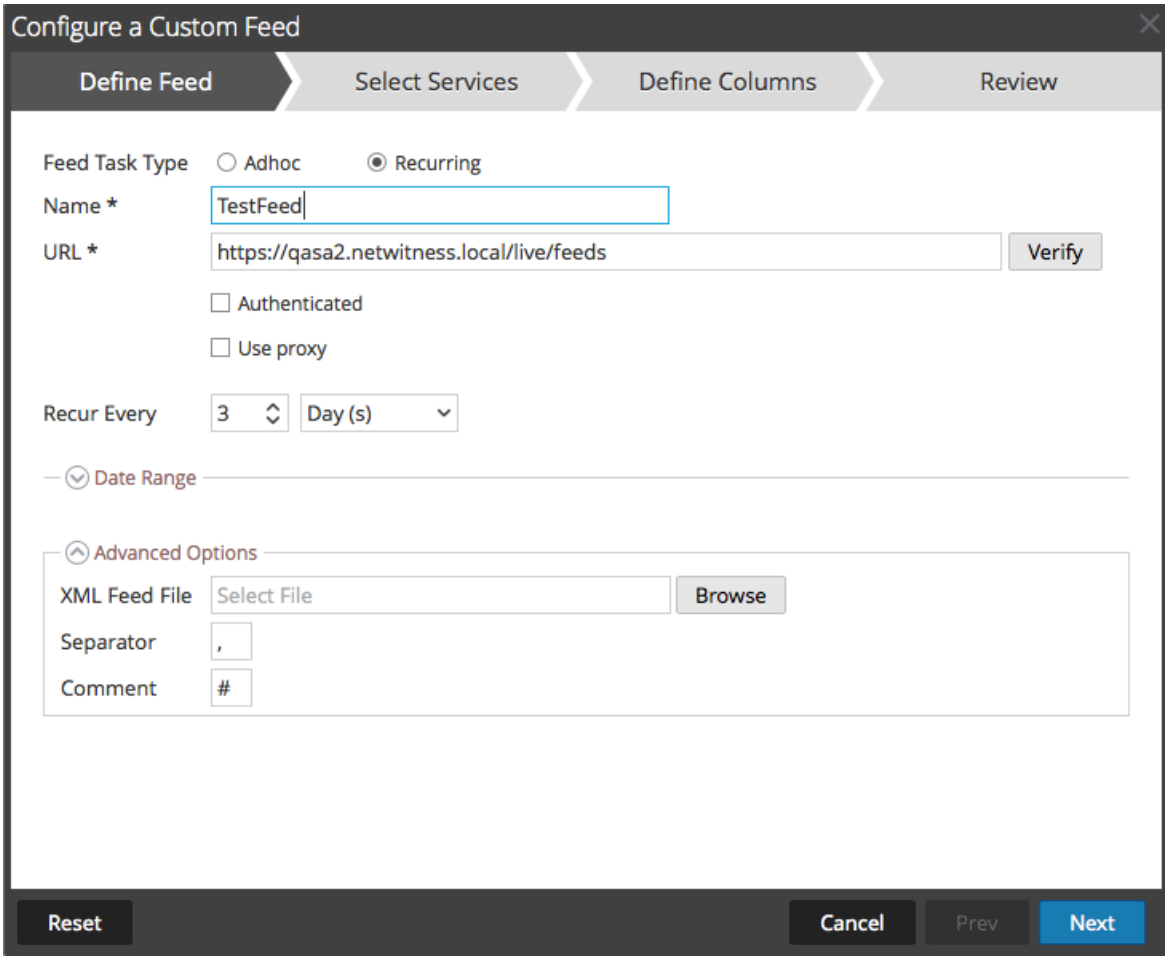
d. If you want the NetWitness server to access the Feed URL through a proxy, select **Use Proxy**. For more information on configuring a proxy, see "Configure Proxy for NetWitness Platform" in the *System Configuration Guide*. By default, the **Use Proxy** checkbox is not set.

e. To define the interval for recurrence, do one of the following:

- Specify the number of minutes, hours, or days between recurrences of the feed.

- Specify recurrence every week, and select the days of the week.

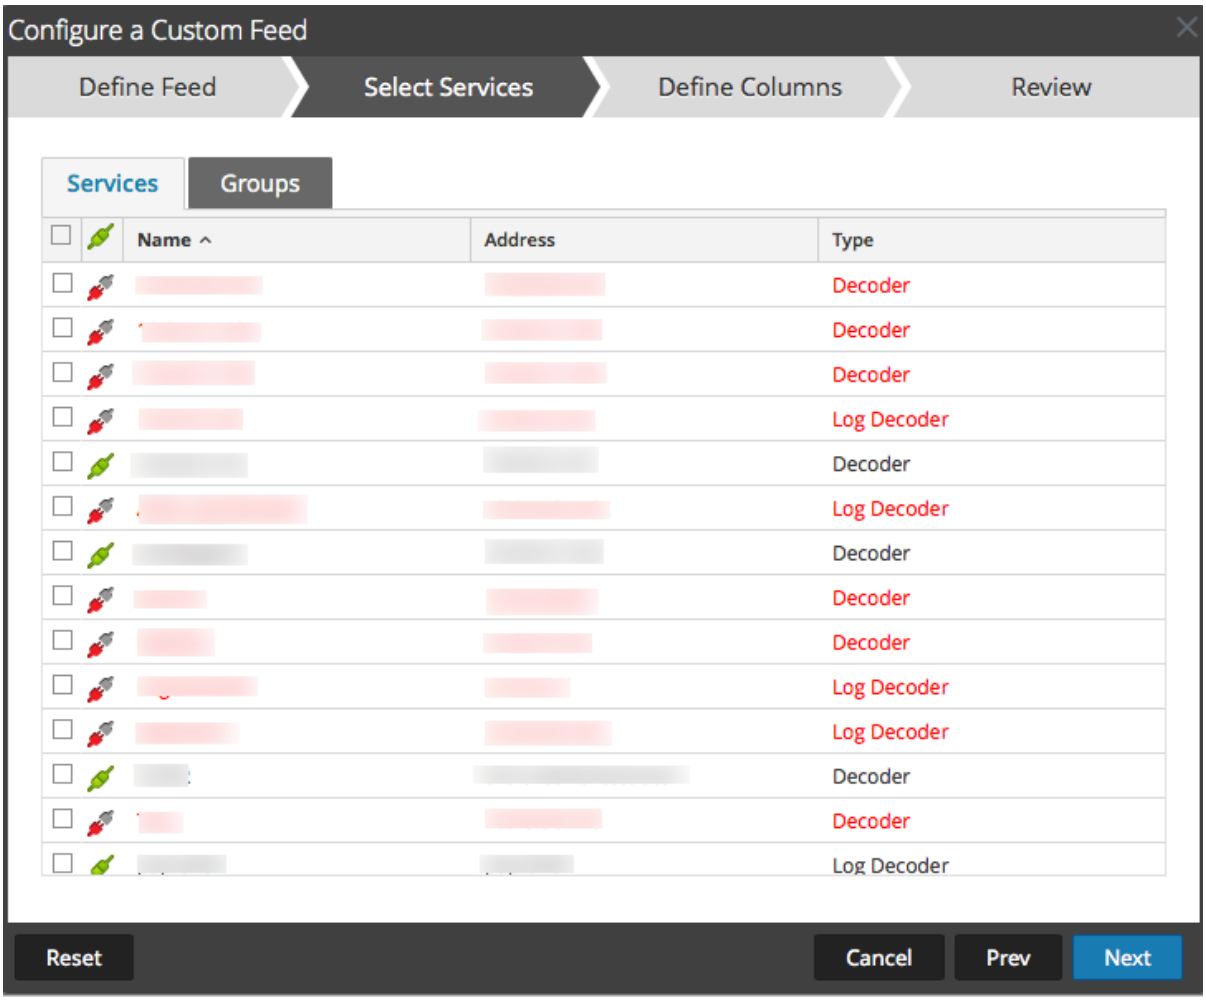
f. To define the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time.



8. (Conditional) If you want to define a feed based on an XML feed file:

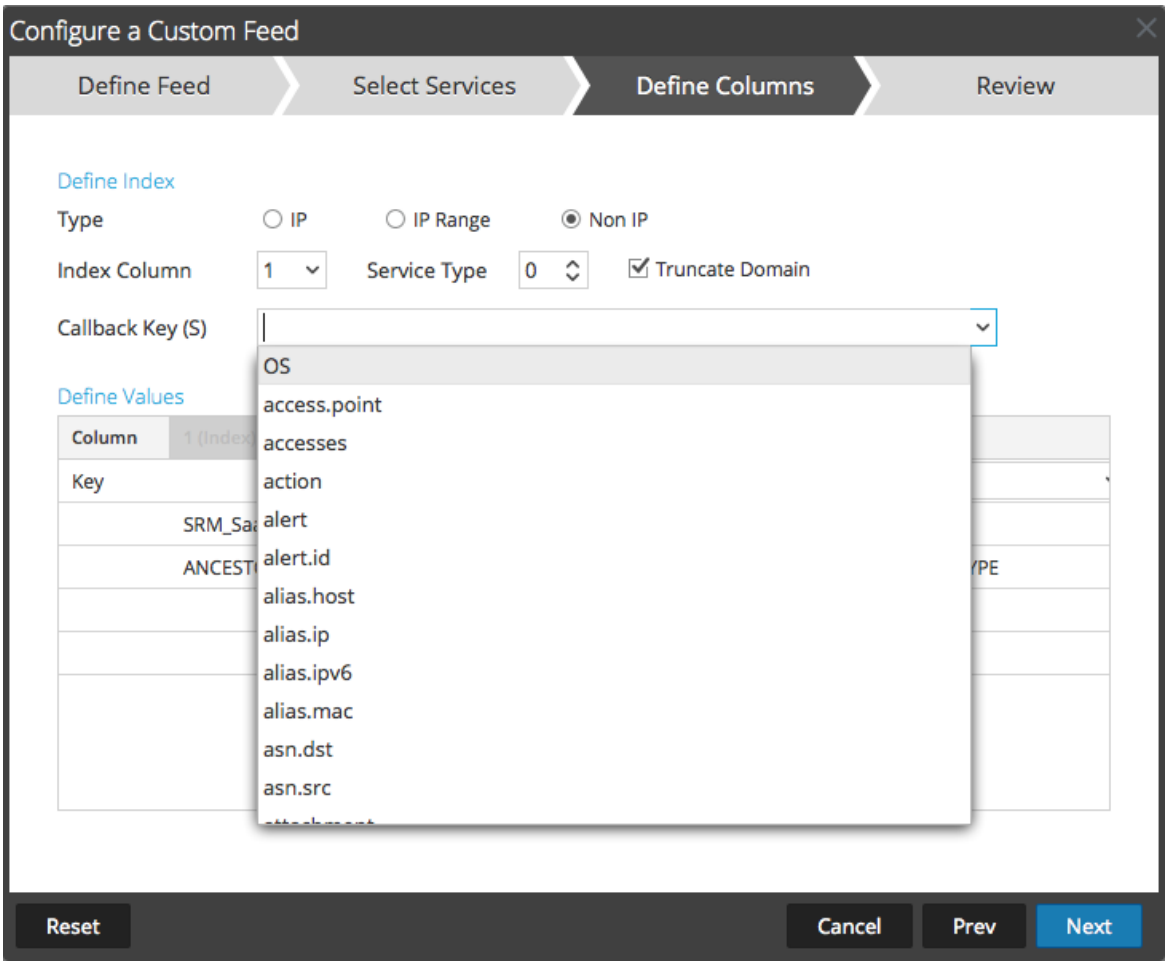
   a. Type the feed **Name**, select **Advanced Options**. The Advanced Options fields are displayed.

   b. Select an XML feed file from the local file system, choose the **Separator** (default is comma), specify the **Comment** characters used in the feed data file (default is #) and click **Next**. The Select Services form is displayed.

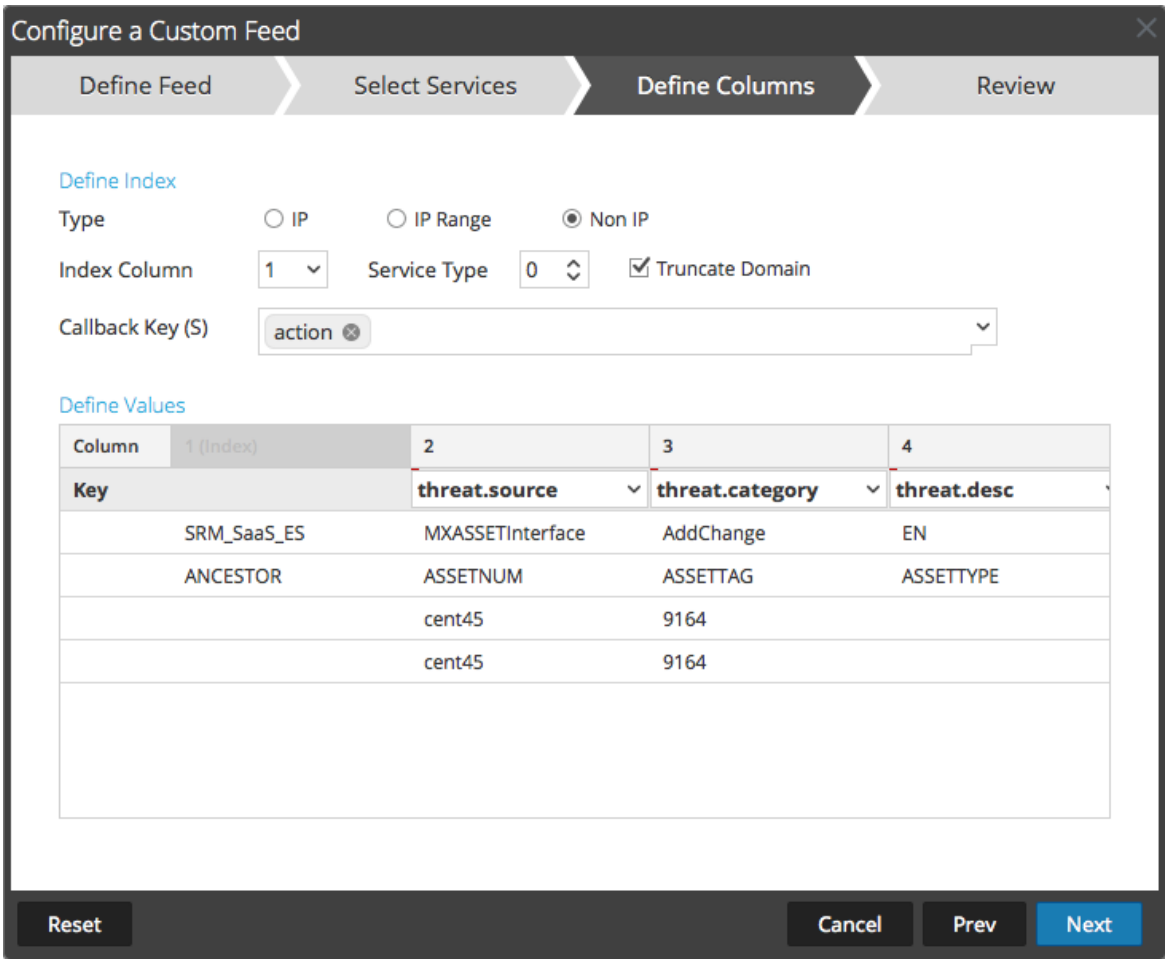


9. To identify services on which to deploy the feed, do one of the following:
   a. Select one or more Decoders and Log Decoders, and click **Next**
   b. Click the **Groups** tab and select a group. Click **Next**.

      The Define Columns form is displayed.
10. To map columns in the Define Columns form:
    a. Define the Index type: **IP**, **IP Range**, or **Non IP**, and select the index column.
    b. (Conditional) If the index type is **IP** or **IP Range** and the IP address is in CIDR notation, select **CIDR**.
    c. Conditional) If the index type is **Non IP**, additional settings are displayed. Select the service type and **Callback Keys,** and optionally select the **Truncate Domain** option.

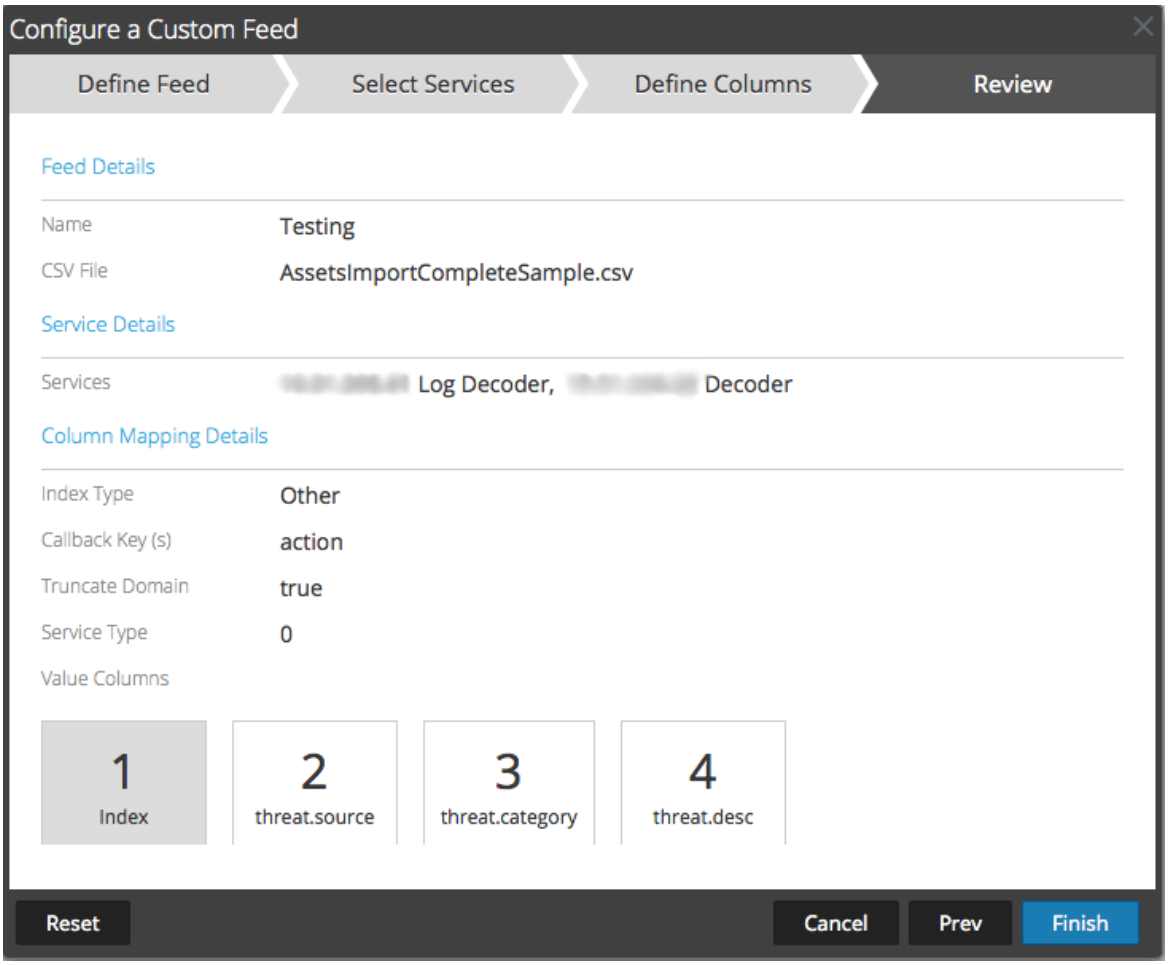


d. Select the language key to apply to the data in each column from the drop-down list. The meta keys displayed in the drop-down list is based on the meta keys available for the service define values. You can also add other meta keys based on advanced expertise.

