   echo -n | openssl s_client -connect <log decoder>:50101 | sed -ne '/BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p'
   ```

   For example:

   ```
   echo -n | openssl s_client -connect salogdecoder01:50101 | sed -ne '/BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p'
   ```

3. Retrieve the CN name of the SSL certificate.

```
depth=0 C = US, CN = NetWitness-SAlogdecoder01
verify error:num=18:self signed certificate
verify return:1
depth=0 C = US, CN = NetWitness-SAlogdecoder01
verify return:1
-----BEGIN CERTIFICATE-----
MIIC2zCCAcOgAwIBAgIBADANBgkqhkiG9w0BAQQFADAxMQswCQYDVQQGEwJVUzEi
MCAGA1UEAxMZTmV0V2l0bmVzcy1TQWxvZ2RlY29kZXIwMTAeFw0xNDAxMTEwMDM1
```

4. Edit the `/etc/hosts` file and add the IP address and CN name to the file.

```
# Created by NetWitness Installer on Fri Jan 10 21:42:10 UTC 2014
127.0.0.1 SAserver01 localhost.localdom localhost
::1 SAserver01 localhost.localdom localhost ip6-localhost ip6-loopback

192.168.10.23 NetWitness-SAlogdecoder01
```

5. Restart the network service on the appliance.
6. Confirm that the name placed in the **/etc/hosts** file is used instead of the FQDN or IP address in the Identity feed URL.
7. Re-verify the Identity feed URL.

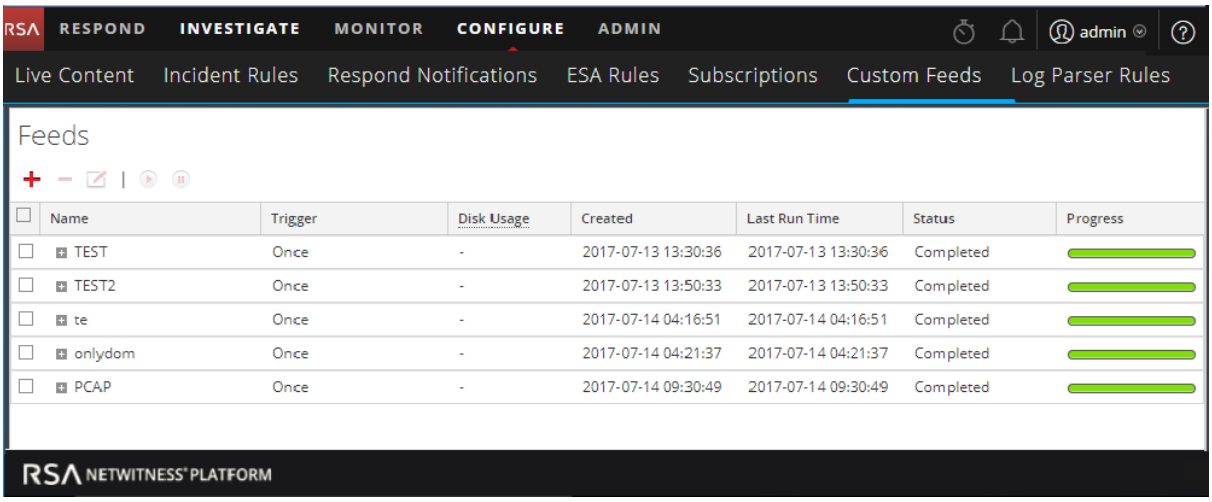
Edit, Upload, or Remove a Feed

You can upload a feed, edit an existing feed, or remove a feed.

To edit an existing feed:

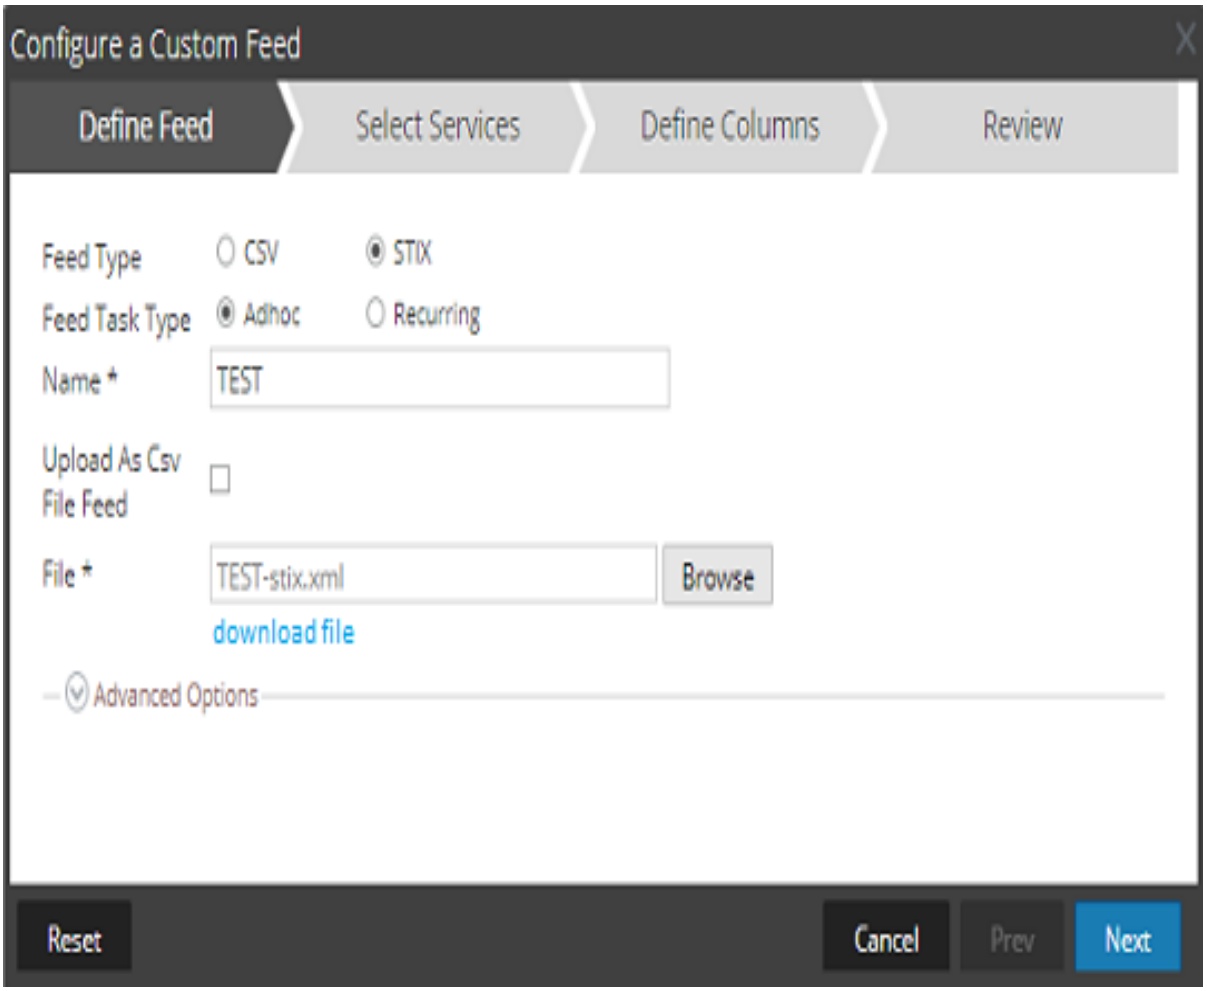
1. Go to **CONFIGURE > Custom Feeds**.

   The Feeds view is displayed.



2. In the toolbar, select a feed and click .

   The Configure Custom Feed or Configure Identity Feed panel opens in the Custom Feed wizard.



3. If you want to edit the feed file:
   a. Click **download file**.

      For an Identity feed, the .zip file is downloaded. For a custom feed, the .csv or .xml file is downloaded to your local file system. For a STIX feed, the .xml file is downloaded to your local file system.

   b. Edit and save the file.

   c. In the **Define Feed** tab, browse for and open the edited file.
4. Edit any other parameters in the **Define Feed** tab, **Select Services** tab, and **Define Columns** tab that apply to the type of feed.
5. Anytime before you click **Finish**, you can:
   - Click **Cancel** to close the wizard without saving your changes.
   - Click **Reset** to clear the data in the wizard.
   - Click **Next** to display the next form (if not viewing the last form).
   - Click **Prev** to display the previous form (if not viewing the first form).
6. In the **Review** tab, review the feed information, and if correct, click **Finish**.

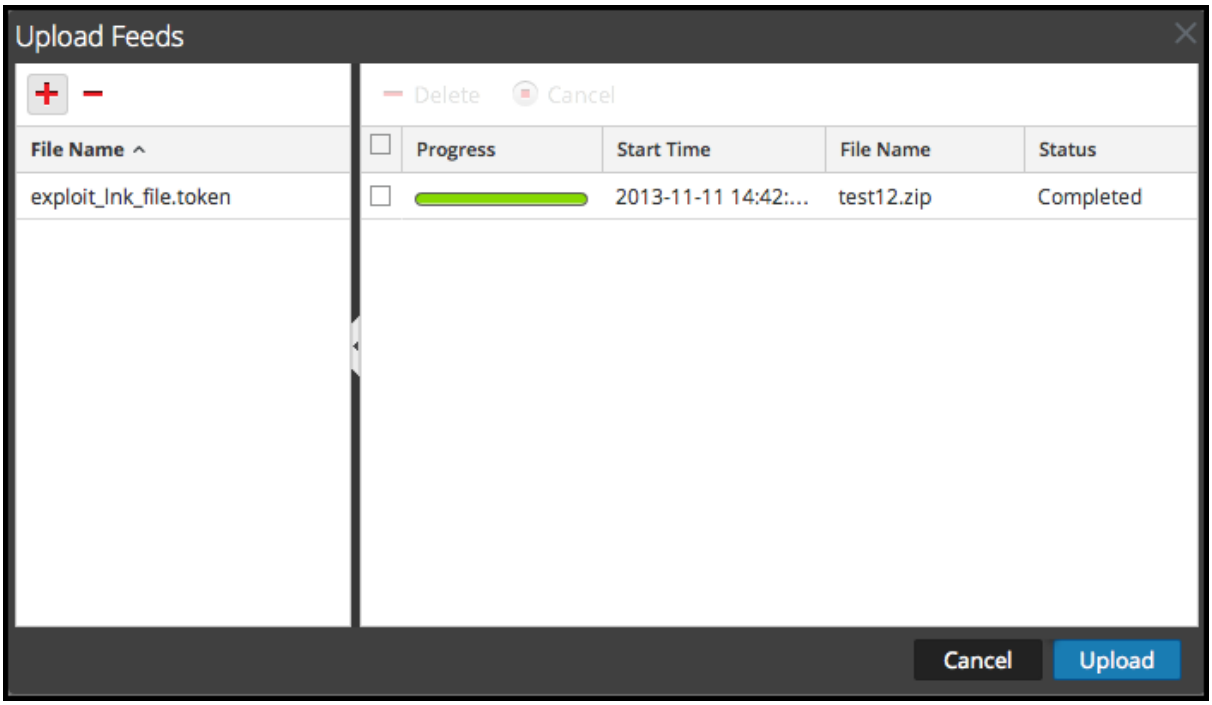
The feed is recreated with the updated file and new feed specifications. The feed is added to the Feeds list and progress bar tracks completion. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file is listed in the Feeds list. You can expand or collapse the entry to see how many services are included, and which services are successful.

To upload a feed to a Decoder or Log Decoder:

1. Go to **ADMIN > Services**.
2. Select a service and click > **View** > **Config**.

   The Services Config view is displayed with the General tab open.
3. Select the **Feeds** tab.
4. In the Feeds tab toolbar, click Upload.

   The Upload Feeds dialog is displayed.



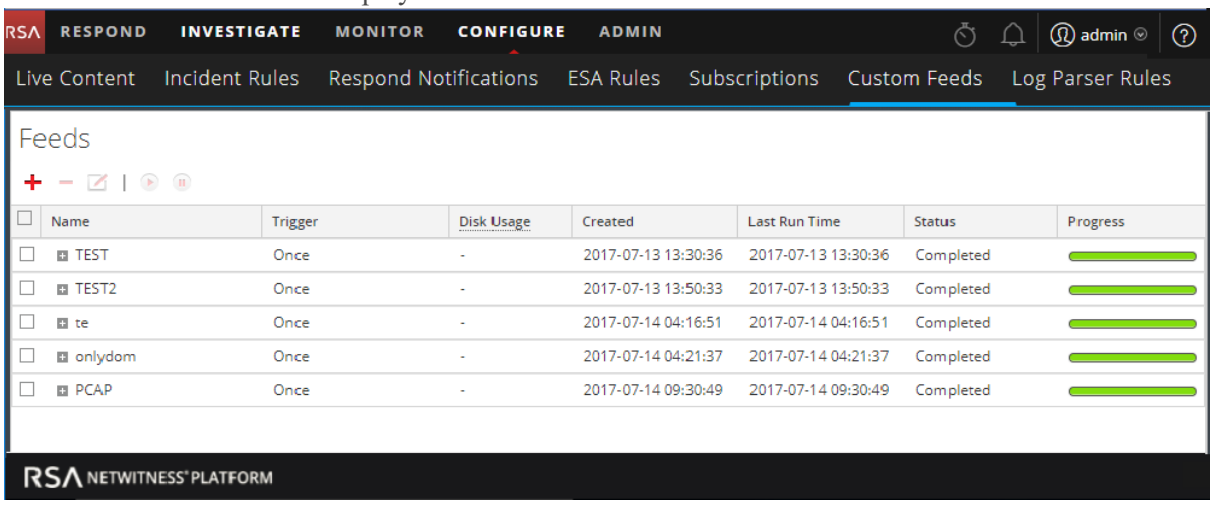
5. In the **File** grid, click and select a feed file. Supported files are *.feed, *.token, and *.filter.
6. Select the feed file from the **File** list and click **Upload**.

   The Upload Job list is updated to show the progress and status of the uploaded feed.

To remove a feed:

1. Go to **CONFIGURE > Custom Feeds**.

   The Custom Feeds view is displayed.



2. In the toolbar, select a feed and click − .

   The Delete Custom Feeds dialog is displayed.

   You can select one of the following options to delete the feed:

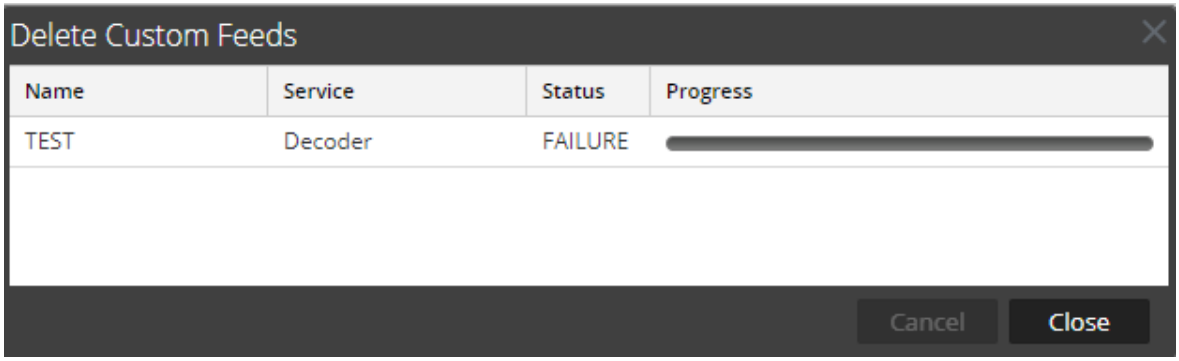
   - If you choose to delete the feed from **Local DB and Service**, the feed is deleted from both the service and the local NetWitness Platform box. The deleted feed will no longer seen on the NetWitness Platform user interface.
   - If you choose to delete the feed from **Local DB Only**, the feed is deleted from the local NetWitness Platform box. The deleted feed will not be seen on the NetWitness Platform user interface; however, the last deployed version of the feeds will be present on the service. The undeployed feeds will be deleted forever.
   - If you choose to delete the feed from **Service Only**, the feed is deleted from the service. The deleted feed will appear on the NetWitness Platform user interface and can be deployed again

3. Select where you want to delete the feed and click **Delete**.

   A warning dialog is displayed.

4. Click **yes** to confirm that you want to delete the feed from the select areas.

- If you chose to delete the feed from the **Local DB Only**, the feed is deleted.
- If you chose to delete the feed from the **Local DB and Service** or **Service Only**, the Delete Custom Feeds view is displayed showing the progress of the deletion on the service.



Create Custom Meta Keys Using a Custom Feed

This topic provides information on how to add custom meta keys using a custom feed in the Log Decoder, and highlights the configuration changes to reflect the custom meta keys in the Concentrator, ESA, Archiver, Warehouse Connector, and Reporting Engine schema. You can create custom meta keys to retrieve data, to investigate and analyze the logs and packets. Custom meta keys enable you to add an enrichment context for the log and packet data.

Here is an example of creating a custom meta key in the Log Decoder. In this scenario, an organization wants to track the location of an asset such as a printer. So, a custom meta key **source location** is introduced, which indicates the location of the asset, for example Printer1, which is located in the 'Fifth Floor A wing'.

Note: Custom meta keys can be created in the Decoder as well. Select the `index-decoder-custom.xml` file when you create a custom meta key in the Decoder.

Add a Custom Meta Key in the Log Decoder

To add custom meta keys using custom feed:

1. Go to **ADMIN** > **Services** .
2. Select a Log Decoder service and click > **View** > **Config** > **Files** tab > **index-logdecoder-custom.xml.**

```
<Language>
  <?xml version="1.0" encoding="utf-8"?>
  <Language level="IndexNone" defaultAction="Auto">
  <!-- Reserved Meta key for Feed -->
  <Key description="Source Location" level="IndexNone"
name="location.src" format="Text"/>
 </Language>
 name = Name of the key (max is 16 chars)
```

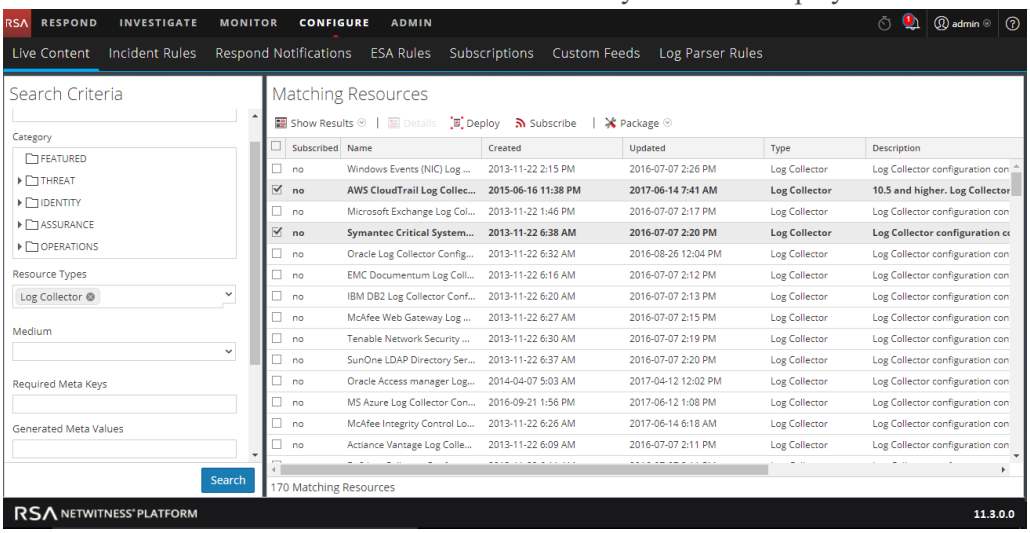
3. Restart the Log Decoder service. In the Services view, click > **Restart**.

Deploy a Log Decoder Feed in Live

To deploy the feed in the live environment:

1. Go to **CONFIGURE > Live Content.**
2. Select a group of resources, or a previously created resource package. To select a resource or group of resources:
   a. In the **Live Search View,** browse Live resources (for example, search for the **Log Collector** resource Type).
   b. In the **Matching Resources** panel, select **Show Results > Grid**.

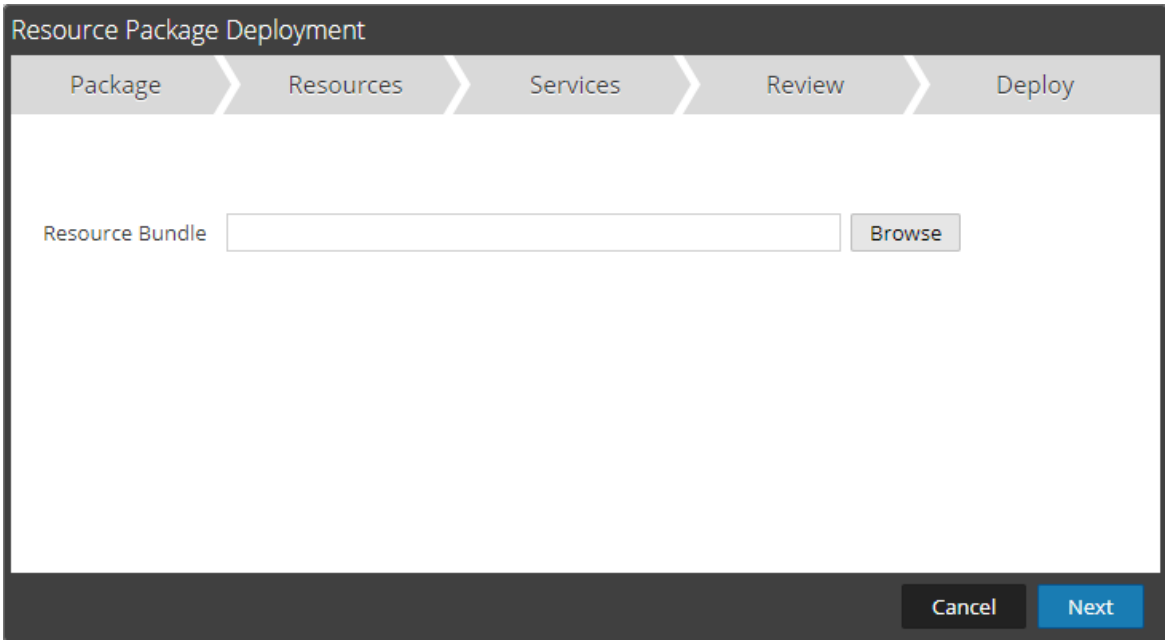
c. Select the checkbox to the left of the resources that you want to deploy.



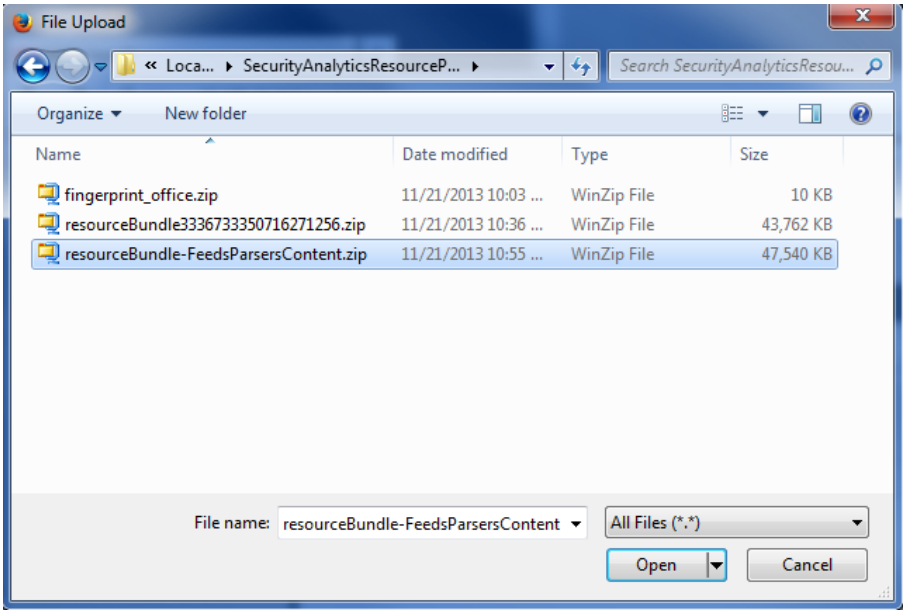
d. In the Matching Resources toolbar, click Deploy.

3. To select a resource package to deploy:

a. In the **Live Search** view - **Matching Resources** toolbar, select **Package** > **Deploy** :
The Package page of the Resource Package Deployment wizard is displayed.



b. Click **Browse** and select a package from your network (for example **resourceBundle-FeedsParsersContent.zip**).



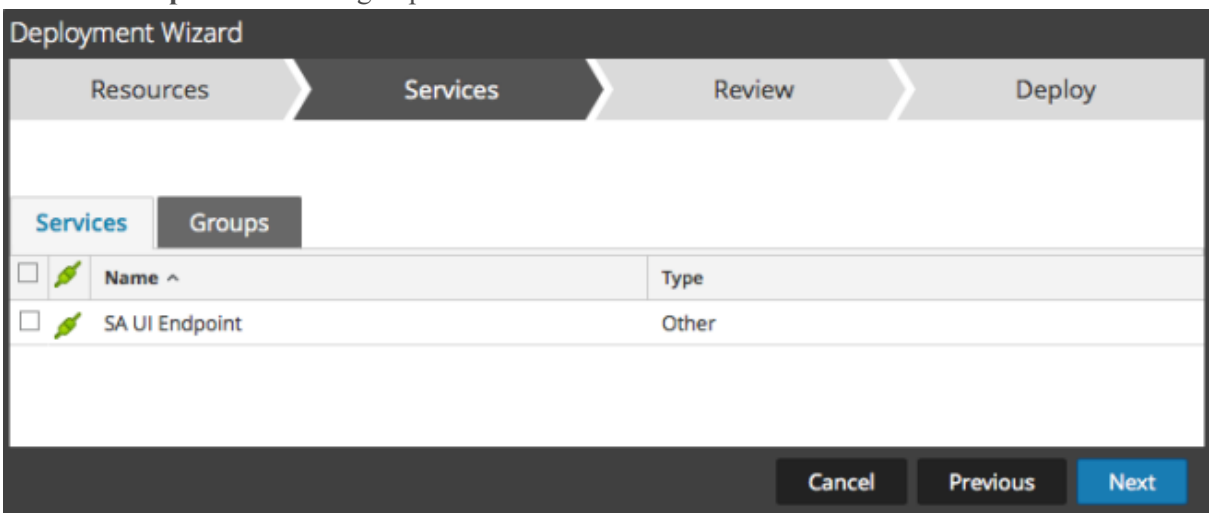
c. Click **Open.**
At this point, whether you are deploying a package or a group of resources, the Deployment Wizard opens, and the Resources page is displayed.

3. Click **Next**.
The **Services** page is displayed. It has two tabs, **Services** and **Groups**, which provide a list of services and service groups that are configured in the Admin > Services view. The columns are a subset of the columns available in the Services view.

> **Note:** The Live server is "smart" about deploying resources to Services. For example, it does not deploy resources that have a Medium of packets to any Log Decoders. This means that only applicable content resources are deployed to each Service.

4. Select the services to which you want to deploy the content. You can select any combination of services and service groups.
Use the **Services** tab to select individual services, list of services and service groups that are configured in the Admin Services view.

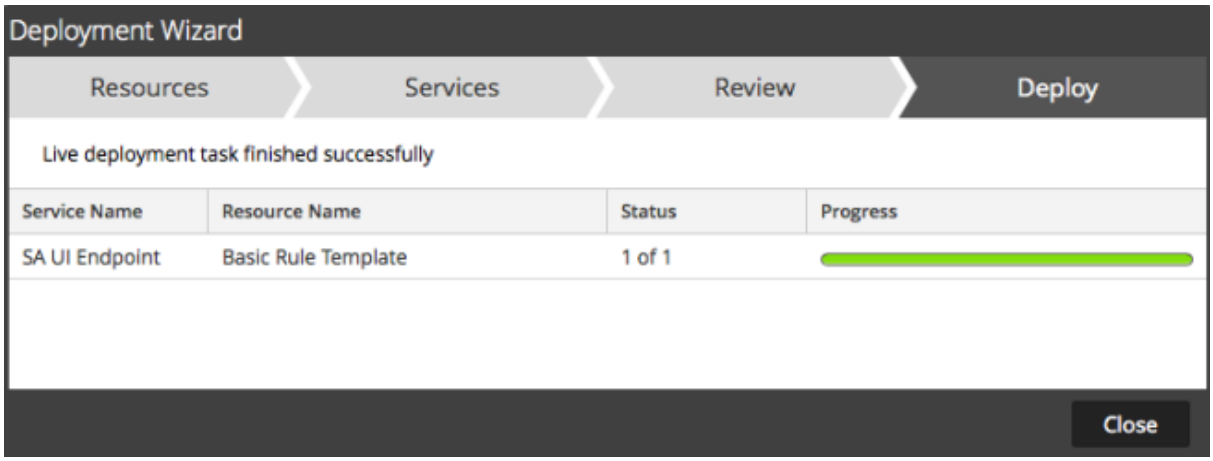
Use the **Groups** tab to select groups of services.



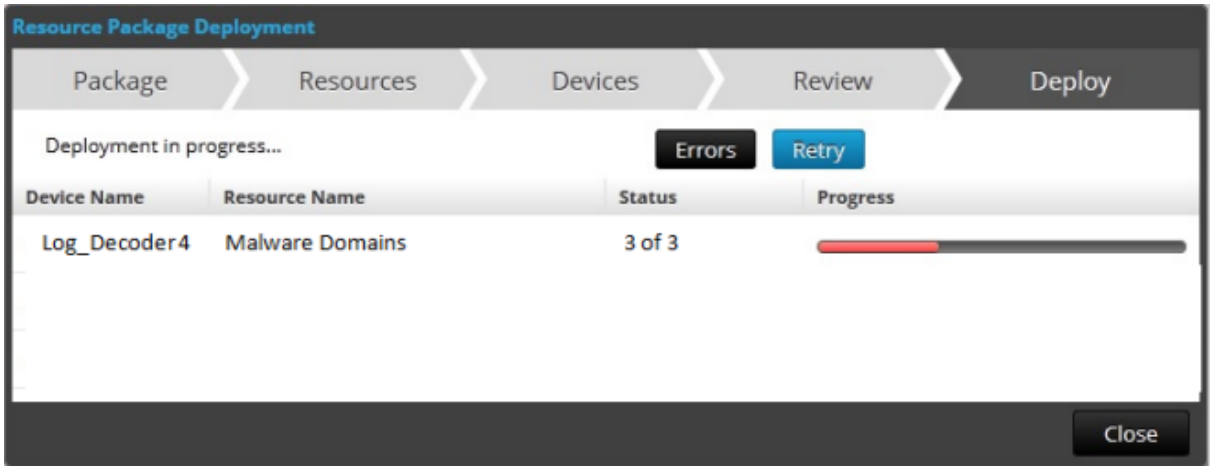
5. Click **Next**.
   The **Review** page is displayed.

   Make sure that you have selected correct resources and the services to which you want to deploy them.

6. Click **Deploy**.
   The **Deploy** page is displayed. The Progress bar turns green when you have successfully deployed the resources to the selected services.



If you try to deploy resources and services that are not compatible, NetWitness Platform displays the Errors and Retry buttons, which you click to review the errors and retry the deployment.



7. Click **Close**.

Note: The Source IP should be indexed by selecting the type as 'IP' as the ip.src. and ip.dst are in IPv4 format.

In this scenario, a custom meta key location.src (location source) is added by indexing the hostname (alias.host). In this example, the printer hostname are populated in meta key 'alias.host'. Select **alias.host** as callback key, and index type as 'Non IP' in the Feed Wizard as shown below. In the Define Values section, select the custom meta key from the drop down menu.

Add the Custom Meta Key Entry in the Concentrator Custom Index file

To add the custom meta key entry in the Concentrator custom index file:

1. Go to **ADMIN** > **Services** > **Concentrator**.
2. Click ⚙ > **View** > **Config** > **Files** tab > **index-concentrator-custom.xml.**
3. Add the custom meta key entry in the Concentrator index file.

```
<Language>
 <?xml version="1.0" encoding="utf-8"?>
 <Language level="IndexNone" defaultAction="Auto">
  <!-- Reserved Meta key for Feed -->
  <Key description="Source Location"  level="IndexValues"
name="location.src" format="Text"  valueMax="10000"
defaultAction="Open"/>
 </Language>
```

4. To restart the Concentrator service, in the Services view, click > **Restart**.

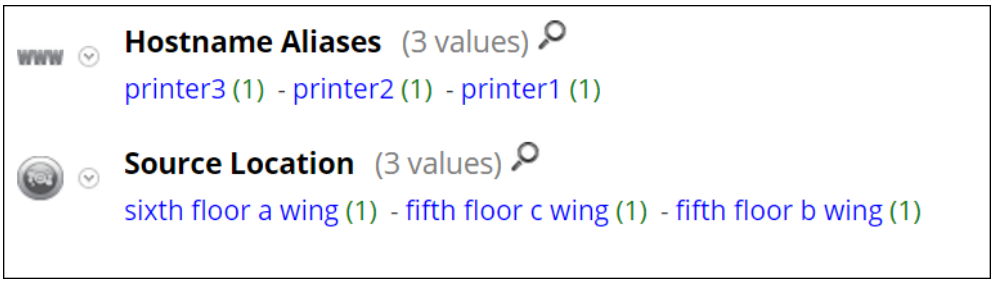
Note: In case of the Broker, the Broker derives its index from the Concentrator from which it aggregates. So you do not need to create custom meta in the Broker. If you have not indexed the meta key in the Concentrator, the Broker does not display the meta key in Investigate.

Investigate a Custom Meta Key

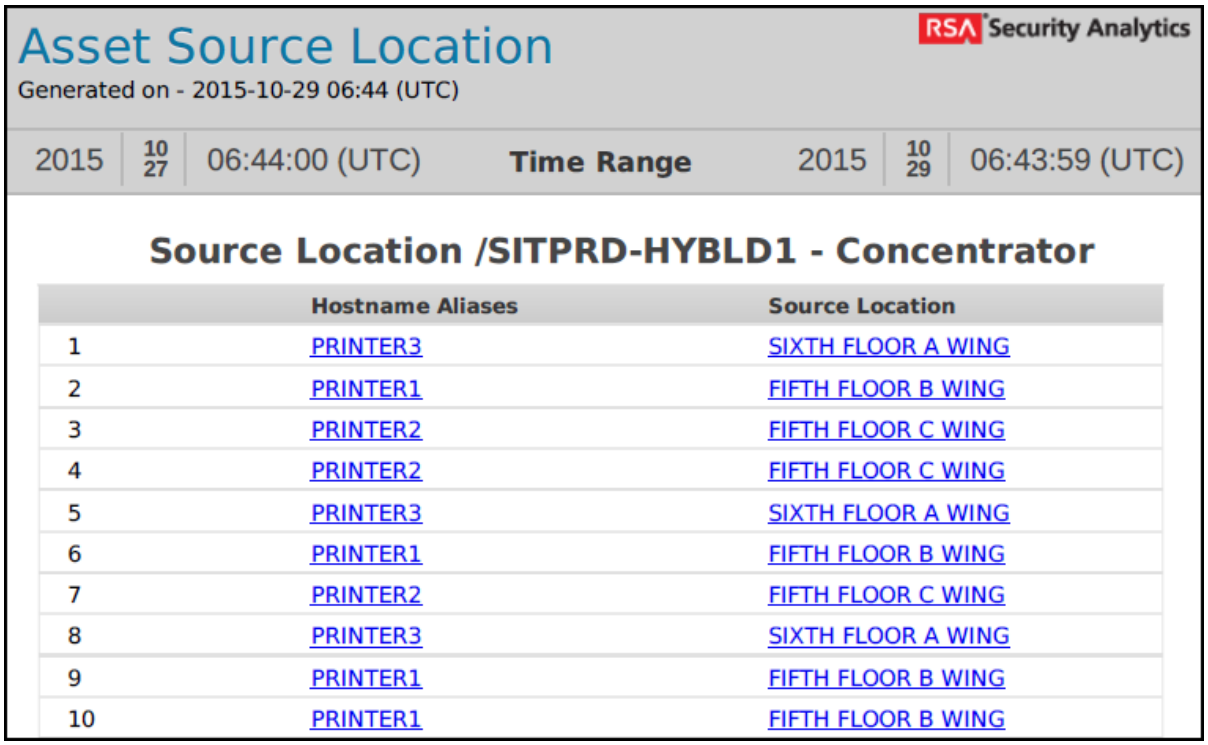
Note: You have to log out and log back in to the NetWitness Platform User Interface in order to view the custom meta key in Investigate.

To investigate a custom meta key:

1. Go to **INVESTIGATE**.
   The Investigate dialog, which provides services, is displayed.
2. Select a Concentrator service, and click **Navigate**.



Here is an example of a report executed on the Concentrator.



Asset Source Location

RSA Security Analytics

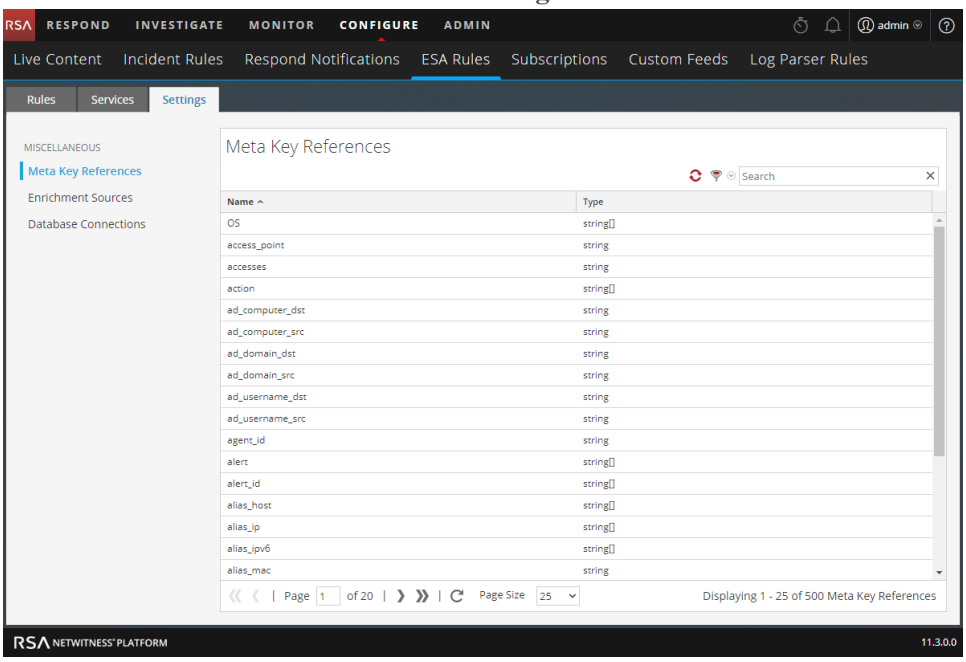
Additional Procedures

The following procedures must be executed if you have Warehouse Connector, Archiver, Reporting Engine, and ESA configured.

Verify the Custom Meta Keys on ESA

After you add custom meta keys on the Concentrator, you can verify that your meta keys are updated on ESA.

1. Go to **CONFIGURE > ESA Rules > Settings** tab.



2. In the Meta Key References, click the Meta Re-Sync (Refresh) icon ( ).

3. Verify that the custom meta keys appear on ESA. If you do not see the meta keys, you may need to restart the Concentrator.

Update the Schema in Archiver

If you want to configure the Archiver, using the new custom meta keys, you need to update the Archiver schema in the Reporting Engine. To update the Archiver schema in Reporting Engine:

1. Go to **ADMIN** > **Services** > **Archiver**.
2. Select > **View** > **Config** > **Files** > **index-archiver-custom.xml**.
3. Add the custom meta key entry in the Archiver index file.

```
<Language>
  <?xml version="1.0" encoding="utf-8"?>
  <Language level="IndexNone" defaultAction="Auto">
  <!-- Reserved Meta key for Feed -->
  <Key description="Source Location" level="IndexValues"
name="location.src" format="Text"
  valueMax="10000" defaultAction="Open"/>
 </Language>
```

4. To restart the Archiver service, click > **Restart.**
   The Archiver schema is updated with the custom meta key.

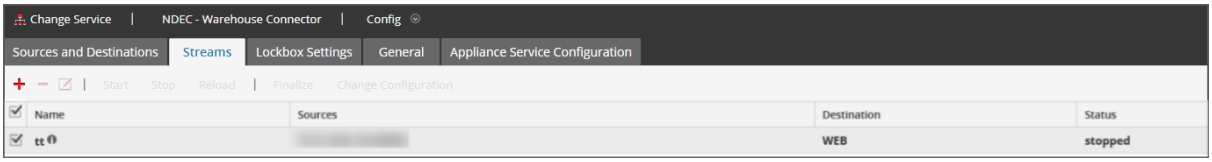
Update the Schema in Warehouse Connector

If you want to configure the Warehouse Connector with custom metadata and use it in a Warehouse Connector report then you need to update the Warehouse Connector schema in the Reporting Engine.

If the Log Decoder or Decoder, where the custom meta key is added, is one of the sources in the Warehouse Connector stream, you need to update the schema in the Warehouse Connector.

To update the Warehouse Connector schema in the Reporting Engine:

1. Go to **ADMIN** > **Services** > **Warehouse Connector**.
2. Click > **View** > **Config**.
   The Services Config view of Warehouse Connector is displayed.
3. Click the **Streams** tab.
4. Select the stream and then click **Reload**.
   The Warehouse Connector pulls the schema from the downstream devices (Log Decoder/Decoder).



For more information on streams, see "Configure Streams" in the *Warehouse Connector Configuration Guide*.

Update the Schema in Reporting Engine

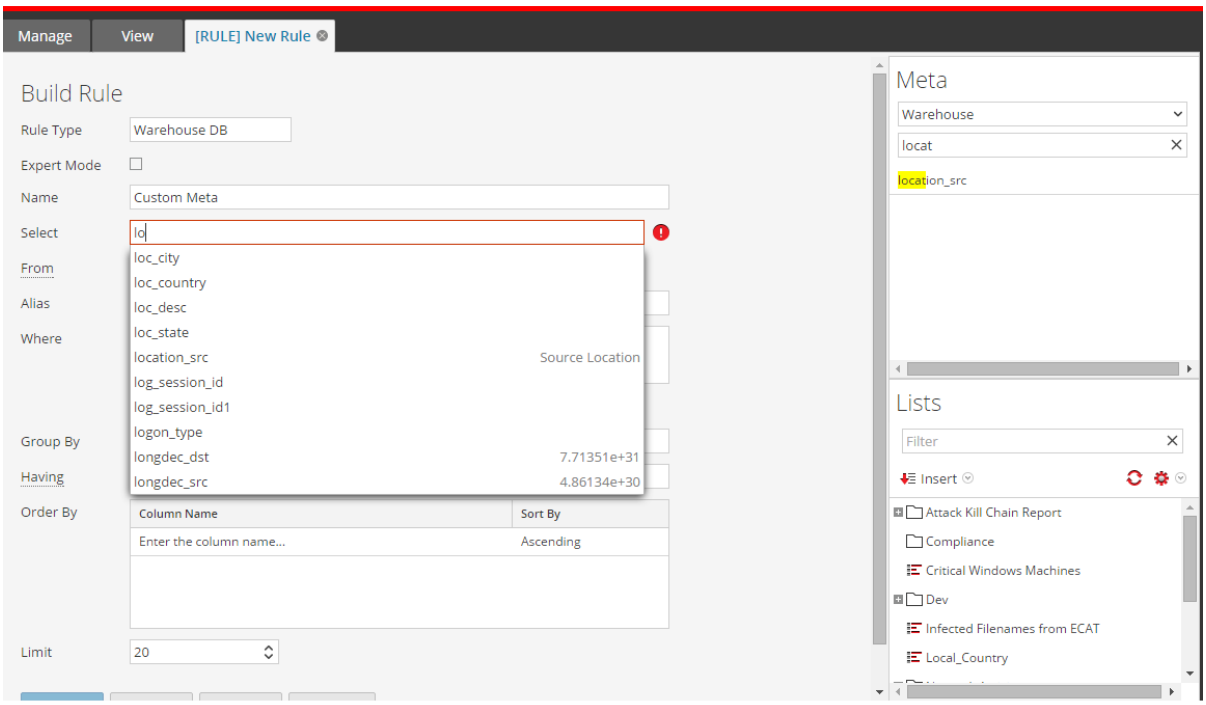
To update the schema in Reporting Engine:

1. Go to **ADMIN** > **Services** > **Reporting Engine.**
2. Click > **Restart.**

Note: Restart the Reporting Engine or wait for thirty minutes for the schema to be updated.

To view the custom meta key:

1. Navigate to **Monitor** > **Reports** > **Rules**.
2. In the toolbar, click .
3. Select **Warehouse DB**.
4. In the **Build Rule** tab, search for the custom meta from the right panel.
   The custom meta key is displayed.



Upload and Delete Custom Parsers

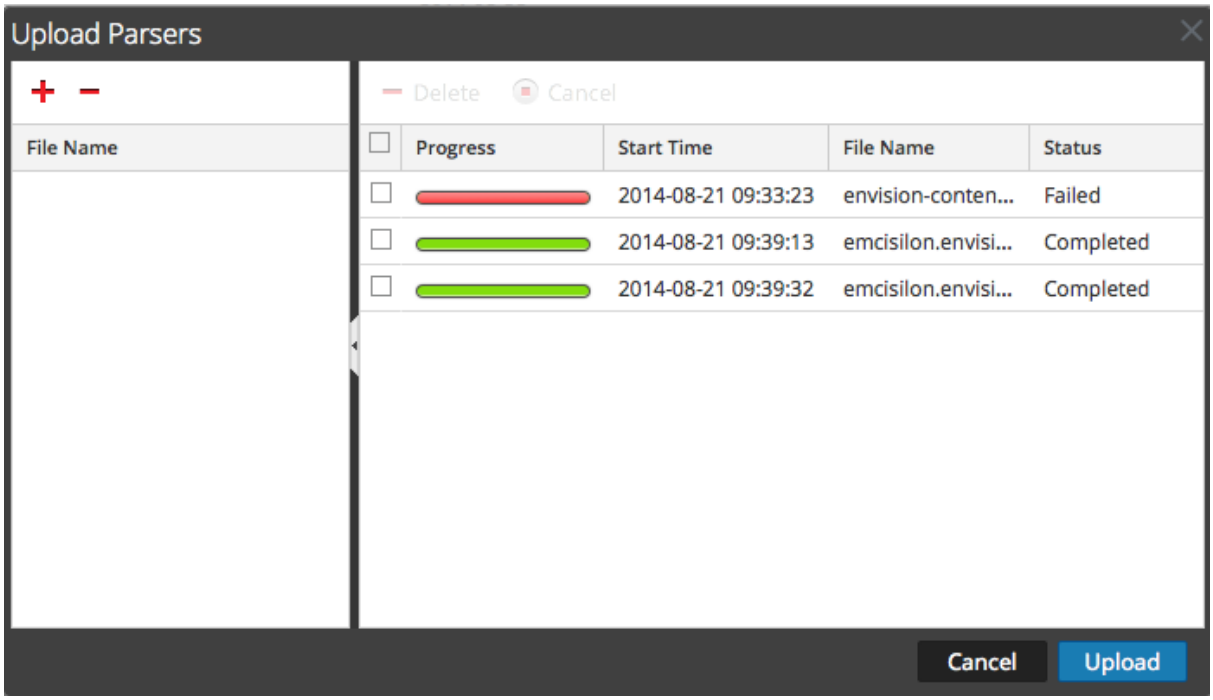
RSA NetWitness Platform has the ability to upload parsers from your local system and delete these parsers.

Upload Parsers to a Decoder or Log Decoder

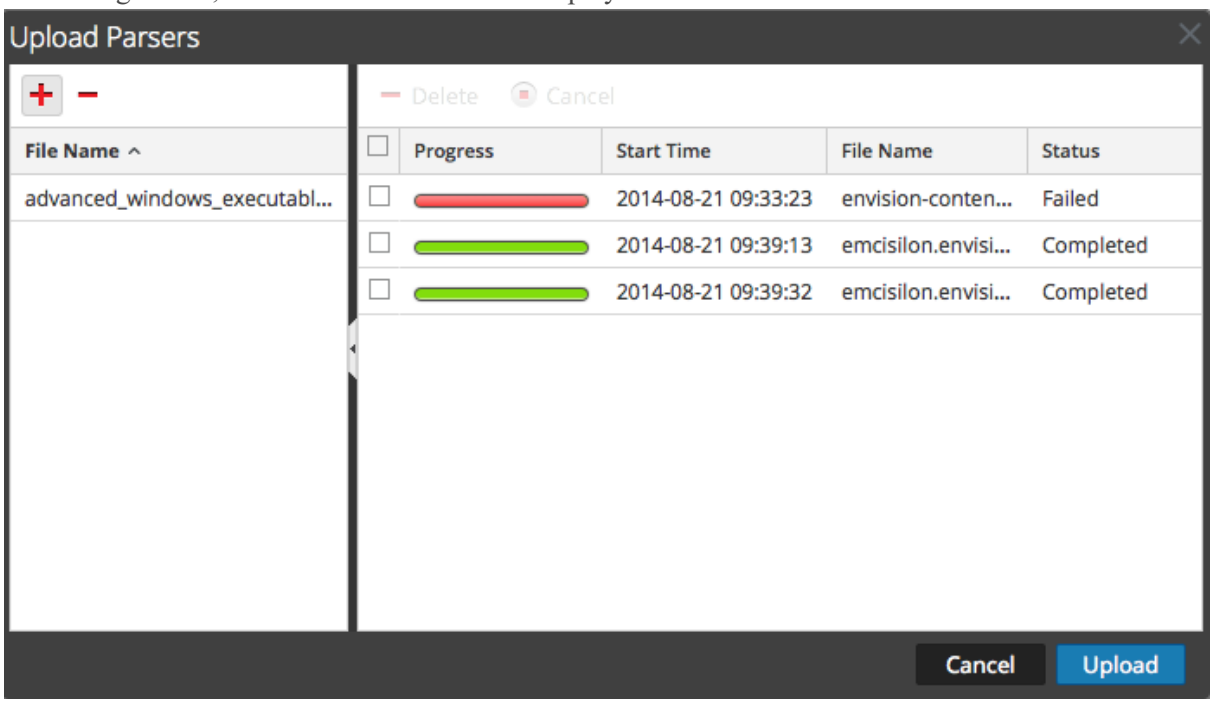
The Upload option in the Service Config view > Parsers tab displays the Upload Parsers dialog, in which you can manage the uploading of parsers to a Decoder or Log Decoder. In the File list, you prepare a list of parsers for uploading. You can add files from a directory structure, and delete files from the list if you decide that you don't want to upload a particular file. When the list is ready, clicking Upload starts the upload process.

1. Go to **ADMIN > Services**, select a service, and > **View > Config.**
   The Config view for the selected service is displayed.
2. Click the **Parsers** tab.

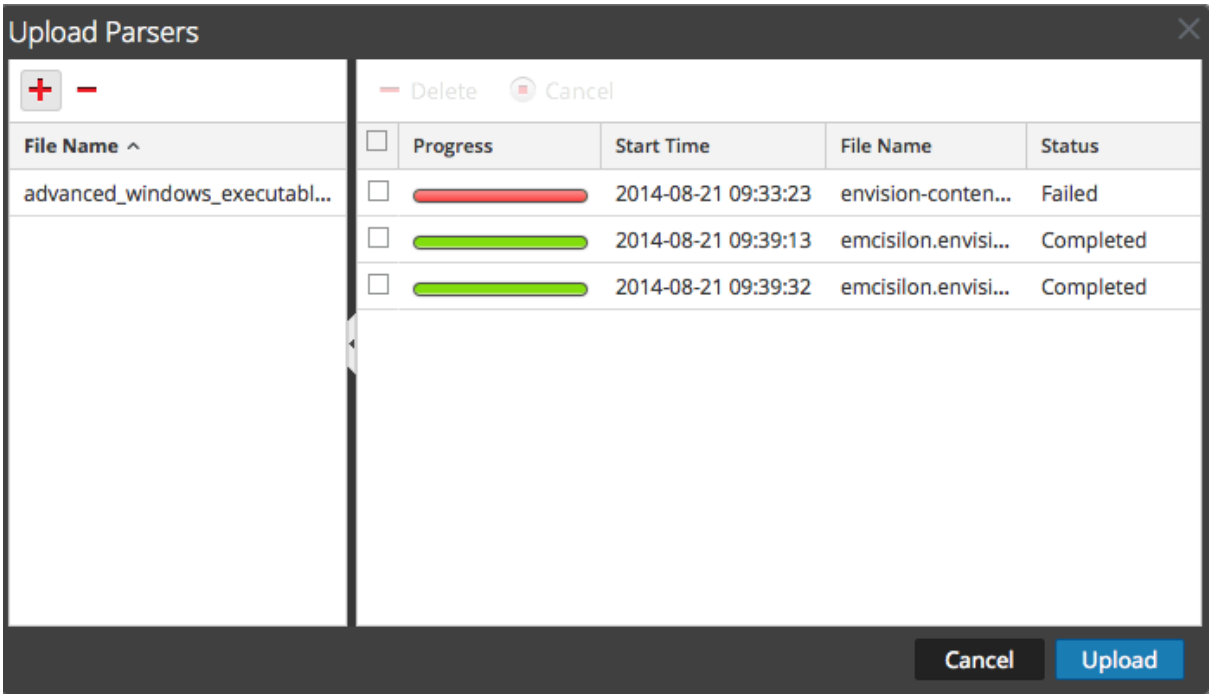
3. Click Upload.
   The Upload Parsers dialog is displayed.



4. Click + .
   A file selection dialog is displayed.
5. Select the **.flex**, **.parser**, and **.lua** files to be updated, and click **Open**.
   The dialog closes, and the selected files are displayed in the File list.



6. Click **Upload**.
   The Upload Job grid shows the progress of the upload jobs with each job representing a file being uploaded.



7. Use any of the Upload grid tools to manage the upload of selected jobs: pause and resume, cancel, and delete.
   Once a job is complete, it is deployed on the Decoder and listed with the deployed parsers in Parsers tab.

Manage Upload Jobs

You can use any of the Upload grid tools to manage the upload of selected jobs: pause, resume, cancel, and delete.

- To cancel uploading a set of parsers while the upload is in queue or progress, click Cancel.
- To pause uploading a set of parsers, if the upload is not yet complete, click Pause.
- To resume uploading a set of parsers after a pause, click Resume.
- To delete an upload job, click −.

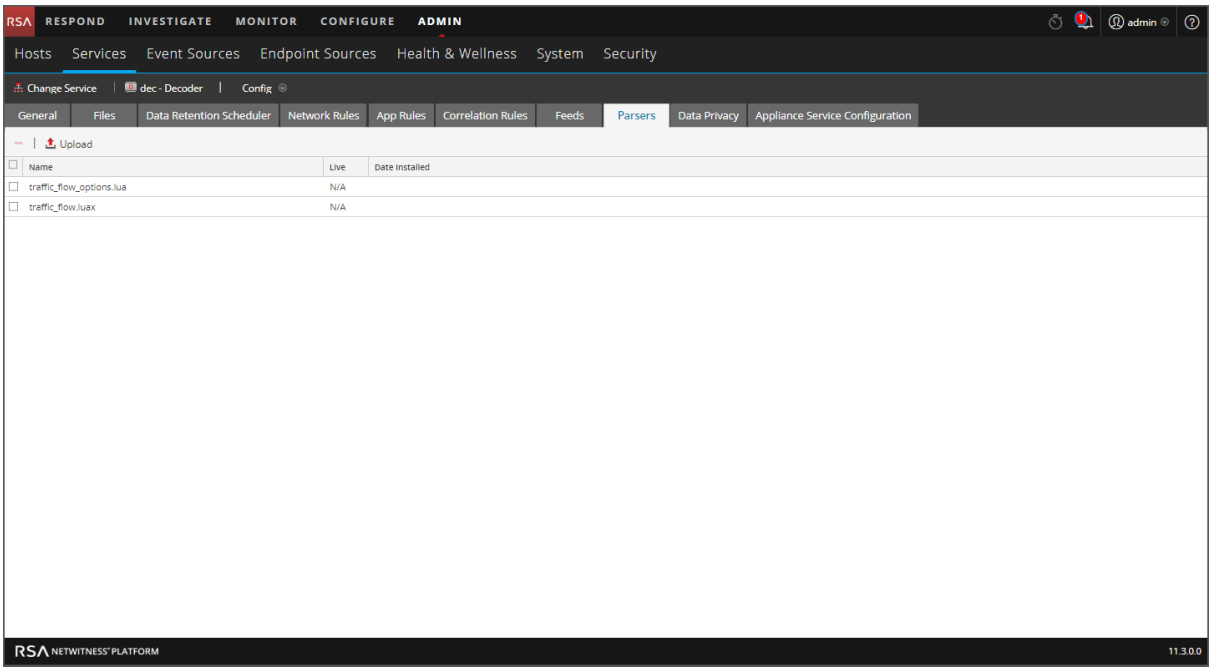
Delete Deployed Parsers

The Delete option in the Service Config view > Parsers tab provides a way to delete deployed parsers from a Decoder or Log Decoder. Parsers can be added and removed while a Decoder is running without affecting capture.

Note: Unless otherwise stated, any reference to Decoders applies to Log Decoders as well.

To delete a parser from a Decoder:

1. Go to **ADMIN > Services**, select a Decoder, and > **View** > **Config.**
   The Services Config view for the selected service is displayed.
2. Click the **Parsers** tab.



3. In the **Parsers** tab, select one or more parsers to delete.
4. Click .
   A dialog requests confirmation that you want to delete the parsers.
5. If you want to delete the parsers, click **Yes**.
   The parsers are removed from the Decoder immediately.

Enable and Configure the Entropy Parser

Beginning with NetWitness Platform 11.0, the administrator can configure a Decoder to use a NetWitness native parser, known as the Entropy parser. When the Entropy parser is enabled, analysts have visibility into channels that are trying to blend in with other traffic, but do not follow normal protocol behavior. This helps to identify channels that do not conform to the normal environment traffic baseline, and may be worthy of investigation.

The parser creates meta keys, based on statistics collected by the native NetWitness Platform parser, that help to identify behavior of any channel that is getting lots of network traffic. When the parser is first enabled, the analyst needs to become familiar with overall behavior for the different channels seen in a captured session to understand the frequency of bytes and the normal client and server payload. Once the normal behavior is known, analysts can use the meta keys to find behavior that does not match the expected.

By default, the Entropy parser generates 10 additional meta keys that do not add significantly to the load on a Decoder, and are useful for this specialized case. The parser is disabled by default.

Enable indexing if you have interest in exploring interesting sessions based on payload byte analysis of the packets. By default, to make indexing easier, the normal `Float32` value for `entropy.req` and `entropy.res` is multiplied by 10k and stored in a `UInt16` (thus giving four digits of precision, 0 to 10,000).

However, if you define the `entropy.*` fields in the Decoder language to be `Float32`, the Decoder will store it as a float with a range of 0.0 to 1.0. Take care to change the language everywhere if you decide to keep it as a `Float32`.

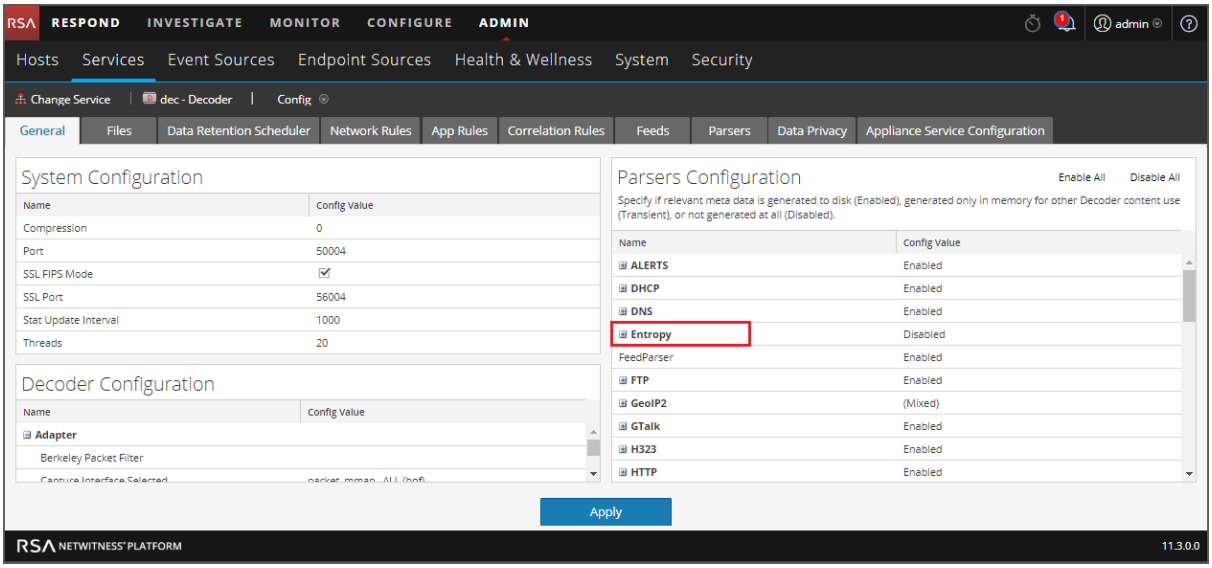
RSA does not recommend indexing as a `Float32` because of the high unique counts due to minute changes in precision.

These are the new meta keys generated by the Entropy parser by default:

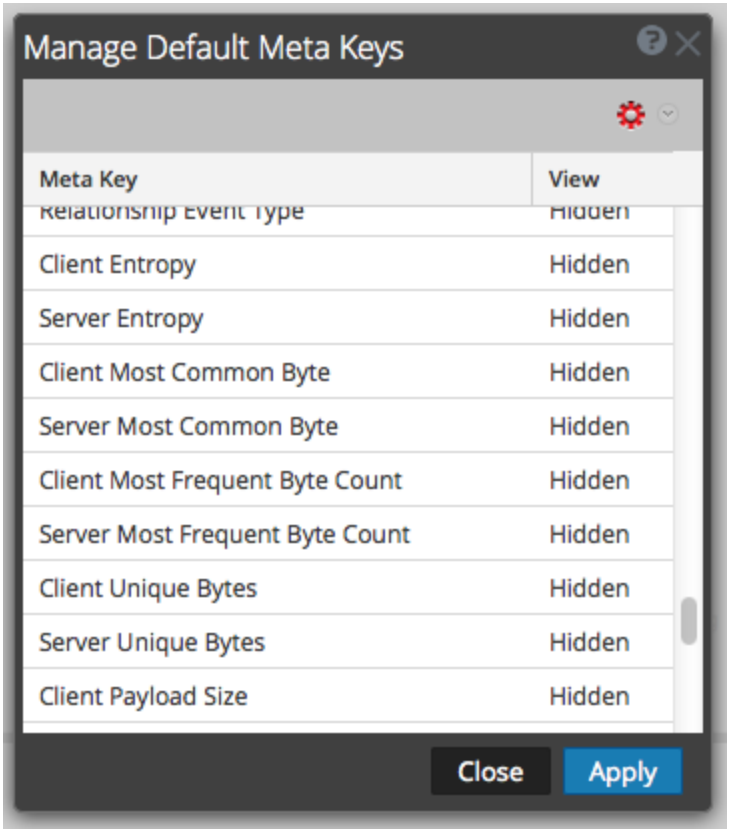
- `entropy.req` and `entropy.res`: These meta keys capture entropy using the Shannon entropy equation, which has a floating point value as a result. The floating point value of 0 to 1.000 is multiplied by 10000 and written in NetWitness Platform as `UInt 16`, an unsigned integer of 0 through 10000. .
- `mcb.req` and `mcb.res`: The most common byte is simply which byte for each side (0 thru 255) was seen the most.
- `mcbc.req` and `mcbc.res`: The most common byte count is the number of times the most common byte (above) was seen in the session streams.
- `ubc.req` and `ubc.res`: - Unique byte count is the number of unique bytes seen in each stream. 256 would mean all byte values of 0 thru 255 were seen at least once.

To enable and configure the Entropy parser on a Decoder:

1. Log in to RSA NetWitness, and select **ADMIN > Services** in the NetWitness Platform menu.
2. In the Services view, select the Decoder that you want to configure, and then **View > Config**. The Services Config view for the selected Decoder is displayed.
3. The Entropy parser is disabled by default. Click the drop-down list under **Config Value** and select **Enabled**. If you want to disable some of the meta keys, click the drop-down list and select **Disabled** next to the meta key.



4. Click **Apply**.
   The Entropy parser is enabled and begins creating the new meta keys as configured in the Concentrator custom index file.
5. In the Service Config view select the Concentrator that is aggregating traffic from this Decoder. Select **View > Files** and open the Custom Index file for the Concentrator. Look for the Entropy parser meta keys to see if they are included and uncommented.
   By default the keys are commented out and therefore not enabled. To enable that part of the language the administrator needs to copy that part of index file into the `index-concentrator-custom.xml` and uncomment the `key description` line for each meta key. An example of the custom index file with the Entropy parser keys and instructions is shown below.
6. With the Entropy meta keys enabled, they are available to analysts in Investigate, but hidden by default. To make the meta keys visible in the Investigate Values view, edit the default meta keys in the Default Meta Keys dialog so that they are open instead of hidden. You can manage these meta key the same way you manage other meta keys.



Entropy Parser Configuration in the Concentrator Custom Index File

The following is an excerpt of the Concentrator Index file lines that the administrator must copy to the custom index file. The comments provide guidance on configuring the parser.

```
<!-- This section is commented out because it's only used by the Entropy
parser which is disabled by default. To enable this part of the language, copy
to index-concentrator-custom.xml and uncomment the keys. HOWEVER, take note
that depending on how the Entropy parser is configured, the entropy.req and
entropy.res format might be a Float32 instead of a UInt16. So make sure to
change to the correct type if necessary.-->

<!-- Entropy parser meta - enable indexing if you have interest in exploring
this for interesting sessions based on payload byte analysis of the packets.
By default, to make indexing easier, the normal Float32 value for entropy.req
and entropy.res is multiplied by 10k and stored in a UInt16 (thus giving 4
digits of precision, 0 to 10,000). However, if you define the entropy.* fields
in the Decoder language to be Float32, it will store it as a float with a
range of 0.0 to 1.0. Take care to change the language everywhere if you decide
to keep it as a Float32. We do not recommend indexing as a Float32 because of
the high unique counts due to minute changes in precision. -->

<!--

<key description="Entropy Request (Client)" format="UInt16" level="IndexNone"
name="entropy.req" valueMax="10001"/>

<key description="Entropy Response (Server)" format="UInt16" level="IndexNone"
name="entropy.res" valueMax="10001"/>

-->

<!-- The most common byte is simply which byte for each side (0 thru 255) was
seen the most -->

<!--

<key description="Most Common Byte Request" format="UInt8" level="IndexNone"
name="mcb.req"/>

<key description="Most Common Byte Response" format="UInt8" level="IndexNone"
name="mcb.res"/>

-->

<!-- The most common byte count is the number of times the most common byte
(above) was seen in the session streams -->

<!--

<key description="Most Common Byte Count Request" format="UInt32"
level="IndexNone" name="mcbc.req" valueMax="500000"/>

<key description="Most Common Byte Count Response" format="UInt32"
level="IndexNone" name="mcbc.res" valueMax="500000"/>

-->

<!-- Unique byte count is the number of unique bytes seen in each stream. 256
would mean all byte values of 0 thru 255 were seen at least once -->

<!--

<key description="Unique Byte Count Request" format="UInt16" level="IndexNone"
name="ubc.req"/>

<key description="Unique Byte Count Response" format="UInt16"
level="IndexNone" name="ubc.res"/>

-->

<!-- The payload size metrics are the payload sizes of each session side at
the time of parsing. However, in order to keep indexing from having high
unique counts (bad for performance), the two payload size metas below are
indexed in buckets. -->
```

```
<!--
<key description="Payload Size Request" format="UInt32" level="IndexNone"
bucket="true" name="payload.req" valueMax="500000"/>
<key description="Payload Size Response" format="UInt32" level="IndexNone"
bucket="true" name="payload.res" valueMax="500000"/>
-->
```

Decoder and Log Decoder Additional Procedures

This topic explains the additional procedures an administrator could choose to follow which are not essential for the configuration of the Decoder or Log Decoder.

Topics

- Configure 10G Capability
- Configure a Log Decoder to Accept Protobuf
- Configure Session Split Timeouts
- Configure Syslog Forwarding to Destination
- Configure Transaction Handling on a Decoder
- Decrypt Incoming Packets
- Edit Decoder System Configuration
- Enable CPU Usage Statistics for Installed Content
- Enable Parser Mappings
- Enable or Disable Lua and Flex Parsing Systems
- Map IP Address to Service Type for Log Parsing
- Obtain Log Files from a Pre-11.0 Log Decoder
- Upload a Log File to a Log Decoder
- Upload a Packet Capture File

Configure 10G Capability

This topic guides administrators in how to tune a Network Decoder specifically for high speed packet capture using NetWitness Platform 11.x. This applies when capturing packets on a 10G interface card.

Caution: Packet capture at high speeds requires careful configuration and pushes the Decoder hardware to its limits, so please read this entire topic when implementing a 10G capture solution.

RSA NetWitness Platform provides support for high-speed collection on the Decoder. You can capture network packet data from higher speed networks and optimize your Network Decoder to capture network traffic up to 8Gb/sec sustained and 10Gb/sec burst, depending on which parsers and feeds you have enabled.

Enhancements that facilitate capture in these environments include the following:

- Utilization of the `pf_ring` capture driver capability to leverage the commodity 10G Intel NIC card for high-speed capture.
- Introduction of `assembler.parse.valve` configuration, which automatically disables application parsers when certain thresholds are exceeded, to limit risk of packet loss. When the application parsers are disabled, network layer parsers are still active. When stats fall below exceeded thresholds, application parsers are automatically re-enabled.

Hardware Prerequisites

- A Series 4S, Series 5 or Series 6 Decoder
- An Intel 82599-based ethernet card, such as the Intel x520. All RSA-provided 10G cards meet this requirement. Two examples are:
  - All SMC-10GE cards provided by RSA.
  - A Dell Network Daughter Card using an Intel controller to provide 10G network interfaces. This is included in all Series 5 hardware.
- For the Series 4S / Dell R620 only: 96 GB of DD3-1600 memory in **dual-rank** DIMMs. Single-rank DIMMs may decrease performance by as much as 10%. To determine the speed and rank of the installed DIMMs, run this command:
  `dmidecode -t 17.`
- Sufficiently large and fast storage to meet the capture requirement. Storage considerations are covered later in this topic.
- Each Network Decoder configured with a minimum of 2 DACs or SAN connectivity.

Software Prerequisites

- Dell R620-based systems, such as the Series 4S, must have their BIOS updated to v1.2.6 or later.
- The 10G Decoder capability is only supported on RSA-provided Decoder Installation images. All

required software is installed by default.

- If upgrading from a previous release, perform the upgrade first before proceeding with configuration

Install the 10G Decoder

Note: You can skip to "Configure the 10G Decoder" if you are starting with new Series 5 or Series 6 hardware.

Perform the following steps to install the NetWitness 10G Decoder:

Download and Update the BIOS

Note: BIOS revisions earlier than v1.2.6 have issues properly identifying the location of the 10G capture card within the system. It is recommended that customers update to the latest v2.2.3 BIOS, but is not required for 10G if they are running v1.2.6 or later.

1. Download BIOS v2.2.3 from the following location:

   http://www.dell.com/support/home/us/en/19/Drivers/DriversDetails?driverId=V7P04
2. Download the Update Package for the Red Hat Linux file.
3. Copy the file to the NetWitness server.
4. Login as `root`.
5. Change the permissions on the file to execute.
6. Run the following file:

   `./BIOS_V7P04_LN_2.2.3.BIN`
7. Reboot the system when execution is complete and a reboot is requested.

Note: The BIOS installation procedure takes approximately 10 minutes.

Locate the 10G Decoder Packages

The packages required to configure the 10G Decoder should already be present on the Decoder installation image. You should not have to install any additional packages.

Verify 10G Decoder Packages Are Installed

Installation of the 10G Decoder packages is handled automatically. Therefore, there should be no action to enable the 10G functionality.

- If you upgraded the kernel packages as part of an upgrade, a reboot is required. The operating system will recompile and install the drivers for the upgraded kernel.
- You can verify that the installation was successful if you see additional `PFRINGZC` interfaces available when selecting the Capture Port Adaper as described below.

Configure the 10G Decoder

Perform the following steps to configure the 10G Decoder:

1. From the **Decoder Explore** view, right-click **Decoder** and select **Properties**.
2. In the properties drop-down menu, select **reconfig** and enter the following parameters:
   `update=1 op=10g`
   This adjusts the Decoder packet processing pipeline to allow for higher raw data throughput, but less parsing ability.
3. From the **Decoder Explore** view, right-click **database** and select **Properties**.
4. In the **Properties** drop-down menu, select **reconfig** and enter the following parameters:
   `update=1 op=10g`
   These parameters adjust the packet database to use very large file sizes and Direct I/O.
5. Select the capture port adapter. Options for this include (in the following examples, "p1p1" and "p1p2" are placeholders and should be replaced with your own interface names):
   - Single port capture - **PFRINGZC,p1p1** or **PFRINGZC,p1p2**
   - Capture off both ports – Select **PFRINGZC,P1P1** and in the **Explore** view, set `capture.device.params = device=zc:p1p2,zc:p1p1`
6. If the write thread is having trouble sustaining the capture speed, you can try the following:

   Change `/datebase/config/packet.integrity.flush` to `normal`.

   Note: You can adjust the `packet.file.size` to a higher value, but keep the file size under 10 GB, as the whole file is buffered in memory.
7. (Optional) Application parsing is extremely CPU intensive and can cause the Decoder to drop packets. To mitigate application parsing-induced drops, you can set `/decoder/config/assembler.parse.valve` to `true`. These are the results:
   - When session parsing becomes a bottleneck, application parsers (HTTP, SMTP, FTP, and others) are temporarily disabled.
   - Sessions are not dropped when the application parsers are disabled, just the fidelity of the parsing performed on those sessions.
   - Sessions parsed when the application parsers are disabled still have associated network meta (from the network parser).
   - The statistic `/decoder/parsers/stats/blowoff.count` displays the count of all sessions that bypassed application parsers (network parsing is still performed).
   - When session parsing is no longer a potential bottleneck, the application parsers are automatically re-enabled.
   - The assembler session pool should be large enough that it is not forcing sessions.
   - You can determine if sessions are being forced by the statistic `/decoder/stats/assembler.sessions.forced` (it will be increasing). Also `/decoder/stats/assembler.sessions` will be within several hundred of `/decoder/config/assembler.session.pool`.
8. (Optional) If you need to adjust the MTU for capture, add the `snaplen` parameter to `capture.device.params`. Unlike previous releases, the `snaplen` does not need to be rounded up to any specific boundary. The Decoder automatically adjusts the MTU set on the capture interfaces.

9. The following configuration parameters are deprecated and no longer necessary
   - The `core= parameter` in `capture.device.params`
   - Any configuration files under `/etc/pf_ring` directory

   Note: An Ethernet device installed post imaging does not require any configuration for use as a capture device. It does require configuration if it is used as a network interface, or for system tools to access it without manual configuration.

Typical Configuration Parameters

Typical configuration parameters are listed below. Actual parameters may vary depending on the amount of memory and CPU resources available.

1. Session and packet pool settings (under `/decoder/config`):
   - `pool.packet.pages` = `1000000`
   - `pool.session.pages` = `300000`
2. Packet write block size under (`/database/config/packet.write.block` size) set to `filesize`.

   Note: This configures the Decoder to buffer the file with huge pages and write using direct I/O for maximum performance.
3. Parse Thread Count (under `/decoder/config`).

   `parse.threads =12`

Storage Considerations

When capturing at 10G line rates, the storage system holding the packet and meta databases must be capable of sustained write throughput of 1400 MBytes/s.

Using the Series 4S Hardware (With Two or More DAC Units)

The Series 4S is equipped with a hardware RAID SAS controller capable of an aggregate 48Gbit/s of I/O throughput. It is equipped with eight external 6 Gbit ports, organized into two 4-lane SAS cables. The recommended configuration for 10G is to balance at least two DAC units across these two external connectors. For example, connect one DAC to one port on SAS card, and then connect another DAC to the other port on the SAS card.

For environments with more than two DACs, chain them off each port in a balanced manner. This may require re-cabling of DACs in an existing deployment, but should not affect data that has already been captured on the Decoder.

If adding new capacity, use the currently available `NwArrayConfig` script to provision the DAC units. The script automatically adds one DAC per execution (that means, if adding three DACs, then the script must be run three times), adding the DACs to the `NwDecoder10G` configuration as separate mount points. The independent mount points are important, as this configuration allows the `NwDecoder10G` to segregate write I/O from capture from the read I/O needed to satisfy packet content requests.

Using SAN and Other Storage Configurations

The Decoder allows any storage configuration that can meet the sustained throughput requirement. The standard 8-Gbit FC link to a SAN is not sufficient to store packet data at 10G; in order to use a SAN it may be required to perform aggregation across multiple targets using a software-RAID Scheme. Thus environments using SAN are required to configure connectivity to the SAN using multiple FCs.

Parsing and Content Considerations

Parsing raw packets at high speeds presents unique challenges. Given the high session and packet rates, parsing efficiency is paramount. A single parser that is inefficient (spends too long examining packets) can slow the whole system down to the point where packets are dropped at the card.

For initial 10G testing, start with only native parsers (except SMB/WebMail). Use the native parsers to establish baseline performance and with little to no packet drops. Do not download any Live content until this has been done and the system is proven to capture without issue at high speeds.

After the system has been operational and running smoothly, Live content should be added very slowly - especially parsers.

Best Practices

Whether you are updating a currently deployed system or deploying a new system, it is recommended you use the following best practices to minimize risk for packet loss. One caveat is if you are updating a current 10G deployment but not adding any additional traffic. For example, a current Decoder capturing off a 10G card at 2G sustained should see no difference in performance, unless part of the update also entails adding additional traffic for capture.

- Incorporate baseline parsers (except SMB/Webmail, both of which generally have high CPU utilization) and monitor to ensure little to no packet loss.
- When adding additional parsers, add only one or two parsers at a time.
- Measure performance impact of newly added content, especially during peak traffic periods.
- If drops start occurring when they did not happen before, disable all newly-added parsers and enable just one at a time and measure the impact. This helps pinpoint individual parsers causing detrimental effects on performance. It may be possible to refactor it to perform better or reduce its feature set to just what is necessary for the customer use case.
- Although lesser performance impacts, feeds should also be reviewed and added in a phased approach to help measure performance impacts.
- Application Rules also tend to have little observable impact, though again, it is best not to add a large number of rules at once without measuring the performance impact.

Finally, making the recommended configuration changes outlined in the Configuration section will help minimize potential issues.

Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- MA content (7 Lua parsers, 1 feed, 1 application rule)
- 4 feeds (alert ids info, nwmalwaredomains, warning, and suspicious)
- 41 application rules
- DNS_verbose_lua (disable DNS)
- fingerprint_javascript_lua
- fingerprint_pdf_lua
- fingerprint_rar_lua
- fingerprint_rtf_lua
- MAIL_lua (disable MAIL)
- SNMP_lua (disable SNMP)
- spectrum_lua
- SSH_lua (disable SSH)
- TLS_lua
- windows_command_shell
- windows_executable

NOT TESTED:

- SMB_lua, native SMB disabled by default
- html_threat

OTHER:

- HTTP_lua reduces the capture rate from >9G to <7G. At just under 5G this parser can be used in place of the native without dropping (in addition to the list above).
- xor_executable pushes parse CPU to 100% and the system can drop significantly due to parse backup.

Aggregation Adjustments Based on Tested Live Content

A 10G Decoder can serve aggregation to a single Concentrator while running at 10G speeds. Deployments using Malware Analysis, Event Stream Analysis, Warehouse Connector, and Reporting Engine are expected to impact performance and can lead to packet loss.

For the tested scenario, the Concentrator aggregates between 45 and 70k sessions/sec. The 10G Decoder captures between 40-and 50k sessions/sec. With the content identified above, this is about 1.5 to 2 million meta/sec. Due to the high volume of session rates, the following configuration changes are recommended:

- Nice aggregation on the Concentrator limits the performance impact on the 10G Decoder. The following command turns on nice aggregation.
  ```
  /concentrator/config/aggregate.nice = true
  ```

- Due to the high volume of sessions on the Concentrator, you may consider activating parallel values mode on the Concentrator by setting `/sdk/config/parallel.values` to `16`. This improves Investigation performance when the number of sessions per second is greater than 30,000.
- If multiple aggregation streams are necessary, aggregating from the Concentrator instead has less impact on the Decoder.
- Further review for content and parsing is required for deployments where you want to use other NetWitness Platform components (Warehouse Connector, Malware Analysis, ESA, and Reporting Engine).

Optimize Read/Write Operations When Adding New Storage

A 10G Decoder is optimized to stagger read and write operations across multiple volumes so that the current file being written is on a different volume from the next file that will be written. This allows maximum throughput on the raid volume when reading data from the last file being written while writing the current file on a different volume. However, if volumes are added after a Decoder has been in use, the ability to stagger is limited because one or more volumes are already full so the new volume is the only place new files can be written.

To remedy this situation, an administrator can run a `stagger` command on an existing NetWitness Platform database (packet, log, meta, or session), that has at least two volumes, to stagger the files across all volumes in the most optimal read/write pattern. The major use case is when new storage is added to an existing Decoder and you want to stagger the volumes BEFORE restarting capture.

The configuration nodes for this command are the session, meta, and packet databases. Each of these lives under `/database/config`, which is usually a root node. The config nodes for a Decoder are:

- `/database/config/packet.dir`
- `/database/config/meta.dir`
- `/database/config/session.dir`

The *NetWitness Platform Core Database Tuning Guide* has information on how those configurations are formatted.

The `stagger` command is typically only useful for a 10G Decoder and usually just for the packet database. Maximum performance is achieved for storing and retrieving packets when multiple volumes are present. In this scenario, the Decoder always fills the volume with the most free space. When the volumes are roughly the same size, this results in a staggered write pattern, which allows maximum throughput for reading and writing across all volumes. However, this only naturally occurs when multiple packet storage volumes are present at the time the Decoder is first deployed.

A typical use case is adding more storage to an existing Decoder to increase retention. However, when adding storage to an deployment that has already filled the existing volumes with stored packets, the Decoder will naturally fill the new storage with packets before rolling out any packets on the existing storage. This results in a suboptimal read/write pattern because most reads will occur on the same volume that is currently being written to. In a 10G deployment, reads are blocked from the volume when writes are occurring. This does not stop ALL reads on that volume, because the file is buffered in memory before being written, but it does result in suboptimal read performance.

With the `stagger` command, you can add more storage and then have the service naturally stagger the files across ALL volumes (existing and new) so that read performance is optimized.

Caution: This command should only be performed AFTER the storage is mounted and the Decoder configured to use it (for example, after adding the mount point(s) to `packet.dir`).

The downside to this command is it can take some time to stagger and the Decoder should not be capturing during the stagger operation.

Recommended workflow:

1. Add all storage and configure mount points.
2. Add new storage mount points to `packet.dir` (or `session.dir`/`meta.dir`) and restart service (very important!).
3. Ensure capture is stopped.
4. Run stagger operation but make sure the connection that initiated the stagger operation is never terminated until the operation is complete. If the connection is terminated, then the stagger operation will be canceled. If the operation is canceled, the files that were already staggered will remain in place. The operation can be resumed by rerunning the same command (the work already done will not need to be done again). If running stagger from NwConsole, run the `timeout 0` command before sending the `stagger` command. This will prevent the normal 30-second command timeout.
5. Start capture after `stagger` command finishes.

The following are the parameters for the command:

- `type` - The database that will be staggered (session, meta, or packet). Typically only the packet database is useful for staggering, but it is possible to do the session or meta database when multiple volumes are present for those databases. Since the session and meta databases write far less data than the packet database, typically staggering those databases results in less noticeable performance gains.
- `dryRun` - If `true` (the default), will only return a description of the operations that would be performed. If `false`, then the files will actually be moved to an optimal read/write pattern. You MUST pass false to actually stagger the files.

Example usage from NwConsole:

```
login <decoder>:50004 <username> <password>
timeout 0
send /database stagger type=packet dryRun=false
```

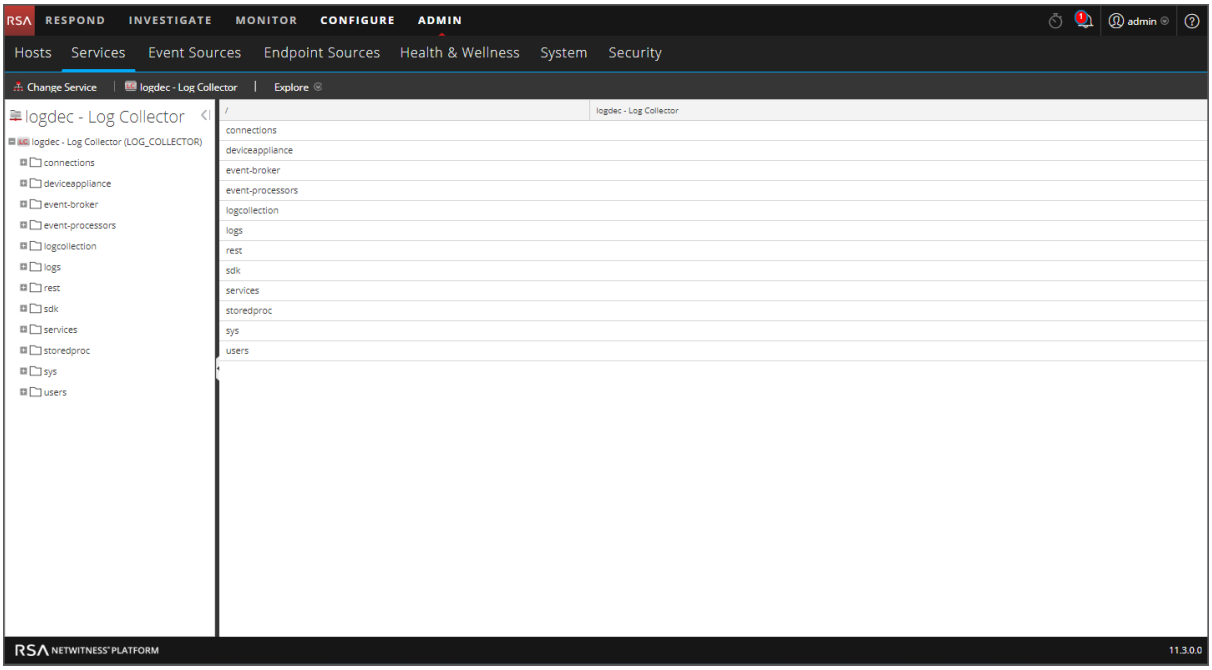
If you run this command via the RESTful API, please pass the additional parameter `expiry=0` to prevent a timeout from the service. You will also need to ensure the HTTP client does not disconnect before the operation completes.

Configure a Log Decoder to Accept Protobuf

There are occasions when you want to analyze log files that are in protobuf (Protocol Buffer) format. You can configure a Log Decoder with a Log Collector service to accept logs in protobuf (Protocol Buffer) format.

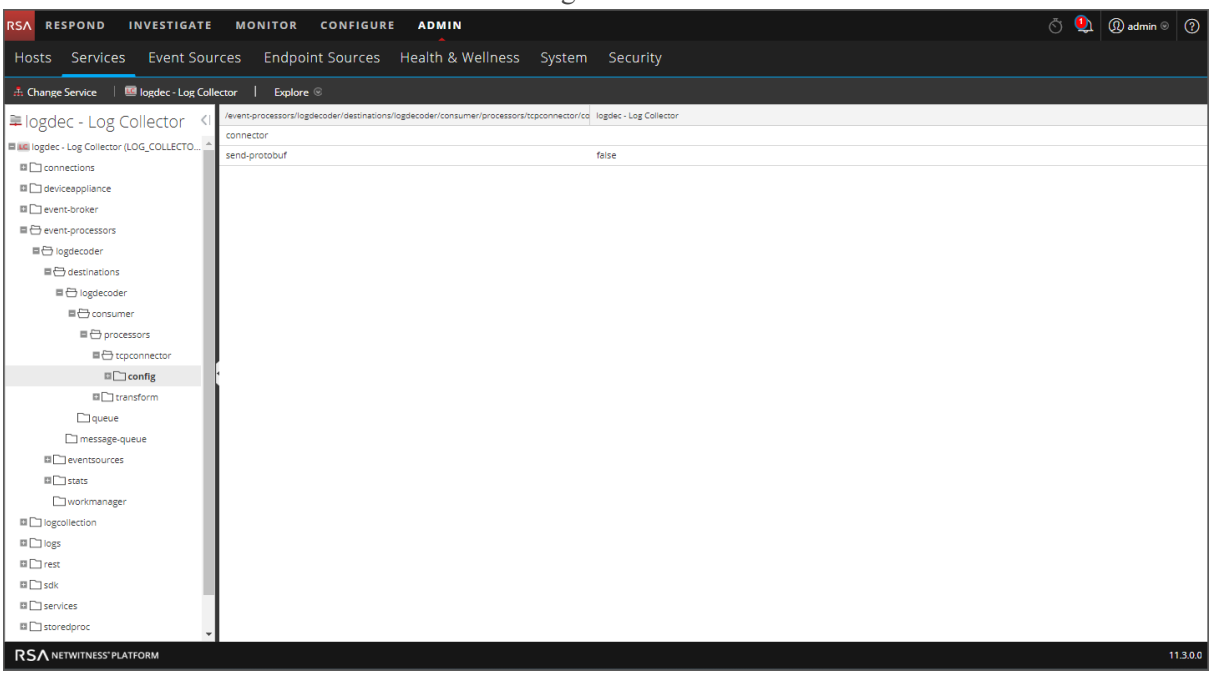
To import a log file to a Log Decoder:

1. Go to **ADMIN > Services**.
2. Select a Log Decoder with a Log Collector service in the **Service** list, and select > **View** > **Explore**.
   The Explore view for the Log Decoder -Log Collector is displayed.



3. Navigate to **`event-processors/logdecoder/destinations/logdecoder/consumer/processors/tcpconnector/config`**

Your screen should look similar to the following.



4. For the **send-protobuf** field, select **false**, and change the value to **true.**
5. Navigate to `event-processors/logdecoder/destinations/logdecoder/consumer/processors/tcpconnector/config/connector/channel/tcp` and change the **port** value to **50202**.
6. Navigate to `event-processors/logdecoder/destinations/logdecoder/consumer/processors/tcpconnector/config/connector/event` and change the following parameters:
   - Clear the **delimiter** field
   - Change **format** to **%text%**

Configure Session Split Timeouts

The default behavior of the Decoder is to automatically end sessions that exceed a configured size or have been inactive for a period of time. When the session is ended due to timeout, any subsequent packets received in that session appear to be stored in a new session. You can mitigate the effect of session splitting due to long periods of inactivity between packets using this procedure.

When a Decoder session exceeds a configured size (32MB by default, the `/decoder/config/assembler.max.size`) or has been inactive for a period of time, the session is split. NetWitness Platform has the previous packet and the next packet and can propagate session state from the initial session fragment to the subsequent session fragment.

Each session fragment is annotated (`session.split` meta) such that it can be identified and associated with other fragments from the actual network session. Directionality as determined by the initial session reduces the occurrence of fragments having reversed directionality.

If there is a gap in time between packets large enough that there are no longer any packets for the session in memory, the session is removed from the Decoder. If a subsequent packet shows up after this occurs, a new session is created with no context to the preceding session. The issue is the inability to continue a session when we encounter a gap between packets of a session that is larger than the packets we are buffering (based upon available memory and timeout configurations). Once the last packet of a session is removed from memory, the session is also removed, and with it the necessary context for ensuring consistent directionality.

There are two timeout settings in a Network Decoder, `/decoder/config/assember.timeout.session` and `assembler.timeout.packet`. Both default to 60 seconds. The setting `assembler.timeout.session` controls how long a session lives in Assembler without receiving another packet. The setting `assembler.timeout.packet` controls how long a session waits before getting parsed. If the session is kicked out of Assembler before this timeout, then it automatically goes to parsing.

The session timeout is the number of seconds since the last packet was added to that session. Therefore, this timeout resets on every packet added to that session. The packet timeout is the number of seconds since the very first packet for that session was added (in other words, the packet that created the session). This is never reset and once the timeout expires, the session is parsed.

The important point is a session can be parsed but still remain in Assembler. A session in Assembler can still have packets added to it, even if it has already been parsed. Packets added after the session is parsed will never be seen by parsers, but they will be attached to the session and can be viewed by a subsequent `/sdk content` or `/sdk packets` call.

After a session is parsed, the session AND its metadata are written to disk. At this point, they can be aggregated and "seen" by `sdk` commands. Packets are written in order of capture and are not reordered by what session they belong to. Nor are they necessarily written when the session and meta data are written.

You can disable both timeout nodes, `/decoder/config/assembler.timeout.session` and `assembler.timeout.packet`, by setting them to zero in the Services Explore view.

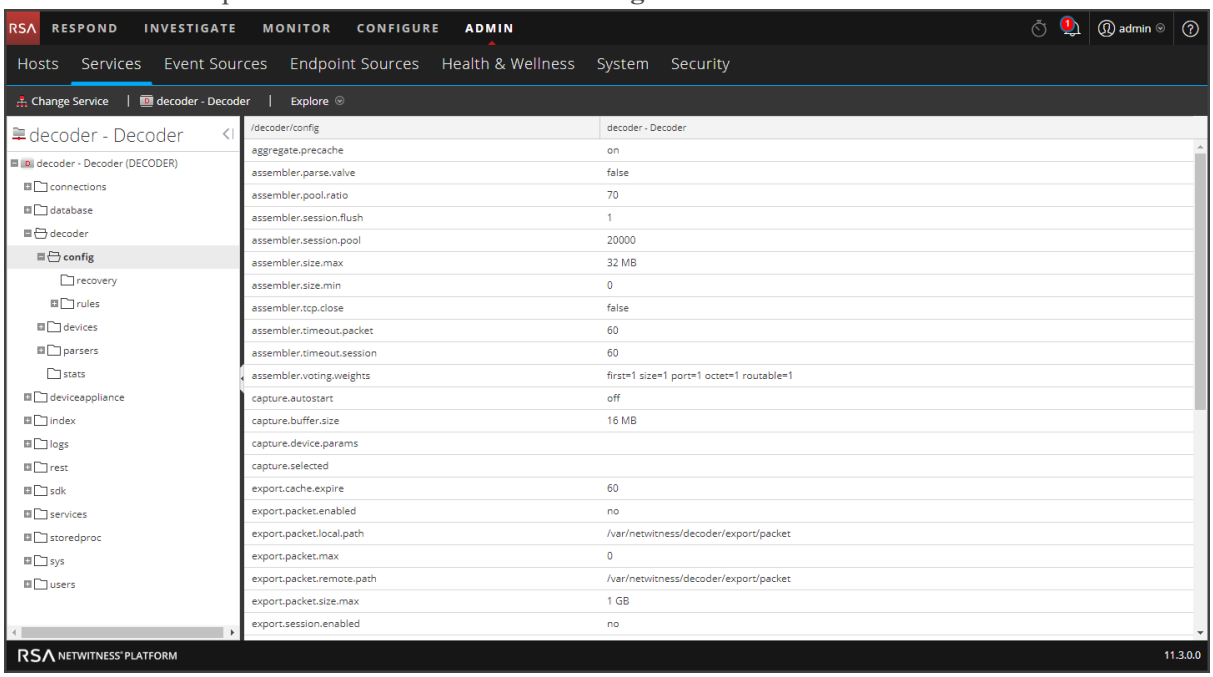
If both timeouts are disabled, the sessions are still split due to time or size expiration. However, the Decoder keeps track of the network stream for as long as it has sufficient memory. Thus, when more packets arrive on the same network stream, the Decoder adds `split` meta items to the subsequent sessions. Using a combination of the `split` metadata and the stream key, it is possible to reconstruct the network stream from the multiple sessions.

The length of time for which sessions are tracked is limited by the number of session pool entries available on the Decoder, and therefore the actual time window varies according to the rate at which new sessions are added. If new sessions are added at a high rate, the size of the time window decreases. The size of the pool is set using the configuration entry `/decoder/config/assembler.session.pool`, which sets the maximum number of sessions that will be tracked at a time.

The `/decoder/stats/assembler.timespan` statistic allows you to see when the Decoder is no longer tracking session splits because the ingest rate is too high and the Decoder does not have enough memory to track. This statistic shows the number of seconds tracked within the session table, which is the effective time window in which the Decoder can link together sessions. Under normal operation this statistic matches the value of `/decoder/config/assembler.timeout.session`, but when running in Time Split mode, the `/decoder/stats/assembler.timespan` statistic grows or shrinks depending on the ingest rate.

To configure Time Split mode, set the following configuration parameters and restart the Decoder:

1. In the ADMIN > Services view, select the Decoder service and **> View > Explore.**
2. In the Services Explore view select **decoder** > **config**.



3. Click in the **Value** column next to the parameter and set these two parameters :
   `/decoder/config/assembler.session.flush = 0`
   `/decoder/config/assembler.timeout.session = 0`
4. To see when the Decoder is no longer tracking session splits because the ingest rate is too high and the Decoder does not have enough memory to track, view the `/decoder/stats/assembler.timespan` statistic, in the Services Explore view select **decoder** >

stats.

Configure Syslog Forwarding to Destination

In addition to collecting Syslog messages, you can configure the Log Decoder to forward Syslog messages to another Syslog receiver.

Note: No configuration is necessary to collect Syslog messages on the Log Decoder.

NetWitness Platform forwards Syslog messages after it has parsed the messages and before it writes the messages to the Log Decoder.

Note: You must configure Syslog Forwarding using the steps defined in this topic using the **Explore** view.

The Log Decoder must be in the **Started** state before you can configure Syslog Forwarding. To configure Syslog Forwarding:

1. Configure Log Decoder application layer rules (Application rules) to tag Syslog messages with metadata that instructs NetWitness Platform to forward the messages:
   a. In the **Services** view, select a Log Decoder, and in the Actions column, select > **View** > **Explore**.
   b. Go to the **/decoder/config/rules/application** node, right-click **application,** and click **Properties**.
   c. In the **Properties** view, specify the **add** command with the following parameters:
   `rule=<query> name=<name>`
   Example 1: `rule=*name=receiver1`
   Example 2: `rule="device.type='winevent_nic'" name=receiver`)
   d. Click **Send**.

   NetWitness Platform creates the `name=receiver1 rule=* order=<n>` rule. NetWitness Platform inserts the order number (for example, `order=49`) based on when you set up the rule.

   e. Go to the `/decoder/config/rules/application` node and click the `name=receiver1 rule=* order=49` rule.

f. Add **alert forward** parameters to the rule parameters.

```
rule=* name=receiver1 order=49 alert forward
```

All other rule parameters have the same meaning as they do in other application rules.

The following Application rule example selects all logs with the `*` rule. It creates an alert meta with the value "**`receiver1`**" and tags the entire log for forwarding it to the syslog forwarding destination. You can define as many different forwarding rules as you need with the same name or unique names.

2. Define Syslog forwarding destinations and enable forwarding.

   a. In the **Services** view, select a Log Decoder, and > **View** > **Explore**.

   b. Syslog forwarding destinations are defined in the configuration node `/decoder/config/logs.forwarding.destination`.
   This configuration node contains one or more name/value pairs. The name corresponds to the name parameter in the application rule that you used to tag logs with forwarding meta. The value is a colon-separated triple of transport, host, and port followed by an optional formatting parameter.
   `name=(udp|tcp|tls):host:port[:(retainsource|rfc3164)]`
   The first parameter indicates the transport protocol and must be one of udp, tcp, or tls. Specifying udp will forward logs via RFC 3164 / RFC 5426 UDP syslog protocol. Specifying tcp will forward logs via a TCP connection with RFC 6587 framing. Specifying tls will forward logs in accordance with RFC 5425.
   The host is an IPv4 address, IPv6 address, or host name.

   The port is the port to which the logs are sent. This is typically port 514 for UDP syslog, and 6514 for TLS connections. There is no standard port assignment for syslog over TCP.

   Optionally, `retainsource` or `rfc3164` can be specified at the and of the destination string to indicate that additional formatting and information should be included with each log forwarded. Specifying `retainsource` will include z-connector headers at the beginning of the log based and will be populated by the `time`, `device.(ip|ipv6|host)`, and `lc.cid` meta and is best used for forwarding to other log decoders. The `rfc3164` option will prepend a valid RFC3164 header to all events forwarded constructed of the `syslog.pri`, `time`, and `device.(ip|ipv6|host)` meta. In both cases, the original log text is unmodified.

   Example forwarding destination:

   ```
   gears=tls:gears.netwitness.local:6514
   ```

   Example forwarding over tcp to blackout on port 514 with z-connector headers:

   ```
   fwdrule=tcp:blackout.netwitness.local:514:retainsour
   ```

In the `/decoder/config/logs.forwarding.destination` parameter, specify the destination. For example:

TLS Connections: `receiver1=tls:receiver1.netwitness.local:6514`

UDP Connections: `receiver1=udp:receiver1.netwitness.local:514`

TCP Connections: **`receiver1=tcp:receiver1.netwitness.local:514`**

Note:
You can configure:
- Multiple rules to forward logs to the same destination.
- Multiple rules to forward logs to multiple destination.

For TLS connections, the certificate of the forwarding destination must be validated. The certificate authority that signed the destination's certificate must be present in the Log Decoder's CA trust store and the certificate must reside on the destination or Syslog receiver. Refer to "Configure Certificates" in the *Log Collection Configuration Guide* for information about manipulating the Log Decoder's CA trust store. (Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.)

c. In the `/decoder/config/logs.forwarding.enabled` parameter, specify **true**.

Configure Transaction Handling on a Decoder

Beginning with RSA NetWitness® Platform 11.0, administrators can configure a Decoder to subdivide incoming sessions into smaller transaction sessions when using LUA parsers designed to create transactions. The feature allows analysts to perform analytics on the split sessions in downstream services such as Investigate.

Transaction Handling

The Decoder service configuration node has a new parameter for configuration of transaction handling: `/decoder/parsers/config/parser.transaction.mode`. This node controls the behavior of the Decoder when a parser defines a transaction within a network session.

The values for `parser.transaction.mode` correspond to the operating modes:

- `off` (transactions off)
- `meta` (transactions represented as meta items)
- `split` (transactions split sessions)

Transactions Off

When transactions mode is off, any application-level transactions created by parsers are ignored, and nothing is stored in the collection to represent the transaction.

Transactions Represented as Meta Items

In this mode of operation, when a parser generates an application-level transaction, a new meta item of type `{{trans}}` is added to the session in which the transaction occurred. The `{{trans}}` meta item contains a list of other meta items that constitute the transaction.

Transactions Split Sessions

In this mode of operation, when a parser generates an application-level transaction, the session is split. The session splitting is accomplished by:

1. A new session item is created.
2. Network meta items are copied from the parsed session into the new session.
3. Meta items marked in the transaction are moved from the original session to the new session.

The following meta items are duplicated into the split session from the session that was parsed:

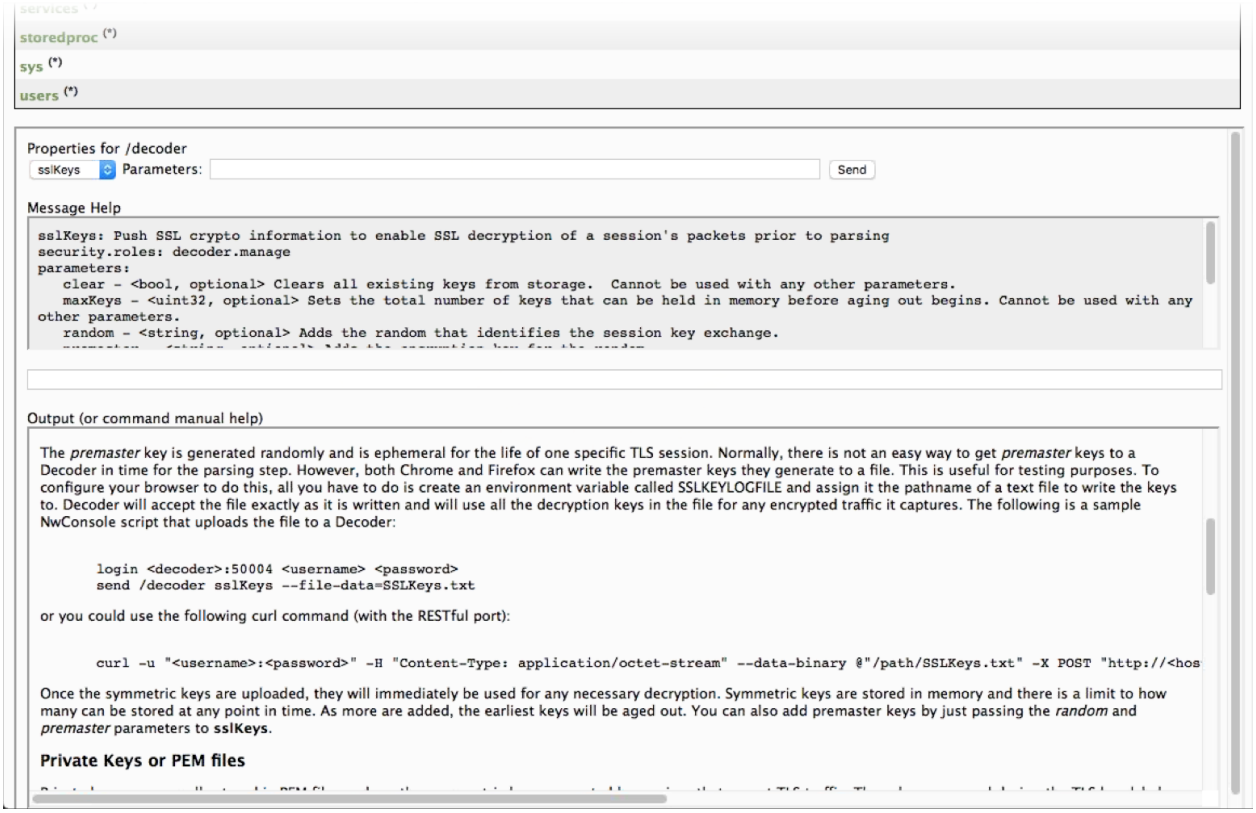
- `time`
- `medium`
- `eth.src`
- `eth.dst`
- `eth.type`
- `ip.proto`
- `ip.src`
- `ip.dst`
- `ipv6.src`
- `ipv6.dst`
- `ipv6.proto`
- `tcp.srcport`
- `tcp.dstport`
- `tcp.flags`
- `udp.srcport`
- `udp.dstport`
- `service`
- `udp.srcport`
- `udp.srcport`
- `tls.premaster`

Decrypt Incoming Packets

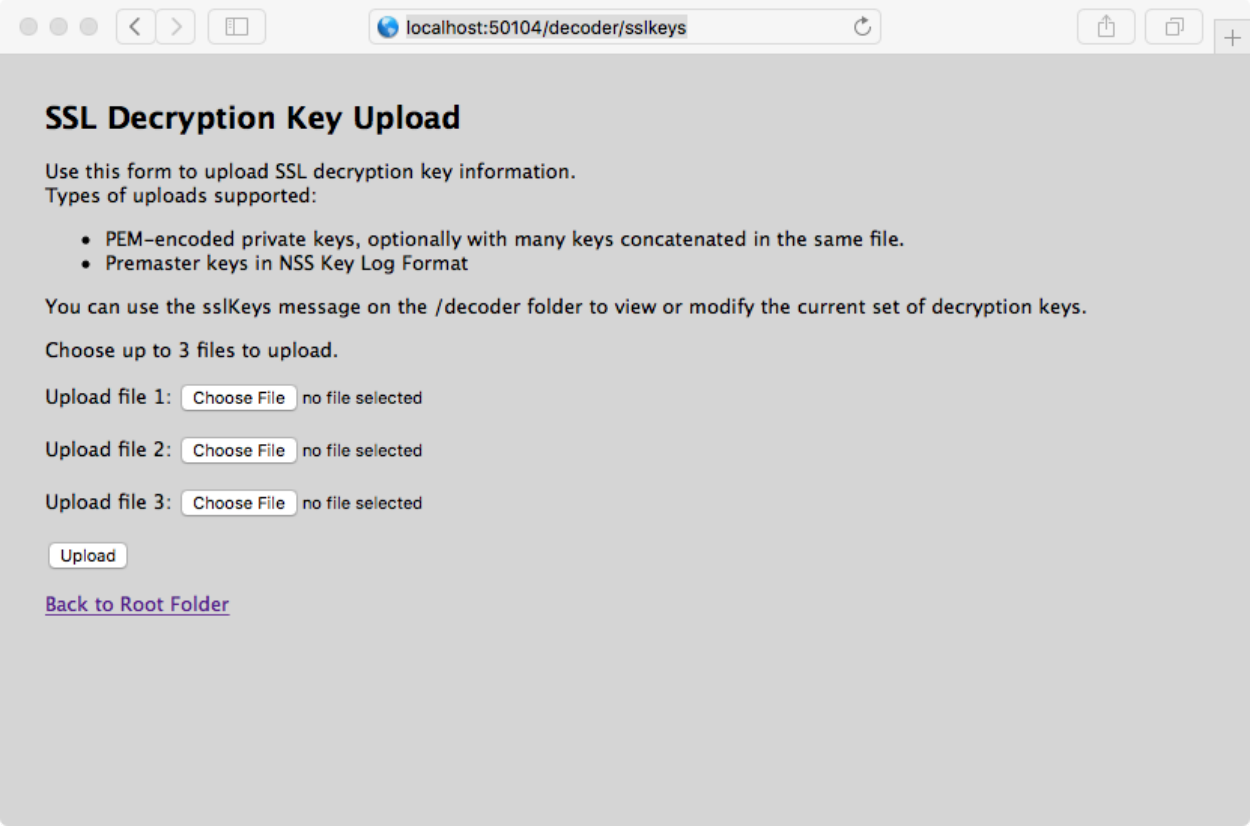
Beginning with NetWitness Platform 11.0, administrators can configure a Network Decoder to decrypt incoming packets using the `sslKeys` command. Enabled parsers see the unencrypted packet payload and create metadata accordingly. If the Decoder is not configured to decrypt incoming packets, most enabled parsers see only encrypted garbage and fail to create meaningful metadata.

Note: If FIPS is enabled, the list of ciphers for decryption is restricted to only those that are FIPS approved.

The `sslKeys` command provides a way to upload premaster or private keys to the Decoder, so that captured encrypted packets that match the keys can be decrypted before parsing. Administrators configure the Decoder by entering the `sslKeys` command using the NwConsole command line interface or the Decoder RESTful interface.



The RESTful interface form at the path: `/decoder/sslkeys` allows uploading a single PEM-encoded private key, a single file containing multiple private keys concatenated together, or a single file of multiple premaster keys.



Although the packets are decrypted during the parse stage, only the encrypted packets are written to disk. The matching premaster key used for decrypting is written to the `tls.premaster` meta key, which analysts can use to subsequently view unencrypted packets on demand.

Details for administrators to configure decryption of incoming packets, and for analysts to view unencrypted packets on demand are provided below.

Decryption of Secure SMTP

In version 11.3, NetWitness Platform supports opportunistic SSL/TLS decryption, which addresses RFC 3207 (https://tools.ietf.org/html/rfc3207). You can add an HTTPS parser option that provides a .csv list of destination ports of the session where the STARTTLS command will be searched, with at least one encryption key that has been uploaded. This enables the STARTTLS functionality.

Note: The .csv list must include all the destination ports of a session. If a destination port is not in the list, the search for STARTTLS will not be started.

The STARTTLS search is limited to the first 1024 bytes of the session's payload, to prevent performance degradation. If STARTTLS is found, the parser uses the next client packet with payload as the start of a TLS negotiation.

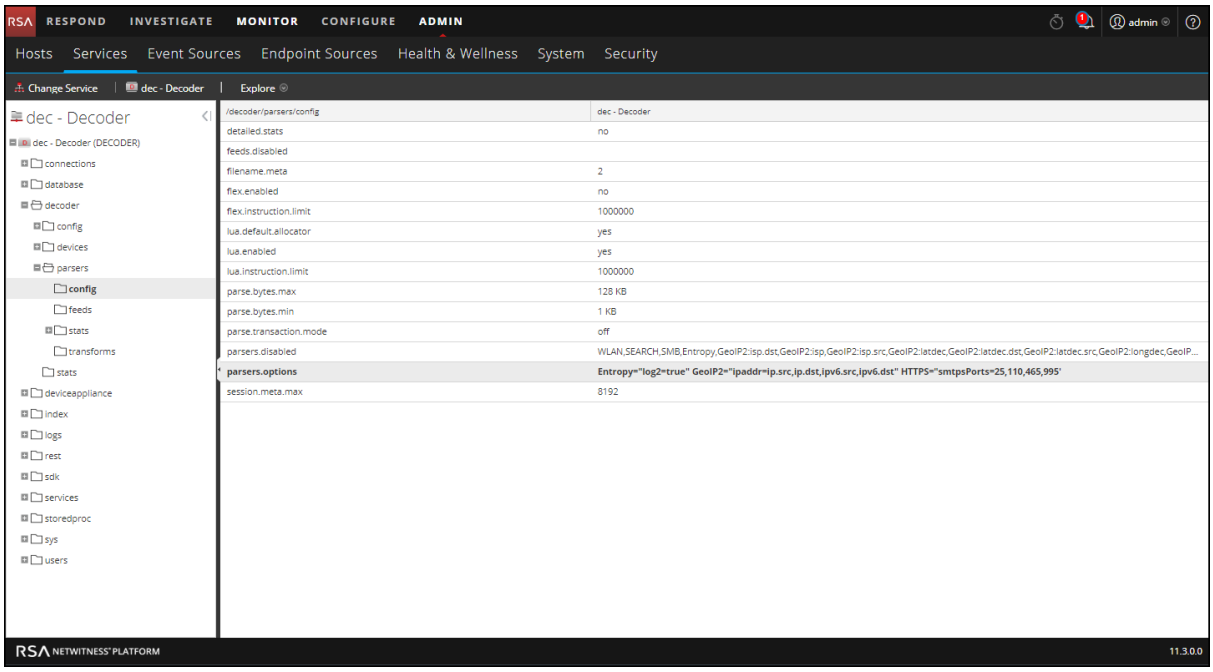
To add an HTTPS parser option for secure SMTP decryption:

1. In the NetWitness Platform User Interface, go to **ADMIN** > **Services**.
2. Select a Log Decoder service and click ⚙ > **View** > **Explore**.
3. In the left panel, select **decoder** > **parsers** > **config**.

4. In **parsers.options**, enter an HTTPS parser option in the following format that provides a .csv list of the destination ports of the session where the STARTTLS command is searched:

   `HTTPS="smtpsPorts=<port#1,port#2,port#n>"`

   The following image shows an example of an HTTPS parser option for secure SMTP decryption.



Performance Considerations

Decrypting packets in real time requires extra work in the parsing stage. Before implementing this feature, plan carefully to ensure the incoming traffic bandwidth does not overwhelm the available compute power. You may need more Decoders to decrypt traffic than you would need if not decrypting.

Packets captured on a Decoder normally have a timeout of ~60 seconds in the assembly stage before they are sent to the parsing step. If the Decoder is under memory pressure due to very high bandwidth, the lifetime of the packets in Assembler may be shortened. To alleviate this situation, you can configure a longer timeout value and increase the amount of memory available to hold packets in Assembly. Also, in order to perform decryption of the packets, the Decoder must receive the decryption key before the parsing stage.

Note: Currently, only TLS 1.2 and earlier protocols can be decrypted

With no feeds loaded, the following parsers enabled, and 50% of the sessions being decrypted,a Decoder can process traffic at 3 Gbps .

Parser Name	Description
SYSTEM	Session Details
NETWORK	Network Layer
ALERTS	Alerts
GeoIP	Geographic data based on ip.src and ip.dst
GeoIP2	Geographic data by default based on IPv4 (`ip.src`, `ip.dst`) and IPv6 (`ipv6.src`, `ipv6.dst`) meta keys
HTTP	Hyper Text Transport Protocol (HTTP)
HTTP_Lua	Hyper Text Transport Protocol (HTTP) Lua
FTP	File Transfer Protocol (FTP)
TELNET	TELNET Protocol
SMTP	Simple Mail Transport Protocol (SMTP)
POP3	Post Office Protocol (POP3)
NNTP	Network News Transport Protocol (NNTP)
DNS	Domain Name Service (DNS)
HTTPS	Secure Socket Layer (SSL) Protocol
MAIL	Standard E-Mail Format (RFC822)
VCARD	Extracts VCARD fullname and email information
PGP	Identifies PGP blocks within network traffic
SMIME	Identifies SMIME blocks within network traffic
SSH	Secure Shell (SSH)
TFTP	Trivial File Transfer Protocol (TFTP)
DHCP	Dynamic Host Configuration Protocol (DHCP and BOOTP)
NETBIOS	Extracts NETBIOS computer name information.
SNMP	Simple Network Management Protocol (SNMP)
NFS	Network File System (NFS) protocol
RIP	Routing Information Protocol (RIP).

Parser Name	Description
TDS	MSSQL and Sybase database protocol (TDS)
TNS	Oracle database protocol (TNS)
IRC	Internet Relay Chat (IRC) protocol
RTP	Real Time Protocol (RTP) for audio/video
SIP	Session Initiation Protocol (SIP)
H323	H.323 Teleconferencing protocol
SCCP	Cisco Skinny Client Control Protocol
GTalk	Google Talk (GTalk)
VlanGre	Vlan ID and GRE/EtherIP tunnel addresses
BITTORRENT	BitTorrent File Sharing Protocol
FIX	Financial Information eXchange Protocol
GNUTELLA	Gnutella file sharing protocol
IMAP	Internet Message Access Protocol
MSRPC	Microsoft Remote Procedure Call protocol
RDP	Remote Desktop Protocol
SHELL	Command Shell Identification
TLSv1	TLSv1
SearchEngines	A parser that extracts search terms
FeedParser	External Feed Parser

Encryption Keys

The `sslKeys` command accepts two types of encryption keys:

- Premaster key: the symmetric key used in the TLS payload stream for encryption and decryption.
- Private key: the asymmetric private key used during the TLS handshake that encrypts the premaster.

Premaster Key

The premaster key is generated randomly and is ephemeral for the life of one specific TLS session. Normally, there is not a good way to get premaster keys to a Decoder in time for the parsing step. However, both Chrome and Firefox can write the premaster keys they generate to a file. This is useful for testing purposes. To configure your browser to do this, create an environment variable called `SSLKEYLOGFILE` and assign it the pathname of a file to which the keys will be written. The Decoder will accept the file exactly as written and will use all the decryption keys in the file for any encrypted traffic it captures.

This is a sample NwConsole script that uploads the file to a Decoder:

```
login <decoder>:50004 <username> <password>
send /decoder sslKeys --file-data=SSLKeys.txt
```

This is an example using a curl command (with the RESTful port) to upload the file to a Decoder:

```
curl -u "<username>:<password>" -H "Content-Type: application/octet-stream" --
data-binary @"/path/SSLKeys.txt" -X POST
"http://<hostname>:50104/decoder?msg=sslKeys"
```

After the symmetric keys are uploaded, they will immediately be used for any necessary decryption. Symmetric keys are stored in memory and there is a limit to how many can be stored at any point in time. As more keys are added, the earliest keys will be aged out. You can also add premaster keys by just passing the `random` and `premaster` parameters to `sslKeys`.

Private Keys or PEM files

Private keys are normally stored in PEM files and are the asymmetric keys generated by services that accept TLS traffic. These keys are used during the TLS handshake to encrypt the premaster symmetric key that will be used for the rest of the payload encryption.

For example, if you have a web server whose traffic you want visibility into, you need to upload the private key it uses to encrypt traffic. You only need to do this once, as it is stored permanently (or until removed by a delete command). Private keys are automatically encrypted before storing to protect them. After upload, you must issue a parser reload command so that the newly installed key becomes visible to the HTTPS parser. Now, all TLS handshakes that use that private key will be able to be decrypted by the Decoder.

Note: Not all ciphers suites use a "known" private key (for example, Ephemeral Diffie Hellman). Encrypted traffic with those ciphers cannot be decrypted unless the premaster key is uploaded to the Decoder before the session is parsed.

These are some sample commands that upload a PEM file to be used for decryption.

Using NwConsole:

```
send /decoder sslKeys pemFilename=MyKey.pem --file-data=/path/MyKey.pem
```

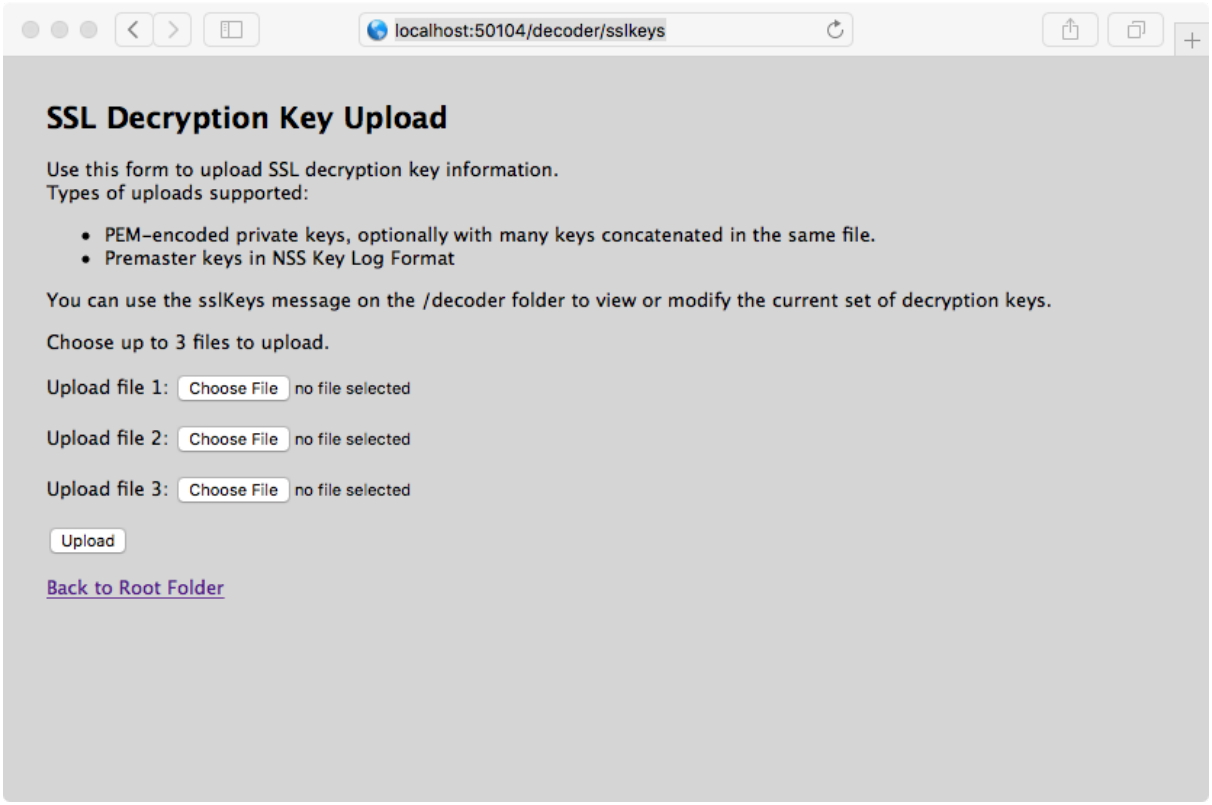
Using the RESTful interface (you must provide the `pemFilename` parameter in the URL):

```
curl -u "<username>:<password>" -H "Content-Type: application/octet-stream" --
data-binary @"/path/MyKey.pem" -X POST
"http://<hostname>:50104/decoder?msg=sslKeys&pemFilename=MyKey.pem"
```

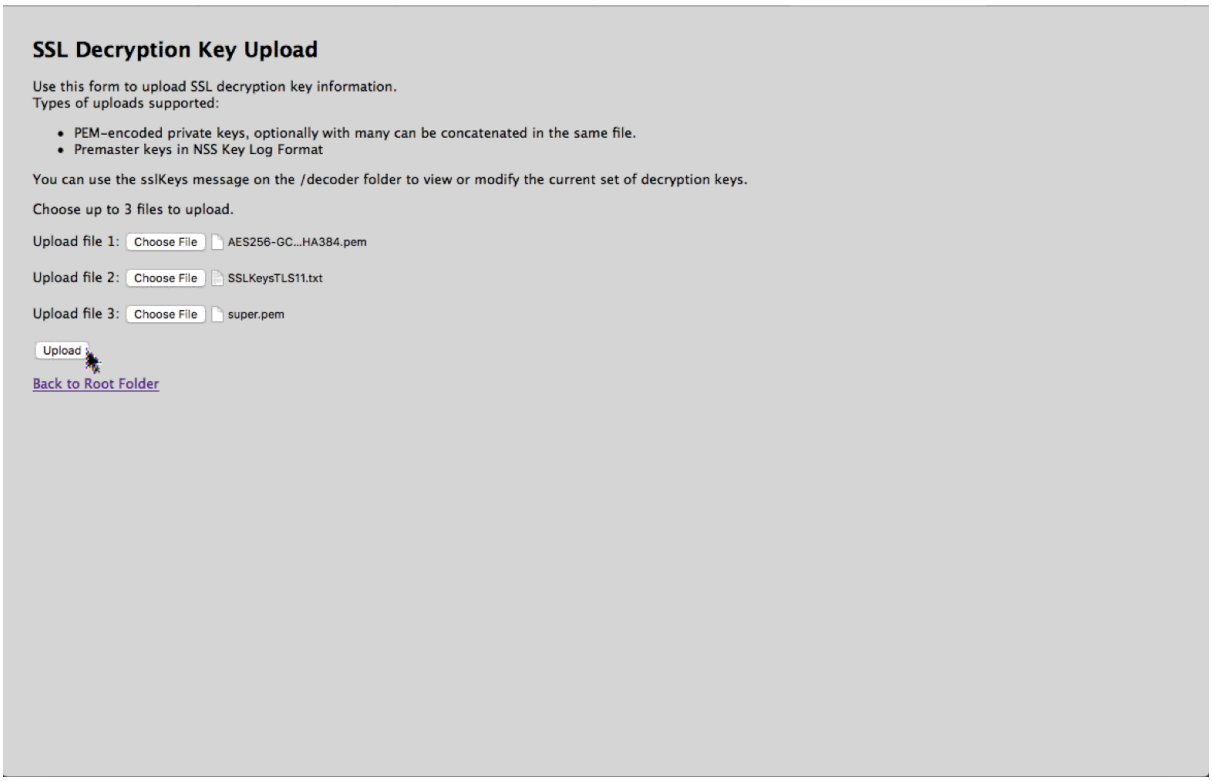
Upload Multiple Premaster and Private Keys

You can use the RESTful interface form to facilitate uploading of multiple keys, both premaster and private at the same time.

1. Open the RESTful API in your browser, and navigate to this path on the Decoder that you want to configure: `/decoder/sslkeys`.

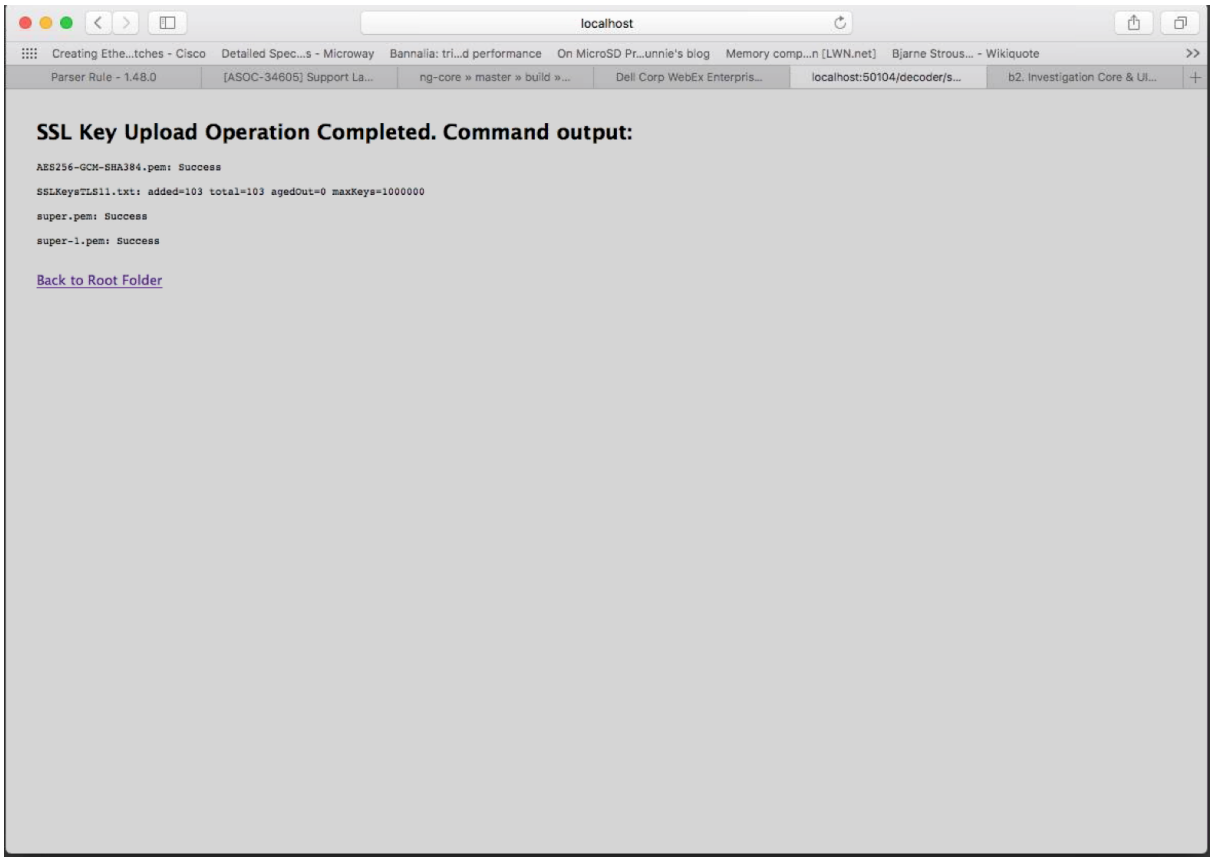


2. Next to **Upload File 1**, click **Choose File** and locate the premaster key file or PEM file that you want to upload on you local file system.
3. (Optional) Repeat for **Upload File 2** and **Upload File 3**.



4. Click **Upload**.

   The files are uploaded to the Decoder and results are displayed in the form.



Parameters for Managing Keys

The `sslKeys` command has several parameters for managing premaster and private keys. This is the full list of parameters:

Parameter	Description
`clear`	Removes all premaster keys from memory. Does not delete any PEM files installed on the system.
`maxKeys`	Changes the maximum number of premaster keys that are stored in memory.
`listPems`	Returns a list of all installed private key PEM files.
`deletePem`	Deletes the named PEM file from the file system. You can pass this parameter more than once to remove multiple files.
`random`	The random hash used to identify the premaster key.
`premaster`	The premaster key that will be installed for the previous `random` parameter. They must show up in pairs and `random` must be first.

Return Values

Most `sslKeys` commands return name/value pairs of statistics about the premaster keys in memory. The statistics are listed in the following table.

Name	Description
`added`	The number of premaster keys just added during this command.
`total`	The total number of premaster keys loaded in memory.
`agedOut`	The total number of premaster keys that were removed during this command; this is not a lifetime stat.
`maxKeys`	The current maximum allowed premaster keys

Viewing Unencrypted Traffic

If packets are decrypted during the parse stage, encrypted packets are written to disk, and the matching premaster key used for decrypting is written to the `tls.premaster` meta key, analysts can view the unencrypted packets using the `tls.premaster` meta key.

One Decoder API that you can use to see the unencrypted packets is the `/sdk/content` RESTful service. You need to know the Session ID of the encrypted packets and the `flags` parameter masked to the value 128 (or 0x80 in hex). Point your browser to the Decoder RESTful interface and type in the following command, substituting the actual Session ID for `<id>`:

`http://<decoder>:50104/sdk/content?session=<id>&flags=128&render=text`

The Decoder returns a simple web page showing the packets after they are decrypted.

If you want to see what the packets look like encrypted, type in one of the following commands, substituting the Session ID for <id>:

`http://<decoder>:50104/sdk/content&session=<id>&render=text`

`http://<decoder>:50104/sdk/content&session=<id>&flags&render=text`

For more information on the `/sdk/content` service, see the manual page for `/sdk content`.

Supported Cipher Suites

The following table lists which cipher-suites are supported using private keys.

Cipher Suite Name (RFC)	Name (OpenSSL)	Cipher Suite	TLS Version	KeyExch.	FIPS	Private Key
TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384	ECDHE-RSA-AES256-GCM-SHA384	[0xc030]	TLSv1.2	Kx=ECDH	Compliant	Not Supported
TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384	ECDHE-ECDSA-AES256-GCM-SHA384	[0xc02c]	TLSv1.2	Kx=ECDH	Compliant	Not Supported

Cipher Suite Name (RFC)	Name (OpenSSL)	Cipher Suite	TLS Version	KeyExch.	FIPS	Private Key
TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384	ECDHE-RSA-AES256-SHA384	[0xc028]	TLSv1.2	Kx=ECDH	Compliant	Not Supported
TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA384	ECDHE-ECDSA-AES256-SHA384	[0xc024]	TLSv1.2	Kx=ECDH	Compliant	Not Supported
TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA	ECDHE-RSA-AES256-SHA	[0xc014]	SSLv3	Kx=ECDH	Compliant	Not Supported
TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA	ECDHE-ECDSA-AES256-SHA	[0xc00a]	SSLv3	Kx=ECDH	Compliant	Not Supported
TLS_DHE_DSS_WITH_AES_256_GCM_SHA384	DHE-DSS-AES256-GCM-SHA384	[0xa3]	TLSv1.2	Kx=DH	Compliant	Not Supported
TLS_DHE_RSA_WITH_AES_256_GCM_SHA384	DHE-RSA-AES256-GCM-SHA384	[0x9f]	TLSv1.2	Kx=DH	Compliant	Not Supported
TLS_DHE_RSA_WITH_AES_256_CBC_SHA256	DHE-RSA-AES256-SHA256	[0x6b]	TLSv1.2	Kx=DH	Compliant	Not Supported
TLS_DHE_DSS_WITH_AES_256_CBC_SHA256	DHE-DSS-AES256-SHA256	[0x6a]	TLSv1.2	Kx=DH	Compliant	Not Supported
TLS_DHE_RSA_WITH_AES_256_CBC_SHA	DHE-RSA-AES256-SHA	[0x39]	SSLv3	Kx=DH	Compliant	Not Supported
TLS_DHE_DSS_WITH_AES_256_CBC_SHA	DHE-DSS-AES256-SHA	[0x38]	SSLv3	Kx=DH	Compliant	Not Supported
TLS_DHE_RSA_WITH_CAMELLIA_256_CBC_SHA	DHE-RSA-CAMELLIA256-SHA	[0x88]	SSLv3	Kx=DH	Non-Compliant	Not Supported
TLS_DHE_DSS_WITH_CAMELLIA_256_CBC_SHA	DHE-DSS-CAMELLIA256-SHA	[0x87]	SSLv3	Kx=DH	Non-Compliant	Not Supported
TLS_ECDH_RSA_WITH_AES_256_GCM_SHA384	ECDH-RSA-AES256-GCM-SHA384	[0xc032]	SSLv3	Kx=ECDH/RSA	Compliant	Not Supported
TLS_ECDH_ECDSA_WITH_AES_256_GCM_SHA384	ECDH-ECDSA-AES256-GCM-SHA384	[0xc02e]	TLSv1.2	Kx=ECDH/ECDSA	Compliant	Not Supported
TLS_ECDH_RSA_WITH_AES_256_CBC_SHA384	ECDH-RSA-AES256-SHA384	[0xc02a]	TLSv1.2	Kx=ECDH/RSA	Compliant	Not Supported

Cipher Suite Name (RFC)	Name (OpenSSL)	Cipher Suite	TLS Version	KeyExch.	FIPS	Private Key
TLS_ECDH_ECDSA_WITH_AES_256_CBC_SHA384	ECDH-ECDSA-AES256-SHA384	[0xc026]	TLSv1.2	Kx=ECDH/ECDSA	Compliant	Not Supported
TLS_ECDH_RSA_WITH_AES_256_CBC_SHA	ECDH-RSA-AES256-SHA	[0xc00f]	SSLv3	Kx=ECDH/RSA	Compliant	Not Supported

TLS Certificate Hashing

The Network Decoder can produce hashes of certificates that are seen in the packet stream. These hashes are the SHA-1 value of any DER-encoded certificate encountered during a TLS handshake. The hashes produced can be used to compare network traffic with hashes from public SSL blacklists, such as the one from sslbl.abuse.ch.

The TLS Certificate hashing feature is disabled by default. It can be enabled by adding the parser option:

```
HTTPS="cert.sha1=true"
```

to a Network Decoder's `/decoder/parsers/config/parsers.options` configuration.

When this option is enabled, the SHA-1 is stored as a text value in the meta key:

`cert.checksum`

Edit Decoder System Configuration

When a service is first added to NetWitness Platform, default values for the system configuration parameters are in effect. In most cases, the default values for compression, statistics update interval, and number of threads in the thread pool are set at a good point for optimal system performance. You do not need to edit these setting unless an RSA Customer Support technician advises you to change them.

System Configuration

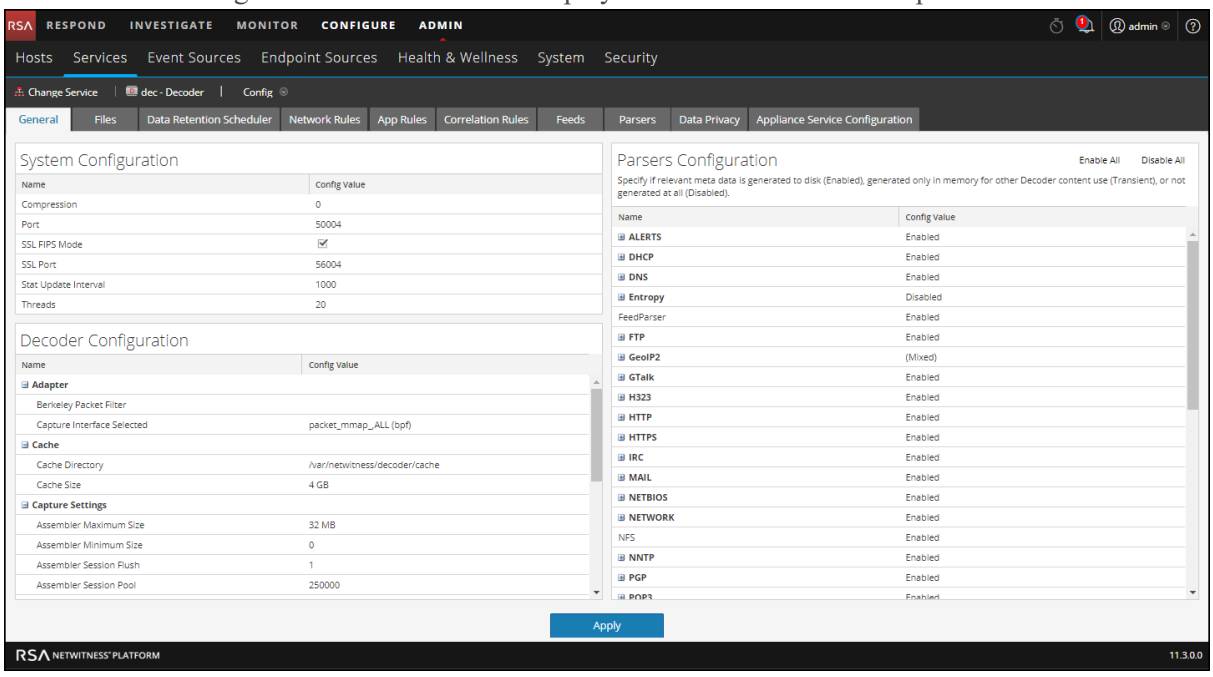
Name	Config Value
Compression	0
Port	50004
SSL FIPS Mode	☐
SSL Port	56004
Stat Update Interval	1000
Threads	20

One parameter that you may want to change for your environment is the SSL setting, which by default is not enabled. When enabled, the security of data transmission is managed by encrypting information and providing authentication with SSL certificates.

To edit system configuration parameters for a Decoder or Log Decoder:

1. Go to **ADMIN > Services**.
2. In the Admin > System view, select a Decoder or Log Decoder service, and select **> View > Config**.

The Services Config view for the service is displayed with the General tab open.



3. Under **System Configuration**, click in a field that you want to edit **(Compression**, **Port**, **SSL FIPS Mode**, **SSL Port**, **Stat Update Intervals**, or **Threads**). Type a new value.
4. When finished editing, click **Apply.**
   The settings become effective immediately.

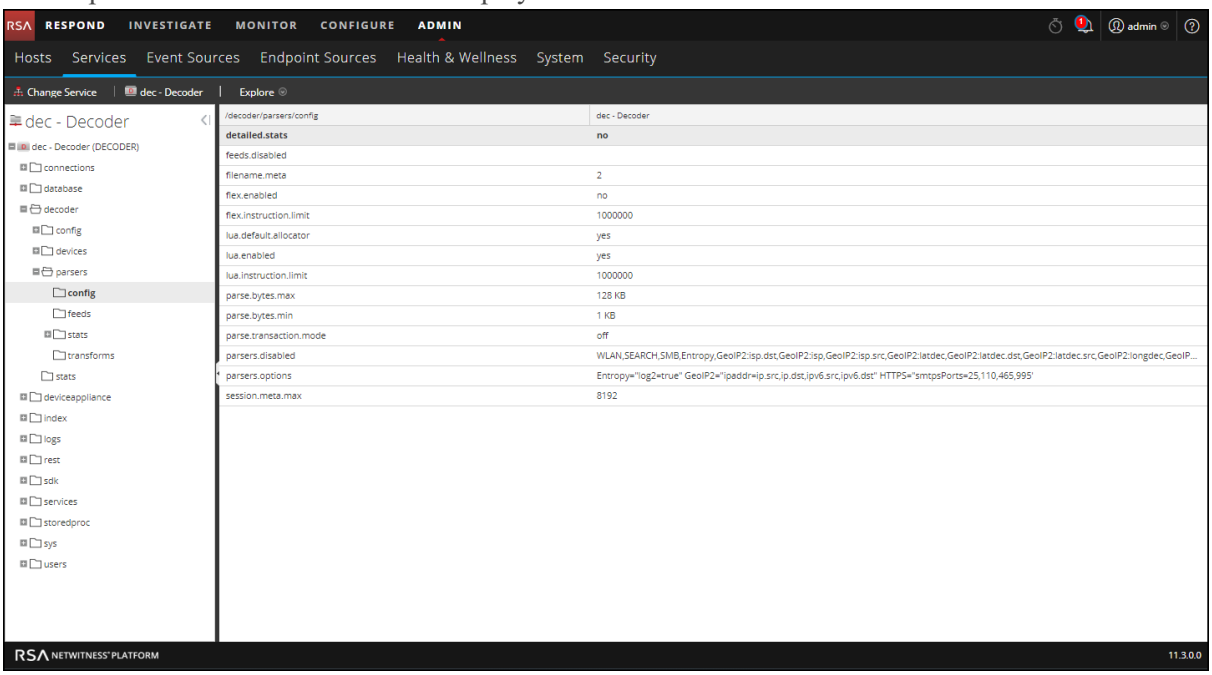
Enable CPU Usage Statistics for Installed Content

Beginning with RSA NetWitness® Platform 11.0, the Decoder provides CPU utilization statistics for all installed content, which you can use to reveal how much CPU time is used by parsers, feeds, application rules, and lexical scanning. The statistics are visible as Stat nodes in the service tree from the Explore view when `/decoder/parsers/config/detailed.stats` is enabled and the Decoder is capturing the stats.

Each piece of content is accounted as a single percentage value (0-100) regardless of the number of parse threads running. The percentage represents an average of the CPU utilization for the content across all threads.

To enable usage statistics monitoring:

1. In the NetWitness Platform User Interface, go to **ADMIN** > **Services**.
2. Select a Decoder service and click ⚙ > **View** > **Explore**.
   The Explore view for the Decoder is displayed.



3. Open `/decoder/parsers/config/` and in the right pane, select the `detailed.stats` parameter.
4. Change the value to **enabled**. If the Decoder is not capturing data, start capture.
   When you open the Decoder Stats node in the Explore view, the new statistic is visible.

Enable Parser Mappings

This topic tells administrators how to enable event source mapping on a Log Decoder.

The Log Collector discovers the event source type on a per-message basis. If the correct parser is not identified for the event source, a small percentage of logs may be misidentified. The misclassified messages do not populate event source rules and alerts, and the reports do not have the correct data. If there are multiple event source types associated with an IP address, it makes it difficult for the parsers to identify the exact event source from which the logs are generated.

If you map an IP address to its event source type, the Log Decoder can identify the event source from which the log is generated. When messages are delivered to the Log Decoder from a mapped event source, only the assigned parsers are queried to find event matches.

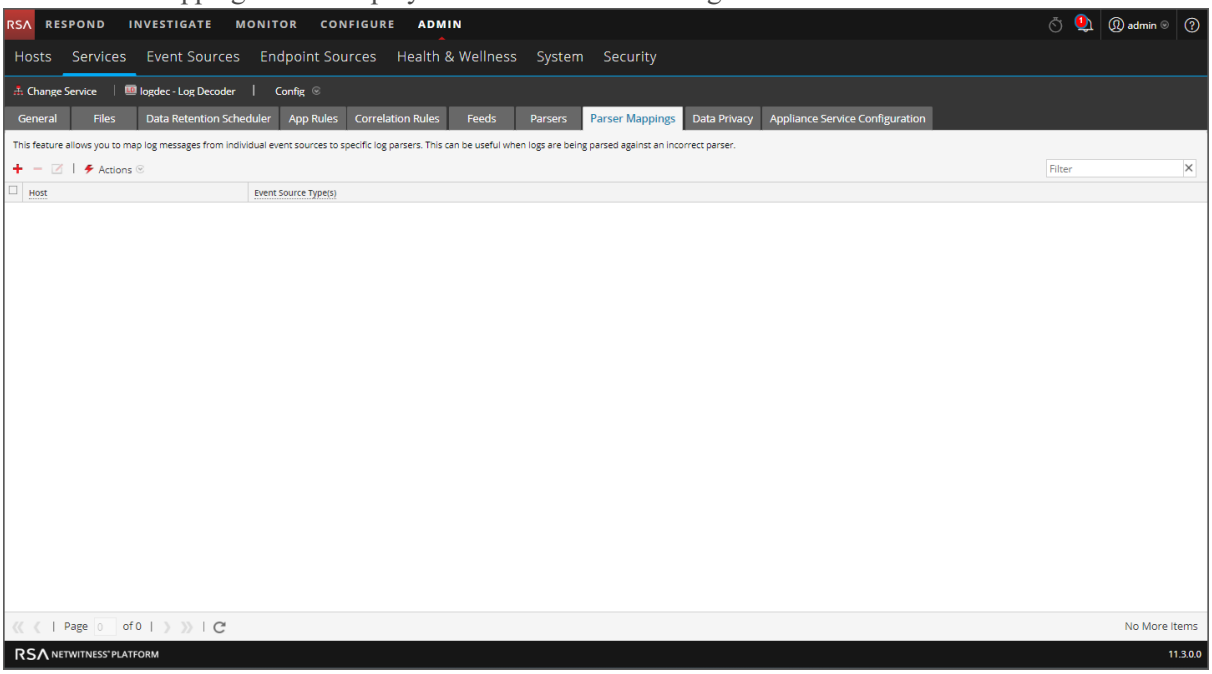
You can assign event source types to IPV4, IPV6, or the hostname value of the event source. You can also assign multiple event source types to a single IP address. You can also use the Log Collector ID when different event source types with the same IP address are sent to different Log Collectors.

Note: You can also enable parser mapping functions by navigating to **ADMIN > Event Sources > Discovery.**

Enable IP Address to Event Source Mapping

To enable an IP address to event source mapping:

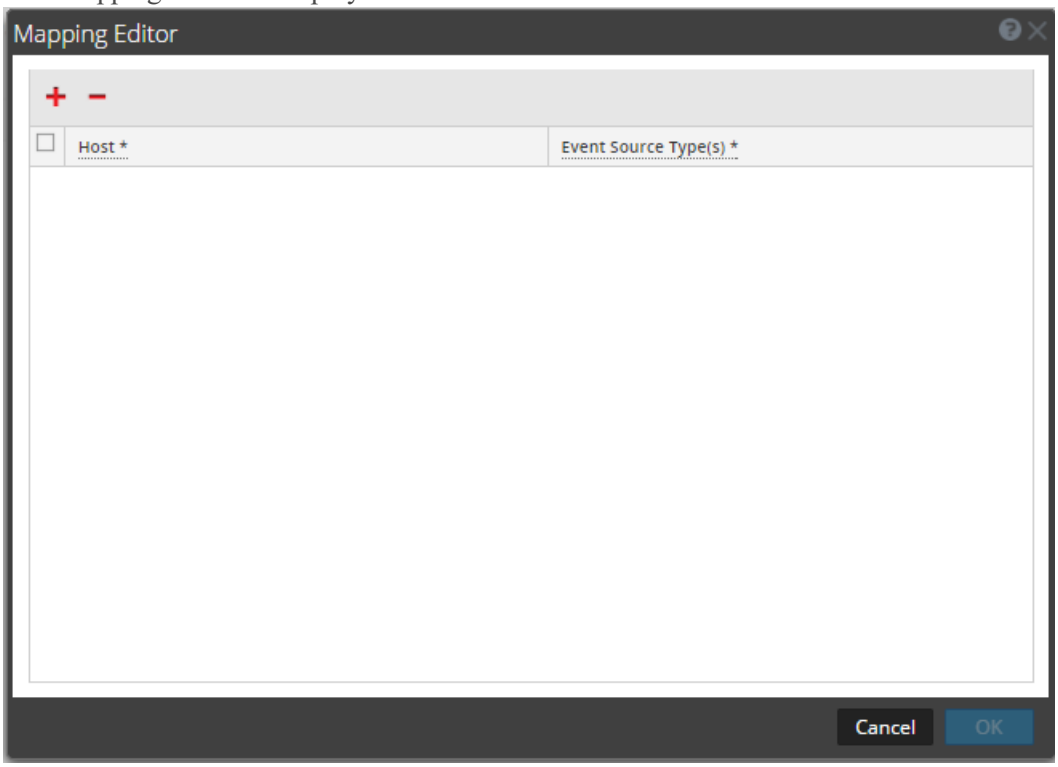
1. Go to **ADMIN > Services** and select a Log Decoder.
2. Select > **View > Config**.
3. In the Configuration page, select the **Parser Mappings** tab.
   The Parser Mappings tab is displayed in the Services Config view.



Update IP to Event Source Mapping

To update an IP to event source mapping:

1. Go to **ADMIN > Services**.
2. Select a **Log Decoder**, and in the **Actions** column, select > **View** > **Config**.
   The Services Config view is displayed.
3. Select the **Parsers Mapping** tab.
4. Click +.
   The Mapping Editor is displayed.



5. Any of the following mappings can be defined:

- **One Host and One Event Source Type**
  In the **Host** field, enter the hostname.
  For example: `10.0.0.1`
- In the **Event Sources**(s) field, enter the event source type.
  For example: `apache`
- **One Host and One or More Event Source Types**
  In the **Host** field, enter the hostname.
  For example: `10.0.0.1`

- In the **Event Source(s)** field, enter the event source type.
  For example: `apache,sap,aix`
- **One Host, One Log Collector, and One Event Source Type**
  In the **Host** field, enter the hostname and Log Collector ID.
  For example: `10.0.0.1,LC-1`
- In the **Event Source(s)** field, enter the event source type.
  For example: `apache`
- **One Host, One Log Collector ID, and One or More Event Source Types**
  In the **Host** field, enter the hostname and Log Collector ID.
  For example: `10.0.0.1,LC-1`
- In the **Event Source(s)** field, enter the event source type.
  For example: `apache,sap,aix`

> **Note:** The event source types are processed in the order you enter the parsers and if one or more parsers matches a log, the first parser in the list is queried. The Host/IP can be IPv4, IPv6, or Hostname.

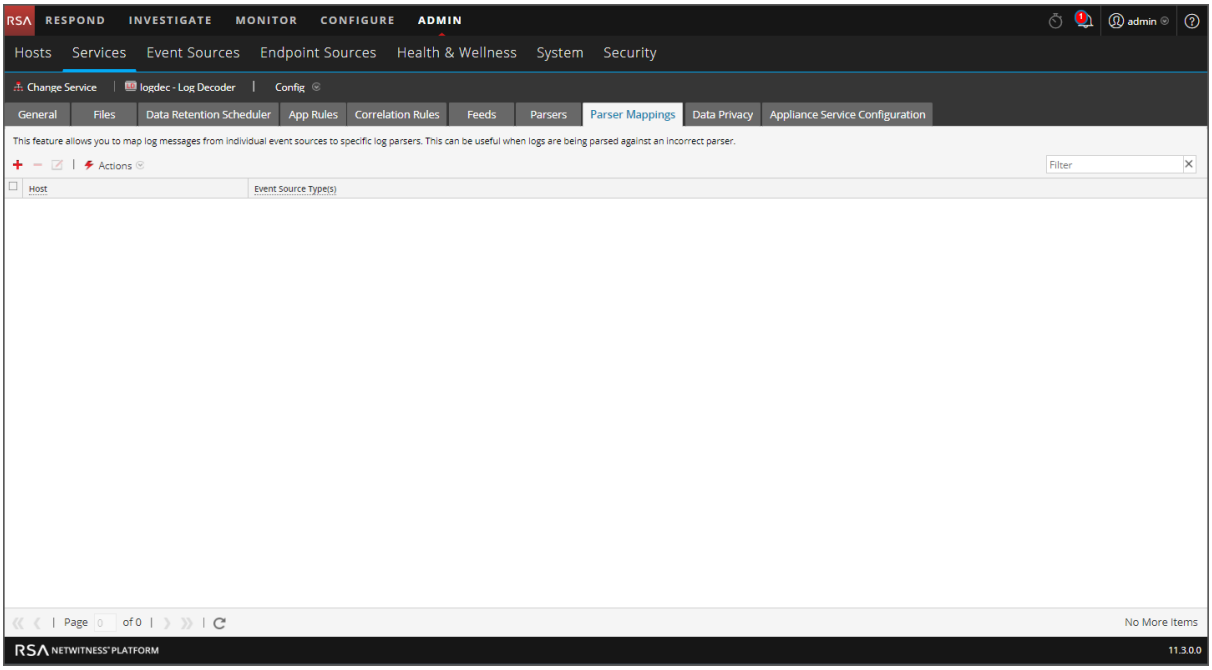
9. Click **OK**.
   The Parser Mapping is added.
7. To cancel the parser mappings selection, click **Cancel**.

Read IP to Event Source Type Mappings

To read an IP to event source type mappings:

1. Go to **ADMIN > Services**, and select a Log Decoder service.
2. In the Actions column, select **> View > Config**.
   The Services Config view is displayed.

3. Select the **Parsers Mapping** tab.
   The mappings are displayed.



Edit IP to Event Source Type Mappings

To edit IP to event source type mappings:

1. Go to **ADMIN > Services**, and select a Log Decoder service.
2. In the Actions column, select > **View** > **Config**.
   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. Select the mapping you want to edit.
   Note: You can only edit one mapping at a time.
5. Click
6. In the **Event Source(s)** field, modify the event source(s).
   Note: The host is not editable and the field is disabled.
7. Click **OK** to accept the edited Event Source.
8. To cancel the changes, click **Cancel**.

Delete IP to Event Source Type Mappings

To delete IP to event source type mappings:

1. Go to **ADMIN > Services**, and select a Log Decoder service.
2. In the Actions column, select > **View** > **Config**.
   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. Select the mapping you want to delete.
5. Click .
   The mapping is deleted and the grid is refreshed.
6. To cancel the changes, click **Cancel**.

Sort the Hostname or Event Source Type

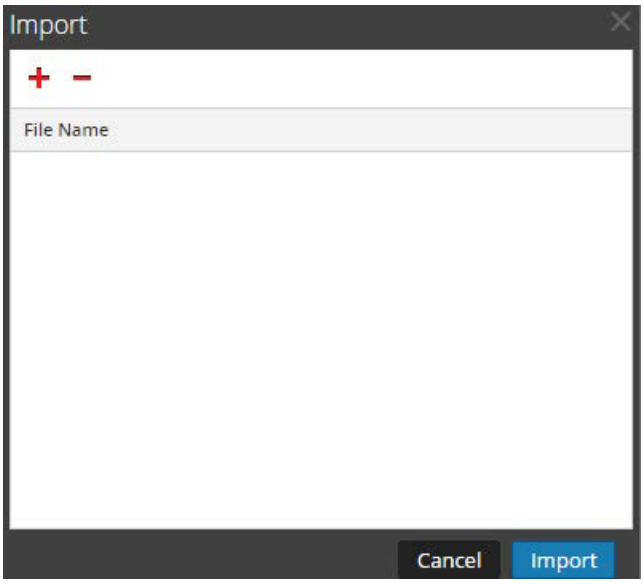
To sort the hostname or event source type:

1. Go to **ADMIN > Services**, and select a Log Decoder service.
2. In the Actions column, select > **View** > **Config**.
   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. To sort a column, click in the column header.
   Event Source Type(s) are applied for your selected IP address. Logs are parsed against the parsers in the order they are listed.

Import IP to Event Source Mapping Entries

To import IP to event source mapping entries:

1. Go to **ADMIN > Services**, and select a Log Decoder service.
2. In the Actions column, select > **View** > **Config**.
   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. Select **Actions** > **Import**.
   The Import dialog is displayed.



5. Click + .
6. Select the file you want to import and click **OK**.
7. To load the parser, click **Import**.

Note: You can only import one .csv file at a time.

Export IP to Event Source Mapping Entries

To export IP to event source mapping entries:

1. Go to **ADMIN > Services**, and select a Log Decoder service.
2. In the Actions column, select ⚙ **> View > Config**.
   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. Select the mappings you want to export.
5. Select **Actions > Export > Selection**.
   The Export Selection dialog is displayed.

6. Enter the file name and click **Export**.

Search IP to Event Source Mapping Entries

To search IP to event source mapping entries:

1. Go to **ADMIN > Services**, and select a Log Decoder service.
2. In the Actions column, select > **View** > **Config**.
   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. In the Parsers Mappings toolbar, enter the Host or Event Source in the **Filter** field.
5. Click **Enter**.
   The Hosts or Event Sources that match the names entered in the **Filter** field are displayed.

Enable or Disable Lua and Flex Parsing Systems

This topic tells administrators how to enable or disable Lua and Flex parsing systems on a Decoder or Log Decoder. Flex parsers are deprecated and disabled by default.

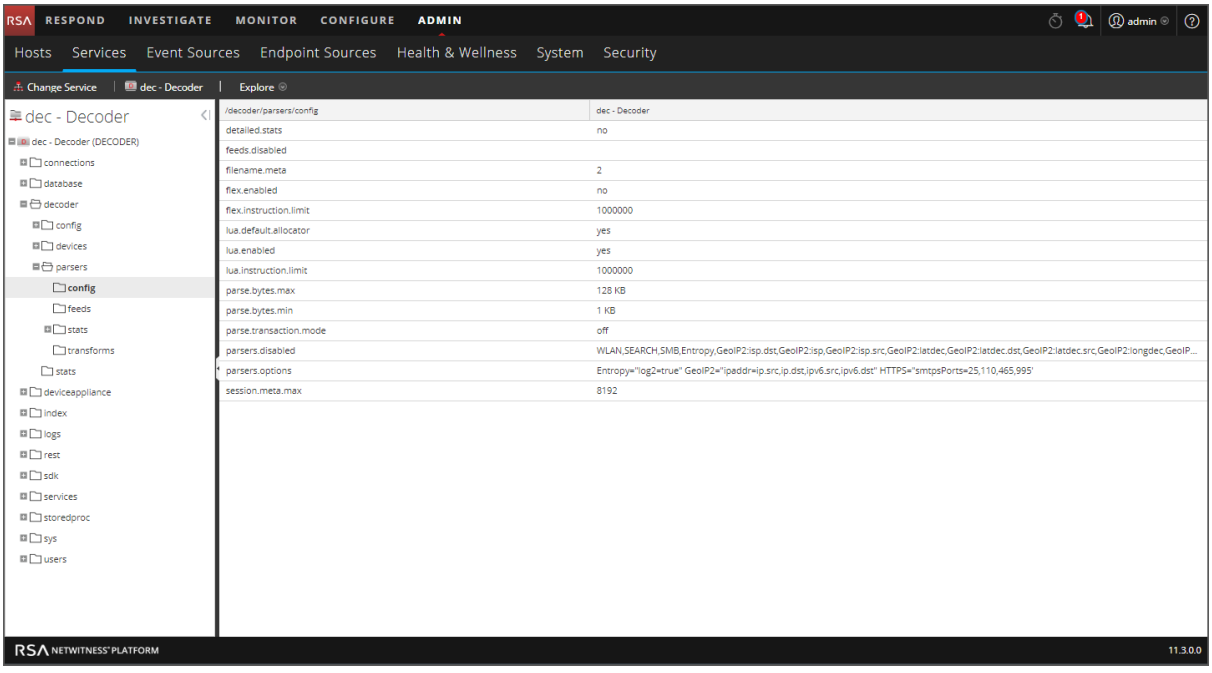
The settings to enable or disable Lua and Flex parsing systems are configured correctly by default and you do not typically have to change them. However, you may need to adjust these settings at the request of RSA Customer Care or for troubleshooting purposes.

In addition to configuring individual parsers, you can enable and disable all Lua parsing as well as all Flex parsing in the Services Explore view. You enable and disable the Lua parsing and Flex parsing systems settings separately, but they work in the same way.

- If you **disable** the Lua or Flex parsing system, the corresponding parsing system is disabled and no parsers are loaded.
- If you **enable** the Lua or Flex parsing system, the corresponding parsing system is enabled and individual parsers are enabled and disabled following the current individual configurations.

To enable or disable Lua and Flex parsing systems on a Decoder or Log Decoder:

1. Go to **ADMIN > Services.**
2. Select a Decoder or Log Decoder and ⚙ **> View > Explore.**
   The Services Explore view for the selected service is displayed.
3. In the Node list, navigate to and select **`/decoder/parsers/config`**.



4. In the Monitor panel:
   - To enable the Lua parsing system, in the value field for `lua.enabled`, type **yes**.
   - To disable the Lua parsing system, in the value field for `lua.enabled`, type **no**.

- To enable the Flex parsing system, in the value field for `flex.enabled`, type **yes**.
- To disable the Flex parsing system, in the value field for `flex.enabled`, type **no**.

Map IP Address to Service Type for Log Parsing

This topic describes the procedure to map an IP address to a service type for log parsing.

The Log Collector discovers event source type on a per-message basis. If the correct parser is not used for the specific event source, the messages that are common between event source types are misclassified. The misidentified messages will not populate service rules and alerts, and the reports will not have proper information. Also, if there are multiple services associated with an IP address, it can be difficult for the parsers to identify the exact service from which the log is generated.

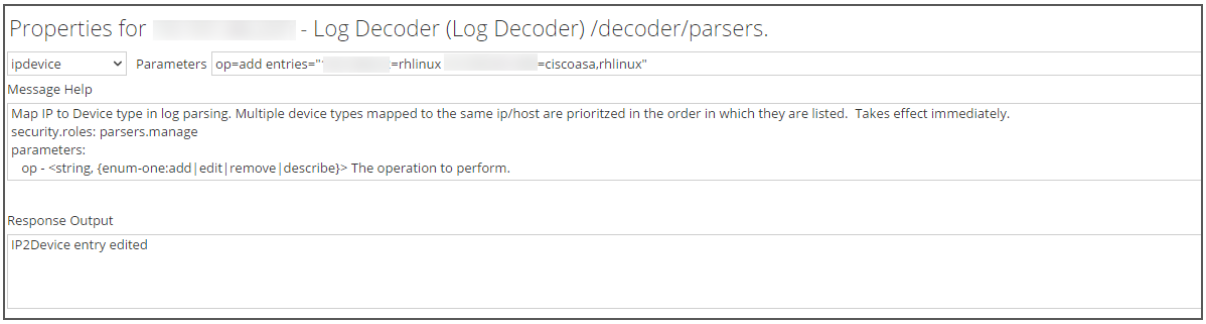
If you map an IP address to its services, the log decoder can identify the service from which the log is generated. When messages come into the log decoder from a mapped service, the assigned parsers are loaded to find event matches.

You can assign service types to IPV4, IPV6 or hostname value of the event source. You can also assign multiple service types to a single IP address. You can also use the CollectorID when different service types with the same IP address are sent to different collectors.

Map an IP Address to a Service Type

To map an IP address to a service type, do the following:

1. Go to **ADMIN > Services**.
2. In the **Services** view, select a Log Decoder, and in the **Actions** column, select ⚙ > **View** > **Explore**.
3. Go to **/decoder/parsers** node, right-click **parsers**, and select **Properties**.
4. In the **Properties** view, specify the **ipdevice** command with the following parameters: `op=add/remove entries="ipaddress=service"` (for example, `op=add entries="10.100.201.300=ciscoasa"`)
5. Click **Send**.



IPdevice Command

In the `ipdevice` command, three operations are available:

- `add`: This operation adds or updates entries in the ipdevice map. Multiple space delimited address/type pairs may be specified.
  `op=add entries="<address>=<service type>"`

- `remove`: This operation removes entries from the ipdevice map. Multiple space delimited address/type pairs may be specified.
  `op=remove entries="<address>"`
- `describe`: This operation returns the values currently in the ipdevice map.

Map an IP Address to a Time Zone

Often times logs do not fully specify timestamps and may be missing time zone information. To properly normalize such timestamps to UTC, the Log Decoder provides the ability to associate devices from a specific address (IPv4 or IPv6) or hostname to a time zone or a fixed offset.

Three time zone formats are currently accepted and are shown in the following examples:

- Olson format: America/Anguilla
- POSIX format: AST2:45ADT0:45,M4.1.6/1:45,M10.5.6/2:45
- Offset by Hours format: = -500

NetWitness Platform maps the device address (IPv4 or IPv6) or hostname to a specific time zone or offset. Event time meta that is parsed from a log that is from a mapped address and does not include an offset or time zone as part of the timestamp is adjusted to UTC according to the mapping.

To map an IP address to a time zone, do the following:

1. Go to **ADMIN > Services**.
2. In the **Services** view, select a Log Decoder, and in the **Actions** column, select ⚙ **> View > Explore**.
3. Go to **/decoder/parsers** node, right click **Parsers**, and select **Properties**.
4. In the **Properties** view, specify the `iptmzone` command with the following parameters:
   `op=add entries="ipaddress=timezone" (for example, op=add entries="10.10.10.10=Africa/Addis Ababa")`
5. Click **Send**.

iptmzone Command

In the `iptmzone` command, three operations are available:

- `add`: This operation adds or updates entries in the iptmzone map. Multiple space delimited address/type pairs may be specified.
  `op=add entries="<address>=<time zone>"`
- `remove`: This operation removes entries in the iptmzone map. Multiple space delimited address/type pairs may be specified.
  `op=remove entries="<address>"`
- `describe`: This operation returns the values currently in the iptmzone map.

Examples

The following examples provide instances for mapping IP addresses to time zones:

- If you want to map two different entries with different IPV4 values and time zone, enter the following parameter in the **iptmzone** command and click **Send**
  `"op=add entries=”10.10.10.10=America/Anguilla 10.10.10.11=Pacific/Rarotonga”`
- If you want to remove an entry for a single IPV4 value and time zone, enter the following parameter in the **iptmzone** command and click **Send**.
  `"op=remove entries=10.5.245.9"`
- If you want to create a single entry for an IPV6 value and time zone, enter the following parameter in the **iptmzone** command and click **Send**.
  `op=add entries=”2001:DB8:85A3::8A2E:370:7334=America/Anguilla”`
- If you want to create a single entry to map an IPV4, IPV6, or hostname with the Minute Offset, Olson, or POSIX format,enter the following parameter in the **iptmzone** command and click **Send**.
  `op=add entries="10.168.0.2=America/Anguilla 2001:DB8:85A3::8A2E:370:7334=0500nwappliance21=EST5EDT,M3.2.0/2,M11.1.0'`

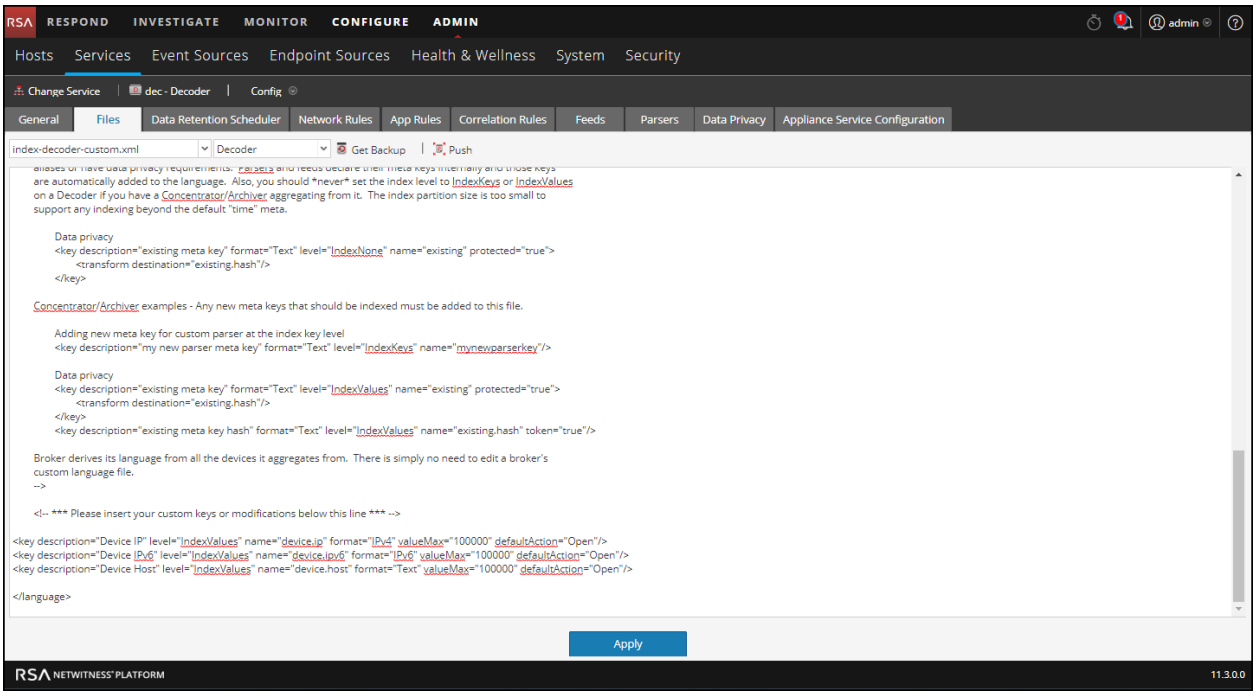
Obtain Log Files from a Pre-11.0 Log Decoder

NetWitness 11.0. added the capability to view a small sampling of recent logs for specific devices through detail tabs of the Discovery View. By default, Log Decoders prior to 11.0 do not have the necessary configuration to enable this feature, but a few minor changes can make it available.

To enable logs preview for a pre-11.0 Log Decoder, follow these steps on the Log Decoder:

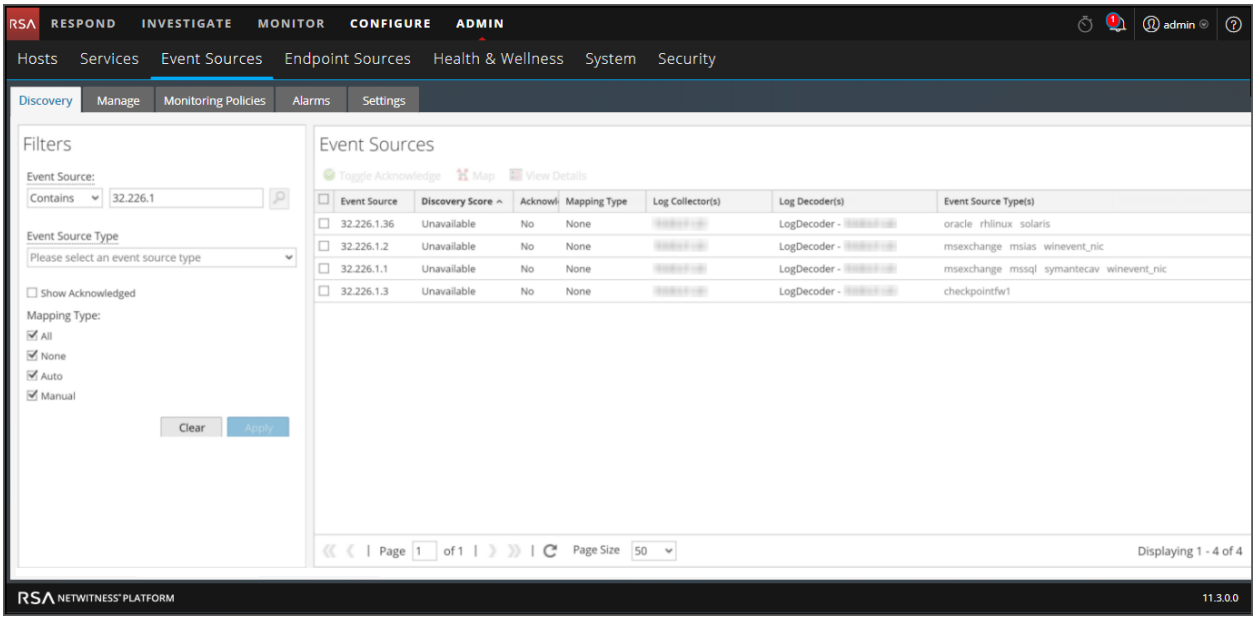
1. Go to **ADMIN** > **Services** > select a **Log Decoder**, then select ⚙ > **View** > **Config**.
2. Click the **Files** tab and select **index-logdecoder-custom.xml** from the drop-down menu.
3. Add the following three lines at the end of the file (before the closing language tag):
   ```
   <key description="Device IP" level="IndexValues" name="device.ip" format="IPv4" valueMax="100000" defaultAction="Open"/>
   <key description="Device IPv6" level="IndexValues" name="device.ipv6" format="IPv6" valueMax="100000" defaultAction="Open"/>
   <key description="Device Host" level="IndexValues" name="device.host" format="Text" valueMax="100000" defaultAction="Open"/>
   ```
4. Click **Apply**.
5. Restart the Log Decoder service as follows.
   Select Log Decoder service > **Explore** > **decoder** > **Properties** > **reset**. You select **reset** from a drop down menu. Click **Send** after you select reset.

This is an example of the **index-logdecoder-custom.xml** file.



Note: Discovery Scores are only available for 11.x and above Log Decoders. Discovery Scores for pre-11.x Log Decoders are displayed as Unavailable.

The following example shows the Discovery Score as **Unavailable** in the **Details** view for a pre-11.0 Log Decoder.



Note: Device logs are only available for 11.x and above Log Decoders.

The following example shows the message that is displayed in the Logs panel for a pre-11.0 Log Decoder.

Upload a Log File to a Log Decoder

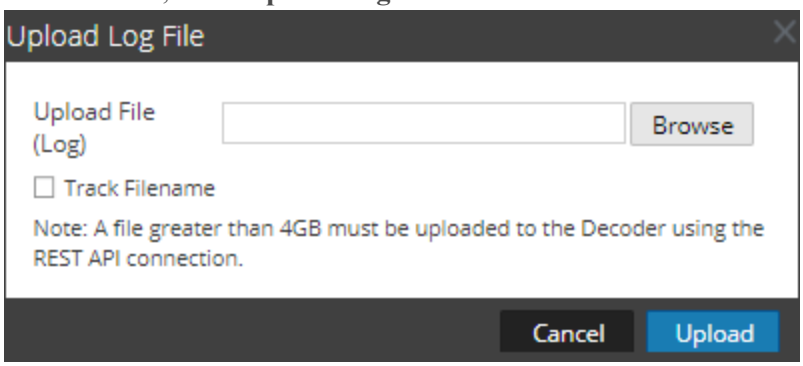
There are occasions when you want to analyze a log file that is not available on the service you are using. You can upload a log file captured on another service to NetWitness Platform. Log filenames are of the type **.log**.

When a log file is uploaded to a Log Decoder, the Log Decoder analyzes and generates meta for each log it contains. These logs are added to the already decoded logs on the Log Decoder and are available for analysis. NetWitness Platform includes a filename tracking option that makes searching for a particular set of logs easier. When the log file is uploaded with file tracking, the Log Decoder adds meta to each log based on the uploaded filename. You can then filter sessions for analysis using that meta.

The option to upload a log file is dimmed when other Log Decoder operations prevent an upload from occurring, for example, when the Log Decoder is capturing logs.

To import a log file to a Log Decoder:

1. Go to **ADMIN > Services**.
2. Select a Log Decoder in the **Service** grid, and select > **View** > **System**.
   The Services System view for the Log Decoder is displayed.
3. In the toolbar, click **Upload Log File**.



4. To choose a log file, click **Browse**.
   A directory view is displayed.
5. Select the log file that you want to upload.
   The filename is displayed in the **Upload File** field.
6. If you want the Log Decoder to add meta to the logs based on the filename, click the checkbox next to **Track Filename**.
7. To upload the file, click **Upload**.
   The selected file is uploaded and a status message indicates that the file is uploaded. The log file is available for analysis.

Upload a Packet Capture File

There are occasions when you want to analyze a packet capture file that is not available on the service you are using. You can upload a file captured on another service to NetWitness Platform. Supported packet capture file types are `pcap` and `pcap.gz`.

When a packet capture file is uploaded to a Decoder, the Decoder creates sessions from the packet capture file packets. These sessions are added to the already decoded sessions on the Decoder and are available for analysis. NetWitness Platform includes a filename tracking option that makes searching for a particular set of sessions easier. When the packet capture file is uploaded with file tracking, the Decoder adds meta to the sessions based on the uploaded filename. You can then filter sessions for analysis using that meta.

The option to upload a packet capture file is dimmed when other Decoder operations prevent an upload from occurring; for example, when the Decoder is capturing packets.

To select and upload a packet capture file:

1. Go to **ADMIN** > **Services**.

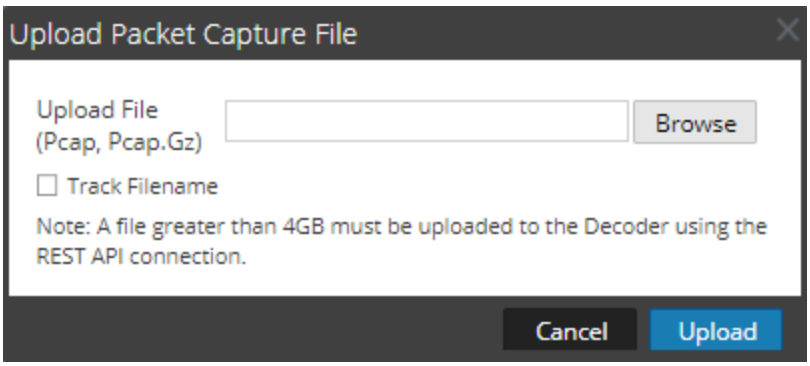
   The Administration Services view is displayed.

2. Select the Decoder name, and ⚙ > **View** > **System**.

   The Services System view for the Decoder is displayed.

3. In the toolbar, click **Upload Packet Capture File**.

   The **Upload Packet Capture File dialog** is displayed.



4. To choose a capture file, click **Select**.

   A directory view is displayed.

5. Browse the directory and select the packet capture file that you want to upload.

   The filename is displayed in the **Upload File(pcap,pcap.gz)** field.

6. If you want the Decoder to add meta to the sessions based on the filename, click the checkbox next to **Track Filename**.

7. To upload the file, click **Upload**.

   A progress bar shows upload progress.

Upload time varies depending on the size of the file. When the file upload is complete, a status message is displayed. The file is now available for investigation.

Feed and Parser References

This topic provides more details about the feeds and parsers that the Decoder uses.

- Feed Definitions File
- Flex Parsers
- GeoIP2 Parsers
- Lua Parsers
- Snort Parsers
- Search Parser
- Wireless LAN Configuration

Feed Definitions File

This topic introduces the feed definitions file, which is available for editing in the Services Config view > Files tab. One of the files available for editing in the Services Config view > Files tab is **`feed-definitions.xml`**, the feed definitions file.

You can define feeds in the `feed-definitions.xml` file. The Decoder uses an XML schema to define feed messages when it creates a binary .feed file from the feeds defined here.

For details on the feed definition language, refer to Custom Feed Definition File Structure

Flex Parsers

One of the files available for editing in the Services Config view > Files tab is `NwFlex.xml`, the Flex parser.

NwFlex.xml

There are two kinds of Flex parsers:

- **Service identification based solely on port.** These are parsers that use only the source or destination ports to identify the session application type (service). These are the most basic and easiest to define.
- **Service identification based on a found token(s).** These parsers use tokens to identify the service type. This is also an easy way to expand which service types are identified. These are important when identifying non-internet standard applications. These parsers require that the protocol has a definable token that can uniquely identify the service type.

Five common parser operations are:

- Match Port and Identify Immediately
- Match Port and Delay Identification
- Match Token and Identify Immediately
- Match Multiple Tokens
- Match Token and Create Metadata

Detailed language information and samples are provided in this topic. This topic describes the XML schema used to define a FlexParse file. The SML node, attribute, and values referenced in descriptive text are **bold**. The root node of every file must be the **parsers** node. Under that node there can be any number of parser nodes. Each parser node defines a single parser. A parser node can have an optional **declaration** node and any number of **match** nodes.

Topics

- Arithmetic Functions
- Common Parser Operations
- General Functions
- Logging Functions
- Nodes
- Payload Functions
- Regex
- String Functions

Arithmetic Functions

This topic defines language for the flex parser arithmetic functions.

This topic defines language for the flex parser arithmetic functions. All numbers are 64-bit unsigned values and subject to both underflow and overflow, depending on the operation.

Language Definition

The following table provides language definitions.

Node Name	Attribute Name	Description
and		Performs bitwise AND between two numbers.
	name	Variable to AND result into.
	value	Number to AND into result.
or		Performs bitwise OR between two numbers.
	name	Variable to OR result into.
	value	Number to OR into result.
increment		Performs ADDITION of two numbers.
	name	Variable containing the initial value AND to receive ADDITION results.
	value	Number to ADD to initial value.
decrement		Performs SUBTRACTION of two numbers.
	name	Variable containing initial value AND to receive SUBTRACTION results.
	value	Number to SUBTRACT from initial value.
divide		Performs DIVISION of two numbers.
	name	Variable containing the initial value AND to receive DIVISION results.
	value	Number by which to divide the initial value. Division by zero generates an error and stops any further processing of the current session by this parser.
modulo		Performs MODULO of two numbers.
	name	Variable containing the initial value AND to receive MODULO results.
	value	Number by which to divide the initial value. Division by zero generates an error and stops any further processing of the current session by this parser.

Node Name	Attribute Name	Description
multiply		Performs MULTIPLICATION of two numbers.
	name	Variable containing the initial value AND to receive MULTIPLICATION results.
	value	Number by which to MULTIPLY the initial value.
shiftleft		Performs a binary shift left.
	name	Variable containing the initial value AND to receive shift results.
	value	Number of bits to shift by.
shiftright		Performs a binary shift right.
	name	Variable containing the inital value AND to receive shift results.
	value	Number of bits to shift by.

Common Parser Operations

This topic provides some examples of common parser operations.

This topic includes five common parser operations.

Match Port and Identify Immediately

```
<?xml version="1.0" encoding="utf-8"?>
<parsers
     xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
     xsi:noNamespaceSchemaLocation="parsers.xsd">
          <parser name="CustApp" desc="Acme Custom App" service="45324">
               <declaration>
                    <port name="port" value="45324" />
               <declaration>
               </match name="port">
                    <identify />
               </match>
          </parser>
</parsers>
```

Match Port and Delay Identification

```
<?xml version="1.0" encoding="utf-8"?>
<parsers
   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
   xsi:noNamespaceSchemaLocation="parsers.xsd">
     <parser name="MSRPC" desc="Microsoft RPC protocol" service=135">
          <declaration>
               <port name="port" value="135" />
               <number name="state" scope="session" />
               <session name="end" value="end" />
          </declaration>
          <match name="port">
               <assign name="state" value="1" />
          </match>
          <match name="end">
               <if name="state" equal="1" />
                    <identify />
               </if>
          </match>
     </parser>
</parsers>
```

Match Token and Identify Immediately

```
<?xml version="1.0" encoding="utf-8?>
<parsers
   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
   xsi:noNamespaceSchemaLocation="parsers.xsd">
     <parser name="RDP" desc="Remote Desktop Protocol" service="3389">
          <declaration>
               <token name="signature" value="Cookie: mstshash=" />
          </declaration>
          <match name="signature">
               <identify />
          </match>
     </parser>
</parsers>
```

Match Multiple Tokens

```
<?xml version="1.0" encoding="utf-8"?>
<parsers
     xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
     xsi:noNamespaceSchemaLocation="parsers.xsd">
     <parser name="MyServiceMultiToken" desc="Multiple Tokens" service="333">
          <declaration>
               <number name="state" scope="stream" />
               <token name="user" value="USER " />
               <token name="pass" value="PASS " />
               <session name="session" value="end" />
          </declaration>
          <match name="user">
               <or name="state" value="1" />
          </match>
          <match name="pass">
               <or name="state" value="2" />
          </match>
          <match name="session">
               <if name="state" equal="3">
                    <identify />
               </if>
          </match>
     </parser>
</parsers>
```

Match Token and Create Metadata

```
<?xml version="1.0" encoding="utf-8"?>
<parsers xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="parsers.xsd">
     <parser name="SHELL" desc="Command Shell Identification">
          <declaration>
               <token name="cmd.exe" value=" (C) Copyright 1985-2001 Microsoft
               Corp" options="linestart" />
               <meta name="client" key="client" format="Text" />
          </declaration>
          <match name="cmd.exe"
               <register  name="client" value="MS Command Shell" />
          </match>
     </parser>
</parsers>
```

General Functions

This topic defines language for the flex parser general functions.

General Functions Language Definition

Node Name	Attribute Name	Description
apptype		Gets the currently defined service type for the current session.
	name	A number variable to receive the current service type.
identify		Marks the session with the parser's service type if the service type has not already been identified.
assign		Assigns a value to a variable.
	name	The unique identifier assigned to the item in the declaration section.
	value	Optional. If specified, the action defined in the match is only applied when the declaration matches the given value.
getmeta		Retrieves the value of meta that generated a callback. This function will return empty results (0, zero length string) if called when there was no meta callback.
	name	The variable to receive the value of the meta key that generated the callback.
gettoken		Returns the current matched token.
	name	A string variable to receive the current matched token. If there is no current token, the variable is assigned an empty string.
end		This terminates the execution of the current **match** section.
if		Compares two values. If the comparison is true, executes any sub-actions. Comparisons can be **number** or **string** types, as long as both values are the same type.
	name	The unique variable identifier assigned to the item in the **declaration** section.
	equal notequal less lessequal greater greaterequal and or	The operation value to compare. If true, any sub-actions are executed.
register		Adds metadata to the session.

Node Name	Attribute Name	Description
	name	The unique identifier of a meta variable to be created, as defined in the **declaration** section.
	value	The value of the metadata to be created.
while		Compares two values and executes any sub-actions if the comparison is true. Comparisons can be **number** or **string** types, as long as both values are the same type.
	name	The unique variable identifier assigned to the item in the declaration section.
	equal notequal less lessequal greater greaterequal and or	Specifies the operation value to compare. If true, any sub-action is executed. The **and** and **or** attributes signify bitwise operations and can only be applied to **number** variables.
call		Executes the specified **match** element. This can be any match element defined in the same flex parser regardless of how it was declared.
	value	The name of the match element, or a string variable containing the name of a match element. • If the match element name is specified, the parser will not load if the named matched element doesn't exist. • If a string variable is specified, the **call** element will execute any child elements that it may have if the string value resolves to a match element after executing the named match element. • If no **match** element can be found matching the string value, no action is taken.

Logging Functions

This topic defines language for the flex parser logging functions.

Logging functions provide a means for a flex parser to write to the system log. Logging functions can be extremely useful when creating a new flex parser, but should be kept to an absolute minimum when a flex parser is deployed to a production system.

Language Definition

Node Name	Attribute Name	Description
failure		Logs a message to the system log with the log level **Failure.**
	value	A string to include as the log message.
warning		Logs a message to the system log with the log level **Warning.**
	value	A string to include as the log message.
info		Logs a message to the system log with the log level **Info**.
	value	A string to include as the log message.
debug		Logs a message to the system log with the log level **Debug.**
	value	A string to include as the log message.

Nodes

This topic defines language for the flex parser nodes.

Nodes Language Definition

Node Name	Attribute Name	Description
parsers		The root node in each definition file.
	xmins:xsi	Defines the namespace to use for the schema inclusion. This attribute is not required; however, language definition is not possible without it. This node must have the following value: http://www.w3.org/2001/XMLSchema-instance
	xsi:noNamespaceSchemaLocation	Defines the XSD schema validation file used to validate the language definition. This attribute is not required; however, language definition is not possible without it. This node must have the following value: parsers.xsd
parser		The node that defines a single parser definition. This node must be directly under the parsers node. There can be more than one per file.
	name	The name that uniquely identifies the parser. This name should be short and succinct. This is used by the system to allow enabling and disabling. It should contain only the letters [a-z] and [A-Z].
	desc	Provides a friendly description of what the parser does.
	service	The unique number assigned to the session when identified.
declaration		Delineates the definition. Each of these definitions can have an associated match entry.

Node Name	Attribute Name	Description
token		Specifies a definition for identifying a token somewhere in the session protocol. This defines a `match` callback when the specified tokens are encountered in a session payload. The `read` position is set to the byte immediately following the matched token.
	name	This is a unique identifier for the declaration.
	value	This is the exact token value to be identified.
	options	Options specify that the token should start on a new line or at an end of a line (`linestart` or `linestop`).
meta-callback		Registers a callback for the flex parser whenever meta of a specific format is created. This can be further qualified to generate callbacks only for sessions that have been identified as a specific apptype (for example, 80 for HTTP).
	name	Name of the match element to be executed when a callback occurs. (String)
	key	Name of the meta key that generates callbacks. (String)
	format	The data type of the meta key that will generate the meta.
	apptype	The meta callback is only generated if the session being parsed has been identified with the specified apptype. (Unsigned Integer, Optional)
number		Defines a numeric variable that can be referenced elsewhere within the parser definition. All numeric values are 64-bit unsigned values.
	name	This is a unique identifier for the declaration.

Node Name	Attribute Name	Description
	`scope` (optional)	Specifies when to reset the variable. This can either be for each side of a two-sided session or only after a new session is detected. The possible values are **`global`**, **`constant`**, **`stream`**, and `session` (default).
`string`		Defines a numeric variable that can be referenced elsewhere within the parser definition.
	`name`	This is a unique identifier for the declaration.
	`scope` (optional)	Specifies when to reset the variable. This can either be for each side of a two-sided session or only after a new session is detected. The possible values are **`global`**, **`constant`**, **`stream`**, and `session` (default).
port		Defines a **match** callback when a session is encountered using the specified port. The **read** position is set to the first byte of the first stream (client) in the session.
	`name`	This is a unique identifier for the declaration.
	`value`	This is the port number to identify.
`session`		Defines a `match` callback for session begin/end events. These events only occur if a token for the parser is encountered in the session.
	`name`	This is a unique identifier for the declaration.
	`value`	Specifies that processing takes place at the beginning of a new session or at the end of a session (`begin` or `end`).
`stream`		Defines a `match` callback for stream begin/end events. These events only occur if a token for the parser is encountered in the stream.
	`name`	This is a unique identifier for the declaration

Node Name	Attribute Name	Description
	value	Specifies that processing takes place at the beginning or at the end of a stream (begin or end).
function		Defines a match section that can be used as a generic function. No callbacks are associated with this declaration.
	name	This is a unique identifier for the declaration.
meta		Defines the type of data that the parser will create.
	key	Specifies the key name. The key needs to be 1-16 bytes in size.
	format	Specifies the variant type (for example, **Text**, **IPv4**, **UInt32**). Refer to the SDK documentation for a full list.
pattern		Defines a regular expression variable for use by the regex function
	name	This is a unique identifier for the declaration.
	scope (optional)	Specifies when to reset the variable. This can be for each side of a two-sided session or only after a new session is detected. Possible values are **global**, **constant**, **stream**, and session (default).
	value (optional)	Specifies a regular expression to assign to the pattern variable. This attribute is only valid when the **scope attribute** is set to constant.
match		The possible entries for taking an action once a match criterion has been found for a declaration. These nodes can be nested to provide deeper logic. There are several categories of execution elements (functions) that can appear as children of a match element: • General • Arithmetic • String • Payload

Payload Functions

This topic defines language for the flex parser payload functions.

These functions operate on a `read` position, set at the beginning of a `match` element.

Language Definition

Node Name	Attribute Name	Description
`find`		Searches the stream payload starting at the read position for a provided string value. If the value is found, the offset from the read position is returned. Any child elements will then execute. If not found, any child elements will not execute.
	`name`	A `number` variable to receive the offset from the `read` position where the match begins.
	`value`	A string to find.
	`length` (optional)	A limit to the length of the payload to be searched. If a limit is not provided, the remainder of the payload is searched. It is recommended to always use the smallest value possible here in order to reduce the effect on performance.
`install-decoder`		To enable tokens to match on payload data that may be fragmented or otherwise encoded. A scan decoder can be installed to preprocess a section of the payload before it is scanned for tokens. An example would be an HTTP response that uses the chunked transfer encoding with gzip content encoding. By parsing the HTTP header, the necessary type, offset, and length parameters can all be set, after which the HTTP response payload would appear to the token scanning as if neither encoding had been applied. However, this incurs significant overhead.
	`type`	The type of decoder to install. Valid options are: gzip, deflate, chunked, chunked-gzip, chunked-deflate.
	`offset`	Offset from the current read position to begin decoding.
	`length`	The maximum payload length to decode.
`isdecoding`		Tests whether an installed decoder is currently active. If so, any children of this function will execute. This function has no parameters.
`move`		Moves the `read` position forward in the current stream by a specified number of bytes. If there is sufficient data in the stream, the `read` position is updated and any child elements will then execute. If not found, the `read` position remains unchanged and any child elements will not execute.
	`value`	The number of bytes to move the `read` position.

Node Name	Attribute Name	Description
	direction (optional)	The direction to move the current read position. Can be forward (default) or **reverse.**
packetid		Returns the id of the packet for the current read position. It is possible for the result to be 0, which indicates that the packet id could not be determined.
	name	A number variable to receive the current packet id.
payload-position		Returns the current read position. This is a zero based index into the stream payload.
	name	A number variable to receive the current read position.
read		Reads a specified number of bytes starting at the read position into a variable. If there is sufficient data in the stream, the read position is updated, the data read assigned, and any child elements will then execute. If not found, the read position remains unchanged and any child elements will not execute.
	name	The name of a string or number variable to receive stream data. If a number variable is provided, the bytes read are interpreted as a single unsigned numeric value.
	length	The number of bytes to read from a stream.
	endianess (optional)	The byte ordering to use when reading into a number variable. Can be big (default) or little. The attribute is invalid when reading into a string variable.

Regex

This topic defines language for the flex parser regex node.

Regex searches the stream payload starting at the `read` position for matches to a provided regular expression. If matches are found, the offset from the `read` position and, optionally the matched string, is returned. Any child elements execute. If no matches are found, child elements do not execute.

Language Definition

Attribute Name	Description
`name`	A `number` variable to receive the offset from the `read` position where the match begins.
`value`	A regular expression to find.
`length` (optional)	A limit to the length of the payload to be searched. If a limit is not provided, the remainder of the payload is searched. It is recommended to always use the smallest value possible here in order to reduce the effect on performance.
`found` (optional)	The name of a `string` variable to receive a matched string.

String Functions

This topic provides language definitions for the flex parser string functions.

String Functions Language Definition

Node Name	Attribute Name	Description
append		Attaches a number or string to the end of a string variable.
	name	The unique identifier of a string variable to which the specified value is to be attached.
	value	A number or string to attach.
find		Searches a string for a provided string value. If it is found, the position is returned and any child elements will execute. Otherwise, child elements will not execute.
	name	A number variable to receive the zero-based position, where the provided value string was found in the **in** string.
	value	A string to find.
	in	A string to search.
	length (optional)	A limit to the length of the **in** string to be searched. If a limit is not provided, all of **in** will be searched.
length		Assigns the length of a string to a number variable.
	name	A number variable to receive the length of the specified string.
	value	A string value whose length is to be determined.
regex		Searches a string for matches to the provided regular expression. If a match is found, the position and, optionally, the matching string is returned. Any child elements will then execute. If not found, any child elements will not execute. Regular expression operations can adversely affect system performance.
	name	A number variable to receive the zero-based position, where the provided regular expression matched in the in string.
	value	A regular expression to be searched for.
	in	A string to search.

Node Name	Attribute Name	Description
	length (optional)	A limit to the length of the in string to be searched. If a limit is not provided, all of **in** will be searched.
	found (optional)	The name of a string variable to receive the matched string.
substring		At least one of the optional attributes from and length must be specified.
	name	The unique identifier of a string variable to receive the extracted value.
	value	A string value from which to extract a substring.
	from (optional)	The zero-based position from which to begin the substring. If not specified, it defaults to zero.
	length (optional)	The number of characters to extract. If not specified, it defaults to the remaining length of the string.
tolower		Converts a string to all lowercase letters.
	name	The name of a string variable to process.
toupper		Converts a string to all uppercase letters.
	name	The name of a string variable to process.
urldecode		Decodes a string containing url-encoded characters.
	name	A string variable to receive the decoded string.
	value	A url-encoded string to decode.
base64decode		Decodes a base-64 encoded string.
	name	A string variable to receive the decoded string.
	value	A url-encoded string to decode.
uudecode		Decode a uuencoded string.
	name	A string variable to receive the decoded string.
	value	A uuencoded string. The header and trailing lines should not be included.
quotedprintabledecode		Decode a Quoted-printable encoded string.
	name	A string variable to receive the decoded string.
	value	A quoted-printable encoded string.
convert-ebcdic		Convert an EBCDIC string to its ASCII equivalent.

Node Name	Attribute Name	Description
	name	A string variable to receive the decoded string.
	value	A url-encoded string to decode.

GeoIP2 Parsers

This topic describes the GeoIP2 parser for Decoders. This parser converts IP addresses into geographic locations, such as the country name and city where the IP address is typically found.

Note: In version 11.3 and later, the native GeoIP2 parser replaces the GeoIP parser (which has been permanently removed). The GeoIP2 parser provides the same basic functionality as the GeoIP parser as well as many enhancements. For example, it converts IP addresses into geographic locations, provides the latest Maxmind GeoIP package, and supports IPv6 addresses as well as IPv4.

Available in NetWitness Platform version 11.2 or later, the GeoIP2 Parser is enabled by default for upgrades and new installations. The GeoIP2 parser provides the latest Maxmind GeoIP package and supports IPv6 addresses as well as IPv4.

To edit the GeoIP2 parser configuration:

1. Go to **ADMIN** > **Services**.
2. In the **Administration services** view, select a Log Decoder or a Decoder.
3. Click the settings icon (⚙) and select **View** > **Config**. In the Parsers Configuration panel, select **GeoIP2** to view and update configuration options.
4. Define the IP addresses to lookup. The GeoIP2 parser enables the following IP addresses by default: `ip.src`, `ip.dst`, `ipv6.src`, and `ipv6.dst`. You can update options by using `parsers.options` to remove or add new IP addresses. For example, you can edit `parsers.options` and pass a comma-separated list of IP addresses to use as follows:
   `GeoIP2="ipaddr=ip.src,ip.dst,ipv6.src,ipv6.dst,ip.addr"`
   This adds a new IP address to lookup called `ip.addr`. However, since `ip.addr` does not end in `.src` or `.dst`, the parser will elect to place the GeoIP2 metadata generated in meta keys without a `.src` or `.dst` suffix. So, you would see country, city, and so on, after the `ip.addr` metadata.

Note: The list you pass for `ip.addr` replaces the default list. So, if you pass `ipaddr=ip.src`, it generates only GeoIP2 metadata for `ip.src`, and generates no metadata for other IP addresses.

Note: `parsers.options` is used for passing options to multiple parsers. So if you add GeoIP2 to it, you should not delete any other options being passed to other parsers (like Entropy).

The following table provides the full list of metadata that the GeoIP2 parser can potentially generate and indicates which metadata is or is not enabled by default:

Enabled by Default	Not Enabled
country, country.src, country.dst	latdec, latdec.src, latdec.dst
	longdec, longdec.src, longdec.dst
domain, domain.src, domain.dst	isp, isp.src, isp,dst
org, org.src, org.dst	city, city.src, city.dst

You can enable the other metadata using the standard parser configurations.

Note: By disabling some metadata by default, the GeoIP2 parser does not work the same as the GeoIP parser (which did not, by default, disable any metadata it generated). If you need any of the disabled metadata, you need to enable them (once only) for each Decoder, after upgrading to 11.2 or later. Keep in mind that the `isp` and `org` meta keys usually produce an equivalent value to `domain`.

Lua Parsers

One of the files available for editing in the Services Config view > Files tab is **`NwLua.xml`**, the Lua parser.

There are a number of Lua parsers available from Live. See RSA Content for:

- A complete list of these parsers
- Their interdependencies
- The Flex parsers that are subsumed by each Lua parser

Five common parser operations are:

- Match Port and Identify Immediately
- Match Port and Delay Identification
- Match Token and Identify Immediately
- Match Multiple Tokens
- Match Token and Create Metadata

Snort Parsers

Snort rules and configuration are added to the `parsers/snort` directory for NetWitness Investigate and the Decoder. The Decoder supports the payload detection capabilities of Snort rules. The rules files must have the extension `.rules` and the configuration files must have the extension `.conf`. The Decoder implementation of Snort rules is centered on using the content strings defined in a Snort rule as a token. Once a token is matched, the rule header and additional rule options can be evaluated. Currently, rules that do not define any content (using `content` or `uricontent` rule options) are not supported.

Configuration

The configuration files are loaded prior to loading rules.

Configuration Options	Description
Variable Definitions	**Description**
`ipvar`	The full language for defining IP address variables is supported, including lists, CIDR, and negation.
`portvar`	The full language for defining IP address variables is supported, including lists, ranges, and negation.
`var`	Not supported; use `ipvar` or `portvar`.
Action Definitions	**Description**
`ruletype`	The definition of additional `ruletypes` is supported. However, only rules that have a base rule type of `alert` are supported.
General Configuration	**Description**
`nopcre`	This configuration option disables all rules with `pcre`'s.

Meta Key Usage

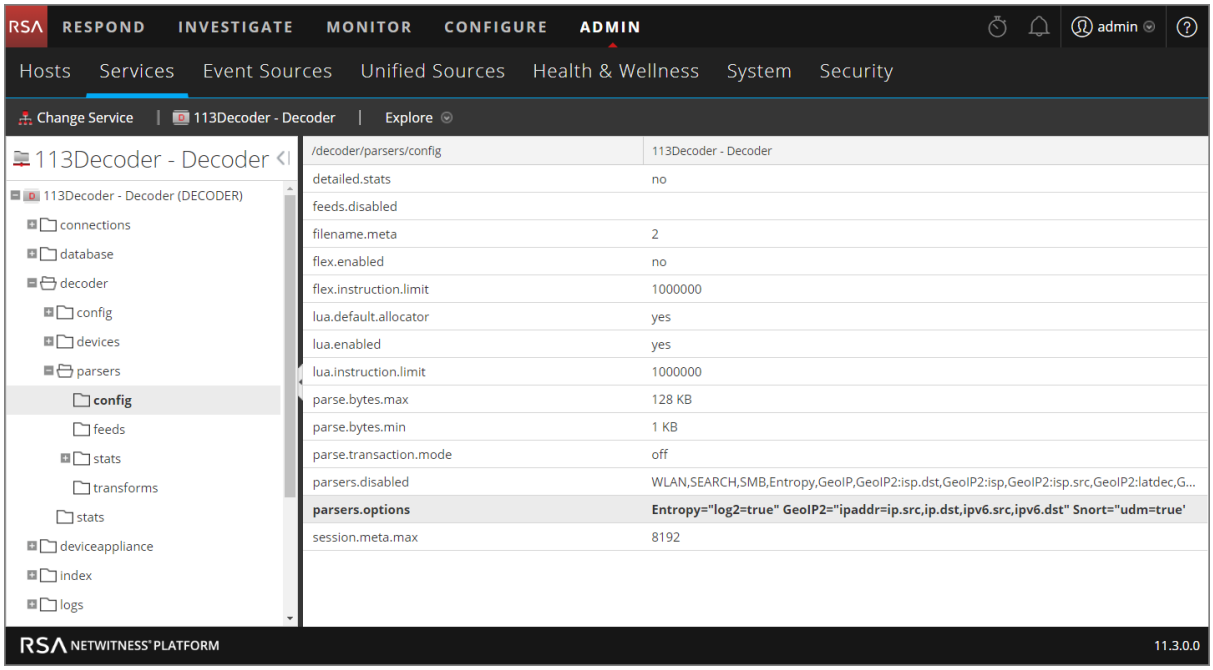
In version 11.3 or later, Snort parser meta key usage has been updated with a new option for the Snort parser. The new option, `Snort="udm=true"`, uses the aligned Unified Data Model (UDM) key set. For information about UDM, see https://community.rsa.com/community/products/netwitness/rsa-content/udm.

By default the legacy key set, which contains keys that are consistent with previous releases, is used. Refer to General Options for a description of how the two key sets differ.

To use the aligned UDM key set for Snort parser meta keys:

1. In the NetWitness Platform User Interface, go to **ADMIN** > **Services**.
2. Select a Decoder and then click ⚙ > **View** > **Explore**.
3. In the left panel, select **decoder** > **parsers** > **config**.

4. In the right panel, in `parser.options`, add `Snort="udm=true"`.
   The following image shows an example of adding `Snort="udm=true"`.



Note: To pass options to parsers, you must first give the name of the parser and then the options to be passed in this format:
`<ParserName>="<ParserOptions>"<Whitespace><ParserName2>="<Parser2Options>"`
Each `ParserName=Value` option must be separated by whitespace. Normally, the `Value` must have double quotes around it. The `Value` itself can sometimes list multiple `Option=Value` pairs, each separated by whitespace, and if those values have whitespace, they must be in escaped double quotes. To escape a quote, place a backslash before it: `\"`.
This is an example of defining options for Parser1, Parser2, and Parser3:

```
Parser1="Option1=\"Option1 Value With Space\" Option2=Option2ValueNoSpace"
Parser2="Option1=Value" Parser3="op1=val1 op2=val2 op3=\"another value\""
```

Rules

Snort rules are parsed and loaded when PCS is loaded (any import or capture in Investigate, initial capture start and parser reload in a Decoder).

- Any rule that does not properly parse is ignored.
- Any valid Snort rule should successfully parse; however, there are rule options that are not supported by Decoders which are not fully parsed.

Section	Description
Header	The header conditions are evaluated when a rule receives the first token callback for a stream. The header is evaluated once per stream, and prevents any further consideration of a rule against a specific stream if the conditions are not met.
Actions	The specified action or a rule must be defined (either one of the native Snort actions, or defined in the configuration using the `ruletype` statement) for the rule to be considered valid. The Decoder only uses rules with alert actions.
Protocols	The Decoder supports the current Snort protocol keywords (`tcp`, `udp`, `icmp`, `ip`).
IP Addresses	The full language for defining IP addresses is supported, including lists, CIDR, and negation.
Port Numbers	The full language for defining port numbers is supported, including lists, ranges and negation.
Direction Operator	The directional operator supports the from-to ('->') and bidirectional ('<>') values. The to-from ('<-') value is invalid and causes the rule to fail to load.

General Options

General options for Snort rules can result in different meta keys being written, depending on whether the Snort parser is in Aligned Key mode or Legacy Key mode.

Aligned Key Mode

Option	Description
`msg`	If the rule matches, the `msg` value is added as `sig.name` meta.
`sid`	If the rule matches, the `sig.id` value is added as meta.
`classtype`	If the rule matches, the `classtype` name is added as `threat.cat` meta.
`priority`	If the rule matches and it has a `priority` option, it is used to determine the type of the `risk.num` meta.

Legacy Key Mode

Option	Description
msg	If the rule matches, the msg value is added as risk.info, risk.warning, or risk.suspicious meta, depending on rule priority.
sid	If the rule matches, the sid value is added as meta.
classtype	If the rule matches, the classtype name is added as threat.cat meta.
priority	If the rule matches and it has a priority option, it is used to determine the type of risk meta associated with the msg value.

Payload Options

The Decoder supports the following payload rule options.

Option	Description
content	The content option creates a token for the Decoder to match. Only tokens of three or more bytes are accepted. It is also important to note that the Decoder differs from Snort in that rules are evaluated across the payload of the reconstructed stream and not just a single packet. This can result in differences in rules matches between Snort and a Decoder, especially when considering positional options.
nocase	Currently not supported. This option is ignored and case-sensitive matching is used.
depth	This option is applied to the distance of the token from the beginning of the stream. If the token position is greater than this value, it is not a match.
offset	This option is applied to the distance of the token from the beginning of the stream. If the token position is less than this value, it is not a match.
distance	This option is applied to the distance of the token from the end of the previous token match. If the relative token position is less than this value, it is not a match.
within	This option is applied to the distance of the token from the end of the previous token match. If the relative token position is greater than this value, it is not a match.
http_uri	Any token that matches is verified to fall within an http_uri as indicated by the HTTP parser. No URI normalization is applied.
uricontent	There is no URI normalization applied. Otherwise, this is equivalent to the content option with the http_uri modifier.

Option	Description
pcre	Currently, Perl Compatible Regular Expressions (PCREs) are only applied to URIs and must specify the U option.

Non-payload Options

Option	Description
flow	Verifies that the rule is only applied to the client or server stream.
to_client	Limits the rule to only matching on a stream that a Decoder has defined as Server.
from_server	Synonym for to_client.
from_client	Limits the rule to only matching on a stream that a Decoder has defined as Client.
flowbits	Maintains state per session and is reset at the end of each session.
set	When the rule matches, the specified flowbit is set.
unset	When the rule matches, the specified flowbit is cleared.
toggle	When the rule matches, the specified flowbit is flipped.
isset	When the rule is evaluated, the specified flowbit state must be set for the rule to match.
isnotset	When the rule is evaluated, the specified flowbit state must not be set for the rule to match.
noalert	Prevents the rule from generating metadata if it matches.

Search Parser

The Search Parser is a custom parser used to generate metadata by scanning for predefined keywords and regular expressions. The parser searches the payload of a reconstructed session for string matches and can execute a regular expression search. You can configure the parser by editing the **search.ini** file.

Caution: The search parser can have a significant impact on system performance. It is important that both the search mechanism and the data to which it is applied to be well understood before creating new search definitions and enabling the search parser.

The search definition is used across all protocols. There are three basic search methods:

- Keyword: Search a stream for a specific set of words
- Pattern: Search a stream for a regular expression match
- Keyword + Pattern: Search a stream for a regular expression if it contains any of a given set of keywords.

Search Methods

The Search parser uses three basic search methods:

- Keyword: Search a stream for a specific set of words.
- Pattern: Search a stream for a regular expression match.
- Keyword+Pattern: Search a stream for a regular expression if it contains any of a given set of key words.

Syntax

```
Maxrecon=<max_size>Maxsearch=<max_ssearch_length>MatchLimit=<max_matches_per_
stream
Search Name
Services=<service_id_list>Keywords=<keyword_list>|Pattern=<expression>Case=0|1
Proximity=<number_of_bytes>Recon=0|1
Raw=0|1
```

Parameters

Parameters used in this command:

Parameter	Description
autocheck	Automatically fixes all problems without prompting

Parameter	Description
header Only	Check/display the header of each file
chatty	Displays a hex dump of every object in the file (huge amount of data)
dump#-#	Indicates a zero-based object or range of objects in the file to output in hex to the console

Example

Following is an example of the command:

To check all NetWitness database files located in the Collection named Default. If any problems are found, the command will describe the problem and ask if you would like to fix it.

```
dbcheck C:\Documents and Settings\User\My Documents\NetWitness\
Investigations\Default\*.nw*
```

Wireless LAN Configuration

One of the files available for editing in the Services Config view > Files tab is **`wlan-config.xml`**, the wireless LAN configuration file.

It controls the 802.11 parsers. Its chief purpose is to control decryption of raw 802.11 frames captured by the Decoder. This file is optional. If decryption of 802.11 traffic is not desired, there is no need to create the file.

There are five link-level parsers related to wireless LAN packet capture:

- IEEE 802.11 parser (data frames and beacons only)
- Radiotap w/ 802.11 header
- Absolute Value Systems (AVS) w/ 802.11 header
- Prism II w/ 802.11 header
- CACE's "Per Packet Information" (PPI) w/ 802.11 header

The 802.11 wireless parsers introduced in 9.8 all share a single configuration file. This wlan-config.xml file is used to define any wireless access points the user may have in the network, and its primary purpose is to control decryption. The BSSID of the access point and the SSID that it's authoritative for is added to this file as well as all of the active default keys used by the access point.

Decoder and Log Decoder References

This is a collection of references, which provide information about the user interface for Decoders and Log Decoders in NetWitness Platform, with references to the procedures that describe the work you can do in that part of the user interface.

Services Config View - Data Privacy Tab

In the Data Privacy tab (**ADMIN > Services > Select a Decoder or Log Decoder >** **> Config > Data Privacy tab)**, administrators can configure data privacy parameters for certain Core services. For the Decoder and Log Decoder, you can set the default hash algorithm and salt.

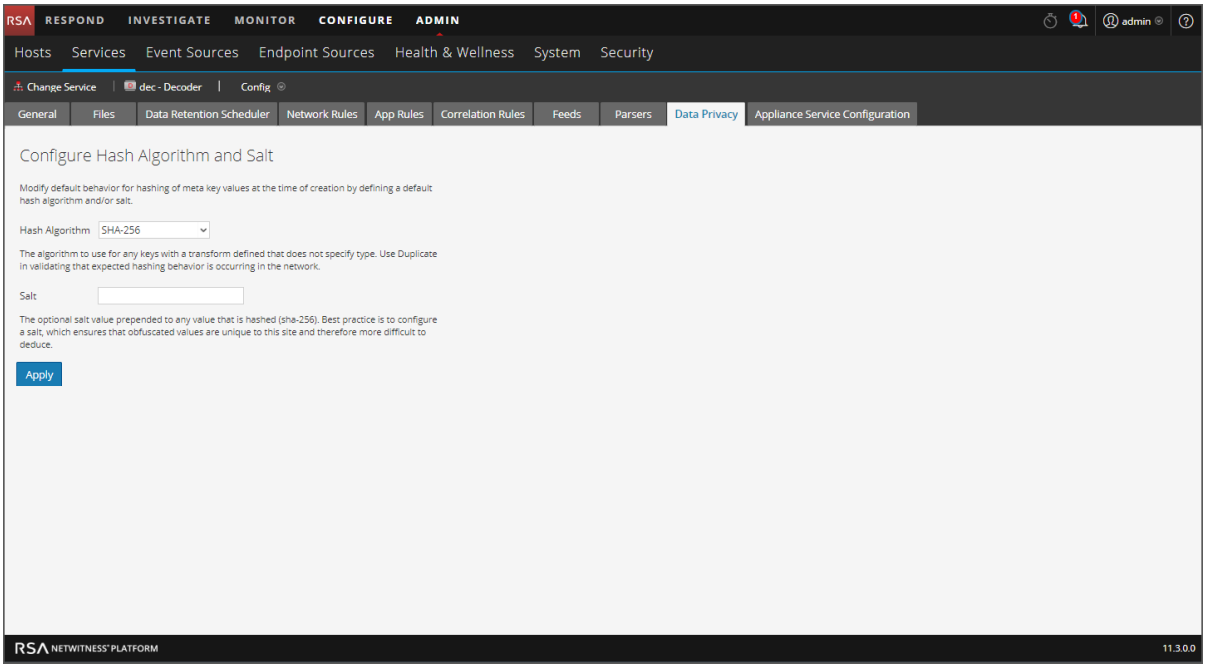
What do you want to do?

User Role	I want to ...	Documentation
Administrator	configure hash algorithm and salt	"Configure the Hash Algorithm and Salt" in the *Data Privacy Management Guide*. (Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.)

Related Topics

- Decoder and Log Decoder Quick Setup
- Configure Common Settings on a Decoder

Quick Look



The Data Privacy tab has the Configure Hash Algorithm and Salt configuration settings. The following table describes the parameters in this tab.

Parameter	Description
Hash Algorithm	Displays a drop-down list of hash algorithms to use for any keys with a transform that does not specify algorithm type. Possible values are SHA-256 and Duplicate. Duplicate is a special algorithm available for administrators to use when validating that expected hashing behavior is occurring in the network.
Salt	Indicates the optional salt value prepended to any value that is hashed. Best practices for security purposes dictate a salt value that is no less than 100 bits or 16 characters in length. Configuring a value ensures that obfuscated values are unique to this site and therefore more difficult to deduce. For more information on this field, see "Configure Data Obfuscation" in the *Data Privacy Management* guide.
Apply	Applies any changes.

Services Config View - Data Retention Scheduler

In the Data Retention Scheduler tab, you can set the rollover criteria for removing database records from primary storage using an age-based threshold. You can also schedule the timing to check whether the threshold is reached.

To access the Data Retention Scheduler tab, go to **ADMIN** > **Services** > select a **Decoder** or **Log Decoder** service and click > **View** > **Config** > **Data Retention** tab.

What do you want to do?

User Role	I want to...	Documentation
Administrator	Schedule the timing to see if the threshold is reached.	Configure Transaction Handling on a Decoder

Related Topics

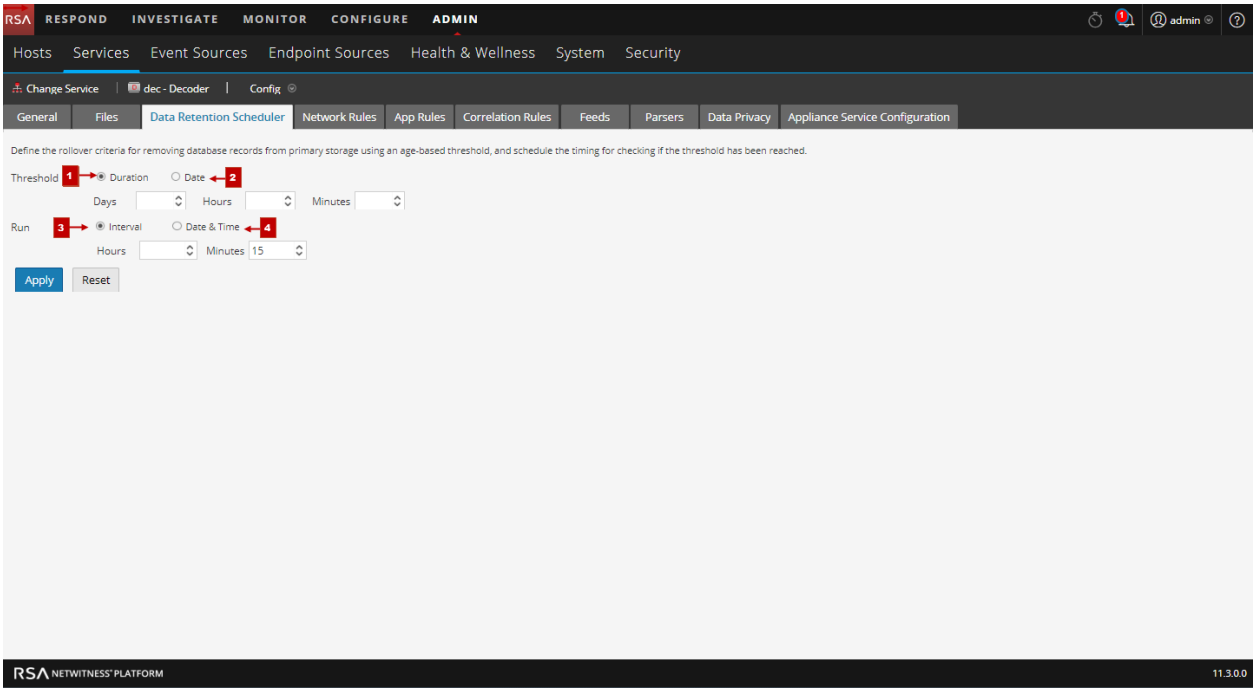
Quick Look

This is an example of the Data Retention Scheduler tab.



1 **Threshold Duration**: Removes database files older than the selected number of days, minutes, or hours.

2 **Threshold Date**: Removes database files older than the selected UTC date (YYYY-MM-DD-

HH:MM:SS) that are not compatible with minutes, hours, or days parameters.

3 **Run Interval**: Indicates the number of hours between executions.

4 **Run Date and Time**: Defines which days of the week to execute the scheduler, as well as time of execution in HH:MM:SS format for the local time of the service.

Services Config View - Feeds Tab

Feeds and parsers are Lua programs loaded and compiled when either processing capture files in NetWitness Investigate or capturing data with Decoders. Most commonly, they are used for static meta extraction and service identification.

Note: Pre-11.0 versions of NetWitness used FLEXPARSE programs in addition to Lua programs; Flexparsers are deprecated in NetWitness Platform 11.0. Unless otherwise stated, any reference to Decoders applies to Log Decoders as well.

NetWitness Platform uses feeds to create metadata based on externally defined meta values. A feed is a list of data that is compared to sessions as they are captured or processed. For each match, additional metadata is created. This data can identify and classify malicious IPs or incorporate additional information such as department and location based on internal network assignments. Some examples of feeds include threat feeds to identify BOTNets, DHCP mappings, or even active directory information such as physical location or logical department.

Feeds can be added, removed, and updated while a Decoder is running without affecting capture. The Feeds tab (**ADMIN > Services** > select a Decoder or Log Decoder service and click > **View** > **Config > Feeds tab**) provides a user interface for managing feeds on Decoders.

What do you want to do?

User Role	I want to...	Documentation
Administrator	configure feeds	Configure Feeds and Parsers
Administrator	enable and disable parsers	Enable and Disable Parsers and Log Parsers

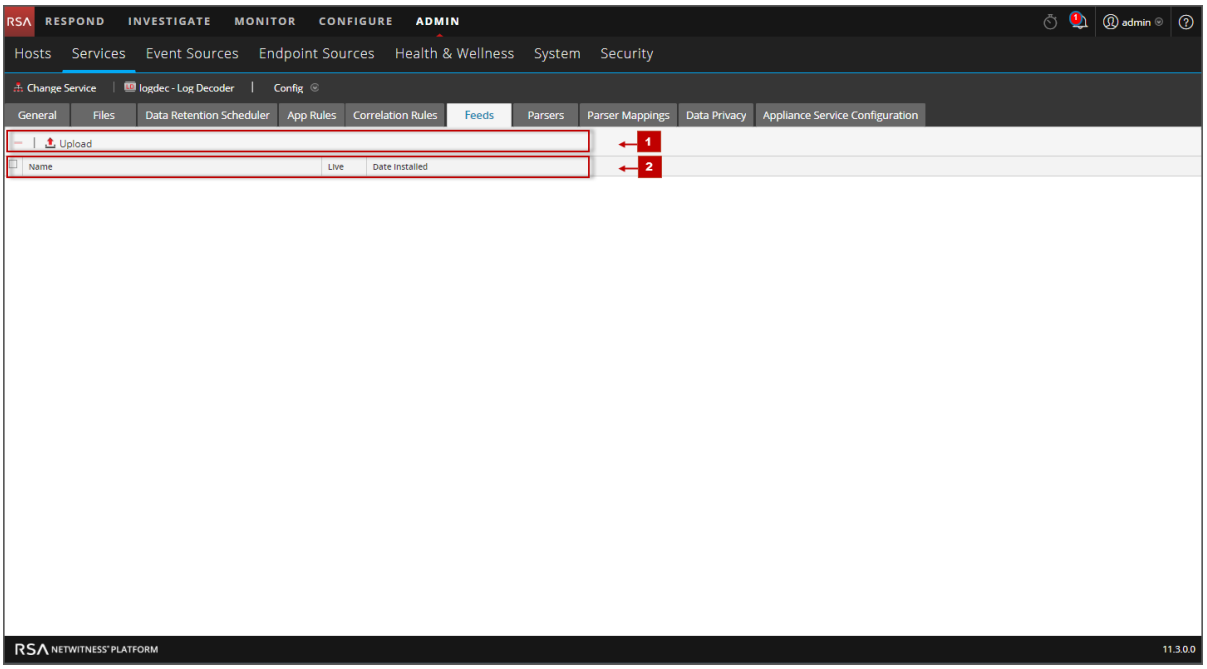
Quick Look

This is an example of the Feeds tab.



1 Feeds Tab Toolbar - Provides options to work with feeds in the grid
2 Feed List - Lists all feeds that are currently deployed on the Decoder

Feeds Tab Toolbar

Feature	Description
Upload	Displays the Upload Feeds dialog.
	Deletes the selected feeds.

Feeds List

The Feeds list provides a listing of all currently deployed feeds for the Decoder.

Column	Description
Name	The name of the feed or the feed file.
Live	Indicates if the feed originated from Live. Possible values are **Yes**, **No**, or **N/A**. • **Yes** = Installed through Live • **No** = Installed through NetWitness Platform • **N/A** = The feed has no attributes file created by NetWitness Platform to track the installation date. The feed may have been installed manually, not through NetWitness Platform or Live Services. Manually installed feeds still function properly.

Column	Description
Date Installed	The date the feed was pushed to the service.

Upload Feeds Dialog

This topic describes the features of the Upload Feeds dialog in the Services Config view > Feeds tab.

The **Upload** option in the Services Config view > Feeds tab displays the Upload Feeds Dialog, in which you can manage the uploading of feeds to a Decoder or Log Decoder.

What do you want to do?

User Role	I want to...	Documentation
Administrator	prepare a list of feeds for upload	Edit, Upload, or Remove a Feed
Administrator	view and delete upload jobs	Edit, Upload, or Remove a Feed

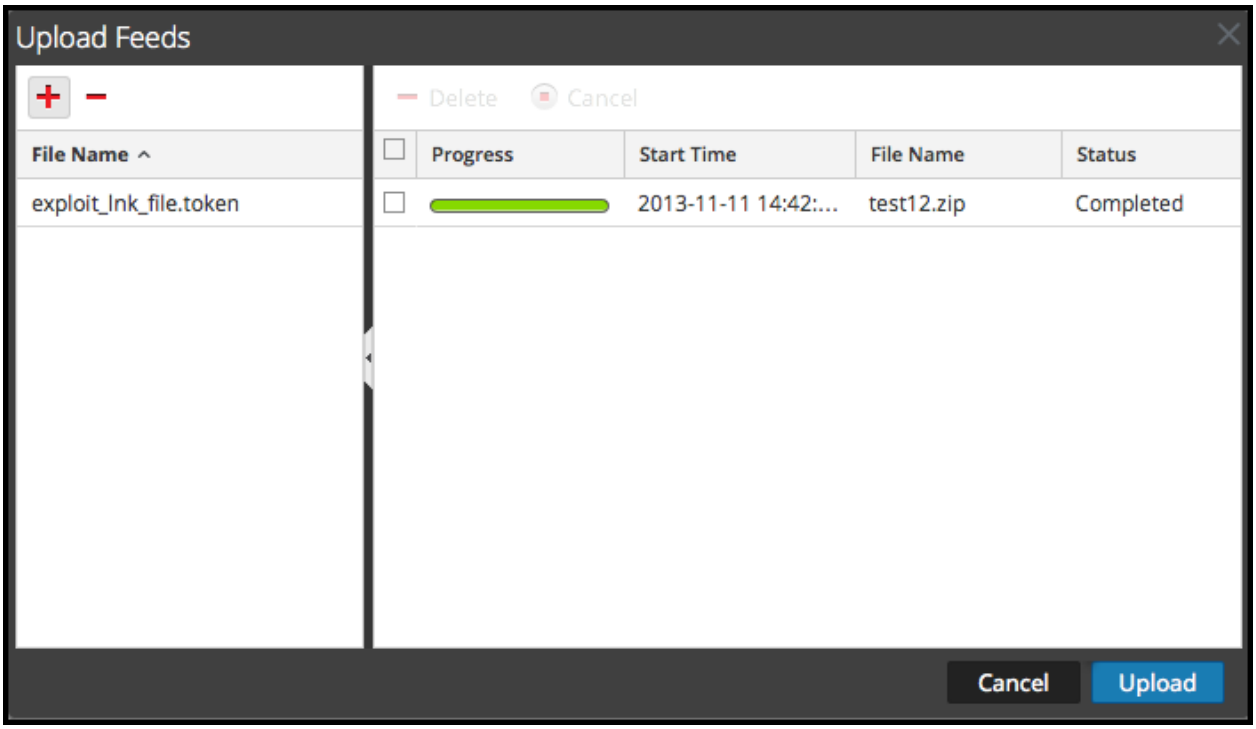
This is an example of the Upload Feeds dialog.



1 File List - Provides place to prepare a list of feeds for uploading
2 Upload Job List - Provides a view of upload jobs
3 Upload Feeds Dialog Buttons

File List

The File list is the place to prepare a list of feeds for uploading. You can add files from a directory structure, and delete files from the list if you decide that you don't want to upload a particular file. When the list is ready, clicking **Upload** starts the upload process.

Feature	Description
	Opens a view of the directory structure where you can select files to add to the File list.
	Deletes the selected files from the File list.
File Name	Lists the feed files you have added from a file system in preparation for uploading to a Decoder. When you click **Upload**, the files listed here are uploaded.

Upload Job List

The Upload Job list provides a view of upload jobs started by clicking **Upload**.

Feature/Column	Description
	Deletes an upload job.
Progress	Displays progress of an upload job.
Start Time	Displays the start time of an upload job.
File Name	Lists filename of the feed being uploaded.
Status	Displays the status of upload job.

Upload Feeds Dialog Buttons

Feature	Description
Cancel	Closes the Upload Feed dialog.
Upload	Starts uploading the feed files listed in the File list. Each feed is listed in a separate row in the Upload job list.

Services Config View - Files Tab

The Decoder and Log Decoder configuration files are visible and editable in the Services Config view > Files tab. "Edit Core Services Configuration Files" in the *Hosts and Services Getting Started Guide* provides general instructions for editing files. (Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.)

Like other Core services, both the Decoder and Log Decoder have an index file, and may also have a crashreporter, netwitness, and scheduler. The Decoder and Log Decoder index files are named **`index-decoder-custom.xml`** and **`index-logdecoder-custom.xml`.**

Note: `Table-map.xml` and `table-map-custom.xml` are available only for Log Decoders with Envision content installed.

What do you want to do?

User Role	I want to...	Documentation
Administrator	obtain log files from pre-11.0 Log Decoder	Obtain Log Files from a Pre-11.0 Log Decoder
Administrator	edit files and parsers	Feed and Parser References

Related Topics

Quick Look

Filename	Description
`GeoPrivate.ipl`	This fixed parser takes the IP addresses and converts them to geographical locations. The locations are displayed through the Google Earth display.
`feed-definitions.xml`	Used to create custom feeds, this is the XML schema used by the Decoder to define a **feed** message when it creates a **.feed** file.
`traffic_flow_options.lua`	Used to provide directionality information. Update this file with environment-specific internal and external subnets for the Lua parser to create proper directionality in metadata. The parser is described in RSA Content for RSA NetWitness Platform.
`search.ini`	This is the Search Parser configuration file. The Search Parser is a custom parser, used to generate metadata by scanning for pre-defined keywords and regular expressions.

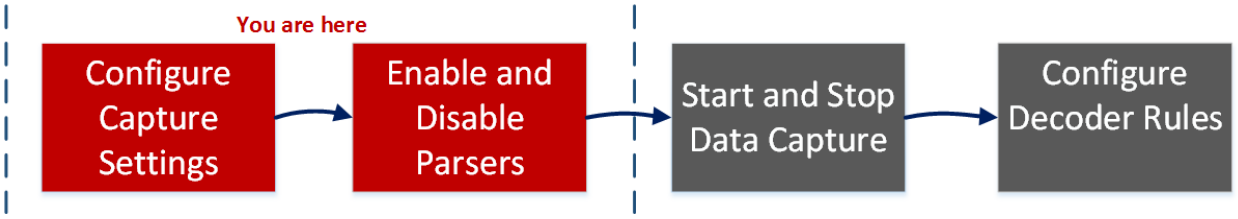
Filename	Description
wlan-config.xml	This is the wireless LAN configuration file (9/9/2009). This file controls the 802.11 parsers. Its chief purpose is to control decryption of raw 802.11 frames captured by the Decoder.

Services Config View - General Tab

The General tab for a Decoder in the Services Config view provides a way to manage basic service configuration, configure data capture, and select the parsers that are applied to the captured data. To access the General tab, go to **ADMIN > Services >** select a Decoder or Log Decoder and click > **View > Config > General tab**.

Workflow

The following figure depicts common Decoder configuration tasks with the steps you can complete in this view highlighted.



What do you want to do?

User Role	I want to...	Documentation
Administrator	configure capture settings*	Configure Capture Settings
Administrator	manage parsers and log parsers*	Enable and Disable Parsers and Log Parsers
Administrator	start and stop data capture	Start and Stop Data Capture
Administrator	configure rules	Configure Decoder Rules

*You can complete these tasks here.

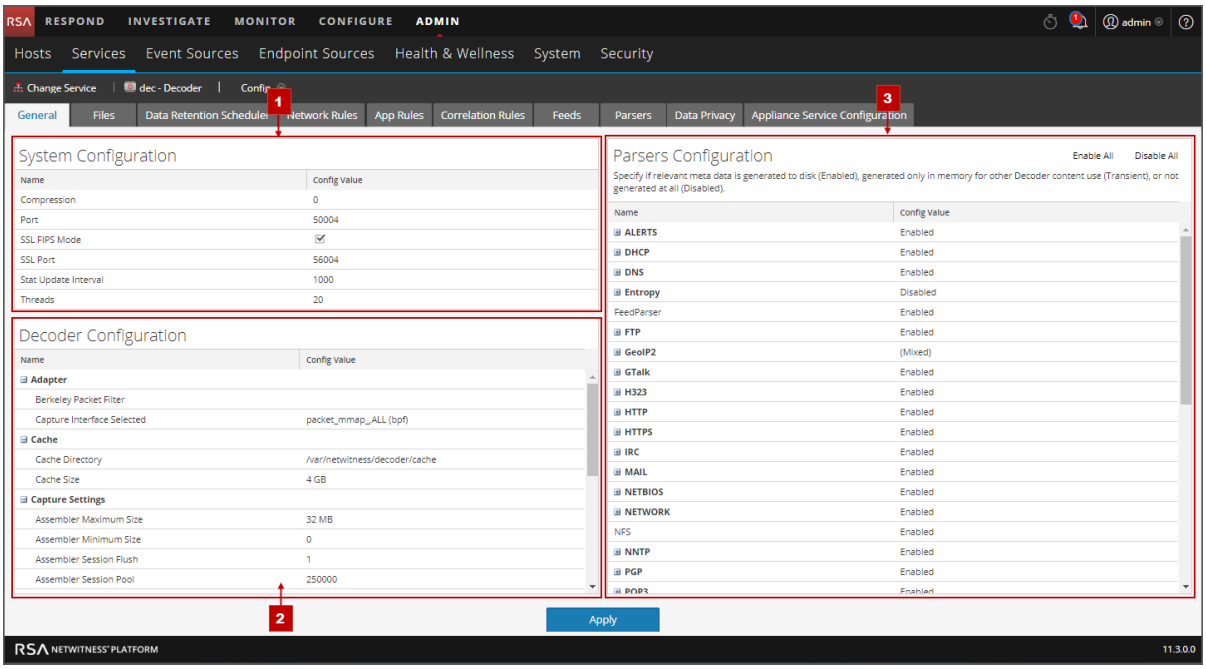
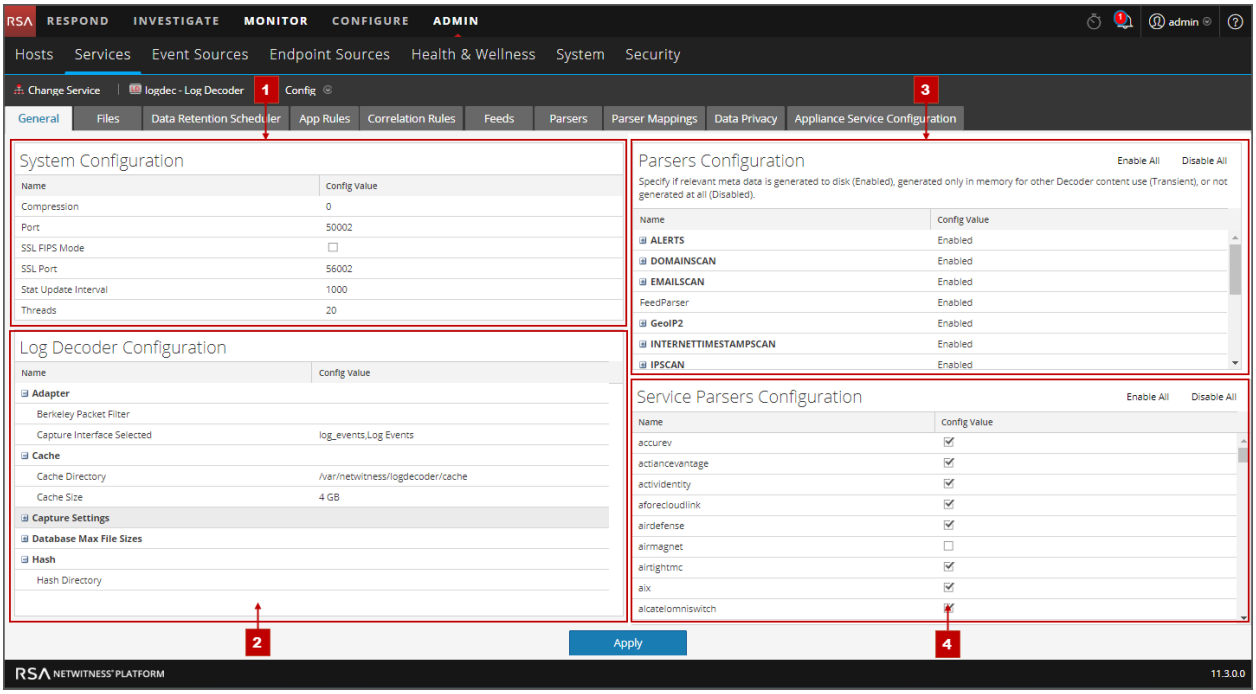
Quick Look

The first figure is an example of the General tab for a Decoder. The second is the General tab for a Log Decoder.





1 System Configuration - Manages service configuration for a Decoder.

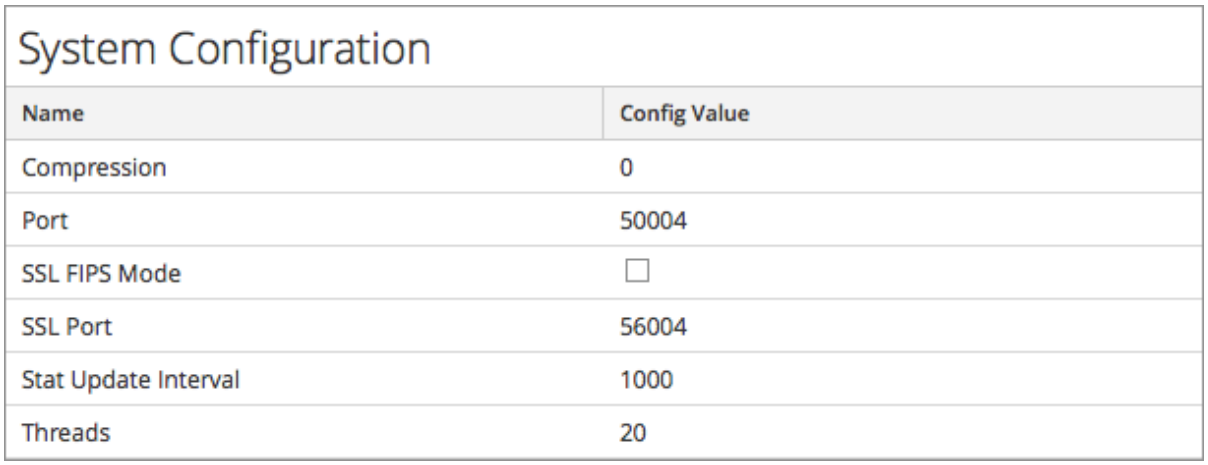
2 Decoder Configuration or Log Decoder Configuration - Lets you view and edit service configuration parameters for a Decoder or Log Decoder.

3 Parsers Configuration - Lets you select parsers to use on the Decoder.

4 Service Parsers Configuration (Log Decoders only) - Lets you select service parsers to use on the Log Decoder.

System Configuration Section

The System Configuration section manages service configuration for a Decoder. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change.



System Configuration

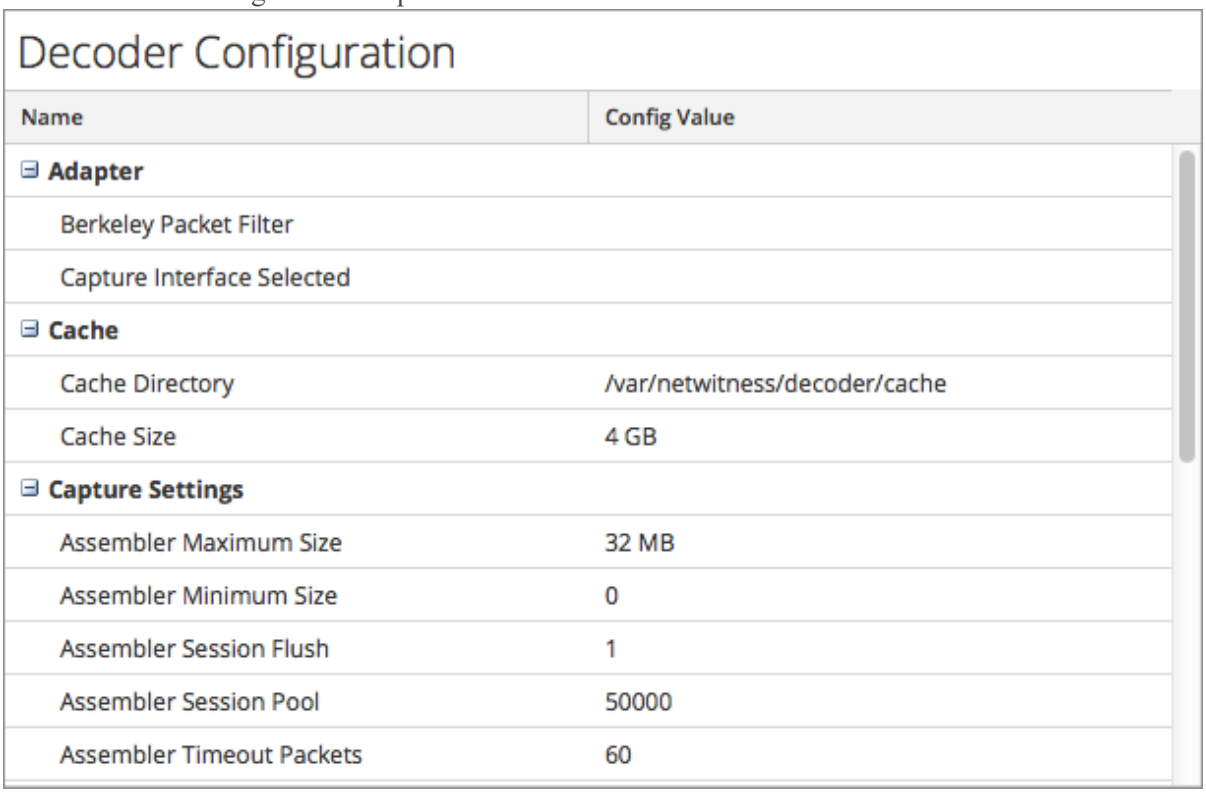
Name	Config Value
Compression	0
Port	50004
SSL FIPS Mode	☐
SSL Port	56004
Stat Update Interval	1000
Threads	20

The System Configuration section has these parameters.

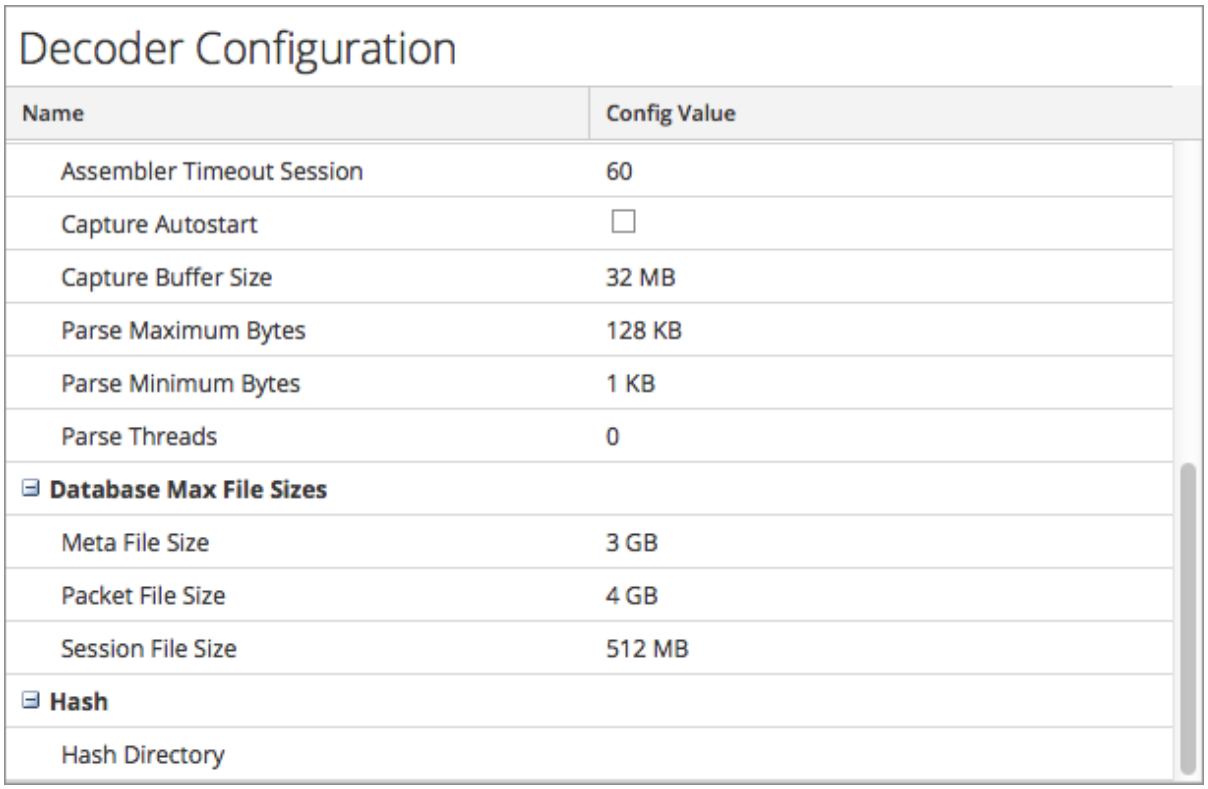
Parameter	Description
Compression	The minimum number of bytes that must be transmitted per response before compression. A setting of 0 disables compression. The default value is **0**. A change in value is effective immediately for all subsequent connections.
Port	Determines the port used by the service. **Note:** If you change the port number, ensure that you restart the service.
SSL FIPS mode	If enabled, all the data transferred in the network will be encrypted using SSL.
SSL Port	Indicates the port used for encrypting using SSL.
Stat Update Interval	The number of milliseconds between statistic updates on the system. Lower numbers cause more frequent updates and can slow down other processes. The default value is **1000**. A change in value is effective immediately.
Threads	The number of threads in the thread pool to handle incoming requests. A setting of **0** lets the system decide. A change takes effect on service restart.

Decoder Configuration Section

The Decoder Configuration section provides a way to view and edit service configuration parameters for a Decoder or Log Decoder. When a service is first added, default values are in effect. You can edit these values to manage traffic capture.



Scrolling to the bottom of the section reveals these additional Decoder Configuration parameters.



Adapter Section

Adapter parameters configure the network interface for capture as described in Configure Capture Settings.

Cache Section

Cache parameters configure the cache directory and size for session cache files. The following table describes the cache settings. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change.

Cache Parameter	Description
Cache Directory	The directory where session cache files are stored. The default value is `/var/netwitness/decoder/cache`. Change takes effect immediately.
Cache Size	The maximum size, in Megabytes (MB), that all files in the cache directory can attain before the oldest files are deleted. Once the threshold is reached, the cache size is reduced by 10%. The default value is **4 GB**. Change takes effect immediately.

Capture Settings Section

The Capture Settings section provides a way to configure operational capture settings. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change.

Capture Settings Parameter	Description
Assembler Maximum Size	Specifies the maximum size in bytes that a session's packet data size can attain. The default value is **32 MB**. Change takes effect immediately.
Assembler Minimum Size	Specifies the minimum size in bytes that a session must have in order to generate metadata. A value of **0** means every session has metadata generated. The default value is **0.** Change takes effect immediately.
Assembler Session Flush	Specifies whether a session is removed from the assembler when the session's last chain is removed from the assembler. The default value is **1**. • **2** = if the first packet of a session times out of assembler, the session is removed from assembler after parsing is complete. Any subsequent packets for this session create a new session in assembler. • **1** = If the last chain of a session times out of assembler, the session is removed from assembler. Any subsequent packets for this session create a new session in assembler. • **0** = If the last chain of a session times out of assembler, the session is left in assembler until it times out. Any subsequent packets for this session are filtered Change takes effect on service restart.
Assembles Session Pool	Specifies the number of entries in the session pool. The default value is **350000**. Change takes effect on service restart.
Assembler Timeout Packets	Specifies the number of seconds before a packet or chain is timed out. T default value is **60**. Change takes effect immediately.
Assembler Timeout Session	Specifies the number of seconds before a session is timed out. Default value is **60**. Change takes effect immediately.
Capture Autostart	Specifies whether capture begins automatically each time Decoder is started. When checked, the value = yes. When unchecked, the value = no. The default value is **no**. Change takes effect immediately.
Capture Buffer Size	The capture memory buffer allocation in Megabytes. Default value is **64 MB**. Change takes effect on service restart.
Parse Maximum Bytes	The maximum number of bytes to scan a stream for additional tokens. When the first token is found, the stream is scanned up to the set number of bytes, but no further. A setting of **0** removes the early termination and the full stream is scanned regardless of size. The default value is **128 KB**. Change takes effect immediately.

Capture Settings Parameter	Description
Parse Minimum Bytes	The minimum number of bytes to scan a stream for the first token. If no token is found within the set number of bytes, scanning is terminated. A setting of **0** removes the early termination and the full stream is scanned regardless of size. The default value is **1 KB**. Change takes effect immediately.
Parse Threads	The number of parse threads to use for session parsing. A value of **0** means let the server decide. The default value is **0**. Change takes effect on service restart.

Database Max File Sizes Section

The Database Max File Sizes section controls the maximum file size for various databases. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change.

File Size Parameter	Description
Meta File Size	The maximum size of meta database files in Megabytes. The default value is **10 MB**. Change takes effect on service restart.
Packet File Size	The maximum size of packet database files in Megabytes. The default value is **10 MB**. Change takes effect on service restart.
Session File Size	The maximum size of session database files in Megabytes. The default value is **100 MB**. Change takes effect on service restart.

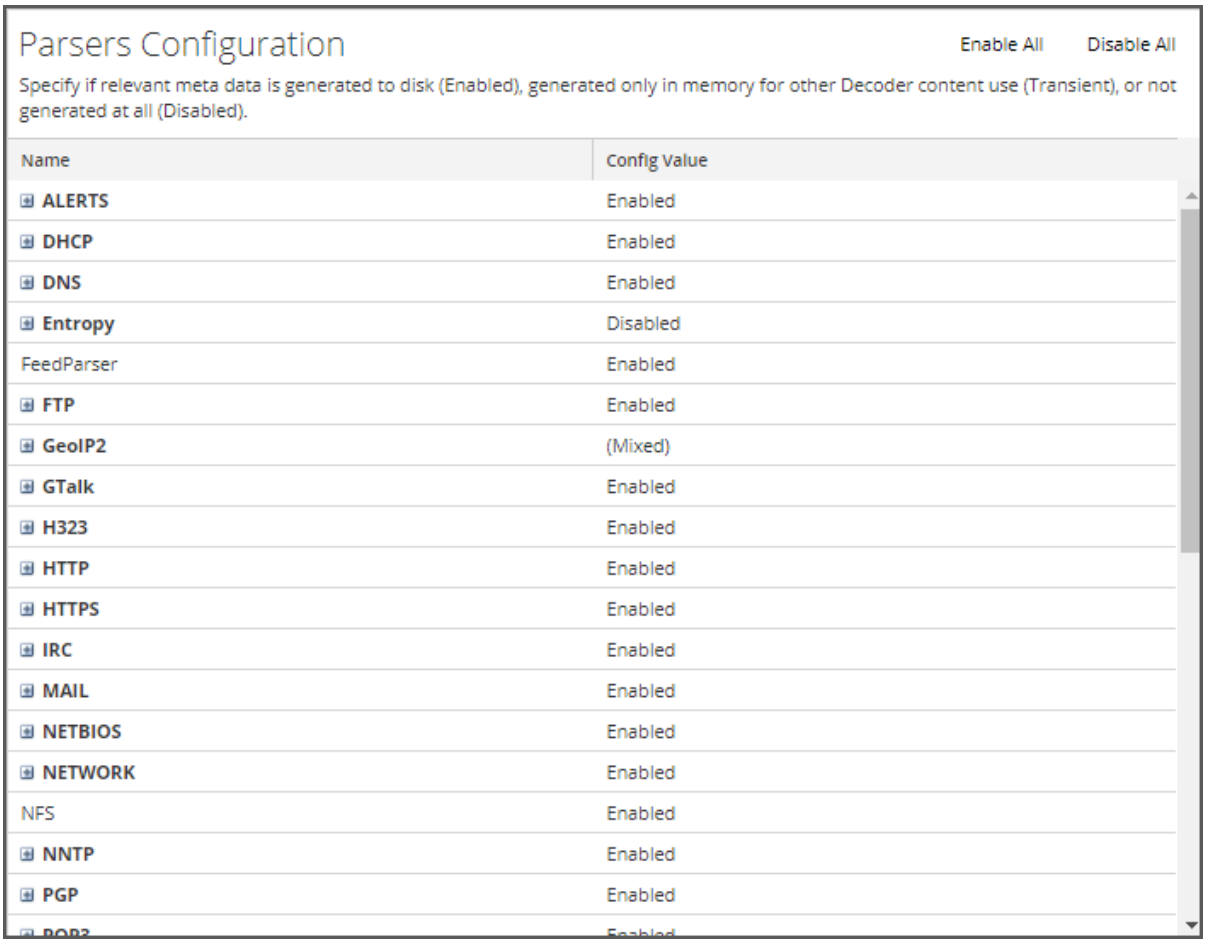
Hash Section

The Hash section settings control data base file hashing options. There is a small performance penalty when hashing.

Hash Parameter	Description
Hash Directory	The server directory where all hash files are written. If empty, each hash file is written to the same directory as the file being hashed. The default value is blank. Change takes effect on service restart.

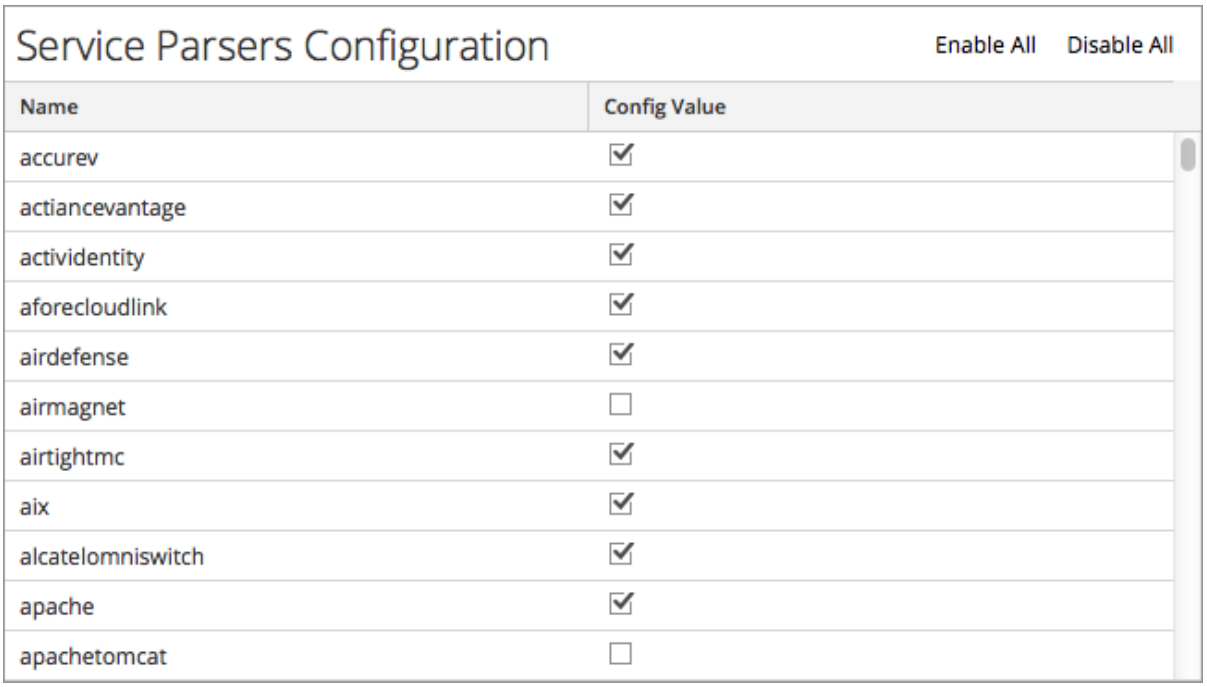
Parsers Configuration Panel

The Parsers Configuration panel provides a way to select parsers to use on the Decoder. Within some parsers, you can also configure the metadata that the parser creates. See Enable and Disable Parsers and Log Parsers for detailed information and procedures.



Service Parsers Configuration Section for Log Decoder

The Service Parsers Configuration section provides a way to select Service parsers to use on the Log Decoder.



Service Parsers Configuration
Enable All
Disable All
Name
Config Value
accurev
actiancevantage
actividentity
aforecloudlink
airdefense
airmagnet
airtightmc
aix
alcatelomniswitch
apache
apachetomcat

Services Config View - Parsers Tab

In the Services Config View > Parsers tab, you can view deployed parsers on a Decoder or Log Decoder, upload parsers, and delete deployed parsers. Parsers can be added and removed while a Decoder or Log Decoder is running without affecting capture.

To access the Parsers tab, go to **ADMIN** > **Services** > select a **Decoder** or **Log Decoder** service and click > **View** > **Config** > **Parsers** tab.

What do you want to do?

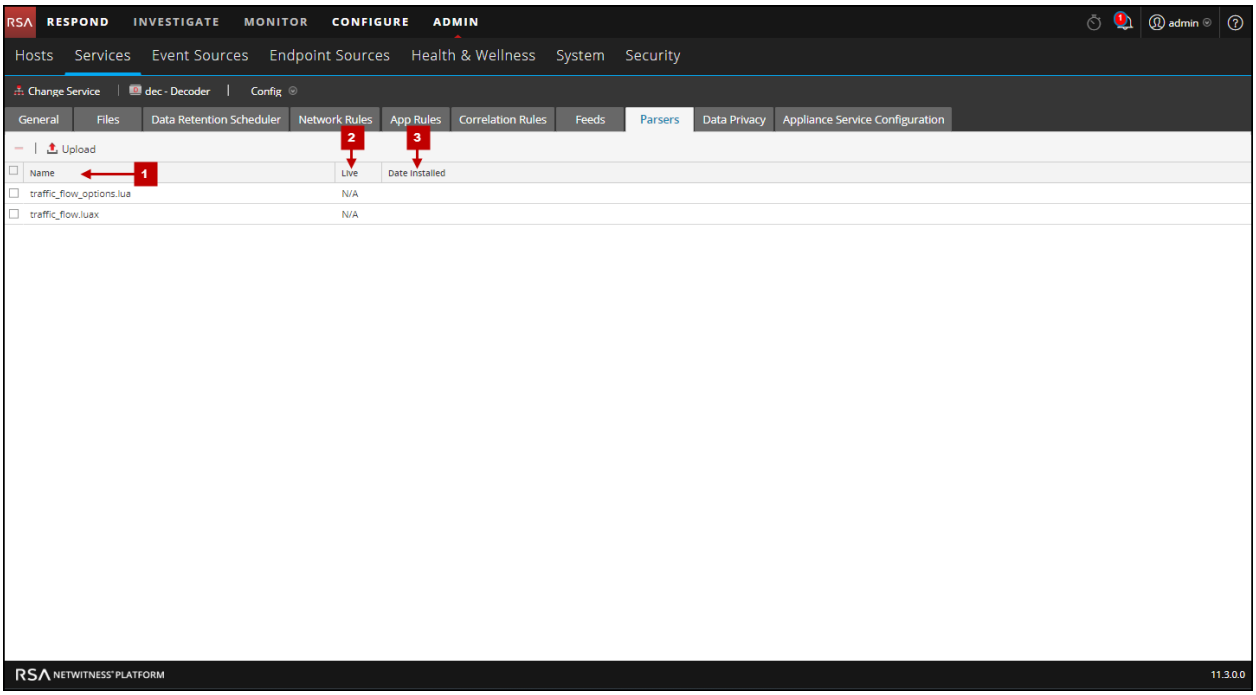
User Role	I want to...	Documentation
Administrator	View deployed parsers.	Enable and Disable Parsers and Log Parsers
Administrator	Upload parsers to a Decoder or Log Decoder.	Enable and Disable Parsers and Log Parsers

Related Topics

- Decoder and Log Decoder Quick Setup
- Configure Common Settings on a Decoder
- Upload and Delete Custom Parsers

Quick Look

This is an example of the Parsers tab. The Parsers grid lists all parsers that are currently deployed on the Decoder.



1 **Name**: The name of the parser or the parser file.

2 **Live**: Indicates if the parser originated from Live. Possible values are **Yes**, **No**, or **N/A**.

- **Yes** = Installed through Live Services.
- **No** = Installed through NetWitness.
- **N/A** = The parser has no attributes file created by NetWitness to track the installation date. The parser may have been installed manually, not through NetWitness or Live Services.

3 **Date Installed**: The date the parser was pushed to the service.

Parsers Tab Toolbar

The Parsers Tab toolbar has options to work with parsers in the grid.

Feature	Description
Upload	Enables you to upload parsers to a Decoder or Log Decoder.
−	Requests confirmation that you want to delete the selected parsers. You can select **No** to cancel the deletion, or select **Yes** to delete the selected parsers.

Services Config View - Parser Mappings Tab

This topic provides a description of the configurable options for a Log Decoder in the Parser Mappings tab.

In the Parser Mappings Administrators can configure log parser mappings for Log Decoder services. To access the Parser Mappings tab, go to **ADMIN** > **Services** > select a Log Decoder service and click > **View** > **Config** > **Parser Mappings** tab.

Note: You can also configure log parser mappings for Log Decoder services by navigating to **ADMIN > Services > Event Sources > Discovery**.

This feature is intended to track a subset of event sources that is parsing against the wrong parser.

What do you want to do?

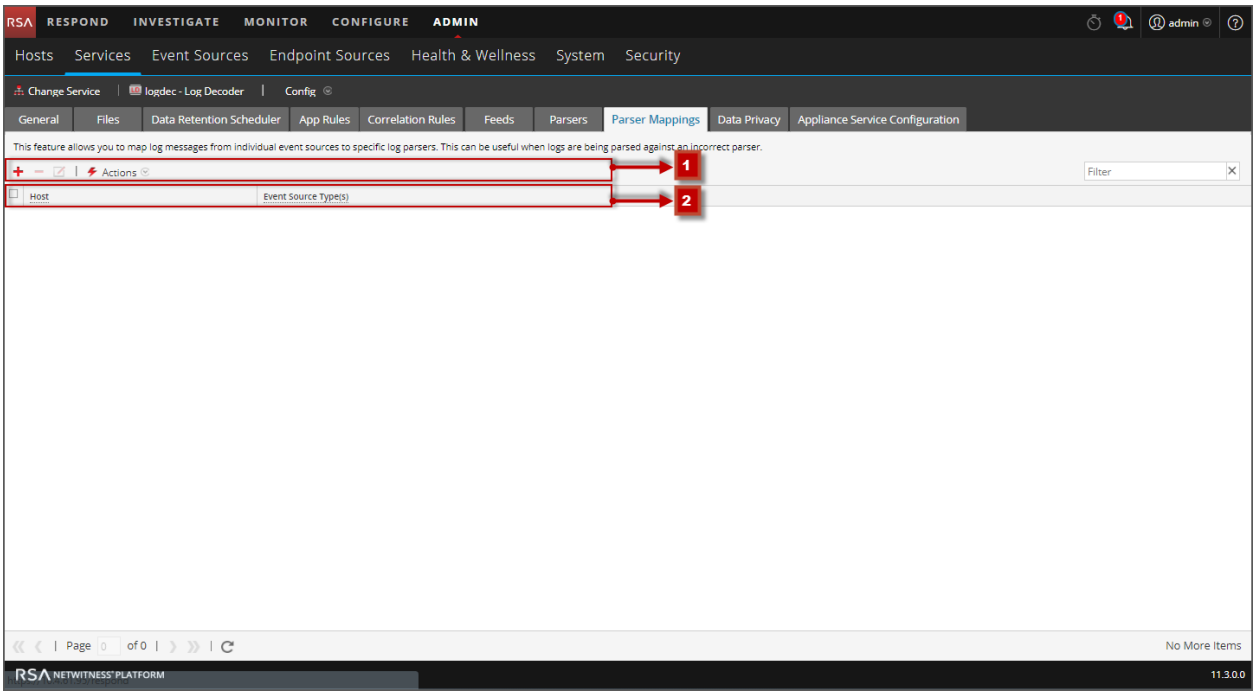
User Role	I want to...	Documentation
Administrator	Manage IPs for Event Source Mapping.	Enable Parser Mappings

Related Topics

- Decoder and Log Decoder Quick Setup
- Configure Common Settings on a Decoder

Quick Look

This is an example of the tab.



1 Parser Mappings Toolbar - Provides options to work with parser mappings in the list
2 Parser Mappings List - Lists all parsers that are currently mapped on the Log Decoder

Parser Mappings Toolbar

The Parser Mappings toolbar has options to work with parser mappings in the grid.

Feature	Description
	Add a parser mapping.
	Delete the selected parser mapping.
	Edit a parser mapping.
	Refresh the list of parser mappings.
	Display the Actions menu. • **Import** - Import a parser mapping to a file. • **Export** - Save a parser mapping to a file.

Parser Mappings List

The Parser Mappings list displays all parsers that are currently mapped on the Log Decoder.

Parameter	Description
Host	Displays the IP address of the host.
Event Source	Displays the event sources that are parsing incorrectly.

Parser Mappings Editor Dialog

The Parser Mappings Editor dialog allows you to update an IP to event source mapping.

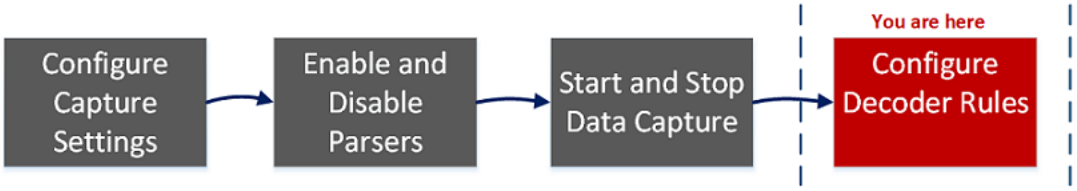
To access the Parser Mappings Editor dialog, in the Services Config view for a Log Decoder, select the Parser Mappings tab.

Services Config View - Rules Tabs

The Rules tabs in the Services Config view (**ADMIN > Services >** select a service and click > **View > Config**) enable you to define and manage capture rules. Each type of rule has a list with slightly different columns and different parameters in the Rule Editor dialog. Application and correlation rules apply to both Decoders and Log Decoders. Network rules apply only to Network Decoders.

Workflow

The following figure depicts the workflow for common Decoder configuration tasks with the steps you can complete in this view highlighted.



What do you want to do?

User Role	I want to...	Documentation
Administrator	configure capture settings	Configure Capture Settings
Administrator	manage parsers and log parsers	Enable and Disable Parsers and Log Parsers
Administrator	start and stop data capture	Start and Stop Data Capture
Administrator	configure rules*	Configure Decoder Rules
Administrator	import, export, or push a rule*	Configure Decoder Rules
Administrator	enable or disable a rule*	Configure Decoder Rules
Administrator	add, edit, or delete a rule*	Configure Decoder Rules

*You can complete these tasks here.

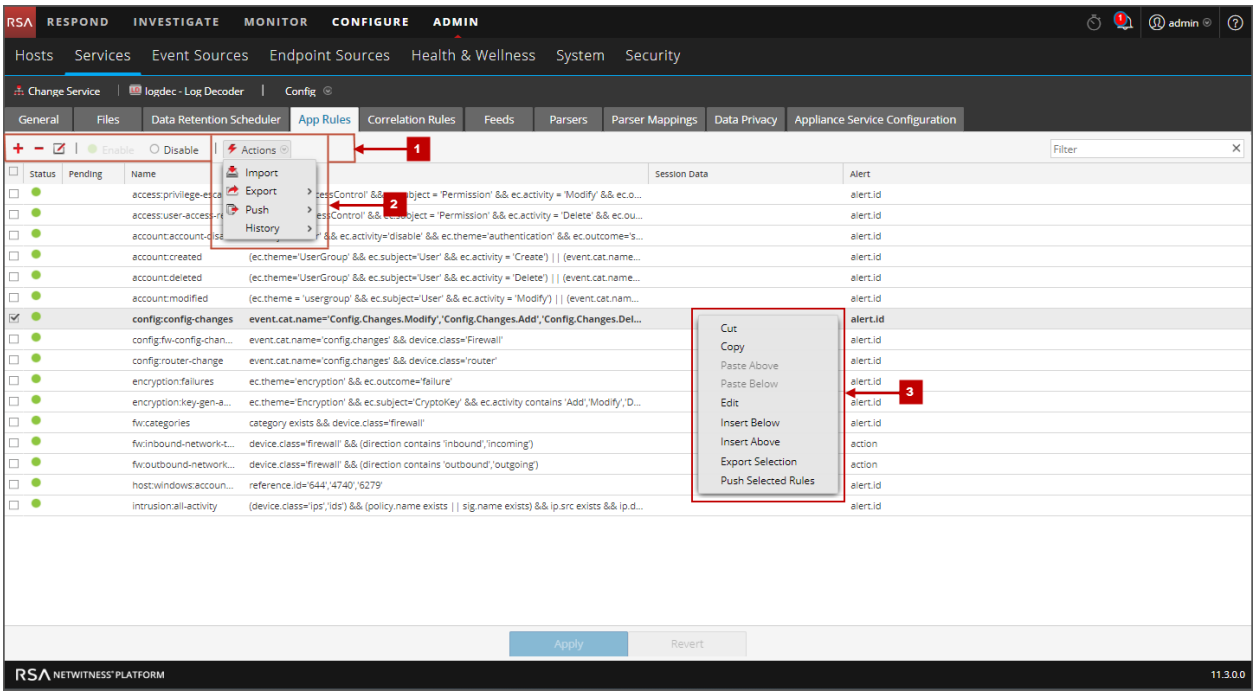
Quick Look

This is an example of the App Rules tab.



1 Rules Tab Toolbar - Provides options to work with rules in the list
2 Rules Actions Menu - Provide options to manage sets of rules
3 Rules List Context Actions - Displays the Rules List Context Menu

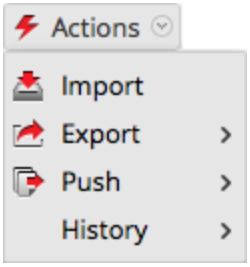
Rules Tab Toolbar

The toolbar is the same for all Config view > Rules tabs.

Feature	Description
Actions	Displays the **Actions** menu.
+	Adds a new rule to a service.
−	Deletes a rule from a service.
	Allows rule modification.
Disable	Disables a rule (without deleting the rule).
Enable	Enables (reactivates) a rule.
Filter	The input field for a search string. NetWitness Platform filters the rules dynamically as you type a search string. Clicking **x** clears the input field, restoring the unfiltered view.
Apply	Saves the changes made to rules and applies the configured rules to a service. Until you apply changes, it is possible to reload the rules as they were before current modifications.
Revert	Discards unsaved changes to the list and reverts to the unedited rules.

Rules Actions Menu

The Actions menu has options that help to manage sets of rules.



Option	Description
Import	Imports a set of rules into the user interface so that it can be applied to a service. You can edit the rules before applying.
Export	Saves selected rules or all rules to an .nwr file on the client machine.

Push	Allows rules to be applied to other services (Decoders or Log Decoders) or Decoders belonging to a service group. When pushing, the rules can either be merged (update existing rules and append new ones) or replaced.
	• **Push > All.** Pushes all rules to other services. All rules on the target services are removed and replaced with all of the rules on the source service.
	• **Push > Selection.** Pushes selected rules to other services. You have two options:
	  • **Replace.** Deletes all rules on the target services and replaces them with the selected rules from the source service.
	  • **Merge.** Merges the selected rules with the existing rules on the target services

History	Displays the last ten snapshots of rules applied through NetWitness Platform. You can select and apply (restore) a snapshot to the Decoder at anytime.

Rules List Context Actions

Within a rules list, right-clicking a row displays the Rules list context menu.

Option	Description
Cut	Deletes the current rule.
Copy	Copies the current rule.
Paste Above	Pastes the copied rule above the current rule.
Paste Below	Pastes the copied rule below the current rule.
Edit	Edits the current rule.
Insert Below	Inserts imported rules below the current rule.
Insert Above	Inserts imported rules above the current rule.

Option	Description
Export Selection	Exports the selected rules.
Push Selected Rules	Pushes the selected rules to other services.

App Rules Tab

The App Rules tab (**ADMIN > Services >** select a Decoder or Log Decoder and click **> View > Config > App Rules tab**) enables you to manage application rules. NetWitness Platform applies application rules at the session level.

What do you want to do?

User Role	I want to...	Documentation
Administrator	add or edit application rules	Configure Application Rules

Related Topics

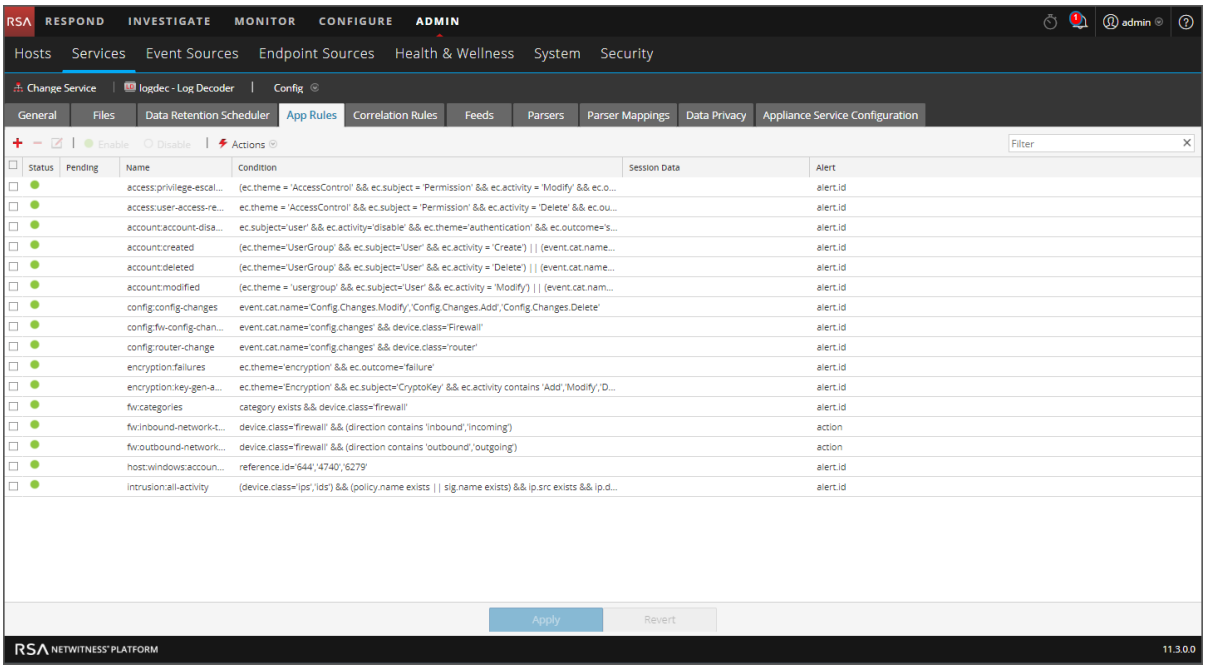
Quick Look

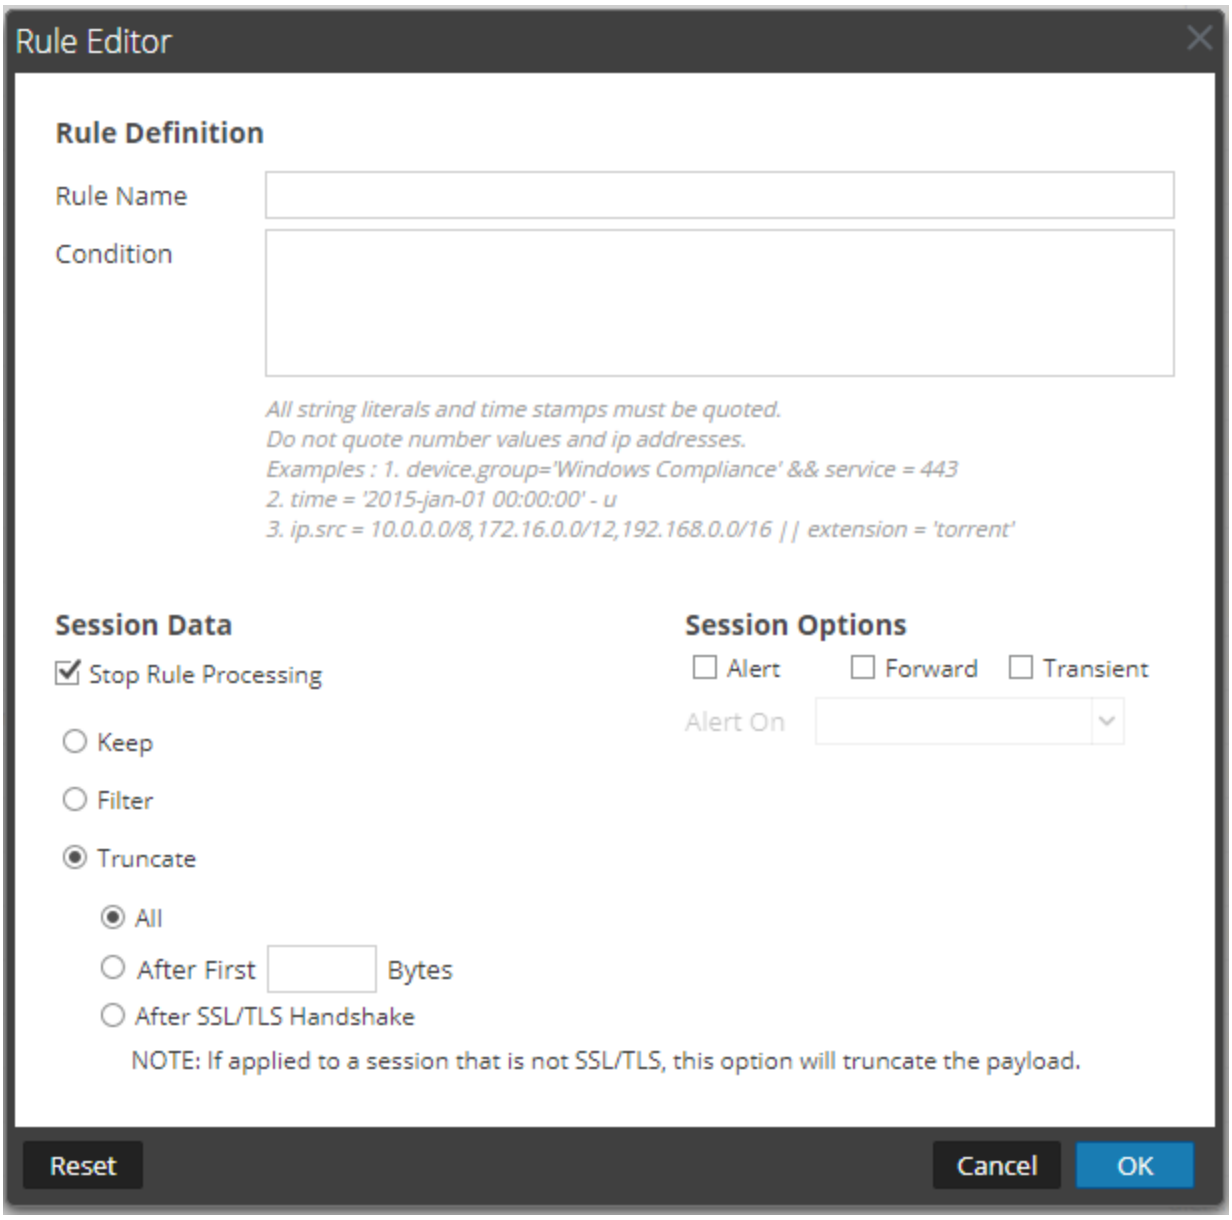
The following figure shows an App Rules tab and the table describes the columns..



Column	Description
Pending	This column indicates whether a rule has pending changes. Rules that are currently active on the Decoder have no indicator. If the rule is new or has been modified, the column contains . Once the rules are applied, the pending indicator is removed.
Name	This is the rule name, a descriptive identifier for the rule.
Condition	This is the definition of the condition that triggers an action when matched.
Session Data	This column displays the Session Data action taken when a packet matches the rule. Possible values are **Filter**, **Keep**, or **Truncate**.
Alert	This column displays the name of the custom alert that the Decoder generates when metadata matches the rule.
Status	This column indicates whether the rule is enabled or disabled with a circle icon. If the circle is filled green, the rule is enabled. If the circle is empty, the rule is disabled.

Rule Editor Dialog

The following figure shows the Rule Editor dialog for an application rule.



The Rule Editor dialog provides the fields and options needed to define an application rule.

Field	Description
Rule Name	The descriptive name that identifies the rule.
Condition	The definition of the condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta from the Intellisense window actions. As you build the rule definition, Intellisense displays syntax errors and warnings. All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details.

The following table describes the Session Data actions and options.

Action	Description
Stop Rule Processing	If checked, further rule evaluation ends if the rule is matched, and the session is saved in accordance with the session action. If not checked, rule evaluation continues until all rules are evaluated.
Keep	The packet payload and associated metadata are saved when they match the rule.
Filter	The packet is not saved when it matches the rule.
Truncate	**Truncate All** – truncates all session payload bytes. The packet payload is not saved when it matches the rule, but packet headers and associated metadata are retained. This is the default truncation option. **Truncate After First <n> Bytes** – truncates the session payload bytes after the specified first <n> bytes, where <n> is an integer. The packet payload is not saved after <n> bytes when it matches the rule, but packet headers and associated metadata are retained. **Truncate SSL/TLS After Handshake** – truncates the payload for all sessions except in the case of an SSL/TLS session, where the SSL exchange is preserved, but the rest of the payload is not saved. This option is for use with SSL parsers.
Alert and **Alert On**	If **Alert** is checked, the packet generates a custom alert when metadata matches the rule. You can select the name of the alert in the **Alert On** field.
Forward	Enables the performance of syslog forwarding when the log matches the rule.
Transient	Prevents the alert metadata that is created from being written to the disk.

The following table describes Rule Editor dialog actions.

Action	Description
Reset	Resets the contents of the dialog to their values before editing; changes are discarded.
Cancel	Cancels any edits and closes the Rule Editor dialog.
OK	Saves the new rule or edited rule, and adds it to the rules grid. The Rule Editor dialog closes.
Save	(Rules with deprecated syntax only) Applies a corrected rule individually to the Decoder service. See Fix Rules with Invalid Syntax.

Correlation Rules Tab

The Correlation Rules tab (**ADMIN > Services >** select a service and click **> View > Config > Correlation Rules tab**) enables you to manage correlation rules. Basic correlation rules are applied at the session level and alert the user to specific activities that may be occurring in their environment. NetWitness Platform applies correlation rules over a configurable sliding time window.

What do you want to do?

User Role	I want to...	Documentation
Administrator	add or edit a correlation rule	Configure Correlation Rules

Related Topics

- Configure Common Settings on a Decoder
- Decoder and Log Decoder Quick Setup

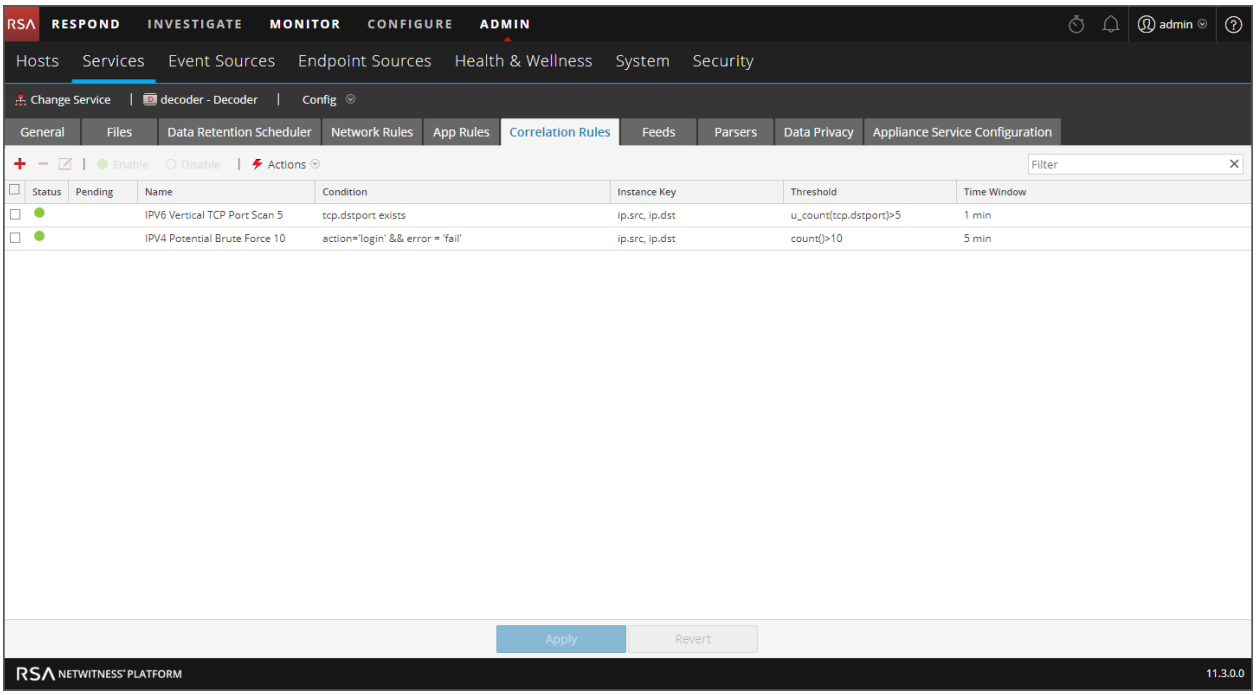
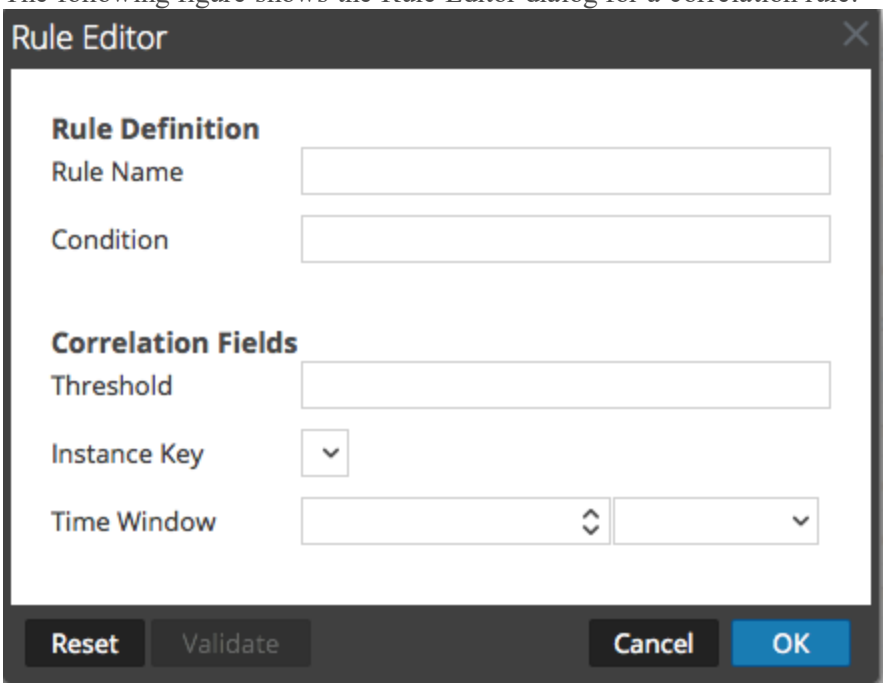
Quick Look

The following figure shows the Correlation Rules tab.



The following figure shows the Rule Editor dialog for a correlation rule.



The following table describes the Correlation Rules tab columns.

Column	Description
Pending	This column indicates whether a rule has pending changes. Rules that are currently active on the Decoder have no indicator. If the rule is new or has been modified, the column contains . Once the rules are applied, the pending indicator is removed.
Name	This is the descriptive name for the rule.
Condition	This is the definition of the condition that triggers an action when matched. In conditions, all string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details.
Instance Key	This is the target indicator to base the event upon. It can be a single primary key, such as ip.src or a compound primary key such as `ip.src,ip.dst`.
Threshold	This is the minimum number of occurrences required to trigger a correlation session and can include a associated key that identifies the meta type that were are counting to determine if the condition is satisfied. The correlation engine cannot use IPv4 or IPv6 as an associated meta type. Use one of these three arguments: • `u_count(associated_key)` = the count of unique values of the specified key. A key is required. • `sum(associated_key)` = the values of the specified key. a key is required. • `count()` = number of sessions, no associated key used. If included, it is ignored.
Time Window	This is the duration in hours, minutes, or seconds within which the threshold must be reached to trigger a correlation session.

Column	Description
Status	This column indicates whether the rule is enabled or disabled with a circle icon. If the circle is filled green, the rule is enabled. If the circle is empty, the rule is disabled.

The **Rule Editor** dialog provides the fields and options needed to define a network rule. The fields correspond exactly to the grid columns.

Action	Description
Reset	Resets the contents of the dialog to their values before editing; changes are discarded.
Cancel	Cancels any edits and closes the Rule Editor Dialog.
OK	Saves the new rule or edited rule, and adds it to the rules grid. The Rule Editor Dialog closes.
Save	(Rules with deprecated syntax only) Applies a corrected rule individually to the Decoder service. See Fix Rules with Invalid Syntax.

Network Rules Tab

The Network Rules tab (**ADMIN > Services >** select a Decoder and click **> View > Config > Network Rules tab**) enables you to manage network rules. NetWitness Platform applies network rules at the packet level. Network rules consist of rule sets from Layer 2, Layer 3, and Layer 4. Multiple rules can be applied to the Decoder. Rules can be applied to multiple layers (for example, when a network rule filters out specific ports for a specific IP address). Network rules apply only to Network Decoders.

What do you want to do?

User Role	I want to...	Documentation
Administrator	add, edit, or fix network rules	Configure Network Rules

The **Rule Editor** dialog provides the fields and options needed to define a network rule.

The following table describes the Rule Definition fields.

Field	Description
Rule Name	The descriptive name that identifies the rule.
Condition	The definition of the condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta from the Intellisense window actions. As you build the rule definition, Intellisense displays syntax errors and warnings. In conditions, all string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details. This section also describes the meta keys that NetWitness Platform supports for use in network rule conditions.

The following table describes the Session Data actions.

Action	Description
Stop Rule Processing	If checked, further rule evaluation ends if the rule is matched, and the session is saved as indicated. If not checked, rule evaluation continues until all rules are evaluated.
Keep	The packet payload and associated meta are saved when they match the rule.
Filter	The packet is not saved when it matches the rule.
Truncate	The packet payload is not saved when it matches the rule, but packet headers and associated meta are retained.

The following table describes the session options.

Action	Description
Assemble	If checked, the assembler assembles the packet chain when it matches the rule.
Network Meta	The packet generates network metadata when it matches the rule.
Application Meta	The packet generates application metadata when it matches the rule.
Alert	The packet generates a custom alert when metadata matches the rule.

The following table describes Rule Editor dialog actions.

Action	Description
Reset	Resets the contents of the dialog to their values before editing; changes are discarded.
Cancel	Cancels any edits and closes the Rule Editor dialog.
OK	Saves the new rule or edited rule, and adds it to the rules grid. The Rule Editor dialog closes.
Save	(Rules with deprecated syntax only) Applies a corrected rule individually to the Decoder service. See Fix Rules with Invalid Syntax.

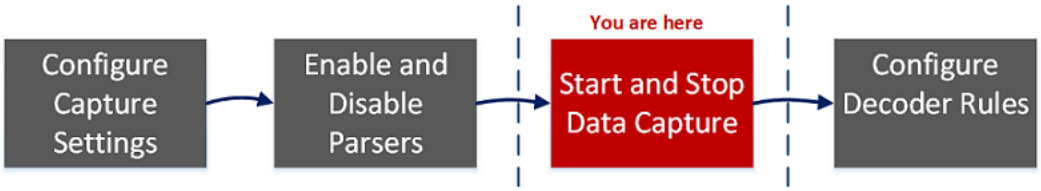
Services System View - Decoders

A Log Decoder is a special type of Decoder, and is configured and managed in a similar way to a Decoder. Therefore, most of the information in this section refers to both types of Decoders. Differences for Log Decoders are noted.

To reach the Services System view, go to **ADMIN > Services >** select a Decoder or Log Decoder > > **View** > **System**.

Workflow

The following figure depicts the workflow for common Decoder configuration tasks with the steps you can complete in this view highlighted.



What do you want to do?

User Role	I want to...	Documentation
Administrator	configure capture settings	Configure Capture Settings
Administrator	manage parsers and log parsers	Enable and Disable Parsers and Log Parsers
Administrator	start and stop data capture*	Start and Stop Data Capture
Administrator	upload packet capture and log files*	Upload a Log File to a Log Decoder Upload a Packet Capture File
Administrator	reset log stats, perform host tasks, shutdown the service, shutdown the appliance service, and reboot the host*	*Hosts and Services Getting Started Guide*
Administrator	configure rules	Configure Decoder Rules

*You can complete these tasks here.

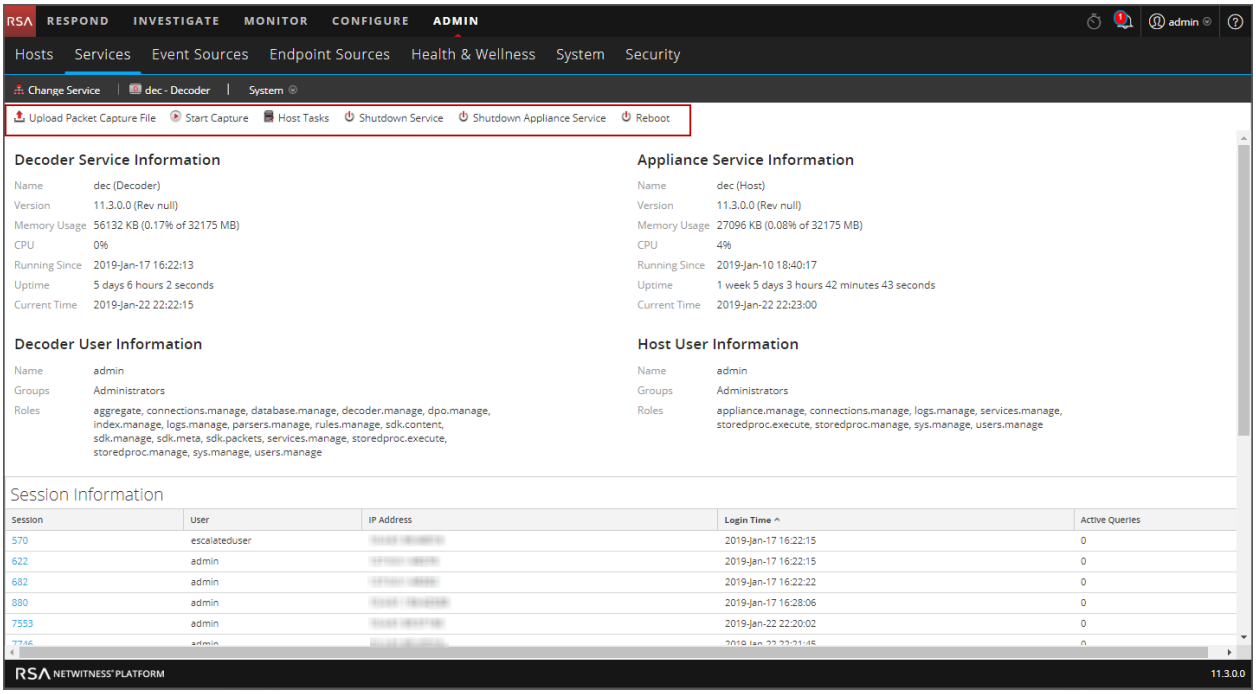
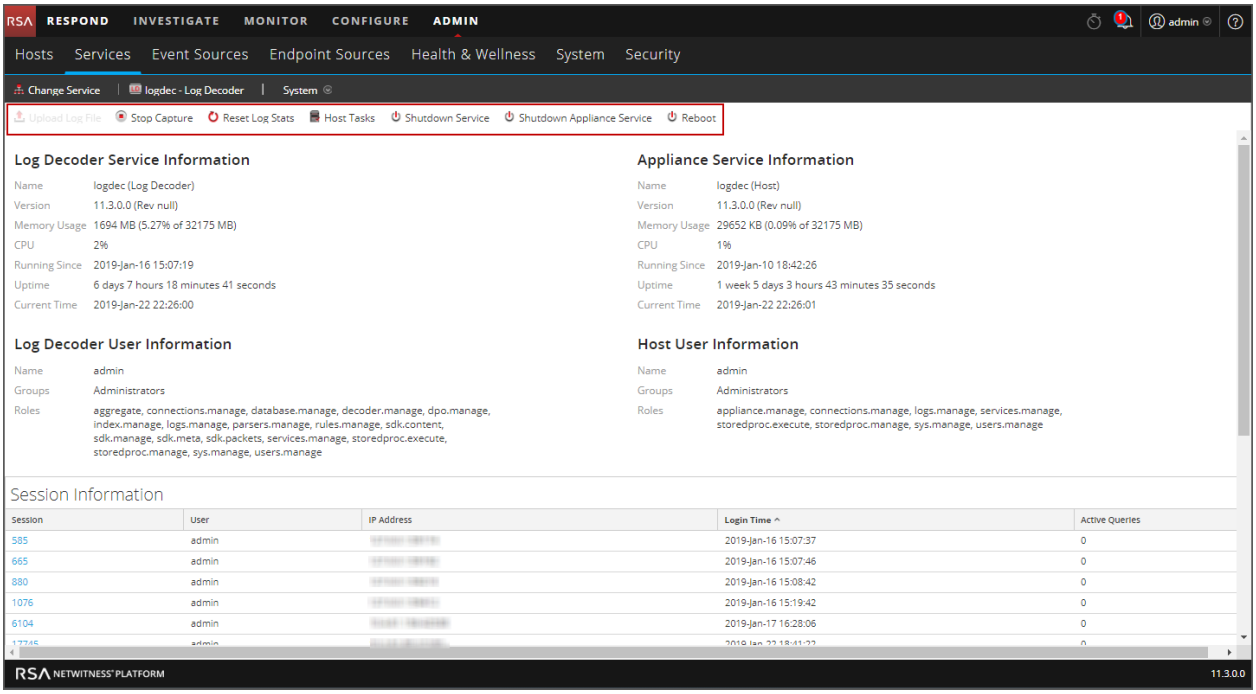
Quick Look

This is an example of the Services System view for a Decoder.

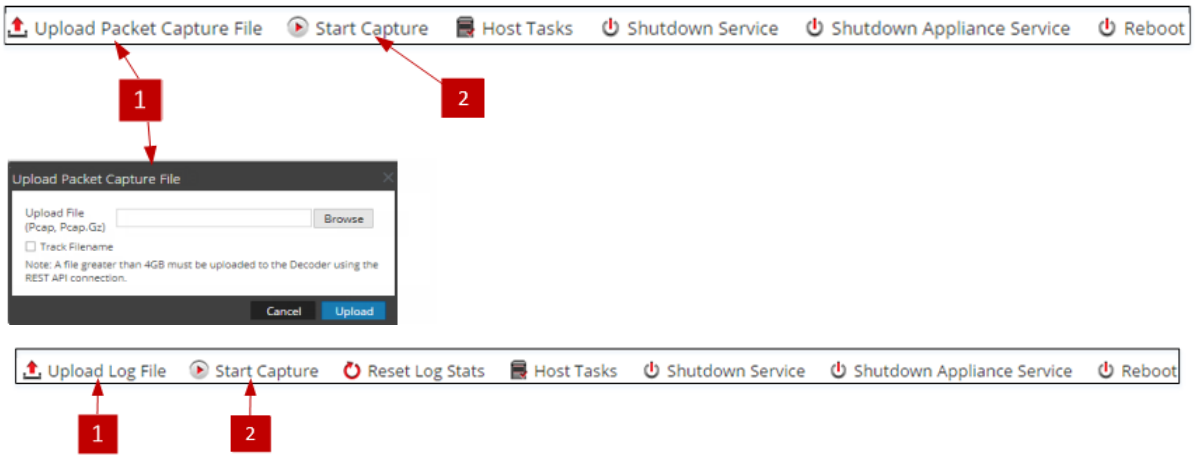


This is an example of the Services System view for a Log Decoder.



Service Info Toolbar

These two toolbars illustrate the options specific to Decoders and Log Decoders.



In addition to the common options in the Services System view toolbar, you can start and stop capture of packets or logs. The upload file options are different for the standard Decoder (packet capture file) and the Log Decoder (log file).

Action	Description
Upload Packet Capture File	Displays a dialog that provides a way to select a packet capture (.pcap) file for upload to the selected Decoder. For more information, see Upload a Packet Capture File. **Note:** This option does not apply to Log Decoders.

Action	Description
Upload Log File	Displays a dialog that provides a way to select a log (.log) file for upload to the selected Log Decoder. For more information, see Upload a Log File to a Log Decoder.
Start/Stop Capture	Starts packet capture on the selected Decoder. When packet capture is in progress, the option in the toolbar changes to Stop Capture, and the option to upload a file is unavailable.

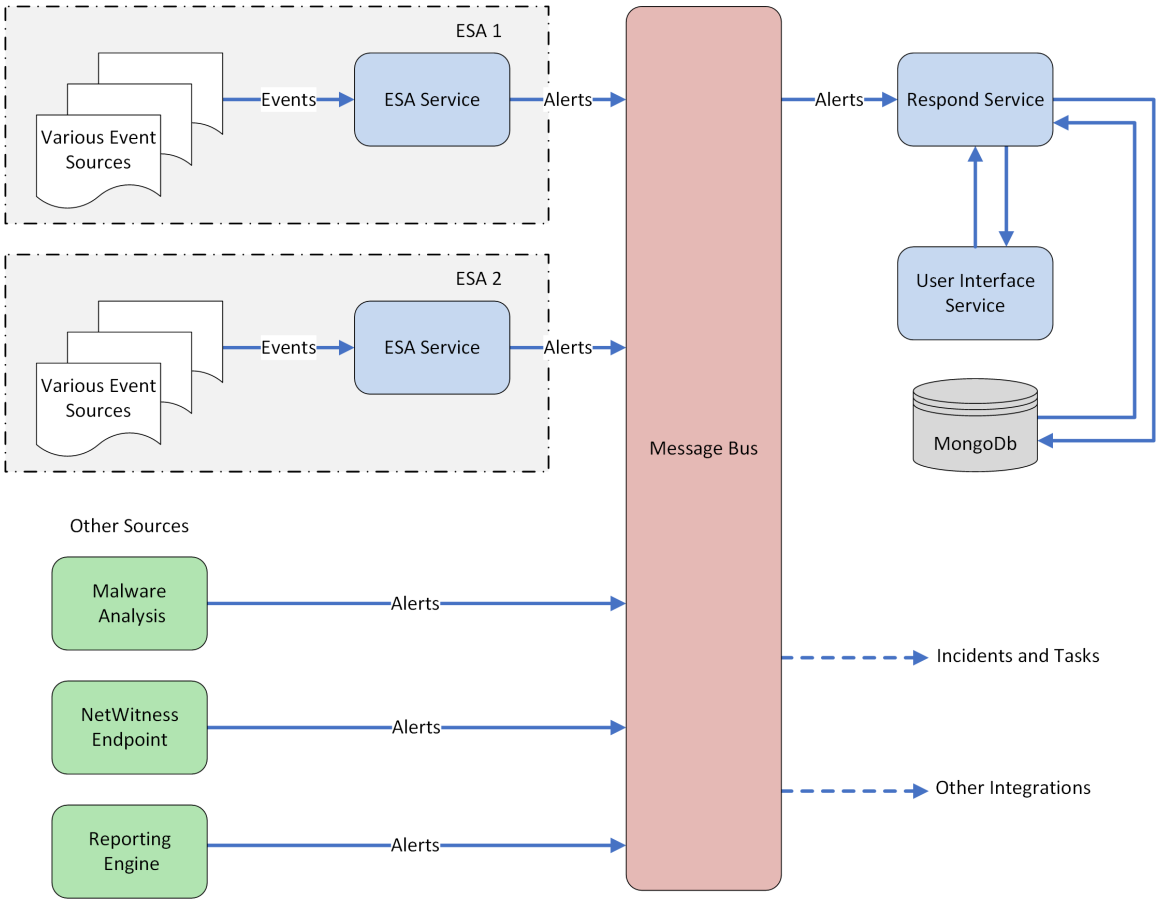
Event Stream Analysis Overview

RSA NetWitness® Platform Event Stream Analysis (ESA) provides advanced stream analytics such as correlation and complex event processing at high throughputs and low latency. It is capable of processing large volumes of disparate event data from Concentrators.

ESA's advanced Event Processing Language allows you to express filtering, aggregation, joins, pattern recognition, and correlation across multiple disparate event streams. Event Stream Analysis helps perform powerful incident detection and alerting.

The following diagram shows the high-level data workflow:



There are two ESA services that can run on an ESA host:

- ESA Correlation (ESA Correlation rules)
- Event Stream Analytics Server (ESA Analytics)

The first service is the ESA Correlation service that creates alerts from ESA rules, also known as ESA Correlation Rules, which you create manually or download from Live.

For NetWitness Platform 11.3 and later, the ESA Correlation service replaces the Event Stream Analysis service and is also known as ESA Correlation Server. The ESA Correlation service provides the same services as the Event Stream Analysis service with the added benefit of enabling you to specify different data sources for your ESA correlation rules. Like the Event Stream Analysis service, the ESA Correlation service installs on the ESA Primary and ESA Secondary host types.

The second service is the ESA Analytics service, which is used for Automated Threat Detection. Because the ESA Analytics service uses preconfigured ESA Analytics modules for Automated Threat Detection, you do not have to create or download rules to use Automated Threat Detection.

ESA Analytics services use query-based aggregation (QBA) to collect filtered events for the ESA Analytics modules from Concentrators. Only the data required by a module is transferred between the Concentrator and the ESA Analytics system. For example, using a Suspicious Domains ESA Analytics module, such as C2 for Packets (http-packet), an ESA Analytics service can examine your HTTP traffic to determine the probability that malicious activity is occurring in your environment.

Note: The Contexthub Server service, which provides enrichment lookup capability in the Respond and Investigate views, runs only on an ESA Primary host. For information, see the *Context Hub Configuration Guide*.

Configure ESA Correlation Rules

This topic provides high-level tasks to configure RSA NetWitness Platform Event Stream Analysis (ESA) Correlation Rules using the ESA Correlation service.

Data Source Configuration Changes

In NetWitness Platform version 11.3 and later, the ESA Correlation service enables you to specify different data sources for different sets of rules. Instead of adding data sources, such as Concentrators, to the entire ESA Correlation service, you can specify different data sources for each ESA rule deployment. An ESA rule deployment includes an ESA Correlation service with its associated data sources and a set of ESA rules. For example, you may want to use Concentrators with HTTP packet data in one deployment and Concentrators with HTTP log data in another deployment. For more detailed information, see "Deploy Rules to Run on ESA" in the *Alerting with ESA Correlation Rules User Guide*.

An Endpoint Risk Scoring Rules Bundle is Available

An Endpoint Risk Scoring Rules Bundle, which contains approximately 400 rules, comes with NetWitness Platform 11.3 and later. Endpoint risk scoring rules only apply to NetWitness Endpoint. You can add the Endpoint Risk Scoring Rules Bundle to an ESA rule deployment in the same way that you would add any ESA rule. However, you must specify endpoint data sources (Concentrators) in the ESA Rule Deployment.

The ESA Correlation service can process endpoint risk scoring rules, which generate alerts that are used in risk scoring calculations to identify suspicious files and hosts. To turn on risk scoring for NetWitness Endpoint, you must deploy endpoint risk scoring rules on ESA. For instructions, see Deploy Endpoint Risk Scoring Rules on ESA. To configure NetWitness Endpoint, see the *NetWitness Endpoint Configuration Guide*.

Upgrade Considerations for ESA Rule Deployments

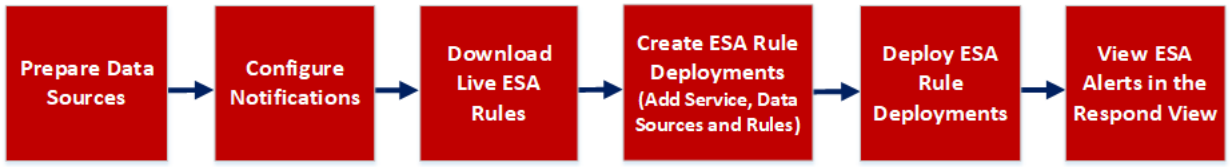
Caution: After upgrading to NetWitness Platform version 11.3 or later, due to the ESA Correlation service data source changes, there are necessary data changes to migrated ESA rule deployments.

After the upgrade to version 11.3 or later, migrated ESA rule deployments change as follows:

1. If an ESA rule deployment contains two services before 11.3, the deployment splits into two deployments. You can only have one ESA Correlation service in an ESA rule deployment in version 11.3 or later.
2. If an ESA service has multiple ESA rule deployments before 11.3, they combine into one deployment in version 11.3 or later. You can still access your old deployments. For a detailed example, see ESA Rule Deployments Upgrade Example.

ESA Correlation Rules Configuration Workflow

The following diagram shows the high-level workflow for configuring ESA Correlation Rules with the ESA Correlation service.



ESA Rule Deployments are groups of ESA Rules processed by an ESA service to create alerts. In NetWitness Platform 11.3 and later, the ESA Correlation service processes the ESA rules and creates alerts.

Before you can configure ESA Correlation Rules, install and configure the data sources (Concentrators) to use for the ESA rules. For example, you may have a Concentrator with HTTP packet data and another with Windows Log data. Next, configure the global notification methods that content experts can use for the ESA rules. For example, they may want to send an email notification when a rule creates an alert.

The NetWitness Platform Live Content Management System (known as *Live*) is a valuable source of the latest internet security resources for NetWitness Platform customers. RSA Live contains an extensive library of ESA rules to detect threats that you can use to save time. Download the rules for the events that you want to detect in your network to the ESA Rule Library and adjust them as needed for your network environment.

After you prepare your data sources and download Live ESA rules, you can create one or more ESA rule deployments. An ESA rule deployment contains an ESA service, one or more data sources, and a set of ESA rules. For example, you can create an ESA rule deployment that contains an ESA Correlation service, a Concentrator with HTTP packet data, and a set of ESA rules for HTTP packet data. When you are ready to have the ESA service run the rule set, you deploy the ESA rule deployment, which places the rules on ESA.

After you deploy an ESA rule deployment, verify that you can view the ESA alerts in the Respond view (Respond > Alerts).

Prerequisites

Make sure that you:

- Install the ESA Correlation service in your network environment.
- Install and configure one or more Concentrators in your network environment.
- Download or ensure that you have access to the *Alerting with Correlation Rules User Guide* for version 11.3 or later. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Procedure

The following table shows the high level tasks required to configure ESA Correlation Rules.

Tasks	Reference
1. Prepare data sources, such as Concentrators, to use for your ESA Correlation Rules.	Refer to *Broker and Concentrator Configuration Guide*.
2. Configure notifications for the ESA Correlation service.	Refer to "Notification Methods" in the *Alerting with ESA Correlation Rules User Guide*.
3. Download Event Stream Analysis rules using Live. Configure the Live ESA Rule parameters for your environment.	Refer to "Download Configurable RSA Live Rules" in the *Alerting with ESA Correlation Rules User Guide*.
4. Create ESA rule deployments*: Choose ESA Rules and the appropriate ESA service to use in the ESA rule deployment. For NetWitness Platform 11.3 and later, you must also choose the data sources to use for these rules.	Refer to "Deployment Steps" in the *Alerting with ESA Correlation Rules User Guide*.
5. Deploy ESA rule deployments.*	Refer to "Deployment Steps" in the *Alerting with ESA Correlation Rules User Guide*.
6. View ESA alerts in the Respond view.	Refer to the *NetWitness Respond User Guide*.

*ESA rule deployments are groups of ESA Rules that are processed by an ESA service, such as the ESA Correlation service in NetWitness Platform version 11.3 and later.

For additional optional advanced ESA Correlation Rules configuration procedures, see Additional ESA Correlation Rules Procedures.

For more information on alerting with ESA Correlation rules best practices, creating rules, working with trial rules, adding data enrichment sources, viewing statistics for an ESA service, and troubleshooting, see the *Alerting with ESA Correlation Rules User Guide*.

ESA Rule Deployments Upgrade Example

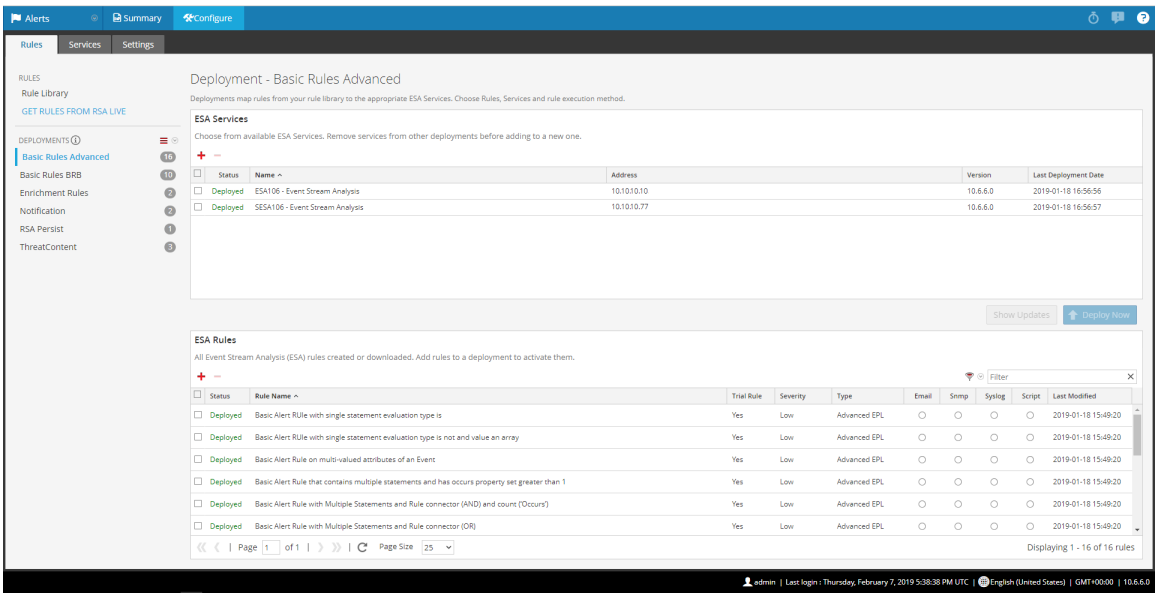
After you upgrade or update to 11.3, verify your ESA rule deployments. For every ESA host, a new deployment is created in the format `<ESA Host name> – ESA Correlation`.

- Verify that a new deployment was created.
- The new deployment should contain an ESA Correlation service, data sources, and rules for all previous deployments on that ESA host.
- The ESA Correlation service should have a status of "Deployed".

The following example shows the changes to NetWitness Platform 10.6.6 ESA rule deployments before and after the upgrade to version 11.3. In this example, before the upgrade there are six 10.6.6 ESA rule deployments. Four deployments have both ESA primary and ESA secondary Event Stream Analysis services. One deployment has only the ESA primary service and another one has only the ESA secondary service. Each 10.6.6 ESA rule deployment before the upgrade has a set of rules as shown in the following table:

10.6.6 ESA Rule Deployment (Before Upgrade)	# of Rules	ESA Primary	ESA Secondary
Basic Rules Advanced	16	x	x
Basic Rules BRB	10	x	x
Enrichment Rules	2	x	x
Notification	2		x
RSA Persist	1	x	
Threat Content	3	x	x
Total # of Rules		**32**	**33**

The following figure shows the 10.6.6 ESA rule deployments before the upgrade.



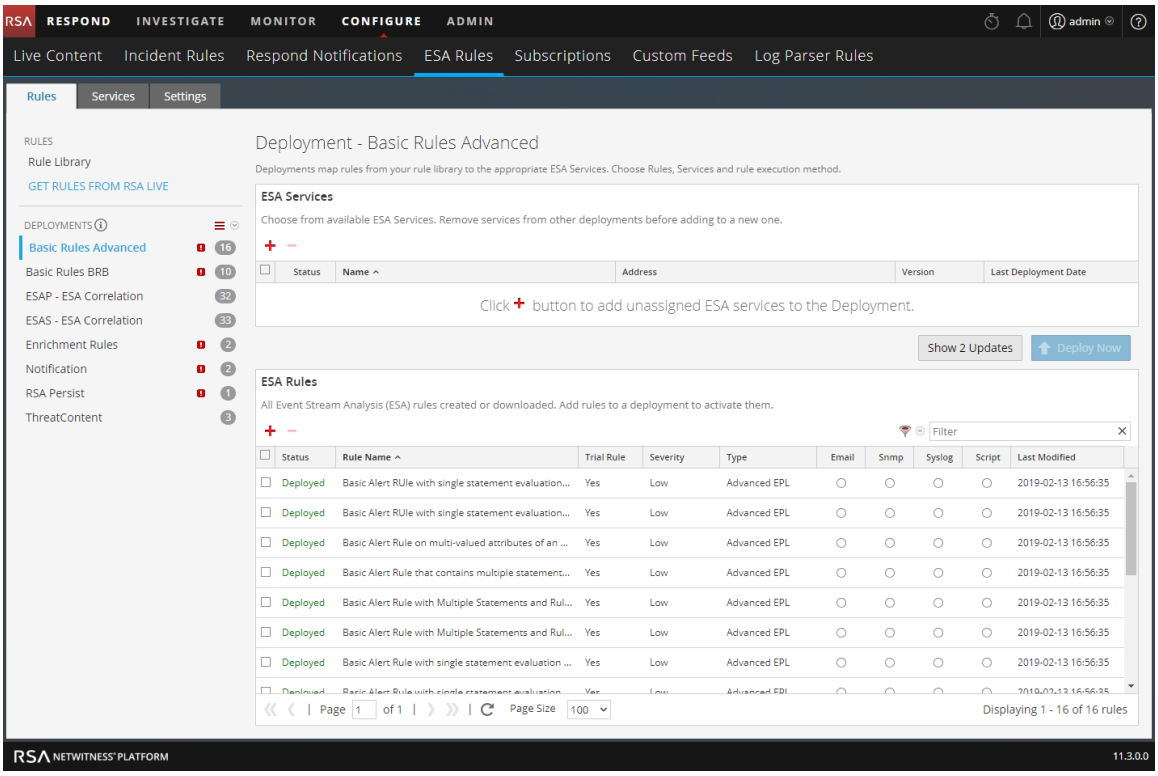
In this example, after the upgrade to 11.3, there are only two functional ESA rule deployments; one has the ESA primary (ESAP) ESA Correlation service and the other has the ESA secondary (ESAS) ESA Correlation service. The ESAP - ESA Correlation service deployment contains 32 rules, which is the total of all of the rules in the 10.6.6 deployments that contained the ESA primary service (16 + 10 + 2 + 1 + 3). The ESA secondary ESA Correlation service contains 33 rules, which is the total of all the rules in the 10.6.6 deployments that contained the ESAS Service (16 + 10 + 2 + 2 + 3). Since the RSA Persist deployment only contained one ESA primary service in 10.6.6, that rule was added to the ESAP 11.3 deployment. Since the Notification 10.6.6 deployment contained one ESA secondary service, the rule was added to the 11.3 ESAS deployment.

The following table shows the 11.3 ESA rule deployments after upgrade, the number of rules in each deployment, and which deployments have the ESA primary and ESA secondary ESA Correlation services.

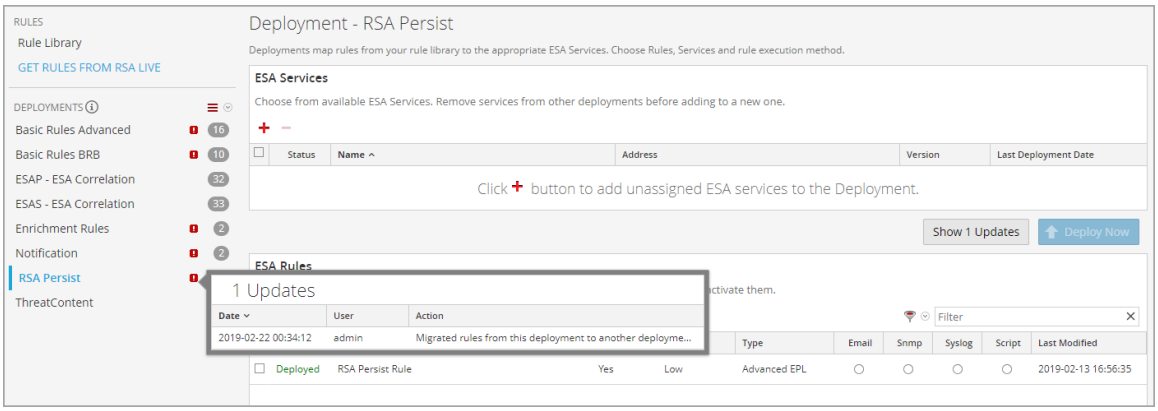
11.3 ESA Rule Deployment (After Upgrade)	# of Rules	ESA Primary	ESA Secondary
Basic Rules Advanced	16		
Basic Rules BRB	10		
ESAP - ESA Correlation	**32**	**x**	
ESAS - ESA Correlation	**33**		**x**
Enrichment Rules	2		
Notification	2		
RSA Persist	1		
Threat Content	3	_	_
Total # of Rules		**32**	**33**

In this example, all of the 10.6.6 ESA rule deployments were moved to 11.3, but they have no services after the upgrade. The only functional 11.3 ESA rule deployments are ESAP and ESAS. The 10.6.6 ESA rule deployments are preserved in case you want to use them.

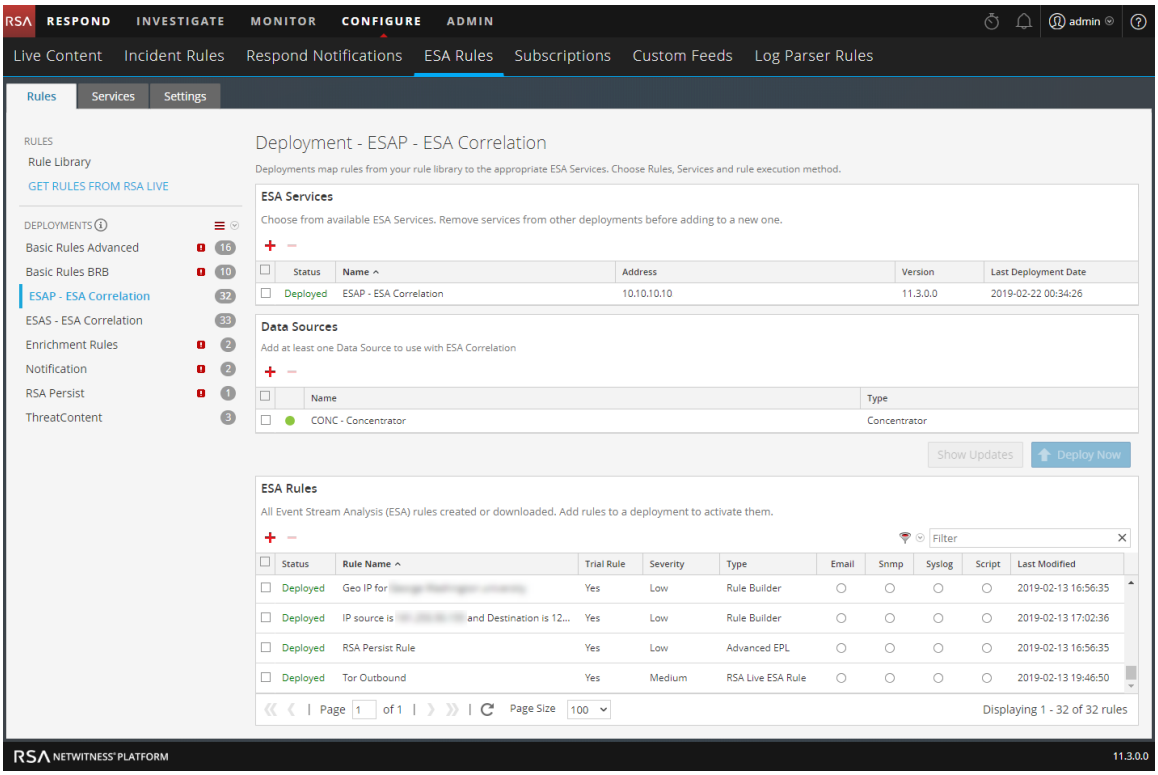
The following figure shows the 11.3 ESA rule deployments after the upgrade. Notice that the Basic Rules Advanced deployment from 10.6.6 does not have any ESA services, but it still contains the original 16 rules.



The 10.6.6 ESA rule deployments show update messages detailing the changes as shown in the following figure.



The following figure shows the ESA primary rule deployment after the upgrade (ESAP - ESA Correlation). Notice that the ESAP - ESA Correlation deployment has only the ESA primary ESA Correlation service.



In NetWitness Platform 11.3 and later, you can only have one ESA Correlation service per deployment, but an ESA Correlation service can be in more than one ESA rule deployment.

Additional ESA Correlation Rules Procedures

This topic is a collection of individual procedures, which an Administrator may perform at any time and they are not required to complete the initial setup of ESA Correlation Rules.

Use this section when you are looking for instructions to perform a specific task after the initial setup of ESA.

- Configure Advanced Settings for an ESA Correlation Service
  - Enable or Disable Sending ESA Rule Alerts to the Respond View
  - Enable ESA Correlation Service Debugging for All Rules
  - Configure Maximum Events per Alert for All Rules
  - Configure Meta Keys as Arrays in ESA Correlation Rule Values
- Deploy Endpoint Risk Scoring Rules on ESA
- Change Memory Threshold for Trial Rules
- Start, Stop, or Restart ESA Service
- View Audit Logs and Verify ESA Component Versions

Configure Advanced Settings for an ESA Correlation Service

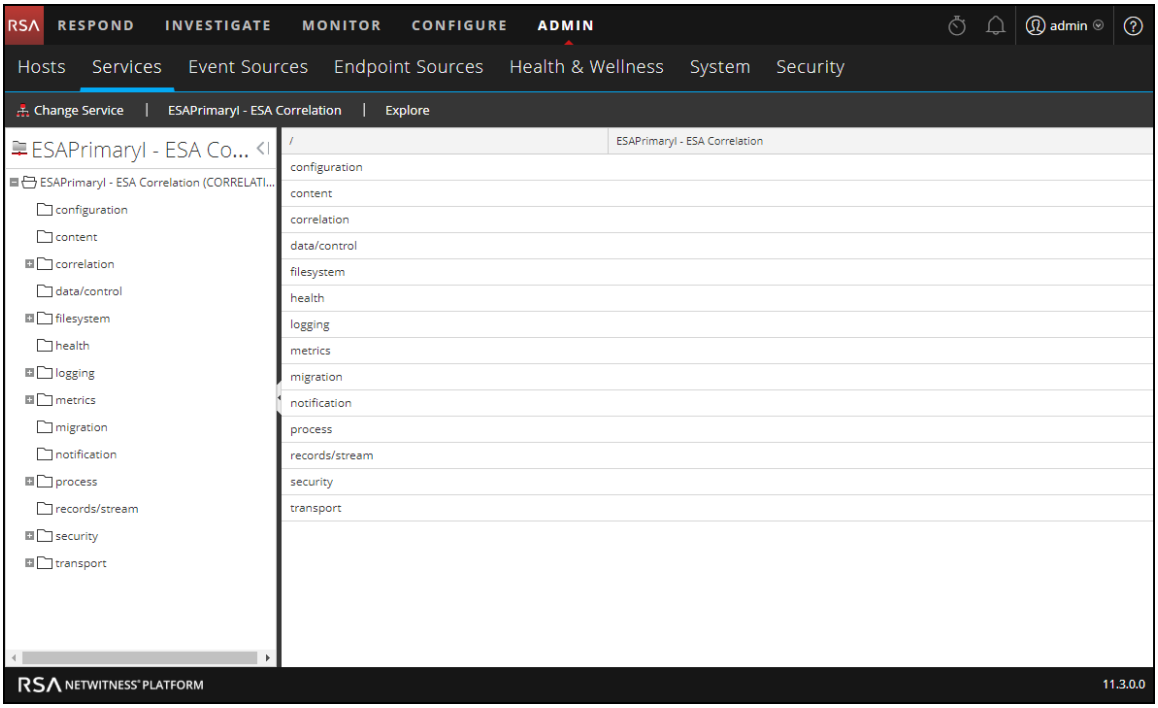
These procedures are optional and they apply only to ESA Correlation Rules.

In the Explore view for an ESA Correlation service, you can manage sending ESA rule alerts to the Respond view, turn on debugging for all rules, configure the events to preserve for rules with multiple events, and configure meta keys as string array values on ESA.

- Enable or Disable Sending ESA Rule Alerts to the Respond View
- Enable ESA Correlation Service Debugging for All Rules
- Configure Maximum Events per Alert for All Rules
- Configure Meta Keys as Arrays in ESA Correlation Rule Values

Access Advanced Settings for an ESA Correlation Service

1. Go to **ADMIN > Services**.
   The Services view is displayed.
2. In Services view, select an ESA Correlation service and then select > **View > Explore**.
   The Explore view is displayed.



Enable or Disable Sending ESA Rule Alerts to the Respond View

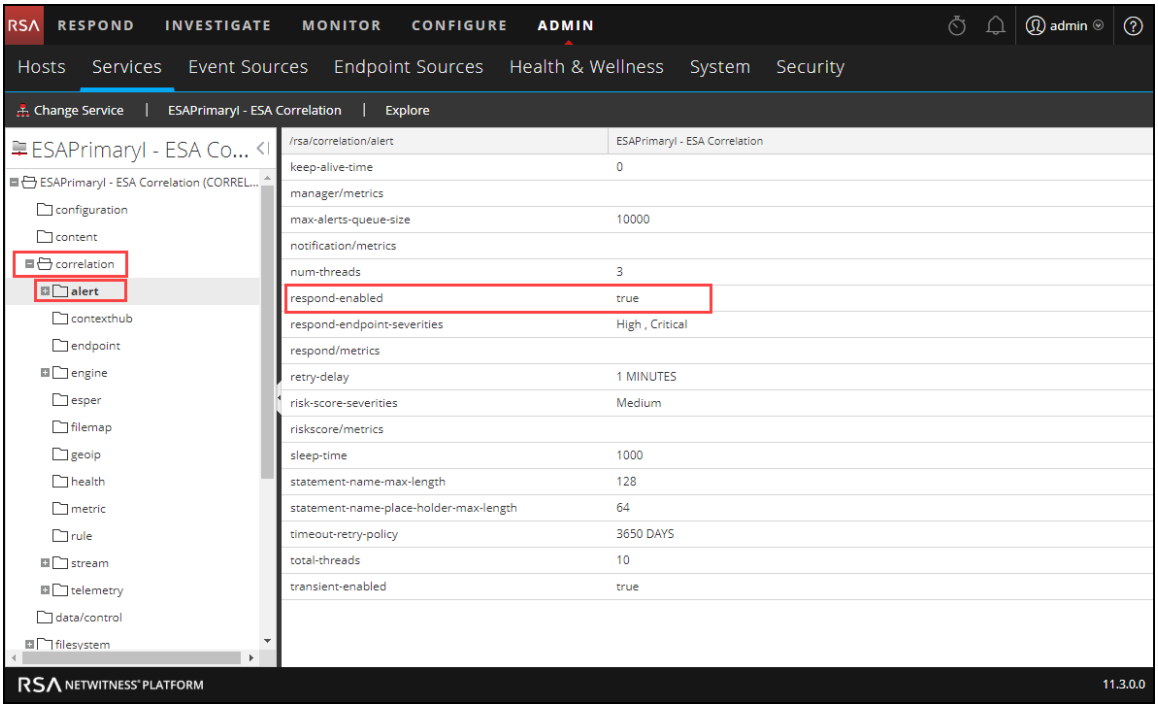
ESA gathers data, runs ESA Correlation rules against the data, captures events that meet rule criteria, and creates alerts for those captured events. You can view those alerts in the Respond view.

Before an ESA Correlation rule alert can go to the Respond view, both of the following settings must be enabled:

1. For all rules, the ESA Correlation service must have the `respond-enabled` parameter set to **true**. (The default is true.)
2. For an individual rule, the ESA Correlation rule must have the **Alert** option selected in the rule builder for that rule.

To enable or disable alert forwarding to the Respond view for ALL ESA Correlation rules:

1. In the Explore view node list for an ESA Correlation service, select **correlation > alert**.



2. To allow all ESA Correlation Rule alerts to go to the Respond view, set `respond-enabled` to **true**. Alerts for ESA rules that have the **Alert** option selected are visible in the Respond view.
3. To stop all ESA Correlation Rule alerts from going to the Respond view, set `respond-enabled` to **false**.
   ESA Correlation Rules do not go to the Respond view, even if you select the **Alert** option in the rule.
   The changes take effect immediately.

Note: The `respond-enabled` parameter is equivalent to the **Forward Alerts On Message Bus** option in the Event Stream Analysis service in NetWitness Platform version 11.2 and earlier.

To send or not send alerts to the Respond view for a single ESA Correlation rule:

Content experts managing the ESA Correlation rules can decide whether to send alerts to the Respond view for each rule.

1. Go to **CONFIGURE > ESA Rules > Rules** tab.
   The Rules tab is displayed.

2. In the **Rule Library**, select the rule you want to edit and click .
   Depending on the rule type, the respective rule tab is displayed.

   - To turn on Respond alerts for a rule, select the **Alert** checkbox.
   - To turn off Respond alerts for a rule, clear the **Alert** checkbox.

3. Click **Save**.

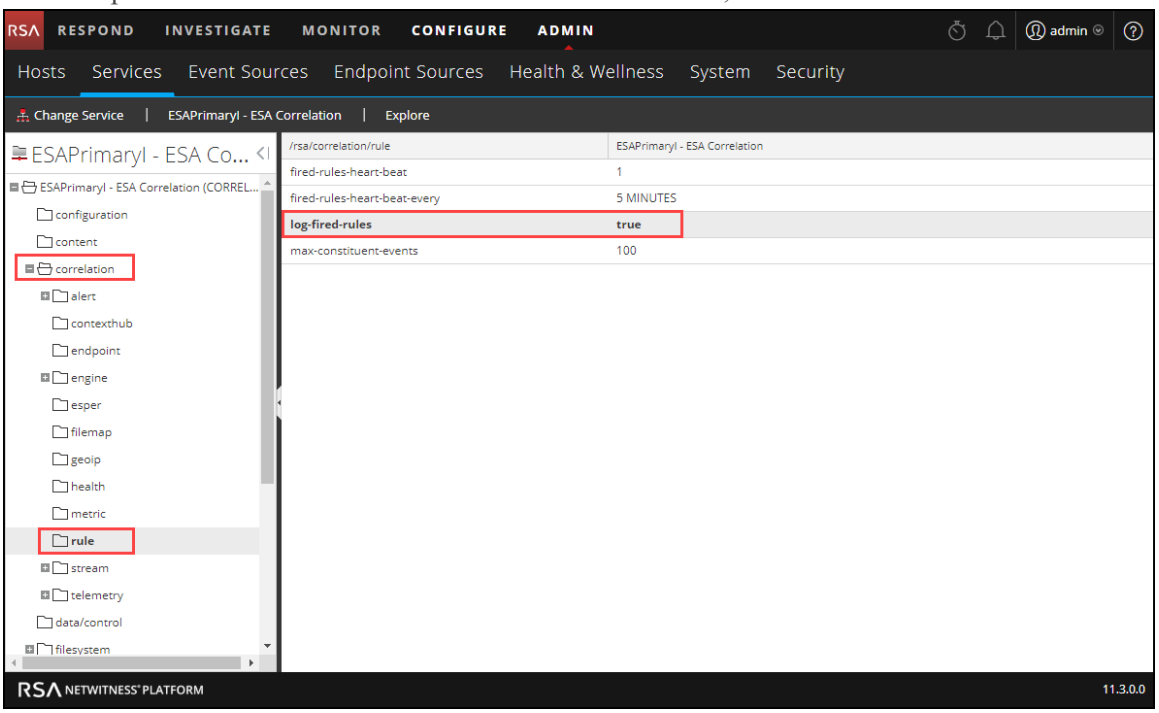
   For more information, see the *Alerting with ESA Correlation Rules User Guide*.

Enable ESA Correlation Service Debugging for All Rules

You can turn on debugging for all ESA rules to see if rules are creating (firing) alerts and data is being processed properly by the ESA Correlation service. This can also be helpful when writing or fixing global notification templates, such as syslog or email. You can see the actual content of an alert before sending the notification.

When you disable ESA Correlation service debugging for all rules, you can still turn on debugging for an individual rule at any time.

1. In the Explore view node list for an ESA Correlation service, select **correlation > rule**.

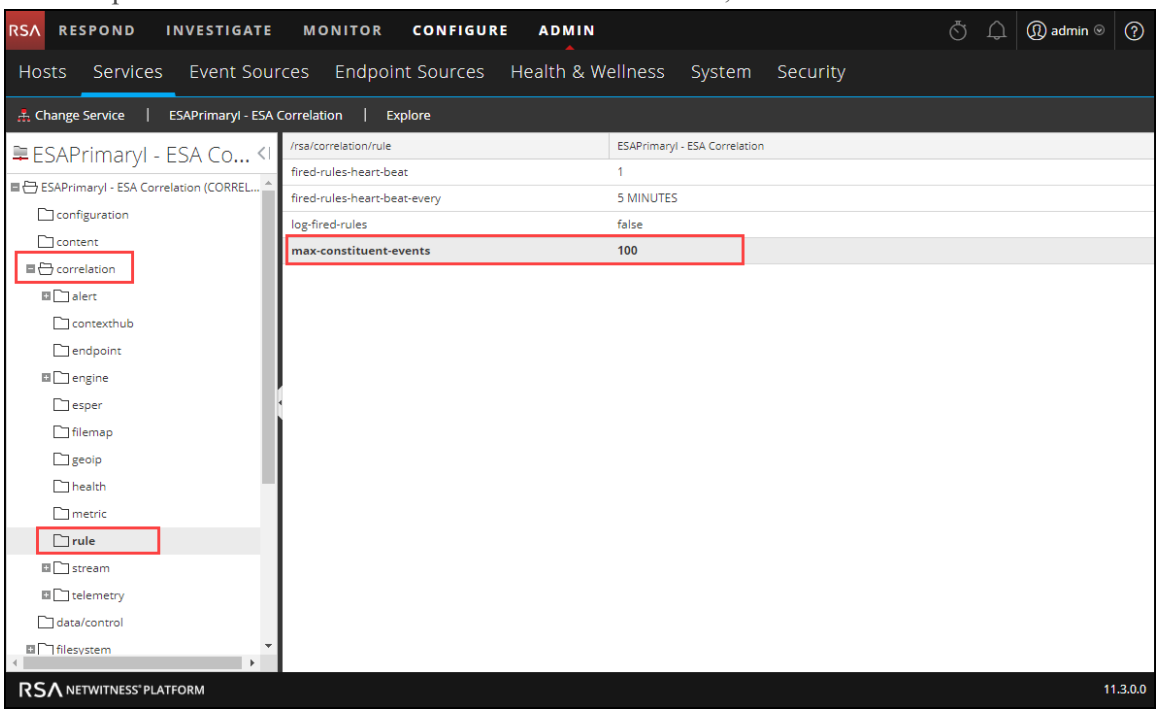


2. Set `log-fired-rules` to **true** to print alerts to the /var/log/netwitness/correlation-server/correlation-server.log for troubleshooting. This is the same as the Debug option in the rule builders for individual ESA rules except that this option enables debugging for all rules.
3. When you are ready to turn off debugging for all ESA rules, set `log-fired-rules` to **false**. The changes take effect immediately.

Note: The `log-fired-rules` parameter is equivalent to the **Debug Rules?** option in the Event Stream Analysis service in NetWitness Platform version 11.2 and earlier.

Configure Maximum Events per Alert for All Rules

1. In the Explore view node list for an ESA Correlation service, select **correlation > rule**.



2. For rules that contain multiple events, in `max-constituent-events`, enter how many of the associated events to preserve. For example, if a rule fires an alert with 200 associated events and this parameter is set to 100, only the first 100 are preserved by ESA, the rest are dropped. The default value is **100**.
   The changes take effect immediately.

Note: The `max-constituent-events` parameter is equivalent to the **Max Constituent Events** option in the Event Stream Analysis service in NetWitness Platform version 11.2 and earlier.

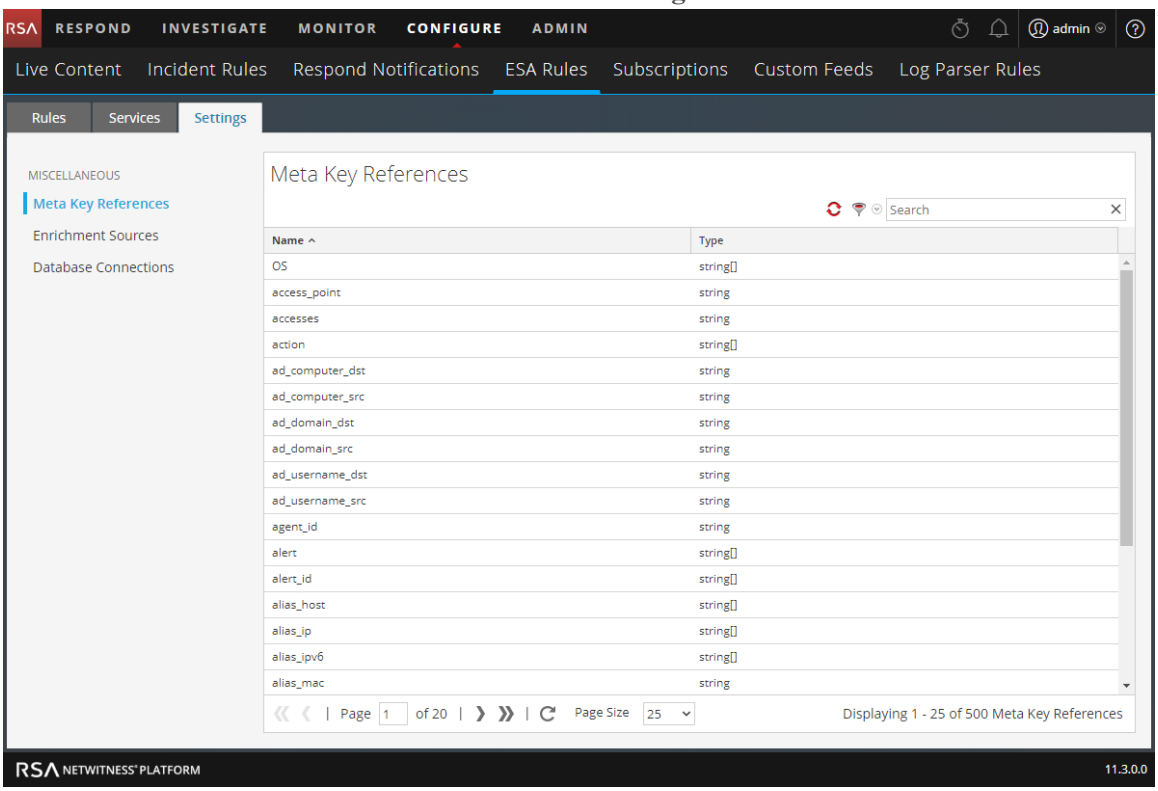
Configure Meta Keys as Arrays in ESA Correlation Rule Values

A common reason for an ESA rule to generate an error during deployment is because a meta key in the rule is a string array type, but it shows as a string type on ESA. To prevent or fix this issue, do the following:

- Determine if a Meta Key is a String Array Type on ESA
- Add the String Array Type Meta Key to ESA
- Verify that the String Array Type Meta Key is Configured Correctly on ESA

Determine if a Meta Key is a String Array Type on ESA

1. Go to **CONFIGURE > ESA Rules** and click the **Settings** tab.

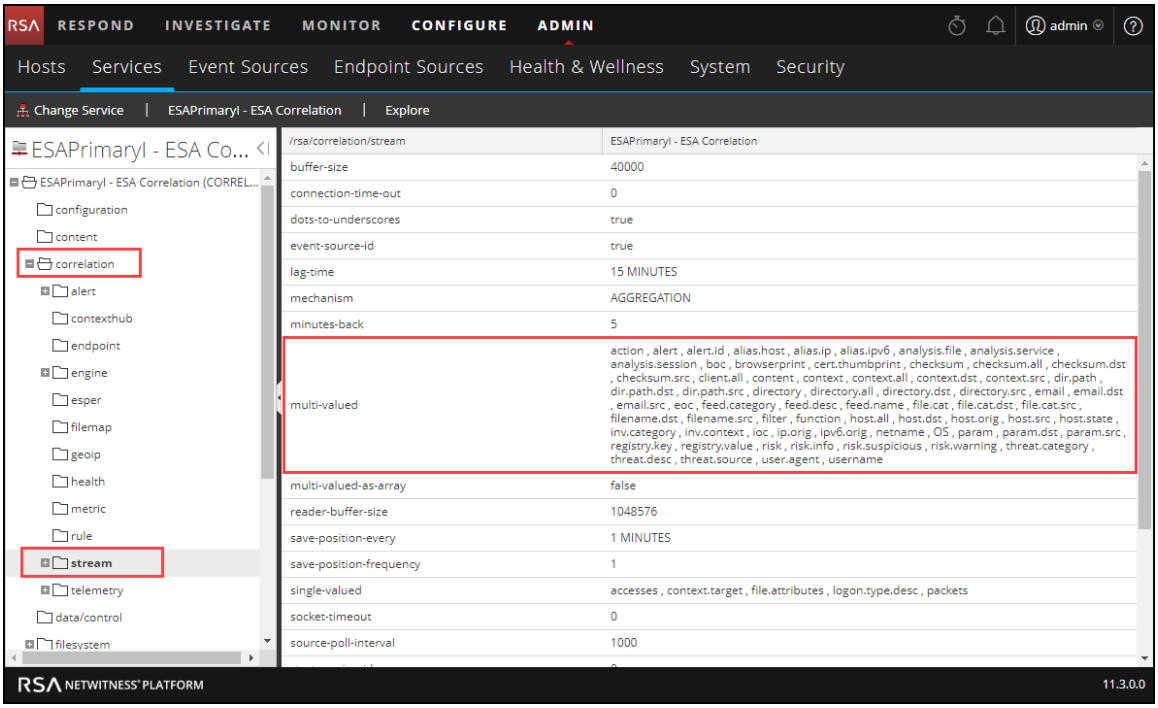


2. In the Meta Key References, for each meta key that is a string array type, locate the meta key in the Name field and then check the value.
   - If it shows `string[]`, it is configured as a string array type on ESA. This is fine.
   - If it shows `string` without the brackets, it is configured as a string type and you need to fix it on ESA. Go to Add the String Array Type Meta Key to ESA.

Add the String Array Type Meta Key to ESA

Caution: You can add string array type meta keys to the ESA Correlation service, but do not remove any of the existing keys. In NetWitness Platform 11.3, the ESA rules on Live use meta keys with array syntax and they depend on these meta keys. Removing values from the multi-valued list can cause the ESA Rule Deployments to fail. For more information, see Required String Array Meta Keys on the ESA Correlation Service.

1. In the Explore view node list for an ESA Correlation service, select **correlation > stream**.
2. Add string array meta keys to the **`multi-valued`** list to allow them to be used as an array in ESA rules.



3. Verify the configuration on ESA. Go to Verify that the String Array Type Meta Key is Configured Correctly on ESA.

Note: The `multi-valued` parameter is equivalent to the `arrayFieldNames` parameter in the Event Stream Analysis service in NetWitness Platform version 11.2 and earlier.

Verify that the String Array Type Meta Key is Configured Correctly on ESA

1. Go back to **CONFIGURE > ESA Rules** and click the **Settings** tab.
2. In the Meta Key References, click the Meta Re-Sync (Refresh) icon ( ).
3. Verify that the meta keys with a string array type show a value of `string[]`.

Required String Array Meta Keys on the ESA Correlation Service

In NetWitness Platform 11.3, the ESA rules from Live use meta keys with array syntax and they depend on these meta keys to work correctly. The `multi-valued` parameter on the ESA Correlation service (Explore view > correlation > stream) includes the following default multi-valued (string array type) meta keys, which the ESA rules from Live require:

```
action , alert , alert.id , alias.host , alias.ip , alias.ipv6 , analysis.file
, analysis.service , analysis.session , boc , browserprint , cert.thumbprint ,
checksum , checksum.all , checksum.dst , checksum.src , client.all , content ,
context , context.all , context.dst , context.src , dir.path , dir.path.dst ,
dir.path.src , directory , directory.all , directory.dst , directory.src ,
email , email.dst , email.src , eoc , feed.category , feed.desc , feed.name ,
file.cat , file.cat.dst , file.cat.src , filename.dst , filename.src , filter
, function , host.all , host.dst , host.orig , host.src , host.state ,
inv.category , inv.context , ioc , ip.orig , ipv6.orig , netname , OS , param
, param.dst , param.src , registry.key , registry.value , risk , risk.info ,
risk.suspicious , risk.warning , threat.category , threat.desc , threat.source
, user.agent , username
```

Caution: You can add to the `multi-valued` parameter on the ESA Correlation service, but do not remove any meta keys. Removing values from the `multi-valued` parameter can cause the ESA Rule Deployments to fail.

Deploy Endpoint Risk Scoring Rules on ESA

Note: The Information in this topic applies to RSA NetWitness® Platform 11.3 and later.

Endpoint Risk Scoring Rules only apply to NetWitness Endpoint.

The ESA Correlation service processes and deploys endpoint risk scoring rules. These rules generate alerts that are used in risk scoring calculations to identify suspicious files and hosts. To turn on Risk Scoring for NetWitness Endpoint, you must deploy endpoint risk scoring rules on ESA. An *Endpoint Risk Scoring Rules Bundle* comes with NetWitness Platform along with the sample ESA rules. The Endpoint Risk Scoring Bundle contains approximately 400 rules. You add this rule bundle to an ESA Rule Deployment in the same way that you would add any ESA rule. However, you must specify endpoint data sources (Concentrators) during ESA Rule Deployment.

For complete information on configuring NetWitness Endpoint, see the *NetWitness Endpoint Configuration Guide*. For more information about ESA rule deployments, see "Deploy Rules to Run on ESA" in the *Alerting with ESA Correlation Rules User Guide*.

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Important Considerations when Deploying the Endpoint Risk Scoring Rules Bundle

- If you add the Endpoint Risk Scoring Bundle to an ESA rule deployment, the deployment should have data sources with endpoint data.
- An ESA rule deployment can have only one ESA Correlation service. You can, however, use the same ESA Correlation service in multiple deployments.
- If you have two ESA Correlation services with the same endpoint data sources, deploy the Endpoint Risk Scoring Rules Bundle on only one of them.

Deploy the Endpoint Risk Scoring Rules Bundle on ESA

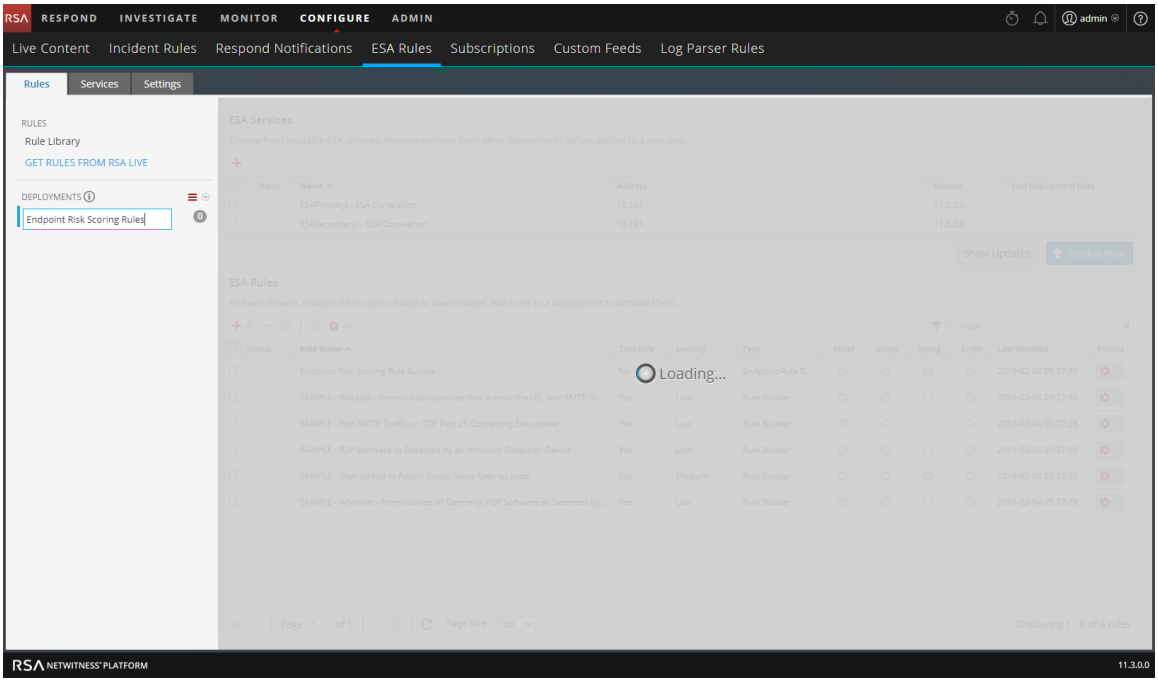
When you deploy the Endpoint Risk Scoring Rules Bundle in an ESA rule deployment, the ESA Correlation service gathers endpoint data in your network and runs endpoint risk scoring rules against the data. The goal is to capture events that match rule criteria, then generate alerts for the captured events.

The following procedure shows how to create an ESA rule deployment with the Endpoint Risk Scoring Rules Bundle and deploy it. If you already have an ESA rule deployment with endpoint data sources, you can add the Endpoint Risk Scoring Rules Bundle to the existing deployment.

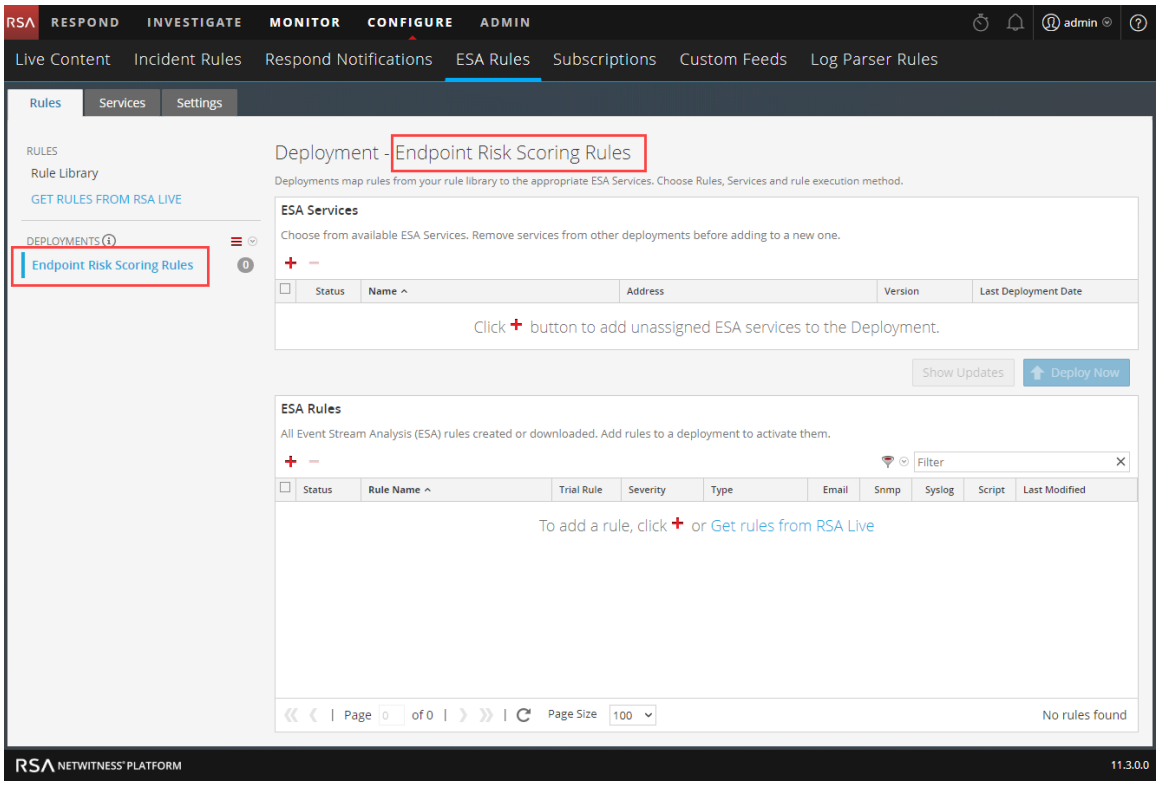
To create and deploy an ESA rule deployment with the Endpoint Risk Scoring Bundle:

1. Go to **CONFIGURE > ESA Rules > Rules tab**.

2. In the options panel on the left, next to Deployments, select **> Add** to add a deployment, type a name for the deployment, such as Endpoint Risk Scoring Rules, and press **Enter**.



The deployment is added and the Deployment view is displayed on the right.



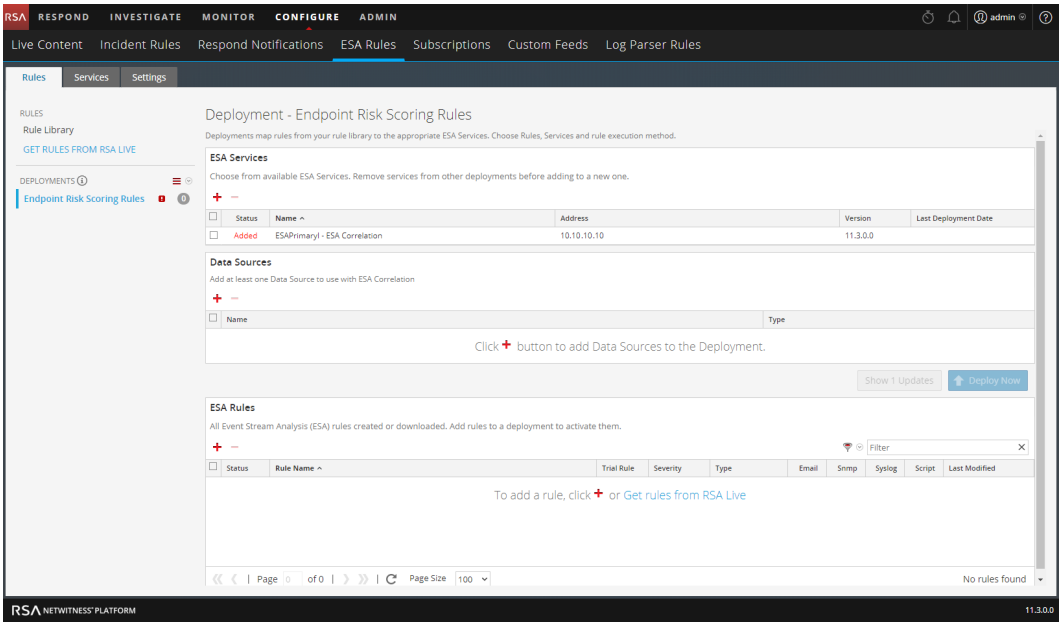
The deployment name that you choose also appears on a deployment tab in the **CONFIGURE > ESA Rules > Services** tab, where you can view deployment details and statistics.

3. Add an ESA Correlation service:

   a. In the **Deployment** view **ESA Services** section, click + .
   The Deploy ESA Services dialog lists each configured ESA Correlation service.

   b. Select an ESA Correlation service and click **Save**.
   The Deployment view is displayed. The ESA Correlation service is listed in the **ESA Services**

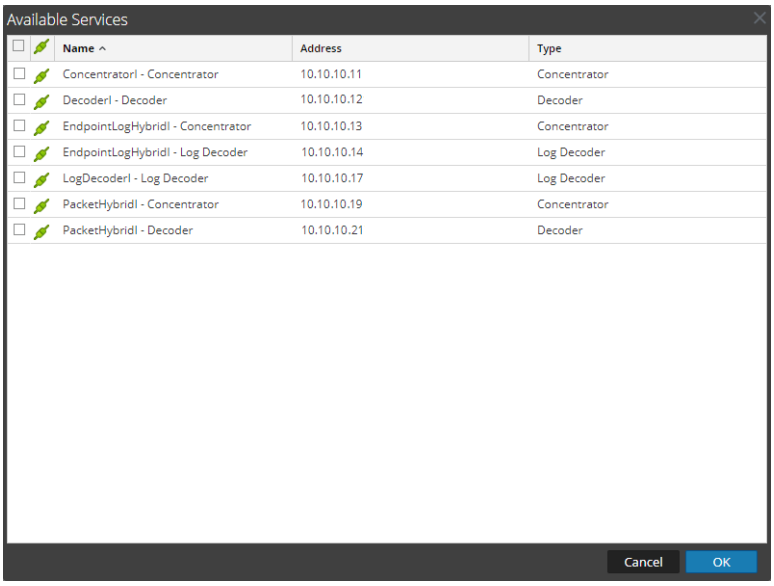
section with an **Added** status.



4. Add one or more data sources with endpoint data:

   a. In the **Deployment** view **Data Sources** section, click + .
   The **Available Configured Data Sources** dialog lists the services that have been configured for use as a data source.

   b. To add a data source configuration, click + .
   The **Available Services** dialog lists the available data sources from the ADMIN > Services view.

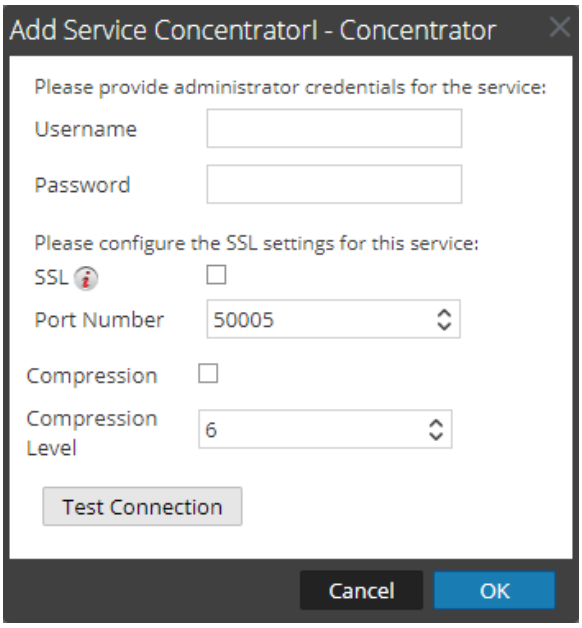


If an endpoint data source (service) that you are looking for is not in the list, see the *Hosts and Services Getting Started Guide* for instructions on how to install a service on a host.

Note: You can add a Log Decoder as a data source for ESA, but it is better to add a Concentrator to take advantage of undivided aggregation as the Decoder may have other processes aggregating from it.

c. In the **Available Services** dialog, select an endpoint data source, such as a Concentrator, and click **OK**.

d. In the **Add Service** dialog, type the Administrator username and password for the endpoint data source.



e. To enable the SSL or Compression options, select the corresponding checkboxes.

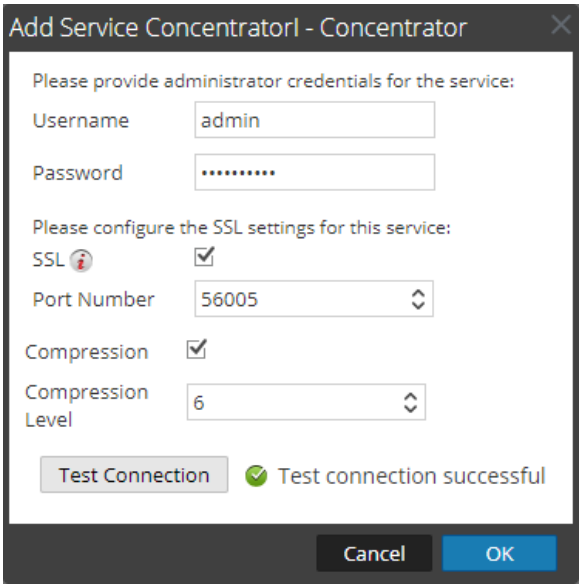
f. (Optional) You have the option to adjust the Compression Level for Concentrators on ESA in NetWitness Platform 11.3 and later. To enable compression, select the **Compression** checkbox. You can set the **Compression Level** for a Concentrator from 0-9:

- Compression Level = **0** (If compression is enabled, it allows Core Services to control the amount of compression.)
- Compression Level = **1** (It uses the lowest amount of compression and has the highest performance.)
- Compression Level = **9** (It uses the highest amount of compression and has the worst performance.)

Somewhere in the middle between 1 and 9 is usually the best setting, which is what you get when you select a compression level of 0. For more detailed information, see the *Core Database Tuning Guide*.

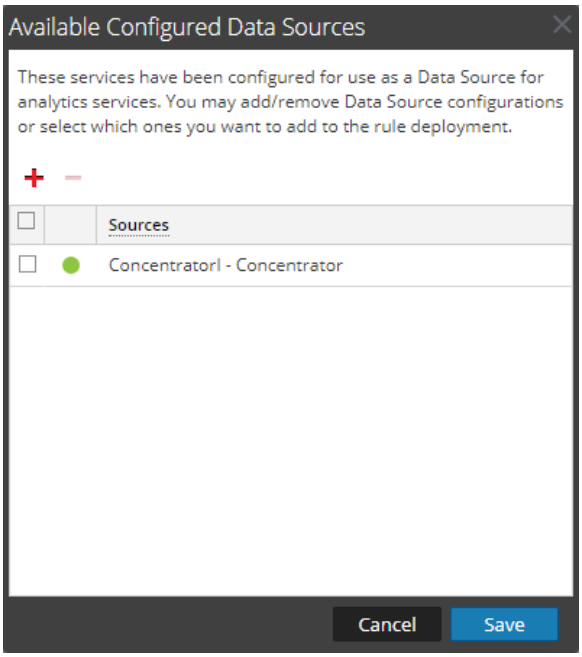
Note: When you set the compression level for a Concentrator on ESA, it sets the same compression level for that Concentrator for ESA Analytics and ESA Correlation Rules.

g. Click **Test Connection** to make sure that it can communicate with the ESA Correlation service.



h. Click **OK**.
After you configure your endpoint data sources and they appear in the **Available Configured Data Sources** dialog, you can use them for your deployment.

i. In the **Available Configured Data Sources** dialog, select at least one endpoint data source to use for the deployment.

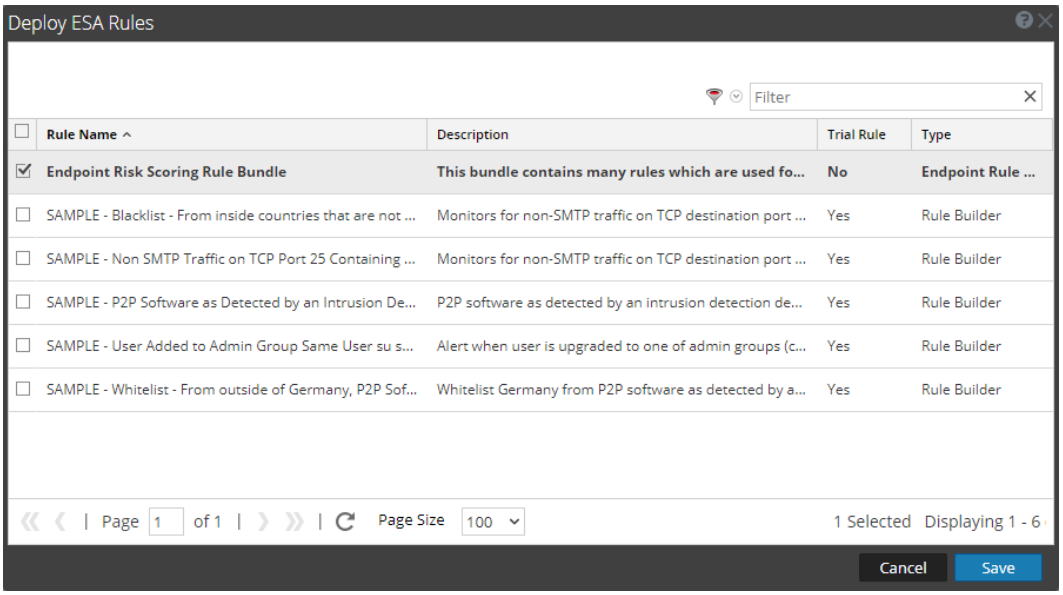


A solid colored green circle indicates a running service and a white circle indicates a stopped service.

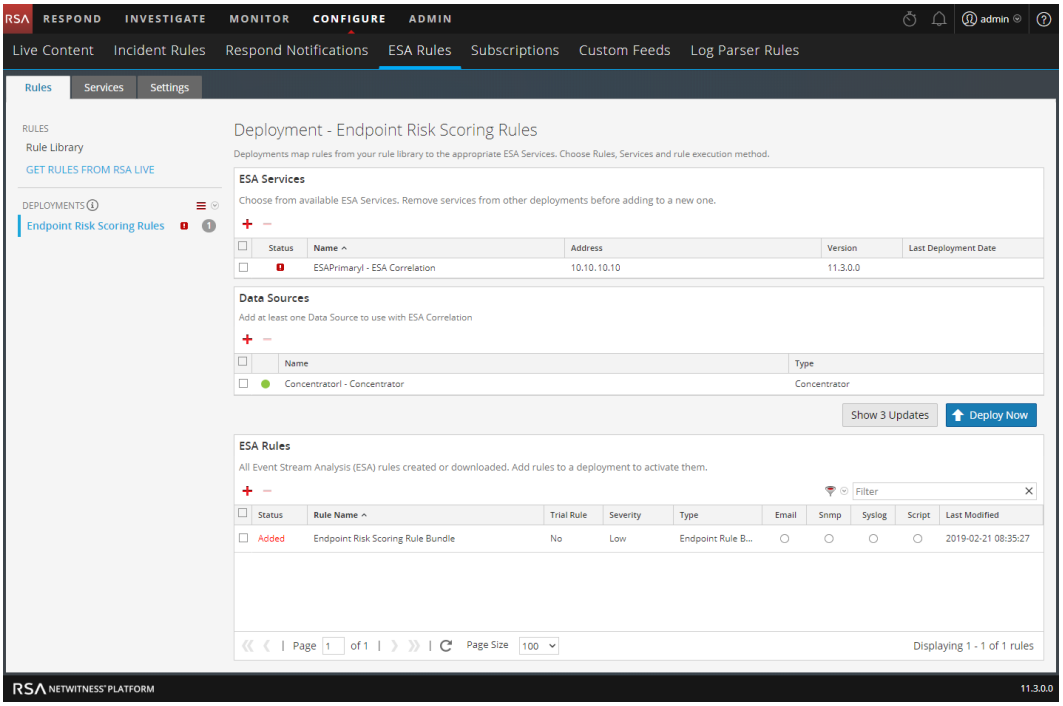
j. Click **Save**.
In the Deployment view **Data Sources** section, the selected data sources are added to the deployment. The **Deploy Now** button activates after a service, data source, and rules are added to an ESA rule deployment.

5. Add the Endpoint Risk Scoring Rules Bundle:

a. In the **Deployment** view ESA Rules section, click + .
The Deploy ESA Rules dialog is displayed and shows each rule in your Rule Library.

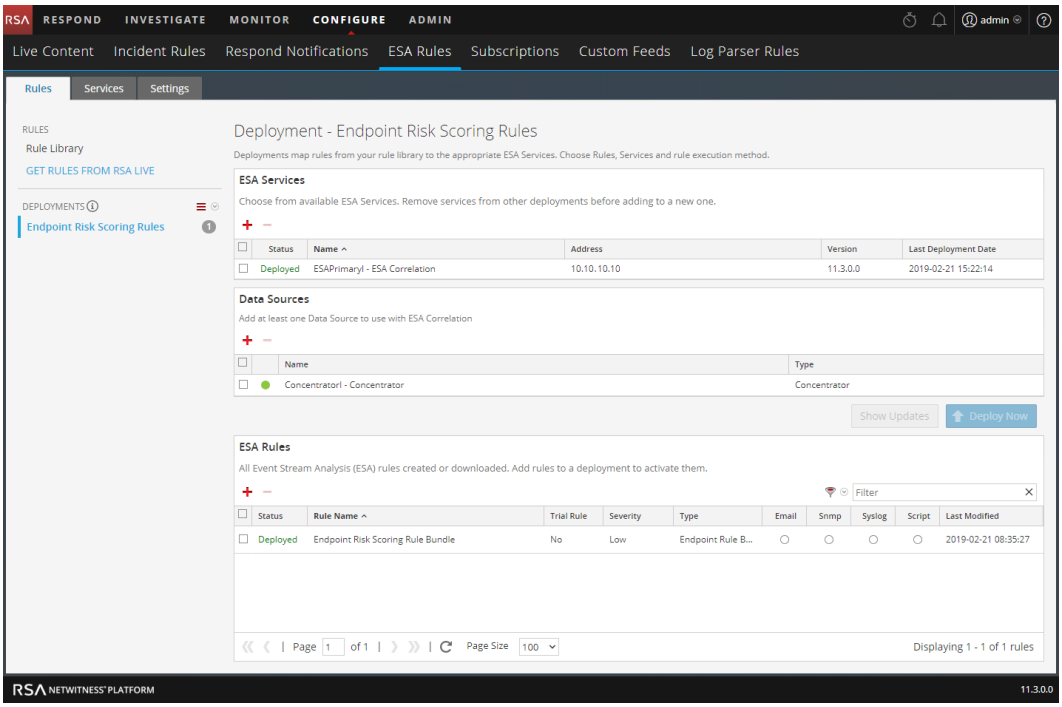


b. Select the Endpoint Risk Scoring Rule Bundle and click **Save**.
The Deployment view is displayed and the **Deploy Now** button is enabled.



The Endpoint Risk Scoring Rules Bundle is listed in the **ESA Services** section with an **Added** status.

6. Click **Deploy Now**.
The ESA Correlation service runs the rules in the Endpoint Risk Scoring Rules Bundle. The status of the bundle changes to **Deployed**.



You can now view information and statistics on the **CONFIGURE > ESA Rules > Services** tab. See View the Status of the Endpoint Risk Scoring Rules Deployment.

Change the Endpoint Risk Scoring Rule Bundle in a Deployment

You cannot edit or duplicate the Endpoint Risk Scoring Rules Bundle. After the bundle is deployed, you can enable and disable individual rules within the bundle. See Disable or Enable Individual Endpoint Risk Scoring Rules.

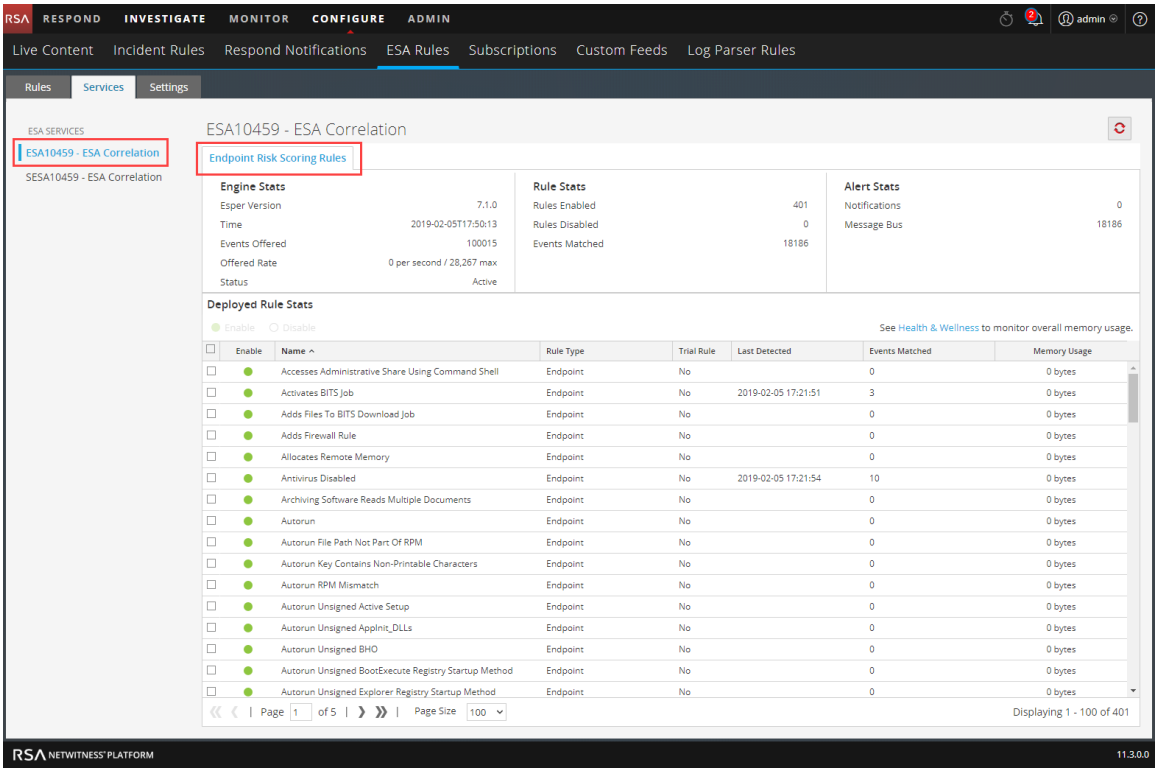
When you make changes to the ESA Rule Deployment containing the Endpoint Risk Scoring Rules Bundle, such as changing the endpoint data sources or changing compression levels, you must redeploy it for the changes to take effect. To redeploy, click the **Deploy Now** button for that deployment.

Caution: Deleting an ESA Rule Deployment with an Endpoint Risk Scoring Rule Bundle stops the Risk Scoring alerts that are used in risk scoring calculations to identify suspicious files and hosts.

For more information about changing ESA rule deployments, see "Additional ESA Rule Deployment Procedures" in the *Alerting with ESA Correlation Rules User Guide*.

View the Status of the Endpoint Risk Scoring Rules Deployment

1. Go to the ESA Rules Services tab (**CONFIGURE > ESA Rules > Services**).
2. In the options panel on the left, select your ESA Correlation service.
   Your deployment name shows on a tab to the right, for example, Endpoint Risk Scoring Rules. If you see multiple tabs on the right, select the tab for your endpoint risk scoring rules deployment.



3. In the **Engine Stats**, **Rules Stats** and **Alert Status** sections, look at the statistics related to the deployment, such as Rules Enabled, Rules Disabled, and Events Matched, which show the total numbers for the deployment.
4. In the **Deployed Rules Stats** section, look at the following details for each Endpoint Risk Scoring Rule:
   - **Enable**: Indicates the enabled status. A green circle icon ● indicates that the rule is enabled. A white circle icon ○ indicates that the rule is disabled.
   - **Name**: Shows the name of the rule.
   - **Rule Type**: Endpoint indicates a rule from the Endpoint Risk Scoring Bundle and Esper indicates Esper-specific rules, such as Rule Builder and Advanced EPL rules.
   - **Last Detected**: Shows the last time an alert was triggered for the rule.
   - **Events Matched**: Shows the total number of events that matched the rule.

Disable or Enable Individual Endpoint Risk Scoring Rules

1. Go to the ESA Rules Services tab (**CONFIGURE > ESA Rules > Services**).
2. In the options panel on the left, select your ESA Correlation service.
   Your deployment name shows on a tab to the right, for example, Endpoint Risk Scoring Rules. If you see multiple tabs on the right, select the tab for your endpoint risk scoring rules deployment.
3. In the **Deployed Rules Stats** section, do one of the following:
   - To enable rules, select the rules that you want to enable in the rules list and click the **Enable** button above the list.

   The selected rules are enabled and a message shows that the rules enabled successfully.

   - To disable rules, select the rules that you want to disable in the rules list and click the **Disable** button above the list.

   The selected rules are disabled and a message shows that the rules disabled successfully.

Change Memory Threshold for Trial Rules

This procedure is optional and applies only to ESA Correlation Rules.

Administrators can increase or decrease the memory threshold for trial rules. Threshold refers to the ESA memory usage, which includes ESA base memory, trial rules, and non-trial rules. When the threshold is exceeded, all deployed trial rules on an ESA service are disabled.

You use trial rules to see if a rule runs efficiently and does not use excessive memory, which can impact performance or force the service to shut down.

By default, the memory threshold is 90, which is the percentage of Java Virtual Memory (JVM).

- The memory threshold is per ESA, not per rule.
- When the memory threshold is exceeded, all trial rules running on the ESA are automatically disabled.
- The ESA configuration has the following parameters for trial rules:
  - `fatal-percentage`: If memory rises above this percentage, ESA disables trial rules. For example, if fatal-percentage is set to 90, when memory rises above 90 percent, ESA disables trial rules.
  - `check-every`: This parameter determines how often ESA checks the fatal-percentage to disable trial rules.

For more information, see "Work with Trial Rules" in the *Alerting with ESA Correlation Rules User Guide*.

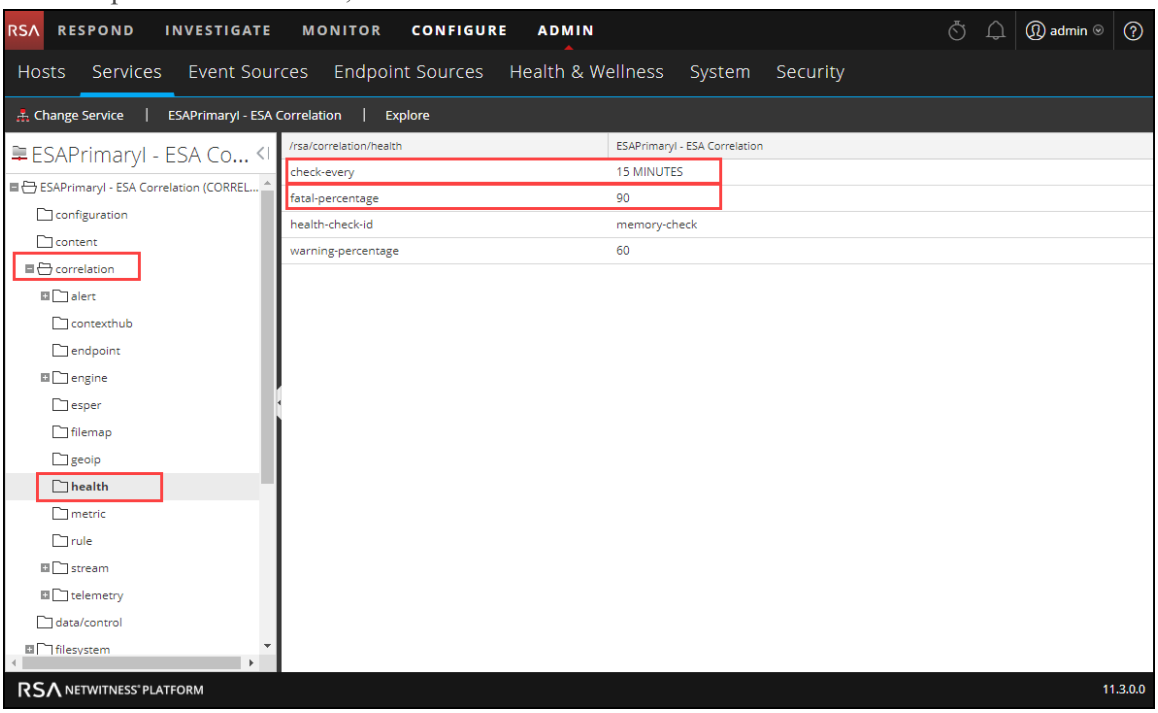
Prerequisites

A role with administrative privileges must be assigned to you.

To change memory threshold for trial rules:

1. Log on to NetWitness Platform as admin.
2. Go to **ADMIN** > **Services**.
3. Select the ESA Correlation service and then select > **View** > **Explore**.

4. In the Explore view node list, select **correlation > health**.



5. In the right panel, in `fatal-percentage`, type a percentage of JVM that trial rules on the ESA cannot exceed.
   The new memory threshold takes effect immediately.
6. If necessary, you can also adjust the `check-every` parameter, which determines how often ESA checks the fatal-percentage to disable trial rules. By default, ESA checks the fatal-percentage every 15 minutes.

Start, Stop, or Restart ESA Service

This topic provides instructions to start, stop, or restart the ESA Correlation service from the NetWitness Platform user interface and from the command line. These procedures apply to ESA Correlation Rules.

Start the ESA Service

1. Log on to NetWitness Platform as admin.
2. Go to **ADMIN** > **Services**.
3. Select the ESA Correlation service and then select > **Start**.

Stop the ESA Service

1. Log on to NetWitness Platform as admin.
2. Go to **ADMIN** > **Services**.
3. Select the ESA Correlation service and then select > **Stop**.

Restart the ESA Service

1. Log on to NetWitness Platform as admin.
2. Go to **ADMIN** > **Services**.
3. Select the ESA Correlation service and then select > **Restart**.

Start the ESA Service from the Command Line

1. Use ssh to connect to the ESA Correlation service and log in as the root user.
2. Type the following command and press **ENTER**:
   ```
   systemctl start rsa-nw-correlation-server
   ```

Stop the ESA Service from the Command Line

1. Use ssh to connect to the ESA service and log in as the root user.
2. Type the following command and press **ENTER**:
   ```
   systemctl stop rsa-nw-correlation-server
   ```

Restart the ESA Service from the Command Line

1. Use ssh to connect to the ESA service and log in as the root user.
2. Type the following command and press **ENTER**:
   ```
   systemctl restart rsa-nw-correlation-server
   ```

View Audit Logs and Verify ESA Component Versions

This topic provides details about audit logging and instructions to verify the versions of the ESA components installed. These procedures apply to ESA Correlation Rules.

View Audit Logs for Rules

Audit logging allows you to view details about rules that are created and changed in NetWitness Platform. There are local audit logs in each of the services in NetWitness Platform. When Global Audit Logging is configured, NetWitness Platform audit logs collect in a centralized system that converts them into the required format and forwards them to an external syslog system.

For details on how to access your local audit logs, see "Local Audit Log Locations" in the *System Configuration Guide*. To set up Global Audit Logging, see "Configure Global Audit Logging" in the *System Configuration Guide*.

The following Syslog global audit log examples show create, update, remove rule, and delete deployment actions for the ESA Correlation service (correlation-server).