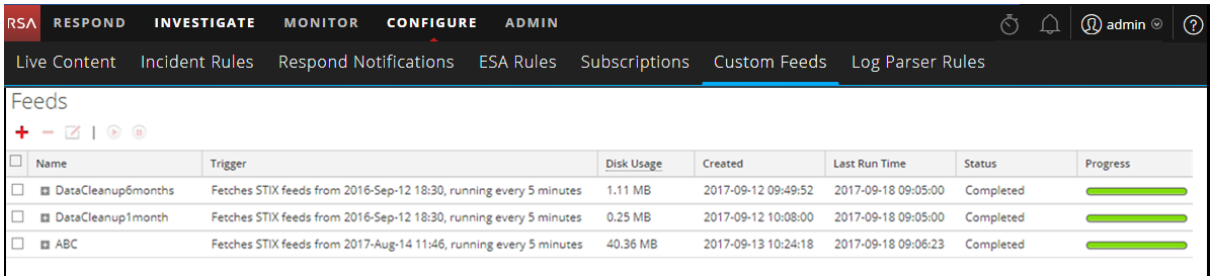


e. Click **Next**.

The Review form is displayed.



11. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form)
12. Review the feed information, and if correct, click **Finish**.
13. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.



Create a STIX Custom Feed

Structured Threat Information Expression (STIX™) is a structured language for describing cyber threat information so it can be shared, stored, and analyzed in a consistent manner. For more information about STIX, see https://stixproject.github.io/.

You can create a custom feed using a STIX-formatted feed data file (`.xml`) in RSA NetWitness Platform. NetWitness Platform supports Structured Threat Information Expression (STIX) 1.0, 1.1 and 1.2 versions only.

Caution: If a STIX recurring feed is configured and you update Security Analytics from 10.6.x to NetWitness Platform 11.x, you must re-configure the STIX recurring feed.

In NetWitness Platform, STIX feeds of type Indicator or Observable that contain properties such as the IP addresses, File hashes, Domain names, URIs and Email addresses are supported. The property values in the Equals operator are supported. Attributes such as Type and Title are also read from the STIX. A STIX file with a single STIX_Package is supported.

TAXII (Trusted Automated eXchange of Indicator Information) is the main transport mechanism for cyber threat information represented in STIX. Using the TAXII services, organizations can share cyber threat information in a secure and automated manner.

The STIX and TAXII communities work closely together to ensure that they continue to provide a full stack for sharing threat intelligence.

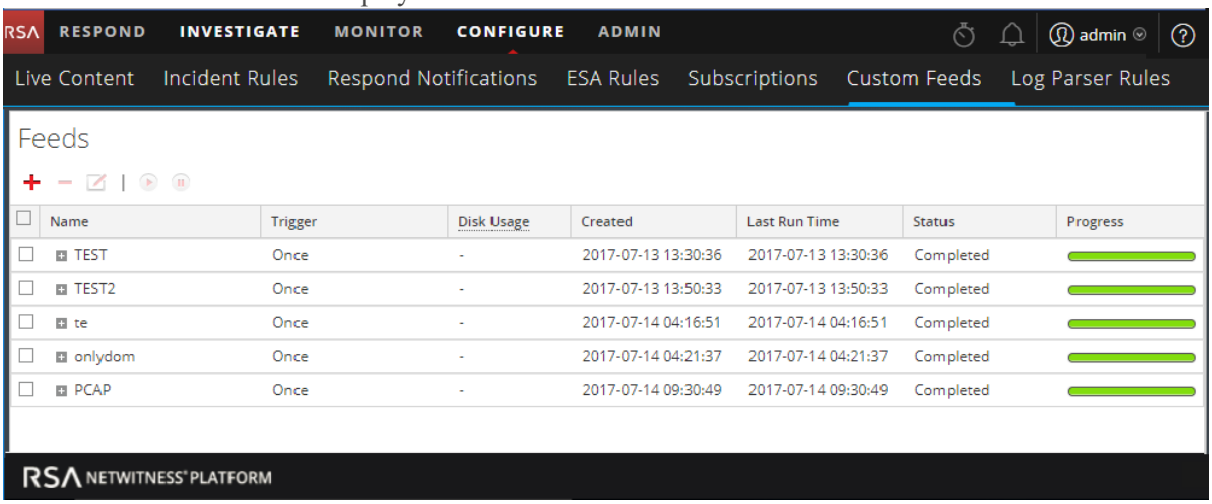
Apart from the TAXII server, STIX data can also reside on a REST server and you can fetch the STIX file from the REST server by providing the URL of the REST server. For example, `http://stixrestserver.internal.com`.

The STIX feed data file and optionally the feed definition file, both in `.xml` format must be available on the local file system for an on-demand custom feed. For a recurring custom feed, the files must be available at a URL that is accessible to the NetWitness Platform server.

To create a STIX custom feed:

1. Go to **Configure > Custom Feeds**.

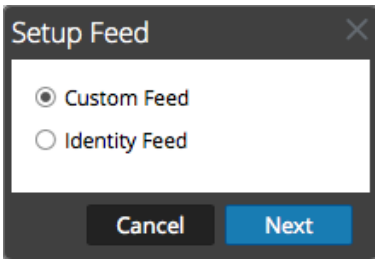
   The Custom Feeds view is displayed.



2. In the toolbar, click

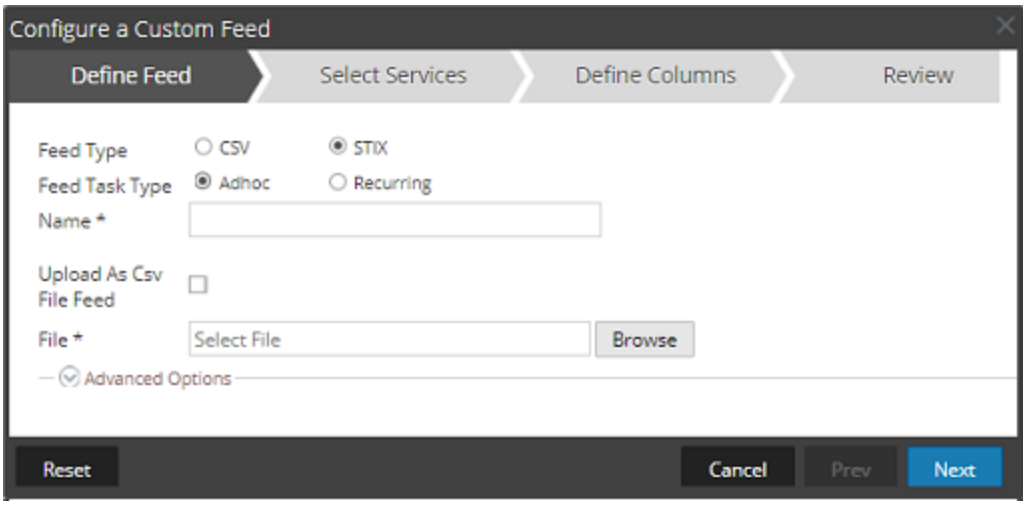
+.

The Setup Feed dialog is displayed.



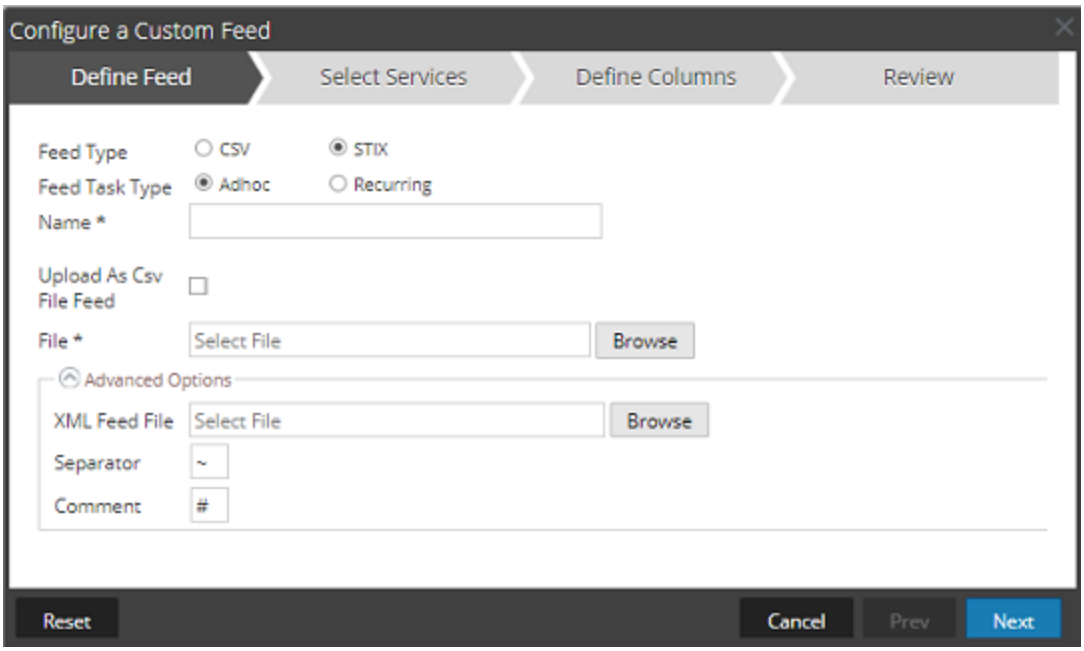
3. To select the feed type, click **Custom Feed** and **Next**.

   The Configure a Custom Feed wizard is displayed, with the Define Feed form open.

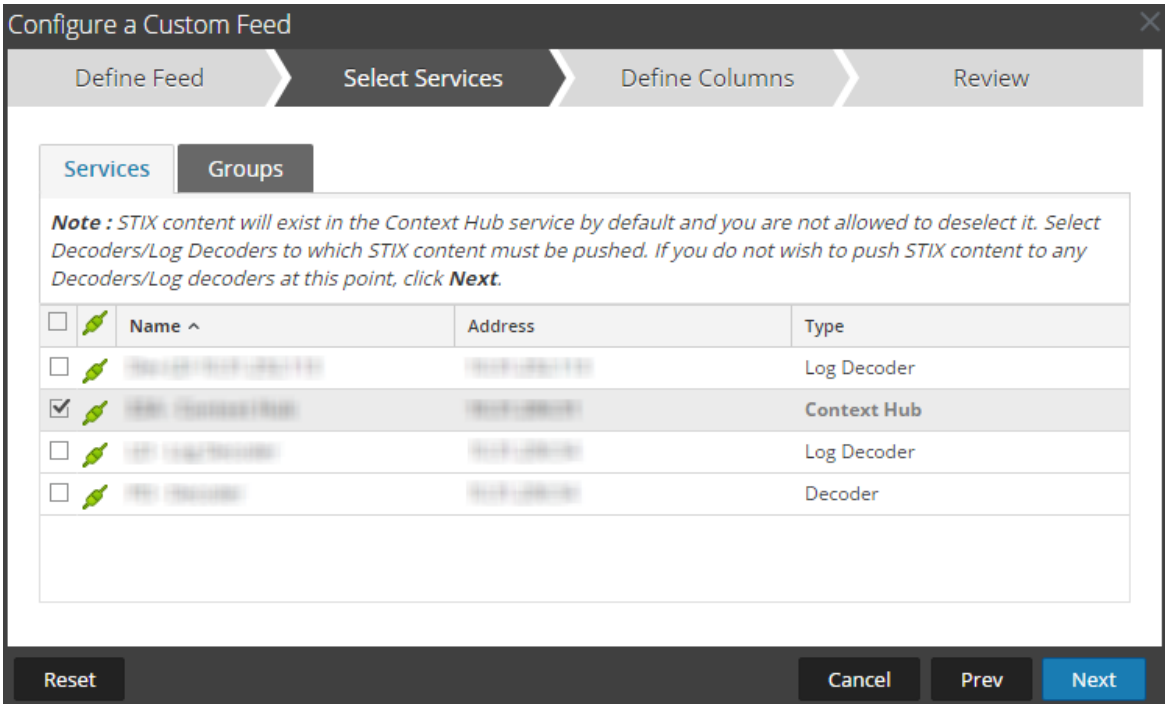


4. To define a feed based on a STIX formatted `.xml` file, select **STIX** in the **Feed Type** field.
5. To define an on-demand feed task that executes once, select **Adhoc** in the **Feed Task Type** field and do one of the following:
   a. (Conditional) To define a feed based on STIX-formatted `.xml` file, type the feed **Name**, select a STIX formatted `.xml` content **File** from the local file system, and click **Next**.
   b. (Conditional) To define a feed based on an XML feed file, select **Advanced Options**.

      The Advanced Options are displayed.



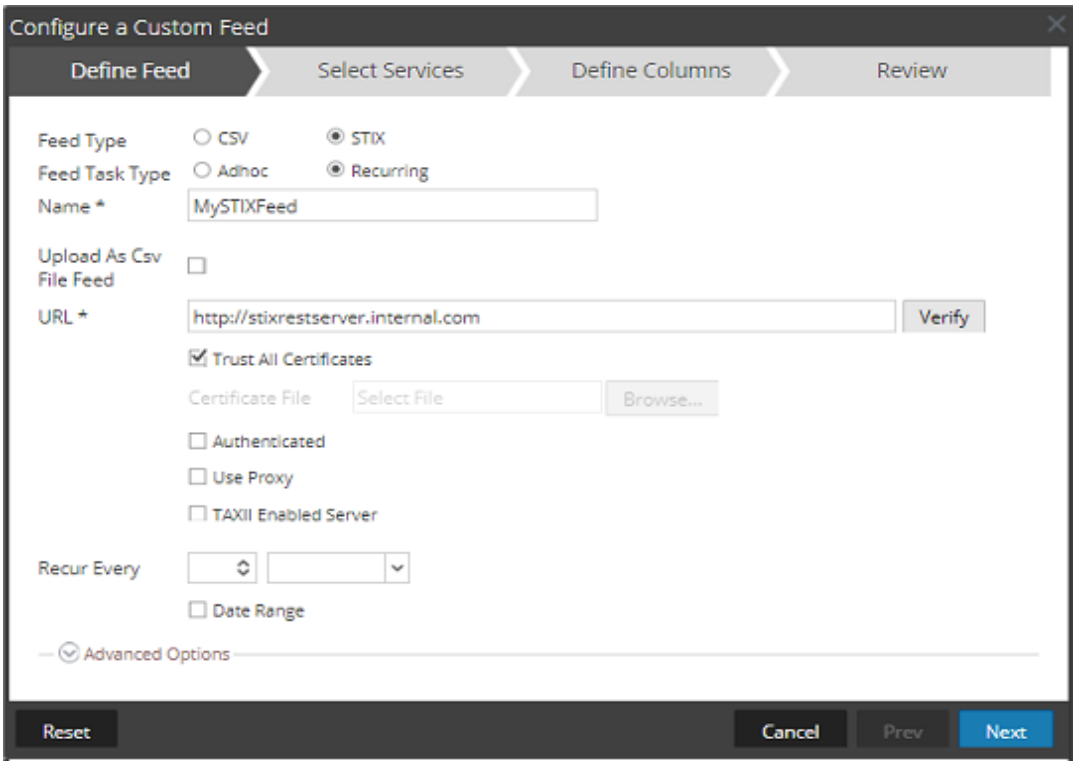
c. Select an XML feed file from the local file system, choose the Separator (default is comma), specify the Comment characters used in the feed data file (default is #), and click **Next**.
The Select Services form is displayed. This is an example of the form for a feed based on a feed data file with no feed definition file. If you are defining a feed based on a feed definition file, the Define Columns tab is not needed.



6. To define a recurring feed task that executes repeatedly at specified intervals, during a specified date range.

a. Select **Recurring** in the **Feed Task Type** field.

The Define Feed form includes the fields for a recurring feed.



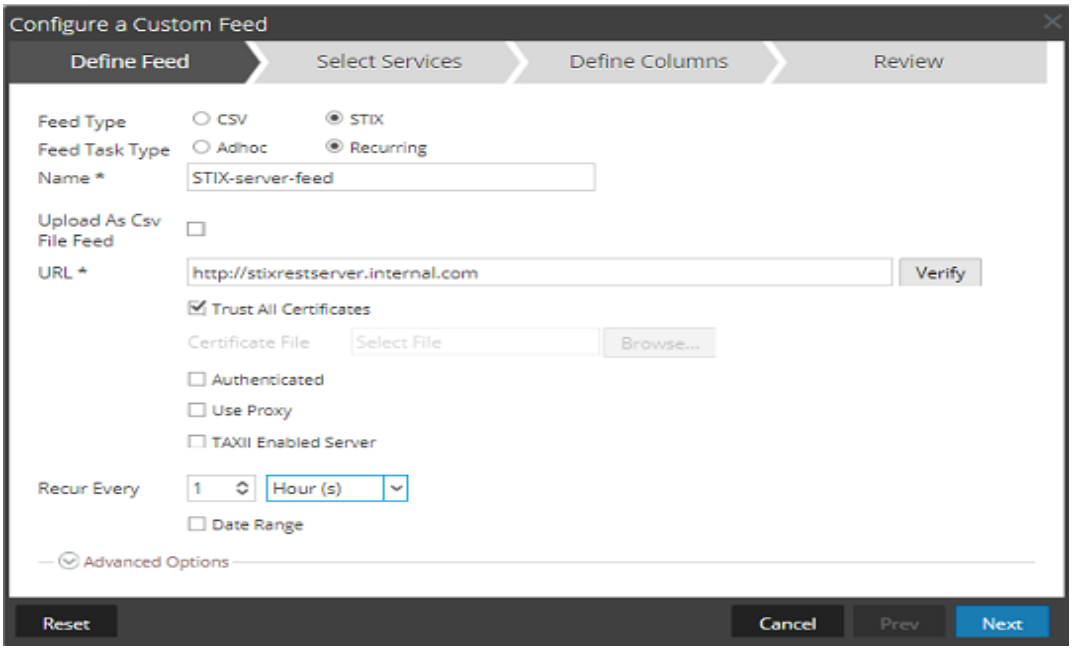
b. In the **URL** field, do one of the following:

- To define a recurring feed based on STIX which pulls STIX packages from a TAXII Server, enter the TAXII server's discovery service URL, for example, `http://hailataxii.com/taxii-discovery-service`.

  Note: A Context Hub service installed on Event Stream Analysis host must be reachable for the specified TAXII server.

- To define a recurring feed based on a STIX-formatted `.xml` file using the REST Server, enter the URL of the REST server where the STIX data file is located, for example,

`http://stixrestserver.internal.com`.



NetWitness Platform verifies the connection to the server, so that NetWitness Platform can check for the latest file automatically before each recurrence.

c. If you do not want NetWitness Platform to verify the REST server's SSL certificate, Select **Trust All Certificate**. This option is enabled by default (checked).

d. For client authentication with the REST URL, in the **Certificate** field, click **Browse** and select the self signed certificate. The supported certificate formats are `.cer`, `.crt` with `Base64` and `DER` encoded files.

e. (Optional) If the URL has restricted access and requires authentication using your username and password, select **Authenticated**.

NetWitness Platform provides your user name and password for authentication to the URL.

f. Select **TAXII Enabled Server**, if you want to select a TAXII collection from the list.
For a valid URL, one or more TAXII collections that contains the STIX data file is displayed based on your credentials. Select the required TAXII collection from the list. Only one collection can be added from a TAXII server for a feed.