```

Each log contains the following parameters:

- **Time stamp**: Time the rule was modified. Example: `09-17-2018 08:54:21`
- **System Info**: Information about the system where the action was performed, such as IP address. Example: `10.0.0.0`
- **deviceVersion**: Version of your ESA service. Example: `11.3.0.0`
- **deviceService**: Example: `correlation-server`
- **action**: Examples: `create`, `update`, `remove`
- **Parameters**: Placeholder for the following keys:
  - **Epl Module Identifier (moduleIds)**: unique identifier for the rules. Example: `5b9fce314a5b1f5951babc2a, 5b9fce314a5b1f5951babc2b`
  - **enabled**: Shows if the rule is enabled or not. Example: `enabled=true`
  - **respondEnabled**: Shows if alerts from this rule can go to the Respond view. Example: `respondEnabled=true`
  - **trial**: Displays if the rule is configured as a trial rule or not. Example: `trial=false`
  - **EplStatements**: Displays the rule syntax. Example:

    ```
    eplStatements=[module GHmoduleId15;@Name('GHmoduleName15') @Description
    ('GHmoduleDesc15') @RSAAlert(oneInSeconds=0, identifiers=

    {"user_dst"}

    ) SELECT * FROM Event(ec_outcome in ('Success', 'Failure') AND ec_
    activity='Logon').win:time(5 min) match_recognize (measures F as f_array,
    S as s pattern (F F F F F+ S+) define F as F.ec_outcome= 'Failure', S as
    S.ec_outcome= 'Success');]
    ```

  - **identity**: Example: `admin`

Verify ESA Correlation Version

1. Use ssh to connect to the ESA Correlation service and log in as the root user.
2. Type the following command and press ENTER:
   `rpm -qa | grep rsa-nw-correlation-server`
   The ESA Correlation server version is displayed.

Configure ESA Analytics

This section provides high-level tasks to configure ESA Analytics services for RSA NetWitness® Platform Automated Threat Detection. The Automated Threat Detection functionality enables you to analyze the data that resides on one or more Concentrators by using preconfigured ESA Analytics modules, such as Suspicious Domains. For example, using a Suspicious Domains module, an ESA Analytics service can examine your HTTP traffic to determine the probability that malicious activity is occurring in your environment.

There are two ESA services that can run on an ESA host:

- ESA Correlation (ESA Correlation Rules)
- Event Stream Analytics Server (ESA Analytics)

The first service is the ESA Correlation service that creates alerts from ESA rules, also known as ESA Correlation Rules, which you create manually or download from Live. The second service is the ESA Analytics service, which is used for Automated Threat Detection and is configured in this section. Because the ESA Analytics service uses preconfigured ESA Analytics modules for Automated Threat Detection, you do not have to create or download rules to use it.

There are currently two ESA Analytics modules available and they are both for Suspicious Domains:

- C2 for Packets (http-packet)
- C2 for Logs (http-log)

Note: The Contexthub Server service, which provides enrichment lookup capability in the Respond and Investigate views, runs only on an ESA Primary host. For information, see the *Context Hub Configuration Guide*.

Configure the Whois Lookup Service

The RSA NetWitness Platform Automated Threat Detection functionality enables you to automatically analyze data sources by using preconfigured ESA Analytics modules. An ESA Analytics module is a pipeline composed of activity objects that enrich an event with additional information through mathematical computations. ESA Analytics services process these modules to identify advanced threats.

The Whois Lookup service configuration is required for the Suspicious Domains modules.

Note: (**Important**) RSA strongly recommends that you configure the Whois Lookup service for accuracy in Automated Threat Detection scoring.

Prerequisites

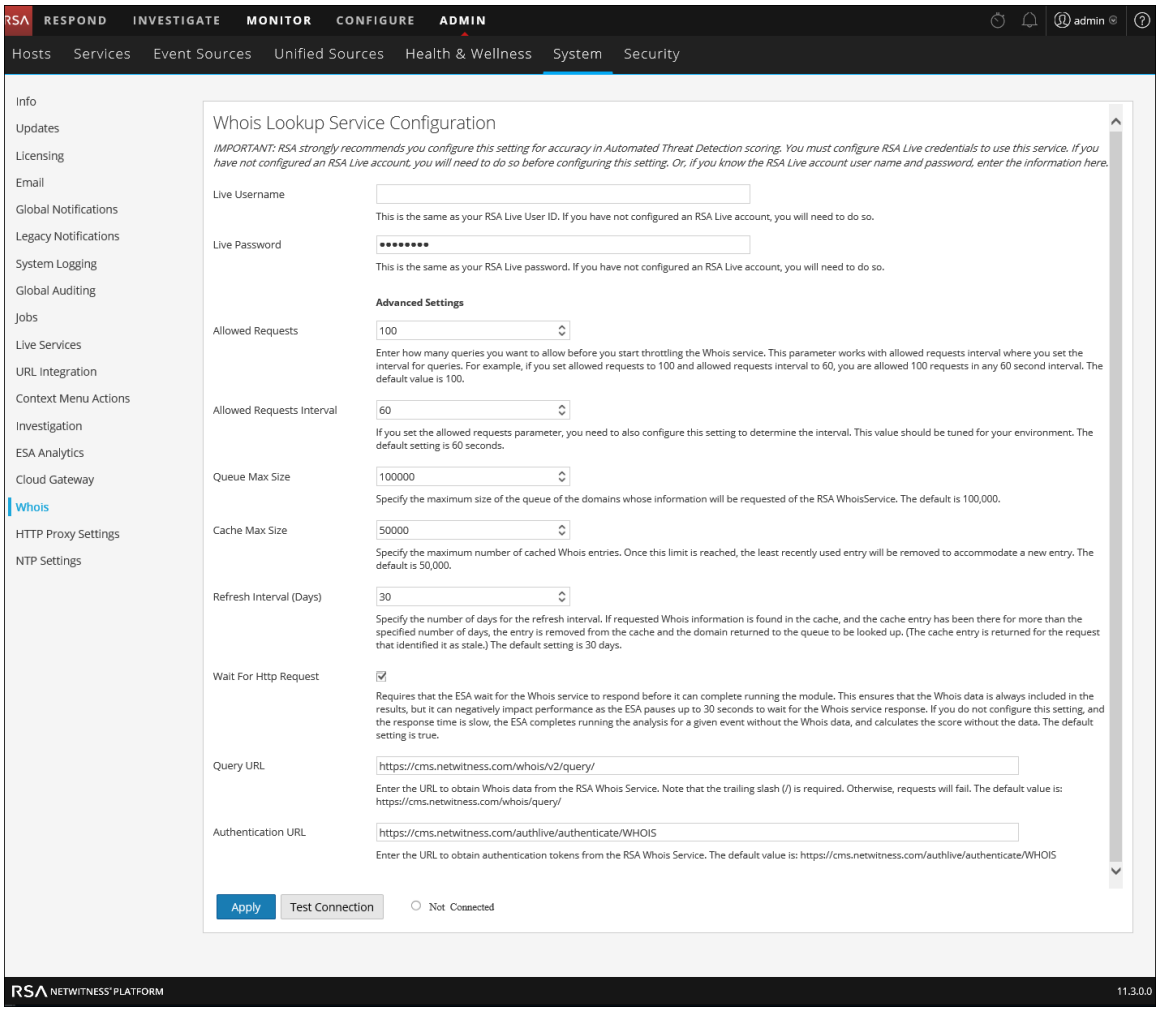
- You must have an RSA Live account to use the Whois Lookup service.
- The ESA Analytics Server service must be available (shows a green circle) in the ADMIN > Services view.

If you configured a Live account in the Live Services panel (ADMIN > System > Live Services), the Whois Lookup Service is automatically configured for you. You only need to check the connection of the Whois Lookup service.

Note: If you do not have an RSA Live account, you can create one at the RSA Live Registration Portal:
https://cms.netwitness.com/registration/
The *Live Services Management Guide* provides additional information.

To configure the Whois Lookup service:

1. Go to **ADMIN > System**.
2. In the options panel, select **Whois**.
3. In the **Whois Lookup Service Configuration** panel, check to see if the Whois Lookup service is connected. At the bottom of the panel, a connected service shows a green circle next to **Connected**:



If it is connected, you are finished with the configuration and you can skip the remaining steps. To adjust the advanced settings, go to step 5.
If the service is not connected, continue to step 4.

4. In the **Live Username** and **Live Password** fields, enter your RSA Live account credentials to access the RSA Whois server.
5. If necessary, you can adjust the advanced settings. However, RSA recommends that you use the default values. Whois Lookup Service Configuration provides additional details.
6. To test your connection, click **Test Connection**.

   A successful connection shows a green circle next to **Connected**:

7. Click **Apply** to save your changes.

Mapping ESA Data Sources to Analytics Modules

This topic tells Administrators how to map specific ESA Analytics modules to multiple data sources and ESA Analytics services, which can make processing more efficient.

You can analyze the data that resides on one or more Concentrators with the RSA NetWitness Platform Automated Threat Detection functionality by selecting a preconfigured ESA Analytics module. The data analyzed by these modules is used to identify advanced threats. To better utilize your network resources and reduce unnecessary data flow, you can map multiple data sources, such as Concentrators, to multiple ESA Analytics services in order to process data more efficiently and take advantage of additional capacity.

An *ESA Analytics module* is a pipeline composed of activity objects that enrich an event with additional information through mathematical computations. ESA Analytics modules reside within ESA Analytics services.

When you deploy your mapping, the selected ESA Analytics services use query-based aggregation to collect the appropriate filtered events for the selected module from the Concentrators. Query-based aggregation is a predefined query that only transfers data for the selected ESA Analytics module. Only the data required by the module is transferred between the Concentrator and the ESA Analytics system.

There are currently two ESA Analytics modules available for Suspicious Domains: C2 for Packets (http-packet) and C2 for Logs (http-log).

Module Deployment Example - Two ESAs

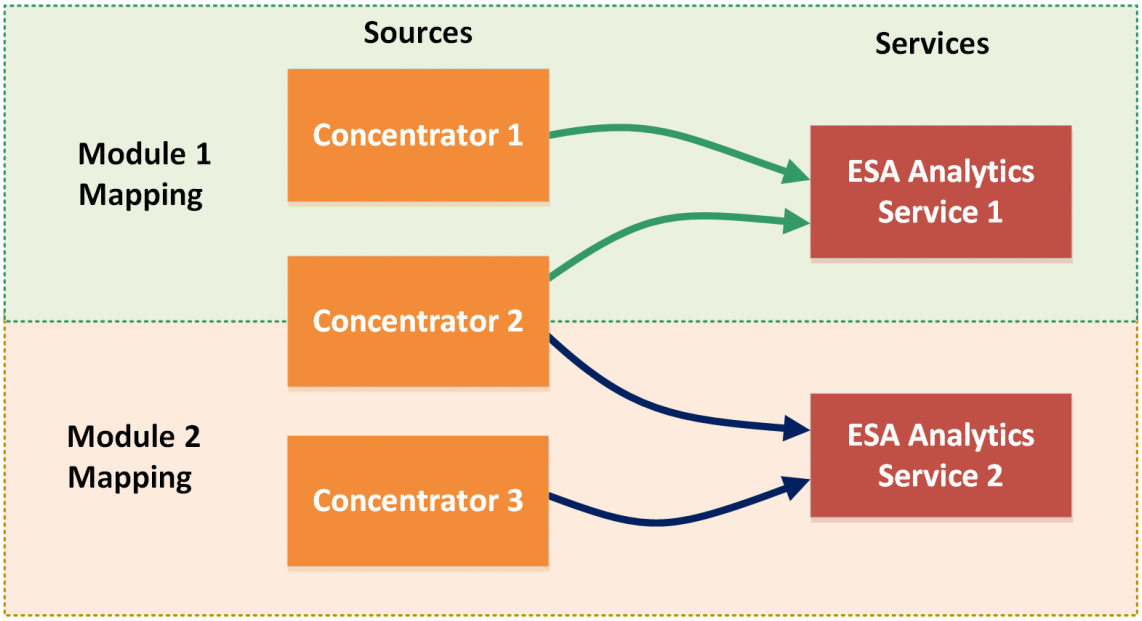
To take advantage of your additional Concentrator capacity, you can map an ESA Analytics module to an ESA Analytics service and deploy it to analyze data from multiple data sources at the same time.

For example, if you have three Concentrators and two ESA Analytics services, you can create and deploy the following mappings:

- Map Module 1 to the Concentrator 1 and 2 sources and the ESA Analytics 1 service. ESA Analytics Service 1 analyzes Module 1 filtered events from Concentrators 1 and 2.
- Map Module 2 to the Concentrator 2 and 3 sources and the ESA Analytics 2 service. ESA Analytics Service 2 processes Module 2 filtered events from Concentrators 2 and 3.

In this example, Module 1 represents an ESA Analytics module, such as C2 for Packets (http-packet) and Module 2 represents another ESA Analytics module, such as C2 for Logs (http-logs) in another location.

Module Deployment Example – Two ESAs



This example shows how both services can process data from the same Concentrator. Notice that ESA Analytics Services 1 and 2 can both process data from Concentrator 2. ESA Analytics Service 1 queries data for Module 1 events and ESA Analytics Service 2 queries different data for Module 2 events.

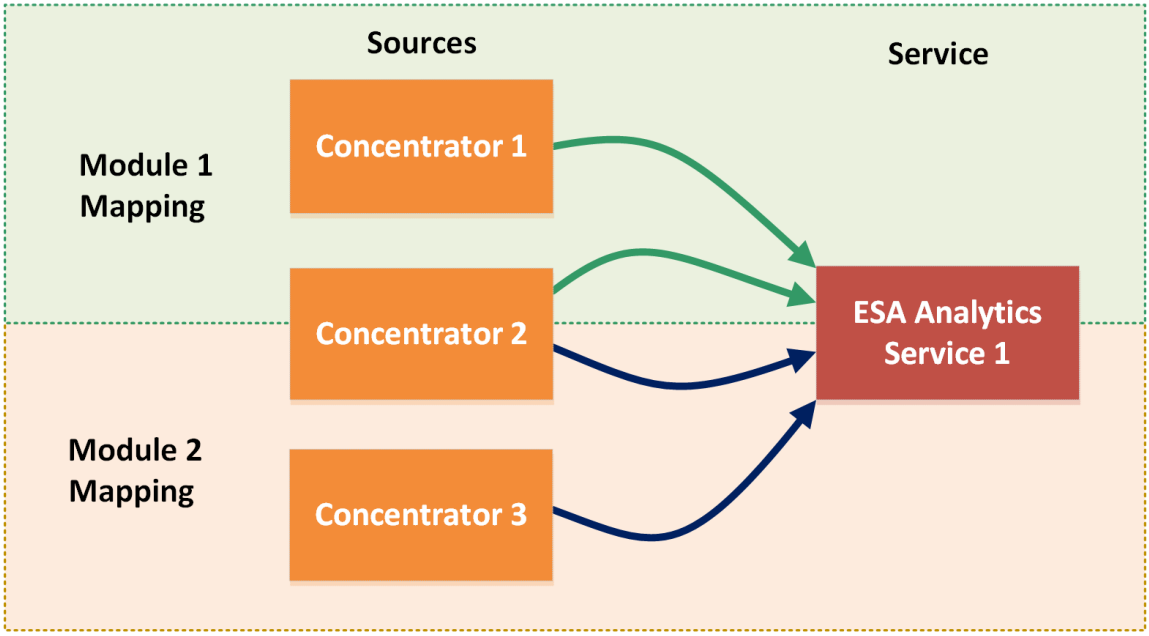
Module Deployment Example - One ESA

In addition to creating module mappings that are processed by different ESA Analytics services, you can map more than one module to the same ESA Analytics service.

For example, if you have three Concentrators and one ESA Analytics service, you can create and deploy the following mappings:

- Map Module 1 to the Concentrator 1 and 2 sources and the ESA Analytics 1 service. ESA Analytics Service 1 analyzes Module 1 filtered events from Concentrators 1 and 2.
- Map Module 2 to the Concentrator 2 and 3 sources and the ESA Analytics 1 service. ESA Analytics Service 1 also processes Module 2 filtered events from Concentrators 2 and 3.

Module Deployment Example – One ESA



This example shows how one service can process data from more than one module. Notice that ESA Analytics Service 1 can process data from Concentrators 1 and 2 for Module 1. It also processes data from Concentrators 2 and 3 for Module 2. ESA Analytics Service 1 queries data for Module 1 events and queries different data for Module 2 events.

Caution: Ensure that all NetWitness Platform host services are in sync with a consistent time source.

Prerequisites

- All NetWitness Platform host services must be in sync with a consistent time source.
- The Concentrator hosts and services must be discovered and available in the NetWitness Platform user interface.
- All module-specific requirements must be followed.
  - For Suspicious Domains:
    - Configure log settings (Suspicious Domains for Logs only)
    - Create a whitelist using the Context Hub service.
    - Configure the Whois Lookup Service.
    - Verify that the C2 incident rule is enabled and monitor it for activity.
    - Verify that the incidents are grouped by Suspected C&C.

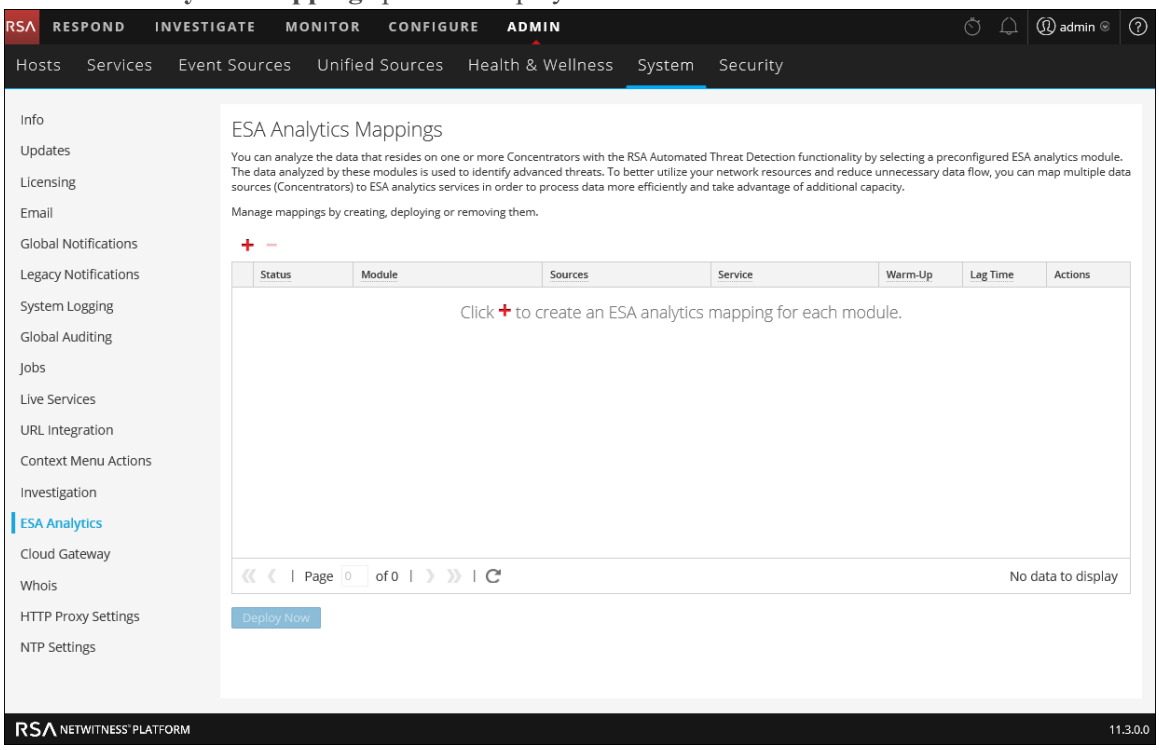
  For step-by-step procedures, see the *NetWitness Platform Automated Threat Detection Configuration Guide*.

  Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

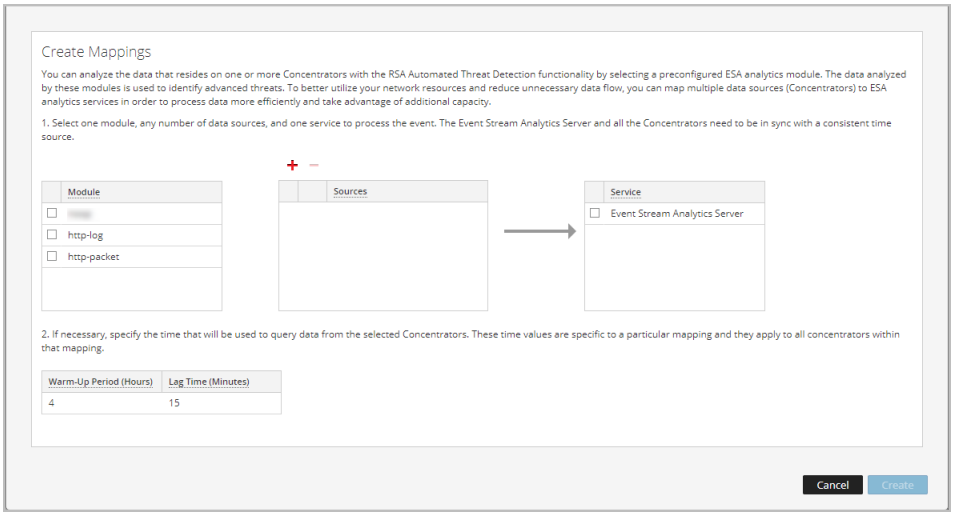
Create ESA Analytics Mappings

The following procedure tells you how to map ESA Analytics modules to sources and services. After creating and reviewing the mappings, you deploy them so that they can start aggregating data.

1. Go to **ADMIN** > **System**, and in the options panel, select **ESA Analytics**.
   The **ESA Analytics Mappings** panel is displayed.



2. Click + to create an ESA Analytics mapping. Create a separate mapping for each module.
   The **Create Mappings** dialog is displayed.



3. In the **Module** list, select a module.

4. Configure one or more data sources (Concentrators) for your mappings. Do the following for each Concentrator:

   a. Click + to view the data sources that are available from the ADMIN > Services view.

   b. In the **Available Services** dialog, select a Concentrator and click **OK**.
   The Add Service dialog is displayed.

   c. In the **Add Service** dialog, type the Administrator username and password for the Concentrator.

   d. (Optional) You have the option to adjust the Compression Level for Concentrators on ESA in NetWitness Platform 11.3 and later. To enable compression, select the **Compression** checkbox. You can set the **Compression Level** for a Concentrator from 0-9:

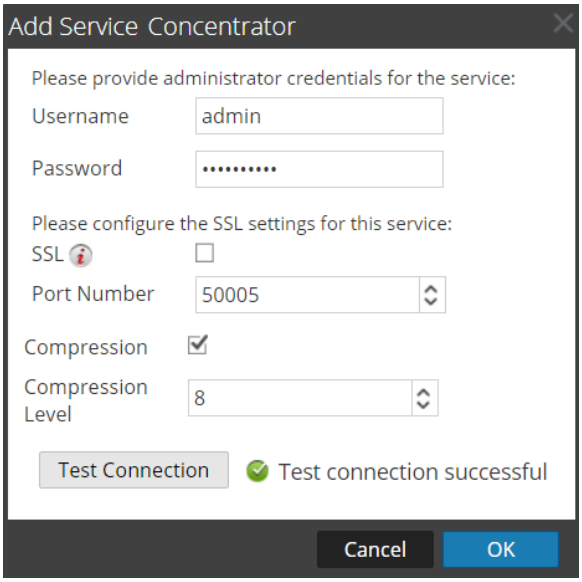
      - Compression Level = **0** (If compression is enabled, it allows Core Services to control the amount of compression.)
      - Compression Level = **1** (It uses the lowest amount of compression and has the highest performance.)

- Compression Level = **9** (It uses the highest amount of compression and has the worst performance.)

Somewhere in the middle between 1 and 9 is usually the best setting, which is what you get when you select a compression level of 0. For more detailed information, see the *Core Database Tuning Guide*.

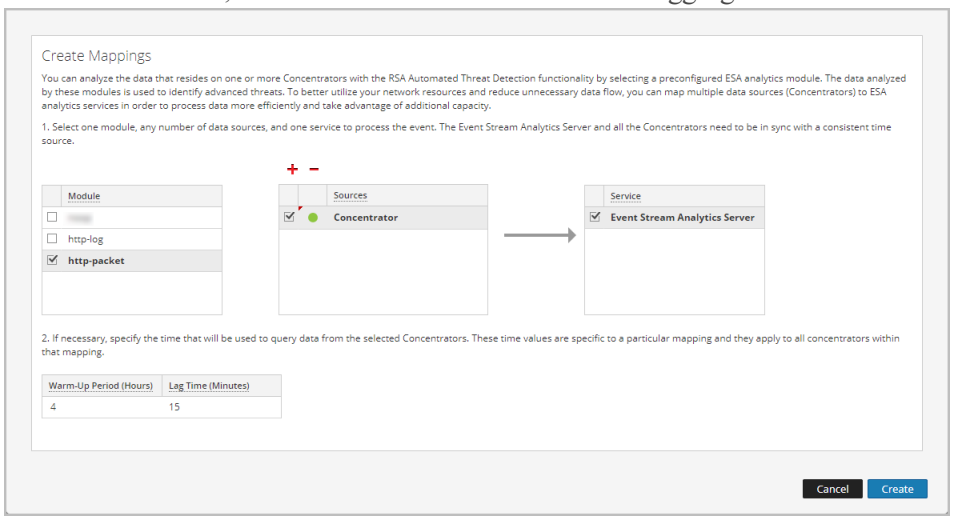
Note: When you set the compression level for a Concentrator on ESA, it sets the same compression level for that Concentrator for ESA Correlation Rules and ESA Analytics.

e. Click **Test Connection** to make sure that it can communicate with the ESA Analytics service.



f. Click **OK**.
After you configure your data sources and they appear in the Sources list, you can reuse them for additional mappings.

5. In the **Sources** list, select one or more data sources to aggregate the data for the module.

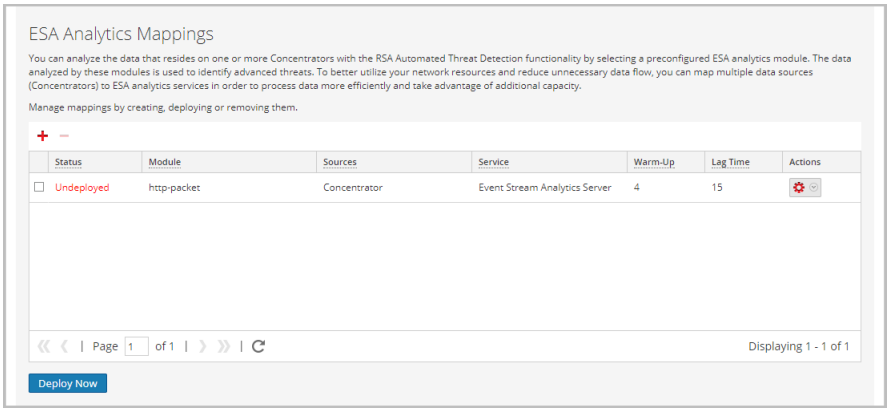


A solid colored green circle indicates a running service and a white circle indicates a stopped service.

6. In the **Service** list, select an ESA Analytics service to process the data for the module.
7. If necessary, specify the time that will be used to query data from the selected Concentrators:

Field	Description
Warm-up Period (Hours)	Specifies a warm-up duration (in hours). A warm-up period is required to allow Automated Threat Detection to "learn" your traffic. The warm-up period should run when typical traffic is running. During this time, alerting for your module mapping is suppressed. The Warm-up Period primes the module with historical data and guarantees that the specified number of hours of data collection completes before sending alerts. RSA provides preconfigured ESA Analytics modules. Each module type has a default warm-up period defined, which you can adjust to your environment, if necessary. After this warm-up period, alerts can be viewed. For more information about Warm-up Period and Lag time, see Module Settings.
Lag Time (Minutes)	Specifies a constant time delay in minutes, which is added to avoid losing events being processed by the data sources during periods of heavy activity. For example, Concentrator performance varies depending on factors such as incoming load, ongoing queries, and indexing. Due to these factors, a Concentrator may not aggregate events in real-time, which leads to the delay. The Lag parameter gives the Concentrator a chance to finish aggregating all of the data. After the warm-up period completes, data aggregation continues at **Current (System) Time - Lag Time**. This is useful when a Concentrator is slow in aggregating data. The Lag time guarantees that the module does not process data that arrives to the Concentrator within the Lag time window so there is adequate delay to ensure all events that get generated in the enterprise can be processed by the module. For example, if Lag time is 30 minutes, and the current time is 2:00 PM, the Concentrator starts pulling records at 1:30 PM. The Lag time window, 30 minutes in this example, remains constant as time advances. When the current time advances to 2:01 PM, the Concentrator pulls the next minute of data at 1:31 PM, and so on. **Important**: The Lag time defines the buffer between the current time and the time when the module ingests the data. **Caution:** RSA recommends that Administrators adjust the Lag parameter dynamically based on the performance of each of the individual Concentrators to avoid missing any events during aggregation. For more information about Warm-up Period and Lag time, see Module Settings.

8. Click **Create**.
   The mappings that you create appear in the list of existing mappings with a status of **Undeployed**.



Important: To start a module so that it starts aggregating data, you need to deploy it.

Deploy ESA Analytics Mappings

After you create your mappings, you need to deploy them in order to start aggregating data for the modules.

1. In the list of mappings, verify that the status of the mappings that you want to deploy show as **Undeployed**.
2. Select one or more mappings with a status of Undeployed and select **Deploy Now**.
   All selected mappings in the Undeployed state start to aggregate data as configured in the mapping.
   The mapping status changes to **Deployed**.
   You cannot deploy a mapping that has already been deployed.

Update a Mapping

You can only have one mapping per module. If you want to make changes to a deployed mapping, such as adding or removing Concentrators or changing the service, you must undeploy and delete the existing mapping and then create and deploy a new mapping for that module.

You can make the following updates to a deployed mapping without deleting it:

- Undeploy the mapping
- Change the warm-up period and lag time

You can also change the warm-up period and lag time for an undeployed module mapping.

Undeploy a Mapping

If you want to stop aggregating data for a module mapping, but you do not want to delete the mapping, you can undeploy it. This gives you the option of deploying it at a later time. When you undeploy a mapping, the specified ESA Analytics service stops pulling data from the data source for that module.

Caution: Undeploying a mapping with a status of Deployed will affect data aggregation for that module.

To undeploy a mapping:

1. In the ESA Analytics Mappings panel, select the deployed mapping that you want to undeploy.
2. In the **Actions** column, select > **Undeploy**.
   The status changes from Deployed to Undeployed and data aggregation stops.

Delete a Mapping

You can delete a mapping with a status of Undeployed at any time. Since a mapping in the Undeployed state is not running, it does not affect data aggregation.

You should undeploy a mapping with a status of Deployed before deleting it. Undeploying and deleting a mapping clears the configuration on the ESA server, reverts the deployment for that mapping, and stops pulling data from the data source for that module.

Caution: Undeploying and deleting a mapping will affect data aggregation for that module.

To delete a mapping:

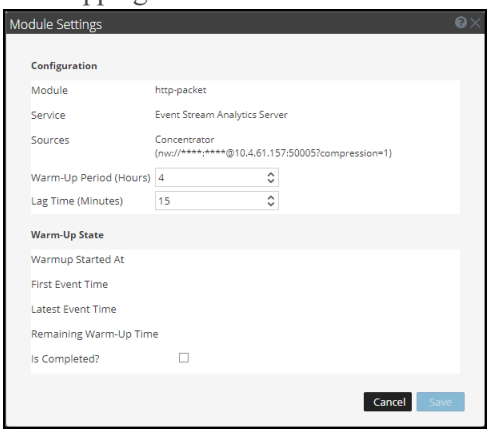
1. In the ESA Analytics Mappings panel, select the mapping that you want to delete. You can only delete one mapping at a time.
2. Click .

Change the Warm-up Period and Lag Time

You may want to adjust the warm-up period for a specific module mapping. For example, after the warm up period is complete, you can increase the warm-up period setting to allow additional warm-up time. You can even increase the warm-up period when your module mapping is actively warming up.

If necessary, you can change the lag time for the module. The lag time defines the buffer between the current (system) time and the time when the module ingests the data.

1. In the ESA Analytics Mappings panel, select the mapping that you want to change and in the **Actions** column, select > **Edit Module**.
   The Module Settings dialog shows the selected module, ESA Analytics service, and data sources for the mapping. The data sources show the URLs used to communicate with ESA.



2. Review the **Warm-Up State** section to determine the current warm-up state:
   - **Warm Up Started At** - The time when the first event was processed by the ESA Analytics module from the data source.
   - **First Event Time** - The time that the first event occurred. The warm-up time is based on this time.
   - **Latest Event Time** - The time that the latest event occurred.
   - **Remaining Warm Up Time** - The number of hours remaining in the warm-up period.
   - **Is Completed?** - Indicates whether the warm-up period is complete. If it is true, the warm-up period is complete. If it is false, the module is still warming up and you can view the number of hours remaining in the Remaining Warm Up Time field.
3. In the **Configuration** section, you can update the **Warm-Up Period (Hours)** depending on whether or not the warm-up period is complete.
   - **During the warm up period** - You can add hours to the warm-up period or subtract any remaining warm-up time.
   - **The warm-up period is complete** - You can add hours to the warm-up period by adding the difference between the current time and the First Event Time to the hours that you want to add. For example, a warm-up period of 10 hours is complete and the First Event Time shows 12:00:00. The current time is 16:00:00 (4 hours later) and you want to add 5 more hours to the warm-up time. To do this, you need to add 9 hours (4+5=9) to the warm-up period of 10, so you would set the new warm-up period to 19 hours.
     You cannot decrease the warm-up period if it is complete, unless you delete the mapping and create a new one.
4. If necessary, you can adjust the **Lag Time (Minutes)** to give the Concentrators in the mapping additional time to finish aggregating all of the data.
5. Click **Save**.
   Changes DO NOT take effect immediately. For the settings to take effect, you need to undeploy and re-deploy the mapping.
6. To undeploy the mapping, in the ESA Analytics Mappings panel, select the mapping that you want to undeploy and then select > **Undeploy**.
   Data aggregation stops for the selected mapping.
7. To re-deploy the mapping, select the mapping that you want to deploy and then select > **Deploy**.
   The selected mapping deploys and starts to aggregate data as configured in the mapping.

References

This section is a collection of references, which describe the user interface for ESA Configuration in NetWitness Platform.

- Whois Lookup Service Configuration

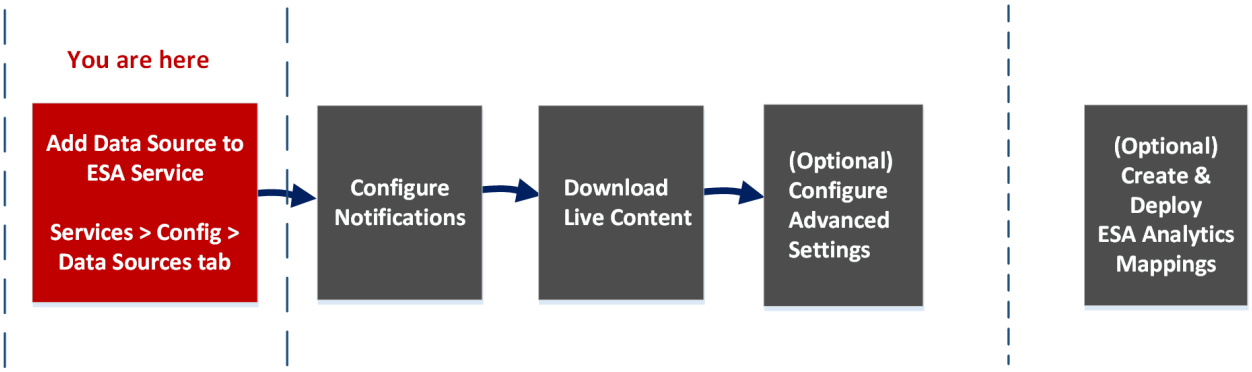
Services Config View Data Sources Tab

Note: The information in this topic applies ONLY to RSA NetWitness® Platform version 11.2 and earlier. For version 11.3 and later, see Data Source Configuration Changes.

The **Services Config view > Data Sources** tab of an ESA service enables you to configure the sources that ESA uses to analyze data. An ESA service ingests data from Concentrators to detect incidents and alert analysts to potential threats.

Workflow

This workflow shows the overall process for configuring ESA. It also shows where configuring data sources is located in the process.



In NetWitness Platform 11.2 and earlier, ESA has two services, the Event Stream Analysis service (ESA Correlation Rules) and the Event Stream Analytics Server service (ESA Analytics). The first four procedures shown pertain to configuring the Event Stream Analysis service:

- Add Data Source to ESA Service*
- Configure Notifications
- Download Live Content
- (Optional) Configure Advanced Settings

The last procedure is separate from the others and pertains to creating mappings for the ESA Analytics services to start automatically detecting advanced threats:

- (Optional) Create and Deploy ESA Analytics Mappings

What do you want to do?

Role	I want to ...	Show me how
Administrator	Add a Concentrator as a data source to the Event Stream Analysis Service *	See "Configure ESA Correlation Rules" and "Step 1. Add a Data Source to an ESA Service" in the *ESA Configuration Guide for version 11.2.*

Role	I want to ...	Show me how
Administrator	Configure Notifications	See "Notification Methods" in the *Alerting with ESA Correlation Rules User Guide for version 11.2.*
Administrator	Download Live Content	See "Download Configurable RSA Live Rules" in the *Alerting with ESA Correlation Rules User Guide for version 11.2.*
Administrator	Configure Advanced Settings	See "Step 2. Configure Advanced Settings for an ESA Service" in the *ESA Configuration Guide for version 11.2.*

*You can complete these tasks here (that is in the Services Config view Data Sources tab).

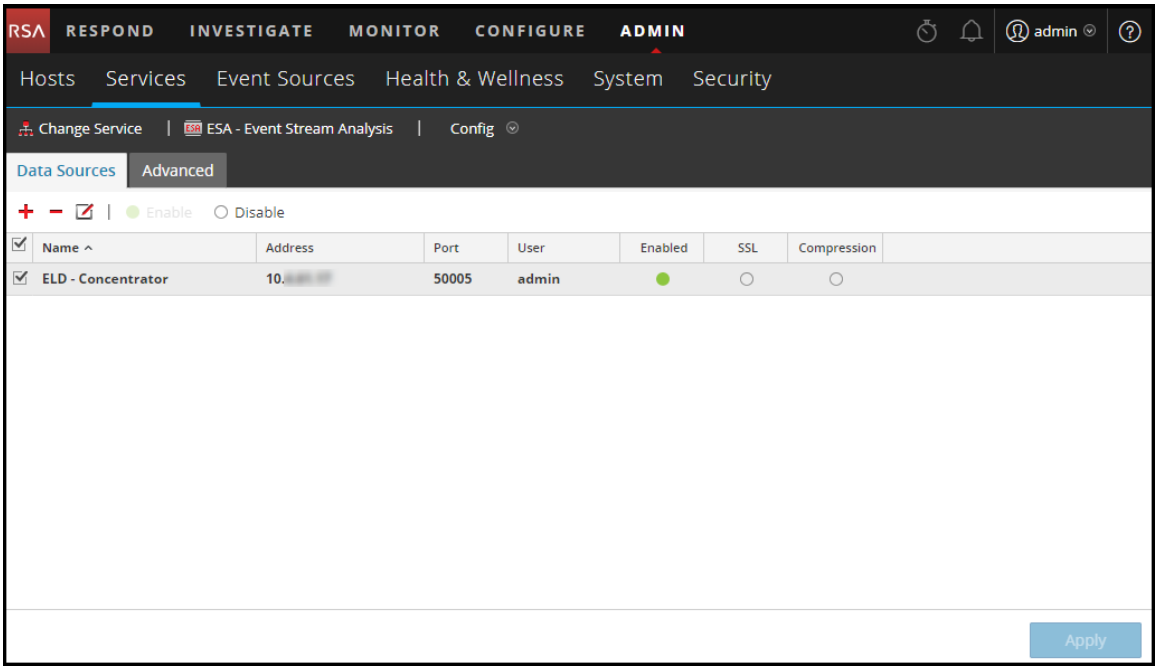
Related Topics

- See "Add or Update a Host" in the *Host and Services Getting Started Guide*.

Quick Look

To access the Data Sources tab, go to **ADMIN > Services >** (Select an ESA service) > **> View > Config**.

The following figure shows the Services Config view Data Sources tab for an ESA service.



Toolbar

The following table describes the options in the toolbar.

Option	Description
	Adds a new data source to the ESA service.
	Deletes a data source from the ESA service.
	Edits a data source. You must have the username and password credentials for the service in order to make changes.
	Enables the selected data source.
	Disables the selected data source.

Data Sources

The Data Sources list shows all of the data sources added to the ESA service. The following table describes the columns the Data Sources list.

Column	Description
Name	The name of the data source service.
Address	The address of the data source service.
Port	The port used by the data source.
User	The user connected with the data source.
Enabled	Indicates if the data source is enabled.
SSL	Indicates if SSL communication is enabled.
Compression	Indicates if compression is enabled.

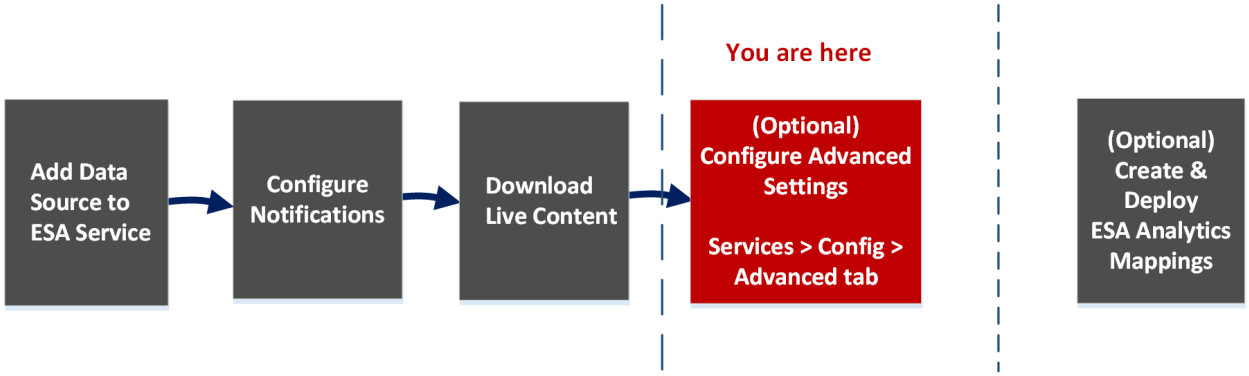
Services Config View Advanced Tab

Note: The information in this topic applies ONLY to RSA NetWitness® Platform version 11.2 and earlier. For version 11.3 and later, see Configure Advanced Settings for an ESA Correlation Service.

The **Services Config view > Advanced** tab of an ESA service enables you to configure advanced settings. In the Advanced view, you can configure advanced settings to improve performance, to preserve events for rules with multiple events, to buffer events in memory, and to set the number of events to be stored on the ESA.

Workflow

This workflow shows the overall process for configuring ESA. It also shows where configuring advanced settings is located in the process.



In NetWitness Platform 11.2 and earlier, ESA has two services, the Event Stream Analysis service (ESA Correlation Rules) and the Event Stream Analytics Server service (ESA Analytics). The first four procedures shown pertain to configuring the Event Stream Analysis service:

- Add Data Source to ESA Service
- Configure Notifications
- Download Live Content
- (Optional) Configure Advanced Settings*

The last procedure is separate from the others and pertains to creating mappings for the ESA Analytics services to start automatically detecting advanced threats:

- (Optional) Create and Deploy ESA Analytics Mappings

What do you want to do?

Role	I want to ...	Show me how
Administrator	Add a Concentrator as a data source to the Event Stream Analysis Service	See "Configure ESA Correlation Rules" and "Step 1. Add a Data Source to an ESA Service" in the *ESA Configuration Guide for version 11.2*.
Administrator	Configure Notifications	See "Notification Methods" in the *Alerting with ESA Correlation Rules User Guide for version 11.2*.
Administrator	Download Live Content	See "Download Configurable RSA Live Rules" in the *Alerting with ESA Correlation Rules User Guide for version 11.2*.
Administrator	Configure Advanced Settings *	See "Step 2. Configure Advanced Settings for an ESA Service" in the *ESA Configuration Guide for version 11.2*.

*You can complete these tasks here (that is in the Services Config view Advanced tab).

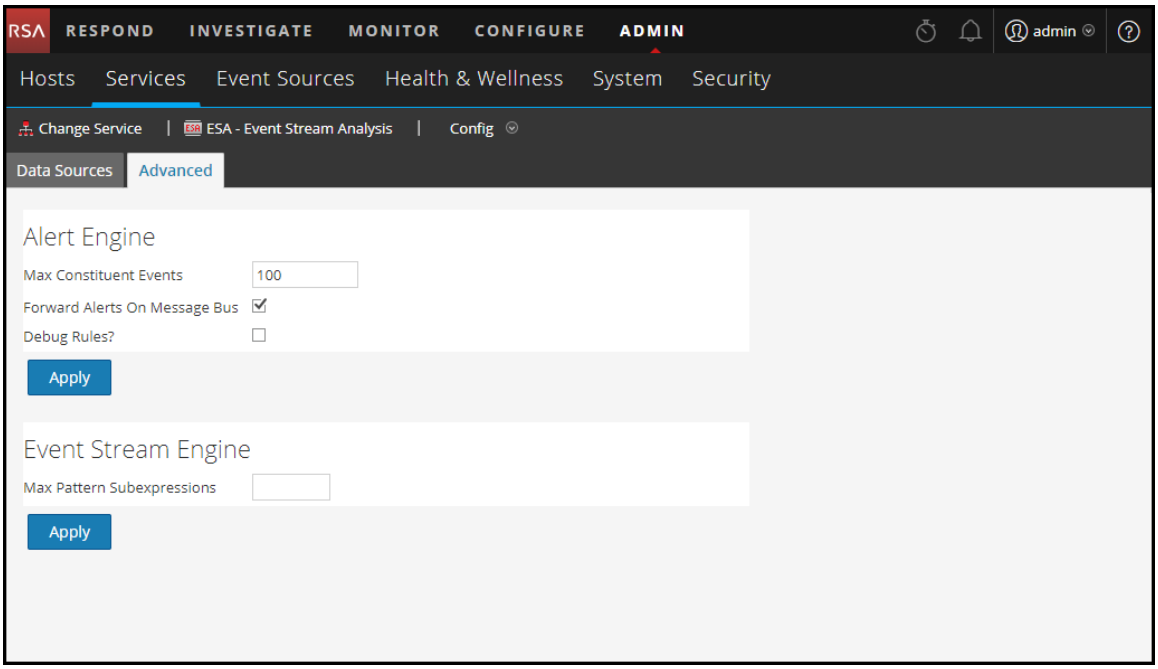
Related Topics

- See "Add or Update a Host" in the *Host and Services Getting Started Guide*

Quick Look

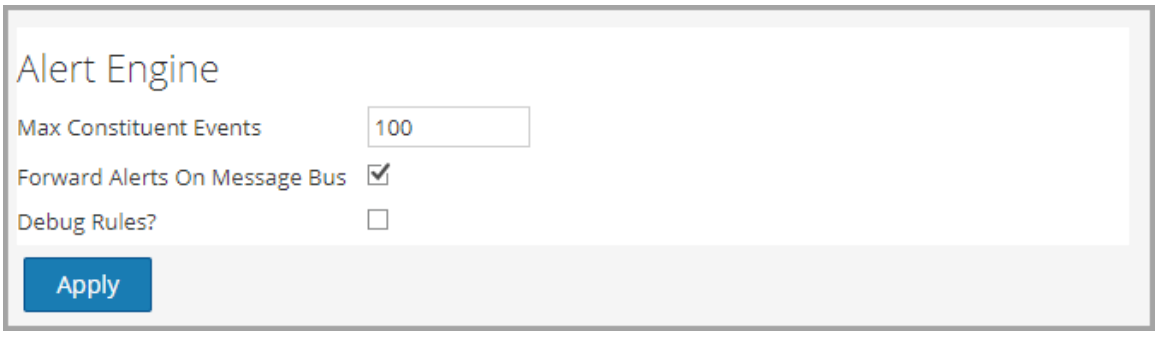
To access the Advanced tab, go to **ADMIN** > **Services** > (Select an ESA service) > > **View** > **Config**.

The following figure shows the Services Config view Advanced tab for an ESA service.



Alert Engine Settings

In the Alert Engine section, you specify values to preserve events for rules that choose multiple events. The following figure shows the Alert Engine section.



The following table lists the parameters in the Alert Engine section and their descriptions.

Parameter	Description
Max Constituent Events	For rules that contain multiple events, this configuration value determines how many of the associated events are preserved. For example, if a rule fires an alert with 200 associated events and this parameter is set to 100, only the first 100 are preserved by ESA, the rest are dropped. The default value is 100.
Forward Alerts On Message Bus	To forward ESA alerts for NetWitness Respond, you must select this option. The ESA alerts generated will be sent to the Message Bus and subsequently to Respond. This option is selected by default. You may want to ensure that the Respond Server service is running.
Debug Rules?	Selecting enables debugging rules.

Event Stream Engine Settings

In the Event Stream Engine section, you specify details to improve performance. The following figure shows the Event Stream Engine section.

The following table lists the parameter in the Event Stream Engine section and its description.

Parameter	Description
Max Pattern Subexpressions	Certain rules require ESPER to maintain subexpressions in memory before deciding to fire them or not. These subexpressions consume memory and if left unchecked may cause the service to go down with memory exhaustion. This parameter is a safety measure that keeps such memory hogging rules under check. If a rule exceeds the specified number of subexpressions, its processing is delayed. The default value is 0, which means this setting is disabled. You must set a value if there are service stability issues.

Whois Lookup Service Configuration

In the Whois Lookup Configuration panel (ADMIN > System > Whois), you configure a connection to the Whois Lookup service for your preconfigured ESA Analytics modules used in RSA Automated Threat Detection. The Whois Service enables you to get accurate data about domains that you connect to. In order to ensure effective scoring, it is important that you configure the Whois service settings.

You must have an RSA Live account to use this service.

If you configured a Live account in the Live Services panel (ADMIN > System > Live Services), the Whois Lookup Service is automatically configured for you. You just need to check the connection of the Whois Lookup service.

Note: If you do not have an RSA Live account, you can create one at the RSA Live Registration Portal: https://cms.netwitness.com/registration/ The *Live Services Management Guide* provides additional information.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure the Whois Lookup service.	Configure the Whois Lookup Service
Administrator	Check the connection of the Whois Lookup service.	Configure the Whois Lookup Service

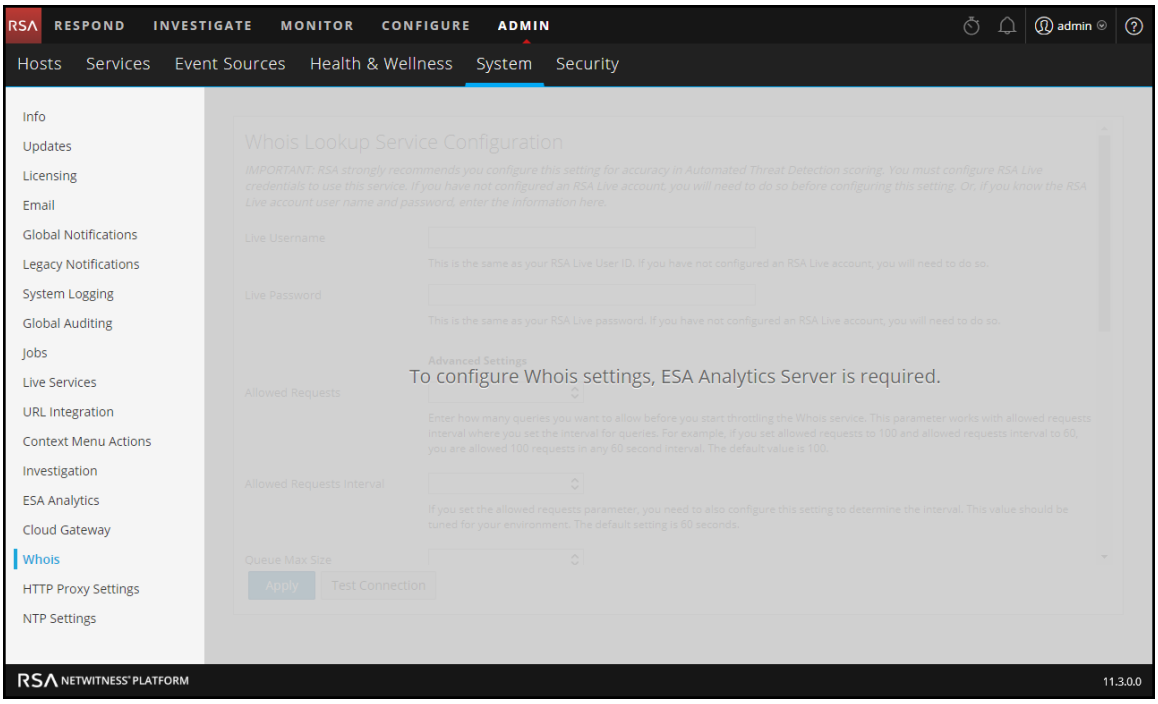
Related Topics

- ESA Analytics Mappings

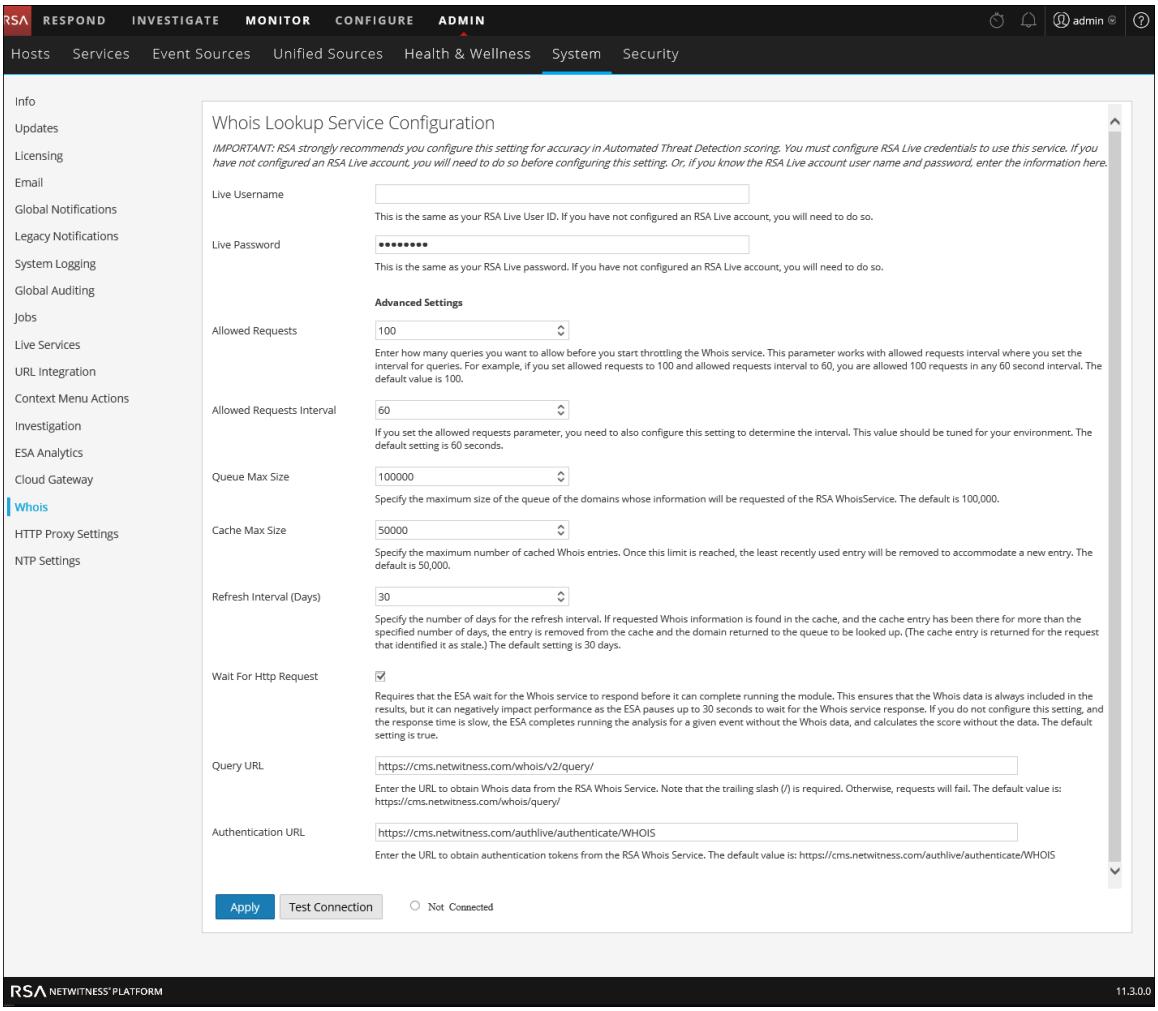
Quick Look

To access the Whois Lookup Service Configuration, go to ADMIN > System and in the options panel, select Whois.

The ESA Analytics Server service must be available (shows a green circle) in the ADMIN > Services view. If you do not have an ESA Analytics Server service available, you will see the following panel.



If you have an ESA Analytics Server service available, you will see the following panel.



The following table describes the listed Whois Lookup Service configuration settings.

Parameter	Description
Live Username	**Required only if you did not already configure the Whois Lookup service.** Enter the authentication credential for the RSA Whois Server. This is the same as your RSA Live User ID. If you have not configured an RSA Live account, you will need to do so. The default value is "whois."
Live Password	**Required only if you did already configure the Whois Lookup service.** Enter the authentication credential for the RSA Whois Server. This is the same as your RSA Live password. If you have not configured an RSA Live account, you will need to do so. The default value is null.

Parameter	Description
Allowed Requests	(Optional) Enter how many queries you want to allow before you start throttling the Whois service. This parameter works with **Allowed Requests Interval** (in seconds), where you set the interval for queries. For example, if you set **Allowed Requests** to 100 and **Allowed Requests Interval** to 60, you are allowed 100 requests in any 60 second interval. The default value is 100.
Allowed Requests Interval	(Optional) If you set the **Allowed Requests** parameter, you need to also configure this setting to determine the interval. This value should be tuned for your environment. The default setting is 60 seconds.
Queue Max Size	(Optional) Specify the maximum size of the queue of the domains whose information will be requested of the RSA WhoisService. The default is 100,000.
Cache Max Size	(Optional) Specify the maximum number of cached Whois entries. Once this limit is reached, the least recently used entry will be removed to accommodate a new entry. The default is 50,000.
Refresh Interval (Days)	(Optional) Specify the number of days for the refresh interval. If requested Whois information is found in the cache, and the cache entry has been there for more than the specified number of days, the entry is removed from the cache and the domain returned to the queue to be looked up. (The cache entry is returned for the request that identified it as stale.) The default setting is 30 days.
Wait For HTTP Request	(Optional) Requires that the ESA wait for the Whois service to respond before it can complete running the module. This ensures that the Whois data is always included in the results, but it can negatively impact performance as the ESA pauses up to 30 seconds to wait for the Whois service response. If you do not configure this setting, and the response time is slow, the ESA completes running the analysis for a given event without the Whois data, and calculates the score without the data. The default setting is true.
Query URL	(Optional) Enter the URL to obtain Whois data from the RSA Whois service. The trailing slash ('/') is required. Otherwise, requests will fail. The default value is: `https://cms.netwitness.com/whois/v2/query/`
Authentication URL	(Optional) Enter the URL to obtain authentication tokens from the RSA Whois service. The default value is: `https://cms.netwitness.com/authlive/authenticate/WHOIS`

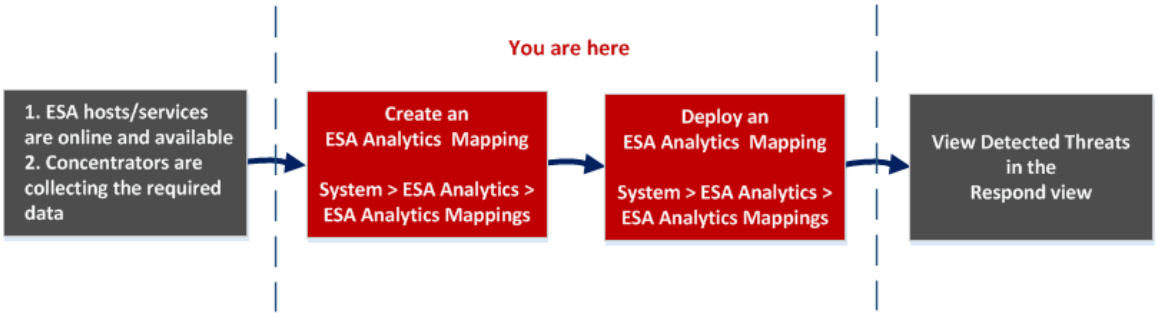
ESA Analytics Mappings

In the ESA Analytics Mappings panel (ADMIN > System > ESA Analytics), you define how the RSA Automated Threat Detection functionality should automatically detect advanced threats. You can analyze the data that resides on one or more Concentrators by selecting a preconfigured ESA Analytics module.

To better utilize your network resources and reduce unnecessary data flow, you can map multiple data sources, such as Concentrators, to available ESA Analytics services in order to process data more efficiently and take advantage of additional capacity.

Workflow

This workflow shows the process for creating and enabling an ESA Analytics mapping to start automatically detecting advanced threats.



Before you create an ESA Analytics mapping, ensure that the ESA hosts and services that you want to use for your mappings are online and available. All of the services need to be in sync with a consistent time source. Also ensure that the Concentrators are collecting the required data. When you create an ESA Analytics mapping, you select an ESA Analytics module to map, such as Suspicious Domains. Then you select the data sources, such as Concentrators, to use for that module along with an ESA Analytics service to process the data. When you are ready to start aggregating data, you deploy the mapping. Analysts can view detected threats for that module in the Respond view.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Verify that the ESA hosts and services are online and available.	ADMIN > HOSTS and ADMIN > SERVICES See *Hosts and Services Getting Started Guide*.
Administrator	Ensure that the Concentrators are collecting the required data.	See *Broker and Concentrator Configuration Guide*
Administrator	Create ESA Analytics mappings.*	Mapping ESA Data Sources to Analytics Modules
Administrator	Deploy ESA Analytics mappings.*	Mapping ESA Data Sources to Analytics Modules

Role	I want to ...	Show me how
Administrator, Analyst	View detected threats.	See *NetWitness Respond User Guide*.

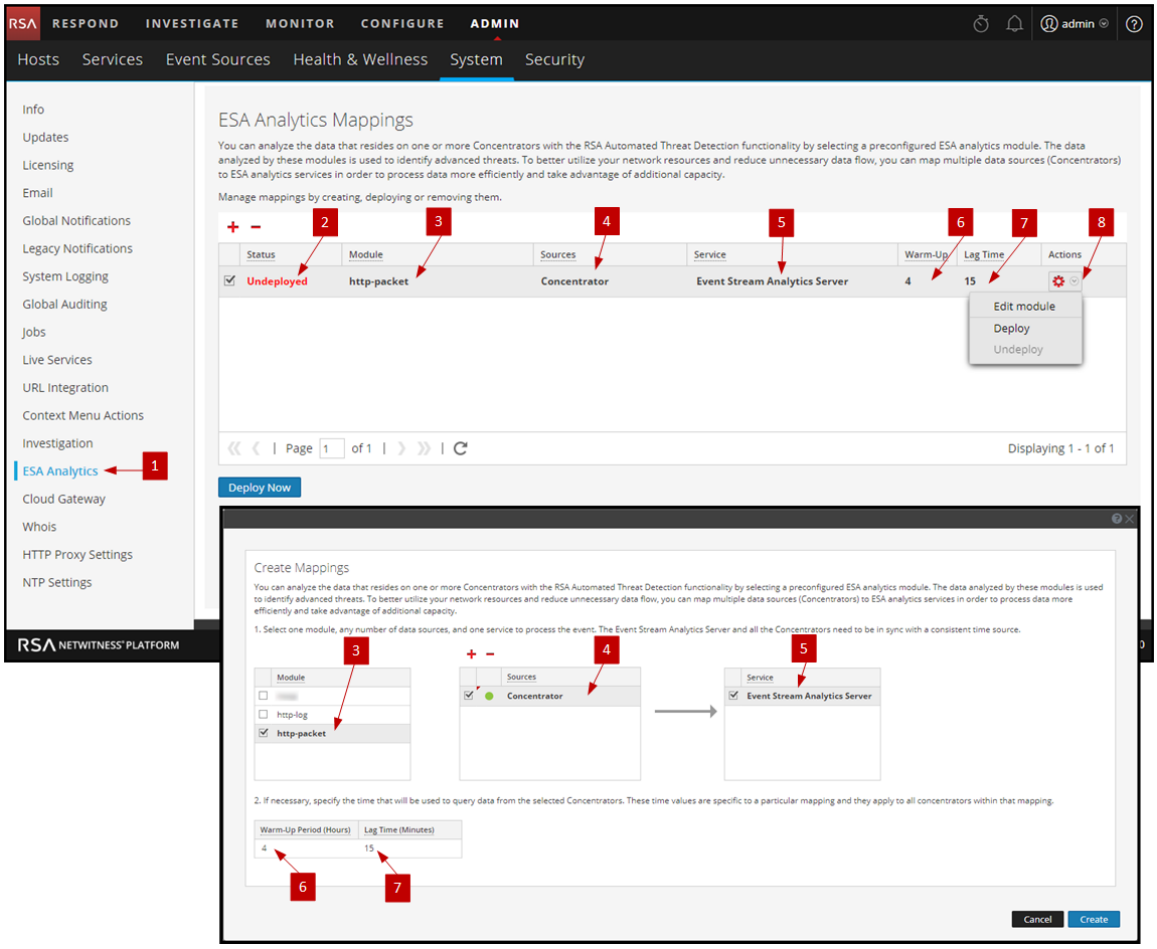
*You can complete these tasks here (that is in the ESA Analytics Mappings panel).

Related Topics

- Configure ESA Analytics
- Update a Mapping
- Undeploy a Mapping
- Delete a Mapping
- Change the Warm-up Period and Lag Time
- Module Settings

Quick Look

The following example illustrates an ESA Analytics mapping. The configuration defines the data sources for the selected module and the ESA Analytics service that will process the events from those data sources.



1. Displays the ESA Analytics Mappings panel.
2. Shows the status of the ESA Analytics mapping.
3. The name of the module that is mapped.
4. Data sources, such as Concentrators, assigned to the mapping.
5. ESA Analytics service that processes the data for the mapping.
6. Warm-up period configuration (in hours) on the data sources for the mapping.
7. Lag configuration (in minutes) on the data sources for the mapping.
8. Actions for changing module settings, deploying module mappings, and undeploying module mappings.

Toolbar

The following table describes the toolbar actions.

Icon / Button	Description
	Opens the Create Mappings dialog where you can create an ESA Analytics mapping. Create a separate mapping for each module. After creating and reviewing the mappings, you deploy them.
	Deletes an ESA Analytics Mapping. • You can delete a mapping with a status of Undeployed at any time. Since a mapping in the Undeployed state is not deployed and is not running, it does not affect data aggregation. • Deleting a deployed mapping clears the configuration on the ESA server, reverts the deployment for that mapping, and stops pulling data from the data source for that module. You should undeploy a mapping with a status of Deployed before deleting it.
Deploy Now	After you create your mappings, you need to deploy them in order to start aggregating data for the modules. You can select one or more mappings with a status of Undeployed to deploy.

Note: If you want to make changes to a deployed mapping, such as adding or removing Concentrators or changing the service, you must undeploy and delete the existing mapping and then create and deploy a new mapping for that module.

ESA Analytics Mappings

The following table describes the listed ESA Analytics mappings.

Title	Description
	To select an individual mapping, select the checkbox next to the mapping.
Status	Shows the status of the mapping. There are two statuses: **Undeployed** - An undeployed mapping maps an ESA Analytics module to sources and an ESA Analytics service. It does not start aggregating data for the module until you deploy the mapping. **Deployed** - A deployed mapping is deployed and running. In a deployed mapping, the selected ESA Analytics service uses query-based aggregation to collect the appropriate filtered events for the selected module from the Concentrators.
Module	Indicates the selected ESA Analytics module. An ESA Analytics module is a pipeline composed of activity objects that enrich an event with additional information through mathematical computations. The module resides within the ESA Analytics service.
Sources	Sources are the data sources, such as Concentrators, from which ESA will aggregate the data for the specified module.

Title	Description
Service	Indicates the ESA Analytics service that will process the data for the specified module. The selected service needs to be in sync with a consistent time source.
Warm-Up Period (Hours)	Specifies a warm-up duration (in hours). A warm-up period is required to allow Automated Threat Detection to "learn" your traffic. The warm-up period should run when typical traffic is running. During this time, alerting for your module mapping is suppressed. The Warm-up Period primes the module with historical data and guarantees that the specified number of hours of data collection completes before sending alerts. RSA provides preconfigured ESA Analytics modules. Each module type has a default warm-up period defined, which you can adjust to your environment, if necessary. After this warm-up period, alerts can be viewed. For more information about Warm-up Period and Lag time, see Module Settings.
Lag Time (Minutes)	Specifies a constant time delay in minutes, which is added to avoid losing events being processed by the data sources during periods of heavy activity. For example, Concentrator performance varies depending on factors such as incoming load, ongoing queries, and indexing. Due to these factors, a Concentrator may not aggregate events in real-time, which leads to the delay. The Lag parameter gives the Concentrator a chance to finish aggregating all of the data. After the warm-up period completes, data aggregation continues at **Current (System) Time - Lag Time**. This is useful when a Concentrator is slow in aggregating data. The Lag time guarantees that the module does not process data that arrives to the Concentrator within the Lag time window so there is adequate delay to ensure all events that get generated in the enterprise can be processed by the module. For example, if Lag time is 30 minutes, and the current time is 2:00 PM, the Concentrator starts pulling records at 1:30 PM. The Lag time window, 30 minutes in this example, remains constant as time advances. When the current time advances to 2:01 PM, the Concentrator pulls the next minute of data at 1:31 PM, and so on. **Important**: The Lag time defines the buffer between the current time and the time when the module ingests the data. **Caution:** RSA recommends that Administrators adjust the Lag parameter dynamically based on the performance of each of the individual Concentrators to avoid missing any events during aggregation. For more information about Warm-up Period and Lag time, see Module Settings.

Title	Description
	Enables you to select additional actions for the selected module mapping: • **Edit Module** - Enables you to configure the warm-up period and lag time for the selected module mapping. • **Deploy** - Deploys the selected module mapping. The specified ESA Analytics service starts pulling data from the data sources for that module. • **Undeploy** - Undeploys the selected module mapping. The specified ESA Analytics service stops pulling data from the data sources for that module. **Caution:** Undeploying a mapping with a status of Deployed will affect data aggregation for that module.

Module Settings

After you create or deploy a module mapping in the ESA Analytics Mappings panel (ADMIN > System > ESA Analytics), you have the option to change some module configurations for that mapping.

What do you want to do?

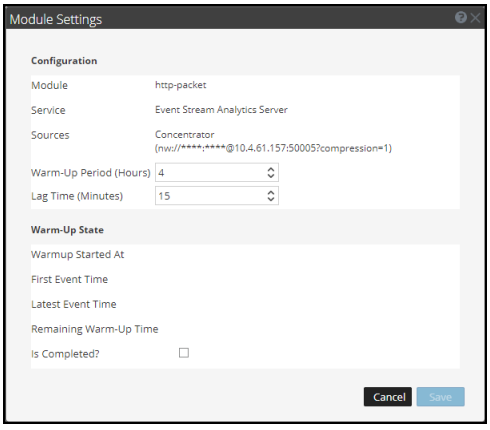
Role	I want to ...	Show me how
Administrator	Change the warm-up period for an undeployed module mapping.	Change the Warm-up Period and Lag Time
Administrator	Change the warm-up period for a module mapping during the warm-up period.	Change the Warm-up Period and Lag Time
Administrator	Change the warm-up period for a module mapping after the warm-up period is complete.	Change the Warm-up Period and Lag Time

Related Topics

- Mapping ESA Data Sources to Analytics Modules
- ESA Analytics Mappings

Quick Look

To access the module settings, in the ESA Analytics Mappings panel, select the mapping that you want to change and in the **Actions** column, select > **Edit Module**. The Module Settings dialog has a Configurations section and a Warm-Up State section.



Configurations

The Configurations section enables you to change the Warm-Up Period and Lag Time configurations.

The following table describes the settings available for an ESA Analytics module mapping.

Field	Description
Module	Shows the name of the mapped module.
Service	Shows the ESA Analytics service that processes the data for the mapping.
Sources	Shows the mapped data sources and the URLs used to communicate with ESA.
Warm-Up Period (Hours)	Specifies a warm-up duration in hours. A warm-up period is required to allow Automated Threat Detection to "learn" your traffic. The warm-up period should run when typical traffic is running. During this time, alerting for your module mapping is suppressed. The Warm-up Period primes the module with historical data and guarantees that the specified number of hours of data collection completes before sending alerts. RSA provides preconfigured ESA Analytics modules. Each module type has a default warm-up period defined, which you can adjust to your environment, if necessary. After this warm-up period, alerts can be viewed. You can update the Warm-Up Period of a deployed module mapping depending on whether or not the warm-up period is complete: • **During the warm up period** - You can add hours to the warm-up period or subtract any remaining warm-up time. • **The warm-up period is complete** - You can add hours to the warm-up period by adding the difference between the current time and the First Event Time to the hours that you want to add. For example, a warm-up period of 10 hours is complete and the First Event Time shows 12:00:00. The current (system) time is 16:00:00 (4 hours later) and you want to add 5 more hours to the warm-up time. To do this, you need to add 9 hours (4+5=9) to the warm-up period of 10, so you would set the new warm-up period to 19 hours. You cannot decrease the warm-up period if it is complete, unless you delete the mapping and create a new one. The Warm-up Period value is specific to a particular mapping and it applies to all Concentrators within that mapping after you deploy it. If a Concentrator is shared between two modules with different warm-up times, the Concentrator uses separate Warm-up Period values for each module mapping.

Field	Description
Lag Time (Minutes)	Specifies a constant time delay in minutes, which is added to avoid losing events being processed by the data sources during periods of heavy activity. For example, Concentrator performance varies depending on factors such as incoming load, ongoing queries, and indexing. Due to these factors, a Concentrator may not aggregate events in real-time, which leads to the delay. The Lag parameter gives the Concentrator a chance to finish aggregating all of the data. When you specify a Lag time, the first time the module deploys, data aggregation starts at **Current (System) Time - Lag Time - Warm-Up Time**. For example, if the current time is 2:00 PM, Lag time is 30 minutes, and Warm-up time is 4 hours, when the module deploys for the first time, data collection starts at 9:30 AM (2:00 PM - .5 hour - 4 hours). After the warm-up period completes, data aggregation continues at **Current (System) Time - Lag Time**. This is useful when a Concentrator is slow in aggregating data. The Lag time guarantees that the module does not process data that arrives to the Concentrator within the Lag time window so there is adequate delay to ensure all events that get generated in the enterprise can be processed by the module. For example, if Lag time is 30 minutes, and the current time is 2:00 PM, the Concentrator starts pulling records at 1:30 PM. The Lag time window, 30 minutes in this example, remains constant as time advances. When the current time advances to 2:01 PM, the Concentrator pulls the next minute of data at 1:31 PM, and so on. **Important**: The Lag time defines the buffer between the current time and the time when the module ingests the data. The Lag time value is specific to a particular mapping and it applies to all Concentrators within that mapping after you deploy it. If a Concentrator is shared between two modules with different Lag times, the Concentrator uses separate Lag values for each module mapping. **Caution:** RSA recommends that Administrators adjust the Lag parameter dynamically based on the performance of each of the individual Concentrators to avoid missing any events during aggregation. To determine the correct Lag Time, add together the following to get an environmental lag time: 1. **Log or Packet Latency** - This is the time it takes for the Log Decoder to receive the logs or the (Packet) Decoder to receive packets. For example, the Log Decoder may get logs every 20 minutes. In this case, you would want to set Lag time to at least 20 minutes, preferably 25 minutes, so that you do not miss events. 2. **Aggregation Latency** - This is the time it takes to get the data from the Log Decoder to the Concentrator. 3. **Other Buffer** - Add in any additional time delay specific to your environment.

Warm-Up State

The Warm-Up State section provides information about the warm-up state, which you can use to determine the appropriate adjustments to the warm-up period.

Field	Description
Warmup Started At	The time when the first event was processed by the ESA Analytics module from the data source.
First Event Time	The time that the first event occurred. The warm-up time is based on this time.
Latest Event Time	The time that the latest event occurred.
Remaining Warm-Up Time	The number of hours remaining in the warm-up period.
Is Completed?	Indicates whether the warm-up period is complete. If it is true, the warm-up period is complete. If it is false, the module is still warming up and you can view the number of hours remaining in the Remaining Warm Up Time field.

Live Services Management

RSA NetWitness Platform Live is the gateway to a rich environment that offers access to feeds, tools, and other resources.

NetWitness Platform Live

Live is the component of NetWitness Platform that manages communication and synchronization between NetWitness Platform services and a library of Live content available to RSA NetWitness Platform customers. Live provides a simple interface for browsing, selecting, and deploying content from the NetWitness Platform Live Content Management System to NetWitness Platform services and software. In addition to managing feeds from the CMS Library, Live allows users to deploy custom feeds and packages.

The CMS Library

The content management system (CMS) library (known as *Live*) is a valuable source of the latest internet security resources for NetWitness Platform customers. It provides a view into the collective intelligence and analytical skills of the worldwide security community to ensure that users have the most current visibility into attack vectors.

Live gathers the best advanced threat intelligence and content in the global security community - the ideas, research, ongoing tracking, and analysis - and brings it directly into the user's security operations center to definitively classify computers associated with botnets, malware, and other malicious exploits. Live aggregates, consolidates, and illuminates only the most pertinent information relevant to an organization on a real-time basis.

NetWitness Platform Feedback and Data Sharing

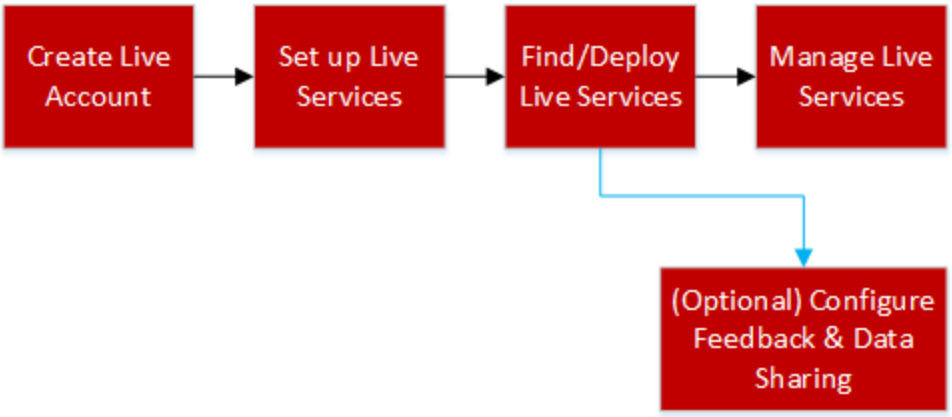
Live Feedback is intended to help improve RSA NetWitness Platform. Once you set up and configure a Live account, usage data is shared with RSA.

RSA Live Connect is a cloud based threat intelligence service. This service collects, analyzes, and assesses threat intelligence data such as IP addresses, domains, and files collected from various sources. It is **Threat Insights**, which provide analysts the ability to pull threat intelligence data from the Live Connect service. It also offers **Analyst Behaviors**, an automated data collection service with the goal of sharing potential threat intelligence for analysis.

For more details, see NetWitness Platform Feedback and Data Sharing.

Live Services Required Procedures

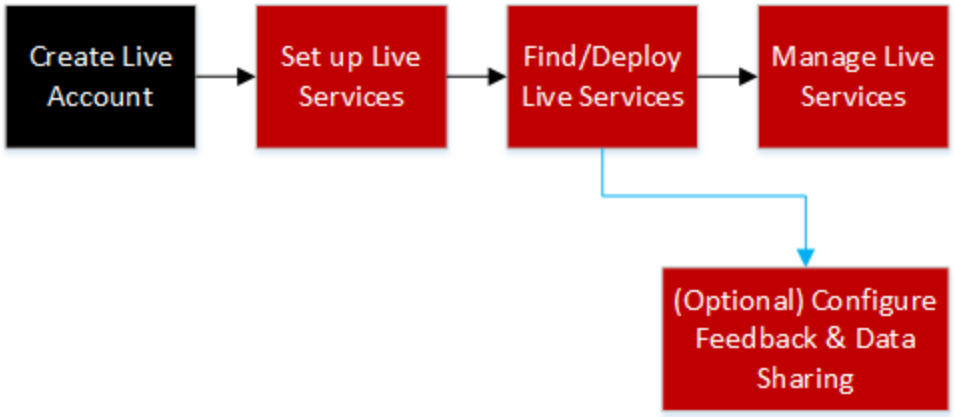
The following workflow describes the basic setup into four steps, which you perform individually.



Configuration Step	Description
Create Live Account	Create a Live Account on the RSA Live Registration portal URL: https://cms.netwitness.com/registration/. If you have an existing account, you can manage your account using this portal.
Set Up Live Services on NetWitness Platform	Set Up Live Services on NetWitness Platform by configuring a connection with the CMS server.
Find and Deploy Live Resources	Search and browse for resources in the Live Search view, and then, deploy the selected resources.
Manage Live Resources	Procedures for administrators to search for, subscribe to, and deploy resources from Live.
NetWitness Platform Feedback and Data Sharing	Describes the feedback and data sharing features provided in RSA NetWitness® Platform, from Live Services. Participation is optional, but can help to provide useful threat intelligence for the community.

Create Live Account

You must create a Live account using the RSA Live Registration Portal (https://cms.netwitness.com/registration/) on the CMS server, and select a subscription level. The CMS Library provides access to all RSA content in one place where you can view, search, deploy, and subscribe to RSA content.



Make sure the following are available to set up a RSA Live account:

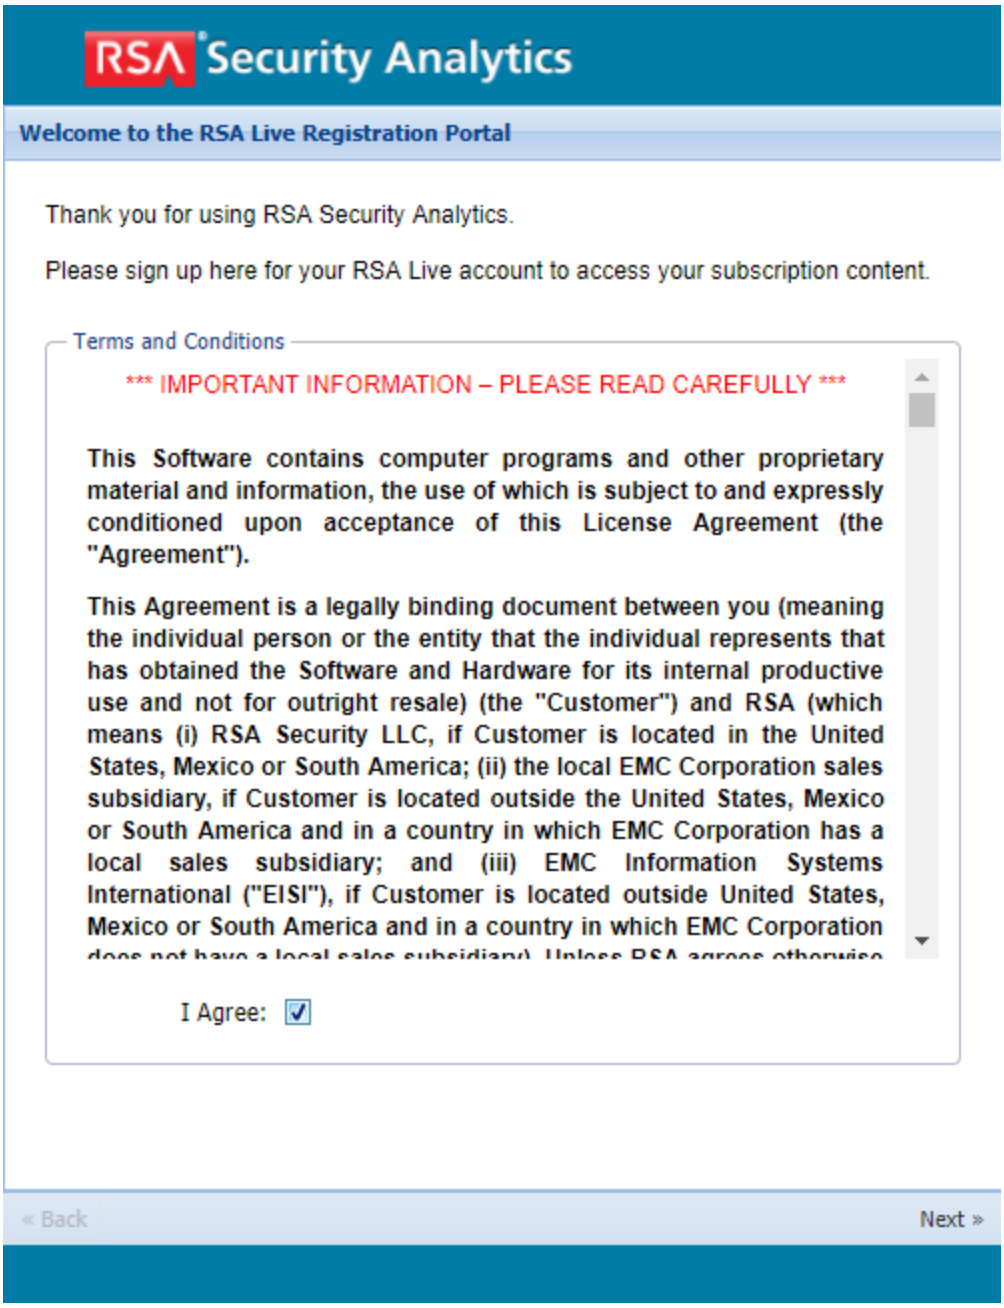
- Active internet connection to access the portal.
- A valid and registered NetWitness Platform License Server on the Flexera Server, before you can register for a Live account. You can view the License ID on the **ADMIN > System > Info** panel.

Note: If the License Server is not set up, contact RSA customer support.

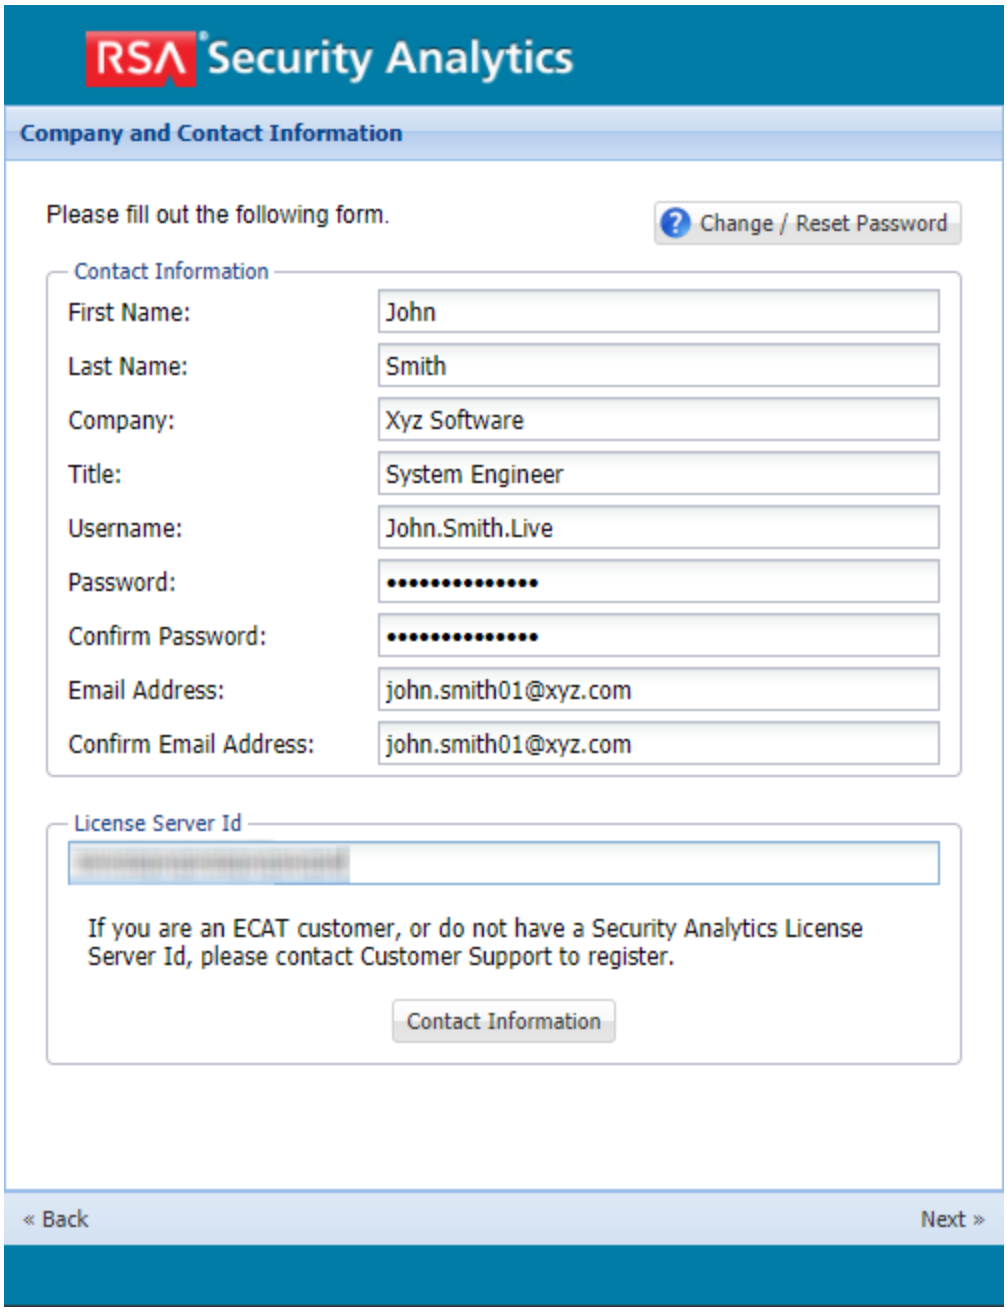
To create a Live Account:

1. Access the RSA Live Registration Portal using the URL: https://cms.netwitness.com/registration/.

   The Welcome page is displayed.
2. Read the Terms and Conditions carefully and select the **I Agree** check box:



3. Click **Next**.
4. In the **Contact Information** section, enter all the fields:
   - The **username** must contain a minimum of nine characters and a maximum of 60 characters.
   - The **password** must contain a minimum of nine characters and a maximum of 60 characters, with at least one uppercase, one lowercase, one number, and one special character.
   - The **email address** you enter is used to send notifications related to your Live account.



5. In the **Subscription Level** section, select one of the following subscription levels:
   - **Basic** - This provides access to the Live content that is tagged for groups such as Basic, Panorama for Log Decoder, and Spectrum for Malware Analysis.
   - **Enhanced** - This provides access to the Live content that is tagged for groups such as Enhanced, Basic, Panorama for Log Decoder, and Spectrum for Malware Analysis.
   - **Premium** - This provides access to the Live content that is tagged for groups such as Premium, Verisign Premium, Enhanced, Basic, Panorama for Log Decoder, and Spectrum for Malware Analysis.
6. In the **Confirm Subscription Level** section, select the subscription level once again to confirm.

7. Enter the **License Server Id**. You can view the License Id on the **ADMIN > SYSTEM > Info** page.

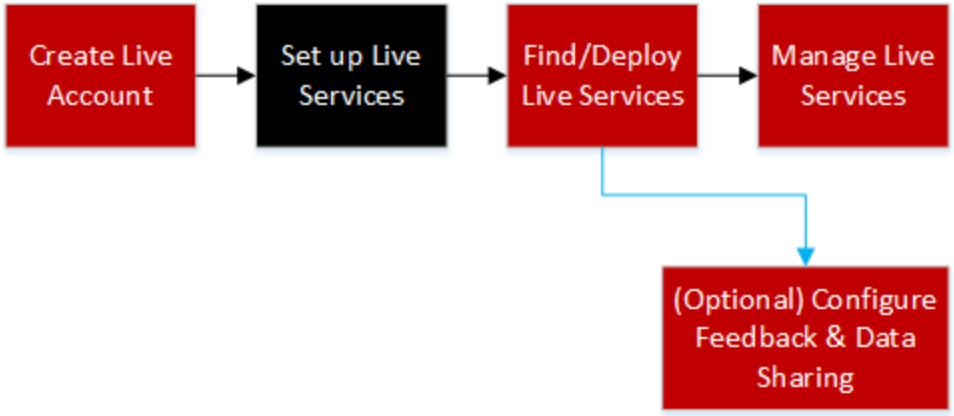
   Caution: Make sure that the license server ID on NetWitness Platform is valid and it is registered on the Flexera Server. If not, contact RSA Customer Support.

8. Click **Next**.

If the registration is successful you will receive RSA Live Account Confirmation email with your username. You now have access to the content subscribed.

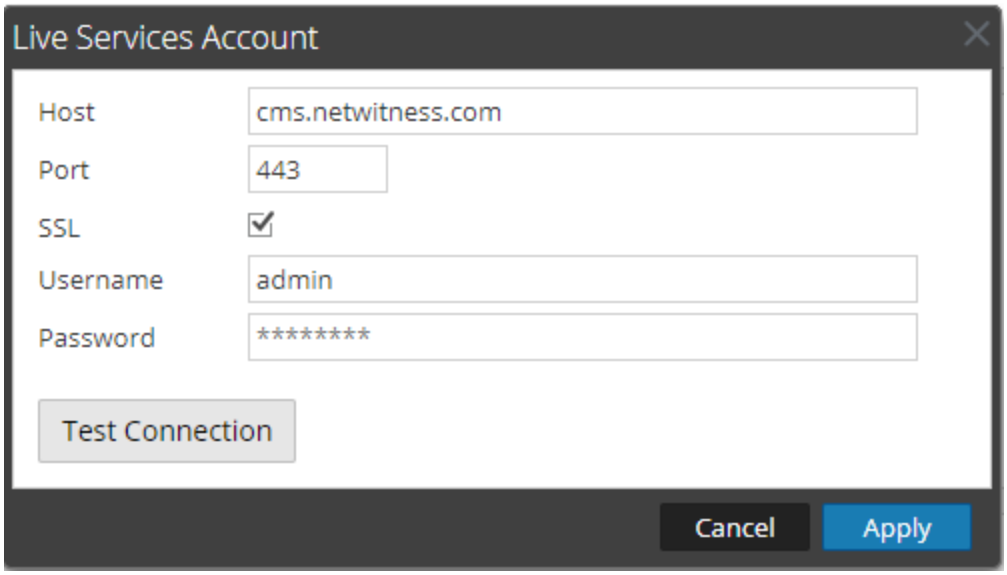
Set Up Live Services on NetWitness Platform

To set up Live on NetWitness Platform, you configure the connection and synchronization between the CMS server and NetWitness Platform. The user interface for this setup is the **ADMIN > System > Live Services** Configuration panel.



To configure the connection to the CMS Server:

1. Navigate to **ADMIN > System > Live Services**.
2. Click Sign In and enter your credentials in the Live Services Account dialog box.

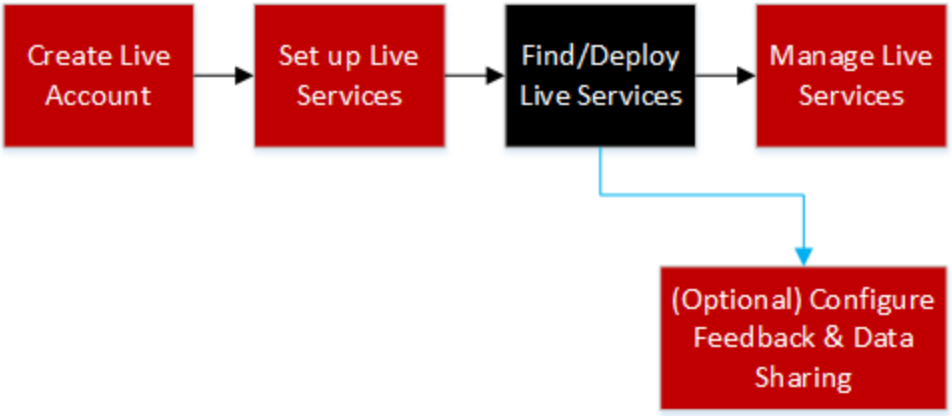


3. Click Test Connection to make sure your connection is working.
4. If the test is successful, click **Apply**. If not, contact RSA Customer Support for help connecting to the Live server.
5. Configure the timing for synchronization of NetWitness Platform with updates from Live.

For more details, see the "Configure Live Services Settings" topic in the *System Configuration Guide*.

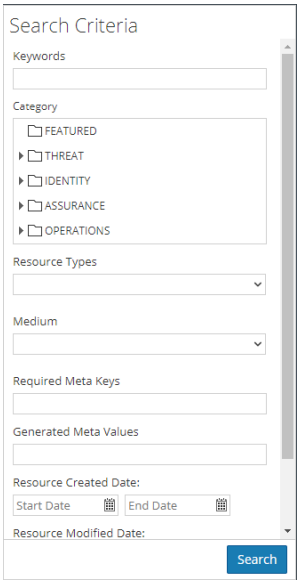
Find and Deploy Live Resources

Administrators can search for resources in the Live Search view, which is also the same as browsing the Live CMS for resources using the Search Criteria panel of the Live Search View.



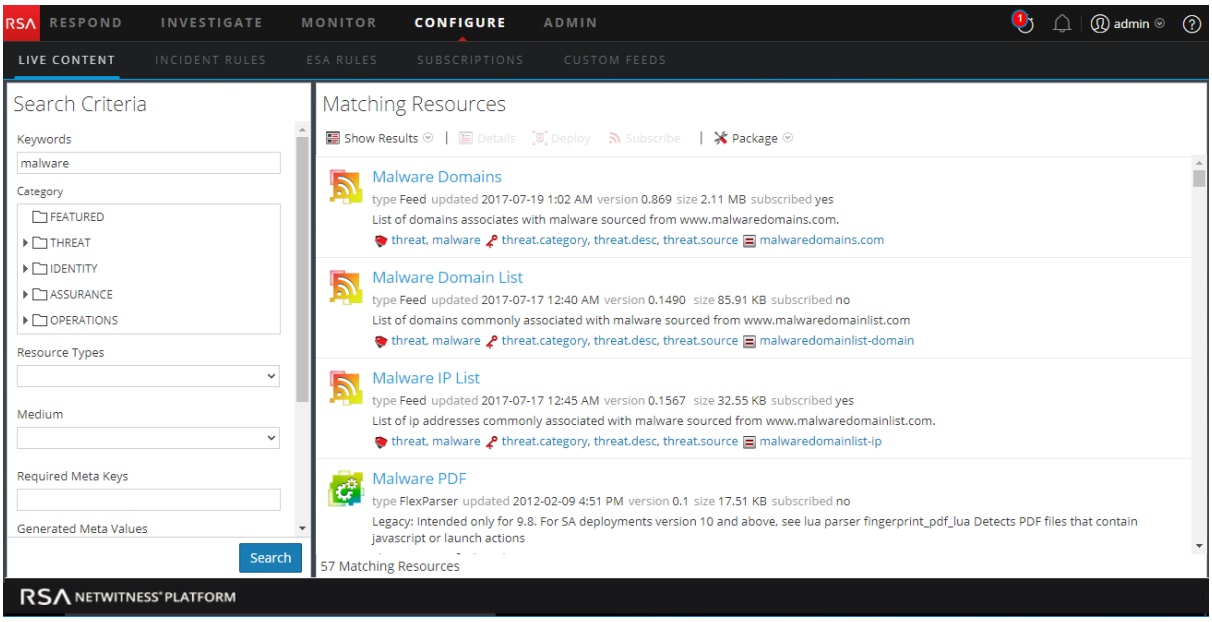
To find resources:

1. In the **Search Criteria** panel, specify search criteria. Enter any or all of these: keyword, category, type of resource, medium, meta keys, meta values, date resource was created, and date resource was modified.



2. Click **Search**.

   The Matching Resources panel displays detailed results.



3. (Optional) To further narrow the results In the Matching Resources panel, click on a tag, meta key, medium or resource meta value in a result.

Deploy Resources in Live

In RSA NetWitness Platform, you can deploy selected resources manually, using the Deployment Wizard, or you can subscribe to a group of resources.

- When you have results from browsing resources in NetWitness Platform Live, you can deploy resources manually to a service or a service group without subscribing to the resources. To deploy resources, select one or more from the list.
- Deploying resources manually deploys to services without taking advantage of the powerful resource management capabilities of NetWitness Platform. If you want to receive notification and updates for updated resources and be able to easily remove resources from a service, you must subscribe to resources in the Live Search view and deploy them in the Live Configure View.
- If you have previously created and saved a resource package, you can deploy the package to services. Please refer to Resource Package Deployment Wizard for instructions on how to create a package.

Caution: For NetWitness Platform 11.3, there is a new Content bundle for Endpoint, which contains approximately 400 application rules. Do not deploy this bundle (or the Endpoint application rules) onto any Log Decoder that is running an earlier version of NetWitness Platform. The rules are only useful for 11.3 and newer, and would have major performance implications if deployed on Log Decoders that cannot process them.

To deploy resources manually:

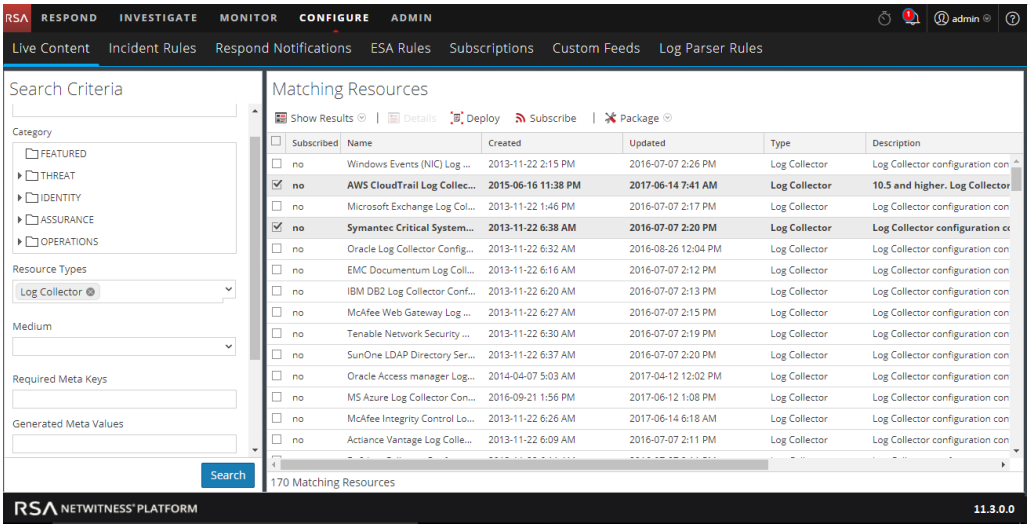
1. Go to **CONFIGURE > Live Content**.
2. Select a group of resources, or a previously created resource package.

To select a resource or group of resources:

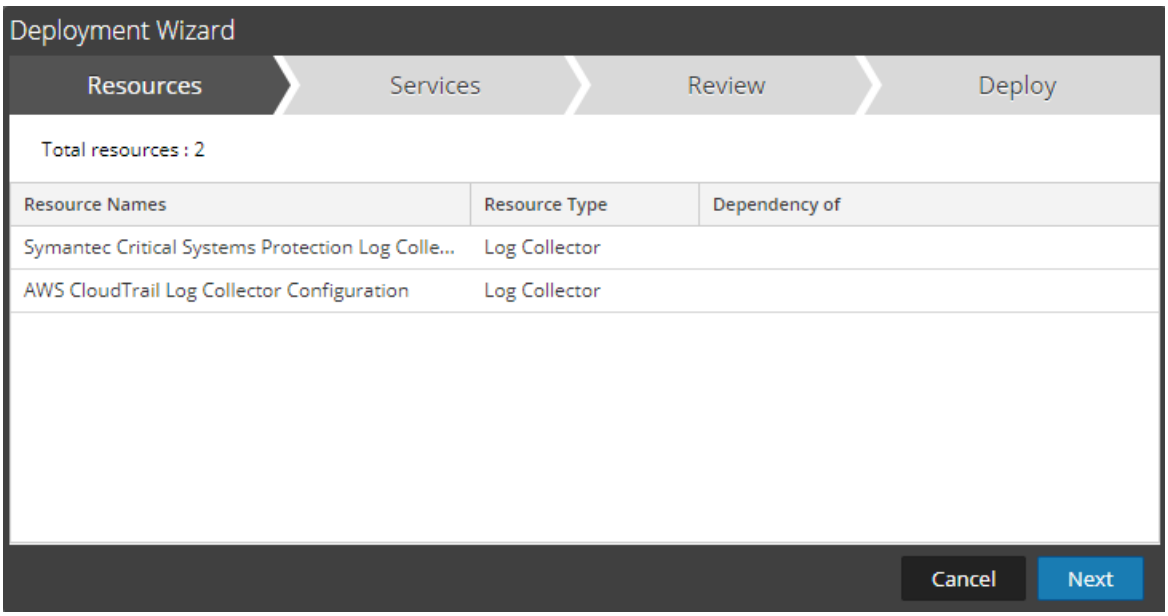
a. In the **Live Search View,** browse Live resources (for example, search for the **Log Collector** resource Type).

b. In the **Matching Resources** panel, select **Show Results > Grid**.

c. Select the checkbox to the left of the resources that you want to deploy.



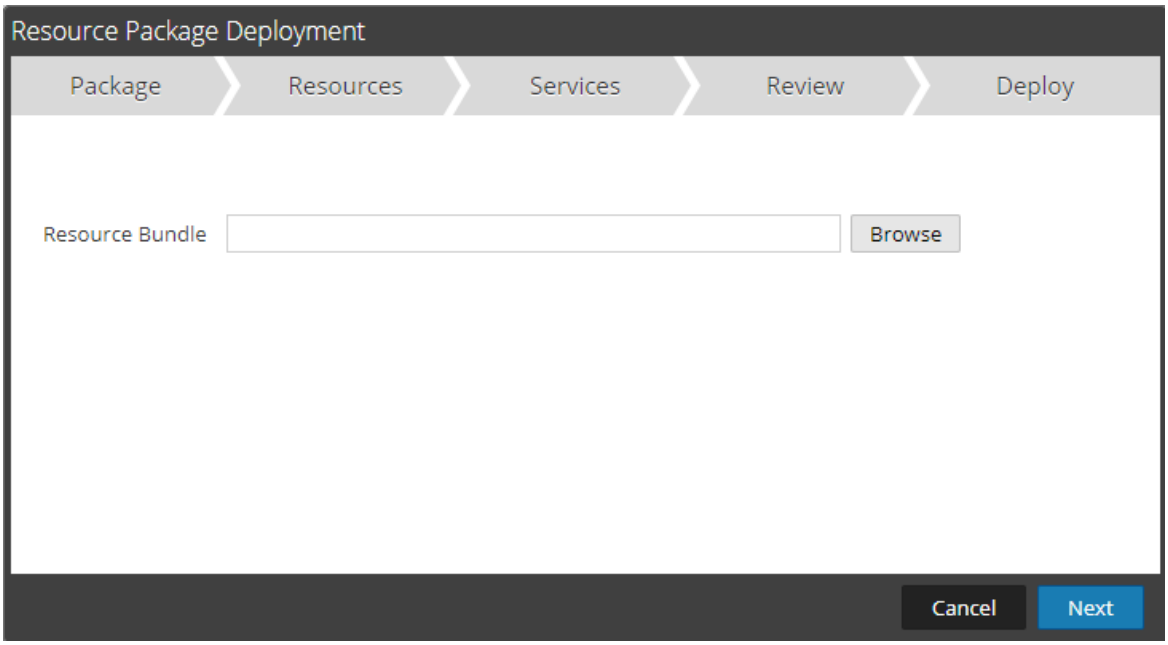
d. In the Matching Resources toolbar, click Deploy.



3. To select a resource package to deploy:

a. In the **Live Search** view **- Matching Resources** toolbar, select **Package** > **Deploy** .

The Package page of the Resource Package Deployment wizard is displayed.



b. Click Browse and select a package from your network (for example **resourceBundle-FeedsParsersContent.zip**).

c. Click **Open**.

At this point, whether you are deploying a package or a group of resources, the **Deployment Wizard** opens, and the **Resources** page is displayed.

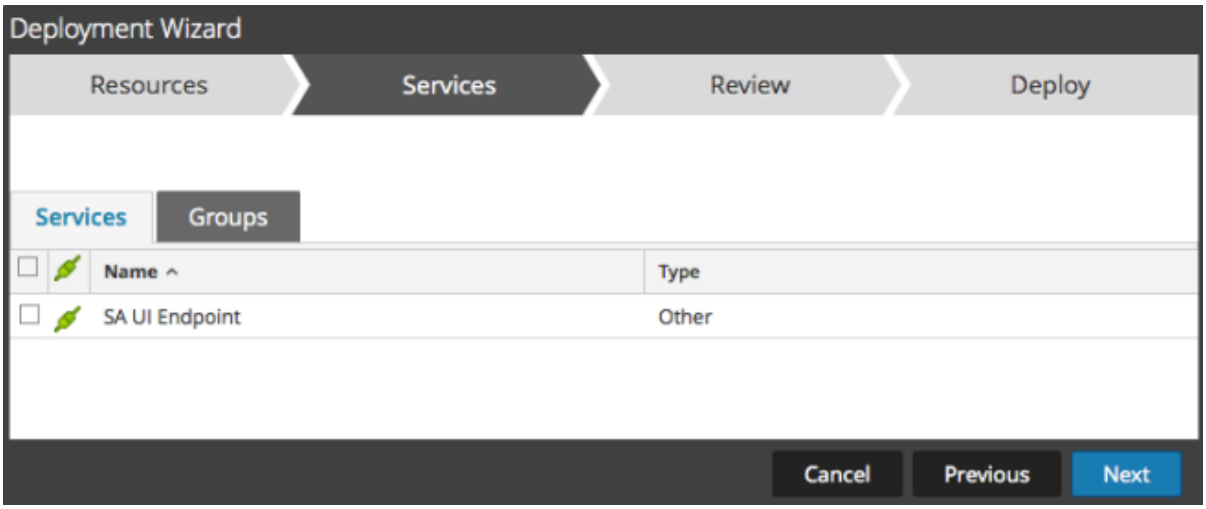
4. Click **Next**.

The **Services** page displayed has two tabs, **Services** and **Groups**, which provide a list of services and service groups that are configured in the **ADMIN > Services** view. The columns are a subset of the columns available in the Services view.

Note: The Live server is "smart" about deploying resources to Services. For example, it does not deploy resources that have a Medium of packets to any Log Decoders. This means that only applicable content resources are deployed to each Service.

5. Select the services on which you want to deploy the content. You can select any combination of services and service groups.

- Use the **Services** tab to select individual services, list of services, and service groups that are configured in the **ADMIN** > **Services** view.
- Use the **Groups** tab to select groups of services.



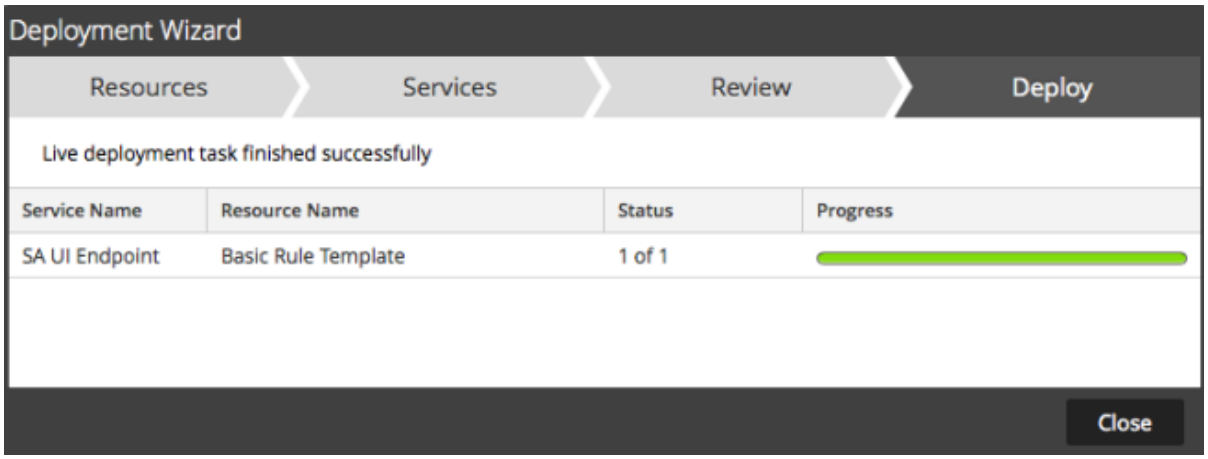
6. Click **Next**.

   The **Review** page is displayed.

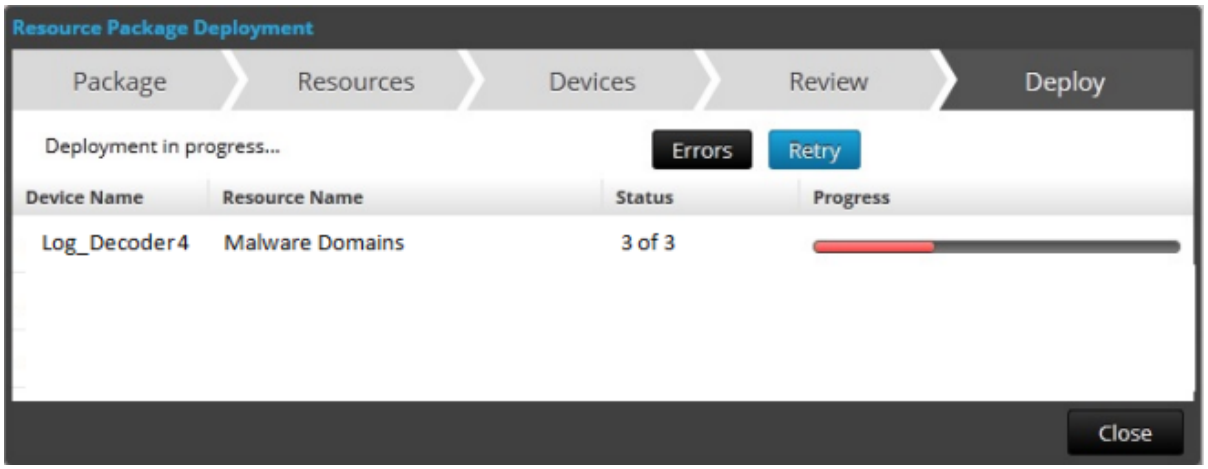
   Make sure that you have selected correct resources and the services on which you want to deploy them.

7. Click **Deploy**.

   The **Deploy** page is displayed. The Progress bar turns green when you have successfully deployed the resources to the selected services.



If you try to deploy resources and services that are not compatible, NetWitness Platform displays the Errors and Retry buttons, which you can click to review the errors and re-attempt the deployment.



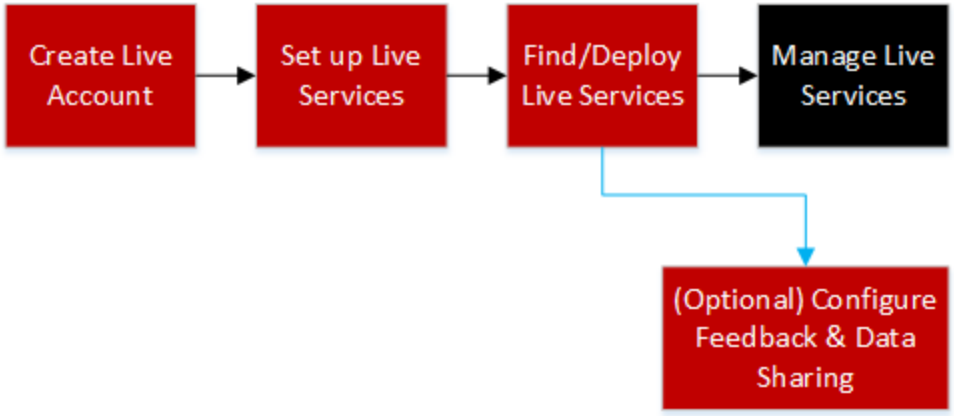
8. Click **Close**.

Next steps

After deploying parsers to Decoders and Log Decoders, you must enable parsers on the individual services. For more information, see the *Decoder and Log Decoder Configuration Guide*.

Manage Live Resources

With a connection to the CMS server, you can search for, subscribe to, and deploy resources from Live in accordance with your subscription level. Once you have found resources, you deploy them to services and service groups that have been configured in the **ADMIN** > **Services** view.



Procedures

There are several workflows for deploying resources to services and managing those deployments. These include:

- Subscribe and deploy resources
- Deploy a resource bundle
- Remove deployments of resources
- Download resources
- Set up data feeds

Manage Subscription and Deployment

The subscription and deployment workflow takes advantage of the resource management tools available in Live. By subscribing to resources, you agree to receive updated resources in accordance with the synchronization configured in the **ADMIN > Live Configuration** panel.

By adding subscribed resources to the deployments list, you configure NetWitness Platform to automatically push those resources to the selected services at the configured synchronization intervals. This method requires some planning of service groups and services where resources are deployed. In addition:

- You can remove a resource from the deployments list in the Deployments Tab.
- You can unsubscribe from a resource in the Subscriptions Tab and the Live Resource View.

To manage subscriptions and deployment:

1. In the **ADMIN > System > Live Services** panel, specify an interval at which NetWitness Platform checks for updates to subscribed resources in Live and specify the email addresses of people to

receive an email listing subscribed resources that have been updated.

2. In the **CONFIGURE > Live Content** search view, search for and subscribe to Live resources.
3. In the **CONFIGURE > Subscriptions > Deployments** tab, select subscribed resources and add them to the deployment list for services groups.
4. (Optional) In the **CONFIGURE > Subscriptions > Deployments** tab, click to deploy the resources listed in the Deployments tab immediately.
5. In the **CONFIGURE > Subscriptions > Deployments** tab, select deployed resources from a Group, and remove them from services.
6. In the **CONFIGURE > Subscriptions** tab, unsubscribe from resources.

Remove a Deployed Resource

Once deployed to a service, Live resources remain on the service until removed. It is a good practice to remove unused resources from services on which they are deployed.

To remove deployed resources:

1. Go to the Live Resource View,
2. Unsubscribe from a resource, and remove it from deployed services.

Deploy a Resource Bundle

To deploy a content package, use the Resource Package Deployment Wizard. You can deploy a content package created in Live to one or more services. NetWitness Platform accepts packages in **.nwp** files or **.zip** files.

Download Resources

To download resources to your local file system, use the **Download** button in the Live Resource view.

Set Up Data Feeds

In the **Live** > **Feeds** view, you can set up and maintain Custom and Identify feeds.

Additional Procedures

This topic explains the additional procedures an administrator could choose to follow which are not essential for the configuration or use of Live Services.

- Export Data to RSA
- Packaging Resources
- Manage Custom Feeds
  - Creating a Custom Feed
  - Create a STIX Custom Feed
  - Creating and Managing an Identity Feed
  - Editing a Feed
  - Removing a Feed
- Miscellaneous Live Services Procedures

Export Data to RSA

A NetWitness Platform administrator can export the metrics in NetWitness Platform for Live Feedback.

About Live Feedback

In the Live Services Configuration panel, there is a Live Feedback Activity Log which enables you to download the usage data required for Live Feedback. This is active regardless of the Live Account configuration.

If the Live Account is not configured, you can manually upload the usage data to RSA. For more information, see the "Configure Live Services Panel" topic in the *System Configuration Guide*.

You must first download the Live Feedback historical data, and then upload it to share with RSA.

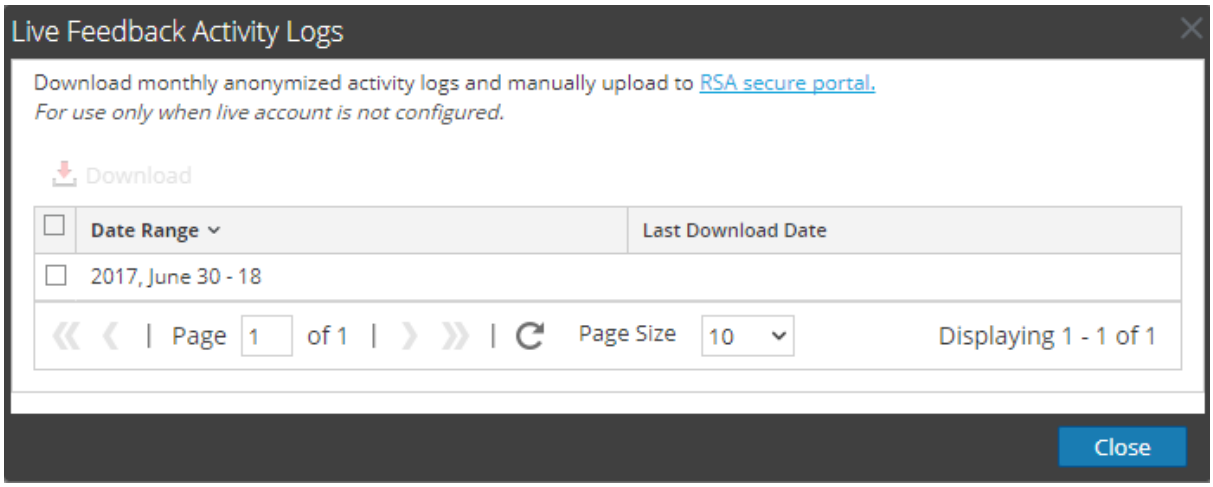
Download Live Feedback Historical Data

To download the Live Feedback historical data:

1. Go to **ADMIN** > **System**.
2. In the options panel, select **Live Services**.

   The **Live Account** screen is displayed which consists of the **RSA Live Status** and Download **Live Feedback Activity Log**.
3. Click **Download Live Feedback Activity Log**.

   The **Download Live Feedback Activity Log** window opens which allows you to download the required Live Feedback historical data.



4. Select one or multiple entries by selecting the checkboxes and click **Download**.

   Note: If you select multiple entries in the history table, the Live Feedback data is downloaded into a ZIP archive, consisting of individual JSON files for each month.

Share Data to RSA

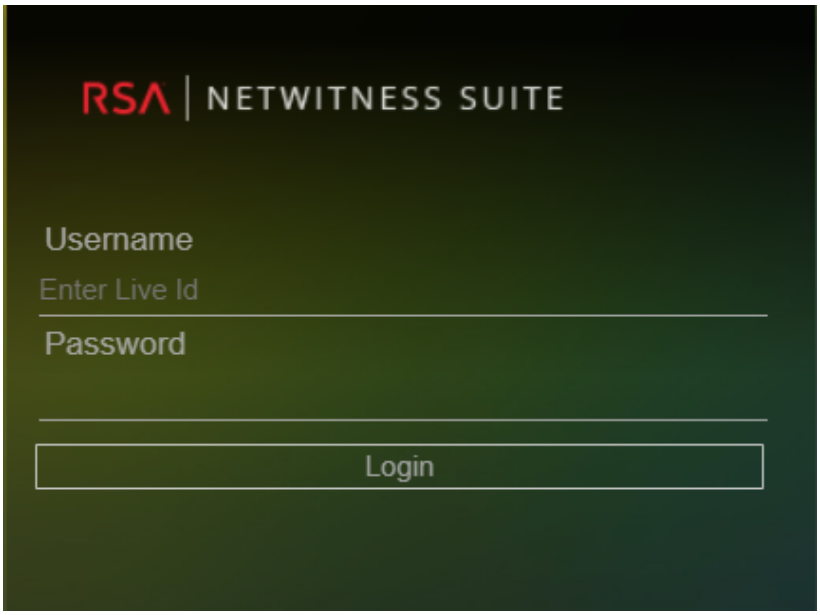
After you download the Live Feedback data, you can then upload it using the following procedure.

To share the data to RSA:

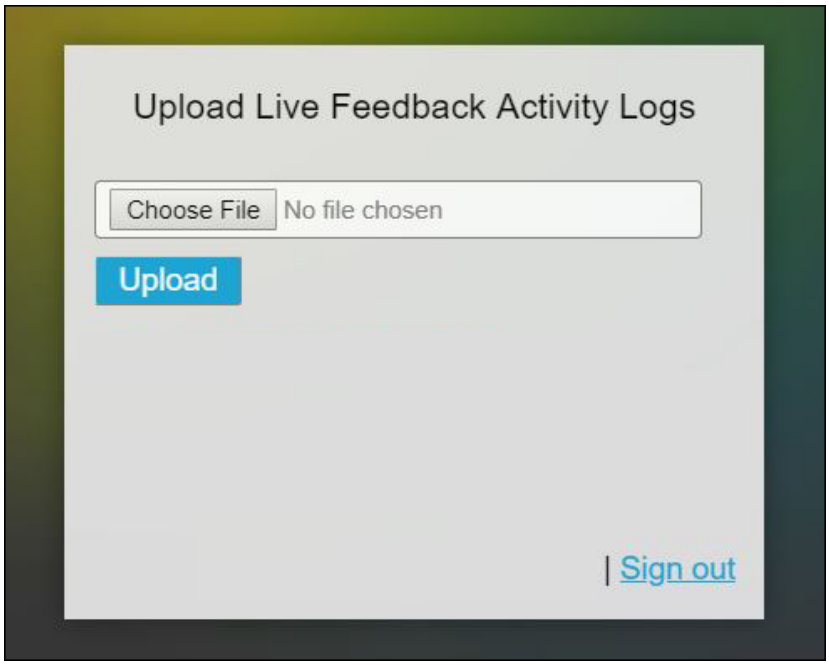
1. Click on the **RSA Secure Portal** available on the **Live Feedback Activity Logs** window.

   The RSA NetWitness Platform Live Feedback log on screen is displayed.

2. Log on to the Upload Live Feedback Activity Logs portal using your Live credentials, and choose **RSA NetWitness** as your application.



3. Click **Download Live Feedback Activity Log**.



4. Click **Upload**.

Packaging Resources

The primary use for creating and subsequently deploying a resource package is for customers using an air gap network environment. In this case, you create a resource package on the network that is connected to the internet, and then deploy the resource package on a more secure network.

Create and Deploy Resource Package Use Case

The basic steps are as follows:

1. Access NetWitness Platform Live Services using an instance that is connected to the internet.
2. Create a Resource package as described below, adding whichever content items you need.
3. Copy the ZIP archive of the packages to your secure NetWitness Platform instance, by using a thumb drive or other manual copying process.
4. On the secure NetWitness Platform instance, deploy the resource package. For more information, see Resource Package Deployment Wizard.

Prerequisites to Create a Resource Package

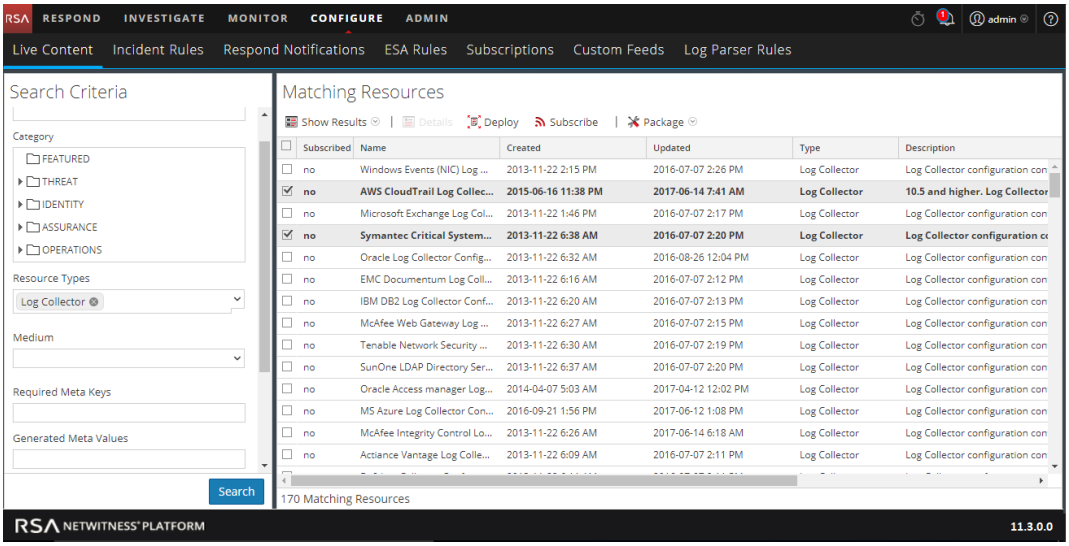
A prerequisite for creating resource packages is configuration of the connection and synchronization between the CMS server and NetWitness Platform and the ability to search for resources in the User Interface.

Creating a Resource Package

The following procedure describes how to create a resource package, as a ZIP archive and save it to your local file system.

To create a resource package:

1. Go to **CONFIGURE** > **Live Content** from the RSA NetWitness UI.
2. Select the resources that you want to package in the Matching Resources grid.



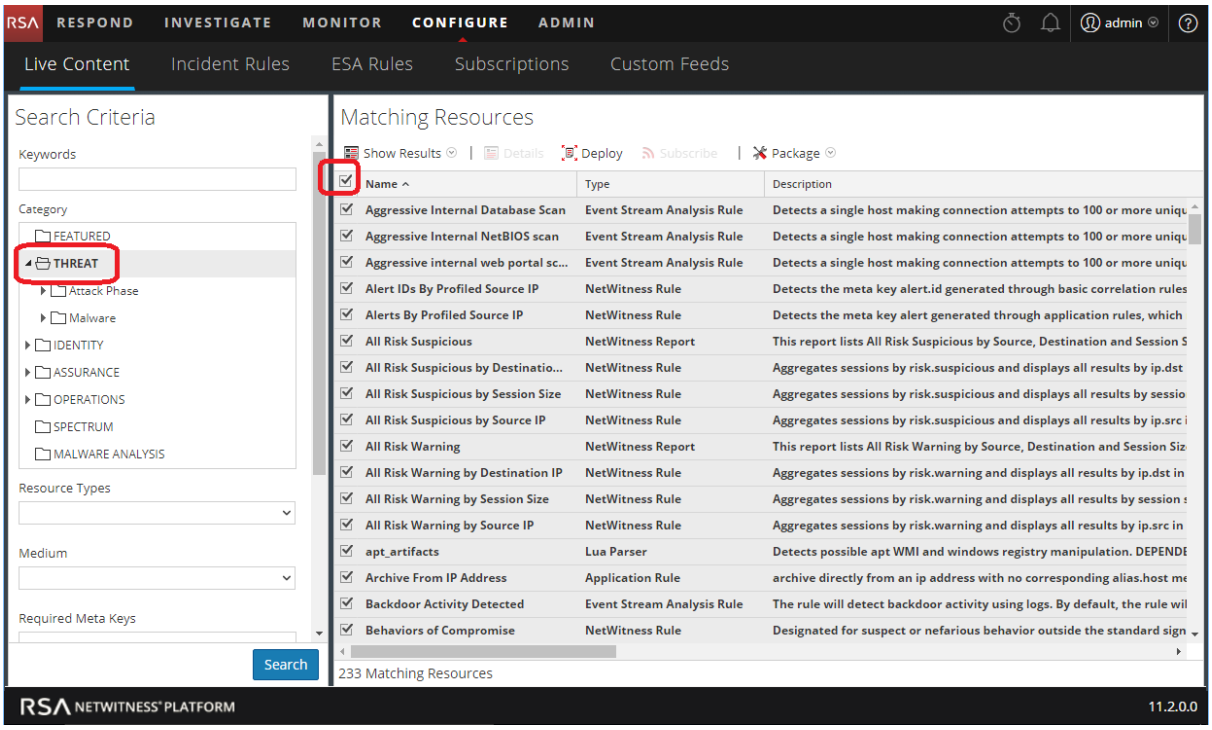
3. Select some or all the resources that are listed in the Matches Resources pane.
4. Select Package > **Create**.

NetWitness Platform creates a **.zip** archive that contains the selected resources and downloads it to your default download folder. NetWitness Platform gives the package a generic name. You should rename it when you save it so that it identifies the resources contained in the package.

Creating Threat Package

The following procedure describes how to create a resource package that contains all the content that is categorized as **Threat**. Then we rename it, using the type of content and date.

1. Go to **CONFIGURE > Live Content**.
2. From the **Category** section, select **THREAT**.
3. Select all items returned by clicking on the checkbox in the column header row of the **Matching Resources** pane.



4. Select Package > **Create**.

   A ZIP archive is saved to your Downloads folder. For example, **resourceBundle8740753704980701969.zip**.

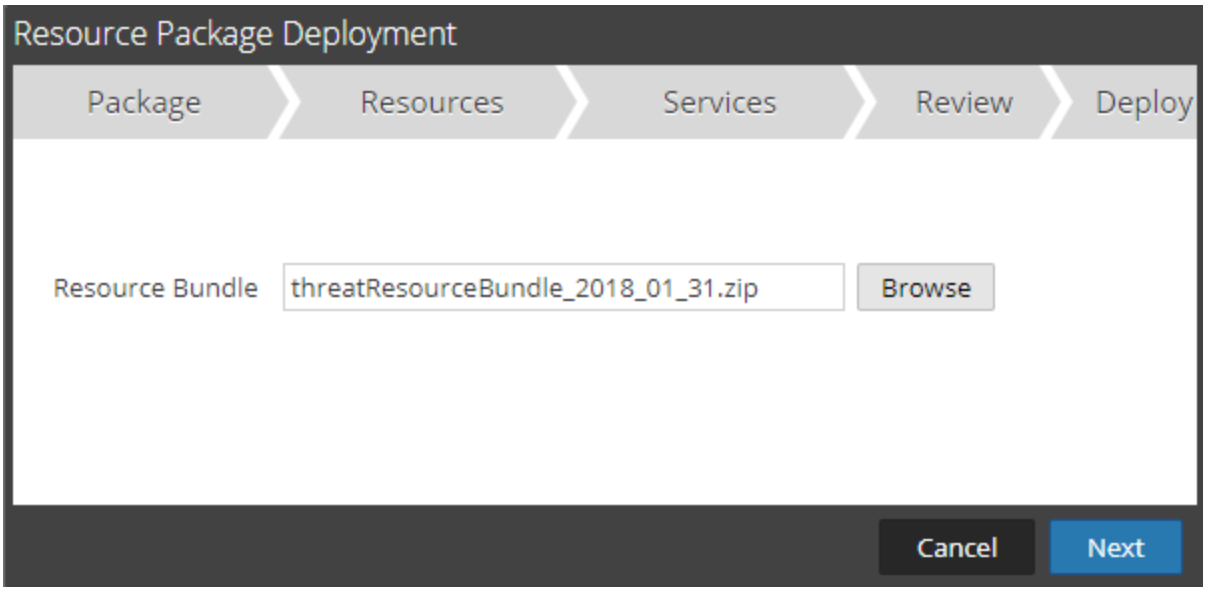
5. Rename the package to something meaningful. For example, in this case, you cold change the package name to **threatResourceBundle_2018_01_31.zip** (assuming today's date is January 31, 2018).

The resource package is now available for later deployment.

Deploying a Threat Package

This procedure assumes that you saved a package named **threatResourceBundle_2018_01_31.zip**, as described in the previous section. It describes how to deploy a saved resource package

1. Go to **CONFIGURE > Live Content**.
2. In the **Matching Resources** pane, select Package > **Deploy**.
3. Click **Browse** and navigate to the **threatResourceBundle_2018_01_31.zip** file that were created earlier.



4. Click **Next**.

   The **Resources** page displays details for the resources in the package.

5. Click **Next**.

   The **Services** page displays two tabs, **Services** and **Groups**, which provide a list of services and service groups that are configured in the **ADMIN > Services** view. The columns are a subset of the columns available in the Services view.

6. Select the services on which you want to deploy the content. You can select any combination of services and service groups.

   Click **Next**.

   The **Review** page is displayed.

   Note: Make sure that you have selected correct resources and the services to which you want to deploy them.

7. Click **Deploy** to complete the deployment process. Alternatively, you can choose **Cancel** or

Previous to either cancel the deployment or go back to the previous screen.

Manage Custom Feeds

The custom feed capability is implemented using the Custom Feed Wizard in RSA NetWitness Platform, allowing you to quickly populate Decoders with custom and identity feeds.

Custom Feed Creation

You can use the **Live** > **Feeds** > **Setup Feed** > **Configure a Custom Feed** wizard to create and deploy Decoder feeds based on deterministic logic that offers the meta keys specific to the selected Decoders and Log Decoders. Although the wizard guides you through the process to create both on-demand and recurring feeds, you should understand the form and content of a feed file when you create a feed.

Feed file names in RSA NetWitness Platform are in the form `<filename>.feed`. To create a feed, NetWitness Platform requires a feed **data** file in `.csv` or `.xml` (for STIX) format and a feed **definition** file in `.xml` format, which describes the structure of a feed data file. The Configure a Custom Feed wizard can create the feed definition file based on a feed data file, or based on a feed data file and the corresponding feed definition file.

The files that you use to create an on-demand feed must be stored on your local file system. The files used to create a recurring feed must be stored at an accessible URL, whence NetWitness Platform can fetch the most current version of the file for each recurrence. After a NetWitness Platform feed is created, you can download the feed to your local file system, edit the feed files, and edit the NetWitness Platform feed to use the updated feed files.

Sample Feed Definition File

This is an example of a feed definition file named `dynamic_dns.xml`, which NetWitness Platform creates based on your entries in the Feed wizards. It defines the structure of the feed data file named `dynamic_dns.csv`.

Note: The feed file path should be `.csv` regardless of the Feed Type (Default or STIX).

```
<?xml version="1.0" encoding="utf-8"?>
 <FDF xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">

   <FlatFileFeed name="Dynamic DNS Domain Feed"
   path="dynamic_dns.csv"
   separator=","
   comment="#"
   version="1">

   <MetaCallback
   name="alias.host"
   valuetype="Text"
   apptype="0"
   truncdomain="true"/>

   <LanguageKeys>
            <LanguageKey name="threat.source" valuetype="Text" />
            <LanguageKey name="threat.category" valuetype="Text" />
            <LanguageKey name="threat.desc" valuetype="Text" />
   </LanguageKeys>
```

```
  <Fields>
  <Field index="1" type="index" key="alias.host" />
  <Field index="4" type="value" key="threat.desc" />
  <Field index="2" type="value" key="threat.source" />
  <Field index="3" type="value" key="threat.category" />
  </Fields>
  </FlatFileFeed>

</FDF>
```

Feed Definition Equivalents for Custom Feed Wizard Parameters

The NetWitness Platform Feeds wizard provide options to define the structure of the data feed file. These correspond directly to attributes in the feed definition (.xml) file.

NetWitness Platform Parameter	Feed Definition File Equivalent
	Define Feed tab
Feed Type	Select: **Default** - to define a feed based on a `.csv` formatted feed data file. **STIX** - to define a feed based on STIX formatted `.xml` file.
Feed Task Type	Select: **Adhoc** - to create an on-demand feed. **Recurring** - to create a feed that recurs automatically.
Name	Enter a custom feed name in the feed data file that corresponds to the `flatfeedfile name` attribute in the feed definition file; for example, `Dynamic DNS Test Feed`.
File/ Browse	Enter a name of the feed data file that corresponds to the `flatfeedfile path` attribute in the feed definition file; for example, `dynamic_dns.csv`.
(STIX, Recurring) **Trust All Certificate**	Select **Trust All Certificate**, if you do not want to validate the REST server certificate. This option is enabled by default (checked).
(STIX, Recurring) **Certificate/Browse**	For client authentication with the REST URL, in the **Certificate** field, click **Browse** and select the self signed certificate. The supported certificate formats are .cer, .crt with Base64 & DER encoded files.
	Define Feed tab - Advanced Options
XML Feed File	Enter a name of the feed definition file, for example, `dynamic_dns.xml`.
Separator	The separator character used to separate attributes in the feed data file. It corresponds to the **`flatfeedfile separator`** in the feed definition file; for example, a comma.
Comment	The character used to identify a comment in the feed data file. It corresponds to the **`flatfeedfile comment`** attribute in the feed definition file; for example, #.

NetWitness Platform Parameter	Feed Definition File Equivalent
Remove STIX data older than	The number of days for which the STIX packages downloaded from TAXII server have to be stored. The STIX packages older than the specified number of days are deleted automatically. The default value is 180 days, which is also the maximum.
Select Services tab	Select the services to which you want to send the data feed.
(Define Columns tab, Define Index) **Type**	The type of lookup value in the index position of the feed data file. **IP** means that each row in the feed data file contains an IP address in the lookup value position. The IP value is in dotted-decimal format (for example, 10.5.187.42). **IP Range** means that each row in the feed data file contains a range of IP addresses in the lookup value position. The IP range is in CIDR format (for example, 192.168.2.0/24). **Non IP** means that the each row in the feed data file contains a metadata value other than IP address in the lookup value position. The Service Type and Truncate Domain, and Callback Keys fields become active for a Non IP index.
(Define Columns tab, Define Index) **CIDR**	Specifies that the IP value in the lookup position is in CIDR format. The **CIDR** attribute sets the IP address format in the field to Classless Inter-Domain Routing (CIDR) notation.
(Define Columns tab, Define Index) **Service Type**	For a Non IP index, the integer service type to filter meta lookups. It corresponds to **MetaCallback apptype** attribute in the feed definition file. A value of **0** indicates no filtering by service type.
(Define Columns tab, Define Index) **Truncate Domain**	For a Non IP index, for meta values that contain domain names (for example, hostnames), the system can strip off the host specific element in the data. Truncate Domain corresponds to the **MetaCallback truncdomain** attribute. If the value is www.example.com, it is truncated to example.com. A value of **False** selects no truncation, and **True** selects truncation.
(Define Columns tab, Define Index) **Callback Keys**	For a Non IP index, the available meta keys to match on instead of ip.src/ip.dst (the defaults for IP index type) are selectable from the drop-down list. The Callback Key corresponds to the **MetaCallback name** attribute, and the index column of the csv file must contain data that can match the chosen meta key. For example, if the username meta key is chosen, the index column of the csv file needs to be populated with users to be matched.
(Define Columns tab, Define Index) **Index Column**	Identifies the column in the feed data file that provides the lookup value for the row. Each position in each row of the feed data file is identified by a **Field index** attribute in the feed definition file. A field with an index of **1** is the first entry in a row, the second field has an index of **2**, the third field has an index of **3**, and so on. You can select multiple index columns, if the **Feed Type** is **STIX** and **Index Type** is **Non IP**. When you select multiple index columns the values from all the selected columns are merged in the first index column that you selected.

NetWitness Platform Parameter	Feed Definition File Equivalent
(DEFINE VALUES) **Key**	The name of the **LanguageKey**, as defined in the feed definition file, for which meta is created from this row of the feed data file. It corresponds to the **Field key** attribute in the feed definition file. A key applies only to a field whose type is set to **value**. In the feed definition file, there is a list of LanguageKeys from **index.xml**, or a summary name if Source Name and Destination Name are used. For example, **reputation** is a summary name for **reputation.src** and **reputation.dst**). This value is referenced by the Field key attribute.

Creating a Custom Feed

This topic provides instructions for creating a custom feed using a .csv or STIX formatted feed data file in RSA NetWitness Platform. For more information about STIX and creating a STIX custom feed, see Create a STIX Custom Feed.

You can easily create a custom feed using the Custom Feed wizard. To complete this procedure, you need a feed data file in `.csv`or `.xml` format. If you also have an associated feed definition file in `.xml` format, which describes the structure of the feed data file, you can use the feed definition file to create a feed. The Custom Feed wizard can create the feed based on a feed data file, or based on a feed data file and corresponding feed definition file.

After completing this procedure, you will have created a custom feed.

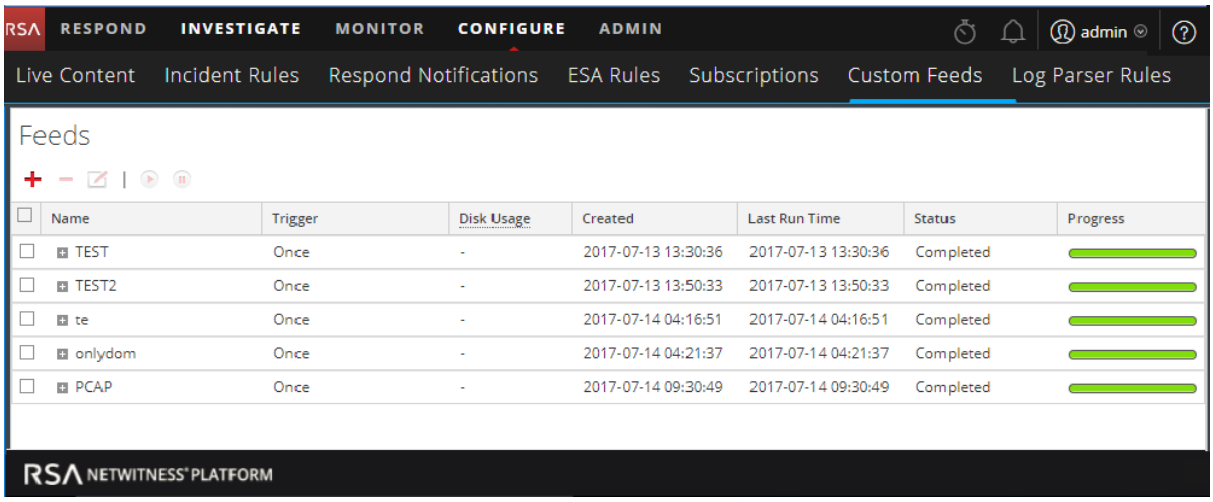
The feed data file (`.csv` or STIX (`.xml`)) and optionally the feed definition file (`.xml`) must be available on the local file system for an on-demand custom feed. For a recurring custom feed, the files must be available at a URL that is accessible to the NetWitness Platform server.

Note: Any feeds that are created in 11.2 release or prior will be automatically pushed to Context Hub as Lists. The lists can be looked up in the context lookup panel of the Respond and Investigate pages. If Context Hub is not configured or the service is down, then the feeds will be pushed to Context Hub the next time the server is available.

To create a custom feed:

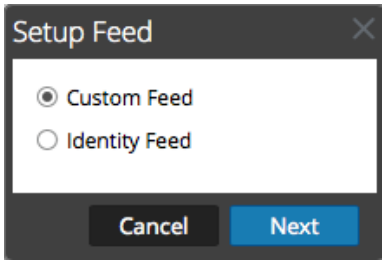
1. Go to **CONFIGURE > CUSTOM FEEDS**.

   The Custom Feeds view is displayed.



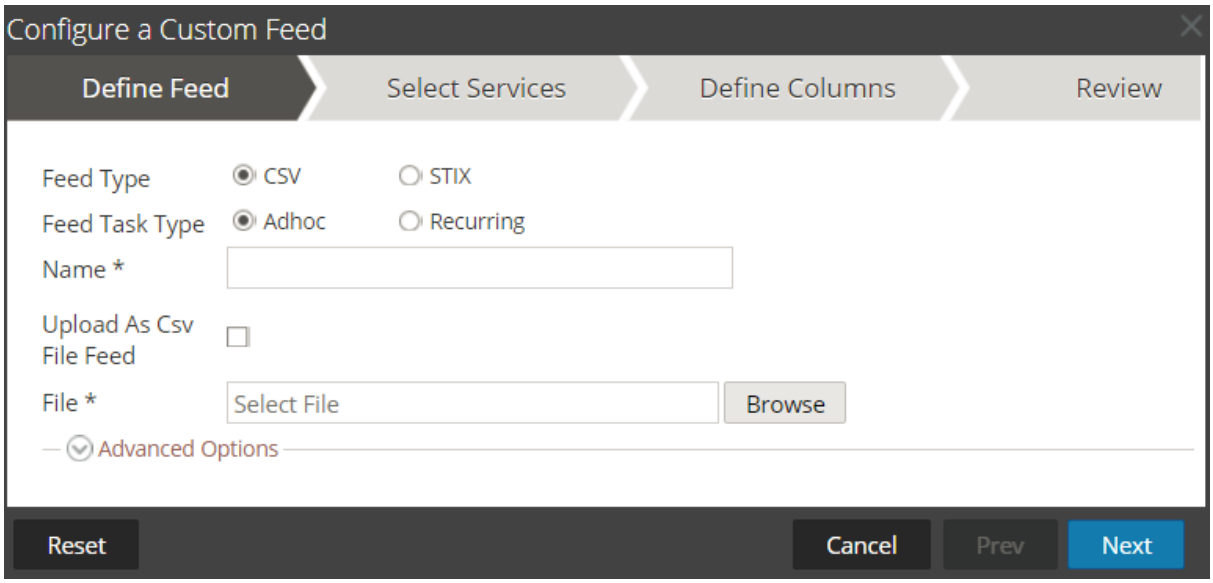
2. In the toolbar, click +.

   The Setup Feed dialog is displayed.



3. To select the feed type, click **Custom Feed** and **Next**.

   The Configure a Custom Feed wizard is displayed, with the Define Feed form open.



4. To define a feed based on a `.csv` formatted feed data file, select **CSV** in the **Feed Type** field.
5. To define an on-demand feed task that executes once, select **Adhoc** in the **Feed Task Type** field and

do one of the following:

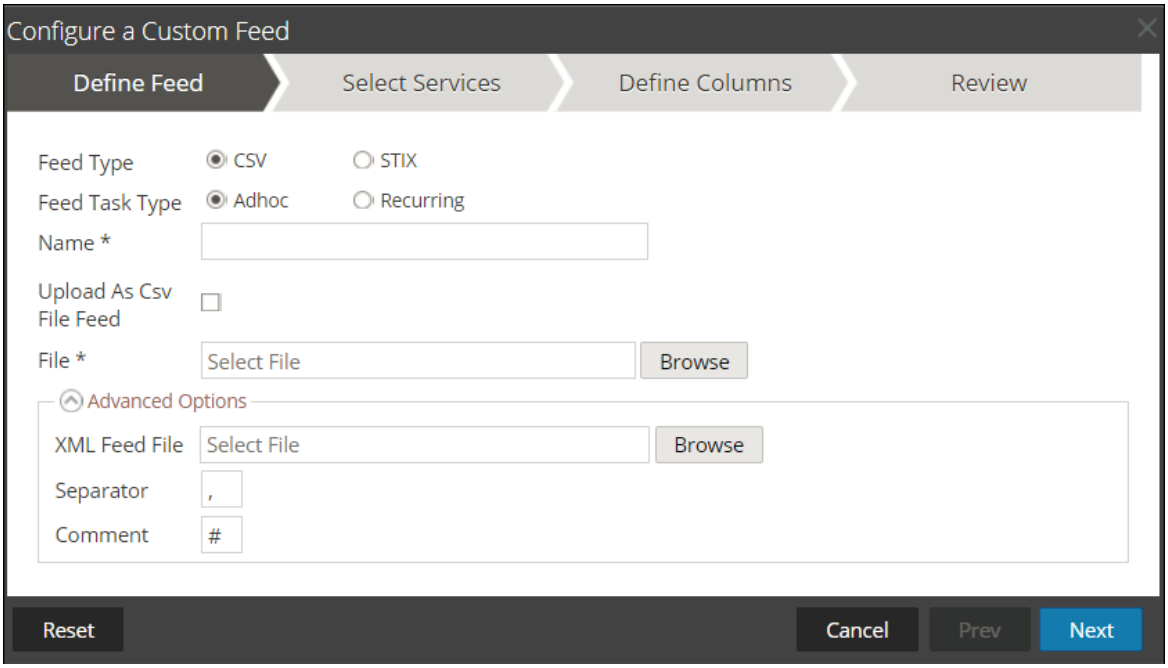
a. (Conditional) To define a feed based on a .csv formatted feed data file, type the feed **Name**.

b. Select the checkbox **Upload As CSV File Feed**, if required.

c. Select a .csv content **File** from the local file system, and click **Next**.

d. (Conditional) To define a feed based on an XML feed file, select **Advanced Options**.

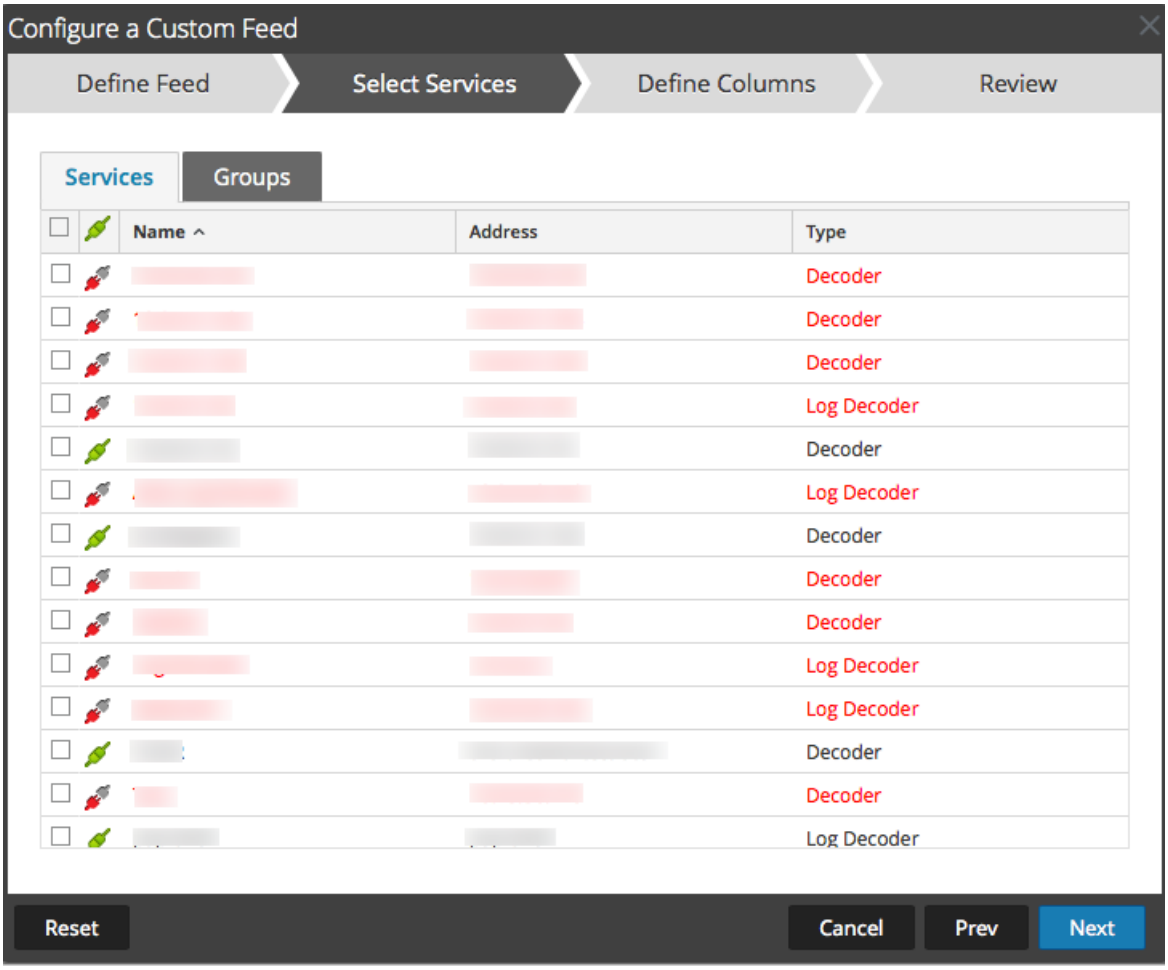
The Advanced Options are displayed:



e. Select an XML feed file from the local file system, choose the **Separator** (default is comma), and specify the **Comment** characters used in the feed data file (default is #), and click **Next**.

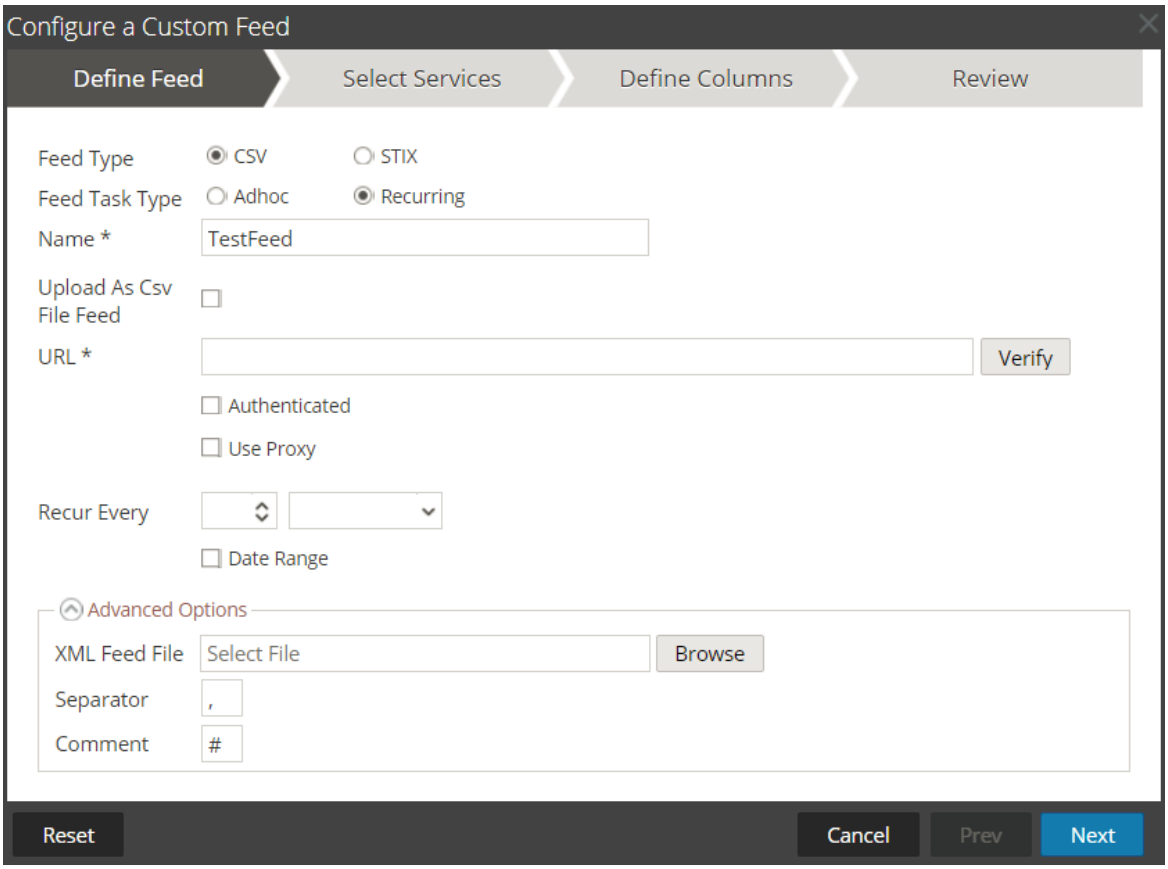
f. The Select Services form is displayed. This is an example of the form for a feed based on a feed data file with no feed definition file. If you are defining a feed based on a feed definition file, the

Define Columns tab is not needed.



6. To define a recurring feed task that executes repeatedly at specified intervals, during a specified date range.
   a. Select **Recurring** in the **Feed Task Type** field.

      The Define Feed dialog includes the fields for a recurring feed.



b. In the **URL** field, enter the URL where the feed data file is located, for example, `http://<hostname>/<feeddatafile>.csv`, and click **Verify**.

   NetWitness Platform verifies the location where the file is stored, so that NetWitness Platform can check for the latest file automatically before each recurrence.

c. (Optional) If the URL has restricted access and requires authentication using your username and password, select **Authenticated**.

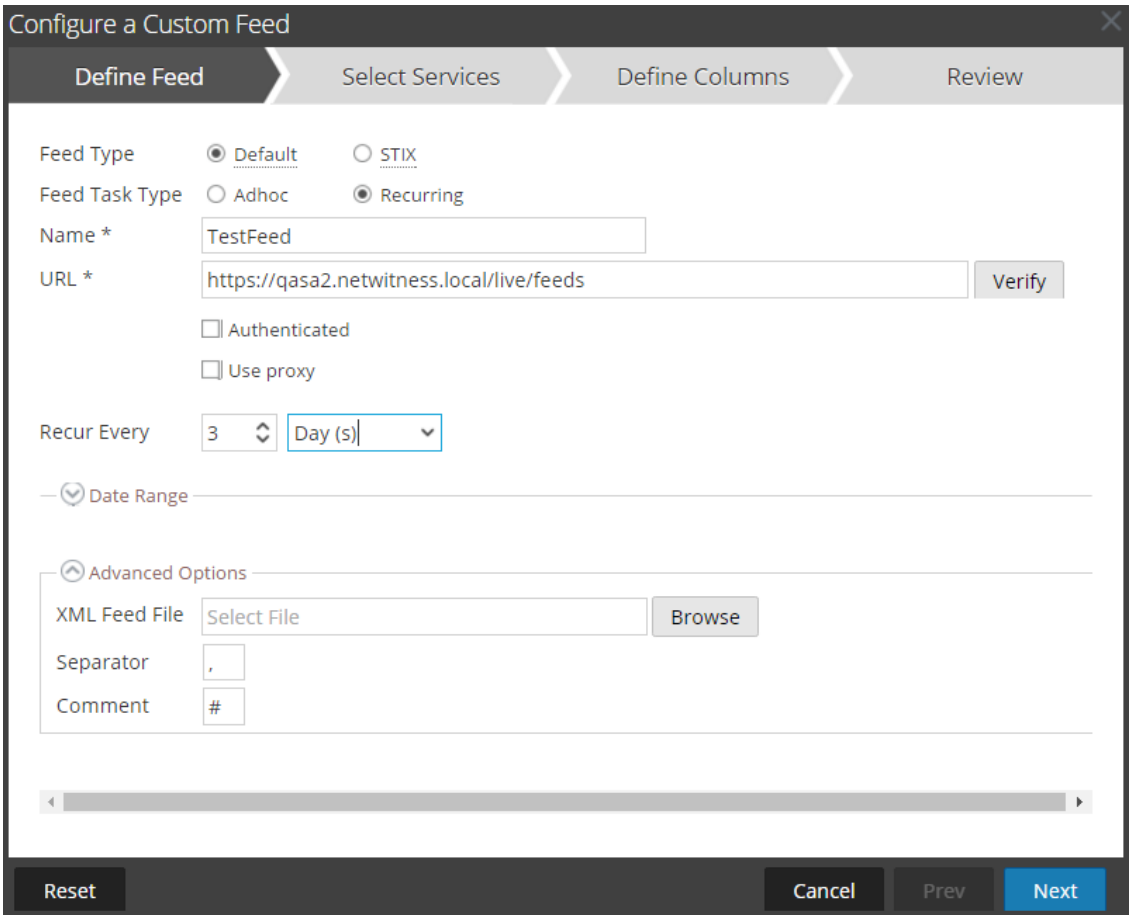
   NetWitness Platform provides your user name and password for authentication to the URL.

d. If you want the NetWitness Platform server to access the Feed URL through a proxy, select **Use Proxy**. For more information on configuring a proxy, see the **Configure Proxy for NetWitness Platform** topic in the *System Configuration Guide*. By default, the **Use Proxy** checkbox is not selected.

e. To define the interval for recurrence, do one of the following:

   - Specify the number of minutes, hours, or days between recurrences of the feed.
   - Specify recurrence every week, and select the days of the week.

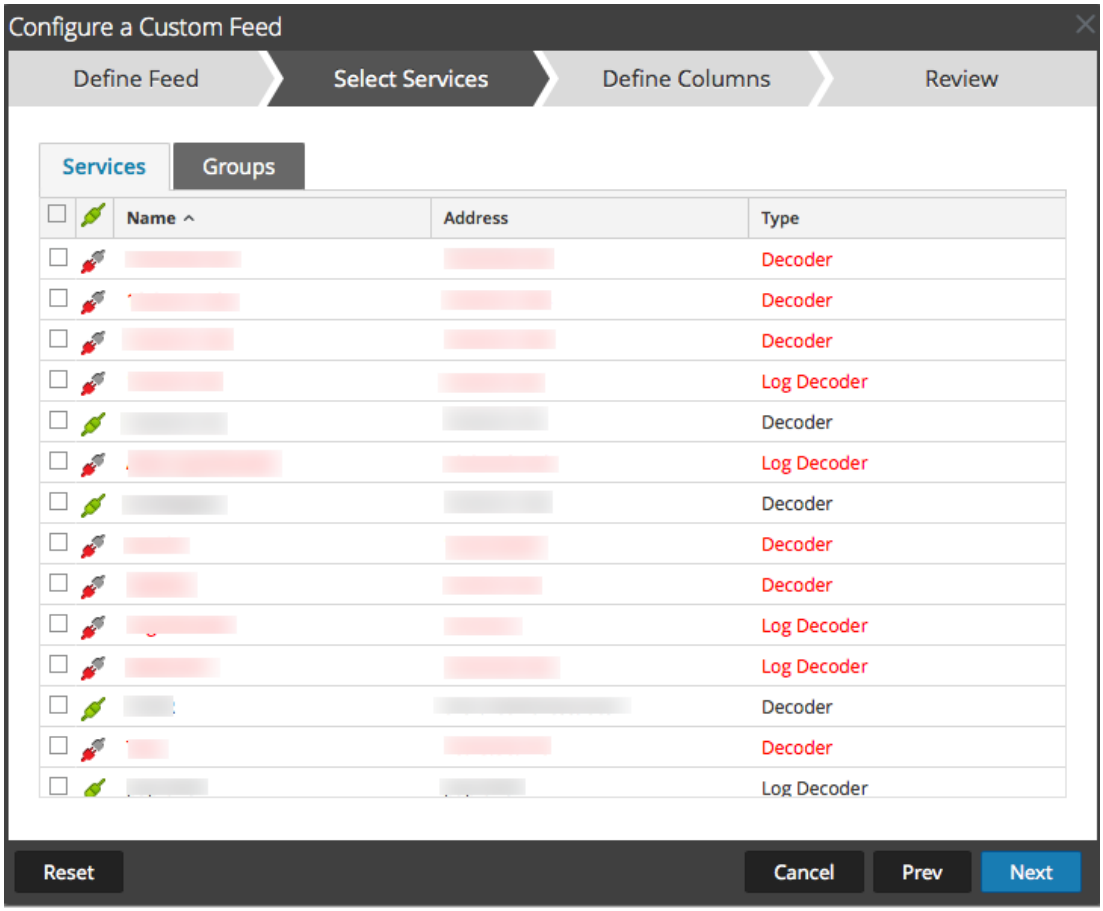
f. To define the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time.



7. (Conditional) If you want to define a feed based on an XML feed file:
   - Type the feed **Name**, select **Advanced Options**.

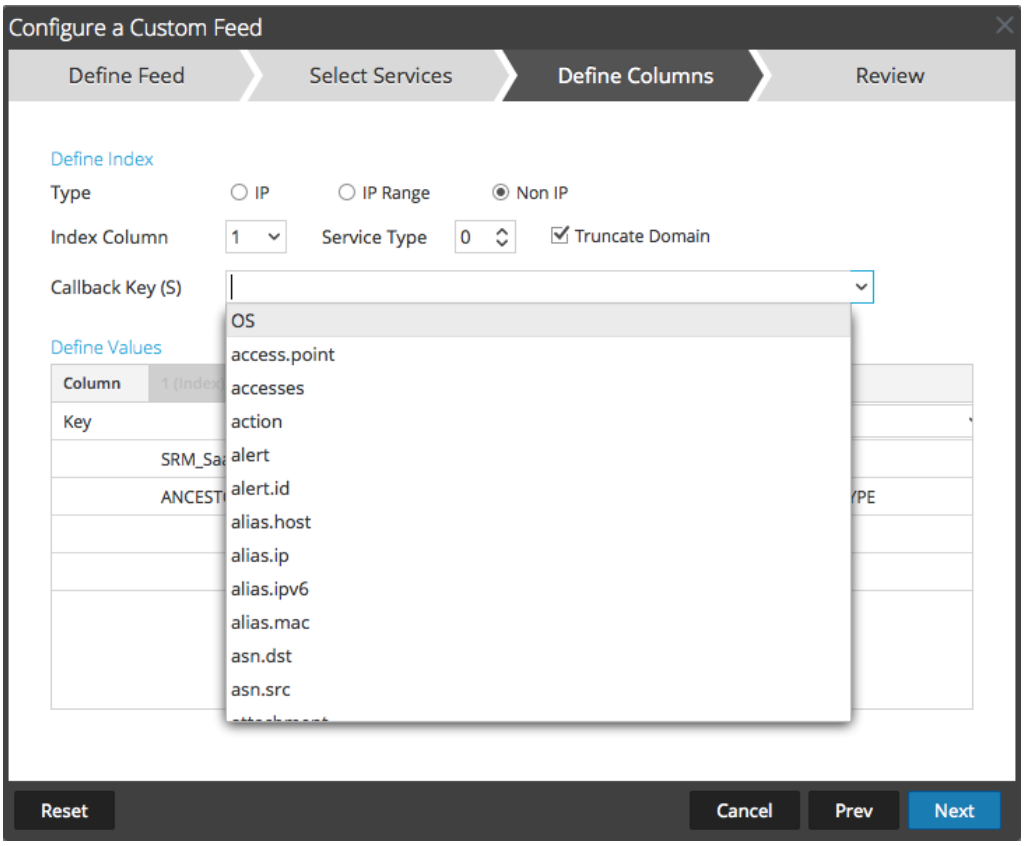
     The Advanced Options fields are displayed.
   - Select an XML feed file from the local file system, choose the **Separator** (default is comma), specify the **Comment** characters used in the feed data file (default is #) and click **Next**.

The Select Services dialog is displayed.

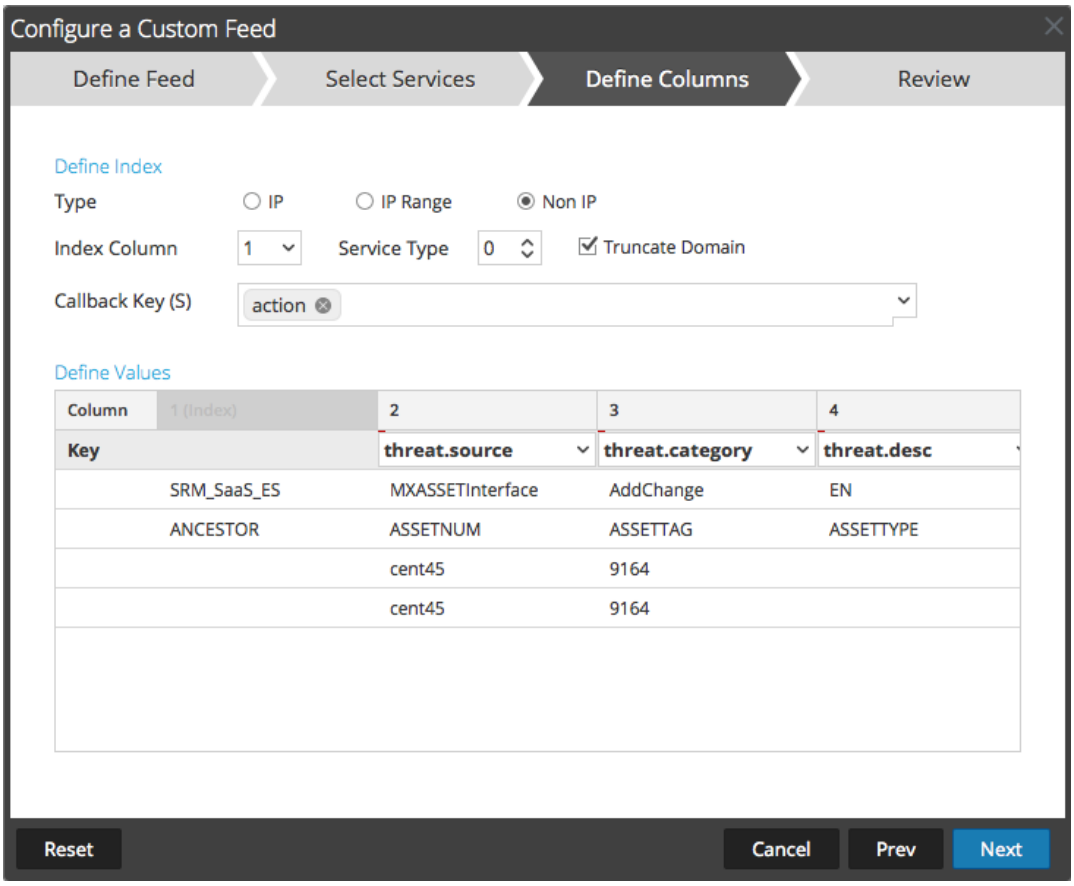


8. To identify services on which to deploy the feed, do one of the following:
   a. Select one or more Decoders and Log Decoders, and click **Next**.
   b. Click the **Groups** tab and select a group. Click **Next**.

      The Define Columns dialog is displayed.
9. To map columns in the Define Columns form:
   a. Define the Index type: **IP**, **IP Range**, or **Non IP**, and select the index column.
   b. (Conditional) If the index type is **IP** or **IP Range** and the IP address is in CIDR notation, select **CIDR.**
   c. (Conditional) If the index type is **Non IP**, additional settings are displayed. Select the service type and **Callback Keys,** and optionally select the **Truncate Domain** option.



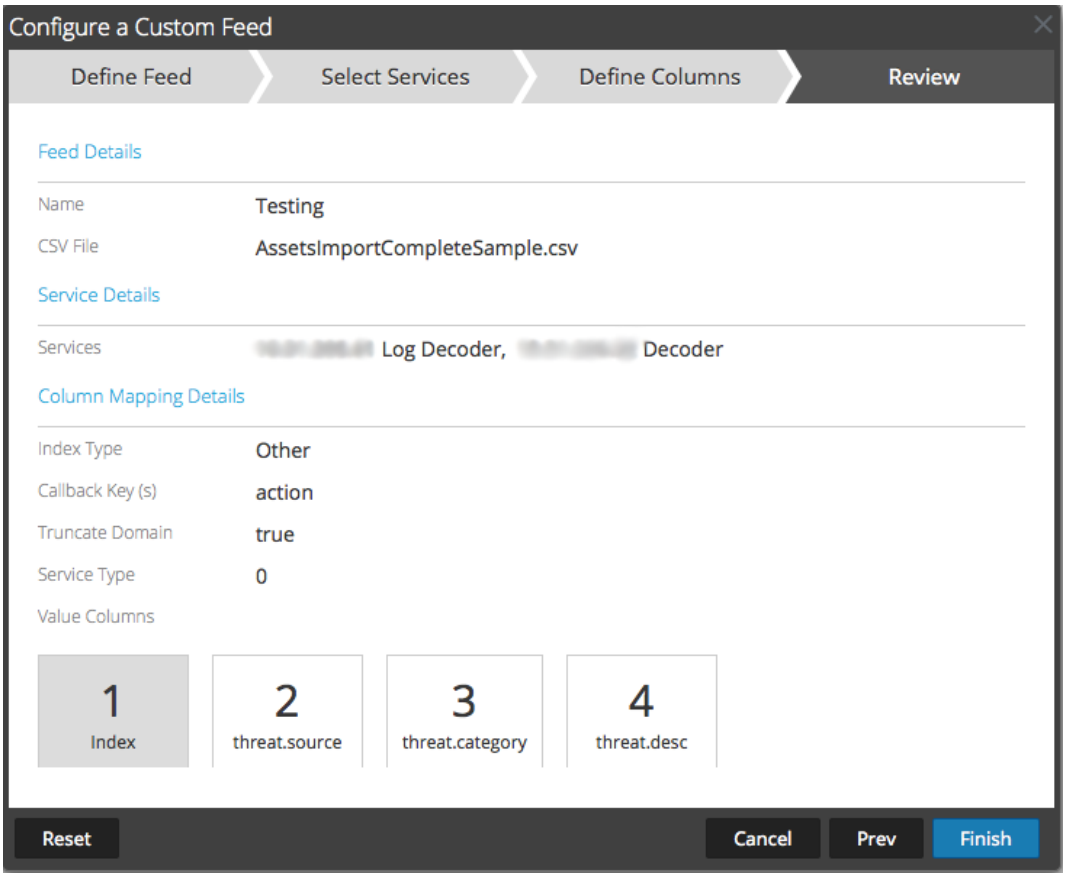
d. Select the language key to apply to the data in each column from the drop-down list. The meta displayed in the drop-down list is based on the meta available for the service define values. You can also add other meta based on advanced expertise.



Note: When a custom feed gets converted into a context hub list, you must map at least one meta key with one or more meta types by mapping a column header with a meta. However, you can add or edit the entity mapping of a list by clicking in the Lists tab. For more information, see the *Context Hub Configuration Guide*.

e. Click **Next**.

The Review dialog is displayed.



10. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form)
11. Review the feed information, and if correct, click **Finish**.
12. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.

Note: When you create a feed, and if there is no entity mapping done such as in case of custom meta, then those columns in the List will not have entity mappings in Context Hub. You have to manually map the entities from the List page.

MetaCallback Feeds using CIDR Index Range for IPv4 and IPv6

This section describes how to use CIDR index ranges for IPv4 and IPv6 in custom MetaCallback feeds. As with other custom feeds, you must create feed data file in .csv format, and a feed definition file in .xml format.

Note: Using MetaCallback feeds with CIDR index ranges is supported only through the Advanced Configuration wizard or the REST interface.

The following example shows the contents of both a .csv file and an .xml file for a MetaCallback feed using CIDR index ranges for IPv4 or IPv6.

.csv file:

```
192.168.0.0/24, Sydney
192.168.1.0/24, Melbourne
```

.xml file:

```
<?xml version="1.0" encoding="UTF-8"?>
<FDF xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">
<FlatFileFeed name="ip_test" path="ip_test.csv" separator="," comment="#">
      <MetaCallback name="DstIP" valuetype="IPv4" apptype="0"
truncdomain="false">
            <Meta name="ip.dst"/>
      </MetaCallback>
      <LanguageKeys>
            <LanguageKey name="alert" valuetype="Text" />
      </LanguageKeys>
      <Fields>
            <Field index="1" type="index" range="cidr"/>
            <Field index="2" type="value" key="alert" />
      </Fields>
</FlatFileFeed>
</FDF>
```

Note: To configure a CIDR index range for feeds with single or multiple MetaCallbacks of value type IPv4 or IPv6, the field of type index MUST contain a range attribute with range="cidr". Also, configuring "cidr" index ranges for feeds with MetaCallbacks of multiple different value types is not supported.

Create a STIX Custom Feed

You can create a custom feed using a .csv or STIX formatted feed data file in RSA NetWitness Platform.

Note: NetWitness Platform supports Structured Threat Information Expression (STIX) 1.0, 1.1 and 1.2 versions only.

Structured Threat Information Expression (STIX™) is a structured language for describing cyber threat information so it can be shared, stored, and analyzed in a consistent manner. For more information about STIX, see https://stixproject.github.io/.

Caution: If STIX recurring feed is configured and you update Security Analytics from 10.6.x to NetWitness Platform 11.0, you must re-configure the STIX recurring feed.

In NetWitness Platform, STIX (`.xml`) feed of type Indicator or Observable which contains the properties such as the IP addresses, File hashes, Domain names, URIs and Email addresses are supported. The properties values in the Equals operator is only supported. And, the attributes such as Type and Title are also read from the STIX (`.xml`). The STIX (`.xml`) with a single STIX_Package is only supported.

TAXII (Trusted Automated eXchange of Indicator Information) is the main transport mechanism for cyber threat information represented in STIX. Using the TAXII services, organizations can share cyber threat information in a secure and automated manner.

The STIX and TAXII communities work closely together to ensure that they continue to provide a full stack for sharing threat intelligence.

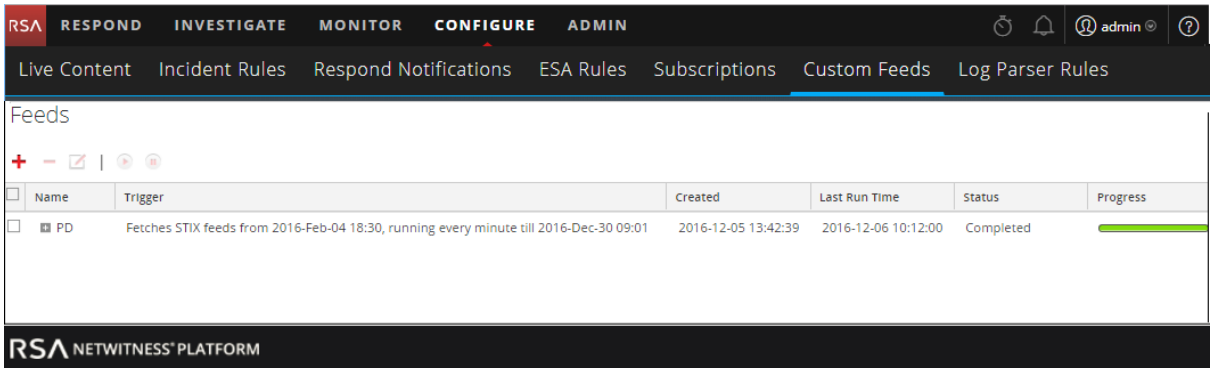
Apart from TAXII server, STIX data can also reside on REST server and you can fetch STIX file from the REST server by providing the URL of the REST server. For example, http://stixrestserver.internal.com.

The feed data file (`.csv` or STIX (`.xml`)) and optionally the feed definition file (`.xml`) must be available on the local file system for an on-demand custom feed. For a recurring custom feed, the files must be available at a URL that is accessible to the NetWitness Platform server.

To create a STIX custom feed:

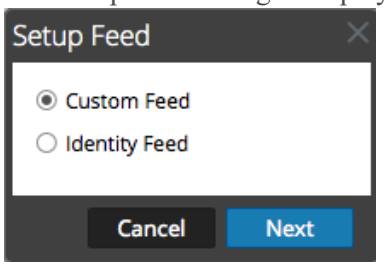
1. Go to **Configure > Custom Feeds**.

   The Feeds view is displayed.



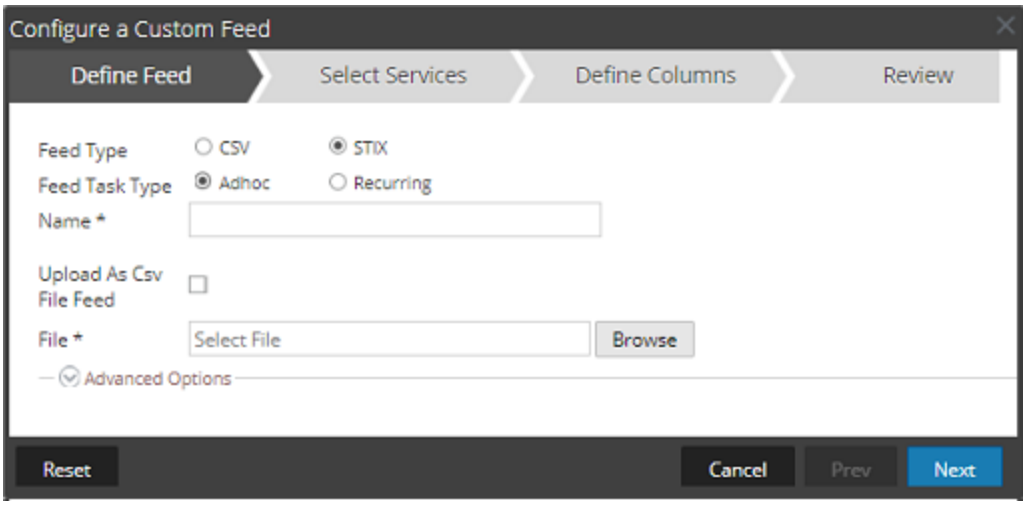
2. In the toolbar, click +.

   The Setup Feed dialog is displayed.



3. To select the feed type, click **Custom Feed** and **Next**.

   The Configure a Custom Feed wizard is displayed, with the Define Feed dialog open.

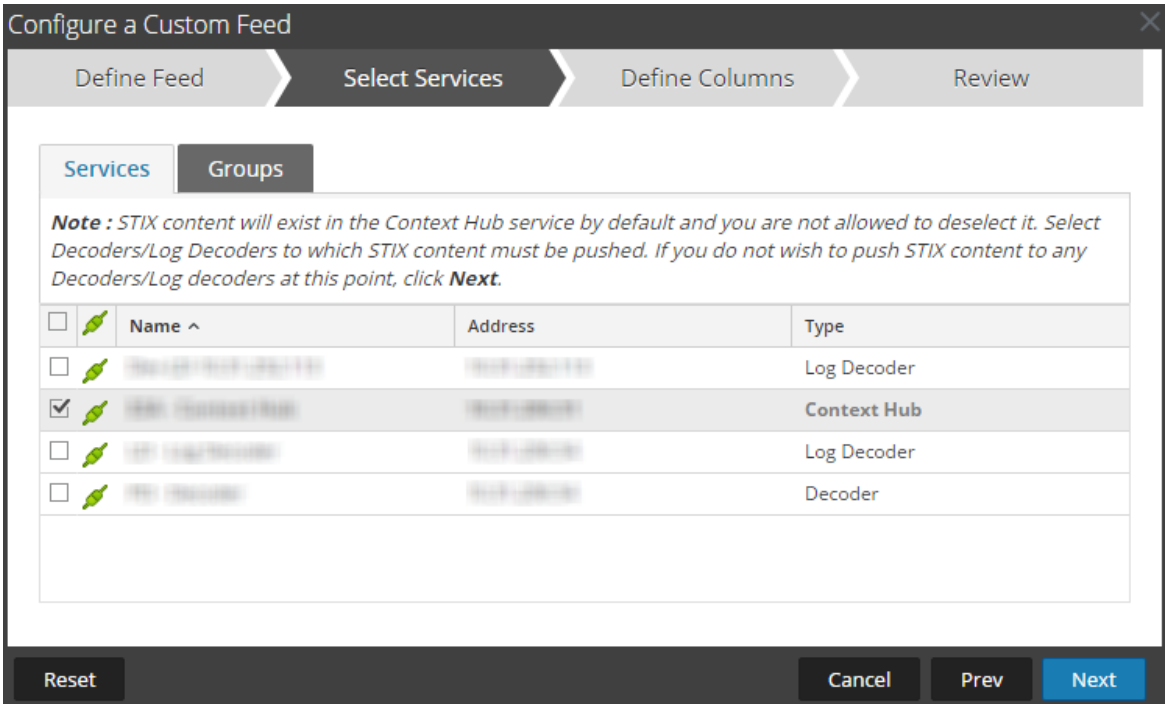


4. To define a feed based on a STIX formatted `.xml` file, select **STIX** in the **Feed Type** field.
5. To define an on-demand feed task that executes once, select **Adhoc** in the **Feed Task Type** field and do one of the following:
   a. (Conditional) To define a feed based on STIX formatted `.xml` file, type the feed **Name**, select a STIX formatted `.xml` content **File** from the local file system, and click **Next**.
   b. (Conditional) To define a feed based on an XML feed file, select **Advanced Options**.

      The Advanced Options are displayed:

   c. Select an XML feed file from the local file system, choose the **Separator** (default is comma), and specify the **Comment** characters used in the feed data file (default is #), and click **Next**.
   d. The Select Services dialog is displayed. This is an example of the form for a feed based on a feed data file with no feed definition file. If you are defining a feed based on a feed definition

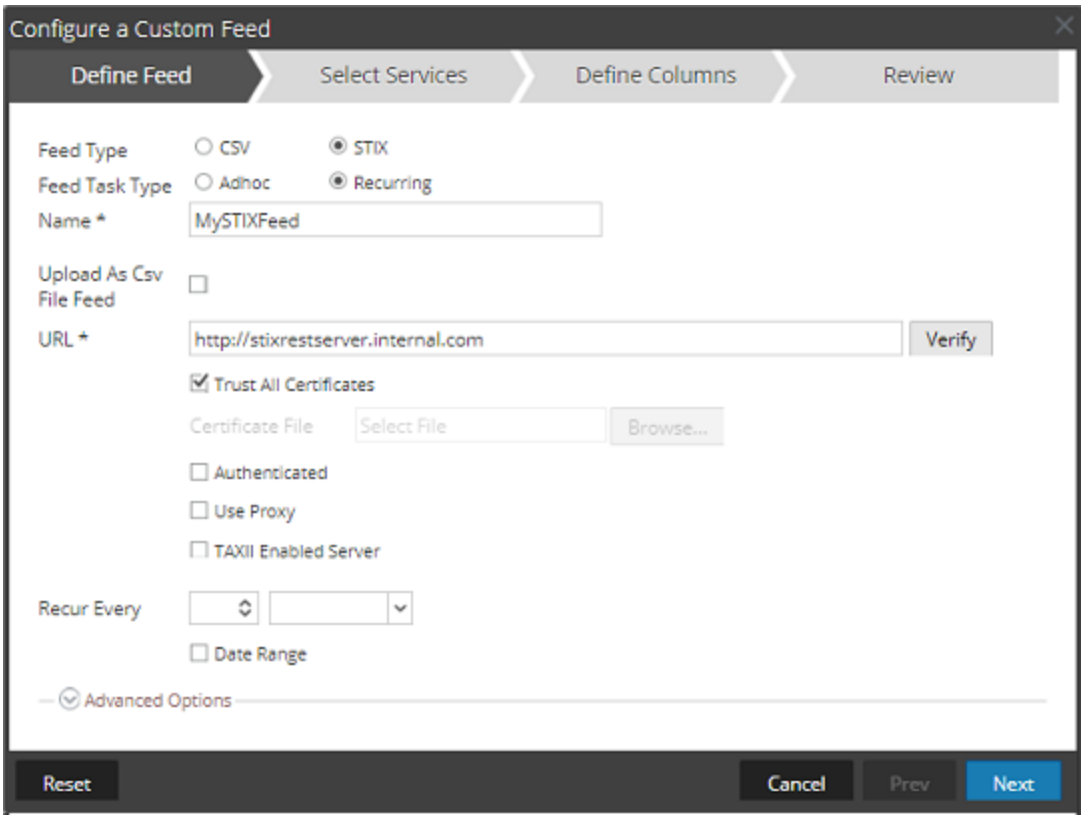
file, the Define Columns tab is not needed.



6. Define a recurring feed task that executes repeatedly at specified intervals, during a specified date range.

   a. Select **Recurring** in the **Feed Task Type** field.

      The Define Feed dialog includes the fields for a recurring feed.



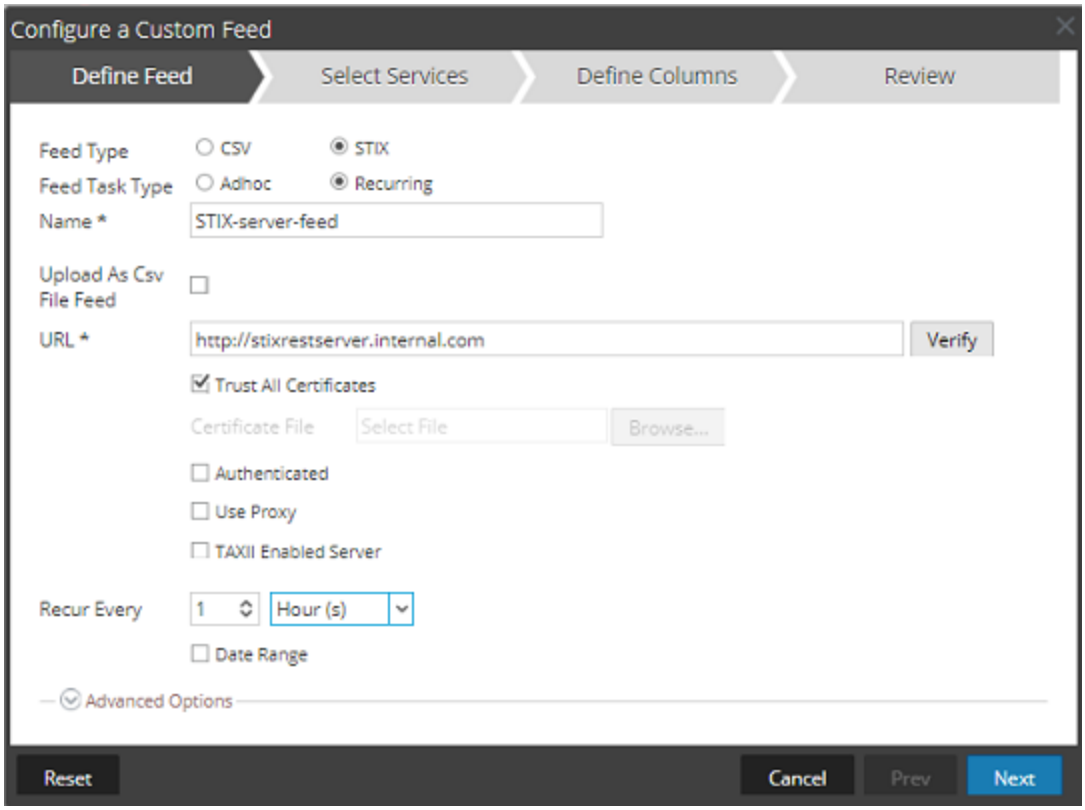
b. In the **URL** field, do one of the following:

- To define a recurring feed based on STIX which pulls STIX packages from a TAXII Server, enter the TAXII server's discovery service URL, for example, http://hailataxii.com/taxii-discovery-service.

  Note: Context Hub service installed on Event Stream Analysis host must be reachable for the specified TAXII server.

- To define a recurring feed based on a STIX formatted .xml file using REST Server, enter the URL of the REST server where the STIX data file is located, for example,

http://stixrestserver.internal.com.



NetWitness Platform verifies the connection to the server, so that NetWitness Platform can check for the latest file automatically before each recurrence.

c. If you do not want NetWitness Platform to verify the REST server's SSL certificate, Select **Trust All Certificate**. This option is enabled by default (checked)

d. For client authentication with the REST URL, in the **Certificate** field, click **Browse** and select the self signed certificate. The supported certificate formats are .cer, .crt with Base64 & DER encoded files.

e. (Optional) If the URL has restricted access and requires authentication using your username and password, select **Authenticated**.

   NetWitness Platform provides your user name and password for authentication to the URL.

f. Select **TAXII Enabled Server**, if you want to select a TAXII collection from the list.
For a valid URL, one or more TAXII collections that contains the STIX data file is displayed based on your credentials. Select the required TAXII collection from the list. Only one collection can be added from a TAXII server for a feed.

   Note: Though multiple feeds from multiple TAXII servers are supported, only one account (username and password) is supported per TAXII server.

g. If you want the NetWitness Platform server to access the Feed URL through a proxy, select **Use Proxy**. For more information on configuring a proxy, see the **Configure Proxy for NetWitness**

Platform topic in the *System Configuration Guide*. By default, the **Use Proxy** checkbox is not selected.

h. (Optional) Click **Verify** to test the settings.

Note: Make sure all the required connection parameters such as Authentication, Proxy, Certificate trust, TAXII Enabled Server etc. are configured before you click **Verify**.

i. To define the interval of recurrence for pushing to Decoder or Log Decoder, do one of the following:

- Specify the number of minutes, hours, or days between recurrences of the feed.
- Specify recurrence every week, and select the days of the week.

j. To define the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time. The Start Date should be defined from when you want to fetch the data. Make sure that the **Start Date** is not before 180 days from today.

7. (Optional) If you want to define a feed based on an XML feed file:

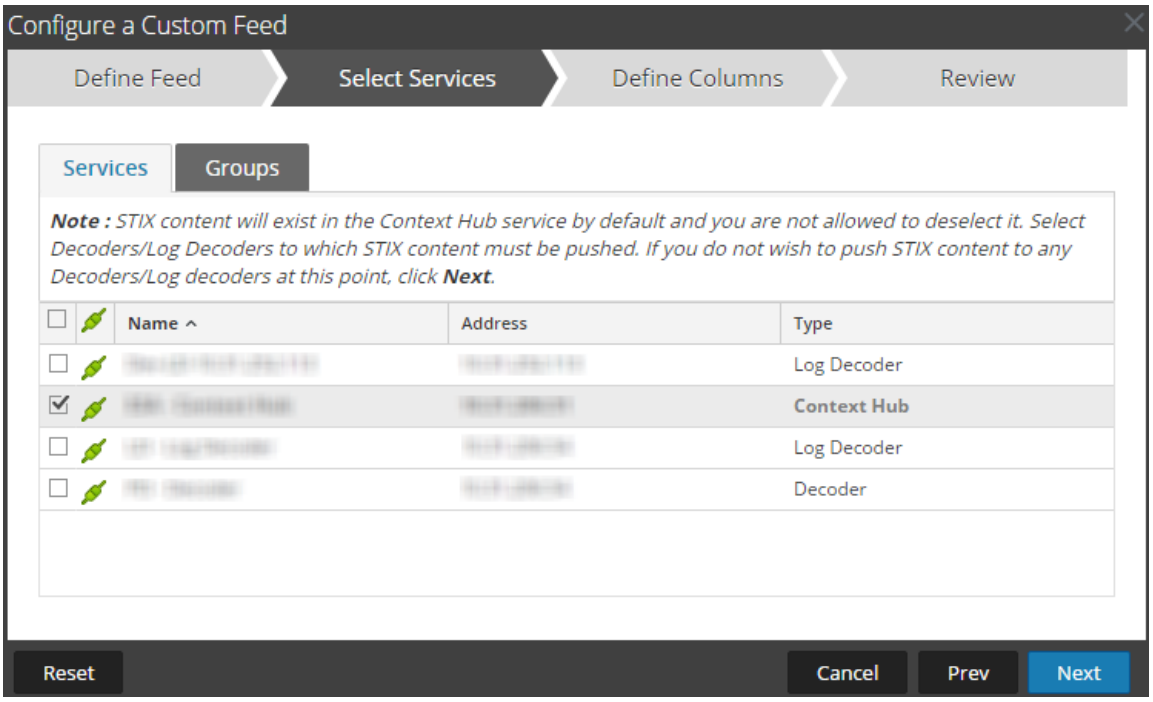
- Type the feed **Name**, select **Advanced Options**.

  The Advanced Options fields are displayed.
- Select an XML feed file from the local file system, choose the **Separator** (default is comma), specify the **Comment** characters used in the feed data file (default is #).
- In the **Remove STIX data older than** field, specify the number of days for which STIX packages pulled from TAXII server is to be stored. The STIX packages older than the specified number of days is deleted automatically.
- Click **Next**.
  The Select Services dialog is displayed.

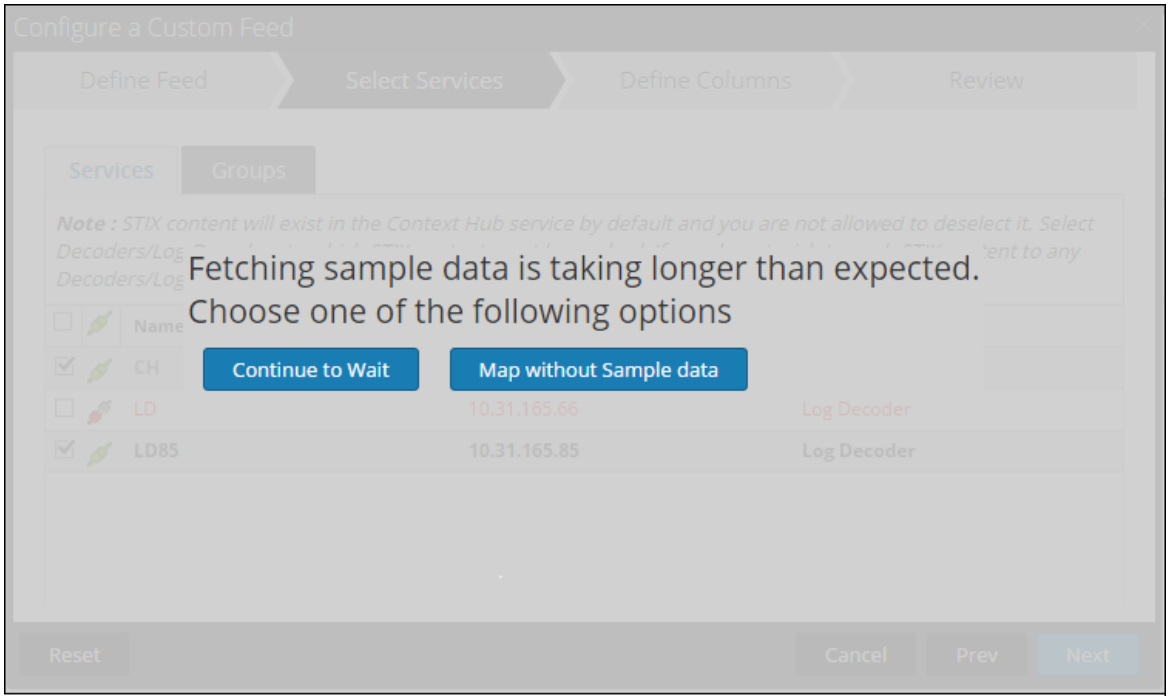
8. To identify services on which to deploy the feed, do one of the following:

a. Select one or more Decoders and Log Decoders, and click **Next**.

b. In case of STIX feed, Context Hub will be selected by default and you are not allowed to deselect it. In addition, you can select one or more Decoders and Log Decoders and click **Next** or Click the **Groups** tab and select a group. Click **Next**.



If the data from the STIX server is large, the following message is displayed:

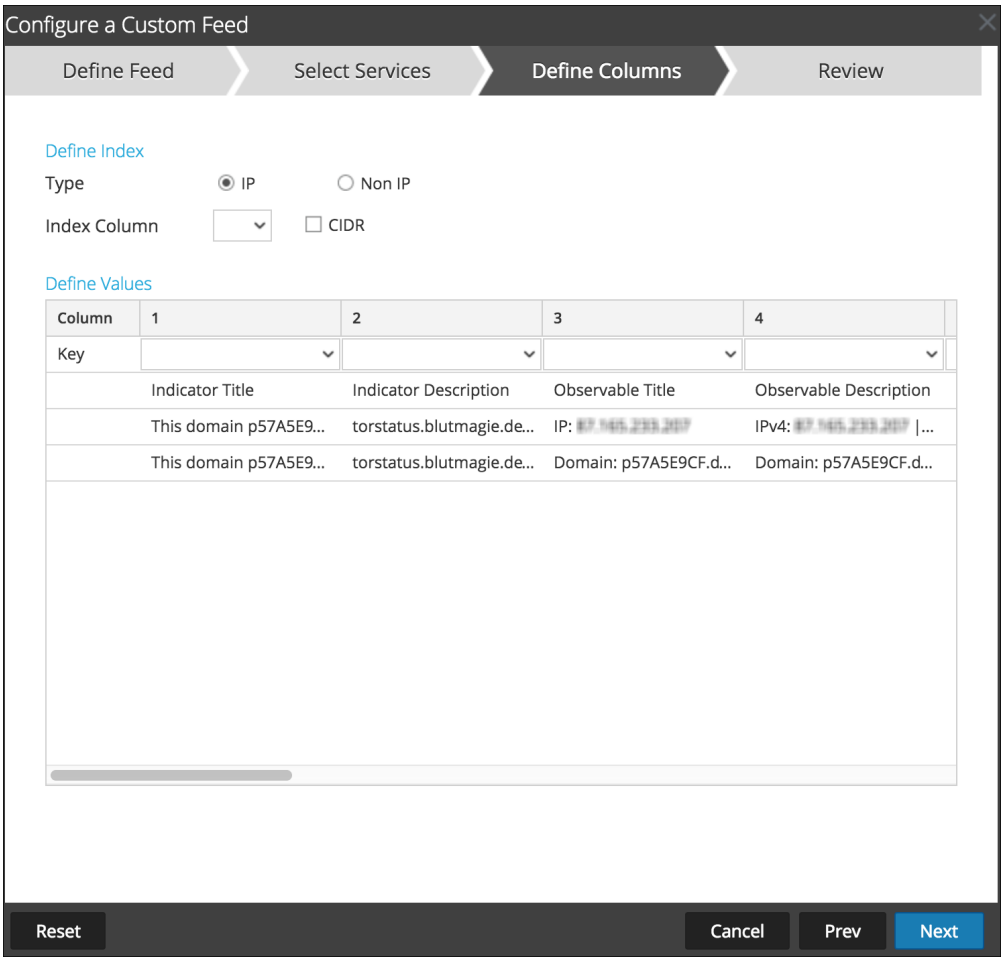


- If you click **Continue to Wait**, it continues to wait till the sample data is fetched or timeout (10 minutes) whichever is sooner. In case of timeout no sample data is retrieved even after 10 minutes.

- If you click **Map Without Sample data**, the mapping column is displayed without any sample data.

The Define Columns dialog is displayed.

9. To map columns in the Define Columns form:
   a. Define the Index type: **IP**, **IP Range**, or **Non IP**, and select the index column.
   b. (Optional) If the index type is **IP** or **IP Range** and the IP address is in CIDR notation, select **CIDR**.
   c. (Optional) If the index type is **Non IP**, additional settings are displayed. Select the service type and **Callback Keys,** and optionally select the **Truncate Domain** option.

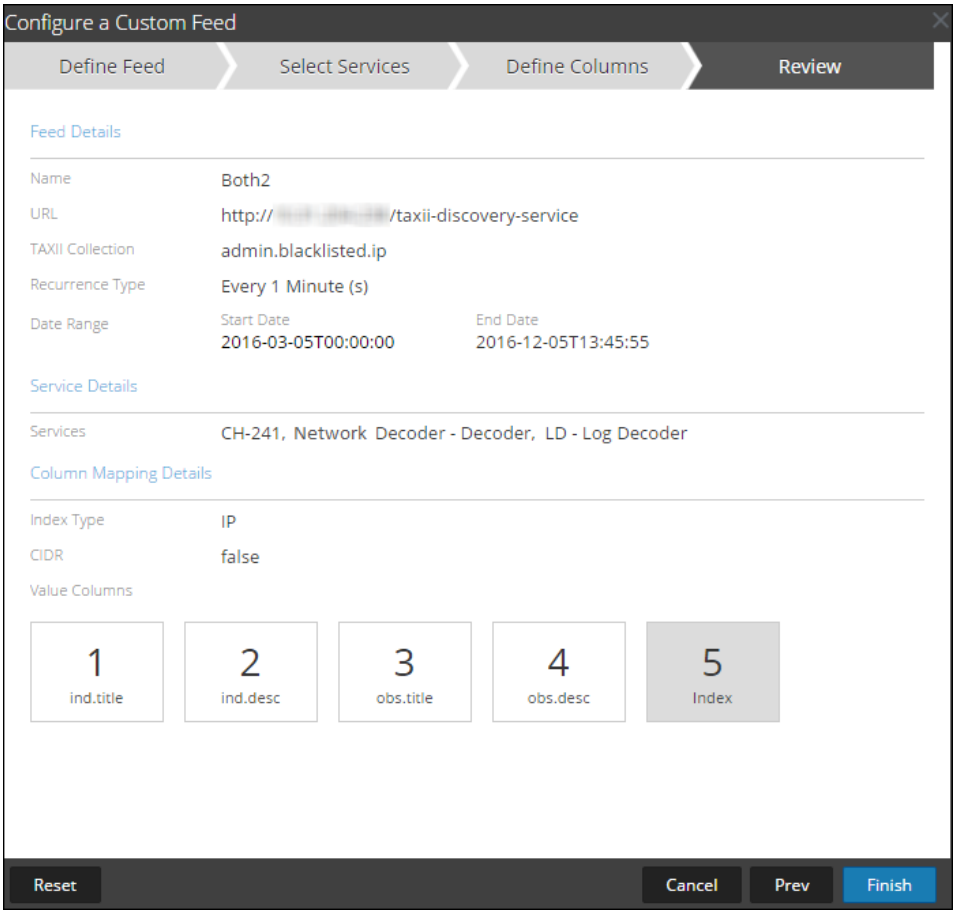


Note:
- If the **Index Type** is Non IP, you can select multiple index columns in the **Index Column(S)**. The values from all the selected columns are merged in the first index column that you selected and the merged values are pushed to the Log Decoder for parsing. For example, in the **Index Column(S)** if you select 2,4,7 as index columns the values from the 2,4 and 7 columns are merged in the column 2 and the values are pushed to Log Decoder for parsing.
- Indexing cannot be done for the columns such as Indicator Title, Indicator Description, Observable Title, Observable Description, as the look up cannot be performed for those columns.

d. Select the language key to apply to the data in each column from the drop-down list. The meta displayed in the drop-down list is based on the meta available for the service define values. You can also add other meta based on advanced expertise.

e. Click **Next**.

The Review dialog is displayed.

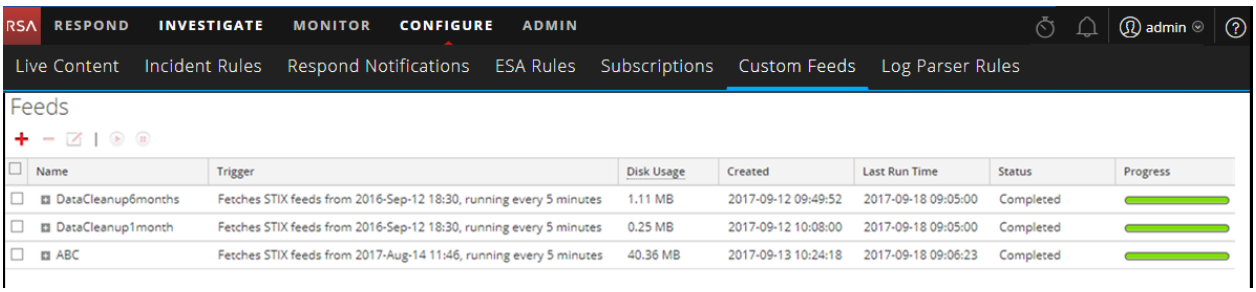


10. Anytime before you click **Finish**, you can:

- Click **Cancel** to close the wizard without saving your feed definition.
- Click **Reset** to clear the data in the wizard.

- Click **Next** to display the next dialog (if not viewing the last form).
- Click **Prev** to display the previous dialog (if not viewing the first form)

11. Review the feed information, and if correct, click **Finish**.
12. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.



Note: Health and Wellness raises alerts when the available heap memory of Context Hub server is critically low and the status displays as unhealthy due to low memory. For more information on how to troubleshoot the `OutOfMemoryError` on the Context Hub Server, see "Troubleshooting" in the *Live Services Management Guide*.

MetaCallback Feeds using CIDR Index Range for IPv4 and IPv6

This section describes how to use CIDR index ranges for IPv4 and IPv6 in custom MetaCallback feeds. As with other custom feeds, you must create feed data file in .csv format, and a feed definition file in .xml format.

Note: Using Metacallback feeds with CIDR index ranges is supported only through the Advanced Configuration wizard or the REST interface.

The following example shows the contents of both a .csv file and an .xml file for a MetaCallback feed using CIDR index ranges for IPv4 or IPv6.

.csv file:

```
192.168.0.0/24, Sydney
192.168.1.0/24, Melbourne
```

.xml file:

```
<?xml version="1.0" encoding="UTF-8"?>
<FDF xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">
<FlatFileFeed name="ip_test" path="ip_test.csv" separator="," comment="#">
      <MetaCallback name="DstIP" valuetype="IPv4" apptype="0"
truncdomain="false">
            <Meta name="ip.dst"/>
      </MetaCallback>
      <LanguageKeys>
            <LanguageKey name="alert" valuetype="Text" />
      </LanguageKeys>
```

```
        <Fields>
                <Field index="1" type="index" range="cidr"/>
                <Field index="2" type="value" key="alert" />
        </Fields>
</FlatFileFeed>
</FDF>
```

Note: To configure a CIDR index range for feeds with single or multiple MetaCallbacks of value type IPv4 or IPv6, the field of type index MUST contain a range attribute with range="cidr". Also, configuring "cidr" index ranges for feeds with MetaCallbacks of multiple different value types is not supported.

Creating and Managing an Identity Feed

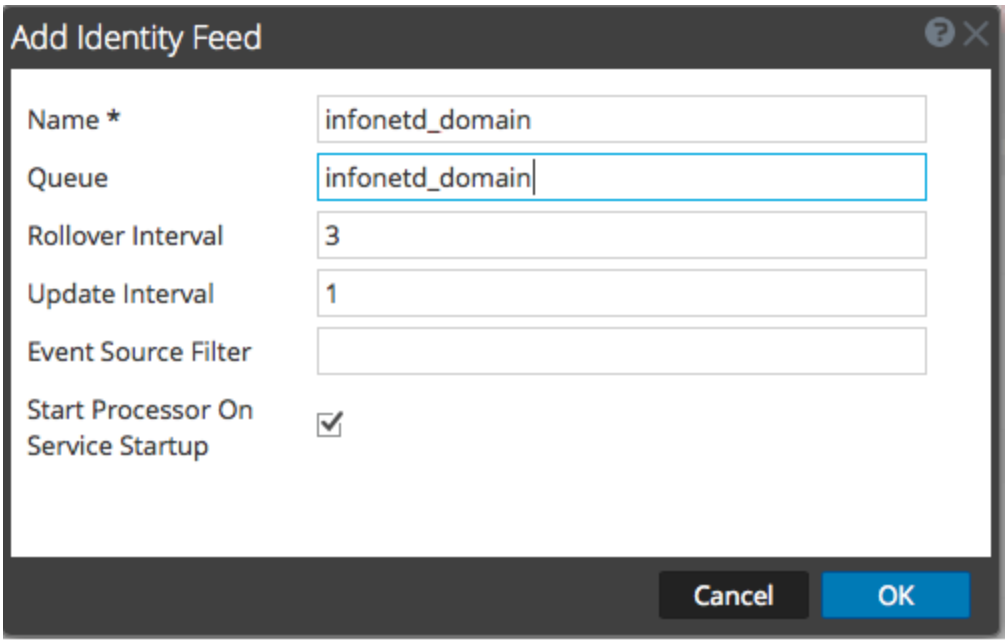
You can easily create an Identity feed and populate it to selected Decoders and Log Decoders. After completing this procedure, you will have created an Identity feed.

To create an identity feed:

1. Add a destination for the feed.
   a. Go to **ADMIN > Services** and in the **Services** list
   b. Select a **Log Collector** service, and select **View > Config**.
   c. Select the **Event Destinations** tab.
   d. In the Select **Event Destinations** field, select **Identity Feed**.

   e. Click + and enter a unique name for the feed.

      The Queue name identifies the feed within the Log Collector. Use the name of the feed for the Queue.



f. Click **OK**.

2. Test generation of messages.

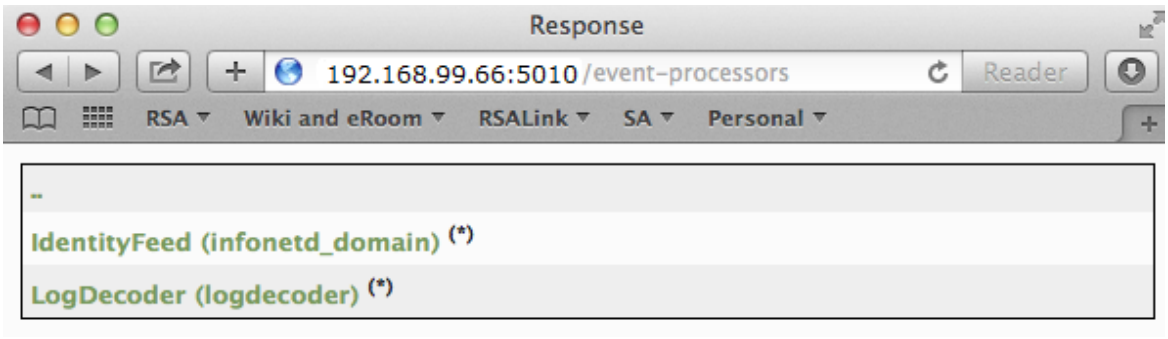
   a. Have users log into Windows boxes on the domain to generate the appropriate log messages on the domain controllers for testing.

   b. Verify that data is written to the feed files. SSH to the Log Decoder/Collector or Virtual Log Collector being configured. Navigate to `/var/netwitness/logcollector/runtime/identity-feed` and verify that the `Identity_deploy` files are getting populated with data.

   c. Open up a web browser (Non-Internet Explorer browsers preferred) and log in to the REST interface of the Log Collector. Use administrative credentials when logging in. For example, if the IP address of your Log Collector is 192.168.99.66, the URL would be:

   - SSL not enabled: **http://192.168.99.66:50101/event-processors**
   - SSL enabled: **https://192.168.99.66:50101/event-processors**

   The browser screen should look like this:

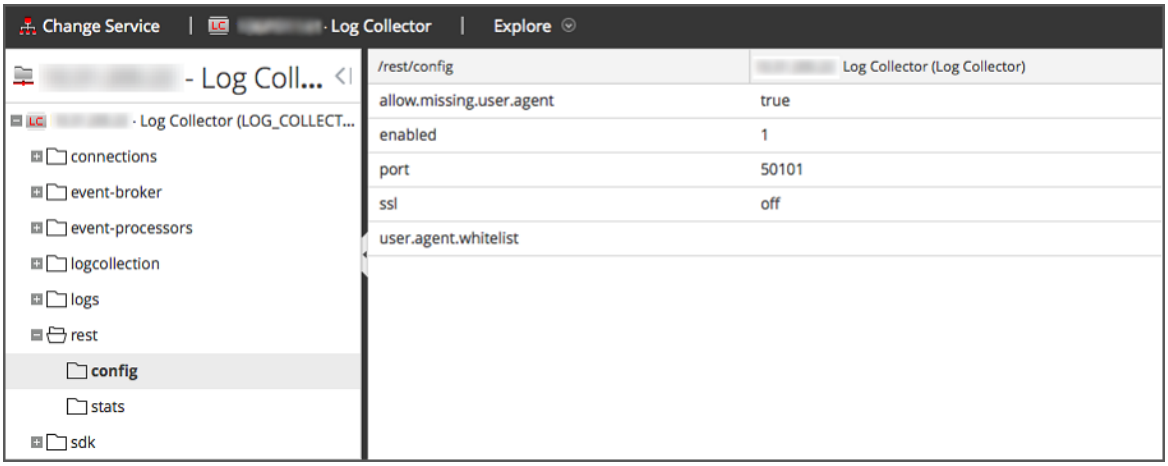


The screen contains the name of the identity feed you created earlier (`infonetd_domain`, in this example).

For the identity feed to function correctly, port 50101 must be active on the Log Collector, and you must determine whether SSL encryption is active.

d. Go to **ADMIN > Services > *<Log Collector being setup>*** **> View > Explore**.

e. In the left pane, expand **rest > config**.



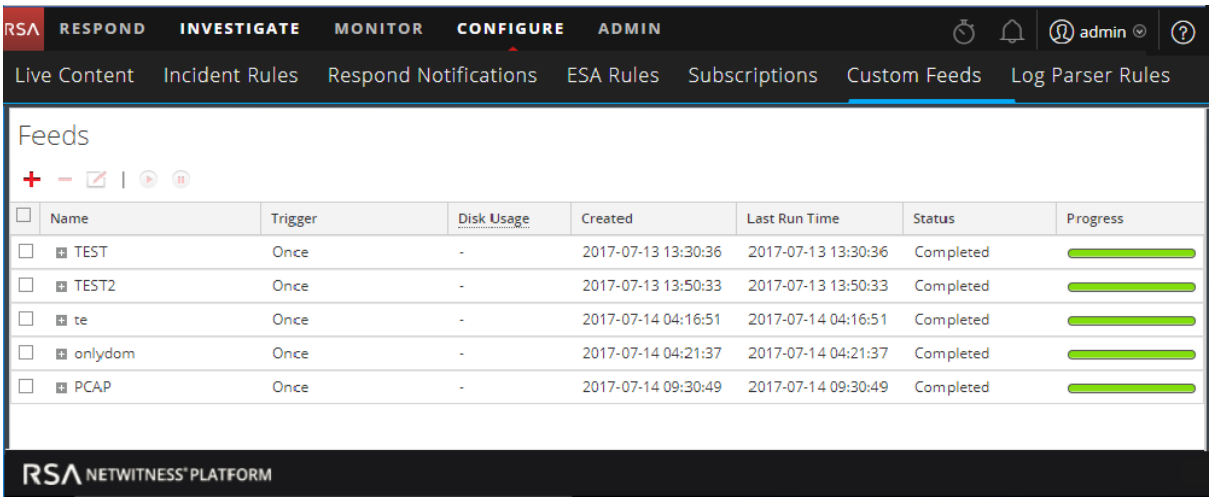
For REST to be active, **enabled** must be set to **1**.

f. Note the value for **ssl**. If SSL should be enabled for your environment, this must be set to **on**.

> **Note:** If you changed the setting for either the **enabled** or **ssl** option you must restart the Log Collector service before moving forward.

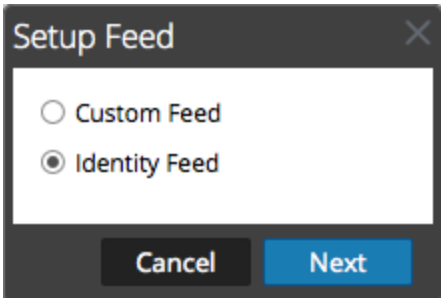
3. Go to **CONFIGURE > Custom Feeds**.

   The Feeds dialog is displayed.



4. In the toolbar, click +.

   The Setup Feed dialog is displayed.



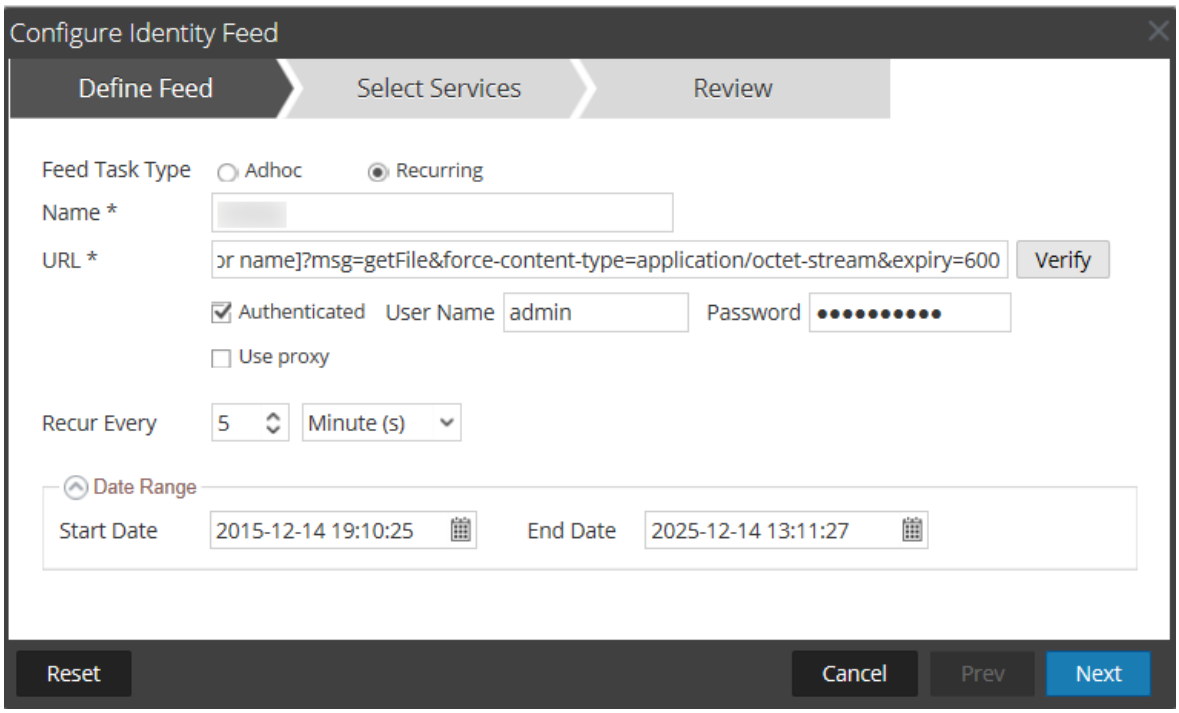
5. Make sure **Identity Feed** is selected and click **Next**.

   The Configure Identity Feed panel opens with the **Define Feed** tab displayed.

6. (Conditional) You can create an on-demand or recurring feed.

   - To define an on-demand Identity feed task that executes once, select **Adhoc** in the **Feed Task Type** field, type the feed **Name**, and browse for and open the feed.
   - To define a recurring Identity Feed task that executes on a recurring basis, select **Recurring** in the **Feed Task Type** field.

     The **Define Feed** dialog includes the fields for a recurring feed.



Note: RSA NetWitness Platform verifies the location where the file is stored, so that NetWitness Platform can check for the latest file automatically before each recurrence.

7. Enter a value and verify the URL field.
   a. In the **URL** field, enter the URL where the feed data file is located. This is the REST API interface that was setup earlier. Make sure you have the following information to construct the URL:
      - The IP address of the Log Collector being used to construct the Identity Feed file.
      - The identity queue name, as set in step 2c.
      - Whether or not SSL is enabled on the Log Collector REST port, as set in step 2f.

      You can construct this value as follows:
      - SSL enabled: `https://<LogCollector>:50101/event-processors/<ID Event processor name>?msg=getFile&force-content-type=application/octet-stream&expiry=600`
      - SSL not enabled: `http://<LogCollector>:50101/event-processors/<ID Event processor name>?msg=getFile&force-content-type=application/octet-stream&expiry=600`

      So, using the example from earlier, the complete value that you would enter into this field is as follows:

      ```
      http://192.168.99.66:50101/event-processors/infonetd_
      domain?msg=getFile&force-content-type=application/octet-
      stream&expiry=600?msg=getFile&force-content-type=application/octet-
      stream&expiry=600
      ```
   b. For the URL verification to work correctly, it is important that the NetWitness Platform UI

server can access the Log Collector's REST API port (50101). This can be tested by going to the NetWitness Platform UI server via SSH. Once there, run the following command:

- SSL enabled: `curl -vk https://<ip of log collector>:50101`
- SSL not enabled: `curl -v http://<ip of log collector>:50101`

If the `curl` command does not connect then there may be a network firewall or routing issue between the NetWitness Platform UI server and the Log Collector.

Example of a bad connection:

```
* About to connect() to 192.168.99.66 port 50105 (#0)
* Trying 192.168.99.66... No route to host
* couldn't connect to host
* Closing connection #0
curl: (7) couldn't connect to host
```

Example of a good connection:

```
* About to connect() to 192.168.99.66 port 50105 (#0)
* Trying 192.168.99.66... connected
* Connected to 192.168.99.66 (192.168.99.66) port 50105 (#0)
> GET / HTTP/1.1
> User-Agent: curl/7.19.7 (x86_64-redhat-linux-gnu) libcurl/7.19.7
NSS/3.19.1 Basic ECC zlib/1.2.3 libidn/1.18 libssh2/1.4.2
> Host: 192.168.99.66:50105
> Accept: */*
>

< HTTP/1.1 401 Unauthorized
< Content-Length: 71
< Connection: Keep-Alive
< Pragma: no-cache
< Expires: -1
< Cache-Control: no-cache, no-store, must-revalidate
< WWW-Authenticate: Basic realm="NetWitness"
< Content-Type: text/xml; charset=utf-8
<

<?xml version="1.0" encoding="utf-8"?>
<error>401 Unauthorized</error>
* Connection #0 to host 192.168.99.66 left intact
* Closing connection #0
```

8. The REST API requires a username and password when attempting to pull the `identity_deploy.csv` file from the Log Collector. This can be any username and password that is available on the service itself. For more information, see the "Services Security View" topic in the *Hosts and Services Guide*.

   To see which accounts are available, go to **ADMIN > Services > <log collector being setup> > Actions > View > Security**.

   Under the Users table, you see all the users that can be used in this step. It is suggested that a separate user account is created specifically for this setup, and is used nowhere else in the environment, for added security. For details, see "Add a User and Assign a Role" in the *System Security and User Management Guide*. (Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.)

9. To define the recurrence interval, do one of the following:

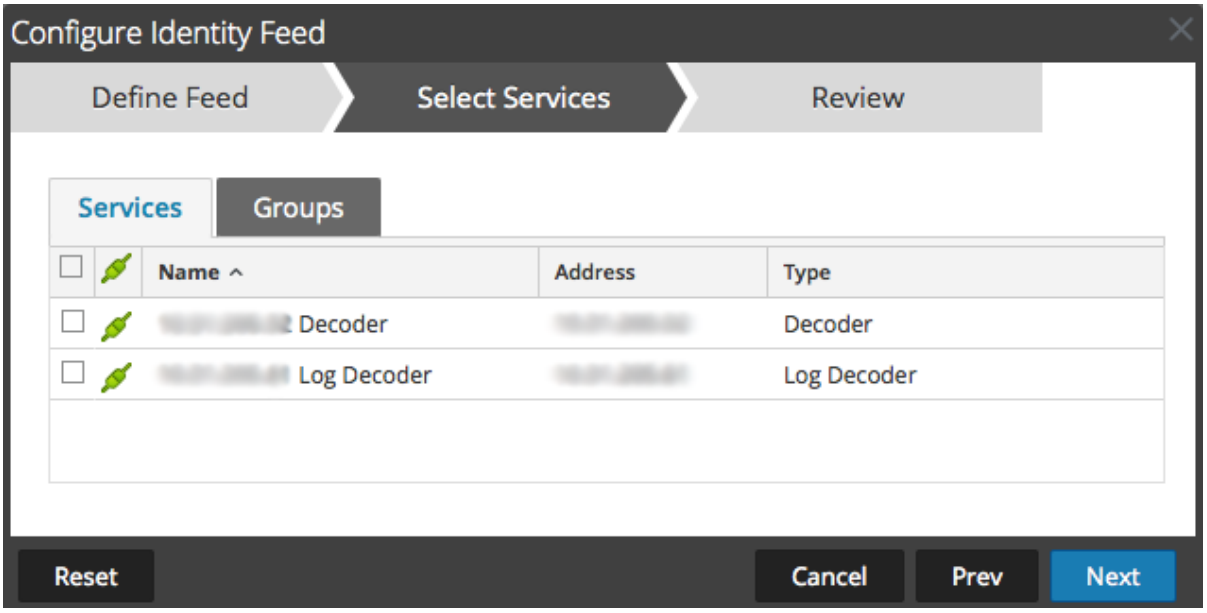
- Specify the number of minutes, hours, or days between recurrences of the feed.
- Enter the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time.

10. If using SSL encryption, you need to install the REST API SSL certificate for the Log Collector into the NetWitness Platform UI server. For more information, see Import the SSL Certificate.

    If, after importing the SSL certificate, the verification of the URL still fails, see Cannot Verify Identity Feed URL.

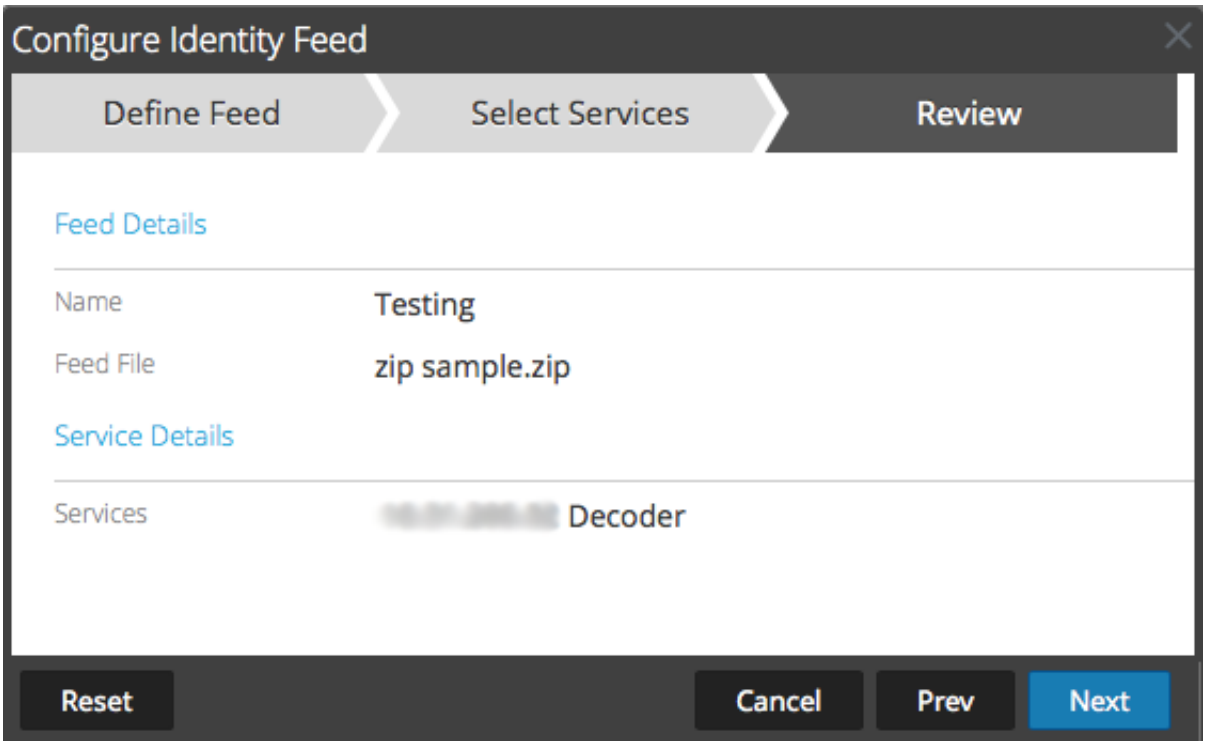
11. Click **Verify** to verify your identity feed configuration before you proceed to the Select Services dialog.
12. Click **Next**.

    The Select Services dialog is displayed.



13. To identify services on which to deploy the feed, select one or more Decoders and Log Decoders and click **Next**.
14. Click the **Groups** tab, select a group, and click **Next**.

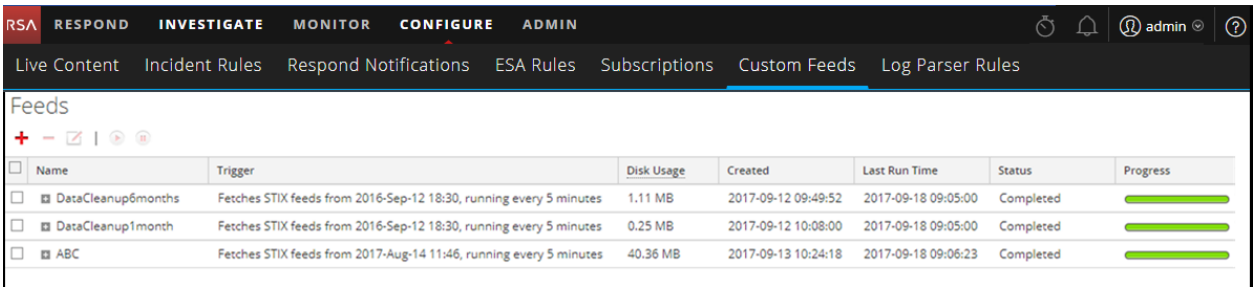
    The Review dialog is displayed.



Note: If a group of devices with Decoders and Log Decoders is used to create recurring or custom feeds and this group is deleted, you can edit the feed and add a new group to the feed.

15. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form).
16. Review the feed information, and if correct, click **Finish**.

Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.



Import the SSL Certificate

If SSL is configured on the Identity feed's Log Collector, follow these steps to import the Log Collector's SSL certificate into the NetWitness Platform UI server key store. If this certificate is not imported, the NetWitness Platform UI server will be unable to pull the Identify feed file from the Log Collector.

1. To pull the SSL certificate off the Log Collector, SSH into the NetWitness Platform UI server and run the following command:

   ```
   echo -n | openssl s_client -connect <HOST>:<PORT> | sed -ne '/-BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p' > /tmp/<SERVERNAME>.cert
   ```

   This command saves the SSL certificate to `/tmp/<SERVERNAME>.cert`. For example:

   ```
   echo -n | openssl s_client -connect 192.168.99.66:50101 | sed -ne '/-BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p' > /tmp/logcollector.cert
   ```

2. To import the SSL certificate into the NetWitness Platform UI server, SSH into the UI server and run the following command:

   ```
   keytool -importcert -alias <name an alias for the cert> -file <the cert file pathname> -keystore /etc/pki/java/cacerts
   ```

   For example:

   ```
   keytool -importcert -alias logcollector01 -file /tmp/logcollector.cert -keystore /etc/pki/java/cacerts
   ```

3. The system requests a password. Enter the password for the keystore on the NetWitness Platform UI server, not for the jetty keystore. The default password is **changeit**.

4. Restart **jettysrv** to allow jetty to read the new certificate in the store.

Cannot Verify Identity Feed URL

If the Identity feed URL cannot be verified, and you are using SSL, make sure you followed the steps in Import the SSL Certificate.

If there are issues, it is possible that the internal name of the certificate does not match the hostname of the Log Collector. The following procedure checks this.

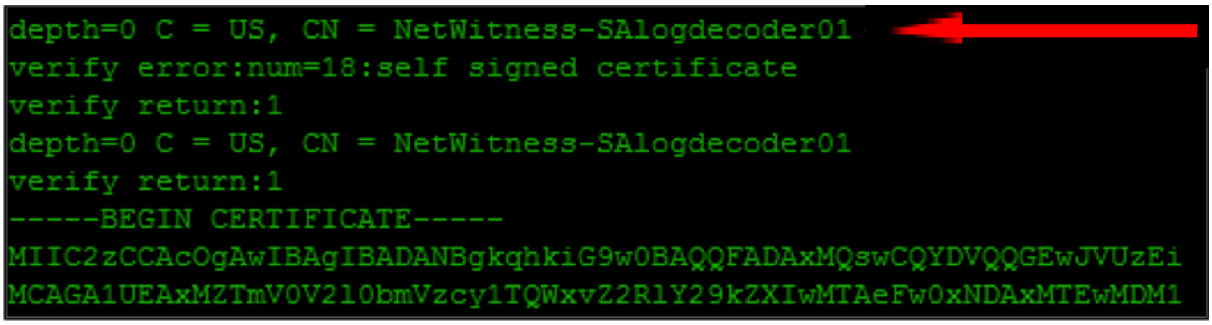
1. SSH to the NetWitness Platform UI server.
2. Run the following command to output the CN name of the SSL cert:

   ```
   echo -n | openssl s_client -connect <log decoder>:50101 | sed -ne '/BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p'
   ```

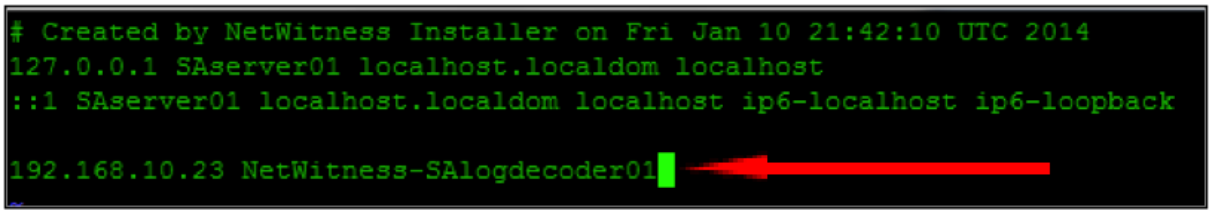
   For example:

   ```
   echo -n | openssl s_client -connect salogdecoder01:50101 | sed -ne '/BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p'
   ```

3. Retrieve the CN name of the SSL certificate.



4. Edit the `/etc/hosts` file and add the IP address and CN name to the file.



5. Restart the network service on the appliance.
6. Confirm that the name placed in the **/etc/hosts** file is used instead of the FQDN or IP address in the Identity feed URL.
7. Re-verify the Identity feed URL.

Investigating an Identity Feed

An identity feed tracks interactive log on events from the Windows operating system. Identity feeds do not track interactive log off events.

In order for an identity feed to process events and tag them, the events need to be collected using a Windows Log Collection module where an Active Domain Controller or non-Domain Controller is configured. Note that identity feeds can only be processed via an Identity Feed Event Processor.

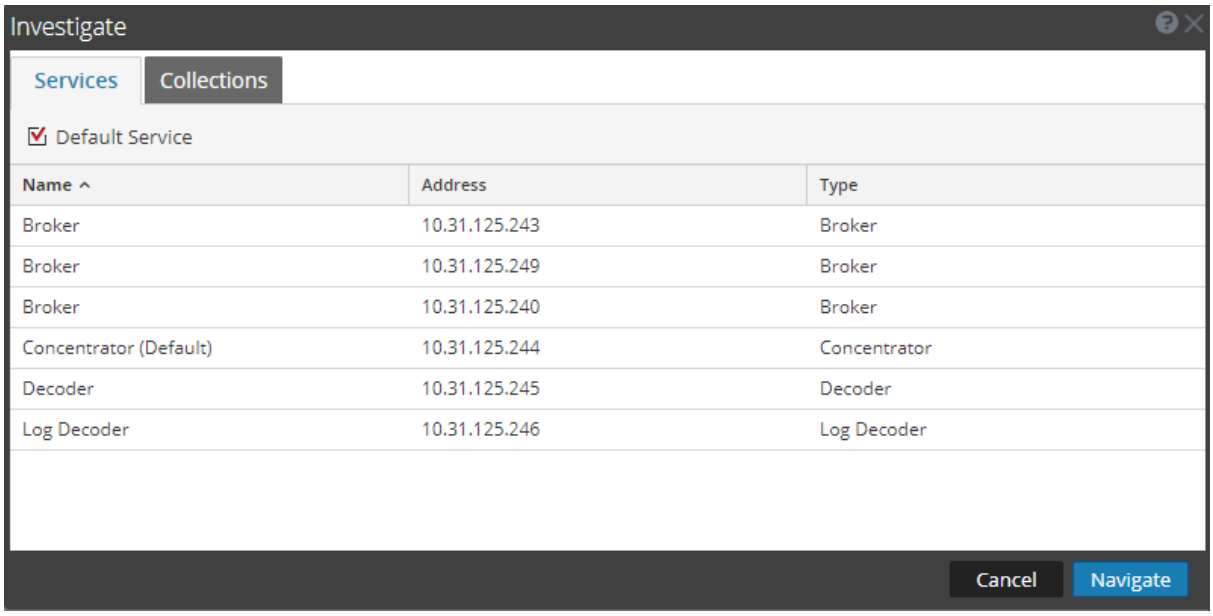
Note: An identity feed only tracks one log in at a time. If two users log in to a system at the same time, the second user will overwrite the first user's data in the identity feed.

Once you have created an identity feed, you can view the results by investigating the feed.

To investigate a configured identity feed:

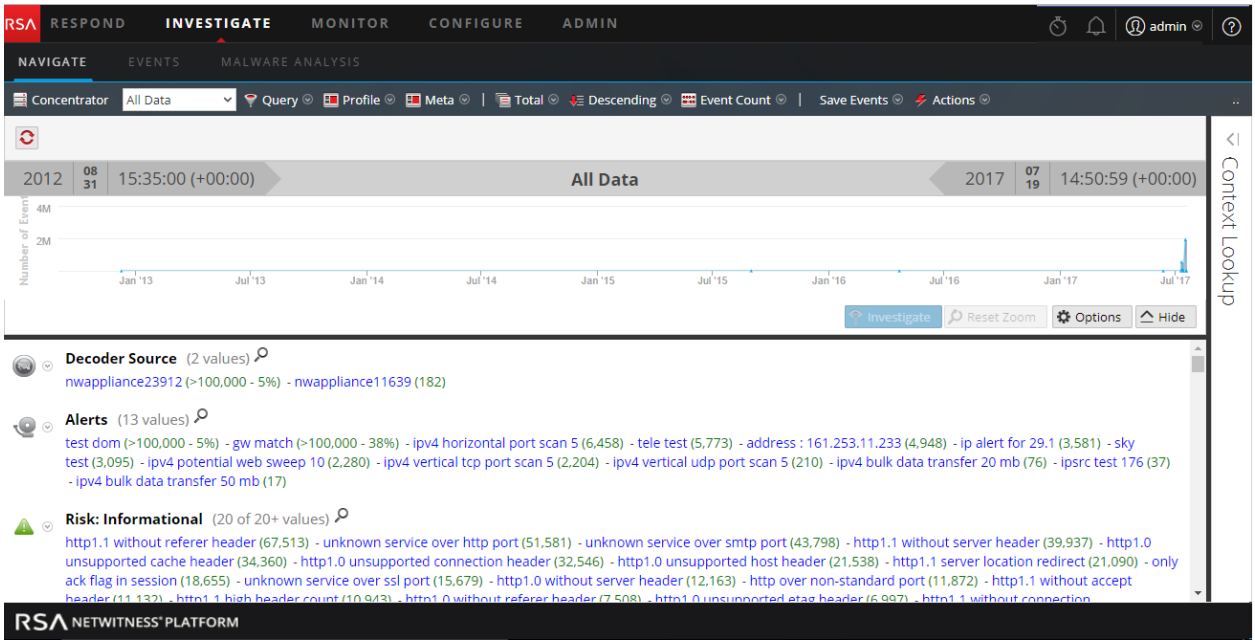
1. Go to **INVESTIGATE > Navigate**.

   If no default service is selected, the Investigate dialog is displayed.



2. Select a service, usually a Concentrator, and click **Navigate**.
3. Select **Load Values** to retrieve meta data.

In the Values panel, scroll down to find the Meta Keys:



The identity feed provides information to selected Decoders and Log Decoders. It associates the Host IP data from the Windows operating system to the user logging into that Host in order to tag all logs associated with that IP and investigate.

Editing a Feed

This topic provides instructions for editing a custom feed using the Custom Feed Wizard.

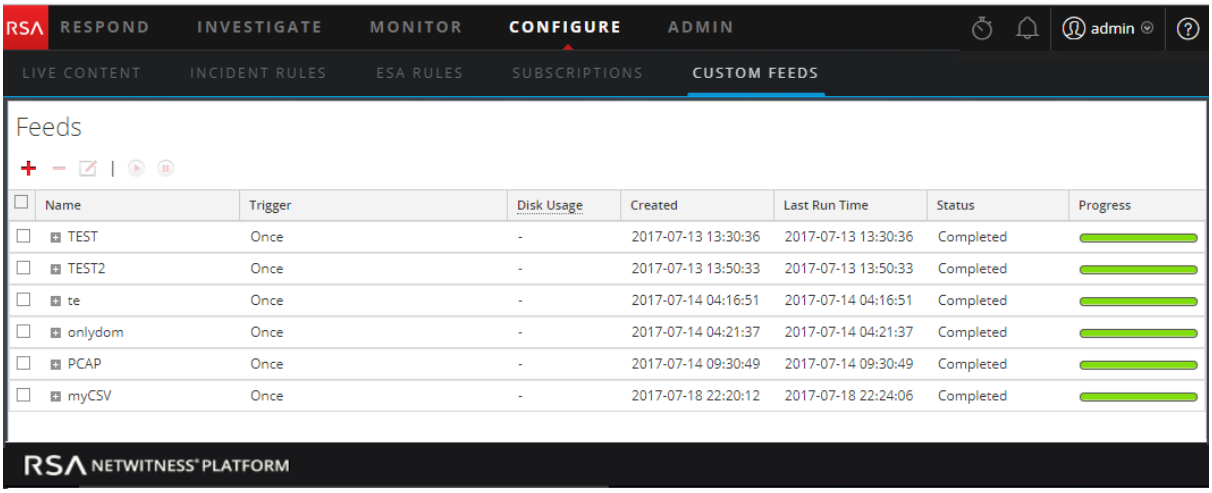
After you edit a feed:

- The feed (**.zip** format) or the file used to create the feed (**.csv** or **.xml**) has been downloaded and edited.
- The feed has been recreated with the updated file and new feed specifications.

To edit an existing feed:

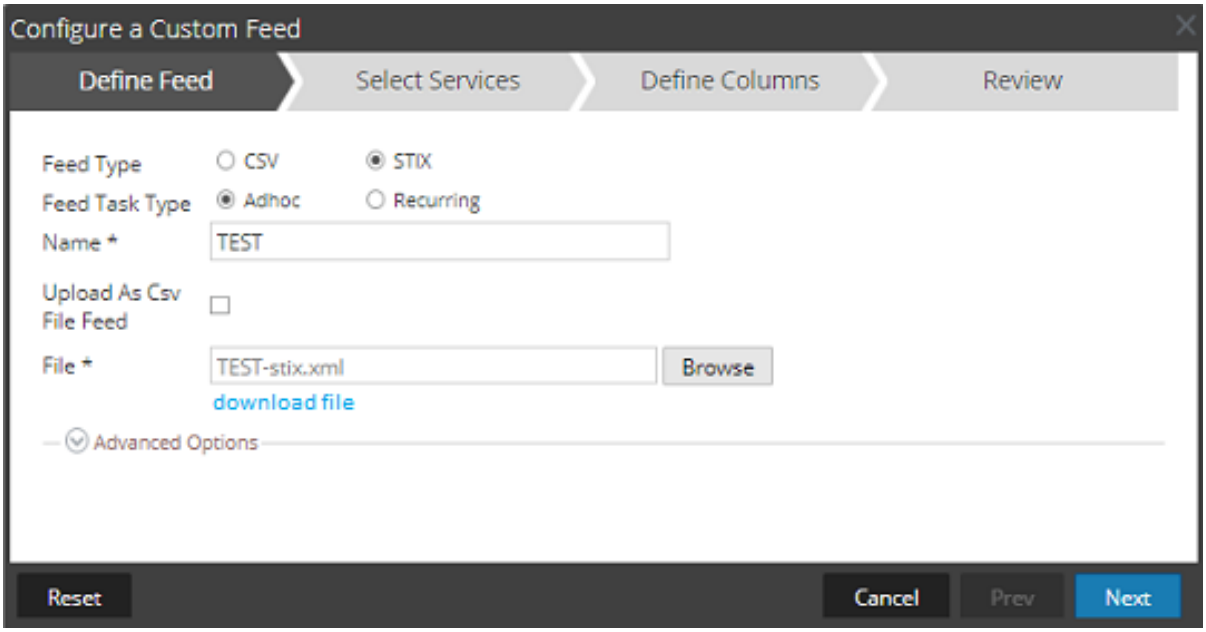
1. Go to **CONFIGURE > CUSTOM FEEDS**.

   The Custom Feeds dialog is displayed.



2. In the toolbar, select a feed and click .

   The Configure Custom Feed or Configure Identity Feed panel opens in the Custom Feed wizard.



3. If you want to edit the feed file:

a. Click **download file**.

   For an Identity feed, the .zip file is downloaded. For a custom feed, the .csv or .xml file is downloaded to your local file system.

b. Edit and save the file.

c. In the **Define Feed** tab, browse for and open the edited file.

4. Edit any other parameters in the **Define Feed** tab, **Select Services** tab, and **Define Columns** tab that apply to the type of feed.
5. Anytime before you click **Finish**, you can:
   - Click **Cancel** to close the wizard without saving your changes.
   - Click **Reset** to clear the data in the wizard.
   - Click **Next** to display the next form (if not viewing the last form).
   - Click **Prev** to display the previous dialog (if not viewing the first form).
6. In the **Review** tab, review the feed information, and if correct, click **Finish**.

The feed is added to the feeds list and progress bar tracks completion. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file is listed in the Feeds list. You can expand or collapse the entry to see how many services are included, and which services are successful.

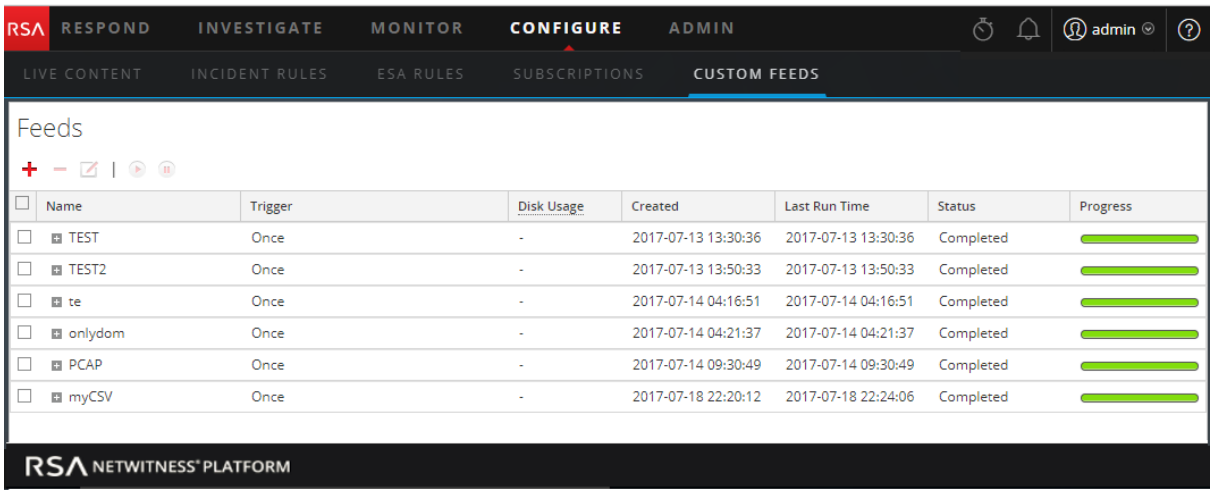
Removing a Feed

This topic provides instructions for removing a feed. You might want to remove a feed when some or all of the information in the feed is no longer useful for your organization.

To remove a feed:

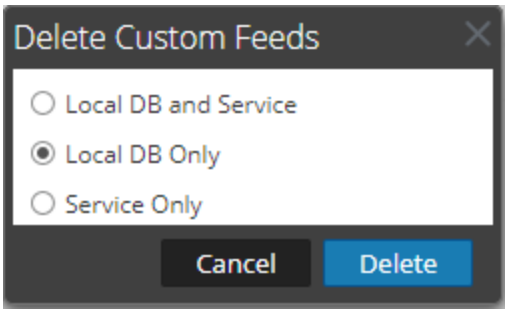
1. Go to **CONFIGURE > CUSTOM FEEDS**.

   The Custom Feeds dialog is displayed.



2. In the toolbar, select a feed and click .

   The Delete Custom Feeds dialog is displayed.



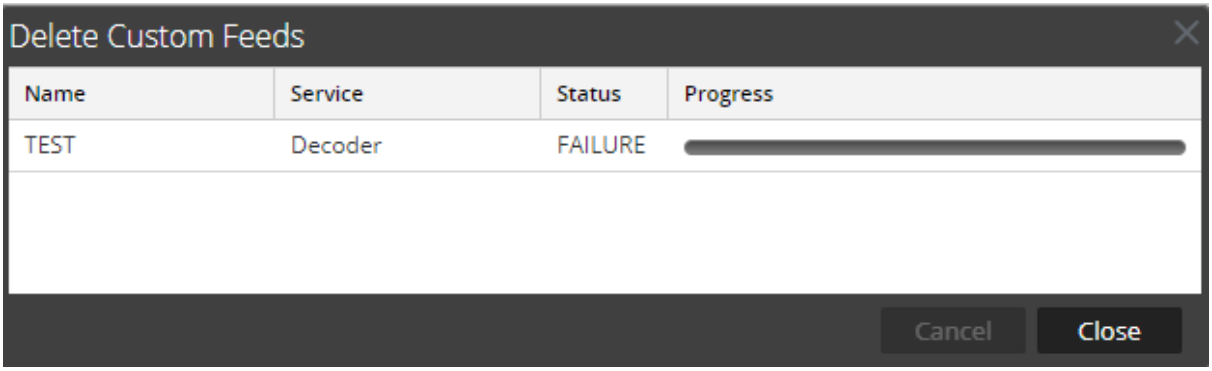
You can select one of the following options to delete the feed:

- If you choose to delete the feed from **Local DB and Service**, the feed is deleted from both the service and the local NetWitness Platform box. The deleted feed will no longer seen on the NetWitness Platform user interface.
- If you choose to delete the feed from **Local DB Only**, the feed is deleted from the local NetWitness Platform box. The deleted feed will not be seen on the NetWitness Platform user interface; however, the last deployed version of the feeds will be present on the service. The undeployed feeds will be deleted forever.
- If you choose to delete the feed from **Service Only**, the feed is deleted from the service. The deleted feed will appear on the NetWitness Platform user interface and can be deployed again

3. Select which feed you want to delete and click **Delete**.

   A warning dialog is displayed.

4. Click **yes** to confirm that you want to delete the feed from the selected areas.



Subscribing to Live Resources

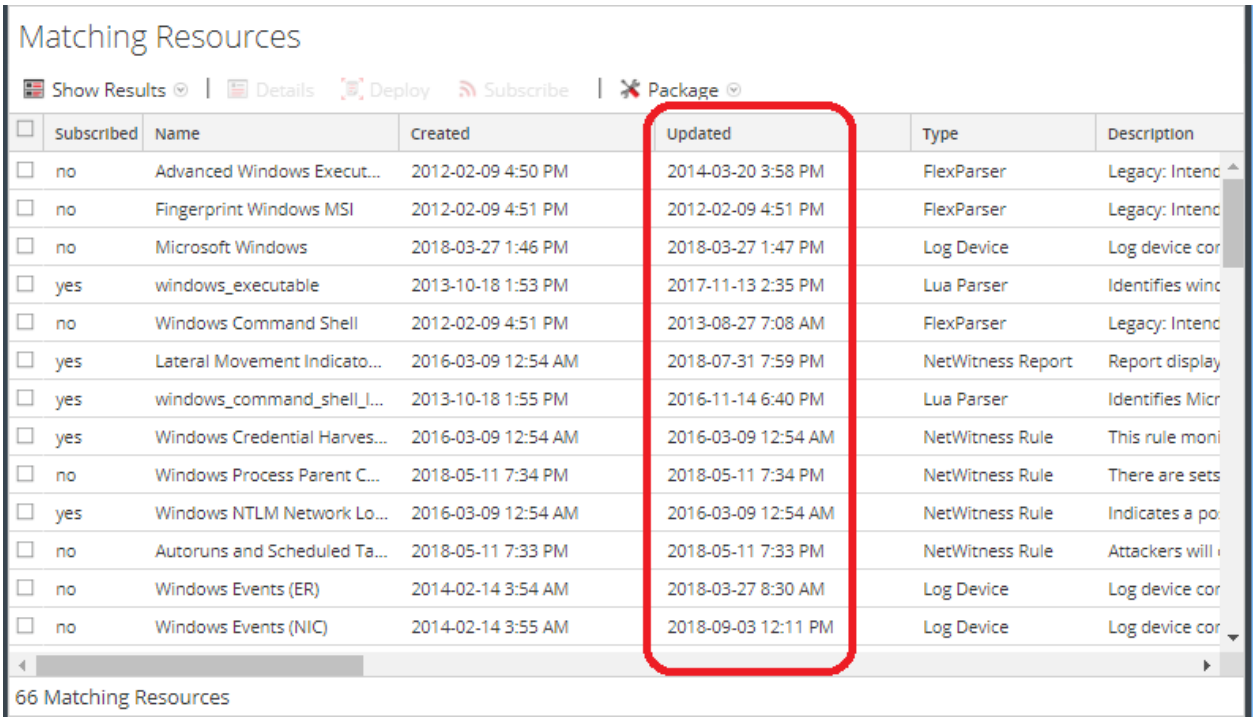
This section describes subscriptions in Live.

Threats and the corporate landscape change over time. RSA periodically reviews existing content to determine whether it needs to be updated based upon current campaigns, or has become irrelevant due to changes in technology or attack techniques and tools.

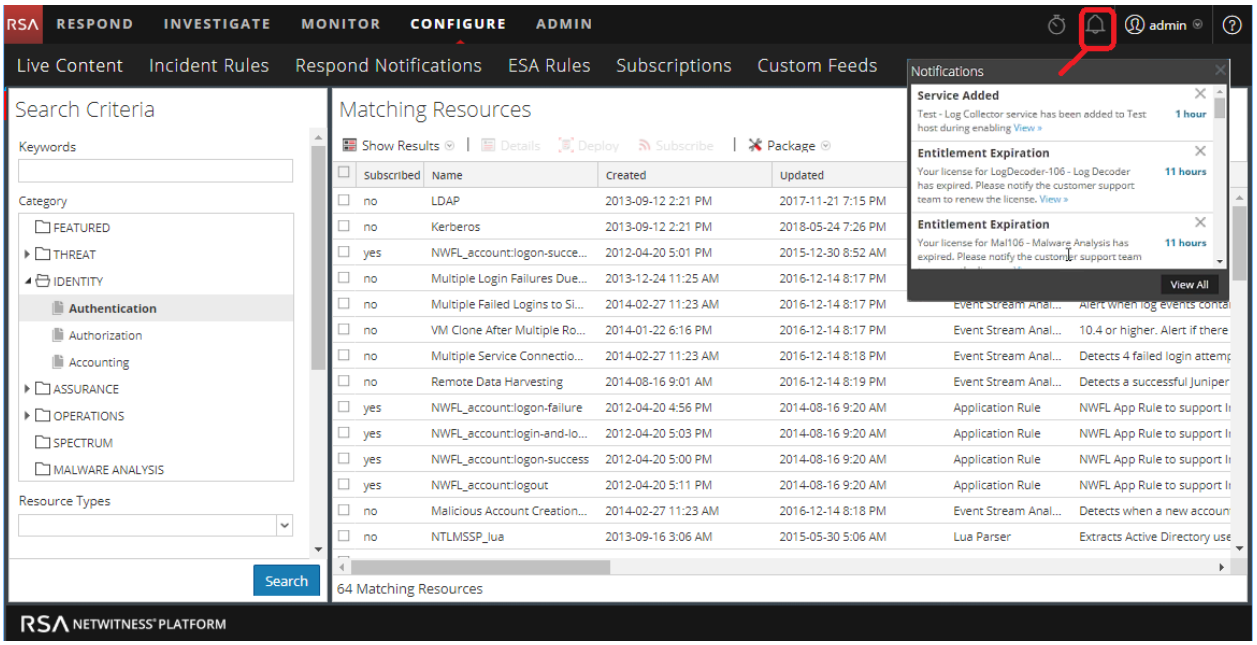
You can discover new content by using the What's New dashlet within the Default Dashboard, or by searching through RSA Live by data range since last deployed. Be sure to subscribe to any content for which you want to receive update notifications.

Subscription Updates

When you view resources in the Matching Resources panel of the Live Content view, there is a column named **Updated**:



This value is also displayed when you select the detailed view for a resource. Every time a resource changes, its **Updated** value changes to match the specific update. If you are subscribed to a resource, and it gets updated, your system is automatically updated with the latest version, and you receive a notification. You can view your notifications by clicking the Notification icon, , from anywhere in the RSA NetWitness® Platform UI.



You can also get email notifications when subscribed resources are updated. System Administrators can add email addresses in the **ADMIN > SYSTEM > Live Services** view. For more information, see the "Live Services Configuration Panel" topic in the *System Configuration Guide*.

Adding Subscribed Resources for Deployment to Services

1. Go to **CONFIGURE > Subscriptions > Deployments**.
2. In the **Groups** panel, select a group.
   Subscribed resources, if any, are listed in the Deployments tab Subscriptions panel.
3. In the **Subscriptions** panel, click .

   The Add Subscription dialog, which lists subscriptions available for deployment, is displayed.
4. Select the subscribed resources that you want to deploy to the services group.
5. Click **Save**.

   The dialog closes and the subscriptions are added to the listing in the Deployments tab, Subscriptions panel. This stages the resources for deployment at the next synchronization.
6. You can click the Synchronize icon, , to immediately synchronize your changes.

Deleting a Subscription

When you delete a subscription to a resource, deployed instances of the resource are not deleted. The deployed resource remains on services until explicitly removed, but the resource is no longer synchronized with the resource in NetWitness Platform Live.

To delete a subscription:

1. Go to **CONFIGURE > Subscriptions**.
2. In the **Subscriptions** tab, select the subscriptions you want to delete.
3. Click , then choose **Delete** to delete your selected resources or **Delete All** delete all subscriptions.

   A dialog asks for confirmation that you want to delete the subscription.
4. To confirm removal, click **Yes**.

   Your selected subscriptions are deleted from the subscriptions list, but any deployed instances of the subscribed resource remain on the services.

Removing Subscribed Resources from the Deployments Subscriptions Grid

Subscriptions that are selected for deployment to a service group are deployed during synchronization. You can remove subscriptions from the Live **CONFIGURE > Subscriptions > Deployments** panel, but any that have actually been deployed to services remain deployed until someone removes them.

To remove resources from the Deployments tab Subscriptions panel:

1. Go to **CONFIGURE > Subscriptions > Deployments**.
2. In the **Groups** panel, select a group.

Subscribed resources, if any, are listed in the Subscriptions panel.

3. In the Subscriptions panel, click .

   A dialog requests confirmation that you want to delete the resource from the service group. The resource is removed from the Deployments tab Subscriptions panel, but is not removed from services on which it is deployed.

Subscribe and Unsubscribe to a Resource

When you subscribe to resources, you will receive notification when new versions of the resources are available.

To subscribe to a resource:

1. Go to **Live > Search** view.
2. In the **Search Criteria** panel, specify search criteria and click **Search**.
3. Select one or more resources and click 
.

   A confirmation dialog is displayed: **By subscribing to these resources, you are indicating that you wish to receive notification when new versions are available.**
4. To confirm that you want to subscribe to the resource, click **OK**.

   The resource is added to the subscriptions managed in the Subscriptions tab and is available for deployment in the Deployments tab.

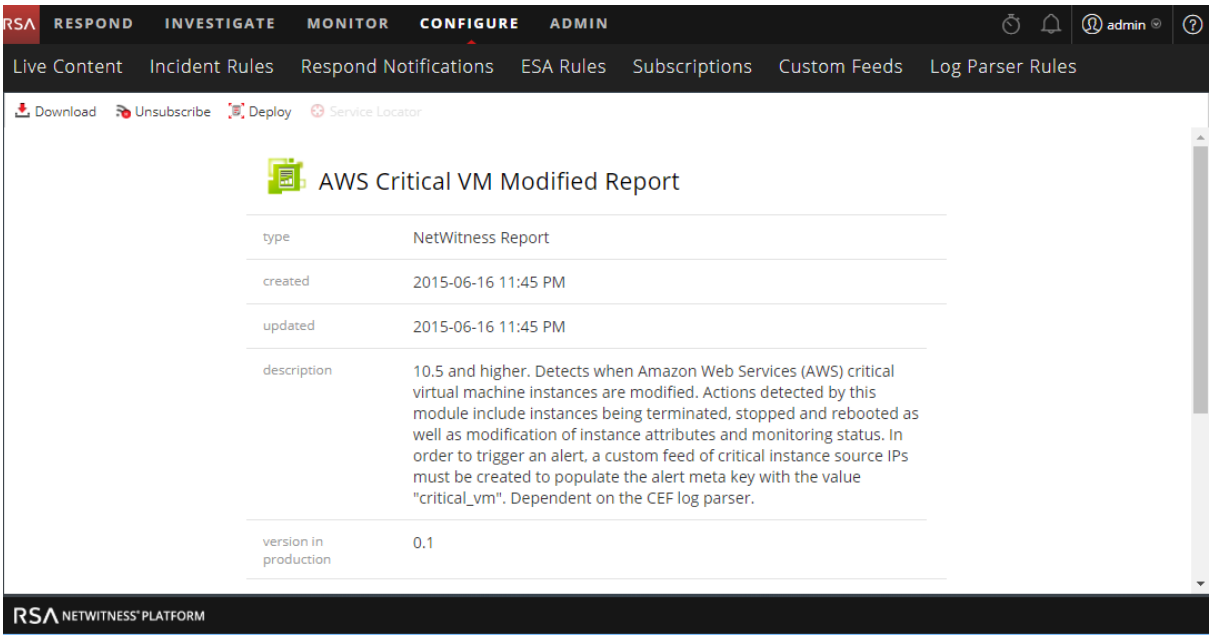
When unsubscribing from a resource, you have the option to leave the resource on services on which it is deployed or to remove it from services.

To unsubscribe from a resource:

1. Open a detailed view of a resource in one of the following ways:
   - Perform a search, **CONFIGURE > Live Content** > enter search criteria, then select the resource in the Matching Resources panel, then click

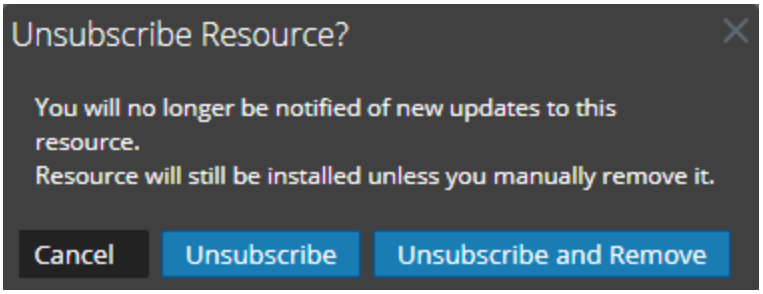
.
   - View subscriptions, **CONFIGURE > Subscriptions**, select the resource from the Subscriptions list, then click

.



2. With the detailed view of a resource displayed. click 
.

   A confirmation dialog is displayed.



3. Do one of the following:
   - To confirm that you want to unsubscribe from the resource and leave it on the services where it is deployed, click **Unsubscribe**.
   - To confirm that you want to unsubscribe from the resource and remove it from the services where it is deployed, click **Unsubscribe and Remove from Services**.
   - To close the dialog without unsubscribing, click **Cancel**.

   The selected action is applied.

Viewing Subscribed Resources Selected to Deploy on Services

In the **CONFIGURE > SUBSCRIPTIONS > Deployments** tab you can view subscribed resources that have been selected for deployment on services.

To view subscribed resources that have been selected for deployment on services:

In the **Groups** panel, select a group, and expand it to view services in the group. The resource subscriptions selected for deployment are listed in the Deployments tab Subscriptions panel.

Miscellaneous Live Services Procedures

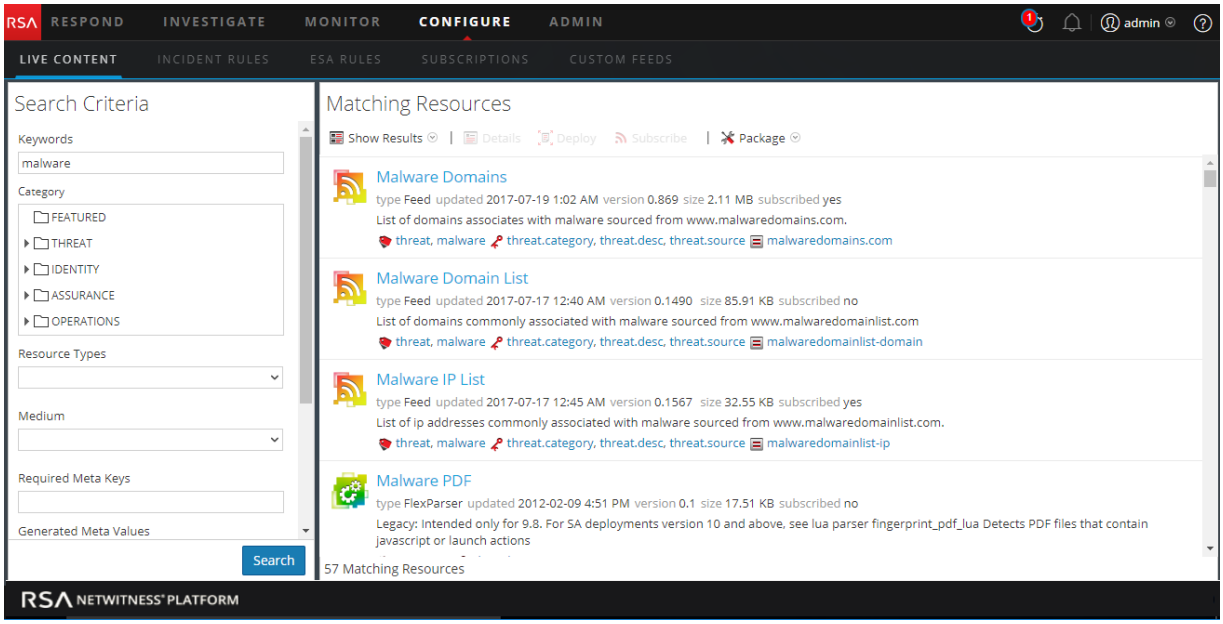
This section describes several other procedures.

Displaying Resource Details in Live Resource View

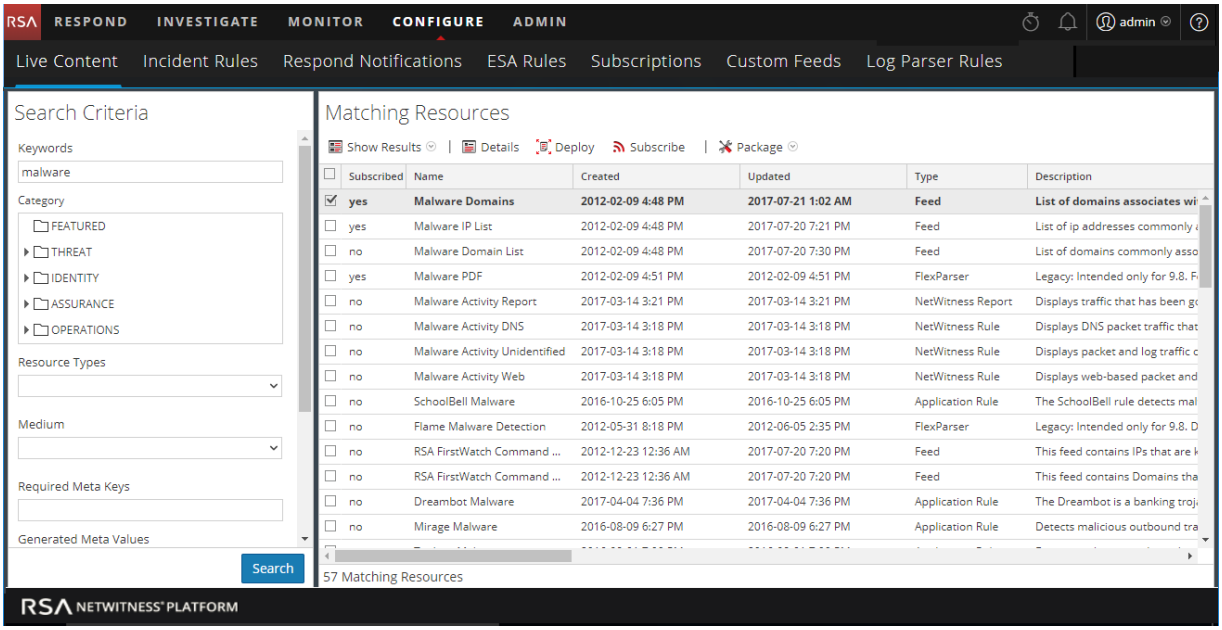
After you select a resource (in the Live Resource View), you can view its detailed information.

To open a separate tab in the Live Resource view with details of a selected resource, do one of the following:

- If you are viewing the **Detailed Results**, click the resource type icon or the resource name.



- If you are viewing the list results, double-click a resource or select a resource and click **Details**.



Downloading a Resource

You can download a single resource from the Live Resource View.

To download a resource:

1. Go to **CONFIGURE > Live Content**.
2. In the **Search Criteria** panel, enter the criteria needed to return the resource you want to download.
3. Select a single resource, then click Details.
4. Click Download.

The resource is saved as a ZIP archive to your local Downloads folder.

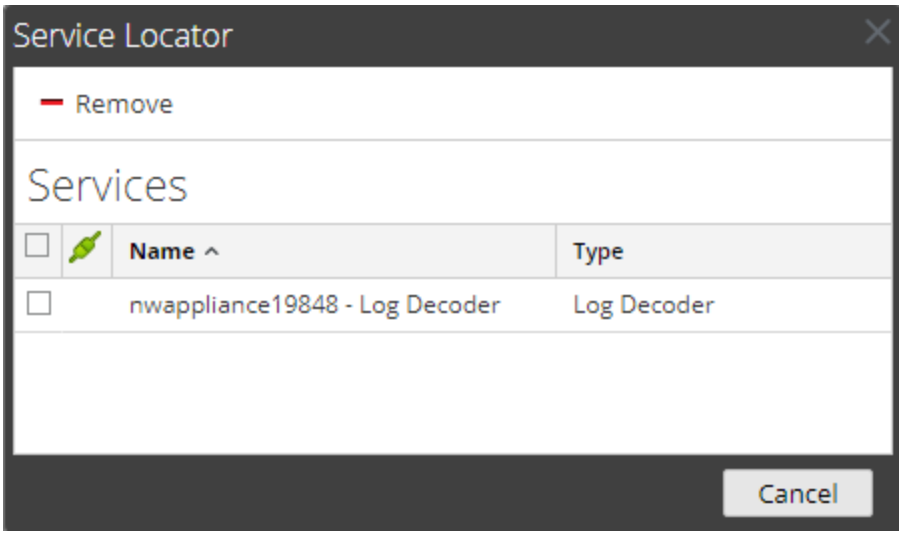
Locating and Removing a Deployed Resource from Services

You can locate and remove a deployed resource from services from the Live Resource View.

To view a list of services on which a resource is deployed:

1. With a resource displayed in the **Resource View**, click Service Locator.

   The Service Locator dialog is displayed.

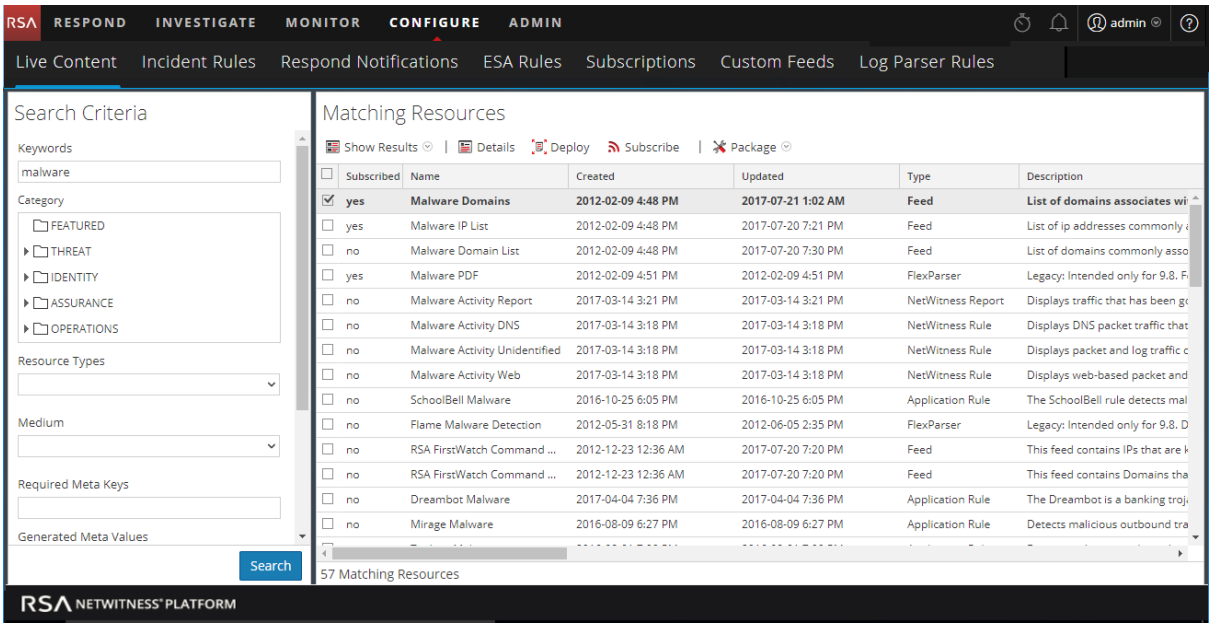


2. Select one or more services in the **Services** list.
3. Click .

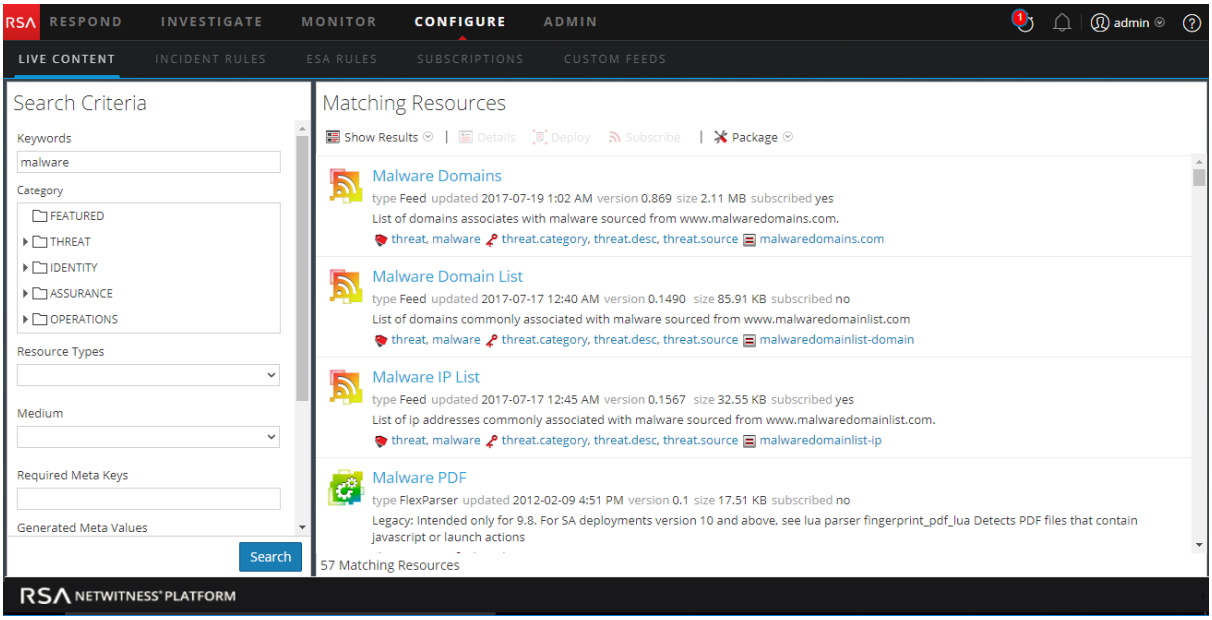
   The resource is removed from the selected services.

Showing Results as a List or in Detail

1. Select **Show Results > Grid** to change to grid results when viewing detailed results.



2. Select **Show Results > Detailed** to change to detailed results when viewing grid results.



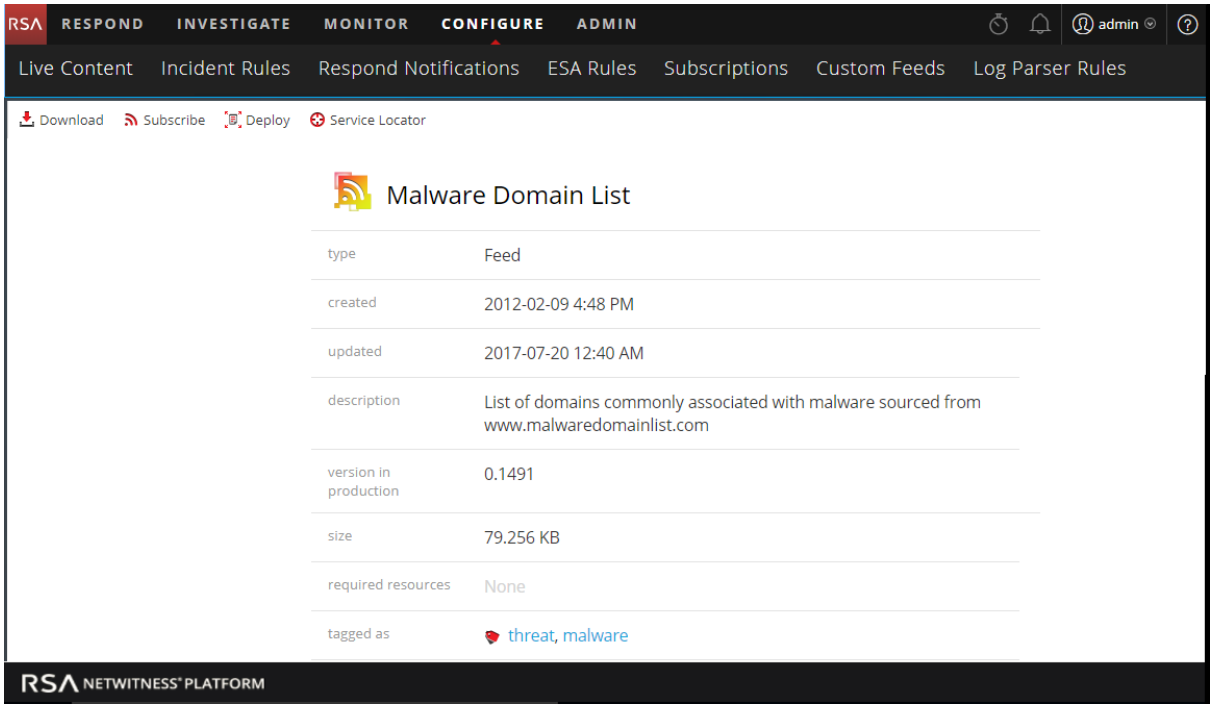
Viewing Resource Details

You can display detailed information about a subscribed resource in the Resource View.

To view details:

1. In the **Subscriptions** tab, select a single subscription.
2. Click Details .

The details of the resource are displayed in the Resource View.



References

This topic is a collection of references, which describe the user interface and more detailed information about how Live works in RSA NetWitness Platform. These topics are presented in alphabetical order.

Live Configure View

In the Live Configure view, NetWitness Platform provides integrated tools for managing Live resources. You can manage resource subscriptions, deployments to services and discontinued resources. The required role to access this view is **Configure Live Resources**. For a high-level description of how to use the different views in NetWitness Platform Live, please read Live Services Management.

To access this view, navigate to **CONFIGURE > Subscriptions**. The view has three tabs: Deployments Tab, Subscriptions Tab, and Discontinued Resources Tab.

Deployments Tab

The Deployments tab provides a user interface in the Live Configure view for:

- Viewing subscribed resources that are selected for deployment on services in a service group.
- Selecting subscribed resources to deploy to services in a service group.
- Removing resources that are selected for deployment on services in a service group.

The resources listed here are not deployed immediately after adding to a service group. Instead the subscribed resources are pushed to the services when NetWitness Platform synchronizes with RSA NetWitness Platform Live. The synchronization schedule is configured in the Live Configuration panel. Additionally, you can synchronize immediately in the **CONFIGURE > Subscriptions > Deployments** tab.

Likewise, resources deleted from the Deployments panel are not deleted from service where they have been deployed. To delete resources from services, delete them in the Live Resource View.

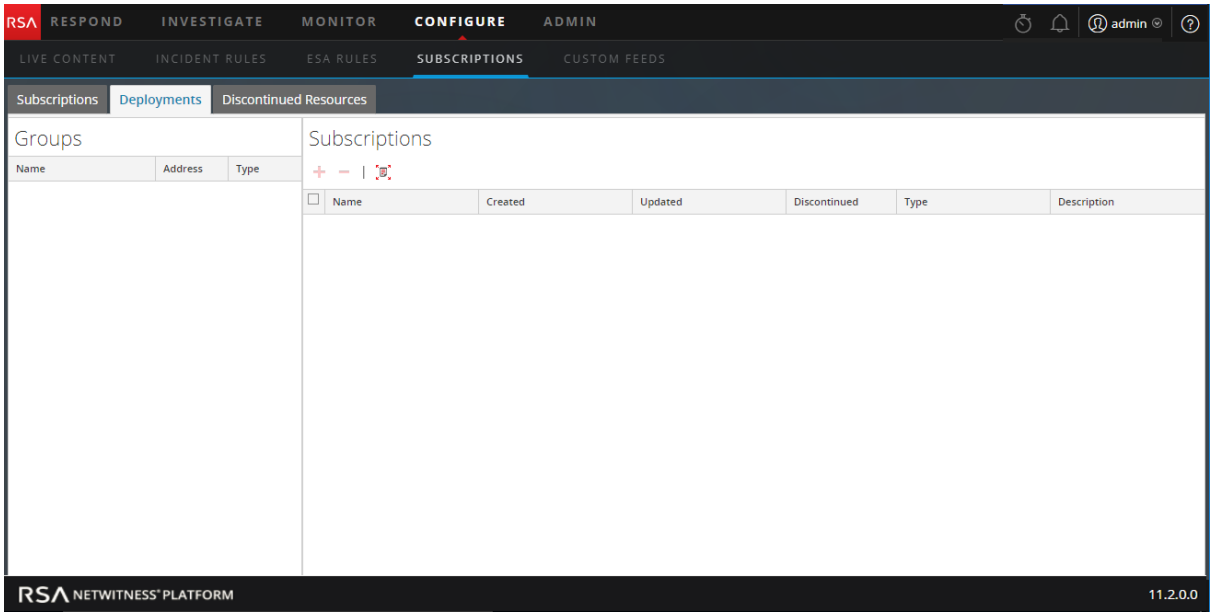
The required permission to access this view is **Manage Live Resources**.

To access this view:

1. Go to **CONFIGURE > Subscriptions**.

   The **Subscriptions** tab is displayed.

2. Click the **Deployments** tab.



The Deployments tab has two panels: **Groups** and **Subscriptions**.

Groups Panel

The Groups panel is a static display of configured service groups that were created in the Administration Services view. Selecting a group in the Groups panel populates the Subscriptions panel with a list of subscriptions that are selected for deployment on the services in the service group.

Feature	Description
Name	Displays the service group name. Clicking the plus sign displays a nested list of services in the group.
Address	Displays the IP address of each service in the group.
Type	Displays the type of service.

Subscriptions Panel

The following table describes the features in the Subscriptions panel.

Feature	Description
+	Click + to open a dialog that lists subscriptions that were added in the Live Search view or in the Live Resource view and are available for deployment.
−	Click − to delete the selected subscriptions from the deployment list for service group.
	Click to synchronize your resources to the latest versions available on Live.
Name	Displays name of the resource.

Feature	Description
Created	Displays date and time that the resource was created.
Updated	Displays date and time that the resource was last updated.
Type	Displays type of resource.
Description	Displays description of the resource.

Subscriptions Tab

Subscriptions are NetWitness Platform Live resources to which you subscribed in the Live Search view or Live Resource view. When you subscribe to a resource, you agree to receive updates on a regular basis from RSA NetWitness Platform Live. The choices made in the Live Configuration panel determine the synchronization frequency and also whether you receive update notifications through email. In addition, if you don't want to wait for the next update, you can force an immediate synchronization.

The Subscriptions tab provides a way to manage subscriptions. Each resource to which NetWitness Platform is subscribed is listed in this tab.

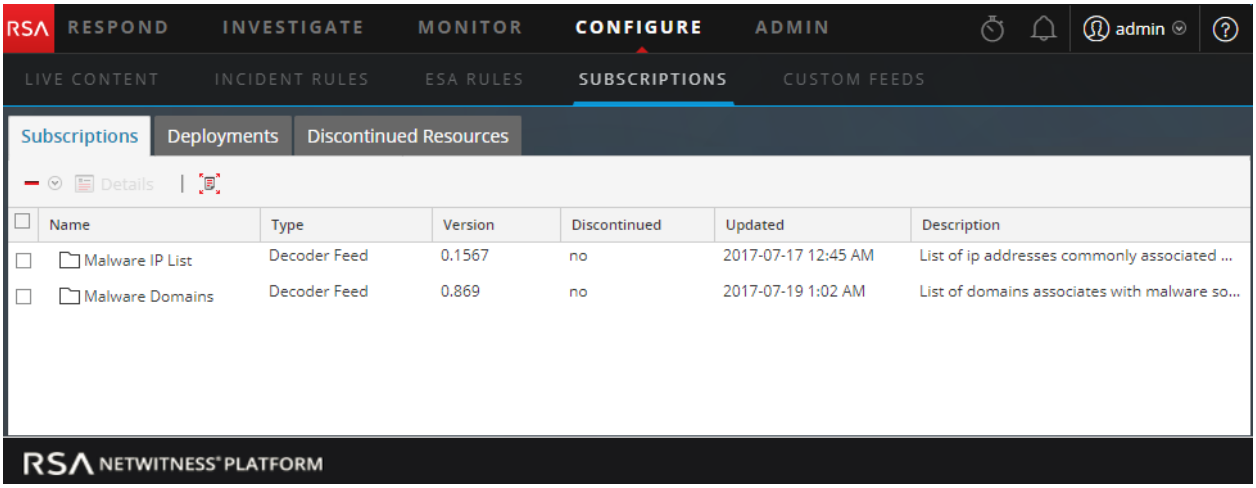
In the Subscriptions tab, you can:

- View all resources to which this NetWitness Platform instance is subscribed.
- Open a detailed view of a subscription in the Live Resource View.
- Delete a subscription.

Note: Subscribing to a resource does not deploy the resource to any services. To deploy one or more subscribed resources, go to the Deployments tab. To deploy a single resource manually, use the Deploy option in the Resource View.

The required permission to access this view is **Manage Live Resources**.

To access this view, in the main menu, select **CONFIGURE > Subscriptions**. The Subscriptions tab is displayed.



The **Subscriptions** tab has a toolbar and a grid.

Toolbar

This table describes the options available in the toolbar.

Feature	Description
	Deletes the selected subscriptions.
	Displays the details of a single subscribed resource in the Resource View.
	Check the Live Server for the latest discontinued resources.

Grid

Column	Description
	Selects subscribed resources to view in detail or delete. You can view details for a single resource. You can delete one or more resources from the subscribed resources, in effect unsubscribing.
Name	Displays name of the subscribed resource.
Type	Displays type of subscribed resource.
Version	Displays version of the subscribed resource.
Discontinued	Indicates the status of the discontinued resources for the subscribed resource. **Yes** - Resource is discontinued. **No** - Resource is not discontinued. **--** - The Live Server is not checked for the discontinued resources.
Updated	Displays date and time when the subscribed resource was last updated.
Description	Displays description of the subscribed resource.

Discontinued Resources Tab

The Discontinued Resources tab provides a user interface in the Live Configure view:

- Scan the services for the discontinued resources.
- Remove the discontinued resources from any service or service group.

Note: Discontinued content still appears. With discontinued content there just won't be any updates, and users won't see these items when they search in Live, unless they check the **Include Discontinued Resources** box while searching.

In the RSA Content space on RSA Link, you can view the complete, up-to-date list of discontinued resources (Discontinued Content). For each resource, there is a description of why it was discontinued. Use these details to determine whether or not to remove a discontinued resource from your installation. .

The required permission to access this view is **Manage Live Resources**.

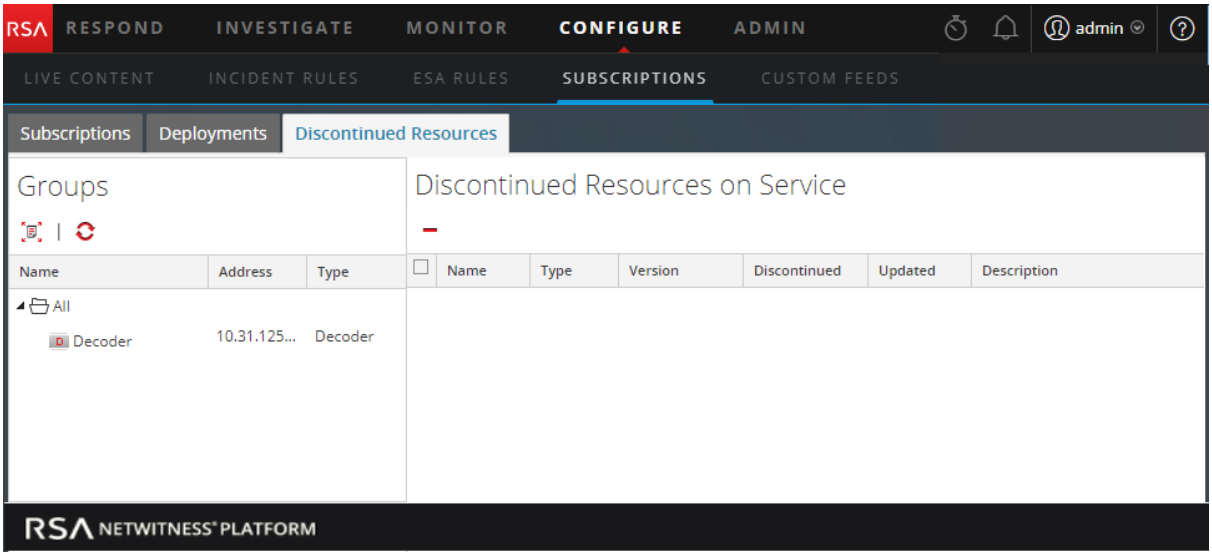
To access this view:

1. Go to **CONFIGURE > Subscriptions**.

   The **Subscriptions** tab is displayed.

2. Click the **Discontinued Resources** tab.

   The Discontinued Resources tab is displayed.



The Discontinued tab has two panels: Groups and Discontinued Resources on Service.

Groups Panel

The Groups panel is a static display of configured service groups that were created in the Admin Services view. Selecting a group in the Groups panel populates the Discontinued Resources panel with a list of discontinued resources which are deployed on the selected service or service group.

Feature	Description
	Click the button to scan the services for a discontinued resource.
	Displays the current status of the discontinued resources on a service. **Note:** The status of a service may change while the services are being scanned.
Name	Displays service group name. Clicking the plus sign displays a nested list of services in the group.
Address	Displays IP address of each service in the group.
Type	Displays type of service.

Discontinued Resources on Service Panel

The following table describes the features in the Discontinued Resources on Service panel.

Feature	Description
−	Click the button to delete the selected resources from the service or service group.
Name	This is the name of the resource.
Type	This is the type of resource.
Version	Version of the discontinued resource.
Discontinued	Indicates the status of the discontinued resources for the subscribed resource. **Yes** - The resource is discontinued. **No** - The resource is not discontinued. **--** - The Live Server is not checked for the discontinued resources.
Updated	Displays date and time that the resource was last updated.
Description	Displays description of the resource.

Live Feeds View

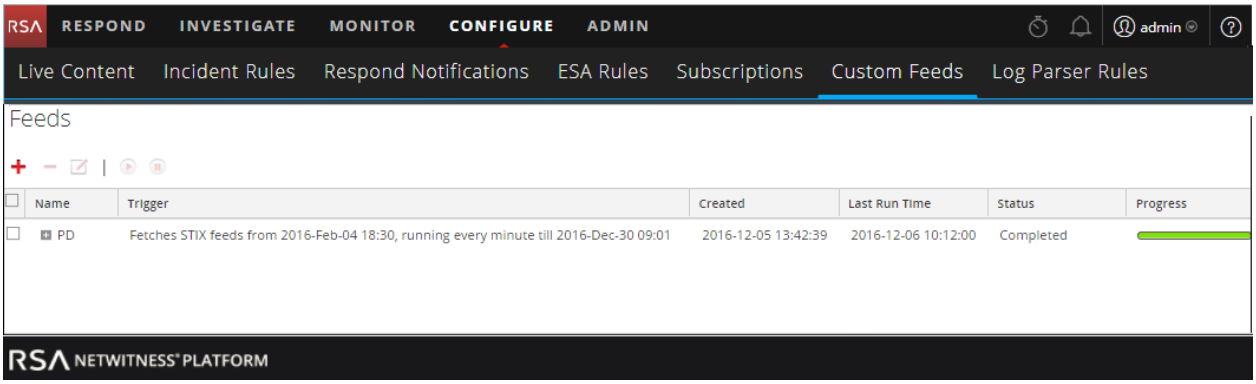
Use the Live Feeds View to:

- Create custom feeds.
- Create identity feeds.
- Edit feeds.

The required role to access this view is **Manage Devices**.

To access this view, navigate to **CONFIGURE > Custom Feeds**.

This is an example of the Feeds view.



The **Feeds** tab has a toolbar and a grid.

Toolbar

This table describes the options in the toolbar.

Feature	Description
	Initiates the creation of a custom or identify feed by displaying the **Setup Feed** dialog is displayed.  • Custom Feed opens the **Configure a Custom Feed** wizard. • Identity Feed opens the **Configure Identity Feeds** wizard.
	Deletes the feed that you selected.
	Opens the Configure Custom Feed or Configure Identity Feed wizard for the feed that you selected (see Editing a Feed.
	Start or resume data feed.
	Stop or pause data feed.

Feeds Grid

This table describes the columns in the grid.

Column	Description
	Selects a feed.
Name	Name of the feed. **Note:** You can now use special characters to define the name of the custom feed.
Trigger	Displays how often the feed runs which is determined by what you defined in **Feed Task Type** when the feed was created.
Created	Displays date and time when the feed was created.
Disk Usage	Displays the MongoDB storage size used by the TAXII feed.
Last Run Time	Displays date and time when the feed was last run.

Column	Description
Status	The status of the feed.
Progress	Progress bar.

Live Resource View

The Live Resource View shows a detailed view of a selected resource, and has the following options:

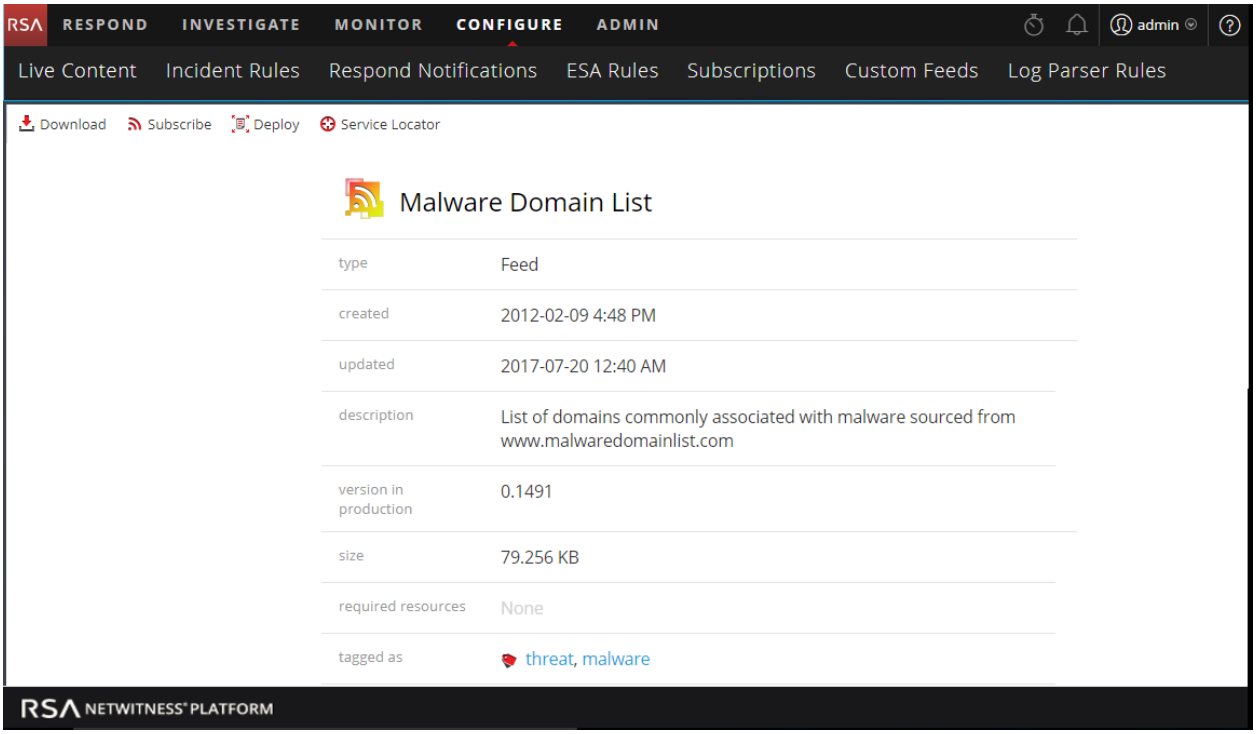
- Download the resource.
- Subscribe or unsubscribe the resource.
- Deploy the resource to services.
- Locate services on which the resource is deployed and remove the resource from services.

The required permission to access this view is View Live Resource Details.

To access this view, do one of the following:

1. Go to **CONFIGURE > LIVE CONTENT > Search Criteria**.
2. In the Live Search view, **Detailed Results**, click the resource type icon or the resource name.
3. In the Live Search view, **Grid Results**, double-click a resource or select a resource and click **Details**.

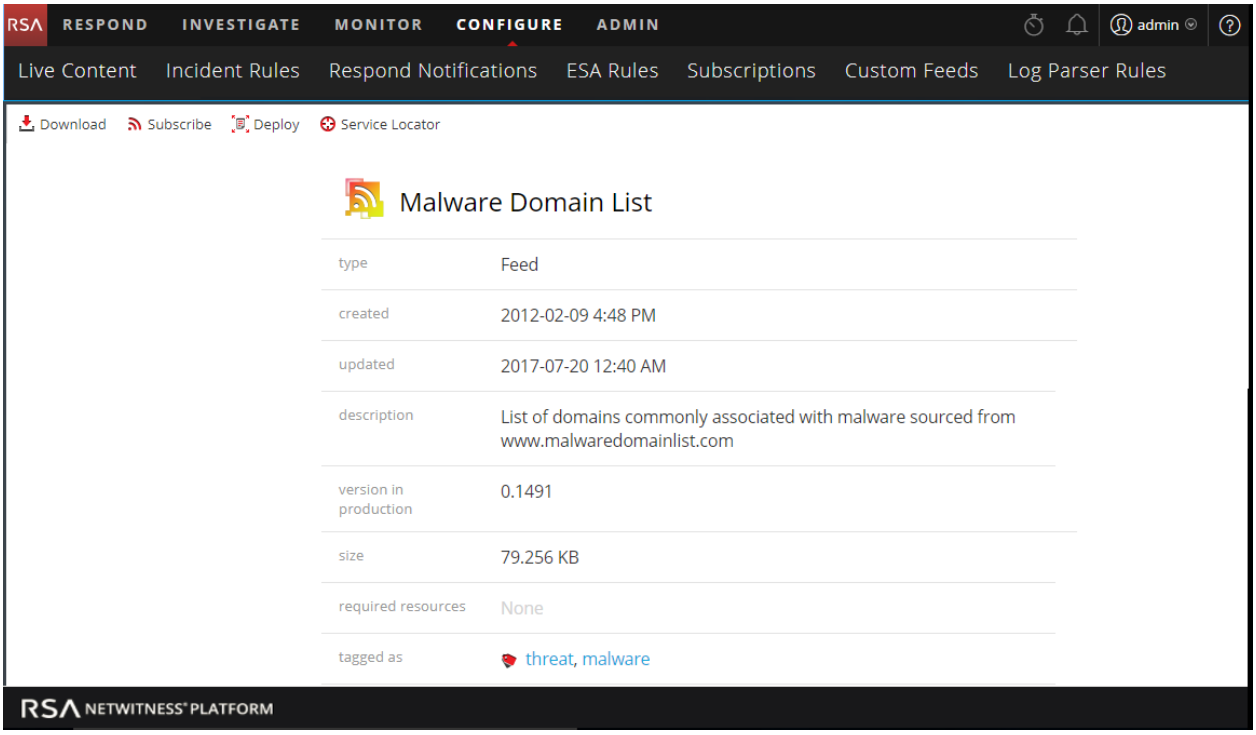
This is an example of the Resource view.



The Live Resource View has a detailed view of a single resource and a toolbar.

Resource Details

This is an example of the resource details displayed in the Resource View.



The following table describes the elements in the Resource Details section.

Feature	Description
Resource Type Icon	A graphic representation of the resource type, for example .
Name	The name of the resource, for example, **fingerprint_office_lua**.
Type	The type of resource, for example, **RSA Lua Parser**.
Created	The date the resource was created, for example, **2013-09-15 02:16 PM**.
Updated	The date the resource was last updated, for example, **2013-09-15 02:16 PM**
Description	The description of the resource, for example, **Identifies Microsoft Office 95, 2007 Word, Excel, and PowerPoint documents**.
Version in production	The version of the resource, for example, **0.1**.
Size	The size of the resource, for example, **9.079 KB**.
Required Resources	A list of resources on which this resource depends, for example, **NetWitness Lua Library**. Clicking a resource replaces the currently displayed details with the details of the one you clicked.

Feature	Description
Tagged as	The tags that apply to the resource. In the example, the tags are **featured, informational**. Clicking a tag opens the Live Search View with the search narrowed to match resources with that tag.
Required Meta Keys	The meta keys that apply to the resource. In the example, there are no meta keys required. Clicking a meta key opens the Live Search View with the search narrowed to match resources with that meta key.
Generates Meta Values	The meta values that the resource generates. In the example, there are no meta values generated. Clicking a meta value opens the Live Search View with the search narrowed to match resources with that meta value.
Permissions	The permissions required for the resource.

Resource View Toolbar

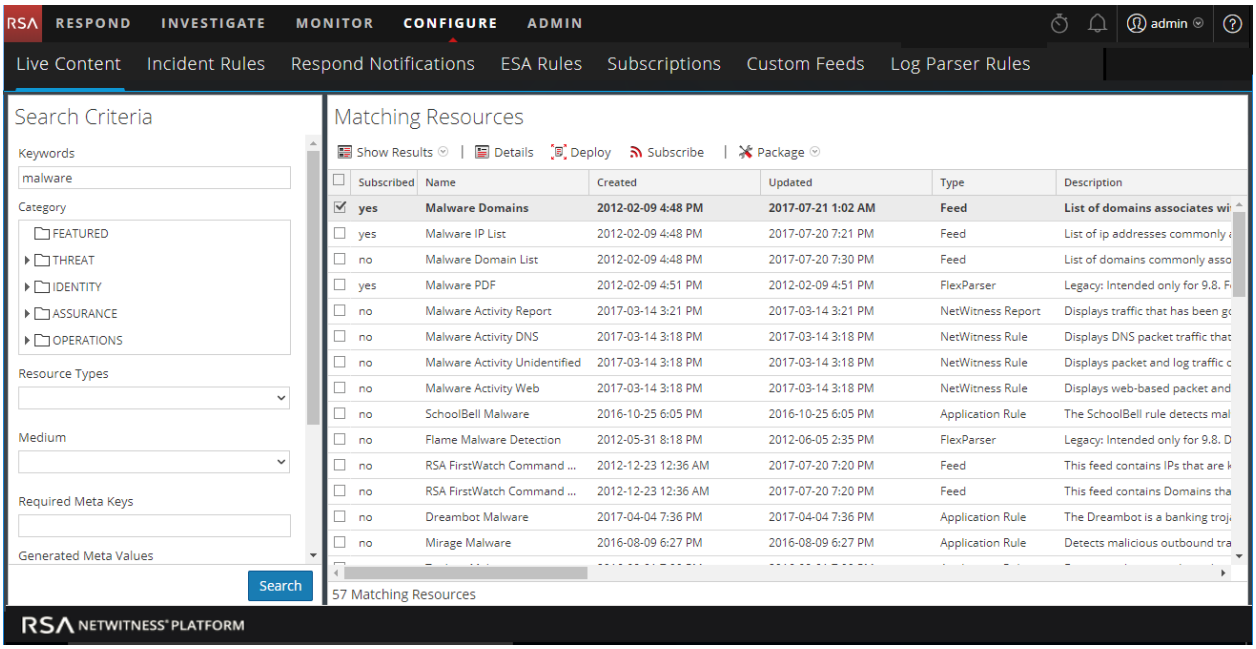
This table describes the Live Resource view toolbar options.

Feature	Icon	Description
Download		This option downloads the resource currently displayed in the Resource View.
Subscribe or Unsubscribe		This option subscribes to or unsubscribes from the resource currently displayed in the Resource View. • Clicking **Subscribe** opens a dialog notifying that you are agreeing to receive notification when the selected resources are updated. You can cancel or click **OK**. • Clicking **Unsubscribe** asks for confirmation that you want to stop receiving notification when the selected resources are updated. You can then choose to cancel or you can click **Unsubscribe** or **Unsubscribe and Remove**, which also removes the resource from services on which it is deployed.
Deploy		This option provides a way to deploy the resource currently displayed in the Resource View. Clicking **Deploy** opens the Manual Resource Deployment dialog.
Service Locator		This option displays a list of services on which the currently displayed resource is deployed. You can remove the resource from all services or selected services.

Live Search View

The Live Search view provides the ability to browse the configured Live CMS for resources. Once matching resources are found, you can view details, subscribe to resources, and deploy resources to services and service groups.

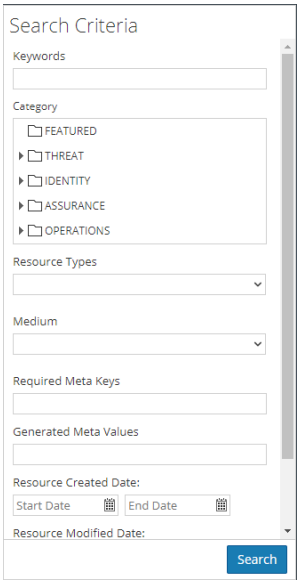
This is an example of the Search view.



The Live Search view has a panel for specifying search criteria and a panel that displays matching resources. The Search Criteria panel is collapsible to provide more width for viewing the Matching Resources panel.

Search Criteria Panel

This is an example of the Search Criteria panel.



The following table provides descriptions of the Search Criteria panel features.

Feature	Description
Keyword(s)	Enter a keyword or keywords to browse for resources that have the keyword in the resource name or the resource description. You can use wildcards when you enter a keyword.

Feature	Description
Category	The categories mirror the hierarchical Investigation Model that RSA uses to organize resources. The purpose of the Investigation model is to deliver an accurate path to information security incident response. For more information, see the Investigation Model topic in the RSA Content space on RSA Link.
Resource Types	Select resources types from the drop-down list to filter resources by type of resource. Possible values are: • Advanced Analytics (Warehouse) • Application Rule • Bundle • Correlation Rule • Event Stream Analysis Rule • Feed • FlexParser • Log Collector • Log Device • Lua Parser • Malware Rules • NetWitness List • NetWitness Report • NetWitness Rule **Note:** Some rules that have been deployed to an earlier version of RSA NetWitness® Platform may not deploy or execute on NetWitness 11.x. For more information, see the Troubleshooting Live Services.
Medium	Select one or more mediums from the drop-down list to search for content based on the meta data source. Available values for medium are as follows: • **log**: applied to content that uses meta derived from log data • **packet**: applied to content that uses meta derived from network packets • **log and packet**: applied to content that correlates meta derived across log and packet data
Tags	Select meta tags from the drop-down list to browse based on how the meta is tagged. For example, to browse resources for a Log Decoder, select the **netwitness for logs** tag. Alternatively, you can click a tag in the Matching Resources panel to insert that tag in this field.
Required Meta Key(s)	Enter a specific meta key; for example, **threat.source**. Alternatively, you can click a meta key in the Matching Resources panel to insert that tag in this field.
Generated Meta Value(s)	Enter a generated meta value; for example, **netwitness**. Alternatively, you can click a generated meta key in the Matching Resources panel to insert that tag in this field.

Feature	Description
Research Created Date	Specify a date range during which resources were created. For example, to browse resources that were created between January 1 and January 4, you select January 1 as the start date and January 4 as the end date. You must enter dates in mm/dd/yyyy format or you click and pick dates from a calendar.
Research Modified Date	Specify a date range during which resources were modified. For example, to browse resources that were modified between January 1 and January 4, you select January 1 as the start date and January 4 as the end date. You must enter dates in mm/dd/yyyy format or you click and pick dates from a calendar.
Search	Click **Search** to send the search request to the Live server. More specific search criteria return matching resources more quickly.
Cancel	Click **Cancel** to cancel the search in progress.
Include Discontinued Resources	Check **Include Discontinued Resources** to include the discontinued resources in the search result. For an up-to-date list of resources that have been discontinued, see the Discontinued Content topic.

Matching Resources Panel

The Matching Resources panel displays search results based on the selections made in the Search Criteria panel. Results are initially displayed in a grid, but you can switch between two Show Results options: Detailed or Grid.

Detailed Results

In the detailed results, you can click a tag, meta key, or resource meta value to auto fill the Search Criteria panel and pivot the search results.

The following table describes the elements in the detailed results.

Feature	Description
Resource Type Icon	A graphic representation of the resource type. For example .
Name	The name of the resource, for example, **Group Management**. **Note:** (Discontinued) is displayed next to the resource name if a resource is discontinued.
Type	The type of the resource, for example, **Rule**.
Updated	The date when the resource was last updated, for example, **2015-09-15 4:27 PM**.
Version	The version of the resource, for example, **0.1**.
Size	The size of the resource, for example, **153 B**.
Subscribed	Subscription status: • **yes**: This NetWitness Platform instance is subscribed to this content resource. • **no**: This NetWitness Platform instance has not subscribed to this content resource.
Description	The description of the resource, for example, **Compliance Rule-Group Management**.

Feature	Description
Tags	The tags that apply to the resource. Clicking a tag narrows the search to resources with that tag. For example, .
Meta Keys	The meta keys that apply to the resource. Clicking a meta key narrows the search to resources with that meta key. For example, .
Resource Meta Values	The meta values generated by the resource. Clicking a meta value narrows the search to resources that generated the meta value. For example, .

Grid Results

In the grid view, you can select one or more resources and use additional options in the toolbar to view the details of a single resource, subscribe to resources, and deploy resources.

The following table describes the elements in the grid results.

Feature	Description
Subscribed	Subscription status: • **yes**: This NetWitness Platform instance is subscribed to this content resource. • **no**: This NetWitness Platform instance has not subscribed to this content resource.
Name	The name of the resource, for example, **Group Management**. **Note:** The resource name is displayed in red color if it is discontinued.
Created	The date when the resource was created, for example, **2015-08-12 3:11 PM**.
Updated	The date when the resource was last updated, for example, **2015-09-15 4:27 PM**.
Type	The type of the resource, for example, **Rule**.
Discontinued	The status of the discontinued resources: • **yes**: The resource that matches the search criteria is discontinued • **no**: The resource is not discontinued • **--**: The Live Server is not checked for the discontinued resources
Description	The description of the resource, for example, **Compliance Rule-Group Management**.
Toolbar	
	This menu offers two ways to view search results: **Detailed** and **Grid**.
	This option applies to a single selected resource. Clicking **Details** opens the selected resource in the Live Resource view.
	This option applies to one or more selected resources.

Feature	Description
Subscribe	This option applies to one or more selected resources. Clicking **Subscribe** opens a dialog that asks for confirmation that you want to receive notification when the selected resources are updated.

Package	This menu offers two packaging functions for the selected resources:
	• **Create**: creates a **resourceBundle.zip** file that contains the selected resources and opens a dialog in which you can either:
	  ◦ open the file, or
	  ◦ save the file for subsequent deployment.
	• **Deploy**: opens the Deployment Wizard, in which you can choose a **resourceBundle.zip** file and deploy it.

See Also

- For more information on Deployment (Deploy), see Find and Deploy Live Resources.
- For more information on Deploying a Package (Package), see the Resource Package Deployment Wizard,.

Resource Package Deployment Wizard

If you have created a package of resources and saved it on a network drive, you can use the Resource Package Deployment Wizard to deploy the resources manually to a service or a service group without subscribing to the resources. NetWitness Platform accepts packages in **.nwp** files or **.zip** files.

Deploying resources manually deploys them directly to the services without taking advantage of the powerful resource management capabilities of NetWitness Platform.

If you want to receive notification and updates for updated resources and be able to easily remove resources from a service, you must subscribe to resources in the Live Search view and deploy the resources in the **Live Configure** view.

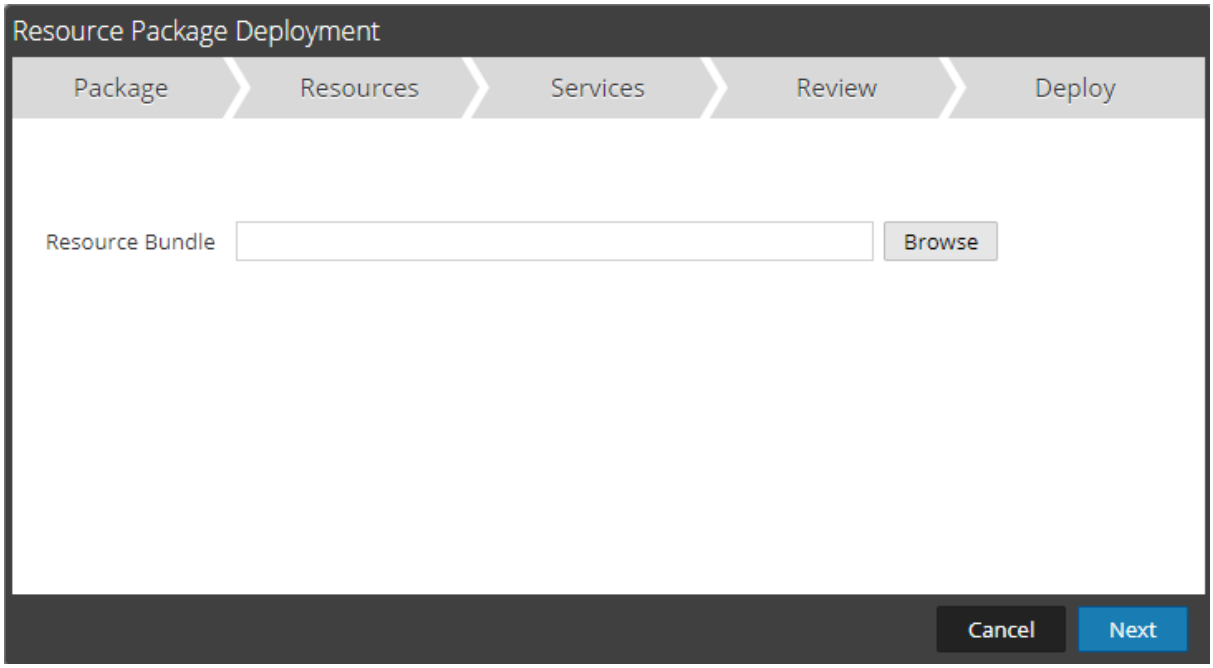
Note: Use NetWitness Platform Live to create resource bundles; this is a different application that is not part of NetWitness Platform. Selecting **Package** > **Create** in the **Live Search - Matching Resources** toolbar displays the Content Package Tool window. You can choose resources to include in a package and save the package as a NetWitness Platform Package File.

The required permission to access this view is **Deploy Live Resources**.

To access this view:

1. Go to **CONFIGURE > Live Content**.
2. In the **Live Search - Matching Resources** toolbar, select Package > **Deploy**.

The Resource Package Deployment wizard is displayed.



Features

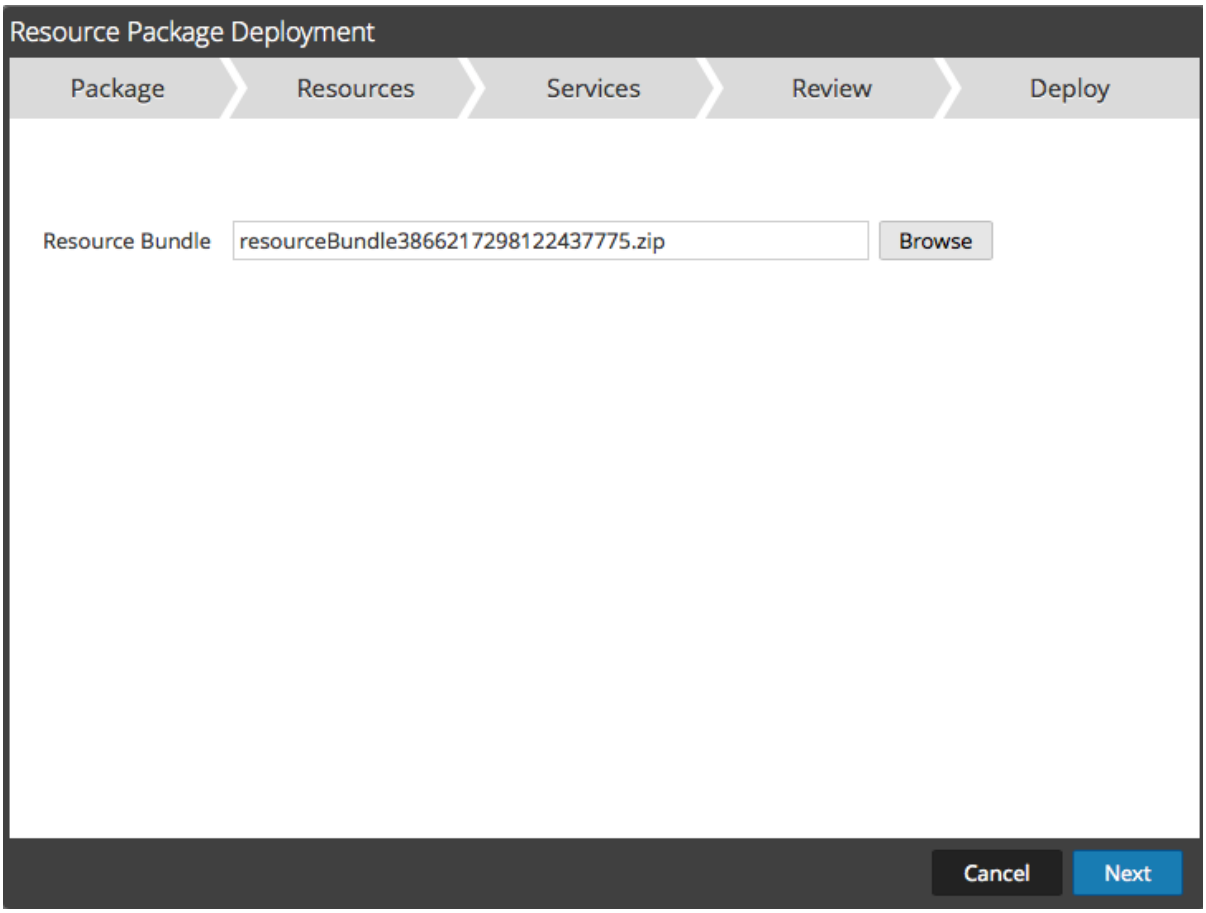
The Deployment Wizard has five tabs: **Package, Resources**, **Services**, **Review** and **Deploy**. Use **Close** to exit before you complete the wizard.

When you complete the wizard, NetWitness Platform returns to the Live Resources View.

Package Tab

You use this tab to select a resource bundle from your network in this page.

This is an example of the Package tab, with a resource bundle already selected.



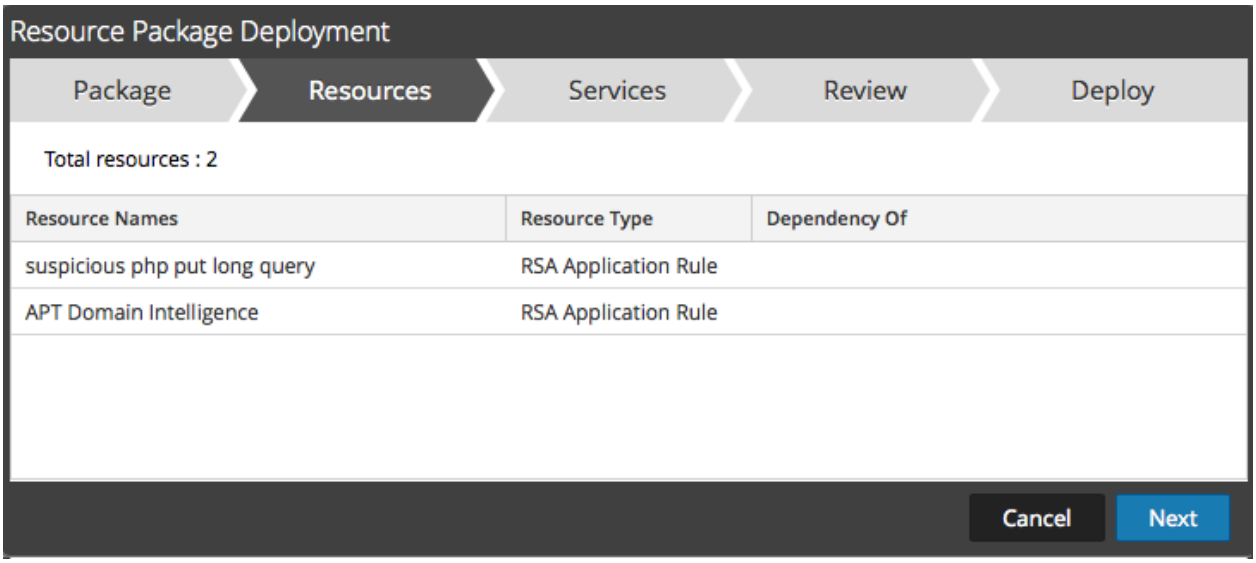
The following table describes the elements in the Package tab.

Column	Description
Resource Bundle	The input field to specify a resource bundle. You can type a path in this field or search using the Browse button.
Command Buttons	
Browse	This button opens a File Upload dialog in which you can browse the local file system and select a bundle.
Cancel	Cancels the deployment and closes the wizard.
Next	Displays the next tab of the wizard.

Resources Tab

This tab displays the resources contained in the bundle.

The following figure shows an example of the Resources tab.



The following table describes elements in the Resources tab.

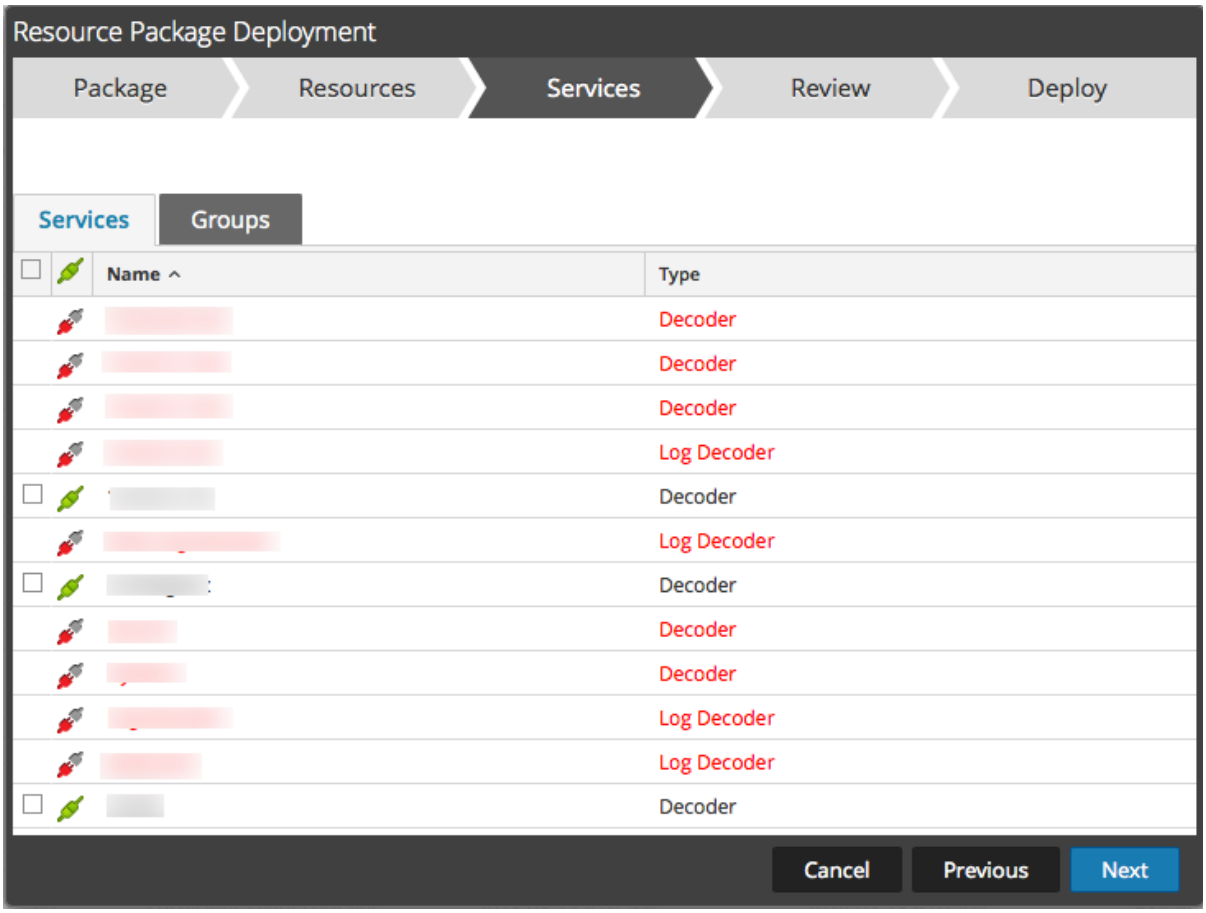
Column	Description
Resource Name	Displays the name of the resources in the bundle (for example, **NetWitness Lua Library**).
Resource Type	Displays the resource types for the resources in the bundle (for example, **RSA Lua Parser**)
Dependency Of	Displays Resources on which the selected resource depends (for example, **AIM lua**).

Services Tab

You select the services on which you want to deploy the resources in the bundle.

The Services tab has two tabs, **Services** and **Groups**. These provide a list of services and service groups that are configured in the **ADMIN > Services** view. The columns are a subset of the columns available in the Services view. You can select the services or the service groups on which you want to deploy the resources in the bundle.

This is an example of the Services tab.



The following table describes the elements in the Services tab.

Column	Description
	Services
	Selects services on which you want to deploy the content. You can select any combination of services and service groups.
Name	Displays the services in your environment on which you can deploy the content.
Host	Displays the name of the resource host.
Type	Displays the type of NetWitness Platform service.
	Groups
	Selects service groups (if you have service groups defined in your environment).
Name	Displays the names of the service groups.

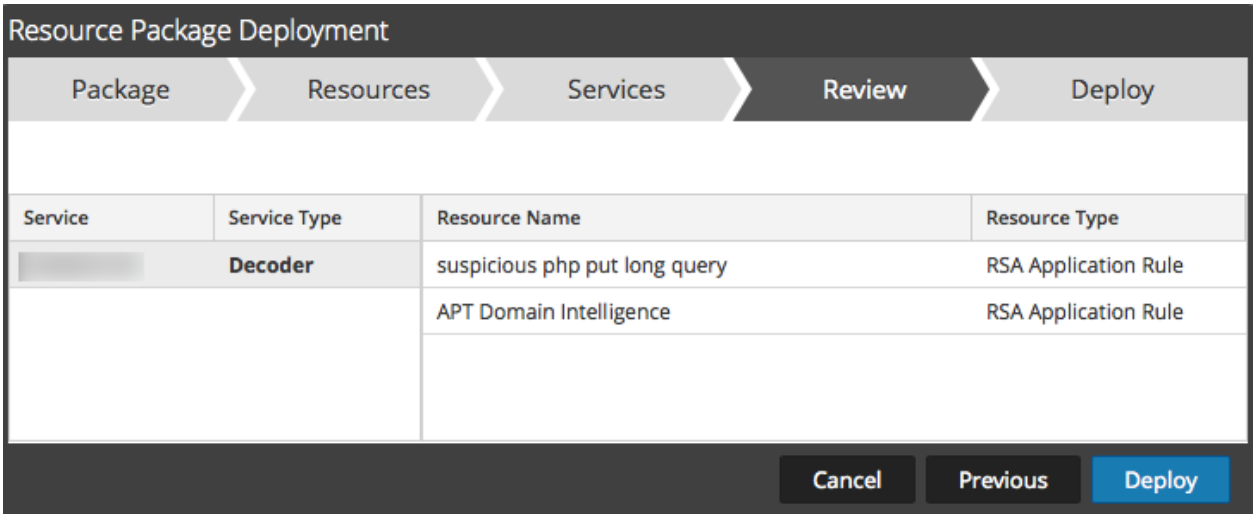
Review Tab

Displays the resources and services on which the resources will be deployed.

In this tab, you can do the following:

- Review the content and services before you deploy.
- Initiate the deployment of the resources.

The following figure shows an example of the Review tab.



The following table describes the elements in the Review tab.

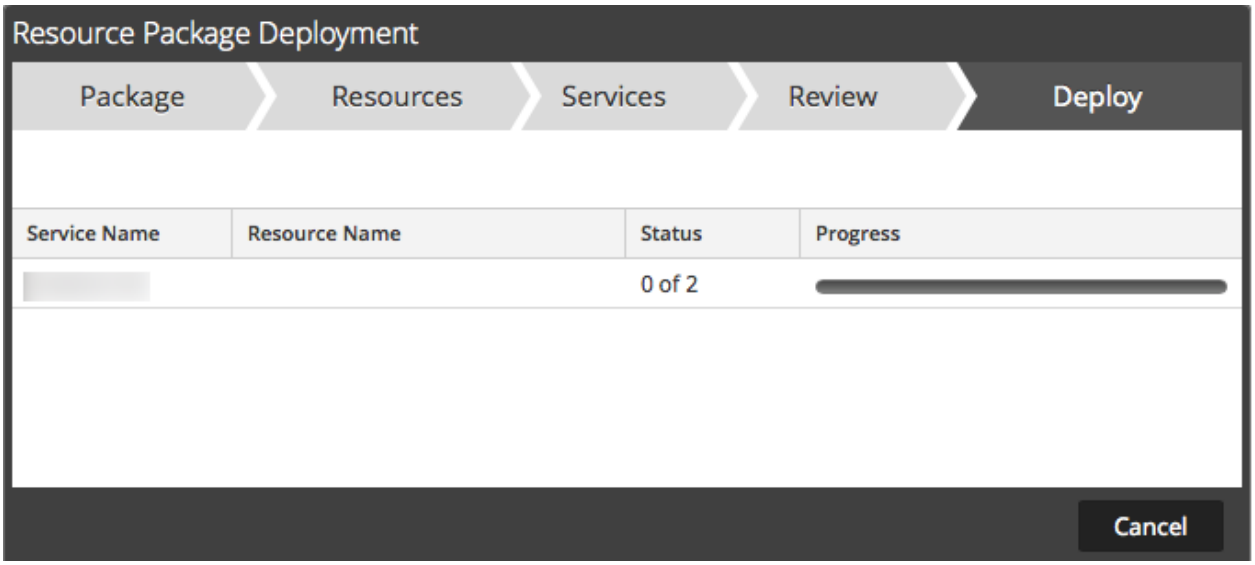
Column	Description
	Service Information
Service	Displays the services in your environment on which you can deploy the content.
Service Type	Displays the type of each NetWitness Platform service (type of host or service).
	Resource Information
Resource Name	Displays the name of the resources you have selected (for example, **NetWitness Lua Library**).
Resource Type	Displays the resource types for the resources you have selected (for example, **RSA Lua Parser**).
Deploy	Initiates the deployment of the resources and displays the **Deploy** page (final page of the wizard).

Deploy Tab

This tab allows you to do the following:

- View the progress of the job
- Cancel the job

This is an example of the Deploy tab.

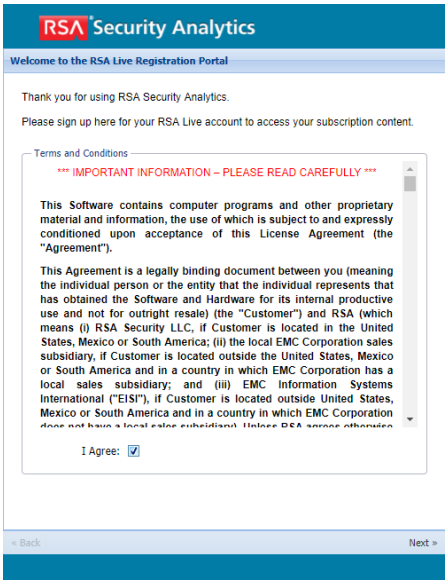


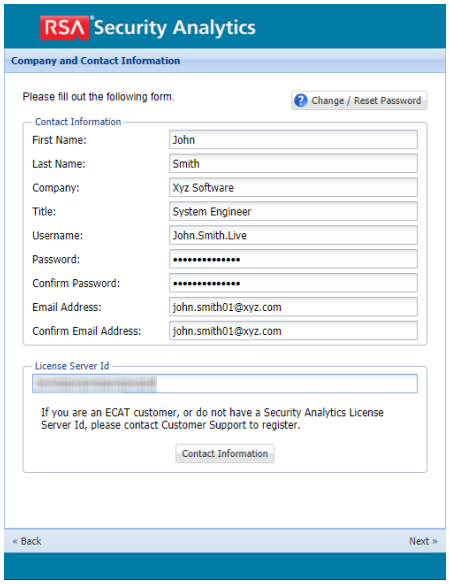
The following table describes the elements in the Deploy tab.

Feature	Description
Service Name	Name of the services to which resources are deployed.
Resource Name	Name of the resources.
Status	Status of the manual deployment.
Progress	Progress of the manual deployment in a progress bar. When complete, the bar turns solid green.
	Command Buttons
Close	Closes the wizard.
Errors	Only displays if NetWitness Platform encountered any errors. Click to display the errors.
Retry	Only displays if NetWitness Platform encountered any errors. Click this button to try to deploy the resources again using the wizard.

RSA Live Registration Portal

The RSA Live Registration Portal is a self-service wizard in which customers can set up a Live account and change or reset the password. A Live account is required to get access to the feeds, parsers, rules, and other content in RSA Live library. To access the portal, go to the following URL: https://cms.netwitness.com/registration/.





After you agree to the Terms and Conditions, click **Next**: the fields for setting up an account are displayed. These include Contact Information, Subscription Level, and License Server Id.

The following table lists the contact information section fields and its descriptions:

Parameter	Description
Change / Reset Password	Allows users to change or reset their RSA Live password.
First Name	Your first name.
Last Name	Your last name.
Company	The name of your company.
Title	Your job title or function in the company.
Username	The username used to log on to RSA Live account. The username must contain a minimum of nine characters and a maximum of 60 characters.
Password	The password for the RSA Live account. The password must contain minimum of nine characters and the maximum length is 60, with at least one uppercase, one lowercase, one number, and one special character.
Confirm Password	Confirmation of your password.
Email Address	The email address where you want to receive notifications related to the Live account.
Confirm Email Address	Confirmation of the email address.

Parameter	Description
Subscription Level / Confirm Subscription Level	• **Basic** - This provides access to the Live content that is tagged for groups like Basic, Panorama for Log Decoder, and Spectrum for Malware Analysis. • **Enhanced** - This provides access to the Live content that is tagged for groups like Enhanced, Basic, Panorama for Log Decoder, and Spectrum for Malware Analysis. • **Premium** - This provides access to the Live content that is tagged for groups like Premium, Verisign Premium, Enhanced, Basic, Panorama for Log Decoder, and Spectrum for Malware Analysis.
License Server Id	This is the License Id on the **ADMIN > SYSTEM > Info** page. **Caution:** The license server ID on NetWitness Platform must be valid and must be registered on the Flexera Server. If not, contact RSA Customer Support.

NetWitness Platform Feedback and Data Sharing

The Live Feedback Activity Log enables you to download the usage data required for Live Feedback. After you download the Live Feedback data, you can then upload it to share with RSA.

The settings for these features are available in **ADMIN > System > Live Services** view,

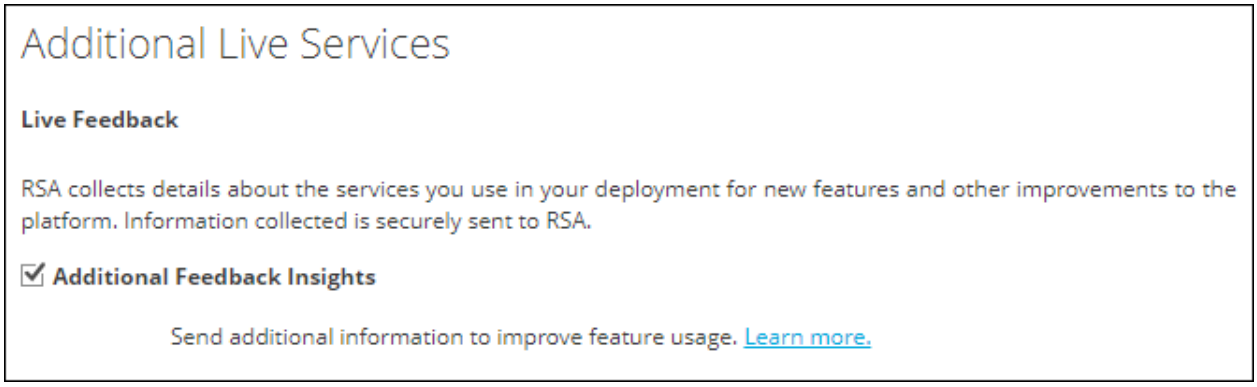
in the Additional Live Services section.

Additional Live Services

Participation in the Additional Live Services is configured in the **ADMIN > SYSTEM > Live Services** view.

Live Feedback

Live Feedback is intended to help improve RSA NetWitness Platform.



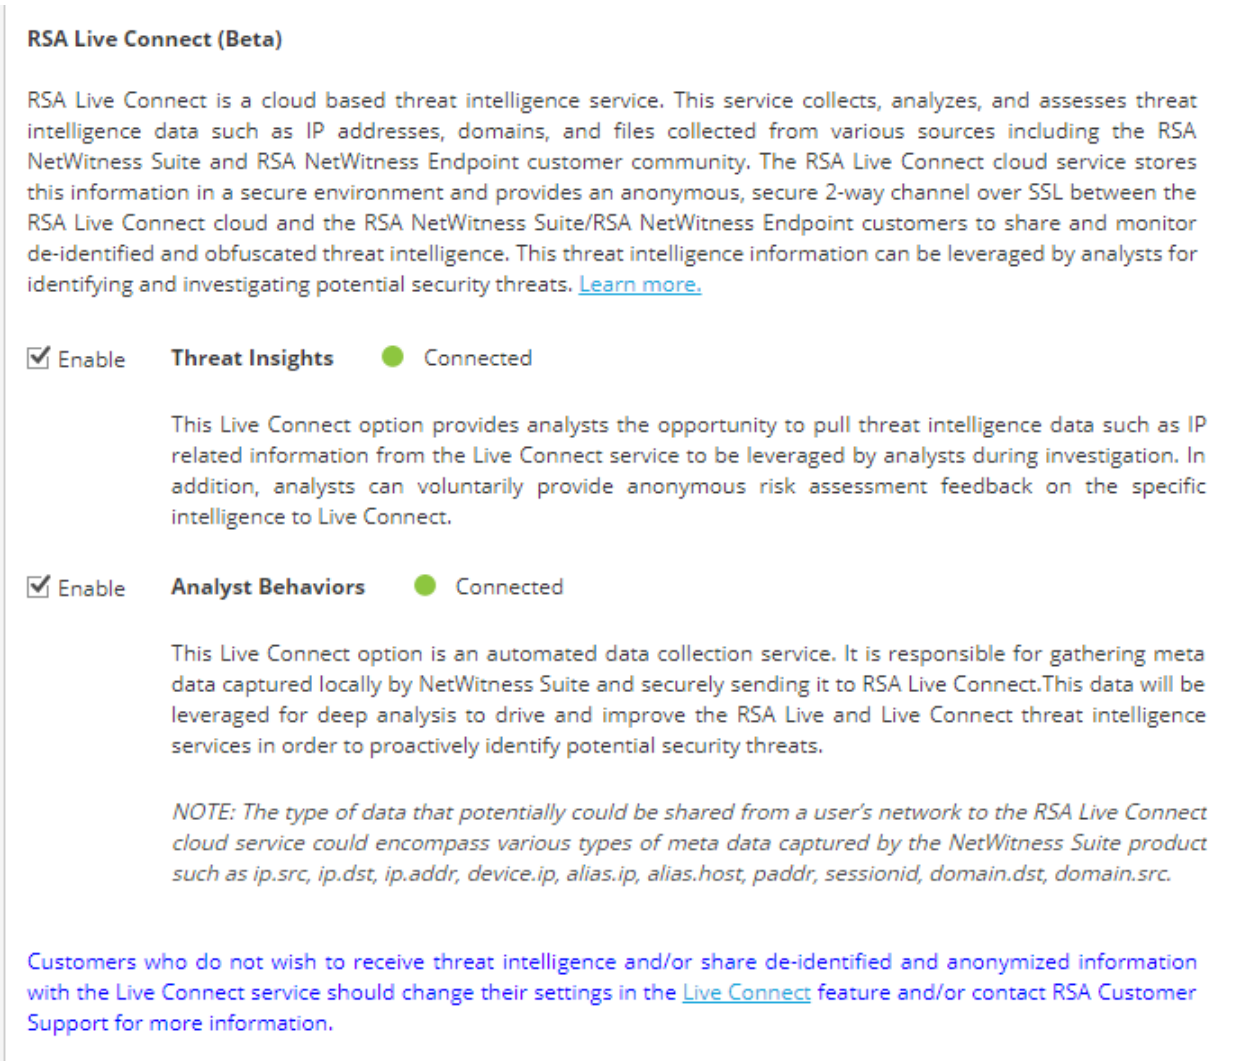
Once you set up and configure a Live account, usage data is automatically shared with RSA and is protected in accordance with the applicable license agreement. All such data shall be anonymized and shall not have any Personally Identifiable Information.

Before data is sent to RSA, all Personally Identifiable Information is removed. Thus, only anonymous usage data gets transferred to RSA.

For more information, see the "Live Feedback Overview" topic in the *System Configuration Guide*.

RSA Live Connect

RSA Live Connect is a cloud based threat intelligence service. This service collects, analyzes, and assesses threat intelligence data such as IP addresses, domains, and files collected from various sources including the RSA NetWitness Platform and RSA NetWitness Endpoint customer community.



RSA Live Connect consists of the following features:

- Threat Insights
- Analyst Behaviors

Threat Insights

Threat Insights provides analysts the opportunity to pull threat intelligence data such as IP related information from the Live Connect service to be leveraged by the analysts during investigation.

By default, **Threat Insights** is enabled in **Additional Live Services** section. If Context Hub service is configured, Live Connect is automatically added as a data source for Context Hub. For more information, see the "Configure Live Connect Data Source for Context Hub" topic in the *Context Hub Configuration Guide*.

With Live Connect as a data source for context hub, you can use the Context Lookup option in **INVESTIGATE > Navigate** view or **INVESTIGATE > Events** view to fetch contextual information. For more information, see the "Look Up Additional Context in the Navigate and Events Views" topic in the *Investigate User Guide*.

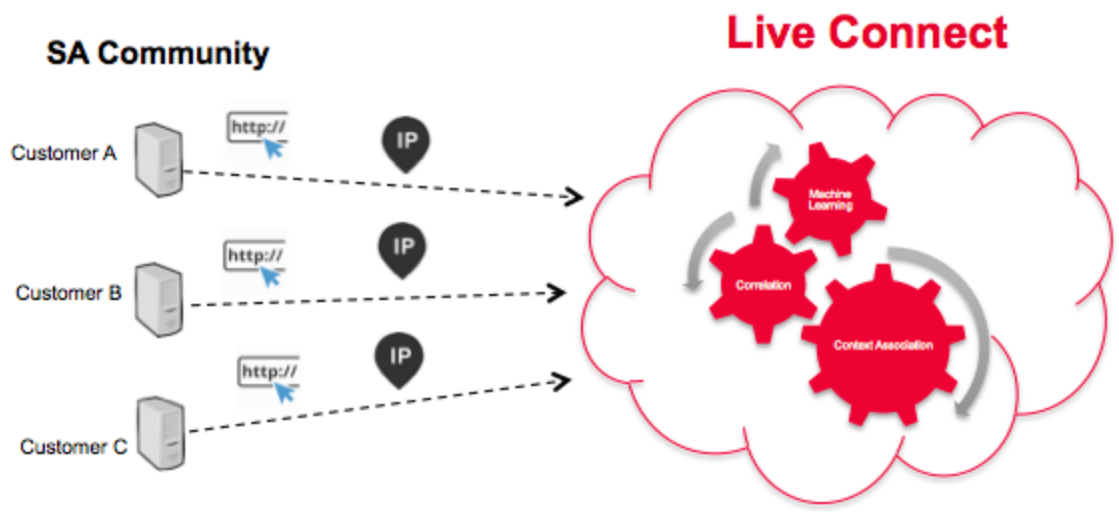
Analyst Behaviors

Analyst Behaviors is a feature where analysts participate in sharing data to RSA community. This is an automated data collection service. Its goal is to share potential threat intelligence data to the RSA Live Connect cloud service for analysis. The type of data that could be shared from your network to RSA Live Connect includes various types of meta data captured by NetWitness Platform such as ip.src, ip.dst, ip.addr, device.ip, alias.ip, alias.host, paddr, sessionid, domain.dst, domain.src.

Note: All data collected locally is de-identified and obfuscated and then sent securely and anonymously to the RSA Live Connect cloud service, where it is stored in a secure environment.

Description

Live Connect Threat Data Sharing has been developed as a Community based threat intelligence sharing platform.



It has the following characteristics and goals:

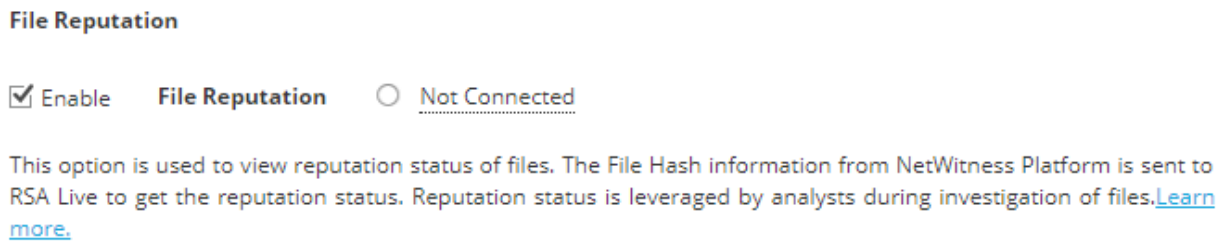
- Crowd-sourced: the RSA community contributes to the entire collection of intelligence
- Centrally collect and analyze data from the RSA community
- Reduce the intelligence cycle time from days to minutes

Some details to consider:

- We are leveraging analyst investigation activity
- We are harvesting meta data such as IP addresses and domain names
- We are doing deep data analysis: Trending, correlation, anomaly detection
- Remember, this feature is currently in Beta

File Reputation

File Reputation service provides instant access to the latest signatures via the RSA Live feed so data is more relevant, with fewer false positives. With this service, users always have reliable data about the reputation of files in their NetWitness Endpoint system. In addition to the whitelisting service, it provides blacklisting information as well.



Participation in RSA Live Connect

On install or upgrade to NetWitness Platform 11.x, a confirmation screen is displayed. You are presented with a New Features Enabled dialog box, where you can enable or disable **Threat Insights** and **Analyst Behaviors**.

Cloud Authentication

Authentication for the program is done in the NetWitness Platform UI, where you configure the Live account in the Live services section.

Configuration

To view or change the settings for Live Connect Threat Data Sharing, select **ADMIN > System > Live Services**. Check or clear the **Enable** box to participate or stop participating in the program.

Data Collection

Data is collected as follows:

- Data Attribution: Anonymous
- Data Source: Subset of meta keys and meta values of a NetWitness Platform analyst's page views from the NetWitness Platform Core Query logs.
- Query Log Harvesting Process:
  - Timing: Batch mode every 24 hours (4 AM – 6 AM UTC)
  - Log Collection: NetWitness Platform server collects NetWitness Platform core device log entries for the previous 24 hours
  - Log Entries: Only SDK-Value and SDK-Query API calls that contain a where clause are collected
  - Log Attribute Parsing: Each entry must have one of the following meta key indicators present: **ip.src**, **ip.dst**, **ip.addr**, **device.ip**, **alias.ip**, **alias.host**, **paddr**, **sessionid**, **domain.dst**, or **domain.src**. If so, meta keys and meta values from the entry will be collected.

Note: Once the above criteria is met, NetWitness Platform sends all the meta keys and values from the query to the cloud—not just the meta key indicators.

The log report is sent in JSON format, over SSL. It contains:

- Timestamps
- Live CMS username (sha256)
- NetWitness Platformlicense server ID (sha256)
- List of SA endpoint IDs (sha256)
- Harvested meta values (MD5 and SHA256 hashed)

Example

This section lists entries from a log, and then the corresponding section of extrapolated data.

Section from a log file:

```
User admin (session 204298, 10.4.50.60:57454) has issued values (channel 205237) (thread 2332): fieldName=filter id1=1 id2=23138902 threshold=100000 size=20 flags=sessions,sort-total,order-descending,ignore-cache where="(alias.host = 'mail.google.com') && (ip.src = 161.253.31.130) && time=\"2015-12-07 18:08:00\"-\"2015-12-07 21:07:59\""
```

Data extrapolation with hashing:

```
{
    timestamp: 1452282588000,
    session: 204298,
    id1: 1,
    id2: 23138902,
    userName: "8c6976e5b5410415bde908bd4dee15dfb167a9c873fc4bb8a81f6f2ab448a918",
    loggerName: "SDK-Values",
    timeRange: "\"2015-12-07 18:08:00\"-\"2015-12-07 21:07:59\"",
  - metaList: [
      - {
            metaKey: "alias.host",
          - properties: {
                domain_hint: "mai*********.com",
                domain_tld: "com",
                md5_value: "be5cab0695415d9363d18ad1345c73eb",
                sha256_value: "3f2728499a4b29460f3e3150df508e06b19edf0f58efd051fac777844d28e452"
            }
        },
      - {
            metaKey: "ip.src",
          - properties: {
                md5_value: "03b81ffdff109a05a3dac88dbec10c59",
                sha256_value: "1d88c6893797c896070bd5470d0026e11b515d5dee97c6173771a43719fa7e78"
            }
        }
    ]
},
```

Troubleshooting Live Services

This section provides troubleshooting instructions for issues faced when using the Live Services module in NetWitness Platform.

Some Rules Are Invalid for Version 11.x

The rules "NetWitness Incident Management - Alert Details" and "NetWitness Incident Management - Incident Summary" are not valid for RSA NetWitness Platform version 11.x. Do not deploy these rules to an 11.x system.

Note: Rules are updated frequently, and the documentation for them is available in the Content space on RSA Link. For the latest information on Rules, see RSA NetWitness Rules.

OutOfMemoryError on Context Hub Server

You may encounter an OutOfMemoryError on Context Hub server, and the service becomes unresponsive.

If there are any TAXII feeds configured, Health and Wellness raises alerts when the available heap memory of Context Hub server is critically low. If the status of Context Hub server is Unhealthy because of low memory, perform the following steps:

1. Make sure that the feeds **Start Date** is within 180 days.
2. Check if any TAXII feed is consuming too much disk space. A TAXII feed can consume maximum of 300 MB. If it consumes more disk space, you must reduce the value in the **Remove STIX data older than** field under **Advanced Options** in the **Custom Feed Creation Wizard** when you edit a TAXII feeds.

   Note: If the issue still persists, you must execute step 3.
3. To decrease the number of parallel threads available for processing STIX:
   a. Go to **ADMIN** > **Services** > **Context Hub service** > **View** > **Explore**.
   b. In the tree panel, navigate to **enrichment/stix/ config**.
   c. In the right panel, set the **stix-query-scheduler-pool-size** field value to 2. By default the value is 5. This setting controls how many number of threads are allowed to process queries for STIX data at the same time.
   d. Set the **taxii-poll-scheduler-pool-size** field value to 2. By default the value is 5. This setting controls how many number of threads are allowed to poll TAXII servers at the same time.
   e. Restart the Context Hub server.

Troubleshooting Live Connect Threat Data Sharing

This section discusses troubleshooting Live Connect Threat Data Sharing.

Query Log Retrieval Sample

To retrieve a sample of threat intelligence data sent to Live Connect, you must construct a URL by setting the following parameters:

- **sendReport**: value is **true** or **false**: true to send this report to the Live Connect server. False to just create the report for viewing. The value defaults to false.
- **hashValues**: value is **true** or **false**: true to hash the values as md5/sha256. False to show values in clear text – should use only for manual viewing. Defaults to false.
- **startDate / endDate**: Dates for time boundaries for log entries. Format: YYYY-MM-DD HH:mm:ss

The following is an example of the URL used to retrieve query logs:

```
https://<server>/admin/liveconnect/force_aggregation?startDate=2016-01-18%2000:00:00&endDate=2016-01-19%2010:10:00&sendReport=false&hashValues=true
```

System Logging: Debug

To access debug information:

1. Go to **ADMIN > System > System Logging**.
2. Select the **Settings** tab.
3. In the Package Configuration section, select **com > netwitness > platform > server > liveconnect > service (DEBUG)**.

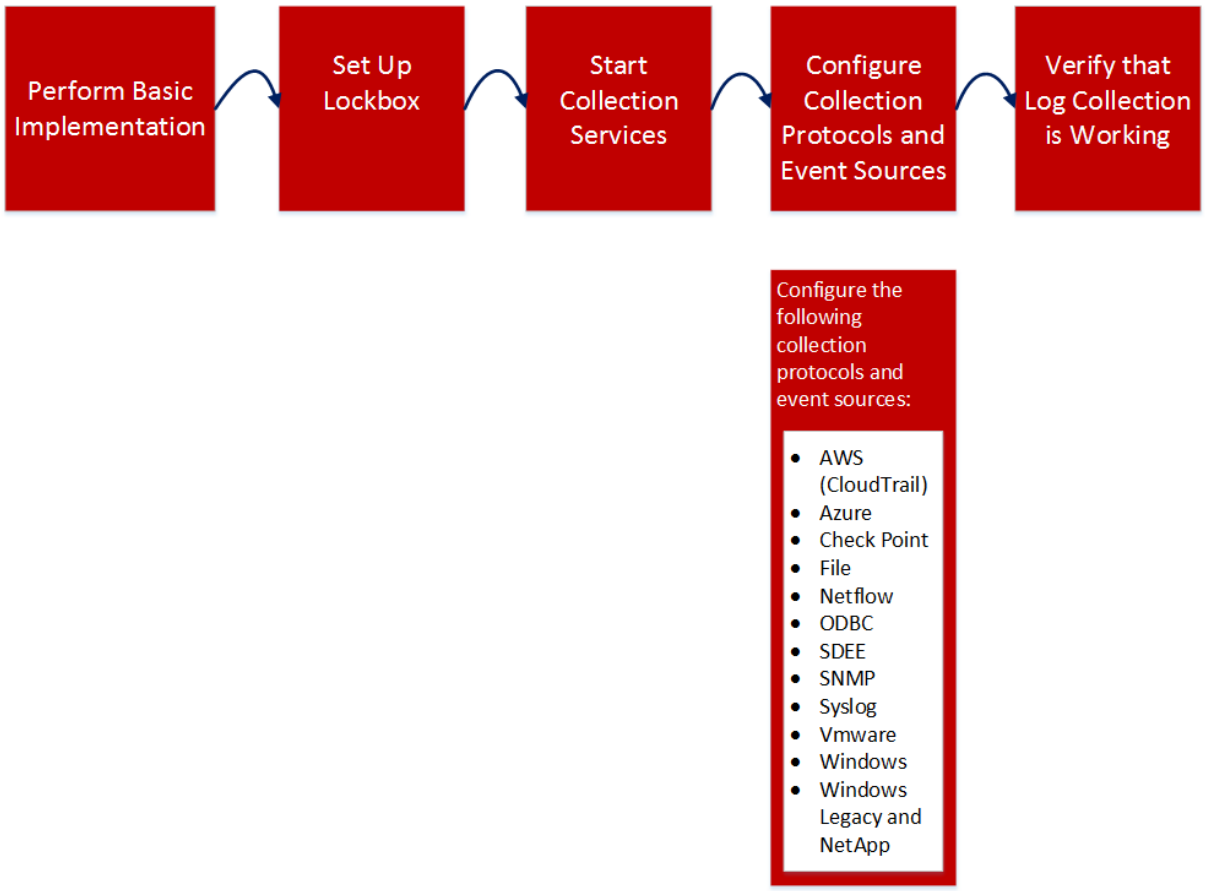
About Log Collection

This guide describes the high-level steps and subtasks for setting up and configuring log collection for event sources that include:

- What Log Collection does, how it works from a high level, and provides high-level deployment diagrams.
- How to start collecting events.
- Where to find instructions to set up more complex deployments.
- How to start any collection protocol.
- Which tools to use to troubleshoot Log Collection issues and lists global troubleshooting instructions.
- How to fine tune and customize Log Collection in your environment.
- How to configure individual collection protocols. Instructions are in the individual Log Collection sections.

Workflow

This workflow depicts the basic tasks needed to start collecting events through Log Collectors.



High-Level Procedures

At a high level, these are the procedures you must follow for log collection:

I. Add local and remote collectors to RSA NetWitness Platform.

Set up a Log Collector locally on a Log Decoder (that is a Local Collector). You can also set up Log Collectors in as many remote locations (that is Remote Collectors) as you need for your enterprise. For details, see Basic Implementation.

II. Download the latest content from RSA Live. You must perform this task periodically, as the content provided on RSA Live is updated regularly.

Log Collection content is marked as one of the following resource types:

- **RSA Log Collector** - content enabling the collection of event source types.
- **RSA Log Device** - the latest supported event source parsers.

You can also subscribe to content on Live. For details, see the *Live Services Management Guide*.

III. Configure Settings: set up the lockbox and Certificates.

For details, see Set Up a Lockbox and Configure Certificates.

IV. Configure Event Sources.

You configure all the event sources on your network to send their log information to RSA NetWitness Platform. Whenever you add new event sources, you need to perform this procedure as well. All event source configuration guides are found in the RSA Supported Event Sources space in RSA Link.

V. Start and stop services for configured protocols. Occasionally, you may be required to stop and restart services, based on new event sources that you add to RSA NetWitness Platform.

VI. Verify that Log Collection is working.

Whenever you set up a new event source or add a new collection protocol, you should verify that the correct logs are being sent to RSA NetWitness Platform.

Log Collection Architecture

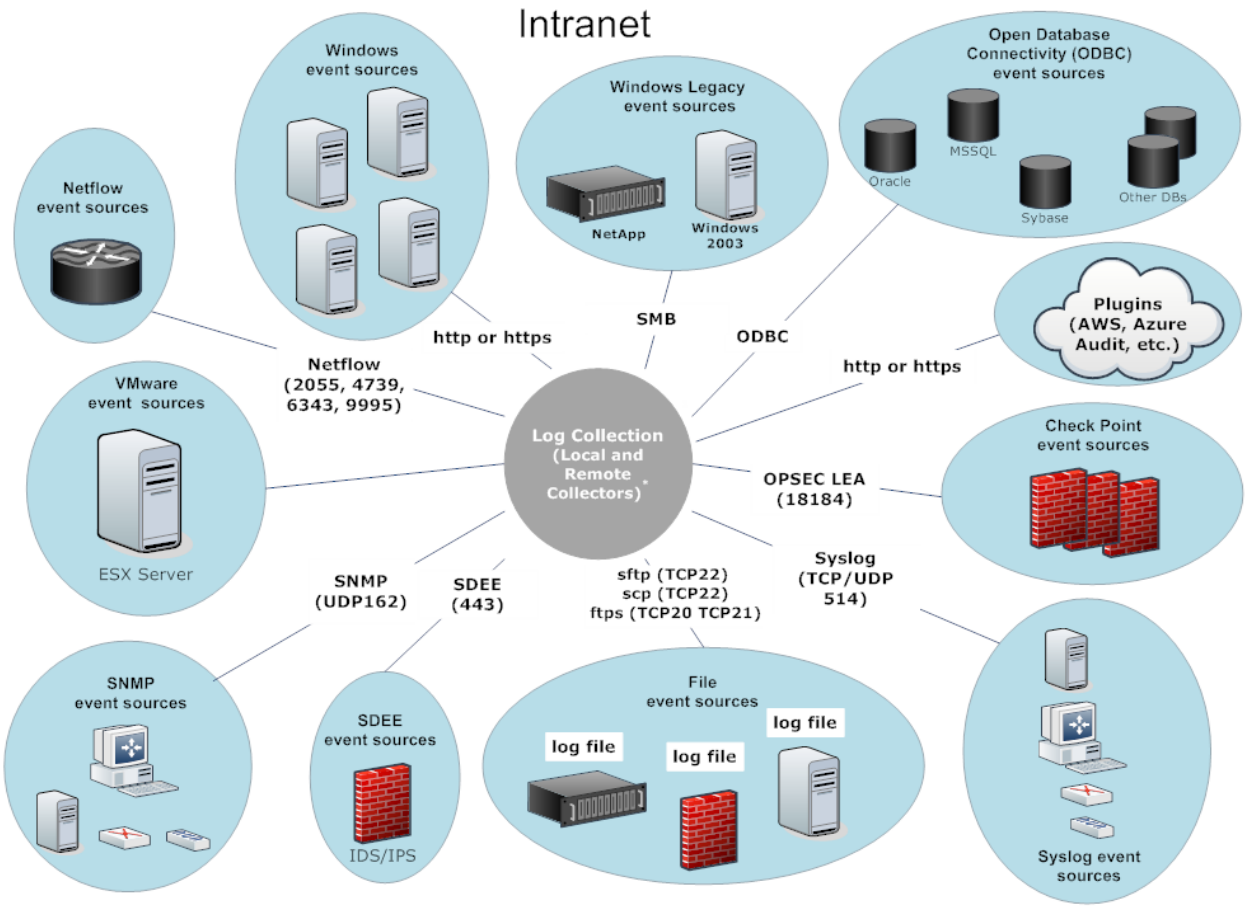
This topic describes how NetWitness Platform performs log collection.