Note: Though multiple feeds from multiple TAXII servers are supported, only one account (username and password) is supported per TAXII server.

g. If you want the NetWitness Platform server to access the feed URL through a proxy, select **Use Proxy**. For more information on configuring a proxy, see "Configure Proxy for NetWitness Platform" in the *System Configuration Guide*. (Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.) By default, the **Use Proxy** checkbox is not selected.

h. (Optional) Click **Verify** to test the settings.

> **Note:** Make sure all the required connection parameters such as Authentication, Proxy, Certificate trust, TAXII Enabled Server, and others, are configured before you click Verify.

i. To define the interval of recurrence for pushing to the Decoder or Log Decoder, do one of the following:

- Specify the number of minutes, hours, or days between recurrences of the feed.
- Specify recurrence every week, and select the days of the week.

j. To define the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time. The Start Date defines from when you want to fetch the data.

7. (Conditional) If you want to define a feed based on an XML feed file:

- Type the feed **Name**, select **Advanced Options**.

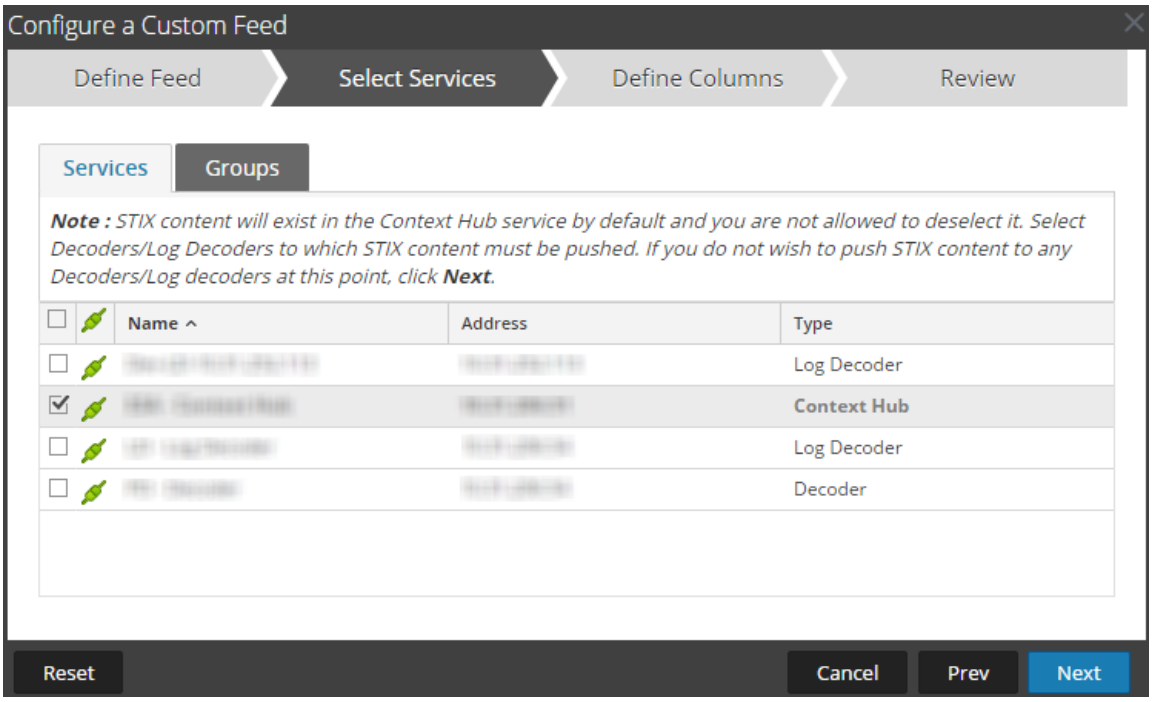
  The Advanced Options fields are displayed.
- Select an XML feed file from the local file system, choose the **Separator** (default is comma), specify the **Comment** characters used in the feed data file (default is #).
- In the **Remove STIX data older than** field, specify the number of days for which STIX packages pulled from TAXII server is to be stored. The STIX packages older than the specified number of days is deleted automatically.
- Click **Next**.

  The Select Services form is displayed.

8. To identify services on which to deploy the feed, do one of the following:

a. Select one or more Decoders and Log Decoders, and click **Next**.

b. In case of STIX feed, Context Hub is selected by default and you cannot deselect it. In addition, you can select one or more Decoders and Log Decoders and click **Next** or click the **Groups** tab and select a group. Click **Next**.

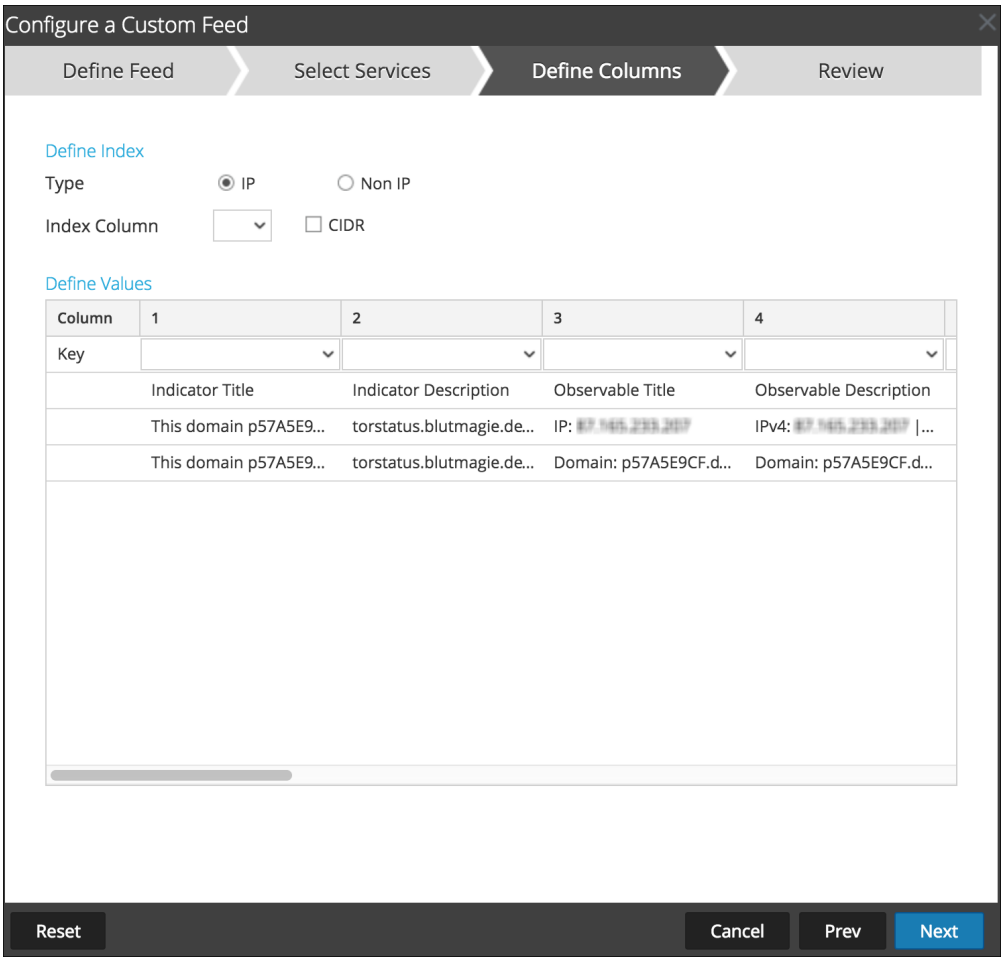


If the data from the STIX server is large, the following message is displayed:
"Fetching sample date is taking longer than expected. Choose one of the following options." You have two options: continue to wait or map without sample data.

- If you click **Continue to Wait**, the Feed Wizard continues to wait till the sample data is fetched or a timeout (10 minutes) occurs, whichever is sooner. If there is a timeout, no sample data is retrieved.
- If you click **Map without Sample data**, the mapping column is displayed without any sample data.

The Define Columns form is displayed.

9. To map columns in the Define Columns form:
   a. Define the Index type: **IP**, **IP Range**, or **Non IP**, and select the index column.
   b. (Conditional) If the index type is **IP** or **IP Range** and the IP address is in CIDR notation, select **CIDR**.
   c. (Conditional) If the index type is **Non IP**, additional settings are displayed. Select the service type and **Callback Keys,** and optionally select the **Truncate Domain** option.

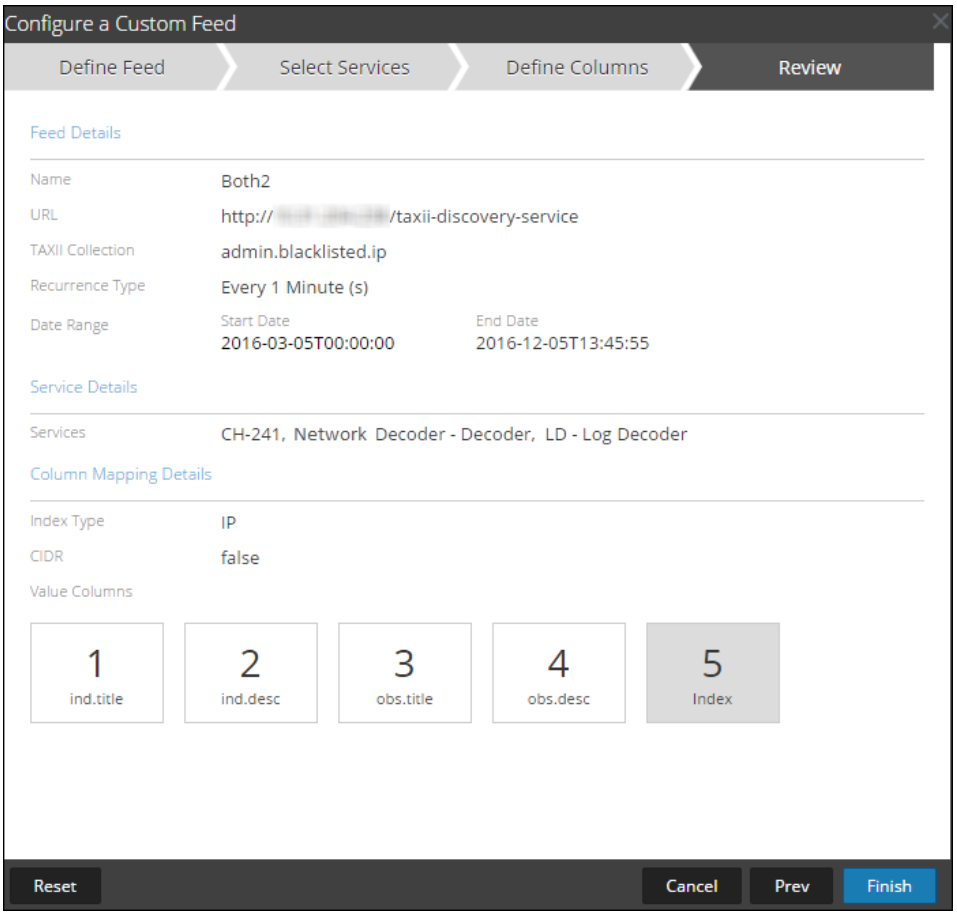


- If the Index Type is Non IP, you can select multiple index columns in the Index Columns. The values from all the selected columns are merged in the first index column that you selected and the merged values are pushed to the Log Decoder for parsing. For example, in the Index Columns if you select 2,4,7 as index columns the values from the 2,4, and 7 columns are merged in the column 2 and the values are pushed to Log Decoder for parsing.
- Indexing cannot be done for columns such as Indicator Title, Indicator Description, Observable Title, and Observable Description, as the look up cannot be performed for those columns.

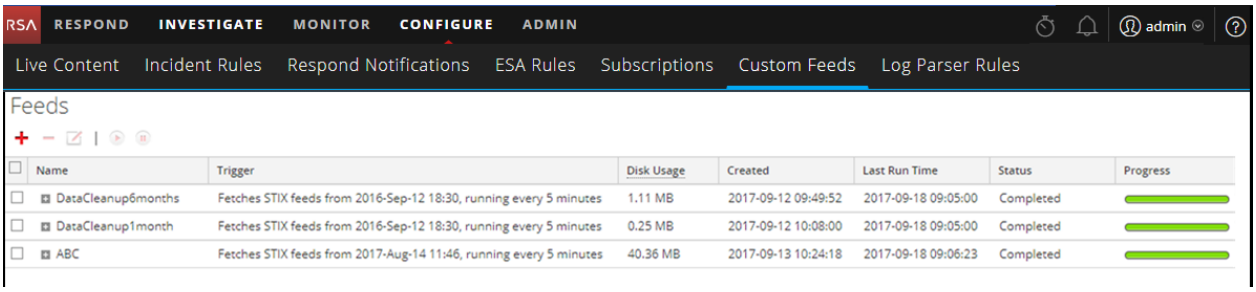
d. Select the language key to apply to the data in each column from the drop-down list. The meta displayed in the drop-down list is based on the meta available for the service define values. You can also add other meta based on advanced expertise.

e. Click **Next**.

The Review form is displayed.



10. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form).
11. Review the feed information, and if correct, click **Finish**.
    Upon successful creation of the feed definition file, the Create Feed wizard closes, the feed and corresponding token file are listed in the Feed grid, and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.



Note: Health and Wellness raises alerts when the available heap memory of Context Hub server is critically low. If the status of Context Hub server is Unhealthy due to low memory. For more information on how to troubleshoot `OutOfMemoryError` on `Contexthub` Server, refer to "Troubleshooting" in the *Live Services Management Guide*.

Create an Identity Feed

You can create an Identity feed and populate it to selected Decoders and Log Decoders. In order to create an identity feed, you need to have:

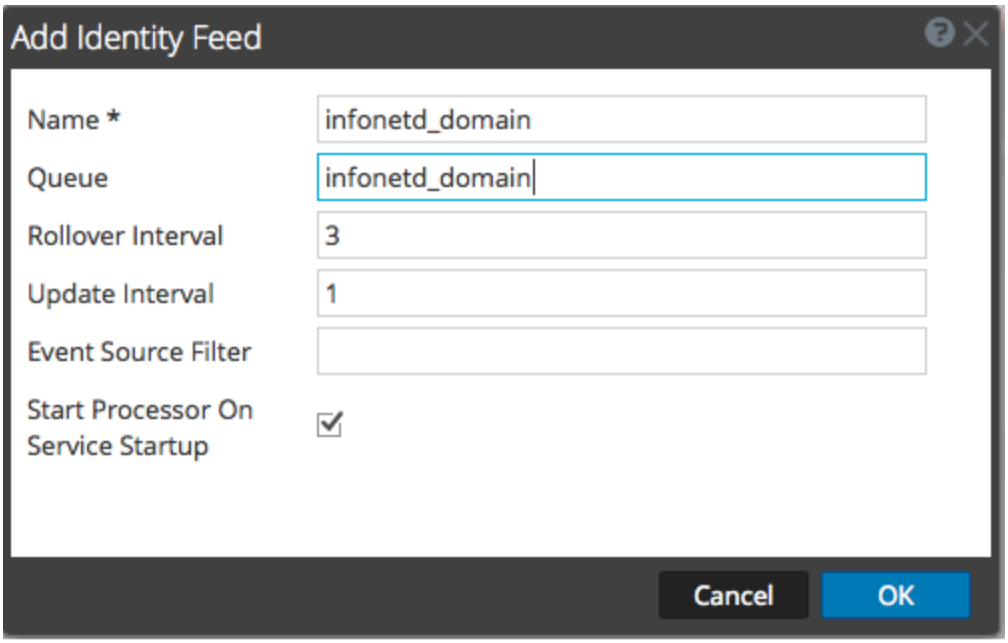
- A Log Collector service with an Identity Feed Event Processor
- A Log Collector service with Windows Collection configured and enabled

To create an identity feed:

1. Add a destination for the feed.
   a. Go to **ADMIN > Services** and in the **Services** list
   b. Select a **Log Collector** service, and select **View > Config**.
   c. Select the **Event Destinations** tab.
   d. In the Select **Event Destinations** field, select **Identity Feed**.

   e. Click + and enter a unique name for the feed.

      The Queue name identifies the feed within the Log Collector. Use the name of the feed for the Queue.



f. Click **OK**.

2. Test generation of messages.

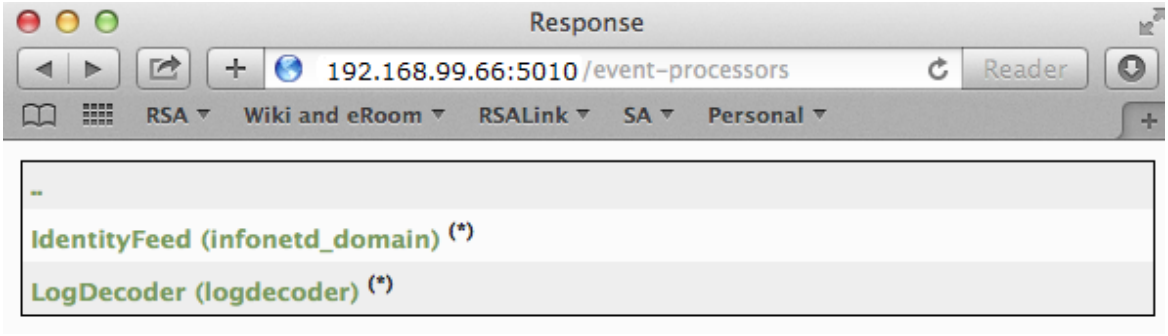
   a. Have users log into Windows boxes on the domain to generate the appropriate log messages on the domain controllers for testing.

   b. Verify that data is written to the feed files. SSH to the Log Decoder/Collector or Virtual Log Collector being configured. Navigate to `/var/netwitness/logcollector/runtime/identity-feed` and verify that the `Identity_deploy` files are getting populated with data.

   c. Open up a web browser (Non-Internet Explorer browsers preferred) and log in to the REST interface of the Log Collector. Use administrative credentials when logging in. For example, if the IP address of your Log Collector is 192.168.99.66, the URL would be:

   - SSL not enabled: **http://192.168.99.66:50101/event-processors**
   - SSL enabled: **https://192.168.99.66:50101/event-processors**

   The browser screen should look like this:

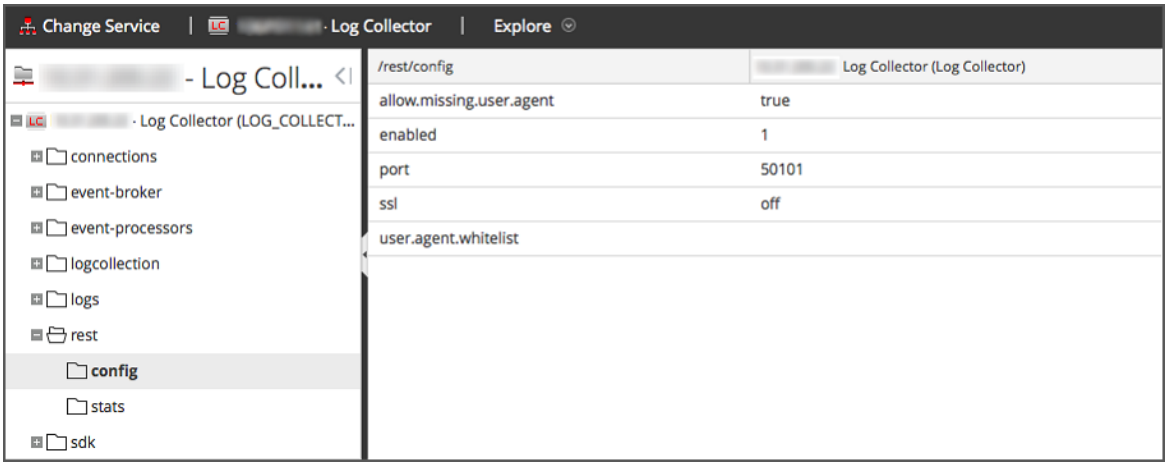


The screen contains the name of the identity feed you created earlier (`infonetd_domain`, in this example).