How to Deploy Log Collection

You can deploy Log Collection according to needs and preferences of your enterprise. This includes deploying Log Collection across multiple locations and collecting data from varying sets of event sources. You do this by setting up a Local Collector with one or many Remote Collectors.

Components of Log Collection

The following figure shows all the components involved in event collection through the NetWitness Platform Log Collector.



Local and Remote Collectors

In this scenario, log collection from various protocols like Windows, ODBC, and so on, is performed through both the Remote Collector and Log Collector service. If the log collection is done by the Local Collector, it is forwarded to the Log Decoder service, just like the local deployment scenario. If the log collection is done by a Remote Collector, there are two methods in which these are transferred to the Local Collector:

- **Pull Configuration** - From a Local Collector, you select the Remote Collectors from which you want to pull events.
- **Push Configuration** - From a Remote Collector, you select the Local Collector to which you want to push events.

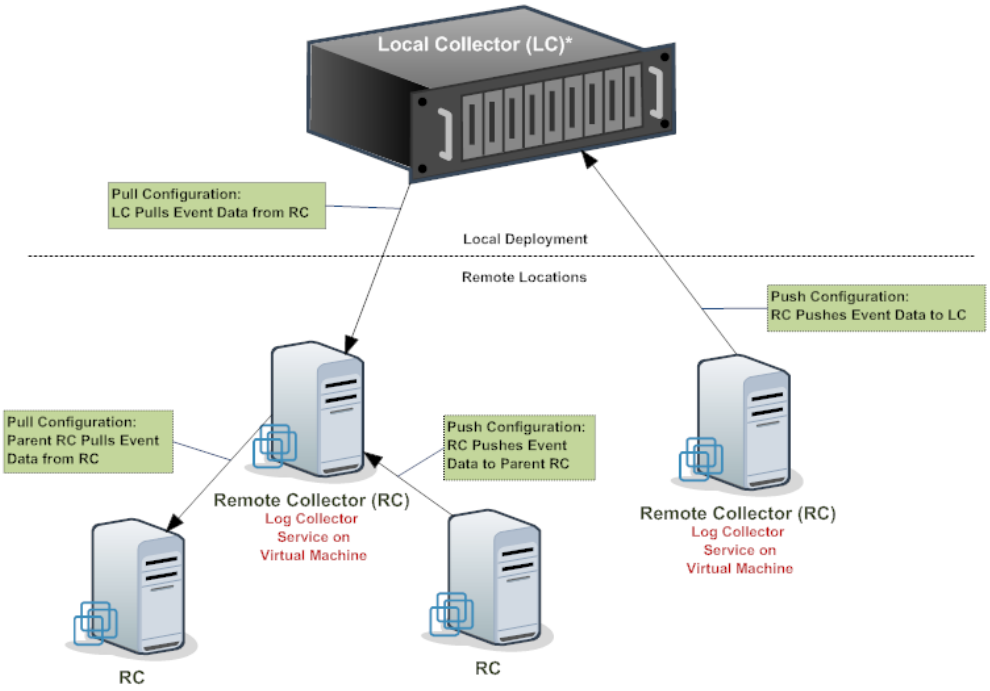
Note: Typically, the Push configuration is used. Pull is available if you have a DMZ in your environment. Less secure network segments are not allowed to make connections to more secure network segments. With Pull, the Log Collector (or Virtual Log Collector) in the secure network initiates the connection to the VLC in the less secure network, and the logs are then transferred without breaking the connection rules.

You can configure one or more Remote Collectors to push event data to a Local Collector, or you can configure a Local Collector to pull event data from one or more Remote Collectors.

Additionally, you can set up a chain of Remote Collectors for which you can configure:

- One or more Remote Collectors to push event data to a Remote Collector.
- A Remote Collector to pull event data from one or more Remote Collectors.

The following figure illustrates how the Local and Remote Collectors interact to collect events from all of your locations.



* The Local Collector (LC) is the Log Collector service on the Log Decoder appliance.

Windows Legacy Remote Collector

The RSA NetWitness® Platform Windows Legacy Collector is a Microsoft Windows based remote log collector (RC) which can be installed on a Windows domain.

It supports collection from:

- Windows 2003 and earlier event sources
- NetApp ONTAP host evt files

The following figure illustrates the deployment required to collect events from Windows Legacy event sources.

Setup

Basic Implementation

This topic tells how to perform the initial setup of Local Collectors and Remote Collectors.

Prerequisites

Verify that the Log Decoder is set up and:

- is capturing data.
- has the current content loaded.
- is properly licensed.

Roles of Local and Remote Collectors

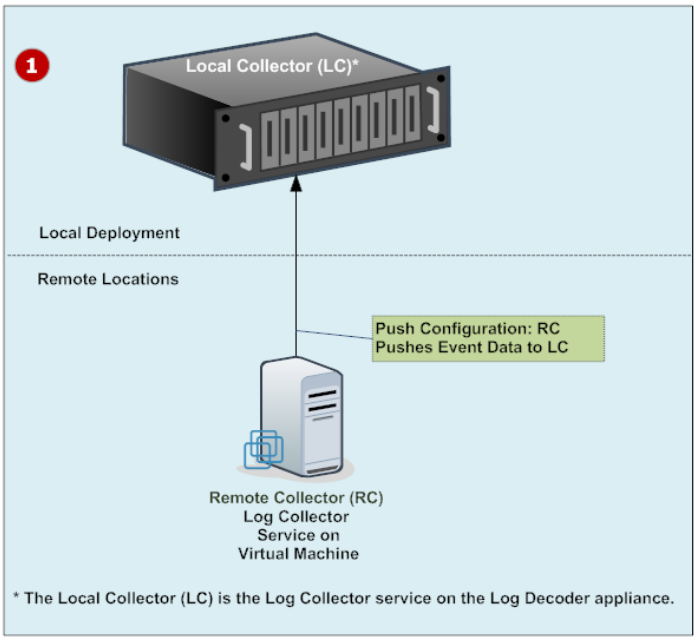
A Local Collector (LC) is a Log Collector service running on a Log Decoder host. In a local deployment scenario, the Log Collector service is deployed on a Log Decoder host, with the Log Decoder service. Log collection from various protocols like Windows, ODBC, and so on, is performed through the Log Collector service, and events are forwarded to the Log Decoder service. The Local Collector sends all collected event data to the Log Decoder service.

You must have at least one Local Collector to collect non-Syslog events.

A Remote Collector (RC), also referred to as a Virtual Log Collector (VLC), is a Log Collector service running on a stand-alone Virtual Machine. Remote Collectors are optional and they must send the events they collect to a Local Collector. Remote Collector deployment is ideal when you have to collect logs from remote locations. Remote Collectors compress and encrypt the logs before sending them to a Local Collector.

Deploying and Configuring Log Collection

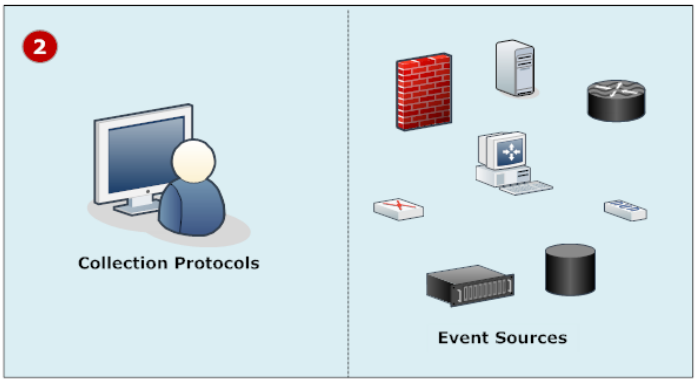
The following diagram illustrates the basic tasks you must complete to deploy and configure Log Collection. To deploy Log Collection, you need to set up a Local Collector. You can also deploy one or more Remote Collectors. After you deploy Log Collection, you need to configure the events sources in NetWitness Platform and on the events sources themselves. The following diagram shows the Local Collector with one Remote Collector that pushes events to the Local Collector.



1 Set up Local and Remote Collectors.

The Local Collector is the Log Collector service running on the Log Decoder host.

A Remote Collector is the Log Collector service running on a virtual machine or Windows server in a remote location.



2 Configure event sources:

- Configure collection protocols
- Configure each event source to communicate with the NetWitness Platform Log Collector.

For details on these procedures, see Configure Collection Protocols and Event Sources.

Adding Local Collector and Remote Collector to NetWitness Platform

To add a Local Collector and Remote Collector to NetWitness Platform:

1. Go to **ADMIN > Services**.
2. Click + and select **Log Collector** from the menu.
   The **Add Service** dialog box is displayed.
3. Define the details of the **Log Collection** service.
4. Select **Test Connection** to ensure that your Local or Remote Collector is added.

Configuring Log Collection

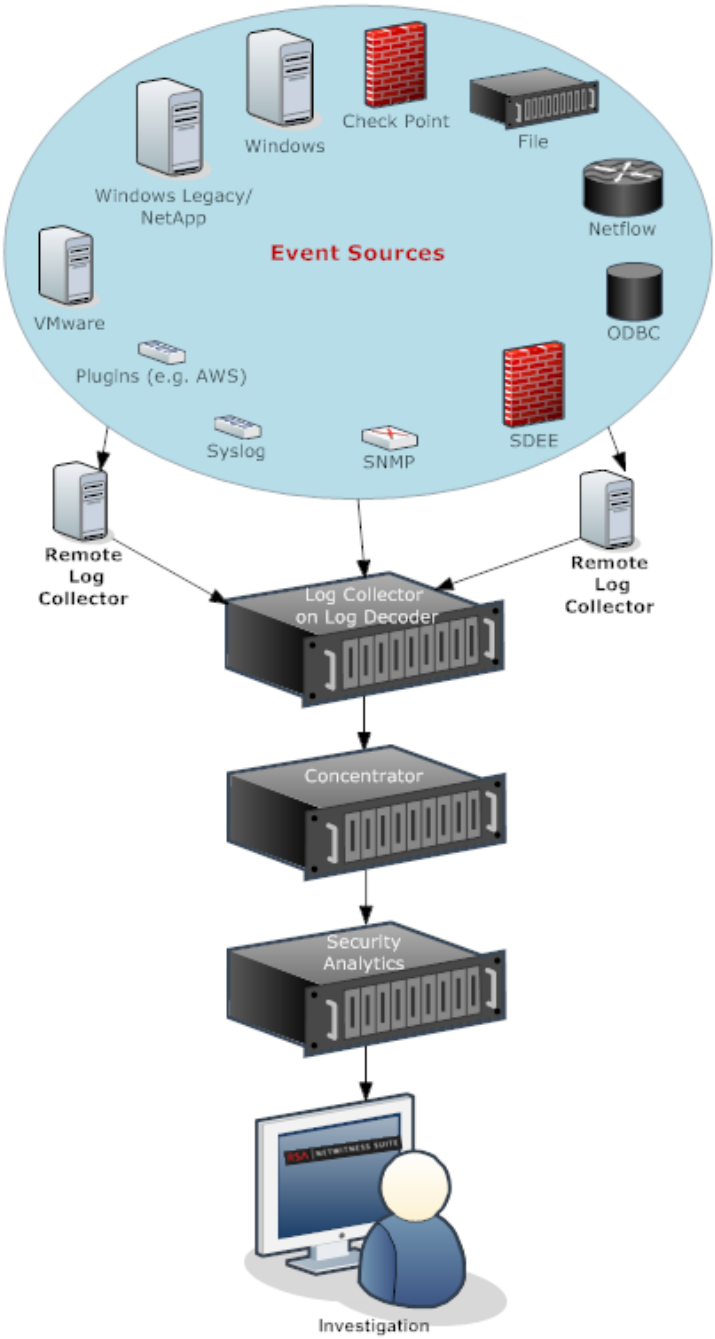
You choose the Log Collector—that is a Local Collector (LC) or Remote Collector (RC)—for which you want to define parameters in the Services view. The following figure shows how to navigate to the Services view, select a Log Collector service, and display the configuration parameter interface for that service.

To configure log collection:

1. Go to **ADMIN > Services**.
2. Select a Log Collection service.
3. Click **View > Config** to display the Log Collection configuration parameter tabs.
4. Define global Log Collection parameters in the **General** tab.
5. The UI presents tabs, depending on whether the current service is Local or Remote.
   - For a Local Collector, NetWitness Platform displays the **Remote Collectors** tab. Select the Remote Collectors from which the Local Collector pulls events in this tab.
   - For a Remote Collector, NetWitness Platform displays the **Local Collectors**. Select the Local Collectors to which the Remote Collector pushes events in this tab.
6. Edit configuration files as text files in the **Files** tab.
7. Define collection protocol parameters in the **Event Sources** tab.
8. Define the lockbox, encryption keys, and certificates in the **Settings** tab.
9. Define Appliance Service parameters in the **Appliance Service Configuration** tab.

Data Flow Diagram

You use the log data collected by the Log Collector service to monitor the health of your enterprise and to conduct investigations. The following figure shows you how data flows through NetWitness Platform Log Collection to Investigation.

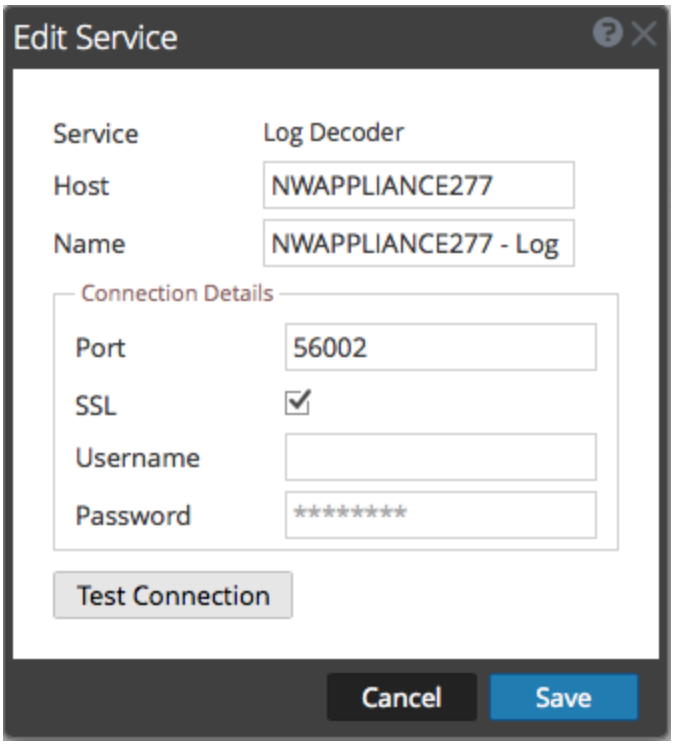


Provision Local Collectors and Remote Collectors

The NetWitness Platform server verifies if an appliance has a Log Decoder service. If there is a Log Decoder service, it becomes a Local Collector. If a Log Decoder service is missing, it becomes a Remote Collector. A local Log Collector has an Event Destination and by default goes to the Local Log Decoder service. A Remote Collector does not have an Event Destination. The NetWitness Server identifies a Legacy Windows Collector as a Remote Collector.

To edit a Local Collector or Remote Collector:

1. Go to **ADMIN > Services**.
2. Select a Log Collector service.
3. In the **Services** view, select in the toolbar.
   The **Edit Service** dialog is displayed.



4. In the **Edit Service** dialog, provide the following information.

Field	Description
Service	Select Log Collector as the service type.
Host	Select a Log Decoder host.
Name	Type name you want to assign to the service.
Port	Default port is 50001 for clear text and 56001 for SSL encrypted.
SSL	Select **SSL** if you want NetWitness Platform to communicate with the host using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates.
(Optional) Username	Type the username of the Local Collector.
(Optional) Password	Type the password of the Local Collector.

5. Click **Test Connection** to determine if NetWitness Platform connects to the service.

6. When the result is successful, click **Save**.

   If the test is unsuccessful, edit the service information and retry.

Configure Local and Remote Collectors

This topic describes how to configure Local and Remote Collectors.

When you deploy Log Collection, you must configure the Log Collectors to collect the log events from various event sources, and to deliver these events reliably and securely to the Log Decoder service, where the events are parsed and stored for subsequent analysis.

You can configure one or more Remote Collectors to push event data to a Local Collector, or you can configure a Local Collector to pull event data from one or more Remote Collectors.

This topic describes how to:

- **Configure Local Collector to Pull Events from Remote Collector**

  If you want a Local Collector to pull events from Remote Collector, you set this up in the Remote Collectors tab of the Local Collector's Configuration view.

- **Configure Remote Collector to Push Events to Local Collectors**

  If you want a Remote Collector to push events to a Local Collector, you set this up in the Local Collector tab of the Remote Collector's Configuration view. In the Push configuration, you can also:

  - **Configure Failover Local Collector for Remote Collector**

    You set up a destination made up of local collectors. When the primary Local Collector is unreachable, the Remote Collector attempts to connect to each Local Collector in this destination until it makes a successful connection.

  - **Configure Replication**

    You set up multiple destination groups so that NetWitness replicates the event data in each group. If the connection to one of the destination groups fails, you can recover the required data because it is replicated in the other destination group.

  - **Configure Log Routing for Specific Protocols**

    You set up multiple destinations in a destination group to direct event data to specific locations according to protocol type.

- **Configure Chain of Remote Collectors**

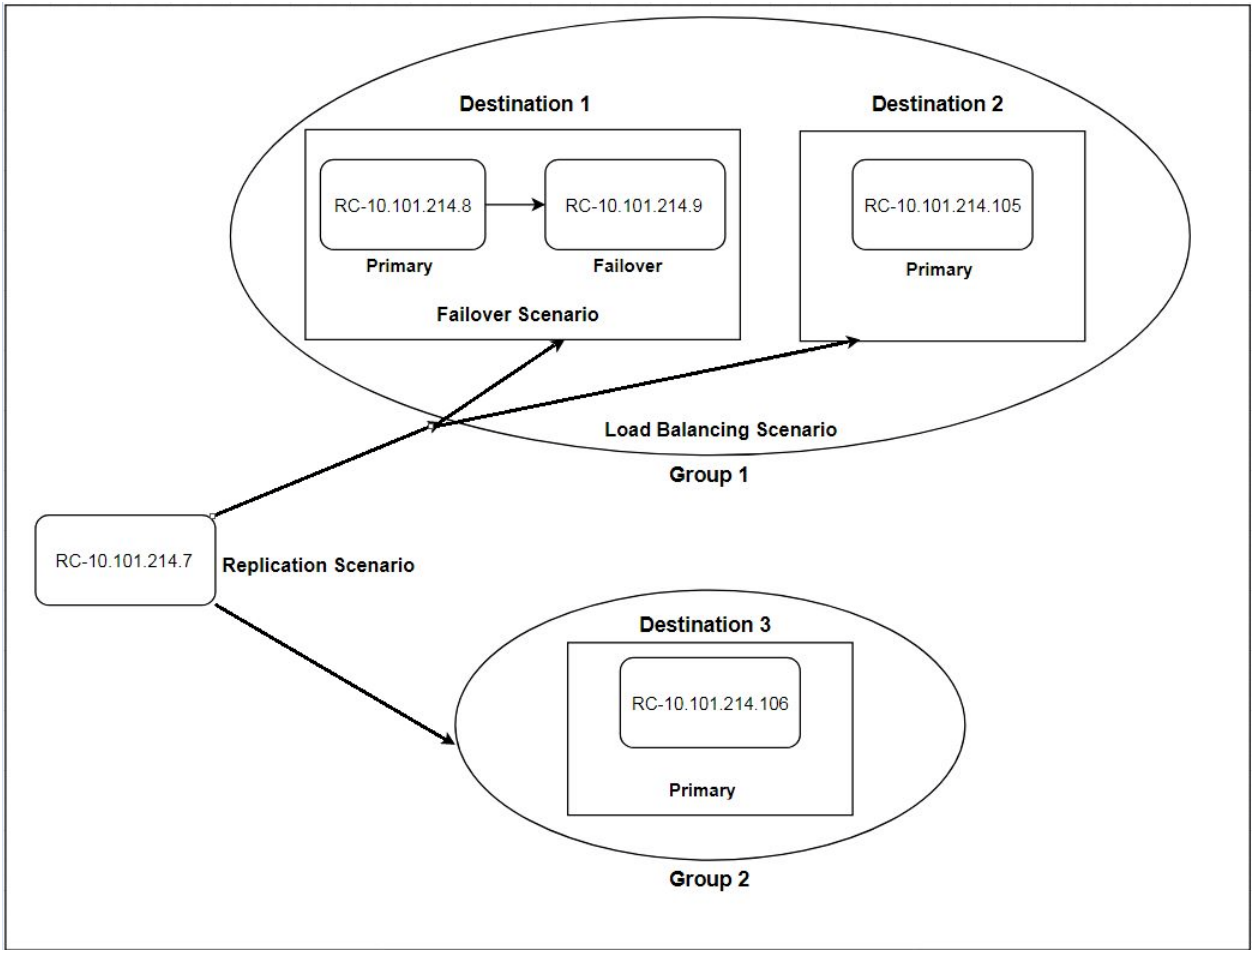
  You can set up a chain of Remote Collectors to push event data to a Local Collector, or you can configure a Local Collector to pull event data from a chain of Remote Collectors.

  - You can configure one or more Remote Collectors to push event data to a Remote Collector.
  - You can configure a Remote Collector to pull event data from one or more Remote Collectors.

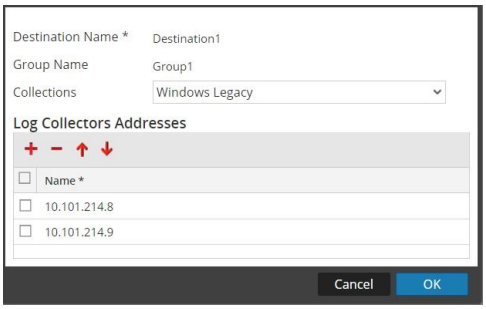
Failover, Replication and Load Balancing

This section describes failover, replication, and load balancing work in how RSA NetWitness Platform.

The following figure illustrates a Remote Collector configured for load balancing, failover and replication.

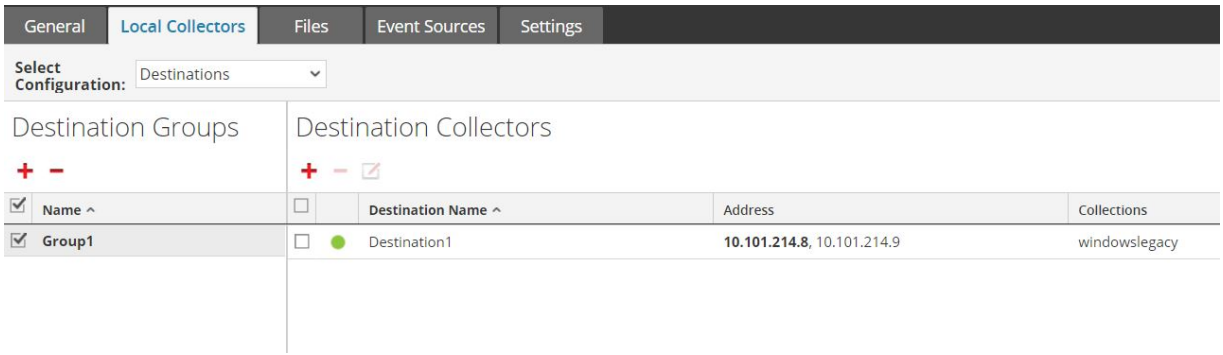


- **Failover** is achieved by setting up multiple collectors in the same Destination. Destination 1 has a primary Collector, and second, failover Collector. This is done in NetWitness Platform by adding multiple Log Collectors to the same Destination.

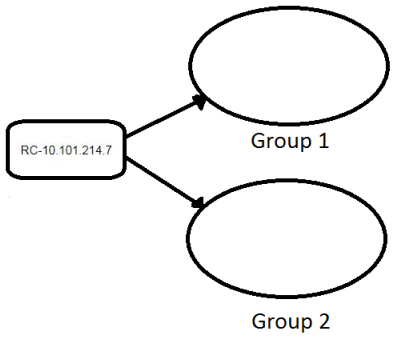


Since 10.101.214.8 is listed first, that becomes the primary collector, and 10.101.214.9 becomes the failover. To make 10.101.214.9 the primary, use the up arrow to change the order.

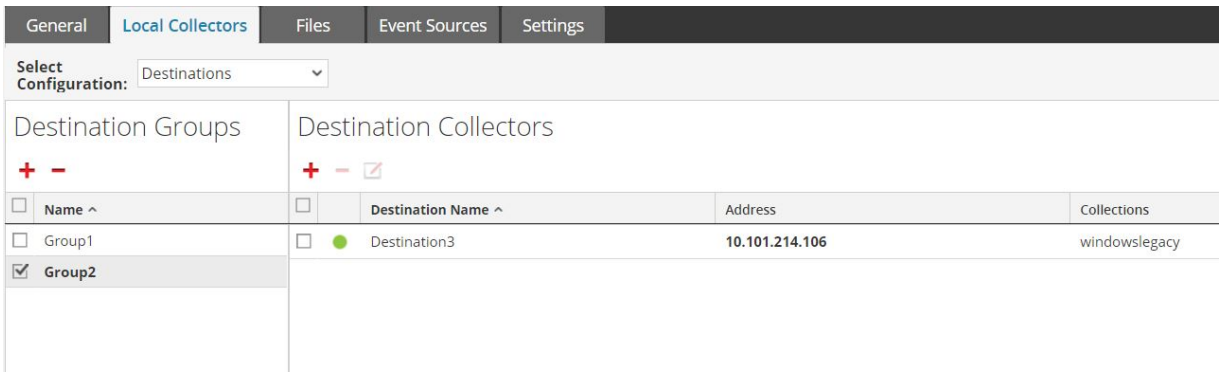
Below, you can see the two collectors both listed for Destination 1. The primary (10.101.214.8) is in bold.



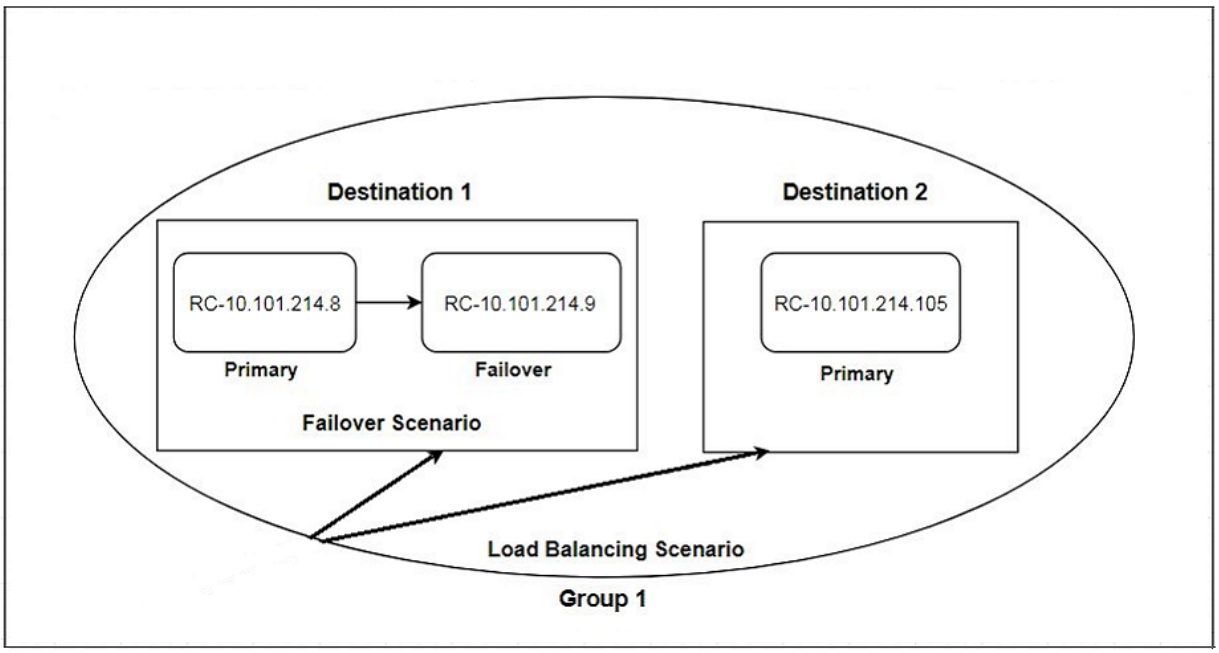
- **Replication** is accomplished by having multiple Destination Groups: each group receive the entire set of message data.



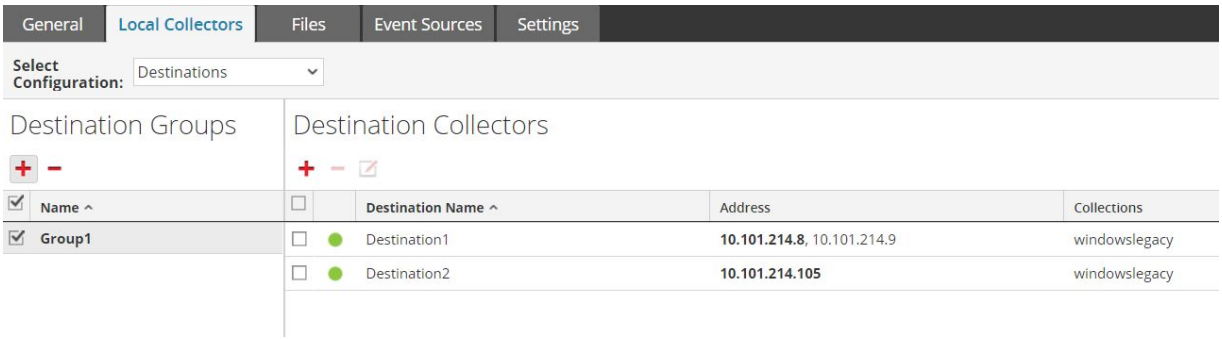
In the following screen, you can see that message data is sent to the collectors in Group 1 *and* Group 2.



- **Load balancing** is achieved by setting up multiple Destinations within a Group.



In the following screen, you can see that Group 1 has two destinations, Destination 1 and Destination 2. The message data is divided up equally among the Destinations in the group.



With two Destinations, each destination receives half the message data. With three Destinations, each would receive 1/3 of the total message data. Keep adding Destinations to further reduce the load on the collectors in each destination.

Note: You can also set up log routing so that event data for specific protocols is sent to specific destinations.

Configure a Local Collector or Remote Collector

You choose the Log Collector, that is a Local Collector (LC) or Remote Collector (RC), for which you want to define deployment parameters in the Services view. The following procedure shows you how to navigate to the Services view, select a Local or Remote Collector, and display the deployment parameter interface for that service.

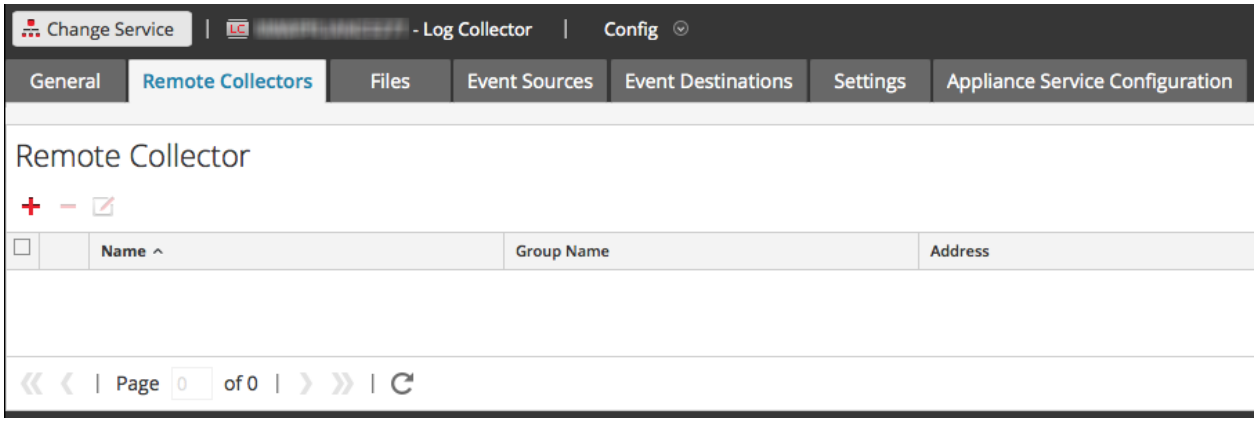
To configure a Local Collector or Remote Collector:

1. Go to **ADMIN > Services**.
2. Select a Local or Remote Log Collection service.

3. Under Actions, select > **View** > **Config** to display the Log Collection configuration parameter tabs.
4. Depending on your selection in step 2:
   - If you selected a Local Collector, the **Remote Collectors** tab is displayed. Select the Remote Collectors from which the Local Collector pulls events in this tab.
   - If you selected a Remote Collector, the **Local Collectors** are displayed. Select the Local Collectors to which the Remote Collector pushes events in this tab.

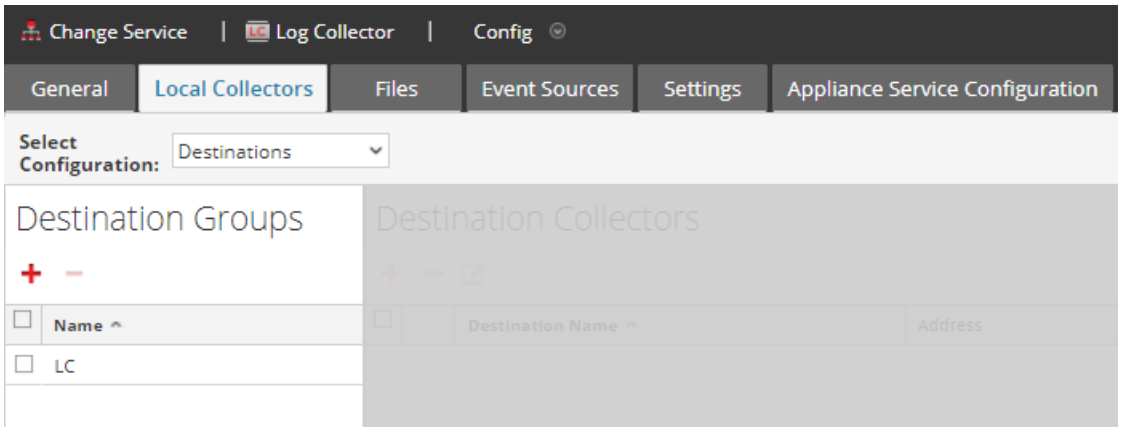
Remote Collectors Tab

The following figure depicts the **Remote Collectors** tab for a Local Collector that is configured to pull events from a Remote Collector. NetWitness Platform displays this tab when you have selected a Local Collector in **Admin** > **Services**.

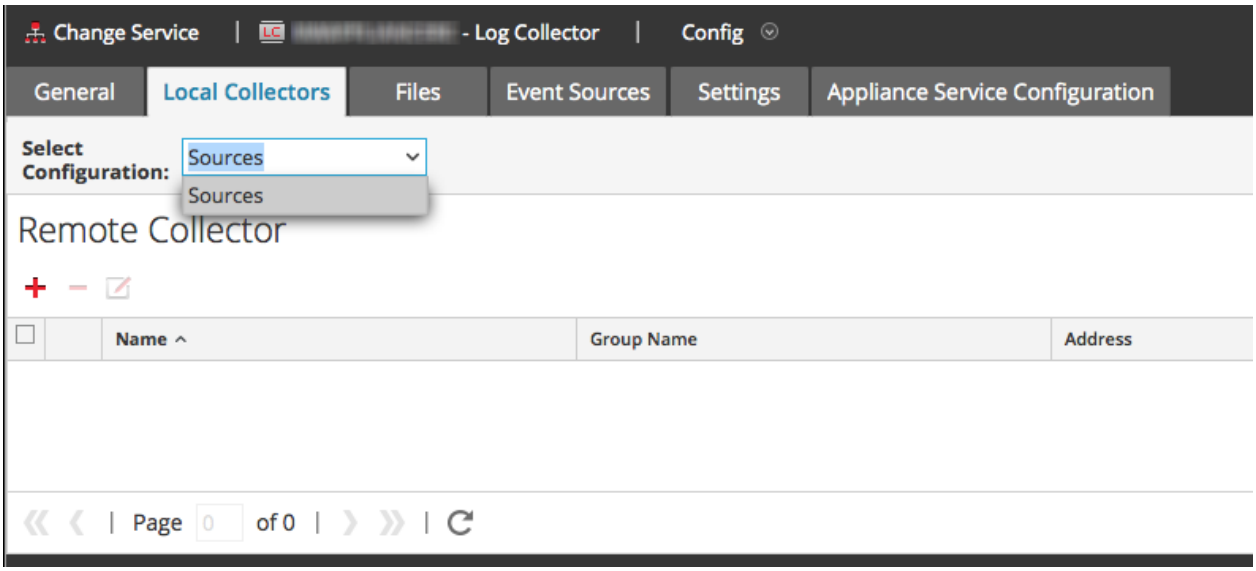


Local Collectors Tab for a Remote Collector

The following figure depicts a **Local Collectors** tab for a Remote Collector that is configured to push events to a Local Collector or another Remote Collector.



The following figure depicts the Local Collectors tab for a Remote Collector that is configured to pull events from a Remote Collector. NetWitness Platform displays this tab when you have selected a Remote Collector in **Admin** > **Services**.



Parameters

Remote/Local Collectors Configuration Parameters

Configure Failover Local Collector

This topic tells you how to set up a Failover Local or Remote Collector.

Set up a Failover Local Collector

You can set up a Failover Local Collector that RSA NetWitness® Platform will fail over to if your primary Local Collector stops operating for any reason.

1. Go to **ADMIN > Services**.
2. In **Services**, select a Remote Collector service.
3. Click **View > Config**.

   The Service Config view is displayed with the **Log Collector General** tab open.
4. Select the **Local Collectors** tab.
5. In the **Destination Groups** panel section, select .

   The Add Remote Destination dialog displays.
6. Set up a Destination Group and select a primary Local Collector (for example, **LC-PRIMARY**).
7. Select the Group (for example, **Primary_Standby_LCs**) in the Destination Groups panel and click .

   The Group you selected is displayed in the Local Collectors panel.
8. Add the Failover Local Collector (for example, **LC-STANDBY**).

   The following examples show the newly added primary and failover Local Collectors showing the primary Local Collector as **Active** and the Failover Local Collector as **Standby**. The active Local Collector is highlighted (for example, **LC-PRIMARY**).

9. (Optional) Add, delete, and change the order of Local Collectors to each Remote Destination.
   a. Click + to add a Log Collector as a failover Remote Destination.
   b. When connecting to a Remote Destination, the Remote Collector will attempt to connect to each Local Collector in this list in order, until it makes a successful connection.
   c. Select a Local Collector and use the up (↑) and down (↓) arrow buttons to change the order of connection.
   d. Select one or more Local Collectors and click − to remove them from the list.

   The selected Local Collectors are added to the Log Collector section. When the Remote Collector starts collecting data, it pushes data to these Log Collectors.

Set up a Failover Remote Collector

You can set up a Failover Remote Collector that RSA NetWitness® Platform will fail over to if your primary Remote Collector stops operating for any reason.

To set up a failover remote collector:

1. Go to **ADMIN > Services**.
2. In **Services**, select a Remote Collector service.
3. Click ⚙ **View > Config**.

   The Service Config view is displayed with the **Log Collector General** tab open.
4. Select the **Local Collectors** tab.
5. Select **Sources** in **Select Configuration** drop-down menu.
6. Click + to display in **Add Source** dialog.
7. Define the failover Remote Collector and click **OK**.

Parameters

Remote/Local Collectors Configuration Parameters

Configure Replication

This topic tells you how to replicate event data sent by a Remote Collector.

You can specify multiple Destination Groups so that the event data is replicated to each group.

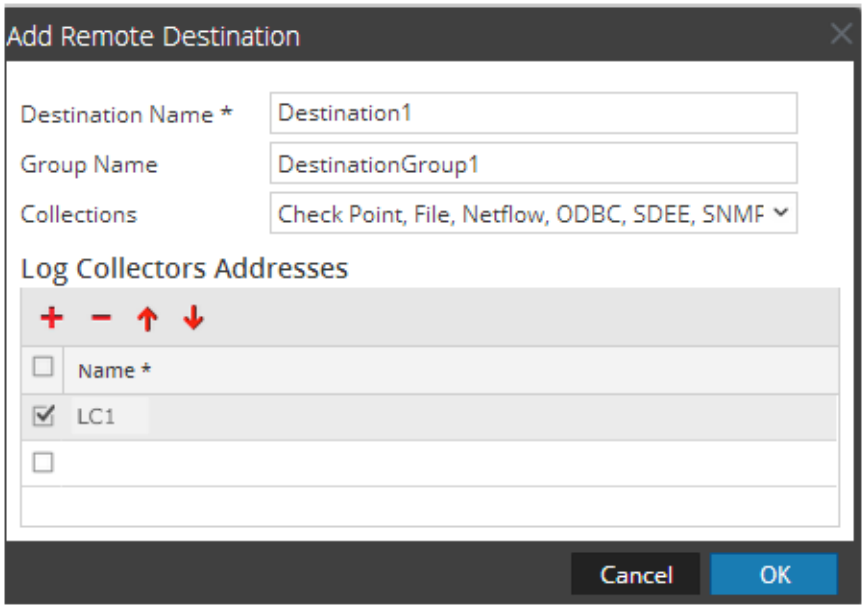
To replicate event data to multiple Local Collectors:

1. Go to **ADMIN > Services.**
2. Select a Remote Log Collection service.
3. Under Actions, select ⚙ **> View > Config**.

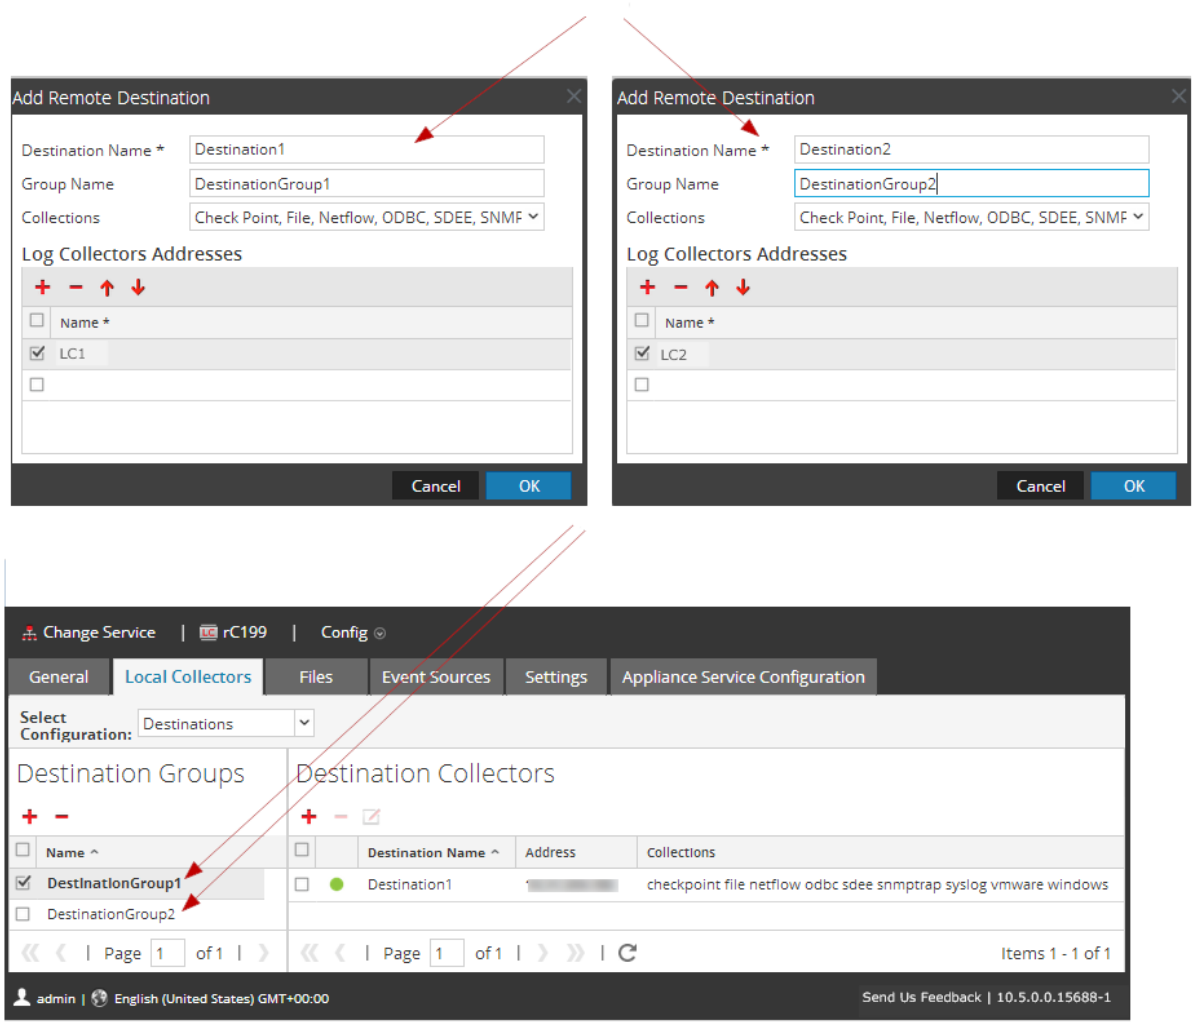
   The Service Config view is displayed with the **Log Collector General** tab open.
4. Select the **Local Collectors** tab.

5. In the **Destination Groups** panel section, click +.

   The **Add Remote Destination** dialog is displayed.



6. Set up a separate Destination for each Local Collector and designate the protocols for which you want to push event messages to that Local Collector. The following examples shows the addition of two Destination Local Collectors (**Destination1** and **Destination2**) for the **Check Point**, **File**, **Netflow**, **ODBC**, **SDEE**, **SNMP**, **Syslog**, and **Windows** collection protocols:



a. Type the **Destination Name**.

b. Type the **Group Name**. If you do not type a Group Name, the Destination Name is taken as the Group Name.

c. Select the collection protocols in the drop-down list.

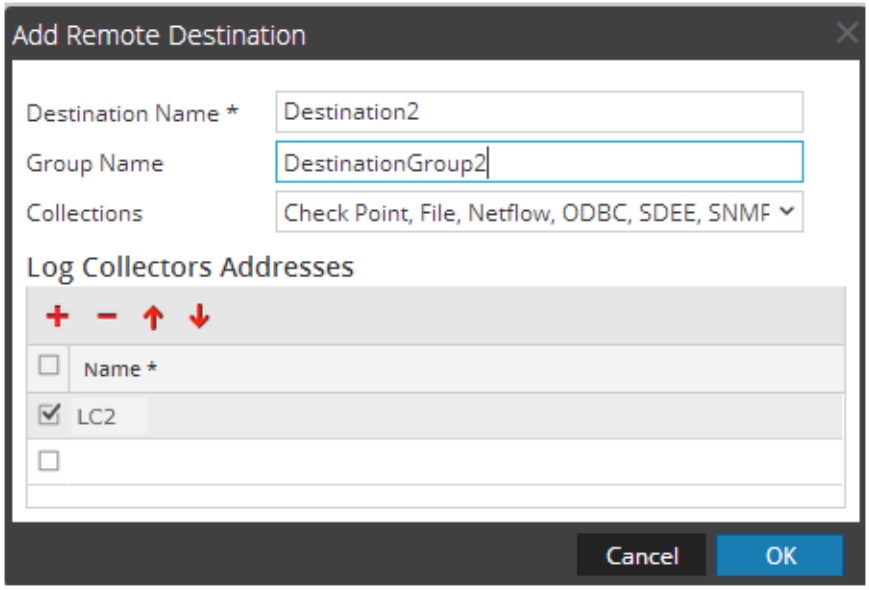
d. Select a Local Collector (for example, **LC1**).

e. Click **OK**.

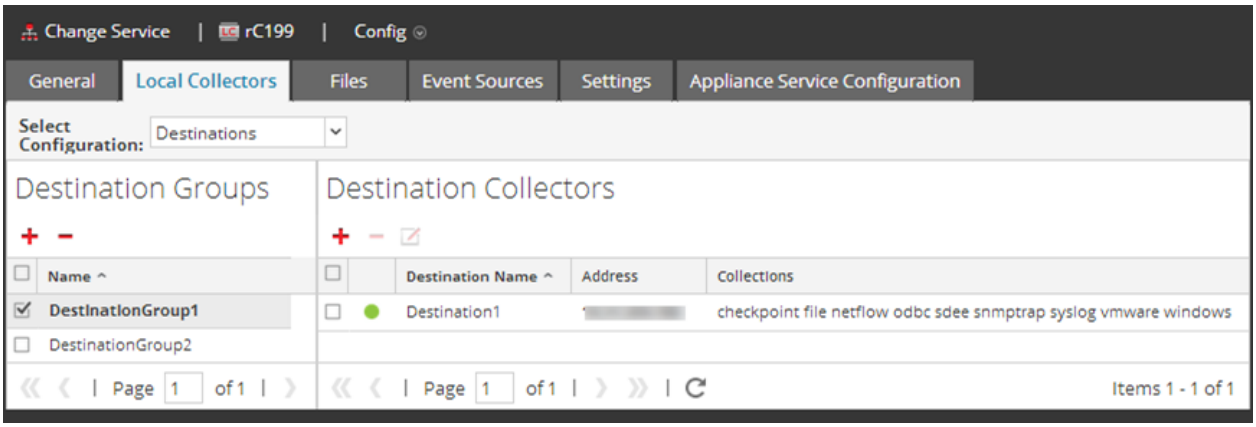
f. Select the new group (for example, **DestinationGroup2**) group in the **Destination Groups** panel and click + in the **Local Collector** panel.

g. In the **Local Collector** panel, click + and complete the **Add Remote Destination** dialog as

illustrated in the following figure.



The **Check Point**, **File**, **Netflow**, **ODBC**, **SDEE**, **SNMP**, **Syslog**, and **Windows** collection protocols are sent to two Local Collectors (**LC1** and **LC2**). Both Local Collectors are active and collecting event data.



Configure Chain of Remote Collectors

This topic describes how to chain Remote Collectors (also referred to as VLCs).

You can set up a chain of Remote Collectors to push event data to a Remote Collector, or you can configure a Remote Collector to pull event data from a chain of Remote Collectors.

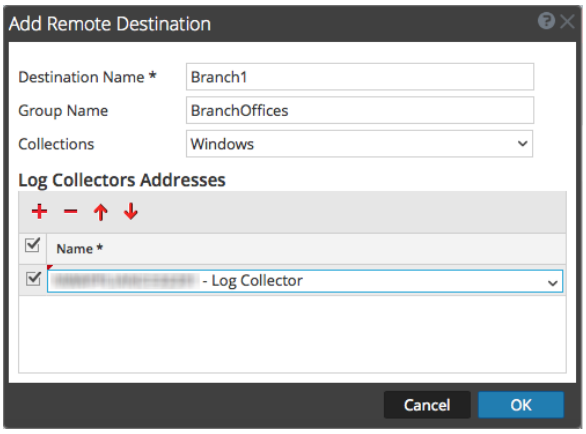
- **Remote Collectors to push data.** Push data from a Remote Collector to other Remote Collectors or Local Collectors.
- **Remote Collector to pull data.** Use a Remote Collector to pull data from one or more Remote Collectors.

Configure Remote Collector to Push Event Data to Remote Collector

1. Go to **ADMIN > Services.**
2. In **Services**, select a **Remote Collector**.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.

   The **Log Collector Service Config** view is displayed with the **Log Collector General** tab open.
4. Select the **Local Collectors** tab.
5. Select **Destinations** in the **Select Configurations** drop-down menu.
6. In the **Destination Groups** panel section, select .

   The **Add Remote Destination** dialog is displayed.
7. Set up a **Destination Group**:
   a. Enter a **Destination Name**.
   b. (Optional) **Enter a Group Name**. If you leave Group Name blank, NetWitness Platform sets it to the value that you specified in Destination Name.
   c. Select one or more collection protocols in the **Collections** drop-down list.
   d. Under **Log Collectors Addresses**, click to select a Remote Collector.



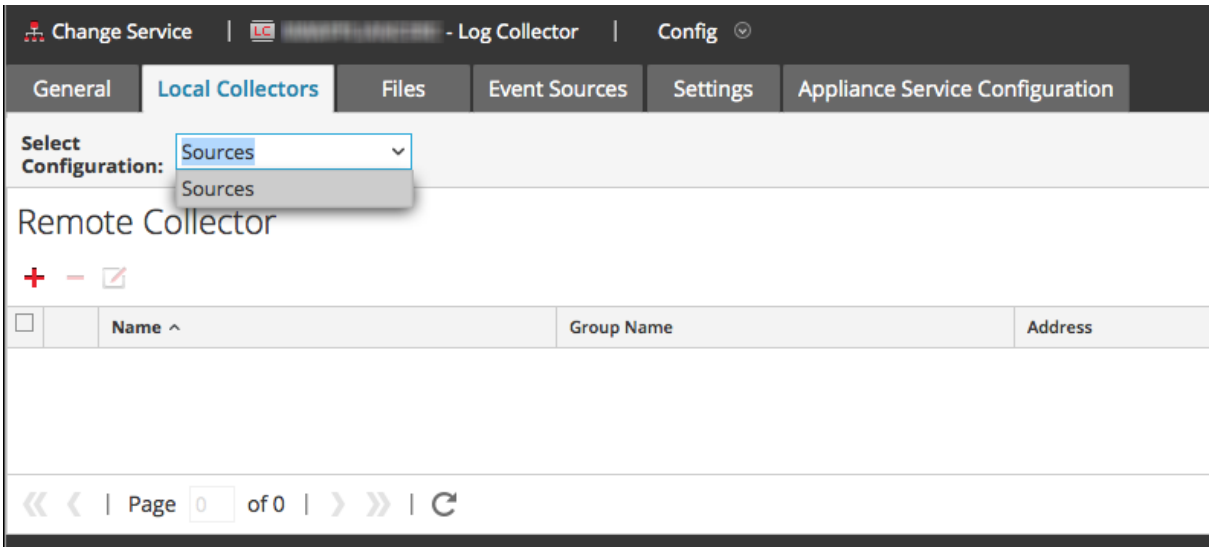
Note: If you do not select a collection protocol, the Remote Collector pushes all collection protocols to the Remote Collectors.

Configure Remote Collector to Pull Event Data from a Remote Collector

1. Go to **ADMIN > Services.**
2. In **Services**, select a **Remote Collector**.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.

   The **Service Config** view is displayed with the **Log Collector General** tab open.

4. Select the **Local Collectors** tab.
5. Select **Sources** in the **Select Configurations** drop-down menu.



6. In the **Remote Collectors** panel, select +.

   The **Add Source** dialog is displayed.
7. In the **Add Source** dialog:
   a. Select one or more collection protocols.

      If you do not select a collection protocol, the Remote Collector pulls all collection protocols from the Remote Collector.

   b. Click **OK**.

      The Remote Collector is added to the Remote Collector section. When the Log Collector starts collecting data, it pulls event data from this Remote Collector.

Throttle Remote Collector to Local Collector Bandwidth

To improve performance, you can throttle the bandwidth to control the rate that the Remote Collector sends event data to Local Collector or between Message Brokers. To do this, you configure the Linux kernel's filtering and IPTable functionality.

This works for both push and pull Remote Collector configurations. The **set-shovel-transfer-limit.sh** shell script located on the **/opt/netwitness/bin** automates the configuration of the kernel filter and iptables related to this port.

This topic describes how to throttle Remote Collector to Local Collector bandwidth using the **set-shovel-transfer-limit.sh** shell script. It contains the following sections:

- The **set-shovel-transfer-limit.sh** shell script command line help.

  Note: The filter value that you need to set depends on the rate at which remote log collector is sending events to the Local Collector.

- An example that sets the Filter to 4096 kilobits per second.

Command Line Help for Set Shovel Transfer Limit Script

Issue the `-h` command to display help for `set-shovel-transfer-limit.sh` shell script.

```
cd /opt/netwitness/bin
./set-shovel-transfer-limit.sh
```

Usage:

```
set-shovel-transfer-limit.sh -s|-c|-d|[-i interface] [-r rate]
```

where:

- -c = clear existing
- -d = display filter
- -s = set new values
- -i = interface is the name of the network interface. Default value is **eth0**
- -r = rate is the bandwidth rate. Default value is **256kbps**

Bandwidths and rates can be specified in:

- **nolimit**: disables throttling
- **kbit**: Kilobits per second
- **mbit**: Megabits per second
- **kbps**: Kilobytes per second
- **mbps**: Megabytes per second
- **bps**: Bytes per second

Set the Filter to 4096 Kilobits per Second

This example sets the Filter to 4096 kilobits per second.

```
[root@<hostname> bin]#./set-shovel-transfer-limit.sh -s -r 4096kbit

RATE=4096kbit
 PORTNUMBER=5671
 DEVICE_INTERACE=eth0

Set Up a Lockbox

What Is a Lockbox

A lockbox is an encrypted file that you use to store confidential information about an application. The NetWitness Platform Lockbox stores an encryption key for the Log Collector.

The encryption key is used to encrypt all event source passwords and the event broker password.

When you create the Lockbox, you need to define a password for the Lockbox.

The Log Collector operates the Lockbox in a mode during data collection that does not require you to specify the password (the Log Collector uses the host system fingerprint instead).

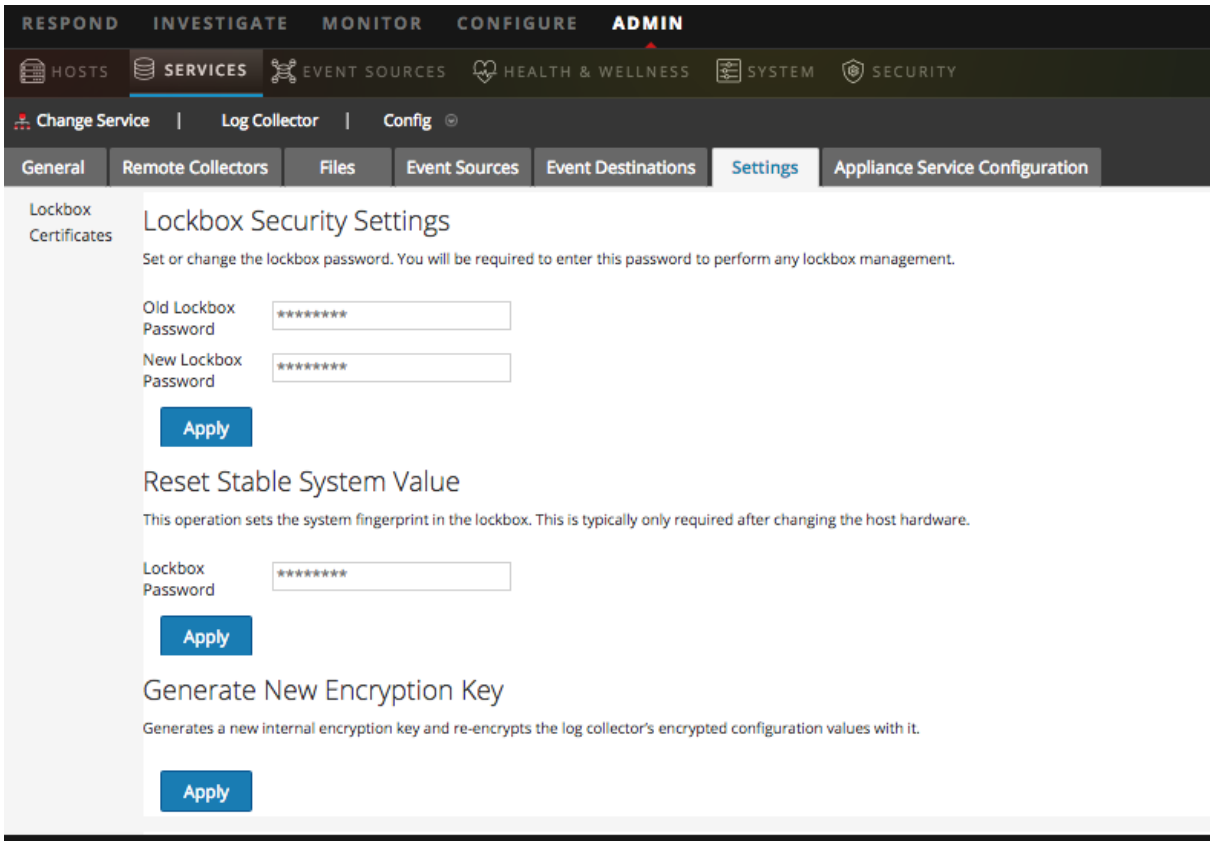
These are the lockbox security settings.

Feature	Description
Old Lockbox Password	When you set up a Lockbox for the first time, this field is blank. NetWitness Platform populates this field after you enter a New Lockbox Password and click Apply.
New Lockbox Password	Initial or new lockbox password. To maximize lockbox security, specify a password that is eight or more characters in length with at least one numeric character, uppercase character, and non-alphanumeric character such as # or !
Apply	Click **Apply** to save the changes to the lockbox password.

Set Up a Lockbox

To set up a lockbox you need to set a password, as follows:

1. Go to **ADMIN > Services**.
2. Select a Log Collection service.
3. Under Actions, select > **View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Settings** tab.



5. In the options panel, select **Lockbox** to configure Lockbox settings.
6. Under **Lockbox Security Settings**, enter a password in the **New Lockbox Password** field and click **Apply**.

Start Collection Services

If a collection service stops, you may need to start it again. You can also enable the automatic start of collection services.

Start a Collection Service

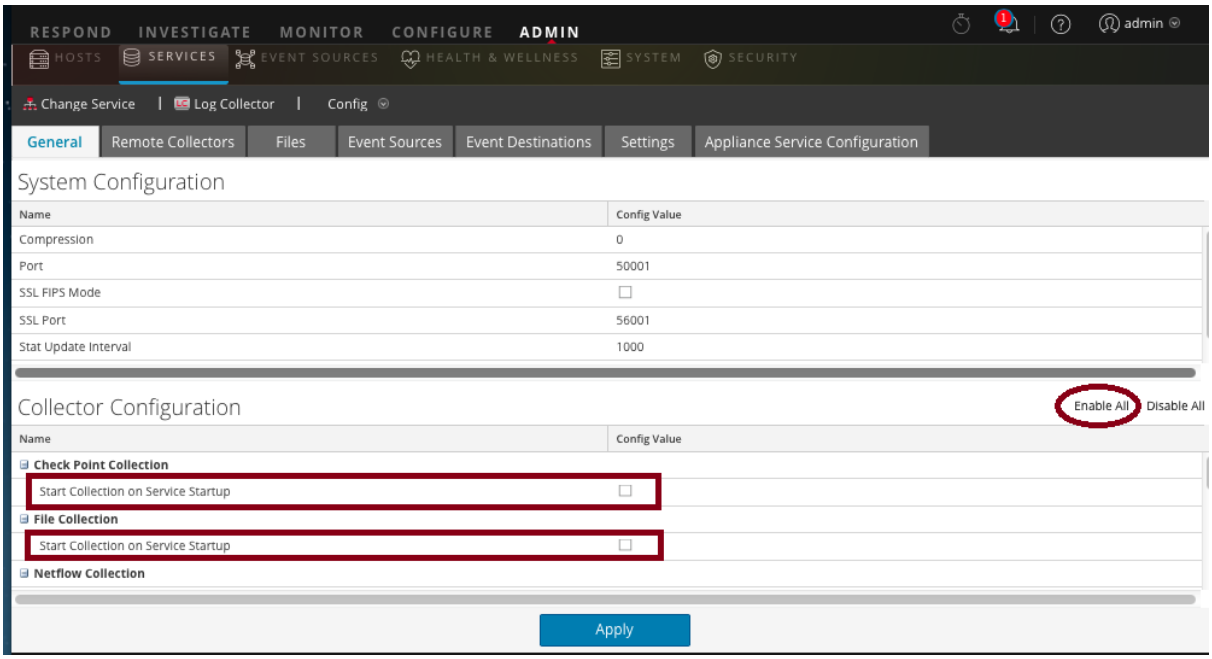
1. Go to **ADMIN > Services**.
2. Select a Log Collector service and click under **Actions**.

3. Click **View** > **System**.
4. Click **Collection** > ***service*** (for example **File**) and click **Start**.

Enable Automatic Start of Collection Services

1. Go to **Admin > Services**.
2. Select a Log Collector service and click under **Actions**.
3. Click **View** > **Config**.

   The General tab is displayed.
4. In the Collector Configuration panel, select **Start Collection on Service Startup** for the individual collection services that you want to start automatically. Alternatively, select **Enable All** to automatically start all collection services.



5. Click **Apply** for your changes to take effect.

Verify That Log Collection Is Working

This topic tells you how to verify that you have set up Log Collection correctly.

The following methods verify that Log Collection is working.

- Verify that there is event activity the Event Source Monitoring tab of the **Administration > Health & Wellness** view.
- Verify that there are parsers in the **device.type** field in the **Details** column in the **Investigation > Events** view for the collection protocol you configured.

Please refer to the topics for each Collection Protocol for steps on how to verify that the protocol is set up correctly.

Configure Certificates

You manage certificates by creating trust stores on the Log Collector. The Log Collector refers to these trust stores to determine whether or not the event sources are trusted.

Add a Certificate

To add a certificate:

1. Go to **ADMIN > Services**.
2. In the **Services** grid, select a **Log Collector** service.
3. Click under **Actions** and select **View > Config**.
4. Click the **Settings** tab.
5. In the options panel, select **Certificates**.
6. Click in the **Certificates** tool bar.
   The **Add Cert** dialog is displayed.
7. Click **Browse** and select a certificate (***.PEM**) from your network.
8. Specify a password (if required).
9. Click **Save**.

Certificates Panel

The following table describe the buttons and columns available in the Certificates panel.

Field	Description
	Opens the Add Cert dialog in which you can add a certificate and password.
	Deletes the selected certificates.
	Selects certificates.
Trust Store Name	Displays the name of the trust store.
Certificate Distinguished Name	For Check Point event source only, displays the distinguished name for the certificate.
Certificate Password Name	For Check Point event source only, displays the password name for the certificate.

Add Cert Dialog

The following table describes the parameters available in the **Add Cert** dialog.

Field	Description
Trust Store Name	Enter a trust store name.
File	Click Browse to select a certificate (*.PEM file) file from your network
Password	Specify the password for this certificate.
Close	Closes the dialog without adding a certificate.
Save	Adds the certificate.

Log Collection Basics

How Log Collection Works

The Log Collector service collects logs from event sources throughout the IT environment in an organization and forwards the logs to other NetWitness Platform components. The logs and the descriptive content are stored as meta data for use in investigations and reports.

Event sources are the assets on the network, such as servers, switches, routers, storage arrays, operating systems, and firewalls. In most cases, your Information Technology (IT) team configures event sources to send their logs to the Log Collector service and the NetWitness Platform administrator configures the Log Collector service to poll event sources and retrieve their logs. As a result, the Log Collector receives all logs in their original form.

Collection Protocols

RSA NetWitness Platform can collect logs from a wide variety of event sources. When you are configuring log collection for a specific event source, you need to know, first and foremost, the protocol that is used to collect the logs.

Collection Protocol	Description
Check Point	Collects events from Check Point event sources using OPSEC LEA. OPSEC LEA is the Check Point Operations Security Log Export API that facilitates the extraction of logs. For details, see Configure Check Point Event Sources in NetWitness Platform.
File	Collects events from log files. Event sources generate log files that are transferred using a secure file transfer method to the Log Collector service. For details, see Configure File Event Sources in NetWitness Platform.
Netflow	Accepts events from Netflow v5 and Netflow v9. For details, see Configure Netflow Event Sources in NetWitness Platform.
ODBC	Collects events from event sources that store audit data in a database using the Open Database Connectivity (ODBC) software interface. For details, see Configure ODBC Event Sources in NetWitness Platform.
Plugins	The Plugins collection is a generic collection framework for collecting events using external scripts written in other languages. RSA currently provides collection for Amazon Web Services (AWS) CloudTrail and Microsoft Azure. • **AWS**: Collects events from Amazon Web Services (AWS) CloudTrail. Specifically CloudTrail records AWS API calls for an account. For details, see Configure AWS (CloudTrail) Event Sources in NetWitness Platform • **Azure**: Collects events from Microsoft Azure. For details, see Configure Azure Event Sources in NetWitness Platform. Customers can use this framework to develop their own collection protocols.

Collection Protocol	Description
SDEE	Collects Intrusion Detection System (IDS) and Intrusion Prevention Service (IPS) messages. For details, see Configure SDEE Event Sources in NetWitness Platform.
SNMP Trap	Accepts SNMP traps. For details, see Configure SNMP Event Sources in NetWitness Platform.
Syslog	Accepts messages from event sources that issue syslog messages. For details, see Configure Syslog Event Sources. **Note:** You do not configure Syslog Collection for Local Log Collectors. You only need to configure Syslog Collection for Remote Collectors.
VMware	Collects events from a VMware virtual infrastructure. For details, see Configure VMware Event Sources in NetWitness Platform.
Windows	Collects events from Windows machines that support the Microsoft Windows model. Windows 6.0 is an event logging and tracing framework included in the operating system beginning with Microsoft Windows Vista and Windows Server 2008. For details, see Configure Windows Event Sources in NetWitness Platform.
Windows Legacy	Collects events from: • Older Windows versions such as Windows 2000 and Window 2003 and collects from Windows event sources that are already configured for enVision collection without having to reconfigure them. • NetApp ONTAP appliance event source so that you can now collect and parse NetApp evt files. • For more information, see.Windows Legacy and NetApp Collection Configuration. **Note:** You install the NetWitness Platform Windows Legacy Collector on a physical or virtual Windows 2008 R2 SP1 64-Bit server using the **SALegacyWindowsCollector-*version-number.exe***.

Basic Procedure

The basic procedure is the same for all of the supported Collection Protocols.

To configure collection for an event source:

1. **Set up your Event Source for collection.** Each supported event source has a configuration document available in the RSA Supported Event Sources space on RSA Link
   a. Navigate to the RSA Supported Event Sources space on RSA Link.
   b. Find the Instructions for your Event Source.

The Overview page lists all of the currently supported Event Sources, as well as information about the collection method, device class, and supported versions.

c. Download the configuration instructions for your event source, and follow them.

2. **Configure collection on RSA NetWitness Platform.** The event source configuration guide contains these instructions. However, this guide also provides these instructions, based on the collection method used by your event source. See Collection Protocols for details.
3. **Start the Service for your Collection Method.** Normally, you only need to do this for the first event source that uses this collection method. For example, the first time you configure an event source that uses File Collection, you may need to start the File Service in NetWitness Platform.
4. **Verify that Collection is working for your Event Source.**

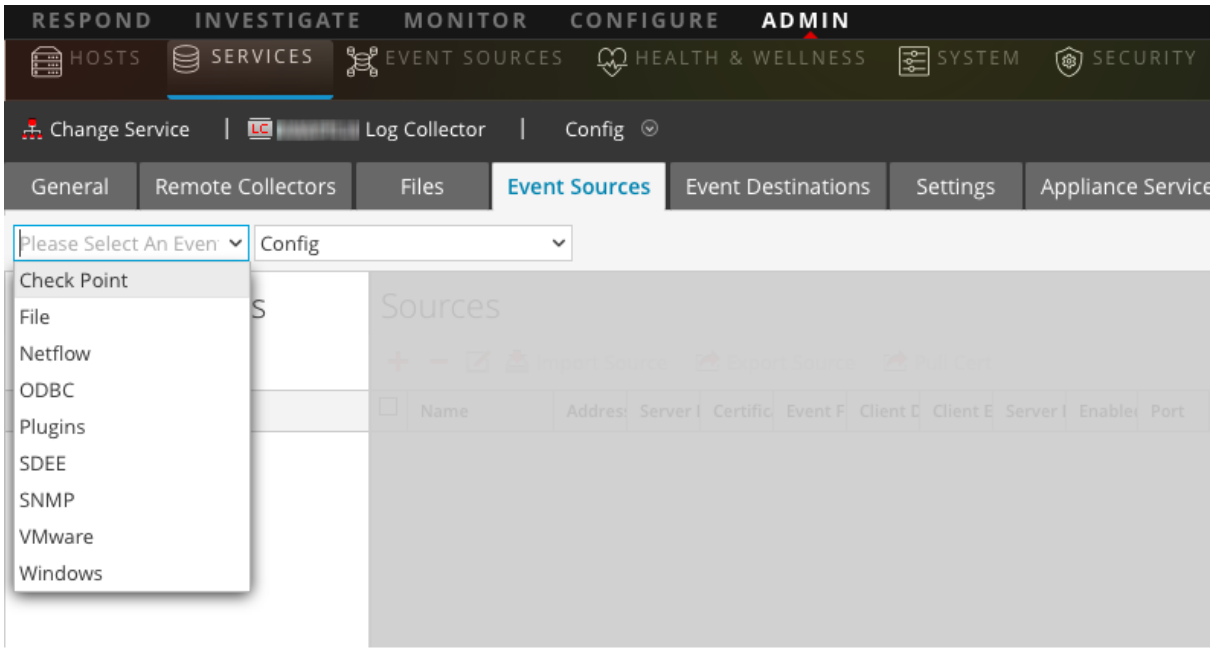
The remainder of this topic discusses steps 2, 3, and 4 in more detail.

Configure Collection in RSA NetWitness Platform

The process to configure event sources is dependent upon the collection method they use. Note, however, that they are very similar. The following procedure is generic: more details for individual collection methods are available in topics that cover the details for each specific collection method.

Basic procedure to configure an event source in RSA NetWitness Platform:

1. Go to **ADMIN > Services** from the NetWitness Platform menu.
2. Select a Log Collection service.
3. Under Actions, select > **View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.



5. In the **Log Collector Event Sources** tab, select your collection method from the drop-down menu.
6. In the **Event Categories** panel toolbar, click +.
   The Available Event Source Types dialog box is displayed.
7. Select an event source type and click **OK**.
   The newly added event source type is displayed in the Event Categories panel.
8. Select the new type in the **Event Categories** panel and click + in the Sources toolbar.
   The **Add Source** dialog is displayed.
9. Enter values for the available parameters.
   Refer to the Parameters section of the specific collection method that you are configuring.
10. Click **OK**.

Start the Service for your Collection Method

To start the service for your collection method:

1. Go to **Admin > Services**.
2. Select a **Log Collector** and select ⚙ **> View > System**.
3. Click **Collection > *protocol* > Start**
   where ***protocol*** is the protocol that you wish to start, for example **Netflow**.

Verify that Collection is working for your Event Source

You can verify that a collection method is working from the **Admin > Health & Wellness > Event Source Monitoring** tab.

To verify that collection is working for an event source:

1. Go to **ADMIN > Health & Wellness**
2. Click the **Event Source Monitoring** tab.
3. In the grid, find the **Log Decoder**, **Event Source**, and **Event Source Type**.
4. Look for activity in the **Count** column for an event source to verify that collection is accepting events.

Configure Event Filters for a Collector

This topics tells you how to create and maintain Event filters across all collection protocols.

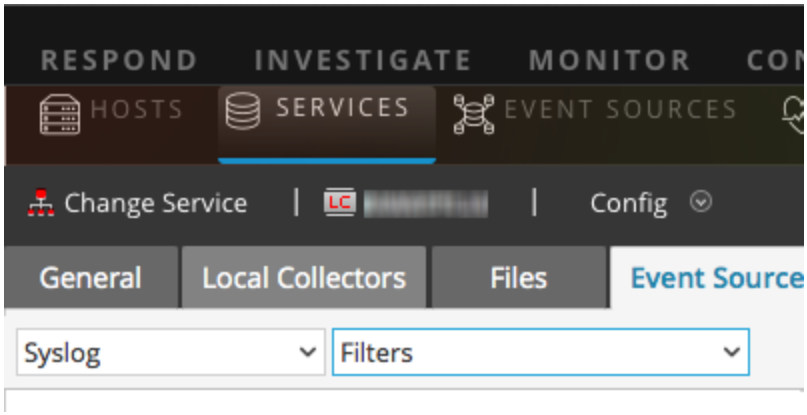
Note: Prior to 11.3, you could not configure Syslog Collection for Local Log Collectors. You ***can*** configure Syslog for local Log Collectors that are on version 11.3 or later.

Configure an Event Filter

To configure an event filter for an event source:

1. Go to **ADMIN > Services**.
2. Select a Log Collection service.
3. Under Actions, select **View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.
5. In the **Event Sources** tab, select any collection method / **Filter** from the drop-down menus.

   The following screen shows **Syslog** selected.

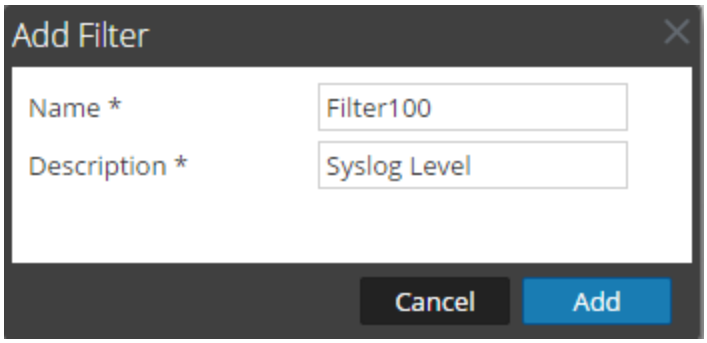


Note: Syslog configuration is only available on Remote Collectors prior to 11.3: if you are working with a Local Collector service, **Syslog** is not available from the drop-down menu for Log Collectors on version 11.0, 11.1, or 11.2.

   The **Filters** view displays the filters that are configured for the selected collection method, if any.

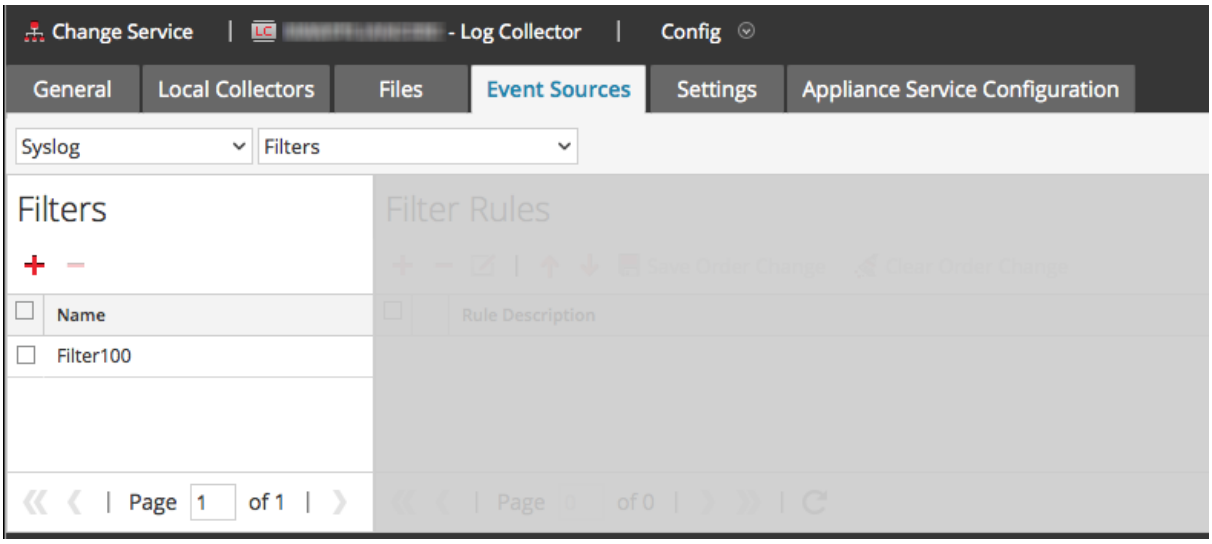
6. In the **Filters** panel toolbar, click +.

   The **Add Filter** dialog displays.

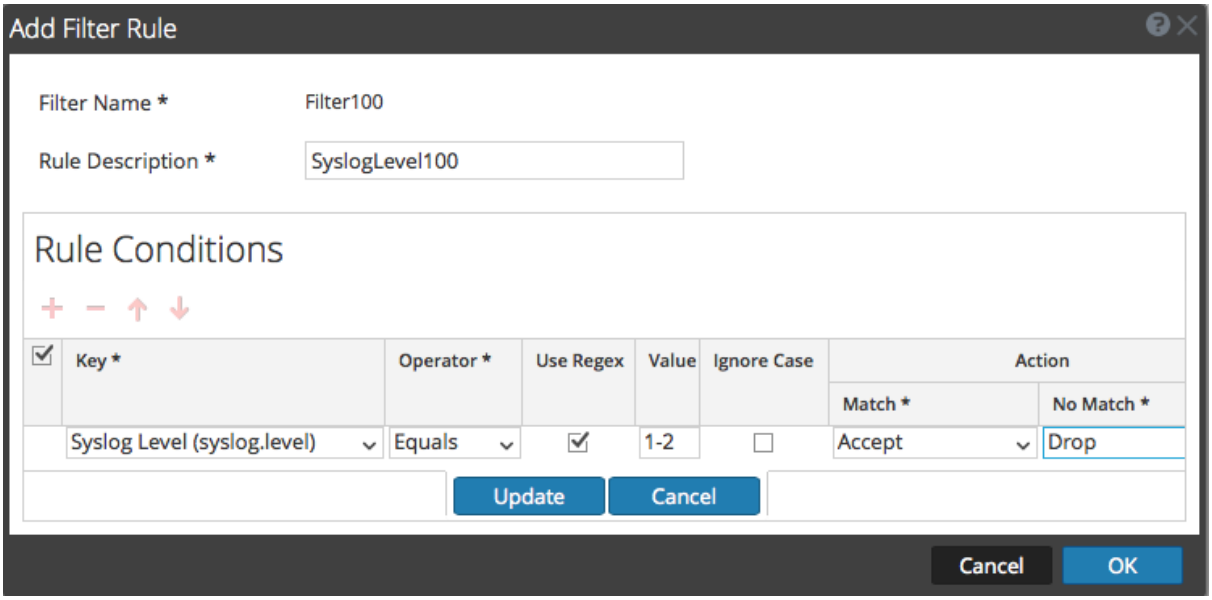


7. Enter a name and description for the new filter and click **Add**.

   The new filter displays in the **Filter** panel.



8. Select the new filter in the **Filters** panel and click + in the **Filter Rules** panel toolbar.
   The **Add Filter Rule** dialog is displayed.
9. Click + under **Rule Conditions**.
10. Add the parameters for this rule and click **Update > OK**.



NetWitness Platform updates the filter with the rule that you defined.

Note: Rules are processed in order from top down until an Action type aborts the processing, or the final rule is checked. Default behavior is to accept the rule if no matches are found.

The following tables describe the parameters for adding a filter rule.

Event Filter Rule "Key" Parameter

The values for the Key field depend on the Collection method to which the filter applies.

Collection Method	Values for the *Key* Field
Checkpoint, File, Netflow, Plugin, SDEE SNMP and VMware	• All Data Fields • Event Source Type • Event Source Name • Source IP • Raw Event
ODBC	• All Data Fields • Event Source Type • Event Source Name • Source IP • Message ID • Message Level
Syslog	• All Data Fields • Event Source Type • Event Source Name • Source IP • Syslog level • Raw Event
Windows	• All Data Fields • Event Source Type • Event Source Name • Source IP • Event ID • Provider • Channel • Computer • UserName • DomainName

Collection Method	Values for the *Key* Field
Windows Legacy	• All Data Fields • Event Source Type • Event Source Name • Source IP • Event ID

Other Event Filter Rule Parameters

The following table describes all the other available fields for creating an event filter rule.

Field	Description
Operator	Valid values are: • Contains • Equal
Use Regex	Optional. You can select this if you want to use Regex.
Value	Value depends on the key value you selected. For example if you choose **Syslog level** for Key, the value will be a number that denotes the syslog level.
Ignore case	Optional. Select this to ignore the case sensitivity.
Action	If there is a match you can choose an action to accept, drop, next condition or next rule: • **Accept**: events that match the IDs provided will be included in event logs, and will display in the Systems Analytics UI. • **Drop**: events that match the IDs provided will not be included in event logs and will not display in the UI. • **Next condition**: the filter will ignore events with IDs that match, and will move on to the next rule condition. • **Next rule**: the filter will ignore events with IDs that match, and will move on to the next rule. If there is no match, you can choose an action to accept, drop, next condition or next rule.

Modify Filter Rules

To modify existing filter rules:

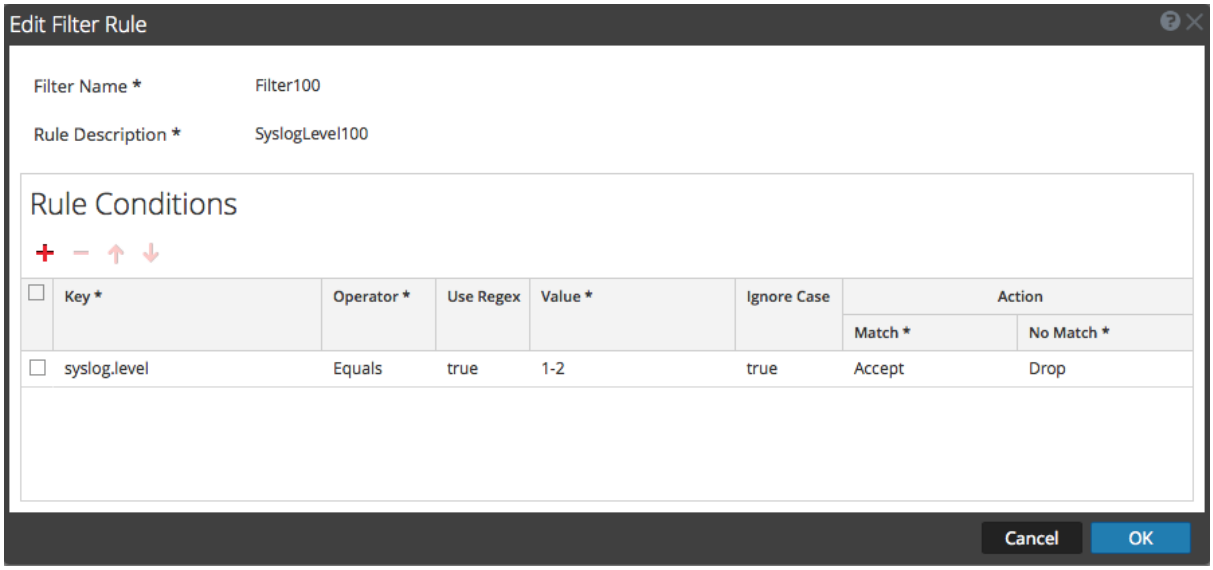
1. Go to **ADMIN > Services**.
2. Select a Log Collection service.
3. Under Actions, select **View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.
5. In the **Event Sources** tab, select any collection method / **Filter** from the drop-down menus.

   The following screen shows **Check Point** selected.

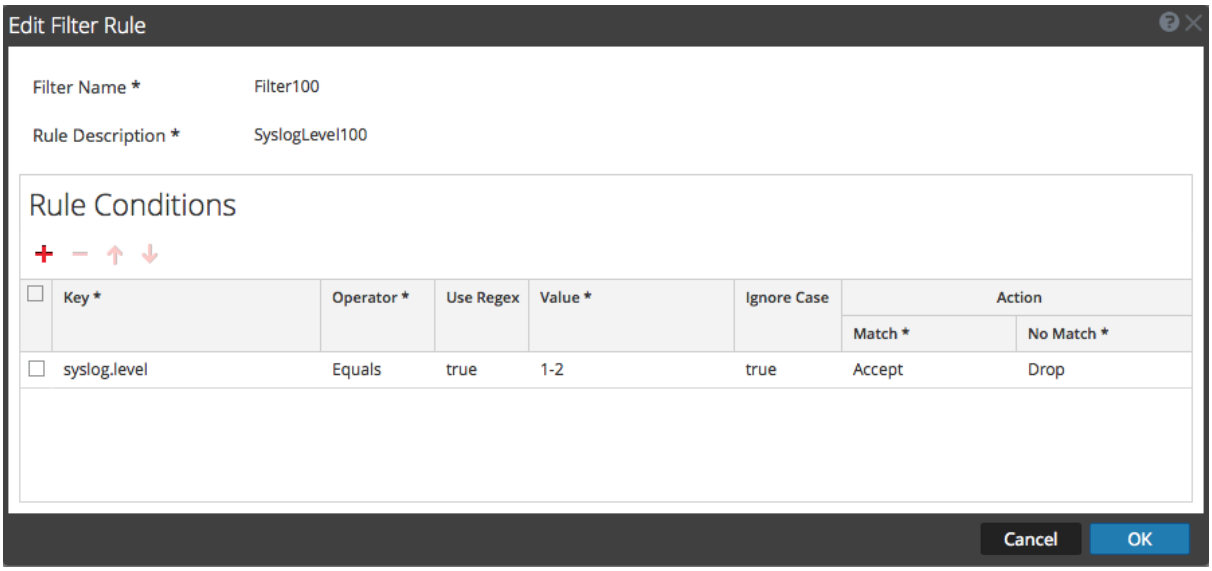
   The **Filters** view displays the filters that are configured for the selected collection method, if any.

6. In the **Filter Rules** list, select a rule and click .

   The **Edit Filter Rule** dialog is displayed.



7. Select the rule condition that you want to modify.



8. Modify the condition parameters that require changes and click **Update** > **OK**.

NetWitness Platform applies the condition parameter changes to the selected filter rule.

Import, Export, Edit, and Test Event Sources in Bulk

This topic describes how to import, export, edit, and test event sources in bulk.

You can use the bulk export option to export the event source details of your current set up and store it. This data can be imported in bulk when you face a problem with your current set up and require the event source data you had.

You can use the bulk edit feature when you have multiple event sources that need a specific modification. You can select all the sources and apply the edit option across them at a time and avoid applying the change one by one.

Import Event Sources in Bulk

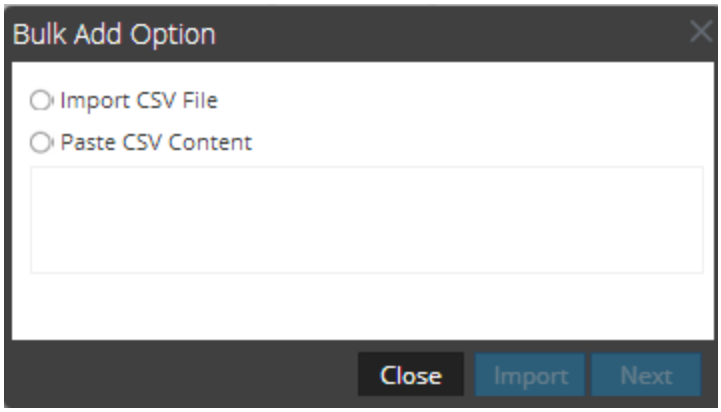
Warning: When using a spreadsheet program to edit an exported event source CSV file, some data fields like numbers and dates can be re-formatted into the spreadsheet program's native field types. This can cause issues when re-importing this information, as some data fields may be garbled or formatted incorrectly. This can be avoided by importing the CSV file into the spreadsheet program, and specifying all data fields as text values.

To import multiple event sources at once:

1. Go to **Admin** > **Services**.
2. Select a Log Collection service.
3. Under Actions, select > **View** > **Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.

5. Select **Check Point**, **File**, **Netflow**, **ODBC**, **Plugins**, **SDEE**, **(Syslog for Remote Collectors) only**, **VMware**, **Windows**, or **Windows Legacy** (SNMP does not have an Import function.).
6. In the **Sources** panel toolbar, click **Import Source**.

   The **Bulk Add Option** dialog is displayed.



7. Select either **Import CSV File** or **Paste CSV Content**. If you select:
   - Import CSV File:
     a. Click **Next**.

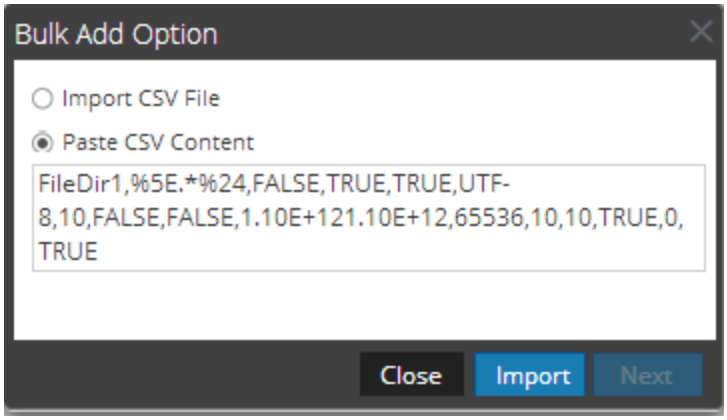
        The **Import dialog** is displayed.

     b. Click **Add** and select a **.csv** file from your network.

     c. Click **Import**.

        The event sources are added to the **Event Source** list.
   - Paste CSV Content

a. Copy the contents of the **.csv** file and paste them into the dialog.



b. Click **Import**.

The event sources are added to **Event Source List**.

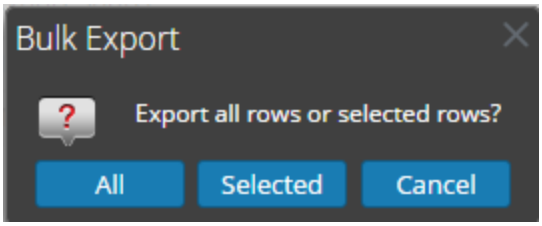
Export Event Sources in Bulk

Warning: When using a spreadsheet program to edit an exported event source CSV file, some data fields like numbers and dates can be re-formatted into the spreadsheet program's native field types. This can cause issues when re-importing this information, as some data fields may be garbled or formatted incorrectly. This can be avoided by importing the CSV file into the spreadsheet program, and specifying all data fields as text values.

To export event source information:

1. Go to **Admin > Services**.
2. Select a Log Collection service.
3. Select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.
5. Select **Check Point**, **File**, **Netflow**, **ODBC**, **Plugins**, **SDEE**, **(Syslog for Remote Collectors) only**, **VMware**, **Windows**, or **Windows Legacy** (SNMP does not have an Export function.).
6. In the **Sources** panel, select one or multiple event sources and click **Export Source**.

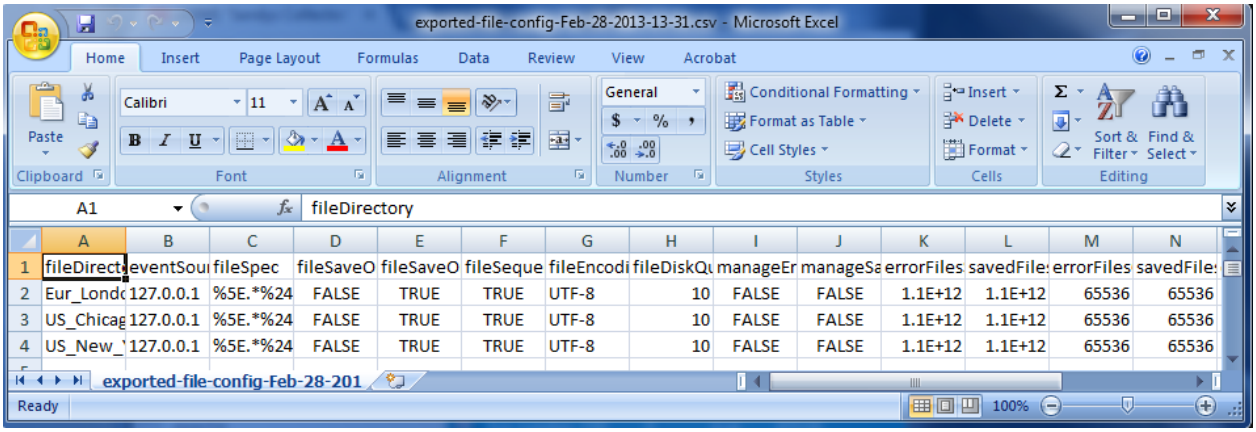
   The **Bulk Export** dialog is displayed.



7. Based on your selection:

- **All**: NetWitness Platform exports all event sources to a time-stamped CSV file.
- **Selected**: NetWitness Platform exports the event source or sources you selected to a time-stamped CSV file.
- **Cancel**: NetWitness Platform cancels the export.

The following is an example of a time-stamped CSV file that gets created with the event sources that you selected from the list.

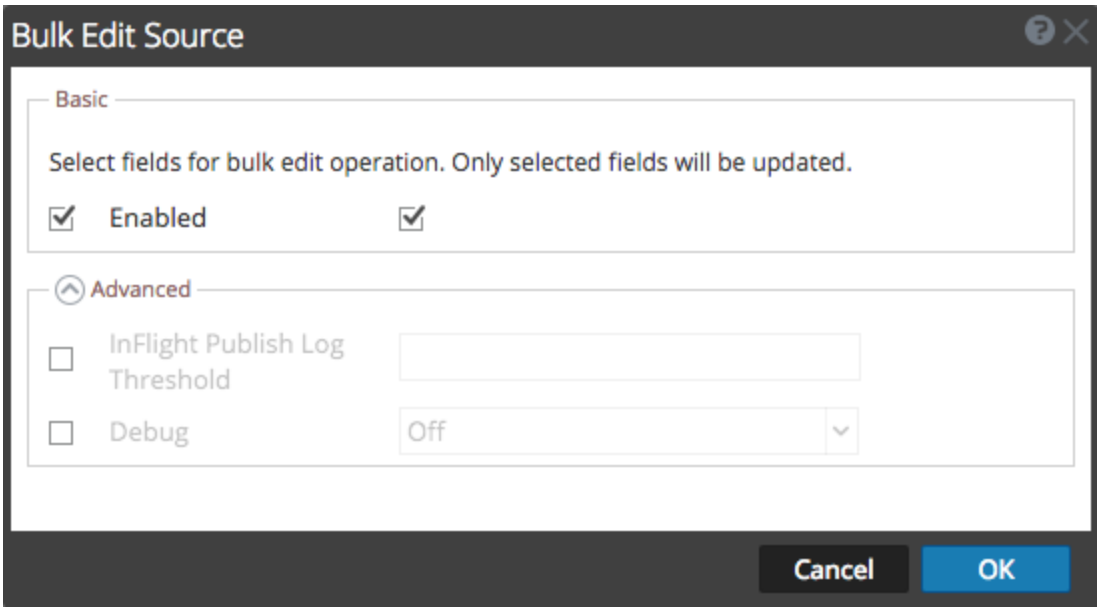


Edit Event Sources in Bulk

To edit multiple event sources at once:

1. On the **Log Collector Event Sources** tab, select **Check Point**, **File**, **Netflow**, **ODBC**, **Plugins**, **SDEE**, **Syslog**, **VMware**, **Windows**, or **Windows Legacy** (SNMP does not have an Edit function.).
2. In the **Sources** panel, select multiple event sources and click .

   The appropriate **Bulk Edit** dialog for the selected event source is displayed. The following figure is an example of **Bulk Edit Source** dialog for File event source parameters.



3. Select the checkbox to the left of the fields that you want to modify (for example, **Debug**).
4. Modify the selected parameters (for example, change Debug from **Off** to **On**).
5. Click **OK**.

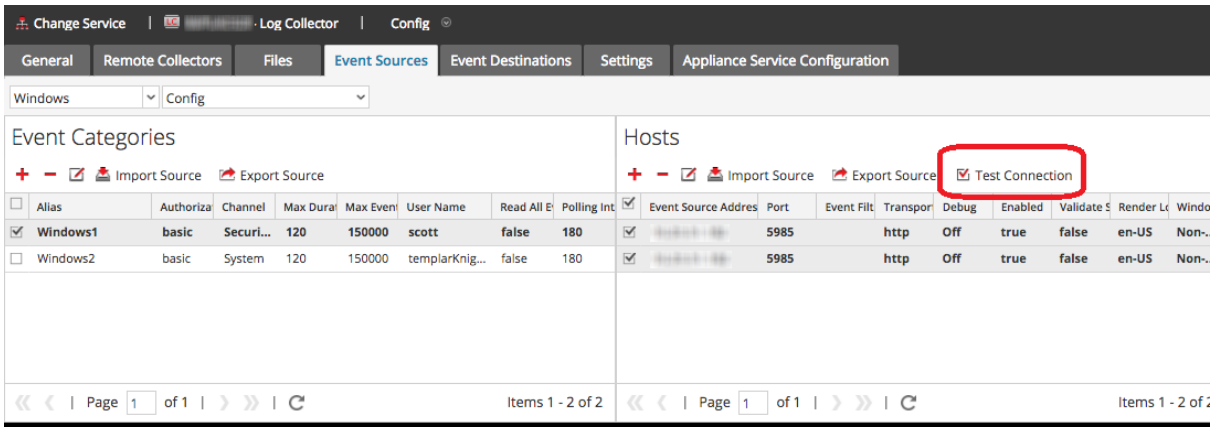
   NetWitness Platform applies the same parameter value change to all of the selected event sources

Test Event Source Connections in Bulk

To test multiple event source connections at once:

1. Go to **Admin** > **Services**.
2. In the **Services** grid, select a **Log Collector** service.
3. Select > **View** > **Config** to display the Log Collection configuration parameter tabs.
4. Select the **Event Sources** tab, select **Plugins**, **ODBC**, or **Windows** (the other protocols do not have a bulk test connection function).
5. Select one or more:
   - sources from the **Sources** panel for **Plugins** or **ODBC**
   - hosts from **Hosts** panel for **Windows**

   The **Test Connection** button is enabled.



6. Click Test Connection .

   The **Bulk Test Connections** dialog is displayed showing the current status of the test for each source. The status can be waiting, testing, passed or failed.

   If you choose to close the testing before it is completed, the testing stops and the **Bulk Test Connections** dialog closes.

After the testing is complete, the results are displayed in the **Bulk Test Connections** dialog.

See Also

You can use the **Event Sources** module (Administration > Event Sources) to create groups of event sources, typically imported from a CMDB, and to monitor event sources based on those groups. For details, see the following topics in the *Event Source Management Guide*:

- Import Event Sources
- Export Event Sources
- Bulk Edit Event Source Attributes

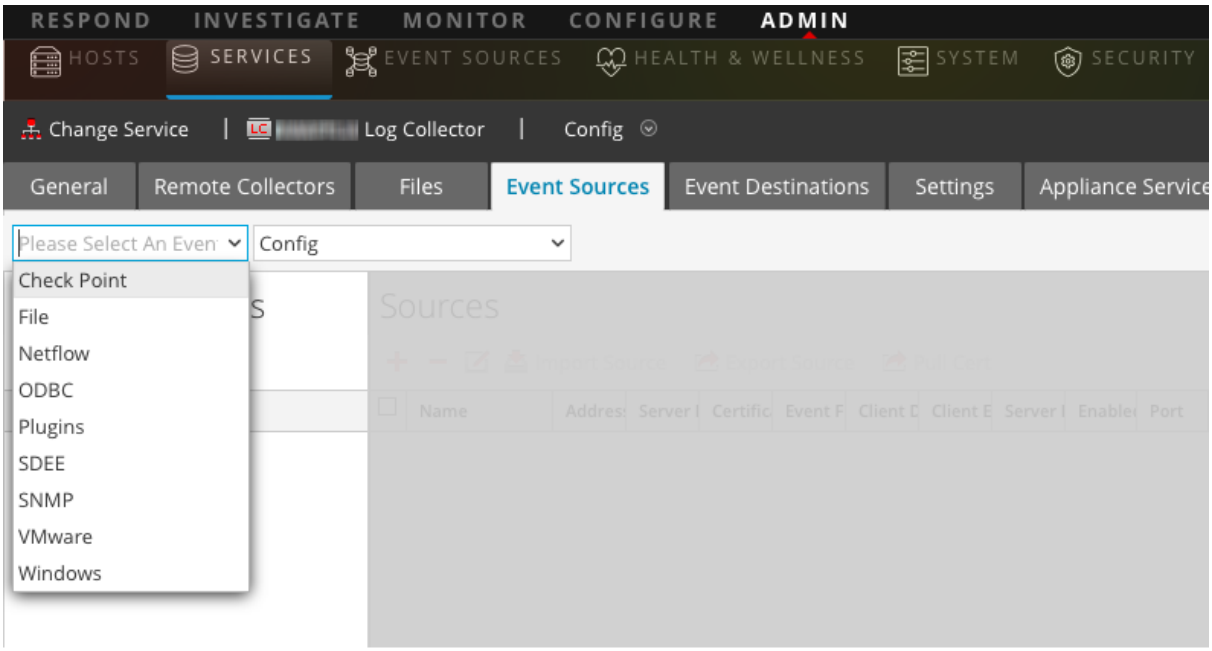
Configure Collection Protocols and Event Sources

This topic tells you how to configure collection protocols and the event sources using those protocols.

You configure the Log Collector to collect event data from your event sources in the Event Sources tab of the Log Collection parameter view.

To configure a collection protocol:

1. Go to **ADMIN > Services** from the NetWitness Platform menu.
2. Select a Log Collection service.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.



5. Select a collection protocol (for example, **File**) and select **Config**.
6. Click and select an event source.
7. Select the newly added category and click .
8. Specify the parameters for the event source. For details, see the individual collection protocol topics.

The following guides provide detailed instructions on how to configure the collection protocols and their associated event sources in NetWitness Platform. Each guide includes an index to configuration instructions for the event sources supported for that collection protocol.

To configure individual collection protocols, see the following topics:

- Configure AWS (CloudTrail) Event Sources in NetWitness Platform
- Configure Azure Event Sources in NetWitness Platform

- Configure Check Point Event Sources in NetWitness Platform
- Configure File Event Sources in NetWitness Platform

Configure AWS (CloudTrail) Event Sources in NetWitness Platform

This topic tells you how to configure the AWS collection protocol, which collects events from Amazon Web Services (AWS) CloudTrail.

Note: The AWS plugin is meant only for collecting from AWS CloudTrail logs, and not for collecting from arbitrary logs in S3 buckets (under arbitrary directories). The AWS CloudTrail logs are sent in JSON format, as detailed in the AWS documentation here: http://docs.aws.amazon.com/awscloudtrail/latest/userguide/cloudtrail-event-reference.html.

How AWS Collection Works

The Log Collector service collects events from Amazon Web Services (AWS) CloudTrail. CloudTrail records AWS API calls for an account. The events contain the identity of the API caller, the time of the API call, the source IP address of the API caller, the request parameters, and the response elements returned by the AWS service. The AWS API call history provided by CloudTrail events enables security analysis, resource change tracking, and compliance auditing. CloudTrail uses Amazon S3 for log file storage and delivery. NetWitness Platform copies the log files from the cloud (S3 bucket), and sends the events contained in the files to the Log Collector.

Deployment Scenario

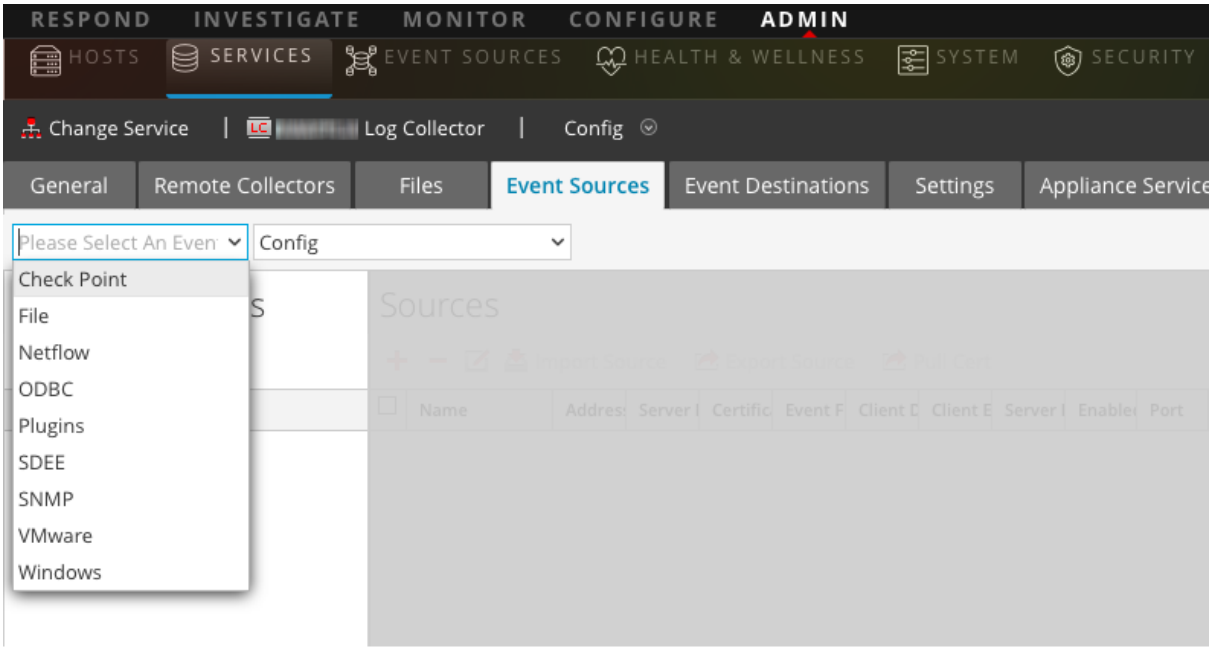
The following figure illustrates how you deploy the AWS Collection Protocol in NetWitness Platform.

Configuration

To configure an AWS (CloudTrail) Event Source:

1. Go to **ADMIN > Services** from the NetWitness Platform menu.
2. Select a Log Collection service.
3. Select **> View > Config** to display the Log Collection configuration parameter tabs.

4. Click the **Event Sources** tab.



5. In the **Event Sources** tab, select **Plugins/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click +.

   The **Available Event Source Types** dialog is displayed.
7. Select **cloudtrail**) and click **OK**.

   The newly added event source type is displayed in the **Event Categories** panel.
8. Select the new type in the **Event Categories** panel and click + in the **Sources** toolbar.

   The **Add Source** dialog is displayed.
9. Define parameter values. For details, see AWS Parameters below.
10. Click **Test Connection**.

    The result of the test is displayed in the dialog box. If the test is unsuccessful, edit the device or service information and retry.

    Log Collector takes approximately 60 seconds to return the test results. If it exceeds the time limit, the test times out and the NetWitness Platform displays an error message.
11. If the test is successful, click **OK**.

    The new event source is displayed in the **Sources** panel.

AWS Parameters

The following table describes the **Basic** configuration parameter for AWS collection.

Note: Required parameters are marked with an asterisk. All other parameters are optional.

Parameter	Description
Name *	Name of the event source.
Enabled	Select the check box to enable the event source configuration to start collection. The check box is selected by default.
Account Id *	Account Identification code of the S3 Bucket
S3 Bucket Name *	Name of the AWS (CloudTrail) S3 bucket. Amazon S3 bucket names are globally unique, regardless of the AWS (CloudTrail) region in which you create the bucket. You specify the name at the time you create the bucket. Bucket names should comply with DNS naming conventions. The rules for DNS-compliant bucket names are: • Bucket names must be at least three and no more than 63 characters long. • Bucket names must be a series of one or more labels. Adjacent labels are separated by a single period ".". Bucket names can contain lowercase letters, numbers, and hyphens. Each label must start and end with a lowercase letter or a number. • Bucket names must not be formatted as an IP address (for example, 192.168.5.4). The following examples are **valid** bucket names: • `myawsbucket` • `my.aws.bucket` • `myawsbucket.1` The following examples are **invalid** bucket names: • `.myawsbucket` - Do not start a Bucket Name with a period • `myawsbucket.` - Do not end a Bucket Name with a period • `my..examplebucket` - Only use one period between labels.
Access Key *	Key used to access the S3 bucket. Access Keys are used to make secure REST or Query protocol requests to any AWS service API. Please refer to Manage User Credentials on the Amazon Web Services support site for more information on Access Keys.
Secret Key *	Secret key used to access the S3 bucket.
Region *	Region of the S3 bucket. `us-east-1` is the default value.
Region Endpoint	Specifies the AWS CloudTrail hostname. For example, for an AWS public cloud for us-east region, the Region Endpoint would be s3.amazonaws.com. More information can be found at http://docs.aws.amazon.com/general/latest/gr/rande.html#s3_region. This parameter is necessary to collect CloudTrail logs from AWS Government or Private clouds.
Use Proxy	Enable **Use Proxy** to set proxy for AWS server. By default, it is disabled.
Proxy Server	Enter the proxy name you want to connect to access the AWS server.
Proxy Port	Enter the port number that connects to the proxy server to access the AWS server.
Proxy User	Enter the user name to authenticate with the proxy server.
Proxy Password	Enter the password to authenticate with proxy port.

Parameter	Description
Start Date *	Starts AWS (CloudTrail) collection from the specified number of days in the past, measured from the current timestamp. The default value is 0, which starts from today. The range is 0–89 days.
Log File Prefix	Prefix of the files to be processed. **Note:** If you set a prefix when you set up your CloudTrail service, make sure to enter the same prefix in this parameter.
Cancel	Closes the dialog without adding the AWS (CloudTrail).
OK	Adds the current parameter values as a new AWS (CloudTrail).

The following table describes the **Advanced** configuration parameter for AWS collection.

Parameter	Description
Debug	**Caution:** Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact. If you change this value, the change takes effect immediately (no restart required).
Command Args	Arguments added to the script.
Polling Interval	Interval (amount of time in seconds) between each poll. The default value is 60. For example, if you specify 60, the collector schedules a polling of the event source every 60 seconds. If the previous polling cycle is still underway, it will wait for it to finish that cycle. If you have a large number of event sources that you are polling, it may take longer than 60 seconds for the polling to start because the threads are busy.
SSL Enabled	Select the check box to communicate using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates. The check box is selected by default.
Test Connection	Validates the configuration parameters specified in this dialog are correct. For example, this test validates that: • NetWitness can connect with the S3 Bucket in AWS using the credentials specified in this dialog. • NetWitness can download a log file from the bucket (test connection would fail if there were no log files for the entire bucket, but this would be extremely unlikely).

Configure Azure Event Sources in NetWitness Platform

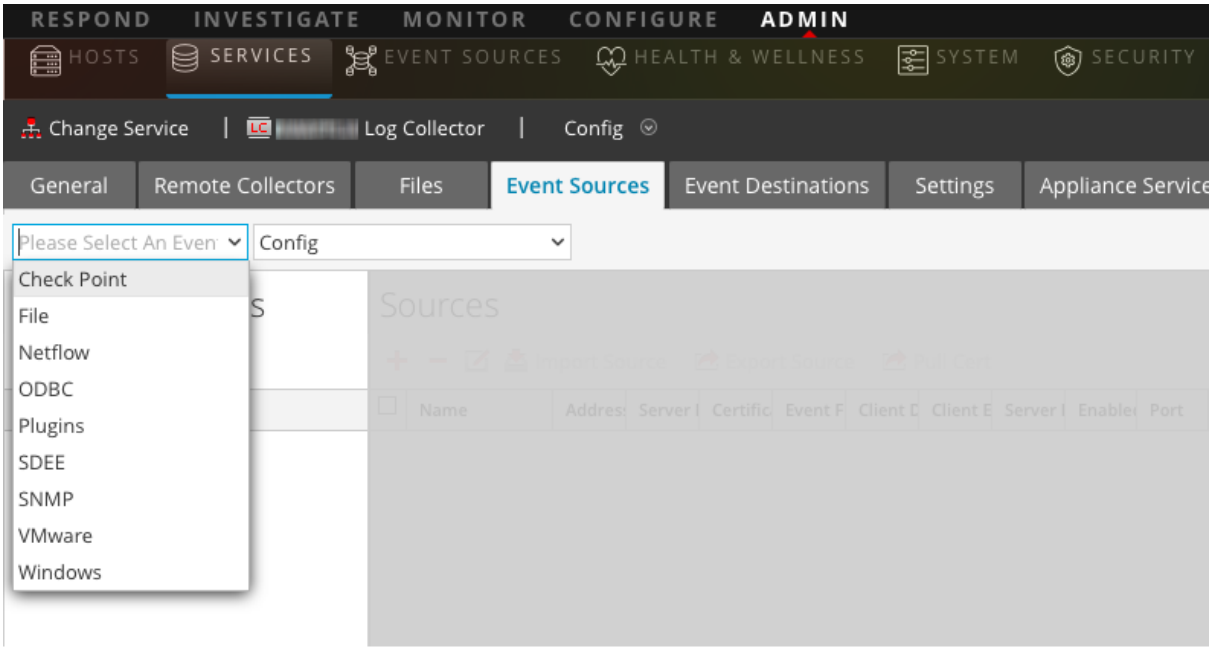
This topic tells you how to configure the Azure collection protocol. Microsoft Azure is a cloud computing platform and infrastructure for building, deploying, and managing applications and services through a global network of Microsoft-managed data centers.

Configuration in NetWitness Platform

For complete details about configuring Azure as an event source, see the Azure Event Source Configuration Guide, available on RSA Link.

To configure an Azure Event Source:

1. Go to **ADMIN> Services** from the NetWitness Platform menu.
2. Select a Log Collection service.
3. Select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.



5. In the **Event Sources** tab, select **Plugins/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click .
   The **Available Event Source Types** dialog is displayed.
7. Select **azureaudit**) and click **OK**.
   The newly added event source type is displayed in the **Event Categories** panel.
8. Select the new type in the **Event Categories** panel and click in the **Sources** toolbar.
   The **Add Source** dialog is displayed.

9. Define parameter values. For details, see Azure Parameters below.
10. Click **Test Connection**.

    The result of the test is displayed in the dialog box. If the test is unsuccessful, edit the device or service information and retry.

    Log Collector takes approximately 60 seconds to return the test results. If it exceeds the time limit, the test times out and the NetWitness Platform displays an error message.
11. If the test is successful, click **OK**.

    The new event source is displayed in the **Sources** panel.

Azure Parameters

This section describes the Azure event source configuration parameters.

Basic Parameters

Note: Required parameters are marked with an asterisk. All other parameters are optional.

Name	Description
Name *	Enter an alpha-numeric, descriptive name for the source. This value is only used for displaying the name on this screen.
Enabled	Select the checkbox to enable the event source configuration to start collection. The checkbox is selected by default.
Client ID *	The Client ID is found the Azure Application Configure tab. Scroll down until you see it.
Client Secret *	When you are configuring the event source, the client secret is displayed when you are creating a key, and you select a duration of validation. Make sure to save this, because you will only be able to see it once, and it cannot be retrieved later.
API Resource Base URL *	Enter `https://management.azure.com/`. Be sure to include the trailing slash (/).
Federation Metadata Endpoint *	In your Azure application, click the **View Endpoints** button (near the bottom of the pane). There are a lot of links that all begin with the same string. Compare the URLs and find the common string that begins most of them. This common string is the endpoint that you need to enter here.
Subscription ID *	You can find this in the Microsoft Azure dashboard: click on Subscriptions at the bottom of the list on the left.
Tenant Domain *	Go to the active directory and click on the directory. In the URL, the tenant domain is the string directly following **manage.windowsazure.com/**. The tenant domain is the string up to and including the **.com**.

Name	Description
Resource Group Names *	In Azure, select Resource groups from the left navigation pane, then select your group.
Start Date *	Choose the date from which to start collecting. Default's to the current date.
Test Connection	Checks the configuration parameters specified in this dialog to make sure they are correct.

Advanced Parameters

Click next to **Advanced** to view and edit the advanced parameters, if necessary.

Name	Description
Polling Interval	Interval (amount of time in seconds) between each poll. The default value is **180**. For example, if you specify 180, the collector schedules a polling of the event source every 180 seconds. If the previous polling cycle is still underway, the collector waits for that cycle to finish. If you have a large number of event sources that you are polling, it may take longer than 180 seconds for the polling to start because the threads are busy.
Max Duration Poll	Maximum duration, in seconds, of a polling cycle. A zero value indicates no limit.
Max Events Poll	The maximum number of events per polling cycle (how many events collected per polling cycle).
Max Idle Time Poll	Maximum duration, in seconds, of a polling cycle. A zero value indicates no limit.
Command Args	Optional arguments to be added to the script invocation.

Name	Description
Debug	**Caution:** Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. If you change this value, the change takes effect immediately (no restart required). The debug logging is verbose, so limit the number of event sources to minimize performance impact.

Configure Check Point Event Sources in NetWitness Platform

This topic tells you how to configure the Check Point collection protocol, which collects events from Check Point event sources.

This protocol collects events from Check Point event sources using OPSEC LEA. OPSEC LEA is the Check Point Operations Security Log Export API that facilitates the extraction of logs.

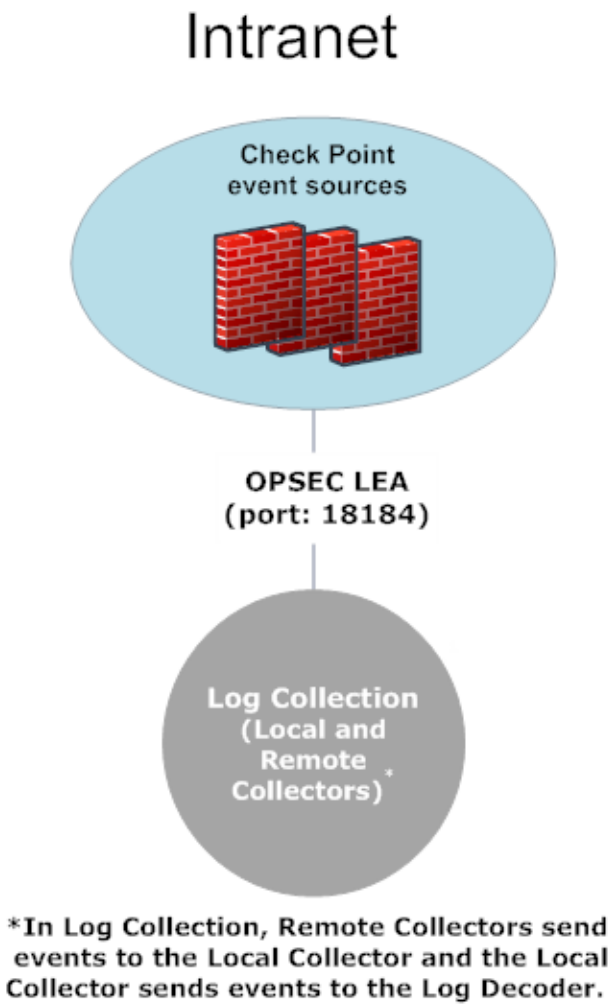
How Check Point Collection Works

The Log Collector service collects events from Check Point event sources using OPSEC LEA. OPSEC LEA is the Check Point Operations Security Log Export API that facilitates the extraction of logs.

Note: OPSEC LEA (Log Export API) supports extraction of logs from Check Point event sources configured with a SHA-256 or SHA-1 certificate.

Deployment Scenario

The following figure illustrates how you deploy the Check Point Collection Protocol in NetWitness Platform.

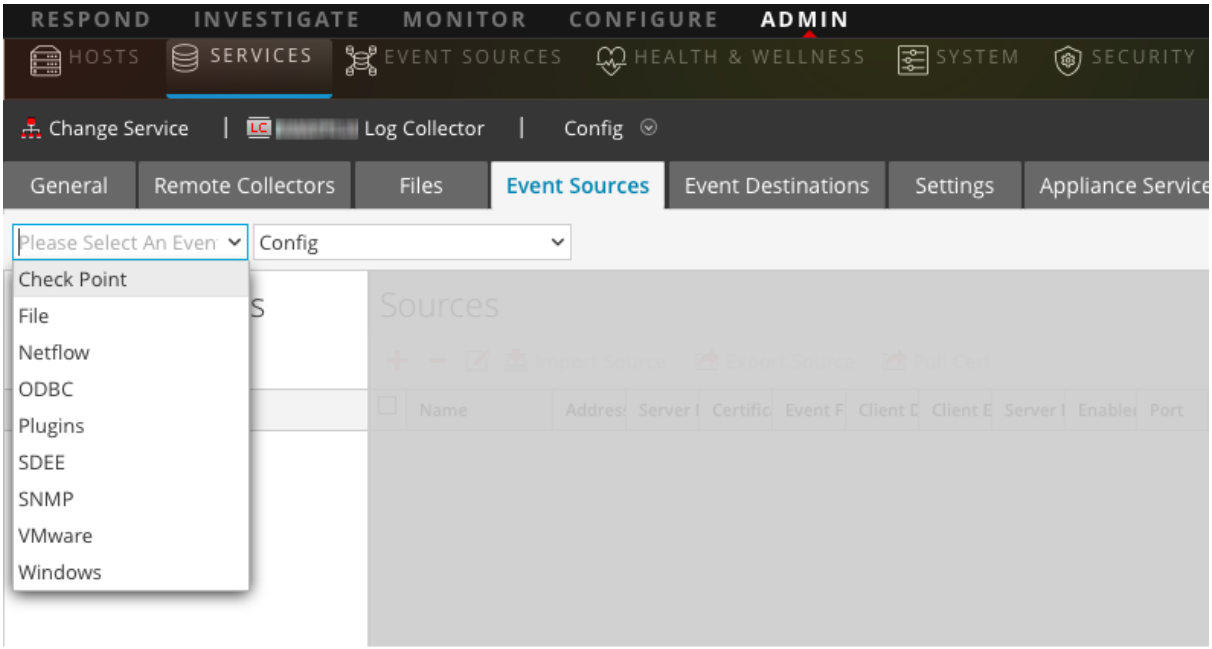


Configuration in NetWitness Platform

To configure a Check Point Event Source:

1. Go to **ADMIN> Services** from the NetWitness Platform menu.
2. Select a Log Collection service.
3. Select **> View > Config** to display the Log Collection configuration parameter tabs.

4. Click the **Event Sources** tab.



5. In the **Event Sources** tab, select **Check Point/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click +.

   The **Available Event Source Types** dialog is displayed.
7. Select a check point event source type and click **OK**.

   The newly added event source type is displayed in the **Event Categories** panel.
8. Select the new type in the **Event Categories** panel and click + in the **Sources** toolbar.

   The **Add Source** dialog is displayed.
9. Define parameter values. For details, see Check Point Parameters below.
10. Click **Test Connection**.

    The result of the test is displayed in the dialog box. If the test is unsuccessful, edit the device or service information and retry.

    Log Collector takes approximately 60 seconds to return the test results. If it exceeds the time limit, the test times out and the NetWitness Platform displays an error message.
11. If the test is successful, click **OK**.

    The new event source is displayed in the **Sources** panel.

Check Point Parameters

This section describes the Check Point event source configuration parameters.

Basic Parameters

Parameter	Description
Name*	Name of the event source.
Address*	IP Address of the Check Point server.
Server Name*	Name of the Check Point server.
Certificate Name	Certificate name for secure connections to use when the transport mode is https. If set, the certificate must exist in the certificate trust store that you created using the Settings tab. Select a certificate from the drop-down list. The file naming convention for Check Point event source certificates is **checkpoint_*name-of-event-source***.
Client Distinguished	Enter the Client Distinguished Name from the Check Point server.
Client Entity Name	Enter the Client Entity Name from the Check Point server.
Server Distinguished	Enter the Server Distinguished Name from the Check Point server.
Enabled	Select the check box to enable the event source configuration to start collection. The check box is selected by default.
Pull Certificate	Select the checkbox to pull a certificate for first time. Pulling a certificate makes it available from the trust store.
Certificate Server Address	IP Address of the server on which the certificate resides. Defaults to the event source address.
Password	Only active when you select the Pull Certificate checkbox for first time. Password required to pull the certificate. The password is the activation key created when adding an OPSEC application to Check Point on the Check Point server.

Determine Advanced Parameter Values for Check Point Collection

You use less system resources when you configure a Check Point event source connection to stay open for a specific time and specific event volume (transient connection). RSA NetWitness Platform defaults to the following connection parameters that establish a transient connection:

- Polling Interval = **180** (3 minutes)
- Max Duration Poll = **120** (2 minutes)
- Max Events Poll = **5000** (5000 events per polling interval)
- Max Idle Time Poll = **0**

For very active Check Point event sources, it is a good practice to set up a connection that stays open until you stop collection (persistent connection). This ensures that Check Point collection maintains the pace of the events generated by these active event sources. The persistent connection avoids restart and connection delays and prevents Check Point collection from lagging behind event generation.

To establish a persistent connection for a Check Point event source, set the following parameters to the following values:

- Polling Interval = **-1**
- Max Duration Poll = **0**
- Max Events Poll = **0**
- Max Idle Time Poll = **0**

Parameter	Description
Port	Port on the Check Point server that Log Collector connects to. Default value is 18184.
Collect Log Type	Type of logs that you want to collect: Valid values are: • **Audit** - collects audit events. • **Security** - collects security events. If you want to collect both audit and security events, you must create a duplicate event source. For example, first you would create an event source with Audit selected pulling a certificate into the trust store for this event source. Next you would create another event source with the same values except that you would select Security for the Collect Log Type and you would select the same certificate in Certificate Name that you pulled when you set up the first set of parameters for this event source and you would make sure that Pull Certificate was not selected.
Collect Logs From	When you set up a Check Point event source, NetWitness collects events from the current log file. Valid values are: • **Now** - Start collecting logs now (at this point in time in the current log file). • **Start of Log** - Collect logs from the beginning of the current log file. If you choose "Start of Log" for this parameter value, you may collect a very large amount of data depending on how long the current log file has been collecting events. Note that this option is effective only for the first collection session.
Polling Interval	Interval (amount of time in seconds) between each poll. The default value is **180**. For example, if you specify 180, the collector schedules a polling of the event source every 180 seconds. If the previous polling cycle is still underway, it will wait for it to finish that cycle. If you have a large number of event sources that you are polling, it may take longer than 180 seconds for the polling to start because the threads are busy.
Max Duration Poll	The maximum duration of polling cycle (how long the cycle lasts) in seconds.

Parameter	Description
Max Events Poll	The maximum number of events per polling cycle (how many events collected per polling cycle).
Max Idle Time Poll	Maximum idle time, in seconds, of a polling cycle. 0 indicates no limit.**> 300** is the default value.
Forwarder	Enables or disables the Check Point server as a forwarder. By default it is disabled.
Log Type (Name Value Pair)	Logs from the event source in Name Value format. By default it is disabled.
Debug	**Caution:** Only enable debugging (set this parameter to "On" or "Verbose") if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables and disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact. If you change this value, the change takes effect immediately (no restart required).

Verify Check Point Collection is Working

The following procedure illustrates how you can verify that Check Point collection is working from the **Administration > Health & Wellness > Event Source Monitoring** tab.

To verify Check Point collection from the Event Source Monitoring tab:

1. Access the **Event Source Monitoring tab** from the **Administration > Health & Wellness** view.
2. Find **checkpointfw1** in the **Event Source Type** column.
3. Look for activity in the **Count** column to verify that Check Point collection is accepting events.

To verify Check Point collection from the Investigation > Events view:

The following procedure illustrates how you can verify that Check Point collection is working from the **Investigation > Events** view.

1. Access the **Investigation > Events** view.
2. Select the Log Decoder (for example, **LD1**) collecting Check Point events in the **Investigate a Device** dialog.
3. Look for a Check Point event source parser (for example, **checkpointfw1**) in the **device.type** field in the **Details** column to verify that Check Point collection is accepting events.

Note: If the logs from the VSX Checkpoint firewall server are collected by the Log Collector checkpoint service, to translate the VSX IP in the logs to **ip.orig** meta, you must add the VSX hostname and the VSX IP address to the `/etc/hosts` file in the Log Collector.

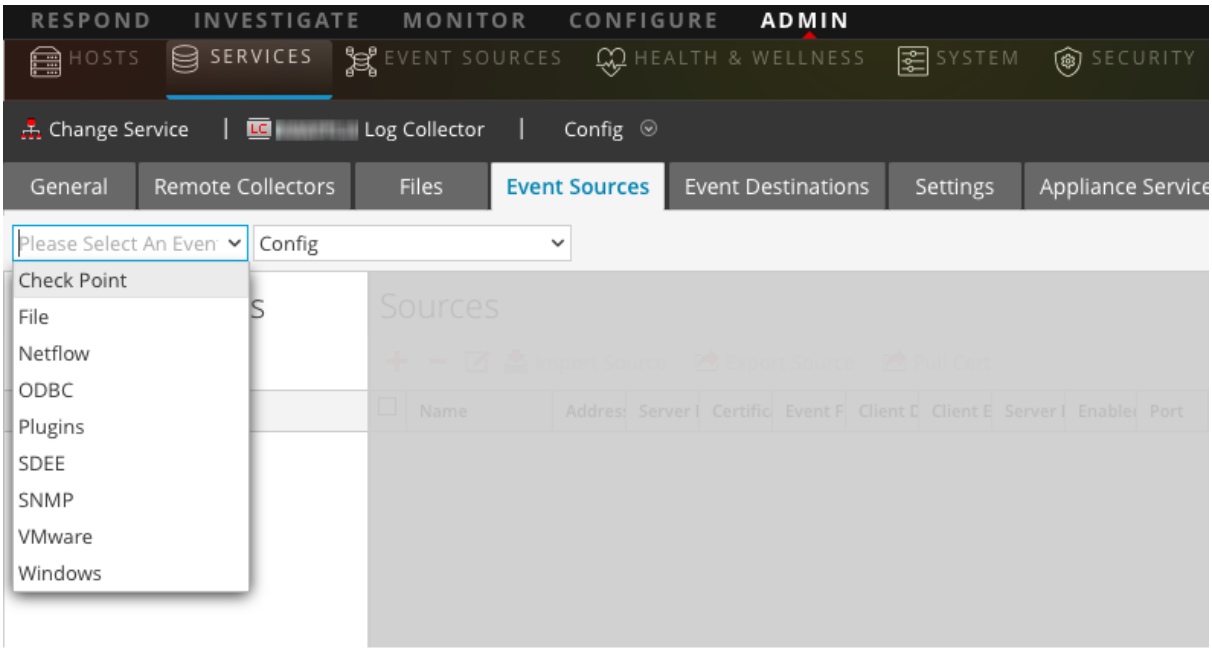
Configure File Event Sources in NetWitness Platform

This topic tells you how to configure the File collection protocol.

Configure a File Event Source

To configure a File Event Source:

1. Go to **ADMIN > Services** from the NetWitness Platform menu.
2. Select a Log Collection service.
3. Under Actions, select > **View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.



5. In the **Event Sources** tab, select **File/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click

.

The **Available Event Source Types** dialog is displayed.

7. Select a file event source type and click **OK**.

   The newly added event source type is displayed in the **Event Categories** panel.

8. Select the new type in the **Event Categories** panel and click in the **Sources** toolbar.

   The **Add Source** dialog is displayed.

9. Add a **File Directory** name and modify any other parameters that require changes. For details, see File Collection Parameters below.

10. To get the public key and enter it into the dialog box, do the following:

    a. Select and copy the public key from the Event Source by running: `cat ~/.ssh/id_rsa.pub`

    b. Paste the public key in the **Eventsource SSH Key** field.

11. Click **OK**.

You need to restart file collection for your changes to take effect.

Stop and Restart File Collection

After you add a new event source that uses file collection, you must stop and restart the NetWitness Platform File Collection service. This is necessary to add the key to the new event source.

File Collection Parameters

The following table provides descriptions of the File Collection source parameters.

The following table describes the **Basic** configuration parameter for File collection.

Note: Required parameters are marked with an asterisk. All other parameters are optional.

Name	Description
File Directory*	Collection directory (for example, **Eur_London100**) into which the File event source places its files. Valid value is a character string that is conforms to the following regular expression: **[_a-zA-Z][_a-zA-Z0-9]*** This means that the file directory must start with a letter followed by numbers, letters, and underscores. Do not modify this parameter after you start collecting event data. After you create the collection, the Log Collector creates the work, save, and error sub-directories under the collection directory.
Address*	IP address of the event source. Valid value is an **IPv4 address**, **IPv6 address**, or a **hostname** including a fully-qualified domain name.
File Spec	Regular expression. For example, **^.*$** = process everything.

Name	Description
File Encoding	Character encoding used by the syslog senders to this port. Defaults to UTF-8. **Note:** It is safe to leave this as UTF-8, since UTF-8 handles ASCII characters as well, and most senders have their encoding set to UTF-8. RSA has tested the following values: • EUC-KR • SJIS • GB3212/GBK • ISO_8859-1 (German) • ISO_8859-7 (Greek)
Cancel	Closes the dialog without making adding an event source type.
OK	Adds the parameters for the event source.

The following table describes the **Advanced** configuration parameter for File collection.

Name	Description
Ignore Encoding Conversion Errors	Select the check box to ignore encoding conversion errors and ignore invalid data. The check box is selected by default. **Caution:** This may cause parsing and transformation errors.
File Disk Quota	Determines when to stop saving files regardless of the **Save On Error** and **Save On Success** parameter settings. For example, a value of 10 indicates that when there is less than 10% available disk left, the Log Collector stops saving files to reserve enough space for your estimated normal collection processing. **Caution:** Available disk refers to a partition where the base collection directory is mounted. If the Log Decoder server has a 10TB disk size and 2TB is allocated to base collection directory, then setting this value to 10 causes log collection to stop when less than 0.2TB (10% of 2TB) of space is left. It does not mean 10% of 10TB. Valid value is a number in the **0** to **100** range. **10** is the default.
Sequential Processing	Sequential processing flag: • Select the check box (default) to process event source files in collection order. • Do not select the checkbox to process event source files in parallel.
Save On Error	Save on error flag. Check the checkbox to retain the **eventsource collection** file when the Log Collector it encounters an error. The check box is selected by default.
Save On Success	Save **eventsource collection** file after processing flag. Check the checkbox to save the eventsource collection file after processing it. The check box is not selected by default.

Name	Description
Eventsource SSH Key	SSH public key used to upload files for this event source. Please refer to the *Generate Key Pair on Event Source and Import Public Key to Log Collector* section in the Install and Update the SFTP Agent Guide for instructions on generating keys. **Note:** If File collection is stopped, NetWitness Platform does not update the authorized_keys file with the SSH public key that you add or modify in this parameter. You must restart File collection to update the public key. You can add or modify the value of the public key in this parameter in multiple File event sources without File collection running, but NetWitness Platform will not update the **authorized_keys** file until File collection is restarted.
Manage Error Files	By default, the Log Collector uses the **File Disk Quota** parameter to ensure that the disk does not fill up with error files. If you set this parameter to **true**, you can specify one of these: • Maximum space allotted to error files in the **Error Files Size** parameter. • Maximum number of error files allowed in **Error Files Count** parameter. A reduction percent is also specified, which tells the system how much to reduce when the maximum is reached. Select the check box to manage error files. The check box is not selected by default.
Error Files Size	Only valid if the **Manage Error Files** and **Save On Error** parameters are set to true. Specifies to what extent NetWitness Platform saves error files. The value that you specify is the maximum total size of all the files in the error directory. Valid value is a number in **0** to **281474976710655** range. You specify these values in either **Kilobytes**, **Megabytes**, or **Gigabytes**. **100 Megabytes** is the default. If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service.
Error Files Count	Only valid if the **Manage Error Files** and **Save On Error** parameters are set to true. Maximum number of error files allowed in the error directory. Valid value is a number in **0** to **65536** range. **65536** is the default. If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service.
Error Files Reduction %	Percent amount by size or count of the error files that the Log Collector service removes when the maximum size or count has been reached. The service removes the oldest files first. Valid value is a number in the **0** to **100** range. **10** is the default.

Name	Description
Manage Saved Files	Select the check box to manage saved files. The check box is not selected by default. By default, the Log Collector uses the **File Disk Quota** parameter to ensure that the disk does not fill up with saved files. If check this check box, you can specify one of these: • Maximum space allotted to saved files in the **Saved Files Size** parameter. • Maximum number of saved files allowed in **Saved Files Count** parameter. A reduction percent is also specified, which tells the system how much to reduce when the maximum is reached.
Saved Files Size	Only valid if the **Manage Saved Files** and **Save On Success** parameters are set to true. Maximum total size of all the files in the save directory. Valid value is a number in the **0** to **281474976710655** range. You specify these values in either **Kilobytes**, **Megabytes**, or **Gigabytes**. **100 Megabytes** is the default. If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service.
Saved Files Count	Only valid if the **Manage Saved Files** and **Save On Success** parameters are set to true. Maximum number of saved files in the save directory. Valid value is a number in **0** to **65536** range. **65536** is the default. If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service.
Saved File Reduction %	Percent amount by size or count of the saved files that the Log Collector service removes when the maximum size or count has been reached. The service removes the oldest files first. Valid value is a number in the **0** to **100** range. **10** is the default.
Debug	**Caution:** Only enable debugging (set this parameter to **On** or **Verbose**) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact. If you change this value, the change takes effect immediately (no restart required).

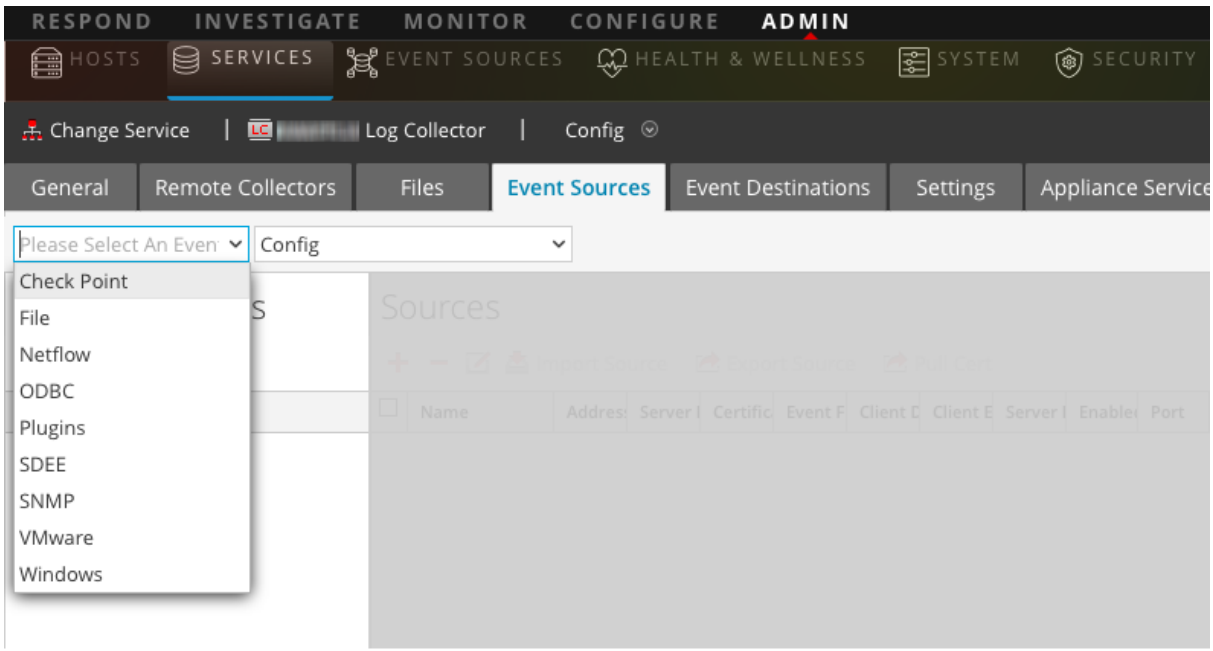
Configure Netflow Event Sources in NetWitness Platform

This topic tells you how to configure the Netflow collection protocol.

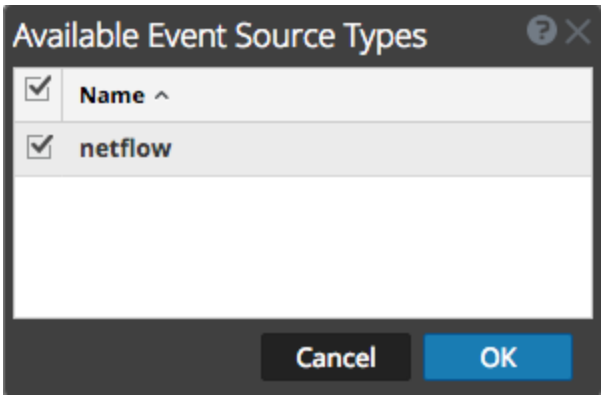
Configure a Netflow Event Source

To configure a Netflow Event Source:

1. Go to **ADMIN > Services** from the NetWitness Platform menu.
2. Select a Log Collection service.
3. Select > **View** > **Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.



5. In the **Event Sources** tab, select **Netflow/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click .
   The **Available Event Source Types** dialog is displayed.
7. Select the **netflow** event source type and click **OK**.



The newly added event source type is displayed in the **Event Categories** panel.

8. Select the new type in the **Event Categories** panel and click + in the **Sources** toolbar.
   The **Add Source** dialog is displayed.
9. Enter a port number in the **Port** field, and ensure the Enabled box is checked.

   Note: NetWitness Platform opens the 2055, 4739, 6343, and 9995 ports on the firewall by default. You can open other ports for Netflow if required.

   For details of other parameters, see Netflow Collection Parameters below.
10. Click **OK**.

The new event source is displayed in the list.

Netflow Collection Parameters

The following table provide descriptions of the basic Netflow Collection parameters.

Name	Description
Port	Specify the port number configured for the Netflow event source. NetWitness Platform opens the 2055, 4739, 6343, and 9995 ports for Netflow by default. You can open other ports for Netflow if required.
Enabled	Select the check box to enable the event source configuration to start collection. The check box is selected by default.
Cancel	Closes the dialog without making adding an event source type.
OK	Adds the parameters for the event source.

The following table provide descriptions of the advanced Netflow Collection parameters.

Name	Description
InFlight Publish Log Threshold	Establishes a threshold that, when reached, NetWitness Platform generates a log message to help you resolve event flow issues. The Threshold is the size of the netflow event messages currently flowing from the event source to NetWitness Platform . Valid values are: • **0 (default)** - disables the log message. • **100-100000000** - generates a log message when this Log Collector has processed the specified number of netflow events. For example, if you set this value to 100, NetWitness Platform generates a log message when 100 netflow events of the specific netflow version (v5 or v9) have been processed.
Debug	**Caution:** Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector . Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact. If you change this value, the change takes effect immediately (no restart required).

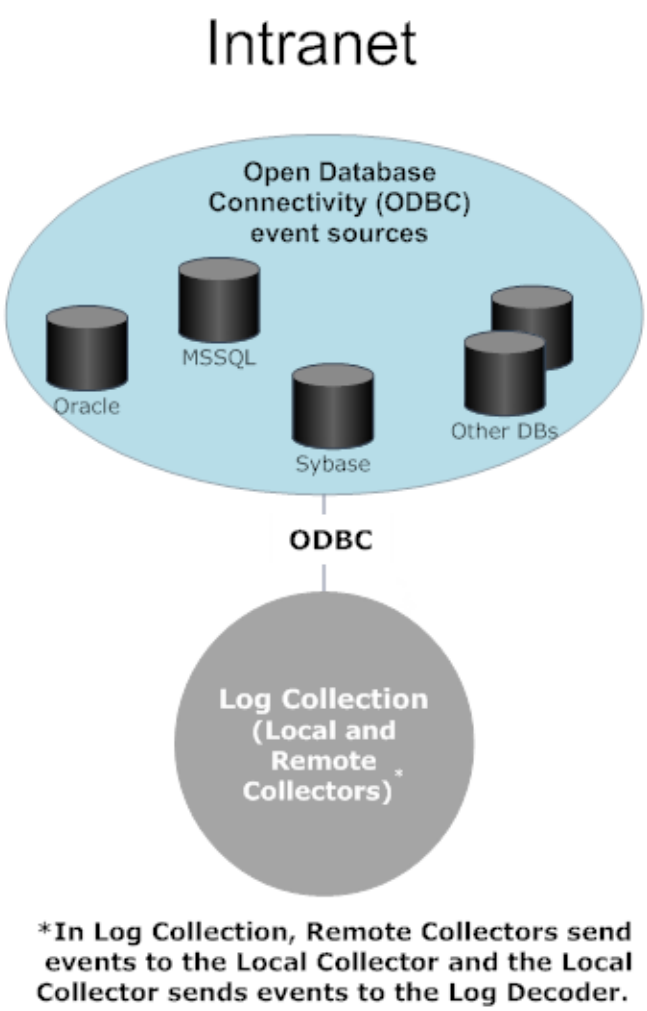
ODBC

Configure ODBC Event Sources in NetWitness Platform

This topic tells you how to configure ODBC collection protocol which collects events from event sources that store audit data in a database using the Open Database Connectivity (ODBC) software interface.

Deployment Scenario

The following figure illustrates how you deploy the ODBC Collection Protocol in NetWitness Platform.



Configure an ODBC Event Source

To configure an ODBC event source, you need to configure an event source type, and also choose a DSN template.

Configure a DSN

The following procedure describes how to add a DSN from an existing DSN template. For other procedures related to DSNs, see Configure Data Source Names (DSNs).

Configure a DSN (Data Source Name):

1. Go to **Administration** > **Services**.
2. In the **Services** grid, select a **Log Collector** service.
3. Click under **Actions** and select **View** > **Config**.
4. In the Log Collector **Event Sources** tab, select **ODBC/DSNs** from the drop-down menu.
5. The DSNs panel is displayed with the existing DSNs, if any.

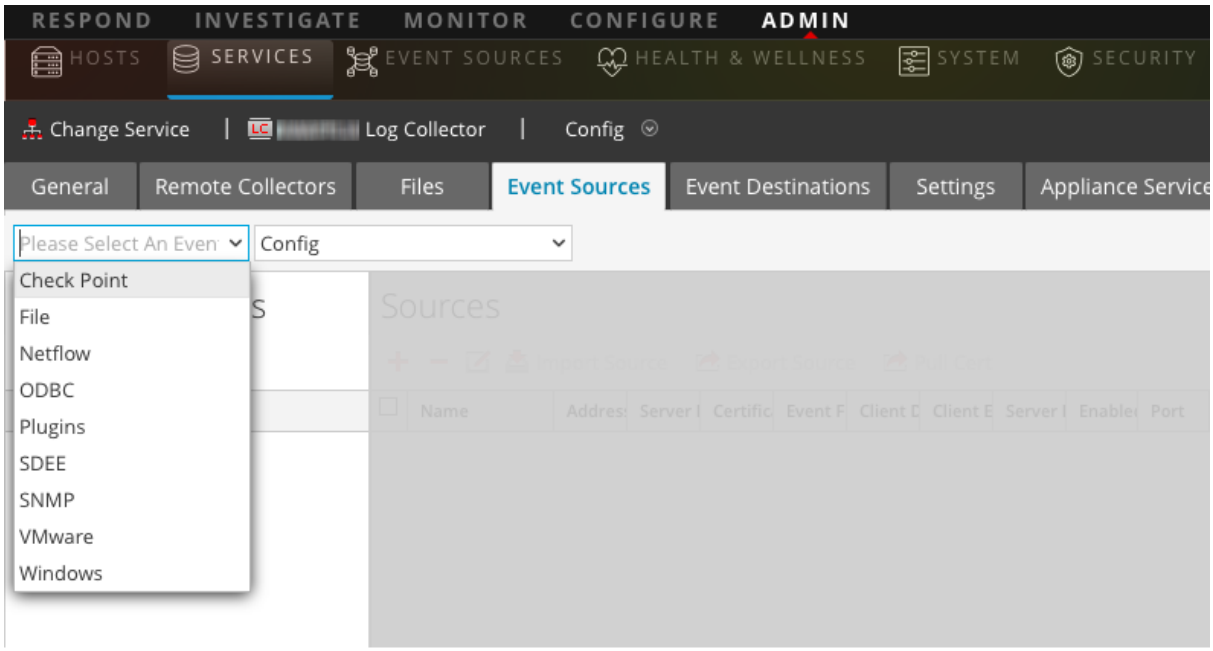
6. Click + to open the **Add DSN** dialog.
7. Choose a DSN Template from the drop down menu and enter a name for the DSN. (You use the name when you set up the ODBC event source type.) If required, click Manage Templates to add or delete DSN templates.
8. Fill in the parameters and click **Save**.

Add an Event Source Type

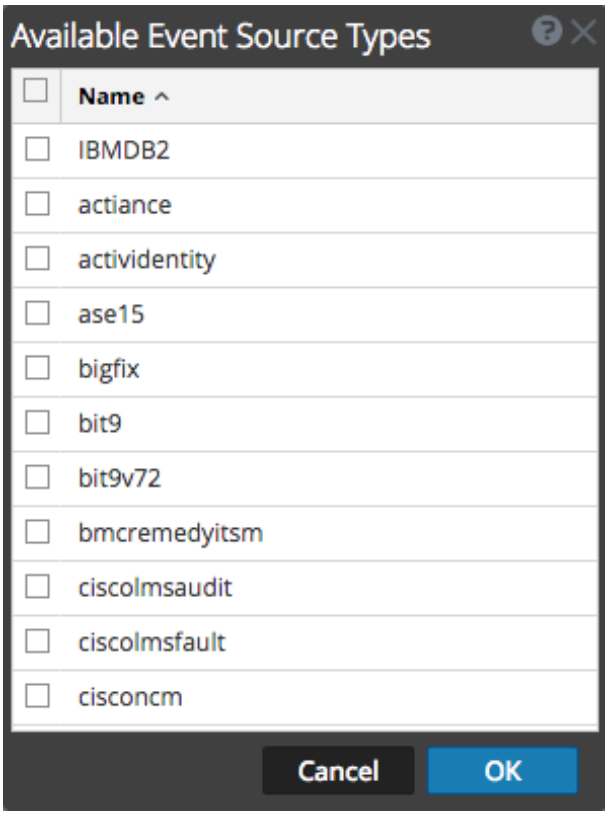
For details on parameters used in the following procedure, see ODBC Event Source Configuration Parameters.

To configure an ODBC Event Source Type:

1. Go to **ADMIN > Services**.
2. Select a Log Collection service.
3. Under Actions, select ⚙ **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.



5. In the **Event Sources** tab, select **ODBC/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click +.
   The **Available Event Source Types** dialog is displayed.

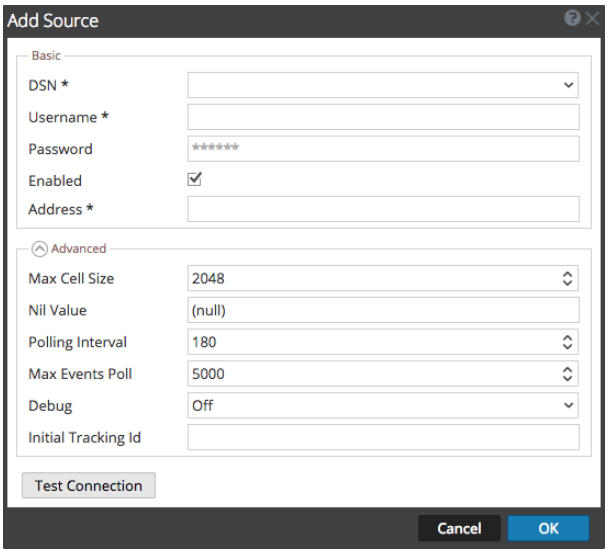


7. Select an event source category (for example **mssql** and click **OK**.

   The newly added event source type is displayed in the **Event Categories** panel.

8. Select the new type in the **Event Categories** panel and click + in the **Sources** toolbar.

   The **Add Source** dialog is displayed.



9. Select a DSN from the drop down list, specify or modify the other parameters as required, and click **OK**.

10. Click **Test Connection**.

    The result of the test is displayed in the dialog box. If the test is unsuccessful, edit the DSN information and retry.

    Note: Log Collector takes approximately 60 seconds to return the test results. If it exceeds the time limit, the test times out and the NetWitness Platform server displays an error message.

11. If the test is successful, click **OK**.

The newly defined DSN is displayed in the **Sources** panel.

Configure Data Source Names (DSNs)

This topic tells you how to create and maintain DSNs for ODBC Collection.

Context

Open Database Connectivity (ODBC) event sources require Data Source Names (DSNs) so you need to define DSNs with their associate value pairs for ODBC event source configuration.

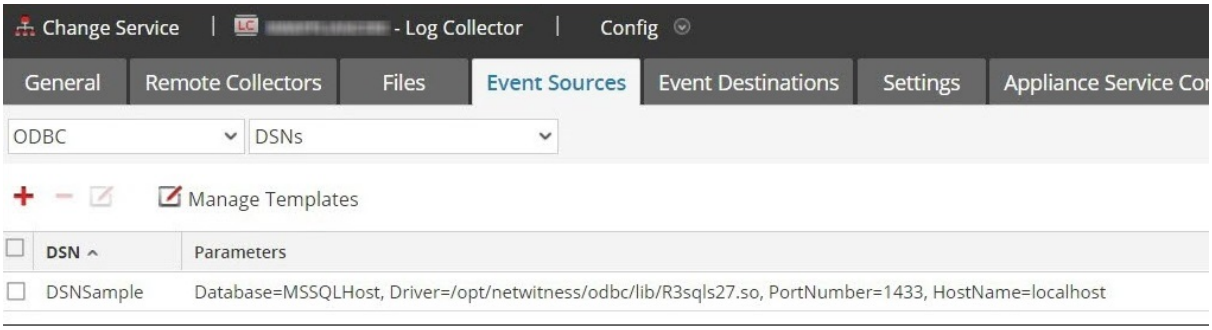
Navigate to the DSN Panel

To add or edit DSNs or DSN templates, first navigate to the appropriate screen.

To navigate to the DSN templates panel:

1. Go to **ADMIN > Services**.
2. In the **Services** grid, select a **Log Collector** service.
3. Click under **Actions** and select **View > Config**.
4. In the **Log Collector Event Sources** tab, select **ODBC/DSNs** from the drop-down menu.

   The **DSNs** panel is displayed with the DSNs that are added, if any.



From this screen, you can perform the following actions:

- Add a new DSN template
- Add a DSN from an existing template
- Add a DSN by editing an existing DSN template
- Remove a DSN or DSN template

Add a New DSN Template

If none of the predefined DSN templates fit your needs, use this procedure to add a DSN template.

1. From the DSNs panel, click Manage Templates.

   The **Manage DSN Templates** dialog is displayed.

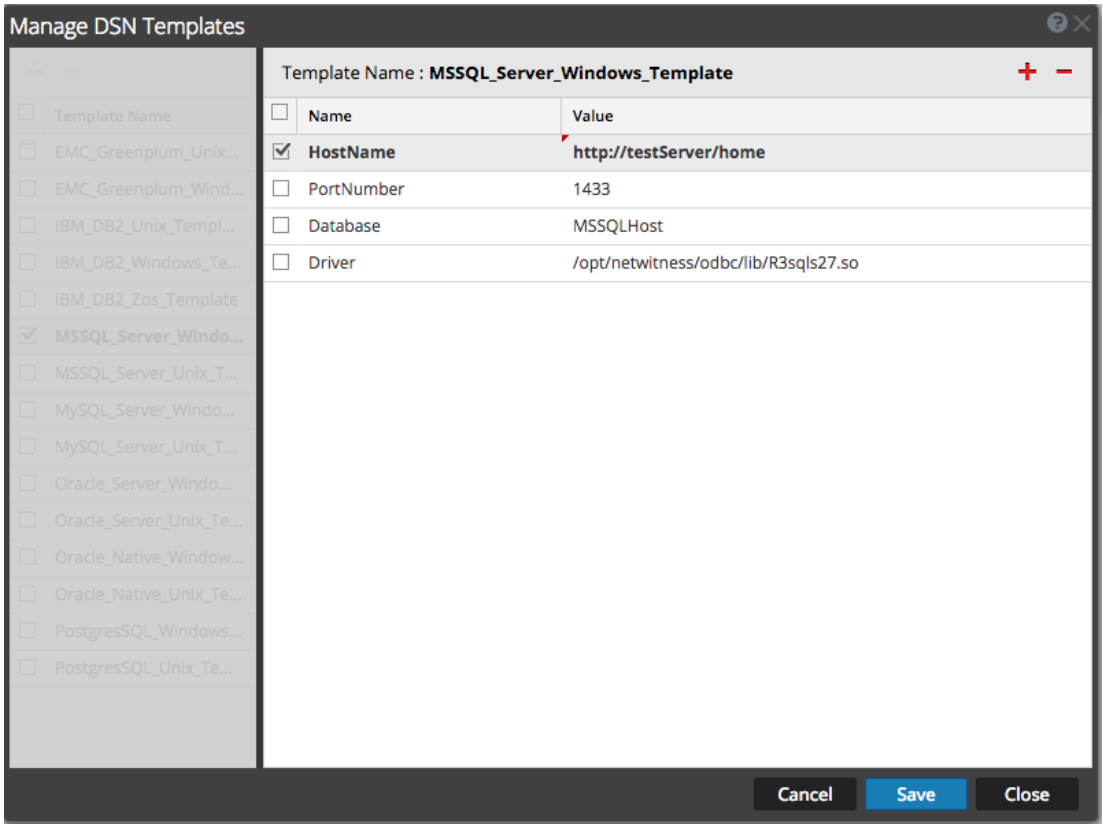
   Note: RSA provides default templates on the left side panel that you can use while adding a new DSN.

2. Click +.

   The right panel is activated.

3. Specify a template name and click + on the right panel to add parameters.

4. Specify the parameters. Click **Save**.



The new DSN template is added in the **Manage DSN Templates** list.

Add a DSN from an existing template

You can select an existing template, and fill in the parameters for your needs.

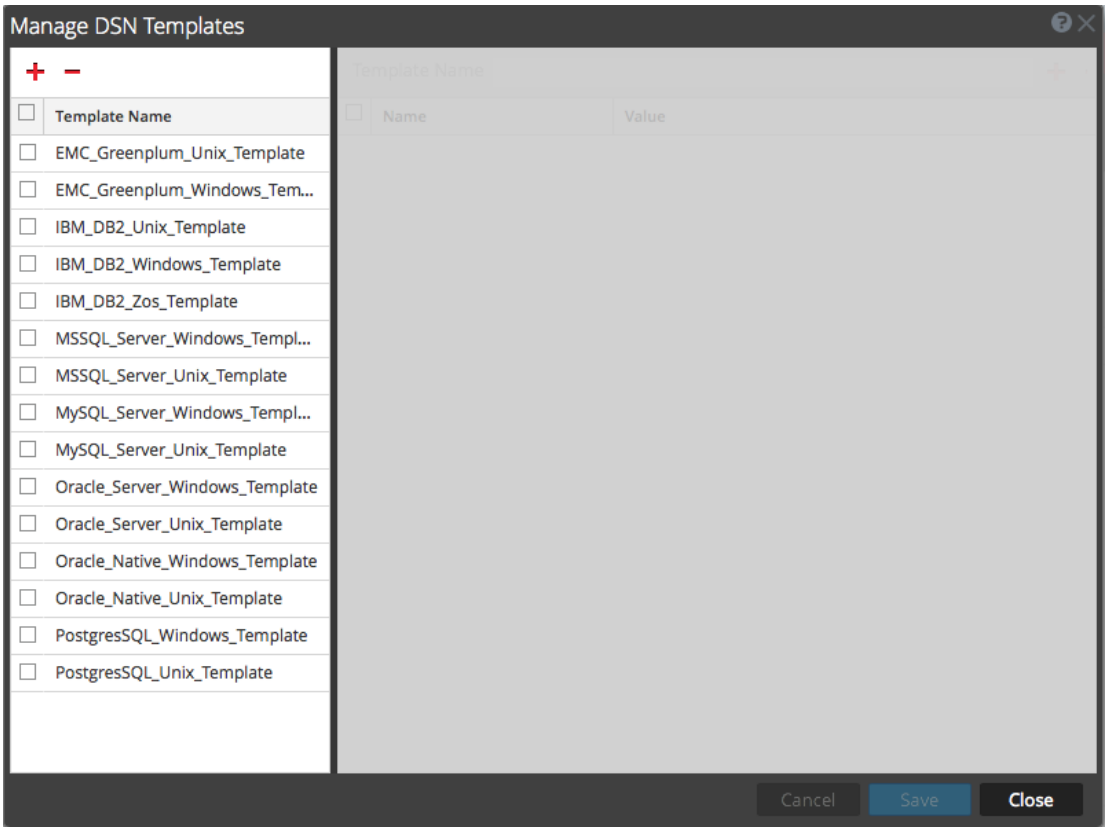
1. From the DSNs panel, click + to open the Add DSN dialog box.
   The **Add DSN** dialog is displayed with existing DSNs, if any
2. Choose a DSN Template from the drop down menu and enter a name for the DSN. (You use the name when you set up the ODBC event source type.)
3. Fill in the parameters and click **Save**.

Your DSN is added to the list of DSNs.

Add a New DSN by editing an existing DSN template

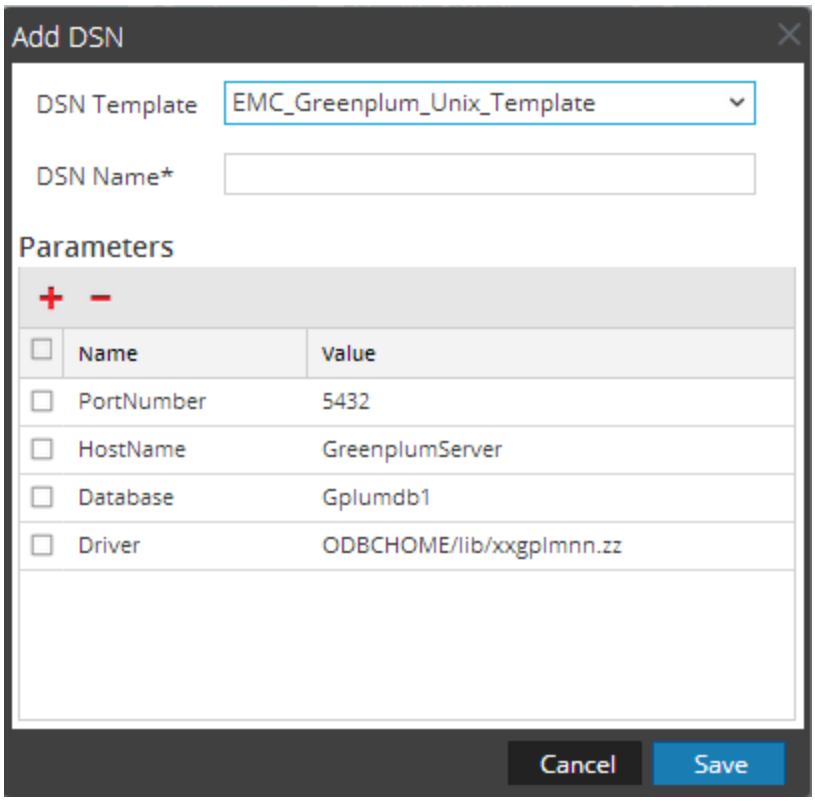
You can add a DSN by updating an existing DSN template to fit your needs.

1. From the DSNs panel, click Manage Templates.
   The **Manage DSN Templates** dialog is displayed.



2. Select the existing template that you want to modify.

   The right panel is activated, and the default parameters for the selected template are displayed.



3. Specify a name in the **DSN Name** field.
4. Add, delete or edit the default parameters.
5. Once you have the set of required parameters, click **Save**, then **Close**.
6. Choose the DSN Template that you updated from the drop down menu and enter a name for the DSN. (You use the name when you set up the ODBC event source type.)
7. Fill in the parameters and click **Save**.

Your DSN is added to the list of DSNs.

Remove a DSN or DSN template

If you no longer use a DSN or a DSN template, you can remove it from the system.

To remove an existing DSN:

1. From the DSNs panel, select an existing DSN.
2. Click —.

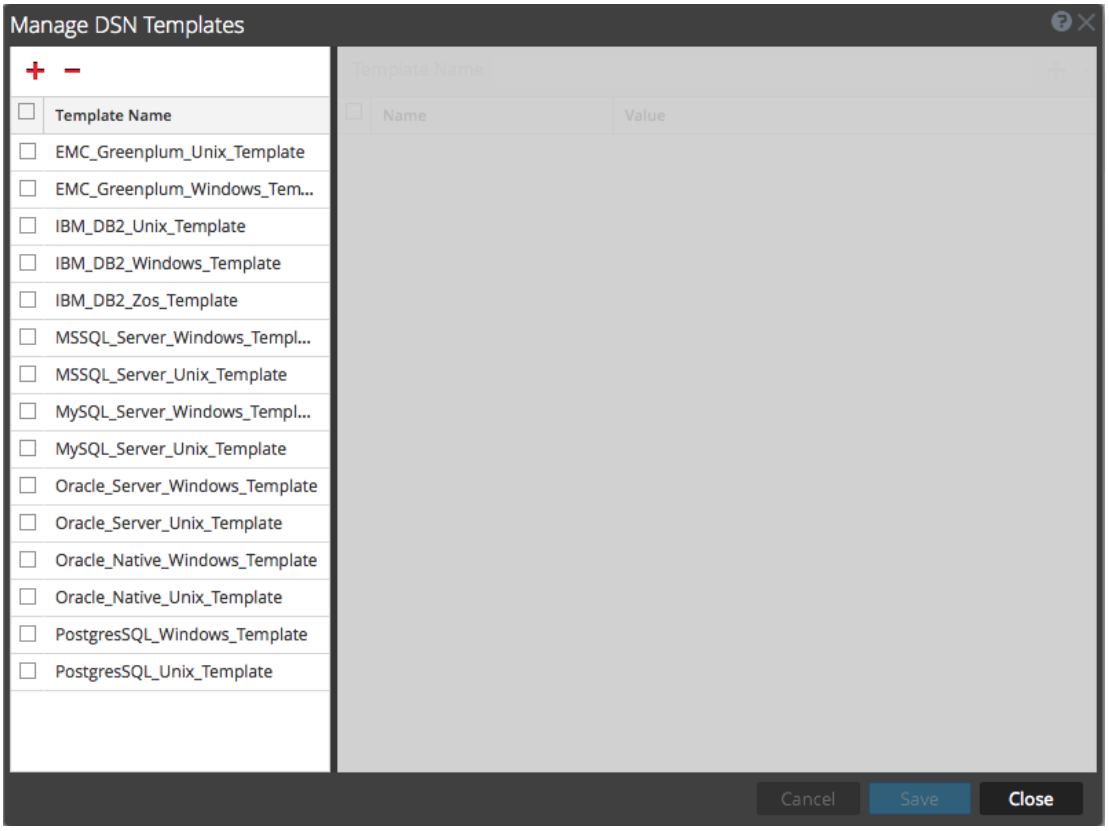
   A Warning message appears, asking whether you are sure you want to delete the DSN.
3. To delete the DSN, click **Yes**. Alternatively, to cancel the deletion, click **No**.

If you confirmed the deletion, the selected DSN is removed from the system.

To remove an existing DSN Template:

1. From the DSNs panel, click Manage Templates.

   The **Manage DSN Templates** dialog is displayed.



2. From the DSNs panel, select an existing DSN Template.
3. Click —.

   A Confirmation message appears, asking whether you are sure you want to delete the DSN Template.

4. To delete the DSN Template, click **Yes**. Alternatively, to cancel the deletion, click **No**.

If you confirmed the deletion, the selected DSN Template is removed from the system.

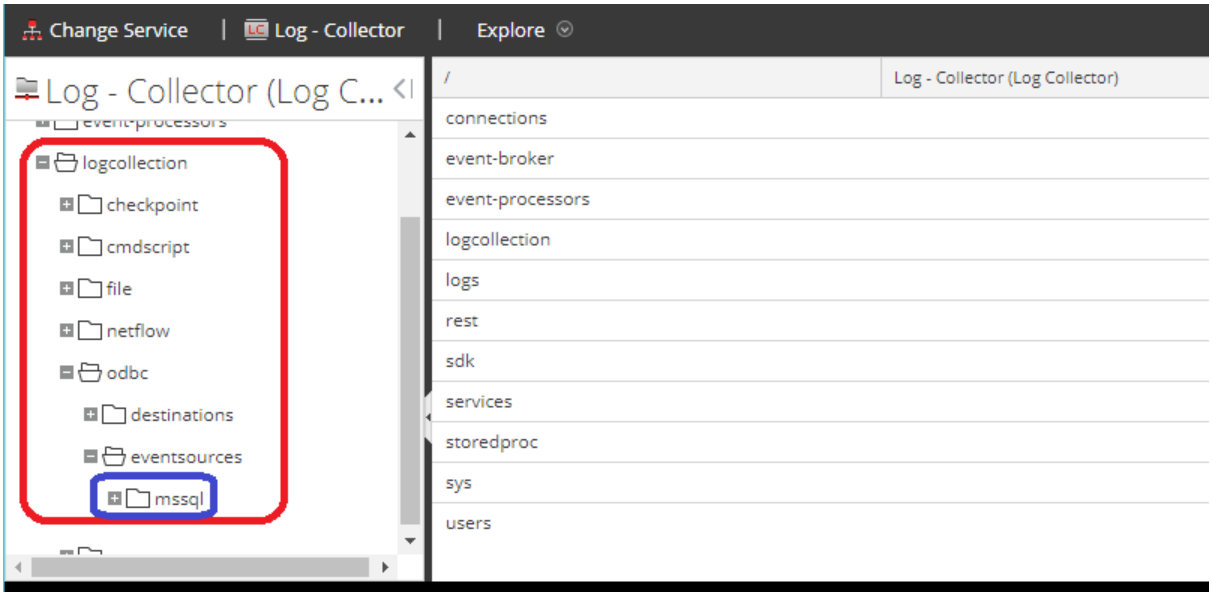
Configure device.ip meta for ODBC Data Source

For any ODBC event source, you can choose to have the ODBC collector populate the **device.ip** meta value with either the event source IP address or the actual source IP on which logs are being collected.

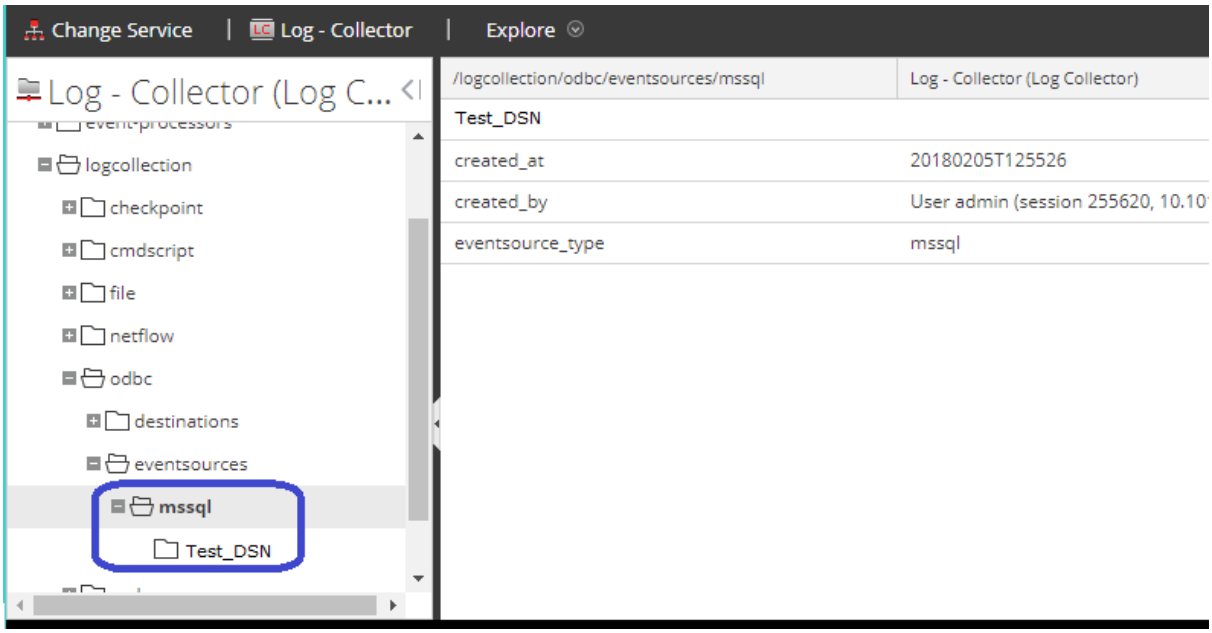
To view or set this parameter:

1. Go to **ADMIN > Services**.
2. In the **Services** grid, select a **Log Collector** service.
3. Click ⚙ under **Actions** and select **View > Explore**.
4. Navigate to **logcollection > odbc > eventsources**.

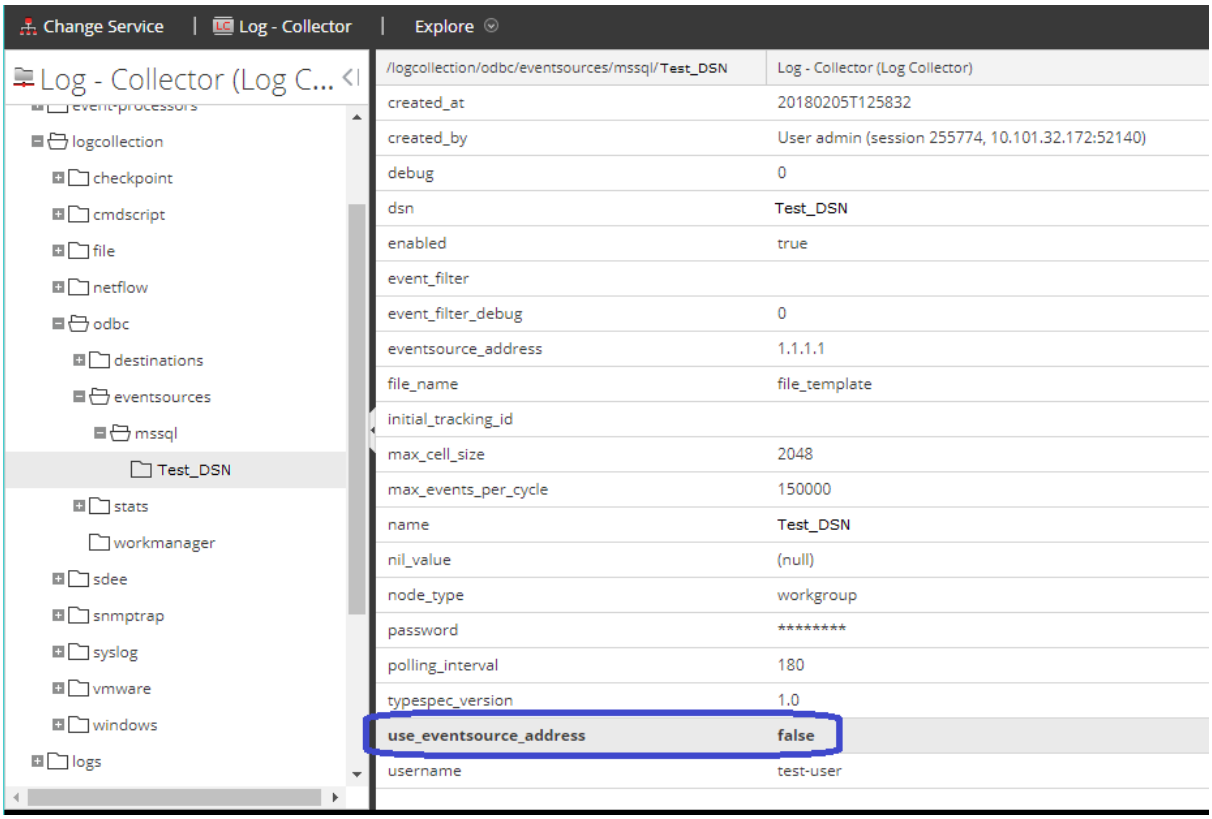
There are entries for each ODBC event source that you have configured in NetWitness. For example, for this installation, the only ODBC event source currently configured is MS SQL:



5. Click + next to an event source to expand it and see its DSN entry.



6. Click the DSN entry (in this example **Test_DSN**) to show the parameters.
7. The **use_eventsource_address** parameter is listed.



- **False**: actual source IP address is used. This is the default value.
- **True**: event source IP address is used.

8. Click on the value (in this case **False**), and type in the new value.

> **Note:** If you type anything other than **true** or **false** (case does not matter), you receive an error saying that the value you entered cannot be set.

Any changes you make take effect immediately.

Create Custom Typespec for ODBC Collection

RSA NetWitness uses type specification (typespec) files for ODBC and file collection. These files act on raw log files, and are used for two main purposes:

- Define where in the log file data resides. For instance, some log files contain header information that is not considered data to be parsed.
- Replace certain types of characters that the log parser cannot parse correctly. For instance, the tab character can sometimes cause problems.

This topic tells you how to create a custom typespec for the Log Collector. The topic includes:

- Create Custom typespec procedure
- ODBC Collection typespec syntax

- Sample ODBC Collection typespec files

Create Custom Typespec

To create a custom typespec file:

1. Open an SFTP client (for example, WinSCP) and connect to a Log Collector or remote Log Collector.
2. Navigate to `/etc/netwitness/ng/logcollection/content/collection/odbc`, and copy an existing file, for example **bit9.xml**.
3. Modify the file according to your requirements. See ODBC Collection Typespec Syntax for details.
4. Rename and save the file to the same directory.
5. Restart the Log Collector.

Note: You will not be able to see new Event Source type in NetWitness Platform until you restart the Log Collector.

ODBC Collection Typespec Syntax

The following table describes the typespec parameters.

Parameter	Description
name	The display name of your ODBC event source (for example, **activeidentity**). NetWitness Platform displays this name in the **Sources** panel of the **View > Config > Events Sources** tab. Valid value is an alphanumeric string. You cannot use - (dashes), _(underscores), or spaces. The name must be unique across all typespec files in the folder.
type	Event source type: **odbc**. Do not modify this line.
prettyName	User-defined name for the event source. You can use the same value as name (for example, apache) or use a more descriptive name.
version	Version of this typespec file. Default value is 1.0.
author	Person who created the typespec file. Replace author-name with your name.
description	Formal description of the event source. Replace formal-description with your description of the event source.
	<device> Section
parser	This optional parameter contains the name of the log parser. This value forces the Log Decoder to use the specified log parser when parsing logs from this event source. **Note:** Please leave the field blank when unsure of the log parser to be used.
name	Name your ODBC event source (for example, **ActivIdentity ActivCard AAA Server**).
maxVersion	The version number of the event source (for example, **6.4.1**).
description	Description of the event source.
	<collection> Section

Parameter	Description
odbc	The syntax under <odbc> is used for event collection and processing. You can provide multiple queries for the same event source type by adding <query> tags.
query	This section contains the details of the query used to collect information from the event source.
tag	The prefix tag you want to add to events during transformation (for example **ActivIdentity**).
outputDelimiter	Specify the delimiter to use to separate fields. Specify any of the following values: • || (piping) • ^ (caret) • , (comma) • : (colon) • **0x20** (to represent a space)
interval	Specify the number of seconds between events. Default value is **60**.
dataQuery	Specify the query to fetch data from the ODBC eventsource database for SQL-syntax. For example: `SELECT acceptedrejected, servername, serveripa, sdate, millisecond, suid, groupname, ipa, reason, info1, info2, threadid FROM A_AHLOG WHERE sdate > '%TRACKING%' ORDER BY sdate`
maxTrackingQuery	The query used on the initial pull of events to identify the starting point within the data set to begin pulling logs from. After the initial pull, this query is no longer used, unless the **maxTracking** value has been reset or altered. For example: `SELECT MAX(Event_Id) from ExEvents`
trackingColumn	The tracking column value used when the ODBC collector pulls a new set of events.

Sample ODBC Collection Typespec Files

The following sample is the typespec file for the IBM ISS SiteProtector event source.

```
<?xml version="1.0" encoding="UTF-8"?>
<typespec>

   <name>siteprotector4_x</name>
   <type>odbc</type>
   <prettyName>SITEPROTECTOR4_X</prettyName>
   <version>1.0</version>
   <author>Administrator</author>
   <description>Collects events from SiteProtector</description>

   <device>
      <name>Internet Security Systems, Inc. RealSecure SiteProtector v 2.0</name>
      <maxVersion>2.0</maxVersion>
      <description></description>
      <parser>iss</parser>
```

```
   </device>

   <configuration>
   </configuration>

   <collection>
      <odbc>
         <query>
            <tag></tag>
            <outputDelimiter></outputDelimiter>
            <interval></interval>
            <dataQuery></dataQuery>
            <maxTrackingQuery></maxTrackingQuery>
            <trackingColumn></trackingColumn>
            <levelColumn></levelColumn>
            <eventIdColumn></eventIdColumn>
            <addressColumn></addressColumn>
         </query>
      </odbc>
   </collection>
</typespec>
```

The following sample is the typespec file for the Bit9 Security Platform event source.

```
<?xml version="1.0" encoding="UTF-8"?>
<typespec>

   <name>bit9</name>
   <type>odbc</type>
   <prettyName>BIT9</prettyName>
   <version>1.0</version>
   <author>Administrator</author>
   <description>Bit9 Events</description>

   <device>
      <name>Bit9</name>
      <parser>bit9</parser>
   </device>

   <configuration>
   </configuration>

   <collection>
```

```
      <odbc>
         <query>
            <tag>BIT9</tag>
            <outputDelimiter>||</outputDelimiter>
            <interval>10</interval>
            <dataQuery>
            SELECT
            Timestamp,
            Event_Id,
            Computer_Id,
            File_Catalog_Id,
            Root_File_Catalog_Id,
            Priority,
            Type,
            Subtype,
            IP_Address,
            User_Name,
            Process,
            Description
            FROM
            ExEvents
            WHERE
            Event_Id > '%TRACKING%'
            </dataQuery>
            <trackingColumn>Event_Id</trackingColumn>
            <maxTrackingQuery>SELECT MAX(Event_Id) from ExEvents</maxTrackingQuery>
            <eventIdColumn></eventIdColumn>
         </query>
      </odbc>
   </collection>
</typespec>
```

Troubleshoot ODBC Collection

You can troubleshoot problems and monitor ODBC collection by reviewing the ODBC collector log informational, warning, and error messages to during execution of collection.

Each ODBC log messages includes the:

- Timestamp
- Category: `debug`, `info`, `warning`, or `failure`
- collection method = `OdbcCollection`

- ODBC event source type (GOTS-name) = Generic ODBC Type Specification name that you configured for the event source.
- collection function completed or attempted (for example, `[processing]`)
- ODBC event source name (DSN-name) = Data Source Name that you configured for the event source.
- description (for example, how many events the Log Collector collected)
- tracking ID = the Log Collector position in the target database table.

The following example illustrates the message you would receive upon successful collection of an ODBC event:

```
2014-July-25 17:21:25 info (OdbcCollection) : [event-source] [processing]
[event-source] Published 100 ODBC events: last tracking id: 2014-July-25
13:22:00.280
```

The following example illustrates a message you may receive upon unsuccessful collection of an ODBC event:

Log Message	`timestamp failure (OdbcCollection: [event-source] [processing] [event-source-type] Failed during doWork: Unable to prepare statement: state: S0002; error-code:208; description: [RSA] [ODBC-driver][event-source-type]Invalid object name 'object-name'.`
Possible Cause	ODBC collection failed while accessing the ODBC Driver or the target database.
Solutions	Validate the DSN value pairs for the events source.

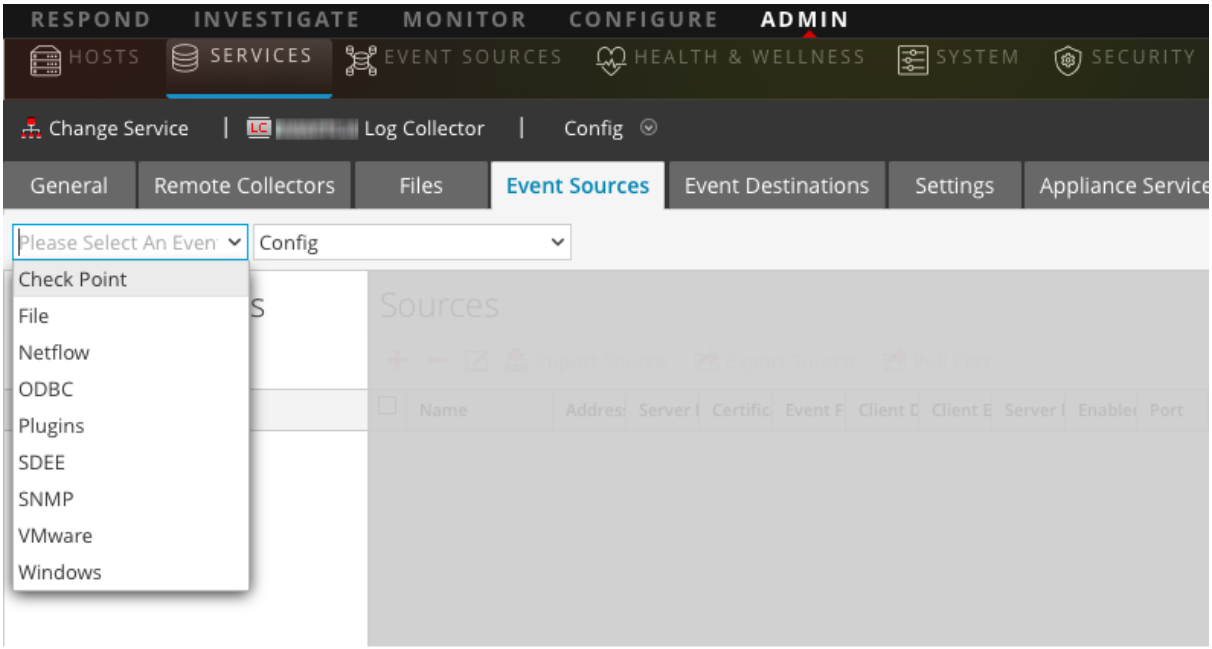
Configure SDEE Event Sources in NetWitness Platform

This topic tells you how to configure the SDEE collection protocol.

To add an SDEE Event Source:

1. Go to **ADMIN > Services**.
2. Select a Log Collection service.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.

4. Click the **Event Sources** tab.



5. In the **Event Sources** tab, select **SDEE/Config** from the drop-down menu.

   The Event Categories panel displays the SDEE event sources that are configured, if any.

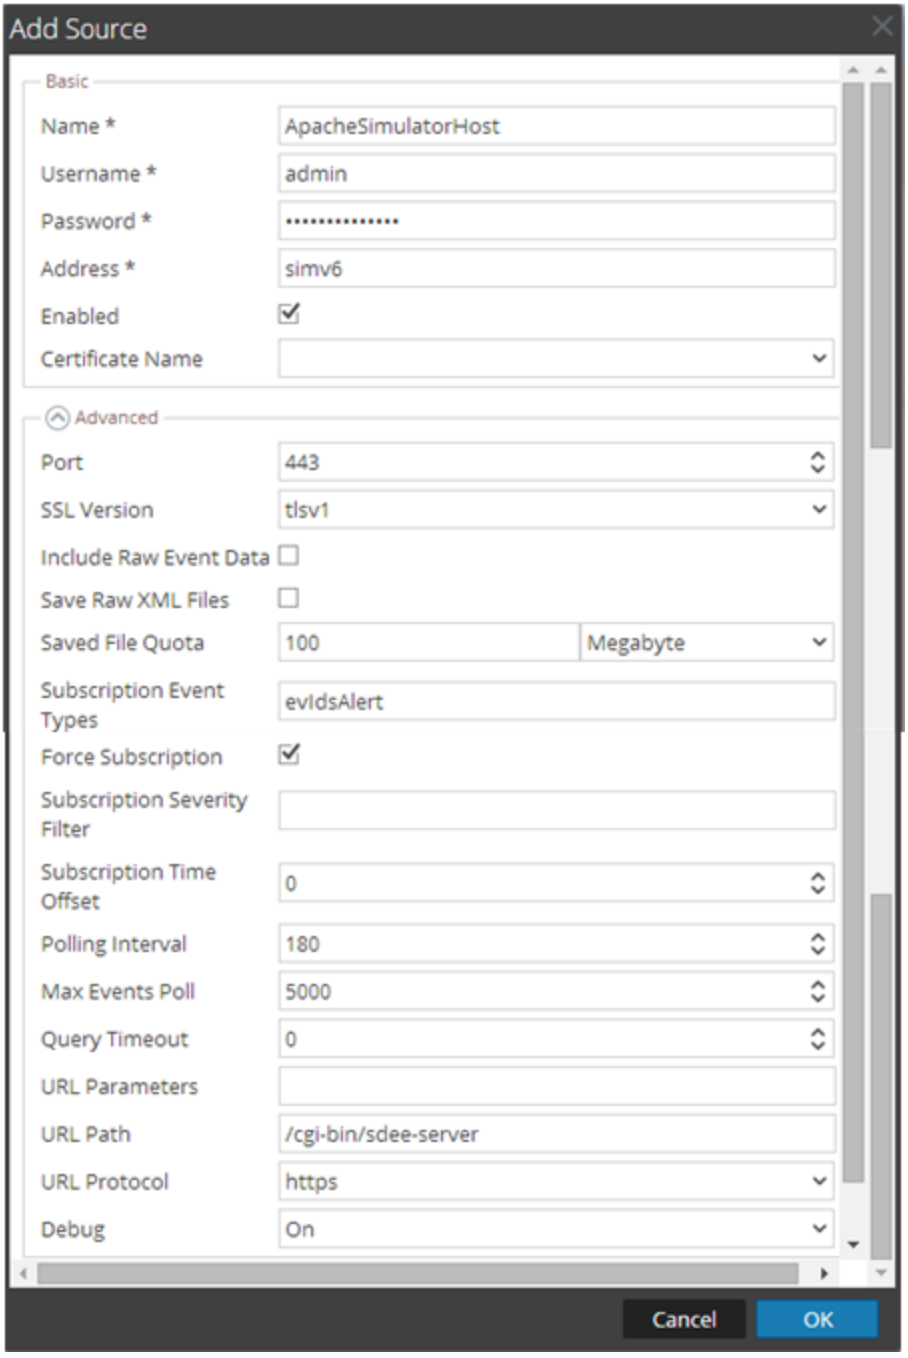
6. In the **Event Categories** panel toolbar, click + .

   The **Available Event Source Types** dialog is displayed.

7. Select an event source type and click **OK**.

   The newly added event source type is displayed in the **Event Categories** panel.

8. Select the new type in the Event Categories panel and click + in the Sources panel toolbar. The Add Source dialog is displayed.



9. Add a Name, Username, Address, and Password, and modify any other parameters that require changes, and click **OK**.

Configure SNMP Event Sources in NetWitness Platform

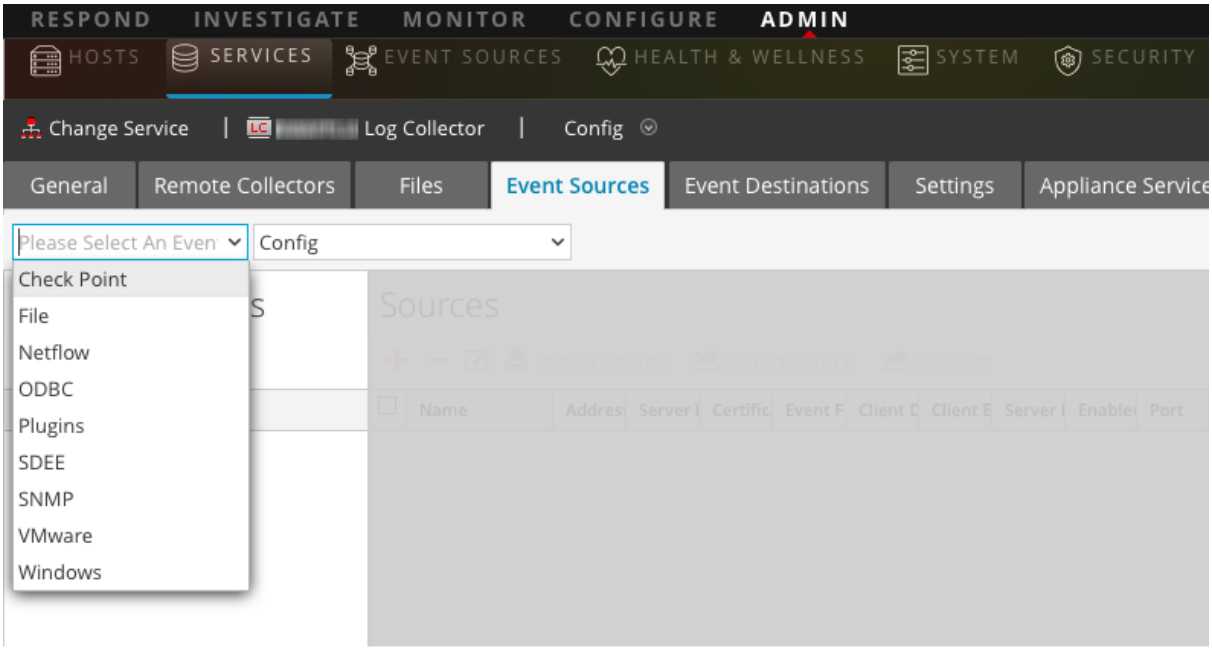
This topic tells you how to configure the SNMP collection protocol.

Configure the SNMP Trap Event Source

To add the SNMP Event Source:

Note: If you have previously added the **snmptrap** type, you cannot add it again. You can edit it, or manage users.

1. Go to **ADMIN > Services** from the NetWitness Platform menu.
2. Select a Log Collection service.
3. Under Actions, select > **View** > **Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.



5. In the **Event Sources** tab, select **SNMP/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click + .
   The **Available Event Source Types** dialog is displayed.
7. Select the **snmptrap** event source type and click **OK**.
   The newly added event source type is displayed in the **Event Categories** panel.
8. Select **snmptrap** in the Event Categories panel.

9. Select **snmptrap** in the Sources panel and then click the Edit icon, , to edit the parameters.
10. Update any of the parameters that you need to change and click **OK**.

(Optional) Configure SNMP Users

If you are using SNMPv3, follow this procedure to update and maintain the SNMP v3 users.

To configure SNMPv3 Users:

1. Go to **Admin** > **Services**.
2. In the **Services** grid, select a **Log Collector** service.
3. Click under **Actions** and select **View** > **Config**.
4. In the Log Collector **Event Sources** tab, select **SNMP/SNMP v3 User Manager** from the drop-down menu.

   The SNMPv3 User panel is displayed with the existing users, if any.
5. Click to open the **Add SNMP User** dialog.
6. Fill in the dialog with the necessary parameters. The available parameters are described below.

SNMP User Parameters

The following table describes the parameters that you need to enter when you create an SNMPv3 user.

Note: Required parameters are marked with an asterisk. All other parameters are optional.

Parameter	Description
Username *	User name (or more accurately in SNMP terminology, security name). NetWitness Platform uses this parameter and the **Engine ID** parameter to create a user entry in the SNMP engine of the collection service. The **Username** and **Engine ID** combination must be unique (for example, **logcollector**).
Engine ID	(Optional) Engine ID of the event source. For all event sources sending SNMP v3 traps to this collection service, you must add the username and engine id of the sending event source. For all event sources sending SNMPv3 informs, you must add just the username with a blank engine id.

Parameter	Description
Authentication Type	(Optional) Authentication protocol. Valid values are as follows: • **None** (default) - only security level of **noAuthNoPriv** can be used for traps sent to this service • **SHA** - Secure Hash Algorithm • **MD5 - Message Digest Algorithm** **IMPORTANT:** DO NOT USE: do not select MD5, as it conflicts with the Log Collector running in FIPS mode.
Authentication Passphrase	Optional if you do not have the **Authentication Type** set. Authentication passphrase.
Privacy Type	(Optional) Privacy protocol. You can only set this parameter if Authentication Type parameter is set. Valid values are as follows: • **None** (default) • **AES** - Advanced Encryption Standard • **DES - Data Encryption Standard** **IMPORTANT:** DO NOT USE: do not select DES, as it conflicts with the Log Collector running in FIPS mode.
Privacy Passphrase	Optional if you do not have the **Privacy Type** set. Privacy passphrase.
Close	Closes the dialog without adding the SNMPv3 user or saving modifications to the parameters.
Save	Adds the SNMPv3 user parameters or saves modifications to the parameters.

Configure Syslog Event Sources

This topic tells you how to configure Syslog event sources for the Log Collector.

Note: Prior to NetWitness Platform 11.3, you did not configure Syslog Collection for Local Log Collectors: syslog collection was only configurable for Remote Collectors. You ***can*** configure Syslog for local Log Collectors that are on version 11.3 or later.

Configure a Syslog Event Source

For Remote or Virtual Log Collectors, syslog listeners for UDP on port 514, TCP on port 514 and SSL on port 6514 are created by default. You should not change the SSL settings on the TCP and SSL listeners. If you need SSL certificate verification, create a new event source type to listen on a different port.

Note: For local Log Collectors, you cannot create syslog listeners on ports 514 and 6514: these ports are used by the Log Decoder service.

To configure the Log Collector for Syslog collection:

1. Go to **ADMIN > Services**.
2. In the Services grid, select a Log Collector, and from the Actions menu, choose **> View > Config**.
3. Select the **Event Sources** tab.
4. Select **Syslog/Config** from the drop-down menu.

   The Event Categories panel displays the Syslog event sources that are configured, if any.

   Note: For RSA NetWitness Platform, some Syslog event sources are available by default. In this case, you can proceed to step 6.

5. In the Event Categories panel toolbar, click .

   The Available Event Source Types dialog is displayed.

6. Select either **syslog-tcp** or **syslog-udp**. You can set up either or both, depending on the needs of your organization.
7. Select the new type in the Event Categories panel and click in the Sources panel toolbar.

   The Add Source dialog is displayed.

8. Enter the port number, and select **Enabled**. Optionally, configure any of the Advanced parameters as necessary.

   Click **OK** to accept your changes and close the dialog box.

Once you configure one or both syslog types, the Log Decoder or Log Collector collects those types of messages from all available event sources. So, you can continue to add Syslog event sources to your system without needing to do any further configuration in RSA NetWitness Platform.

Character Encodings

For each protocol (TCP, UDP), you need to instantiate a separate syslog listener for each character encoding.

For example, assume that you have legacy event sources sending syslog in UDP and TCP with EUC-KR and EUC-JP encodings. You would need to configure four listeners for the Log Collector, and configure the syslog event sources to send to separate ports as follows:

- UDP *<port1>* for EUC-KR
- UDP *<port2>* for EUC-JP
- TCP *<port3>* for EUC-KR
- TCP *<port4>* for EUC-JP

Alternatively, you could use separate Remote/Virtual Log Collectors, each using the default port 514.

Syslog Parameters

The following tables describe the available basic and advanced parameters for Syslog configuration.

Note: Required parameters are marked with an asterisk. All other parameters are optional.

Basic Parameters

Name	Description
Port*	Enter the port number that you configured for your event sources.
Enabled	Select the check box to enable the event source configuration to start collection. The check box is selected by default.
SSL Receiver	**Note:** This parameter applies to RSA NetWitness® Platform version 11.1 and newer. It is available only for the **syslog-tcp** Event Category. If you select the check box, the event source accepts SSL/TLS connections only. Also, if you change this setting, you must stop and restart Syslog collection for the change to become effective.
Encoding	Character encoding used by the syslog senders to this port. Defaults to UTF-8. **Note:** It is safe to leave this as UTF-8, since UTF-8 handles ASCII characters as well, and most senders have their encoding set to UTF-8. RSA has tested the following values: • EUC-KR • SJIS • GB3212/GBK • ISO_8859-1 (German) • ISO_8859-7 (Greek)

Advanced Parameters

Name	Description
Inflight Publish Log Threshold	Establishes a threshold that, when reached, NetWitness generates a log message to help you resolve event flow issues. The Threshold is the size of the syslog event messages currently flowing from the event source to NetWitness. Valid values are: • **0** (default) - disables the log message • **100-100000000** - generates log message when the syslog event messages currently flowing from the event source to NetWitness are within the 100 to 100000000 byte range.
Maximum Receivers	Maximum number of receiver resources used to process collected syslog events. The default value is **2**.

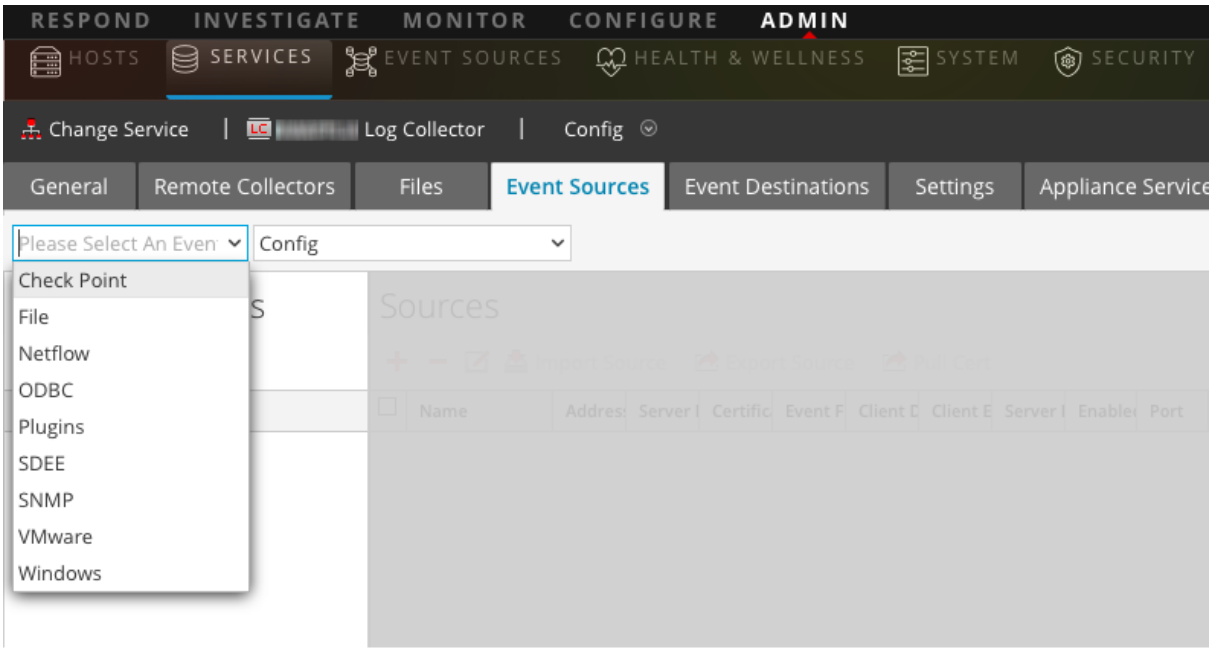
Name	Description
Event Filter	Select a filter. Please refer to Configure Event Filters for a Collector for instructions on how to define filters.
Debug	**Caution:** Only enable debugging (set this parameter to "On" or "Verbose") if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact. If you change this value, the change takes effect immediately (no restart required).
SSL Verify Mode	**Note:** This parameter applies to RSA NetWitness® Platform version 11.1 and newer. It is available only for the **syslog-tcp** Event Category. This setting is relevant only if the **SSL Receiver** setting is selected. If you change the SSL Verify Mode, you must stop and restart Syslog collection for the change to become effective. Available options: • **verify-none**: (default) The server does not verify the client's certificate, if any. A client can connect without presenting a certificate. • **verify-peer**: The server verifies the client's certificate, if any. A client can connect without presenting a certificate. **Note:** If verification fails, a warning is logged but the messages will still be accepted. • **verify-peer-fail-if-no-cert**: The client must present a certificate and the server will verify it. **Note:** If you use this mode, the client's CA certificate ***must*** be uploaded to the Log Collector's truststore using the REST API at `http://LC-ip-address:50101/sys/caupload`

Configure VMware Event Sources in NetWitness Platform

This topic tells you how to configure the VMware collection protocol.

To add a VMware Event Source:

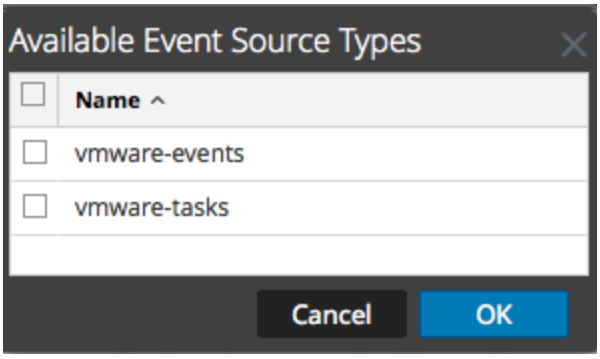
1. Go to **ADMIN > Services**.
2. Select a Log Collection service.
3. Under Actions, select > **View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.



5. In the Log Collector **Event Sources** tab, select **VMware/Config** from the drop-down menu.

   The Event Categories panel displays the VMware event sources that are configured, if any.

6. Click + to open the **Available Event Source Types** dialog.



7. Select **vmware-events** or **vmware-tasks** from the Available Event Source Types dialog and click

OK.

The VMware available event source types are as follows:

- **vmware-events:** Setup vmware-events to collect events from vCenter Servers and ESX/ESXi servers.
- **vmware-tasks:** (Optional) Setup vmware-tasks to collect tasks from vCenter Servers.

8. Select the new type in the Event Categories panel, and click + in the Sources toolbar.
9. Add a Name, Username and Password, and modify any other parameters that require changes.

Caution: If you need to enter the domain name as part of the Username, you must use a double-backslash as a separator. For example, if the domain|username is corp\smithj, you must specify **corp\\smithj**.

10. Click **OK** to save your changes.

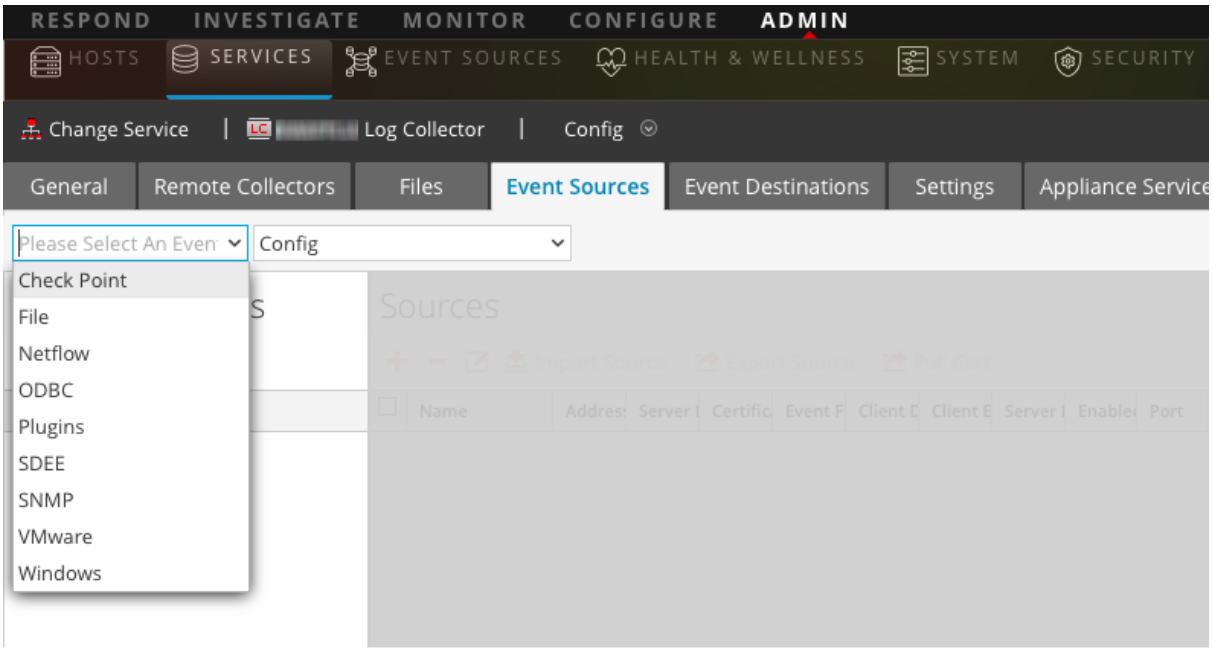
Configure Windows Event Sources in NetWitness Platform

This topic tells you how to configure the Windows collection protocol.

In RSA NetWitness Platform, you need to configure the Kerberos Realm, and then add the Windows Event Source type.

To configure the Kerberos Realm for Windows collection:

1. Go to **ADMIN > Services**.
2. Select a Log Collection service.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.



5. Select **Windows/Kerberos Realm** from the drop-down menu.
6. In the Kerberos Realm Configuration panel toolbar, click + to add a new realm.
   The Add Kerberos Domain dialog is displayed.
7. Fill in the parameters, using the guidelines below.

Parameter	Details
Kerberos Realm Name	Enter the realm name, in all caps. For example, DSNETWORKING.COM. Note that the Mappings parameter is automatically filled with variations on the realm name.
KDC Host Name	Enter the name of the Domain Controller. ***Do not*** use a fully qualified name here: just the host name for the DC. **Note:** Make sure that the log collector is configured as a DNS client for the corporate DNS server. Otherwise, the Log Collector will not know how to find the Kerberos Realm.
Admin Server	(Optional) The name of the Kerberos Administration Server in FQDN format.
Mappings	This parameter is automatically filled after you enter the realm name.

8. Click **Save** to add the Kerberos domain.

To add a Windows Event Source:

1. Go to **ADMIN > Services**.
2. Select a Log Collection service.
3. Under Actions, select ⚙ > **View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.

5. In the Log Collector **Event Sources** tab, select **Windows/Config** from the drop-down menu.

   The Event Categories panel displays the VMware event sources that are configured, if any.

Next, continue from the current screen to add a Windows Event Category and type.

To configure the Windows Event Type:

1. Select **Windows/Config** from the drop-down menu.
2. In the Event Categories panel toolbar, click + to add a source.

   The Add Source dialog is displayed.
3. Fill in the parameters, using the guidelines below.

Parameter	Details
Alias	Enter a descriptive name.
Authorization Method	Choose **Negotiate**.
Channel	For most event sources that use Windows collection, you want to collect from the **Security**, **System**, and **Application** channels.
User Name	Enter the account name for the Windows user account that you set up earlier for communicating with NetWitness. Note that you need to enter the full account name, which includes the domain. For example, `rsalog@DSNETWORKING.COM`.
Password	Enter the correct password for the user account.
Max Events Per Cycle	(Optional). RSA recommends that you set this value to 0, which collects everything.
Polling Interval	(Optional). For most users, a value of **60** should work well.

4. Click **OK** to add the source.

   The newly added Windows event source is displayed in the Event Categories panel.
5. Select the new event source in the Event Categories panel.

   The **Hosts** panel is activated.
6. Click + in the Hosts panel toolbar.
7. Fill in the parameters, using the guidelines below.

Parameter	Details
Event Source Address	Enter the IP address for the Windows host.
Port	Accept the default value, **5985**.
Transport Mode	Enter **http**.
Enabled	Ensure the box is checked.

8. Click **Test Connection**.

Note: You should be able to successfully test the connection, even if the Windows service is not running.

For more information on any of the previous steps, see the following Help topics in the NetWitness Platform User Guide:

- Configure Windows Collection: https://community.rsa.com/docs/DOC-43410
- Microsoft WinRM Configuration Guide: https://community.rsa.com/docs/DOC-58163
- Test and Troubleshoot Microsoft WinRM Guide: https://community.rsa.com/docs/DOC-58164

Windows Legacy and NetApp Collection Configuration

This **Windows Legacy** protocol collects events from Windows Legacy (Windows 2003 or earlier event sources) and CIFS Auditing events from NetApp ONTAP event sources.

You must deploy Log Collection, that is set up a Local Collector and Windows Legacy Remote Collector, before you can configure the Windows Legacy collection protocol.

How Legacy Windows and NetApp Collection Works

You use the Windows Legacy collection protocol to configure NetWitness Platformto collection events from:

- Legacy Microsoft Windows event sources (Window 2003 and earlier event sources)
- NetApp event sources

Window 2003 and Earlier Event Sources

Legacy Windows event sources are older Windows versions (such as Windows 2000 and Window 2003). The Windows Legacy collection protocol collects from Windows event sources that are already configured for enVision collection without having to reconfigure them. You set up these event sources under the windows event source type.

NetApp Event Sources

NetApp appliances running Data ONTAP support a native auditing framework that is similar to Windows Servers. When configured, this auditing framework generates and saves audit events in Windows.evt file format. The Windows Legacy collection protocol supports collection of events from such NetApp.evt files. You set up these event sources under the netapp_evt event source type.

The NetApp Data ONTAP appliance is configured to generate CIFS Auditing events and save them periodically as.evt files in a format that includes the timestamp in the filename. Refer to the Network Appliance Data ONTAP Event Source Configuration Guide on RSA Link for details. The collection protocol saves the timestamp of the last processed.evt filename to keep track of collection status.

Net App Specific Parameters

Most of the parameters that you maintain in Add/Edit Source dialog apply to both Windows Legacy and Net App events sources.

The following two parameters are unique to NetApp event sources.

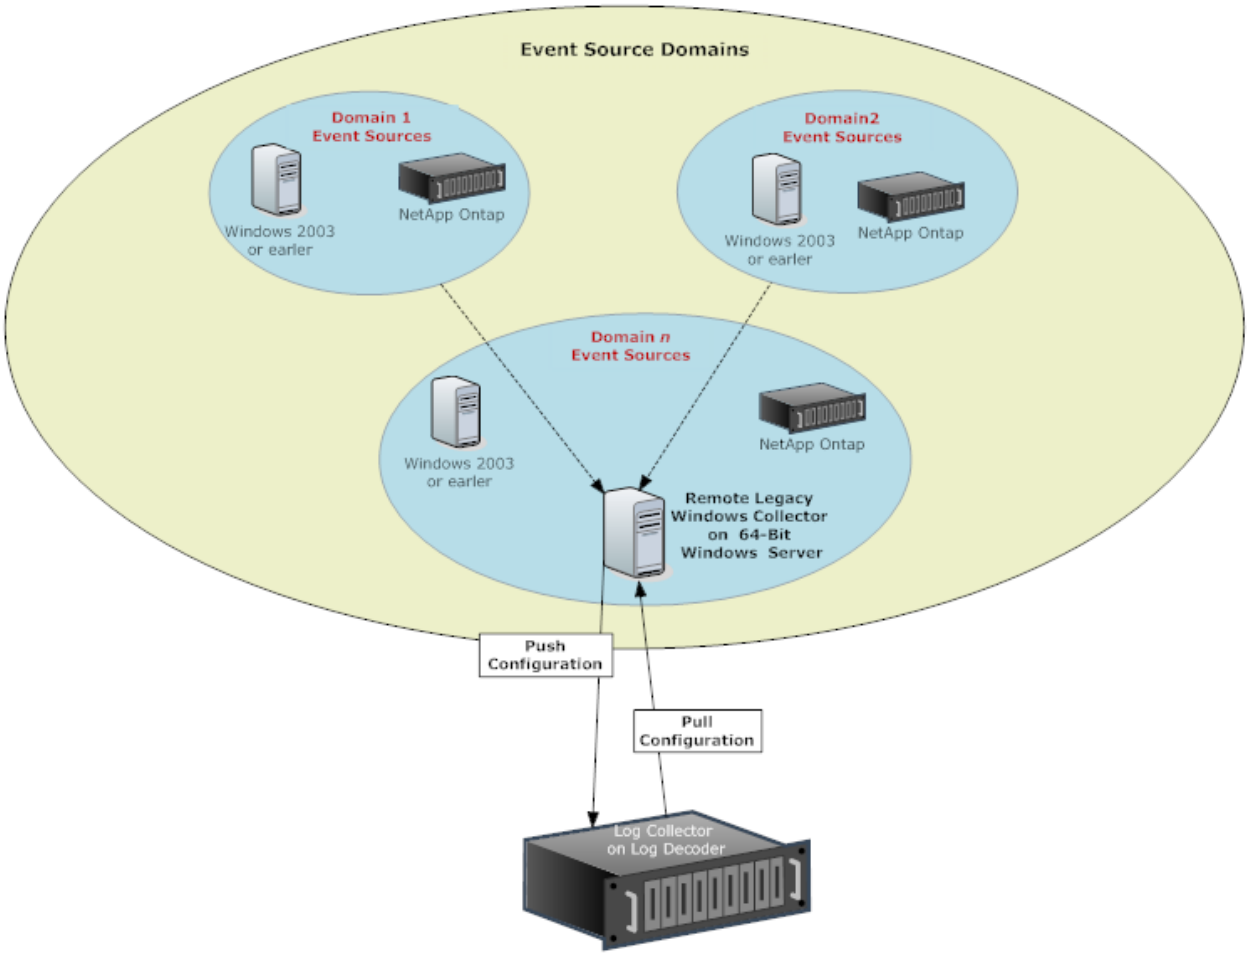
- **Event Directory Path** - The NetApp appliance generates event data and saves it in.evt files in a shareable directory on the NetApp appliance. NetWitness Platform requires you to specify this directory path in the Event Directory Path parameter
- **Event File Prefix** - Similar to the Event Directory Path, NetWitness Platform requires you to specify the prefix (for example, adtlog.) of the event data.evt files so that NetWitness Platform can process this data.

In each polling cycle, NetWitness Platform browses the configured NetApp shared path for the **.evt** files that you identified with the Event Directory Path and Event File Prefix parameters. NetWitness Platform:

- Sorts Files matching the event-file-prefix.YYMMDDhhmmss.evt format in ascending order.
- Uses the timestamp of the last file processed to determine the files that still need processing. If NetWitness Platform finds a partially processed file, it skips the events already processed.

Deployment Scenario

The Windows Legacy collection protocol collects event data from Windows 2003 or earlier, and NetApp ONTAP appliance, event sources. The Windows Legacy Remote Collector is the SA Legacy Windows Collector installed on physical or virtual Windows 2008 64-bit server in your event source domain.



Set Up the Windows Legacy Collector

This topic tells you where to find the executable and instructions required to install or upgrade the Windows Legacy collector in your Windows Legacy domain or domains.

You install the NetWitness Platform Windows Legacy collector on a physical or virtual Windows 2008 R2 SP1 64-Bit server using the **NWLegacyWindowsCollector-11.*version-number.exe***. You download the **NWLegacyWindowsCollector-11.*version-number.exe*** from RSA Link. Please refer to the *NetWitness 11.x Windows Legacy Collection Upgrade & Installation Instructions* for the details on how to install or upgrade Windows Legacy collection.

Note: The Microsoft Management Console (MMC) should be closed during the installation process.

Configure Windows Legacy and NetApp Event Sources

This topic tells you how to configure Windows Legacy event sources in NetWitness Platform.

The Windows Legacy collection protocol collects event data from Windows 2003 or earlier event sources, and from NetApp event sources.

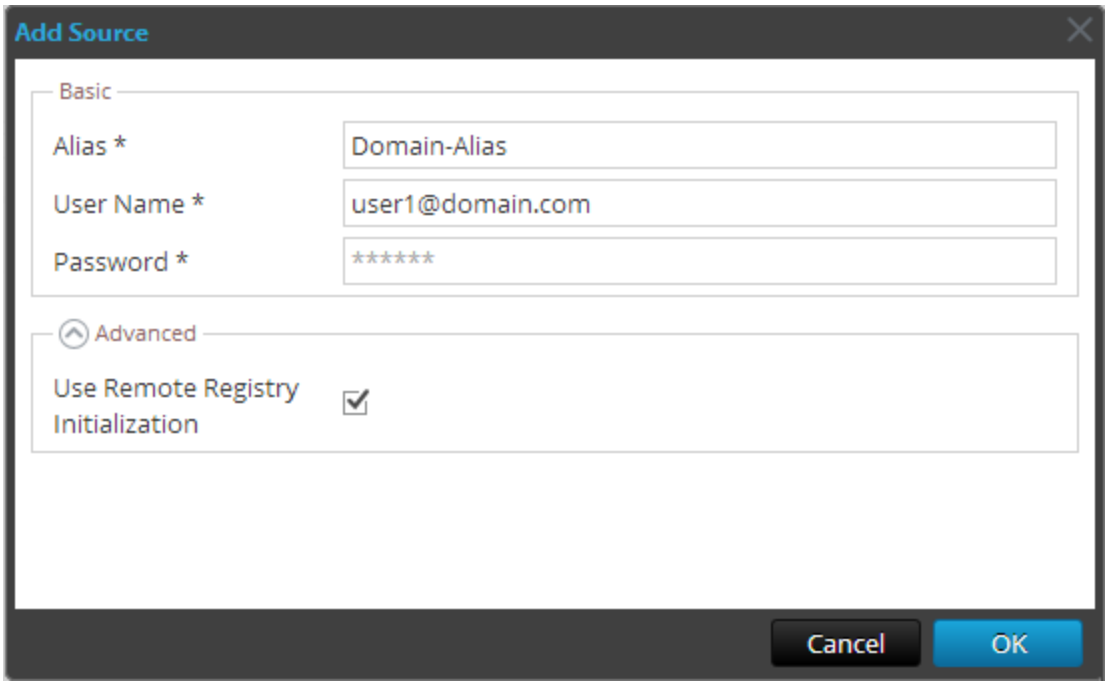
Prerequisites

Before you configure a Windows Legacy event source, make sure that you have:

1. Installed the NetWitness Platform Windows Legacy Remote Collector on a physical or virtual Windows 2008 64-bit server.
2. Added this Windows Legacy Remote Collector to NetWitness Platform.

Add a Windows Legacy Event Source

1. Access the Services view by selecting **Admin > Services** from the NetWitness Platform menu.
2. In the **Services** grid, select a **Windows Legacy Log Decoder** service.
3. Under Actions, select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.
5. In the **Event Sources** tab, select one of the following options from the drop-down menu.
   - Windows Legacy/Windows.
   - Windows Legacy/NetApp.
6. Configure the alias:
   a. Click in the **Event Categories** panel toolbar.
   The **Add Source** dialog is displayed.
   b. Specify values for the parameters and click **OK**.



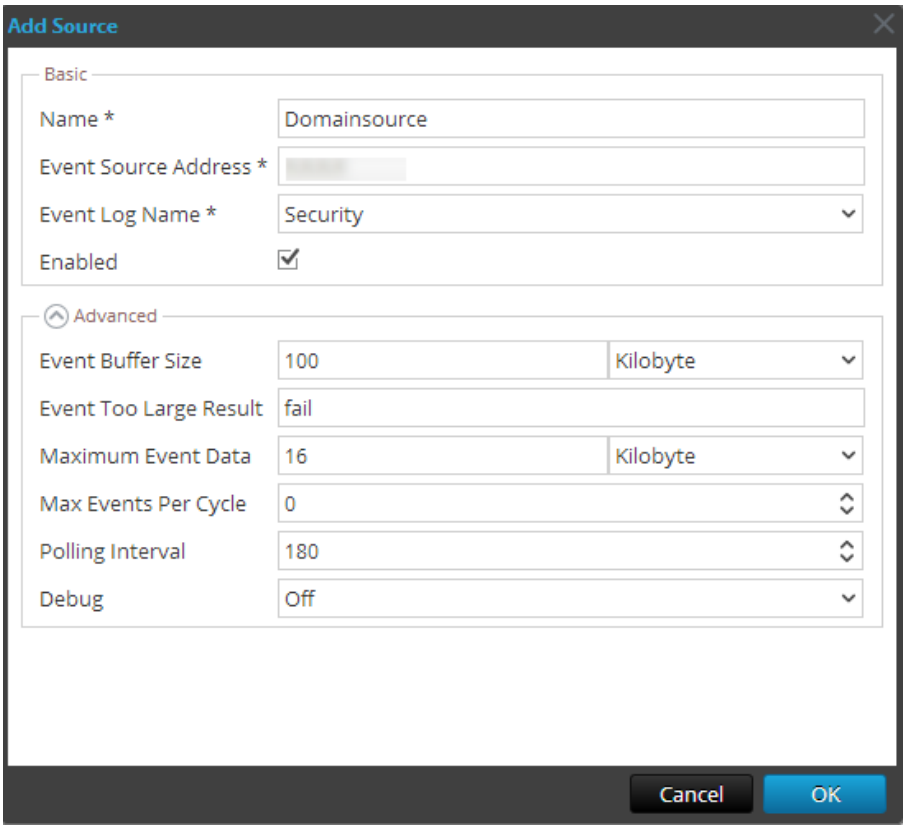
Note: By default, **Remote Registry Initialization** is selected. For details, see Remote Registry Access below.

The newly added windows event source type is displayed in the **Event Categories** panel.

7. Add the event source:

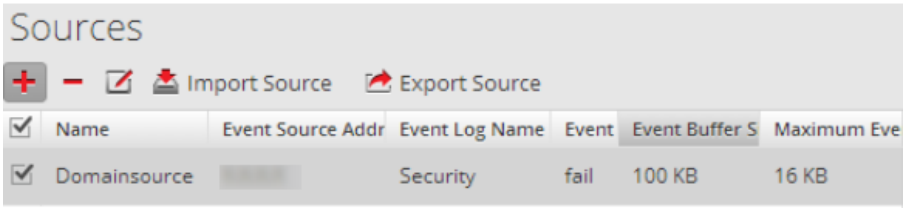
   a. Select the new alias in the **Event Categories** panel and click + in the **Source** panel toolbar. The **Add Source** dialog is displayed.

   b. Specify values for the event source parameters and click **OK**.



For details, see Windows Legacy Configuration Parameters below.

The newly added Windows event source is displayed in the **Event Categories** panel.



Remote Registry Access

Windows Legacy Collector performs an initial verification of the event source before collecting data. By default, Windows Legacy Collector uses Windows Management Instrumentation (WMI) method to perform this initial verification. If you enable Remote registry access method, Windows Legacy Collector performs a remote registry query to verify the event source.

Configure Push or Pull between Log Collector and Windows Legacy Collector

You can configure the Windows Legacy Collector to push event data to a Local Collector, or you can configure a Local Collector to pull event data from the Windows Legacy Collector.

To configure a Local Collector or the Windows Legacy Collector:

1. Go to **ADMIN > Services**.
2. Select a Local Collector or the Windows Legacy Collection service.

3. Under Actions, select > **View** > **Config** to display the Log Collection configuration parameter tabs.
4. Depending on your selection in step 2:
   - If you selected a Local Collector, the **Remote Collectors** tab is displayed. Select the Windows Legacy Collector from which the Local Collector pulls events in this tab.
   - If you selected a Windows Legacy Collector, the **Local Collectors** are displayed. Select the Local Collectors to which the Windows Legacy Collector pushes events in this tab.

Windows Legacy Configuration Parameters

The following table describes the basic parameters for a Windows Legacy event source.

Note: Required parameters are marked with an asterisk. All other parameters are optional.

Feature	Description
Name*	The name of the event source. Valid value is a name in the **[_a-zA-Z] [_a-zA-Z0-9]*** range. You can use a dash "-" as part of the name.
Event Source Address*	IP address of the event source. Valid value is an IPv4 address, IPv6 address, or a hostname including a fully qualified domain name. NetWitness Platform defaults to **127.0.0.1**. Log Collector converts the hostname to lower-case letters to prevent duplicate entries.
Event Log Name	The name of the event log from which to collect event data (for example, **System**, **Application**, or **Security**). The following are examples of some of these channels: • **System** - applications that run under system service accounts (installed system services), drivers, or a component or application that has events that relate to the health of the system. • **Application** - all user-level applications. This channel is unsecured and it is open to any application. If an application has extensive information, you should define an application-specific channel for it. • **Security** - the Windows Audit Log (event log) used exclusively for the Windows Local Security Authority.
Enabled	Select this checkbox to collect from this event source. If you do not check this checkbox, the Log Collector does not collect events from this event source.

Event Directory Path	NetApp **.evt or.evtx** files directory path. This must be the UNC path.
	The NetApp generates event data and saves it in.evt or.evtx files in a shareable directory on the NetApp appliance.
	• In each polling cycle, Log Collector browses the configured NetApp shared path for the.evt files that you identified with the **Event Directory Path** and **Event File Prefix parameters**. Log Collector :
	  ○ sorts files that match the **event-file-prefix.YYMMDDhhmmss.evt** format in ascending order.
	  ○ uses the timestamp of the last file processed to determine the files that still need processing. If Log Collector finds a partially processed file, it skips the events already processed.
	• In each polling cycle, Log Collector browses the configured NetApp shared path for the **.evtx** files that you identified with the **Event Directory Path** and **Event File Prefix parameters**. Log Collector :
	  ○ sorts files that match the **event-file-prefix.YYMMDDhhmmssms.evtx** format in ascending order.
	  ○ uses the timestamp of the last file processed to determine the files that still need processing. If Log Collector finds a partially processed file, it skips the events already processed.

Event File Prefix	Prefix of the **.evt** files (for example, **adtlog**.) saved in the **Event Directory Path**.

Feature	Description
Cancel	Closes the dialog without adding the Windows Legacy event source.
OK	Adds the current parameter values as a new event source

The following table describes the advanced parameters for a Windows Legacy event source.

Feature	Description
Event Buffer Size	Maximum size of the data the Log Collector pulls from the event source for each request. Valid value is a number in **0** to **511** Kilobytes range. You specify this value in **Kilobytes**.
Event Too Large Result	Tells Log Collector what to do if an event is too large for the event buffer.
Maximum Event Data	Maximum size of event data to include in the output. Valid value is a number in **0** to **511Kilobytes** range. You specify this value in **Kilobytes** or **Megabytes**. • 1 Kilobyte - 100 Megabytes • 0 = do not include event data in the output.
Max Events Per Cycle	The maximum number of events per polling cycle (how many events collected per polling cycle).
Polling Interval	Interval (amount of time in seconds) between each poll. The default value is **180**. For example, if you specify 180, the collector schedules a polling of the event source every 180 seconds. If the previous polling cycle is still underway, it will wait for it to finish that cycle. If you have a large number of event sources that you are polling, it may take longer than 180 seconds for the polling to start because the threads are busy.
Debug	**Caution:** Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. If you change this value, the change takes effect immediately (no restart required). Limit the number of event sources for which you use Verbose debugging to minimize performance impact.

Troubleshoot Windows Legacy and NetApp Collection

This topic highlights possible problems that you may encounter with Windows Legacy Collection (LWC) and suggested solutions to these problems.

Note: In general, you receive more robust log messages by disabling SSL.

Protocol Restart Problems

Problem	Possible Causes	Solutions
You restart the Legacy Windows collection protocol, but NetWitness Platform is not receiving events.	The logcollector service is stopped.	Restart the **logcollector** service. 1. Log on to the **Windows Legacy Remote Collector**. 2. Go to **Start > Administrative Tools > Task Scheduler** and click on **Task Scheduler Library**. 3. In the right panel, look for the **restartnwlogcollector** task and make sure that it is running. 4. If this is not the case, right-click **restartnwlogcollector** and select **Run**.

Installation Problems

If you see any of the following messages in the **MessageBroker.log**, you may have issues.

Log Messages	Any message that contains "rabbitmq"
Possible Cause	RabbitMQ service may not be running. Port **5671** may not be opened.
Solutions	Make sure that the RabbitMQ service is running. Make sure that port **5671** is open.
Log Messages	Error: Adding logcollector user account. Error: Adding administrator tag to logcollector account. Error: Adding logcollection vhost. Error: Setting permissions to logcollector account in all vhosts.
Possible Cause	**rabbitmq-server** was not running when installer tried to create users and vhosts.

Solutions	Make sure that the **RabbitMQ** service is running and run below commands manually.
	`rabbitmqctl -q add_user logcollector netwitness`
	`rabbitmqctl -q set_user_tags logcollector administrator`
	`rabbitmqctl -q add_vhost logcollection`
	`rabbitmqctl -q set_permissions -p / logcollector ".*" ".*" ".*"`
	`rabbitmqctl -q set_permissions -p logcollection logcollector ".*" ".*" ".*"`

Windows Legacy Federation Script Issues

If you see any of the following messages in the federation script log, you may have issues.

Problem	Possible Symptoms	Solutions
Federation script started, but the LWC service went down.	NetWitness Platform log shows connection failure exceptions with Windows Legacy Collector.	This issue is fixed automatically after restarting the Windows Legacy service.

LWC is running, but RabbitMQ service is down or restarting.	Federation log file at Windows Legacy side displays an error message about RabbitMQ service being down.
	The log file to look at is: **C:\NetWitness\ng\logcollector**
	The following error message is logged in case RabbitMQ is not running:
	`"Unable to connect to node logcollector@localhost: nodedown"`
	The following diagnostics messages are displayed:
	`attempted to contact: [logcollector@localhost]`
	`logcollector@localhost:`
	`* connected to epmd (port 4369) on localhost`
	`* epmd reports: node 'logcollector' not running at all other nodes on localhost: ['rabbitmqctl-4084']`
	`* suggestion: start the node`
		Run the **federation.bat** script manually at LWC. To run the **federate.bat** script manually, perform the following steps:
		1. Go to folder C:**Program Files\NwLogCollector** where the Windows Legacy instance is installed.
		2. Locate the file **federate.bat i**n this folder. Select the file and right click.
		3. Select **Run as Administrator**.
		4. To monitor the log file, navigate to **C:\NetWitness\ng\logcollector\federate.log** while the **federate.bat** script is being executed.
		Note: Make sure the log file does not show any errors while the script is being executed.

RabbitMQ service is down on the NetWitness Platform side.	NetWitness Platform User Interface pages do not work.	Restart RabbitMQ service.
Customer receives a Health and Wellness notification, or the following Health and Wellness Alarm is displayed: "Communication failure between Master NetWitness Platform Host and a Remote Host" with LWC Host as the Remote IP.	**Federate.bat** script failed to run successfully.	If the **Federate.bat** script did not run correctly, run it manually as described previously.

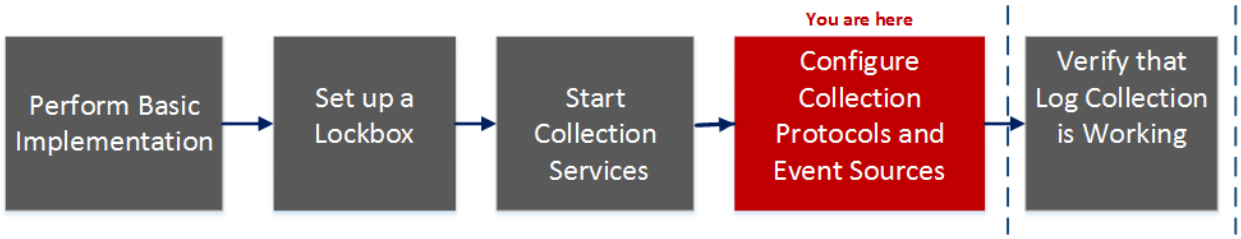
Reference

AWS Parameters

This topic provides an overview of the AWS collection configuration parameters for deploying a remote log collection service (VLC) in an Amazon Web Services (AWS) environment.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.



What do you want to do?

Role	I Want to...	Documentation
Administrator	Perform basic Log Collection implementation	Basic Implementation
Administrator	Set up a lockbox to maintain lockbox settings.	Set Up a Lockbox
Administrator	Start Log Collection services.	Start Collection Services
Administrator	*Configure Log Collection protocols and event sources.	Configure Collection Protocols and Event Sources
Administrator	Verify that Log Collection is working.	Verify That Log Collection Is Working

*You can perform this task here.

Related Topics

- Configure AWS (CloudTrail) Event Sources in NetWitness Platform

The following table describes the **Basic** configuration parameter for AWS collection.

Note: Required parameters are marked with an asterisk. All other parameters are optional.

Parameter	Description
Name *	Name of the event source.
Enabled	Select the check box to enable the event source configuration to start collection. The check box is selected by default.

Parameter	Description
Account Id *	Account Identification code of the S3 Bucket
S3 Bucket Name *	Name of the AWS (CloudTrail) S3 bucket. Amazon S3 bucket names are globally unique, regardless of the AWS (CloudTrail) region in which you create the bucket. You specify the name at the time you create the bucket. Bucket names should comply with DNS naming conventions. The rules for DNS-compliant bucket names are: • Bucket names must be at least three and no more than 63 characters long. • Bucket names must be a series of one or more labels. Adjacent labels are separated by a single period ".". Bucket names can contain lowercase letters, numbers, and hyphens. Each label must start and end with a lowercase letter or a number. • Bucket names must not be formatted as an IP address (for example, 192.168.5.4). The following examples are **valid** bucket names: • `myawsbucket` • `my.aws.bucket` • `myawsbucket.1` The following examples are **invalid** bucket names: • `.myawsbucket` - Do not start a Bucket Name with a period • `myawsbucket.` - Do not end a Bucket Name with a period • `my..examplebucket` - Only use one period between labels.
Access Key *	Key used to access the S3 bucket. Access Keys are used to make secure REST or Query protocol requests to any AWS service API. Please refer to Manage User Credentials on the Amazon Web Services support site for more information on Access Keys.
Secret Key *	Secret key used to access the S3 bucket.
Region *	Region of the S3 bucket. `us-east-1` is the default value.
Region Endpoint	Specifies the AWS CloudTrail hostname. For example, for an AWS public cloud for us-east region, the Region Endpoint would be s3.amazonaws.com. More information can be found at http://docs.aws.amazon.com/general/latest/gr/rande.html#s3_region. This parameter is necessary to collect CloudTrail logs from AWS Government or Private clouds.
Use Proxy	Enable **Use Proxy** to set proxy for AWS server. By default, it is disabled.
Proxy Server	Enter the proxy name you want to connect to access the AWS server.
Proxy Port	Enter the port number that connects to the proxy server to access the AWS server.
Proxy User	Enter the user name to authenticate with the proxy server.
Proxy Password	Enter the password to authenticate with proxy port.
Start Date *	Starts AWS (CloudTrail) collection from the specified number of days in the past, measured from the current timestamp. The default value is 0, which starts from today. The range is 0–89 days.

Parameter	Description
Log File Prefix	Prefix of the files to be processed. **Note:** If you set a prefix when you set up your CloudTrail service, make sure to enter the same prefix in this parameter.
Cancel	Closes the dialog without adding the AWS (CloudTrail).
OK	Adds the current parameter values as a new AWS (CloudTrail).

The following table describes the **Advanced** configuration parameter for AWS collection.

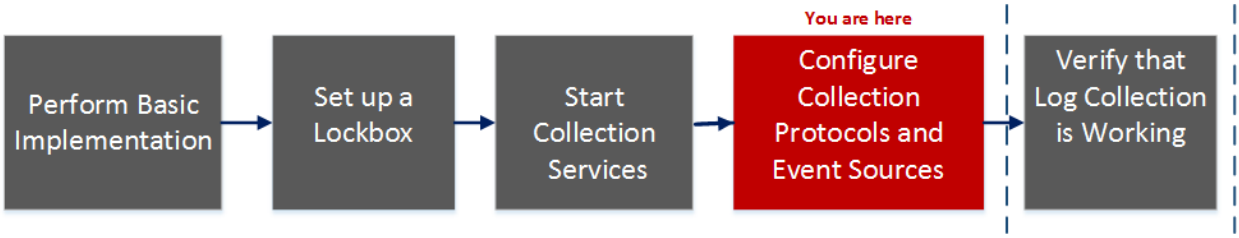
Parameter	Description
Debug	**Caution:** Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact. If you change this value, the change takes effect immediately (no restart required).
Command Args	Arguments added to the script.
Polling Interval	Interval (amount of time in seconds) between each poll. The default value is 60. For example, if you specify 60, the collector schedules a polling of the event source every 60 seconds. If the previous polling cycle is still underway, it will wait for it to finish that cycle. If you have a large number of event sources that you are polling, it may take longer than 60 seconds for the polling to start because the threads are busy.
SSL Enabled	Select the check box to communicate using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates. The check box is selected by default.
Test Connection	Validates the configuration parameters specified in this dialog are correct. For example, this test validates that: • NetWitness can connect with the S3 Bucket in AWS using the credentials specified in this dialog. • NetWitness can download a log file from the bucket (test connection would fail if there were no log files for the entire bucket, but this would be extremely unlikely).

Azure Parameters

Microsoft Azure is a cloud computing platform and infrastructure for building, deploying, and managing applications and services through a global network of Microsoft-managed data centers.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.



What do you want to do?

Role	I Want to...	Documentation
Administrator	Perform basic Log Collection implementation	Basic Implementation
Administrator	Set up a lockbox to maintain lockbox settings.	Set Up a Lockbox
Administrator	Start Log Collection services.	Start Collection Services
Administrator	*Configure Log Collection protocols and event sources.	Configure Collection Protocols and Event Sources
Administrator	Verify that Log Collection is working.	Verify That Log Collection Is Working

*You can perform this task here.

Related Topics

- Configure Azure Event Sources in NetWitness Platform

Azure Event Source Configuration Parameters

This topic describes the Azure event source configuration parameters.

Basic Parameters

Note: Required parameters are marked with an asterisk. All other parameters are optional.

Name	Description
Name *	Enter an alpha-numeric, descriptive name for the source. This value is only used for displaying the name on this screen.

Name	Description
Enabled	Select the checkbox to enable the event source configuration to start collection. The checkbox is selected by default.
Client ID *	The Client ID is found the Azure Application Configure tab. Scroll down until you see it.
Client Secret *	When you are configuring the event source, the client secret is displayed when you are creating a key, and you select a duration of validation. Make sure to save this, because you will only be able to see it once, and it cannot be retrieved later.
API Resource Base URL *	Enter `https://management.azure.com/`. Be sure to include the trailing slash (/).
Federation Metadata Endpoint *	In your Azure application, click the **View Endpoints** button (near the bottom of the pane). There are a lot of links that all begin with the same string. Compare the URLs and find the common string that begins most of them. This common string is the endpoint that you need to enter here.
Subscription ID *	You can find this in the Microsoft Azure dashboard: click on Subscriptions at the bottom of the list on the left.
Tenant Domain *	Go to the active directory and click on the directory. In the URL, the tenant domain is the string directly following **manage.windowsazure.com/**. The tenant domain is the string up to and including the **.com**.
Resource Group Names *	In Azure, select Resource groups from the left navigation pane, then select your group.
Start Date *	Choose the date from which to start collecting. Default's to the current date.
Test Connection	Checks the configuration parameters specified in this dialog to make sure they are correct.

Advanced Parameters

Click next to **Advanced** to view and edit the advanced parameters, if necessary.

Name	Description
Polling Interval	Interval (amount of time in seconds) between each poll. The default value is **180**. For example, if you specify 180, the collector schedules a polling of the event source every 180 seconds. If the previous polling cycle is still underway, the collector waits for that cycle to finish. If you have a large number of event sources that you are polling, it may take longer than 180 seconds for the polling to start because the threads are busy.

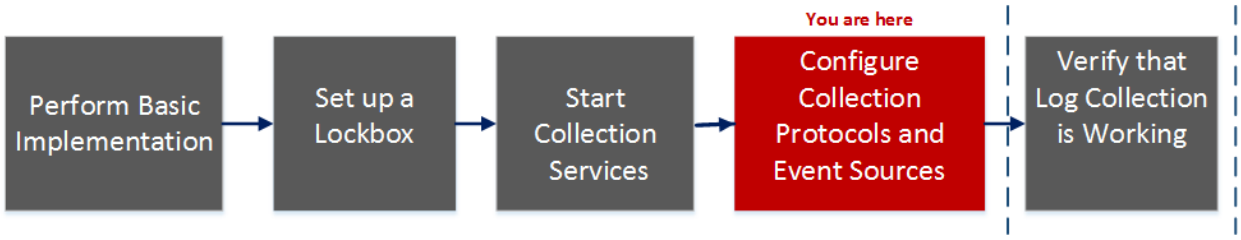
Name	Description
Max Duration Poll	Maximum duration, in seconds, of a polling cycle. A zero value indicates no limit.
Max Events Poll	The maximum number of events per polling cycle (how many events collected per polling cycle).
Max Idle Time Poll	Maximum duration, in seconds, of a polling cycle. A zero value indicates no limit.
Command Args	Optional arguments to be added to the script invocation.
Debug	**Caution:** Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. If you change this value, the change takes effect immediately (no restart required). The debug logging is verbose, so limit the number of event sources to minimize performance impact.

Check Point Parameters

The Check Point Collection protocol collects events from Check Point event sources using OPSEC LEA. OPSEC LEA is the Check Point Operations Security Log Export API that facilitates the extraction of logs.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.



What do you want to do?

Role	I Want to...	Documentation
Administrator	Perform basic Log Collection implementation	Basic Implementation
Administrator	Set up a lockbox to maintain lockbox settings.	Set Up a Lockbox
Administrator	Start Log Collection services.	Start Collection Services
Administrator	*Configure Log Collection protocols and event sources.	Configure Collection Protocols and Event Sources
Administrator	Verify that Log Collection is working.	Verify That Log Collection Is Working

*You can perform this task here.

Related Topics

- Configure Check Point Event Sources in NetWitness Platform

Check Point Collection Configuration Parameters

Note: Required parameters are marked with an asterisk. All other parameters are optional.

Basic Parameters

Parameter	Description
Name*	Name of the event source.
Address*	IP Address of the Check Point server.

Parameter	Description
Server Name*	Name of the Check Point server.
Certificate Name	Certificate name for secure connections to use when the transport mode is https. If set, the certificate must exist in the certificate trust store that you created using the Settings tab. Select a certificate from the drop-down list. The file naming convention for Check Point event source certificates is **checkpoint_*name-of-event-source***.
Client Distinguished	Enter the Client Distinguished Name from the Check Point server.
Client Entity Name	Enter the Client Entity Name from the Check Point server.
Server Distinguished	Enter the Server Distinguished Name from the Check Point server.
Enabled	Select the check box to enable the event source configuration to start collection. The check box is selected by default.
Pull Certificate	Select the checkbox to pull a certificate for first time. Pulling a certificate makes it available from the trust store.
Certificate Server Address	IP Address of the server on which the certificate resides. Defaults to the event source address.
Password	Only active when you select the Pull Certificate checkbox for first time. Password required to pull the certificate. The password is the activation key created when adding an OPSEC application to Check Point on the Check Point server.

Determine Advanced Parameter Values for Check Point Collection

You use less system resources when you configure a Check Point event source connection to stay open for a specific time and specific event volume (transient connection). RSA NetWitness Platform defaults to the following connection parameters that establish a transient connection:

- Polling Interval = **180** (3 minutes)
- Max Duration Poll = **120** (2 minutes)
- Max Events Poll = **5000** (5000 events per polling interval)
- Max Idle Time Poll = **0**

For very active Check Point event sources, it is a good practice to set up a connection that stays open until you stop collection (persistent connection). This ensures that Check Point collection maintains the pace of the events generated by these active event sources. The persistent connection avoids restart and connection delays and prevents Check Point collection from lagging behind event generation.

To establish a persistent connection for a Check Point event source, set the following parameters to the following values:

- Polling Interval = **-1**
- Max Duration Poll = **0**
- Max Events Poll = **0**
- Max Idle Time Poll = **0**

Parameter	Description
Port	Port on the Check Point server that Log Collector connects to. Default value is 18184.
Collect Log Type	Type of logs that you want to collect: Valid values are: • **Audit** - collects audit events. • **Security** - collects security events. If you want to collect both audit and security events, you must create a duplicate event source. For example, first you would create an event source with Audit selected pulling a certificate into the trust store for this event source. Next you would create another event source with the same values except that you would select Security for the Collect Log Type and you would select the same certificate in Certificate Name that you pulled when you set up the first set of parameters for this event source and you would make sure that Pull Certificate was not selected.
Collect Logs From	When you set up a Check Point event source, NetWitness collects events from the current log file. Valid values are: • **Now** - Start collecting logs now (at this point in time in the current log file). • **Start of Log** - Collect logs from the beginning of the current log file. If you choose "Start of Log" for this parameter value, you may collect a very large amount of data depending on how long the current log file has been collecting events. Note that this option is effective only for the first collection session.
Polling Interval	Interval (amount of time in seconds) between each poll. The default value is **180**. For example, if you specify 180, the collector schedules a polling of the event source every 180 seconds. If the previous polling cycle is still underway, it will wait for it to finish that cycle. If you have a large number of event sources that you are polling, it may take longer than 180 seconds for the polling to start because the threads are busy.
Max Duration Poll	The maximum duration of polling cycle (how long the cycle lasts) in seconds.
Max Events Poll	The maximum number of events per polling cycle (how many events collected per polling cycle).
Max Idle Time Poll	Maximum idle time, in seconds, of a polling cycle. 0 indicates no limit.**> 300** is the default value.
Forwarder	Enables or disables the Check Point server as a forwarder. By default it is disabled.

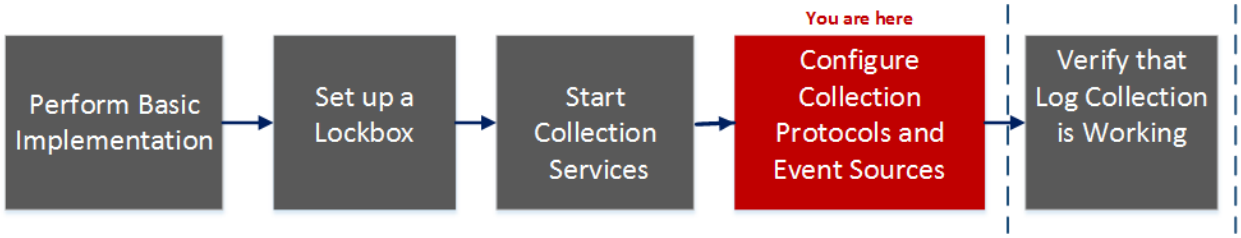
Parameter	Description
Log Type (Name Value Pair)	Logs from the event source in Name Value format. By default it is disabled.
Debug	**Caution:** Only enable debugging (set this parameter to "On" or "Verbose") if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables and disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact. If you change this value, the change takes effect immediately (no restart required).

File Parameters

This topic describes the File Collection configuration parameters.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.



What do you want to do?

Role	I Want to...	Documentation
Administrator	Perform basic Log Collection implementation	Basic Implementation
Administrator	Set up a lockbox to maintain lockbox settings.	Set Up a Lockbox
Administrator	Start Log Collection services.	Start Collection Services
Administrator	*Configure Log Collection protocols and event sources	Configure Collection Protocols and Event Sources
Administrator	Verify that Log Collection is working.	Verify That Log Collection Is Working

*You can perform this task here.

- Configure File Event Sources in NetWitness Platform

File Collection Event Source Parameters

The following table provides descriptions of the File Collection source parameters.

The following table describes the **Basic** configuration parameter for File collection.

Note: Required parameters are marked with an asterisk. All other parameters are optional.

Name	Description

Name	Description
File Directory*	Collection directory (for example, **Eur_London100**) into which the File event source places its files. Valid value is a character string that is conforms to the following regular expression: **[_a-zA-Z][_a-zA-Z0-9]*** This means that the file directory must start with a letter followed by numbers, letters, and underscores. Do not modify this parameter after you start collecting event data. After you create the collection, the Log Collector creates the work, save, and error sub-directories under the collection directory.
Address*	IP address of the event source. Valid value is an **IPv4 address**, **IPv6 address**, or a **hostname** including a fully-qualified domain name.
File Spec	Regular expression. For example, **^.*$** = process everything.
File Encoding	Character encoding used by the syslog senders to this port. Defaults to UTF-8. **Note:** It is safe to leave this as UTF-8, since UTF-8 handles ASCII characters as well, and most senders have their encoding set to UTF-8. RSA has tested the following values: • EUC-KR • SJIS • GB3212/GBK • ISO_8859-1 (German) • ISO_8859-7 (Greek)
Cancel	Closes the dialog without making adding an event source type.
OK	Adds the parameters for the event source.

The following table describes the **Advanced** configuration parameter for File collection.

Name	Description
Ignore Encoding Conversion Errors	Select the check box to ignore encoding conversion errors and ignore invalid data. The check box is selected by default. **Caution:** This may cause parsing and transformation errors.

Name	Description
File Disk Quota	Determines when to stop saving files regardless of the **Save On Error** and **Save On Success** parameter settings. For example, a value of 10 indicates that when there is less than 10% available disk left, the Log Collector stops saving files to reserve enough space for your estimated normal collection processing. **Caution:** Available disk refers to a partition where the base collection directory is mounted. If the Log Decoder server has a 10TB disk size and 2TB is allocated to base collection directory, then setting this value to 10 causes log collection to stop when less than 0.2TB (10% of 2TB) of space is left. It does not mean 10% of 10TB. Valid value is a number in the **0** to **100** range. **10** is the default.
Sequential Processing	Sequential processing flag: • Select the check box (default) to process event source files in collection order. • Do not select the checkbox to process event source files in parallel.
Save On Error	Save on error flag. Check the checkbox to retain the **eventsource collection** file when the Log Collector it encounters an error. The check box is selected by default.
Save On Success	Save **eventsource collection** file after processing flag. Check the checkbox to save the eventsource collection file after processing it. The check box is not selected by default.
Eventsource SSH Key	SSH public key used to upload files for this event source. Please refer to the *Generate Key Pair on Event Source and Import Public Key to Log Collector* section in the Install and Update the SFTP Agent Guide for instructions on generating keys. **Note:** If File collection is stopped, NetWitness Platform does not update the authorized_keys file with the SSH public key that you add or modify in this parameter. You must restart File collection to update the public key. You can add or modify the value of the public key in this parameter in multiple File event sources without File collection running, but NetWitness Platform will not update the **authorized_keys** file until File collection is restarted.
Manage Error Files	By default, the Log Collector uses the **File Disk Quota** parameter to ensure that the disk does not fill up with error files. If you set this parameter to **true**, you can specify one of these: • Maximum space allotted to error files in the **Error Files Size** parameter. • Maximum number of error files allowed in **Error Files Count** parameter. A reduction percent is also specified, which tells the system how much to reduce when the maximum is reached. Select the check box to manage error files. The check box is not selected by default.

Name	Description
Error Files Size	Only valid if the **Manage Error Files** and **Save On Error** parameters are set to true. Specifies to what extent NetWitness Platform saves error files. The value that you specify is the maximum total size of all the files in the error directory. Valid value is a number in **0** to **281474976710655** range. You specify these values in either **Kilobytes**, **Megabytes**, or **Gigabytes**. **100 Megabytes** is the default. If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service.
Error Files Count	Only valid if the **Manage Error Files** and **Save On Error** parameters are set to true. Maximum number of error files allowed in the error directory. Valid value is a number in **0** to **65536** range. **65536** is the default. If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service.
Error Files Reduction %	Percent amount by size or count of the error files that the Log Collector service removes when the maximum size or count has been reached. The service removes the oldest files first. Valid value is a number in the **0** to **100** range. **10** is the default.
Manage Saved Files	Select the check box to manage saved files. The check box is not selected by default. By default, the Log Collector uses the **File Disk Quota** parameter to ensure that the disk does not fill up with saved files. If check this check box, you can specify one of these: • Maximum space allotted to saved files in the **Saved Files Size** parameter. • Maximum number of saved files allowed in **Saved Files Count** parameter. A reduction percent is also specified, which tells the system how much to reduce when the maximum is reached.
Saved Files Size	Only valid if the **Manage Saved Files** and **Save On Success** parameters are set to true. Maximum total size of all the files in the save directory. Valid value is a number in the **0** to **281474976710655** range. You specify these values in either **Kilobytes**, **Megabytes**, or **Gigabytes**. **100 Megabytes** is the default. If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service.
Saved Files Count	Only valid if the **Manage Saved Files** and **Save On Success** parameters are set to true. Maximum number of saved files in the save directory. Valid value is a number in **0** to **65536** range. **65536** is the default. If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service.
Saved File Reduction %	Percent amount by size or count of the saved files that the Log Collector service removes when the maximum size or count has been reached. The service removes the oldest files first. Valid value is a number in the **0** to **100** range. **10** is the default.

Name	Description
Debug	**Caution:** Only enable debugging (set this parameter to **On** or **Verbose**) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact. If you change this value, the change takes effect immediately (no restart required).

Log Collection Service System View

A Log Collector is a service that runs on a Log Decoder host (referred to as a Local Collector) or sends events from a Remote Collector to a Local Collector, and is configured and managed in a similar way to a Log Decoder.

To access the Log Collection Service System view, go to ADMIN > Services and select a Log Collector service, then select View > System.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.

ODBC Event Source Configuration Parameters

This topic tells you how to configure ODBC collection protocol which collects events from event sources that store audit data in a database using the Open Database Connectivity (ODBC) software interface.

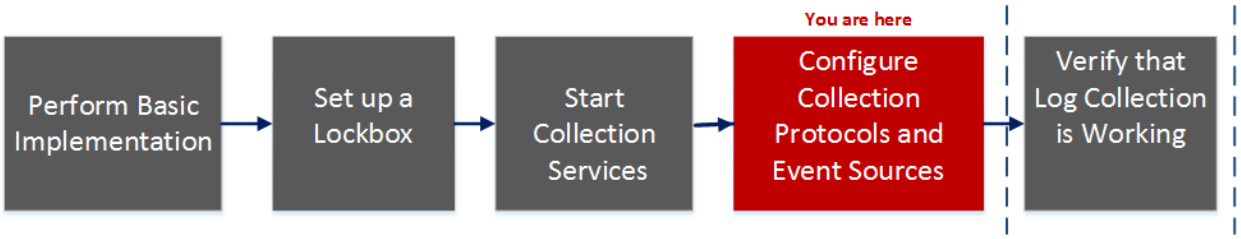
Access ODBC Configuration Parameters

To access the ODBC Event Source Configuration Parameters:

1. Go to **Administration** > **Services** from the NetWitness Platform menu.
2. Select a Log Collection service.
3. Select > **View** > **Config** to display the Log Collection configuration parameter tabs.
   The **Service Config** view is displayed with the Log Collector **General** tab open.
4. Click the **Event Sources** tab, and select **ODBC/Config** from the drop-down menu.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.



What do you want to do?

Role	I Want to...	Documentation
Administrator	Perform basic Log Collection implementation.	Basic Implementation
Administrator	Set up a lockbox to maintain lockbox settings.	Set Up a Lockbox
Administrator	Start Log Collection services.	Start Collection Services
Administrator	*Configure Log Collection protocols and event sources.	Configure Collection Protocols and Event Sources
Administrator	Verify that Log Collection is working.	Verify That Log Collection Is Working

*You can perform this task here.

Data Source Name (DSN) Parameters

Use the Sources panel to review, add, modify, and delete Data Source Name (DSN) parameters.

Sources Panel

An ODBC DSN tells the Log Collector how to reach an ODBC endpoint. You refer to an ODBC DSN when you configure a data source name with information such as which ODBC driver to use or the host name and port of the ODBC endpoint.

An ODBC DSN is a sequence of name-value pairs. For information about the valid names for a given ODBC data source type, such as Sybase, Microsoft SQL Server, or Oracle, please download the *DataDirect Connect Series for ODBC User's Guide and DataDirect Connect Series for ODBC User's Guide* in the Progress DataDirect Document Library.

Toolbar

The following table provides descriptions of the toolbar options.

Option	Description
	Opens the Add DSN dialog in which you add an event source for the event source type you selected in the Event Categories panel.
	Deletes the selected event sources.
	Opens the Edit DSN dialog in which you modify the configuration parameters for the selected event source. When you select multiple event sources, this option opens the Bulk Edit Source dialog in which you can edit the parameters values for the selected file directories.
	Opens the Bulk Add Option dialog in which you can import DSN parameters in bulk from a comma-separated values (CSV) file. The Bulk Add Option dialog has the following two options: • Import CSV File • Paste CSV Content
	Creates a **.csv** file that contains the parameters for the selected DSNs.
	Validates the configuration parameters for the selected ODBC database.

Add or Edit DSN Dialog

In this dialog, you add or modify an event source for the selected event source.

Basic Parameters

Note: Required parameters are marked with an asterisk. All other parameters are optional.

Name	Description
DSN*	The data source name (DSN) that defines the database from which to collect events. Select an existing DSN from the drop-down list. For details, see ODBC DSNs Event Source Configuration Parameters.
Username*	User name that the data source name uses to connect to the database. You must specify a user name when you create the event source.
Password	Password that the data source name uses to connect to the database. **Caution:** The password is encrypted internally and is displayed in its encrypted form.
Enabled	Select the checkbox to enable the event source configuration to start collection. The checkbox is selected by default.
Address*	For ODBC, this field is not used. The Log Collector uses the address in the **ODBC.ini** file.

Advanced Parameters

Name	Description
Max Cell Size	Maximum size in bytes of the data that the Log Collector can pull from one cell in the database. The default value is **2048**.
Nil Value	Character string that the Log Collector displays when NIL is returned for a cell in the database. Default value: "" (null).
Polling Interval	Interval (amount of time in seconds) between each poll. The default value is **180**. For example, if you specify 180, the collector schedules a polling of the event source every 180 seconds. If the previous polling cycle is still underway, the collector waits for that cycle to finish. If you have a large number of event sources that you are polling, it may take longer than 180 seconds for the polling to start because the threads are busy.
Max Events Poll	The maximum number of events per polling cycle (how many events collected per polling cycle).
Debug	**Caution:** Caution: Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. If you change this value, the change takes effect immediately (no restart required). The debug logging is verbose, so limit the number of event sources to minimize performance impact.

Name	Description
Initial Tracking Id	Initial identification code that the Log Collector assigns to this event source if collection is not started. If there is no value for this parameter, the Log Collector starts at the end of the table and only pulls rows after the end of the table as they are added. The default value is "" (null).
Filename	For Microsoft SQL Server Event Sources only, the location of the trace files directory (for example, **C:\MyTraceFiles**). Refer to the RSA Microsoft SQL Server Event Source Configuration Guide, located on RSA Link here: https://community.rsa.com/docs/DOC-40241.
Test Connection	Checks the configuration parameters specified in this dialog to make sure they are correct.
Cancel	Closes the dialog without adding or modifying DSN parameters.
OK	Adds or modifies the parameters for the DSN.

ODBC DSNs Event Source Configuration Parameters

Open Database Connectivity (ODBC) event sources require Data Source Names (DSNs) so you need to define DSNs with their associate value pairs for ODBC event source configuration.

Access ODBC Configuration Parameters

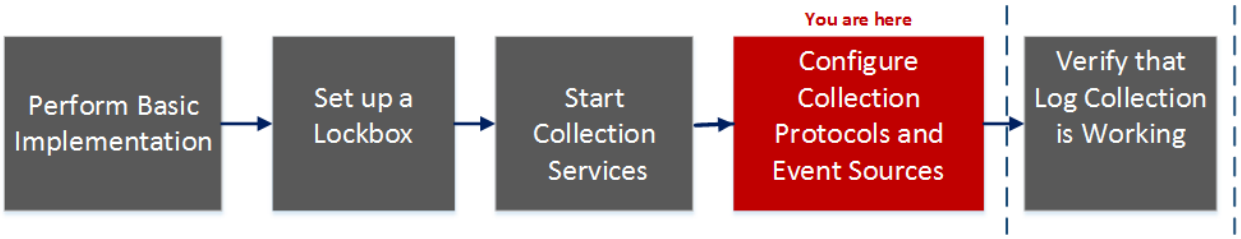
To access the ODBC Event Source Configuration Parameters:

1. Access the Services view by selecting **Admin > Services** from the NetWitness Platform menu.
2. Select a Log Collection service.
3. Under Actions, select **View > Config** to display the Log Collection configuration parameter tabs.

   The **Service Config** view is displayed with the Log Collector **General** tab open.
4. Click the **Event Sources** tab, and select **ODBC/DSNs** from the drop-down menu.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.



What do you want to do?

Role	I Want to...	Documentation
Administrator	Perform basic Log Collection implementation	Basic Implementation
Administrator	Set up a lockbox to maintain lockbox settings.	Set Up a Lockbox
Administrator	Start Log Collection services.	Start Collection Services
Administrator	*Configure Log Collection protocols and event sources.	Configure Collection Protocols and Event Sources
Administrator	Verify that Log Collection is working.	Verify That Log Collection Is Working

*You can perform this task here.

ODBC DSN Configuration Parameters

This topic describes the Data Source Names DSNs configuration parameters.

DSN Panel

In the DSNs panel, you can add, delete, or edit DSNs and the DSN name-value pairs for ODBC Event sources.

Feature	Description
	Displays the Add DSN dialog in which you define a DSN and its parameters.
	Deletes the selected DSNs.
	Displays the Edit DSN dialog in which you edit the name-value pairs for the selected DSN.
	Displays the Manage DSN Templates dialog in which you can add or delete DSN name-value pair templates.
	Selects DSNs.
DSN	Name of the DSN that you added.
Parameters	**<name-value for="" p="" pairs="" the=""> </name-value>**

Add or Edit DSN Dialog

In this dialog, you add or modify a file directory for the selected event source.

Note: Required parameters are marked with an asterisk. All other parameters are optional.

Feature	Description
DSN Template	Select a predefined DSN value name-value pairs template for the DSN.
DSN Name*	Add the name of the DSN. You cannot edit a DSN name after you add it. This value must correspond with a DSN entry in the ODBC.ini file. Valid value is a character string that is restricted to the following characters: `[_a-zA-Z][_a-zA-Z0-9]*` This means that the file directory must start with a letter followed by numbers, letters, and underscores (for example, **oracle_executive_compensation**).

Feature	Description
Parameters	Adds a row in which you can define a parameter name-value pair. Deletes the selected parameter name-value pair. Selects parameter name-value pairs. Name - Enter or modify the parameter name. Value - Enter or modify the value associated with the parameter name.
Cancel	Closes the dialog without adding the DSN and its name-value pairs or saving modifications to the name-value pairs.
Save	Adds the DSN and its name-value pairs or saves modifications to the name-value pairs.

Manage DSN Templates Dialog

In this dialog, you can add or delete DSN name-value pair templates.

Feature	Description
	Template Selection Panel
	Opens the Add Template panel in which you can add a DSN name-value pair template.
	Deletes the selected template.
	Selects a template for deletion or modification.
	Add Template Panel
	Adds a value pair row.
	Deletes a value pair row.
	Selects a value pair row.
Name	Enter the parameter name.
Value	Enter the value associated with the parameter name.
Cancel	Cancels any changes you made in the dialog.
Save	Adds the DSN and its name-value pairs or saves modifications to the name-value pairs.
Close	Closes the dialog without adding the DSN and its name-value pairs or saving modifications to the name-value pairs.

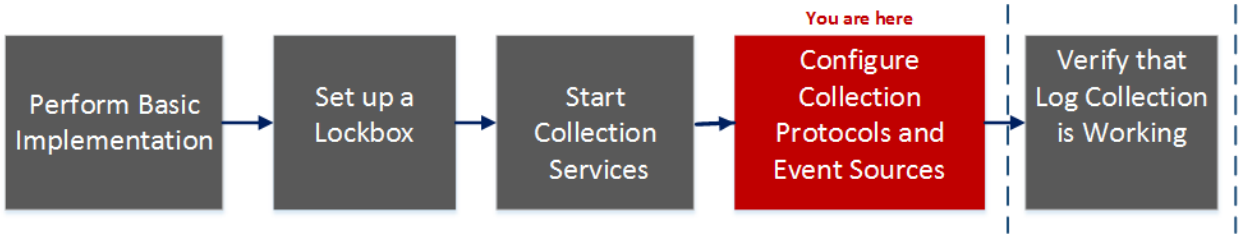
Remote/Local Collectors Configuration Parameters

When you deploy Log Collection, you must configure the Log Collectors to collect the log events from various event sources, and to deliver these events reliably and securely to the Log Decoder host, where the events are parsed and stored for subsequent analysis.

This topic introduces features of the Services Config view > Remote Collectors/Local Collectors tab.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.



What do you want to do?

Role	I Want to...	Documentation
Administrator	Perform basic Log Collection implementation	Basic Implementation
Administrator	Set up a lockbox to maintain lockbox settings.	Set Up a Lockbox
Administrator	Start Log Collection services.	Start Collection Services
Administrator	*Configure Log Collection protocols and event sources.	Configure Collection Protocols and Event Sources
Administrator	Verify that Log Collection is working.	Verify That Log Collection Is Working

*You can perform this task here.

Related Topics

Services Config View

The Services Config view is the view on which you maintain all the Log Collection parameters. The tab in which you maintain the deployment parameters referred to in this guide is the **Remote/Local** Collectors tab:

- If you are configuring a Local Collector , NetWitness Platform displays the **Remote Collectors** tab so that you can configure the Local Collector to pull events from Remote Collectors.

- If you are configuring a Remote Collector , NetWitness Platform displays the **Local Collectors** tab so that you can configure the Remote Collector to push events to a Local Collector .

Remote Collectors Tab

On a Local Collector, the Remote Collectors panel provides a way to add or delete Remote Collectors from which the Local Collector pulls events.

Column	Description
	Displays the **Add Source** dialog in which you select the Remote Collectors from which you want the Local Collector to pull events.
	Deletes the Remote Collector from the Local Collector Remote Collectors panel.
	Displays the **Edit Source** dialog for the selected Remote Collector .
	Selects Remote Collectors.
Name	Names of the Remote Collectors from which the Local Collector currently pulls events.
Address	IP Addresses of the Remote Collectors from which the Local Collector currently pulls events.
Collections	Choose which collection protocols that the Remote Collector pushes to a Local Collector. You can select any combination of protocols. If you do not select a protocol, NetWitness Platform selects all protocols.

Local Collector Tab

On a Remote Collector , the Local Collector panel provides a way to add or delete the Local Collectors to which you want to the Remote Collector to push events.

Select the **Destination** or **Source** in the **Select Configuration** drop-down menu.

- **Destination** displays the **Add Remote Destination** dialog.
- Source displays the **Add Source** dialog.

The following table describes the Add Source dialog.

Column	Description
	Displays the **Add Source** dialog in which you select the Remote Collectors from which you want the Local Collector to pull events.
	Deletes the Remote Collector from theLocal Collector Remote Collectors panel.
	Displays the **Edit Source** dialog for the selected Remote Collector .

Column	Description
	Selects Remote Collectors.
Name	Names of the Remote Collectors from which the Local Collector currently pulls events.
Address	IP Addresses of the Remote Collectors from which the Local Collector currently pulls events.

The following table describes the Local Collectors Panel.

Column	Description
	Displays the **Add Remote Destination** dialog for the Group that you selected. You add destination Local Collectors for this group to which you want the Remote Collector to push events.
	Deletes the destination Log Collector from the group.
	Displays the **Edit Remote Destination** dialog for the selected destination Local Collector .
	Selects a destination Local Collector .
Destination Name	Displays the name of the destination Local Collector .
Address	Displays the IP address of the destination Local Collector .
Collections	Choose which collection protocols that the Local Collector pulls from a Remote Collector. You can select any combination of protocols. If you do not select a protocol, NetWitness Platform selects all protocols.

Log Collection Tabs

This topic describes the tabs available in the Log Collection view.

Access Log Collection View

To access the log collection view:

1. Go to **ADMIN > Services** from the NetWitness Platform menu.
2. Select a Log Collection service.
3. Under Actions, select **View > Config** to display the Log Collection configuration parameter tabs.

   The **Service Config** view is displayed with the Log Collector **General** tab open.
4. Select any of the available tabs to view or update the corresponding parameters.

Available Tabs

Use the Admin > Services view to maintain Log Collection parameters. It has the following tabs:

- **General**: contains high-level parameters that govern the operation of the Log Collector service and each collection protocol. See Log Collection General Tab for details.
- **Remote Collectors**: use this tab to set up remote collectors. See Configure Local and Remote Collectors for details.
- **Files**: provides an interface for editing Log Collector configuration files.
- **Event Sources**: use this tab to configure collection for your event sources. See Log Collection Event Sources Tab for details.
- **Event Destinations**: Use the Event Destinations tab of the Log Collection service Config view to configure the destination of event data collected by the Log Collector. See Log Collection Event Destinations Tab for details.
- **Settings**: contains parameters for Lockbox security setup, and certificate management.
- **Appliance Service Configuration**: contains configuration parameters for the RSA NetWitness Platform Core Appliance service.

Please refer to the **Files** tab and the **Appliance Service Configuration** tab in the *Host and Services Configuration Guide* for information on the configuration parameters on these tabs.

Log Collection General Tab

This topic introduces features of the service Config view > General tab that relate specifically to Log Collector .

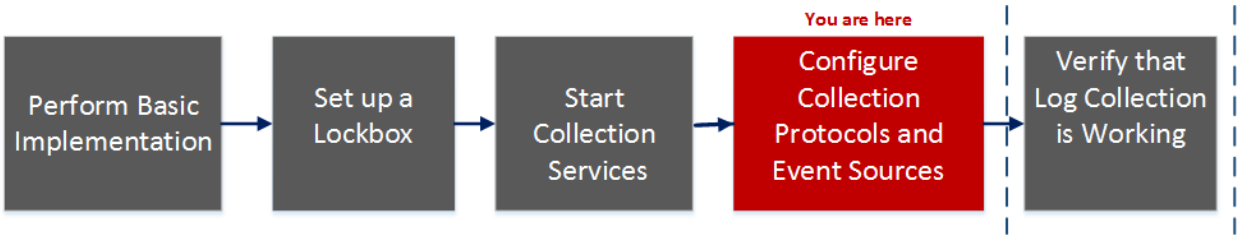
To access the Log Collection General tab:

1. Go to **ADMIN > Services** from the NetWitness Platform menu.
2. Select a Log Collection service.
3. Click > **View > Config**.

   The **Service Config** view is displayed with the Log Collector **General** tab open.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.



What do you want to do?

Role	I want to...	Documentation
Administrator	Perform basic Log Collection implementation.	Basic Implementation
Administrator	Set up a lockbox to maintain lockbox settings.	Set Up a Lockbox
Administrator	Start Log Collection services.	Start Collection Services
Administrator	Configure Log Collection protocols and event sources.	Configure Collection Protocols and Event Sources
Administrator	*Verify that Log Collection is working.	Verify That Log Collection Is Working

*You can perform this task here.

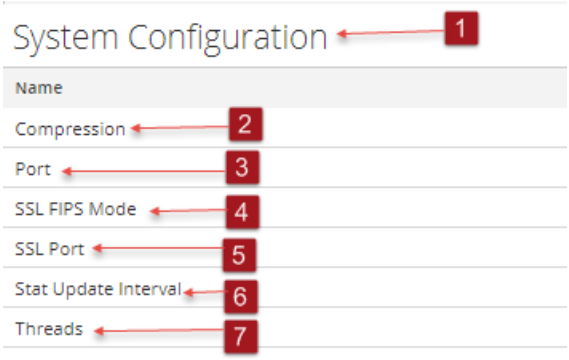
- Configure VMware Event Sources in NetWitness Platform
- Configure Windows Event Sources in NetWitness Platform
- Windows Legacy and NetApp Collection Configuration

Quick Look

The RSA NetWitness Platform administrator must configure event sources to send logs to the collectors. When event sources are configured they poll event sources, retrieve logs, and send the event data to NetWitness Platform).

System Configuration Panel

The System Configuration panel manages service configuration for a NetWitness Platform service. When a service is first added, default values are in effect. You can edit these values to tune performance. Refer to the **General** tab for a description of these parameters.

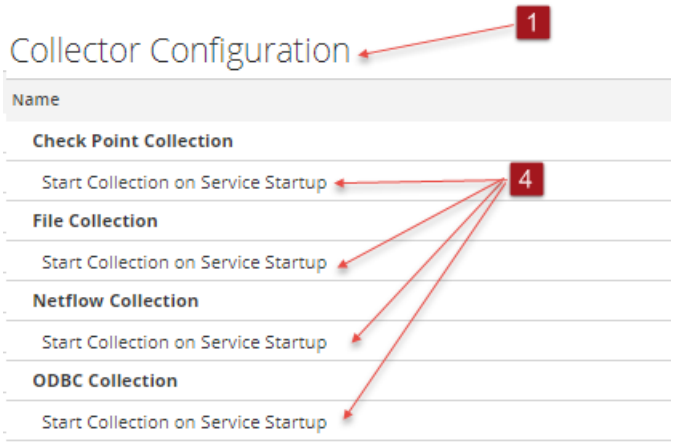


1	System Configuration Panel manages service configuration for a NetWitness Platform service.
2	Compression: The minimum number of bytes that must be transmitted per response before compression. A setting of 0 disables compression. The default value is **0**. A change in value is effective immediately for all subsequent connections.
3	Port: The port on which the service listens. The ports are: • 50001 for Log Collectors • 50002 for Log Decoders • 50003 for Brokers • 50004 for Decoders • 50005 for Concentrators • 50007 for other services
4	SSL FIPS Mode: When enabled (**on**), the security of data transmission is managed by encrypting

	information and providing authentication with SSL certificates. The default value is **off**.
5	SSL Port: The NetWitness Platform Core SSL port on which the service listens. The ports are: • 56001 for Log Collectors • 56002 for Log Decoders • 56003 for Brokers • 56004 for Decoders • 56005 for Concentrators • 56007 for other services
6	Stat Update Interval: The number of milliseconds between statistic updates on the system. Lower numbers cause more frequent updates and can slow down other processes. The default value is **1000**. A change in value is effective immediately.
7	Threads: The number of threads in the thread pool to handle incoming requests. A setting of 0 lets the system decide. The default value is 15. A change takes effect on service restart.

Collector Configuration Panel

The Collector Configuration panel provides a way to enable automatic start of log collection by event source type.



1	Collector Configuration Panel provides a way to enable automatic start of log collection by event source type.
2	Enable All enables the automatic collection for all event types. **Enable All** = start receiving events and collecting logs for all event types when the Log Collector service starts.
3	Disable all disables the automatic collection for all event types. **Disable All** = (default) do not receive event data for all event types until you explicitly start collection.
4	Start Collection on Service Startup enables automatic start, per event source type, of log collection when the Log Collector service starts. Valid values are:

- Selected = start collecting logs when the Log Collector service starts.
- Not selected = (default) do not collect event data until you explicitly start collection.

5 **Apply**: Click **Apply** to save the changes to the parameter values.

Log Collection Event Destinations Tab

Use the Event Destinations tab of the Log Collection service Config view to configure the destination of event data collected by the Log Collector :

- Log Decoders
- Identity Feed

Prerequisites

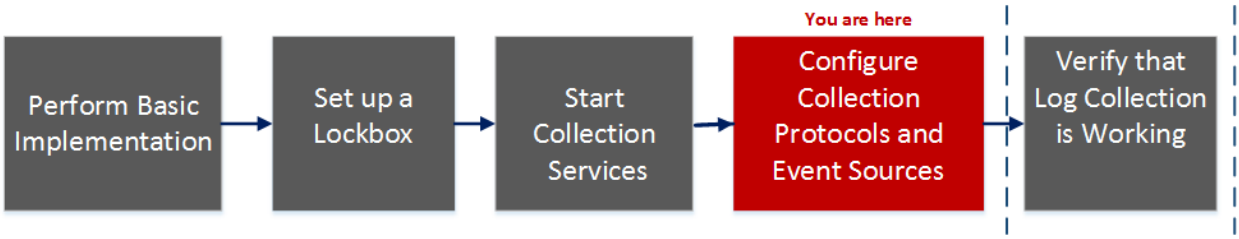
You must implement the following configuration to create an identity feed.

- A Log Collector service with an Identity Feed Event Processor
- A Log Collector service with Windows Collection configured and enabled

Note: See the "Create an Identity Feed" topic in the *Live Resource Management Guide* for more information on how to create and investigate on an identity feed.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.



What do you want to do?

Role	I want to...	Documentation

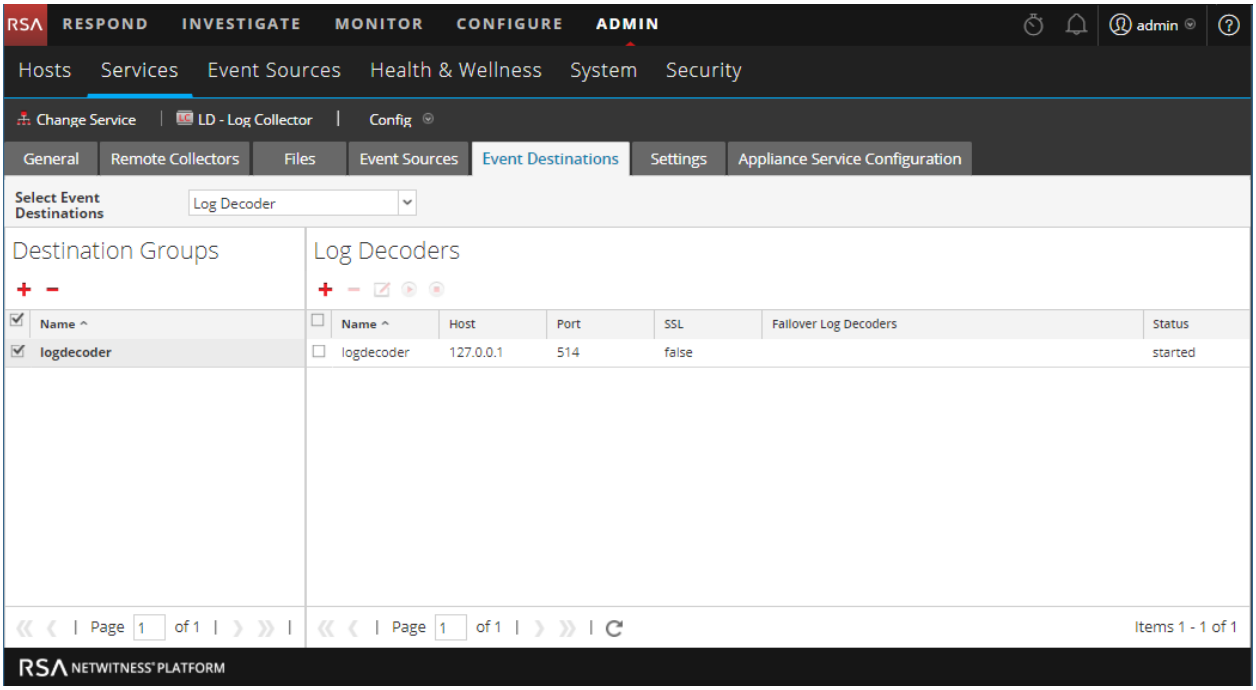
Quick Look

The Event Destinations tab of the Log Collection service Config view allows you to configure the destination of event data collected by the Log Collector.



The required permission to access this view is Manage Services.

To access the Event Destinations tab:

1. Go to **ADMIN > Services** .
2. Select a Log Collection service.
3. Select **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Destinations** tab.
5. In the **Select Event Destinations** drop-down menu:
   - Select **Log Decoder** to configure Log Decoder destinations for event data collected by the Log Collector.

     Note: You must select a Log Decoder service from the Add Log Decoder Destination dialog, but the remainder of the configuration is done automatically.

   - Select **Identity Feed** to configure an identity feed destination for event data collected by the Log Collector.

Related Topics

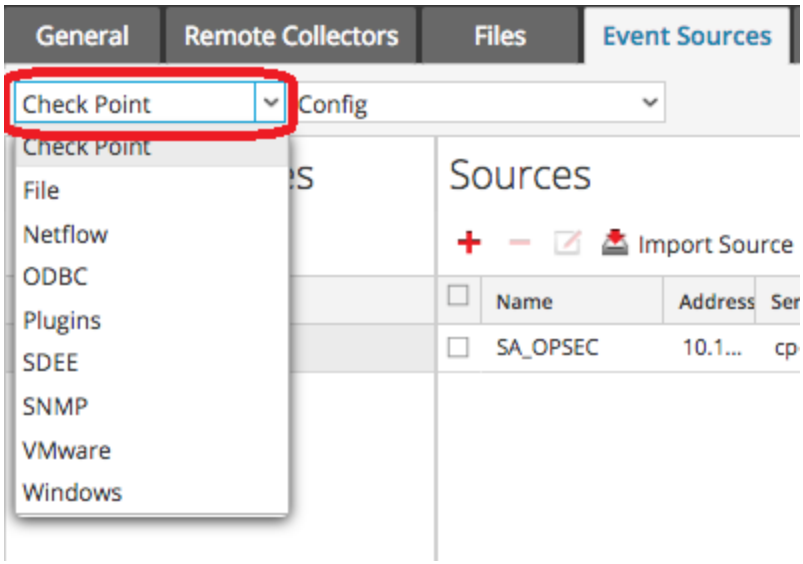
- Configure AWS (CloudTrail) Event Sources in NetWitness Platform
- Configure Check Point Event Sources in NetWitness Platform
- Configure File Event Sources in NetWitness Platform
- Configure ODBC Event Sources in NetWitness Platform
- Configure SDEE Event Sources in NetWitness Platform
- Configure SNMP Event Sources in NetWitness Platform
- Configure Syslog Event Sources

- Configure VMware Event Sources in NetWitness Platform
- Configure Windows Event Sources in NetWitness Platform
- Windows Legacy and NetApp Collection Configuration

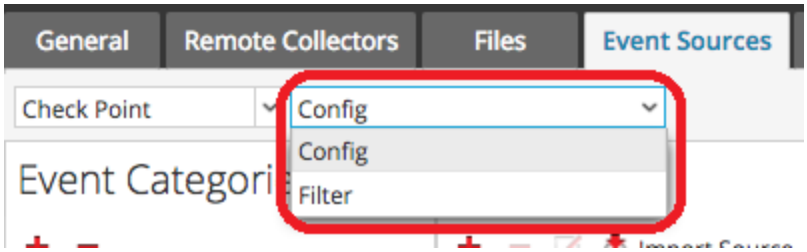
Quick Look

The Config view has two drop-down menus:

- The left-most menu lists all of the available collection protocols.



- The right-most menu has two choices: **Config** and **Filter**.



The Config view in the Event sources tab has two panels: Event Categories and Sources.

Note: For details on the Filter menu item, see Configure Event Filters for a Collector.

Event Source Types Menu

The Log Collector Event Sources tab has a two-box, drop-down menu in which you select the collection protocol and any supporting parameters for that protocol.

In the left box, you select one of the following protocols: Check Point, File, ODBC, Plugins, SDEE, SNMP, SNMP, VMware, Windows, and Windows Legacy.

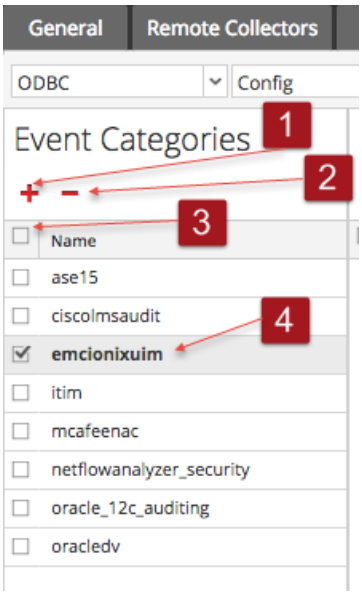
In the right box, you select:

- Config to configure the generic event source parameters for the type you selected in the left drop-down. All generic Config panels have a toolbar with these options:
  - Add, Edit, and Delete
  - Import (also Import Source, Import DSN)
  - Export (also Export Source, Export DSN)
- For ODBC, SNMP, and Windows only:
  - For ODBC, DSNs to configure
  - For SNMP, SNMP v3 User Manager
  - For Windows, Kerberos Realm Configuration

Selecting an option displays a configuration panel where you configure the collection parameters for the event source. The configuration panels are slightly different for different event sources and are described separately.

Event Categories Panel

Once you select a collection protocol, the Event Categories panel is populated with all of the event sources that you have configured for that collection protocol. For example, the following image shows ODBC event sources that have been configured:



The Event Categories panel provides a way to add or delete event source types.

1	Displays the Available Event Source Types dialog from which you select the event source type for which you want to define parameters.
2	Deletes the selected event source types from the Event Categories panel.
3	Selects event source types.
4	Displays the name of the event source types that you have added.

Sources Panel

The Sources panel lists the values of the parameters for the selected event source type. For details, see the individual collection protocol topics.

Log Collection Settings Tab

Use the Settings tab to:

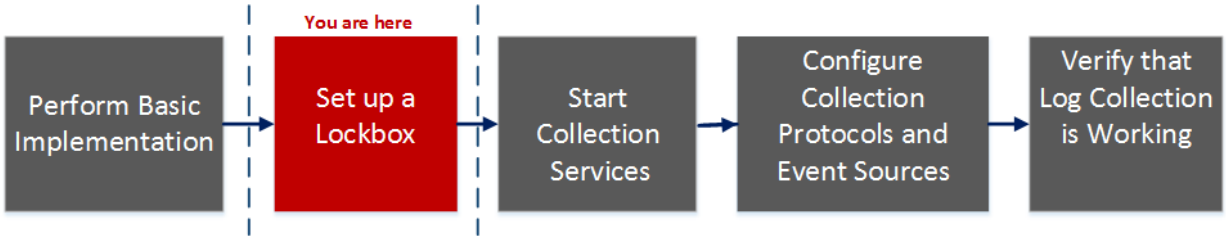
- Set up a lockbox
- Reset Stable System value
- Manage certificates

Caution: If the host name on which the Log Collector is installed is changed after installation, the Log Collector will fail to collect events from event sources. You must reset stable system values if the hostname changes.

To access the Log Collection Settings Tab, go to ADMIN > Services. In the Services grid, select a Log Collector Service. Click Actions menu cropped under Actions and select View > Config.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.



What do you want to do?

Role	I want to...	Documentation
Administrator	Perform basic Log Collection implementation.	Basic Implementation
Administrator	*Set up a lockbox to maintain lockbox settings.	Set Up a Lockbox
Administrator	Start Log Collection services.	Start Collection Services
Administrator	Configure Log Collection protocols and event sources.	Configure Collection Protocols and Event Sources

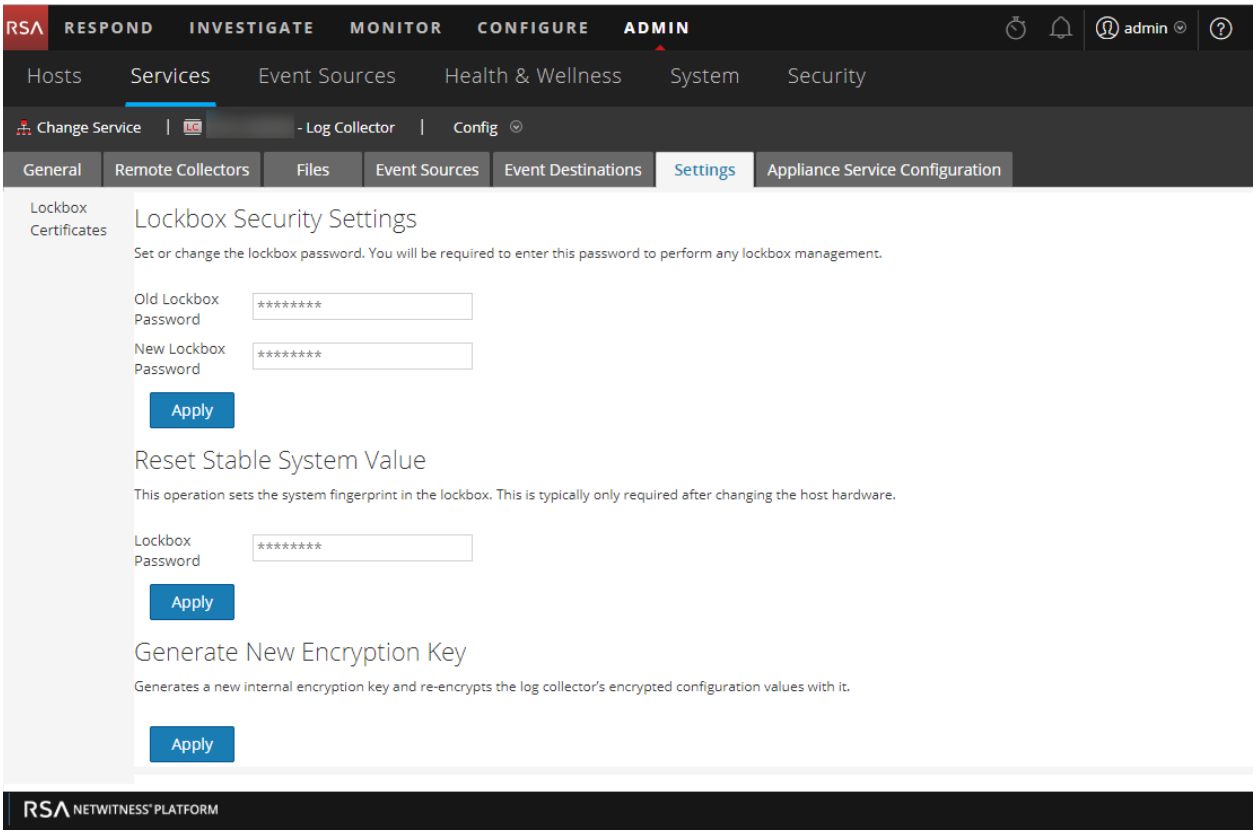
Quick Look

This is an example of the Settings tab.



Troubleshoot Log Collection

This topic describes the format and content of Log Collection Troubleshooting. NetWitness Platform informs you of Log Collector problems or potential problems in the following two ways.

- Log files.
- Health and Wellness Monitoring views.

Junk Syslog Messages

The remote log collector has been made looser in regards to how it handles syslog messages. This was done to reduce the number of dropped messages due to missing parts of the header, or for other minor formatting errors. However, this might also allow syslog event messages that contain junk to get through the parser. If you see such messages in the system, you can add a syslog collection filter to remove events that are sending these messages.

Log Files

If you have an issue with a particular event source collection protocol, you can review debug logs to investigate this issue. Each event source has a Debug parameter that you can enable (set parameter to On or Verbose) to capture these logs.

Caution: Only enable debugging if you have a problem with this event source and you need to investigate this problem. If you have Debug enabled all the time it will adversely affect the performance of the Log Collector.

Health and Wellness Monitoring

Health and Wellness monitoring makes you aware of potential hardware and software problems in a timely manner so that you can avoid to outages. RSA recommends that you monitor the Log Collector statistical fields to make sure that the service is operating efficiently and is not at or near the maximum values you have configured. You can monitor the following statistics (Stats) described in the **Admin > Health & Wellness** view.

Sample Troubleshooting Format

RSA NetWitness Platform returns the following types of error messages in the log files for.

Log Messages	`timestamp failure (LogCollection) Message-Broker Statistics:...`
	`timestamp failure (AMQPClientBaseLogCollection):...`
	`timestamp failure (MessageBrokerLogReceiver):...`

Possible Cause	The Log Collector cannot reach the Message Broker because the Message Broker: • has stopped running

Solutions

- has erroneous connection settings

1. <use the="the" systemctl="systemctl" command="command" on="on" console="console" to="to" check="check" status="status" of="of" message="message" broker="broker" shell="shell" console.="console.">returns the following if the message broker is not running:</use>

```
prompt$ systemctl status rabbitmq-server
rabbitmq start/running, process 10916
```

2. Start the RabbitMQ Message Broker on event-broker node in the Explore view:

Log Parser Rules Tab

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

Introduction

This tab contains details about the rules for the default log parser, as well as any other custom rules and log parsers that have been defined.

The *default log parser* parses logs that do not match any installed log parsers. The information contained in such a log is processed against the default log parser's rules, and metadata is then extracted by those rules and is available for Enrichment, Investigation, Reporting, and Alerting. This provides immediate visibility into logs from custom or unsupported sources.

You can also add or extend a log parser. For example, you may need to parse certain fields differently than in the manner provided by the log parser for a particular event source. You can add rules that change the way meta information is extracted from the logs for the event source.

Finally, you can view and test sample log messages and rules for your log parsers, including the default log parser.

The Log Parser Rules tab displays information about log parsers that use dynamic log parser rules. This includes the following:

- The default log parser that parses logs that are not associated with a particular log parser
- Native XML-defined device parsers that have been extended with dynamic log parser rules, and
- User-created custom device parsers used to parse unsupported custom event sources

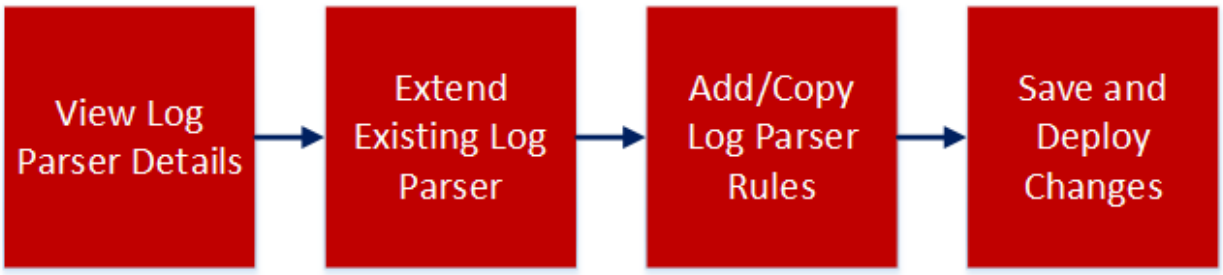
This tab contains the following information:

- You can view the rules for a particular event source type, including the default parser.
- You can view the Names, Literals, patterns, and meta for each configured log parser.
- You can add log parsers
- You can add, edit, and delete custom rules for log parsers

To access this tab, go to **CONFIGURE > Log Parser Rules**.

Workflow

This workflow shows processes available from the Log Parser Rules view.



What do you want to do?

Role	I want to...	Documentation
Administrator	*View log parser rules.	Default Log Parser and Log Parser Rules
Administrator	*Add, edit or delete a log parser rule (version 11.2 and later)	Add or Delete a Log Parser Rule
Administrator	*Add or remove a log parser (version 11.2 and later)	Add or Delete a Log Parser

*You can perform this task here.

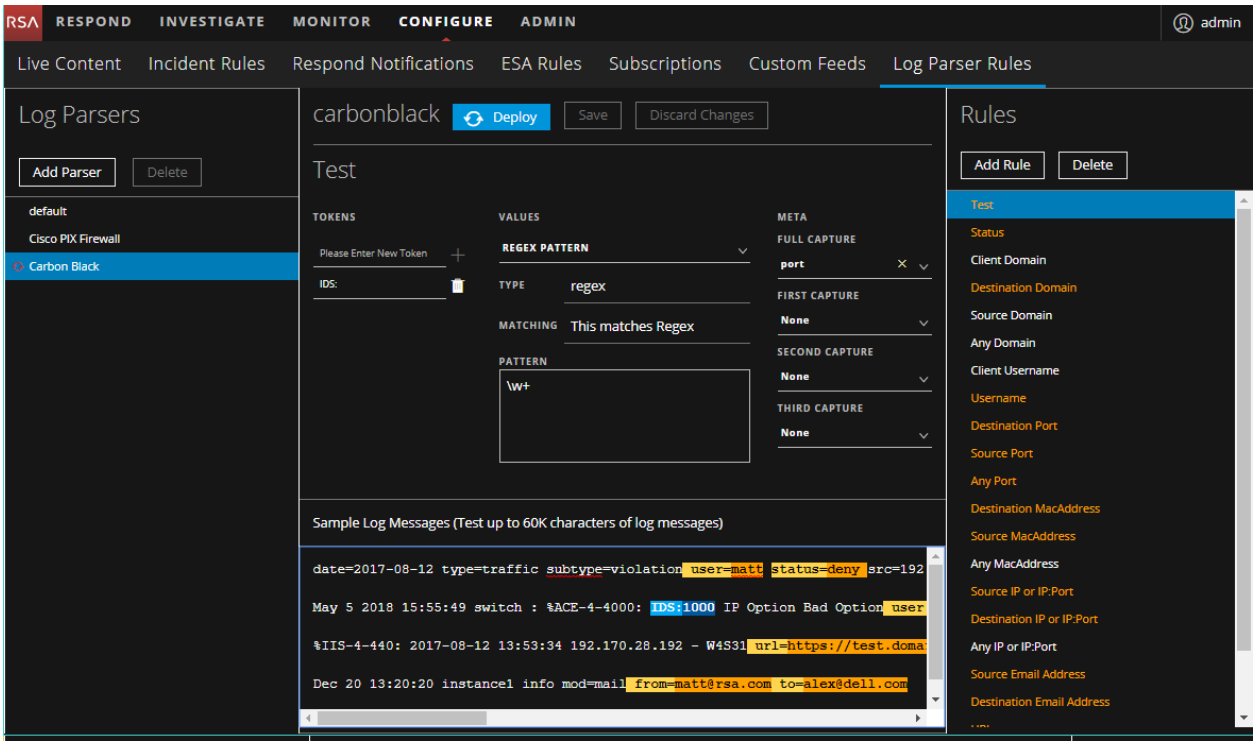
Related Topics

Default Log Parser and Log Parser Rules

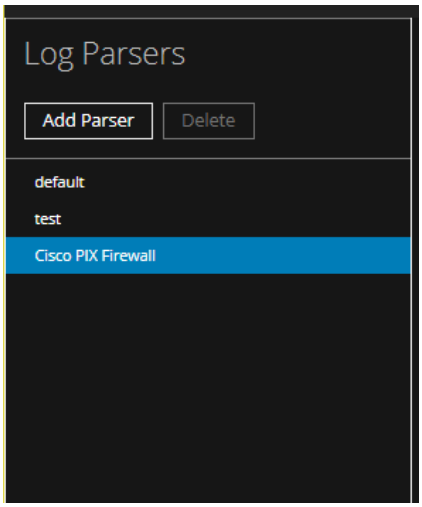
Quick Look

Note: The list of log parsers is based on the first Log Decoder that is installed or registered by the Orchestration Server. If you have more than one Log Decoder, this tab only lists log parsers that have been configured on the first one.

The Log Parser Rules tab organizes and displays information about the configured log parsers in your system. This tab consists of three panels: Log Parsers list, Details for the selected log parser, and Rules for the selected log parser.



Log Parsers Panel

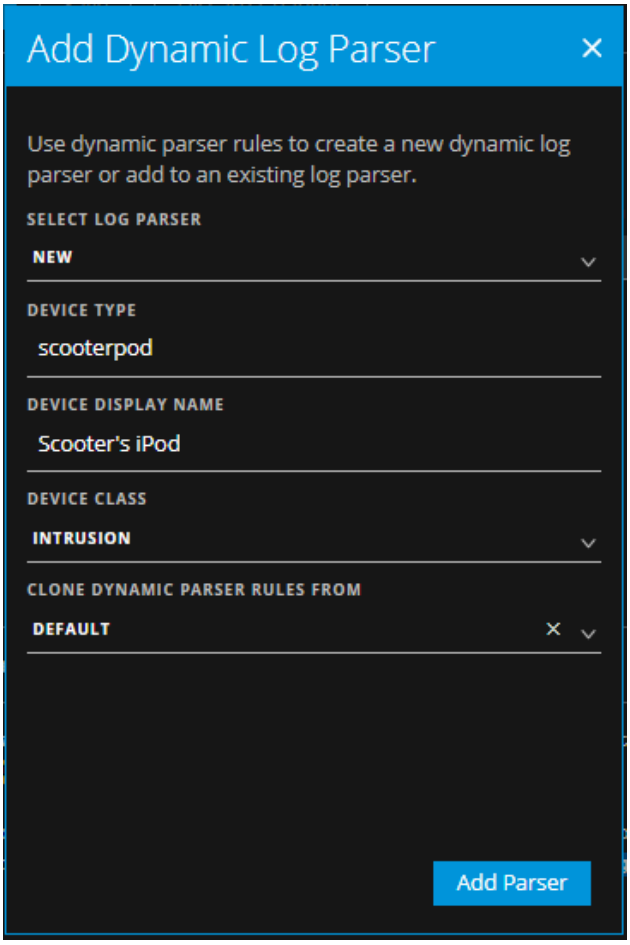


The Log Parsers Panel lists the configured log parsers.

- Until you add rules to existing XML parsers on your reference Log Decoder, (or add a new, custom log parser) only the **default** parser is listed here.
- Select a specific log parser to view its details in the Details and Rules panels.
- Click **Add Parser** to open the Add Dynamic Log Parser dialog box.
- Click **Delete** to delete a log parser.

IMPORTANT: Once you deploy a log parser, you can no longer delete it through this interface. The **Delete** button is not available for deployed parsers. To manually delete a log parser, see Delete a Log Parser Manually.

The Add Dynamic Log Parser dialog box allows you to add a custom log parser.



When you are adding a log parser, the following parameters are available.

Field	Details
SELECT LOG PARSER	Select NEW, or choose an existing log parser. By choosing an existing log parser, you can add rules to that parser, essentially extending its parsing capabilities. **Note:** If you select an existing log parser, the remaining fields are auto-filled based on the values for selected log parser.
DEVICE TYPE	Enter a string to define the device type. The name must be between 3 and 30 alphanumeric characters (including underscores), and must not match the name of any existing log parsers.
DEVICE DISPLAY NAME	Enter the display name for the log parser. **Note:** The display name must be 64 characters or fewer, and must not match the name of any other device display name.
DEVICE CLASS	Select a device class.
CLONE DYNAMIC PARSER RULES FROM	Leave blank to start with no rules, or select one of the existing log parsers to clone its rules.

Details Panel

The details panel shows the three pieces for the selected rule:

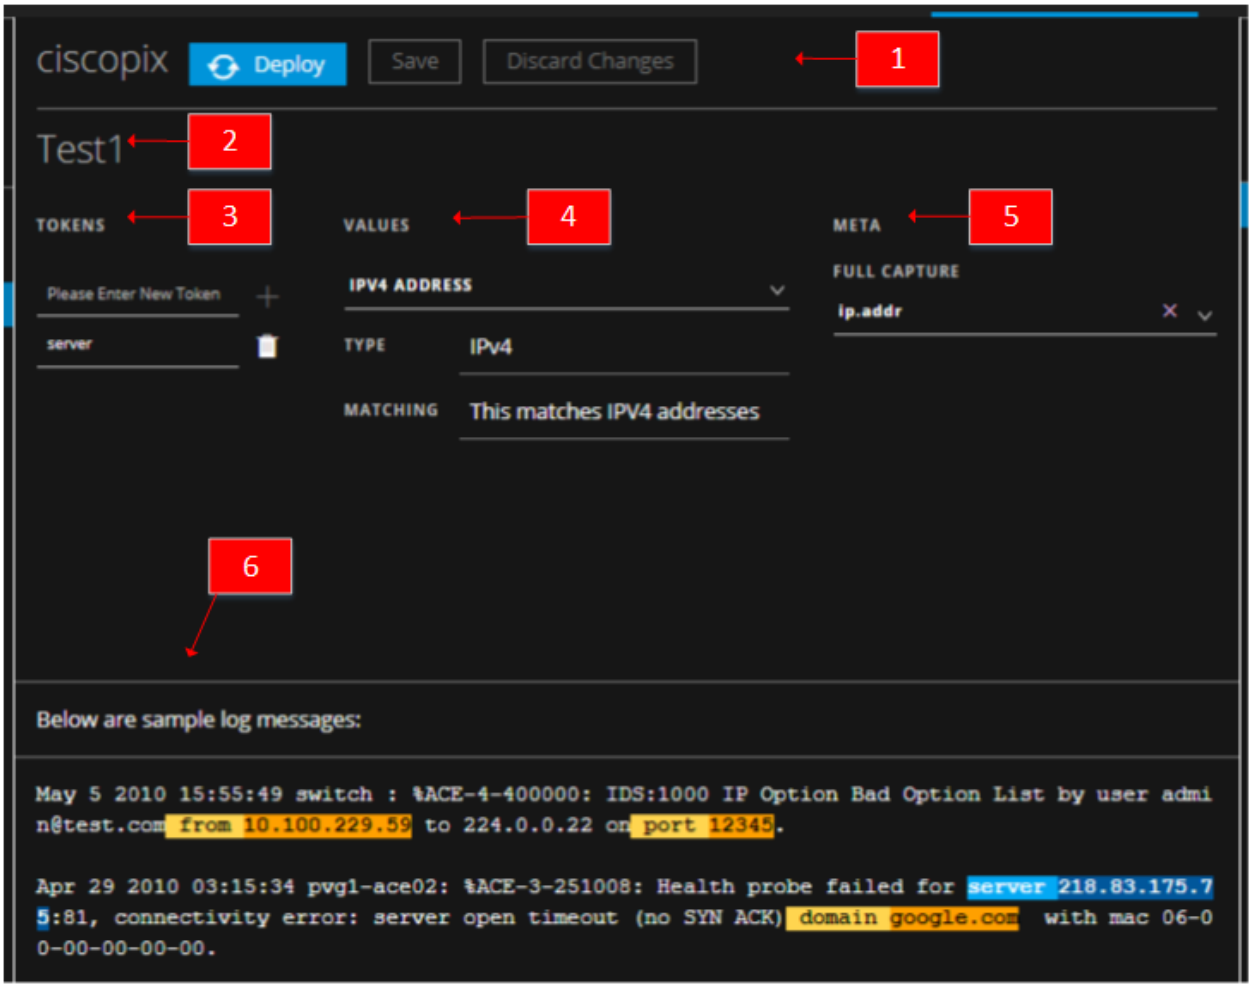
- **Tokens:** one or more tokens to match in the message. For example, the Any Port rule looks for the following strings to match against: **port** , **port:**, **port=**, and others.
- **Values:** the value that follows the token. This is a string that is captured as meta. For example, assume a log contains the following string:

  ```
  port 12345
  ```

  The Any Port rule has a token that matches "port ". When it encounters that string, it assigns the token value, "12345" to a meta key.
- **Meta:** the meta keys to which the value is mapped. For example, the Any Port rule maps the port value to the **port** meta key.

Essentially, a rule says, "when you are parsing a message, if you match one of my tokens, assign the value that follows the token to the meta key that I want it stored as."

The bottom section of the Details panel contains sample log messages, and how they would be parsed for the selected log parser.



1	Displays the name of the selected log parser, and the buttons for deploying, saving, and discarding changes. This value changes when you select a different parser.
2	Displays the name of the selected rule. This value changes when you select a different rule for this parser.
3	Displays the list of tokens defined for the selected rule.
4	Displays the type and pattern of the value matching for the selected parser. The values here are determined by the type of the selected value. You can also use the Regex option to define a custom regular expression.
5	Displays the NetWitness meta to which the selected rule maps any matched tokens. The values here are determined by the selected Rule.
6	Displays a sample log message, and highlights strings that match tokens in the selected log parser. You can edit this field, and add in your own logs to preview how the selected parser will parse your logs. **Note:** The sample section refreshes whenever a rule is changed or updated, as well as when you paste in samples from your logs.

For example, consider the following scenario:

- The **default** parser is selected.
- The **Any Domain** rule is selected.
- The Tokens matching list displays all of the tokens that are matched when found in a log message: **Domain**, **Domain Name**, **domain**, **ADMIN_DOMAIN**, and so on.
- The Meta list displays the NetWitness meta to which the value for the token is mapped: **domain**.

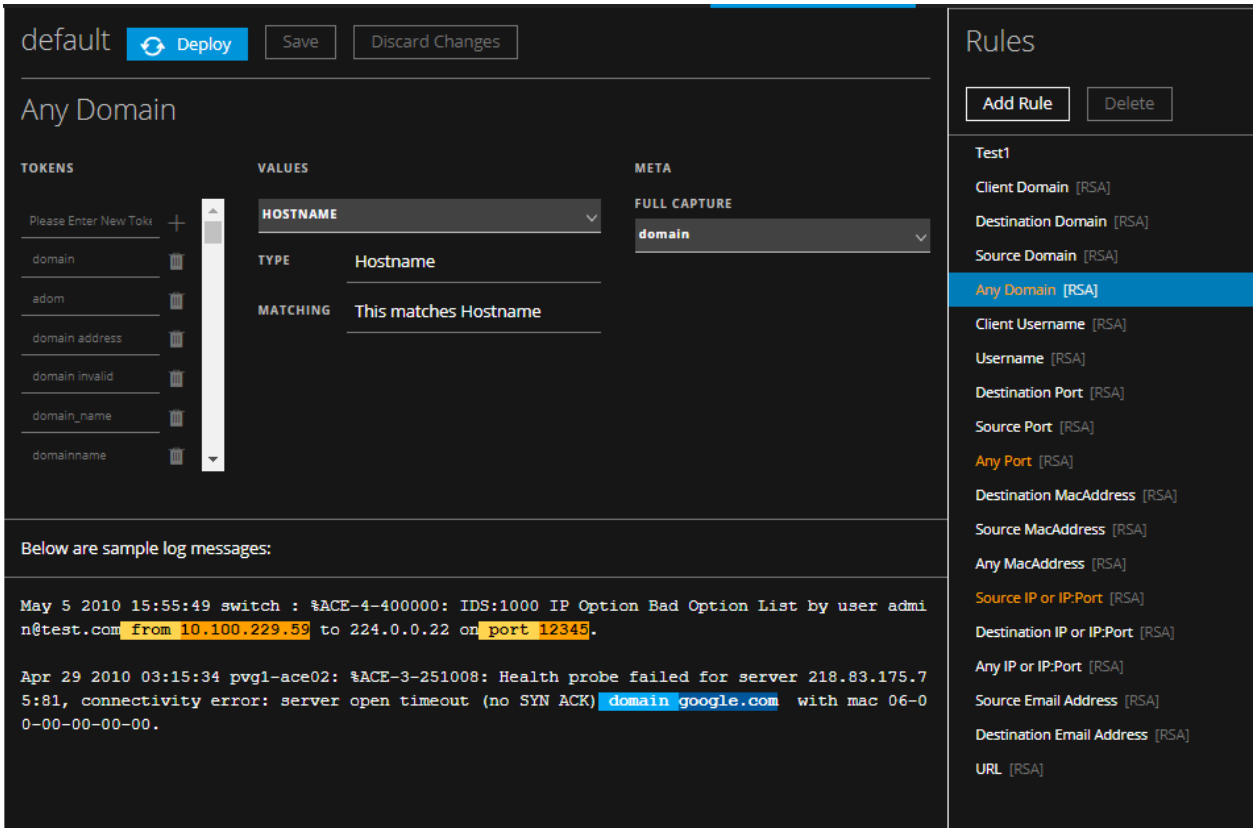
So, let's say the sample log message area has the following text:

```
Below are sample log messages:

May 5 2010 15:55:49 switch : %ACE-4-400000: IDS:1000 IP Option Bad Option
List by user admin@test.com from 10.100.229.59 to 224.0.0.22 on port 12345.