For the identity feed to function correctly, port 50101 must be active on the Log Collector, and you must determine whether SSL encryption is active.

d. Go to **ADMIN > Services > <*Log Collector being setup*>** **> View > Explore**.

e. In the left pane, expand **rest > config**.



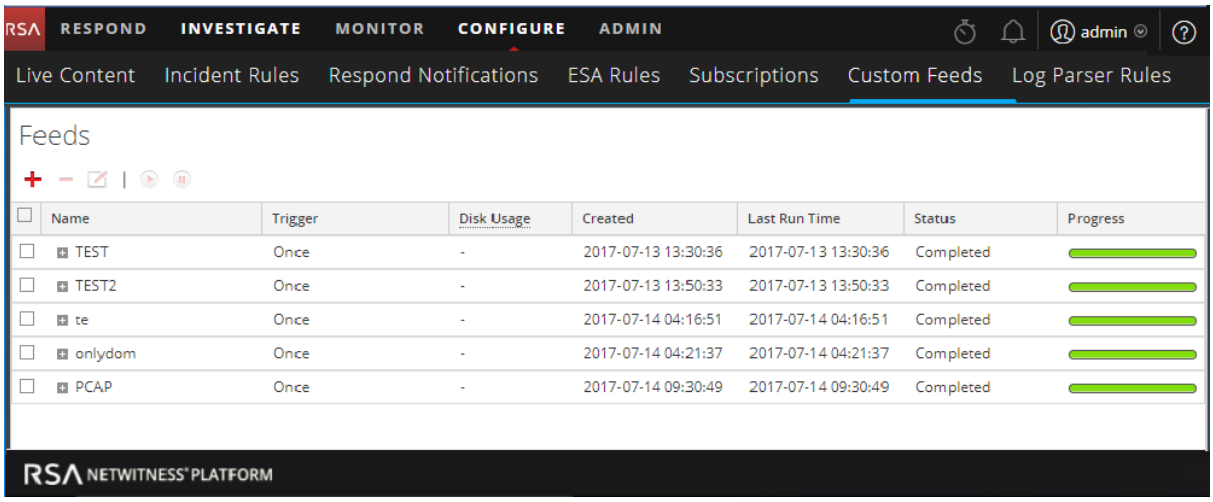
For REST to be active, **enabled** must be set to **1**.

f. Note the value for **ssl**. If SSL should be enabled for your environment, this must be set to **on**.

Note: If you changed the setting for either the **enabled** or **ssl** option you must restart the Log Collector service before moving forward.

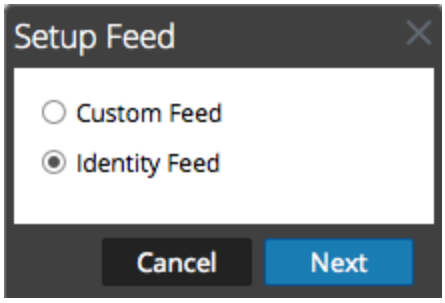
3. Go to **CONFIGURE > Custom Feeds**.

The Feeds dialog is displayed.



4. In the toolbar, click +.

   The Setup Feed dialog is displayed.



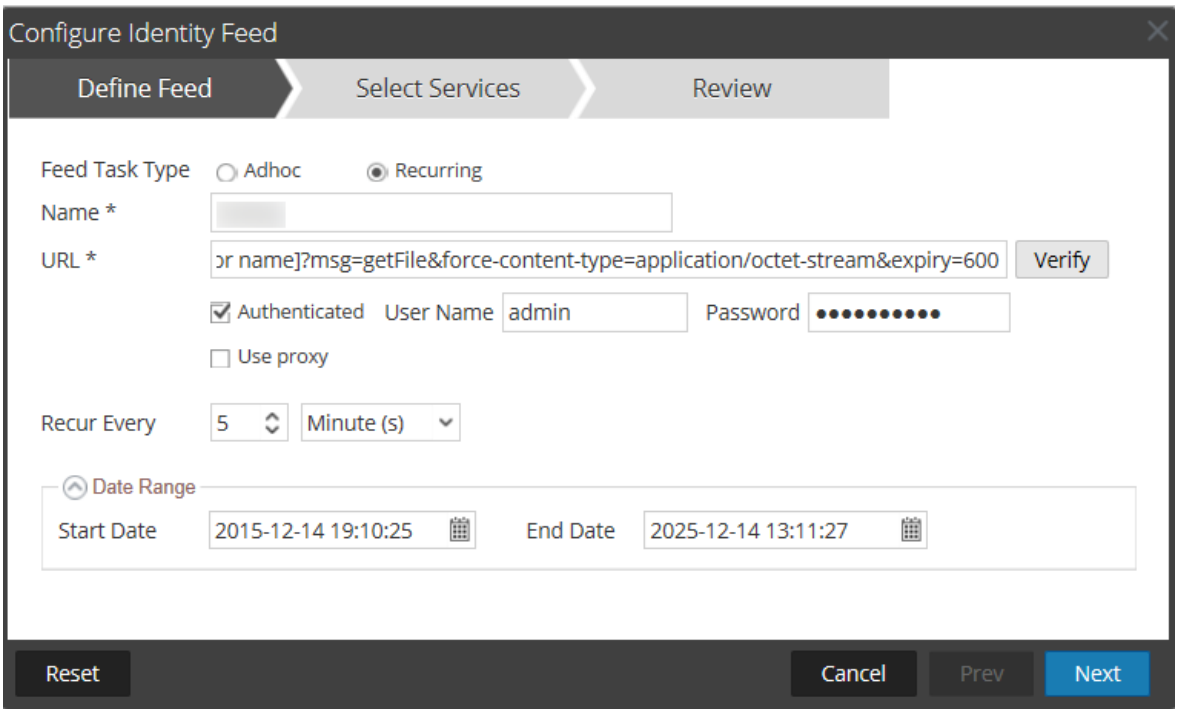
5. Make sure **Identity Feed** is selected and click **Next**.

   The Configure Identity Feed panel opens with the **Define Feed** tab displayed.

6. (Conditional) You can create an on-demand or recurring feed.

   - To define an on-demand Identity feed task that executes once, select **Adhoc** in the **Feed Task Type** field, type the feed **Name**, and browse for and open the feed.
   - To define a recurring Identity Feed task that executes on a recurring basis, select **Recurring** in the **Feed Task Type** field.

     The **Define Feed** dialog includes the fields for a recurring feed.



Note: RSA NetWitness Platform verifies the location where the file is stored, so that NetWitness Platform can check for the latest file automatically before each recurrence.

7. Enter a value and verify the URL field.
   a. In the **URL** field, enter the URL where the feed data file is located. This is the REST API interface that was setup earlier. Make sure you have the following information to construct the URL:
      - The IP address of the Log Collector being used to construct the Identity Feed file.
      - The identity queue name, as set in step 2c.
      - Whether or not SSL is enabled on the Log Collector REST port, as set in step 2f.

      You can construct this value as follows:
      - SSL enabled: `https://<LogCollector>:50101/event-processors/<ID Event processor name>?msg=getFile&force-content-type=application/octet-stream&expiry=600`
      - SSL not enabled: `http://<LogCollector>:50101/event-processors/<ID Event processor name>?msg=getFile&force-content-type=application/octet-stream&expiry=600`

      So, using the example from earlier, the complete value that you would enter into this field is as follows:

      ```
      http://192.168.99.66:50101/event-processors/infonetd_
      domain?msg=getFile&force-content-type=application/octet-
      stream&expiry=600?msg=getFile&force-content-type=application/octet-
      stream&expiry=600
      ```

   b. For the URL verification to work correctly, it is important that the NetWitness Platform UI

server can access the Log Collector's REST API port (50101). This can be tested by going to the NetWitness Platform UI server via SSH. Once there, run the following command:

- SSL enabled: `curl -vk https://<ip of log collector>:50101`
- SSL not enabled: `curl -v http://<ip of log collector>:50101`

If the `curl` command does not connect then there may be a network firewall or routing issue between the NetWitness Platform UI server and the Log Collector.

Example of a bad connection:

```
* About to connect() to 192.168.99.66 port 50105 (#0)
* Trying 192.168.99.66... No route to host
* couldn't connect to host
* Closing connection #0
curl: (7) couldn't connect to host
```

Example of a good connection:

```
* About to connect() to 192.168.99.66 port 50105 (#0)
* Trying 192.168.99.66... connected
* Connected to 192.168.99.66 (192.168.99.66) port 50105 (#0)
> GET / HTTP/1.1
> User-Agent: curl/7.19.7 (x86_64-redhat-linux-gnu) libcurl/7.19.7
NSS/3.19.1 Basic ECC zlib/1.2.3 libidn/1.18 libssh2/1.4.2
> Host: 192.168.99.66:50105
> Accept: */*
>

< HTTP/1.1 401 Unauthorized
< Content-Length: 71
< Connection: Keep-Alive
< Pragma: no-cache
< Expires: -1
< Cache-Control: no-cache, no-store, must-revalidate
< WWW-Authenticate: Basic realm="NetWitness"
< Content-Type: text/xml; charset=utf-8
<

<?xml version="1.0" encoding="utf-8"?>
<error>401 Unauthorized</error>
* Connection #0 to host 192.168.99.66 left intact
* Closing connection #0
```

8. The REST API requires a username and password when attempting to pull the `identity_deploy.csv` file from the Log Collector. This can be any username and password that is available on the service itself. For more information, see the "Services Security View" topic in the *Hosts and Services Guide*.