Apr 29 2010 03:15:34 pvg1-ace02: %ACE-3-251008: Health probe failed for
server 218.83.175.75:81, connectivity error: server open timeout (no SYN ACK)
domain google.com with mac 06-00-00-00-00-00.
```

In this case, the Sample Log Message area looks like this:



Note that some strings are highlighted, and that there are two "pairs" of highlight colors:

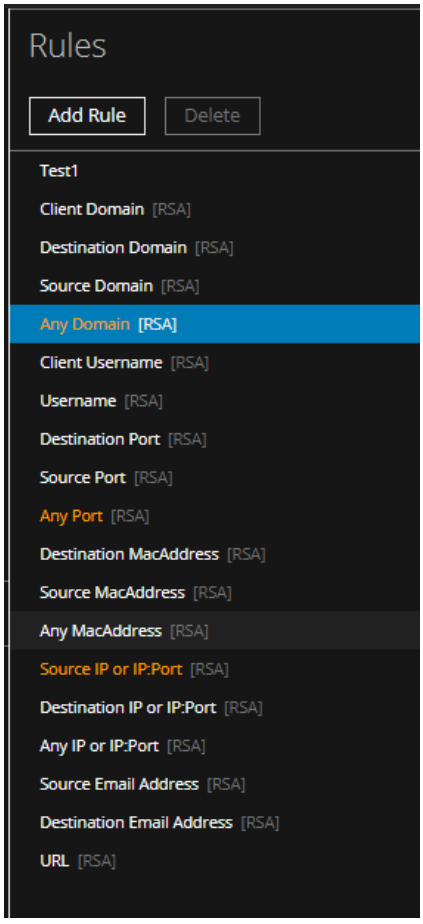
- Dark blue and light blue highlighting is applied to the strings that match the currently selected rule.
  - Dark Blue highlighted strings match a token in the selected rule. In this case, **domain** is the token that is matched for the **Any Domain** rule.

  - Light Blue highlighted strings are the values that correspond to the tokens in dark blue. For example, **google.com** is highlighted in light blue, because it corresponds to the **domain** token.
- Orange and yellow highlighting is applied to the strings that match rules for the current parser that are *not* currently selected.
  - Orange highlighted strings match a token in a rule that is not currently selected.
  - Yellow highlighted strings are the values that correspond to the tokens in orange. For example, the **user** token matches the **Username** rule (which is not currently selected).

In this example, the **domain** meta would be assigned a value of **google.com** for this log message, if it was parsed using the default log parser.

Rules Panel

The Rules panel displays the list of rules used by the selected log parser. When you select a rule, you change the values that are displayed in both the **Tokens** and **Values** areas of the panel.



Note the highlighted rules:

- The currently selected rule is highlighted in blue.
- Other rules that match tokens in the sample log message area are highlighted in orange.

Other notes for the Rules panel:

- RSA rules (the rules provided out-of-the-box for each log parser) are identified by **[RSA]** following the rule name.

  You can copy these rules when adding a new log parser, and then change them as needed.
- The **Delete** button is only available for custom rules; for RSA rules, it is greyed out.
- Use the **Add Rule** button to add a custom rule.

Disable log Parser Rules

You can disable log parser rules, so that none of them are processed by the Log Decoder. You might have your log parsers working as you like, and do not want any extra processing that you do not need.

You disable them from the reference Log Decoder.

1. Go to**ADMIN > Services**.
2. In the **Administration Services view**, select the Decoder and **> View > Config.**

   The Services Config view is displayed with the General tab open.
3. Under **Parsers Configuration**, look at the Config Value for **PARSERULESCAN**.

   If it is **Enabled**, log parser rules are processed. If it is **Disabled**, they are not processed.
4. If the rules are Enabled, click Enabled and select Disabled to disable the log parser rules.

   To save the changes, click **Apply**.

Add or Delete a Log Parser

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.2 and later.

For version 11.2, RSA has added the ability to add log parsers through the UI. You can also delete log parsers, as long as they have never been deployed to a Decoder. You can create a new log parser definition from scratch, or extend an existing one.

You can add a log parser to extend the functionality for an existing parser. For example, if you have some unknown messages for the Cisco Pix parser, you could add rules to match your unknowns.

IMPORTANT: If you are adding a new log parser, for example when onboarding an event source, you must map the event source IP to the new log parser in order for messages to be parsed. For details, see "Acknowledging and Mapping Event Sources" in the *Event Source Management User Guide*.

Add a Log Parser

1. In the NetWitness Platform UI, navigate to **CONFIGURE > Log Parser Rules**.
2. From the **Log Parsers** pane, click **Add Parser**.

   The Add Dynamic Log Parser dialog box is displayed.
3. Fill in details for this dialog box. For details, see Add Dynamic Log Parser Parameters below.
4. Click **Save** to save the new log parser.

   This updates the definition file in the file system. It *does not* deploy the changes.
5. To deploy your changes to all of your Decoders, click **Deploy**.

Delete a Log Parser using the UI

You can use the UI to delete a log parser that has never been deployed.

To delete a log parser:

Note: You cannot delete a log parser through the UI, if it has ever been deployed to a Decoder.

1. In the NetWitness Platform UI, navigate to **CONFIGURE > Log Parser Rules**.
2. From the **Log Parsers** pane, select a log parser.

   Delete Parser dialog box is displayed.
3. Click **Delete** to remove the log parser from the system.

Delete a Log Parser Manually

To manually delete a log parser that has been deployed at any time, you can use NwConsole.

To delete a log parser that has been deployed:

1. Access the RSA NetWitness Console, using the **NwConsole** command. For details, see "Access NwConsole and Help" in the *NwConsole User Guide*.
2. Run the following command:

   ```
   [localhost:50002] /decoder/parsers> send . delete file=filename.xml
   type=device
   ```

   where ***filename*** is the name of the XML file for the log parser. For example, to delete the log parser for Oracle Access Manager, run the following command:

   ```
   [localhost:50002] /decoder/parsers> send . delete file=oracleam.xml
   type=device
   ```

Notes about the log parser filename:

- Log parser files are located on the Log Decoder in the following path:

  `/etc/netwitness/ng/envision/etc/devices`

- Each log parser has its own sub-folder. For example, the Cisco ASA parser files are in the following folder:

  `/etc/netwitness/ng/envision/etc/devices/ciscoasa`

- Some log parser file names begin with **v20_**, while others do not—the only way to tell is by examining the `devices` folders. For Cisco ASA, the log parser file name is **v20_ciscoasamsg.xml**. However, in the previous command, when you specify the filename, do ***not*** use the **v20_** prefix.

Add Dynamic Log Parser Parameters

When you are adding a log parser, the following parameters are available.

Field	Details
SELECT LOG PARSER	Select NEW, or choose an existing log parser. By choosing an existing log parser, you can add rules to that parser, essentially extending its parsing capabilities. **Note:** If you select an existing log parser, the remaining fields are auto-filled based on the values for selected log parser.
DEVICE TYPE	Enter a string to define the device type. The name must be between 3 and 30 alphanumeric characters (including underscores), and must not match the name of any existing log parsers.
DEVICE DISPLAY NAME	Enter the display name for the log parser. **Note:** The display name must be 64 characters or fewer, and must not match the name of any other device display name.
DEVICE CLASS	Select a device class.
CLONE DYNAMIC PARSER RULES FROM	Leave blank to start with no rules, or select one of the existing log parsers to clone its rules.

Add or Delete a Log Parser Rule

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.2 and later.

For version 11.2, RSA has added the ability to create custom rules for log parsers. You can create rules to change how meta values are parsed for a particular log parser. Prior to version 11.2, you could only view the out-of-the-box log parser rules.

About Log Parser Rules

Parsers are described within their XML files. Each log parser has an XML file that contains rules on how to parse messages for that parser. The out-of-the-box rules are contained within these XML files. For details, see the Log Parser Customization topic in the RSA Link space for RSA Content.

Custom Log Parser Rules

When you create a new log parser rule, it is saved to another XML definition file for the parser. These files are known as token files. This is important, since the out-of-the-box rules are overwritten if you update the parser through RSA Live, but any custom log parser rules are not overwritten, since Live does not update the token files for log parsers.

To create a custom log parser rule:

1. In the NetWitness Platform UI, navigate to **CONFIGURE > Log Parser Rules**.
2. From the **Log Parsers** pane, select a log parser.
3. From the **Rules** pane, click **Add**.

   The Add Rules dialog box is displayed.

   IMPORTANT: If you click outside of the Add Rule dialog box before you save your rule, your changes will be lost.
4. Add at least one meta key and a value to match, in order to create a valid rule.
5. Click **Save** to save your new rule.

   This updates the definition file in the file system. It *does not* deploy the changes.
6. To deploy your changes to all of your Decoders, click **Deploy**.

Guidelines for Custom Rules

When you are creating a custom rule, keep in mind the following:

- For the list of tokens that match strings from the log file, very short tokens are not useful. For example, a one- or two-character string can match more items than desired.

- Remember to add the delimiter (especially if it is a space) as part of the token. For example "domain=" or "email ".
- When constructing regular expressions, the more complexity you add, the more performance overhead added to the system to compare against the rule.
- To see examples of good tokens and regular expressions, examine the rules that are provided for the default log parser.

Default Log Parser and Log Parser Rules

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

This tab displays information about pattern matching and rules for the parsers in your system. The features on this tab apply to all log parsers, including the Default Log Parser

Default Log Parser

The NetWitness Platform default log parser is used to parse logs coming from the Log Decoder that do not match any of the configured log parsers. This default parser parses these logs by using a default set of rules and tokens.

You can view the default log parser and its details by going to **ADMIN > Event Sources > Log Parser Rules** and selecting **default** from the Log Parsers panel.

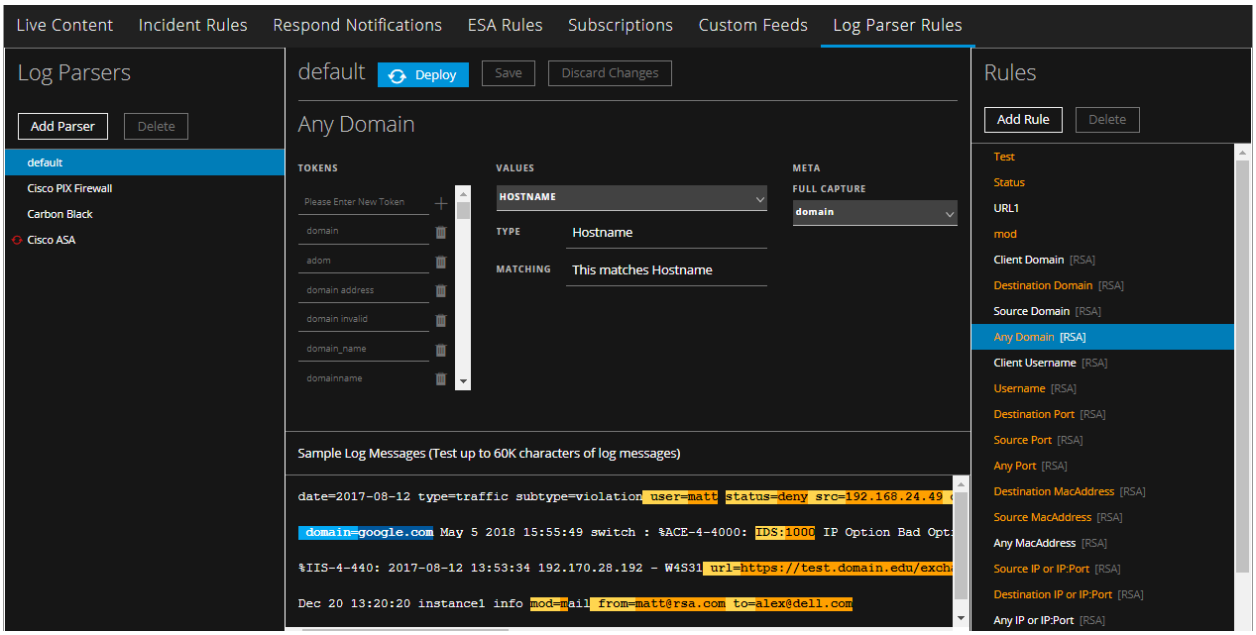
Note: If you do not see the default log parser and its rules, you might need to go to Live and deploy the RSA Content to your log decoders. Additionally, you must have at least one Log Decoder at version 11.2 to view the default log parser.

You can view the default log parser and its details, depending on your version:

- For RSA NetWitness® Platform version 11.1, go to **ADMIN > Event Sources > Log Parser Rules**, then select **default** from the Log Parsers panel.
- For RSA NetWitness® Platform version 11.2 and later, go to **CONFIGURE > Log Parser Rules**, then select **default** from the Log Parsers panel.

Note: The list of log parsers is based on the first Log Decoder that is installed or registered by the Orchestration Server. If you have more than one Log Decoder, this tab only lists log parsers that have been configured on the first one.

This is a view of the Log Parser Rules tab, showing the **Default Log Parser** and **Any Domain** rule selected:



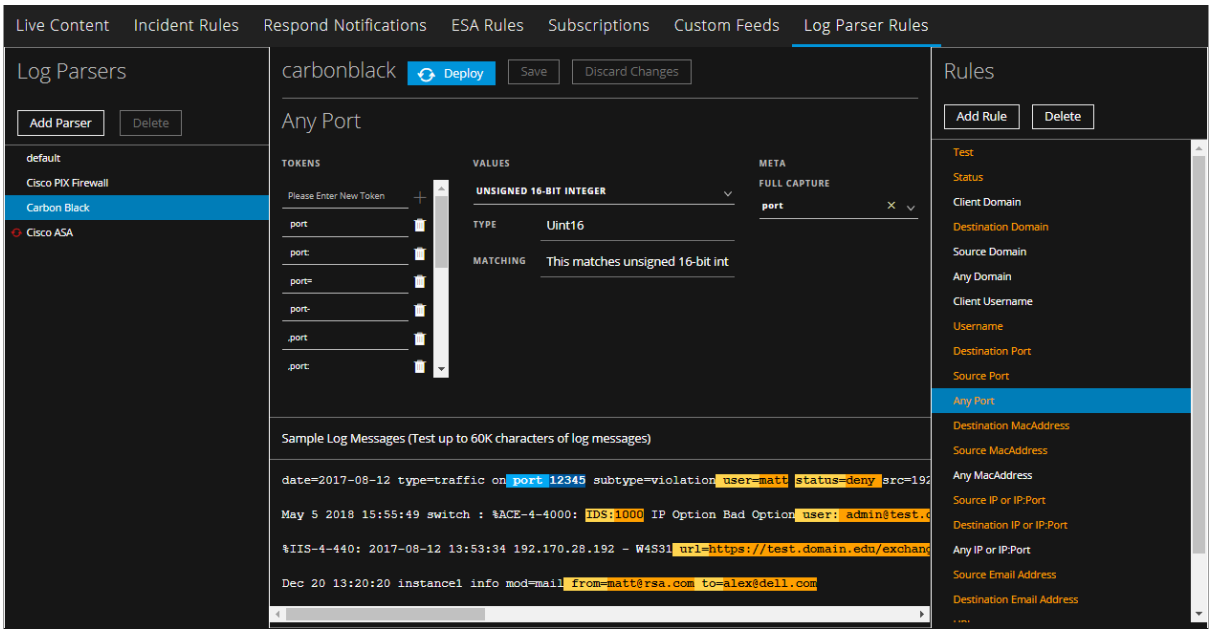
The Log Parser Rules Tab topic describes the items available for the Log Parsers tab.

Highlight Matching Patterns

You can paste logs into the Log Messages text box, and the system highlights the matching literals and patterns for the rules for the selected event source type. Use this feature to confirm that the parser is behaving as expected.

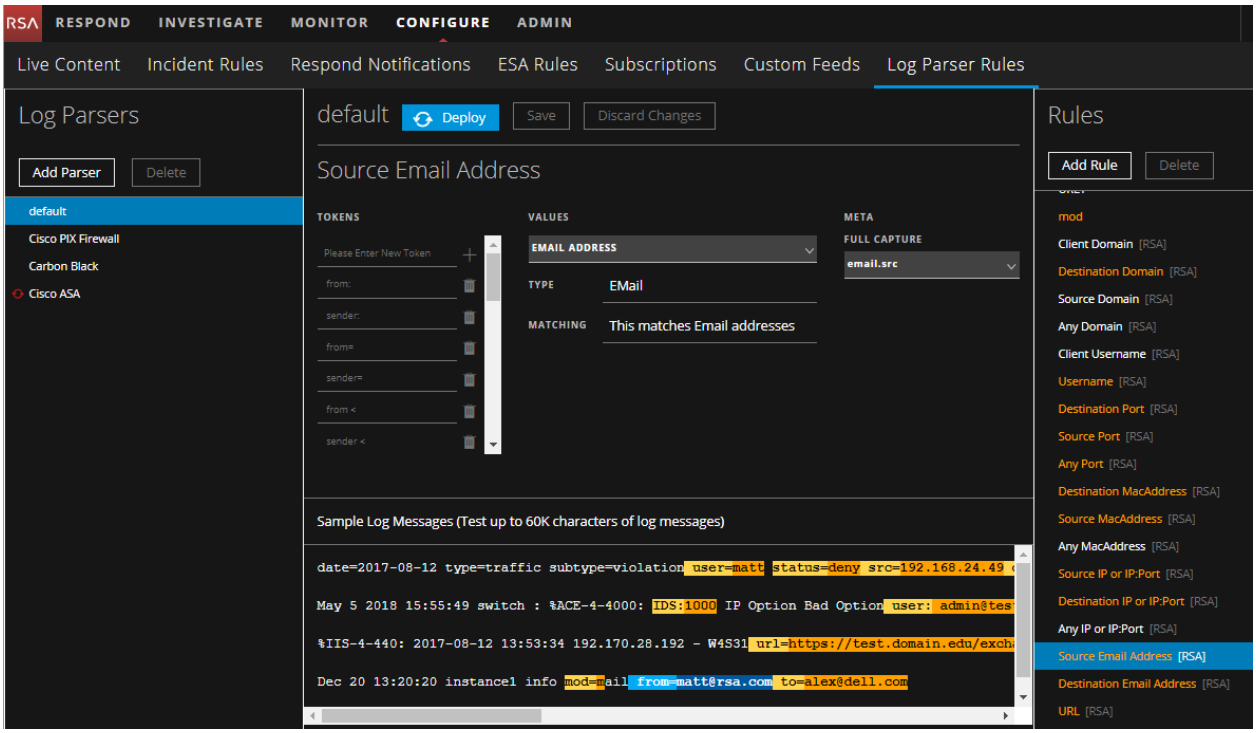
1. n the NetWitness Platform UI, navigate to **ADMIN > Event Sources > Log Parser Rules**.
2. In the NetWitness Platform UI, navigate as follows, depending on your version:
   - For RSA NetWitness® Platform version 11.1, go to **ADMIN > Event Sources > Log Parser Rules**.
   - For RSA NetWitness® Platform version 11.2 and later, go to **CONFIGURE > Log Parser Rules**.
3. From the **Log Parsers** pane, select a log parser.
4. From the **Rules** pane, select a rule.

   For example, this screen shows the **Any Port** rule for the **carbonblack** log parser:



5. Add text or paste in a sample log message.

Strings that match tokens for the selected rule are highlighted in blue. Strings that match other rules for the parser (and the rules themselves) are highlighted in orange.



For example, in the previous screen, note:

- The source email address, matching the **from** token, is highlighted in blue. The token is in dark blue, and the matching string is highlighted in light blue. This is because the **Source Email Address** is the

currently selected Rule.

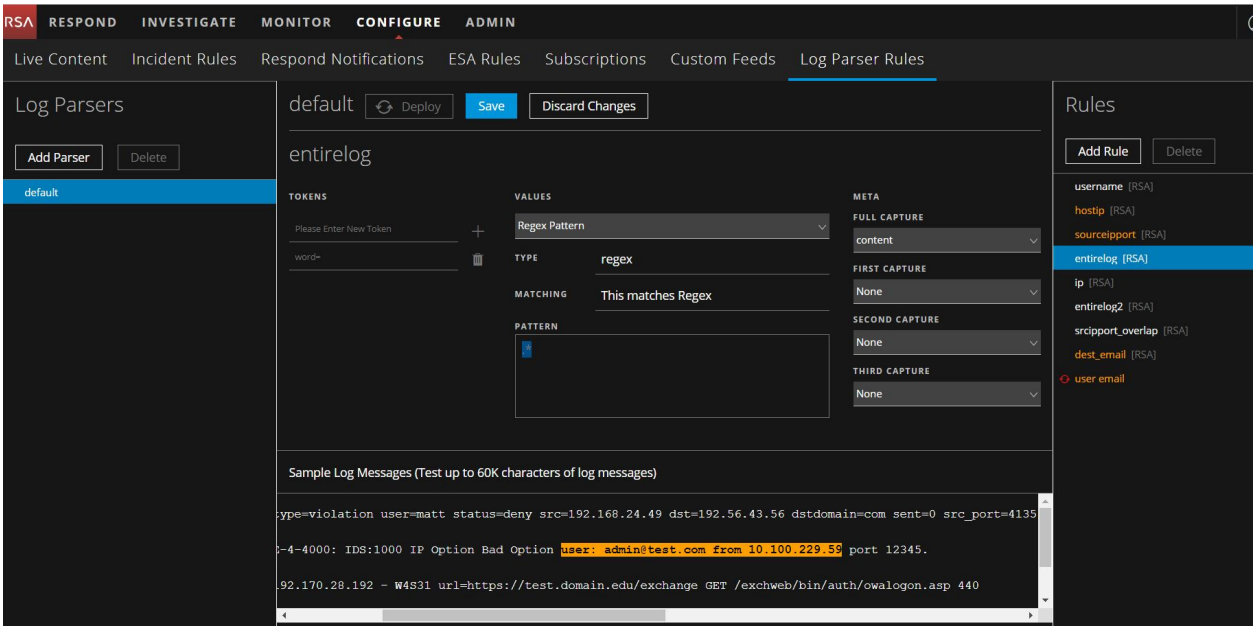
- The strings highlighted in orange match tokens for rules for **Any MacAddress**, **Any Port** and **Source Port**. This is because they are in rules for the default parser that are not currently selected.

Highlight Overlapping Patterns

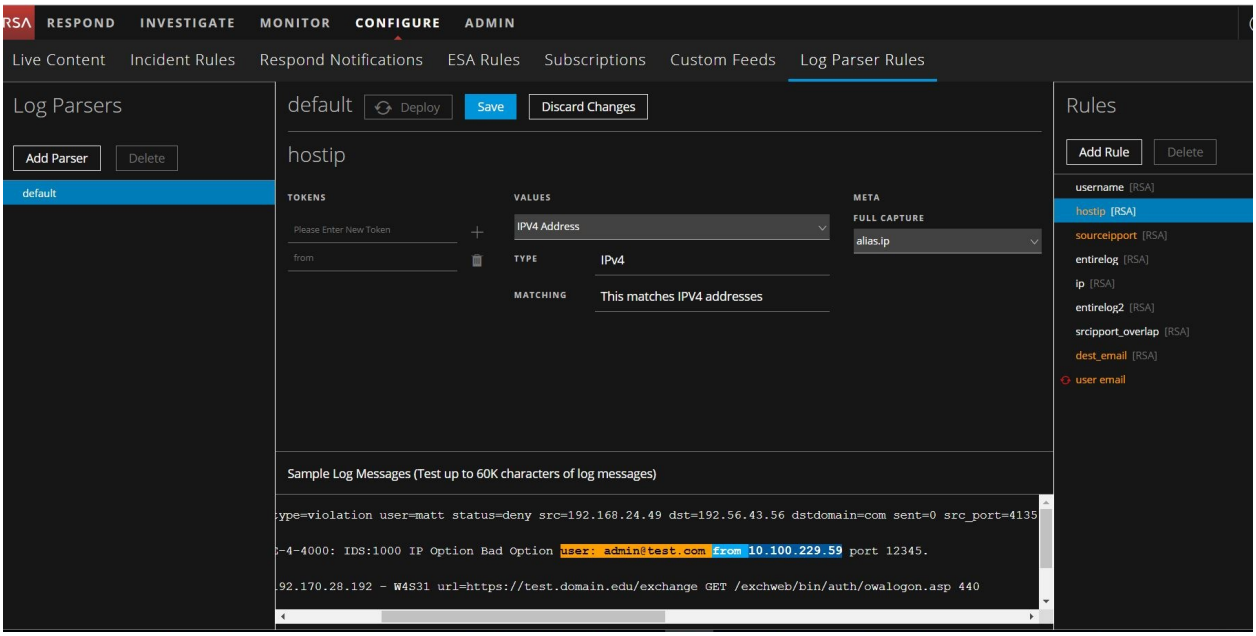
When you have patterns that overlap rules (that is, one pattern matches more than one rule), the behavior is as follows:

- The pattern is displayed in a single color (yellow)
- When you select one of the matching rules, the exactly-matched pattern is displayed in light and dark blue

For example, the pattern `user: admin@test.com from 10.100.229.59` matches several rules.



When you select the **hostip** rule, the highlighting that matches only this rule is shown in dark and light blue.



Use Cases

This topic describes the procedures you use to either on board a new event source, or to extend the parsing capabilities for an existing log parser.

Use Case 1: On Board a New Event Source

In this case, a customer has an event source and wants to add it into the RSA NetWitness® Platform. Perform the following tasks:

I. For your event source, get examples of the logs.

II. In the **CONFIGURE > Log Parser Rules** view, add the Log Parser.

III. From your sample logs, paste applicable sections into the Sample Log Messages section of the **Log Parser Rules** screen.

IV. Use the sample area to understand which items are being parsed by the current parser, and note the items that are not being parsed.

V. For anything that is not currently being parsed, add rules.

- If the new rules apply to all parsers, you can add them to the Default parser.
- If not, add them only to the new log parser you are creating.

VI. Save the new rules, and deploy them to all Log Decoders.

VII. Map the IP address for the newly added event source to the newly-created log parser. For details, see "Acknowledging and Mapping Event Sources" in the *Event Source Management User Guide*.

Use Case 2: Modify an Existing Parser

In this case, a customer wants to parse some items from the logs that are not currently being parsed by the existing log parser. Perform the following tasks:

I. For your event source, get examples of the logs.

II. In the **CONFIGURE > Log Parser Rules** view, add the Log Parser.

III. From your sample logs, paste applicable sections into the Sample Log Messages section of the **Log Parser Rules** screen.

IV. Use the sample area to understand which items are being parsed by the current parser, and note the items that are not being parsed.

V. For anything that is not currently being parsed, add rules.

VI. Save the new rules, and deploy them to all Log Decoders.

For a detailed walk through of some of the steps in these use cases, see Extend an Existing Log Parser Example.

Extend an Existing Log Parser Example

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.2 and later.

One typical use case is for extending the capabilities of an existing log parser. In RSA NetWitness® Platform 11.2, you can add rules to a log parser to extend its parsing capabilities. In this topic, we walk through an example of this.

Task Overview

In this example, a customer wants to parse some items from the logs that are not currently being parsed by the existing log parser. Perform the following tasks:

I. For your event source, get examples of the logs.

II. In the CONFIGURE > Log Parser Rules view, Add the Log Parser

III. From your sample logs, paste applicable sections into the Sample Log Messages section of the **Log Parser Rules** screen.

IV. Use the sample area to understand which items are being parsed by the current parser, and note the items that are not being parsed.

V. For anything that is not currently being parsed, add rules as described in Add Rules and Deploy.

VI. Save the new rules, and deploy them to all Log Decoders.

Notes

Note: All the procedures in the topic use the CONFIGURE > Log Parser Rules view.

In the Log Parser Rules tab, you may see the Refresh icon ( ) next to an item. This indicates that the item has undeployed changes.

Add the Log Parser

The first step in the process is to add a log parser, based on an existing log parser that you want to customize.

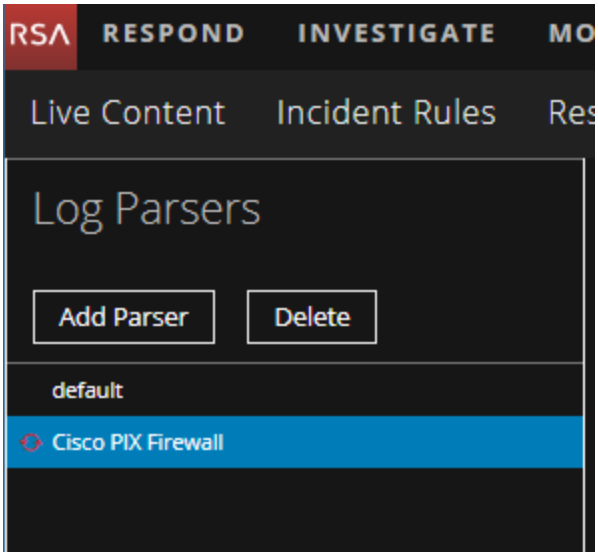
To add a log parser

1. In the RSA NetWitness® Platform menu, navigate to **CONFIGURE > Log Parser Rules**.
2. In the Log Parsers panel, click **Add Parser**.

   The Add Dynamic Log Parser dialog box is displayed.
3. In the **SELECT LOG PARSER** field, select the existing parser to extend. In this example, we use Cisco Pix Firewall.

4. You can clone the rules from any of your existing parsers, including the **default** parser. For simplicity, in this example we leave this field blank: thus, only the rules we create are added to the new parser.
5. Click **Add Parser** to create the new parser.

The new parser is listed in the Log Parsers panel. Note the symbol next to the new parser—this indicates that your changes have not yet been saved.



About Custom Rules

When you create a new log parser rule, it is saved to an XML definition file for the parser. These files are known as token files. This is important, since the out-of-the-box rules are overwritten if you update the parser through RSA Live, but any custom log parser rules are not overwritten, since Live does not update the token files for log parsers.

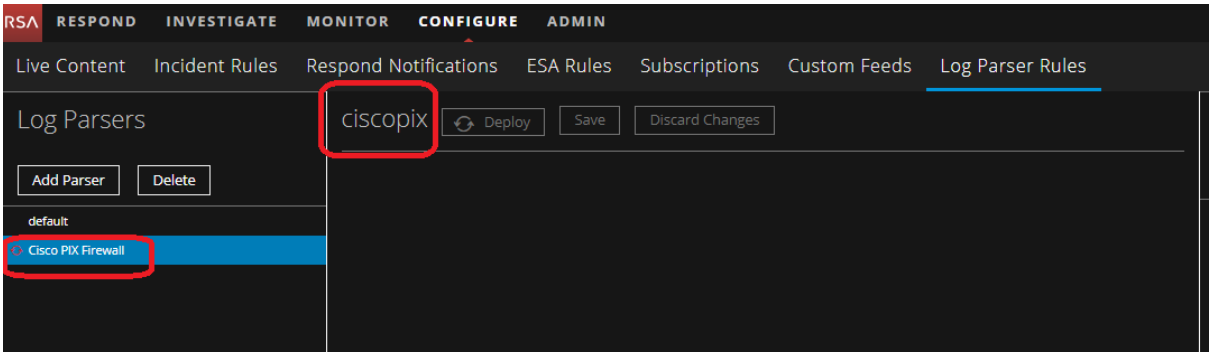
Add Rules and Deploy

Once you have added the parser, the next step is to add one or more rules.

Let's say you know that your log messages have some email addresses that follow a "source_mail" string. You could add the following rule to parse these strings:

IMPORTANT: If you click on another parser in the **Log Parsers** panel, before you save your rule, your changes will be lost.

1. Make sure the Cisco Pix Firewall parser is selected.



2. In the Rules panel, click **Add Rule**.

   The Add New Rule dialog box is displayed.

3. Enter a name for the rule, and click **Add New Rule**.

   The center panel is updated to reflect that you are working on a new rule.

   In the TOKENS section, enter a string for the token that you want to match, then click +.

   In this example, we entered **email** .

> **Note:** Make sure to include a delimiter for your token. For example, in this case, the token consists of 6 characters: the string "email," and then a space. Some tokens might use a colon, semicolon, or some other character as the delimiter, but it can be easy to forget to add the space character when that is the delimiter.

4. You can enter more tokens, or continue to add values.
5. In the VALUES section, choose the value for the rule. If you choose to match a Regex Pattern, you

need to enter the pattern in the PATTERN field. Other values do not require any options.

In this example, we selected **Email**.

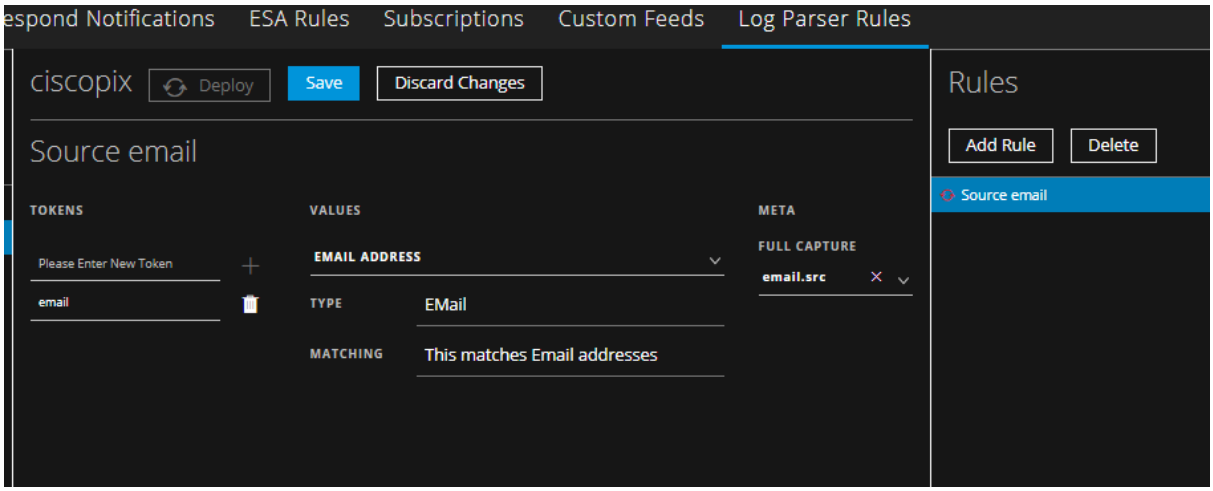
6. In the META section, click to select a meta key to which the rule stores its information. Some notes:

   - Enter characters to filter the list of available meta keys.
   - For Regex values, you can select "pieces" of the value, and store each piece to its own meta key.

   Note: If any new meta keys are added to the Log Decoder, they do not appear in the list of Meta immediately. They appear automatically after 24 hours, or you can restart the **content server** service to view them.

   In this example, we selected the **email.src** meta key.

   The following image shows an example rule:



7. Click **Save** to save the rule. Repeat this procedure to continue adding rules.
8. Once you have added all of your rules, click **Deploy** to deploy the new parser to your Log Decoders. Some notes about deploying rules:

   - You deploy an entire set of rules for a parser. That is, you can continue adding rules for a specific parser until you have all of your rules, and then you can deploy them all at once.
   - Once you deploy a custom parser, you can no longer delete it. You can only delete parsers that you have not yet deployed.

Note: In this example, we extended an existing log parser. However, if you are creating a new log parser for a new event source, make sure to map the new log parser to the IP address of the event source, as described in "Acknowledging and Mapping Event Sources" in the *Event Source Management User Guide*.

Regex Values

Custom Log Parser Rules can match regular expression patterns. If you select a Regex pattern for your Value, you can capture the entire matched token, or sections of it:

- Full capture: the entire matched string is stored to your selected meta key.
- First capture: the first portion of the string, up to the period character, is stored to the meta key.
- Second capture: the second portion of the string, starting after the first period character, is stored to the meta key.
- Third capture: the third portion of the string, starting after the second period character, is stored to the meta key.

You can choose any or all four of these captures, depending on the token you are matching.

For example, we examine the **Source IP or IP:Port** RSA rule:

- Regex Pattern: \s*(\b(?:[0-9]{1,3}\.){3}[0-9]{1,3}\b):?(\d*)
- Full capture: none
- First capture: **ip.src**
- Second capture: **port.src**
- Third capture: none
- Assume example string of "src=192.168.24.4:8080", where **src** is one of the tokens defined for this rule:
  - **192.168.24.4** is saved to the **ip.src** meta key.
  - **8080** is saved to the **port.src** meta key.

For more details, see any online reference that describes PERL regular expressions. There are many tutorials available online.

IMPORTANT: Be careful when constructing regular expressions in your custom rules. Badly constructed regular expressions could impact your performance.

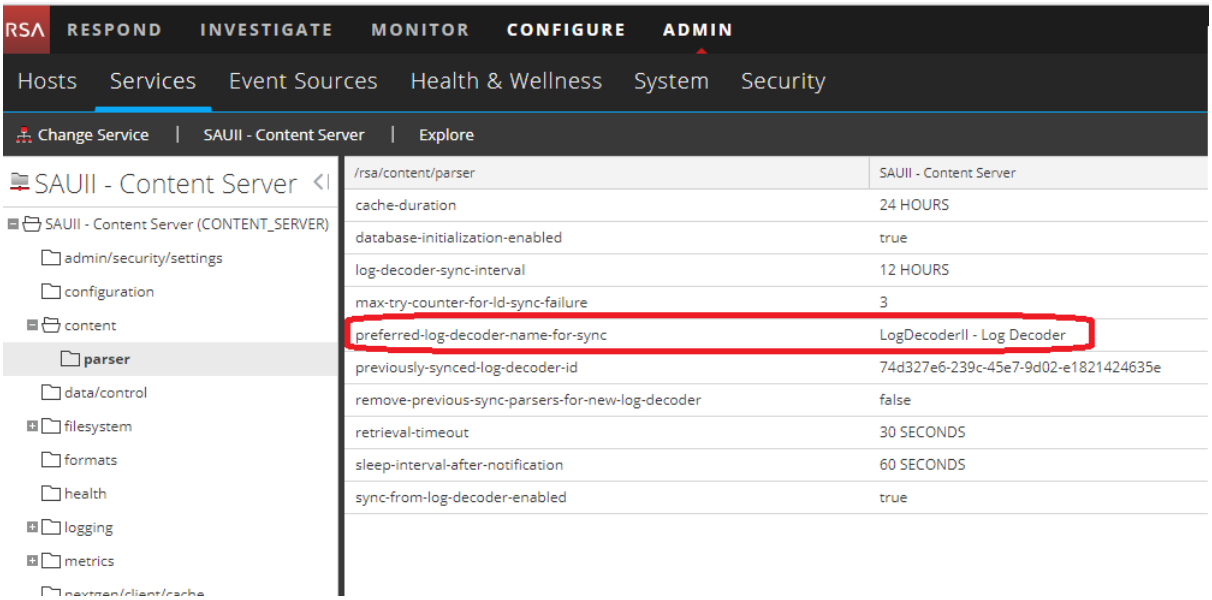
Appendix A: Select the Reference Log Decoder

For version 11.2, RSA has added the ability to add log parsers and log parsing rules through the UI, using the Log Parsers view. The Log Parsers tab is populated based on your reference Log Decoder. If you have more than one Log Decoder, you can select which acts as the reference one for populating the tab in the UI. This topic describes the procedure to do so.

To change the reference log decoder:

1. In the NetWitness Platform UI, navigate to **ADMIN > Services**.
2. For the **Content Server**, select **View > Explore**.
3. From the left navigation panel, expand **content > parser**.
4. To set the reference log decoder, enter a value for `preferred-log-decoder-name-for-sync`.

   Enter the name listed in the **Name** column on the **ADMIN > Services** screen for your preferred log decoder.



5. The change takes effect during the next system sync, based on the `log-decoder-sync-interval`. To sync sooner, you can do either of the following:

   - To sync immediately, restart the Content Sever: in the **ADMIN > Services** view, from the **Actions** menu for the Content Server, select **> Restart**.
   - Change the `log-decoder-sync-interval` parameter from its default of 12 hours to your preferred interval. Note that the minimum value for this parameter is **1 HOUR**.

Appendix B: Move Log Parsers to Production

You may have a development or test environment where you work on new and updated log parsers and log parser rules. In this case, at some point you need to move your new and updated log parsers into your production environment. This topic describes how to do this.

To move custom log parsers and log parser rules from development to production environment:

1. On the development system, do the following:
   a. SSH to the NetWitness Server
   b. Export the log parser information by running the following command:

      ```
      mongodump --host localhost --port 27017 --db "content-server" --username
      "deploy_admin" --password "netwitness" --authenticationDatabase admin
      ```

   c. Copy the "dump" folder to your production NetWitness Server.
2. On the production system, do the following:
   a. SSH to the NetWitness Server
   b. Drop the content-server table from Mongo by running below commands in the order listed:

      ```
      mongo --username deploy_admin --password netwitness --
      authenticationDatabase admin
      use content-server
      db.logDeviceParser.drop()
      db.patternFormatType.drop()
      exit
      ```

   c. Run the following restore command:

      ```
      mongorestore --host localhost --port 27017 --db "content-server" --
      username "deploy_admin" --password "netwitness" --authenticationDatabase
      admin PATH_TO_DUMP_FOLDER
      ```

      Make sure to replace *PATH_TO_DUMP_FOLDER* with the actual path to the "dump" folder.
   d. Restart the content-server by running the following command:

      ```
      systemctl restart rsa-nw-content-server
      ```

Appendix C: Troubleshooting and Limitations

This section describes some common issues that can occur when you customize log parsers and log parser rules.

Troubleshooting

You do not see any log parsing against a newly created parser.	You may have forgotten to map the new parser. To map a parser, go to **Admin > Event Sources > Discovery** tab. See the "Discovery Tab" topic in the *Event Source Management Guide* for details.
Deployment fails	If you click Deploy to deploy a new or updated log parser, and it fails, you should check the log for your reference log decoder. You access this log in the following location on the NetWitness Server: `/var/log/netwitness/content-server/content-server.log`

NwLogPlayer

NwLogPlayer is a troubleshooting tool that simulates syslog traffic. `NwLogPlayer.exe` is a command line utility located on the Log Decoder host in `/usr/bin`.

At the command line, type `nwlogplayer.exe -h` to list the available options, as reproduced here:

Option	Description
`--priority arg`	set log priority level
`-h [ --help ]`	show this message
`-f [ --file ] arg (=stdin)`	input message; defaults to **stdin**
`-d [dir ] arg`	input directory
`-s [ --server ] arg (=localhost)`	remote server; defaults to **localhost**
`-p [ --port ] arg (=514)`	remote port; defaults to **514**
`-r [ --raw ] arg (=0)`	Determines raw mode. • 0 = add priority mark (default) • 1= File contents will be copied line by line to the server. • 3 = auto detect • 4 = enVision stream • 5 = binary object
`-m [ --memory ] arg`	Speed test mode. Read up to 1 Megabyte of messages from the file content and replays.

Option	Description
`--rate arg`	Number of events per second. This argument has no effect if **rate** > eps that the program can achieve in continuous mode.
`--maxcnt arg`	maximum number of messages to be sent
`-c [ --multiconn ]`	multiple connection
`-t [ --time ] arg`	simulate time stamp time; format is `yyyy-m-d-hh:mm:ss`
`-v [ --verbose ]`	If **true**, output is verbose
`--ip arg`	simulate an IP tag
`--ssl`	use SSL to connect
`--certdir arg`	OpenSSL certificate authority directory
`--clientcert arg`	use this PEM-encoded SSL client certificate
`--udp`	send in UDP

Limitations

Please note the following limitations when using the Log Parser Rules tab:

- **Log Decoder must be at version 11.2:** For the functionality in the Log Parser Rules tab to work, your installation must have at least one Log Decoder running NetWitness version 11.2.
- **Mixed Mode:** If any Log Decoders are at version 11.2, and the NetWitness Server is at version 11.2, the Log Decoders will have parseall rules enabled by default, and thus will begin to parse logs accordingly. However, the 11.2 NetWitness Server does not support Log Decoders with versions less than 11.2, so the Log Parser Rules tab in the UI stays blank.
- **Meta key fields list refresh:** If any new meta keys are added to the Log Decoder, they do not appear in the list of Meta in the Log Parser Rules tab immediately. They appear automatically after 24 hours, or you can restart the **content server** service to view them.
- **Field Restrictions:** Note the following field restrictions:
  - **Rule name** must be 64 characters or fewer.
  - **Parser Name** must be between 3 and 30 alphanumeric characters (including underscores), and must not match the name of any existing log parsers.
  - **Parser Display Name** must be 64 characters or fewer, and cannot match any other parser display name.
  - **Regex Expression** must be 1-255 characters, and a valid regex (closed capture list allowed).
  - **Tags** cannot be duplicates.
- **Deploy only to 11.2 Log Decoders:** The Deploy operation only deploys log parsers to version 11.2 Log Decoders.
- **Cannot Remove Deployed Parsers:** Once deployed, you cannot delete a log parser using the UI.

- **See log for errors:** Refer to content-server logs for more details on deploy failure details and log decoder names.

How Malware Analysis Works

NetWitness Platform Malware Analysis is an automated malware analysis processor designed to analyze certain types of file objects (for example, Windows portable executable (PE), PDF, and MS Office) to assess the likelihood that a file is malicious.

Malware Analysis detects indicators of compromise using four distinct analysis methodologies:

- Network Session Analysis (network)
- Static File Analysis (static)
- Dynamic File Analysis (sandbox)
- Security Community Analysis (community)

Each of the four distinct analysis methodologies is designed to compensate for inherent weaknesses in the others. For example, Dynamic File Analysis can compensate for Zero-Day attacks that are not detected during the Security Community Analysis phase. By avoiding malware analysis that strictly focuses on one methodology, the analyst is more likely to be shielded from false negative results.

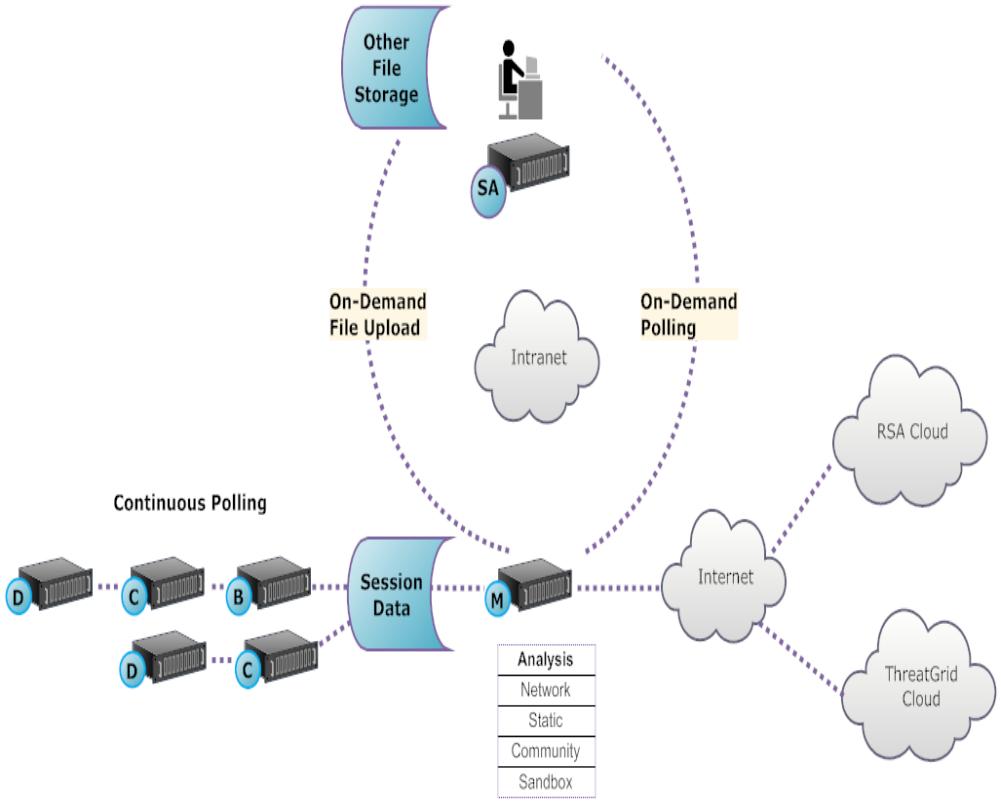
In addition to the built-in indicators of compromise, Malware Analysis supports indicators of compromise written in YARA. YARA is a rule language, which allows malware researchers to identify and classify malware samples. This allows Indicators of Compromise (IOC) authors to add detection capabilities to RSA Malware Analysis by authoring YARA rules and publishing them in RSA Live. These YARA-based IOCs in RSA Live will automatically be downloaded and activated on the subscribed host, to supplement the existing analysis that is performed in each analyzed file.

Malware Analysis also has features that support alerts for NetWitness Respond.

Functional Description

This figure depicts the functional relationship between the Core services (the Decoder, Concentrator, and Broker), the Malware Analysis service, and the NetWitness Server.

Daily Quota (Number of Files)	Free	Standard	Enterprise
Malware Analysis	100	unlimited	unlimited
ThreatGrid Analysis	5	1000	5000



The Malware Analysis service analyzes file objects using any combination of the following methods:

- **Continuous automatic polling of a Concentrator or Broker** to extract sessions identified by a parser as potentially carrying malware content.
- **On-demand polling of a Concentrator or Broker** to extract sessions identified by a malware analyst as potentially carrying malware content.
- **On-demand upload of files** from a user-specified folder.

When automatic polling of a Concentrator or Broker is enabled, the Malware Analysis service continuously extracts and prioritizes executable content, PDF documents, and Microsoft Office documents on your network, directly from data captured and analyzed by your Core service. Because the Malware Analysis service connects to a Concentrator or Broker to extract only those executable files that are flagged as possible malware, the process is both rapid and efficient. This process is continuous and does not require monitoring.

When on-demand polling of a Concentrator or Broker is chosen, the malware analyst uses Investigation to drill into captured data and choose sessions to be analyzed. The Malware Analysis service uses this information to automatically poll the Concentrator or Broker and to download the specified sessions for analysis.

On-demand upload of files provides a method for the analyst to review files captured external to the Core infrastructure. The malware chooses a folder location and identify one or more files to be uploaded and analyzed by Malware Analysis. These files are analyzed using the same methodology as files automatically extracted from network sessions.

Analysis Method

For the Network analysis, the Malware Analysis service looks for characteristics that seem to deviate from the norm, much as an analyst does. By looking at hundreds to thousands of characteristics and combining the results into a weighted scoring system, legitimate sessions that coincidentally have a few abnormal traits are dismissed, while the actual bad ones are highlighted. A user can learn patterns that indicate anomalous activity in the sessions as indicators that warrant further investigation, Indicators of Compromise.

The Malware Analysis service can perform Static analysis against suspicious objects it finds on the network and determine whether those objects contain malicious code. For Community analysis, new malware detected on the network is pushed to the RSA Cloud for checking against RSA's own malware analysis data and feeds from the SANS Internet Storm Center, SRI International, the Department of the Treasury and VeriSign. For Sandbox analysis, the services can also push data into major security, information and event management (SIEM) hosts (the ThreatGRID Cloud).

Malware Analysis has a unique method for analysis that is partnered with industry leaders and experts, so their technologies can enrich the Malware Analysis scoring system.

NetWitness Server Access to the Malware Analysis Service

The NetWitness Server is configured to connect to the Malware Analysis service and import tagged data for deeper analysis in Investigation. Access is based on three subscription levels.

- Free subscription: All NetWitness Platform customers have a free subscription, with a free trial key for ThreatGRID analysis. The Malware Analysis service is rate-limited to 100 file samples per day. The number of samples (within the set of files from above) submitted to the ThreatGRID Cloud for sandbox analysis is limited to 5 per day. If one network session had 100 files in it, customers would hit the rate limit after processing the one network session. If 100 files were manually uploaded, that would cause the rate limit to be reached.
- Standard subscription tier: The number of submissions to the Malware Analysis service is unlimited. The number of samples submitted to the ThreatGRID Cloud for sandbox analysis is 1000 per day.
- Enterprise subscription tier: The number of submissions to the Malware Analysis service is unlimited. The number of samples submitted to the ThreatGRID Cloud for sandbox analysis is 5000 per day.

Scoring Method

By default, the Indicators of Compromise (IOC) are tuned to reflect industry best practices. During analysis, the IOCs that trigger cause the score to move upward or downward to indicate the likelihood that the sample is malicious. The tuning of IOCs is exposed in NetWitness Platform so that the malware analyst can choose to override the assigned score or to disable an IOC from being evaluated. The analyst has the flexibility to either use the default tuning, or to completely customize the tuning to specific needs.

YARA-based IOCs are interleaved with the built-in IOCs within each built-in category and are not distinguished from native IOCs. When viewing IOCs in the Service Configuration view, administrators can select YARA from the Module selection list to see a list of YARA rules.

After a session is imported into NetWitness Platform, all of the viewing and analysis capabilities in Investigation are available to further analyze Indicators of Compromise. When viewed in Investigation, YARA IOCs are distinguished from the built-in native IOCs by the tag `Yara rule`.

Deployment

The Malware Analysis service is deployed as a separate RSA Malware Analysis host. The dedicated Malware Analysis host has an onboard Broker which connects to the Core infrastructure (either another Broker or a Concentrator). Prior to this connection, a collection of parsers and feeds must be added to the Decoders that are connected to the Concentrators and Brokers from which the Malware Analysis service pulls data. This allows suspicious data files to be marked for extraction. These files are `malware analysis` tagged content available through the RSA Live content management system.

Scoring Modules

RSA NetWitness Platform Malware Analysis analyzes and scores sessions and the embedded files within these sessions by scoring four categories: Network, Static Analysis, Community, and Sandbox. Each category comprises many individual rules and checks that are used to calculate a score between -100 and 100. The higher the score, the more likely the session is to be malicious and worthy of more in-depth follow-on investigation.

Malware Analysis can facilitate a historical investigation into events leading up to a network alarm or incident. If you know that a certain type of activity is taking place on your network, you can select only the reports of interest to examine the content of data collections. You can also modify behavior for each scoring category based on the scoring category or the file type (Windows PE, PDF, and Microsoft Office).

Once you become familiar with data navigation methods, you can explore the data more completely through:

- Searching for specific types of information
- Reviewing specific content in detail.

Category scores for Network, Static Analysis, Community, and Sandbox are maintained and reported independently. When events are viewed based on the independent scores, as long as one category detects malware, it is evident in the Analysis section.

Network

The first category examines each core network session to determine if the delivery of the malware candidates was suspicious. For example, benign software being downloaded from a well-known safe site, using proper ports and protocols, is considered less suspicious than downloading software known to be malicious from a known dubious download site. Sample factors used in the scoring of this criteria set may include sessions that:

- Contain threat feed information
- Connect to well-known bad sites
- Connect to high-risk domains/countries (for example, .cc domain)
- Use well-known protocols on non-standard ports
- Contain obfuscated JavaScript

Static Analysis

The second category analyzes each file in the session for signs of obfuscation in order to predict the likelihood of the file behaving maliciously if allowed to run. For example, software that links to networking libraries is more likely to perform suspicious network activity. Sample factors used in the scoring of this criteria set may include:

- Files found to be XOR encoded
- Files found embedded within non-EXE formats (for example, PE file found embedded in a GIF format)
- Files linking to higher risk import libraries
- Files highly deviating from the PE Format

Community

The third category scores the session and files based on the collective knowledge of the security community. For example, files whose fingerprint/hash is already known to be good or bad by respected anti-virus (AV) vendors is scored accordingly. Files are also scored based on knowledge that a file was delivered from a site known to be good or bad by the security community.

Community scoring also indicates whether the AV on your network flagged the files as malicious. It does not indicate that the resident AV product acted to protect your system.

Sandbox

The fourth category examines the behavior of the software by actually running it in a sandbox environment. By running the software to watch its behavior, a score can be calculated by identifying well-known malicious activity. For example, software that configures itself to autostart on each reboot and make IRC connections would score higher than a file with no known bad behavior.

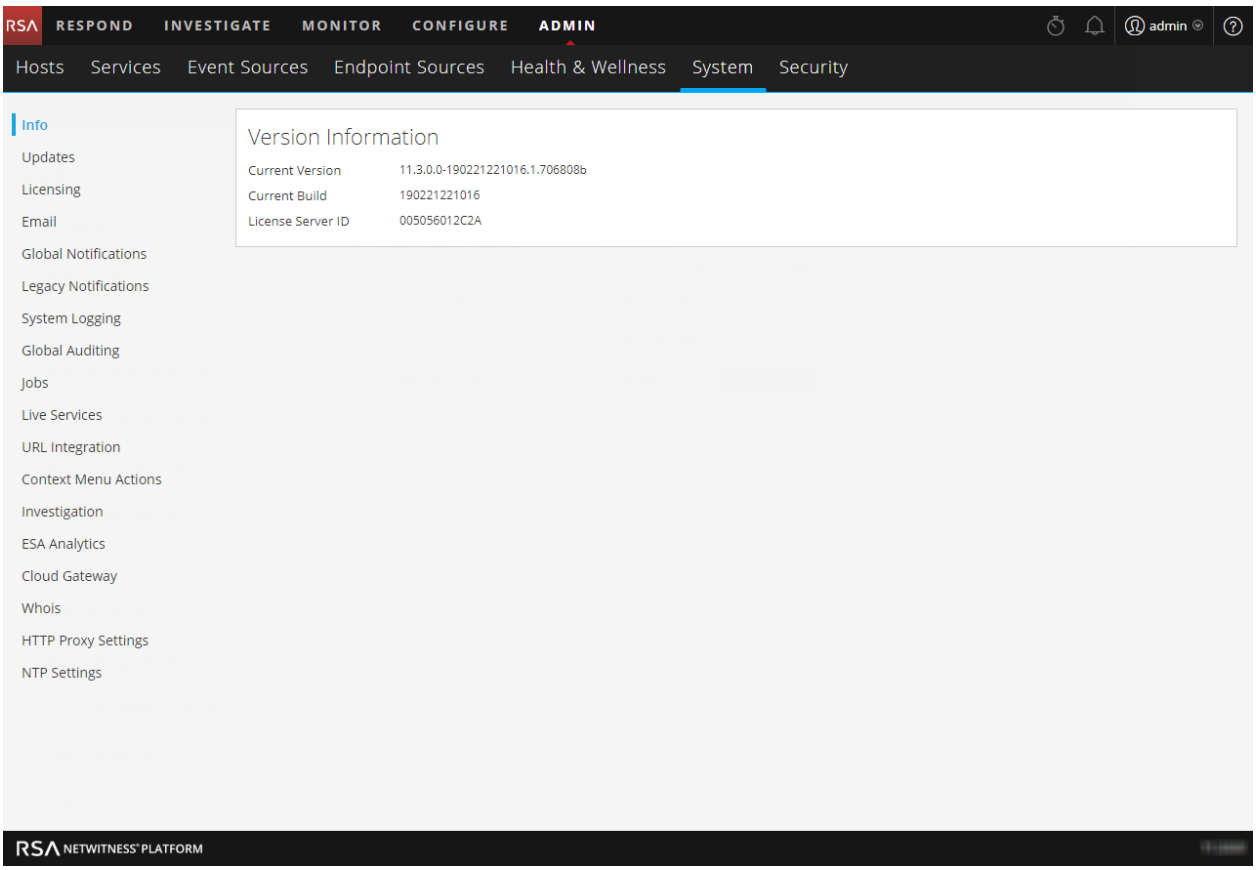
Roles and Permissions for Analysts

This topic identifies the user roles and permissions required for a user to conduct malware analysis in NetWitness Platform. If you cannot perform an analysis task or see a view, the administrator may need to adjust the roles and permissions configured for you.

Required Roles and Permissions

RSA NetWitness Platform manages security by providing access to views and functions using both system permissions and permissions on individual services.

On the system level, the user needs to be assigned a system role, in the ADMIN > System view, that provides access to specific views and functions.



The default `Malware_Analysts` role in NetWitness Platform11.3 is assigned all of the permissions listed below. If necessary, an Administrator can create a custom role with some combination of the following permissions:

- Access Investigation Module (required)
- Investigation - Navigate Events
- Investigation - Navigate Values

- Access Incident Module
- View and Manage Incidents
- View Malware Events (to view events)
- File Download (to download files from the Malware Analysis service)
- Initiate Malware Scan (to initiate a one-time service scan or one-time file upload)
- Dashlet permissions for convenience: Dashlet - Investigate Top Values Dashlet, Dashlet - Investigate Service List Dashlet, Dashlet - Investigate Jobs Dashlet, Dashlet - Investage Shortcuts Dashlet.

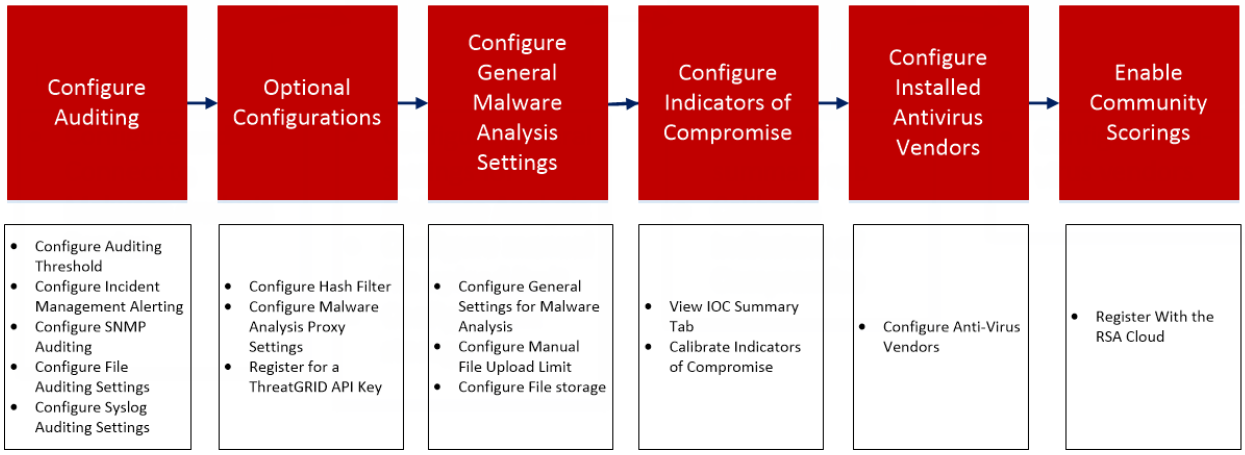
A use case for creating a custom role would be a Junior Malware Analyst role, with limited permissions that do not include the File Download permission.

On specific services, a malware analyst needs to be a member of the **Analysts** group, or to a group that has the two default permissions assigned to the Analyst group: **sdk.meta** and **sdk.content**. Users who have these permissions can use specific applications, run queries, and view content for purpose of analysis on the service.

Basic Setup

Malware Analysis can operate as a service on a Decoder or as a service on a dedicated appliance. This guide includes instructions for setting up the operating environment and then configuring the Malware Analysis service. After this configuration is complete, analysts can conduct malware analysis.

These are the configuration steps for Malware Analysis, and also for editing the configuration. Perform the steps in the section in the sequence they are given.



Basic Configuration Checklist

The following checklist provides the sequence for tasks that are required to configure Malware Analysis that has been added to NetWitness Platform in accordance with the *Hosts and Services Guide*.

Step	High-Level Task
Step 1 - (Optional) Configure Dedicated Appliance	(Optional) Configure Dedicated Appliance This topic describes the procedures for configuring the environment to connect to the Malware Analysis service.
Step 2 - Configure General Malware Analysis Settings	Configure General Malware Analysis Settings • Enable continuous polling. • Configure manual file upload limit. • Configure the file storage repository and database. • Calibrate the Static, Network, Community, and Sandbox scoring modules.

Step	High-Level Task
Step 3 - Configure Indicators of Compromise	Configure Indicators of Compromise Calibrate Indicators of Compromise that are applied for each scoring module (Static, Network, Community, Sandbox) and for YARA-based IOCs.
Step 4 - Configure Installed Antivirus Vendors	Configure Installed Antivirus Vendors
Step 5 - Enable Community Scoring	Enable Community Analysis Register with the RSA cloud and test connections to enable Community scoring.
Step 6 - Configure Auditing on Malware Analysis Host	(Optional) Configure Auditing on Malware Analysis Host Configure auditing thresholds and enable Syslog, SNMP, and file auditing.
Step 7 - Configure Hash Filter	(Optional) Configure Hash Filter Configure hash filtering to fine tune Malware Analysis event analysis based on known good or bad file hashes.
Step 8 - Configure Malware Analysis Proxy Settings	(Optional) Configure Malware Analysis Proxy Settings (Optional) Configure Malware Analysis to communicate with the RSA Cloud through a web proxy instead of directly.
Step 9 - Register for a ThreatGRID API key	(Optional) Register for a ThreatGRID API Key

(Optional) Configure Dedicated Appliance

You can configure the NetWitness Platform operating environment to connect to a NetWitness Platform Malware Analysis service.

Malware Analysis operates as a service on a dedicated Malware Analysis appliance. If your site is using a dedicated appliance, do one of the following:

- If your site is adding a new dedicated NetWitness Platform Malware Analysis appliance, install the physical appliance in your network and configure the operating environment.
- If your site is upgrading a dedicated Spectrum appliance to a dedicated NetWitness Platform Malware Analysis appliance, re-image the Spectrum appliance as a Malware Analysis appliance.

Malware Analysis is dependent on the Core infrastructure to operate. The following steps are necessary before Malware Analysis can successfully analyze data.

1. Configure the onboard Broker on the Malware Analysis appliance to connect another Broker or Concentrator in the existing Core infrastructure.

Note: If no Core infrastructure exists, only manually uploaded files can be analyzed.

2. Use NetWitness Platform Live to find all Live resources with the `malware analysis` tag and deploy these resources to each Decoder service that will be capturing traffic for Malware Analysis to analyze. NetWitness Platform uses this proprietary set of parsers and feeds to find events that are likely to be malware.
3. Configure communications ports. Malware Analysis requires a number of different communications ports to be open, including TCP/443 for HTTPS. These are described below in Network Connections.
4. Configure the NextGen source to which Malware Analysis will connect. This is the Broker or the Concentrator.
   Malware Analysis is now ready to begin analyzing network traffic.

Network Connections

The inbound and outbound network connections must be configured for the Malware Analysis appliance to properly communicate with services, RSA sources for software updates, and other critical information.

Your network firewall must be configured to allow the Malware Analysis access to the internet. Proxy servers may be used to facilitate these connections, if necessary.

Inbound Connections

TCP/22 - Secure Shell access to the Malware Analysis server to review log files and troubleshoot. Access can be limited to IP addresses that will be managing Malware Analysis.

- TCP/443 - HTTPS web-based connection to access the Malware Analysis user interface.
- TCP/50008 - JMX port for performance troubleshooting, using an application such as JVisualVM. This is optional and access can be limited to IP addresses that will be managing Malware Analysis.

Outbound Connections

- TCP/443 - HTTPS connections to SSL-based web servers. Some features include Malware Analysis sending files or documents to servers for analysis, which require a secure connection. Use of a web proxy server is supported.
- (TCP/443 - SSL connection from Malware Analysis to the RSA Cloud. Use of a SOCKS proxy server is supported. Customer infrastructure changes may be required to ensure that 443 is open to cloud.netwitness.com.)
- TCP/50103 - REST API port used to communicate with a Broker. (NetWitness Platform 10.3.x and earlier)
- TCP/50105 - REST API port used to communicate with a Concentrator. (NetWitness Platform 10.3.x and earlier)
- TCP/50003 TCP/56003 - Ports used to communicate with a Broker. (NetWitness Platform 10.4 and later)

- TCP/50005 TCP/56005 - Ports used to communicate with a Concentrator. (NetWitness Platform 10.4 and later)
- ICMP - JMS connection from NetWitness Platform to the Malware Analysis service to verify if the hostname and ip address entered is valid for a successful test connection.

Configure General Malware Analysis Settings

You can configure several basic settings required to enable and calibrate the consumption of sessions, manual file upload, and the different scoring modules that Malware Analysis uses to analyze data.

You can also set up file sharing with the data repository. Malware Analysis has three modes of consuming sessions and files. Any combination of the three choices may be used to initiate analysis in Malware Analysis. The choices are:

- **Continuous Polling of the Core service:** You can enable and configure continuous polling of the Core service. When enabled and configured, Malware Analysis continuously polls the Core service for sessions tagged for analysis. By default, continuous polling is disabled. You can enable Denial of Service (DOS) attack prevention for use during continuous polling. You can test the connection to the Malware Analysis service that is being continuously polled using an option in the Integration tab.

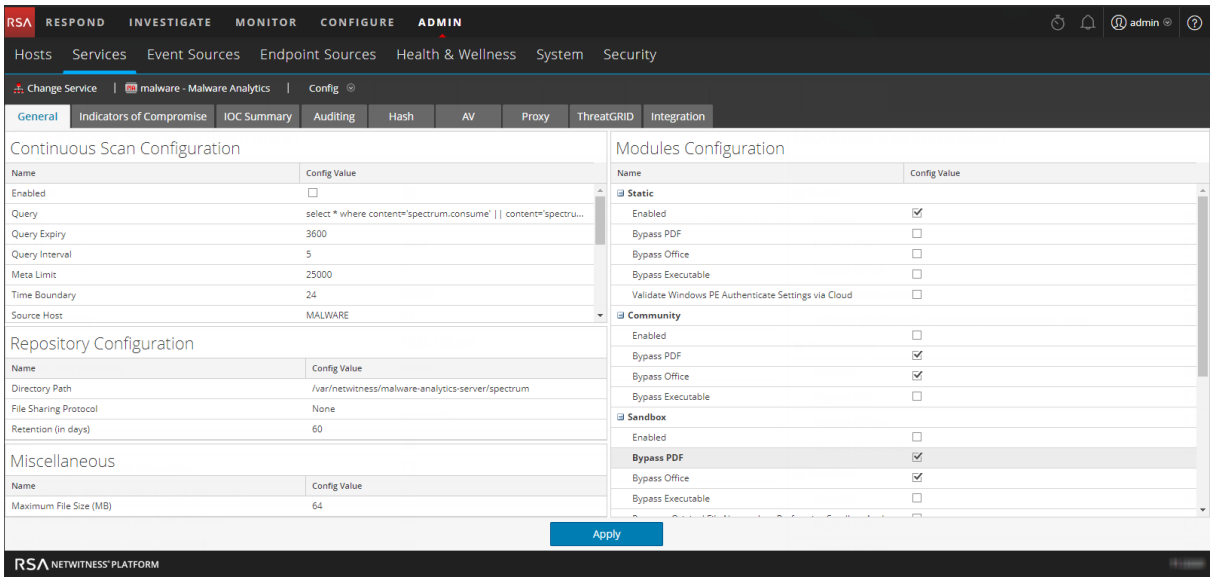
  Note: When adding a Core service as a service for continuous polling on 10.3.5 and earlier Malware Analysis, use the REST port; for example, add a Concentrator to 10.3.5 Malware Analysis with REST port (50105) instead of the native NexGen port (50005).

- **On-Demand Analysis of the Core service:** You can analyze sessions based on Investigations initiated directly in NetWitness Platform. This method allows manually controlled consumption of Core sessions and allows tighter control over how files in those sessions are processed (for example, send to sandbox for processing). Document types can bypass the default restrictions and be sent to community or sandbox processing regardless of the configured setting.
- **Manual File Upload:** You can manually upload one or more files for analysis by navigating to a visible folder on your computer and selecting files to be uploaded. The maximum size for the uploaded files is configurable.

View the Basic Settings

To view the basic settings:

1. In the **main menu**, select **ADMIN > Services**.
2. In the **Services** grid, select a Malware Analysis service and click **> View > Config**.
   The Service Config for the service is displayed with the **General** tab open.



Configure Continuous Polling

Malware Analysis is rate limited so that 1,000 files per day may be submitted to ThreatGRID's Cloud for sandbox processing. To optimize your use of the sandbox, Malware Analysis configuration allows you to choose which of several methods of consumption Malware Analysis uses; you can enable or disable continuous polling.

An important consideration when configuring continuous polling is the Denial of Service (DOS) Prevention parameters. By default this feature is disabled because you need to carefully consider the settings for your environment before enabling the feature.

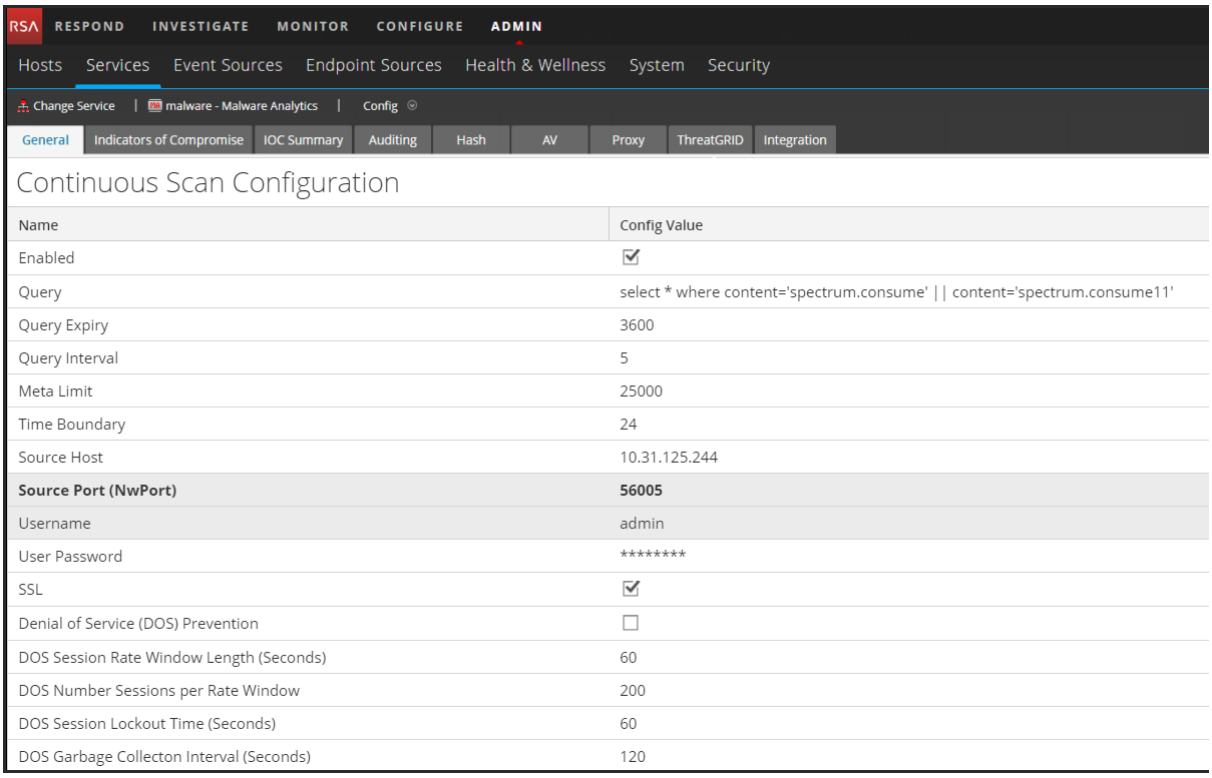
When DOS Prevention is disabled, Malware Analysis analyzes the queued sessions in first-in first-out order. A DOS attack may rapidly fill the queue so that Malware Analysis is busy handling those sessions, while a malware attack is occurring in a later session. The later session with the actual attack may not reach the beginning of the queue and undergo analysis until after the attack has begun.

When DOS Prevention is enabled, Malware Analysis treats too many sessions from a single IP address as a DOS attack. If an IP address exceeds the Number of Sessions per Rate Window, Malware Analysis begins to disregard sessions from that address until the Session Lockout time is reached. Then Malware Analysis resumes analysis of the sessions from that IP address. The disregarded sessions from the IP address are not analyzed at all, so a malware attack may slip through during the Session Lockout period.

Using the DOS Garbage Collection Interval setting, Malware Analysis clears in-memory storage of an IP source after a specified number of seconds. IP addresses with little activity during this interval are cleared from memory. If an IP address is active at intervals that exceed the DOS Garbage Collection Interval, Malware Analysis may not identify it as a DOS attack.

To configure Malware Analysis for continuous polling, in the Continuous Scan Configuration section:

1. Under **ADMIN**, click **Services**.
2. In the **General** tab, under **Continuous Scan Configuration** you can configure continuous polling.



3. To enable continuous polling, click **Enabled**.
4. (Optional) If you want to change the default values for querying, enter new values for the **Query Expiry**, **Query Interval**, **Meta Limit**, and **Time Boundary**.
5. To configure the Malware Analysis appliance that Malware Analysis queries to retrieve data for analysis, specify the **Source Host** and **Source Port (NwPort)**.
6. (Optional) If you want to change the default logon credentials for the Malware Analysis appliance, specify the **Username** and **User Password**.
7. If you want to use SSL for communication between the Malware Analysis appliance and the Core service, enable **SSL**.
8. (Optional) If you want to configure Denial of Service (DOS) prevention:
   a. Enable the **Denial of Service (DOS) Prevention** parameter.
   b. Set up the DOS prevention session limitations:
      - Specify the number of seconds of the time window during which Malware Analysis counts sessions for a single IP address (**DOS Session Rate Window Length**). The window is called a Rate Window and a counter is set when the first session is received from that IP source. The default value is 60 seconds.
      - Specify the number of sessions allowed per Rate Window in the **DOS Number Session per Rate Window**. The default value is 200 sessions. When the number of sessions is reached within the Rate Window; Malware Analysis begins disregarding sessions from the IP address

and the disregarded sessions from that IP are not analyzed at all. Malware Analysis continues to disregard sessions until the lockout time is reached.

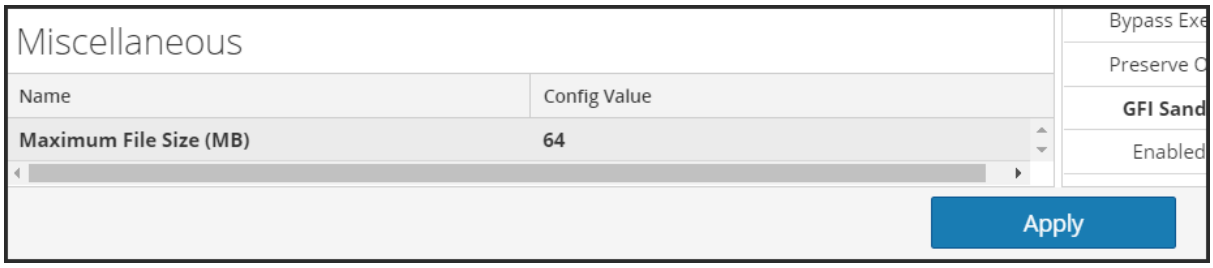
- Specify the length of lockout time (during which sessions from the IP address are disregarded and not analyzed) in the **DOS Session Lockout Time (Seconds)**. The default value is 60 seconds. When the lockout duration has elapsed, Malware Analysis resumes analysis of sessions from that IP address.
- Specify the interval of inactivity for an IP address before NetWitness Platform removes the in-memory object for the IP source in **DOS Garbage Collection Interval (Seconds)**. The default value is 120 seconds.

9. Click **Apply** to apply the changes.
   The applied changes become immediately effective as Malware Analysis receives new packets.
10. Test the connection of the Malware Analysis service to the Core service selected in the **Integration** tab by clicking the **Test Connection** button in the **Continuous Scan Connection Test** section.

Configure Manual File Upload Settings

To configure the maximum file size for manual file upload:

1. In the Miscellaneous section, type the maximum file size in Megabytes allowed for files uploaded manually for Malware Analysis scanning.



2. Click **Apply**.
   The changes become immediately effective.

Configure the Data Repository

Malware Analysis can store a finite number of files on the appliance. The data repository configuration has a file system retention period of 60 days. This setting determines how long files are retained in the Malware Analysis appliance. When old files are deleted, they cannot be recovered. Every day, Malware Analysis deletes files that exceed the file system retention period to ensure that there is no wasted disk space.

The File System Retention Period is the only setting that governs when files are deleted. Files are not deleted based on the amount of disk space being used. If the setting needs to be changed, the administrator must configure the retention period based on the anticipated space usage during the number of retention days specified.

The visible data repository parameters in the NetWitness Platform user interface are:

- The location of the repository is **/var/lib/netwitness/malware-analytics-server/spectrum**. Do not edit this value.
- The file sharing protocol, which allows access through one of the File Sharing Protocols to copy files from the Malware Analysis service.
- The file retention period in number of days.

To configure file sharing, in the Repository Configuration section:

1. Click on the File Sharing Protocol and select **FTP** or **SAMBA** or **None**.
2. Select the number of days that files are maintained in the repository before deletion.
3. Click **Apply.**

The changes become immediately effective.

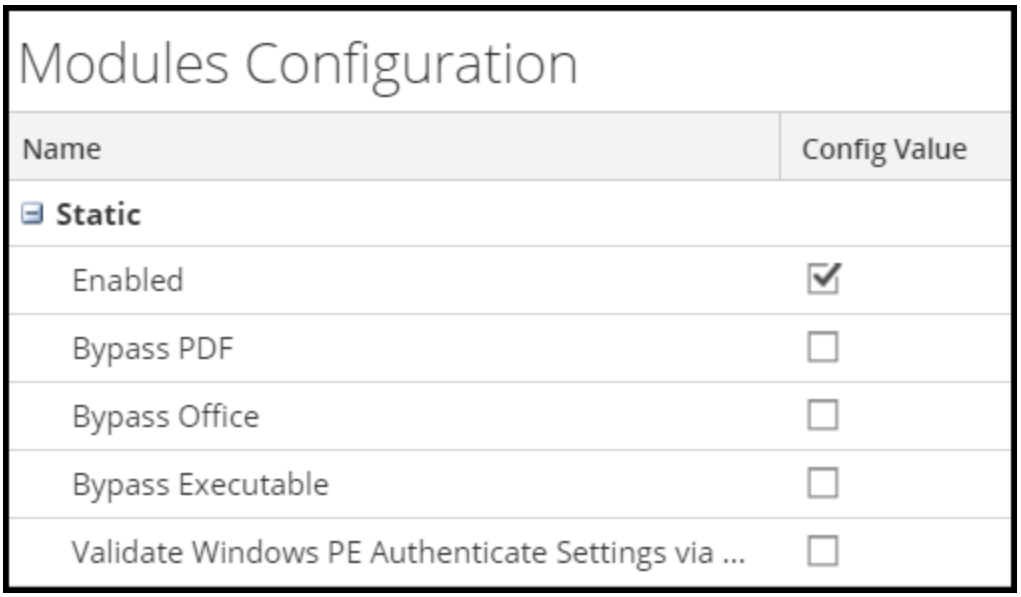
Calibrate Scoring Modules

The Modules Configuration section helps configure the following components of Malware Analysis to:

- Completely disable any or all of three scoring modules (Static, Community, and Sandbox). Before disabling or enabling any scoring module, ensure that you understand what each scoring module detects.
- Malware Analysis tags sessions containing Microsoft Office, Windows PE, and PDF files for consumption by the Malware Analysis service. You can configure Malware Analysis to ignore Windows PE, Microsoft Office, and PDF documents entirely. If this is the case, a better option is to adjust your Core settings to ignore these files so they are not tagged for Malware Analysis consumption.

A sample application for using scoring module calibration is this: when setting up rule groups or analyzing system performance, you can test various scenarios in which PDF documents are not analyzed, but Microsoft Office and Windows PE documents are. You can test the scenario in each of the three scoring modules. If you see a measurable improvement in system performance, you can apply this knowledge on a broader scale.

Configure Static Analysis Scoring



To configure Static analysis scoring, in the **Modules Configuration** section:

1. By default the Static module is enabled. To enable or disable Static analysis entirely, click the **Enabled** checkbox.
2. To configure handling of PDF, Microsoft Office, and Windows PE files in a session, select any of the checkboxes **Bypass PDF**, **Bypass Office**, and **Bypass Executable**.
3. To configure your preference for Authenticode validation of digitally signed Windows PE files, click the **Validate Windows PE Authenticate Settings via Cloud** checkbox. If you want to prevent Windows PE files that are digitally signed from being transmitted to the RSA Cloud for validation, remove the check.
   When disabled, ALL static analysis is performed locally (skipping Authenticode validation). Regardless of this setting, PDF and MS Office documents are not subject to Authenticode validation and are not transmitted over the network during static analysis.
4. Click **Apply.**The changes become immediately effective as Malware Analysis receives new packets.

Configure Community Analysis Scoring

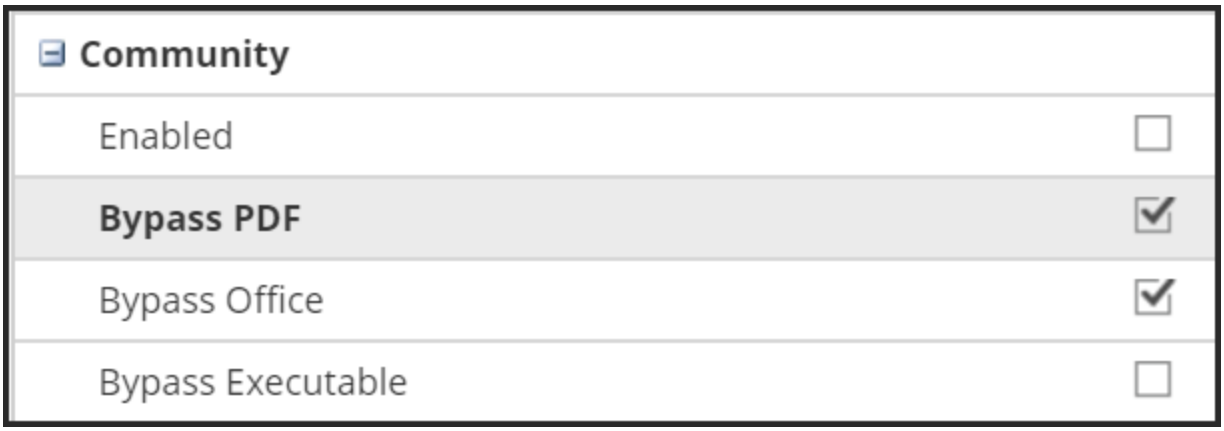
Once the Community module is enabled, the security community analyzes all documents not prevented from processing. This is achieved by sending network session and file attributes to the RSA Cloud for processing. The RSA Cloud then may make external connection to security community partners as needed to process the information.

The file content is never sent to the community for analysis. Instead, the MD5/SHA-1 hash of the file is sent for Anti-Virus detection and Blacklisting. Similarly, session Meta is harvested and analyzed as part of this process. Meta elements such as URL and Domain Name are examined and transmitted to the RSA Cloud to identify known bad URLs/Domains.

You can enable Community analysis and limit which document types are processed. There is no risk for the file content (except for a hash) being sent outside of your network.

Note: To gain access to the RSA Cloud where processing occurs, you must register your Malware Analysis service with RSA customer service. There are two methods: register the service using the options in the Integration tab or contact RSA Customer Care.

To configure Community analysis scoring, in the Modules Configuration section:



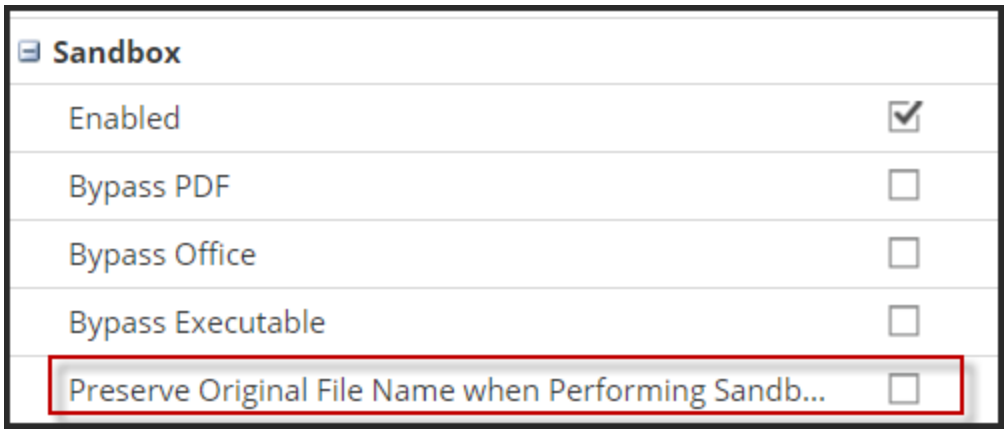
1. To enable or disable Community analysis entirely, click the **Enabled** checkbox. The default value is **Disabled**.
2. To configure handling of PDF, Microsoft Office, and Windows PE files in a session, select the specific checkboxes - **bypasspdf**, **bypass office, bypass executable.**
3. Click **Apply** to save the changes and put them into effect immediately as Malware Analysis receives new packets.

Configure Sandbox Analysis Scoring

By default, the sandbox module is disabled and MS Office and PDF files are prevented from being processed. The intent is to set to the most restrictive settings to force the user to specify whether or not potentially sensitive information is sent outside of the network for processing. If a document type is not prevented from being processed, the entire file (not just the hash) is sent to the destination sandbox server.

In addition, you can choose to preserve the original file name when performing sandbox analysis.

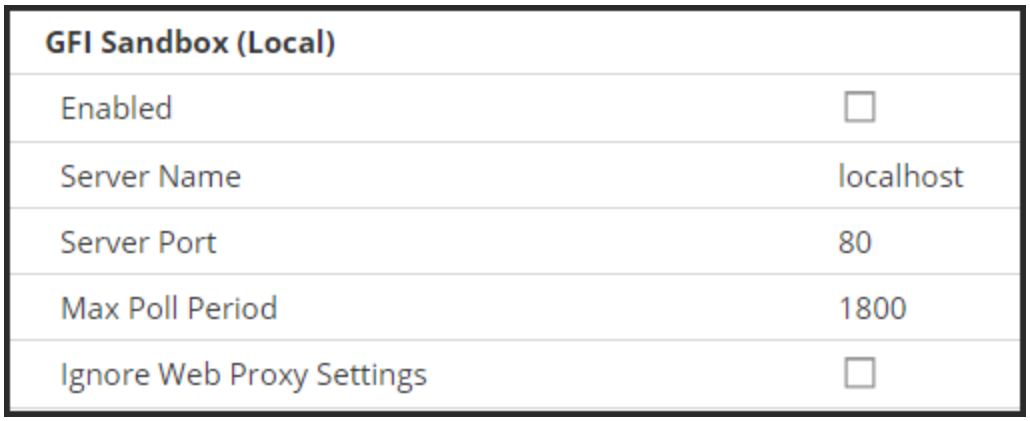
Note: If you do not specify the **Preserve Original File Name when Performing sandbox Analysis** parameter, NetWitness Platform hashes the files.



When you enable the sandbox module, you must specify whether or not the sandbox processing is performed using a local GFI sandbox, a local ThreatGRID sandbox, or a cloud version of the ThreatGRID sandbox. The cloud version of the ThreatGRID sandbox is provided directly by ThreatGRID and requires an activation key to be obtained from ThreatGRID and configured in the ThreatGRID tab.

GFI Sandbox Settings

To use a locally installed GFI sandbox, you must enable GFI and supply the Server Name and Server Port of the GFI sandbox Server. The Max Poll Period and Polling Interval determine how long to wait for a submitted sample to finish processing and how often to check the status (in seconds). The Ignore Web Proxy Settings option allows you to indicate that you want Malware Analysis to bypass a web proxy when making this connection. If no Web Proxy has been configured in Malware Analysis, the setting is ignored.



ThreatGRID Sandbox Settings

Note: Before enabling ThreatGRID scoring, a ThreatGRID-supplied Service Key must be configured so that ThreatGRID can recognize that samples submitted from this site are legitimate. Use NetWitness Platform to register for a ThreatGRID API key, then you can enable and configure a locally installed ThreatGRID sandbox or the ThreatGRID Cloud sandbox. Refer to the following detailed task: Register for a ThreatGRID API Key.

The Ignore Web Proxy Settings allows you to indicate that you want Malware Analysis to bypass a web proxy when making this connection. If no Web Proxy has been configured in Malware Analysis, the setting is ignored.

To configure sandbox scoring, in the Modules Configuration section:

1. To enable or disable sandbox analysis entirely, click the **Enabled** checkbox. The default value is **Disabled**.
2. To configure handling of PDF, Microsoft Office, and Windows PE files in a session, select any of the three checkboxes **Bypass PDF**, **Bypass Office, Bypass Executable.**
3. Configure the active sandbox vendor. You have three options:
   a. To use a locally installed instance of the GFI sandbox, provide the Server Name and Server Port of the GFI sandbox Server, the Max Poll Period and Polling Interval, and optionally, select the **Ignore Web Proxy** checkbox.
   b. To use a locally installed instance of ThreatGRID, enable ThreatGRID scoring, provide the ThreatGRID Service Key and optionally, select the **Ignore Web Proxy** checkbox.
   c. To use the ThreatGRID Cloud, you must first register for a ThreatGRID API key. Then enable ThreatGRID scoring, provide the ThreatGRID Service Key, enter the URL for the ThreatGRID server (https://panacea.threatgrid.com), and optionally, select the **Ignore Web Proxy** checkbox.
4. Click **Apply**.
   The changes become immediately effective.

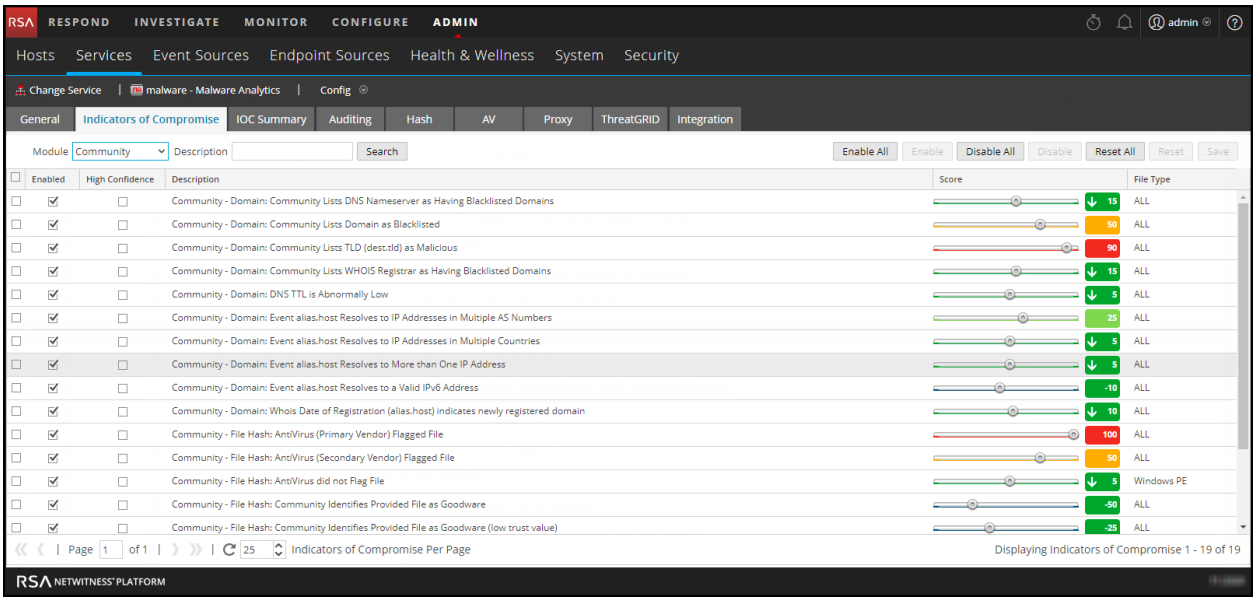
Configure Indicators of Compromise

The Indicators of Compromise (IOC) for the Malware Analysis scoring modules are configured since, each Malware Analysis scoring module -- Network, Static, Community, Sandbox, and YARA -- has a default set of Indicators of Compromise (IOCs) that it uses to evaluate the file and session data in order to assess the likelihood of malware being present.

Each IOC is assigned a numeric score weighting between -100 (good) and 100 (bad). When an IOC triggers, the numeric score weighting is factored into the total score for the session or file being analyzed. The individual score weightings for all matched IOCs are aggregated to produce the resulting score for each session or file. The aggregated score is adjusted to ensure that it does not exceed the valid score range (-100 through 100).

Note: The score weighting assigned to an IOC is not always the explicit score value that is aggregated (it is not a simple addition of score weights for each IOC that triggers). Instead, the IOC's score is a weighting or indicator of importance that is factored into calculating an overall score.

The Indicators of Compromise (IOC) configuration settings for Malware Analysis are in the Service Config view > Indicators of Compromise tab. Below is an example of the tab.



Using the **Community - File Hash: AntiVirus (Primary Vendor) Flagged File** IOC as an example, the IOC's score weighting could be set to 100. However, Malware Analysis dilutes this value based on the percentage of primary AV vendors that agree if the sample is malicious. The closer to 100% of the vendors who agree that the sample is malicious, the closer to the full 100 points are used in aggregating a score. As the percentage drops closer to 0%, the proportion of the full 100 points used in the aggregated score drops.

IOCs use logic implemented natively in Malware Analysis. You cannot adjust the logic. Instead, you can only adjust the IOC to increase or decrease its impact on scoring, to indicate a confidence setting, or to turn the IOC on or off. The typical scenario is to adjust a limited set of IOC score weighting values downward for IOCs that are inflating the final score and causing false positive analysis results. An extreme version of tuning would be to disable the IOCs entirely if they consistently contribute to false positive results. Additionally, the flexibility exists to allow you to disable all IOCs and to choose a select few to leave enabled. For example, all IOCs can be disabled with the exception of a select few IOCs that detect AntiVirus matches. Using Malware Analysis in this extremely limited configuration, you can reduce results in Malware Analysis such that only known A/V matches generate results.

You can configure this functionality in several ways:

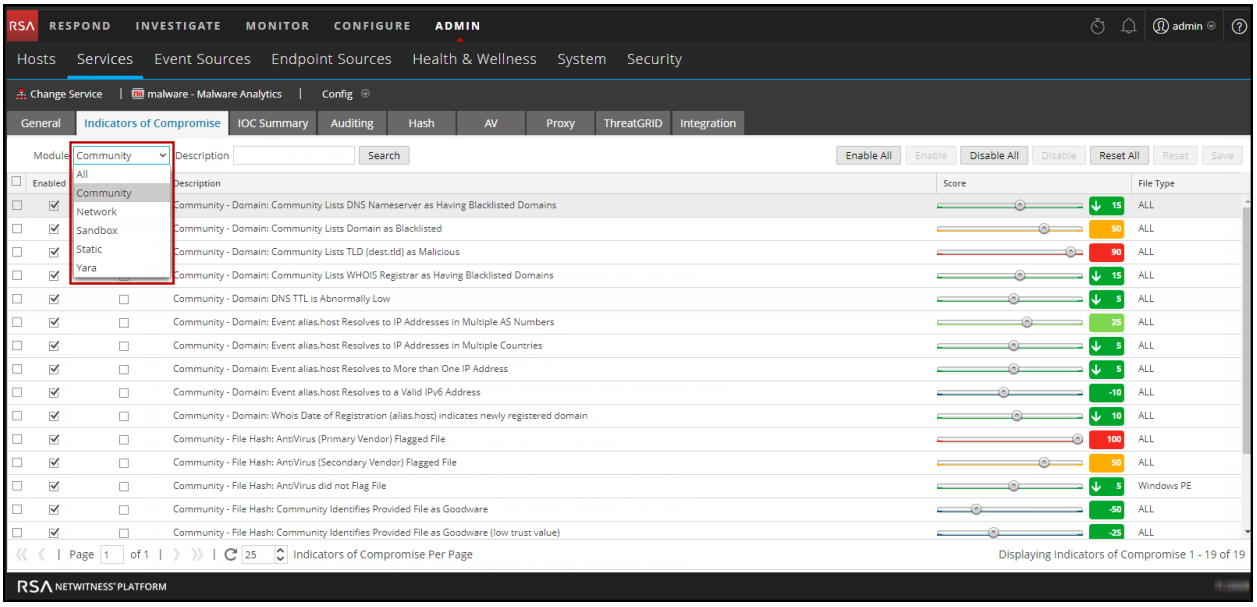
- Disable IOCs so that they are not evaluated as part of the scoring module to which they are assigned.
- Adjust the score weight for an IOC such that its impact on the aggregated score is increased or decreased.
- Mark IOCs that you expect to be strong indicators of malware and display a high-confidence (HC) flag on sessions that triggered these IOCs in the Malware Analysis results.
- Customize score and confidence settings uniquely to the file type being analyzed. Each IOC is pre-assigned a file type to which it is applied. Possible values are **ALL**, **PDF**, **MS Office**, and **Windows PE**. The IOC with the most applicable file type is used during file-based analysis. For example, if a PDF is analyzed, an IOC with a file type set to **PDF** will be chosen rather than the same IOC with a file type set to **ALL.** If no file-type specific match is found, the IOC with a file type set to **ALL** is selected.
- Search for rules to display in the grid based on a match to the rule description.

Filter Displayed IOCs by Module

You can filter the displayed IOCs by scoring module: one of the four built-in modules or YARA. YARA-based IOCs are interleaved with the native IOCs with each category. Although the YARA IOCs are not identified as such in the other views, you can select YARA from the Module selection list to see a list of YARA rules.

To view the IOCs for one or the four scoring modules or for YARA:

1. In the **main menu**, select **ADMIN** > **Services**.
2. Select a Malware Analysis service.
3. In the row, select **> View > Config**.
4. Click the **Indicators of Compromise** tab.
5. In the **Module** selection list, select **All**, **NextGen**, **Static**, **Community**, **Sandbox**, or **YARA**.
   The configured rules and settings for the module are displayed.



Filter Displayed Modules to Show Only Modified Modules

The **Indicators of Compromise** tab visually identifies IOCs that are locally modified. When an IOC has been modified, for example, the score weight has been changed, and the name is displayed in red and includes a modification indicator appended to the IOC name. The modification indicator is ++ and can be used as a filtering mechanism when searching for IOCs.
To limit the display to locally modified IOCs:

1. In the **Description** field, enter ++.
2. Click **Search**.
   The view is filtered to show only modified IOCs.

Enable and Disable IOCs for a Scoring Module

When an IOC is disabled, it no longer impacts the aggregate score for the scoring module to which it belongs. If the IOC has multiple instances (differentiated only by file type), disabling a more file-type specific IOC results in use of the more file-type agnostic version of the IOC in scoring.
For example, if the same IOC exists as file type **ALL** and file type **Windows PE**, disabling the **Windows PE** instance of the IOC causes the **ALL** version to be used in scoring. In order to disable the IOC entirely for **Windows PE**, while leaving the IOC enabled for other file types, set the score weighting of the **Windows PE** instance of the IOC to a value of zero as described below. This leaves the IOC enabled for Windows PE files (although it has a zero weighting and is suppressed from being displayed in analysis results), while not affecting the other file types. The remaining file types will continue to use the **ALL** instance of the IOC.

To enable or disable an IOC so that it no longer factors into a scoring module:

1. In the **main menu**, select **ADMIN** > **Services**.
2. Select a Malware Analysis service, and in the row select > **View** > **Config**.
3. Click the **Indicators of Compromise** tab.
4. In the **Module** selection list, select a scoring module: **All**, **Community**, **Network**, **Sandbox**, **Static**, or **YARA**.
   The configured rules and settings for the module are displayed.
5. Do one of the following:
   a. Click the **Enabled** checkbox in the column next to a rule that you want to enable.
   b. Select one or more rules, and click **Enable** or **Disable** in the toolbar.
   c. To toggle between Enabled and Disabled for all rules displayed on the page, click the **Enabled** checkbox in the column title.
   d. To enable or disable all rules for the scoring module, click **Enable All** or **Disable All** in the toolbar.
6. To save the changes to the page, click **Save** in the toolbar.

> **Note:** Rules that have changed settings are displayed with a red corner. If you navigate to another page of rules before saving, all changes to this page are lost.

Adjust the Score Weight for an IOC

Adjusting the score weight for an IOC increases or decreases the IOC's overall impact on the aggregate score for the module in which it is configured. To raise or lower the overall impact of the IOC, reduce the current value to a new setting.

- Values ranging from -100 to -1 indicate that the session or file being analyzed is not likely to be malware (-100 being the least likelihood).
- Values ranging from 1 to 100 indicate a likelihood that the file or session being analyzed is malware (100 being the highest likelihood).
- Setting the value to zero leaves the IOC enabled, but causes the IOC to no longer impact the aggregate score and suppresses the IOC from being displayed in analysis results. Setting the value to zero is a method of disabling a file-type specific instance of an IOC while leaving the original file-type agnostic instance of the rule intact for scoring of the remaining file types.

To adjust the score weight:

1. In the **main menu**, select **ADMIN** > **Services**.
2. Select a Malware Analysis service.
3. In the row, select **> View > Config**.
4. Click the **Indicators of Compromise** tab.
5. In the **Module** selection list, select a scoring module: **All**, **Network**, **Static**, **Community**, **Sandbox** or **YARA**.
   The configured rules and settings for the module are displayed.
6. Do one of the following:
   a. Drag the score slider left or right to decrease or increase the score weight.
   b. Click directly on the displayed score weight and enter a new score weight.
7. To save the changes to the page, click **Save** in the toolbar.

Note: Rules that have changed settings are displayed with a red corner. If you navigate to another page of rules before saving, all changes to this page are lost.

Set the High Confidence Flag for an IOC

The High Confidence setting is used as a method of flagging specific IOCs as high confidence indicators that malware is present. As an example, the **Community - File Hash: AntiVirus (Primary Vendor) Flagged File** IOC has a low probability of being a false positive, combined with a high probability of being an accurate measurement of malware being present. By flagging this IOC (and others) as High Confidence, you can use a filter in the Malware Analysis results to limit display to only those sessions that include one or more high confidence rules. By doing so, the display is limited to a smaller subset of results whose accuracy is accorded a higher degree of confidence. Displaying results not limited to high confidence IOCs still allows you to review results that are more grey in nature. This provides for results that are less prone to false negative results. Choosing to filter or to not filter results based on confidence level has a valid use case in the NetWitness Platform workflow.
To set the High Confidence flag:

1. In the **Indicators of Compromise** tab, select a scoring module from the **Module** selection list: **All**, **Network**, **Static**, **Community**, **Sandbox**, or **YARA**.
   The configured rules and settings for the module are displayed.
2. Click the **High Confidence** checkbox in the column next to a rule that you want to flag or unflag as highly likely to indicate the presence of malware in a session when matched.
3. To save the changes to the page, click **Save** in the toolbar.

Note: Rules that have changed settings are displayed with a red corner. If you navigate to another page of rules before saving, all changes to this page are lost.

Reset IOCs to Default Settings

1. In the **Indicators of Compromise** tab, select a scoring module from the Module selection list: **All**, **Network**, **Static**, **Community**, **Sandbox**, or **YARA**.
   The configured rules and settings for the module are displayed.
2. If you want to reset all rules on the current page to their default settings, click **Reset** in the toolbar.
3. If you want to reset all rules for the selected scoring module to default settings, click **Reset All** in the toolbar.
4. To save changes to the page, click **Save** in the toolbar.

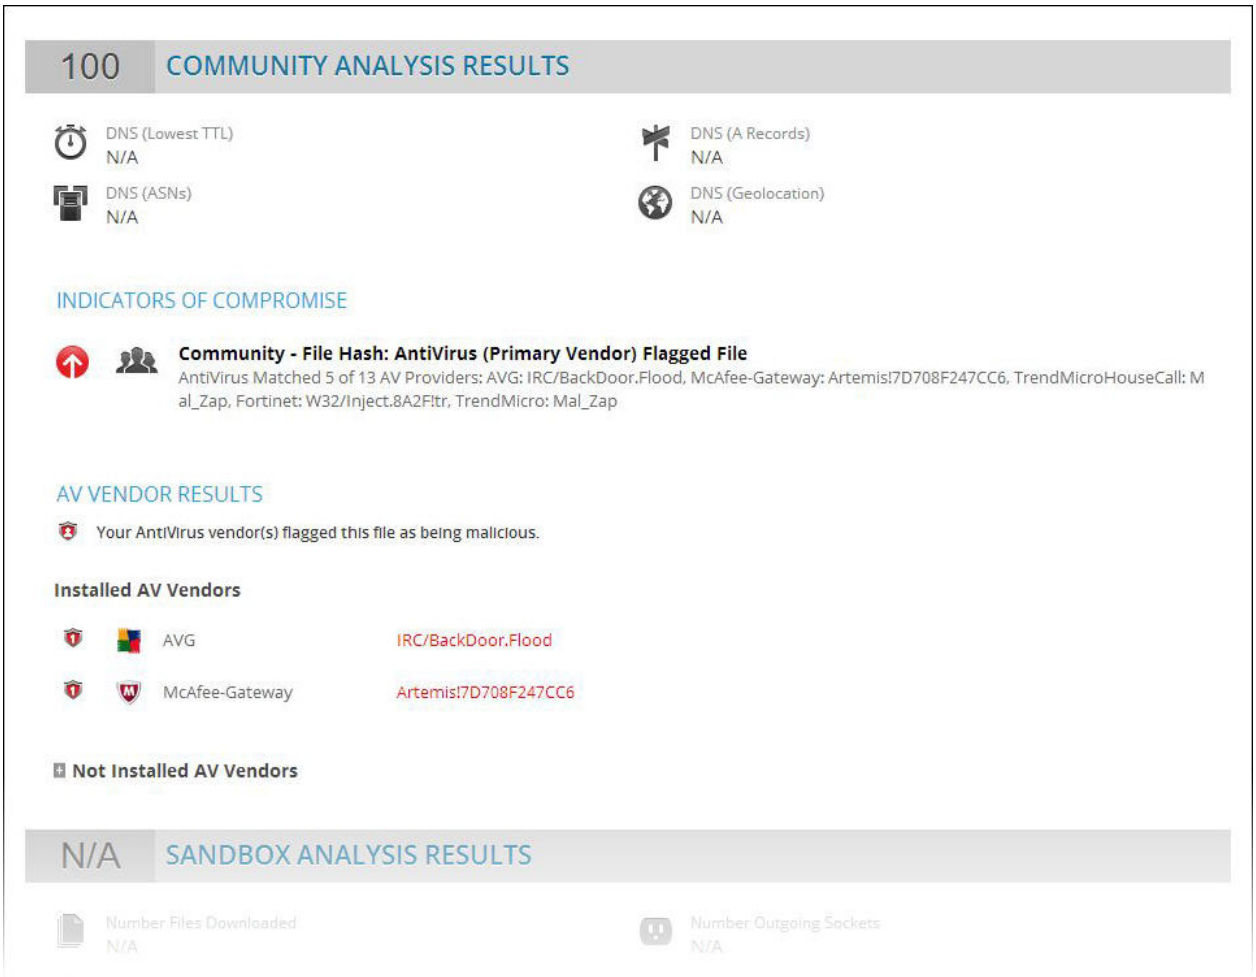
Configure Installed Antivirus Vendors

You can compare file analysis results from your installed antivirus (AV) vendors versus community results from the Malware Analysis knowledge base. While a file is being analyzed by community analysis, Malware Analysis checks an antivirus knowledge base to determine if the sample is already known to be malicious. If the file is known to be malicious, NetWitness Platform flags the file to indicate whether a primary antivirus vendor or a secondary antivirus vendor identified the sample. NetWitness Platform classifies vendors as primary and secondary to indicate the level of reputation the vendors have in the industry, and Indicators of Compromise factor the reputation into scoring. For example, detection made solely by secondary antivirus vendors may score less than detection by primary vendors.

Note: When choosing AV vendor software to install on your network, it is highly recommended that you include at least one from NetWitness Platform Primary Vendors list.

You can identify the antivirus vendors installed on your network to NetWitness Platform. NetWitness Platform compares the antivirus results during community analysis against the results from the installed vendors selected in the AV tab. If a match is detected, the file being analyzed is flagged to indicate that your locally installed primary or secondary antivirus software detected the sample.

The example below shows the community analysis results for a file that had a score of 100. Under **Indicators of Compromise**, you can see that the file was flagged by the listed AV vendors in the Community. Under **AV Vendor Results**, NetWitness Platform indicates whether the AV vendors installed in your environment flagged the file as malicious. If your installed AV vendors detected the virus, the name of the malware is displayed. If your installed AV vendors did not detected the virus, **--Not detected--** is displayed next the AV vendor name. Under **Not Installed Vendors**, you can click + to expand the section and see if other vendors not installed on your system detected the virus.



Identify Installed AV Software

To identify Antivirus software installed on your network:

1. Go to **ADMIN > Services.**
2. Select a Malware Analysis service, and in the row select > **View** > **Config**.
3. In the **Service Config View**, select the **AV** tab.
4. Select the checkbox next to each antivirus vendor (primary and other) whose software is installed on your network.
5. To save the changes, click **Apply**.
   The Community Analysis results will indicate whether your software flagged an event.
6. (Optional) If you want to reset the list of installed AV software to the default value (none), click **Reset**.
   All selections are removed.
7. To save changes, click **Apply**.

Enable Community Analysis

An Administrator can enable community analysis. For Community analysis, new malware detected on the network is pushed to the RSA Cloud for checking against RSA's own malware analysis data and feeds from the SANS Internet Storm Center, SRI International, the Department of the Treasury and VeriSign. To enable Community analysis, you must register with the RSA cloud and test connection to the cloud, then to test the connection between the RSA cloud and the service you have configured for continuous scanning.

A complete description of analysis methods is provided in How Malware Analysis Works.

1. Go to **ADMIN > Services.**
2. Select a Malware Analysis service, and in the row select **> View > Config**.
3. In the **Service Config View**, select the **Integration** tab.
4. Scroll down to **RSA Cloud Connection Test and Registration**.

   NetWitness Platform tests communications with the site at `https://cloud.netwitness.com`. If your company uses a proxy for outbound traffic, please check your Proxy settings. A valid connection is required in order to register with the RSA Community Service.
5. Enter your company name and contact email. Click **Register**.

   If all required fields are complete, your registration is completed. The label on the button used to register changes to Update.
6. To verify that the Malware Analysis Service can connect to the Core service selected for continuous scanning, click **Test Connection**.

   NetWitness Platform initiates a check based on the Source Host, Source Port, Username, and User Password specified in the General tab. When the test executes successfully, analysts are able to see Community Scoring in Malware Analysis.

(Optional) Configure Auditing on Malware Analysis Host

This topic introduces the configurable features of the Malware Analysis auditing log and the procedures for configuring the features. Malware Analysis is capable of generating auditing alerts based on configured score module thresholds. Once the analysis score for a file in an analysis session meets or exceeds the configured threshold(s), an auditing alert is generated. Thresholding allows sessions and files that score high enough to be likely malware candidates to automatically generate an alert.

Alerts can be configured to be formatted as SNMP, Syslog or File entries. Supporting various audit formats provides a method for external systems to ingest auditing events based on their capability of parsing the supported formats.

In addition to auditing analysis sessions, the following events will trigger an audit alert:

- User login successes and failures
- Changes to system configuration settings
- Server restart
- Server version upgrade and install

The Auditing configuration settings for Malware Analysis are in the Service Config view > Auditing tab.

Configure the Auditing Threshold

The sole purpose of the thresholds is to specify the criteria that must be reached prior to an alert being generated for an analyzed session/file. If auditing is enabled, each scored file/session is examined to determine if the score in each score module meets or exceeds the configured auditing threshold. If so, an alert is generated using the configured audit alert format (e.g., SNMP, Syslog or File). For example, by configuring SNMP and setting the Community Threshold to 90, all sessions/files that score 90 or higher in the Community Score module generate an SNMP trap. If all of the thresholds are set to 90, then an alert is not generated unless a session or file scores 90 or higher in the Network, Static, Community and sandbox score modules.

To configure the auditing threshold:

1. Go to **ADMIN > Services**.
2. Select a Malware Analysis service, and select **> View > Config**.
3. In the **Services Config** view, click the **Auditing** tab.
4. In the **Auditing Thresholds** section:
   a. Set the threshold for the **Community**, **Static**, **Network**, and **Sandbox** by doing one of the following for each scoring module:
      - In the slider, click and drag the handle in either direction.
      - In the value field, type a number between 0 and 100, inclusive.
   b. (Optional for 10.3 SP2) Select one or more triggers to record a message and deliver it through all enabled auditing methods.
   c. Click **Apply**.
      - The threshold setting becomes effective immediately for all enabled auditing methods: SNMP, File, and Syslog.
      - The recorded messages are sent through all enabled auditing methods: SNMP, File, and Syslog.

Configure Incident Management Alerting

When enabled, Malware Analysis alerts feed into the NetWitness Respond workflow.

1. Go to **ADMIN > Services**.
2. Select a Malware Analysis service, and select select **> View > Config**.
3. In the **Services Config** view, select the **Auditing** tab.
4. In the **Respond Alerting** section, select the **Enabled** checkbox and click **Apply**.
   Alerting becomes effective immediately.

Configure SNMP Auditing

The Simple Network Management Protocol (SNMP) is an Internet-standard protocol for managing services on IP networks. When SNMP auditing is enabled, Malware Analysis can send an audit event as an SNMP trap to a configured SNMP trap host. In addition to the score and event ID, the alert includes all session meta as well as generated meta data. This is useful for users who want to feed event data to third-party systems.

To configure SNMP auditing:

1. Go to **ADMIN > Services**.
2. Select a Malware Analysis service, and select **> View > Config**.
3. In the **Services Config** view, select the **Auditing** tab.
4. In the **SNMP Auditing** section, click the checkbox to enable SNMP auditing.
5. Configure the SNMP server name and port.
6. Configure the SNMP version and trap OID for sending traps.
7. Configure the Malware Analysis community, and retry and timeout parameters when sending traps.
8. Click **Apply**.
   The SNMP auditing settings become effective immediately.

Configure File Auditing Settings

When file auditing is enabled, the audit log file is kept in the Malware Analysis Home Directory. The default location for this log file is:

`/var/lib/netwitness/malware-analytics-server/spectrum/logs/audit/audit.log`.

As each log reaches the maximum file size, it is archived and a new log is created. The size of these audit logs and their number are both configurable.

Caution: Avoid setting the max file size and archive file count too high, because it may have an adverse effect on the available disk space on the Malware Analysis appliance.

To configure the file auditing settings:

1. Go to **ADMIN > Services**.
2. Select a Malware Analysis service, and select **> View > Config**.
3. In the **Services Config** view, select the **Auditing** tab.
4. In the **File Auditing** section, click the checkbox to enable file auditing.
5. (Optional) Set the Archive File Count and Max File Size.
6. Click **Apply**.
   The file auditing settings become effective immediately.

Configure Syslog Auditing Settings

When enabled, Syslog provides auditing through the use of the RFC 5424 syslog protocol. Regulations, such as SOX, PCI DSS, HIPAA, and many others are requiring organizations to implement comprehensive security measures, which often include collecting and analyzing logs from many different sources. Syslog has proven to be an effective format to consolidate logs, as there are many open source and proprietary tools for reporting and analysis.

In addition to the score and event ID, the syslog includes all session meta as well as generated meta data. This is useful for users who want to feed event data to third-party systems.

To configure the syslog auditing settings:

1. Go to **ADMIN > Services**.
2. Select a Malware Analysis service, and select **> View > Config**.
3. In the **Services Config** view, select the **Auditing** tab.
4. In the **Syslog Auditing** section, click the checkbox to enable syslog auditing.
5. Configure the host where the target syslog process is running and the port on the host where the syslog process is listening.
6. Configure the facility, encoding, format, max length, and timestamp for outgoing syslog messages.

   Note: (Optional) Configure Identity String to prepend to syslog alerts.
   For CEF format, please refer to Create Custom Alert in CEF Format for additional considerations.
7. Click **Apply**.

   The syslog auditing settings become effective immediately.

(Optional) Configure Hash Filter

This topic introduces hash filters as a method of marking files in Malware Analysis that are known to be good or known to be bad. Hash filtering allows you to maintain a list of known good or known bad file hashes. In the Hash tab, you can fine tune Malware Analysis event analysis based on file hashes. When a file hash is marked as Good, Malware Analysis does not analyze the file the next time it is seen. When a file hash is marked as Bad, Malware Analysis automatically raises the file's community score by a large number of points. Malware Analysis still analyzes the file, just in case new information becomes available.

Note: If an event contains a single file and that file's hash is marked as Good, Malware Analysis filters the entire event and you do not see it in Malware Analysis results.

To add hash filters to the hash list, you can use either of these manual methods:

1. Context menu add in the Event Detail view: Right-click on a file, and a context menu allows marking of the hash for the selected file as Good (Normal) or Bad (Malicious).
2. Hash tab toolbar: Click **Add** in the Hash tab to add a file hash, file size, and optionally, mark the hash as trusted.

There is also an automated method to add hash filters to Malware Analysis by importing a hash list in bulk from the watched folder. Hashes imported through the watched folder do not appear in the hash list. With bulk importing and the watched directory (/var/netwitness/malware-analytics-server/spectrum/hashWatch) on the Malware Analysis server set up, copy a hash list into the watched folder to be automatically imported into the system. Hashes imported using the bulk import method overwrite hashes that were previously imported through the watched folder.

View the Hash List

To view the Hash List:

1. Go to **ADMIN > Services**.
2. In the Services view, select a Malware Analysis service, and select **> View > Config**.
3. Select the **Hash** tab.

   The hash list is displayed in the Hash tab. Only file hashes that have been added using one of the methods are displayed.

Add a File Hash to the Hash Filter

To add a file hash to the hash filter:

1. In the **Hash** tab, in the toolbar, click **Add**.

   The Add Hash dialog is displayed.
2. If the hash is trusted, select **Trusted**.
3. Enter the MD5 hash and the file size in bytes.
4. Click **Save**.

   The file hash is added to the hashes and used to perform hash filtering in Malware Analysis.

Mark a Hash as Trusted or Untrusted

To mark a file hash as trusted or untrusted:

1. In the **Hash** tab, to toggle between trusted and untrusted, click in the **Trusted** column for the hash.
2. In the toolbar, click **Save Edit**.

Delete a Hash from the Hash Filter

To delete a hash from the hash filter:

1. In the **Hash** tab, select one or more hashes that you want to remove from the hash filter.
2. In the toolbar, click **Delete**.

   A dialog requests confirmation and offers an opportunity to cancel.
3. To confirm the deletion, click **Yes**.

   The file hash is deleted from the grid and no longer used to perform hash filtering in Malware Analysis.

Search for a File Hash

In the Hash tab, you can search for a file hash that is displayed in the grid. In the MD5 field, type the file hash for which you are searching, and click **Search**. The list of files that contain the hash is displayed in the grid.

Import a Hash List Using the Watched Folder

To import a hash list from the watched directory, the hash list must be in the specified format and must be sorted on md5. You can drop a file formatted as described below into a folder (/var/netwitness/malware-analytics-server/spectrum/hashWatch) on the Malware Analysis appliance, and it is automatically imported into the local hash database. This is the only way to import file hashes into. An additional use case is to allow a system administrator to expose the watched directory to some process that would push a file to this directory. This is a bulk import method designed to handle a high volume of hash imports.

This is a csv-formatted file with no spaces between the data in each row. The assumption with the data in the hash list is that there are no duplicates. Duplicates are ignored during processing. If duplicate hashes are encountered, the log file will display the following message to indicate the number of duplicate hashes contained in the file:

2013-08-09 09:46:00,674 [jobExecutor-2(HashFileWatch)] INFO com.netwitness.malware.core.scheduler.jobs.HashFileWatch - Processing - /var/lib/rsa>malware/hashWatch/test.csv
2013-08-09 09:47:56,619 [jobExecutor-2(HashFileWatch)] INFO com.netwitness.malware.core.services.file.hash.HashServiceImpl - Skipped 21 Duplicate Hashes Already on File
2013-08-09 09:48:06,638 [jobExecutor-2(HashFileWatch)] INFO com.netwitness.malware.core.scheduler.jobs.HashFileWatch - Processed - /var/lib/rsa>malware/hashWatch/test.csv

Below is an example of a hash list in the default file format.

```
[BeginFileExample]
392126E756571EBF112CB1C1cdEDF926,98865,True
0E53C14A3E48D94FF596A2824307B492,2226,True
176308F27DD52890F013A3FD80F92E51,42748,False
9B3702B0E788C6D62996392FE3C9786A,32768,False
937ADE76A75712B7FF339403B4FCB5A6,4821,False
B47139415F735A98069ACE824A114399,1723,False
E6CAF205E602CFA9A65663DB1A087874,704,False
680CA0BCE1FC7BC4136ADF4E210869C5,2075,False
[EndFileExample]
```

A NetWitness Platform configuration file (**/var/netwitness/malware-analytics-server/spectrum/conf/hashFileWatchConfig.xml**) specifies the format and options in the hash list import process. Below is a listing of the configuration file.

```
<config>
 <enabled>true</enabled>
 <distributedCacheEnabled>true</distributedCacheEnabled>
 <watchDirectory>//var/lib/rsamalware/hashWatch</watchDirectory>

<processedDirectory>/
var/lib/rsamalware/hashWatch/processed</processedDirectory>

<erroredDirectory>/
var/lib/rsamalware/hashWatch/error</erroredDirectory>
 <md5Col>0</md5Col>
 <fileSizeCol>-1</fileSizeCol>
 <isTrustedCol>1</isTrustedCol>
 <isTrust>false</isTrust>
 <ignoreFirstLine>false</ignoreFirstLine>
 <frequencyInMinutes>1</frequencyInMinutes>
 <isGzipCompressed>false</isGzipCompressed>
 </config>
```

Line	Description
<md5Col>0</md5Col>	The location of the md5 hash in each entry. The default value is position **0**, or the first position.
<fileSizeCol>1</fileSizeCol>	The location of the hash size in each entry. The default value is position **1**, or the second position. If the hash size is not included in the csv file, the value must be **-1**.
<isTrustedCol>2</isTrustedCol>	The location of the Trusted Column in each entry. The default value is position **2**. If the Trusted parameter is not included in the csv file, the value must be **-1**.
<isTrust>false</isTrust>	The default assumption for **Trusted** in each entry is **false**.
<ignoreFirstLine>false</ignoreFirstLine>	The presence or absence of a header in the hash. The default value is **false**. If the hash has a header, the value must be set to **true**.
<frequencyInMinutes>1</frequencyInMinutes>	The interval between checks by NetWitness Platform in the watched directory. The default value is **1** minute.
<isGzipCompressed>false</isGzipCompressed>	The hash is compressed using Gzip. The default value is **false**. If the hash is Gzip compressed, the value must be set to **true** here.

When the hash list has been imported, the system log has entries similar to this:

```
2013-04-11 03:22:00,597 [jobExecutor-9(HashFileWatch)] INFO
com.netwitness.malware.core.scheduler.jobs.HashFileWatch -
Processing - /var/lib/rsamalware/spectrum/hashWatch/simpleHash.csv
 2013-04-11 03:22:00,600 [jobExecutor-9(HashFileWatch)] INFO
com.netwitness.malware.core.scheduler.jobs.HashFileWatch - Processed
- /var/lib/rsamalware/spectrum/hashWatch/simpleHash.csv
```

If there is a problem loading the file, the system log has entries similar to this:

```
2013-04-11 03:17:00,597 [jobExecutor-4(HashFileWatch)] INFO
com.netwitness.malware.core.scheduler.jobs.HashFileWatch -
Processing - /var/lib/rsamalware/spectrum/hashWatch/simpleHash.csv
 ... Verbose log
 2013-04-11 03:17:00,632 [jobExecutor-4(HashFileWatch)] INFO
com.netwitness.malware.core.scheduler.jobs.HashFileWatch - Error
Processing - /var/lib/rsamalware/spectrum/hashWatch/simpleHash.csv
```

To import a hash list using the watched folder method:

1. Copy the hash lists that you want to import into the **/var/netwitness/malware-analytics-sever/spectrum/hashWatch** directory.
   Malware Analysis automatically watches this folder and processes files placed there.
   Malware Analysis adds every hash found in the hash lists to the hash filter.
   If there are processing errors, they are logged in **/var/netwitness/malware-analytics-sever/spectrum/hashWatch/error**
   Processed files are cataloged in **/var/netwitness/malware-analytics-sever/spectrum/hashWatch/processed**
   Processed files are not removed from the hashWatch directory.
2. After importing hashes in bulk, the System Administrator can use a cronjob to clean up old processed files.

(Optional) Configure Malware Analysis Proxy Settings

This topic describes the configuration of a web proxy for communicating with the RSA Cloud service and local ThreatGRID or GFI service. The settings in the Service Configuration view > Proxy tab set up communication by web proxy, which Malware Analysis can use to communicate with RSA Cloud for community analysis and sandbox analysis. Once the proxy is configured:

- Malware Analysis communicates via web proxy with the RSA Cloud for community analysis.
- Malware Analysis communicates via web proxy with the configured ThreatGRID or GFI sandbox service. Using a web proxy may negatively affect performance. ThreatGRID and GFI configuration sections in the General tab have an option to ignore the web proxy and communicate directly with the sandbox to improve performance.

Configure the Web Proxy

To configure the web proxy for Malware Analysis:

1. Go to **ADMIN > Services** view.
2. Select a Malware Analysis service, and select **> View > Config**.
3. In the **Services Config** view, select the **Proxy** tab.
4. To enable the proxy, select the **Enabled** checkbox.
5. (Optional) To automatically detect proxy settings for the NetWitness Server, select the checkbox.

The proxy host and proxy port fields are autofilled.

6. If you want to use a different proxy, enter the **Proxy Host** and **Proxy Port**.
7. Enter the username and password used to log on to the proxy host.
8. (Optional) Select **SSL**, if the proxy host communicates over SSL.
9. Click **Apply**.

   The settings are saved and become effective immediately.

Note: Malware Analysis does not support NTML web proxy authentication.

(Optional) Register for a ThreatGRID API Key

This topic provides the procedure for obtaining a trial ThreatGRID API key for use in the ThreatGRID Cloud sandbox. Before enabling ThreatGRID as the sandbox service in the sandbox module, a ThreatGRID-supplied Service Key must be configured so that ThreatGRID can recognize that samples submitted from this site are legitimate.

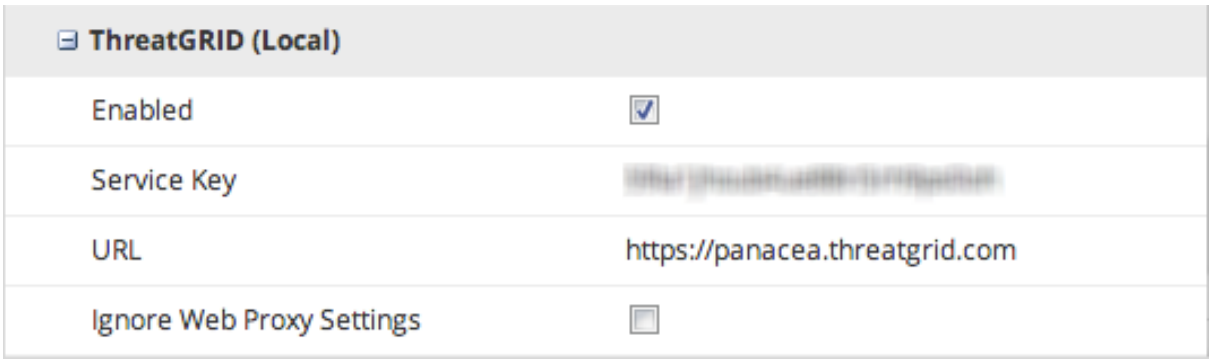
If you do not have a ThreatGRID-supplied Service Key, you can obtain a key using this tab. The key is provided on a trial basis.

When you fill in your user information and click **Register**, a key is displayed in this tab, and automatically added to the ThreatGRID configuration in the **General** tab. In a few minutes, you will receive an email from ThreatGRID containing a link to their page where you can log on. After you agree to the license terms on the ThreatGRID page, you can submit files for analysis, and ThreatGRID will recognize files that Malware Analysis submits for sandbox analysis.

To obtain a Trial ThreatGRID API key:

1. Go to **ADMIN > Services**.
2. Select a Malware Analysis service, and select **> View > Config**.
3. In the **Services Config** view, select the **ThreatGRID** tab.
4. Enter your full name, job title, organization name, and email address.
5. In the User Id and Password field, create a user ID and password for logging on to ThreatGRID.
6. Click **Register**.

   Your registration is sent to ThreatGRID and an API key is displayed below the Register button. The key is automatically filled in the **General** tab.
7. Select the **General** tab to confirm that the ThreatGRID configuration now includes the API key.



8. When you receive an email from ThreatGRID with a link where you can log on, log on and accept the terms of the agreement.

   Your trial of ThreatGRID begins and Malware Analysis can send five files per day to the ThreatGRID Cloud for sandbox analysis.

Additional Procedures for Configuring Malware Analysis

This topic provides procedures that an Administrator may perform to accomplish an objective that is not part of basic Malware Analysis setup. After Malware Analysis is configured, administrators may want to fine-tune the service and implement advanced customization; an example of this is implementing custom YARA content.

- Create Custom Alert in CEF Format
- Enable Custom YARA Content

Create Custom Alert in CEF Format

This topic provides instructions for creating custom alerts in Common Event Format (CEF) to send to a service that ingests events as CEF. This is an advanced configuration task, which requires sufficient knowledge to manually edit the configuration file: `/var/netwitness/malware-analytics-server/spectrum/conf/malwareCEFDictionaryConfiguration.xml`. Before editing the file, you must stop the Malware Analysis service in the operating system. The CEF Alert becomes active when you restart the Malware Analysis service.

The CEF Template

To send events to a service ingesting events as CEF, NetWitness Platform runs them through a configuration file that serves as a CEF template before feeding the events to a correlation technology. You can tune the configuration file, which specifies the sequence and mapping of syslog fields in each alert.

The following example syslog message shows the CEF fields in the extensions section of the alert (following the last '|' in the alert). Each field can be configured to indicate the sequence (described in the Example section below). Fields can be excluded entirely from the alert via a configuration setting.

```
CEF:0|NetWitness|Spectrum|10.3.0.7995.1.0|Suspicious Event|Detected
suspicious network event ID 4 session ID n/a|2|static=100.0 nextgen=25.0
community=100.0 sandbox=25.0 file.name=myFile.exe file.size=1234556
file.md5.hash=DEADBEEFBABECAFEDEADBEEFBABECAFE
event.source=spectrum://admin@0:0:0:0:0:0:0:1:64563 event.type=MANUAL_
UPLOAD event.id=0 country.dst.code=-- country.dst=Unavailable
ip.src=0:0:0:0:0:0:0:1 ip.dst=0:0:0:0:0:0:0:1 event.uuid=f7a6155a-31de-

```

First Line

```
Feb 6 10:02:28 10.10.10.125 SpectrumServer125
```

Log Information	Description
Feb 6 10:02:28	The timestamp for the entry.
10.10.10.125	The source IP address for the event.
SpectrumServer125	The source hostname for the event.

Audit Common Event Format (CEF) Header

```
0|NetWitness|Spectrum|1.2.1.130|Suspicious Event|Detected suspicious network
event ID 857 session ID 73|2|
```

The audit CEF header is a pipe-separated listing of the following fields:

Log Information	Description
0	The ArcSight Common Event Format (CEF) version used for the audit syslog.
NetWitness	The service that created the syslog message.
Spectrum	Malware Analysis is the logger for the event.
1.2.1.130	Malware Analysis version.
event ID 857	Unique network event id for this event.
session ID 73	Core unique session id for the session that included this event.

Log Information	Description
2	Severity, an integer between 1 and 6 indicates the level of severity for the message. • 1 = INFORMATION_LEVEL • 2 = WARNING_LEVEL • 3 = ERROR_LEVEL • 4 = SUCCESS_LEVEL • 5 = FAILURE_LEVEL • 6 = AUDIT_FAILURE_LEVEL

Audit CEF Extension

Analysis Scores

The first entry in the audit CEF extension provides the four Malware Analysis scores for the event: Static, Network, Community, and Sandbox.

Log Information	Sample Value
static	100.0
network	29.0
community	8.0 A score of 0.0 can be a community score for the event or can indicate that no community services were enabled.

Log Information	Sample Value
sandbox	N/R N/R means not run. This indicates that the GFI sandbox was not enabled.

File Information

The next three entries provide file information: file name, size, and hash.

Log Information	Sample Value
file.name	-CVE-00_DOC_2010-05-13_attachment.doc
file.size	0
file.md5.hash	20a29259c0e5958afb2f50c4177bb307

Event Meta Data Retrieved by NextGen

The record continues with the Core meta data for the event. The meta data in the message depends on the event. The amount of data in the message is truncated to the maximum length in bytes configured in the Syslog Settings. The default value is 1024.

Log Information	Sample Value
com.netwitness.event.internal.id	73
com.netwitness.event.internal.uuid	37d2bad7-06bc-4b34-88e1-df43d9710204
alias.ip	10.25.50.149
client	Wget/1.11.4 Red Hat modified

Edit the Configuration File

1. Stop the Malware Analysis service.
2. Edit the configuration file as described in the Example.
3. Start the Malware Analysis service.

The Malware Analysis service begins processing alerts through the configuration file and sending CEF alerts to designated services.

Example

The configuration file can be used to dictate which fields appear in the resulting alert as well as the label associated with each field and the order in which the data fields appear. The configuration file is composed of one or more XML `MalwareCefExtension` blocks as shown in the example below. The ordering of these blocks in the configuration file implies the order of the data fields in the CEF alert.

In the example below, the CEF alert would include two data fields, `ip.src` followed by `ip.dst`. The `customKey` is used to indicate the labeling of the data field in the alert. This allows the user to choose a custom label in order to force the alerting format to better match the expectations of the alert consumer. In other words, the format can be tuned to prevent unwanted changes to an existing alert parser. Lastly, the `isDisplay` setting determines if the field is included in the alert output. This allows the user to turn off data fields without having to physically delete the `MalwareCefExtension` block from the configuration.

```
 <config>
 <malwareExtensionList>
<com.netwitness.malware.core.cef.MalwareCefExtension>
   <customKey>ip.src</customKey>
   <malwareKey>ip.src</malwareKey>
   <isDisplay>true</isDisplay>
</com.netwitness.malware.core.cef.MalwareCefExtension>
<com.netwitness.malware.core.cef.MalwareCefExtension>
   <customKey>ip.dst</customKey>
   <malwareKey>ip.dst</malwareKey>
   <isDisplay>true</isDisplay>
</com.netwitness.malware.core.cef.MalwareCefExtension>
 </malwareExtensionList>
</config>
```

At the end of the configuration file are three additional settings that can be used to further tune the alert format. They are as follows:

Setting	Description
`includesUnknownMeta`	This true or false setting indicates if unknown data elements are included in the resulting alert. Any NextGen session meta can be considered for inclusion into a CEF alert. Because additional session meta can be introduced via authoring new NextGen parsers, meta that is not contained in the default configuration may be encountered. You can set `includesUnknownMeta` to true to include the unknown meta in the alert and label it using the NextGen meta key name. To force a custom key for the unknown meta, you must edit this file and add a new `MalwareCefExtension` to the dictionary. To omit unknown meta from the alert, set `includesUnknownMeta` to false.

Setting	Description
displayNulls	This true or false setting indicates if values that are set to null are included in the alert. If displayNulls is set to false, the null value fields are omitted even if their MalwareCefExtension isDisplay property is turned on. This allows dynamic formatting of alerts to exclude null fields.
valueIfNull	This true or false setting allows you to specify a string placeholder (n/a by default) to be used as the value for any null valued fields. If displayNulls is set to true, then null valued fields are included in the alerts. Their value is set to the value specified in valueIfNull.

The following represents the default CEF configuration file. The default configuration file includes all default NextGen session meta.

Enable Custom YARA Content

This topic provides instructions for enabling custom YARA content on the NetWitness Platform host on which the Malware Analysis service is installed. In addition to the built-in Indicators of Compromise, Malware Analysis supports indicators of compromise written in YARA. YARA is a rule language that allows malware researchers to identify and classify malware samples. RSA makes built-in YARA-based Indicators of Compromise (IOCs) available in RSA Live; these are automatically downloaded and activated on subscribed appliances.

Customers with advanced skills and knowledge can add detection capabilities to RSA Malware Analysis by authoring YARA rules and publishing them in RSA Live or placing YARA rules in a watched folder for the appliance to consume. This section provides instructions for the Administrator who configures appliances to enable the creation of custom YARA content.

Prerequisites

This is an advanced configuration task, which requires sufficient privilege and knowledge to set up a GNU Compiler Collection (GCC) and C++ Python development library to build YARA. In addition, you must be thoroughly familiar with the standard YARA documentation. The following components are required:

- The Perl-Compatible Regular Expression (PCRE) library: pcre-8.33.tar.bz2
- The yara 1.7 (rev:167) stand-alone YARA command line: yara-1.7.tar
- The YARA extension for Python: yara-python-1.7.tar.gz
- YARA rules documentation: YARA User's Manual 1.6.pdf

The components are available for download here: https://code.google.com/p/yara-project/downloads/list

Note: As of writing, YARA 2.0 is available but not supported for Malware Analysis 10.5.

Install Libraries and Applications Required to Build YARA on a CentOs-Based Appliance

As a prerequisite to building YARA on a host that is running CentOS, you must install `make`, the GNU Compiler Collection, and C++ Python Development Library on the appliance. To install the applications and libraries required to build YARA:

1. To ensure the standard YUM repo and no other repo files are in the /etc/yum.repos.d folder, enter the following command:

   `ls -al /etc/yum.repos.d`

   The results should be similar to the following:

   ```
   -rw-r-r-. 1 root root 1926 Jun 26  2012 CentOS-Base.repo
   -rw-r-r-. 1 root root  637 Jun 26  2012 CentOS-Debuginfo.repo
   -rw-r-r-. 1 root root  626 Jun 26  2012 CentOS-Media.repo
   -rw-r-r-. 1 root root 2593 Jun 26  2012 CentOS-Vault.repo
   ```

2. To install `make` on the appliance, enter the following commands:

   a. **`yum search make`**

      The following message is returned: `make.x86_64 : A GNU tool which simplifies the build process for user`

   b. **`yum install make.x86_64`**

3. To install and test GCC on the host, enter the following commands:

   a. **`yum search gcc`**

      The following messages are displayed:

      ```
      gcc-c+.x86_64 : C+ support for GCC
      gcc.x86_64 : Various compilers (C, C++, Objective-C, Java, ...)
      ```

   b. Enter the following commands:

      `yum install gcc.x86_64`
      `yum install gcc-c++.x86_64`

   c. To test the gcc commands, enter the following commands:

      `gcc -v`
      `cc -v`

4. To install the C++ Python development library on the appliance, enter the following commands:

   a. **`yum search python dev`**

      The following message is returned:

      `python-devel.x86_64 : The libraries and header files needed for Python development`

   b. **`yum install python-devel.x86_64`**

Set Up YARA

To create a GCC and C++ Python development library in which you can build YARA on the NetWitness Platform host that is running Malware Analysis:

1. Do one of the following:
   a. If the host on which you are installing is running Mac OS, install xCode for Mac OS.
   b. If the host on which you are installing is running CentOS, install make, GCC and C++ Python development library using the YUM command line.
2. To Install the PCRE library on the host, open a terminal window and enter the following commands:
```
tar -xvf pcre-8.33.tar.bz2
cd pcre-8.33
./configure
make
sudo make install
```
3. To install the stand-alone YARA command line, enter the following commands:
```
tar -xvf yara-1.7.tar
cd yara-1.7
./configure
make
sudo make install
```
4. To test the stand-alone YARA command line:
   a. Enter the following command:
```
yara
```
   b. If the command succeeds, continue with Step 7. If the command fails and returns the `yara: error while loading shared libraries: libpcre.so.1: cannot open shared object file: No such file or directory` error, enter the following command to check the `/etc/ld.so.conf` file or `LD_LIBRARY_PATH` environment variable.
```
ldconfig -v
```
5. To install the YARA extension for Python, enter the following commands:
```
tar -xvf yara-python-1.7.tar.gz
cd yara-python-1.7
python setup.py build
sudo python setup.py install
```
6. To test the YARA extension:
   a. Enter the following command: **python**
   b. At the Python prompt (>>>), enter the following commands:
```
import yara
exit()
```

When this configuration is complete, analysts can create custom YARA IOCs for consumption on a Malware Analysis host as described in "Implement Custom YARA Content" in the *Malware Analysis User Guide*

Services Config View - General Tab

This topic introduces the configuration settings in the Service Config view > General tab for Malware Analysis, which has parameters specific to the Malware Analysis service. In this tab, you can configure:

- The processing parameters for Core services that are capturing data.
- The repository for captured data.
- The static, community, and sandbox scoring categories used to analyze the data.

Workflow

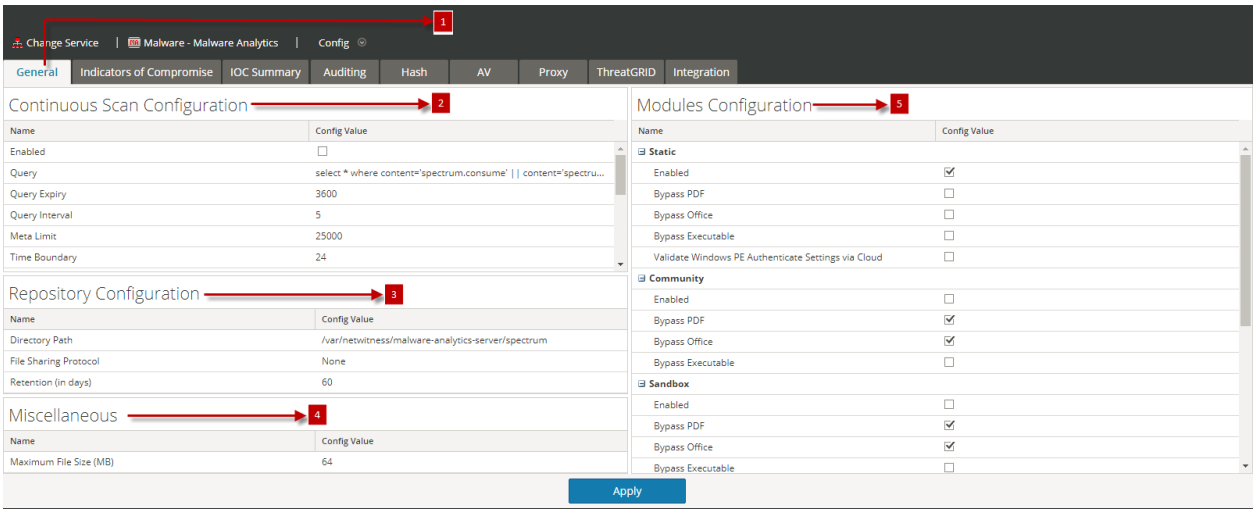
Quick Look

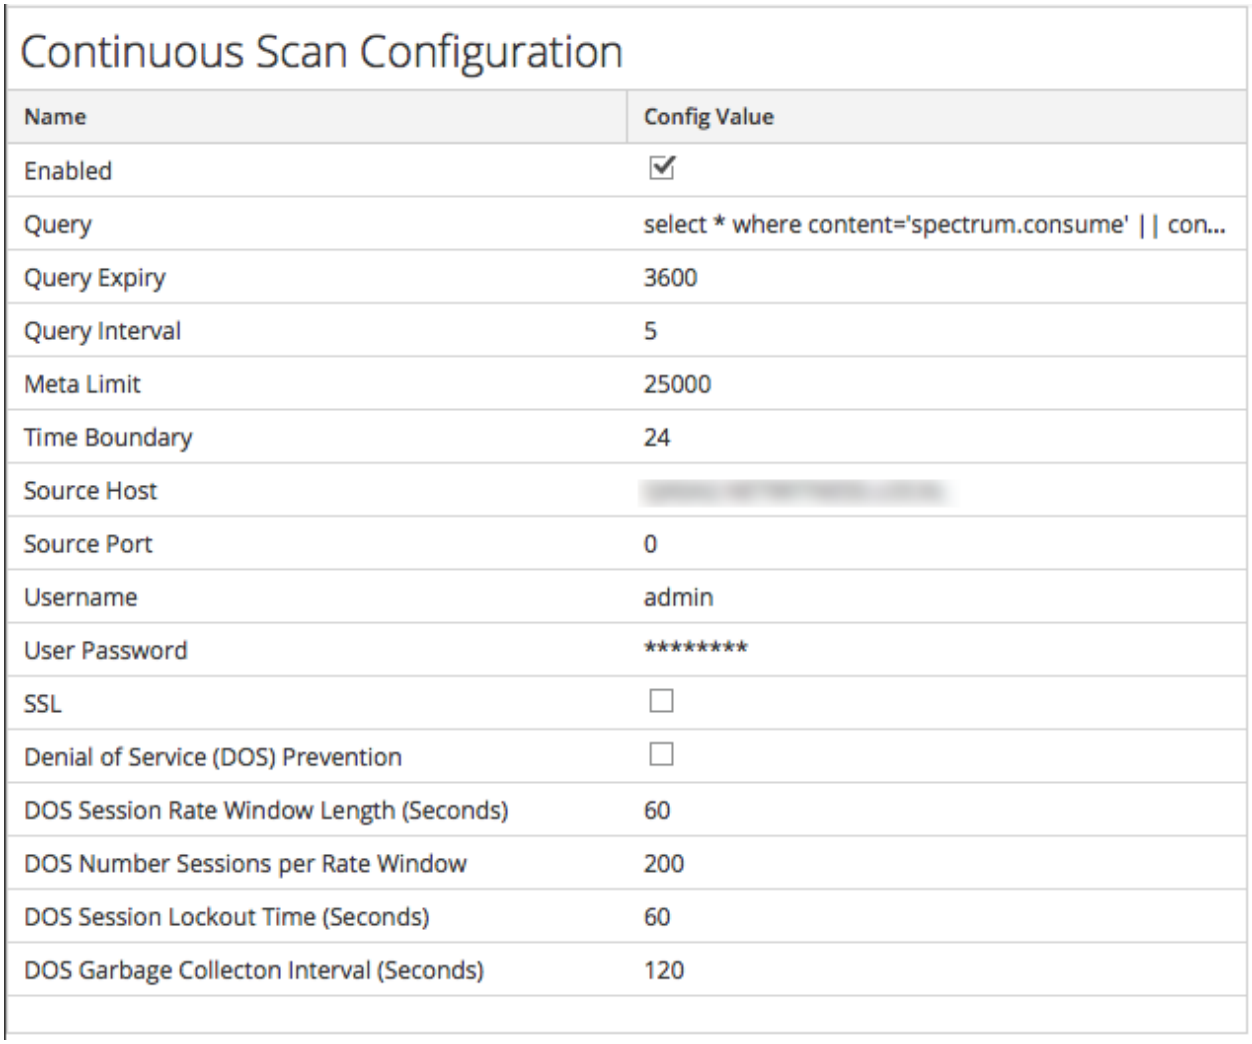
This is an example of the General tab.



1 Displays the General Tab.
2 Allows you to Configure Continuous Scan.
3 Allows you to Configure Repository.
4 Displays Miscellaneous Settings.
5 Allows you to Configure Modules.

This tab has four sections: Continuous Scan Configuration, Repository Configuration, Miscellaneous, and Modules Configuration.

Continuous Scan Configuration Section



Continuous Scan Configuration

Name	Config Value
Enabled	☑
Query	select * where content='spectrum.consume' || con...
Query Expiry	3600
Query Interval	5
Meta Limit	25000
Time Boundary	24
Source Host	[redacted]
Source Port	0
Username	admin
User Password	********
SSL	☐
Denial of Service (DOS) Prevention	☐
DOS Session Rate Window Length (Seconds)	60
DOS Number Sessions per Rate Window	200
DOS Session Lockout Time (Seconds)	60
DOS Garbage Collecton Interval (Seconds)	120

This table describes the features of the Continuous Scan Configuration section.

Parameter	Description
Enabled	Completely disable or enable continuous polling of the Core service. By default this is not selected (**disabled**).
Query	While the Decoder is analyzing network traffic, it creates a meta field called content with a value of **spectrum.consume** in sessions that are likely to contain malware. By default, Malware Analysis only performs analysis on events that have this particular meta value. By changing this query, Malware Analysis can be configured to analyze different types of events. Making this query too broad may force Malware Analysis to analyze too many events, causing it to fall behind or perform poorly. The default query is **select * where content='spectrum.consume'**

Parameter	Description
Query Expiry	When Malware Analysis queries the Core service for meta, it gets a result back within a few seconds. If there is a problem, such as a network connectivity issue, Malware Analysis abandons the query after this configured amount of time. The default value is **3600 seconds**.
Query Interval	How often, in minutes, to query for new session meta and files.
Meta Limit	Each time Malware Analysis queries the Core service, it pulls an amount of meta, up to this meta limit. Using this setting, in conjunction with the query interval, you can tune the performance of Malware Analysis in the Core infrastructure. The default value is **25000**.
Time Boundary	Malware Analysis analyzes sessions that occurred after the Time Boundary. This setting is most important when installing a new Malware Analysis appliance, because it determines how far back in time to begin analysis. Setting the boundary too many hours in the past may cause Malware Analysis to analyze too many past events, causing a large delay before you see any traffic happening in real time. The default value is **24 hours**.
Source Host	Hostname of the Malware Analysis appliance. This is the IP address, or the hostname, of the service that Malware Analysis queries to retrieve its data for analysis. Do not use localhost as the source host. Depending on the model of the appliance and the configuration of the NetWitness Platform infrastructure, this source host can vary.
Source Port	Malware Analysis communicates with the NetWitness Platform infrastructure using the REST service listening on this port. This port number is specific to the type of the Core service that is being used as the Source host. This corresponds to the outbound connections for your Core service.
Username	Username. The default value is **admin**. Malware Analysis must authenticate to the Source host each time it queries for data. In most cases, the account used by Malware Analysis is the same account used to access the Core service through NetWitness Platform. However, it is recommended to create a new account on the Core service dedicated to Malware Analysis.
User Password	User password. The default value is **netwitness**.
SSL	Use SSL when communicating with Core. If Malware Analysis is using an SSL connection to communicate with a Core service, check this option. The default value is unchecked.
Denial of Service (DOS) Prevention	The Denial of Service Prevention feature provides safeguards against malware that intentionally generates high volumes of network connections between two endpoints containing Windows PE content. Generating a high volume of connections artificially inflates the amount of traffic that security services monitoring the network must consume and analyze resulting in a denial of service. This feature helps identify these sessions so that you can have the analysis processing disregard them. The default value is unchecked.

Parameter	Description
DOS Session Rate Window Length (Seconds)	Malware Analysis uses this parameter with the **DOS Number Sessions per Rate Window** and **DOS Session Lockout Time (Seconds)** parameters to identify a Denial of Service Attack and determine how long to disregard sessions from a single IP address. To identify a Denial of Service Attack, Malware Analysis monitors the number of sessions established by a single IP address during a specific time frame. The **DOS Session Rate Window Length (Seconds)** defines this time frame. If the number of sessions exceeds the **DOS Number Sessions per Rate Window** setting within the number of seconds defined in **DOS Session Rate Window Length**, Malware Analysis identifies the activity as a Denial of Service attempt. In this case, traffic from the IP address is disregarded for the length of time specified in **DOS Session Lockout Time (Seconds)**. The default value is: **60** seconds.
DOS Number Sessions per Rate Window	Malware Analysis uses this parameter with the **DOS Session Rate Window Length (Seconds)** and **DOS Session Lockout Time (Seconds)** parameters to identify a Denial of Service Attack and determine how long to disregard sessions from the IP address. To identify a Denial of Service Attack, Malware Analysis monitors the number of sessions established by a single IP source during a specific time frame. The **DOS Session Rate Window Length (Seconds)** defines this time frame. If the number of sessions exceeds the **DOS Number Sessions per Rate Window** setting within the number of seconds defined in **DOS Session Rate Window Length**, Malware Analysis identifies the activity as a Denial of Service attempt. In this case, traffic is disregarded for the length of time specified in **DOS Session Lockout Time (Seconds)**. The default value is: **200** sessions
DOS Session Lockout Time (Seconds)	Malware Analysis uses this parameter with the **DOS Session Rate Window Length (Seconds)** and **DOS Number Sessions per Rate Window** parameters to identify a Denial of Service Attack and determine how long to disregard such an attack. To identify a Denial of Service Attack, Malware Analysis monitors the number of sessions established by a single IP address during a specific time frame. The **DOS Session Rate Window Length (Seconds)** defines this time frame. If the number of sessions exceeds the **DOS Number Sessions per Rate Window** setting within the number of seconds defined in **DOS Session Rate Window Length**, Malware Analysis identifies the activity as a Denial of Service attempt. In this case, traffic is disregarded for the length of time specified in **DOS Session Lockout Time (Seconds)**. The default value is: **60** seconds
DOS Garbage Collection Interval (Seconds)	Performs garbage collection on the internal memory structure used to track Denial of Service attempts. If memory usage is abnormally high, you can decrease this setting to free unused memory more often. If CPU usage is abnormally high, you can increase this setting to eliminate processing overhead (at the expense of memory usage). The default value is: **120** seconds

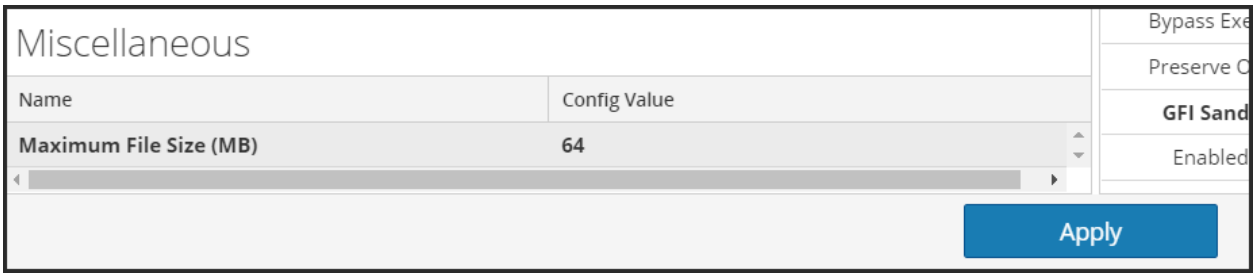
Repository Configuration Section

Malware Analysis stores all of the files that are analyzed for future use. These files can be downloaded through the user interface or accessed via one of the file sharing protocols.

This table describes the features of the Repository Configuration section.

Parameter	Description
Directory Path	All files are stored in the following directory on the Malware Analysis appliance: **/var/lib/netwitness/spectrum**
File Sharing Protocol	Possible values for the file sharing protocol are FTP, SAMBA, and None. You can enable FTP access and SAMBA file sharing to allow a user access to the stored files on the Malware Analysis from a remote location. No credentials are required to access these files. The port required for FTP access is TCP/21. The default file sharing protocol is **None**.
Retention (in days)	Malware Analysis maintains files stored in the repository for a specified number of days. You can set the number of days that files are retained before being deleted. The default value is **60** days.

Miscellaneous Configuration Section (10.3 SP2 and Later)



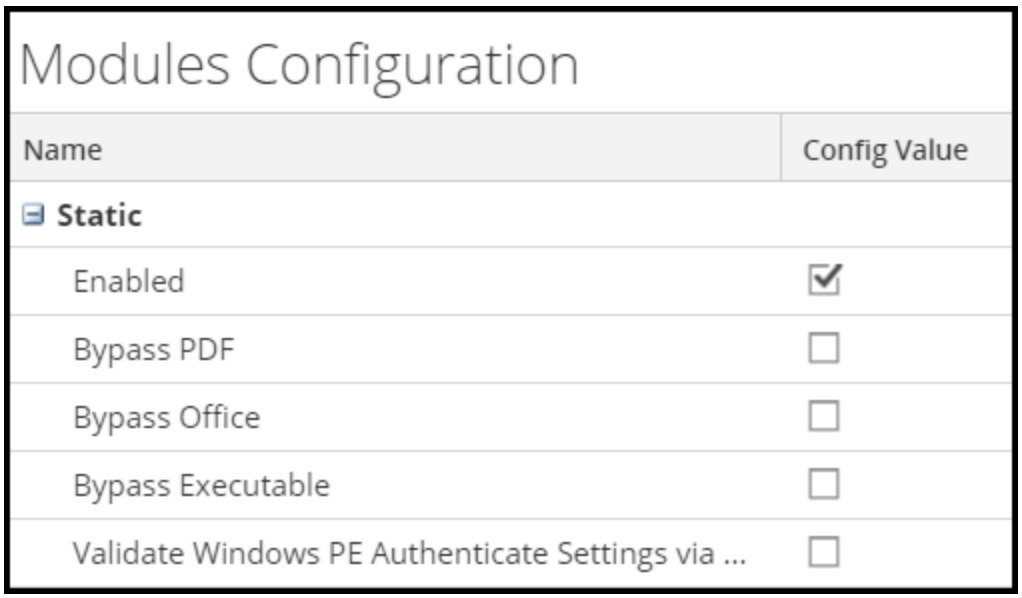
This table describes the features of the Miscellaneous Configuration section.

Parameter	Description
Maximum File Size	Limits the size of each file that you can scan for manually. This parameter applies to the feature described in "Upload Files for Malware Scanning" in the Investigation and Malware Analysis Configuration Guide. The default value is **64 MB**. If the file size limit is exceeded, prevents you from scanning the file.

Modules Configuration Section

The Modules Configuration section allows configuration of the static, community, and sandbox scoring categories.

Static Analysis Configuration

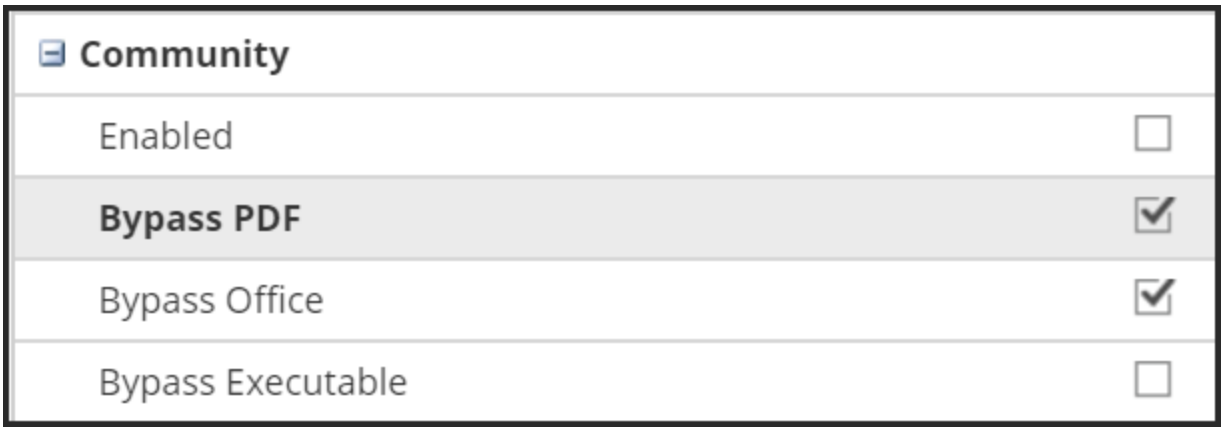


The static module is the only scoring category that is enabled by default. This table describes the parameters for configuring static analysis.

Feature	Description
Enabled	Completely disable or enable static analysis. By default this is selected (**enabled**).
Bypass PDF	Disable analysis of PDF documents. By default this is not selected; all PDF files undergo static analysis.
Bypass Office	Disable analysis of Office documents. By default this is not selected; all MS Office files undergo static analysis.
Bypass Executable	Disable analysis of Windows PE documents. By default this is not selected; all Windows PE files undergo static analysis.

Feature	Description
Validate Windows PE Authenticate Settings via Cloud	Specify whether or not Windows PE files are sent to the RSA-Netwitness Cloud for Authenticode validation. The default value is selected. • When selected, any Windows PE file that is digitally signed is transmitted over the network (in its entirety) to the RSA-Netwitness Cloud for validation. If the intent is to prevent Windows PE files from leaving the customer network, you should disable this option. • When not selected, ALL static analysis is performed locally (skipping Authenticode validation). Regardless of this setting, PDF and M/S Office documents are not subject to Authenticode validation and are not transmitted over the network during static analysis.

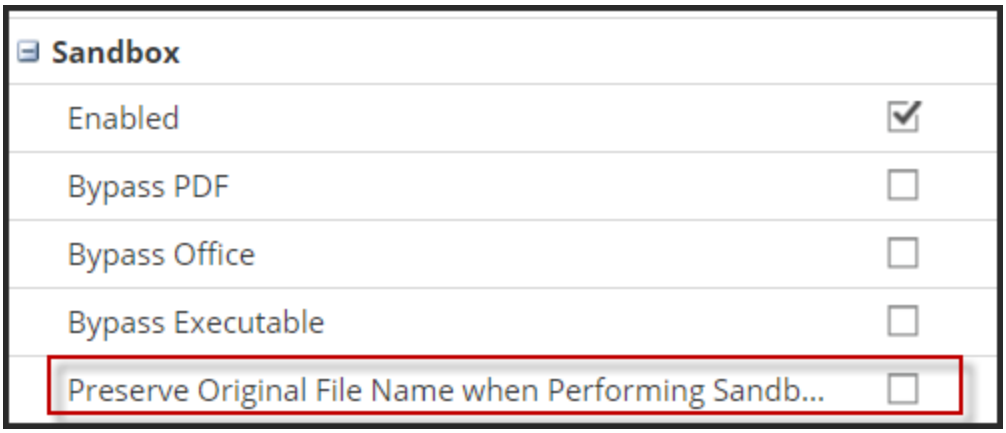
Community Analysis Configuration



By default, the community module is disabled and the options are selected to prevent PDFs and MS Office documents from being processed. The intent is to default the settings to the most restrictive choices so that no sensitive documents leave the network unless the user chooses. This table describes the parameters for configuring Community analysis.

Feature	Description
Enabled	Completely disable or enable static analysis. By default this is not selected (**disabled**).
Bypass PDF	Disable analysis of PDF documents. By default this is selected; PDF files are not processed.
Bypass Office	Disable analysis of Office documents. By default this is selected; Microsoft Office documents are not processed.
Bypass Executable	Disable analysis of Windows PE documents. By default this is selected; Windows PE documents are not processed

Sandbox Analysis Configuration

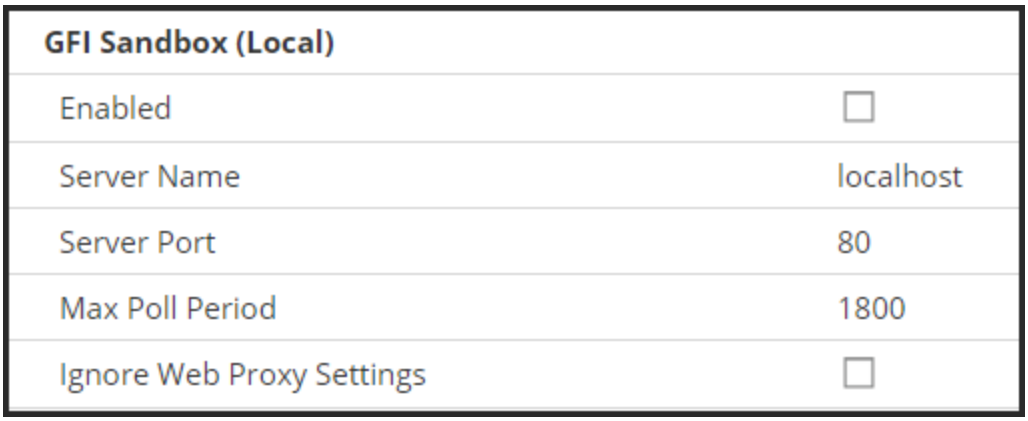


By default, the sandbox module is disabled and MS Office and PDF files are prevented from being processed. The intent is to set the most restrictive settings to force the user to specifically choose whether or not potentially sensitive information is sent outside of the network for processing. If the document type is not prevented from being processed, the file is sent to the destination sandbox server in its entirety (not limited to a hash of the file contents).

This table describes the parameters for configuring Sandbox analysis.

Feature	Description
Enabled	Completely disable or enable sandbox analysis. By default this is not selected **(disabled)**.
Bypass PDF	Disable analysis of PDF documents. By default this is selected; PDF files are not processed. When not selected, all PDF files are submitted in their entirety to the Sandbox for analysis.
Bypass Office	Disable analysis of Office documents. By default this is selected; Microsoft Office documents are not processed. When not selected, all MS Office files are submitted in their entirety to the Sandbox for analysis.
Bypass Executable	Disable analysis of Windows PE documents. By default this is selected; Windows PE documents are not processed. When not selected, all Windows PE documents are submitted in their entirety to the Sandbox for analysis.
Preserve Original File Name when Performing Sandbox Analysis	In 10.3 SP2 and later, enable the ability to hash for filenames when they are sent to a local sandbox. By default this is not selected. **Note:** If you do not select this parameter, NetWitness Platform hashes the files.

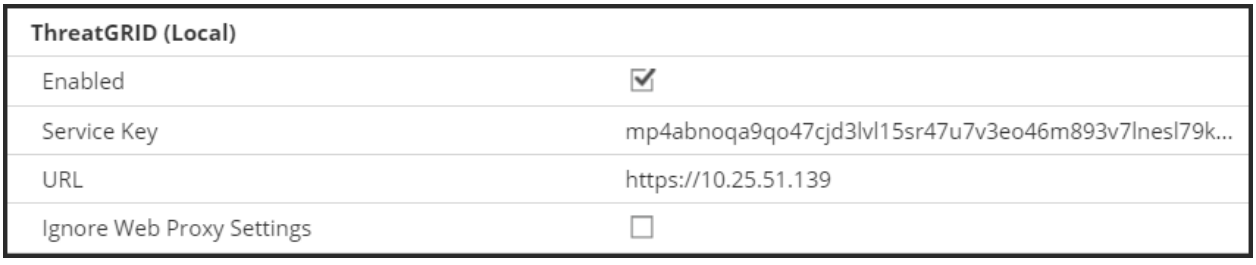
GFI Sandbox Settings



In the GFI Sandbox section, you can enable sandbox processing by GFI and configure the locally installed GFI sandbox. The table describes the parameters for configuring the GFI sandbox.

Feature	Description
Enabled	When enabled, sandbox processing is performed by a local copy of GFI. The default value is **disabled**. If you enable GFI, you need to configure the remaining parameters.
Server Name	The GFI Sandbox server name. No default value.
Server Port	The GFI Sandbox server port. Default value is **80**.
Max Poll Period	Determines how long to wait for a submitted sample to finish processing. Default value is **600 seconds**.
Ignore Web Proxy Settings	Tells Malware Analysis to bypass the web proxy, if a web proxy is configured, when making this connection. If no web proxy has been configured in Malware Analysis, the setting is ignored.

ThreatGRID Sandbox Settings



In the ThreatGRID Sandbox section, you can enable sandbox processing by ThreatGRID and choose whether to use the locally installed ThreatGRID or the ThreatGRID Cloud for sandbox analysis.

- If you have a local copy of ThreatGRID, configure sandbox processing to use the local copy.
- If no local instance of ThreatGRID has been purchased and installed, configure the ThreatGRID Cloud.

The table describes the parameters for configuring the ThreatGRID sandbox.

Note: Before enabling this service, you must configure a ThreatGRID-supplied Service Key. The service key allows ThreatGRID to recognize that samples submitted from this site are legitimate.

Feature	Description
Enabled	When enabled, sandbox processing is performed by ThreatGRID, either a local copy or the ThreatGRID Cloud. The default value is **disabled**.
Service Key	Before enabling the sandbox module, a ThreatGRID-supplied Service Key must be configured. The service key allows ThreatGRID to recognize that samples submitted from this site are legitimate.
URL	The URL for the ThreatGRID server to be used (if you are not using a locally installed ThreatGRID). The ThreatGRID Cloud is reachable via https://panacea.threatgrid.com
Ignore Web Proxy Settings	Tells Malware Analysis to bypass the web proxy, if a web proxy is configured, when making this connection. If no Web Proxy has been configured in Malware Analysis, the setting is ignored.

Services Config View - Indicators of Compromise Tab

This topic introduces the features and functions available in the Service Config view > Indicators of Compromise tab, which applies to the Malware Analysis service. This tab provides a way to configure the way each of the four scoring modules uses the available rules to score data.

Workflow

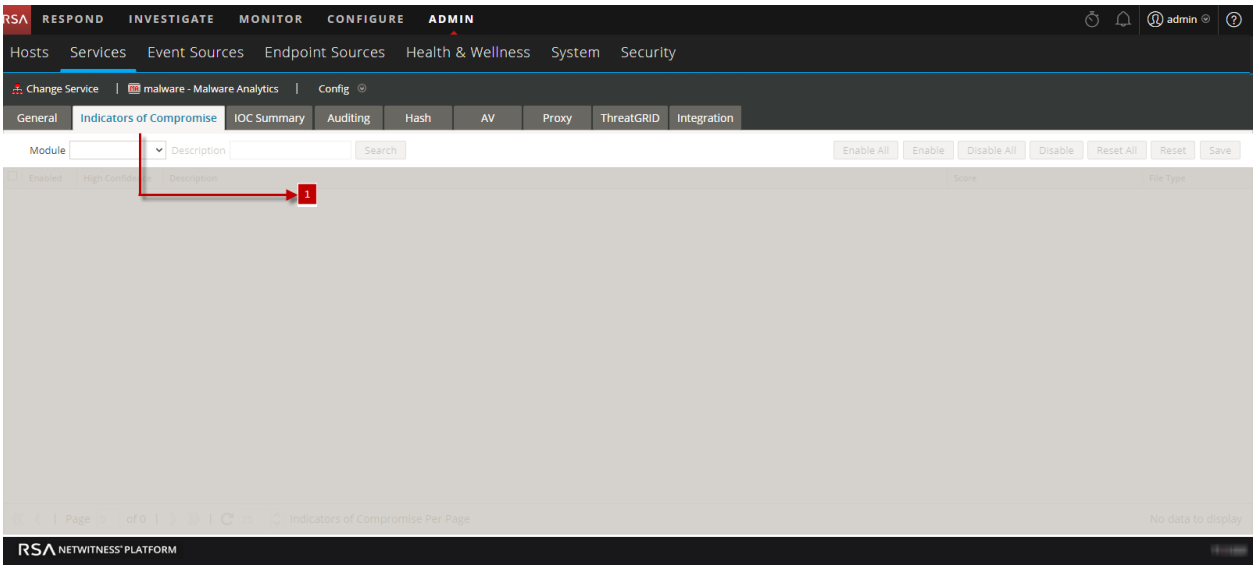
Basic Setup

Quick Look

This is an example of the Indicators of Compromise tab.



1 Displays the Indicators of Compromise Tab.

Features

The Indicators of Compromise tab consists of a toolbar and page-able grid.

This table describes the features of the grid.

Feature	Description
Module selection list	Selects the scoring module for which you want to view the Indicators of Compromise: All, Network, Static, Community, Sandbox, or Yara.
Search field	Type text for which you are searching in the Description field.
Search option	Filters the grid to display only Descriptions that match the Description search term.
Enable All option	Click to enable all rules for the scoring module, as opposed to enabling all rules on the page using the checkbox.
Enable option	Click to enable selected rules.
Disable All option	Click to disable all rules for the scoring module, as opposed to disabling all rules on the page using the checkbox.
Disable option	Click to disable selected rules.
Reset All option	Click to reset all rows on the page to their default values.

Feature	Description
Reset option	Click to reset selected rows to their default values.
Save option	Click to save changes you made on this page. If you leave the page without saving, the changes are lost. The description of each row with unsaved changes has a red corner.

This table describes the features of the toolbar.

Column	Description
Selection checkbox	Checkboxes for selecting individual rows or all rows on the page.
Enabled checkbox	If the indicator of compromise is enabled, Malware Analysis uses the rule for scoring session data.
High Confidence checkbox	If checked, Malware Analysis treats the rule as one very likely to indicate the presence of malware, and an event that triggers that rule is marked in the results grid.
Description	Describes the Indicator of Compromise.
Score	Specifies the score that you want to factor in to the total score for any event that triggers the rule. The default score is displayed and you can raise or lower the score by dragging the slider or typing a number in the score box.
File Type	Displays the file types to which the rule applies. Possible values are **ALL**, **PDF**, **MS Office**, and **Windows PE**.

Services Config View - IOC Summary Tab

This topic introduces the features and functions available in the Service Config view > IOC Summary tab. This tab provides a way to view summary information for any IOC. A grid for each scoring module lists the configured IOCs along with statistics associated with that IOC of a specific range of time. The statistics include:

- The number of events for a network session or the number of files for a static, community, or sandbox event that were flagged with the IOC.
- The current score configured for the IOC in the Indicators of Compromise tab.
- The scores returned by each of the scoring modules.

When you select an event, you can show the Malware Events view or Malware Files view for the IOC. You can also open the selected IOC in the Indicators of Compromise tab to edit the Current Score.

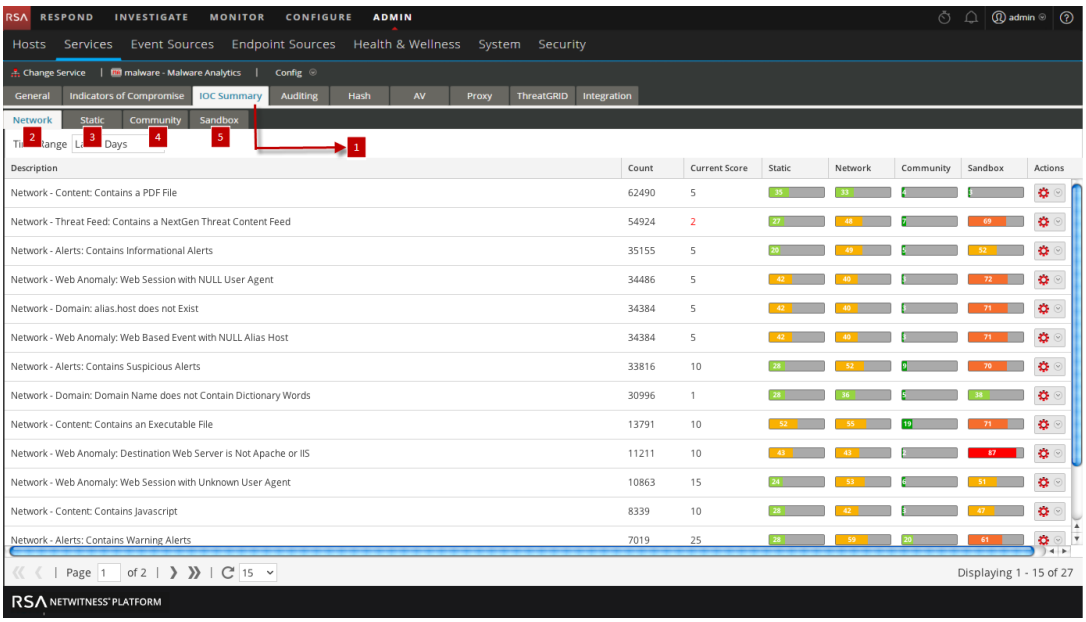
Basic Setup

Quick Look

This is an example of the IOC Summary tab for the Network scoring module.



1. Displays the IOC Summary Tab.
2. Displays the Network View.
3. Displays the Static View.
4. Displays the Community View.
5. Displays the Sandbox View.

Features

The IOC Summary consists of four tabs, one for each scoring module: Network, Static, Community, and Sandbox. Each tab has the same form and same information with a toolbar and page-able grid.

This table describes the features of each tab.

Feature	Description
Time Range	Selects the time range for the IOC Summary. Possible values are: Last 5 Minutes, Last 15 Minutes, Last 30 Minutes, Last Hour, Last 3 Hours, Last 6 Hours, Last 12 Hours, Last 24 Hours, Last 2 Days, Last 5 Days, Early Morning, Morning, Afternoon, Evening, All Day, Yesterday, This Week, Last Week, or Custom.

Feature	Description
Description column	Lists the descriptions for the IOCs.
Count column	Lists the number of occurrences of the IOCs. In the Network tab, the count is the number of events in which the IOC was found. In the other tabs, the count is the number of files in which the IOC was found.
Current Score column	Lists the current score for the IOCs as configured in the Indicators of Compromise tab.
Static, Network, Community, and Sandbox columns	List the scores that each of the scoring modules gave the IOCs.
Actions drop-down	The Actions drop-down menu has two options: • Show Events/Files: opens the IOC in the Investigation Events view or Files view. This view can also be opened by double-clicking on the IOC. • Edit: opens the IOC in the Indicators of Compromise tab to edit the Current Score.

Services Config View - Auditing Tab

This topic introduces the features and functions of the Auditing tab in the Services Config view for Malware Analysis. The Auditing tab in the Services Config view for Malware Analysis provides a way to configure the auditing feature. Malware Analysis has an automated auditing system capable of sending alerts (syslog, snmp, audit log file entries) as Malware Analysis exceeds configured score value thresholds for each scoring module (Network, Static, Community, Sandbox). Malware Analysis can automatically feed any external system capable of ingesting the supported audit formats. One alert is generated for each file in an analyzed session that meets or exceeds the configure threshold.

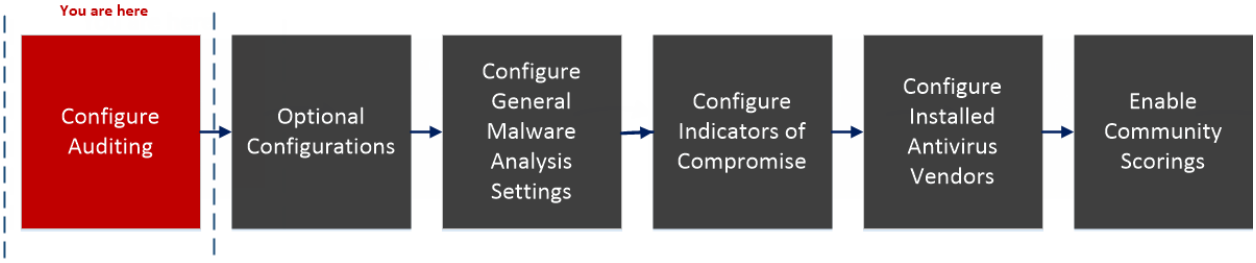
The audit log is a log file maintained on the Malware Analysis appliance for every significant event or action. Audit logs are rolled out and archived over time as they become large so an audit history is maintained. The size of these audit logs and their number are both configurable.

Some examples of events that are logged are:

- User login successes and failures
- Changes to system configuration settings
- Server restart
- Server version upgrade and install
- Suspicious events that exceed the Audit Thresholds

Malware Analysis can send audit events as an SNMP trap to a configured SNMP trap host, and consolidate logs in syslog format. Refer to the following task topic for detailed procedures: (Optional) Configure Auditing on Malware Analysis Host.

Workflow



What do you want to do?

Role	I Want to...	Show me how

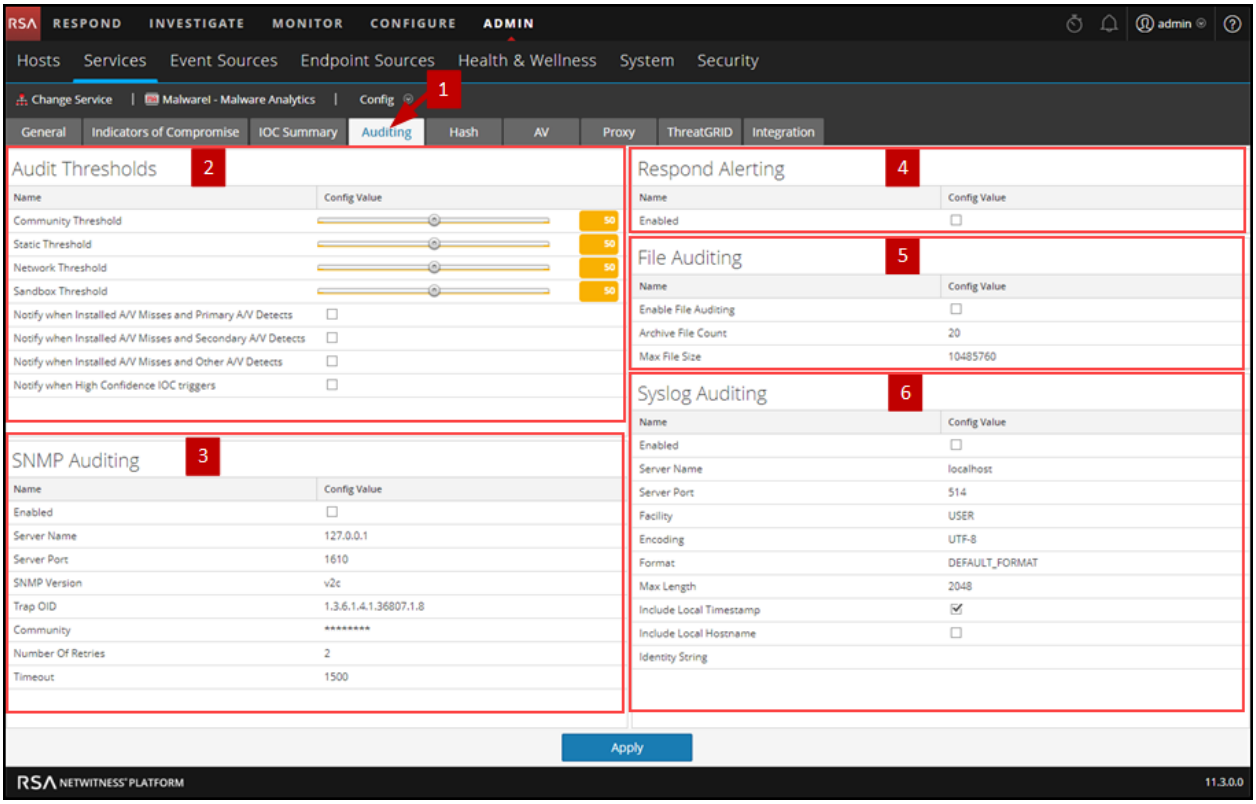
Basic Setup

Quick Look

This is an example of the Auditing tab.



1 Displays the Auditing Tab.
2 Displays the Audit Thresholds section.
3 Displays the SNMP Auditing section.

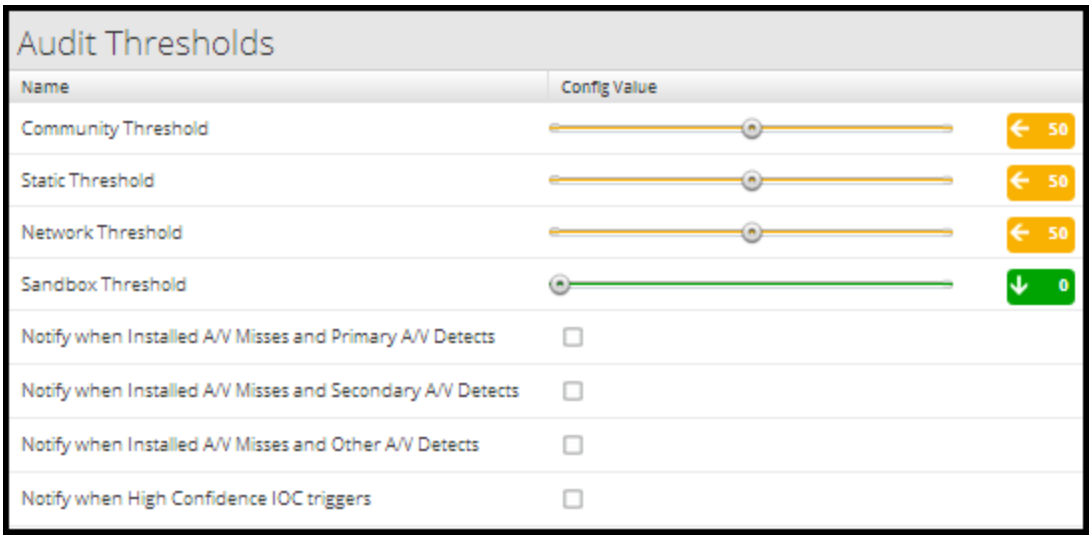
4 Displays the Respond Alerting section.
5 Displays the File Auditing section.
6 Displays the Syslog Auditing section.

Features

The Auditing tab includes five sections and an Apply button used to save changes made in this tab and put them into effect.

- Auditing Thresholds
- SNMP Auditing
- Respond Alerting
- File Auditing
- Syslog Auditing

Audit Thresholds



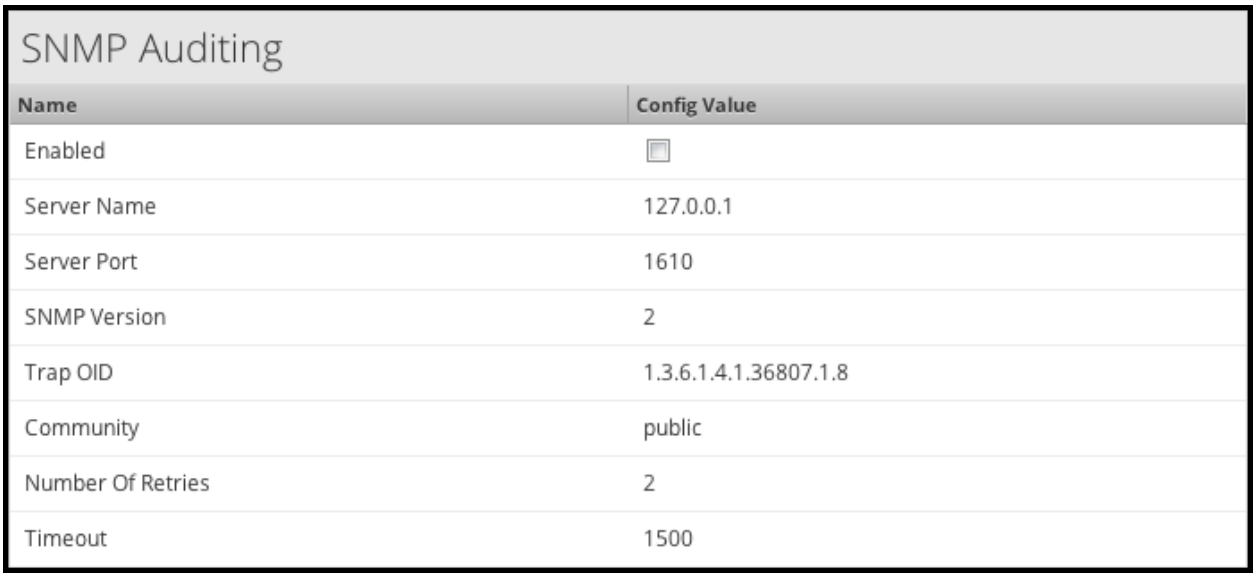
This table describes the features in the Audit Thresholds section.

Name	Config Value
Community, **Static**, **Network**, and **Sandbox Thresholds**	Malware Analysis scoring module thresholds for recording event information in a log file. Malware Analysis records the event information in a log file if the event scored high enough to satisfy all of the auditing thresholds. Each scoring category that completed analysis (for example, not all sessions invoke sandbox analysis) is compared against the configured audit threshold for that category. All completed categories must exceed the threshold in order for an audit event to be triggered. An integer between 0 and 100 is a valid value. Setting these thresholds too low may cause a very large volume of audit events and notifications.

Name	Config Value
Notify when Installed A/V Misses and Primary A/V Detects	Records a message in a log file when installed antivirus software misses a virus and the primary antivirus software detects that virus. The recorded message is sent through all enabled auditing methods: SNMP, File, and Syslog. The default value is unchecked.
Notify when Installed A/V Misses and Secondary A/V Detects	Records a message in a log file when installed antivirus software misses a virus and the secondary antivirus software detects that virus. The recorded message is sent through all enabled auditing methods: SNMP, File, and Syslog. The default value is unchecked.
Notify when Installed A/V Misses and Other A/V Detects	Records a message in a log file when installed antivirus software misses a virus and the other antivirus software detects that virus. The recorded message is sent through all enabled auditing methods: SNMP, File, and Syslog. The default value is unchecked.
Notify when High Confidence IOC triggers	Records a message in a log file when a high confidence IOC (Indicators of Compromise) triggers. The recorded message is sent through all enabled auditing methods: SNMP, File, and Syslog. The default value is unchecked.

SNMP Auditing

The Simple Network Management Protocol (SNMP) is an Internet-standard protocol for managing services on IP networks. When SNMP auditing is enabled, Malware Analysis can send an audit event as an SNMP trap to a configured SNMP trap host.

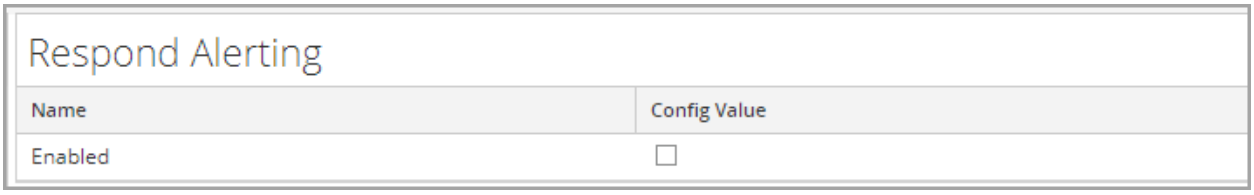


This table describes the features in the SNMP Auditing section.

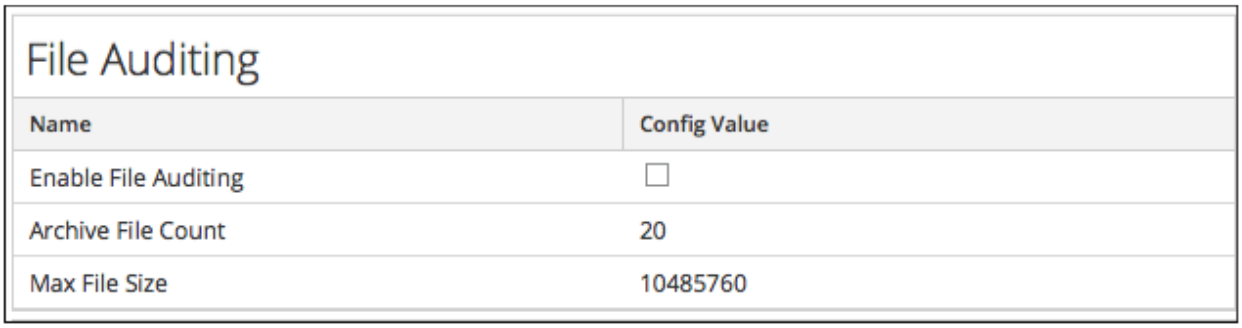
Name	Config Value
Enabled	Click to enable or disable SNMP auditing.
Server Name	The host where the target SNMP server is running.
Server Port	The port used where the SNMP trap receiver is listening.
SNMP Version	The version of the SNMP protocol to use when sending traps.
Trap OID	The object ID to use to identify the type of trap to send.
Community	The SNMP group to which Malware Analysis belongs.
Number Of Retries	The number of retries for sending a trap.
Timeout	The timeout period to wait for acknowledgment.

Respond Alerting

The Respond Alerting section enables NetWitness Respond to receive alerts from Malware Analysis. Select Enabled to forward alerts to the Respond view.



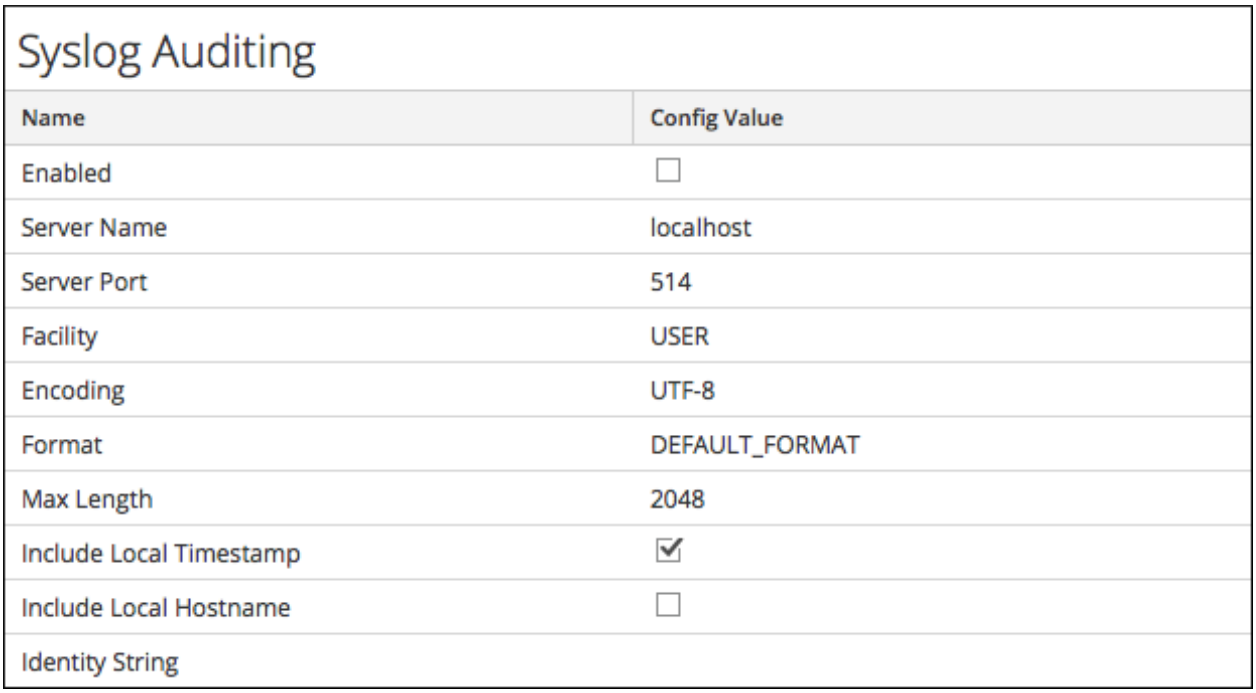
File Auditing



This table describes the features in the File Auditing section. Avoid setting the max file size and archive file count too high because it may have an adverse effect on the available disk space on the Malware Analysis appliance.

Name	Config Value
Enable File Auditing	Click to enable or disable file auditing.
Archive File Count	Malware Analysis keeps only as many log files as defined by this setting. When the maximum number is reached, the oldest log files are deleted and cannot be recovered. The default value is 20. Valid value: Integer between 1 and 50, inclusive.
Max File Size	The maximum file size for a single auditing log before it is archived. The default value is 10485760 bytes.

Syslog Auditing



This table describes the features in the Audit Thresholds section.

Feature	Description
Enabled	Click to enable or disable syslog auditing.
Server Name	This is the host where the target syslog process is running.
Server Port	This is the port where the target syslog process is listening.
Facility	This is the designated syslog facility to use for all outgoing messages. Possible values are KERN, USER, MAIL, DAEMON, AUTH, SYSLOG, LPR, NEWS, UUCP, CRON, AUTHPRIV, and LOCAL1 through LOCAL7.
Encoding	This is the encoding to use for text in syslog messages; for example, UTF-8.
Format	This is the desired message format. Possible values are: Default, PCI DSS, or SEC.
Max Length	This is the maximum length in bytes that any syslog message can be. Default is 1024. Messages that exceed the maximum length are truncated.
Include Local Timestamp	Check this box to include the local timestamp in messages.

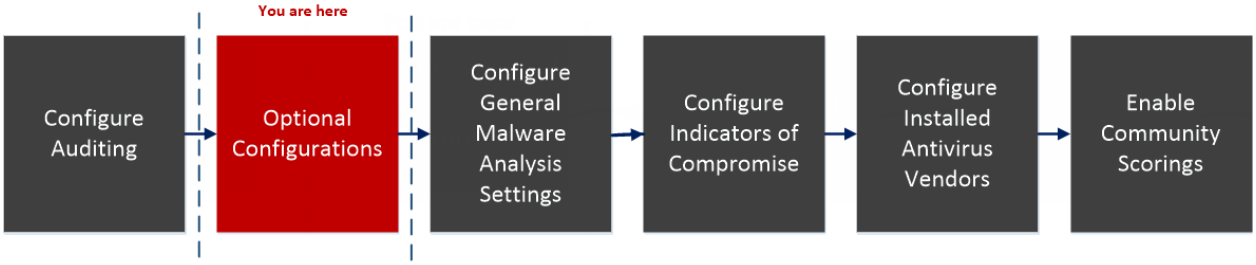
Feature	Description
Include Local Hostname	Check this box to include the local hostname.
Identity String	This is an identity string to be prepended to each syslog alert. If the string is blank, no identity string is prepended to the outgoing syslog alerts. You can use this to identify the source of the alert. Users conventionally set it to the name of the program that will submit the messages to a syslog auditing.

Services Config View - Hash Tab

This topic introduces the features and functions available in the Service Config view > Hash tab for Malware Analysis.

In this tab, you can manage hash filtering in Malware Analysis. The hash grid is initially empty; the grid lists filters that have been added to Malware Analysis. In this view, you can add a hash filter, delete a hash filter, mark a hash filter as trusted or untrusted, and save changes.

Workflow



What do you want to do?

Role	I Want to...	Show me how

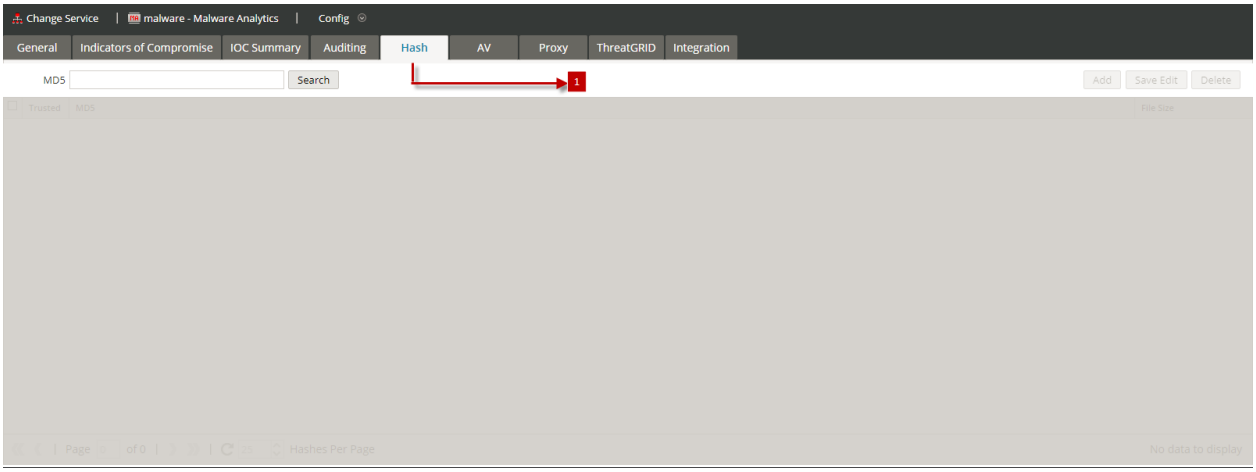
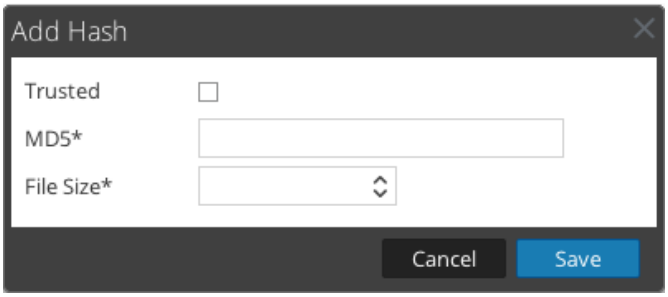
Quick Look

This is an example of the Hash tab.



1 Displays the Hash Tab.

This is an example of the Add Hash dialog.



Features

The **Hash** tab consists of a toolbar and a pageable hash grid.

This table describes the Hash tab toolbar.

Feature	Description
MD5 Search	Enter an MD5 hash for which you want to search the results in the grid. The search function is case-insensitive.
Add	Displays the Add Hash dialog in which you can add a new hash to the hash grid, specify whether the hash is trusted or not, and provide the hash file size.
Save Edit	Saves any additions or edits to hashes in the grid.
Delete	Deletes selected hashes from the grid.

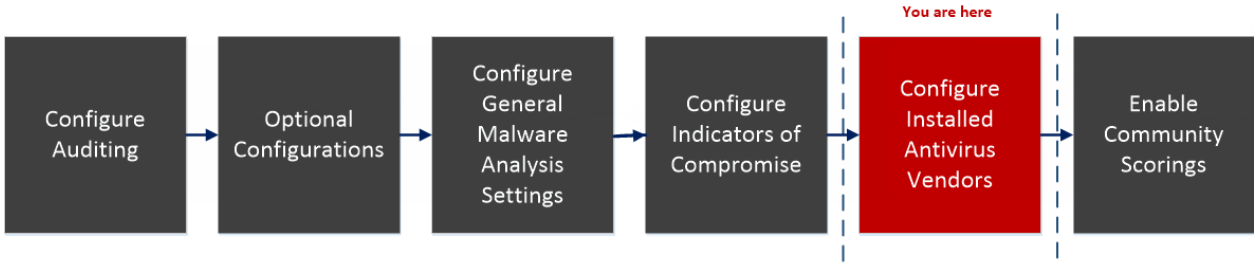
This table describes the Hash grid columns.

Feature	Description
Select Checkbox	Click to select a row. Click in the column header to select a header.
Trusted	Marks a hash as trusted or untrusted.
MD5	Identifies the MD5 hash.
File Size	Identifies the hash file size in kilobytes.

Services Config View - AV Tab

This topic introduces the features and functions of the AV tab in the Service Config view for a Malware Analysis service. The AV tab provides a way to identify the anti-virus software vendors whose software is in use on your network. NetWitness Platform can include the results from these vendors in the detailed results view of an event that has been analyzed using Malware Analysis.

Workflow



What do you want to do?

Role	I Want to...	Show me how

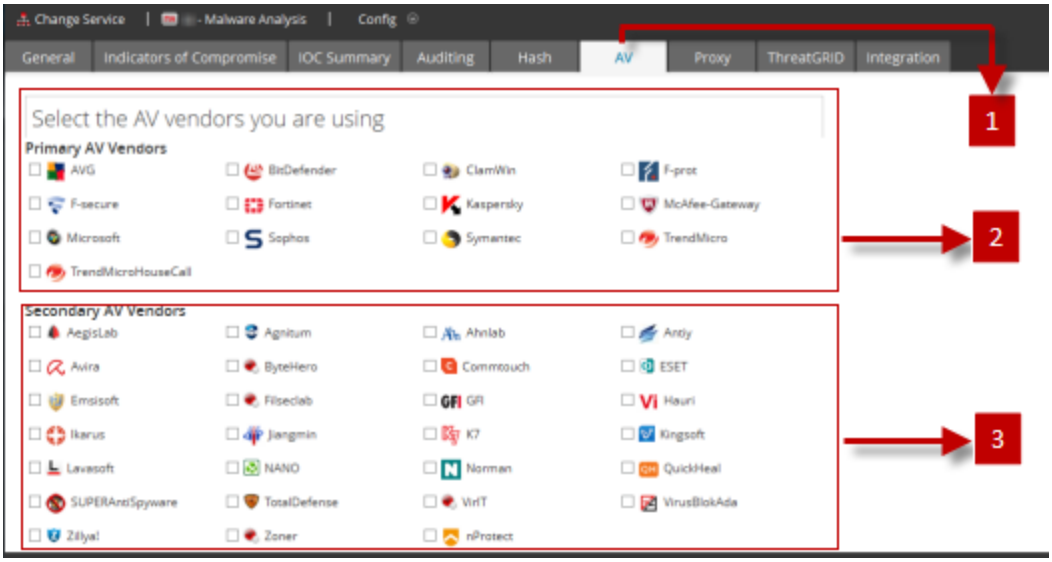
Configure Installed Antivirus Vendors

Quick Look

This is an example of the AV tab.



1 Displays the Av Tab.
2 Allows you to select the AV vendor that you are using.
3 Displays the Secondary AV vendors.

Features

The AV tab lists anti-virus vendors whose software may be installed in your network. There are two categories for vendors: Primary, which are the most trusted, and Secondary, which are less known. Each vendor name has a checkbox and an icon. Checking a vendor name indicates that you have installed the selected AV software from that vendor in your environment.

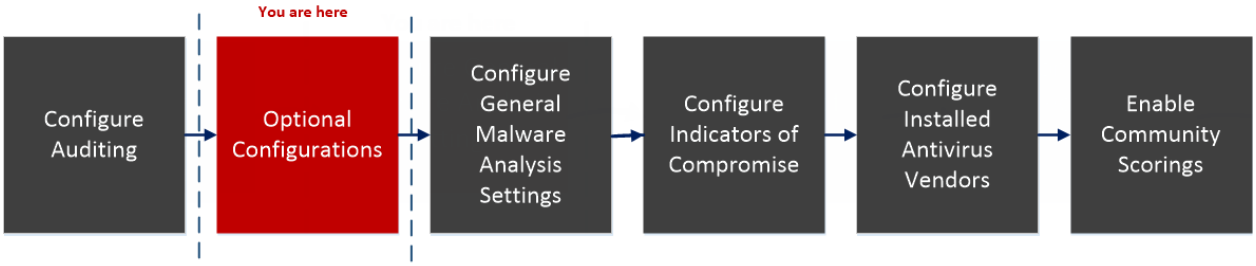
This table describes the options in the AV tab.

Feature	Description
Vendor Checkbox	Choose one or more Anti Virus vendors from the supplied list to indicate which products have been installed in the local organization.
Apply	Saves changes made in the AV tab.
Reset	Resets the AV list to the default state, which has no vendors selected.

Service Config View - Proxy Tab

This topic introduces the parameters configured in the Proxy tab in the Service Config view for a Malware Analysis service. This tab configures Malware Analysis communication via web proxy with the RSA Cloud for community analysis and with the sandbox service for sandbox analysis to preserve anonymity. If you are using a local sandbox service, communications via web proxy are unnecessary and may slow performance. When configuring the sandbox module in the **General** tab, you can choose to bypass the configured web proxy.

Workflow



What do you want to do?

Role	I Want to...	Show me how
Administrator	Configure General Malware Analysis Settings	Configure General Malware Analysis Settings
Administrator	Configure Indicators of Compromise	Configure Indicators of Compromise
Administrator	Configure Auditing on Malware Analysis Host	(Optional) Configure Auditing on Malware Analysis Host

Automatically detect web proxy settings	Select the checkbox to use settings configured in the System settings.
Proxy host	Enter the hostname for the proxy host.
Proxy port	Enter the port used for communication on the proxy host
Users	Enter the username used to log on to the proxy host.
User Password	Enter the user password used to log on to the proxy host.
SSL	(Optional) Select the checkbox to enable communication using SSL.
Apply button	Click the **Apply** button to submit chosen settings.

Services Config View - ThreatGRID Tab

This topic introduces the parameters required to obtain a trial ThreatGRID API key in the Malware Analysis **ThreatGRID** tab, which provides a method of obtaining a trial ThreatGRID API key for use in the ThreatGRID Cloud sandbox. Before enabling ThreatGRID as the sandbox service in the Sandbox module, a ThreatGRID-supplied Service Key must be configured so that ThreatGRID can recognize that samples submitted from this site are legitimate.

If you do not have a ThreatGRID-supplied Service Key, you can obtain a key using this tab. The key is provided on a trial basis.

Workflow

Related Topic

Basic Setup

Quick Look

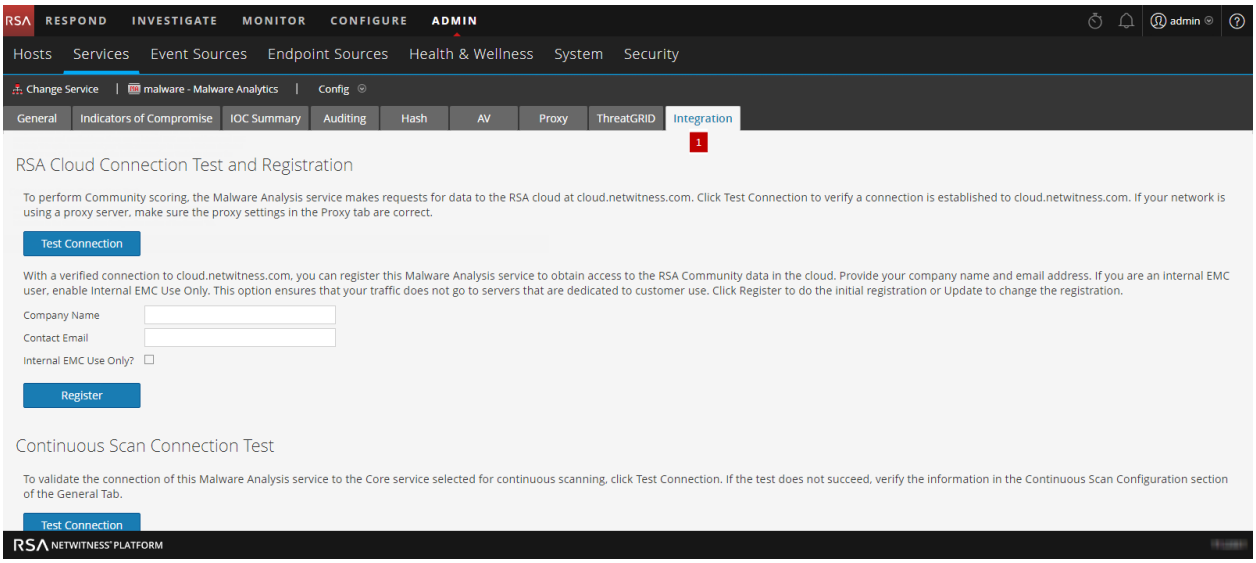
The following figure is an example of the Integration tab.



1 Displays the Integration Tab.

Features

This tab has two sections: RSA Cloud Connection Test and Registration and Continuous Scan Connection Test. The following table describes the features.

Feature	Description
RSA Cloud Connection Test and Registration button	Clicking this button tests for an active connection to cloud.netwitness.com. NetWitness Platform tests communications with the site and checks Proxy settings. A valid connection is required in order to register with the RSA Community Service.
Company Name	This is the name of your company. This is a required field.
Contact Email	This is the contact email. This is a required field.
Internal EMC Use Only Check box	This is an optional field. EMC customers, salespersons, or demo users should check this option to ensure that their requests do not use bandwidth on the production server. When the box is checked the following warning is displayed: `Checking this box may cause a less robust performance because the production server isn't being used.`
Register button	Clicking the Register button completes registration if all required fields are filled in. The Register button becomes the Update button after registration is complete.
Update button	The Update button is displayed after registration is complete.
Continuous Scan Connection Test button	Clicking this button initiates a check to verify that the Malware Analysis service can connect to the Core service selected for continuous scanning (the Source Host, Source Port, Username, and User Password as specified in the General tab).

NetWitness Endpoint Overview

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

NetWitness Platform provides an endpoint detection and response solution that continuously monitors the behavior of all endpoints in the network to provide deep visibility and analysis of executables and processes. It helps to detect new, unknown, and targeted attacks, highlights suspicious activity for investigation, exposes anomalous behaviors, and determines the scope of compromise to help analysts respond to advanced threats faster. During investigation, the analyst can use the visual indication of threat level to assess the risk of endpoints.

As part of this solution, NetWitness Platform introduces **Endpoint Log Hybrid** that:

- Collects and manages endpoint (host) data from Windows, Mac, and Linux hosts.
- Collect logs from Windows hosts.
- Generates metadata to correlate endpoint data with sessions from other events sources, such as logs and network.

Analysts can:

- Perform instant scans for detailed insights of the host behavior at any point in time.
- Analyze the scope of the attack across hosts and network through integrated metadata.
- Quickly triage and focus their investigation by managing suspect and legitimate files.
- Perform multiple checks of file legitimacy to determine if a file is malicious, including checking file certificates and hashes.
- Blacklist malicious files and then block them across all hosts in the network to prevent future execution of this file on any host.

Endpoint Log Hybrid runs an Nginx server (in a reverse proxy mode) that receives data from the Endpoint Agent. The following services run on the Endpoint Log Hybrid:

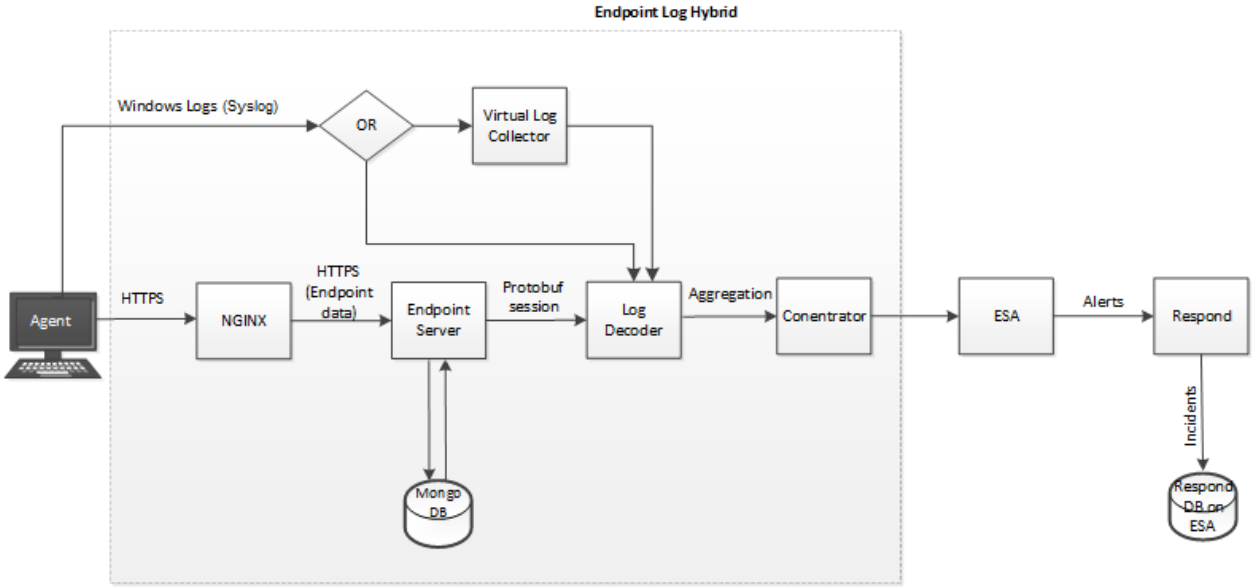
- **Endpoint Server**: Manages data received through Nginx, stores it in the Mongo database. It parses the events, generates metadata, and forwards it to the Log Decoder through protobuf.
- **Log Decoder**: Captures data from the Endpoint Server and processes the metadata.
- **Concentrator**: Aggregates metadata from the Log Decoder and makes it available for all upstream components like Investigate, Reporting Engine, Respond, and Event Stream Analysis similar to NetWitness Decoder and Concentrator.
- **Log Collector**: Collects logs from all event sources that are supported for the log collection in the NetWitness Platform.

In addition to the above services, the Endpoint Log Hybrid leverages the following services:

- **Event Stream Analysis (ESA)**: Creates alerts from ESA rules for Endpoint data.
- **Endpoint Broker**: Provides a consolidated view of all Endpoint servers in a multiple Endpoint Log Hybrid deployment.

Endpoint Agent Data Flow

The following figure shows the endpoint data flow from the agent to the NetWitness Platform:



The *Hosts and Services Getting Started Guide* provides the information you need to understand and install all the NetWitness Platform services.

Basic configuration involves:

- Installing agents on hosts
- Deploying the ESA rules from the Endpoint Rule Bundle
- Creating groups and policies
- Configuring Endpoint metadata forwarding and retention policies
- Defining health and wellness policies to monitor Endpoint Server

You can configure the required settings in the NetWitness Platform user interface under Administration Services Config view (**ADMIN > Services > Endpoint Server > Config**).

Agent Modes

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.3 and later.

In NetWitness Platform 11.3, the Endpoint agent can operate either in Insights or Advanced mode depending on the policy configuration. For more information on policy configuration, see the *NetWitness Endpoint Configuration Guide*. You can have both Insights and Advanced agents in a single deployment.

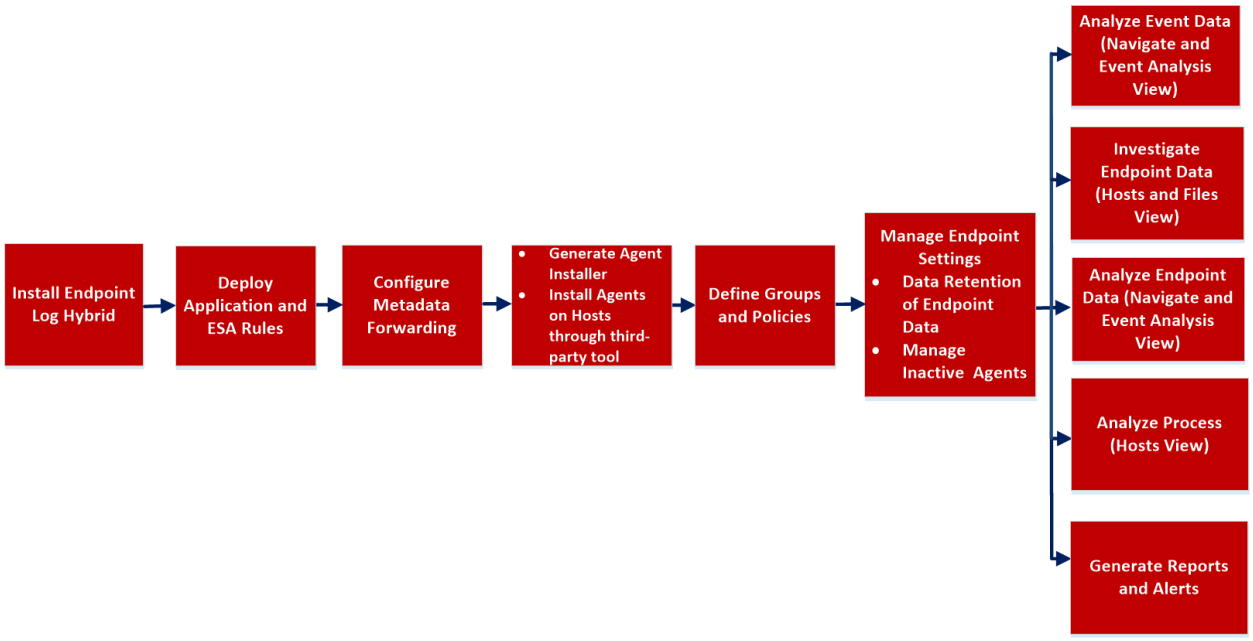
There is no license required for the Insights agent. However, you must procure a Throughput license for an Advanced agent. For more information on licensing, see the *Licensing Management Guide*.

The following table list the features supported for Insights and Advanced agents:

Feature	Insights Agent	Advanced Agent
Scan data - Processes, Autroruns, Files, Drivers, Libraries, and System Information	Yes - Windows, Mac, and Linux	Yes - Windows, Mac, and Linux
Tracking data - Process, File, Registry, Network, and Console	No	Yes - Windows and Mac Registry and Console events are applicable only for Windows.
Anomaly detection - Image Hooks, Kernel Hooks, Registry Discrepancies, and Suspicious Threads	No	Yes - Windows
Windows log collection	Yes	Yes
Threat detection content - ESA, Application Rules	Yes	Yes
Analysis of downloaded file	No	Yes
File status - Whitelist, Blacklist, Graylist, and Neutral	Yes (View only)	Yes (View and modify)
File Remediate (Block)	No	Yes
Process visualization	No	Yes
Live connect	Yes	Yes
File reputation service (Third-party lookup)	Yes	Yes
Risk score for hosts	No	Yes

Endpoint Log Hybrid Configuration

This topic provides the high-level tasks required to configure the Endpoint Log Hybrid.



Tasks	Description
Install the Endpoint Log Hybrid	See the *Physical Host Installation Guide* and *Virtual Host Setup Guide*.
Deploy Application and ESA Rules	See Deploying Endpoint Application Rules and ESA Correlation Rules.
Configuring Metadata Forwarding	Similar to logs and packets, you can view Endpoint metadata in the Navigate and Event Analysis view. You can also generate reports and alerts for the Endpoint data. By default, the Endpoint Meta option is disabled. The agent must be installed with the Endpoint Meta option enabled to forward metadata.

Tasks	Description
Install Agents on Hosts	The Endpoint agent installer is generated using the Packager tab under **ADMIN > Services > Config > Endpoint Server** from the NetWitness Platform user interface. The Packager is a zip file that contains executables and configuration files for generating agent installer for Linux, Mac, and Windows operating systems. You can install only one version of the agent on a host. If you have a previous version of an agent installed (for example, 4.4), uninstall this agent to install the 11.3 agent. After the agent is installed, it appears on the **Investigate > Hosts** view. By default, the Endpoint data is posted for the first time. To collect subsequent Endpoint data, you have to either schedule a scan or perform ad hoc scan. It retrieves data, such as drivers, processes, DLLs, files (executables), services, autoruns, security information, anomalies, system configurations, and scripts found on the host.
Endpoint Sources	To efficiently manage and update endpoint agent configurations, you can group the agents, and manage their behavior using policies.
Enable Reputation Status	Reputation Status is enabled by default in an NetWitness Platform 11.3 deployment and displays information about the file. For troubleshooting, see the *Live Services Guide*.
Risk Score	Risk Score is calculated and obtained from NetWitness Respond for hosts and files. For more information, see the *NetWitness Respond Configuration Guide*.
Configuring Data Retention Policy	Define data retention policies to optimally store and manage the Endpoint data based on the age of the Endpoint data or the storage size. By default, 30 days of agent data is retained.
Managing Inactive Agents	By default, agents (including all the collected Endpoint data) that have not communicated with the Endpoint Server for 90 days will be automatically deleted.
Investigate Endpoint data	You can investigate the Endpoint data in the **Investigate > Hosts** and **Investigate > Files** views. For more information, see the *NetWitness Endpoint User Guide*.

Deploying Endpoint Application Rules and ESA Correlation Rules

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.3 and later.

The existing IIOCs from NetWitness Endpoint 4.4.0.x are now available as OOTB Endpoint Application rules tagged as Indicators of Compromise, Behaviors of Compromise, Enablers of Compromise, and Analysis.File. Application rules for Endpoint are automatically available on installation of NetWitness Platform 11.3.

For Endpoint risk score, every Application rule must have an ESA rule that generates alerts used for the risk score calculation. A set of OOTB ESA rules are available as Endpoint Rule Bundle. You must specify the Endpoint data sources (Concentrators) and deploy the ESA Rules from the Endpoint Rule Bundle. For more information, see "Deploy Endpoint Risk Scoring Rules on ESA" section in the *ESA Configuration Guide*.

If the Application rule key value matches with ESA rule then an alert is triggered which is used to compute the risk score and an incident is raised when risk score exceeds the defined threshold limit.

Note: If you are upgrading from an existing Endpoint Log Hybrid to 11.3 , you must deploy the Application rules from RSA Live. During deployment, you must specify Endpoint Log Hybrid Log Decoder service. In case of multiple Endpoint servers, select all the Endpoint Log Hybrid Log Decoder services. For more information, see the *Live Services Management Guide*.

You can view the application rules that are deployed in **Admin** > **Endpoint Log Hybrid - Log Decoder** > **Config** > **App Rules** and application rules that were triggered in **Investigate** > **Navigate**> **Endpoint Log Hybrid - Concentrator** > **App rules**.

The Endpoint ESA rules generate alerts with the severity; Critical, High, and Medium. You can view the alerts on:

- Risk Details tab - You can view Critical, High and Medium alerts for a host or file on **Investigate** > **Hosts**> **Risk Details** or **Investigate** > **Files**> **Risk Details**.
- Respond view : You can view only critical and high severity alerts on **NetWitness Respond** > **Alerts**.

Custom Endpoint Rule for Risk Scoring

If you have custom IIOCs in NetWitness Endpoint 4.4.0.x, you need to create these custom Endpoint rules. Once you have created your custom Application rule, you must create the custom ESA Rule for risk score calculation and update the RiskConfig file in MongoDB.

To create a custom Endpoint rule, perform the following:

1. Add a custom Application rule
2. Add a custom ESA rule
3. Update the risk configuration file

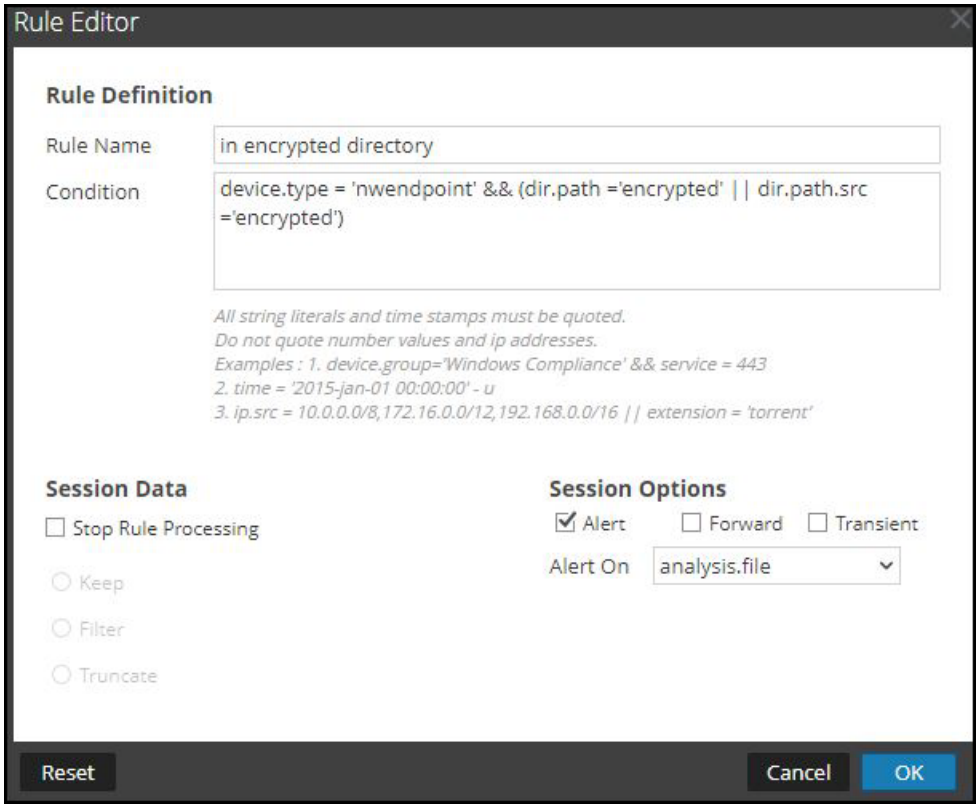
1. Add a custom Application Rule

To add a custom application rule:

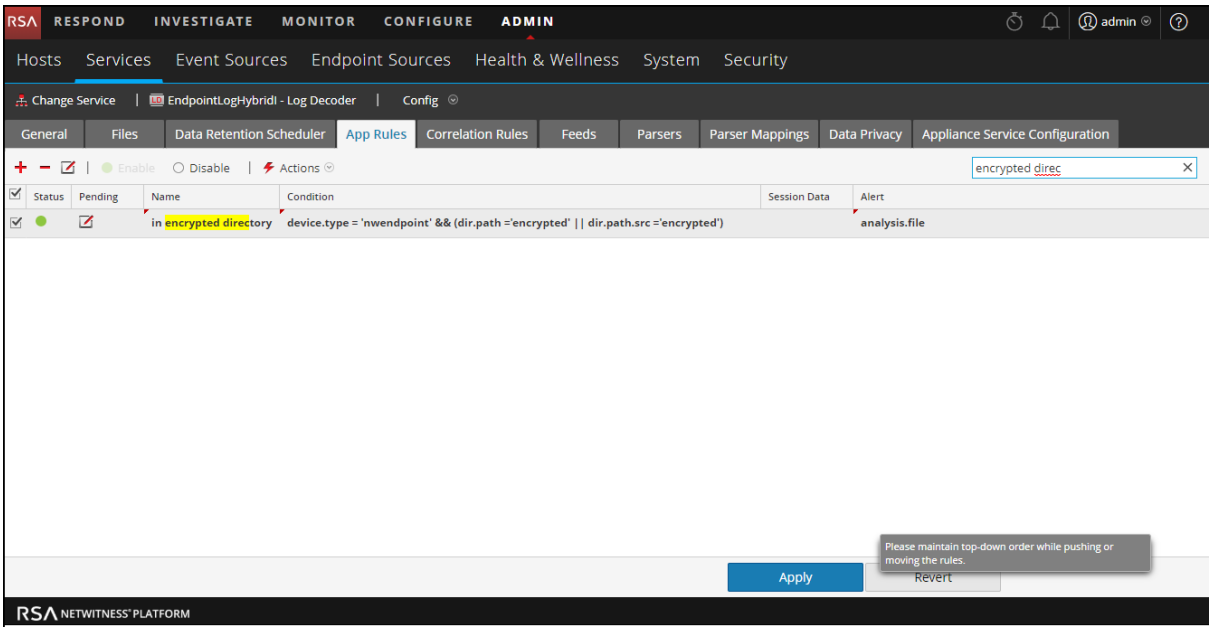
1. Complete steps 1-11 in "Configure Application Rules" topic of *Decoder and Log Decoder Configuration Guide*.

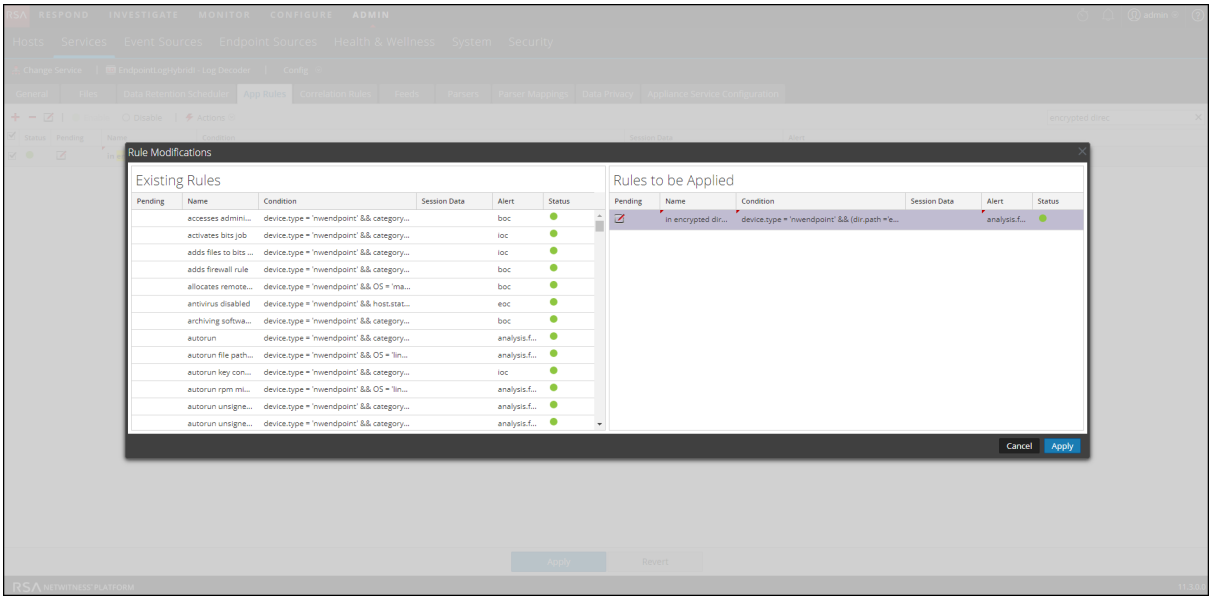
   Note: You must be familiar with the metakeys tagged as (Indicators of Compromise, Behaviors of Compromise, Enablers of Compromise, and Analysis.File) on which an alert will be generated. In the example below, the alert is generated on Analysis.File metakey for In Encrypted Directory rule.

   Following is an example of an Application Rule created for In Encrypted Directory alert.



2. After a custom application rule is added successfully, select the newly created rule (For example, In Encrypted Directory alert) and click **Apply**.





In case of multiple Endpoint servers, you must create this custom Application rule on every Endpoint Hybrid Log Decoder service.

2. Add a custom ESA Rule

To add a custom ESA rule, perform the following.

1. SSH to the Admin Server.
2. Create a new JSON file (for example,`in encrypted directory.json`) with the custom ESA rule definition in the below format.

```
{
"id": "In Encrypted Directory","key": "analysis.file",
```

```
"value": "in encrypted directory",
"title": "In Encrypted Directory",
"type": "ENDPOINT",
"enabled": true,
"description": "End Point rule for In Encrypted Directory",
"severity": "MEDIUM"
}
```

The following table describes the fields that define a rule.

Fields	Description
id	The name of the ESA Rule. For example, In Encrypted Directory.
key	The metakey on which an alert would be generated. For example, alert is generated on analysis.file metakey for In Encrypted Directory rule.
value	Specify the value. The value must exactly match with the App rule name. For example, in encrypted directory.
title	The name of the alert. For example, In Encrypted Directory.
type	Specify the type of rule. For custom endpoint rule, the type must be ENDPOINT.
enabled	The status of the rule. Specify true, if the rule should be considered for risk scoring.
description	The description of the rule.
severity	The severity of the rule; critical, high or medium.

3. To enter shell mode of nw-shell, execute the following command:
   `nw-shell`
4. Connect to ESA correlation-server using the following command:
   `connect --service correlation-server`
5. Login to the ESA correlation-server using the following command
   `login`

   Note: You must provide Administrator username and password.
6. Navigate to the API xpath using the following command:
   `cd correlation/keyvalue/settings/set`
7. Execute the API using the following command:
   `invoke --file <absolute-path-to-rule-definition-file>`

   Note: You must specify the absolute path to the rule definition file. For example, `invoke --file /root/rule.json`

3. Add the rule to RiskConfig

After you create the custom Application rule and the ESA rule, you must update the RiskConfig in mongoDB.

To update the riskconfig file, perform the following:

1. SSH to Admin Server.
2. Create a JavaScript file (For example, `in-encrypteddirectory- rule.js)` with the custom ESA rule definition in the below format.

```
db.risk_rule.insertMany(
[ {
"name" : "In Encrypted Directory",
"enabled" : true,
"handler" : "Default",
"entities" : {

},
"metas" : {
"File" : [
{
"meta" : "checksum_src",
"name" : "filename_src",
"weight" : NumberInt(100)
}
],
"Host" : [
{
"meta" : "agent_id",
"name" : "alias_host",
"weight" : NumberInt(100)
}
]
},
"_class" : "com.rsa.asoc.respond.pipeline.risk.rules.AlertScoringRule"
} ]
)
```

The following table describes the fields that define a rule.

Field	Description
name	The name of the ESA rule.
enabled	The flag to enable or disable risk scoring. Specify true to enable risk scoring.

Field	Description
handler	The value of this should be Default.
entities	The value of this should be empty.
metas > Files > meta	The metakey for a file for which score should be calculated.
metas > Files > name	The name of the metakey of the file identity.
metas > Files > weight	By default the weight value is 100.
metas > Host > meta	The metakey for a host for which score should be calculated.
metas > Host > name >	The name of the metakey of the host identity.
metas > Host > weight	By default the weight value is 100.
_class	This is used for internal purpose, do not change.

3. Insert the new rule into the riskconfig file on mongoDB using following command:

```
mongo respond-server --authenticationDatabase admin -u deploy_admin
-p <deploy_admin-user-password> in-encrypted-directory-rule.js
```

4. Confirm if ESA rule is updated successfully in the riskconfig, using following command

```
mongo respond-server --authenticationDatabase admin -u deploy_admin -p
<deploy_admin-user-password> --eval "db.risk_rule.find({ "name": /.*In
Encrypted Directory.*/i })"
```

5. Restart the Respond server for the changes to take effect.

```
service rsa-nw-respond-server restart
```

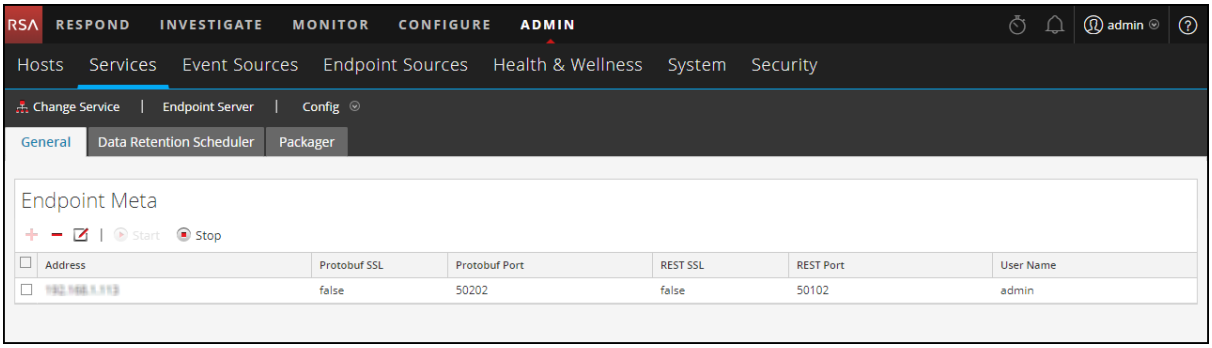
After you create a custom Endpoint rule and update the risk configuration file, whenever an event is generated for the new rule (For example, In Encrypted Directory) an alert will be generated and the risk score is calculated for the host and file.

Configuring Metadata Forwarding

To view the metadata, you must enable the metadata forwarding while installing the Endpoint Log Hybrid. The Endpoint metadata is displayed in the NetWitness Platform Investigate (**Navigate** and **Event Analysis** views) similar to Logs and Packets. For information on metadata mappings, see Endpoint Metadata Mappings.

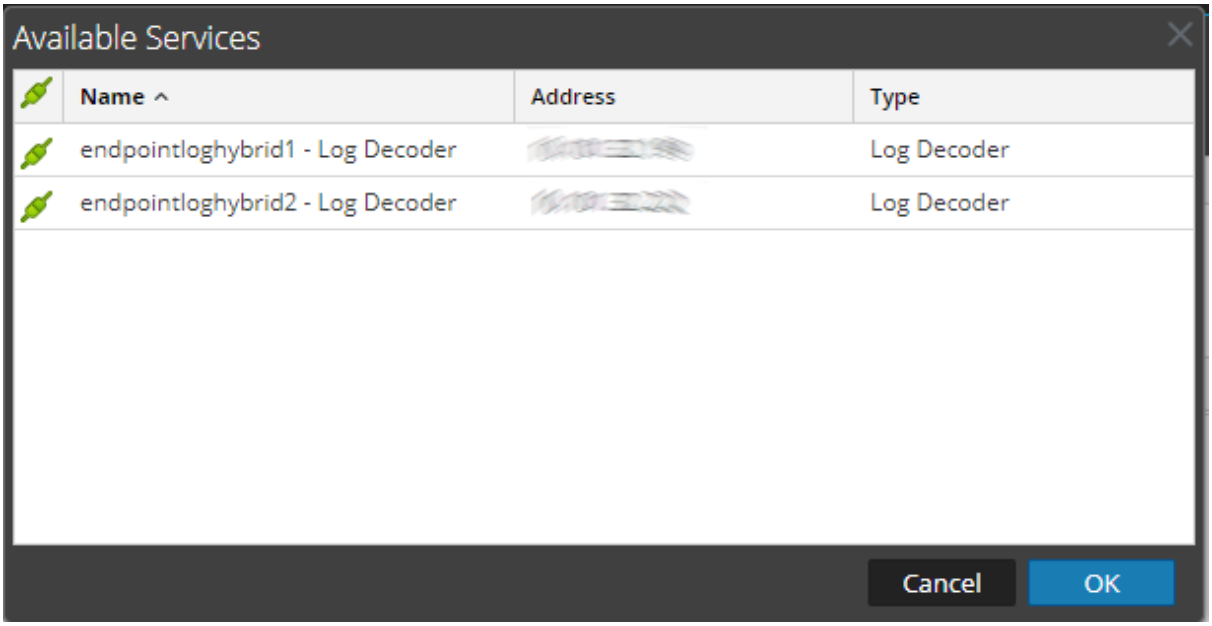
To configure metadata forwarding:

1. Go to **ADMIN** > **Services**.
2. In the Services view, select the **Endpoint Server** service.
3. Click and select > **View** > **Config**.
4. Click the **General** tab.



5. Click in the toolbar.

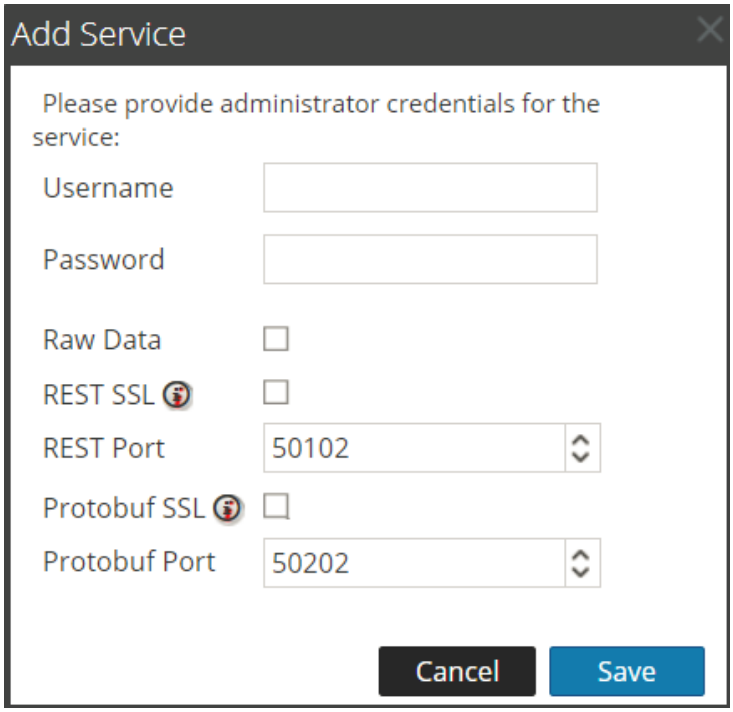
   The Available Services dialog is displayed.



6. Select a Log Decoder service and click **OK**.

The Add Service dialog is displayed.

Note: You can add only one Log Decoder service.



7. Enter the administrator credentials for authentication.
8. (Optional) If you enable Raw Data, a brief summary of the session is forwarded along with the metadata.
9. (Optional) If you have enabled SSL on the REST port in the Log Decoder, select the **REST SSL** option. By default, the REST port for non-SSL is 50202 and SSL is 56202.
10. Select the **Protobuf SSL** option to enable SSL on Protobuf. By default, the Protobuf port is 50202.
11. Click **Save**.

After configuring the metadata forwarding, make sure to:

- Start the capture on the Log Decoder
- Start the aggregation on the Concentrator
- Add the Log Decoder as a service in the **Concentrator**

Start Metadata Forwarding to the Log Decoder

1. In the Endpoint Meta config > General view, select the service.
2. Click Start
   The Endpoint Server starts forwarding the metadata to the Log Decoder.

Stop Metadata Forwarding to the Log Decoder

1. In the Endpoint Meta config > General view, select the service.
2. Click Stop.
   The Endpoint Server stops forwarding the metadata to the Log Decoder.

Remove Metadata Forwarding

Note: Make sure you stop the service, before removing the metadata forwarding.

1. In the Endpoint Meta config view, select the service.
2. Click .
3. Click **Apply**.

Endpoint Metadata Mappings

You can view the default metadata mappings or modify the metadata mappings for endpoints.

JSON Schema for Metadata Mappings

All metadata mappings is configured using the JSON schema. The following is a sample JSON schema:

```
{
"metaKeyPairs" : [
     {
     "metaKeyPairsCategory" : "",
     "keyPairs" : [
          {
          "endpointJpath" : "",
          "metaName" : "",
          "type" : "",
          "enabled" : true
          },
          {
          "endpointJpath" : "",
          "metaName" : "",
          "type" : "",
          "enabled" : true
          }
      ]
      }
]
```

```
}
```

The following APIs are used to view or modify the metadata mappings:

- `get-default` - Returns the default configurations for the endpoint metadata mappings.
- `get-custom` - Returns the custom configurations for the endpoint metadata mappings.
- `set-custom` – Helps customize the endpoint metadata mappings.

View the Metadata Mappings

To view the endpoint metadata mappings:

1. On the NW server, run the `nw-shell` command from the command line.
2. Run the `login` command and enter the credentials.
3. Connect to the Endpoint Server using the following command:
   `connect --host <IP address> --port <number>`

Note: The default port is 7050.

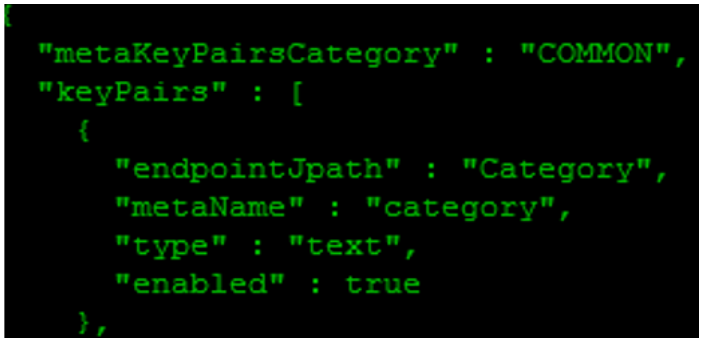
4. Run the following commands:
   ```
   cd endpoint/meta
   cd get-default
   invoke
   ```

The following screen shows the default metadata mappings:

To disable a default metadata mapping:

Enter the same endpointJpath value and set the enabled parameter to `false`.

For example, if the endpointJpath is `Category` and enabled parameter is `true`, enter the same endpointJpath and set the enable parameter to `false`.



Note: Do not modify the metaKeyPairsCategory in the schema; “COMMON”, “COMMON_MACHINE”, “COMMON_MACHINE_FOR_EVENTS”.

To change the metadata name or metadata type:

Enter the same endpointJpath value and specify values for the metaName and type.

Note: The metaName must exist in the table-map.xml of the Log Decoder, index-concentrator.xml or index-concentrator-custom.xml file of the Concentrator, for the metaName to appear on the Investigate view.

Add or Modify Metadata Mappings

To add or modify the metadata mappings, run the `set-custom` API. The metaKeyPairs configuration provided in the JSON file should match the JSON schema of the default configuration received through the `get-default` API.

1. On the NW server, run the `nw-shell` command from the command line.
2. Run the `login` command and enter the credentials.
3. Connect to the Endpoint Server using the following commands:

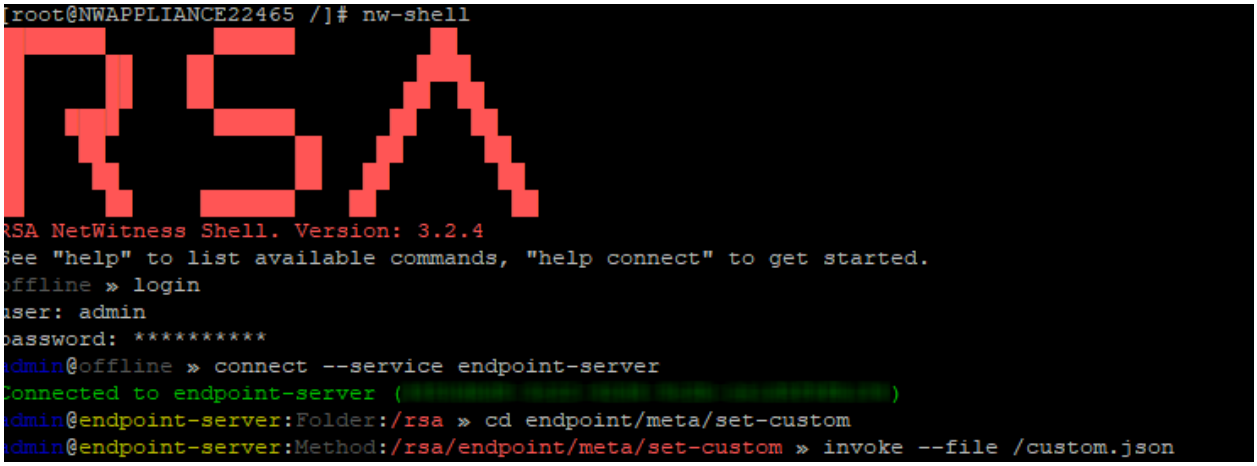
   ```
   connect --service endpoint-server
   ```

   Note: The default port number is 7050.

4. Run the following commands:

   ```
   cd endpoint/meta
   cd set-custom
   invoke --file <json file>
   ```

You can add new metaKeys by adding entries to the file that will be uploaded using the `set-custom` API. The following example shows how to add a new metadata mapping:



View the Custom Metadata Mappings

To view the custom metadata mappings, run the `get-custom` API, and then invoke commands.

Note: The `get-custom` API will return values only if the metadata mappings are modified using the `set-custom` API.

Endpoint Sources

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.3 and later.

The Endpoint agents deployed in your environment may be large in number and geographically distributed. To efficiently manage and update configurations automatically, agents can be organized into smaller subsets called **Groups**.

Groups

Groups can be created based on IP address (IPv4 and IPv6), host names, operating system type, and operating system description. You can create groups based on your requirements. For example, you can group all agents running on Windows 2016 Server and IP ranging from 10.40.10.1 to 10.40.10.200. For more information on creating groups, see Creating Groups and Policies.

Note: All agents that are not part of any group use the default policy settings.

Policies

To manage the behavior of agents in a group, you can apply a set of rules called **Policies**. The RSA NetWitness Platform supports two types of policies for endpoints: **Agent Endpoint** and **Agent Windows Logs** policies. The following default policies are available on installation.

Note: RSA recommends that you review these default policies before deploying agents.

- Default Agent Endpoint (EDR) Policy
- Default Windows Log Policy

You can either assign the default policies to a group, modify the default EDR policy, or create custom policies based on your organization requirements.

Note: You cannot edit the default Windows Logs policy.

You can do the following through a policy:

- Define the agent mode - Insights or Advanced
- Configure scan schedule and settings
- Configure endpoint settings, such as which Endpoint server the agents should communicate, port details, and beacon intervals
- Configure response actions such as blocking
- Configure Windows Log collection

For example, you can create a policy to schedule scan and enable blocking. For more information on creating policies, see Create an EDR Policy or Create a Windows Log Policy.

Group Ranking

When a group is created, a rank is associated with every group based on the creation order. If an agent belongs to multiple groups, to handle conflicting configurations, you can reorder the groups to change the ranking, and the policy associated with the highest ranked group takes precedence.

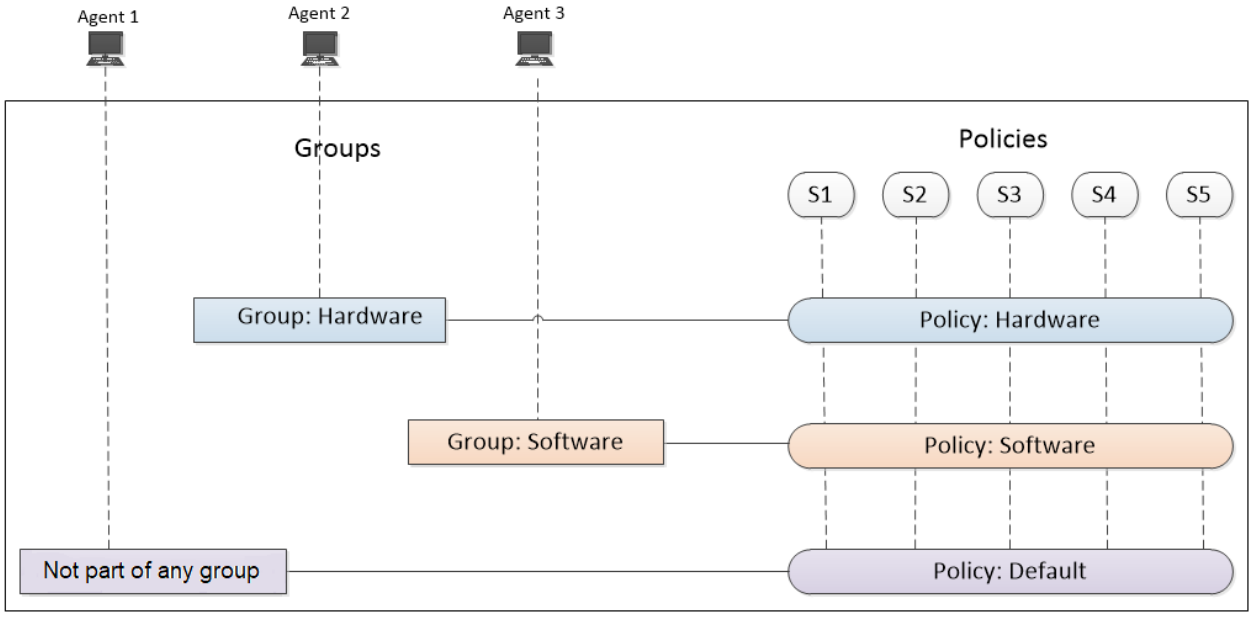
Example 1

A **Server** group contains 100 hosts with a default Agent Endpoint policy. Amongst these, if 20 hosts require further investigations, analyst can:

1. Create a temporary group with a static list of these 20 hosts.
2. Create or apply any policy to this group that will not impact any other hosts.
3. Edit the ranking for the new group, moving to the top of the Ranking list (making sure it is above the existing Server group).
4. After investigation is done, delete this group. The hosts are revalidated and assigned to the appropriate group based on the ranking.

Example 2

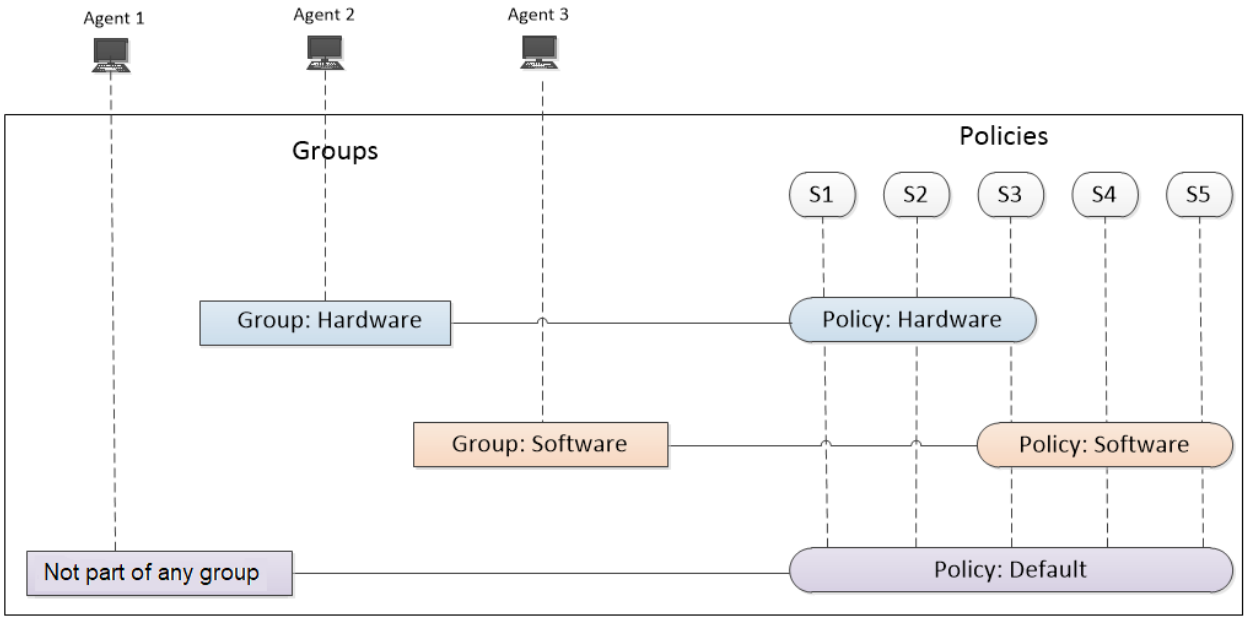
Case 1:



* S1, S2, S3, S4, and S5 represents policy settings, such as run scheduled scan, agent mode, scan settings, response actions, and so on.

Each agent is a part of a unique group that is associated with a policy, where each policy has all settings S1, S2, S3, S4, and S5 defined. For example, Agent 2 is a part of the group Hardware, where all settings in the policy Hardware are applicable.

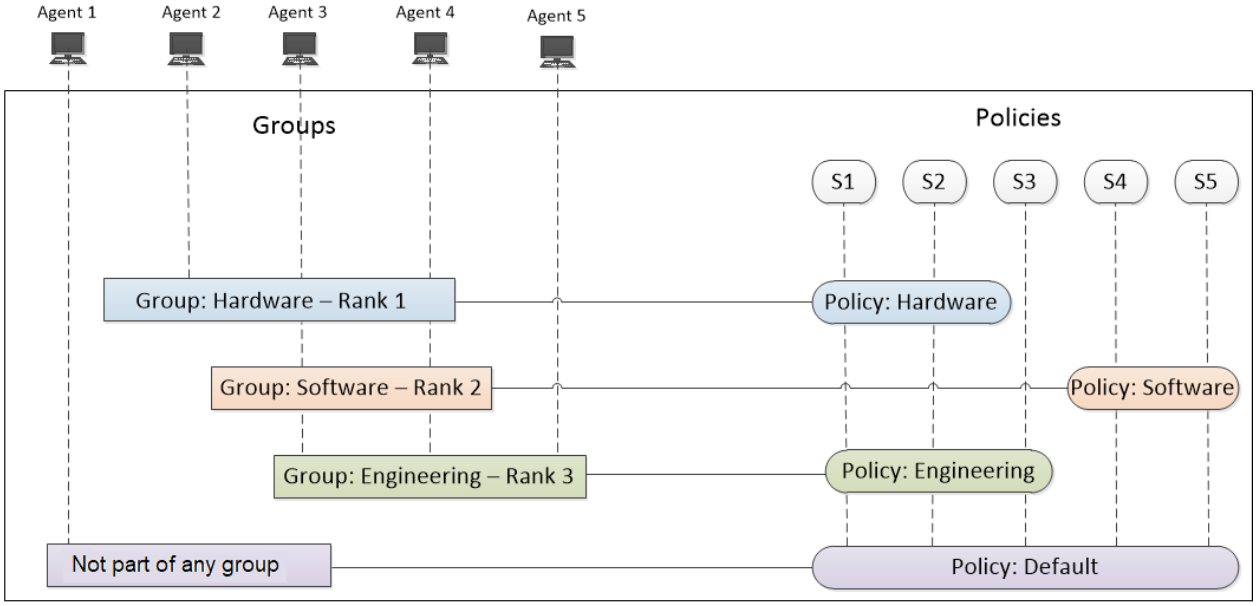
Case 2:



* S1, S2, S3, S4, and S5 represents policy settings, such as run scheduled scan, agent mode, scan settings, response actions, and so on.

In the policy Hardware, S4 and S5 settings are not defined, and hence the agent 2 inherits settings S4 and S5 from the default policy.

Case 3:



* S1, S2, S3, S4, and S5 represents policy settings, such as run scheduled scan, agent mode, scan settings, response actions, and so on.

- Agent 2 is a part of the highest ranked group Hardware, and with the policy Hardware. The agent 2 inherits settings S3, S4, and S5 from the default policy as they are not defined in the policy Hardware.
- Agent 3 is a part of Hardware, Software, and Engineering groups, and with the policy Software. The agent considers the settings S4 and S5 from the policy Software, and the remaining undefined settings are inherited as follows:

- S1 and S2 from the policy Hardware, which is associated with the highest ranked group.
- S3 from the policy Engineering, which is the next ranked group.

- Agent 4 is a part of Hardware, Software, and Engineering groups, and with the policy Engineering.
  - Though settings S1 and S2 are defined in policy Engineering, the agent 4 considers the settings S1 and S2 from the policy Hardware as it is associated with the highest ranked group.
  - S4 and S5 from the policy Software, which is the associated with the next highest ranked group.
  - S3 from the policy Engineering.

The following are some of the key points:

- If an agent is not assigned to any group, default policies are applied.
- A policy can be assigned to multiple groups. However, a group can only have one policy of each type (Agent Endpoint and Agent Windows Logs).
- An agent can belong to multiple groups. The policy is derived based on the ranking of the group as shown in the above example (case 3).
- If all settings are defined in a single policy, and it is the highest ranked policy for an agent, no policy settings from other ranked groups are inherited (case 1).
- If there are any undefined settings in the policy, the settings from the default policy is considered as shown in the example above (case 2 and 3).
- If an agent falls into more than one group, its complete set of policy attributes is determined as follows:
  - It takes all settings from the highest ranked policy that applies.
  - Any settings that are not set in the highest ranked policy are taken from the next highest ranked policy that applies.
  - If there are still unset attributes , they are taken from the default policy.
  - If there are any conflicts, the higher ranked policy wins.

Example 3

Assume the following:

- Agent A belongs to below two groups, **Production Servers** and **All Windows Hosts**.
- The Production Servers group has the **Schedule scan set and no blocking** policy assigned, and it has the following settings:
  - Schedule Scan : Enabled
  - Effective Date: 2019-03-08
  - Start Time: 09:00
  - Scan Frequency: Every 1 week
  - CPU Maximum: 45 %

  - Virtual Machine Maximum: 20 %
  - Blocking: Disabled
- The All Windows Hosts group has the **EDR for All Windows** policy applied, which has the following settings:
  - Scan Master Boot Record: Disabled
  - Blocking: Enabled
- The **Production Servers** group is ranked higher than the **All Windows Hosts** group for EDR policies. Keep in mind that ranking only applies to policies of the same source type: that is, all EDR policies are ranked, and all Windows Logs policies are ranked separately.

Agent A gets its final policy configuration as per the ranking of the groups (and associated policies) to which it belongs:

- The agent uses the schedule set in the **Schedule scan set and no blocking** policy.
- Scan Master Boot Record is disabled, because that is set in the **EDR for All Windows** policy.
- Blocking is disabled: since there is a conflict, the value in the higher ranked policy is used.
- All other attributes are set based on values in the Default EDR policy.
- Note that if you wanted Blocking to be enabled, you could change the group ranking so that All Windows Hosts is higher than Production Servers: in this case, Production Servers would win the conflict, and Blocking would be enabled for Agent A.

Default Agent Endpoint (EDR) Policy

When an agent is installed, it operates in an Insights mode until a policy is assigned. The following are the default EDR policy settings:

Settings	Fields	Default Value
Scan Schedule	Run Scheduled Scan	Disabled
	Effective Date	Current date
	Scan Frequency	Every 1 week
	Start Time	09:00 (this is 9 AM)
	CPU Maximum	25%
	Virtual Machine Maximum	10%
Agent Mode	Monitoring mode	Advanced

Settings	Fields	Default Value
Scan Settings	Scan Master Boot Record	Disabled
	Auto Scan New Systems When Added	Disabled
Response Action Settings	Blocking	Disabled
Endpoint Server Settings	Endpoint Server	The agent considers the default Endpoint Server that is configured during packager generation.
	Endpoint Server Forwarder (Optional)	
	HTTPS Port	443
	HTTPS Beacon Interval	15 Minutes
	UDP Port	444
	UDP Beacon Interval	30 Seconds

Default Windows Log Policy

The following are the default Windows Log policy settings:

Settings	Fields	Default Value
Windows Log Settings	Status	Disabled
	Protocol	TLS
	Send Test Log	Disabled

Creating Groups and Policies

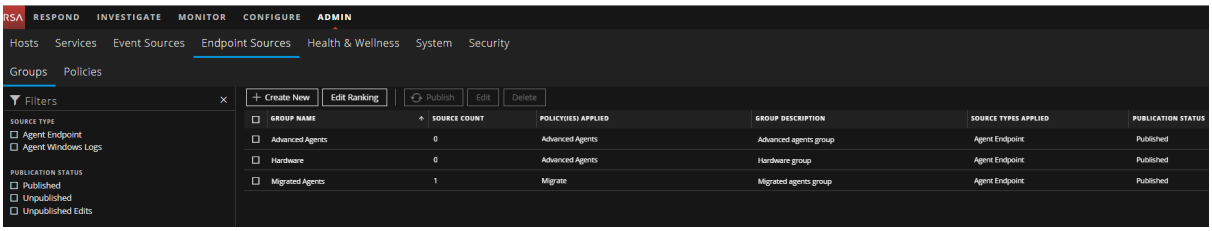
Note: The information in this topic applies to RSA NetWitness® Platform Version 11.3 and later.

The following sections provide instructions on how to create groups and policies.

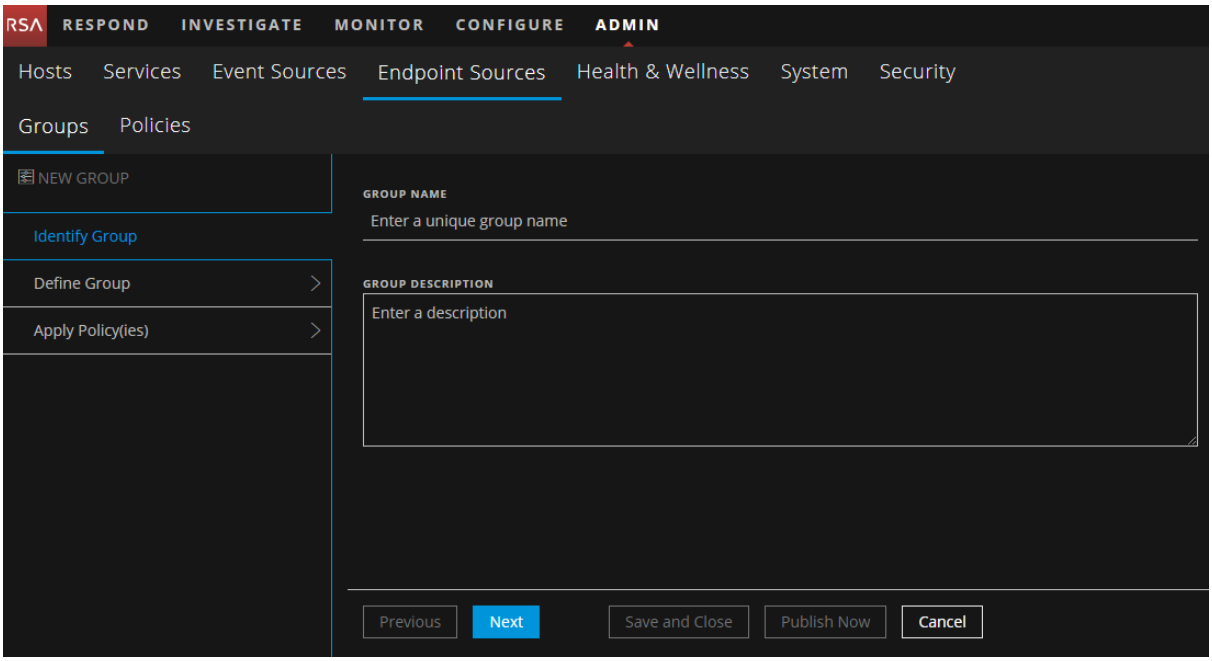
Create a Group

To create a group:

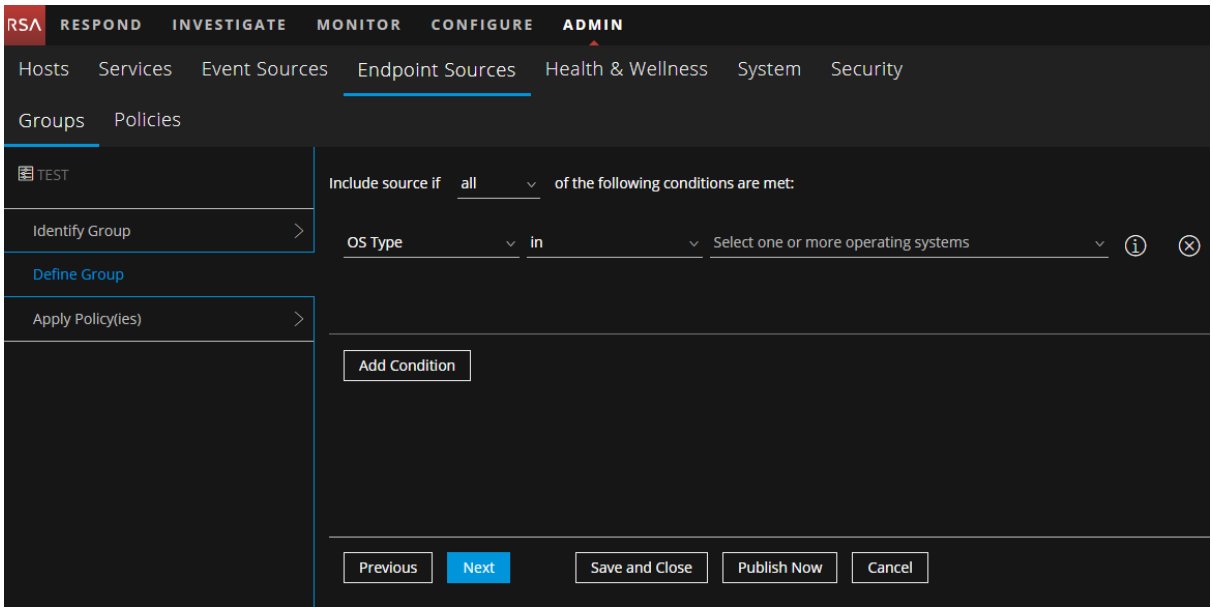
1. Go to **ADMIN > Endpoint Sources** view.
2. In the left panel, select the **Groups** tab.



3. In the toolbar, click **Create New**.
4. In the **New Group** panel, click **Identify Group**, and enter a group name and group description, and click **Next**.



5. Click **Define Group** and specify the logical statements that define the condition for an agent to be included in the group. Each logical statement consists of: parameter, operator, and values to match.



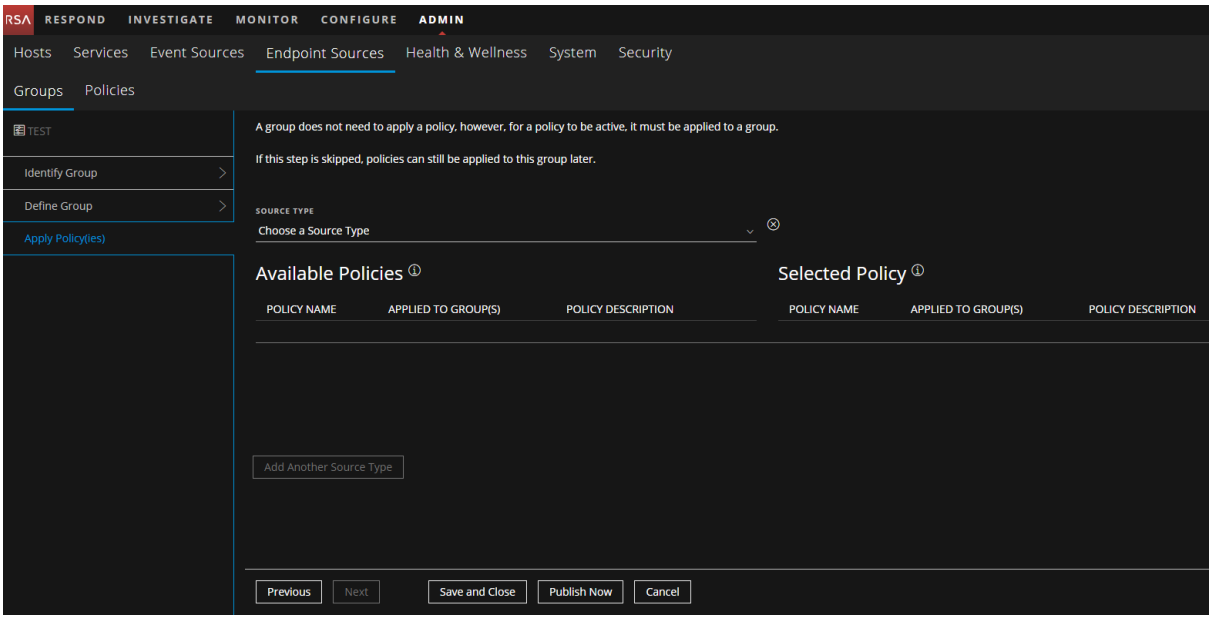
- In the **Include source if ___ of the conditions are met** field, select the appropriate conditions - all or any.
- For each logical statement, select the required options:

Item	Description
Parameter	The parameter can be OS Type, OS Description, Host Name, IPv4, or IPv6. • OS Type, OS Description, Host Name: The value you enter should reference hardware or virtual machines that are running endpoint agents. • IPv4 or IPv6: Enter valid IP addresses as either ranges or as a set of IP addresses to include or exclude. **Note:** If you do not want to include certain IP addresses, use the **Not in** operator, and enter the IP address separated by a space or a comma.
Operator	The choice of values is dependent upon the parameter you chose. For example, if your parameter is OS Type, the only operator available is **in**.
Value or values to match	The value or values to match. For the OS Type parameter, you can choose one or more values from the drop-down list. For all other parameters, you can enter free-form text. **Note:** Although you can enter any text for values, the system validates your entries when you attempt to proceed to another screen, and will not allow you to proceed until values are valid.

6. Click **Add Condition** to add another condition.
7. Click **Next** to proceed.
8. (Optional) Click **Apply Policy(ies)** and select the source type from the drop-down list. Policies with

the selected source type are displayed below **Available Policies**. You can either assign default policies or custom policies. For more information on creating policies, see Create an EDR Policy and Create a Windows Log Policy.

Select a policy by clicking . Skip this step if you want to apply the policy later to the group.



Note: You can attach only one policy per source type to a group. That is, you cannot attach more than one Agent Endpoint policy to a single group, nor more than one Agent Windows Logs policy.

9. Do one of the following:
   - Click **Save and Close** to save the settings and return to the Groups view. The publication status is displayed as **Unpublished** in the Groups view.

     Note: You can select an unpublished group and click **Publish** to publish a group.
   - Click **Publish Now** to publish the group.

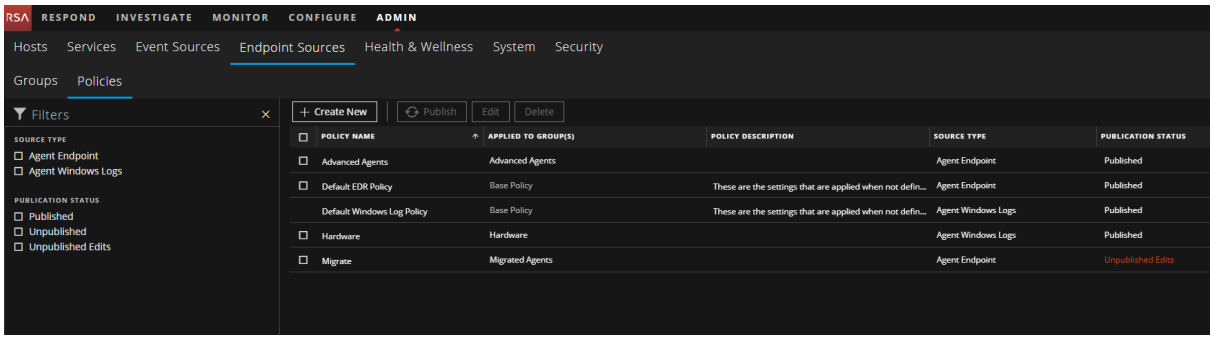
Create an EDR Policy

While creating a policy (either an EDR policy or a Windows Log policy), note the following:

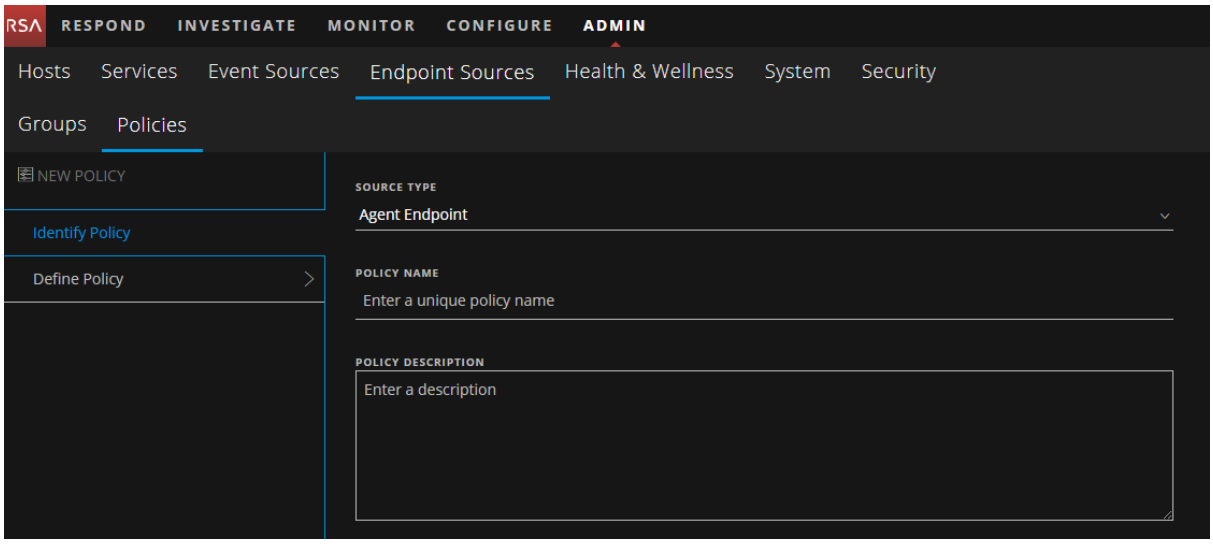
- Whenever you choose a setting, it is added to the **Selected Settings** panel.
- To clear any of your selected settings, click to remove that setting.
- At any point in the wizard, you can choose **Save and Close**, so that you can return to complete the policy creation at a later time.

To create an EDR policy:

1. Go to **ADMIN > Endpoint Sources**.
2. Click **Policies**. The available policies are displayed.

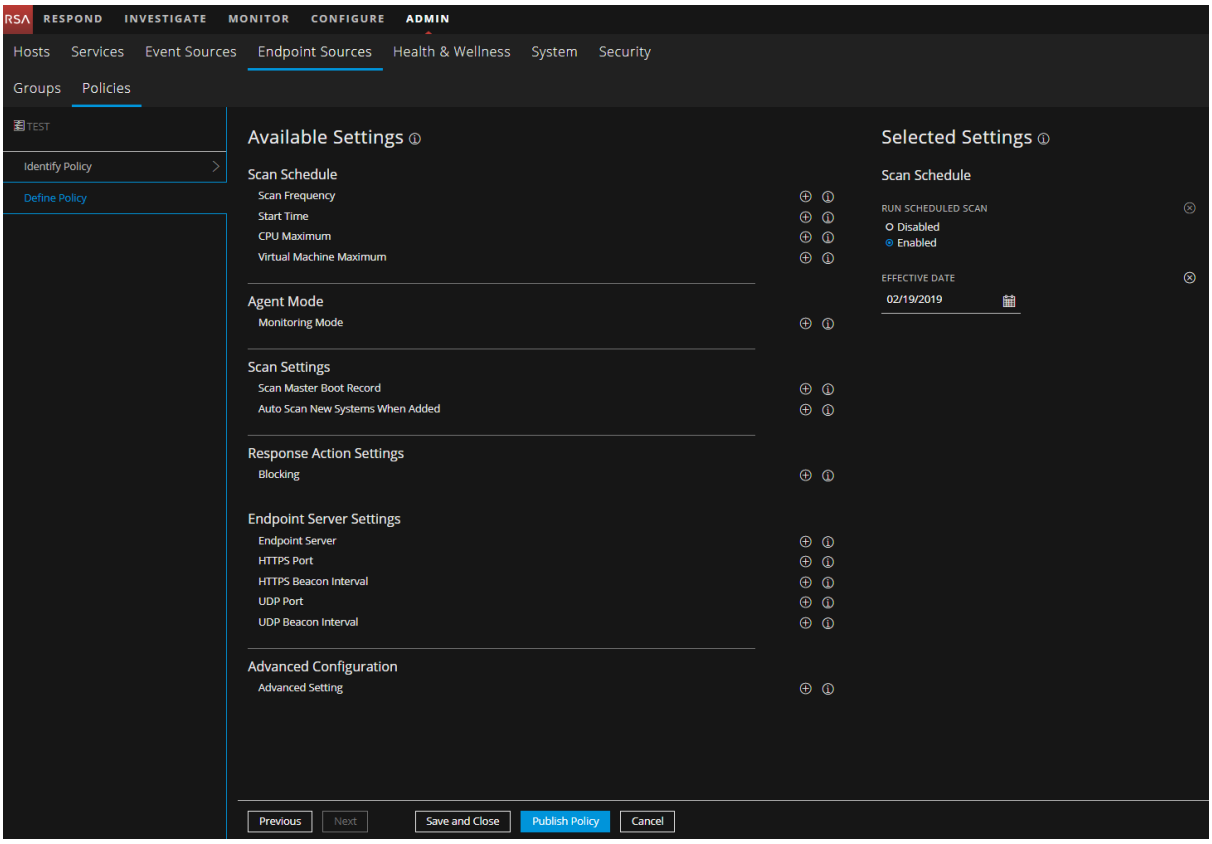


3. Click **Create New** to add a new policy.
4. In the New Policy panel, select **Identify Policy**, and do the following:



- Select **Agent Endpoint** as the source type from the drop-down list.
- Enter the policy name.
- Enter a description for the policy.

5. Click **Next**.
6. Click to select a setting from list of **Available Settings**. Once clicked, the specific setting is moved under the **Selected Settings** panel. You need to enter the required values for the selected settings. For details, see Define Policy Panel for Agent Endpoint Policy.



- In the Scan Schedule category:

  - Enable **Run Schedule Scan** to configure the scan.

  Note: The following scan schedule options are available only when the scan schedule is enabled.

  - Set the date when the scan schedule should be effective.

  - Select the recurrence (days or weeks) and frequency of the scan.

  - Select the start time of the scan.

  - Set the CPU Maximum value using the slider.

  - If the agents are running on virtual machines, set the Virtual Machine Maximum value using the slider.

- Add **Agent Mode** to select the monitoring mode of the agent - Insights or Advanced.
- In the Scan Settings category:

  - Enable **Scan Master Boot Record** to include Master Boot Record (MBR) details in scheduled scans.

  - Enable **Auto Scan New Systems When Added** to automatically queue a scan for any host that does not have any snapshot data.

- Enable **Response Action Settings** to prevent the execution of a malicious file on any host.
- In the Endpoint Server Settings:

- Add the Endpoint server that the agent will communicate from the drop-down list.

  Note: If you do not select an Endpoint Server, the agent uses the default Endpoint Server that is configured during packager generation.

- (Optional) Enter an alternative hostname or IP address.
- Enter the HTTPS port used for communication.
- Specify the HTTPS beacon interval.
- Enter the UDP port used for communication.
- Specify the UDP beacon interval.

- **Advanced Configuration** - For RSA Support staff only.

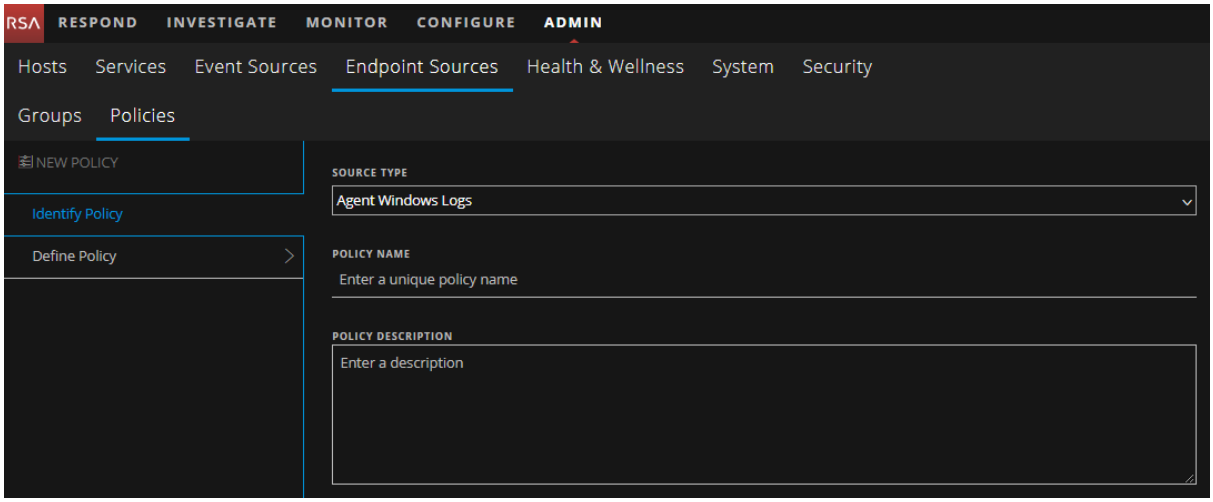
  IMPORTANT: It is strongly recommended not to use the Advanced Configuration unless advised to do so by RSA Support staff.

7. Do one of the following:
   - Click **Save and Close** to save the settings and return to the Policies view. The policy will be listed under the **Unpublished** category.
   - Click **Publish Policy** to publish the policy.

Create a Windows Log Policy

To create a Windows Log policy:

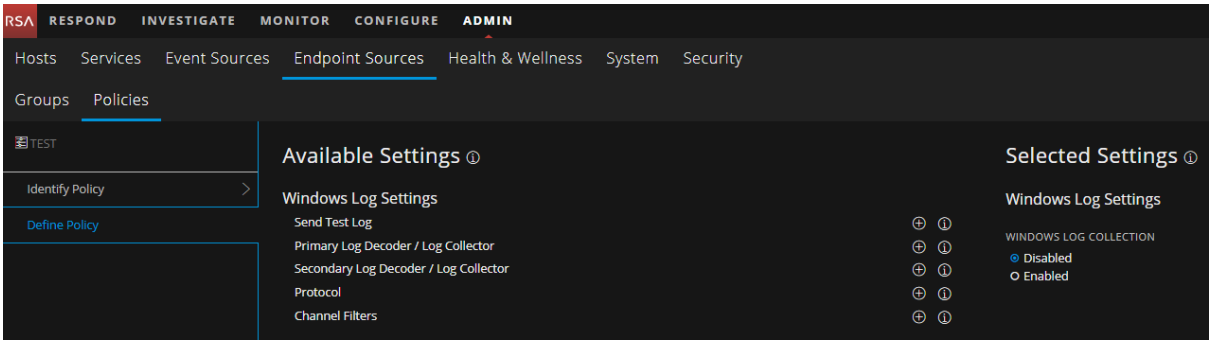
1. Go to **ADMIN > Endpoint Sources**.
2. Click **Policies**. The available policies are displayed.
3. Click **Create New** to add a new policy.
4. In the New Policy panel, select **Identify Policy**, and do the following:



- Select **Agent Windows Logs** as the source type from the drop-down list.
- Enter the policy name.
- Enter a description for the policy.

5. Click **Next**.

6. Click to select a setting from list of **Available Settings**. Once clicked, the specific setting is moved under the **Selected Settings** panel. You need to enter the required values for the selected settings.



- Select **Windows Log Collection** to enable Windows Log collection. By default, this option is disabled.
- Enable **Send Test Log** to send a test log. By default, this option is disabled.
- Select **Primary Log Decoder / Log collector** to forward logs from the drop-down list.
- (Optional) Select **Secondary Log Decoder / Log collector** to forward logs from the drop-down list.

  Note: When the Endpoint Agent is configured to use the UDP protocol and the Primary Log Decoder/ Remote Log Collector is not reachable, the secondary Log Decoder or Log Collector is not functional. The logs are not forwarded to the secondary Log Decoder or Log Collector when the primary is down, thus resulting in the event loss.

- Select **Protocol** from the drop-down list. The available options are UDP, TCP, and TLS. By default, the protocol is TCP.
- Add **Channel Filters** and select the channels from which the logs are collected from the drop-down list. You can add or remove a channel filter and specify individual Event IDs.

7. Do one of the following:

- Click **Save and Close** to save the settings and return to the Policies view. The policy will be listed under the **Unpublished** category.
- Click **Publish Policy** to publish the policy.

Managing Groups

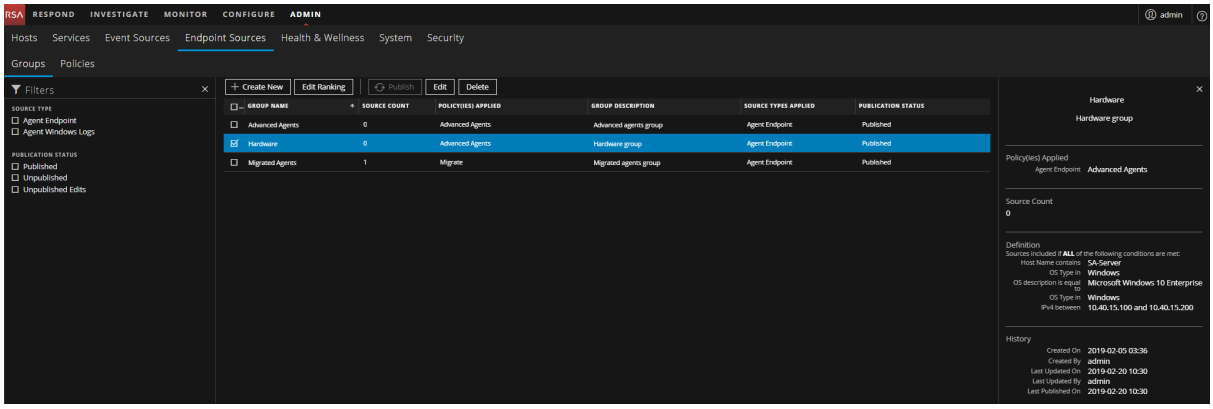
Note: The information in this topic applies to RSA NetWitness® Platform Version 11.3 and later.

You can view group details, edit group details, filter endpoint groups, delete groups, and edit group ranking. For details on how to create groups, see Create a Group.

View Group Details

To view properties of the selected group:

1. Go to **ADMIN > Endpoint Sources**.
2. In the left panel, select the **Groups** tab. The details, such as group name, source count, policies applied, group descriptions, source type applied, and publication status are displayed. For more details on these columns, see Endpoint Sources - Groups.
3. Click the row to view the properties in the right-panel.



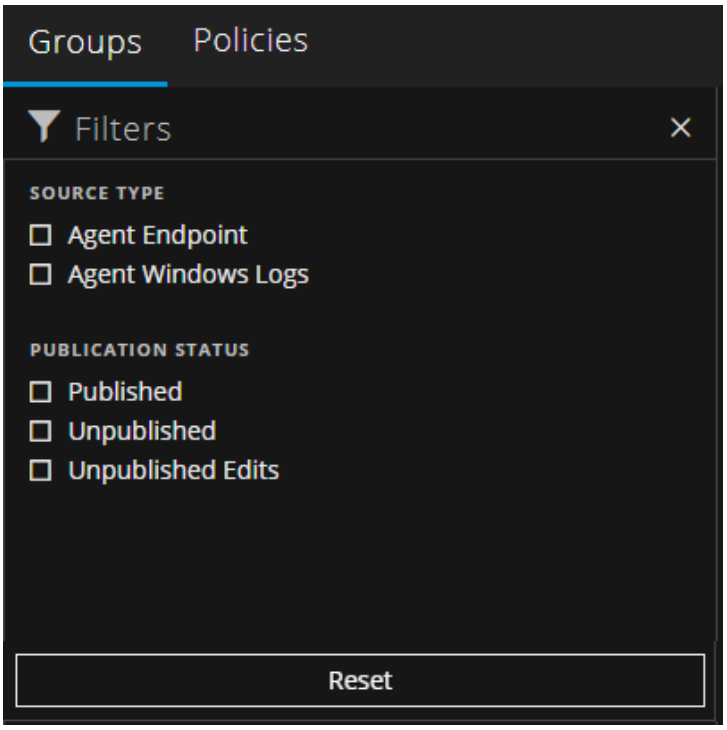
Filter Endpoint Groups

The Filters Panel allows you to filter the list of displayed groups, based on the one of the following source type:

- Agent Endpoint
- Agent Windows Logs

Additionally, you can sort based on publication status:

- Published - Groups that are published to use.
- Unpublished - Groups that are saved but not published.
- Unpublished Edits - Groups that are previously published and edited later and saved, but not published.



The Filters panel can be hidden or displayed:

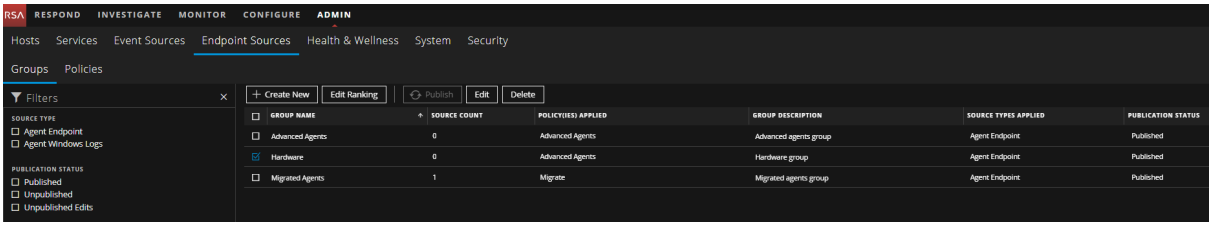
- To hide, click the icon at the top-right of the panel.
- To display if hidden, click the icon in the toolbar.

Click **Reset Filters** to remove the currently applied filter criteria.

Edit a Group

You can edit the properties of the group at any point in time. To edit properties of a group:

1. Go to **ADMIN > Endpoint Sources**.
2. Select a group and click **Edit**.



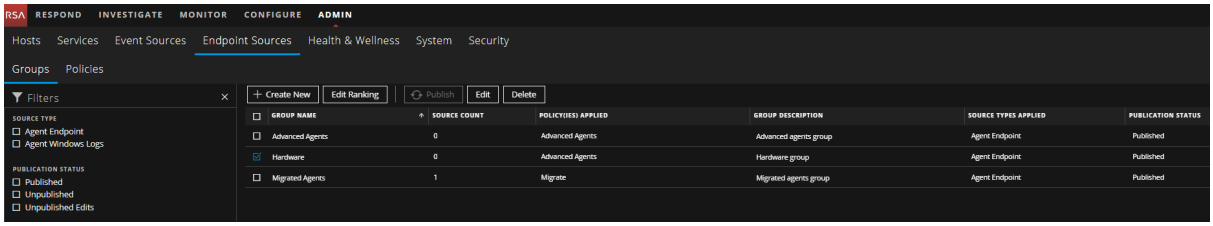
3. Edit the group details as required.
4. Do one of the following:
   - Click **Save and Close** to save the changes and return to the Groups view. The group will be listed under the **Unpublished Edits** category.

- Click **Publish Now** to publish the changes.

Change Policy Ordering for Groups

An endpoint agent can be included in multiple groups. And these groups can have different policies applied to them. In this case, you can edit the ordering or ranking of policies, to specify a hierarchy for your policies. To edit the ordering or ranking of a group:

1. Go to **ADMIN > Endpoint Sources**.
2. Select the Groups tab and click **Edit Ranking**.



3. Select one of the following source type for the drop-down list:
   - Agent Endpoint to rank the groups associated with Agent Endpoint type policies.
   - Agent Windows Logs to rank the groups associated with Agent Windows Log type policies
4. Click **Next**.
5. Reorder your groups as necessary.

   a. Select next to a group.

   b. Drag the group up or down to change the priority. Priority decreases from top to bottom.

   c. Repeat moving groups until they are ordered as you prefer.

   Note: To move any group to the top, select the group and click **Set Top Ranking**.

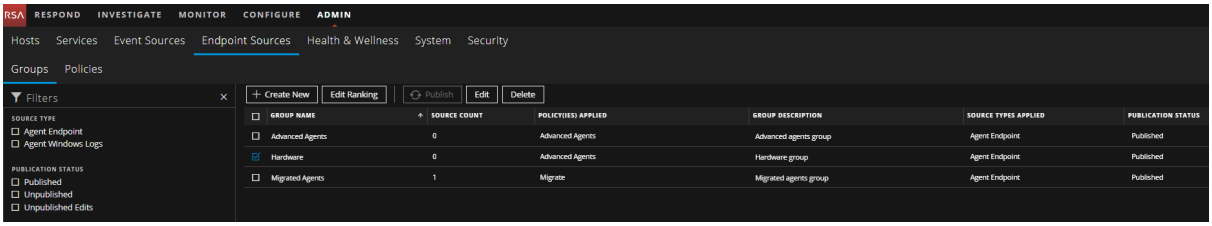
6. Once you have the preferred order, click the appropriate option:
   - **Publish Ranking** for the new ranking to take effect.

- **Reset Ranking** to reset the ranking to the last saved or published order.
- **Cancel** to exit without changing the rankings.

Delete a Group

To delete a group:

1. Go to **ADMIN > Endpoint Sources**.
2. The **Groups** tab and available groups are displayed.



3. Select one or more groups and click **Delete**.
4. Click **Delete**. The confirmation message is displayed.
5. In the Delete Groups dialog, click **Delete Group(s)** to permanently delete the selected groups.

Managing Policies

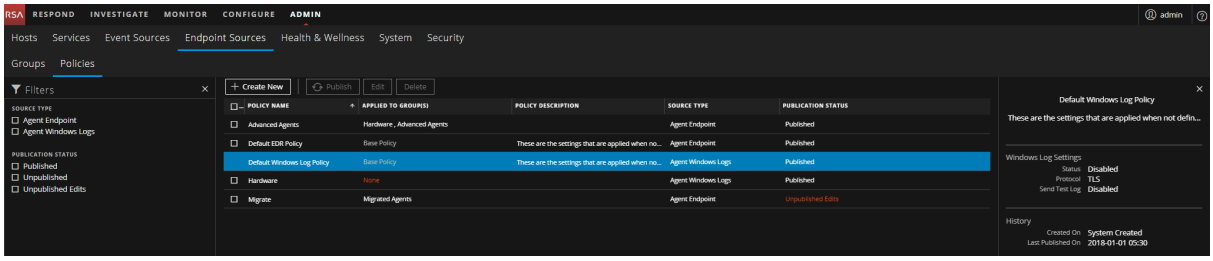
Note: The information in this topic applies to RSA NetWitness® Platform Version 11.3 and later.

You can view, edit, filter, and delete policies. For details on how to create policies, see Create an EDR Policy or Create a Windows Log Policy.

View Policy Details

To view properties of the selected policy:

1. Go to **ADMIN > Endpoint Sources**.
2. In the left panel, select the **Policies** tab. The details, such as policy name, applied to groups, policy description, source type, and publication status are displayed. For more details on these columns, see Endpoint Sources - Policies.
3. Click the row to view details about selected policy in right pane.



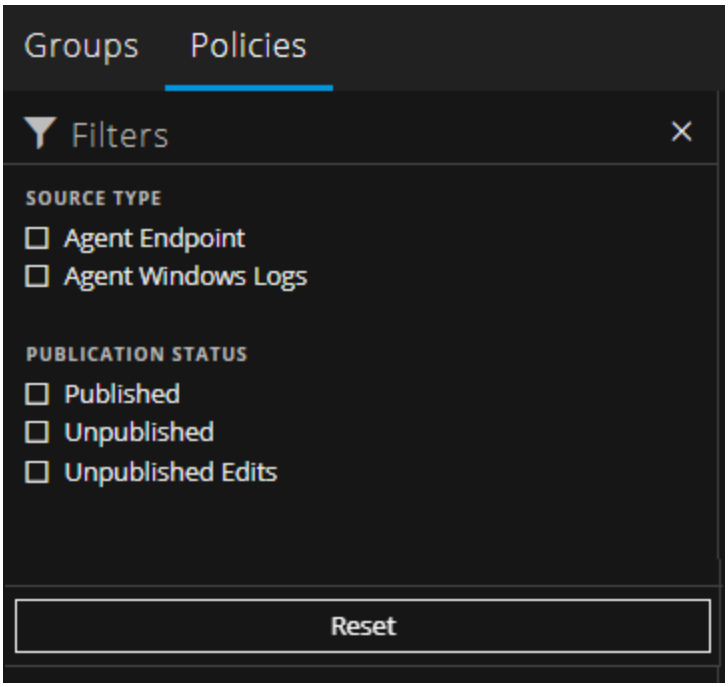
Filter Policies

The Filters Panel allows you to filter the list of displayed policies, based on the source type:

- Agent Endpoint, or
- Agent Windows Logs

Additionally, you can filter based on publication status:

- Published: Policies that are published to use.
- Unpublished: Policies that are saved but not published.
- Unpublished Edits: Policies that are previously published and edited later and saved, but not published.



The Filters panel can be hidden or displayed:

- To hide, click the icon at the top-right of the panel.
- To display if hidden, click the icon in the toolbar.

Click **Reset Filters** to remove the currently applied filtering criteria.

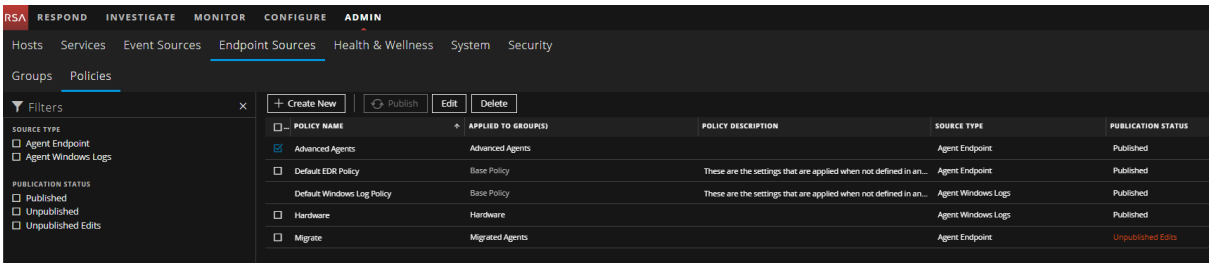
Edit a Policy

You can edit the settings of the default Agent Endpoint and custom policies. The default Agent Windows Log policy cannot be edited.

Note: For the default EDR policy, you cannot edit the source type, policy name, and policy description. However, you can edit the details in the Define Policy panel.

To edit a policy:

1. Go to **ADMIN > Endpoint Sources**, and select the **Policies** tab.
2. Select a policy and click **Edit**.

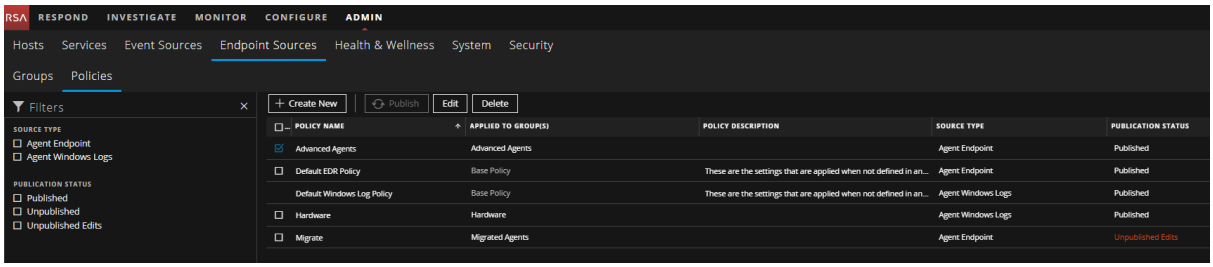


3. Edit the policy details as required.
4. Do one of the following:
   - Click **Save and Close** to save the changes and return to the Policies view. The policy will be listed under the **Unpublished Edits** category.
   - Click **Publish Policy** to publish the changes.

Delete a Policy

To delete a policy:

1. Go to **ADMIN > Endpoint Sources**.
2. Click the **Policy** tab. The available policies are displayed.



3. Select one or more policies and click **Delete**.

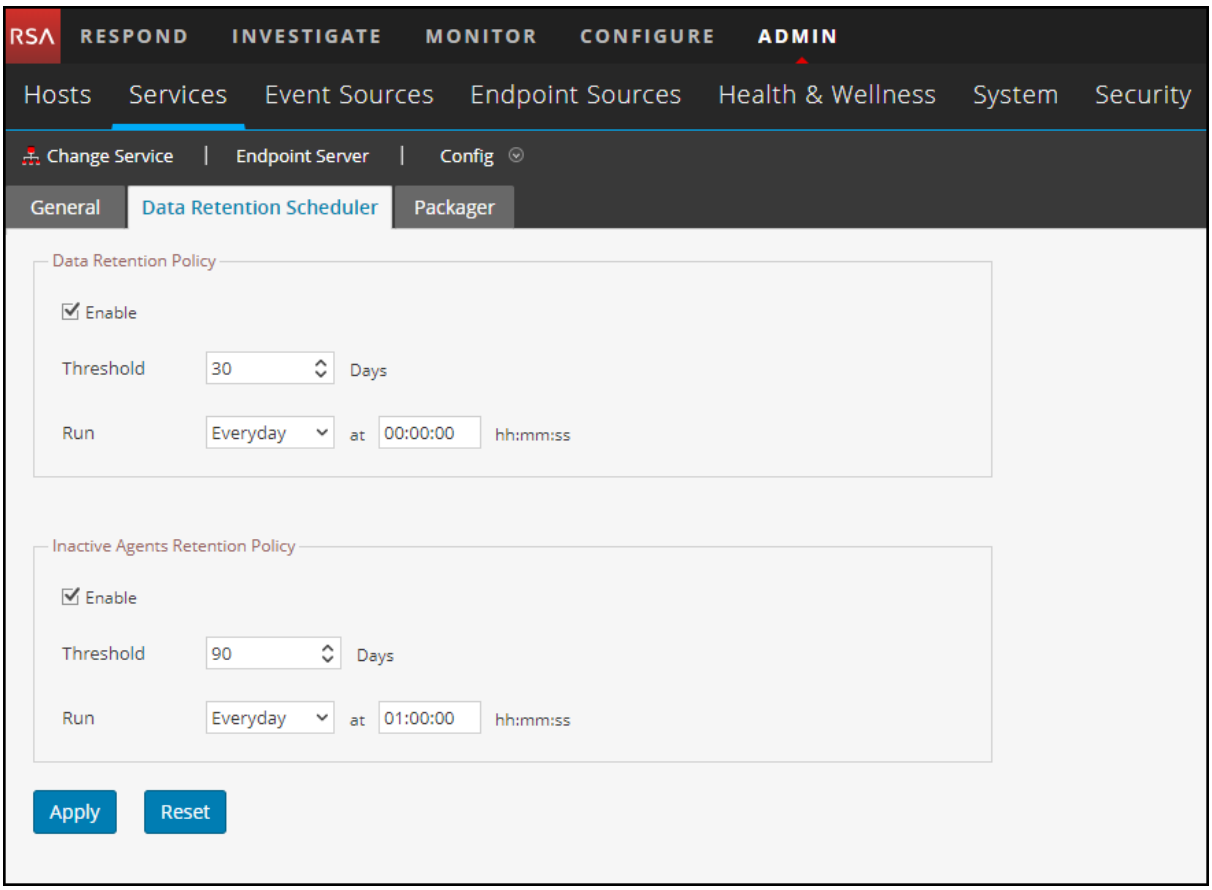
   The confirmation message is displayed.
4. In the Delete Policies dialog, click **Delete Policy(ies)** to permanently delete the selected policies.

Configuring Data Retention Policy

An administrator can configure the retention policies to retain the Endpoint data based on the age or the storage size. By default, days and size-based retention policies are enabled.

To change the configuration for age-based retention:

1. Go to **ADMIN** > **Services**
2. In the Services view, select the **Endpoint Server** service.
3. Click and select > **View** > **Config**.
4. Click the **Data Retention Scheduler** tab.

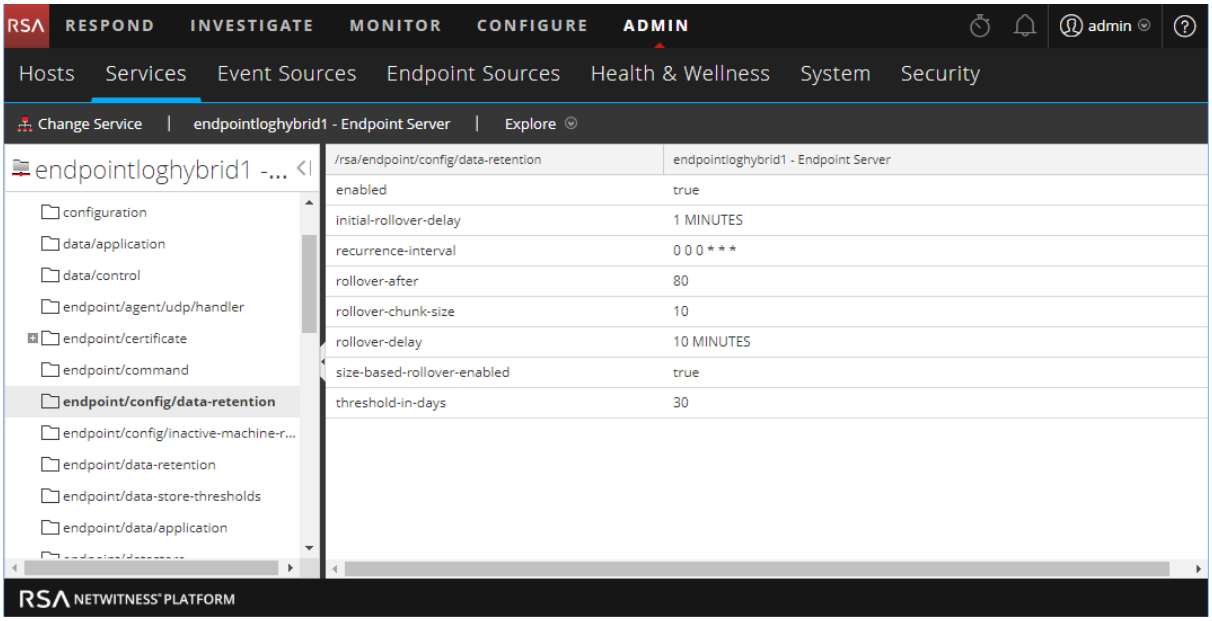


5. In the **Data Retention Policy** panel, by default, the **Threshold** is set to 30 days, and **Run** to Everyday. This means only 30 days of Endpoint data is retained and the older data is deleted from the database.
6. Click **Apply**.

To change the configuration for size-based retention:

By default, for the size-based retention, the `rollover-after` value is set to 80 and `rollover-chunk-size` is set to 10. This means that when the storage size exceeds 80 percent of the space allocated for the disk partition, 10 percent of the older Endpoint data is deleted from the database. However, you can change these values as follows:

1. Go to **ADMIN** > **Services**.
2. In the Services view, select the **Endpoint Server** service.
3. Click and select > **View > Explore**. The Explore view is displayed:



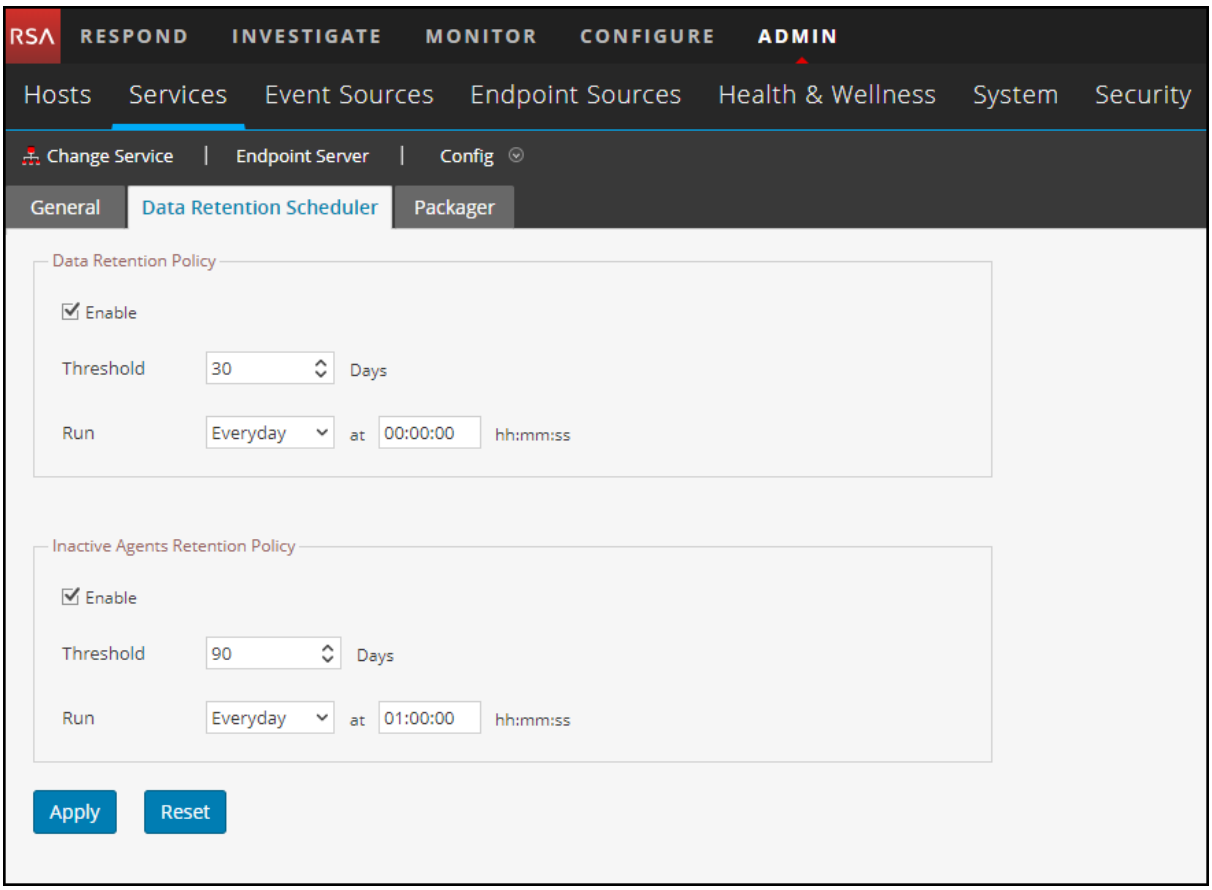
4. In the left panel, select **endpoint/config/data-retention**.
5. Edit the configurations based on your requirements.

Managing Inactive Agents

An administrator can configure the inactive agent retention policy to delete data of agents that are inactive, from the Endpoint Server. On deletion, the Endpoint Server stops collecting data from these agents. By default, this option is enabled.

To configure the inactive agent retention policy:

1. Go to **ADMIN** > **Services**.
2. In the Services view, select **Endpoint Server**.
3. Click and select > **View** > **Config**.
4. Click the **Data Retention Scheduler** tab.



5. In the **Inactive Agents Retention Policy** panel, by default, the **Threshold** is set to 90 days and **Run** to Everyday. This means that the data of agents that have not communicated with the Endpoint server for 90 days is deleted from the database.
6. Click **Apply**.

Note: The Inactive Agents Retention Policy is not applicable for NetWitness Endpoint 4.4.0.2 or later agents.

Configuring Location for File Download

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.3 and later.

You must configure the location to download the files from hosts to the Endpoint server. To configure, make sure that you have endpoint-server.configuration.manage permissions.

1. Create a directory in the Endpoint server and provide write permissions for the user "netwitness".
2. In the Explore view, go to **endpoint/download**.
3. In the base-path, provide the location of the directory.

Integrating NetWitness Endpoint 4.4.0.2 or Later with NetWitness Platform

You can configure the Endpoint Metadata for the NetWitness Endpoint 4.4.0.2 by integrating the Meta Integrator service in the NetWitness Endpoint 4.4.0.2 directly to a Log Decoder. You can view the Endpoint metadata in the **Investigate > Navigate** and **Event Analysis** view. This integration includes the following steps:

- Enabling the NetWitness Endpoint 4.4.0.2 Metadata Forwarding to the Log Decoder
- Enabling Machines to Forward Metadata from the NetWitness Endpoint 4.4.0.2 to the NetWitness Endpoint Server

Enabling the NetWitness Endpoint 4.4.0.2 Metadata Forwarding to the Log Decoder

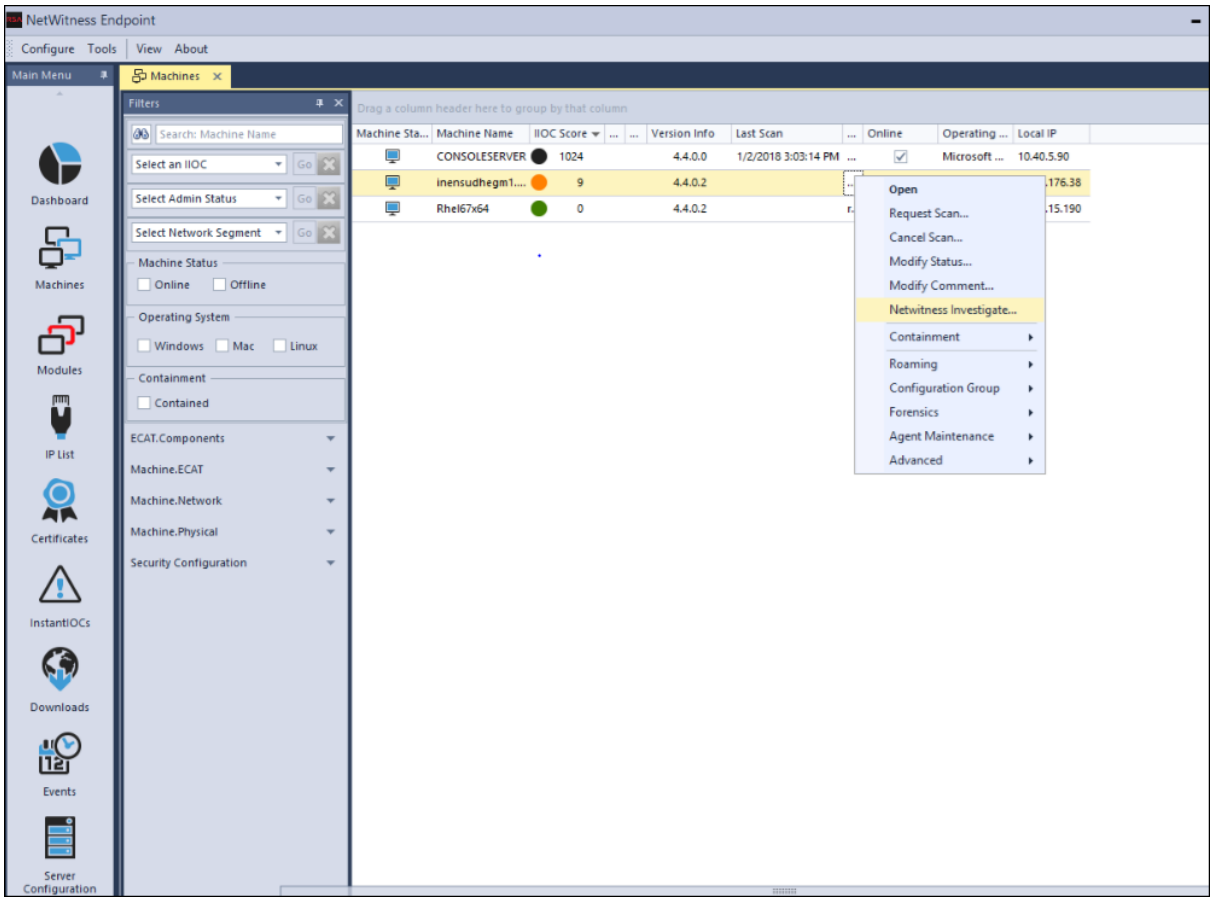
To enable the Metadata Integrator service for the selected NetWitness Endpoint 4.4.0.2 agents, run the following command:

```
ConsoleServer.exe /nw-investigate enable
```

Enabling Machines to Forward Metadata from the NetWitness Endpoint 4.4.0.2 to the NetWitness Endpoint Server

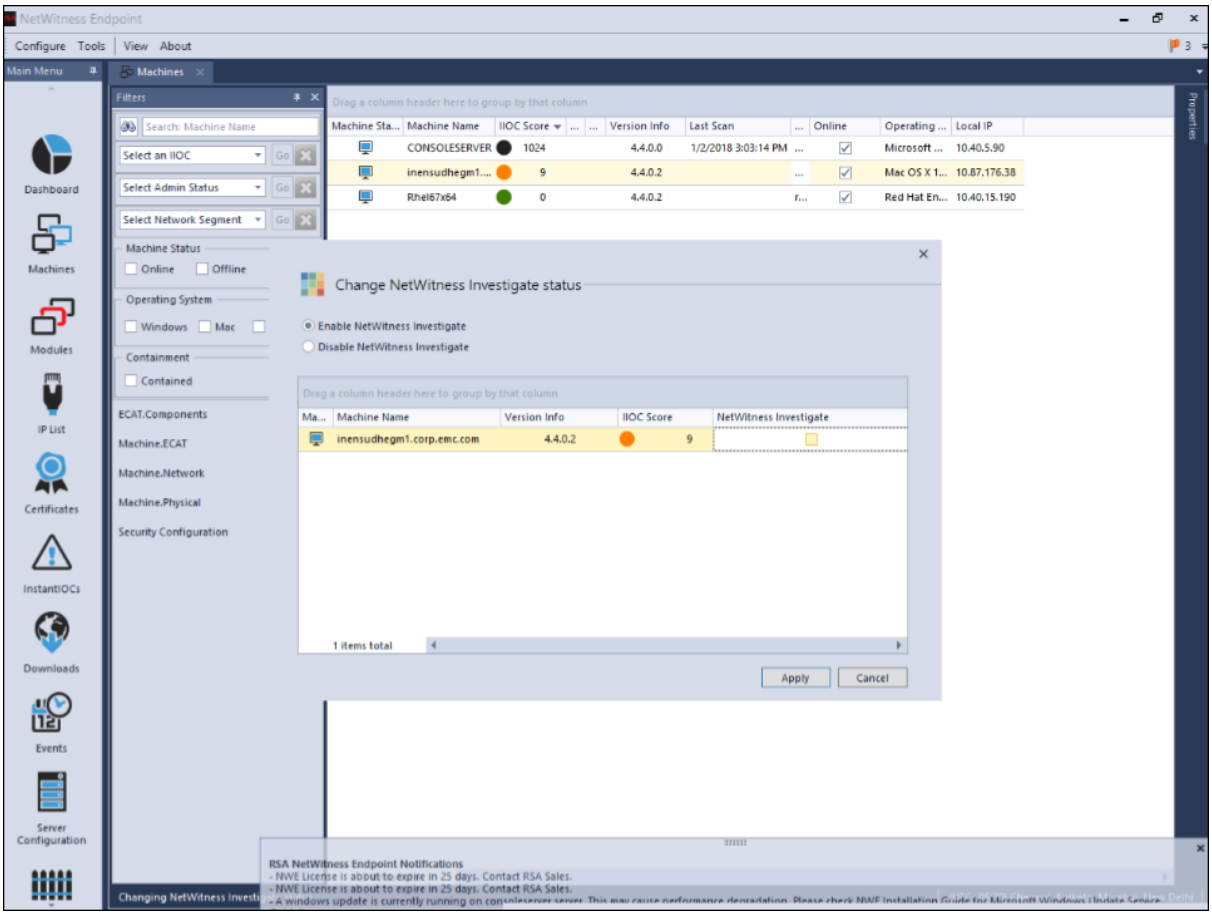
After you enable the Metadata Forwarding using any one of the above options, perform the following to enable the machines to forward metadata.

1. Open the NetWitness Endpoint 4.4.0.2 user interface.
2. Click **Machines** from the left panel. The list of available machines are displayed.



3. Select machines for which you want to forward metadata to the NetWitness Endpoint Server.
4. Right-click and select the **NetWitness Investigate** option.

   The Change NetWitness Investigate Status dialog is displayed.



5. Select the **Enable NetWitness Investigate** option.
6. Click **Apply**.
7. To verify if the **Enable NetWitness Investigate** option is enabled, repeat step 4.

Endpoint References

This section is intended to help you understand the purpose of the Services Config View for the Endpoint Server. For each configuration, there is a brief introduction and a What Do You Want To Do table with links to related procedures. In addition, it includes workflow and Quick Look sections to highlight important features in the user interface.

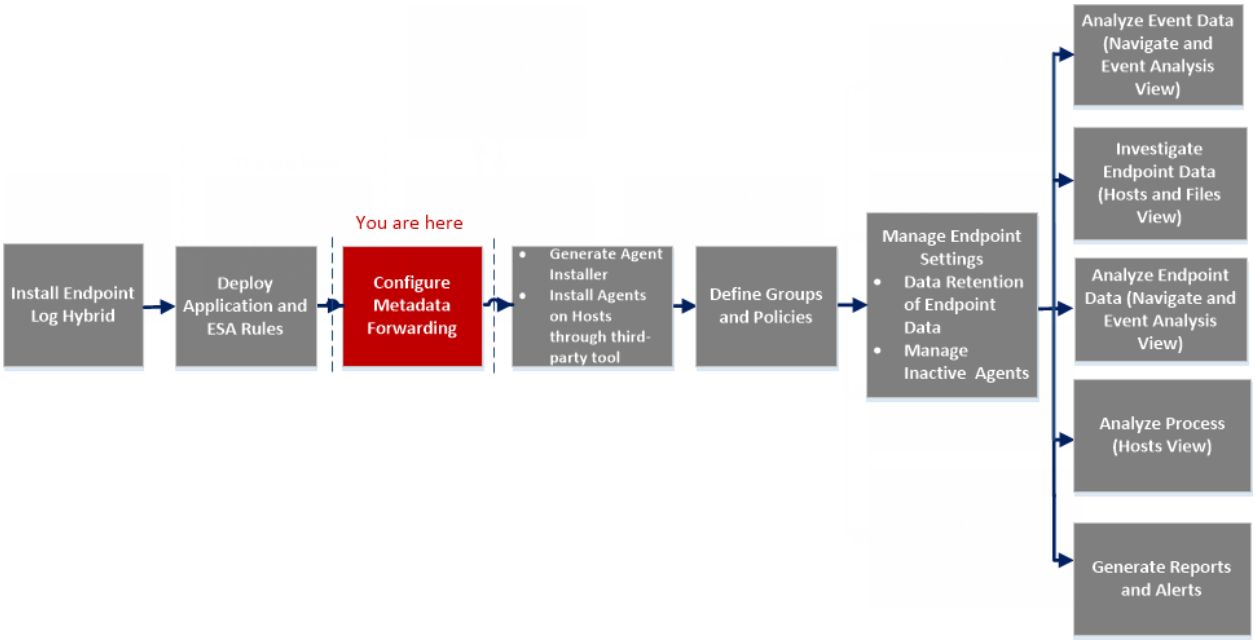
You can view the complete service nodes in tree form in the Services Explore view. For more information, see the "Services Explore View" topic in the *Hosts and Services Getting Started Guide*.

General Tab

In the **General** tab, you can configure the Endpoint metadata forwarding for multiple endpoint servers. To access this view:

1. Go to **ADMIN** > **Services**.
2. In the Services view, select **Endpoint Server** for which you want to configure the metadata forwarding.
3. Click and select > **View** > **Config**.
4. Click the **General** tab.

Workflow



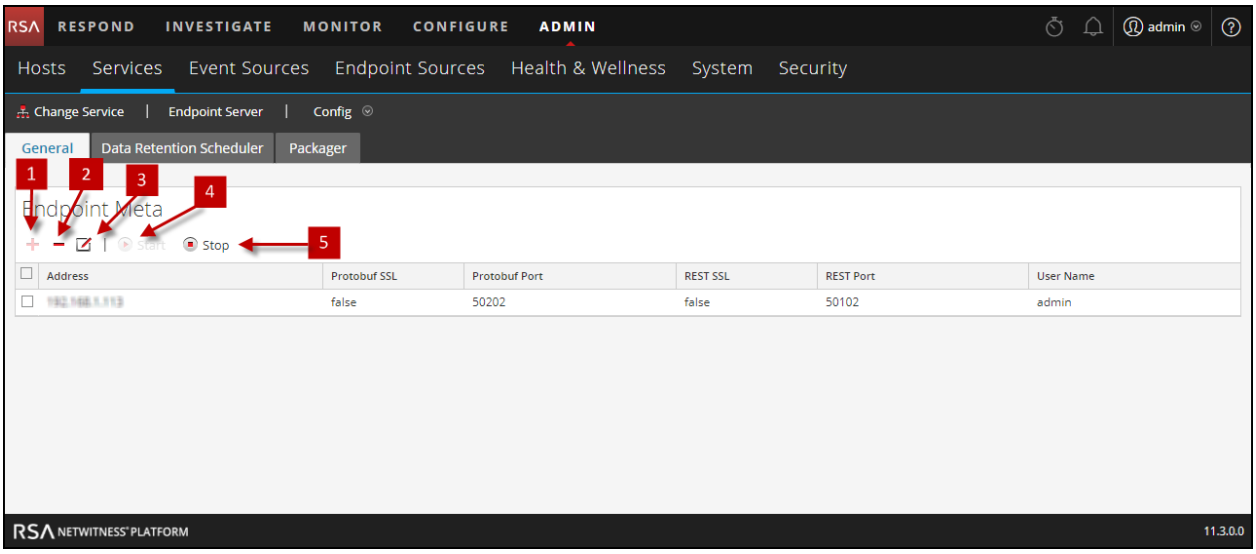
What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure Endpoint Metadata Forwarding for the NetWitness Endpoint Agents	Configuring Metadata Forwarding
Administrator	Configure Endpoint Metadata Forwarding for the NetWitness Endpoint 4.4.0.2 or later Agents	Integrating NetWitness Endpoint 4.4.0.2 or Later with NetWitness Platform

*You can perform this task in the current view.

Quick Look

The following figure is an example of the General tab.



1. Click + to view the Available Services dialog.
2. Click − to delete the added service.
3. Click to edit the information for the added service.
4. Click Start to start the Endpoint metadata forwarding.
5. Click Stop to stop the Endpoint metadata forwarding.

The following table describes the fields in the General tab.

Field	Description
Address	Displays the IP address of the Log Decoder.
Protobuf SSL	Indicates if SSL is enabled on Protobuf. By default, this option is disabled.
Protobuf Port	Displays the port used for Protobuf. By default, the port is 50202.
REST SSL	Indicates if SSL is enabled on the REST port in the Log Decoder. By default, this option is disabled.
REST Port	Displays the port used for REST communication. The default value is 50202 (for non-SSL) and value 56202 (for SSL).
User Name	Displays the user name.

Field	Description
Raw Data	Sends a brief summary of the session along with the metadata if enabled. By default, this option is disabled.

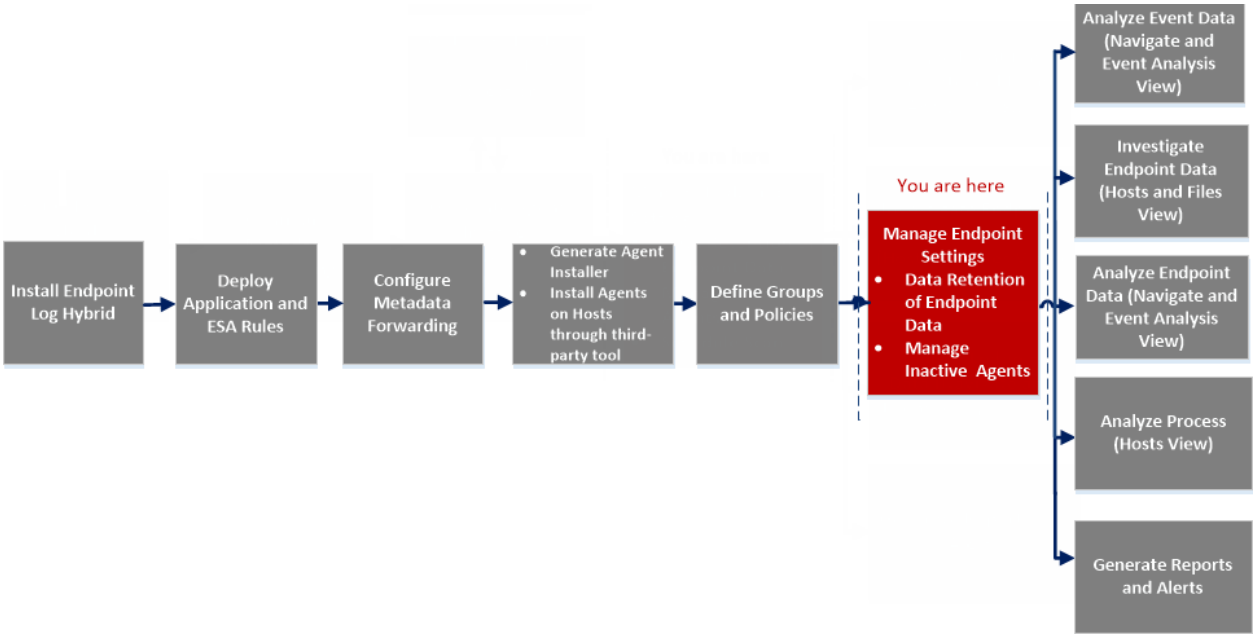
Data Retention Scheduler Tab

In the **Data Retention Scheduler** tab, you can configure data retention and inactive agents policies for multiple endpoint servers. To access this view:

1. Go to **ADMIN** > **Services**.
2. In the Services view, select **Endpoint Server**.
3. Click and select > **View** > **Config**.
4. Click the **Data Retention Scheduler** tab.

Repeat the above steps to configure data retention settings for multiple endpoint servers.

Workflow



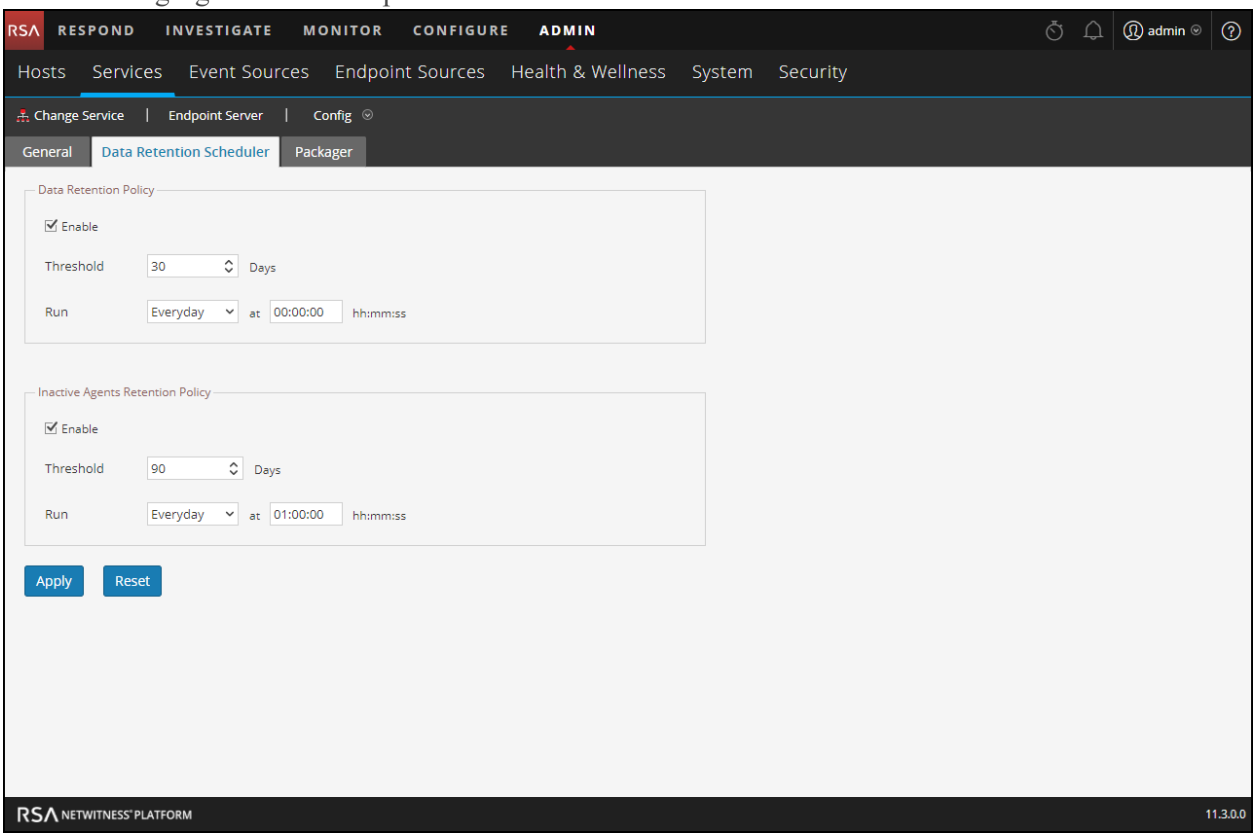
What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure Data Retention Policy*	Configuring Data Retention Policy
Administrator	Configure Inactive Agents Policy*	Managing Inactive Agents

*You can perform this task in the current view.

Quick Look

The following figure is an example of the Data Retention Scheduler tab.



Features

The following table lists the fields for data retention policy.

Field	Description
Enable	Enables the configuration for the data retention policy. By default, this option is enabled.
Threshold	Displays the number of days the Endpoint data is retained in the database. By default, the Threshold is set to 30 days. The data older than 30 days is deleted from the database.
Run	Displays the schedule for running the data retention job. By default, the database check occurs everyday at 00:00:00 AM. You can select the frequency from the drop-down list (Everyday, Weekdays, Weekends, or Custom, where Custom allows you to select one or more specific days of the week) and time to run the job.
Apply	Overwrites any previous schedule for the data retention policy and applies the new schedule immediately.
Reset	Resets the schedule to the default settings.

The following table lists the fields for inactive agents retention policy.

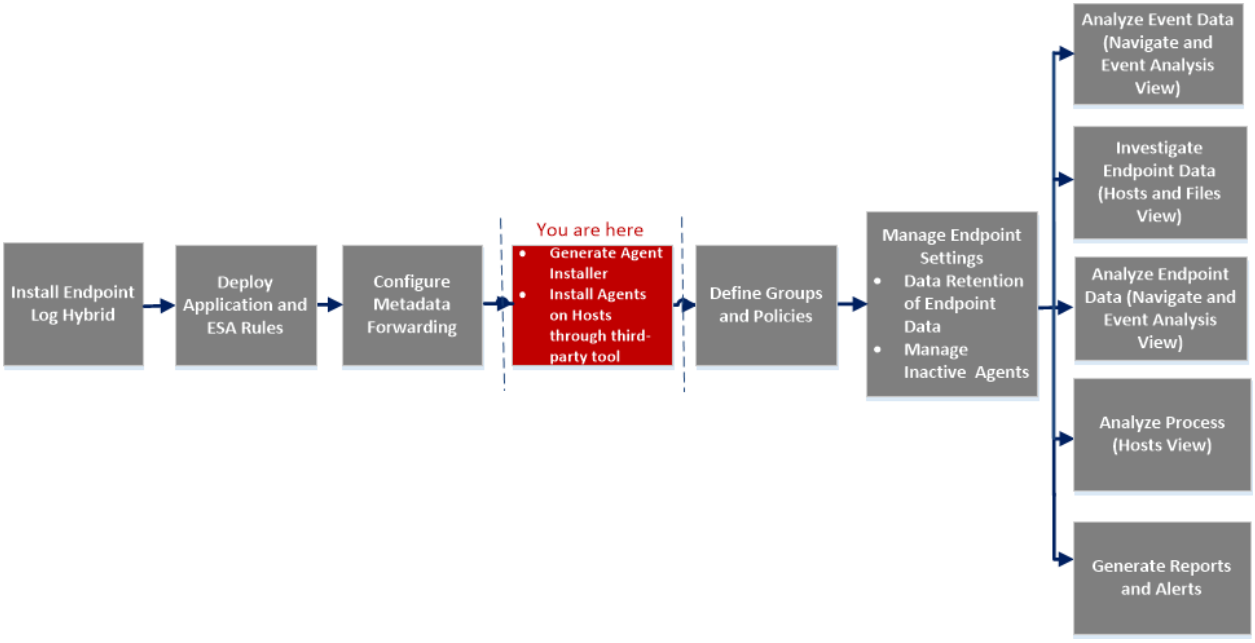
Fields	Description
Enable	Enables the configuration for the inactive agents policy. By default, this option is enabled.
Threshold	Displays the number of days the inactive agents are retained in the Endpoint Server. By default, the threshold value is 90 days.
Run	Displays the schedule for running the inactive agents retention job. By default, the database check occurs everyday at 00:00:00 AM. You can select the frequency from the drop-down list (Everyday, Weekdays, Weekends, or Custom, where Custom allows you to select one or more specific days of the week) and time to run the job.
Apply	Overwrites any previous schedule for the inactive agents retention policy and applies the new settings immediately.
Reset	Resets the schedule to the default settings.

Packager Tab

In the **Packager** tab, you can generate an agent packager and agent installer. To access this view:

1. Go to **ADMIN** > **Services**.
2. In the Services view, select **Endpoint Server**.
3. Click and select > **View** > **Config**.
4. Click the **Packager** tab.

Workflow



What do you want to do?

Role	I want to ...	Show me how
Administrator	Generate an Agent Packager for Endpoint Data Collection*	*NetWitness Endpoint Agent Installation Guide*
Administrator	Generate an Agent Installer*	

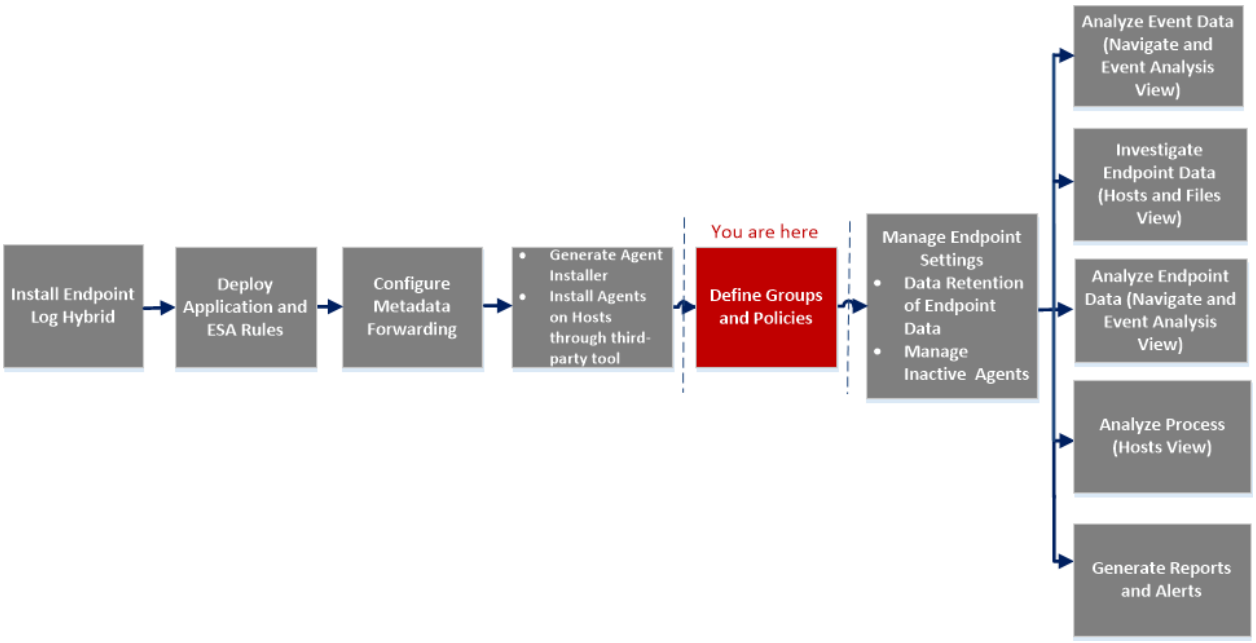
*You can perform this task in the current view.

Endpoint Sources - Groups

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.3 and later.

The **ADMIN > Endpoint Sources** view contains two tabs: **Groups** and **Policies**.

Workflow



What do you want to do?

User Role	I want to ...	Show me how
Administrator	create new groups*	Create a Group
Administrator	edit groups*	Edit a Group
Administrator	edit ranking*	Change Policy Ordering for Groups
Administrator	delete groups*	Delete a Group
Administrator	view default policies	Default Agent Endpoint (EDR) Policy
Administrator	create an EDR policy	Create an EDR Policy
Administrator	create a Windows Log policy	Create a Windows Log Policy
Administrator	edit policies	Edit a Policy
Administrator	delete policies	Delete a Policy

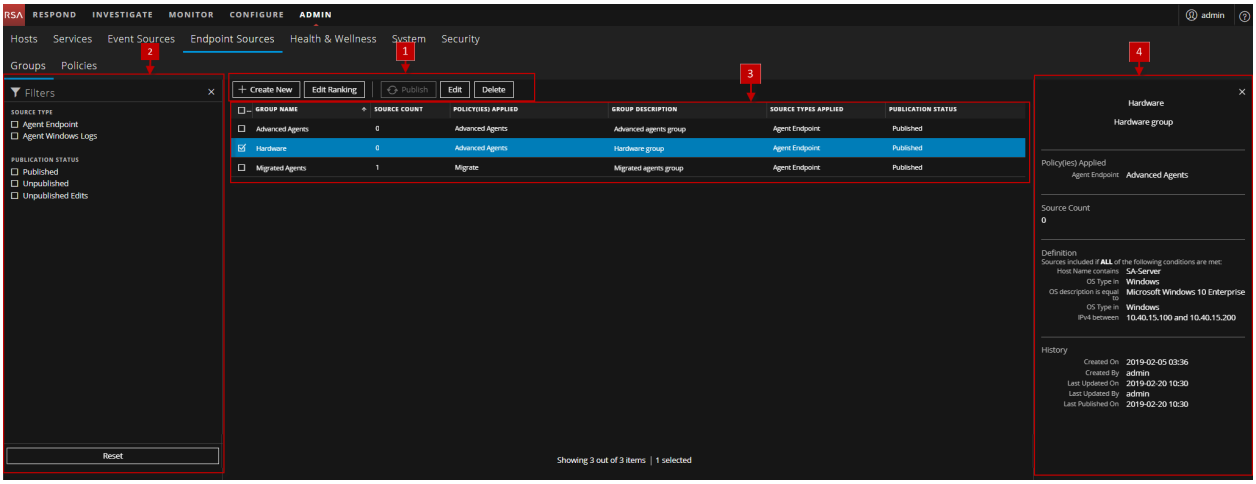
*You can perform this task in the current view.

Related Topics

- Endpoint Sources
- Managing Policies

Quick Look

Below is an example of the Groups tab:



1 **Actions in the toolbar:**

Create New - Lets you create a new group. For more information, see Create a Group

Edit Ranking - Lets you edit the ranking of groups. For more information, see Change Policy Ordering for Groups

Publish - Publishes the selected group or groups.

Edit - Lets you edit the details of an existing group. For more information, see Edit a Group.

Delete - Deletes the selected group or groups permanently. For more information, see Delete a Group.

2 **Filters.** You can filter groups based on Source Type and Publication Status.

To hide, click the icon at the top-right of the panel. To display if hidden, click the icon in the toolbar.

Reset - Removes the currently applied filter criteria.

For more information, see Filter Endpoint Groups.

3 **Table.** Displays the group details:

- Group name - Name of the group.
- Source Count: Number of hosts that are currently members of the group.
- Policies applied: Lists the policies applied to this group.
- Group description - Description of the group.
- Source Types Applied: Type of policies applied to the group: Agent Endpoint, Agent Windows Logs, or both
- Publication Status: Status of the group - Published or Unpublished.

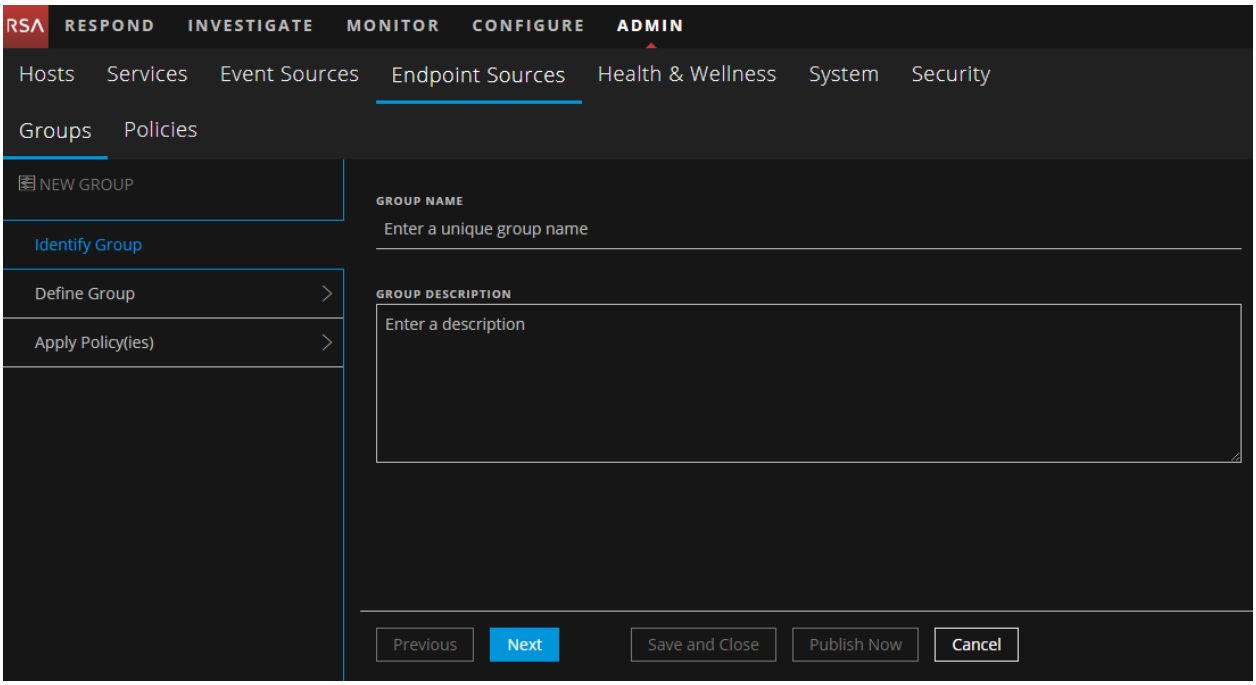
Sort Columns. If you mouse over a column header, a sort icon is displayed: . Click the icon to sort by the selected column.

4 **Details panel.** Displays the properties of the selected group.

Note: Click the row to view the Properties panel for a group.

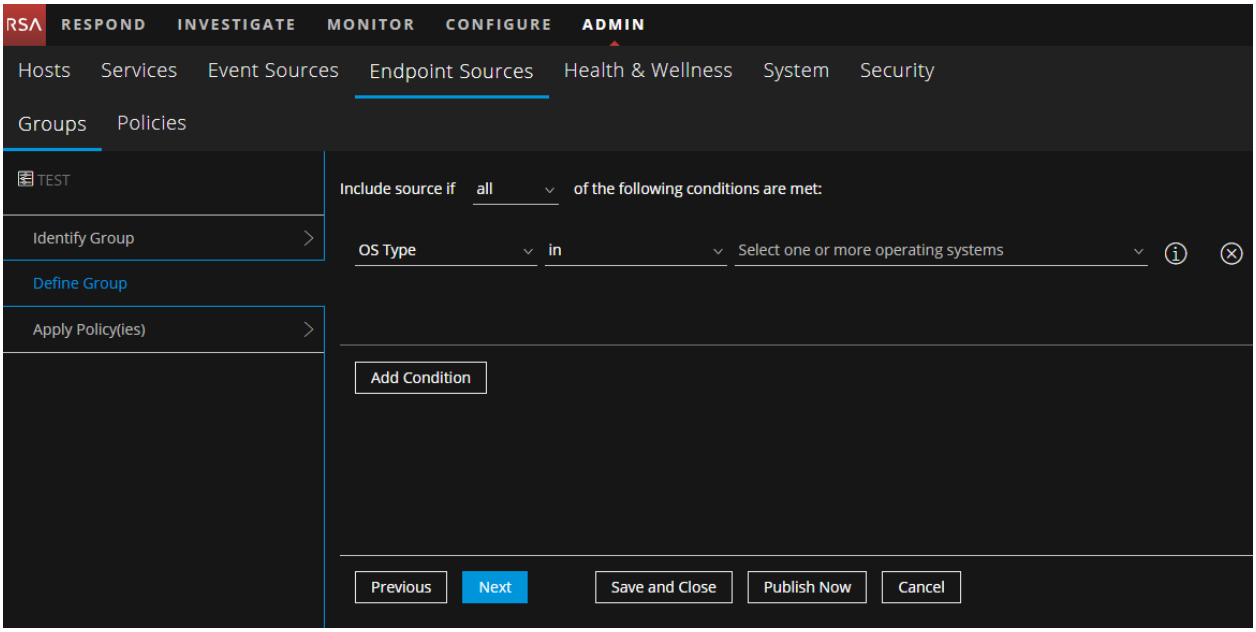
Create Group

Below is an example of the Create Group dialog. The table describes the information and options in the Create Group dialog.



Field	Description
Group Name	Name of the group. The name should be unique.
Group Description	Description of the group and should not exceed 8000 characters.

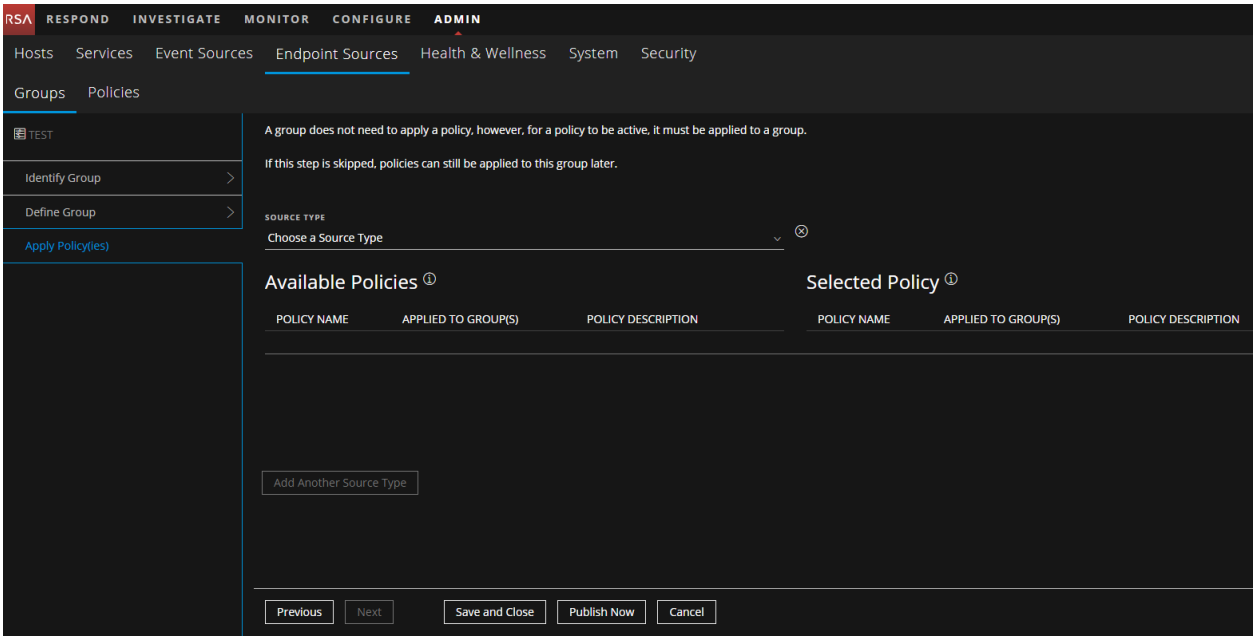
Below is an example of Define Group panel. The table describes the information and options in the Define Group panel:



Field	Description
Include source if ...of the conditions are met	Defines the conditions for an agent to be included in the group. Available options are all or any.
Parameter	The parameter can be OS Type, OS Description, Host Name, IPv4, or IPv6. • OS Type - Type of operating system. Available options are: Windows, Linux, and MacOS. • OS Description - Description of the operating system. The description should not exceed 256 characters. Available operators are: is equal to, contains, start with, and ends with. For example, Microsoft Windows 10 Enterprise. • Host name - Name of the host. The host name can contain only alphanumeric characters. Available operators are: is equal to, contains, start with, ends with, and in. For example, DESKTOP-QQPDNG3. • IPv4 and IPv6 - IP address. Available operators are: between, in, not in, and between. For example, 10.40.15.220. **Note:** If you do not want to include certain IP addresses, use the **Not in** operator, and enter the IP address separated by a space or a comma.

Field	Description
Operator	The choice of values is dependent upon the parameter you chose. For example, if your parameter is OS Type, the only operator available is **in**.
Value or values to match	The value or values to match. For the OS Type parameter, you can choose one or more values from the drop-down list. For all other parameters, you can enter free-form text. **Note:** Although you can enter any text for values, the system validates your entries when you attempt to proceed to another screen, and will not allow you to proceed until values are valid.
Add condition	Lets you add another condition.

Below is an example of Apply Policies panel. The table describes the information and options in the Apply Policies panel:

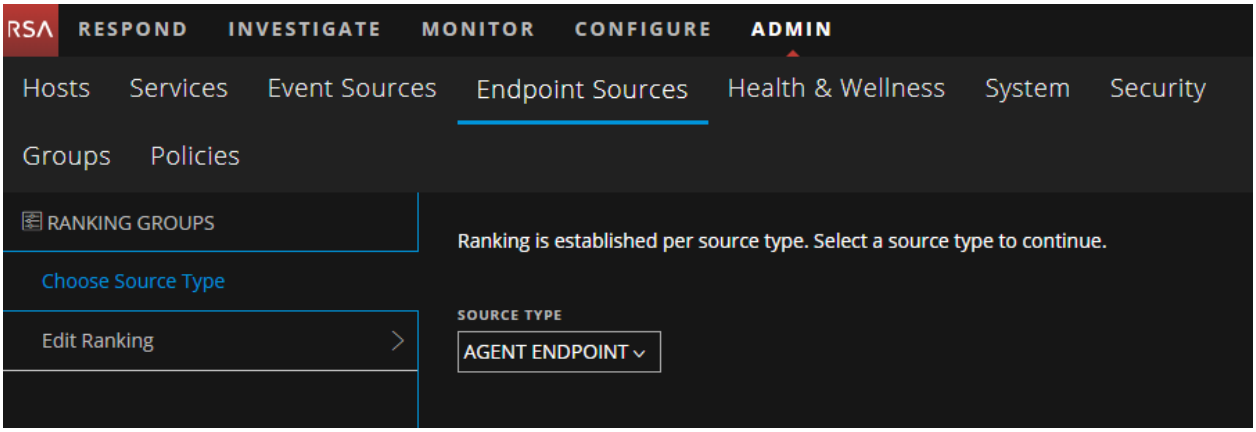


Field	Description
Source Type	Defines the source type for the group. Available options are Agent Endpoint and Agent Windows Logs.
Available Policies	List the available policies associated with the source type.
Selected Policies	List the policies selected.
Add Another Source Type	Lets you add another source type.
Save and Close	Saves the settings and closes the Create Group dialog.

Field	Description
Publish Now	Publishes the created group.

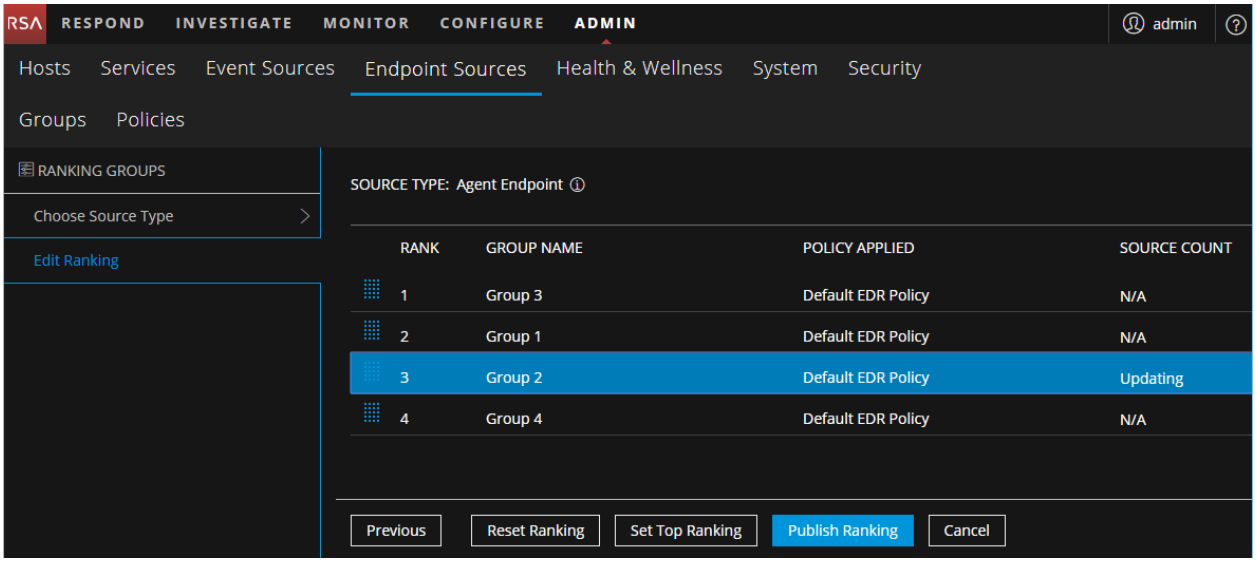
Ranking Groups

Below is an example of the Ranking Groups dialog. The table describes the information and options in the Ranking Groups dialog.



Field	Description
Source Type	Establishes ranking for the source type. Available options are Agent Endpoint and Agent Windows Logs.

Below is an example of the Edit Ranking panel.



1 Drag the group up or down to change the priority. Priority decreases from top to bottom.

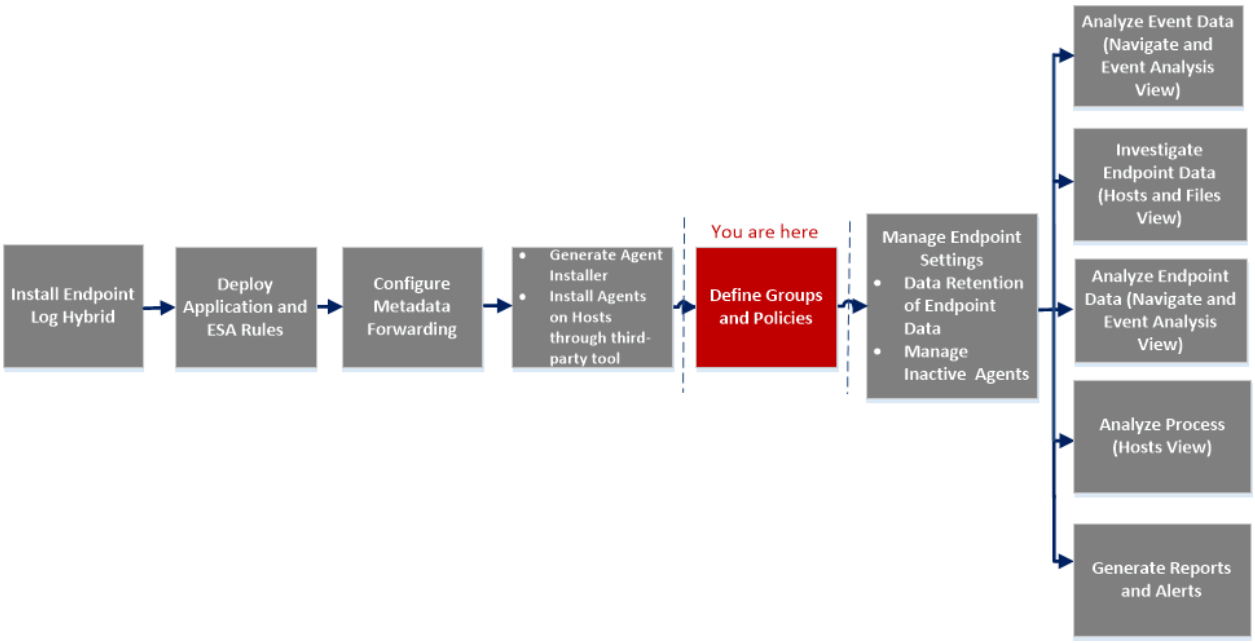
2	**Actions in the toolbar:** **Previous** - Navigates to the Choose Source Type panel. **Reset Ranking** - Resets the ranking to the original order. **Set Top Ranking** - Moves the selected group to the top. **Publish Ranking** - Lets you edit the details of an existing group. For more information, see Edit a Group. **Cancel** - Discards the changes and returns to the Groups tab.

Endpoint Sources - Policies

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.3 and later.

The **ADMIN > Endpoint Sources** view contains two tabs: **Groups** and **Policies**.

Workflow



What do you want to do?

User Role	I want to ...	Show me how
Administrator	create new groups	Create a Group
Administrator	edit groups	Edit a Group
Administrator	edit ranking	Change Policy Ordering for Groups
Administrator	delete groups	Delete a Group
Administrator	view default policies*	Default Agent Endpoint (EDR) Policy
Administrator	create an EDR policy*	Create an EDR Policy
Administrator	create a Windows Log policy*	Create a Windows Log Policy
Administrator	edit policies*	Edit a Policy
Administrator	delete policies*	Delete a Policy

*You can perform this task in the current view.

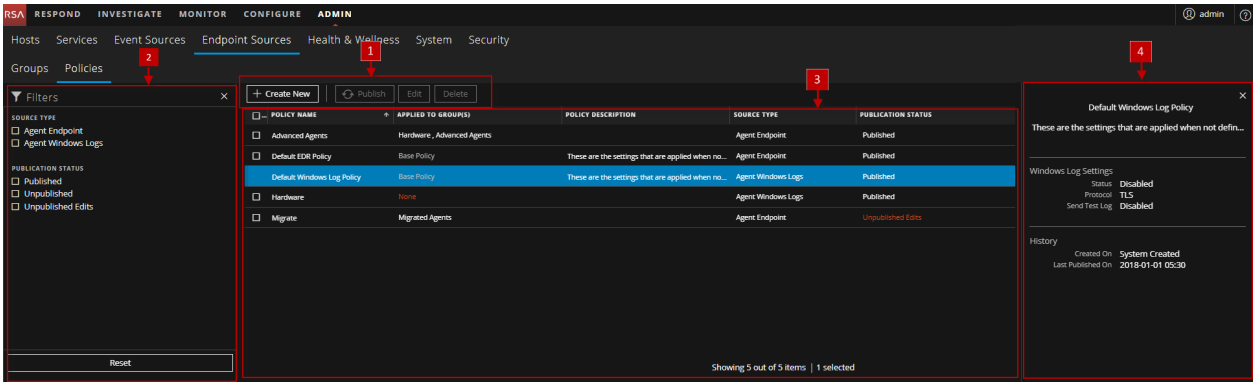
Quick Look

Below is an example of the Policies tab:



1 **Actions in the toolbar:**

- **Create New**: Lets you create a new policy. For more information, see Managing Policies.
- **Publish**: Publishes the selected policy.
- **Edit**: Lets you edit the details of an existing policy. For more information, see Edit a Policy.
- **Delete**: Deletes the selected policies permanently. For more information, see Delete a Policy.

2 **Filters**: You can filter groups based on Source Type and Publication Status. To hide, click the icon at the top-right of the panel. To display if hidden, click the icon in the toolbar.
Reset: Removes the currently applied filter criteria.
For more information, see Filter Policies.

3 **Policy View.** Displays the policy details:

- Policy name: Name of the policy.
- Applied to groups: Lists the group to which this policy is applied.
- Policy description: Description of the policy.
- Source type: Defines the source type: Agent Endpoint or Agent Windows Logs.
- Publication Status: Status of the policy: Published or Unpublished.

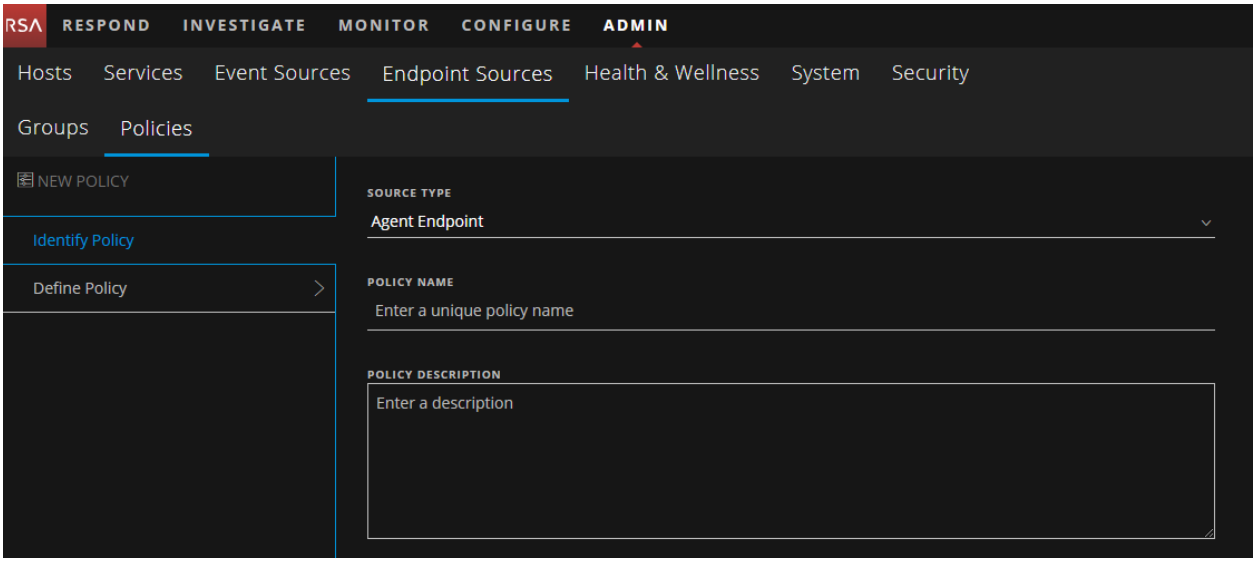
Sort Columns. If you mouse over a column header, a sort icon is displayed: . Click the icon to sort by the selected column.

4 **Properties Panel.** Displays the properties of the selected policy.

Note: To view the Properties panel for a policy, click the Policy Name.

Create Policy

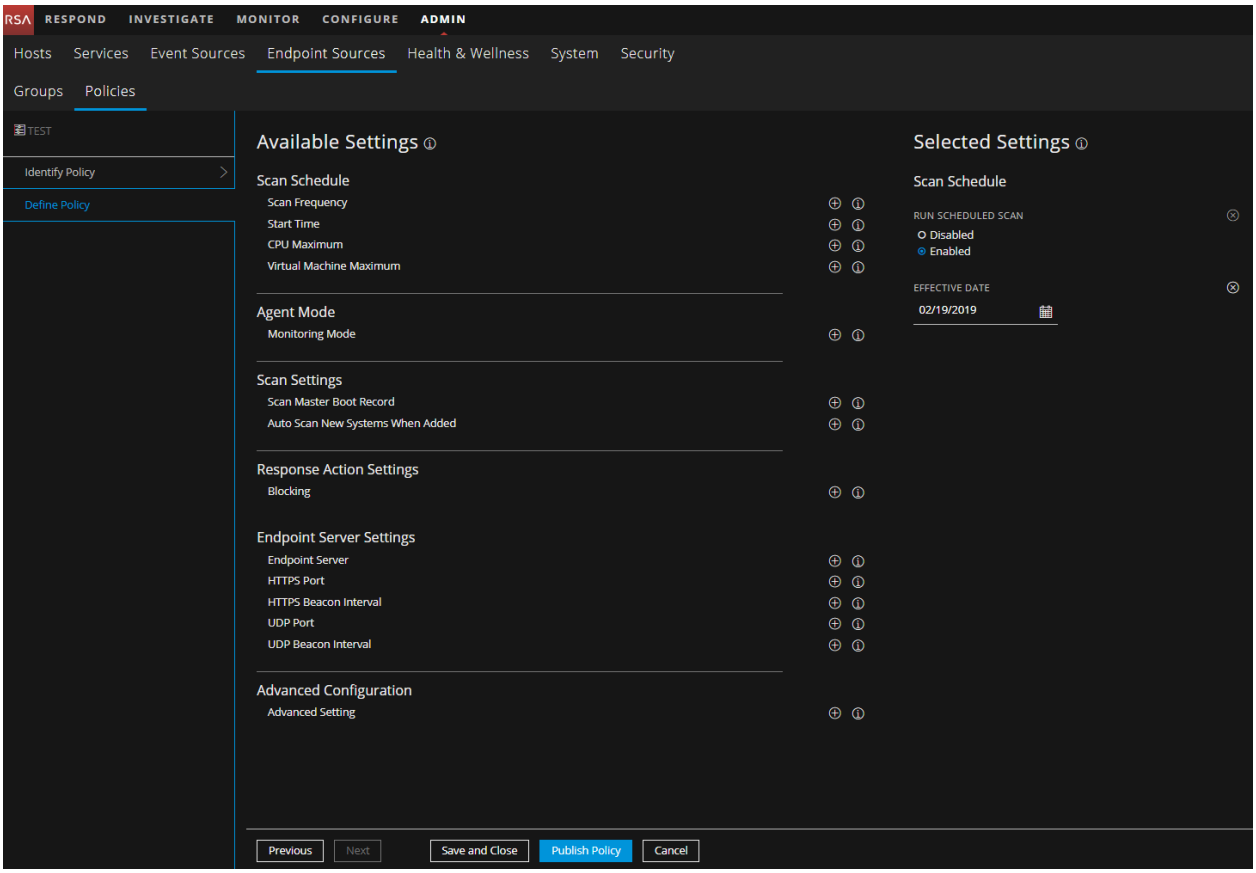
Below is an example of the Create Policy dialog. The table describes the information and options in the Create Policy dialog.



Field	Description
Source Type	Displays the source type for the policy. Available options are Agent Endpoint and Agent Windows Logs.
Policy Name	Name of the policy. The name should be unique.
Policy Description	Description of the policy. Description should not exceed 8000 characters.

Define Policy Panel for Agent Endpoint Policy

Below is an example of Define policy panel. The table describes the information and options for Agent Endpoint policy:



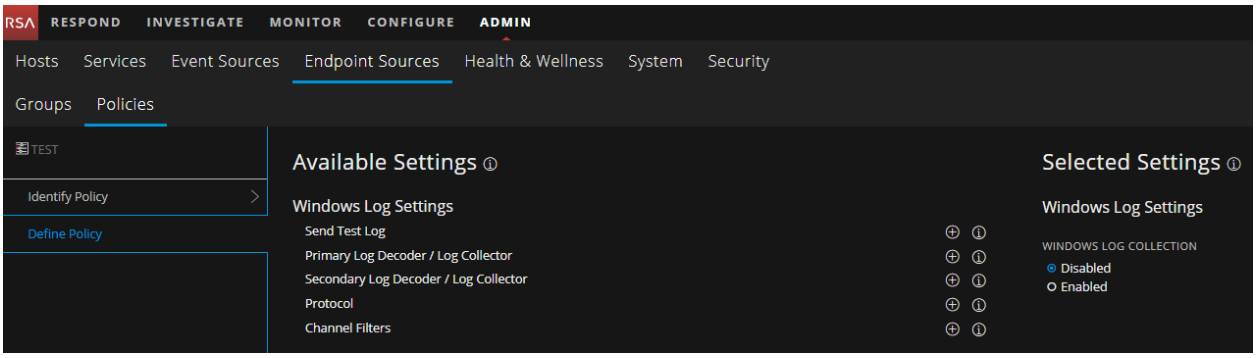
Settings	Description
	Scan Schedule
Run Scheduled Scan	Run a scheduled scan if you want to receive regular snapshots from a host. Scan snapshots provide detailed information about processes and files loaded on the memory. By default, this option is disabled. You can also run a manual scan from the **INVESTIGATE > Hosts** view. **Note:** The following scan schedule options are available only when the scan schedule is enabled. The values entered are specific to the agent time zone.
Effective Date	Date when the policy takes effect. If you do not want this policy to take effect as soon as it is applied to a group and published, set an effective date that is in the future. By default, this is set to the current date.

Settings	Description
Scan Frequency	Determines how often the scheduled scan runs on a host. By default, this is set to every 1 week. Every network is different and the frequency should balance the needs of the analysts for current data, availability to review the data, and how systems deal with the load of the generated data. Select Days or Weeks: • Days: Select the number of days of the scan frequency. You can set a schedule to scan every n days, where n is 1, 2, 3, 4, 5, 6, 10, 15, or 20. For example, to scan every third day, select 3. • Weeks: Select after how many weeks the policy scan should be initiated and on which day of the week the policy scan should initiate. For example, to scan every other Wednesday, choose 2 and W.
Start Time	Time when the scheduled scan starts to run on a host. By default, this is set to 9:00. This is the local host time, meaning that scans across a global network will not run all at once. Note that the time is in 24 hour format. To set a time of 7:30 PM, select 19:30.
CPU Maximum	Amount of CPU the agent can use to run scheduled scans on physical hosts. By default, the value is set at 25%. Increasing the CPU maximum increases the speed of scan snapshot retrieval. Drag the slider to specify the maximum CPU usage by the created policy. Minimum value is 5%. Use the slider to select the maximum CPU processing power to use for the scan. Note that the higher the percentage, the less CPU is available for other tasks on the host.
Virtual Machine Maximum	Amount of CPU the agent can use to run scheduled scans on virtual machines. By default, the value is set at 10%. Increasing the virtual machine maximum value increases the speed of scan snapshot retrieval. Drag the slider to specify the maximum Virtual Machine usage by the policy. Minimum value is 5%. Use the slider to select the maximum CPU processing power to use for the scan. Keep in mind that the higher the percentage, the less CPU is available for other tasks running on the virtual machine.
Agent Mode	
Monitoring mode	Allows you to specify whether an agent should operate in Insights (free) or Advanced mode (license). By default, it is set to Advanced.
Scan Settings	
Scan Master Boot Record	Includes Master Boot Record (MBR) details in scheduled scans. By default, this option is disabled. This can help to identify when an operating system boot sequence is compromised. However, not all modifications to the MBR are malicious, as they could be made to provide encryption or enforce licensing of certain legitimate software.

Settings	Description
Auto Scan New Systems When Added	Automatically scans when a new host is added. By default, this option is disabled. If this option is disabled, no snapshot data is displayed in the **INVESTIGATE > Hosts** view until a manual or scheduled scan is run on these hosts. Existing hosts will not be affected. **Note:** Enabling this option on a new deployment when this policy is applied to a large number of hosts may result in a large number of simultaneous scans that cause performance degradation.
Response Action Settings	
Blocking	Allows an analyst to prevent the execution of a malicious file on any host running an Advanced mode agent. By default, this option is disabled. File blocking will not be enforced if it is disabled by policy, which might be desirable to ensure that there are no performance side effects on systems where CPU or IO performance is critical. **Note:** Blocking is not supported for an Insights agent.
Endpoint Server Setting	
Endpoint Server	Displays all available Endpoint servers in the deployed. **Note:** If you do not select an Endpoint Server, the agent uses the default Endpoint Server that is configured during packager generation.
Endpoint Server Forwarder (Optional)	The optional server alias allows you to enter an alternative hostname or IP address on which the server can be reached in the case that agents need to go through a NAT or similar in order to reach the Endpoint Server.
HTTPS Port	Port number used for HTTPS communication. By default, the port is set to 443. If you want to change this port, make sure that it matches the server configuration. If you enter the wrong port, the agents can no longer communicate with the Endpoint server and the system will be non-functional.
HTTPS Beacon Interval	Determines how often an agent can communicate with the Endpoint server over HTTPS. By default, the value is set to 15 minutes. The default method of beaconing is UDP. Beaconing is used as a method of keep-alive to know if a host is online and to allow hosts to respond faster than the fallback HTTPS beacon time.
UDP Port	Port number used for UDP communication. By default, the port is set to 444. If you want to change this port, make sure that it matches the server configuration. Entering the wrong port results in loss of functionality and effects performance.
UDP Beacon Interval	Determines how often an agent can communicate with the Endpoint server over UDP. By default, the value is set to 30 seconds.

Define Policy Panel for Windows Logs Policy

The table describes the information and options for Agent Windows Logs policy:



Settings	Description
Windows Log Collection	If enabled, logs from the Windows hosts are collected and forwarded to the NetWitness Platform. By default, this option is disabled.
Send Test Log	If enabled, a sample log is sent to the configured server when the policy is loaded to test connectivity. This allows to test the configuration before standard logs are available. By default, this option is disabled.
Primary Log Decoder / Log collector	Primary NetWitness Platform Log Decoder or Log Collector to which the collected Windows logs are forwarded.
(Optional) Secondary Log Decoder / Log collector	If the primary Log Decoder or Log Collector is not reachable, the collected Windows logs are forwarded to the secondary Log Decoder or Log Collector. **Note:** NetWitness Platform cannot detect failures when UDP protocol is used.
Protocol	Select whether TLS, TCP, or UDP transport protocol is used to forward the collected Windows logs to the NetWitness Platform servers. By default, the protocol is TCP.
Channel Filters	Configure which Windows Log events to collect by selecting a channel, filter condition, and the relevant event IDs. You can either select common channels, such as Security or System from the drop-down list, or create custom channels by entering the channel name. By default, all events are collected from a selected channel. To collect a subset of events from that channel replace 'ALL' with the relevant Event IDs. Select **INCLUDE** if only events with the listed Event IDs should be collected or select **EXCLUDE** to collect all events except for these events.

Troubleshooting

This section provides information about possible issues when using the RSA NetWitness Endpoint.

Agent Communication Issues

Issue	Agent is unable to communicate with the Endpoint server.

Explanation	This could be due to one of the following reasons:
	• In the agent packager:
	  • Server IP is incorrect
	  • Port specified is not available for communication with the Endpoint server
	• Endpoint Server or Nginx Server is not running
	• Firewall or IP table rules are blocking the connection between the host and Endpoint Server
	• Agent is inactive or manually deleted from the UI

Resolution	• Check if the Endpoint Server and Nginx Server are reachable • Uninstall the agent, reboot the host, and reinstall the agent • Update Firewall or IP table rules, if required

Issue	Agent takes a long time to scan.
Explanation	Sometimes, the NetWitness Endpoint scan takes a long time to complete. This is because of the CPU usage by other antivirus programs (such as Windows Defender, McAfee, Norton, and so on) that may be installed on the agent machines.
Resolution	It is recommended to whitelist the `NWEAgent.exe` file in the antivirus Windows Suite.

Issue	You want to change the responsiveness of the Agent.
Explanation	Depending on your installation, you can adjust Beaconing intervals to change how responsive your agents are.
Resolution	If resources are not a concern, you can lower the HTTPS Beacon Interval and UDP Beacon Intervals. If resources are a concern and responsiveness of the agent is not, you can increase these intervals.

Packager Issues

Message	`Failed to load the client certificate.`

Issue	Incorrect certificate password.
Explanation	While generating the agent installer, the certificate password does not match with the one provided while downloading the agent packager from the UI.
Resolution	Specify the correct certificate password.

Message	`An unexpected error has occurred attempting to retrieve this data.`
Issue	When attempting to access the Packager tab, it opens with the message.
Explanation	Endpoint Server might be down or not reachable.
Resolution	Check the status of the Endpoint Server under **ADMIN > Service**. If the service is not running, start the Endpoint Server.

Scan Schedule Issues

Message	`An unexpected error has occurred attempting to retrieve this data.`
Issue	When attempting to access the Scan Schedule tab, it opens with the message.
Explanation	Endpoint Server might be down or not reachable.
Resolution	Check the status of the Endpoint Server under **ADMIN > Service**. If the service is not running, start the Endpoint Server.

Health and Wellness Issues

Behavior	Endpoint metadata is not available in the **INVESTIGATE > Navigate** or **Event Analysis** view.
Issue	The health check of the Meta-Ld-Buffer shows **Unhealthy** in the Health and Wellness with the following exceptions: `dataprocessor-5] WARN MetaManagement|Meta Forwarding waiting for free buffer in Log decoder`
Resolution	Make sure that: • Capture is enabled on the Log Decoder • Metadata is configured properly

Behavior	For the NetWitness Endpoint 4.4.0.2 or later, metadata is not reaching the Endpoint Server.
Issue	The health of the Meta-Ld-Buffer shows **Unhealthy** in the Health and Wellness with the

Explanation	following exceptions: `dataprocessor-5] WARN MetaManagement|Meta Forwarding waiting for free buffer in Log decoder`
	Make sure that: • Certificate is obtained and imported to the NetWitness 4.4.0.2 or later Console Server. • NetWitness Investigate option is enabled in the NetWitness Endpoint UI. • Metadata forwarding is configured in the NetWitness 4.4.0.2 or later Console server.

Behavior	The health check of the Data.Application.Connection-Health for Endpoint Server shows **Unhealthy**.
Issue	Either Mongo or Endpoint Server service is down.
Explanation	For error details, check the Endpoint Server logs in `/var/log/netwitness/endpoint-server/endpoint-server.log`.
Resolution	Restart the Mongo or Endpoint Server service.

Behavior	The health check of the Endpoint.Health.Overall-Health statistic shows **Unhealthy**.
Issue	Either Mongo or Endpoint Server service is down.
Explanation	Check the other Endpoint Server health statistics (such as, Data.Application.Connection-Health, Endpoint.Health.Ld-Buffer-Health) to identify which stats shows Unhealthy. If one of them is Unhealthy, the overall health of the Endpoint Server shows Unhealthy.
Resolution	See the resolution for these statistics in the Health and Wellness Issues section.

Issue	Agent rejection count is more than the alarm threshold.
Explanation	The agent rejected count is more than a specific limit and your custom policy is triggered. For example, agent rejected count for the last 5 hours is 10 percent of the deployed agents.
Resolution	Check the overall health of the Endpoint Server and the sizing guidelines.

Issue	Storage size of the Data application statistic has exceeded the alarm threshold.
Explanation	The storage size of the Data application has exceeded the threshold (for example, 75%), and the custom policy is triggered. **Note:** By default, the server automatically deletes the older data when it reaches 80% of the disk space.

Resolution	Check the threshold set in the data retention policy.

Issue	The health check of the Data.Application.Connection-Health shows Unhealthy or Fatal.
Explanation	The Mongo service is down.
Resolution	Check if the Mongo service is running and the Endpoint Server logs for error details.

Issue	The agent request count shows 0 for a alarm threshold.

Explanation	The agent request count shows 0 for the entire day or week. This could be due to one of the following reasons:
	• In the agent packager:
	  ◦ Server IP is incorrect .
	  ◦ Port specified is not available for communication with the Endpoint server.
	• Endpoint Server or Nginx Server is not running .
	• Firewall or IP table rules are blocking the connection between the host and Endpoint Server.
	• Agent is inactive or manually deleted from the UI.

Resolution	• Check if the Endpoint Server and Nginx Server are reachable. • Uninstall the agent, reboot the host, and reinstall the agent. • Update Firewall or IP table rules, if required.

Installation Issue

Behavior	NetWitness Platform allows multiple instances of Endpoint Hybrid or Endpoint Log Hybrid to be installed.
Issue	Only one instance of the Endpoint Hybrid or Endpoint Log Hybrid can be used for endpoint data.
Explanation	While the installation of Endpoint Hybrid or Endpoint Log Hybrid is in-progress, you can install another instance and the installation will be successful.
Resolution	You must delete all instances of Endpoint Hybrid or Endpoint Log Hybrid except the one that you want to use for endpoint data.

Finding Inactive Agents Issue

Issue	Agent might be inactive or has not communicated with the Endpoint Server for a

	long time.
Explanation	A list of inactive agents is available in the Mongo database with the agent ID. Using this information, you can search for further details of the inactive agents.
Resolution	To find inactive agents in your deployment, perform the following: 1. Open the Endpoint Server log file from `/var/log/netwitness/endpoint-server/endpoint-server.log` and search for Agent <ID> does not exist string. 2. Copy the agent ID displayed in the log file. 3. Search for the agent ID in the NGINX access log file (`/var/log/nginx/access.log`) to retrieve the following details of an inactive agent: • IP Address • Date and time that the agent became inactive • Location

NGINX Issue

Issue	Nginx rejects post requests exceeding request size 100 GB.
Explanation	By default, the payload size in the NGINX server is set to 100 GB. This causes any data post request exceeding 100 GB to fail.
Resolution	Add the following setting to the Nginx configuration file (`/etc/nginx/conf.d/nginx.conf`) and restart the Nginx server. `client_max_body_size xx` where, `xx` is the size that you want to set.

About this Document

This guide provides an overview of NetWitness Respond, detailed instructions on how to configure NetWitness Respond in your network, additional procedures that are used at other times, and reference materials that describe the user interface for configuring NetWitness Respond in your network.

Topics

- NetWitness Respond Configuration Overview
- Configuring NetWitness Respond
- Additional Procedures for Respond Configuration
- NetWitness Respond Configuration Reference

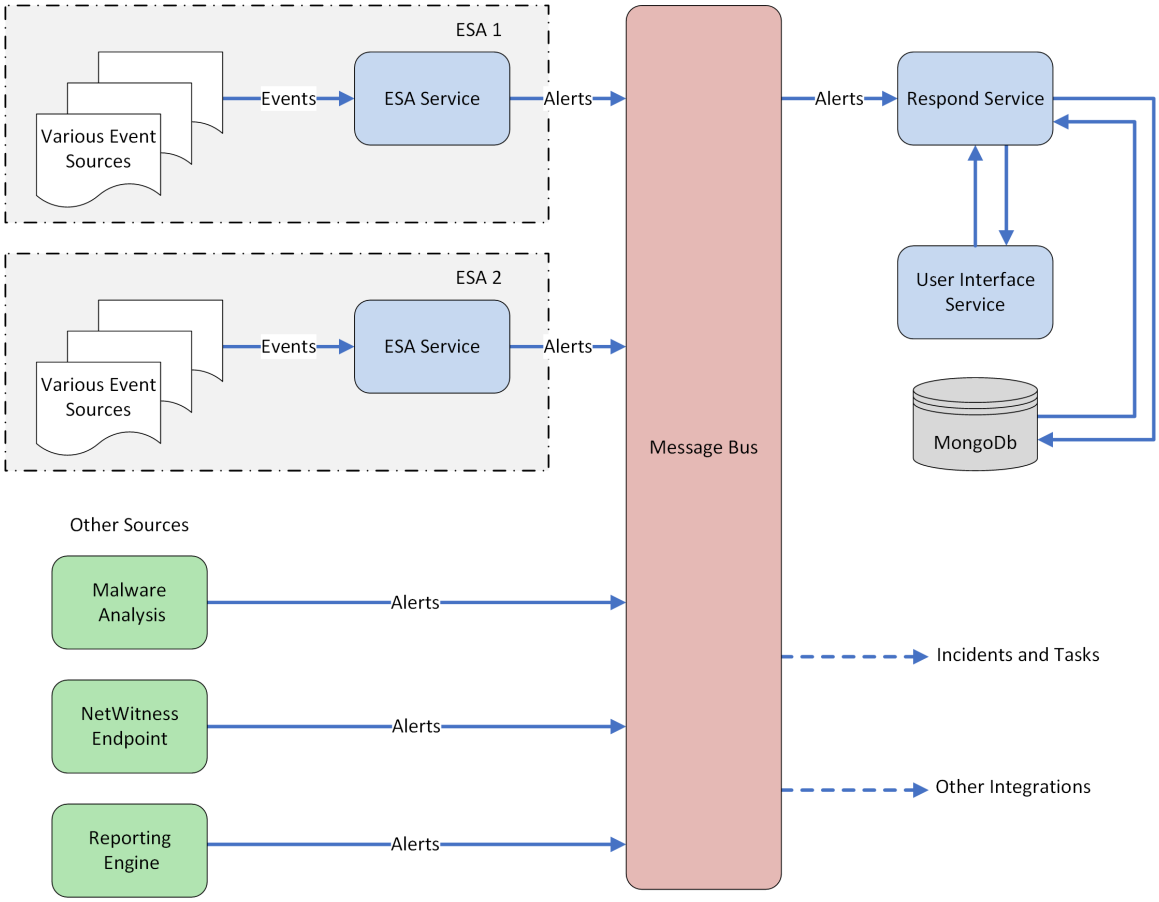
NetWitness Respond Configuration Overview

NetWitness Respond consumes alert data from various sources via the Message Bus and displays these alerts on the NetWitness Platform user interface. The Respond Server service allows you to group the alerts logically and start a NetWitness Respond workflow to investigate and remediate the security issues raised.

The Respond Server service consumes alerts from the message bus and normalizes the data to a common format (while retaining the original data) to enable simpler rule processing. It periodically runs rules to aggregate multiple alerts into an incident and set some attributes of the Incident (for example, severity, category, and so on). The incidents are persisted into MongoDb by the Respond Server service. Incidents are also posted onto the message bus for consumption by other systems (for example, Archer integration).

Note: NetWitness Respond requires an ESA primary server that contains the MongoDb. Alerts, Incidents, and Task records are persisted into this MongoDb by the Respond Server.

The following diagram illustrates the high-level flow of alerts.



You have to configure various sources from which the alerts are collected and aggregated by the Respond Server service.

Configuring NetWitness Respond

This topic provides the high-level tasks required to configure the Respond Server service. The administrator needs to complete the steps in the sequence provided.

Topics

- Step 1. Configure Alert Sources to Display Alerts in the Respond View
- Step 2. Assign Respond View Permissions
- Step 3. Enable and Create Incident Rules for Alerts

Step 1. Configure Alert Sources to Display Alerts in the Respond View

This procedure is required so that alerts from the alert sources are displayed in NetWitness Respond. You have an option to enable or disable the alerts being populated in the Respond view. By default this option is disabled in the Reporting Engine, Malware Analysis, and NetWitness Endpoint and enabled only in Event Stream Analysis. So when you install the Respond Server service you need to enable this option in the Reporting Engine, Malware Analysis, and NetWitness Endpoint to populate the corresponding alerts in the Respond view.

Prerequisites

Ensure that:

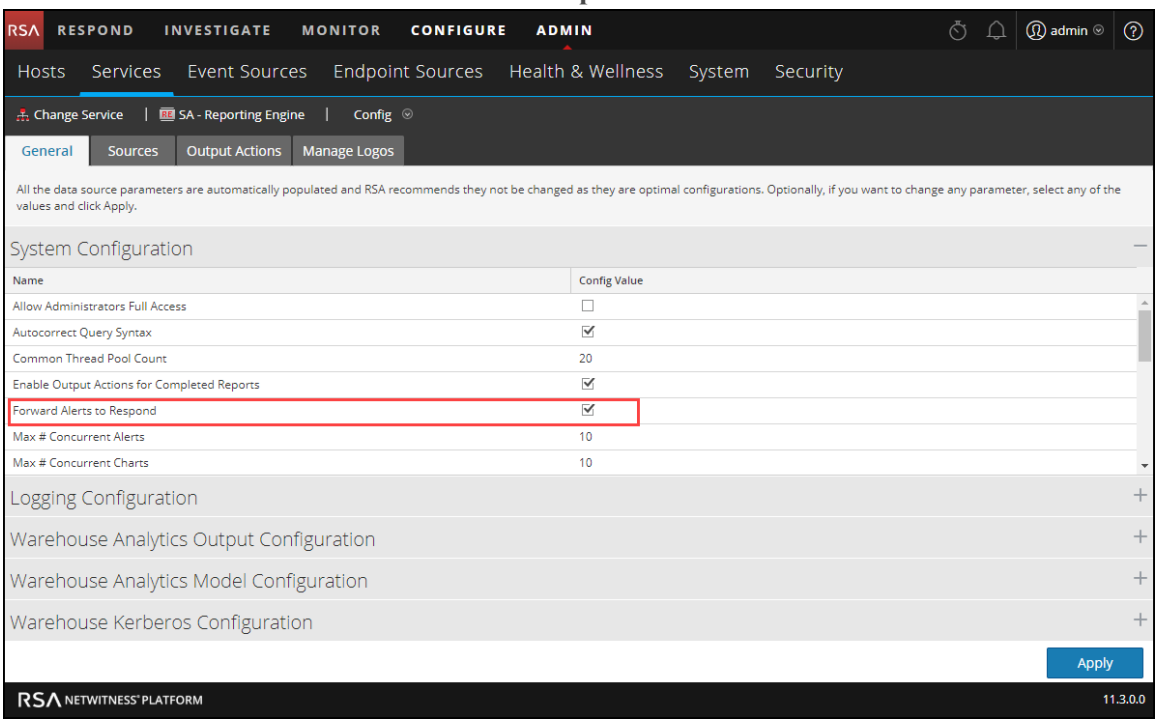
- The Respond Server service is installed and running on NetWitness Platform.
- NetWitness Endpoint is installed and running. This is necessary only if you want to configure NetWitness Endpoint as an alert source in the Respond view.

Configure Reporting Engine to Display Reporting Engine Alerts in the Respond View

The Reporting Engine alerts are by default disabled from being displayed in Respond view. To display and view the Reporting Engine alerts, you have to enable the NetWitness Respond alerts in the Services Config view > General tab for the Reporting Engine.

1. Go to **ADMIN > Services,** select a Reporting Engine service, and then select **> View > Config**.
   The Services Config view is displayed with the Reporting Engine General tab open.
2. Select **System Configuration**.

3. Select the checkbox for **Forward Alerts to Respond**.



4. Click **Apply**.
   The Reporting Engine now forwards the alerts to NetWitness Respond.

For details on parameters in the General tab, see the "Reporting Engine General Tab" topic in the *Reporting Engine Configuration Guide*.

Configure Malware Analysis to Display Malware Analysis Alerts in the Respond View

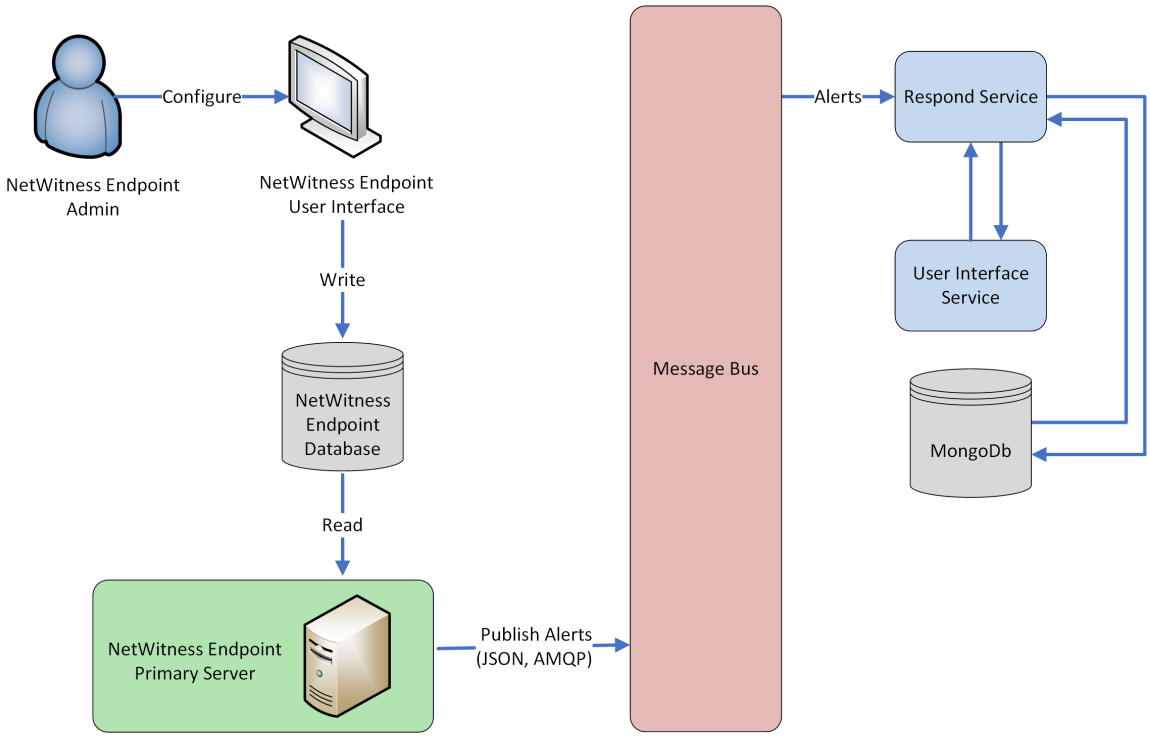
Viewing NetWitness Respond alerts is a function of auditing in Malware Analysis. The procedure for enabling NetWitness Respond alerts is described in the "(Optional) Configure Auditing on Malware Analysis Host" topic in the *Malware Analysis Configuration Guide*.

Configure NetWitness Endpoint to Display NetWitness Endpoint Alerts in the Respond View

This procedure is required to integrate NetWitness Endpoint with NetWitness Platform so that the NetWitness Endpoint alerts are picked up by the NetWitness Respond component of NetWitness Platform and displayed in the **RESPOND > Alerts** view.

Note: RSA supports NetWitness Endpoint versions 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later for NetWitness Respond integration. For more detailed information, see "RSA NetWitness Endpoint Integration" in the *NetWitness Endpoint User Guide*.

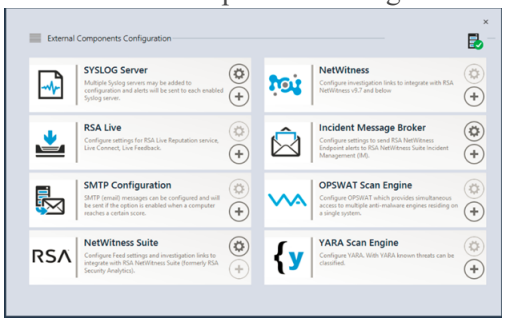
The diagram below represents the flow of NetWitness Endpoint alerts to the NetWitness Platform Respond Server service and its display in the **RESPOND > Alerts** view.



To configure NetWitness Endpoint to display NetWitness Endpoint alerts in the NetWitness Platform user interface:

1. In the NetWitness Endpoint user interface, click **Configure > Monitoring and External Components**.

   The External Components Configuration dialog is displayed.



2. From the components listed, select **Incident Message Broker** and click + to add a new IM Broker.
3. Enter the following fields:
   a. **Instance Name**: Enter a unique name to identify the IM broker.
   b. **Server Hostname/IP address**: Enter the Host DNS or IP address of the IM Broker (NetWitness Server).
   c. **Port number**: The default port is 5671.
4. Click **Save**.
5. Navigate to the **ConsoleServer.exe.Config** file in **C:\Program Files\RSA\ECAT\Server**.

6. Modify the virtual host configurations in the file as follows:
   `<add key="IMVirtualHost" value="/rsa/system" />`

   Note: In NetWitness Platform 11.0 and later, the virtual host is "/rsa/system". For version 10.6.x and below, the virtual host is "/rsa/sa".

7. Restart the API Server and Console Server.

8. To set up SSL for Respond Alerts, perform the following steps on the NetWitness Endpoint primary console server to set the SSL communications:

   a. Export the NetWitness Endpoint CA certificate to .CER format (Base-64 encoded X.509) from the personal certificate store of the local computer (without selecting the private key).

   b. Generate a client certificate for NetWitness Endpoint using the NetWitness Endpoint CA certificate. (You MUST set the CN name to `ecat`.)

   ```
   makecert -pe -n "CN=ecat" -len 2048 -ss my -sr LocalMachine -a sha1 -sky
   exchange -eku 1.3.6.1.5.5.7.3.2 -in "NWECA" -is MY -ir LocalMachine -sp
   "Microsoft RSA SChannel Cryptographic Provider" -cy end -sy 12
   client.cer
   ```

   Note: In the above code sample, if you upgraded to Endpoint version 4.3 from a previous version and did not generate new certificates, you should substitute `EcatCA` for `NWECA`.

   c. Make a note of the thumbprint of the client certificate generated in step b. Enter the thumbprint value of the client certificate in the IMBrokerClientCertificateThumbprint section of the `ConsoleServer.Exe.Config` file as shown.

   ```
   <add key="IMBrokerClientCertificateThumbprint"
   value="896df0efacf0c976d955d5300ba0073383c83abc"/>
   ```

9. On the NetWitness Server, copy the NetWitness Endpoint CA certificate file in .CER format into the import folder:
   `/etc/pki/nw/trust/import`

10. Issue the following command to initiate the necessary Chef run:
    `orchestration-cli-client --update-admin-node`
    This appends all of those certificates into the truststore.

11. Restart the RabbitMQ server:
    `systemctl restart rabbitmq-server`
    The NetWitness Endpoint account should automatically be available on RabbitMQ.

12. Import the **/etc/pki/nw/ca/nwca-cert.pem** and **/etc/pki/nw/ca/ssca-cert.pem** files from the NetWitness Server and add them to the Trusted Root Certification stores in the Endpoint Server.

Step 2. Assign Respond View Permissions

Add users with the required permissions to investigate incidents and alerts in NetWitness Respond. Users with access to the Respond view need both Incidents and Respond-server permissions. Users with access to configure Respond notification settings need additional Integration-server permissions.

The following pre-configured roles have permissions in the Respond view:

- **Analysts**: The Security Operations Center (SOC) Analysts have access to Alerting, NetWitness Respond, Investigate, and Reporting, but not system configurations.
- **Malware Analysts**: Malware Analysts have access to investigations and malware events.
- **Operators**: Operators have access to configurations, but not Investigate, ESA, Alerting, Reporting and NetWitness Respond.
- **SOC_Managers**: The SOC Managers have the same access as Analysts plus additional permissions to handle incidents and configure NetWitness Respond.
- **Data_Privacy_Officers**: Data Privacy Officers (DPOs) are like Administrators with additional focus on configuration options that manage obfuscation and viewing of sensitive data within the system. See the *Data Privacy Management Guide* for additional information.
- **Respond_Administrator**: The Respond Administrator has full access to NetWitness Respond.
- **Administrators**: The Administrator has full system access to NetWitness Platform and has all permissions by default.

The NetWitness Respond default permissions are shown in the following tables. You need to assign user permissions from both the **Incidents** and **Respond-server** tabs, which are the Permissions tab names in the ADMIN > Security view Add or Edit Roles dialogs. You may want to add additional user permissions for Alerting, Context Hub, Investigate, Investigate-server, and Reports.

Caution: It is very important that you assign equivalent user permissions from BOTH the Respond-server tab AND the Incidents tab.

Users who configure Respond notification settings also need permissions in the Integration-server tab.

Respond-server

Permissions	Analysts	SOC Mgrs	DPOs	Respond Admin	Operators	MAs
respond-server.alert.delete			Yes*	Yes*		
respond-server.alert.manage	Yes	Yes	Yes*	Yes*		Yes
respond-server.alert.read	Yes	Yes	Yes*	Yes*		Yes
respond-server.alertrule.manage		Yes	Yes*	Yes*		
respond-server.alertrule.read		Yes	Yes*	Yes*		
respond-server.configuration.manage			Yes*	Yes*		
respond-server.health.read			Yes*	Yes*		
respond-server.incident.delete			Yes*	Yes*		
respond-server.incident.manage	Yes	Yes	Yes*	Yes*		Yes
respond-server.incident.read	Yes	Yes	Yes*	Yes*		Yes
respond-server.journal.manage	Yes	Yes	Yes*	Yes*		Yes
respond-server.journal.read	Yes	Yes	Yes*	Yes*		Yes
respond-server.logs.manage			Yes*	Yes*		
respond-server.metrics.read			Yes*	Yes*		
respond-server.notification.manage (Available in 11.1 and later)		Yes	Yes*	Yes*		
respond-server.notification.read (Available in 11.1 and later)		Yes	Yes*	Yes*		
respond-server.process.manage			Yes*	Yes*		
respond-server.remediation.manage	Yes	Yes	Yes*	Yes*		Yes
respond-server.remediation.read	Yes	Yes	Yes*	Yes*		Yes
respond-server.risk.manage	Yes		Yes*	Yes*		
respond-server.risk.read	Yes		Yes*	Yes*		
respond-server.security.manage			Yes*	Yes*		
respond-server.security.read			Yes*	Yes*		

* Data Privacy Officers and Respond Administrators have the **respond-server.*** permission, which gives them all of the Respond-server permissions.

Incidents

Permissions	Analysts	SOC Mgrs	DPOs	Respond Admin	Operators	MAs
Access Incident Module	Yes	Yes	Yes	Yes		Yes
Configure Incident Management Integration		Yes	Yes	Yes		
Delete Alerts and Incidents			Yes	Yes		
Manage Alert Handling Rules		Yes	Yes	Yes		
View and Manage Incidents	Yes	Yes	Yes	Yes		Yes

The Respond Administrator has all of the Respond-server and Incidents permissions.

Integration-server

Note: The Integration-server permissions are available in NetWitness Platform version 11.1 and later.

Users who configure Respond Notifications also need Integration-server permissions. The following table lists the Respond Notification setting permissions in the Integration-server tab assigned to each role.

Permissions	Analysts	SOC Mgrs	DPOs	Respond Admin	Operators	MAs
integration-server.notification.read		Yes	Yes	Yes		
integration-server.notification.manage		Yes	Yes	Yes		

Investigate-server

Users who view Event Analysis in Respond also need Investigate-server permissions. The following table lists the Respond Event Analysis permissions required in the Investigate-server tab and the permissions assigned to each role.

Permissions	Analysts	SOC Mgrs	DPOs	Respond Admin	Operators	MAs
investigate-server.event.read	Yes	Yes	Yes	Yes		Yes
investigate-server.content.reconstruct	Yes	Yes	Yes	Yes		Yes
investigate-server.content.export	Yes	Yes	Yes	Yes		Yes

Respond Notification Settings Permissions

Note: The Respond notification setting permissions are available in NetWitness Platform version 11.1 and later.
If you are updating from NetWitness Platform version 11.0 to 11.1 or later, you will need to add additional permissions to your existing built-in NetWitness Platform user roles. For all upgrades to 11.1 or later, you will need to add additional permissions to custom roles.

The following permissions are required for Respond Administrators, Data Privacy Officers, and SOC Managers to access Respond Notification Settings (CONFIGURE > Respond Notifications).

Incidents tab:

- Configure Incident Management Integration

Respond-server tab:

- respond-server.notification.manage
- respond-server.notification.read

Integration-server tab:

- integration-server.notification.read
- integration-server.notification.manage

Respond Event Analysis Permissions

Note: The Event Analysis panel in the Respond view is available in NetWitness Platform version 11.2 and later.

The Event Analysis panel in the Respond view shows the Event Analysis view from Investigate for specific indicator events. The following permissions are required to view Event Analysis in the Respond view. These permissions are provided by default for users with the Analysts role.

Investigate-server tab:

- investigate-server.event.read
- investigate-server.content.reconstruct
- investigate-server.content.export

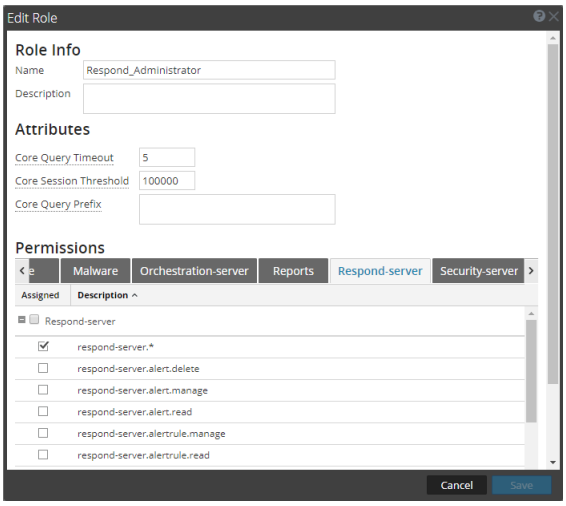
Administration tab:

- Access Administration Module

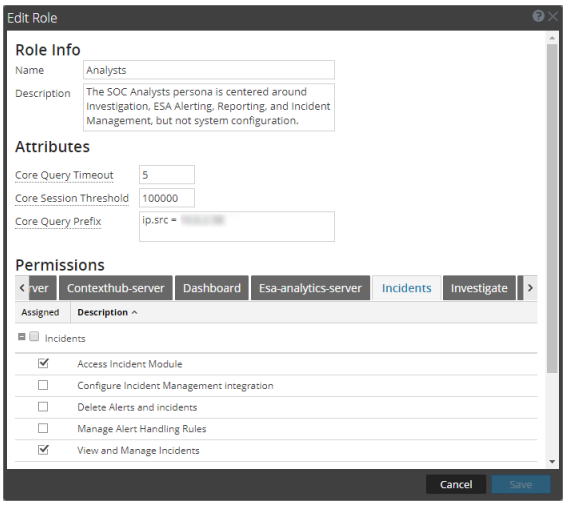
Note: Migrated incidents from NetWitness Platform versions before 11.2 will not show the Event Analysis panel in the Respond Incident Details view Indicators panel. Likewise, if you use alerts that were migrated from versions before 11.2 to create incidents in 11.2, you will also not be able to view the Event Analysis panel in the Respond view for those incidents.

Respond Role Permission Examples

The following figure shows Respond-server permissions for the default Respond Administrator role. The Respond Administrator role contains all of the NetWitness Respond permissions.



The following figure shows the Incidents permissions for the default Analysts role:



For more information, see "Role Permissions" and "Manage Users with Roles and Permissions" in the *System Security and User Management* guide.

Step 3. Enable and Create Incident Rules for Alerts

NetWitness Respond incident rules contain criteria to automate the process of creating incidents from alerts. Alerts that meet the rule criteria are grouped together to form an incident. Analysts use these incidents to locate indicators of compromise. Instead of creating an incident for a particular set of alerts and adding the alerts to that incident manually, you can save time by using incident rules to create incidents from alerts for you.

NetWitness Platform provides predefined incident rules that you can use and you can also create your own rules based on your business requirements.

To create incidents automatically, you need to enable at least one incident rule.

When you have two or more incident rules enabled, the order of the rules becomes very important. The highest priority rules are at the top of the Incident Rules list. The highest priority rule has the number 1 in the Order field. The next highest priority rule is number 2 in the Order field, and so on. Alerts can only be part of one incident. If an alert matches more than one rule in the Incident Rule list, it is only evaluated using the highest priority rule that it matches.

NetWitness Platform has 13 predefined incident rules that you can use. To set up your incident rules, you can do any of the following:

- Enable predefined incident rules
- Add new rules
- Clone rules
- Edit existing rules

The User Entity Behavior Analytics incident rule is available in 11.3 and later. It captures user entity behavior grouped by Classifier ID to create incidents from alerts. The User Behavior default incident rule is available in NetWitness Platform 11.1 and later. It captures network user behavior and uses deployed RSA Live ESA Rules to create incidents from alerts.

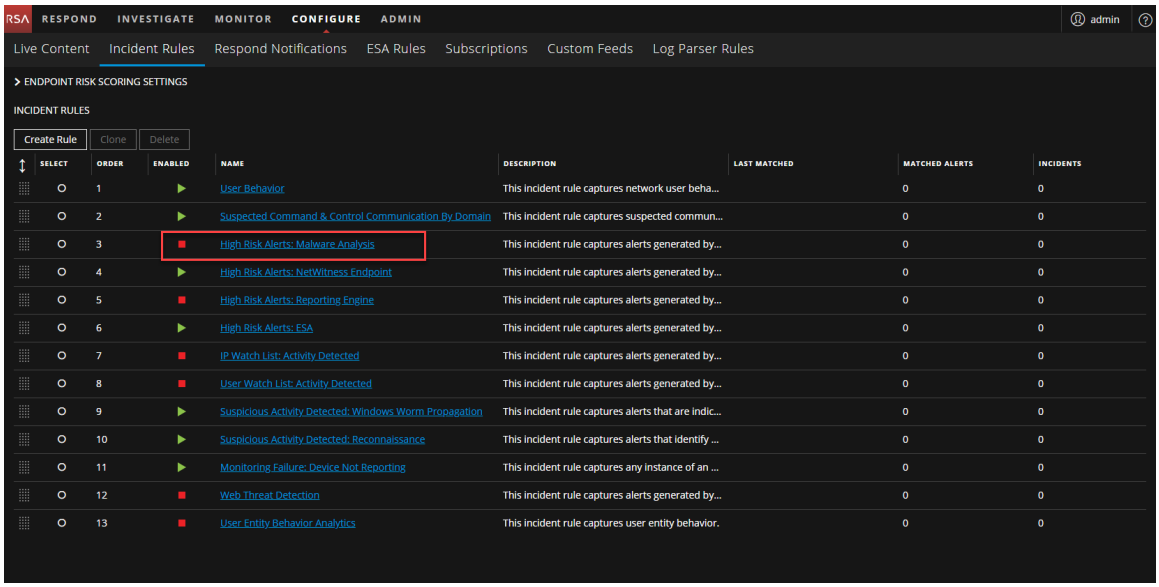
You can select and deploy the RSA Live ESA Rules that you want to monitor. For more information, see Deploy the RSA Live ESA Rules.

Some predefined (default) incident rules changed slightly in 11.1 and later. To verify your existing default incident rules with the 11.3 default incident rules, see Set Up and Verify Default Incident Rules.

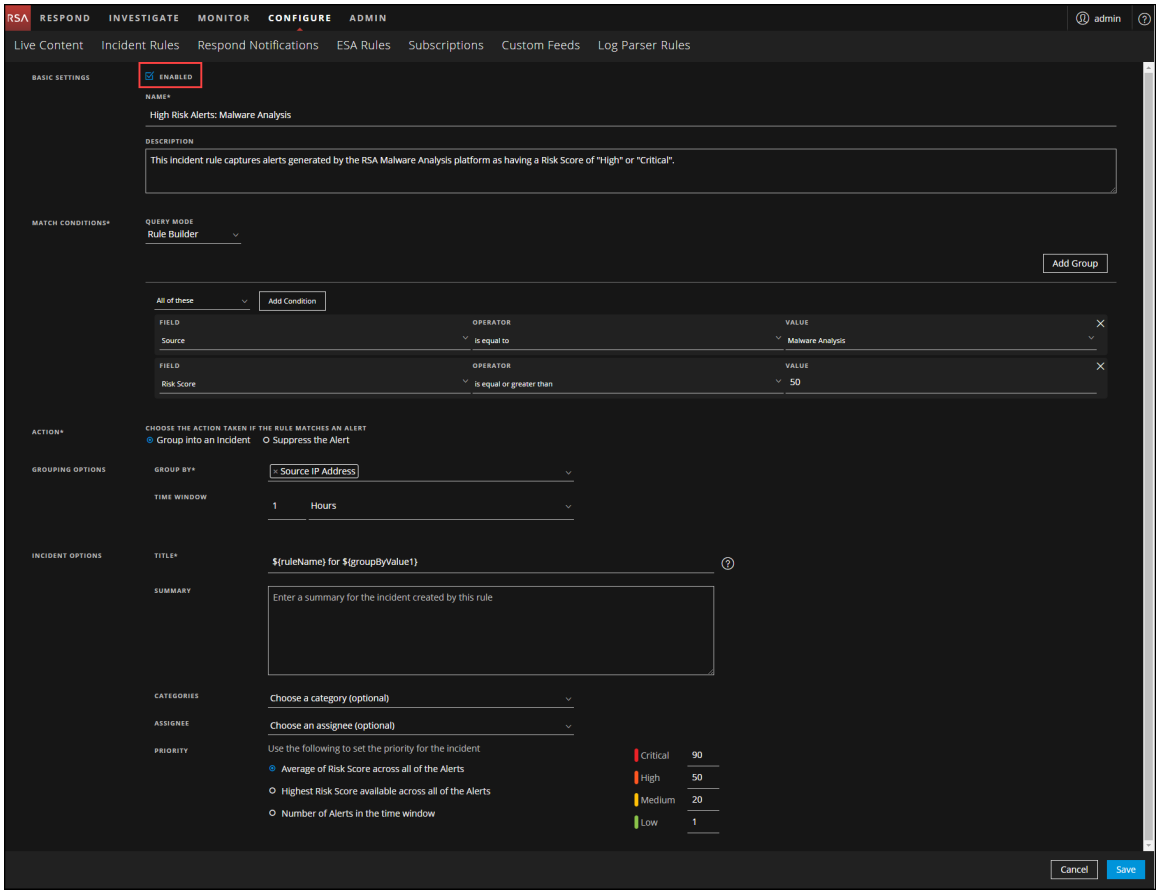
Enable an Incident Rule

To create incidents automatically, you need to enable at least one incident rule. Predefined (default) incident rules or rules that you create must be enabled before they start creating incidents.

1. Go to **CONFIGURE > Incident Rules**.
   The Incident Rules view is displayed.

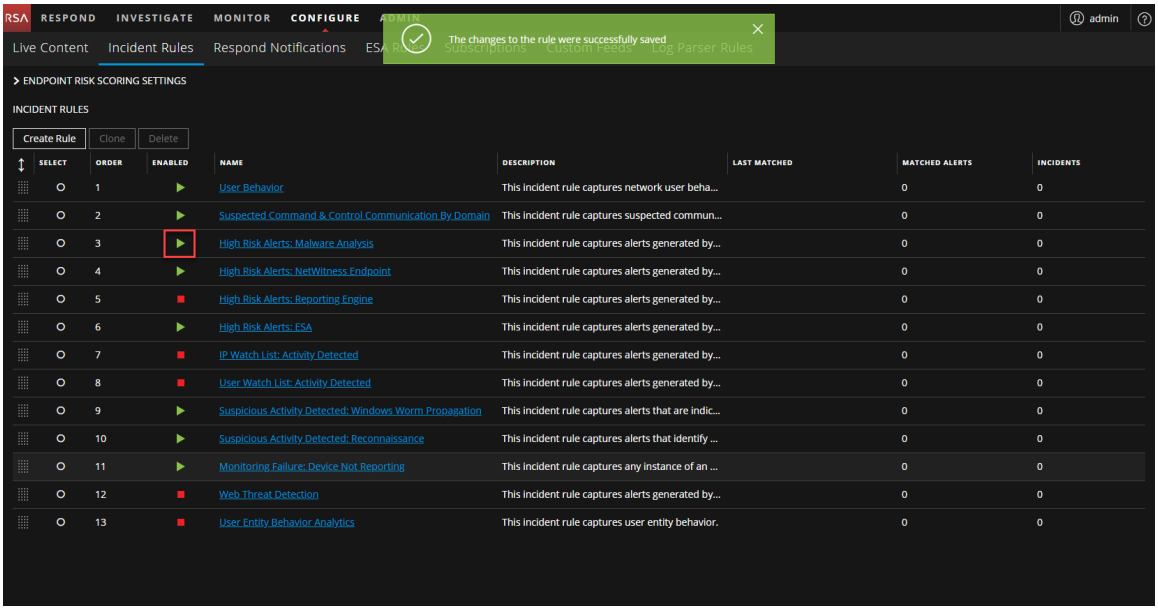


2. Click the link in the **Name** column for the rule that you want to enable.
   The Incident Rule Details view is displayed for the selected rule.



3. Adjust the parameters and conditions of your rule as required. For details about various parameters that can be set as criteria for an incident rule, see Incident Rule Details View.
4. In the Basic Settings section, select **Enabled**.

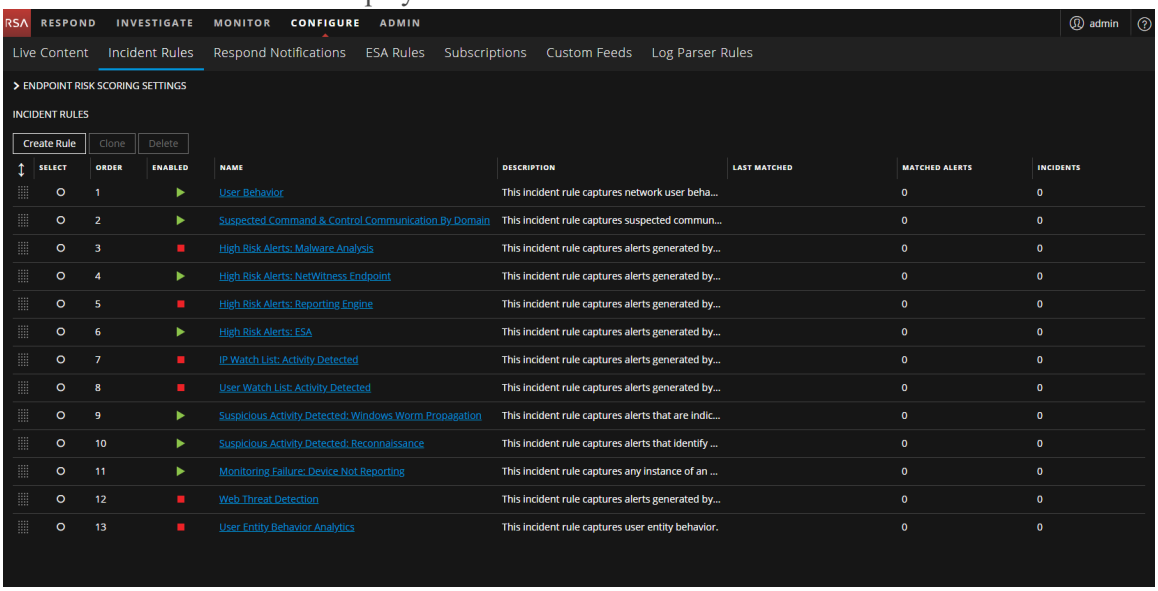
5. Click **Save** to enable the rule.
   Notice that the Enabled column changes from a red square ■ (Disabled) to green triangle ▶ (Enabled).



6. Verify the order of your incident rules.

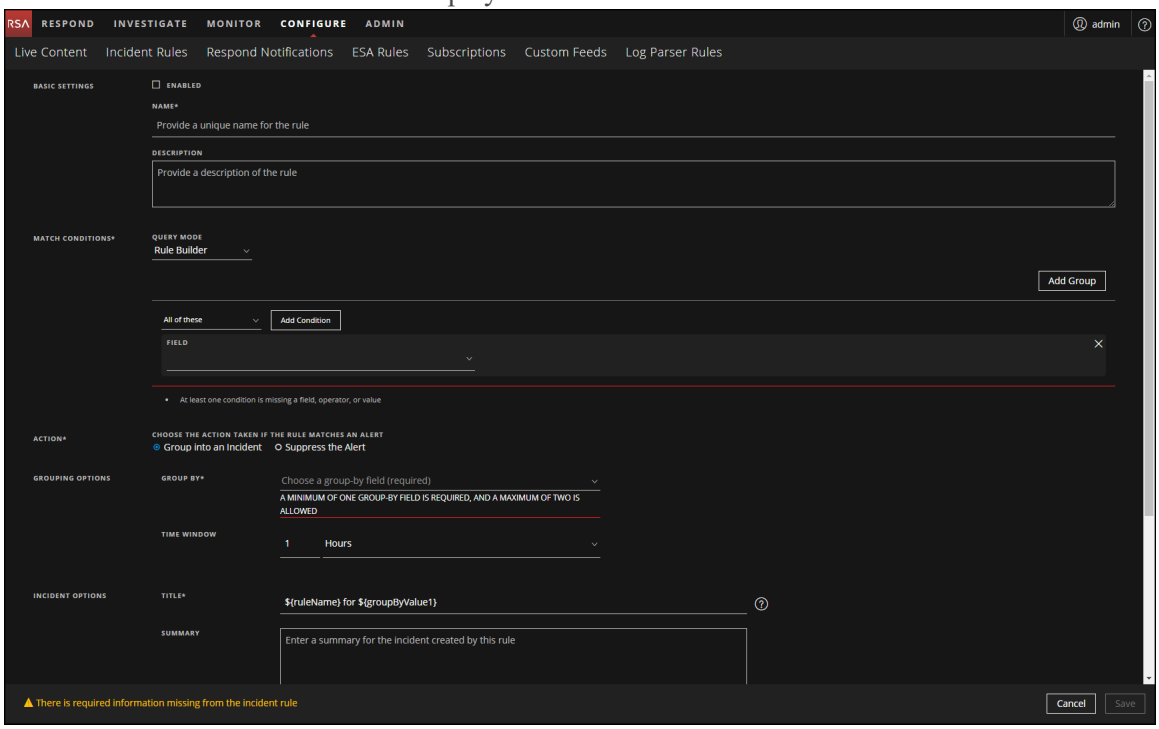
Create an Incident Rule

1. Go to **CONFIGURE > Incident Rules**.
   The Incident Rules view is displayed.



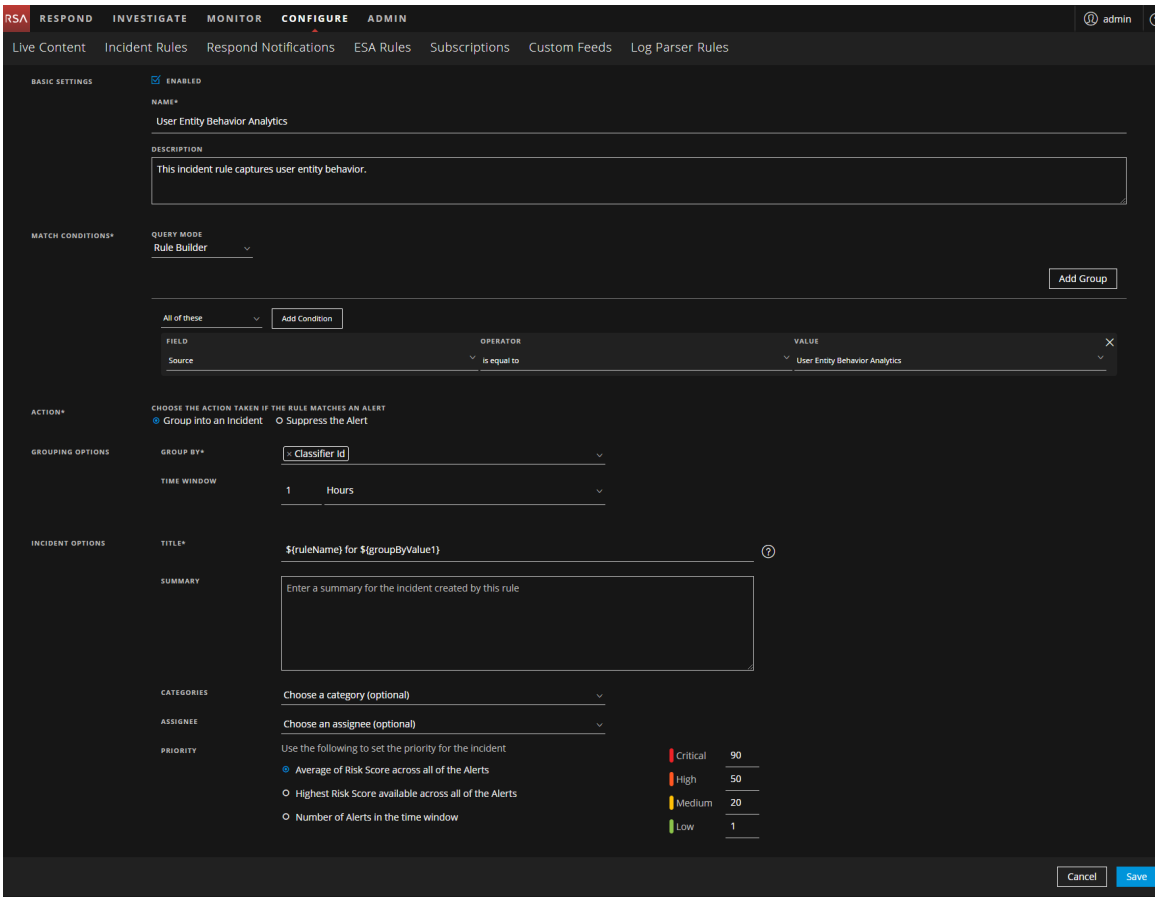
2. To add a new rule, click **Create Rule**.

The Incident Rule Details view is displayed.



3. Enter the parameters and conditions of your rule. All rules need to have at least one condition. For details about parameters that can be set as criteria for an incident rule, see Incident Rule Details View.

   The following figure shows a rule example.



4. If you are ready to enable your rule, in the Basic Settings section, select **Enabled**.
5. Click **Save**.

   The rule appears in the Incidents Rules list. If you selected Enabled, the rule is enabled and it starts creating incidents depending on the incoming alerts that match the selected criteria.

6. Verify the order of your incident rules.

Verify the Order of Your Incident Rules

NetWitness Respond evaluates incoming alerts against the incident rules in the order that you define. If alerts match the first rule listed, then that rule creates an incident. If alerts match the second rule listed and those alerts did not match the first rule, then the second rule creates an incident. If alerts match the third rule listed and those alerts did not match the first or second rule listed, then the third rule creates an incident, and so on.

To change the order of the rules, use the drag pads ( ) in front of the rules to move them up and down in the list.
The rule order determines which rule takes effect if the criteria for multiple rules match the same alert. If multiple rules match an alert, only the rule with the highest priority creates an incident.

Clone an Incident Rule

It is often easier to duplicate an existing rule that is similar to a rule that you want to create and adjust it accordingly.

1. Go to **CONFIGURE > Incident Rules**.
   The Incident Rules view is displayed.
2. Select the rule that you would like to copy and click **Clone**.
3. Adjust the parameters and conditions of your rule as required. All rules need to have at least one condition.
4. If you are ready to enable your rule, in the Basic Settings section, select **Enabled**.
5. Click **Save** to create the rule.
6. Verify the order of your incident rules.

Edit an Incident Rule

1. Go to **CONFIGURE > Incident Rules** and click the link in the **Name** column for the rule that you want to update.
   The Incident Rule Details view is displayed.
2. Adjust the parameters and conditions of your rule as required. All rules need to have at least one condition.
3. If you are ready to enable your rule, in the Basic Settings section, select **Enabled**.
4. Click **Save** to update the rule.
5. Verify the order of your incident rules.

See Also:

- For details about parameters that can be set as criteria for an incident rule, see Incident Rule Details View.
- For details on the parameter and field descriptions in the Incident Rules list, see Incident Rules View.

Additional Procedures for Respond Configuration

Use this section when you are looking for instructions to perform a specific task after the initial setup of NetWitness Respond.

- Set Up and Verify Default Incident Rules
- Configure Risk Scoring Settings for Automated Incident Creation
- Configure Respond Email Notification Settings
- Set a Retention Period for Alerts and Incidents
- Obfuscate Private Data
- Manage Incidents in Archer Cyber Incident & Breach Response
- Configure the Option to Send Incidents to RSA Archer
- Configure Threat Aware Authentication
- Set Counter for Matched Alerts and Incidents
- Configure a Database for the Respond Server Service

Set Up and Verify Default Incident Rules

A User Entity Behavior Analytics default incident rule is available in NetWitness Platform 11.3 and later. It captures user entity behavior grouped by Classifier ID to create incidents from alerts.

A User Behavior incident rule, which captures network user behavior, is available in NetWitness Platform 11.1 and later. This rule uses deployed RSA Live ESA Rules to create incidents from alerts. You can select and deploy the RSA Live ESA Rules that you want to monitor.

The following default incident rules changed slightly for 11.1 and later and now have **Source IP Address** as the Group By value:

- High Risk Alerts: Reporting Engine
- High Risk Alerts: Malware Analysis
- High Risk Alerts: ESA

The following default incident rule changed slightly for 11.3 and now has the **Host Name** as the Group By value:

- High Risk Alerts: NetWitness Endpoint*

*If you have NetWitness Endpoint, the High Risk Alerts: NetWitness Endpoint default incident rule captures alerts generated by NetWitness Endpoint with a risk score of High or Critical. To aggregate NetWitness Endpoint alerts based on the File Hash instead of Host Name, create another NetWitness Endpoint Rule using the File Hash as the Group By value. See Create a NetWitness Endpoint Incident Rule using File Hash for step-by-step instructions.

To verify your existing default incident rules with the 11.3 default incident rules, look at the default incident rule tables following these procedures. If you are missing a default incident rule, you can create it manually. Review the default incident rules and adjust them to your environment as required.

Set Up the User Behavior Incident Rule

In order to use the default User Behavior incident rule, you need to deploy the RSA Live ESA Rules that you want to monitor from those listed in the User Behavior incident rule conditions. Complete the following procedures to start aggregating alerts for the User Behavior default incident rule:

- Deploy the RSA Live ESA Rules
- Adjust and enable the User Behavior default rule (or create it if you do not have it)

Deploy the RSA Live ESA Rules

1. Go to **CONFIGURE > Live Content**.
2. In the **Resource Types** field, select **Event Steam Analysis Rule** and click **Search**.
3. In the **Matching Resources** list, select the ESA Rules from the following **User Behavior** table that you are interested in monitoring and deploy them (click **Deploy**).
4. Go to **CONFIGURE > ESA Rules > Rules** tab, and in the Rule Library **Filter** drop-down list, select **RSA Live ESA Rule**.

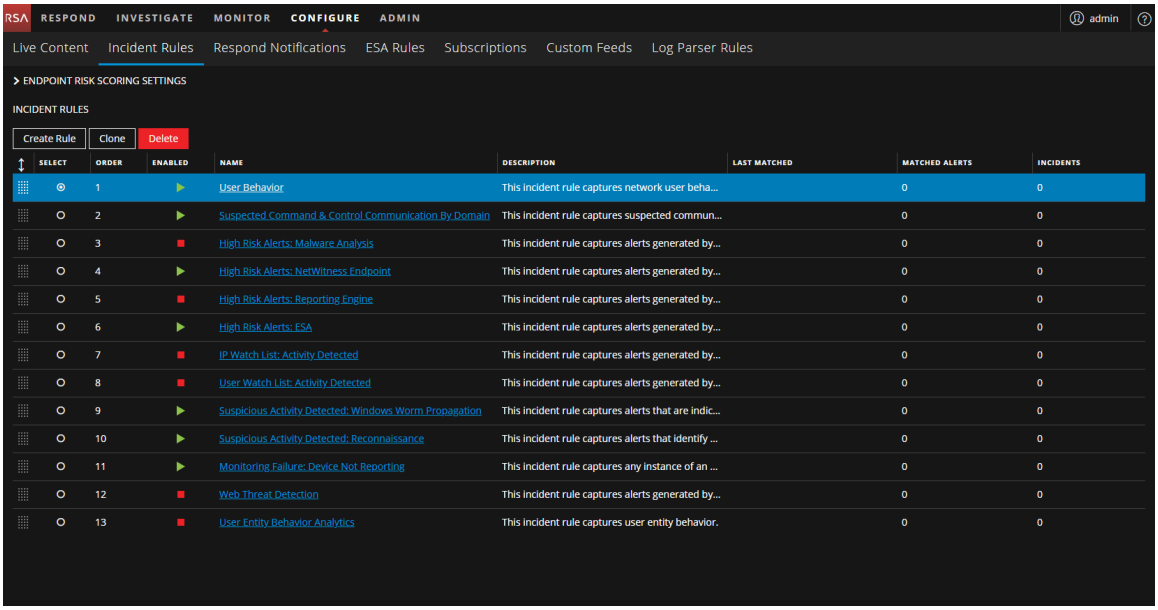
5. To add a new Deployment, in the drop-down list near **DEPLOYMENTS**, click **Add**.
   a. In the ESA Services section, add and then select your ESA service.
   b. In the ESA Rules section, click + and in the Deploy ESA Rules dialog, select the ESA Rules that you selected from the **User Behavior** table, and then click **Save**.
   The selected ESA rules are listed with a status of **Added**.
6. Select the ESA rules that you added from the previous step, and click **Deploy Now**.
   The status of the selected ESA rules changes to **Deployed**.
7. Go to **CONFIGURE > ESA Rules > Services** tab.
   In the **Deployed Rule Stats** for your ESA service, the rules that you added should have a status of enabled, which is indicated by a green circle in the Enable column.

Adjust and Enable the User Behavior Default Rule (or Create It If You Do Not Have It)

If you have the User Behavior default rule, you can adjust it for your environment and enable it. If you do not have the User Behavior default rule, you can create it manually.

(Optional) To create the User Behavior default rule:

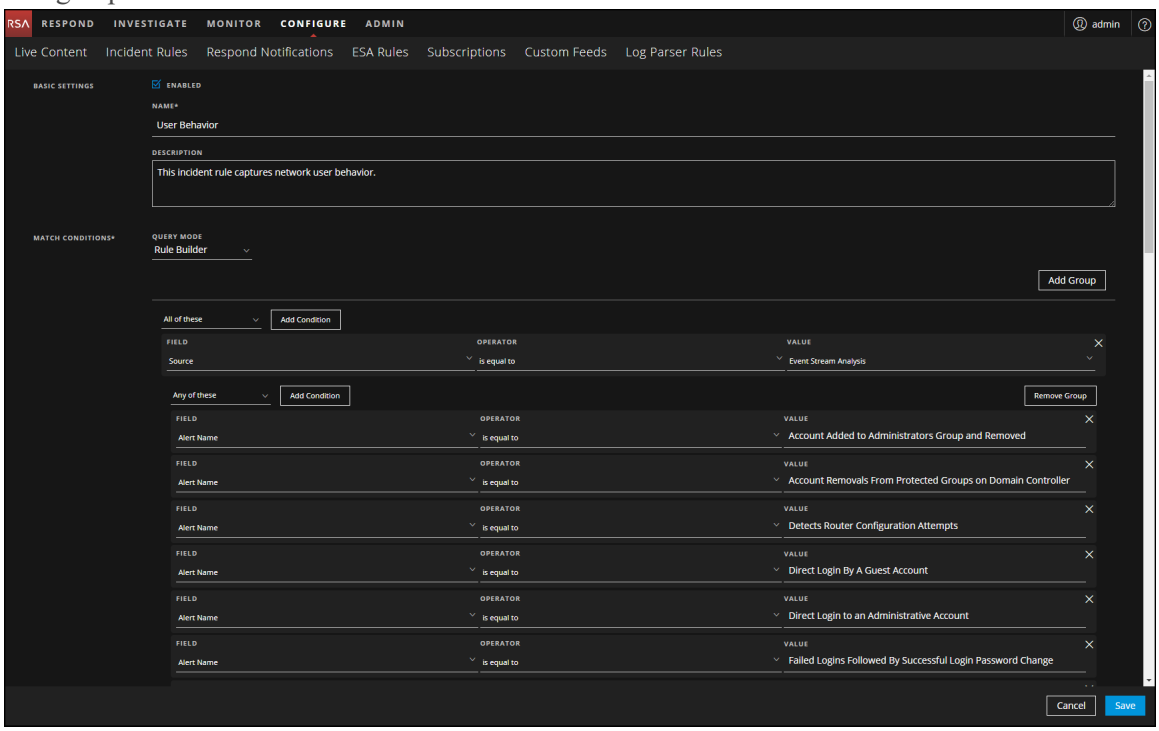
1. Go to **CONFIGURE > Incident Rules.**
   The Incident Rules view is displayed. (The following figure shows what the User Behavior rule looks like if it was there.)



2. Click **Create Rule** and in the Incident Rule Details view, create the User Behavior default incident rule using the values in the User Behavior table following this procedure. Values not listed in the table should be set for your business requirements. For details about various parameters that can be set as criteria for an incident rule, see Incident Rule Details View.

   The following figure shows a portion of the User Behavior default rule details. Notice that there are

two groups in this rule.



3. If you are ready to enable your rule, in the Basic Settings section, select **Enabled**.
4. Click **Save**.
   The rule appears in the Incidents Rules list. If you selected Enabled, the rule is enabled and it starts creating incidents depending on the incoming alerts that are matched as per the rule criteria.
5. Verify the order of your incident rules. For more information, see Verify the Order of Your Incident Rules.

User Behavior

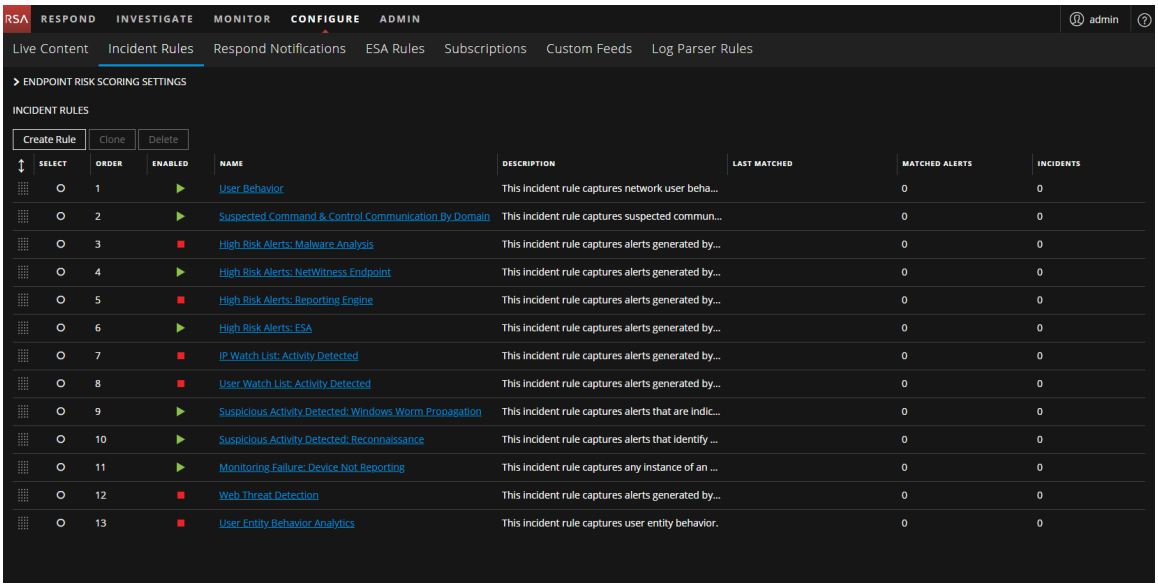
The following table shows the values for the User Behavior default incident rule.

Field	Condition Field	Condition Operator	Value
Name			User Behavior
Description			This incident rule captures network user behavior.
1st Group:			All of these
Condition:	Source	is equal to	Event Stream Analysis
2nd Group:			Any of these
Conditions:	Alert Name	is equal to	Account Added to Administrators Group and Removed
	Alert Name	is equal to	Account Removals From Protected Groups on Domain Controller
	Alert Name	is equal to	Detects Router Configuration Attempts
	Alert Name	is equal to	Direct Login By A Guest Account
	Alert Name	is equal to	Direct Login to an Administrative Account
	Alert Name	is equal to	Failed Logins Followed By Successful Login Password Change
	Alert Name	is equal to	Insider Threat Mass Audit Clearing
	Alert Name	is equal to	Internal Data Posting to 3rd Party Sites
	Alert Name	is equal to	kbrtgt Account Modified on Domain controller
	Alert Name	is equal to	Lateral Movement Suspected Windows
	Alert Name	is equal to	Logins across Multiple Servers
	Alert Name	is equal to	Logins by Same User to Multiple Servers
	Alert Name	is equal to	Malicious Account Creation Followed by Failed Authorization
	Alert Name	is equal to	Multiple Account Lockouts From Same or Different Users
	Alert Name	is equal to	Multiple Failed Logins Followed By a Successful Login
	Alert Name	is equal to	Multiple Failed Logins from Same User Originating from Different Countries
	Alert Name	is equal to	Multiple Failed Privilege Escalations by Same User
	Alert Name	is equal to	Multiple Intrusion Scan Events from Same User to Unique Destinations

Field	Condition Field	Condition Operator	Value
	Alert Name	is equal to	Multiple Login Failures by Administrators to Domain Controller
	Alert Name	is equal to	Multiple Login Failures by Guest to Domain Controller
	Alert Name	is equal to	Multiple Failed Logons from Same Source IP with Unique Usernames
	Alert Name	is equal to	Multiple Successful Logins from Multiple Diff Src to Diff Dest
	Alert Name	is equal to	Multiple Successful Logins from Multiple Diff Src to Same Dest
	Alert Name	is equal to	Privilege Escalation Detected
	Alert Name	is equal to	Privilege Escalation Detected in Unix
	Alert Name	is equal to	Privilege User Account Password Change
	Alert Name	is equal to	Failed Logins Outside Business Hours
	Alert Name	is equal to	DNS Tunneling
	Alert Name	is equal to	User Login Baseline
Group By			Destination User Account
Time Window			1 Hour
Title			${ruleName} for ${groupByValue1}

Set up or Verify a Default Incident Rule

1. Go to **CONFIGURE > Incident Rules.**
   The Incident Rules view is displayed.



2. Click the link in the **Name** field of a default incident rule to view the Incident Rule Details view. Set up or verify the default incident rule using the values in the default incident rules tables in this topic. Values not listed in the tables should be set for your business requirements. For details about various parameters that can be set as criteria for an incident rule, see Incident Rule Details View.
3. When you are ready to enable your rule, in the Basic Settings section, select **Enabled**.
4. Click **Save**.
5. Verify the order of your incident rules. For more information, see Verify the Order of Your Incident Rules.

Suspected Command & Control Communication By Domain

The following table shows the values for the Suspected Command & Control Communication By Domain default incident rule.

Field	Condition Field	Condition Operator	Value
Name			Suspected Command & Control Communication By Domain
Description			This incident rule captures suspected communication with a Command & Control server and groups results by domain.
Group:			All of these
Conditions:	Source	is equal to	Event Stream Analysis
	Alert Rule Id	is equal to	Suspected C&C
Group By			Domain for Suspected C& C
Time Window			7 Days
Title			Suspected C&C with ${groupByValue1}
Summary			NetWitness Platform detected communications with ${groupByValue1} that may be command and control malware. 1. Evaluate if the domain is legitimate (online radio, news feed, partner, automated testing, etc.). 2. Review the domain registration for suspect information (Registrant country, registrar, no registration data found, etc). 3. If the domain is suspect, go to the Investigation module to locate other activity to or from it.

High Risk Alerts: Malware Analysis

The following table shows the values for the High Risk Alerts: Malware Analysis default incident rule.

Field	Condition Field	Condition Operator	Value
Name			High Risk Alerts: Malware Analysis
Description			This incident rule captures alerts generated by the RSA Malware Analysis platform as having a Risk Score of "High" or "Critical".
Group:			All of these
Conditions:	Source	is equal to	Malware Analysis
	Risk Score	is equal or greater than	50
Group By			Source IP Address
Time Window			1 Hour
Title			${ruleName} for ${groupByValue1}

High Risk Alerts: NetWitness Endpoint

The following table shows the values for the High Risk Alerts: NetWitness Endpoint default incident rule.

Field	Condition Field	Condition Operator	Value
Name			High Risk Alerts: NetWitness Endpoint
Description			This incident rule captures alerts generated by the RSA NetWitness Endpoint platform as having a Risk Score of "High" or "Critical".
Group:			All of these
Conditions:	Source	is equal to	NetWitness Endpoint
	Risk Score	is equal or greater than	50
Group By			Host Name*
Time Window			1 Hour

Field	Condition Field	Condition Operator	Value
Title			${ruleName} for ${groupByValue1}

*To aggregate NetWitness Endpoint alerts based on the File Hash, create another NetWitness Endpoint Rule using the File Hash as the Group By value. See Create a NetWitness Endpoint Incident Rule using File Hash for step-by-step instructions.

High Risk Alerts: Reporting Engine

The following table shows the values for the High Risk Alerts: Reporting Engine default incident rule.

Field	Condition Field	Condition Operator	Value
Name			High Risk Alerts: Reporting Engine
Description			This incident rule captures alerts generated by the RSA Reporting Engine as having a Risk Score of "High" or "Critical".
Group:			All of these
Conditions:	Source	is equal to	Reporting Engine
	Risk Score	is equal or greater than	50
Group By			Source IP Address
Time Window			1 Hour
Title			${ruleName} for ${groupByValue1}

High Risk Alerts: ESA

The following table shows the values for the High Risk Alerts: ESA default incident rule.

Field	Condition Field	Condition Operator	Value
Name			High Risk Alerts: ESA
Description			This incident rule captures alerts generated by the RSA ESA platform as having a Risk Score of "High" or "Critical".
Group:			All of these
Conditions:	Source	is equal to	Event Stream Analysis

Field	Condition Field	Condition Operator	Value
	Risk Score	is equal or greater than	50
Group By			Source IP Address
Time Window			1 Hour
Title			${ruleName} for ${groupByValue1}

IP Watch List: Activity Detected

The following table shows the values for the IP Watch List: Activity Detected default incident rule.

Field	Condition Field	Condition Operator	Value
Name			IP Watch List: Activity Detected
Description			This incident rule captures alerts generated by IP addresses that have been added as "Source IP Address" *and* "Destination IP Address" conditions of the rule. To add additional IP addresses to the watch list, simply add a new Source and Destination IP Address conditional pair.
Group:			Any of these
Conditions:	Source IP Address	is equal to	1.1.1.1
	Destination IP Address	is equal to	1.1.1.1
	Source IP Address	is equal to	2.2.2.2
	Destination IP Address	is equal to	2.2.2.2
Group By			Source IP Address
Time Window			4 Hours
Title			${ruleName}

User Watch List: Activity Detected

The following table shows the values for the User Watch List: Activity Detected default incident rule.

Field	Condition Field	Condition Operator	Value
Name			User Watch List: Activity Detected
Description			This incident rule captures alerts generated by network users whose user names have been added as a "Source UserName" condition. To add more than one Username to the watch list, simply add an additional Source Username condition.
Group:			Any of these
Conditions:	Source Username	is equal to	jsmith
	Source Username	is equal to	jdoe
Group By			Source Username
Time Window			4 Hours
Title			${ruleName}

Suspicious Activity Detected: Windows Worm Propagation

The following table shows the values for the Suspicious Activity Detected: Windows Worm Propagation default incident rule.

Field	Condition Field	Condition Operator	Value
Name			Suspicious Activity Detected: Windows Worm Propagation
Description			This incident rule captures alerts that are indicative of worm propagation activity on a Microsoft network
1st Group:			All of these
Condition:	Source	is equal to	Event Stream Analysis
2nd Group:			Any of these
Conditions:	Alert Name	is equal to	Windows Worm Activity Detected Logs
	Alert Name	is equal to	Windows Worm Activity Detected Packets
Group By			Source IP Address
Time Window			1 Hour
Title			${ruleName}

Suspicious Activity Detected: Reconnaissance

The following table shows the values for the Suspicious Activity Detected: Reconnaissance default incident rule.

Field	Condition Field	Condition Operator	Value
Name			Suspicious Activity Detected: Reconnaissance
Description			This incident rule captures alerts that identify common ICMP host identification techniques (i.e. "ping") accompanied by connection attempts to multiple service ports on a host
1st Group:			All of these
Condition:	Source	is equal to	Event Stream Analysis
2nd Group:			Any of these
Conditions:	Alert Name	is equal to	Port Scan Horizontal Packet
	Alert Name	is equal to	Port Scan Vertical Packet
	Alert Name	is equal to	Port Scan Horizontal Log
	Alert Name	is equal to	Port Scan Vertical Log
Group By			Source IP Address
Time Window			4 Hours
Title			${ruleName}

Monitoring Failure: Device Not Reporting

The following table shows the values for the Monitoring Failure: Device Not Reporting default incident rule.

Field	Condition Field	Condition Operator	Value
Name			Monitoring Failure: Device Not Reporting
Description			This incident rule captures any instance of an alert designed to detect the absence of log traffic from a previously reporting device

Field	Condition Field	Condition Operator	Value
Group:			All of these
Conditions:	Source	is equal to	Event Stream Analysis
	Alert Name	is equal to	No logs traffic from device in given time frame
Group By			Source IP Address
Time Window			2 Hours
Title			${ruleName}

Web Threat Detection

The following table shows the values for the Web Threat Detection default incident rule.

Field	Condition Field	Condition Operator	Value
Name			Web Threat Detection
Description			This incident rule captures alerts generated by the RSA Web Threat Detection platform.
Group:			All of these
Condition:	Source	is equal to	Web Threat Detection
Group By			Alert Rule Id
Time Window			1 Hour
Title			${ruleName} for ${groupByValue1}

User Entity Behavior Analytics

The following table shows the values for the User Entity Behavior Analytics default incident rule.

Field	Condition Field	Condition Operator	Value
Name			User Entity Behavior Analytics
Description			This incident rule captures user entity behavior.
Group:			All of these

Field	Condition Field	Condition Operator	Value
Condition:	Source	is equal to	User Entity Behavior Analytics
Group By			Classifier id
Time Window			1 Hour
Title			${ruleName} for ${groupByValue1}

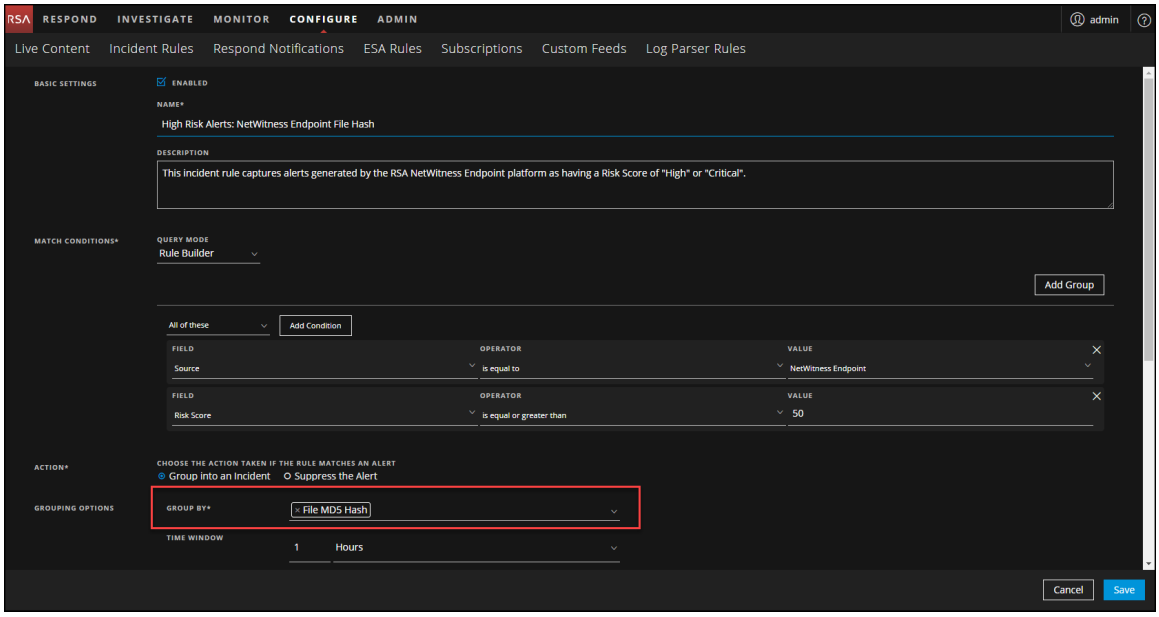
Create a NetWitness Endpoint Incident Rule using File Hash

To aggregate NetWitness Endpoint alerts based on the File Hash, create another NetWitness Endpoint Rule using the File Hash as the Group By value. To do this, you clone the default NetWitness Endpoint incident rule and change the Group By value.

1. Go to **CONFIGURE > Incident Rules**.
   The Incident Rules view is displayed.
2. Select the **High Risk Alerts: NetWitness Endpoint** default incident rule and click **Clone**.

   You will receive a message that you successfully cloned the selected rule.
3. Change the **Name** of the rule to an appropriate name, such as High Risk Alerts: NetWitness Endpoint File Hash.

4. In the **Group By** field, remove the previous Group By value and add **File MD5 Hash**.
   It is important that File MD5 Hash is the only Group By value listed.



5. If you are ready to enable your rule, in the Basic Settings section, select **Enabled**.
6. Click **Save** to create the rule.
   The Incident Rules view shows your new rule.

7. Verify the order of your incident rules. For more information, see Verify the Order of Your Incident Rules.

Configure Risk Scoring Settings for Automated Incident Creation

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.3 and later.

Endpoint Risk Scoring Settings only apply to NetWitness Endpoint.

In addition to automatically creating incidents with predefined rules and rules that you define, NetWitness Respond automatically creates risk scoring incidents for suspicious files and hosts when defined risk score thresholds are crossed. In the background, it monitors the following types of alerts and calculates risk scores for each file and host:

- Critical and High priority alerts from NetWitness Respond
- Medium priority Endpoint alerts from ESA

NetWitness Respond calculates risk score using a combination of the number of distinct alerts and the severity of alerts associated with the file or host. A higher risk score indicates more of these types of alerts. When the calculated risk score exceeds the specified threshold, NetWitness Respond does one of the following during the specified time window, such as 1 day:

- Creates a risk scoring alert and uses it to create a risk scoring incident
- Adds risk scoring alerts along with associated events to the same incident

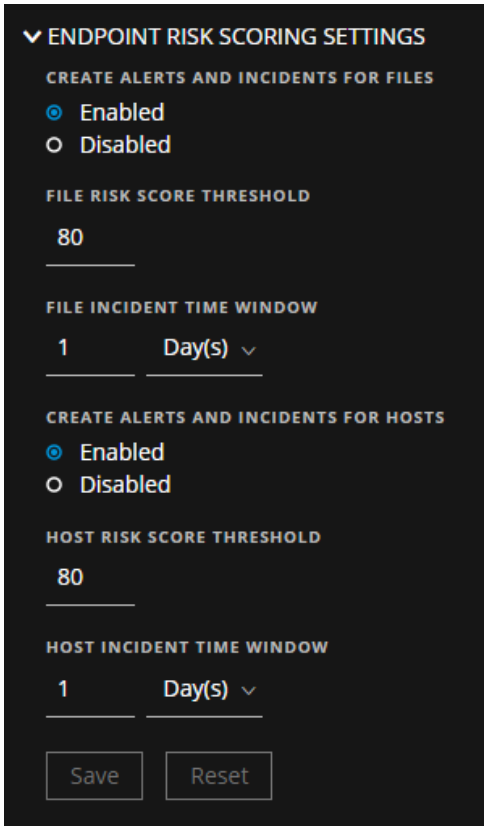
For more information on configuring NetWitness Endpoint, see the *NetWitnesss Endpoint Configuration Guide*.

To configure the Endpoint Risk Scoring Settings:

You should leave the Endpoint Risk Scoring Settings at the default values. However, if you are getting too many risk scoring alerts and incidents created, increase the risk score threshold to a higher value. Also, if you are getting too many incidents created for the same hosts or files, increase the time window to add more alerts to the same risk scoring incidents. If you are not seeing many risk scoring incidents, you can either decrease the risk scoring thresholds for hosts and files or decrease the incident time windows.

1. Go to **CONFIGURE > Incident Rules**.
   The Incident Rules view is displayed.

2. Click the arrow in front of **ENDPOINT RISK SCORING SETTINGS** to expand the Endpoint Risk Scoring Settings section.



3. In the Endpoint Risk Scoring Settings section, adjust the settings as follows:

   a. **Create Alerts and Incidents for Files**:

      - Select **Enabled** to automatically create risk scoring alerts and incidents for suspicious files. When calculated file risk scores go above the file risk score threshold, it triggers the creation of risk scoring alerts and incidents.
      - Select **Disabled** to stop automatically creating risk scoring alerts and incidents. If you disable it, incidents are not created for suspicious files where risk scores are high.

   b. **File Risk Score Threshold**: The File Risk Score Threshold is the risk score level used to trigger alert and incident creation. The File Risk Score Threshold range is from 0-100. For example, if the File Risk Score Threshold is 80 and the calculated risk score of a suspicious Openme.rar file is 81, which is over the Risk Score Threshold of 80, NetWitness Respond creates a risk scoring alert and incident or adds a risk scoring alert to an existing incident depending on the file incident time window.

      - If you are seeing too many alerts and incidents, increase the risk score threshold.
      - If you are not seeing many alerts and incidents, decrease the risk score threshold.

   c. **File Incident Time Window**: The File Incident Time Window is the period of time to wait before creating another incident. The file incident time window range is from 1-24 (hours or days). For example, the suspicious Openme.rar file has a calculated risk score of 81 and a file

time window of 1 day. A risk scoring alert and incident is created for the Openme.rar file. During the time window, any similar risk scoring alerts with the same name created for the Openme.rar file get added to the same incident. At the end of the time window (day 1), if the calculated risk score of the file is still over the file risk score threshold and a change occurs with the risk score, another risk scoring alert and incident gets created and any new risk scoring alerts associated with the file get added to the new incident until the next time window (day 3).

- If you are seeing too many alerts and incidents, increase the incident time window.
- If you are not seeing many alerts and incidents, decrease the incident time window.

d. **Create Alerts and Incidents for Hosts**:

- Select **Enabled** to automatically create risk scoring alerts and incidents for suspicious hosts. When calculated host risk scores go above the host risk score threshold, it triggers the creation of risk scoring alerts and incidents.
- Select **Disabled** to stop automatically creating risk scoring alerts and incidents when calculated host risk scores go above the host risk score threshold. If you disable it, incidents are not created for suspicious hosts where risk scores are high.

e. **Host Risk Score Threshold**: The Host Risk Score Threshold is the risk score level used to trigger alert and incident creation. The host risk score threshold range is from 0-100. For example, if the Host Risk Score Threshold is 80 and the calculated risk score of a suspicious host IP address is 81, which is over the Risk Score Threshold of 80, NetWitness Respond creates a risk scoring alert and incident or adds a risk scoring alert to an existing incident depending on the file incident time window.

- If you are seeing too many alerts and incidents, increase the risk score threshold.
- If you are not seeing many alerts and incidents, decrease the risk score threshold.

f. **Host Incident Time Window**: The Host Incident Time Window is the period of time to wait before creating another incident. The host incident time window range is from 1-24 (hours or days). For example, the suspicious host has a calculated risk score of 81 and a Host Time Window of 1 day. During the time window, any similar risk scoring alerts with the same name created for the suspicious host get added to the same incident. At the end of the time window (day 1), if the calculated risk score of the host is still over the host risk score threshold and a change occurs with the risk score, another risk scoring alert and incident gets created. Any new risk scoring alerts associated with that suspicious host add to that incident until the next time window.

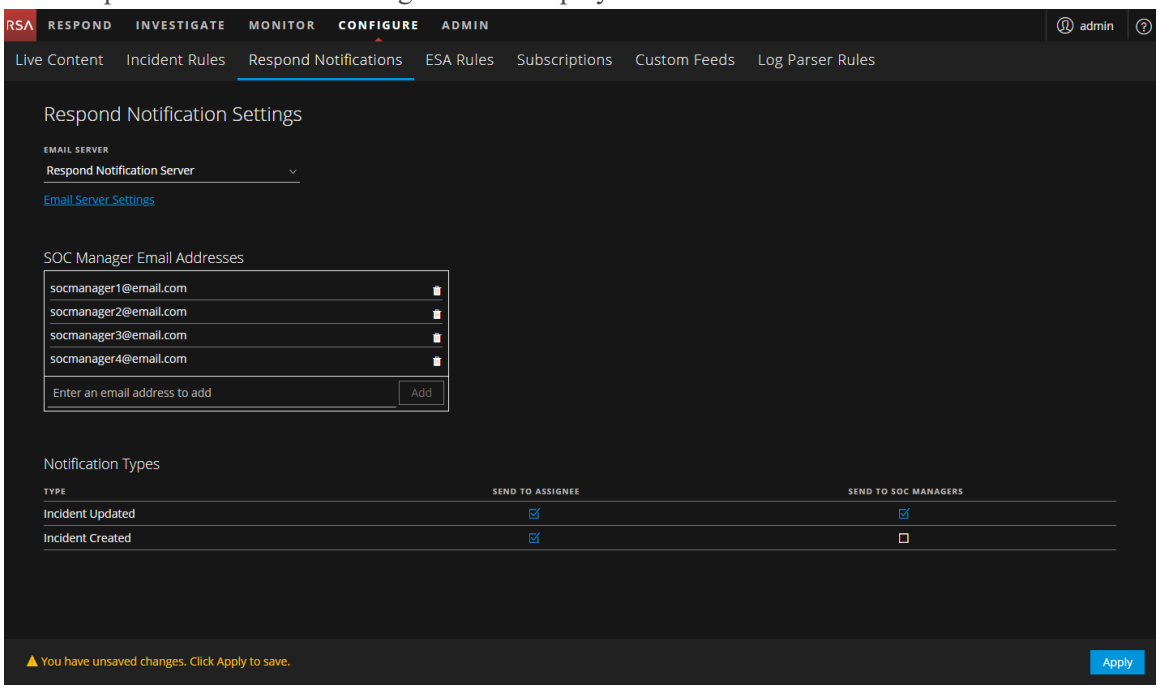
- If you are seeing too many risk scoring alerts and incidents, increase the incident time window.
- If you are not seeing many risk scoring alerts and incidents, decrease the incident time window.

4. Click **Save**.

Configure Respond Email Notification Settings

NetWitness Respond notification settings enable email notifications to be sent to SOC Managers and the Analyst assigned to an incident when an incident is created or updated.

1. Go to **CONFIGURE > Respond Notifications**.
   The Respond Notifications Settings view is displayed.



2. In the **Email Server** section, select the email server from the drop-down list that will send out email notifications when the notification settings are enabled.
   If there is no email server configured, you do not see an email server listed in the drop-down list. You have to configure an email server before you can continue with this procedure. To configure an email server, click the **Email Server Settings** link. For more information, click the help icon or refer to the *System Configuration Guide*.
3. In the **SOC Manager Email Addresses** section, add the email addresses of the SOC Managers that you want to receive email notifications. To add an SOC Manager email address to the list, type it in the field that shows **Enter an email address to add** and click **Add**. To remove an SOC Manager email address from the list, click next to the email address to be removed.
4. In the **Notification Types** section, select who should receive an email notification when an incident is created and when an incident is updated.
   - **Send to Assignee**: An email is sent to the Analyst assigned to the incident.
   - **Send to SOC Manager**: An email is sent to all of the addresses listed in the **SOC Manager Email Addresses** list.
5. Click **Apply**. Changes take effect immediately.

Note: If user email address information is updated in the ADMIN > Security > Users tab, it can take up to two minutes for the new email changes to take effect. Any incident creation or incident update email notifications sent during this time go to the old email address.

Migration Considerations

Notification Settings do not migrate from NetWitness Platform version 10.6.x to 11.1 and later. The Incident Management Notification Settings in 10.6.x are different from the Respond notification settings available in 11.1 and later. You will need to manually update the Respond Notification Settings in version 11.1 and later.

Notification Servers from 10.6.x are not displayed in the Email Server drop-down list. The email servers settings must be added to the Global Notification Servers (ADMIN > System > Global Notifications > Server tab).

Custom Incident Management notification templates cannot be migrated to 11.1 and later. No custom templates are supported in 11.1 and later.

Set a Retention Period for Alerts and Incidents

Sometimes data privacy officers want to retain data for a certain period of time and then delete it. A shorter retention period frees up disk space sooner. In some cases, the retention period must be short. For example, laws in Europe state that sensitive data cannot be retained for more than 30 days. After 30 days, the data must be obfuscated or deleted.

Setting a retention period for data is an optional procedure. The time that NetWitness Respond receives alerts and creates an incident determine when retention begins. Retention periods range from 30 to 365 days. If you set a retention period, one day after the period ends data is permanently deleted.

Retention is based on the time that NetWitness Respond receives the alerts and the incident creation time.

Caution: Data deleted after the retention period cannot be recovered.

When the retention period expires, the following data is **permanently deleted**:

- Alerts
- Incidents
- Tasks
- Journal entries

Logs track retention and manual deletion so you can see what has been deleted. You can view Respond Server logs in the following locations:

- **Respond Server Service log**: `/var/log/netwitness/respond-server/respond-server.log`
- **Respond Server Audit log**: `/var/log/netwitness/respond-server/respond-server.audit.log`

The data retention period that you set here does not apply to Archer or other third-party SOC tools. Alerts and incidents from other systems must be deleted separately.

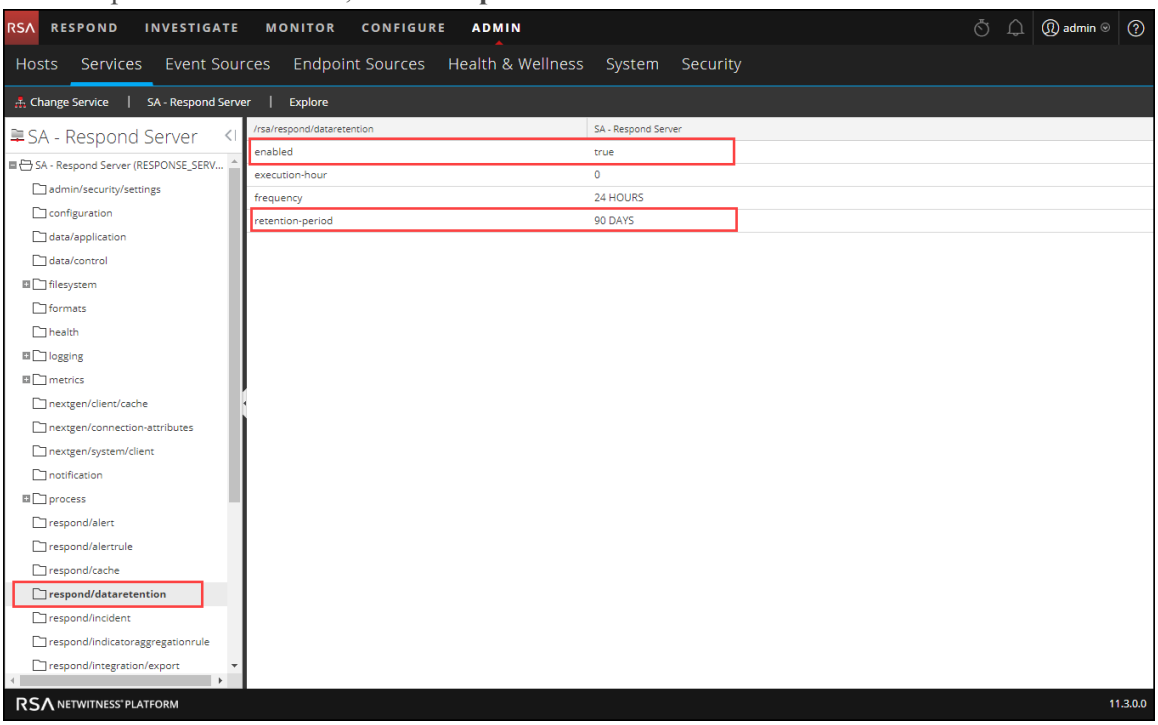
Prerequisites

The Administrator role must be assigned to you.

Procedure

1. Go to **ADMIN > Services**, select the Respond Server service, and then select **> View > Explore**.

2. In the Explore view node list, select **respond/dataretention**.



3. In the **enabled** field, select **true** to delete incidents and alerts older than the retention period. The scheduler runs every 24 hours at 23:00.
   You will see a notice that the configuration was successfully updated.
4. In the **retention-period** field, type the number of days to retain incidents and alerts. For example, type 30 DAYS, 60 DAYS, 90 DAYS, 120 DAYS, 365 DAYS, or any number of days.
   A message informs you that the configuration was successfully updated.

Result

Within 24 hours after the retention period ends, the scheduler permanently deletes all alerts and incidents older than the specified period from NetWitness Respond. Journal entries and tasks associated with the deleted incidents are also deleted.

Obfuscate Private Data

The Data Privacy Officer (DPO) role can identify meta keys that contain sensitive data and should display obfuscated data. This topic explains how the administrator maps those meta keys to display a hashed value instead of the actual value.

The following caveats apply to hashed meta values:

- NetWitness Platform supports two storage methods for hashed meta values, HEX (default) and string.
- When a meta key is configured to display a hashed value, all security roles see only the hashed value in the Incidents module.
- You use hashed values the same way you use actual values. For example, when you use a hashed value in rule criteria the results are the same as if you used the actual value.

This topic explains how to obfuscate private data in NetWitness Respond. Refer to the "Data Privacy Management Overview" topic in the *Data Privacy Management Guide* for additional information about data privacy.

Mapping File to Obfuscate Meta Keys

In NetWitness Respond, the mapping file for data obfuscation is data_privacy_map.js. In it you type an obfuscated meta key name and map it to the actual meta key name.

The following example shows the mappings to obfuscate data for two meta keys, ip.src and user.dst:

```
'ip.src.hash' : 'ip.src',
 'user.dst.hash' : 'user.dst'
```

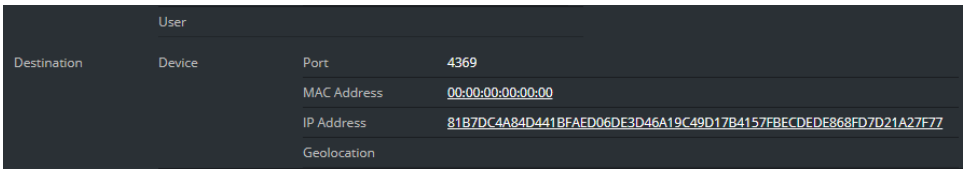
You determine the naming convention for obfuscated meta key names. For example, ip.src.hash could be ip.src.private or ip.src.bin. You must choose one naming convention and use it consistently on all hosts.

Prerequisites

- DPO role must specify which meta keys require data obfuscation.
- Administrator role must map meta keys for data obfuscation.

Procedure

1. Open the data privacy mapping file:
   /var/lib/netwitness/respond-server/scripts/data_privacy_map.js
2. In the `obfuscated_attribute_map` variable , type the name of a meta key to hold obfuscated data. Then map it to the meta key that does not contain obfuscated data according to this format:
   `'ip.src.hash' : 'ip.src'`
3. Repeat step 2 for every meta key that should display a hashed value.
4. Use the same naming convention as in step 2 and use it consistently on all hosts.
5. Save the file.
   All mapped meta keys will display hashed values instead of actual values.
   In the following figure, a hashed value displays for the destination IP address in the Event Details:



New alerts will display obfuscated data.

Note: Existing alerts still display sensitive data. This procedure is not retroactive.

Manage Incidents in Archer Cyber Incident & Breach Response

If you want to manage incidents in RSA Archer® Cyber Incident & Breach Response instead of NetWitness Respond, you have to configure system integration settings in the Respond Server service Explore view. After you configure the system integration settings, all incidents are managed in Archer Cyber Incident & Breach Response. Incidents created before the integration will not be managed in Archer Cyber Incident & Breach Response.

Caution: If you are managing incidents in Archer Cyber Incident & Breach Response instead of NetWitness Respond, do not use the following in the Respond view: Incidents List view, Incident Details view, and Tasks List view. Do not create incidents from the Respond Alerts List view or from Investigate.

For more detailed integration information, see the *RSA Archer Integration Guide*.

Prerequisites

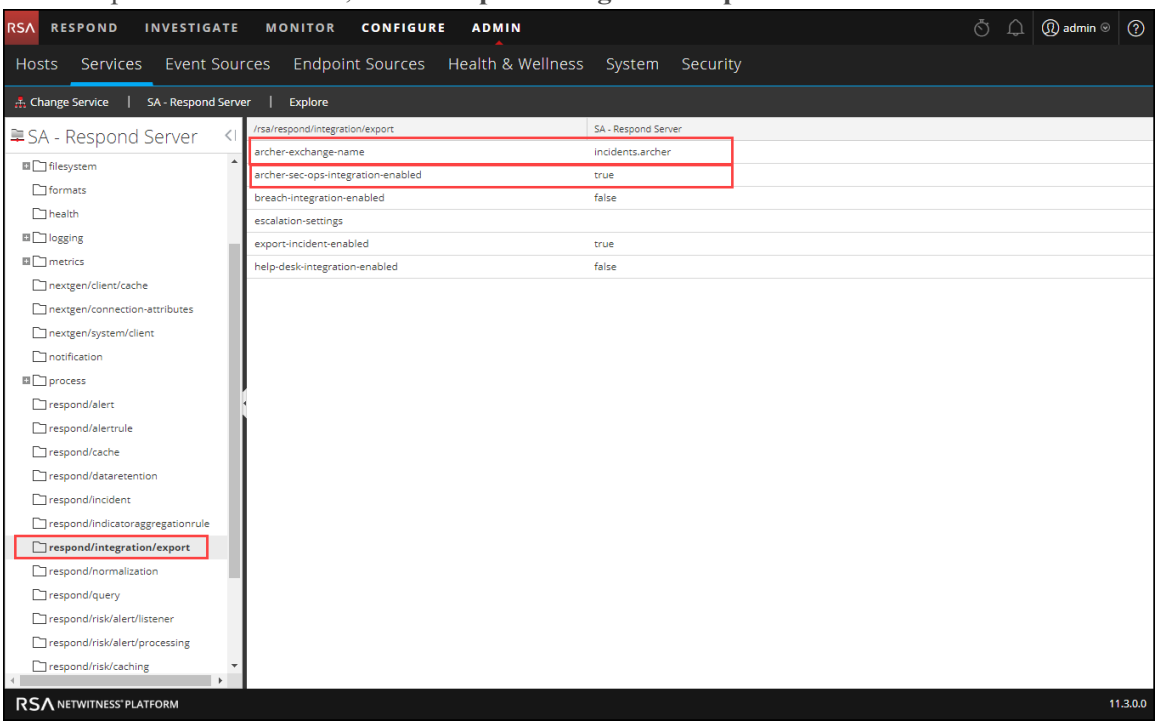
- Archer Cyber Incident & Breach Response 1.3.1.2 (NetWitness Platform 11.0 works only with Archer Cyber Incident & Breach Response 1.3.1.2.)

Procedure

Follow this procedure to configure Respond Server service settings to manage incidents in Archer Cyber Incident & Breach Response.

1. Go to **ADMIN > Services**, select the Respond Server service, and then select **> Config > Explore**.

2. In the Explore view node list, select **respond/integration/export**.



3. In the **archer-exchange-name** field, type `incidents.archer`.
   You will see a notice that the configuration was successfully updated.
4. In the **archer-sec-ops-integration-enabled** field, select **true**.
   A message informs you that the configuration was successfully updated.
   Incidents will be managed exclusively in Archer Cyber Incident & Breach Response.

Configure the Option to Send Incidents to RSA Archer

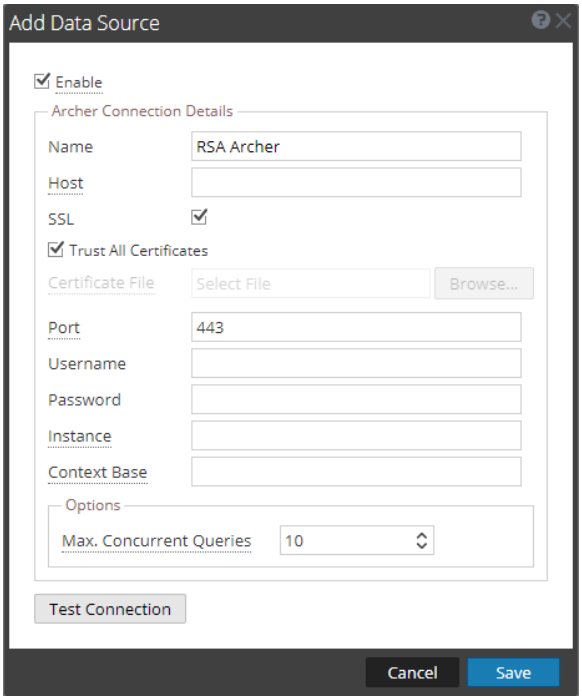
Note: The information in this topic applies to RSA NetWitness® Platform Version 11.2 and later.

If you want to manage incidents in NetWitness Respond, you have the option to configure the NetWitness Platform so that you can send incidents to RSA Archer® Cyber Incident & Breach Response. If RSA Archer is configured as a data source in Context Hub, you can send incidents to Archer Cyber Incident & Breach Response and you will be able to see a Send to Archer option and a Sent to Archer status in NetWitness Respond. For information on how to use the Send to Archer option and Sent to Archer status, see the *NetWitness Respond User Guide*.

Add RSA Archer as a Data Source for Context Hub

To configure sending incidents to Archer Cyber Incident & Breach Response from NetWitness Respond, RSA Archer must be configured as a data source for Context Hub. For more detailed instructions for configuring the RSA Archer data source, see the "Configure Archer as Data Source" topic in the *Context Hub Configuration Guide*.

1. Go to **ADMIN** > **Services**.
   The Services view is displayed.
2. Select the Context Hub service, and then select **> View > Config**.
   The Services Config view is displayed.
3. On the **Data Sources** tab, click **> RSA Archer**.
   The **Add Data Source** dialog is displayed.



4. Provide the following information:

- By default, the **Enable** checkbox is selected. If this option is unchecked, the save button is disabled, you cannot add the data source, and cannot view the contextual information.
- Enter the following fields:
  - **Name**: Enter a name for Archer data source.
  - **Host**: Enter the hostname or IP address where Archer server is installed.
  - **SSL**: By default this option is selected and enables SSL communication to Archer .
  - **Trust All Certificates**: Select this checkbox to add the data source without validating the certificate. If you uncheck this option, you need to upload a valid Endpoint server certificate for the connection to be successful.
  - **Port**: The default port is 443.
  - **Username**: Enter the Archer Server username.
  - **Password**: Enter the Archer Server password.
  - **Instance**: Enter the Instance name from which you want to extract data. An RSA Archer instance is a single setup that includes unique content in a database, the connection to the database, the interface, and login. You might have individual instances for each office location or region or for development, test, and production environments. The Instance Database stores the RSA Archer content for a specific instance.
  - **Context Base**: Enter the virtual directory name where the files are stored. For example, rsaarcher located at the RSA Archer web address https://archer.company.com/**rsaarche**r/default.aspx. If the files are stored in the IIS default web address https://archer.company.com/default.aspx, then this field must be empty.
  - **Max. Concurrent Queries**: You can configure the maximum number of concurrent queries defined by the Context Hub service to be run against the configured data sources. The default value is 10.

5. Click **Test Connection** to test the connection between Context Hub and the Archer data source.
6. Click **Save**.
   RSA Archer is added as a data source for Context Hub and is displayed in the **Data Sources** tab. A Send to Archer button and Sent to Archer status is visible in NetWitness Respond.

Configure Threat Aware Authentication

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.3 and later.

NetWitness Platform creates a list of suspicious users that have an incident created against them and sends it to RSA SecurID Access. The list contains the email IDs of the corresponding suspicious users associated with the incident. RSA SecurID Access maintains this high-risk users list and reduces the access levels or blocks such users using defined policies. When an incident is closed in RSA Netwitness Platform, the associated email IDs are automatically removed from the RSA SecurID high-risk user list.

By default this configuration is disabled in the NetWitness Server. You can enable this feature by editing the yml file located at `/etc/netwitness/respond-server/respond-server.yml`.

Enable Threat Aware Authentication

To enable this configuration:

1. Create a yml file at `/etc/netwitness/respond-server/respond-server.yml`
2. Edit and enter `rsa.respond.securid-integration.enabled: true`
3. Enter `rsa.security.pki.use-jvm-trust: true` to enable the configuration.