   To see which accounts are available, go to **ADMIN > Services > <log collector being setup> > Actions > View > Security**.

   Under the Users table, you see all the users that can be used in this step. It is suggested that a separate user account is created specifically for this setup, and is used nowhere else in the environment, for added security. For details, see "Add a User and Assign a Role" in the *System Security and User Management Guide*. (Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.)

9. To define the recurrence interval, do one of the following:

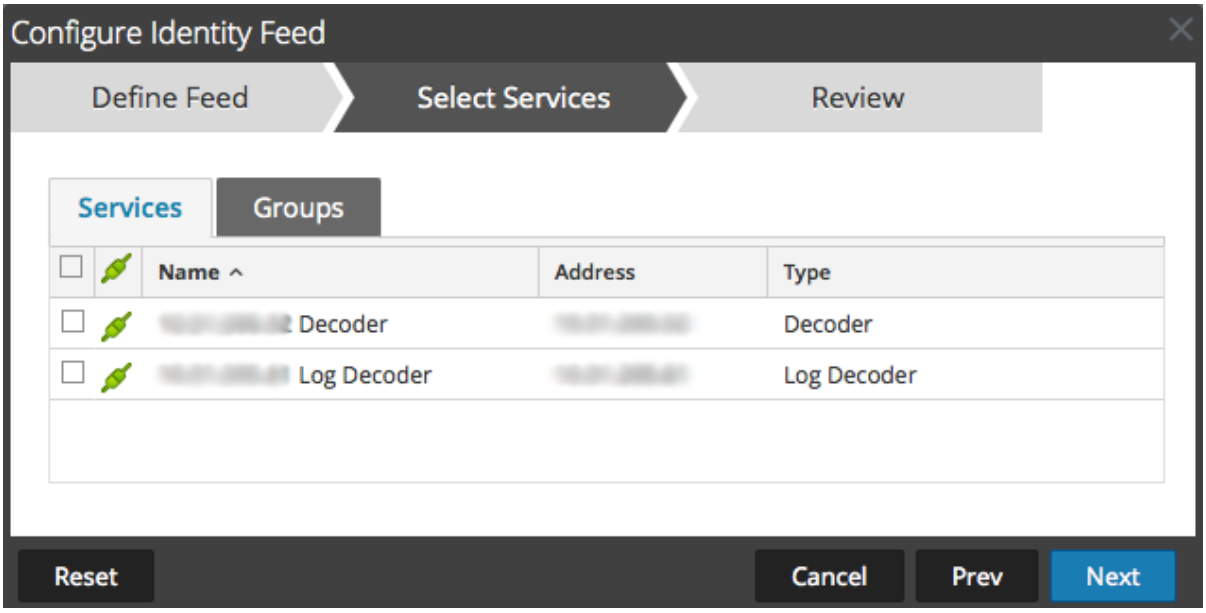
- Specify the number of minutes, hours, or days between recurrences of the feed.
- Enter the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time.

10. If using SSL encryption, you need to install the REST API SSL certificate for the Log Collector into the NetWitness Platform UI server. For more information, see Import the SSL Certificate.

    If, after importing the SSL certificate, the verification of the URL still fails, see Cannot Verify Identity Feed URL.

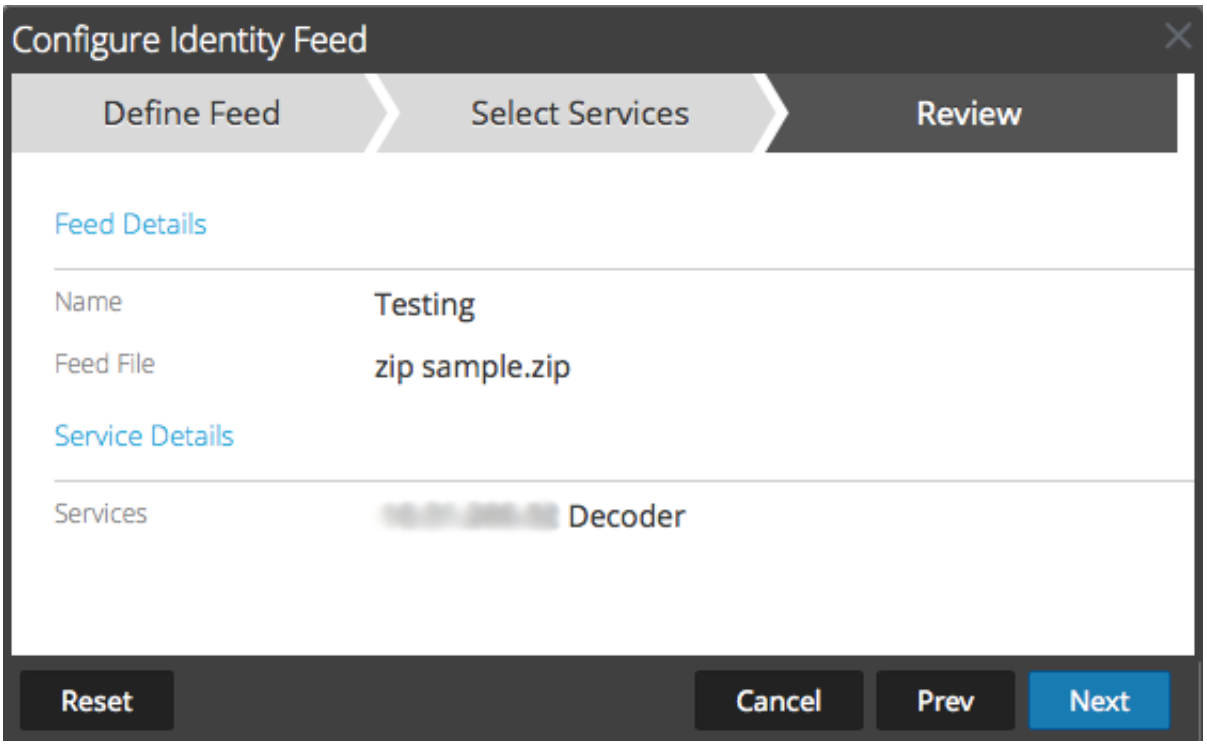
11. Click **Verify** to verify your identity feed configuration before you proceed to the Select Services dialog.
12. Click **Next**.

    The Select Services dialog is displayed.



13. To identify services on which to deploy the feed, select one or more Decoders and Log Decoders and click **Next**.
14. Click the **Groups** tab, select a group, and click **Next**.

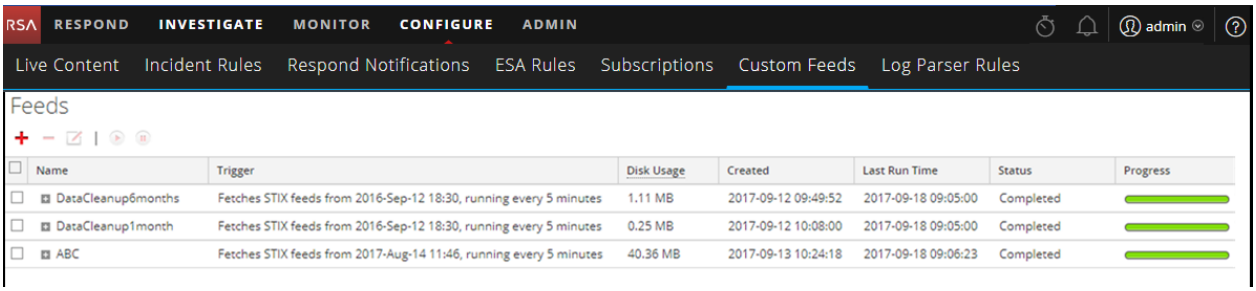
    The Review dialog is displayed.



Note: If a group of devices with Decoders and Log Decoders is used to create recurring or custom feeds and this group is deleted, you can edit the feed and add a new group to the feed.

15. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form).
16. Review the feed information, and if correct, click **Finish**.

Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.



Import the SSL Certificate

If SSL is configured on the Identity feed's Log Collector, follow these steps to import the Log Collector's SSL certificate into the NetWitness Platform UI server key store. If this certificate is not imported, the NetWitness Platform UI server will be unable to pull the Identify feed file from the Log Collector.

1. To pull the SSL certificate off the Log Collector, SSH into the NetWitness Platform UI server and run the following command:

   ```
   echo -n | openssl s_client -connect <HOST>:<PORT> | sed -ne '/-BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p' > /tmp/<SERVERNAME>.cert
   ```

   This command saves the SSL certificate to `/tmp/<SERVERNAME>.cert`. For example:

   ```
   echo -n | openssl s_client -connect 192.168.99.66:50101 | sed -ne '/-BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p' > /tmp/logcollector.cert
   ```

2. To import the SSL certificate into the NetWitness Platform UI server, SSH into the UI server and run the following command:

   ```
   keytool -importcert -alias <name an alias for the cert> -file <the cert file pathname> -keystore /etc/pki/java/cacerts
   ```

   For example:

   ```
   keytool -importcert -alias logcollector01 -file /tmp/logcollector.cert -keystore /etc/pki/java/cacerts
   ```

3. The system requests a password. Enter the password for the keystore on the NetWitness Platform UI server, not for the jetty keystore. The default password is **changeit**.

4. Restart **jettysrv** to allow jetty to read the new certificate in the store.

Cannot Verify Identity Feed URL

If the Identity feed URL cannot be verified, and you are using SSL, make sure you followed the steps in Import the SSL Certificate.

If there are issues, it is possible that the internal name of the certificate does not match the hostname of the Log Collector. The following procedure checks this.

1. SSH to the NetWitness Platform UI server.
2. Run the following command to output the CN name of the SSL cert:

   ```