```
[root@adminserver ~]# vi /etc/netwitness/respond-server/respond-server.yml
[root@adminserver ~]# cat /etc/netwitness/respond-server/respond-server.yml
rsa.respond.securid-integration.enabled: true
rsa.security.pki.use-jvm-trust: true
[root@adminserver ~]# service rsa-nw-respond-server restart
Redirecting to /bin/systemctl restart rsa-nw-respond-server.service
[root@adminserver ~]#
```

4. Save the yml file and restart the Respond Server service.

Obtain SecurID API Key

A super administrator must generate and download a SecurID API key, and connect to RSA SecurID Access.

To obtain the API key from RSA SecurID Access:

1. Log in to the **RSA SecurID Access Cloud Administration** Console.
2. Click **Platform** > **API Key Management**.
3. Click **ADD**.
   The new key is displayed.
4. Change the **Administrator** role to **Super Administrator**.
5. Click **Save** and **Download** to download and save the API key file.

For more information about generating the API Keys and other related details, see "Manage the Cloud Administration API Keys" at https://community.rsa.com/docs/DOC-94440 and "Determining Access Requirements for High-Risk Users in the Cloud Authentication Service" topic at https://community.rsa.com/docs/DOC-90586.

Configure RSA SecurID Access API Key

To configure RSA SecurID Access API key using RSA NetWitness Shell:

1. SSH to the NetWitness Server.
2. Type the command `nw-shell`.
   A console window is displayed.

3. Type `connect --service respond-server` to connect to the Respond Server.
4. Type `login` and enter admin username and password.
5. To set the API key:
   a. Navigate to set-api-key node: `cd /rsa/respond/securid/set-api-key`
   b. type: `invoke --file <path to api key>`

   Note: The path to the API key is the location on the NetWitness Server.

6. Test the connection using the command:
   a. `cd /rsa/respond/securid/test-secur-id-connection`
   b. Type `invoke`.
   A "Connection OK" message is displayed if test connection is successful.
7. To start the process use the command:
   a. `cd /rsa/respond/securid/process-incidents`
   b. `invoke`.

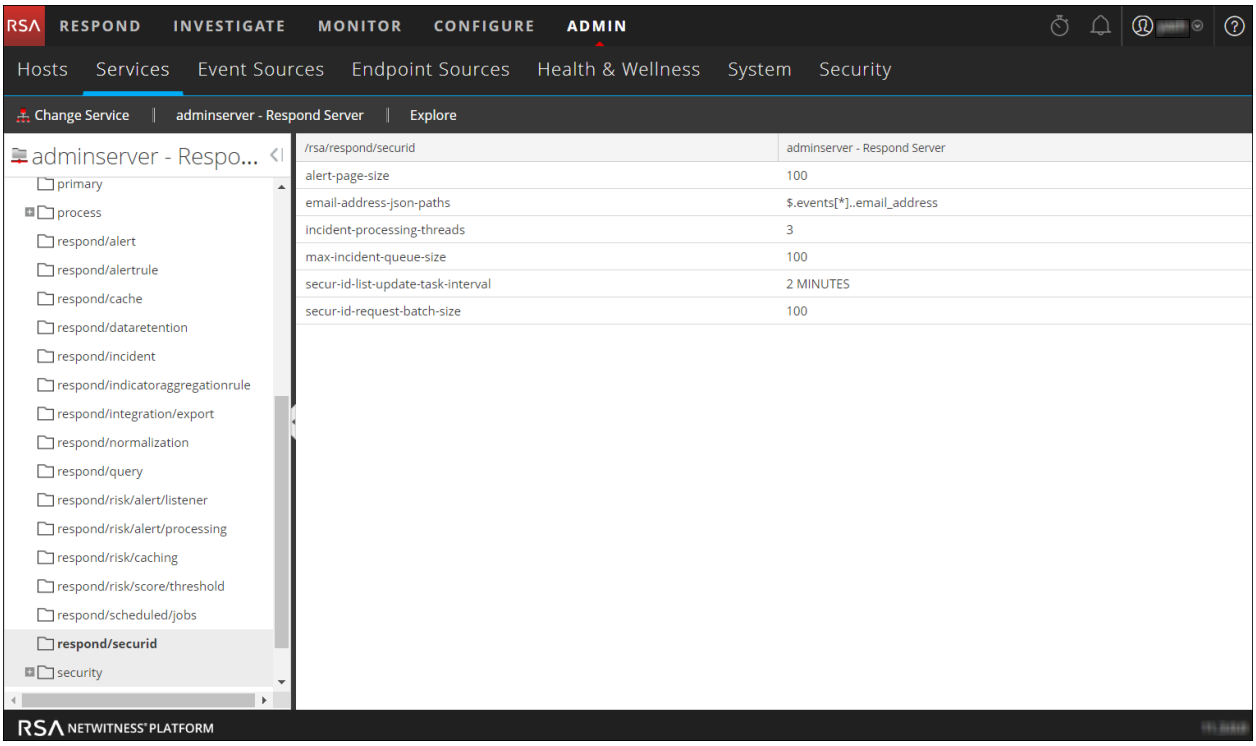
   For more information on how to define policies, see the *RSA SecurID Access Guide* on RSA link.

Configure Sync Frequency

By default, the sync frequency is set to 15 minutes.

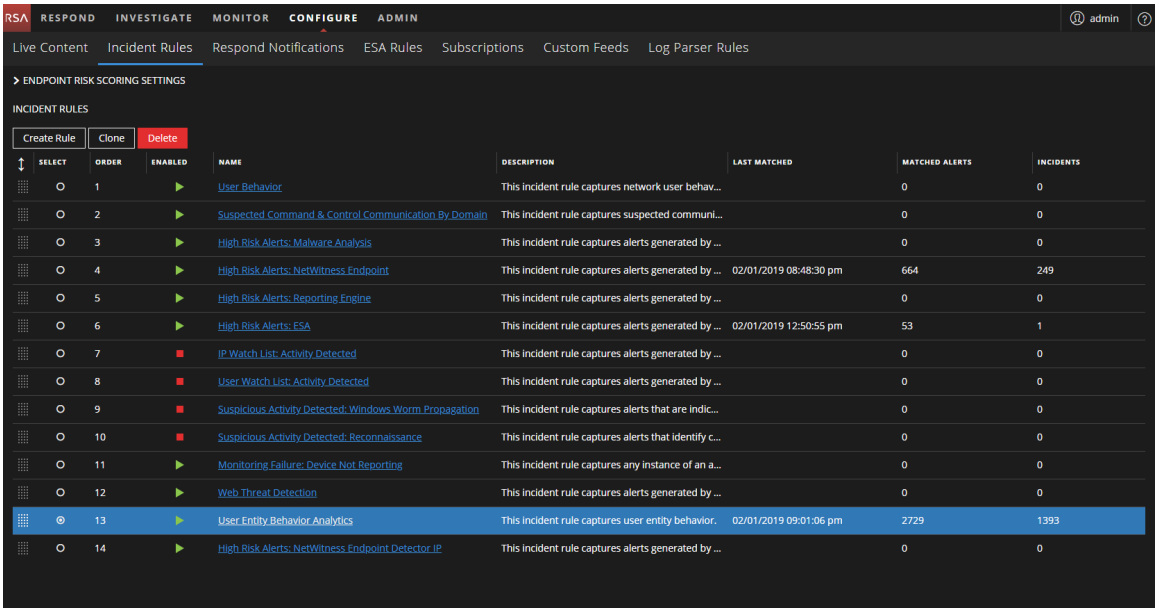
To edit the frequency:

1. Log in to NetWitness Platform.
2. Go to **ADMIN** > **Services**, select the Respond Server service, and then select > > **View** > **Explore**.
3. Edit the duration at `rsa/respond/securid`.



Set Counter for Matched Alerts and Incidents

This procedure is optional. Administrators can use it to change when the count for matched alerts is reset to 0. The Incident Rules view displays these counts in columns on the right.



These columns provide the following information for a rule:

- **Last Matched** column shows the time when the rule last matched alerts.
- **Matched Alerts** column displays the number of matched alerts for the rule.
- **Incidents** column displays the number of incidents created by the rule.

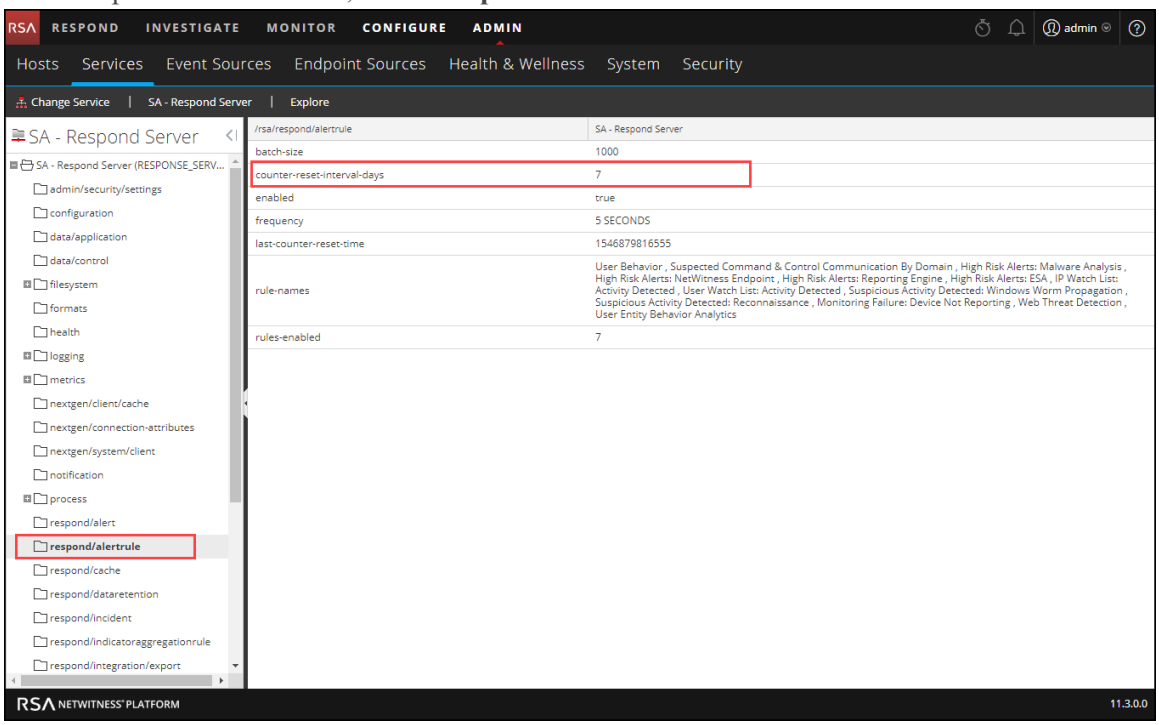
By default, these values reset to zero every 7 days. Depending on how long you want the counts to continue, you can change the default number of days.

Note: When the counter resets to zero, only the numbers in the three columns change to zero. No alerts or incidents are deleted.

To set a counter for matched alerts and incidents:

1. Go to **ADMIN > Services**, select the Respond Server service and then select **> View > Explore**.

2. In the Explore view node list, select **respond/alertrule**.



3. In the right panel, type the number of days in the **counter-reset-interval-days** field.
4. Restart the Respond Server service for the new setting to take effect. To do this, go to **ADMIN** > **Services**, select the Respond Server service, and then select > **Restart**.

Configure a Database for the Respond Server Service

This procedure is required only if you need to change the database configuration for Respond Server after the deployment of the NetWitness or ESA Primary hosts and their corresponding services. You have to select the ESA Primary server to act as the database host for NetWitness Respond application data, such as alerts, incidents, and tasks. You also have to select the NetWitness Server to act as the database host for NetWitness Respond control data, such as incident rules and categories.

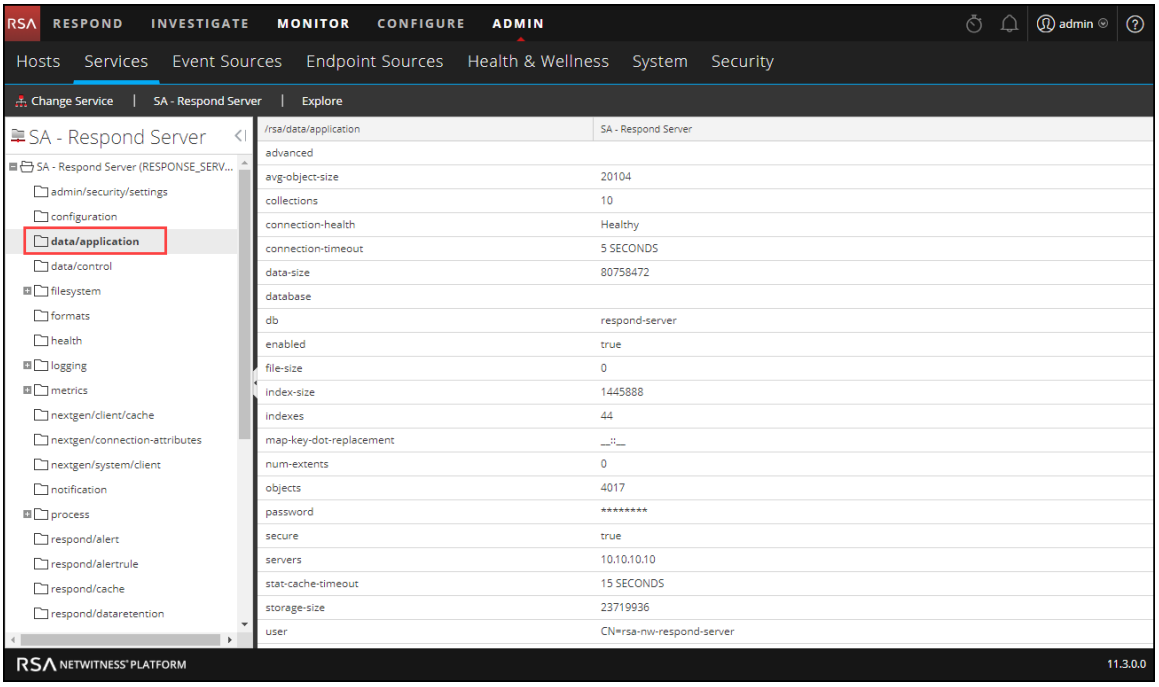
Prerequisites

Ensure that:

- The Respond Server service is installed and running on NetWitness Platform.
- An ESA host is installed and configured.

Procedure

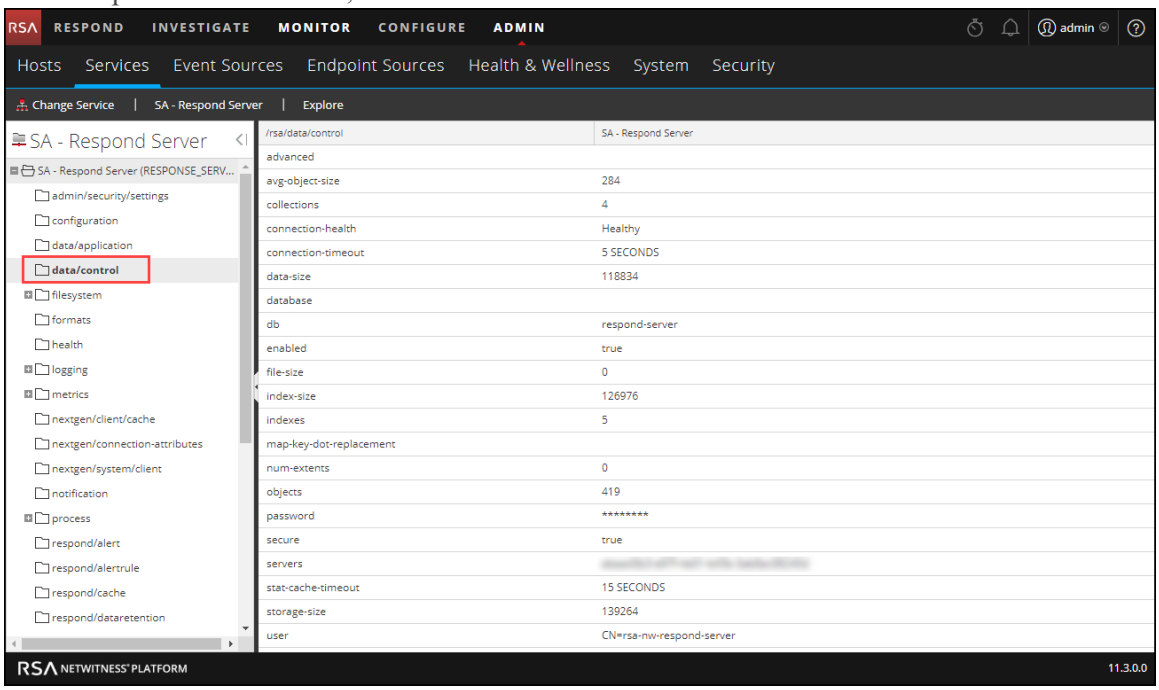
1. Go to **ADMIN > Services**.
   The Services view is displayed.
2. In the Services panel, select the **Respond Server** service and then select **> View > Explore**.
3. In the Explore view node list, select **data/application**.



4. Provide the following information:

- **db**: The database name. The default value is respond-server.
- **password**: The password used for the deployment of the ESA primary server (password for deploy_admin user).
- **servers**: The hostname or IP address of the **ESA primary server** to act as the database host for NetWitness Respond application data, such as alerts, incidents, and tasks.
- **user**: Enter **deploy_admin**.

5. In the Explore view node list, select **data/control**.



6. Provide the following information:
   - **db**: The database name. The default value is respond-server.
   - **password**: The password used for the deployment of the NetWitness Server (password for deploy_admin user).
   - **servers**: The hostname or IP address of the **NetWitness Server** to act as the database host for NetWitness Respond control data, such as incident rules and categories.
   - **user**: Enter **deploy_admin**.
7. Restart the Respond Server service. To do this, go to **ADMIN > Services**, select the Respond Server service, and then select **> Restart**.

Note: Restarting the Respond Server service is required for the database configuration to be complete.

NetWitness Respond Configuration Reference

This section contains reference information for configuring NetWitness Respond.

Configure View

The Configure view enables you to configure NetWitness Respond functionality.

You can configure incident rules to automate the Respond workflow for automatically creating incidents. You can also configure notification settings to send emails when incidents are created or updated.

Topics

- Incident Rules View
- Incident Rule Details View
- Respond Notification Settings View
- Aggregation Rules Tab
- New Rule Tab

Incident Rules View

The Incident Rules view enables you to manage the automated incident creation process. NetWitness Respond creates incidents in two ways:

- **Incident Rules**: NetWitness Platform provides preconfigured rules that you can adjust for your environment. You can also create your own rules.
- **Risk Scoring**: (Endpoint Risk Scoring Settings are available in NetWitness Platform version 11.3 and later and only apply to NetWitness Endpoint.) NetWitness Respond uses these settings to automatically create risk scoring incidents for suspicious files and hosts that cross the defined risk score thresholds. If you get too many or too few risk scoring incidents, you can adjust these thresholds.

Note: The information in this topic applies to RSA NetWitness® Platform 11.1 and later.

What do you want to do?

Role	I want to ...	Show me how
Analyst, Content Expert, SOC Manager	Create or edit an incident rule.	Step 3. Enable and Create Incident Rules for Alerts
Analyst, Content Expert, SOC Manager	Configure the threshold that creates risk scoring alerts and incidents to adjust the amount of alerts and incidents created. Turn off the creation of risk scoring alerts and incidents. Endpoint Risk Scoring Settings only apply to NetWitness Endpoint.	Configure Risk Scoring Settings for Automated Incident Creation
Incident Responders, Analysts, Content Experts, SOC Manager	View the results of my incident rule (View Detected Threats).	See "Responding to Incidents" in the *NetWitness Respond User Guide*.

Related Topics

- Incident Rule Details View

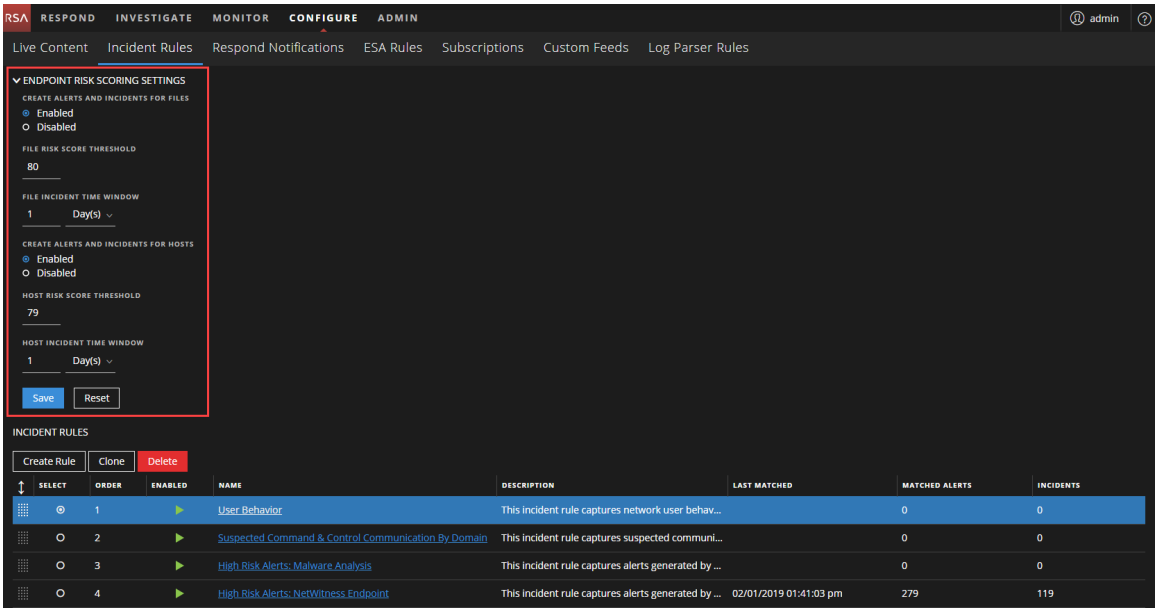
Quick Look

1. To access the Incident Rules view, go to **CONFIGURE > Incident Rules**.

   The Incident Rules view has two sections, one for each type of automated incident creation:

   - Endpoint Risk Scoring Settings
   - Incident Rules

2. To view the Endpoint Risk Scoring Settings section, click the arrow in front of **Endpoint Risk Scoring Settings**.

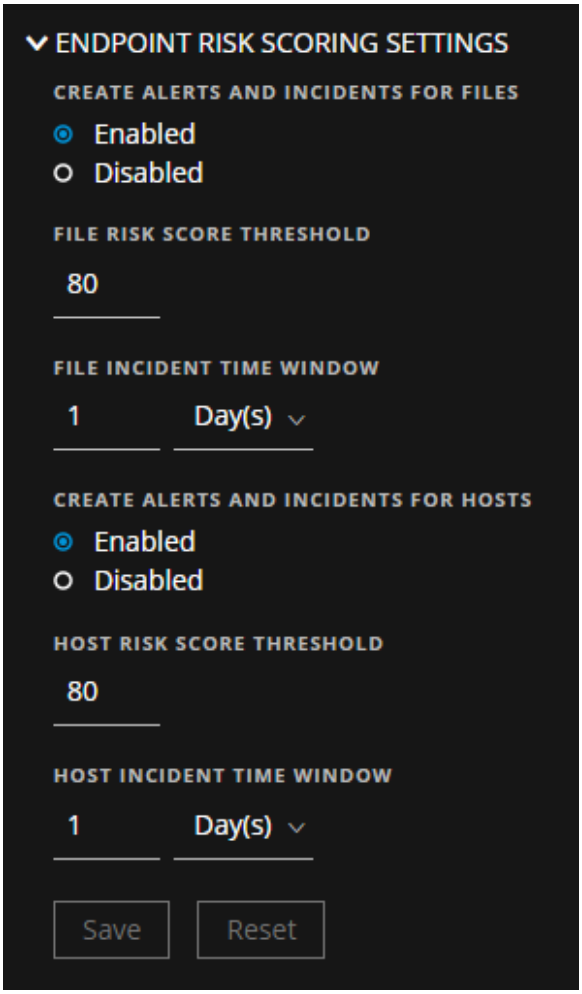


Endpoint Risk Scoring Settings

Note: Endpoint Risk Scoring Settings are available in NetWitness Platform version 11.3 and later and only apply to NetWitness Endpoint. NetWitness Respond uses these settings to automatically create risk scoring incidents for suspicious files and hosts that cross the defined risk score thresholds.

The Endpoint Risk Scoring Settings enable you to configure the thresholds used to automatically create risk scoring alerts and incidents. When calculated risk scores for suspicious files and hosts exceed the specified thresholds, it triggers the creation of risk scoring alerts and incidents. RSA recommends that you keep the thresholds at the default values, but you may need to adjust these settings if you get too many or too few alerts and incidents.

For more information on configuring NetWitness Endpoint, see the *NetWitnesss Endpoint Configuration Guide*.



The following table describes the fields in the Endpoint Risk Scoring Settings.

Field / Button	Description
Create Alerts and Incidents for Files	Select **Enabled** to automatically create risk scoring alerts and incidents for suspicious files. When calculated file risk scores go above the file risk score threshold, it triggers the creation of risk scoring alerts and incidents. Select **Disabled** to stop automatically creating risk scoring alerts and incidents. This option is enabled by default.
File Risk Score Threshold	The File Risk Score Threshold is the risk score level used to trigger alert and incident creation. The file risk score threshold range is from 0-100. NetWitness Respond calculates risk score using a combination of the number of distinct alerts and the severity of alerts associated with the file or host. A higher risk score indicates more of these types of alerts. For example, if the file risk score threshold is 80, any calculated file risk score over 80 creates a risk scoring alert and incident or adds a risk scoring alert to an existing incident depending on the file incident time window.
File Incident Time Window	The File Incident Time Window is the period of time to wait before creating another incident. The file incident time window range is from 1-24 (hours or days). For example, an openme.rar file containing suspicious code with enough associated endpoint alerts to get a risk score of 81, which is over the file risk score threshold of 80, automatically creates a risk scoring alert and incident or adds a related risk scoring alert to the same incident within a 1 day time window.
Create Alerts and Incidents for Hosts	Select **Enabled** to automatically create risk scoring alerts and incidents for suspicious hosts. When calculated host risk scores go above the host risk score threshold, it triggers the creation of risk scoring alerts and incidents. Select **Disabled** to stop automatically creating risk scoring alerts and incidents. This option is enabled by default.
Host Risk Score Threshold	The Host Risk Score Threshold is the risk score level used to trigger alert and incident creation. The host risk score threshold range is from 0-100. NetWitness Respond calculates risk score using a combination of the number of distinct alerts and the severity of alerts associated with the file or host. A higher risk score indicates more of these types of alerts. For example, if the host risk score threshold is 80, any calculated host risk score over 80 creates a risk scoring alert and incident or adds a risk scoring alert to an existing incident depending on the host incident time window.
Host Incident Time Window	The Host Incident Time Window is the period of time to wait before creating another incident. The host incident time window range is from 1-24 (hours or days). For example, a suspicious host with enough associated endpoint alerts to get a risk score of 81, which is over the host risk score threshold of 80, automatically creates a risk scoring alert and incident or adds a related risk scoring alert to the same incident within a 1 day time window.

Incident Rules

The Incident Rules section enables you to create and manage incident rules for automating the incident creation process. NetWitness Platform provides preconfigured rules. You can add to and adjust these rules for your own environment.

The Incident Rules section consists of a list and series of buttons. The following table describes the columns in the Incident Rules list.

Column	Description
	Enables you to change the priority order of the rules. Use the drag pad ( ) in front of a rule to move it up and down in the list.
Select	Enables you to select a rule in order to take an action, such as Clone or Delete.
Order	Shows the order in which the rule is placed. The rule order determines which rule takes effect if the criteria for multiple rules match the same alert. If multiple rules match an alert, only the rule with the highest priority creates an incident. NetWitness Respond evaluates incoming alerts against the incident rules in the order that you define. If alerts match the first rule listed, then that rule creates an incident. If alerts match the second rule listed and those alerts did not match the first rule, then the second rule creates an incident. If alerts match the third rule listed and those alerts did not match the first or second rule listed, then the third rule creates an incident, and so on.
Enabled	Shows whether the rule is enabled or not. The ▶ specifies that the rule is enabled. The ■ specifies that the rule is not enabled.
Name	Displays the name of the rule with a hyperlink. If you click the link, it opens the Rule Details view, where you can edit the rule.
Description	Displays the description of the rule.
Last Matched	Displays the time when an alert was successfully matched with the rule. This value is reset once a week.
Matched Alerts	Displays the number of matched alerts. This value is reset once a week. To change the setting, see Set Counter for Matched Alerts and Incidents.
Incidents	Displays the number of incidents created by the rule. This value is reset once a week. To change the setting, see the Set Counter for Matched Alerts and Incidents.

Incident Rules Actions

The following table shows the operations that can be performed on the Incident Rules list.

Action	Description
Create Rule button	Allows you to add a new rule.
Delete button	Allows you to delete a rule.

Action	Description
Clone button	Allows you to duplicate a rule.
Name hyperlink	Allows you to edit a rule.

Incident Rule Details View

The Incident Rule Details view enables you to create and edit incident rules for creating incidents from alerts. This topic describes the information required when creating or editing a new rule.

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

What do you want to do?

Role	I want to ...	Show me how
Analyst, Content Expert, SOC Manager	Enable, create, or edit an incident rule.	Step 3. Enable and Create Incident Rules for Alerts
Analyst, Content Expert, SOC Manager	Set up and use the User Behavior default rule. Set up or verify the preconfigured (default) incident rules.	Set Up and Verify Default Incident Rules
Incident Responders, Analysts, Content Experts, SOC Manager	View the results of my incident rule (View Detected Threats).	See "Responding to Incidents" in the *NetWitness Respond User Guide*.

Related Topics

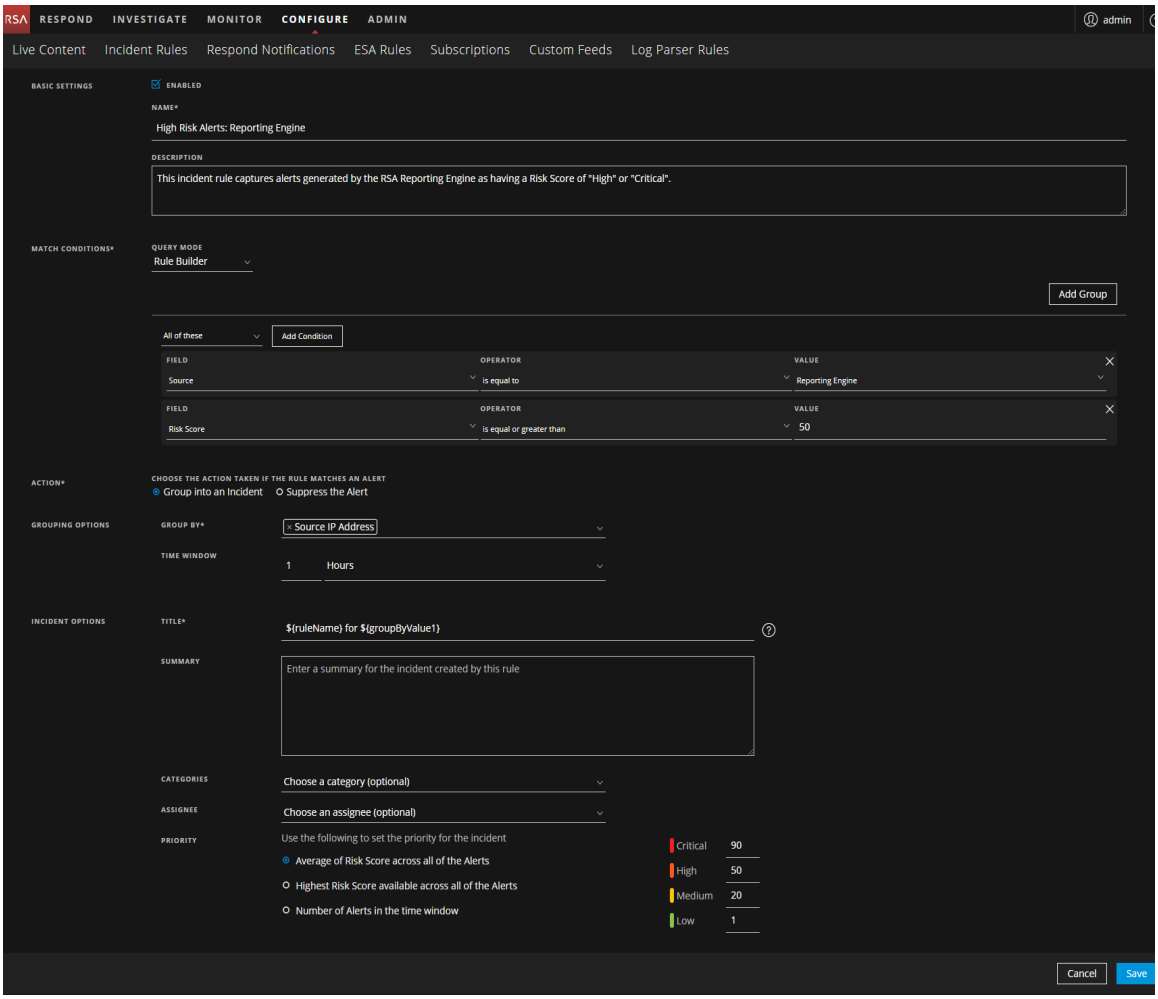
- Incident Rules View

Quick Look

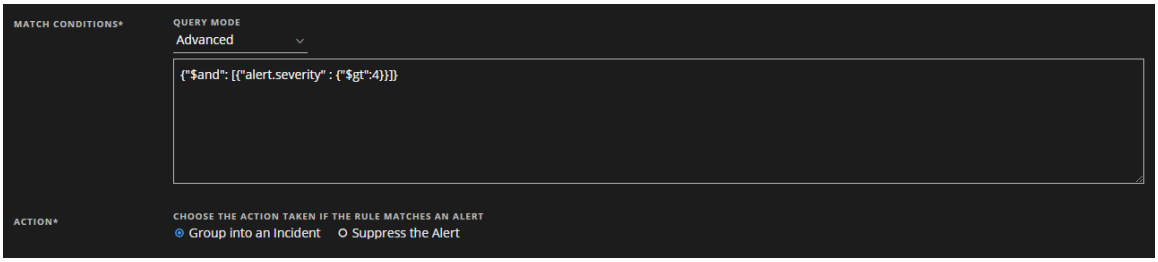
To access the Incident Rule Details view, do one of the following:

- To create a rule, go to **CONFIGURE > Incident Rules** and click **Create Rule**.
- To edit a rule, go to **CONFIGURE > Incident Rules** and click the link in the **Name** column for the rule that you want to update.

  The Incident Rule Details view is displayed. The following figure shows the Incident Rule Details view in Rule Builder query mode.



In the Match Conditions section, if you select Advanced query mode, a field to enter advanced queries is available as shown in the following figure.



The following table describes the options available when creating or editing incident rules.

Section	Field	Description
BASIC SET-TINGS	ENABLED	Select to enable the rule.
	NAME*	Name of the rule. *This is a required field.
	DESCRIP-TION	A description of the rule to indicate which alerts get aggregated.
MATCH CONDI-TIONS*	QUERY MODE	**Rule Builder**: Select the Rule Builder option if you want to build a query with various conditions that can be grouped. You can also have nested groups of conditions. In the Match Conditions, you can set the value to **All of these**, **Any of these**, or **None of these**. Depending on what you select, the criteria types specified in the Conditions and Group of conditions are matched to group the alerts. For example, if you set the match condition to **All of these**, alerts that match the criteria mentioned in the Conditions and Group Conditions are grouped into one incident. • Add a Condition to be matched by clicking the **Add Condition** button. • Add a Group of Conditions by clicking the **Add Group** button and add conditions by clicking the **Add Condition** button. You can include multiple Conditions and Groups of Conditions that can be matched as per criteria set and group the incoming alerts into incidents. **Advanced**: Select the Advanced query option if you want to use the advanced query builder. You can add a specific condition that needs to be matched as per the matching option selected. For example, you can type the criteria builder format **{"$and": [{"alert.severity" : {"$gt":4}}]}** to group alerts that have severity greater than 4. For advanced syntax, refer to http://docs.mongodb.org/manual/reference/operator/query/ or http://docs.mongodb.org/manual/reference/method/db.collection.find/
AC-TION*	CHOOSE THE ACTION TAKEN IF THE RULE MATCHES THE ALERT	**Group into an Incident**: If enabled, the alerts that match the criteria set are grouped into an alert. **Suppress the Alert**: If enabled, the alerts that match the criteria are suppressed.

Section	Field	Description
GROUPING OPTIONS	GROUP BY*	The criteria to group the alerts in accordance with the specified alert fields. You can use a maximum of two fields to group the alerts. You cannot group alerts with fields that do not have values. When alerts are grouped on an alert field, all matching alerts containing the same meta key value for that field are grouped together in the same incident. (See the following **Group By Meta Key Mappings** table.)
	TIME WINDOW	The time range for grouping alerts. For example, if the time window is set to 1 hour, all alerts that match the criteria set in the Group By field and that arrive within an hour of each other are grouped into an incident.

Section	Field	Description
INCIDENT OPTIONS	TITLE*	Title of the incident. You can optionally include placeholders in your title. Placeholders enable you to have different titles based on the attributes you grouped. If you do not use placeholders, all incidents created by the rule will have the same title. For example, if you grouped them according to the source, you can name the resulting Incident as Alerts for **${groupByValue1}**, and the incident for all alerts from NetWitness Endpoint would be named **Alerts for NetWitness Endpoint**.
	SUMMARY	(Optional) Summary of the incident created by this rule.
	CATEGORIES	(Optional) Category of the incident created. An incident can be classified using more than one category.
	ASSIGNEE	(Optional) Name of the user assigned to the incident.
	PRIORITY	**Average of Risk Score across all of the Alerts**: Takes the average of the risk scores across all the alerts to set the priority of the incident created. **Highest Risk Score available across all of the Alerts**: Takes the highest score available across all the alerts to set the priority of the incident created. **Number of Alerts in the time window**: Takes the count of the number of alerts in the time window selected to set the priority of the incident created. **Critical, High, Medium, and Low**: Specify the incident priority threshold of the matched incidents. The defaults are: • Critical: 90 • High: 50 • Medium: 20 • Low: 1 For example, with the Critical priority set to 90, incidents with a risk score of 90 or higher are assigned a Critical priority for this rule.

Group By Meta Key Mappings

When alerts are grouped on an alert field, all matching alerts containing the same meta key value for that field are grouped together in the same incident. For example, if you select the Group By field value **Destination Host**, it uses the mapped meta key `alert.groupby_host_dst`. All alerts with the same meta key value for `alert.groupby_host_dst` are grouped together in the same incident.

The following table shows the mapped meta keys for the Group By field selections.

Group By Field Value	Mapped Meta Key
Alert Name	alert.name
Alert Rule Id	alert.signature_id
Alert Type	alert.groupby_type
Date Created	alert.timestamp
Destination Country	alert.groupby_destination_country
Destination Domain	alert.groupby_domain_dst
Destination Host	alert.groupby_host_dst
Destination IP Address	alert.groupby_destination_ip
Destination Port	alert.groupby_destination_port
Destination User Account	alert.groupby_user_dst
Detector IP Address	alert.groupby_detector_ip
Domain	alert.groupby_domain
Domain for Suspected C&C	alert.groupby_c2domain
File Analysis	alert.groupby_analysis_file
Filename	alert.groupby_filename
File MD5 Hash	alert.groupby_data_hash
Risk Score	alert.risk_score
Service Analysis	alert.groupby_analysis_service
Session Analysis	alert.groupby_analysis_session
Severity	alert.severity
Source	alert.source
Source Country	alert.groupby_source_country
Source Domain	alert.groupby_domain_src
Source Host	alert.groupby_host_src
Source IP Address	alert.groupby_source_ip
Source User Account	alert.groupby_user_src
Source Username	alert.groupby_source_username
User Account	alert.groupby_username

Respond Notification Settings View

The Respond Notification Settings view enables you to send email notifications when incidents are created or updated to SOC Managers and the Analysts assigned to the incidents.

Note: The information in this topic applies to RSA NetWitness® Platform 11.1 and later.

What do you want to do?

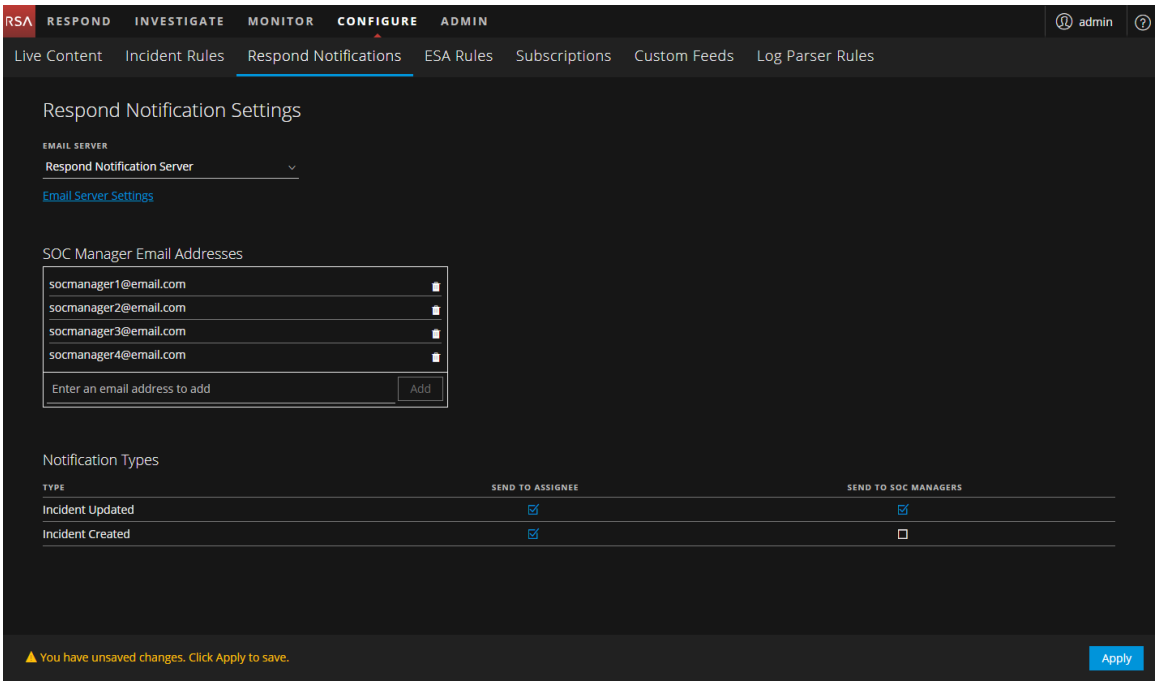
Role	I want to ...	Show me how
Administrator	Configure an email server.	Refer to "Configure the Email Settings as Notification Server" in the *System Configuration Guide*. (To access these settings, click the **Email Server Settings** link or go to ADMIN > System > Global Notifications > Servers tab.)
Incident Responders, Analysts, Content Experts, SOC Manager	Configure email notifications for when an incident is created or updated.	Configure Respond Email Notification Settings

Related Topics

- Incident Rules View

Quick Look

To access the Respond notification settings, go to **CONFIGURE > Respond Notifications**.
The Respond Notification Settings view is displayed.



The following table lists the Respond notification settings.

Setting	Description
Email Server	Specifies the Email server that will send the email notifications.
Email Server Settings	Allows you to configure an Email server if the one you want to use for notifications is not listed. Clicking the **Email Server Settings** link goes to ADMIN > SYSTEM > Global Notifications. For instructions, refer to "Configure the Email Settings as Notification Server" in the *System Configuration Guide*.
SOC Manager Email Addresses	Lists the SOC Manager email addresses that receive email notifications when you select **Send to SOC Manager** in the Notification Types section. You can add and remove email addresses as needed.
Notification Types - Incident Created	Specifies who should receive an email notification when an incident is created. • **Send to Assignee**: When an incident is created, an email is sent to the Analyst assigned to the incident. • **Send to SOC Manager**: When an incident is created, an email is sent to all of the addresses listed in the SOC Manager Email Addresses list.

Setting	Description
Notification Types - Incident Updated	Specifies who should receive an email notification when an incident is created. • **Send to Assignee**: When an incident is updated, an email is sent to the Analyst assigned to the incident. • **Send to SOC Manager**: When an incident is updated, an email is sent to all of the addresses listed in the SOC Manager Email Addresses list.
Apply	Applies changes made to Respond Notification Settings. Changes to these settings take effect immediately.

Note: If user email address information is updated in the ADMIN > Security > Users tab, it can take up to two minutes for the new email changes to take effect. Any incident creation or incident update email notifications sent during this time go to the old email address.

Aggregation Rules Tab

The Aggregation Rules tab enables you to create and manage aggregation rules for automating the incident creation process. NetWitness Platform provides 11 preconfigured rules. You can add to and adjust these rules for your own environment.

Note: This topic applies to NetWitness Platform version 11.0 and earlier.

What do you want to do?

Role	I want to ...	Show me how
Analyst, Content Expert, SOC Manager	Create an aggregation rule.	Step 3. Enable and Create Incident Rules for Alerts
Incident Responders, Analysts, Content Experts, SOC Manager	View the results of my aggregation rule (View Detected Threats).	See "Responding to Incidents" in the *NetWitness Respond User Guide*.

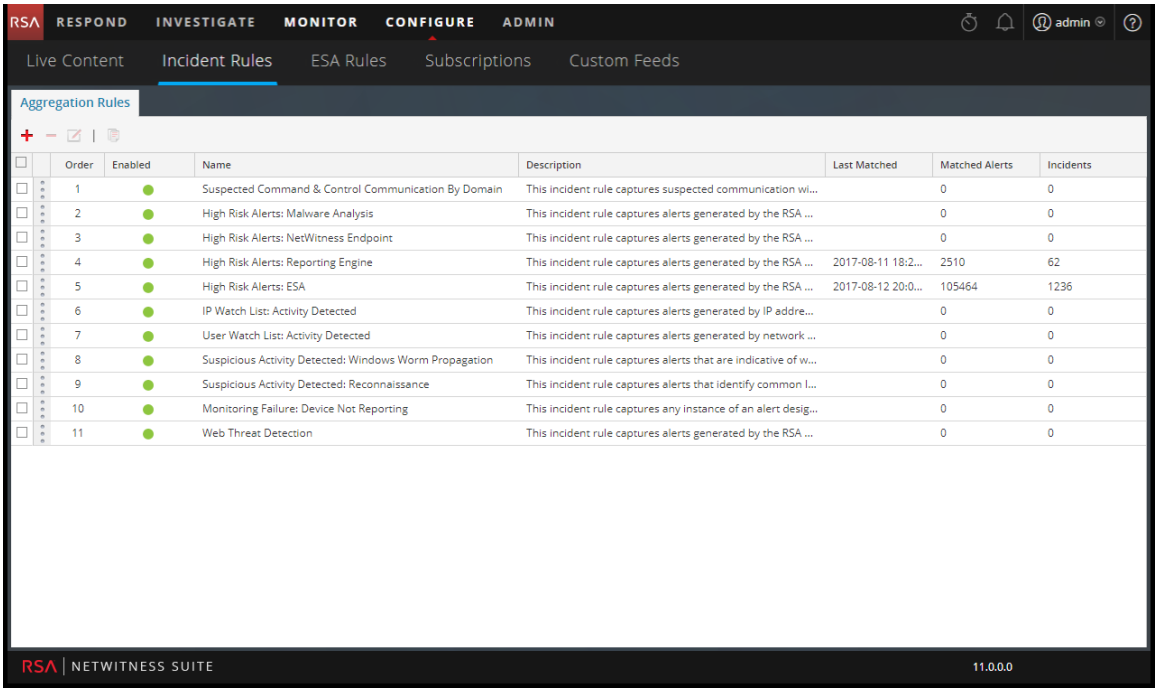
Quick Look

To access the Aggregation Rules tab, go to **CONFIGURE > Incident Rules > Aggregation Rules** tab.



The Aggregation Rules tab consists of a list and toolbar.

Aggregation Rules List

The following table describes the columns in the Aggregation Rules list.

Column	Description
Select	Enables you to select a rule in order to take an action, such as Clone or Delete.
Order	Shows the order in which the rule is placed. The rule order determines which rule takes effect if the criteria for multiple rules match the same alert. If two rules match an alert, only the rule with the highest priority is evaluated.
Name	Displays the name of the rule.
Enabled	Shows whether the rule is enabled or not. The ● specifies the rule is enabled.
Description	Displays the description of the rule.
Last Matched	Displays the time when an alert was successfully matched with the rule. This value is reset once a week.
Matched Alerts	Displays the number of matched alerts. This value is reset once a week. To change the setting, see Set Counter for Matched Alerts and Incidents.
Incidents	Displays the number of incidents created by the rule. This value is reset once a week. To change the setting, see the Set Counter for Matched Alerts and Incidents.

Aggregation Rules Toolbar

The following table shows the operations that can be performed in the Aggregation Rules tab.

Option	Description
+	Allows you to add a new rule.
	Allows you to edit a rule.
−	Allows you to delete a rule.
	Allows you to duplicate a rule.

New Rule Tab

The New Rules tab enables you to create custom aggregation rules for automating the incident creation process. This topic describes the information required when creating a new rule.

Note: This topic applies to NetWitness Platform version 11.0 and earlier.

What do you want to do?

Role	I want to ...	Show me how
Analyst, Content Expert, SOC Manager	Create an aggregation rule.	Step 3. Enable and Create Incident Rules for Alerts
Incident Responders, Analysts, Content Experts, SOC Manager	View the results of my aggregation rule (View Detected Threats).	See "Responding to Incidents" in the *NetWitness Respond User Guide*.

Related Topics

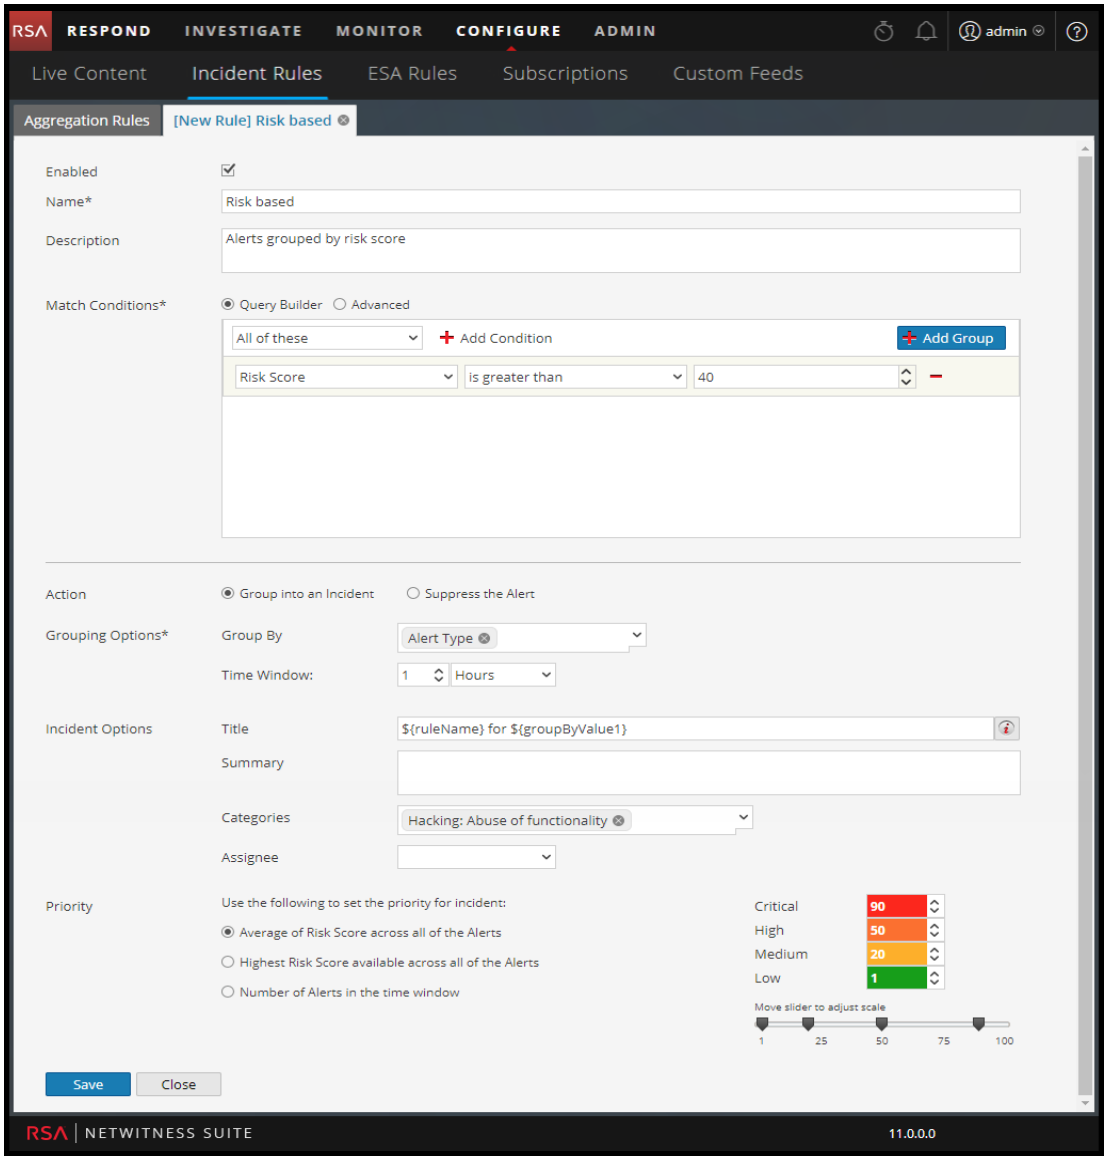
- Aggregation Rules Tab

Quick Look

To access the New Rule tab view:

1. Go to **CONFIGURE > Incident Rules > Aggregation Rules** tab.
2. Click +.

The **New Rule** tab is displayed.



The following table describes the options available when creating customized aggregation rules.

Field	Description
Enabled	Select to enable the rule.
Name*	Name of the rule. *This is a required field.
Description	A description for the rule to give an idea about what alerts get aggregated.

Field	Description
Match Conditions*	**Query Builder** - Select if you want to build a query with various conditions that can be grouped. You can also have nested groups of conditions. Match Conditions - You can set the value to **All of these**, **Any of these**, or **None of these**. Depending on what you select, the criteria types specified in the Conditions and Group of conditions are matched to group the alerts. **For example**, if you set the match condition to **All of these**, alerts that match the criteria mentioned in the Conditions and Group Conditions are grouped into one incident. • Add a Condition to be matched by clicking **Add Condition**. • Add a Group of Conditions by clicking **Add Group** and adding conditions by clicking **Add Condition**. You can include multiple Conditions and Groups of Conditions that can be matched as per criteria set and group the incoming alerts into incidents.
	Advanced - Select if you want to add an advanced query builder. You can add a specific condition that needs to be matched as per the matching option selected. **For example:** you can type the criteria builder format **{"$and": [{"alert.severity" : {"$gt":4}}]}** to group alerts that have severity greater than 4. For advanced syntax, refer to http://docs.mongodb.org/manual/reference/operator/query/ or http://docs.mongodb.org/manual/reference/method/db.collection.find/
Action	**Group into an Incident** - If enabled, the alerts that match the criteria set are grouped into an alert. **Suppress the Alert** - If enabled, the alerts that match the criteria are suppressed.
Grouping Options*	**Group By:** The criteria to group the alerts as per the specified category. You can use a maximum of two attributes to group the alerts. You can group the alerts with one or two attributes. You can no longer group alerts with attributes that do not have values (empty attributes). Grouping on an attribute means that all matching Alerts containing the same value for that attribute are grouped together in the same incident. **Time Window:** The time range specified to group alerts. For example if the time window is set to 1 hour, all alerts that match the criteria set in Group By field and that arrive within an hour of each other are grouped into an incident.

Field	Description
Incident Options	**Title -** (Optional) Title of the incident. You can provide placeholders based on the attributes you grouped. Placeholders are optional. If you do not use placeholders, all Incidents created by the rule will have the same title. For example, if you grouped them according to the source, you can name the resulting Incident as Alerts for **${groupByValue1}**, and the incident for all alerts from NetWitness Endpoint would be named **Alerts for NetWitness Endpoint**.
	Summary - (Optional) Summary of the incident.
	Category - (Optional) Category of the incident created. An incident can be classified using more than one category.
	Assignee - (Optional) Name of the assignee to whom the incident is assigned to.
Priority	**Average of Risk Score across all of the Alerts** - Takes the average of the risk scores across all the alerts to set the priority of the incident created. **Highest Risk Score available across all of the Alerts** - Takes the highest score available across all the alerts to set the priority of the incident created. **Number of Alerts in the time window** - Takes the count of the number of alerts in the time window selected to set the priority of the incident created. **Critical, High, Medium, and Low** - Specify the incident priority threshold of the matched incidents. The defaults are: • Critical: 90 • High: 50 • Medium: 20 • Low: 1 For example, with the Critical priority set to 90, incidents with a risk score of 90 or higher will be assigned a Critical priority for this rule. You can change these defaults by manually changing the priorities or by moving the slider under **Move slider to adjust scale**.

How Reporting Engine Works

Netwitness Reporting Engine is a service on the Netwitness Admin Server. Ifacilitates the data extraction from different data sources to generate reports for compliance and analysis. Reporting Engine stores the definitions of the charts, rules, reports and alerts that are used to generate reports, charts and alerts.

Reporting Engine configuration includes configuring the data sources, definitions of outputs or notifications and parameters to improve the performance of data extraction and report, chart, and alert generation.

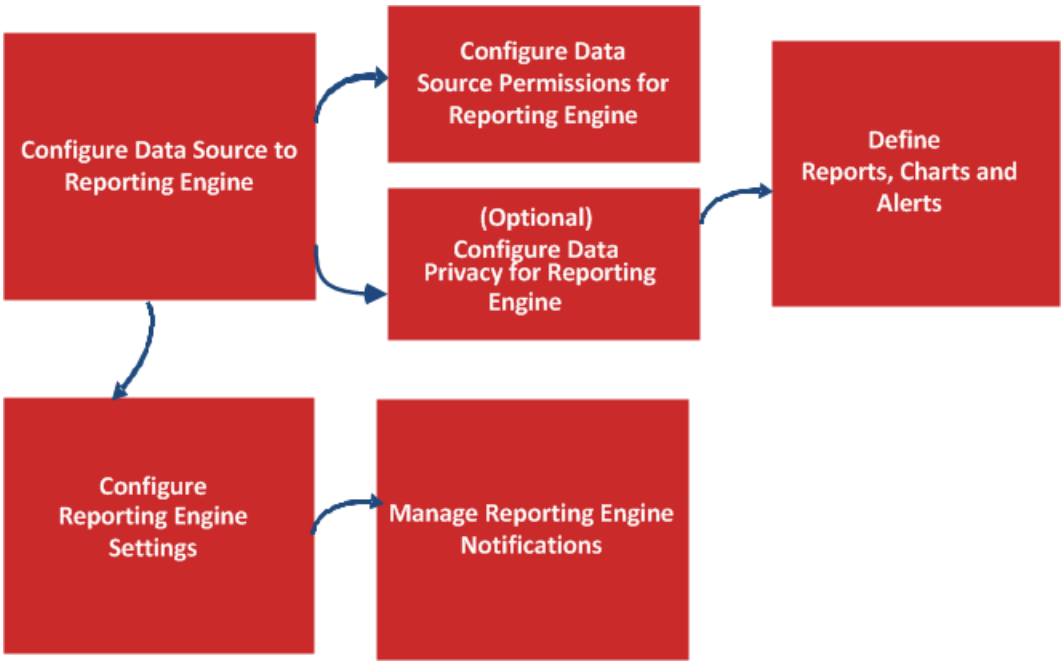
When you install the NetWitness Platform, Reporting Engine is automatically installed as a service. This enables the Reports, Charts, and Alerts to be maintained in the RSA NetWitness Platform and be available to view, download reports as PDF or CSV format, download charts as PDF and be added as dashlets.

For the Reporting Engine to run reports and alerts based on the data drawn from a data source, you must associate a data source, or multiple data sources to a Reporting Engine. There are three types of data sources:

- NWDB - The NetWitness Database (NWDB) data sources are Decoders, Log Decoders, Brokers, Concentrators, Archiver, and Collection. Reporting Engine supports the generation of reports, alerts, and charts.
- Warehouse - The Warehouse data sources are Horton Works and MapR which collects information from the Warehouse Connector and generates reports and alerts. This data source generates Reports only.
- Respond - Respond is used to generate reports on alerts and incidents. This data source generates Reports only.

Workflow

The following workflow shows an overview of the Reporting Engine configuration which enables the user to generate Reports, Charts, and Alerts.



Configure Data Source to Reporting Engine
Configure Data Source Permissions for Reporting Engine
(Optional) Configure Data Privacy for Reporting Engine
Define Reports, Charts and Alerts
Configure Reporting Engine Settings
Manage Reporting Engine Notifications

Configure the Reporting Engine

On installation of the NetWitness Server, the Reporting Engine service is automatically available and some parameters are pre-populated with default values to achieve optimal results.

Make sure that the data sources are deployed and configured in the NetWitness Platform. For more information, see "Add Service or Edit Service Dialog" topic in the *Host and Service Configuration Guide*.

You can perform the following tasks:

- Check Live for the latest data source content and deploy it on a regular basis. (For more information, see "Manage Live Resources" topic in the in *Live Services Guide*).
- (Optional) Add Additional Space for Large Reports.

Configure the Data Sources

You must configure NWDB, Warehouse, and Respond to generate Reports, Charts, and Alerts. Optionally, you can also configure Archiver, Collection, and Workbench data sources.

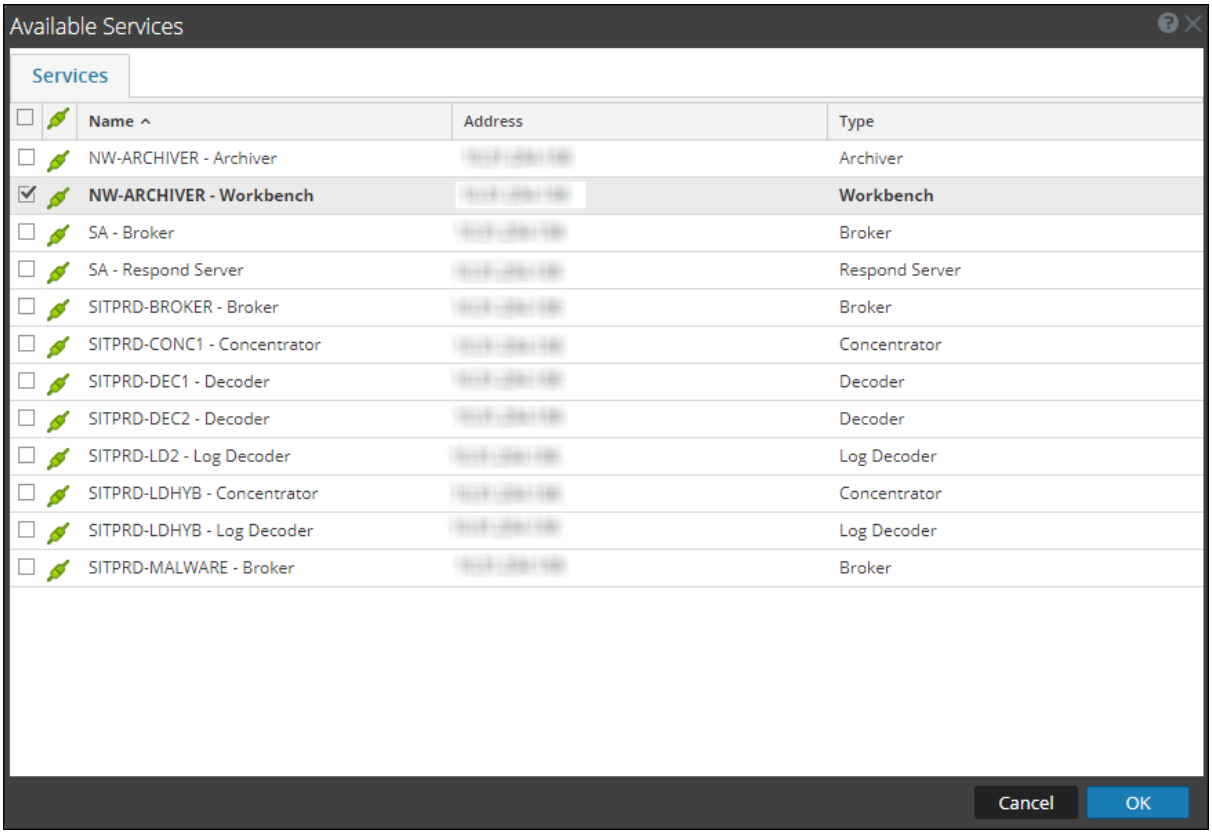
Configure a NWDB Data Source

To add a NWDB data source:

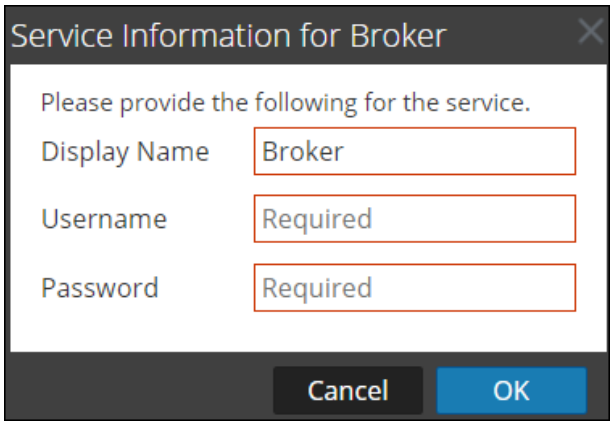
1. Go to **ADMIN** > **Services**.
2. In the **Services**, select **Reporting Engine** service.
3. Click > **View** > **Config**

   The Services Config View of Reporting Engine is displayed.
4. On the **Sources** tab, click > **Available Services**.

   The **Available Services** dialog is displayed.



5. Select a NWDB service you want to add and click **OK**.
6. In the Service Information for Broker dialog, enter the service information for the service and click **OK**. In this example, we are adding a Broker service.



7. The service is displayed in the Sources tab when it is successfully added.

Note: The services with the Trust Model enabled must be added individually. You are prompted to provide a username and password for the selected service.

Configure a Warehouse Data Source

You can add the warehouse data source to Reporting Engine, so that you can extract the data from the required services, store them in MapR or Horton works and generate Reports and Alerts. The procedure to configure Warehouse as a data source differs. To extract data from a Warehouse data source, you must configure it using the following procedure.

Note: Warehouse Analytics is not supported in NetWitness Platform 11.0 or later releases.

Prerequisite

Make sure you:

- Add a Warehouse Data Source to Reporting Engine.
- Set Warehouse Data Source as the Default Source.
- HIVE server is in running state on all the Warehouse nodes. Use the following command to check the status of the HIVE server:

  ```
  status hive2 (MapR deployments)
  service hive-server2 status (Horton Works deployments)
  ```

- Warehouse Connector is configured to write data to the warehouse deployments.
- If Kerberos authentication is enabled for HiveServer2, make sure that the keytab file is copied to the `/var/netwitness/re-server/rsa/soc/reporting-engine/conf/` directory in the Reporting Engine Host.

  Note: The `rsasoc` user should have read permissions for the keytab file. For more information, see Configure Data Source Permissions.

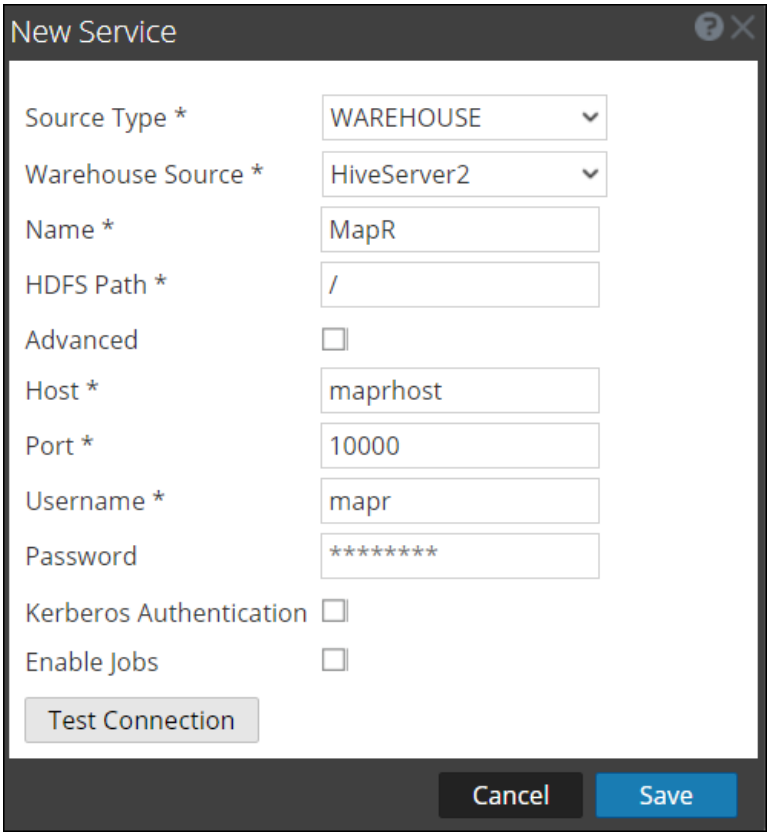
  Also, make sure that you update the keytab file location in the **Kerberos Keytab File** parameter in the Reporting Engine Service Config View. For more information, see Reporting Engine General Tab.

To add Warehouse data source for MapR:

1. Go to **Admin** > **Services**.
2. In the **Services** list, select the **Reporting Engine** service.
3. Click > **View** > **Config**.
4. Click the **Sources** tab.

   The **Service Config** view is displayed with the **General** tab open.
5. In the **Sources** tab, click and select **New Service**.

   The New Service dialog is displayed.



6. In the **Source Type** drop-down menu, select **WAREHOUSE**.
7. In the **Warehouse Source** drop-down menu, select the warehouse data source.
8. In the **Name** field, enter the host name of the Warehouse data source.
9. In the **HDFS Path** field, enter the HDFS root path to which the Warehouse Connector writes the data.

   For example:

If `/saw` is the local mount point for HDFS that you have configured while mounting NFS on the device. And if you have installed the Warehouse Connector service to write to SAW. For more information, see "Mount the Warehouse on the Warehouse Connector" topic in the *Warehouse (MapR) Configuration Guide*.

If you have created a directory named `Ionsaw01` under `/saw` and provided the corresponding Local Mount Path as `/saw/Ionsaw01`, then the corresponding HDFS root path would be `/Ionsaw01`.

The `/saw` mount point implies to `/`as the root path for HDFS. The Warehouse Connector writes the data `/Ionsaw01` in HDFS. If there is no data available in this path, the following error is displayed:

`"No data available. Check HDFS path"`

Make sure that `/lonsaw01/rsasoc/v1/sessions/meta` contains avro files of the meta data before performing test connection.

10. Select the **Advanced** checkbox to use the advanced settings, and fill in the **Database URL** with the complete JDBC URL to connect to the HiveServer2.

    For example:

    If kerberos is enabled in HIVE then the JDBC url will be:

    ```
    jdbc:hive2://<host>:<port>/<db>;principal=<Kerberos serverprincipal>
    ```

    If SSL is enabled in HIVE then the JDBC url will be:

    ```
    jdbc:hive2://<host>:<port>/<db>;ssl=true;sslTrustStore=<trust_store_
    path>;trustStorePassword=<trust_store_password>
    ```

    For more information on HIVE server clients, see https://cwiki.apache.org/confluence/display/Hive/HiveServer2+Clients.

11. If not using the advanced settings, enter the values for the **Host** and **Port**.
    - In the **Host** field, enter the IP address of the host on which HiveServer2 is hosted.

      Note: You can use the virtual IP address of MapR only if HiveServer2 is running on all the nodes in the cluster.

    - In the **Port** field, enter the HiveServer2 port of the Warehouse data source. By default, the port number is **10000**.
12. In the **Username** and **Password** field, enter the JDBC credentials used to access HiveServer2.

    Note: You can also use LDAP mode of authentication using Active Directory. For instructions to enable LDAP authentication mode, see Enable LDAP Authentication.

13. Enable Kerberos authentication: see Enable Kerberos Authentication.
14. If you want set the added Warehouse data source as default source for the Reporting Engine, select the added Warehouse data source and click 
.

To add Warehouse data source for Horton Works (HDP):

Note: Make sure you download the `hive-jdbc-1.2.1-with-full-dependencies.jar`. This jar contains the driver file of HIVE 1.2.1 which connects to Reporting Engine for Hive 1.2.1 Hiveserver2, from RSA Link (https://community.rsa.com/docs/DOC-67251).

1. SSH to the NetWitness Platform server.
2. In the `/opt/rsa/soc/reporting-engine/plugins/` folder, take a backup of the following jar:

   `hive-jdbc-0.12.0-with-full-dependencies.jar` or `hive-jdbc-1.0.0-mapr-1508-standalone.jar`
3. Remove the following jar:

   `hive-jdbc-0.12.0-with-full-dependencies.jar` or `hive-jdbc-1.0.0-mapr-1508-standalone.jar`
4. In the /opt/rsa/soc/reporting-engine/plugins folder, copy the following jar using WinSCP:

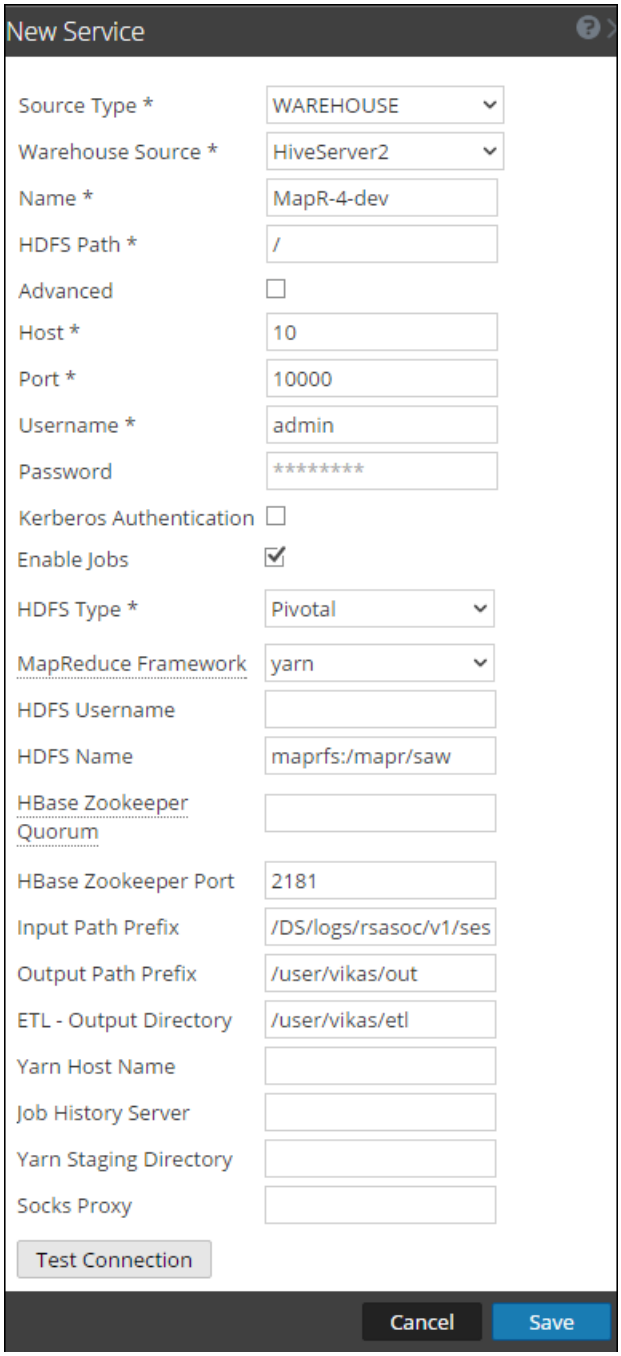
   `hive-jdbc-1.2.1-with-full-dependencies.jar`
5. Restart the Reporting Engine service.
6. Log in to NetWitness Platform UI.
7. Select the **Reporting Engine** service and select > **View** > **Explore**.
8. In the **hiveConfig**, set **EnableSmallSplitBasedSchemaLiteralCreation** parameter to **true**.

Enable Jobs

Note: Warehouse Analytics is not supported in NetWitness Platform 11.0 or later releases.

To run warehouse analytics reports, perform this procedure.

1. Select the **Enable Jobs** checkbox.



Note: Do not select Pivotal in the HDFS field as it is not supported.

2. Enter the following details:

a. Select the type of HDFS from the **HDFS Type** drop-down menu.

- If you select the Horton Works HDFS type, enter the following information.

Field	Description
HDFS Username	Enter the username that Reporting Engine should claim when connecting to Horton Works. For standard horton works DCA clusters, this would be 'gpadmin'.
HDFS Name	Enter the URL to access HDFS. For example, hdfs://hdm1.gphd.local:8020.
HBase Zookeeper Quorom	Enter the list of host names separated by a comma on which the ZooKeeper servers are running.
HBase Zookeeper Port	Enter the port number for the ZooKeeper servers. The default port is 2181.
Input Path Prefix	Enter the output path of the Warehouse Connector (`/sftp/rsasoc/v1/sessions/data/<year>/<month>/<date>/<hour>`) until the year directory. For example, `/sftp/rsasoc/v1/sessions/data/`.
Output Path Prefix	Enter the location where the data science job results are stored in HDFS.
Yarn Host Name	Enter the Hadoop yarn resource-manager host name in the DCA cluster. For example, `hdm3.gphd.local`.
Job History Server	Enter the Hadoop job-history-server address in the DCA cluster. For example, `hdm3.gphd.local:10020`.
Yarn Staging Directory	Enter the staging directory for YARN in the DCA cluster. For example, `/user`.
Socks Proxy	If you use the standard DCA cluster, most hadoop services will be running in a local private network and will not reachable from Reporting Engine. So, you must run a socks proxy in the DCA cluster and allow access from outside the cluster. For example, `mdw.netwitness.local:1080`.

- If you select the MapR HDFS type, enter the following information:

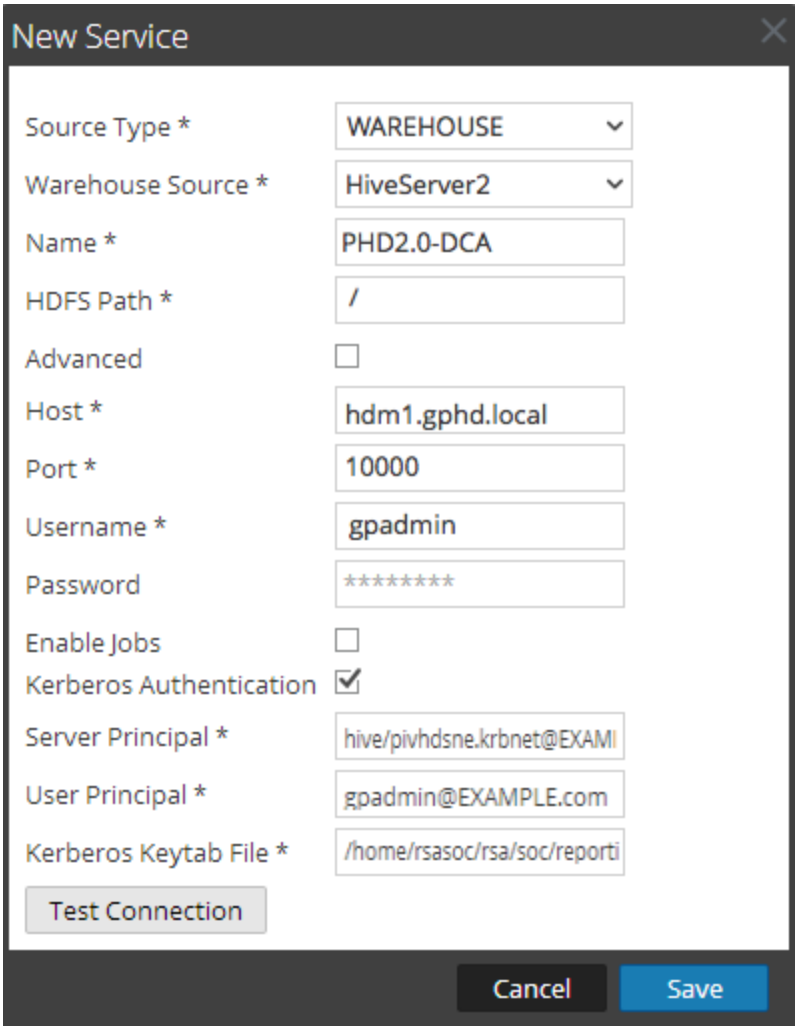
Field	Description
MapR Host Name	The public IPaddress of any one of the MapR warehouse hosts can be entered.
MapR Host User	Enter a UNIX username in the given host that has access to execute map-reduce jobs on the cluster. The default value is 'mapr'.
(Optional) MapR Host Password	To setup password-less authentication, copy the public key of the "rsasoc" user from `/home/rsasoc/.ssh/id_rsa.pub` to the "authorized_keys" file of the warehouse host located in `/home/mapr/.ssh/authorized_keys`, with the assumption that "mapr" is the remote UNIX user.
MapR Host Work Dir	Enter a path that the given UNIX user (for example, "mapr") has write access to. **Note:** The work directory is used by Reporting Engine to remotely copy the Warehouse Analytics jar files and start the jobs from the given host name. You must not use "/tmp" to avoid filling up of the system temporary space. The given work directory will be remotely managed by Reporting Engine.
HDFS Name	Enter the URL to access HDFS. For example, to access a specific cluster, `maprfs:/mapr/<cluster-name>`.
HBase Zookeeper Port	Enter the port number for the ZooKeeper servers. The default port is 5181.
Input Path Prefix	Enter the output path (`/rsasoc/v1/sessions/data/<year>/<month>/<date>/<hour>`) until the year directory. For example, `/rsasoc/v1/sessions/data/`.
Input Filename	enter the file name filter for avro files. For example, `sessions-warehouseconnector`.
Output Path Prefix	Enter the location where the data science job results are stored in HDFS.

b. Select the MapReduce Framework as per the HDFS type.

Note: For HDFS type MapR, select MapReduce framework as Classic. For HDFS type Horton Works, select MapReduce Framework as Yarn.

Enable Kerberos Authentication

1. Select **Kerberos Authentication** checkbox, if the Warehouse is Kerberos enabled HIVE server.



2. Fill in the fields as follows:

Field	Description
Server Principal	Enter the Principal used by the HIVE server to authenticate with the Kerberos Key Distribution Center (KDC) Server.
User Principal	Enter the Principal that HIVE JDBC client uses to authenticate with the KDC server for connecting the HIVE server. For example, gpadmin@EXAMPLE.COM.
Kerberos Keytab File	View the Kerberos keytab file location configured in the HIVE Configuration panel on the Reporting Engine General Tab. **Note:** Reporting Engine supports only the data sources configured with the same Kerberos credentials, like, User Principal and key tab file.

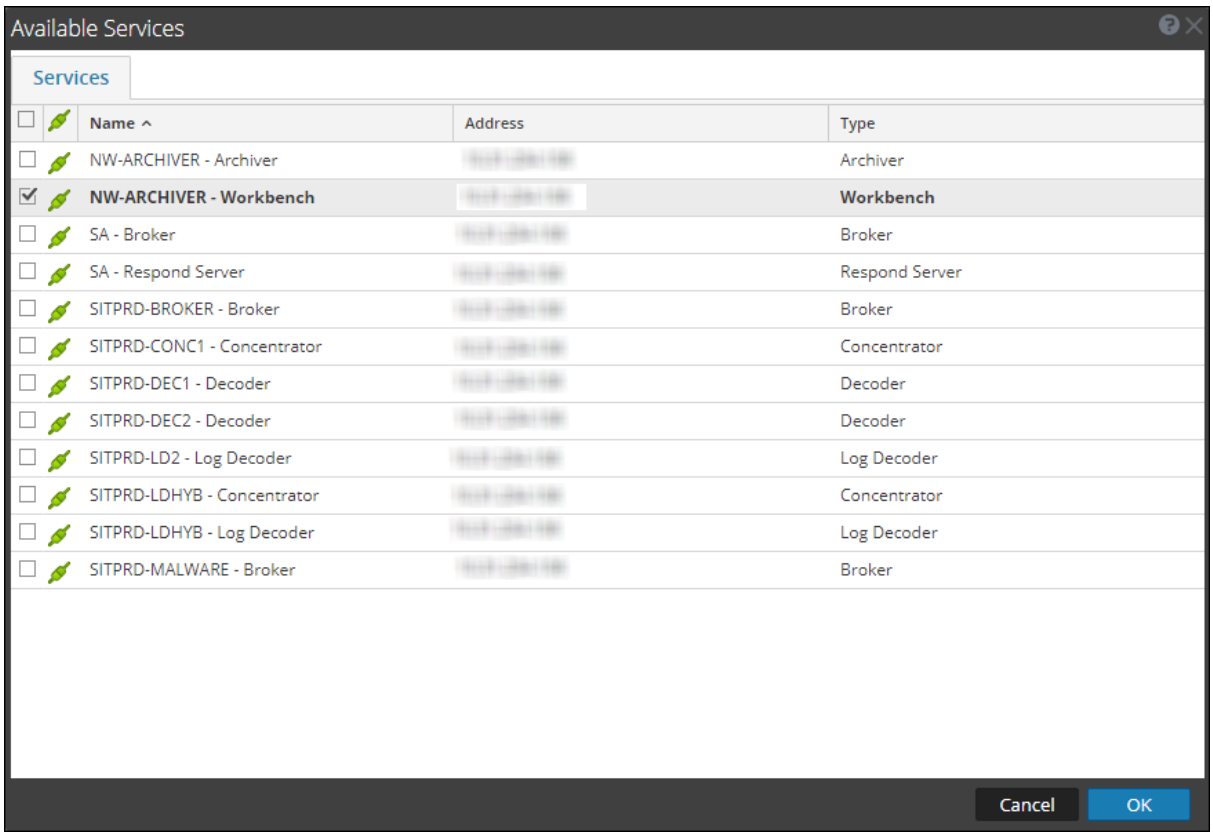
3. Click **Test Connection** to test the connection with the values entered.

4. Click **Save**.

   The added Warehouse data source is displayed in the Reporting Engine Sources tab.

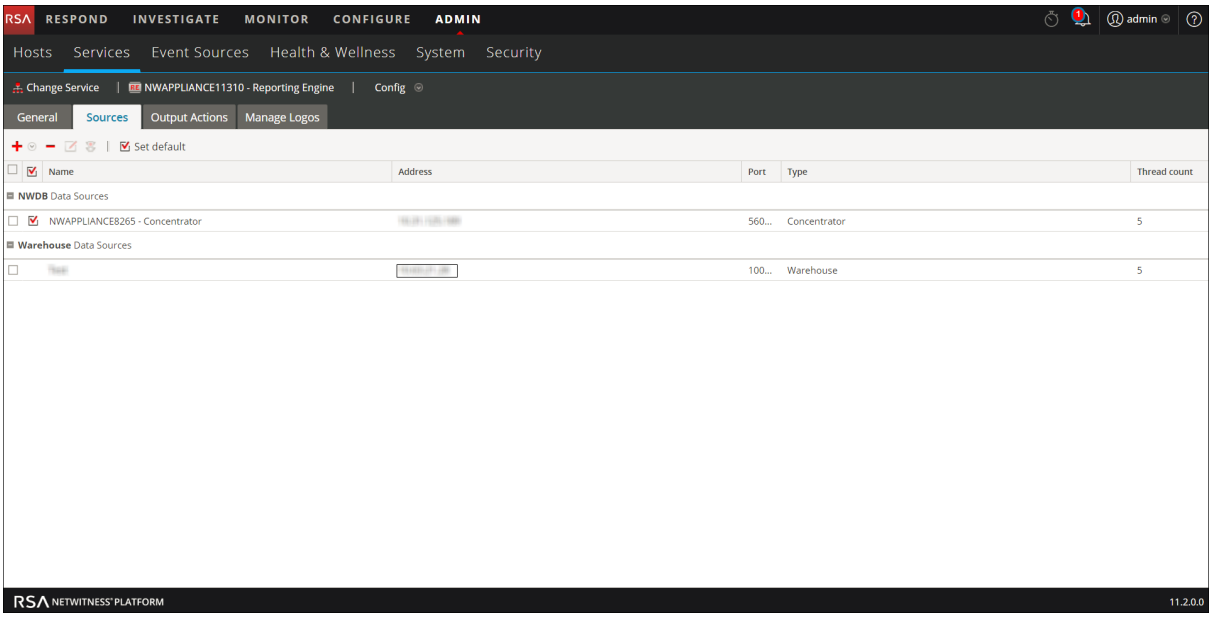
5. Click + > **Available Services**.

   The Available Services dialog box is displayed.



6. In the Available Services dialog box, select the service that you want to add as data source to the Reporting Engine and click **OK**.

   NetWitness Platform adds this as a data source available to reports and alerts against this Reporting Engine.



Note: This step is relevant only for an Untrusted model.

Set a Data Source as the Default Source

To set a data source to be the default source when you create reports and alerts:

1. Go to **ADMIN** > **Services**.
2. In the **Services** list, select a **Reporting Engine** service.
3. Select > **View**> **Config**.

   The Services Config View of Reporting Engine is displayed.
4. Select the **Sources** tab.

   The **Services Config View** is displayed with the Reporting Engine Sources tab open.
5. Select the source that you want to be the default source (for example, Broker).
6. Click the Set default checkbox.

   NetWitness Platform defaults to this data source when you create reports and alerts against this Reporting Engine.

(Optional) Add Workbench as Data Source

You must configure Workbench,to be able to use data from Workbench data source to generate Reports and Alerts. The following instructions describe how to add Workbench service as a data source to Reporting Engine to generate report for the data collected by Workbench.

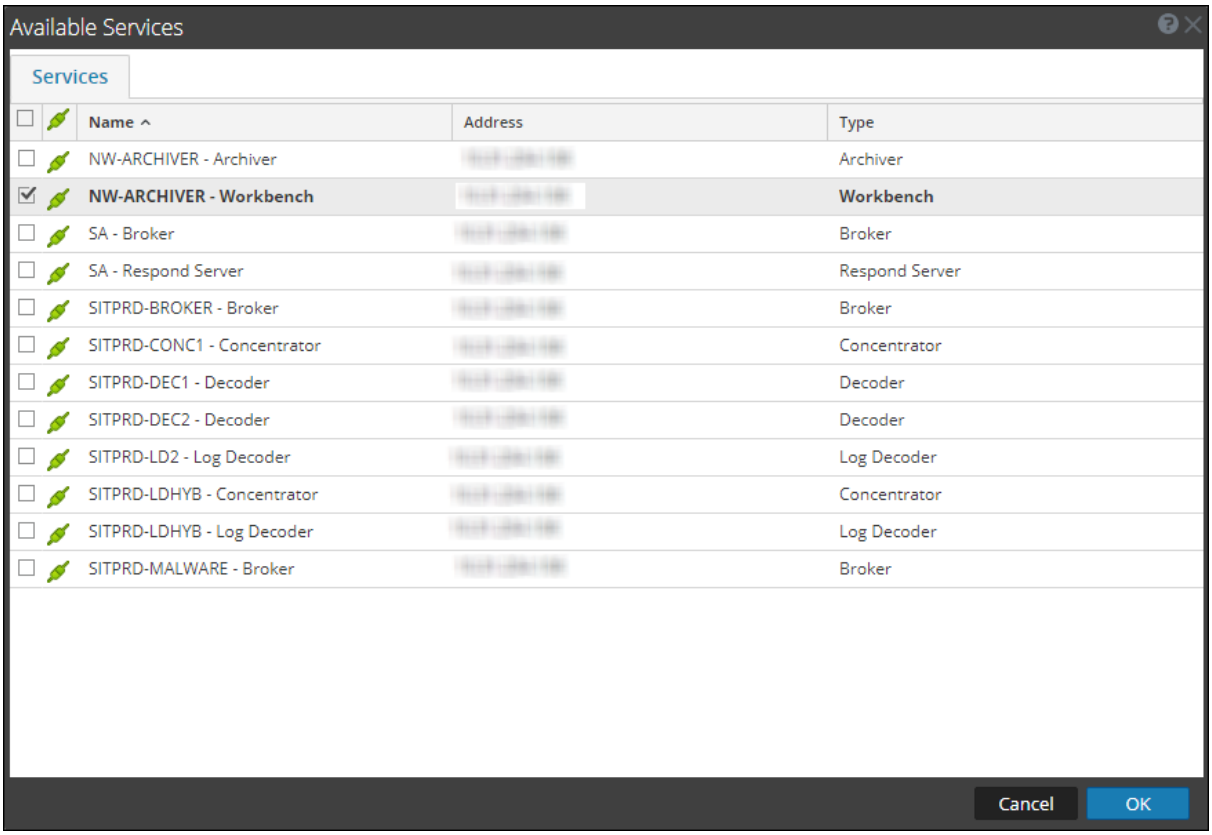
Prerequisites

Make sure you have:

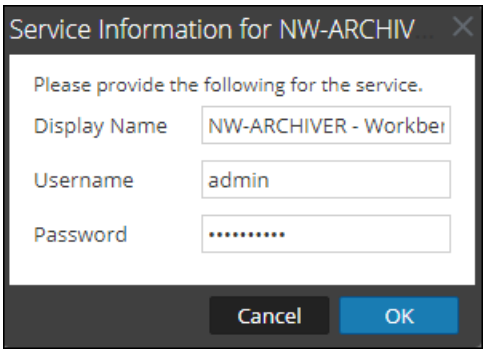
1. Added Workbench as a service to your NetWitness Platform deployment. For more information, see the *Archiver Configuration Guide*.
2. Added a Collection on the Workbench service.

To add Workbench as a data source to Reporting Engine:

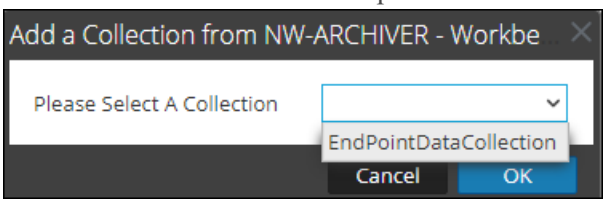
1. Go to **ADMIN** > **Services**.
2. In the **Services** list, select a **Reporting Engine** service.
3. Select > **View** > **Config**.
   The Services Config View of Reporting Engine is displayed.
4. Select the **Sources** tab.
5. Click and select **Available Services**.
   The Available Services dialog is displayed:



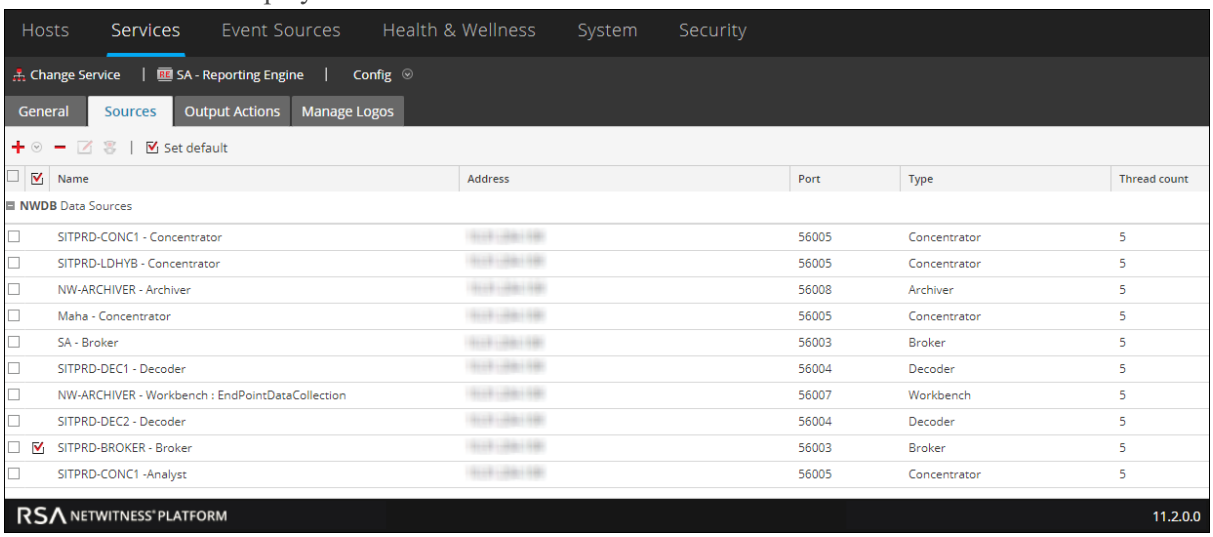
6. Select the Workbench service and click **OK**.
   A list of collections are displayed.
7. Enter the service information, and click **OK**



8. Select a collection from the dropdown.



9. The data source is displayed in the Sources tab.



The workbench service is now added as a data source to the Reporting Engine.

Note: The services with the Trust Model enabled must be added individually. You are prompted to provide a username and password for the selected service.

(Optional) Add Archiver as Data Source

You must configure Archiver, to be able to use data from Archiver data source to generate Reports and Alerts:

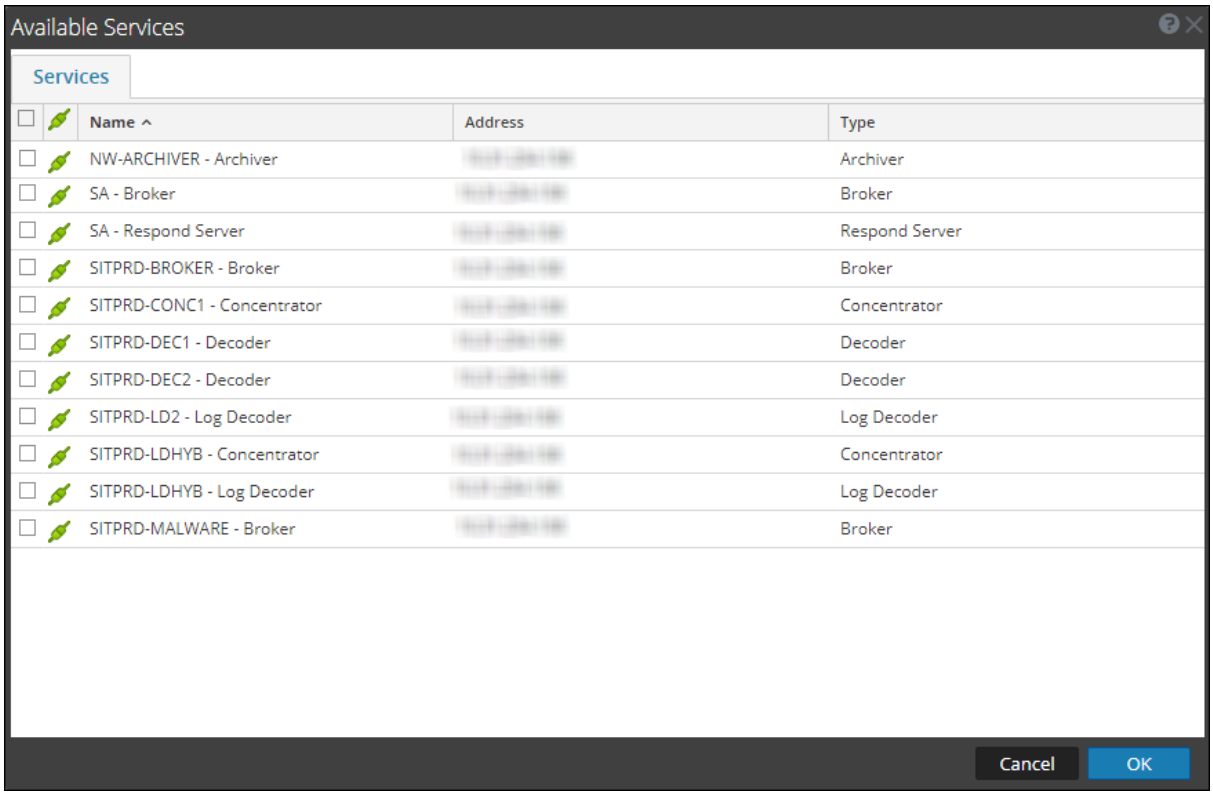
Prerequisites

Make sure that you have:

1. Installed the NetWitness Platform Archiver host in your network environment. For more information, see the *Hosts and Services Getting Started Guide*.
2. Installed and configured Log Decoder in your network environment. For more information, see "Add Log Decoder as a Data Source to Archiver" in the *Archiver Configuration Guide*.
3. Reporting Engine service is available in your NetWitness Platform deployment.
4. Added Archiver service to your NetWitness Platform deployment. For more information, see "Add the Archiver Service" in the *Archiver Configuration Guide*.
5. Applied license to the Archiver service.

To add Archiver Data Source to Reporting Engine:

1. Go to **ADMIN** > **Services**.
2. In the **Services** list, select the **Reporting Engine** service.
3. Click > **View** > **Config**.
   The Services Config View of Reporting Engine is displayed.
4. Select the **Sources** tab.
5. Click and select **Available Services**.
   The Available Services dialog is displayed.



6. Select the Archiver service and click **OK**.

   The service authentication dialog box is displayed.

   Note: The services with the Trust Model enabled must be added individually. You are prompted to provide a username and password for the selected service.

7. Enter the Username and Password for the Archiver.
8. Click **OK**.

   The selected Archiver is listed in the Aggregate Services pane.

(Optional) Integrate Endpoint Information Into Reports

You can use the Endpoint data by using the following instructions to add the Endpoint information into Reports. The *Endpoint Integration Guide* provides an overview of Endpoint integration into RSA NetWitness Platform.

Prerequisites

Make sure that:

- You have configured the Endpoint alerts via syslog into a Log Decoder. For more information see, "Configure Endpoint Alerts Via Syslog into a Log Decoder" topic in *Endpoint Integration Guide*).

To integrate Endpoint information into Reports:

1. In **Reporting Engine**> **View**> **Config**> **Sources**.
2. Add the Concentrator that is consuming data from the Log Decoder as a data source. Endpoint meta is populated in Reporting Engine.
3. Run reports by selecting the appropriate meta.

(Optional) Add Collection as Data Source to Reporting Engine

You must configure Collection, to be able to use data from Collection data source to generate Reports, Charts, and Alerts:

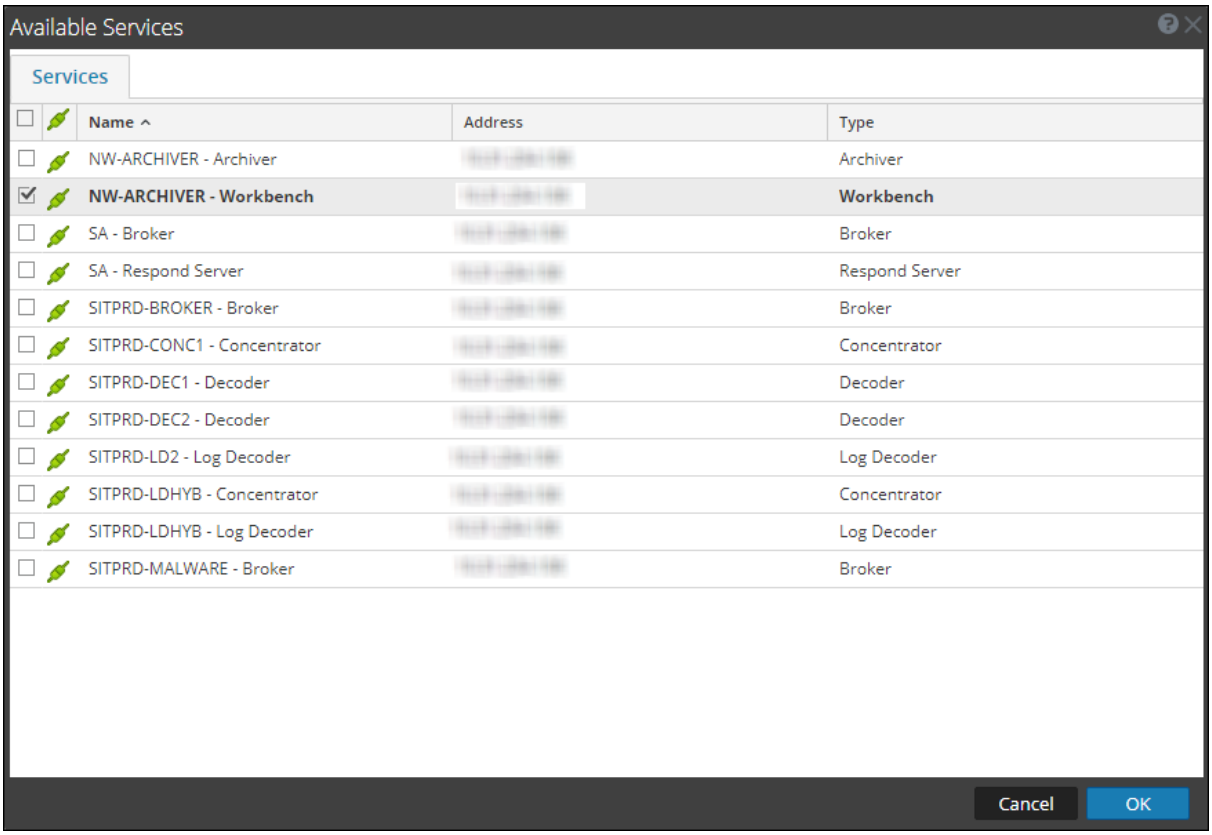
Prerequisites

Make sure that you have:

- Installed a Workbench service on a Reporting Engine host.
- Backed up data in a known location on your local host, if you are adding a collection using the data restored from the backed up data.

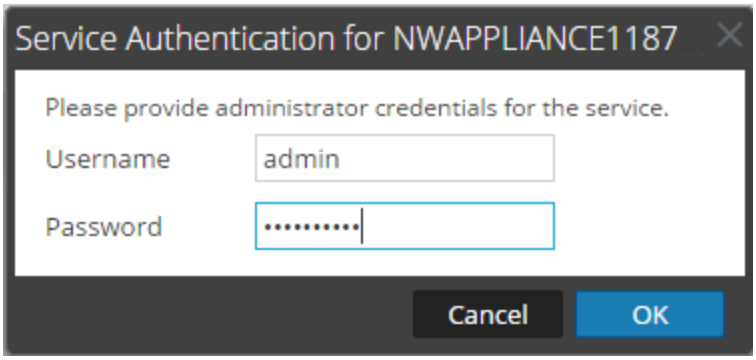
To associate a Collection as a data source with Reporting Engine:

1. Go to **ADMIN** > **Services**.
2. In the **Services** list , select a **Reporting Engine** service.
3. Click > **View** > **Config**.
   The Services Config View of Reporting Engine is displayed.
4. Select the **Sources** tab.
5. Click and select **Available Services**.
   The Available Services dialog is displayed.



6. Select the Workbench service and click **OK**.

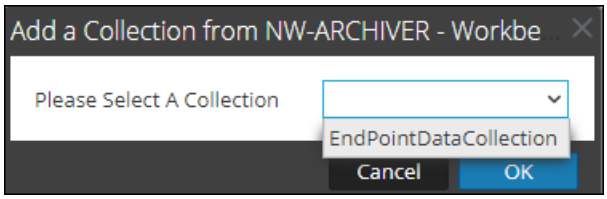
   The Service Authentication dialog for the selected service is displayed.



Note: The services with the Trust Model enabled must be added individually. You are prompted to provide a username and password for the selected service.

7. Enter the username and password for admin credentials for the service.
8. Click **OK**.

   The add collection dialog is displayed.



9. Select a collection from the drop-down list and click **OK**.

   The workbench service is now added as a data source to the Reporting Engine.

Configure Data Privacy for the Reporting Engine

You can configure the data privacy for all data sources of Reporting Engine using the Sources tab of the **Services** > **View** > **Config** view.

With the addition of the Data Privacy feature to NetWitness Platform 11.0 and above, access to sensitive meta in NetWitness Platform Core services can be restricted by configuring separate data sources for Data Privacy Officer (DPO) users and non-DPO users, and limiting access to those data sources by assigning appropriate permissions.

In the **Services** > **Config** view, you can add each Core service as two separate data sources: one with a service account having privileges equivalent to a DPO and the other with a service account having privileges equivalent to any other user. Then, to limit access to those data sources based on roles, you can assign read access or no access to those data sources for individual roles. To limit access to Warehouse data sources, you can do the same.or more information, see Configure Data Source Permissions.

Note: A user assigned to the `Data_Privacy_Officers` role (or an equivalent custom role), can create a report, chart and alert. Also, configure a report or alert output actions in the Reporting module. In an environment where data privacy features of NetWitness Platform are enabled and one or more meta keys are configured as protected, these actions can result in the following:
- When an alert is created by a DPO user, any protected or sensitive meta involved in the alert is automatically available in Respond. This may inadvertently provide all the users of Respond module access to the sensitive meta values, regardless of their roles. One option to prevent this is to disable publishing into Respond from Reporting.
- When an Output Action is configured by a DPO user, either sensitive meta values, reports with sensitive meta values or both, may become available to target users or destinations of that Output Action, regardless of the role assigned to the target user.

It is strongly recommended that DPO users completely avoid creating alerts or configuring output actions for a report or alert in the Reporting module. If they do such configuration, the above implications must be carefully considered.

NetWitness Platform Core services (for example, Concentrator, Broker, or Archiver) support the ability to restrict meta data based on the configured user role. To make use of the data privacy feature for Reporting Engine, you can configure two separate service accounts against Core services. One service account for general purpose reporting that does not include any sensitive data and the other account for privileged users with access to all data including sensitive data. The access to restricted meta data for the two service accounts is configured as part of the data privacy plan on each Core service.

In Reporting Engine, you can add each Core service as two separate data sources (one being the regular data source and the other a privileged data source) using the two separate service accounts. You can configure Reporting Engine to allow only users with privileged roles to access the sensitive data source. Hence, Reporting Engine can connect to a NWDB Data source in two ways:

- Using a service account with DPO role.
- Using a service account without a DPO role.

Note: You can also add two or multiple data sources for the same Core service.

After adding two data sources with different service accounts for the same Core service, you can configure data source permissions to manage access to these data sources. For more information, see Configure Data Source Permissions.

Note: If the content is changed to utilize the transformed meta key, the hash value of the original meta is displayed in its place when viewing reports, charts and alerts.

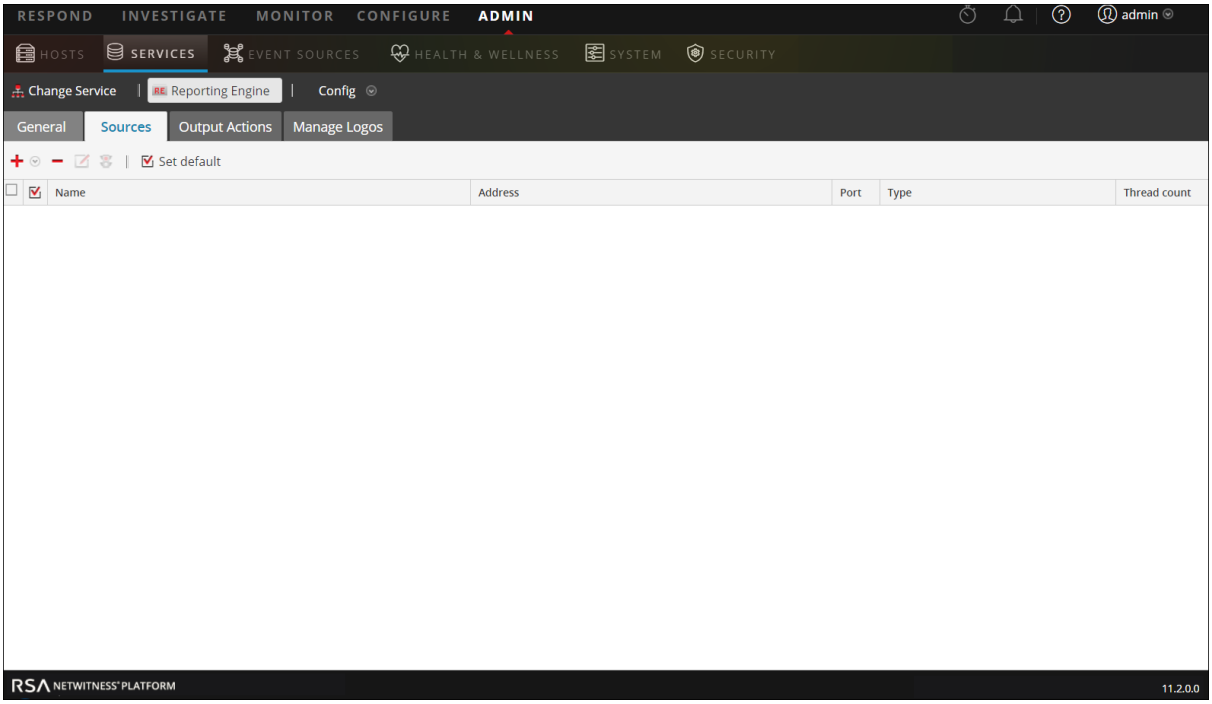
Add a NWDB Data Source with Different Service Accounts

To add a NWDB data source:

1. Go to **ADMIN** > **Services**.
2. In the **Services** list, select a **Reporting Engine** service.
3. Click **View** > **Config**.

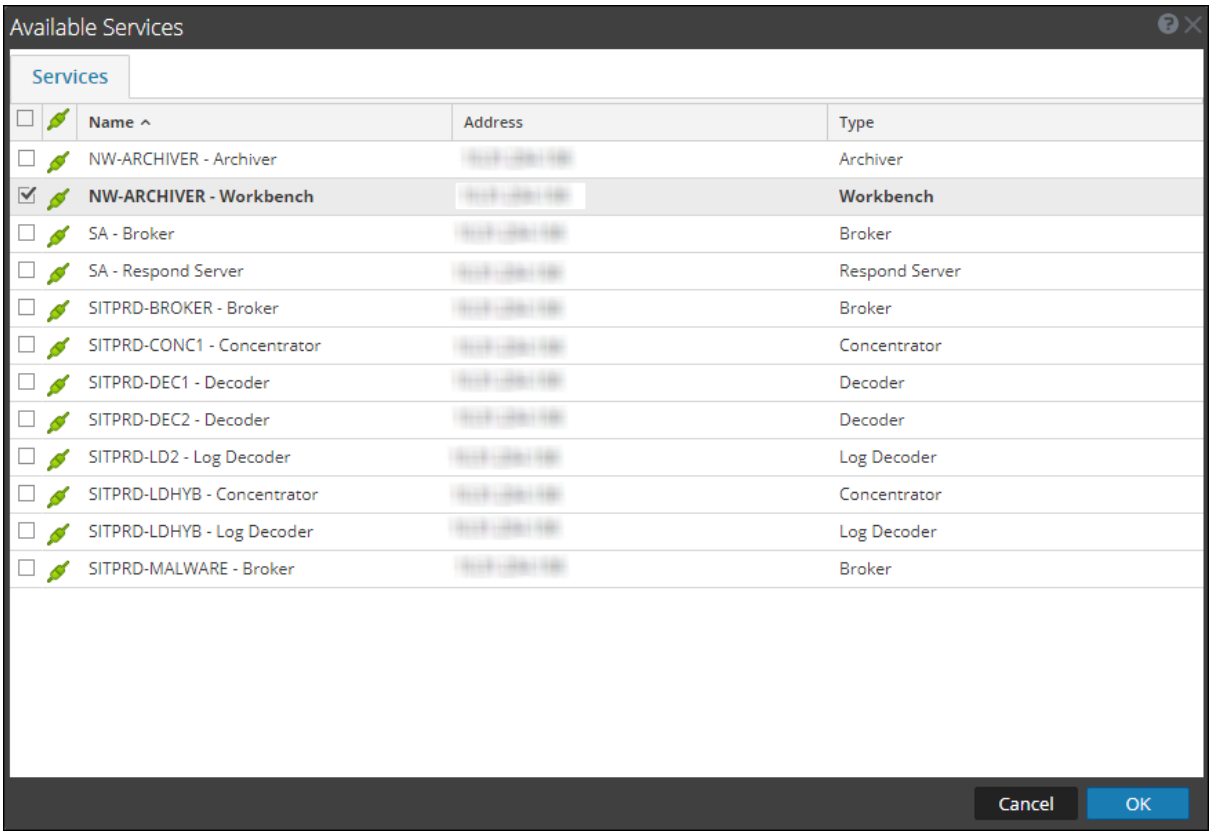
   The Services Config view of Reporting Engine is displayed.
4. Select the **Sources** tab.

   The Services Config View is displayed.



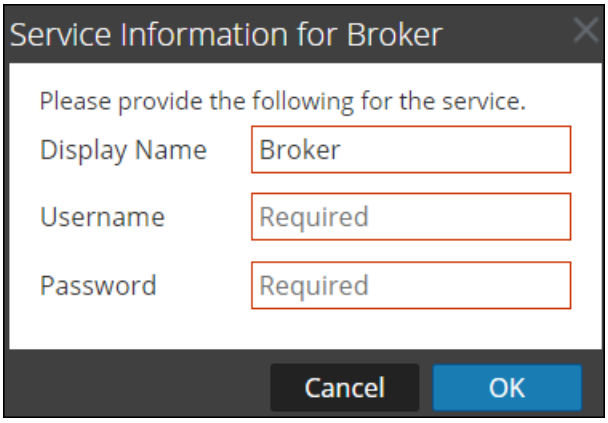
5. Click and select Available Services.

   The Available Services dialog is displayed. All services are listed, including those that have already been added to the Reporting Engine.



6. Select the checkbox next to the service and click **OK**.

   The Service Information dialog for the selected service is displayed.



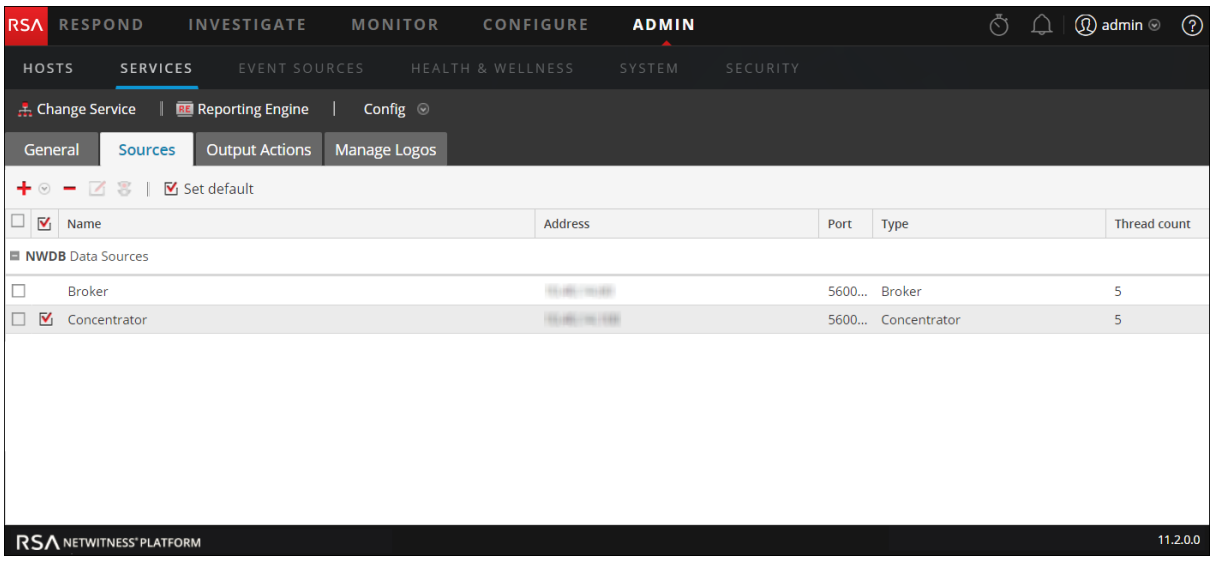
Note: NetWitness Platform prompts you to provide a username and password for the selected service. To limit access to sensitive data, DPO users must use their credentials while adding the source instead of using the admin credentials. These credentials need to be applied to the host even if using trusted connections between the NetWitness Platform server and NetWitness Platform Core hosts.

   Repeat the step for Non-DPO data source.

7. Enter the username and password for the required service account.

8. Click **OK**.

   The required service is added as a data source to the Reporting Engine. Two data sources are added to Reporting Engine for the same Core device.



Configure Data Source Permissions

You can configure data source permissions for Reporting Engine using the **Sources** tab of the **Services** > **Config** view. This helps manage access control to the data sources by setting the data source permissions. Now, with the ability to add more than one data source for the same Core service, you can configure different permissions for each data source of the same Core service. For example, data privacy officers (DPO) can create a Warehouse source using their credentials, and that allows them to execute reports against the Warehouse while restricting everyone else from being able to use that source.

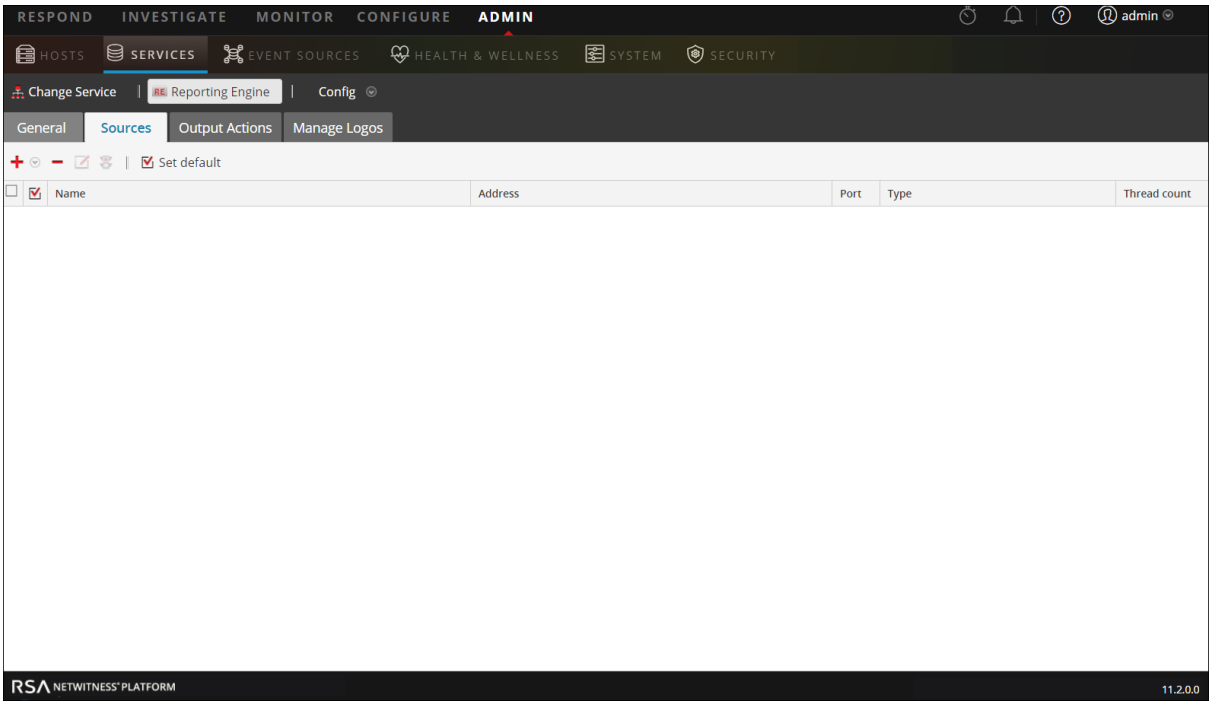
Note: In 11.x, the permissions for NWDB and Warehouse data sources are automatically set based on the permissions of the reporting objects. For example, if the role had the permissions set as **Read Only**/**Read & Write** for any reporting object in 10.5, then that role is automatically assigned read only permission for all the data sources that existed in 10.5. If no permission is set for the role, then the data source permission is automatically set to No Access.

To configure permissions to data sources:

1. Go to **ADMIN** > **Services**.
2. In the **Services** list, select a **Reporting Engine** service.
3. Click > **View** > **Config**.

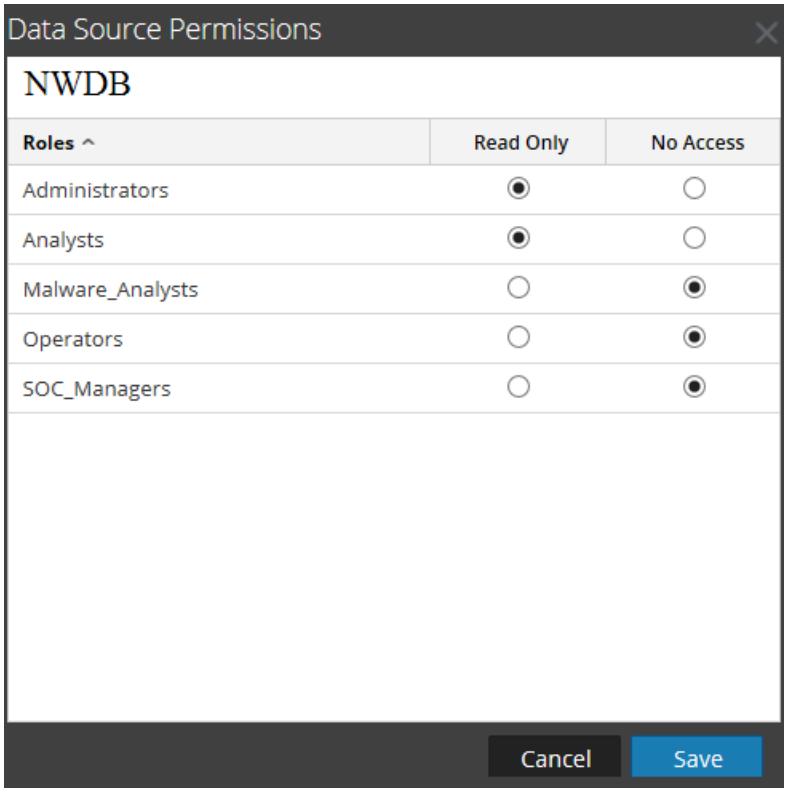
   The Services Config view of Reporting Engine is displayed.
4. Select the **Sources** tab.

   The Service Config View displays the Sources tab.



5. Select the data source for which you want to configure permissions by selecting the checkbox.
6. Click .

   The Data Source Permissions dialog is displayed.



7. Modify the access permission for different users based on the type of service account of the data source. The permission can be either **Read Only** or **No Access**.
8. Click **Save**.

   The required permissions are configured for the data source. For more information, see the *Reporting Guide*.

Configure Reporting Engine Settings

After you configure the Reporting Engine and required data sources based on your requirements, you can modify some of the configurations to customize your Reports, Charts, and Alerts.

To configure the settings:

1. Go to **ADMIN** > **Services**.
2. In the **Services** list, select a **Reporting Engine** service.
3. Click > **View** > **Config**.

   The Services Config View of Reporting Engine is displayed with the General tab highlighted. For more information on Reporting Engine General tab, see Reporting Engine General Tab.
4. Edit the Reporting Engine service settings and click **Apply**.

   The service settings are configured on Reporting Engine.

Enable LDAP Authentication

To enable LDAP mode of authentication using Active Directory for HiveServer2 for Warehouse data source, follow these steps.

1. Log on to the RSA Analytics Warehouse appliance as root user.
2. Navigate to `/opt/mapr/hive/hive-0.11/conf.new/` directory. Type the following command and press ENTER:

   ```
   cd /opt/mapr/hive/hive-0.11/conf.new/
   ```
3. Edit the file `hive-site.xml`. Type the following command and press ENTER:

   ```
   vi hive-site.xml
   ```
4. Add the following properties under `<Configuration>` tag:

   ```
   <property> <name>hive.server2.authentication</name> <value>LDAP</value>
   </property> <property> <name>hive.server2.authentication.ldap.url</name>
   <value>LDAP_URL</value> </property>
   ```

   Where `LDAP_URL` is the URL of the LDAP Server.
5. Restart HiveServer2.

Add Additional Space for Large Reports

To add additional disk space to the Reporting Engine for large reports, follow the below steps. If large compliance reports have to be generated for Warehouse, the Reporting Engine disk space might get consumed quicker than expected. In such cases, you can mount any external storage such as SAN or NAS for storing reports.

The directories that tend to fill up disk space are `resultstore` and `formattedReports` under the Reporting Engine home directory. It is recommended to move only these two directories to SAN or NAS and replace the original locations with soft links pointing to the new locations. It is also recommended to leave the remaining directories in the local disk itself for reliable and high I/O performance.

Note: The following steps assume that the Reporting Engine home directory is located at `/var/netwitness/re-server/rsa/soc/reporting-engine/` and the external storage is mounted under `/externalStorage/`. Also, the 'rsasoc' user must have read-write access to the specified external storage path.

To move disk space for the Reporting Engine to external storage:

1. Stop Reporting Engine service as a root user.

   ```
   service rsasoc_re stop
   ```

2. Switch to `rsasoc` user.

   ```
   su rsasoc
   ```

3. Change to RE home directory.

   ```
   cd /var/netwitness/re-server/rsa/soc/reporting-engine/
   ```

4. Move the resultstore directory to a mounted external storage. Type the following command and press ENTER:

   ```
   mv resultstore /externalStorage
   ```

5. Move the formatted Reports directory to a mounted external storage. Type the following command and press ENTER:

   ```
   mv formattedReports /externalStorage
   ```

6. Create a soft link for resultstore. Type the following command and press ENTER:

   ```
   ln -s /externalStorage/resultstore /var/netwitness/re-server/rsa/soc/reporting-engine/resultstore
   ```

7. Create a softlink for formattedReports. Type the following command and press ENTER:

   ```
   ln -s /externalStorage/formattedReports /var/netwitness/re-server/rsa/soc/reporting-engine/formattedReports
   ```

8. Exit the `rsasoc` user.

   ```
   exit
   ```

9. Start Reporting Engine service as a root user.

   ```
   service rsasoc_re start
   ```

   Note: If the external storage is offline, you cannot perform the following tasks:
   1) Execute Reports or Reporting Alerts
   2) View existing Reports or Reporting Alerts
   However, you can create new Reporting objects such as Reports and Charts, and access Charts and Live Dashboard created for charts. Therefore, you must ensure that the external storage is reliable and has the required space.

   Additionally, if you want to store reports beyond 100 days, change the retention configuration appropriately for the service that you are using as a data source.

Accessing Reporting Engine Log Files

You can access the Reporting Engine log files which are stored in the following logs directory `/var/netwitness/re-server/rsa/soc/reporting-engine/logs/`

- Current logs in the `reporting-engine.log` file.
- Backup copies of previous logs in the `reporting-engine.log.*` file.
- All UNIX script logs in the files that have the following syntax: `reporting-engine.sh_timestamp.log` (for example, `reporting-engine.sh_20120921.log`)

The Reporting Engine rarely writes command line error messages to the `rsasoc/nohup.out` file.

The Reporting Engine appends the log messages and output written by systemd system and the commands used to start the reporting-engine to the directory `/var/log/messages`.
A `/var/log/messages` log file is a system log file so only the root user can read it.

Configuring Task Scheduler for a Reporting Engine

You can configure queues and pools in the Reporting Engine to schedule NWDB or Warehouse reports. For more information on Task Schedulers, see "Task Scheduler for Warehouse Reporting" in the *Reporting Guide*

Prerequisites

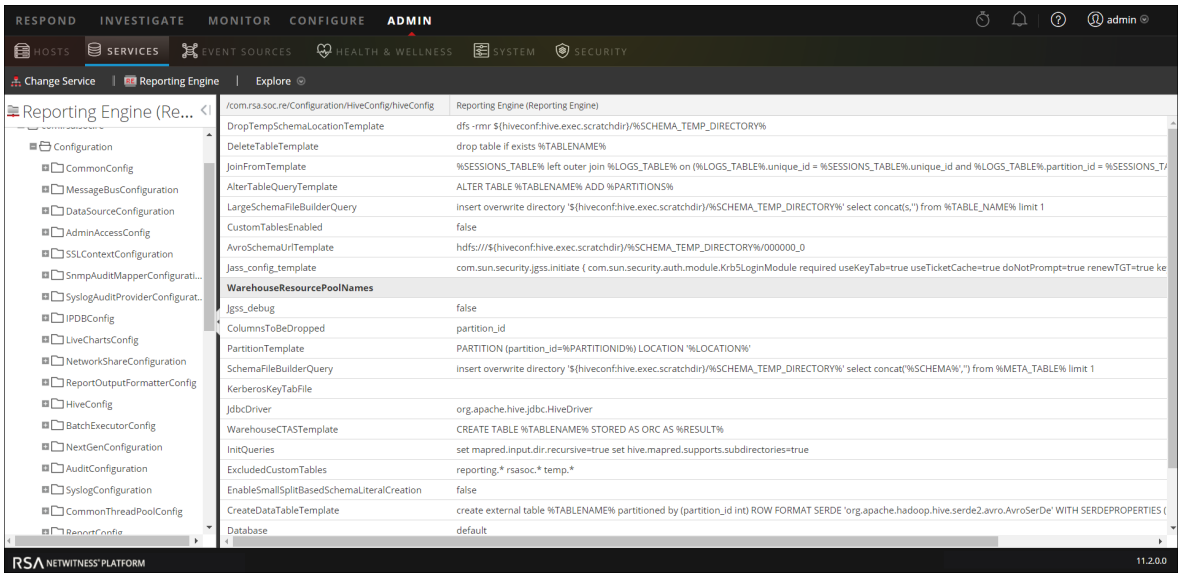
Make sure that you have identified the following:

- Scheduler type and pools or queues you want to use. You can configure only one scheduler for the Reporting Engine. By default the Fair Scheduler is configured.
- Names of the queues or pools, and the resources given to each queue and pool.
- NetWitness Platform does not support multiple queues or pools per cluster. RSA recommends that you either provide unique names to queues or pools in all the clusters or use the same queue or pool names in both the clusters. If cluster size is large, there may be more than 3 pools or queues.
- If you are using an unsupported scheduler, the Reporting Engine does not set any property for the jobs that it launches.
- If the name of the pool or queue does not exist in the cluster, then Capacity Scheduler uses the default queue for the report. The Fair Scheduler may not execute the rule or creates a new pool with the lowest share. This is based on the value specified for the Fair Scheduler property `mapred.fairscheduler.allow.undeclared.pools`.
- If you do not specify a pool or queue, the job launched by the test rule is in the `mapr` pool or the default queue. RSA recommends that you configure a pool mapr with low (around 1/10 of total capacity) share with `maxRunningJobs = 2` so that these rules do not disrupt running reports. Make sure that you do not specify this pool name for any reports.

Specify the Pools and Queues

To specify the pools and queues:

1. Go to **ADMIN** > **Services**.
2. Select **Reporting Engine** and click > **View** > **Explore**.
3. Select **com.rsa.soc.re** > **Configuration** > **HiveConfig** > **hiveconfig** > **WarehouseResourcePoolNames**.
4. In the **WarehouseResourcePoolNames** field, enter the pool or queue names separated by spaces. For example, to configure four pools or queues with the names pool1, pool2, wrong and default, enter the names separated by a space.



Define Reports, Charts, and Alerts

After you configure the Reporting Engine and the required data source based on your requirement, you can generate your Reports, Charts, and Alerts.

Define Reports

After creating the data sources and configuring the user permissions to these data sources, you can now use these data sources to perform the following tasks for Reporting module:

- Define a Rule
- Test a Rule
- Schedule Reports
- Add an Alert
- Add a Chart
- Test a Chart

For more information, see the above topics in the *NetWitness Reporting Guide*.

Define Charts

After creating the data sources and configuring the user permissions to these data sources, you can now use these data sources to perform the following tasks for Reporting module:

- Define a chart and Chart Groups
- Test a Chart
- Investigate Charts
- Manage Charts

For more information, see the above topics in the *NetWitness Reporting Guide*.

How to define Alerts

After creating the data sources and configuring the user permissions to these data sources, you can now use these data sources to perform the following tasks for Alerting module:

- Configure Alerts
- Generate Alerts
- Add an Alert
- View an Alert

- View and Alert
- View Alerts Schedule
- Investigate an Alert

For more information, see the above topics in the *NetWitness Reporting Guide*.

Configure Reporting Engine General Settings

After you add and configure the Reporting Engine service, the system settings are defined with default values to achieve optimal results. However, you can modify and customize the Reporting Engine notifications based on your requirement by navigating to the **General** tab in the **Services** > **Config** view for a Reporting Engine.

Access the General Tab

You need to open the General tab to configure the general parameters for Reporting Engine.

To access this view:

1. Go to **ADMIN** > **Services**.
2. In the Services list, select a **Reporting Engine** service.
3. Click **View** > **Config**.
4. Select the **General** tab.
5. Click **Apply** after you edit the parameters.

After you navigate to the General tab, you can modify the following parameters.

- System Configuration
- Logging Configuration
- Warehouse Analytics Output Configuration
- Warehouse Analytics Model Configuration
- Warehouse Kerberos Configuration

For more information see, General tab for details on the configuration parameters.

References

You can customize and make optimum use of the service by modifying the Reporting Engine settings in the **Services** > **Config** view, which has parameters that specifically pertain to the Reporting Engine.

Reporting Engine General Tab

The General tab for the Reporting Engine service controls several settings that can tune the performance of a service and specify the user credentials for the service. Navigate to Services > View > Config > Reporting Engine > General. These settings are used for the Reporting Engine service exclusively.

The required permission to access this view is Manage Services.

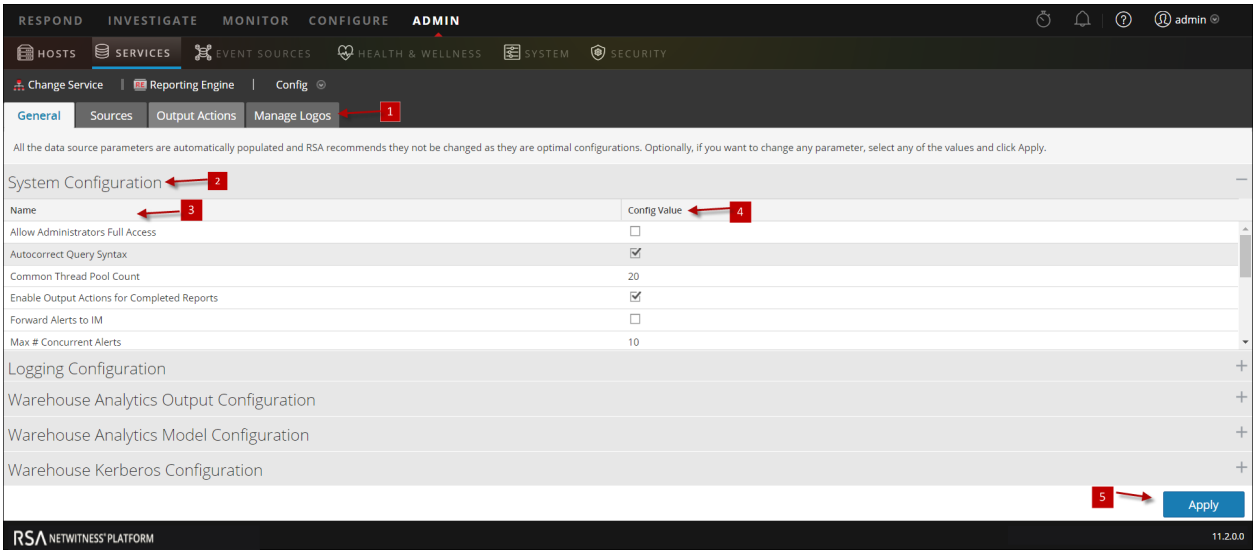
- How Reporting Engine Works

Quick Look

Here is example of the General tab where service configurations are displayed.



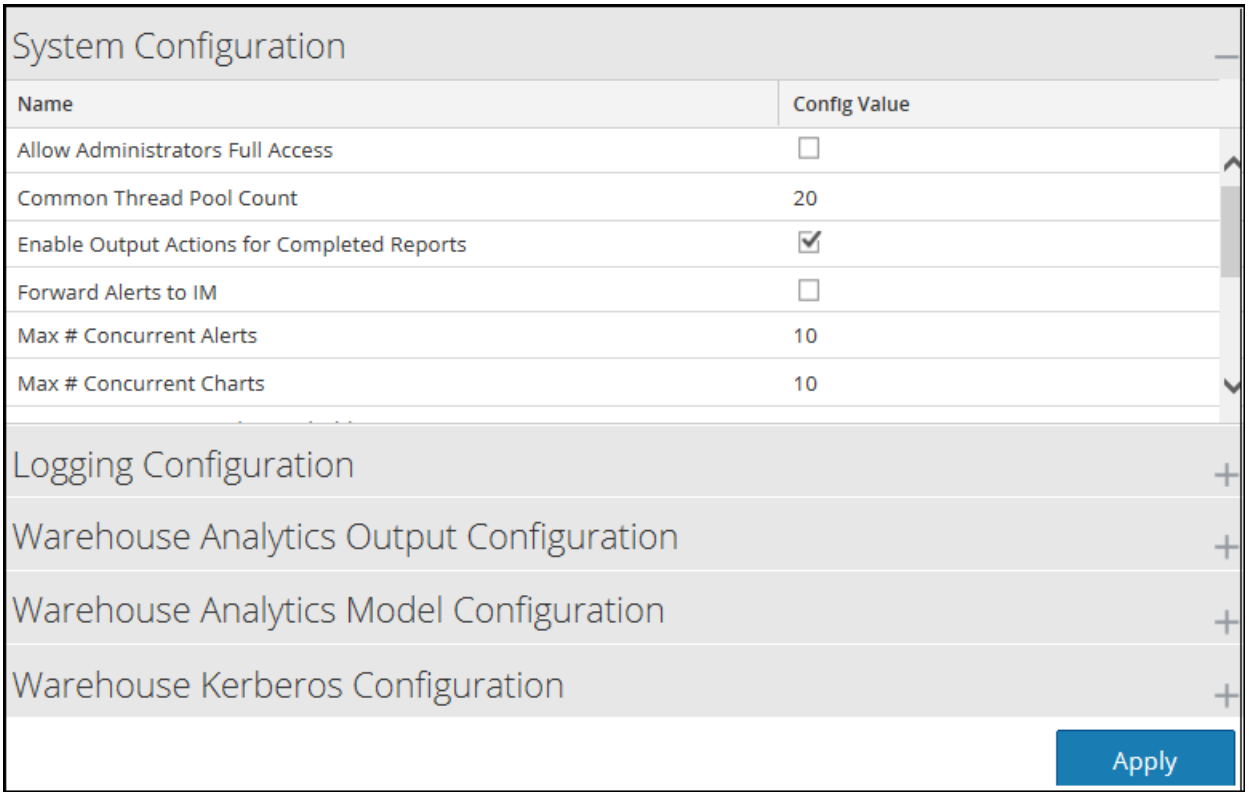
1 Displays all the available configurable tabs.
2 Displays the available configuration parameters for the system.
3 Displays the name of the parameter.
4 Displays the set values for each parameter.
5 Applies the changes.

Note: Warehouse Analytics is not supported in NetWitness Platform11.0 or later release.

System Configuration

The System Configuration panel parameters for the Reporting Engine manage service configuration for a Reporting Engine service. When you add a Reporting Engine service, default values are in effect. The default values are designed to accommodate most environments and recommends that you do not edit these values because it may adversely affect performance.

The following figure displays the fields that can be configured in the System Configuration panel:



The following table describes the System Configuration panel features.

Name	Config Value
Allow Administrators Full Access	Select the checkbox if you want to access all the Reporting Engine objects (Reports, Rule, Charts, Schedule, and List) created by other users (non-admin). By default, this is not enabled. **Note:** If you enable the checkbox and then disable it, the access on all Reporting Engine objects that were enabled by selecting the checkbox will not be accessible. But, if you have defined the access on specific objects via Permissions window (**Reports > Manage > RE Object >** **> Permissions**), enabling/disabling this checkbox will not have impact on these objects.

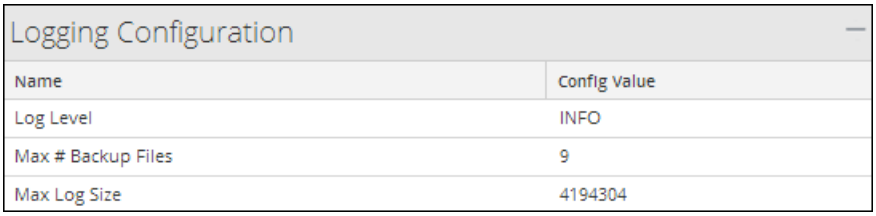
Name	Config Value
Common thread pool count	The number of thread pools assigned for executing common tasks on the Reporting Engine. A valid value is an integer (**20** default).
Enable Output Actions for Completed Reports	Select the checkbox to process the output actions only for reports with all rule executions successful. By default, this is enabled. If disabled, the output actions are processed for all scenarios (completed, partial, failure).
Forward Alerts to Respond	Select the checkbox to forward all the alerts to Respond. By default, this is not enabled.
Max# of Concurrent Alerts	The maximum number of alerts that can be run simultaneously. This has a direct impact on the RSA service against which the alerts are run, as each alert consumes a query thread on the RSA service. A valid value is an integer (**10** default).
Max # of Concurrent Charts	The maximum number of charts that can be run simultaneously. A valid value is an integer (**10** default).
Max # of Concurrent LookupAndAdd Queries	The maximum number of parallel LookupAndAdd Queries that can be run per NWDB rule. A valid value is an integer (**2** default). When you increase this value, for better performance, you must ensure the NWDB data source is configured to handle the parallel queries.
Max # Concurrent List Value Reports	The maximum number of list value reports per schedule that can be generated in parallel. A valid value is an integer (**1** default).
Max # List Value Reports	The maximum number of list value reports generated, irrespective of the number of values in the list. A valid value is an integer (**10000** default).
Max rows stored per Rule (Billions)	The maximum number of rows that a rule can fetch when queried. A valid value is an integer (**100** default).
Maximum disk space threshold	The maximum disk space threshold allotted (in GB) to execute reports, alerts and charts. The initial value is configured based on the available system space.
Minimum disk space threshold	The minimum disk space threshold allotted (in percentage) required to execute reports, charts, and alerts. By default, this is value is set to 5. **Note:** If the minimum threshold is reached, then the execution of reports, charts and alerts will stop even if the service is running.
NWDB Info Queries Time Out	The info queries time out in seconds for NWDB server. A valid value is an integer (**0** default).
NWDB Maximum aggregate Rows	The maximum number of rows that is returned when an aggregation is used in the NWDB rule. A valid value is an integer (**1000** default).

Name	Config Value
NWDB Query Time out	The time out in seconds for NWDB server to time out the rule execution, if it cannot process the result in configured time. The default value is set to 0 which implies that there is no time out. A valid value is an integer.
Process output actions for successful reports only	Select this checkbox to process output actions only for reports whose all rule executions are successful. When you de-select this checkbox, output action will be triggered for partial, completed, and failed reports. **Note:** This is applicable for all output actions except for dynamic list output actions.
Retain Alert history for # days	The maximum number of days to retain the alert history and alert status. A valid value is an integer (**100** default).
Retain Chart history for # days	The maximum number of days to retain the chart history and chart status. A valid value is an integer (**30** default).
Retain Report history for # days	The maximum number of days the system retains report history and report status. A valid value is an integer (**100** default).
Schedule Thread pool count	The number of thread pools assigned for scheduled tasks (for example, clearing history) on the Reporting Engine. A valid value is an integer (**5** default).

Logging Configuration

The Logging Configuration panel parameters of the Reporting Engine manages the logging configuration for a Reporting Engine service. When you add a Reporting Engine service, default values are in effect. RSA designed the default values to accommodate most environments and recommends that you do not edit these values because it may adversely affect performance of the Reporting Engine.

The following figure displays the fields that can be configured in the Logging Configuration panel.



The following table describes the Logging Configuration panel features.

Name	Config Value
Log Level	The logging level that determines the scope of information included in log files. Possible values are: • ERROR • WARN • INFO (default) • DEBUG • ALL
Maximum # Backup Files	The maximum number of backup log files the system retains. A valid value is an integer (**9** default).
Max Log Size	The maximum size (in bytes) of the primary log file. A valid value is an integer (**4194304** default).

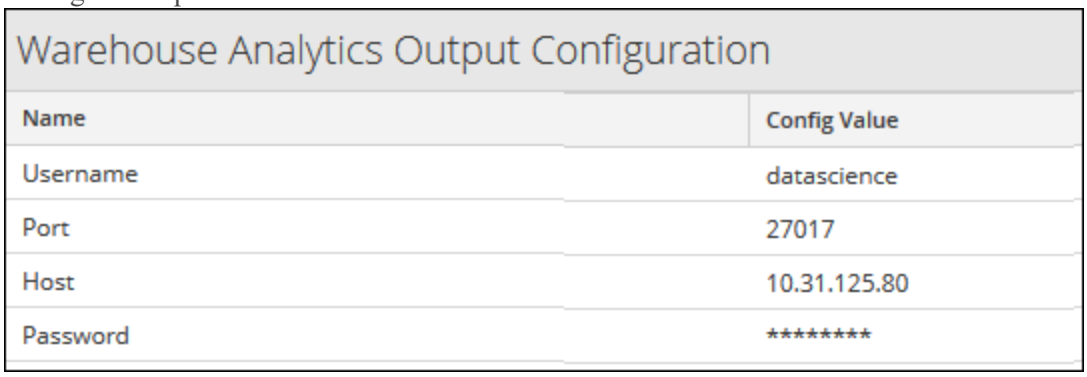
For more information on Reporting Engine logging, see Accessing Reporting Engine Log Files.

Warehouse Analytics Output Configuration

Note: Warehouse Analytics is not supported in NetWitness Platform11.0 release.

The Warehouse Analytics Output Configuration panel provides a way to specify the Warehouse Analytics Output configuration on this Reporting Engine.

The following figure displays the fields that can be configured in the Warehouse Analytics Output Configuration panel:



After an upgrade, make sure you update the centralized **Mongo DB** details to be able to use Warehouse Analytics.

The following table describes the Warehouse Analytics Output Configuration panel features.

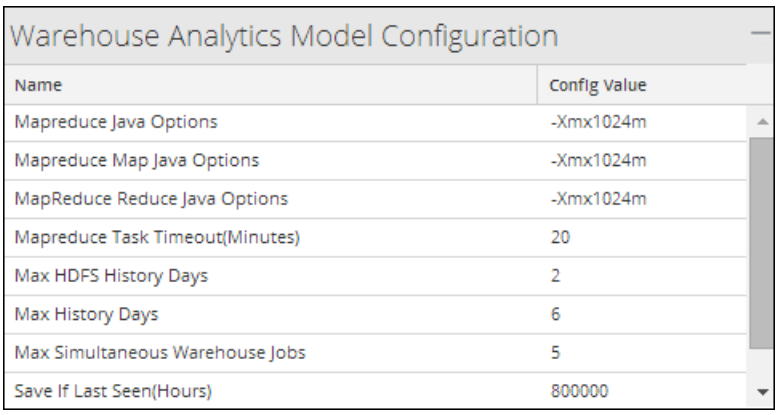
Name	Config Value
Name	**Config Value**
Username	The username for the warehouse analytics user.

Name	Config Value
Port	The port of the Mongo DB used by warehouse analytics.
Host	The host of the Mongo DB used by warehouse analytics.
Password	The password for the warehouse analytics user.

Warehouse Analytics Model Configuration

The Warehouse Analytics Model Configuration panel provides a way to specify the Warehouse Analytics Model configuration on this Reporting Engine.

The following figure shows the fields that can be configured in the Warehouse Analytics Model Configuration panel:



The following table describes the Warehouse Analytics Model Configuration panel features:

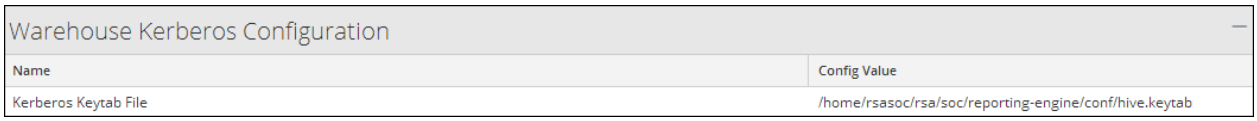
Name	Config Value
Mapreduce Java Options	The JVM Parameters for Hadoop MapReduce task tracker child JVM. By default, the value is **-Xmx1024m**.
Mapreduce Map Java Options	The parameter which controls the JVM parameters for Map jobs inside the Hadoop cluster. By default, the value is **-Xmx1024m**.
MapReduce Reduce Java Options	The parameter which controls the JVM parameters for Reduce jobs inside the Hadoop cluster. By default, the value is **-Xmx1024m**.
Mapreduce Task Timeout (Minutes)	The number of minutes before a task is terminated when a MapReduce framework titles it as non-responsive or idle. A valid value is an integer (**20** default).
Max HDFS History Days	The maximum number of days to maintain the temporary and output files of the job in HDFS. A valid value is an integer (**2** default).
Max History Days	The maximum number of days to maintain the job output in Mongo DB. A valid value is an integer (**6** default).

Name	Config Value
Max Simultaneous Warehouse Jobs	The parameter which controls the maximum number of parallel jobs executed through the Warehouse Analytics framework. A valid value is an integer (**1** default).
Save If Last Seen (Hours)	The parameter to save the keys from the job output is they were not seen in the last 'n' hours. A valid value is an integer (**800000** default).
Threshold Score	The parameter to save the keys from the job output to watchlists for use by ESA only if the score is greater than 'n'. A valid value is an integer (**55** default).

Warehouse Kerberos Configuration

The Warehouse Kerberos Configuration panel provides a way to specify the Kerberos Keytab file on this Reporting Engine.

The following figure displays the field that can be configured in the Warehouse Kerberos Configuration panel:



The following table describes the Kerberos Configuration panel features:

Name	Config Value
Kerberos Keytab File	The Kerberos keytab file location. For example: `/var/netwitness/re-server/rsa/soc/reporting-engine/conf/hive.keytab`

The default Kerberos configuration file is located at, `/etc/kbr5.conf` in the Reporting Engine. You can modify the configuration file to provide details for Kerberos realms and other parameters related to Kerberos.

Added the host name (or FQDN) and IP address of the Horton Works nodes and Warehouse Connector to the DNS server. If the DNS server is not configured, add the host name (or FQDN) and IP address of the Horton Works nodes and Warehouse Connector to the `/etc/hosts` file in the host on which the Warehouse Connector service is installed.

Sources Tab

The services configuration parameters are available in the Sources tab of the Services Config view for the Reporting Engine. The Sources tab for the Reporting Engine service in the Services Config view controls that data sources associated with a Reporting Engine. The Source tab consists of a single panel with a toolbar and a grid that lists the data sources associated with the Reporting Engine.

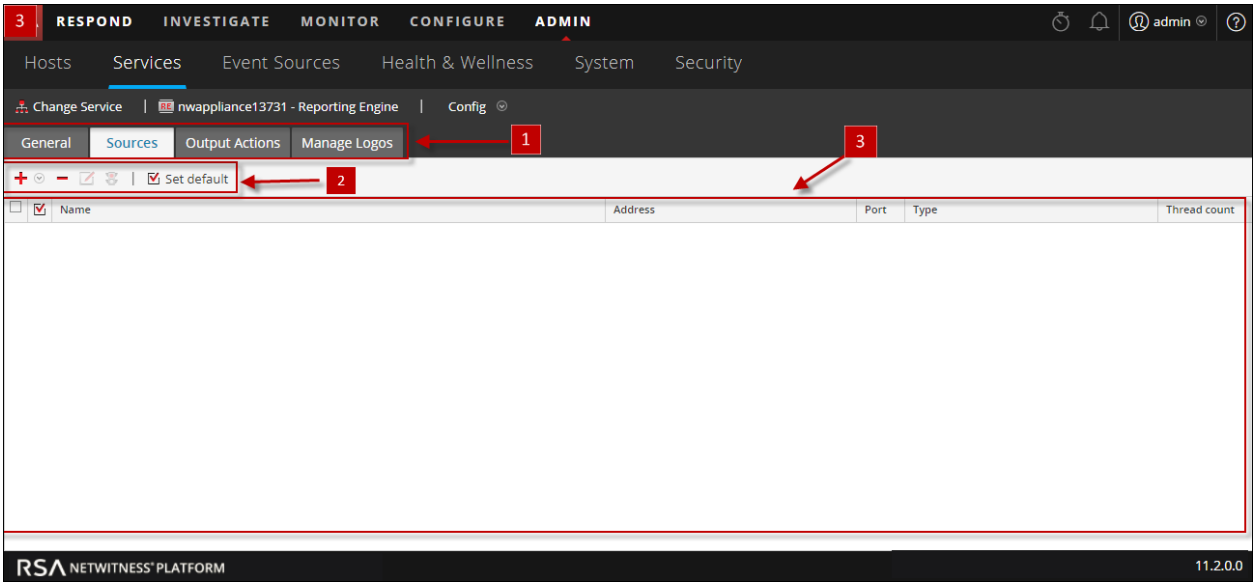
Related Topics

- How Reporting Engine Works

Quick Look

Here is example of the Sources tab where the available services are displayed.



1 Displays all the available configurable tabs.
2 Displays the available configuration parameters for the selected service .
3 Displays the field parameters for the selected service.

The data sources available to the Reporting Engine for which you are defining reports, charts and defining alerts are:

- **NWDB Data Sources** - The NetWitness Database (NWDB) data sources are Decoders, Log Decoders, Brokers, Concentrators, Archiver, and Collection.

Note: When a data privacy plan has been implemented to limit access to sensitive data on a data source, you must configure different service accounts in Reporting Engine for privileged and non-privileged users. To configure different service accounts for data privacy, you can add more than one NWDB data source. This procedure is available under Configure Reporting Engine Settings.

- **Warehouse Data Sources** - The Warehouse data sources are Horton Works and MapR.
- **Respond Data Sources** - Respond is used to generate reports on alerts and incidents. The Respond data sources are Reporting Engine, ESA, Malware, EndPoint, and Web Threat Detection. Respond is used to store the alerts and incidents reports.

If you set a source as the default data source, NetWitness Platform uses that source when you create reports and alerts unless you choose to override it with one of the other sources listed in this tab.

Note: You can manage access control to NWDB and Warehouse Data Sources. For more information, see Configure Reporting Engine Settings.

Features

You can perform the following actions on the Sources tab:

Icon	Actions
	This option adds new services as data sources for Reporting Engine. Add existing services (Archiver, Workbench, and Collection) as data sources for Reporting Engine. For details, see the corresponding topic: • (Optional) Add Archiver as Data Source • (Optional) Add Collection as Data Source to Reporting Engine • (Optional) Add Workbench as Data Source
	This option removes data sources from a Reporting Engine.
	This option configures the Data Source Permissions. This is enabled only for NWDB and Warehouse Data Sources. For more information, see Configure Data Source Permissions.
	This option sets the default data sources for a Reporting Engine. This is the source to which NetWitness Platform defaults in the **Data source** field of the following views: • Rule Definition view. • Create or Modify Alert view.

The NetWitness Platform data sources are listed under the different categories as follows:

- NWDB Data Sources category displays the NetWitness data sources.
- Warehouse Data Sources category displays the Warehouse data sources.

Column	Description
	Clicking the check box selects the data source. After you select it, you can use toolbar to remove the source or set the source as the default.
Name	Displays the name of the data source.
Address	Displays the IP Address of the data source.
Port	Displays the port of the data source.
Type	Displays the service type of the data source.
Thread Count	Displays the thread pool size used for executing rules on the data source.

Output Actions Tab

You can configure output actions for a Reporting Engine to determine the format you want the data to be presented to you based on your requirements. The service configuration parameters are available in the Output Actions tab of the Services Config view configured for a report or an alert execution. This tab consists of the following panels:

- NetWitness Platform Configuration
- Simple Mail Transfer Protocol (SMTP)
- Simple Network Management Protocol (SNMP)
- Syslog
- Simple File Transfer Protocol (SFTP)
- Uniform Resource Locator (URL)
- Network Share

For instance, Syslog output action is used specifically for Reporting Engine Alerts, whereas, SFTP, URL, and Network Share output action is used specifically for Reporting Engine Reports.

You can configure the required permission to access this view in Manage Services.

You must ensure that the Reporting Engine is up and running and the data source from which you want to generate a report is configured in the NetWitness Platform.

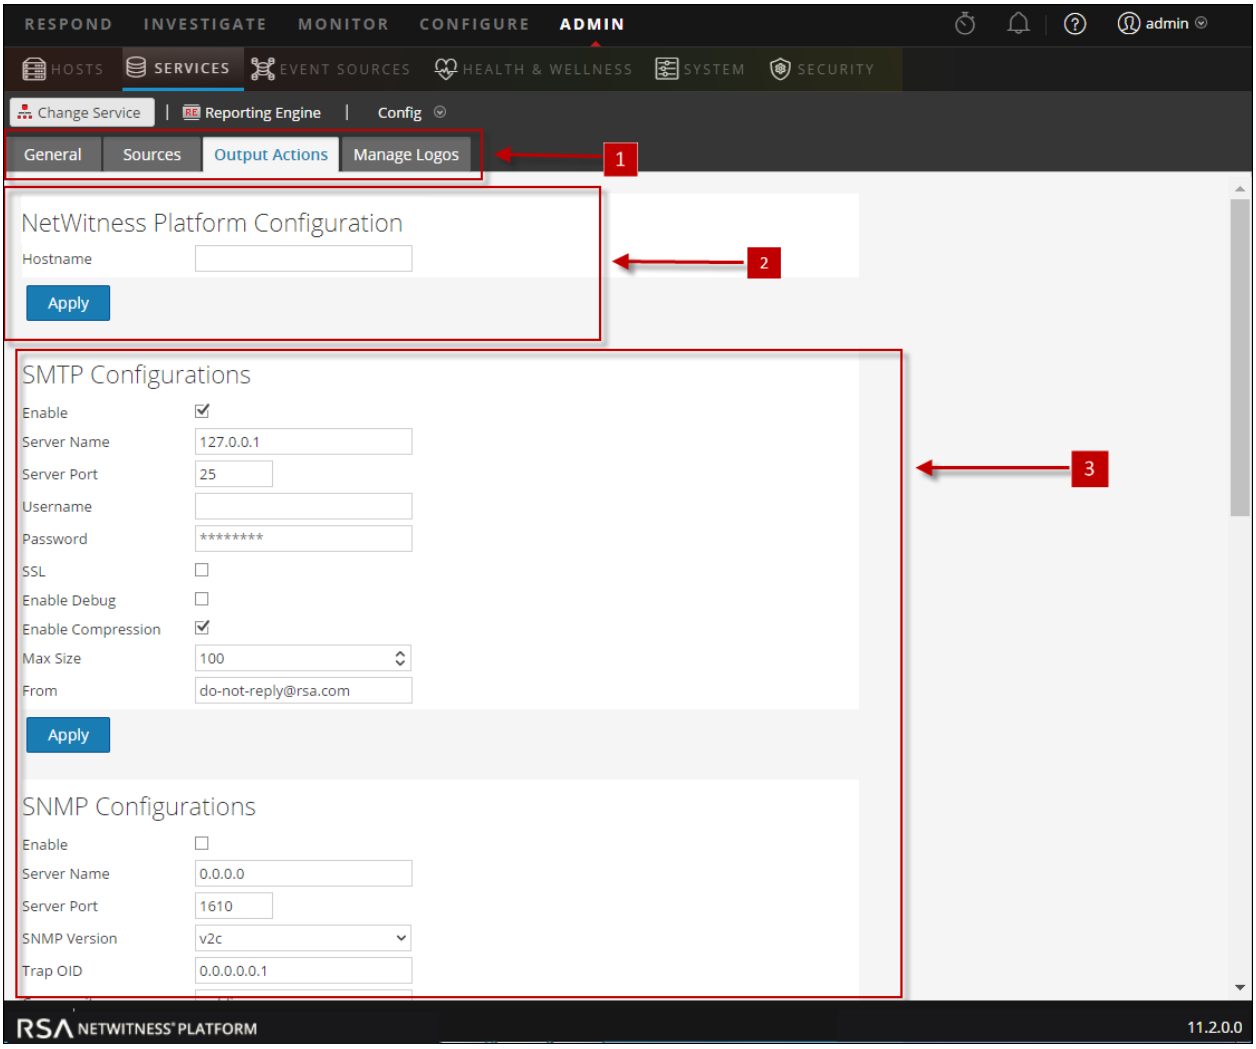
Related Topics

- How Reporting Engine Works

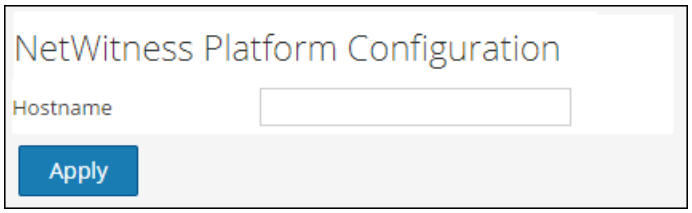
Quick Look



1	Displays all the available configurable tabs.
2	Displays the NetWitness Platform configuration host.
3	Displays all the types of output action that can be configured.

NetWitness Platform Configuration

The following figure shows the NetWitness Platform Configuration on the Output Actions Tab.



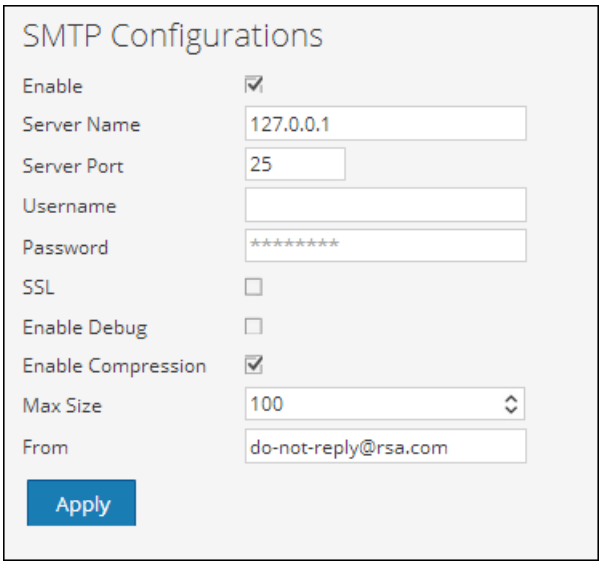
The following parameters identify the NetWitness Platform host that is associated with the Reporting Engine.

Name	Config Value
Host Name	IP Address or Hostname of the NetWitness Platform server. You must specify this parameter for all kind of deployments so that you can refer to this address to create investigation links to NetWitness Platform from Reports, Alerts, and so on. The NetWitness Platform uses this parameter to correctly generate: • SMTP Output Action • SNMP Output Action • Syslog Output Action • SFTP Output Action • URL Output Action • Network Share Output Action • Hyperlinks for meta values in Report PDFs
Apply	Update the configuration.

SMTP

After an execution is completed, an email notification is sent to the user based on the SMTP configuration.

The following figure shows the SMTP Configuration on the Output Actions Tab.



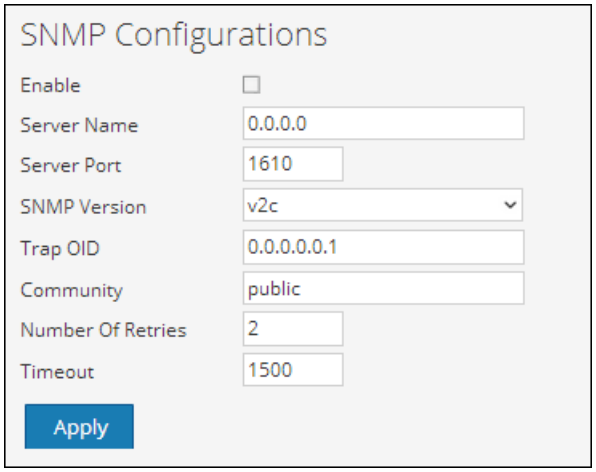
The following parameters manage SMTP (email) output action configuration for a Reporting Engine service. When you add a Reporting Engine service, default values are in effect. You must modify the **Config Values** of these parameters according to the requirements of your enterprise.

Name	Config Value
Enable	Check this box to enable SMTP as an output action for both alert and report from this Reporting Engine. By default, this value is enabled.
Server Name	Specify the hostname or IP Address of the server on which the target SMTP server runs. Default value is 0.0.0.0.
Server Port	Specify the SMTP server port number. Default value is 25.
Username	Specify the username of your SMTP account. Default value is blank. Password Specify
Password	Specify the password of your SMTP account.
SSL	Check this box to use Secure Socket Layer (SSL) to communicate with the SMTP server. Default value is do not use SSL.
Enable Debug	Check this box to enable debugging. Default value is do not enable debug.
Enable Compression	Check this box to enable compression. Default value is enable compression. If this value is enabled, the output files will have `.zip` extension.
Max Size	Specify the maximum size of attachments that can be sent. Default value is 100.
From	Specify the email address from which Security Analytics sends all messages. Default value is `do-not-reply@rsa.com`.
Apply	Update the configuration.

SNMP

After an execution is completed, a trap notification is sent to the user based on the SNMP configuration.

The following figure shows the SNMP Configuration on the Output Actions Tab.



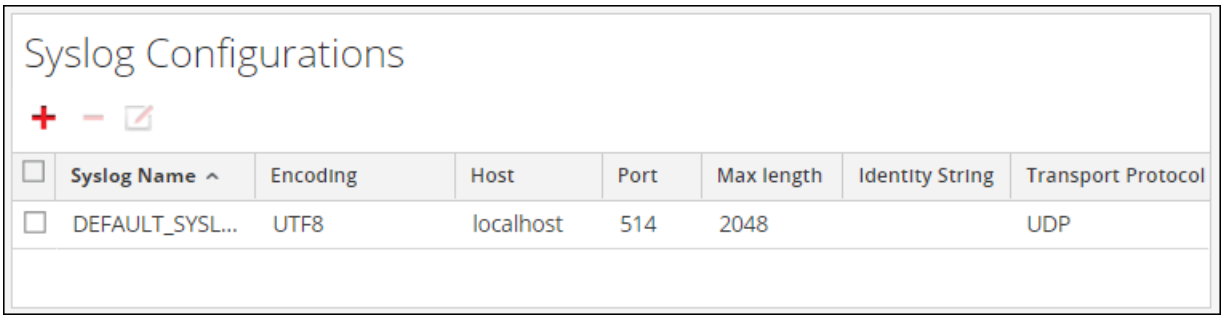
The following parameters manage SNMP (messages to network-attached services) output action configuration for a Reporting Engine service. When you add a Reporting Engine service, default values are in effect. You must modify the **Config Values** of these parameters according to the requirements of your enterprise.

Name	Config Value
Enable	Check this box to enable SNMP output action as an output for alert messages from this Reporting Engine. Default value is Disable.
Server Name	Specify the hostname or IP Address of the server on which the target SNMP server runs. Default value is **0.0.0.0**.
Server Port	Specify the port number of the server on which the target SNMP server listens for faults and exceptions. Default value is **1610**.
SNMP Version	Specify the version number of the SNMP protocol NetWitness Platform uses to send SNMP traps.
Trap OID	Specify the object identification number that identifies the type of trap to send. Default value is **0.0.0.0.0.1**.
Community	Specify the SNMP group to which NetWitness Platform belongs. The default value is **public**.
Number Of Retries	Specify the maximum number of times NetWitness Platform tries to resend the alert message through SNMP. Default value is **2**.
Timeout	Specify the number of seconds after which NetWitness Platform times out (stops trying to send SNMP alerts). Default value is **1500**.
Apply	Update the configuration.

Syslog

After an execution is completed, all notifications are sent via Syslog messages to a particular host based on the Syslog configuration. Multiple Syslog servers can be configured on the Syslog Configuration panel.

The following figure displays the Syslog Configuration on the Output Actions Tab.



The following parameters manage syslog output action configuration for a Reporting Engine service. When you add a Reporting Engine service, you can define values for this output configuration, as no default values are available for this configuration. You must modify the **Config Values** of these parameters according to the requirements of your enterprise.

Name	Config Value
Syslog Name	The name of the Syslog configuration. **Note:** You cannot create a Syslog configuration with a name that already exists in the Reporting Engine Syslog configuration list.
Encoding	Specify the internationalization encoding for Syslog messages. Default value is **UTF8**.
Server Name	Specify the hostname or IP Address of the server on which the target Syslog process runs. Default value is blank.
Server Port	Specify the port number of the server on which the target Syslog server listens for faults and exceptions. Default value is **514**.
Max Length	Specify the maximum size (in bytes) of each Syslog alert message. Default value is **2048**. If **UDP** is the transport type and the Syslog message size is greater than 1024 bytes, you must configure a Syslog server that supports message sizes greater than 1024 bytes.
Identity String	Specify the string NetWitness Platform inserts as a prefix in all Syslog alert messages. Default value is blank.
Include Local Hostname	Check this box to include the local hostname in all Syslog alert messages. Default value is do not include local hostname.
Truncate Message	Check this box to truncate all Syslog alert messages. Default value is do not truncate Syslog messages.

Name	Config Value
Use Identity	Check this box to use the IDENT protocol. Default value is does not use this protocol.
Include Local Timestamp	Check this box to include the local timestamp in all Syslog alert messages. Default value is do not include local timestamp.
Transport Protocol	Specify the transport type for Syslog message delivery. There are three parts to the Syslog transport type: UDP, TCP, and SECURE_TCP. Default value is **UDP**.
Syslog Message Delimiter	Specify the delimiter for the Syslog message. There are three delimiters: CR, LF, and CRLF. By default the value is **CR**. **Note:** This field populates when you select TCP or SECURE_TCP as the transport protocol.
Trust Store Password	Specify the password for the Trust store. **Note:** This field populates when you select SECURE_TCP as the transport protocol.
Key Store Password	Specify the password for the Key store. **Note:** This field populates when you select SECURE_TCP as the transport protocol.
Apply	Save the configuration.

SFTP

After an execution is completed, you can send or transfer files to a remote location based on the SFTP configuration.

The following figure displays the SFTP Configuration on the Output Actions Tab.

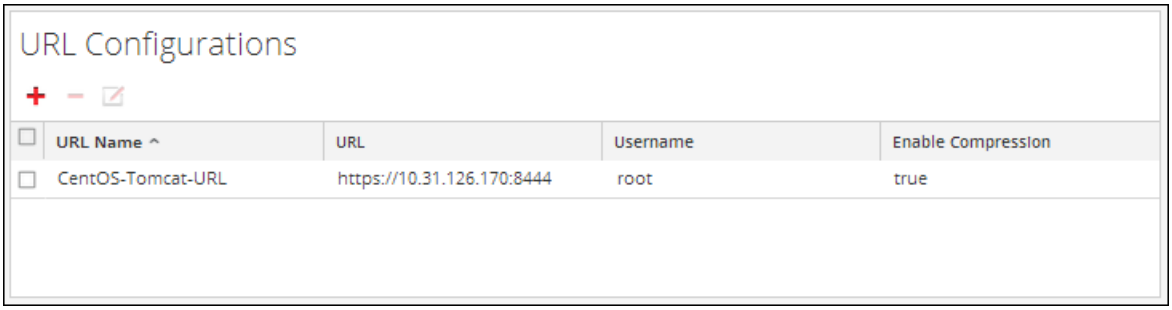
The following parameters manage SFTP (file transfer to a local drive) output action configuration for a Reporting Engine service. When you add a Reporting Engine service, you can define values for this output configuration, as no default values are available for this configuration. You must modify the **Config Values** of these parameters according to the requirements of your enterprise.

Name	Config Value
SFTP Name	The name of the SFTP configuration. **Note:** You cannot create an SFTP configuration with a name that already exists in the Reporting Engine SFTP configuration list.
Host	The IP Address or Hostname of the Reporting Engine server associated with the file transfer.
Port	If you want to use a different port than the default port, enter a port number. Default value is **22**.
Username	Specify the username for the SFTP configuration.
Password	Specify the password for the SFTP configuration.
Custom Folder	Select an SFTP location where you want to transfer the file to. You can use the pre-defined Windows or Linux directory structure in the custom folder path. For example, **/root/Downloaded_Files**. **Note:** If the directory does not exist, RE will create the directory in the custom folder path and copy files to this directory.
Enable Compression	Select this checkbox to enable compression. Default value is enable compression. If this value is enabled, the output files will have ".zip" extension.

URL

After an execution is completed, the output files are published to a URL based on the URL configuration.

The following figure shows the URL Configuration on the Output Actions Tab.



The following parameters manage URL (file transfer to a URL) output action configuration for a Reporting Engine service. When you add an Reporting Engine service, you can define values for this output configuration, as no default values are available for this configuration. You must modify the Config Values of these parameters according to the requirements of your enterprise.

Name	Config Value
URL Name	The name of the URL configuration. **Note:** You cannot create a URL configuration with a name that already exists in the Reporting Engine URL configuration list.
URL	The URL address associated with the file transfer.
Username	Specify the username for the URL configuration.
Password	Specify the password for the URL configuration.
Enable Compression	Select this checkbox to enable compression. Default value is enable compression. If this value is enabled, the output files will have ".zip" extension.

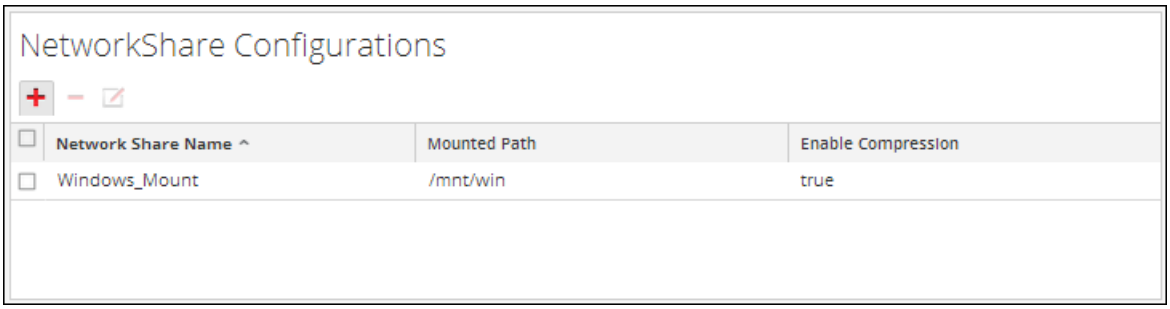
After the URL is configured, the files will be copied under the "URL_OUTPUT_ACTION" directory and the following parameters are sent to the server along with the compressed file.

Name	Config Value
filename	The name of the file.
filesize	The file size in bytes.
filetype	The file type associated with the file.
filechecksum	The number computed from a file that can be used to confirm that this is the one you expect and has been downloaded and stored properly.
hashingalgorithm	The hashing algorithm used to calculate the file checksum.
reportname	The name of the downloaded report.
executionid	The execution id associated with the report execution.
reportexecutionstarttime	The start time the report was executed.
status	The report creation status.
status description	The status description.

Network Share

After an execution is completed, you can transfer the output files to a mounted path or shared location based on the Network Share configuration.

The following figure shows the Network Share Configuration on the Output Actions Tab.



The following parameters manage Network Share (file transfer to a shared location on the network) output action configuration for a Reporting Engine service. When you add a Reporting Engine service, you can define values for this output configuration, as no default values are available for this configuration. You must modify the **Config Values** of these parameters according to the requirements of your enterprise.

Name	Config Value
Network Share Name	The name of the Network Share. **Note:** You cannot create a Network Share configuration with a name that already exists in the Reporting Engine Network Share configuration list.
Mounted Path	The path (location) associated with the file transfer. You can use the pre-defined Linux directory structure in the mounted path. For example, **/mnt/win**. **Note:** The 'rsasoc' user must have read-write access to the specified Network Share mounted path.
	Click to view how the mounted path is created. This pop-up notifies that you must manually create the mounted path.
Enable Compression	Select this checkbox to enable compression. Default value is enable compression. If this value is enabled, the output files will have ".zip" extension.

The following table lists the common operations you can perform in the Syslog, SFTP, URL and Network Share sections.

Operation	Description
	Create a Syslog, SFTP, URL and Network Share configuration.
	Delete a Syslog, SFTP, URL and Network Share configuration.
	Edit a Syslog, SFTP, URL and Network Share configuration.

Manage Logos Tab

The Manage Logos option available in the **Services Config View** > **Manage Logos** tab, helps you to manage the logos associated with the Reporting Engine. The Manage Logos tab consists of a single panel with a toolbar and a grid that lists the logos.

You can upload the logos that you want to use in your report. After you upload the logo, you can set any logo as a default logo which will be automatically used in all the scheduled reports. You can choose to override the default logo with any other logo listed in this tab when you schedule a report. For more information, see "Select a Logo Dialog" topic in the *Reporting Guide*.

The supported image formats are:

- .jpg
- .png
- .gif

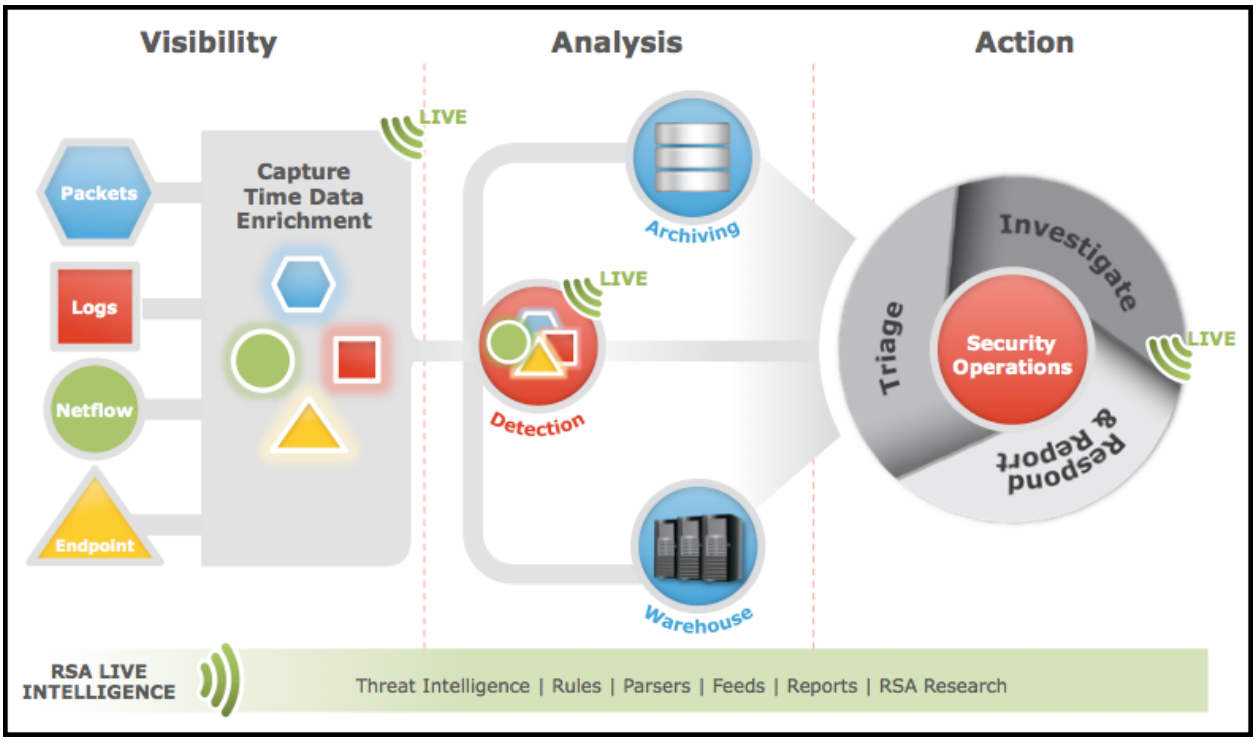
RSA NetWitness Warehouse Overview

RSA NetWitness Warehouse provides the capacity to process large amounts of current and long term data through a Hadoop-based distributed computing system that collects, manages, and enables advanced analytics and reporting on NetWitness Platform data. RSA NetWitness Warehouse requires a service called Warehouse Connector to collect metadata and events from Decoder and Log Decoder and write them in Avro format into a Hadoop-based distributed computing system. For more information, see "How Warehouse Connector Works" topic in the *Warehouse Connector Configuration Guide*.

The Warehouse is made up of three or more nodes depending on the organization's analytic, archiving, and resiliency requirements.

The following figure depicts the architecture of a NetWitness Platform network that implements the RSA NetWitness Warehouse component.



How Warehouse (MapR) Works

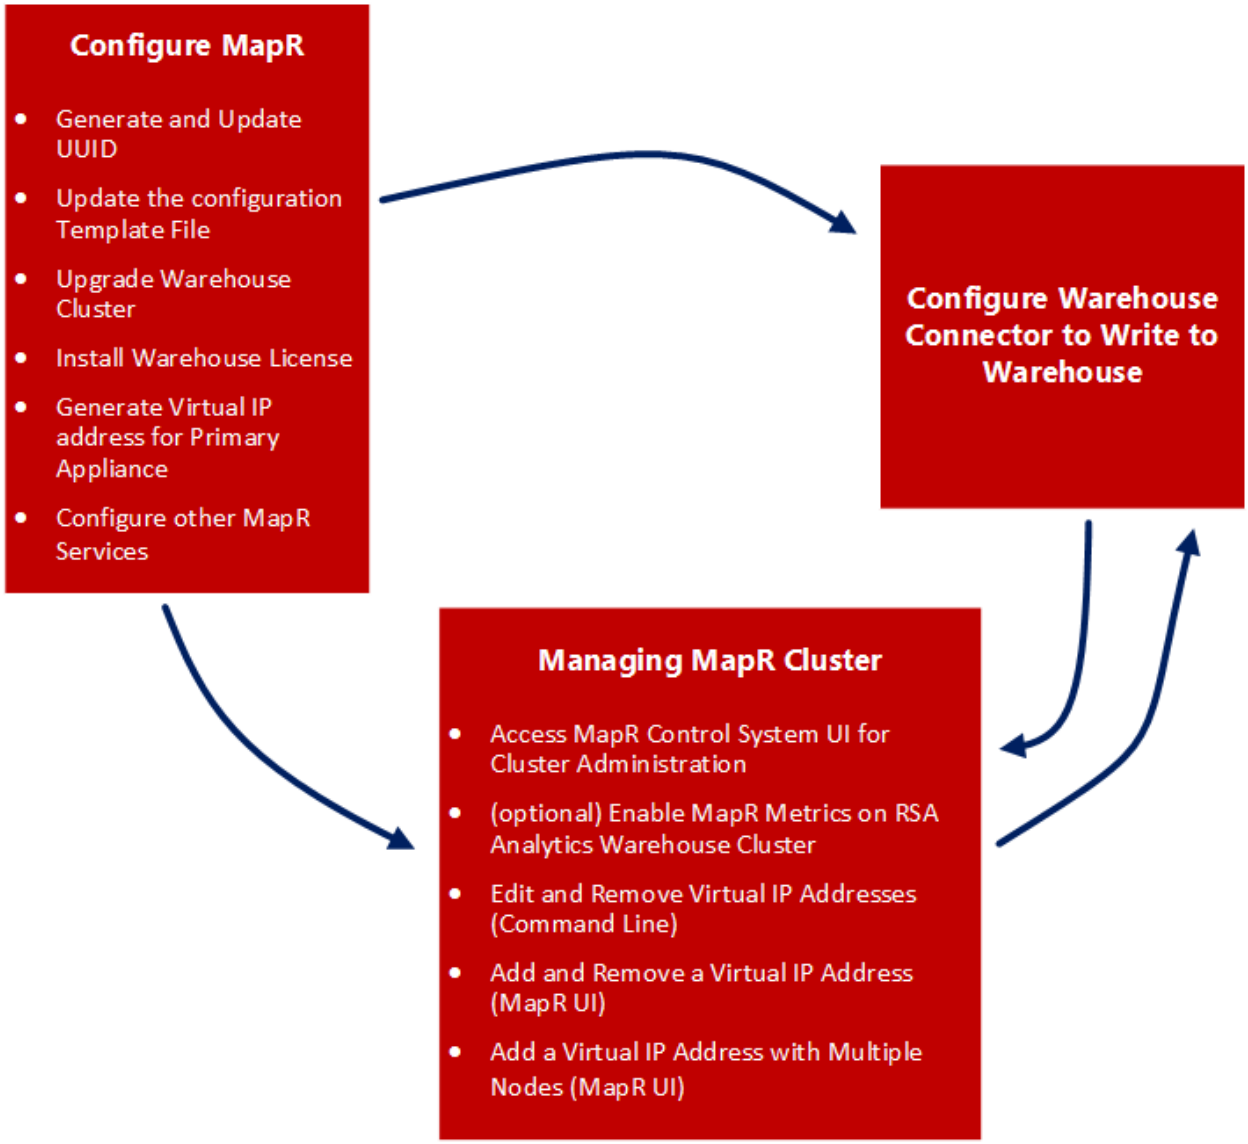
You must configure the nodes for the RSA NetWitness Warehouse (MapR). It only applies to RSA NetWitness Warehouse instances running MapR.

Prerequisites

Make sure that you have:

- Installed the RSA NetWitness Warehouse appliance in your network environment. For more information, see "RSA Analytics Warehouse (MapR) Setup Guide" in the *Hardware Setup guides*.
- Configured the network interface of the Warehouse appliance.

This figure is an overview of the entire process of configuring Warehouse appliance in your network.



To configure the nodes for the RSA NetWitness Warehouse (MapR), perform the following:

1. Configure MapR
2. Configure Warehouse Connector to Write to NetWitness Warehouse
3. Manage MapR Cluster

Note: If you are planning to have a cluster of Warehouse appliances, make sure you perform the following tasks on all the appliances in the cluster.

Caution: Prerequisites are mandatory. Your installation will fail if you have not set the network configuration as described in the *RSA Analytics Warehouse (MapR) Setup Guide* or *Virtual Host Setup Guide* depending on your deployment.

Configure MapR

You can configure MapR using the following procedure.

Generate and Update the Default UUID in Appliances

You need to manually generate and update the default Universally Unique Identifier (UUID) on the Appliances in the cluster. The UUID must be unique to the Appliance in the cluster.

To generate and update the default UUID in the Appliance:

1. Log on to the Appliance as root user.
2. Generate the UUID and copy it in the correct files, using the following commands:
   - `/opt/mapr/server/mruuidgen > /opt/mapr/hostid`
   - `cp /opt/mapr/hostid /opt/mapr/server/hostid.xxxxx`

   Where, xxxxx refers to the 5-digit number randomly assigned to the existing file.

   Note: Review `/opt/mapr/server` for the full name of this file.
3. Restart the appliance, using the following command:
   `reboot`

Update the Configuration Template File

You must update the configuration template file in the RSA NetWitness Warehouse Appliance. The configuration template file in the RSA NetWitness Warehouse appliance must include the following parameters:

- Nodes
- Internalnetworks
- Clustername
- Disks

By default, a configuration template is provided with the RSA NetWitness Warehouse appliance and is located on the RSA NetWitness Warehouse appliance at `/opt/rsa/saw/install`.

Prerequisites

Make sure that you validated the volume in the server to identify available drive space for Warehouse to store data. The total drive space of the additional volume is considered as a single drive by the HDFS. In Warehouse, the AVRO files are stored in the drive space.

Note: The server contains additional volumes of identical size other than the operating system volume.

To check free space, enter the command `fdisk -l | grep /dev/s |sort` in the Warehouse node. A list of disks that are not partitioned for usage is displayed. You need to list the identified disks in the configuration template file so that Warehouse utilizes this space for the Hadoop Cluster.

To update the configuration template file in the RSA NetWitness Warehouse Appliance:

1. Log on to the appliance as the root user.
2. Navigate to `/opt/rsa/saw/install`, enter the following command:

   ```
   cd /opt/rsa/saw/install
   ```
3. Create a copy of the configuration template, enter the following command:

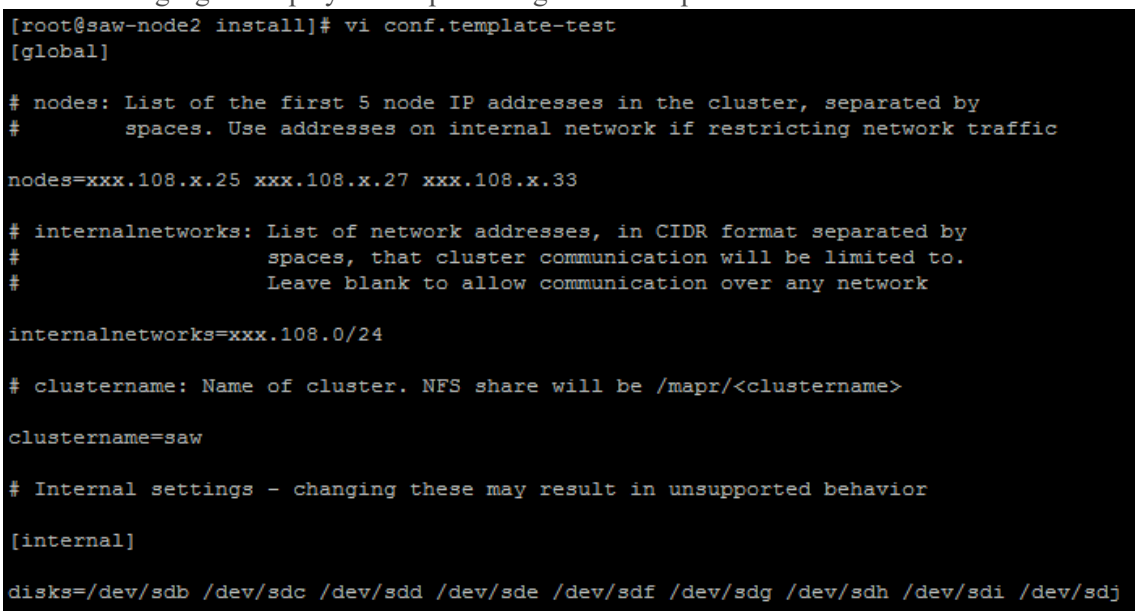
   ```
   cp conf.template conf.template-<name>
   ```

   where `<name>` is the custom name of the configuration template file.
4. Edit the configuration template file, enter the following command:

   ```
   vi conf.template-<name>
   ```

Parameter	Description
Nodes	List the IP addresses of the appliances in the cluster separated by spaces. All the appliances in the cluster must be listed in the same order in every configuration file for each RSA NetWitness Warehouse appliance.
Internalnetworks	List the network addresses in CIDR format separated by spaces. This Warehouse appliance cluster communication is limited to the provided network addresses. **Note:** RSA recommends that you do not leave this parameter blank.
Clustername	Name of the cluster. The cluster name is used to identify the Network File System (NFS) share.
Disks	Displays the list of disks recognized by the operating system, and these disks will be formatted in HDFS for the Warehouse when this configuration script is executed.

The following figure displays a sample configuration template file:



```
[root@saw-node2 install]# vi conf.template-test
[global]

# nodes: List of the first 5 node IP addresses in the cluster, separated by
#        spaces. Use addresses on internal network if restricting network traffic

nodes=xxx.108.x.25 xxx.108.x.27 xxx.108.x.33

# internalnetworks: List of network addresses, in CIDR format separated by
#                   spaces, that cluster communication will be limited to.
#                   Leave blank to allow communication over any network

internalnetworks=xxx.108.0/24

# clustername: Name of cluster. NFS share will be /mapr/<clustername>

clustername=saw

# Internal settings - changing these may result in unsupported behavior

[internal]

disks=/dev/sdb /dev/sdc /dev/sdd /dev/sde /dev/sdf /dev/sdg /dev/sdh /dev/sdi /dev/sdj
```

5. Execute the configuration template file, using the following command:

   ```
   ./configure.py conf.template-<name>
   ```

6. Restart the appliance, using the following command:

   ```
   reboot
   ```

Upgrade the Warehouse Cluster

You must upgrade the warehouse cluster after updating the configuration template file and reboot the RSA NetWitness Warehouse appliance.

To Upgrade the Warehouse Cluster

You must manually open Hiveserver port 10000, which is not opened by default:

1. Get the line number where the REJECT statement appears in the Iptable.
2. Make sure that the Iptables service is running, using the following command:

   ```
   NUM=$(iptables -L INPUT -n --line-numbers |grep 'reject-with' |awk
   ' {print $1}')
   ```

   Note: The ACCEPT statements that follow the REJECT statement in the Iptables will not take effect. You can incorporate the line number of the REJECT statement in the command to ensure that the ACCEPT statements proceed the REJECT statement.

3. Add the firewall exception for port 10000 to the Iptables, using the following command:

   ```
   iptables -I INPUT $NUM -m state --state NEW -p tcp --dport 10000 -j
   ACCEPT
   ```

4. Save the Iptables, using the following command:

```
/etc/init.d/iptables save
```

5. Restart the Iptables, using the following command:

   ```
   /etc/init.d/iptables restart
   ```

6. Verify if the firewall exceptions for the ports are added, using the following command:

   ```
   Service iptables status | grep 10000
   ```

   The following output should be displayed:

   ```
   ACCEPT tcp -- 0.0.0.0/0 0.0.0.0/0 state NEW tcp dpt:10000
   ```

Install the Warehouse License File

The Warehouse license file must be manually installed on the Warehouse appliance. If you have a Warehouse appliances cluster, you must install the license file on the first Warehouse appliance in the cluster.

Prerequisites

Make sure that you have:

- Obtained the Warehouse license file.
- Copied the license file to `/root/` on the first Warehouse appliance in the cluster using a USB drive or through SCP.

To install the Warehouse license file:

1. Log on to the appliance as a root user.
2. Install the license file, using the following command:

   ```
   maprcli license add –is_file true –license <license_filename>
   ```

   where `<license_filename>` is filename of the RSA NetWitness Warehouse license file. The license file is installed without any output messages. If you included a network range in the `internalnetworks` parameter in the configuration template file, a warning message appears suggesting that the Warehouse is configured only to communicate with the network entered in the configuration template file. You can ignore this warning as this does not have any functional issue.

3. Confirm the license file installation, using the following command:

   ```
   maprcli license list
   ```

   The output messages appears on the console screen. The last two lines of the output message should be similar to the following sample:

   ```
   hash: "b8xO1flW8EMNSqq7zztn8D2BXnQ="
    3 May 14, 2013
   ```

4. Retrieve a list of directories, using the following command:

   ```
   hadoop fs -ls /
   ```

Generate the Virtual IP Address for Primary Appliance

Generate a virtual IP address for the primary RSA NetWitness Warehouse (Warehouse) appliance.

Prerequisites

Make sure you note down the MAC addresses of all the Warehouse appliances in the cluster. Use the following command on the appliance to view the MAC address of appliance:

```
ifconfig <interface> | grep HWaddr
```

where `<interface>` is the network interface.

To generate a virtual IP address for the primary Warehouse appliance:

1. Log on to the primary appliance as root user.
2. Create the virtual IP address. using the following command:
   ```
   maprcli virtualip add -virtualip <VIP_address> -netmask <netmask> -
   macs <mac_node1> <mac_node2> <mac_node3> ……< mac_node n>
   ```
   where:
   - `<VIP_address>` is the virtual IP address for the primary Warehouse appliance.
   - `<netmask>` is the netmask address of the primary Warehouse appliance.
   - `<mac_node1>` is the MAC address of the first node in the Warehouse cluster.
   - `<mac_node2>` is the MAC address of the second node in the Warehouse cluster.

   For example, if the MAC address for node 1 is `01:Z1:1X:00:20:Y1` and node 2 is `32:Y2:4Z:40:10:X3`, and the IP address is `192.168.100.10`, then enter the command as following:
   ```
   maprcli virtualip add -virtualip 192.168.100.10 -netmask <netmask>
   -macs 01:Z1:1X:00:20:Y1 32:Y2:4Z:40:10:X3
   ```
3. Verify the virtual IP address, using the following command:
   ```
   maprcli virtualip list
   ```
4. To add or remove virtual IP addresses, you can use the command line or the MapR Control System. For more information, see "Edit and Remove Virtual IP Addresses (Command Line)" and "Add and Remove a Virtual IP Address (MapR UI)" sections in Manage MapR Cluster.

Configure other NetWitness Platform Services

Configure other NetWitness Platform services for the RSA NetWitness Warehouse (MapR).

1. If you are not using Vulnerability Response Management (VRM), disable the Hbase services to return the configured memory so that it is available for use elsewhere in the cluster. To stop the Hbase services, you can use the command line or the MapR Control System. For more information, see Stop the Hbase Services Using the Command Line and Stop the Hbase Services Using the MapR Control System.

2. Add Warehouse data sources to the Reporting Engine. For more information, see "Add Warehouse as Data Source to Reporting Engine" topic in the *Reporting Engine Configuration Guide*.

Stop the Hbase Services Using the Command Line

This section provides the steps to stop the Hbase services using the command line. If you are not using Vulnerability Response Management (VRM), stop the Hbase services to return the configured memory so that it is available for use elsewhere in the cluster.

Hbase Services Stop and Start Commands Summary

The following tables summarize the commands used to stop and start the Hbase services for the **HBase RegionServer** and **HBase Master** services.

HBase RegionServer	Command to run using the Command Line
Stop on All the Appliances	`maprcli node services -hbregionserver stop -filter "[hn==*]"`
Start on All the Appliances	`maprcli node services -hbregionserver start -filter "[hn==*]"`
Stop on Specific node	`maprcli node services -hbregionserver stop -filter "[hn==<Hostname>]"`
Start on Specific node	`maprcli node services -hbregionserver start -filter "[hn==<Hostname>]"`

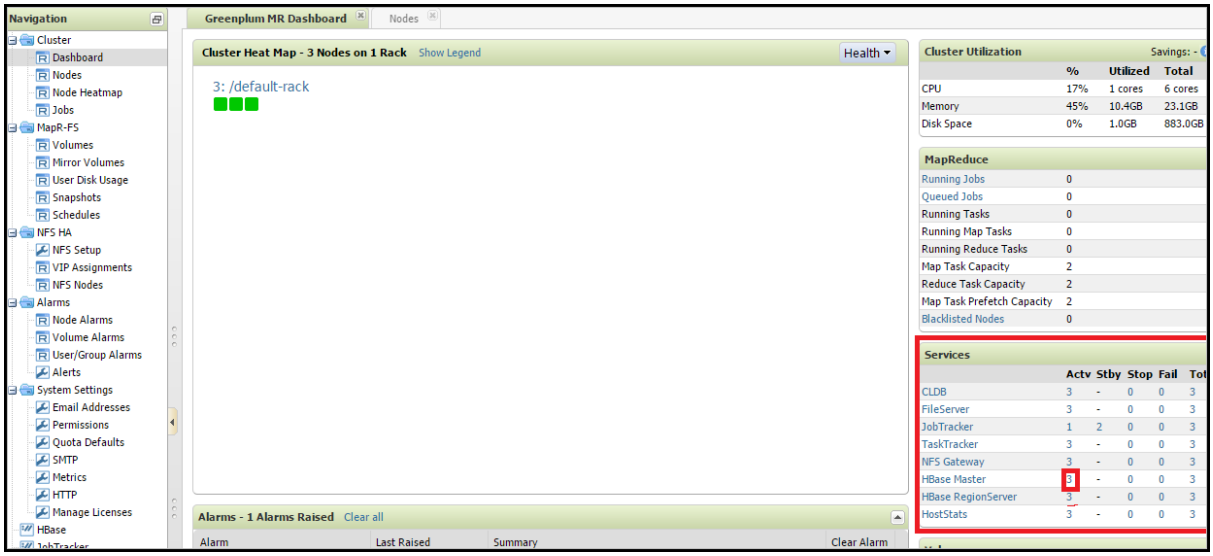
HBase Master	Command to run using the Command Line
Stop on All the Appliances	`maprcli node services -hbmaster stop -filter "[hn==*]"`
Start on All the Appliances	`maprcli node services -hbmaster start -filter "[hn==*]"`
Stop on Specific node	`maprcli node services -hbmaster stop -filter "[hn==<Hostname>]"`
Start on Specific node	`maprcli node services -hbmaster start -filter "[hn==<Hostname>]"`

Where `<Hostname>` is the specific node hostname.

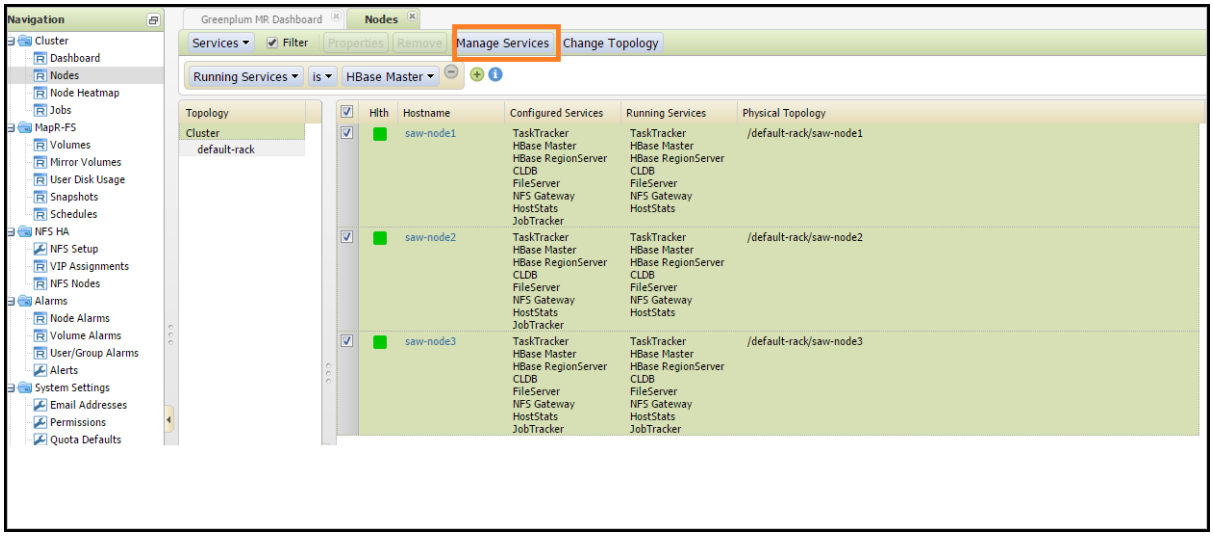
Stop the Hbase Services Using the MapR Control System

This section provides the steps to stop the Hbase services using the MapR Control System. If you are not using Vulnerability Response Management (VRM), stop the Hbase services to return the configured memory so that it is available for use elsewhere in the cluster.

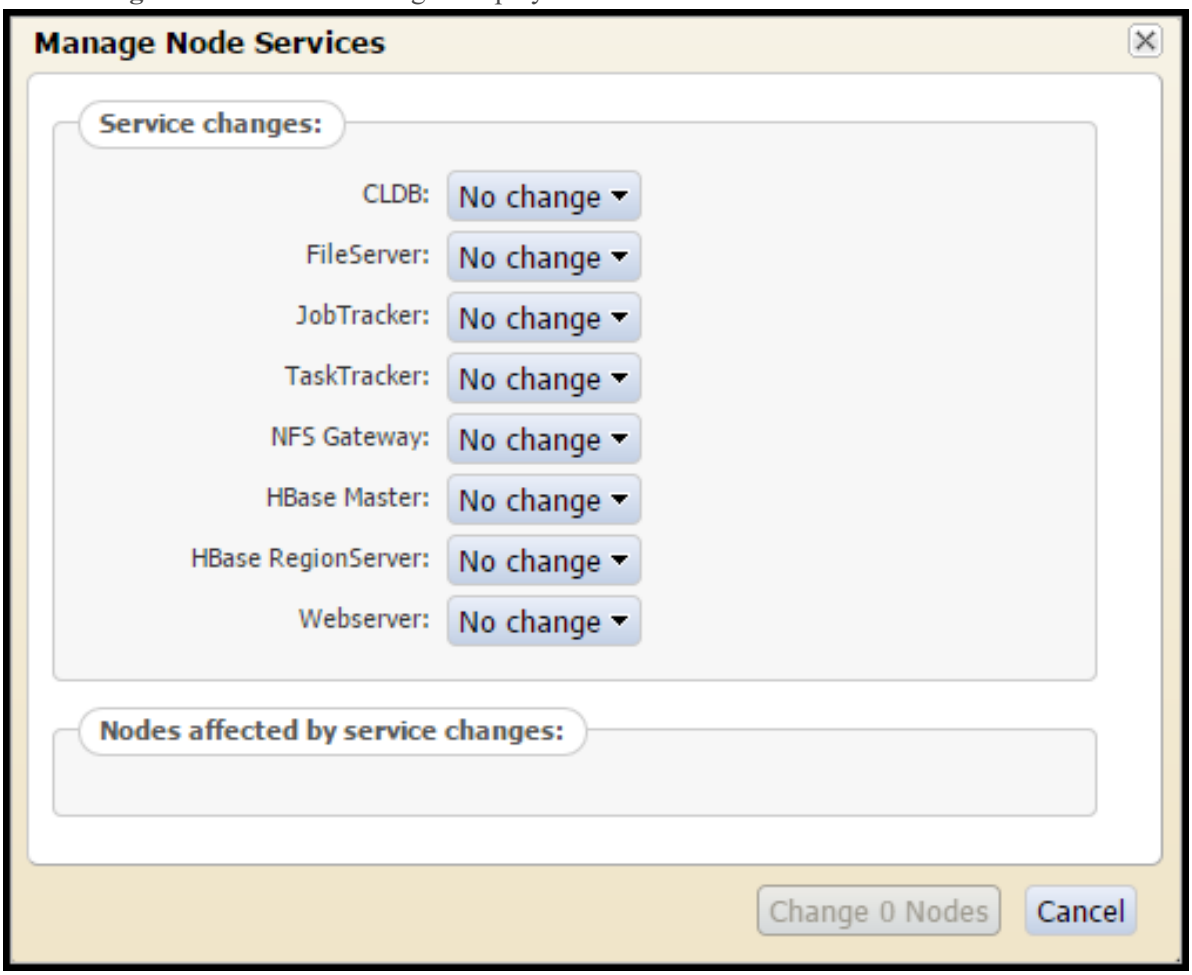
1. Log on to the MapR Control System user interface. For more information see "Access MapR Control System UI for Cluster Administration" section in Manage MapR Cluster.
2. Stop the **HBase Master** services, in the **Services** section of the dashboard, click the number in the **Actv** column for the **HBase Master** service. This is the number of active services for the **HBase Master** service.



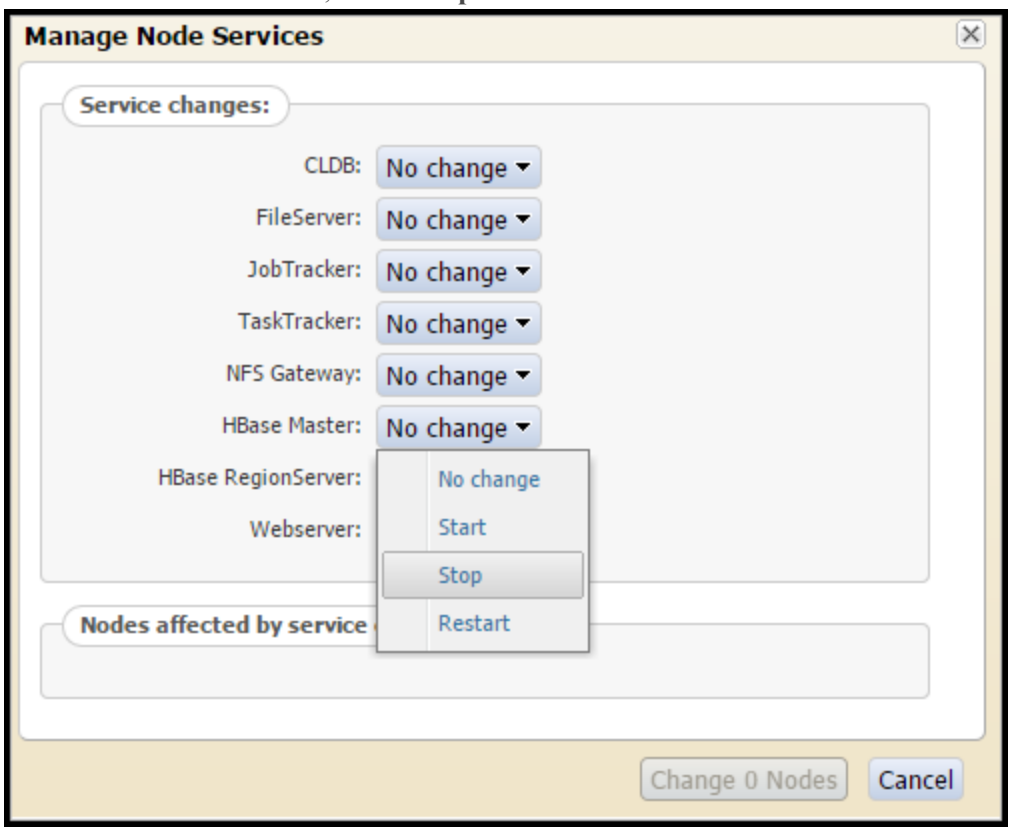
3. On the **Cluster Nodes** tab, click **Manage Services**.



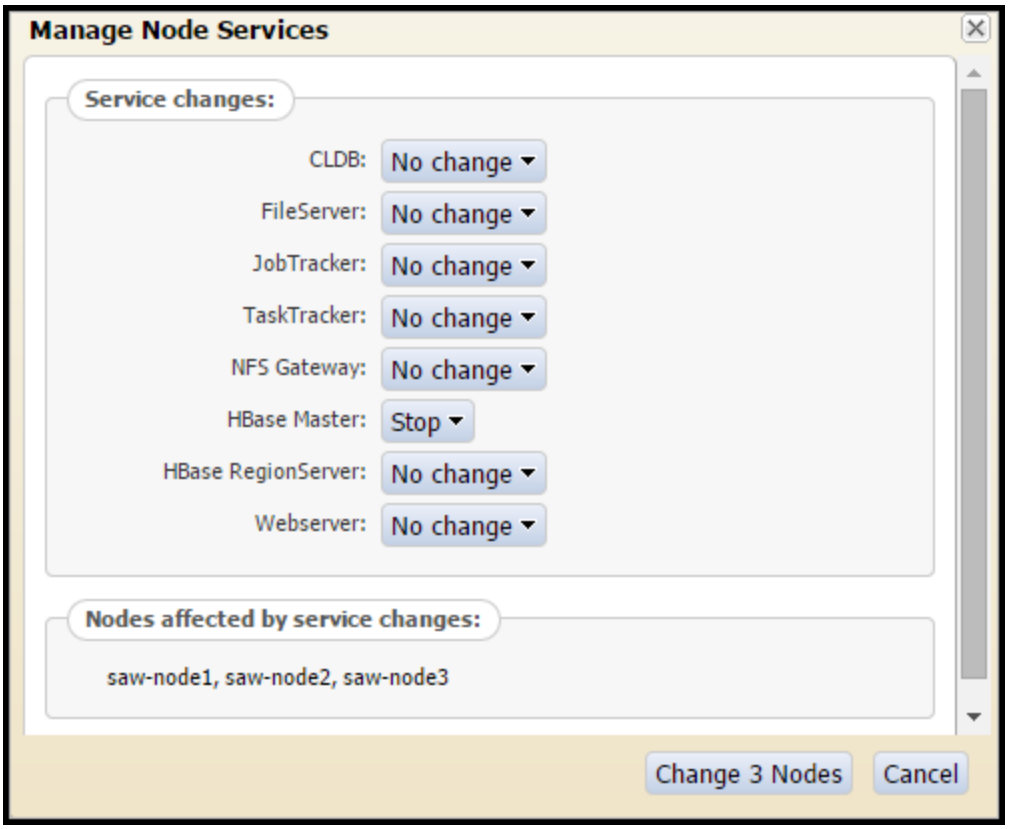
The **Manage Node Services** dialog is displayed.



4. In the **HBase Master** field, select **Stop**.



5. Click **Change <number_of_nodes> Nodes.**
   Where <number_of_nodes> is the number of active nodes selected.
   For example, click **Change 3 Nodes**.



The **Hbase Master** service on the selected nodes must be in a stopped state.

6. Stop the **Hbase RegionServer** services, repeat steps 2 to 5 for the **Hbase RegionServer** services.

Configure Warehouse Connector to Write to NetWitness Warehouse

You must enable the Warehouse Connector services to write to RSA NetWitness Warehouse.

To configure Warehouse Connector to write to the NetWitness Warehouse, perform the following tasks on the Log Decoders and Decoders where the Warehouse Connectors are installed:

Note: If you are configuring on a virtual environment, perform these tasks on a standalone Warehouse Connector server.

Verify the Network File System (NFS) Services Status

To verify the NFS services status:

1. Log on to the Warehouse Connector appliance where you have installed the Warehouse Connector service.
2. Enter the following command:
   ```
   rpm -qa |grep nfs
   ```
   The NFS package names appear in the output message. For example:
   ```
   nfs-utils-lib-1.1.5-6.el6.x86_64
   nfs-utils-1.2.3-36.el6.x86_64
   ```
3. If the output message is empty, install the NFS packages.

Install the Network File System Packages

Prerequisites

If the NFS packages are already downloaded on the appliances manually, install the packages and mount RSA NetWitness Warehouse. You need to have internet access to complete this task. If internet access is not available, you must download the RPM packages offline and copy them to this machine for installation.

Note: Install the NFS packages only if the NFS packages are not displayed when you verify the status of NFS in the Warehouse Connector appliance or on the appliance where you have installed the Warehouse Connector service.

To install NFS packages:

1. Log on to the Warehouse Connector appliance or on the appliance where you have installed the Warehouse Connector service.
2. Verify the NFS status, using the following command:

```
rpm -qa |grep nfs
```

The NFS package names appear in the output message. For example:

```
nfs-utils-lib-1.1.5-6.el6.x86_64
 nfs-utils-1.2.3-36.el6.x86_64
```

If the `nfs-utils` and `nfs-utils-lib` are properly identified, you can skip the remaining steps in this procedure (*Install the Network File System Packages*).

3. Search for NFS package, using the following command:

```
yum search nfs-utils
```

The output ends with the following message:

```
"name and summary matches only, use "search all" for everything."
```

> **Note:** Contact RSA Customer Support if the output ends with the following message:
> `"no matches found"`

4. Install the NFS programs, using the following command:

```
yum install nfs-utils nfs-utils-lib
```

The output prompts for **y** or **n**. Type **y** and press **ENTER**.

The NFS packages are successfully installed.

Mount the Warehouse on the Warehouse Connector

To mount RSA NetWitness Warehouse on the appliance:

1. Create a new directory named **/saw**, using the following command:
   `mkdir /saw`
2. Enter the following command:
   `ll /`
   The new directory is displayed.
3. Mount the Warehouse, using the following command:
   `mount -t nfs -o nolock,tcp,hard,intr <IP_Address_for_SAW>:/mapr/<cluster-name> /saw`
   Where `<IP_Address_for_SAW>` is the IP address of the primary Warehouse appliance in the cluster and `<cluster-name>` is the name provided in the template file.

   Note: If a virtual IP address is configured for the Warehouse, you have to use it as the IP address in `<IP_Address_for_SAW>`.
4. Verify if the Warehouse is mounted successfully, using the following command
   `mount`
   The IP address of the primary Warehouse appliance and other details you have provided in **step 3** appear in the last line of the output message.
5. List the content in the newly created directory, **/saw**, using the following command:
   `ll /saw`
   The following directories are displayed:
   hbase
   index-scratch
   jars
   logs
   user
   var
6. To add NFS to the Auto-mount options. Do the following:
   a. To check if the IP address of the primary Warehouse appliance and other details you have provided while mounting Warehouse appears in `/etc/fstab`, enter the following command:
      `cat /etc/fstab`
      If the detail does not appear in the `/etc/fstab` file, perform the following steps.
   b. Enter the following command:
      `tail -n 1 /etc/mtab`
      The IP address of the primary Warehouse appliance and other details you provided while mounting Warehouse appear in the last line of the output message.
   c. Enter the following command:
      `tail -n 1 /etc/mtab >> /etc/fstab`

d. Edit the /etc/fstab file to add the word ‘auto’ at the end of the file. Enter the following command:
`vi /etc/fstab`
For example, `10.11.111.11:/mapr/saw /saw nfs rw,nolock,tcp,auto,addr=10.11.111.11 0 0`

Manage MapR Cluster

You can manage the MapR cluster using the following procedures.

Access MapR Control System UI for Cluster Administration

You can access the MapR Control System user interface for RSA NetWitnessWarehouse cluster administration. MapR Control System user interface enables you to administer the RSA NetWitnessWarehouse cluster. The MapR Control System user interface provides details of the following:

- Nodes
- Node Heatmap
- Jobs
- MapR Tables
- Volumes
- Mirrors
- User Disk Usage
- Snapshots
- Schedules
- NFS Setup
- Virtual IP Assignments
- NFS Nodes
- Node Alarms
- Volume Alarms
- User/Group Alarms
- HBase
- JobTracker
- CLDB

To access the MapR Control System user interface:

1. Log on to one of the appliances in the RSA NetWitnessWarehouse cluster.
2. Start the webserver. using the following command:

   ```
   /opt/mapr/adminuiapp/webserver start
   ```

   Note: The default webserver port is **8443**.

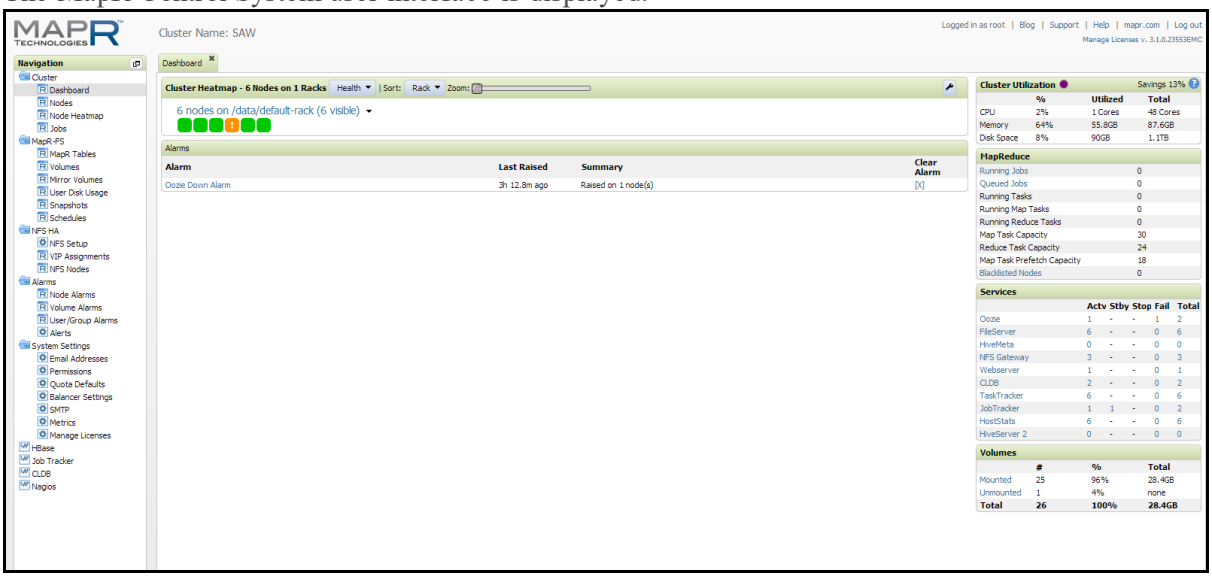
Note: If you receive the error `/opt/mapr/conf/ssl_keystore (No such file or directory)` in the `/opt/mapr/logs/adminuiapp.log` after executing the command `/opt/mapr/adminuiapp/webserver start`, enter the following commands:

```
./configure.sh -R -genkeys
service mapr-warden restart
```

3. Using a web browser to access the MapR Control System, type the following url:

   `https://<NODE-IP-OR-HOSTNAME>:8443`

   The MapR Control System user interface is displayed.



Enable MapR Metrics on RSA NetWitnessWarehouse Cluster

You can enable MapR Metrics on the RSA NetWitnessWarehouse cluster. This optional procedure enables Administrators to see job details in the MapR Control System UI rather than going to the JobTracker for details.

Prerequisites

Make sure that you have the following MapR Metrics dependencies installed in your environment:

- MySQL Server installed and configured.
- Libraries hosted on the EPEL Repository.
- Libraries hosted on the CentOS base repositories.

To Enable MapR Metrics

To enable MapR Metrics on the RSA NetWitnessWarehouse cluster, follow the instructions in the following links:

- http://doc.mapr.com/display/MapR/Setting+up+the+MapR+Metrics+Database
- http://doc.mapr.com/display/MapR/MapR+Metrics+and+Job+Performance

Note: Make sure you install MapR Mertics on the nodes in your RSA NetWitnessWarehouse Cluster where Job Tracker or Web Server is running.

Edit and Remove Virtual IP Addresses (Command Line)

You can edit and remove virtual IP addresses in the Warehouse cluster using the command line. This procedure is optional and used when you want to change the virtual IP addresses in the Warehouse cluster.

Adding and removing Warehouse appliances to and from a virtual IP group is accomplished by executing an **edit** command. This is the same as the add command, except that ALL of the MAC addresses are replaced with ONLY the MAC addresses that you enter.

Prerequisites

Make sure you note down the MAC addresses of all the Warehouse appliances in the cluster. Use the following command on the appliance to view the MAC address of the appliance:

```
ifconfig <interface> | grep HWaddr
```

where `<interface>` is the network interface.

Also note the MAC addresses of the Warehouse appliances that you want to add.

To add or remove a virtual IP address in the primary Warehouse appliance:

1. Log on to the primary appliance as root user.
2. Edit the virtual IP address, using the following command:

   ```
   maprcli virtualip edit -virtualip <VIP_address> -netmask <netmask>
   -macs <mac_node1> <mac_node2> <mac_node3> ……< mac_node n>
   ```

   where:

   - `<VIP_address>` is the virtual IP address for the primary Warehouse appliance.
   - `<netmask>` is the netmask address of the primary Warehouse appliance.
   - `<mac_node1>` is the MAC address of the first node in the Warehouse cluster.
   - `<mac_node2>` is the MAC address of the second node in the Warehouse cluster.

   For example, if the IP address of the primary warehouse is `192.168.100.10` and the MAC address for node 1 is `01:Z1:1X:00:20:Y1`, node 2 is `32:Y2:4Z:40:10:X3`, and you want to add node 3, which is `20:Y2:4Z:20:10:X3`, then enter the following:

   ```
   maprcli virtualip edit -virtualip 192.168.100.10 -netmask <netmask>
   -macs 01:Z1:1X:00:20:Y1 32:Y2:4Z:40:10:X3 20:Y2:4Z:20:10:X3
   ```

3. Verify the virtual IP addresses, using the following command:

   ```
   maprcli virtualip list
   ```

To remove the virtual IP address of the primary Warehouse appliance group entirely:
Enter the following command:

```
maprcli virtualip remove -virtualip 192.168.100.10
```

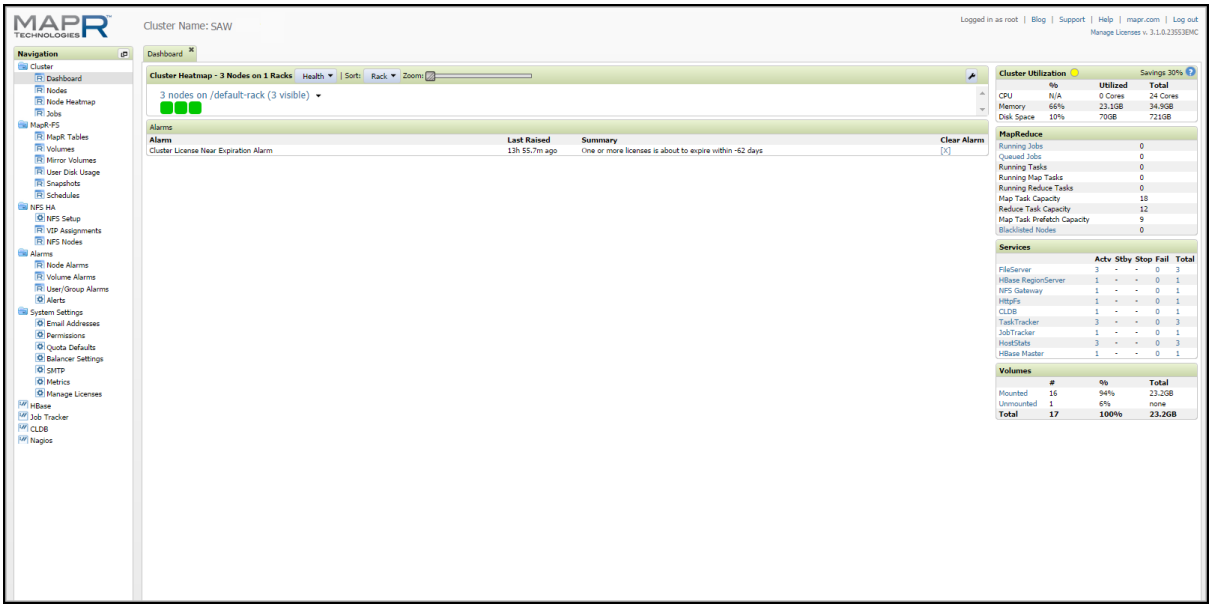
Add and Remove a Virtual IP Address (MapR UI)

This is an optional procedure and can be performed using the MapR Control System to add a virtual IP address (VIP) in the Warehouse cluster.

Prerequisites

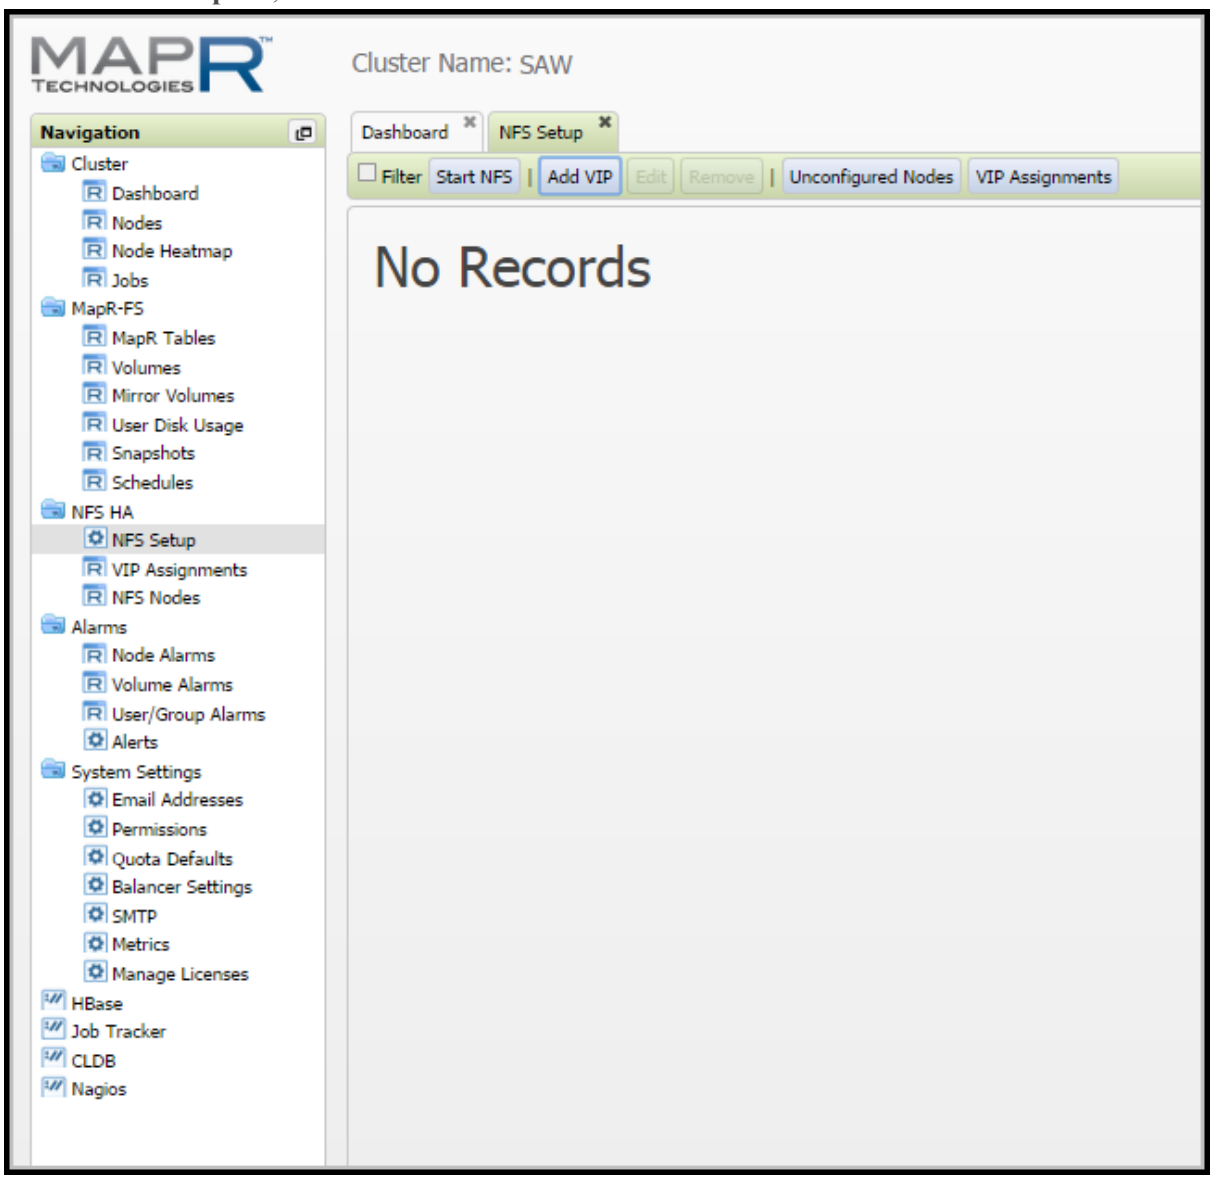
Follow the instructions in Access MapR Control System UI for Cluster Administration before completing this procedure.

1. Log on to the MapR Control System.

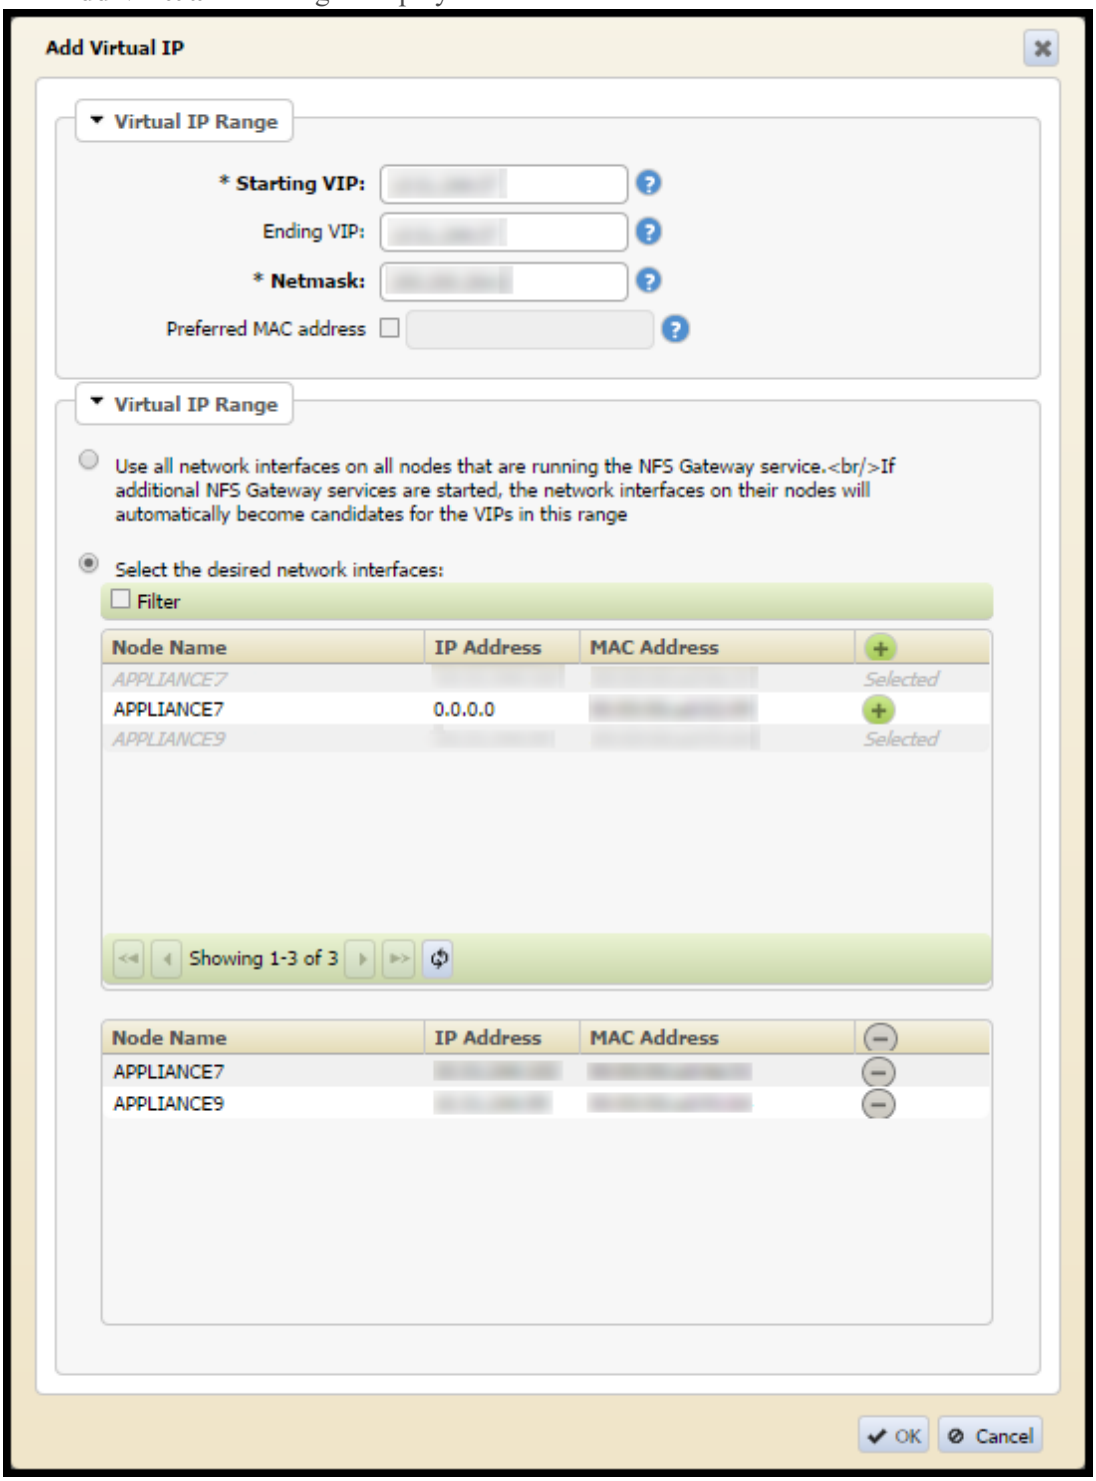


2. In the Navigation panel, select **NFS HA > NFS Setup**.
   The NFS Setup tab is displayed. The NFS Setup tab enables you to edit, remove or add VIPs in the Warehouse cluster.

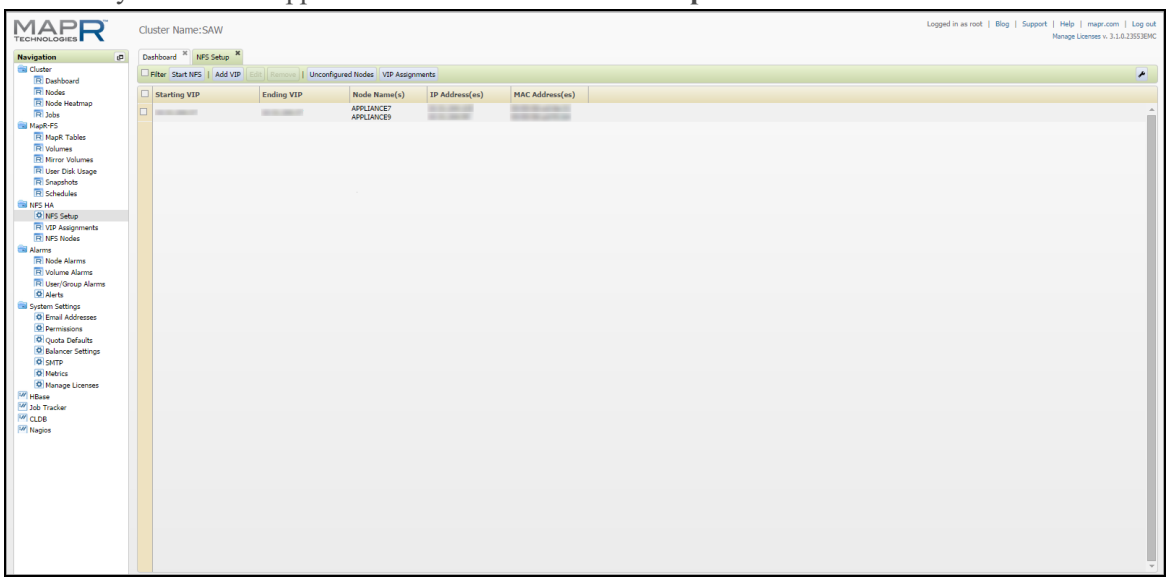
3. On the **NFS Setup** tab, click the **Add VIP** button.



The **Add Virtual IP** dialog is displayed.

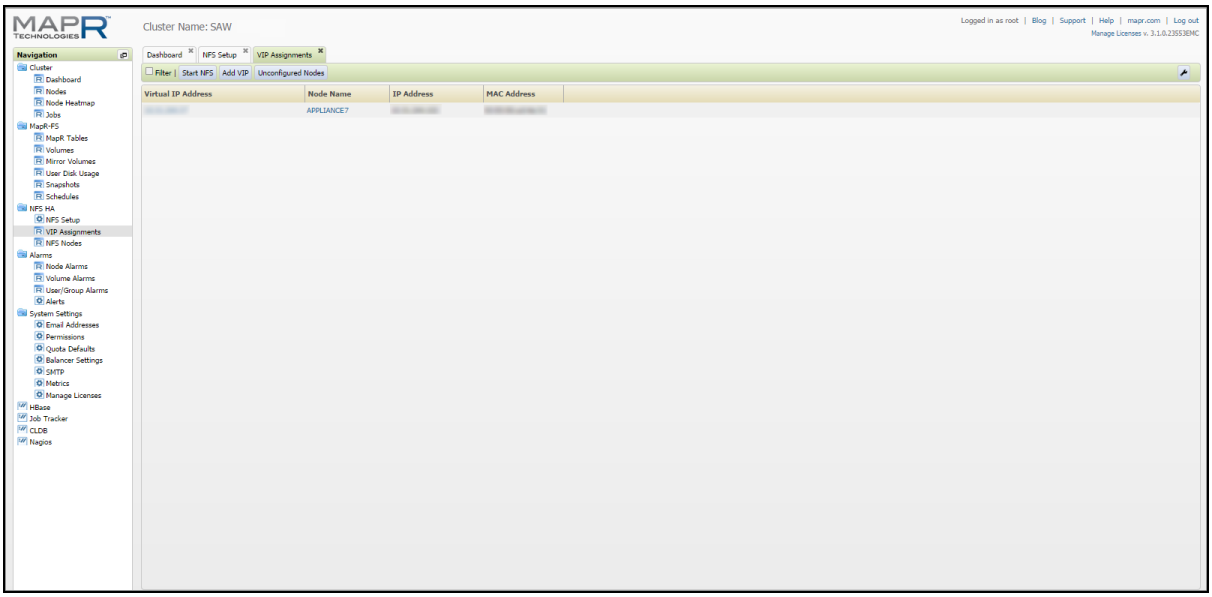


4. In the **Add Virtual IP** dialog, do the following:
   a. In the **Starting VIP** field, type the starting IP Address for VIP.
   b. In the **Ending VIP** field, type the ending IP Address for VIP. If this field is left blank, only one IP address is used for VIP allocation.
   c. In the **Netmask** field, type the Netmask for the deployment.
   d. Select **Select Desired Network Interfaces** to choose the available Network Interfaces that need to be used for VIP assignment. Select all of the external Interfaces from the list of available nodes by clicking the plus button next to the interface entry. Selected Interfaces will appear at the bottom list.
   e. Click **OK** to add the VIP.
   The newly added VIP appears in the list on the **NFS Setup** tab.



Note: VIP allocation can also be removed or edited from the **NFS HA > NFS Setup** tab by selecting a VIP and clicking the **Edit** or **Remove** button.

5. In the Navigation panel, select **NFS HA > VIP Assignment** to view the node that is assigned to the newly added VIP.



Add a Virtual IP Address with Multiple Nodes (MapR UI)

You can add a virtual IP address (VIP) with multiple nodes. Virtual IP (VIP) is a technique used to load balance data access into HDFS by using a floating IP Address among the cluster nodes. This technique is mostly used by the MapR Hadoop Distribution along with the MapR-NFS Service. VIP can provide High Availability and Load Balancing by dynamically allocating the Floating IP among the nodes.

Optimal VIP Configuration

By default, the HDFS replication factor is set to 3, and it is recommended to use one VIP for every three nodes. This also helps in optimizing the performance of the cluster.

In the case of High Data Load (>20K EPS), a single NFS might overload while replicating the file into the cluster. If the NFS Server crashes before the data is replicated, you may lose data.

Multiple NFS Servers also allow more distributed data locality which helps in High Availability and Fault Tolerance.

Prerequisites

Calculate how many VIPs you can afford.

- In case the number of nodes that you have is not a multiple of three, you can allocate multiple VIPs to more than three nodes. For example, two VIPs among five Nodes.

The steps to add the VIP are the same as adding any other VIP, but instead of choosing “all nodes” for VIP, you choose a subset of nodes to participate in the VIP.

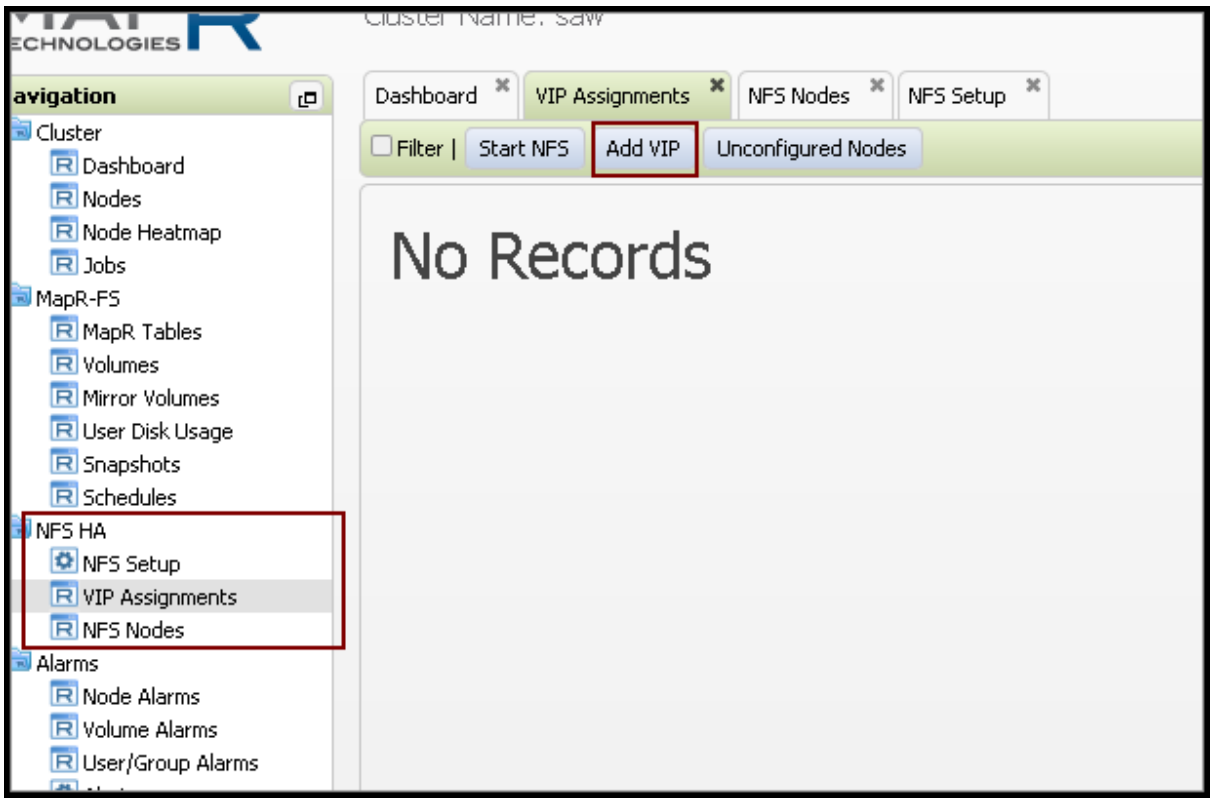
- A node can participate in Multiple VIPs.
- For more information, see http://doc.mapr.com/display/MapR/Setting+Up+VIPs+for+NFS

Optimal Configuration with the Warehouse Connector

The recommended configuration is to have one VIP per Warehouse Connector. In cases where Warehouse Connector numbers are higher than VIPs, configure multiple Warehouse Connectors to write to a VIP in a way so that traffic on VIPs can be normalized.

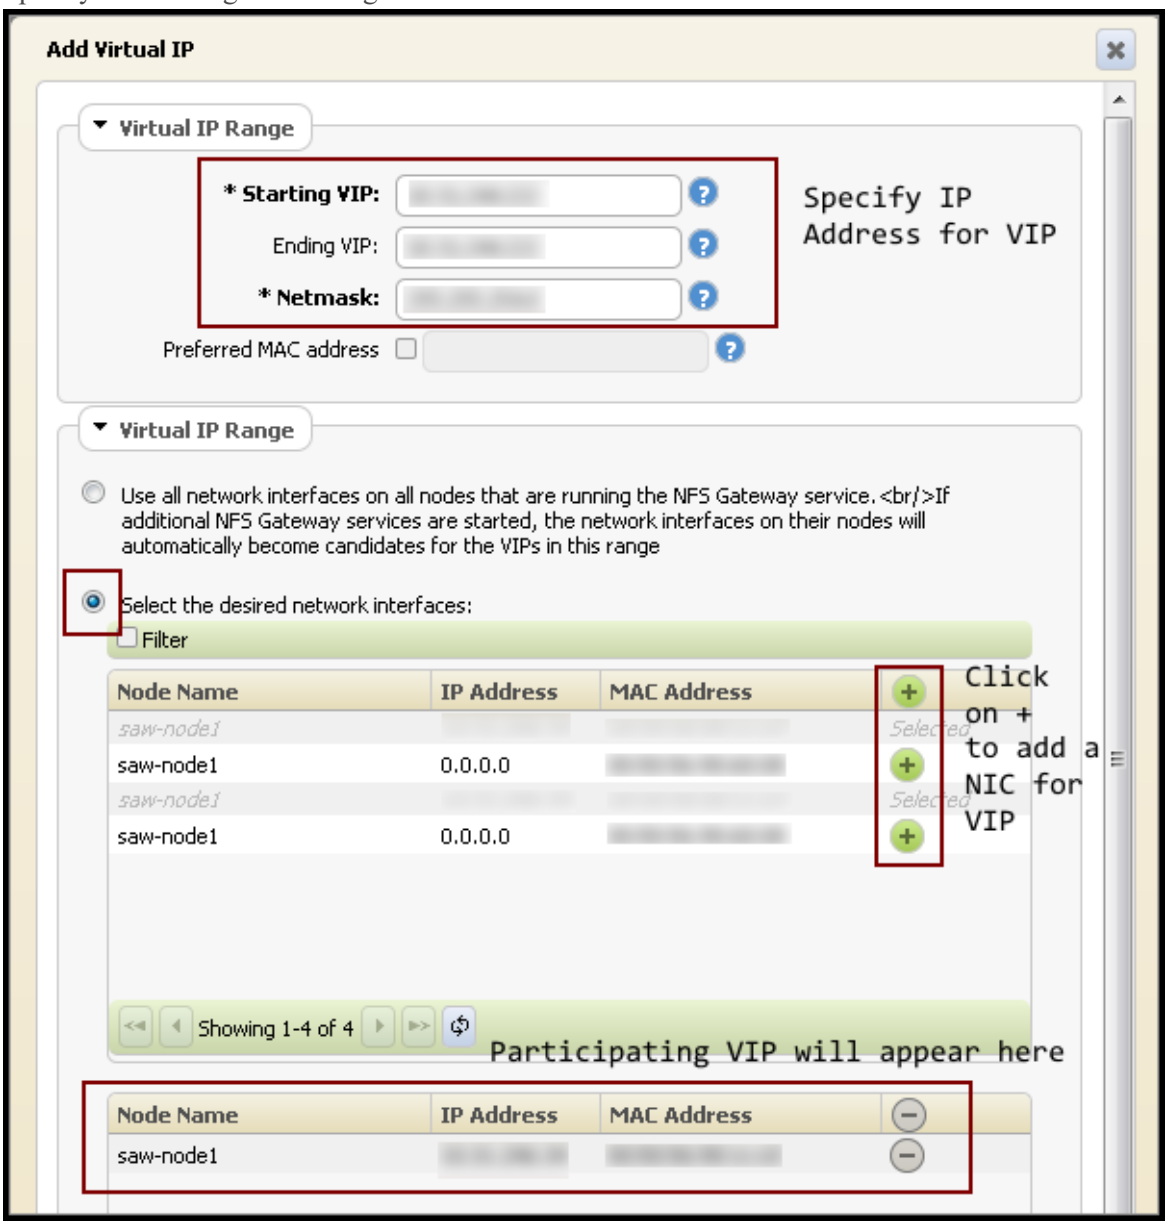
Add a Virtual IP Address that has Multiple Nodes

1. Log on to the MapR Control System.
2. In the Navigation panel, select **NFS-HA > VIP Assignments**.
3. On the **NFS Setup** tab, click the **Add VIP** button.



4. In the **Add Virtual IP** dialog, do the following:

a. Specify the Starting and Ending VIP as the same IP address.



b. Set **Select the Desired Network Interfaces** to choose the available Network Interfaces that need to be used for the VIP assignment. Select the NIC Cards that you want to participate in the VIP. A node can have multiple NICs, so depending on the Network Configuration you can select them.

c. Click **OK** to add the VIP.

Example VIP Configurations

The following table shows configuration examples of virtual IP addresses (VIPs) with different number of nodes in the cluster.

Number of Nodes in Cluster	Number of VIPs
3 Nodes	1 VIP
5 Nodes	2 VIPs (3 Nodes each, 1 Common Node)
7 Nodes	2 VIPs (3 Nodes each, 1 Free Node)
8 Nodes	3 VIPs (3 Nodes each, 1 Common Node among 2 VIPs)
11 Nodes	4 VIPs (3 Nodes each, 1 Common Node among 2 VIPs)
11 Nodes	3 VIPs (3 Nodes each, 2 Free Nodes)

How Warehouse Connector Works

Warehouse Connector collects meta and events from Decoder and Log Decoder and writes them in AVRO format into a Hadoop-based distributed computing system. You can set up the Warehouse Connector as a service on existing Log Decoders or Decoders.

The Warehouse Connector contains the following components:

- Data Source
- Destination
- Data Stream

Data Source

Warehouse Connector collects data from the data source to store it in the destination. The supported data sources are Log Decoder and Decoder.

Destination

Destination is the Hadoop-based distributed computing system that collects, manages, and enables reporting on security data. The following are the supported destinations:

- RSA NetWitness Warehouse (MapR) deployments
- HortonWorks Data Platform
- Any Hadoop-based distributed computing system that supports WebHDFS or NFS mounting of HDFS file systems.
  Example: Commercial MapR M5 Enterprise Edition for Apache Hadoop

Data Streams

A data stream is a logical connection between the data source and destination. You can have multiple streams for different subsets of data collected. You can setup streams to segregate data from multiple Decoder and Log Decoder services. You can create a stream with a single data source and destination or with multiple data sources and a single destination.

The Warehouse Connector:

- Aggregates session and raw log data from Decoders and Log Decoders.
- Transfers the aggregated data to supported destinations like Hadoop based deployments.
- Serializes the aggregated data that includes both schema and data into AVRO format.

Meta Filters

Meta filters enables you to filter the meta keys that should be written into the Warehouse. For more information, see Specify Meta Filters for a Stream.

Multi-Valued Meta Keys

RSA NetWitness Warehouse supports multi-valued meta keys. The multi-valued meta keys is the meta field with the array type. You can use the meta keys library to determine the meta fields of type array and write HIVE queries with the correct syntax for arrays. By default, the following meta keys are treated as multi-valued and are defined in the file, **multivalue-bootstrap.xml** located at **/etc/netwitness/ng** in the Warehouse Connector:

- alias.host
- action
- username
- alias.ip
- alias.ipv6
- email
- device.group
- event.class

Checksum Validation

You can validate the file integrity of the AVRO files that are transferred from the Warehouse Connector to the data destinations. You need to enable checksum validation option when you configure the Warehouse Connector.

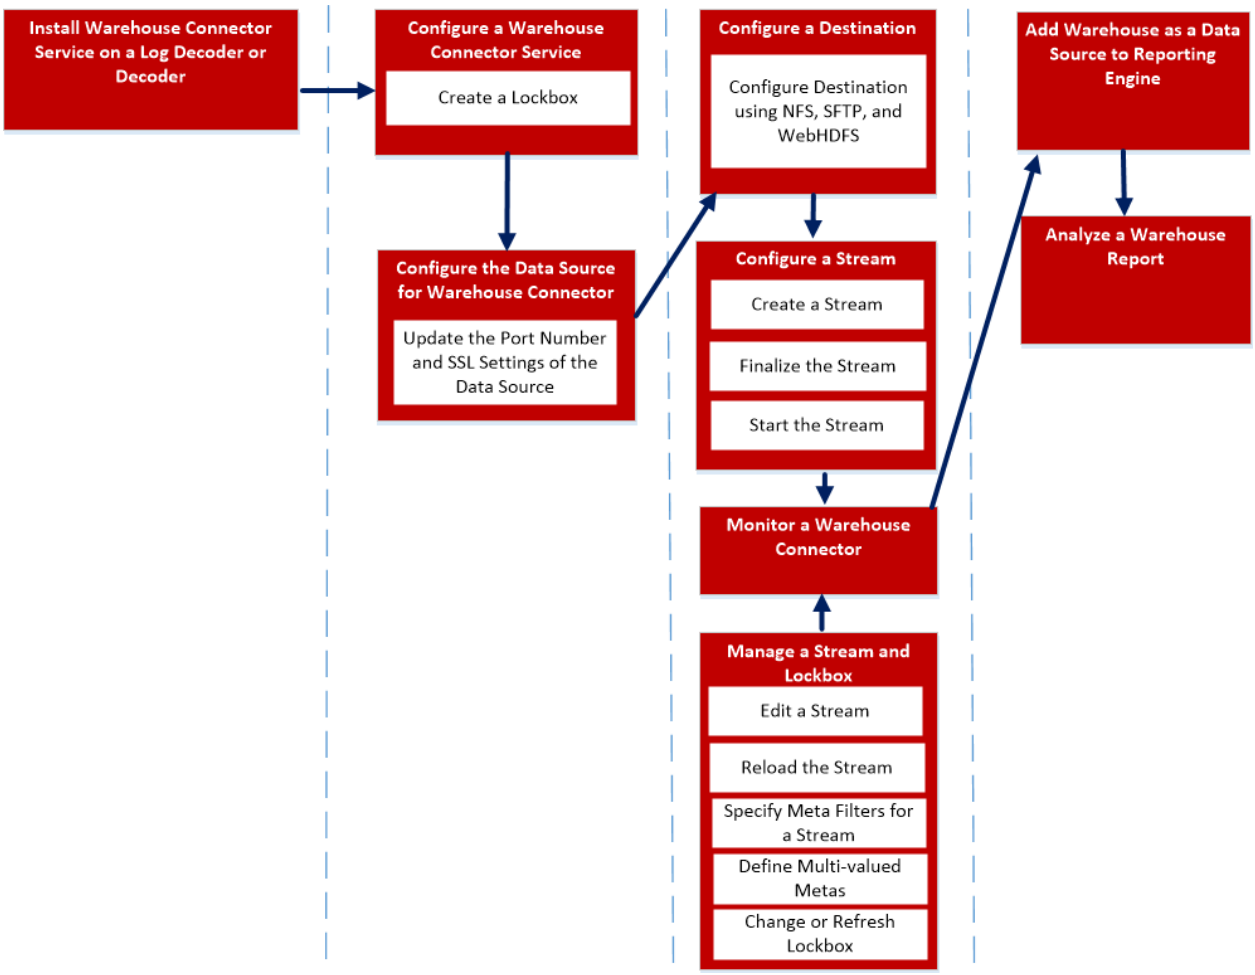
Lockbox Support

Lockbox provides an encrypted file that Warehouse Connector uses to store and protect sensitive data. You need to create the lockbox by providing a lockbox password while configuring the Warehouse Connector for the first time.

Note: You can orchestrate Warehouse Connector on a Log Decoder or a Decoder appliance.

The following is an overview on how to install and configure the Warehouse Connector service on Log Decoder or Decoder.

- Configuring the Warehouse Connector service on NetWitness,
- Configuring data sources,
- Destinations,
- Streams for Warehouse Connector,
- Configuring alert notifications on NetWitness.



To install and configure the Warehouse Connector service, perform the following:

1. Install Warehouse Connector Service on a Log Decoder or Decoder or Hybrid
2. Configure a Warehouse Connector Service
3. Configure the Data Source for Warehouse Connector
4. Configure the Destination
5. Configure a Stream
6. Monitor a Warehouse Connector
7. Add Warehouse as a Data Source to Reporting Engine
8. Analyze a Warehouse Report
9. Manage a Stream and Lockbox

Install Warehouse Connector Service on a Log Decoder or Decoder or Hybrid

To install (fresh install) the Warehouse Connector service on a Log Decoder or Decoder or Hybrid:

1. Log in to NW Admin server
2. Enter the following command on NetWitness Server:
   `warehouse-installer --help`
   The command line interface (CLI) usage descriptions are displayed.
3. Install Warehouse Connector service by executing either one of the following commands:
   `warehouse-installer --host-addr 10.0.0.0`
   `warehouse-installer --host-id 5928b9d8-83be-4143-9602-fa936de5c41e`
   `warehouse-installer --host-name NW11AdminServer`
   Where,
   `10.0.0.0` - IP address of the Host
   `5928b9d8-83be-4143-9602-fa936de5c41e` - Host ID of Log Decoder or Decoder
   `NW11AdminServer` - Host name of Log Decoder or Decoder
4. Restart the Warehouse Connector using following command:
   `service nwwarehouseconnector restart`

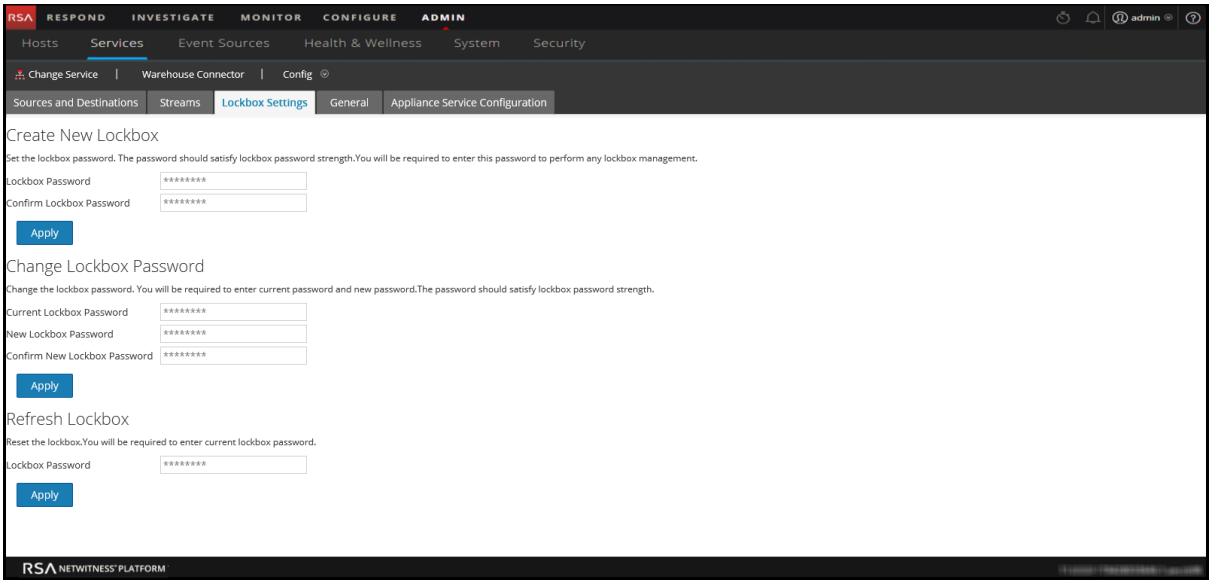
The Warehouse Connector service is successfully installed on the Log Decoder or Decoder or Hybrid.

Configure a Warehouse Connector Service

You can configure the Warehouse Connector service using the following procedure.

To set the Lockbox password:

1. Log on to NetWitness Platform.
2. Go to **ADMIN > Services**.
3. In the Services view, select the added Warehouse Connector service, and select **> View > Config**.
4. In the Services Config view of Warehouse Connector, click the **Lockbox Settings** tab.



5. In the **Create New Lockbox** section, perform the following:
   a. In the **Lockbox Password** field, enter the new lockbox password.

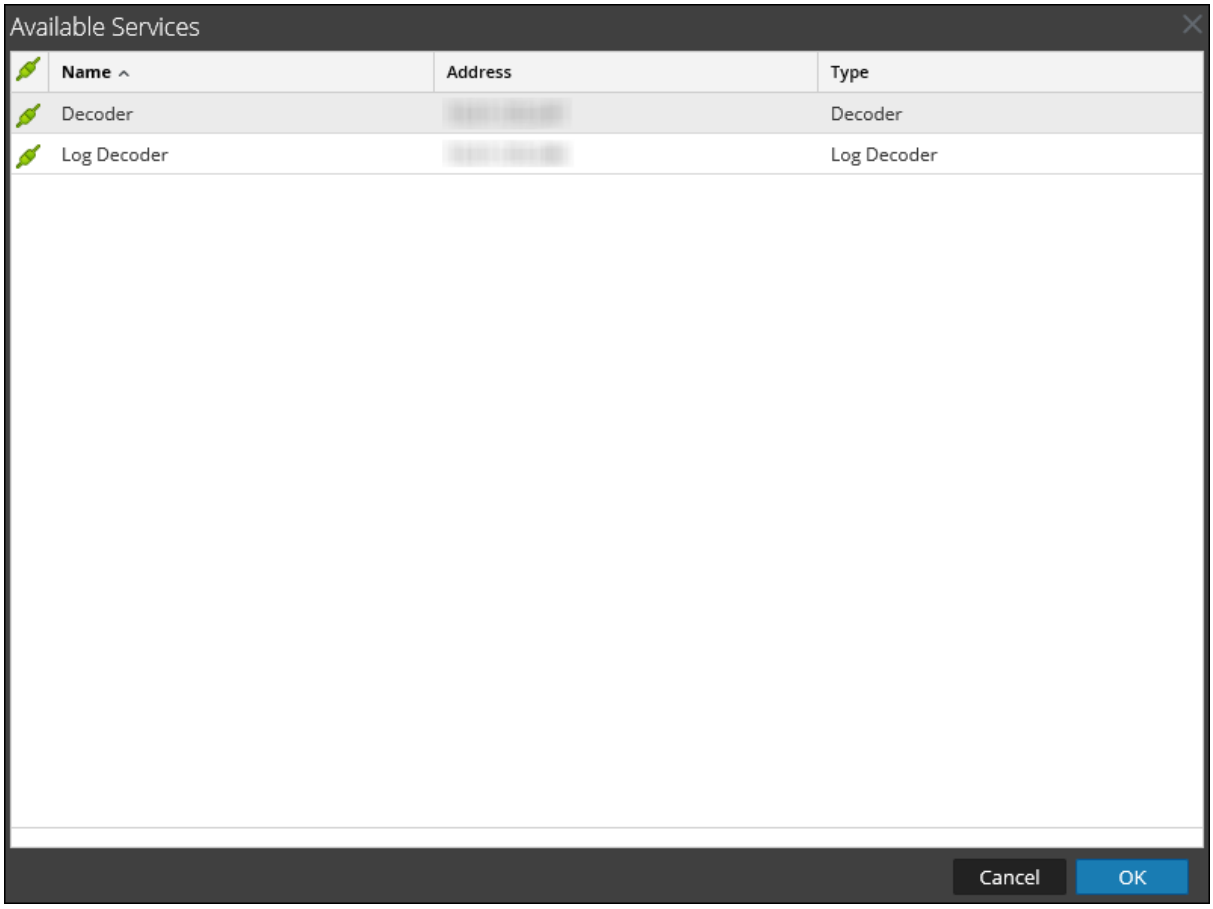
      Note: The lockbox password must be at least eight characters in length and it must contain at least three of the following groups: one uppercase character [A-Z], one lowercase character [a-z], one numeral [0-9], and one special character.

   b. In the **Confirm Lockbox Password** field, enter the added lockbox password to confirm.
   c. Click **Apply**.
      The Lockbox password is set.

Configure the Data Source for Warehouse Connector

To configure the data source:

1. Log on to NetWitness Platform.
2. Go to **ADMIN > Services**.
3. In the Services view, select the added Warehouse Connector service, and select **> View > Config**.
   The Services Config view of Warehouse Connector is displayed.
4. On the **Sources and Destinations** tab, in the **Source Configuration** section, click .



5. In the **Available Services** dialog, select the Log Decoder or Decoder services that you want to add as a source to the Warehouse Connector service and click **OK**.
   The selected Log Decoder and Decoder services are listed in the **Source Configuration** section.

Update the Port Number and SSL Settings of the Data Source

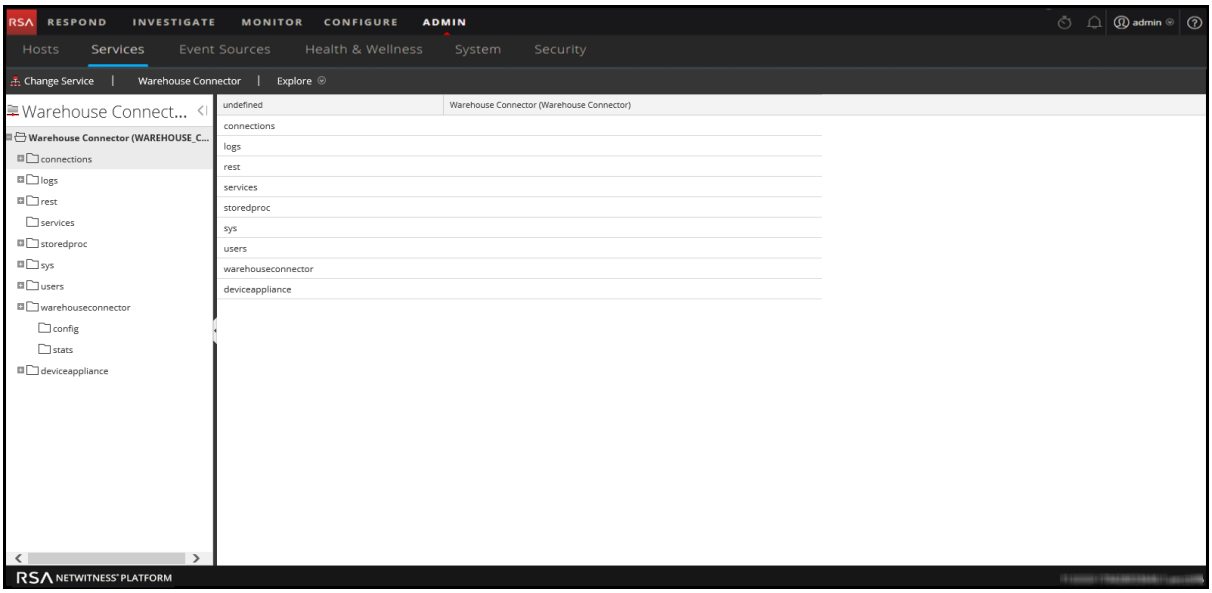
If there is change to the port number or SSL settings of the Warehouse Connect data sources, you can update the changes in Explore view of the Warehouse Connector.

Make sure that:

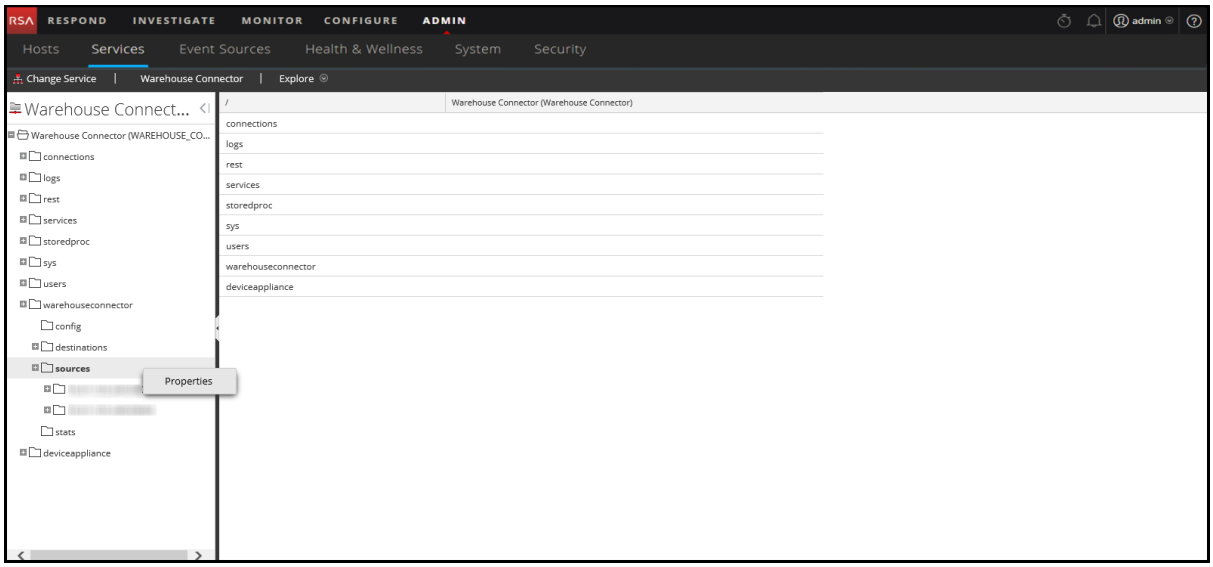
- You have the changed port number or SSL settings of the data source.
- You have stopped the streams related to the data source that is updated with the port number or SSL settings.

To update the port number or SSL settings:

1. Log on to NetWitness Platform.
2. Go to **ADMIN > Services**.
3. In the Services view, select the added Warehouse Connector service and select **> View > Explore**.
   The Service Explore view of Warehouse Connector is displayed.



4. Navigate to **warehouseconnector/sources**, right-click the source, and click **Properties**.
   The Properties of the source is displayed.



5. In the drop-down menu, select **update**. In the Parameters field, perform the following:
   - To update the port number of the source, enter `port=<new_source_portnumber>` and click **Send**.

   - To update the SSL settings of the source, enter `ssl=<new_ssl_settings>` and click **Send**.

     Note: You can also update the port number and ssl settings simultaneous by adding space between the parameters.

     
6. Restart the Warehouse Connector service.
7. Start the streams.

Configure the Destination

You can configure the destination using NFS, SFTP, and WebHDFS. Change the destination to which the Warehouse Connector service needs to write the collected data using NFS:

- RSA NetWitness Warehouse (MapR) deployments
- Commercial MapR M5 Enterprise Edition for Apache Hadoop deployments

You can configure the Warehouse Connector to write to a remote destination using Secure File Transfer Protocol (SFTP). The remote destination can be a remote server that is NFS mounted to the MapR cluster or it can be a remote staging server.

By default, in the remote destination the Warehouse Connector writes data in the following directory structure:

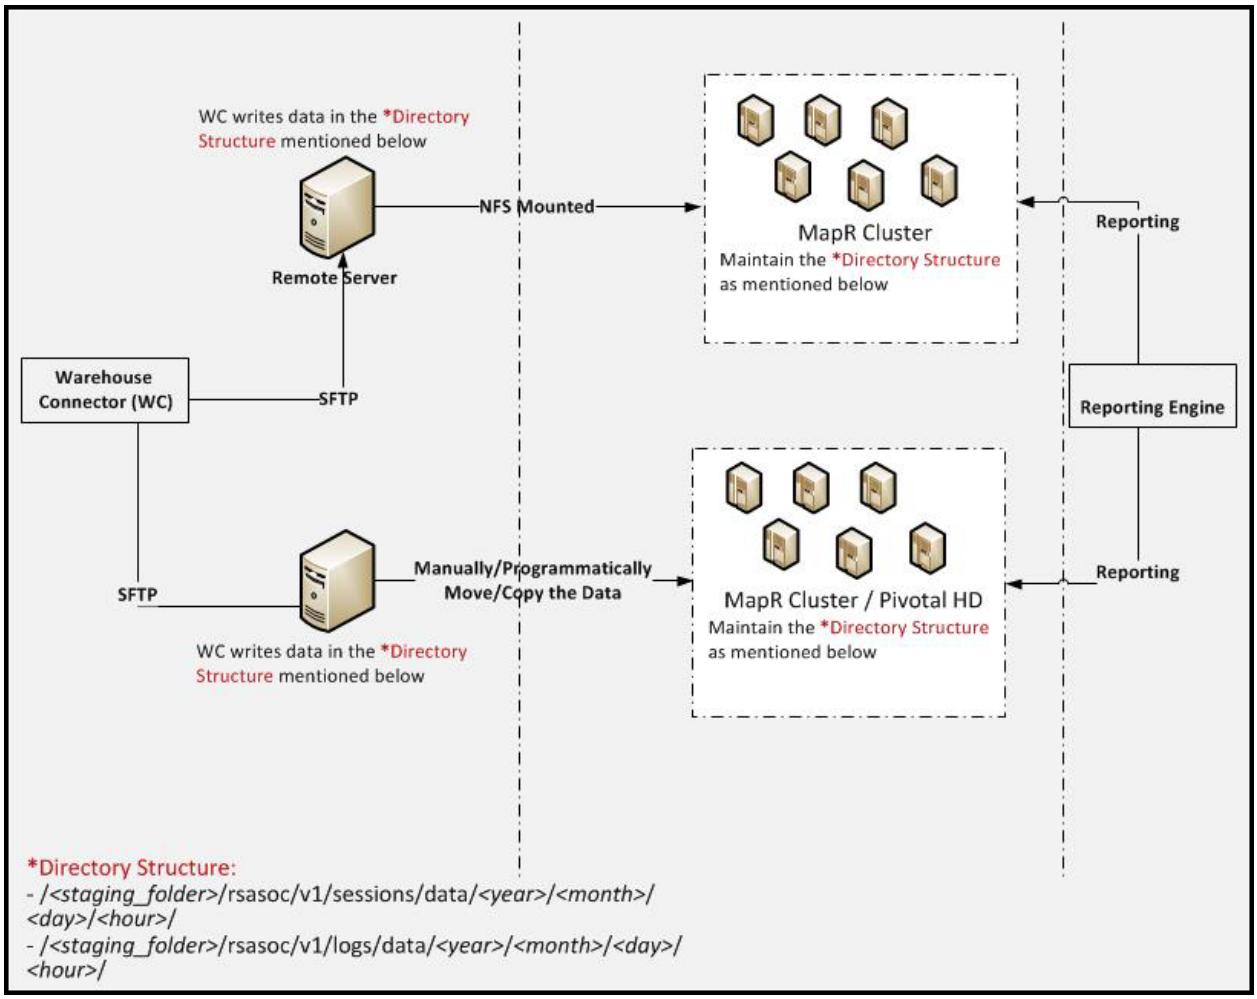
- `/<staging_folder>/rsasoc/v1/sessions/data/<year>/<month>/<day>/<hour>/`
- `/<staging_folder>/rsasoc/v1/logs/data/<year>/<month>/<day>/<hour>/`
  Where <staging_folder> is the folder on the remote server where the Warehouse Connector writes the data.

If you are using a remote staging server as the remote destination, you need to manually copy or move the directory structure to any of the following deployments:

- RSA NetWitness Warehouse (MapR)
- Commercial MapR M5 Enterprise Edition for Apache Hadoop
- HortonWorks HD

To generate reports from the data written by Warehouse Connector, make sure that in your Hadoop deployment you maintain a similar directory structure that is created by Warehouse Connector in the remote destinations.

The following illustration describes how you can use SFTP to write data from Warehouse Connector to a remote destination.



You can configure the Warehouse Connector service to write the collected data to a Hadoop-based distributed computing system that supports WebHDFS.

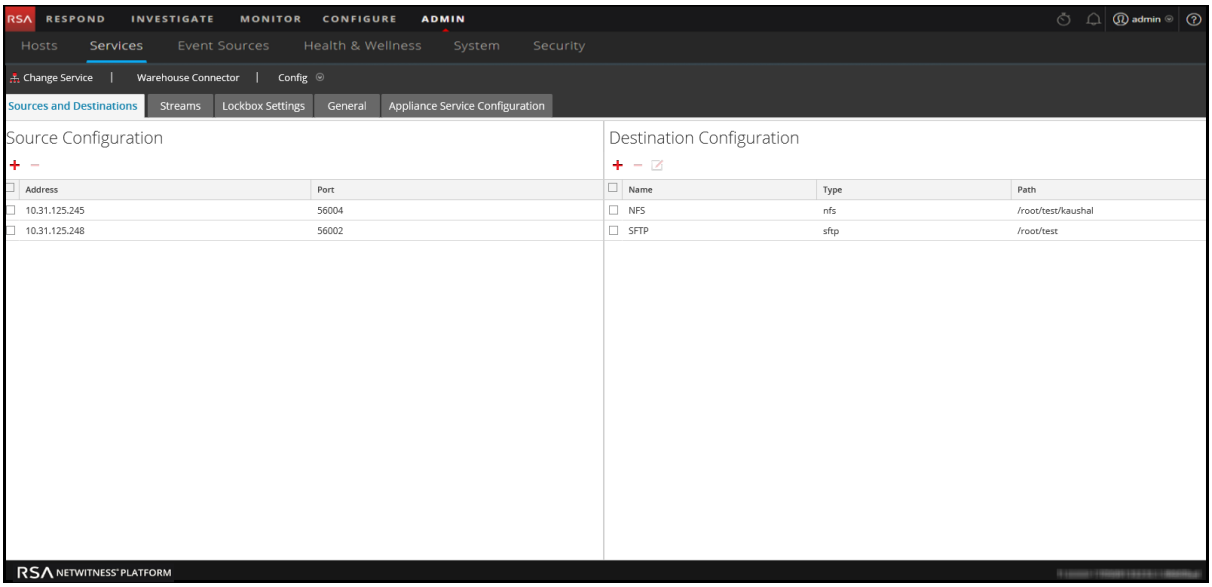
Configure the Destination Using NFS

Make sure that you have:

- Installed the Warehouse Connector service or virtual appliance in your network environment.
- Added the Warehouse Connector service to NetWitness. For more information, see "Add a Service to a Host" in the *Hosts and Services Getting Started Guide*.
- Set up NFS on Warehouse Connector. For more information on how to set up NFS on Warehouse Connector, see "Configure Warehouse Connector to Write to Warehouse" in the *Warehouse (MapR) Configuration Guide*.

To configure the destination using NFS:

1. Log on to NetWitness Platform.
2. Go to **ADMIN > Services**.
3. In the Services view, select the Warehouse Connector service, and select **> View > Config**.
   The Services Config View of Warehouse Connector is displayed.



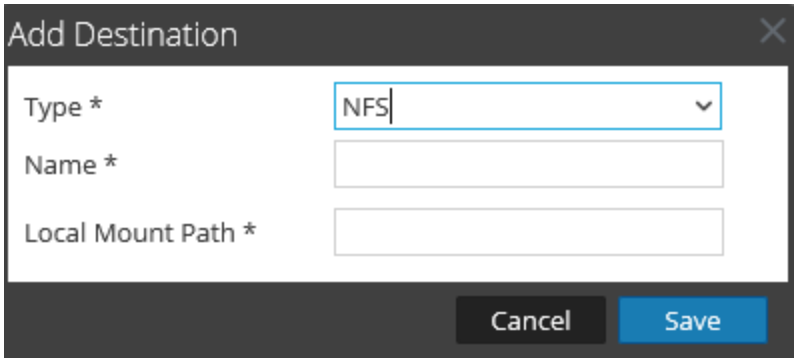
4. On the **Sources and Destinations** tab, in the **Destination Configuration** section, click .
5. In the **Add Destination** dialog, from the **Type** drop-down list, select **NFS**.
6. In the **Name** field, enter a unique symbolic name for the destination.

   Note: The **Name** field does not support spaces or special characters except underscore (_).

7. In the **Local Mount Path** field, enter the locally mounted directory for HDFS where you want the Warehouse Connector to write the data. For example:
   If **/saw** is the local mount point for HDFS that you have configured while mounting the

mapr NFS cluster on the host where you have installed the Warehouse Connector service to write to RSA NetWitness Warehouse (MapR), create a directory named **Ionsaw01** under **/saw** and the corresponding Local Mount Path for the destination would be **/saw/Ionsaw01**.

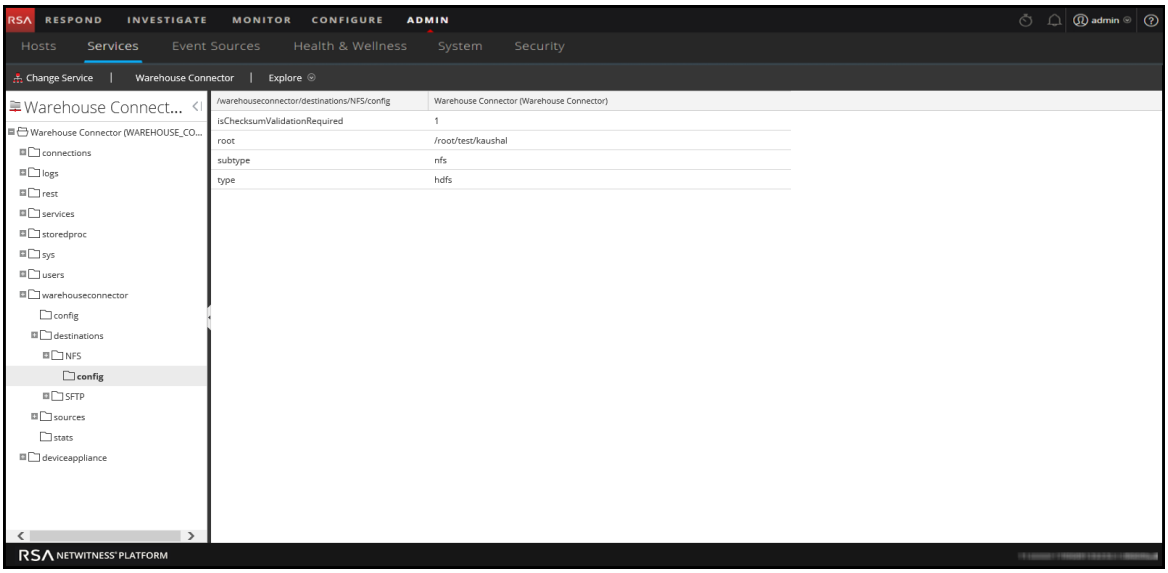
For more information, see "Mount the Warehouse on the Warehouse Connector" topic in the *Warehouse (MapR) Configuration Guide*.



The **/saw** mount point implies to / as the root path for HDFS. The Warehouse Connector writes the data to **/Ionsaw01** in HDFS.

8. Click **Save**.
9. (Optional) If you want to enable checksum validation, perform the following:
   a. Go to **ADMIN > Services**.
   b. In the Services view, select the added Warehouse Connector service, and select **> View > Explore**.
   The Explore view of Warehouse Connector is displayed.

   c. In the options panel, navigate to **warehouseconnector/destinations/nfs/config**. This is the name of the destination and is dynamic.
   d. Set the parameter `isChecksumValidationRequired` to **1**.



e. Restart the respective stream.

Configure the Destination Using SFTP

Make sure that you have:

- Installed the Warehouse Connector service or virtual appliance in your network environment.
- Added the Warehouse Connector service to NetWitness. For more information, see the "Add a Service to a Host" in the *Hosts and Services Getting Started Guide*.
- For the SFTP destination type, the destination host should be listed in the **/root/.ssh/known_hosts** file used by the ssh service (for example, sshd) running on the Warehouse Connector.

Add Destination from Warehouse Connector Host

To add the destination host to the **/root/.ssh/known_hosts** file, from the Warehouse Connector host, initiate a secure connection to the destination host:

1. Log in to the Warehouse Connector.
2. Enter `ssh root@<SAWIP>` or `ssh username@<SAWIP>`.
3. Select **Yes** and enter the password.
4. Add the host key in the **/root/.ssh/known_hosts** file

> **Note:** After you upgrade Warehouse Connector to 11.0, you must make sure that the destination host is listed in the `/root/.ssh/known_hosts` file used by the SSH service (i.e. sshd) running on the Warehouse Connector. If you do not perform this action, the streams configured with SFTP in Warehouse Connector will not start.

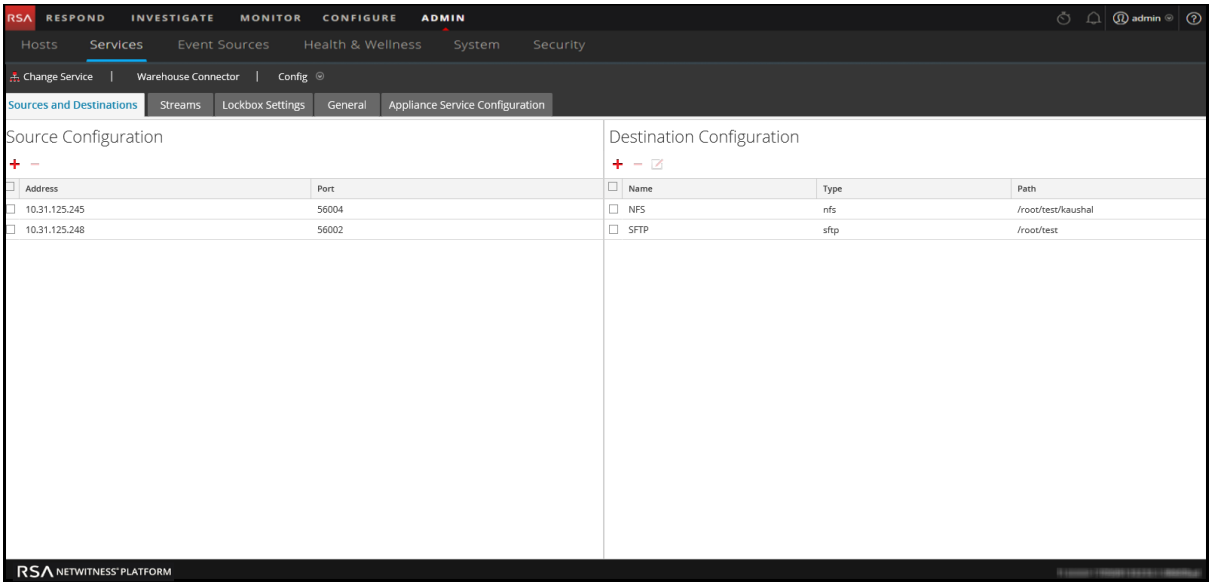
- If you want to use SFTP to write data into the destination using SSH key-based access, you need to configure SSH key-based access between the Warehouse Connector and the Warehouse host or Hadoop node. For more information, see **Configure SSH Keys** below.

> **Note:** If you want to enable checksum validation to validate the integrity of the AVRO files that are transferred from the Warehouse Connector to the destinations, make sure that you generate the keys without setting the passphrase and do a key exchange between Warehouse Connector and the warehouse nodes.

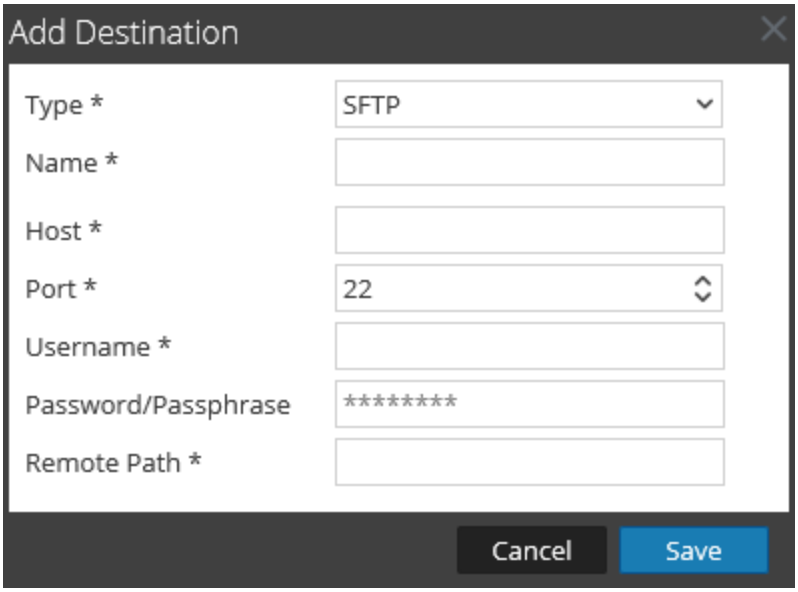
Configure Warehouse Connector to use SFTP destination

To configure the destination:

1. Log on to NetWitness Platform
2. Go to **ADMIN > Services**.
3. In the Services view, select the added Warehouse Connector service, and select **> View > Config**.
   The Services Config view of Warehouse Connector is displayed.



4. On the **Sources and Destinations** tab, in the **Destination Configuration** section, click +.
5. In the **Add Destination** dialog, select **SFTP** from the **Type** drop-down list.



6. In the **Name** field, enter a unique symbolic name for the destination.

   Note: The **Name** field does not support spaces or special characters except underscore (_).

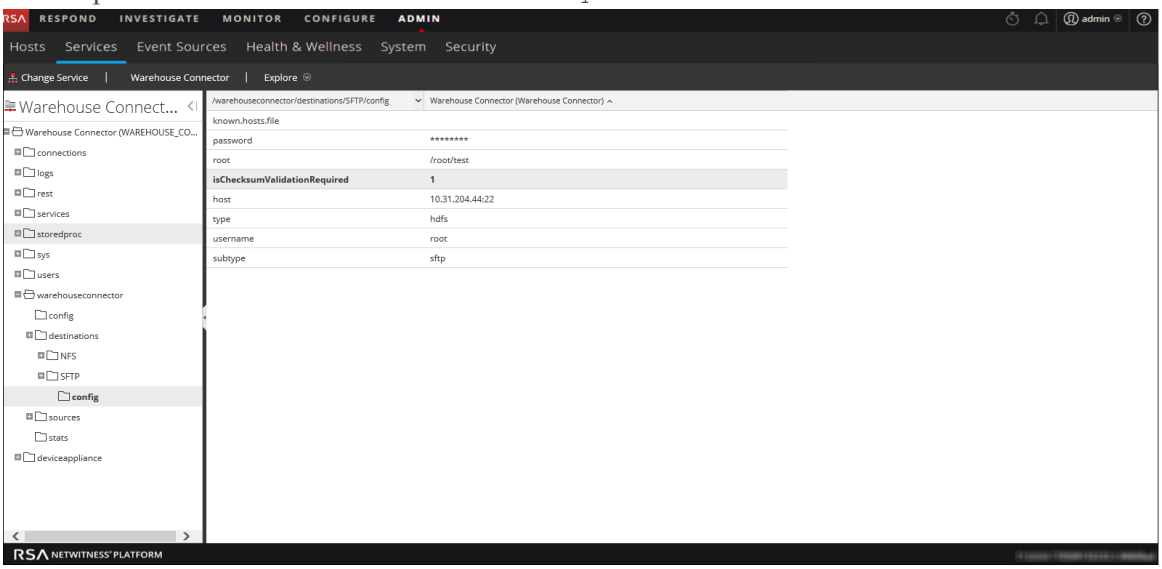
7. In the **Host** field, enter the remote server IP address.
8. In the **Port** field, retain the default port, **22**.
9. In the **Username** field, enter the SSH username.

   Note: In the case of HortonWorks HD, ensure that the username is gpadmin and for password based access the password for gpadmin should be used. For passphrase-based access, the passphrase used to generate the keys for gpadmin user should be used.

10. In the **Password/Passphrase** field, enter one of the following:
    - SSH password - If you are using SFTP to write data into the destination using password-based access.
    - SSH passphrase - If you are using SFTP to write data into the destination using SSH key-based access.
11. In the **Remote Path** field, enter the path of the directory present on the SFTP server.
12. Click **Save**.
13. (Optional) If you want to enable checksum validation, perform the following:
    a. Go to **ADMIN > Services**.
    b. In the Services view, select the added Warehouse Connector service, and select **> View > Explore**.
    The Explore view of Warehouse Connector is displayed.

    c. In the options panel, navigate to **warehouseconnector/destinations/sftp/config**.

d. Set the parameter `isChecksumValidationRequired` to **1**.



e. Restart the respective stream.

Configure SSH Keys

To configure SSH key-based access between the Warehouse Connector and the Warehouse host or Hadoop node:

1. Generate SSH keys on the Warehouse Connector at the default location. Perform the following:

   a. Log on to the Warehouse Connector.

   b. Type the following command and press ENTER:

   ```
   $ OWB_FORCE_FIPS_MODE_OFF=1 ssh-keygen -t dsa
   ```

   c. The command prompts you to enter the file in which to save the generated key.

   ```
   Enter file in which to save the key (/root/.ssh/id_dsa):
   ```

   d. Enter the file in which you want to save the key and press ENTER.

   The command prompts you to enter and confirm the passphrase.

   > **Note:** If you want to enable checksum validation to validate the integrity of the AVRO files that are transferred from the Warehouse Connector to the destinations, make sure that you do not set the **passphrase**. Then, the below steps e, f, g, and h are not applicable.

   ```
   Enter passphrase (empty for no passphrase):
    Enter same passphrase again:
   ```

   The public key is generated and is saved in the location that you provided.

   e. Change the directory by entering the following command:

   ```
   cd /root/.ssh/
   ```

f. Move the generated key to the below location:

```
mv id_dsa id_dsa.old
```

g. Type the following command and press ENTER:

```
$ OWB_FORCE_FIPS_MODE_OFF=1 openssl pkcs8 -topk8 -v2 des3 -in id_dsa.old
-out id_dsa
```

The command prompts you to enter and confirm the passphrase.

h. Enter the encryption passphrase.

i. Run the following command to change the file permission:

```
chmod 600 id_dsa
```

2. Append the generated public key to the remote Warehouse host or Hadoop node's authorized keys list located at: `~/.ssh/authorized_keys`

> **Note:** Make sure that you copy the public keys to the Hadoop node and while copying the public key ensure that you provide the login details of the user using which the WebHDFS destination would be added.

You can now securely communicate between Warehouse Connector and Warehouse nodes or Hadoop nodes.

Configure the Destination Using WebHDFS

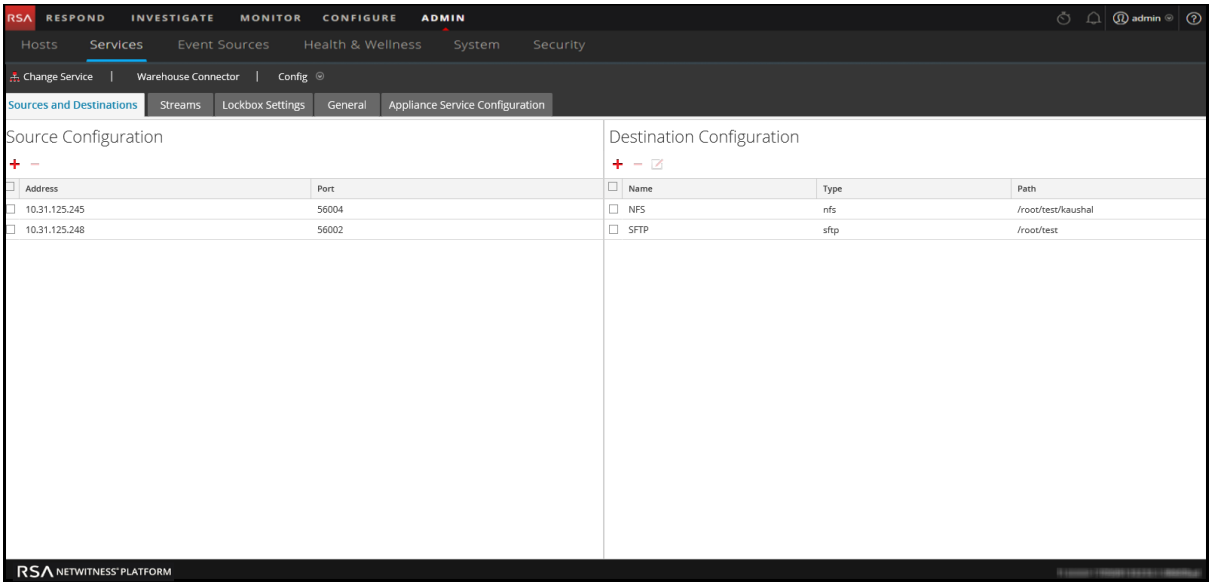
Make sure that you have:

- Installed the Warehouse Connector service or virtual appliance in your network environment.
- Added the hostname (or FQDN) and IP address of the warehouse nodes and Warehouse Connector to the DNS server. If the DNS server is not configured, add the hostname (or FQDN) and IP address of the warehouse nodes and Warehouse Connector to the file in the host on which the Warehouse Connector service is installed.
- If you want Kerberos authentication between the warehouse connector and the warehouse cluster, make sure that you perform the following:
  - Kerberos Key Distribution Center (KDC) Server is configured in your network environment and the Kerberos Keytab file is copied to the host on which you have installed Warehouse Connector.
  - Kerberos authentication is enabled in the warehouse cluster.
- If you want to enable checksum validation to validate the integrity of the AVRO files that are transferred from the Warehouse Connector to the destinations, make sure that you generate the keys without setting the passphrase and do a key exchange between the Warehouse Connector and the warehouse nodes. You need to configure SSH key-based access between the Warehouse Connector and the Warehouse host or hadoop node. For more information, see 'Configure SSH Keys' in Configure the Destination Using SFTP.

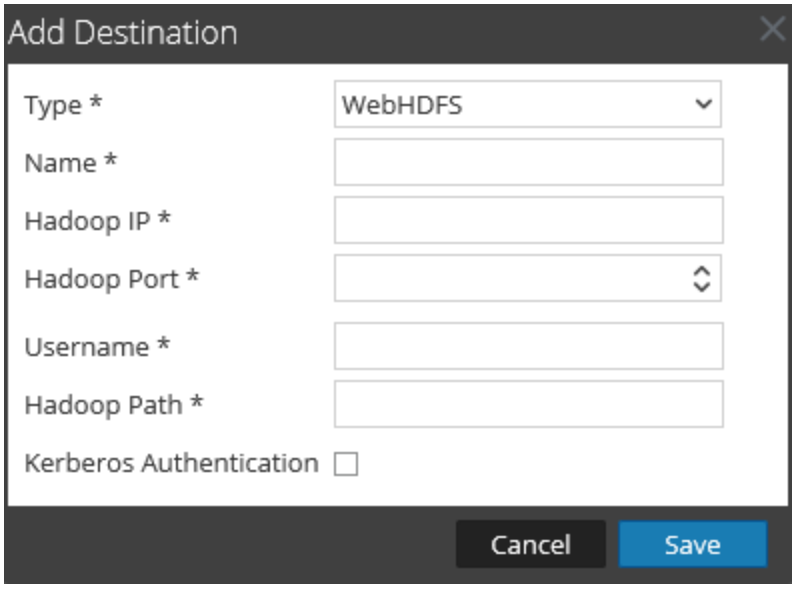
Configure Warehouse Connector to Write to SFTP destination

To configure the destination:

1. Log on to NetWitness Platform.
2. Go to **ADMIN > Services**.
3. In the Services view, select the added Warehouse Connector service and select **> View > Config**.
   The Services Config view of Warehouse Connector is displayed.



4. On the **Sources and Destinations** tab, in the **Destination Configuration** section, click .
5. In the **Add Destination** dialog, select **WebHDFS** from the drop-down list.



6. In the **Name** field, enter a unique symbolic name for the destination.

   Note: The **Name** field does not support spaces or special characters except underscore (_).

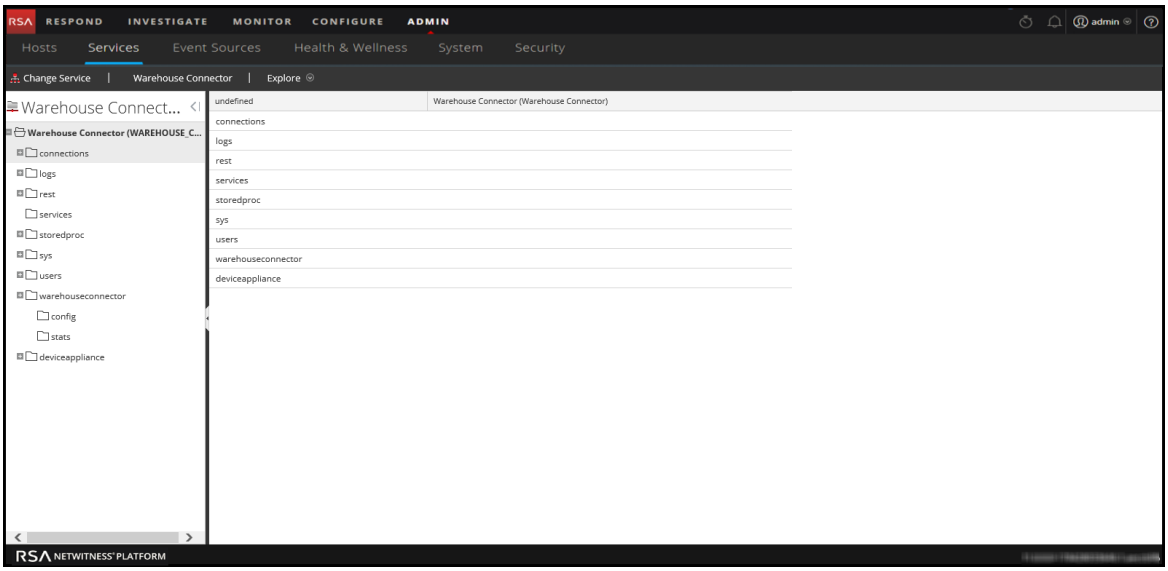
7. In the **Hadoop IP** field, enter the namenode IP address of the warehouse cluster.
8. In the **Hadoop Port** field, enter the base port that is used by the namenode web user interface.
9. In the **Username** field, enter the owner of the directory in the warehouse to which Warehouse Connector should write the data.
10. In the **Hadoop Path** field, enter the path of the directory in the warehouse to which Warehouse Connector should write the data.
11. Select the **Kerberos Authentication** checkbox, if you want the warehouse connector to securely communicate with the warehouse using Kerberos authentication.

   Perform the following:

   a. In the **Kerberos Principal** field, enter the KDC Principal used for Kerberos authentication.
   b. In the **Kerberos Keytab File Path** field, enter the path of the Kerberos Keytab file in the Warehouse Connector.

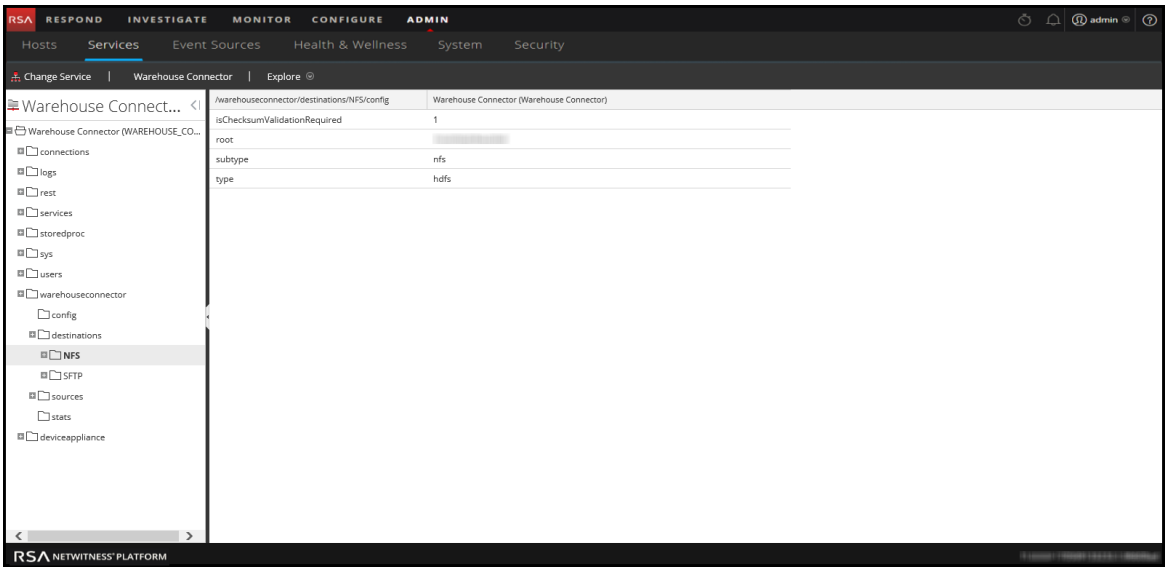
12. Click **Save**.
13. (Optional) If you want to enable checksum validation, perform the following:

   a. Go to **ADMIN > Services**.
   b. In the Services view, select the added Warehouse Connector service and select **> View > Explore**.
   The Explore view of Warehouse Connector is displayed.



c. In the options panel, navigate to **warehouseconnector/destinations/webhdfs/config**.

d. Set the parameter `isChecksumValidationRequired` to **1**.



e. Restart the respective stream.

Configure a Stream

You can configure the data stream to define the data source and destination combinations.

Make sure that you have:

- Installed the Warehouse Connector service or virtual appliance in your network environment.
- Added the Warehouse Connector service to NetWitness. For more information, see "Add a Service to a Host" in the *Hosts and Services Getting Started Guide*.
- Configured the data source from which the Warehouse Connector service needs to collect data. For more information, see Configure the Data Source for Warehouse Connector.
- Configured the destination to which the Warehouse Connector service needs to write the collected data. For more information, see Configure the Destination.

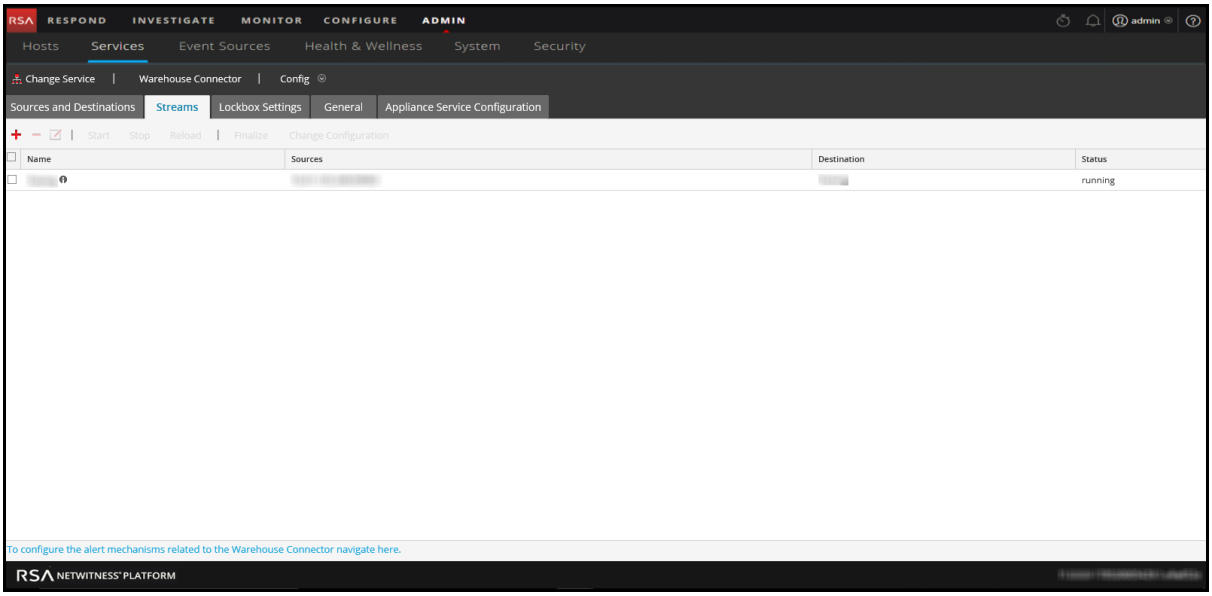
To configure the stream:

1. Create a stream
2. Finalize the stream
3. Start the stream

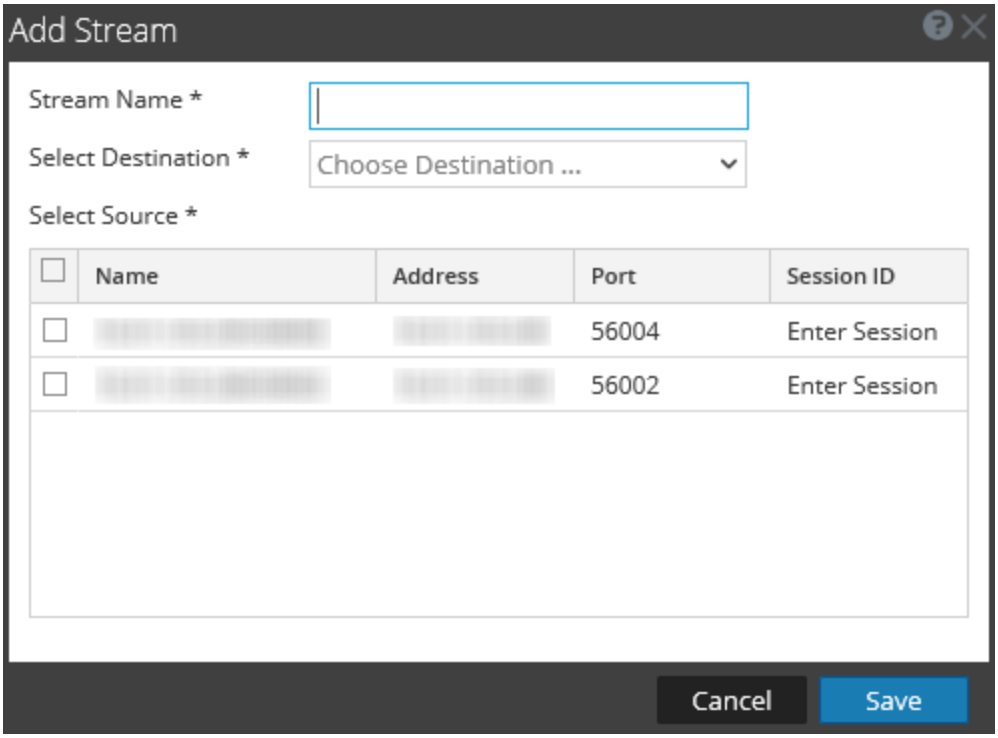
Create a Stream

To create a stream:

1. Go to **ADMIN > Services**.
2. In the Services view, select the added Warehouse Connector service and select **> View > Config**.
   The Services Config view of Warehouse Connector is displayed.
3. Click the **Streams** tab.



4. On the **Streams** tab, click +.



5. In the **Add Stream** dialog, perform the following:
   a. In the **Stream Name** field, enter a name for the stream.

      Note: The **Stream Name** field does not support spaces or special characters except underscore (_).

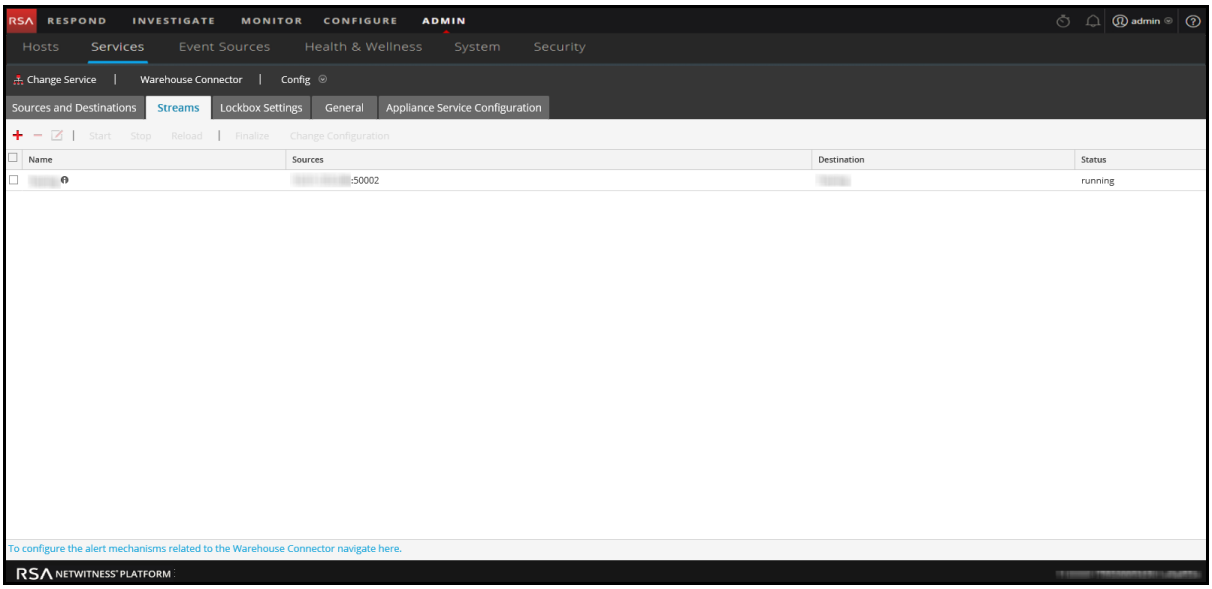
   b. In the **Select Destination** drop-down menu, select a destination from the list of destinations added to the Warehouse Connector.
   c. In the **Select Source** field, select sources from the list of sources displayed.
   d. In the **Session ID** column, enter the last session id.
      If you provide any session id, the Warehouse Connector will start the aggregation from that session, whereas if this is left blank, the aggregation will start from the current session.
   e. Click **Save**.

Finalize the Stream

Note: Make sure that you have created a stream.

To finalize the stream:

1. Go to **ADMIN > Services**.
2. In the Services view, select the added Warehouse Connector service and select **> View > Config**.
   The Services Config view of Warehouse Connector is displayed.
3. On the **Streams** tab, select the stream that you have created.



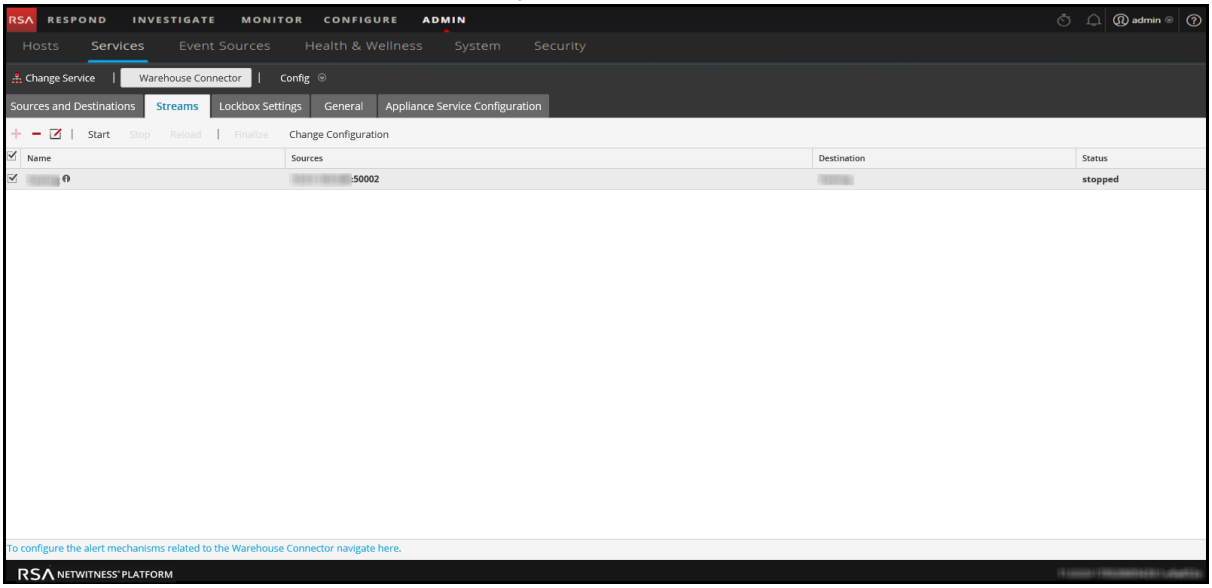
4. Click **Finalize**.

Start the Stream

Note: If you have deployed a Warehouse Connector Virtual Appliance, make sure that you change the default value of the `Maximum Message Hold Count` parameter to 800000. For more information, see General Tab Settings.

To start the stream:

1. Go to **ADMIN> Services**.
2. In the Services view, select the added Warehouse Connector service and select **> View > Config**.
   The Services Config view of Warehouse Connector is displayed.
3. On the **Streams** tab, select the stream that you have created.



4. Click **Start**.

Monitor a Warehouse Connector

By monitoring a Warehouse Connector, you can automatically generate notifications when critical thresholds concerning Warehouse Connector and its storage have been met.

To monitor a Warehouse Connector:

1. Go to **ADMIN > Services**.
2. In the Services view, select the added Warehouse Connector service and select **> View > Config**.
   The Services Config view of Warehouse Connector is displayed.
3. Click the **Streams** tab.
4. At the bottom of the **Streams** tab, click **To configure the alert mechanisms related to the Warehouse Connector navigate here**.
   The Warehouse Connector Monitoring view is displayed.

Caution: This page is deprecated and will be removed in a future release.

5. In the **Source or Destination Status** section, select the number of minutes or hours in the **Notify After Failing For** field.
   You will receive a notification if the source or destination connection fails for the defined number of minutes or hours.
6. In the **Stream Status** section, perform the following:
   a. In the **Notify Stopped For** field, define the number of minutes or hours after which you would like to receive a notification when the stream goes offline.
   b. In the **Disk Is** field, define the limit on the percentage of disk usage after which you would like to receive a notification.
   c. In the **Source is Behind** field, define the number of sessions. A notification is raised if the source goes behind the defined number of sessions.
   d. In the **Rejected Folder Size is** field, define the limit on the percentage of folder usage after which would like to receive a notification.
   e. In the **Number Of Files in Permanent Failure Folder** field, define the limit on the number of files in the permanent failure folder after which you would like to receive a notification.
7. In the **Notification Type** field, perform the following:
   a. Click **Configure email or distribution list** to configure email so that you can receive notifications in NetWitness. For more information, see the "Configure Email Server and Notification Account" topic in the *System Configuration* guide.
   b. Click **Configure Syslog and SNMP Trap servers** to configure audit logs. For more information, see the "Configure Syslog and SNMP Settings" topic in the *System Configuration* guide.

c. Select the following notification mechanisms as per your requirement:

- **NetWitness Console** - To get notifications on the NetWitness UI notification toolbar.
- **Email** - To get email notifications.
- **Syslog Notification** - To generate syslog events.
- **SNMP Trap Notifications** - To get audit events as SNMP traps.

Add Warehouse as a Data Source to Reporting Engine

You must add Warehouse as a data source to Reporting Engine to make this data source available to report against this Reporting Engine. For more information, see "Add Warehouse as a Data Source to Reporting Engine" in the *Reporting Engine Configuration Guide*.

Analyze a Warehouse Report

The Warehouse modules provide analysts with reports of early indicators of compromise. The following Warehouse reports can be analyzed in NetWitness:

- Suspicious Domains report
- Suspicious DNS Activity report
- Host Profile report

For more information, see "Step 4. Analyze a Warehouse Report" in the *Warehouse Guide*.

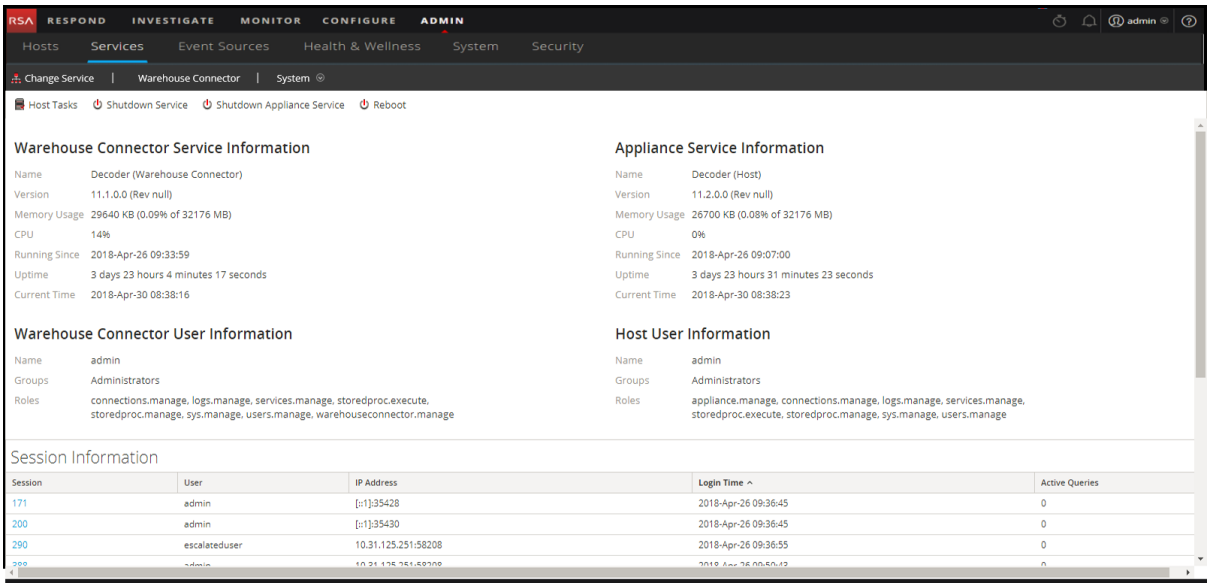
View the Warehouse Connector Service

While the information displayed in the Services System view is the same for all types of core services, several options in the toolbar are relevant only for Warehouse Connector.

To access this view:

1. Go to **ADMIN > Services**.

2. In the Services view, select a Warehouse Connector and select **> View > System**.
   The Systems view for the selected Warehouse Connector is displayed.



The following is an example of toolbar options for Warehouse Connectors.

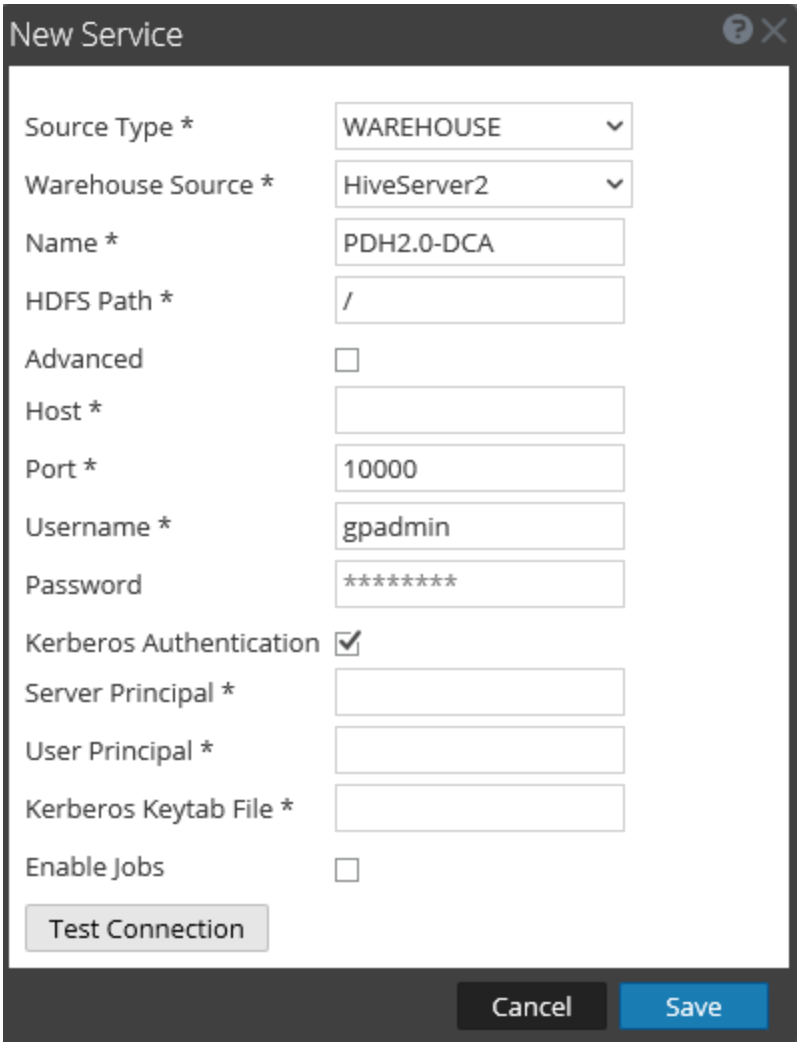
Host Tasks, Shutdown Service, Shutdown Appliance Service or (Shutdown Appliance), and Reboot are common to all services and are described in the *Hosts and Services Getting Started Guide*.

Troubleshoot the Warehouse Connector

The following information suggests the possible issues that NetWitness users may encounter when adding a Warehouse service to the Reporting Engine as a data source for reporting in NetWitness. Look for explanations and solutions in this section.

While adding a Warehouse service to the Reporting Engine as a data source for reporting, you may observe some of the errors listed in this document. Information is provided on how to troubleshoot the errors and add the data source successfully.

The following figure shows the New Service dialog.



For more information, see "Add Warehouse as a Data Source to Reporting Engine" in the *Reporting Engine Configuration Guide*.

Error	Possible Solutions
Could not open connection to HiveServer	• Ensure that the HiveServer2 is running on the Host. • Check if the port provided can be accessible from the Reporting Engine server.
No Schema found in HDFS path	Ensure that meta avro data file(s) are available in the HDFS path (**<HDFS Path>/rsasoc/v1/sessions/meta**) mentioned. The following figure shows an example of the command to check the files in hdfs.
	Could not open connection to HiveServer, GSS initiate failed	GSS initiate failed errors will be observed only in the case of Kerberos enabled Hive. Ensure that the proper keytab file is provided and it should have read options for the rsasoc user (user on which the Reporting Engine Server runs). Ensure that the system time is synchronized between KDC, Hadoop (HortonWorks) server, and the Reporting Engine system.

Manage a Stream and Lockbox

You can manage a stream using the following procedures:

- Edit a Stream
- Reload the Stream
- Specify meta filters for a Stream
- Define muti-valued metas

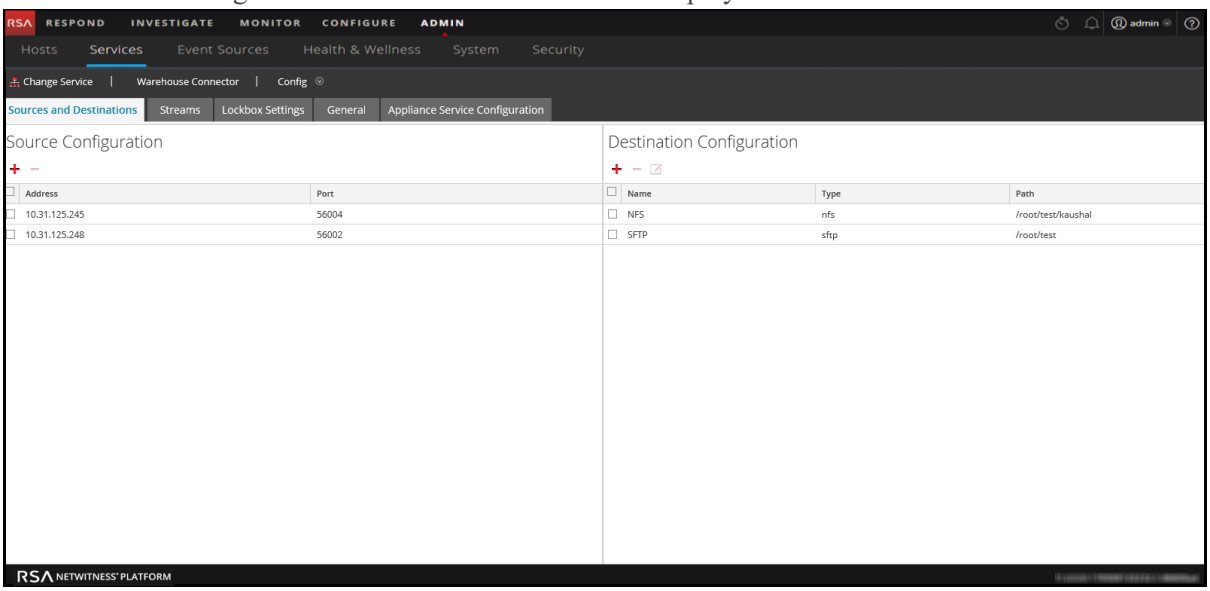
Edit a Stream

You can edit a stream to perform the following:

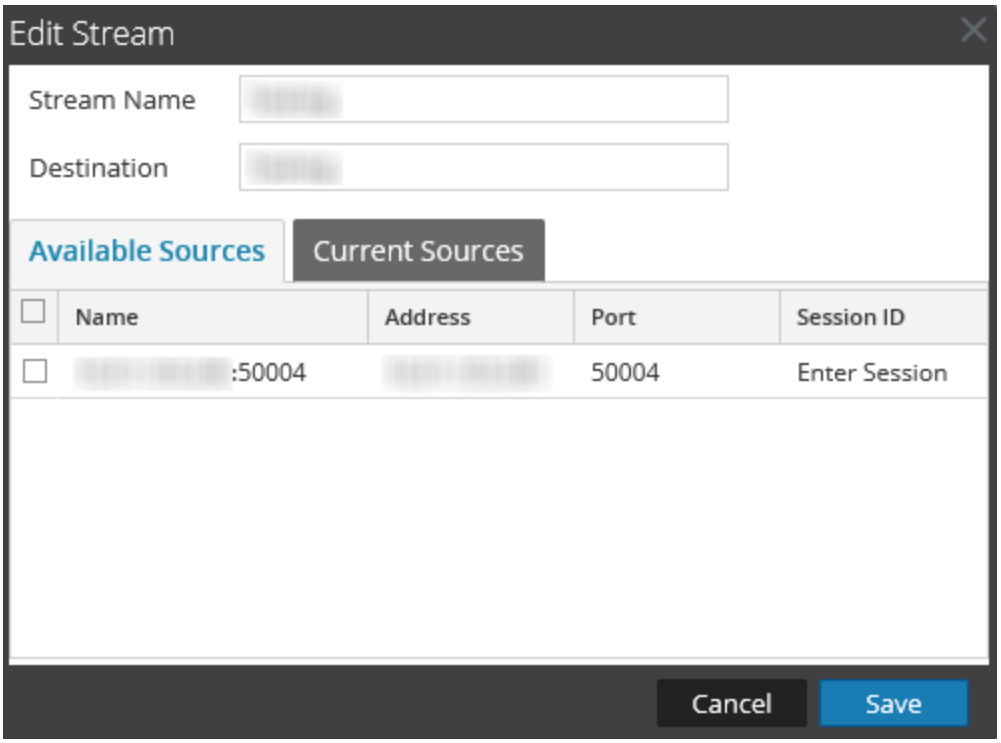
- Add data sources to the stream.
- Delete existing data sources from the stream.

To edit a stream:

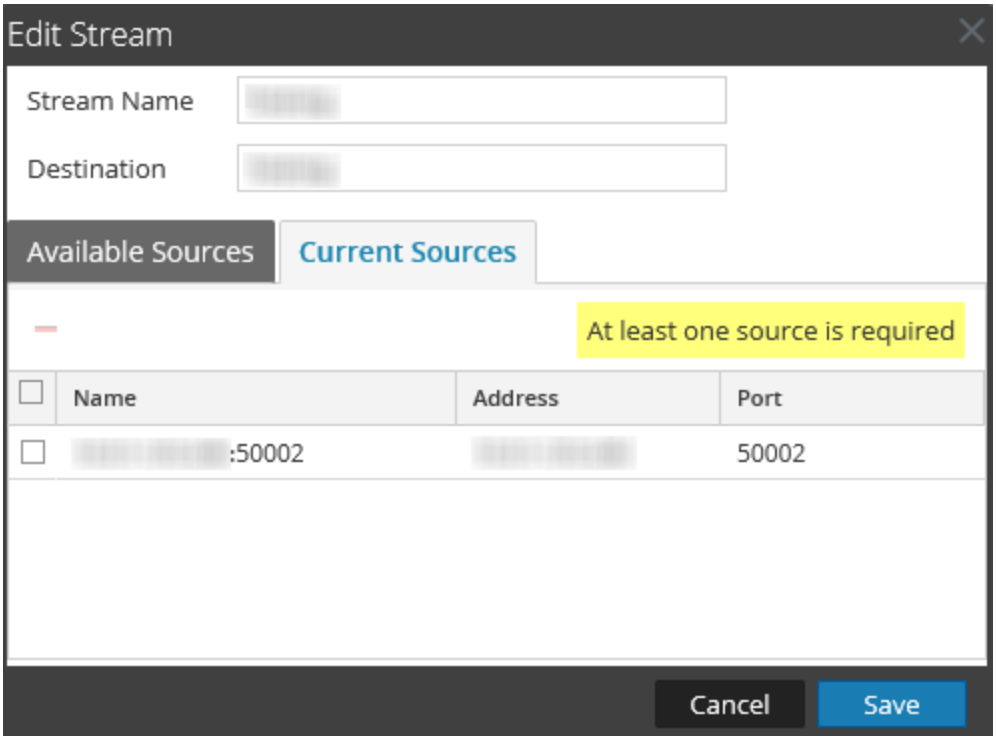
1. Go to **ADMIN > Services**.
2. In the Services view, select the added Warehouse Connector service and select **> View > Config**.
   The Services Config view of Warehouse Connector is displayed.



3. On the **Streams** tab, click .
4. In the **Edit Stream** dialog, you can perform the following:
   - On the **Available Sources** tab, you can select the available data sources to add to the stream and click **Save**.



- On the **Current Sources** tab, you can delete an existing data source from the stream. Select the data source and click − .



Reload the Stream

When you reload the stream, the Warehouse Connector updates the schema file for the stream. You must reload the stream when you add a new custom meta to the Log Decoder or Decoder.

To reload the stream:

1. Go to **ADMIN > Services**.
2. In the Services view, select the added Warehouse Connector service and select **> View > Config**.
   The Services Config view of Warehouse Connector is displayed.
3. On the **Streams** tab, select the stream that you want to reload.
4. Click **Reload**.

Specify Meta Filters for a Stream

You need to specify the filter for each stream in the `export.session.meta.fields` parameter in the Explore view of the Warehouse Connector.

The following table lists the values that you can provide as a filter:

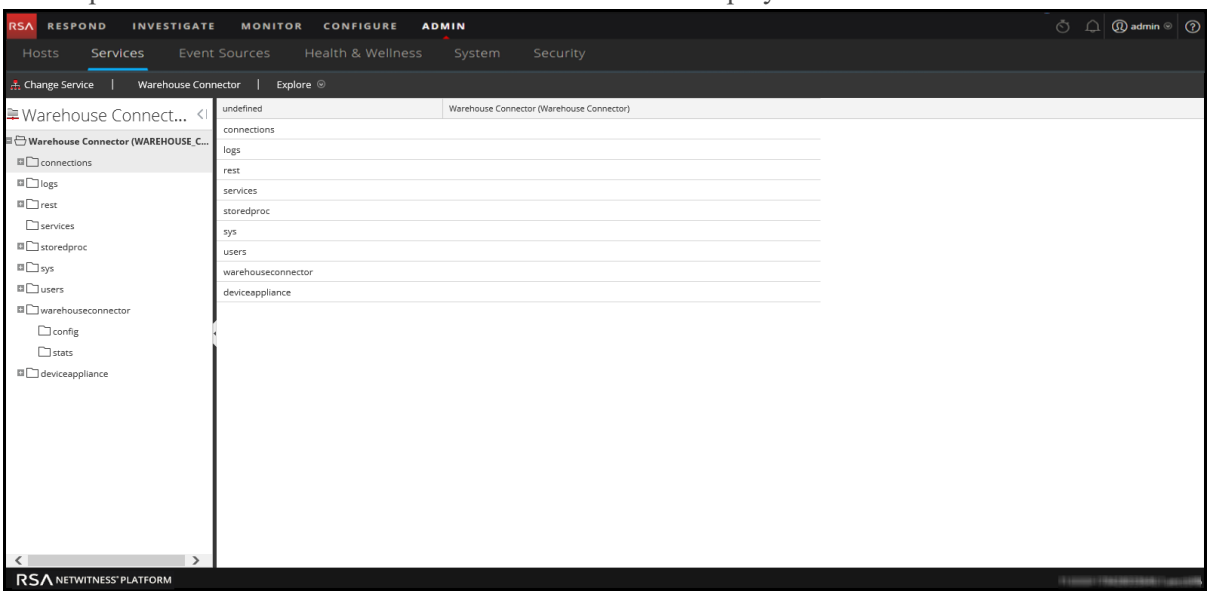
Values	Description
*	All the collected metas are written to SAW.
*, *meta1*, *meta2*	All the metas except the defined metas are written to SAW. For example, **Filter:** `*,ip.src` All the metas except `ip.src` is written to SAW.
meta1, meta2, meta3	Only the defined metas are written to SAW.

Note: By default, the following metas are written to Warehouse even if you specify them in the filter:
- ng_source
- unique_id
- time

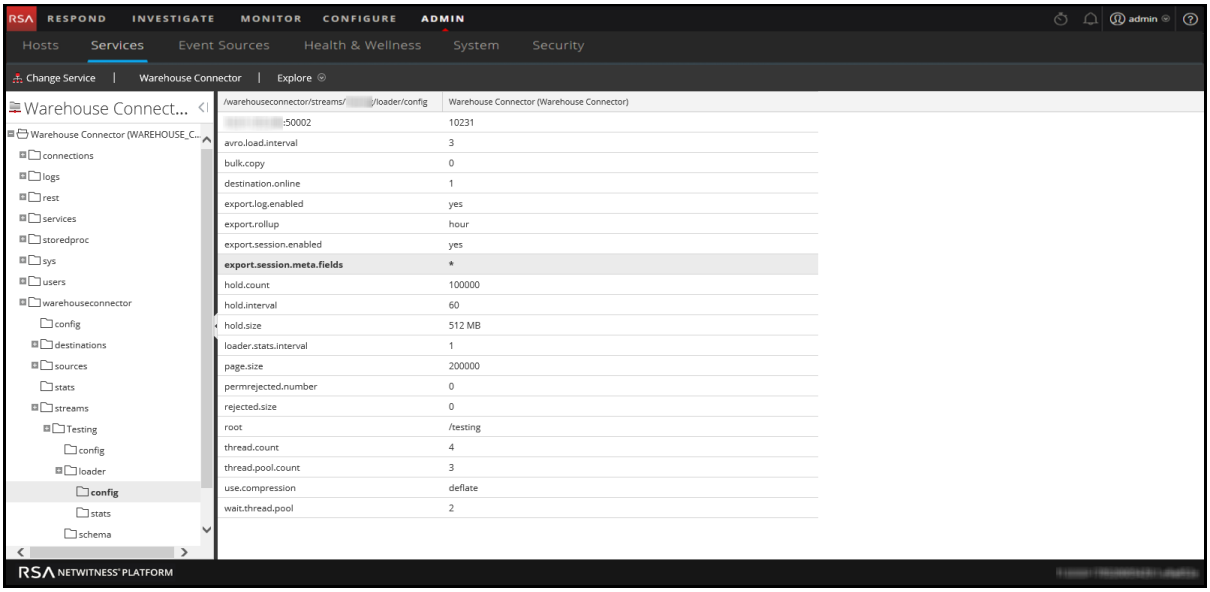
To specify meta filters for a Stream:

1. Go to **ADMIN > Services**.

2. In the Services view, select a Warehouse Connector services and select > **View** > **Explore**. The Explore view of the Warehouse Connector service is displayed.



3. In the options panel, select **warehouseconnector** > **streams** > **<stream_name>** > **loader** > **config**.
4. In the `export.session.meta.fields` parameter, enter the filter.



5. Restart the stream.

Define Multi-valued Metas

You can also define an existing meta or a custom meta to be treated as multi-valued meta.

To define multi-valued metas:

Caution: Defining an existing meta to be treated as multi-valued may change the data type of the meta and cause the associated reports to fail.

1. Create a new file with the filename **multivalue-users.xml** in the **/etc/netwitness/ng** directory.
2. Add the following entries:

```
<?xml version="1.0" encoding="utf-8"?>

<Netwitness>
    <MultiValueMetas>
<Meta>NEWMETANAME</Meta>
    </MultiValueMetas>
</Netwitness>
```

   Where *NEWMETANAME* is the existing meta or a custom meta to be treated as multi-valued meta.

   Caution: Make sure that you do not add metas that are by default treated as non multi-value.

3. Restart the stream.

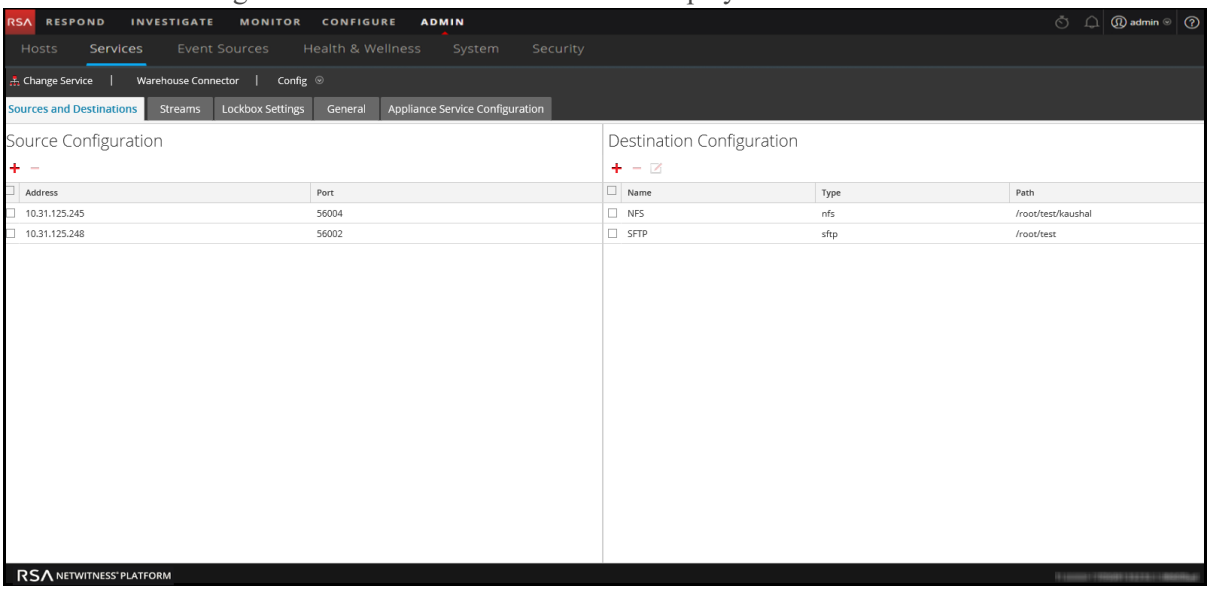
Manage a Lockbox

You can manage a lockbox using the following procedures:

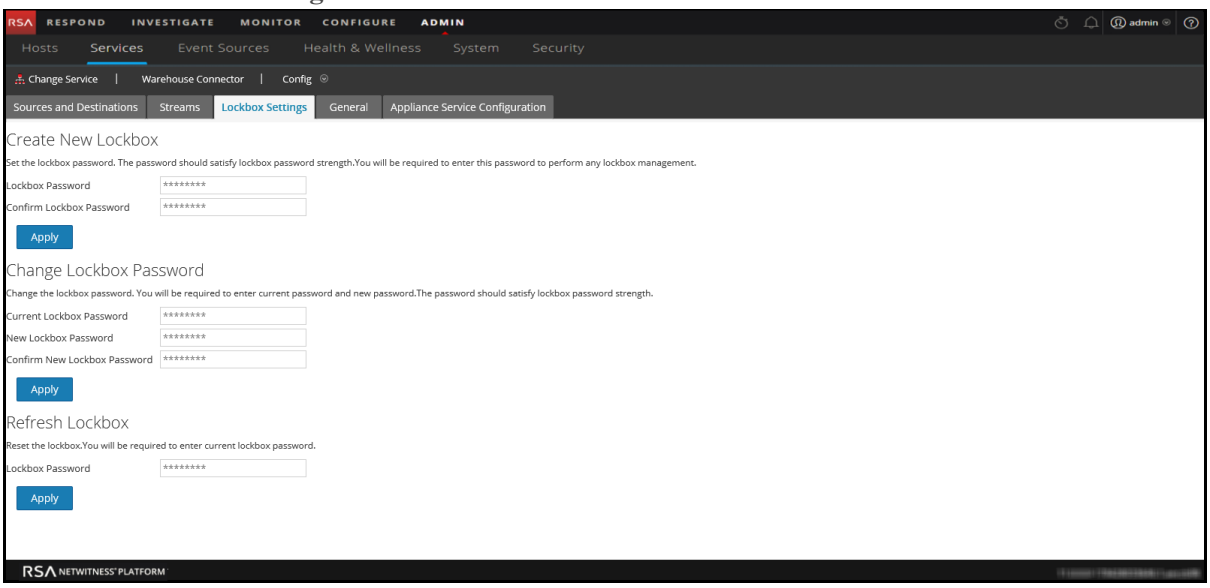
- Change the Lockbox password
- Refresh the Lockbox

To change the Lockbox password:

1. Log on to NetWitness Platform.
2. Go to **ADMIN > Services**.
3. In the Services view, select the added Warehouse Connector service, and select **> View > Config**.
   The Services Config view of Warehouse Connector is displayed.



4. Click the **Lockbox Settings** tab.



5. In the **Change Lockbox Password** section, perform the following:
   a. In the **Current Lockbox Password** field, enter the current lockbox password.
   b. In the **New Lockbox Password** field, enter the new lockbox password.

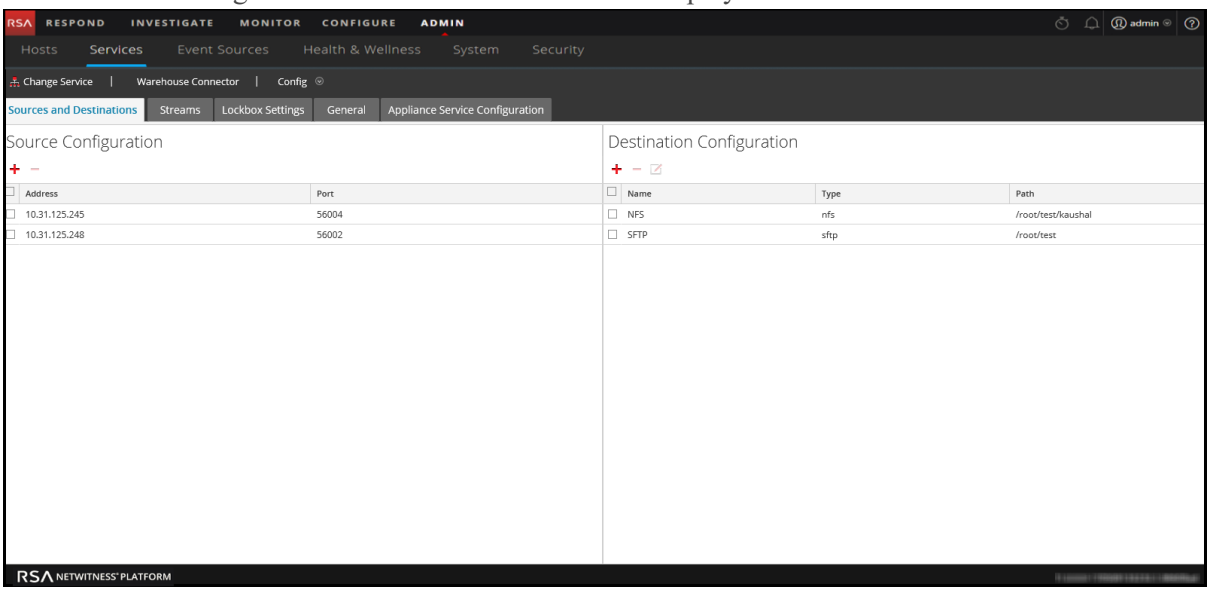
      Note: The lockbox password must be at least eight characters in length and it must contain at least three of the following groups: one uppercase character [A-Z], one lowercase character [a-z], one numeral [0-9], and one special character.

   c. In the **Confirm New Lockbox Password** field, enter the new lockbox password to confirm.
   d. Click **Apply**.
      The Lockbox password is successfully changed.

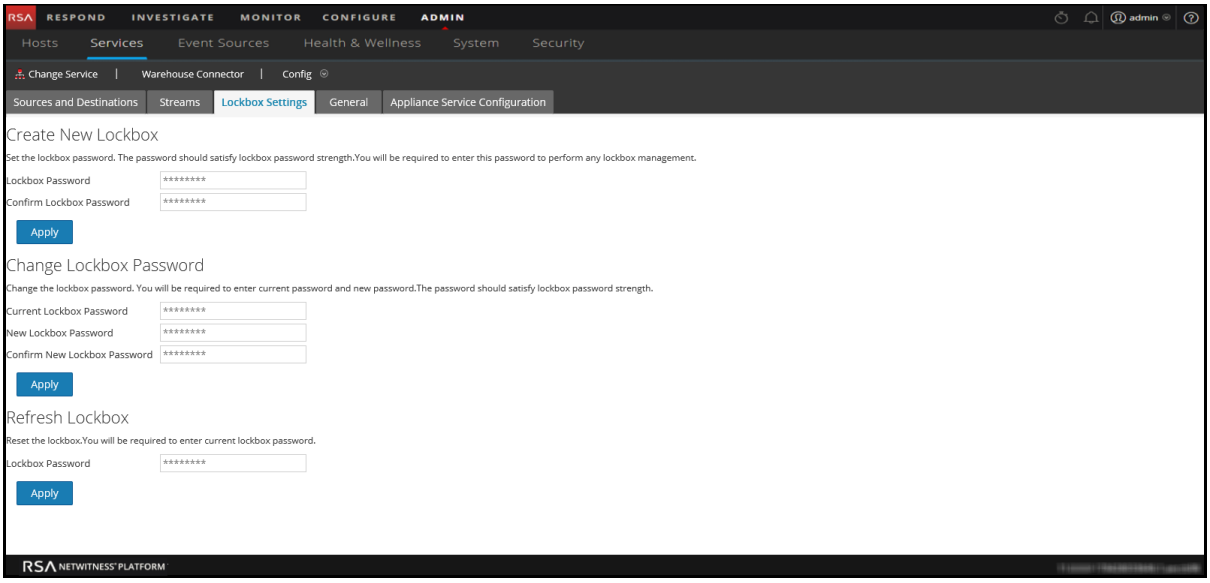
To refresh the Lockbox:

1. Log on to NetWitness Platform.
2. Go to **ADMIN > Services**.
3. In the Services view, select the added Warehouse Connector service, and select **> View > Config**.

The Services Config view of Warehouse Connector is displayed.



4. Click the **Lockbox Settings** tab.



5. In the **Refresh Lockbox** section, enter the current lockbox password in the **Lockbox Password** field.
6. Click **Apply**.
   The Lockbox is reset.

Warehouse Connector Configuration References

This section contains descriptions of the user interface as well as other reference information.

General Tab Settings

The General tab displays the general configuration settings for Warehouse Connector service.

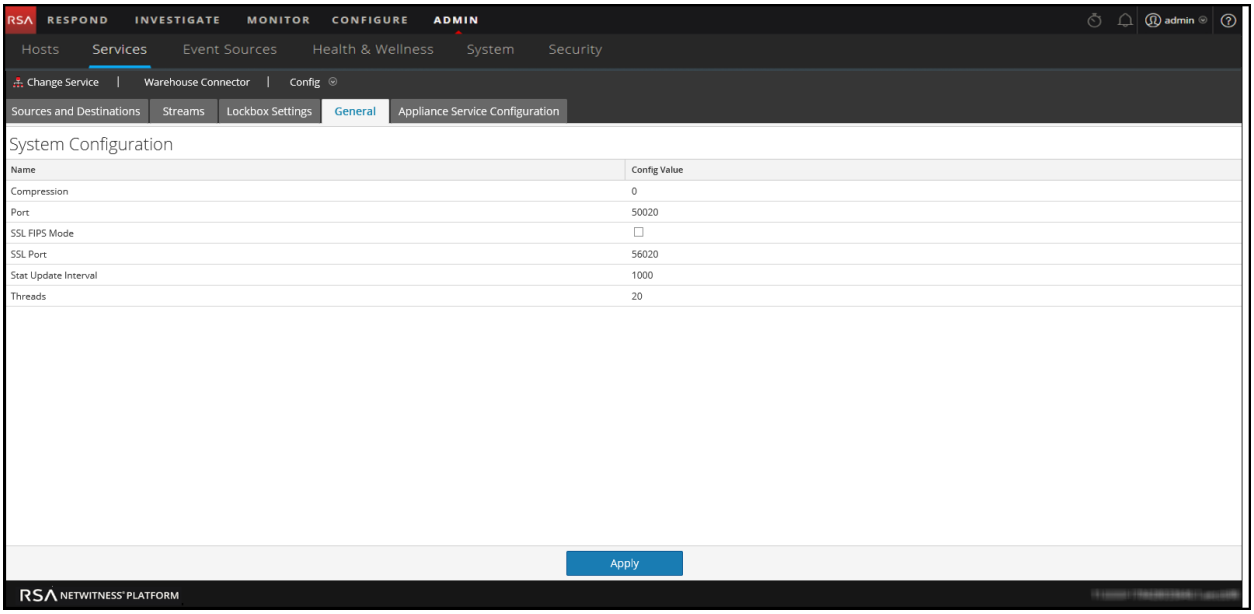
- Configure a Warehouse Connector Service

Quick Look

The following figure shows the General tab on the Warehouse Connector Services Config view.

The General tab displays the system configuration parameters for the Warehouse Connector service.



When you add a Warehouse Connector service, default values are in effect. RSA designed the default values to accommodate most environments and recommends that you do not modify these values because it may adversely affect performance.

The following table describes the System Configuration parameters:

Name	Config Value
Compression	Determines the minimum amount of bytes before a message is compressed. If set to zero, messages are not compressed.
Port	Determines the port used by the service. **Note:** If you change the port number, ensure that you restart the service.
SSL	If enabled, all the data transferred in the network will be encrypted using SSL.
Stat Update Interval	Determines how often (in milliseconds) statistic nodes are updated in the system.
Threads	Determines the number of threads in the thread pool to handle incoming requests.

Appliance Service Configuration Tab Settings

The Appliance Service Configuration tab displays the appliance configuration settings for Warehouse Connector service. For more information, see "Appliance Service Configuration" in the *Hosts and Services Getting Started Guide*.

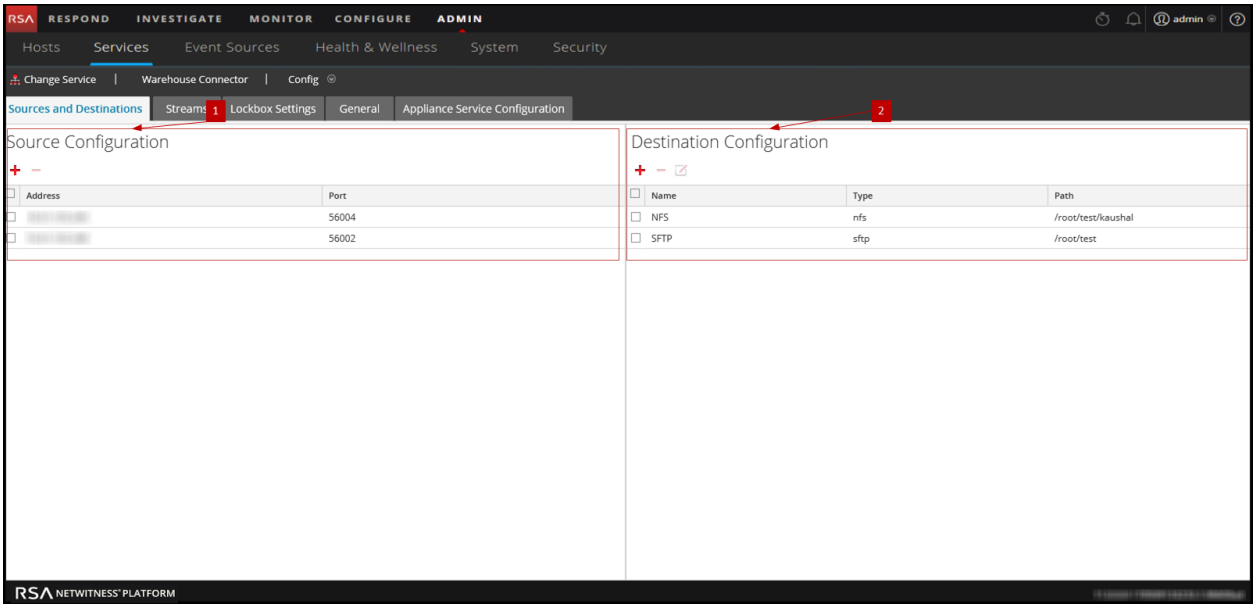
- Configure the Destination

Quick Look

The following figure shows the Sources and Destinations tab on the Warehouse Connector Services Config view.



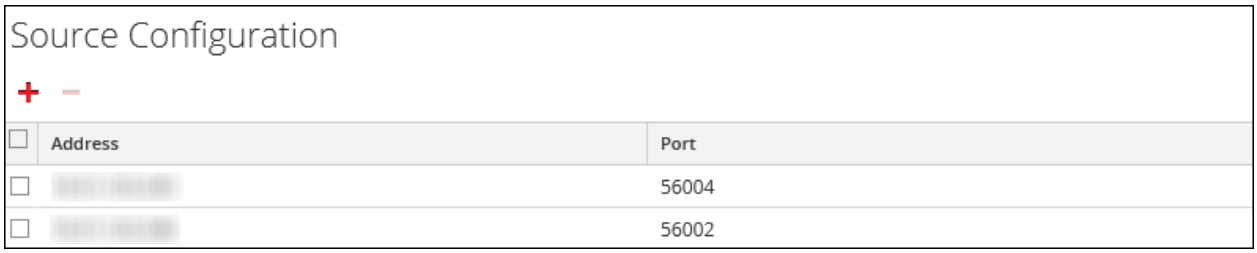
The Sources and Destinations tab includes the following two sections:

1 Source Configuration
2 Destination Configuration

Source Configuration

The Source Configuration section allows you to configure the data sources from which the Warehouse Connector service needs to collect data.

The following is an example of the Source Configuration section.

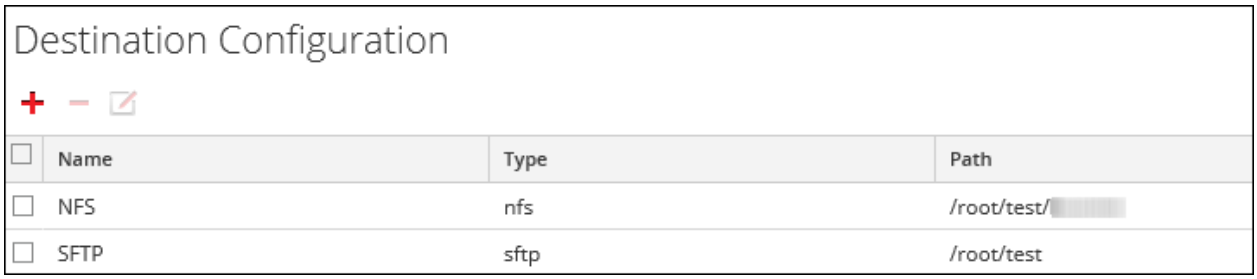


The Source Configuration section allows you to perform the following:

Features	Description
+	Add the data source.
−	Delete the data source.

Destination Configuration

The Destination Configuration section allows you to configure the destination to which the Warehouse Connector service needs to write the collected data.



The Destination Configuration section allows you to perform the following:

Features	Description
+	Add the destination.
−	Delete the destination.
✎	Edit the destination. **Note:** You can only edit the SFTP destination type.

Add Stream Dialog

You can configure and add a stream to a Warehouse Connector in this dialog

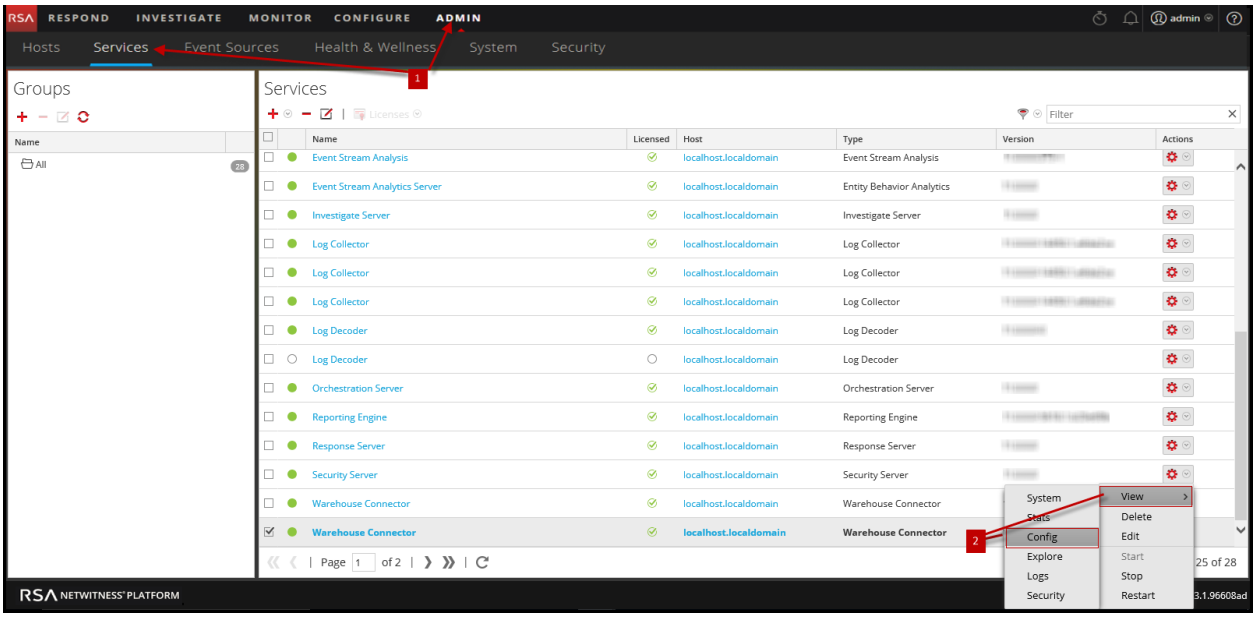
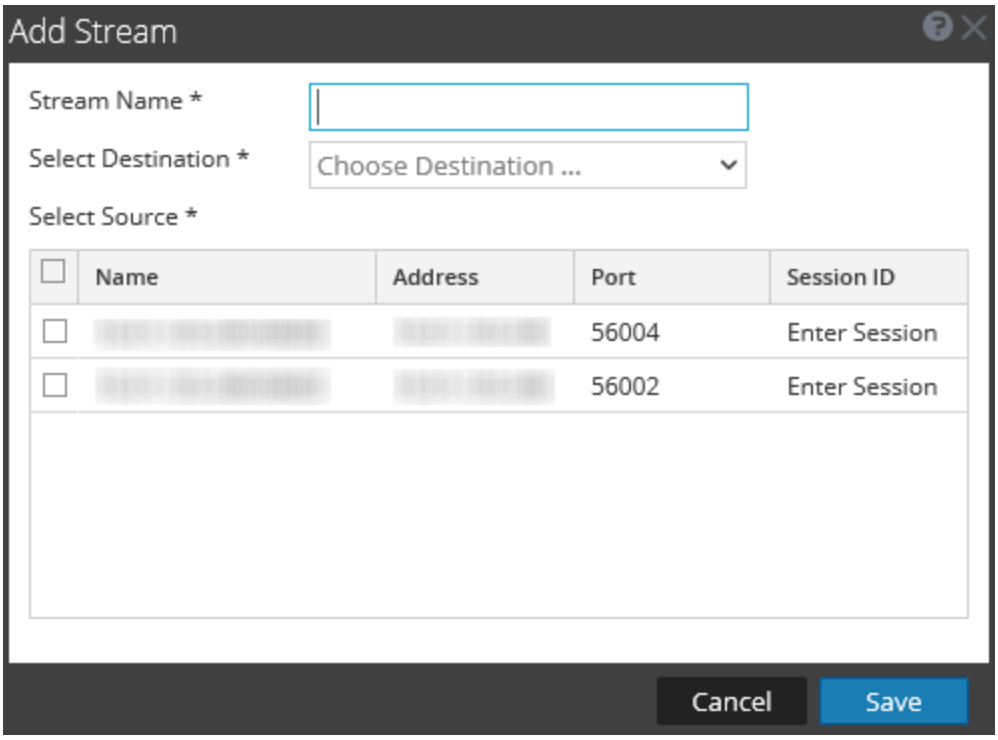
Related Topics

- Configure a Stream

Quick Look

The following figure is an example with the important features labeled.





1. Go to **ADMIN > Services**.
2. In the services view, select a Warehouse Connector service and select **>view>config**
3. In the **Streams** tab, click + to view the add stream dialog.

The following table describes the fields in the Add Stream dialog:

Parameter	Description
Stream Name	Type the name of the stream. The stream name may only contain alphanumeric characters and underscores. It cannot exceed 20 characters in length.
Select Destination	Select a destination from the drop-down list.
Select Source	Select a source from the grid at the bottom section of the dialog.
Name	The name of the source.
Address	The address of the source.
Port	The port of the source.
Session ID	The session ID of the source.

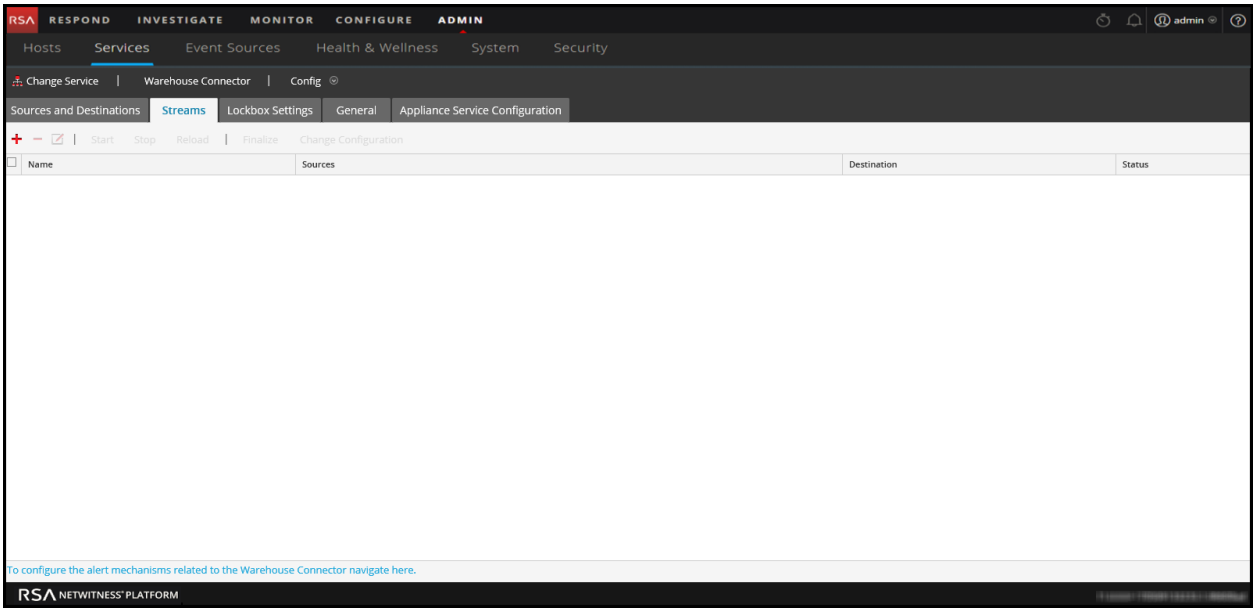
Configure a Stream

Quick Look

The following figure shows the Streams tab on the Warehouse Connector Services Config view.



The Streams tab allows you to perform the following:

Features	Description
+	Add a stream.
−	Delete a stream.
	Edit the stream.
Start	Start the stream.

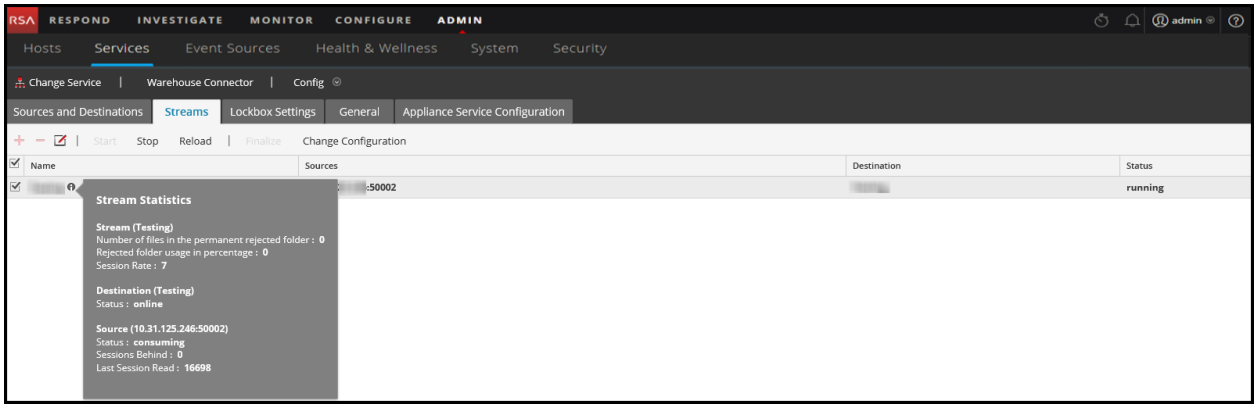
Features	Description
Stop	Stop the stream.
Finalize	Finalize the stream.
Reload	Reload the stream. If you have added a new meta or if a new meta is added as part of content update to any of the sources, Log Decoder or Decoder, you need to reload the stream for the meta to be visible in the schema for the Reporting Engine. Reloading a stream does not have any impact on the data, but only the new meta list is fetched from the sources.

The following table describes the fields in the Streams tab:

Parameter	Description
Name	Name of the stream.
Sources	The sources associated with the stream.
Destination	The destinations associated with the stream.
Status	Status of the stream.

Stream Statistics

You can view the statistics of a configured stream. Click the icon next to the name of the stream.



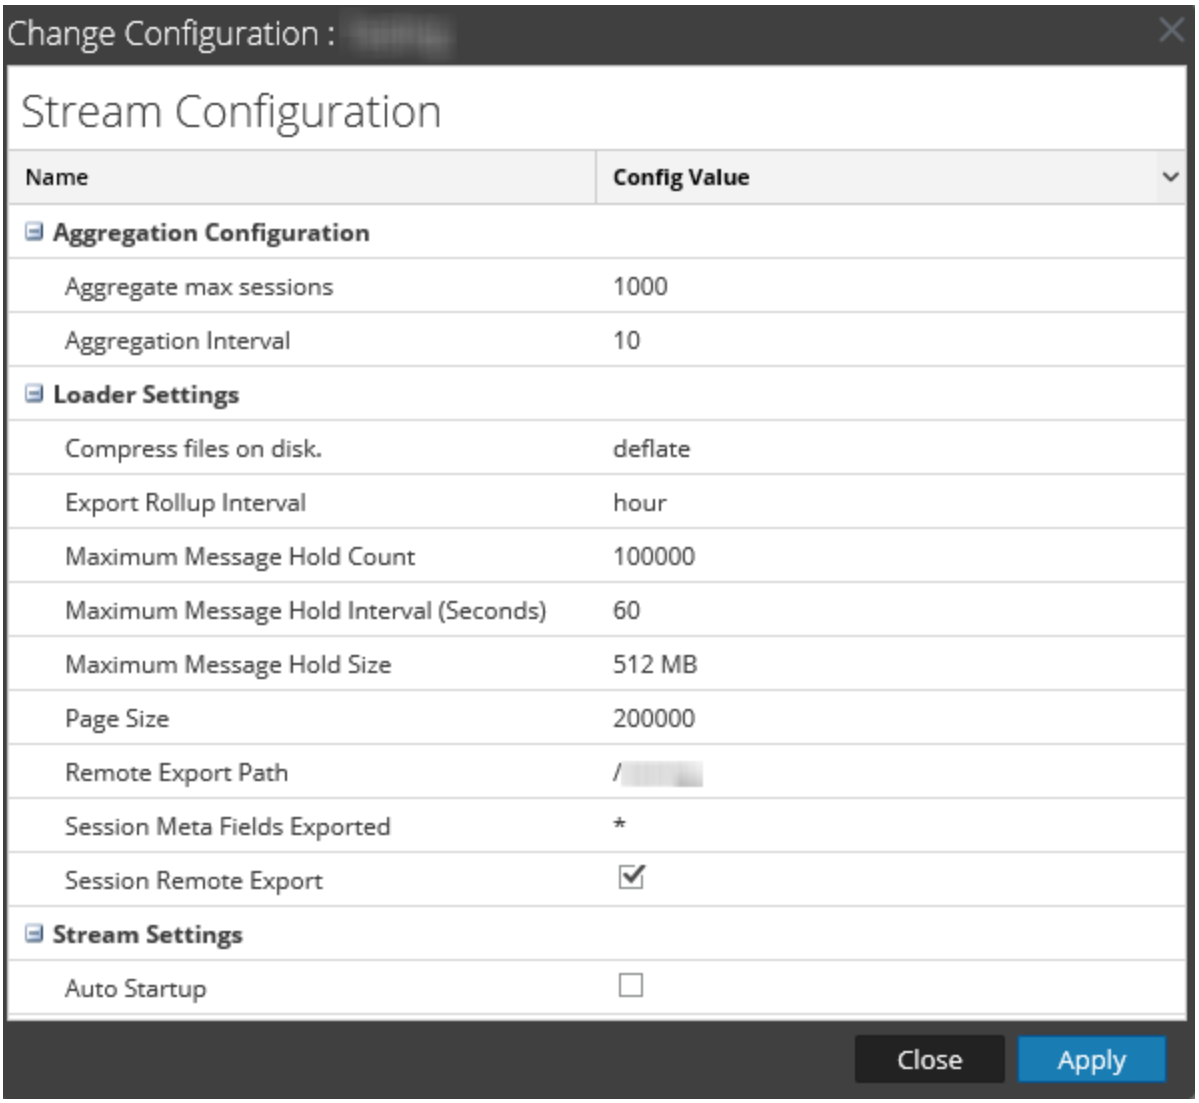
The following parameters are displayed in the Stream Statistics:

Section	Parameter	Description
Stream		
	Number of files in the permanent rejected folder	Determines the number of files in the permanent rejected folder (named, **permfail**) in the Warehouse Connector. The permanent rejected folder contains the files that Warehouse Connector failed to write to the destination.

Section	Parameter	Description
	Rejected folder usage in percentage	Determines the disk usage of the rejected folder.
	Session Rate	Determines the rate at which the session is processed by the Warehouse Connector for the source.
Destination		
	Status	Indicates the status of the destination.
Source		
	Status	Indicate the status of the source.
	Sessions Behind	Determines that number of sessions that needs to be processed by the Warehouse Connector.
	Last Session read	Determines the last session id processed by the Warehouse Connector.

Change Stream Configuration

You can change configuration of a stream in runtime. In the **Streams** tab, click **Change Configuration** to change the configuration of the selected stream.



You can change the following parameters of the Stream Configuration:

Note: If you change the value of any parameter in stream configuration, make sure that you restart the stream.

After upgrading, if the values of Maximum Message Hold Count, Maximum Message Hold Interval and Maximum Message Hold Size are 3000000, 60 and 128 respectively, ensure that you assign the following values to the streams:

- Maximum Message Hold Count - 2400000
- Maximum Message Hold Interval - 600
- Maximum Message Hold Size - 512

You can assign these values by modifying the existing Stream configuration.

Parameter	Description
	Aggregation Configuration
Aggregate max sessions	Determines the maximum number of sessions in a response for an aggregation request from the Warehouse Connector to the source .
Aggregation Interval	Determines the time between the responses from the source.
	Loader Settings
Compress files on disk	Enable to compress files on disk. Supported values: • Deflate - Provides smaller compressed files and good performance while generating reports. • Off By default, the parameter is set to **deflate**.
Export Rollup Interval	Determines the roll-up interval for export files and also the directory structure the Warehouse Connector writes to the destination. For example: If the parameter is set to: **Value** — **Directory Structure** hour — /rsasoc/v1/[logs | sessions]/data/{year}/{month}/{day}/{hour} minute — /rsasoc/v1/[logs | sessions]/data/{year}/{month}/{day}/{hour}/{minute} day — /rsasoc/v1/[logs | sessions]/data/{year}/{month}/{day} If you change the value of the parameter, ensure that you restart the stream. Recommended value is **hour**.
Maximum Message Hold Count	Determines the maximum number of sessions to store in the memory before processing. **Note:** If you have deployed a Warehouse Connector Virtual Appliance, make sure that you change the default value of the parameter to 800000.
Maximum Message Hold Interval (Seconds)	Determines the maximum time (in seconds) to hold the sessions in memory before processing.
Maximum Message Hold Size	Determines the maximum size for the sessions to store in the memory before processing.
Remote Export Path	Determines the remote local mount point for HDFS (nfs://) and the location to export the data.
Page Size	Determines the maximum pages.

Parameter	Description
	Stream Settings
Auto Startup	Enable to automatically start the stream whenever the Warehouse connector process is restarted. By default, the parameter is set to **off**.

Lockbox Settings

The Lockbox Settings tab for a Warehouse Connector in the Services Config view provide a way to manage the lockbox settings.

Workflow

NetWitness Legacy Windows Collection Update & Installation Instructions

RSA NetWitness® Platform Legacy Windows collection collects event data from multiple Windows Event Source domains.

It supports collection from:

- Windows 2003 and earlier event sources
- NetApp ONTAP host evt files

This document contains the following sections:

- Setup Requirements
- Update the RSA NetWitness® Suite Legacy Windows Collector from 10.6.x to 11.x
- Fresh Install 11.x Legacy Windows Collector
- Troubleshooting for Fresh or Upgrade Install
- (Optional) Backup and Restore Legacy Windows Collector
- Add a Windows Legacy Collector Host and Service in RSA NetWitness® Platform

Setup Requirements

This section provides the RSA NetWitness® Suite Legacy Windows Collector Setup requirements.

Caution: If you are installing or updating to version 11.x, in order to use the Security Analytics Legacy Windows Collector with NetWitness, you need to first install the following windows updates:

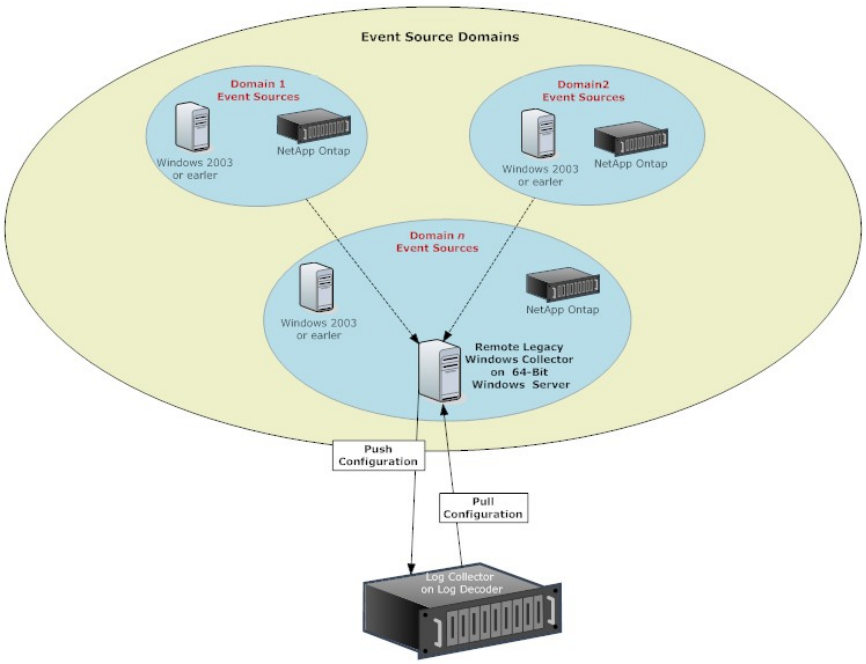
- KB2919355
- KB2919442
- KB2999226
- KB3173424

If these updates are not installed, you will get an error message, and the Legacy Windows Collector will not be installed.

To set up the RSA NetWitness ® Suite Legacy Windows Collector, you need:

- Any physical or virtual Windows 2008 R2 SP1 64-Bit Server that can reach the Windows 2003 event source domains.
- A minimum of 20% free disk space. For example, you need at least 20 GB of free space if your system drive is 100 GB in size.

IMPORTANT: Do not install the Legacy Windows Collector on a domain controller.



Update the RSA NetWitness® Suite Legacy Windows Collector from 10.6.x to 11.x

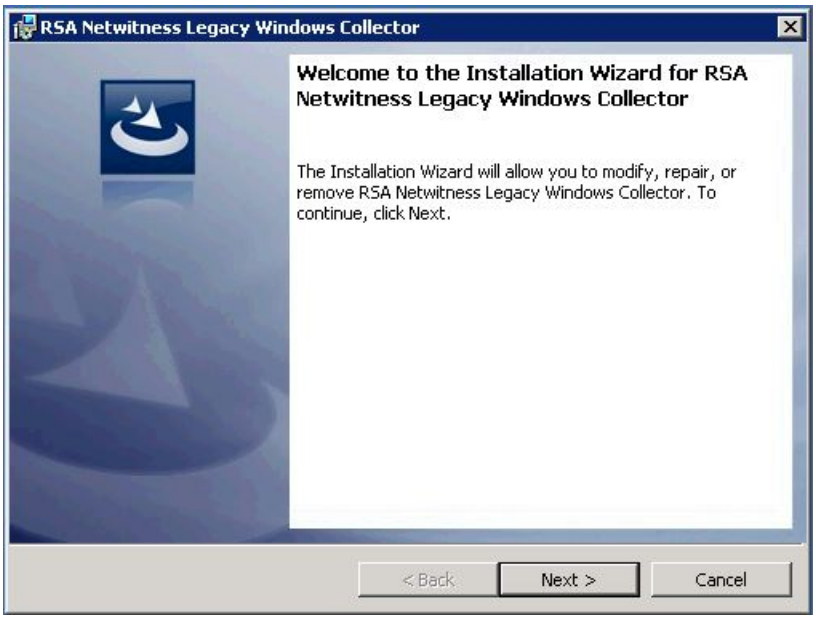
This section tells you how to update the RSA NetWitness® Platform 10.6.x Legacy Windows Collector to 11.

To update the RSA NetWitness® Suite 10.6.x Legacy Windows Collector to 11 on a Windows 2008 R2 SP1 64-Bit server:

1. Navigate to https://community.rsa.com/docs/DOC-83034 on RSA link. Click **RSA NetWitness Logs & Packets 11.x - Legacy Windows Collector** to download the ZIP archive.
2. Unzip the downloaded file.
3. Log on to a Windows 2008 machine.
4. Copy **NWLegacyWindowsCollector-*version-number*.exe** to the Windows 2008 server.
5. Right click on **NWLegacyWindowsCollector-*version-number*.exe** and select **Run As Administrator**.

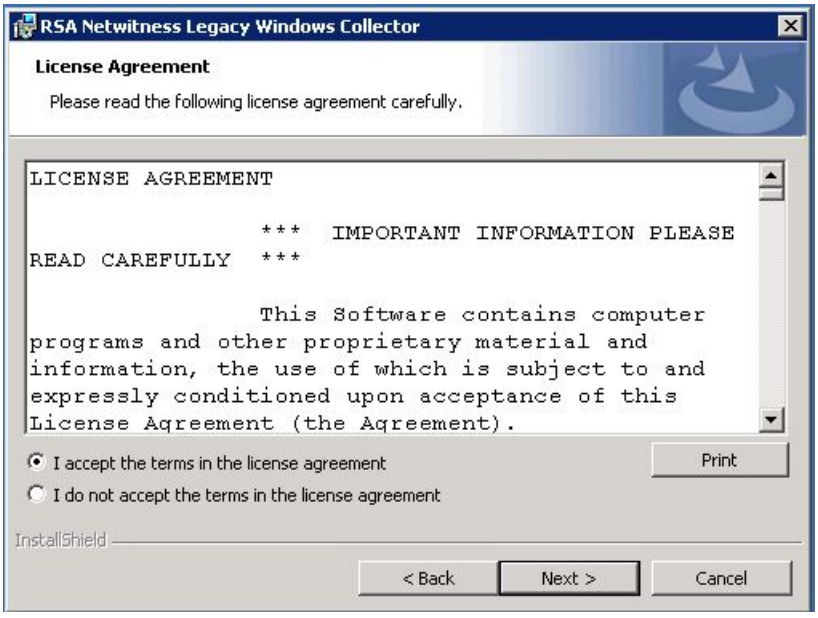
   The Preparing to Install…. page of update installation wizard is displayed.

   After the update installation program extracts RSA NetWitness® Suite Legacy Windows Collector installation files, the **Welcome** page is displayed.



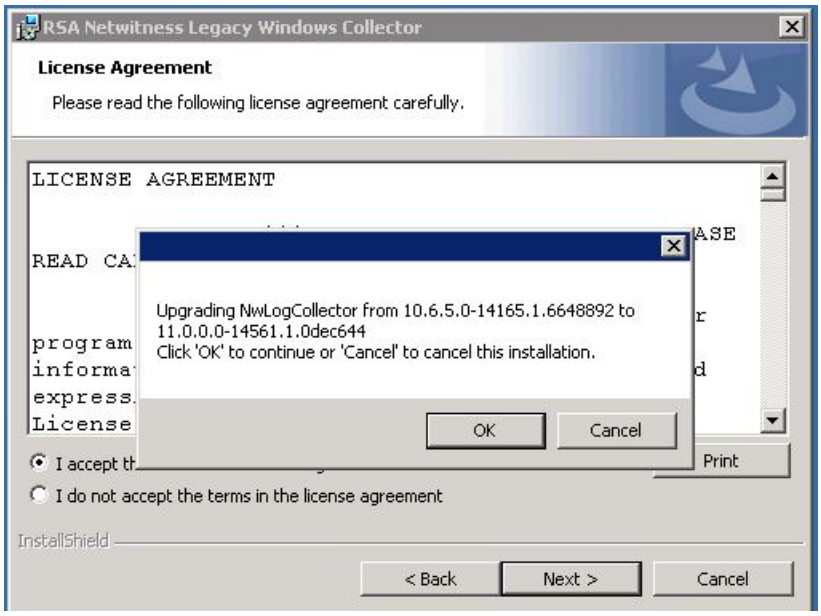
6. Click **Next**.

   The License Agreement page is displayed.



7. Read the License agreement carefully, select the **I accept the terms in the license agreement** radio button, and click **Next**.

   Before it starts the update, the wizard asks if you want to continue or cancel the installation of the update.



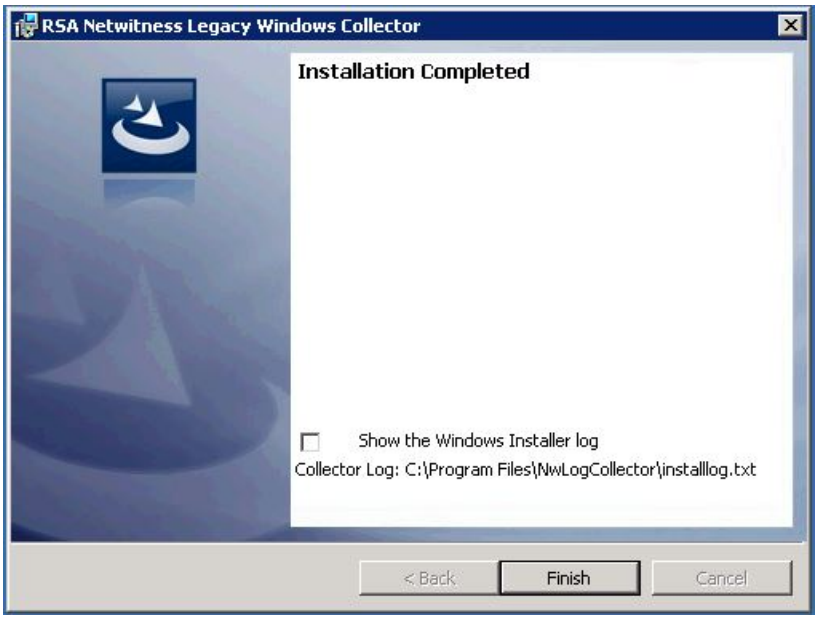
8. Click **OK** to continue installing the update.
9. Click Install.

   The Installation screens for the Legacy Windows Collector page is displayed.

After the update installation completes, the **Next** button becomes active.

10. Click **Next**.

    The Installation Completed page is displayed.



11. (Optional) If you want to review a log of the update installation, select the **Show the Windows Installer** log checkbox.
12. Click **Finish**.
13. Reboot the machine.

This completes the update of the Legacy Windows Collector to RSA NetWitness® Platform 11.x.

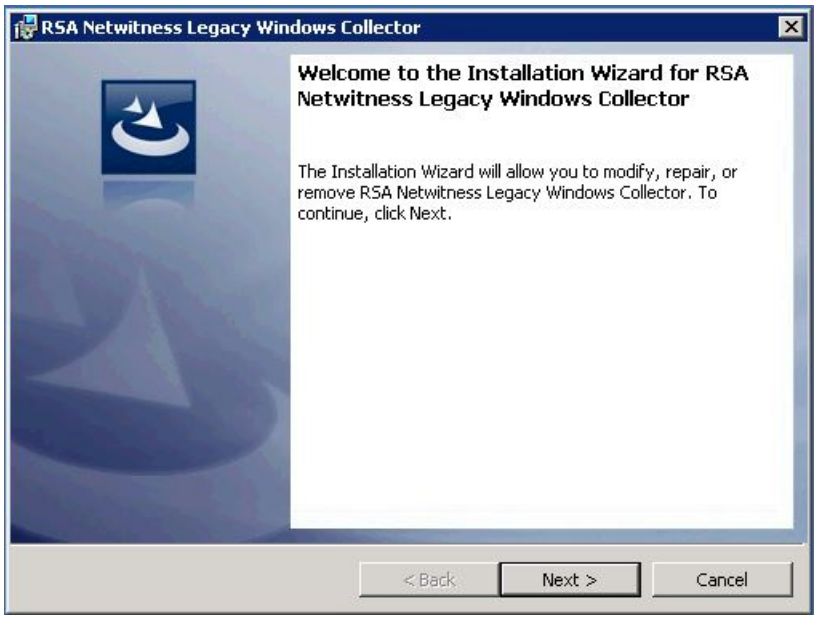
Fresh Install 11.x Legacy Windows Collector

This section describes how to install the 11.x Legacy Windows Collector on a Windows 2008 R2 SP1 64-Bit server

To install the RSA NetWitness® Platform Legacy Windows Collector on a Windows 2008 R2 SP1 64-Bit server:

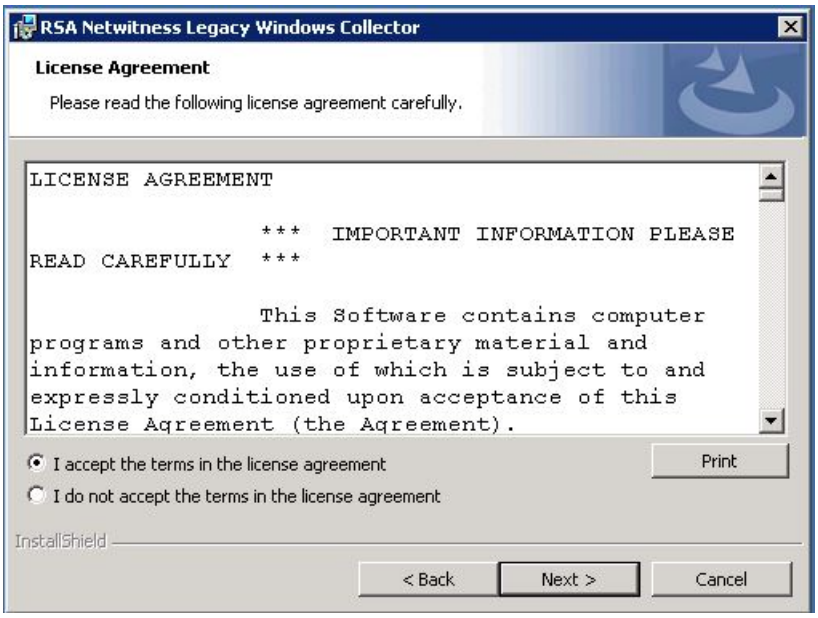
1. Navigate to https://community.rsa.com/docs/DOC-83034 on RSA link. Click **RSA NetWitness Logs & Packets 11.x - Legacy Windows Collector** to download the ZIP archive.
2. Unzip the downloaded file.
3. Copy the **NWLegacyWindowsCollector-*version-number*.exe** to the Windows 2008 server.
4. Right click on the **NWLegacyWindowsCollector-*version-number*.exe** and select **Run As Administrator**.

   The **Welcome** page of installation wizard is displayed.



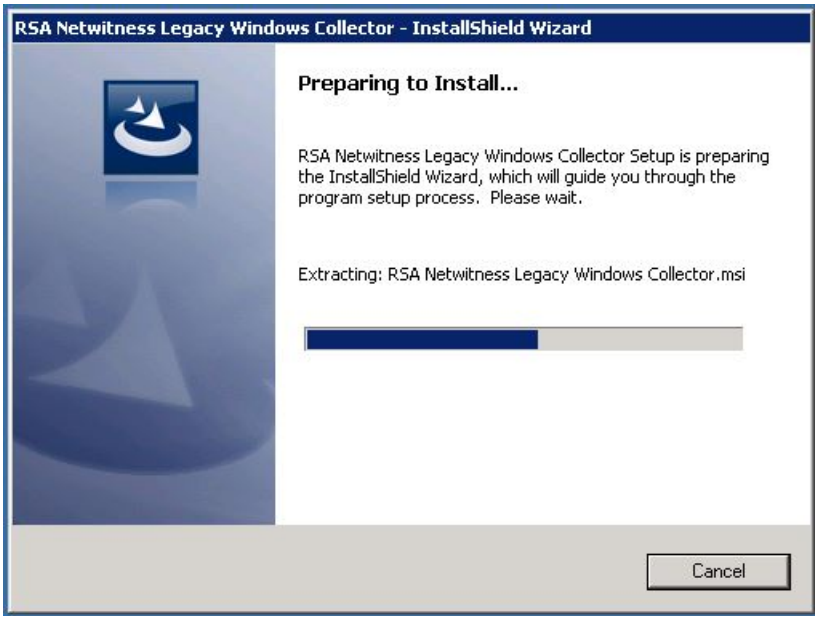
5. Click **Next**.

   The License Agreement page is displayed.



6. Read the License agreement carefully, select the **I accept the terms in the license agreement** radio button, and click **Next**.

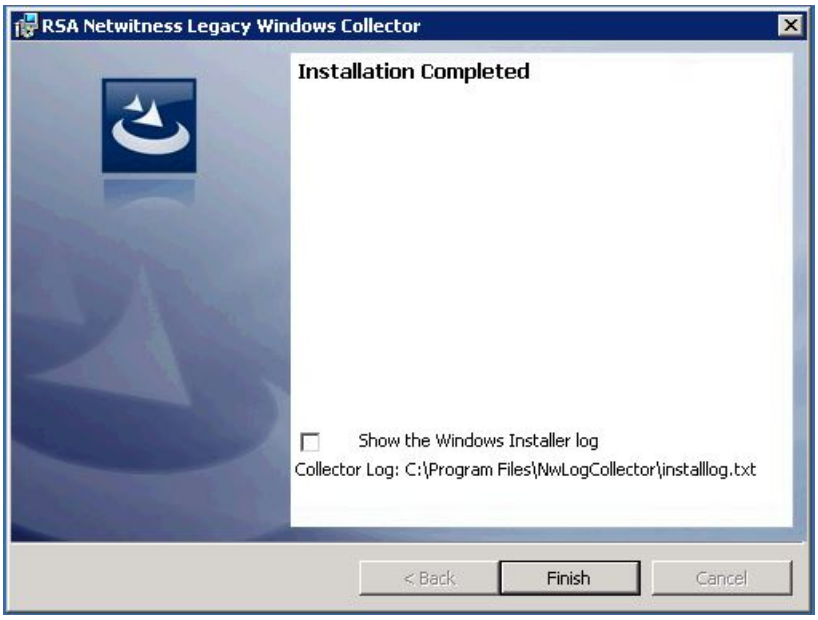
   The Ready to Install the Program page is displayed.



7. Click **Install**.

   The Installation screens for the Legacy Windows Collector page are displayed.

The Installation Completed page is displayed.



8. (Optional) If you want to review a log of the installation, select the **Show the Windows Installer** log checkbox.
9. Click **Finish**.
10. Reboot the machine.

This completes the installation of the 11.x Legacy Windows Collector. Please refer to the **Windows Legacy and NetApp Collection Configuration Guide** on RSA Link for instructions on how to configure Legacy Windows collection in RSA NetWitness® Platform.

Troubleshooting for Fresh or Upgrade Install

Logs to Examine for Information

Refer to the following log files if you need to troubleshoot problems:

- `%systemDrive%\Netwitness\ng\logcollector\MessageBroker.log`
- `%systemDrive%\Program Files\NwLogCollector\installlog.txt`

Run `C:\Program Files\NwLogCollector\ziplogfiles.vbs` to generate the ***`hostname`***`_WLCversion_timestamp.zip` that contains all the log files and other information needed for troubleshooting.

Issues with the Lockbox

When you create a lockbox password on a new Windows Legacy Collector, you might see the following error:

```
failed to set secure storage password: failed to create lockbox: The Lockbox
or cryptography library could not be found.
```

This can occur if you are running Windows Legacy Collector version 11.x.

If you encounter this issue, download and install both of the following redistributable packages:

- Visual C++ 2010: https://www.microsoft.com/en-us/download/details.aspx?id=14632
- Visual C++ 2012: https://www.microsoft.com/en-us/download/details.aspx?id=30679

(Optional) Backup and Restore Legacy Windows Collector

This section tells you how to upgrade from 10.6.4 to NetWitness 11.x for the Legacy Windows Collector.

Note: You only need to do this if you are changing the Windows VM where you run the Windows Legacy Collector.

During upgrade to RSA NetWitness® Platform 11.x, the backup script for the Windows Legacy Collector is invoked automatically, and creates the 10.6.4 configuration and run-time backups. After the 11.x installation is completed, run the Restore script to restore the configuration and run-time files for the updated Windows Legacy Collection.

Restore the Windows Legacy Collection Backup after Upgrade

To restore the Windows Legacy Collection setup on a newly upgraded RSA NetWitness® Platform 11 platform:

1. On the Windows Legacy Collector, open a command prompt window.
2. Navigate to **C:\Program Files\NwLogCollector**, where the scripts are stored.
3. Run the following commands for restoring a backup:
   - Backup configuration files: `WLC-Restore.bat "Config-bkup_timestamp.zip"`
   - Backup run-time files: `WLC-Restore.bat "Runtime-bkup_timestamp.zip"`
4. Once the restore is completed, set the lockbox SSV to use the password that you created during 10.6.4 setup.
   a. In the **Security Analytics** menu, select **Services**, then select your Windows Legacy Collector and choose **Explore**.
   b. From the left navigation pane, expand **logcollection** > **properties** > **crypto**.
   c. Run the following command: `op=setssv pw=password_for_10.6.x_lockbox`, and hit **Send**.

Revert Windows Legacy Collection from 11.x Back to 10.6.4

To revert the Windows Legacy Collection setup from 11.x back to 10.6.4:

1. Uninstall the 11.x Setup. Note the location of the backup folder created by the system during the uninstall procedure.
2. Install the 10.6.4 version of the Windows Legacy Collector.
3. Navigate to **C:\Program Files\NwLogCollector**, where the scripts are stored.

4. Run the Restore script from backup folder present in **C:\Program Files\NwLogCollector** to restore the configuration and run-time setup on the 10.6.4 Windows Legacy Collector.
   - Backup configuration files: `WLC-Restore.bat "Config-bkup_timestamp.zip"`
   - Backup run-time files: `WLC-Restore.bat "Runtime-bkup_timestamp.zip"`
5. Once the restore is completed, set the lockbox SSV to use the password that you created during 10.6.4 setup.
   a. In the **Security Analytics** menu, select **Services**, then select your Windows Legacy Collector and choose **Explore**.
   b. From the left navigation pane, expand **logcollection > properties > crypto**.
   c. Run the following command: `op=setssv pw=password_for_10.6.x_lockbox`, and hit **Send**.

Add a Windows Legacy Collector Host and Service in RSA NetWitness® Platform

For this version of the Windows Legacy Collector, RSA has provided a script that replaces the manual steps of adding a Windows Legacy Collector host and service in the NetWitness UI.

To create a Windows Legacy Collector Host and Service in NetWitness:

1. SSH to your NetWitness server.
2. Run the following command:

   ```
   wlc-cli-client --host-display-name hostDisplayName --service-display-name
   serviceDisplayName --host WLChostIPAddress --port 50101 --use-ssl false
   ```

   The parameters are explained below:

   - **--host-display-name**: the name for the host as it is displayed in the NetWitness Hosts page
   - ***--service-display-name***: the name for the host as it is displayed in the NetWitness Services page
   - **--host**: the IP address for the Windows Legacy Collector
   - **--port**: the port NetWitness uses to communicate with the Windows Legacy Collector. The recommended value is 50101.
3. You will be prompted to supply the following information:
   - **Windows Log Collector REST Username** and **Windows Log Collector REST Password**: you must supply admin credentials for the Windows Legacy Collector.
   - **Security Server Username** and **Security Server Password**: you must supply admin credentials for RSA NetWitness Suite.

When you complete this procedure, you should see the Windows Legacy Collector Host and Service as shown in the following screenshots.

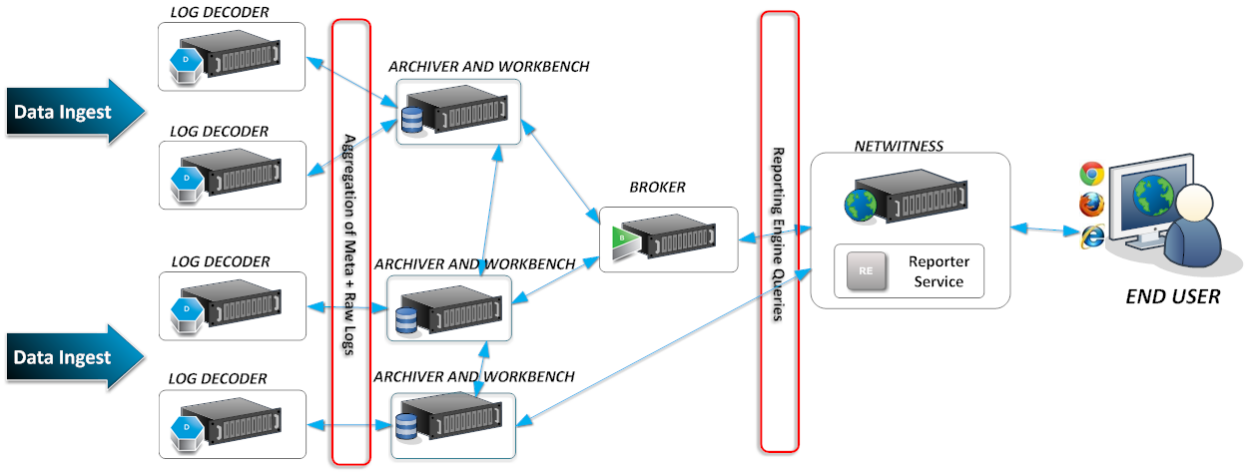
Workbench Overview

NetWitness Platform Workbench service allows collections to be created with restored data that was saved offline from an Archiver. Once the data is copied and saved into a collection, it can be analyzed from Investigation and Reporting.

The following diagram depicts the architecture of a NetWitness Platform network that implements the Workbench.

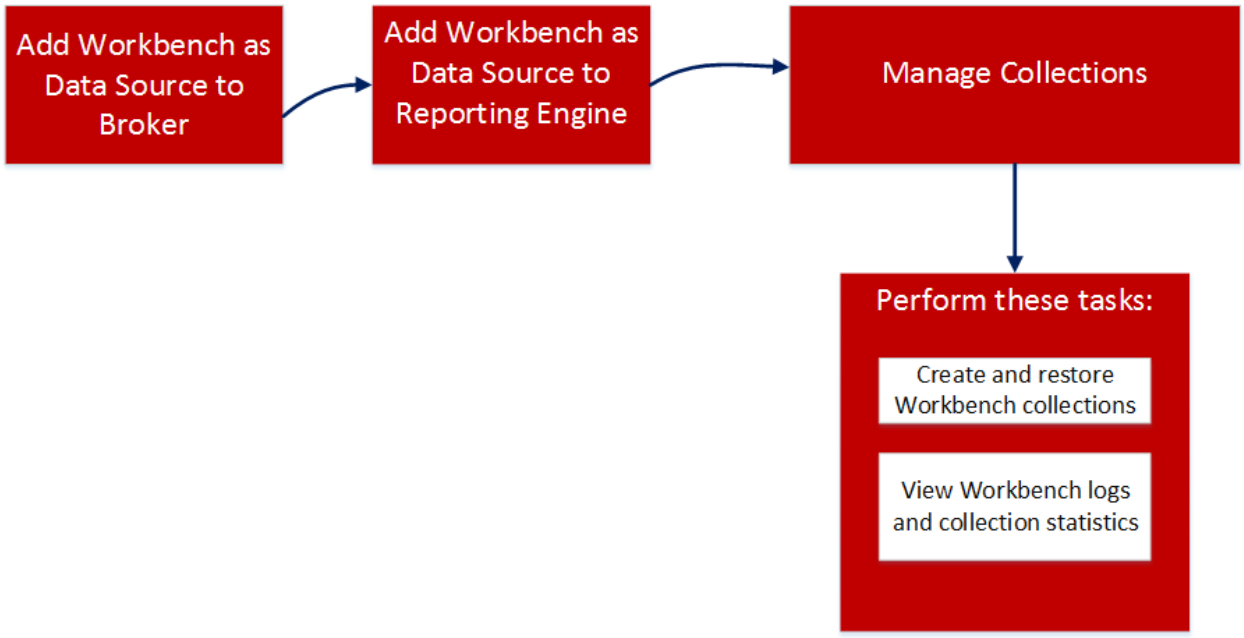


Workbench Configuration Procedures

Note: While NetWitness Platform 11.0 and later continues to support the Workbench, and some customers may have configured Workbench to handle restoring of data. The best practice for restoring data is to use the Archiver to configure archival and restoring of data. For more information, see *Archiver Configuration Guide*.

Workflow

These are the basic steps for configuring and managing a Workbench service.



1. Add a Workbench service as a data source to Broker (see Adding Workbench Service as a Data Source to Broker).
2. Add a Workbench service as a data source to Reporting Engine (see Adding Workbench as a Data Source to Reporting Engine
3. Manage collections on a Workbench service (see Managing Collections).
4. Investigate a Workbench (see Managing Collections).

Prerequisites

Before configuring the Workbench service, you must:

- Add the NetWitness Platform workbench service to the host in your network environment. For more information, see Workbench Overview.
- Install the NetWitness Platform Workbench host in your network environment. For more information, see *Host and Services Getting Started Guide*.

The steps to configure the Workbench service are:

1. Adding Workbench Service as a Data Source to Broker
2. Adding Workbench as a Data Source to Reporting Engine

When configuration is complete, you can create and manage collections as described in Managing Collections.

Adding Workbench Service as a Data Source to Broker

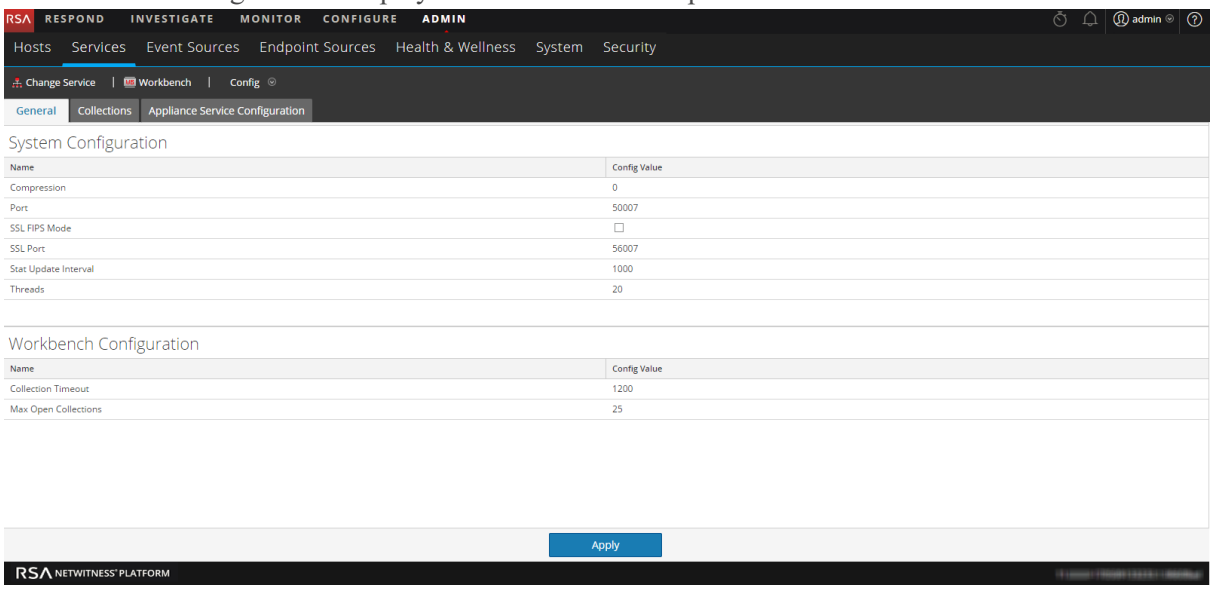
Prerequisites

Before adding the Workbench service, you must:

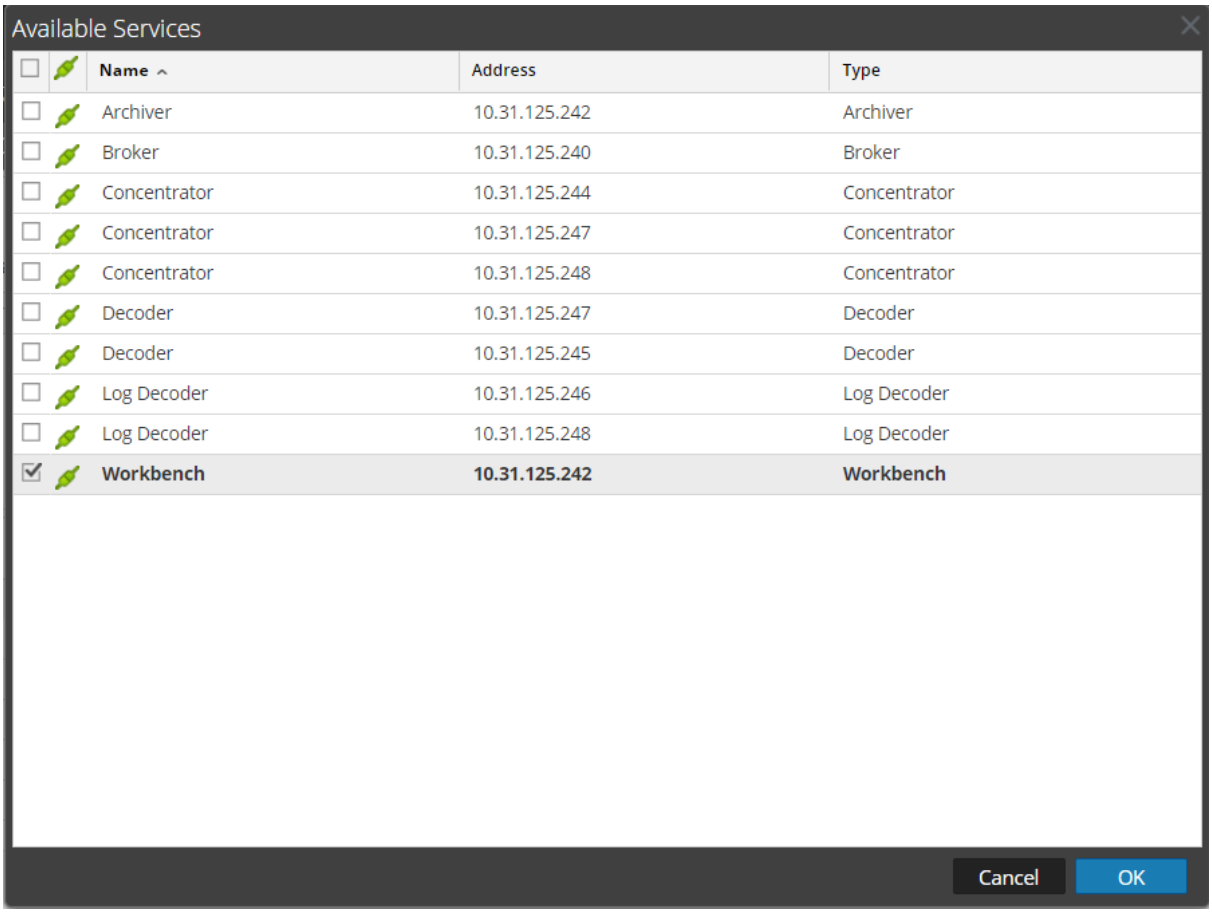
- Install the Workbench service on the Archiver appliance.
- Add a collection on the workbench service.

To add the Workbench service as a data source on the Broker:

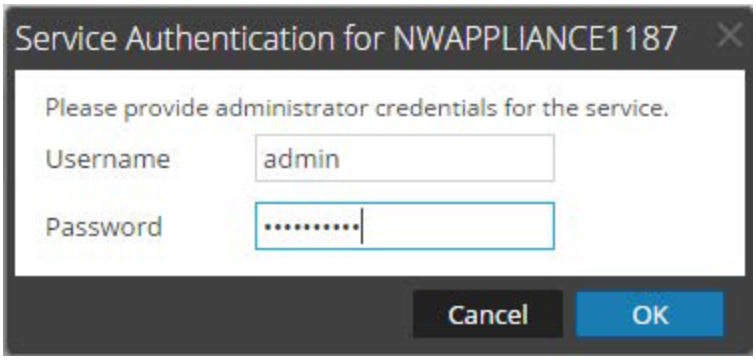
1. Go to **ADMIN >Services**.
2. Select a Broker service, and select **> View > Config.**
   The Service Config view is displayed with General tab open.



3. In the Aggregate Services section, Click .
   The Available Services dialog is displayed.

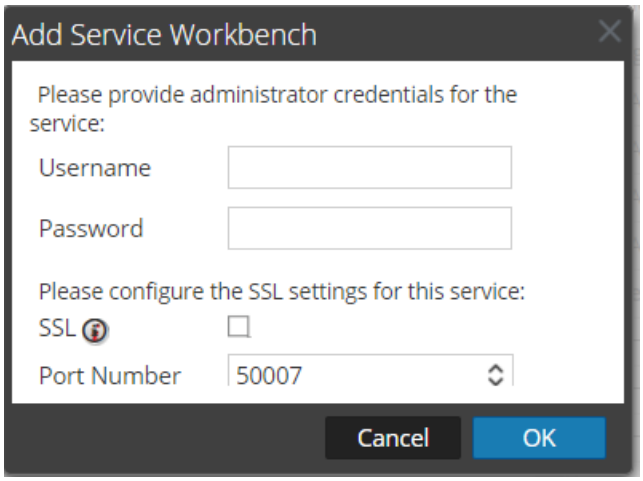


4. Select the Workbench service and click **OK**.
5. If the Workbench service is using a Trust Model, a Service Authentication dialog for the selected service is displayed.



6. Type the username and password for admin credentials for the service and click **OK**.

   The Add Service Workbench dialog is displayed.



7. Type the username and password for admin credentials for the service and click **OK**.

   The workbench service is now added as a data source to the Broker and is listed in the NWDATA Sources list.

Note: You must perform this procedure for each collection.

Adding Workbench as a Data Source to Reporting Engine

Prerequisites

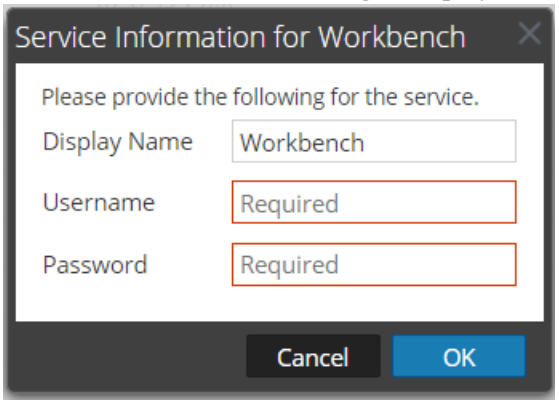
These are the tasks required before adding the Workbench as a data source to Reporting:

1. Add the Reporting Engine as a service to your NetWitness Platform deployment.
2. Add the Workbench as a service to your NetWitness Platform Archiver host (if not already installed).

Note: Adding Workbench collections as a data source to Reporting Engine depends on a trusted connection. If the Workbench is established with a trusted connection, you must manually add Workbenchcollections as a source to the Reporting Engine.

To associate the Workbench data source with the Reporting Engine:

1. Go to **ADMIN > Services**.
2. Select a **Reporting Engine** in the Services grid. Select **View > Config**.
   The Services Config view is displayed with General tab Open.
3. Click the **Sources** tab, click + in the toolbar and select **Available Services**.
   The Available Services dialog is displayed.
4. Select a Workbench service and Click **OK**.
   The Service Information dialog is displayed.



5. Enter User Name and Password.
   - Required if the Workbench service is Trusted.
   - Optional if the Workbench service is not trusted (added manually).
6. Click **OK**.

7. Select **Collection** in Add a Collection from Workbench dialog.
8. Click **OK**.

Result

You can now create reports on the data collected by the Workbench.

Managing Collections

An Administrator can create and delete Workbench collections and view Workbench statistics and logs. This topic provides all of these procedures and an example procedure for restoring a collection for Reporting and Investigation.

- Mount Archiver Directories
- Create a Collection
- Delete a Collection
- Investigate a Collection
- View Workbench Collection Statistics
- View Workbench Logs

Mount Archiver Directories

If data is in offline storage or cold-tier storage, you need to mount the Archiver directories in order to restore the data for reporting and investigation purposes:

1. Go to **ADMIN > Services**.
2. Select an **Archiver** from the Services grid and select **> View > Explore**.
   The Explorer view for the Archiver is displayed
3. Right-click on the Database node in left-hand tree and select **properties** to open them in the right-hand panel.
4. Run the **manifest** command for a time range, for example, 2017-April-01 to 2017-April-10.
   The search returns all files that need to be restored for the selected query.

Create a Collection

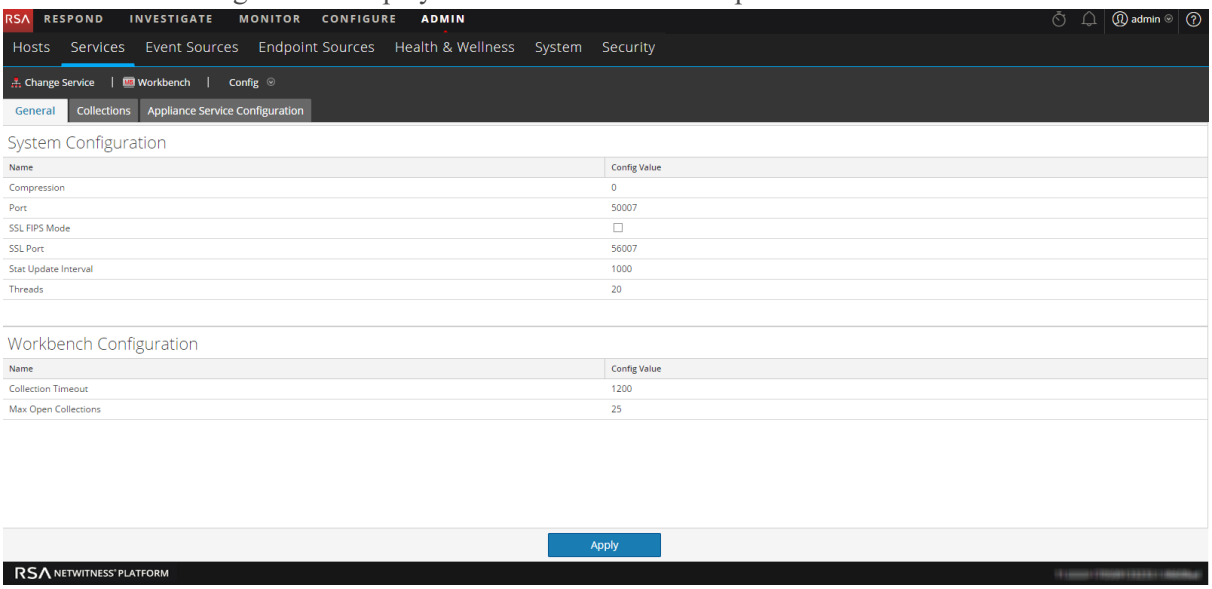
Administrators can create collections of restored data from a backup or from an existing set of data.

Note: You can point the source path to the location of the database files and the restore command copies them to the workbench. You need to mount those directories to the Archiver (where the Workbench is installed) before a restoration collection can be created.

To create a collection using data restored from the backed up data or existing subset of data:

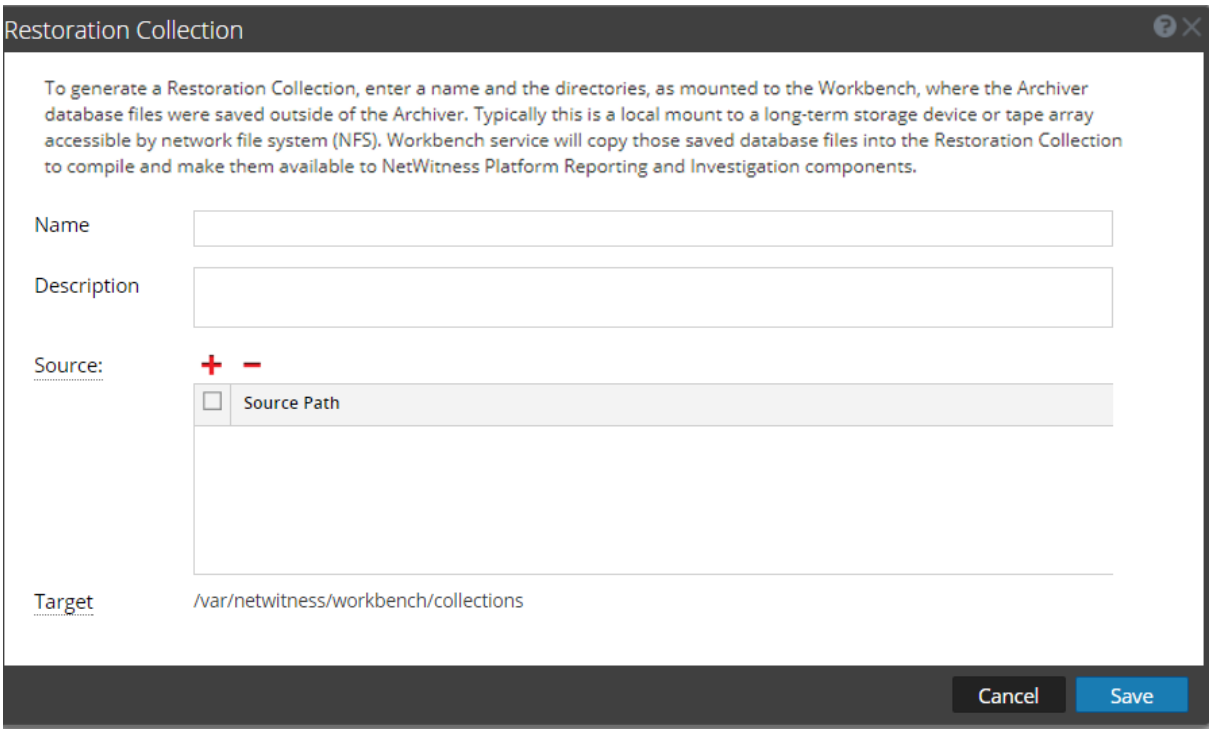
1. Go to **ADMIN> Services.**

2. In the Services view, select a **Workbench**, then select **> View > Config**.
   The Services Config view is displayed with the General tab open.



3. Click the **Collections** tab.
   The Collections grid is displayed.

4. Click in the toolbar.
   The Restoration Collection dialog is displayed.



5. Provide the following information:

- **Name:** Name of the Workbench collection that you want to restore.
- **Source:** Location where the Archiver database files have been moved from cold storage.

Note: Target is the location where the collection is created.

6. Click **Save** to restore the collection.

Note: If the source path provided to create the restoration collection does not exist, the following error message is displayed:

```
The source path does not exist '/xxx/xxx/'.
```

If there is insufficient storage to restore your collection, the following error is displayed:

```
Error during disk space checking. Insufficient disk space in location
'/xxx/xxx'.
```

The Schedule Job dialog is displayed with the following message:

```
Restoring data into a new collection. Check the jobs page for progress.
```

7. Click the **Jobs** icon in the NetWitness Platform toolbar to expand the list of restoration collection jobs with their current status.

Note: Restoring a collection that is larger than 550 GB may take several hours to process.

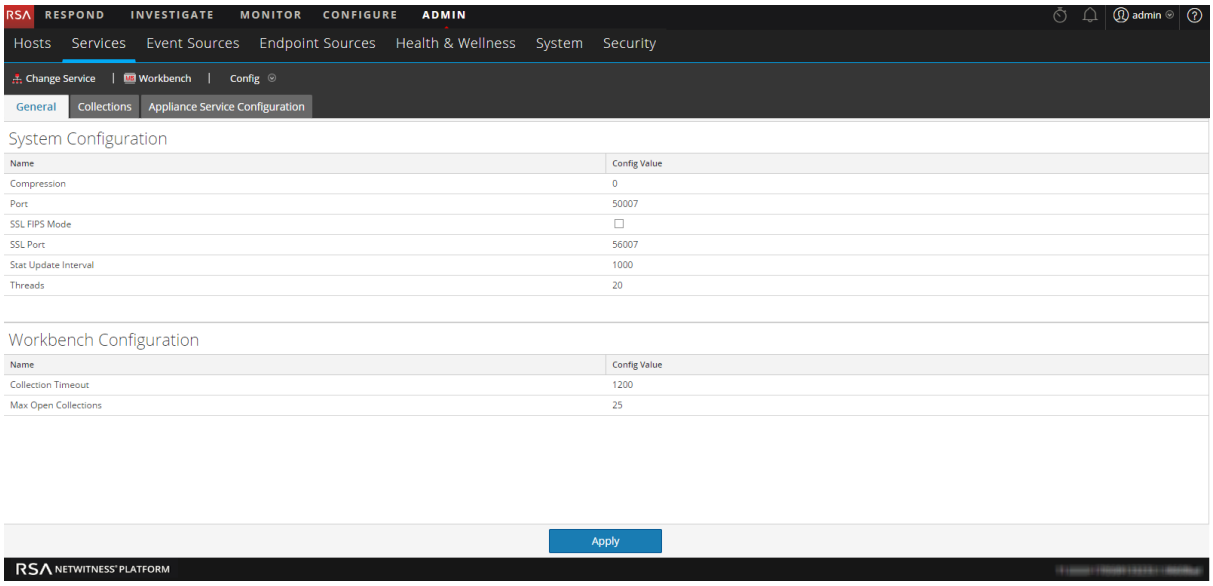
Delete a Collection

Administrators can delete collections from the Workbench service.

Perform the following steps to delete a collection:

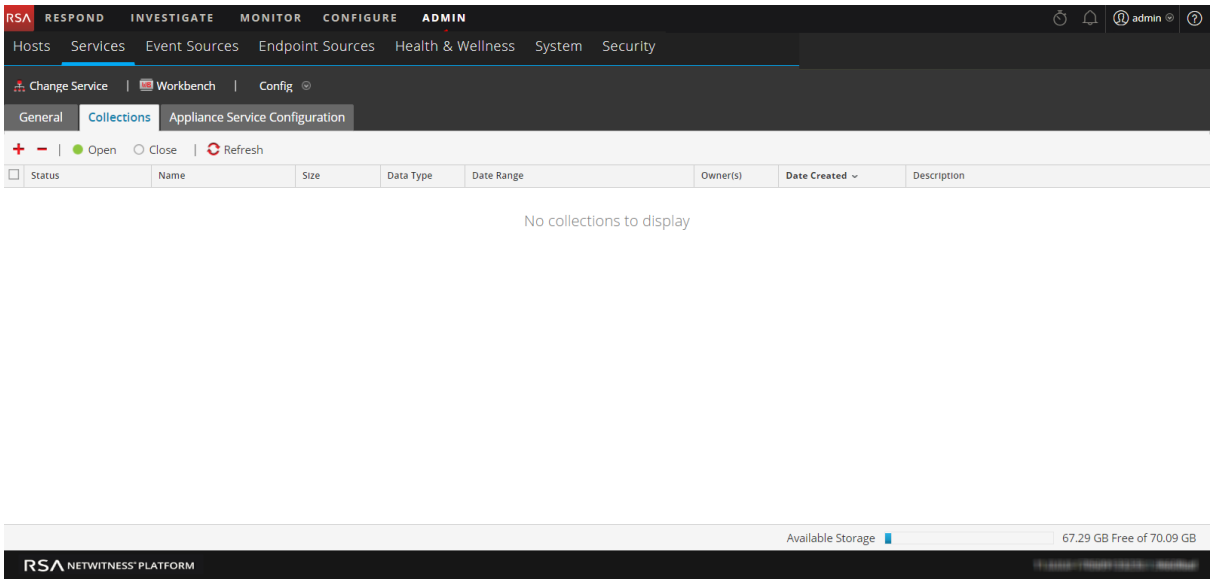
1. Go to **ADMIN > Services.**
2. From the Services view, select a **Workbench** and click **> View > Config**.

   The Services Config view opens with the General tab displayed.



3. Select the **Collections** tab.

   The Collections grid is displayed.



4. In the Collections grid, select the collection that you want to delete.
5. Click − from the toolbar.

   A warning dialog requests confirmation.
6. If you want to delete the collection, click **Yes**.

   The collection is removed from the Workbench service.

Example Procedure: How to Restore a Collection for Reporting and Investigation

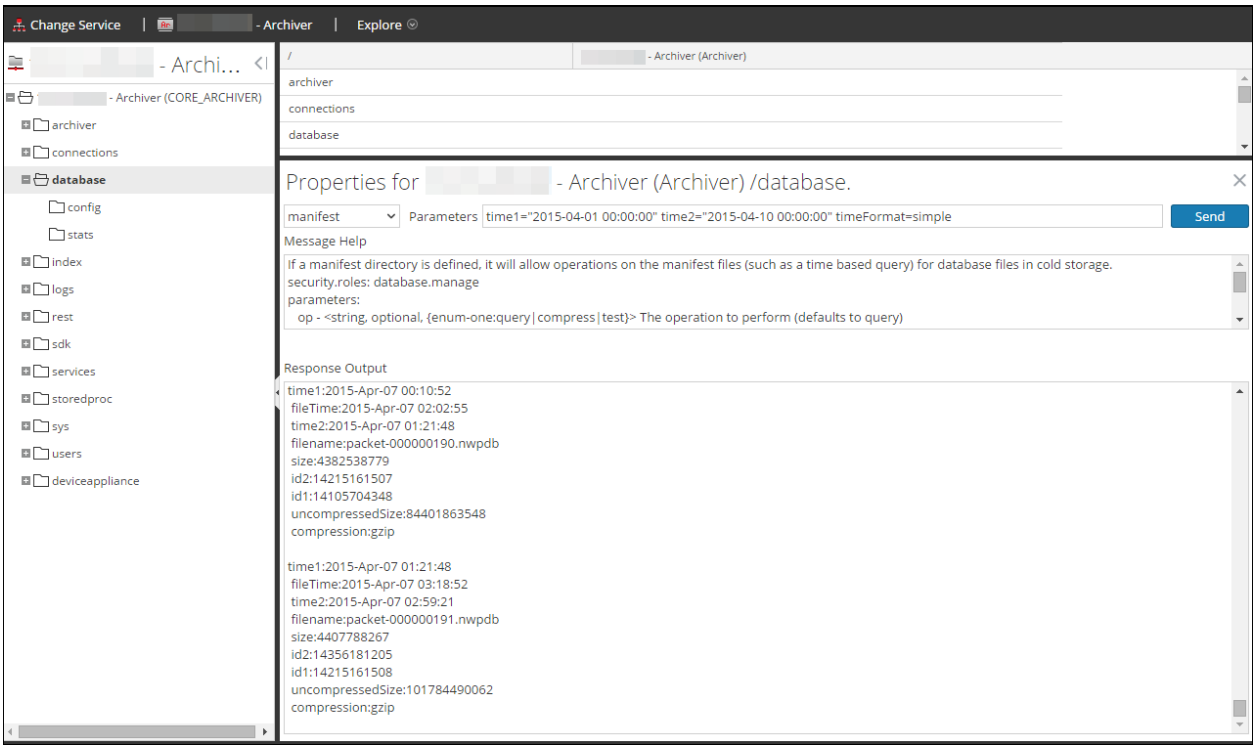
The following steps illustrate how to restore data for reporting and investigation purposes that is in offline storage or cold-tier storage. In the following example, data is restored for the time range beginning on 2015-April-01 through 2015-April-10.

To restore data for reporting and investigation purposes:

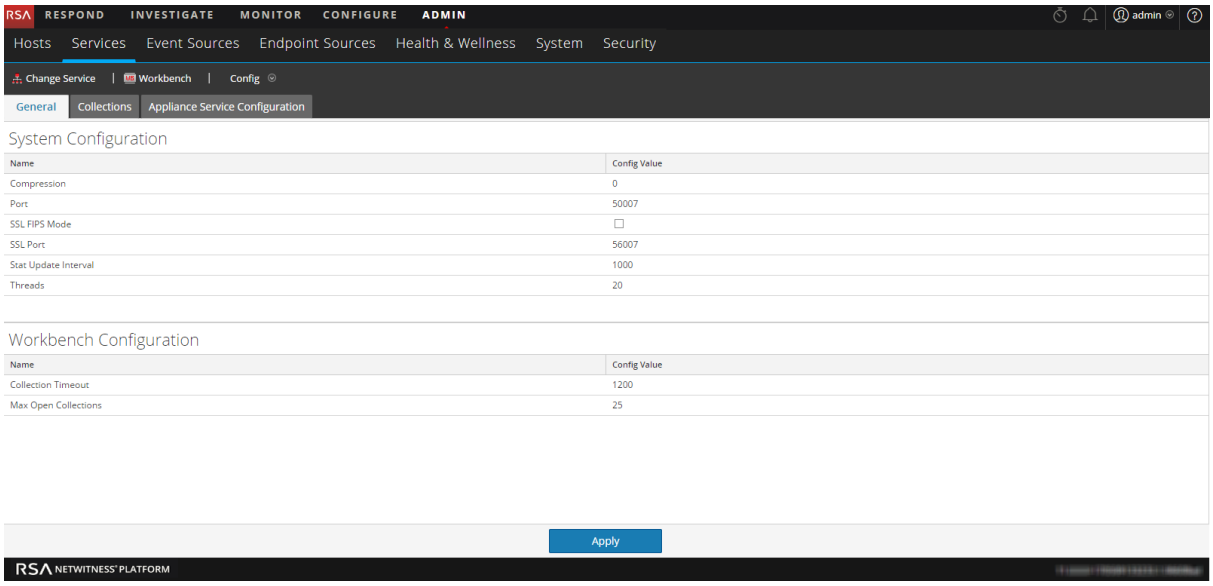
1. Go to **ADMIN > Services**.
2. Select the **Archiver** from the Services grid and Click **> View > Explore**.
   The Explorer view for Archiver is displayed
3. Right click on Database node in left-hand tree and select **properties** to open them in the right-hand panel.
4. Run the **manifest** command for the selected time range 2015-April-01 to 2015-April-10.
   The search returns all files that need to be restored for your selected query.

Example Search:

```
time1="2015-04-01 00:00:00" time2="2015-04-10 00:00:00" timeFormat=simple
```



6. Go to **ADMIN > Services**.
7. In the Services view, select a **Workbench**, then select **> View > Config**.
   The Services Config view is displayed with the General tab open.



8. Select the **Collections tab.**
9. Create a restoration collection with the source path pointing to files listed in the manifest command output.
10. Save the collection.

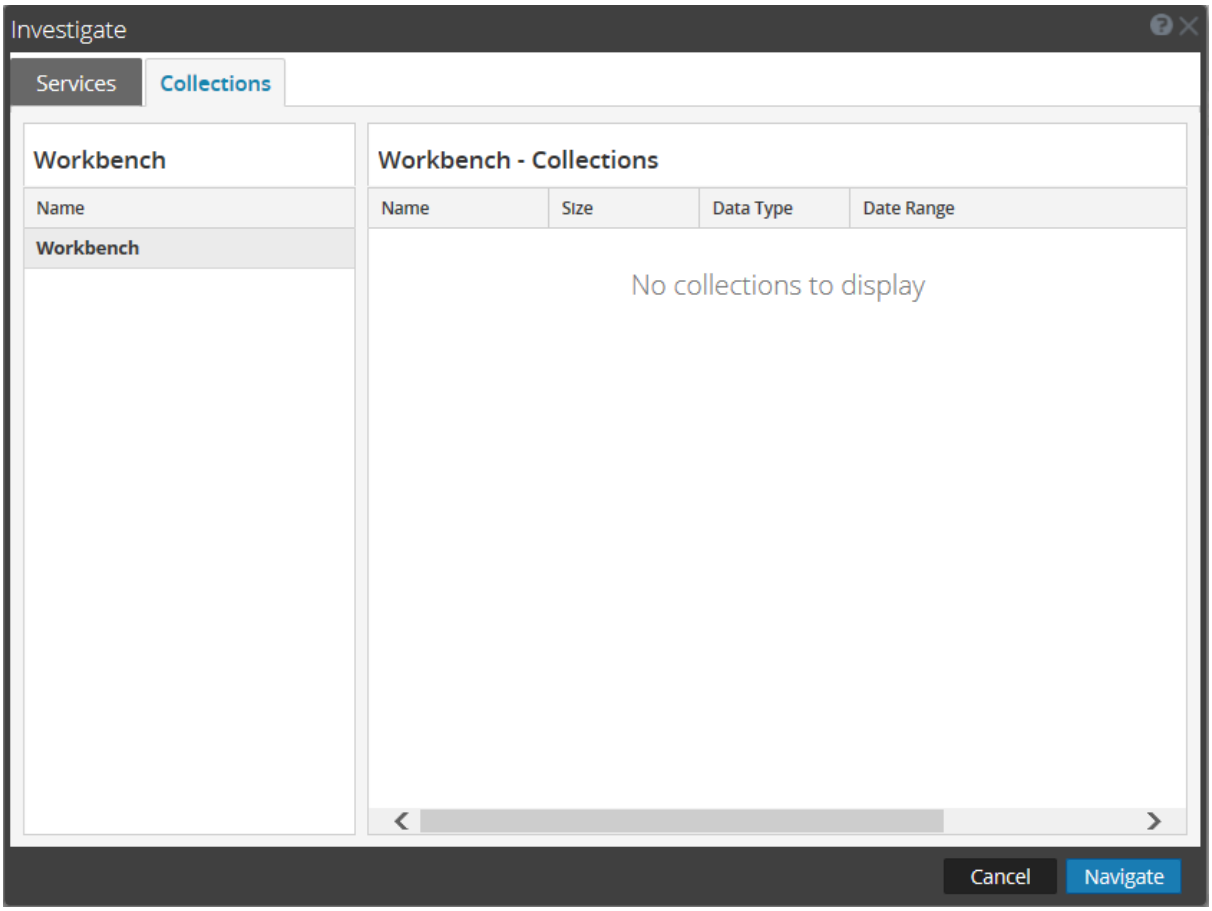
    After successfully creating a collection, you can use this collection for reporting and investigation purposes.

Investigate a Collection

To perform an investigation on a workbench collection:

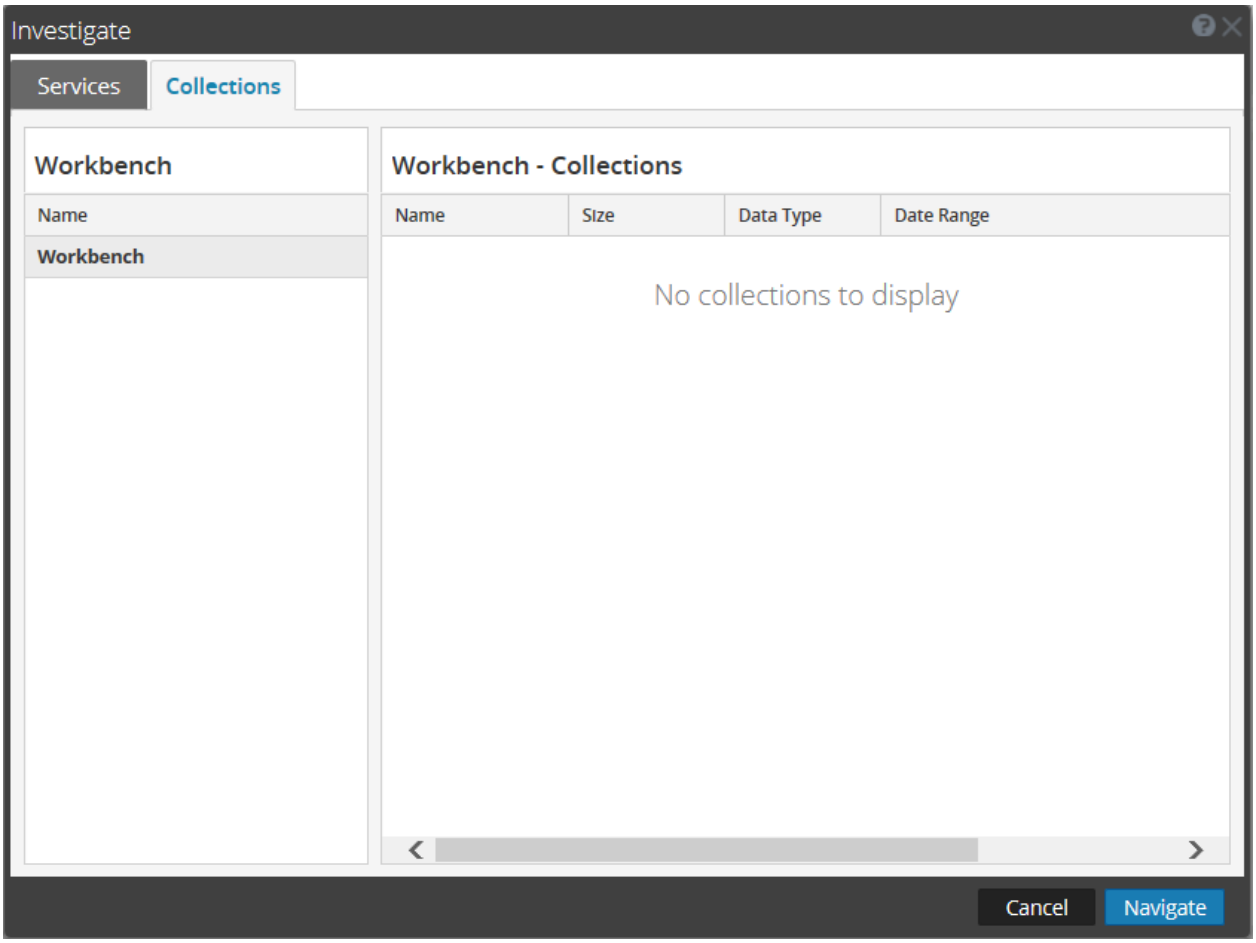
1. Select **Investigate**.

   The Investigate dialog is displayed.



2. Click the **Collections** tab in the Investigate dialog.
3. Select a Workbench service in the left panel.
4. Select the collection you want to investigate in the right panel.
5. Click **Navigate**.

The Navigate view is displayed showing data pertaining to the Workbench collection that you selected.



Note: For detailed information about using Investigation, see *Investigation and Malware Analysis Guide*.

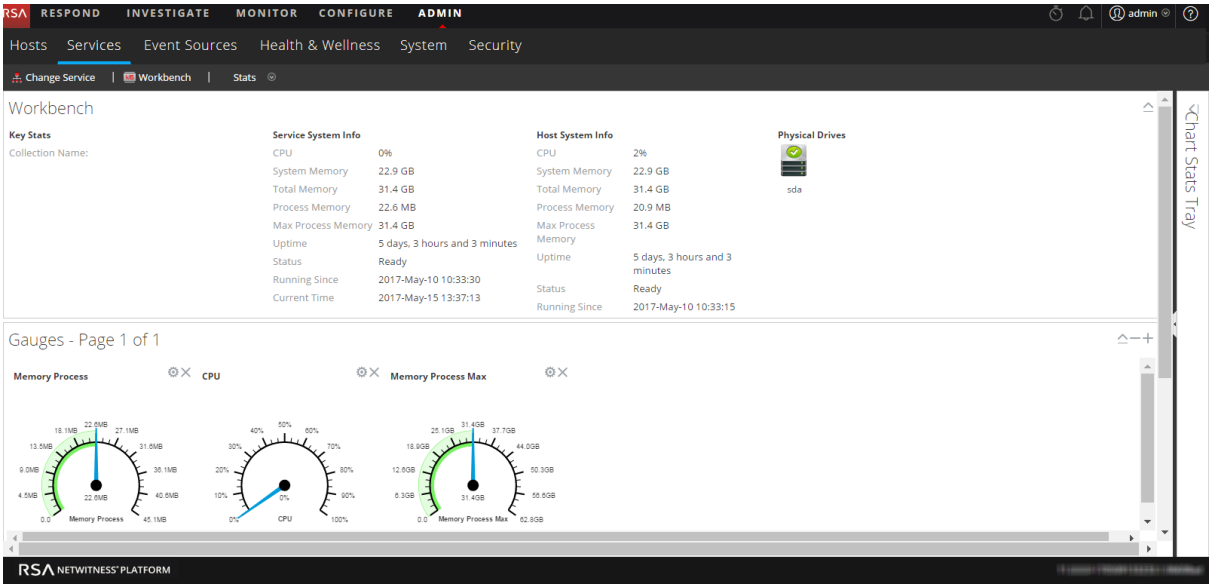
View Workbench Collection Statistics

The same statistics available for other services are provided for the Workbench service. The Services Stats view displays key statistics and system information that pertain to your selected Workbench service. The information is displayed in several different sections within the Stats view: Workbench, Gauges, Timeline Charts and Chart Stats Tray. The Chart Stats Tray lists all available statistics for the Workbench. Any statistic in the Chart Stats Tray can be displayed in a gouge or a timeline chart.

Perform the following steps to view workbench statistics:

1. Go to **ADMIN > Services**.
2. In the Services view, select a **Workbench**, then select **> View > Stats**.

The Services Stats view is displayed.



Note: For more information about Workbench statistics, see the *Host and Services Getting Started Guide*.

View Workbench Logs

Perform the following steps to view logs on a Workbench service:

1. Go to **ADMIN > Services.**
2. In the Services view, select a **Workbench**, then select **> View > Logs**.

   The Services Logs grid is displayed.

Note: For information about viewing and configuring audit logs, see the topic "Configure Global Audit Logging" in the *System Configuration Guide* .

Workbench Reference Topics:

- Services Config View - Workbench
- Services Config View - Collections Tab
- Services Config View - General Tab

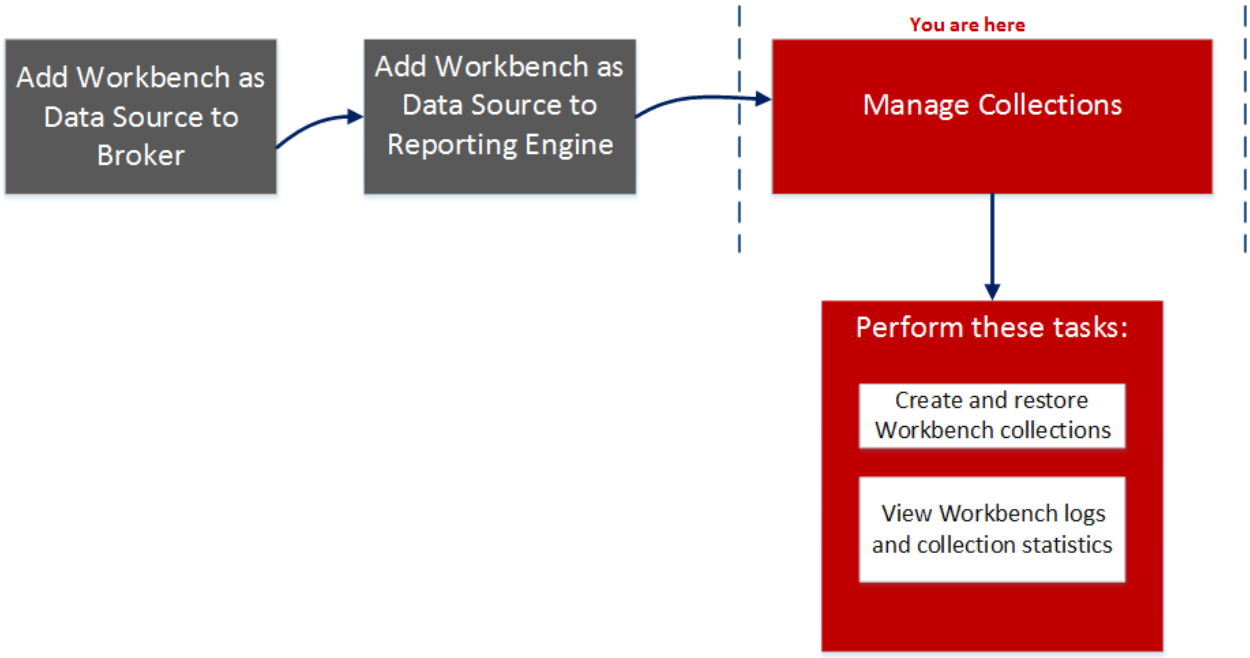
Services Config View - Workbench

In the Services Config view for workbench, some of the parameters are the same as other NetWitness Platform services, while others are specific to the Workbench service.

The Services Config view - Workbench (ADMIN > Services >, select Workbench service and select View > Config) provides a way to configure a Workbench service.

Workflow

These are the basic steps for configuring and managing a Workbench service.



What do you want to do?

Role	I want to...	Show me how...
Administrator	Add Workbench as data source to Broker	Adding Workbench Service as a Data Source to Broker
Administrator	Add Workbench as a Data Source to Reporting Engine	Adding Workbench as a Data Source to Reporting Engine
Administrator	*Create or delete a collection	Managing Collections
Administrator	*View Workbench statistics and logs	Managing Collections

Role	I want to...	Show me how...
Administrator	View configuration information about appliances that are connected to the Workbench service.	Select the **Appliance Service Configuration** tab. The Appliance Service Configuration tab is the same for all NetWitness Platform services. It provides configuration information about appliances that are connected to the Workbench service. For information on the **Appliance Service Configuration** tab, see **Appliance Service Configuration Tab** in the *Host and Services Getting Started Guide*.

*You can perform this task here.

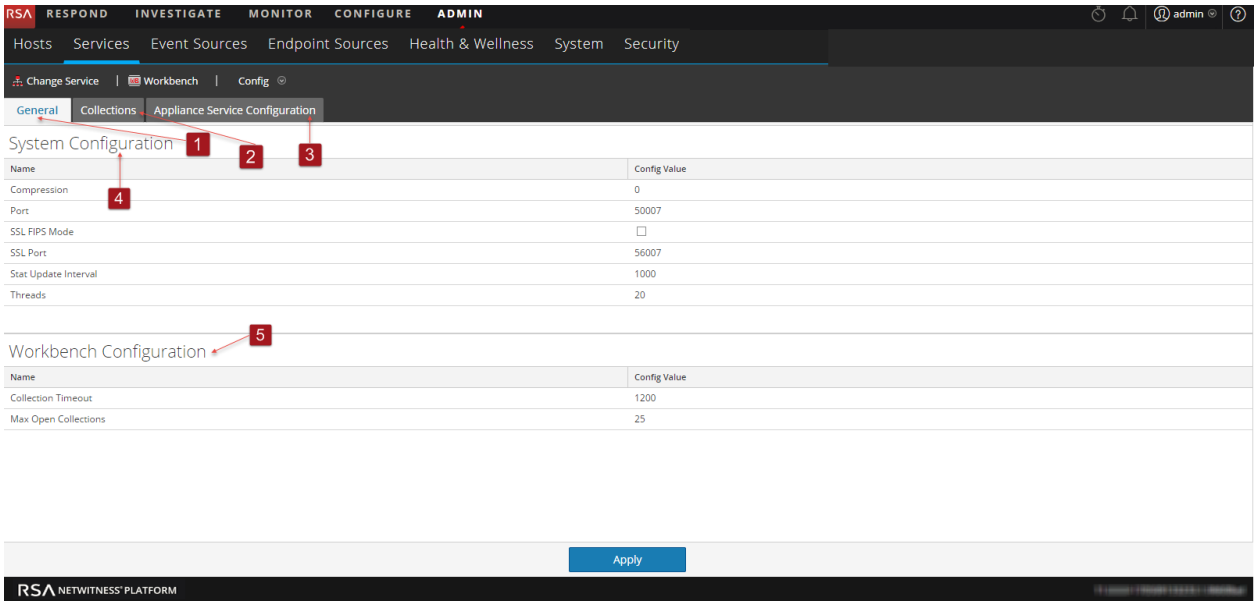
- Workbench Configuration Procedures

Quick Look

The Workbench service has three tabs and two panels in the Config view:

- General tab
- Collections tab
- Appliance Service Configuration tab
- System Configuration panel
- Workbench Configuration panel



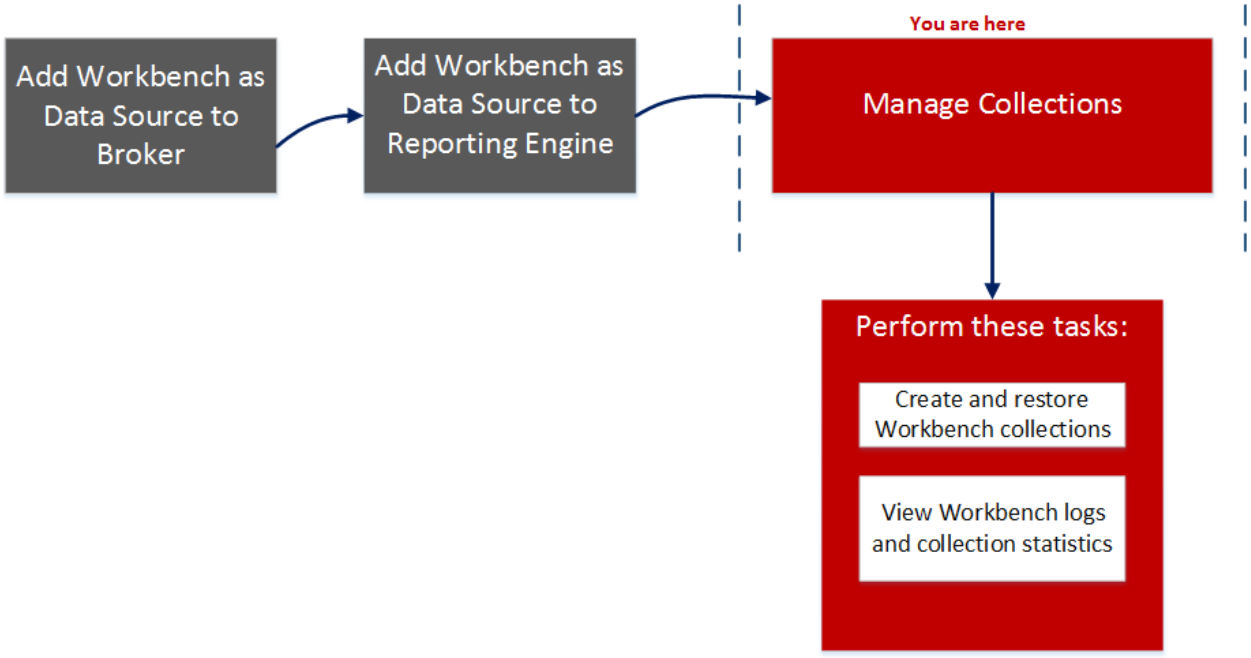
1	General tab provides a way to manage basic Workbench service configuration.
2	Collections tab provides a way to manage collections on a Workbench service.
3	Appliance Service Configuration tab provides a way to configure a Workbench service.
4	System Configuration panel provides a way to manage service configuration for a Workbench service.
5	Workbench Configuration panel provides a way to start and stop a Workbench service.

Services Config View - Collections Tab

The Collections tab for the Workbench service provides a way to manage workbench collections. To access the Collections tab, go to **ADMIN > Services >** select a Workbench service, select **View > Config** and select the **Collections** tab.

Workflow

These are the basic steps for configuring and managing a Workbench service.



What do you want to do?

Role	I want to...	Documentation
Administrator	*Create and restore Workbench collections.	Managing Collections
Administrator	*View Workbench logs and collection statistics.	Managing Collections

Role	I want to...	Documentation
Administrator	View configuration information about appliances that are connected to the Workbench service.	Select the **Appliance Service Configuration** tab. The Appliance Service Configuration tab is the same for all NetWitness Platform services. It provides configuration information about appliances that are connected to the Workbench service. For information on the **Appliance Service Configuration** tab, see **Appliance Service Configuration Tab** in the *Host and Services Getting Started Guide*.

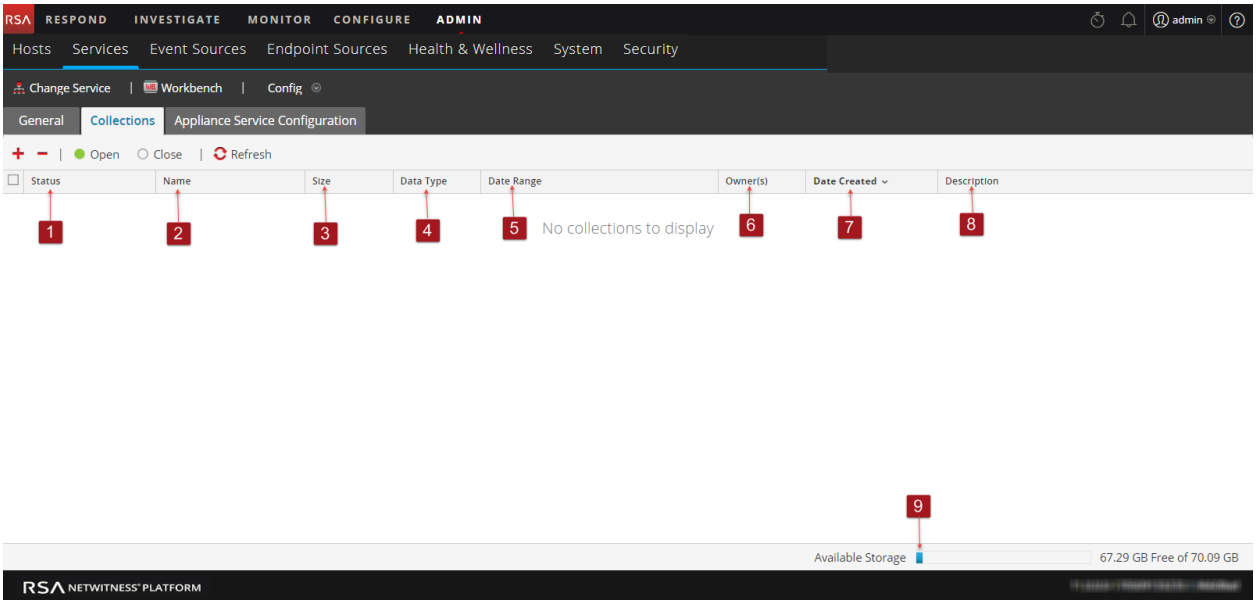
- Workbench Configuration Procedures

Quick Look

The Collections tab has a toolbar and a grid that lists relevant information about the Workbench collections.

The following figure is an example of the Collections grid.



1 Status of the Restoration Collection:

- **Resorting Data** - Data restoration is in progress.
- **Closed** - Data is restored.

- **Opening** - Data is being indexed.
- **Ready** - Indexing is complete.
- **Closing** - Collection is closing.

2 **Name**: Name of the file being restored.
3 **Size**: Collection size.
4 **Data Type**: Logs.
5 **Date Range**: Lists the range of dates when the collection is being restored.
6 **Owner**: Lists the Collection creator.
7 **Date Created**: Shows the date when the collection was created.
8 **Description**: Description of the Restoration collection.
9 **Available Storage Indicator**: Shows the available disk space, given in gigabytes (GB). The Workbench validates to ensure there is enough available space when attempting to create a restoration collection.

Toolbar

These are the toolbar options.

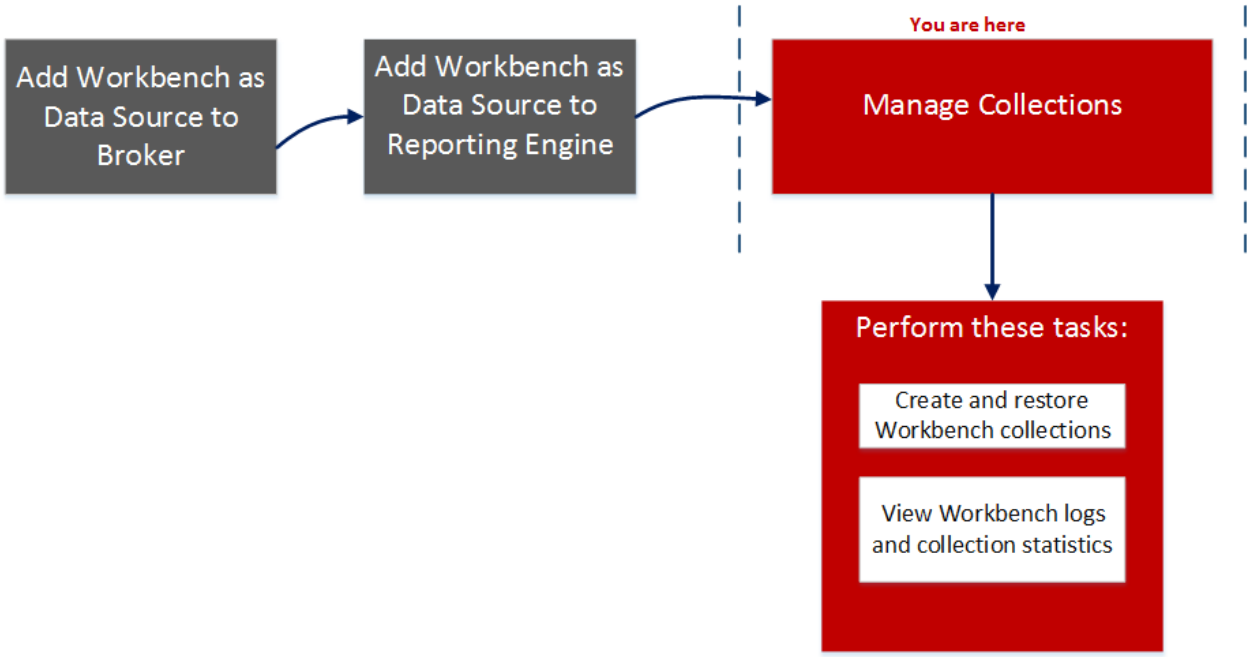
Parameter	Description
+	Creates a new restoration collection.
−	Deletes the selected Workbench collection.
Open and Close - Refers to the status of the restoration collection.	Open - Makes collection available for investigation and reporting. Close - Makes collection unavailable for investigation and reporting while preserving resources.
↻	Refreshes the list of Workbench collections.

Services Config View - General Tab

The General tab for the Workbench service provides a way to manage basic service configuration. To access the General tab, go to **Admin** > **Services** > select service and select > **View** > **Config**.

Workflow

These are the basic steps for configuring and managing a Workbench service.



What do you want to do?

Role	I want to...	Show me how...
Administrator	*Create and restore Workbench service collections.	Managing Collections
Administrator	*View Workbench logs and collection statistics.	Managing Collections
Administrator	*Process Workbench collections.	Managing Collections

*You can perform this task here.

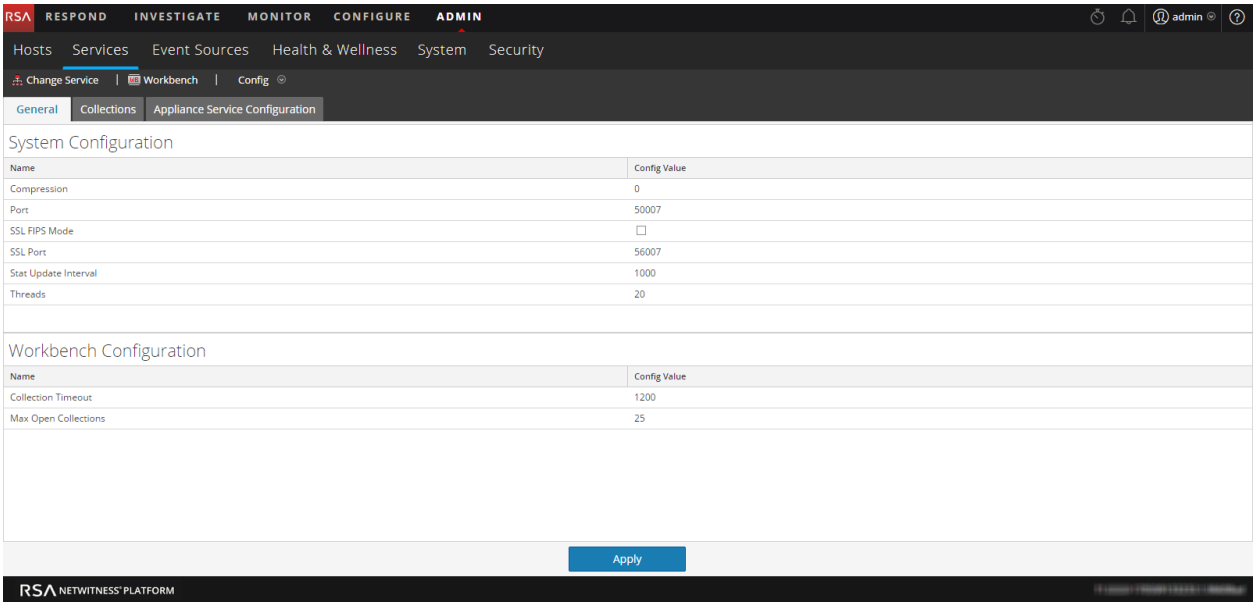
- Workbench Configuration Procedures

Quick Look

The General tab has two panels:

- System Configuration
- Workbench Configuration

The following figure is an example of the General tab.



System Configuration Panel

The System Configuration panel displays configuration parameters for the Workbench service. The following table describes the System Configuration panel features.

Parameter	Description
Compression	When set to a positive value, the minimum amount of bytes before a message is compressed. **0** means no compression for any message. Change takes effect on subsequent connections.
Port	The unencrypted port this service will listen on. **0** means disabled. Change takes effect on service restart.
SSL FIPS Mode	Determines whether the OpenSSL library will enter FIPS mode. Change takes effect on service restart.
SSL Port	The SSL port this service will listen on. **0** means disabled. Change takes effect on service restart.
Stat Update Interval	Determines how often (in milliseconds) statistic nodes are updated in the system. Change takes effect immediately.
Threads	The number of threads in the thread pool to handle incoming requests. Change takes effect immediately.

Workbench Configuration Panel

The Workbench Configuration panel displays configuration parameters for the Workbench collections. The following table describes the Workbench Configuration panel features.

Parameter	Description
Collection Timeout	The number of seconds before an idle collection is automatically closed.
Max Open Collections	The number of collections that can be open at once. A setting of 0 disables the limit.
Apply	Updates the modified configurations in the panel.

Troubleshooting

NetWitness Platform notifies users of issues using popup notifications.

NetWitness Platform Workbench returns the following types of error messages explained in the following table.

Problem	Possible Causes	Solutions

Unable to connect to workbench service from NetWitness Platform **user interface Administration page.**	NetWitness Platform service is not running.	Verify that your NetWitness Platform service is running. Log in to your NetWitness Server and run the following command:
		`status nwworkbench`
		Firewall rules should allow connections from 50007, 50607 and 50107.
		Verify your connection by running the following command:
		`service iptables status`
		Verify that you are able to launch REST. Execute the following command for your appliance:
		`https://<IPAddress>:50107 service`
		If you are able to launch REST service for your appliance, you can confirm that there is no problem with the appliance. Navigate to the NetWitness Platform side for further investigation as follows:
		• Enable debug mode and watch for sa.log errors located at:
		`/var/lib/netwitness/uax/logs`
		• Enable developer tools using the shortcut `Ctrl+Shift+I` for Chrome and verify the preview and response for the request.

Problem	Possible Causes	Solutions
Not able to view Appliance service configuration tab for workbench appliance running in SSL mode.		Enable SSL for appliance service and restart the appliance service.

The following error message is displayed when trying to load meta in order to create a report on a workbench collection: "Unable to fetch schema from data source when trying to load meta."		Load meta for the appliance from the NetWitness Platform User Interface Rule library and watch for any errors in Reporting Engine log located at:
		`/home/rsasoc/rsa/soc/reporting-engine/logs`
		Launch REST for the device and watch for any error if you run the following query:
		`/sdk?msg=language&force-content-type=text/plain&expiry=600&size=10`

No results are displayed after running query from NetWitness Platform User Interface via the Reporting Engine.		Run the query on the Reporting Engine and watch for `/var/log/messages` on the data source. Look for an exact query that matches the data source. **TIP**: Search for `[SDK-Query]` in log file. Copy the exact query and run from REST SDK to see if you get any results. `REST Query: /sdk?msg=query&force-contenttype=text/plain&expiry=600&query=select%20user.dst&size=10`
Workbench Available storage indicator in Workbench Collections Tab is not accurate.	Available storage indicator in the User Interface displays the default Collections directory shown below: `/VAR/NETWITNESS/WORKBENCH/COLLECTIONS`	None.

Problem	Possible Causes	Solutions
Unable to open new collections after opening existing collections.	There is a workbench configuration called “Max Open Collections” that is set to 25 by default. This configuration specifies the number of collections that can be open at the same time.	You can modify this number. A setting of zero disables the limit of maximum open collections.
Successfully opened a collection that got to Ready state. But after a while, the collection automatically changed to Closed state.	There is a workbench configuration called “collection.timeout” that is set to 1200 seconds by default. This configuration specifies the number of seconds before an idle collection is automatically closed. Maximum time allowed before timeout occurs is 86,400 seconds (24 hours).	A setting of zero disables the timeout.
Querying for a time range using `/database manifest` command returned blank output.	Blank output indicates that there are no **nwdb** files available for the time range.	None.
Created collection, but collection status is not available in Jobs, and collection is not displayed in workbench Collections tab.	You might be running in a mixed mode environment (for example, creating a collection on a 10.4.x version of workbench from a 10.5 NetWitness Platform User Interface.	The collection is displayed in the workbench Collections tab after you reload the page.
Noticed blank Date Range and Date Created values for collections.	All collections display blank Date Range and blank Date Created values.	Date Range and Date Created values are displayed after upgrading to 10.5.

Problem	Possible Causes	Solutions
Discrepancy in behavior of adding workbench collections as a data source to Reporting Engine.	This behavior depends on whether you have a trusted connection or a non-trusted connection.	If your workbench service is established with a trusted connection, you should manually add workbench collections as a source to Reporting Engine. If your workbench service is not established with a trusted connection when the workbench restoration collection was created, it automatically sends a message to the Reporting Engine to add it as a source in the Reporting Engine.
Collection attributes (size, date range and date created) are not displayed.	Date range is not displayed for a collection if Jetty service is restarted while restoration is in process. Restoration collections created from an Explorer view display a blank Date Range. Any collections created on a 10.4 Workbench will display blank Date Range and blank Date Created values after upgrading to 10.5. In a mixed mode environment (10.5 NetWitness Server and 10.4.x workbench), size, date range, and date created are not displayed.	None.
Exception or blank page is displayed when drilling down on a workbench collection.	Collection closed because it exceeded the collection time out.	Investigate the collection from the beginning.
Empty collection is created.	Empty collection is displayed if restoration fails because Workbench service is restarted during collection creation.	None.
Service abruptly shuts down.		Run the service from command line and watch for any errors. For an example, run the command from the server console `/usr/sbin/NwWorkbench` for workbench.

Problem	Possible Causes	Solutions
REST request denied.		Verify user.agent.whitelist config located at `/rest/config/`. If non-blank, this should be a regex expression to match valid HTTP user agents. If the regex fails to match, all REST requests will be denied (see allow.missing.user.agent for the potential exception). If blank, all requests are allowed.
Queries with raw meta return blank values for Raw field.		Verify that you have a relevant **`packet db`**.

Getting Started with ESA

This topic covers quick start topics for RSA NetWitness® Platform Event Stream Analysis (ESA) to help you get started in using ESA. The following topics are designed to assist you in working with ESA Correlation Rules.

- Best Practices helps you to understand how to best set up, deploy, and create rules.
- Troubleshoot ESA helps you to troubleshoot different aspects of ESA, including rule writing and deployment.
- View Memory Metrics for Rules helps you to work with memory metrics to understand memory usage for ESA services.

There are two ESA services that can run on an ESA host:

- ESA Correlation (ESA Correlation Rules)
- Event Stream Analytics Server (ESA Analytics)

The first ESA service is the ESA Correlation service that creates alerts from ESA rules, also known as ESA Correlation Rules, which you create manually or download from Live.

For NetWitness Platform 11.3 and later, the ESA Correlation service replaces the Event Stream Analysis service and is also known as ESA Correlation Server. The ESA Correlation service provides the same services as the Event Stream Analysis service with the added benefit of enabling you to specify different data sources for your ESA correlation rules. Like the Event Stream Analysis service, the ESA Correlation service installs on the ESA Primary and ESA Secondary host types.

This user guide covers alerting using ESA Correlation Rules. It is intended for Threat Intel personnel (Content Experts), who configure data sources and inputs to NetWitness Platform. For information on configuring ESA Correlation Rules, see the "Configure ESA Correlation Rules" section of the *ESA Configuration Guide*.

The second ESA service is the ESA Analytics service, which is used for Automated Threat Detection. Because the ESA Analytics service uses preconfigured ESA Analytics modules for Automated Threat Detection, you do not have to create or download rules to use it. For information on the ESA Analytics service, see the *Automated Threat Detection Configuration Guide* and the "Configure ESA Analytics" section of the *ESA Configuration Guide*.

Note: The Contexthub Server service, which provides enrichment lookup capability in the Respond and Investigate views, runs only on an ESA Primary host. For information, see the *Context Hub Configuration Guide*.

Data Source Configuration Changes

In NetWitness Platform version 11.3 and later, the ESA Correlation service enables you to specify different data sources for different sets of rules. Instead of adding data sources, such as Concentrators, to the entire ESA Correlation service, you can specify different data sources for each ESA rule deployment. An ESA rule deployment includes an ESA Correlation service with its associated data sources and a set of ESA rules. For example, you may want to use Concentrators with HTTP packet data in one deployment and Concentrators with HTTP log data in another deployment. For more detailed information, see Deploy Rules to Run on ESA.

An Endpoint Risk Scoring Rules Bundle is available in NetWitness Platform

An Endpoint Risk Scoring Rules Bundle, which contains approximately 400 rules, comes with NetWitness Platform 11.3 and later. Endpoint risk scoring rules only apply to NetWitness Endpoint. You can add the Endpoint Risk Scoring Rules Bundle to an ESA rule deployment in the same way that you would add any ESA rule. However, you must specify endpoint data sources (Concentrators) in the ESA Rule Deployment.

The ESA Correlation service can process endpoint risk scoring rules, which generate alerts that are used in risk scoring calculations to identify suspicious files and hosts. To turn on risk scoring for NetWitness Endpoint, you must deploy endpoint risk scoring rules on ESA. For instructions, see "Deploy Endpoint Risk Scoring Rules on ESA" in the *ESA Configuration Guide*. For complete information on configuring NetWitness Endpoint, see the *NetWitness Endpoint Configuration Guide*.

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

How ESA Generates Alerts

The ESA Correlation service runs rules that specify criteria for problem behavior or threatening events in your network. When ESA detects a threat that matches rule criteria, it generates an alert.

To generate alerts, ESA performs the following functions:

1. Gathers data
2. Runs ESA rules against the data
3. Captures events that meet rule criteria
4. Generates alerts for those captured events

Best Practices

Best practices provide guidelines to help you write and manage rules, deploy rules, and maintain system health for your ESA services.

Understand Event Stream Analysis Rule Types

The ESA Correlation service provides advanced stream analytics such as correlation and complex event processing at high throughputs and low latency. It is capable of processing large volumes of disparate event data from Concentrators. However, when working with Event Stream Analysis, you should be aware of the factors that affect resource usage in order to create effective rules.

Each event that is received by ESA is evaluated to determine if it may trigger a rule. There are three types of rules that can be deployed in order to determine what the ESA engine should do with the incoming event. Each of these rule types have different impacts on system resource utilization. All three rule types may be created via the Rule Builder, Advanced Event Processing Language (EPL) rules, or downloaded via RSA Live. The table below lists the rule type and the impact this rule may have on system resources.

Rule Type	Description
Simple Filter Rule	This rule has no correlation to other events. At ingestion time, this rule is evaluated against a set of conditions, and if those conditions are met an alert is generated. If no conditions match, the event is quickly released by the engine to free up memory usage. These rules do not take up memory since the events are not retained beyond the initial evaluation. The memory resource usage does not increase as more simple filter rules are deployed. However, if the filter condition is too generic, it is possible that this rule can generate too many alerts, which will strain the system resources for the storage and retrieval of these alerts. For example, you might write a rule to generate an alert when HTTP network activity arrives over a non-standard HTTP port.
Event Window Rule	This rule evaluates a set of events over a time period for specific conditions. At ingestion time, the rule is evaluated against a set of conditions. If those conditions are met, the event is retained in memory for a specific amount of time. After the specified time passes, the events are removed from the time window if the number of events collected does not meet the threshold to trigger an alert. The memory consumption of such rules is highly dependent on the incoming event rate (traffic), the amount of data per event, and the time length specified in the event window. Each matching event is retained in memory until the time window has passed, so the longer the time window, the greater the potential volume. For example, you might write a rule that generates an alert if a user has five failed login attempts within a ten minute time frame.

Rule Type	Description
Followed By Rule	This rule evaluates a chain of incoming events to determine if the sequence of events matches a particular condition. At ingestion time, the rule is evaluated against a set of conditions. If the conditions are met, one of two actions occurs: • If this is the first event of the sequence, a new event thread is started, and the event is retained as the head of the sequence. • If the event belongs to an existing event thread, it is added to that sequence. In both cases, the event is retained in memory. The amount of resource usage is particularly sensitive to the customer environment for this type of rule. If the filter condition generates many event threads, resources are consumed for each new thread (in addition to the event). Additionally, if the end of the event thread is never met (that is, an alert is never generated), then the entire event is saved in memory indefinitely. For example, you might write a rule to generate an alert when a user fails to log in to a server, then performs a successful login, and then creates a new account.

Note: ESA sends alerts to NetWitness Respond for processing and the alerts are eventually stored in a database. If your rule creates too many alerts, it can slow down another part of the system.

When writing and deploying rules, you should be aware that rule memory usage and alert generation consume system resources. The sections below are designed to help you keep your usage at a healthy level and monitor for problems if systems are becoming overloaded.

Best Practices for Writing Rules

These are general guidelines for writing rules.

- **Create alerts for actionable events.** The purpose of an alert should be to notify you of an event that requires immediate and specific action. For events that do not require action, or only require you to have awareness of the event, you can create a report.
- **Configure new rules as trial rules so you can observe how they react in your environment**. If you deploy new rules as trial rules, they will be disabled if the configured memory threshold is exceeded.
- **Configure Alert notifications only after your rule testing and tuning is complete**. This can help ensure you do not get flooded with notifications if a rule behaves differently than you expect.
- **Rules need to be specific so that you limit resource usage**. Use the following guidelines to limit usage:
  - Make the filters on the rule exclude all but the necessary events for the rule to fire accurately.
  - Make the size of your windows (window time for correlation) as small as possible.

  - Limit the events that you include in the window: For example, if you only want to see IDS events, ensure that you only include those events in your time window.
- **Rules need to be tuned to an alert level that is manageable**. If you are flooded with alerts, then the purpose and utility of an alert is lost. For example, maybe you want to know about encrypted traffic to other countries. But, you could limit the list to countries that are known risks. This limits the volume of alerts to a level you can manage.

Best Practices for Working with RSA Live Rules

These are guidelines for RSA Live Rules.

- **Deploy RSA Live rules in small batches**. Not every rule is suited to every environment. The best way to ensure your RSA Live rules are successful is to deploy them in small batches so you can test them in your environment. If you deploy small batches, it's much easier to tell if a particular rule has an issue.
- **Read the rule descriptions provided with RSA Live rules**. ESA rules are not “one size fits all.” Not all rules will work in your environment. The rule descriptions tell you which parameters you will need to modify to successfully deploy a rule in your environment.
- **Set your parameters**. RSA Live rules have parameters that need to be modified. If you do not modify your parameters, the rule may not work or it may exhaust your memory.
- **Deploy new rules as trial rules so you can observe how they react in your environment.** If you deploy new rules as trial rules, they will be disabled if the configured memory threshold is exceeded. For more details, see Work with Trial Rules.

Best Practices for Deploying Rules

These are general guidelines for deploying rules.

- **Deploy rules in small batches so you can observe how they react in your environment.** Not all environments are the same, and a rule will need to be tuned for memory usage, alert volume, and effective detection of events.
- **Test rules before you configure alert notifications**. Configure Alert notifications only after your rule testing and tuning is complete. This can help ensure you do not get flooded with alerts if a rule behaves differently than you expect.
- **Monitor system health as a part of your deployment process**. When you deploy rules, monitor your system’s health as a part of your deployment process. You can view total memory usage for your ESA in the Health and Wellness tab. For more information, see "View Detailed Statistics in Health and Wellness" in Troubleshoot ESA.

Best Practices for System Health

These are general guidelines for system health.

- **Set up new rules as trial rules**. A common issue is that new rules may cause memory issues. To prevent this, you can set up new rules as trial rules. If the configured memory threshold is met, all trial rules are disabled to prevent the system from running out of memory. For more information about trial rules, see Work with Trial Rules.
- **Set up thresholds in Health & Wellness to alert you if memory usage is too high**. There are metrics in NetWitness Platform Health & Wellness that track memory usage. You can set up alerts and notifications to send you an email if those thresholds are crossed. For more information about the memory statistics you can view, see View Memory Metrics for Rules.
- **Monitor memory metrics for each rule in Health & Wellness**. For each rule, you can view the estimated memory usage in Health & Wellness. You can use this information to ensure that rules do not use too much memory. For more information about the memory statistics you can view, see View Memory Metrics for Rules.

Troubleshoot ESA

This section describes common issues that may occur while using ESA, and it suggests common solutions to these problems.

Troubleshoot ESA Correlation Services

Problem	Possible Causes	Solutions
On the NetWitness Platform Dashboard, the ESA service appears in red to indicate it is offline. In the **CONFIGURE** > **ESA Rules** view, the following message appears: "The Service is either offline or not reachable."	Several	When an ESA Correlation service is offline, there are many possible causes. However, a common issue is that you have created a rule that uses excessive memory and causes the ESA service to fail. To troubleshoot this problem, see Steps to Troubleshoot Memory Issues with an ESA Service Offline. Other common causes might be that your firewall is blocking the connection between the ESA and NetWitness Platform, or the ESA Correlation service machine may be down. To bring up ESA Services: Go to **ADMIN** > **Services**, select your ESA service, and then select > **Start**. If your ESA service is stopping and restarting in a loop, you may need to call Customer Support to get the services to start.
After a recent upgrade, the ESA service appears in red on the NetWitness Platform Dashboard to indicate it is offline. In the **CONFIGURE** > **ESA Rules** view, the following message appears: "The Service is either offline or not reachable."	Configuration issues	If your system has been recently upgraded, you may have made a configuration error. Go to **ADMIN** > **Services**, select your ESA service, and then select > **Edit**. In the Edit Service dialog, click **Test Connection**. If the connections fails, you likely have a configuration error. Attempt to fix your configuration error and try again.

Troubleshoot RSA Live Rules for ESA

Problem	Possible Causes	Solutions
I imported a group of rules from RSA Live, and now my ESA service is crashing. Why?	You may not have configured the parameters for the RSA Live rule to tune it for your environment.	Each rule in RSA Live has a description that includes the parameters you must configure and prerequisites for your environment. Review this description to see if the rule is appropriate for your environment. To ensure that you deploy rules safely in your environment, configure new rules as trial rules to test them in your environment. Trial rules add a safeguard for testing new rules. For details on this, see Deploy Rules as Trial Rules.

I imported a group of rules from RSA Live, and while the rules deployed without errors, they were later disabled.	Not all RSA Live rules are meant for every environment. You may not have the correct meta in your ESA for the rule to run.	You can verify that a rule was disabled by going to **CONFIGURE > ESA Rules > Services > Deployed Rule Stats**. If the rule is disabled, the green icon does not display next to the rule.
		If a rule deployed correctly but was disabled, check the logs for exceptions related to the rule. Specifically, check to see if the rules were disabled due to missing meta. To do this, go to the ESA Correlation logs. You can use SSH to get in the system and go to: `/var/log/netwitness/correlation-server/correlation-server.log`.
		Then, search for a message similar to the following:
		`"Property named '<meta_name>' is not valid in any stream"`
		For example, you might see:
		`Failed to validate filter expression '(medium=1 and streams=2 or medium=3...(238 chars)': Property named 'tcp_flags_seen' is not valid in any stream`
		If a similar message displays, you may need to add a custom meta key to the Log Decoder or Concentrator. To do this, follow these instructions: "Create Custom Meta Keys Using Custom Feed" in the *Decoder and Log Decoder Configuration Guide*.

Troubleshoot ESA Rules

Problem	Possible Causes	Solutions
I have an ESA rule that is not getting deployed and is not creating alerts.	A meta key that the rule uses is a string array type, but it shows as a string type on ESA.	Check to see if any string array meta keys that the rule uses are configured as string array types on ESA. Go to **CONFIGURE > ESA Rules > Settings** tab (Meta Key References). • If it shows `string[]`, it is configured as a string array type on ESA. This is fine. • If it shows `string` without the brackets, it is configured as a string type and you need to fix it on ESA. In the ESA Correlation service Explore view, go to `correlation/stream`. Add string array meta keys to the **multi-valued** list to allow them to be used as an array in ESA rules. Go back to the Meta Key References and click the refresh icon ( ). Verify that the meta keys with a string array type show a value of `.string[]`. For additional details, see "Configure Meta Keys as Arrays in ESA Correlation Rules" in the *ESA Configuration Guide*.
I created a rule, and I checked the syntax. The rule looked fine. When I went to deploy the rule, I got an error. Why?	You may not have the correct meta to deploy the rule.	Check the Meta Key References. You may not have the correct meta to deploy the rule. Check the ESA Correlation service log files to see which meta keys are missing: `/var/log/netwitness/correlation-server/correlation-server.log`.
I created a rule with an enrichment, added an SMTP notification, and deployed my rule. We are not receiving SMTP notifications. Why?	You do not have a template that met the criteria to parse the events.	Check the ESA Correlation service log files to see if the SMTP notification failed: `/var/log/netwitness/correlation-server/correlation-server.log`. For more details on the notification error, check the Integration-Server log file on the NetWitness Server (also known as Node 0, Admin server, or NWServer): `/var/log/netwitness/integration-server/integration-server.log`. If you use an ESA rule that has an enrichment, such as a Context Hub list, you must create a custom template. You can duplicate a default template and adjust it for your enrichment. See SMTP Notification Error Example below for a notification error example. For information on creating a custom ESA template, see "Define a Template for ESA Alert Notifications" in the *System Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Problem	Possible Causes	Solutions
I created a custom rule (via the Rule Builder or Advanced EPL), and my rule is not firing. Why?	You may have connectivity issues.	Check the Offered Rate statistic on the **CONFIGURE> ESA Rules>Services** tab. Select the ESA service and then look at the statistics on the tab for the Deployment. If the Offered Rate is zero, then the ESA service is not receiving data from Concentrators. Check the ESA Correlation log files for connectivity issues: `/var/log/netwitness/correlation-server/correlation-server.log`. If the offered rate is not zero, the meta key name and type used in the rule likely doesn't match the meta key present in events. Check to see if the meta key name and type used in the rule is valid by searching for the meta key name in **CONFIGURE>ESA Rules>Settings** tab (Meta Key References).
I created a custom rule (via the Rule Builder or Advanced EPL), and my rule is not firing. Why?	There may be a problem with the rule.	**If a specific rule is not firing**, go to **CONFIGURE>ESA Rules>Services** to see if the rule was disabled. In the **Deployed Rule Stats** section, a rule that is disabled displays a clear enabled button (instead of the green enabled button). You can also check Events Matched field. Go to **CONFIGURE >ESA Rules> Services**. From there, you can see the number of events that were matched in the **Events Matched** column. If no events matched, check the logic of your rule for errors. For example, check the syntax for uppercase and lowercase errors, and check the time window. If the rule still doesn't fire, consider simplifying the logic of the rule to see if it fires when there is less complexity.
After a recent upgrade, I am not seeing alerts and I am seeing disabled rules.	There may be a problem with the ESA rule deployment.	Deploy the ESA rule deployments again. ESA Rule Deployment Steps provides more information on deploying rules using the ESA Correlation service. If this does not resolve the issue, check the ESA Correlation log files for more information: `/var/log/netwitness/correlation-server/correlation-server.log`.

SMTP Notification Error Example

The following SMTP notification error example is an excerpt from a `correlation-server.log` file, which shows an error message for sending notifications with unsupported templates. In this example, there is a rule that is configured with the GeoIP enrichment, which has a hash table as one of its fields (the GeoIPLookup meta). Because the default SMTP template is only designed to deal with metas that are either singular values or arrays that contain only singular values, such as `"ip.src":"1.1.1.1"` and `"action":["fw:inbound-network-traffic"]`, sending the email notification fails due to the array containing a hash table.

```
FTL stack trace ("~" means nesting-related):

- Failed at: ${value!""} [in template "smtp.ftl" in macro "value_of" at line
1, column 152]

- Reached through: @value_of metadata[key] [in template "smtp.ftl" at line 85,
column 141]

----

...

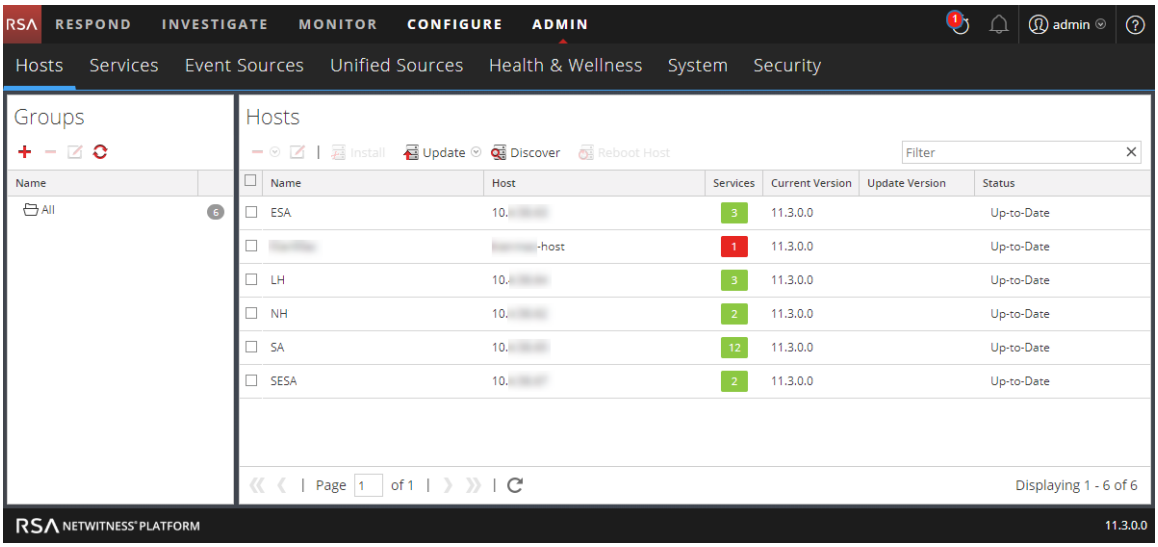
For "${...}" content: Expected a string or something automatically convertible
to string (number, date or boolean), or "template output" , but this has
evaluated to an extended_hash (LinkedHashMap wrapped into
f.t.DefaultMapAdapter):

==> value!"" [in template "smtp.ftl" at line 1, column 154]
```

Steps to Troubleshoot Memory Issues with an ESA Service Offline

Step 1: Verify that your Host Is Running

The first step to troubleshooting is to ensure that your host is running. To do this, go to **ADMIN > Hosts**. If the host is down, the system parameters will not display (updating host information can sometimes be delayed), the **Services** display in red, and you may see an error message.

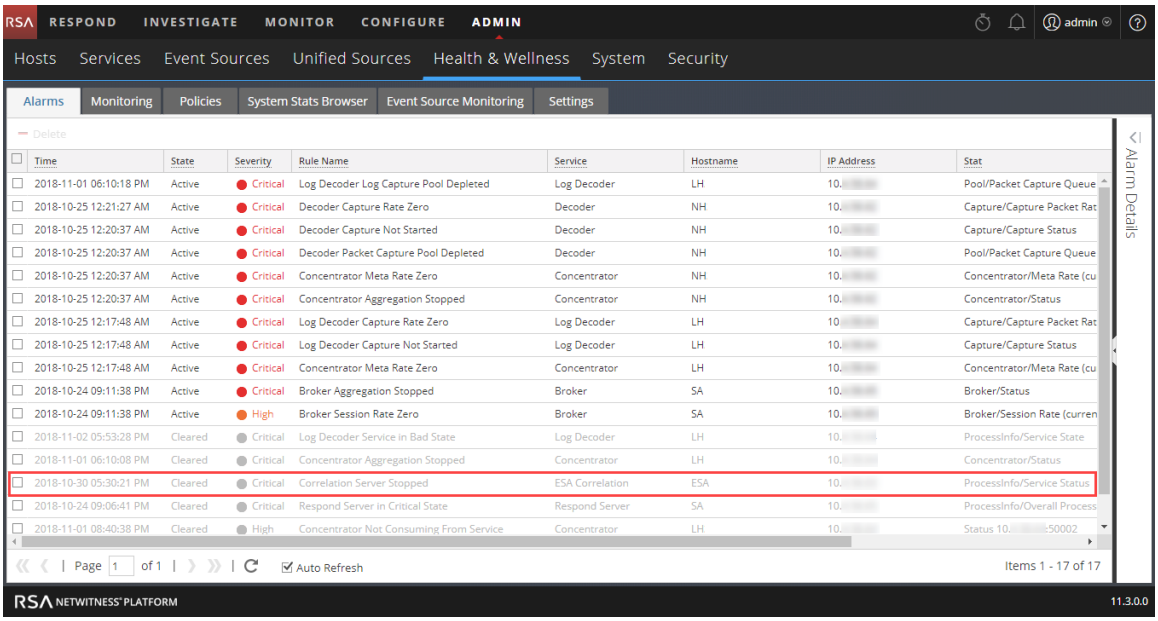


If your host is down, contact your NetWitness Platform Administrator to restart it. Otherwise, go to Step 2.

Step 2: View Detailed Statistics in Health & Wellness

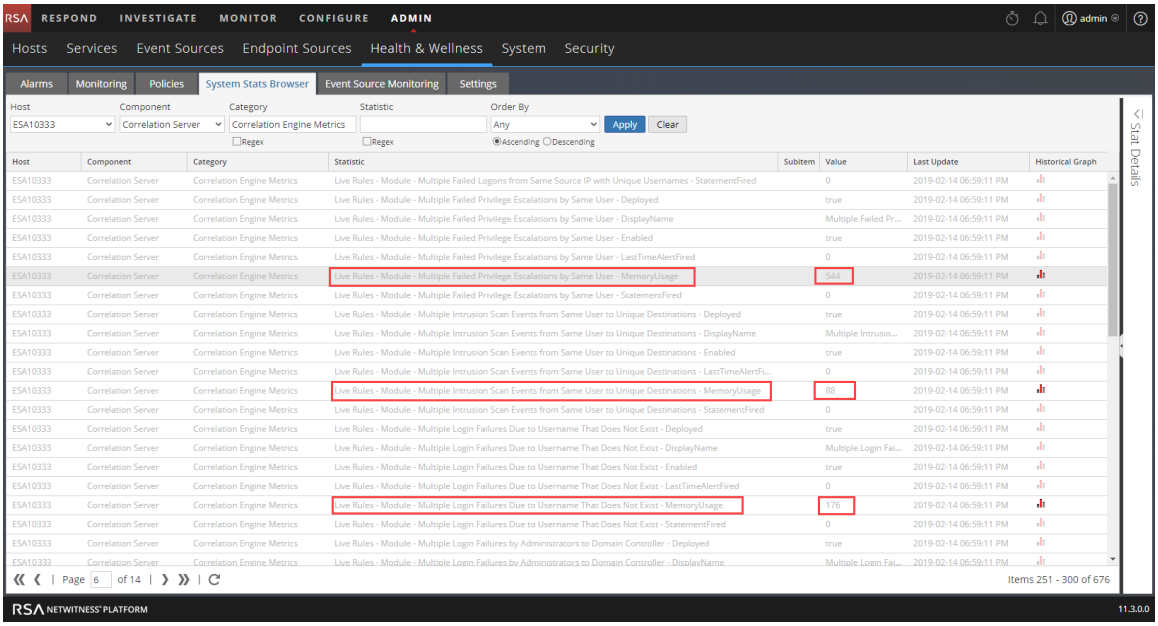
If your ESA service is down, you can go to Health & Wellness and view the **last known metrics** to see where potential issues are occurring. The most common problem is that your ESA service is exceeding memory thresholds, which causes it to stop or fail.

1. Go to **ADMIN > Health & Wellness > Alarms** to see if the ESA triggered any alarms. Look for the following alarms for ESA Correlation:
   - Correlation Server in Critical State
   - Correlation Server in Unhealthy State
   - Correlation Server Stopped



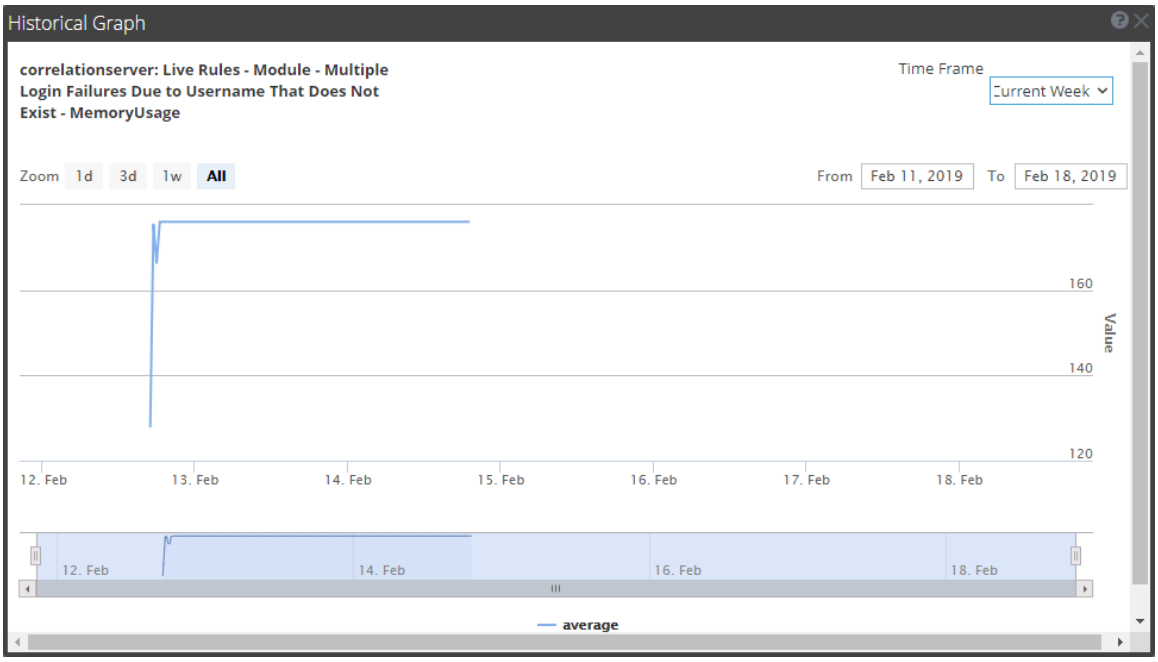
2. Go to **ADMIN > Health & Wellness > System Stats Browser** to see the memory metrics for each rule's performance. To view the metrics, enter the following and click **Apply**:

Host	Component	Category
<your host>	Correlation Server	Correlation Engine Metrics

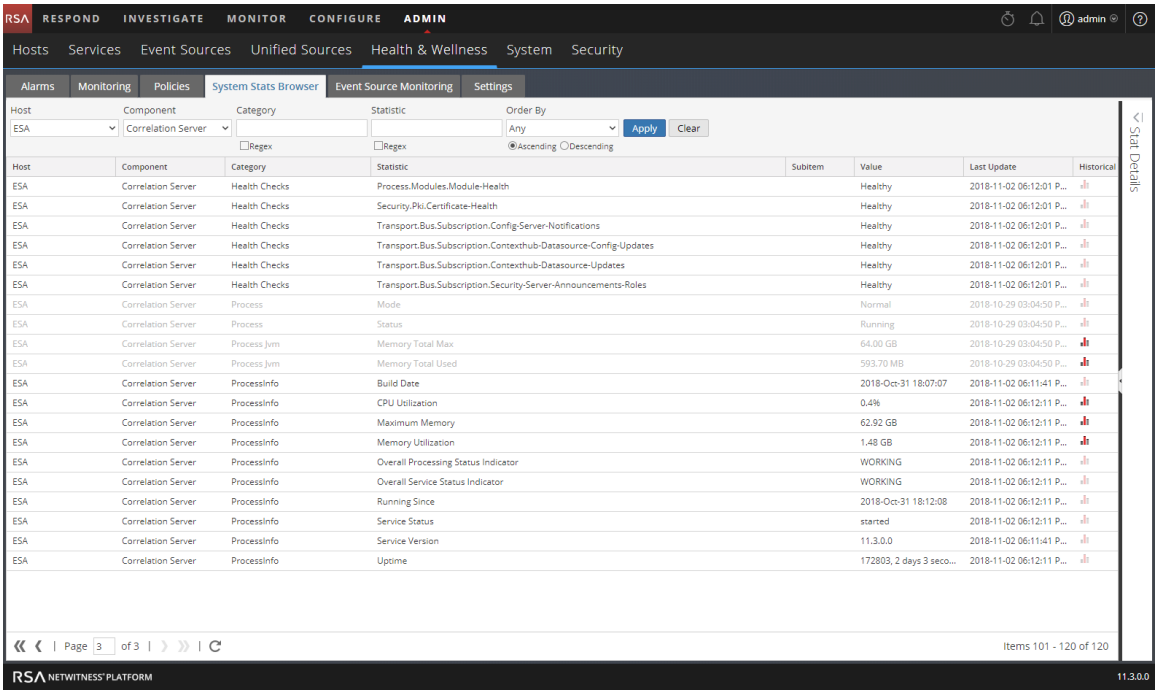


The name of the rule is in the **Statistic** column and the memory usage in bytes is in the **Value** column.

3. Click to view a historical view of memory usage for the rule in the **Historical Graph** column.



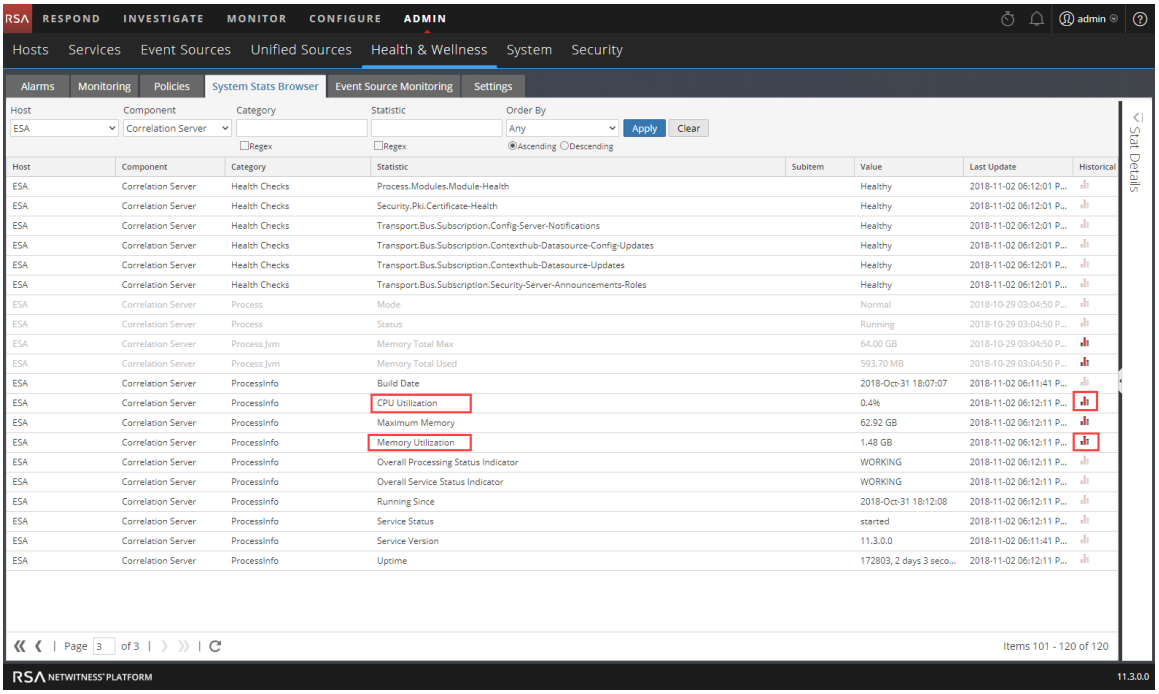
4. In the **System Stats Browser**, you can also see details of your ESA Correlation service performance.



Select your host, and use the following filters to view the following statistics:

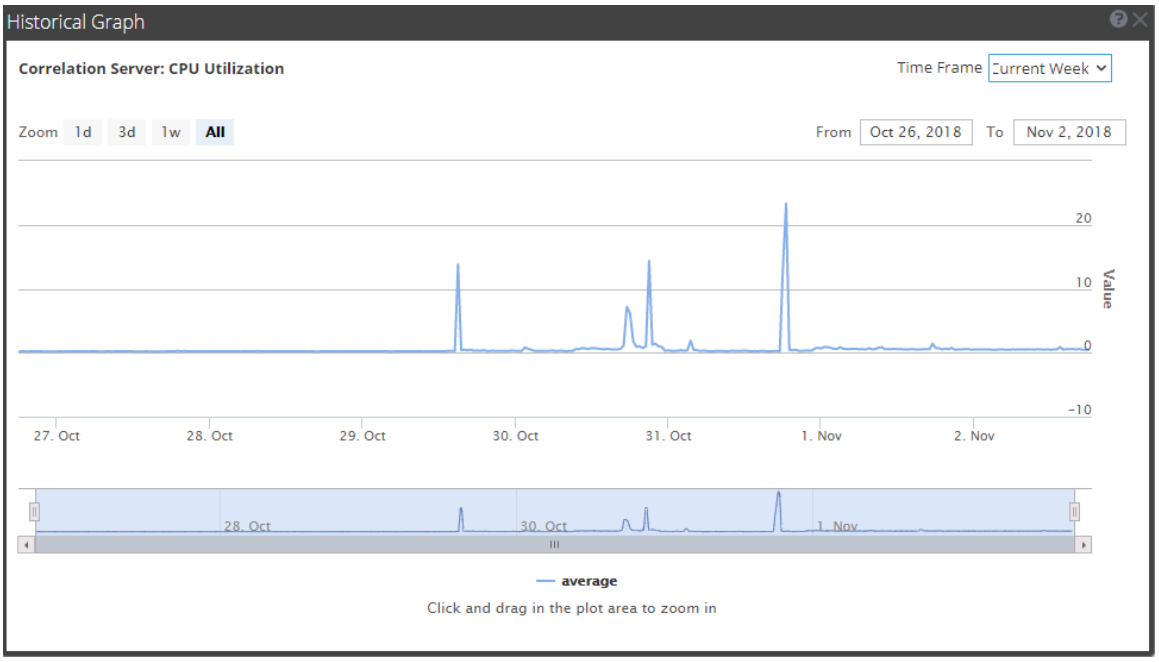
Host	Component	Category	Statistic	Example
<your host>	Host	SystemInfo	CPU Utilization	1.14%
<your host>	Host	SystemInfo	Memory Utilization	30.64%
<your host>	Host	SystemInfo	Used Memory	15.05 GB
<your host>	Host	SystemInfo	Total Memory	49.14 GB
<your host>	Host	SystemInfo	Uptime	259493, 3 days 16 minutes 53 seconds
<your host>	Correlation Server	Process jvm	Memory Total Max	64.00 GB
<your host>	Correlation Server	Process jvm	Memory Total Used	593.70 MB
<your host>	Correlation Server	ProcessInfo	CPU Utilization	0.4%
<your host>	Correlation Server	ProcessInfo	Maximum Memory	62.92 GB
<your host>	Correlation Server	ProcessInfo	Memory Utilization	1.48 GB

The following figure shows the location of the ESA Correlation service CPU and Memory Utilization statistics.

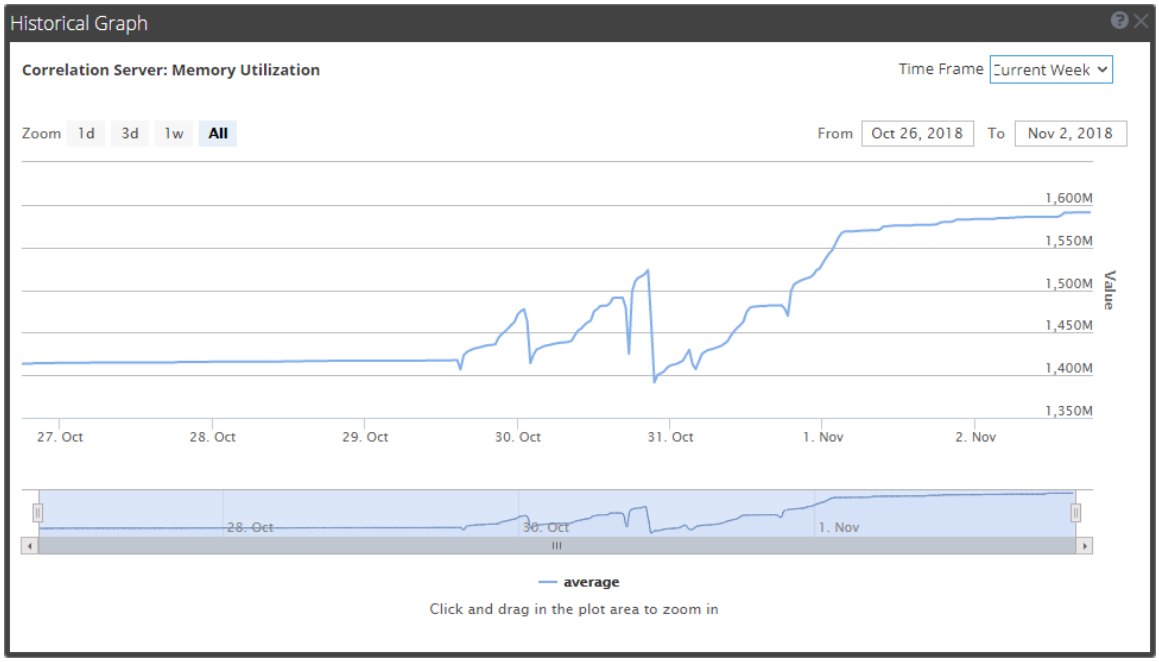


5. Click to view a historical view of CPU and memory utilization.

   The following figure shows the historical graph of **CPU utilization**.



The following figure shows the historical graph of **Memory Utilization**.



If you are having a problem with memory or CPU utilization, continue to step 3.

Step 3: Bring up your ESA Services

1. Go to **ADMIN > Services**, select your ESA service, and then select **> Start**.
2. Return to the ESA Service to troubleshoot which rules have created memory issues.

If your ESA service is stopping and restarting in a loop, you may need to call Customer Support to get the services to start.

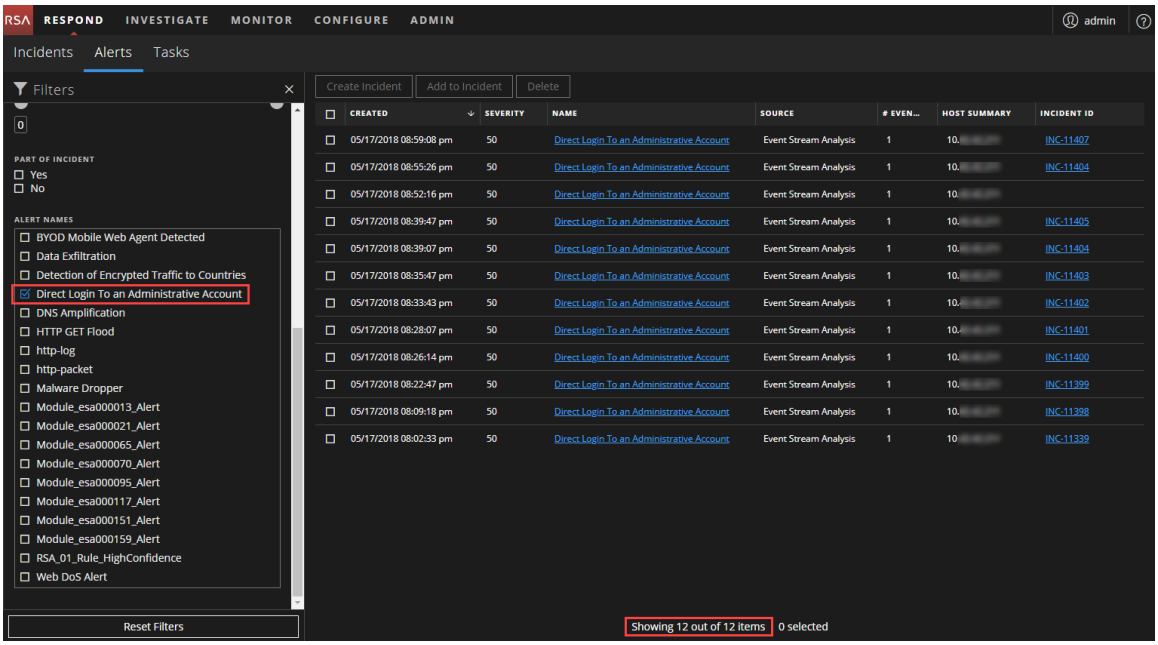
If you are able to start your ESA service without a shutdown, continue to step 4.

Step 4: Check the Alerts and Events Volume

After you are able to restart your ESA service without an immediate shutdown, you can review the stats for your rules to see which rules are consuming too many resources. Sometimes, ESA services fail because a rule is generating too many alerts or a rule is matching too many events. Check for both of these issues if you have determined that memory usage is causing your ESA service to shut down.

View Alert Summaries

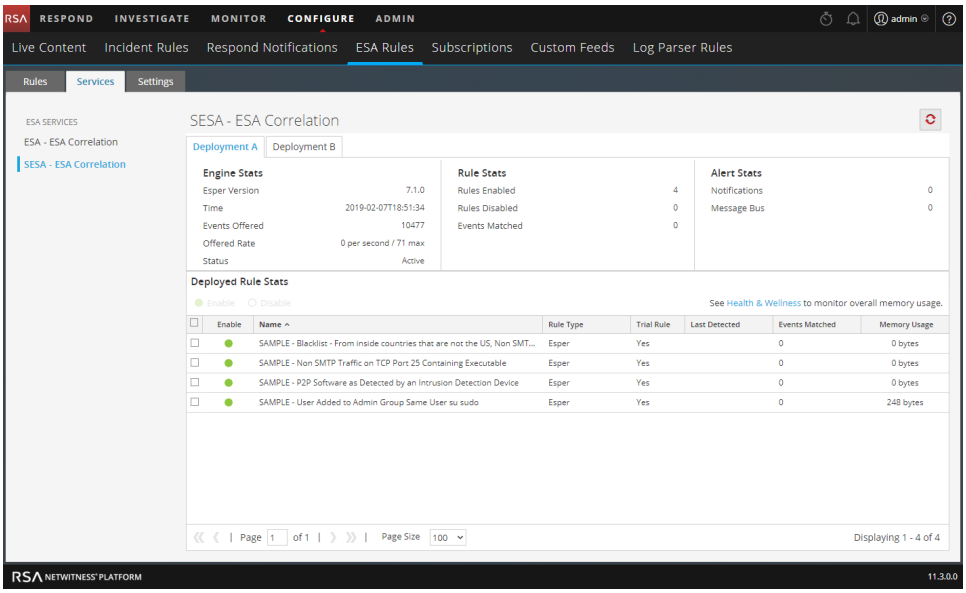
Rules that generate a high volume of alerts can overwhelm the system and cause it to fail or restart. To view the alert summaries, go to **RESPOND > Alerts**. In the **Filters** panel on the left, in the **ALERT NAMES** section, select the alert name for the rule. The number of alerts with that name appears at the bottom of the Alerts list results. If the number is significantly high for a particular rule, you need to disable the rule and rewrite it to be more efficient.



To clear your filter, click **Reset Filters**.

View Events Matched

Sometimes a rule matches too many events, which can use up excessive memory. This typically occurs if you create a large event window where a great number of events accumulate without triggering an alert. This is a problem because each event is stored in memory while the rule waits for the alert to trigger. To check for this issue, go to **CONFIGURE > ESA Rules > Services**. From there, you can see the number of events that were matched in the **Events Matched** column for the deployment. If a high number of events were matched for a given rule, you can investigate the rule further to see if you can make it more efficient.



Step 5: Disable and Repair the Rule that Caused Issues

Once you have determined the rules that need to be rewritten, disable them and rewrite rules so that they don't generate such a high volume of alerts or events. For pointers on how to write more efficient rules, see Best Practices.

Disable Rules

1. To disable rules, go to **CONFIGURE > ESA Rules > Services**, and select the rules you want to disable in the **Deployed Rules Stats** field.
2. Select **Disable** to disable the rules.

Edit Rules

1. To repair the rules, go to **CONFIGURE > ESA Rules > Rules** tab **> Rule Library**.
2. For each rule that you repair, do the following:
   a. Select the rule to edit and then select **> Edit**.
   b. Edit the rule to be more efficient. For instructions on creating rules, see Add Rules to the Rule Library
   c. When you are satisfied with your rule, you can save the rule as a trial rule to ensure that any memory issues do not affect ESA services performance. To do this, follow the steps listed in Work with Trial Rules.

Deploy Rules

1. Go to **CONFIGURE > ESA Rules > Rules** tab.
2. In the options panel on the left, select the deployment that contains the rule.
3. In the Deployment view, the rule that you changed shows a status of Updated. Click **Deploy Now**. The rule status changes to Deployed.

Verify that the Rules are Enabled

After you deploy the ESA rules, they should automatically show as enabled. If not, you can enable the rules.

1. Go to **CONFIGURE > ESA Rules > Services** tab, and select the ESA service in the options panel.
2. On the deployment tab for the deployment that contains the rules, in the Deployed Rule Stats section, look at the status of the rules in the Enable column. Enabled rules show a green circle. If the rules show a white circle, you can enable the rules.
3. To enable rules, select the rules you want to enable and select **Enable** above the table.

(Optional) Check the ESA Correlation Log Files for More Information

Once you verify that your services are down and some potential causes for the system going down, check to see if the service is stopping and restarting in a loop. To do this, go to the ESA Correlation logs. You can use SSH to get in the system and go to: `/var/log/netwitness/correlation-server/correlation-server.log`.

View Memory Metrics for Rules

This topic tells ESA rule writers how to view memory metrics for an ESA Correlation service and its associated ESA rules. You can see estimated memory usage for each rule running on a server, and you can use this information to modify your rule statements and conditions if they use too much memory.

Rules can sometimes consume more memory than you expect, causing ESA to slow down or stop. To see approximately how much memory a rule is using, you can view estimated memory usage for each rule in the Health & Wellness System Stats browser (you need permissions to access this module). You can use this information to modify your rules to be more efficient.

At a high level, you need to complete the following steps to use memory metrics to troubleshoot memory usage for rules:

1. Ensure you have the correct permissions to view the Health & Wellness module. For information on roles and permissions, see Role Permissions.
2. View the memory statistics in Health & Wellness.
3. (Recommended) Configure Health & Wellness ESA policies to send an email if memory thresholds are exceeded. See "Manage Policies" in the *System Maintenance Guide* for instructions on sending email notifications.
4. Use the memory metrics data to modify rules to be more efficient, if necessary.

Note: You can also view memory metrics for ESA rules in the **CONFIGURE > ESA Rules > Services** tab. See View Stats for an ESA Service.

Prerequisites

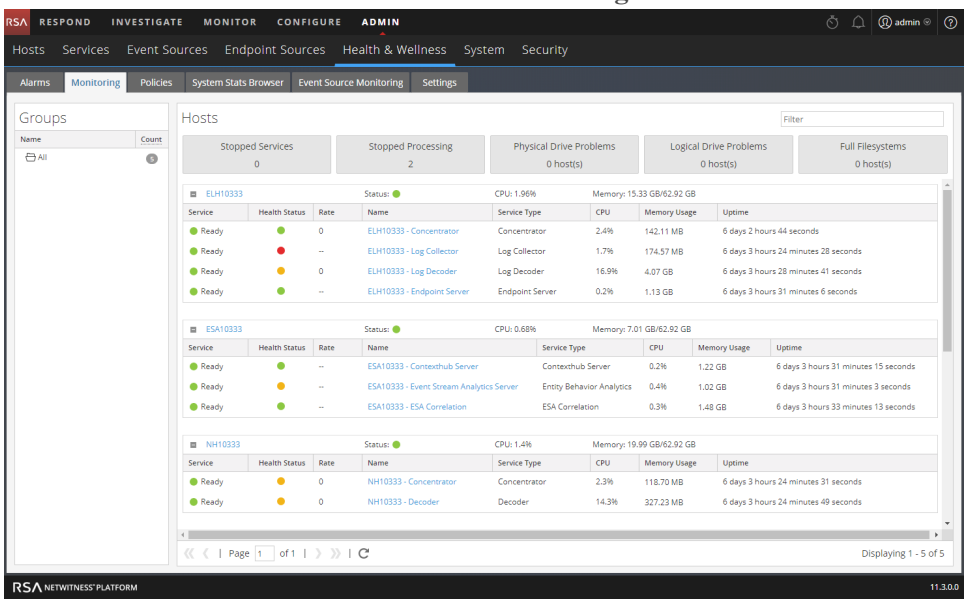
The following are requirements for using memory metrics:

- You must have the appropriate permissions to view Health & Wellness statistics.
- (Recommended) Configure the ESA Health & Wellness policy to send an email when memory thresholds are exceeded.

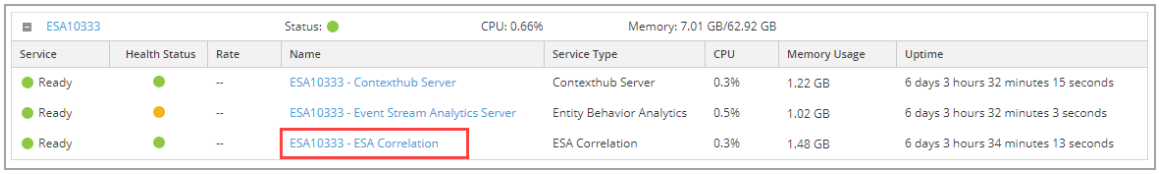
Note: Memory Metrics is always on for the ESA Correlation service; you do not have to enable it.

View Memory Metrics for an ESA Correlation Service in Health & Wellness

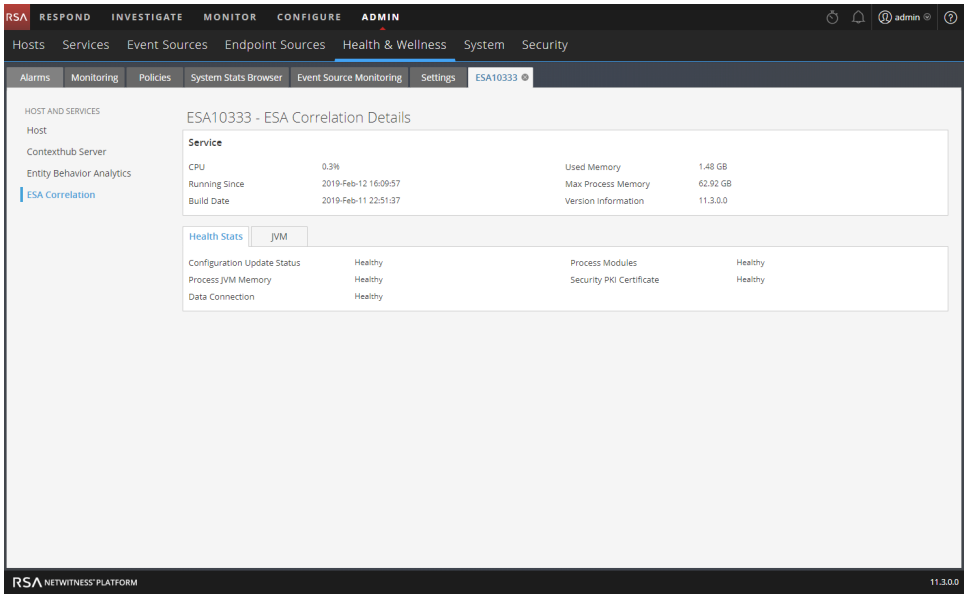
1. Go to **ADMIN > Health & Wellness > Monitoring** tab.



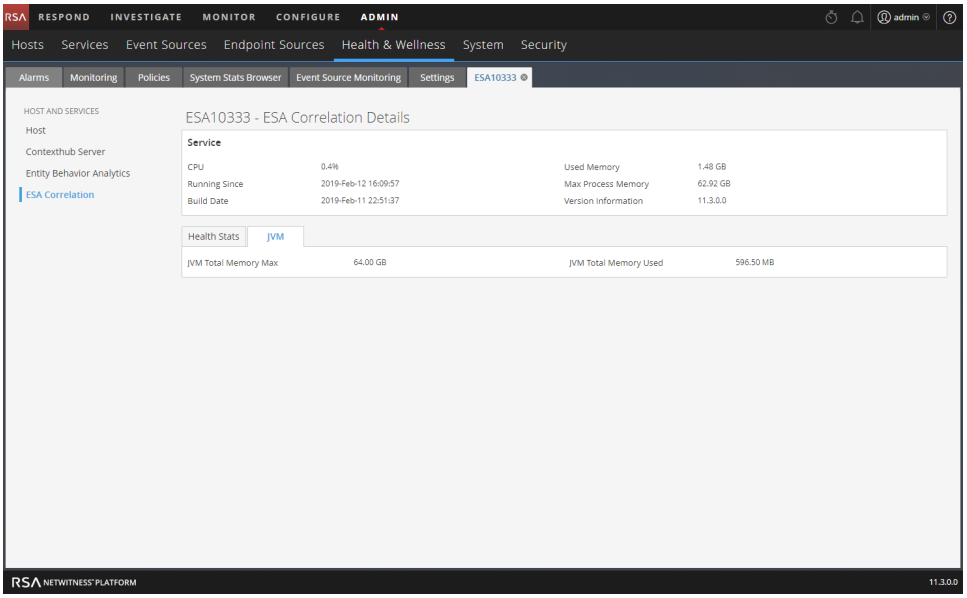
2. Locate your host and click the link in the **Name** field for your ESA Correlation service, for example, ESAxxxxx - ESA Correlation.



3. On the tab for your ESA host, click the **Health Stats** tab.
   You can view the health status of the ESA Correlation service.



4. Click the **JVM** tab.
   You can view the JVM total memory used by the selected ESA Correlation service.

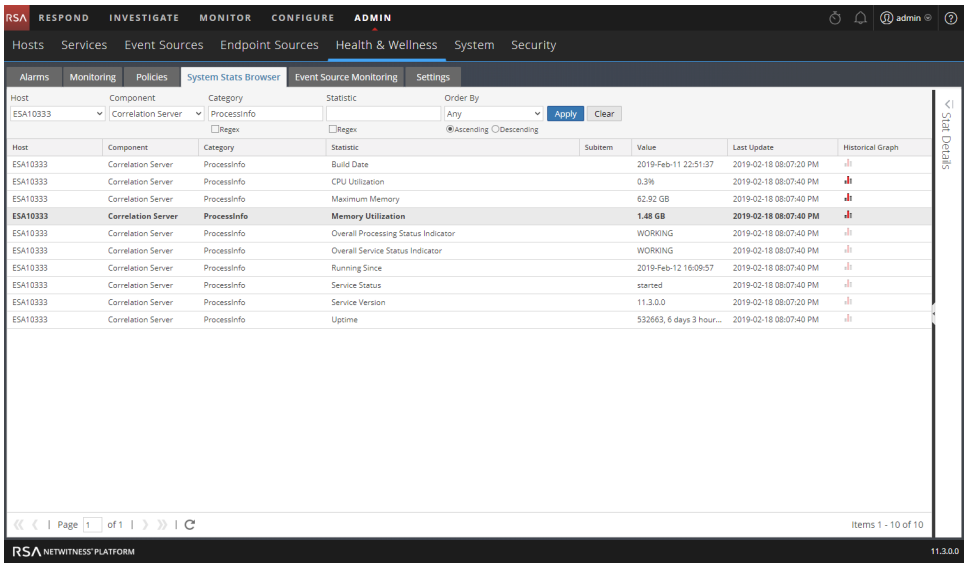


Note: You can also view memory metrics for the ESA Correlation service in the **CONFIGURE > ESA Rules > Services** tab. See View Stats for an ESA Service.

View Memory Metrics for an ESA Correlation Service and its ESA Rules

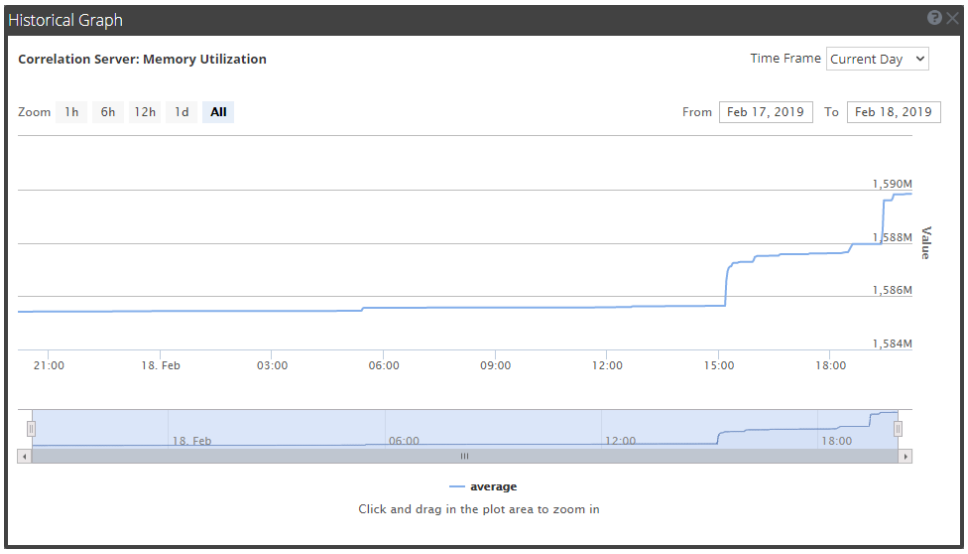
1. Go to **ADMIN > Health & Wellness > System Stats Browser**.
2. To view memory metrics for an ESA Correlation service, in the **Host** field, select your ESA host. Select **Correlation Server** for **Component**, enter **ProcessInfo** for **Category**, and then click **Apply**.

Host	Component	Category
<your host>	Correlation Server	ProcessInfo



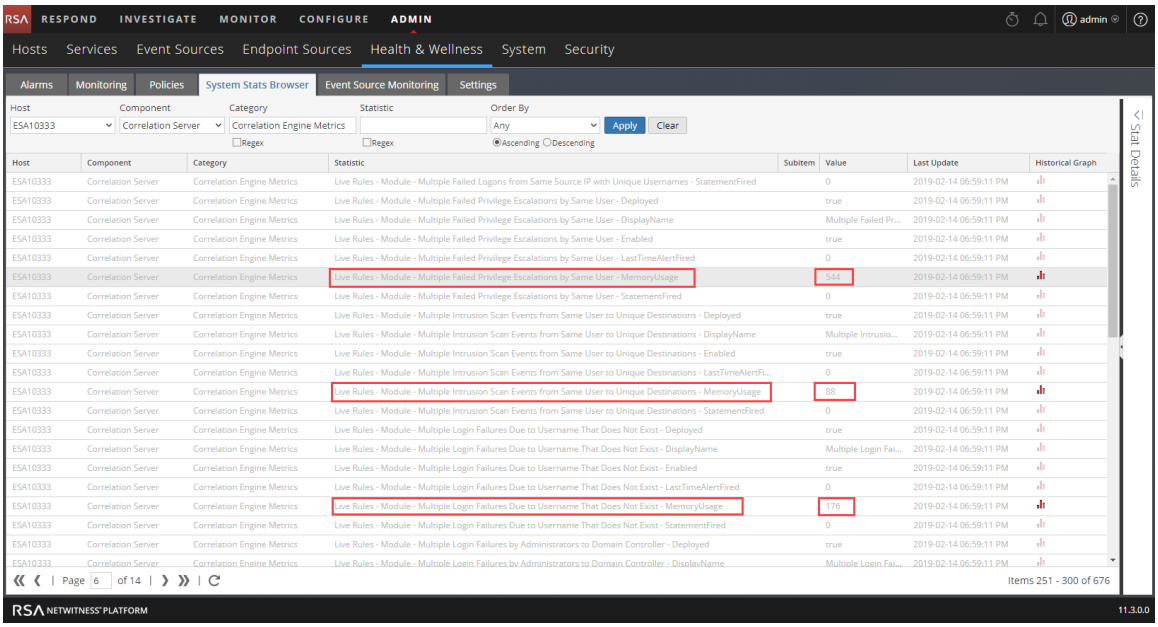
The **Memory Utilization** statistic shows the total memory in use by the ESA Correlation service.

3. To view the historical memory usage for the ESA Correlation service, click the **Historical Graph** icon.



4. To view the memory metrics for individual rules, in the **Category** field, enter **Correlation Engine Metrics** and click **Apply**.

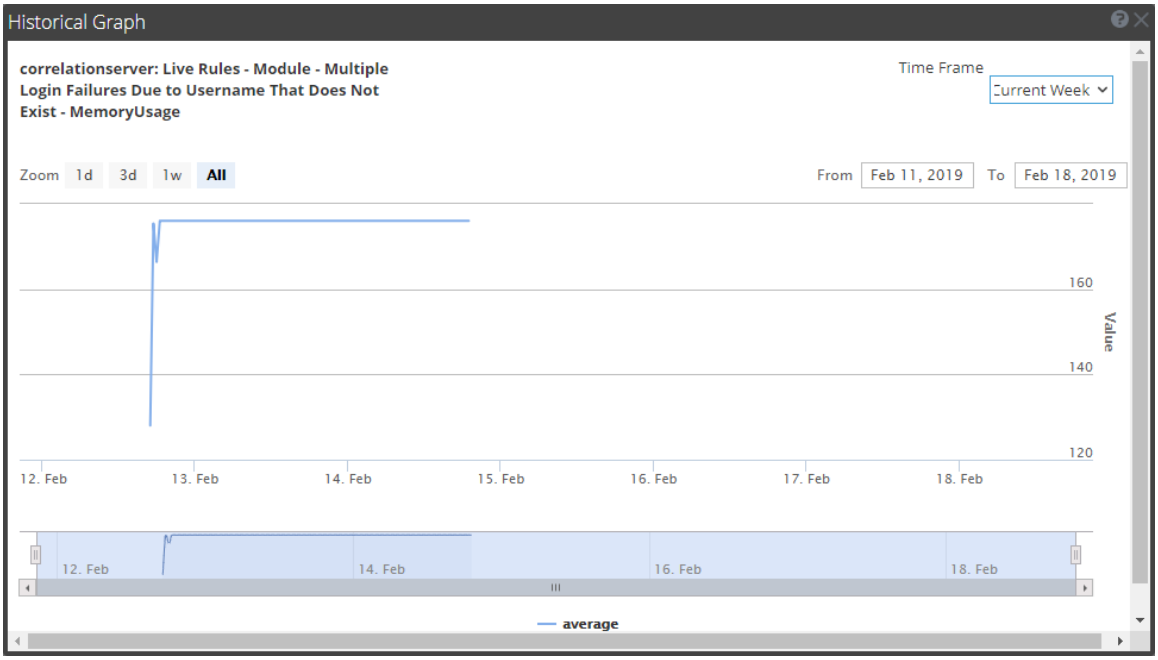
Host	Component	Category
<your host>	Correlation Server	Correlation Engine Metrics



The name of the rule is in the **Statistic** column appended with **MemoryUsage** and the memory usage in bytes is in the **Value** column.

Note: The **Last Update** field reflects when Health & Wellness polls ESA. However, the Memory Metrics is not synchronized with the Health & Wellness polling. For example, if the memory threshold is exceeded on 2/10/19 at 12 p.m., but Health & Wellness polls at 2/10/19 at 12:10 p.m., the **Last Update** field will display a timestamp of 2/10/19 12:10 p.m.

5. Click to view a historical view of memory usage for the rule in the **Historical Graph** column.



Note: You can also view memory metrics for ESA rules in the **CONFIGURE > ESA Rules > Services** tab. See View Stats for an ESA Service.

How ESA Handles Sensitive Data

This topic explains how ESA treats sensitive data, such as usernames or IP address, that it receives from Core services. The Data Privacy Officer (DPO) role can identify meta keys that contain sensitive data and should display obfuscated data. ESA does not display or store sensitive meta. Consequently, ESA will not pass sensitive data to NetWitness Respond.

Optionally, ESA can add an obfuscated version of the sensitive data to an event. For example, the DPO identifies `user_dst` as sensitive. ESA can add an obfuscated version, such as `user_dst_hash`, to an event. The obfuscated meta is not sensitive, so ESA will display and store it the same way as any other non-sensitive meta.

For more information on the strategy and benefits of obfuscating data, see the *Data Privacy Management Guide*.

This topic explains the following:

- How ESA treats sensitive data it receives from Core services
- How to prevent sensitive data leaks in an Advanced EPL rule

How ESA Treats Sensitive Data from Core Services

When ESA receives sensitive data from Core services, ESA passes on only the obfuscated version of the data. ESA does not store or show sensitive data.

The following features are impacted:

- Outputs – ESA does not forward sensitive data to outputs, which include alerts, notifications, and MongoDB storage.
- Advanced EPL rules – If an EPL statement creates an alias for a sensitive meta key, sensitive data will leak. This topic illustrates how this happens so you can avoid it.
- Enrichments – If a sensitive meta key is used in the join condition, sensitive data will leak. This topic illustrates how this happens so you can avoid it.

Advanced EPL Rule

If an EPL query statement renames a sensitive meta key, the data will not be protected.

ESA identifies a sensitive meta key by the name:

- `ip_src` is the sensitive meta key.
- `ip_src_hash` is the non-sensitive, obfuscated version.

To support data privacy, the sensitive meta key must not be renamed in an EPL query. If a sensitive meta key is renamed, the data will no longer be protected.

For example, in a rule such as select `ip_src as ip_alias...`, `ip_alias` contains the sensitive data but it is not protected because ESA only knows about `ip_src`, not `ip_alias`. In this case, IP addresses would not be obfuscated. Real values would be displayed.

Enrichment Source

When a sensitive meta key is used in a join condition, sensitive data can be displayed.

The enrichment database, which is the other part of the join condition, has one column that matches the sensitive meta key. This cross reference is to actual values not obscured values. Consequently, actual values are displayed.

In the following example, both parts of the join condition are highlighted.

- `ip_src` contains sensitive data.
- `ipv4` will be added to the alert and exposed as non-sensitive data.

Because the `ipv4` value is the same as the `ip_src` value, `ipv4` contains and displays sensitive data.

ESA Rule Types

This topic describes each type of ESA rule, when to use them and the permissions each role has with them. The following table lists each type, describes it, and explains when to use it.

Rule Type	Description	When to Use
RSA Live ESA	RSA Live has a catalog of ESA rules that you can download and modify to run in your network.	Download RSA Live ESA rules to leverage rules that are already built. Modify the configurable parameters to customize to meet your requirements.
Rule Builder	In the rule builder, you define rule criteria in an easy-to-use interface.	Use the rule builder to create your first rules. You choose many of the rule conditions from lists.
Advanced EPL	With the Event Processing Language (EPL), you define rule criteria by writing a query.	Use advanced EPL rules to define rule criteria in the EPL syntax.
Endpoint Rule Bundle	An Endpoint Risk Scoring Rules Bundle, which contains approximately 400 rules, comes with NetWitness Platform 11.3 and later. The rules in this bundle only apply to NetWitness Endpoint.	If you have NetWitness Endpoint, you can configure risk scoring to identify suspicious files and hosts. To turn on risk scoring for NetWitness Endpoint, you must deploy endpoint risk scoring rules on ESA. For instructions, see "Deploy Endpoint Risk Scoring Rules on ESA" in the *ESA Configuration Guide*. For complete information on configuring NetWitness Endpoint, see the *NetWitness Endpoint Configuration Guide*.

Starter Pack Rules

Sample Rule Builder rules come with NetWitness Platform and appear in the Rule Library. Use starter pack rules to get comfortable working with rules before creating your own. You can safely edit and deploy these sample rules.

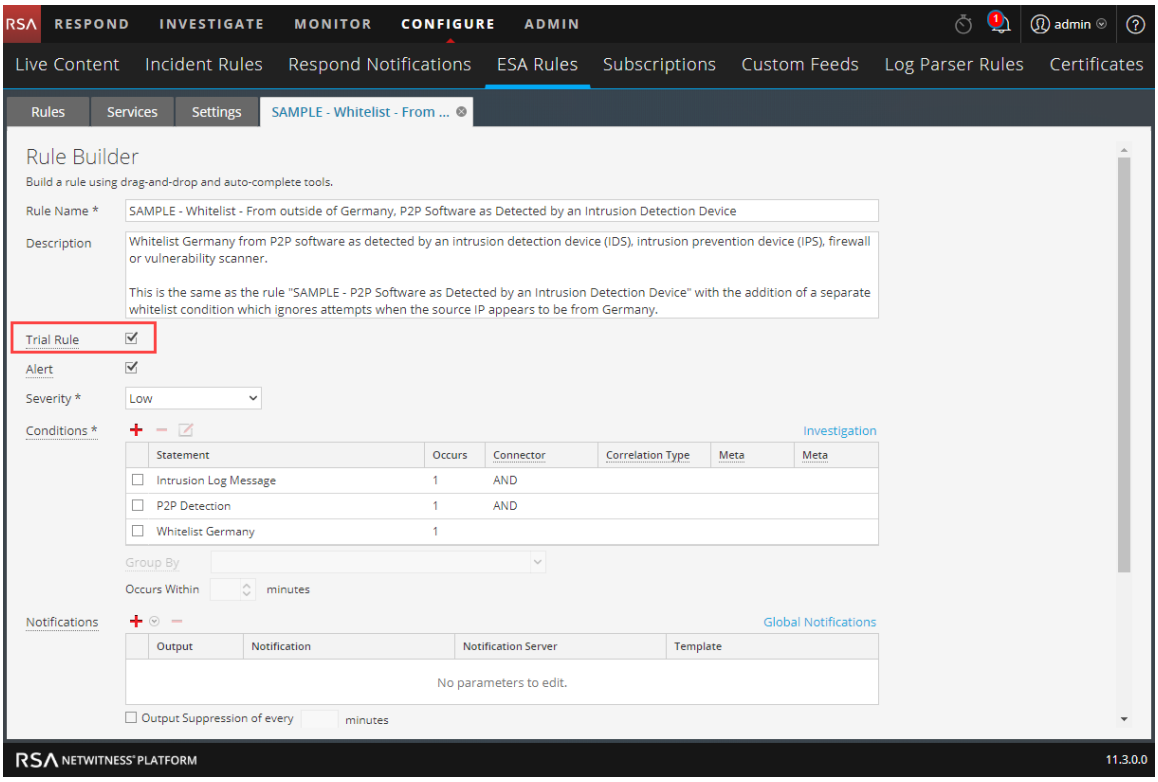
Endpoint Risk Scoring Rules Bundle

An Endpoint Risk Scoring Rules Bundle, which contains approximately 400 rules, comes with NetWitness Platform 11.3 and later. These rules appear in the Rule Library with the sample rules. Endpoint risk scoring rules only apply to NetWitness Endpoint. You can add the Endpoint Risk Scoring Rules Bundle to an ESA rule deployment in the same way that you would add any ESA rule. However, you must specify endpoint data sources (Concentrators) in the ESA Rule Deployment.

Trial Rules Mode

For any type of rule, you can select the Trial Rule setting as an additional safeguard. Trial rules get disabled if they exceed a memory threshold set by the administrator. Run a rule in trial mode to monitor memory usage and to disable the rule automatically if it uses more memory than the threshold allows.

The following figure shows the Trial Rule setting in the Rule Builder.



Role Permissions

This topic lists all ESA permissions and shows which permissions are assigned to each pre-configured NetWitness Platform role. User access is restricted based on roles and permissions assigned to roles.

- Administrators
- Operators
- Analyst
- Security Operations Center (SOC) Managers
- Malware Analysts (MA)
- Data Privacy Officer

There are four permissions for ESA:

- **Access Alerting Module**: Is required for any permission
- **View Rules**: Allows view-only permission for rules in the Rule Library
- **View Alerts**: Allows view-only permission for alerts ESA generates
- **Manage Rules**:Allows you to view, create, edit, and delete rules

The following table lists permissions for ESA and the roles to which they are assigned. Use this table to see how each role can work with rules and alerts.

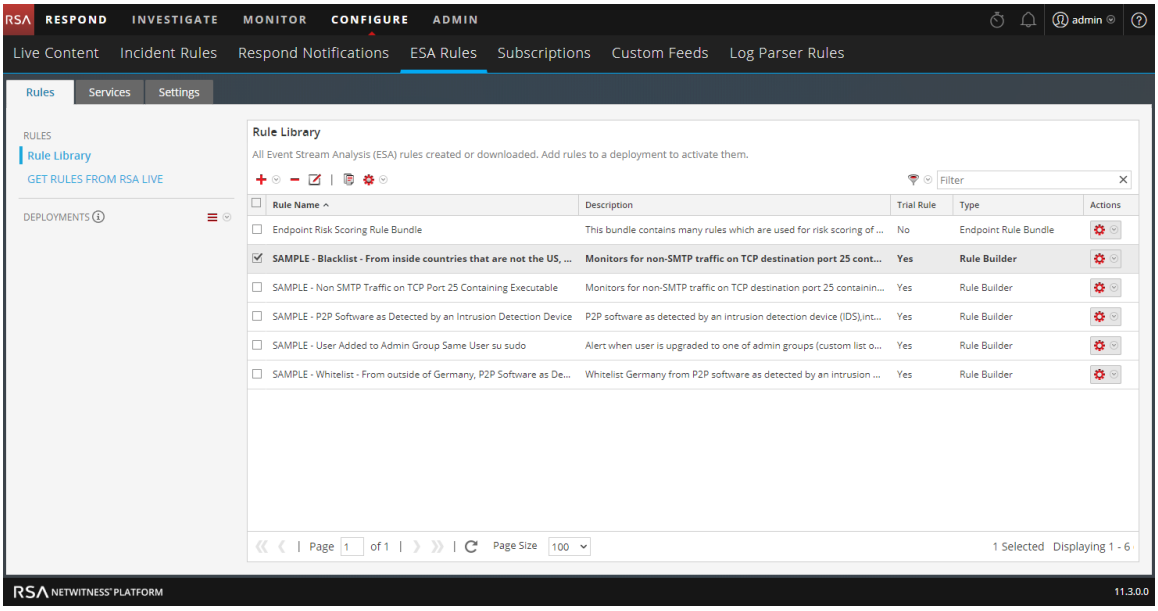
Permission	Administrators	Operators	Analysts	SOC Mgrs	MAs	DPOs
Access Alerting Module	Yes	Yes	Yes	Yes		Yes
View Rules	Yes	Yes		Yes		Yes
View Alerts	Yes		Yes	Yes		Yes
Manage Rules	Yes	Yes		Yes		Yes

For more information on roles and permissions, see the *System Security and User Management Guide*.

Practice with Starter Pack Rules

NetWitness Platform comes with starter pack rules so analysts can become familiar with how rules look before they create their own rules. Use the starter pack rules to become familiar with the Rule Builder and to practice editing and deploying a rule.

Starter pack rules are installed in the Rule Library, which contains every rule you download or create. The following figure shows sample rules in the Rule Library.



These are the available starter pack rules:

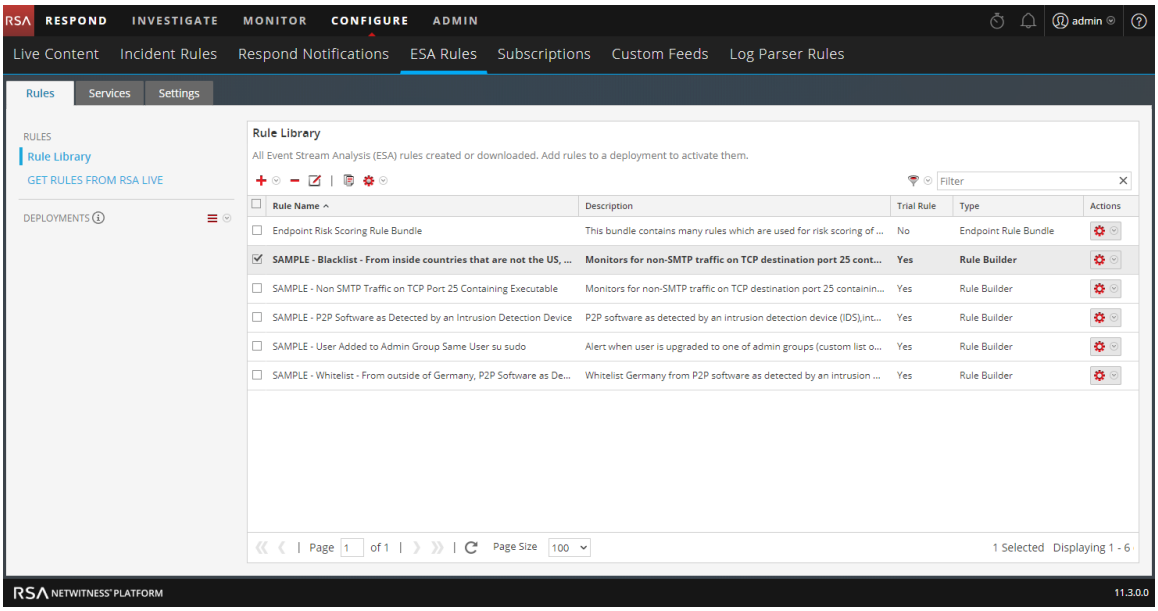
- SAMPLE - Blacklist - From inside countries that are not the US, Non SMTP Traffic on TCP Port 25 Containing Executable
- SAMPLE - Non SMTP Traffic on TCP Port 25 Containing Executable
- SAMPLE - P2P Software as Detected by an Intrusion Detection Device
- SAMPLE - User Added to Admin Group Same User su Sudo
- SAMPLE - Whitelist - From outside of Germany, P2P Software as Detected by an Intrusion Detection Device.

Each name begins with SAMPLE to distinguish the rules that are installed with NetWitness Platform from the rules you download and create.

Rule Library

The Rule Library shows the following information for a rule:

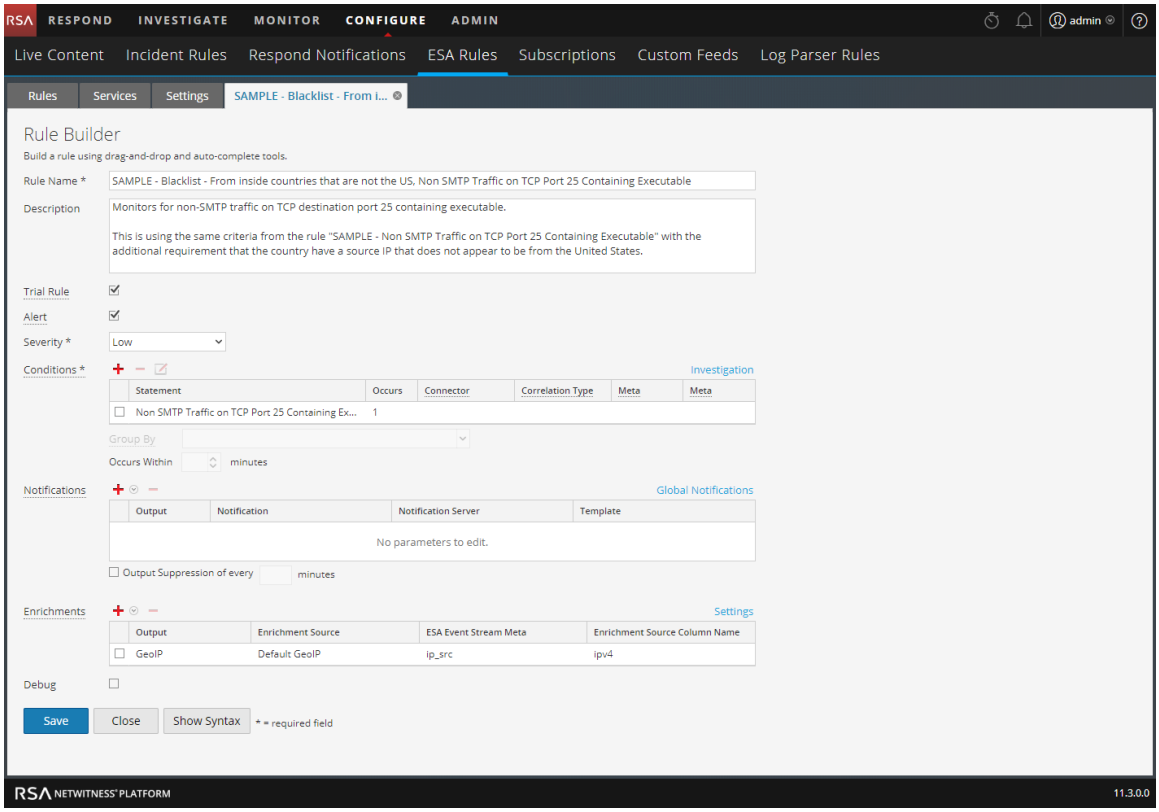
- **Name** summarizes the data or events the rule collects.
- **Description** explains the rule in more detail, although only the beginning shows in the Rule Library.
- **Trial Rule** indicates if trial mode is enabled or disabled for the rule.
- **Type** shows the origin of the rule, built in Rule Builder or Advanced EPL, downloaded from RSA Live, or Endpoint Rule Bundle.



Practice with Starter Pack Sample Rules

1. Go to **CONFIGURE > ESA Rules**.
   The ESA Rules view is displayed with the Rules tab open.

2. In the **Rule Library**, double-click a sample rule or select a sample rule and click . The rule is opened in Rule Builder.



3. To practice with a starter pack rule, refer to the following topics for detailed descriptions and procedures:
   - To familiarize yourself with the Rule Builder user interface, see Rule Builder Tab for a description of each field.
   - To learn how to edit a rule, see Add a Rule Builder Rule for a step-by-step procedure.
   - To deploy a starter pack rule, see Deploy Rules to Run on ESA to learn how to associate the rule with an ESA service.

After you practice with starter pack rules, you will be able to download, create, and deploy your own rules.

Work with Trial Rules

The ESA Correlation service is capable of processing large volumes of disparate event data from Concentrators. However, when working with ESA Correlation rules, it is possible to create rules that use excessive memory. This can slow your ESA service or even cause it to shut down unexpectedly. To ensure that rules do not use excessive memory, you can enable them as trial rules. You should disable the trial rule setting only after testing the new rule in your environment during times of both normal and peak network traffic.

You can set a global threshold of the percentage of memory that trial rules may use. If that configured memory threshold is exceeded, all trial rules are disabled automatically. To configure the memory threshold, see "Change Memory Threshold for Trial Rules" in the *ESA Configuration Guide*.

For suggestions on creating more efficient rules, see "Best Practices for Writing Rules" in Best Practices.

By default, new rules and RSA Live rules that you import are configured as trial rules. As a best practice, when you edit an existing rule, select the Trial Rule option, which allows you to deploy the rule with an added safeguard.

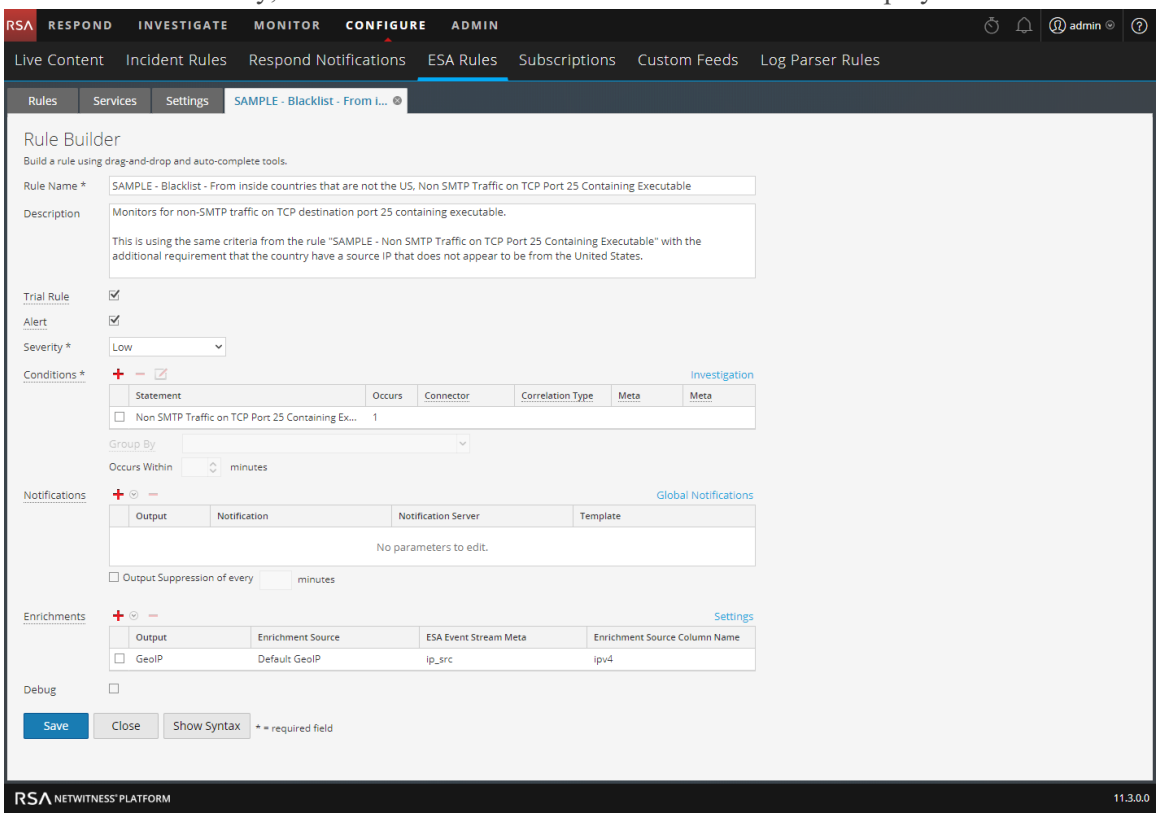
Note: Run a rule as a trial rule long enough to assess the performance during normal and peak network traffic.

Deploy Rules as Trial Rules

This topic explains to administrators how to enable trial rules when creating new rules or editing rules. Trial rules are automatically disabled if a specified total JVM memory utilization threshold is exceeded.

1. Go to **CONFIGURE > ESA Rules**.
   The Configure ESA Rules view is displayed with the Rules tab open.

2. From the Rule Library, choose to add or edit a rule. The rule builder is displayed in a new tab.



3. To make a new or existing rule a trial rule, select the **Trial Rule** checkbox.
4. Add the rule conditions or modify the rule as needed. For instructions on editing rules, see Add Rules to the Rule Library.
5. Click **Save**.
6. Ensure that trial rules are enabled for your ESA and that you are satisfied with the thresholds configured for trial rules.
   The memory threshold is set in the configuration file. To configure it, see "Change Memory Threshold for Trial Rules" in the *ESA Configuration Guide*.
   - The threshold is configured per ESA and is a percentage of Java Virtual Memory.
   - The configuration parameter, `fatal-percentage`, has a default value of 90.
7. Optionally, you can set up the policies in Health and Wellness to send you an email notification if the total JVM memory utilization threshold is exceeded.

The next time you deploy the rule, it runs in trial rule mode.

Note: If a trial rule is disabled, you will need to go to the **CONFIGURE > ESA Rules > Services** tab to re-enable the trial rules. For more instructions on re-enabling trial rules on a service, see View ESA Stats and Alerts.

Add Rules to the Rule Library

This topic explains how to add each type of rule to the rule library. You must add a rule to the Rule Library before you can deploy it. Permission to manage rules is required for all tasks in this section. To add rules, you can download them from ESA Live, create a rule via the Rule Builder, or write advanced EPL rules.

For more details on each of these procedures, see:

- Download Configurable RSA Live ESA Rules
- Add a Rule Builder Rule
- Add an Advanced EPL Rule

In addition to deploying a rule, you can edit, duplicate, import, export, and remove a rule in the Rule Library. For details on these procedures, see Working with RulesWorking with Rules

Download Configurable RSA Live ESA Rules

This topic explains how to download configurable rules from the NetWitness Platform Live Content Management System so you can customize them to meet your needs.

RSA Live contains a catalog of rules. Each rule has configurable parameters so you can customize the rule for your environment. If RSA Live has a rule to detect events that you want to detect in your network, download the rule to save time. You can edit the configurable parameters and save the rule in your Rule Library. For detailed information about each rule, including whether the rule is for logs, packets, or both, see "RSA ESA Rules" at the following link: https://community.rsa.com/docs/DOC-43401

This is an example of how each RSA Live ESA rule is described on RSA Live:

Rule Name	Description
Logins across Multiple Servers	Detects logins from the same user across 3 or more separate servers within 5 minutes. The time window and number of unique destinations are configurable.

As the name shows, the rule looks for logins across multiple servers. The description explains the rule criteria in more detail and specifies which parameters you modify.

Note: When a rule description includes a configurable parameter, the default setting for the parameter is used. In the sample rule, the description states 5 minutes. However, the time window is configurable so 5 is the default number of minutes.

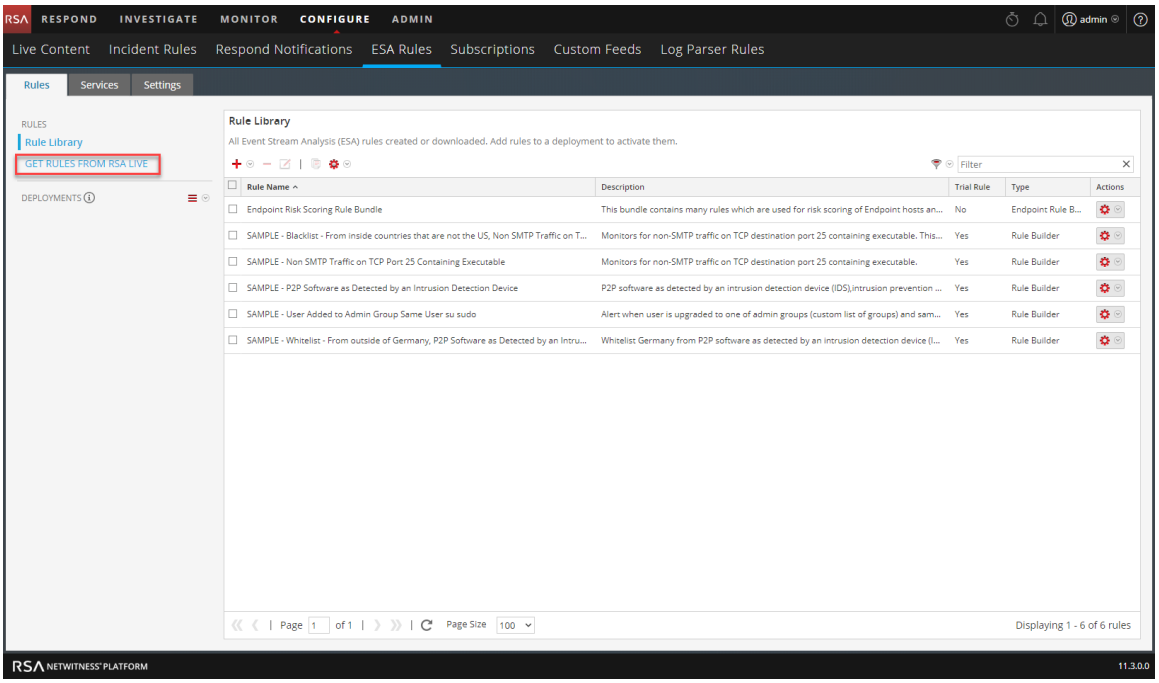
Prerequisites

These are the prerequisites for downloading configurable RSA Live ESA rules;

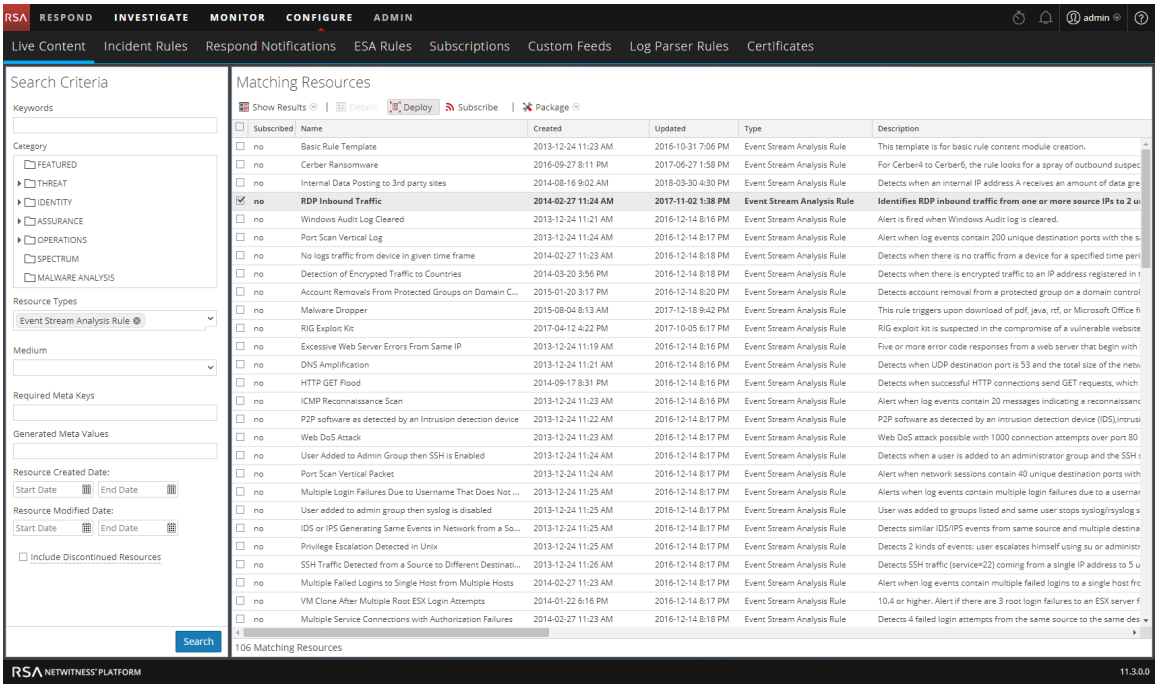
- Have permission to manage rules
- Create a Live Account. See the *Live Services Management Guide* for details.
- Set up Live on NetWitness Platform. See the *Live Services Management Guide* for details.

Download RSA Live ESA Rules

1. Go to **CONFIGURE > ESA Rules**.
   The Rules tab is displayed.



2. In the options panel, click **Get Rules from RSA Live**.
   The Live Content Search view is displayed. (Alternatively, you can go to **CONFIGURE > Live Content**.)

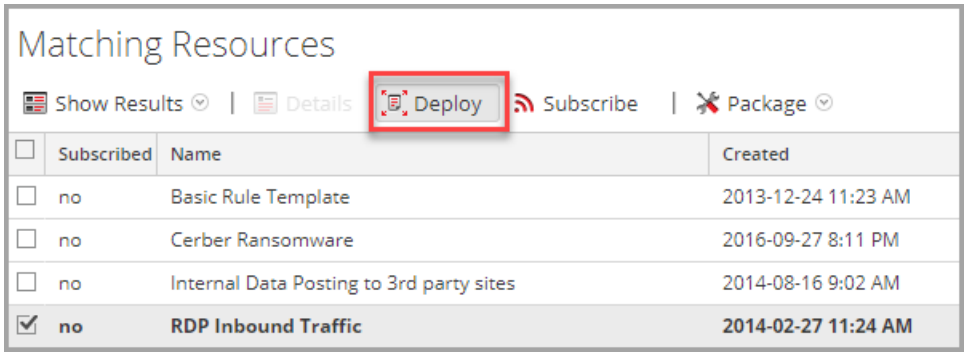


3. In **Search Criteria**, for **Resource Types** select **Event Stream Analysis Rule**.
4. Specify any of the following criteria to find a rule to configure for your environment. For detailed information about each rule, including whether the rule is for logs, packets, or both, see "RSA ESA Rules" at the following link: https://community.rsa.com/docs/DOC-43401
   For a detailed description of the search criteria, see "The Live Search View" in the *Live Services*

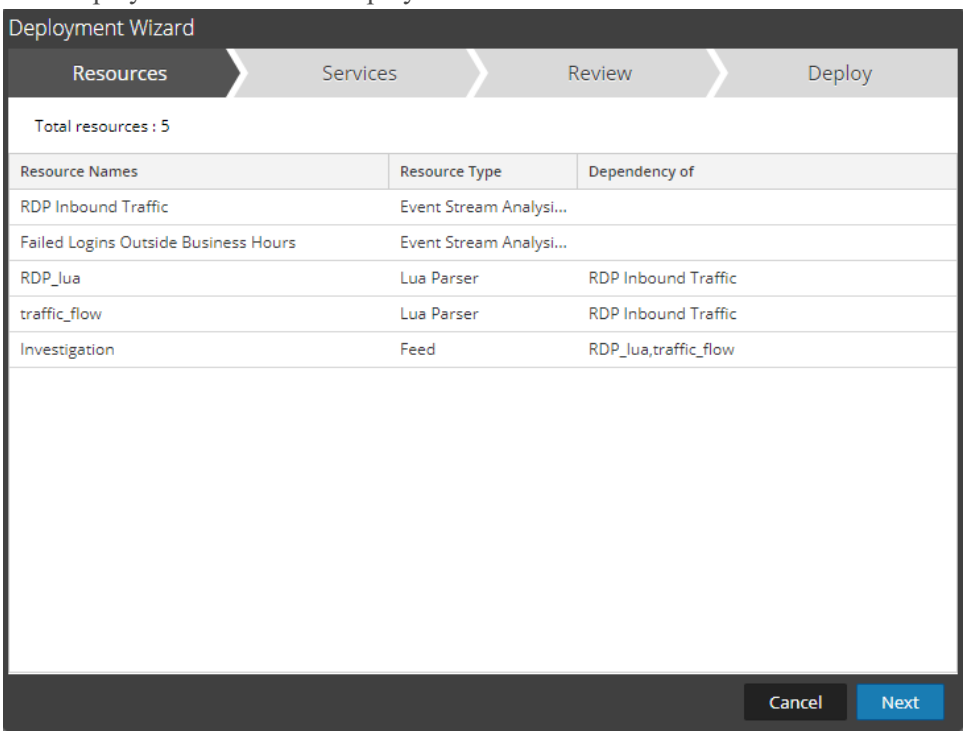
Management Guide.

a. Keywords
b. Category
c. Resource Types (Event Stream Analysis Rule)
d. Medium (Log, Log and Packet, or Packet)
e. Required Meta Keys
f. Generated Meta Values
g. Resource Created Date
h. Resource Modified Date
i. Include Discontinued Resources

5. Click **Search**. Rules that match the search criteria are displayed in Matching Resources.
6. Select each rule to download and click **Deploy**.



The Deployment Wizard is displayed.



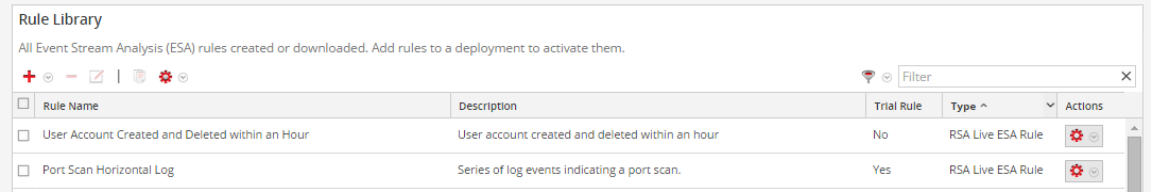
7. Follow the steps in the wizard. If you need more information, see "Deploy Resources in Live" in the *Live Services Management Guide*.

When you finish the steps in the wizard, the selected rules are displayed in the Rule Library.

Customize an RSA Live ESA Rule

This topic explains how to configure parameters in an RSA Live ESA rule. When you download an RSA Live ESA rule, the rule appears in the Rule Library which includes the following columns:

- Rule Name
- Description
- Trial Rule
- Type
- Actions



The type is RSA Live ESA Rule.

Prerequisites

- Administrator, Operator, SOC Manager, or DPO role permissions are required.
- Rules must be downloaded to the Rule Library.

Configure Parameters for an RSA Live ESA Rule

1. Go to **CONFIGURE > ESA Rules > Rules** tab.
2. In the **Rule Library**, double-click an RSA Live ESA Rule or select the rule and click . The RSA Live ESA Rule tab is displayed.
3. (Optional) Change the following fields:
   - Rule Name
   - Description
   - Trial Rule (Enabled by default. RSA recommends you run a rule as a trial rule long enough to assess the performance during normal and peak network traffic.)
   - Alert (This option applies to 11.3 and later.) Select Alert to send an alert to Respond. Clear the checkbox if you do not want to send an alert to Respond. To turn alerts on or off for ALL rules, see the *ESA Configuration Guide*.
   - Severity
   - Notifications
   - Enrichments
4. To configure the rule for your environment, in the **Parameters** section replace the default in the **Value** Column.

Parameters

Name ^	Value
With this number of events	200
Within this number of seconds	60

5. Click **Save**

Add a Rule Builder Rule

Each ESA rule is designed to detect something in your network and to generate an alert for it:

- User activity that is not allowed, such as attempting to download software that is not sanctioned
- Suspicious behavior, such as mass audit clearing
- Known malicious threats, such as worm propagation or a password-cracking tool

There are two methods to design a rule in ESA:

- **Rule Builder** is an easy-to-use interface. You provide a meta key and value, then select choices from lists to complete the criteria.
- **Advanced EPL** allows you to write queries in the Event Processing Language. You must know EPL syntax.

If you know EPL, you can use either method. If you do not know EPL, you should use Rule Builder. These topics explain the Rule Builder.

Step 1. Name and Describe the Rule

This topic provides instructions to identify a rule, indicate if it is a trial rule and assign a severity level. When you add a new rule, the first information to provide is a unique name and description of what the rule detects. After you save the rule, this information is displayed in the Rule Library.

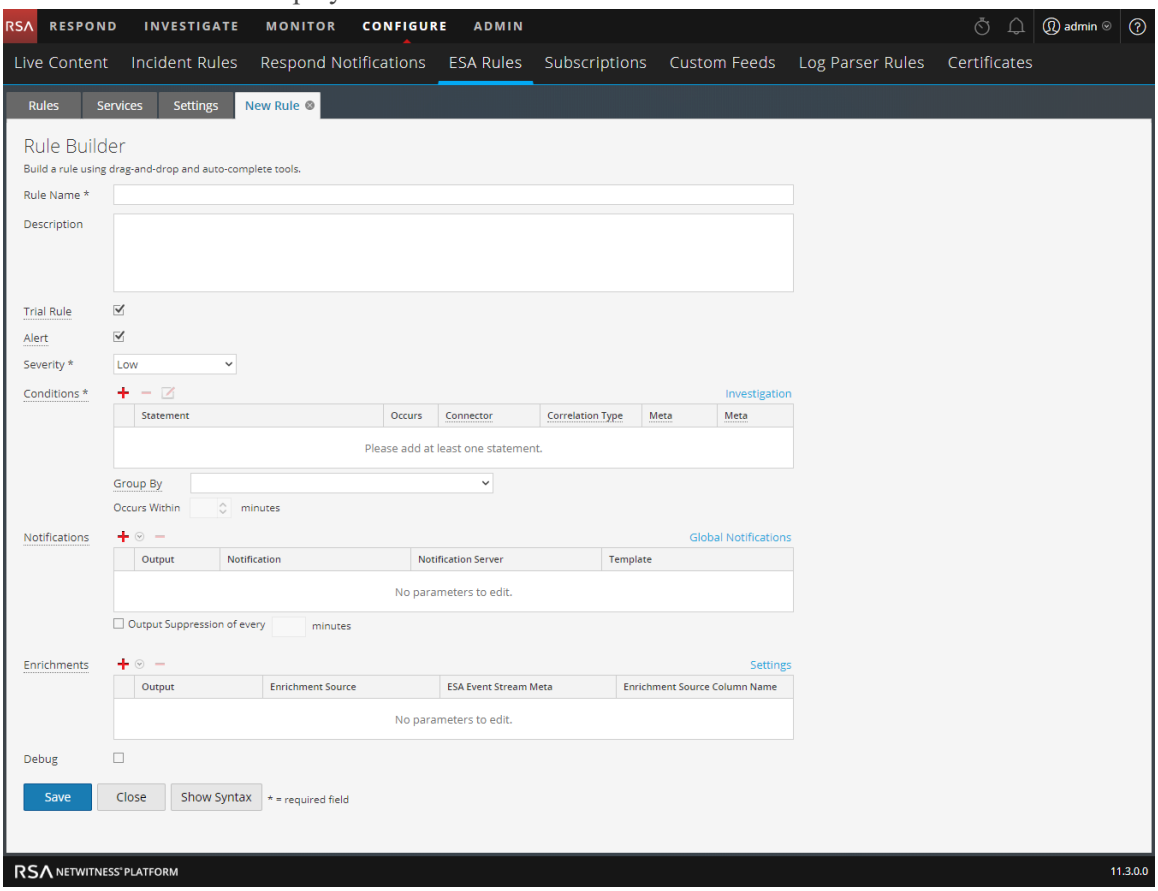
Prerequisites

You must have permission to manage rules. See Role Permissions.

Name and Describe a Rule

1. Go to **CONFIGURE > ESA Rules > Rules** tab.

2. In the **Rule Library**, select > **Rule Builder**.
   The New Rule tab is displayed.



3. Type a unique, descriptive name in the **Rule Name** field.
   This name will appear in the Rule Library so be specific enough to distinguish the rule from others.
4. In the **Description** field, explain which events the rule detects.
   The beginning of this description will appear in the Rule Library.
5. By default, new rules are configured as a Trial Rule. A trial rule automatically disables the rule if all trial rules collectively exceed the memory threshold. If you are editing an existing rule, you can select **Trial Rule** to safely test the rule edits.
   Use trial rule mode as a safeguard to see if a rule runs efficiently and to prevent downtime caused by running out of memory. For more information, see Work with Trial Rules.
6. (This option applies to 11.3 and later.) Select **Alert** to send an alert to Respond. Clear the checkbox if you do not want to send an alert to Respond. To turn alerts on or off for ALL rules, see the *ESA Configuration Guide*.
7. For **Severity**, classify the rule as Low, Medium, High or Critical.

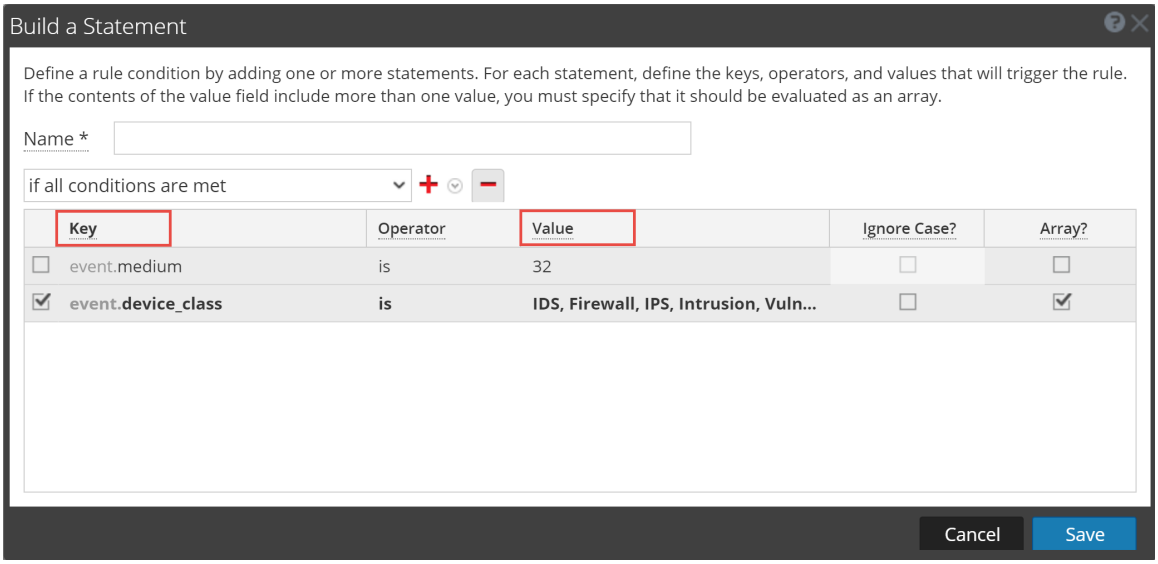
Step 2. Build a Rule Statement

This topic provides instructions to define rule criteria in Rule Builder by adding statements. A statement is a logical grouping of rule criteria in the Rule Builder. You add statements to define what a rule detects.

Example

The following graphic shows an example of a Rule Builder statement.

Every statement contains a key and value. Then, you build logic around the pair by selecting an option in each other field.



Prerequisites

To build a rule statement, you must know the meta key and the meta value.
For a complete list of meta keys, go to **CONFIGURE > ESA Rules > Settings > Meta Key References**.

Build a Rule Statement

1. Go to **CONFIGURE > ESA Rules**.

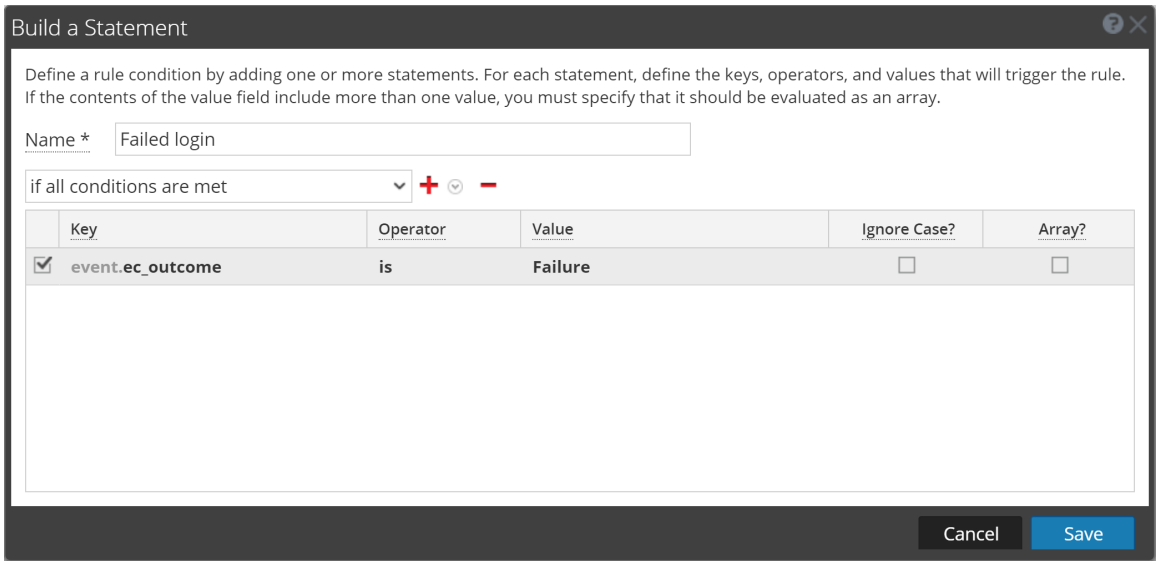
   The Rules tab is displayed by default.

2. In the **Rule Library**, click + > **Rule Builder** or edit an existing Rule Builder rule.

   The Rule Builder view is displayed.

3. In the **Conditions** section, click + .

   The Build Statement dialog is displayed.



4. **Name** the statement. Be clear and specific. The statement name will appear in the Rule Builder.
5. From the drop-down list, select which circumstances the rule requires:
   - if **all conditions** are met
   - if **one of these conditions** are met
6. Specify the criteria for the statement:
   a. For **Key,** type the name of the **Meta Key**.
   b. For **Operator** specify the relationship between the meta key and the value you will provide for it. The operator that you use depends on the metadata type.
   The choices are: is, is not, is not null, is greater than (>), is greater than or equal to (>=), is less than (<), is less than or equal to (<=), is one of (For array type meta), is not one of (For array type meta), contains, not contains, begins with, ends with
   c. Type the **Value** for the meta key.
   Do not add quotes around a value. Separate multiple values with a comma.
   d. The **Ignore Case?** field is designed for use with string and string array values. By choosing the **Ignore Case** field, the query will treat all string text as a lowercase value. This ensures that a rule that searches for the user named Johnson would trigger if the event contains "johnson," "JOHNSON," or "JoHnSoN."
   e. The **Array?** field indicates if the contents of the Value field represent one or more than one value.

      Select the Array checkbox if you entered multiple, comma-separated values in the **Value** field. For example, "ec_activity is Logon, Logoff" requires you to select the Array checkbox.
7. To use another meta key in the statement, click +, select **Add Meta Condition** and repeat step 6.
8. To add a whitelist, click + and select **Add Whitelist Condition**.
9. To add a blacklist, click + and select **Add a Blacklist Condition**.

10. To save the statement, click **Save**.

To Add a Whitelist

You use a whitelist to ensure that specified entities are excluded from triggering the rule. Whitelists can be based on geographic location, in-memory enrichment, or Context Hub list sources. For example, if you want to create a rule that only triggers for IP addresses outside of the US, you can create a whitelist of US IP addresses.

1. After you add a meta condition, click + and select **Add Whitelist Condition**.
2. In the **EnterWhitelist Name** field, select an enrichment source. Any in-memory enrichment, Context Hub list, or a named window in Esper can be used as the source for a whitelist.
3. For the subcondition:
   a. If you used a GeoIP source for the whitelist, ipv4 is automatically entered for the subcondition. Enter the meta value for the corresponding value field. For example, enter *ipv4 is ip_src* to ensure the GeoIP records are selected based upon the ip_src being found in the GeoIP lookup database. In addition, if you used a GeoIP source for the whitelist, you might want to add a subcondition to specify the geographic region to exclude from the rule results. For example, to specify that the country code must be USA, enter "*CountryCode is US*".
   b. If you used a Context Hub list for the whitelist, select a column name from the list, then select an operator and enter the meta value for the corresponding value field.

Note: An *Entity* is a specified piece of meta, such as IP address, MAC address, user, host, domain, file name, or file hash.

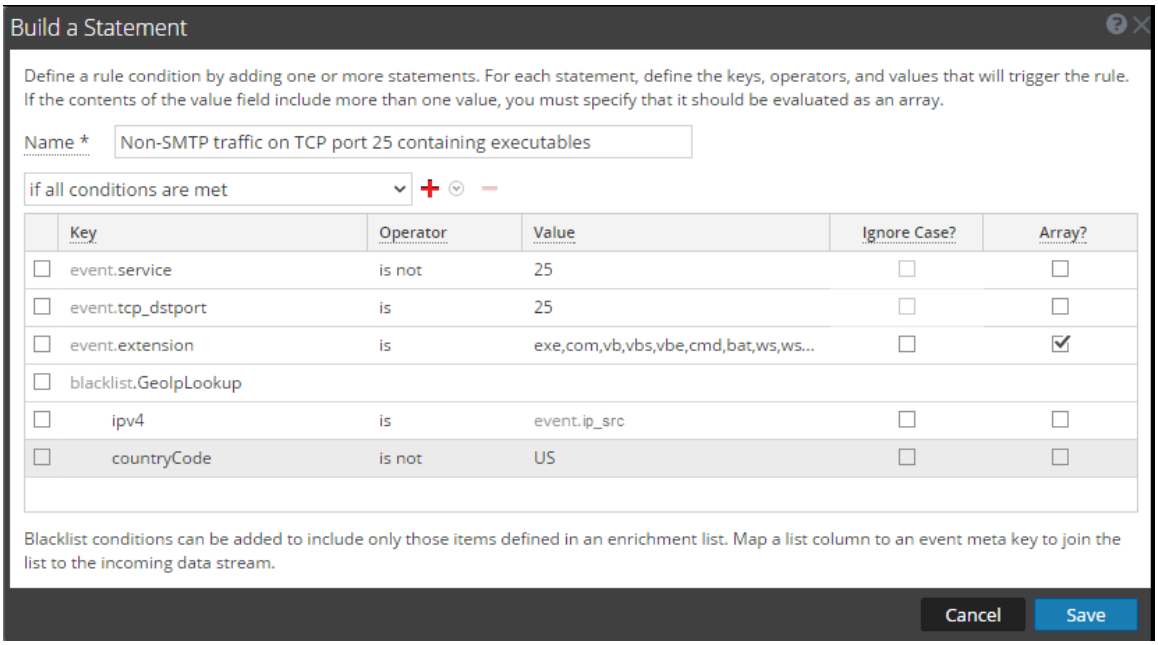
To Add a Blacklist

You use a blacklist to ensure that specified entities trigger the rule. Blacklists can be based on geographic location, in-memory enrichment, or Context Hub list sources.. For example, you can specify that the rule only includes results from Germany.

1. After you add a meta condition, click + and select **Add Blacklist Condition**.
2. In the **Enter Blacklist Name** field, select an enrichment source. Any in-memory enrichment, Context Hub list, or a named window in Esper can be used as the source for a blacklist.
3. For the subcondition:
   a. If you used a GeoIP source for the blacklist, ipv4 is automatically entered for the subcondition. Enter the meta value for the corresponding value field. For example, enter ipv4 is ip_src to ensure the GeoIP records are selected based upon the ip_src being found in the GeoIP lookup database. In addition, if you used a GeoIP source for the blacklist, you might want to add a subcondition to specify the geographic region to include in the rule results. For example, to specify that the rule only includes results for Germany, enter "*CountryCode is DE*".
   b. If you used a Context Hub list for the blacklist, select a column name from the list, then select an operator and enter the meta value for the corresponding value field.

Example: Blacklist

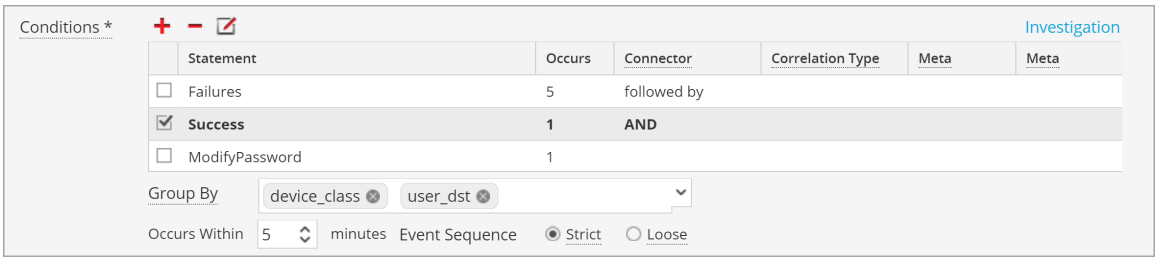
The following statement shows a blacklist statement for a rule that monitors for non-SMTP traffic on TCP destination port 25 containing an executable from countries that are outside of the United States.



Statement	Description
service is not 25	The traffic is not SMTP traffic.
tcp_dstport is 25	The traffic is running on TCP port 25.
extension is exe, com,vb,vbs,vbe,cmd,bat,ws,wsf,src,sh	The file extension is an executable.
GeoIpLookup	The blacklist is based on a GeoIPLookup source.
ipv4 is ip_src	The GeoIP records are selected based upon the ip_src being found in the GeoIP lookup database.
countryCode is not US	When looking up the IP address Event.ip_src in the GeoIP database, the record it returns does not contain "US" in the countryCode field.

Example: Ignoring Case, Strict Pattern Matching, and Using The *Is Not Null* Operator

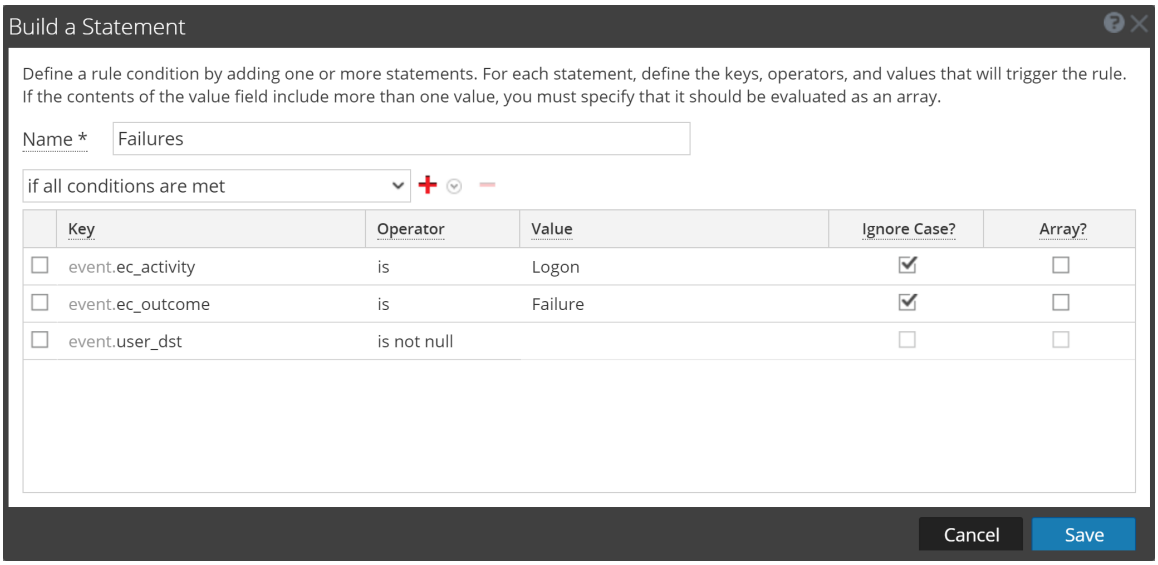
The following example uses the ability to ignore case, exclude null values, and create a strict pattern match to ensure that it returns the expected rule results. The following conditions make up the rule:



Rule Condition	Description
Failures	This condition searches for five failed logins with a "followed by" connector, meaning that the condition (Failures) must be followed by the next condition (Success).
Success	This condition searches for one successful login.
ModifyPassword	This condition searches for an instance where the password is modified.
GroupBy: user_dst, device class	The GroupBy field ensures that all the previous conditions are grouped by the user_dst meta (the user destination account) and device class. This is important to the construction of the rule because the rule attempts to find a case where a user has attempted to log into the same destination account multiple times, finally logged in successfully, and then changed the password. Grouping by device class ensures that the user logged in from the same machine attempted to log into an account multiple times. The rule may give unexpected results if you do not group the results.
Occurs within 5 minutes	The time window for the events to occur is five minutes. If the events occur outside of this time window, the rule does not trigger.
Event Sequence: Strict	The event sequence is configured for a strict pattern match. This means that the pattern must match exactly as it is specifiedwith no intervening events. Strict pattern matching allows you to ensure that the Esper engine only generates alerts for rules that exactly match the pattern you want to find. For example, a common rule might be to search for five failed logins followed by a successful login. If you select a loose pattern match, this rule will trigger if there are any number of successful logins between the failed logins. Since the point of the rule is to find frequent *and* sequential login attempts, a strict match is required to ensure that you get the results you expect.

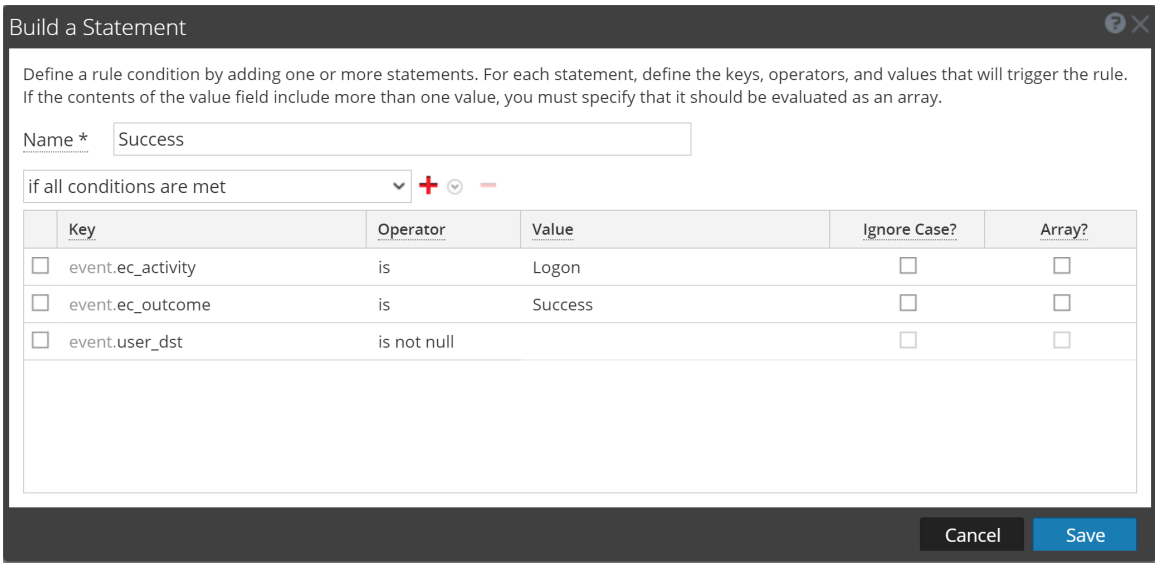
Note: Each of these conditions is explained in further detail in the sections below.

For each condition, a statement is built in the Rule Builder. The following statement makes up the Failures condition:



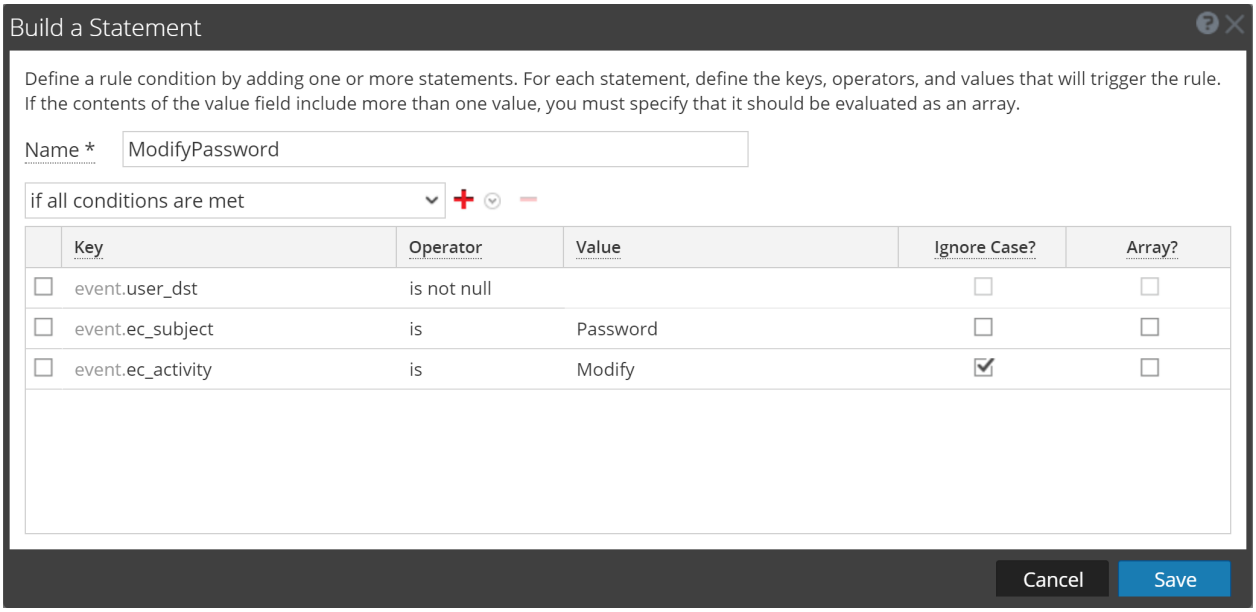
Rule Statement	Description
ec-activity is Logon (ignore case)	Identifies activity that attempts to log on to a system. The **Ignore Case** field is designed for use with string and string array values. By choosing the **Ignore Case** field, the query will treat all string text as a lowercase value. You may want to use this field if you are unsure what case may be used when logging a particular event. Because the case is ignored, the rule can trigger if the activity is logged as Logon, logon, or LoGoN.
ec_outcome is Failure (ignore case)	Identifies activity outcome logged as "failure." Because the case is ignored, the rule can trigger if the activity is logged as "failure", "Failure," or "FaiLuRe."
user_dst is not null	Ensures that the condition is only true if user_dst is populated. The **is not null** operator allows you to ensure that a field returns a value. You may want to use this field when a rule depends on a particular field returning a value. For example, you want to create a rule that identifies the same user attempting to log into the same destination account multiple times (potentially a password-guessing attack). If the field that represents the user destination account is empty, you don't want the rule to trigger. To ensure the field contains a value, you use the **is not null** operator.

The following statement makes up the Success condition:



Rule Statement	Description
ec_activity is Logon	Identifies logon activity.
ec_outcome is Success	Identifies a logon that is successful.
user_dst is not null	Ensures that user destination account field must be populated for the condition to be true.

The following statement makes up the ModifyPassword condition:

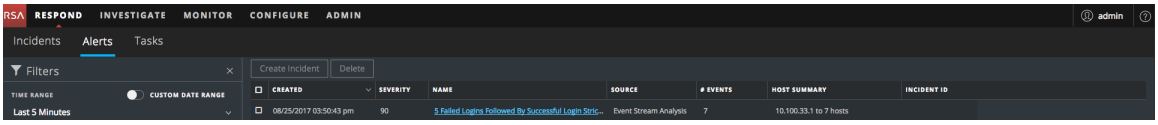


Rule Statement	Description
user_dst is not null	Ensures the user destination account field must be populated for the condition to be true.
ec_subject is Password	Identifies a subject of Password.
ec_activity is Modify	Identifies activity where the password was modified.

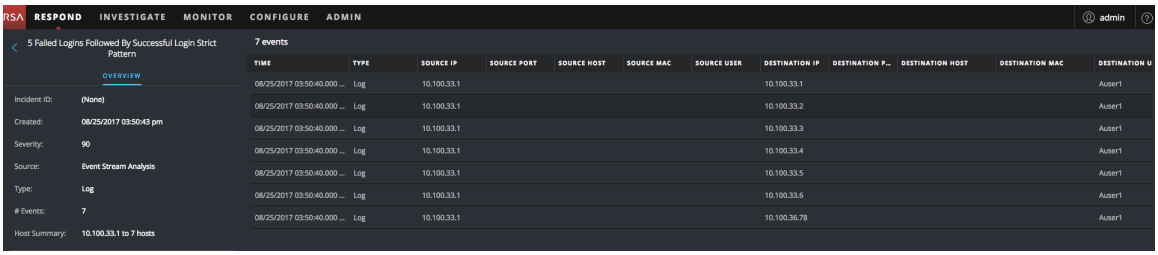
Example Results

When the alert fires for the above example rule, you can see that the rule triggered for seven events, and that each event contains a user. You can also see that the events follow a strict pattern: five failed login events, followed by a successful login event, followed by a modification to the account.

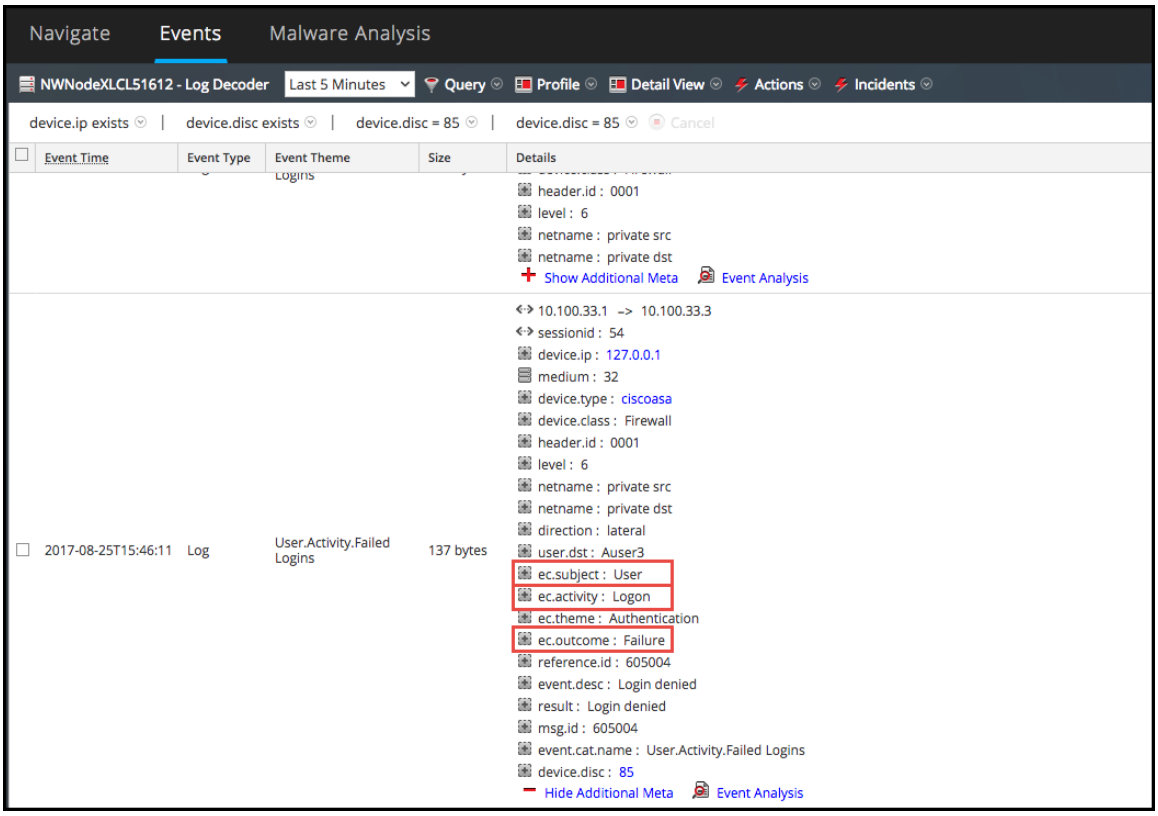
The following figure shows the alert in the Respond Alerts List view.



The next figure shows the events in the alert in the Respond Alert Details view.



Drilling down into the Investigation module by clicking on the source for one of the events, you can see the case for each of the string values. Because you used **Ignore Case**, the rule would trigger if the string values were upper or lower case.

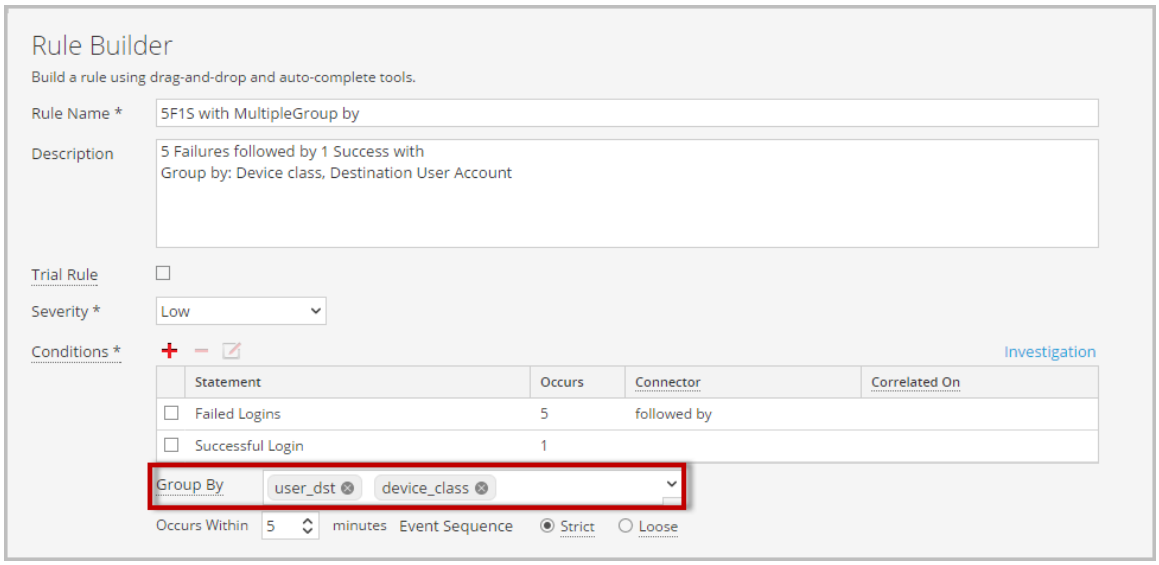


Example: Grouping the Rule Results

The **Group By** field allows you to group and filter rule results. For example, suppose that there are three user accounts; Joe, Jane, and John and you use the **Group By** meta, user_dst. The result will show events grouped under the accounts for Joe, Jane, and John.

You can also group by multiple keys, which can further filter rule results. For example, you might want to group by user destination account and machine to see if a user logged into the same destination account from the same machine attempts to log into an account multiple times. To do this, you might group by device_class and user_dst.

The following example shows a rule grouped by device_class and user_dst.

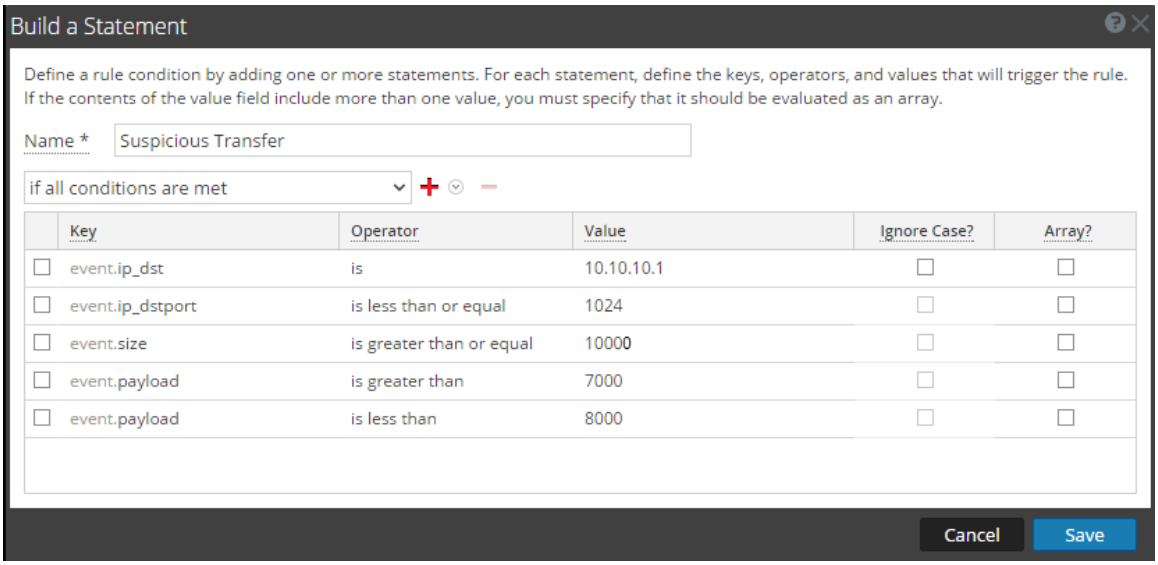


Rule Condition	Description
Failed Logins	Identifies five failed login attempts (must be followed by the next condition; that is, the five failed logins must be followed by a successful login).
Successful Login	Identifies one successful login.
Group By: user_dst and device_class	Groups the rule results by user_dst (user destination account) and device_class (type of machine the user is logging in from). This allows the rule to look for a user logged in from the same machine to the same destination account, resulting in a much more targeted rule result.
Occurs within 5 minutes with a strict pattern match	The events must occur within five minutes, and the pattern matching is strict, meaning it must follow the pattern exactly for the rule to trigger.

Example: Working with Numeric Operators

Numeric operators allow you to write rules against numeric values, such as specifying that a value is greater than, less than, or equal to a specific value. This is useful particularly for cases where you might want to specify a numeric threshold, that is, *payload is greater than 7000*.

The following example attempts to identify a data transfer to a particular destination through the common ports where the transfer size is high and the payload is in a suspicious range.



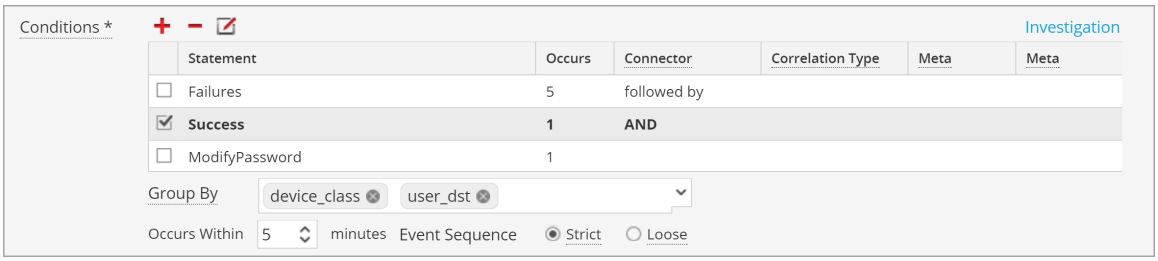
Rule Statement	Description
ip_dst is 10.10.10.1	The destination port is 10.10.10.1.
ip_dstport is greater than or equal to 1024	The destination port is in a commonly used port range, 1024 or greater.
size is greater than or equal to 10000	The size of the transfer is 10000 or greater, which is a suspiciously large transfer.
payload is greater than 7000	The payload is between 7000 and 8000, which is a suspiciously large payload.
payload is less than 8000	The payload is between 7000 and 8000, which is a suspiciously large payload.

Step 3. Add Conditions to a Rule Statement

This topic provides instructions to add conditions, such as specifying a certain time frame, to a rule statement. When you build a statement, you specify what a rule detects. You add conditions to make further stipulations, such as how many times or when the criteria must occur.

Example

The following graphic shows an example of the conditions for Rule Builder statements. Combined, the statements and conditions comprise the rule criteria.



This rule detects 5 failed logon attempts followed by one successful logon, which could be the sign that someone has hacked into user account. This is the criteria for the rule:

A. 5 failed logons are required.

B. 1 successful logon must follow the failures

C. A password was changed.

D. All events must occur within 5 minutes.

E. Group alerts by user (user_dst), because steps A and B must be performed on the same user destination account. Also, group by machine (device_class) to ensure that the user logged in from the same machine attempts to log into an account multiple times.

F. The match is a strict pattern, meaning that the pattern must match exactly with no intervening events.

Add Conditions to a Rule Statement

1. In the **Conditions** section, select a statement and click .
2. For **Occurs**, enter a value to specify how many occurrences are required to meet the rule criteria.
3. If you have multiple statements, in the **Connector** field select a logical operator to join one statement to another:
   - followed by
   - not followed by
   - AND
   - OR
4. **Correlation Type** applies only to **followed by** and **not followed by**. If you choose a correlation type of SAME, select one meta to correlate on, and if you choose a correlation type of JOIN, select two meta to correlate on. You may want to use JOIN if you are trying to correlate on meta from two different data sources. For example, say you want to correlate an AV alert with an IDS alert. See the examples below for a use case where two meta from different sources are joined.
5. If events must happen within a specific timeframe, enter a number of minutes in the **Occurs Within** field.
6. Choose whether the pattern must follow a **Strict** match or a **Loose** match. If you specify a strict match, this means that the pattern must occur in the exact sequence you specified with no additional events occurring in between. For example, if the sequence specifies five failed logins (F) followed

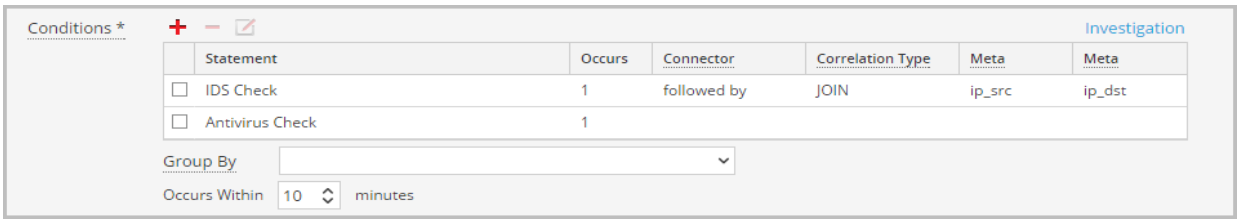
by a successful login (S), this pattern will only match if the user executes the following sequence: F,F,F,F,F,S. If you specify a loose match, this means that other events may occur within the sequence, but the rule will still trigger if all of the specified events also occur. For example, five failed login attempts (F), followed by any number of intervening successful login attempts (S), followed by a successful login attempt might create the following pattern: F,S,F,S,F,S,F,S,F,S which would trigger the rule despite the intervening successful logins.

7. Choose the fields to group by from the dropdown list. The **Group by** field allows you to group and evaluate the incoming events. For example, in the rule that detects 5 failed logon attempts followed by 1 successful attempt, the user must be the same, so user_dst is the **Group By** meta key. You can also group by multiple keys. Using the previous example, you might want to group by user and machine to ensure that the same user logged in from the same machine attempts to log into an account multiple times. To do this, you might group by device_class and user_dst.

Example

The following graphic shows an example of the conditions for a rule that allow you to evaluate the same entities across multiple devices so you can accomplish complex use cases. For example, you can create a rule that triggers if an IDS (Intrusion Detection System) alert is followed by an AV(Anti-virus) alert for the same workstation. The work station key is not the same between the two (IDS & AV) sources, so you can perform a JOIN in order to evaluate the different entities.

In the IDS alert, the workstation is identified by the source IP address from the IDS alert, and would be compared to the destination IP address from the AV alert.



This is the criteria for the rule:

A. An IDS alert occurs.

B. The destination IP address from the AV alert and source IP address for the workstation from the IDS alert are joined to allow you to view the same entities across different sources.

C. An Antivirus alert follows the IDS alert.

Add an Advanced EPL Rule

This topic provides instructions to define rule criteria by writing an EPL query. EPL is a declarative language for handling high-frequency time-based event data. It is used to express filtering, aggregation, and joins over possibly sliding windows of multiple event streams. EPL also includes pattern semantics to express complex temporal causality among events.

Write an advanced EPL rule when rule criteria is more complex than what you can specify in Rule Builder.

It is outside the scope of this guide to explain EPL syntax.

- For EPL Documentation, see http://www.espertech.com/esper/esper-documentation/
- For the EPL Online Tool, see http://esper-epl-tryout.appspot.com/epltryout/mainform.html

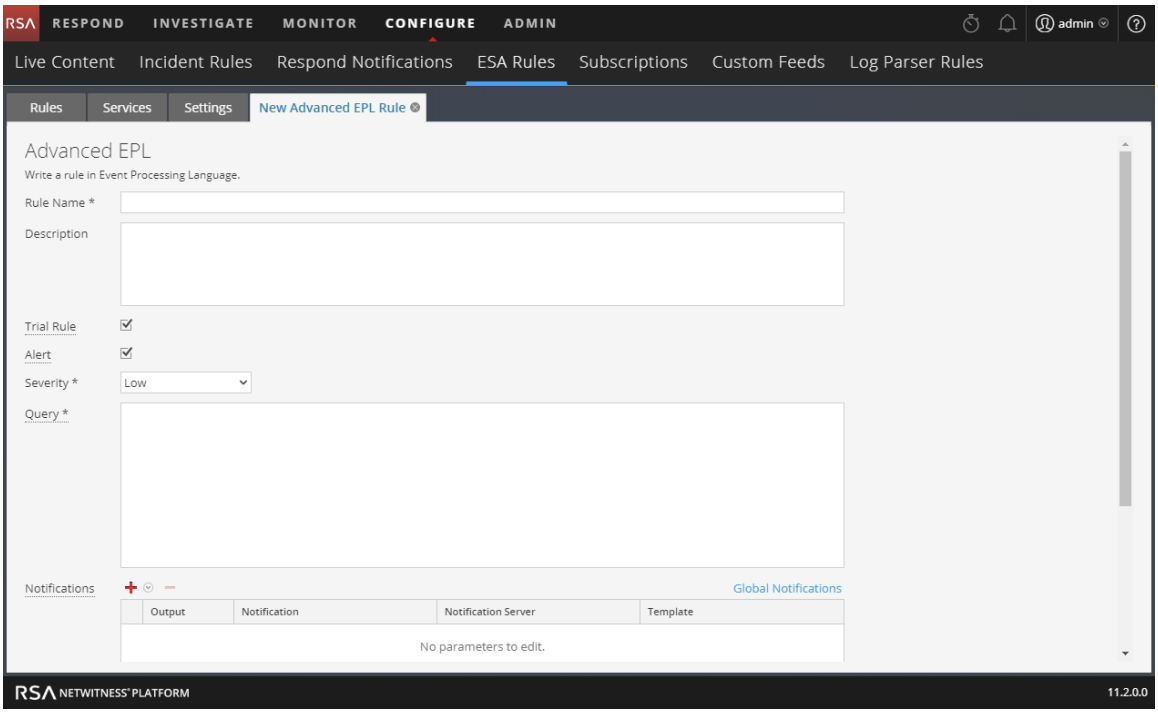
Prerequisites

The following are prerequisites for adding an advanced rule:

- You must know Event Processing Language (EPL).
- You must understand ESA Annotations to mark which EPL statements are linked to generating alerts.

Add an Advanced EPL Rule

1. Go to **CONFIGURE > ESA Rules**.
2. In the **Rule Library**, select **> Advanced EPL**.



3. Type a unique, descriptive name in the **Rule Name** field.

   This name will appear in the Rule Library so be specific enough to distinguish the rule from others.

4. In the **Description** field, explain which events the rule detects.

   The beginning of this description will appear in the Rule Library

5. Select **Trial Rule** to automatically disable the rule if all trial rules collectively exceed the memory threshold.

   Use trial rule mode as a safeguard to see if a rule runs efficiently and to prevent downtime caused by running out of memory. For more information, see Work with Trial Rules.

6. (This option applies to 11.3 and later.) Select **Alert** to send an alert to Respond. Clear the checkbox if you do not want to send an alert to Respond. To turn alerts on or off for ALL rules, see the *ESA Configuration Guide*.

7. For **Severity**, classify the rule as Low, Medium, High or Critical.

8. To define rule criteria, write a **Query** in EPL.

   Note: For all meta key names, use an underscore not a period. For example, `ec_outcome` is correct but `ec.outcome` is not.

9. For dynamic statement name generation in ESA, you must enclose the meta keys in curly brackets and include this annotation in the syntax:

   ```
   @Name("RIG {ip_src} {alias_host} {ec_activity}")
   ```

   where,

- RIG is the static part of the statement name
- {ip_src}, {alias_host}, {ec_activity} is the dynamic part of the statement name

Note: If any of the metas in the dynamic part of the statement name has a null value, it is displayed as a static text.

If a rule should generate an alert, include this ESA annotation in the syntax:

```
@RSAAlert
```

For more information on ESA Annotations, see ESA Annotations.

Event Processing Language (EPL)

This topic describes Event Processing Language (EPL), a declarative language for dealing with high frequency time-based event data. ESA uses Event Processing Language (EPL), a declarative language for dealing with high frequency time-based event data. It is used for express filtering, aggregation, and joins over possibly sliding windows of multiple event streams. EPL also includes pattern semantics to express complex temporal causality among events. It can perform, but is not limited to, the following functions:

- Filter Event
- Alert Suppression
- Compute percentages or rations
- Average, count, min and max for a given time window
- Correlate events arriving in multiple stream
- Correlate events that arrive out of order
- On-Off Windows
- Followed-by and Not Followed-by support
- Regex filter support

Databases require explicit querying to return meaningful data and are not suited to push data as it changes. The developer must implement the temporal and aggregation logic himself. By contrast, the EPL engine provides a higher abstraction and intelligence and can be thought of as a database turned upside-down. Instead of storing the data and running queries against stored data, EPL allows applications to store queries and continuously run the data through. Response from the EPL engine is real-time when conditions occur that match user defined queries.

Advanced ESA rules require correct character case, but in the Investigation view all characters are converted to lowercase. However, the meta may not be lowercase despite appearances in the Investigation view. To ensure you are using the correct case, RSA recommends you use the *toLowerCase()* function. For example,

```
@RSAAlert(oneInSeconds=0)
SELECT * FROM Event(
/* Statement: Download PDF File */
(filetype.toLowerCase() IN ( 'pdf' ) AND medium IN ( 1 ))
OR
```

```
/* Statement: Download EXE File */
(filetype.toLowerCase() IN ( 'windows_executable' , 'x86 pe' , 'windows
executable' ) AND medium IN ( 1 ))
).win:time(5 Minutes)
MATCH_RECOGNIZE (
PARTITION BY ip_src
MEASURES E1 as e1_data , E2 as e2_data
PATTERN (E1+ E2)
DEFINE
E1 as (E1.filetype.toLowerCase() IN ( 'pdf' ) AND E1.medium IN ( 1 )),
E2 as (E2.filetype.toLowerCase() IN ( 'windows_executable' , 'x86 pe' ,
'windows executable' ) AND E2.medium IN ( 1 ))
```

For the purposes of online help, basic statements are used to illustrate how to set up ESA; however, for more information about writing EPL statements, the http://www.espertech.com site provides tutorials and examples.

Note: In NetWitness Platform version 11.3, ESA Correlation supports Esper version 7.1.0.

ESA Annotations

This topic describes annotations that NetWitness Platform provides to use in advanced EPL rules.

@RSAAlert Annotation

The @RSAAlert annotation is used to mark which EPL statements are linked to generating alert notifications. It is designed to work with the alert notification suppression feature in the Rule Builder user interface.

The @RSAAlert annotation can be useful when working with alert notifications, especially if you want to filter notifications, such as sending one notification for each user that triggers an alert.

For example, suppose you want to generate alert notifications for login failures. You could add the following statement:

*@RSAAlert select * from event(msg_id="login_fail")*

Event number	Message ID	username	src_ IP	Time
1	login_fail	alice	1.2.3.4	10:00
2	login_fail	alice	1.2.3.4	10:01
3	login_fail	alice	6.7.8.9	10:01
4	login_fail	bob	1.2.3.4	10:01
5	login_fail	alice	1.2.3.4	10:03

For the above statement, five alert notifications are generated.

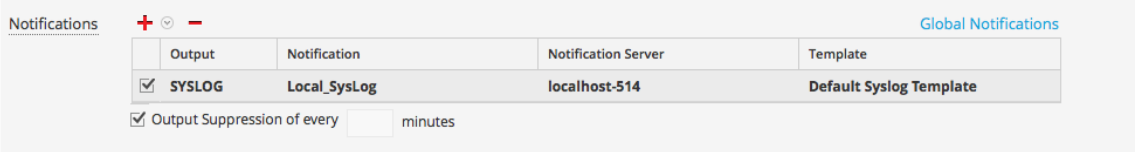
However, suppose you wanted to modify the statement to generate one alert for each separate username. You can use the *identifier* attribute. For example, the statement *@RSAAlert(identifier={"username"}) SELECT* FROM Event(msg_id="login_fail")* generates one notification for the first alert for "bob" and one for the first alert for "alice." Subsequent alerts for "bob" and "alice" are ignored.

You can further distinguish the users by adding details via the identifier variable. For example, you can distinguish by user and IP address using the following statement: *@RSAAlert(identifier={"username", "src_ip"}) SELECT* FROM Event(msg_id="login_fail")*. Then, you would see notifications generated by user name and IP address (one alert for "alice" at 1.2.3.4, another alert for "alice" at 6.7.8.9, and an alert for "bob" at 1.2.3.4).

To use identifiers with Alert Notification Suppression:

The @RSAAlert annotation is designed to work with the alert notification suppression feature in the Rule Builder user interface. To do this:

1. Create a rule in the Rule Builder user interface, and select the alert suppression feature when configuring notifications.



2. Copy the code from the Rule Builder rule into a new advanced rule.
3. Configure the advanced rule to include identifiers (as described above) and save the advanced rule.
4. Delete the original rule builder rule.

@RSAPersist Annotation

The @RSAPersist annotation is used to mark a named window as an ESA managed window for persistence. By marking the named window as an ESA managed window, ESA periodically writes the contents of the window to disk and restores them back if the window is un-deployed and re-deployed. The systems take a snapshot just before the module is un-deployed and the window is removed. Conversely, it restores the window contents from the snapshot just after the module is re-deployed. This ensures that the contents of the window are not lost if the module state is altered or if the ESA service goes down.

For example, consider a named window, `DHCPTracker` that holds a mapping from IP addresses to each assigned hostname.You can annotate the statement with the @RSAPersist annotation as:

```
@RSAPersist
 create window DHCPTracker.std:unique(ip_src) as (ip_src string, alias_
host string);
 insert into DHCPTracker select IP as ip_src, HostName as alias_host from
DHCPAssignment(ID=32);
```

Note: All windows definitions are not suitable for persistence. `@RSAPersist` annotation must be used with care. If the window has timed-records or if it depends on time based constraints it is very likely that the reverted snapshots will not restore it to the correct state. Also, any changes to the window definition will invalidate the snapshots and reset the window to a blank state. The system does not do any semantic analysis to determine if the changes to the window definition are conflicting or not. Note that other parts of a module (that is, other than the particular CREATE WINDOW call that defines the window) may change, without invalidating the snapshots.

@UsesEnrichment (10.6.1.1 and later)

The @UsesEnrichment can be used in advanced EPL rules to reference enrichments. In order to synchronize enrichments with ESA, all enrichment dependencies in EPL rules must be referenced with the @UsesEnrichment annotation.

The @UsesEnrichment annotation uses the following format:

```
@UsesEnrichment(name= '<enrichment_name>')
```

For example, the following EPL references a whitelist enrichment:

```
@UsesEnrichment(name = 'Whitelist')
@RSAAlert
SELECT * FROM Event(ip_src NOT IN (SELECT ip_address FROM Whitelist))
```

@Name

The @Name is the statement name defined in ESA advanced rules. It is used to dynamically generate statement names in ESA alerts. The statement name of only an alert triggering statement is displayed. This annotation has meta keys enclosed in curly brackets.

The @Name annotation uses the following format:

```
@Name("<static_part_of_statement_name> {meta_key1} {meta_key2}…")
```

For example, the following EPL references meta keys *ip_src* and *user_name* whose values will be dynamically generated.

@Name(“Login Event to {ip_src} by {user_name}”)

Note: You can specify any number of meta keys in the statement for dynamic statement name generation.
The length of individual meta key is limited to 64, after which the value is truncated and appended with “…”.
The length of the dynamic generation of statement name is limited to 128, after which the value is truncated to 128 and appended with “…”. All the remaining values post truncation will be treated as static values.

Sample Advanced EPL Rules

Following are the examples of Advanced ESA rules. Each example has multiple ways of implementing the same use-case.

Example #1:

Create an user account and delete the same user account in 300s. User information is stored in user_src meta.

EPL #1:

Rule Name	CreateuseraccountFollowedbyDeletionof Useraccount1
Rule Description	Create a user account followed by an action to delete the same user account in 300 seconds.

Rule Code	`SELECT * FROM Event(ec_subject='User'`
	`  AND ec_outcome='Success'`
	`  AND user_src is NOT NULL`
	`  AND ec_activity IN ('Create', 'Delete')`
	`  ).win:time(300 seconds)`
	`match_recognize (partition by user_src`
	`   measures C as c, D as d`
	`   pattern (C D)`
	`  define`
	`   C as C.ec_activity='Create' ,`
	`   D as D.ec_activity='Delete');`

Note	• Filter events needed for pattern in given time frame. Filter conditions should be such that only required events are passed to match recognize function. In this case, they are create and delete user account Events. That is, Event(ec_subject='User' AND ec_outcome='Success' AND user_src is NOT NULL AND ec_activity IN ('Create', 'Delete') • Partition by creates buckets. In this case, esper creates buckets per value of user_src. And hence value of user_src is common between both events. • Define pattern you want. Right now it is set to Create Followed by Delete. You can do multiple creates followed by delete (C+ D). Pattern is very similar to regular expression. • Most efficient use case.

EPL #2:

Rule Name	CreateuseraccountFollowedbyDeletionof Useraccount2
Rule Description	Create a user account followed by an action to delete the same user account in 300 seconds.

Rule Code	`SELECT * from pattern[every (a= Event(ec_subject='User' AND ec_outcome='Success' AND user_dst is NOT NULL AND ec_activity IN ('Create'))`
	`  ->`
	`( Event(ec_subject='User' AND ec_outcome='Success' AND user_dst is NOT NULL AND ec_activity IN ('Create') AND user_src = a.user_`

	src)))where timer:within(300 Sec)];
Note	• Lets say same user is created twice and deleted once in that order. Then the above pattern will fire 2 alerts. • A thread is created for every User creation. • There is no way to control threads. It is important to have time bonds and preferably small intervals.

Example #2:

Detect pattern where user created followed by login by same user and user is deleted in end. In case of windows logs user info is stored in either user_dst or user_src depending on event.

user_src(create) = user_dst(Login) = user_src(Delete)

EPL #3:

Rule Name	CreateUserLoginandDeleteUser
Rule Description	Detect a pattern where a user creates a User account followed by login by the same user followed by deletion of the User account.
Rule Code	SELECT * FROM Event(ec_subject='User' and ec_activity in ('Create','Logon','Delete') and ec_theme in ('UserGroup', 'Authentication') and ec_outcome='Success').win:time(300 seconds) match_recognize (measures C as c, L as l, D as d pattern (C L D) define C as C.ec_activity = 'Create', L as L.ec_activity = 'Logon' AND L.user_dst = C.user_src, D as D.ec_activity = 'Delete' AND D.user_src = C.user_src);
Note	• Since user_src/user_dst is not common across all events we can't use partition. It will be 1 single bucket running 1 pattern at a time. For example, for user 1 and 2 if the stream of events are C1C2L1D1, C1L1C2D1, there will be no alert because C1 thread got reset by C2. Alert will be fired only if C1L1D1 are in order and no other event either from same user or other user falls in between. • Another solution would be to use Named Window and merge user_dst and user_src into single column and then run match recognize. (EPL #3). • Pattern can also be used. You might get more alerts than expected. (EPL #4).

EPL #4: Using NamedWindows and match recognize

Rule Name	CreateUserLoginandDeleteUser
Rule	Detect a pattern where a user creates a User account followed by login by the same

Description	user followed by deletion of the User account.

Rule Code	`@Name('NormalizedWindow') create window FilteredEvents.win:time (300 sec) (user String, ecactivity string, sessionid Long);`
	`@Name('UsersrcEvents') Insert into FilteredEvents select user_src as user, ec_activity as ecactivity, sessionid from Event ( ec_subject='User' and ec_activity in ('Create','Delete') and ec_theme in ('UserGroup', 'Authentication') and ec_outcome='Success' and user_src is not null );`
	`@Name('UsrdstEvents') Insert into FilteredEvents select user_dst as user, ec_activity`
	`as ecactivity, sessionid from Event( ec_subject='User' and ec_activity in (Logon') and ec_theme in ('UserGroup', 'Authentication') and ec_outcome='Success' and user_dst is not null );`
	`@Name('Pattern')`
	`@RSAAlert(oneInSeconds=0, identifiers={"user"})`
	`select * from FilteredEvents`
	`match_recognize (`
	`partition by user`
	`measures C as c, L as l, D as d`
	`pattern (C L+D)`
	`define C as C.ecactivity= 'Create',`
	`L as L.ecactivity= 'Logon',`
	`D as D.ecactivity='Delete'`
	`);`

EPL #5: Using Every @RSAAlert(identifiers={"user_src"})

Rule Name	CreateUserLoginandDeleteUser
Rule Description	Detect a pattern where a user creates a User account followed by login by the same user followed by deletion of the User account.
Rule Code	`SELECT a.time as time,a.ip_src as ip_src,a.user_dst as user_dst,a.ip_dst as ip_dst,a.alias_host as alias_host from pattern [every (a=Event (ec_subject='User' and ec_activity='Create' and ec_theme='UserGroup' and ec_outcome='Success') -> (Event(ec_subject='User' and ec_activity='Logon' and ec_theme='Authentication' and user_src=a.user_dst) -> b=Event(ec_subject='User' and ec_activity='Delete' and ec_theme='UserGroup' and user_dst=a.user_dst))) where timer:within(300 sec)];`

Example #3:

Excessive login failures from same sourceIP

EPL #6: @RSAAlert(identifiers={"ip_src"})

Rule Name	ExcessLoginFailure
Rule	The same user tried logging in from the same Source IP and faced login failures

Description	
Rule Code	`SELECT * FROM Event( ip_src IS NOT NULL AND ec_activity='Logon' AND ec_outcome = 'Failure' ).std:groupwin(ip_src).win:time_length_batch(300 sec, 10) GROUP BY ip_src HAVING COUNT(*) = 10;`
Note	• Creates window per ip_src • Uses time_length_batch: Looks at events in batches(tumbling window). Every event will be part of only 1 window. Window releases events either when time elapses or count is reached. • One of issues with tumbling windows that events occurring towards end of batch might not lead to an alert. In below sequence of events at t=301 even though 10 login failures occurred for same login in last 300 secs there will be no alert because batch of events was dropped at t=300

Time t	Login Failures for Specific Users	Alert	Time Batch
0	0	0	1
295	6	0	1
299	3	0	1
301	1	0	2
420	6	0	2
550	3	0	2
600	0	0	3
720	6	0	3
850	3	0	3
900	1	1	3 ends and 4 begins

- Above problem can be resolved using win:time windows (EPL#7)instead of win:time_length_batch windows.
- Outer group by is to control events when time elapses. Say you have 9 events at end of 60 secs, esper engine will push those 9 events to listener. Group by and count will restrict it since count is not equal to 10.
- Time and count can be modified as needed.

EPL #7: @RSAAlert(identifiers={"ip_src"})

Rule Name	ExcessLoginFailure
Rule Description	The same user tried logging in from the same Source IP and faced login failures
Rule Code	`SELECT * FROM Event( ip_src IS NOT NULL AND ec_activity='Logon' AND ec_outcome =`

	'Failure').std:groupwin(ip_src).win:time (300 sec) GROUP BY ip_ src HAVING COUNT(*) = 10
Note	• This is sliding window and hence once alert is fired for a set of events they can be used for another alert as well till time has passed. • If 10 events were involved in causing alert only last event will appear • If < or > are used then you might see more than 1 alert. You should use alert suppression accordingly.

Example #4:

Multiple failed logins from multiple different users from same source to same destination, a single user from multiple different sources to same destination.

EPL #8: using groupwin , time_length_batch and unique

Rule Name	MultiplefailedLogins
Rule Description	There are multiple failed logins for the following cases: - From multiple users from same source to same destination. - Single user from multiple sources to the same destination.
Rule Code	SELECT * FROM Event(ec_activity='Logon' AND ec_outcome='Failure' AND ip_ src IS NOT NULL AND ip_dst IS NOT NULL AND user_dst IS NOT NULL).std:groupwin(ip_src,ip_dst).win:time_length_batch(300 seconds, 5}).**std:unique**(user_dst) group by ip_src,ip_dst having count(*) = 5;
Note	• ip.dst and ip.src are common across all events. • user_dst is unique for all events. • Alert is fired when there are atleast 5 different users try to login from same ip.src and ip.dst combination.

Example #5:

No Log traffic from a device in a given timeframe.

EPL #9: using groupwin , time_length_batch and unique

Rule Name	NoLogTraffic
Rule Description	There is no log traffic observed from a device in a given time frame.
Rule Code	SELECT * FROM pattern [every a = Event(device_ip IN ('10.0.0.0','10.0.0.1') AND medium = 32) -> (timer:interval (3600 seconds) AND NOT Event(device_ip = a.device_ip AND device_type = a.device_type AND medium = 32))];

Note	• Rule only detects sudden loss of traffic. It won't alert if there is no traffic to begin with. You need at least 1 event for rule to alert. • List of device ip address or device hostnames as input. Only these systems will be tracked. • Time input is required. Alert is fired when time interval between events exceeds input time.

Example #6:

Multiple Failed Logins NOT followed by a Lockout event by the same user.

EPL #10: using groupwin , time_length_batch and unique

Rule Name	FailedloginswoLockout
Rule Description	There are multiple failed logins that are not followed by Lockout event by the same user.

Rule Code	`SELECT * FROM pattern [every-distinct(a.user_dst, a.device_ip, 1 msec) (a= Event(ec_activity='Logon' and ec_outcome='Failure' and user_dst IS NOT NULL) -> [2]( Event ( device_ip =a.device_ip and ec_activity='Logon' and ec_outcome='Failure' and user_dst=a.user_dst)`
	`AND NOT Event( ( ec_activity='Logon' and ec_outcome='Success' and device_ip = a.device_ip and user_dst=a.user_dst) or (ec_activity='Lockout' and device_ip = a.device_ip and user_dst=a.user_dst))))`
	`where timer:within(60 seconds) -> (timer:interval(30 seconds) and not Event(device_ip=a.device_ip and user_dst=a.user_dst and ec_activity='Lockout')) ];`

Note	• Above query detects the absence of a Lockout Event after the occurrence of 2 failed logins from same user. • The occurrence of the multiple failed logins are timed and are assumed to occur within a certain period of time. Also, in-practice the Lockout event is assumed to occur within a short time after the occurrence of the last failed login event because the threshold value of Failed logins per user is set in a given domain. • In current query, every distinct will suppress new thread for combination of user and device for 1 millisec. • Time allowed for 3 failed logins is 60 secs since 1st failed attempt. Wait period for lockout event to occur is 30 secs

Example #7:

Custom functions to perform LIKE and REGEX operations for ARRAY elements.

EPL #11: @RSAAlert(oneInSeconds=0)

Rule Name	MatchLikeRegex
Rule Description	There are custom functions to perform LIKE and REGEX comparisons of array meta keys.

Rule Code	`SELECT * FROM pattern[`
	`e1=Event(matchLike(alias_host, "10.0.0.%")) AND`
	`e2=Event(matchRegex(alias_host, "10\.0\.0\.1[0-9][0-9]"))`
	`where timer:within(5 Minutes)];`

Note:
1. "**.**" in meta keys should be replaced with ("_").
2. All patterns should be time bound.
3. Use appropriate tags in front of statements, for example:
@RSAPersist:
@RSAAlert:

For additional details you can refer to:

- EPL Documentation: http://www.espertech.com/esper/esper-documentation/
- EPL Online Tool: http://esper-epl-tryout.appspot.com/epltryout/mainform.html

Working with Rules

This topic discusses additional procedures you can perform on rules. You may want to perform any of the following procedures:

- Edit, Duplicate or Delete a Rule
- Filter or Search for Rules
- Import or Export Rules

Edit, Duplicate or Delete a Rule

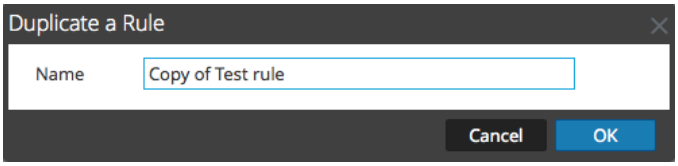
This topic provides instructions to edit, duplicate, or delete an Event Stream Analysis (ESA) rule. When you edit a rule, ESA applies the updated criteria going forward. No changes are made to previously generated alerts.

Edit a Rule

1. Go to **CONFIGURE > ESA Rules > Rules** tab.
   The Rules tab is displayed.
2. In the **Rule Library**, select the rule you want to edit and click .
   Depending on the rule type, the respective rule tab is displayed.
3. Modify the required parameters.
4. Click **Save**.

Duplicate a Rule

1. In the **Rule Library**, select the rule you want to duplicate and click .
2. The Duplicate a Rule dialog is displayed. The system adds **Copy of** in front of the rule name.

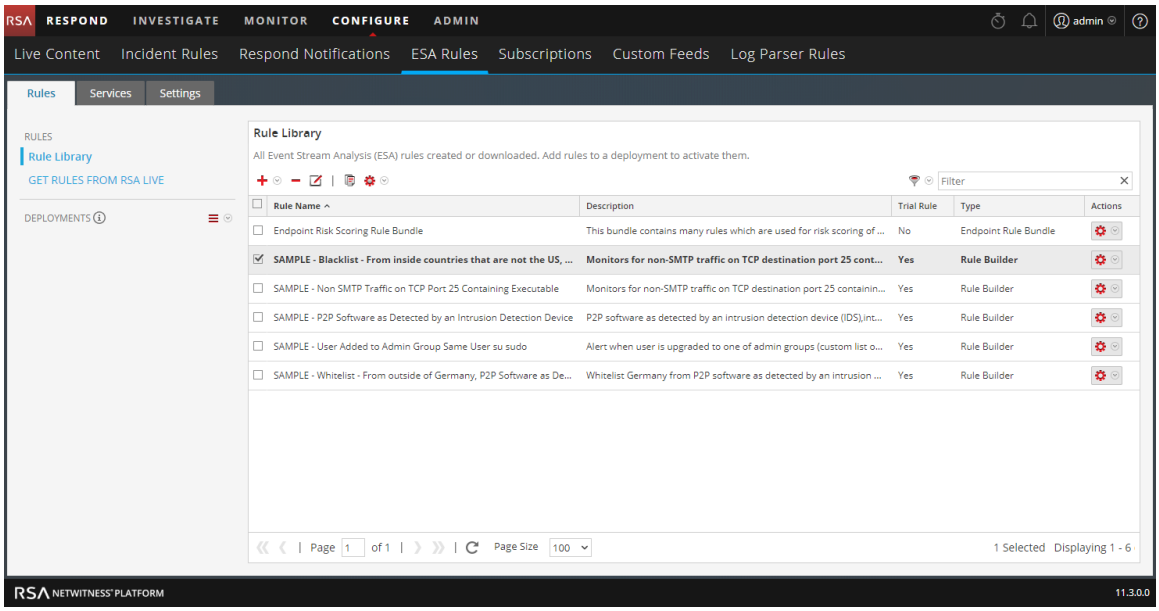


3. In the **Name** field, type a unique name for the duplicate rule and click **OK**.

A duplicate rule with the new name is added to the Rule Library.

Delete a Rule

1. Go to **CONFIGURE > ESA Rules > Rules**.
   The Rules tab is displayed.



2. In the Rule Library, select one or more rules and click .

   A warning dialog is displayed.

3. Click **Yes**.
   A confirmation message that the rule is deleted successfully is displayed and the selected rule is deleted from the Rule Library.

Filter or Search for Rules

This topic shows analysts how to specify the type of rules that display in the Rule Library.

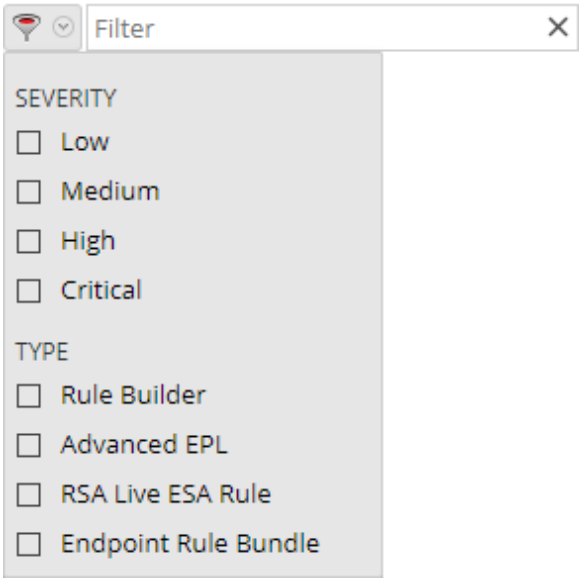
Prerequisites

Make sure that you understand the Rule Library view components. For more information, see Rule Library Panel.

Filter Rules

1. Go to **CONFIGURE > ESA Rules**.
   The Rules tab is displayed by default.

2. In the **Rule Library** panel toolbar, click and select the severity and type of rules that you would like to appear in the Rule Library list. The following figure shows the Filter drop-down list.



The selected rule types appear in the list.

Search for Rules

1. Go to **CONFIGURE > ESA Rules**.
   The Rules tab is displayed by default.
2. In the **Rule Library** panel toolbar, type a rule name in the Filter field.
   The Rule Library panel lists the rules that match the names entered in the Filter field.

Import or Export Rules

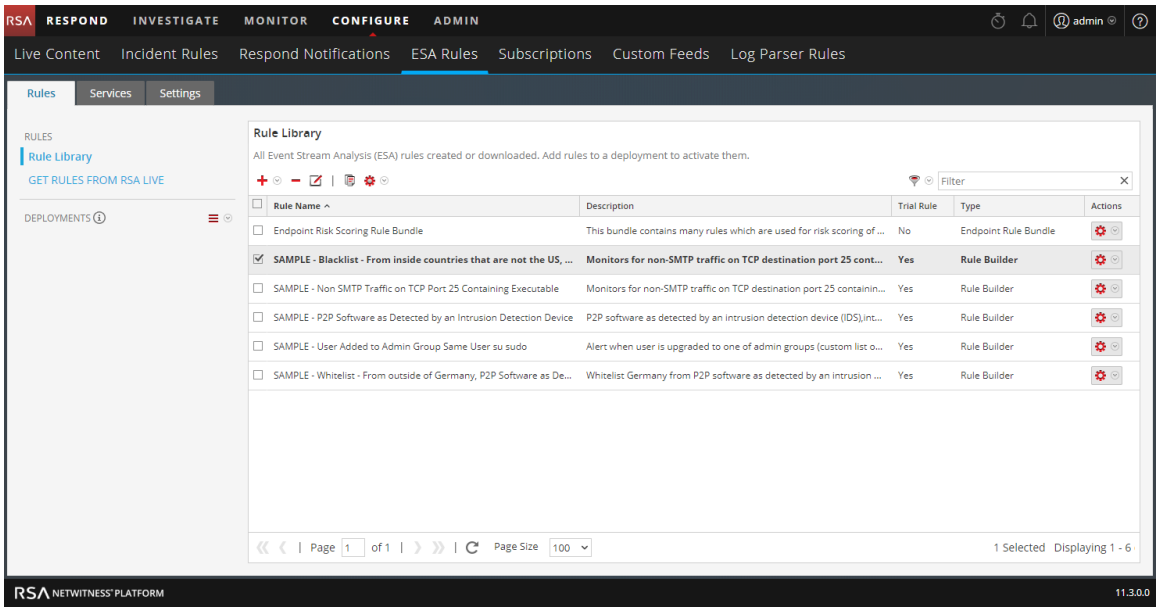
The topic provides instructions to import ESA rules from a NetWitness Platform instance and to export ESA rules to your hard drive so you can keep a local copy.

If you exported a rule in an earlier version of NetWitness Platform, the following conditions apply when you import the rule in version 10.5 or later:

- Exported in version 10.3 – You cannot import rules to version 10.5 or later.
- Exported in version 10.4 – You can import rules to version 10.5 or later.

Import ESA Rules

1. Go to **CONFIGURE > ESA Rules > Rules** tab.
   The Rules tab is displayed.



2. In the **Rules Library** toolbar, select > **Import**.
   The Import ESA Rules dialog is displayed.

3. Click **Browse** to browse and select the file containing the ESA rules.
4. Click **Import**.

Export ESA Rules

1. Select an ESA rule or multiple rules and select > **Export** in the Rule Library toolbar.
   A warning dialog is displayed.
2. Click **Yes**.
   The Export Rules dialog is displayed.
3. In the **Enter File Name** field, type a filename for the file with the ESA rules and click **Export**.
   The file is exported as a binary file to your machine.

Note: The binary file cannot be edited.

Choose How to be Notified of Alerts

This topic explains the different notification methods and how to add a notification method to a rule. Administrator, SOC Manager or DPO role permissions are required for all tasks in this section.

When a rule triggers an alert, ESA can send a notification in the following ways:

- Email
- Syslog
- Script

To configure a notification, you configure these components:

- **Notification Server**: The notification server is the source of the notifications. After you configure a notification server, you can add it to a rule. When the rule triggers an alert, the rule will use that server to send alert notifications.
- **Notifications**: These are the outputs (destinations) of the notifications, which can be email, script, and Syslog. When you design a rule, you can specify the notification for an alert.
- **Templates**: The message format of an alert notification is defined in a template.

If you use an ESA rule that has an enrichment, such as a Context Hub list, you must create a custom template. You can duplicate a default template and adjust it for your enrichment. For more information, see Troubleshoot ESA Rules. For information on creating a custom template, see see "Configure Meta Keys as Arrays in ESA Correlation Rules" in the *System Configuration Guide*.

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Note: ESA SNMP notifications are not supported for NetWitness Platform 11.3 and later.

Alert suppression and alert rate regulation are two features that Event Stream Analysis provides. Alert suppression ensures that multiple emails are not sent out for the same alert. For example, consider a rule to detect failed user logins. If you set the alert suppression to three minutes, you will see only the alerts generated in that time frame. This is fewer than the number of alerts you would see without alert suppression. Some alerts can be duplicates. With alert suppression, emails are not sent for duplicate alerts. This ensures the inbox is not flooded with redundant alert notifications.

Alert rate regulation is a preventive measure to ensure that alerts from misconstrued rules do not flood the system. This ensures that ESA does not send more than the configured limit of emails within one minute.

Notification servers, notifications, and templates are configured in the Administration System view. For more information, see "Configure Notification Servers", "Configure Notification Outputs", and "Configure Templates for Notifications" in the *System Configuration Guide*.

Notification Methods

When a rule triggers an alert, ESA can send a notification in the following ways:

- Email
- Syslog
- Script

Note: ESA SNMP notifications are not supported for NetWitness Platform 11.3 and later.

Email Notifications

ESA Correlation can send notifications to users through email about various system events.

To configure these email notifications, you need to:

- Configure the SMTP email server as an output provider. For instructions, see "Configure the Email Settings as Notification Server" in the *System Configuration Guide*.
- Set up an email account to receive notifications. For instructions, see "Configure Email as a Notification" in the *System Configuration Guide*.
- Configure a template for email notification. For instructions, see "Configure Global Notifications Templates" in the *System Configuration Guide*.

Syslog

Event Stream Analysis can send events and consolidate logs in Syslog format to a Syslog server.

To configure these Syslog notifications, you need to:

- Configure Syslog server settings as an output provider. For instructions, see "Configure a Syslog Notification Server" in the *System Configuration Guide*.
- Configure Syslog message format as an output action. For instructions, see "Configure Syslog as a Notification" in the *System Configuration Guide*.
- Configure a template for Syslog. For instructions, see "Configure Global Notifications Templates" in the *System Configuration Guide*.

Script Alerter

Apart from the alert notifications ESA allows users to run scripts in response to ESA alerts.

Scripts enable you to do custom integration with applications that exist in your environment. For example, if you want to open an incident ticket from an application when a specific alert is triggered, Script Alerter lets you write a script that calls the application API and has ESA invoke it when the specific ESA rule is triggered. You can configure a FreeMarker template to define what details you want to extract from the output of the ESA rule and pass it as command line arguments to the script.

To use the Script Alert, you need to:

- Configure the user identity and other details that are required to execute the script. For instructions, see "Configure Script as a Notification Server" in the *System Configuration Guide*.
- Define the Script. For instructions, see "Configure Script as a Notification" in the *System Configuration Guide*.

- Configure a template for the script. For instructions, see "Configure Global Notifications Templates" in the *System Configuration Guide*.

Add Notification Method to a Rule

This topic tells administrators how to add a notification, such as email, to a rule. ESA uses the notification method when it generates an alert for an event that meets rule criteria.

You add a notification to a rule so ESA can let you know when a rule triggers an alert. Although the notification fields are not required, it is a best practice to add a notification to a rule.

When you add a notification method to a rule, you select the following information:

- Output
- Notification
- Notification Server
- Template

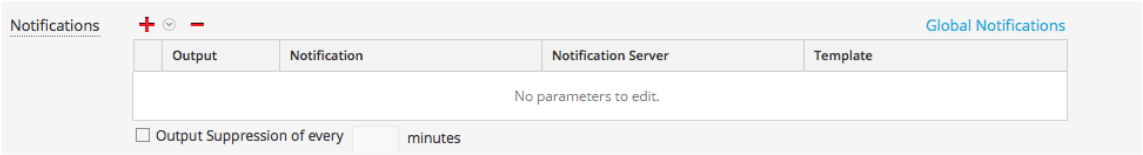
Prerequisites

- Your role must have permission to manage rules.
- The rule must exist.
- The notification method must be configured with a supported server and template:
  Go to **ADMIN > System > Global Notifications**.

  For detailed procedures, see the *System Configuration Guide*.

Add a Notification Method to a Rule

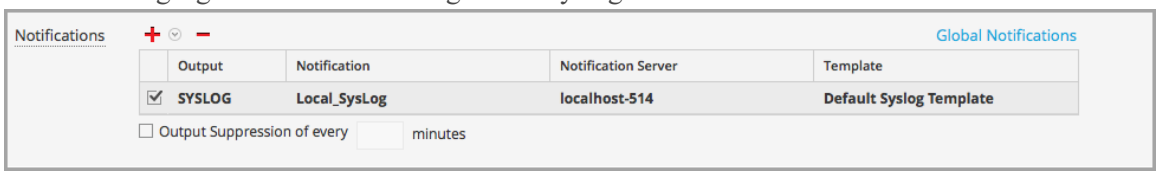
1. Go to **CONFIGURE > ESA Rules > Rules** tab.
2. In the **Rule Library**, click to add a new rule or select an existing rule and click .
   Depending on the rule type, the Rule Builder or Advanced EPL tab is displayed.
   The Notifications section is the same for both tabs.



3. Click and select the **Output** for the alert:
   - Email
   - SNMP (This option is not supported in NetWitness Platform 11.3 and later.)

- Syslog
- Script

4. Double-click the **Notification** field and select the name of a previously configured output.
   For example, Level 1 Analyst could be the name of an email notification that goes to the L1-Analysts email distribution group.
5. Double-click the **Notification Server** field and select the server that sends the notification.
6. Double-click the **Template** field and select a format for the alert.
   The following figure shows the settings for a Syslog notification.

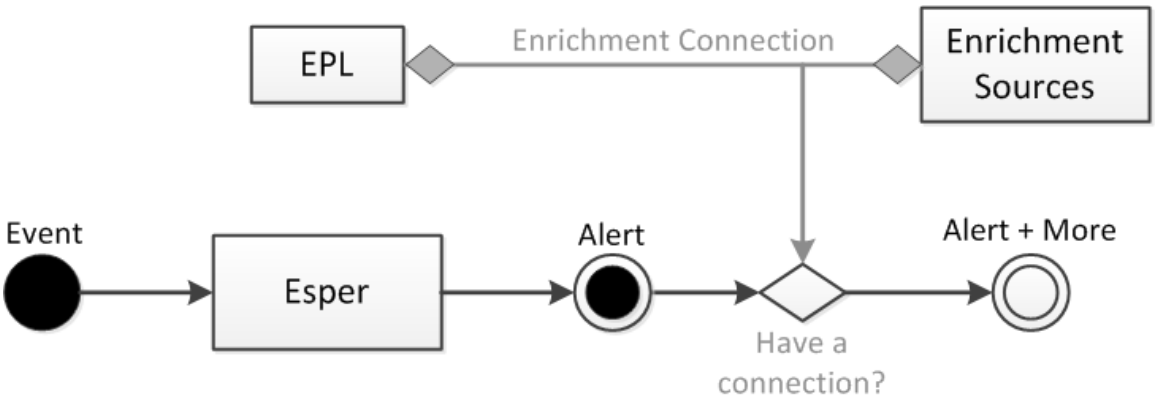


7. If you want to specify frequency, select **Output Suppression**, then enter the number of **minutes**.
8. If you want to add another notification, repeat steps 3-7.
9. Click **Save**.
   When ESA generates an alert for an event that matches the rule criteria, you will be notified of the alert via each notification method added to the rule.

Add a Data Enrichment Source

This topic tells how to add a previously configured enrichment source to a rule. When ESA creates an alert, information from the source gets included in it.

Enrichments provide the ability to include contextual information into correlation logic and alert output. Without enrichments, all information included in an ESA alert is from a Core service. With enrichments, you can request for look ups into a variety of sources and include the results into the outgoing alerts. The following figure illustrates the enrichment feature.



Enrichment configuration is made up of two logical units:

- Enrichment Sources – These are data stores of contextual information.
- Enrichment Connections – These act as connectors between alert meta and source columns.

ESA allows you to make connections between Event Processing Language (EPL) statements and enrichment sources. Once the connections are established, the system joins the selected fields from the alert output with the information in the sources and uses the matching data to enrich the alert that is sent out. ESA can connect with the following sources:

- Esper Named Windows
- MaxMindGeoIP Database

Note: The geoIP enrichment source can neither be created nor deleted. It is provided out of the box to the user.

Sample Rule with Enrichment

The following sample rule illustrates the enrichment feature provided by ESA:

```
@RSAAlert @Name("simple") SELECT * FROM CoreEvent(ec_theme='Login Failure')
```

The rule generates an alert for every logon failure and thus if the following (simplified) event stream is received at ESA:

sessionid	ec_theme	username	ip_src	ip_dst	host_dst
1	Login Success	dshrute	23.xx.23x.16		
2	Login Failure	jhalpert	23.xx.23x.16	31.1x.x9.1x8	www.facebook.com

An alert with the following constituent `events` might be generated in response to the second session:

```
{
     "events": [
          {
               "username": "jhalpert",
               "host_dst": "www.facebook.com",
               "ip_dst": "31.1x.x9.1x8",
               "sessionid": 2,
               "ec_theme": "Login Failure",
               "esa_time": 1406148964130,
               "ip_src": "23.xx.23x.16"
          }
     ]
 }
```

The JSON output shows all the information available for inclusion into an ESA notification using an appropriate FreeMarker template. For instance, the template expression `${events[0].username}` would evalute to `jhalpert`.

With enrichments, the same module, with the same event stream, can generate the alert shown below. The system can make multiple enrichment connections and pull contextual data to make the alert more meaningful.

For example:
`${events[0]["RSADataScienceLookup"][0].score}` gives the **"risk"** score of the destination domain computed by the RSA Warehouse Analytics module while `${events[0]["orgchart"][0].supervisor}` gives the name of the supervisor of the employee that the alert pertains to (pulled from an HR database) and `${events[0]["LoginRegister"][0].username}` gives the name of the user with the last successful logon from the same `ip_src` (using a stream based Named Window).

```
{"events": [
     {
          "username": "jhalpert",
          "host_dst": "www.facebook.com",
          "GeoIpLookup": [
          {
               "city": "Cambridge",
               "longitude": -71,
               "countryCode": "US",
               "areaCode": 617,
               "metroCode": 506,
               "region": "MA",
               "dmaCode": 506,
               "ipv4Obj": "/23.62.236.16",
               "countryName": "United States",
               "postalCode": "02142",
               "ipv4": "23.62.236.16",
               "latitude": 42,
               "organization": "Verizon Business"
          }
     ],
     "RSADataScienceLookup": [
          {
               "model_id": "suspiciousDomains_1",
```

```
            "_id": "EXEC_BATCH_1_20140630153740_facebook.com",
            "score": 10,
            "key": "www.facebook.com"
        }
    ],
    "orgchart": [
        {
            "supervisor": "mscott",
            "name": "James Halpert",
            "extension": 3692,
            "location": "Scranton",
            "department": "Sales",
            "id": "jhalpert"
        }
    ],
    "ip_dst": "31.13.69.128",
    "sessionid": 2,
    "LoginRegister": [
        {
            "username": "dshrute",
            "ip_src": "23.62.236.16"
        }
    ],
    "ec_theme": "Login Failure",
    "esa_time": 1406155218912,
    "ip_src": "23.62.236.16"
    }
]}
```

Enrichment Sources

This topic explains options for adding an external data source to provide additional information in alerts. Enrichment sources provide additional information in alerts. For example, an in-memory table can provide a full name, title, office location, and employee number if a user matches rule criteria. The following types of enrichment sources are available:

- Context Hub List (Preferred)
- In-Memory Table
- GeoIP

Note: Database, Database Connection, and Warehouse Analytics as enrichment sources are not supported for the ESA Correlation service in NetWitness Platform 11.3 and later.

RSA recommends that you use Context Hub List enrichment sources instead of In-Memory Table enrichment sources. You can share Context Hub List enrichment sources across the NetWitness Platform. You can only use the In-Memory Table with ESA.

Note: The geoIP enrichment source can neither be created nor deleted. It is provided out of the box to the user.

Configure In-Memory Table as an Enrichment Source

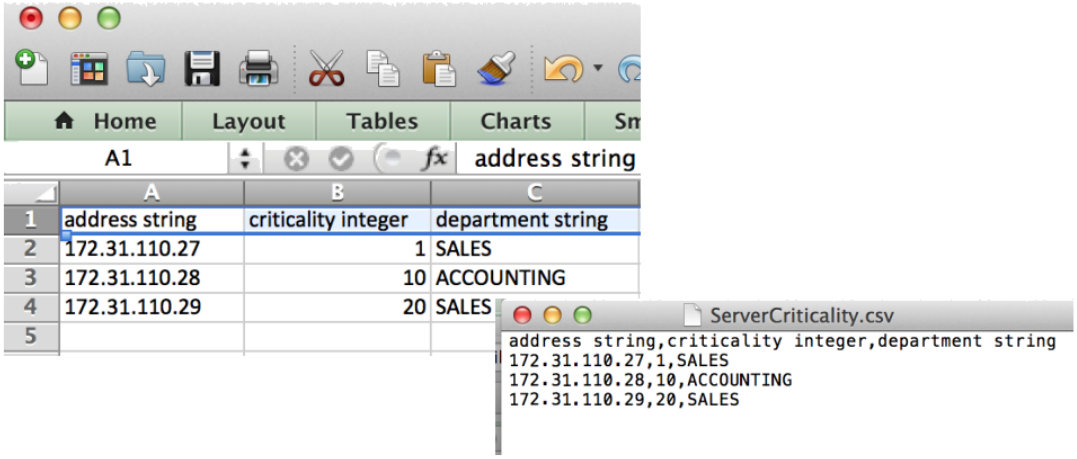
This topic provides instructions on how to configure an in-memory table. When you configure an in-memory table, you upload a .CSV file as an input to the table. You can associate this table with a rule as an enrichment source. When the associated rule generates an alert, ESA will enrich the alert with relevant information from the in-memory table.

For example, a rule could be configured to detect when a user tries to download freeware and to identify the person by user ID in the alert. The alert could be enriched with additional information from an in-memory table that contains details such as full name, title, office location and employee number.

Prerequisites

- The column name in the .CSV file cannot have whitespace characters.
  For example *Last_Name* is correct, and *Last Name* is incorrect.
- The .CSV file must begin with a header line that defines fields and types.
  For example, *address string* would define the header field as *address*, and the type as *string*.

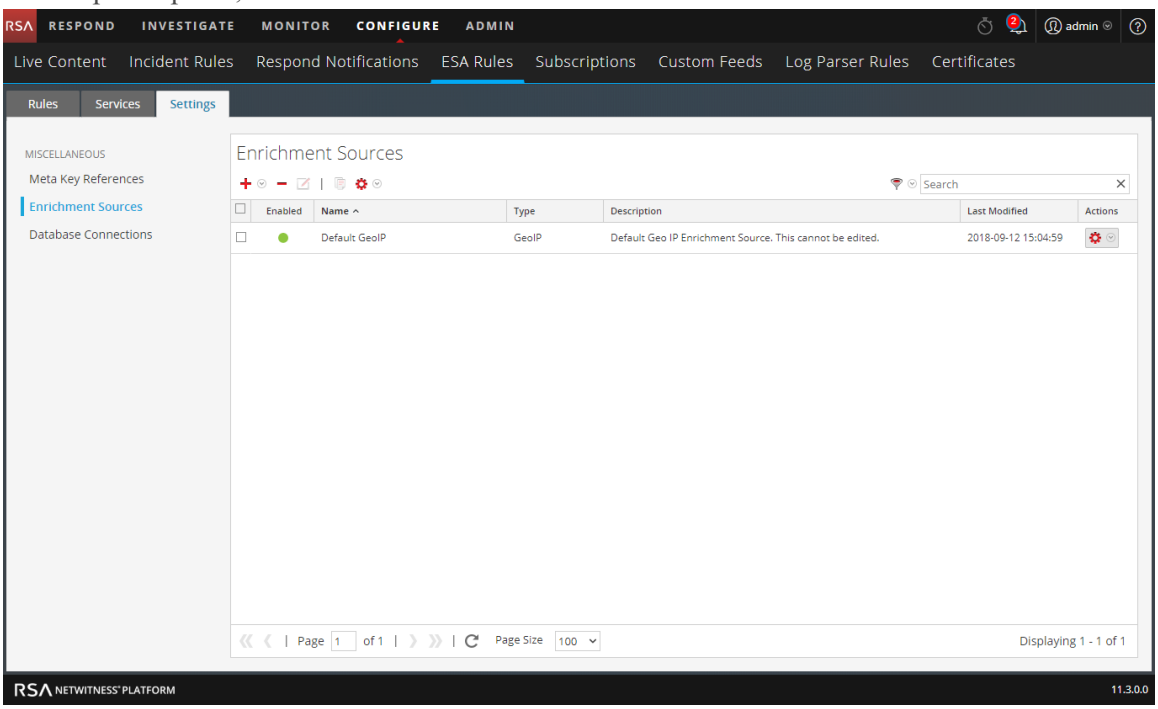
The following shows a valid .CSV file represented as a .CSV and as a table.



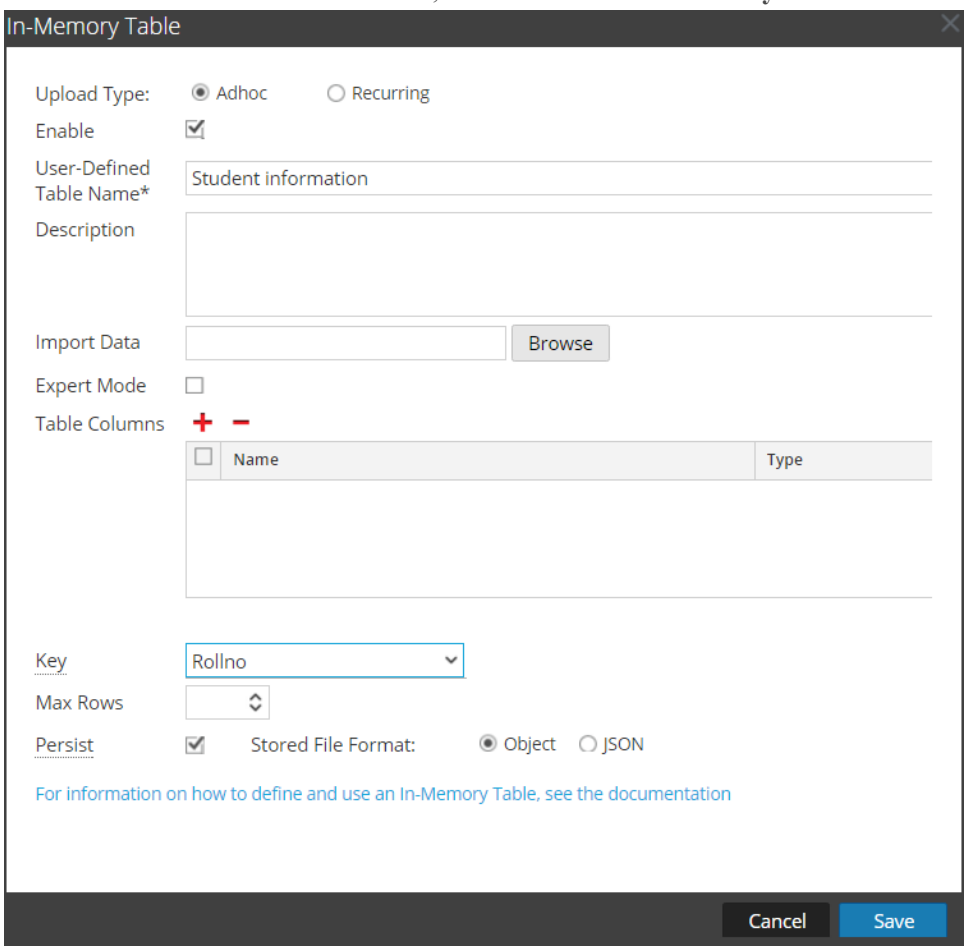
Configure an Ad hoc In-Memory Table

1. Go to **CONFIGURE > ESA Rules**.
   The Configure view is displayed with the ESA Rules tab open.
2. Click the **Settings** tab.

3. In the options panel, select **Enrichment Sources**.



4. In the **Enrichment Sources** section, click + > **In-Memory Table**.



5. Describe the in-memory table:
   a. Select **Ad hoc**.
   b. By default, **Enable** is selected. When you add the in-memory table to a rule, alerts will be enriched with data from it.
      If you add an in-memory table to a rule but do not want alerts to be enriched, deselect the checkbox.
   c. In the **User-Defined Table Name** field, type a name, such as Student Information, for the in-memory table configuration.
   d. If you want to explain what the enrichment adds to an alert, type a **Description** such as:
      When an alert is grouped by Rollno, this enrichment adds student information, such as name and marks.
6. In the **Import Data** field, select the .CSV file that will feed data to the in-memory table.
7. If you want to write an EPL query to define an advanced in-memory table configuration, select **Expert Mode**.
   The Table Columns are replaced by a **Query** field.

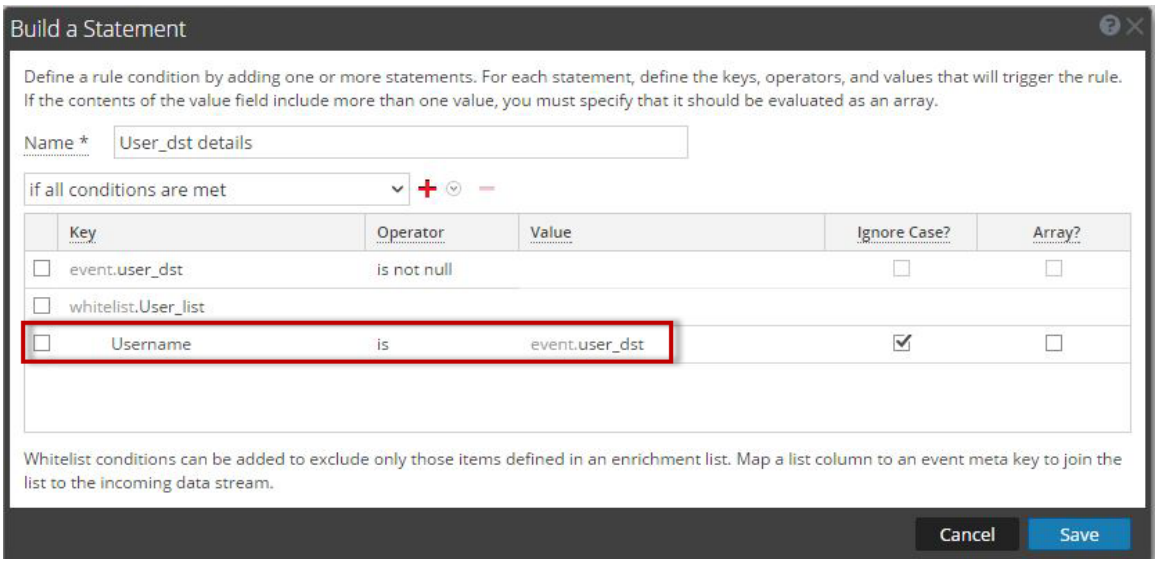
8. In the **Table Columns** section, click + to add columns to the in-memory table.
9. If a valid file is selected in the Import Data field, the columns populate automatically.

Note: If you selected Expert mode, a Query field is displayed instead of Table Columns.

10. In the **Key** drop-down menu, select the field to use as the default key to join incoming events with the in-memory table when using a CSV-based in-memory table as an enrichment. By default, the first column is selected. You can also later modify the key when you open the in-memory table in enrichment sources.
11. In **Max Rows** drop-down menu, select the number of maximum number of rows that can reside in the in-memory table at a particular instance.
12. Select **Persist** to preserve the in-memory table on disk when the ESA service stops and to re-populate the table when the service restarts.
13. In **Stored File Format** field, do one of the following:
    - Select **Object**, if you want to store the file in a binary format.
    - Select **JSON**, if you want to store the file in a text format.
      By default, **Object** is selected.
14. Click **Save**.
    The adhoc in-memory table is configured. You can add it to rule as an enrichment or part of the rule condition. See Add an Enrichment to a Rule.

When you add an in-memory table, you can add it to a rule as an enrichment or as a part of the rule condition. For example, the following rule uses an in-memory table as a part of the rule condition to create a whitelist, and it also uses an in-memory table of details in the user_dst file to enrich the alert that is displayed.

The rule shows the in-memory table as a whitelist rule condition:

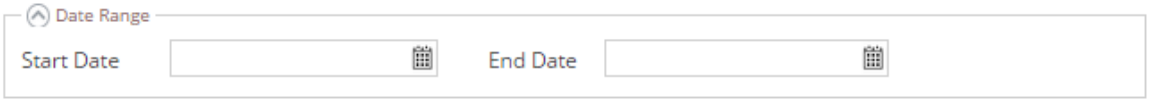


Next, the alert is enriched with the User_list in-memory table:

Therefore, the user_dst in-memory table is used to create a whitelist, and it is also used to enrich the data in the alert if the alert is triggered.

Add a Recurring in-Memory Table

1. Go to **CONFIGURE > ESA Rules**.
   The Configure view is displayed with the ESA Rules tab open.
2. Click the **Settings** tab.
3. In the options panel, select **Enrichment Sources**.
4. Click > **In-Memory Table**.
5. Describe the in-memory table:
   a. Click **Recurring**.
   b. By default, **Enable** is selected. When you add the in-memory table to a rule, alerts will be enriched with data from it.
      If you add an in-memory table to a rule but do not want alerts to be enriched, deselect the checkbox.
   c. In the **User-Defined Table Name** field, type a name, such as Student Information, for the in-memory table configuration.
   d. If you want to explain what the enrichment adds to an alert, type a **Description** such as:
      When an alert is grouped by Rollno, this enrichment adds student information, such as name and marks.
6. Type the URL of the .CSV file that will feed data to the in-memory table. Click Verify to validate the link and populate the columns in the .CSV file. You can add or remove columns using the plus or minus button.
7. If the server is configured behind another server, select **Use Proxy**.
8. If the server requires logon credentials, select **Authenticated**
9. For **Recur Every**, indicate how frequently ESA must check for the most recent .CSV:
   a. Select Minute(s), Hour(s), Day(s), or Week.
   b. If you select Week, select a day of the week.
   c. Click **Date Range** to select a **Start Date** and **End Date** for the recurring schedule.



10. In the **Key** drop-down menu, select the field to use as the default key to join incoming events with the in-memory table when using a CSV-based in-memory table as an enrichment. By default, the first

column is selected. You can also later modify the key when you open the in-memory table in enrichment sources.

11. In **Max Rows** drop-down menu, select the number of rows that can reside in the in-memory table at a particular instance.
12. Select **Persist** to preserve the in-memory table on disk when the ESA service stops and to re-populate the table when the service restarts.
13. In **Stored File Format** field, do one of the following:
    - Select **Object**, if you want to store the file in a binary format.
    - Select **JSON**, if you want to store the file in a text format.
      By default, **Object** is selected.
14. Click **Save**.
    The recurring in-memory table is configured. You can add it to rule as an enrichment or part of the rule condition. See Add an Enrichment to a Rule.

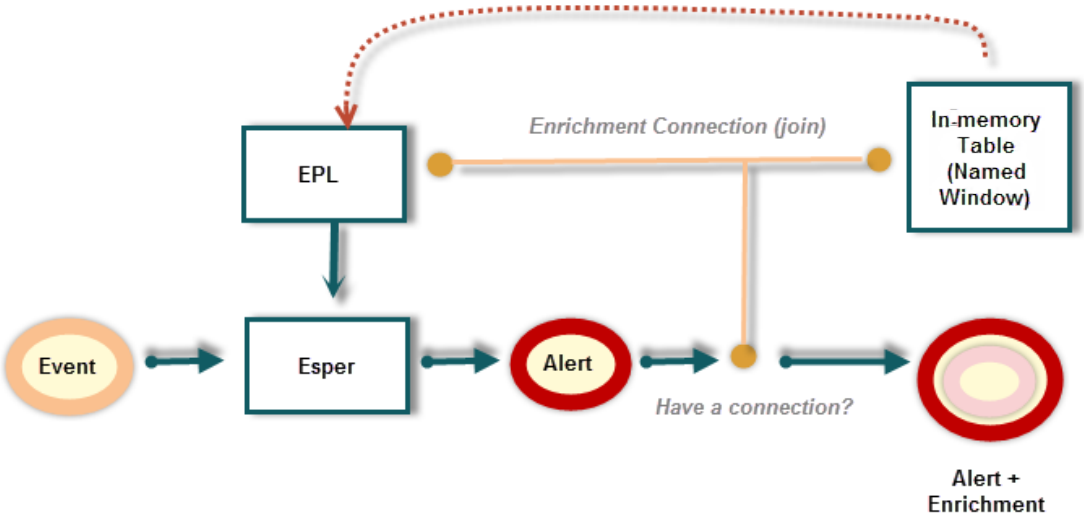
Configuring an Esper Query as an Enrichment Source

When you use "expert mode," you can create an enrichment source or named window based on an Esper query. This allows you to have more control over the content and create more dynamic content. When you do this, an EPL query constructs the named window to capture interesting state from event stream.

Workflow

The following shows the workflow for creating a query using a named window:

1. The event is sent to the Esper Engine.
2. An EPL query is generated.
3. An alert is triggered.
4. The query checks to see if there is a connection between the event and the Named Window.
5. If there is a connection, the query that populates the Named Window is run and populated.
6. The content from the Named Window is added to the alert content and sent or displayed (depending on your settings).



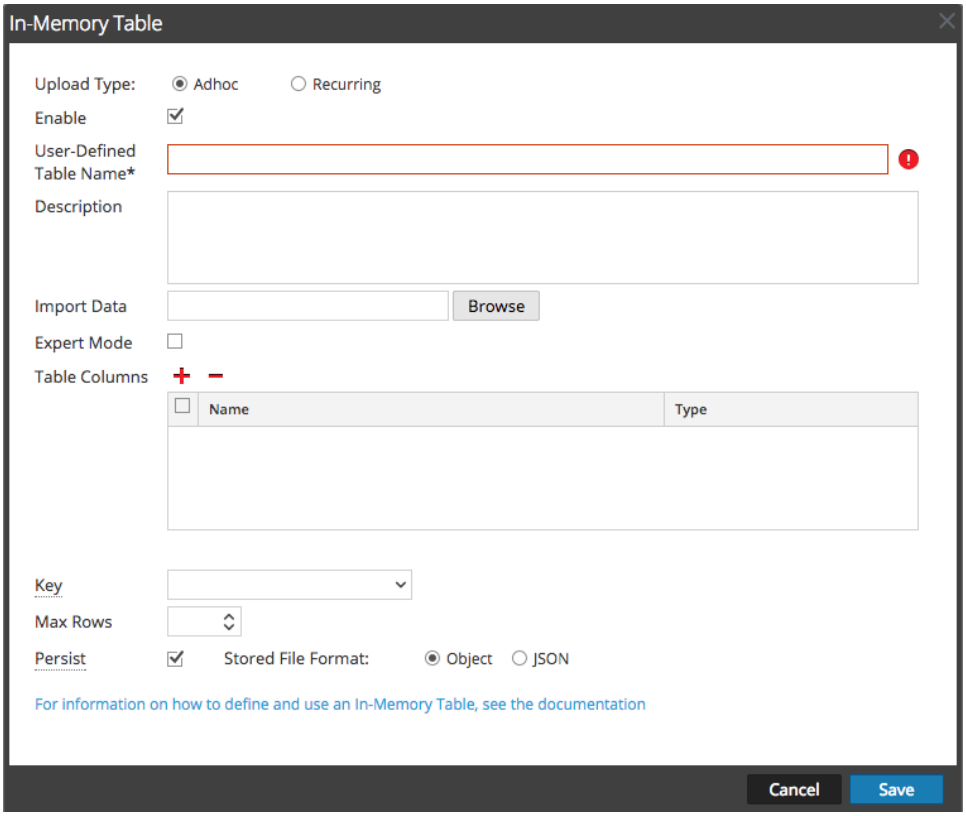
Prerequisites

- The meta used in the EPL statement must exist in the data.
- You must create well-formed EPL statements.

Configure an In-Memory Table Using an EPL Query

1. Go to **CONFIGURE > ESA Rules**.
   The Configure view is displayed with the Rules tab open.
2. Click the **Settings** tab.
3. In the options panel, select **Enrichment Sources**.

4. In the **Enrichment Sources** section, click > **In-Memory Table**.



5. Select **Adhoc**.
   By default, Enable is selected. When you add the in-memory table to a rule, alerts will be enriched with data from it.
6. In the **User-Defined Table Name** field, type a descriptive name to describe the in-memory table.
7. If you want to explain what the enrichment adds to an alert, enter information in the **Description** field.
   This description displays when you view the list of enrichments from the Enrichment Sources view, so it's a good idea to enter a thorough description as a best practice. Doing this allows other users to understand the content of the enrichment without opening it to examine its contents.
8. Select **Expert Mode** to define an advanced in-memory table configuration by writing an EPL query. The Table Columns are replaced by a **Query** field.
9. Select **Persist** to preserve the in-memory table on disk when the ESA service stops and to re-populate the table when the service restarts.
10. Enter the EPL query in the **Query** field. The query should be well-formed, and it's a good idea to test it before entering it in the field.
11. Click **Save**.

Example

For example, you created a rule that searches for five failed attempted logins followed by a successful login. When that rule is triggered, you may want the notification to contain information about the last user logged into the system when this successful login occurred. To add this enrichment to the notification, you might choose to create a stream-based in-memory lookup table that is populated from incoming events to maintain a mapping of IP addresses to the last user logged in from that address. To do this, you create an enrichment using a query as your source.

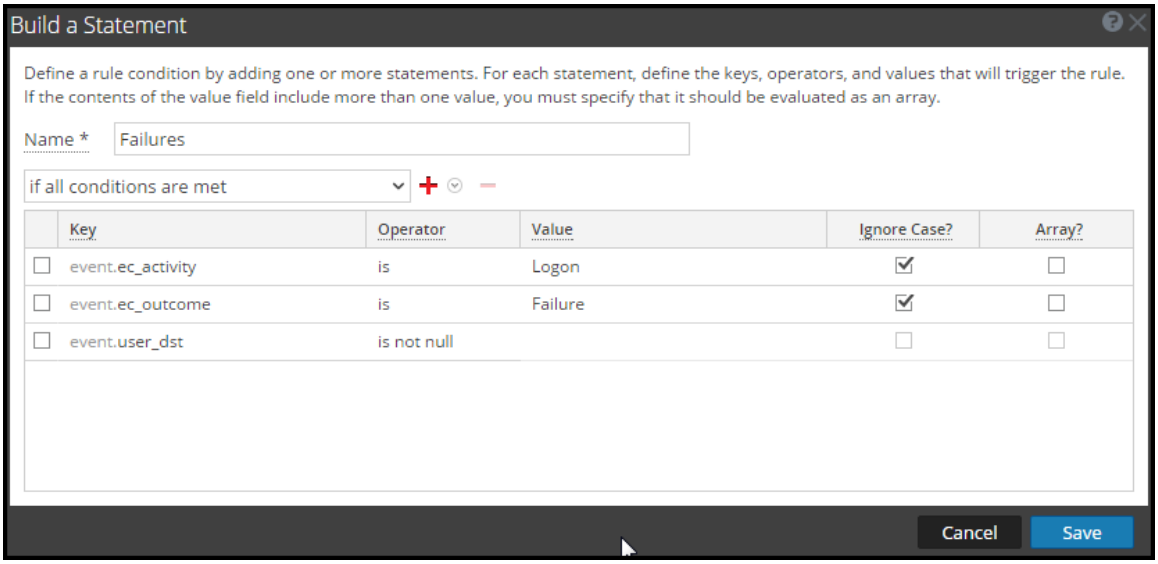
Step 1: Create Your Rule

First, you need to create your correlation rule. In this case, you create failure and success rule conditions, and group by the ip_src.

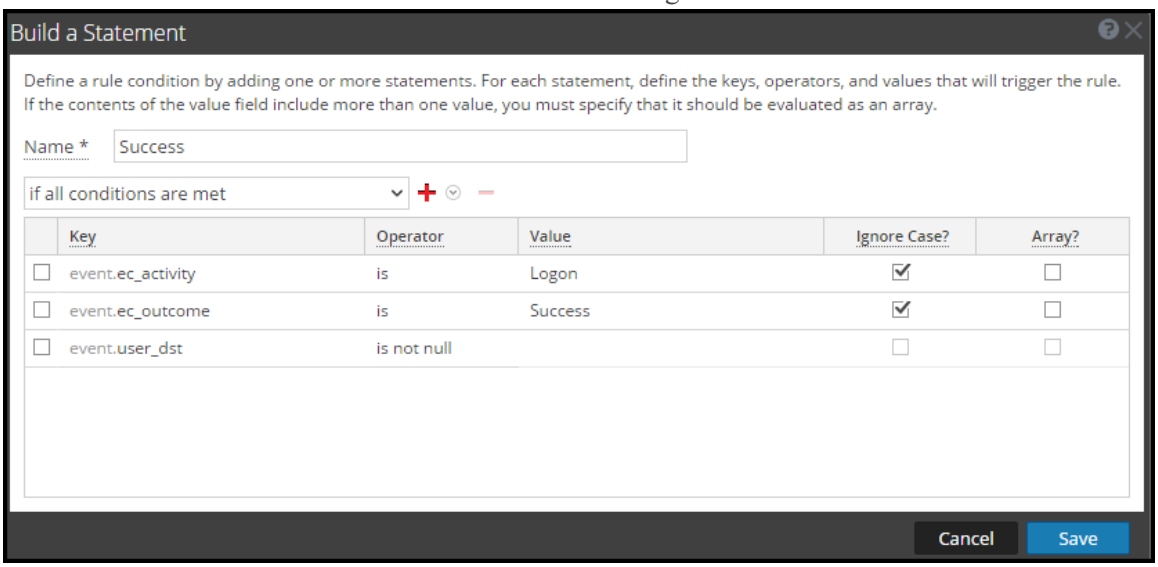
Rule Condition	Description
Failures	This condition searches for five failed logins with a "followed by" connector, meaning that the condition (Failures) must be followed by the next condition (Success).
Success	This condition searches for one successful login.
GroupBy: ip_src, device class	The GroupBy field ensures that all the previous conditions are grouped by the ip_srcand device class. This is important to the construction of the rule because the rule attempts to find a case where a user has attempted to log into the same destination account multiple times, and finally logged in successfully. Grouping by device class ensures that the user logged in from the same machine attempted to log into an account multiple times. The rule may give unexpected results if you do not group the results.
Occurs within 5 minutes	The time window for the events to occur is five minutes. If the events occur outside of this time window, the rule does not trigger.
Event Sequence: Strict	The event sequence is configured for a strict pattern match. This means that the pattern must match exactly as it is specifiedwith no intervening events.

For the rule conditions, you create the following statements:

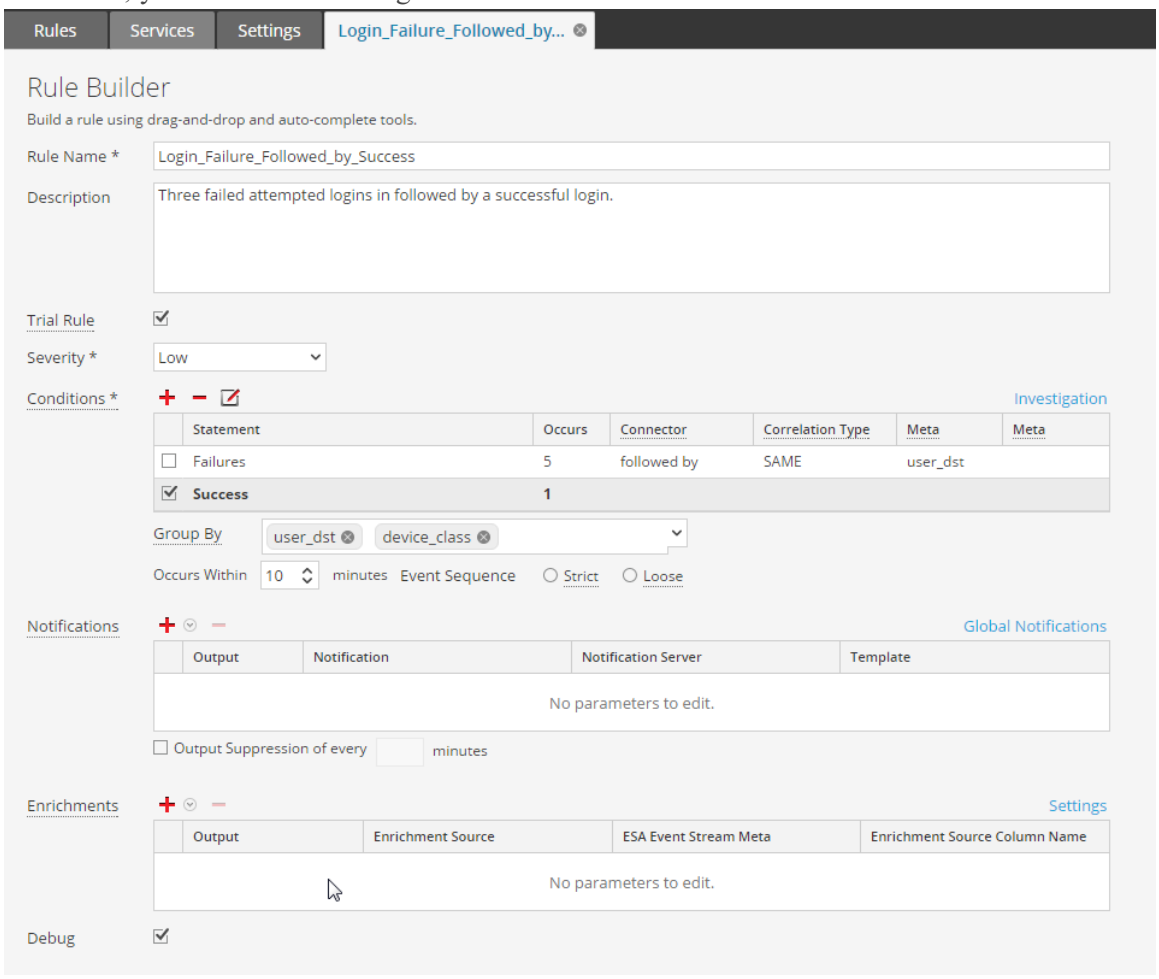
- The "Failures" statement searches for failed login attempts:



- The "Success" statement searches for one successful login:



- Combined, you have the following correlation rule:

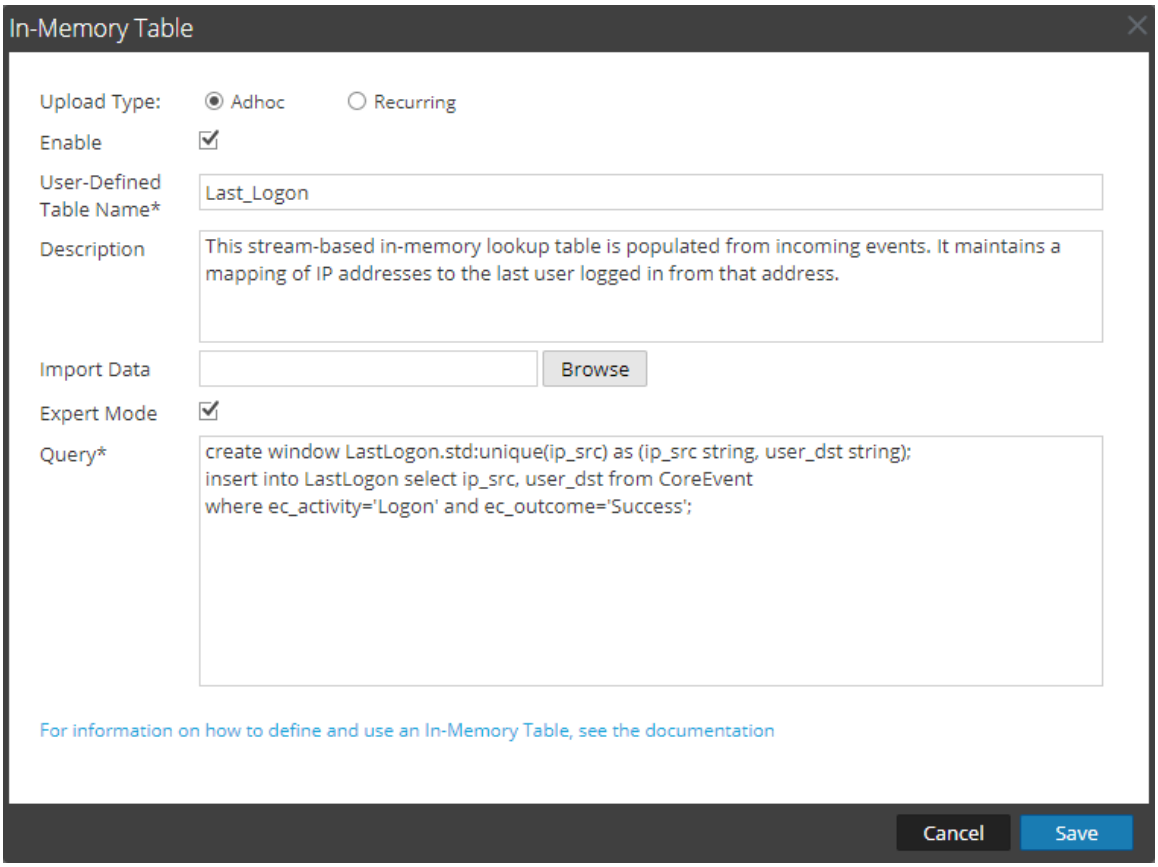


Step 2: Create the Enrichment

Now that you have created your rule, you need to create the enrichment to add to the notification output. Follow the steps above to create the enrichment, name it *Last_Logon*, and add the following query:

```
create window LastLogon.std:unique(ip_src) as (ip_src string, user_dst
string);
insert into LastLogon select ip_src, user_dst from CoreEvent
where ec_activity='Logon' and ec_outcome='Success';
```

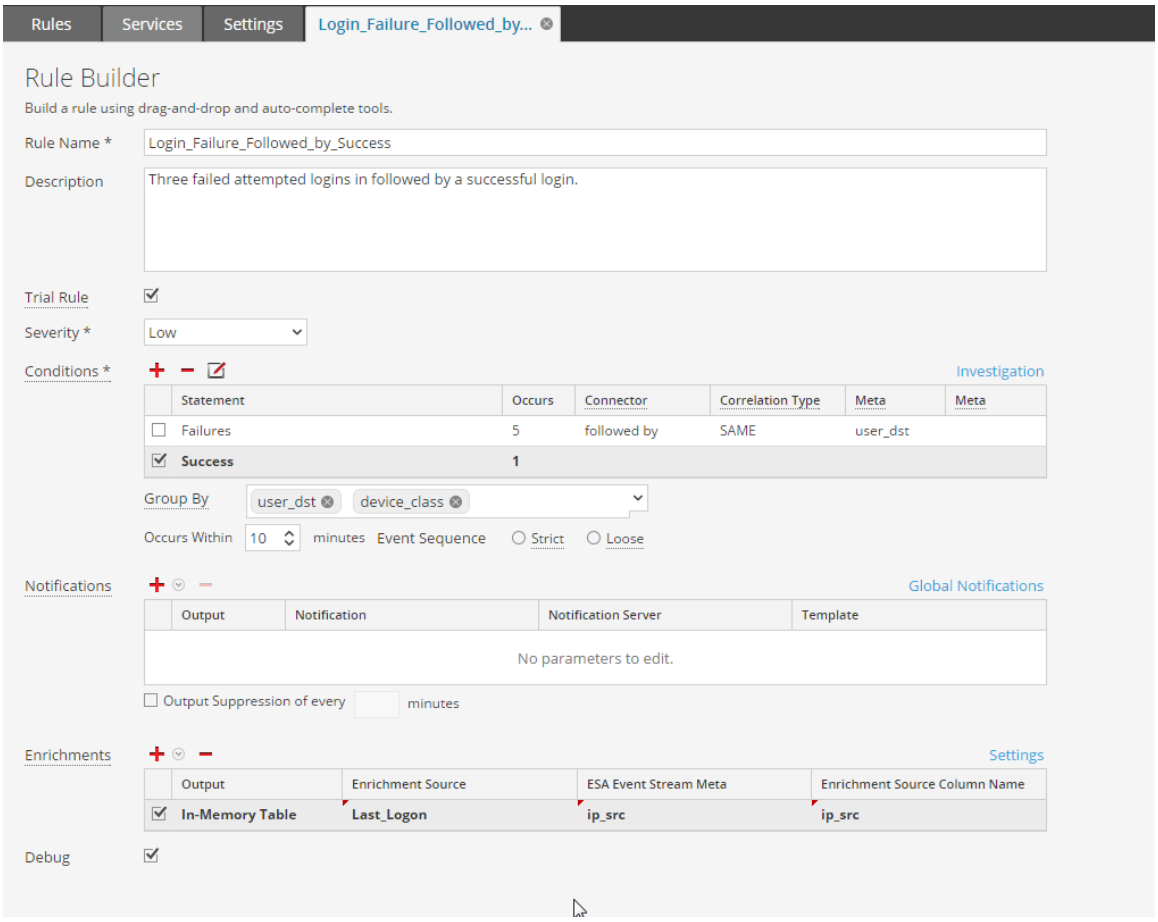
The enrichment should look like the following:



Step 3: Add the Enrichment to the Rule

Now that you have created your basic rule and your enrichment, you'll need to add the enrichment to the rule and join (or connect) the enrichment to the meta in the rule.

Open the Login_Failure_Followed_by_Success rule for editing.



Field	Enter	Description
Output	In-Memory Table	The In Memory Table option creates a Named Window, which can be populated with the EPL query data.
Enrichment Source	Last_Logon (the enrichment you created above).	This is the stream-based in-memory lookup table that is populated from incoming events to maintain a mapping of IP addresses to the last user logged in from that address.
ESA Event Stream Meta	ip_src	This is an event stream meta that you can join to the enrichment data you are populating. Essentially, ip_src is the join condition .
Enrichment Source Column Name	ip_src	This is the meta from the enrichment that you can join to the event stream data. It must be the same as join condition from the Event Stream Meta field.

Once you have added the enrichment, you can save the rule.

When the rule is triggered, the ESA runs the query in the enrichment and populates the Named Window with the data. If the data in the Named Window matches the join condition, the data is added to the output you can view in Email, Syslog or Script, depending on how you configured notifications.

Configure Context Hub List as an Enrichment Source

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

This topic provides instructions on how to configure a Context Hub list as an enrichment source for ESA. Once a Context Hub list is added as an enrichment source, analysts can use the configured list as a statement condition when creating an ESA rule. Any changes made to the list from within Context Hub are automatically reflected in the enrichment source in real-time. For example, you could create a list of IP addresses in Context Hub and then use that list as either a blacklist or whitelist as part of a correlation rule condition. Any subsequent changes made to the IP list in Context Hub will be reflected in the enrichment source in real-time, to ensure the correlation rule operates with a constantly updating set of information.

Prerequisites

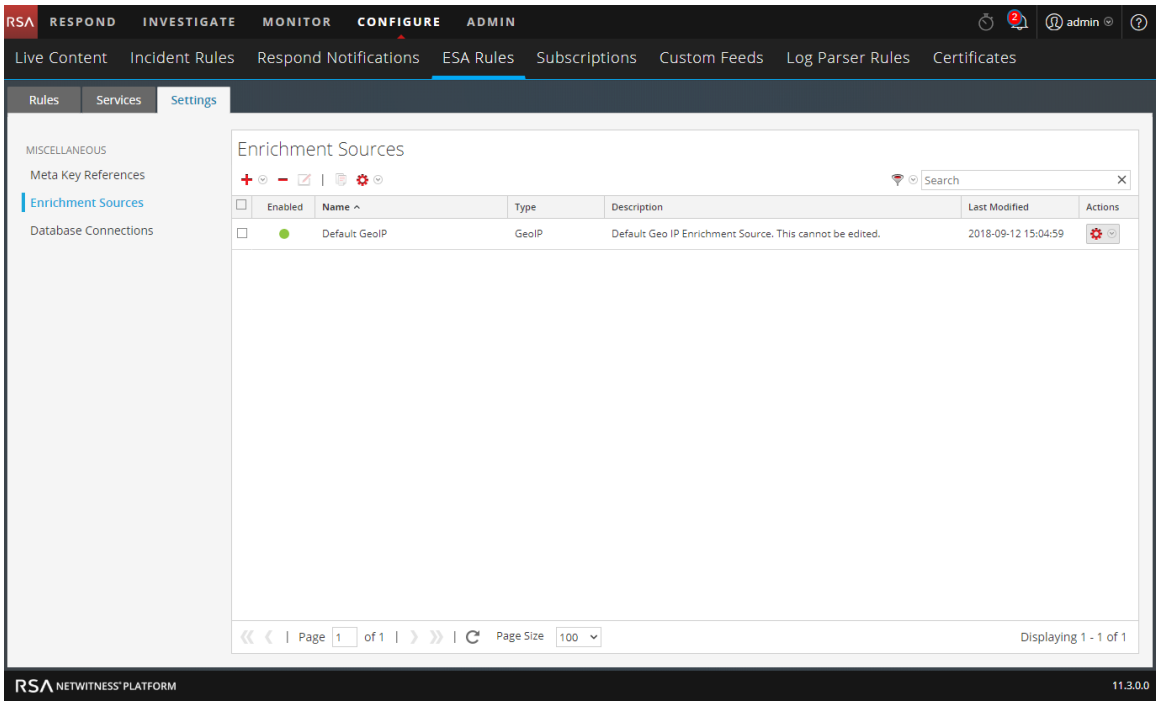
Before configuring a Context Hub list as an enrichment source, the list must first be created as a data source in Context Hub. Any list created in Context Hub is supported and the lists may contain string or numeric values, including IP addresses. For information on creating a list as a data source in Context Hub, see the *RSA NetWitness Context Hub Configuration Guide*.

Caution: When creating a Context Hub list for use as an enrichment source, the list name and its field names cannot include any spaces or special characters, or start with a number. If you do not follow this naming convention, when you attempt to add the list as an enrichment source in ESA, an error message will be displayed and you will not be allowed to add the list.

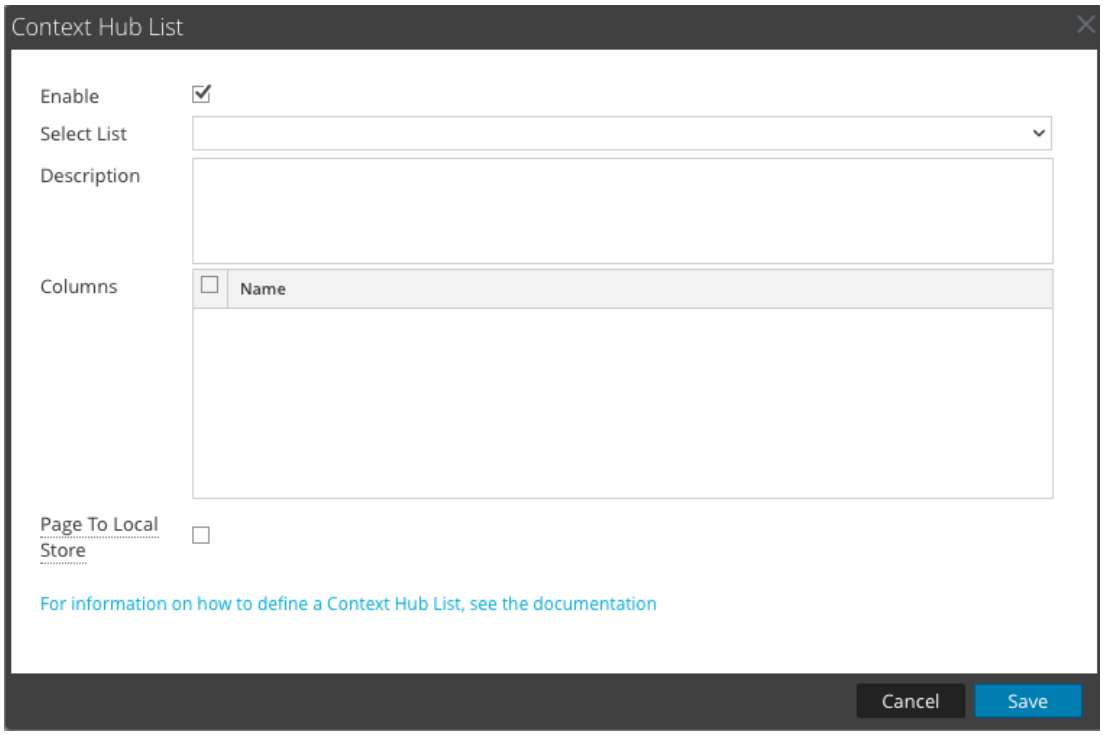
Configure a Context Hub List as an Enrichment Source

1. Go to **CONFIGURE > ESA Rules > Settings** tab.
2. In the options panel, select **Enrichment Sources**.

   The Enrichment Sources panel is displayed.



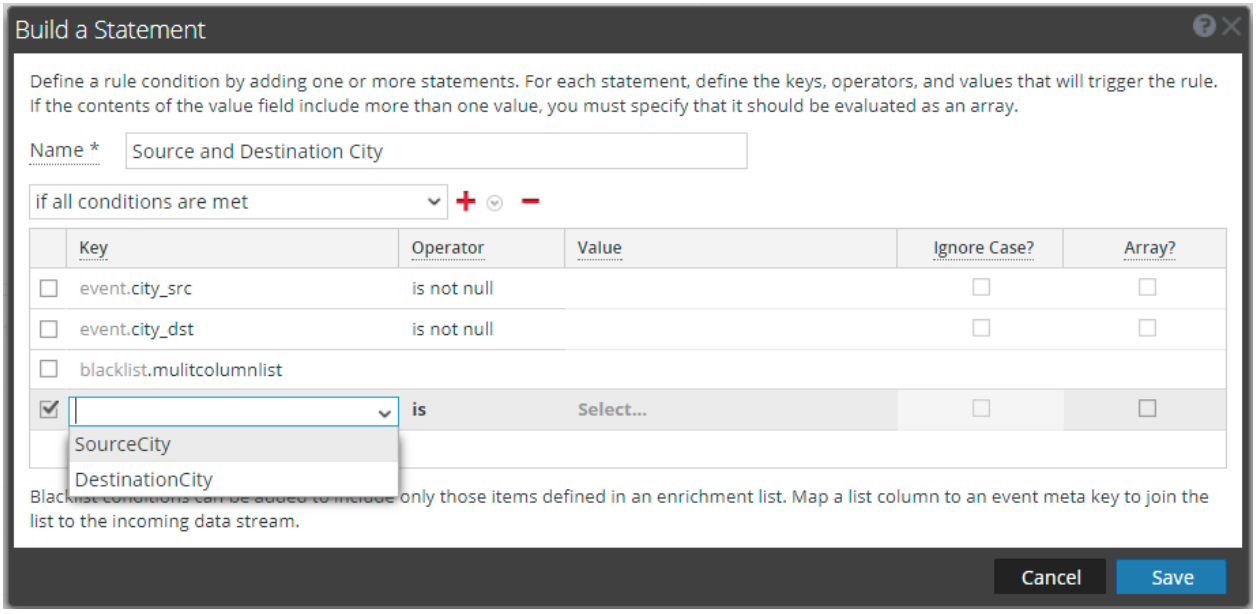
3. From the drop-down menu, select **Context Hub**.



4. Select **Enable** to enrich alerts with a Context Hub list. This is selected by default. If disabled, the alerts will not be enriched with the configured Context Hub list.
5. Select the desired Context Hub list from the **Select List** drop-down menu of pre-configured lists.

6. (Optional) In the **Description** field, type a brief description about the selected Context Hub list. The text entered here is displayed on the Enrichment Sources panel.
7. In the **Columns** field, all columns included in the selected Context Hub list are listed. Click to enable or disable the columns in the list that you wish to include when using this list as an enrichment source in an alert.
8. (Optional) Click to enable the **Page To Local Store** option. This option is useful if you have a very large list and performance is affected. If this is the case, enabling this option will write a copy of the Context Hub list to the local disk to improve performance.
9. Click **Save**.
   The Context Hub list is configured. You can now add it to an ESA rule as part of a condition statement as either a blacklist or a whitelist condition.

The following figure illustrates adding a Context Hub list as part of a condition statement. In this example, a context Hub list named "multicolumnlist" was added as a blacklist condition. The list contains two columns, SourceCity and DestinationCity. The next step would be to select one of the column names as the subcondition and then specify the operator and enter the meta value for the corresponding value field.



For complete details for adding a whitelist or blacklist to a condition statement, see Step 2. Build a Rule Statement.

To add a Context Hub list as a condition to an existing rule, select to edit the desired rule in the Rule Library, then add a condition in the Conditions section and select to add a whitelist or blacklist condition to the new condition statement.

Add an Enrichment to a Rule

This topic tells how to add a previously configured enrichment source to a rule. When ESA creates an alert, information from the source gets included in it.

Adding an enrichment to a rule allows you to request for look ups into a variety of sources and include the results in the outgoing alerts, giving you a more detailed alert. This procedure requires role permissions for Administrator, DPO, and SOC Manager.

Note: This procedure does not apply to adding a Context Hub list as an enrichment to a condition statement in an existing rule. For information see Configure Context Hub List as an Enrichment Source.

To add an enrichment to a rule:

1. Go to **CONFIGURE > ESA Rules**.
2. In the **Rule Library** view, do one of the following:
   - Double-click a rule.
   - Select a rule and click in the **Rule Library** toolbar.

   The Rule Builder panel is displayed in a new NetWitness Platform tab.
3. In the **Enrichments** section, click and select any of the following enrichment types:
   - In-Memory Table
   - GeoIP

   Note: If you use a GeoIP source, ipv4 is automatically populated, and is not editable.

   The enrichment types that you have selected are displayed in the table.
4. For the added enrichment type, perform the following:
   - In the **Output** column, select the type that you have configured.
   - In the **Enrichment Source** drop-down list, select the enrichment source defined.
   - In the **ESA Event Stream Meta** field, type the event stream meta key whose value will be used as one operand of join condition.

     
   - In the **Enrichment Source Column Name** field, type the enrichment source column name whose value will be used as another operand of the join condition.
5. Select **Debug**. This will add a @Audit('stream') annotation to the rule. This is useful when debugging the esper rules.
6. Click **Show Syntax** to test if the defined ESA rule is valid.
7. Click **Save**.

For details on parameters and their descriptions, see Rule Builder Tab.

Deploy Rules to Run on ESA

This topic explains how to select an ESA service and the rules to run on it. Administrator, SOC Manager or DPO role permissions are required for all tasks in this section.

To create an ESA rule deployment, you need to perform the steps described in ESA Rule Deployment Steps

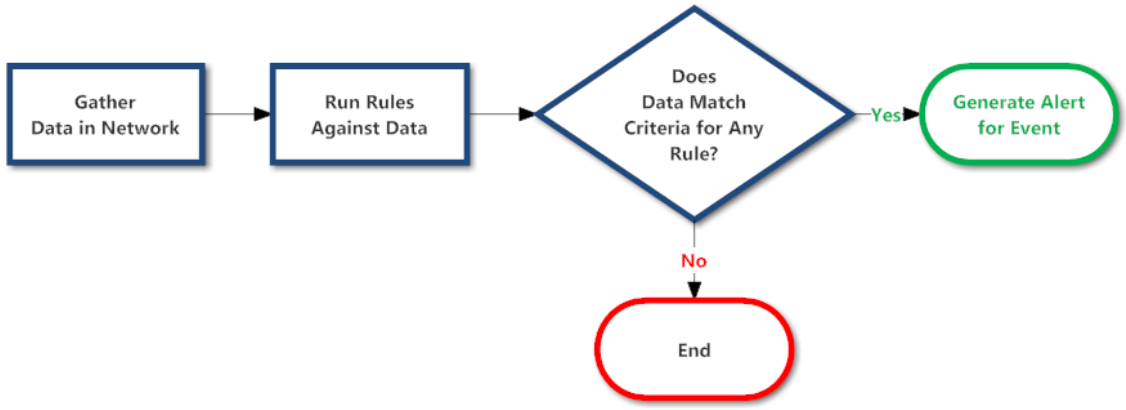
How an ESA Rule Deployment Works

An ESA rule deployment consists of an ESA service, one or more data sources, and a set of ESA rules. When you deploy rules, the ESA service runs them to detect suspicious or undesirable activity in your network. Each ESA rule detects a different event, such as when a user account is created and deleted within one hour.

The ESA service performs the following functions:

1. Gathers **data** in your network
2. Runs ESA **rules** against the data
3. Applies rule **criteria** to data
4. Generates an **alert** for the captured event

The following graphic shows this workflow:



In addition, you may want to perform other steps on your deployment, such as replacing an ESA service, changing a data source, editing or deleting a rule from the deployment, renaming or deleting the deployment, or showing updates to the deployment. For descriptions of these procedures, Additional ESA Rule Deployment Procedures.

ESA Rule Deployment Steps

This topic explains how to add an ESA rule deployment, which includes an ESA service with its associated data sources and a set of ESA rules. You can add an ESA rule deployment to organize and manage ESA services and rules. Think of the deployment as a container for these components:

1. An ESA service
2. One or more data sources (This is available in version 11.3 and later.)
3. A set of ESA rules

For example, if you add a Spam Activity deployment it could include an ESA London service, Concentrators with the appropriate data, and a set of ESA rules to detect suspicious email activity.

Note: An ESA rule deployment can have only one ESA service. You can, however, use the same ESA service in multiple deployments.
In NetWitness Platform version 11.2 and earlier, the ESA service is the Event Stream Analysis service. In version 11.3 and later, it is the ESA Correlation service.

To add an ESA rule deployment, you need to complete the following procedures:

- Step 1. Add an ESA Rule Deployment
- Step 2. Add an ESA Service
- Step 3. Add Data Sources
- Step 4. Add and Deploy Rules

Step 1. Add an ESA Rule Deployment

Prerequisites

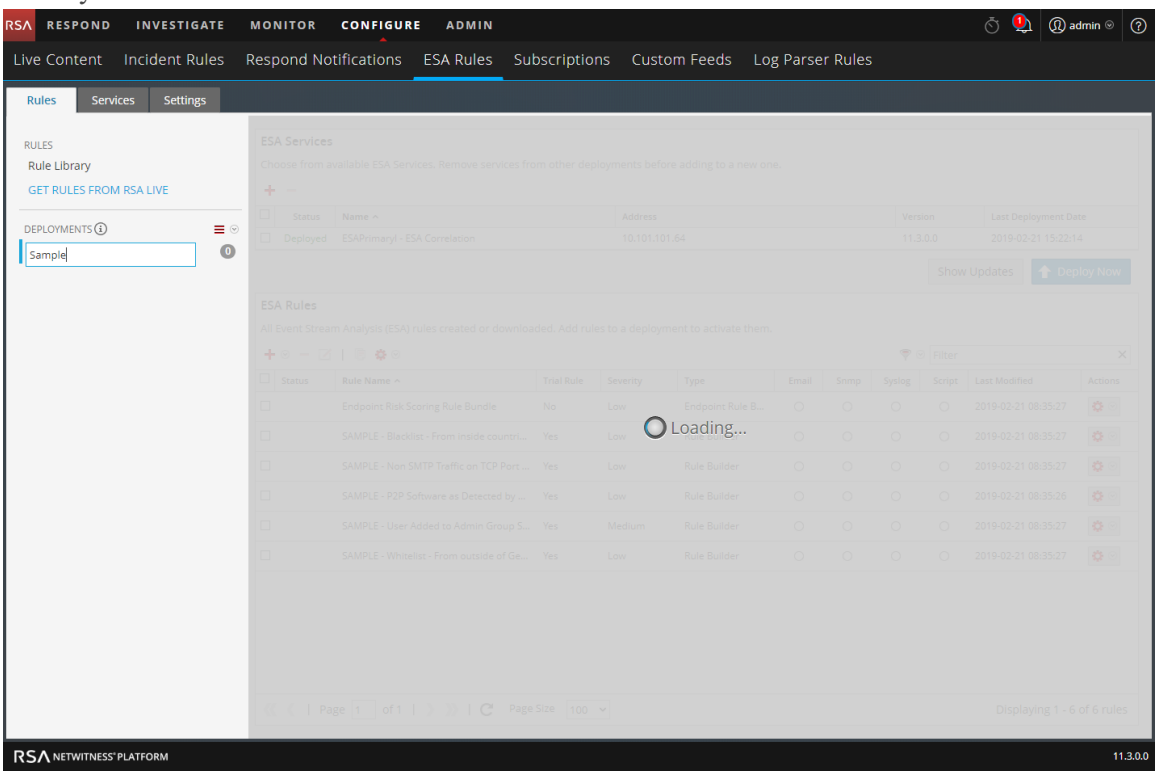
The following are required to add an ESA rule deployment:

- The ESA service must be configured on the host.
- Rules must be in the Rule Library. See Add Rules to the Rule Library.

To add an ESA rule deployment:

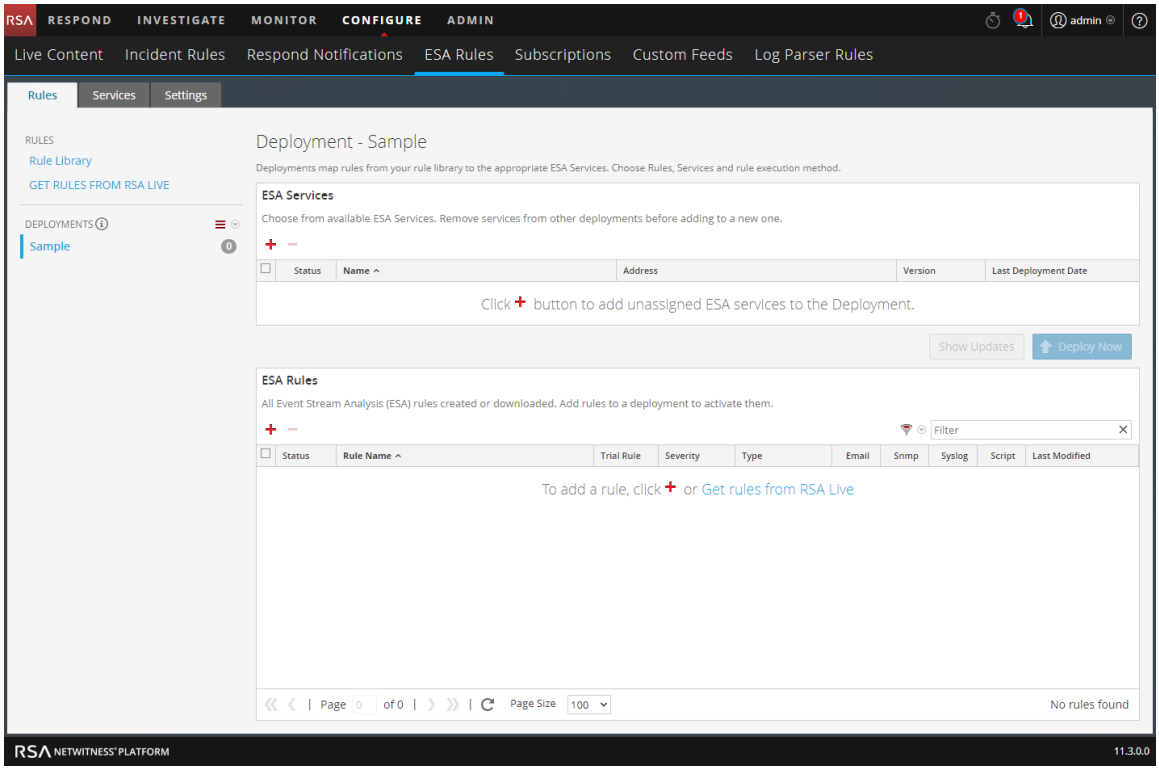
1. Go to **CONFIGURE > ESA Rules**.
   The Rules tab is displayed.
2. In the options panel on the left, next to Deployments, select **> Add** and type a **name** for the deployment. The naming convention is up to you. For example, it could indicate the purpose or

identify an owner.



In NetWitness Platform 11.3 and later, the deployment names that you choose appear on the deployment tabs in the **ADMIN > ESA Rules > Services** tab.

3. Press **Enter**.
   The deployment is added. The Deployment view is displayed on the right.



Step 2. Add an ESA Service

The ESA service in an ESA rule deployment gathers data in your network and runs ESA rules against the data. The goal is to capture events that match rule criteria, then generate an alert for the captured event.

An ESA rule deployment can have only one ESA service. You can, however, use the same ESA service in multiple deployments. For example, ESA London could be in these deployments simultaneously:

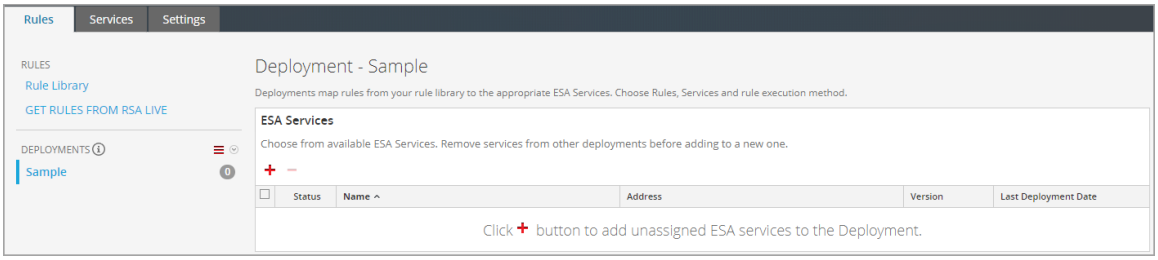
- Deployment EUR, which includes one set of rules
- Deployment CORP, which includes another set of rules.

Changes made to an ESA rule deployment do not take effect until you click Deploy Now. For example, Deployment EUR could include the ESA London service and a set of 25 rules. If you replace the ESA London service with the ESA Paris service, the next time you deploy Deployment EUR, the 25 rules will be removed from ESA London and added to ESA Paris.

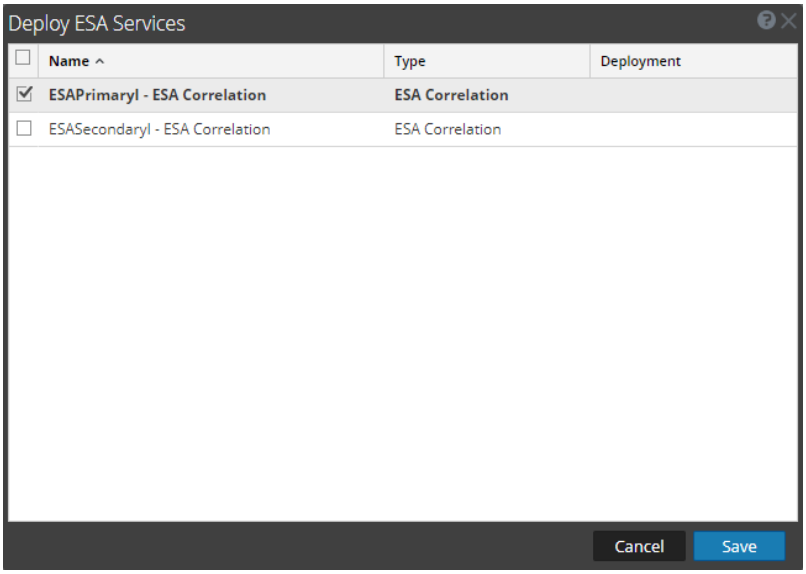
Deleting an ESA rule deployment immediately removes the rules from the ESA service. If an ESA service is not part of any deployment, the ESA service does not have any rules.

To add an ESA service:

1. Go to **CONFIGURE > ESA Rules > Rules** tab.
2. In the options panel, select a deployment:

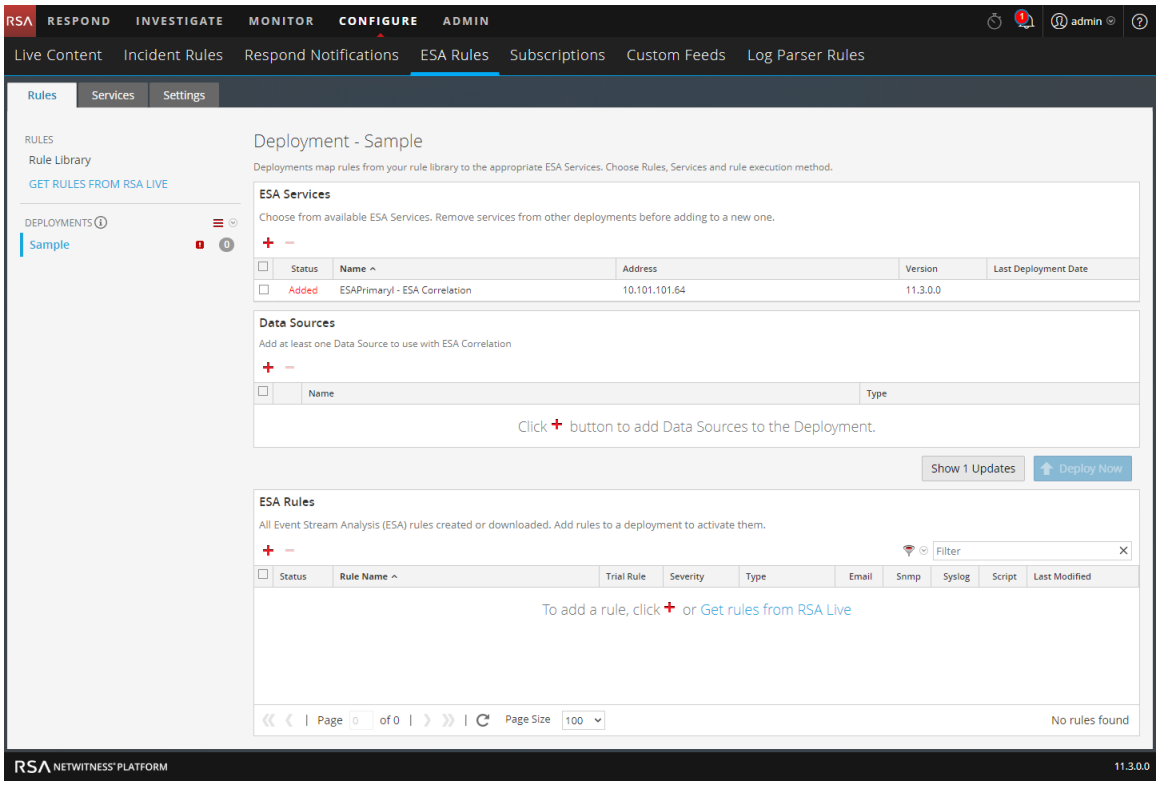


3. In the **Deployment** view, click + in **ESA Services**.
   The Deploy ESA Services dialog lists each configured ESA.



4. Select an ESA service and click **Save**.
   The Deployment view is displayed. The ESA service is listed in the **ESA Services** section, with the

status **Added**.



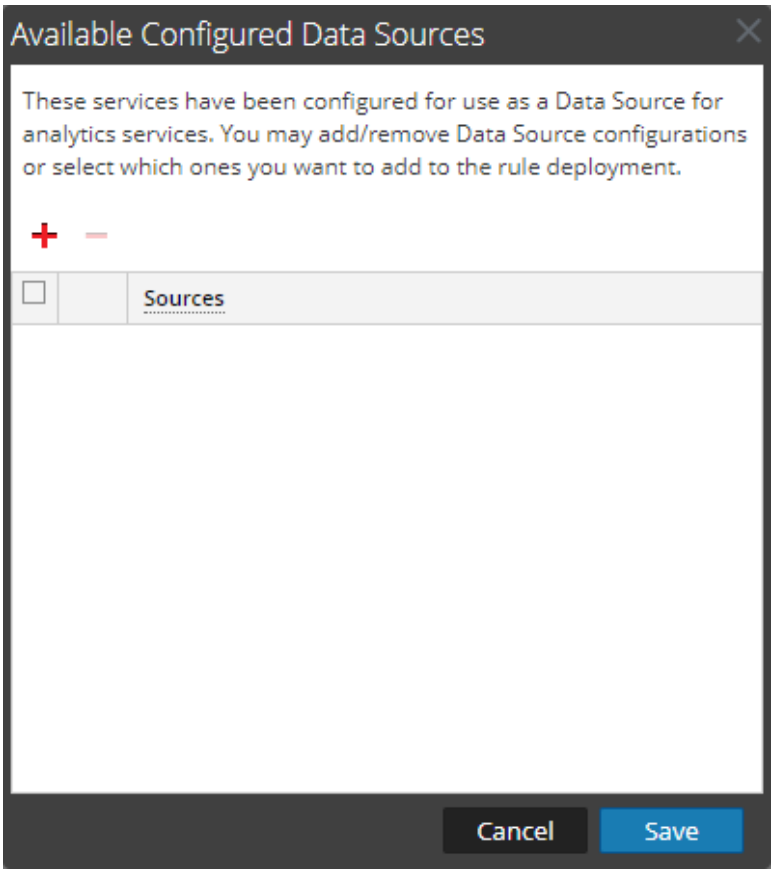
Step 3. Add Data Sources

Note: This option is available in version 11.3 and later.

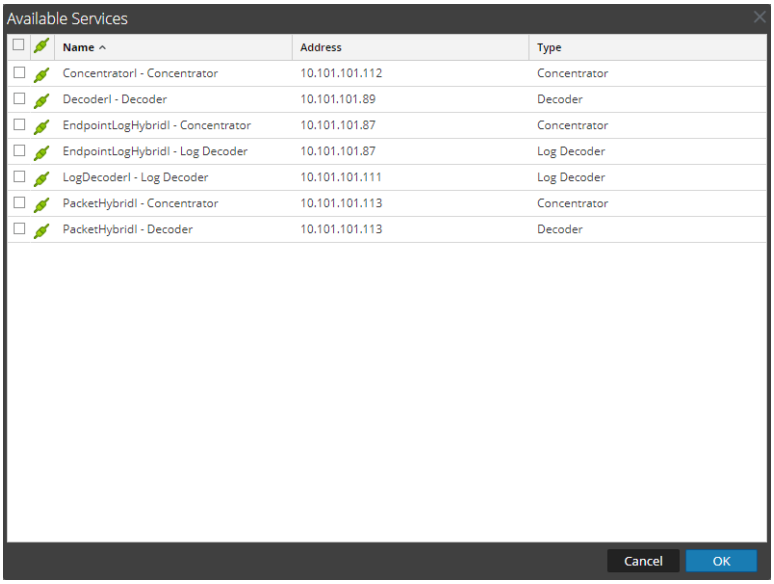
You can select one or more data sources, such as Concentrators, to use for your selected ESA Service. This enables you to specify different data sources for each deployment. For example, you may want to use Concentrators with HTTP packet data in one deployment and Concentrators with HTTP log data in another deployment.

1. Go to **CONFIGURE > ESA Rules > Rules** tab.
2. In the options panel, select a deployment.
3. Configure one or more data sources for your deployment. Do the following for each data source:

   a. In the **Deployment** view **Data Sources** section, click + .
   The **Available Configured Data Sources** dialog lists the services that have been configured for use as a data source.



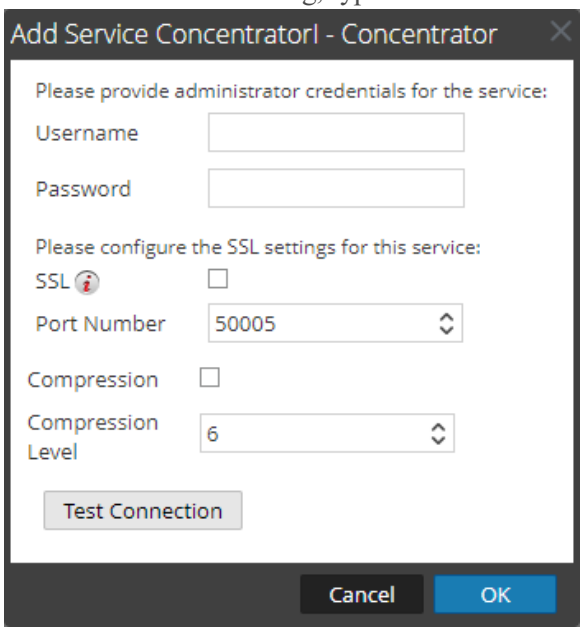
b. To add a data source configuration, click + .
The **Available Services** dialog lists the available data sources from the ADMIN > Services view, such as Concentrators.



Note: You can add a Log Decoder as a data source for ESA, but it is better to add a Concentrator to take advantage of undivided aggregation as the Decoder may have other processes aggregating from it.

c. In the **Available Services** dialog, select a data source, such as a Concentrator, and click **OK**.

d. In the **Add Service** dialog, type the Administrator username and password for the data source.



e. To enable the SSL or Compression options, select the corresponding checkboxes.

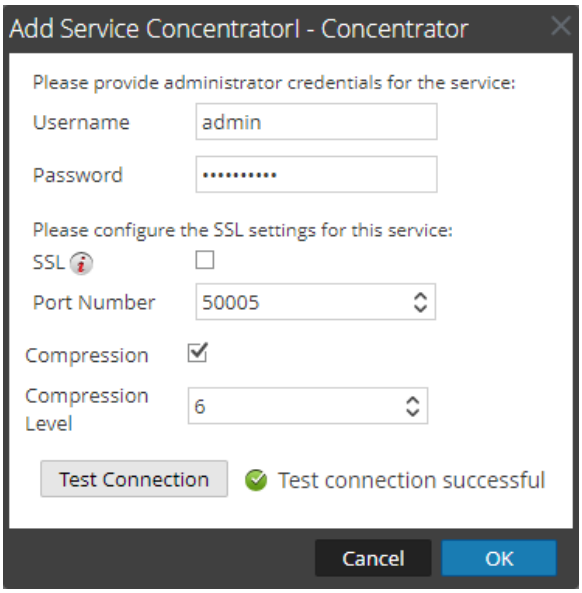
f. (Optional) You have the option to adjust the Compression Level for Concentrators on ESA in NetWitness Platform 11.3 and later. To enable compression, select the **Compression** checkbox. You can set the **Compression Level** for a Concentrator from 0-9:

- Compression Level = **0** (If compression is enabled, it allows Core Services to control the amount of compression.)
- Compression Level = **1** (It uses the lowest amount of compression and has the highest performance.)
- Compression Level = **9** (It uses the highest amount of compression and has the worst performance.)

Somewhere in the middle between 1 and 9 is usually the best setting, which is what you get when you select a compression level of 0. For more detailed information, see the *Core Database Tuning Guide*.

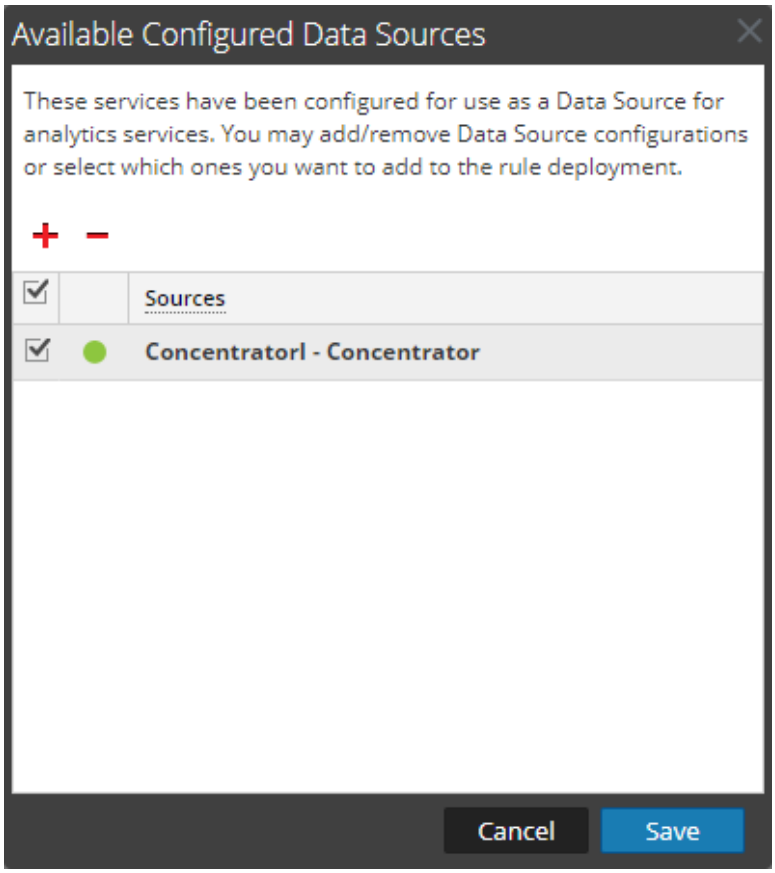
Note: When you set the compression level for a Concentrator on ESA, it sets the same compression level for that Concentrator for ESA Correlation Rules and ESA Analytics.

g. Click **Test Connection** to make sure that it can communicate with the ESA service.



h. Click **OK**.
After you configure your data sources and they appear in the **Available Configured Data Sources** dialog, you can use them for your deployment.

4. In the **Available Configured Data Sources** dialog, select at least one data source to use for the deployment.



A solid colored green circle indicates a running service and a white circle indicates a stopped service.

5. Click **Save**.
   In the Deployment view **Data Sources** section, the selected data sources are added to the deployment. The **Deploy Now** button activates after an ESA service, a data source, and rules are added to an ESA rule deployment.

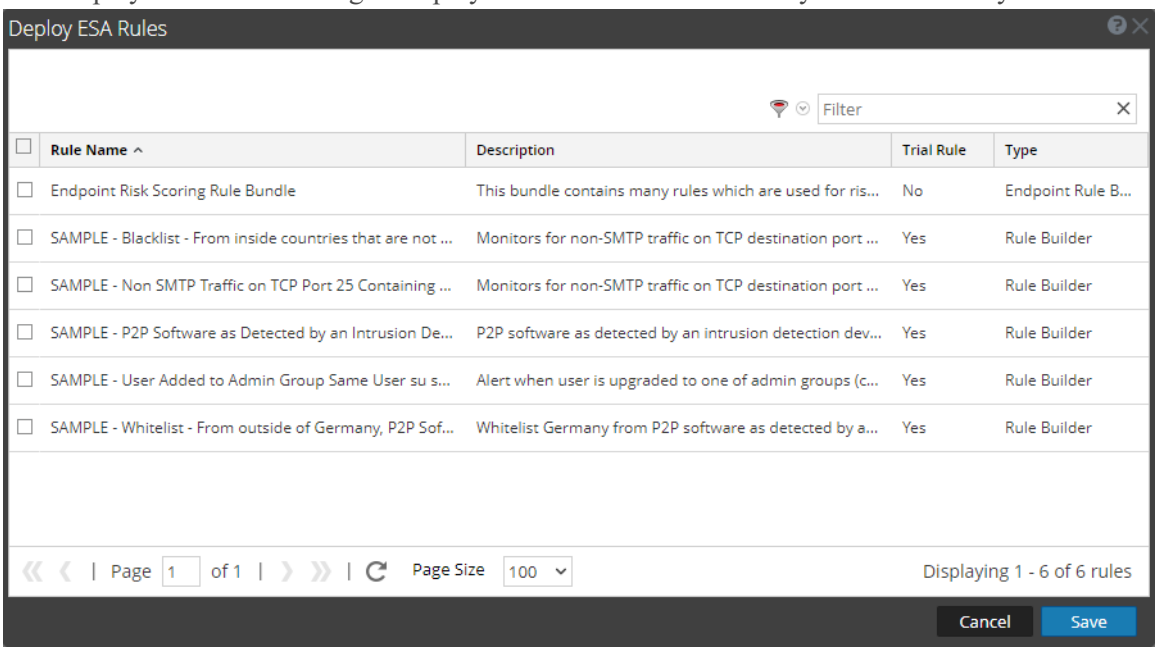
Step 4. Add and Deploy Rules

This topic explains how to add ESA rules to an ESA rule deployment and then deploy the rules on ESA. Each ESA rule has unique criteria. The ESA rules in an ESA rule deployment determine which events ESA captures, which in turn determine the alerts you receive.

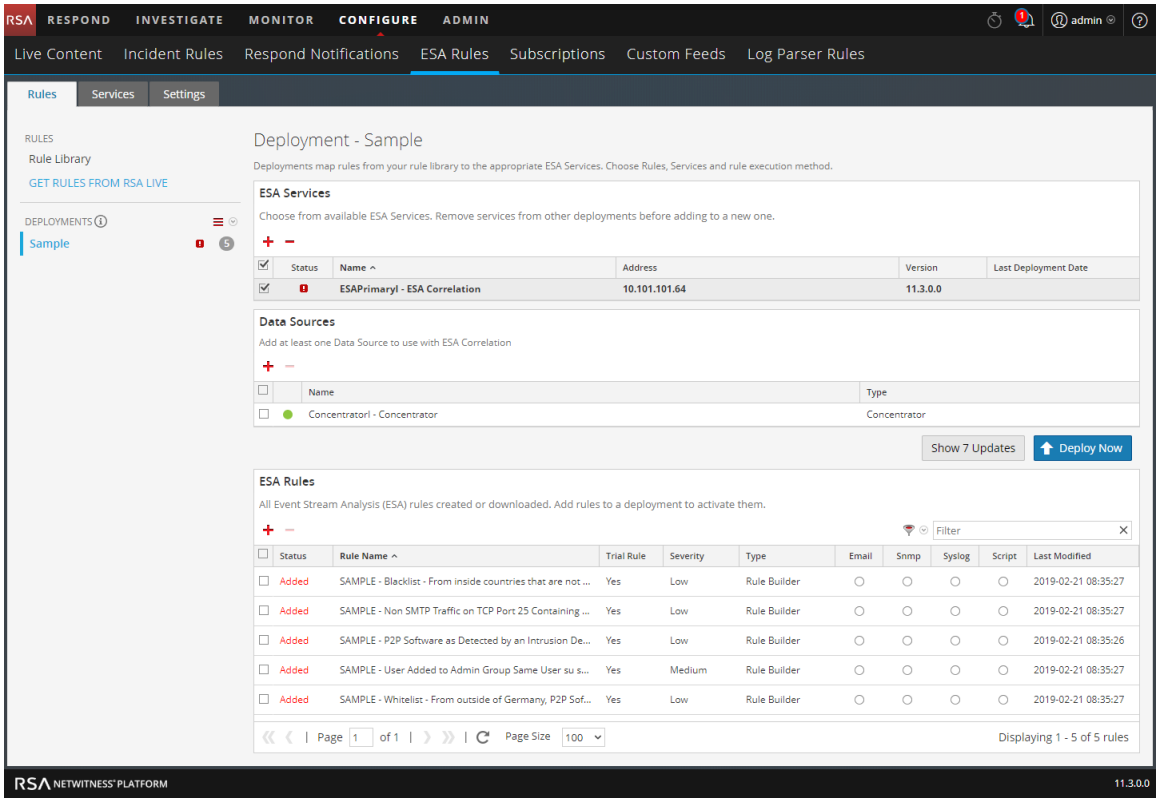
For example, Deployment A includes ESA Paris and, among others, a rule to detect file transfer using a non-standard port. When ESA Paris detects a file transfer that matches the rule criteria, it captures the event and generates an alert for it. If you remove this rule from Deployment A, ESA will no longer generate an alert for such an occurrence.

To add and deploy rules:

1. Go to **CONFIGURE > ESA Rules > Rules** tab.
2. In the options panel, select a deployment.
3. In the **Deployment** view, click + in **ESA Rules**.
   The Deploy ESA Rules dialog is displayed and shows each rule in your Rule Library:



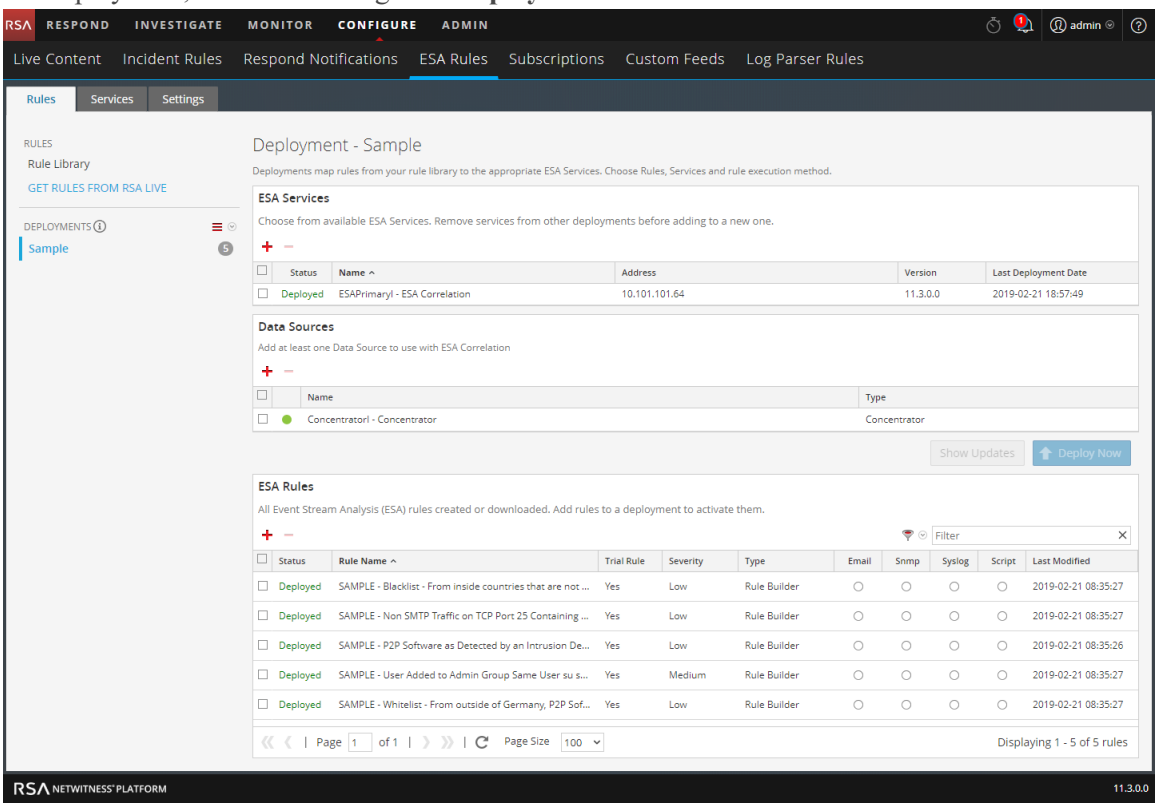
4. Select rules and click **Save**.
   The Deployment view is displayed and the **Deploy Now** button is enabled.



5. The rules are listed in the ESA Rules section.
   - In the Status column, **Added** is next to each new rule.
   - In the Deployments section, indicates there are updates to the deployment.
   - The total number of rules in the deployment is on the right.

6. Click **Deploy Now**.
   The ESA service runs the rule set. After the ESA service completes the processing of each rule in

the deployment, the status changes to **Deployed**.



Deploy the Endpoint Risk Scoring Rules Bundle

An Endpoint Risk Scoring Rules Bundle, which contains approximately 400 rules, comes with NetWitness Platform 11.3 and later. Endpoint risk scoring rules only apply to NetWitness Endpoint. You can add the Endpoint Risk Scoring Rules Bundle to an ESA rule deployment in the same way that you would add any ESA rule. However, you must specify endpoint data sources (Concentrators) in the ESA Rule Deployment.

The ESA Correlation service can process endpoint risk scoring rules, which generate alerts that are used in risk scoring calculations to identify suspicious files and hosts. To turn on risk scoring for NetWitness Endpoint, you must deploy endpoint risk scoring rules on ESA. For instructions, see "Deploy Endpoint Risk Scoring Rules on ESA" in the *ESA Configuration Guide*. For complete information on configuring NetWitness Endpoint, see the *NetWitness Endpoint Configuration Guide*.

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Additional ESA Rule Deployment Procedures

In addition to deploying an ESA service and rules, you may want to perform other steps on your ESA rule deployment, such as replacing an ESA service, changing a data source, editing or deleting a rule from the deployment, renaming or deleting the deployment, or showing updates to an ESA rule deployment.

Note: You cannot edit or duplicate an Endpoint Risk Scoring Rules Bundle.

In NetWitness Platform version 11.3 and later, you can add or remove a data source from a deployment.

- Replace an ESA Service in an ESA Rule Deployment
- Add or Remove a Data Source (This option is available in version 11.3 and later.)
- Edit or Delete a Rule in a Deployment
- Edit the ESA Rule Deployment Name or Delete a Deployment
- Show Updates to an ESA Rule Deployment

Each of the following procedures starts in the Rules tab **(CONFIGURE > ESA Rules > Rules tab)**.

Anytime you make changes to an ESA rule deployment, you must redeploy it for the changes to take effect. To redeploy the deployment, click the **Deploy Now** button for that deployment.

Replace an ESA Service in an ESA Rule Deployment

An ESA rule deployment can have only one ESA service, but you can replace it at any time with another ESA service. You can use the same ESA service in multiple deployments.

Remove an ESA Service from an ESA Rule Deployment

1. Go to **CONFIGURE > ESA Rules > Rules** tab.
   The Rules tab is displayed.
2. In the options panel, under **Deployments**, select a deployment.
3. In the **ESA Services** section, select a service and click − in the toolbar.
   A confirmation dialog is displayed.
4. Click **Yes**.
   The service is removed from the deployment.

Add an ESA Service to an ESA Rule Deployment

To add an ESA Service to an ESA rule deployment, see Step 2. Add an ESA Service. For the ESA Correlation service in NetWitness Respond 11.3 and later, you must add at least one data source to the service. See Step 3. Add Data Sources.

After you finish making changes to the ESA rule deployment, click **Deploy Now** to redeploy it. The changes take effect on ESA after the ESA rule deployment is redeployed.

Add or Remove a Data Source

Note: This option is available in NetWitness Platform version 11.3 and later.

Remove a Data Source from an ESA Rule Deployment

1. Go to **CONFIGURE > ESA Rules > Rules** tab.
   The Rules tab is displayed.
2. In the Rules tab options panel, under **Deployments**, select a deployment.
3. In the **Data Sources** section, select a rule and click − in the toolbar.
   The data source is removed from the deployment.

Add a Data Source to an ESA Rule Deployment

To add a data source, see Step 3. Add Data Sources.

After you finish making changes to the deployment, click **Deploy Now** to redeploy it. The changes take effect on ESA after the deployment is redeployed.

Edit or Delete a Rule in a Deployment

In an ESA rule deployment, you can edit and delete rules to customize the deployment.

Edit a Rule

1. Go to **CONFIGURE > ESA Rules > Rules** tab.
   The Rules tab is displayed.
2. In the Rules tab options panel, under **Deployments**, select a deployment.
3. In the **ESA Rules** panel, double-click a rule to open it in a new tab.
4. Modify the rule, then click **Save**.
   The rule is saved.
5. Click **Deploy Now** to redeploy the deployment.
   The changes take effect on ESA after the deployment is redeployed.

Delete a Rule

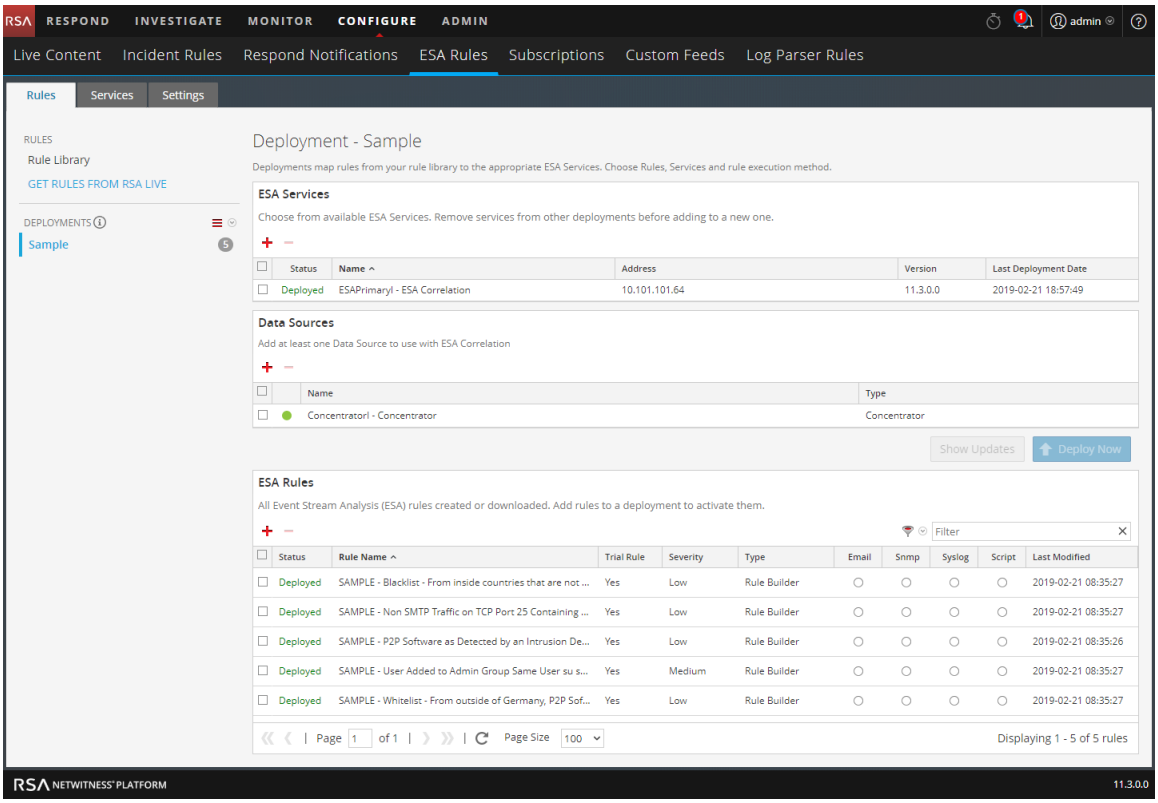
1. Go to **CONFIGURE > ESA Rules > Rules** tab.
   The Rules tab is displayed.
2. In the options panel, under **Deployments**, select a deployment.
3. In the **ESA Rules** panel, select a rule and click − in the toolbar.
   A confirmation dialog is displayed.
4. Click **Yes**.
   The rule is deleted.

5. Click **Deploy Now** to redeploy the deployment.
   The changes take effect on ESA after the deployment is redeployed.

Edit the ESA Rule Deployment Name or Delete a Deployment

To access the deployments:

1. Go to **CONFIGURE > ESA Rules**.
   The Configure view is displayed with the Rules tab open.
2. In the options panel, under **Deployments**, select a deployment.
   The Deployment view is displayed.



Edit the ESA Rule Deployment Name

1. In the options panel, under **Deployments**, select a deployment.
   The Deployment view is displayed.
2. Select **> Edit**.
   The deployment name is made available for editing.
3. Enter the new deployment name.
4. Click **Deploy Now** to redeploy the deployment.
   The changes take effect on ESA after the ESA rule deployment is redeployed. In NetWitness

Platform 11.3 and later, the deployment names that you choose appear on the deployment tabs in the **ADMIN > ESA Rules > Services** tab.

Delete an ESA Rule Deployment

1. In the options panel, under **Deployments**, select a deployment.

   The Deployment view is displayed.

2. Select **> Delete**.

   A confirmation dialog is displayed.

3. Click **Yes**.

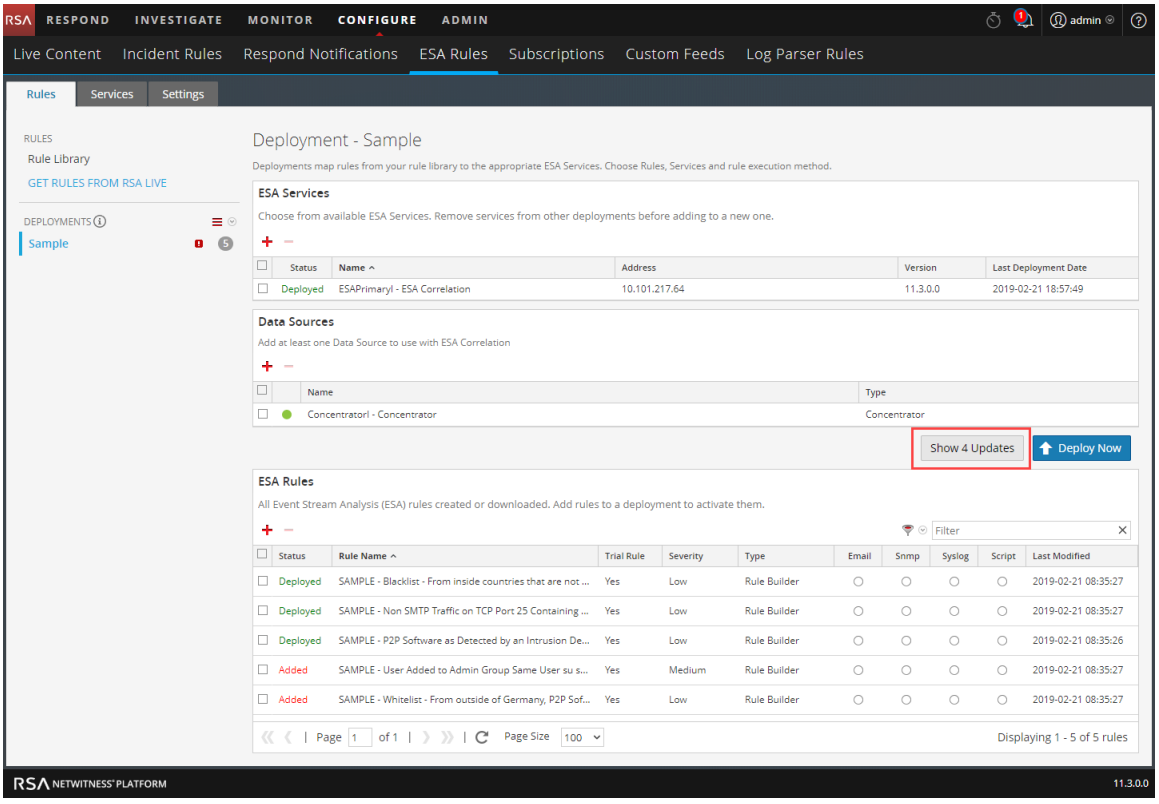
   The deployment is deleted.

Show Updates to an ESA Rule Deployment

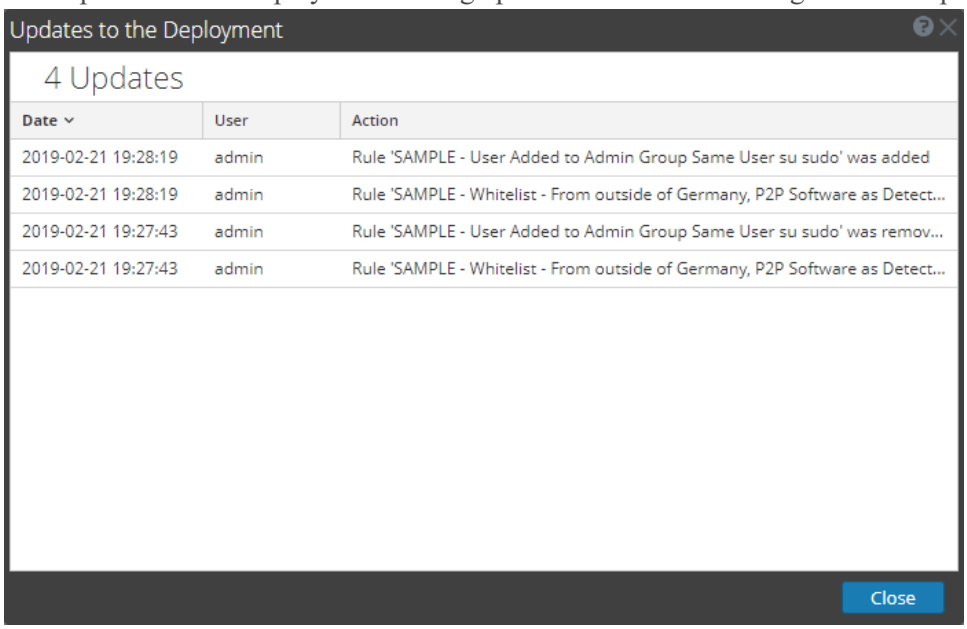
You can view changes to an ESA rule deployment, such as adding or removing rules. When there is a change to a deployment, the update icon ( ) appears next to the name of the deployment in the Rules tab options panel.

1. Go to **CONFIGURE > ESA Rules.**
   The Rules tab is displayed.

2. In the options panel, under **Deployments** click **Show Updates** on the far right.



The Updates to the Deployments dialog opens and shows the changes to the deployment.



3. Click **Close**.

View ESA Stats and Alerts

When ESA generates alerts, you can view details about how the rules performed, such as statistics on the engine, rule, and alert, and you can also view information on which rules are enabled or disabled. For instructions on viewing ESA stats, see View Stats for an ESA Service

When your ESA generates alerts, you can view the results in the Respond Alerts List view. This enables you to see trends and understand both the volume and frequency of alerts. For instructions on viewing alerts, see View a Summary of Alerts

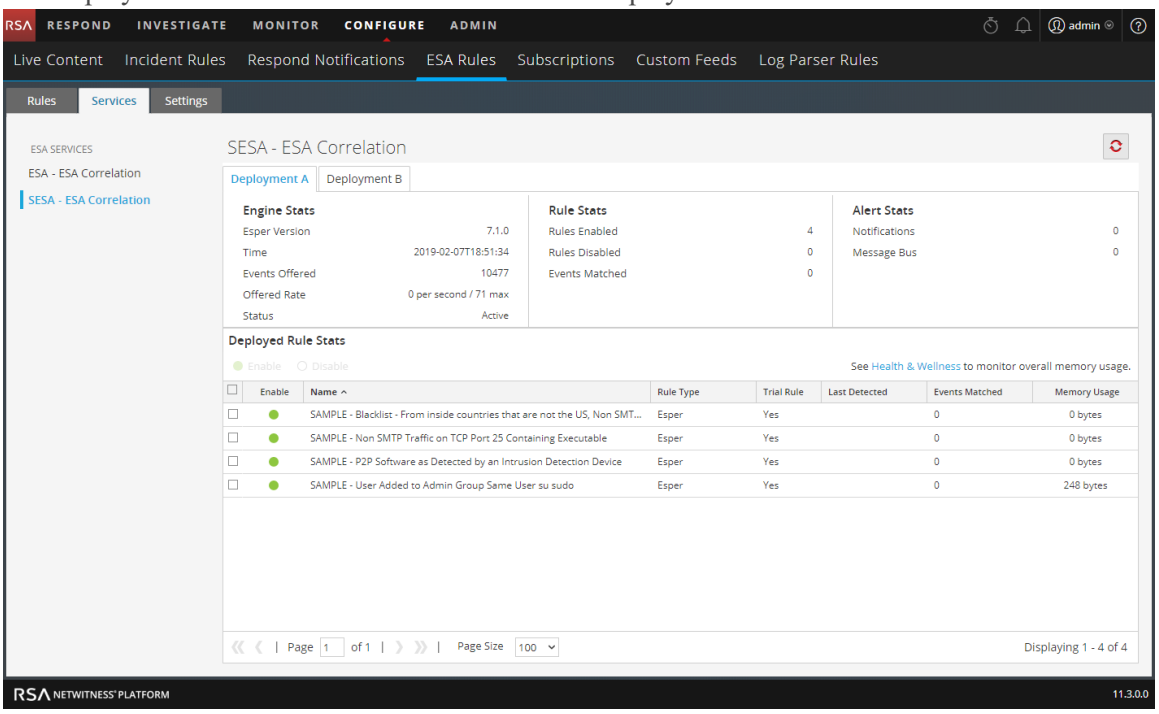
View Stats for an ESA Service

This topic describes how to view the deployment statistics (stats) for an ESA Correlation service. This procedure is useful when you are attempting to determine the effectiveness of a rule or troubleshoot an ESA rule deployment.

Caution: When you modify and re-deploy an ESA rule deployment, all of the stats are removed from that deployment. The generated alerts are not removed from NetWitness Respond.

View ESA Stats

1. Go to **CONFIGURE > ESA Rules > Services** tab.
2. From the **ESA Services** list on the left, select a service.
   The deployment stats for the selected service are displayed.



3. (This option applies to NetWitness Platform version 11.3 and later.) In the Deployment view under the ESA Correlation service name, select the tab of the deployment you would like to view. For example, select the Deployment A tab to view the stats for deployment A. Select the Deployment B tab to view the status for deployment B.
4. Review the following sections of ESA stats.
   For a complete description of each statistic in each section, see Services Tab.
   - **Engine Stats**
   - **Rule Stats**
   - **Alert Stats**
5. In the **Deployed Rule Stats**, review details about the rules deployed on the ESA.
   For a complete description of each column in each section, see Services Tab.
   - If the rule is enabled or disabled
   - What the rule name is
   - The type of rule
   - If the rule is running in Trial Rule mode
   - Last detected
   - Events matched
   - The amount of memory used by the rule
6. To monitor overall memory usage and health of your ESA Correlation service, click **Health & Wellness**.

Enable or Disable Rules

1. In the **Deployed Rule Stats** panel, select a rule from the grid.
2. Click Enable to enable the rule, or click Disable to disable the rule.
   The Services tab is refreshed to show the changes, which take effect immediately.

Refresh the Statistics

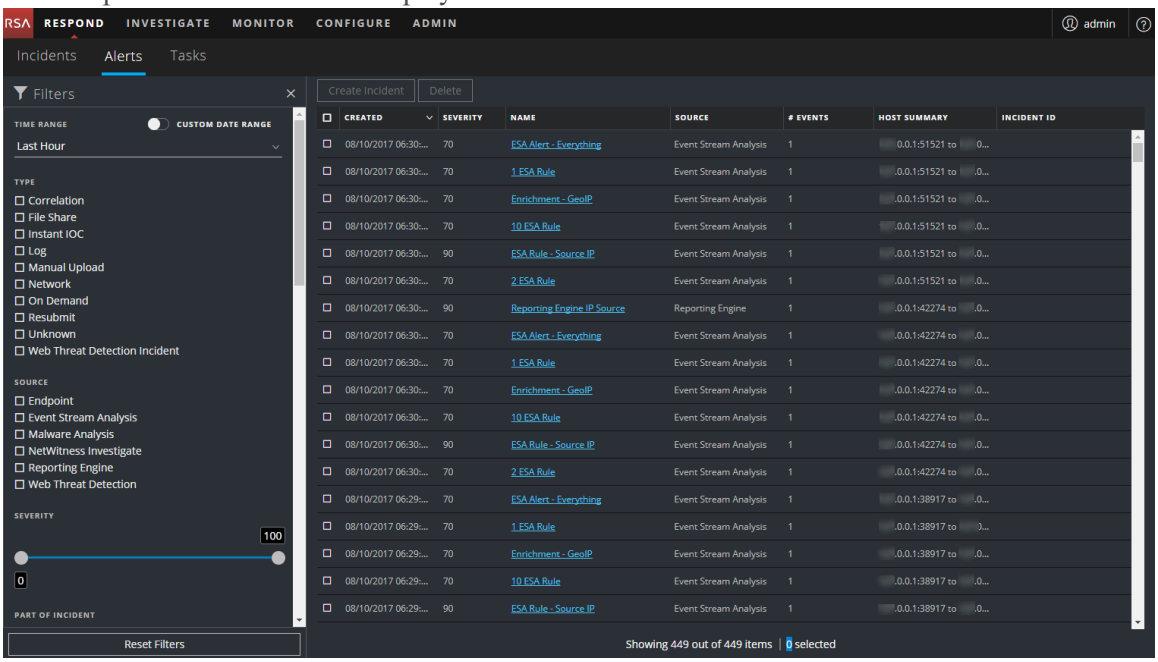
The Services tab does not update statistics automatically unless you enable or disable a rule. To ensure you view current statistics:

1. Click in the upper right corner to refresh the information.
2. View the updated information.

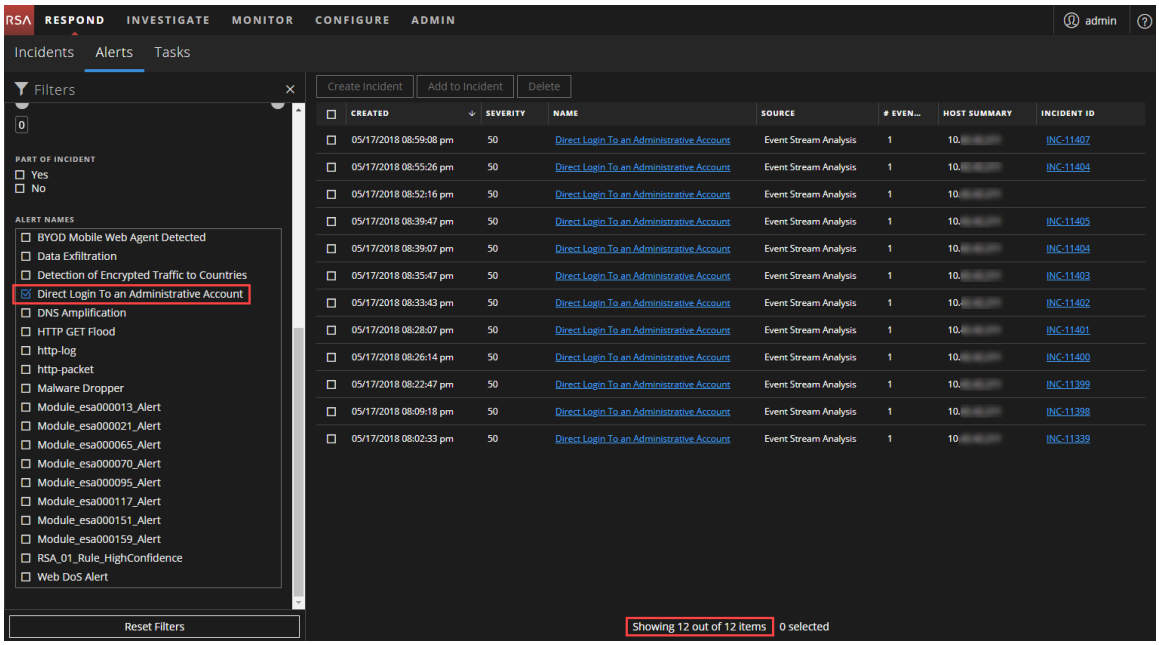
View a Summary of Alerts

In the Repond view, you can browse through various alerts from multiple sources. You can filter the alerts list to show only alerts of interest, such as by Alert Name, alert source, and a specific time range.

1. Go to **RESPOND > Alerts**.
   The Respond Alerts List view displays a list of all NetWitness Platform alerts.



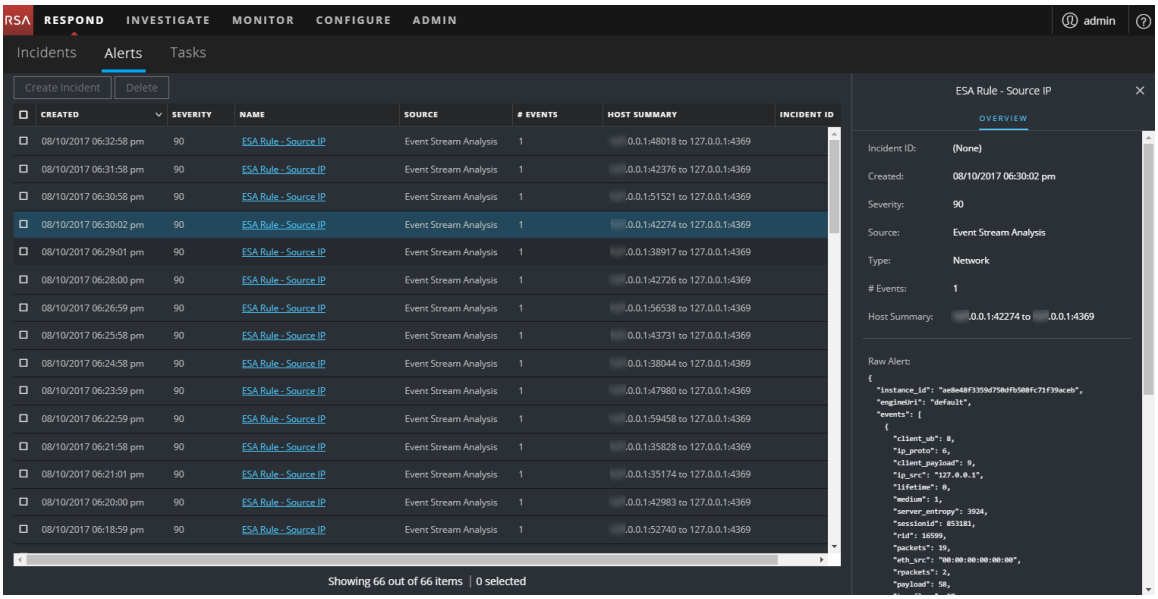
2. In the **Filters** panel on the left, you can filter the alerts list to view specific alerts for a specific time frame. For example, in the ALERT NAMES section, you can select an alert for an ESA rule, such as Direct Login to an Administrative Account, and leave the TIME FRAME set to Last Hour.
   The alerts list to the right shows a list of alerts that match your filter selection along with a count of the alerts at the bottom of the alerts list.



The alerts list shows information about each of the alerts.

- **Created**: Displays the date and time when the alert was created in the source system.
- **Severity**: Displays the level of severity of the alert. The values are from 1 to 100.
- **Name**: Displays a basic description of the alert.
- **Source**: Displays the original source of the alert.
- **# of Events**: Indicates the number of events contained within an alert.
- **Host Summary**: Displays details of the host, like the host name from where the alert was triggered.
- **Incident ID**: Shows the incident ID of the alert. If there is no incident ID, the alert does not belong to an incident.

3. You can click an alert in the list to open an **Overview** panel on the right where you can view raw alert metadata.



For more information about filtering alerts and viewing alert details, see the *NetWitness Respond User Guide*.

ESA Alert References

In Event Stream Analysis (ESA), you configure and deploy ESA rules to get alerted about potential network threats.

These topics explain the user interface for ESA Correlation rules.

- New Advanced EPL Rule Tab
- Build a Statement Dialog
- Deploy ESA Rules Dialog
- Deploy ESA Services Dialog
- Rule Builder Tab
- Rules Tab
- Rule Syntax Dialog
- Services Tab
- Settings Tab
- Updates to the Deployment Dialog

New Advanced EPL Rule Tab

The Advanced EPL Rule tab enables you to define rule criteria with an Event Processing Language (EPL) query.

What do you want to do?

Role	I want to ...	Show me how
Content Expert	Define an Advanced EPL rule.	Add an Advanced EPL Rule
Content Expert	See examples of an Advanced EPL Rule.	Sample Advanced EPL Rules

Related Topics

- Add a Rule Builder Rule

Advanced EPL Rule

To access the Advanced EPL Rule tab:

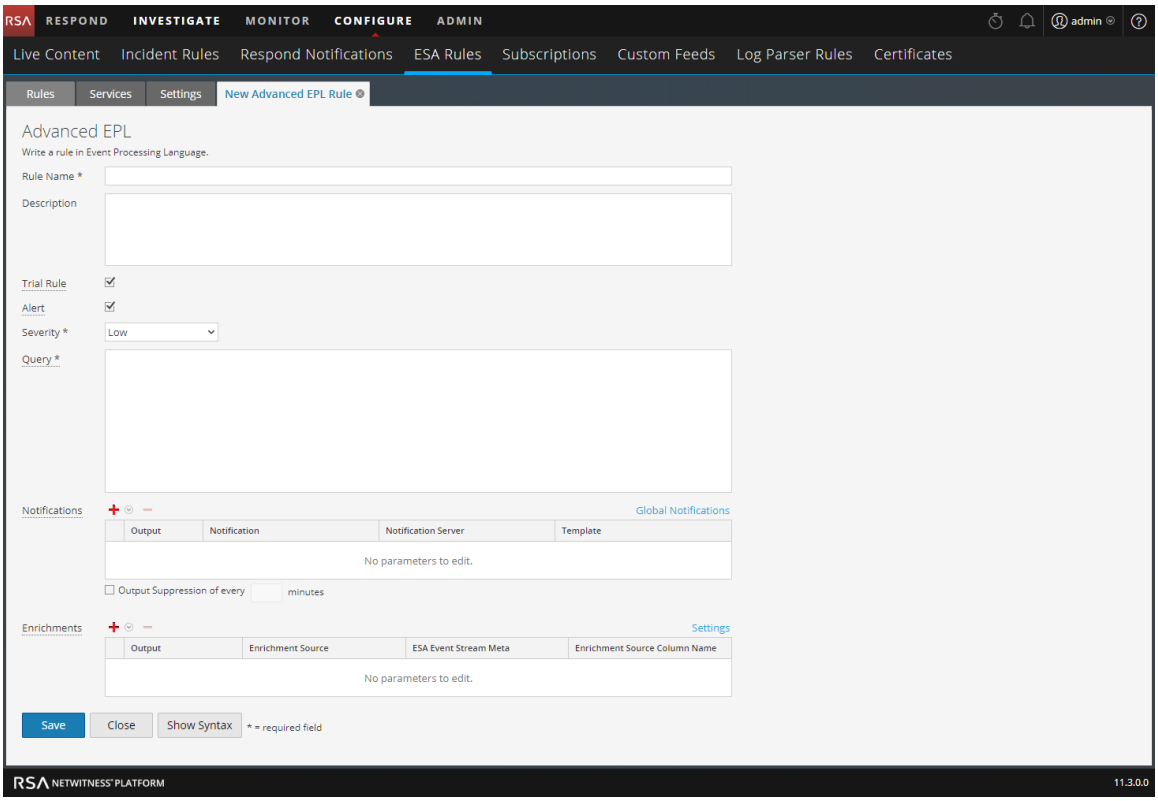
1. Go to **CONFIGURE > ESA Rules**.

   The Configure view is displayed with the Rules tab open by default.

2. In the **Rule Library** toolbar, select **> Advanced EPL**.

   The Advanced EPL Rule tab is displayed.

Below is a screen shot of the Advanced EPL Rule tab.



The following table lists the parameters in the Advanced EPL Rule tab.

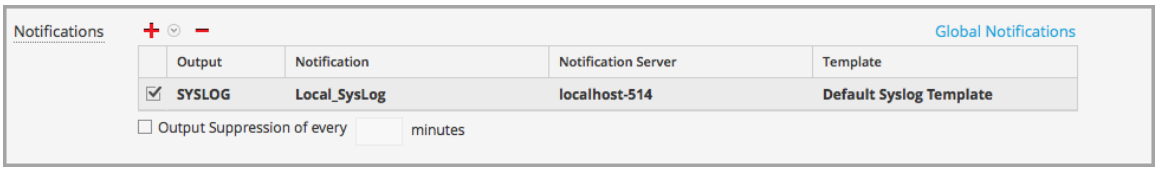
Parameters	Description
Rule Name	Purpose of the ESA rule.
Description	Summary of what the ESA rule detects.
Trial Rule	Deployment mode to see if the rule runs efficiently.
Alert	(This option applies to version 11.3 and Later.) When selected, the alert is sent to Respond. If the checkbox is cleared, an alert will not be sent to Respond. To turn alerts on or off for ALL rules, see the *ESA Configuration Guide*.
Severity	Threat level of alert triggered by the rule.
Query	EPL query that defines rule criteria.

Notifications

In the Notifications section, you can choose how to be notified when ESA generates an alert for the rule.

For more information on the alert notifications, see Add Notification Method to a Rule.

The following figure shows the Notifications section.



Parameter	Description
+	To add an alert notification type.
−	To delete the selected alert notification type.
Output	Alert notification type. Options are: • Email • SNMP (This option is not supported in NetWitness Platform version 11.3 and later.) • Syslog • Script
Notification	Name of previously configured output, such as an email distribution list.
Notification Server	Name of server that sends the output.
Template	Name of template for the alert notification.
Output Suppression of every	Option to specify alert frequency.
Minutes	Alert frequency in minutes.

Enrichments

In the Enrichments section, you can add a data enrichment source to a rule.

For more information on the enrichments, see Add an Enrichment to a Rule.
The following figure shows the Enrichments section.

Parameter	Description
+	To add an enrichment.
−	To delete the selected enrichment.

Parameter	Description
Output	Enrichment source type. Options are: • In-Memory Table • External DB Reference (This option is not supported in NetWitness Platform version 11.3 and later.) • Warehouse Analytics (This option is not supported in NetWitness Platform version 11.3 and later.) • GeoIP
Enrichment Source	Name of previously configured enrichment source, such as a .CSV filename for an In-Memory Table.
ESA Event Stream Meta	ESA meta key whose value will be used as one operand of join condition.
Enrichment Source Column Name	Enrichment source column name whose value will be used as the other operand of the join condition.

Syntax

Click **Show Syntax** to view the EPL syntax of conditions, statements, and debugging parameters. It also provides a warning when the syntax is invalid. For more information, see Rule Syntax Dialog.

Build a Statement Dialog

The Build a Statement dialog allows you to construct a condition statement when creating a new Rule Builder rule.

What do you want to do?

Role	I want to ...	Show me how
Content Expert	Configure a rule statement.	Add an Advanced EPL Rule
Content Expert	Add conditions to the rule.	Step 3. Add Conditions to a Rule Statement

Related Topics

- Add a Rule Builder Rule

Build a Statement Dialog

To access the Build a Statement dialog:

1. Go to **CONFIGURE > ESA Rules**.

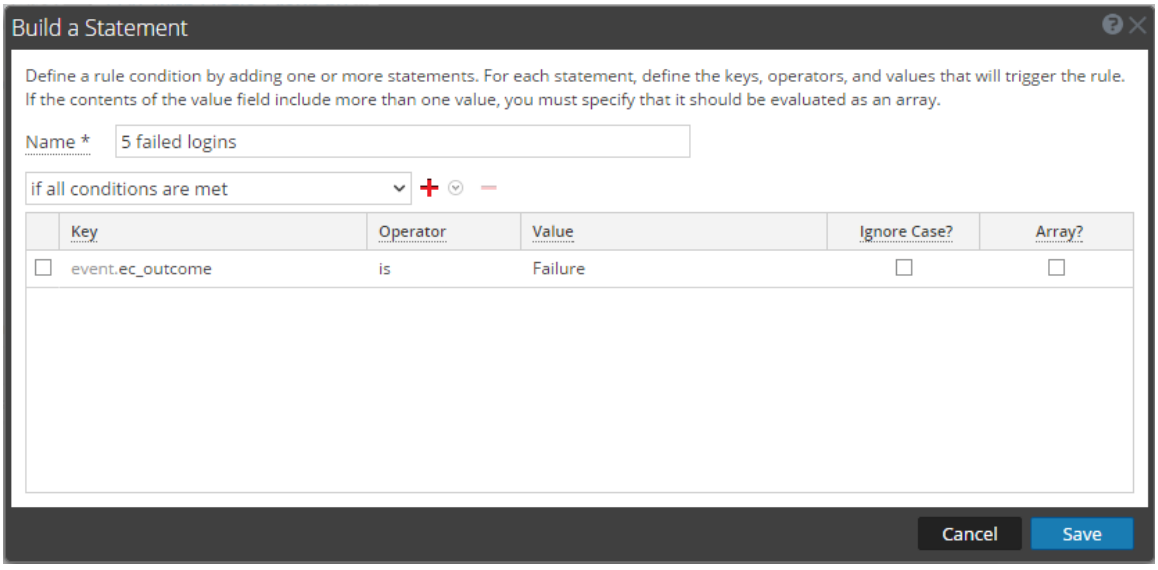
   The Configure ESA Rules view is displayed with the Rules tab open.

2. In the **Rule Library** toolbar, select **> Rule Builder**.

   A New Rule tab is displayed..

3. In the **Conditions** section, click .

   The Build a Statement dialog is displayed.



The following table describes the parameters in the Build a Statement dialog.

Parameter	Description
Name	Purpose of the statement.
Select	Conditions the rule requires. There are two options: • If all conditions are met • If any of these conditions are met
Key	Key for ESA to check in the rule statement.
Operator	Relationship between the meta key and value for the key: • is • is not • is not null • is greater than (>) • is greater than or equal to (>=) • is less than (<) • is less than or equal to (<=) • is one of (For array type meta) • is not one of (For array type meta) • contains • not contains • begins with • ends with
Value	Value for ESA to look for in the key.
Ignore Case?	This field is designed for use with string and array of string values. By choosing the **Ignore Case** field, the query will treat all string text as a lowercase value. This ensures that a rule that searches for the user named Johnson would trigger if the event contains "johnson," "JOHNSON," or "JoHnSoN."
Array?	Choice to indicate if contents of Value field represent one value or multiple values: • Select the box to indicate multiple values. • Clear the box to indicate one value.
+	Add a statement. You can add a meta condition, whitelist condition, or blacklist condition.
–	Delete selected statement.
Save	Add statement to the Conditions section of the Rule Builder tab.

The following table shows the operators you can use in the Rule Builder:

Operator	Required Value	Usage	Example	Meaning
is	Singular string value	The meta key is equal to the *value* field.	***user_dst*** is John Doe.	***user_dst*** is equal to the string *"John Doe"*.
is	Array string value	The meta key is equal to one of the elements of the *value* field.	*user_dst* is John, Doe, Smith.	*user_dst* is equal either to the string *"John"* or to the string *"Doe"* or to the string *"Smith"* (Note, the spaces are stripped.).
is not	Singular string value	The meta key is not equal to the *value* field.	***size*** is not 200.	***size*** is not equal to the number 200 (size is a numeric value).
is not	Array string value	The meta key is not equal to any of the elements of the *value* field.	***size*** is not 200, 300, 400.	***size*** is equal neither to *200* nor to *300* nor to *400*.
is not null	N/A (looks for any value)	The meta key value is not null.	***user_dst*** is not null.	***user_dst*** is a meta that contains a value.
is greater than (>)	Number	The numeric value of the meta key is greater than the number in the *value* field.	***payload*** is greater than 7000.	***payload*** is a numeric value that is greater than 7000.
is greater than or equal to (>=)	Number	The numeric value of the meta key is greater than or equal to the number in the *value* field.	***payload*** is greater than or equal to 7000.	***payload*** is a numeric value that is greater than or equal to 7000.
is less than (<)	Number	The numeric value of the meta key is less than the number in the *value* field.	***ip_dstport*** is less than 1024.	***ip_dstport*** is a numeric value that is less than the numeric value 1024.
is less than or equal to (<=)	Number	The numeric value of the meta key is less than or equal to the number in the *value* field.	***ip_dstport*** is less than or equal to 1024.	***ip_dstport*** is a numeric value that is less than or equal to numeric value 1024.
is one of	Array string value	The meta key is one of the array string values in the *value* field.	*alias_host* is one of Facebook, UTube, Instagram.	*alias_host* is one of the array string values *Facebook, UTube, Instagram*.

Operator	Required Value	Usage	Example	Meaning
is not one of	Array string value	The meta key is not one of the array string values in the *value* field.	*alias_host* is not one of Facebook, UTube, Instagram.	*alias_host* is not one of the array string values *Facebook, UTube, Instagram*.
contains	String	The *value* field is a substring of the meta key. (This operator is only available for a string-valued meta key).	***ec_outcome*** contains failure.	***ec_outcome*** is a string that contains the substring *"failure"*.
not contains	String	The *value* field is not a substring of the meta key (This operator is only available for a string-valued meta key).	***ec_outcome*** not contains failure.	***ec_outcome*** is a string that does not contain the substring*"failure"*.
begins with	String	The *value* field is the beginning of the meta key (This operator is only available for a string-valued meta key).	***ip_dst*** begins with 127.0.	***ip_dst*** is a string that starts with *"127.0"*.
ends with	String	The *value* field is the end of the meta key (This operator is only available for a string-valued meta key).	***user_dst*** ends with son.	***user_dst*** is a string that ends in*"son"*.

Note: Terms in ***bold italics*** are Meta that may not exist in all customer environments.

Deploy ESA Rules Dialog

The Deploy ESA Rules dialog enables you to filter and select rules to deploy to an ESA service.

What do you want to do?

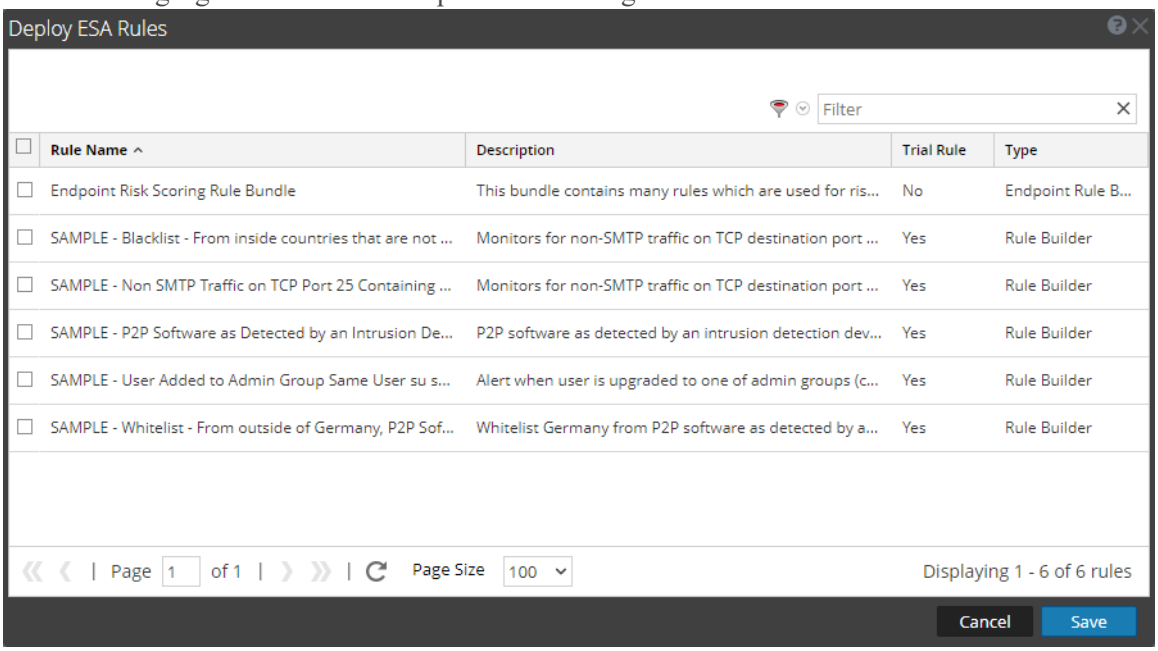
- Additional ESA Rule Deployment Procedures

Deploy ESA Rules Dialog

To access this dialog:

1. Go to **CONFIGURE > ESA Rules**.
   The Rules tab opens by default.
2. In the options panel, under the **Deployment** section, select or add a new deployment by clicking **> Add**.
3. If you add a new deployment, type the name of the deployment in the box in the options panel.
4. In the **ESA Rules** panel, click .
   The Deploy ESA Rules dialog is displayed.

The following figure shows an example of this dialog.



The following table describes the parameters of the Deploy ESA Rules dialog.

Parameters	Description
	Filters the list of rules based on severity and type. The text box beside this icon filters based on rule name.
Rule Name	Displays the name of the rule.
Description	Describes the rule.
Trial Rule	Indicates whether or not the rule is a trial rule.
Type	Indicates the type of rule: RSA Live ESA, Advanced EPL, or Rule Builder.

Deploy ESA Services Dialog

The Deploy ESA Services dialog displays all ESA services available to be added to an ESA rule deployment.

What do you want to do?

Role	I want to ...	Show me how
Content Expert	Configure an ESA rule deployment.	ESA Rule Deployment Steps
Content Expert	Add a service.	ESA Rule Deployment Steps
Content Expert	Add data sources. (This is available in 11.3 and later.)	ESA Rule Deployment Steps
Content Expert	Add and deploy rules.	ESA Rule Deployment Steps

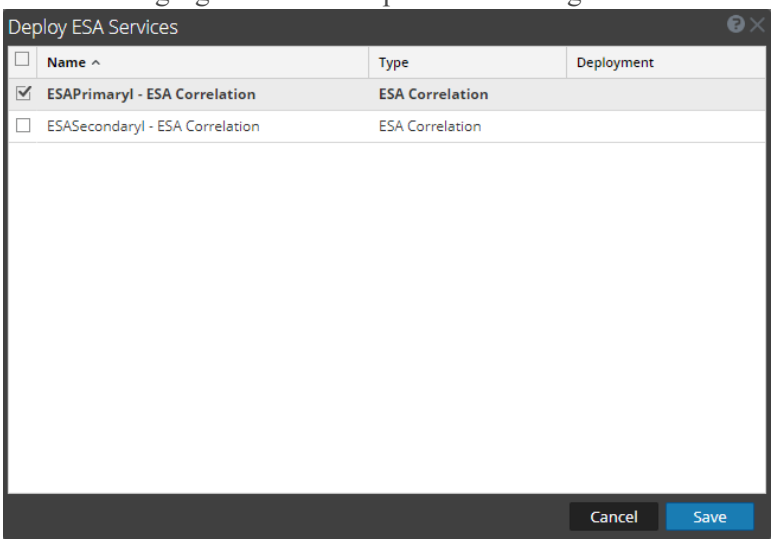
Deploy ESA Services Dialog

To access this dialog:

1. Go to **CONFIGURE > ESA Rules**.
   The Rules tab opens by default.
2. In the options panel, under the **Deployment** section, select or add a deployment.
3. In the **ESA Services** panel, click .
   The Deploy ESA Services dialog is displayed.

The following figure is an example of this dialog.



The following table describes the parameters of the Deploy ESA Services dialog.

Parameters	Description
Name	Displays the name of configured ESA services.
Deployment	Displays the ESA rule deployments to which the service has already been added.

Rule Builder Tab

The Rule Builder tab enables you to define a Rule Builder rule.

What do you want to do?

Role	I want to ...	Show me how
Content Expert	Define a Rule Builder rule.	Add a Rule Builder Rule
Content Expert	Define rule criteria.	Step 2. Build a Rule Statement
Content Expert	Add conditions to the rule.	Step 3. Add Conditions to a Rule Statement

Related Topics

- Add an Advanced EPL Rule

Rule Builder

To access the Rule Builder tab:

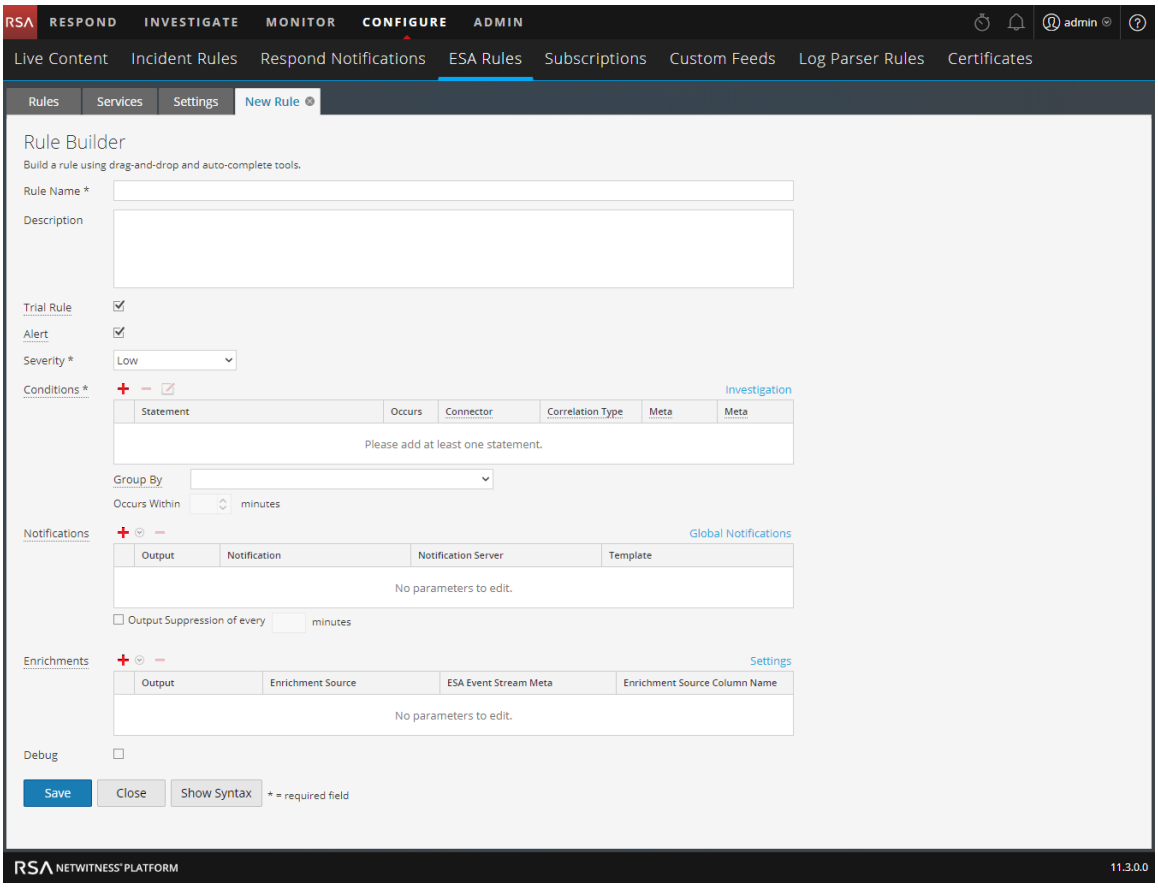
1. Go to **CONFIGURE** > **ESA Rules**.

   The Rules tab opens by default.

2. In the **Rule Library** toolbar, select > **Rule Builder**.

   The Rule Builder tab is displayed.

The following figure shows the Rule Builder tab.



The following table lists the parameters in the Rule Builder tab.

Parameters	Description
Rule Name	Purpose of the ESA rule.
Description	Summary of what the ESA rule detects.
Trial Rule	Deployment mode to see if the rule runs efficiently.
Alert	(This option applies to version 11.3 and later.) When selected, the alert is sent to Respond. If the checkbox is cleared, an alert will not be sent to Respond. To turn alerts on or off for ALL rules, see the *ESA Configuration Guide*.
Severity	Threat level of alert triggered by the rule.

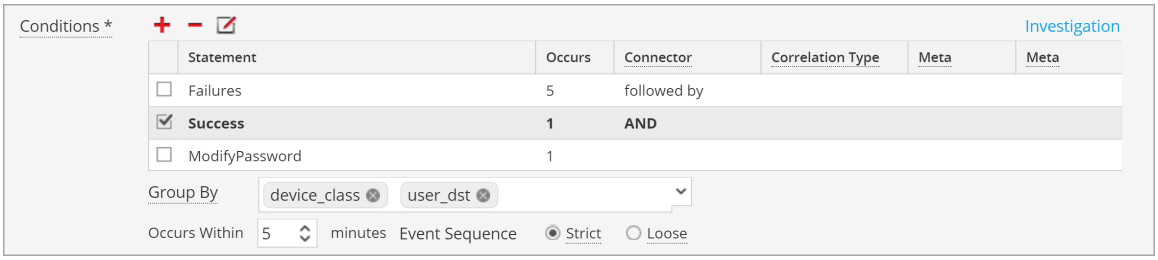
The Rule Builder includes the following components:

- Conditions section
- Notifications section
- Enrichments section

Conditions Section

In the Conditions section of the Rule Builder tab, you define what the rule detects.

The following figure shows the Conditions section.



The following table lists the parameters of the Conditions section.

Parameter	Description
+	Add a statement.
−	Remove selected statement.
✎	Edit selected statement.
Statement	Logical group of conditions for one operation.
Occurs	Alert frequency if the condition is met. This specifies that there must be at least that many events that satisfy the criteria in order to trigger an alert. The time window in minutes binds the Occurs count.
Connector	Options to specify relationship among the statements: • followed by • not followed by • AND • OR The Connector joins two statements with AND, OR, followed by, or not followed by. When followed by is used, it specifies that there is a sequencing of those events. AND and OR build one large criteria. The followed by creates distinct criteria that occurs in sequence.
Correlation Type	**Correlation Type** applies only to **followed by** and **not followed by**. If you choose a correlation type of SAME, select one meta to correlate on, and if you choose a correlation type of JOIN, select two meta to correlate on. You may want to use JOIN if you are trying to correlate on meta from two different data sources. For example, say you want to correlate an AV alert with an IDS alert.
Meta	Enter the meta condition if choosing a correlation type of SAME or JOIN (as described above).

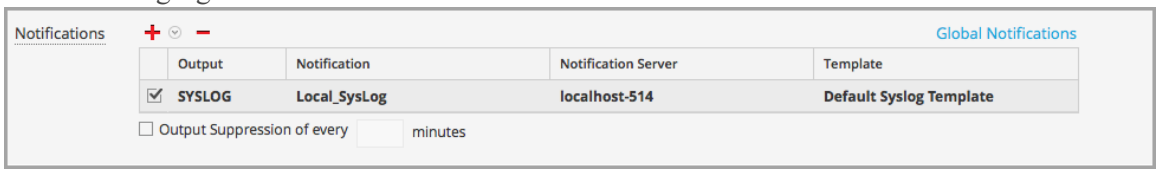
Parameter	Description
Meta	Enter the second meta condition if choosing a correlation type of JOIN (as described above). For example, The destination IP address from the AV alert and source IP address for the workstation from the IDS alert are joined to allow you to view the same entities across different sources.
occurs within minutes	Time window within which the conditions must occur.
Event Sequence	Choose whether the pattern must follow a *strict* match or a *loose* match. If you specify a strict match, this means that the pattern must occur in the *exact* sequence you specified with no additional events occurring in between. For example, if the sequence specifies five failed logins (F) followed by a successful login (S), this pattern will only match if the user executes the following sequence: F,F,F,F,F,S. If you specify a loose match, this means that other events may occur within the sequence, but the rule will still trigger if all of the specified events also occur. For example, five failed login attempts (F), followed by any number of intervening successful login attempts (S), followed by a successful login attempt might create the following pattern: F,S,F,S,F,S,F,S,F,S which would trigger the rule despite the intervening successful logins.
Group By	Select the meta key by which to group results from the dropdown list. For example, suppose that there are three users; Joe, Jane, and John and you use the Group By meta, **user_dst** (user_dst is the meta field for the user destination account). The result will show events grouped under the user destination accounts, Joe, Jane, and John. You can also group by multiple keys. For example, you might want to group by user and machine to see if a user logged in from the same machine attempts to log into an account multiple times. To do this, you might group by device_class and user_dst.

Notifications

In the Notifications section, you can choose how to be notified when ESA generates an alert for the rule.

For more information on the alert notifications, see Add Notification Method to a Rule.

The following figure shows the Notifications section.



Parameter	Description
+	To add an alert notification type.
−	To delete the selected alert notification.

Parameter	Description
Output	Alert notification type. Options are: • Email • SNMP (This option is not supported in NetWitness Platform version 11.3 and later.) • Syslog • Script
Notification	Name of previously configured output, such as an email distribution list.
Notification Server	Name of server that sends the output.
Template	Name of template for the alert notification.
Output Suppression of every	Option to specify alert frequency.
Minutes	Alert frequency in minutes.

Enrichments

In the Enrichments section, you can add a data enrichment source to a rule.

For more information on the enrichments, see Add an Enrichment to a Rule.

The following figure shows the Enrichments section.

Parameter	Description
+	To add an enrichment.
−	To delete the selected enrichment.
Output	Enrichment source type. Options are: • In-Memory Table • External DB Reference (This option is not supported in NetWitness Platform version 11.3 and later.) • Warehouse Analytics (This option is not supported in NetWitness Platform version 11.3 and later.) • GeoIP

Parameter	Description
Enrichment Source	Name of previously configured enrichment source, such as a .CSV filename for an In-Memory Table.
ESA Event Stream Meta	ESA meta key whose value will be used as one operand of join condition.
Enrichment Source Column Name	Enrichment source column name whose value will be used as the other operand of the join condition. For an in-memory table, If you configured a key when creating a .CSV-based enrichment, this column automatically populates with the selected key. However, you can change it if you like. For a GeoIP enrichment source, ipv4 is automatically selected.

Debug

Select the Debug option to print alerts to the ESA logs for troubleshooting.

Syntax

Click **Show Syntax** to view the EPL syntax of conditions, statements, and debugging parameters. It also provides a warning when the syntax is invalid. For more information, see Rule Syntax Dialog.

Rules Tab

The Rules tab enables you use to manage ESA rules and deployments.

What do you want to do?

Role	I want to ...	Show me how
Content Expert	View types of rules.	ESA Rule Types
Content Expert	Deploy Trial Rules.	Work with Trial Rules
Content Expert	Create a rule.	Add Rules to the Rule Library
Content Expert	Deploy a rule.	Deploy Rules to Run on ESA

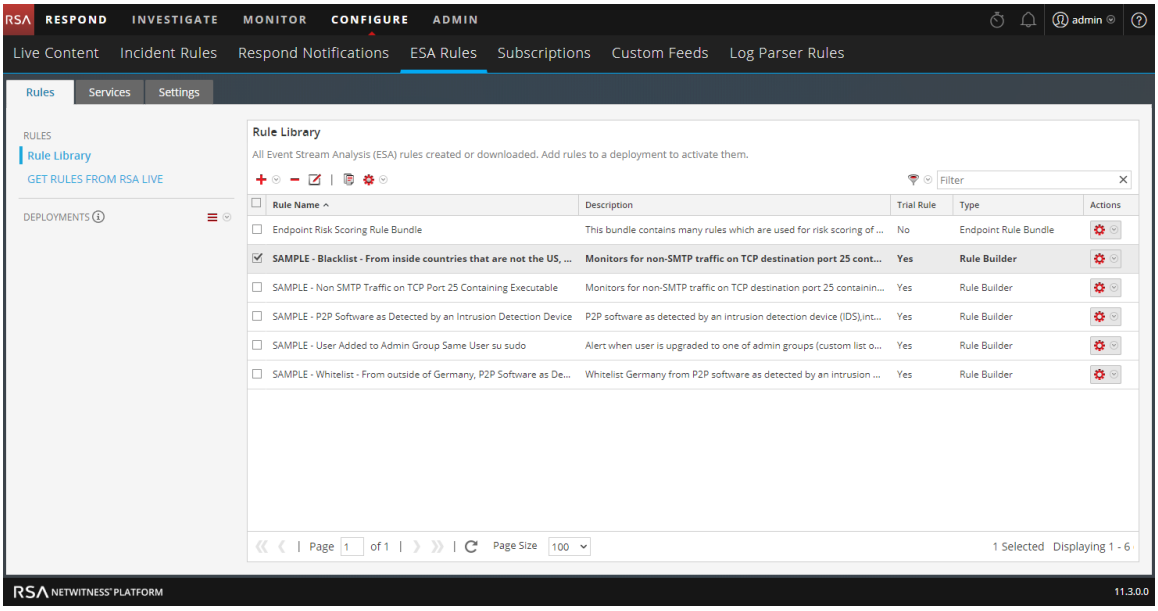
Related Topics

- Getting Started with ESA

Quick Look

The Rules tab is displayed when you go to **CONFIGURE > ESA Rules**.

The following figure shows the Rules tab.



The Rules tab is divided into three sections:

- Rules Tab Options Panel
- Rule Library Panel
- Deployment Panel

Rules Tab Options Panel

In the **Rules** tab options panel to the left, you can view ESA rules in the Rule Library and create ESA rule deployments.

What do you want to do?

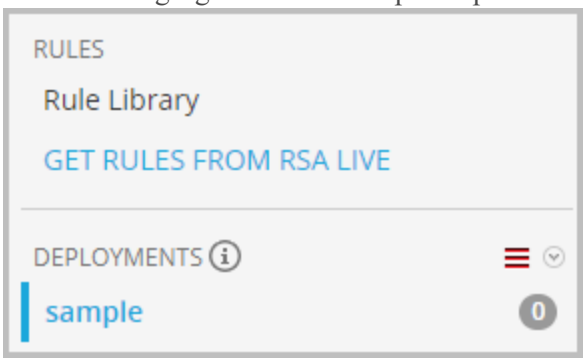
Role	I want to ...	Show me how
Content Expert	View an ESA rule.	Add Rules to the Rule Library
Content Expert	Create an ESA rule deployment.	ESA Rule Deployment Steps

Related Topics

- Working with Rules

Options Panel

The following figure shows the options panel in the **Rules** tab.



There are two sections in the options panel: Rules and Deployments.

Rules Section

The Rules section contains two options. **Rule Library** is selected by default, and when it's selected, the Rule Library view is displayed within the tab. **Get Rules From RSA Live** navigates to the Live Search view, where you can search for rules.

Deployments Section

The Deployments section lists ESA rule deployments and indicates whether there are updates to the deployments. From this section, deployments can be added, deleted, edited, and refreshed. Selecting a deployment from the list displays the Deployment panel within the tab. The following table describes the features of this section.

Feature	Description
	Displays a drop-down menu from which you can choose to add, edit, or delete an ESA rule deployment. You can also refresh the list of deployments to see if there are any new updates to the list.
	Indicates whether there are any updates to the deployment.
	Indicates the number of rules in the deployment.

Rule Library Panel

The Rule Library panel allows you to manage rules.

What do you want to do?

Role	I want to ...	Show me how
Content Expert	Add an ESA rule.	Add a Rule Builder Rule
Content Expert	Edit, duplicate, or delete an ESA rule.	Edit, Duplicate or Delete a Rule
Content Expert	Import or export ESA rules.	Import or Export Rules
Content Expert	Filter the ESA rules list.	Filter or Search for Rules

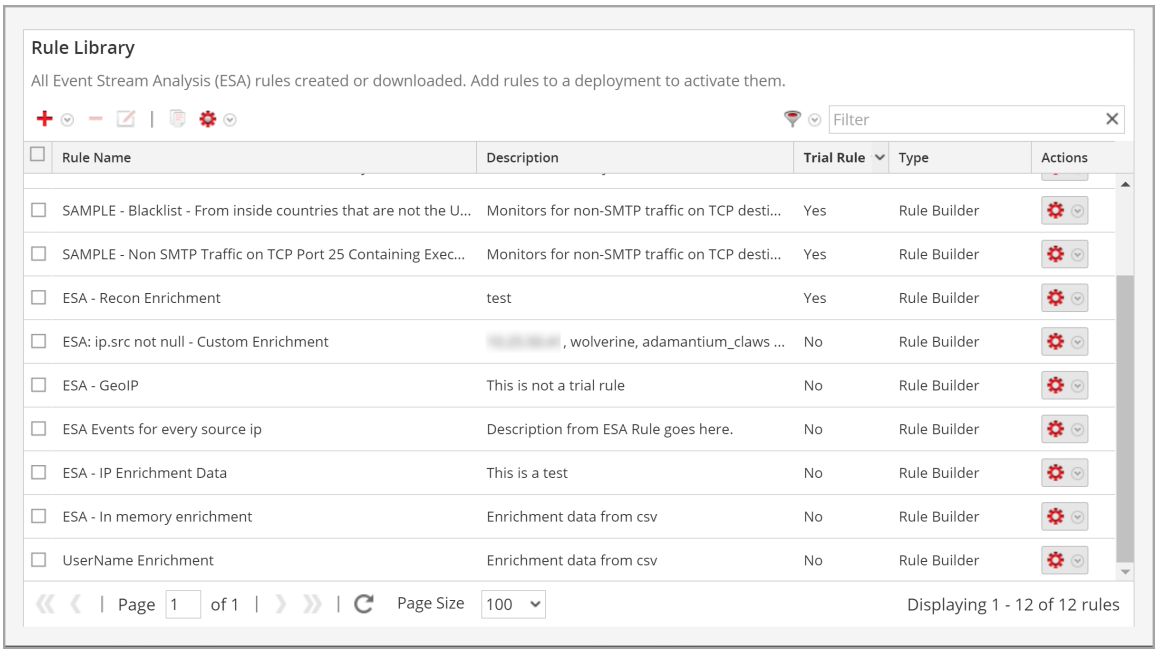
Related Topics

- Add an Advanced EPL Rule

Rule Library Panel

To access this view, go to **CONFIGURE > ESA Rules**. The Rules tab is displayed and the Rule Library panel is on the right.

The following figure shows the Rule Library panel.



The Rule Library panel includes the following components:

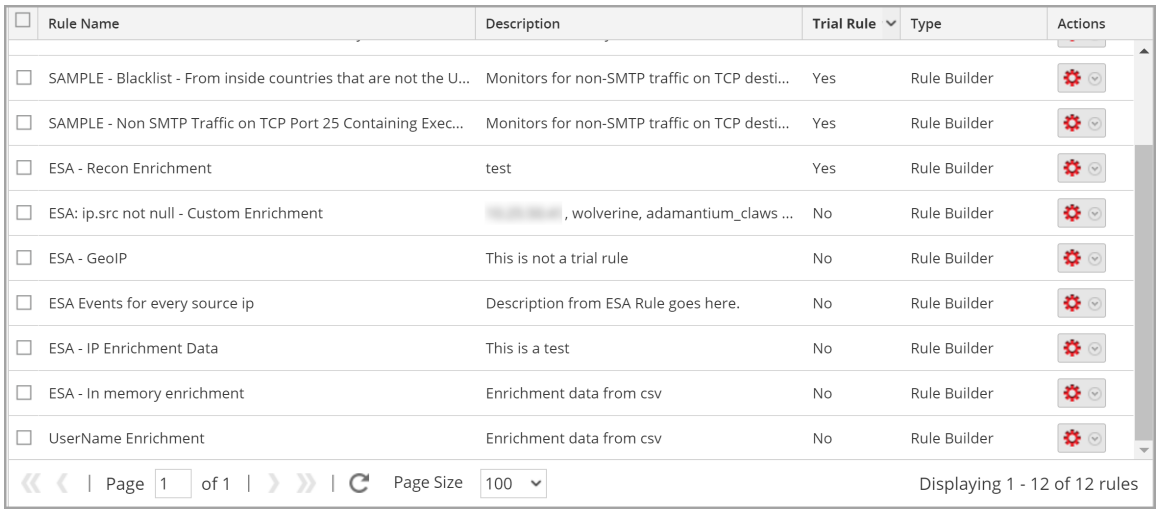
- Rule Library toolbar
- Rule Library list

Rule Library Toolbar

The Rule Library toolbar allows you to add, delete, edit, duplicate, filter, export, and import ESA rules. The following figure shows the icons for these actions.

Rule Library List

The following figure shows the Rule Library list.

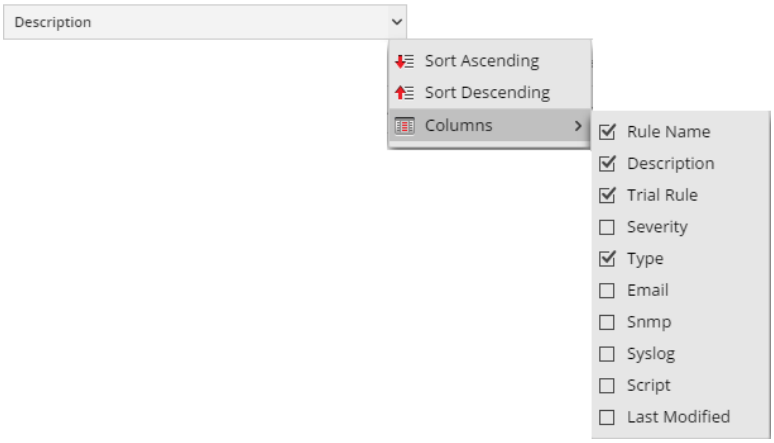


The Rule Library list shows all of the ESA rules. The following table lists the columns in the Rule Library list and their description.

Column	Description
Rule Name	Purpose of the ESA rule.
Description	Summary of what the ESA rule detects.
Trial Rule	Deployment mode to see if the rule runs efficiently.
Type	The type of rule. For more information, see ESA Rule Types.
Actions (⚙)	Menu to delete, edit, duplicate, or export the selected rule.
Severity	Threat level of alert triggered by the rule.
Email	Indicates whether an alert notification for the rule is sent by email. This column is not visible by default.

Column	Description
SNMP	Indicates whether an alert notification for the rule is sent using SNMP. This column is not visible by default. (ESA SNMP notifications are not supported in NetWitness Platform version 11.3 and later.)
Syslog	Indicates whether an alert notification for the rule is sent using Syslog. This column is not visible by default.
Script	Indicates whether an alert notification for the rule executes a script. This column is not visible by default.
Last Modified	The date and time when the ESA rule was last modified. This column is not visible by default.

To display columns which aren't visible by default, hover over the title of a column and click the **v** on the right. This opens a drop-down menu in which you can sort the contents of the column or choose which columns you want to see in the Rule Library list.



Deployment Panel

ESA rule deployments map rules from your rule library to the appropriate ESA Services and data sources. The Deployment panel (CONFIGURE > ESA Rules > Rules tab) enables you to create and configure ESA rule deployments that specify:

- ESA Services
- Data Sources (This is available in NetWitness Platform version 11.3 and later.)
- ESA Rules

When you are ready to start aggregating data and generating alerts from an ESA rule deployment, you deploy the ESA rule deployment to activate it.

Note: An ESA rule deployment can have only one ESA service. You can, however, use the same ESA service in multiple deployments.
In NetWitness Platform version 11.2 and earlier, the ESA service is the Event Stream Analysis service. In version 11.3 and later, it is the ESA Correlation service.

What do you want to do?

Role	I want to ...	Show me how
Content Expert	Add an ESA rule deployment.	ESA Rule Deployment Steps

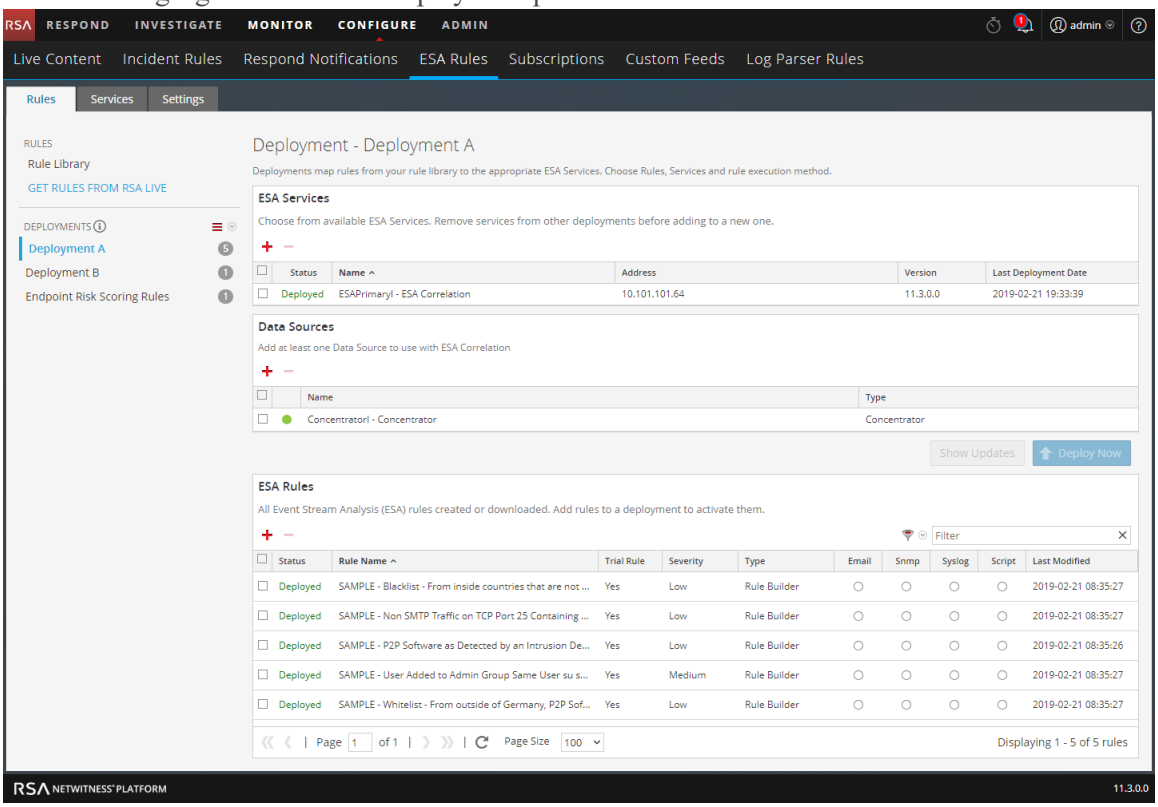
- View Stats for an ESA Service

Deployment Panel

The following figure shows the Deployment panel.



ESA Services

In the ESA Services section, you can manage each ESA service in the deployment.

The following table describes the actions you can perform in the ESA Services section.

Task	Description
+	Adds an ESA service to the deployment.
−	Removes the selected ESA service from the deployment.

The following table describes the columns in the ESA Services section.

Title	Description
Status	Indicates if the deployment status is **Added**, **Deployed**, **Updated**, or **Failed**.
Name	Name of the ESA service.
Address	IP address of the host where the ESA service is installed.

Title	Description
Version	Version of the ESA service.
Last Deployment Date	The date and time when the ESA service was last deployed.

Data Sources

Note: This option is available in NetWitness Platform version 11.3 and later.

In the Data Sources section, you can select one or more data sources, such as Concentrators, to use for your selected ESA Service.

The following table describes the actions you can perform in the Data Sources section.

Task	Description
+	Adds a data source for the selected ESA service to the deployment.
−	Removes a data source for the selected ESA service from the deployment.

The following table describes the columns in the Data Sources section.

Title	Description
(Status)	Shows the status of the data source. A solid colored green circle indicates a running service and a white circle indicates a stopped service.
Name	Shows the name of the data sources used by the selected ESA service. You can specify the data sources separately for each ESA rule deployment.
Type	Shows the type of the data sources. Data sources can be Concentrators or Decoders. It is important that you choose data sources that have the appropriate data for the rules in the deployment. For example, if you have NetWitness Endpoint and you want to deploy the Endpoint Risk Scoring Rules Bundle, you must choose endpoint data sources.

Note: You can add a Log Decoder as a data source for ESA, but it is better to add a Concentrator to take advantage of undivided aggregation as the Decoder may have other processes aggregating from it.

Deployment Options

There are two deployment options below the Data Sources section. These options apply to the entire ESA rule deployment.

The following table describes these deployment options.

Task	Description
Show Updates	Enables you to view a history of updates to the deployment.

Task	Description
Deploy Now	Activates the ESA rule deployment. The selected ESA service starts aggregating data and generating alerts using the specified ESA rules in the deployment. You need to add ESA Rules to the deployment before deploying the ESA rule deployment.

ESA Rules

In the ESA Rules section, you manage rules in the deployment. This section lists all rules that are currently in the deployment.

The following table describes the actions you can perform in the ESA Rules section.

Task	Description
	Opens the Deploy ESA Rules dialog, where you can select a rule.
	Removes the selected ESA rules from the deployment.
	Filters the list of rules.
	Enables you to search for a rule.

The following table describes the columns in the ESA Rules section.

Title	Description
Status	Indicates the rule status: • Deployed - the rule is deployed. • Updated - the rule has been updated since the last deployment. • Added - the rule has been added since the last deployment. • Failed - the deployment failed.
Rule Name	Describes the purpose of the ESA rule.
Trial Rule	Indicates whether the rule is Deployment mode to see if the rule runs efficiently.
Severity	Shows the threat level of alert triggered by the rule.
Type	Shows the type of the ESA rule. For more information, see ESA Rule Types.
Email, SNMP, Syslog, Script	Indicates which notification types are used for alerts generated by the rules. (ESA SNMP notifications are not supported in NetWitness Platform version 11.3 and later.)
Last Modified	Shows the date and time when the ESA rule was last modified.

Rule Syntax Dialog

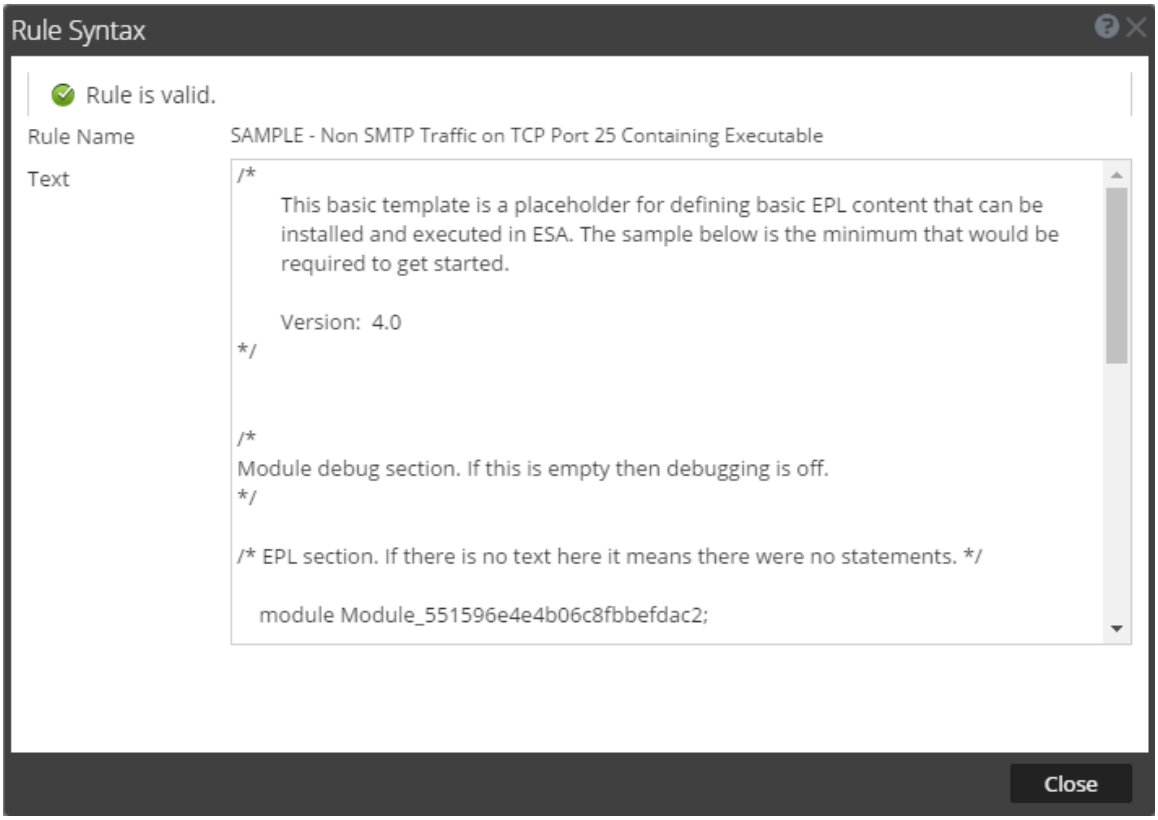
This topic describes the features of the Rule Syntax dialog. The Rule Syntax dialog displays the EPL syntax of conditions, statements, and debugging parameters, and provides a warning when the syntax is invalid.

Rule Syntax Dialog

To access this dialog:

1. Go to **CONFIGURE > ESA Rules**.
2. In the **Rule Library** view, do one of the following:
   a. Click and select **Advanced EPL** or **Rule Builder**.
   b. Double-click an existing rule.
   c. Select an existing rule and click in the **Rule Library** toolbar.
   d. In the row of an existing rule, select **> Edit**.
   The new or existing rule is displayed in a new tab, available to edit.
3. Click **Show Syntax** at the bottom of the tab.

The following figure shows an example of the Rule Syntax dialog showing a valid rule.



The following table describes the Rule Syntax dialog parameters.

Parameters	Description
Rule is valid or **Validation error in rule**	Indicates whether the rule syntax is valid or needs to be changed.
Rule Name	Displays the name of the rule.
Text	Displays the EPL syntax of conditions, statements, and debugging parameters if the rule is valid.

Services Tab

This topic provides an overview of the **CONFIGURE > ESA Rules > Services** tab. The Services tab provides details of the ESA services added to NetWitness Platform.

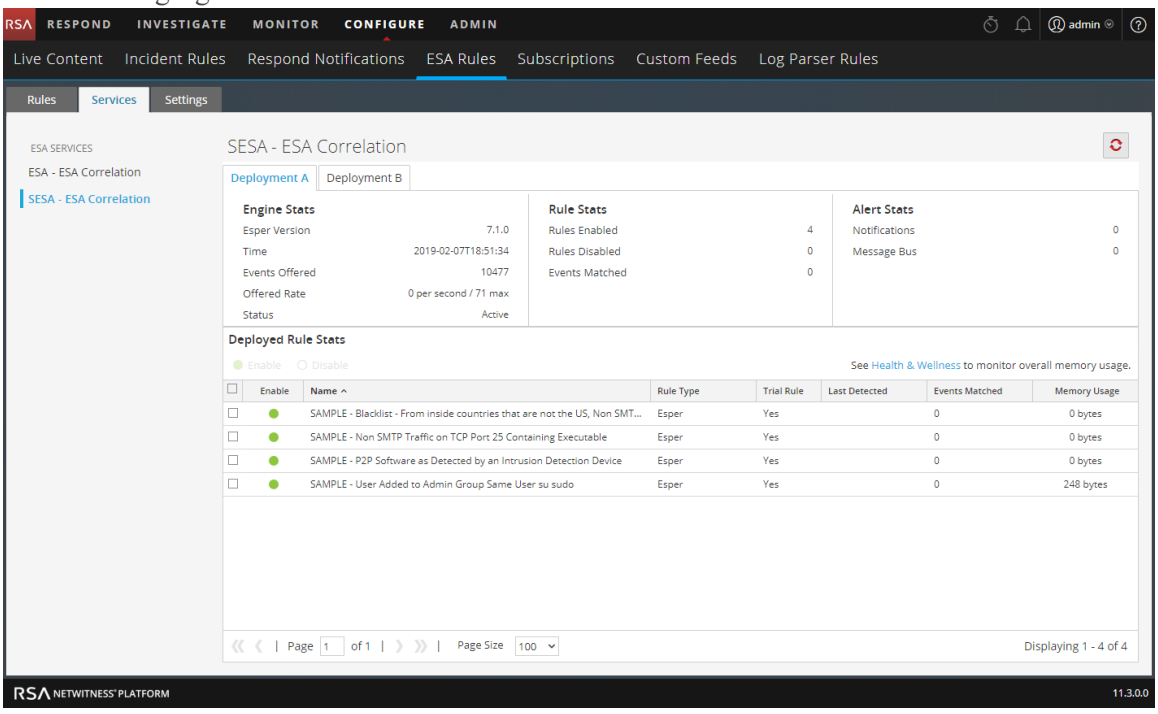
Services

The following figure shows the Services tab:



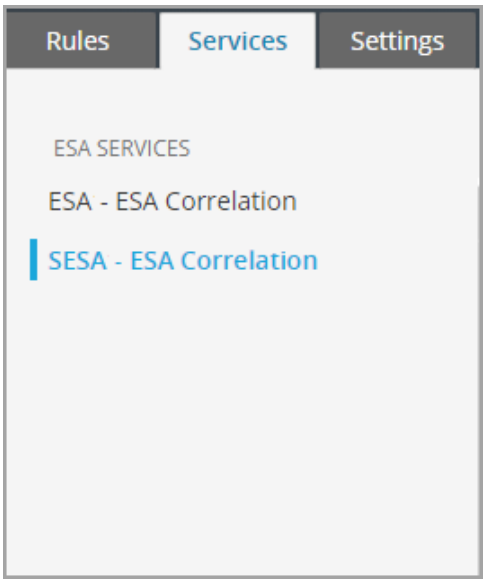
(This option is available in NetWitness Platform version 11.3 and later.) If an ESA Correlation service has multiple deployments, under the service name, you will see a tab for each deployment. In the above example, there are two deployment tabs, Deployment A and Deployment B. Each tab displays information specific to that deployment.

The Services tab has the following sections:

- ESA Services panel (on the left)
- General Stats panel (top right)
- Deployed Rule Stats panel (bottom right)

ESA Services Panel

The ESA Services panel lists the name of each ESA service added to NetWitness Platform.



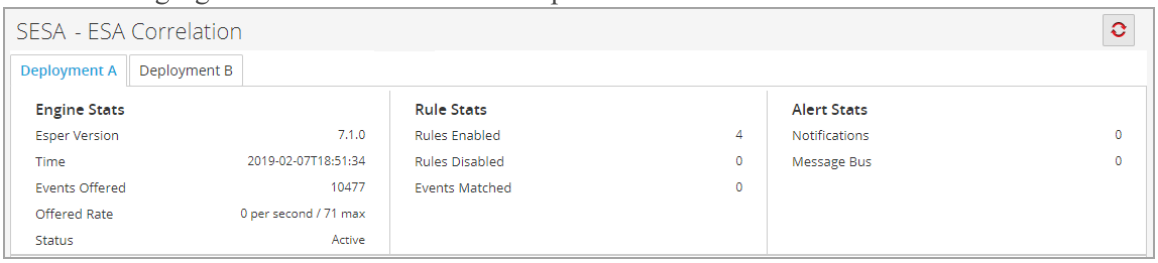
General Stats Panel

The General Stats panel provides information on the Esper engine, rules, and alerts.

The General Stats panel contains the following sections:

- Engine Stats
- Rule Stats
- Alert Stats

The following figure shows the General Stats panel.



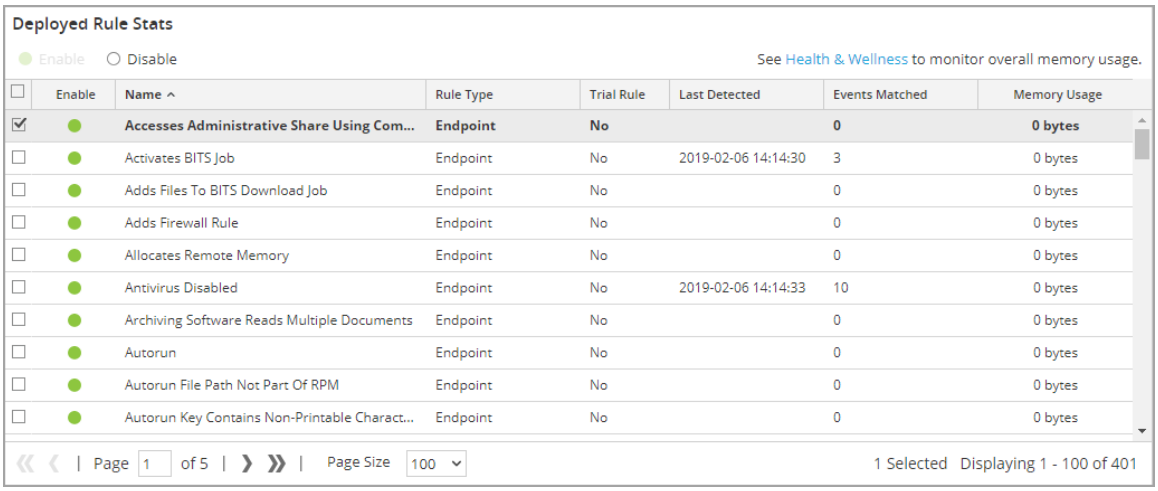
The following table lists and describes the parameters in each section.

Sections	Parameter	Description
Engine Stats	Esper Version	Esper version running on the ESA service
	Time	Time when the last event was sent to Esper Engine
	Events Offered	Number of events processed by the ESA service since the last service start
	Offered Rate	The rate that the ESA service processes current events / The maximum rate that the ESA service processed events.
	Status	Shows the status of the deployment. A status of **Active** means that the deployment is active. A status of **Inactive** means that there was probably an error starting the deployment. Check the error log file for more information: `/var/log/netwitness/correlation-server/correlation-server.log`.
Rule Stats	Rules Enabled	Number of rules enabled
	Rules Disabled	Number of rules disabled
	Events Matched	Total number of events matched to all rules on the ESA service
Alert Stats	Notifications	The total number of notifications sent by email, SNMP, syslog, or script for the deployment. (ESA SNMP notifications are not supported in NetWitness Platform version 11.3 and later.)
	Message Bus	The total number of alerts sent to Respond for the deployment

Deployed Rule Stats Panel

The Deployed Rule Stats panel provides details on the rules that are deployed on the ESA service.

The following figure shows the Deployed Rule Stats panel.



The table lists the various parameters in the view and their description.

Parameters	Description
Enable	Enables a rule that was disabled.
Disable	Disables a rule that was enabled.
Health & Wellness link	Enables you to monitor overall memory usage and health of your ESA Correlation service.
Enable	Indicates whether the rule is enabled or disabled. A green circle icon indicates that the rule is enabled. A white circle icon indicates that the rule is disabled.
Name	Name of the ESA rule.
Rule Type	(This field applies to version 11.3 and later.) **Endpoint** indicates a rule from the Endpoint Risk Scoring Bundle and **Esper** indicates Esper-specific rules, such as Rule Builder and Advanced EPL rules.
Trial Rule	Indicates if the rule is running in trial rule mode.
Last Detected	The last time alert was triggered for the rule.
Events Matched	The total number of events that matched the rule.
Memory Usage	The total amount of memory used by the rule. **Note:** The Endpoint Risk Scoring Rules Bundle rules do not show memory usage.

Settings Tab

This topic describes the components of the **CONFIGURE > ESA Rules > Settings** tab. In the Settings tab, you can perform the following tasks:

- View a list of meta keys
- Configure a data enrichment source
- Add a connection to an external database (This option applies to NetWitness Platform version 11.2 and earlier.)

What do you want to do?

Role	I want to ...	Show me how
Content Expert	Configure a connection to an external database. (This opton applies to NetWitness Platform version 11.2 and earlier.)	See "Configure a Database Connection" in the NetWitness Platform 11.2 *Alerting with ESA Correlation Rules User Guide*.
Content Expert	Configure a database as an enrichment source. (This option applies to NetWitness Platform version 11.2 and earlier.)	See "Enrichment Sources" in the NetWitness Platform 11.2 *Alerting with ESA Correlation Rules User Guide*.
Content Expert	Configure an in-memory table as an enrichment source.	Configure In-Memory Table as an Enrichment Source
Content Expert	Configure a Context Hub list as an enrichment source.	Configure Context Hub List as an Enrichment Source

Related Topics

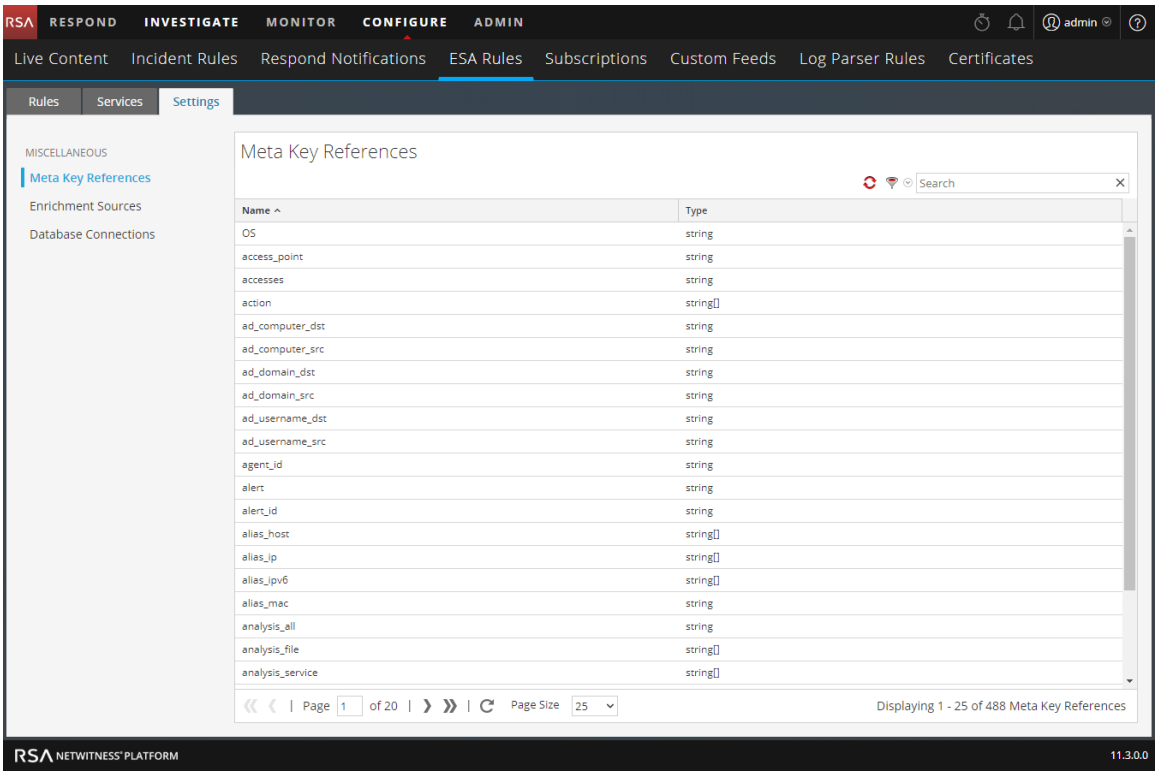
Settings

The following figure shows the Meta Key References section in the Settings tab.



Meta Key References

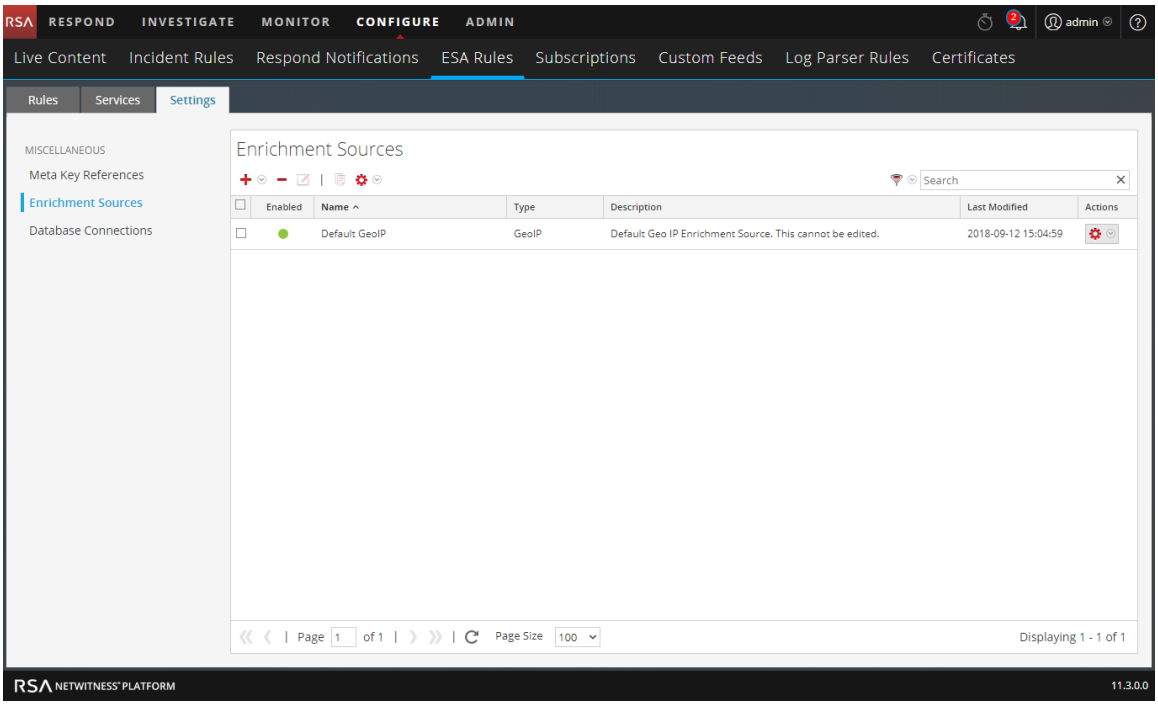
The Meta Key References section lists each meta key and the type of value the key requires.

Enrichment Sources

In the Enrichment Sources section, you can configure the following external data sources:

- GeoIP
- External Database Reference (This option applies to NetWitness Platform version 11.2 and earlier.)
- In-Memory Table
- Warehouse Analytics (This option applies to NetWitness Platform version 11.2 and earlier.)
- Context Hub

The following figure shows the Enrichment Sources section in the Settings tab.

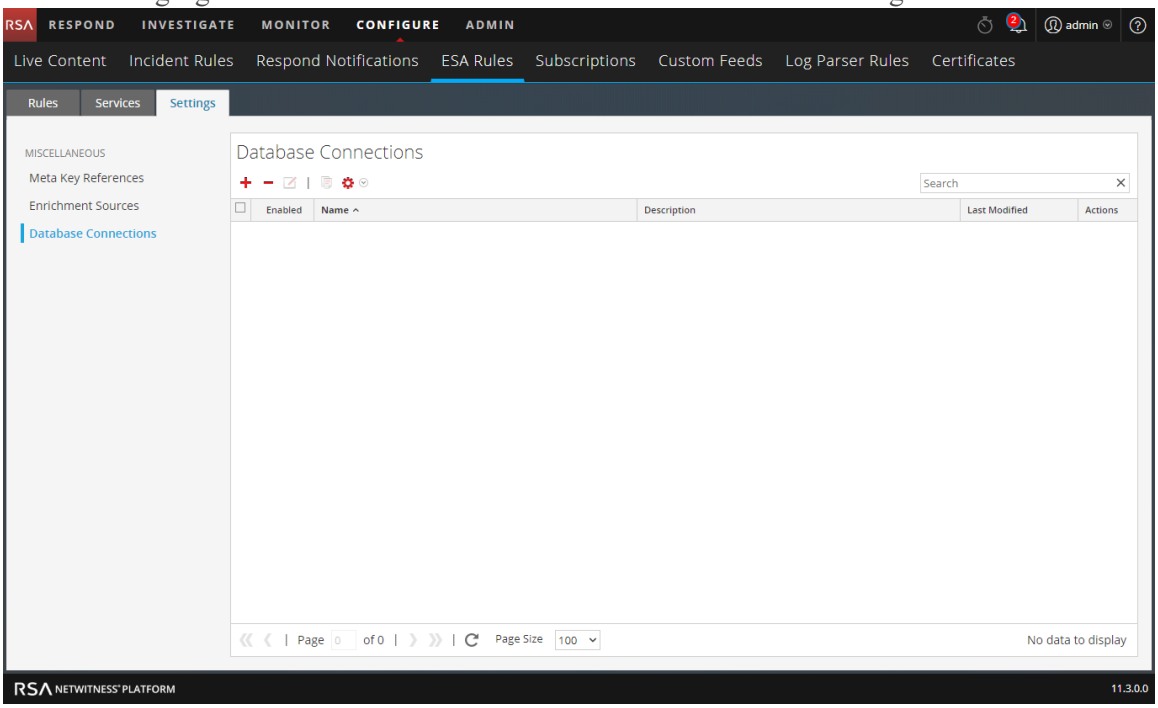


Database Connections

Note: This section applies to RSA NetWitness® Platform Version 11.2 and earlier.

In the Database Connections section, you can configure a connection to an external database so ESA can access that data.

The following figure shows the Database Connections section in the Settings tab.



In the Database Connections section you can perform the following:

- Add a Database Connection
- Delete a Database Connection
- Edit a Database Connection
- Duplicate a Database Connection
- Import a Database Connection
- Export a Database Connection

Updates to the Deployment Dialog

The Updates to the Deployment dialog displays changes to the deployment, such as adding a rule or service. Deployment updates are indicated by the update icon ( ) next to the name of the deployment in the Rules tab options panel.

What do you want to do?

Role	I want to ...	Show me how
Content Expert	Deploy rules to run on ESA.	ESA Rule Deployment Steps
Content Expert	Edit or delete an ESA rule deployment.	Edit the ESA Rule Deployment Name or Delete a Deployment
Content Expert	View deployment updates.	Show Updates to an ESA Rule Deployment

NetWitness Event Sources

Event sources are network sources that send information about events to the RSA NetWitness® Platform. They can be physical devices, such as laptops, network switches or firewall, and virtual or cloud-based applications, such as VMware. For example:

- An Apache HTTP Server
- Amazon Web Services CloudTrail
- A Barracuda Web Application Firewall
- A connection to Dropbox
- An Oracle Database
- A VMware vCenter Server

You first configure all of your event sources so that they can communicate with the NetWitness Platform. RSA provides configuration guides for many common event sources, using a variety of collection methods (such as Syslog or file collection). After you have your event sources configured, use the information in this guide to manage them going forward.

Event Source Management

The Event Sources module in NetWitness Platform provides an easy way to manage event sources and configure alerting policies for your event sources.

Workflow

This workflow shows the overall process for managing event sources, and configure monitoring for them. It also shows where configuring alarms and alerts settings are located in the process.

Prerequisites

There are two permissions that affect Event Source Management:

- **View Event Sources** is needed for users to view event sources, their attributes, and their thresholds and policies.
- **Modify Event Sources** allows users to add, edit, and otherwise update event sources.

For details, see the following topics:

- The *Roles Tab* topic available in the **System Security and User Management** guide > **References** > **Administration Security View** > **Roles Tab**.
- The *Role Permissions* topic describes the built-in NetWitness Platform system roles, which control access to the user interface. Available in the **System Security and User Management** guide > **How Role-Based Access Control Works**.
- The *Manage Users with Roles and Permissions* topic describes how to manage users in NetWitness Platform, using roles and permissions. Available in the **System Security and User Management** guide > **Manage Users with Roles and Permissions**.

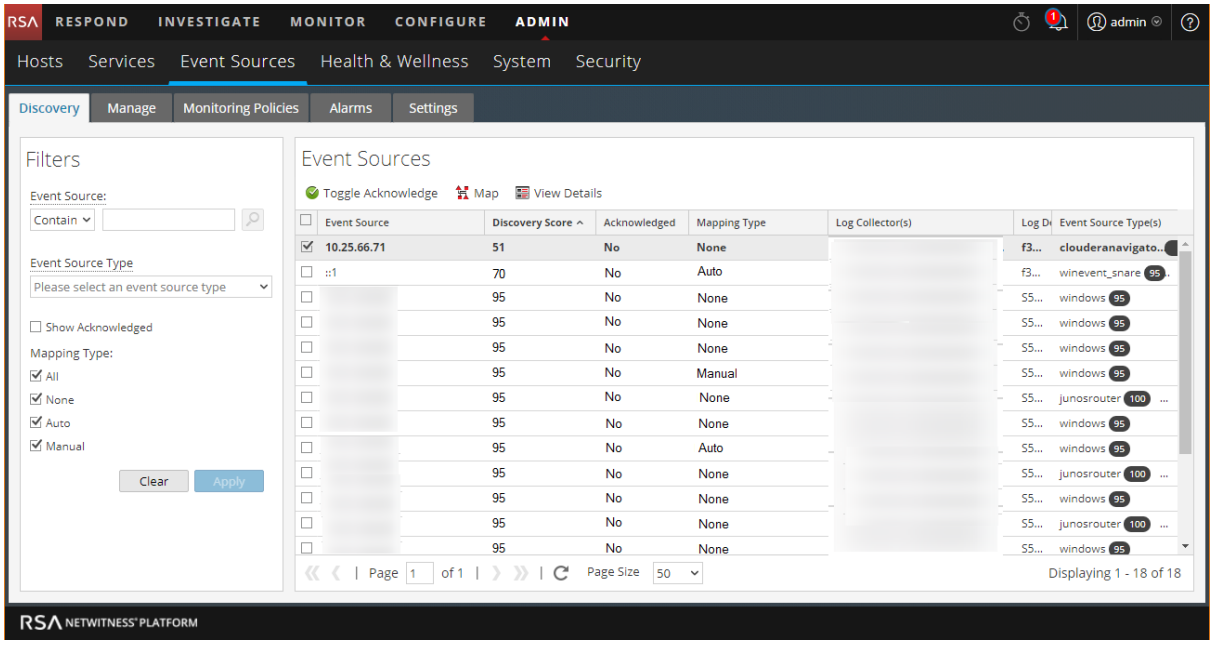
Automatic Mapping

Introduced in RSA NetWitness® Platform version 11.1, the system maps incoming events to a type based on previous logs received from that address, reducing the mis-parsing of messages and reducing the number of items that need attention in the Discovery workflow. The User Interface (UI) indicates that an address has been auto-mapped in the Discovery workflow.

Navigate to Event Source Management

You can view the details about your existing event source groups by doing the following:

1. Go to **ADMIN > Event Sources**.



2. Click any of the following:

- The **Discovery** tab. Use this tab to review the event source types that NetWitness has discovered for each address and the system's confidence of how likely it is that they were identified completely accurately.
- The **Manage** tab. Use this tab to add, edit, and delete event source groups and view details for your existing event source groups.
- The **Monitoring Policies** tab. Use this tab to view or edit your event source alerting configuration.
- The **Alarms** tab. Use this tab to see the details of the alarms that have been generated. Alarms are generated when event sources exceed or fall below their set thresholds.
- The **Settings** tab. Use this tab to view or change the behavior for automatic alerts.

Note: When the system receives logs from an event source that does not currently exist in the Event Source List, NetWitness Platform adds the event source to the list. Additionally, if it matches the criteria for any existing group, it becomes part of that group.

How Alarms and Notifications Work

The Event Source module in NetWitness Platform displays alarms and sends notifications based on alarms that are triggered.

For alarms, consider the following:

Alarms are of two types: **automatic** (triggered when baselines are exceeded or not met) and **manual** (configured using thresholds).

- **Automatic**: If you turn on automatic alerts, the system reports alarms for **all** event sources that go above or below their normal baselines by the required amount. You can specify the over / under percentage on the Settings Tab.
- **Manual**: The system sends an alert whenever an event source exceeds the thresholds in the policy for the associated groups.
- Alarms appear on the UI, in the Alarms Tab.

For notifications, consider the following:

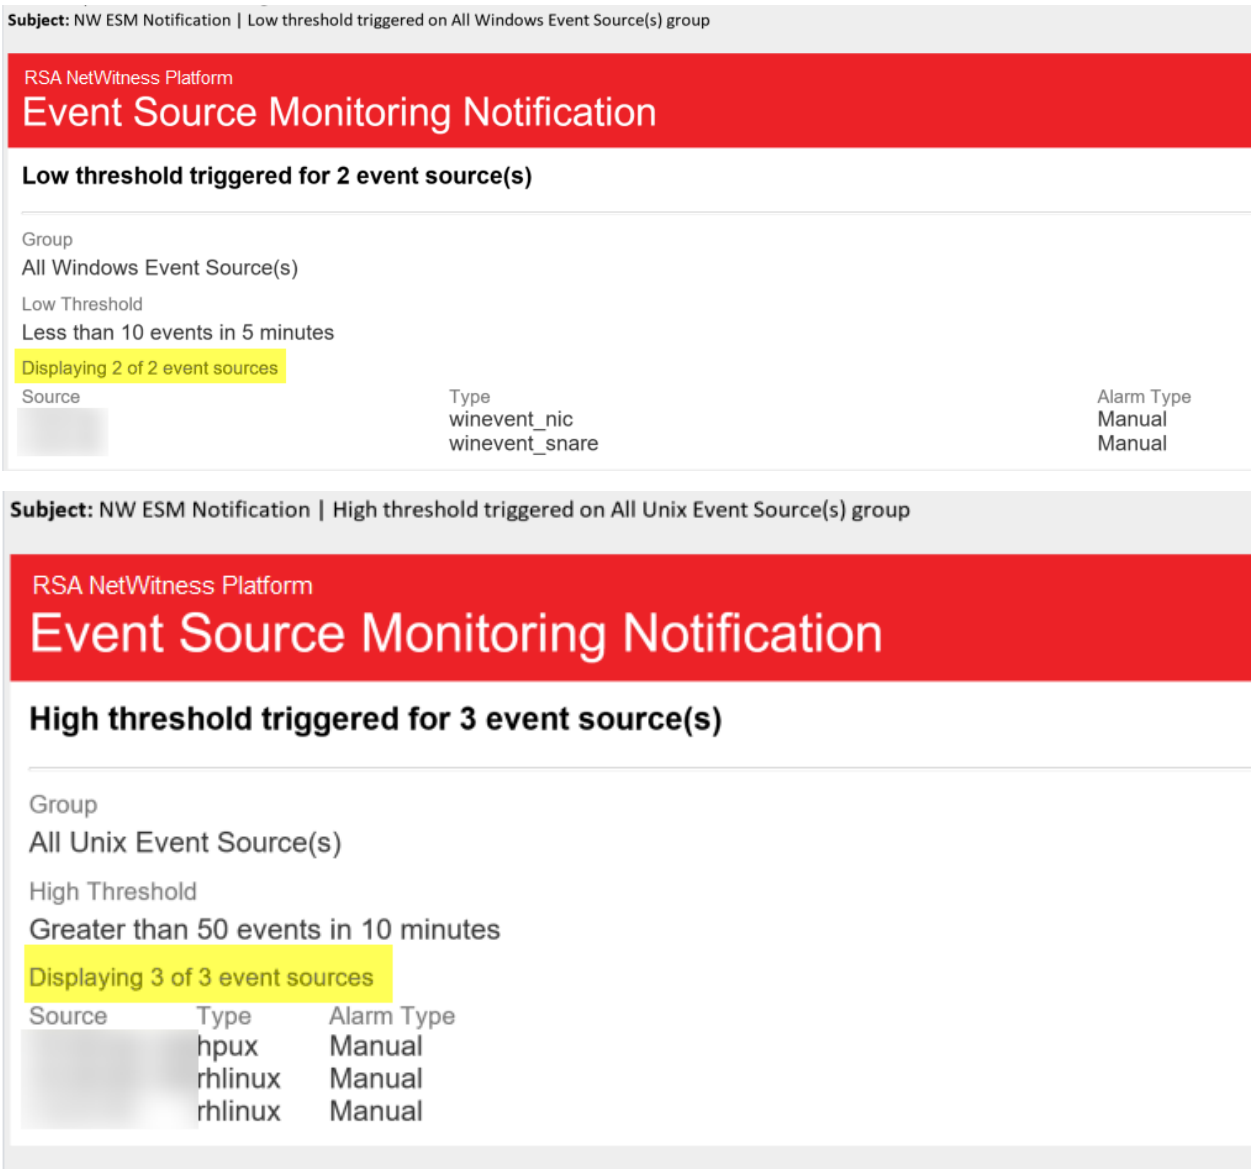
- To receive manual notifications (through email, SNMP or Syslog):
  - Specify a policy for an event source group.
  - Set a high or low (or both) threshold.
  - Enable the policy.
- To receive automatic (baseline) notifications:
  - Baseline alerting must be on. This is turned on by default.
  - You must enable notifications from automatic monitoring. See Configuring Automatic Alerting for details.
  - The event source that triggers the alarm must be in a group that has a policy enabled.
- If you have automatic alerting turned on, and you have configured a policy and threshold for a group:
  - If the event source goes outside its baseline, you see an automatic alert and receive a notification.
  - If the event source goes outside its thresholds, you see a manual alert and receive a notification.
  - If both occur (threshold and baseline exceeded or not met), you receive two alarms (visible on the Alarms tab) and a notification that indicates both alarms. That notification will list the event source that double alarmed twice; one listing indicating it was an automatic alarm.

Large Email Notifications

If you have set up email notifications, keep in mind that the email can grow very large, depending on the number of event sources in the notification.

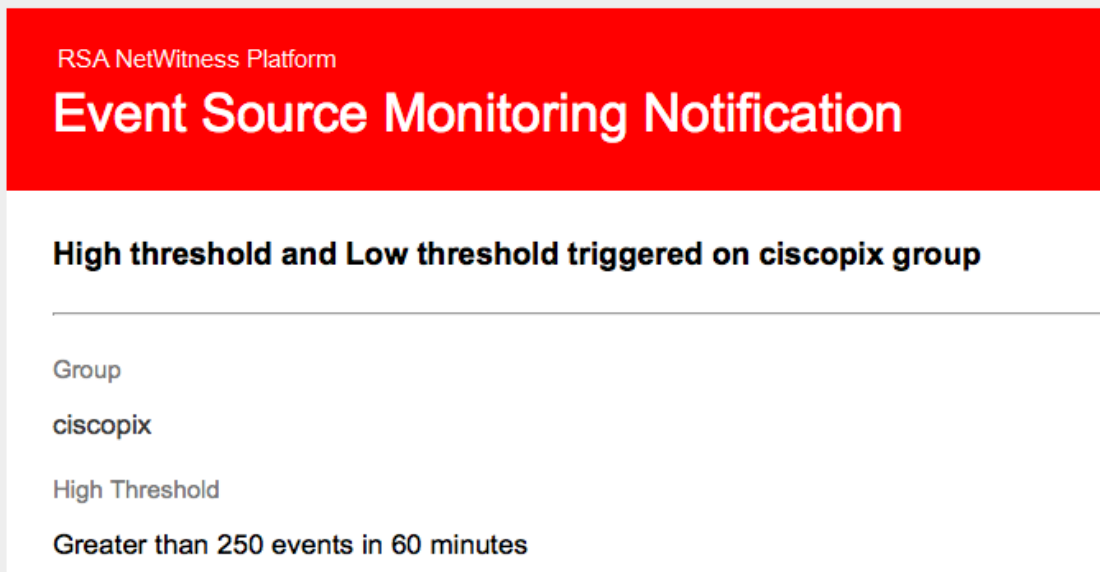
If the number of event sources in the alarmed state exceeds 10,000, then the email notification contains the details for only the first 10,000 and a total count. This is to ensure that the email is successfully delivered.

The following examples show a low threshold triggered for two event source groups and a high threshold triggered for three event source groups.



High and Low Thresholds Both Triggered

Occasionally, both the high and low alarms are triggered for a particular event source group. The easiest way to see when this happens is to read the email header, which clearly states when both thresholds are triggered, as shown in this image:



In this example, the header states, "High threshold and Low threshold triggered on ciscopix group." To see the details for the low threshold event sources, you may need to scroll down past hundreds, or even thousands, of the high threshold event sources.

Automatic Alerting

This topic describes automatic alerts, which are based on baseline settings.

Note: Automatic alerting, and all of the parameters that determine its behavior, are currently in Beta testing.

You can set up policies and thresholds for your event source groups. You do this so that you receive notifications when the thresholds are not met. NetWitness Platform also provides an automatic way to receive alarms, if you do not want to set up thresholds to generate alarms.

To trigger automatic alerts, you can use baseline values. This way, you do not need to set up numerous group thresholds and policies in order to receive alerts. Any anomalous amount of messages trigger alerts, without needing to do any configuration (except for turning on automatic alerting).

Note the following:

- After you begin collecting messages from an event source, it takes the system approximately a week to store a baseline value for that event source. After this initial period, the system alerts you when the number of messages for a period are above or below the baseline by a set amount. By default, this amount is 2 standard deviations above or below the baseline.
- Base your high and low deviation settings on how "regular" your event sources behave. That is, if you expect little or no variance in the number of messages that arrive for a given time (for example, 8 to 9 am on a weekday), then you can set a low value for the Deviation. Conversely, if you often see peaks and valleys, set the Deviation value higher.
- If you enable a policy, but do not have any thresholds set, then you can still receive automatic (baseline) notifications, as long as you have turned on automatic alerting.

Common Scenarios for Monitoring Policies

Typically, organizations monitor their event sources in "buckets" based on how critical the event sources are. One typical example is as follows:

- There is a group of PCI devices, and it is critical to know if any of these devices stop sending messages (or send too few messages) within a half hour.
- There is a group of Windows devices, and it is useful to know if any of these devices stop sending messages after four hours.
- There is a group of quiet devices that do not typically send a lot of messages, but you would like to know if they do not send anything for 24 hours.

Many organizations may have a network that resembles this example. You may have more or different categories, but this example is used to discuss this feature.

You may have dozens or even hundreds of event source groups, and still only have a few groups for which you need to set thresholds and alerts.

Note: If an Event Source is a member of multiple groups that have alerting configured, it will only alert on the first matching group in the ordered list. (The Monitor Policies tab presents an ordered list of your groups.)

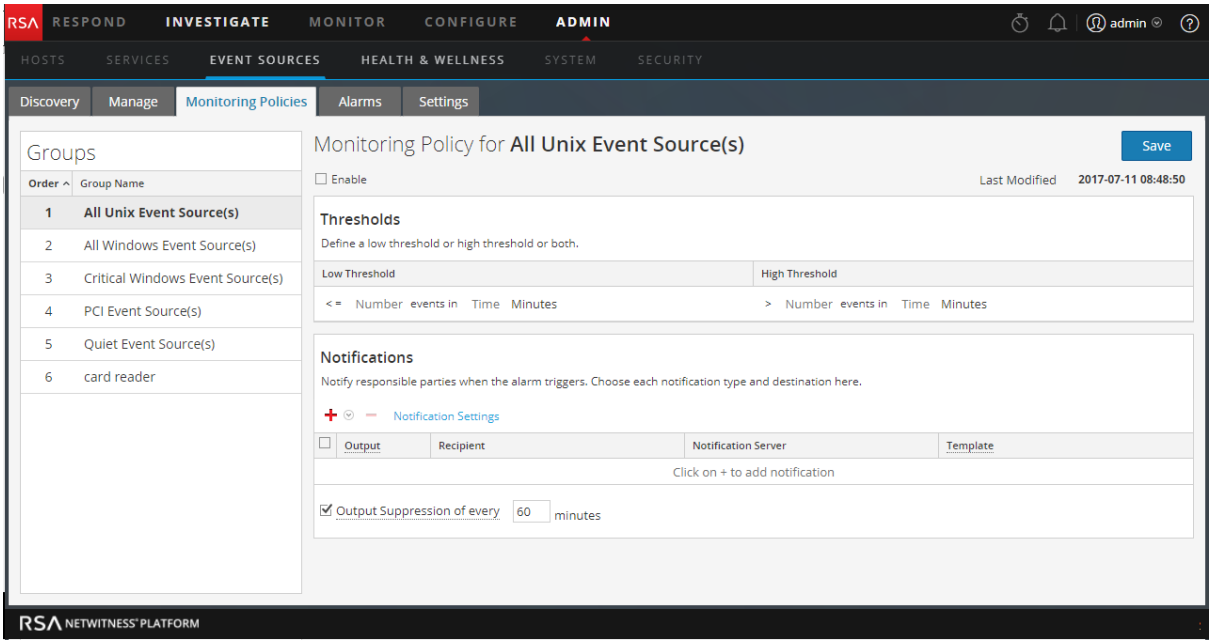
Ordering the Groups

Note: To change the order of the groups, drag and drop a group to its new location. The higher a group is listed, the higher the precedence for that group's thresholds: RSA NetWitness Platform checks the thresholds in the order provided in this panel. Thus, your highest priority groups should be at the top of this list.

The first thing to keep in mind is how to order your groups on the Monitoring Policies page. Assuming that you have the three groups mentioned above, you should order them as follows:

1. Quiet event sources. Having this group first ensures that you will not get numerous false alerts.
2. High priority PCI event sources. The highest priority devices should be after the quiet devices
3. Windows event sources. The time range is longer (four hours versus a half hour) for these devices than for the PCI devices. Therefore, they should come after the PCI devices.
4. All event sources. Optionally, you could set thresholds for all devices as a catch-all. This ensures that your entire network is operating as expected. For the catch-all group, you do not need to specify any thresholds—you can use automatic alerting to generate alarms for the event sources in this

group.



In the figure above, note the following:

- The groups are ordered as discussed in the previous section.
- The threshold for PCI devices is to alert if the number of messages coming in to NetWitness Platform is fewer than 10 messages in 30 minutes.
- A low threshold is defined, but not a high threshold. This is typical for many use cases.

After you have set up and ordered your groups and begun to receive alerts, you may need to adjust the order. Use these guidelines to help you adjust the ordering:

- If you receive more notifications than you need, you can move the group down in the order. Similarly, if you are getting too few notifications, move the group up towards the top.
- If you notice that one event source is creating more alerts than it should, you can move it to another group, or create a new group for that event source.

Managing Event Source Groups

Definitions

When dealing with event source groups in NetWitness Platform, note the following:

- An **event source** is essentially the combination of values for all of its attributes.
- An **event source group** is the set of event sources that match a set of criteria that are defined for that group.

For example, you might have the following groups:

- A group named **Windows Devices**, consisting of all the event source types associated with Microsoft Windows event sources (`winevent_nic`, `winevent_er`, and `winevent_snare`).
- A group named **Low Priority Services**, consisting of all services where the Priority attribute has been set lower than 5.
- A group named **U.S. Sales Servers**, where you gather event sources located in the U.S.A. and having an Organization attribute of Sales, Finance, or Marketing.

Manage Tab Details

The Manage tab in the Event Source module provides an easy way to manage event sources. In this tab, you can:

- Set up event source groups in a consistent way.
- Work with event source attributes in a consistent, straightforward manner.
- Easily search through your entire set of event sources.
- Bulk edit and update your event sources and event source groups.

You can view the details about your event source groups by doing the following:

1. Go to **ADMIN** > **Event Sources**.
2. Select the **Manage** panel to see the details for your existing event source groups.

Note: When the system receives logs from an event source that does not currently exist in the Event Source List, NetWitness Platform automatically adds the event source to the list. Additionally, if it matches the criteria for any existing groups, it becomes part of that group.

Default Groups

RSA NetWitness Platform has several default groups. You can customize these as required and use them as templates for creating new groups.

The default groups are as follows:

- All Event Sources
- All Unix Event Sources
- All Windows Event Sources
- Critical Windows Event Sources
- PCI Event Sources
- Quiet Event Sources

You can edit any of these groups to investigate the rules that define the groups.

Note: You cannot edit or delete the **All** event source group.

Creating Event Source Groups

Administrators must receive notifications when event sources are no longer being collected by NetWitness Platform. They need to be able to configure how long the event sources can be quiet (that is, not collect any log messages) before sending a notification based on different factors.

RSA NetWitness Platform provides event source groups so that you can group similarly important devices together. You can create groups based on attributes that you imported from your CMDB (configuration management database), or by manually choosing event sources to add to the group.

For example, these are some of the types of event source groups that you can create:

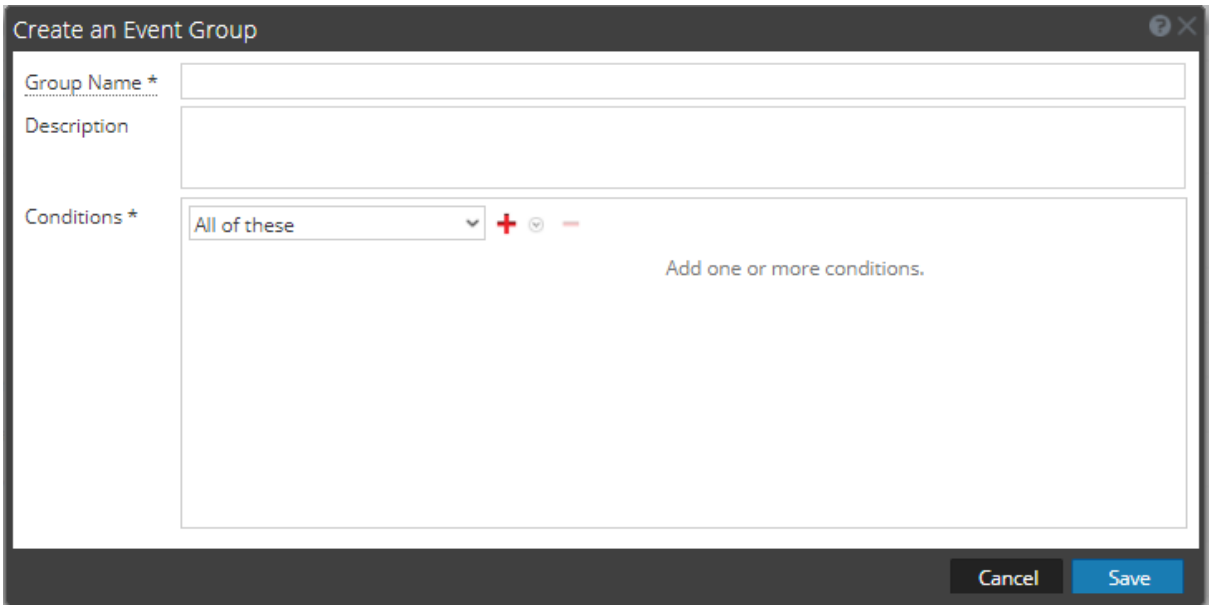
- PCI sources
- Windows Domain Controllers
- Quiet sources
- Finance Servers
- High Priority devices
- All Windows sources

Procedure

To create an Event Source group:

1. Go to **ADMIN** > **Event Sources**.
2. In the **Manage** panel, click .

   The Create an Event Group dialog is displayed.



3. Enter a Group Name.
4. Enter a Description.
5. Click + to add a condition. Continue adding conditions as necessary. For details on constructing conditions, see Create/Edit Group Form.
6. Click **Save**.

   The new group is listed in the **Manage** panel.

Examples

This section describes a simple example, and then discusses how to set up a more complex set of rules.

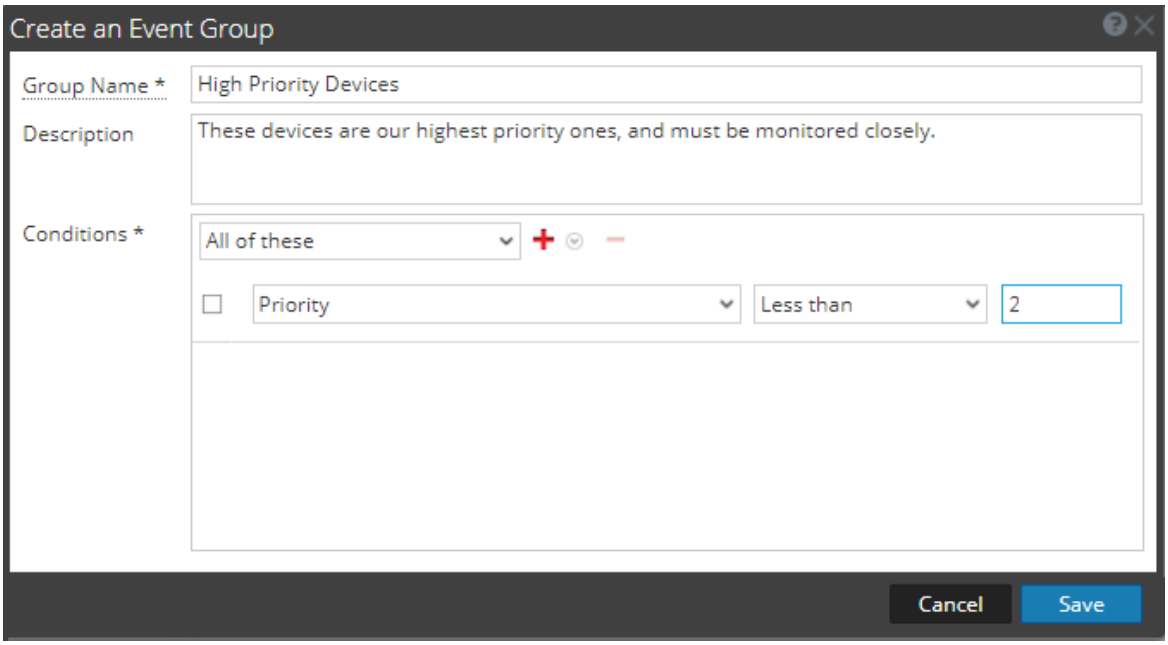
Simple Example

If you want to create an event source group that contains all of your high priority event sources, this example describes the necessary steps.

1. Go to **ADMIN > Event Sources**.
2. In the **Manage > Groups** panel, click + .
3. Enter **High Priority Devices** for the Group Name.
4. Enter a description, such as, "These devices are our highest priority ones, and must be monitored closely."
5. Leave **All of these** selected and click + to add a condition.
6. Select **Add condition** from the drop-down menu.
   a. Select an Attribute: **Priority**.
   b. Select an Operator: **Less than**.

c. Enter a value: **2**.

The following figure displays the updated Edit Event Group dialog.



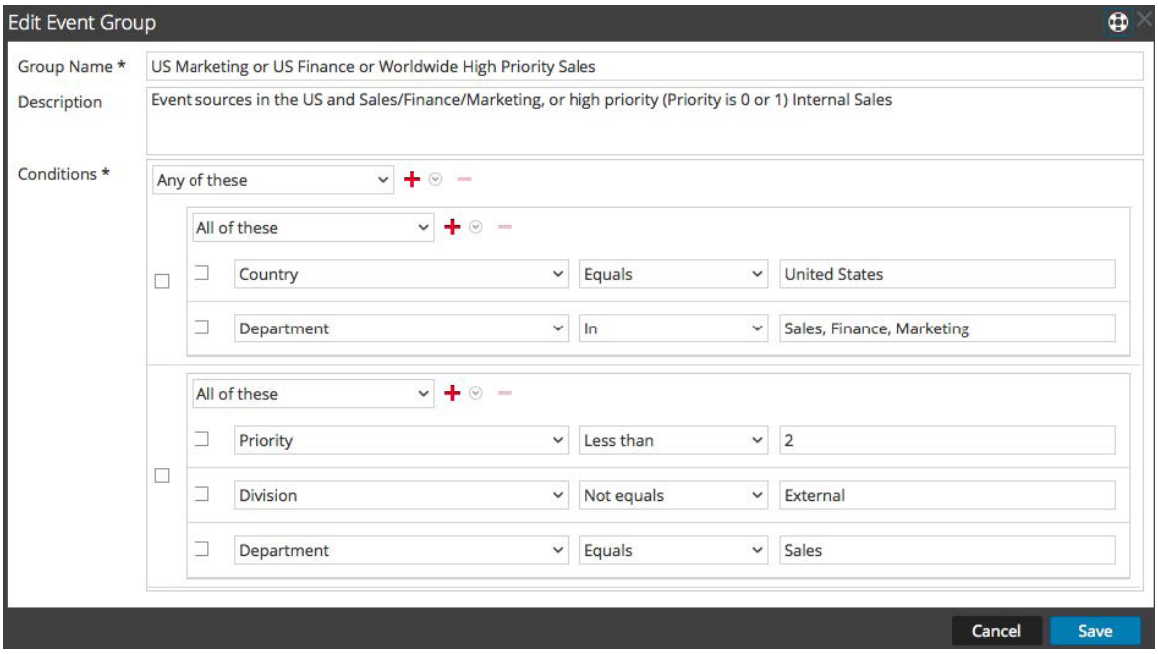
7. Click **Save**.

Complex Example

In this example, you want to create a fairly complex rule: match event sources that are in the United States, and in either the Sales, Finance, or Marketing departments. Also, match worldwide internal, high priority Sales event sources. High Priority is assumed to be where the priority is 1 or 0. Logically, the definition is as follows:

```
(Country=United States AND (Dept.=Sales OR Dept.=Finance OR
Dept.=Marketing))
 OR
 (Priority < 2 AND Division != External AND Dept.=Sales)
```

The following figure is an example of the criteria for creating such an Event Source Group.



Creating Event Source Group Form

The Create Event Source Group form is displayed when you are creating or editing an Event Source Group.

Parameters

The following table describes the fields on the Create/Edit an Event Group form.

Field	Description
Group Name	This field is required, and appears throughout the NetWitness Platform UI as the identifier for the group.
Description	An optional description to help describe the purpose or details for the group.
Tools	The following items are available on the toolbar: • **Add (+)**: clicking the **Add** displays a menu where you can choose to add a condition or a group. • **Remove (−)**: removes the selected rule or group of rules from the list. When you add a new group, that has the effect of creating nested levels of conditions.
Conditions	Described below, in the **Rule Criteria** table.
Cancel / Save	**Cancel** and **Save** options are available in the form.

Rule Criteria

The rules that you specify determine the event sources that will become part of this event source group. A rule consists of the following:

- Grouping: how the rule interacts with other rules
- Attribute: which attribute the rule is matching against
- Operator: how the rule matches the attribute
- Value: the attribute value used for the rule

The following table provides details on these rule constructors.

Rule Constructor	Details
Grouping	You can group conditions, in order to create complex rules for an event source group. The following choices are available when grouping your rules: • **All of these**: logically equivalent to AND • **Any of these**: logically equivalent to OR • **None of these**: logically equivalent to NOT If you are creating a simple group, and specifying a single condition, you can leave the default value (**All of these**) selected.
Attribute	This contains a drop-down list, consisting of all event source attributes. The attributes are displayed by the section to which they belong. For example, all of the **Identification** attributes are displayed first, followed by the **Properties**, **Importance**, and so on.

Rule Constructor	Details

Operator	Choose from the following options:
	• **Equals**: matches the provided value
	• **Not equals**: returns event sources whose specified attribute not equal to the provided value
	• **In**: provide a list of values in comma separated format, and event sources that match any of the provided values are included. For example:
	`Where IP in 10.25.50.146, 10.25.50.248`
	This condition returns event sources that have either `10.25.50.146 or 10.25.50.248` as their IP attribute.
	• **Not in**: similar to **In**, except that it matches items whose attribute is not equal to any of the listed values.
	• **Like**: matches items that begin with the provided string. For example:
	`Where Event Source Type Like Apache`
	This condition returns event sources whose Event Source Type begins with `Apache`.
	• **Not like**: similar to **Like**, except that it matches items whose attribute does not begin with the provided string.
	• **Greater than**: matches items whose attribute is greater than the provided value. For example, if you specify Priority Greater than 5, the condition would match any item with a priority of 6 or higher.
	• **Less than**: similar to **Greater than**. Matches items whose attribute is less than the provided value.

Value	Enter a value or group of values. The value type depends on the attribute for the condition. For example, for IPv6, you need to specify a value in IPv6 format.

Acknowledging and Mapping Event Sources

In RSA NetWitness® Platform version 11.1, RSA introduced Automatic Mapping. The system automatically maps incoming events to a type based on previous logs received from that address, reducing the number of items that need attention in the Discovery workflow. The UI indicates that an address has been auto-mapped in the Discovery workflow.

Acknowledge Event Source Types

The Discovery tab lets you review the event source types that NetWitness has discovered for each address and the system's confidence of how likely it is that they were identified accurately. If the discovered event source types are correct, you can acknowledge to filter out that event source from the view by default. If incorrect, you can set the allowed event source types for a particular address so that future logs will parse against the correct parsers.

To acknowledge event sources:

1. Go to **ADMIN > Event Sources**.

   The Discovery tab is displayed.

2. Select one or more event sources.
3. Click **Toggle Acknowledge**.

Note the following:

- After Event Sources are Acknowledged, they are no longer displayed in the Event Source Type(s) column.
- The **Toggle Acknowledge** button behaves as follows:
  - If the Acknowledged state for all of the selected event sources is the same, all values are toggled. That is, if you select only event sources with **Yes** in Acknowledged column, the value changes to **No** for all of them. Similarly if they all have **No** in the Acknowledged column, the value changes to **Yes** for all selected event sources.
  - If you select a multiple event sources, and the value for some is **Yes** and for other it is **No**, when you click **Toggle Acknowledge**, all of the values are set to **Yes** for the selected event sources.

Note: Acknowledged Event Sources are not displayed by default.

Manually Map Event Source Types

When discovered event source types are not completely accurate, you can manually map the parsers to obtain additional information.

To map one or more event sources:

1. Go to **ADMIN > Event Sources**.

   The Discovery tab is displayed.

2. Select one or more event sources.

3. Click Map .

   The Manage Parser Mappings dialog box is displayed.

4. Add or remove parser mappings, and change the priority order, based on the needs of your organization. For more details, see Manage Parser Mappings .

Note: Discovery scores for the mapped Event Sources are listed in the Event Source Type(s) column from the lowest to highest discovery scores. Discovery scores range from 0 (least confident) to 100 (most confident).

Viewing Logs from Pre-11.0 Log Decoder

RSA NetWitness® Platform 11.0 added the capability to view a small sampling of recent logs for specific devices through detail tabs of the Discovery View. By default, Log Decoders prior to 11.0 do not have the necessary configuration to enable this feature, but a few minor changes can make it available. For more details, see Viewing Logs from Pre-11.0 Log Decoder.

Editing or Deleting Event Source Groups

You may occasionally need to remove an event source group. For example, if you close an office, and you had a group consisting of all the event sources in that office, you can remove the group, since none of those event sources will send information to NetWitness Platform.

Similarly, you may need to change some of the conditions that are used to populate the group.

Note: You cannot edit the event source group name. After you create a group, that name exists as long as the group itself exists.

Edit an Event Source Group

1. Go to **ADMIN > Event Sources**.
2. In the **Manage** panel, select an existing Event Source Group.
3. Click .

   The Edit Event Group dialog is displayed.

4. Modify any of the details, or add, edit or remove conditions as necessary.
5. Click **Save**.

Delete an Event Source Group

Note the following:

- You can delete any group except for the **All** group, which lists all configured event sources in the system.
- If you delete a group, the associated policy for that group also gets deleted automatically.

- If there are any event sources that belong **only** to the deleted group, they would no longer have a policy alarm associated with them. Remember that event sources can belong to multiple groups.
- Deleting a group has no effect on baseline alarms.

To delete an event source group:

1. Go to **ADMIN > Event Sources**.
2. In the **Manage** panel, select an existing Event Source Group.
3. Click − .

   A confirmation dialog is displayed.
4. Click **Yes** to delete the group.

Removing Idle Event Sources

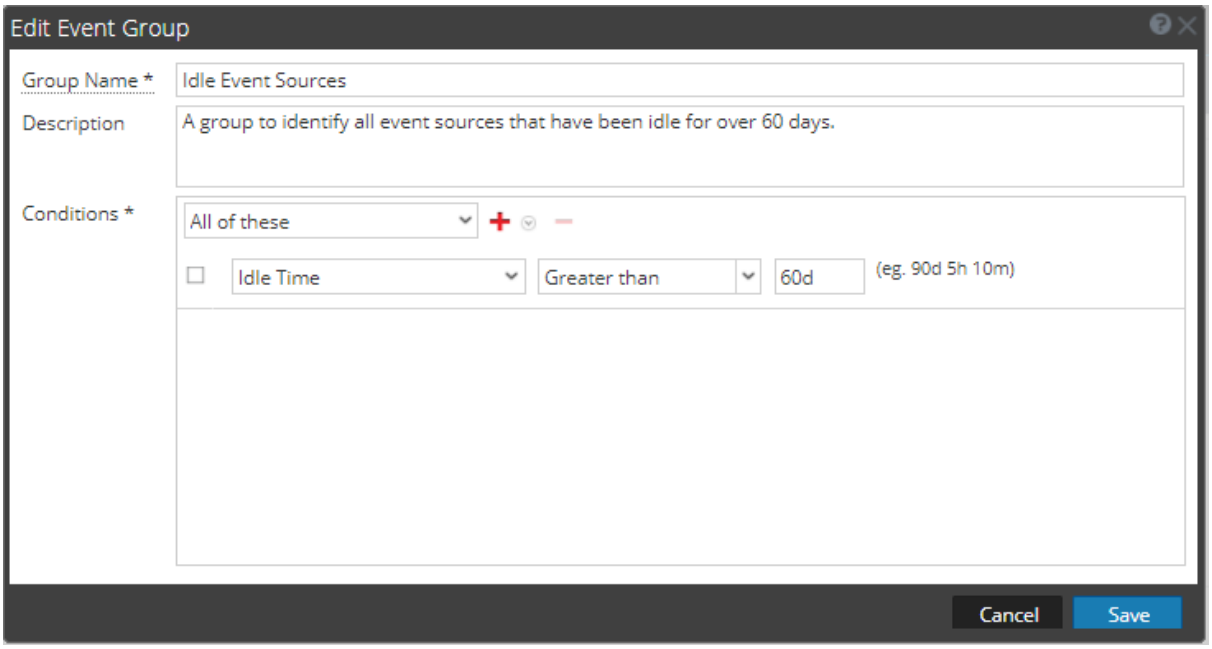
Periodically, you may want to update your set of event sources, and remove ones that are no longer being used. You can use the **Idle Time** parameter to do this.

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.2 and later.

To remove idle event sources:

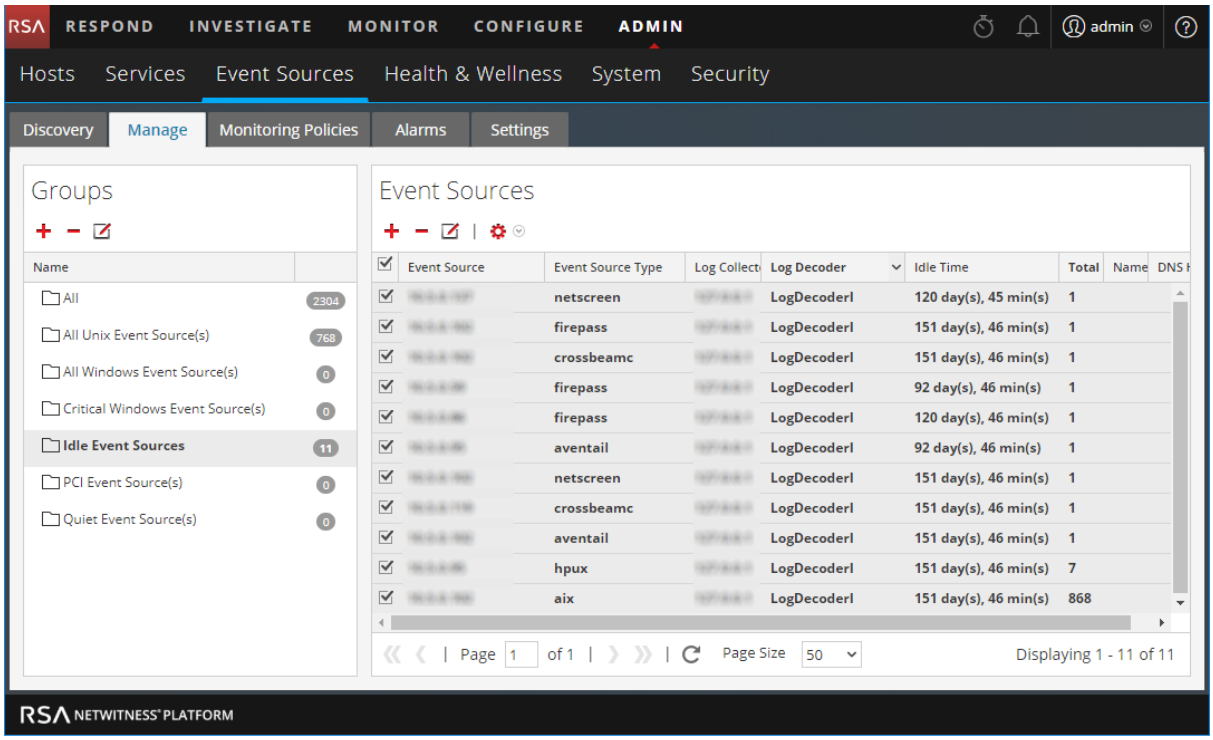
1. Go to **ADMIN > Event Sources**.
2. In the **Manage** panel, click + .

   The Create an Event Group dialog is displayed.
3. Fill in the name and description as you like, and add a condition that uses the **Idle Time** parameter, as shown here:



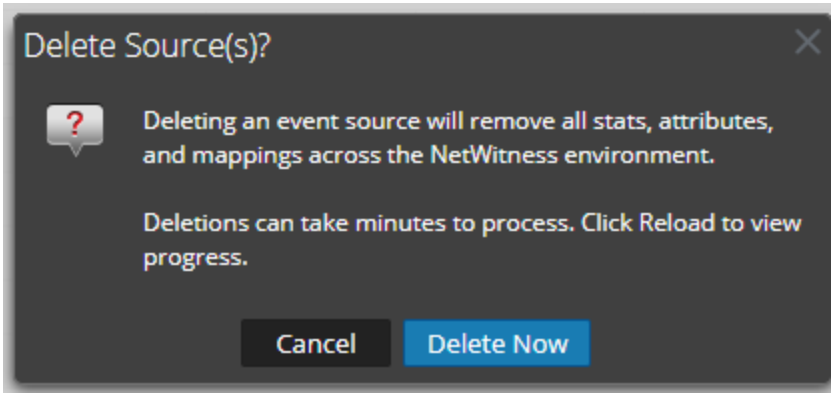
In this example, we have set the condition to identify event sources that have been idle for at least 60 days.

4. Save the new group, then select it in the Groups panel.
5. Select some or all event sources in the group. The following screen shows all event sources from this group selected.



6. In the Event Sources panel, click − to delete the selected, idle event sources.

   A confirmation message appears:



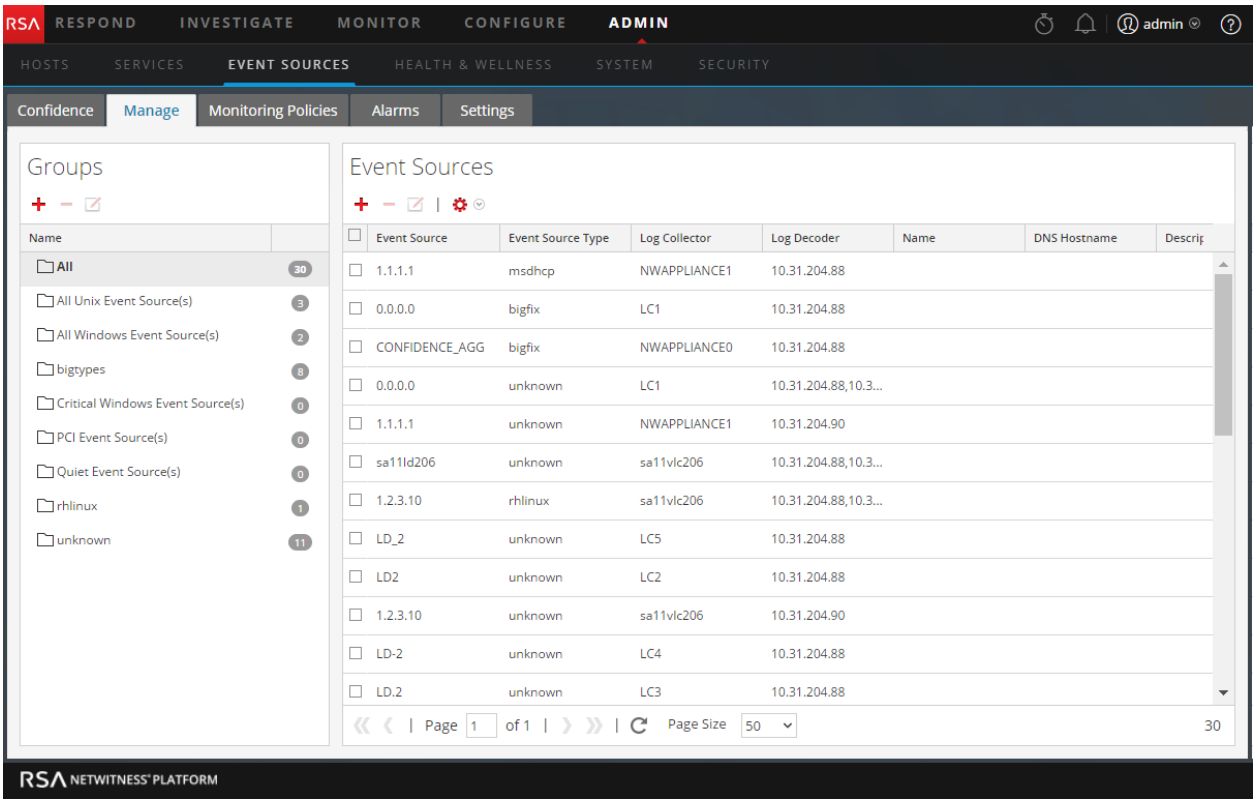
7. Click Delete Now to confirm your intention to delete the selected event sources.

If, in the future, an event source that has been removed sends logs, a new event source will be created.

Creating an Event Source and Editing Attributes

You can organize your event sources into groups. You do this by entering values for various attributes for each event source. For example, for all of your high priority event sources, you could set the **Priority** to 1. You can see details about the available attributes on the Manage Event Source Tab.

The following figure shows an example of the Event Sources panel:



Event source attributes are a combination of auto-populated and user-entered information. When an event source sends log information to NetWitness Platform, it is added to the list of event sources, and some basic information is auto-populated. At any time after that, users can add or edit details for other event source attributes.

Mandatory Attributes

The following identification attributes are handled specially: **IP**, **IPv6**, **Hostname**, **Event Source Type**, **Log Collector**, and **Log Decoder**. If you create an event source manually, you can enter these values. After you save the event source, these values can no longer be changed.

Event sources can also be auto-discovered; any event source that sends messages to the Log Decoder will be added to the list of event sources. If you edit the attributes for an auto-discovered event source, you cannot edit any of these fields.

Note that not all of these fields are mandatory. To uniquely identify an event source, the following information is required:

- IP or IPv6 or Hostname, and
- Event Source Type

Additionally, RSA NetWitness Platform uses a hierarchy for IP, IPv6, and Hostname. The order is as follows:

1. IP
2. IPv6
3. Hostname

If you enter event sources manually, then you need to keep this order in mind, otherwise, you may end up with duplicates when messages are received from the event sources that you manually added.

All other attributes (such as Priority, Country, Company, Vendor, and so on) are optional.

Create an Event Source

1. Go to **ADMIN > Event Sources**.
2. Select the **Manage** tab.
3. In the **Event Sources** panel, click + to open the details screen, which contains all of the event source attributes.

   The Manage Event Source Tab is displayed.
4. Enter or change the values for any attributes.
5. Click **Save**.

Note: The Discovery Score is listed as **Unavailable** for manually-added event sources. The score remains as **Unavailable** until the event source begins sending information to the RSA NetWitness® Platform

Update Attributes for an Event Source

1. Go to **ADMIN> Event Sources**.
2. Select the **Manage** tab.
3. In the **Event Sources** panel, select an event source from the list.
4. In the **Event Sources** panel, click + to open the details screen, which contains all of the event source attributes.

   The Manage Event Source Tab is displayed.
5. Enter or change the values for any attributes, except for certain attributes that cannot be altered after you have entered them.
6. Click **Save**

Bulk Editing Event Source Attributes

You can select multiple event sources, or an entire group, or even all event sources for bulk editing. For example, you might want to change the Priority or the Manager for a large number of your event sources.

Note: You cannot select individual event sources across displayed pages. For example, if you have a group with 225 event sources, and your Page Size is 50, you can only select event sources from the currently displayed 50 items.

If you want to edit items that span multiple pages, you can do the following:

- In the browser, increase the page size (the maximum is 500 entries on a single page). If your page size is small, you might be able to get all of your items on a single page.
- Create a new event source group that contains only the items that you want to bulk edit. Then, you can select all items for that group, rather than selecting individual items.
- Bulk edit incrementally. On the first page, select the items that you want to edit. Make your edits, then go to the next page and repeat the process, until you have made all of your changes.

Note: Mandatory fields cannot be edited; IP, IPv6, Hostname, Event Source Type, Log Collector, and Log Decoder.

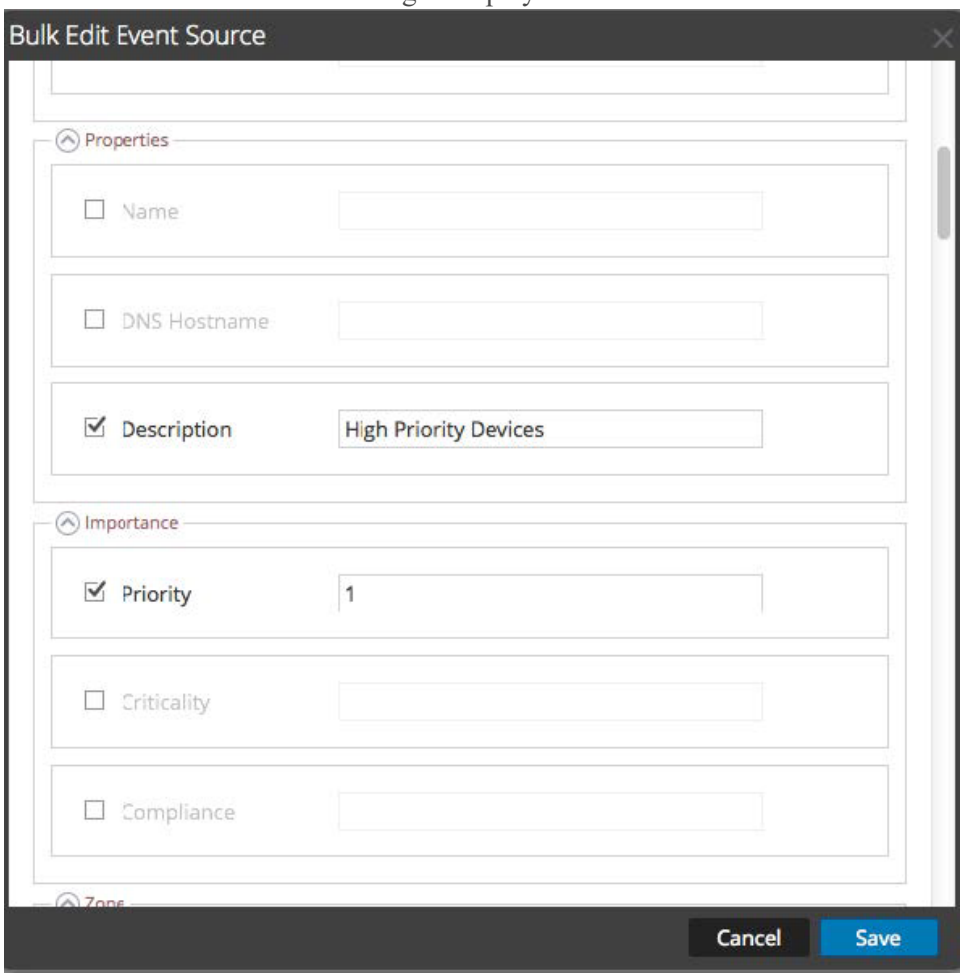
To bulk edit attributes for Event Sources:

1. Go to **ADMIN > Event Sources**.
2. Select the **Manage** tab.
3. Optionally, select an event source group.
4. In the **Event Sources** panel, select one or more event sources to edit.

   Note: To select all event sources, select the box next to the **Actions** column in the last (far-right) column of the list table.

5. Select the **Edit** icon from the menu bar.

The Bulk Edit Event Source dialog is displayed.



6. Enter values for any of the available attributes. In the screen shot above, the Name and Priority attributes have been updated.
7. When you have updated as many attributes as required, click **Save**.

Importing Event Sources

You can import event source attributes from a CSV-formatted file. To import information from a configuration management database (CMDB), a spreadsheet, or other type of file, first convert or save the information to a CSV file.

Note: The following identification attributes are handled specially: **IP**, **IPv6**, **Hostname**, **Event Source Type**, **Log Collector**, and **Log Decoder**. If you import an event source that includes a different value for any of these fields (when compared with the value in NetWitness Platform), the original value in NetWitness Platform will **not** be overwritten.

The imported attributes are associated with the matched Event Source and are available for use in rules to create Event Source Groups.

RSA NetWitness Platform treats the import file as the correct, complete record. This assumption leads to the following behaviors related to importing event source attributes:

- By default, when you import attributes, the system updates attributes for existing event sources only.
- If the event source exists in the import file, but not in NetWitness Platform, the attributes for that event source are ignored. That is, NetWitness Platform does **not** create a new event source for these attributes.
- If the event source exists in both the import file and NetWitness Platform, values for that event source are overwritten.
- If an attribute is blank in the import file, it clears the corresponding attribute in NetWitness Platform.
- If an attribute is not specified in the import file, then the corresponding attribute is ignored in NetWitness Platform (that is, it is **not** cleared).

Note: There is a difference between a blank attribute vs. one that is not specified at all. If an attribute is specified but blank, the assumption is that it is meant to be blank, and NetWitness Platform clears that attribute for the corresponding event source. However, if an attribute is not specified at all, it is assumed that no change is expected.

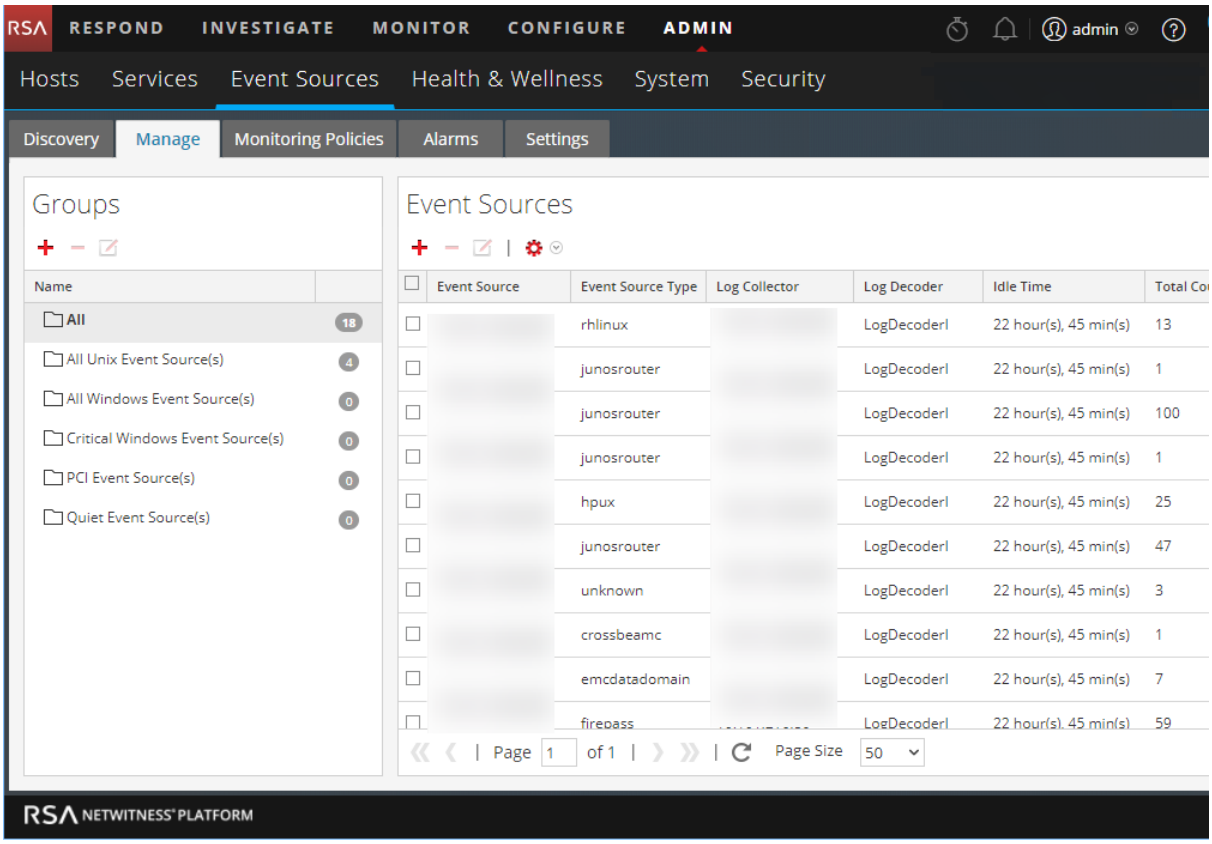
The above behaviors are the defaults—you can change the behavior as specified in the following procedure.

Import Event Source Attributes

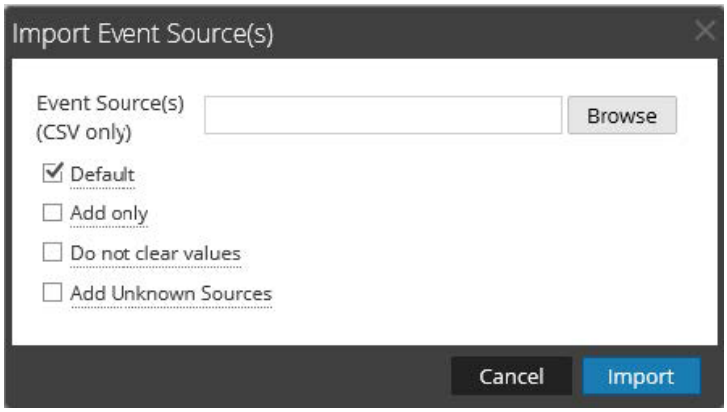
To import Event Source attributes from a file:

1. Go to **ADMIN > Event Sources**.
2. Select the **Manage** tab.

   The Event Sources Manage tab is displayed.



3. From the Import/Export menu in the toolbar ( ), select **Import** (Import).
   The Import Event Sources dialog is displayed.



4. Navigate to the import file, and select the appropriate boxes:
   - **Default**: The default behavior is described above.
   - **Add only**: Imports an attribute only if the corresponding field in NetWitness Platform is blank. Thus, no existing values will be overwritten.

- **Do not clear values**: Does not clear attribute values in NetWitness Platform for items in the import file that are blank.
- **Add Unknown Sources**: Adds new event sources based on items in the import file.

Note: You can select multiple options.

5. Click **Import**.
6. Click **Yes** in the confirmation dialog to perform the import.

Troubleshooting the Import File

If your import file is not formatted correctly, or is missing required information, an error is displayed, and the file is not imported.

Check the following:

- If you are adding unknown sources, each line in the file must contain a combination of the required attributes:
  - IP or IPv6 or Hostname, and
  - Event Source Type
- The first line of the file must contain header names, and the names must match the names in NetWitness Platform. To get a list of correct column names, you can export a single event source. Examine the exported CSV file: the first row of the file contains the correct set of attribute/column names.

If your import file is not formatted correctly, or is missing required information, an error is displayed, and the file is not imported.

Exporting Event Sources

You can export all or some of your event sources, along with their corresponding attributes, to a CSV file.

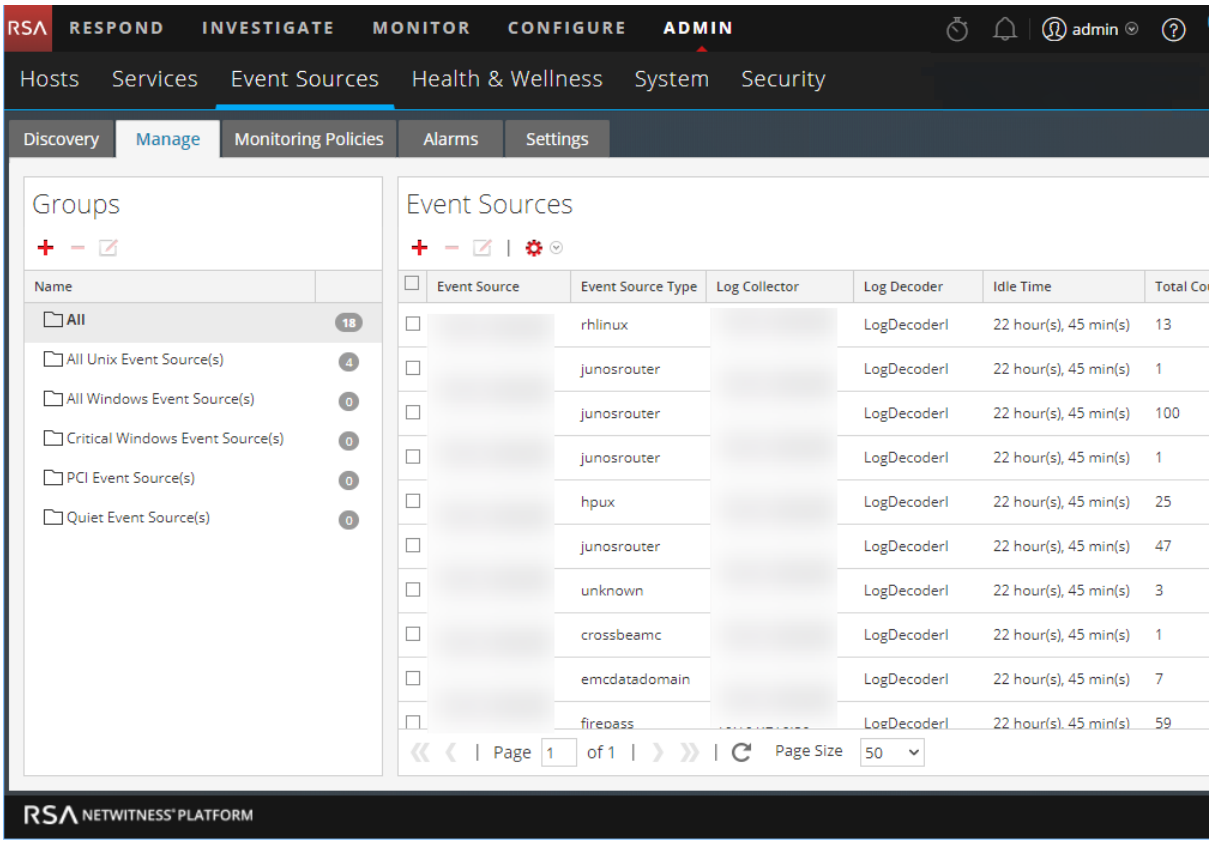
Note the following:

- The exported CSV includes all attribute columns.
- The exported CSV includes a header line at the top, listing each column name.
- You can export all entries in a group.
- You can export all entries (select the **All** group).
- You can select entries and export only those entries.

To export your Event Sources:

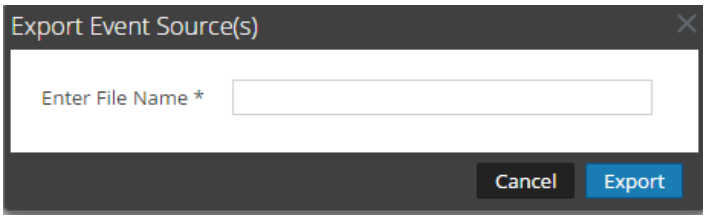
1. Go to **ADMIN > Event Sources**.
2. Select the **Manage** tab.

   The Event Sources Manage tab is displayed.



3. Select the group that contains the event sources to export.
4. Select as many event sources as you need. Alternatively, you can export the entire group: to export the entire group, you do not need to select any individual event sources.
5. From the Import/Export menu in the toolbar (), select **Export (.csv)** or **Export Group (.csv)**.

   The Export Event Sources dialog is displayed.



6. Enter a file name and click **Export**.

The event source attributes are saved to the file name you specified, in a CSV format.

Sorting Event Sources

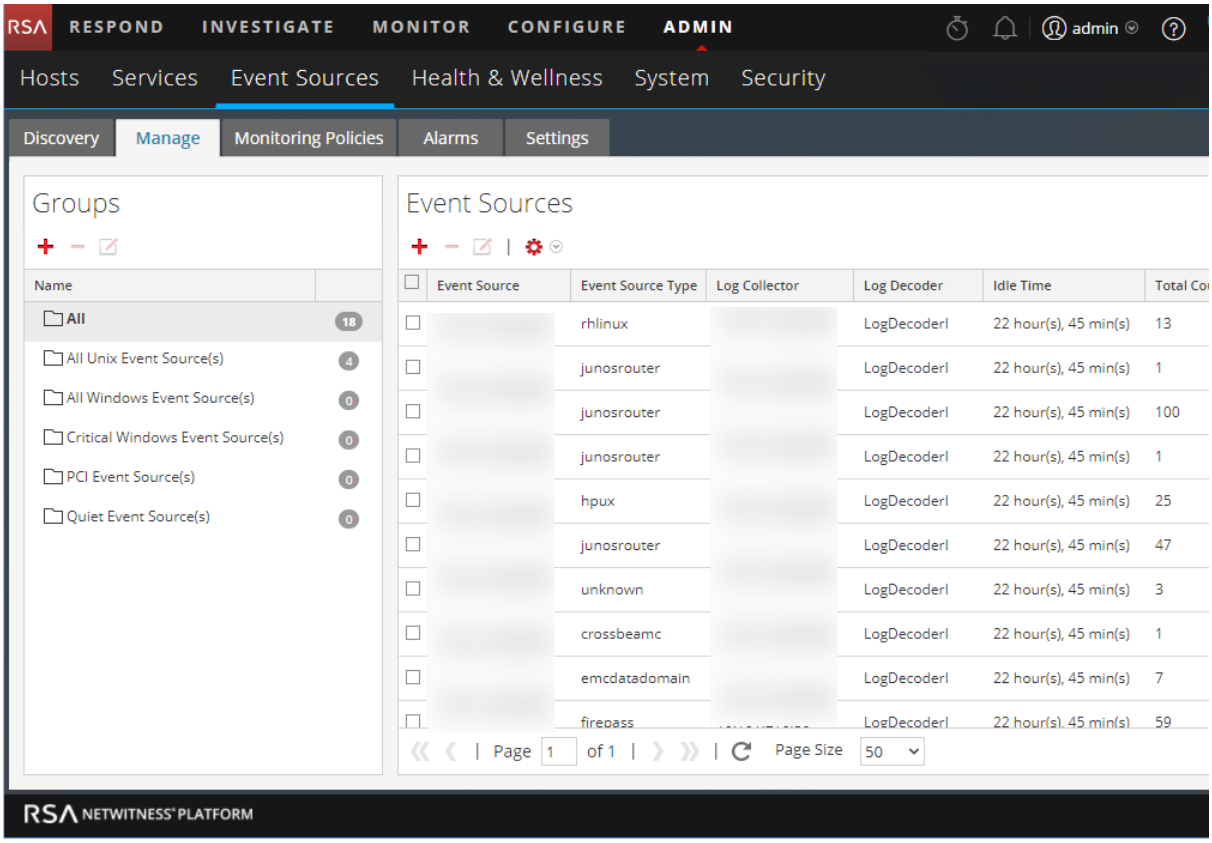
The event sources panel displays attributes for the currently selected event source group. You can configure the list of attributes that are displayed, as well as sort the list on any of the displayed attributes.

Note: The entire list is sorted, not just the items displayed on the current page. (The navigation bar at the bottom of the page shows how many pages exist for this list of event sources.)

To sort your event sources:

1. Go to **ADMIN > Event Sources**.
2. Select the **Manage** tab.

   The Event Sources Manage tab is displayed.



3. To sort a column, click + in the column header.

   The Sort Options drop-down menu is displayed.

4. Select the sort order that you want.

Monitoring Policies

Use the Monitoring Policies view to manage alert configuration for your event source groups.

You can create policies that alert on event source groups, by setting thresholds and notifications:

- Thresholds set ranges for frequency of log messages. You can specify a low threshold, a high threshold, or both.
- Notifications describe how and where to send alerts when thresholds are not met.
- You combine thresholds and notifications to create alerts based on the frequency you specify.
- If automatic alerting is enabled (it is by default), you can create and enable a policy ***without*** setting any thresholds. If you then turn on automatic notifications, notifications will be sent whenever an event source in the group is above or below its baseline by the specified amount.

For example, let's say that you have created an event source group that consists of all your Windows event sources based in the United Kingdom. You could specify a policy that alerts you whenever fewer than 1000 events per 30 minutes arrive.

Note: In addition to, or instead of setting up monitoring policies for your event source groups, you can Configuring Automatic Alerting to view alarms when the number of messages for an event source are outside of the normal bounds.

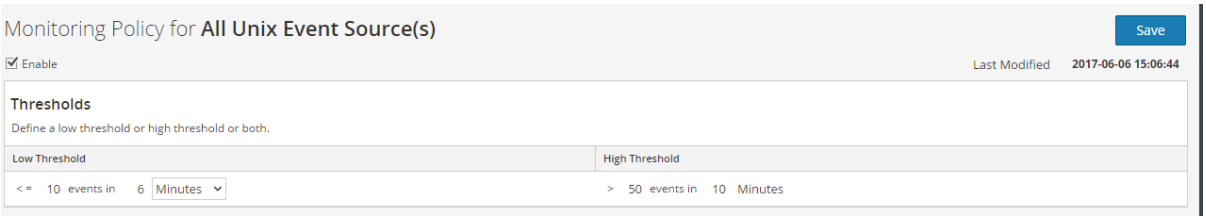
Configuring Event Source Group Alerts

Each event source group can have its own alerting policy. This includes setting the thresholds for when to alert, and setting the notification type when an alert is triggered. This topic describes the steps involved in creating an alert policy for an event source group.

Create an Alert Policy for an Event Source Group

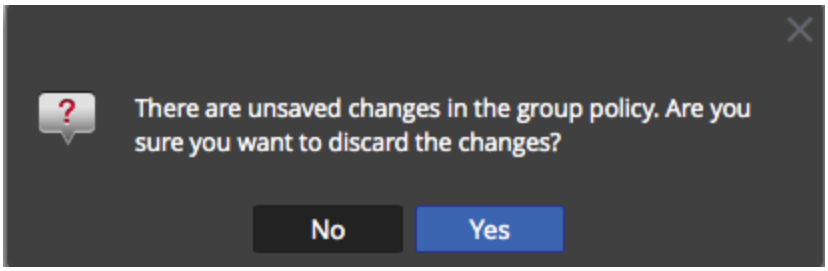
1. Go to **ADMIN > Event Sources**.
2. Select the **Monitoring Policies** tab.
3. In the **Event Groups** panel, select a group.
4. Enter values for the Low Threshold and High Threshold fields.

   This is an example of alert thresholds.



5. Select **Enable** and click **Save** to enable the alert policy that you have configured.

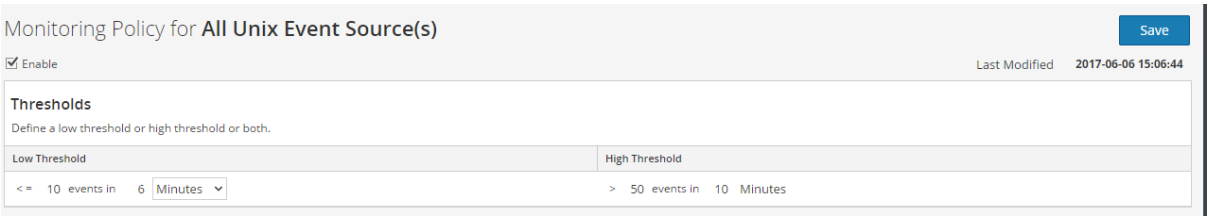
Note: If you make changes to a policy, and attempt to exit the page before you save your changes, an Unsaved Changes warning message is displayed:



Set and View the Thresholds for an Alert Policy

Every event source group is also an alert policy. Thresholds are part of an alert policy. You can set thresholds for each alert policy. For each policy, you can set a low threshold, a high threshold, or both. Additionally, you can enable a policy without setting any thresholds; this allows you to receive notifications based on automatic alerts. Automatic alerts are generated when the baseline for an event source is out of normal bounds.

1. Go to **ADMIN > Event Sources**.
2. Select the **Monitoring Policies** tab.
3. In the **Event Groups** panel, select a group.
   Any thresholds set for the selected group are displayed in the **Thresholds** panel.

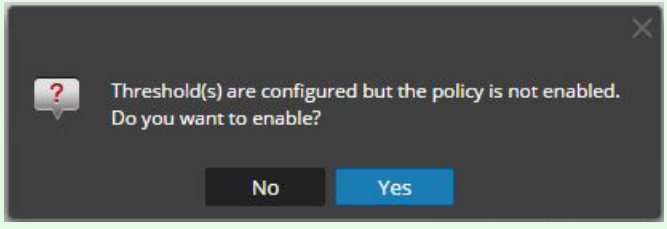


4. Edit the values in either the Low or High Threshold as follows:
   a. Enter the number of events for the threshold.
   b. Enter the number of minutes or hours for the threshold. The minimum value is 5 minutes.

Note: For each threshold, you can set either the low values, the high values, or both.

5. Select **Enable** to enable alarms when thresholds are not met.

Note: If you configure a threshold and attempt to save the page without enabling it, you receive a confirmation message, asking you whether or not to enable the policy: ddd



For example, suppose you enter 10 and 30 for the values for the low threshold: **10** events in **30** minutes, and 20 and 30 for the values for the high threshold: **20** events in **30** minutes. This means that you expect between 10 to 20 events are logged in 30 minutes (for the selected event source group). That is, anything between the low and high threshold is considered normal, and does not trigger an alarm.

Note: After you add a threshold for a policy, you cannot delete it. You can disable the policy, or set the low or high threshold to 0 events in 5 minutes. Five minutes is the minimum duration for a threshold.

Setting Up Notifications

This topic describes how to configure notifications for event source groups. Notifications are sent when thresholds are not met.

Notifications go hand-in-hand with Thresholds. Before you configure notifications, you should set up Thresholds for an event source group.

Note: After configuring the thresholds for an event source group, if you do not set any notifications, then even if an alarm is triggered, users are not notified. However, all alarms are visible on the Alarms Tab.

Prerequisites

Before you set up notifications for an event source group, you should review the available notification items:

- **Notification Servers:** These are the servers that you want to receive notifications from the system. For more details, see the **Notification Servers Overview** topic in the *System Configuration Guide*.
- **Notification Templates:** These are the available templates for each type of notification. For Event Source Management, default templates are supplied for Email (SMTP), SNMP, and Syslog. You can use these templates as supplied, or customize them if necessary. For more details, see the **Templates Overview** topic in the *Systems Configuration* Guide.
- **Notification Output:** The outputs contain the parameters for the notification type. For example, an email notification type contains the email addresses and subject for the notification. For more details, see the **Notification Outputs Overview** topic in the *Systems Configuration* Guide.

Add Notifications for an event source group

To add notifications for an event source group:

1. Go to **ADMIN > Event Sources**.
2. Select the **Monitoring Policies** tab.
3. In the **Event Groups** panel, select a group.

Note: You should have already set a threshold for the group. If not, see Set and View the Thresholds for an Alert Policy to set a threshold, and then return to this procedure. Alternatively, if you have automatic alerting turned on, then you do not need to set thresholds for a policy. Automatic alarms generate notifications without the need to set thresholds.

4. In the Notifications panel, click , and from the drop-down menu, select the type of notification you want to add:
   - Email
   - SNMP
   - Syslog

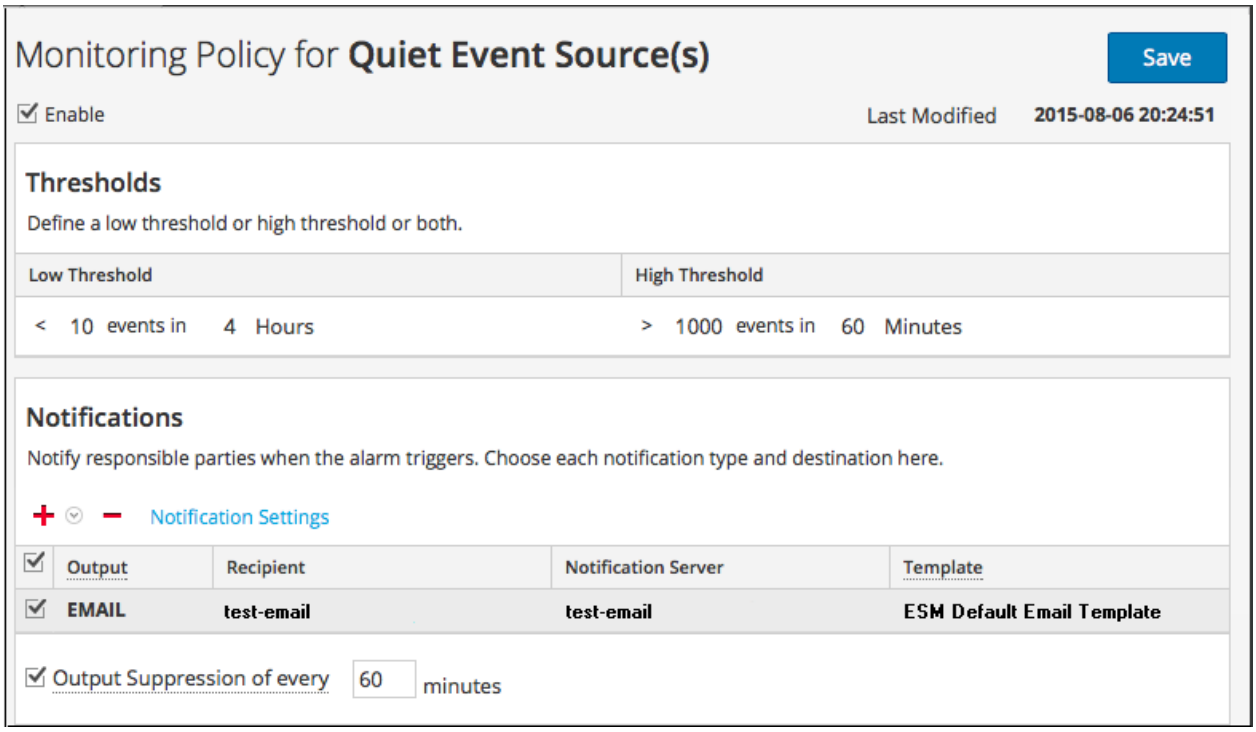
   Note: Default ESM (Event Source Monitoring) templates are provided for each type of notification.

5. Enter values for the Notification, Notification Server, and Template fields.
   a. For Notification, select from the list, or add a suitable notification type in **Notifications**, and then select it here.
   b. For the Server, select one from the list, or add a suitable server in **Notifications**, and then select it here.
   c. For Template, select an available template, or create a suitable template in **Notifications**, and then select it here.

   Note: If you need to add or edit one of these items, click **Notification Settings**. A new browser window opens on the **Administration > System > Global Notifications** page. Use this page to view or update the available Notification items.

6. Optionally, you can limit the rate of notifications for a policy.
   a. Select **Output Suppression** to enable setting a limit.
   b. Enter a value, in minutes, for the suppression rate. For example, if you enter **30**, notifications for this policy are limited to one notification every 30 minutes.
   c. Click **Save**.

Here is an example of a monitoring policy that contains a threshold and notification for an event source group.



Disabling Notifications

Notifications are sent when thresholds are not met. Additionally, automatic notifications are sent when baselines are not met. However, you may determine that you no longer require notifications for the event sources in a particular group. In this case, you can disable notifications for the event source group.

Note: Even if you disable all notifications, the details for alarms are still visible on the Alarms Tab.

Prerequisites

You must have configured thresholds and notifications for an event source group, and enabled them. For automatic notifications, you must have selected **Enable Notifications From Automatic Monitoring** on the Alarms Tab

Disable Notifications

To disable notifications (both manual and automatic) for an event source group:

1. Go to **ADMIN> Event Sources**.
2. Select the **Monitoring Policies** tab.
3. In the **Event Groups** panel, select a group.
4. Click **Enable** to remove the check mark. Clearing this option means that notifications are not sent for this event source group, even if thresholds are not met or exceeded.
5. Additionally, you can remove all notifications. However, this is not required to stop the notifications.

Configuring Automatic Alerting

Note: Automatic alerting, and it settings, are currently in Beta testing.

Prerequisites

Before you set up notifications for an event source group, you should review the available notification items:

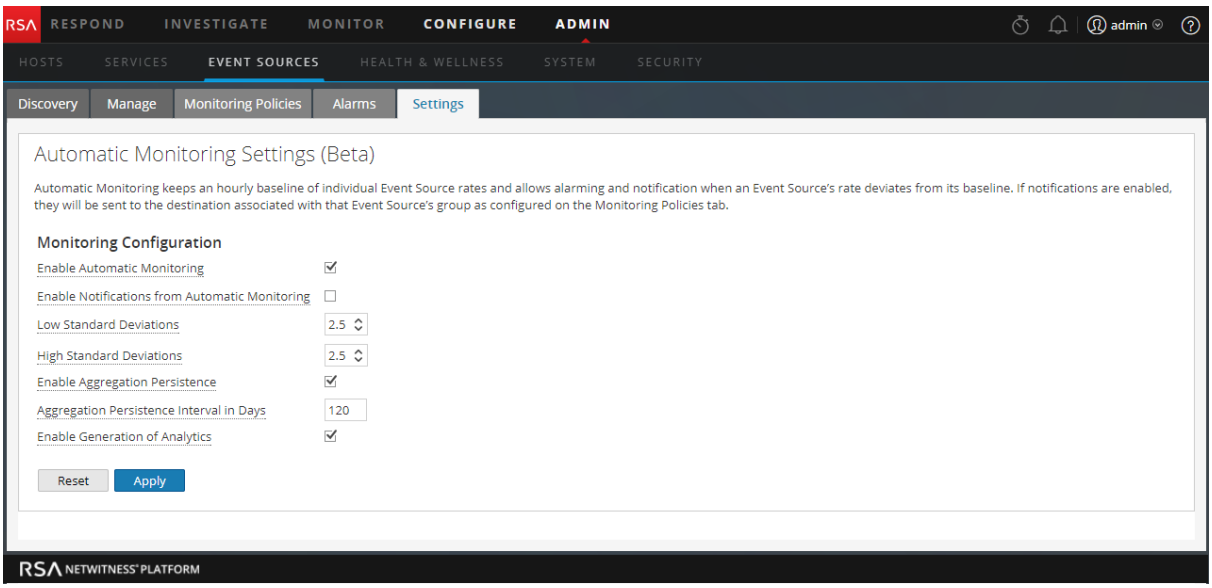
- **Notification Servers:** These are the servers that you want to receive notifications from the system. For more details, see the **Notification Servers Overview** topic in the *System Configuration Guide*.
- **Notification Templates:** These are the available templates for each type of notification. For Event Source Management, default templates are supplied for Email (SMTP), SNMP, and Syslog. You can use these templates as supplied, or customize them if necessary. For more details, see the **Templates Overview** topic in the *Systems Configuration* Guide.
- **Notification Output:** The outputs contain the parameters for the notification type. For example, an email notification type contains the email addresses and subject for the notification. For more details, see the **Notification Outputs Overview** topic in the *Systems Configuration* Guide.

Configure Automatic Alerting

To configure automatic alerting:

1. Go to **ADMIN > Event Sources**.
2. Select the **Settings** tab.

   The Settings tab is displayed.



3. By default, automatic monitoring is turned on. To turn off automatic alerting, clear the **Enable Automatic Monitoring** option.
4. By default, notifications for automatic alerts is turned off. To turn on automatic notifications, select the **Enable Notifications From Automatic Monitoring** option.
5. Configure the parameters, based on your usage patterns:
   - **Low Standard Deviations**: standard deviations below which to receive alerts. Default is **2.5** (95% confidence).
   - **High Standard Deviations**: standard deviations above which to receive alerts. Default is **2.5** (95% confidence).

   Note: You can adjust the standard deviation settings in increments of 0.1 (one tenth) of a standard deviation.
6. Click **Save** to close the dialog and save your settings.

Viewing Event Source Alarms

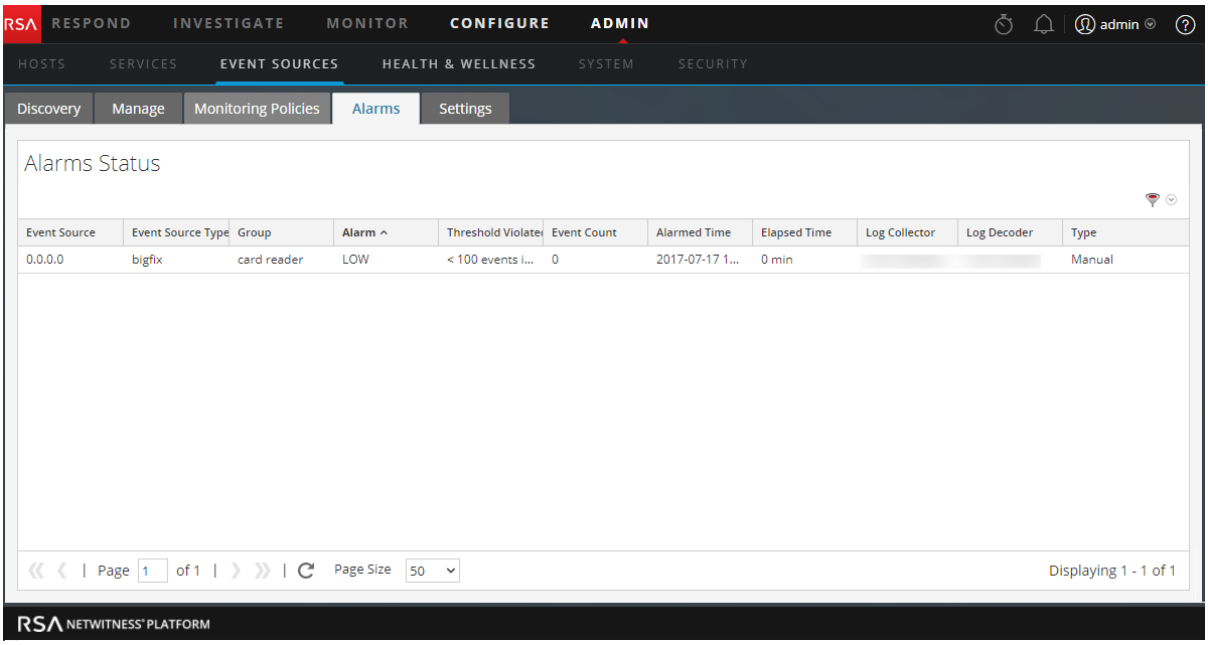
This topic describes how to view alarms for your event source groups. After you have configured and set alerts, you can view all of the generated alarms in the **Alarms** tab of the **Event Sources** view.

Sort the Alarms Information

When you first access this view, the data is sorted by most recent alarm (the Alarmed time column). You can sort by any column.

1. Go to **ADMIN> Event Sources**.
2. Mouse over a column that you want to sort.
3. Click the Select the **Alarms** tab.
4. Mouse over the column that you want sorted, and click the icon.

   This is an example when you mouse over the Alarm column.



5. Select either **Sort Ascending** or **Sort Descending** to sort the column in the way you wish.

   The data is sorted across all pages.

Note: You can also sort by two columns. To do this, first sort by the secondary column, then sort by the primary column. For example, if you want to see all the HIGH alarms by their group order, first sort on **Group**, then sort on **Alarm**.

Filter Alarms by Type

You can also filter the alarms by their type: you can display only the Manual or Automatic (baseline) alarms. To filter by alarm type, select the filter icon on the right side of screen, in the heading area: Select either Automatic or Manual:

- If you select Automatic, only the alerts based on baselines are displayed.
- If you select Manual, only the alarms for which you have set thresholds are displayed.

Event Source Management References

The following topics contain reference information for Event Source Management:

- Discovery Tab
- Manage Tab
- Manage Event Source Tab
- Event Sources View
- Create/Edit Group Form
- Details View
- Manage Parser Mappings
- Alarms Tab
- Monitoring Policies Tab
- Settings Tab

Discovery Tab

To access the Discovery tab, go to NetWitness ADMIN> Event Sources. The Discovery tab is displayed.

The Discovery tab lets you review the event source types that NetWitness has discovered for each address and the system's confidence of how likely it is that they were identified completely accurately. If the discovered event source types are correct, you can acknowledge to filter out that event source. If incorrect, you can set the allowed event source types for a particular address so that future logs will parse against the correct parsers.

Note: The following features apply to RSA NetWitness® Platform version 11.1 and later:
- Acknowledging multiple event sources
- Filtering by event source type
- (for 11.2 and later) Mapping filter options include None, Auto, and Manual
- Mapping multiple event sources
- Searching for event sources on the Event Source Discovery page

RSA NetWitness® Platform, version 11.2 and later, automatically maps incoming events to a type based on previous logs received from that address, reducing the mis-parsing of messages and reducing the number of items that need attention in the Discovery workflow. A value of **Auto** in the **Mapping Type** column indicates that an address has been auto-mapped.

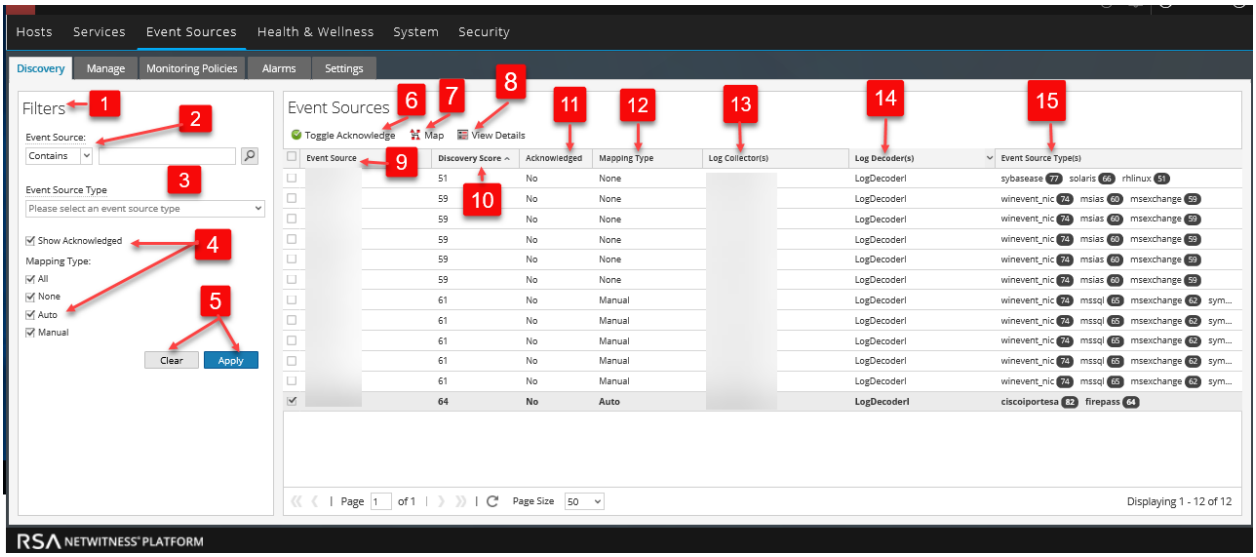
Details View

Quick Look

The following example displays a list of addresses and their discovered Event Source types. The Event Source types display the Event Sources that have been discovered.

This is an example of the tab.



1	Displays the Filters and Event Sources panels with the Discovery tab open.
2	Displays the Event Source Filter field with a drop-down menu that offers the following options: • Enter the full or partial address (IP, IPv6 or Hostname) of the source(s) you want to review. You can also enter multiple entries that are separated by commas. For example, **10.10.10.10,10.10.10.11,host1.company.com** • **Exact:** Returns sources that completely match the search term. For example, **10.10.10.10** only returns **10.10.10.10**, not **10.10.10.101**. • **Starts With:** Returns sources that start with the search term. For example,**10.10.10.** returns the whole **10.10.10.x subnet**. • **Contains:** Returns sources that start with the search term. For example, **exch** returns all terms such as **us-exch-1.company.com**, or **lab21** returns all **hostx.lab21.company.com** terms. • **Ends With:** Returns sources that end with the search term. For example, **lab21.company.com** returns all hosts. **Note:** When specifying the search string, you can use **. - :** (period, dash, colon).
3	The Event Source Type drop-down menu filters for addresses containing all of the selected event source types.
4	• Select the **Show Acknowledged** checkbox to display acknowledged Event Sources. • Mapping filter options can include just one of the mapping types listed in the Filter Panel, or multiple Mapping Types can be selected. **Note:** If no mapping filter options are selected, the default is to display **All**, **None**, **Manual**, and **Auto** mapping types.
5	• The **Apply** button uses all criteria that is set in all filters. • The **Clear** button clears all filters from the panel.

6 Toggles the event sources between acknowledged and not acknowledged states.
7 Maps the selected event sources.
8 View Details button to view details of the selected Event Source.
9 Displays the addresses of the selected Event Sources.
10 Displays the discovery scores of the selected Event Sources.
11 Displays whether or not the selected Event Sources have been acknowledged.
12 Displays the selected Event Source Mapping type as Auto, Manual, or None. Any changes to the mapping are only displayed here.
13 Displays the host names of the Log Collectors where the Event Sources are located.
14 Displays the host names of the Log Decoders where the Event sources are located.
15 Displays the discovered Event Source Types and their associated discovery scores.

Toolbar and Features

The Discovery tab contains the following features:

Field	Description
Tools   	The following items are available on the toolbar: • **Toggle Acknowledge**: Toggles the acknowledged state for the selected Event Source between **Yes** and **No**. • **Map**: Opens the Manage Parser Mappings dialog box, where you can map an event source to the correct log parser. • **View Details**: Provides details on the selected Event Source.
Event Source	The IP, IPv6, or Hostname of the Event Source.
Discovery Score	Displays the overall discovery score associated with that particular address. Higher scores indicate better confidence. Discovery scores range from 0 (least confident) to 100 (most confident).
Acknowledged	Selections are either **Yes** (you have acknowledged the Event Source) or **No** (you have not acknowledged the Event Source).

Field	Description
Mapping Type	Selections are **Manual** (you mapped the Event Source), **Auto** (the system automatically mapped the Event Source), or **None** (you have not mapped the Event Source). Auto mapping is content aware. When a log message is parsed to a high confidence header or message that has been tagged, an auto mapping will be set for that address and type. This auto-mapping is valid for 24 hours and will be renewed every time a log message matches a tagged header of a message. Log messages are first parsed against auto-mapped parsers, and only fall back to discovery if there is no match amongst the mapped parsers. Log messages that fall back to discovery can match the tagged headers or messages from other event sources: this results in multiple types being mapped. For example, an address could eventually be mapped to Windows, MS SQL, and Apache, and these parsers are evaluated first. If an event source is decommissioned, and its IP re-purposed, the 24-hour timer ages out the mappings for the decommissioned types. **Note:** This features applies to RSA NetWitness version 11.2 and later.
Log Collector(s)	Log Collectors that have received logs from this Event Source address.
Log Decoder(s)	Log Decoders that have received logs from this Event Source address.
Event Source Type(s)	The parsed type(s) of the Event Source address and the corresponding Discovery Score for each type.

Note: Discovery Scores are only available for 11.0 and above Log Decoders. Discovery Scores for pre-11.0 Log Decoders display as Unavailable.

The following table describes the sorting order for discovery scores. To access the Sorting Order drop-down menu, click on the down arrow in the Event Sources column.

Field	Description
Sort Ascending	Sort the column by discovery score in ascending order.
Sort Descending	Sort the column by discovery score in descending order.
Columns	Used to hide or show one or more columns.

Manage Tab

The Manage tab organizes event sources into groups, and displays attributes for each event source.

To access this tab, go to **ADMIN > Event Sources > Manage**.

Workflow

This workflow shows the overall process for configuring event sources.

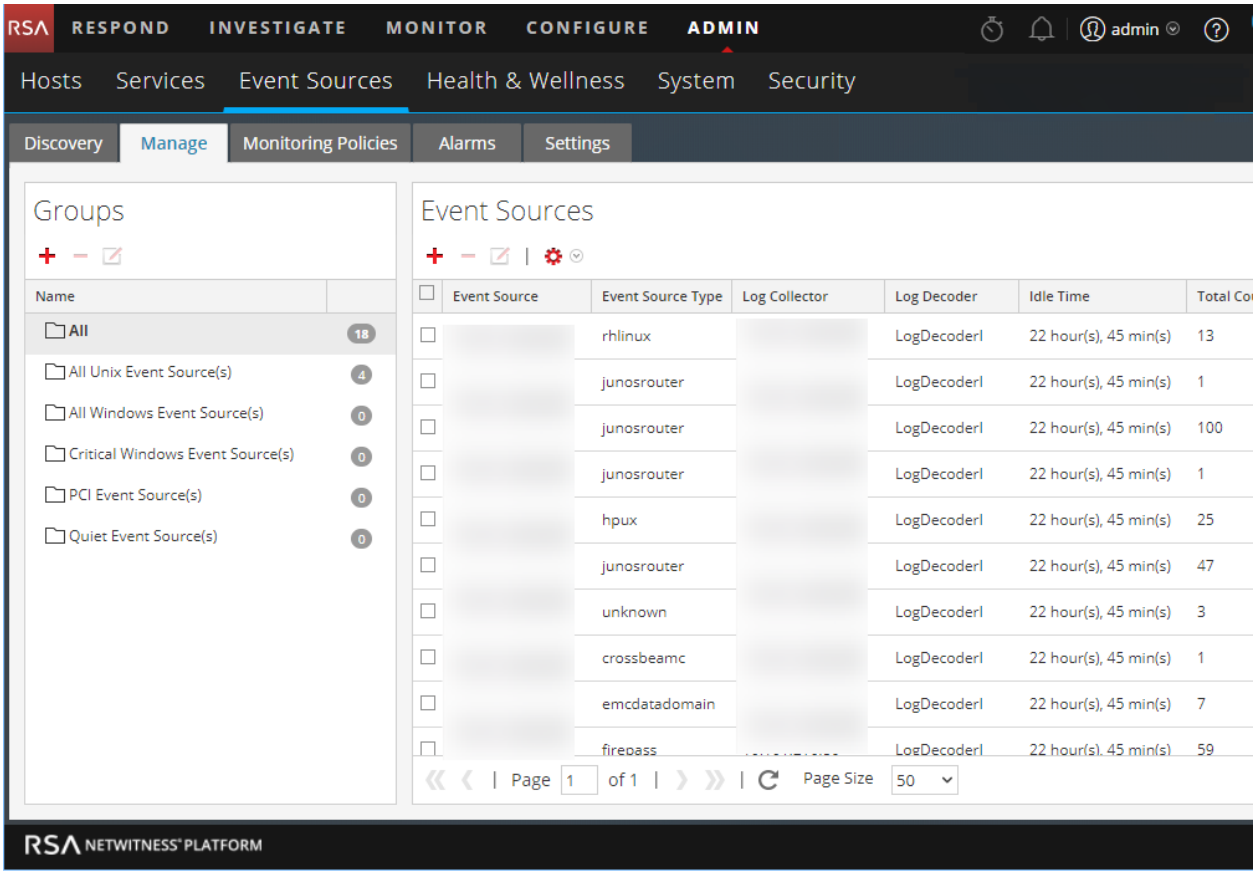
Creating Event Source Groups

Creating an Event Source and Editing Attributes

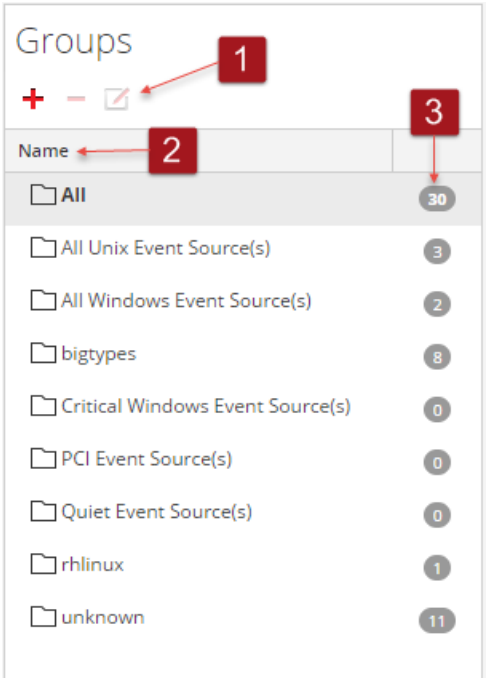
Quick Look

The Manage tab organizes event sources into groups, and displays attributes for each event source. The Manage tab consists of two panels, Groups and Event Sources.



Groups Panel

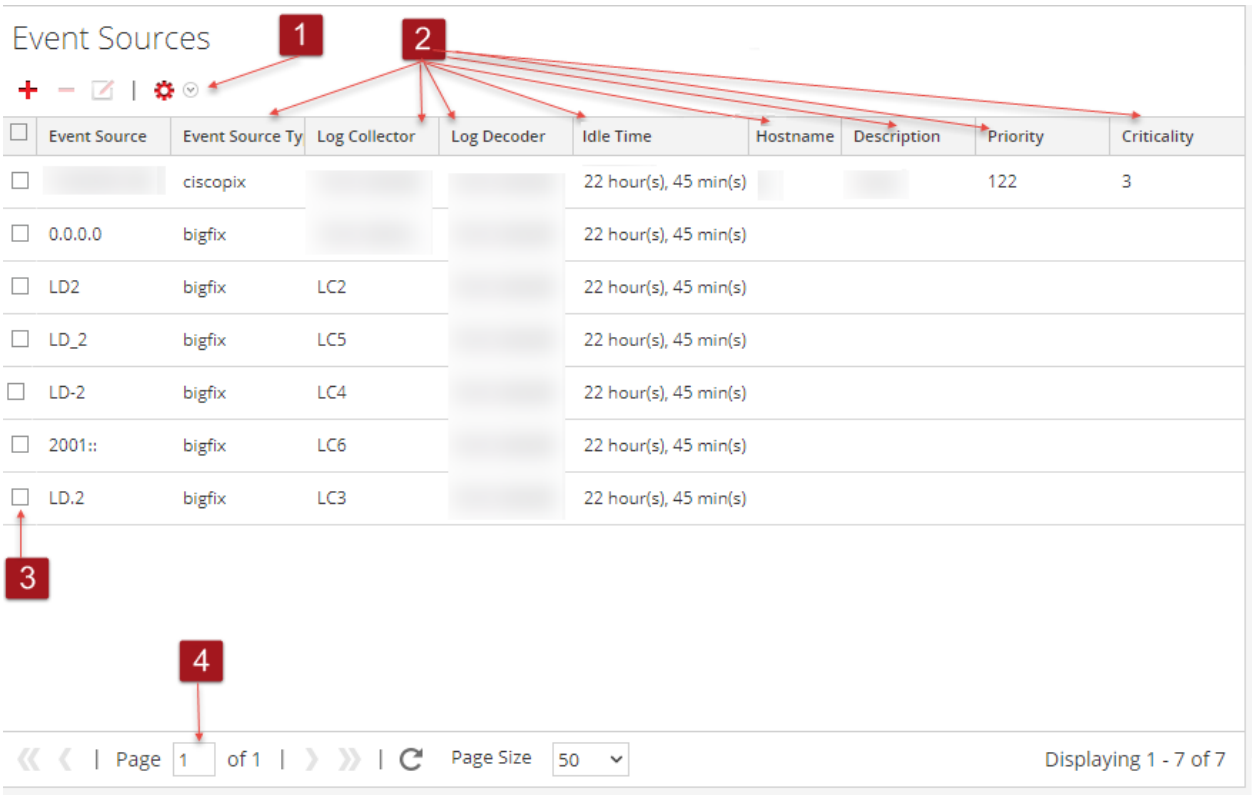
The Groups Panel lists the event source groups, as well as a count of the members for each group. To see all event sources, select **All** from the groups list. This is an example of the Groups panel.



1	Displays the standard NetWitness Platform icons for adding, removing, or editing groups.
2	Lists the identifier for each group in the Name column. You can use the group names to quickly identify some of the criteria used to form the group. For example, if you create a group that consists of Windows event sources for the Sales organization, you could name the group **Windows Sales Sources**. **Note:** The event source group name is not editable. After you create a group, that name exists as long as the group itself.
3	The count for an event source group indicates the number of event sources in that group. That is, the number of event sources that match the criteria used to define the group. **Note:** The count is not dynamically updated when new event sources are added. Thus, you may need to refresh to see an updated group count.

Event Sources Panel

The Event Sources panel displays the attributes for the event sources in the selected group. Or, if All is selected in the Groups panel, the Event Sources panel lists all event sources.



1 The toolbar contains the following tools:

- **Add**: manually add an event source
- **Remove**: remove an event source
- **Edit**: Update attributes for an existing event source
- **Import / Export** menu: Displays a menu with the following options:
  - **Import**: Import event sources from a Content Management Database (CMDB), spreadsheet, or other tool.
  - **Export**: Export selected event sources and their attributes in CSV format.
  - **Export Group**: Export the entire group that is currently selected.

2 Columnar display of attributes. You can choose which attributes to display.

3 Checkboxes: Select rows to use when performing tasks on multiple event sources, such as bulk editing.

4 Navigation Tools:

At the bottom of the screen, there are items that help in navigating your group:

- **Page *x* of *y***: indicates which page you are currently displaying, and how many total pages exist for this group.
- <<, <, > and >>: click these icons to move between pages either one at a time (< and >) or to the first (<<) or last (>>) page.
- **Page Size**: use this selector to choose your page size.
- **Displaying *x* - *y* of *z***: quick check of which event sources are currently displayed out of the total number for the group.

Sorting

In the Event Sources panel, the list of items is presented in a sorted order. You can choose which column on which to sort. Note, however, that the sort order depends on capitalization.

For any string column, if the values contains a mix of lower case and upper case, the upper case appear in the list before the lower case values.

For example, assume the Event Source Type column contains the following entries: Netflow, APACHE, netwitnessspectrum, ciscoasa. The sort order would be as follows:

- APACHE
- Netflow
- ciscoasa
- netwitnessspectrum

Manage Event Source Tab

The Manage Event Source screen has several integrated components that present different perspectives of an event source.

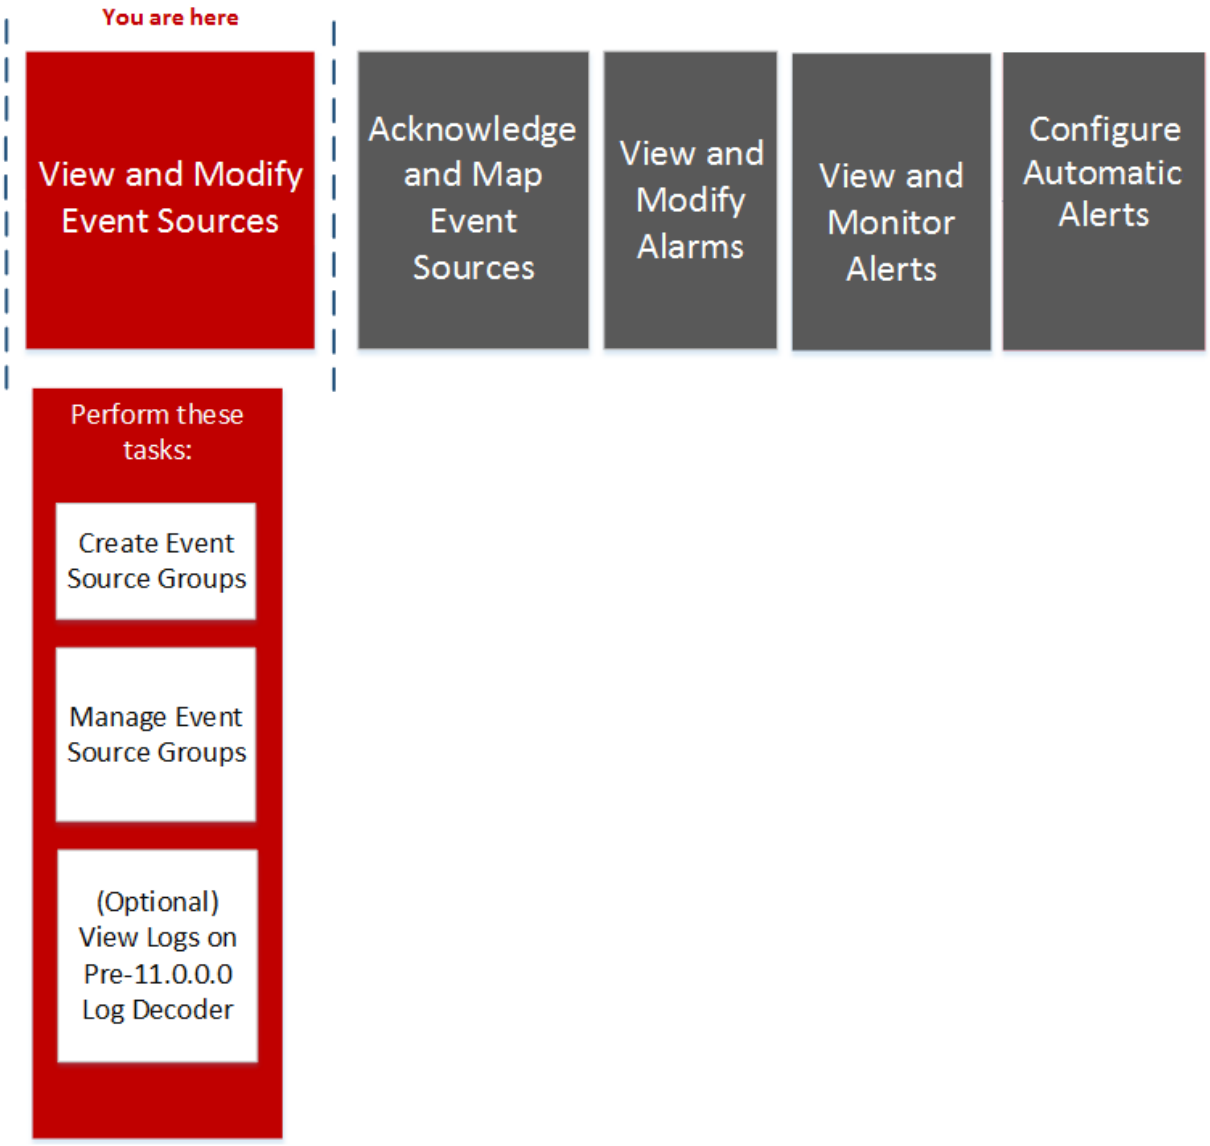
- Show Event Source Details
- Add attribute values to an event source
- Remove attribute values for an event source

To view the Manage Event Source screen for an event source:

1. Go to **ADMIN> Event Sources**.
2. Select the **Manage** tab.
3. From the Event Sources pane, select an event source from the list and click + .

Workflow

This workflow shows the end-to-process for modifying, acknowledging, mapping, and configuring event sources, along with viewing and configuring event source alarms and alerts.



What do you want to do?

Role	I want to...	Documentation

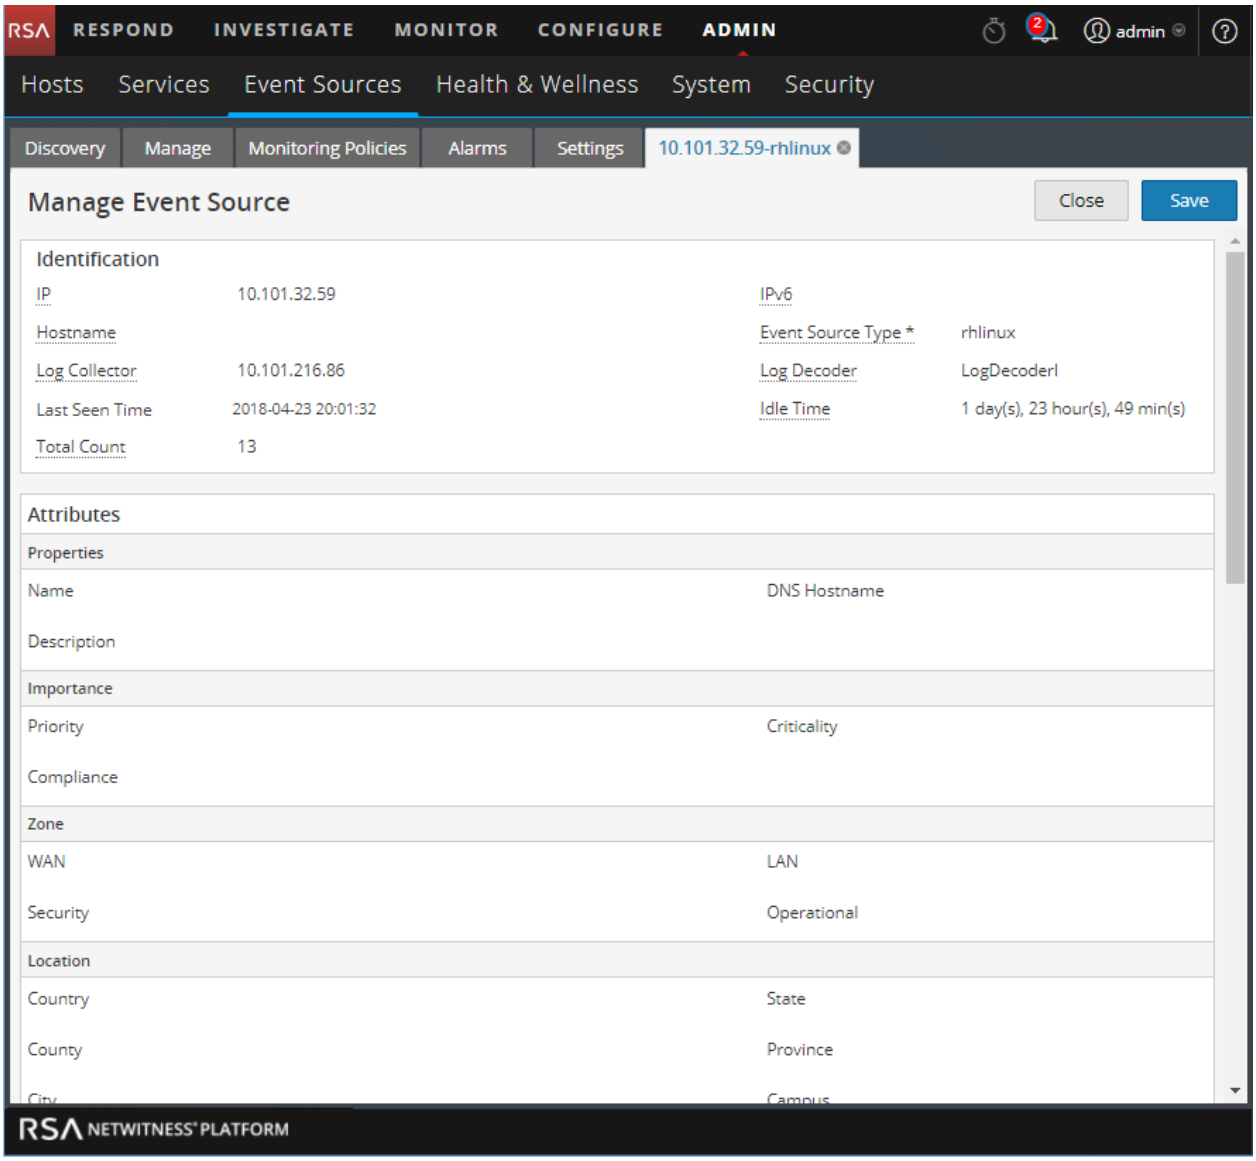
Creating an Event Source and Editing Attributes

Creating Event Source Groups

Quick Look

This is an example of the Event Source tab:



This table describes event source attribute categories.

Attribute Section	Description
Identification	These attributes are the main attributes that collectively identify an event source. You can only change these attributes when you are specifying the details for a new event source. For an existing event source, the attributes in this section are auto-populated, and cannot be changed while on this screen. Attributes available for a new event source: • IP • IPv6 • Hostname • Event Source Type • Log Collector • Log Decoder The following attributes are displayed when viewing the details for an existing event source: • Last Seen Time: this is the last time there was communication between NetWitness Platform and the event source • Idle Time: this is the amount of time elapsed since the **Last Seen Time**. This time can be useful if you want to filter event sources that have been inactive for a certain duration. • Total Count: total count of all event sources for this **Event Source Type**.
Properties	These attributes provide the name and description. • Name • DNS Hostname • Description
Importance	These attributes can be used for grouping by priority. • Priority • Criticality • Compliance

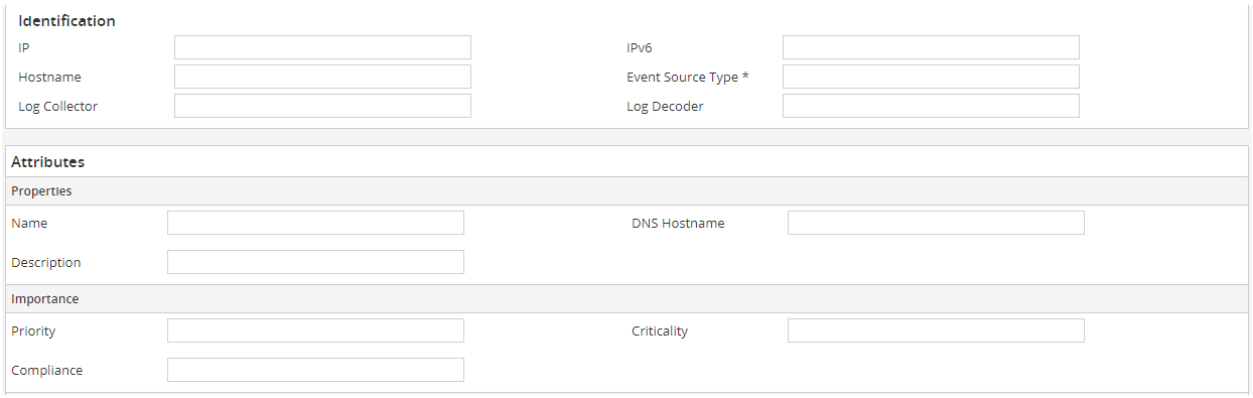
Attribute Section	Description
Zone	These attributes can be used for grouping by zone. • WAN (Wide Area Network) • LAN (Local Area Network) • Security • Operational
Location	These attributes can be used to group by the physical or geographical location. • Country • State • County • Province • City • Campus • Postal Code • Building • Floor • Room
Organization	These attributes can be used to group by organization, and also to provide contact information. • Company • Division • Business Unit • Department • Group • Contact • Contact Phone • Contact Ema
Owner	These attributes specify those responsible for the event source. • Manager • Primary Administrator • Backup Administrator

Attribute Section	Description
Physical	These attributes specify the physical properties for the event source. • Vendor • Serial Number • Asset Tag • Voltage • UPS Protected • Rack Height • Depth • BTU Output • Color
Function	These attributes can be used to group by function. • Primary Role • Sub Role 1 • Sub Role 2
System Information	These attributes specify system information. • Domain Name • System Name • Identifier • System Description
Custom	This section provides eight custom attributes, for any other attributes that your organization might need.

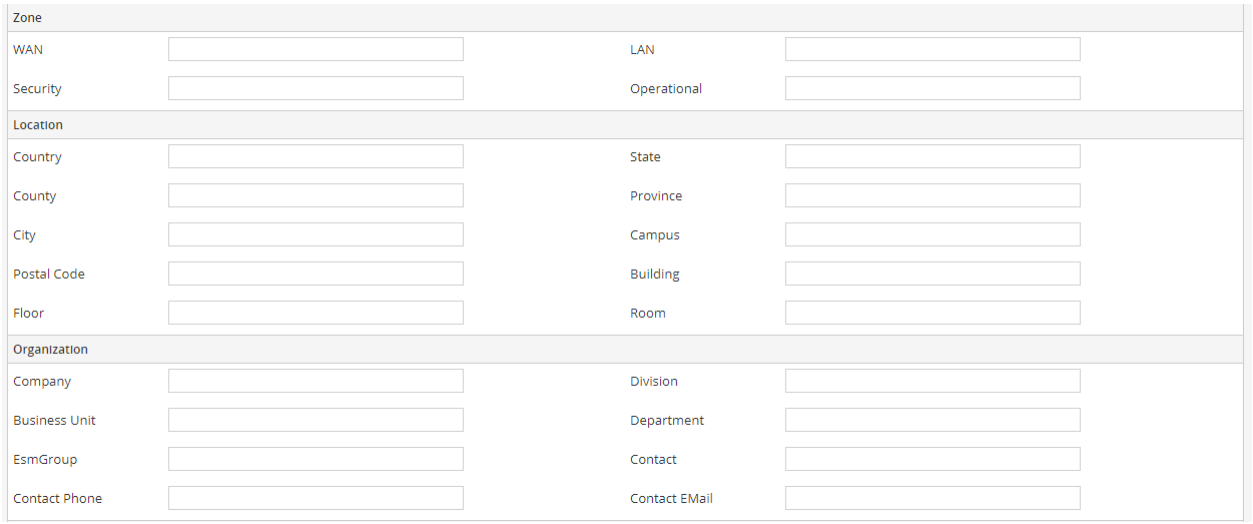
Features

The settings in the Manage Event Source tab are a combination of auto-populated and user-entered information. When an event source sends log information to NetWitness Platform, it is added to the list of event sources, and some basic information is auto-populated. At any time after that, users can add or edit details for other event source attributes.

This figure shows an example of the **Identification**, **Properties**, and **Importance** sections.



This figure shows an example of the **Zone**, **Location**, and **Organization** sections.



Event Sources View

The Event Source Attributes panel has the following tabs.

To access this panel, go to **ADMIN > Event Sources**.

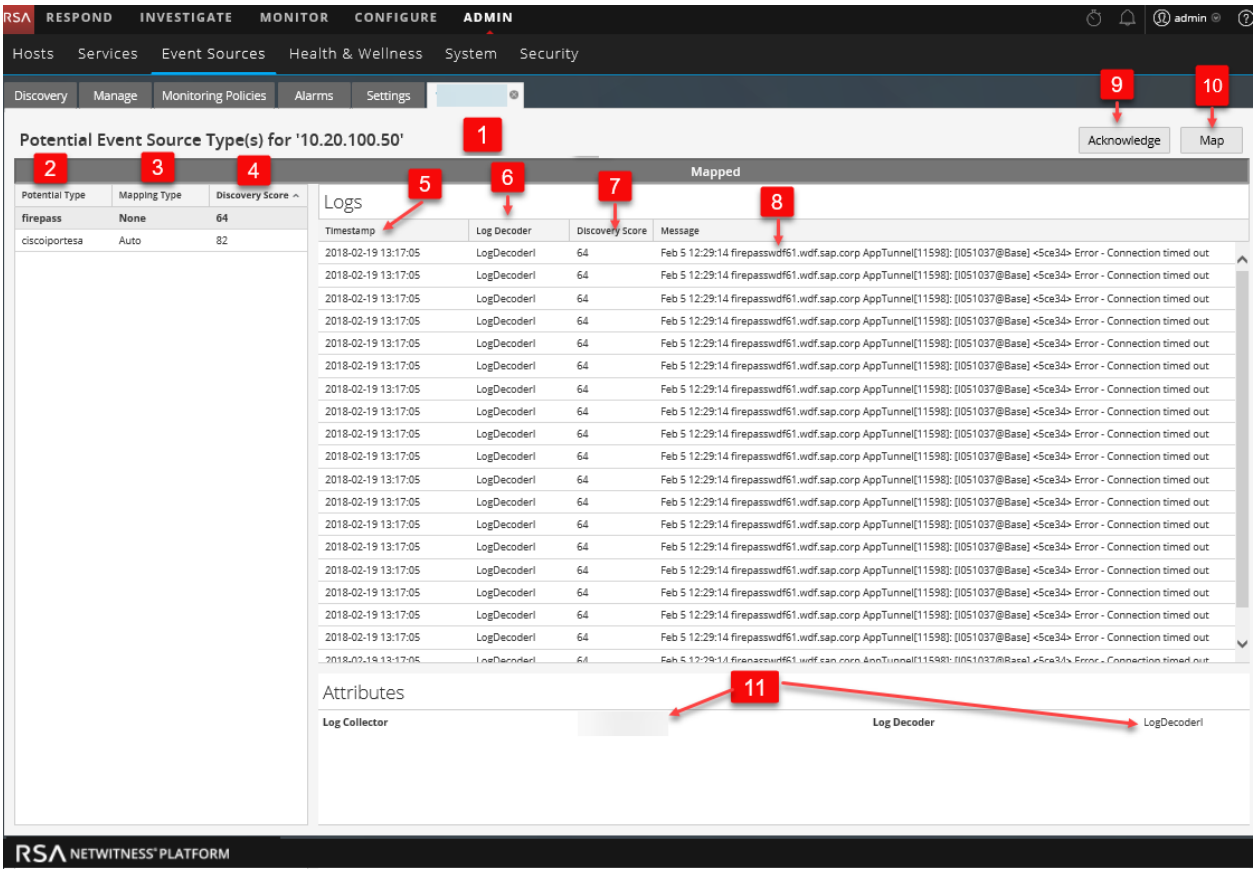
Viewing Logs from Pre-11.0 Log Decoder

Quick Look

The following example shows the discovery scores, event source types, logs, and attributes that correspond with the Event Source you selected in the Event Sources panel for a single Log Decoder.

Note: Device logs are only available for 11.0.0.0 and above Log Decoders.



1	Displays the address of the selected Event Source.
2	Displays the potential type of the selected Event Source.
3	Displays the selected Event Source Mapping Type as Auto-Mapped, Manually Mapped, or None. Any changes to the Event Source Mapping are only displayed here.
4	Displays the discovery score for the selected Event Source type from least confident (0) to most confident (100).
5	Displays timestamps for the last few logs that have been parsed to the selected Event Source Type.
6	Displays the address of the Log Decoder that is parsing event sources.
7	Displays the discovery score of the corresponding log.
8	Displays logs for the selected Event Source type.
9	Allows you to acknowledge that all the discovered Event Source types are correct.
10	Allows you to set the appropriate parsers for selected Event Source addresses.
11	Displays the Event Source Management attributes for the selected Event Source Type.

Manage Parser Mappings

The **Manage Parser Mappings** dialog allows you to map the appropriate parsers for selected Event Source addresses. From the **Details** view, select the **Map** button.

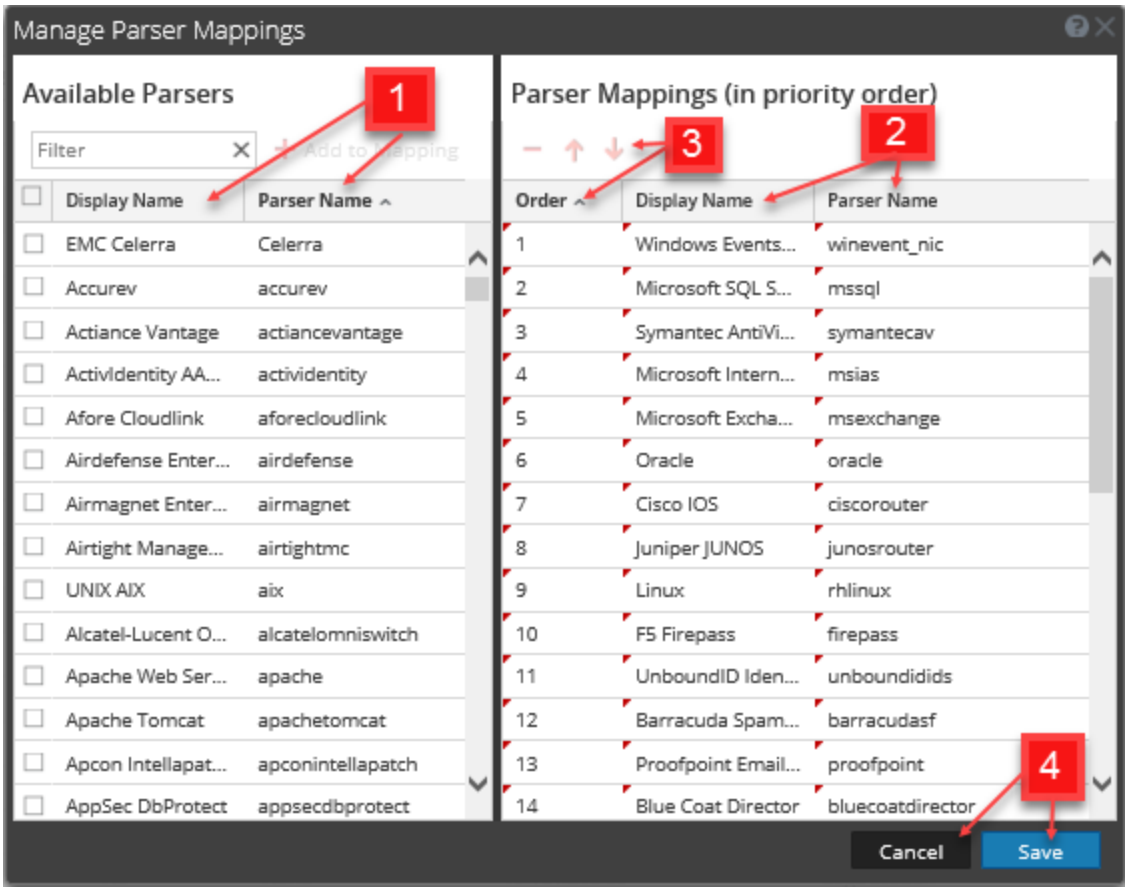
*You can perform this task here.

Related Topics

Viewing Logs from Pre-11.0 Log Decoder

Quick Look



1	Displays all the available parsers that you can map based on the event sources that you selected from the **Discovery** view. Also displays the mappings that are already present in the Log Decoders for the selected event source or the parsers that have been discovered. To filter your available parsers, type the first few letters of the parser name that you want to map. Click the **Add to Mapping** button to add the parser to the parser mappings listed in the right panel. You need to select parsers before the **Add toMapping** button is enabled. Add the selected parser by clicking the **Add to Mapping** button in the right panel. You can rearrange the order of the parser mappings using the up and down arrow keys and you can also drag and drop selected parser mappings. You can select multiple mappings by pressing the **Ctrl** key.
2	Displays the names of the selected parsers that you want to map.
3	Displays the order of the selected parser mappings. You can delete parser mappings by selecting the minus sign ( ). Press the **Ctrl** key to select multiple mappings to perform group operations on them.
4	Click **Save** to save your mappings to all the Log Decoders. A pop-up message informs you that your mappings are successfully saved. When the window is closed, the banner on the **Details** tab is updated to reflect the status. If mapped, the text displayed is **Mapped**. Click **Cancel** to return to the **Details** tab.

Best Practices

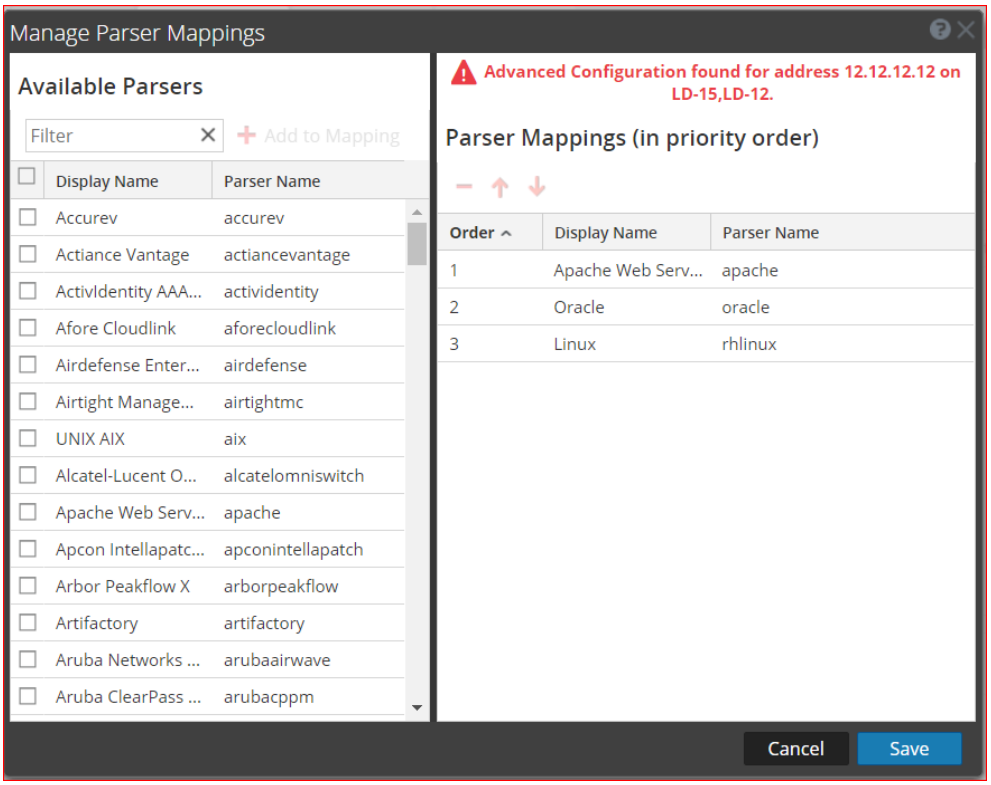
When mapping multiple device types from the same event source, assign the highest priority to the strictest log parser. Conversely, a log parser with generic headers should be lowest in priority. The CEF log parser is an example of a strict log parser.

Advanced Configuration

Mapping configurations with the Log Collector are not displayed in the Parser Mappings window. If the mapping is saved, it is saved for the corresponding IP address, not for the corresponding Log Collector entry. If no mappings are found for the corresponding IP address, the discovered event source types are displayed in the Parser Mappings window.

If advanced Log Decoder configurations are discovered, a message similar to the one below displays in the Manage Parser Mappings dialog.

Note: If you want to edit the advanced configuration, you need to navigate to the Log Decoder service's parser mappings configuration.



Alarms Tab

From the Alarms tab you can view details of the alarms that have been generated.

The Alarms tab has one panel that displays Alarm status.

To access this tab, go to ADMIN > **Event Sources** > **Alarms**.

Workflow

This workflow shows the overall process for configuring event sources. It also shows where configuring alarms and alerts settings are located in the process.

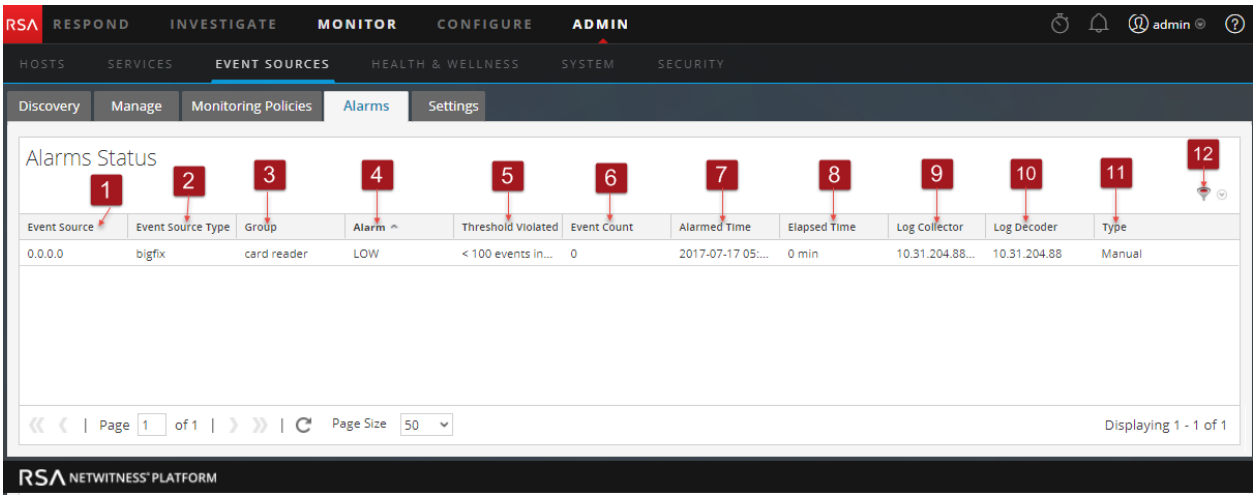
Configuring Automatic Alerting

Quick Look

The Alarms tab presents the details for Event Sources that are currently in violation of a policy and threshold. Only Event Sources in violation of a policy appear in the list. After the event source returns to a normal state, the corresponding alarm disappears from the list.



1	Displays the IP, IPv6, or Hostname of the event source that is alarmed.
2	Displays the type of the alarmed event source. For example, **winevent_nic** (for Microsoft Windows) or **rhlinux** (for Linux).
3	Displays the event source group that contains the event source for which the alarm has been triggered.
4	Displays the type of threshold that was triggered: **High** or **Low**
5	Displays the conditions of the threshold that was triggered. For example: `5,000,000 events in 5 minutes`
6	Displays the number of events in the threshold time period causing the alarm.
7	Displays the initial time the event source went into an alarmed state. **Note:** When you first access this view, the data is sorted by this column (most recent alarm first).
8	Displays the elapsed time since the event source entered an alarmed state.
9	Displays the Log Collector last collecting from this event source.
10	Displays the Log Decoder last receiving from this event source.
11	Displays the alarm type. Alarm type is either **Manual** or **Automatic**: • **Manual**: these are alarms that violate the configured threshold policy. • **Automatic**: these are alarms that deviate from the baseline for the alarmed event source.
12	Select the **Filter** icon to display the **Filter** menu: ALARM TYPE ☐ Automatic ☐ Manual Select either **Automatic** or **Manual**: • If you select **Automatic**, only the alerts that are based on baselines are displayed.

- If you select **Manual**, only the alarms for which you have set thresholds are displayed.

Note: You can hide or show columns by right-clicking in the table header and choosing **Columns** from the drop-down menu. Select a column to display it, or clear the column to hide it.

Monitoring Policies Tab

The Monitoring Policies tab organizes thresholds by event source group.

To access this tab, go to **ADMIN > Event Sources**. The **Manage** tab is displayed. Select the **Monitoring Policies** tab.

Setting Up Notifications

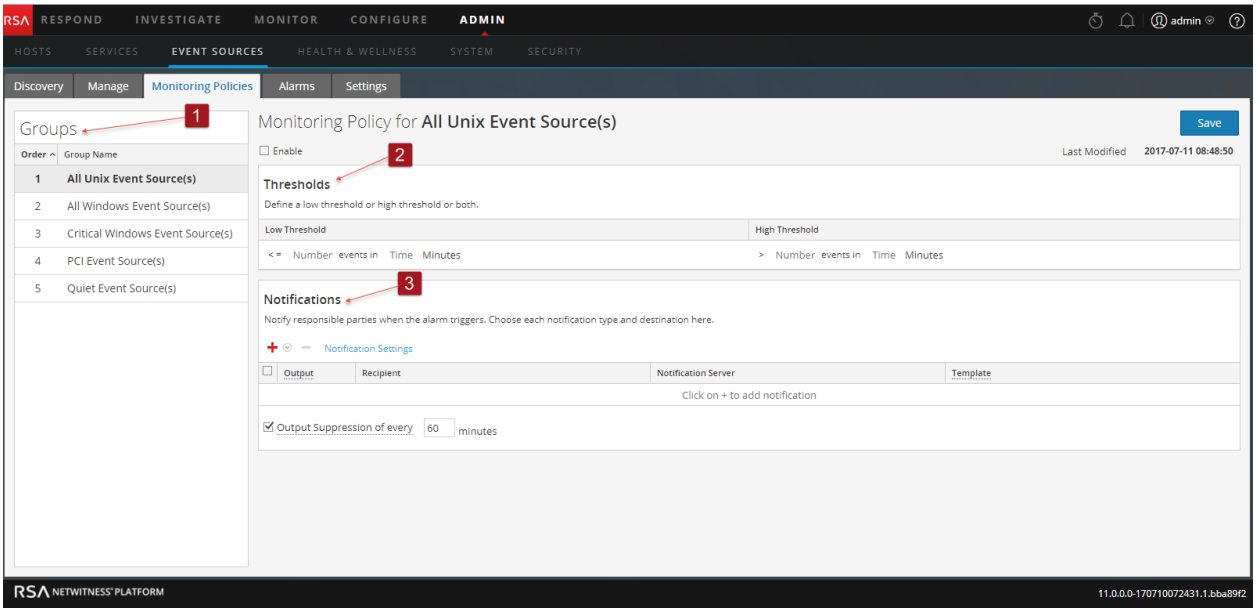
Disabling Notifications

Quick Look

The **Monitoring Policies** tab consists of three panels:

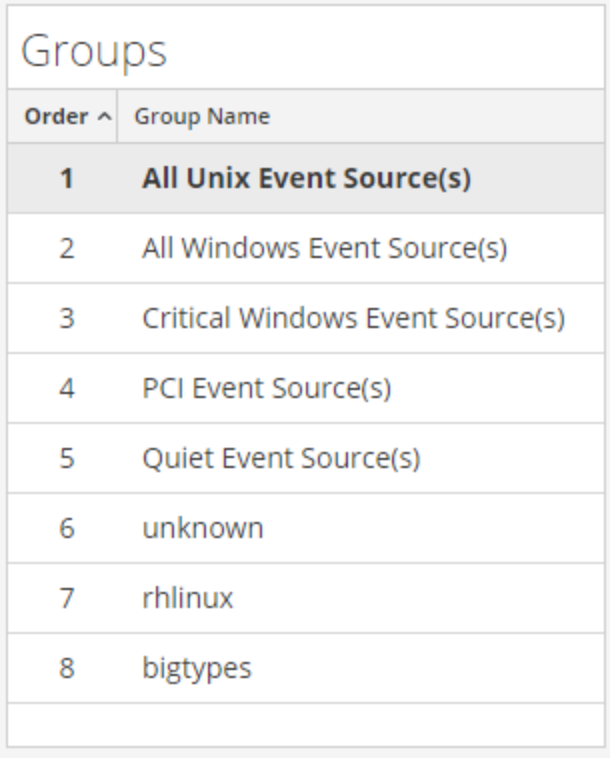
- Event Groups Panel
- Thresholds Panel
- Notifications Panel

This is an example of the **Monitoring Policies** tab.



1 Displays the Groups panel.
2 Displays the Thresholds panel.
3 Displays the Notifications panel.

Event Groups Panel



The group selected in this panel determines which thresholds appear in the Thresholds panel. You can define a set of thresholds for each event source group. Notice that the groups are listed in a specific order:

- Drag and drop groups to change the specified order.
- The higher a group is listed, the higher the precedence for that group's thresholds: RSA NetWitness Platform checks the thresholds in the order provided in this panel. Thus, your highest priority groups should be at the top of this list

Thresholds Panel

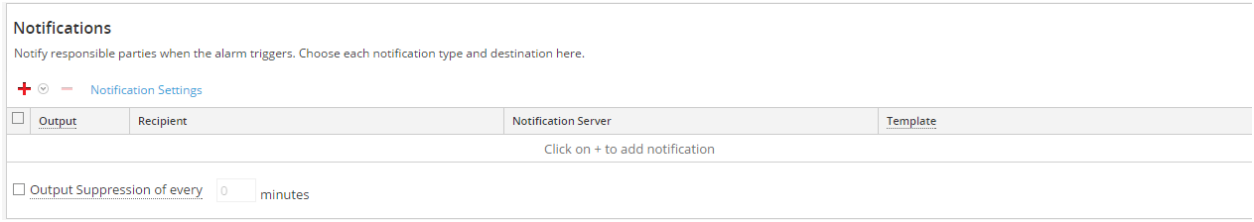
This is an example of the Thresholds panel for an event source group.

The Thresholds Panel contains the following features.

Feature	Description
Enable	The Enable checkbox designates whether or not the thresholds that you define for a group are enabled. If so, notifications are sent whenever the thresholds for that group are outside of the defined range. If not, then no monitoring of that event source group is occurring. **Note:** If you configure a threshold and attempt to save the page without enabling it, you receive a confirmation message, asking you whether or not to enable the policy. If you enable a policy, but do not have any thresholds set, then you can still receive automatic (baseline) notifications, as long as you have turned on automatic notifications. See below for more details on the look of notifications.
Low number of events Low number of minutes or hours	This is the low end of the threshold. Enter the fewest number of events and the time range. If the event source group receives fewer messages than specified here, the threshold is not met, and notifications are sent.
High number of events High number of minutes or hours	Works similarly as for the low values: If more messages than specified here are received, the threshold is not met, and notifications are sent.
Last Modified date and time	This field indicates the last time and date that the thresholds were changed.
Save	Saves the changes you have made to the thresholds.

Notifications Panel

This is an example of the Notifications panel for an event source group.

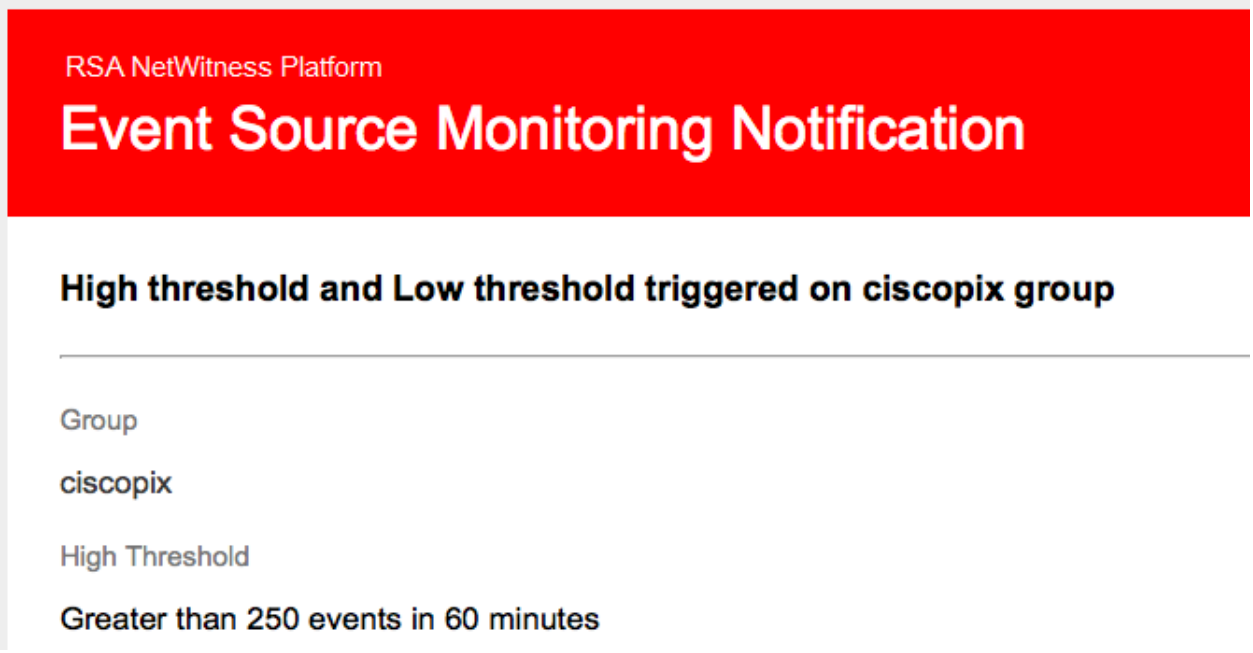


The following table describes the fields on the Notifications panel

Field	Description
Tools + -	The following items are available on the toolbar: • **Add (+)**: clicking the **Add** presents a menu where you can choose the type of the notification • **Remove (-)**: removes the selected row from the list.

Field	Description
Notification Settings	Clicking this link opens a new browser tab, and takes you to the **Admin** > **System** > **Notifications** page in NetWitness Platform.
Type	Displays the type of the notification that you have chosen. The available options are as follows: • Email • SNMP • Syslog
Notification	See the **Configure Notification Outputs** topic in the *System Configuration Guide* for more details.
Notification Server	See the **Configure Notification Servers** topic in the *System Configuration Guide* for more details
Template	For Event Source Management, RSA provides three out-of-the-box templates for notifications. You can use the following templates as delivered, or customize them based on the needs of your organization: • **Email template**: sends notifications to the specified email addresses. • **SNMP template**: sends notifications to the specified SNMP server • **Syslog** template: sends notifications to the specified Syslog server. See the **Configure /Templates for Notifications** topic in the *System Configuration Guide* for more details.
Output Suppression	Use this item to limit how often notifications are received for this policy, in case a lot of alerts are triggered in a short period of time.

The following are sample notifications, based on the supplied Templates.



- Email:

  For email notifications, the third column, **Alarm Type**, specifies whether the triggered alarm was based on a user threshold, or the baseline data being out of normal bounds. If you have automatic monitoring or notifications turned off, you will not receive any **Automatic** notifications. The same is true for Syslog and SNMP, except those notifications are formatted differently.

- SNMP trap:

```
11-11-2015 11:57:33 Local7.Debug 127.0.0.1 community=public,

Automatic Alerting

Disabling Notifications

Quick Look

You can set up policies and thresholds for your event source groups. You do this so that you can receive notifications when the thresholds are not met. NetWitness Platform also provides an automatic way to receive alarms, if you do not want to set up thresholds to generate alarms.

About Automatic Alerting

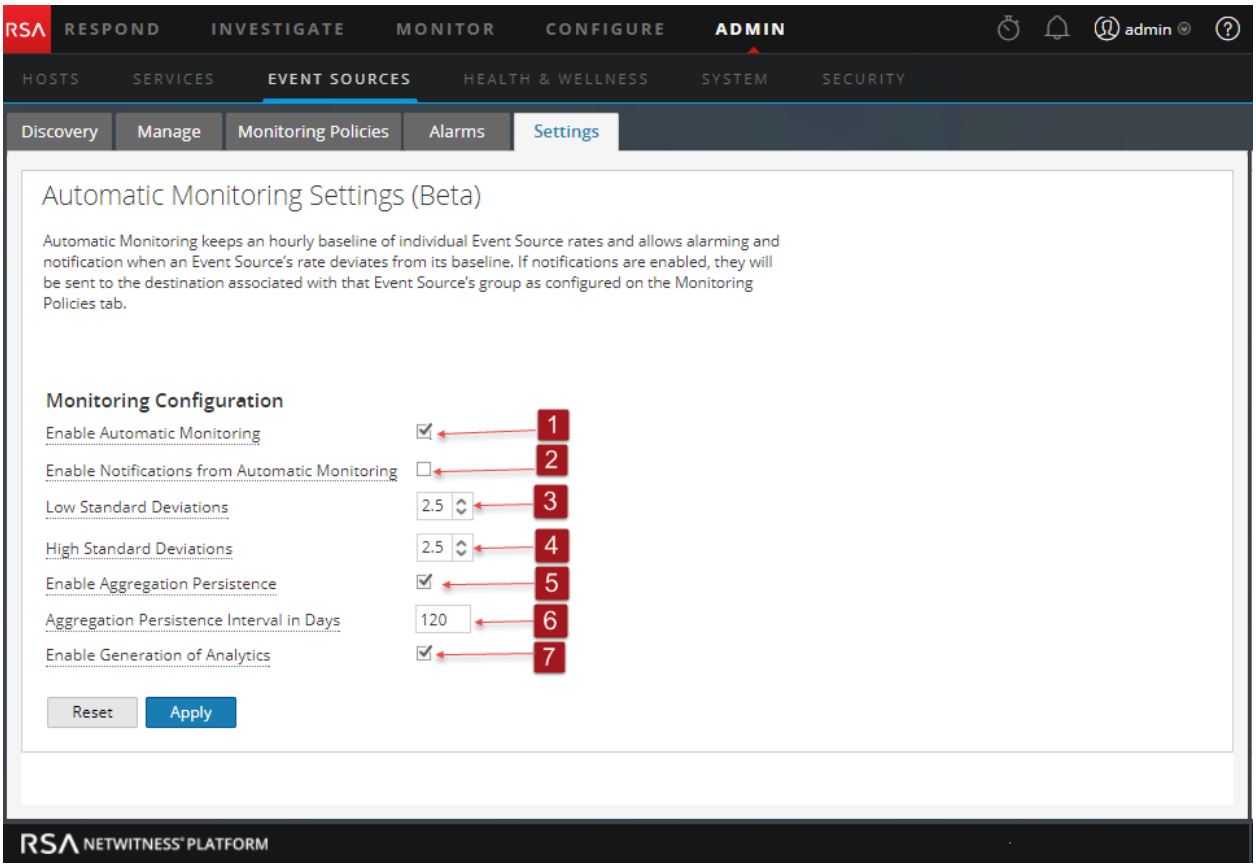
You can set up policies and thresholds for your event source groups. You do this so that you receive notifications when the thresholds are not met. NetWitness Platform also provides an automatic way to receive alarms, if you do not want to set up thresholds to generate alarms.

To trigger automatic alerts, you can use baseline values. This way, you do not need to set up numerous group thresholds and policies in order to receive alerts. Any anomalous amount of messages trigger alerts, without needing to do any configuration (except for turning on automatic alerting).

Note the following:

- After you begin collecting messages from an event source, it takes the system approximately a week to store a baseline value for that event source. After this initial period, the system alerts you when the number of messages for a period are above or below the baseline by a set amount. By default, this amount is 2 standard deviations above or below the baseline.
- Base your high and low deviation settings on how "regular" your event sources behave. That is, if you expect little or no variance in the number of messages that arrive for a given time (for example, 8 to 9 am on a weekday), then you can set a low value for the Deviation. Conversely, if you often see peaks and valleys, set the Deviation value higher.
- If you enable a policy, but do not have any thresholds set, then you can still receive automatic (baseline) notifications, as long as you have turned on automatic alerting.

Note: Automatic alerting, and it settings, are currently in Beta testing.



1	Determines whether automatic alerting is on or off. By default, this option is selected (automatic alerting turned on)
2	Determines whether notifications for automatic alerts are on or off. By default, this option is cleared (automatic notifications are not sent when automatic alerts are triggered)
3	The standard deviations below which to receive alerts. Default is **2.5** (95% confidence)
4	The standard deviations above which to receive alerts. Default is **2.5** (95% confidence)
5	When selected, this option stores event source counts per one-hour interval. The data that is collected is used to form the baseline values for each event source. • **Enabled (default)**: one count per hour per event source is stored in the underlying database. These one-hour counts (or aggregations) form the historical basis for computing the normal range for each event source. • **Disabled**: when the SMS Server is restarted, Event Source Monitoring will have no historical data with which to compute the normal range and the user will have to wait until enough data (about a week's worth) is collected to form a new basis for each event source
6	Controls how much historical data (see **Enable Aggregation Persistence**) to maintain for each event source. The default value of 120 days means roughly 4 months of history is kept and used when reconstructing the basis for each event source
7	When enabled, data about the behavior of the automatic alerting is stored to disk. The default value is **Enabled**. The data retained includes baseline value over time and the alerting history for each event source. Note, however, the event source address and type is anonymized, so only your event rate information is revealed.

Since automatic alerting is a beta feature, this data is important to measure the efficacy of the feature. This can be disabled without affecting the automatic alerting functionality

8 The **Reset** option discards any unsaved changes for all settings on the page.

9 Click **Apply** to save any changes you made to the values on the page.

Features

The Settings tab contains the following features.

Feature	Description
Enable Automatic Monitoring	Determines whether automatic alerting is on or off. By default, this option is selected (automatic alerting turned on)
Enable Notifications From Automatic Monitoring	Determines whether notifications for automatic alerts are on or off. By default, this option is cleared (automatic notifications are not sent when automatic alerts are triggered)
Low Standard Deviations	The standard deviations below which to receive alerts. Default is **2.5** (95% confidence)
High Standard Deviations	The standard deviations above which to receive alerts. Default is **2.5** (95% confidence)
Enable Aggregation Persistence	When selected, this option stores event source counts per one-hour interval. The data that is collected is used to form the baseline values for each event source. • Enabled (default): one count per hour per event source is stored in the underlying database. These one-hour counts (or aggregations) form the historical basis for computing the normal range for each event source. • Disabled: when the SMS Server is restarted, Event Source Monitoring will have no historical data with which to compute the normal range and the user will have to wait until enough data (about a week's worth) is collected to form a new basis for each event source
Aggregation Persistence Interval in Days	Controls how much historical data (see **Enable Aggregation Persistence**) to maintain for each event source. The default value of 120 days means roughly 4 months of history is kept and used when reconstructing the basis for each event source
Enable Generation of Analytics	When enabled, data about the behavior of the automatic alerting is stored to disk. The default value is **Enabled**. The data retained includes baseline value over time and the alerting history for each event source. Note, however, the event source address and type is anonymized, so only your event rate information is revealed. Since automatic alerting is a beta feature, this data is important to measure the efficacy of the feature. This can be disabled without affecting the automatic alerting functionality

Feature	Description
Reset	This option discards any unsaved changes for all settings on the page.
Apply	Click **Apply** to save any changes you made to the values on the page.

ESM Troubleshooting & Appendix

Troubleshooting Topics:

- Alarms and Notifications Issues
- Duplicate Log Messages
- Troubleshooting Feeds
- Import File Issues
- Negative Policy Numbering

Appendix: Viewing Logs from Pre-11.0 Log Decoder

Alarms and Notifications Issues

This topic describes how to address problems you may encounter with alarms or notifications.

Alarms

If you are not seeing alarms that you expect to see, make sure that you have configured all the necessary items, as discussed below.

Automatic Alarms

To see automatic alarms appear on the Alarms screen, the **Enable Automatic Monitoring** option must be selected.

This option is on the **Setting** tab (**ADMIN** > **Event Sources** > **Settings**), and is selected by default. However, at some point someone may have cleared this option.

Manual Alarms

To see manual alarms appear on the Alarms screen, all of the following conditions must be met:

- The event source must be part of a Group.
- The Group must have a policy with either a low or high (or both) threshold defined.
- The Group Policy must be enabled.

Notifications

If you are seeing alarms, but are not receiving the expected notifications, make sure that you have configured all the necessary items, as discussed below.

Also, make sure that you have correctly configured the Notification Servers and Notification Outputs. Much of the preliminary configuration for Notifications is done from **ADMIN > System > Global Notifications**. For details, see the **Global Notifications Panel** topic in the *System Configuration Guide*.

Automatic Notifications

To have the system send automatic notifications, all of the following conditions must be met:

- The **Enable Automatic Monitoring** option must be selected (this option is selected by default).
- The **Enable Notifications From Automatic Monitoring** option must be selected. This option is cleared by default, so you or someone in your organization must select it. Navigate to **ADMIN** > **Event Sources** > **Settings** to see this option.
- The event source that triggered the alarm must be in a group that has a policy enabled: note that no thresholds need to be set for automatic notifications.
- The policy must at least one notification configured (either email, SNMP or Syslog).

Manual Notifications

To have the system send manual notifications (that is, a notification which says that a manual alarm was triggered):

- The event source that triggered the alarm must be in a group that has a group policy enabled.
- There must be a threshold set for the policy.
- At least one notification has been configured for the policy.

Duplicate Log Messages

It is possible that you are collecting messages from the same event source on two or more Log Collectors. This topic describes the problem and ways to troubleshoot the issue.

Details

If the ESM aggregator detects the same events for the same event source on multiple Log Collectors, you receive a warning similar to the following:

```
2015-03-17 15:25:29,221 [pool-1-thread-6] WARN
com.rsa.smc.esm.groups.events.listeners.EsmStatEventListener -
 192.0.2.21-apache had a previous event only 0 seconds ago; likely because it
exists on multiple log collectors
```

This warning message means the `192.0.2.22-apache` event source is being collected by multiple hosts. You can see the list of hosts in the Log Collector column in the **Manage** tab in the Administration > Event Sources view.

Clean Up Duplicate Messages

1. Stop collectd on NetWitness Platform and Log Decoders:

   ```
   service collectd stop
   ```

2. Remove the ESM Aggregator persisted file on NetWitness Platform:

   ```
   rm /var/lib/netwitness/collectd/ESMAggregator
   ```

3. Reset the Log Decoder.
   a. Navigate to the Log Decoder REST, at `http://<LD_IP_Address>:50102`.
   b. Click **decoder(*)** to view the properties for the decoder.
   c. In the Properties drop-down menu, select **reset**, then click **Send**.
4. In the Event Sources panel from the Event Sources Manage tab, select all event sources and then click − to remove them.
5. Start the collectd service:
   ```
   service collectd start
   ```

Troubleshooting Feeds

The purpose of the feed generator is to generate a mapping of an event source to the list of groups to which it belongs.

If you have an event source from which you are collecting messages, and yet it is not displayed in the correct event source groups, then this topic provides background and information to help you track down the problem.

Details

The ESM Feed maps multiple keys to single value. It maps the DeviceAddress, Forwarder, and DeviceType attributes to groupName.

The purpose of the ESM feed is to enrich event source Meta with the groupName collected on the Log Decoder.

How it Works

The feed generator is scheduled to update every minute. However, it is triggered only if there are any changes (create, update, or delete) in event sources or groups.

It generates a single feed file with event source to group mapping, and pushes the same feed to all of the Log Decoders that are connected to NetWitness Platform.

After the feed file is uploaded on the Log Decoders, for any new events, it enriches events Meta data with groupName, and appends this groupName to logstats.

After the groupName is in logstats, the ESM Aggregator groups information and sends it to ESM. At this point, you should see the **Group Name** column under the **Event Source Monitoring** tab.

The entire process can take some time. Therefore, you may need to wait for several seconds after you add a new group or event source, before the Group name is displayed.

Note: If the event source type attribute changes when the feed is updated, NetWitness Platform adds a new logstats entry, rather than updating the existing one. Thus, there will be two different logstats entries in logdecoder. Previously existing messages would have been listed under the previous type, and all new messages are logged for the new event source type.

Feed File

The format of the feed file is as follows:

```
DeviceAddress, Forwarder, DeviceType, GroupName
```

The `DeviceAddress` is either `ipv4, ipv6`, or `hostname`, depending on which of these have been defined for the event source.

The following is a sample of the feed file:

```
"12.12.12.12","d6","NETFLOW","grp1"
"12.12.12.12","ld4","netflow","grp1"
"12.12.12.12","d6","netfow","grp1"
"0:E:507:E6:D4DB:E:59C:A","10.25.50.243","apache","Apachegrp"
"1.2.3.4","LCC","apache","Apachegrp"
"10.100.33.234","LC1","apache","Apachegrp"
"10.25.50.248","10.25.50.242","apache","Apachegrp"
"10.25.50.251","10.25.50.241","apache","Apachegrp"
"10.25.50.252","10.25.50.255","apache","Apachegrp"
"10.25.50.253","10.25.50.251","apache","Apachegrp"
"10.25.50.254","10.25.50.230","apache","Apachegrp"
"10.25.50.255","10.25.50.254","apache","Apachegrp"
"13.13.13.13","LC1","apache","Apachegrp"
"AB:F255:9:8:6C88:EEC:44CE:7",,"apache","Apachegrp"
"Appliance1234",,"apache","Apachegrp"
"CB:F255:9:8:6C88:EEC:44CE:7","10.25.50.253","apache","Apachegrp"
```

Troubleshooting Feeds

You can check the following items to narrow down where the problem is occurring.

10.5 Log Decoders

Are your NetWitness Platform Log Decoders at version 10.5 or later? If not, you need to upgrade them. For NetWitness Platform version 10.6, feeds are sent only to version 10.5 and later Log Decoders.

Feed File Existence

Verify that the feeds ZIP archive exists in the following location:

```
/opt/rsa/sms/esmfeed.zip
```

Do not modify this file.

Group Meta Populated on LD

Verify that the group meta is populated on the Log Decoder. Navigate to the Log Decoder REST and check logstats:

```
http://LogDecoderIP:50102/decoder?msg=logStats&force-content-type=text/plain
```

This is a sample logstats file with group information:

```
device=apache forwarder=NWAPPLIANCE10304 source=1.2.3.4 count=338
lastSeenTime=2015-Feb-04 22:30:19 lastUpdatedTime=2015-Feb-04
22:30:19
groups=IP1234Group,apacheGroup
device=apachetomcat forwarder=NWAPPLIANCE10304 source=5.6.7.8
count=1301 lastSeenTime=2015-Feb-04 22:30:19 lastUpdatedTime=2015-
```

```
Feb-04 22:30:19
groups=AllOtherGroup,ApacheTomcatGroup
```

In the above text, the group information is bolded.

Device Group Meta on Concentrator

Verify that the **Device Group** meta exists on the Concentrator, and that events have values for the `device.group` field.

SMS Log File

Check the SMS log file in the following location to view informational and error messages:
`/opt/rsa/sms/logs/sms.log`

The following are example *informational* messages:

```
Feed generator triggered...
Created CSV feed file.
Created zip feed file.
Pushed ESM Feed to LogDeocder : <logdecoder IP>
```

The following are example *error* messages:

```
Error creating CSV File : <reason>Unable to push the ESM Feed:
Unable to create feed zip archive.
Failed to add Group in CSV: GroupName: <groupName> : Error: <error>
Unable to push the ESM Feed: CSV file is empty, make sure you have
al-least on group with at least one eventsource.
Unable to push the ESM Feed: No LogDecoders found.
Unable to push the ESM Feed: Unable to push feed file on LogDecoder-
<logdecoderIP>Unable to push the ESM Feed:
admin@<logdecoderIP>:50002/decoder/parsers received error: The zip
```

```
archive "/etc/netwitness/ng/upload/<esmfeedfileName>.zip" could not
be opened
Unable to push the ESM Feed: <reason>
```

Verify Logstats data is getting Read & Published by ESMReader & ESMAggregator

These are the steps to verify that logstats are collected by **collectd** and published to Event Source Management.

ESMReader

1. On Log Decoders add **debug "true"** flag in in **/etc/collectd.d/logdecoder-esm.conf**:

```
#
# Copyright (c) 2014 RSA The Security Division of EMC
#
<Plugin generic_cpp>    PluginModulePath "/usr/lib64/collectd"
    debug "true"

    <Module "NgEsmReader" "all">
        port      "56002"
        ssl       "yes"
        keypath   "/etc/pki/nw/node/node-key.pem"
        certpath  "/etc/pki/nw/node/node-cert.pem"
        interval  "600"
        query     "all"
        <stats>
        </stats>
    </Module>
    <Module "NgEsmReader" "update">
        port      "56002"
        ssl       "yes"
        keypath   "/etc/pki/nw/node/node-key.pem"
        certpath  "/etc/pki/nw/node/node-cert.pem"
        interval  "60"
        query     "update"
        <stats>
        </stats>
    </Module>
</Plugin>
```

2. Run the command:

```
collectd service restart
```

3. Run the following command:

```
tail -f /var/log/messages | grep collectd
```

Verify that ESMReader is reading logstats and there are no errors. If there are any read issues, you will see errors similar to the following:

```
Apr 29 18:47:45 NWAPPLIANCE15788 collectd[14569]: DEBUG: NgEsmReader_all:
error getting ESM data for field "groups" from logstat device=checkpointfw1
```

```
forwarder=PSRTEST source=1.11.51.212. Reason: <reason>Apr 29 18:58:36
NWAPPLIANCE15788 collectd[14569]: DEBUG: NgEsmReader_update: error getting
ESM data for field "forwarder" from logstat device=apachetomcat
source=10.31.204.240. Reason: <reason>
```

ESMAggregator

1. On NetWitness Platform, uncomment the verbose flag in **/etc/collectd.d/ESMAggregator.conf**:

```
# ESMAggregator module collectd.conf configuration file
#
# Copyright (c) 2014 RSA The Security Divsion of EMC
#
<Plugin generic_cpp>
PluginModulePath "/usr/lib64/collectd"
<Module "ESMAggregator">
        verbose 1
        interval "60"
        cache_save_interval "600"
        persistence_dir "/var/lib/netwitness/collectd"
</Module>
</Plugin>
```

2. Run the following:

   ```
   collectd service restart.
   ```

3. Run the following command:

   ```
   run "tail -f /var/log/messages | grep ESMA
   ```

   Look for ESMAggregator data and make sure your logstat entry is available in logs.

Sample output:

```
Mar  1 02:32:08 NWAPPLIANCE15936 collectd[11203]: ESMAggregator: MetaData[0]
logdecoder[0] = d4c6dcd4-6737-4838-a2f7-ba7e9a165aae
Mar  1 02:32:08 NWAPPLIANCE15936 collectd[11203]: ESMAggregator: MetaData[1]
logdecoder_utcLastUpdate[0] = 1425174451
Mar  1 02:32:08 NWAPPLIANCE15936 collectd[11203]: ESMAggregator: MetaData[2]
groups = Cacheflowelff,Mixed
Mar  1 02:32:08 NWAPPLIANCE15936 collectd[11203]: ESMAggregator: MetaData[3]
logdecoders = d4c6dcd4-6737-4838-a2f7-ba7e9a165aae

Configure JMX Feed Generator Job Interval

Although the feed generation job is scheduled to execute every minute by default, you can change this by using **jconsole**, if necessary.

To change the feed generator job interval:

1. Open **jconsole** for the SMS service.
2. On the MBeans tab, navigate to **com.rsa.netwitness.sms** > **API** > **esmConfiguration** > **Attributes**.
3. Modify the value for the property **FeedGeneratorJobIntervalInMinutes**.
4. Go to **Operations** under the same navigation tree, an click **commit()**. This persists the new value in the corresponding json file under **/opt/rsa/sms/conf**, and uses the value if SMS is restarted.

Setting a new value reschedules the feed generator job for the new interval.

Import File Issues

If your import file is not formatted correctly, or is missing required information, an error is displayed, and the file is not imported.

Check the following:

- If you are adding unknown sources, each line in the file must contain a combination of the required attributes:

- IP or IPv6 or Hostname, and
- Event Source Type

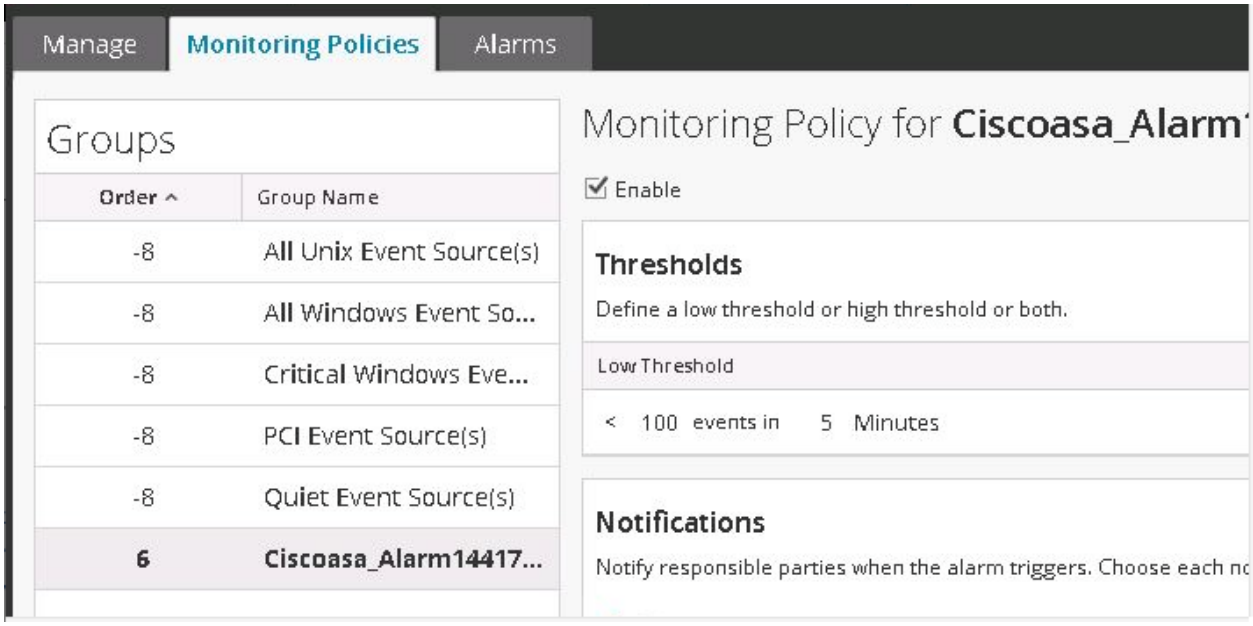
- The first line of the file must contain header names, and the names must match the names in NetWitness Platform. To get a list of correct column names, you can export a single event source. Examine the exported CSV file: the first row of the file contains the correct set of attribute/column names.

Negative Policy Numbering

You may see negative numbers in the Order field in the Groups section of the Monitoring Polices tab. This topic describes a workaround to restore the correct numbering scheme for your policies.

Details

The following screen shows an example of the situation where the numbers of group policies become negative.



If you encounter this situation, drag and drop the top group (**All Unix Event Source(s)** in the above image) to after the last group (**Ciscoasa_Alarm14417**). This restores normal, ordinal numbering. You can then continue to drag and drop groups until you have them in their proper order for your organization.

Clean Up Duplicate Messages

1. Stop collectd on NetWitness Platform and Log Decoders:

   ```
   Service collectd stop
   ```

2. Remove the ESM Aggregator persisted file on NetWitness Platform:

   ```
   rm /var/lib/netwitness/collectd/ESMAggregator
   ```

3. Reset the Log Decoder.
   a. Navigate to the Log Decoder REST, at `http://<LD_IP_Address>:50102`
   b. Click **decoder(*)** to view the properties for the decoder.
   c. In the Properties drop-down menu, select **reset**, then click **Send**.
4. In the Event Sources panel from the Event Sources Manage tab, select all event sources and then click − to remove them.

Viewing Logs from Pre-11.0 Log Decoder

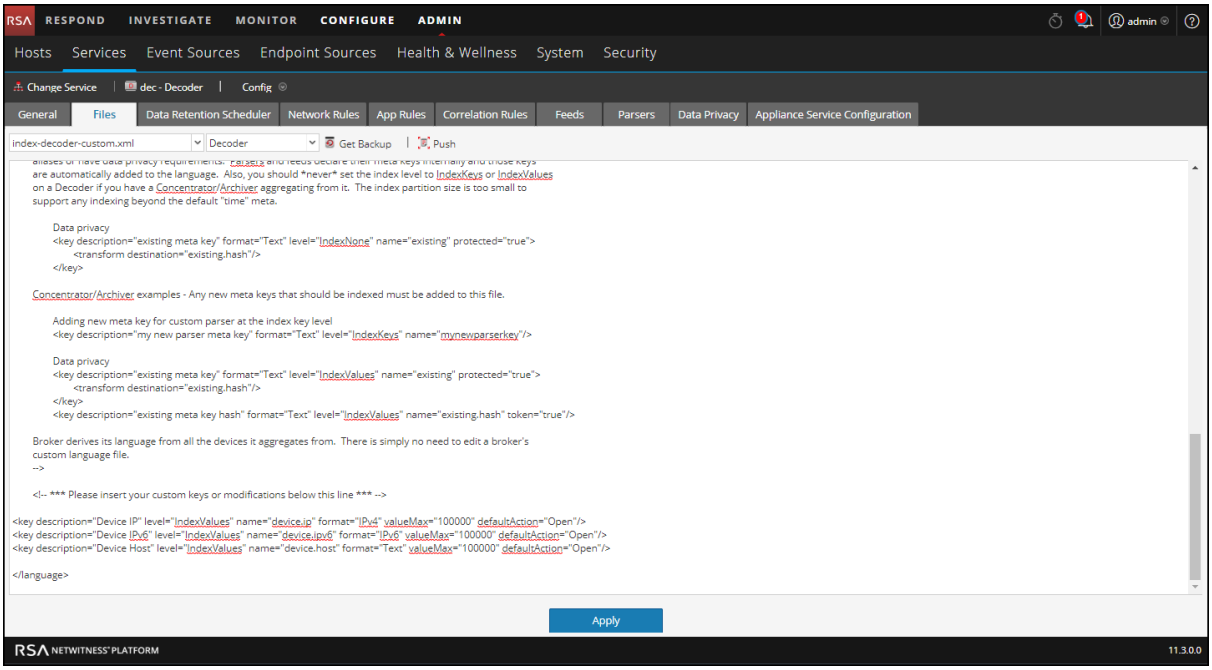
RSA NetWitness® Platform 11.0 added the capability to view a small sampling of recent logs for specific devices through detail tabs of the Discovery View. By default, Log Decoders prior to 11.0 do not have the necessary configuration to enable this feature, but a few minor changes can make it available.

To enable logs preview for a pre-11.0.0.0 Log Decoder, follow these steps on the Log Decoder:

1. Go to **ADMIN > Services >** select a Log Decoder, then select ⚙ **> View > Config**.
2. Click **Files** tab, then select **index-logdecoder-custom.xml** from the drop-down menu.
3. Add the following three lines at the end of the file (before the closing language tag):

```
<key description="Device IP" level="IndexValues" name="device.ip" format="IPv4" valueMax="100000"
defaultAction="Open"/>
<key description="Device IPv6" level="IndexValues" name="device.ipv6" format="IPv6"
valueMax="100000" defaultAction="Open"/>
<key description="Device Host" level="IndexValues" name="device.host" format="Text"
valueMax="100000" defaultAction="Open"/>
```

4. Click **Apply**.



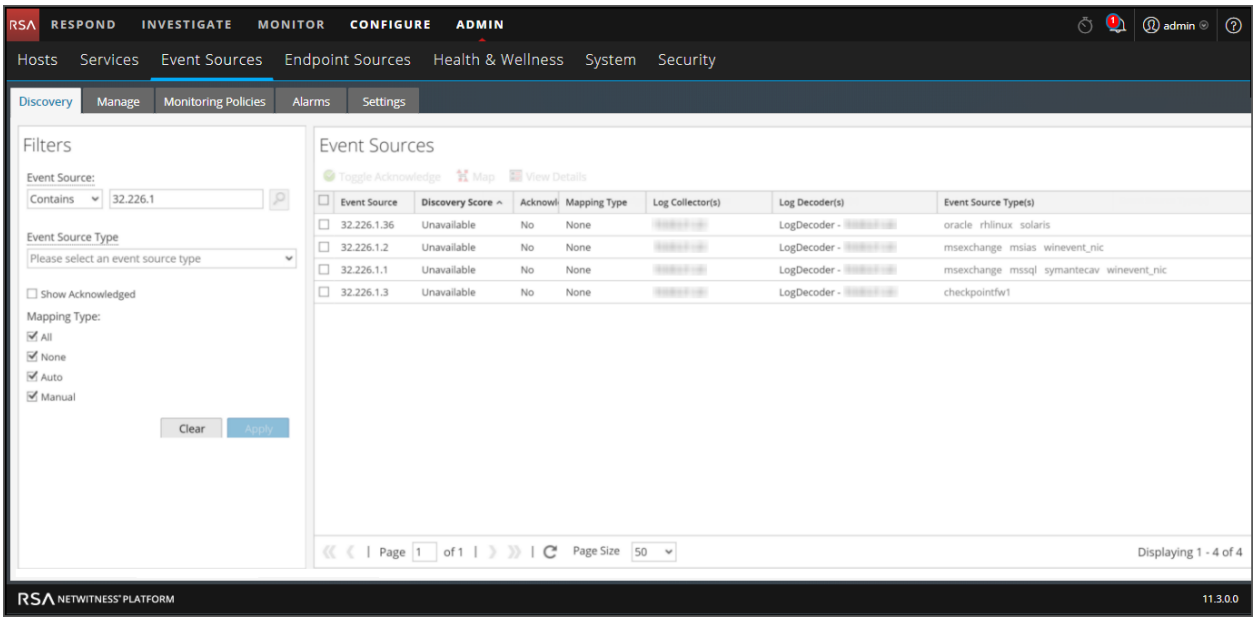
5. Restart the Log Decoder as follows.

   Select **Log Decoder > Explore > sys > Properties > shutdown**

This is an example of the **index-logdecoder-custom.xml** file.

Note: Discovery Scores are only available for 11.0 and above Log Decoders. Discovery Scores for pre-11.0 Log Decoders display as Unavailable.

The following example displays the Discovery Score as **Unavailable** in the **Details** view for a pre-11.0 Log Decoder.



Note: Device logs are only available for 11.0 and above Log Decoders.

The following example shows the message that displays in the displays in the Logs panel for a pre-11.0 Log Decoder.

Malware Analysis Functions

NetWitness Platform Malware Analysis is an automated malware analysis processor designed to analyze certain types of file objects (for example, Windows portable executable (PE), PDF, and MS Office) to assess the likelihood that a file is malicious.

Malware Analysis detects indicators of compromise using four distinct analysis methodologies:

- Network Session Analysis (network)
- Static File Analysis (static)
- Dynamic File Analysis (sandbox)
- Security Community Analysis (community)

Each of the four distinct analysis methodologies is designed to compensate for inherent weaknesses in the others. For example, Dynamic File Analysis can compensate for Zero-Day attacks that are not detected during the Security Community Analysis phase. By avoiding malware analysis that strictly focuses on one methodology, the analyst is more likely to be shielded from false negative results.

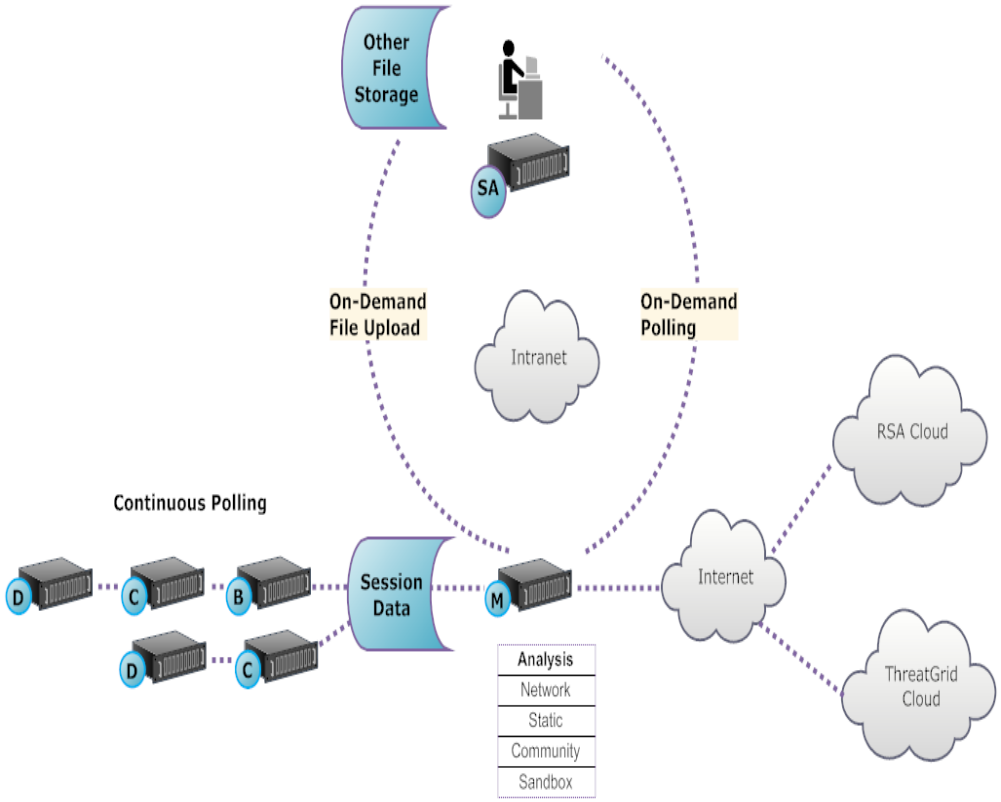
In addition to the built-in indicators of compromise, Malware Analysis supports indicators of compromise written in YARA. YARA is a rule language, which allows malware researchers to identify and classify malware samples. This allows IOC authors to add detection capabilities to RSA Malware Analysis by authoring YARA rules and publishing them in RSA Live. These YARA-based IOCs in RSA Live will automatically be downloaded and activated on the subscribed host, to supplement the existing analysis that is performed in each analyzed file.

Malware Analysis also has features that support alerts for Incident Management.

Functional Description

This figure depicts the functional relationship between the Core services (the Decoder, Concentrator, and Broker), the Malware Analysis service, and the NetWitness Server.

Daily Quota (Number of Files)	Free	Standard	Enterprise
Malware Analysis	100	unlimited	unlimited
ThreatGrid Analysis	5	1000	5000



The Malware Analysis service analyzes file objects using any combination of the following methods:

- **Continuous automatic polling of a Concentrator or Broker** to extract sessions identified by a parser as potentially carrying malware content.
- **On-demand polling of a Concentrator or Broker** to extract sessions identified by a malware analyst as potentially carrying malware content.
- **On-demand upload of files** from a user-specified folder.

When automatic polling of a Concentrator or Broker is enabled, the Malware Analysis service continuously extracts and prioritizes executable content, PDF documents, and Microsoft Office documents on your network, directly from data captured and analyzed by your Core service. Because the Malware Analysis service connects to a Concentrator or Broker to extract only those executable files that are flagged as possible malware, the process is both rapid and efficient. This process is continuous and does not require monitoring.

When on-demand polling of a Concentrator or Broker is chosen, the malware analyst uses Investigation to drill into captured data and choose sessions to be analyzed. The Malware Analysis service uses this information to automatically poll the Concentrator or Broker and to download the specified sessions for analysis.

On-demand upload of files provides a method for the analyst to review files captured external to the Core infrastructure. The malware chooses a folder location and identify one or more files to be uploaded and analyzed by Malware Analysis. These files are analyzed using the same methodology as files automatically extracted from network sessions.

Analysis Method

For the Network analysis, the Malware Analysis service looks for characteristics that seem to deviate from the norm, much as an analyst does. By looking at hundreds to thousands of characteristics and combining the results into a weighted scoring system, legitimate sessions that coincidentally have a few abnormal traits are dismissed, while the actual bad ones are highlighted. A user can learn patterns that indicate anomalous activity in the sessions as indicators that warrant further investigation, Indicators of Compromise.

The Malware Analysis service can perform Static analysis against suspicious objects it finds on the network and determine whether those objects contain malicious code. For Community analysis, new malware detected on the network is pushed to the RSA Cloud for checking against RSA's own malware analysis data and feeds from the SANS Internet Storm Center, SRI International, the Department of the Treasury and VeriSign. For Sandbox analysis, the services can also push data into major security, information and event management (SIEM) hosts (the ThreatGrid Cloud).

Malware Analysis has a unique method for analysis that is partnered with industry leaders and experts, so their technologies can enrich the Malware Analysis scoring system.

NetWitness Server Access to the Malware Analysis Service

The NetWitness Server is configured to connect to the Malware Analysis service and import tagged data for deeper analysis in Investigation. Access is based on three subscription levels.

- Free subscription: All NetWitness Platform customers have a free subscription, with a free trial key for ThreatGrid analysis. The Malware Analysis service is rate-limited to 100 file samples per day. The number of samples (within the set of files from above) submitted to the ThreatGrid Cloud for sandbox analysis is limited to 5 per day. If one network session had 100 files in it, customers would hit the rate limit after processing the one network session. If 100 files were manually uploaded, that would cause the rate limit to be reached.
- Standard subscription tier: The number of submissions to the Malware Analysis service is unlimited. The number of samples submitted to the ThreatGrid Cloud for sandbox analysis is 1000 per day.
- Enterprise subscription tier: The number of submissions to the Malware Analysis service is unlimited. The number of samples submitted to the ThreatGrid Cloud for sandbox analysis is 5000 per day.

Scoring Method

By default, the Indicators of Compromise (IOC) are tuned to reflect industry best practices. During analysis, the IOCs that trigger cause the score to move upward or downward to indicate the likelihood that the sample is malicious. The tuning of IOCs is exposed in NetWitness Platform so that the malware analyst can choose to override the assigned score or to disable an IOC from being evaluated. The analyst has the flexibility to either use the default tuning, or to completely customize the tuning to specific needs.

YARA-based IOCs are interleaved with the built-in IOCs within each built-in category and are not distinguished from native IOCs. When viewing IOCs in the Service Configuration view, administrators can select YARA from the Module selection list to see a list of YARA rules.

After a session is imported into NetWitness Platform, all of the viewing and analysis capabilities in Investigation are available to further analyze Indicators of Compromise. When viewed in Investigation, YARA IOCs are distinguished from the built-in native IOCs by the tag `Yara rule`.

Deployment

The Malware Analysis service is deployed as a separate RSA Malware Analysis host. The dedicated Malware Analysis host has an on-board Broker which connects to the Core infrastructure (either another Broker or a Concentrator). Prior to this connection, a collection of parsers and feeds must be added to the Decoders that are connected to the Concentrators and Brokers from which the Malware Analysis service pulls data. This allows suspicious data files to be marked for extraction. These files are `malware analysis` tagged content available through the RSA Live content management system.

Malware Scoring Modules

RSA NetWitness Platform Malware Analysis analyzes and scores sessions and the embedded files within these sessions by scoring four categories: Network, Static Analysis, Community, and Sandbox. Each category comprises many individual rules and checks that are used to calculate a score between 1-100. The higher the score, the more likely the session is to be malicious and worthy of more in-depth follow-on investigation.

Malware Analysis can facilitate a historical investigation into events leading up to a network alarm or incident. If you know that a certain type of activity is taking place on your network, you can select only the reports of interest to examine the content of data collections. You can also modify behavior for each scoring category based on the scoring category or the file type (Windows PE, PDF, and Microsoft Office).

Once you become familiar with data navigation methods, you can explore the data more completely through:

- Searching for specific types of information
- Reviewing specific content in detail.

Category scores for Network, Static Analysis, Community, and Sandbox are maintained and reported independently. When events are viewed based on the independent scores, as long as one category detects malware, it is evident in the Analysis section.

Network

The first category examines each core network session to determine if the delivery of the malware candidates was suspicious. For example, benign software being downloaded from a well-known safe site, using proper ports and protocols, is considered less suspicious than downloading software known to be malicious from a known dubious download site. Sample factors used in the scoring of this criteria set may include sessions that:

- Contain threat feed information
- Connect to well-known bad sites
- Connect to high-risk domains/countries (for example, .cc domain)
- Use well-known protocols on non-standard ports
- Contain obfuscated JavaScript

Static Analysis

The second category analyzes each file in the session for signs of obfuscation in order to predict the likelihood of the file behaving maliciously if allowed to run. For example, software that links to networking libraries is more likely to perform suspicious network activity. Sample factors used in the scoring of this criteria set may include:

- Files found to be XOR encoded
- Files found embedded within non-EXE formats (for example, PE file found embedded in a GIF format)
- Files linking to higher risk import libraries
- Files highly deviating from the PE Format

Community

The third category scores the session and files based on the collective knowledge of the security community. For example, files whose fingerprint/hash is already known to be good or bad by respected anti-virus (AV) vendors is scored accordingly. Files are also scored based on knowledge that a file was delivered from a site known to be good or bad by the security community.

Community scoring also indicates whether the AV on your network flagged the files as malicious. It does not indicate that the resident AV product acted to protect your system.

Sandbox

The fourth category examines the behavior of the software by actually running it in a sandbox environment. By running the software to watch its behavior, a score can be calculated by identifying well-known malicious activity. For example, software that configures itself to autostart on each reboot and make IRC connections would score higher than a file with no known bad behavior.

Conducting Malware Analysis

Analysts can use the RSA NetWitness Platform Malware Analysis service to detect malware in selected data and files.

Analysts who conduct analyses using NetWitness Platform Malware Analysis need to have the appropriate system roles and permissions set up for their user accounts.

The following procedures provide instructions for using Malware Analysis:

- Begin a Malware Analysis Investigation.
- Upload Files for Malware Analysis Scanning.
- Implement Custom YARA Content.
- Configure the Malware Analysis Summary of Events View
- Filter Dashlet Data in the Summary of Events View.
- Examine Scan Files and Events in List Form
- View Detailed Malware Analysis of an Event.

Begin a Malware Analysis Investigation

You can investigate data that has been scanned, flagged, and rated by Malware Analysis as containing Indicators of Compromise. This includes all types of Malware Analysis scans: continuous mode polling, on-demand polling, and on-demand uploaded files. Continuous mode polling must be enabled when the administrator configures basic settings for the Malware Analysis service.

NetWitness Platform provides several methods of launching a Malware Analysis investigation.

Fastest: Instant Launch from Malware Analysis Dashlets

The fastest way to begin a Malware Analysis investigation is an Instant launch from the NetWitness Platform Dashboard using one of the Malware Analysis dashlets that lists events or files that are likely to contain malware. The dashlets are described as part of the RSA NetWitness Content in Dashlets. From one of these dashlets, you can go directly to the Analysis Results for a specific event that has been listed as worthy of investigation:

- Top Listing of Highly Suspicious Malware
- Top Listing of Possible Zero Day Malware
- Malware with High Confidence IOCs and High Scores Dashlet

On-Demand Polling from a Meta Value in the Navigate View

You can initiate on-demand polling from within an investigation by right-clicking a meta value in the Navigate view, and choosing an option from the context menu. When polling is complete, the scanned data is available for malware analysis (see "Launch a Malware Analysis Scan from the Navigate View" in the *NetWitness Investigate User Guide*).

Investigate a Specific RSA Service

You can also begin a Malware Analysis investigation of a service in the Investigate > Malware Analysis view. For Malware Analysis investigation on a service basis, a service must be specified in the Investigate > Malware Analysis view:Inve

1. Investigate opens the Malware Analysis view with the user-specified default service selected.
2. If no default service is currently specified, a dialog allows you to select the Malware Analysis service to investigate.
3. When a service has been selected in the Malware Analysis view, the Summary of Events for the selected service and continuous scan data for the service is displayed.

This topic provides instructions for all methods of launching a Malware Analysis investigation.

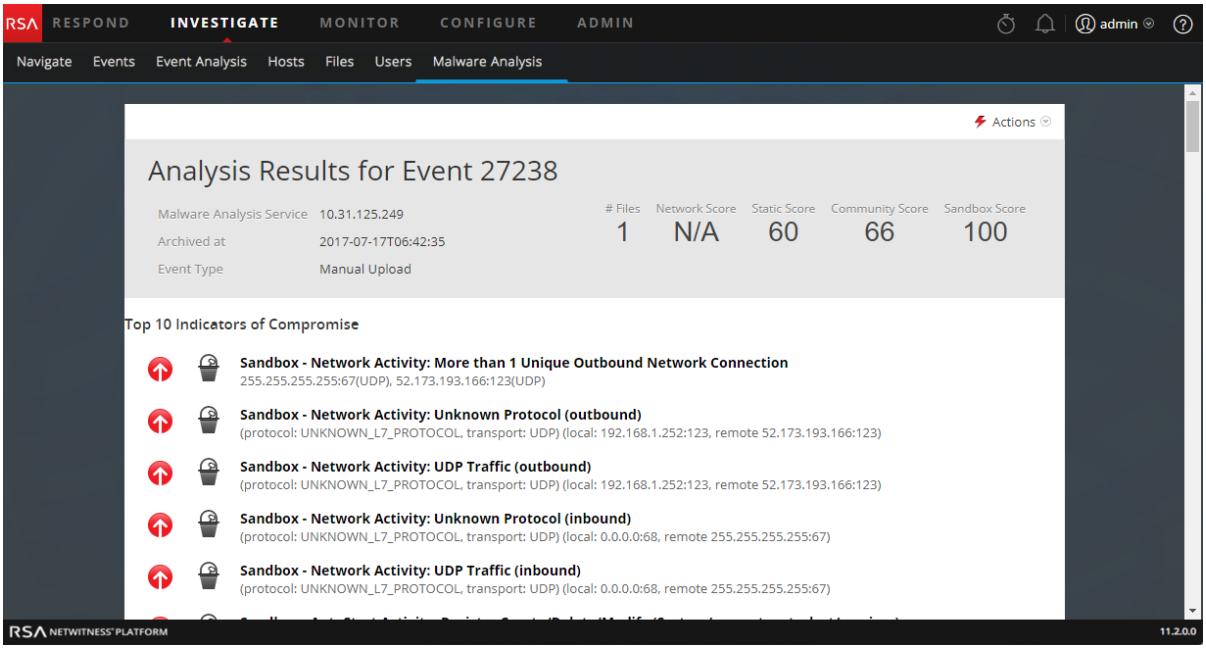
Launch a Malware Investigation from a Malware Analysis Dashlet

A prerequisite for this procedure is that one of the following dashlets must be visible in the NetWitness Platform dashboard or in the Malware Analysis view, and must be populated with listed events or files. If you do not see the dashlets, add them and configure the dashlets.

- Top Listing of Highly Suspicious Malware
- Top Listing of Possible Zero Day Malware
- Malware with High Confidence IOCs and High Scores Dashlet

To launch a Malware Analysis investigation from a dashlet:

1. Log in to NetWitness Platform and look for one of the above dashlets in the Monitor view or in the Malware Analysis view
2. In the dashlet, double-click an event or file for deeper analysis. A detailed analysis of the event in the Events List or the event with which the file in the File List is associated is displayed in the Malware Analysis view.



To learn more about configuring the Malware Analysis dashlets in the Monitor dashboard, see "Dashlets" in the *Getting Started with NetWitness Platform Guide*.

To learn about the ways you can configure and filter information in dashlets in the Malware Analysis view, refer to Filter Dashlet Data in the Summary of Events View.

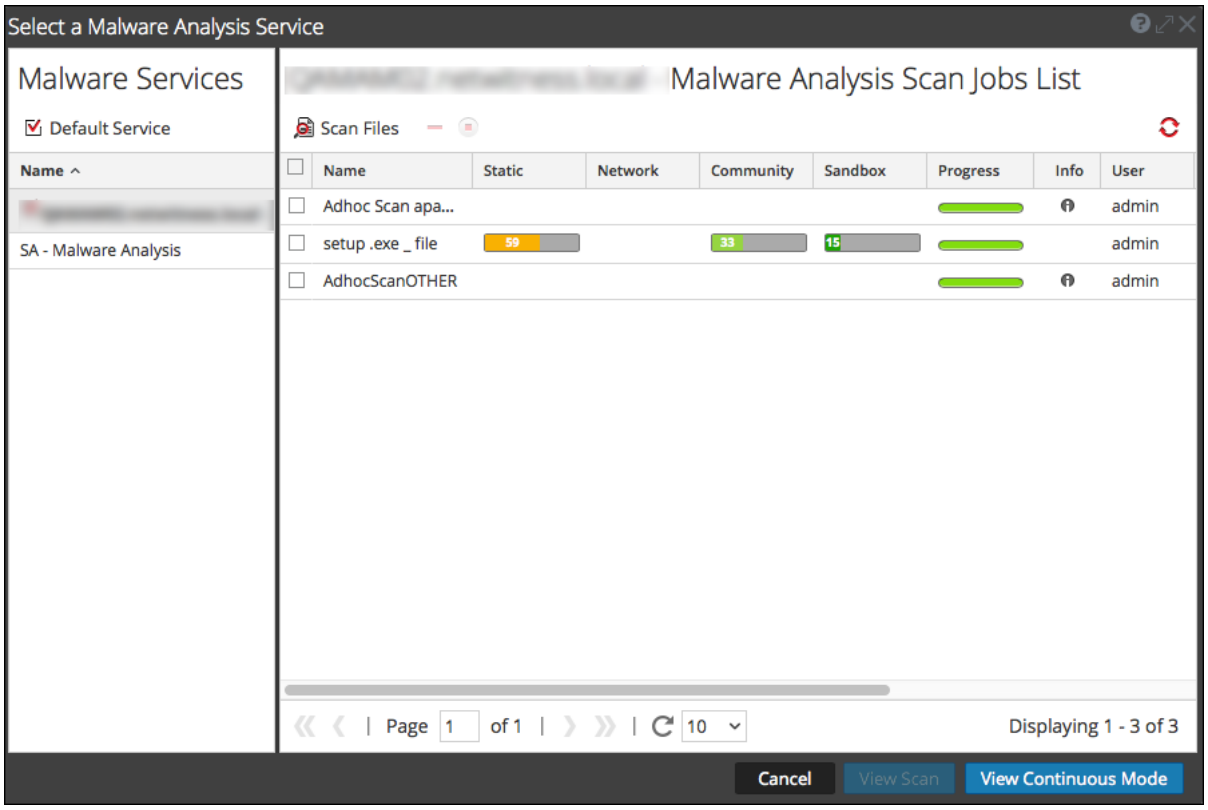
To learn about the actions you can perform in the Analysis Results, refer to View Detailed Malware Analysis of an Event.

Begin a Malware Analysis Investigation (No Default Service)

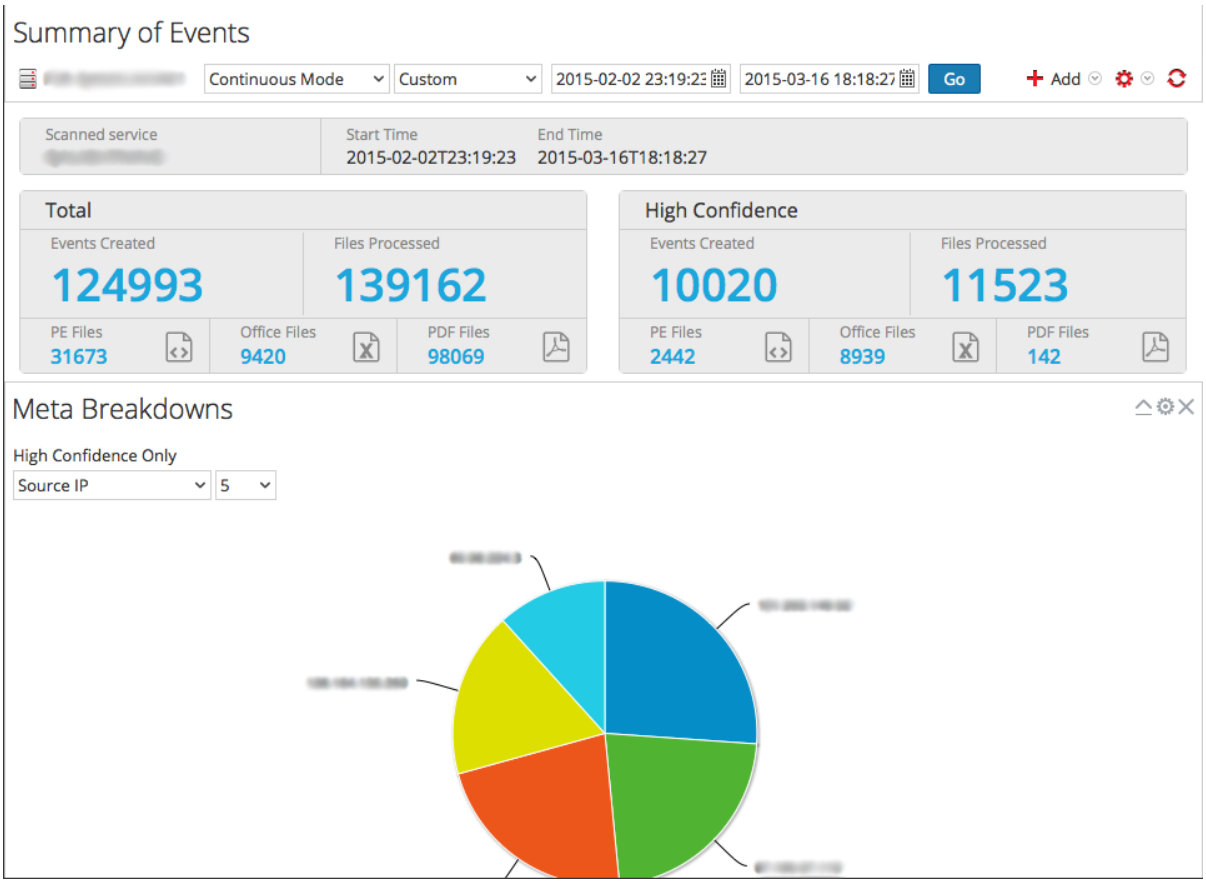
To begin an investigation with no default service specified:

1. Select **Investigation > Malware Analysis**.
   The Select a Malware Analysis Service dialog is displayed, with available Malware Analysis hosts and services for the current user in the left panel and available scan jobs in the right panel. This scan jobs panel contains the same columns as the Malware Scan Jobs dashlet in the Unified dashboard. In

addition, it has a toolbar and View options, which are described in Select a Malware Analysis Service Dialog.



2. In the list of Malware Analysis hosts, select a host and a list of scan jobs is displayed in the right panel. These jobs are created when you scan an event or a file (see Upload Files for Malware Analysis Scanning and "Launch a Malware Analysis Scan from the Navigate View" in the *NetWitness Investigate User Guide*.
3. To begin analyzing a scan, do one of the following:
   a. Select a scan and click **View Scan**.
   b. Click **View Continuous Mode**.
      The Summary of Events for the selected scan is displayed with the default dashlets open. Each user can add, modify, and delete default dashlets, which persist through different scan investigations. Users can also restore default dashlets as described in Filter Dashlet Data in the Summary of Events View.

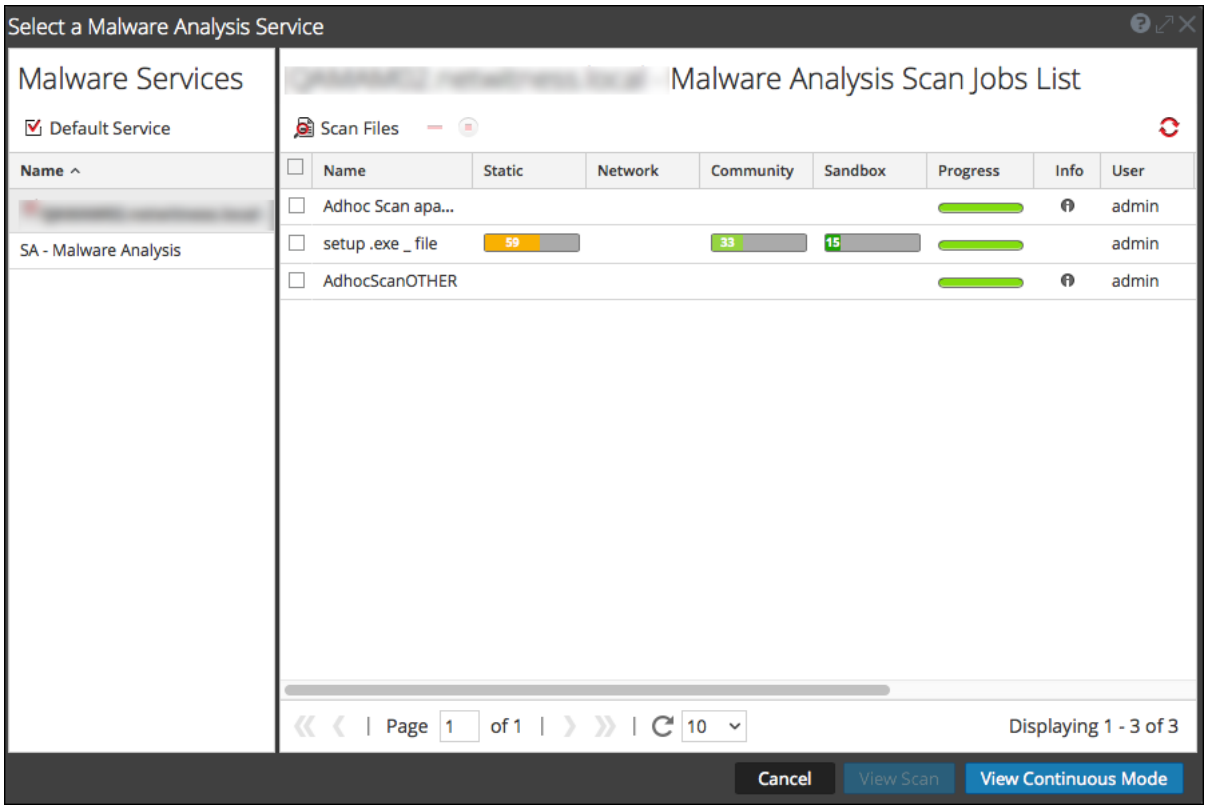


Set or Clear the Default Service

You can set the default service and clear the default service in the Select a Malware Analysis Service dialog.

To set a default service:

1. Click the service name in the Summary of Events toolbar.
   The Select a Malware Analysis Service dialog is displayed.



2. Select a service on the list of available Malware services, and click Default Service.
   The service becomes the default, (indicated by ☑ in front of the host name).
3. To clear the default service, select the default service in the grid, and click Default Service.
   No default service is set.

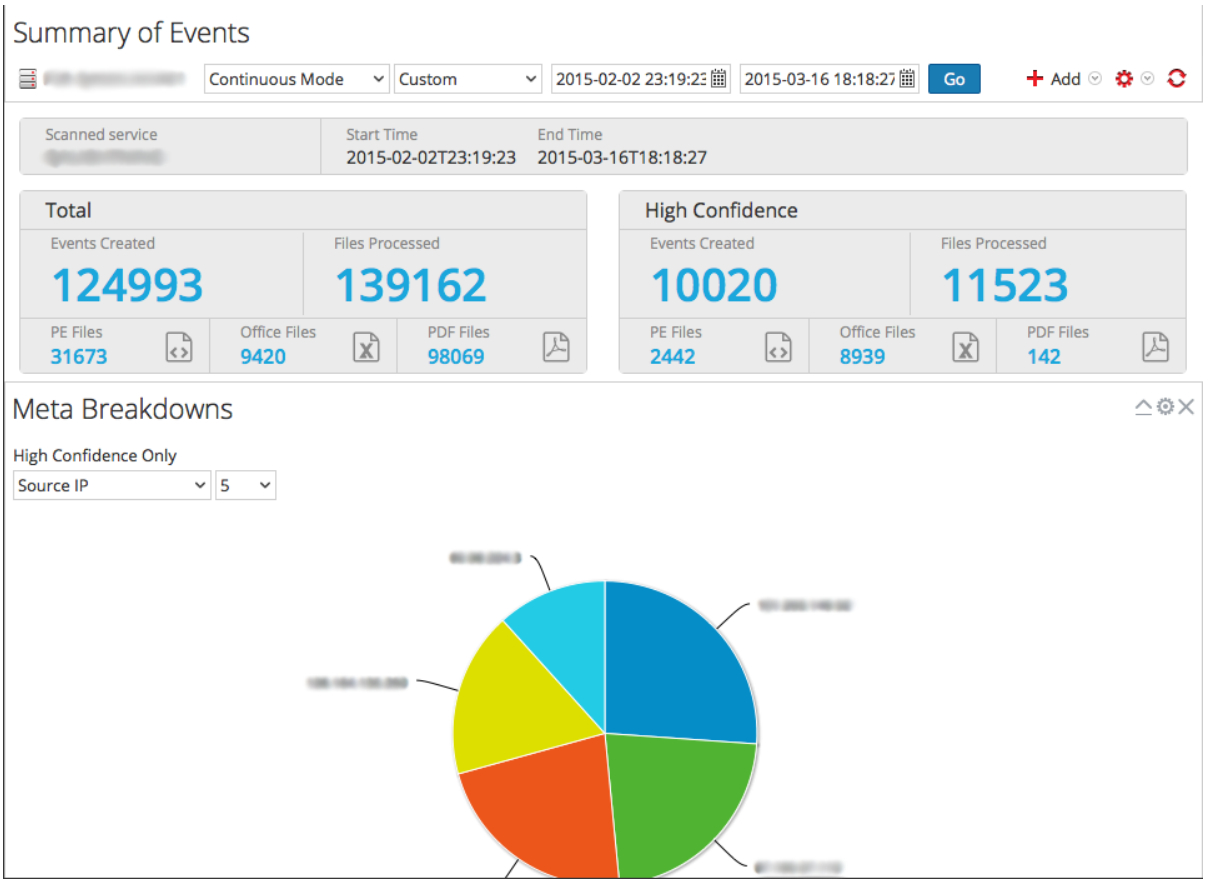
Upload and Scan Files

A Malware Analyst with permission to `Initiate Malware Analysis Scan` can upload files to scan using the Scan Files option in the Select a Malware Analysis Service dialog (see Upload Files for Malware Analysis Scanning. An administrator can upload packet capture files to a Decoder for Malware Analysis in the Services System view as described in "Upload Packet Capture File" in the *Decoder and Log Decoder Configuration Guide*.

Begin an Investigation (Default Service Specified)

To begin an investigation with a default service specified:

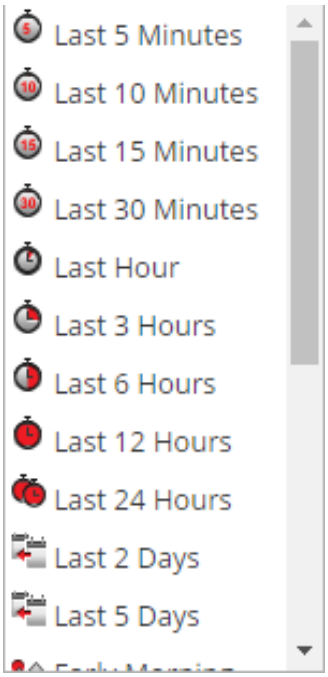
1. Select **Investigation > Malware Analysis**.
   The Summary of Events for a continuous scan of the selected service is displayed with the default dashlets open. Each user can add, modify, and delete default dashlets, which persist through different scan investigations. Users can also restore default dashlets as described in Filter Dashlet Data in the Summary of Events View.



Apply Time Parameters Filter for Results

You can apply a Threshold filter to refresh the results of the chosen dashlets.

1. To select a different time range, select either **Continuous Mode** or a different scan from the toolbar. The Malware Summary of Events for the selected scan is displayed.
2. To select a new time range for the scan, click in the range selection list in the toolbar. Ranges available are: Last 5 minutes, Last 10 minutes, Last 15 minutes, Last 30 minutes, Last Hour, Last 3 Hours, Last 6 Hours, Last 12 Hours, Last 24 Hours, Last 2 Days, Last 5 Days, Early Morning, Morning, Afternoon, Evening, All Day, Yesterday, This Week, Last Week, or Custom.



The results are updated immediately.

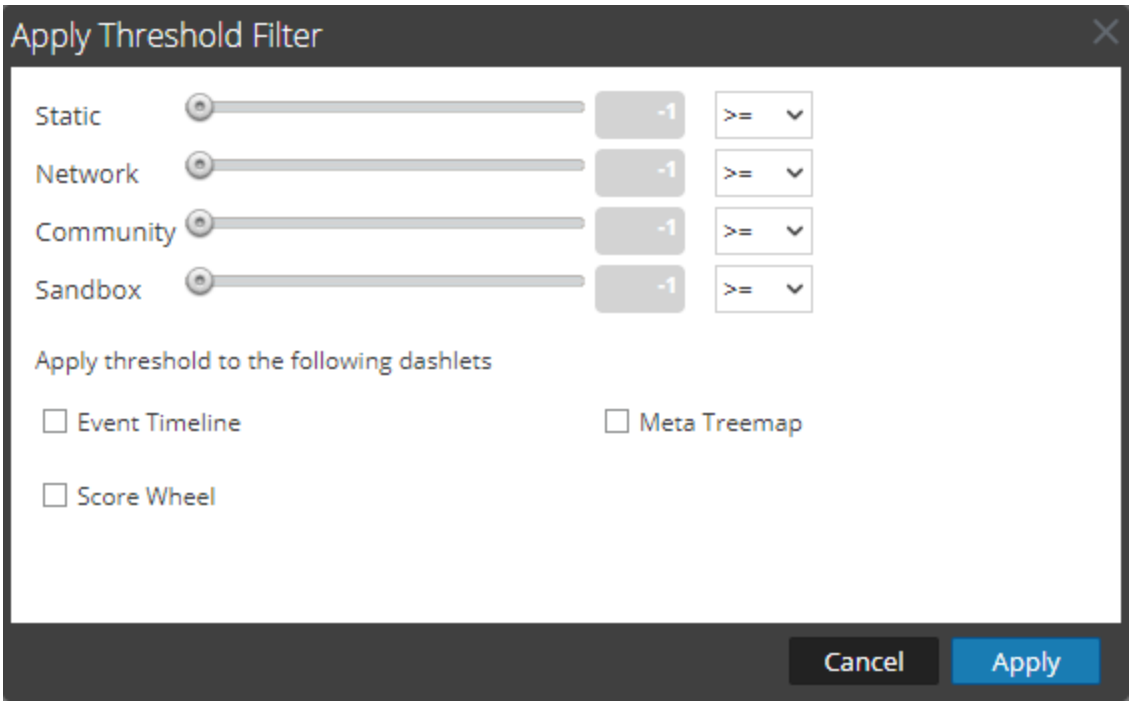
3. To refresh a continuous mode scan with new data, click .

Apply a Threshold Filter to Continuous Mode Results

You can apply a new threshold filter to an instance of the Malware with High Confidence IOCs and High Scores dashlet, the Meta Treemap dashlet, the Score Wheel dashlet, and the Event Timeline dashlet.

To customize the scoring applied to the scan, in the toolbar, do the following:

1. Select > **Apply Threshold Filter.**
   The Apply Threshold Filter dialog is displayed.



2. If you want to limit the number of events displayed to events that were given a score above a certain number, do the following:
   a. Drag the slider in the Static, Network, Community, and Sandbox slider bars.
   b. To select the dashlets in which the thresholds apply, select the appropriate checkboxes.
   c. Click **Apply**.

Delete or Resubmit an On-Demand Scan with New Bypass Settings

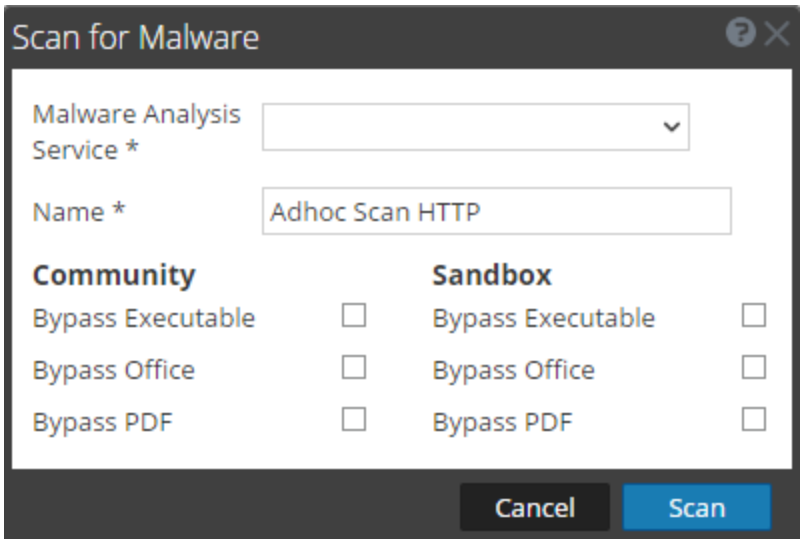
You can delete an on-demand scan or resubmit an on-demand scan with different bypass settings than those specified in the Service Configuration view for a Malware Analysis service.

To delete a scan while viewing an on-demand scan, do the following:

1. Select **Actions > Delete Scan**.
   A dialog asks for confirmation that you want to delete the scan.
2. Click **Yes**.
   The selected scan is deleted.

To apply different bypass settings to the current scan:

1. Select **Actions > Resubmit Scan**.
   The Scan for Malware dialog is displayed.



2. Select the bypass settings that you want to use on the new scan, and click **Scan**.
   Malware Analysis resets cache and resubmits the file for a new scan, and the scan jobs are added to the jobs queue.
3. When the job is complete, scroll to the left and select **View**.
   The Malware Summary of Events for the selected scan is displayed.

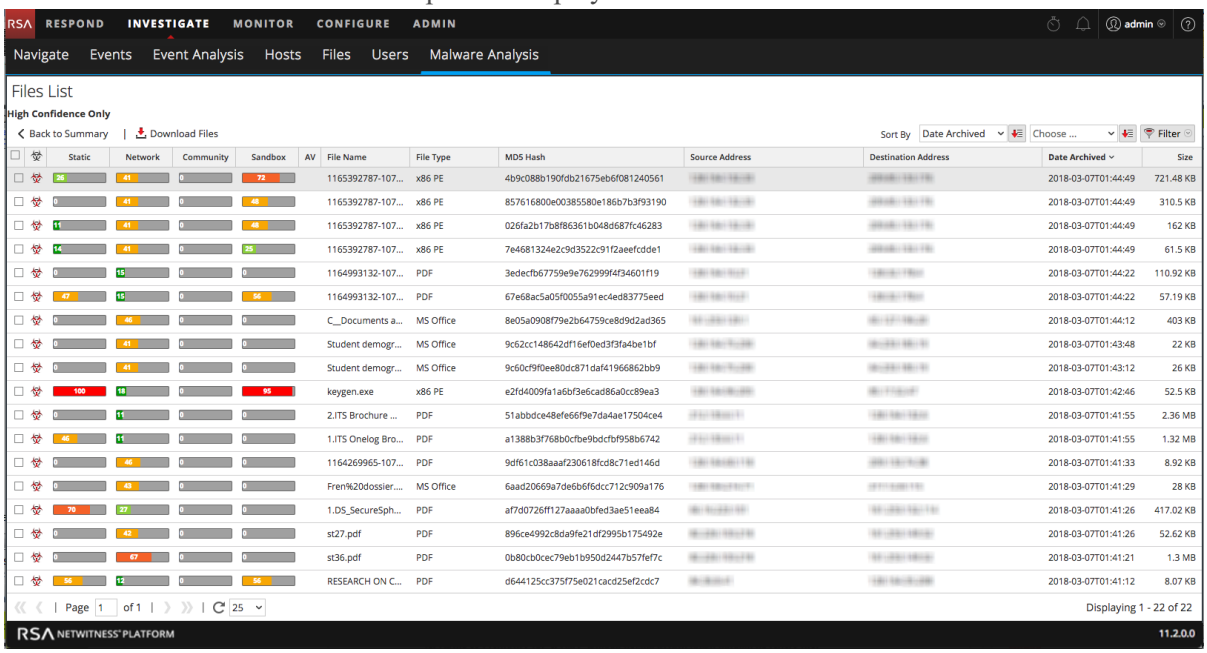
View the Files List

You can view a list of files for an event from the Malware Analysis Summary of Events and from each of the Visualization charts: Event Timeline, Meta Breakdowns, Meta Treemap, and Score Wheel.

To view the Files List, do one of the following:

- In the Summary of Events, click on the number of files in the **Total** row or the **High Confidence** row under **Files Processed**, **PE Files**, **Office Files**, or **PDF Files**. The Files List is displayed.
- In any visualization dashlet, click the number next to the **Files** field in the top right corner of the dashlet.

The Files List for the selected drill point is displayed.



From the Files List, you can search for a file by filename or MD5 file hash, sort the list using two criteria and ascending or descending order, and download files as described in Examine Scan Files and Events in List Form.

To return to the Summary of Events, click **Back to Summary**.

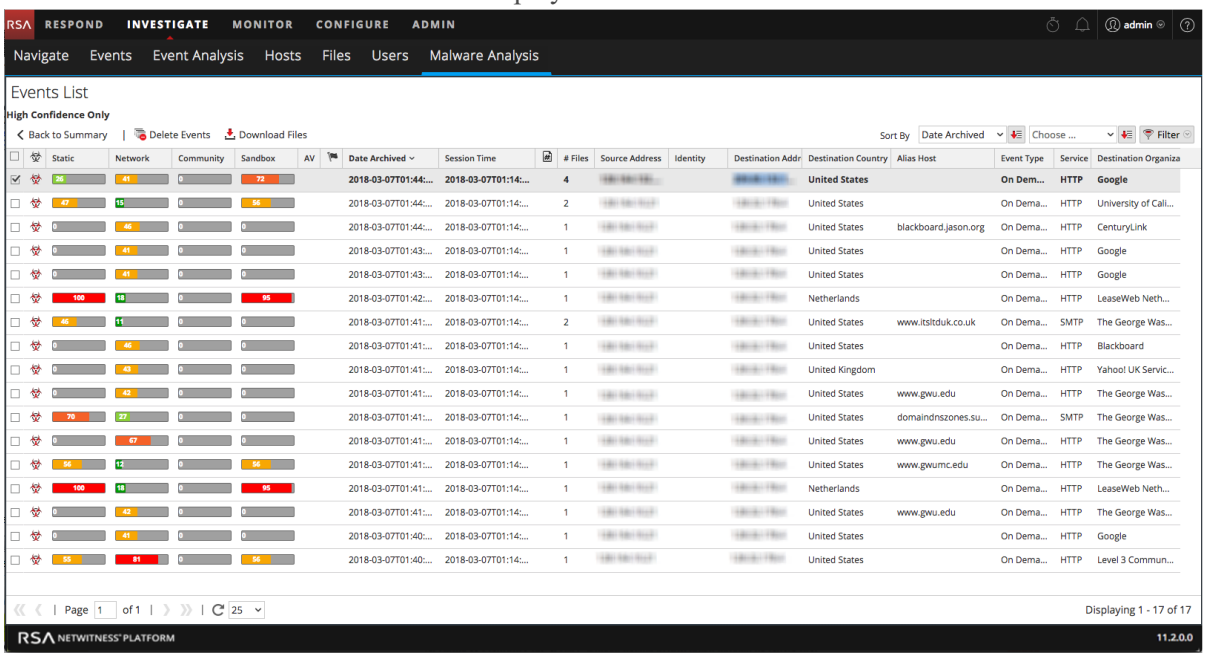
View the Events List

From the Malware Analysis Summary of Events and from each of the visualization charts (Event Timeline, Meta Breakdowns, Meta Treemap, and Score Wheel), you can select events to view in the Events grid.

To view the Events List, do one of the following:

- In the Summary of Events, click the number of Events Created in the **Total** row or the **High Confidence** row. The Events List is displayed.
- In any visualization dashlet, click the number next to the Events field in the top right corner of the dashlet.

The Events List for the selected time is displayed.



Implement Custom YARA Content

In addition to the built-in indicators of compromise, Malware Analysis supports indicators of compromise written in YARA. YARA is a rule language that allows malware researchers to identify and classify malware samples. RSA makes built-in YARA-based Indicators of Compromise (IOCs) available in RSA Live; these are automatically downloaded and activated on subscribed hosts.

Customers with advanced skills and knowledge can add detection capabilities to RSA Malware Analysis by authoring YARA rules and publishing them in RSA Live or placing YARA rules in a watched folder for the host to consume.

As malware and the threat landscape evolve, it is important to review and examine existing custom rules. Updates are often necessary to incorporate new detection methods. RSA also updates YARA rules in Live from time to time. To receive updates, you can subscribe to the RSA Blog and RSA Live at http://blogs.rsa.com/feed.

This document provides information to help customers implement custom YARA rules in Malware Analysis.

Prerequisites

The host on which you are adding custom rules must be configured to support authoring of YARA rules as described in "Enable Custom YARA Content" in the *Malware Analysis Configuration Guide*.

YARA Version and Resources

RSA Malware Analysis is packaged with YARA version 1.7 (rev:167). To find out the exact version, you can run `yara -v` on the Malware Analysis host as shown in this example:

```
[root@TESTHOST yara] # yara -v
 yara 1.7 (rev:167)
```

Meta Keys in YARA Rules

Malware Analysis is compliant with other sources of YARA rules, and it also consumes additional meta keys that are specific to Malware Analysis. Each YARA rule is equivalent to an Indicator of Compromise (IOC) within Malware Analysis. The example below illustrates the meta definitions in a rule:

```
meta:
 iocName = "FW.ecodedGenericCLSID"
        fileType = "WINDOWS_PE"
        score = 25
        ceiling = 100
        highConfidence = false
```

Meta Key	Description
iocName	(Required) This is the name that MA uses as the rule name. It is specific to Malware Analysis and is required to add the rule to the IOC list.
fileType	Specifies the files type. Possible values are: WINDOWS_PE, MS_OFFICE, and PDF. If not specified, the default value is WINDOWS_PE.

Meta Key	Description
score	This value that is added to the static score if the YARA rule is triggered. If not specified, the default value is 10.
ceiling	This is the maximum amount that is added to the static scores when a rule is triggered multiple times in one session. For example, if each time a rule is triggered, 20 points are added to the static, and you do not want more that 40 points added when the rule is triggered more than two times, you can specify a ceiling of 40. If not specified, the default value is 100.
highConfidence	This sets the High Confidence flag, which is set on IOCs when there are high confidence indicators that malware is present. If not specified, the default file value is false.

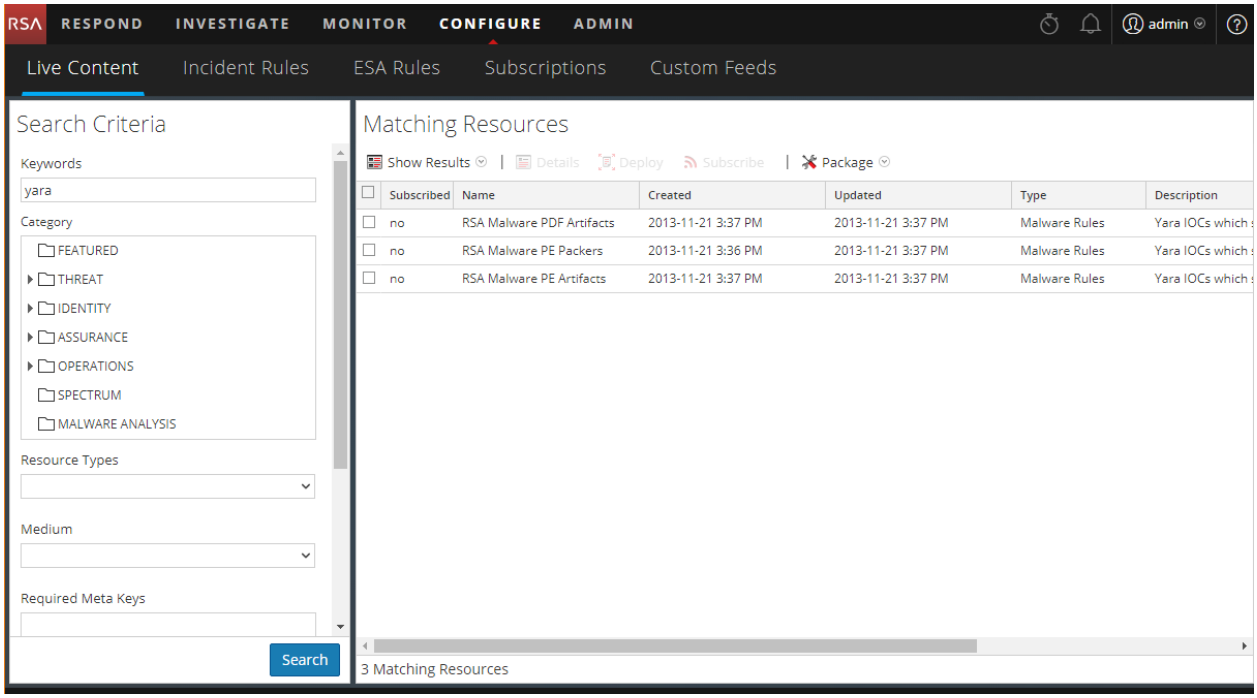
Note: Refer to the following URL for YARA resources: https://code.google.com/p/yara-project/downloads/list. NetWitness Platform uses YARA 1.7, not YARA 2.0.

YARA Content

RSA Live contains 3 sets of Yara rules:

- PE Packers
- PDF Artifacts
- PE Artifacts

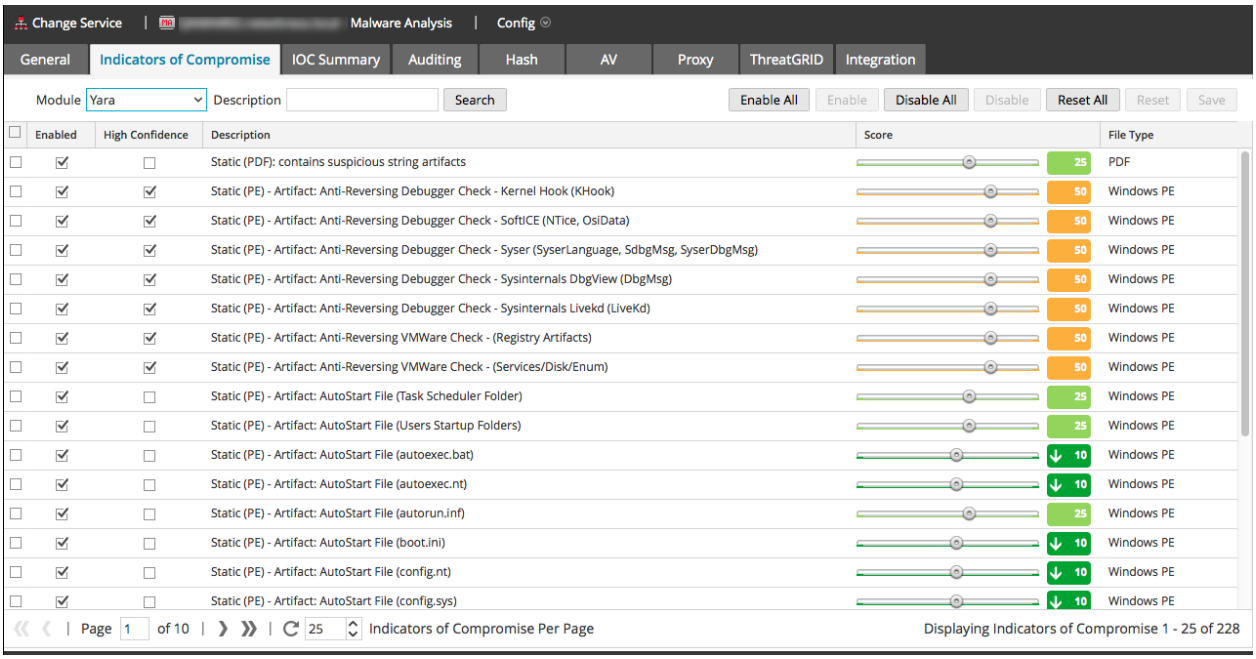
The following figure illustrates YARA content available as YARA rules in NetWitness Platform Live.



On the Malware Analysis host, the YARA rules reside in `/var/lib/netwitness/malware-analytics-server/spectrum/yara`, as shown in the example below.

```
[root@TESTHOST yara]# pwd
 /var/lib/netwitness/malware-analytics-server/spectrum/yara
 [root@TESTHOST yara]# ls *.yara
 rsa_mw_pdf_artifacts.yara rsa_mw_pe_artifacts.yara rsa_mw_pe_packers.yara
```

The individual rules are listed as IOCs in the Malware Analysis Service Config view > Indicators of Compromise tab. To view them, use the Yara module as the filter. You can adjust the configuration of an individual in the same way that you configure other IOCs.



Add Custom YARA Rules

To introduce custom YARA rules from other sources:

1. To ensure that the YARA rules follows the correct format and syntax, use the YARA command to compile the YARA rule as shown in the following example. If the rule compiles with no errors, this indicates that the YARA rule has the correct syntax.

   ```
   [root@TESTHOST yara]# yara rsa_mw_pe_packers.yara dummy.txt
    [root@TESTHOST yara]#
   ```

2. Ensure that custom rules do not duplicate existing YARA rules from RSA or other sources. All YARA rules are in `/var/lib/netwitness/malware-analytics-server/spectrum/yara`

3. Ensure that the meta keys that RSA supports are included to organize the YARA rules as part of the configurable IOCs, and name the file with the yara extension (<filename>.yara). For better organization, make sure that the `iocName` meta is included in the meta section as shown in the following example.

   Example:

   ```
   rule HEX_EXAMPLE
   ```

```
{
    meta:
        author = "RSA"
        info = "HEX Detection"
       iocName = "Hex Example"
     strings:
        $hex1 = { E2 34 A1 C8 23 FB }
        $wide_string = "Ausov" wide ascii
     condition:
        $hex1 or $wide_string
}
```

4. When ready, place the custom YARA file in the folder that the Malware Analysis service watches:
   `/var/lib/netwitness/malware-analytics-server/spectrum/yara/watch`
   The file is consumed within one minute.
   Once consumed, NetWitness Platform moves the file to the `processed` folder, and the new rule is added to the Malware Analysis Services Config view > Indicators of Compromise tab.

Examine Scan Files and Events in List Form

When viewing the Summary of Events in a Malware Analysis scan, you can click a file count or an event count to view the Files List or the Events List for the scan (see Begin a Malware Analysis Investigation). In the Files List and Events List, you can search for a file by filename or MD5 file hash, sort the list using two criteria and ascending or descending order, and download files. When you find an event or file of interest in the Events List or Files List, you can view many details about the event in the Event Details view.

For each event in the Events List, NetWitness Platform provides the following information:

- Flagged as a High Confidence event, which is considered likely to contain Indicators of Compromise.
- The numeric score for each scoring module: Static, Network, Community, and Sandbox.
- Antivirus vendor scores.
- The Influenced by customized rule flag.
- The date the event was archived.
- The session time.
- The MD5 hash filter.
- The number of files in the event.
- The source IP address of the event.
- The Identity.
- The destination IP address.
- The destination country.
- The name of the alias host.
- The event type, for example, Network.
- The service used by the event.
- The destination organization

For each file in the Files List, NetWitness Platform provides the following information:

- Flagged as a High Confidence event, which is considered likely to contain Indicators of Compromise.
- The numeric score for each scoring module: Static, Network, Community, and Sandbox.
- Antivirus vendor scores.
- The filename.
- The file type.
- The MD5 hash filter.
- The source IP address of the event that contained the file.

- The destination IP address.
- The date the event that contained the file was archived.
- The file size.

Sort the Files List or Events List

You can sort the Files List and Events List by column name in ascending and descending order. You can choose one or two columns.

To sort the list:

1. In the first **Sort By** drop-down list, choose a column name and sort direction: for descending order or for ascending order.

2. (Optional) In the second **Sort By** drop-down list, choose a column name, and sort direction, for descending order or for ascending order.
   The column titles reflect the selected sort order.

Filter the List by Filename or MD5 File Hash

You can filter the Files List and Events List by filename or file hash. With this feature, you can specify a limited subset of the original data based on the search criteria.

Note: When you perform a search, you search the scan that you are currently displaying, not all scans.

1. Click 
   .
   The Filter dialog is displayed.
2. Enter a value in **File Name** or **MD5 Hash** and click **Filter**. The File Name and Hash field are not case sensitive. Wild card or regular expressions are not supported. The filter is based on exact matches. You can drag across a filename or hash to select from the Files list or Events list, then copy and paste it in the dialog.
3. Click **Filter**.
   Malware Analysis filters the list to display only files or events with the selected hash
4. To revert to the unfiltered list, click 
   . When the Filter dialog is displayed, click **Reset**.

Download Files from the Files List

NetWitness Platform lets you select and download files from the Files List or the Events List.

Caution: Use caution when downloading files from Malware Analysis; some files may contain harmful code. File Download is a specific permission that can be configured, refer to "Define Roles and Permissions for Malware Analysts" in the *Malware Analysis Configuration Guide* for more details.

To download files from the Files List or Events List:

1. In the **Files List** or **Events List**, select the checkbox next to one or more rows.
2. In the toolbar, select 
.
   The Malware File Download dialog is displayed.
3. Do one of the following:
   a. If you decide not to download the file, click **Cancel**.
   b. If you want to download the file, select click the **Download** button.
      The file or files selected are downloaded in a zip archive with the name `Malware_Files.zip`.

Delete Events from the Scan

In the Events List, you select one or more events and delete them from the scan. This is useful for removing events that are not of interest.

To remove an event from the scan being viewed:

1. In the **Events List**, select one or more events.
2. In the toolbar, click

.
   NetWitness Platform asks for confirmation that you want to delete the events.
3. In the confirmation dialog, click **Yes**.
   The selected events are deleted.

Return to the Summary of Events

To leave the Files List or Events List and return to the Summary of Events, click **Back to Summary**.

Open the Detailed Analysis for an Event

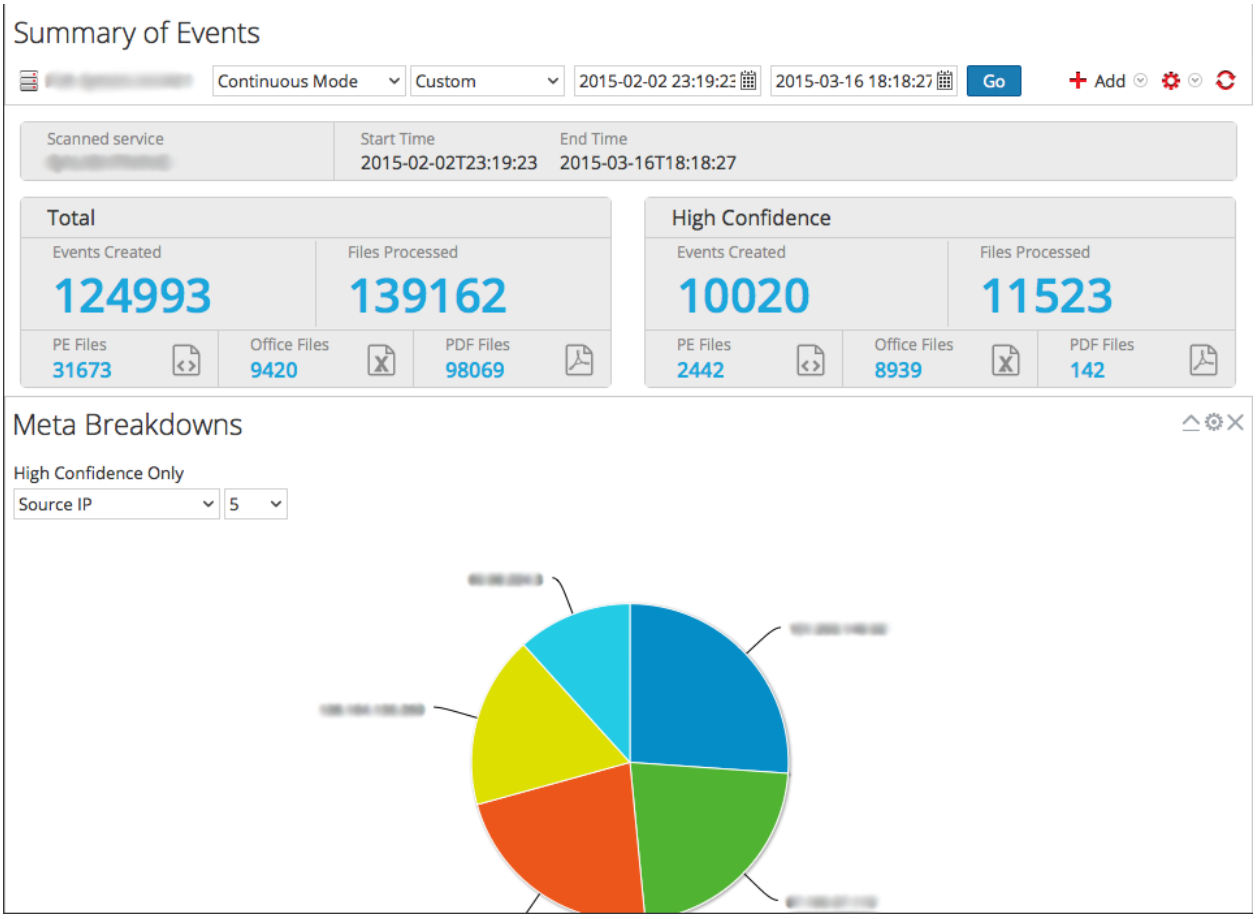
While you examine events or files in the Files List or Events List, you can double-click any event or file to open a detailed analysis of the event in the Events List or the event with which the file in the Files List is associated (see View Detailed Malware Analysis of an Event).

Configure the Malware Analysis Summary of Events View

The Summary of Events provides a summary of the scan being investigated, and below the summary are configurable dashlets such as visualization charts and listings. By default, the Summary of Events for a scan opens with the default dashlets displayed. You can customize the view by adding, modifying, and deleting default dashlets. The configured customization of dashlets persists through different scan investigations, and you can restore default dashlets at any time. The default dashlets are:

- Summary of Events (Fixed)
- Event Timeline
- Top Listing of Highly Suspicious Malware
- Meta Treemap
- Score Wheel
- Meta Breakdowns

The following figure is an example of the default Summary of Events.



The rest of this topic provides instructions for managing and configuring dashlets.

Add a Dashlet

You can add multiple copies of dashlets in the Malware Analysis Summary of Events. To add a dashlet:

1. In the toolbar, select **Add**.
   The drop-down list of dashlets is displayed. There are four visualization options: Score Wheel, Meta Treemap, Meta Breakdowns, and Event Timeline. The other three dashlets are the same dashlets available in the NetWitness Platform dashboard: Malware with high Confidence IOCs and High Scores, Top Listing of Highly Suspicious Malware, Top Listing of Possible Zero Day Malware. Details for these common dashlets are provided in "Dashlets" in RSA Content for RSA NetWitness Platform.
2. Select a dashlet.
   The new dashlet is added as the last dashlet below the existing dashlets.
3. If the dashlet is a duplicate of an existing dashlet, change the name of the new dashlet so that it is unique.

Modify or Delete a Dashlet Using Toolbar Options

Each dashlet has a toolbar that offers options for modifying the dashlet. The visualization charts have the same configuration settings, while some of the other dashlets have different additional settings.

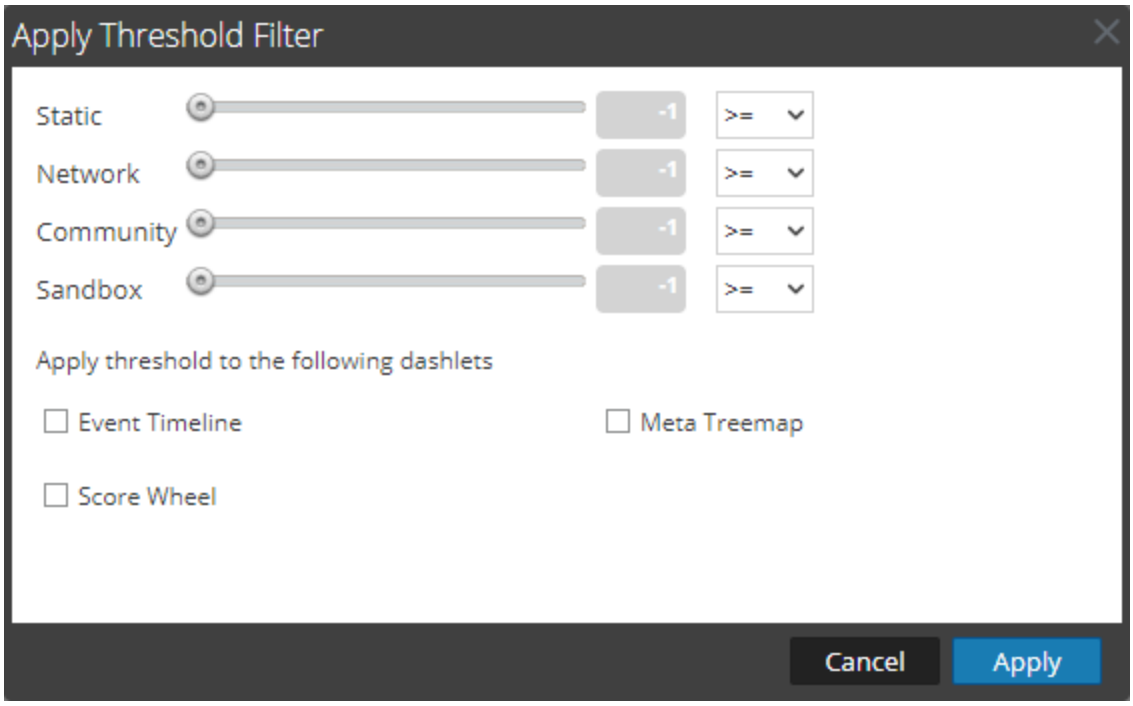
To use the toolbar options:

- To close a dashlet so that only the title bar is displayed, click .
- To open a dashlet that is closed, click .
- To display the configurable settings for a dashlet, click .
  The settings dialog for the dashlet is displayed.
- To delete a dashlet, click .

Apply Threshold Filter to Multiple Dashlets

Within dashlets, you can set a threshold to show only events equal to, above, or below a certain score in the four categories (Static, Network, Community, and Sandbox). This procedure sets the thresholds by dashlet type for these dashlets: Event Timeline, Score Wheel, and Meta Treemap. You can also set the threshold for individual dashlets.

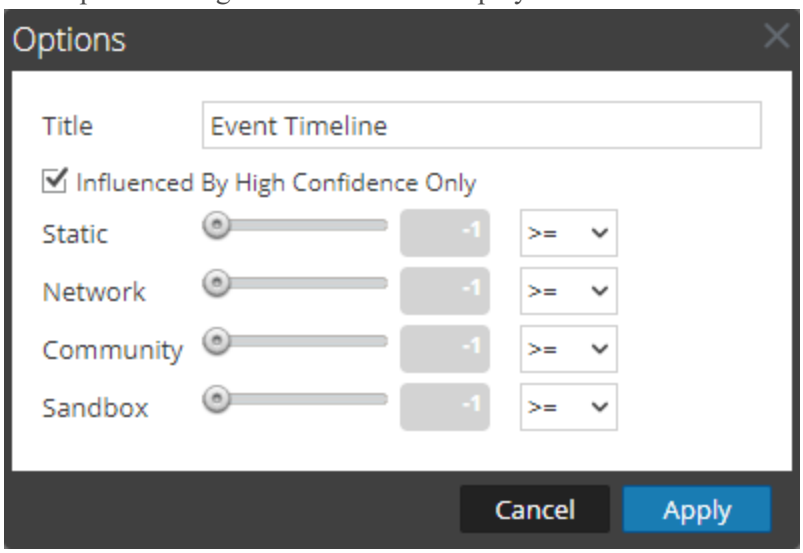
1. In the toolbar, select > **Apply Threshold Filter**.
   The Apply Threshold Filter dialog is displayed.



2. Select one or more dashlet types: Event Timeline, Score Wheel, and Meta Treemap.
3. Drag the corresponding slider or enter a numeric value, then select an operator in the drop-down list: =, >=, or <=.
4. Click **Apply**.
   The threshold filters are applied to the selected dashlet types in the Summary of Events.

Set Title and Category Options for a Dashlet

1. To display the configurable settings for a dashlet, click ⚙.
   The Options dialog for the dashlet is displayed.

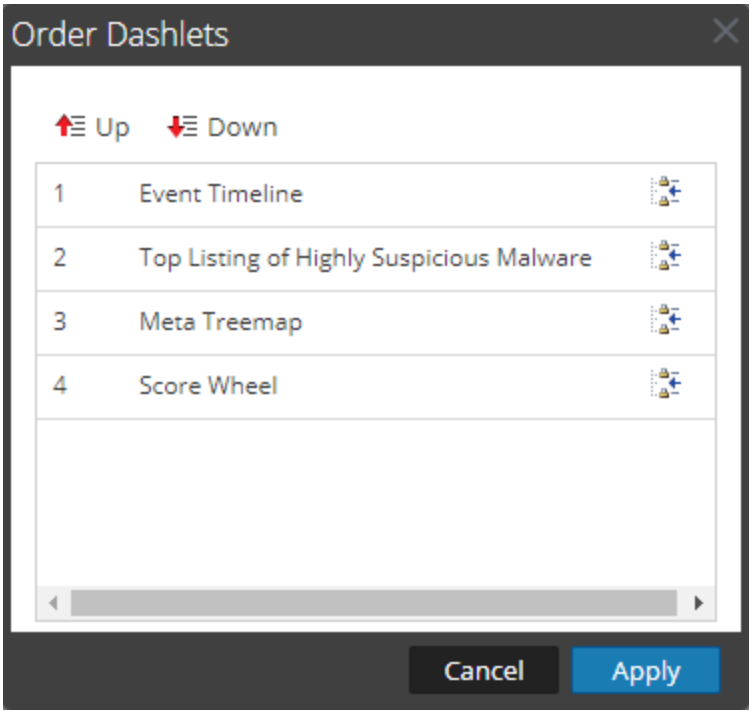


2. Type a new title for the dashlet in the **Title** field.
3. If you want to see only events that are influenced by a High Confidence tag, which means there is high confidence that the event contains harmful code, check the **Influenced By High Confidence Only** option.
4. If you want to see only events that were given a score above a certain score in the four categories (Static, Network, Community, and Sandbox), drag the corresponding slider or enter a numeric value, then select an operator in the drop-down list: =, >=, or <=.
5. Click **Apply**.
   The title and filters are applied to the dashlet.

Order Dashlets

To change the order of dashlets as they appear beneath the Summary of Events:

1. In the toolbar, select > **Order Dashlets**.
   The Order Dashlets dialog is displayed.



2. Select a dashlet that you want to move up or down, and click Up or Down.
3. When you are satisfied with the order, click **Apply**.
   The dialog closes and the order of dashlets below the Summary of Events is changed to match your choices.

Restore Default Dashlets

After you have added, modified, and arranged dashlets, you can revert to the default settings for dashlet display. To restore the default dashlets:

1. In the toolbar, select > **Restore Default Configuration**.
   A dialog requests confirmation that you want to restore the configuration.
2. Do one of the following:
   a. If you decide to keep the dashlet arrangement you have configured, click **No**.
   b. If you are sure that you want to restore the defaults, click **Yes**,
      The dashlet display reverts to the default display.

Filter Dashlet Data in the Summary of Events View

The Summary of Events provides a summary of the scan being investigated with selectable dashlets. The Summary of Events is fixed, but Analysts can configure each dashlet to filter out information and drill into the data.

The rest of this topic provides instructions for managing and configuring dashlets.

Configure the Score Wheel Dashlet

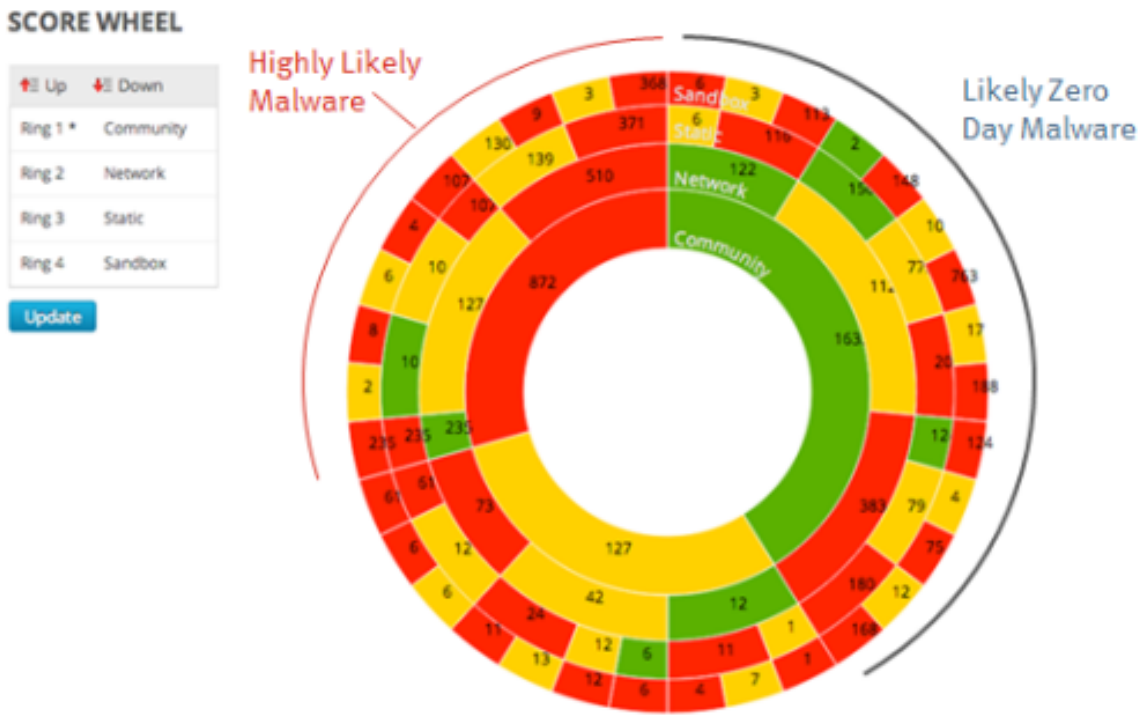
The Score Wheel is a high-level visualization of analyzed sessions that scored high, medium, or low in each of the scoring categories: Static, Network, Community, and Sandbox. The Score Wheel is a quick way to drill into sessions to review them. Each ring represents a different scoring category so that you can visually compare results by category.

You can change the order of the rings to highlight indicators of compromise that were flagged in one category but not in another category. Comparing the same results in a different sequence of the rings provides visibility into additional vulnerabilities in a session, and you can drill into sessions of interest. The following examples show two possible use cases.

Zero-Day Candidates Example

This example shows how to drill into sessions that the Community did not flag as malicious, but all other scoring categories did. The resulting list of sessions highlights zero-day candidates.

1. Configure the Score Wheel rings in the following sequence:
   Community (innermost) > **Static** > **Network** > **Sandbox** (outermost)
2. Click the red slice in the outermost (Sandbox) ring that aligns with a green slice on the innermost ring (Community): green (innermost) -> **Static**: red -> **Network**: red -> **Sandbox**: red (outermost).



Malicious Sessions Example

This example shows how to drill into sessions in which all scoring categories identify the resulting list of sessions as malicious, indicating Malware Analysis has the most confidence that they are malware.

1. Configure the Score Wheel rings in the following sequence:
   Community (innermost) > **Static** > **Network** > **Sandbox** (outermost)
2. Click the red slice of the outermost (Sandbox) ring that aligns within a red slice on the innermost ring (Community): red (innermost) -> Static: red -> Network: red -> Sandbox: red (outermost).

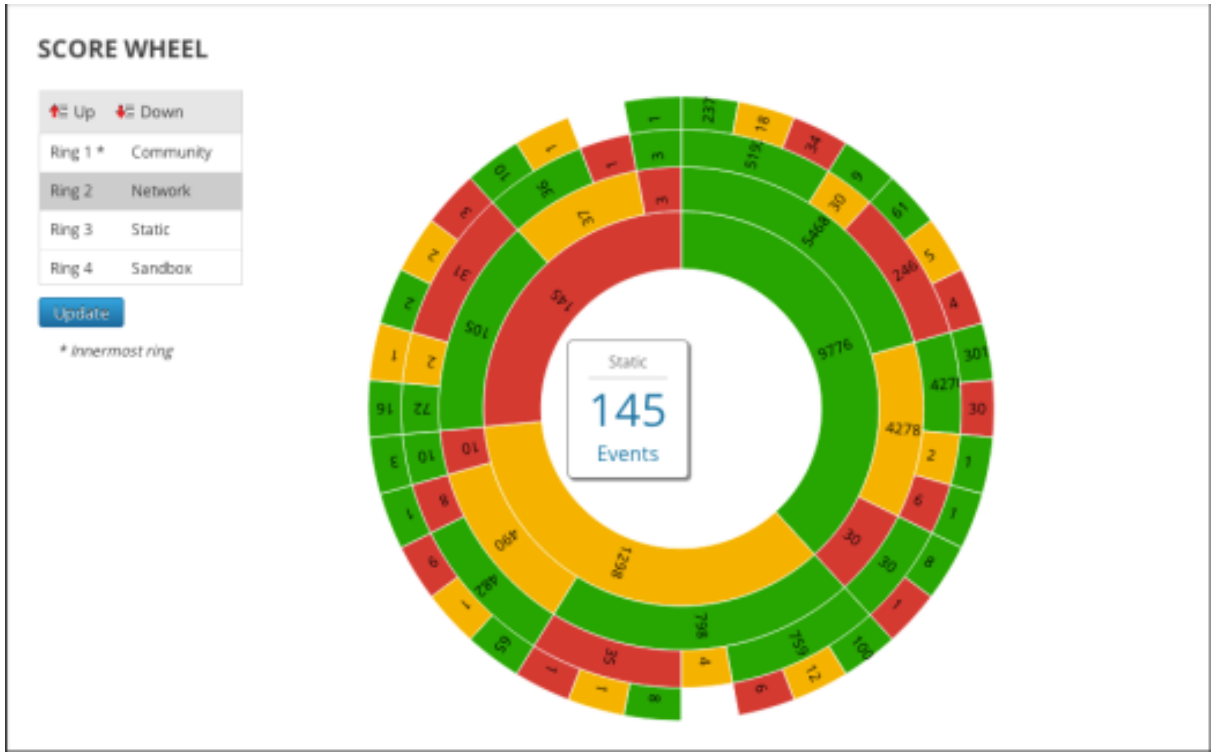
Arrange the Ring Sequence by Scoring Module

In the Score Wheel, you can arrange the sequence of the rings by scoring module. Initially, the sequence of rings from inside to outside is Static, Network, Community, and Sandbox.

To change the ring sequence:

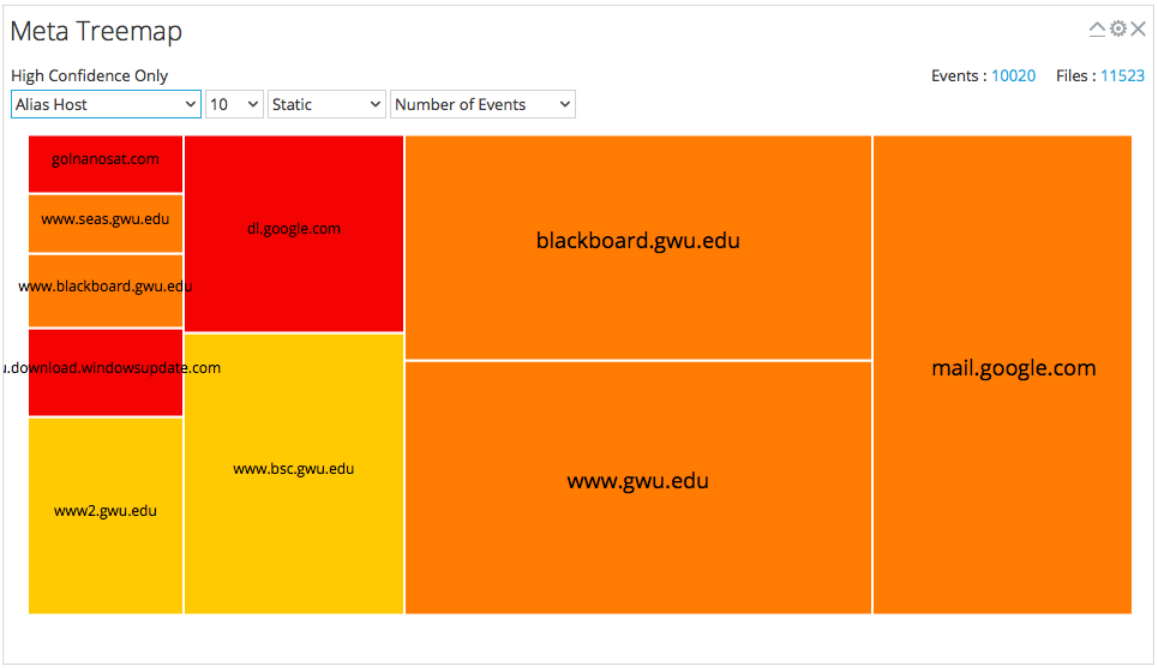
1. Do one of the following:
   a. Click and drag each scoring module up or down.
   b. Select each scoring module and use the Up and Down buttons to move it.

2. When the ring sequence is the way you want it, click the **Update** button.
   The Score Wheel is refreshed with the new sequence.



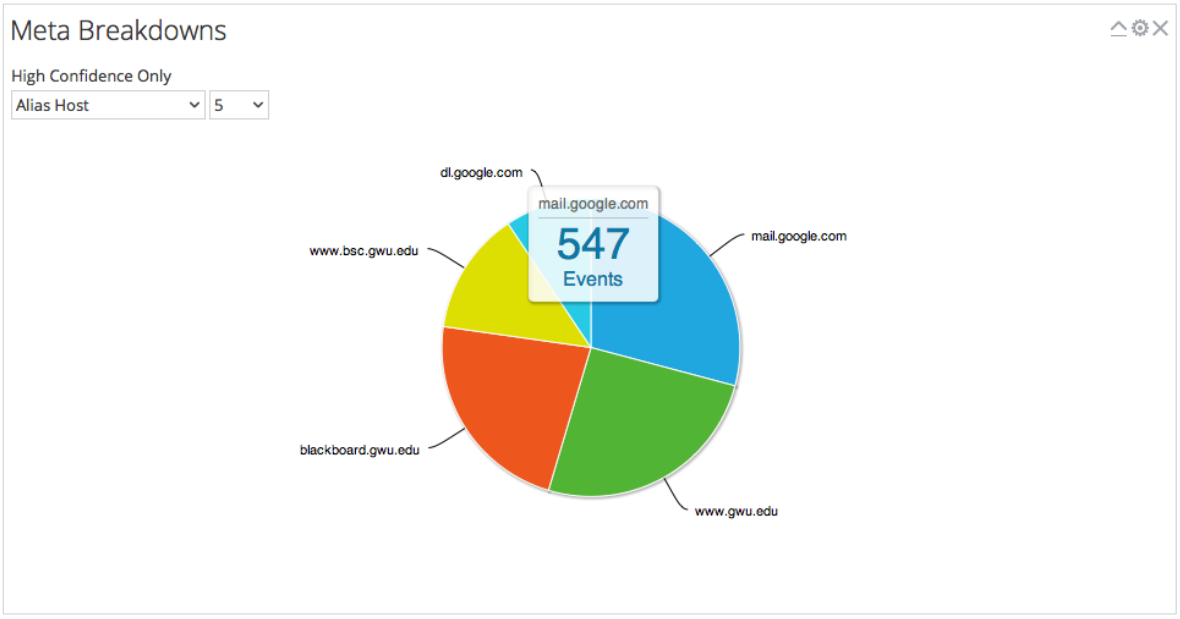
Configure the Meta Treemap Dashlet

In the Meta Treemap chart, you can visualize and filter meta breakdowns by meta type, count, and analysis type. Use the three selection lists to set the filter, and the Meta Treemap chart is refreshed immediately.



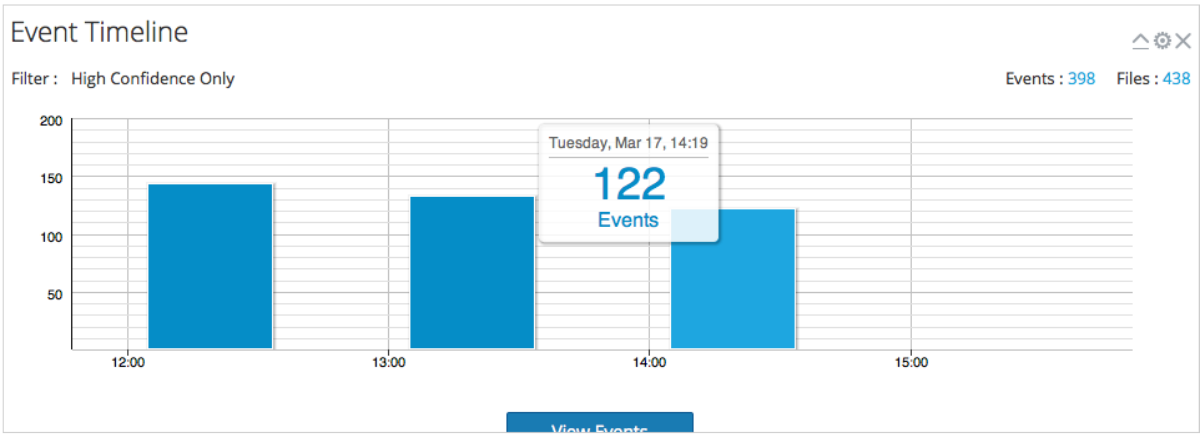
Configure the Meta Breakdowns Dashlet

The Meta Breakdowns dashlet is a visualization of values for a specific meta key in a pie chart. In the Meta Breakdowns chart, you can filter meta breakdowns by meta type and count. Use the two selection lists to set the filter, and the Meta Breakdowns chart is refreshed immediately.



Configure the Events Timeline Dashlet

The Events Timeline dashlet is a visualization of the events along a timeline. No additional filters are available for the Event Timeline.

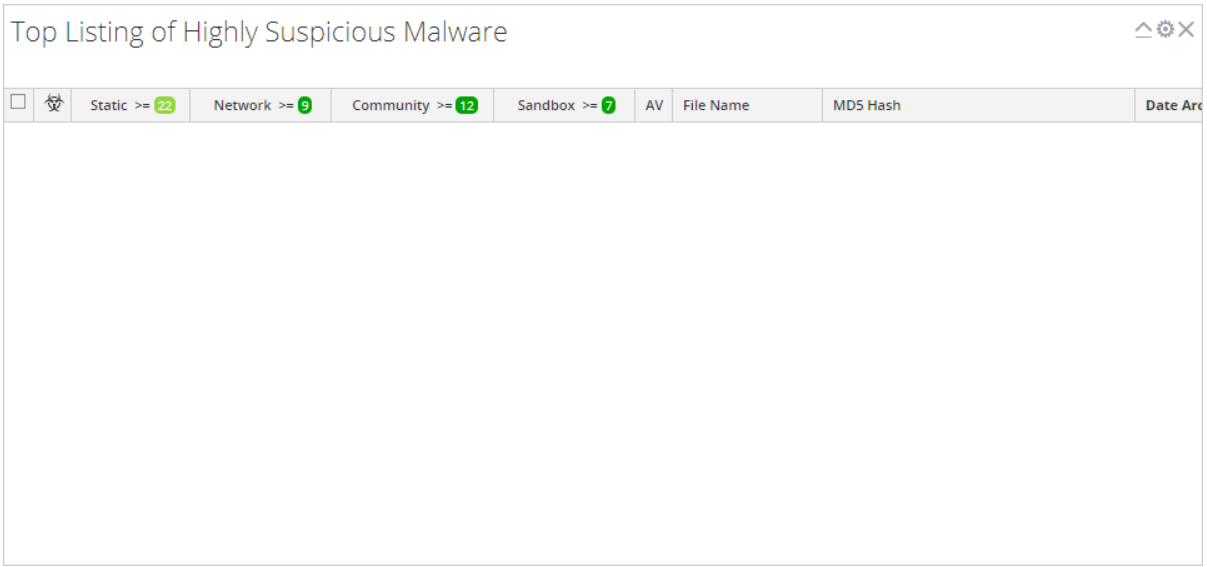


Open All Events in the Events List

From within the Event Timeline, you can open the entire list of events in the Events List. To do so, click View Events. This option is not the same as clicking the count next to Events, which is the same for all visualization charts and opens the current drill point in the Events List.

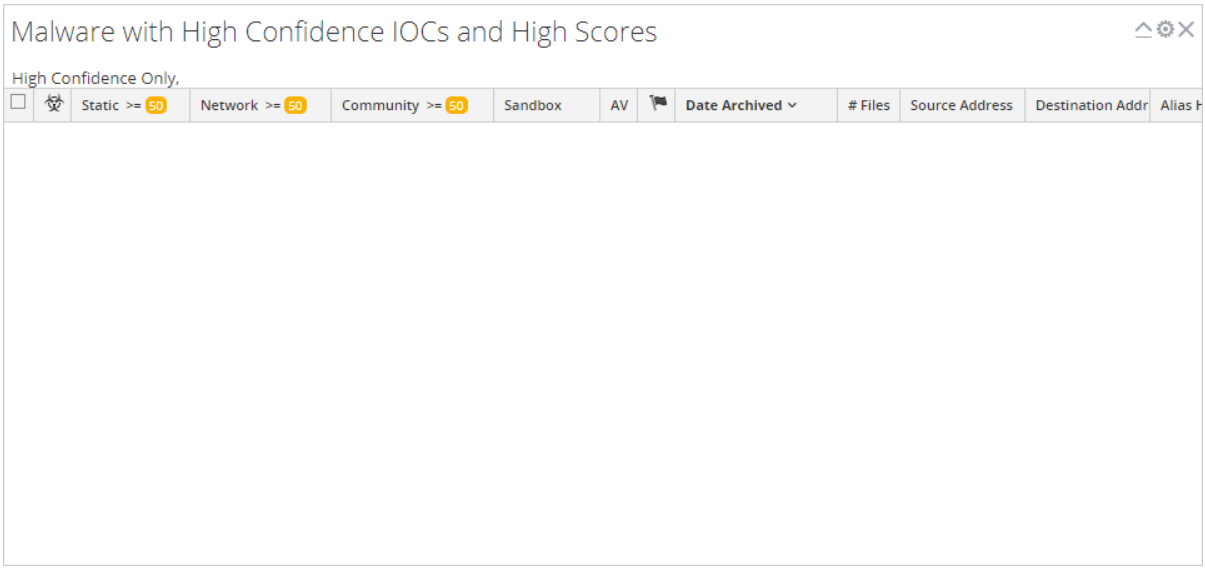
Configure the Top Listing of Highly Suspicious Malware Dashlet

The Top Listing of Highly Suspicious Malware Dashlet presents the Top 10 most suspicious events in the Events List or the Files List. This dashlet is also available in the Monitor dashboard, and the configuration options are described as part of the RSA NetWitness Content in Dashlets..



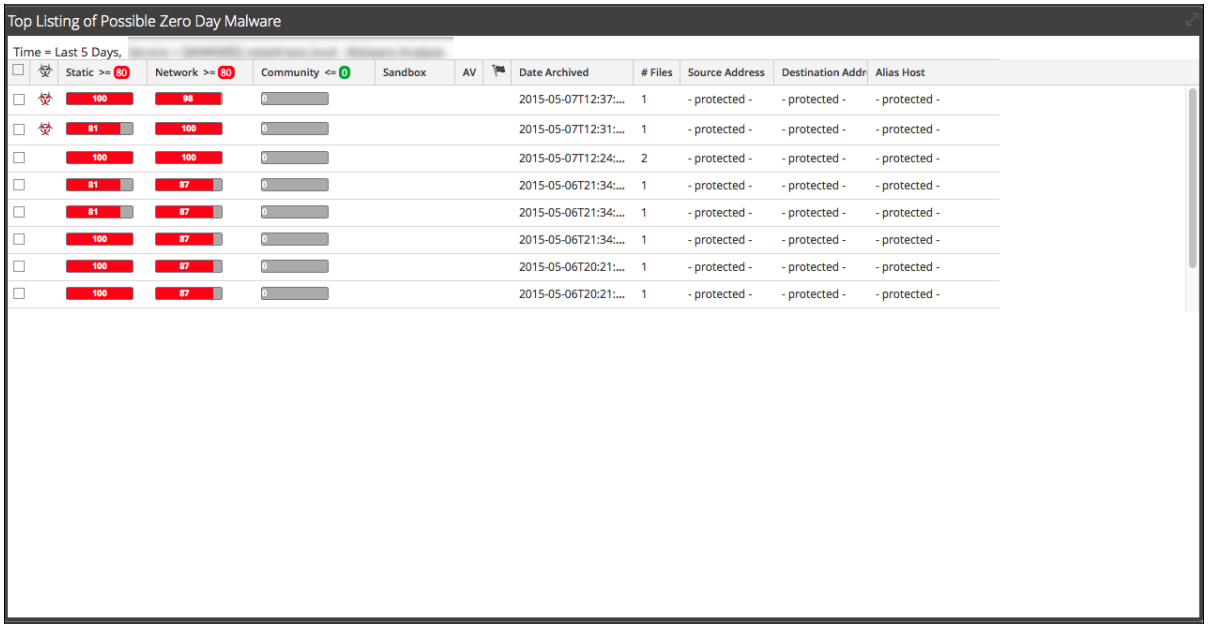
Configure the Malware with High Confidence IOCs and High Scores Dashlet

The Malware with High Confidence IOCs and High Scores dashlet presents Indicators of Compromise that have both high scores and high confidence that the events are likely to contain malware. The dashlet is also available in the Unified dashboard, and the configuration options are described as part of the RSA NetWitness Content in Dashlets..



Configure the Top Listing of Possible Zero Day Malware Dashlet

The Top Listing of Possible Zero Day Malware dashlet presents potential zero day events in the Events List or the Files List. The dashlet is also available in the Unified dashboard, and the configuration options are described as part of the RSA NetWitness Content in Dashlets.



Upload Files for Malware Analysis Scanning

There are two methods for analysts to upload files for Malware Analysis scanning.

A Malware Analyst with permission to Initiate Malware Analysis Scan can upload files to scan using the Scan Files option in the Select a Malware Analysis Service dialog.

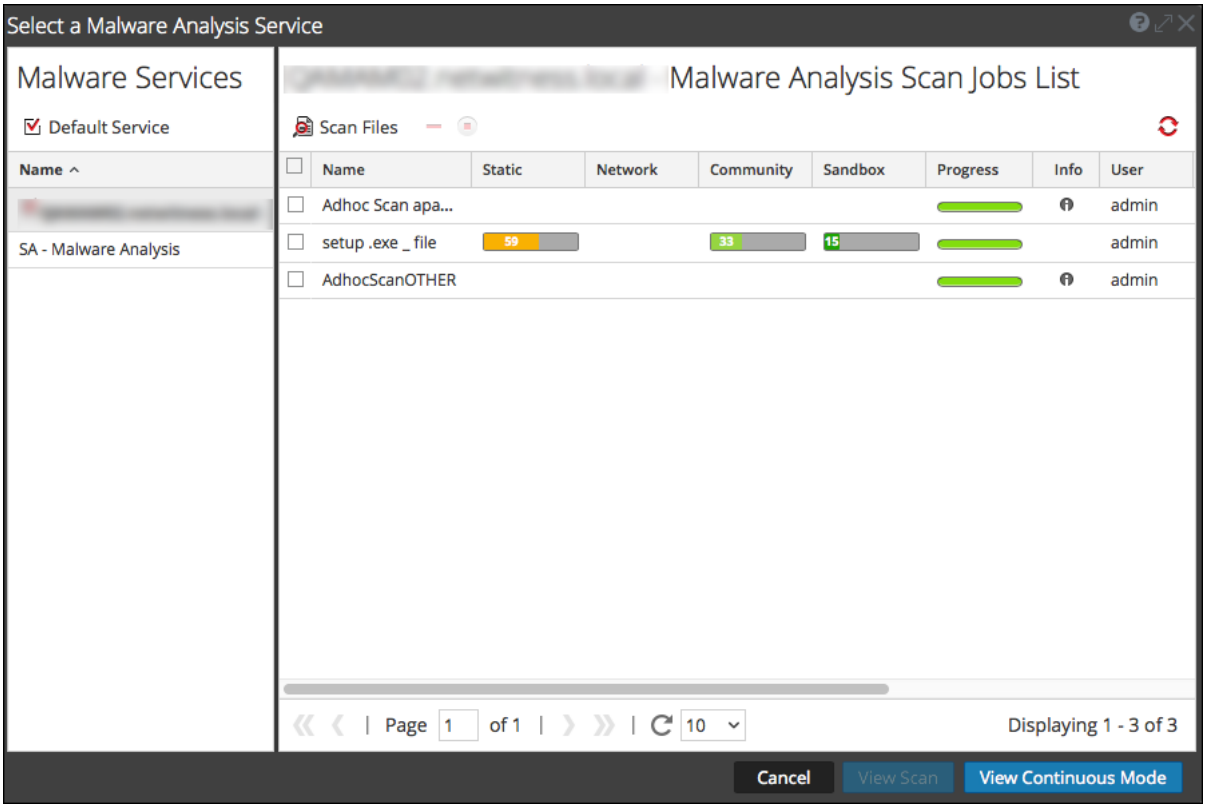
It is also possible to upload a file for scanning using a watched file share.

Upload Files Manually

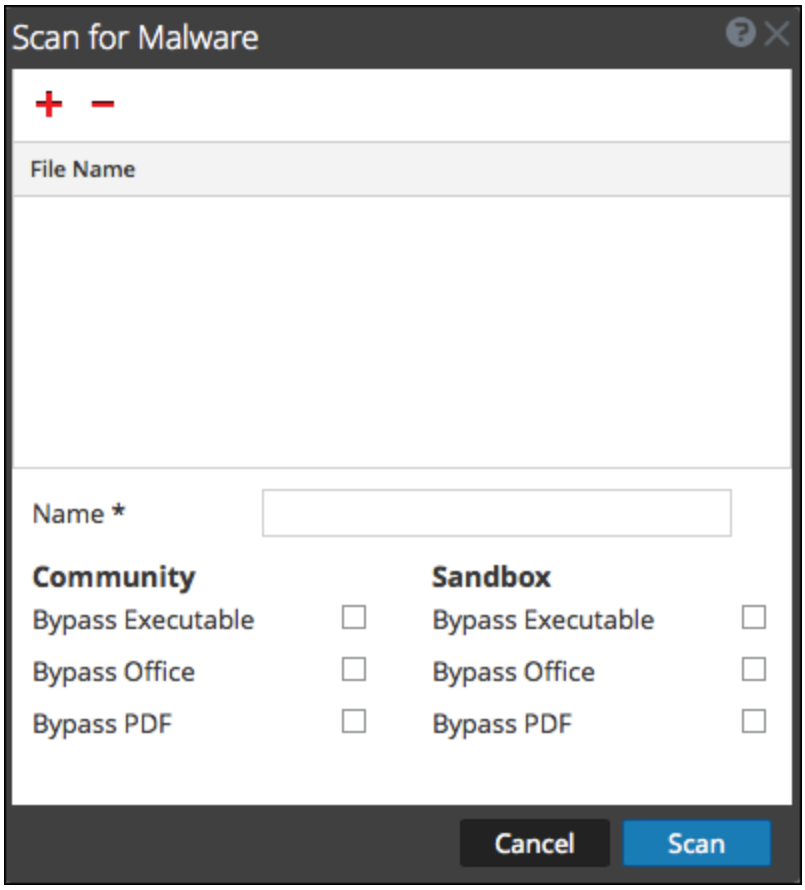
This topic provides instructions for initiating on-demand scanning of an uploaded file. When you upload a file for scanning, NetWitness Platform starts the upload job and adds it to the jobs queue. When the job is complete, you can view the scan in Malware Analysis.

To upload a file to scan:

1. Go to **INVESTIGATE > Malware Analysis**.
   The Select a Malware Analysis Service dialog is displayed, with available Malware Analysis hosts and services for the current user in the left panel.



2. Click **View Scan**.
   The Scan for Malware dialog is displayed.



3. Click +
   A view of the files system is displayed so that you can choose files to upload.
4. Select one or more files from the list and click **Open**.
   The file names are added. Malware Analysis escapes the filename characters before processing a file. The maximum number of filename characters after escaping is 200. If the filename is greater than 200 characters, Malware Analysis truncates the filename characters and displays the truncated filename in the NetWitness Platform user interface.
5. Continue adding and deleting files until you have a list of the files that you want to upload.
6. Name the scan and select the types of files to bypass. This is useful for a zip archive that contains different types of files, and overrides the default bypass settings.
7. Click **Scan**.
   The scan job is submitted and NetWitness Platform displays a confirmation message for successful submission. The scan request is added to the Scan Jobs List dashlet. The bypass settings in this dialog override the default settings in the basic Malware Analysis configuration settings.
8. The job is added to the Scan Jobs List in the Select a Malware Analysis Service dialog and in the Unified dashboard Scan Jobs List dashlet.
9. To view the scan when complete, double-click the scan.
   The Malware Summary of Events for the selected scan is displayed.

Upload Files from a Watched Folder

To upload files from a watched folder, you can drop files into a watched file share for Malware Analysis. Analysts can share YARA rules, hash files, and infected zip archives with Malware Analysis.

Malware Analysis watches a file share and automatically consumes files placed in specific folders in the file share. This feature is useful for:

- Bulk import of hash files from `/var/lib/rsamalware/spectrum/hashWatch`.
- Addition of custom-YARA rules to the Indicators of Compromise (IOC) list on the host from `/var/lib/netwitness/malware-analytics-server/spectrum/yara/watch`.
- Creation of on-demand scan jobs from a zip archive of infected zip files from `/var/lib/rsamalware/spectrum/infectedZipWatch/watch`.

Analysts need to prepare the files for consumption in accordance with requirements, the file extension must be correct, and the file must be copied to the correct watched folder in the file share.

Import a Hash List

To import a hash list from the watched directory, the hash list must be in the specified format and must be sorted on md5. You can drop a file formatted into a folder (`/var/lib/rsamalware/spectrum/hashWatch`) on the Malware Analysis host, and it is automatically imported into the local hash database. This is described in "Configure Hash Filter" in the *Malware Analysis Configuration Guide*.

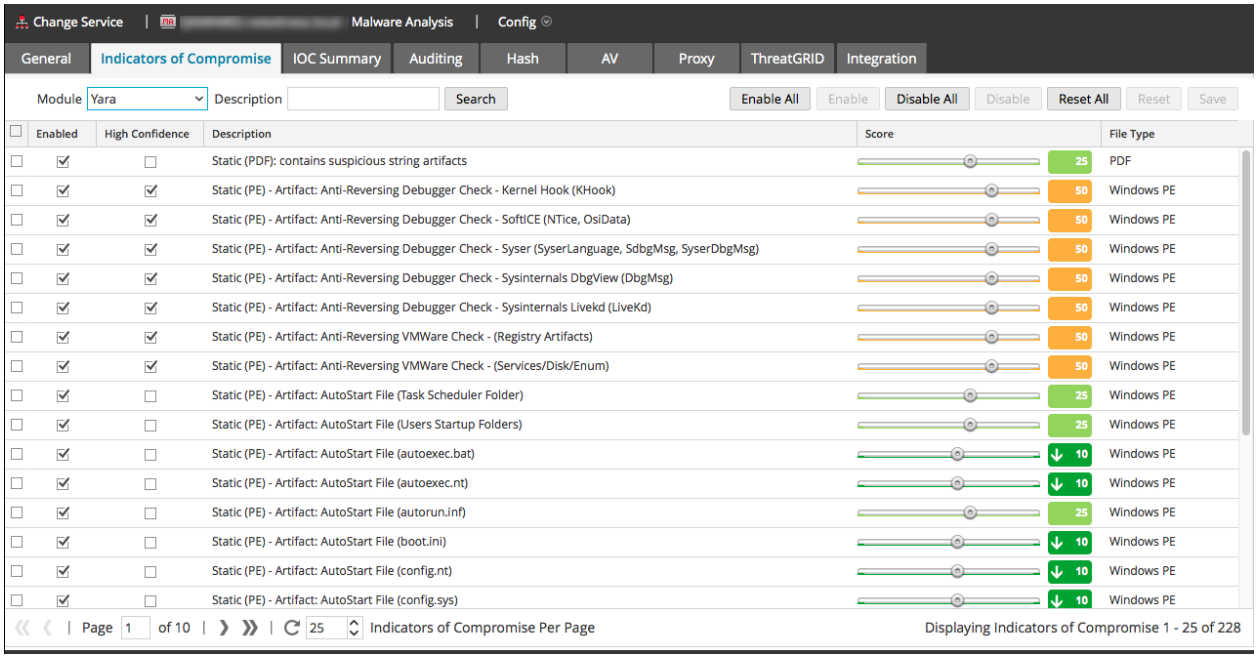
To import a hash list using the watched folder method:

1. Copy the hash lists that you want to import into the **`/var/lib/rsamalware/spectrum/hashWatch`** directory.
   NetWitness Platform Malware Analysis automatically watches this folder and processes files placed there.
   a. Malware Analysis adds every hash found in the hash lists to the hash filter.
   b. If there are processing errors, they are logged in: `/var/lib/rsamalware/spectrum/hashWatch/error`
   c. Processed files are cataloged here: `/var/lib/rsamalware/spectrum/hashWatch/processed`
   d. Processed files are not removed from the hashWatch directory.
2. After importing hashes in bulk, the System Administrator can use a cronjob to clean up old processed files.

Import YARA rules to the IOC List

Customers with advanced skills and knowledge can add detection capabilities to RSA Malware Analysis by authoring YARA rules and publishing them in RSA Live or placing YARA rules in a watched folder for the host to consume. Implement Custom YARA Contentprovides complete information on the prerequisites for using custom YARA content and authoring rules.

When the rules are ready, place the custom YARA files in the folder that the Malware Analysis service watches:
`/var/lib/netwitness/malware-analytics-server/spectrum/yara/watch`
The file is consumed within one minute.
Once consumed, NetWitness Platform moves the file to the `processed` folder, and the new rule is added to the Malware Analysis Service Config view > Indicators of Compromise tab.



Import Files into the Scan Jobs List

When you obtain samples from perimeter security solutions and would like to perform further analysis on the files, you can zip the files and password protect the archive with `infected`, then add to the watched folder for consumption by Malware Analysis. This zipped archive is ready to be placed in the watched folder: `/var/lib/rsamalware/spectrum/infectedZipWatch/watch`.

Note: The maximum size of the archive is 100 MB.

To analyze infected, password-protected zip files, Malware Analysis consumes archives place in a watched folder and creates an on-demand job that is added to the Scan Jobs List.

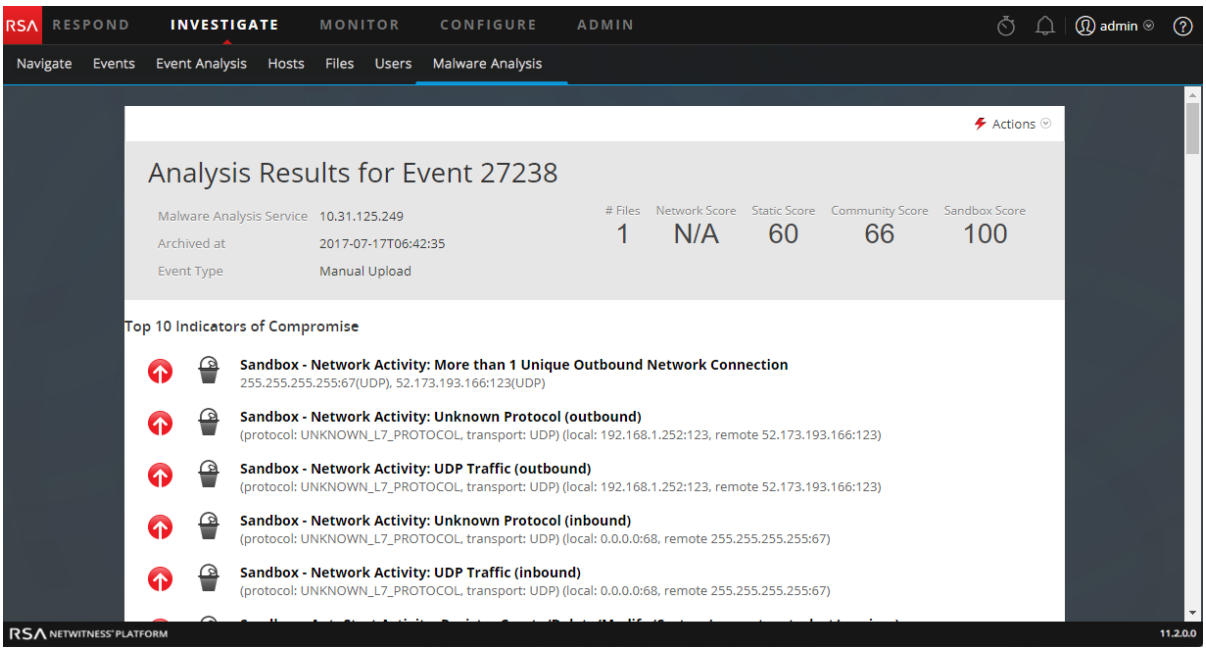
1. While logged on as administrator, place the files to be processed in a zip file with password `infected` at `/var/lib/rsamalware/spectrum/infectedZipWatch/watch`
   In a minute or two Malware Analysis consumes the archive and creates an on-demand job in the Scan Jobs List. The scan job name is the name of the file, the user is **file share**, and the Event Type is 1. The archive is moved to `/var/lib/rsamalware/spectrum/infectedZipWatch/processed`
2. After the job is added to the Scan Job List, run a script or cronjob to clean up the zip file in `/var/lib/rsamalware/spectrum/infectedZipWatch/processed`.

View Detailed Malware Analysis of an Event

When viewing the list of individual events in a Malware Analysis scan in the Malware Analysis Events grid, you can double-click an event to view the detailed analysis results for the event.

View Malware Analysis Details for an Event

1. Start an investigation in the **Malware Analysis** tab.
   The Malware Summary of Events is displayed, and includes four charts, including the Event Timeline.
2. Do one of the following:
   a. To view all events in the Event Timeline, click the **View Events** button.
   b. Double-click data in the **Meta Breakdown**, **Meta Treemap Chart**, or **Score Wheel**.
   The Events List is displayed.
3. Double-click an event.
   The Analysis Results for the event are displayed.

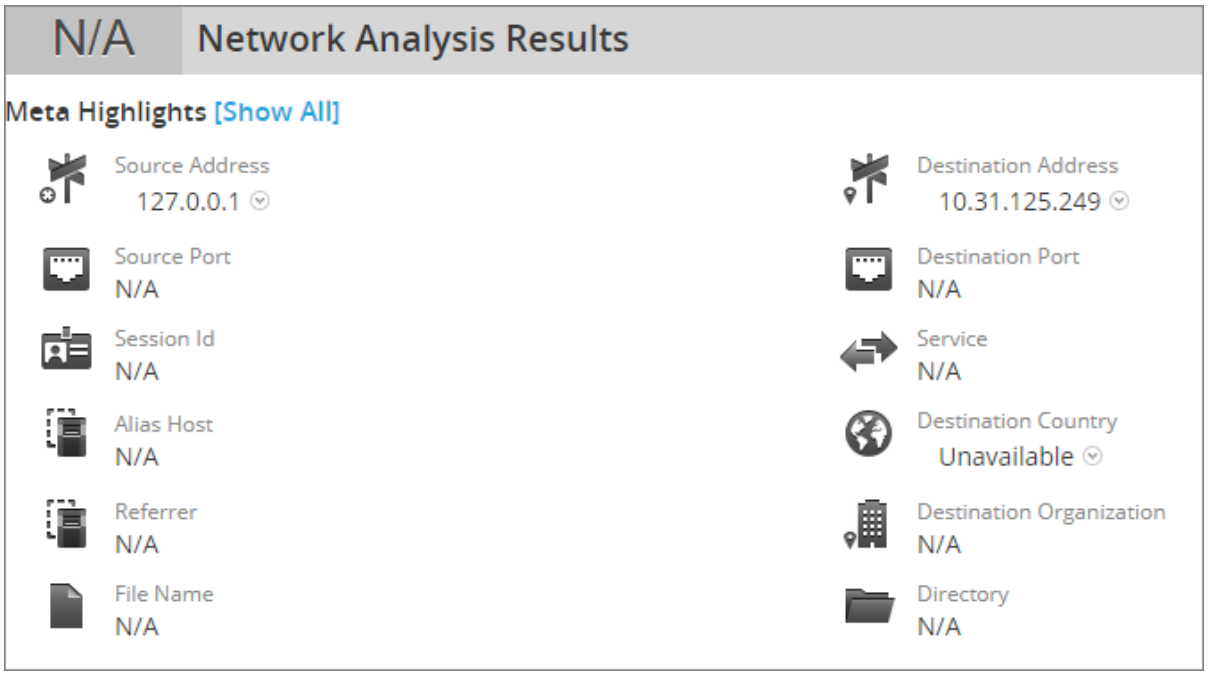


4. (Optional) If you want to delete an event, select **Actions > Delete Event**.
5. If you want to view a reconstruction of the network session, select **Actions > View Network Session**.
   The session opens in the Navigate view > Event Reconstruction.

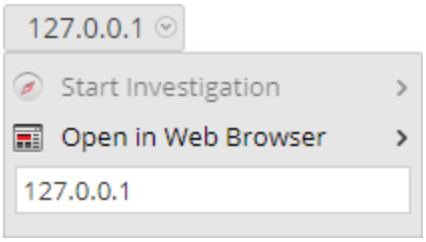
Pivot Network Analysis Results

You can pivot the Network Analysis Results in several ways:

1. Scroll down to the Network Analysis Results.



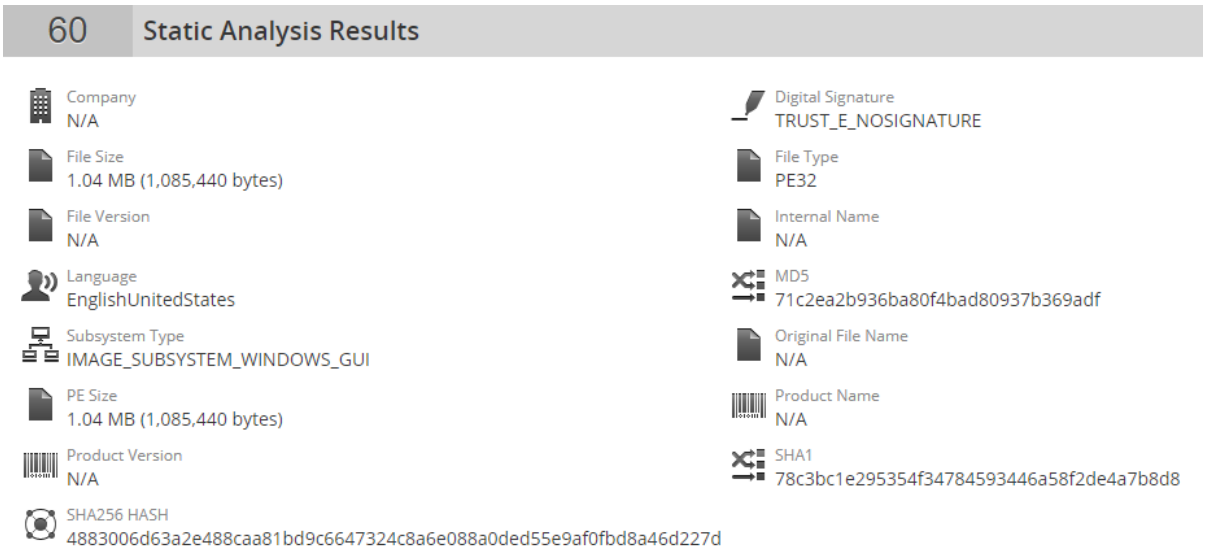
2. Hover over a meta value and left-click.
   The context menu is displayed.



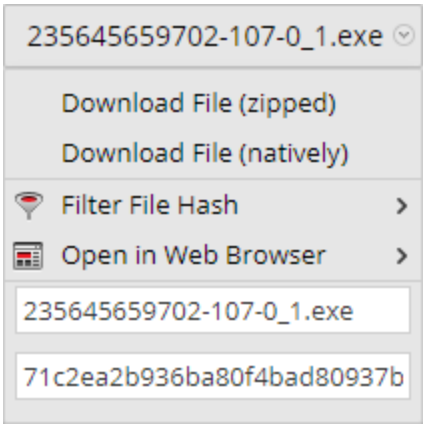
3. To view the selected meta value in the **Navigate** view, select **Start Investigation** and a time option.
4. To view the selected meta value in a browser, select **Open in Web Browser > Open in Google**.

Use File Actions in the Static Analysis Results

1. Scroll down to the Static Analysis Results.



2. If you want to download a file, select the file name and either **Download File (zipped)** or **Download File (natively)** in the drop-down menu. It is safer to download a file in zipped format.



3. If you want to mark the file as safe or unsafe in the hash list, select **Filter File Hash** and **Mark hash as good** or **Mark hash as bad**.

View Community Analysis Results Details

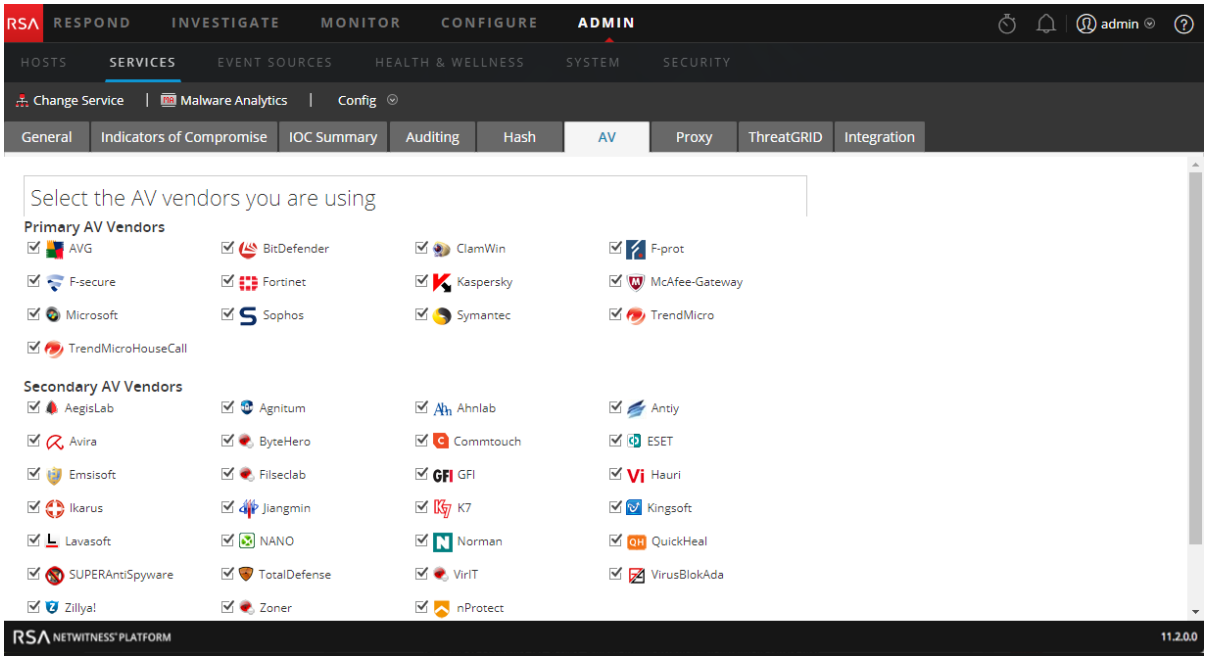
The Community Analysis Results summarizes results from the community, identifying Indicators of Compromise that were flagged as a risk or identified as good.

In addition, this view lists the results from Installed AV Vendors and Not Installed AV Vendors. You can compare results of the installed AV vendors that were configured for the current Malware Analysis service versus Community results. You can also see results from a list of AV vendors that are not configured as installed for the current Malware Analysis service.

Each row of AV vendor results includes the shield icon to show whether the IOC was discovered by a Primary ( ) or Secondary AV ( ) vendor in the community, the name of the Installed or Not Installed vendor, and the name of malware or risk detected by the community and AV vendor. If the AV vendor did not detect a risk, **-- Not detected --** is displayed instead of the name of the risk.

The Not Installed AV Vendors section is expandable to view all entries, but is collapsed by default to minimize the need to scroll. Clicking the + expands the list.

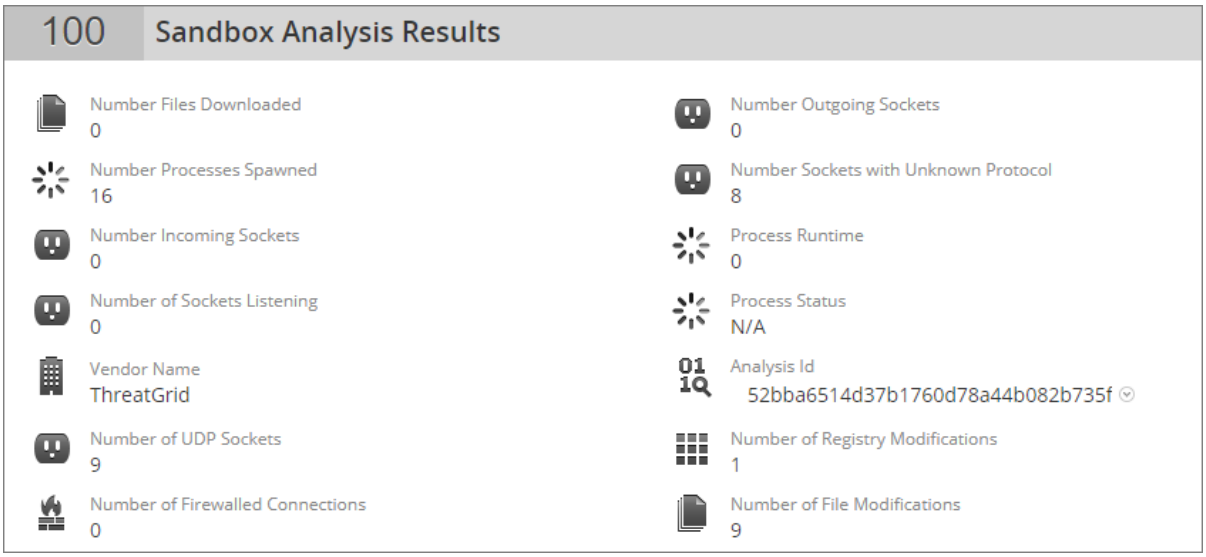
If no installed AV vendors have been configured for the current Malware Analysis service, the following message is displayed: No AV vendors were marked as installed. Please go to the Malware Analysis Service configuration page to identify installed AV vendors.



View Sandbox Analysis Results in the ThreatGRID User Interface

If you have registered with ThreatGRID, you can view the Sandbox results directly in ThreatGRID.

1. Scroll down to the Sandbox Analysis Results.



2. Click the **Analysis ID** and select **Open In ThreatGRID**.
   The analysis report in ThreatGRID is displayed.

Malware Analysis Reference Materials

This section provides is intended to help you understand the purpose and application of Malware Analysis views in NetWitness Investigate. For each view, there is a brief introduction and a What Do You Want To Do table with links to related procedures. In addition some of the reference materials include workflows and Quick Looks to highlight important features in the user interface.

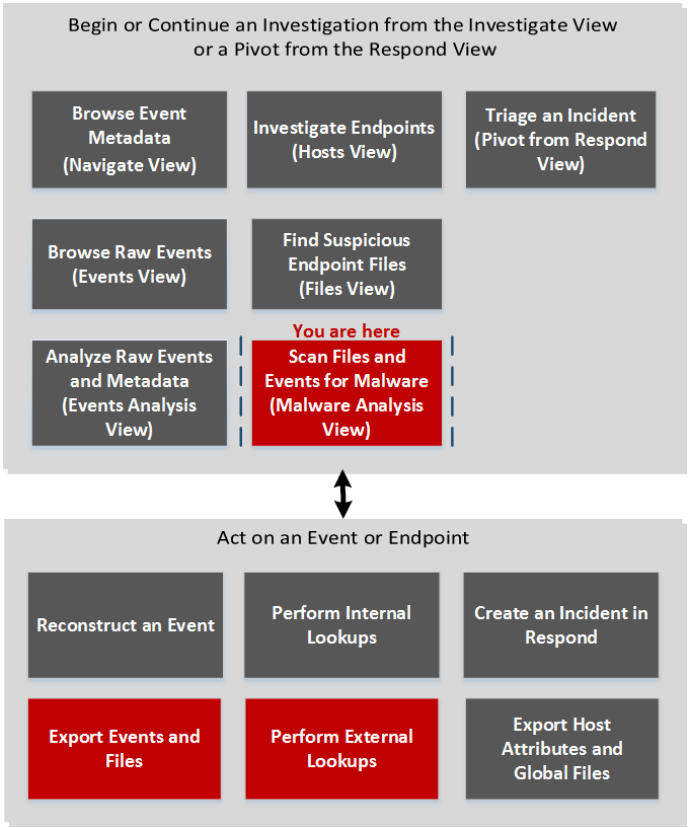
- Malware Analysis View
- Malware Analysis Events List and Files List
- Scan For Malware Dialog
- Select a Malware Analysis Service Dialog

Malware Analysis View

In NetWitness Investigate, the Malware Analysis view provides the user interface for conducting a malware analysis. The Malware Analysis view is in the form of a customizable dashboard, in which default dashlets in the initial view are based on the user role (Administration or Analyst) and user customizations. Initially, the Summary of Events dashlet is displayed in the Malware Analysis view. Additional dashlets present different visualizations of the events being viewed, and each representation is configurable to further refine your view as you search for Indicators of Compromise. The Malware Analysis dashlets available in the Dashboard are also available in the Malware view.

To access this view, select **INVESTIGATE > Malware Analysis.**. If a default service has not been selected, the Select a Malware Analysis Service dialog is displayed. Select a service, then click **View Continuous Mode**.

Workflow



What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	browse event metadata	*NetWitness Investigate User Guide*

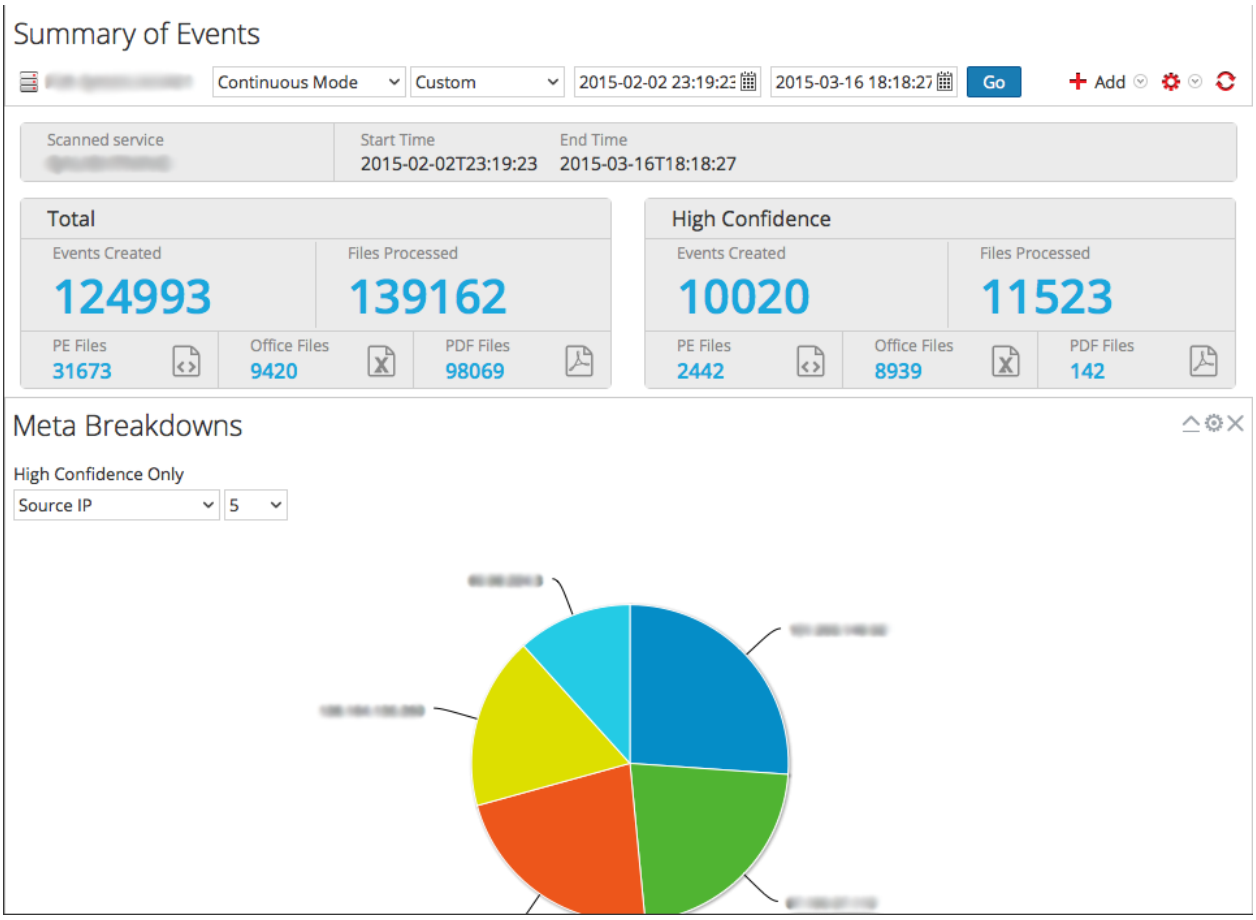
Quick Look

Below is an example of the Malware Analysis view.



The Malware Analysis view consists of the Summary of Events panel and four dashlets unique to this view. Each of the unique dashlets have identical Options dialogs. The Malware Analysis dashlets in the MONITOR view are also available, and are described in the Dashlets topic in the RSA Content for the RSA NetWitness Platform space.

Summary of Events Panel

In the Summary of Events panel, you can select the service, the scan mode, and the time range. In addition, you can select a data point and view the events associated with the event.

The following table describes all features in the Summary of Events panel.

Feature	Description
	Selects a service to display.
Scan Mode	Displays a drop-down list of available scan modes.
Time Range	Displays a drop-down list of time ranges to view events.
Start Date	When Time Range is set to custom, offers a calendar from which to choose the start date of the time range.

Feature	Description
End Date	When Time Range is set to custom, offers a calendar from which to choose the end date of the time range.
	Displays a drop-down list of dashlets you can add to the view.
	Displays a drop-down list of actions you can perform in this view: • Restore Default Configuration • Order Dashlets • Apply Threshold Filter
	Refreshes the Malware Analysis view.

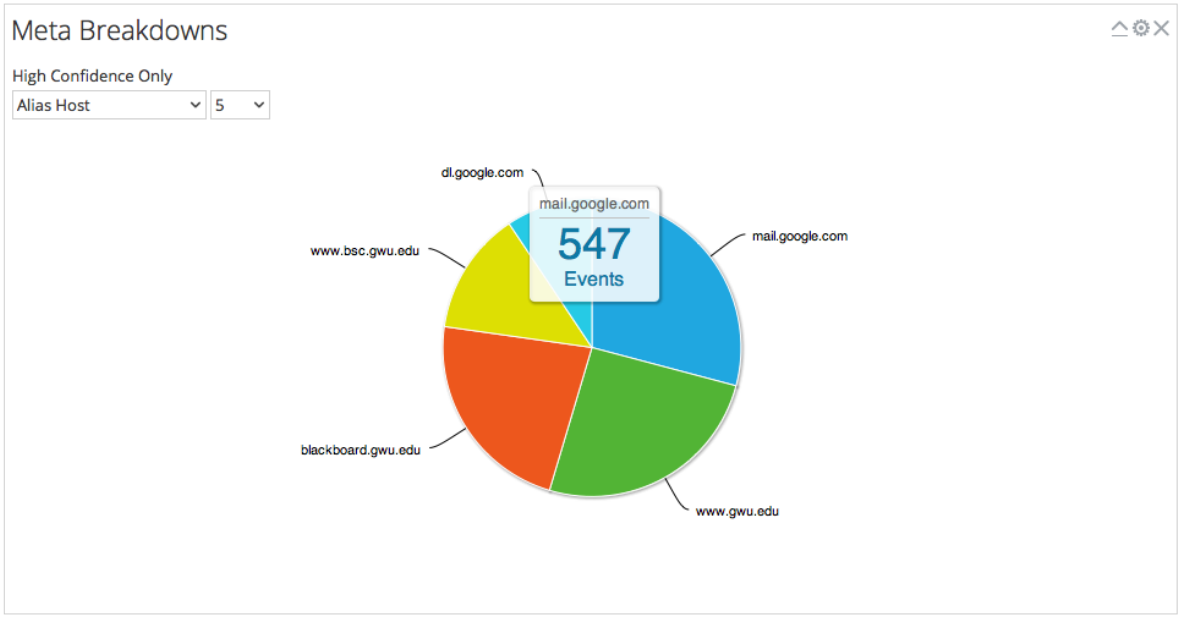
Options Dialog

In the Options dialog, you can customize the results displayed in the dashlet. This dialog can be accessed by clicking the icon in the top right corner of each dashlet. The following table describes the features of the Options dialog.

Feature	Description
Title	Indicates whether the data shown is restricted to events flagged as high confidence or not. If the data is not restricted, this line will not be displayed.
Influenced By High Confidence Only	Indicates whether the data shown is restricted to events flagged as high confidence.
Static, Network, Community, Sandbox	Allows you to filter results based on the scores in the scoring modules.
Cancel	Closes the dialog without saving any changes.
Apply	Applies changes to the dashlet immediately and closes the dialog.

Meta Breakdowns

Meta Breakdowns presents events in the form of a pie chart, with each slice representing a meta value for the specified meta key. You can select the meta key and the count of meta values for that key to render in the chart, starting with the meta value having the most events. Hovering over an event displays the count.

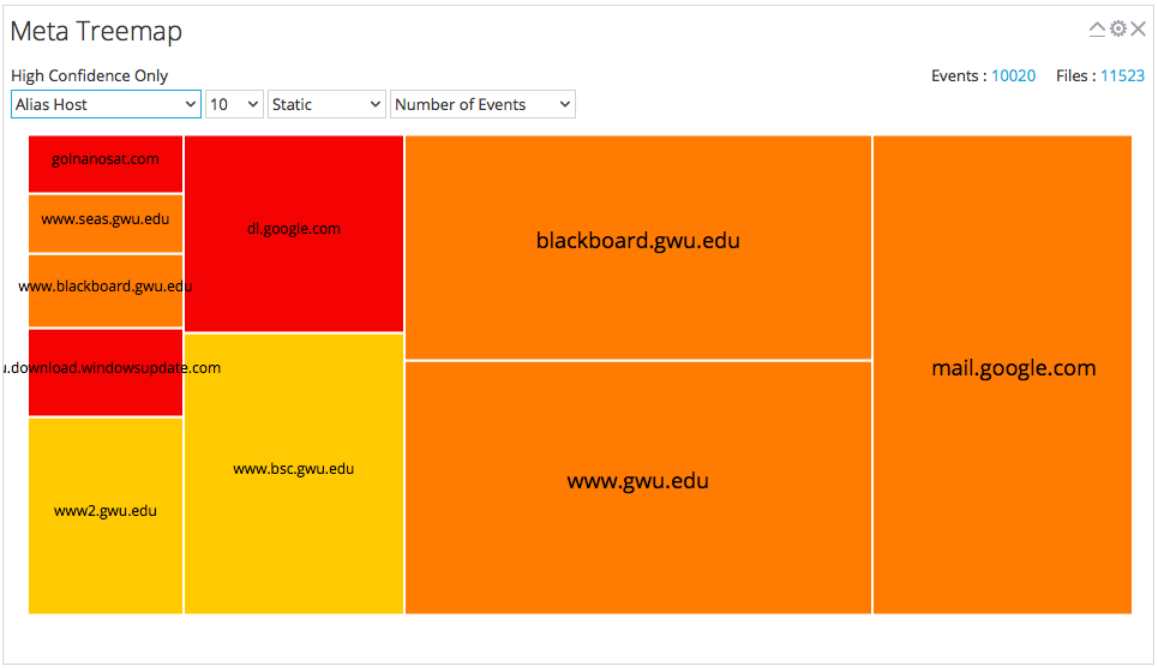


The following table describes the options in the Meta Breakdowns dashlet.

Feature	Description
High Confidence Only	Indicates whether the data shown is restricted to events flagged as high confidence or not. If the data is not restricted, this line will not be displayed.
Meta Key	Drop-down list of available meta keys.
Count	Drop-down list specifying how many of the top results are displayed.

Meta Treemap

Meta Treemap presents events in the form of a heat map. You can select the meta key and the count of meta values for that key to render in the chart, starting with the meta values having the most events. In addition, you can select the module that detected the meta value in the events: static, network community, or sandbox.



The following table describes the options in the Meta Treemap dashlet.

Feature	Description
High Confidence Only	Indicates whether or not the results are restricted to events flagged as high confidence or not. If the results are not restricted, this line will not be displayed.
Meta Key	Drop-down list of available meta keys to select as a filter.
Count	Drop-down list specifying how many of the top results are displayed.
Module	Drop-down list specifying which module results will be pulled from.
Value	Drop-down list specifying what information will be displayed when the mouse is hovering over a result (for example, Average Score).

Score Wheel

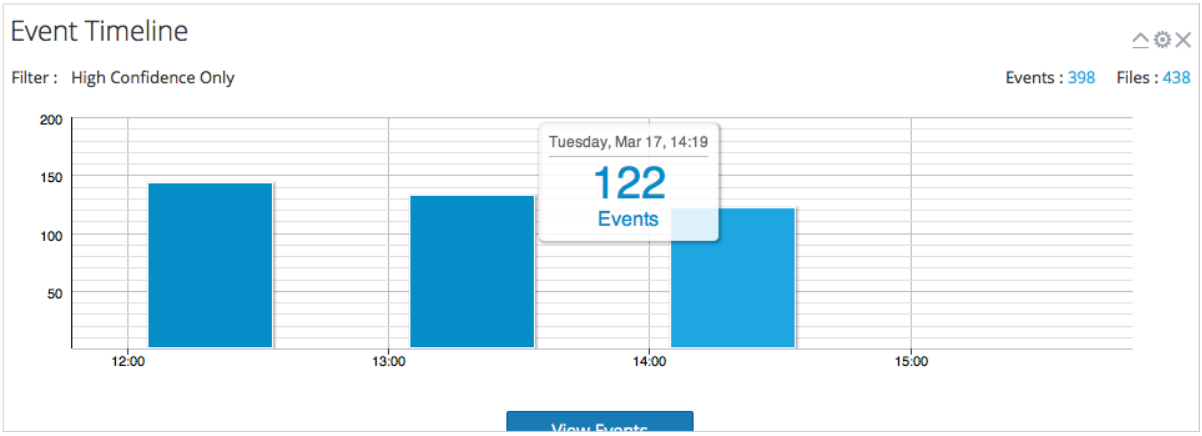
The Score Wheel offers a view of events as concentric rings with colors representing scores for events based on Indicators of Compromise and the scoring module. You can arrange the position of the rings using the Up and Down arrows to obtain a view that highlights events that were detected by one scoring module (red) and not detected by other scoring modules.

The following table describes the features of the Score Wheel dashlet.

Feature	Description
High Confidence Only	Indicates whether or not the results are restricted to events flagged as high confidence or not. If the results are not restricted, this line will not be displayed.
Module Order grid	Displays the order of the rings in Score Wheel, Ring 1 being the innermost ring and Ring 4 being the outermost ring. You can click the **Up** and **Down** buttons to reorder the modules, then click **Update** to apply the changes.

Event Timeline

The Event Timeline offers a view of events organized by the time of occurrence in a bar graph. Clicking and dragging to select a time range within the chart zooms in on the selected time.



The following table describes the features of the Event Timeline dashlet.

Feature	Description
High Confidence Only	Indicates whether or not the results are restricted to events flagged as high confidence or not. If the results are not restricted, this line will not be displayed.
View Events	Displays the Investigation > Events view.

Malware Analysis Events List and Files List

The Malware Analysis Events List and Files List provide a detailed view of events or files. You can double-click on an event or file in either of the lists to display the Analysis Results view in a new browser tab.

To access this view, go to **INVESTIGATE > Malware Analysis > Select a Malware Analysis Service** dialog. Select a service from the left panel, then select a job from the right panel, and click **View Scan**. In the Summary of Events view do one of the following:

- In either the **Total** panel or the **High Confidence** panel, click the number in the **Events Created** section.
- If you want to view the Files List, click the number in the **Files Processed** section.

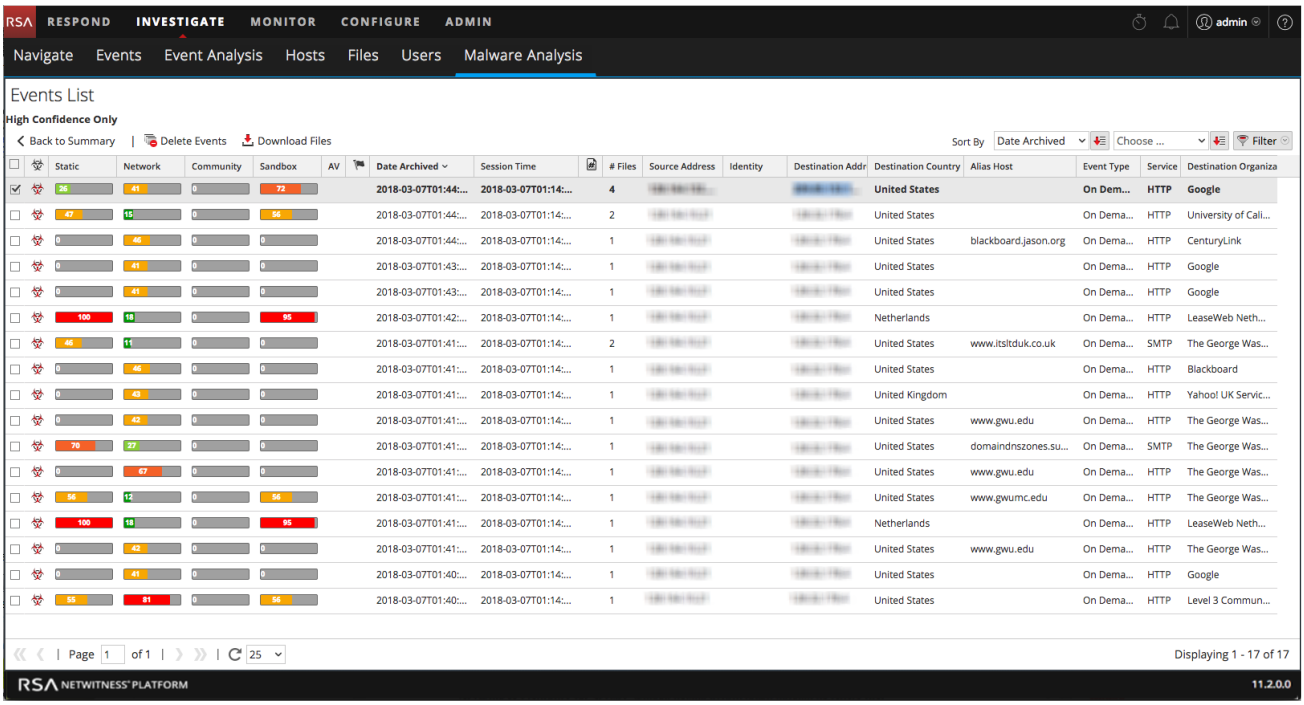
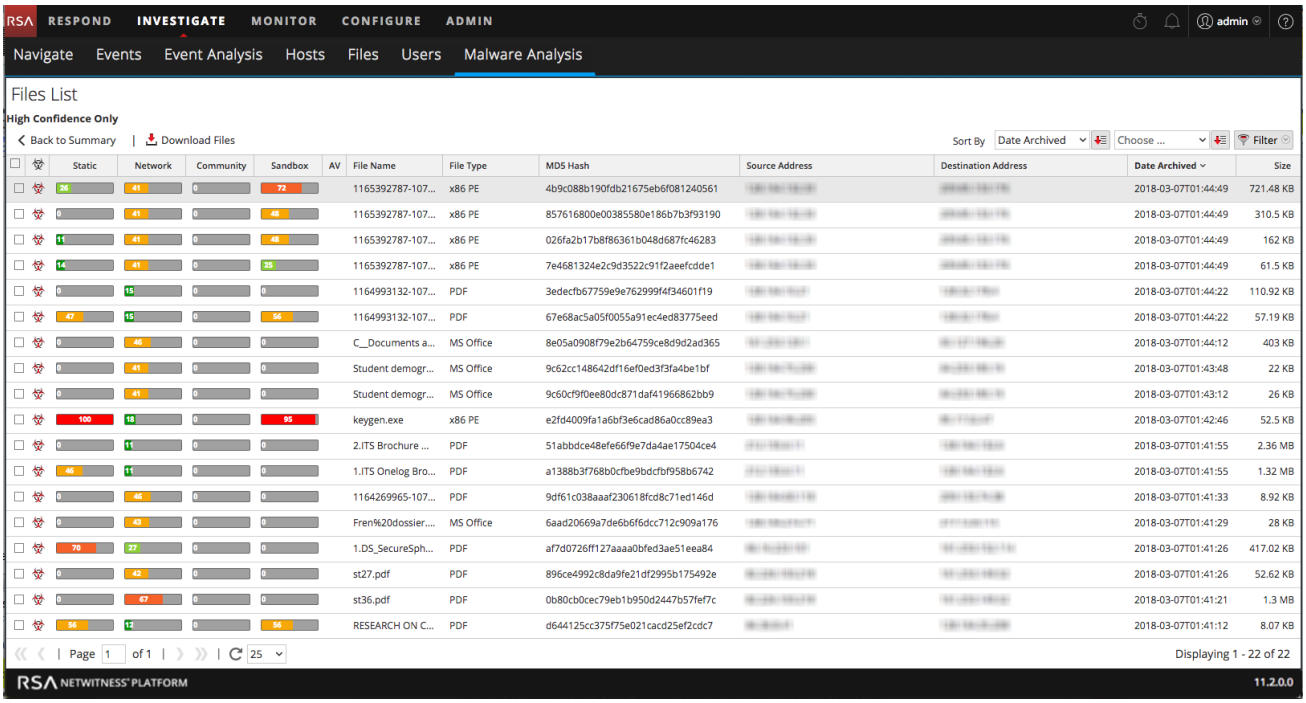
Quick Look

This is an example of the Events List view.



This is an example of the Files List view.



These are the features in the Events List toolbar, and the Files List toolbar is the same, except it has no option to delete events.

Feature	Description
Back to Summary	Returns to the Summary of Events view.
Delete Events	Removes the selected events from the current events list.
Download Files	Displays the Malware File Download dialog, which allows you to download available files.
	Displays a drop-down menu from which you can decide how to sort the list. These are the options for sorting: • High Confidence • Static • Network • Community • Sandbox • AV • File Name • File Type • Hash • Date Archived • Size The button directly to the right of this drop-down indicates whether the list will be sorted by ascending or descending values.
	Displays a drop-down menu from which you can select a secondary sorting order. This menu includes an option forNetWitness Platform**None**, so selecting a secondary sorting order is not necessary.
	Displays a drop-down window in which you can filter the list by filename or MD5 Hash.

These are the features in the Events List.

Feature	Description
	Indicates whether the event is influenced by the high confidence flag.
Static, Network, Community, Sandbox	Displays the scores for each scoring module.
AV	Indicates whether the AV flagged this event as suspicious.
	Indicates whether the event is influenced by a customized rule.

Feature	Description
Date Archived	Displays the date and time the event was archived.
Session Time	Displays the time of the event's session.
	Indicates whether the hash value is marked as trusted.
# Files	Displays the number of files included in the event.
Source Address	Displays the address of the event source.
Identity	Displays the identity of the event source.
Destination Address	Displays the address of the event destination.
Destination Country	Displays the country of the event destination.
Alias Host	Displays the hostname of the alias.
Event Type	Displays the type of event. For example, Manual Upload.
Service	Displays the service on which the event occurred.
Destination Organization	Displays the organization of the destination.

These are the features in the Files List grid.

Feature	Description
	Indicates whether the event is influenced by high confidence flag.
Static, Network, Community, Sandbox	Displays the scores for each scoring module.
AV	Indicates whether the AV flagged this event as suspicious.
File Name	Displays the name of the file.
File Type	Displays the type of the file (for example, PDF or x86 PE)
MD5 Hash	Displays the MD5 hash.
Source Address	Displays the address of the file source.
Destination Address	Displays the address of the file destination.
Date Archived	Displays the date and time the file was archived.
Size	Indicates the size of the file.

Scan For Malware Dialog

In the Scan for Malware dialog, Malware Analysis analysts can upload files to investigate in Malware Analysis.

To access this dialog go to the **Malware Analysis** view. In the **Select a Malware Analysis Service** dialog, select a service in the left panel, then click Scan Files in the right panel.

Workflow

Quick Look

The Select a Malware Analysis Service dialog has a Malware Services panel on the left and a Scan Jobs List on the right. The Scan Jobs List panel has a toolbar, list, and buttons to view scans.

The Malware Services panel is a list of services available for malware analysis. In this panel, you can select the service to investigate and you set a default service using the Default Service icon. When you select a service, the available scan jobs for that service are listed in the Scan Jobs list.

These are the features in the Scan Jobs List toolbar.

Feature	Description
	Displays the Scan for Malware dialog, in which you can upload a file to the service for scanning.
Delete scan job ( )	Deletes one or more selected scan jobs, NetWitness Platform displays a confirmation dialog before deleting scan jobs.
Cancel scan job ( )	Pauses or continues one or more scan jobs.
Refresh ( )	Refreshes the list of scan jobs.

These are the columns in the Scan Jobs list. This list is also available in the Malware Scan Jobs dashlet.

Feature	Description
Name	Displays the name of the job.
Static, Network, Community, Sandbox	Filters the results based on the scores for each scoring module.
Progress	Displays the current progress made on the job. • Green: The job is finished. • Black: The job is in progress. • Red: An error occurred.
Info	Provides additional information. Displays the query for the job. If the job is not complete, it also displays more detailed description of the status.
User	Displays the name of the user who created the job.
Events	Counts the number of events for the job.
Dropped	Counts the number of files/events in the job that were dropped because the scores are below their configured threshold.
Event Type	Displays the type of job: Manual Upload, On Demand, or Resubmit.
Scheduled	Displays the date and time when the job was executed.

These are the available actions in the dialog.

Feature	Description
Cancel button	Cancels the selected scan job.

Feature	Description
View Scan button	Displays the Summary of Events for the selected scan with the default dashlets displayed.
View Continuous Mode button	Displays the Summary of Events for the selected scan with the default dashlets displayed.

Introduction

NetWitness Investigate provides data analysis capabilities in RSA NetWitness® Platform, so that analysts can analyze packet, log, endpoint, and UEBA data, and identify possible internal or external threats to security and the IP infrastructure. This guide helps analysts perform investigations of endpoint data using NetWitness Investigate.

Note: In Version 11.1 and later, the Hosts and Files views provide a view into endpoint data. Earlier versions offer access to endpoint data using a standalone NetWitness Endpoint server.

For more information, see the *NetWitness Endpoint Quick Start Guide*, the *NetWitness Investigate Quick Start Guide*, and the *NetWitness Investigate User Guide*.

Endpoint Metadata

Endpoint metadata is generated when hosts are scanned and when there are real-time activities on the hosts. You can view the following categories of sessions when metadata forwarding is enabled:

Operating System	Scan Categories	Tracking Categories

Windows	file, service, dll, process, task, autorun, machine, kernel hook, image hook, registry discrepancies, and suspicious threads	• Process event - Reports any process related activities, such as `openprocess`, `openosprocess`, `createprocess`, `createremotethread`, `openbrowserprocess`.
		• File event - Reports any file related activities by an executable, such as `readdocument`, `writetoexecutable`, `renameexecutable`, `selfdeleteexecutable`, `openphysicaldrive`.
		• Registry event - Reports activities that result in registry creation or modification, such as `modifyservicesimagepath`, `modifyfirewallpolicy`, `createservicesimagepath`, `createsecuritycenterconfiguration`, `modifybadcertificatewarningsetting`.
		• System event - Reports IP change and boot events.
		• Network event - TCP/UDP and incoming/outgoing.
		  • Reports outbound and inbound network connections on all supported Windows platforms.
		  Note: Reports events only on Windows operating systems that support Windows Filtering Platform (WFP), such as Windows Vista, Windows Server 2008 and later.
		  • Reports IPv4 and IPv6 connections.
		• Console event (for Windows 8 and later) - Reports user input that is entered into a console application, such as `cmd.exe`, `powershell.exe`. For example, `Get-Item -Path Registry::HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion`.
		Note: For Windows 10 version 1809:
		- When you execute a command in powershell, and press **Tab**, the powershell console events captured contains only the characters entered before pressing Tab.
		- Some powershell console events captured may contain repeated characters.

Linux	file, autrorun, loaded library, systemd, process, cron, initd, and machine	-

Operating System	Scan Categories	Tracking Categories

Mac	file, daemon, process, task, dylib, autorun, and machine	• Process event - Reports any process related activities, such as `openprocess`, `createprocess`, `openosprocess`, `openbrowserprocess`, `allocateremotememory`, `createremotethread`.
		• File event - Reports any file related activities by an executable, such as `writetoexecutable`, `renameexecutable`, `createautorun`, `deleteexecutable`, `selfdeleteexecutable`, `writetoplist`, `writetosudoers`, `createbrowserextension`.
		• Network event - TCP/UDP and incoming/outgoing.
		  ◦ Reports outbound and inbound network connections on all supported Mac operating system.
		  ◦ Reports IPv4 and IPv6 connections.

For more information on metadata, meta keys, meta values, and meta entities, see the *NetWitness Investigate User Guide*.

Risk Score

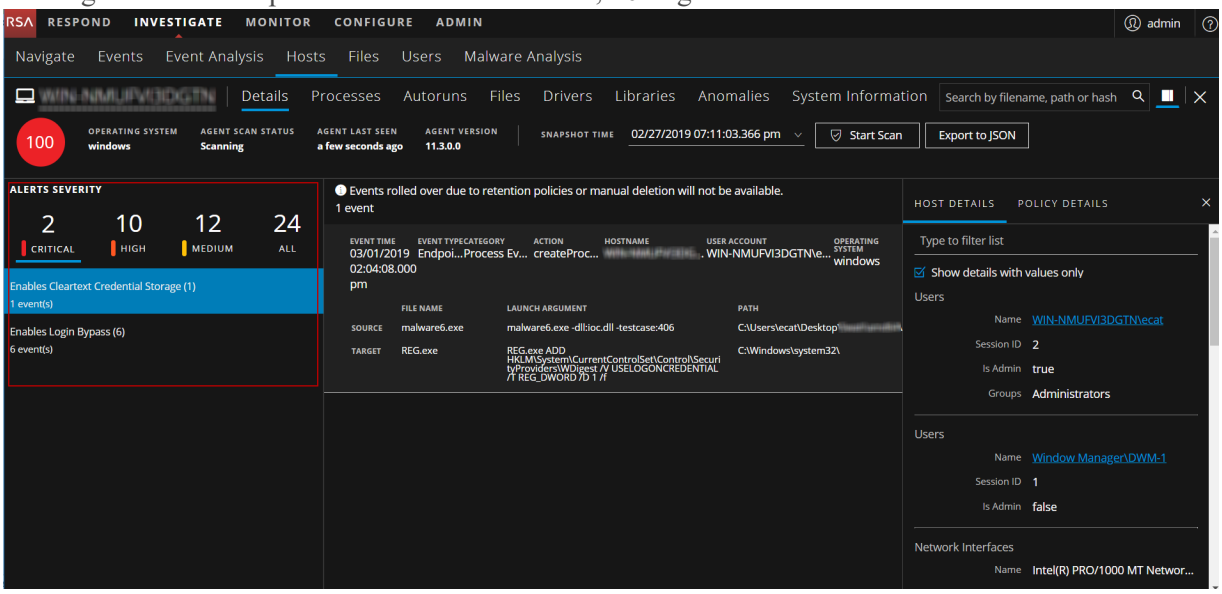
Analysts can use the risk score to begin an investigation on hosts and files. RSA uses a proprietary algorithm to calculate the risk scores ranging from 0 to 100. A subset of alerts associated with hosts and files contribute to the risk score calculation. Analysts can review critical and high alerts associated with a risk score to identify strong evidence of malicious activity and take required action.

Note: If you have an Insights agent, you can view the risk score for files but not for hosts. To view the risk score for hosts, upgrade to the Advanced agent. For more information, see the *NetWitness Endpoint Configuration Guide*.

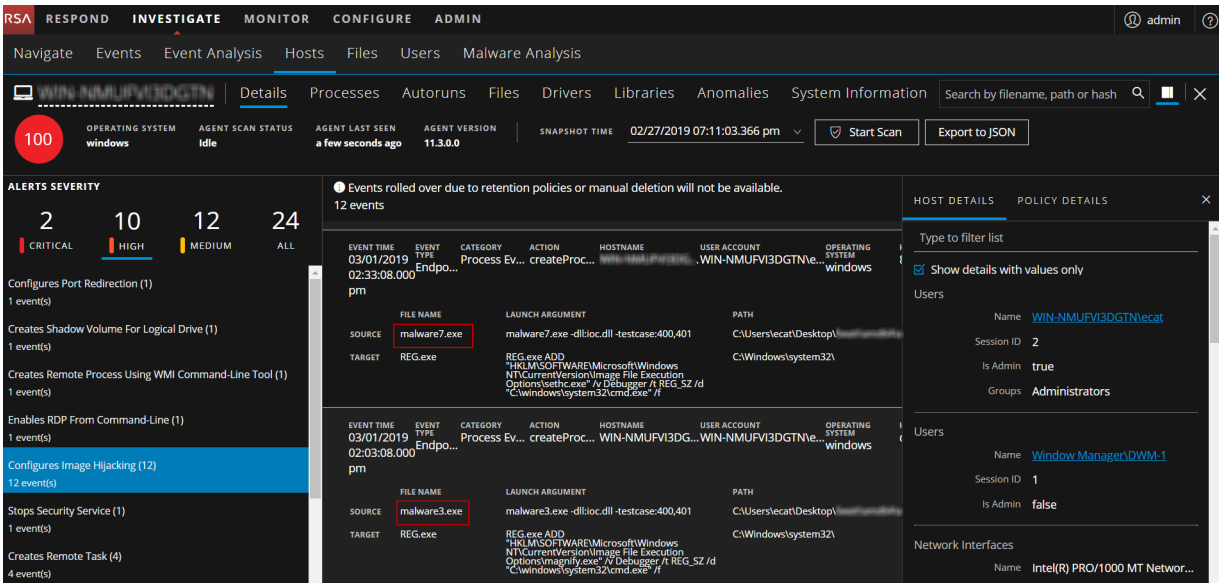
The following factors contribute to the risk score:

- **Distinct Alerts.** Any host or file activities that are suspicious or malicious generate alerts. Only the distinct alerts are used for risk score calculation.
- **Severity of Alerts.** Severity of alerts, such as critical, high, and medium.

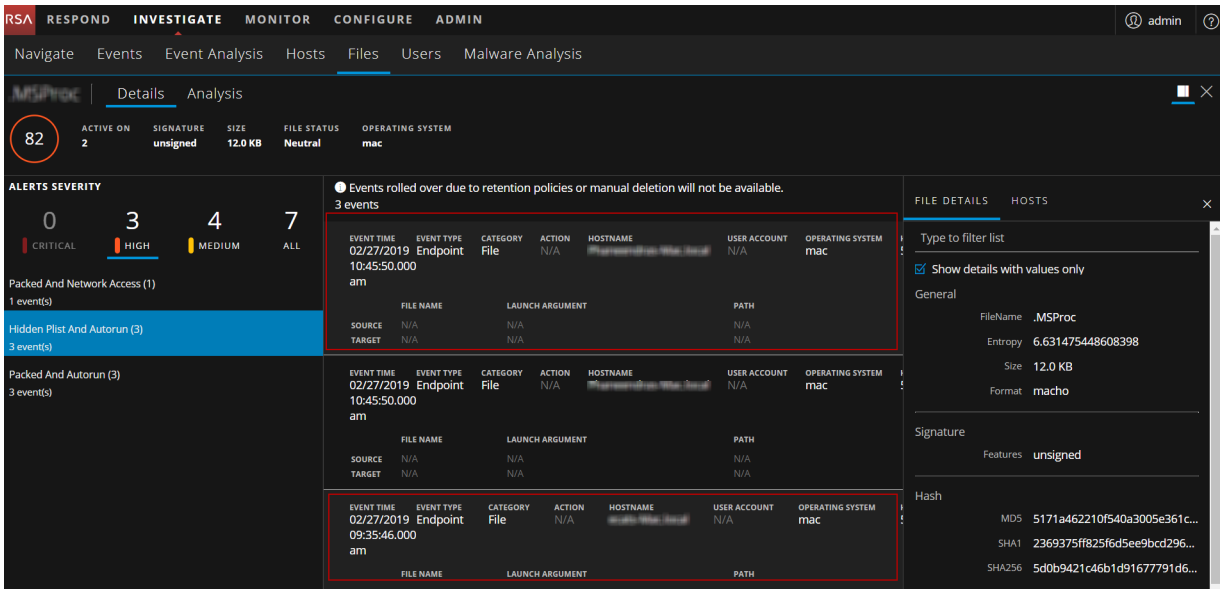
This figure is an example of a host with 2 Critical, 10 High and 12 Medium distinct alerts.



All the distinct alert shown in the above example can be for the same file or different files. For example, Configures Image Hijacking alert is triggered for files, such as `malware4.exe` and `malware7.exe`.



This figure is an example of files with distinct alerts. Each file can have a multiple distinct alerts. The files can have a same alert name being triggered by two different hosts as shown below.



Besides the above factors, the risk score is reset when you perform any of the following actions:

- Whitelist or blacklist a file after investigation. The risk score of a file is set to 0 on whitelisting and set to 100 on blacklisting.
- If the alerts or events triggered by the host or files on the host are false positive, you make changes to the Endpoint Application rules or ESA rules and reset the risk score.

Note: When you whitelist a file or reset the risk score, the alerts that contributed to the risk score are not shown in the Host Details tab.

The host risk score depends on the risk score of all the files on the host. When you change the file status or reset the file risk score, the host risk score is recalculated. For example, the score for all the hosts on which a blacklisted file is present is recalculated and becomes 100. If the host is not found to be infected, you can reset the host risk score. This deletes the alerts contributed to the risk score and does not impact the global file score. For more information on changing the file status, see Changing File Status or Remediate.

Note: For the risk score calculation, the ESA Correlation server must be configured with an Endpoint Concentrator. The application rules are automatically deployed on installation. For an upgrade, you must deploy the application rules from RSA Live. For more information, see the *NetWitness Endpoint Configuration Guide*.

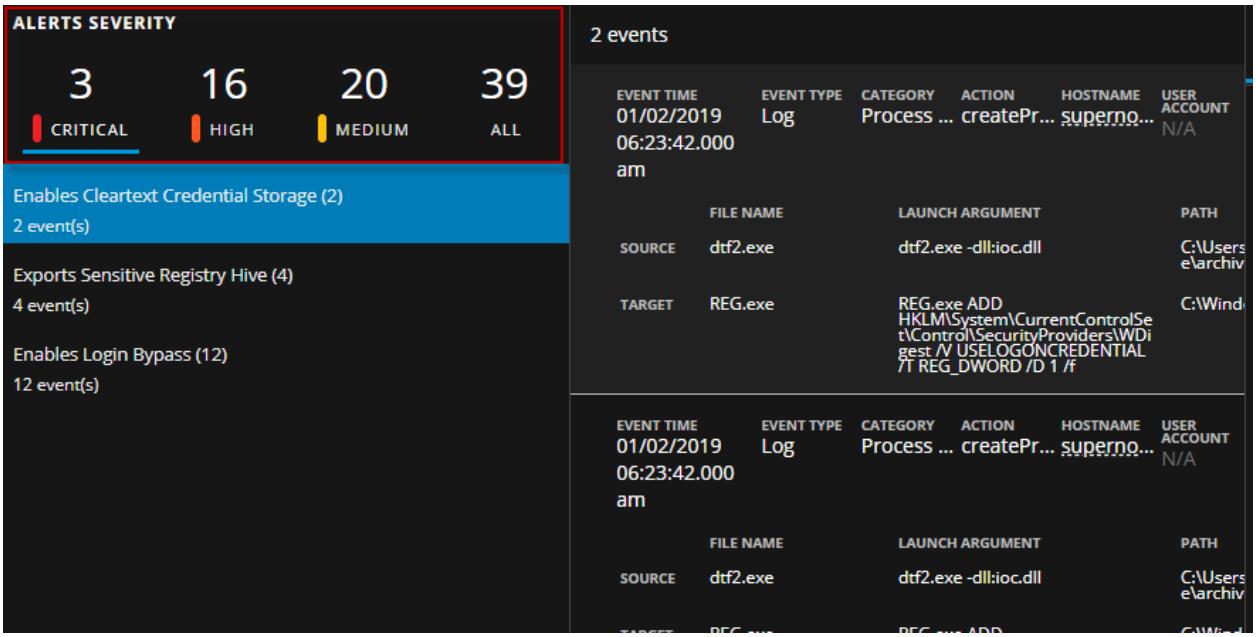
Severity of Alerts

The following table depicts the risk score range based on the associated alert severity:

Severity	Color	Risk Score Range
Critical	Red	100

Severity	Color	Risk Score Range
High	Orange	70-99
Medium	Yellow	31-69
Low	Green	0-30

The following is an example of alerts contributing to the risk score:



In the above example, there are three distinct critical alerts. For each alert type, associated events are displayed. You can see that the "Enables Cleartext Credential Storage" alert was triggered twice. The details of the two events are displayed with the metadata information. For more information on severity alerts and metadata information, see Analyze Hosts Using the Risk Score and Analyze Files Using the Risk Score.

Global and Local Risk Score

Analysts can get better context on file activities on hosts using the global risk score and the local risk score of a file.

Global Risk Score - The global risk score is an aggregate of all suspicious and malicious activities performed by the file across all hosts. This score indicates the potential threat posed by the file across the NetWitness Platform.

Local Risk Score - The local risk score is calculated on suspicious or malicious activities performed by the file on a specific host. The local risk score is used for the host risk score calculation.

For more information on the global and local risk score, see Investigating Files and Investigating Hosts.

Automated Incident Creation Based on Risk Score

By default, a threshold is set for the risk score to control the generation of incidents and alerts in NetWitness Respond. For more information on configuring the threshold limit, see the *NetWitness Respond Configuration Guide*.

File Reputation

The File Reputation service available on RSA Live checks the reputation of every file hash against an extensive database of known file hashes updated in real-time. The file reputation is displayed on the Investigate and Respond views.

The reputations for a file hash are:

Reputation	Description
Malicious	File hash is labeled as malicious.
Suspicious	File hash is suspected to be malicious.
Unknown	File hash is not known.
Known	File hash information is known to the file reputation service and does not have any previous bad record.
Known Good	File hash information is known good, such as files signed by Microsoft or RSA.
Invalid	File hash format is invalid.

The suspicious or malicious files are available for further analysis in the **Investigate > Navigate** view and **Investigate > Event Analysis** view. For more information on the file reputation service, see the *Live Services Management Guide*.

Note: The File Reputation service supports maximum of 10 million files for a reputation of file hash.

File Status

To help analysts triage and focus on their investigation, NetWitness Platform provides capabilities to manage suspect and legitimate files. For example, you can whitelist files that are legitimate (such as security products), or blacklist files based on known threats and investigation.

A file can be classified as follows:

- Blacklist: File that is marked suspicious, such as when ransomware is found by scan.
- Graylist: File that is marked for a later review.
- Whitelist: File that is legitimate and is not to be considered for risk scoring.
- Neutral: Default status.

Remediation

If a file is malicious or infected, you can block the file to prevent future execution on any host. Remediation helps to:

- Stop or reduce the spread of identified malware, such as viruses, trojans, rootkits, worms, spyware, and adware.
- Identify attempted breach points to aid in deeper analysis; all events are time-stamped allowing analysts to trace backward to identify the entry point.
- Remove unwanted software, such as adware, which can potentially mask real malware.
- Stop all actions possible by the loader.

You can block files with the following file extension: EXE, COM, SYS, DLL, SCR, OCX, BAT, PS1, VBS, VBE, and VB.

Focusing on Endpoint Analysis

This guide provides the information needed to conduct an investigation that is focused on endpoint data from configured hosts. Analysts who conduct analysis using Investigate need to have the appropriate system roles and permissions set up for their user accounts. An administrator must configure roles and permissions as described in Roles and Permissions for Endpoint Analysts. For more information on roles and permissions, see the *System Security and User Management Guide*.

To hunt for information on hosts that have the agent running, begin the investigation in the Hosts view (**INVESTIGATE > Hosts**). For every host, you can see processes, drivers, DLLs, files (executables), services, anomalies, and autoruns that are running, and information related to logged-in users. (See Investigating Hosts.)

You can begin the investigation on files in your deployment in the Files view (**INVESTIGATE > Files**). (See Investigating Files.)

Note: To access the Hosts and Files views, you must have the `endpoint-server.filter.manage` permission.

Analysts use the Hosts and Files views to investigate or perform analysis on hosts or files using attributes such as IP address, host name, Mac address, risk score, and so on. This figure shows the high-level capabilities of an endpoint investigation. The top box are all the possible starting points, and the lower box shows the tasks that you can accomplish from different starting points.

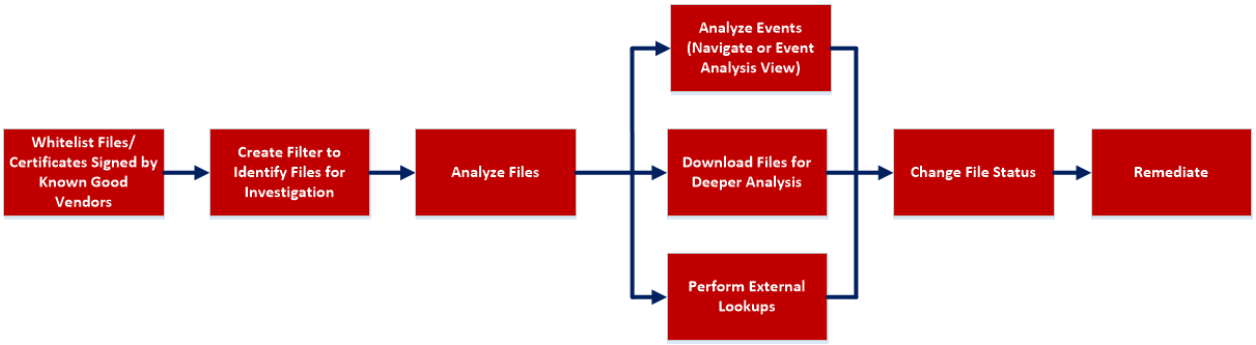
Investigating Files

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.3 and later.

The Files view provides a holistic view of all files in your deployment. You can apply various filters, sort, and categorize files into different status to reduce the number of files for analysis and identify suspicious or malicious files.

Best Practices

The following are some best practices and tips that may help you investigate efficiently to identify and isolate threats or attacks:



- Whitelist all files signed by RSA, Microsoft, and any other known good vendors. Use the filters to list the files and change the status of all these files to whitelist. For more information, see Filter Files and Changing File Status or Remediate.

  Note: Some Microsoft signed files are restricted from whitelisting as there is a potential risk of them being used for malicious purposes. To view the list, see Files Restricted from Whitelisting.

- Change the status of certificate and the associated files automatically. For more information, see Analyze Certificates.
- Filter to exclude whitelisted, files with valid signature, known good files based on reputation status. For more information, see Filter Files.
- Lookup Google or VirusTotal with the filename or hash to get more information about a suspected file. For more information, see Launch an External Lookup for a File.
- Analyze the files using one or more of these indicators:

  a. Risk score - Displays the risk score for a file. Analysts can view the associated alerts and events for further investigation. For more information, see Analyze Files Using the Risk Score.

  b. Active on - Indicates the number of hosts on which this file is active in the past seven days. This helps an analyst to determine whether the file is of interest or not. If a file is present on fewer hosts with a high risk score, it may require further investigation. For more information, see Analyze Hosts with File Activity.

c. File status - To manage suspected and legitimate files, analysts can use the file status to manage. For more information on the various file status, see Changing File Status or Remediate.

d. Reputation status - Indicates the reputation of a file hash for analyst to narrow-down the files to investigate. For more information, see File Reputation.

e. Signature - A valid signature on a file signed by a trusted vendor, such as Microsoft and Apple indicates that the file is not a risk. If a file is unsigned, it may be malicious, and needs investigation.

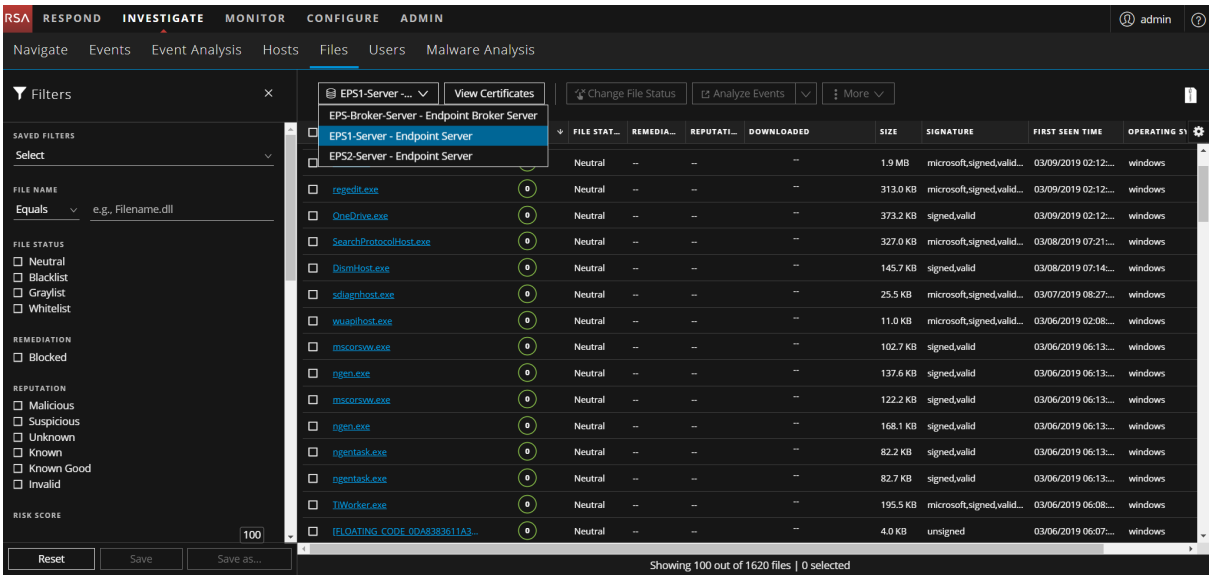
f. File name - Many trojans write random file names when dropping their payloads to prevent an easy search across the hosts in the network based on the filename. For example, if a file is named `svch0st.exe`, `scvhost.exe`, or `svchosts.exe`, it indicates that the legitimate Windows file named `svchost.exe` is being mimicked.

- Investigate a particular file name or hash by pivoting to Navigate or Event Analysis view to view context, file activity on different hosts, and any file transfers across the network through packet data. For more information, see Analyzing Events.
- Download suspicious files to the server for deeper analysis. For more information, see Analyzing Downloaded Files.
- Change the status of the file (blacklist or graylist), and block an infected or malicious file. For more information, see Changing File Status or Remediate.

View Files

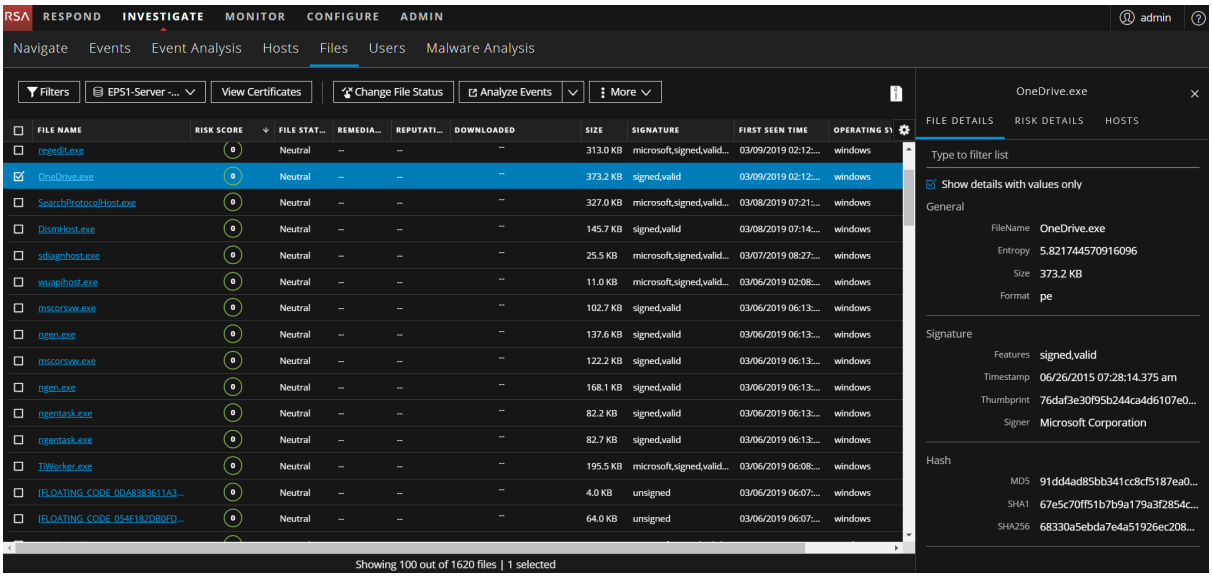
You can view all files present on a specific Endpoint server or consolidated list of all files on multiple Endpoint servers using the Endpoint Broker for analysis. To view files:

1. Go to **INVESTIGATE > Files**.
2. Select one of the following:



- **Endpoint Broker Server** to view all files across all Endpoint servers.
- **Endpoint Server** to view files on a specific Endpoint server.

3. Select the file that you want to analyze.
4. Click a row to view the following details:

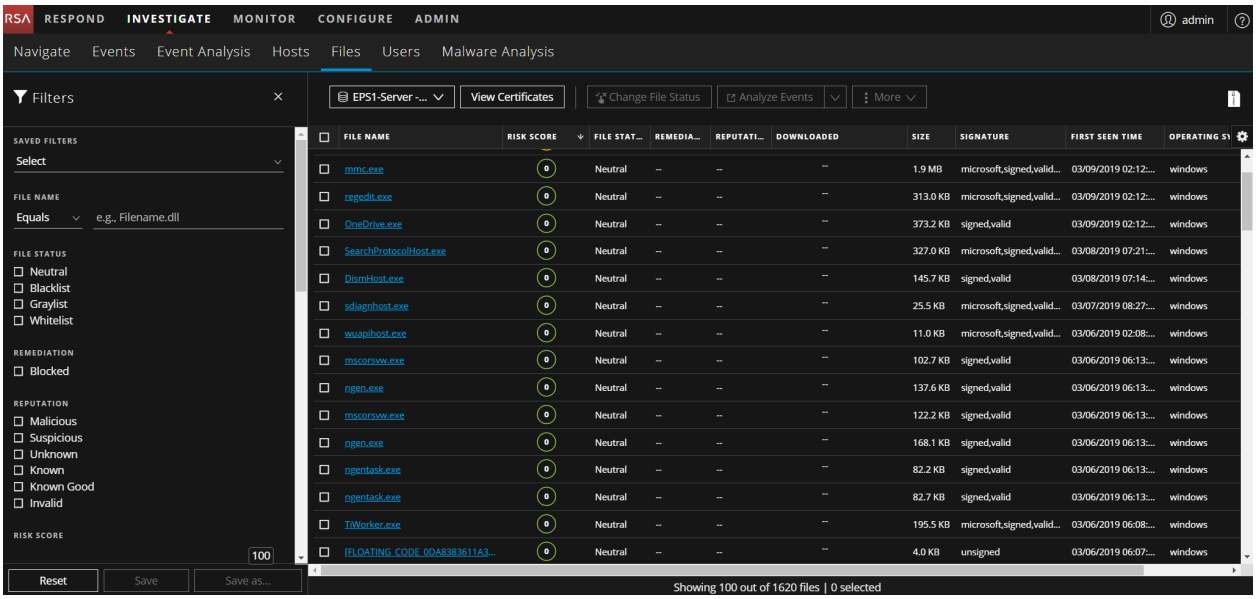


- **File Details** displays the file information. For more information, see Launch an External Lookup for a File.
- **Risk Details** displays the distinct alerts associated with the risk score. For more information, see Analyze Files Using the Risk Score.
- **Hosts** displays the number of hosts on which file activities are present. For more information, see Analyze Hosts with File Activity.

Filter Files

You can narrow down the search by filtering files on file name, file status, risk score, remediation, reputation status, operating system, size, entropy, format, signature, company name, checksum (MD5 and SHA256), and downloaded status.

Note: While filtering on a large data set, use at least one indexed field with the `Equals` operator for better performance. The following fields are indexed in the database - Filename, MD5, SHA256, Operating System, First Seen Time, Format, Risk Score, File Status, and Reputation Status.



Select the parameters in the Filters tab. Click **Save** to save the search and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters list. To delete a filter, hover over the name and click .

Note: Special characters are not allowed in the filter name except underscore (_) and hyphen (-) while saving the filter.

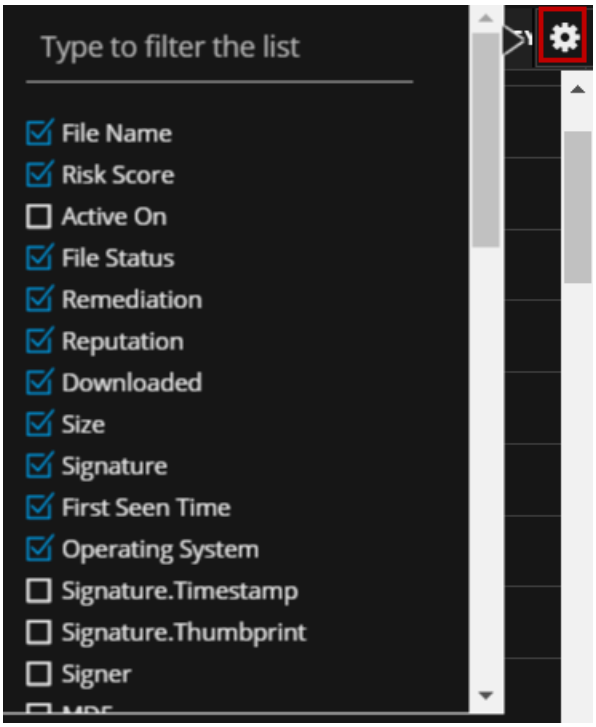
For example, to filter the files based on file reputation, select the reputation status in the Filter panel.

Note: For the file size, 1 KB is calculated as 1024 bytes. For example, if the actual size of the file is 8421 bytes, the UI will display it as 8.2 KB instead of 8.22 KB. It is recommended to search using the bytes format when using the `Equals` operator.

Add and Sort Columns in the Table

By default, the Files view displays a few columns, and files are sorted based on the risk score. To add or remove columns:

1. Go to **INVESTIGATE > Files**.
2. Select the columns by clicking in the right-hand corner.



3. Scroll down or enter the keyword to search and select the required columns.
4. To sort the column in ascending or descending order, click the arrow on the column header.

Analyze Files Using the Risk Score

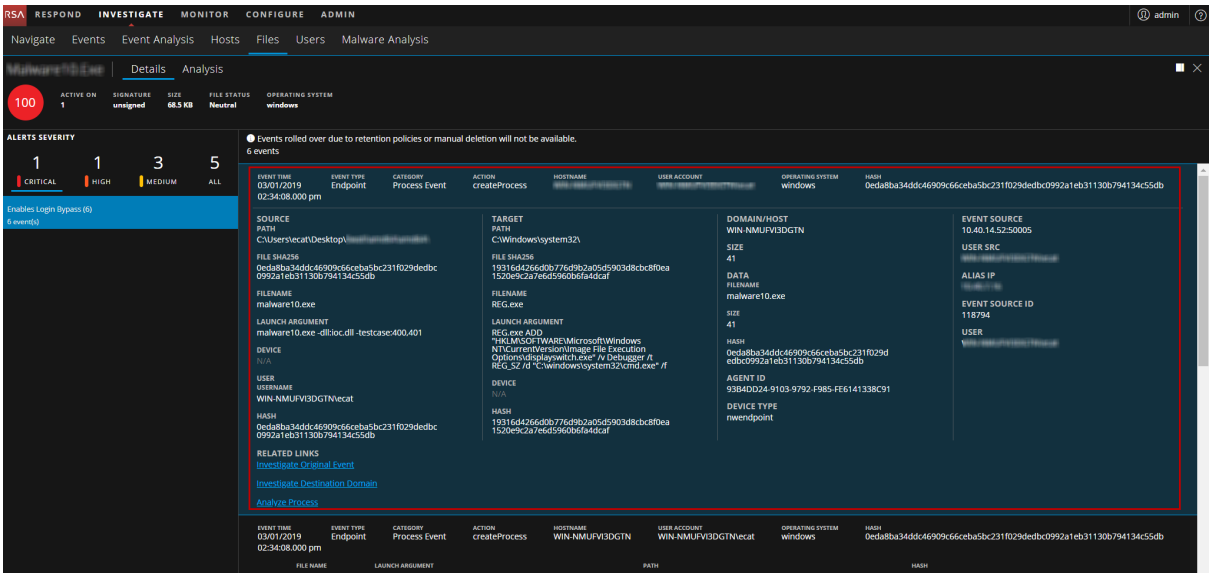
To analyze files using the risk score:

1. Go to **INVESTIGATE** > **Files**.

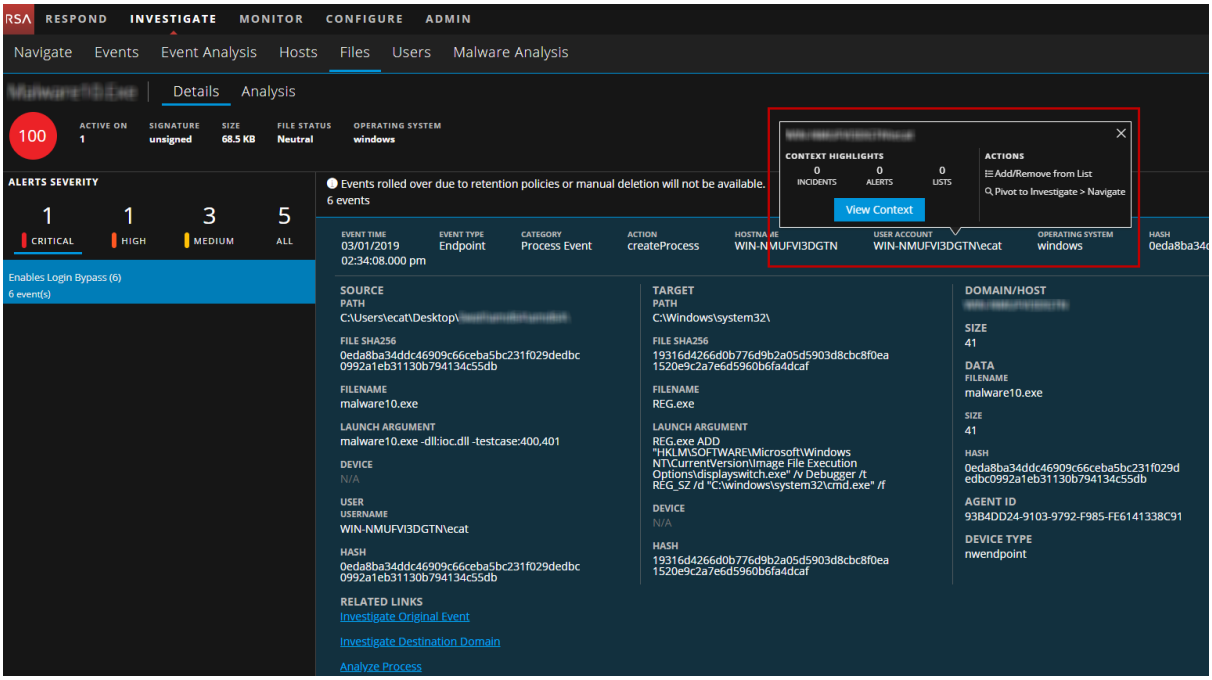
   The Files view is displayed.
2. In the Server drop-down list, select the Endpoint server or Endpoint Broker server to view the files.
3. Select the file and do any of the following.
   - Click a row to view the risk associated with the file in the **Risk Details** panel.
   - Click the hostname to investigate the host.

     The Details tab is displayed.
4. In the **Alert Severity** panel, click the alert severity, such as **Critical**, **High**, **Medium**, or **All**.
   The list of distinct alerts is displayed along with the total number of events associated with the alert.
5. Click an alert to view the associated events.

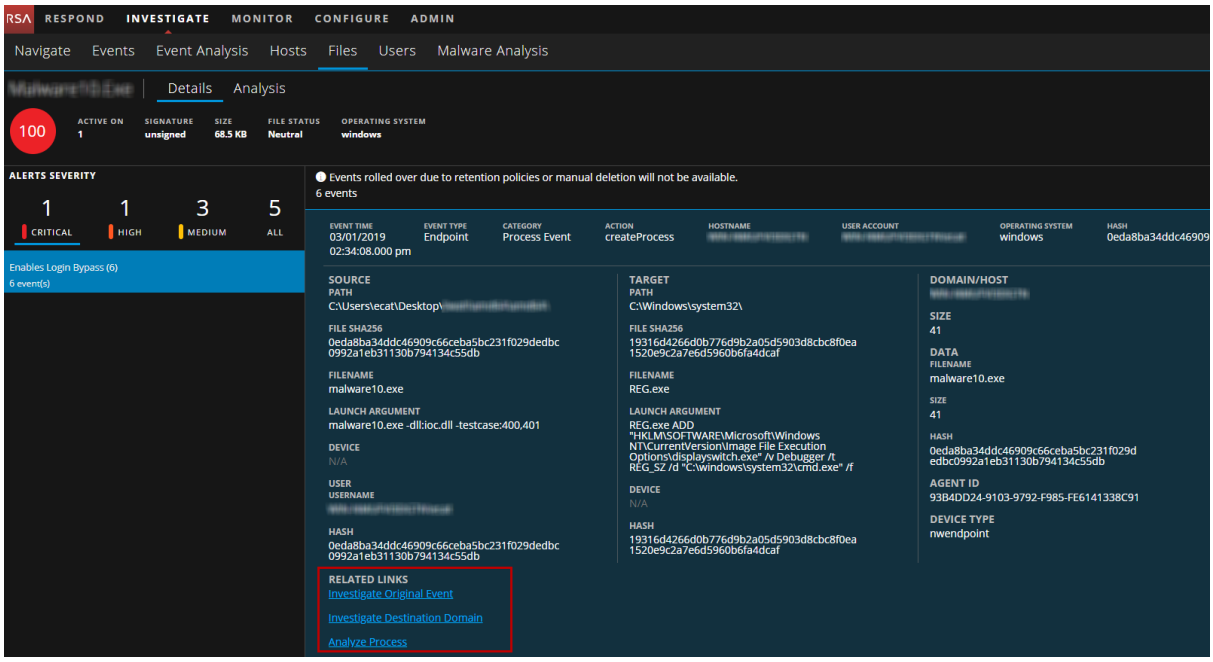
   Note: Only the latest 1000 events are displayed.
6. To view all the metadata associated with a specific event, click the event header. The information such as source path, target path, filename, and others is displayed.



7. Hover over one of the meta values for IP, Hostname, Mac, File name, File hash, User, and Domain to view additional information about the specific metadata. A hover box displays a list of the data sources that have context data available for meta value. These are the possible data sources: NetWitness Endpoint, Incidents, Alerts, Hosts, Files, Feeds, and Live Connect.



8. To investigate the original event and destination domain of the event, do any of the following:



- To reconstruct an event in a readable form that matches the original, click the **Investigate Original Event** link highlighted in blue. For more information on event reconstruction, see the *NetWitness Investigate User Guide*.
- For details about the elements associated with an event, click the **Investigate Destination Domain** link highlighted in blue. For more information on Contextual Information for an Event, see the *NetWitness Investigate User Guide*.

  Note: Investigate Destination Domain link is not displayed if there is no domain.dst event.

- To view a list of processes captured on the hosts and investigate a particular process, click the **Analyze Process** link highlighted in blue. For more information on process analysis, see Investigating a Process.

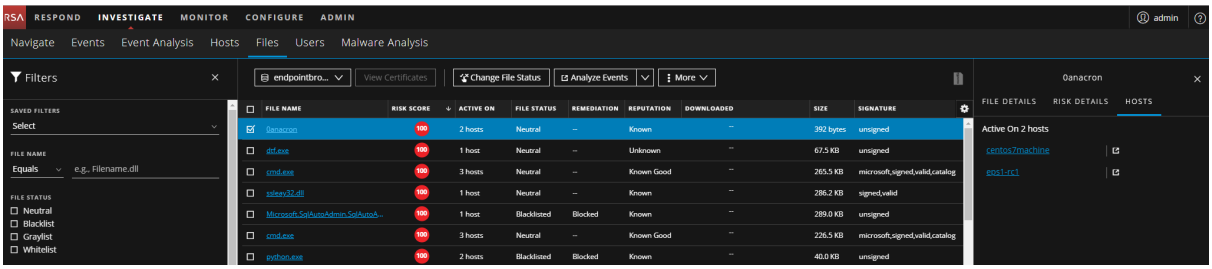
  Note: Analyze Process link is not displayed if there is no createprocess event.

Analyze Hosts with File Activity

To view the list of hosts on which the file activities are present, do the following:

Note: By default, the system detects the best data source for the active on aggregation. To change the data source, modify the investigate service ID under `endpoint/investigate` in the Explore view.

1. Click the number in the **Active on** column for the file you want to analyze.
2. In the right panel, click the **Hosts** tab. The list of hosts is displayed.



3. Click the host name to open the host details.

4. Click to analyze events on the host in the Event Analysis view. For more information, see Analyzing Events.

Launch an External Lookup for a File

While analyzing a file, you can search Google or VirusTotal with the filename or hash to get more information about the file. To launch the search:

1. Go to **INVESTIGATE > Files**.

2. View the details of the file name and hash from the table MD5, SHA1, and SHA256 columns, or view the details in the File Details tab on the right panel.

3. Select one or more files, and right-click or in the **More** drop-down list in the toolbar, do the following:

   a. Select **Google Lookup** and perform a search on the filename, MD5, SHA1, or SHA256.

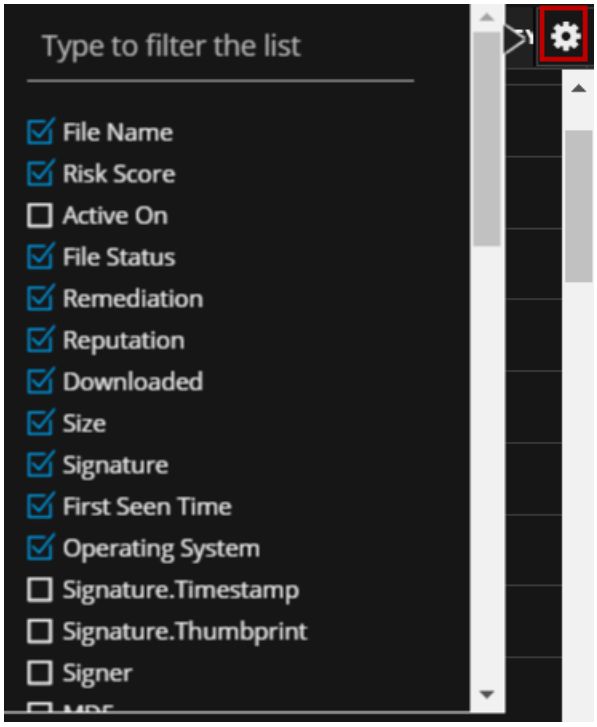
   b. Select **VirusTotal Lookup** and perform a search on MD5, SHA1, or SHA256.

Note: To open files in multiple tabs, make sure you enable the pops-up in the browser.

Set Files Preference

By default, the Files view displays a few columns and the files are sorted based on the risk score. If you want to view specific columns and sort data on a specific field:

1. Go to **INVESTIGATE > Files**.
2. Select the columns by clicking in the right-hand corner. The following example shows the drop-down list displayed while adding columns:



3. Sort the data on the required column.

Note: The selections you make here become your default view every time you log in to the Files view.

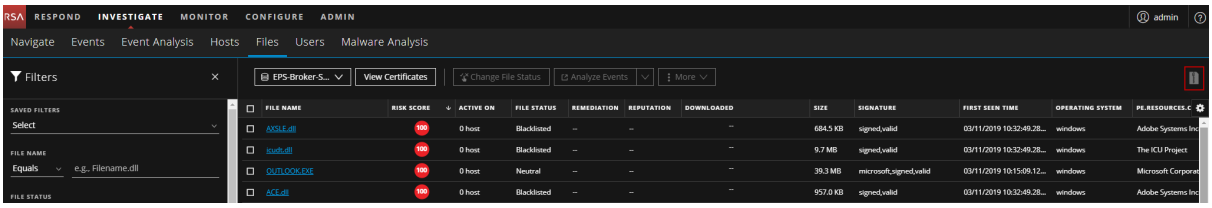
Export Global Files

To extract the list of global files to a comma-separated values (csv) file:

Note: While filtering on a large data set, use at least one indexed field with the `Equals` operator for better performance. You can export up to 100k files at a time.

1. Go to **INVESTIGATE > Files**.
2. Filter the files by selecting the required filter option.
3. Add columns by clicking in the right-hand corner.
4. Click

to export the files to a csv file.



You can either save or open the CSV file.

Note: This exports all columns in the table except Active on.

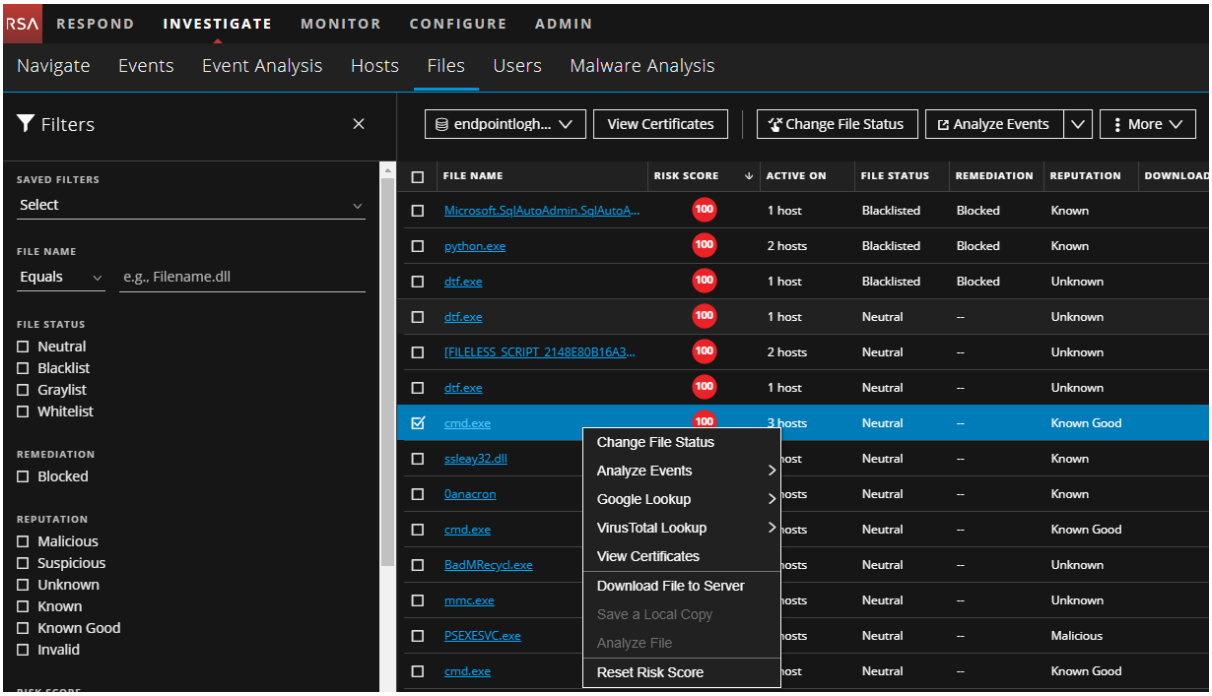
Analyze Certificates

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.3 and later.

The Certificates view provides a list of code-signing certificates reported by hosts found in your deployment and their associated properties. You can select the certificates under a specific Endpoint server.

To view the certificates in an Endpoint server:

1. Go to **INVESTIGATE > Files**.
2. From the drop-down menu, select the Endpoint server to view certificates present on that server. To view a consolidated list of certificates, select the Endpoint Broker server.
3. Select a file and do one of the following:



- Right-click and select **View Certificates** from the context menu.
- Click **View Certificates** in the toolbar.

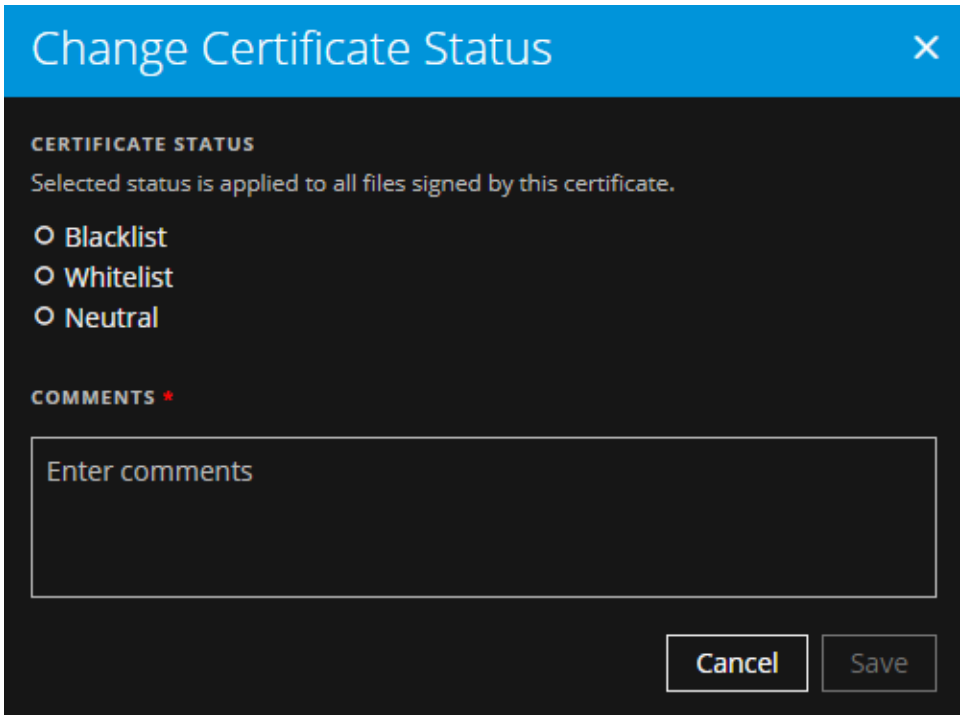
Change the Certificate Status

You can assign a Whitelist status to the certificate signed by certain trusted vendors and this status can be automatically applied to all files that is signed by this certificate. If you consider abc a trusted vendor, you can set the status for the certificates signed by abc as Whitelist.

Similarly, you can also set the certificate status as Blacklist or Neutral. If a company's certificate is stolen or compromised, you can blacklist this certificate and remediate.

To change the certificate status:

1. Select a certificate, and click **Change Certificate Status**.



2. In the Change Certificate Status dialog, select a status - Blacklist, Whitelist, or Neutral.

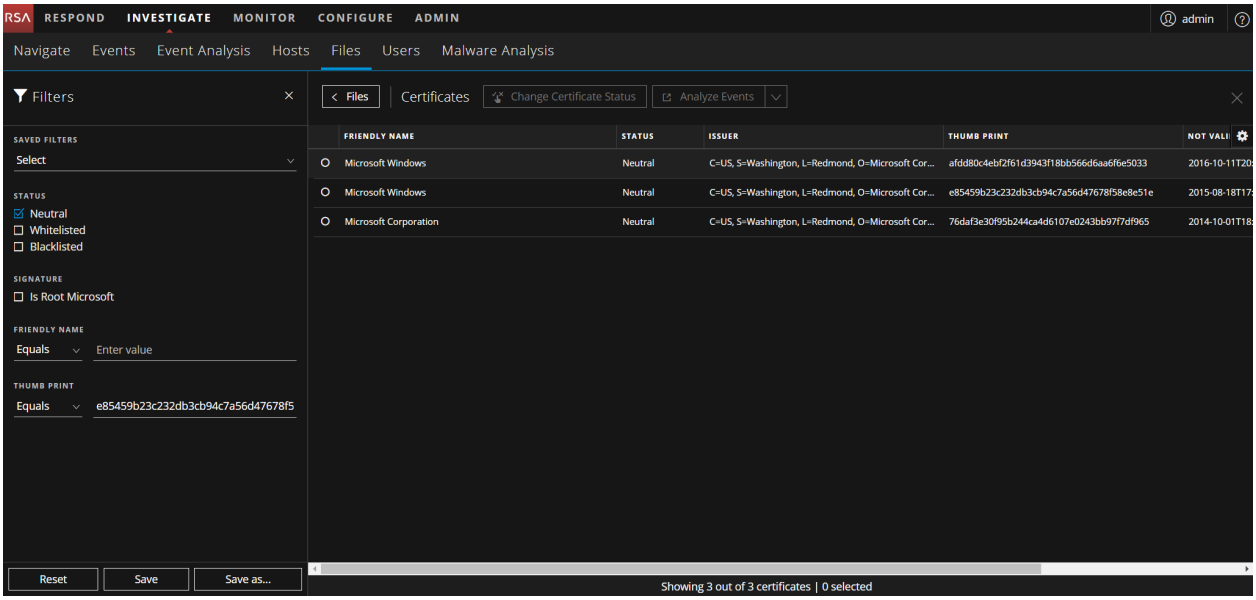
   Note: If you have manually updated a file status in the Files or Hosts view, changing the status in the Certificate view does not impact the file status as the manual update takes precedence. For example, if you have whitelisted the file vmci.sys that is signed by VMware, Inc. in the Files or Hosts view, and you have blacklisted VMware, Inc. in the Certificate view, the file vmci.sys remains Whitelisted though the certificate is blacklisted.

3. Add a comment and click **Save**.
4. Click **< Files** to go to the Files view.

Note: In a multi-server environment, changing the status of a certificate in one endpoint server updates the respective files in other endpoint servers. For example, if a certificate status is set to Blacklist on one endpoint server, all files signed by this certificate are set to Blacklisted on all endpoint servers.

Filter Certificates

You can filter certificates on status, signature, friendly name, and thumb print.



Click **Save** to save the filter and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters list. To delete a filter, hover over the name, and click .

Note: Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.

Resetting Risk Score of Files

You can reset the risk score for a file in these situations:

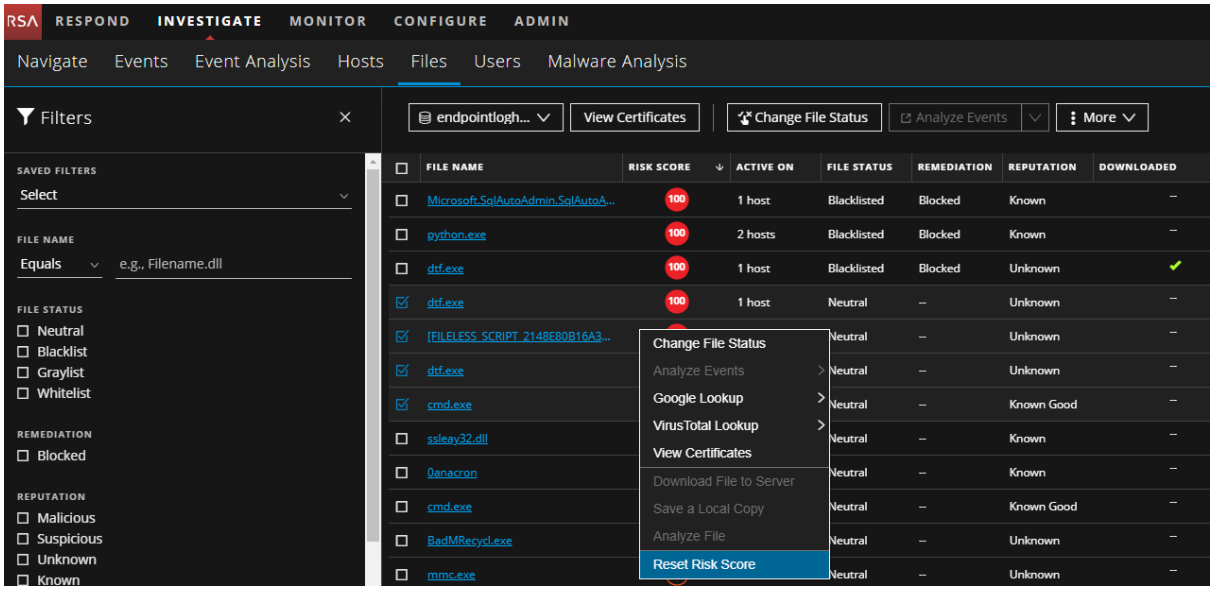
- If the alerts or events triggered by the host or a file are considered to be false positive, you can make required changes to the Endpoint Application rules or ESA rules.
- After you take required action on a malicious file.

When you reset the risk score, the risk calculation for the file is deleted and score is set to 0. The risk score on all the hosts on which this file exists is recalculated. You can reset the risk score for a single file or multiple files.

To reset the risk score of a file:

1. Go to **INVESTIGATE** > **Files**.
2. Select the Endpoint Server or Endpoint Broker.

3. Select one or more files and do one of the following:



- Right-click and select **Reset Risk Score** from the context menu.
- Click **More Actions** > **Reset Risk Score** in the toolbar.

All the alerts associated with the score are deleted.

Note: You can select a maximum of 100 files to reset the score.

4. Refresh the page to view and confirm if the file's score is reset. This may take sometime for changes to take effect.

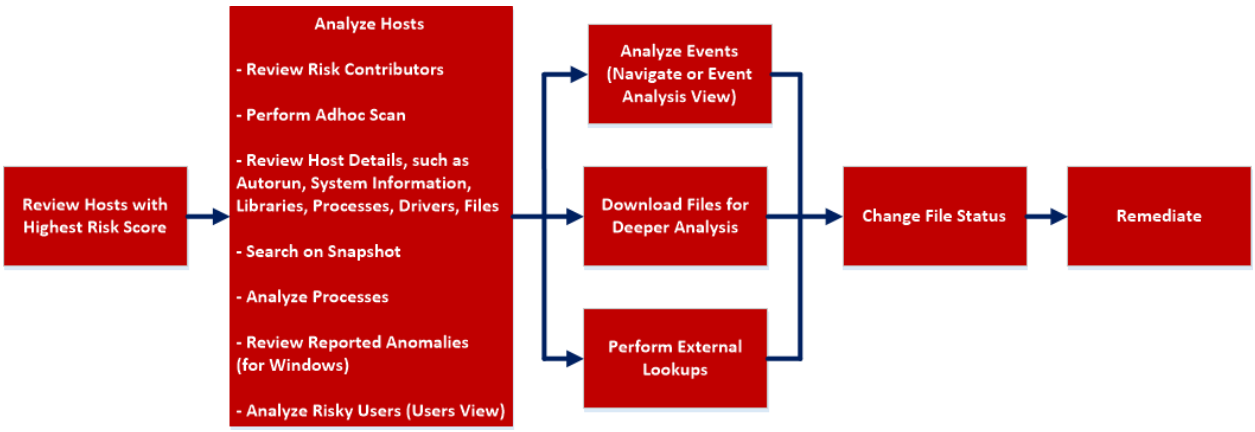
Investigating Hosts

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.3 and later.

The Hosts view allows you to investigate on a host, which includes scan details, tracking events related to alerts, anomalies, and process details.

Best Practices

The following are some best practices and tips that may help you investigate efficiently to identify and isolate threats or attacks:



- Review hosts with highest risk score and analyze the alerts contributing to the risk. Review the entities, such as file name, processes involved in the alerts. For more information, see Analyze Hosts Using the Risk Score.
- Review files or processes that created this suspected file, and check if any other files are accessed or created in the Event Analysis view. For more information, see Analyzing Events.
- Review hosts for rare files in the **Active On** column. If a file is present on 100 hosts, it might be legitimate. If a file is present on fewer hosts with a high risk score, it could be malicious and needs further investigation.
- Search Google or VirusTotal with the file hash and review any reported activities. For more information, see Launch an External Lookup for a File.
- Review the processes, autoruns, files, libraries, drivers, and system information. For example,
  - Search for files in known malware locations. For example,
    - C:\Windows\.
    - C:\Users\<name>\AppData\<uncommon folder>.

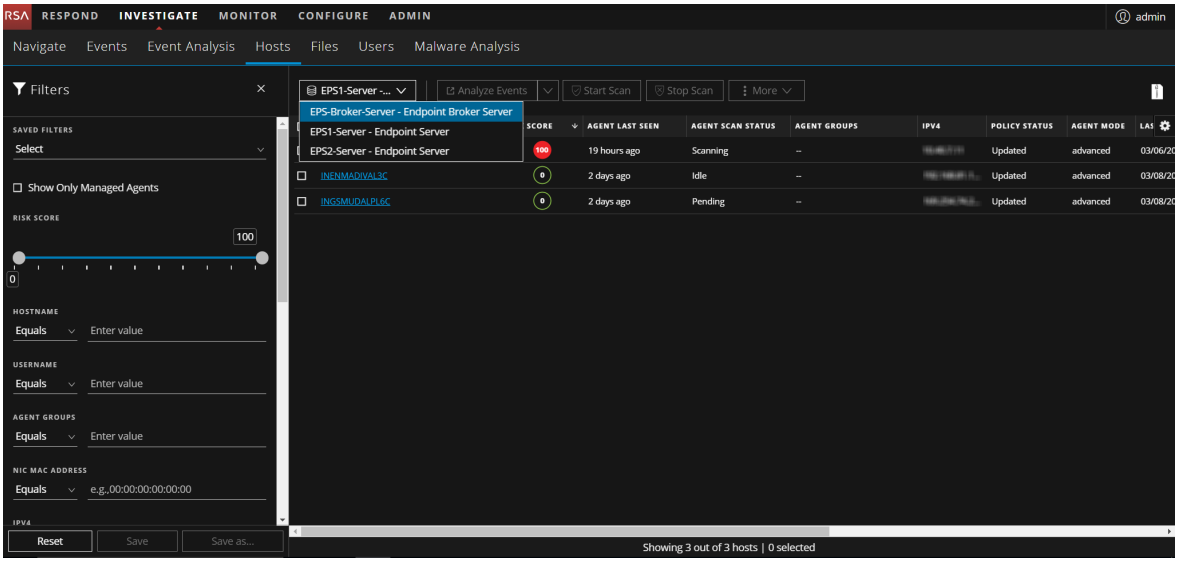
    - C:\Users\<name>\AppData\Local\Temp.
    - C:\Windows\Temp\.
  - Search for a particular file name or hash and review the snapshot to check when the file was first seen.
  - Review any network connections established by the process, such as:
    - Domain or IP address.
    - Ports used (common (80 and 443) versus uncommon ports (8080 , 8888, and 3465)) and check if the ports are listening actively.
  - Check the file compile time. If the date is recent, it could be malicious.
  - Check the file creation time on the host.
- Review reported anomalies, such as suspicious threads, kernel hooks, image hooks, and registry discrepancies. For more information, see Analyze Anomalies.
- Launch Process Analysis to view the sequence of activities performed on the host by the file or process. For more information, see Analyze Processes.
- Download suspicious files to the server for deeper analysis. For more information, see Analyzing Downloaded Files.
- After investigation if a file is found to be malicious you change the status of the file (blacklist or graylist) and block infected or malicious file. For more information, see Changing File Status or Remediate.

View Hosts

You can view all hosts present on a specific Endpoint server or consolidated list of all hosts on multiple Endpoint servers using the Endpoint Broker for analysis. By default, hosts are sorted based on the risk score. To view the hosts:

1. Go to **INVESTIGATE** > **Hosts**.
2. Select from the following:
   - **Endpoint Broker Server** to view all hosts across all Endpoint servers. When querying, the Endpoint Broker ignores Endpoint servers that are offline. If the Endpoint server is online but is not responding, the Endpoint Broker waits for 10 seconds, and ignores if it does not respond.

- **Endpoint Server** to view hosts on a specific Endpoint server.

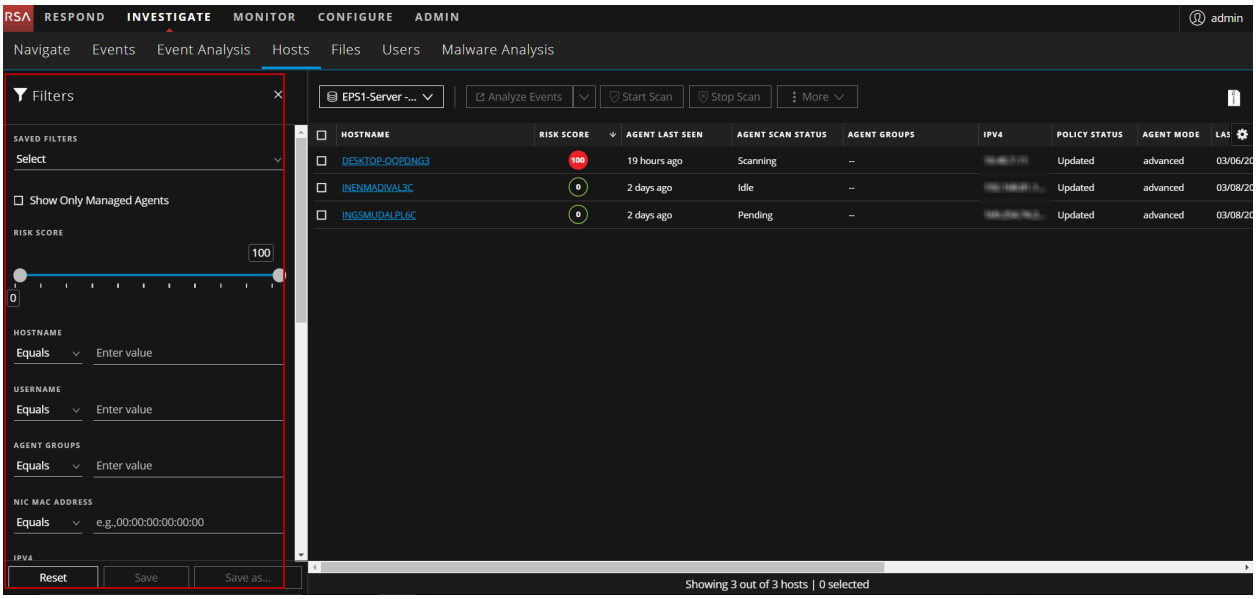


3. Select a host that you want to analyze.
4. Click a row to view the following details:
   - **Host Details** displays the host information such as Network Interfaces, operating system, hardware and others.
   - **Risk Details** displays the distinct alerts associated to the risk score and the alerts severity. Click **Critical**, **High**, **Medium**, or **All** to display all the alerts. For more information, see Analyzing Risky Users.
5. Click **Show next 100 hosts** to view other hosts.
6. Click the host name to investigate the scan results. For more information, see Analyze Host Details.

Filter Hosts

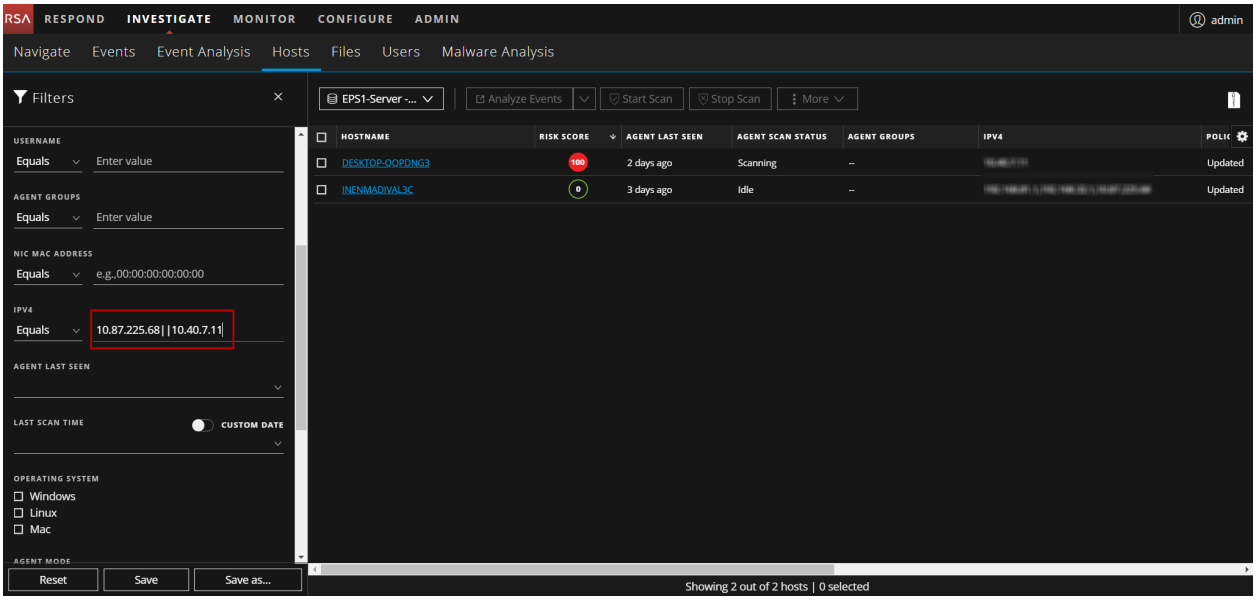
You can filter hosts on agent version, agent ID, agent mode, agent last seen time, last scan time, operating system, hostname, username, managed agents, Mac address, risk score, IPV4, driver error code, security configurations, and agent groups.

Note: While filtering on a large amount of data, use at least one indexed field with the `Equals` operator for better performance. The following fields are indexed in the database - Hostname, IPv4, Operating System, Last Scan Time, and Risk Score.

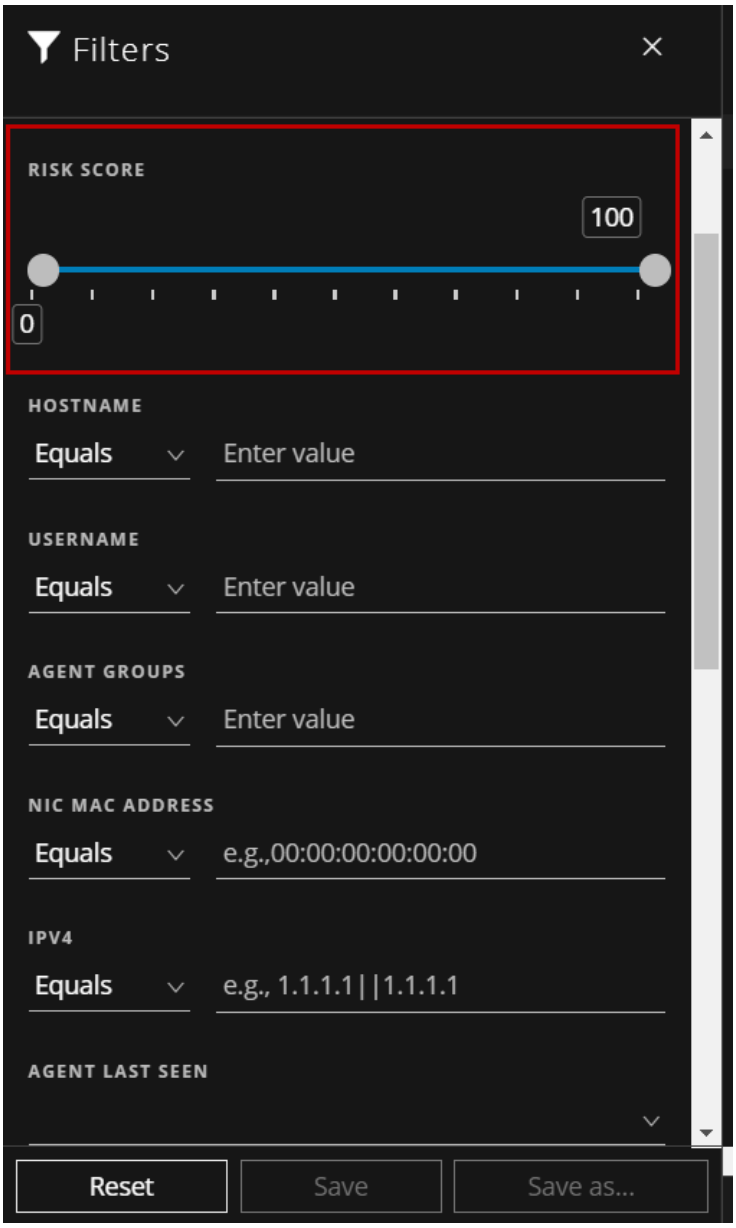


To search multiple values within a field, set the filter option to `Equals`, and use `||` as a separator.

For example, using `Equals` operator for multiple IPV4 values with a separator `||`.



To filter on the risk score, use the slider to increase or decrease the values between 0 to 100.



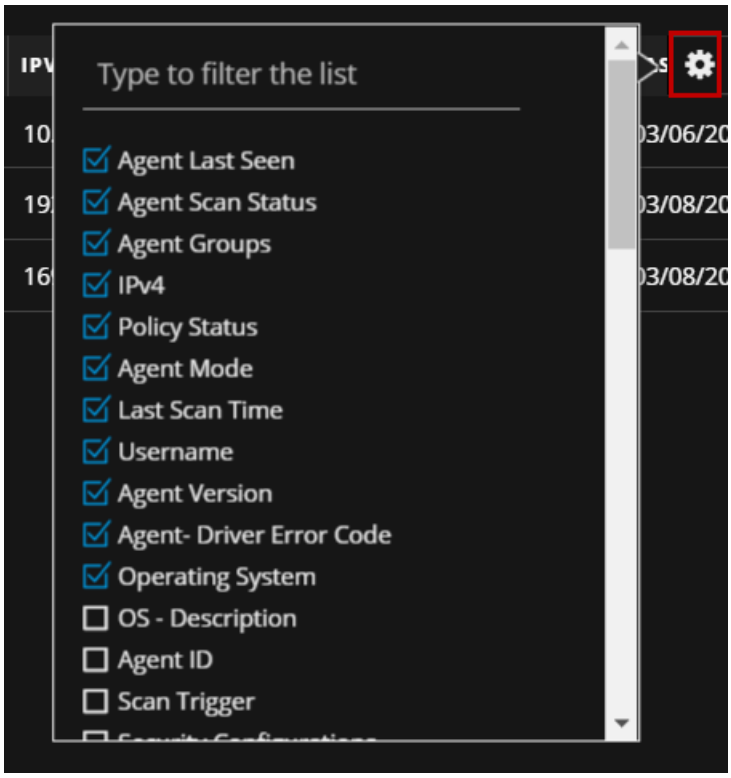
Click **Save** to save the search and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters panel on the left. To delete a filter, hover over the filter name and click .

Note: Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.

Adding and Sorting Columns in the Table

By default, the Hosts view displays a few columns and the hosts are sorted based on the risk score. To add or remove columns:

1. Go to **INVESTIGATE** > **Hosts**.
2. Select the columns by clicking in the right-hand corner.



3. Scroll down or enter the keyword to search for the column.
4. Click the arrow on the column header to sort the column in ascending or descending order.

Scan Hosts

You may want to perform an on-demand scan if you want to get the latest snapshot of the host.

When the hosts are scanned, the Endpoint Agent retrieves the following data that can be used for investigation:

- Drivers, processes, DLLs, files (executables), services, autoruns, anomalies, host file entries, and scheduled tasks running on the host.
- System information such as network share, installed Windows patches, Windows tasks, logged-in users, bash history, and security products installed.

To start a scan:

1. Go to **INVESTIGATE** > **Hosts**.
2. Select one or more hosts (up to 100) at a time for an on-demand scan, and do one of the following:

- Right-click and select **Start Scan** from the context menu.
- Click **Start Scan** in the toolbar.

3. Click **Start Scan** in the dialog. This performs a quick scan of all executable modules loaded in memory.

   The following are the scan statuses:

Status	Description
Idle	No scan is in progress.
Scanning	Scan is in progress.
Pending	Scan request is sent to the server and the agent will receive the request the next time it communicates with the server.
Cancel	Stop request is sent to the server and the agent will receive the request the next time it communicates with the server.

Analyze Hosts Using the Risk Score

You can investigate a host by analyzing the risk contributors such as alerts and events to look for suspicious or malicious activity.

To analyze the hosts using the risk score:

1. Go to **INVESTIGATE** > **Hosts**.

   The Hosts view is displayed.

2. In the Server drop-down list, select the Endpoint server or Endpoint Broker server to view the hosts.

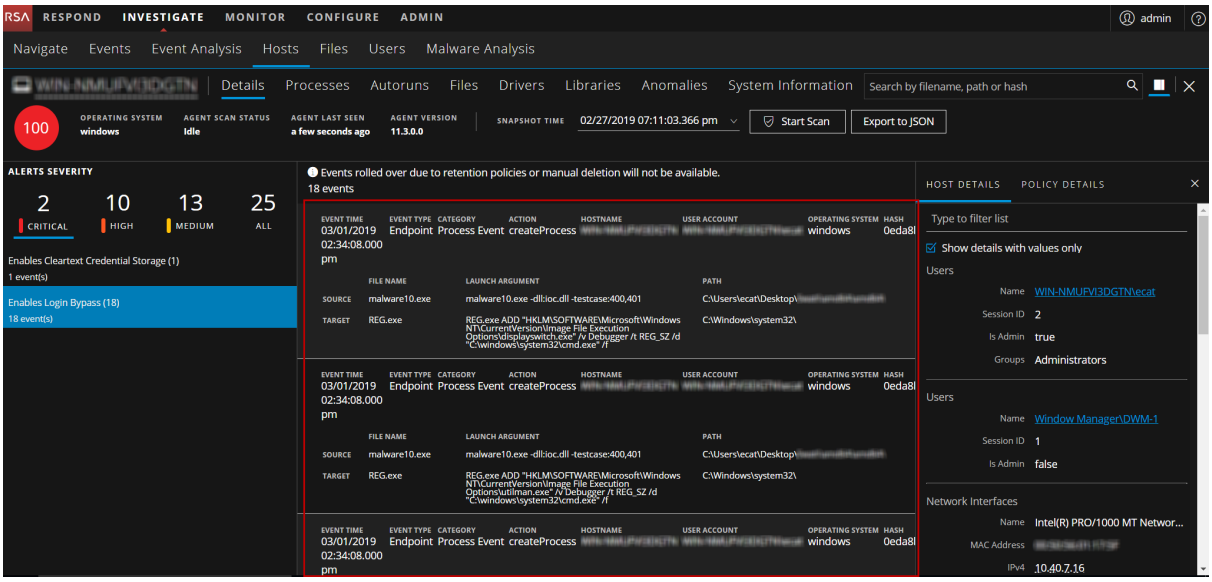
3. Select the host and do any of the following.

   - Click a row to view the risk associated with the host in the **Risk Details** panel.
   - Click the hostname to investigate the host.

4. In the **Alert Severity** panel, click the alert severity such as **Critical**, **High**, **Medium**, or **All**.

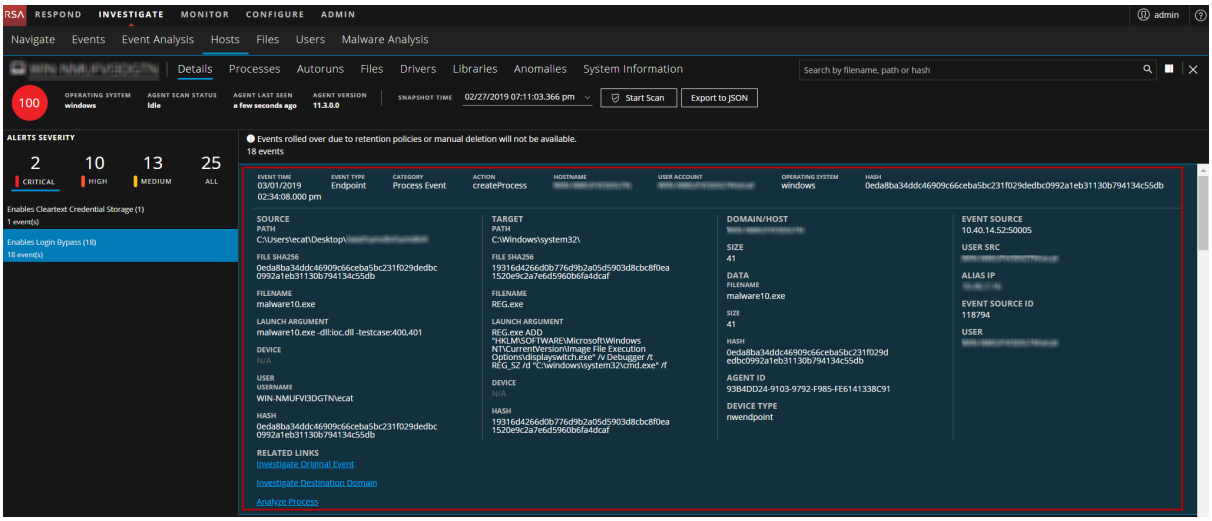
   The list of distinct alerts is displayed along with the total number of events associated with the alert.

5. Click an alert to view the associated events.

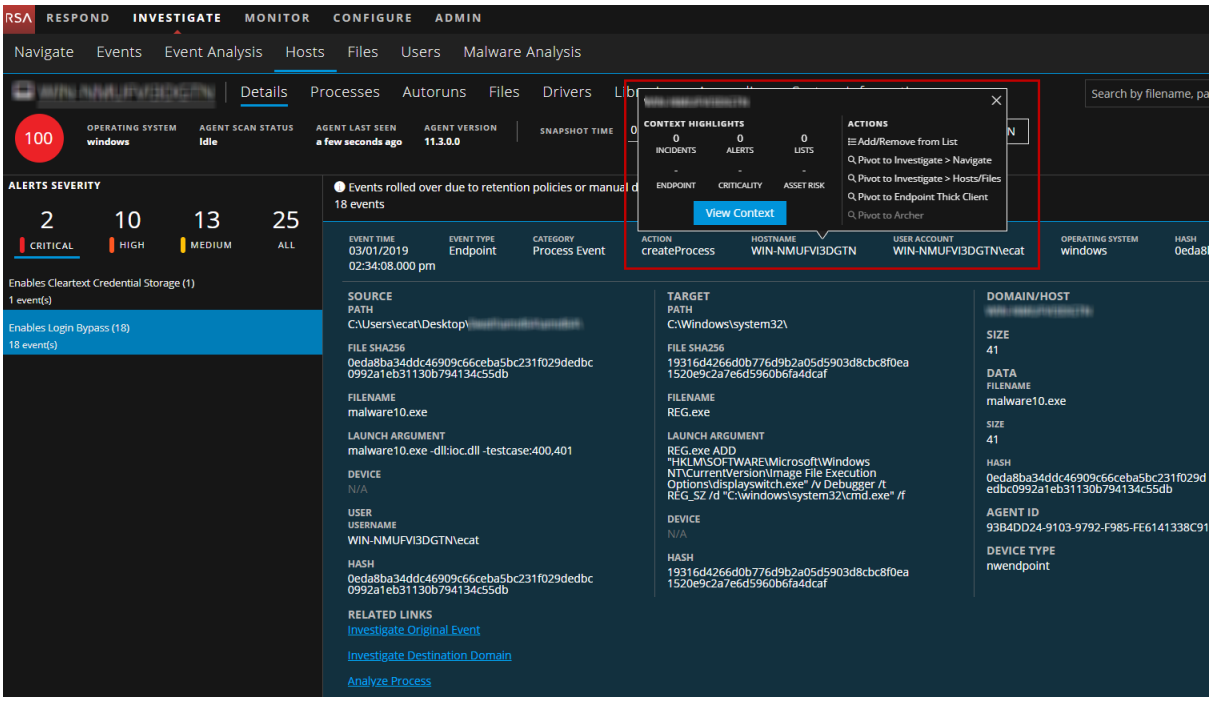


Note: Only the latest 1000 events are displayed.

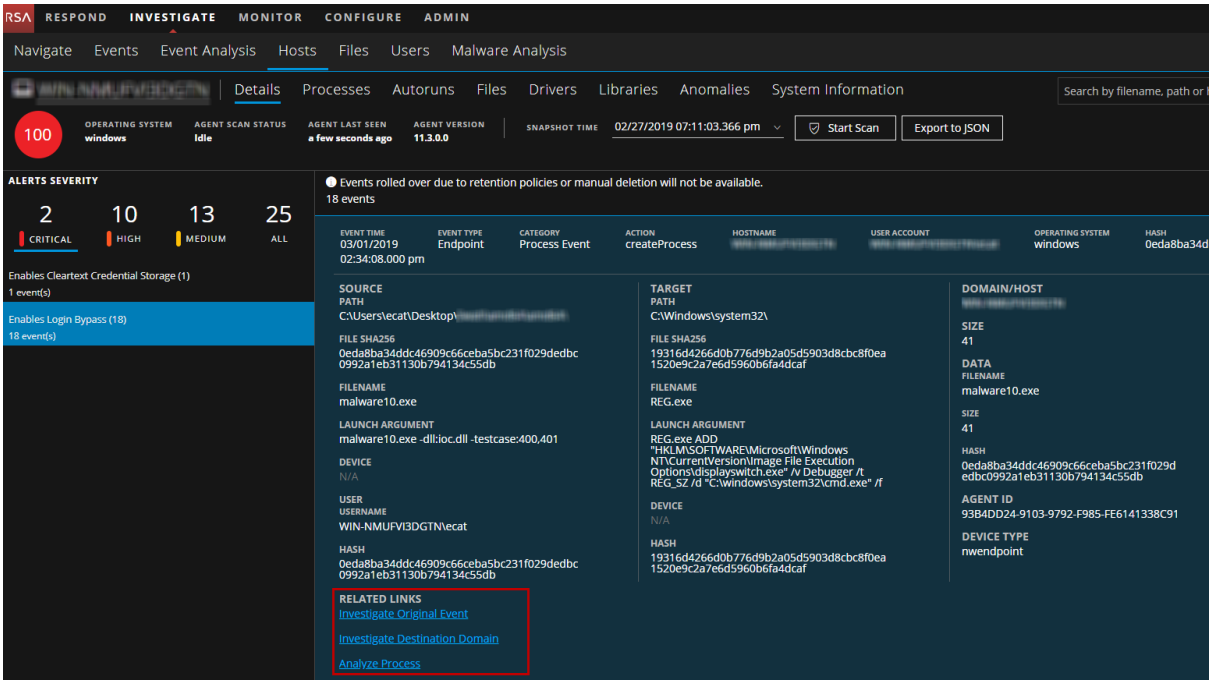
6. To view all the metadata associated with a specific event, click the event header. The information such as source path, target path, filename, and others is displayed.



7. Hover over one of the meta values for IP, Hostname, Mac, File name, File hash, User, and Domain to view additional information about the specific metadata. A hover box displays a list of the data sources that have context data available for meta value. These are the possible data sources: NetWitness Endpoint, Incidents, Alerts, Hosts, Files, Feeds, and Live Connect.



8. To investigate the original event and destination domain of the event, do any of the following:



- To reconstruct an event in a readable form that matches the original, click the **Investigate Original Event** link highlighted in blue. For more information on event reconstruction, see the *NetWitness Investigate User Guide*.
- For details about the elements associated with an event, click the **Investigate Destination Domain** link highlighted in blue. For more information on Contextual Information for an Event, see the *NetWitness Investigate User Guide*.

Note: Investigate Destination Domain link is not displayed if there is no domain.dst event.

- To view a list of processes captured on the hosts and investigate a particular process, click the **Analyze Process** link highlighted in blue. For more information on process analysis, see Investigating a Process.

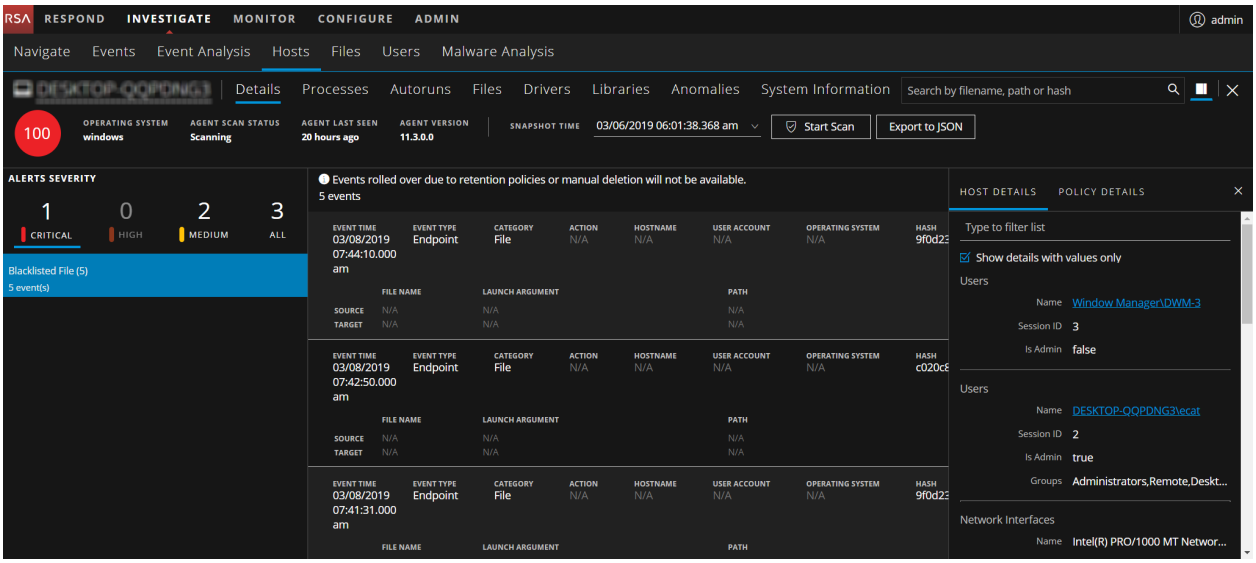
Note: Analyze Process link is not displayed if there is no createprocess event.

Analyze Host Details

To look for suspicious files on a host, click the host name and view the details of the host, or start an on-demand scan to get the most recent information. On the right-hand panel, you can view the following:

- **Host Details** displays the host information,such as Network interface, operating system, hardware and others.
- **Policy Details** displays the complete resolved policy settings.

For more details, see Hosts View - Details Tab.



Search on Snapshots

To investigate a host or to check if it is infected with a known malware, you can search for occurrences of the file name, file path, or SHA-256 checksum.

Note: To search for a SHA-256 checksum, provide the entire hash string in the search box.

The result displays details, such as file name, signature information, along with its interaction with the system (ran as process, library, autorun, service, task, or driver). To view more details for these results, click the category.

For example, a user has clicked and executed a malicious attachment through a phishing email, and downloaded it to `C:\Users`. To investigate this file:

1. Go to **INVESTIGATE** > **Hosts**.
2. Select the host that you want to investigate or select the Endpoint Broker server to investigate all the hosts.
3. In the **Details** tab, enter the file path `C:\Users` in the search box.

   The search displays a maximum of 100 results of the executables in this folder. In this example, the file `Malware.exe`, is an unsigned file that might be malicious. If the search is executed on an Endpoint Broker server, it queries all the Endpoint servers.

   This file is run as a Process.

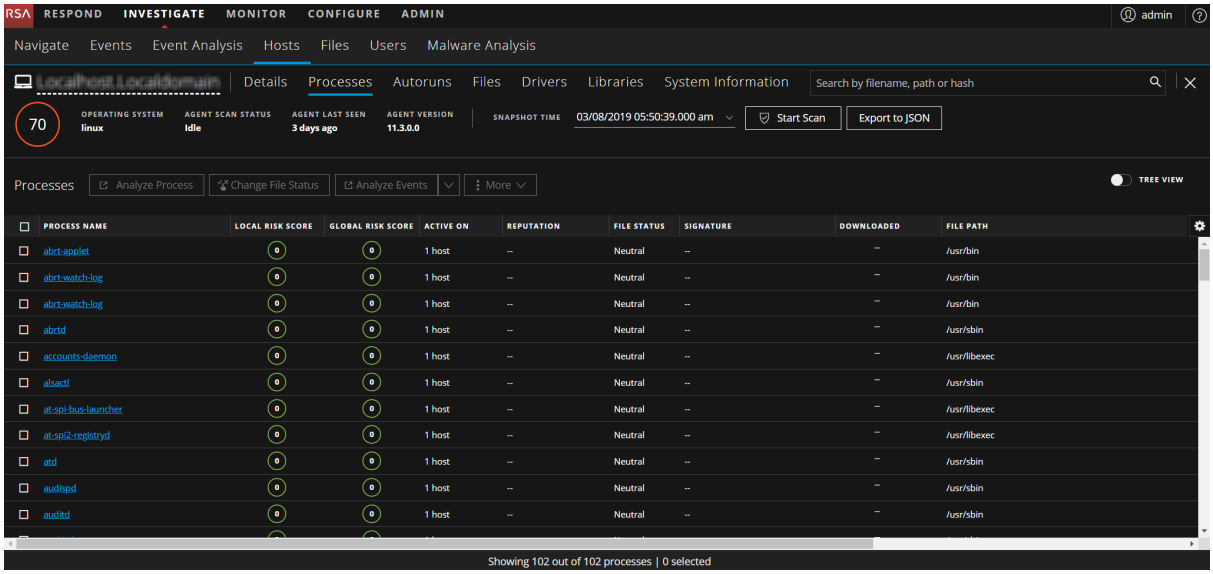
4. To view details of this file, click **Process** in the result.

   This opens the Process tab where you can view the process details.

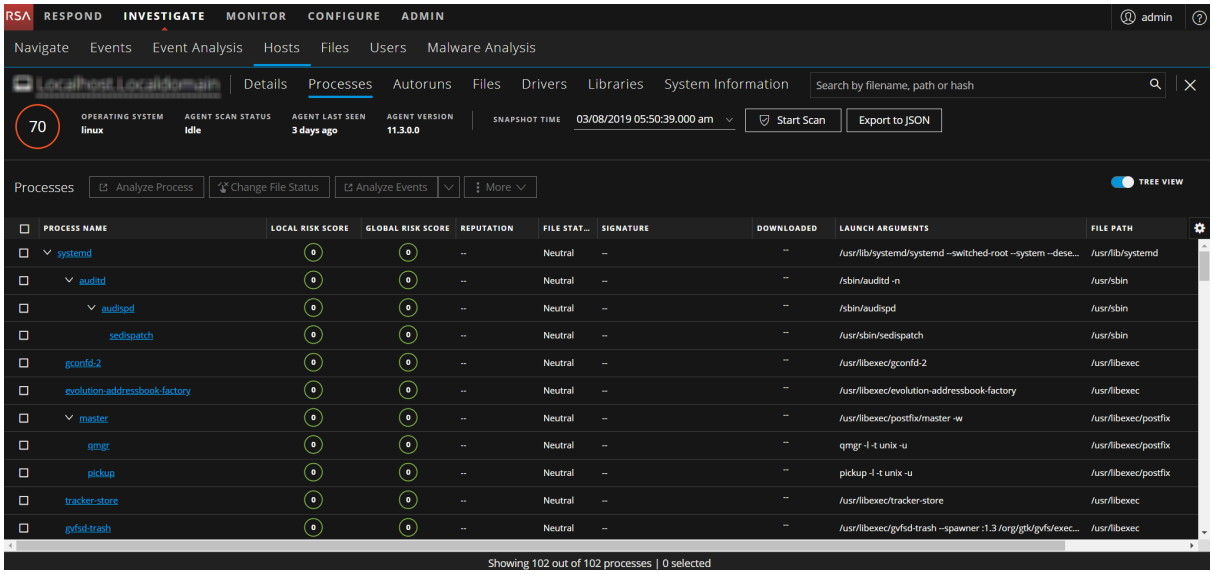
Analyze Processes

To analyze the process:

1. In the **Hosts Details** view, select the **Processes** tab.

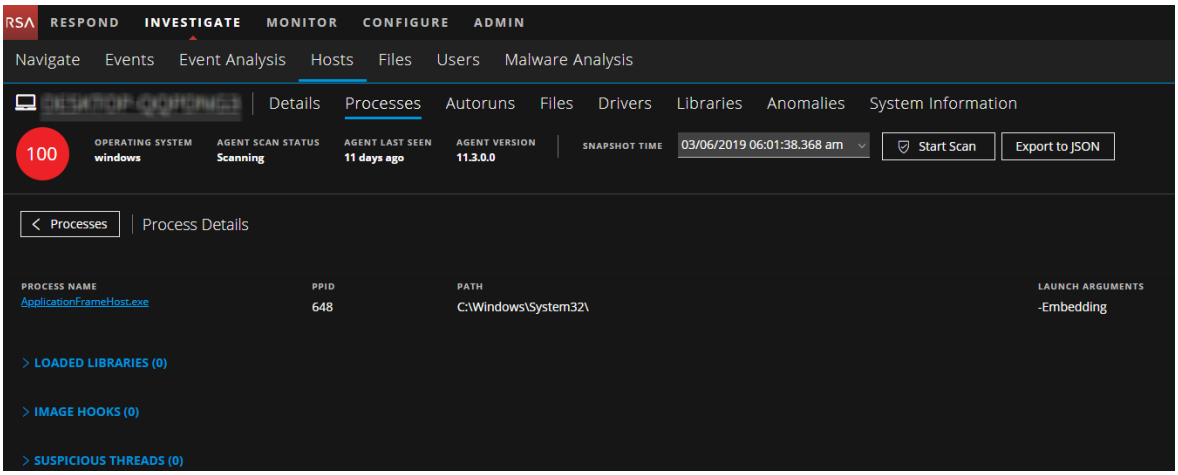


The following is an example of the tree view:



2. In the **Processes** Tab, do one of the following:
   - Click a row to view the properties of a process in the right panel.

   - Click the process name to view the process details of a specific process.



When reviewing processes, it is important to see the launch arguments. Even legitimate files can be used for malicious purposes, so it is important to view all of them to determine if there is any malicious activity.

For example,

- `rundll32.exe` is a legitimate Windows executable that is categorized as a good file. However, an adversary may use this executable to load a malicious DLL. Therefore, when viewing processes, you must view the arguments of the `rundll32.exe` file.
- `LSASS.EXE` is a child to `WININIT.EXE`. It should not have child processes. Often malware use this executable to dump passwords or mimic to hide on a system (`lass.exe`, `lssass.exe`, `lsasss.exe`, and so on).

- Most legitimate user applications like Adobe and Web browsers do not spawn child processes like `cmd.exe`. If you encounter this, investigate the processes.

You can view the sequence of activities performed on the host by the file or process using the process analysis. For more information, see Investigating a Process.

Analyze Autoruns

In the Hosts view, select the **Autoruns** tab. You can view the autoruns, services, tasks, and cron jobs that are running for the selected host.

For example, in the Services tab, you can look for the file creation time. The compile time is found within each portable executable (PE) file in the PE header. The time stamp is rarely tampered with, even though an adversary can easily change it before deploying to a victim's endpoint. This time stamp can indicate if a new file is introduced. You can compare the time stamp of the file against the created time on the system to find the difference. If a file was compiled a few days ago, but the time stamp of this file on the system shows that it was created a few years ago, it indicates that the file is tampered.

Analyze Files

In the Hosts view, select the **Files** tab. You can view the list of files scanned on the host at the time of scan. By default, the table displays 100 files. To display more files, click **Load More** at the bottom of the page.

For example, many trojans write random filenames when dropping their payloads to prevent an easy search across the endpoints in the network based on the filename. If a file is named `svch0st.exe`, `scvhost.exe`, or `svchosts.exe`, it indicates that the legitimate Windows file named `svchost.exe` is being mimicked.

Analyze Libraries

In the Hosts view, select the **Libraries** tab. You can view the list of libraries loaded at the time of scan.

For example, a file with high entropy gets flagged as packed. A packed file means that it is compressed to reduce its size (or to obfuscate malicious strings and configuration information).

Analyze Drivers

In the Hosts view, select the **Drivers** tab. You can view the list of drivers running on the host at the time of scan.

For example, using this panel, you can check if the file is signed or unsigned. A file that is signed by a trusted vendor such as Microsoft and Apple, with the term `valid`, indicates that it is a good file.

Analyze Anomalies

Note: This tab is available only for advanced agent.

In the Hosts view, select the **Anomalies** tab. You can view the following details for the selected host:

- Image hooks - Hooks found in executable images (user-mode or kernel-mode) - IAT, EAT, Inline, exceptionHandler.
- Kernel hooks - Hooks found on kernel objects (such as Driver Object [Pointers, IRP_MJ, SSDT, IDT, and so on]). This also includes filter devices.
- Suspicious threads - Threads whose starting address points to memory DLLs or floating code. The threads could be running with either user-mode or kernel-mode privileges. These threads could run malicious code inside a trusted application to execute their own code.
- Registry discrepancies - The Windows registry is a hierarchical database that stores configuration settings and options on Microsoft Windows operating systems. It contains settings for low-level operating system components and for applications running on the platform: the kernel, device drivers, services, SAM, user interface, and third party applications all use the registry. The discrepancies between low-level parsing with Win32 registry API are reported.

Note: Anomalies is applicable only for Windows hosts.

For example, hooking is used to intercept calls in a running application and to capture information related to the API invocations. Malicious programs can implant hooks in various system applications for different purposes, such as hiding files, directories, registry entries, intercepting users keystrokes to establish a stealthy communication channel with the attacker.

Analyze System Information

In the Hosts view, select the **System Information** tab. This panel lists the agent system information. For Windows operating system, the panel displays the host file entries and network shares of that host.

For example, malware might use host file entries to block antivirus updates.

Export Host Details to JSON File

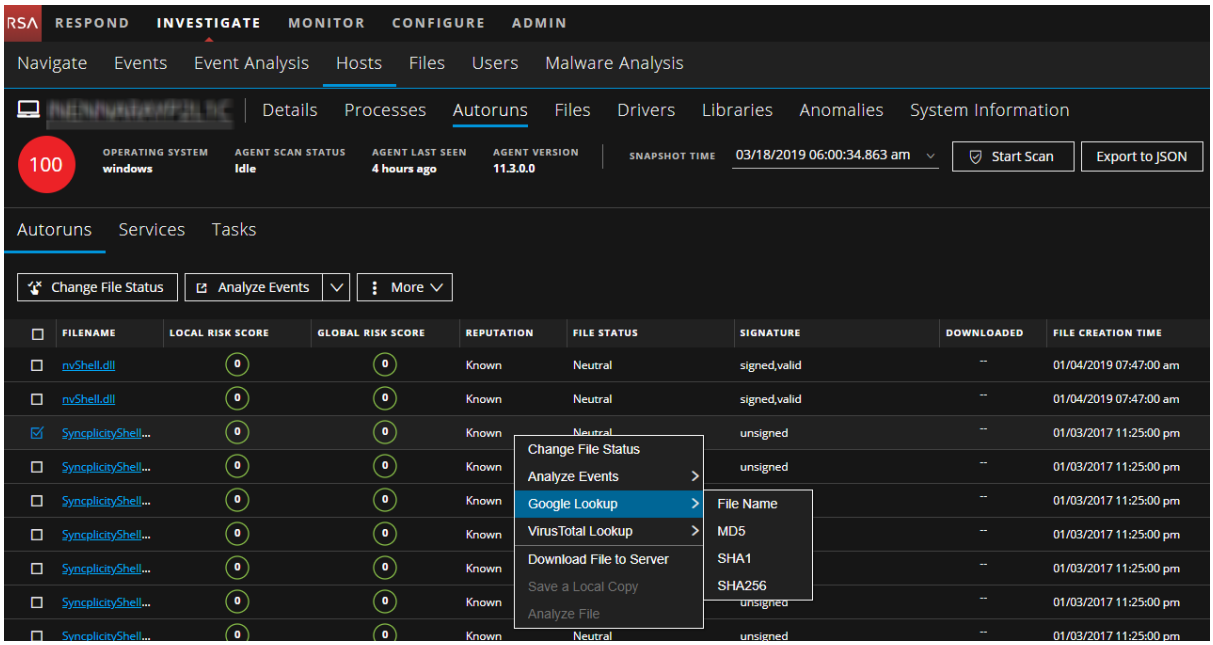
To export host details about a particular snapshot time:

1. Go to **INVESTIGATE > Hosts**.
2. Click the hostname to view the details.
3. In any of the tabs, select the snapshot time, and click **Export to JSON**.

Launch an External Lookup for a File

While analyzing a file, you can search Google or VirusTotal with the filename or hash to get more information about the file. To launch the search:

1. Go to **INVESTIGATE > Host Details** (Autorun, Files, Drivers, Libraries, or Anomalies tab).
2. Right-click one or more files, or in the **More** drop-down list in the toolbar, do the following:



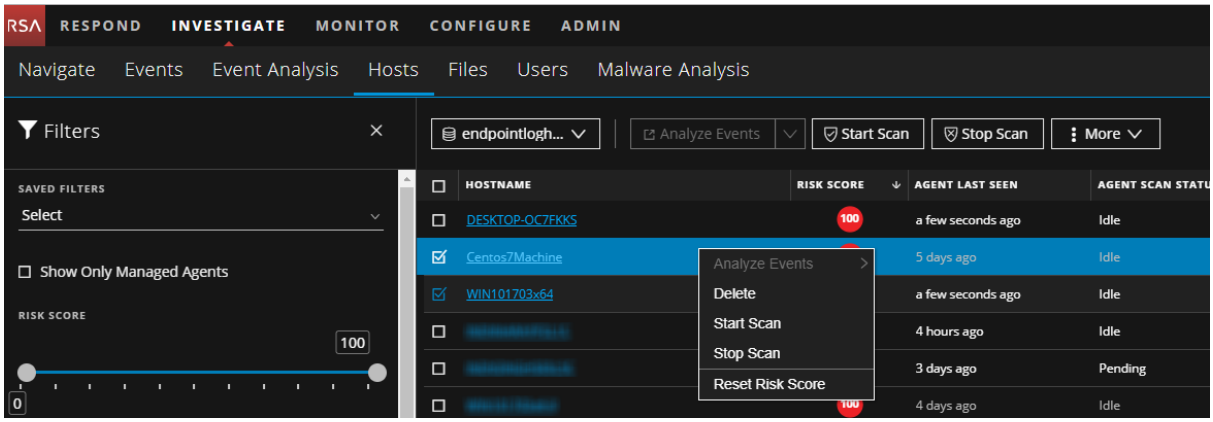
- Select **Google Lookup** to perform a search on the filename, MD5, SHA1, or SHA256.
- Select **VirusTotal Lookup** to perform a search on MD5, SHA1, or SHA256.

Note: To open files in multiple tabs, make sure you enable the pops-up in the browser.

Delete a Host

If the agent is uninstalled on a host or if you no longer require the host scan data, you can manually delete this host from the Hosts view. Deleting a host deletes all scan data associated with the host. To delete hosts:

1. Go to **INVESTIGATE > Hosts**.
2. Select the hosts that you want to delete from the Hosts view and do one of the following:



- Right-click and select **Delete** from the context menu.
- Click **More** drop-down list in the toolbar and select **Delete**.

Note: If you accidentally delete a host from the Hosts view, the Endpoint Server forbids all requests from this agent. The agent must be uninstalled manually from the host and reinstalled for it to appear on the Hosts view.

Deleting Hosts with Older Agent Versions

After upgrading the 11.1.x and 11.2.x agents to 11.3, if you want to delete the hosts with older versions:

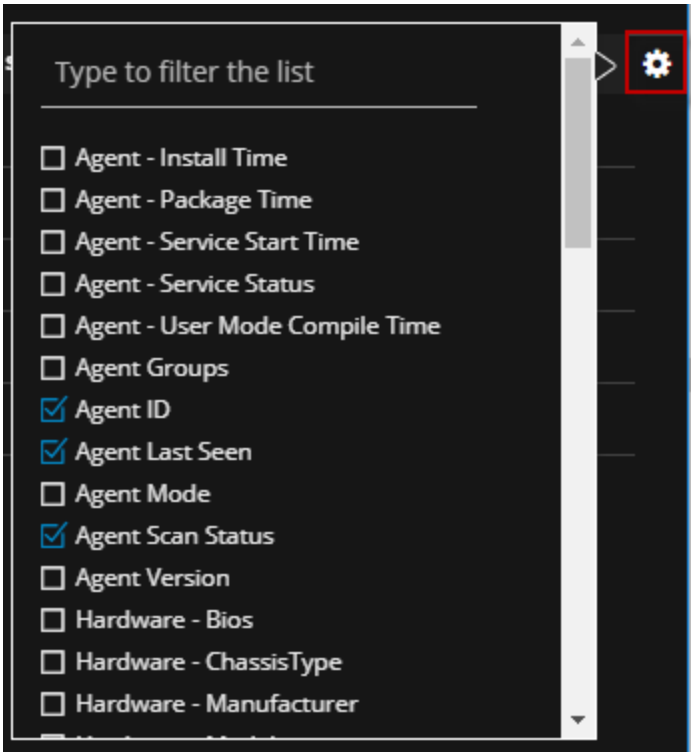
1. Go to **Investigate > Hosts** view.
2. Filter the hosts based on the Agent version, and delete these hosts.

   If you do not delete, the hosts are deleted based on the Data Retention Policy settings.

Set Hosts Preference

By default, the Hosts view displays a few columns and the hosts are sorted based on the risk score. If you want to view specific columns and sort data on a specific field:

1. Go to **INVESTIGATE > Hosts**.
2. Select the columns by clicking in the right-hand corner. The following example shows the drop-down list displayed while adding columns:



3. Scroll down or enter the keyword to search for the column in the displayed list.

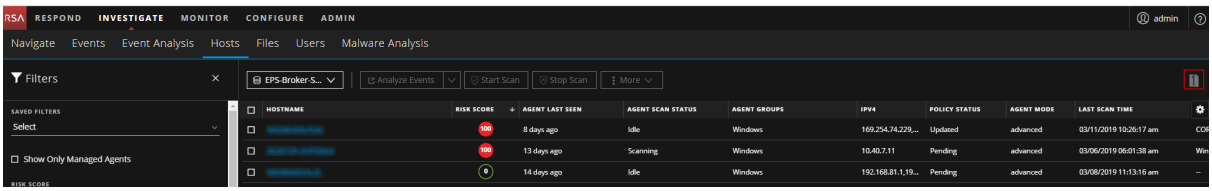
4. Sort the data on the required column.

> **Note:** The selections you make here become your default view every time you log in to the Hosts view.

Export Host Attributes

You can export up to 100,000 host attributes at a time. To extract the host attributes to a csv file:

1. Go to **INVESTIGATE > Hosts**.
2. Filter the hosts by selecting the required filter options.
3. Add columns by clicking in the right-hand corner.
4. Click to export the host attributes to a csv file.



You can either save or open the csv file.

Migrate Hosts

Hosts can be migrated from one Endpoint server to another using groups and policy associated with the host. If a host is migrated, the Server column shows as **Migrated**. The risk score of a migrated host is displayed on all Endpoint servers where it is present.

> **Note:** Some of the actions are disabled for the migrated host on the selected server, such as start scan, start stop, analyze events, and others. If you want to perform the required action, select the Endpoint server to which the host is migrated.

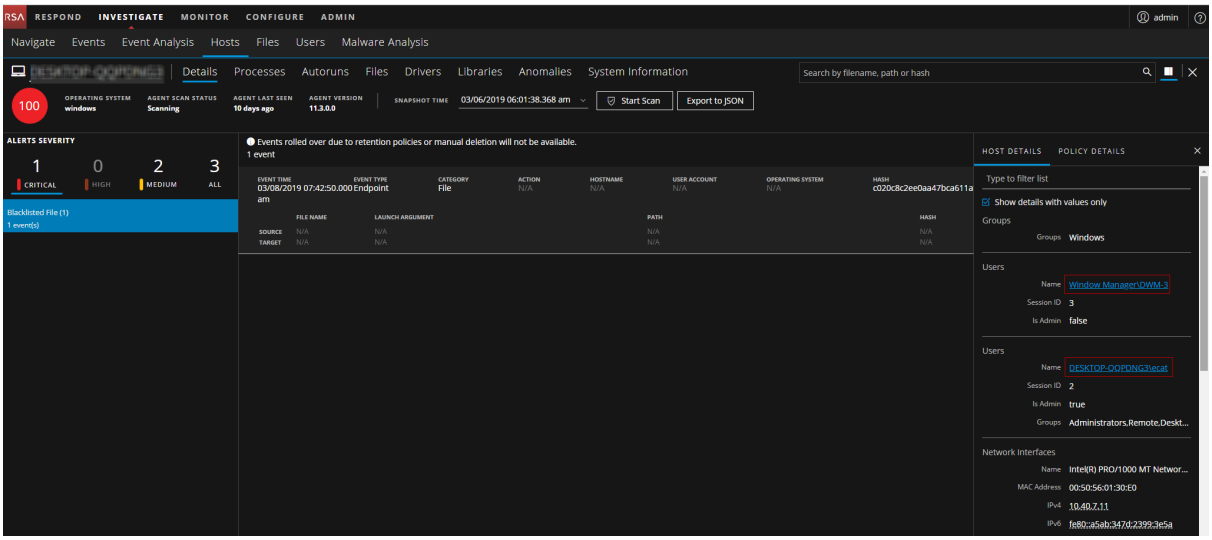
> **Note:** To view only managed hosts, select the **Show Only Managed Agents** option in the Filters panel.

Analyzing Risky Users

If you have NetWitness UEBA installed, you can view the alerts associated with users logged in on the host. To analyze risky users:

1. Go to **INVESTIGATE > Hosts**.
2. Click the host name you want to analyze.
3. In the **Host Details** panel, under the Users category, click the name.

This opens the Users tab for investigation in a new tab.



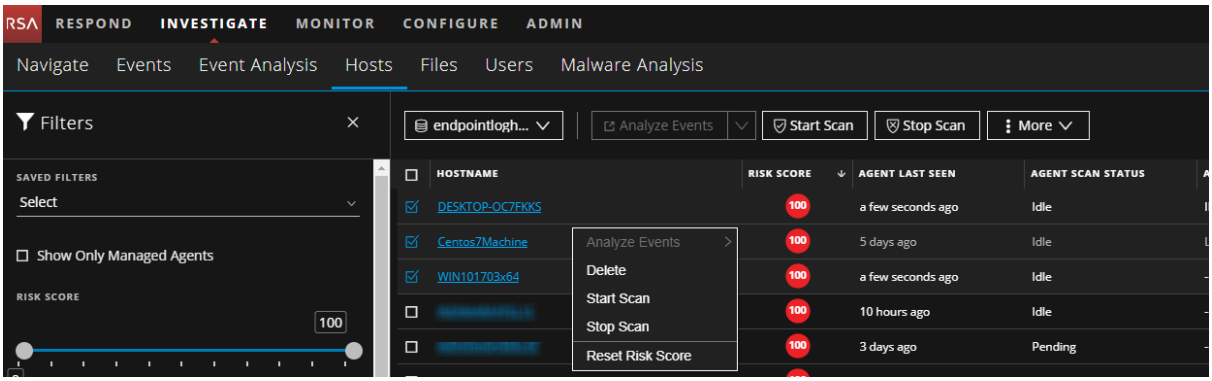
Resetting Risk Score of Hosts

You can reset the risk score for a host in these situations:

- If the alerts or events triggered by the host or files on the host are false positive, you can make changes to the Endpoint Application rules or ESA rules.
- After you take required action on the host for malicious file activities contributing to the risk score. When you reset the risk score, all the risk calculation for the host is deleted. When you reset the host's risk score, it does not change the file's risk score. You can reset the score for a single host or multiple hosts.

To reset the risk score of a host:

1. Go to **INVESTIGATE** > **Hosts**.
2. Select the Endpoint Server or Endpoint Broker.
3. Select one or more hosts and do one of the following:



- Right-click and select **Reset Risk Score** from the context menu.
- Click **More Actions** > **Reset Risk Score** in the toolbar.

All the alerts associated with the score are deleted.

Note: You can select a maximum of 100 hosts to reset the score.

4. Refresh the page to view and confirm if the host's score is reset. This may take sometime for changes to take effect.

Investigating a Process

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.3 and later.

Analysts can perform process analysis to investigate a particular process behavior to:

- Understand the entire process event chain, process parent-child relationships, and all associated events in a timeline view.
- Analyze important process attributes, such as username, launch arguments, reputation, file status, signer, signature, and file path.

The Analyze Process view provides a list of processes captured on hosts in a parent-child hierarchical format over a time range. The process tree is created from the tracking event type "Process event" where the action meta key is `createProcess`. The agent reports new events for the same createProcess if the following parameters change:

- Parent process filename
- Child process filename
- Launch arguments
- User name

If the above parameters do not change, the event is reported only once every eight hours.

Best Practices

When reviewing a host for malicious activity, there are a few key things to review while looking for malicious processes.

- Process Name - When reviewing running processes on a host, check for the name of the program that looks suspicious. Sometimes malware uses random names, such as `wzuduje.exe`. In some cases, the names might be misleading such as `adob3.exe`, `scvhost.exe`, or `Microsoft.exe`. Being familiar with Windows processes and any type of internal tool that might be used throughout the environment, also helps you to identify potentially malicious or suspicious files.
- File Path - Similar to knowing normal and key Windows processes, knowing what path the processes originate from is a key to detect certain processes that imitate the legitimate process. For instance, if you see `svchost.exe` running on a system from `C:\Users\<username>\AppData\Roaming\adobe\` (which is a valid file path), and knowing that the legitimate Windows process originates from `C:\Windows\System32\`, you can determine that the `svchost.exe` file starting from the `C:\Users\<username>\AppData\Roaming\adobe\` directory is the suspicious one. To help determine further identification of a suspicious process, review the Autoruns tab to see if this process is running as an autorun, service, or task.
- File Signature - When a software package is created, it has a valid digital signature. The following are a few exceptions:

  - If a process that is running is not digitally signed, it does not automatically confirm that the file is malicious.
  - While files may have a valid signature, it does not mean that they are legitimate. There are instances of software identified as a Potentially Unwanted Program (PUP) or Adware, which can have a valid signing certificate.
- Active On - Determines on how many hosts a file is currently active. You can look for suspicious files based on the rarity of a file.
- Reputation - Leveraging the reputation service is a way to find malicious processes.
- Analyze events - For further insight to a process, you can analyze console events, network events, file events, process events, and registry events.
  - Network events - Look for any suspicious domains to which the process is connecting. Sometimes malware creates legitimate connections to a known site, such as google.com, bing.com to hide its activity on the network. Look for connections to Dynamic DNS domains where a lot of known malicious activity resides. During analysis, consider uncommon processes making direct connections to an IP address or to a uncommon port number.
  - File and process events - Review process interactions that have occurred on the system with the suspected file. You can look for key events such as `writeToExecutable`, `renameExecutable`, and `createRemoteThread`, which indicate suspicious behavior.
- Leverage other methods
  - Look up with Google - You can search the file name or hash value against Google to determine if the file is malicious.
  - Look up with VirusTotal – You can search the hash value against the VirusTotal to determine if the file is malicious between multiple AV vendors.
  - Download file – Download and analyze a file to find indicators such as compile time, imported DLLs, section names, and performing string searches. Look for TLD values (.com, .net, .biz) or debug information of a compiled binary (.pdb), which can be easily changed or forged.
  - Time stamp values – Review modified, accessed, and created dates associated with the binary. Review how long a file has been residing on a host. While this value is correct most of the time, attackers can change the time stamp values of a file.

Analyze a Process

Note: Linux is not supported for analyzing a process.

To analyze the process:

1. Go to **INVESTIGATE > Hosts**.
2. Click the hostname.
3. To analyze process activities of a file, do one of the following:

- In the **Host Details** tab:

  a. Click the alert severity.

  The list of distinct alerts is displayed along with the total number of events associated with the alert.

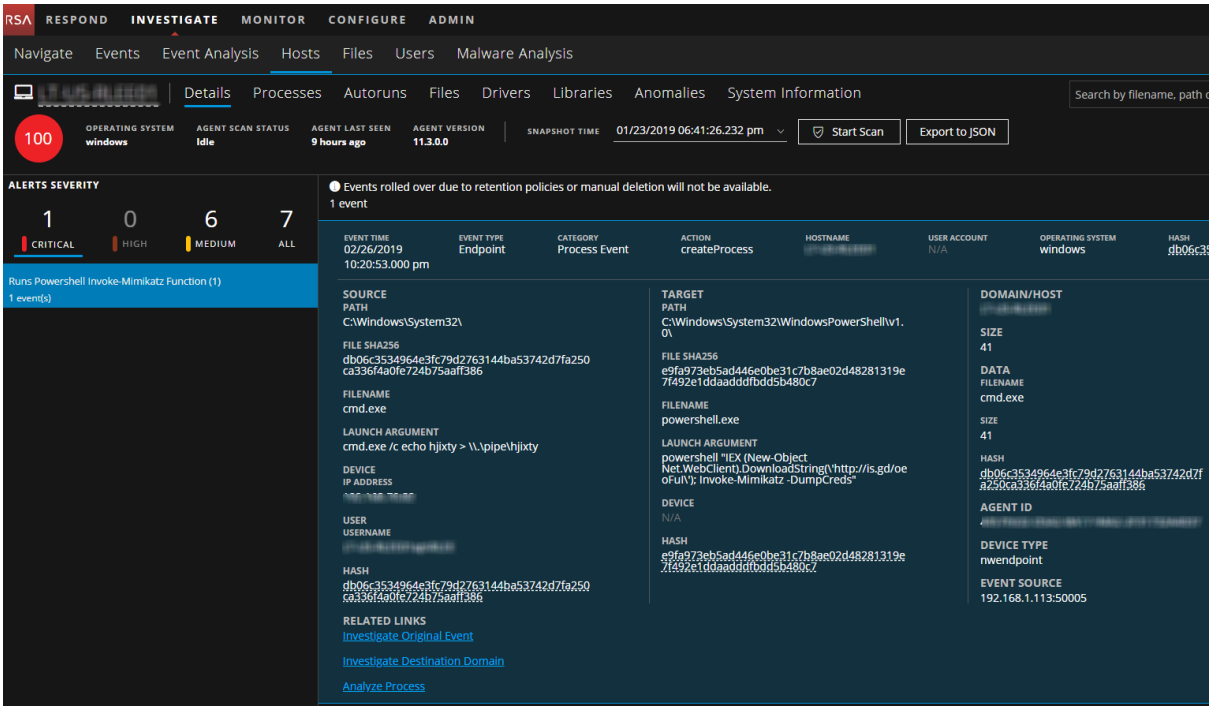
  b. Click the event header and click the **Analyze Process** link at the bottom.

- Select the **Processes** tab and do one of the following:

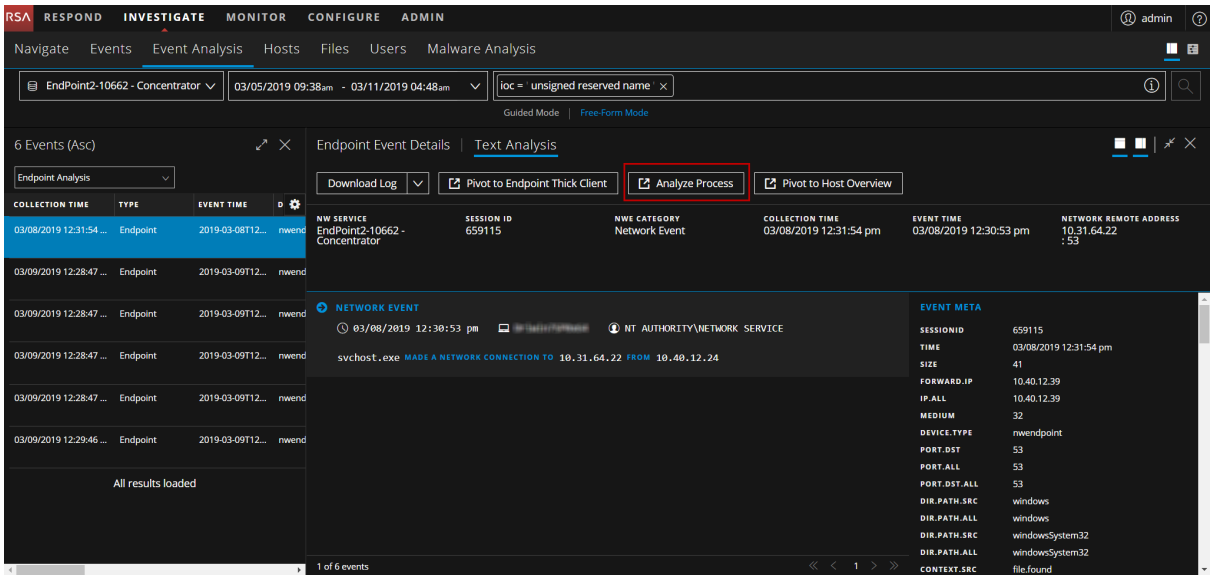
  - Right-click a process and select **Analyze Process** from the context menu.

  - Click **Analyze Process** in the toolbar.

In the following example, there is one critical alert, where the file `powershell` has invoked `mimikatz`, which is a tool to extract plain text passwords, hashes, and kerberos tickets from memory.

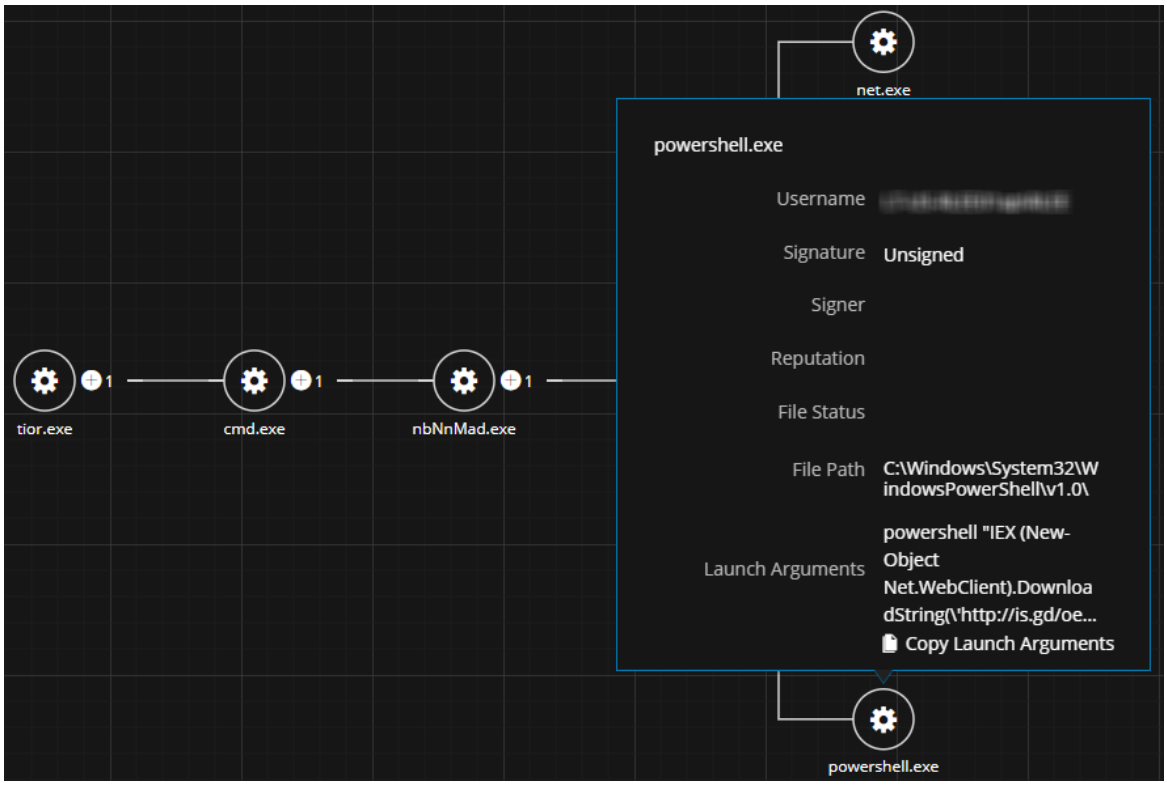


Clicking **Analyze Process** displays the process visualization along with the associated events. Optionally, you can change the time range to view data. Also you can filter the events based on the events category. For more information on filtering, see Analyze Events for a Process.



Note: The result is not displayed in the process visualization view, if there is no data for last seven days or if there is no `createprocess` event.

4. Hover over the process name to analyze important process attributes, such as username, launch arguments, reputation, file status, signer, signature, and file path.



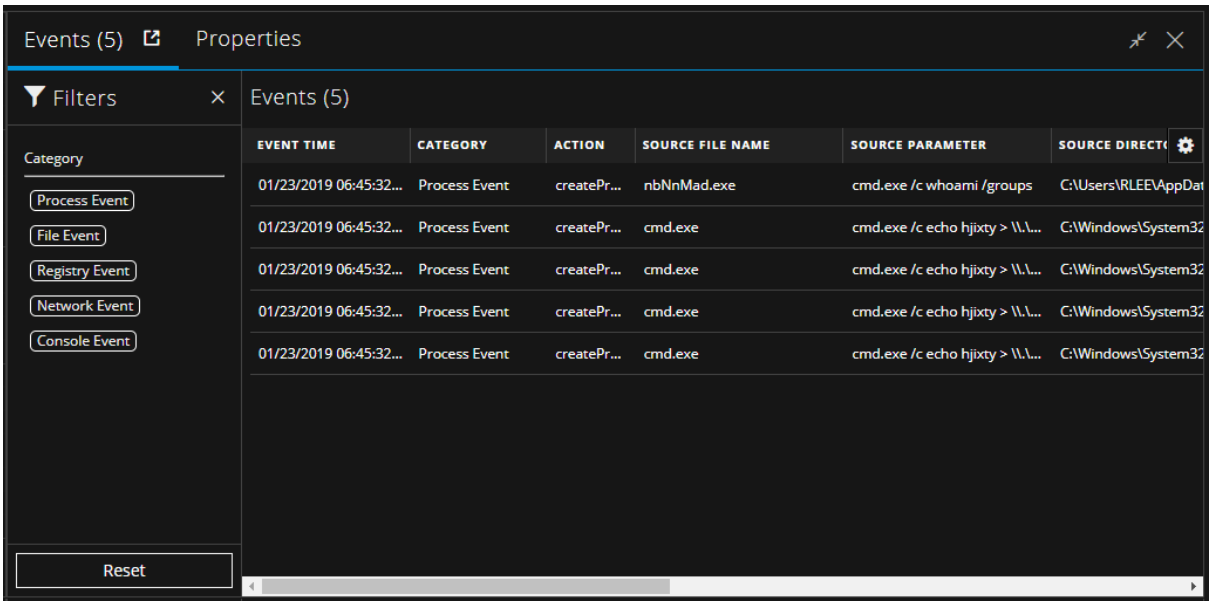
5. Click to load the child processes. The associated events and properties are displayed in the right panel.

Analyze Events for a Process

To analyze events for the selected process:

1. Perform steps 1 to 5 in Analyze a Process.
2. In the process visualization, click the **Events** tab. You can sort the result based on the event time.
3. To narrow down the search to find any suspicious indicators, behaviors, or specific type of event, filter on a set of matched events based on a category - Process, File, Registry, Network Event, or Console Event (for Windows).

   For example, while viewing events, to view only network connections made by the process, or view the registry modifications done by the process, filter events on these categories.



4. When you select a category, you have an option filter on action (`openProcess`, `createProcess`, and so on). The result displays the sequence of activities involving this process for the selected

filters.

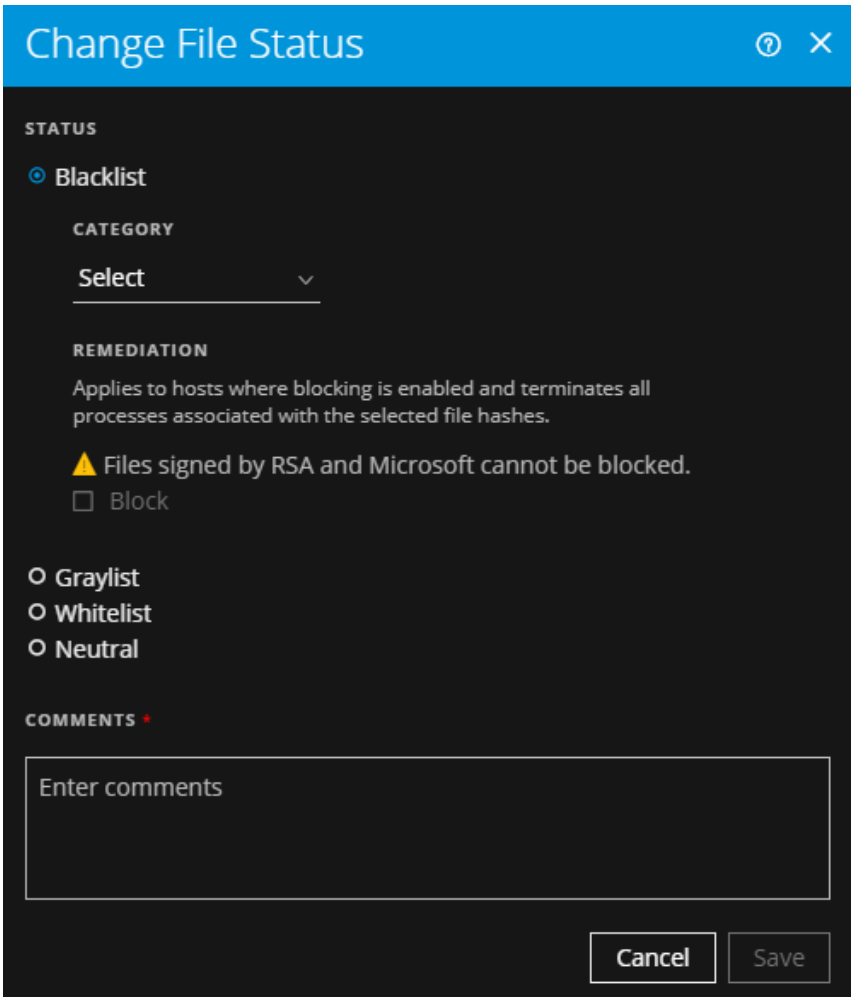
Changing File Status or Remediate

Note: By default, the blocking option is disabled. To enable blocking, in the policy configuration, change the **Blocking** option to **Enabled** under Response Action Settings. For more information, see the *NetWitness Endpoint Configuration Guide*.

To change the status of a file:

1. Do one of the following:
   - Go to **INVESTIGATE > Host Details** (Processes, Autoruns, Files, Drivers, Libraries, or Anomalies tab).
   - Go to **INVESTIGATE > Files**.
2. Select one or more files and do one of the following:

   - Right-click and select **Change File Status** from the context menu.
   - Click **Change File Status** in the toolbar.
3. In the Change File Status dialog, select a status - **Blacklist**, **Whitelist**, **Graylist**, or **Neutral**.



Note: You cannot whitelist certain Microsoft files, such as `cscript.exe`, `wscript.exe`, `cmd.exe`, `bash.exe`, as there is a potential risk of them being used for malicious purposes. For more information, see Files Restricted from Whitelisting.

If you select Blacklist or Graylist, the following options are displayed:

a. **Category:** Select the appropriate category type: **Generic Malware**, **APT: Advanced Persistent Threats**, **Attacker Tool**, **Unidentified**, **Ransomware**.

Caution: Before blocking, make sure that you review the file because this may cause the system or software to be unusable.

b. **Remediate:** Select **Block** to block the file.

Note: Blocking is supported only for Windows hosts.
You cannot block the following:
- Memory DLL and floating code
- Files that are signed by Microsoft or RSA.

4. Add a comment and click **Save**.

You can change the status of only 100 files at a time. When the status is changed, it impacts the file status on all hosts on which the file is present. The status is sent as a session under the **File** category, and available for investigation. If the file is seen in subsequent scan or tracking, the corresponding sessions contain a meta value with the file status (except Neutral).

Files Restricted from Whitelisting

To view or update the files that are restricted from whitelisting, do the following:

1. On the NW server, run the `nw-shell` command from the command line.
2. Run the `login` command and enter your credentials.
3. Connect to the Endpoint Server using the following command:

   ```
   connect endpoint-server
   ```

4. Run the following commands to view the list of files:
   - `cd endpoint/file/status/restricted/get`
   - `invoke Whitelist`
5. Run the following commands to add files to the list:
   - `cd endpoint/file/status/restricted/get`
   - `invoke '{"id":"<filename>","restrictedStatus":["Whitelist"], "enable":true}`
6. Run the following commands to delete files from the list:
   - `cd endpoint/file/status/restricted/update`
   - `invoke '{"id":"<filename>","restrictedStatus":["Whitelist"], "enable":false}`

Analyzing Downloaded Files

To perform a deep analysis of suspicious files, you can manually download the file to the server.

Note: Make sure that the location for file download is configured. For more information, see "Configure Location for File Download" in the *NetWitness Endpoint Configuration Guide*.

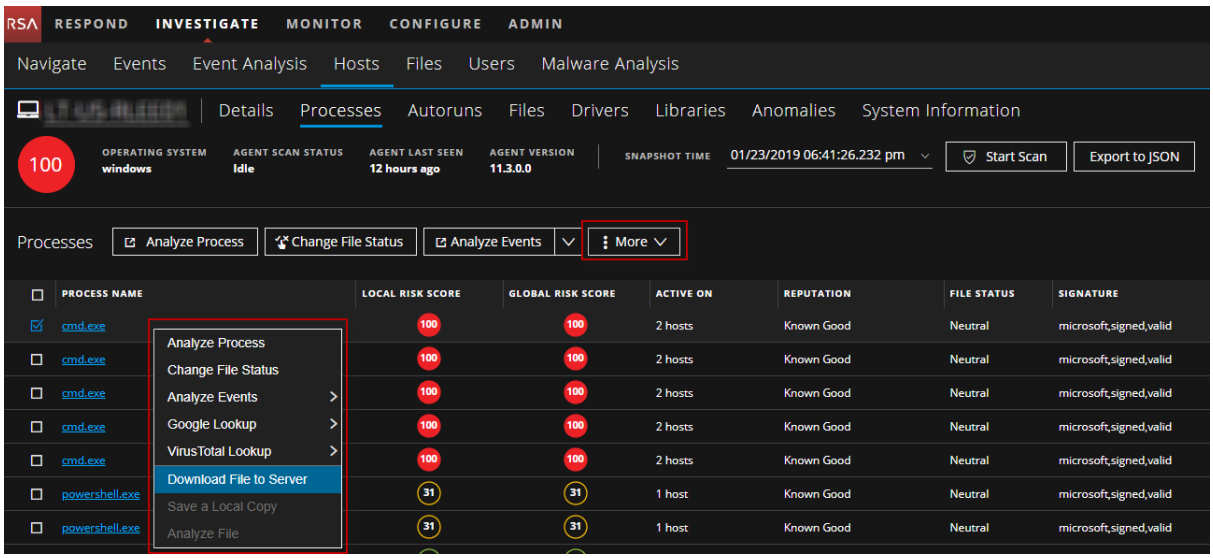
For the downloaded file, you can:

- Search for strings in the executable
- View text content for scripts
- View imported libraries and functions
- Save a local copy for further analysis

Download Files to Server

The Download to Server option is disabled for memory DLL and floating code. To download file to the server from the Hosts view:

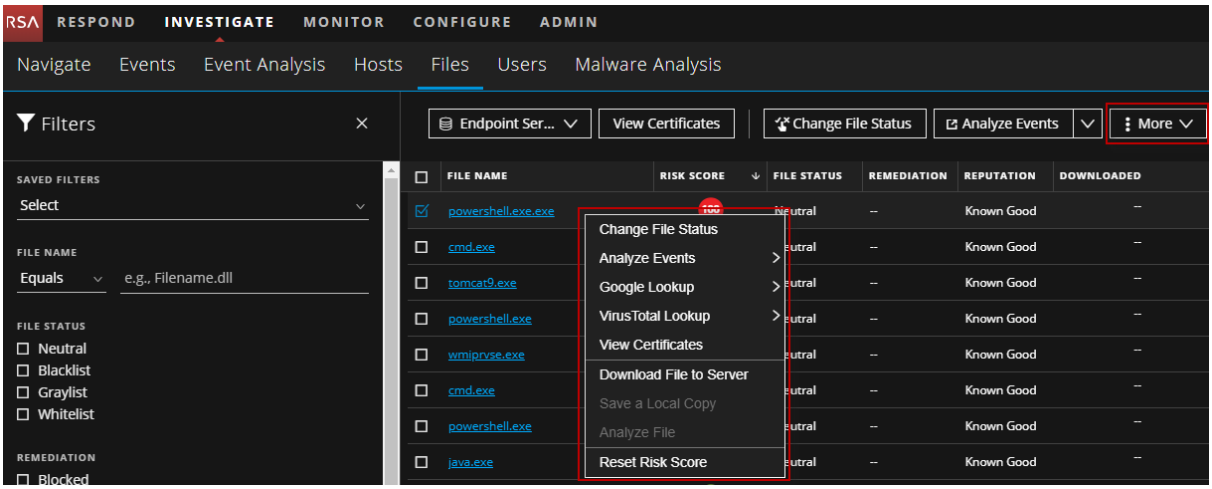
1. Go to **INVESTIGATE > Hosts**.
2. Select the hostname to open the Host Details view.
3. In any of the Processes, Autoruns, Files, Drivers, Libraries, or Anomalies tabs, select the file, and do one of the following:



- Right-click and select **Download File to Server** from the context menu.
- Select **Download File to Server** from the **More** drop-down list in the toolbar.

To download files to the server from the Files view:

1. Go to **INVESTIGATE > Files**.
2. Select the file and do one of the following:



- Right-click and select **Download File to Server** from the context menu.
- Select **Download File to Server** from the **More** drop-down list in the toolbar.

The status of the download is displayed in the Downloaded column. The download statuses are Downloaded, Not downloaded, and Error.

Save Downloaded Files

You can retrieve a downloaded file and save it to your local file system for further analysis. Downloaded files are stored in the server in the configured location. This option is enabled only if the file is downloaded to the server.

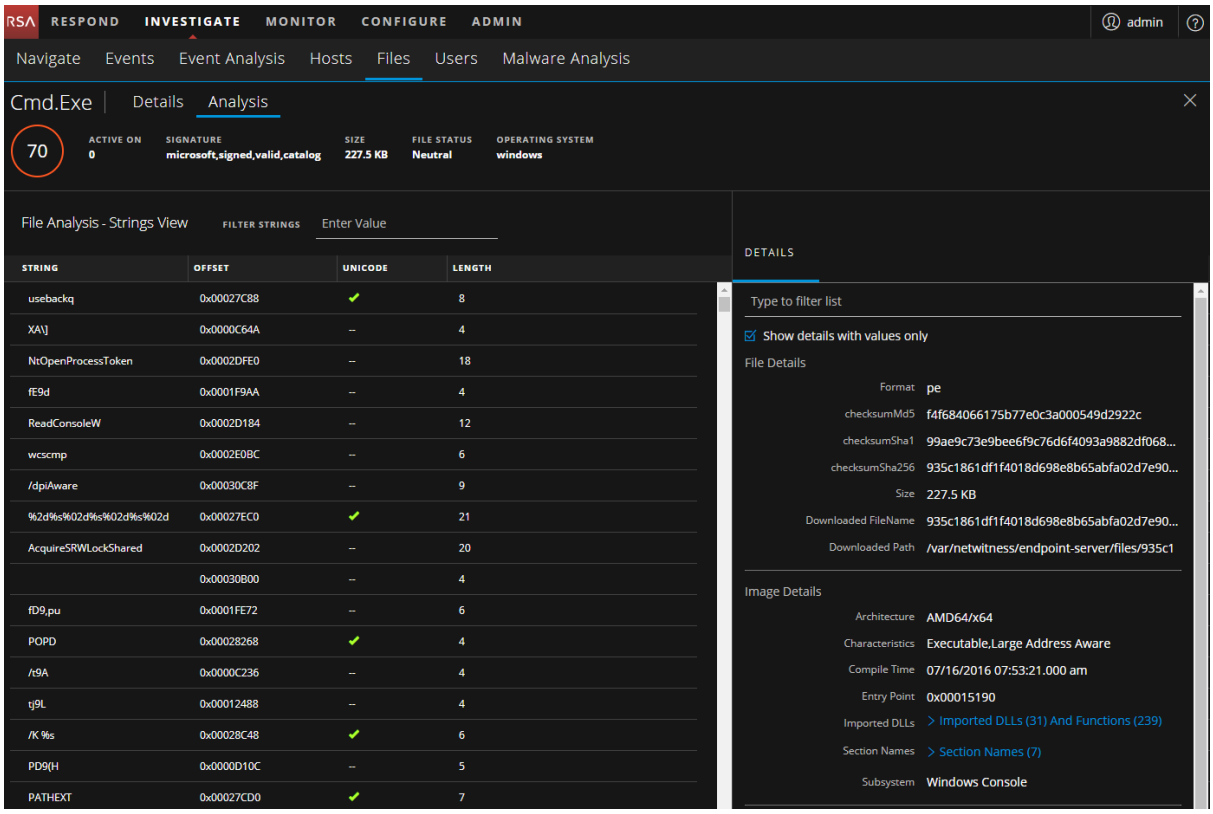
To save a file:

1. Go to **INVESTIGATE > Hosts** Details or **Files** .
2. Right-click the file you want to save and select **Save a Local Copy**.
3. Browse the location and click **Save**.

Analyze Downloaded Files

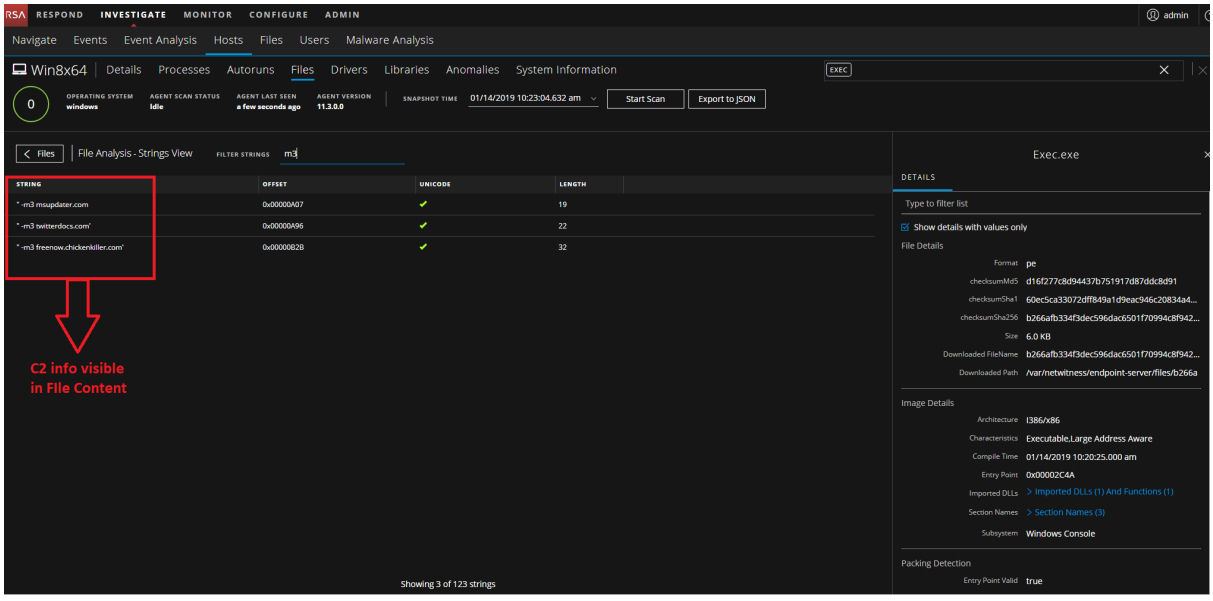
You can use the **Analyze File** option to view detailed information about a downloaded file. This option is enabled only if the file is downloaded to the server. To analyze a file:

1. Go to **INVESTIGATE > Hosts** or **Files**.
2. Right-click the downloaded file and select **Analyze File**. The File Analysis view opens and properties of the are is displayed in the right panel.

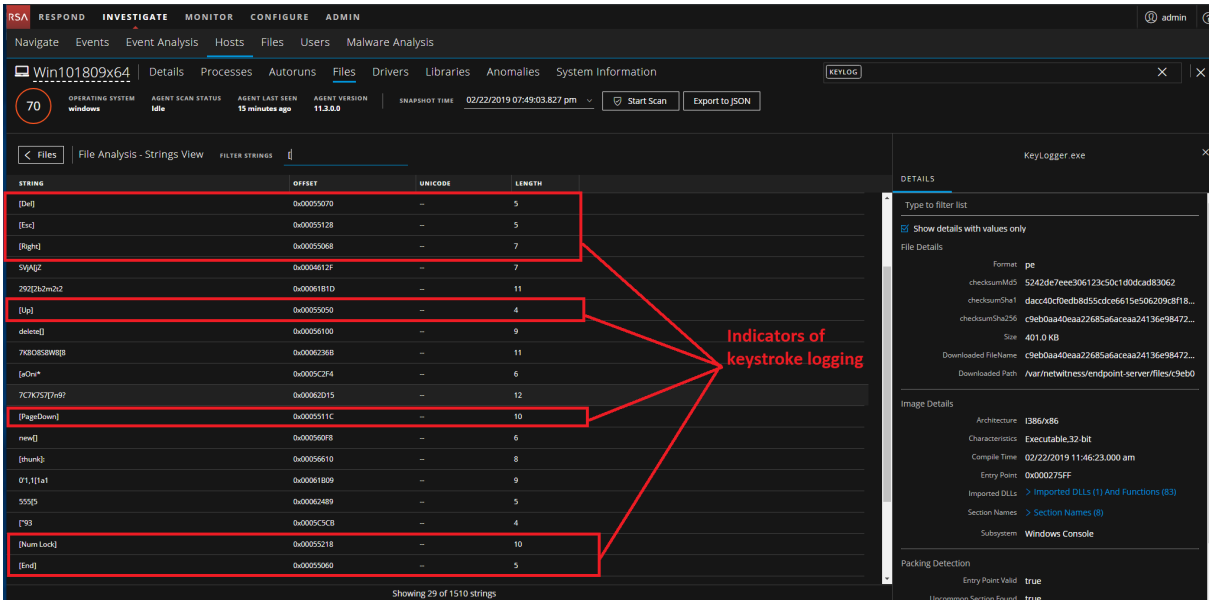


3. View strings in the file in the Strings view while analyzing an executable (such as `macho`, `pe`, `elf`). This view contains the string, offset in the binary, unicode, and the length of the string. You can search for or filter on a specific string value in the **Filter String** field.
4. View the text content of the file and look for any suspicious behavior in the script file.

   For example, if the file contains C2 information in the form of domain names or IP addresses, it is highly suspicious.



If you see unprintable keyboard keys listed within the file, such as: [F1], [F2]…[Page Up], [Enter], [ESC], and so on, that may be indicative of a keystroke logger.



Analyzing Events

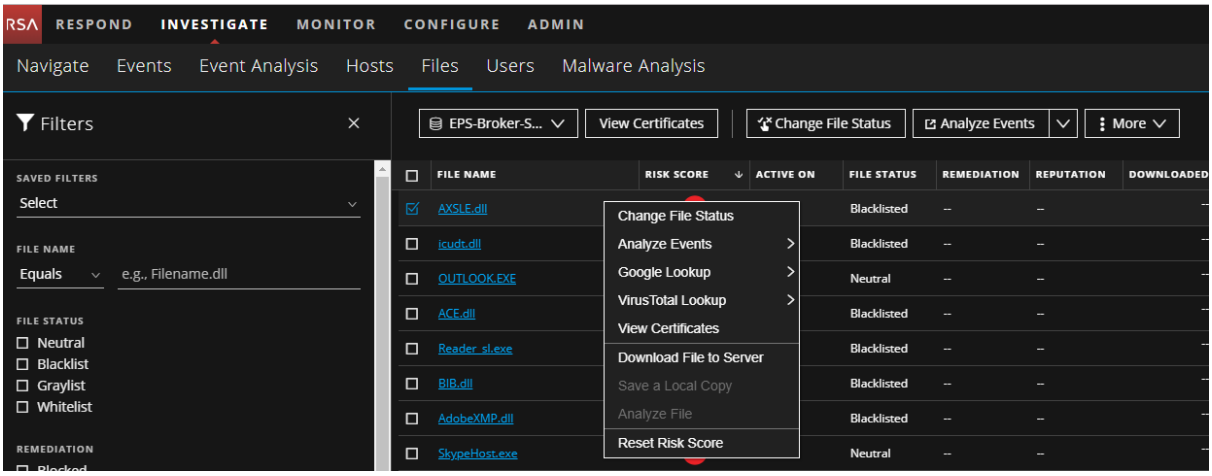
If you need to investigate a particular host, IP address, username, filename, or hash to look for related activity across a time range, you can pivot to Navigate view to get the entire context of the activity. By default, the time range is set to 7 days. You can change the time range.

Note: By default, the system detects the best data source to pivot to Navigate view. To change the data source, modify the investigate service ID under endpoint or investigate in the Explore view.

Analyze Events from Files View

To investigate a particular filename or hash (SHA256 and MD5):

1. Go to **INVESTIGATE > Files**.
2. Select the file you want to analyze and do one of the following:
   - Right-click and select **Analyze Events** from the context menu.
   - Click **Analyze Events** in the toolbar.



This opens the Navigate view with data related to the file. For more information on analyzing events in the Navigate and Event Analysis views, see the *NetWitness Investigate User Guide*.

Note: If the values are not indexed, the results take time to load. For more information, see Troubleshooting NetWitness Endpoint.

Analyze Events from Hosts View

To investigate a particular host, IP address (IPV4), or username:

1. Go to **INVESTIGATE** > **Hosts**.
2. Do one of the following.
   - Select a file and click **Analyze Events** from the toolbar.
   - Right-click a file, select **Analyze Events**, and select a specific event type (such as network events, file events) that you want to view.
     The following figure is an example of the Autoruns tab.

   This opens the Navigate view with data related to the file.

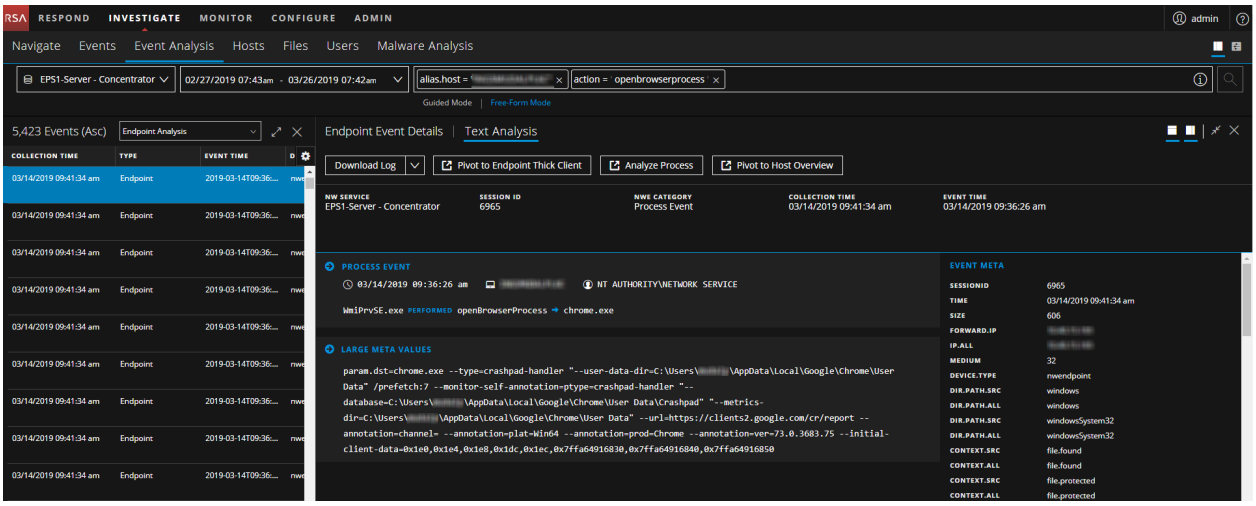
For more information on analyzing events in the Navigate and Event Analysis views, see the *NetWitness Investigate User Guide*.

Text Analysis for an Endpoint Event

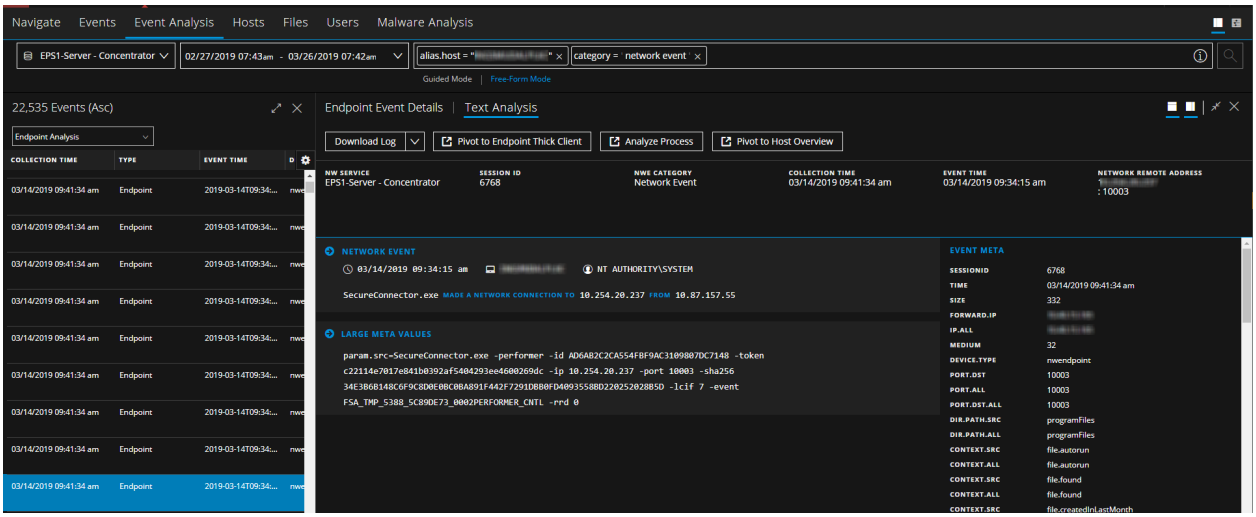
You can view all Endpoint events in their original text format in the Event Analysis view Event List panel. When you click an event in the Event list panel, the adjacent panel shows the Text Analysis. Pagination controls add flexibility when paging through the reconstructed text of an event. The Text Analysis displays the following:

- Event Header, which provides summary information about the event.
- Options for exporting - log, csv, xml, and json formats.
- Option to pivot to the Endpoint Thick Client to analyze the meta value.
- Option to analyze process details associated with the event.
- Option to view the host details for further analysis.

Below is an example of the Process event for Endpoint. The text in the Text Analysis panel explains that a source process `WmiPrvSE.exe` opened a browser process named `chrome.exe`. In the events, if there is a meta value that exceeds 255 characters, the value is displayed in the Large Meta Values panel.



Below is an example of the Network event:



For more information on Event Analysis, see the *NetWitness Investigate User Guide*.

Troubleshooting NetWitness Endpoint

This section provides information about possible issues when using NetWitness Endpoint.

General Issues

Issue	Some of the hosts or files data are not displayed when Endpoint Broker is selected for querying.
Solution	While querying, the Endpoint Broker ignores the Endpoint servers that are offline, and shows the result of Endpoint server that is online, only if the Endpoint server responds with in 10 seconds. The Endpoint Broker ignores the query if Endpoint server does not respond with in 10 seconds. You must increase the query timeout value to see the result of Endpoint server that is online. Perform the following: 1. Go to **ADMIN** > **Endpoint Broker** service. 2. Click > **View** > **Explore**. 3. Click **endpoint/broker** node. 4. In the **query-timeout** field increase the value, for example, 30 seconds.

Issue	The Endpoint Agent is unable to communicate with the Endpoint Server. The connection may not be established due to any of the following issues: • UDP • HTTP • Firewall

Solution	• To verify the UDP or HTTP connection, you must verify the connection between Windows Endpoint Agent and Endpoint Server:
	1. Go to System32 folder using the following command:
	`cd C:\Windows\System32`
	2. Execute the following command:
	`<Agent Service name>.exe /testnet`
	For example, `NWEAgent.exe /testnet`
	• If the issue is with the firewall, check the incoming and

	outgoing firewall rules.

Issue	The Endpoint Agent is unable to communicate with the Log Decoder. The connection may not be established due to any of the following issues: • UDP • HTTP • Firewall

Solution	• To verify the UDP or HTTP connection, you must verify the connection between Windows Endpoint Agent and the Log Decoder:
	1. Go to System32 folder using the following command:
	`cd C:\Windows\System32`
	2. Execute the following command:
	`<Agent Service name>.exe /testlognet`
	For example, `NWEAgent.exe /testlognet`
	• If the issue is with the firewall, check the incoming and outgoing firewall rules.

Issue	After you update to 11.3 and try to delete the meta forwarding configuration of the Log Decoder that you have configured in 11.1.x.x or 11.2.x.x, the Log Decoder configuration is not deleted and automatically starts the meta forwarding. Therefore, you will not be able to configure a new Log Decoder for meta forwarding.
Solution	You must stop the meta forwarding for the existing Log Decoder, add the new Log Decoder service using nw-shell and start the meta forwarding. Perform the following steps: 1. Go to **ADMIN** > **Services**, select the Endpoint Server service. 2. Click and select > **View** > **Config**. 3. In the **General** tab, **Endpoint Meta** view, select the Log Decoder service. 4. Click . 5. On the NW server, run the nw-shell command from the command line. 6. Run the `login` command and enter the credentials. 7. Connect to the Endpoint Server using the following command:

	`connect --service endpoint-server.<service-id>`
	8. Run the following commands:
	`cd endpoint/meta/logdecoder-host`
	`set <log-decoder-ip>`
	9. Go to **ADMIN** > **Services**, select the Endpoint Server service.
	10. Click and select > **View** > **Config**.
	11. In the **General** tab, **Endpoint Meta** view, select the new Log Decoder service.
	12. Click .

Hosts View Issues

Message	`An error has occurred. The Endpoint Server may be offline or inaccessible.`
Issue	When attempting to access the Hosts or Files view, the view opens with the message.
Explanation	Endpoint Server or Nginx Server is not running. Check the status of the Endpoint Server under **ADMIN > Service** or check if the Endpoint Server host IP address is registered with the Admin Server. For more information, see the *Physical Host Installation Guide* or *Virtual Host Installation Guide*. If the service is not running, start the Endpoint Server.

Issue	The Hosts and Files views do not load in the Safari browser.
Explanation	When you open the Ember pages in the Safari browser with a non-trusted SSL certificate, the Hosts and Files views do not load. To load the views. 1. Click the **Show Certificate** pop-up menu. 2. Enable the **Always trust NetWitness when connecting to <IP Address>** checkbox. 3. Click **Continue**. 4. Enter your username and password. 5. Click **Update Settings**.

Message	`No process information was found.`
Issue	When attempting to access the Process or Libraries tab in the Host Details view, the detailed host information is not available, and the view opens with the message.
Explanation	Scan data is not available due to any of the following reasons:

	• First time scan is not complete. • Data retention policy has deleted all scan snapshots.

Files View Issues

Behavior	Meta values take time to load.
Issue	Meta values are not set to index by values.
Explanation	During investigation, while pivoting to the Navigate or Event Analysis view from the Files view, if the filename or hash (SHA256 and MD5) are not set to index by values, the matching results take time to load because the Concentrator must generate the index by accessing the meta database and retrieving value of the meta for each event. You have to manually index the values before pivoting.

Issue	Filtering files takes a longer time to load results.
Explanation	In the Files view, while filtering files with the `Contains` operator, the results takes a few seconds to load on the UI. You must use at least one indexed field with the `Equals` operator while filtering the files.

Issue	Unable to analyze events from **Investigate > Hosts** and **Files** view.
Explanation	Other than Broker or Concentrator, if any aggregation service, such as Archiver, is aggregating data from the Log Decoder that is configured for metadata forwarding from any Endpoint server, clicking **Analyze Events** from **Hosts** and **Files** view for this Endpoint server may not work. To resolve this issue: **Note:** To get the investigate-service-id: 1) Go to **ADMIN** > **Concentrator** service. 2) Click > **View** > **Explore** tab. 3) Expand the **sys/stats** node list. 4) In the UUID filed, copy the value. 1. Go to **ADMIN > Endpoint Server** service. 2. Click > **View** > **Explore** tab. 3. In the **endpoint/investigate** field, specify the **investigate-service-id**.

Policy Issue

Issue	Policy status in the Policy Details panel is not updated or shows Policy Unavailable/Permission Required.

Explanation	**Policy Unavailable** - Hosts belong to previous versions, such as NetWitness Platform 11.1 or 11.2, where a policy is not applied. **Permission Required** - If you do not have permissions, see the "Role Permissions" topic in the *System Security and User Management Guide*.

Issue	Policy Status shows error.
Explanation	Policy may have wrong configurations. Check the error description, logs in Endpoint server, and audit logs for details. Contact your system administrator with the error details.

Driver Issue

Issue	While loading the driver on the host, an error is encountered.
Explanation	Check the driver error code. Contact your system administrator with the error code.

File Reputation Service Issue

Issue	When you configure RSA Live for the first time and the File Reputation service is not connected.
Solution	You must manually enable the File Reputation service. To enable the File Reputation service: 1. Go to **ADMIN** > **System** > **Live Services**. 2. In the **Additional Live Services** section, select the enable File Reputation check box. 3. Click **Apply**.

Risk Scoring for Hosts or Files Issue

Issue	NetWitness Endpoint takes a long time to process risk scoring for Hosts or Files.
Solution	Check the backlog of alerts for risk scoring. 1. SSH to the ESA Primary appliance. 2. Execute the following command: `mongo respond-server --authenticationDatabase admin -u deploy_admin -p <deploy_admin_password> --eval 'db.staging.find({"$or": [{state:"STAGED"},{state :"WORKING"}]}).count`

```
()' --quiet
```

The backlog count is displayed. If the backlog count is 1 million or greater, you must disable the risk scoring and Endpoint ESA alerts.

3. To disable risk scoring:
   a. Go to **ADMIN** > **Respond** service.
   b. Click > **View** > **Explore**.
   c. Expand the **respond/scheduled/jobs** node list.
   d. In the **risk-scoring-enabled** field, set the value to **false**.
4. To disable Endpoint ESA alerts:
   a. To disable NetWitness Endpoint ESA alerts generation for severity; Critical, High and Medium.
      i. Go to **CONFIGURE** > **ESA Rules**.

         The Configure view is displayed with the Rules tab open.
      ii. In the **Options** panel, under Deployments, select the Endpoint deployment to delete.
      A confirmation dialog is displayed.
      iii. Click **Yes**.
   b. To disable only Medium severity NetWitness Endpoint ESA alerts:
      i. Go to **ADMIN** > **ESA Correlation** service (on which Endpoint deployment is added).
      ii. Click > **View** > **Explore**.
      iii. Expand the **correction/alert** node list.
      iv. In the **transient-enabled** field, set the value to **false**.

NetWitness Endpoint Reference Materials

This section provides is intended to help you understand the purpose and application of NetWitness Investigate > Hosts view and Files view. For each view, there is a brief introduction and a What Do You Want To Do table with links to related procedures. In addition some of the reference materials include workflows and Quick Looks to highlight important features in the user interface.

- Files View
- Hosts View
- Hosts View - Details Tab
- Hosts View - Process Tab
- Hosts View - Autoruns Tab
- Hosts View - Files Tab
- Hosts View - Drivers Tab
- Hosts View - Libraries Tab
- Hosts View - Anomalies Tab
- Hosts View - System Information Tab

Files View

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

The Files view provides a holistic view of all files in your deployment. To access this view, go to **INVESTIGATE > Files**. By default, the Files view displays 100 files. To display more files, click **Load More** at the bottom of the page.

You can either view files specific to an Endpoint server or view all files from multiple Endpoint servers by selecting the Endpoint Broker.

Workflow

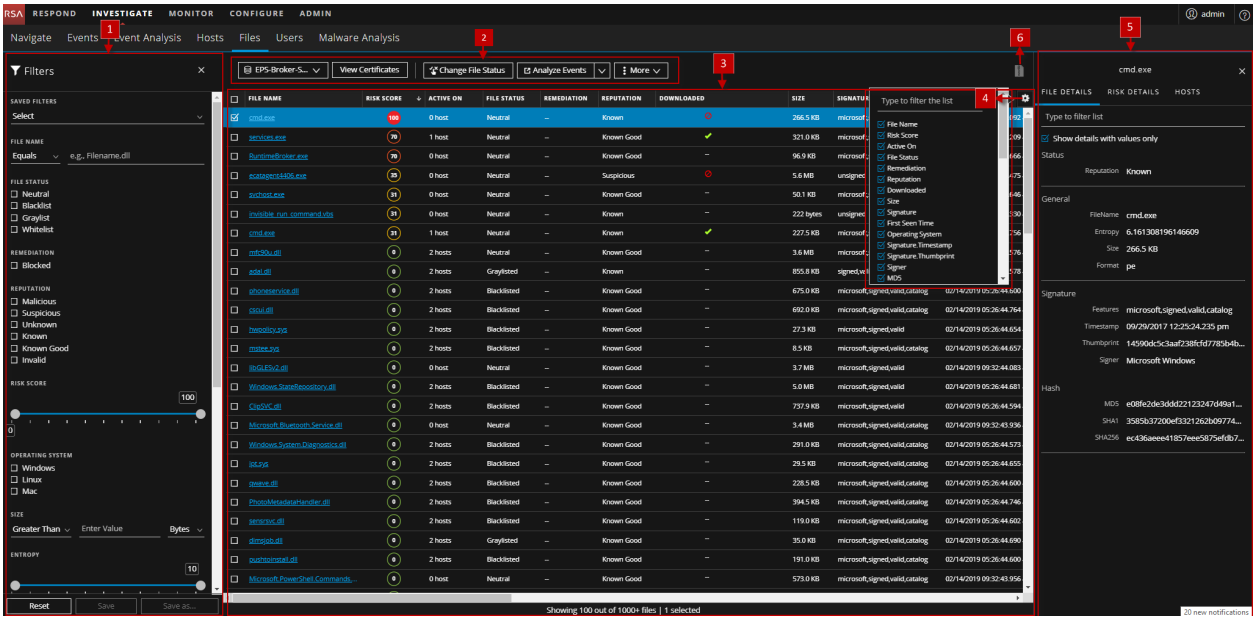
- Analyze Certificates
- Changing File Status or Remediate

Quick Look

Below is an example of the Files view:



1 **Filter Files**. You can filter the files by selecting the options in the Filters panel and create filters. For more information, see Filter Files.

2 **Actions in the toolbar:**

Server drop-down list - You can select the Endpoint server or Endpoint Broker server to view the hosts.

View Certificates - Provides a list of code-signing certificates reported by hosts found in your deployment and their associated properties. For more information, see Analyze Certificates.

Change File Status - Provides capabilities to manage suspect and legitimate files and block malicious or infected files to prevent future execution of the file on any host. For more information, see Changing File Status or Remediate.

Analyze Events - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events.

More - Provides options to:

- Perform external lookups.
- Download files to server, save a local copy, and analyze files for deeper analysis.
- Reset risk score.

Note: You can perform the above actions from the right-click context menu.

3 **Sort Columns.** Lets you sort on column titles.

4 **Settings Menu.** You can set Files view preferences by selecting columns from the Settings menu. For more information, see Set Files Preference.

5 **Show/Hide File Properties Panel.** Click a row to show or hide the File Properties panel. It displays the following tabs:

File details - Displays the file information.

Risk details - Displays the distinct alerts associated with the risk score.

Hosts - Displays the hosts on which file activities are present. For more information, see Analyze Hosts with File Activity.

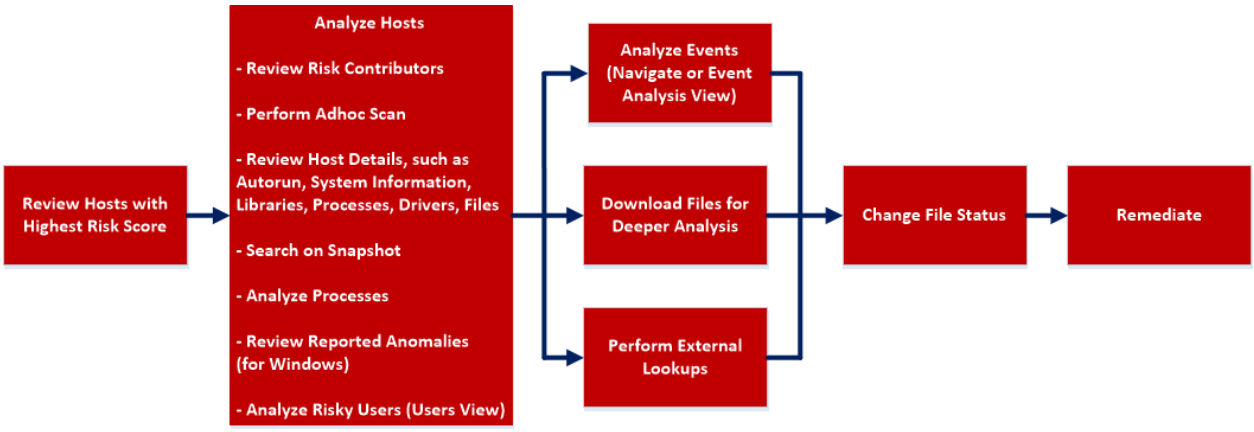
6 **Export to CSV** - Extracts global files to a CSV file. For more information, see Export Global Files.

Hosts View

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

The Hosts view provides a list of all hosts with an Endpoint agent installed. To access this view, go to **INVESTIGATE > Hosts**. By default, hosts are sorted based on the risk score.

Workflow



What do you want to do?

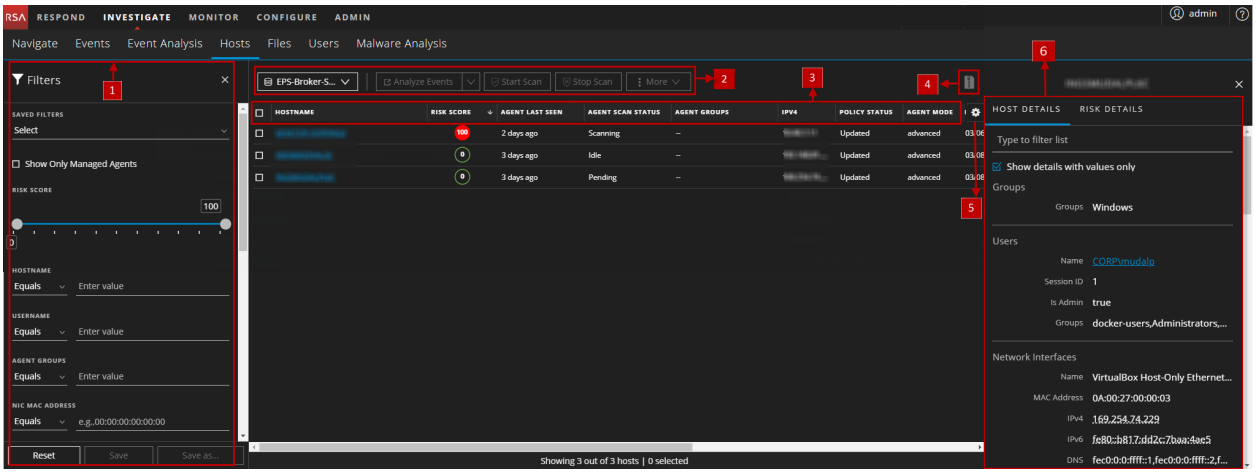
- Investigating a Process
- Analyzing Events

Quick Look

Below is an example of the Hosts view:



1 **Filter Hosts**. You can filter the hosts by selecting the options in the Filters panel and create filters. For more information, see Filter Hosts.

2 **Actions in the toolbar:**

Server drop-down list - You can select the Endpoint server or Endpoint Broker server to view the hosts.

Analyze Events - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events.

Start Scan - Starts a scan for the selected hosts.

Stop Scan - Stops a scan for the selected hosts.

More - Provides options to:

- Reset risk score.
- Delete - Lets you delete hosts manually from the user interface. After deletion, the Endpoint server does not process any request from this host. For more information, see Delete a Host .

Note: You can perform the above actions from the right-click context menu.

3 **Sort Columns**. Lets you sort on on column titles.

4 **Export to CSV** - Extracts host attributes to a CSV file. For more information, see Export Host Attributes.

5 **Settings Menu.** You can set Hosts view preferences by selecting columns from the Settings menu. For more information, see Set Hosts Preference.

6 **Show/Hide Host Properties Panel.** Click a row to show or hide the Host Properties panel. It displays the following tabs:

Host details - Displays the host information such as Network Interfaces, operating system, hardware and others.

Risk details - Displays the distinct alerts associated with the risk score.

Hosts View - Details Tab

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

The Details tab provides details of the selected host. To access this view, go to **INVESTIGATE** > **Hosts**, and select a host from the **Hosts** view.

Workflow

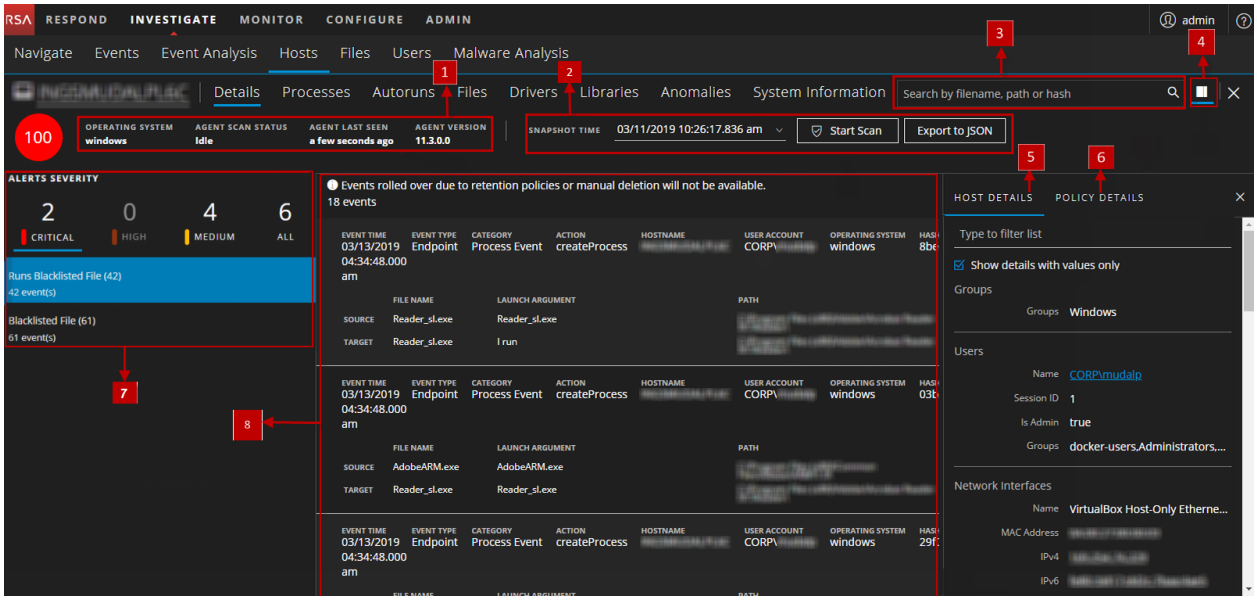
Quick Look

Below is an example of the Details tab:



1	**Agent and Scan Details**. You can view the following agent and scan details of the selected host: **Host name** - Name of the host. For example, `WIN-ABC`. **Risk score** - Risk score of the host. **Operating System** - Operating system on which the agent is running (Linux, Windows, or Mac). **Agent Scan Status** - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts. **Agent Last Seen** - Time when the agent last communicated with the Endpoint server. **Agent Version** - Version of the agent. For example, `11.3.0.0`.
2	**Actions in the toolbar:** **Snapshot Time** - Lists scanned time stamps. To view the scan history, you can select the snapshot time from the drop-down menu. **Start Scan** - Starts a scan for the selected hosts. For more information, see Scan Hosts. **Export to JSON** - Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes.
3	**Search on Snapshots**. Lets you search on all snapshots (file name, file path, and SHA-256 checksum). For more information, see Search on Snapshots.
4	**Show/Hide Right Panel** - Displays host and policy details panel.

5	**Host Details Panel** - Displays all properties of the selected host. It is grouped as follows: **Groups** - Groups on which the host is added on. **User** - Information related to the user. **Network Interfaces** - Network adapter information, such as Mac Address, Gateway. **Operating System** - Operating system version and build information. **Agent** - Agent-related information, such as agent ID, driver error code, install time, and agent mode. **Hardware** - Information related to the architecture. **Locale** - Time zone and language that is local to the host.

6	**Policy Details Panel** - Displays the following:
	• EDR Policy Name that is associated with the highest ranked group.
	• Windows Log Policy Name.
	• Policy Status -
	  • Updated - Host has the latest policy.
	  • Pending - Policy is resolved but the latest policy is not updated on the host. When the host communicates with the Endpoint server next time, the latest policy is applied if there are no errors.
	  • Unavailable - Hosts that belong to previous versions, such as NetWitness Platform 11.1 or 11.2, or the source server is not installed.
	  • Error - Problem applying the latest policy along with the error description.
	• Evaluated Time - Time when the Endpoint server evaluated the policy.
	• Complete resolved policy settings. For more information, see the *NetWitness Endpoint Configuration Guide*.

7	**Alerts Severity** - Displays list of distinct alerts, such as Critical, High, Medium and All, along with the total number of events associated with the alert.
8	Displays events for an alert and metadata associated with a specific event.

Hosts View - Process Tab

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

The Process panel provides a list of processes running on the host. To access this tab, select a host from the **Hosts** view and click the **Process** tab.

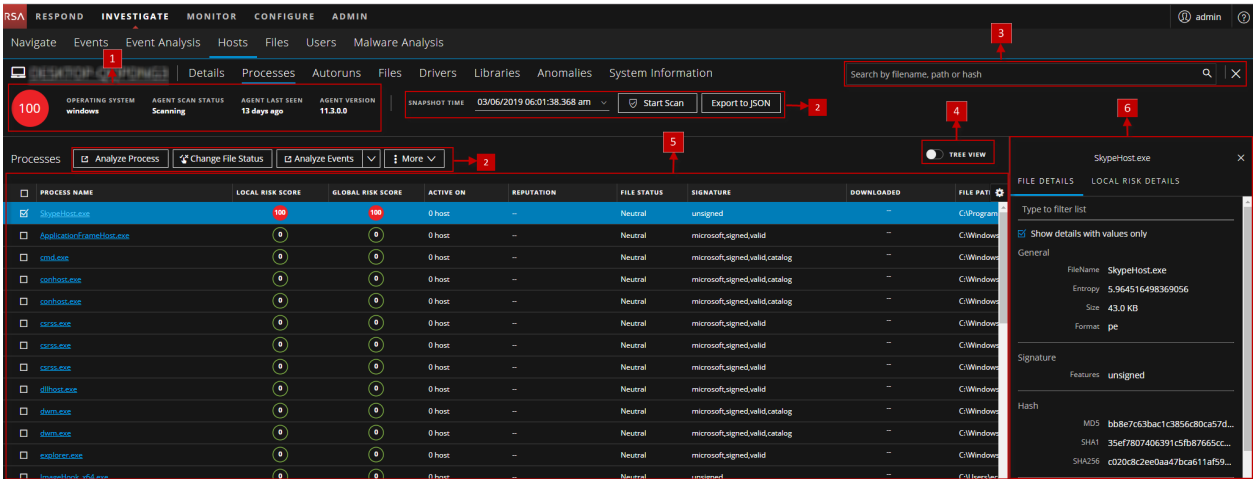
Quick Look

Below is an example of the Process tab:



1 **Agent and Scan Details**. You can view the following agent and scan details of the selected host:

Host name - Name of the host. For example, `WIN-ABC`.

Risk score - Risk score of the host.

Operating System - Operating system on which the agent is running (Linux, Windows, or Mac).

Agent Scan Status - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts.

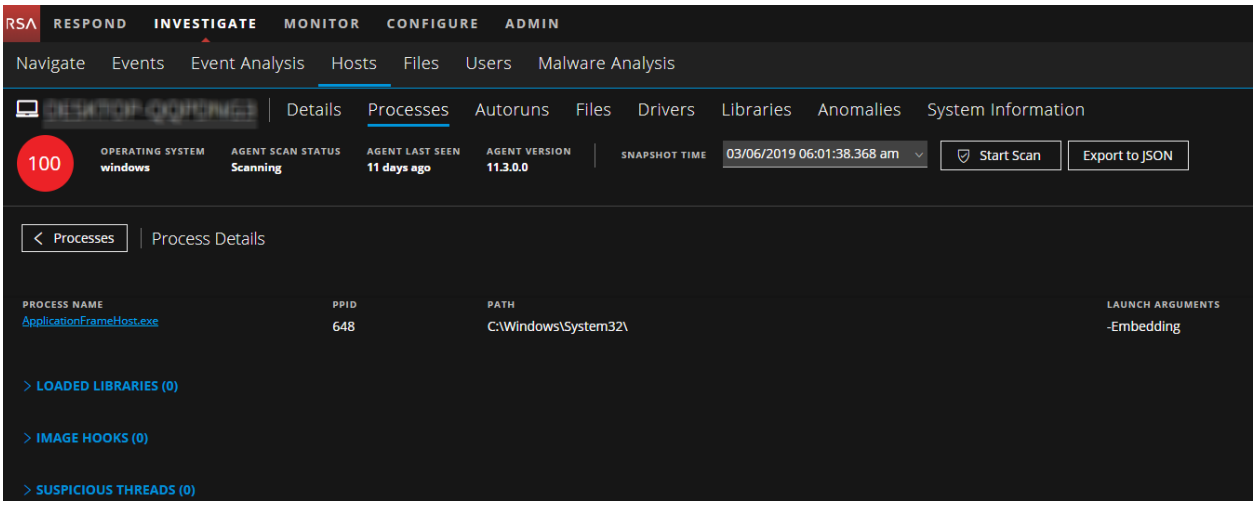
Agent Last Seen - Time when the agent last communicated with the Endpoint server.

Agent Version - Version of the agent. For example, `11.3.0.0`.

2	**Actions in the toolbar:** **Snapshot Time** - Lists scanned time stamps. To view the scan history, you select the snapshot time from the drop-down menu. **Start Scan** - Starts a scan for the selected hosts. For more information, see Scan Hosts. **Export to JSON** - Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Investigating Hosts. **Analyze Process** - Lets you perform process analysis to investigate a particular process behavior, and understand the entire process event chain, process parent-child relationships, and all associated events. For more information, see Investigating a Process. **Change File Status** - Provides capabilities to manage suspect and legitimate files and block malicious or infected file to prevent future execution of the file on any host. For more information, see Changing File Status or Remediate. **Analyze Events** - Lets you investigate a particular host, IP address, username, filename, or hash to get the entire context of the activity. For more information, see Analyzing Events. **More** - Provides options to: • Perform external lookups. • Download files to server, save a local copy, and analyze files for deeper analysis. **Note:** You can perform some of the above actions from the right-click context menu.
3	**Search on Snapshots**. Lets you search on all snapshots (file name, file path, and SHA-256 checksum). For more information, see Search on Snapshots.
4	**Toggle.** Lets you toggle between List view and Tree view.
5	**Process panel** - Displays process information, such as process name, local risk score, global risk score, active on, reputation status, file status, and others.
6	**Show/Hide Right Panel** - Displays the following properties of a process in the right panel: • File Details - Displays all properties of the selected process. It is grouped as follows: **General** - General information about the file, such as file name, entropy, size, and format. **Signature** - Provides signatory information. **Hash** - Hash type of the file (MD5, SHA1, and SHA256). **Time** - Time when the file was created, modified, or accessed. **Location** - Location of the file. **Process** - Details of the process, such as image size and PID. **Image** - Image details loaded by the process. • Local Risk Details - Displays the alerts associated with the local risk score, such as Critical, High, Medium and All.

Process Details

Clicking the process name displays the process details of a specific process as shown in the following figure:



Field	Description
Process Name	Name of the process. For example, `server.exe`.
PID	ID of the process. For example, `492`.
Path	Path of the file associated with the process on the disk. For example, `C:\Windows\System32`.
Launch Arguments	Command line arguments passed to the process when it is launched. For example, `-k LocalServiceNoNetwork`.

- List of loaded libraries for the selected process, such as DLLs (for Windows), Dylibs (for Mac), or .SO (for Linux).
- List of autoruns (if configured).
- List of image hooks and suspicious threads (for Windows).

Hosts View - Autoruns Tab

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

The Autoruns panel provides a list of autoruns, services, tasks, and cron jobs running on the host. To access this tab, select a host from the **Hosts** view and click the **Autoruns** tab.

  General - General information about the file, such as file name, entropy, size, and format.

  Signature - Provides signatory information.

  Hash - Hash type of the file (MD5, SHA1, and SHA256).

  Time - Time when the file was created, modified, or accessed.

  Location - Location of the file.

  Image Hooks/Kernel Hooks/Suspicious Threads/Registry Discrepancies - Details related to image hooks, kernel hooks, suspicious threads, or registry discrepancies.

- Local Risk Details - Displays the alerts associated with the local risk score, such as Critical, High, Medium and All.

6 Clicking a filename lets you navigate to the Files view for further analysis.

Image Hooks

Image hooks found in executable image are displayed in the following columns.

Columns	Description
Type	Type of the hook . Possible values are - inline, iat, eat, or exception Handler.
Local Risk Score	Risk score of suspicious or malicious activities performed by the file on a specific host.
Global Risk Score	Aggregated score of all suspicious and malicious activities performed by the file across all hosts.
Reputation	Reputation of a file hash. The statuses are - Malicious, Suspicious, Unknown, Known, Known Good, and Invalid.
Signature	Provides signatory information.
Downloaded	Indicates the status of the downloaded file - Downloaded, Not Downloaded, and Error.
Hooked Process	Process in which hooks are placed.
Hooked Filename	Name of the file that was modified by the hook.
Hooked Symbol	Symbol in which the hook is performed.

Kernel Hooks

Hooks found on kernel objects are displayed in the following columns.

Category	Description
Type	Type of kernel object which was modified. Possible values are: objectInitializer,basicObjectPointer, majorFunction, invalidObject, fastIO, notifyRoutine, attachedDevice, device, miniPort, sdt, sysEnter, or type.idt.
Driver name	Name of the driver which placed the hooks.
Local Risk Score	Risk score of suspicious or malicious activities performed by the file on a specific host.
Global Risk Score	Aggregated score of all suspicious and malicious activities performed by the file across all hosts.
Reputation	Reputation of a file hash. The statuses are - Malicious, Suspicious, Unknown, Known, Known Good, and Invalid.
Signature	Provides signatory information.
Downloaded	Indicates the status of the downloaded file - Downloaded, Not Downloaded, and Error.

Category	Description
Object Function	Name of the object function hooked into.
Hooked File Name	Name of the file that was modified by the hook.

Suspicious Threads

Threads whose service table was hooked are displayed in the following columns.

Category	Description
Start Address	Start Address - Start address of the thread.
DLL Name	Name of the DLL.
Local Risk Score	Risk score of suspicious or malicious activities performed by the file on a specific host.
Global Risk Score	Aggregated score of all suspicious and malicious activities performed by the file across all hosts.
Reputation	Reputation of a file hash. The statuses are - Malicious, Suspicious, Unknown, Known, Known Good, and Invalid.
Process	File name and PID of the process in which thread is running.
Downloaded	Indicates the status of the downloaded file - Downloaded, Not Downloaded, and Error.
Signature	Provides signatory information.
Thread ID	ID of the running thread.
Thread Environment Block	Address of the thread environment block.

Registry Discrepancies

Configuration settings and options on Microsoft Windows operating systems that are stored are displayed in the following columns.

Category	Description
Hive	Name of the registry hive when possible, otherwise it displays the hive ID. Possible values are: `hkeyClassesRoot`, `hkeyCurrentUser`, `hkeyLocalMachine`, `hkeyUsers`, or `hkeyPerformanceData`.
Reason	Type of registry discrepancy. Possible values are: notFound, embeddedNull, accessDenied, parentIsHidden, or dataMismatch.

Category	Description
Registry Path	Registry path that is affected. The value is separated by a @ character.
Raw Type	Value type found in the low-level parsing.
Raw Data	Value data extracted from the low-level parsing.
API Type	Value type from the Win32 registry API.
API Data	Value data from the Win32 registry API.

Hosts View - System Information Tab

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

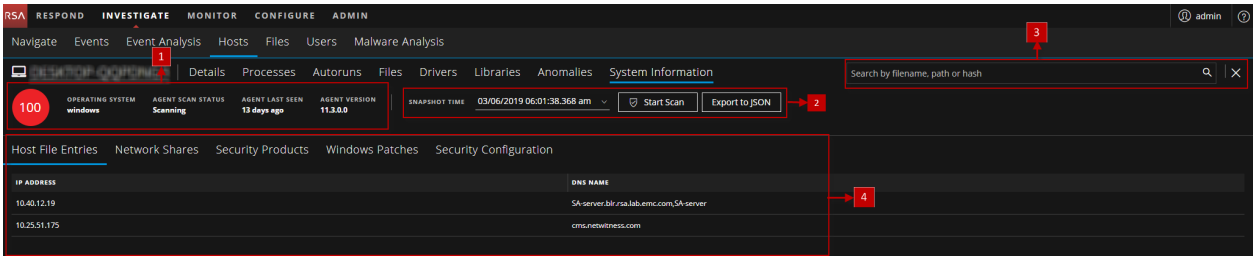
Below is an example of the System Information tab:



1	**Agent and Scan Details**. You can view the following agent and scan details of the selected host: **Host name** - Name of the host. For example, `WIN-ABC`. **Risk score** - Risk score of the host. **Operating System** - Operating system on which the agent is running (Linux, Windows, or Mac). **Agent Scan Status** - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan. For more information, see Scan Hosts. **Agent Last Seen** - Time when the agent last communicated with the Endpoint server. **Agent Version** - Version of the agent. For example, `11.3.0.0`.
2	**Actions in the toolbar:** **Snapshot Time** - Lists scanned time stamps. To view the scan history, you can select the snapshot time from the drop-down menu. **Start Scan** - Starts a scan for the selected hosts. For more information, see Scan Hosts. **Export to JSON** - Extracts host attributes and endpoint data to a JSON file of the selected snapshot. For more information, see Export Host Attributes.
3	**Search on Snapshots**. Lets you search on all snapshots (file name, file path, and SHA-256 checksum). For more information, see Search on Snapshots.
4	**System Information Panel** - See System Information Panel.

System Information Panel

The System Information panel displays the following tabs:

Tabs	Description
Host File Entries	All network redirections written in the host file. For example, IP Address - `10.10.10.3` and DNS Name - `localhost,localhost.localdomain,localhost4,localhost4.localdomain4`
Network Shares	Network name of the shared resource (for Windows only). For example, Name - `Admin$`, Description - `Remote Admin`, Path - `C:\`, Permissions - `None`, Type - `disk, special`, Max Users - `4294967295`, Current Users - `0`.
Security Products	Installed security products (for Windows only). For example, Display Name - `Windows Defender`, Instance - `D68DDC3A-831F-4FAE-9E44-DA132C1ACF46`, Features - `Enabled`, Type - `antiVirus`.
Windows Patches	List of patches applied by Windows update (for Windows only). For example, `KB2959936`.
Security Configuration	Security configuration details on the host. For example, firewall disabled or enabled, smart screen filter disabled or enabled. This field is only applicable for Windows and Mac.

How NetWitness Investigate Works

NetWitness Investigate provides the data analysis capabilities in RSA NetWitness® Platform, so that analysts can analyze packet, log, and endpoint data, and identify possible internal or external threats to security and the IP infrastructure.

Note: In Version 11.1 and later, the Hosts and Files views provide a view into endpoint data. Earlier versions offer access to endpoint data using a standalone NetWitness Endpoint server.

Metadata, Meta Keys, Meta Values, and Meta Entities

RSA NetWitness Platform audits and monitors all traffic on a network. One type of service--a Decoder--ingests, parses, and stores the packets, logs, and endpoint data traversing the network.

The configured parsers and feeds on the Decoder create *metadata* that analysts can use to investigate the ingested logs and packets. Another type of service, called a Concentrator, indexes and stores the metadata.

The metadata is in the form of a *meta key* and *meta values* for the key. For example, `ip.src` is a meta key, and an IP address that is the source of the traffic is tagged as `ip.src`. When you view data in Investigate, you see the meta key `ip.src` and all of the IP addresses (values) that are tagged with that key. Some meta keys are built-in and others may be custom keys defined by the administrator.

Meta entities are available in Version 11.1 and later. A *meta entity* is an alias that groups together the results from other meta keys. Meta entities organize similar meta keys into a single, easier to use, meta type. Some meta entities are already included by default, and the administrator can create custom meta entities. Analysts can use a meta entity in a query, a meta group, a column group, and a profile. Parallel coordinates visualizations do not support meta entities. Administrators can use meta entities to define a query prefix to apply to a user role and a user. The *Decoder Configuration Guide* provides additional information about creating meta entities and how they can be used in rules.

Note: Meta entities need to be configured on all upstream Concentrators. If any Concentrator does not have a meta entity configured, that meta entity will be empty when you query the Broker.

For example, the default Core database language includes distinct meta keys for IP source and IP destination. One of the built-in meta entities named `ip.all` represents the combined set of all IP sources and destinations.

Analysts usually query the Concentrator to discover threats. The Concentrator handles queries, only going to the Decoder when a full reconstruction of sessions or raw logs is required. ESA, Malware Analysis, and Reporting Engine also query the Concentrator, where they can quickly get all the pertinent metadata associated with an event and generate information on the event without having to go to each Decoder. In some special cases, analysts may query a Decoder.

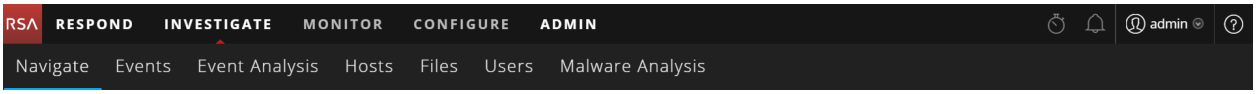
Triggers for an Investigation

These are a few examples of triggers for an investigation:

- You receive intelligence about a new active directory hack. Starting in the Events view, you use that intelligence to run a search across all of your raw Active Directory log data for the last 24 hours.
- You are asked by the SOC manager to find any Pokemon Go malware due to its popularity. Starting in the Navigate view, you craft a query to look for an HTTP session using a specific user agent related to the malware he found on a security blog.
- An incident responder escalates a ticket that shows some odd indicators related to a host. Starting in the Hosts view, you examine that host to find specific details.
- You are looking for the next zero day attack and start pivoting through network metadata in the Navigate view to find any abnormal automated sessions leaving the enterprise.
- You are asked by your SOC manager to find any information related to user `jarvis`, an employee who was just let go. Starting in the Hosts view, you query against the past week for that username.

Workflow of an Investigation

Analysts can investigate data captured by NetWitness Platform, and deep dive from information on a NetWitness Platform dashboard, a NetWitness Respond incident or alert, a report created by the NetWitness Platform Reporting Engine, or a third-party application. During the course of an investigation, analysts can move seamlessly between the views in Investigate: the Navigate view, the Events view, the Event Analysis view, the Hosts view, the Files view, the Users view, and the Malware Analysis view. This figure illustrates the NetWitness Investigate submenus.



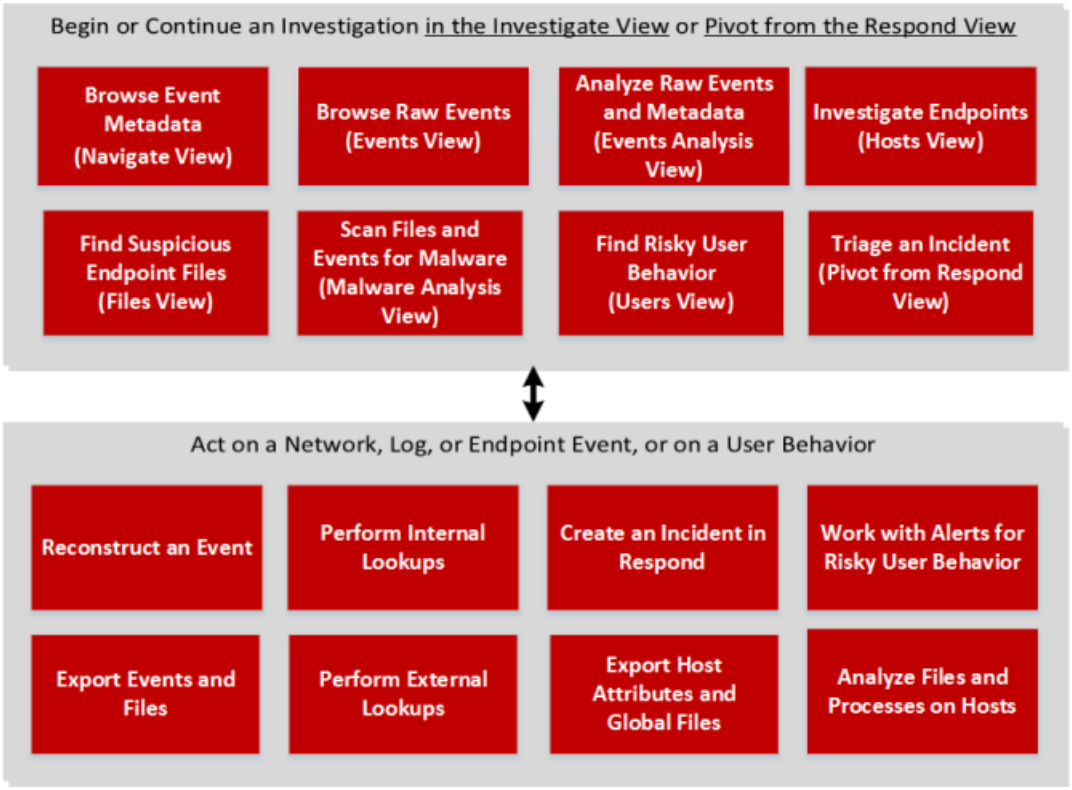
Note: The Files and Hosts views are available in Version 11.1 and later. The Users view is available in Version 11.2 and later. Specific user roles and permissions are required for a user to conduct investigations and malware analysis in NetWitness Platform. If you cannot perform an analysis task or see a view, the administrator may need to adjust the roles and permissions configured for you.

You can access each view from the Investigate submenu and from other Investigate views. You can also go directly into an Investigate view from NetWitness Respond, and go directly from NetWitness Investigate to NetWitness Respond and standalone NetWitness Endpoint. Your use case determines the starting point for your investigation. This table provides general guidance on the starting view for different use cases.

Go to...	Focus
Navigate view	All meta keys and meta values for logs, endpoints, and packets are grouped by meta key. You can pivot through the data to refine results, then go to the Events view or Event Analysis view, or look up in Malware Analysis or Live. This is the default NetWitness Investigate view. (See Investigating Metadata in the Navigate View.)

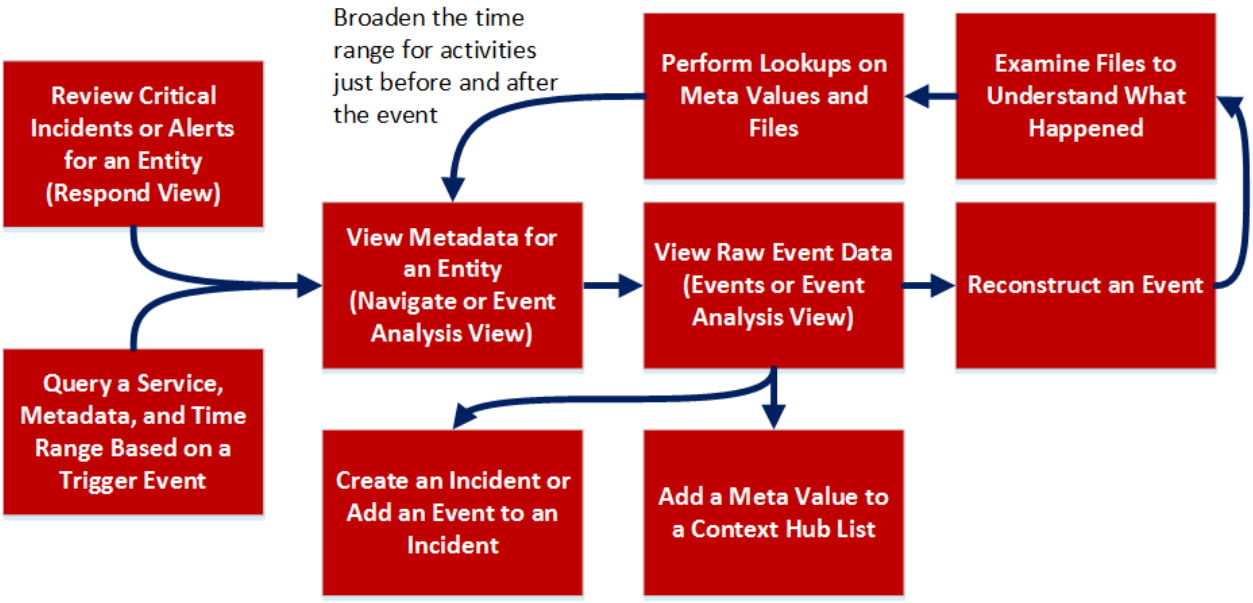
Go to...	Focus
Events view	Events are listed in order by time. You can view the raw event and related metadata, view a reconstruction, and download events and files. You can go to the Event Analysis view. (See Examining Raw Events in the Events View.)
Event Analysis view	Events are listed in order by time. You can view the raw event and related metadata, view a reconstruction that offers helpful cues to identify points of interest in a reconstruction, such as interesting bytes, file types, and encoded data. You can pivot to standalone Endpoint, look up in Live, and do external lookups. External lookups allow you to search the internet for meta values with which you interacted, determine passive DNS information related to an IP address, ascertain if a URL is blacklisted, and other third-party context integrations. (See Analyzing Raw Events and Metadata in the Event Analysis View)
(Version 11.1 and later) Hosts view	Hosts on which the NetWitness Endpoint Insights Agents are running are listed. For every host, you can view processes, drivers, DLLs, files (executables), services, anomalies, and autoruns that are running, and information related to logged-in users. From the Hosts view, you can go to the Navigate, Event Analysis, and Users views. (See the *NetWitness Endpoint User Guide*.)
(Version 11.1 and later) Files view	Unique files such as PE, Macho, and ELF in your deployment are listed. For each file, you can view details such as file name, reputation status, file status, risk score, signature, checksum, and others. From the **Files** view, you can go to the Navigate and Event Analysis views. (See the *NetWitness Endpoint User Guide*.)
Malware Analysis view	If you are running a Malware Analysis appliance, you can scan files and see results of four types of analysis: network, static, community, and sandbox. If a file is malware, you can go to the Hosts view to see which hosts downloaded the file. (See the *Malware Analysis User Guide*.)
(Version 11.2 and later) Users view	Provides visibility into risky user behaviors across your enterprise using NetWitness UEBA. You can view a list of high-risk users and a summary of the top alerts for risky behavior for your environment, and then select a user or an alert and view details about the risky behavior, and a timeline during which the behaviors occurred. NetWitness Platform users assigned the Administrators or UEBA Analysts role have access to this view. (See the *NetWitness UEBA User Guide*..

Every situation is unique in terms of the types of information the analyst is attempting to find. Many investigations start in one view, and end in a different view as the analyst learns something and then needs to follow that result to a different line of questioning. This figure shows the high-level capabilities of NetWitness Investigate. In the top box are all the possible starting points, and the lower box shows the tasks that you can accomplish from different starting points.



Focus on Metadata, Query, and Time

The following figure depicts the workflow for an investigation with focus on metadata, a query, and time range.



Analysts use NetWitness Investigate to hunt for events that drive the incident response workflow and to do strategic analysis after another tool has generated an event. Beginning in the Navigate view, Events view, or Event Analysis view:

- You start by executing a query on a service for a specific time range, then filter results to get a subset of events, reconstruct or analyze an event, and repeat the process to reconstruct or analyze another event. Built in profiles, meta groups, and column groups provide a good starting point. For example, you can choose the RSA Email Analysis profile to see only metadata that is useful when investigating email risks.
- When you encounter an event that bears a closer look, you view the context around the event, and decide whether to create an incident or add the event to an incident. If you decide not to add the event to an incident, you run another query to gain further insight, which starts again at the beginning of the workflow.
- If you notice suspicious activity or files on a specific host in the network, you can gather additional information about the host and files found on the host in the Hosts and Files view, or in a standalone NetWitness Endpoint server.
- If you find a file or event that potentially contains malware, you can do a Malware Analysis scan of the file or you can open Malware Analysis and start a scan of the service on which the event was seen.

Here is one simple use case: If there is a concern regarding suspicious traffic with foreign countries, the Destination Country meta key reveals all destinations and the frequency of the contact. Drilling into those values yields the specifics of the traffic, such as the IP address of the originator and the recipient. Checking other metadata can expose the nature of attachments exchanged between the two IP addresses. When suspect IP addresses are identified, looking at the addresses in the Navigate view or Event Analysis view with a broader time range can provide clues about what happened before and after the event being investigated.

Another use case is to investigate an alert to discover a malicious insider in the network who is exfiltrating intellectual property or other sensitive data from a specific IP address. The investigation begins with an **Upload without change request followed by download alert**. Start in the Navigate view by filtering the values to the IP address during the time range in which the alert was generated. Alerts metadata in the Navigate view show risk indicators as meta values and you can click on different meta values to reconstruct the event. Next extract files and examine the files to understand what happened. With this information, you can filter on the same IP address and broaden the time range to see activities before and after the event.

Focus on NetWitness Respond Incidents and Alerts

An analyst who is working on an incident or an alert in NetWitness Respond can open the incident in NetWitness Investigate (Navigate view) to do a deeper analysis of the event or alert.

- The workflow to respond to an incident typically begins in the Respond view, where the analyst who is investigating an incident needs to gather intelligence about the incident in NetWitness Investigate. You can hover over an underlined entity in an incident or alert, such as an IP address, and then select the action Pivot to Investigate > Navigate. The Navigate view opens and is filtered for the selected entity. After you launch an investigation from NetWitness Respond, defined meta keys are queried and the content of captured packets, logs, and endpoint events is displayed in the Navigate view.
- If you find events that are relevant to the incident, you can add the events to the incident in Respond. You can also create a new incident in Respond based on one or more events found in Investigate.
- (Version 11.2 and later) From the Incident Details view Indicators panel in Respond, you can open the Event Analysis view to get a better understanding of an indicator event.

NetWitness Investigate Views

This section provides a brief description and example of the Navigate view, Events view, and Event Analysis view, and views that provide additional context for data found--the Context Lookup panel and the Event Reconstruction view.

Refer to these guides for information about other Investigate views:

- The *NetWitness Endpoint User Guide* covers features and functions of the Hosts view and Files view.
- The *NetWitness UEBA User Guide* covers features and functions of the Users view.
- The *Malware Analysis User Guide* covers features and functions of the Malware Analysis view.

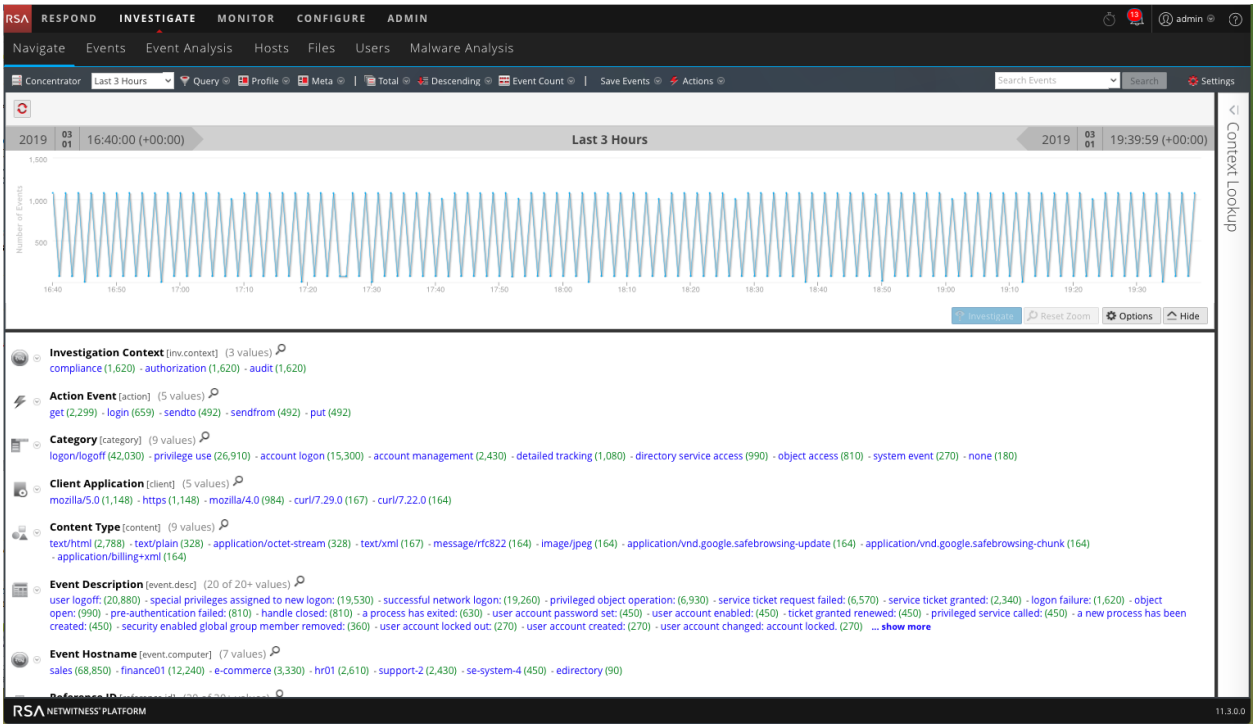
Navigate View

The Navigate view provides the capability to drill into and query contents of captured packets, logs, and endpoint events on a Broker, Concentrator, or Decoder (though investigating a Decoder is not typical).

- When you select a service, the defined meta keys for that service are queried, and values are returned along with the number of events. Clicking a value filters out the other value,s providing a view into a more focused set of data. This is called drilling into the data.

- For certain configured meta keys, such as IP address, or hostname, you can see additional context information around a value using the Context Hub. The additional context may include incidents, alerts, and other sources where the value was mentioned.
- The Navigate view also provides a sequential visualization of the data in a timeline. You can zoom in on a selected time period.

This figure illustrates the Navigate view.

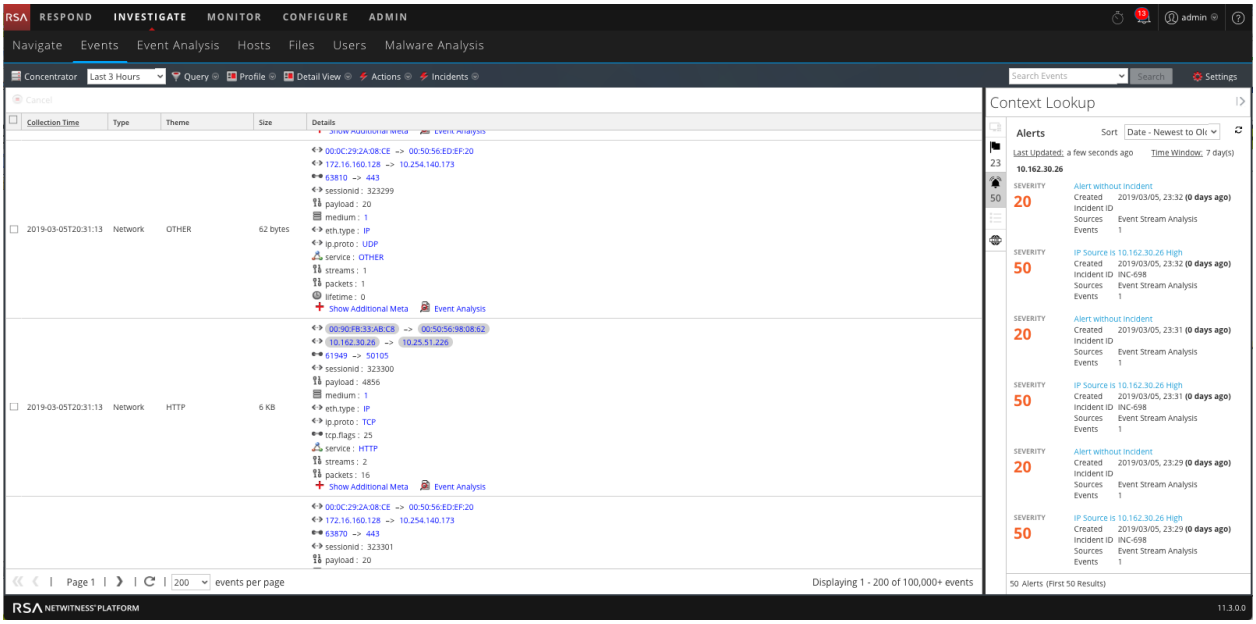


Events View

The Events view provides a view of packet, log, and endpoint events in list form so that you can view events sequentially and reconstruct events safely.

- You can open the Events view for a meta value that you see in the Navigate view.
- For analysts without sufficient privilege to navigate a service, the Events view is a standalone investigation view in which analysts can access a list of network, log, and endpoint events from a NetWitness Platform Core service without having to drill down through metadata first.
- The Events view presents event information in three standard forms, a simple list of events, a detailed listing of events, and a log view.
- For certain configured meta keys, such as IP address, or hostname, you can see additional context information around a value using the Context Hub. The additional context may include incidents, alerts, and other sources where the value was mentioned.
- You can export events and associated files, and create an incident from an event.

This figure illustrates the Events view.

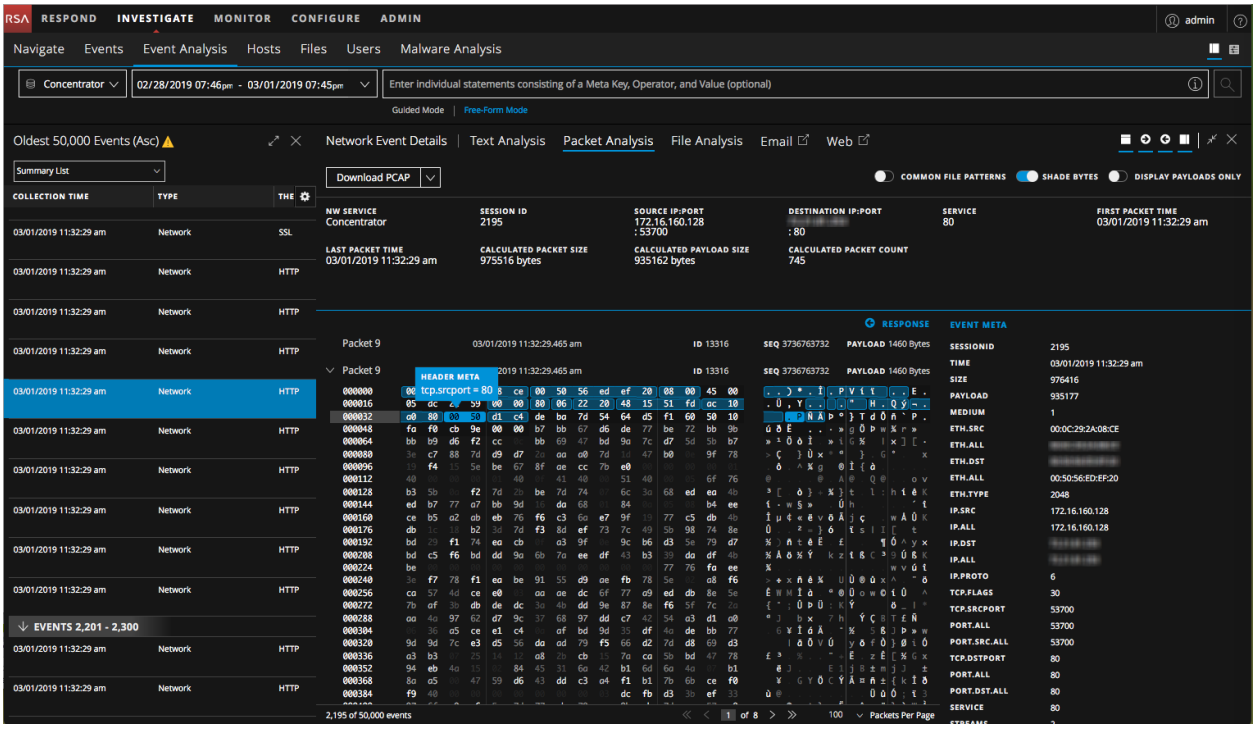


Event Analysis View

The Event Analysis view is an interactive tool to help analysts see the packets, text, or files in an event with visual cues to highlight certain types of information. Depending on the type of reconstruction different information is relevant.

- For certain configured meta keys, such as IP address, or hostname, you can search for additional context information around a value using the Context Hub. The additional context may include incidents, alerts, and other sources where the value was mentioned.
- When viewing files, you can export files in a zip archive to your local file system.
- You can download logs from the Text view, and export packets from the Packet view.

This figure is an example of the Event Analysis view.



Contextual Information for an Event

In the Navigate view, Events view, and Event Analysis view (Version 11.2 and later), the Context Lookup panel shows details about elements associated with an event (IP Address, User, Host, Domain, MAC Address, Filename, and File hash) in the Context Hub. In addition, you can right-click all meta keys except time to see additional context.

- You can interact with the elements of an event to get further insight including related incidents, alerts, custom lists, Archer assets, active directory details, and NetWitness Endpoint IIOCs.
- You can click on a data point to go to the Navigate view.

Note: Archer assets and active directory details are available in the Event Analysis view context lookup. Endpoint context lookup is available for NetWitness Endpoint 4.4.0.2 or later hosts, but not for the NetWitness Endpoint 11.1 hosts.

The following figures show the Context Lookup panel in the Events view and the Event Analysis view.

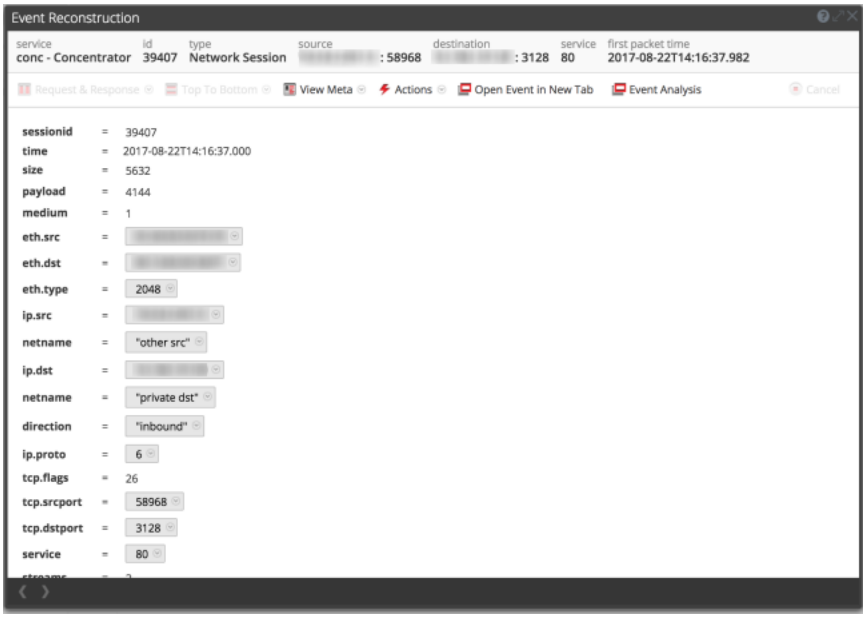
Event Reconstruction

Three NetWitness Investigate views offer the ability to reconstruct an event: Navigate view, Events view and Event Analysis view. When you discover an event that merits additional investigation, you can reconstruct an event safely in a form similar to its native form. The rendering of events restricts the use of dynamic or active code that might be contained in the event to limit any adverse outcome to your system or browser. Cache is used to improve performance when viewing previously viewed events. Each analyst has a separate cache of reconstruction data, and you can only access reconstructed events in your own cache.

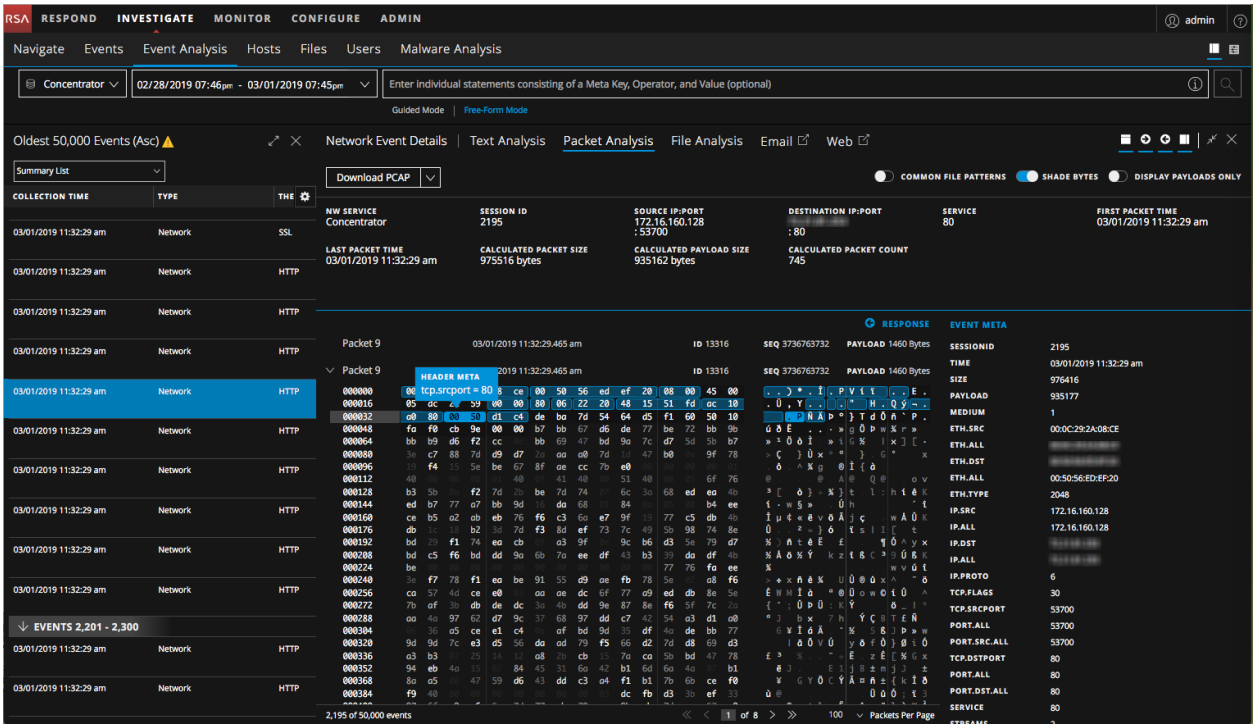
The Event Reconstruction in the Events view presents the raw data and the meta keys and meta values for an event in a list form. This figure is an example of the Event Reconstruction.



In this Event Reconstruction, you can:

- Page through the reconstruction to view the next event in this form.
- Reconstruct events using different methods to suit the type of data: metadata, text, hexadecimal, packets, web, mail, files, or the best reconstruction selected automatically.
- Export packet capture files, extract files, and export the meta values for the event.

The Event Analysis view presents an interactive event reconstruction, which includes raw data, meta keys, and values. This figure is an example of a reconstruction in the Event Analysis view.



In the Event Analysis view reconstruction, you can:

- Reconstruct an event using different methods to suit the type of data: metadata, text, hexadecimal, packets, and files.
- Understand more about highlighted information in the headers and payloads.
- View decoded and encoded payloads and see common file signatures.
- Search for locations of meta keys or values in the reconstruction.
- Export events and files.

Configuring NetWitness Investigate Views and Preferences

Analysts can configure some aspects of NetWitness Investigate views and behavior. You can customize the way that Investigate views appear, the types of information displayed, and factors that affect performance in returning results and reconstructing events. All configurable settings have default values that are effective in most deployments; however, analysts have the option to adjust these if necessary.

Analysts using Investigate need to have the appropriate system roles and permissions set up for their user accounts. An administrator must configure roles and permissions as described in the *System Security and User Management Guide*.

These topics provide details:

- Configure the Navigate View and Events View
- Configure the Event Analysis View

Configure the Navigate View and Events View

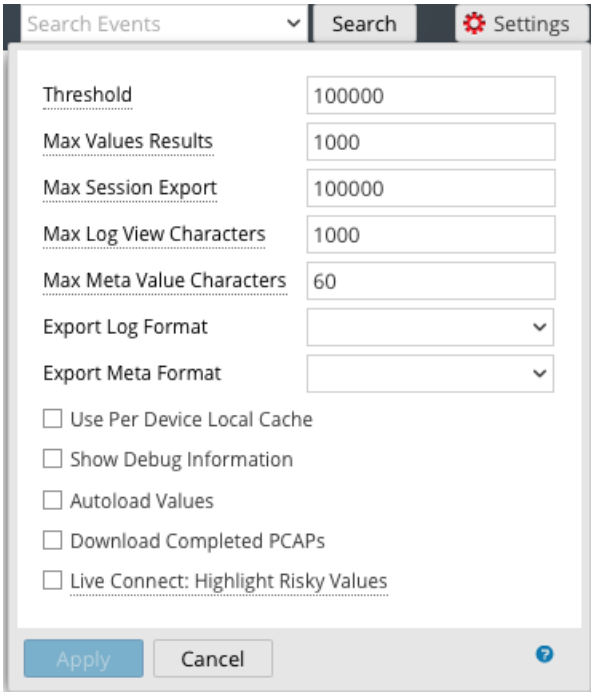
Analysts can set preferences that affect performance and behavior of NetWitness Platform when using the Navigate view and Events view. Some of the same settings are available in two places in NetWitness Platform, and changes made in either location are applied in the other view:

- Investigate view > Settings dialog for the Navigate view and the Events view.
- Profiles > Preferences panel > Investigation tab.
- Navigate view and Events view Search Options drop-down.

Access the Navigate View and Events View Settings

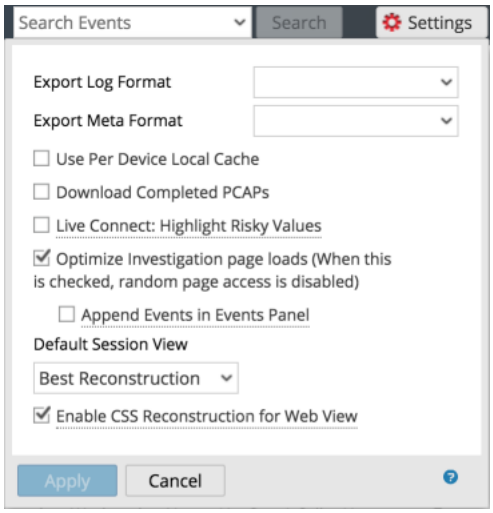
To access the settings, do one of the following:

- In the **Navigate** view toolbar, select the **Settings** option.
  The Settings dialog for the Navigate view is displayed.



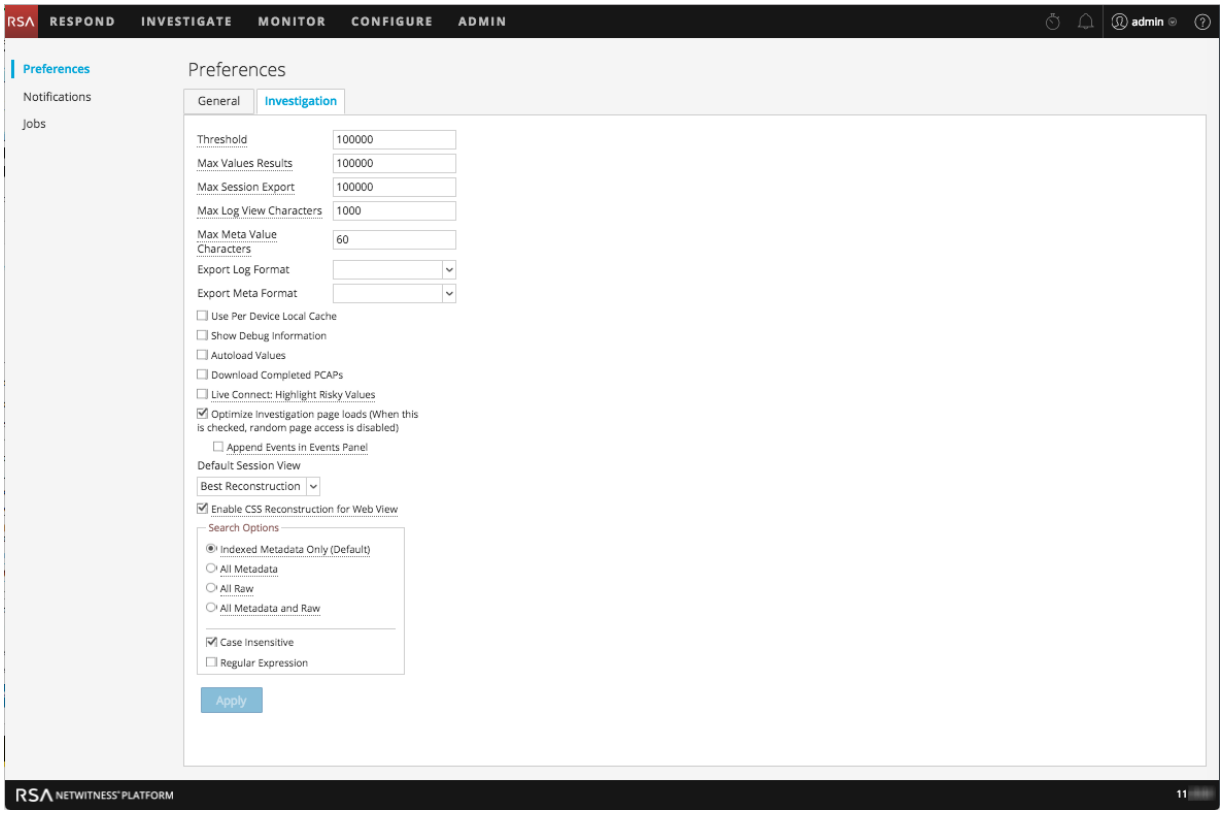
Note: Version 11.0 included a setting to Append Events in Events Panel, which was moved to the Events view settings panel in Version 11.1.

- In the **Events** view toolbar, select the **Settings** option.
  The Settings dialog for the Events view is displayed.



Note: Version 11.1 and later includes the Append Events in Events Panel setting.

- In the top right corner of NetWitness Platform, go to > , Profile, and in the **Preferences** panel click the **Investigation** tab.
  The Investigation panel is displayed. The figure below illustrates the Investigation panel.



Calibrate Navigate View Value Loading Parameters

Several settings influence the performance of NetWitness Platform when loading values in the Values panel. Default values are set based on common usage, and individual analysts can adjust these settings for their own investigations. To adjust these settings:

1. Go to the **Preferences** panel >**Investigation** tab or to the **Settings** dialog for the Navigate view.
2. Adjust the following parameters:
   - **Threshold:** Set the threshold for the maximum number of sessions loaded for a meta key value in the Values panel. A higher threshold allows accurate counts for a value, and also causes longer load times. The default value is **100000**.
   - **Max Values Results:** Set the maximum number of values to load in the Navigate view when the Max Results option is selected in the Meta Key Menu for an open Meta Key. The default value is **1000**.
   - **Max Session Export:** Specify the number of events that can be exported in a single PCAP or Log file.
   - **Max Log View Characters:** Set the maximum number of characters to be displayed on **Investigate > Events > Log Text**. The default value is **1000**.
   - **Max Meta Value characters:** Set the maximum number of characters in a meta value name displayed in the Navigate view Values panel. The default value is **60**.
   - **Show Debug Information:** If you want NetWitness Platform to display the `where` clause beneath the breadcrumb in the Navigate view and the elapsed load time for each aggregated service on a Broker, check this option. The default value is **Off.**
   - **Append Events in Events Panel:** This option affects paging in the Events view and is described below under "Calibrate Events View Retrieval and Default Reconstruction."
   - **Autoload Values:** If you want NetWitness Platform to automatically load values for the selected service in the Navigate view, check this option. When not selected, NetWitness Platform displays a **Load Values** button, allowing the opportunity to modify options. The default value is **Off**.
3. Click **Apply**.
   The settings become effective immediately and are visible the next time you load values.

Configure Navigate View and Events View Parameters

Several settings influence the performance of NetWitness Platform when loading values in the Navigate view and the Events view. Default values are set based on common usage, and individual analysts can adjust these settings for their own investigations. You can set these parameters separately in the Navigate view and the Events view. When configured in one view, the setting does not automatically apply to the other view. To adjust these settings:

1. Go to the **Preferences** panel > **Investigation** tab or to the **Settings** dialog for the Navigate view or the Events view.

2. Adjust the following parameters:
   - **Live Connect: Highlight Risky Values:** If you want NetWitness Platform to highlight and display only IP addresses that are considered as risky by RSA community, check this option. When not selected, NetWitness Platform displays all IP addresses. By default, this option is not selected (**Off**).
   - **Use Per Device Local Cache:** You can specify the use of locally cached data from the selected service. By default, this option is not selected **(Off)**. When unchecked, Investigate sends a fresh query to the database rather than displaying cached data in the Investigate views after the initial load. If checked, Investigate uses the data from local cache.
   - **Download Completed PCAPs:** You can automate the downloading of extracted PCAPs in the Navigate view and Events view so that the browser downloads the extracted PCAP and opens it in the default application for opening PCAP files, such as Wireshark. By default, this option is not selected (**Off**). If you are going to enable this option, ensure that an application that can open PCAPs is installed on your local file system and that the application is set as the default application to handle PCAP file formats.
   - **Live Connect: Highlight Risky Values:** If this option is unchecked, all the meta values that have context available in Live Connect are highlighted in the Navigate view Values panel. If the option is checked, among the values that have context in Live Connect, only those values deemed Risky/Suspicious/Unsafe by the community are highlighted. By default this option is unchecked (**Off**).
3. Click **Apply**.
   The settings become effective immediately.

Configure the Default Log Export Format

You can export logs from the Navigate view and the Events view as Text, XML, comma-separated values (CSV), and JSON. There is no built-in default value for the log export format. If you do not select a format here, NetWitness Platform displays a selection dialog when you invoke export of logs. To select the format for exported logs:

1. Go to the **Preferences** panel >**Investigation** tab or to the **Settings** dialog for the Navigate view or Events view.
2. Select one of the options from the **Export Log Format** drop-down menu.
3. Click **Apply**.
   The setting goes into effect immediately.

Configure the Default Meta Export Format

You can export meta values from the Navigate view and Events view as Text, CSV, tab-separated values (TSV), and JSON. There is no built-in default value for the meta export format. If you do not select a format here, NetWitness Platform displays a selection dialog when you invoke export of meta values. To select the format for exported meta values:

1. Go to the **Preferences** panel > **Investigation** tab or to the **Settings** dialog for the Navigate view or Events view.
2. Select one of the options from the **Export Meta Format** drop-down menu.
3. Click **Apply.**
   The setting goes into effect immediately.

Calibrate Events View Retrieval and Default Reconstruction

You can configure several parameters that control the how NetWitness Platform retrieves events and reconstructs events in the Events view. To adjust these paramaters:

1. Go to the **Preferences** panel > **Investigation** tab or to the **Settings** dialog for the Events view.
2. Configure the following parameters.
   - **Optimize Investigation page loads**: Set a paging option. When optimized, results are returned as quickly as possible,and you cannot go to a specific page in the event list. Unchecking this box changes the Events list pagination to allow you to go to a specific page in the list (or to the last page). The default value is **enabled**.
   - **Default Session View:** Selects the default reconstruction type for the initial reconstruction in the Events view. The default value is **Best Reconstruction** in which events are reconstructed using the reconstruction method most appropriate to the event.
3. Go to the **Preferences** panel > **Investigation** tab, or to the **Settings** dialog for the Navigate view (11.1) or the Events view (11.2), and set the **Append Events in Events Panel** option. When this option is selected, the events displayed in the **Events Panel** are added incrementally. For example, each time you click the next page icon, the next increment of events is added, at first you see 1 to 25, then 1 to 50, then 1 to 75 and so on. This option is available only if the **Optimize Investigation Page Loads** option is enabled.
4. To activate the changes immediately, click **Apply**.

Enable or Disable Cascading Style Sheet Rendering in Web Content Reconstructions

Analysts can enable the use of cascading style sheets (CSS) when reconstructing web content. If enabled, the web reconstruction includes CSS styles and images so that its appearance matches the original view in a web browser. This includes scanning and reconstructing related events, and searching for style sheets and images used in the target event. The option is enabled by default. Disable this option if there are problems viewing specific websites.

Note: The appearance of the reconstructed content may not match the original web page perfectly if related images and style sheets could not be found or were loaded from the web browser's cache. Also, any layout or styling that is performed dynamically through the client side javascript is not rendered in the reconstruction because all client side javascript is removed for security purposes.

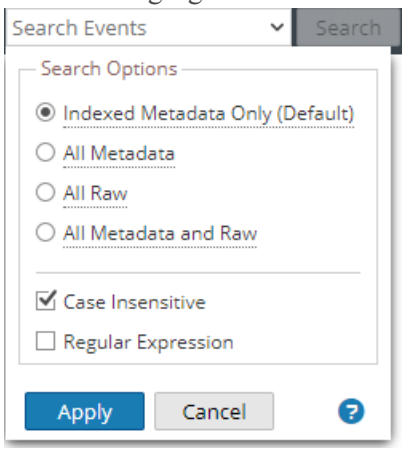
To enable or disable this option:

1. Go to the **Preferences** panel > **Investigation** tab.
2. Select the **Enable CSS Reconstruction for Web View** checkbox.
3. Click **Apply**.
   The setting becomes effective immediately and is visible in the next web content reconstruction.

Configure Search Options

You can configure search options to apply when you type a search string in the Search field. Edit the Search Options in the Profile > Preferences panel > Investigation tab or in the Navigate and Events view Search Options drop-down menu. To configure search options:

1. Navigate to the Search Options.
   The following figure illustrates the Search Options drop-down menu for Version 11.2 and later.



2. Select one or more search options to apply to the search. Search for Text Patterns provides detailed information about each option.
3. To save the search settings, click **Apply**.
   The preferences are saved and effective immediately.

Configure the Event Analysis View

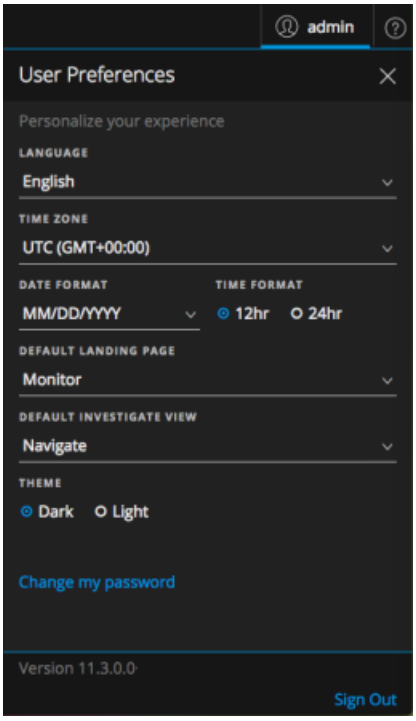
Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

Analysts can set preferences that affect the behavior of NetWitness Platform when using the Investigate > Event Analysis view. In the Event Analysis view is open; these two buttons give access to preferences dialogs: and . The User menu ( ) is focused on global user preferences such as time zone, while the Event Analysis preferences menu ( ) is focused on user preferences for behavior in the Event Analysis view. The rest of this section describes both sets of preferences.

Set the Default Investigate View

You can select the default view when you open Investigate: Navigate view, Events view, Event Analysis view, Hosts view, Files view or Malware Analysis view. The default Investigate view is set in the global User Preferences dialog (in the upper right corner of the NetWitness Platform browser window, select).

The global user preferences are described in detail in the *NetWitness Platform Getting Started Guide*.

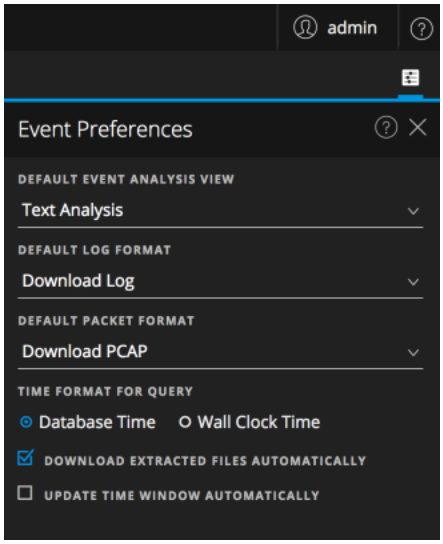


Set User Preferences for the Event Analysis View

You can set your own preferences relevant to the Event Analysis view. The preferences selected persist per user and are available whenever the specific user logs in to the application.

To set default values for working in the Event Analysis view:

1. In the Event Analysis view, click .



2. In the **Default Event Analysis View** drop-down menu, select the default reconstruction type when you open an event in the Event Analysis panel: **Text Analysis**, **Packet Analysis**, or **File Analysis**. If you have not selected a default analysis type, when you open an event, the default reconstruction type is the Packet Analysis, except for log and endpoint events, which open to the Text Analysis. If you select a default reconstruction type, the reconstruction type is the default reconstruction that you specified. In both cases, the default is the starting point, and if you change the type while you are working, the type you choose is used for the next reconstruction.
3. In the **Default Log Format** drop-down, select the download format for exporting logs: **Download Log**, **Download XML**, **Download CSV**, or **Download JSON**. If you do not select a format here, the default download format is **Download Log**. These options are also available at the time of download in a drop-down menu.
4. In the **Default Packet Format** drop-down menu, select the default format for downloading packets. These options are also available at the time of download in a drop-down menu:
   - **Download PCAP** to download the entire event as a packet capture (*.pcap) file
   - **Download All Payloads** to download the payload as a *.payload file
   - **Download Request Payload** to download the request payload as a *.payload1 file
   - **Download Response Payload** to download the response payload as a *.payload2 file
5. Under **Time Format for Query**, choose either **Database Time** or **Wall Clock Time**. The Event Analysis view can display results based on the database time or the current clock time. When you set the time format, your individual user preference is saved until changed again. The default setting for

this preference is **Database Time**, which is the same time format used to display query results in the Navigate view and Events view.

- When **Database Time** is selected, the start and end time for a query is based on the time that the event was stored.
- When **Wall Clock Time** is selected, the query is executed with the current time in accordance with the timezone set in user preferences. The current time is focused on real time ingestion of captured data rather than PCAP uploads.

6. If you want all extracted files to be downloaded automatically, select the **Download extracted files automatically** checkbox. You can go to the Jobs queue to view the extracted files.
7. (Version 11.3 and later) To automatically update the time range window in the query bar when the service is polled (at one minute intervals) and sends fresh results, select the **Update Time Window Automatically** checkbox. When the time range is updated, the (Submit Query) button is activated and you can click to get the fresh results. To keep the time range window in the query bar synchronized with the current results, clear the checkbox (this is the default value).

Beginning an Investigation

Based on the question you are attempting to answer, NetWitness Platform offers different starting points: Navigate view, Events view, Event Analysis view, Hosts view, Files view, Users view, and Malware Analysis view.

Note: Specific user roles and permissions are required for a user to conduct investigations in NetWitness Platform. If you cannot perform a task or see a view, the administrator may need to adjust the roles and permissions configured for you.
-The Hosts and Files views are available in Version 11.1 and later (refer to the *NetWitness Endpoint Quick Start Guide* and *NetWitness Endpoint User Guide* for details).
-The Users view is available in Version 11.2 and later (refer to the *NetWitness UEBA Quick Start Guide* and the *NetWitness UEBA User Guide* for details).

Focus on Metadata, Raw Events, and Event Analysis

To hunt for events that drive the incident response workflow and to do strategic analysis after another tool has generated an event, go to **INVESTIGATE > Navigate**, **INVESTIGATE > Events**, or **INVESTIGATE > Event Analysis**. You can investigate the metadata and raw events for a single Broker or Concentrator. In each of these views, you can execute a query and filter the results by narrowing the time range and querying metadata. These topics provide details about beginning an investigation:

- Begin an Investigation in the Navigate or Events View
- Begin an Investigation in the Event Analysis View

Focus on Hosts and Files

To hunt for information on hosts that have the Endpoint agent running, go to **INVESTIGATE > Hosts**. For every host, you can see processes, drivers, DLLs, files (executables), services, and autoruns that are running, and information related to logged-in users. To begin an investigation by looking at files in your deployment, go to **INVESTIGATE > Files**. (See the *NetWitness Endpoint User Guide* for detailed information.)

Focus on Risky User and Entity Behavior

To discover, investigate, and monitor risky behaviors across all users and entities in your network environment, go to **INVESTIGATE > Users** and NetWitness UEBA (User and Entity Behavior Analytics). You can detect malicious and rogue users, pinpoint, high-risk behaviors, discover attacks, and investigate emerging security threats. (See the *NetWitness UEBA User Guide* for detailed information.)

Focus on Scanning Files for Malware

To scan files for potential malware, or set up a continuous scan of a service, go to **INVESTIGATE > Malware Analysis**. Scan results are expressed as four types of analysis: network, static, community, and sandbox with an indicator of compromise (IOC) rating. There are several other ways to begin working in Malware Analysis:

- You can begin Malware Analysis from the Malware Analysis dashlets in the Monitor view to quickly see the riskiest potential threats.
- You can right-click a meta key in the Navigate view, and select **Scan for Malware**.

See the *Malware Analysis User Guide* for detailed information.

Begin an Investigation in the Navigate or Events View

The Navigate view is the default view for Investigate unless you have selected a different view as your opening view. This user preference is set on the application level as described in Configuring NetWitness Investigate Views and Preferences. In the Navigate view and Events view, you are hunting for events of interest based on a query. In the Navigate view you can also refine results by clicking on meta keys and meta values. When you find interesting events, you can take a closer look at the event in the other Investigate views.

To begin an investigation in the Navigate view or Events view, a service must be specified.

- NetWitness Platform opens the Navigate view or the Events view with the user-specified default service selected.
- If no default service is currently specified and the service id is not in the URL, NetWitness Platform presents a dialog for selecting the service or collection to investigate.
- When a service is selected manually or by default in the Navigate view or Events view, you can change the service or collection to investigate by selecting the service name in the toolbar. NetWitness Platform presents the dialog for selecting the service to investigate.

Note: The Archiver service does not appear in the Navigate view to minimize user experience of slow performance when performing investigations. The Archiver is available in the Events view for log exports and enhanced search capabilities.

With a service or collection selected, NetWitness Platform is ready to load data for the service or collection. It is recommended that you also select a time range so that results load faster. Several settings in the Navigate View and Events View Settings dialog or the Profiles > Preferences panel > Investigations tab affect the loading process: Threshold, Max Values Results, Show Debug Information, Autoload Values, and Optimize Investigation page loads (see Configuring NetWitness Investigate Views and Preferences).

Note: In the Events view data loads automatically. If you specified Autoload Values in the Navigate view preferences, NetWitness Platform populates the data automatically. Otherwise, you must select Load Values . NetWitness Platform populates the meta data in the Navigate view Values panel and results become visible almost immediately.

The rest of this topic provides instructions for beginning the investigation of data on a service.

Note: Only users with the administrator role can create a collection, and only the creator of the collection is able to investigate a collection.

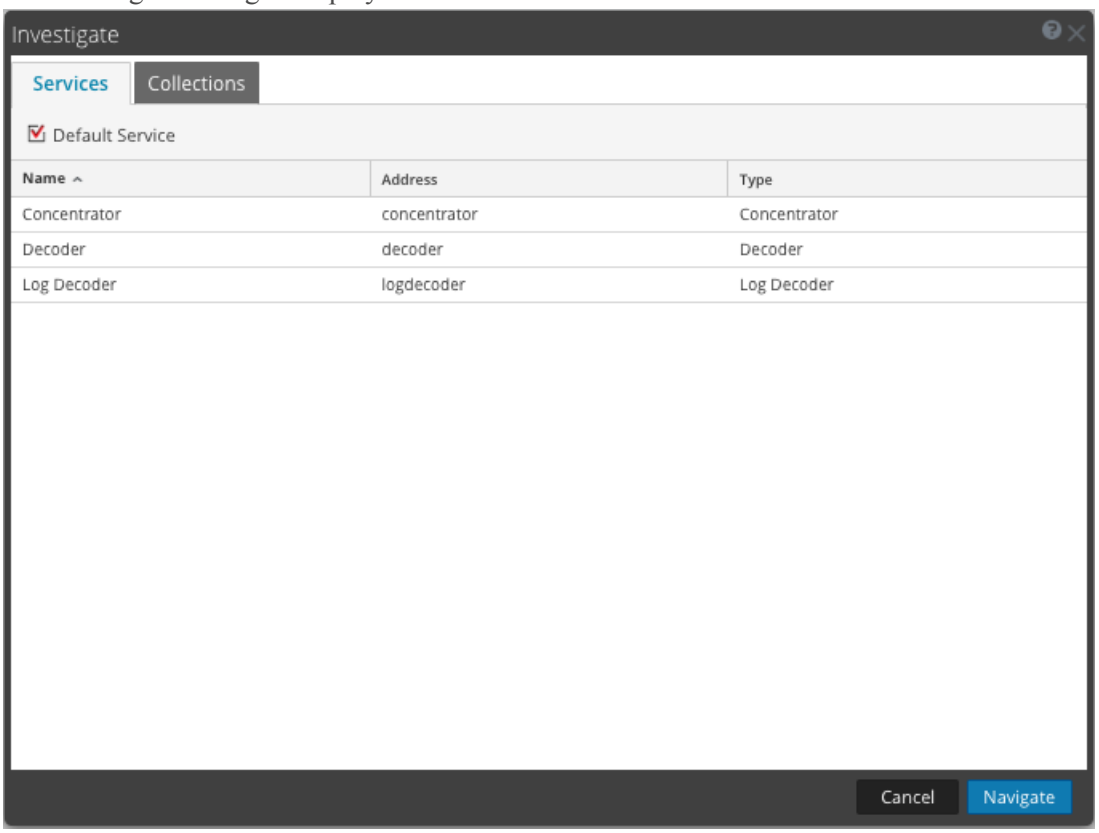
After loading data in the Navigate or the Events view:

1. Refine results, visualize data, and act on a drill point (see Investigating Metadata in the Navigate View) and Examining Raw Events in the Events View). For example, you can Look Up Additional Context for a Data Point, Launch a Malware Analysis Scan from the Navigate View, or Add Events to an Incident for Response.

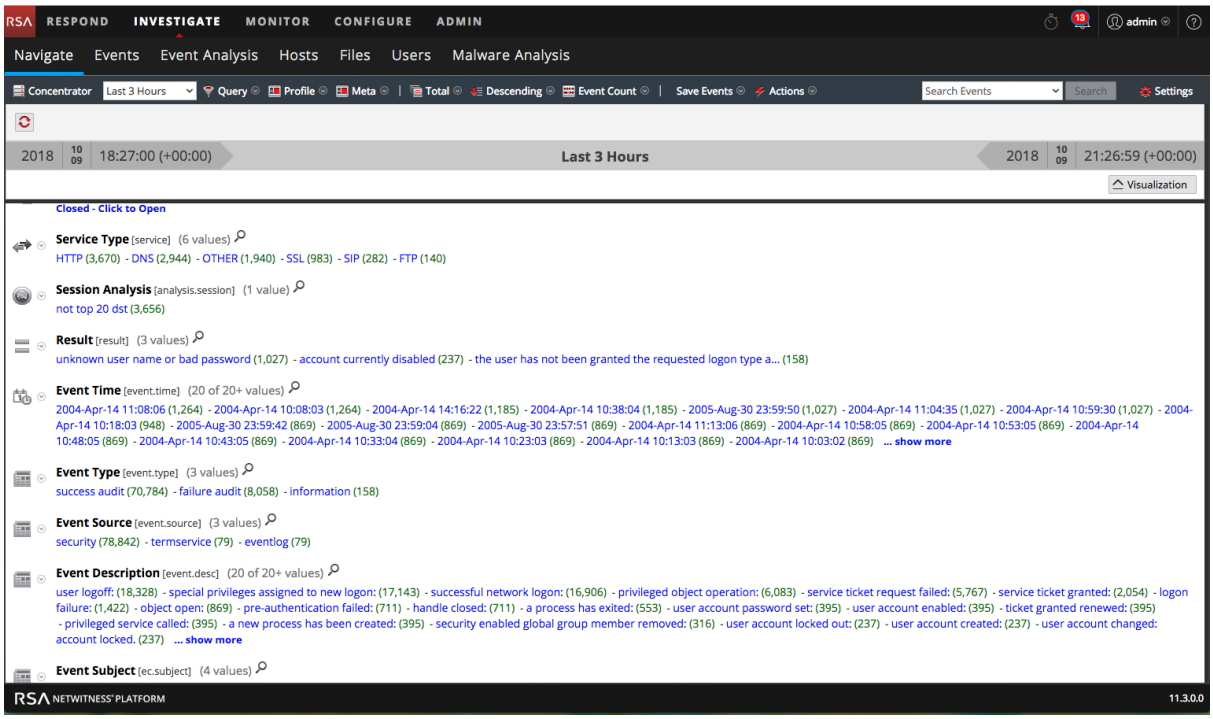
2. Reconstruct an event (see Reconstruct an Event) or view the interactive Event Analysis of an event (see Begin an Investigation in the Event Analysis View).

Begin an Investigation (No Default Service)

1. Go to **INVESTIGATE > Navigate** or **Events**.
   The Investigate dialog is displayed.



2. Double-click a service or select a service, usually a Concentrator, and click **Navigate**.
   The data loads automatically in the Events view. If you are working in the Navigate view, the resulting panel displays the activity for the selected service, but the data is not loaded automatically.
3. (Recommended) Select a specific time range so that results load faster.
4. If you want to modify investigation options before loading, you can create or modify a custom profile, apply a different time range, create or apply a meta group, and perform a custom query as described in Querying and Acting on Data in the Navigate and Events Views. You can also modify options at any time during the investigation.
5. To load data in the Navigate view, click Load Values.
   The data for the selected service begins loading.

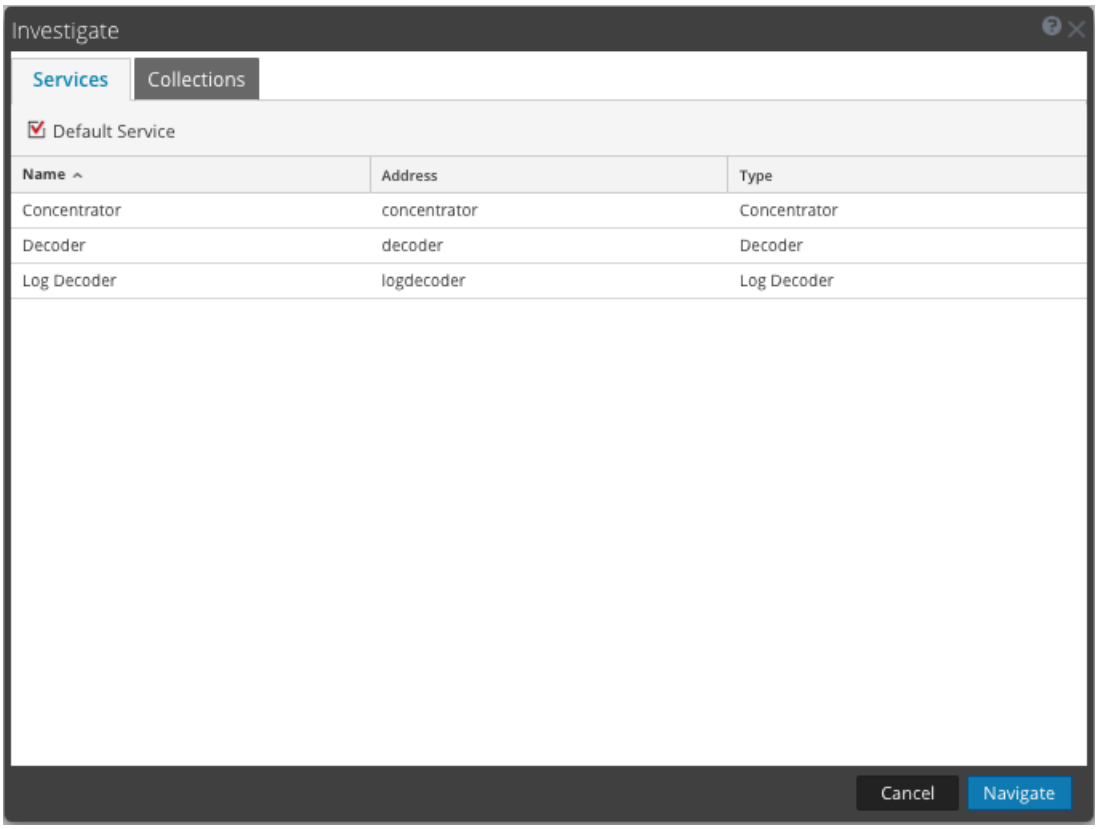


With the service selected and data loaded, you are ready to begin analyzing the data.

Set or Clear the Default Service

You can set the default service and clear the default service in the Investigate a Service dialog.

1. Click the service name in the toolbar.
   The Investigate dialog is displayed.



2. Select a service on the **Services** grid, and click Default Service.
   The service becomes the default, (indicated by **Default** in parentheses after the service name).

3. To clear the default service, select the default service in the grid, click Default Service, and click **Cancel** to close the dialog.
   No default service is set.

> **Note:** Clicking cancel does not cancel your selection of the default service. It closes the dialog without navigating to the currently selected service in the grid. Setting a default service that is different from the service currently being investigated, does not refresh the Navigate view. You must explicitly select and navigate to a different service.

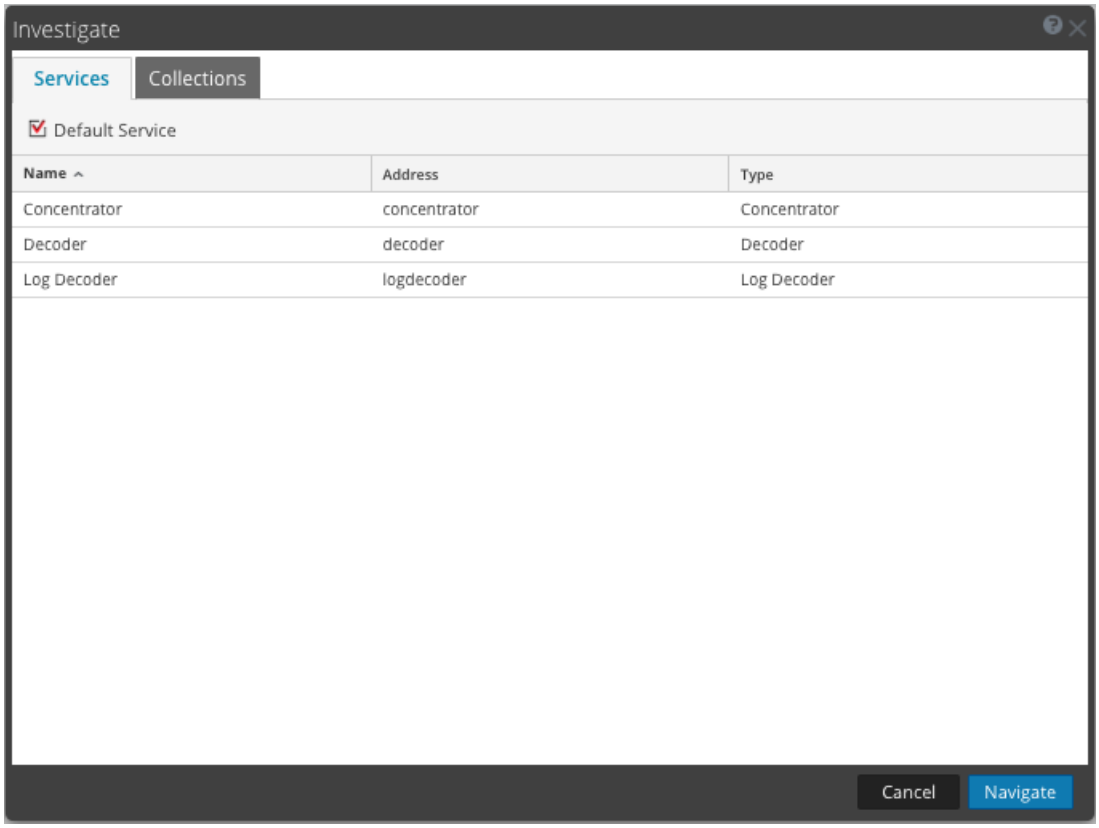
Begin an Investigation (Default Service Specified)

1. Go to **INVESTIGATE > Navigate** or **Events**.
   If the Autoload Values setting is set to off, the Navigate view is displayed with the default service selected, and ready to load data. If the Autoload Values setting is on, the values are loaded as shown in Step 3. In the Events view, the data is loaded automatically.
2. If you want to modify investigation options in the Navigate view before loading, you can create or modify a custom profile, apply a different time range, create or apply a meta group, and perform a custom query.

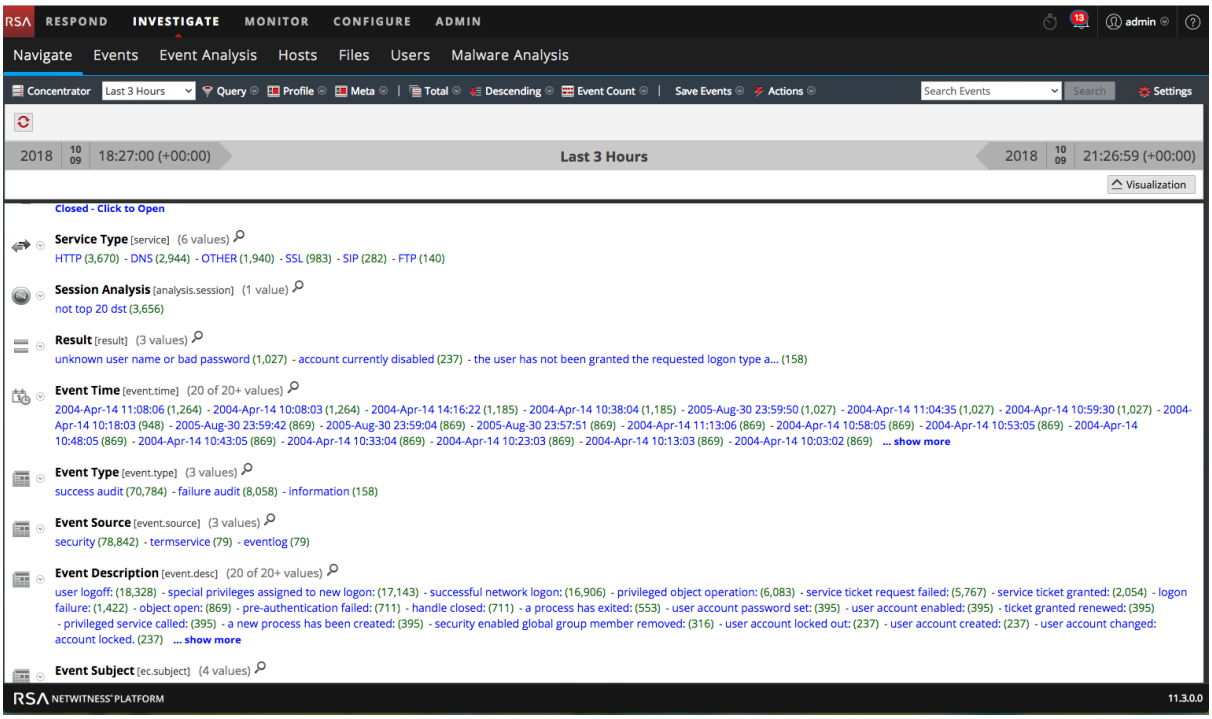
3. When ready, click Load Values.
   The values for the service are loaded in accordance with the selected options. With the service selected and data loaded you are ready to begin analyzing the data.

Change the Service or Collection to Investigate

1. In the Navigate view or the Events view, click the service name at the top of the options panel.
   The Investigate dialog is displayed.



2. Double-click a service or select a service and click **Navigate**. The resulting panel displays the activity for the selected service.
   If the Autoload Values setting is on, the values are loaded as shown in Step 3. Otherwise, the Navigate view is displayed with the default service selected, and data ready to load. In the Events view the data is loaded automatically.
3. When ready, click Load Values.
   The values for the service begin loading in accordance with the selected options.



With the service selected and data loaded you are ready to begin analyzing the data.

Investigate Workbench Restoration Collections

This procedure enables administrators to select content from an existing collection to reprocess for further investigation. This applies to Decoders that use Workbench services.

Note: Only a user with administrative privileges can create a collection, and you can view only those collections that you created.

To reprocess data for further investigation:

1. Go to **INVESTIGATE > Navigate** or **Events**.
   The Investigate dialog is displayed.
